L'articolo 24, paragrafo 3, della direttiva sulle condizioni di accoglienza (rivista) stabilisce altresì che gli Stati membri inizino a rintracciare i familiari del minore non accompagnato, se necessario anche con l'assistenza di organizzazioni internazionali o altre organizzazioni competenti, quanto prima, non appena sia manifestata la volontà di chiedere la protezione nazionale, sempre tutelando l'interesse superiore del minore. Nei casi in cui sussistano rischi per la vita o l'integrità del minore o dei suoi parenti stretti, in particolare se questi sono rimasti nel paese di origine, la raccolta, il trattamento e la diffusione delle informazioni relative a queste persone sono effettuate in via confidenziale, in modo da non mettere in pericolo la loro sicurezza. Inoltre, ai sensi dell'articolo 31, paragrafo 5, della direttiva qualifiche (rifusa), il riconoscimento della protezione

444 Articolo 10, paragrafo 3, lettere a) e b) rispettivamente.

445 Direttiva 2001/55/CE del Consiglio, del 20 luglio 2001, sulle norme minime per la concessione della protezione temporanea in caso di afflusso massiccio di sfollati e sulla promozione dell'equilibrio degli sforzi tra gli Stati membri che ricevono gli sfollati e subiscono le conseguenze dell'accoglienza degli stessi (GU L 212 del 7.8.2001).

internazionale per il minore non deve interferire con l'inizio o il proseguimento delle operazioni di rintracciamento.

In aggiunta a ciò, il regolamento di Dublino stabilisce che, se un minore non accompagnato ha uno o più parenti presenti in un altro Stato membro che possono occuparsi di lui/lei, gli Stati membri provvedono, ove possibile, al ricongiungimento del minore con tali parenti, purché ciò sia nell'interesse superiore del minore (articolo 8). Il regolamento contiene altresì l'obbligo per gli Stati membri di rintracciare i parenti che si trovino nel territorio degli Stati membri, sempre tutelando l'interesse superiore del minore (articolo 6). Inoltre, la direttiva sulle condizioni di accoglienza stabilisce la necessità di iniziare a rintracciare i familiari del minore, se necessario con l'assistenza di organizzazioni internazionali o altre organizzazioni competenti (articolo 24). Quest'ultima forma di assistenza è contemplata anche dal regolamento di Dublino (articolo 6).

Il principio dell'interesse superiore del minore deve sempre essere applicato al momento di adottare una decisione sul ricongiungimento familiare. Per esempio, i genitori devono poter dimostrare di essere in grado di esercitare i propri doveri genitoriali nei confronti del minore. I giudici nazionali riterranno illegittimo il rimpatrio di un minore nel suo Paese d'origine se le autorità non avranno accertato che in quel paese siano stati adottati provvedimenti adeguati per accogliere e assistere il minore (direttiva rimpatri, articolo 10, paragrafo 2).

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 8 della CEDU non conferisce ai genitori migranti e ai loro figli il diritto assoluto di scegliere dove vivere. Le autorità nazionali possono infatti legittimamente rimpatriare o rifiutare l'ingresso ai familiari, purché non vi siano ostacoli insormontabili alla costruzione della vita familiare altrove.[446] Tali decisioni devono sempre rappresentare una risposta proporzionata a questioni generali di ordine pubblico, compreso il desiderio di rimpatriare o impedire l'ingresso di un genitore che è stato coinvolto in attività criminali.

446 Corte EDU, sentenza 12 giugno 2012, *Bajsultanov c. Austria* (n. 54131/10); Corte EDU, sentenza 5 aprile 2005, *Latifa Benamar e altri c. Paesi Bassi, decisione di inammissibilità* (n. 43786/04).

Esempio: nel caso *Şen c. Paesi Bassi* la Corte EDU ha confermato che, nel tracciare uno spartiacque tra i diritti del minore/della famiglia e i generali interessi di ordine pubblico, occorre tenere in considerazione tre fattori: l'età dei minori; la loro situazione nel paese d'origine; e il grado di effettiva dipendenza dai genitori.

Esempio: il caso *Jeunesse c. Paesi Bassi*[447] riguarda il rifiuto delle autorità olandesi di consentire a una donna del Suriname sposata a un cittadino olandese, con il quale aveva avuto tre figli, di soggiornare nei Paesi Bassi in virtù dei suoi vincoli familiari in questo paese. La Corte EDU ha ritenuto che le autorità interne non avessero prestato sufficiente attenzione alle conseguenze che avrebbe avuto per i figli della ricorrente e per i loro interessi superiori la decisione di negare alla loro madre il permesso di soggiorno. La Corte EDU ha riscontrato una violazione dell'articolo 8 della CEDU in ragione del fatto che non era stato raggiunto un giusto equilibrio tra gli interessi personali della ricorrente e della sua famiglia di mantenere la vita familiare nei Paesi Bassi e gli interessi di ordine pubblico del governo di controllare l'immigrazione.

Nell'ambito del diritto internazionale, un minore ha il diritto di non essere separato dalla sua famiglia a meno che questa separazione non sia considerata necessaria nell'interesse preminente del fanciullo (articolo 9, paragrafo 1, della CRC). L'articolo 10 della CRC stabilisce che un fanciullo i cui genitori risiedono in Stati diversi ha diritto a spostarsi da un paese all'altro per intrattenere contatti regolari con entrambi i genitori, o per ricongiungersi a loro, nel rispetto della legislazione nazionale in materia di immigrazione. L'interesse superiore del fanciullo, sancito dall'articolo 3 della CRC, deve essere alla base di tutte le decisioni concernenti il ricongiungimento familiare con un minore o un minore non accompagnato.[448]

447 Corte EDU, sentenza 3 ottobre 2014, *Jeunesse c. Paesi Bassi* [GC] (n. 12738/10).

448 Secondo l'UNICEF, in relazione alle richieste di ricongiungere il fanciullo alla sua famiglia nel paese ospitante, i giudici nazionali devono altresì garantire che i genitori non stiano sfruttando la situazione per ottenere un permesso di soggiorno in quel pese. Cfr. UNICEF, Judicial impementation of Art. 3 of the CRC in Europe (Attuazione giudiziaria dell'articolo 3 della CRC in Europa), pag. 104. Cfr. anche Alto Commissario delle Nazioni Unite per i rifugiati (UNHCR), *Guidelines on Determining the Best Interests of the Child*, maggio 2008.

9.4. Trattenimento

Punti salienti

- La legislazione europea ammette il trattenimento di minori in un contesto migratorio solo come misura estrema.
- Le autorità nazionali sono tenute a fornire ai minori un alloggio alternativo adeguato.

Nell'ambito del diritto dell'UE, l'articolo 11 della direttiva sulle condizioni di accoglienza (rivista) stabilisce che i minori possono essere trattenuti solo come ultima risorsa e solo dopo ci sia stato accertato che misure alternative meno coercitive non possono essere applicate in maniera efficace. A tale trattenimento deve farsi ricorso per un periodo di durata più breve possibile ed deve essere fatto il possibile perché i minori trattenuti siano rilasciati e ospitati in alloggi idonei. I minori trattenuti devono poter avere la possibilità di svolgere attività di svago, compresi il gioco e attività ricreative consone alla loro età. Secondo il medesimo articolo, anche i minori non accompagnati sono trattenuti soltanto in circostanze eccezionali ed vengono prese tutte le misure necessarie siano rilasciati il più rapidamente possibile. I minori non accompagnati non sono mai trattenuti in istituti penitenziari, ma deve essergli fornita una sistemazione in istituti dotati di personale e strutture consoni a soddisfare le esigenze di persone della loro età. Deve essere garantita loro una sistemazione separata dagli adulti.

L'articolo 17 della direttiva rimpatri prevede il trattenimento di minori e famiglie la cui domanda di asilo sia stata respinta, a determinate condizioni. Nel caso dei minori non accompagnati, tuttavia, la direttiva stabilisce che siano sistemati in istituti dotati di personale e strutture consoni a soddisfare le esigenze di persone della loro età. Non esiste finora un filone giurisprudenziale della GCUE che riguardi nello specifico il trattenimento di minori.

Nell'ambito del diritto del Consiglio d'Europa, il trattenimento di migranti minorenni è stato esaminato alla luce degli articoli 3 e 5 della CEDU.

Esempio: il caso *Mubilanzila Mayeka e Kaniki Mitunga c. Belgio*[449] riguarda un minore non accompagnato sottoposto a una misura di trattenimento. Una bambina di cinque anni è stata trattenuta in un centro di transito per adulti per due mesi, senza adeguato supporto. La bambina, sprovvista dei necessari documenti di viaggio, proveniva dalla Repubblica democratica del Congo e cercava di ricongiungersi alla madre, cui era stato riconosciuto il diritto di asilo in Canada. La bambina era stata successivamente rimpatriata nella Repubblica democratica del Congo, nonostante non vi fossero in quel paese familiari che potessero occuparsi di lei. La Corte EDU ha stabilito che, non essendoci stato alcun rischio che la bambina cercasse di sottrarsi alla sorveglianza delle autorità belghe, il suo trattenimento in un centro chiuso per adulti è stato superfluo. La Corte EDU ha altresì osservato che avrebbero potuto essere intraprese altre misure (il suo inserimento in un centro specializzato o l'affido a una famiglia) più adatte a garantire l'interesse superiore della fanciulla sancito dall'articolo 3 della CRC. La Corte EDU ha riscontrato una violazione degli articoli 3, 5 e 8 della CEDU.

Altri casi hanno messo in rilievo l'illegittimità del trattenimento, anche quando il minore in questione era accompagnato da un genitore.

Esempio: nel caso *Muskhadzhiyeva e altri c. Belgio*,[450] la Corte EDU ha stabilito che il trattenimento protratto nell'arco di più mesi in un centro di transito chiuso di una madre e dei suoi quattro figli, di età compresa tra sette mesi e sette anni, costituiva una violazione dell'articolo 3 della CEDU. Nel raggiungere tali conclusioni, la Corte ha attirato l'attenzione sul fatto che il centro era "inadeguato per ospitare minori", con gravi conseguenze per la loro salute psichica.

Esempio: il caso *Popov c. Francia,*[451] riguardante il trattenimento amministrativo di una famiglia per due settimane in attesa della loro espulsione in Kazakistan, conferma questa sentenza. La Corte EDU ha infatti riscontrato una violazione dell'articolo 3 della Corte EDU per il fatto che le autorità francesi non avevano soppesato le inevitabili conseguenze negative sui

449 Corte EDU, sentenza 12 ottobre 2006, *Mubilanzila Mayeka e Kaniki Mitunga c. Belgio* (n. 13178/03).

450 Corte EDU, sentenza 19 gennaio 2010, *Muskhadzhiyeva e altri c. Belgio* (n. 41442/07) (consultabile in francese).

451 Corte EDU, sentenza 19 gennaio 2012, *Popov c. Francia* (nn. 39472/07 e 39474/07).

due bambini (di cinque mesi e tre anni) del trattenimento in un centro di detenzione in condizioni considerate "inadatte alla presenza di minori".[452] Ha altresì riscontrato una violazione dell'articolo 5 e dell'articolo 8 con riferimento all'intera famiglia e una violazione dell'articolo 37 della CRC, che stabilisce che "ogni fanciullo privato di libertà sia trattato con umanità e con il rispetto dovuto alla dignità della persona umana e in maniera da tener conto delle esigenze delle persone della sua età".[453]

Esempio: analogamente, nel caso *Kanagaratnam c. Belgio*,[454] il trattenimento di una madre richiedente asilo e dei suoi tre figli in un centro di detenzione per stranieri irregolari per quattro mesi equivale a una violazione degli articoli 3 e 5 della CEDU. Nonostante il fatto che i bambini fossero accompagnati dalla madre, la Corte ha ritenuto che, trattenendoli in un centro di detenzione, le autorità belghe li avessero esposti a sentimenti di angoscia e di inferiorità e si fossero assunte il rischio, in modo pienamente consapevole, di compromettere il loro sviluppo.[455]

Nell'ambito del diritto internazionale, l'articolo 9, paragrafo 4, della CRC stabilisce che, in caso di trattenimento di un minore, le autorità statali sono tenute a fornire ai genitori del minore informazioni riguardanti il luogo dove si trovano.[456]

452 *Ibid*., punto 95.

9.5. Espulsione[457]

Punti salienti

- La vulnerabilità dei figli dei migranti all'espulsione è intrinsecamente legata allo status di residenza dei loro genitori nel paese ospitante.
- Il principio dell'interesse superiore dovrebbe orientare tutte le decisioni relative all'espulsione dei migranti minorenni e delle loro famiglie/dei responsabili della loro assistenza.
- Il diritto dell'UE contempla situazioni in cui i migranti minorenni possono rimanere in un paese ospitante nonostante lo status giuridico dei loro genitori, in particolare allo scopo di terminare gli studi o qualora la costruzione di una vita familiare altrove fosse difficile.

Nell'ambito del diritto dell'UE, come per altre sfere della legislazione dell'UE in materia di migrazione, le norme che disciplinano l'espulsione dei minori variano a seconda della loro cittadinanza, della cittadinanza dei loro genitori e del contesto del loro trasferimento. Una volta che un minore ottiene l'autorizzazione ad accedere a uno Stato membro in virtù della legislazione sulla libera circolazione nell'UE, vi sono buone probabilità che possa rimanere in quel Paese, anche se il cittadino dell'UE con cui si era trasferito originariamente non ha più diritto a soggiornare o decide di andarsene.

In particolare, ai sensi della direttiva sulla libera circolazione, i figli e altri familiari possono rimanere nel paese ospitante dopo il decesso del cittadino dell'Unione con cui si erano inizialmente trasferiti (articolo 12, paragrafo 2), purché abbiano soggiornato nello Stato ospitante per almeno un anno prima del decesso del genitore. Analogamente, possono rimanere nel paese ospitante, in linea di principio, anche dopo la partenza del genitore. In entrambi i casi, tuttavia, se il figlio o familiare è cittadino di un paese terzo, il diritto a soggiornare in questo Paese è subordinato alla loro capacità di dimostrare di disporre di risorse economiche sufficienti a mantenersi. Devono anche possedere un'assicurazione malattia (articolo 7).

457 Detta anche rimpatrio, allontanamento o estradizione, a seconda del contesto legale. Ai fini del presente capitolo, il termine espulsione sarà usato per indicare l'allontanamento illecito di uno straniero o di un altro soggetto da uno Stato. Cfr. anche FRA e Corte EDU (2014), sezione 5.4 sul ricongiungimento familiare – protezione dall'espulsione.

Le norme sono ancora più permissive nel caso di figli iscritti presso strutture scolastiche nel Paese ospitante. In questi casi i minori e i genitori o tutori che ne hanno l'effettivo affidamento sono autorizzati a rimanere nel Paese ospitante dopo la partenza del cittadino dell'Unione dallo Stato membro ospitante o il suo decesso, indipendentemente dalla cittadinanza del minore (articolo 12, paragrafo 3). Se originariamente si è ritenuto che questo ulteriore diritto correlato al percorso scolastico si applicasse soltanto ai figli di famiglie con risorse sufficienti a mantenersi,[458] successivamente la giurisprudenza ha confermato che esso si estende anche ai figli che beneficiano di un supporto di previdenza sociale per potersi dedicare agli studi.[459]

Inoltre, hanno diritto a rimanere nel Paese ospitante anche i familiari e, in particolare, il genitore non avente la cittadinanza di uno Stato membro e divorziato dal coniuge cittadino dell'UE, se ha ottenuto l'affidamento dei figli o beneficia del diritto di visita ai figli se le visite devono obbligatoriamente essere effettuate nel Paese ospitante (articolo 13, paragrafo 2, lettere b) e d)).

La Corte si è fondata direttamente sullo status di cittadino dell'Unione di cui all'articolo 20 del TFUE per accordare ai genitori di un minore che siano cittadini di un Paese terzo il permesso di lavorare e soggiornare nello Stato membro dell'UE di cittadinanza del minore. In questo modo il minore può godere dei diritti correlati al suo status di cittadino dell'UE, se in caso contrario il minore sarebbe costretto a lasciare l'UE per accompagnare i genitori.[460] La giurisprudenza della CGUE indica, tuttavia, che "la mera circostanza che possa apparire auspicabile al cittadino di uno Stato membro, per ragioni economiche o per mantenere l'unità familiare nel territorio dell'Unione, che i suoi familiari, che non possiedono la cittadinanza di uno Stato membro, possano soggiornare con lui nel territorio dell'Unione, non basta di per sé a far ritenere che il cittadino dell'Unione sia costretto ad abbandonare il territorio dell'Unione qualora un tale diritto non gli venga concesso".[461]

Nimco Hassan Ibrahim e Secretary of State for the Home Department*. L'istruzione dei figli dei migranti è esaminata anche al paragrafo 8.2.

460 CGUE, sentenza 8 marzo 2011, causa C-34/09, *Gerardo Ruiz Zambrano c. Office National de l'Emploi (ONEm)*.

461 CGUE, sentenza 15 novembre 2011, causa C-256/11, *Murat Dereci e altri c. Bundesministerium für Inneres*, punto 68. Cfr. anche la sentenza della Corte 8 novembre 2012, causa C-40/11, *Yoshikazu Iida c. Stadt Ulm* Cfr. anche FRA e Corte EDU (2014), pag. 125–127.

La direttiva sulla libera circolazione stabilisce esplicitamente che qualsiasi misura di allontanamento di minori adottata in circostanze eccezionali dovrebbe essere conforme alla CRC (considerando 24). Inoltre, l'articolo 28, paragrafo 3, lettera b), ribadisce il divieto di allontanamento nei confronti di un minore, salvo quando sia necessario nell'interesse del bambino, secondo quanto contemplato dalla CRC.

Per quanto riguarda i minori richiedenti asilo la cui domanda sia stata respinta, la direttiva rimpatri specifica che le decisioni riguardanti il rimpatrio dei minori non accompagnati devono essere adottate tenendo conto dell'interesse superiore del minore (articolo 10). Oltretutto, prima di allontanare un minore non accompagnato dal territorio di uno Stato membro, le autorità di tale Stato membro si accertano che questi sarà ricondotto ad un membro della sua famiglia, a un tutore designato o presso adeguate strutture di accoglienza nello Stato di rimpatrio (articolo 10, paragrafo 2).

Quando i minori richiedenti asilo sono trasferiti in un altro Stato membro ai fini della valutazione della domanda di asilo, il regolamento di Dublino stabilisce che l'interesse superiore del minore deve orientare l'attuazione di tali decisioni (articolo 6). Il regolamento fornisce anche un elenco di fattori per assistere le autorità nell'individuazione dell'interesse superiore del minore, tra cui le possibilità di ricongiungimento familiare; il benessere e lo sviluppo sociale del minore; le considerazioni di sicurezza, in particolare se sussiste un rischio che il minore sia vittima della tratta di esseri umani; l'opinione del minore, secondo la sua età e maturità.

Esempio: nella causa *The Queen, su istanza di MA e altri c. Secretary of State for the Home Department*,[462] la CGUE doveva stabilire quale Stato fosse competente nel caso di un minore non accompagnato che aveva presentato più domande di asilo in vari Stati membri dell'UE e che non aveva alcun familiare presente in altri Stati membri dell'UE. La CGUE ha chiarito che, in mancanza di un familiare che si trovi legalmente in uno Stato membro, è competente a esaminare la domanda lo Stato membro nel quale si trova il minore. Così facendo, la CGUE si è richiamata all'articolo 24, paragrafo 2, della Carta dei diritti fondamentali dell'Unione europea, in base al quale, in tutti gli atti relativi ai minori, l'interesse superiore del minore deve essere considerato preminente.

462 CGUE, sentenza 6 giugno 2013, causa C-648/11, *The Queen, su istanza di MA e altri c. Secretary of State for the Home Department*.

Nell'ambito del diritto del Consiglio d'Europa, in linea di principio gli Stati sono autorizzati a interferire con il diritto al rispetto della vita familiare di cui all'articolo 8, paragrafo 2, della CEDU.

Esempio: il caso *Gül c. Svizzera*[463] riguarda un ricorrente che viveva in Svizzera con la moglie e la figlia e al quale, insieme ai suoi familiari, erano stati concessi diritti di soggiorno per motivi umanitari. Il ricorrente desiderava richiamare in Svizzera il figlio minorenne, che era rimasto in Turchia, ma le autorità svizzere avevano respinto la domanda, perché non godeva dei mezzi sufficienti per sostenere la sua famiglia. La Corte EDU ha sostenuto che, lasciando la Turchia, il ricorrente si era intenzionalmente separato dal figlio. I recenti viaggi in Turchia del richiedente dimostrano che i motivi inizialmente considerati per la richiesta di asilo politico in Svizzera erano venuti meno. Non sussistevano più ostacoli che impedivano alla famiglia di stabilirsi nel Paese d'origine, dove il figlio minorenne aveva sempre vissuto. Pur riconoscendo le gravi difficoltà in cui la famiglia versava dal punto di vista umanitario, la Corte non ha riscontrato una violazione dell'articolo 8 della CEDU.

Esempio: nel caso *Üner c. Paesi Bassi*[464] è stata ribadita la necessità di tenere in considerazione l'impatto che l'espulsione avrebbe sui bambini membri di una famiglia al momento di stabilire se l'espulsione rappresenta una risposta proporzionata. Si deve pertanto considerare: "il miglior interesse dei minori eventualmente coinvolti (in particolare la loro difficoltà a integrarsi nel Paese verso cui il genitore è espulso) e la solidità dei legami sociali, culturali e familiari coltivati dall'individuo nel paese di residenza e in quello di destinazione".

Esempio: il caso *Tarakhel c. Svizzera*[465] riguarda il rifiuto delle autorità svizzere di esaminare la domanda di asilo di una coppia afgana e dei loro sei figli, e la decisione di rinviarli in Italia. La Corte EDU ha accertato che, alla luce della situazione attuale del sistema di accoglienza in Italia, e in assenza di dettagliate e affidabili informazioni riguardo alla specifica struttura di destinazione, le autorità svizzere non possedevano sufficienti garanzie che, se i ricorrenti fossero stati rinviati in Italia, sarebbero stati accolti in

463 Corte EDU, sentenza 19 febbraio 1996, *Gül c. Svizzera* (n. 23218/94).

464 Corte EDU, sentenza 18 ottobre 2006, *Üner c. Paesi Bassi*, (n. 46410/99), punti 57–58. Cfr. anche Corte EDU, sentenza 2 agosto 2001, *Boultif c. Svizzera* (n. 54273/00).

465 Corte EDU, sentenza 4 novembre 2014, *Tarakhel c. Svizzera* [GC] (n. 29217/12).

condizioni adeguate rispetto all'età dei minori. La Corte EDU ha pertanto dichiarato che, se le autorità svizzere avessero rinviato i ricorrenti in Italia in virtù del regolamento di Dublino II, senza prima aver ottenuto dalle autorità italiane garanzie individuali sull'adeguatezza delle condizioni di accoglienza rispetto all'età dei minori e sul mantenimento dell'unità familiare, esse sarebbero incorse in una violazione dell' articolo 3 della CEDU.

Nell'ambito del diritto internazionale, in caso di detenzione, imprigionamento, esilio, espulsione o morte di uno o entrambi i genitori, o del fanciullo, uno Stato fornisce dietro richiesta ai genitori, o al fanciullo, le informazioni essenziali concernenti il luogo dove si trovano il familiare o i familiari, a meno che la divulgazione di tali informazioni possa mettere a repentaglio il benessere del fanciullo (articolo 9, paragrafo 4, della CRC).

9.6. Accesso alla giustizia[466]

Punto saliente

- I figli dei migranti hanno diritto a un rimedio efficace.

Nell'ambito del diritto dell'UE, i diritti dei minori di accedere alla giustizia in un contesto migratorio sono sanciti da una serie di strumenti diversi. In primo luogo, il diritto a un ricorso effettivo e a un giudice imparziale è stabilito dall'articolo 47 della Carta dei diritti fondamentali dell'UE. È compreso in questo articolo il diritto di un individuo a che la sua causa sia esaminata equamente, pubblicamente ed entro un termine ragionevole da un giudice indipendente e imparziale, con la facoltà di ogni individuo di farsi consigliare, difendere e rappresentare in maniera adeguata (articolo 48). Per i figli dei migranti, tali garanzie sono rafforzate da una serie di disposizioni legislative secondarie. In particolare, il regolamento di Dublino impone agli Stati membri l'obbligo di garantire che un minore non accompagnato sia rappresentato da qualcunoche possieda le necessarie qualifiche e che abbia accesso al contenuto dei documenti pertinenti della pratica del minore (articolo 6). Disposizioni analoghe sono contenute nella direttiva qualifiche (articolo 31) e nella direttiva sulle procedure d'asilo (articolo 25). Il diritto dei minori

466 Cfr. anche FRA e Corte EDU (2014), sezione 4.5 sulla consulenza legale nei casi di asilo e sulle procedure di rimpatrio.

alla rappresentanza legale è altresì rafforzato dal diritto di accesso ai servizi di assistenza alle vittime e a specifici servizi di assistenza riservati, di cui all'articolo 8 della direttiva 2012/29/UE che istituisce norme minime in materia di diritti, assistenza e protezione delle vittime di reato (Direttiva sui diritti delle vittime).[467]

Tuttavia, i diritti associati all'accesso alla giustizia non sono privi di limiti e possono essere subordinati a determinate condizioni correlate all'età. Per esempio, la direttiva sulle procedure d'asilo consente agli Stati membri di "astenersi dal nominare un rappresentante [legale], se il minore non accompagnato raggiungerà presumibilmente l'età di 18 anni prima che sia presa una decisione in primo grado" (articolo 25, paragrafo 2).

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU si è espressa sull'applicabilità dell'articolo 6 (diritto a un equo processo) della CEDU nei casi concernenti decisioni sull'ingresso, il soggiorno e l'espulsione di stranieri[468]. Tuttavia, in determinate circostanze è possibile invocare l'articolo 13 della CEDU (diritto a un ricorso efficace).

Esempio: il caso *Rahimi c. Grecia*[469] riguarda le condizioni in cui un migrante minorenne proveniente dall'Afghanistan, che era arrivato in Grecia illegalmente, era stato costretto a vivere in un centro di trattenimento, dal quale successivamente era stato allontanato in vista dell'espulsione. Nel riscontrare una violazione dell'articolo 13 della CEDU, la Corte EDU ha osservato che la brochure informativa fornita al ricorrente non indicava la procedura da seguire per poter presentare ricorso al capo della polizia. Inoltre, la brochure informativa che faceva riferimento ai rimedi disponibili al ricorrente per lamentare le condizioni di detenzione cui era stato sottoposto, non era redatta in una lingua a lui comprensibile. Rifacendosi alle relazioni del comitato europeo per la prevenzione della tortura e delle pene o trattamenti inumani o degradanti (CPT), la Corte EDU ha preso atto dell'assenza in Grecia di un'autorità indipendente deputata all'ispezione delle strutture di detenzione gestite dalle autorità di polizia. Ha altresì osservato che non esiste un'autorità imparziale che possa rendere efficaci i rimedi

467 Direttiva 2012/29/UE del Parlamento europeo e del Consiglio, del 25 ottobre 2012, che istituisce norme minime in materia di diritti, assistenza e protezione delle vittime di reato (GU L 315 del 14.11.2012, pag. 57).

468 Corte EDU, sentenza 5 ottobre 2000, *Maaouia v. Francia* [GC] (n. 39652/98).

469 Corte EDU, sentenza 5 aprile 2011, *Rahimi c. Grecia* (n. 8687/08) (consultabile in francese).

previsti. Di conseguenza, la Corte ha riscontrato una violazione dell'articolo 3, dell'articolo 5, paragrafi 1 e 4, e dell'articolo 13 della CEDU.

La CSE stabilisce che gli Stati promuovono lo sviluppo legale (oltre che sociale ed economico) della famiglia (articolo 16). Inoltre, in virtù dell'articolo 19, paragrafo 1, gli Stati s'impegnano a mantenere "adeguati servizi gratuiti" e a garantire che i lavoratori migranti e le loro famiglie ricevano informazioni esatte in materia di emigrazione e immigrazione. Un obbligo analogo in materia di "informazioni" (fondamentali per l'accesso dei migranti alla giustizia) è previsto dall'articolo 6 della Convenzione europea sullo statuto giuridico dei lavoratori emigranti, benché le più ampie disposizioni sul diritto di accesso ai giudici e alle autorità amministrative (articolo 26) siano riservate esclusivamente ai lavoratori migranti anziché ai loro familiari.[470]

Vale la pena notare, inoltre, che il Consiglio d'Europa ha elaborato orientamenti estremamente esaustivi sulla giustizia a misura di minore, che precisano in che modo tutti i procedimenti giudiziari e amministrativi, compresi i procedimenti in materia di immigrazione, devono essere adattati per rispondere alle esigenze dei minori.[471]

Nell'ambito del diritto internazionale, l'articolo 37 della CRC è particolarmente importante per i migranti minorenni privati di libertà, poiché garantisce a questi soggetti il diritto ad avere rapidamente accesso a un'assistenza giuridica o a ogni altra assistenza adeguata, nonché il diritto di contestare la legalità della loro privazione di libertà dinanzi a un Tribunale o altra autorità competente, indipendente e imparziale, che devono adottare una decisione sollecita in materia.

In questo capitolo saranno esaminate la legislazione e la giurisprudenza europee nella sfera della protezione dei consumatori e della tutela dei dati. A livello dell'UE esistono una nutrita legislazione e giurisprudenza, dal momento che il TFUE definisce espressamente la competenza dell'UE in tali ambiti. Il contributo del Consiglio d'Europa in questo ambito è più limitato. A livello dei trattati, vi sono due importanti convenzioni sui mezzi d'informazione e sulla tutela dei dati. La Corte EDU si è inoltre espressa in alcuni casi riguardanti la tutela dei dati personali.

Nei seguenti paragrafi saranno esaminati aspetti specifici della legislazione sui consumatori relativa ai minori (paragrafo 10.1) e alla tutela dei dati (paragrafo 10.2). Per ciascuno di questi aspetti si analizzeranno il quadro giuridico generale e la sua applicabilità nel caso dei minori, oltre che le norme specifiche per la tutela dei minori, se del caso.

10.1. Protezione dei minori come consumatori

Punti salienti

- Secondo la Corte di giustizia dell'Unione europea, il miglior interesse dei minori come consumatori e la tutela dei loro diritti prevalgono rispetto ai requisiti di interesse pubblico per il quale è giustificato limitare la libera circolazione di beni, persone, servizi e capitali.
- I minori come consumatori devono ricevere informazioni pertinenti per poter essere in grado di considerare tutti gli elementi rilevanti e fare una scelta informata.
- Sono inique le prassi commerciali non conformi al principio della diligenza professionale che possono influenzare le decisioni di natura commerciale dei consumatori adulti e non.
- I minori possono essere inseriti in sperimentazioni cliniche soltanto se si prevede che il medicinale somministrato avrà un beneficio diretto, che sia superiore ai rischi.
- La legislazione dell'UE e del Consiglio d'Europa limita l'esposizione dei minori alle attività di commercializzazione, senza tuttavia vietare questa pratica.
- I minori hanno diritto a una tutela specifica, che prevede la protezione da pubblicità e da programmi di televendita che potrebbero causare loro pregiudizi di natura morale o fisica.
- È vietato l'uso della pubblicità commerciale nei programmi per bambini.

10.1.1. Diritti dei consumatori

Nell'ambito del diritto dell'UE i principali pilastri della tutela dei consumatori sono sanciti all'articolo 169, paragrafo 1, del TFUE e all'articolo 38 della Carta dei diritti fondamentali dell'Unione europea. La Corte di giustizia ha riconosciuto che il miglior interesse del minore prevale sui requisiti di ordine pubblico, giustificando dunque l'esistenza di limitazioni alle libertà del mercato comune.

Esempio: la causa *Dynamic Medien*[472] riguarda la vendita tramite Internet in Germania di DVD di cartoni animati giapponesi. Nel Regno Unito i cartoni animati erano stati classificati nella categoria "vietati ai minori di 15 anni". L'autorità tedesca competente aveva considerato i cartoni animati non idonei. La questione pregiudiziale sottoposta alla Corte di giustizia era se il divieto in vigore in Germania fosse contrario al principio della libera circolazione. La Corte ha appurato che lo scopo principale della legislazione tedesca era quello di proteggere i minori da informazioni che potessero nuocere al loro benessere. Ha quindi stabilito che la restrizione alla libera circolazione di merci non era sproporzionata nella misura in cui non eccedeva quanto necessario per conseguire l'obiettivo della tutela dei minori perseguito dallo Stato membro in questione.

Esempio: la causa *Omega*[473] riguarda la gestione di un "laserdromo" in Germania. Il gioco che si svolgeva nel "laserdromo" prevedeva che si colpissero i sensori fissati sui giubbotti indossati dai giocatori. L'attrezzatura per il gioco era fornita da una società britannica ed era stata commercializzata legalmente, insieme al modello di gioco, nel Regno Unito. Il gioco era stato vietato in Germania perché contrario a valori fondamentali quali la dignità umana. La Corte di giustizia ha appurato che la limitazione imposta dalle autorità tedesche non era contraria al diritto dell'UE, poiché era stata correttamente giustificata da motivi di ordine pubblico.

Il più recente processo di revisione della legislazione dell'UE in materia di consumatori è sfociato nell'adozione della direttiva 2011/83/EU (direttiva sui diritti dei consumatori), che mira ad armonizzare completamente le legislazioni nazionali sui contratti di vendita a distanza e sui contratti negoziati al di fuori dei locali commerciali, oltre che su altre tipologie di contratti conclusi dai consumatori.[474] L'intenzione è raggiungere un equilibrio tra un elevato livello di tutela dei consumatori e la competitività delle imprese. La direttiva, ai sensi dell'articolo 3, paragrafo 3, lettera a), non si applica ai contratti per i servizi sociali, compresi

472 CGUE, sentenza 14 febbraio 2008, causa C-244/06, *Dynamic Medien Vertriebs GmbH c. Avides Media AG*.

473 CGUE, sentenza 14 ottobre 2004, causa C-36/02, *Omega Spielhallen- und Automatenaufstellungs-GmbH c. Oberbürgermeisterin der Bundesstadt Bonn*.

474 Direttiva 2011/83/UE del Parlamento europeo e del Consiglio, del 25 ottobre 2011, sui diritti dei consumatori, recante modifica della direttiva 93/13/CEE del Consiglio e della direttiva 1999/44/CE del Parlamento europeo e del Consiglio e che abroga la direttiva 85/577/CEE del Consiglio e la direttiva 97/7/CE del Parlamento europeo e del Consiglio (GU L 304 del 22.11.2011, pag. 64). La direttiva avrebbe dovuto essere stata applicata entro il 13 dicembre 2013.

gli alloggi popolari, l'assistenza all'infanzia e il sostegno alle famiglie e alle persone temporaneamente o permanentemente in stato di bisogno, ivi compresa l'assistenza a lungo termine. I servizi sociali comprendono, tra gli altri, i servizi per i bambini e i giovani, i servizi di assistenza per le famiglie, per i genitori soli e le persone anziane e i servizi per i migranti. La direttiva dedica un'attenzione specifica alle informazioni precontrattuali. Gli "obblighi di informazione" sono fondati sul presupposto che se i consumatori, compresi i minori, riceveranno informazioni adeguate, essi saranno in grado di considerare tutti gli elementi pertinenti e prendere decisioni informate.

10.1.2. Pratiche commerciali illecite nei confronti di minori

Nell'ambito della legislazione dell'UE, la direttiva 2005/29/CE relativa alle pratiche commerciali sleali tra imprese e consumatori nel mercato interno[475] riguarda la totalità delle pratiche commerciali tra imprese e consumatori (sia offline che online, e concernenti sia merci che servizi). La direttiva inserisce i minori nella categoria dei "consumatori vulnerabili" (articolo 5, paragrafo 3). Non sono ammesse decisioni commerciali prese nell'ambito di pratiche commerciali che comportano il ricorso a molestie, coercizione o informazioni ingannevoli, e i consumatori minorenni hanno il diritto di prendere le proprie decisioni liberamente. La direttiva vieta le attività di commercializzazione di prodotti, compresa la pubblicità, che ingenerano confusione con un altro prodotto o con il marchio di un concorrente, e introduce l'obbligo di fornire ai consumatori tutte le informazioni necessarie in maniera chiara e comprensibile, e con la tempestività necessaria per consentire ai consumatori di prendere una decisione di natura commerciale (articoli 6 e 7).

10.1.3. Sicurezza del prodotto

Nell'ambito del diritto dell'UE esiste un quadro legislativo esaustivo che garantisce che soltanto i prodotti sicuri e comunque conformi possano essere immessi sul mercato. In particolare, la direttiva 2001/95/CE relativa alla sicurezza generale dei prodotti dedica un'attenzione specifica alla sicurezza dei minori, includendoli nella categoria di consumatori che possono essere particolarmente vulnerabili ai

475 Direttiva 2005/29/CE del Parlamento europeo e del Consiglio, dell'11 maggio 2005, relativa alle pratiche commerciali sleali tra imprese e consumatori nel mercato interno e che modifica la direttiva 84/450/CEE del Consiglio e le direttive 97/7/CE, 98/27/CE e 2002/65/CE del Parlamento europeo e del Consiglio e il regolamento (CE) n. 2006/2004 del Parlamento europeo e del Consiglio (GU L 149 dell'11.6.2005, pag. 22).

rischi presentati dai prodotti in esame (considerando 8 della direttiva). Pertanto, la sicurezza dei prodotti dev'essere valutata tenendo conto di tutti gli aspetti pertinenti, in particolare delle categorie di consumatori cui sono destinati i prodotti.

La direttiva 87/357/CEE tratta specificamente della sicurezza dei prodotti e riguarda il ravvicinamento delle legislazioni degli Stati membri relative ai prodotti che, avendo un aspetto diverso da quello che sono in realtà, compromettono la salute o la sicurezza dei consumatori.[476] La direttiva vieta la commercializzazione, l'importazione e la fabbricazione di prodotti che possono essere confusi con prodotti alimentari ma che non sono commestibili. Gli Stati membri devono effettuare controlli per evitare che prodotti di questo genere siano commercializzati. Se uno Stato membro vieta un prodotto in virtù di questa direttiva, deve darne comunicazione alla Commissione e fornire informazioni dettagliate da trasmettere agli altri Stati membri. Il problema della sicurezza dei giocattoli in particolare è affrontato in maniera più esaustiva nel paragrafo 10.1.6.

10.1.4. Sperimentazioni cliniche su minori

Nell'ambito del diritto dell'UE, la direttiva 2001/20/CE[477] concernente il ravvicinamento delle disposizioni legislative relative all'applicazione della "buona pratica clinica" nell'esecuzione della sperimentazione clinica di medicinali ad uso umano riconosce i bambini come una fascia di popolazione particolarmente bisognosa di tutela, in grado di dare validamente il proprio consenso informato ad una sperimentazione clinica (considerando 3). I bambini possono partecipare a sperimentazioni cliniche soltanto se la somministrazione del medicinale reca un beneficio diretto superiore ai rischi (considerando 3). Le sperimentazioni cliniche devono tutelare al massimo le persone (articolo 4).

Analogamente, il regolamento (UE) n. 536/2014 sulla sperimentazione clinica di medicinali per uso umano contiene disposizioni specifiche per i minori appartenenti alla fascia della popolazione vulnerabile (articolo 10, paragrafo 1). Scopo del

476 Direttiva 87/357/CEE del Consiglio, del 25 giugno 1987, concernente il ravvicinamento delle legislazioni degli Stati Membri relative ai prodotti che, avendo un aspetto diverso da quello che sono in realtà, compromettono la salute o la sicurezza dei consumatori (GU L 192 dell'11.7.1987, pag. 49).

477 Direttiva 2001/20/CE del Parlamento europeo e del Consiglio, del 4 aprile 2001, concernente il ravvicinamento delle disposizioni legislative, regolamentari ed amministrative degli Stati membri relative all'applicazione della buona pratica clinica nell'esecuzione della sperimentazione clinica di medicinali ad uso umano (GU L 121 dell'1.5.2001, pag. 34).

regolamento è sostituire gradualmente la direttiva 2001/20/CE.[478] Esso prescrive un'attenta valutazione delle domande di autorizzazione alla sperimentazione clinica effettuata su minori. Il rappresentante legale del minore deve fornire il consenso informato alla sperimentazione clinica, così come il consenso del minore, se questi è in grado di formarsi un'opinione propria (articolo 29, paragrafi 1 e 8). Il regolamento definisce condizioni specifiche per la conduzione di sperimentazioni cliniche sicure sui minori e per l'acquisizione del loro consenso informato (articolo 32). Si tratta cioè di provvedere affinché non siano riconosciuti incentivi o benefici finanziari al soggetto, ad eccezione di un'indennità compensativa per le spese e i mancati guadagni direttamente connessi alla partecipazione alla sperimentazione clinica; affinché la sperimentazione clinica sia finalizzata a studiare trattamenti per una condizione clinica che colpisce solo i minori; e affinché vi siano motivi scientifici per ritenere che la partecipazione alla sperimentazione clinica rechi: al minore interessato un beneficio diretto superiore ai rischi e agli oneri associati; o determinati benefici alla popolazione rappresentata dal minore interessato e che tale sperimentazione clinica comporti solo un rischio e un onere minimi per tale minore rispetto al trattamento standard applicato alla sua condizione. È possibile eseguire la sperimentazione clinica su minori senza prima ottenerne il consenso informato o senza ottenere il consenso dei loro rappresentanti legali esclusivamente in situazioni di emergenza (articolo 35, paragrafo 1).

10.1.5. Cibo destinato a lattanti e bambini piccoli

Nell'ambito del diritto dell'UE, la direttiva *2009/39/CE relativa ai prodotti alimentari destinati ad un'alimentazione particolare*[479] si sofferma sulla composizione nutrizionale e la sicurezza dei cibi fabbricati specificamente per lattanti e bambini di età inferiore a 12 mesi. Le sue disposizioni riguardano alimenti per lattanti e alimenti di proseguimento, alimenti a base di cereali destinati ai lattanti e ai bambini e additivi presenti in alimenti per lattanti e bambini. La direttiva si prefigge lo scopo di garantire la sicurezza dei prodotti e di fornire ai consumatori prodotti adatti e informazioni adeguate. Specifica, tra le altre cose, che un utilizzo nutrizionale particolare risponde a esigenze nutrizionali particolari di alcune categorie di persone, compresi i lattanti e i bambini nella prima infanzia in buona salute (articolo 1, paragrafo 3, lettera c)).

478 Regolamento (UE) n. 536/2014 del Parlamento europeo e del Consiglio, del 16 aprile 2014, sulla sperimentazione clinica di medicinali per uso umano e che abroga la direttiva 2001/20/CE (GU L 158 del 27.5.2014, pag. 1).

479 Direttiva 2009/39/CE del Parlamento europeo e del Consiglio, del 6 maggio 2009, relativa ai prodotti alimentari destinati ad un'alimentazione particolare (GU L 124 del 20.5.2009, pag. 21).

10.1.6. Sicurezza dei giocattoli

Nell'ambito del diritto dell'UE, la direttiva 2009/48/CE sulla sicurezza dei giocattoli[480] all'articolo 2 definisce i giocattoli "prodotti progettati o destinati, in modo esclusivo o meno, a essere utilizzati per fini di gioco da bambini di età inferiore a 14 anni".[481] L'allegato I fornisce un elenco non esaustivo di oggetti che non sono considerati giocattoli, ma che potrebbero ingenerare confusione. L'articolo 2, paragrafo 2, elenca alcuni giocattoli che sono esclusi dal suo raggio d'azione. La direttiva inoltre rafforza i requisiti di salute e sicurezza limitando i quantitativi di talune sostanze chimiche che possono essere contenute nei materiali usati per la fabbricazione dei giocattoli (articolo 10).[482]

10.1.7. Minori e pubblicità

Nell'ambito del diritto dell'UE, la direttiva 2010/13/UE relativa ai servizi di media audiovisivi (direttiva sui servizi di media audiovisivi)[483] ha ampliato l'ambito di applicazione della disciplina legale della direttiva 89/552/CEE relativa al coordinamento di determinate disposizioni legislative, regolamentari e amministrative degli Stati Membri concernenti l'esercizio delle attività televisive (direttiva sulla televisione senza frontiere). La direttiva sui servizi di media audiovisivi disciplina la quantità, la qualità e i contenuti delle pratiche di commercializzazione cui possono essere esposti i minori, regolamentando la durata della pubblicità (articoli 20, 24 e 27). Essa vieta l'inserimento di prodotti nei programmi per minori (articolo 11) e autorizza gli Stati membri a vietare l'esibizione del logo di una

480 Direttiva 2009/48/CE del Parlamento europeo e del Consiglio, del 18 giugno 2009, sulla sicurezza dei giocattoli (GU L 170 del 18.6.2009, pag. 170).

481 *Ibid*., articolo 2, paragrafo 1.

482 La Commissione europea ha altresì stipulato "accordi volontari" con industrie/commercianti di giocattoli per migliorare la sicurezza dei giocattoli. Per ulteriori informazioni cfr. http://ec.europa.eu/growth/sectors/toys/safety/index_en.htm.

483 Direttiva 2010/13/CEE del Parlamento europeo e del Consiglio, del 10 marzo 2010, relativa al coordinamento di determinate disposizioni legislative, regolamentari e amministrative degli Stati membri concernenti la fornitura di servizi di media audiovisivi (direttiva sui servizi di media audiovisivi) (GU L 95 del 15.4.2010, pag. 1).

sponsorizzazione durante i programmi per bambini (articolo 10, paragrafo 4).[484] La direttiva sui servizi di media audiovisivi mira a conciliare la tutela dei minori con altri importanti valori democratici, tra cui la libertà di espressione, sostenendo che tale tutela è possibile tramite l'indispensabile coinvolgimento della responsabilità genitoriale (considerando 48 e 59).

L'applicazione effettiva della direttiva sui servizi di media audiovisivi è integrata dalle raccomandazioni del 1998[485] e del 2006[486] sulla tutela dei minori e della dignità umana.

Nell'ambito del diritto del Consiglio d'Europa, la Convenzione europea sulla televisione transfrontaliera[487] è stata il primo trattato internazionale a creare un quadro giuridico per la libera circolazione dei programmi televisivi transfrontalieri in Europa. La convenzione tutela nello specifico i minori e i giovani (articolo 7, paragrafo 2), per esempio vietando la trasmissione di materiali pornografici e violenti e di programmi che incitano all'odio razziale. Definisce inoltre norme riguardanti la pubblicità e disciplina l'orario di trasmissione e la durata degli spot pubblicitari.

484 Per una panoramica più generale del funzionamento della direttiva sui servizi di media audiovisivi cfr.: COM(2012)203 final, Relazione della Commissione al Parlamento europeo, al Consiglio, al Comitato economico e sociale europeo e al Comitato delle Regioni sull'applicazione della direttiva 2010/13/UE "Direttiva sui servizi di media audiovisivi", Bruxelles, 4 maggio 2012, e il relativo documento di lavoro dei servizi della commissione: SWD(2012)125 final, Commission Staff Working Document attached to the First Report from the Commission to the European Parliament, the Council, The European Economic And Social Committee And The Committee of the Regions on the Application of Directive 2010/13/EU 'Audiovisual Media Services', Bruxelles, 4 maggio 2012.

485 Raccomandazione del Consiglio 98/560/CE, del 24 settembre 1998, concernente lo sviluppo della competitività dell'industria dei servizi audiovisivi e d'informazione europei attraverso la promozione di strutture nazionali volte a raggiungere un livello comparabile e efficace di tutela dei minori e della dignità umana (GU L 270 del 7.10.1998).

486 Raccomandazione 2006/952/CE del Parlamento europeo e del Consiglio, del 20 dicembre 2006, relativa alla tutela dei minori e della dignità umana e al diritto di rettifica relativamente alla competitività dell'industria europea dei servizi audiovisivi e d'informazione in linea (GU L 378 del 27.12.2006).

487 Consiglio d'Europa, Convenzione europea sulla televisione transfrontaliera, STE n. 132, 5 maggio 1989. Modificata dalle disposizioni del Protocollo, STE n. 171, 1 marzo 2002.

10.2. Minori e protezione dei dati personali

Punti salienti

- Nell'ambito del diritto dell'UE e del Consiglio d'Europa, la protezione dei dati personali è riconosciuta come un diritto fondamentale.
- Il diritto al rispetto della vita privata e familiare, del proprio domicilio e della propria corrispondenza (articolo 8 della CEDU) comprende il diritto alla protezione dei dati personali.
- I minori, tra i diritti correlati ai dati personali, godono del diritto di opporsi al trattamento dei dati che li riguardano, salvo in casodi motivi preminenti e legittimi.

10.2.1. Diritto dell'Unione europea in materia di protezione dei dati

Nell'ambito del diritto dell'UE, l'Unione è competente a legiferare in materia di protezione dei dati (articolo 16 del TFUE).[488] L'articolo 8, paragrafo 2, della Carta dei diritti fondamentali dell'Unione europea contiene una serie di principi fondamentali in materia di protezione dei dati (trattamento secondo il principio di lealtà, in base al consenso o a un altro fondamento legittimo previsto dalla legge, diritto di accesso e di rettifica), mentre il paragrafo 3 del medesimo articolo stabilisce che il rispetto delle norme in materia di protezione dei dati sia soggetto al controllo di un'autorità indipendente. Il diritto alla protezione dei dati personali sancito dall' articolo 8 può essere limitato nel rispetto della legge e allo scopo di rispettare i principi di una società democratica quali le libertà e i diritti degli altri (articolo 52 della Carta).[489]

La protezione dei dati personali si è affermata come una delle principali sfere del diritto dell'UE in relazione alla vita privata. Lo strumento principe in questo ambito è la direttiva 95/46/CE relativa alla tutela delle persone fisiche con riguardo

488 Per una panoramica generale della legislazione dell'UE in materia di protezione dei dati, cfr.: FRA e Consiglio d'Europa (2014).

489 CGUE, sentenza 24 novembre 2011, cause riunite C-468/10 e C-469/10, *Asociación Nacional de Establecimientos Financieros de Crédito (ASNEF) e Federación de Comercio Electrónico y Marketing Directo (FECEMD) c. Administración del Estado*, punto 48; CGUE, sentenza 29 gennaio 2008, causa C-275/06, *Productores de Música de España (Promusicae) c. Telefónica de España SAU*, punto 68.

al trattamento dei dati personali, nonché alla libera circolazione di tali dati (direttiva sulla tutela dei dati).[490]

Poiché il trattamento dei dati avviene in spazi chiusi non aperti al pubblico, i minori e altre persone interessate sono solitamente all'oscuro del fatto che i loro dati sono oggetto di trattamento. Per contrastare la vulnerabilità delle persone interessate, il diritto dell'UE riconosce ai minori (e ad altre persone interessate) specifici diritti individuali tra cui il diritto a essere informati del fatto che i loro dati sono raccolti, il diritto di accesso ai dati conservati e di conoscere i dettagli del trattamento, il diritto di opporsi a un trattamento illecito, il diritto di rettifica, cancellazione e congelamento dei dati.

I responsabili del trattamento devono fornire informazioni adeguate sul trattamento dei dati (articoli 10 e 11 della direttiva sulla protezione dei dati). Se considerata dalla prospettiva dei minori, tale disposizione implica che la lingua e il formato delle informazioni devono essere adattati al livello di maturità e di comprensione dei minori. Come requisito minimo, le informazioni fornite devono menzionare le finalità del trattamento e l'identità e i recapiti del responsabile del trattamento (articolo 10, lettere a) e b), della direttiva sulla protezione dei dati).

La direttiva sulla protezione dei dati prevede che le persone interessate acconsentano al trattamento dei dati, indipendentemente dalla delicatezza dei dati trattati (articoli 7, 8 e 14). Una procedura di consenso a misura di minore implica che si tenga conto delle capacità *in fieri* del bambino e quindi di un suo progressivo coinvolgimento. Il primo passo prevede che il rappresentante legale del minore si consulti con il diretto interessato prima di autorizzare il trattamento; successivamente, il consenso va ottenuto sia dal rappresentante legale che dal minore; infine, il consenso si richiede unicamente al minore quando questi è adolescente.

Le persone interessate hanno diritto di cancellare i dati, compresa la possibilità di eliminare o espungere i dati su richiesta, nonché il diritto di opporsi al trattamento dei dati personali. Quest'ultima possibilità è cresciuta in importanza per i minori, in ragione dell'enorme volume di dati personali riguardanti i minori che circolano e sono disponibili attraverso i media sociali. Benché la Corte di giustizia dell'Unione europea non abbia ancora esaminato casi concernenti i minori, in una recente controversia che ha interessato un ricorrente adulto, questaha

490 Direttiva 95/46/CE del Parlamento europeo e del Consiglio, del 24 ottobre 1995, relativa alla tutela delle persone fisiche con riguardo al trattamento dei dati personali, nonché alla libera circolazione di tali dati (direttiva sulla tutela dei dati) (GU L 281 del 23.11.1995).

dichiarato che il diritto a opporsi si applica in particolare a dati e informazioni che "risultino inadeguati, non siano o non siano più pertinenti, ovvero siano eccessivi in rapporto alle finalità suddette e al tempo trascorso".[491] La Corte ha altresì dichiarato che occorre ricercare un giusto equilibrio tra l'esercizio di tale diritto e altri diritti fondamentali.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha interpretato l'articolo 8 della CEDU come un riconoscimento del diritto alla protezione dei dati personali. La Corte esamina situazioni in cui emerge il problema della protezione dei dati, tra cui l'intercettazione di comunicazioni,[492] varie forme di sorveglianza,[493] e la protezione dalla conservazione dei dati personali da parte di autorità pubbliche.[494] Inoltre, la Corte EDU ha stabilito che la legislazione nazionale deve introdurre misure adeguate per assicurare la disponibilità di ricorsi giurisdizionali contro violazioni dei diritti di protezione dei dati.

Esempio: nel caso *K. U. c. Finlandia*,[495] il ricorrente, un minore, aveva denunciato la pubblicazione a suo nome di un annuncio a sfondo sessuale su un sito Internet di incontri. Il provider del servizio Internet si era rifiutato di rivelare l'identità della persona che aveva postato le informazioni, ritenendosi vincolato dagli obblighi di riservatezza previsti dalla legislazione finlandese. Il ricorrente lamentava l'assenza nella legislazione finlandese di strumenti adeguati a consentirgli di tutelarsi contro le azioni commesse da un privato che aveva pubblicato in Internet dati compromettenti che lo riguardavano. La Corte EDU ha stabilito che gli Stati sono soggetti a obblighi positivi, che comprendono tra l'altro l'adozione di misure atte a garantire il rispetto della vita privata, anche nelle relazioni tra individui. Nel caso di specie, ha ritenuto che la tutela concreta ed effettiva del ricorrente richiedeva che fossero prese misure efficaci per identificare e perseguire

491 CGUE, sentenza 13 maggio 2014, causa C-131/12, *Google Spain SL e Google Inc. c. Agencia Española de Protección de Datos (AEPD) e Mario Costeja González* [GS], punto 93.

492 Cfr., per esempio: Corte EDU, sentenza 2 agosto 1984, *Malone c. Regno Unito* (n. 8691/79); Corte EDU, sentenza 3 aprile 2007, *Copland c. Regno Unito* (n. 62617/00).

493 Cfr., per esempio: Corte EDU, sentenza 6 settembre 1978, *Klass e altri c. Germania* (n. 5029/71); Corte EDU, sentenza 2 settembre 2010, *Uzun c. Germania* (n. 35623/05).

494 Cfr., per esempio: Corte EDU, sentenza 26 marzo 1987, *Leander c. Svezia* (n. 9248/81); Corte EDU, sentenza 4 dicembre 2008, *S. e Marper c. Regno Unito* [GC] (nn. 30562/04 e 30566/04).

495 Corte EDU, sentenza 2 dicembre 2008, *K.U. c. Finlandia* (n. 2872/02). Cfr., più avanti, il capitolo 4.

l'autore del fatto. Non essendo stata tale protezione garantita dallo Stato, la Corte ha riscontrato una violazione dell'articolo 8 della CEDU.[496]

Esempio: il caso *Avilkina e altri c. Russia*[497] riguarda la divulgazione dei dossier medici di una bambina di due anni a un magistrato, in seguito alla richiesta di quest'ultimo di informazioni circa tutti i rifiuti di trasfusioni di sangue opposti dai testimoni di Geova. Pur riconoscendo che gli interessi di un'indagine giudiziaria potrebbero prevalere rispetto agli interessi di un paziente e della comunità in generale a tutelare la riservatezza delle informazioni mediche, la Corte ha tuttavia osservato che la ricorrente non era indagata o imputata in un procedimento penale. Inoltre, gli operatori sanitari che avevano avuto in cura la ricorrente avrebbero potuto richiedere l'intervento dell'autorità giudiziaria per effettuare la trasfusione, se avessero temuto che la paziente si trovava in pericolo di vita. In assenza di ragioni pressanti di natura sociale per richiedere la divulgazione di informazioni mediche riservate riguardanti la ricorrente, la Corte EDU ha riscontrato una violazione dell'articolo 8 della CEDU.

Esempio: nel caso *S. e Marper c. Regno Unito*,[498] le impronte digitali e campioni di DNA prelevati a un ragazzino di undici anni sospettato di tentata rapina sono stati conservati senza limiti di tempo, anche dopo che il ragazzino era stato assolto. Considerata la natura e la quantità delle informazioni personali contenute nei campioni di cellule e profili di DNA, la loro conservazione equivaleva in sé a un'ingerenza nel diritto al rispetto della vita privata del ricorrente. I principi fondamentali degli strumenti pertinenti del Consiglio d'Europa nonché il diritto e la prassi in vigore presso gli altri Stati contraenti richiedono che la conservazione dei dati sia proporzionata allo scopo per il quale essi sono raccolti e limitata nel tempo, in particolare nell'ambito della pubblica sicurezza. La protezione offerta dall'articolo 8 della CEDU sarebbe indebolita in modo inaccettabile qualora si consentisse, nel settore della giustizia penale, l'utilizzo ad ogni costo di moderne tecniche scientifiche e ciò senza operare un attento bilanciamento tra i vantaggi che esse possono offrire e i fondamentali interessi che sono collegati al rispetto della vita privata. A tale proposito, il carattere generale

498 Corte EDU, sentenza 4 dicembre 2008, *S. e Marper c. Regno Unito* [GC] (nn. 30562/04 e 30566/04).

e indifferenziato con cui opera il meccanismo di conservazione dei dati in Inghilterra e Galles è particolarmente sorprendente, poiché autorizza la conservazione dei dati a tempo indefinito qualunque sia la natura o la gravità del reato di cui una persona di qualsiasi età è sospettata. La conservazione dei dati personali potrebbe essere particolarmente dannosa nel caso di minori, in considerazione della loro situazione specifica e dell'importanza del loro sviluppo e della loro integrazione nella società. In conclusione, la conservazione dei dati personali costituiva un'ingerenza sproporzionata nel diritto del ricorrente al rispetto della vita privata.

La Convenzione del Consiglio d'Europa sulla protezione delle persone rispetto al trattamento automatizzato di dati a carattere personale[499] (convenzione n. 108) si applica a tutti i trattamenti di dati effettuati nel settore sia pubblico che privato e tutela gli individui, inclusi i minori, da abusi che potrebbero essere compiuti nel corso dell'elaborazione dei dati personali. La convenzione n. 108 è corredata di un protocollo addizionale che disciplina l'istituzione di autorità di controllo e i flussi transfrontalieri di dati personali verso Paesi terzi.[500]

I principi sanciti nella convenzione n. 108 in relazione al trattamento dei dati personali riguardano l'ottenimento e l'elaborazione automatica dei dati personali in maniera leale e legittima, la loro conservazione per fini determinati e legittimi, e il divieto di utilizzo di questi dati in modo incompatibile con tali fini. I dati personali infine non devono essere conservati per un periodo superiore al necessario. questi principi riguardano altresì la qualità dei dati. In assenza di adeguate garanzie previste dalla legge, è vietato il trattamento di dati "sensibili" tra cui i dati che rivelano l'origine razziale, le opinioni politiche, le convinzioni religiose, nonché i dati a carattere personale relativi alla salute, alla vita sessuale o a condanne penali. La convenzione sancisce altresì il diritto dell'individuo, compreso il minore, di essere informato riguardo alla conservazione di informazioni che lo riguardano e di chiederne la rettifica, se del caso. Le restrizioni dei diritti stabiliti nella convenzione sono possibili solo quando sono in gioco interessi superiori, quali la sicurezza o la difesa dello Stato.

499 Consiglio d'Europa, Convenzione sulla protezione delle persone rispetto al trattamento automatizzato di dati a carattere personale, STE n. 108, 28 gennaio 1981.

500 Consiglio d'Europa, Protocollo addizionale alla Convenzione sulla protezione delle persone rispetto al trattamento automatizzato di dati a carattere personale, concernente le autorità di controllo e i flussi transfrontalieri di dati, concernente le autorità di controllo ed i flussi transfrontalieri, STE n. 181, 8 novembre 2001.

Nell'ambito del diritto internazionale, il diritto alla protezione dei dati è integrato nel diritto dei minori alla vita privata, che è sancito dall'articolo 16 della CRC. Questo articolo stabilisce che nessun fanciullo sarà oggetto di interferenze arbitrarie o illegali nella sua vita privata, nella sua famiglia, nel suo domicilio o nella sua corrispondenza, e neppure di affronti illegali al suo onore e alla sua reputazione. Questo diritto deve essere rispettato da tutti, compreso il rappresentante legale del minore.

I diritti dei minori nell'ambito di procedimenti di giustizia minorile riguardano i soggetti accusati, perseguiti o condannati per aver commesso reati penali, oltre che i minori che partecipano a procedimenti giudiziari o di natura analoga in qualità di vittime e/o testimoni. La posizione dei minori nell'ambito della giustizia minorile è disciplinata da disposizioni generali in materia di diritti umani, che si applicano indifferentemente agli adulti e ai minori.

Questo capitolo contiene una panoramica delle norme europee riguardanti i minori implicati in procedimenti giudiziari o stragiudiziali. In particolare, esamina le garanzie in materia di equo processo, compresa la partecipazione efficace e l'accesso a un difensore, i diritti dei minori responsabili di reati in stato di detenzione, compresa la detenzione preventiva (garanzie sostanziali e procedurali), le condizioni di detenzione e la tutela da maltrattamenti, oltre che la protezione di testimoni e vittime minorenni. La protezione è particolarmente rilevante nel caso degli strumenti alternativi al procedimento giudiziario, che dovrebbero essere incoraggiati ogniqualvolta questi possano servire al meglio l'interesse superiore del minore.[501] Nel caso dei minori sono valorizzati gli obiettivi di giustizia penale quali l'integrazione sociale, l'istruzione e la prevenzione delle recidive.[502]

501 Consiglio d'Europa, Comitato dei ministri (2010), Linee guida per una giustizia a misura di minore, 17 novembre 2010, paragrafo 24.

502 Cfr. anche, Consiglio d'Europa, Comitato dei ministri (2008), raccomandazione CM/Rec(2008)11 del comitato dei ministri agli Stati membri sulle norme europee per i rei minori oggetto di sanzioni o di altri provvedimenti, 5 novembre 2008, parte I.A.2.

11.1. Garanzie relative a un equo processo

Punti salienti

- Nei procedimenti penali i minori hanno il diritto di essere trattati in maniera giusta e adeguata alla loro età.
- I procedimenti giudiziari dovrebbero essere adattati alle esigenze dei minori, in modo da garantirne una partecipazione efficace.
- I minori hanno il diritto di usufruire di un avvocato fin dalle tappe iniziali del procedimento penale e dal primo interrogatorio di polizia.

In questo paragrafo, oltre a definire brevemente i requisiti generali di un processo equo a livello dell'UE e del Consiglio d'Europa, si vuole prestare particolare attenzione alle garanzie per un processo equo disponibile ai minori.

Il diritto ad un equo processo rappresenta un pilastro fondamentale di una società democratica. I minori sospettati o accusati di aver commesso un reato hanno il diritto ad un equo processo e godono delle medesime garanzie di qualsiasi altra persona che abbia compiuto atti contrari alla legge. Le garanzie per un processo equo si applicano dal primo interrogatorio del minore e sono assicurate nel corso del processo. I minori responsabili di azioni contrarie alla legge, tuttavia, sono particolarmente vulnerabili e, di conseguenza, possono necessitare di ulteriori tutele. Gli organismi dell'UE hanno elaborato criteri specifici per garantire che i bisogni di questi minori siano effettivamente soddisfatti.

Nell'ambito del diritto dell'UE, svariate disposizioni della Carta dei diritti fondamentali dell'Unione europea sanciscono diritti imprescindibili di accesso alla giustizia, che sono il fondamento delle garanzie per un processo equo per adulti e minori. L'articolo 47 tratta nello specifico del diritto a un ricorso effettivo e a un giudice imparziale, definendo obblighi che assumono una particolare rilevanza per i minori, quali il diritto a che una causa sia esaminata equamente, pubblicamente ed entro un termine ragionevole, oltre che la facoltà di farsi consigliare, difendere e rappresentare. È altresì contemplato il diritto al patrocinio a spese dello Stato. I principi della legalità e proporzionalità dei reati e delle pene sanciti all'articolo 49 sono parimenti importanti per i minori. Inoltre, alcune direttive dell'UE prevedono specifiche garanzie per un equo processo nei procedimenti

penali: la direttiva sul diritto all'interpretazione e alla traduzione,[503] la direttiva sul diritto all'informazione[504] e la direttiva sull'accesso a un difensore.[505] Le prime due direttive non contemplano garanzie specifiche per i minori, sebbene la direttiva sul diritto all'informazione contenga disposizioni che disciplinano, più in generale, il caso di persone vulnerabili sospettate o accusate di un reato. Al contrario, le disposizioni che riguardano i minori presenti nella direttiva sull'accesso a un difensore sono esaminate nel paragrafo 11.2.2.

Anche in assenza di disposizioni specifiche relative ai minori, gli Stati membri devono osservare la Carta dei diritti fondamentali dell'UE quando si tratta di applicare le disposizioni delle suddette direttive. Pertanto, principi quali l'interesse superiore del minore, sancito all'articolo 24, devono essere tenuti in debita considerazione qualora un minore sia soggetto a una qualsiasi delle disposizioni delle direttive. Ad oggi, non sono stati portati all'attenzione della Corte di giustizia europea casi che riguardano l'interpretazione dell'articolo 24 della Carta in combinato disposto con una delle summenzionate direttive.[506]

Di particolare rilievo è la proposta della Commissione europea di una direttiva sulle garanzie procedurali per i minori indagati o imputati in procedimenti penali,[507] che garantisce l'obbligatorietà del difensore in tutte le fasi del procedimento penale. Stabilisce altresì che i minori hanno diritto a ottenere informazioni tempestive circa i propri diritti, a godere dell'assistenza dei genitori (o di figure adeguate) e ad essere sottoposti a interrogatorio a porte chiuse. Inoltre, i minori privati di libertà dovrebbero godere del diritto a un'istruzione, un orientamento

503 Direttiva 2010/64/CE del Parlamento europeo e del Consiglio, del 20 ottobre 2010, sul diritto all'interpretazione e alla traduzione nei procedimenti penali (GU L 280 del 26.10.2010, pag. 1).

504 Direttiva 2012/13/CE del Parlamento europeo e del Consiglio, del 22 maggio 2012, sul diritto all'interpretazione e alla traduzione nei procedimenti penali (GU L 142 dell'1.6.2012, pag. 1).

505 Direttiva 2013/48/UE del Parlamento europeo e del Consiglio, del 22 ottobre 2013, relativa al diritto di avvalersi di un difensore nel procedimento penale e nel procedimento di esecuzione del mandato d'arresto europeo, al diritto di informare un terzo al momento della privazione della libertà personale e al diritto delle persone private della libertà personale di comunicare con terzi e con le autorità consolari (GU L 294 del 6.11.2013, pag. 1)

506 La Corte di giustizia europea si è occupata dell'interpretazione dell'articolo 24 nell'ambito di procedimenti concernenti la sottrazione internazionale di minori (cfr. il paragrafo 5.4).

507 Commissione europea (2013), Proposta di direttiva del Parlamento europeo e del Consiglio sulle garanzie procedurali per i minori indagati o imputati in procedimenti penali (COM(2013) 822 final, Bruxelles, 27.11.2013).

e una formazione professionale adeguati, così come a un'assistenza medica appropriata, e della possibilità di essere detenuti separatamente dagli adulti.[508]

Nell'ambito del diritto del Consiglio d'Europa, le garanzie per un processo equo della CEDU sono esplicitate all'articolo 6, che genera anche la più copiosa giurisprudenza della Corte EDU. L'articolo 6, paragrafo 1, della CEDU elenca espressamente alcune garanzie per un processo equo: il diritto a che la causa sia esaminata equamente e pubblicamente e a che la sentenza sia resa pubblicamente (a meno che ciò non sia contrario, tra le altre cose, agli interessi dei minori); il diritto a che la causa sia esaminata entro un termine ragionevole; il diritto a che la causa sia esaminata da un tribunale indipendente e imparziale;[509] il diritto a che la causa sia esaminata da un tribunale costituito per legge. Fondandosi sul concetto di equo processo, la Corte EDU ha elaborato le seguenti garanzie: parità di mezzi e contraddittorio; facoltà di non rispondere; accesso a un difensore; partecipazione efficace; presenza alle udienze; decisioni motivate. Inoltre, ogni persona accusata di un reato è presunta innocente fino a quando la sua colpevolezza non sia stata legalmente accertata (articolo 6, paragrafo 2, della CEDU).

Ogni accusato di un reato gode dei seguenti diritti minimi: il diritto a essere informato, nel più breve tempo possibile e in una lingua a lui comprensibile, dei motivi dell'accusa formulata a suo carico (articolo 6, paragrafo 3, lettera a), della CEDU); il diritto di disporre del tempo e delle facilitazioni necessarie a preparare la sua difesa (articolo 6, paragrafo 3, lettera b), della CEDU); il diritto ad avere l'assistenza di un difensore di sua scelta (articolo 6, paragrafo 3, lettera c), della CEDU); il diritto a esaminare o far esaminare i testimoni (articolo 6, paragrafo 3, lettera d), della CEDU); il diritto a farsi assistere gratuitamente da un interprete (articolo 6, paragrafo 3, lettera e), della CEDU). Tali garanzie si applicano indifferentemente ad adulti e minori. Tuttavia, tra gli aspetti di particolare rilievo per i minori, e che hanno generato una giurisprudenza concernente i minori, si annoverano il diritto a una partecipazione efficace e il diritto di accesso ad un difensore. Pertanto, in questo capitolo ci si soffermerà soprattutto su queste due specifiche garanzie per un processo equo.

508 Cfr. anche il paragrafo 11.2. Di particolare rilievo per la tutela dei minori può essere anche Commissione europea (2013), proposta di direttiva del Parlamento europeo e del Consiglio sull'ammissione provvisoria al patrocinio a spese dello Stato per indagati o imputati privati della libertà personale e sull'ammissione al patrocinio a spese dello Stato nell'ambito di procedimenti di esecuzione del mandato d'arresto europeo (COM(2013) 824 final, Bruxelles, 27.11.2013).

509 Corte EDU, sentenza 24 agosto 1993, *Nortier c. Paesi Bassi* (n. 13924/88); Corte EDU, sentenza 2 marzo 2010, *Adamkiewicz c. Polonia* (n. 54729/00).

Particolarmente importanti per i minori indagati/imputati sono le Linee guida del Consiglio d'Europa per una giustizia a misura di minore.[510] Pur non essendo giuridicamente vincolanti, esse rappresentano un passo intermedio verso l'obiettivo che i procedimenti giudiziari, inclusi quelli inseriti nel sistema di giustizia penale, tengano conto delle esigenze specifiche dei minori. Partendo dalla giurisprudenza della Corte EDU e da altre norme giuridiche europee e internazionali tra cui la Convenzione delle Nazioni Unite sui diritti dell'infanzia, esse rappresentano un utile strumento per i professionisti alle prese con minori. Ai sensi del capitolo I, paragrafo 1, le linee guida si occupano dei diritti e dei bisogni del minore nei procedimenti giudiziari (penali e non solo) nonché nei sistemi a essi alternativi. Di specifico rilievo per i minori coinvolti in procedimenti penali è il diritto a che le informazioni sulle imputazioni a loro carico siano comunicate sia al minore sia ai genitori in modo tale che essi comprendano l'esatta accusa (capitolo IV.A, punto 1, paragrafo 5); il diritto a essere interrogato in presenza di un avvocato o di uno dei genitori o di un'altra persona di fiducia (capitolo IV.C, paragrafo 30); il diritto a un processo rapido (capitolo IV.D, punto 4) e il diritto a essere ascoltati o interrogati con modalità adeguate allo stato di minore (capitolo IV.D, punto 5).

Nel giugno 2014 l'APCE ha adottato una risoluzione sulla giustizia minorile a misura di bambino, in cui sottolinea la necessità di garantire ai minori responsabili di atti contrari alla legge un trattamento garante dei diritti e adeguato alla loro età.[511] L'APCE esorta gli Stati membri ad applicare le norme internazionali in materia di diritti umani nel settore della giustizia minorile, ivi comprese le Linee guida del Consiglio d'Europa per una giustizia a misura di minore, e a conformare la legislazione e la prassi nazionali a tali norme. L'APCE raccomanda altresì di ricorrere alla privazione della libertà soltanto come ultima istanza e per un periodo di tempo il più breve possibile, di fissare a 14 anni l'età minima della responsabilità penale, senza ammettere eccezioni in presenza di reati gravi, e di introdurre un sistema di giustizia minorile specializzato, che preveda meccanismi di *diversion* volti a evitare il processo giudiziale, misure non detentive e l'intervento di professionisti qualificati.

Nell'ambito del diritto internazionale, l'articolo 40 della CRC riconosce a ogni fanciullo sospettato, accusato o riconosciuto colpevole di reato penale il diritto

510 Consiglio d'Europa, Comitato dei ministri (2010), Linee guida per una giustizia a misura di minore, 17 novembre 2010.

511 Assemblea parlamentare del Consiglio d'Europa, Risoluzione 2010 (2014), "Child-friendly juvenile justice: from rhetoric to reality" (Giustizia minorile a misura di bambino: dalla retorica alla realtà).

a un trattamento equo e che tenga conto della sua età. L'obiettivo fondamentale della giustizia minorile, secondo il disposto dell'articolo 40 della CRC, consiste nel reinserire i fanciulli nella società, dove possano svolgere un ruolo costruttivo. Il paragrafo 2 del medesimo articolo della CRC riconosce il diritto dei fanciulli a un equo processo e ad alcune garanzie supplementari, tra cui il diritto a godere dell'assistenza dei genitori, il diritto di ricorso e il diritto a che la loro vita privata sia pienamente rispettata in tutte le fasi della procedura.

Altri strumenti hanno sviluppato i principi del processo equo e il diritto a un trattamento adeguato all'età sanciti nella CRC, tra cui il ricorso alla privazione della libertà come provvedimento di ultima risorsa e per una durata più breve possibile (cfr. l'articolo 37, lettera b), della CRC). Particolarmente importanti al riguardo sono le regole minime delle Nazioni Unite relative all'amministrazione della giustizia minorile (Regole di Pechino),[512] le Linee guida delle Nazioni Unite per la prevenzione della delinquenza giovanile (Linee guida di Riyadh)[513] e le Regole delle Nazioni Unite per la protezione dei minori privati della libertà (o "Regole dell'Avana").[514] Le regole di Pechino forniscono orientamenti dettagliati sull'attuazione dei requisiti per un processo equo e del trattamento a misura di minore sanciti dall'articolo 40 della CRC, compresi gli obiettivi della giustizia minorile, la tutela della vita privata, le indagini e il procedimento, la custodia preventiva, il giudizio e la relativa decisione, e il trattamento in istituzione e non. Le regole dell'Avana riguardano il trattamento di minori privati della libertà e comprendono norme concernenti la definizione di privazione della libertà, custodia cautelare e detenzione preventiva, condizioni degli istituti di custodia minorile, procedure disciplinari, metodi di screening e uso della forza o della coercizione, meccanismi di denuncia, meccanismi di ispezione e monitoraggio e reinserimento dei minori. Infine, le linee guida di Riyadh forniscono orientamenti dettagliati sulle politiche finalizzate alla prevenzione della delinquenza minorile.

L'UNCRC ha emanato un commento generale (n. 10)[515] sulla giustizia minorile, che offre dettagliati orientamenti su come interpretare e attuare la CRC per quanto

512 ONU, Assemblea generale (1985), regole minime delle Nazioni Unite per l'amministrazione della giustizia minorile, doc. ONU ris. dell'AG n. 4033,19 novembre 1985.

514 ONU, Assemblea generale (1990), regole delle Nazioni Unite per la protezione dei minori privati della libertà, documento ONU ris. dell'AG 45/113, 14 dicembre 1990.

515 ONU, Comitato sui diritti dell'infanzia (2007), *Commento generale n. 10 – I diritti dell'infanzia e dell'adolescenza in materia di giustizia minorile*, CRC/C/GC/07, 25 aprile 2007.

riguarda la giustizia minorile. Questo documento esamina i principi fondamentali della giustizia minorile, tra cui il diritto a una partecipazione efficace nell'ambito del diritto a un equo processo (cfr. anche il paragrafo 11.1.1), l'uso della privazione della libertà come provvedimento di ultima risorsa e per una durata più breve possibile, il ricorso a misure alternative ai procedimenti giudiziari (*diversion*) e la prevenzione della delinquenza minorile, l'introduzione del principio dell'interesse superiore del bambino e del principio della non discriminazione nel sistema di giustizia minorile, e i limiti di età. L'UNCRC raccomanda di fissare a 12 anni l'età minima per la responsabilità penale o di portarla a un'età preferibilmente superiore. Raccomanda altresì di riconoscere a tutti i minori il diritto a essere giudicati in base alle norme della giustizia minorile e proibisce che ragazzi di 16 e 17 anni siano trattati come adulti criminali in caso di reati gravi. Anche altri commenti generali, per esempio concernenti il diritto a essere ascoltati (che è collegato al diritto a una partecipazione efficace ai procedimenti giudiziari) e la protezione da ogni forma di violenza, sono rilevanti per la giustizia minorile.[516]

11.1.1. Partecipazione efficace

Nell'ambito del diritto dell'UE, l'articolo 47 della Carta dei diritti fondamentali dell'UE stipula garanzie simili a quelle fornite dall'articolo 6 della CEDU, compreso il diritto a che la causa sia esaminata equamente, pubblicamente ed entro un termine ragionevole da un giudice indipendente e imparziale, il diritto alla rappresentanza legale e il diritto a un ricorso effettivo. La proposta di direttiva sulle garanzie procedurali per i minori indagati o imputati in procedimenti penali contempla il diritto ad una partecipazione efficace, oltre che il diritto alla rappresentanza legale.[517]

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha elaborato, ai sensi dell'articolo 6, specifici obblighi per garantire la partecipazione efficace dei minori nei procedimenti penali. In linea di principio, nel corso del procedimento si dovrebbe tener conto dell'età del minore, del suo livello di maturità e delle sue capacità emotive.[518] Esempi concreti di obblighi in materia di "partecipazione

516 ONU, Comitato sui diritti dell'infanzia (2009), *Commento generale n. 12 (2009) – Il diritto del bambino e dell'adolescente di essere ascoltato*, CRC/C/GC/12, 1 luglio 2009; ONU, Comitato sui diritti dell'infanzia (2011), *Commento generale n. 13 (2011),* relativo al diritto del fanciullo alla libertà da tutte le forme di violenza, CRC/C/GC/13, 18 aprile 2011.

517 Commissione europea (2013), Proposta di direttiva del Parlamento europeo e del Consiglio sulle garanzie procedurali per i minori indagati o imputati in procedimenti penali (COM(2013) 822 final, Bruxelles, 27.11.2013).

518 Corte EDU, sentenza 16 dicembre 1999, *T. c. Regno Unito* [GC] (n. 24724/94), punto 61.

efficace" sono rappresentati dalla presenza del minore alle udienze, dalla sua partecipazione a udienze a porte chiuse, da restrizioni alla pubblicità del caso, dalle misure prese per garantire che il minore sia consapevole degli interessi in gioco e da una riduzione delle formalità durante le udienze. Finora la Corte EDU non ha statuito che la fissazione di una soglia eccessivamente bassa per l'età minima per la responsabilità penale costituisca di per sé una violazione dell'articolo 6 della CEDU. Nel valutare se un minore sarebbe stato in grado di partecipare efficacemente a un procedimento nazionale, la Corte EDU esamina le circostanze concrete di ciascun caso.

Esempio: il caso *T. c. Regno Unito*[519] riguarda l'omicidio di un bambino di due anni da parte di due ragazzini di dieci anni. I due ragazzini erano stati sottoposti a un processo pubblico, che era stato seguito con enorme attenzione dagli organi d'informazione. In quell'occasione erano stati introdotti alcuni accorgimenti per modificare il procedimento giudiziario, accorciando cioè i tempi delle udienze, autorizzando la presenza dei genitori accanto all'imputato e allestendo un'area gioco durante le interruzioni, ecc. Nonostante ciò, l'imputato e il suo compagno erano stati giudicati da un giudice penale ordinario e la maggior parte delle rigide formalità del procedimento penale erano state mantenute. La Corte EDU ha stabilito che il ricorrente non era stato messo nelle condizioni di partecipare efficacemente al procedimento, a causa della risonanza data alle udienze associata all'elevato livello di attenzione mediatica, oltre che della sua limitata capacità di collaborare con i suoi avvocati e di fornire testimonianze adeguate. Erano stati pertanto violati i suoi diritti ai sensi dell'articolo 6 della CEDU.

Il riconoscimento del diritto a una partecipazione efficace costituisce anche il fulcro delle Linee guida del Consiglio d'Europa su una giustizia a misura di minore. La giustizia per i minori, compresa la giustizia minorile, dovrebbe essere "accessibile, adeguata all'età, rapida, diligente, adatta alle esigenze e ai diritti del minore e su di essi incentrata, nel rispetto dei diritti del minore, tra cui il diritto al giusto processo, alla partecipazione e alla comprensione del procedimento, al rispetto della vita privata e familiare, all'integrità e alla dignità".[520] Le linee guida forniscono specifici orientamenti sul trattamento da riservare ai minori nel corso di procedimenti di giustizia minorile o di altro genere. I minori devono avere

519 Corte EDU, sentenza 16 dicembre 1999, *T. c. Regno Unito* [GC] (n. 24724/94).

520 Consiglio d'Europa, Comitato dei ministri (2010), Linee guida per una giustizia a misura di minore, 17 novembre 2010, paragrafo II. C.

accesso ai tribunali e ai procedimenti giudiziari e i loro diritti all'assistenza e alla rappresentanza legale, oltre che il diritto di essere ascoltati e di esprimere le proprie opinioni, devono essere salvaguardati; si devono evitare ritardi ingiustificati, i procedimenti devono essere organizzati con modalità a misura di minore (con implicazioni per l'ambiente e il linguaggio) e devono essere poste in essere garanzie per raccogliere prove e dichiarazioni fornite dai minori.[521]

11.1.2. Accesso alla giustizia

Nell'ambito del diritto dell'UE, la direttiva sull'accesso a un difensore (2013/48/UE)[522] - che dovrà essere recepita entro il 27 novembre 2016 - contiene riferimenti diretti ai minori nei considerando 52 e 55 del preambolo e nell'articolo 5, paragrafi 2–4. Ai sensi del considerando 55 e dell'articolo 5, paragrafo 2, qualora un minore sia privato della libertà personale, il titolare della responsabilità genitoriale dovrebbe essere informato quanto prima e dovrebbe ricevere comunicazione dei relativi motivi, a meno che ciò non sia contrario all'interesse superiore del minore. In tale evenienza, è opportuno che sia informato un altro adulto idoneo. Secondo l'articolo 2, la direttiva si applica agli indagati e imputati dal momento in cui sono informati di aver commesso un reato fino alla conclusione del procedimento, vale a dire fino al giudizio definitivo di colpevolezza o innocenza. Inoltre, conformemente all'articolo 3, paragrafo 3, il diritto di avvalersi di un difensore comporta il diritto di indagati/imputati di incontrare in privato il difensore che li assiste e di comunicare con questi, anche prima del primo interrogatorio, oltre che il diritto alla presenza e alla partecipazione effettiva del proprio difensore durante gli interrogatori e il diritto alla presenza del proprio difensore nei seguenti atti di indagine o di raccolta delle prove.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU afferma che il diritto di accesso a un avvocato figura tra gli elementi fondamentali del processo equo.[523] Ogni persona accusata di reato ha il diritto di essere difesa da un avvocato fin dalle primissime fasi delle indagini di polizia. Tale diritto può essere limitato in circostanze eccezionali, purché tale restrizione non pregiudichi in-

521 *Ibid.*, capitolo D.

522 Direttiva 2013/48/UE del Parlamento europeo e del Consiglio, del 22 ottobre 2013, relativa al diritto di avvalersi di un difensore nel procedimento penale e nel procedimento di esecuzione del mandato d'arresto europeo, al diritto di informare un terzo al momento della privazione della libertà personale e al diritto delle persone private della libertà personale di comunicare con terzi e con le autorità consolari (GU L 294 del 6.11.2013, pag. 1).

523 Corte EDU, sentenza 27 novembre 2008, *Salduz c. Turchia* [GC] (n. 36391/02), punto 51.

debitamente i diritti dell'accusato. La Corte EDU è del parere che ciò potrebbe verificarsi quando le dichiarazioni rese dall'accusato senza avere accesso a un avvocato servano per fondare la sua condanna.[524] L'esame della Corte EDU se a un ricorrente sia stato efficacemente concesso l'accesso a un avvocato è più rigoroso nel caso dei minori.[525]

Esempio: il caso di *Panovits c. Cipro*[526] riguarda un ragazzo di 17 anni, accusato di omicidio e rapina. Il ragazzo era stato portato alla stazione di polizia, accompagnato dal padre. Successivamente era stato arrestato e trasferito in una stanza separata per l'interrogatorio, senza l'assistenza del padre o di un avvocato. Durante l'interrogatorio, il padre era stato informato del diritto del ricorrente a contattare un avvocato. Pochi minuti dopo, l'uomo aveva appreso che, nel frattempo, il figlio aveva confessato di aver commesso il reato. La Corte EDU ha riscontrato che, in considerazione dell'età, non si poteva pensare che il ricorrente fosse al corrente del proprio diritto a una rappresentanza legale prima di rilasciare qualsiasi dichiarazione. Era altrettanto improbabile che egli potesse essere ragionevolmente consapevole delle conseguenze di un interrogatorio condotto senza l'assistenza di un legale nell'ambito di un procedimento penale per omicidio. Nonostante le autorità abbiano dimostrato in ogni occasione di essere disposte a consentire al ricorrente di essere assistito da un avvocato, se questi l'avesse richiesto, esse non avevano messo il ragazzo al corrente del suo diritto a richiedere l'assegnazione d'ufficio di un avvocato senza oneri a suo carico, se necessario. Non vi sono prove che dimostrino che il ricorrente o il padre abbiano espressamente o inequivocabilmente rinunciato al proprio diritto all'assistenza legale. Pertanto la Corte ha riscontrato una violazione dell'articolo 6, paragrafo 3, lettera c), in combinato disposto con l'articolo 6, paragrafo 1, della CEDU.

524 *Ibid.*, punto 62.

525 *Ibid.*, punto 60.

526 Corte EDU, sentenza 11 dicembre 2008, *Panovits c. Cipro* (n. 4268/04).

11.2. Diritti dei rei minori in relazione alla detenzione

Punti salienti

- Un minore può essere privato della sua libertà soltanto come misura di ultima istanza e della più breve durata possibile.
- I minori detenuti devono essere trattati in maniera consona all'età e nel rispetto della loro dignità.
- I minori non dovrebbero essere detenuti assieme agli adulti.

Ogni persona ha diritto alla libertà. La privazione della libertà pertanto costituisce un'eccezione e comprende ogni forma di collocazione in un istituto per decisione di un'autorità giudiziaria o amministrativa, senza che il minore sia autorizzato a lasciare l'istituto a suo piacimento.[527] Data l'importanza di tutelare i diritti dei minori, compreso il loro interesse superiore, nel caso dei minori le situazioni che prevedono misure di privazione della libertà dovrebbero essere esaminate da questa particolare prospettiva.

Per quanto le circostanze che possono sfociare nella detenzione siano varie, questo paragrafo tratta esclusivamente il caso di minori che vengono in contatto con i sistemi della giustizia penale.

Gli strumenti internazionali affermano universalmente che la detenzione deve rappresentare una misura di ultima istanza. Ciò significa che le autorità statali, ogniqualvolta si trovino nella posizione di decidere se ricorrere alla detenzione per un minore, dovrebbero innanzitutto considerare in maniera adeguata le alternative disponibili per tutelare l'interesse superiore del fanciullo oltre che per facilitarne il reinserimento nella società (articolo 40, paragrafo 1, della CRC). Tra le alternative possibili si annoverano: "le cure, l'orientamento, la supervisione, i consigli, la libertà condizionata, il collocamento in famiglia, i programmi di formazione generale e professionale" (articolo 40, paragrafo 4, della CRC). Il ricorso alla detenzione dovrebbe essere vagliato soltanto nell'eventualità in cui

527 Regola 21.5 del Consiglio d'Europa, Comitato dei ministri (2008), Raccomandazione CM/Rec(2008)11 sulle norme europee per i rei minori oggetto di sanzioni o di altri provvedimenti, 5 novembre 2008.

i provvedimenti alternativi non fossero praticabili. Inoltre, la detenzione dovrebbe essere ordinata esclusivamente per la più breve durata possibile e nel rispetto di adeguate garanzie sostanziali e procedurali. In considerazione dell'età e della vulnerabilità, i minori posti in stato di detenzione godono di speciali diritti e garanzie.

11.2.1. Forme di detenzione (garanzie sostanziali e procedurali)

Nell'ambito del diritto dell'UE, l'attuale quadro giuridico che disciplina i procedimenti di giustizia penale non include uno strumento vincolante sulla detenzione dei minori.

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 5 della CEDU stabilisce che ogni persona ha diritto alla libertà. La detenzione è una situazione eccezionale che dovrebbe essere prevista dalla legge e non applicata in maniera arbitraria. La detenzione inoltre deve essere giustificata da una delle sei situazioni esaustivamente elencate all'articolo 5, paragrafo 1, lettere da a) a f). La detenzione di minori che sono venuti in contatto con il sistema di giustizia penale può essere giustificata nei seguenti casi: a) detenzione in seguito a condanna da parte di un tribunale competente; c) detenzione preventiva; d) detenzione finalizzata in particolare alla sorveglianza della loro educazione. Gli ultimi due casi meritano di essere analizzati, poiché hanno dato origine a obblighi specifici da parte delle autorità statali.

Detenzione preventiva

L'espressione "detenzione preventiva" si riferisce a situazioni in cui un soggetto è trattenuto in stato di arresto o di custodia cautelare da parte della polizia perché sospettato di aver commesso un reato. La detenzione preventiva inizia quando il soggetto è trattenuto dalla polizia e termina con la decisione nel merito del caso da parte di un tribunale di primo grado.[528] Benché i minori godano delle medesime garanzie degli adulti, la Corte EDU ha stabilito una serie di ulteriori principi per rafforzare la posizione dei minori nei procedimenti penali a livello nazionale.

La Corte EDU ha generalmente interpretato l'articolo 5, paragrafo 1, lettera c), e l'articolo 5, paragrafo 3, nel senso che prevedono il trattenimento di una persona in via preventiva soltanto in presenza di un ragionevole sospetto che la

528 Corte EDU, sentenza 22 maggio 2012, *Idalov c. Russia* (n. 5826/03), punto 112.

stessa abbia compiuto un reato. Inoltre, la detenzione preventiva non dovrebbe protrarsi oltre un periodo di tempo ragionevole e la sua necessità dovrebbe essere riconsiderata a intervalli ragionevoli. Maggiore la durata del trattenimento, più fondate devono essere le ragioni mosse dalle autorità per giustificarne l'applicazione. Secondo la giurisprudenza della Corte EDU, una persona accusata di un reato deve essere sempre rilasciata in attesa di processo, a meno che lo Stato non possa dimostrare che vi sono ragioni "rilevanti e sufficienti" che giustificano il proseguimento della detenzione.[529]

La Corte EDU ha individuato quattro fondamentali ragioni accettabili per rifiutare il versamento della cauzione al detenuto nei casi di custodia preventiva, vale a dire i casi in cui vi sia rischio di fuga, pregiudizio dell'amministrazione della giustizia, compimento di altri reati o turbamento dell'ordine pubblico. Inoltre, il proseguimento della detenzione preventiva dovrebbe essere strettamente necessario e lo Stato è tenuto a esaminare tutti i fatti, vagliando l'esistenza o meno di un genuino criterio di interesse pubblico che imponga una misura protratta di privazione della libertà.[530]

Nei casi che riguardano minori, la Corte EDU stabilisce che le autorità statali debbano prestare particolare attenzione all'età del minore nel bilanciare le relative argomentazioni a favore e contro la detenzione preventiva; la custodia precautelare deve essere utilizzata come ultima istanza e per una durata più breve possibile.[531] Ciò implica l'obbligo da parte delle autorità di vagliare alternative alla detenzione preventiva.[532] Inoltre, le autorità statali dovrebbero mostrare particolare diligenza a che una causa concernente un minore sia esaminata entro un periodo di tempo ragionevole.[533]

529 Corte EDU, sentenza 24 luglio 2003, *Smirnova c. Russia* (n. 46133/99 e n. 48183/99), punto 58.

530 *Ibid.*, punti 58–59; Corte EDU, sentenza 18 marzo 2008, *Ladent c. Polonia* (n. 11036/03), punto 55.

531 Corte EDU, sentenza 19 gennaio 2012, *Korneykova c. Ucraina* (n. 39884/05), punti 43-44. Corte EDU, sentenza 10 gennaio 2006, *Selçuk c. Turchia* (n. 21768/02), punti 35–36; Corte EDU, sentenza 13 novembre 2012, *J.M. c. Danimarca* (n. 34421/09), punto 63.

532 Corte EDU, sentenza 9 luglio 2013, *Dinç e Çakır c. Turchia* (n. 66066/09), punto 63 (consultabile in francese); Corte EDU, sentenza 20 gennaio 2009, *Güveç c. Turchia* (n. 70337/01), punto 108.

533 Corte EDU, sentenza 3 marzo 2011, *Kuptsov e Kuptsova c. Russia* (n. 6110/03), punto 91.

Esempio: nel caso *Nart c. Turchia*,[534] il ricorrente, un ragazzo di 17 anni, è stato arrestato perché sospettato di aver rapinato un piccolo negozio di generi alimentari. Il ragazzo è stato trattenuto in detenzione cautelare, in un carcere per adulti, per 48 giorni. La Corte EDU, considerando in particolare che il ricorrente era minorenne, ha stabilito che "la detenzione cautelare dei minori dovrebbe essere utilizzata come misura di *extrema ratio*; dovrebbe essere quanto più breve possibile e, laddove la detenzione sia strettamente necessaria, i minori dovrebbero essere tenuti separati dagli adulti".[535] In questo caso particolare le autorità hanno tentato di giustificare la detenzione cautelare sulla base dello "stato degli elementi di prova", ma la Corte EDU ha riscontrato che questa motivazione non può da sola giustificare la durata della detenzione lamentata dal ricorrente. Di conseguenza, la Corte ha accertato una violazione dell'articolo 5, paragrafo 3, della CEDU.

Detenzione finalizzata alla sorveglianza dell'educazione del minore

Questa forma di trattenimento è stata ordinata in situazioni in cui il minore presenta un particolare bisogno di sorveglianza a scopo educativo, perché manifesta una personalità disturbata e comportamenti violenti. L'articolo 5, paragrafo 1, lettera d), della CEDU riguarda prevalentemente forme di detenzione che esulano dall'ambito di applicazione del sistema della giustizia minorile.

Esempio: il caso *Bouamar c. Belgio*[536] riguarda il collocamento di un minore in penitenziario in nove occasioni, per periodi di circa 15 giorni ciascuno. Il ricorrente era un adolescente con una personalità disturbata e comportamenti violenti. Il governo belga aveva dichiarato di aver collocato il ragazzo in penitenziario allo scopo di sorvegliarne l'educazione. La Corte EDU ha osservato che il trattenimento provvisorio in un penitenziario di per sé non rappresenta una violazione dell'articolo 5, paragrafo 1, lettera d), purché le autorità perseguano lo scopo di inserire il minore in una struttura rieducativa. Tuttavia, la Corte EDU ha appurato che nel caso del ricorrente le autorità non avevano dimostrato di avere avuto l'intenzione o la possibilità di trasferirlo in un istituto dove avrebbe potuto godere di una sorveglianza a scopo educativo. Di conseguenza, la Corte ha accertato una violazione dell'articolo 5, paragrafo 1, lettera d), della CEDU.

534 Corte EDU, sentenza 6 maggio 2008, *Nart c. Turchia*, (n. 20817/04).

535 *Ibid.*, punto 31.

536 Corte EDU, sentenza 29 febbraio 1988, *Bouamar c. Belgio* (n. 9106/80).

Esempio: la causa *D.G. c. Irlanda*[537] riguarda la collocazione di un ragazzo violento in un centro di detenzione. La Corte EDU ha stabilito che il concetto di "inserimento in struttura rieducativa" non deve essere rigorosamente equiparato all'insegnamento scolastico. L'inserimento in una struttura rieducativa implica svariati aspetti di godimento dei diritti genitoriali da parte delle autorità locali, a beneficio e tutela della persona interessata. La Corte EDU ha dichiarato che le autorità nazionali sono autorizzate a collocare provvisoriamente un minore in una struttura penitenziaria in attesa di individuare una struttura adatta, purché ciò avvenga in tempi rapidi. Nel caso del ricorrente, il requisito della rapidità non era stato soddisfatto, poiché il ragazzo era stato trasferito in una struttura idonea oltre sei mesi dopo il rilascio dal penitenziario. Di conseguenza, la Corte ha accertato una violazione dell'articolo 5, paragrafo 1, lettera d), della CEDU.

Ricorso alla detenzione, tempestività dell'esame e accesso a un difensore

La Corte EDU richiede alle autorità nazionali particolare diligenza nell'esaminare i casi che riguardano minori trattenuti in stato di detenzione. Oltre alle garanzie summenzionate, le autorità statali devono accertarsi che i minori abbiano il diritto di contestare la legittimità della detenzione a intervalli ragionevoli e che abbiano accesso a un avvocato durante il procedimento atto ad accertare la legittimità della loro detenzione. Questi ricorsi legali devono altresì essere esaminati dai tribunali nazionali, che devono giungere rapidamente a una decisione. La Corte trae queste garanzie procedurali dal disposto dell'articolo 5, paragrafo 4, della CEDU.

Esempio: nel caso *Bouamar c. Belgio*, [538] la Corte EDU ha riscontrato una violazione dell'articolo 5, paragrafo 4, perché: le udienze per la determinazione della legittimità della detenzione del ricorrente si sono tenute senza che fossero presenti i suoi avvocati; i giudici non si sono espressi rapidamente sul caso; non è stata presa di fatto alcuna decisione sulla "legittimità della detenzione", poiché i giudici nazionali hanno rigettato le richieste del ricorrente in quanto infondate.

537 Corte EDU, sentenza 16 maggio 2002, *D.G. c. Irlanda* (n. 39474/98).

538 Corte EDU, sentenza 29 febbraio 1988, *Bouamar c. Belgio* (n. 9106/80).

11.2.2. Condizioni detentive

Nell'ambito del diritto dell'UE, l'articolo 4 della Carta dei diritti fondamentali dell'UE proibisce la tortura e i trattamenti inumani o degradanti. Tuttavia, poiché la Carta si applica soltanto nell'ambito del diritto dell'UE, per poter vincolare gli Stati membri in tal senso questa disposizione dev'essere collegata a un altro strumento giuridico dell'UE relativo alla detenzione. Finora la Corte di giustizia europea non ha esaminato cause concernenti l'articolo 4 della Carta.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha appurato che il trattenimento di minori in stato di detenzione assieme ad adulti potrebbe costituire una violazione dell'articolo 3[539] o dell'articolo 5 della CEDU.[540] Inoltre, anche l'assenza di un'assistenza medica adeguata in carcere potrebbe sollevare rilievi in relazione all'articolo 3.[541] Altri aspetti che potrebbero dar adito a doglianze in relazione all' articolo 3 comprendono lo spazio disponibile in cella, l'illuminazione e le attività ricreative.[542] Nel valutare la compatibilità delle condizioni di detenzione con il disposto dell'articolo 3 della CEDU, la Corte EDU spesso fa affidamento su una serie di norme elaborate dal Comitato europeo per la prevenzione della tortura e delle pene o trattamenti inumani o degradanti (CPT), che monitora le condizioni detentive nell'ambito della Convenzione europea per la prevenzione della tortura e delle pene o trattamenti inumani o degradanti, effettuando visite sul posto negli Stati membri del Consiglio d'Europa.[543]

> Esempio: nel caso *Güveç c. Turchia*,[544] un ragazzino di quindici anni è stato arrestato per sospetta appartenenza al partito dei lavoratori del Kurdistan (PKK). Per ordine della Corte per la sicurezza statale il ricorrente è stato trattenuto in un carcere per adulti per cinque anni. La Corte EDU ha osservato che la detenzione del ricorrente era contraria alle norme e agli obblighi incombenti sulla Turchia ai sensi dei trattati internazionali, compreso tra gli altri l'articolo 37, lettera c), della CRC, che stabilisce che ogni fanciullo privato di libertà deve essere detenuto separatamente dagli adulti. La Corte ha altresì osservato che il ricorrente aveva iniziato ad avere problemi

539 Corte EDU, sentenza 20 gennaio 2009, *Güveç c. Turchia* (n. 70337/01).

540 Corte EDU, sentenza 6 maggio 2008, *Nart c. Turchia* (n. 20817/04).

541 Corte EDU, sentenza 20 gennaio 2009, *Güveç c. Turchia* (n.70337/01); Corte EDU, sentenza 14 novembre 2013 (deferita alla GC il 24 marzo 2014) *Blokhin c. Russia* (n. 47152/06).

542 Corte EDU, sentenza 3 marzo 2011, *Kuptsov e Kuptsova c. Russia* (n. 6110/03), punto 70.

543 Cfr., per esempio, Corte EDU, sentenza 20 gennaio 2009, *Güveç c. Turchia* (n. 70337/01).

544 *Ibid*.

psicologici in carcere, in conseguenza dei quali aveva ripetutamente tentato il suicidio. In aggiunta, le autorità non avevano provveduto a fornire al ricorrente adeguate cure mediche. Di conseguenza, in considerazione dell'età del ricorrente, della durata della sua detenzione in carcere assieme a persone adulte, dell'incapacità delle autorità statali di fornire al ricorrente adeguate cure mediche per i suoi problemi psicologici e della mancata adozione di misure volte a prevenire i suoi ripetuti tentativi di suicidio, la Corte EDU ha riscontrato una palese evidenza di trattamento inumano e degradante nei confronti del ricorrente, e dunque una violazione dell'articolo 3 della CEDU.

Il CEDS ha costantemente interpretato l'articolo 17 della CSE nel senso che, in caso di detenzione di minori, questi dovrebbero essere tenuti separati dagli adulti.

Le norme del Comitato europeo per i rei minori oggetto di sanzioni o di altri provvedimenti forniscono orientamenti dettagliati sulle condizioni detentive. Stabiliscono altresì che i minori non dovrebbero essere detenuti in istituti per adulti, bensì in strutture apposite a loro destinate.[545]

Nell'ambito del diritto internazionale, la CRC contiene una disposizione distinta sulla privazione della libertà dei minori, in cui si prevede che il fanciullo privato della libertà sia separato dagli adulti, a meno che si ritenga preferibile il contratio nel suo interesse preminente (articolo 37, lettera c), della CRC). Questo stesso articolo stipula altresì che i minori, in linea di principio, hanno diritto a rimanere in contatto con la sua famiglia per mezzo di corrispondenza e visite.

11.2.3. Protezione da abusi e maltrattamenti

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha ripetutamente dichiarato che le autorità nazionali sono responsabili della protezione delle persone in stato di arresto dalla morte, dagli abusi o da maltrattamenti causati da altri detenuti o dalle autorità stesse. Gli obblighi degli Stati in tal senso sono particolarmente rigidi, poiché i detenuti si trovano sotto l'autorità e il controllo dello Stato.[546] Oltre ad adottare misure ragionevoli per proteggere i detenuti, le auto-

545 Consiglio d'Europa, Consiglio dei ministri (2008), Raccomandazione CM/Rec(2008)11 sulle norme europee per i rei minori oggetto di sanzioni o di altri provvedimenti, 5 novembre 2008, regola 59.1.

546 Corte EDU, sentenza 13 giugno 2002, *Anguelova c. Bulgaria* (n. 38361/97); Corte EDU, sentenza 6 ottobre 2005, *H.Y. e Hü.Y. c. Turchia* (n. 40262/98).

rità statali devono anche condurre indagini efficaci in caso di denunce di asseriti maltrattamenti o decessi.

Esempio: il caso *Coselav c. Turchia* riguarda il suicidio in carcere di un adolescente[547] che in più occasioni in precedenza aveva tentato, senza successo, di togliersi la vita. Dopo questi tentativi le autorità l'avevano trasferito da un'ala del carcere riservata ai minori a una struttura penitenziaria per adulti. La Corte, una volta stabilito che le autorità erano al corrente o dovevano essere al corrente dell'esistenza di un pericolo concreto e immediato per la vita del figlio dei ricorrenti, ha appurato che esse non avevano adottato misure ragionevoli per impedire il rischio di suicidio. La Corte EDU si è soffermata in particolare a considerare l'età del ragazzo e il fatto che fosse stato destinato a un'ala del carcere riservata agli adulti, ritenendo quindi violato l'articolo 2 della CEDU sotto il profilo sostanziale. La Corte EDU ha accertato una violazione del medesimo articolo 2 anche sotto il profilo procedurale, stigmatizzando che le autorità non avevano condotto un'indagine efficace sulla morte del figlio dei ricorrenti. Le ragioni a sostegno di tale rilievo sono le seguenti: le autorità non avevano prontamente avvisato i ricorrenti della morte del figlio; gli inquirenti non avevano mosso alcun passo per accertare le presunte omissioni delle autorità nel prevenire il suicidio; il procedimento amministrativo successivamente avviato aveva avuto una durata eccessiva.

11.3. Tutela dei minori vittime e testimoni

Punto saliente

- I minori vittime e testimoni hanno diritto a essere protetti da vittimizzazioni secondarie, a ricevere cure e a essere reinseriti, oltre che a partecipare in maniera efficace ai procedimenti penali e alternativi.

Nell'ambito del diritto dell'UE e del Consiglio d'Europa, la posizione dei minori vittime e testimoni è stata riconosciuta.

547 Corte EDU, sentenza 9 ottobre 2012, *Çoşelav c. Turchia*, (n. 1413/07).

Nell'ambito del diritto dell'UE, la direttiva sui diritti delle vittime (2012/29/UE)[548] riconosce esplicitamente la posizione delle vittime minorenni. Stabilisce che, se la vittima è un minore, sia innanzitutto considerato l'interesse superiore del minore e si proceda a una valutazione individuale. Inoltre, si privilegia un approccio rispettoso delle esigenze del minore, che ne tenga in considerazione età, maturità, opinioni, necessità e preoccupazioni. La direttiva mira altresì a garantire che il minore e il titolare della potestà genitoriale o altro eventuale rappresentante legale siano informati in merito a eventuali misure o diritti specificamente vertenti sui minori (articolo 1, paragrafo 2). Le vittime minorenni hanno anche il diritto di essere sentiti nel corso del procedimento penale e gli Stati membri sono tenuti a garantire che questi stessi possano fornire elementi di prova. Quando la vittima da sentire è un minore, si tengono in debito conto la sua età e la sua maturità (articolo 10, paragrafo 1). Inoltre, la direttiva mira a proteggere la vita privata e l'identità delle vittime minorenni nel corso del procedimento penale, tra l'altro al fine di evitare la vittimizzazione secondaria (articolo 21, paragrafo 1, cfr. anche l'articolo 26). Inoltre, la direttiva prevede una disposizione specifica sul diritto alla protezione delle vittime minorenni durante il procedimento penale (articolo 24) che tratta della registrazione audiovisiva delle audizioni del minore vittima di reato e del loro utilizzo come prova nei procedimenti penali; della nomina di rappresentanti speciali; e del diritto alla rappresentanza legale nel caso sussista un conflitto di interessi tra il minore vittima di reato e i titolari della potestà genitoriale. La direttiva inoltre contiene varie disposizioni per la protezione delle vittime in generale, tra cui l'accesso ai servizi di assistenza alle vittime. Nel caso di minori o di altri gruppi vulnerabili, dovrebbero essere messi a disposizione servizi di assistenza specialistici (cfr. il capitolo 38 della risoluzione che accompagna la direttiva).[549]

Prima di essere sostituita dalla direttiva sui diritti delle vittime, la decisione quadro 2001/220/GAI relativa alla posizione della vittima nel procedimento penale si occupava, tra le altre cose, del tema della partecipazione delle vittime, dei diritti delle vittime e dell'equo trattamento. Pur non menzionando esplicitamente i minori, riconosceva tuttavia la particolare posizione delle vittime vulnerabili. Ai sensi di questa decisione quadro, la Corte di giustizia dell'Unione europea ha stabilito che i minori possono essere qualificati come vulnerabili alla luce dell'età e della natura delle infrazioni di cui ritengono di essere state vittime. Essi hanno

548 Direttiva 2012/29/UE del Parlamento europeo e del Consiglio, del 25 ottobre 2012, che istituisce norme minime in materia di diritti, assistenza e protezione delle vittime di reato (GU L 315 del 14.11.2012, pag. 57).

549 Cfr. anche FRA (2014b), pag. 36.

quindi diritto a misure di tutela specifiche, tra cui il diritto a essere sentiti fuori dall'aula di un tribunale, prima che inizi il processo.[550] La Corte ha altresì dichiarato che tutte le misure adottate per proteggere le vittime devono essere concepite in modo da garantire comunque all'imputato un equo processo. In altre parole, la tutela delle vittime e dei testimoni non può mettere a repentaglio il diritto delle persone a un equo processo (cfr. anche gli esempi della giurisprudenza della Corte EDU).[551]

Esempio: nella causa *Pupino*,[552] un'insegnante di scuola materna italiana è stata condannata per maltrattamento nei confronti di un alunno. Ai sensi del codice di procedura penale italiano, di norma i testimoni devono deporre la propria testimonianza in tribunale, nel corso del processo. In talune circostanze, tuttavia, la testimonianza di una persona può essere assunta dinanzi a un giudice prima del dibattimento attraverso una speciale procedura (incidente probatorio). Nella specie il pubblico ministero aveva chiesto al giudice nazionale di autorizzare i bambini in età infantile a rendere la loro deposizione nelle fasi precedenti il dibattimento, ma il giudice aveva negato l'autorizzazione. Per la prima volta la Corte di giustizia ha dato una sua interpretazione di alcune disposizioni relative alla comparsa di minori in qualità di vittime e testimoni nell'ambito di un procedimento penale. La Corte ha sottolineato che la decisione quadro 2001/220/GAI impone agli Stati membri l'obbligo di garantire la tutela specifica delle vittime vulnerabili, per cui il giudice nazionale deve avere la possibilità di autorizzare le vittime vulnerabili a rendere la loro deposizione secondo modalità che permettano di garantirne la tutela, ad esempio al di fuori dell'udienza pubblica e prima della tenuta di quest'ultima. La Corte ha statuito: "Tuttavia, indipendentemente dalla questione se la circostanza che la vittima di un'infrazione penale sia un minore basti, in linea di massima, per qualificare tale vittima come particolarmente vulnerabile ai sensi della decisione quadro, non può essere contestato che qualora, come nella causa principale, bambini in età infantile sostengano di aver subito maltrattamenti, per giunta da parte di un'insegnante, tali bambini possano essere così qualificati alla

550 CGUE, sentenza 16 giugno 2005, causa C-105/03, *Procedimento penale a carico di Maria Pupino* [GS], punto 53.

551 CGUE, sentenza 16 giugno 2005, causa C-105/03, *Procedimento penale a carico di Maria Pupino* [GS]. Cfr. anche CGUE, sentenza 21 dicembre 2011, causa C-507/10, *Procedimento penale a carico di X*.

552 CGUE, sentenza 16 giugno 2005, causa C-105/03, *Procedimento penale a carico di Maria Pupino* [GS].

luce, in particolare, della loro età, nonché della natura e delle conseguenze delle infrazioni di cui ritengono di essere stati vittime".[553] La Corte ha altresì stabilito che tutte le misure riguardanti la tutela e la prevenzione della vittimizzazione secondaria devono essere definite in modo tale da garantire all'indagato un processo equo.[554]

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha dichiarato che lo Stato ha il dovere di tutelare gli interessi delle vittime. Ciò vale in particolare per le vittime che partecipano nei procedimenti penali in qualità di testimoni. I loro interessi ai sensi delle disposizioni della CEDU, tra cui l'articolo2 e l'articolo 8, devono essere bilanciati rispetto agli interessi della difesa.[555] La Corte EDU si è pronunciata in più occasioni in merito a reati a sfondo sessuale in cui minori hanno deposto le proprie testimonianze contro i presunti responsabili delle violenze. Questa giurisprudenza dimostra che la Corte riconosce che i procedimenti penali aventi a oggetto reati sessuali sono spesso considerati dalla vittima come supplizi, in particolare quando quest'ultima non è disposta a confrontarsi con l'indagato, e che questa reazione è particolarmente evidente nel caso dei minori.[556] Di conseguenza, la Corte ha accettato che, in questi casi, siano adottate misure volte a tutelare le vittime minorenni. Tuttavia, si fa presente che tali misure non possono mettere a repentaglio l'esercizio adeguato ed efficace dei diritti dell'indagato, e le autorità giudiziarie possono pertanto essere tenute ad adottare provvedimenti atti a controbilanciare le difficoltà in cui la difesa si trovi a operare.[557]

Esempio: nel caso *Kovač c. Croazia*,[558] una ragazza di 12 anni ha deposto dinanzi a un magistrato inquirente, accusando il ricorrente di aver commesso atti indecenti nei suoi confronti. Durante questa deposizione il ricorrente non era presente né rappresentato, né aveva avuto la possibilità di contestare le dichiarazioni della vittima. La Corte EDU ha ribadito che, di norma, tutte le deposizioni devono essere fornite in presenza dell'indagato nel corso di una pubblica udienza, allo scopo di garantire il contraddittorio

558 Corte EDU, sentenza 12 luglio 2007, *Kovač c. Croazia* (n. 503/05).

rio. Se le dichiarazioni rilasciate durante l'indagine di polizia o l'inchiesta giudiziaria sono utilizzate come prove, di per sé questo fatto non è in contrasto con l'articolo 6 della CEDU, purché all'indagato sia data un'adeguata e appropriata opportunità di porre domande al testimone in questione e di esaminarne le deposizioni, sia al momento della deposizione sia in una fase successiva del procedimento. Nel caso di specie, le dichiarazioni della vittima rappresentavano l'unica prova diretta dei fatti contestati al ricorrente, e queste prove sono state decisive per la decisione del giudice di emettere una sentenza di condanna. Tuttavia, il ricorrente non era stato in grado di contestare né ottenere dai giudici nazionali una risposta in merito alla sua lagnanza al riguardo. Oltretutto, le effettive dichiarazioni della vittima non erano mai state lette nel corso del dibattimento. Al contrario, il giudice si era limitato a osservare che la vittima confermava la dichiarazione resa dinanzi al magistrato inquirente. Di conseguenza, la Corte EDU ha concluso che il ricorrente era stato privato del diritto a un equo processo, in violazione dell'articolo 6, paragrafo 1, in combinato disposto con l'articolo 6, paragrafo 3, lettera d), della CEDU.

Esempio: nel caso *S.N. c. Svezia*,[559] un ragazzino di dieci anni ha testimoniato alla polizia di avere subito abusi sessuali dal ricorrente. Il ragazzo è stato sottoposto a due interrogatori da parte di un ispettore di polizia con una solida esperienza in materia di casi di abuso ai danni di minori. Il primo colloquio è stato videoregistrato, mentre del secondo è disponibile una registrazione audio. L'avvocato del ricorrente non ha presenziato al secondo colloquio, ma ha concordato con l'ispettore di polizia le questioni che avrebbero dovuto essere discusse. Nel corso del processo, il tribunale distrettuale ha ascoltato le registrazioni dei colloqui con il ragazzino, senza sentirlo personalmente. Il giudice ha condannato il ricorrente facendo affidamento quasi interamente sulle testimonianze del ragazzino. La Corte d'appello ha confermato la condanna. Questa ha riscontrato che i colloqui di polizia rappresentavano una prova sufficiente su cui stabilire la colpevolezza del ricorrente, pur ammettendo l'assenza di prove tecniche a sostegno delle accuse del minore, che a volte risultavano imprecise. La Corte EDU riconosce che, nei casi concernenti reati sessuali, non sempre è possibile ricorrere al controinterrogatorio di un testimone e che, in queste situazioni, le deposizioni dei testimoni devono essere trattate con estrema attenzione. Nonostante le dichiarazioni del bambino fossero di fatto l'unica

559 Corte EDU, sentenza 2 luglio 2002, *S.N. c. Svezia* (n. 34209/96)

prova della colpevolezza dell'imputato, nel complesso il processo è stato equo. La videoregistrazione è stata mostrata nel corso del dibattimento e nelle udienze di appello e la trascrizione del secondo colloquio è stata letta dinanzi al giudice distrettuale; inoltre, la registrazione audio è stata ascoltata dalla Corte d'appello. Ciò ha dato al ricorrente sufficienti opportunità per esaminare le deposizioni del minore e mettere in discussione la sua credibilità nel corso del procedimento penale. Di conseguenza, non è stata accertata una violazione dell'articolo 6, paragrafo 3, lettera d), della CEDU.

La giurisprudenza della Corte EDU non si occupa soltanto di conciliare la protezione delle vittime minorenni e il diritto dell'indagato a un equo processo, bensì anche della protezione del diritto alla vita dei testimoni e delle loro famiglie, compresi i minori, ai sensi dell'articolo 2 della CEDU, come emerge dal seguente esempio.

Esempio: il caso *R.R. e altri c. Ungheria*[560] riguarda un detenuto che in un dibattimento pubblico aveva reso testimonianza in merito alle sue attività di traffico di stupefacenti e che era stato inserito assieme alla moglie e ai due figli in un programma ufficiale di protezione dei testimoni dal rischio di ritorsioni. Quando le autorità si erano accorte che il detenuto era ancora in contatto con le cerchie criminali, avevano escluso il testimone e la sua famiglia dal suddetto programma, per violazione delle relative condizioni. Invocando l'articolo 2 della CEDU, la famiglia sosteneva che la loro esclusione dal programma di protezione dei testimoni aveva messo le loro vite a rischio di ritorsioni da parte della mafia. La Corte ha riconosciuto che l'inserimento dei ricorrenti nel programma di protezione dei testimoni e la collaborazione del capofamiglia con le autorità implicavano una situazione di rischio per la vita dei ricorrenti, dal momento che era stata messa originariamente in atto tale misura. Poiché la cancellazione della loro protezione dal programma non era stata giustificata da una diminuzione di tale rischio, ma da una violazione delle condizioni di partecipazione al programma, la Corte non era del parere che le autorità avessero dimostrato che il rischio era venuto meno. Inoltre, non era irragionevole supporre che, dopo il ritiro delle identità di copertura della famiglia, le loro vere identità e il luogo in cui si trovavano sarebbero stati accessibili a chiunque desiderasse nuocergli. In tal modo, le autorità avevano potenzialmente esposto la famiglia a un pericolo per la vita, in violazione dell'articolo 2 della CEDU.

560 Corte EDU, sentenza 4 dicembre 2012, *R.R. e altri c. Ungheria* (n. 19400/11).

L'articolo 31 della convenzione di Lanzarote indica quali misure generali di tutela dovrebbero adottare gli Stati membri per proteggere i diritti e gli interessi delle vittime, compresi i loro bisogni speciali in qualità di testimoni, in tutte le fasi delle indagini e dei procedimenti penali (articolo 31, paragrafo 1). Tra le misure elencate si annoverano la trasmissione di informazioni sui loro diritti, sulla disponibilità di servizi e sullo svolgimento generale delle indagini o del procedimento penale, la protezione della loro vita privata e della loro sicurezza (comprese informazioni sulla rimessa in libertà della persona imputata e condannata) e la garanzia che siano evitati i contatti diretti tra le vittime e gli autori di reato nell'ambito dei locali dei servizi d'indagine e degli edifici giudiziari. L'articolo 31 prevede altresì che le vittime abbiano accesso a un'assistenza legale (articolo 31, paragrafo 3). Le informazioni devono essere fornite in maniera adatta all'età e al grado di maturità delle vittime, nonché in una lingua che possano comprendere (articolo 31, paragrafo 6).

Anche le *Linee guida del Consiglio d'Europa sulla giustizia a misura di minore* [561] sono attente alla posizione dei minori in qualità di vittime e testimoni, in particolare quando questi siano chiamati a deporre nell'ambito di un procedimento giudiziario. Il documento invita gli Stati membri a "fare ogni sforzo per consentire ai minori di testimoniare negli ambienti più favorevoli possibili e nelle condizioni più favorevoli, tenendo conto della loro età, grado di maturità e livello di comprensione, nonché delle eventuali difficoltà di comunicazione che potrebbero avere".[562] A tal fine dovrebbero essere coinvolti professionisti qualificati e, per esempio, dovrebbero essere incoraggiate le dichiarazioni audiovisive. I minori dovrebbero inoltre avere la possibilità di testimoniare nelle cause penali senza la presenza del presunto autore del reato. Le linee guida riconoscono altresì che questo approccio a misura di minore dovrebbe tuttavia rispettare il diritto di altre parti di contestare le dichiarazioni del minore. Inoltre, esse stabiliscono che la vita privata e familiare dei testimoni minorenni dovrebbe essere protetta (sezione IV, paragrafo a.9), e che il procedimento dovrebbe preferibilmente svolgersi a porte chiuse.

Nell'ambito del diritto internazionale, la posizione delle vittime minorenni è esplicitamente riconosciuta dall'articolo 39 della CRC. Questa disposizione stipula che gli Stati parti adottano ogni adeguato provvedimento per agevolare il recupero

561 Consiglio d'Europa, Comitato dei ministri (2010), *Linee guida per una giustizia a misura di minore*, 17 novembre 2010. Cfr. anche FRA (2015b).

fisico e psicologico e il reinserimento sociale delle vittime minorenni. Tale recupero e reinserimento devono svolgersi in condizioni tali da favorire la salute, il rispetto della propria persona e la dignità del fanciullo.

È importante notare inoltre che le Nazioni Unite hanno adottato le "Linee guida sulla giustizia nelle questioni che coinvolgono minori vittime e testimoni di reato".[563] Questo documento invita a trattare le vittime e i testimoni minorenni in modo "rispettoso della sensibilità del minore", nel senso di "un approccio che tiene nella dovuta considerazione il diritto del minore a essere protetto e che tiene conto dei bisogni e punti di vista del minore".[564] Le linee guida forniscono orientamenti molto dettagliati su come attivare tali aspetti. Nel suo commento generale il comitato sui diritti dell'infanzia dell'ONU ha anch'esso sottolineato l'importanza di tali linee guida ai sensi dell'articolo 12 della CRC (diritto a essere ascoltato).[565] Secondo il comitato, le vittime minorenni e i testimoni minorenni di un reato devono avere l'opportunità di esercitare pienamente i propri diritti di esprimere liberamente le proprie opinioni, il che in particolare "implica che deve essere fatto tutto il possibile per garantire che un minorenne vittima e/o testimone sia consultato sulle questioni riguardanti il coinvolgimento nel caso in esame e che gli sia permesso di esprimere liberamente, e nel modo che gli è proprio, opinioni e preoccupazioni riguardanti il suo coinvolgimento nel processo penale".[566] Il comitato precisa altresì che il "diritto del minorenne vittima e testimone è correlato al diritto di essere informato sulle questioni quali la disponibilità di servizi sanitari, psicologici e sociali, sul ruolo di un minorenne vittima e/o testimone, sui modi in cui è condotto 'l'interrogatorio', sui meccanismi di sostegno esistenti per il minorenne al momento della presentazione di una denuncia e la partecipazione a indagini e procedimenti giudiziari, i luoghi ed gli orari specifici delle audizioni, la disponibilità di misure di protezione, la possibilità di ricevere il risarcimento e le disposizioni per il ricorso".[567]

Come reperire la giurisprudenza delle corti europee

Corte europea dei diritti dell'uomo: banca dati della giurisprudenza "HUDOC"

La **banca dati** "**HUDOC**" offre accesso gratuito alla giurisprudenza della Corte EDU: http://HUDOC.echr.coe.int.

La banca dati è disponibile in inglese e in francese e comprende un motore di ricerca di facile impiego che permette di reperire agevolmente la giurisprudenza desiderata.

Sulla pagina "**Help**" **(Aiuto)** del portale "HUDOC" sono disponibili lezioni video e manuali per gli utenti. Per ricevere informazioni dettagliate ed esempi su come usare i filtri e le funzioni di ricerca, l'utente può posizionare il puntatore del mouse su ? alla destra di ogni campo di ricerca.

I riferimenti alla giurisprudenza contenuti in questo manuale forniscono al lettore informazioni esaurienti che permettono di reperire facilmente il testo completo della sentenza o della decisione citate.

Prima di avviare una ricerca, occorre tenere presente che le impostazioni predefinite mostrano le sentenze della Grande Camera e della Camera a partire dall'ultima sentenza pubblicata. Per effettuare una ricerca in altre raccolte, per esempio nelle decisioni, l'utente deve spuntare l'apposita casella nel campo "**Document Collections**" **(Raccolte di documenti)** che compare nella parte superiore sinistra dello schermo.

Il modo più semplice per reperire un caso è inserire il numero di domanda nel campo "Application Number" (Numero di domanda) della sezione "**Advanced Search**" **(Ricerca avanzata)** che compare nella parte superiore destra dello schermo e successivamente cliccare sul pulsante blu "Search" (Cerca).

Per consultare ulteriore giurisprudenza riguardante altre questioni, per esempio in materia di minori, l'utente può utilizzare il **campo** "**Search**" **(Cerca)** indicato con una lente di ingrandimento sulla parte superiore destra dello schermo. Nel campo "Search" (Cerca), l'utente può effettuare una ricerca digitando:

- una singola parola (per esempio "minori")
- un'espressione (per esempio "minori richiedenti asilo")
- il titolo di un caso
- uno Stato
- un'espressione booleana (per esempio minori IN accoglienza alternativa)

Per facilitare l'utente e' possibile effettuare una **ricerca booleana semplice (Simple Boolean search)** cliccando sulla freccia che compare all'interno del **campo** "**Search**" **(Cerca)**. La ricerca booleana semplice offre sei possibilità di ricerca: "this exact word or phrase" (questa esatta parola o espressione), "all of these words" (tutte queste parole), "any of these words" (una di queste parole), "none of these words" (nessuna di queste parole), "near these words" (simile a queste parole), "free Boolean search" (ricerca booleana libera).

Una volta comparsi i risultati della ricerca, l'utente può facilmente restringere i risultati utilizzando i filtri che compaiono nel campo "**Filters**" **(Filtri)** sulla parte sinistra dello schermo, per esempio "Language" (Lingua) o "State" (Stato). I filtri possono essere utilizzati singolarmente o in combinazione al fine di restringere ulteriormente i risultati della ricerca. Il filtro "Keywords" (Parole chiave) può essere uno strumento utile, poiché spesso comprende termini estratti dal testo della CEDU ed è direttamente collegato al ragionamento e alle conclusioni della Corte.

Esempio: trovare la giurisprudenza della Corte sulla questione dell'espulsione dei richiedenti asilo che può esporre tali persone al rischio di tortura o di pene o trattamenti inumani o degradanti ai sensi dell'articolo 3 CEDU.

1) Innanzitutto l'utente digita l'espressione "richiedenti asilo" nel **campo** "**Search**" **(Cerca)** e clicca sul pulsante blu "**Search**" (Cerca).

2) Dopo la visualizzazione dei risultati della ricerca, l'utente seleziona quindi il "3" all'interno del filtro "Violation" (Violazione) del campo "**Filters**" (**Filtri**) al fine di restringere i risultati a quelli connessi alle violazioni di cui all'articolo 3.

3) L'utente può dunque selezionare le rilevanti parole chiave nell'ambito del filtro "**Keywords**" (Parole chiave) al fine di restringere i risultati a quelli che sono pertinenti per l'articolo 3, quali le parole chiave "(Articolo 3) Proibizione della tortura".

Per i casi più significativi, sul portale "HUDOC" è disponibile un riassunto della sentenza costituito da una nota descrittiva e da una presentazione concisa degli elementi di fatto e di diritto, in cui viene dato risalto agli aspetti di interesse giuridico. Qualora sia presente una riassunto, nei risultati figurerà un collegamento assieme al collegamento al testo della sentenza o alla decisione. In alternativa, l'utente può effettuare esclusivamente una ricerca di massime giuridiche spuntando la casella "Legal Summaries" (Sintesi giuridiche) nel campo "**Document collections**" **(Raccolte di documenti)**.

Qualora di un determinato caso siano state pubblicate traduzioni non ufficiali, nei risultati figurerà un collegamento sotto la voce "**Language versions**" (Versioni in altre lingue) assieme al collegamento al testo della sentenza o alla decisione. Il portale "HUDOC" fornisce anche collegamenti a siti Internet di terzi su cui sono presenti altre traduzioni della giurisprudenza della Corte EDU. Per maggiori informazioni, consultare "Language versions" (Versioni in altre lingue) nella sezione "Help" (Aiuto) del portale "HUDOC".

Corte di giustizia dell'Unione europea: banca dati della giurisprudenza "CURIA"

La **banca dati della giurisprudenza** "**CURIA**" offre accesso gratuito alla giurisprudenza della CG/CGUE: http://curia.europa.eu.

Il motore di ricerca è disponibile in tutte le lingue ufficiali dell'UE.[568] La lingua puo essere selezionata nel riquadro che appare sullo schermo in alto a destra. Il motore di ricerca può essere utilizzato per cercare informazioni in tutti i documenti connessi a cause definite e pendenti presso la Corte di giustizia, il Tribunale e il Tribunale della funzione pubblica.

All'indirizzo http://curia.europa.eu/common/juris/it/aideGlobale.pdf# è disponibile una sezione **Aiuto**. È presente una pagina di aiuto anche per ogni riquadro di ricerca, alla quale si può accedere cliccando sull'icona e che contiene informazioni utili volte ad aiutare l'utente a utilizzare lo strumento nel miglior modo possibile.

Il modo più semplice per reperire una causa specifica consiste nell'inserire il numero completo della causa nel riquadro di ricerca denominato **Numero di causa** e poi cliccare sul pulsante verde "Cerca". È anche possibile cercare una causa utilizzando una parte del numero di causa. Per esempio, digitando "122" nel campo "Numero di causa" si trovano le cause n. 122 di tutti gli anni nonché trattate dinanzi a tutti e tre gli organi giurisdizionali: Corte di giustizia, Tribunale e/o Tribunale della funzione pubblica.

In alternativa, è altresì possibile utilizzare il campo **Nome delle parti** per effettuare una ricerca con il nome corrente di una causa. Si tratta in genere del nome delle parti in causa indicato in forma semplificata.

Per contribuire a restringere i risultati della ricerca sono disponibili complessivamente 16 campi di ricerca multifunzionali. I differenti campi di ricerca sono di facile impiego e possono essere utilizzati in varie combinazioni. Spesso i campi sono dotati di elenchi di ricerca ai quali si può accedere cliccando sull'icona corrispondente e selezionando i termini di ricerca disponibili.

Per ricerche più generali, utilizzando il campo **Parole del testo** si ottengono risultati basati su ricerche di parole chiave in tutti i documenti pubblicati nella Raccolta della giurisprudenza dal 1954 e, dal 1994, nella Raccolta della giurisprudenza – Funzione pubblica (RaccFP).

568 Lingue disponibili dal 30 aprile 2004: spagnolo, danese, tedesco, greco, inglese, francese, italiano, olandese, portoghese, finlandese e svedese; dal 1° maggio 2004: ceco, estone, lettone, lituano, ungherese, polacco, slovacco e sloveno; dal 1°gennaio 2007: bulgaro e rumeno; dal 30 aprile 2007: maltese; dal 31 dicembre 2011: irlandese; misure temporanee di deroga sono state stabilite dal regolamento (CE) n. 920/2005 del Consiglio e dal regolamento (UE) n. 1257/2010. Il diritto derivato dell'UE in vigore alla data dell'adesione della Croazia è attualmente in corso di traduzione e verrà pubblicato gradualmente sulla Gazzezzetta ufficiale edizione speciale.

Per effettuare ricerche in settori più specifici, si può utilizzare il campo **Materia**. A tal fine occorre cliccare sull'icona alla destra del campo e selezionare dall'elenco la/e materia/e pertinente/i. I risultati della ricerca mostreranno quindi un elenco alfabetico dei documenti selezionati connessi alle questioni giuridiche trattate nelle decisioni della Corte di giustizia, del Tribunale e del Tribunale della funzione pubblica nonché nei pareri degli Avvocati generali.

Il portale "CURIA" dispone inoltre di strumenti aggiuntivi della giurisprudenza:

Accesso alla giurisprudenza per numero di causa: questa sezione è una raccolta che consente di individuare informazioni per ogni causa trattata dinanzi a uno dei tre organi giurisdizionali. Le cause sono presentate in ordine numerico, in base al loro deposito presso le rispettive cancellerie. È stabilito un collegamento attraverso il numero di causa. È possibile accedere alla sezione "Accesso alla giurisprudenza per numero di causa" all'indirizzo http://curia.europa.eu/jcms/jcms/Jo2_7045/;

Repertorio della giurisprudenza: questa sezione offre una classificazione sistematica delle massime della giurisprudenza sui punti essenziali di diritto illustrati nella pronuncia considerata. Tali massime si basano il più fedelmente possibile sul testo stesso della pronuncia. La sezione "Repertorio" è disponibile all'indirizzo http://curia.europa.eu/jcms/jcms/Jo2_7046/;

Note di dottrina alla giurisprudenza: questa sezione contiene gli estremi di pubblicazione delle note di dottrina alla giurisprudenza dei tre organi giurisdizionali dalla data della loro istituzione. La giurisprudenza è classificata per singola giurisdizione in ordine cronologico di pubblicazione, secondo il numero di causa. Gli estremi di pubblicazione sono in lingua originale. La sezione "Note di dottrina alla giurisprudenza" è disponibile all'indirizzo http://curia.europa.eu/jcms/jcms/Jo2_7083/;

Banca dati di giurisprudenza nazionale: questa banca dati esterna, alla quale è possibile accedere tramite il portale "CURIA", offre accesso alla giurisprudenza nazionale pertinente relativa al diritto dell'Unione. La banca dati si basa su una raccolta della giurisprudenza degli organi giurisdizionali nazionali degli Stati membri dell'UE, effettuata mediante uno spoglio selettivo di riviste giuridiche e di contatti diretti con numerosi organi giurisdizionali nazionali. La "Banca dati di giurisprudenza nazionale" è disponibile in inglese e in francese all'indirizzo http://curia.europa.eu/jcms/jcms/Jo2_7062/.

	Titolo
Non discriminazione	
Direttiva sull'uguaglianza razziale 2000/43/CE	Direttiva 2000/43/CE del Consiglio, del 29 giugno 2000, che attua il principio della parità di trattamento fra le persone indipendentemente dalla razza e dall'origine etnica (GU L 180 del 19.7.2000, pagg. 22–26).
Direttiva sulla parità di trattamento in materia di occupazione 2000/78/CE	Direttiva 2000/78/CE del Consiglio, del 27 novembre 2000, che stabilisce un quadro generale per la parità di trattamento in materia di occupazione e di condizioni di lavoro (GU L 303 del 2.12.2000, pagg. 16–22).
Direttiva sulla parità di trattamento nell'accesso a beni e servizi (2004/113/CE)	Direttiva 2004/113/CE del Consiglio, del 13 dicembre 2004, che attua il principio della parità di trattamento tra uomini e donne per quanto riguarda l'accesso a beni e servizi e la loro fornitura (GU L 373 del 21.12.2004, pagg. 37–43).
Vita familiare e assistenza genitoriale	
Regolamento Bruxelles II bis (CE) n. 2201/2003	Regolamento (CE) n. 2201/2003 del Consiglio, del 27 novembre 2003, relativo alla competenza, al riconoscimento e all'esecuzione delle decisioni in materia matrimoniale e in materia di responsabilità genitoriale, che abroga il regolamento (CE) n. 1347/2000 (GU L 338 del 23.12.2003, pagg. 1–29)
Regolamento (CE) n. 4/2009 in materia di obbligazioni alimentari	Regolamento (CE) n. 4/2009 del Consiglio, del 18 dicembre 2008, relativo alla competenza, alla legge applicabile, al riconoscimento e all'esecuzione delle decisioni e alla cooperazione in materia di obbligazioni alimentari (GU L 7 del 10.1.2009, pagg. 1–79)
Direttiva 2008/52/CE sulla mediazione	Direttiva 2008/52/CE del Parlamento europeo e del Consiglio, del 21 maggio 2008, relativa a determinati aspetti della mediazione in materia civile e commerciale (GU L 136 del 24.5.2008, pagg. 3–8).
Direttiva 2002/8/CE sull'accesso alla giustizia	Direttiva 2002/8/CE del Consiglio, del 27 gennaio 2003, intesa a migliorare l'accesso alla giustizia nelle controversie transfrontaliere attraverso la definizione di norme minime comuni relative al patrocinio a spese dello Stato in tali controversie (GU L 26 del 31.1.2003, pagg. 41–47).

Protezione dei minori contro la violenza e lo sfruttamento	
Direttiva 94/33/CE relativa ai giovani sul lavoro	Direttiva 94/33/CE del Consiglio, del 22 giugno 1994, relativa alla protezione dei giovani sul lavoro (GU L 216 del 20.8.1994, pagg. 12–20).
Direttiva sulla tratta (2011/36/UE)	Direttiva 2011/36/UE del Parlamento europeo e del Consiglio, del 5 aprile 2011, concernente la prevenzione e la repressione della tratta di esseri umani e la protezione delle vittime, e che sostituisce la decisione quadro del Consiglio 2002/629/GAI (GU L 101 del 15.4.2011, pagg. 1–11).
Direttiva relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile (2011/93/UE)	Direttiva 2011/93/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile, e che sostituisce la decisione quadro 2004/68/GAI del Consiglio (GU L 335 del 17.12.2011, pagg. 1–14).
Direttiva sulle vittime (2012/29/UE)	Direttiva 2012/29/UE del Parlamento europeo e del Consiglio, del 25 ottobre 2012, che istituisce norme minime in materia di diritti, assistenza e protezione delle vittime di reato e che sostituisce la decisione quadro 2001/220/GAI (GU L 315 del 14.11.2012, pagg. 57–73).
Direttiva sui titoli di soggiorno per le vittime della tratta di esseri umani (2004/81/CE)	Direttiva 2004/81/CE del Consiglio, del 29 aprile 2004, riguardante il titolo di soggiorno da rilasciare ai cittadini di paesi terzi vittime della tratta di esseri umani o coinvolti in un'azione di favoreggiamento dell'immigrazione illegale che cooperino con le autorità competenti (GU L 261 del 6.8.2004, pagg. 19–23).
Decisione 2007/698/CE della Commissione	Decisione della Commissione, del 29 ottobre 2007, recante modifica della decisione 2007/116/CE per quanto riguarda l'introduzione di altri numeri riservati che iniziano con "116" [notificata con il numero C(2007)5139] (Testo rilevante ai fini del SEE) (2007/698/EC) (GU L 284 del 30.10.2007, pagg. 31–32).
Migrazione e asilo, compresi i diritti sociali dei minori migranti	
Direttiva sulle procedure di asilo (2013/32/UE)	Direttiva 2013/32/UE del Parlamento europeo e del Consiglio, del 26 giugno 2013, recante procedure comuni ai fini del riconoscimento e della revoca dello status di protezione internazionale (GU L 180 del 29.6.2013, pagg. 60–95).
Regolamento (UE) n.604/2013 di Dublino	Regolamento (UE) n. 604/2013 del Parlamento europeo e del Consiglio, del 26 giugno 2013, che stabilisce i criteri e i meccanismi di determinazione dello Stato membro competente per l'esame di una domanda di protezione internazionale presentata in uno degli Stati membri da un cittadino di un paese terzo o da un apolide (GU L 180 del 29.6.2013, pagg. 31–59).

Direttiva qualifiche (2011/95/UE)	Direttiva 2011/95/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, recante norme sull'attribuzione, a cittadini di paesi terzi o apolidi, della qualifica di beneficiario di protezione internazionale, su uno status uniforme per i rifugiati o per le persone aventi titolo a beneficiare della protezione sussidiaria, nonché sul contenuto della protezione riconosciuta (GU L 337 del 20.12.2011, pagg. 9–26).
Regolamento (UE) n. 492/2011	Regolamento (UE) n. 492/2011 del Parlamento europeo e del Consiglio, del 5 aprile 2011, relativo alla libera circolazione dei lavoratori all'interno dell'Unione (GU L 141 del 27.5.2011, pagg. 1–12).
Direttiva sulla libera circolazione (2004/38/CE)	Direttiva 2004/38/CE del Parlamento europeo e del Consiglio, del 29 aprile 2004, relativa al diritto dei cittadini dell'Unione e dei loro familiari di circolare e di soggiornare liberamente nel territorio degli Stati membri, che modifica il regolamento (CEE) n. 1612/68 ed abroga le direttive 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE e 93/96/CEE (Testo rilevante ai fini del SEE) (GU L 158 del 30.4.2004, pagg. 77–123).
Direttiva 77/486/CEE del Consiglio sull'istruzione dei bambini dei lavoratori migranti	Direttiva 77/486/CE del Consiglio, del 25 luglio 1977, relativa alla formazione scolastica dei figli dei lavoratori migranti (GU L 199 del 6.8.1977, pagg. 32–33).
Direttiva sul ricongiungimento familiare (2003/86/CE)	Direttiva 2003/86/CE del Consiglio, del 22 settembre 2003, relativa al diritto al ricongiungimento familiare (GU L 251 del 3.10.2003, pagg. 12–18).
Direttiva sulla protezione temporanea (2001/55/CE)	Direttiva 2001/55/CE del Consiglio, del 20 luglio 2001, sulle norme minime per la concessione della protezione temporanea in caso di afflusso massiccio di sfollati e sulla promozione dell'equilibrio degli sforzi tra gli Stati membri che ricevono gli sfollati e subiscono le conseguenze dell'accoglienza degli stessi (GU L 212 del 7.8.2001, pagg. 12–23).
Direttiva sulle condizioni di accoglienza (2013/33/CE)	Direttiva 2013/33/UE del Parlamento europeo e del Consiglio, del 26 giugno 2013, recante norme relative all'accoglienza dei richiedenti protezione internazionale (GU L 180 del 29.6.2013, pagg. 96–116).
Direttiva rimpatri (2008/115/CE)	Direttiva 2008/115/CE del Parlamento europeo e del Consiglio, del 16 dicembre 2008, recante norme e procedure comuni applicabili negli Stati membri al rimpatrio di cittadini di paesi terzi il cui soggiorno è irregolare (GU L 348 del 24.12.2008, pagg. 98–107).

Direttiva sui soggiornanti di lungo periodo (2003/109/CE)	Direttiva 2003/109/CE del Consiglio, del 25 novembre 2003, relativa allo status dei cittadini di paesi terzi che siano soggiornanti di lungo periodo (GU L 16 del 23.1.2004, pagg. 44–53).
Regolamento (CE) n. 562/2006 relativo al codice frontiere Schengen	Regolamento (CE) n. 562/2006 del Parlamento europeo e del Consiglio, del 15 marzo 2006, che istituisce un codice comunitario relativo al regime di attraversamento delle frontiere da parte delle persone (codice frontiere Schengen) (GU L 105 del 13.4.2006, pagg. 1–32).
Consumatori e protezione dei dati personali	
Direttiva sui diritti dei consumatori (2011/83/UE)	Direttiva 2011/83/UE del Parlamento europeo e del Consiglio, del 25 ottobre 2011, sui diritti dei consumatori, recante modifica della direttiva 93/13/CEE del Consiglio e della direttiva 1999/44/CE del Parlamento europeo e del Consiglio e che abroga la direttiva 85/577/CEE del Consiglio e la direttiva 97/7/CE del Parlamento europeo e del Consiglio (GU L 304 del 22.11.2011, pagg. 64–88).
Direttiva 87/357/CEE concernente i prodotti che, avendo un aspetto diverso da quello che sono in realtà, compromettono la salute o la sicurezza dei consumatori	Direttiva 87/357/CEE del Consiglio, del 25 giugno 1987, concernente il ravvicinamento delle legislazioni degli Stati Membri relative ai prodotti che, avendo un aspetto diverso da quello che sono in realtà, compromettono la salute o la sicurezza dei consumatori (GU L 192 dell'11.7.1987, pagg. 49–50).
Direttiva sulle vendite a distanza (97/7/CE)	Direttiva 97/7/CE del Parlamento europeo e del Consiglio, del 20 maggio 1997, riguardante la protezione dei consumatori in materia di contratti a distanza - Dichiarazione del Consiglio e del Parlamento europeo sull'articolo 6, paragrafo 1 – Dichiarazione della Commissione sull' articolo 3, paragrafo 1, primo trattino (GU L 144 del 4.6.1997, pagg. 19–27).
Direttiva sulla sicurezza generale dei prodotti (2001/95/CE)	Direttiva 2001/95/CE del Parlamento europeo e del Consiglio, del 3 dicembre 2001, relativa alla sicurezza generale dei prodotti (GU L 11 del 15.1.2002, pagg. 4–17).
Direttiva 2009/39/CE relativa ai prodotti alimentari destinati a un'alimentazione particolare	Direttiva 2009/39/CE del Parlamento europeo e del Consiglio, del 6 maggio 2009, relativa ai prodotti alimentari destinati ad un'alimentazione particolare (rifusione) (Testo rilevante ai fini del SEE) (GU L 124 del 20.5.2009, pagg. 21–29).
Direttiva sulla sicurezza dei giocattoli (2009/48/CE)	Direttiva 2009/48/CE del Parlamento europeo e del Consiglio, del 18 giugno 2009, sulla sicurezza dei giocattoli (Testo rilevante ai fini del SEE) (GU L 170 del 30.6.2009, pagg. 1–37).

Direttiva sull'esercizio delle attività televisive senza frontiere (89/552/CEE)	Direttiva 89/552/CEE del Consiglio, del 3 ottobre 1989, relativa al coordinamento di determinate disposizioni legislative, regolamentari e amministrative degli Stati Membri concernenti l'esercizio delle attività televisive (GU L 298 del 17.10.1989, pagg. 23–30).
Direttiva sui servizi di media audiovisivi (2010/13/UE)	Direttiva 2010/13/UE del Parlamento europeo e del Consiglio, del 10 marzo 2010, relativa al coordinamento di determinate disposizioni legislative, regolamentari e amministrative degli Stati membri concernenti la fornitura di servizi di media audiovisivi (Testo rilevante ai fini del SEE) (GU L 95 del 15.4.2010, pagg. 1–24).
Direttiva sulla protezione dei dati (95/46/CE)	Direttiva 95/46/CE del Parlamento europeo e del Consiglio, del 24 ottobre 1995, relativa alla tutela delle persone fisiche con riguardo al trattamento dei dati personali, nonché alla libera circolazione di tali dati (GU L 281 del 23.11.1995, pagg. 31–50).
Direttiva 2002/58/CE relativa al trattamento dei dati personali e alla tutela della vita privata nel settore delle comunicazioni elettroniche	Direttiva 2002/58/CE del Parlamento europeo e del Consiglio, del 12 luglio 2002, relativa al trattamento dei dati personali e alla tutela della vita privata nel settore delle comunicazioni elettroniche (direttiva relativa alla vita privata e alle comunicazioni elettroniche) (GU L 201 del 31.7.2002, pagg. 37–47).
Direttiva relativa alle pratiche commerciali sleali tra imprese e consumatori (2005/29/CE)	Direttiva 2005/29/CE del Parlamento europeo e del Consiglio, dell'11 maggio 2005, relativa alle pratiche commerciali sleali tra imprese e consumatori nel mercato interno e che modifica la direttiva 84/450/CEE del Consiglio e le direttive 97/7/CE, 98/27/CE e 2002/65/CE del Parlamento europeo e del Consiglio e il regolamento (CE) n. 2006/2004 del Parlamento europeo e del Consiglio (direttiva sulle pratiche commerciali sleali) (Testo rilevante ai fini del SEE) (GU L 149 dell'11.6.2005, pagg. 22–39).
Direttiva sulla sperimentazione clinica (2001/20/CE)	Direttiva 2001/20/CE del Parlamento europeo e del Consiglio, del 4 aprile 2001, concernente il ravvicinamento delle disposizioni legislative, regolamentari ed amministrative degli Stati membri relative all'applicazione della buona pratica clinica nell'esecuzione della sperimentazione clinica di medicinali ad uso umano (GU L 121 dell'1.5.2001, pagg. 34–44).
Regolamento 536/2014 sulla sperimentazione clinica dei medicinali per uso umano	Regolamento (UE) n. 536/2014 del Parlamento europeo e del Consiglio, del 16 aprile 2014, sulla sperimentazione clinica di medicinali per uso umano e che abroga la direttiva 2001/20/CE (Testo rilevante ai fini del SEE) (GU L 158 del 27.5.2014, pagg. 1–76).

Giustizia penale e procedimenti alternativi	
Direttiva sul diritto all'interpretazione e alla traduzione (2010/64/UE)	Direttiva 2010/64/CE del Parlamento europeo e del Consiglio, del 20 ottobre 2010, sul diritto all'interpretazione e alla traduzione nei procedimenti penali (GU L 280 del 26.10.2010, pagg. 1–7).
Direttiva sul diritto all'informazione (2012/13/UE)	Direttiva 2012/13/UE del Parlamento europeo e del Consiglio, del 22 maggio 2012, sul diritto all'informazione nei procedimenti penali (GU L 142 dell'1.6.2012, pagg. 1–10).
Direttiva sull'accesso a un difensore (2013/48/UE)	Direttiva 2013/48/UE del Parlamento europeo e del Consiglio, del 22 ottobre 2013, relativa al diritto di avvalersi di un difensore nel procedimento penale e nel procedimento di esecuzione del mandato d'arresto europeo, al diritto di informare un terzo al momento della privazione della libertà personale e al diritto delle persone private della libertà personale di comunicare con terzi e con le autorità consolari (GU L 294 del 6.11.2013, pagg. 1–12)
Carta dei diritti fondamentali	Carta dei diritti fondamentali dell'Unione europea (GU C 326 del 26.10.2012, pagg. 391–407).
Minori con disabilità	
Decisione 2010/48/CE del Consiglio	Decisione 2010/48/CE del Consiglio relativa alla conclusione, da parte della Comunità europea, della convenzione delle Nazioni Unite sui diritti delle persone con disabilità (GU L 23 del 27.1.2010, pagg. 35–36).

Numerose informazioni sull'Agenzia dell'Unione europea per i diritti fondamentali sono disponibili su Internet. È possibile accedervi attraverso il sito Internet della FRA (fra.europa.eu).

Ulteriori informazioni sulla giurisprudenza della Corte europea dei diritti dell'uomo sono disponibili sul sito web della Corte: echr.coe.int. Il portale di ricerca HUDOC consente di accedere alle sentenze e decisioni in inglese e/o francese, le traduzioni in altre lingue, riassunti, comunicati stampa e altre informazioni sul lavoro della Corte.

COME OTTENERE LE PUBBLICAZIONI DELL'UNIONE EUROPEA

Pubblicazioni gratuite:

- una sola copia:
  tramite EU Bookshop (http://bookshop.europa.eu);
- più di una copia o poster/carte geografiche:
- presso le rappresentanze dell'Unione europea (http://ec.europa.eu/represent_it.htm),
- presso le delegazioni dell'Unione europea nei paesi terzi (http://eeas.europa.eu/delegations/index_it.htm),
- contattando uno dei centri Europe Direct (http://europa.eu/europedirect/index_it.htm), chiamando il numero 00 800 6 7 8 9 10 11 (gratuito in tutta l'UE) (*).

(*) Le informazioni sono fornite gratuitamente e le chiamate sono nella maggior parte dei casi gratuite (con alcuni operatori e in alcuni alberghi e cabine telefoniche il servizio potrebbe essere a pagamento).

Pubblicazioni a pagamento:

- tramite EU Bookshop (http://bookshop.europa.eu).

Come ottenere le pubblicazioni del Consiglio d'Europa

Consiglio d'Europa Pubblicazioni realizza prestazioni in tutti i settori di riferimento dell'Organizzazione, compreso i diritti umani, scienza giuridica, la salute, l'etica, gli affari sociali, l'ambiente, l'istruzione, la cultura, lo sport, la gioventù e il patrimonio architettonico. Libri e pubblicazioni elettroniche dal vasto catalogo possono essere ordinati online (http://book.coe.int/).

Una sala di lettura virtuale consente agli utenti di consultare gratuitamente estratti dalle principali opere appena pubblicate o i testi integrali di alcuni documenti ufficiali.

Informazioni su, così come il testo integrale, delle Convenzioni del Consiglio d'Europa sono disponibili sul sito web dell'Ufficio dei Trattati: http://conventions.coe.int/.

CONSEIL DE L'EUROPE

Bambini e adolescenti sono titolari di diritti a pieno titolo. Sono beneficiari di tutti i diritti umani e fondamentali nonché oggetto di regolamenti speciali, in virtù delle loro caratteristiche specifiche. Il presente manuale si prefigge lo scopo di illustrare in che modo il diritto e la giurisprudenza europei tengono conto degli interessi e delle esigenze specifici dei minori. Evidenzia altresì l'importanza del ruolo svolto dai genitori e dai tutori o da altri rappresentanti legali e fa riferimento, ove opportuno, alle situazioni in cui diritti e responsabilità sono conferiti prevalentemente alle persone che si prendono cura dei minori. Il manuale mira a sensibilizzare e migliorare le conoscenze delle norme di legge che proteggono e promuovono questi diritti in Europa. Esso rappresenta un punto di riferimento per quanto concerne sia il diritto dell'Unione europea (UE) sia il diritto del Consiglio d'Europa (CdE) in materia e illustra come ciascun tema sia disciplinato dal diritto dell'UE, compresa la Carta dei diritti fondamentali dell'Unione europea, oltre che dalla Convenzione europea sui diritti dell'uomo (CEDU), dalla Carta sociale europea (CSE) e da altri strumenti del Consiglio d'Europa. Il manuale è destinato a professionisti legali non specializzati, giudici, magistrati e autorità responsabili della protezione dei minori, nonché ad altre figure professionali e organizzazioni impegnate nell'offrire una protezione legale dei diritti dell'infanzia e dell'adolescenza. Illustra la giurisprudenza principale, riportando una sintesi delle principali sentenze sia della Corte di giustizia dell'Unione europea (CGUE) sia della Corte europea dei diritti dell'uomo (Corte EDU).

Obiettivi formativi

03

unità

Illustrare gli spazi partecipativi del minore maltratto nei procedimenti civili e penali che lo riguardano e gli strumenti volti a garantirne la sicurezza e il benessere psico-fisico

Principali fonti internazionali ed europee

- Convenzione internazionale sui diritti dell'infanzia (CRC)

COUNCIL OF EUROPE
CONSEIL DE L'EUROPE

- Convenzione europea sull'esercizio dei diritti dei minori (Conv. Strasburgo)
- Convenzione di Lanzarote
- Convenzione europea dei diritti dell'uomo (CEDU)

- Carta dei diritti fondamentali dell'Unione europea (Carta di Nizza)
- Direttiva 2011/36/UE in materia di tratta di esseri umani
- Direttiva 2012/29/UE sui diritti delle vittime nei procedimenti penali
- Direttiva 2011/93/UE in materia di abuso, sfruttamento sessuale dei minori e pornografia minorile

Contesti di coinvolgimento del minore

1. Procedimento penale

Obbligo delle autorità statali di **prevenire** e **punire** violenze e abusi ai danni dei minori (vittimizzazione primaria)

Artt. 3-7 CRC; art. 3 CEDU; art. 18 e ss. Conv. Lanzarote; artt. 2-10 Direttiva n. 36; artt. 3-17 Direttiva n. 93

Prevenzione

Introduzione di **reati** penali per le condotte di violenze e abusi verso i minori

Repressione

Ricerca e **punizione** degli autori di violenze e abusi verso i minori

2. Procedimenti civili

Quando uno o entrambi i **genitori** sono direttamente autori del maltrattamento, o comunque l'hanno consentito

Necessità di garantire al minore un **ambiente familiare** sicuro e sereno

Art. 9 CRC; art. 8 CEDU

Prescrizioni ai genitori

Affidamento del minore ad altro nucleo famigliare

Collocamento in comunità

Adozione del minore

- Video Baldelli
- Video Ceccarelli
- Video Cibinel

- Video Cibinel
- Video Baldelli

Rapporti fra procedimento penale e procedimento civile

carepath

Procedimento penale

obiettivo → individuare e punire l'autore del condotta subita dal minore, se questa costituisce reato

Procedimento civile

obiettivo → verificare l'adeguatezza del contesto famigliare del minore ed eliminare eventuali situazioni pregiudizievoli

Sono due **strade separate e indipendenti** → condotte che non costituiscono reato possono rivelare una situazione famigliare compromessa, tanto da giustificare ugualmente l'intervento del giudice civile

3. Procedure extragiudiziali

Quando il rapporto, o il legame familiare, fra l'autore della condotta e la vittima minorenne appaiono **recuperabili**

Art. 13 Conv. Strasburgo; art. 12 Direttiva n. 29

Per evitare procedure penali/civili maggiormente intrusive, che potrebbero compromettere definitivamente il **risanamento** del rapporto

- Mediazione
- Tentativo di conciliazione
- Ulteriori strumenti volti al riavvicinamento

carepath

Principio del superiore interesse del minore

Vale per ogni sede procedimentale e impone di anteporre il **benessere** psico-fisico del minore a qualsiasi altra esigenza meritevole di tutela

Art. 3 CRC; art. 6 Conv. Strasburgo

Giudice deve acquisire ogni **informazione** necessaria per conoscere i fatti in questione e il contesto socio-famigliare del minore

Decisione giudiziale deve essere sempre orientata alla miglior tutela possibile degli interessi del minore

- Video Ceccarelli
- Video Long

Il diritto all'ascolto del minore nel procedimento

Il pensiero del minore deve tendenzialmente essere conosciuto dal giudice e tenuto in considerazione per la decisione

Art. 12 CRC; art. 3 Conv. Strasburgo

Garanzie **partecipative** del minore nei procedimenti che lo riguardano

MA

Necessari strumenti procedimentali di **protezione** per evitare la «vittimizzazione secondaria»

Garanzie partecipative del minore-vittima

1. Diritto alla comprensione e all'informazione

Art. 31 Conv. Lanzarote; art. 3 Conv. Strasburgo; artt. 3-4 Direttiva n. 29

Garanzia presupposto → solo chi è dotato di **conoscenze adeguate** può partecipare proficuamente alla procedura decisionale in cui sono coinvolti i suoi interessi

Cosa?

- significato del procedimento in atto
- decisione che deve essere presa
- diritti e protezioni a disposizione del minore
- ruolo che sarà chiamato a svolgere
- possibili conseguenze delle sue dichiarazioni e/opinioni

Chi?

- autorità giudiziaria
- difensore
- rappresentante
- professionista sociale o sanitario

Come?

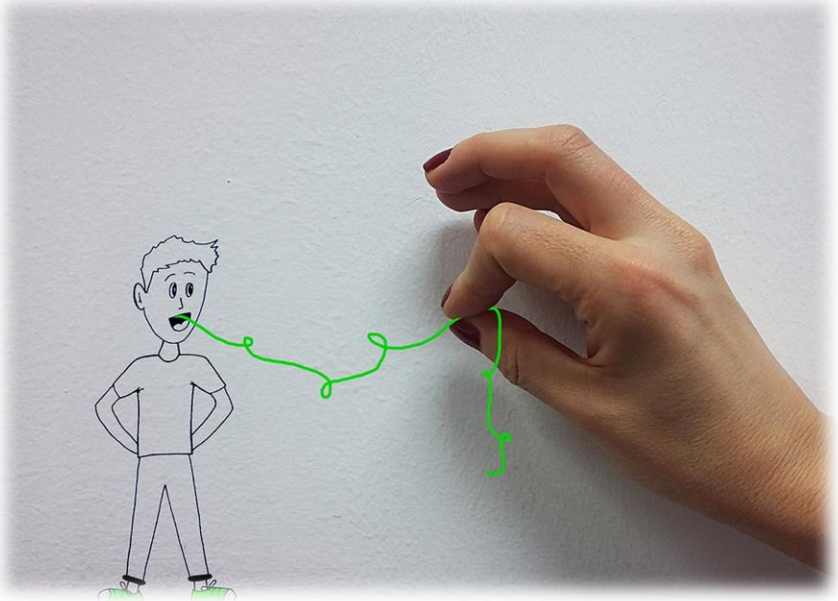
linguaggio e concetti adatti alla età e alla capacità di discernimento del minore

2. Diritto all'ascolto sui fatti oggetto del procedimento

Il minore può essere chiamato a rendere **dichiarazioni** su fatti di sua conoscenza, rilevanti per la decisione da prendere

Processo penale

Minore come testimone del maltrattamento subito, per accertare la responsabilità dell'autore del reato



Processi civili

Minore come testimone delle condotte subite e dei rapporti famigliari, per stabilire se sottrarlo all'ambiente famigliare d'origine, o alla vicinanza di uno dei genitori

Contesto a forte rischio di «vittimizzazione secondaria»

- Video Ceccarelli
- Video Cibinel
- Video Long

3. Diritto di essere consultato in merito alla decisione da prendere

Prima che una decisione venga presa, il minore ha diritto di esprimere la propria **opinione** sulle varie questioni affrontate nel procedimento

Art. 12 CRC; art. 3 Conv. Strasburgo

Processo penale

- avvio del procedimento
- applicazione di misure provvisorie contro l'imputato, o per la protezione del minore
- accesso dell'imputato a riti premiali, o messa alla prova
- valore delle prove acquisite

Processi civili

- sottrazione dalla famiglia
- allontanamento di uno dei genitori
- affidamento ad altro nucleo famigliare
- adozione

Spesso, l'opinione è sostituita dalla più forte garanzia del consenso

Procedure extragiudiziali

Consenso/richiesta del minore per l'avvio del tentativo di mediazione e risanamento del rapporto

Obbligatorietà e peso dell'opinione dipendono da capacità di discernimento

Strumenti di protezione dentro al procedimento

1. Presenza di figure di supporto

Art. 12 CRC; art. 31 Conv. Lanzarote; artt. 9-10 Conv. Strasburgo; art. 24 Direttiva n. 29

Rappresentante (se mancano i genitori, o sono in conflitto di interessi)

individua e tutela gli interessi esistenziali del minore

Difensore

sceglie la strategia giuridica più adeguata per ottenere un provvedimento conforme agli interessi esistenziali del minore

Professionista sociale o sanitario (psicologo, psichiatra, assistente sociale)

- salvaguardia il minore dalla «vittimizzazione secondaria»
- aiuta giudice, genitori, difensori a comprendere esigenze e fragilità del minore
- contribuisce al superamento del trauma derivante dalla violenza subita

Queste figure possono eventualmente essere designate dal giudice

2. Riservatezza

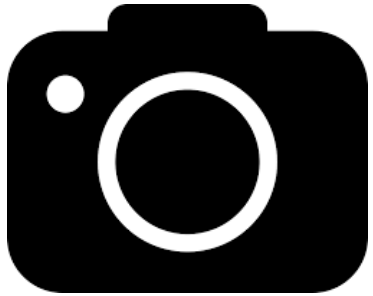
Art. 16 CRC; art. 8 CEDU; art. 21 direttiva n. 29

carepath

Procedimento senza **pubblico**

se necessario per tutelare la riservatezza del minore si può procedure in udienza a porte chiuse

Limitazione alla diffusione di **immagini** e **informazioni**



Limiti alle **domande** rivolgibili al minore durante il procedimento

divieto di porre domande sulla vita privata non attinenti ai fatti oggetto del procedimento

3. Ragionevole durata

Il rischio di «vittimizzazione secondaria» è legato anche alla durata del procedimento

Art. 7 Conv. Strasburgo

conflitto di valori

la decisione va presa nel più breve tempo possibile per evitare al minore stress continuo e prolungato

non possono però essere completamente sacrificati gli altri interessi del minore e degli ulteriori soggetti coinvolti nella decisione

necessità di **bilanciamento**

4. Protezioni durante l'audizione (parte I)

Quando il minore deve rendere dichiarazioni sui maltrattamenti subiti, sui suoi rapporti con l'autore della condotta, sul suo ambiente famigliare

Art. 31 Conv. Lanzarote; art. 18 e ss. Direttiva n. 29; Corte EDU, 2.7.2002, S.N. c. Svezia

⇩

accorgimenti da prendere se viene stimato un rischio di «vittimizzazione secondaria»

Luogo di audizione

audizione può avvenire in un luogo diverso dalla ordinaria aula di udienza

⇩

casa del minore, ufficio del giudice, studio dell'avvocato, stanza apposita per l'audizione dei minori

Chi rivolge le domande?

le domande al minore possono non essere rivolte direttamente dai difensori delle parti, ma dal giudice, o dall'esperto

⇩

i difensori rischiano di essere aggressivi, potrebbero approfittare delle fragilità del minore o, più semplicemente, non hanno esperienza nell'audizione dei minori

4. Protezioni durante l'audizione (parte II)

carepath

Procedere il **prima possibile** all'audizione ed evitare più ripetizioni

L'attesa dell'audizione e più ripetizioni accrescono il rischio di stress, mentre i ricordi del fatto si attenuano

⇩

ascoltare il minore durante le prime fasi del procedimento, evitando poi di sentirlo di nuovo più avanti

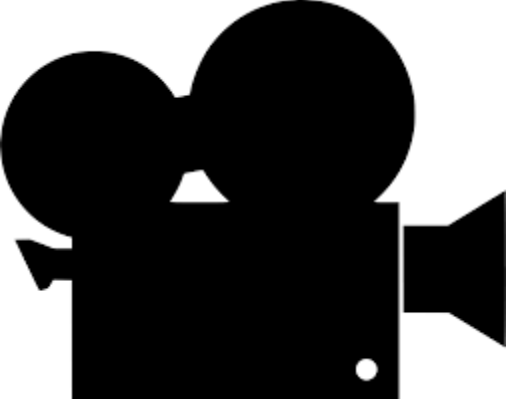
Prevenzione dal **contatto** con imputato, genitore in conflitto di interessi, loro difensori

Il contatto visivo con questi soggetti può stressare e intimorire il minore dichiarante

⇩

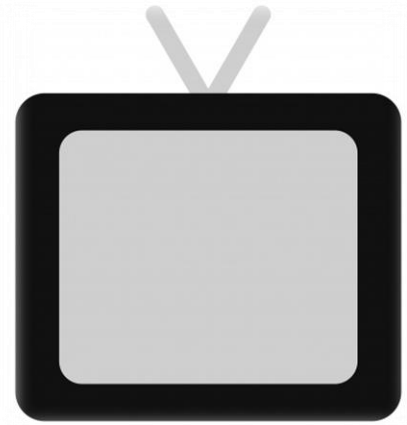
- impianto citofonico con vetro-specchio
- trasmissione da altro locale in video conferenza
- domande preparate dai difensori ma rivolte da giudice o esperto in ambiente protetto

necessità di bilanciare interesse del minore con diritto delle parti di difendersi e di far valere le proprie ragioni



carepath

Materiale video sull'ascolto del minore



Esempio di sala d'ascolto in un tribunale italiano

La preparazione del minore alla testimonianza
(video 1 e video 2)

La testimonianza di un bambino sull'omicidio della sorella

5. Protezione durante espressione dell'opinione o del consenso

Art. 6 Conv. Strasburgo

Quando il minore deve esprimere la propria volontà o addirittura il proprio consenso sul tema della decisione che il giudice deve prendere

La libera manifestazione dell'**opinione** o del **consenso** potrebbe essere pregiudicata dalla presenza dei soggetti direttamente interessati, come genitori, difensori, imputati

Giudice può sentire ciò che il minore vuole dire al di fuori dell'aula di udienza, o comunque in mancanza degli altri protagonisti del procedimento

- Video Ceccarelli
- Video Long

- Video Baldelli
- Video Cibinel

6. Tutela integrità psico-fisica in corso di procedimento

Artt. 20-21 CRC; art. 31 Conv. Lanzarote; art. 18 Direttiva n. 29

carepath

Prima che la decisione definitiva venga presa, possono essere adottati **provvedimenti cautelari** provvisori per la tutela del minore

Provvedimenti nei confronti dell'**autore** del maltrattamento

- custodia in carcere/arresti
- limitazione responsabilità genitoriale
- allontanamento dalla casa famigliare
- divieto di avvicinamento alla vittima

(limitazione responsabilità genitoriale, allontanamento dalla casa famigliare) → se genitore della vittima

Provvedimenti nei confronti del **minore**

- affidamento provvisorio
- allontanamento da casa famigliare

→ se il maltrattamento è avvenuto all'interno del nucleo famigliare

7. Assistenza extra procedimentale

Art. 39 CRC; art. 31 Conv. Lanzarote; artt. 8-9 Direttiva n. 29

Sostegno **psicologico** ed **emotivo** al minore anche fuori dal procedimento in corso

Video Cibinel

La «vittimizzazione secondaria» va combattuta assistendo il minore anche prima e dopo gli atti del procedimento a cui partecipa

Punizione del colpevole ed eventuale risanamento dell'ambiente famigliare non bastano

necessario supporto *extramoenia* per il superamento del trauma derivante dal maltrattamento subito («vittimizzazione primaria»)

Queste esigenze vengono spesso assicurate tramite la presa in carico del minore da parte dei servizi sociali

Riassunto sul ruolo del professionista sociale o sanitario

carepath

Nel procedimento

- valutazione sul grado di protezione necessario
- assistenza durante la partecipazione del minore agli atti procedimentali
- partecipazione all'audizione/consultazione del minore
- valutazione su capacità testimoniale/ attendibilità del minore
- partecipazione a tentativi di conciliazione
- valutazione su capacità di discernimento
- valutazione dell'ambiente familiare

⇩

<u>fine principale</u> → prevenire vittimizzazione secondaria e fornire al giudice le conoscenze utili per la sua decisione

Fuori dal procedimento

- sostegno psicologico ed emotivo al minore
- verifiche sull'eventuale nuovo contesto famigliare (provvisorio o definitivo)

⇩

<u>fine principale</u> → superamento del trauma derivante dal maltrattamento subito e ripristino dell'equilibrio famigliare eventualmente infranto

Gli effetti sulle politiche sociali e sanitarie riguardanti minorenni maltrattati di un approccio centrato sui diritti fondamentali di bambini e ragazzi

Co-funded by the European Union's Rights, Equality and Citizenship Programme (2014-2020)

04

unità

Obiettivi formativi

Comprendere le ricadute operative sulle politiche sociali e sanitarie di un approccio centrato sui diritti fondamentali di bambini e ragazzi e in particolare sui loro diritti di partecipazione

Quadro legislativo vs. politiche

Le politiche sono una componente essenziale del quadro ordinamentale di contrasto delle violenze sui minori: la presenza di una legislazione adeguata che vieti tali violenze NON è sufficiente!

"troppo spesso vediamo che leggi rimangono nei libri ma che molti bambini rimangono ai margini della società (…), grandemente esposti alle violenze e agli abusi"

(Rima Salah, Vice Direttrice Esecutiva, UNICEF, cit. in United Nations Secretary, *General's Study on Violence against Children,* 2006)

Le politiche sociali e sanitarie & i diritti di partecipazione

Bambini e ragazzi contribuiscono a determinare le politiche:

- partecipando attivamente ai processi decisionali sul loro specifico caso (es. mediante colloqui/lettere all'assistente sociale o al giudice responsabile del loro caso, partecipazione diretta a incontri in cui si prendono decisioni sul suo caso, presenza di un rappresentante speciale)
- partecipando come gruppo alla definizione delle priorità e delle azioni di contrasto alle violenze sui minori (es. istituzione di consigli consultivi di ragazzi, coinvolgimento di ragazzi nella formazione dei professionisti dei servizi per l'infanzia, coinvolgimento dei ragazzi in studi e ricerche sul funzionamento dei servizi all'infanzia)

Il contesto familiare

«Una famiglia in cui i bambini e gli adolescenti possono esprimere liberamente le proprie opinioni e in cui queste sono prese seriamente in considerazione… **gioca un ruolo di prevenzione di tutte le forme di violenza in casa e in famiglia**»

Programmi pubblici di educazione dei genitori che affrontino:

- la relazione di mutuo rispetto tra genitori e bambini;
- il coinvolgimento di bambini e ragazzi nei processi decisionali;
- le strategie per gestire opinioni conflittuali all'interno della famiglia

Fonte: Comitato sui diritti dell'infanzia, *Commento generale n.12*

ESEMPIO N. 1

A livello mondiale ed europeo esistono plurime iniziative di sensibilizzazione, **anche rivolte specificamente ai genitori**, volte ad affermare l'illegittimità di ogni punizione corporale delle persone di età minore

I minori «fuori famiglia»

devono essere «in grado di esprimere le proprie opinioni e … a queste sia dato il giusto peso, sulle questioni riguardanti il loro collocamento, le regole della cura nelle famiglie e case affidatarie e la loro vita quotidiana» (Comitato sui diritti dell'infanzia, *Commento generale n. 12*)

devono essere consultati in vista di decisioni che riguardino per esempio:

- la scelta dei tempi e del luogo del loro collocamento "fuori famiglia"
- i membri della famiglia con cui mantenere i contatti durante il collocamento extrafamiliare, la frequenza e le modalità di tali contatti
- i progetti sul loro futuro
- le revisioni periodiche sulla loro situazione (SOS, Children's Villages International/ISS, Guidelines for the Alternative Care of Children: A UN Framework, Geneva, 2009)

I minori «fuori famiglia»

Da un punto di vista generale occorrono:

- un organo di monitoraggio (quale il garante per l'infanzia) che deve poter accedere senza impedimenti alle strutture assistenziali per ascoltare direttamente le opinioni e preoccupazioni dei minori
- consigli rappresentativi dei bambini e ragazzi partecipano all'ideazione e attuazione delle politiche e regole della struttura in cui sono ospitati
- formazione dei professionisti alla partecipazione di bambini e adolescenti, anche coinvolgendo come formatori i minori stessi

Fonte: Comitato sui diritti dell'infanzia, *Commento generale n.12*

ESEMPIO N. 2

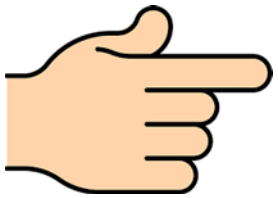
In alcuni Paesi europei si sono sviluppate reti informali di ragazzi ospiti ed ex-ospiti di comunità, case famiglia, famiglie affidatarie, coinvolti in un percorso di partecipazione e cittadinanza attiva con la finalità di:

- creare momenti di aggregazione, di confronto e arricchimento reciproco tra i partecipanti
- contribuire a migliorare le politiche relative all'accoglienza extrafamiliare e le azioni da intraprendere per sostenere i giovani durante la delicata fase di "uscita" dai sistemi di accoglienza.

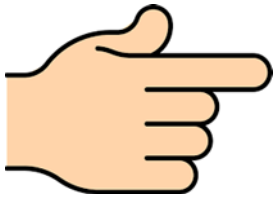
E' attualmente in fase di costituzione una rete europea, la *Care Leavers Europe*

Fonte: *http://www.agevolando.org/leavecare-livelife/*

Una delle preoccupazioni più ricorrenti dei ragazzi «fuori famiglia» è il futuro dopo il compimento della maggiore età, cui consegue – spesso – la cessazione della presa in carico (anche economica) da parte dello Stato



Per un'azione concreta di sensibilizzazione del Care Leavers Network italiano sulla difficoltà per i care leavers di rendersi autonomi alla maggiore età: si veda il video «18 anni e (non) sentirli»



Per un'azione concreta di un ombudsman: si veda il video dell'Ombudsman irlandese «Young person in residential care makes complaint to Ombudsman for Children»

Le cure sanitarie

Bambini e ragazzi devono sempre essere **coinvolti** nelle discussioni e decisioni relative alla loro salute

(Unicef- Save The Children, *Every child's right to be heard*, 2009)

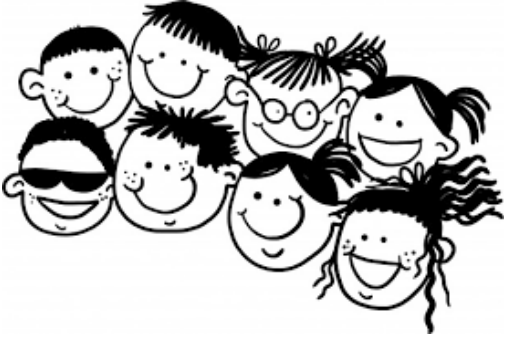
devono anzitutto ricevere **informazioni** adeguate, secondo l'età e la capacità di comprensione (art. 4 Carta di EACH, *European Association for Children in Hospital*)

carepath

Nelle situazioni di violenza domestica o in caso di conflitto con i genitori, bambini e ragazzi devono avere «accesso a **consulenze** e consigli medici confidenziali senza il consenso dei genitori, indipendentemente dalla loro età, laddove necessario per la loro sicurezza e il loro benessere» (Comitato sui diritti dell'infanzia, *Commento generale n.12*)

«Quando, secondo la legge, un minore non ha la capacità di dare **consenso** a un intervento, questo non può essere effettuato senza l'autorizzazione **del suo rappresentante**, di un'autorità o di una persona o di un organo designato dalla legge. Il **parere di un minore** è preso in considerazione come un fattore **sempre più determinante, in funzione della sua età e del suo grado di maturità**»

(art. 6 comma 2° Convenzione europea per la protezione dei diritti dell'uomo e la dignità dell'essere umano riguardo alle applicazioni della biologia e della medicina, cosiddetta «Convenzione di Oviedo»)



«La partecipazione del minore contribuisce non solo a promuovere il suo sano sviluppo e il suo benessere, ma anche a migliorare le politiche, i servizi sanitari e le prassi destinati all'infanzia e all'adolescenza» (Codice del diritto del minore alla salute e ai servizi sanitari, 2013)

Possibili strumenti includono:

- Sistemi di feedback da parte degli utenti
- Ricerche e consultazioni che abbiamo come destinatari e/o attori I minorenni
- Coinvolgimento di consigli/parlamenti di minori per lo sviluppo di standard e indicatori per servizi sanitari rispettosi dei diritti dell'infanzia
- Coinvolgimento di minori in ispezioni e monitoraggio [Unicef- Save The Children, *Every child's right to be heard*, 2009, p.98]

Le situazioni di violenza

Gli Stati dovrebbero:

- consultare bambini e adolescenti, con particolare attenzione ai gruppi svantaggiati e marginalizzati, per lo sviluppo e l'attuazione di misure legislative politiche, educative e altre per affrontare tutte le forme di violenza (Comitato sui diritti dell'infanzia, *Commento generale n.12*)
- stabilire per i minori che subiscono violenze un facile accesso agli individui o alle organizzazioni alle quali poter riferire in maniera sicura e confidenziale le proprie esperienze (Comitato sui diritti dell'infanzia, *Commento generale n.12*)
- istituire autorità indipendenti a garanzia dei diritti di tutti i minori e in particolare di quelli che abbiano subito violenze

ESEMPIO N. 3

Il video del Consiglio d'Europa "Tell someone you trust" affronta con un linguaggio e modalità adatti ai bambini il tema dell'abuso sessuale su minori **incoraggiando i bambini a denunciare le violenze subite**

ESEMPIO N. 4

The Italianaire è un video cartoon realizzato con la partecipazione di cinque ragazzi residenti in Italia e provenienti dall'Egitto, facilitati da *Save the Children*, finalizzato a **informare e sensibilizzare i minori egiziani** che vivono in tre governatorati ad alto tasso di emigrazione minorile in Egitto **circa le condizioni di vita in Italia dei minori migranti egiziani**

ESEMPIO N. 5

Il video del Consiglio d'Europa "Beat Bullying" mostra gli effetti del **bullismo** con un linguaggio e modalità adatti ai **bambini**, che vengono altresì incoraggiati ad assumere un **ruolo da protagonisti nel contrasto** dello stesso

«Il diritto di bambini e ragazzi di essere ascoltati può giocare un ruolo preventivo contro ogni forma di violenza a scuola, in famiglia, a scuola e in strutture assistenziali»

(European Network of Ombudspersons for Children (ENOC), *Position Statement on 'Violence against Children'*, 2015)

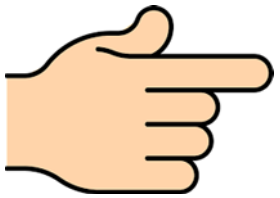
Gli adulti devono garantire la partecipazione del minore ai processi decisionali prendendo sempre tutte le precauzioni necessarie a ridurre il rischio di violenza o qualsiasi altra conseguenza negativa che possa derivare dalla partecipazione stessa

(Comitato sui diritti dell'infanzia, *Commento generale n.12*)

Conclusioni

Occorre un **approccio integrato** e in particolare:

- attenzione non solo al contrasto ma soprattutto alla **prevenzione** delle violenze contro i minori
- promozione di una **cultura di rispetto dei diritti di bambini e ragazzi**
- **formazione** specifica **dei professionisti** che operano a contatto con i minorenni sui temi della protezione e dei diritti di partecipazione
- **servizi** per l'infanzia e l'adolescenza creati e gestiti "**a misura di minore**"
- sportelli/linee di aiuto facilmente accessibili ai minori che subiscono violenze



Fonte: Council of Europe, *Policy Guidelines on Integrated National Strategies for the Protection of Children from Violence*, 2009. In senso analogo European Network of Ombudspersons for Children (ENOC), *Position Statement on 'Violence against Children"*, 2015.

«Bambini e ragazzi hanno una conoscenza privilegiata delle loro vite, dei loro bisogni e delle loro preoccupazioni, così come idee e opinioni che derivano dal loro proprio vissuto…. **Decisioni adottate dopo aver considerato il punto di vista fornito direttamente dai minorenni saranno più adeguate, più efficaci e più sostenibili»**

Preface

This Third Edition of the Practice Guidelines replaces the second edition published in 2009. Legislation, practice and technology have moved on since then and these changes are captured in the new guidance.

This edition of the guidelines was produced through the British Psychological Society's Professional Practice Board by a working group drawn from the range of Member Networks across The Society whose members are engaged in professional practice, as well as representatives from relevant expert reference groups of The Society, in particular areas of practice. Further information is available in ***Appendix 3: How this document has been developed.***

These Practice Guidelines aim to define good practice for all psychologists whether registered, chartered or in training and offer guidance for decision making. The Guidelines have been designed for broad application across the full range of applied psychology.

The first part of the guidance (sections 1–3) set out considerations for psychologists on different contexts of practice. The second part of the guidance (sections 4–8) sets out guidance for psychologists on how to manage work with clients.

It is recognised that in addition psychologists may require more detailed guidance for some particular roles and responsibilities or for particular situations in which they work. Further information is available in the ***Appendices***.

The Society expects that the guidelines will be used to form a basis for consideration, with the principles being taken into account in the process of decision-making, together with the needs of others and the specific circumstances. No guidance can replace the need for psychologists to use their own professional judgement. Effective practice means exercising this professional judgement in a defensible way that does not put clients or the public at risk, or undermine, or call into question the reputation of the profession as a whole.

The Guidelines will be reviewed in accordance with Society policy within a maximum period of five years in order to reflect current legislation, evidence and practice contexts. Psychologists using the Practice Guidelines should do so in conjunction with the ***BPS Code of Ethics and Conduct*** and the ***BPS Code of Human Research Ethics***, as necessary.

Glossary of terms

Client

The Society's *Code of Ethics and Conduct* uses the term person or people throughout, this is in recognition of the fact that the document is generic and may be used by all psychologists; academics, researchers, students and practitioners alike.

Throughout this Practice Guidelines document the term 'client' is used and refers to any person or persons with whom a psychologist interacts on a professional basis.

For example, the 'client' may be a couple, a family group, an educational institution, a community organisation or group or a private or public organisation including a court, an individual (sometimes referred to as, for example, athlete, child/young person, patient, prisoner, coachee, service user, stakeholder, leader, or student), who are in receipt of the services of the psychologist.

Psychologist

Throughout this Practice Guidelines document the term 'psychologist' is used and refers to all psychologists whether registered, chartered or in training who provide psychological services across the full range of applied psychology, in any context of practice.

1. How psychologists work

1.1 Legal and professional obligations of psychologists

Psychologists' professional practice is impacted upon and governed by a range of legislation and regulation. Particular psychological disciplines may also need to consider additional legislation, regulation and guidelines. It is the psychologist's responsibility to ensure they are aware of the legislation and guidelines that govern their particular area of practice as well as the terms of their employment or terms contracted with a commissioner of their services.

Psychologists are also advised to consider membership of a union or similar body to ensure they have access to appropriate representation, support and legal advice should they be subject to a complaint or disciplinary action, or require support for example with an employment grievance, which may be related to concerns over quality and standards of psychological service provision.

Further information is available in the ***Appendices***. Important examples to note are:

Health and Care Professions Council (HCPC) Registration

It is a statutory requirement for all psychologists wishing to practice using one of the titles protected by the HCPC to register with the HCPC. Unregistered psychologists offering services to the public in any of the domains regulated by the HCPC may commit an offence by doing so, even if they refrain from using protected titles, provided intent to deceive can be proved. The Society's position is that it is in the interests of both the public and the profession for all psychologists providing services in a regulated domain to be registered with the HCPC.

Professional competence

Psychologists should value the continuing development and maintenance of high standards of competence in their practice and the importance of working within the recognised limits of their knowledge, skill, training, education, and experience. Psychologists should consider advances in the evidence base, the need to maintain technical and practical skills and knowledge and the limits of their competence. This is stipulated in both the ***BPS Code of Ethics and Conduct*** and the ***HCPC Standards of Proficiency***.

Professional indemnity insurance

The UK Government has introduced legislation (The Health Care and Associated Professions (Indemnity Arrangements) Order 2014) which now makes it mandatory for health professionals to have a professional indemnity arrangement in place. The HCPC has made having such an arrangement in place a condition of registration.

This may be achieved either through the employer or through a privately arranged policy. An employer's insurance may provide cover only for a negligence claim but not for the costs of a disciplinary hearing. It is the psychologist's responsibility to check carefully that

they have cover in place that meets their personal/professional needs. Further information is available in the ***Society document: Career Support and Development***

Disclosure and Barring Service (DBS) Checks

Psychologists working in certain fields, for example with children or in healthcare, will need to demonstrate they have had a satisfactory criminal records check at the appropriate level for the nature of the work undertaken.

Applicants will be provided with a certificate to demonstrate this. Applicants cannot request a check personally, this can be requested by a psychologist's employer. For psychologists practising independently the Society offers this as a service to members. Further information is available on the ***Society Website: https://beta.bps.org.uk/Practice-Guidelines***

Equality Act 2010

This Act protects people against unfair treatment, promotes equality and prevents discrimination against any of nine protected characteristics: age, disability, gender reassignment, marriage and civil partnership, pregnancy and maternity, race, religion and belief, sex, and sexual orientation. Respect is a core ethical value for psychologists and a commitment to equality of opportunity is embedded in all aspects of psychological practice. Psychologists, where they operate in an organisational context, must also seek to encourage and influence others in ensuring that equality of opportunity is embedded in all thinking and all practice relating to access to services for client groups and recruitment and employment practices.

Providers of service to the public must also make reasonable adjustments for people who have a disability under the Act. This requirement is anticipatory so requires consideration, and adjustment where reasonable, of any barriers which may prevent a person with a disability from using a service.

Data Protection Act 1998

The Data Protection Act defines personal and sensitive personal data, and data must be processed in accordance with eight principles. It gives individuals the right to know what information is held about them and provides a framework to ensure that personal information is handled properly.

Good information governance is at the heart of safe practice. It encompasses physical data security, access controls and acceptable use, data quality, and records management, among other things. Psychologists must have appropriate security to prevent any personal data held from being accidentally or deliberately compromised. In most circumstances, independent practitioners will also need to register as a data controller with the Information Commissioner's Office.

Further information is available in ***Section 7.1: Information governance, Appendix 1: Relevant legislation*** and ***Society Document: Data Protection Act 1998 – Guidelines for Psychologists.***

Freedom of Information Act 2000

The Freedom of Information Act 2000 provides public access to information held by public authorities. Public authorities include government departments, local authorities, the NHS, State schools and police forces.

It does this in two ways:

- public authorities are obliged to publish certain information about their activities; and
- members of the public are entitled to request information from public authorities.

The Act covers any recorded information that is held by a public authority in England, Wales and Northern Ireland, and by UK-wide public authorities based in Scotland. Information held by Scottish public authorities is covered by Scotland's own Freedom of Information (Scotland) Act 2002.

This legislation permits information to be withheld from disclosure in certain prescribed circumstances, for example information provided in confidence, related to law enforcement or where it relates to personal matters.

Health and Safety at Work Act 1974

This Act places a duty on all employers 'to ensure, so far as is reasonably practicable, the health, safety and welfare at work' (Part 1, Section 2.1) of all their employees. Employees themselves also have obligations under the legislation.

Working together to safeguard children guidance

The Government website provides statutory guidance on inter-agency working to safeguard and promote the welfare of children. Statutory guidance is issued by law; it must be followed unless there is a good reason not to. All organisations, including charities, are expected to comply with this government inter-agency statutory guidance. Psychologists have a duty of care to both their clients and the public. Any allegations of abuse, either ongoing or historic, must be taken seriously and consideration must be given about breaking confidentiality especially in cases where other vulnerable people may be at risk. Further information is available in ***Section 4: Safeguarding***.

Mental Capacity Act 2005

The Mental Capacity Act (2005) provides a clear and comprehensive framework with regard to capacity and consent for all individuals aged 16 years and above in England and Wales.

There are five key principles set out in the Act which underpin practice (quoted from legislative source):

(i) A person must be assumed to have capacity unless it is established that he lacks capacity.

(ii) A person is not to be treated as unable to make a decision unless all practicable steps to help him to do so have been taken without success.

(iii) A person is not to be treated as unable to make a decision merely because he makes an unwise decision.

(iv) An act done, or decision made, under this Act for or on behalf of a person who lacks capacity must be done, or made, in his best interests.
(v) Before the act is done, or the decision is made, regard must be had to whether the purpose for which it is needed can be as effectively achieved in a way that is less restrictive of the person's rights and freedom of action.

In Scotland the Adults with Incapacity (Scotland) Act 2000 applies and in Northern Ireland the Mental Capacity Act (Northern Ireland) 2016 is used.

Mental Health Act 1983 as amended 2007

The main purpose of the Mental Health Act 1983 as amended 2007 (MHA) is to allow compulsory action to be taken, where necessary, to ensure that people with mental disorders receive the care and treatment they require for their own health or safety, or for the protection of other people.

The Act sets out the criteria that must be met before compulsory measures can be taken, along with protections and safeguards for patients. The Code of Practice[1] provides statutory guidance for mental health professionals on how they should carry out their responsibilities in practice under the MHA. Although the Act allows for people to be compulsorily detained and treated without their consent if required, empowerment and involvement of patients as far as is possible is required by the Code of Practice.

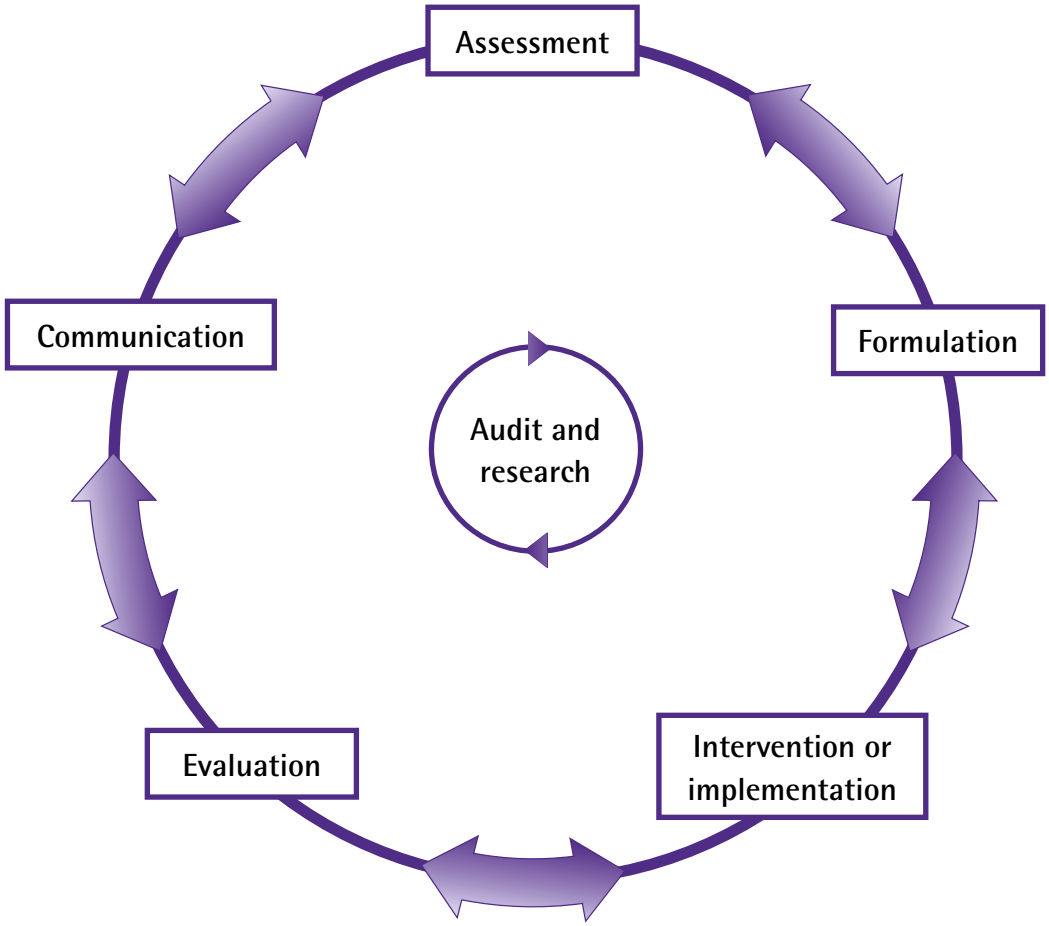
Those involved in working with people subject to provisions of the MHA, including psychologists, must understand and give consideration to the five key principles set out in the Code:
(i) least restrictive option and maximising independence;
(ii) empowerment and involvement;
(iii) respect and dignity;
(iv) purpose and effectiveness; and
(v) efficiency and equity.

1.2 Cycle of professional practice

The professional practice of psychologists is underpinned by four key ethical values – Respect, Competence, Responsibility and Integrity – and five core skills:

- **assessment** and establishment of agreements with the client;
- **formulation** of client needs and problems;
- **intervention or implementation** of solutions;
- **evaluation** of outcomes; and
- **communication** through reporting and reflecting on outcomes.

These core competencies flow and inform each other as illustrated below.



Assessment and establishment of agreements with the client

Assessment of psychological processes and behaviour is derived from the theory and practice of both academic and applied psychology. It includes both assessing change and stability, and comparison with others. Assessment procedures used will depend heavily on the practice context and may include:

- the development and use of psychometric tests following best practice;
- the application of systematic observation and measurement of behaviour in a range of contexts and settings;
- devising structured assessment strategies for individual clients, teams and organisations; and
- the use of a range of interview processes with clients, carers, other stakeholders and other professionals.

Results of these assessments are integrated within the context of the historical, dynamic and developmental processes that will have shaped the client as well as future aspirations or needs. Psychologists have the ability to assess the suitability of different measurement procedures, depending on the purpose for which the assessment is needed, as well as being competent to devise and use context-specific procedures.

Formulation of client needs and problems

Formulation is the summation and integration of the knowledge that is acquired by the assessment process. This will draw on psychological theory and research to provide a framework for describing a client's needs. Because of their particular training in the relationship of theory to practice, psychologists will be able to draw on a number of models to meet needs or support decision-making. This process provides the foundation from which actions derive. What makes this activity unique to psychologists is the knowledge base, experience and information on which they draw. The ability to access, review, critically evaluate, analyse and synthesise data and knowledge from a psychological perspective is one that is distinct to psychologists, both academic and applied.

Intervention or implementation of solutions

This will be the stage where the client's needs, as described by formulation, begin to be met. This may involve the use of psychological models or approaches to, for example, facilitate change, solve a problem or improve the quality of a relationship. All these interventions, or implementation of solutions, are tests of the provisional hypotheses contained in the formulation, and are subject to repeated modification in the light of experience and new data.

Evaluation of and reflecting on outcomes

Evaluation is used to measure the effectiveness of activities and interventions both during and after their implementation. The results of any evaluation and reflection will impact the next steps taken by a psychologist.

Although employers and others may demand certainty about outcomes, psychologists should always be careful to make it clear that they are able to provide only interpretations of behaviour, and advice and guidance, rather than necessarily predicting future behaviours.

Communication through reporting

Communication skills are integral to all aspects of a psychologist's role. Effective communication skills are essential in relation to all aspects of work with others. Communication skills include communication with clients, all forms of electronic and verbal communication, professional letters and reports, and the dissemination of research findings.

Audit and research

Audit and research underpin the cycle, as they help to inform all stages of professional practice.

Audit aims to evaluate how close assessment, formulation, intervention and implementation are against a set of previously given standards of practice. Audit also evaluates how protocols and procedures, for example related to consent or recording of activity, have been followed.

Research provides the evidence base for the practice of psychology. Research methods in psychology vary from qualitative observation to quantitative scientific method, so it is important to distinguish the nature and quality of the evidence underpinning any knowledge or techniques being applied. In general, basic research develops theories, models and data to describe and explain psychological processes and structures, while primary research develops and evaluates ways of using psychological knowledge to intervene with people, organisations, processes or technologies to achieve desired effects. Secondary research consolidates other research to identify higher order trends and directions.

1.3 Reflective practice

One of the key processes that should be encouraged for psychologists is having a complex understanding of self in the context of others. The HCPC requires reflection in the record of continued professional development in order to retain continued registration.

Psychologists will need to make decisions about clients which may have a profound impact on their lives. Decision-making is often subject to various competing biases. Psychologists should be aware of the possibility that they may be influenced by considerations which are not driven by professional knowledge, skills or experience. Maintaining awareness of these biases is important when trying to think through dilemmas.

Sources of influence and bias may include:

- **Cognitive Biases –** Over 150 have been described[2,3,4] including salience (how readily something comes to mind), confirmation bias (the human tendency to look for evidence that confirms their belief and to ignore other evidence), loss aversion (risky behaviour to avoid loss), beliefs about disclosure (tendency to be more honest when they believe their actions will be known by others), and dissonance reduction (justifying actions if consequences are considered worth it).
- **Personal Experience –** the experience of the psychologist may affect how they view or treat a client or situation. This may include current or historical trauma, or the kind of organisation and culture with which they are most familiar. Interventions which may be appropriate in one context may be ineffective and cause distress in another.
- **Motivation –** the original reasons for undertaking the profession may change or be challenged due to fatigue or experience within the profession which may affect the psychologist's viewpoint.
- **Health –** psychologists should be mindful of the potential effect of health conditions or medications which they may be taking, on their practice.
- **Control over the psychologist's own practice –** this refers to clarity and openness in the management of the psychologist's business and maintaining the professional's autonomy in their interactions with clients.
- **Pro bono public work –** psychologists are encouraged, and personally motivated to

engage with such work, while being mindful of impact on the value that is placed on the profession as a whole.

- **An unethical environment –** maintaining self-recognition of what the appropriate ethical standard should be, irrespective of the prevailing situation.
- **Environment –** political realities may lead the psychologist to make compromises; while there is nothing wrong with compromises, their constant use may mean a decline in overall standards.

The literature is generally pessimistic about the ability of practitioners to overcome some of these biases, considering them to be inherent in human thinking patterns. By being aware of and acknowledging them, it can be possible to manage their influence. For example, biases can be levelled out by presenting information in different ways, by engaging the perspectives of people with different experiences and expectations, or by priming thinking with different examples.

A key factor in developing and maintaining these skills is the use of consultation or supervision and having a space where it is possible to open up thinking to the mind of another with a view to extending knowledge about the self.

It is important that psychologists from all disciplines look after their own wellbeing. This is not only important for them as individuals, but also for the quality of the care they give their clients. In their practice and, for example, within their CPD plans and supervision psychologists should consider self-care and how they can maintain their own wellbeing.

It is also important for psychologists to evaluate effectiveness of practice, by welcoming feedback from clients. This can be difficult due to fears of criticism but reflective practitioners are eager to improve and welcome any feedback that will support this process.

1.4 Continuing professional development

Continuing professional development (CPD) is the professional and work-related aspect of lifelong learning. It is an integral part of the process of adapting to change, and essential for maintaining and enhancing professionalism and competence. The Society provides an online facility to record CPD, further information is available on the ***Society website: http://beta.bps.org.uk/Practice-Guidelines***.

- CPD is both a professional expectation and an individual responsibility to taking a structured and self-managed approach to further learning through:
  - actively engaging in a range of CPD
  - maintaining a record of CPD
  - applying learning from CPD to professional practice.
- There is a range of formal and informal learning activities that may be used for CPD and it is recommended that psychologists engage in a mix of CPD activities.
- Professional development is not purely about inputs (i.e. undertaking CPD activities); it also requires a reflective, outcomes-based approach which focuses on the learning gained from CPD and its application to current or future practice, together with the associated benefits for clients and the services provided.

- All members who are registered with the HCPC are required to comply with their CPD requirements as a condition of continued professional registration. Further information is available in ***Appendix 2: Websites and further information***

Mentoring

Psychologists may seek a mentoring relationship with colleagues in order to focus their attention on skills to add to their competencies. Psychologists taking on the role of mentor often support the psychologist with their career path. Early career psychologists may find it beneficial to be mentored by a more experienced psychologist.

1.5 Consultation/supervision

Consultation or supervision is considered an essential part of good practice as a psychologist. There is no legal requirement for supervision, although it is considered an ethical and professional expectation to engage in appropriate consultation in order to support effective practice. Provision of this is therefore an important underpinning to good quality service delivery. The Society's position is, for safe and effective practice in clinical and mental health settings, or with other vulnerable groups, supervision is a requirement of practice.

The objectives of consultation/supervision are:

- to provide practitioners with consultation on their work with clients;
- to enhance the quality and competence of practice offered to all clients;
- to offer psychologists intellectual challenge enabling reflection, transformational learning and psychological support to maximise their responsibility for appropriate self-care; and
- to contribute to the CPD of both psychologist and supervisor by developing competence in the use and practise of supervision.

All aspects of practice are appropriate for discussion in supervision, including research activity, administrative and managerial work, service developments, team working, teaching and the process of supervising others. Supervision is not personal therapy and nor is it a form of, or substitute for, line management or appropriate training.

For psychologists working in a wide range of settings such as therapeutic and organisational settings, supervision is a core component of the psychologist's CPD. For some areas of practice, the nature of supervision changes over time. This may be unique to each psychologist and the context of their application. Expectations should be agreed from the outset and reviewed at appropriate intervals.

Forms of consultation/supervision

Supervision may take the form of clinical supervision, mentoring, coaching, supervision on placement/work setting, tutorials and peer support. Psychologists may engage in one to one supervision; group supervision (facilitated or non-facilitated) or peer supervision and any of these may be face to face or virtual. Whilst it should not be a substitute for line management, a psychologist's supervisor may also be their line manager.

Those working in independent practice, or in the absence of service-based supervision, should seek supervision from appropriately qualified and experienced personnel as appropriate. Peer supervision (individual or group) may be an appropriate way to find collegial support.

Psychologists may select different supervisors, depending on their preferred supervisory style, nature, orientation and their needs at the time. Particularly for experienced psychologists, this may be from an experienced colleague from outside their profession, professional specialty or organisation. Psychologists could also invite supervision from experts by experience for whom they provide services, where appropriate to the context of practice.

The Society maintains the Register of Applied Psychology Practice Supervisors (RAPPS), which recognises psychologists with special expertise in supervision and supervisory practice. Further information is available on the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines***.

Amount of supervision

While there is a specified number of supervision sessions for trainees (e.g. for their Chartered status) which varies across different sub-disciplines of psychology, no definitive amount of supervision is specified as part of CPD. To determine both the quantity and nature of the supervision, the psychologist may consider their need for supervision from various perspectives: their own assessment of need, the competencies required for their practice; the context of their work; organisational requirements; and the support available. For psychologists in employment the arrangements for consultation/supervision should be agreed after considering these factors in consultation with the employer.

Roles and responsibilities of the supervisor

Psychologists undertaking supervision should ensure that they are sufficiently experienced, competent and appropriately trained to provide supervision. Psychologists are often called upon to supervise non-psychologists, in which case these guidelines would also apply.

In supervision, the psychologist as supervisor needs be aware of their own competence in relation to the work of the psychologist and, where necessary, recommend additional supervisors who may have the appropriate level of expertise. Psychologists may offer consultancy supervision to professional colleagues, organisations and stakeholders in line with their competencies.

Psychologists should avoid personal relationships between the supervisor and psychologist which could adversely affect integrity and objectivity.

Psychologists providing consultation/supervision should do so in line with the guidance in other relevant sections of these Practice Guidelines.

Issues of power and control

The nature of supervision itself creates a power imbalance, even between peers. Both the person providing supervision and the person receiving it need to be aware of this.

The supervisory leadership relationship should be both informative and reflective. Psychologists in leadership roles as supervisors should provide regular, informative feedback to the psychologist as well as motivating them to reflect on their own practice, continue to self-assess and improve self-awareness.

1.6 Leadership

Psychologists at any stage of their career are likely to find themselves in a position where they are required to demonstrate or model leadership. This may be an integral part of their practitioner work or may arise through being a leader of a team, including leading in Society work. Leadership is widely quoted and described in the context of leading change as, *'accepting responsibility to create conditions that enable others to achieve shared purpose in the face of uncertainty'*[5]. Furthermore, leaders 'can create conditions interpersonally, structurally, and/or procedurally'[6]. These descriptors highlight the often complex process of psychological change through clinical intervention and also through leading others.

Contemporary leadership styles are generally more aligned to working *within* a team or a system rather than being directive. Leading as a psychologist is likely to include dealing with highly complex information and systems whatever the context. Leading in this way demands high levels of skill in developing, managing and maintaining professional relationships. This may include communicating complex and sensitive information, and reflexivity to enable individuals and teams to co-formulate around difficulty and challenge.

2. Where psychologists work

2.1 Working environment

When undertaking work with clients, psychologists need to give consideration to providing an environment which is welcoming, accessible, safe, and offers privacy. Although choice of workspace is not always available, it is important wherever work takes place with clients that psychologists consider:

- whether lighting, acoustics, heating and seating are comfortable;
- whether confidential conversations may be audible to others;
- whether there are arrangements to ensure client and practitioner safety, for example through easy access to another member of staff if a difficulty arises;
- whether access and exits are safe, well-lit and in areas which are likely to be overseen;
- that reasonable adjustments can be made to support effects of special needs and/or disability;
- whether the setting is culturally acceptable to clients; and
- whether there are facilities and equipment suitable for the clients, for example lavatories, play materials for children.

Where context of practice allows, psychologists could seek the assistance of relevant workplace representatives, for example their trade union representative or human resources staff, in situations where appropriate workplace conditions are not being provided. However, it is acknowledged that sometimes the ideal workspace may not be available or that psychologists may not have access to these workplace representatives due to their context of practice and psychologists should, within the limits of safe practice, be able to adapt to situations within local constraints in order to provide the best service for clients.

Sometimes, it is important to work with clients in representative environments in order to understand behavioural drivers. This will apply if the psychologist's task is to understand behaviours in such environments and provide support, for example through the use of technology, design of procedures, training or team design. Psychologists should consider carefully how to create representative conditions without causing harm. Equally it may sometimes be necessary for psychologists to work in a client's own context as that is where any intervention may be formulated or put in place. Psychologists should ensure they follow the relevant health and safety guidelines in place at their working location even if that location is not their usual place of work.

There may be a temptation to make assumptions about what sort of environment is most suitable, comfortable and culturally appropriate for clients, however it is helpful to ask them and endeavour to make appropriate adjustments to meet their needs.

Lone working

Many psychologists practise in a lone worker workplace and on occasion visit clients in their own homes. When working at home, it is necessary to ensure the proper insurance

and protocols for this type of work, as well as manage boundaries between personal and private space. When working alone, the Suzy Lamplugh Trust recommends always ensuring that someone else has access to schedules and contact details for clients. Psychologists may also want to put in place a 'code word call', where should they fail to answer or speak the correct code word, the police are alerted. This is just an example of an additional safety practice, and there may be different ideas for ensuring personal safety when lone working. However, the important point is to think about keeping safe, have a plan and stick to it. Further information is available in ***Appendix 2: Websites and further information.***

Harassment and bullying

Bullying is behaviour that may take the form of actions or comments that are offensive, which are intended to humiliate, undermine, demean or injure the recipient. It may target an individual or group of individuals and is a form or abuse that may be explicit and therefore obvious, or it may be insidious, an experience recognised only by the recipient and harder to notice by others. Bullying may be vertical (i.e. between managers/supervisors and staff) or horizontal (i.e. between colleagues). Clients may also experience bullying by professionals. While bullying may involve a misuse of power and be committed in the workplace by a manager, supervisor or senior colleagues (sometimes known as downwards bullying), it should be borne in mind that it is not uncommon for senior staff to be bullied by those whose work they oversee.[7] What can be legitimately classified as bullying may take into account the particular personal sensitivities and characteristics of the person suffering the alleged bullying.

Harassment can be defined as actions or comments that are unwanted and which may be related to age, disability, gender reassignment, race, sex, sexual orientation, religion or belief or any other personal characteristic of the recipient. Harassment occurs when someone engages in unwanted conduct in relation to the aforementioned characteristics and that conduct has the purpose or effect of violating the other person's dignity or creating an intimidating, hostile, degrading, humiliating or offensive environment for the other person.

The Society is a charity and bound by its objects which do not include providing direct assistance to individual psychologists in these situations by offering advice. Psychologists with concerns over the above behaviour should seek the support of their supervisor, line manager or other appropriate senior staff member, accredited trade union workplace representative or human resources department. Further information is available in ***Appendix 2: Websites and further information.***

Whistleblowing

Whistleblowing is the disclosure of wrong doing (beyond normal managerial channels) and is important as it is a critical way not only of seeking justice for the individual or individuals affected, but also of developing inside information within organisations about incorrect or unfair practices,[8] thereby increasing the evidence required for corrective action to take place.

A whistle-blower is protected by law (the Public Interest (Disclosure) Act 1998) if:

1. They are a worker (this includes trainees and can include self-employed personnel servicing an organisation in certain circumstances).
2. They are acting in the public interest.
3. The disclosure relates to past, present or likely future wrongdoing which involves one or more of the following:
    - criminal offences (which may include fraudulent actions);
    - a person has failed, is failing or is likely to fail to comply with any legal obligation to which he is subject;
    - a miscarriage of justice has occurred, is occurring or is likely to occur;
    - the health or safety of any individual has been, is being or is likely to be endangered;
    - the environment has been, is being or is likely to be damaged; or
    - information tending to show any matter falling within any one of the preceding paragraphs has been, is being or is likely to be deliberately concealed.

If the individual has been victimised or if they have lost their job due to whistleblowing, the legislation provides them with the right to take a case to an employment tribunal. Whistleblowing is a complex legal area and it is important that anyone considering it considers appropriate advice, for example from an accredited trade union workplace representative or helpline. The relevant human resources department which will have a policy relating to this, or it may be appropriate to seek formal legal advice. Some organisations such as NHS Trusts have a nominated Director responsible for dealing with disclosure issues who may be contacted directly. The Society is a charity and bound by its objects which do not include providing direct assistance to individual psychologists in these situations by offering advice. Further information is available in ***Appendix 2: Websites and further information.***

Psychologists can inform on all aspects of the establishment of workplace cultural norms that promote positive managerial and leadership behaviour and can help facilitate the development of cultures that support the disclosure of inappropriate practices. Psychologists are also appropriately qualified to support workers who have been subject to bullying or harassment or who are contemplating or indeed have already 'blown the whistle'. Whistleblowing, and even the prospect of such, can create traumatic responses in workers[9] and can lead to retaliation as a consequence. Empirical evidence highlights the link between whistleblowing and the devastating effects on health that may follow, such as depression, anxiety and symptoms relating to post-traumatic stress[10]. Psychologists are able to work with affected employees and in a consultative capacity with organisations to manage work-related stress disorders caused by these incidents of bullying, harassment and whistleblowing to lessen the risk of absenteeism and to facilitate a return to work following a period of absence. Further information is available in ***Section 8: How to respond when things go wrong.***

2.2 Working in the digital age

Digital media continues to advance in terms of choice and functionality. It is becoming increasingly common for psychologists in particular when working with clients to make use of the internet and/audio-visual technology. These technologies require the psychologist to ensure that the network used is as secure as reasonably possible and, as far as is feasible, assures privacy to their clients.

There can be no guarantee of security when using the internet, and voice over internet protocol (VOIP) services such as 'Skype' or 'FaceTime' are no different, as they use the same data infrastructure as the rest of the internet.

Most, if not all, VOIP systems encrypt the voice into waveforms during digital transit across the internet, and it would be impossible to eavesdrop on these data packets in real time. However, the information is potentially vulnerable to eavesdropping/compromise before encryption by the speaker's system, and after decryption by the listener's system. This will depend upon the security measures in place for the end user's (speaker and listener) own networking infrastructures, be that a company, institution or home user. If an end user's computer has been compromised by any form of malware, then there will be a risk of eavesdropping, data theft and/or denial of service.

The risk for eavesdropping on VOIP systems is no more or less than that of traditional analogue phone systems, and both would require specialist knowledge, equipment and software to be achieved. However, it is recommended that only fit-for-purpose VOIP systems are used, and that public networks, such as Social Media sites, are avoided for VOIP communications. Further information is available on the ***Society website: http://beta.bps.org.uk/Practice-Guidelines***.

Some employers may have their own rules about which media are acceptable to use. The USA has the Health Insurance Portability and Accountability Act (HIPAA) which sets standards for security for electronic data. There is no such provision in the UK to date, and so psychologists must satisfy themselves that any media used to communicate personal data is secure. This is a rapidly changing area and so technology-specific guidance has not been provided in this document. Further information is available in ***Section 7.1: Information governance*** and ***Appendix 2: Websites and further information.***

The use of online 'Apps', computer assisted decision-making and artificial intelligence in psychological practice and research is evolving rapidly. When recommending or using computerised systems psychologists should pay due regard to peoples' health, wellbeing and safety being mindful of Clinical Safety Evaluations, Medical Device Evaluations and other relevant guidance such as NICE.

Use of social media

Many psychologists are using social media, networking sites or blogs to communicate with friends, family, professionals, colleagues and clients. This specific guidance therefore addresses the use of social media by psychologists, and provides practical advice for using them responsibly. Further information is available in ***Appendix 2: Websites and further information.***

Psychologists should:

- Remember that social networking sites are generally public and permanent. Once something is posted online, it remains traceable even if it is later deleted.
- Keep their professional and personal life as separate as possible. This may be best achieved by having separate accounts for work-related communications to those for friends/family.
- Consider whether, in their context of practice, it is appropriate to accept 'friend' requests from current or past clients, if necessary, decline the request via more formal means of communication. It is highly unlikely to be appropriate to accept in a clinical or forensic context.
- Be minded to act responsibly at all times and uphold the reputation of the profession, whether identified as a psychologist or not on the social media platform.
- Be aware that social networking sites may update their services and that privacy settings can be reset to a default that deletes personalised settings.
- Remember that images posted online by family or friends may be accessible, as they may not have set privacy settings as tightly.
- Be minded that social networking sites can make it easier to engage (intentionally or unintentionally) in professional misconduct.
- Report the misconduct of other psychologists on such social networking sites to any relevant parties (such as the employer or the HCPC).
- Be aware of their employer's social media policy.

Psychologists should not:

- Establish inappropriate relationships with clients online.
- Discuss work-related or confidential issues online in any non-secure medium.
- Publish pictures of clients online, where they are classified as clinical records.
- Use social networking sites for whistle-blowing or raising concerns.
- Post defamatory comments about individuals or institutions. Defamation law can apply to any comments posted on the web, irrespective of whether they are made in a personal or professional capacity.

2.3 Working for the court

Psychologists may be asked to act as professional or expert witnesses in court. The main difference between an expert witness and an ordinary witness (i.e. a witness to fact), is that the former are able to give an opinion, whereas ordinary witnesses can give only factual evidence. A professional witnesses' remit can cross the boundary of both fact and opinion.

Psychologists are responsible for ensuring they are sufficiently competent and expert in offering an opinion. It is not appropriate for trainee or assistant psychologists to act as expert witnesses. Indications of competence in respect of the knowledge required by the court, and expertise within a specialised field, may include:

- qualifications and/or degree(s) in the areas(s) in question;
- a number of years of post-doctoral/post-qualification experience;
- academic, professional and scientific publications in relevant areas;
- demonstrations of professional practice, competence, specialist knowledge and expertise with a bearing upon the issues in the case; and

- current experience in applying psychology in the area of claimed expertise.

It follows that a psychologist with trainee or assistant status is unlikely to have the necessary experience and qualifications to be retained as an expert witness by a legal firm. However, trainees or assistants who have written reports on individuals in the course of their employment may be required to give evidence (for example, at a tribunal). If so, they should bear in mind that only qualified psychologists should give evidence of opinion, and that their supervisor is responsible for the professional quality of their work in this situation as in all others.

Psychologists instructed as experts need to ensure that they can provide an independent and impartial opinion, and that their independence is clear to all. Any potential conflicts of interest should be made explicit and should be reported as soon as they arise. This can extend to being asked to provide an expert report on someone the psychologist is providing with therapy as an 'Applicant', 'Claimant' or 'Complainer'. This dual relationship is an unacceptable conflict.

When lawyers seek to introduce expert psychological evidence, it is the judge in the case who decides whether an individual has the requisite expertise to give evidence with the potential to be relevant to the case. The judge also decides whether what the expert asserts is relevant and, therefore, admissible in law.

Expert evidence in civil court proceedings is governed by Part 35 of the Civil Procedure Rules 1998, and its associated practice direction. This rule makes clear that an expert's overriding duty is to help the court on matters within their expertise and that this duty overrides the expert's duty to the person from whom they are receiving instructions. Any report must be written in accordance with the criteria in Practice Direction 35.

Further information is available in ***Society documents: Psychologists as Expert Witnesses: Guidelines and Procedure*** and ***Psychologists as Expert Witnesses in the Family courts in England and Wales.***

2.4 Working for defence and security organisations

Psychologists may work with defence and security interests in many different capacities. This may include supporting military or security personnel to perform their roles through the development of skills and behaviours, supporting the mental health and wellbeing of people affected by threats, activities and events in this context, and offering advice and consultancy. It is also UK Defence practice to enlist uniformed psychologists for roles associated with psychology. However, in general, psychologists in defence will be in a civilian role and therefore not under military command.

While there is a strong sense of common culture within the defence and security sectors, there are also important variations. For example, each of the armed forces has its own organisational culture resulting in different attitudes and behaviours. There are also differences within different sectors of each organisation. All these differences are very important to the individuals concerned, forming a large part of their sense of identity.

Psychologists working with these populations should ensure they investigate and acknowledge cultural differences, particularly when working with other national cultures. They should also take careful account of the environments in which people are living and working. Psychologists can be working with civilians and/or members of the armed forces who are operating in life threatening environments and are required to make decisions under extraordinary pressure. It is usually invalid to extrapolate from behaviour in benign conditions to behaviour under threat, hardship and stress.

3. Who psychologists work with

3.1 Working with Experts by Experience

In relevant services it is best practice for psychologists to work collaboratively with clients and Experts by Experience in developing and delivering all aspects of psychological services. In mental health, the Government is committed to shared decision-making and the principle 'no decision about me without me'[11]. This applies from work with an individual client through to changes in government policy relevant to the services provided by psychologists. Psychologists should develop services, policies and guidelines in collaboration with the people who use their services.

In professional practice it is important and helpful to work collaboratively with clients and, where relevant, others in order to ensure that the application of psychological research and theory is understood by and adapted appropriately to the client group and context, which may differ from the populations on which the research was based.

3.2 Working with assistants/interns

Many graduate psychologists take up assistant psychologist positions on either a paid or an unpaid basis.

The following (non-exhaustive) list provides examples of activities which can be carried out by assistant psychologists/interns. This list can guide those who are working as assistant psychologists/interns to request or refuse a task or assignment, as well as assist those who are practising and supervising to observe boundaries and limitations:

- research, audit and service evaluation;
- literature searches, developing and maintaining training packs, information leaflets, libraries of equipment, and other tasks necessary to the efficient running of the service;
- assessment of individuals and groups, for example, direct observations, formal psychometric testing, semi-structured interviews, and writing appropriate reports;
- delivery of interventions with individuals, groups and organisations;
- undertaking supportive work with carers, family members, employers, human resources professionals, team members, health staff and other professionals;
- delivering training for other professionals (if and when competent to do so); or
- promoting applied psychology services by providing relevant information to referrers, commissioners and others.

An assistant psychologist/intern should not be employed to:

- substitute for qualified applied psychologists; or
- undertake solely administrative or clerical duties for which a clerical assistant should be employed.

In occupational settings, the issue of appropriate supervision and guidance is of particular importance when the needs of individuals and organisational demands need to be balanced. Appropriate mechanisms need to be in place to ensure that no assistant psychologist/intern is, for instance, put in a position where they have to design or decide on any materials or processes which could have a potential harmful impact on individuals or groups or to an organisation (such as potential loss of profit or revenue).

In clinical and forensic settings, there are some additional limitations, related to the clear delineation between qualified and assistant psychologist/intern, as follows:

- An assistant psychologist should carry out only prescribed interventions with individuals or in groups, and should write reports only when under close supervision of the primary, qualified psychologist. Any report should be signed as having been written 'under the supervision of' followed by the name, registration status and job title of the qualified psychologist.
- When an assistant psychologist is called to give evidence in a legal setting, such as a tribunal, the qualified psychologist remains responsible for the professional quality of the assistant's work. This means the qualified psychologist should attend the hearing also, as there may be questions which an assistant cannot answer. Both should bear in mind that an assistant is not qualified to give evidence of opinion.
- An assistant psychologist should not undertake tasks in areas where there is not a competent supervisor.
- An assistant psychologist should not carry out the duties of a care assistant.

The managing or supervising psychologist has a responsibility to ensure that assistant psychologists are not given work to do that is over and above their level of competence. Further information is available in ***Society Document: Applied practitioner psychologist internship programmes and unpaid voluntary assistant psychologist posts.***

3.3 Working with trainee psychologists

The Society's standards related to working with trainees across the domains of applied psychology are set out in the Standards for accreditation of training programmes. These set out: the required core competencies that trainees need to develop, the curriculum and assessment requirements that programme providers need to deliver against, and the requirements of supervised practice; expectations around trainees' understanding of and ability to work ethically and legally; selection and recruitment of trainees; personal and professional development of trainees whilst in training; academic staffing and leadership for accredited programmes; and expectations in relation to quality management. Psychologists working with trainees as practice educators should familiarise themselves with these standards and adhere to them in their work with trainees. Further information is available on the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines.***

3.4 Working with multiple clients

Psychologists will sometimes be in situations where their client will not be one clear individual or group, for example, a psychologist may be employed by an organisation to

provide assessment or psychological support for employees. Psychologists need to consider and be mindful of the demands that this might place on their ethical practice and how this might lead to conflicts of interest.

Identification of the following client hierarchy may be considered[12],[13]:

- Primary client – the person or persons with whom the psychologist is interacting directly: the recipient of a psychological service.
- Commissioning stakeholders – the organisation or overall commissioning body that has sought the psychologist.
- Others affected by the primary client's actions – the customers of the organisation or service, or the personal acquaintances, friends and family of the primary client. In some circumstances, this will be the general public or larger groups interested in the outcomes of the intervention.

The psychologist's role will be mainly to the primary client and then the commissioning stakeholder. It is paramount that issues around boundaries and sharing of information are made explicit and addressed appropriately through a clear contracting agreement. Further information is available in ***Section 3.5: Working with other professionals***, ***Section 5: Making and maintaining agreements*** and ***Section 7: Managing data and confidentiality.***

Within each of the levels of the hierarchy, varying allegiances to associates (friends, family, acquaintances, colleagues) will need to be attended to, as will consideration of the impact of professional activity on the reputation of the profession and all those concerned.

3.5 Working with other professionals (including in multi-agency settings)

In order to meet the complex needs of clients fully, psychologists will often be required to work collaboratively with other professionals from their own or other agencies.

Such collaborative working will be for the benefit of clients and/or the promotion of the safety and protection of the public or the benefit of the organisation, and is required by national policy and legislation in a number of areas in which psychologists work. Engaging in partnerships drawing on a wide range of services and agencies enables psychologists to address identified community issues with the optimum use of resources.

Where appropriate to their context of practice, and consistent with the requirements of psychological practice, psychologists should:

- Work together with colleagues to develop a shared view of the aims and objectives of work at all levels. They should respect the professional standing and views of other colleagues and commit themselves to joint working.
- Make it clear to other professional colleagues what can be expected of them in collaborative work, the work that will be done, and the point at which the work will be terminated.
- Ensure that there are explicit agreements about information-sharing and confidentiality and its limits, and that these are adhered to.

- Practise and encourage in others full and open communication with colleagues/ agencies to support effective collaboration within the boundaries of the agreed limits on information-sharing and confidentiality,
- Demonstrate their commitment to involving clients in multi-agency work, finding ways to engage them and retaining the central principle of better outcomes for clients as the rationale for multi-professional and multi-agency work, as long as this is consistent with public safety.
- Be sensitive to the effects of clients receiving contradictory advice from different professionals or agencies and should work towards a co-ordinated view wherever possible.

3.6 Boundaries in professional relationships

Psychologists seek to establish good relationships and trust with their clients, other professionals, organisations and the community. They are aware of the complexity of professional relationships and the need to observe their boundaries. Multiple relationships occur when a psychologist is in a professional role with a client or colleague and at the same time is in another role with the same person or group e.g. as a supervisor, sports club member or co-author in a publication or where a psychologist is asked to work at a school where their child is a pupil.

Psychologists should:

- Ensure that the relationship reflects the appropriate context within which the practice is taking place.
- Be aware of the issues of multiple relationships and professional boundaries which may lead to (real or perceived) conflicts of interest or ethical considerations.
- Clarify for clients and other relevant stakeholders when these issues might arise.

When acting as leaders in practitioner or managerial roles, psychologists should maintain an awareness of the importance of respect for boundary and power issues within leadership relationships. In particular, an awareness of the possible abuse of these relationships should be maintained at all times. It is important that psychologists explicitly define the boundary of the relationship and negotiate and respect the responsibility that each holds in relation to it. Where psychologists are in a position of power/leadership with individuals, it is particularly important that they exercise caution and consider the possible issues which may arise from developing a personal relationship with these individuals. It may be necessary to seek further supervision where appropriate, with additional peers as necessary.

Psychologists have a duty of care towards their clients, who may be vulnerable, and should maintain a professional emotional distance from clients, services users or relatives and should not enter into an intimate or sexual relationship with any clients, service users or relatives they come into contact with as part of practice. Psychologists should also be aware that their duty of care can continue after a client practitioner relationship has ended.

As far as is reasonably practical, psychologists should not enter into a professional relationship with someone with whom they already have, or have had, a close personal

relationship. This includes family members and friends. Where there is no reasonable alternative, such as a lack of availability of other professionals, and it is acceptable in the particular context of practice, the psychologist should make every effort to remain professional and objective while working with the individual they know or have known. In such circumstances, at the earliest possible opportunity, this should be disclosed and discussed with a manager, where there is one, and supervisor and a note should be made in client records.

A range of psychologists work with people who initially have accessed the services in a dependent position, and have then transitioned to becoming partners and colleagues in service and policy development and design. The nature of the work becomes more collegiate and the psychologist holds multiple roles including facilitating participation, adapting communication and advocacy.

3.7 Working with children and young people

When seeking to work with children and young people, psychologists should consider how they can develop ways of communicating with the child or young person that will be most effective in ensuring they can express their views and feelings.

In most instances psychologists will use their specialist professional training and experience working with children, young people and families in order to understand the developmental needs of the child or young person in question; where a psychologist does not have specialist training that has included children and young people then there would be an expectation that advice or supervision should be sought before working with a child, young person, or their family. Similarly, work with children, young people and their families should take account of wider systemic factors outside of the child or young person; this will usually involve the child's family and may also include their school, and other settings.

As with adult clients, there can be misunderstandings and confusions about the role of a psychologist, the nature of the work being undertaken, and the possible outcomes of the work. It is essential to ask the children and young people about their understanding of what is happening on a regular basis (this may be appropriate at each session) and address any confusion that has arisen.

When working with children and young people, psychologists are advised to ensure that they have ascertained who has parental responsibility and that those with parental responsibility are aware of their planned involvement, if this is appropriate. Psychologists working with children, young people and families need to be aware that young people who are deemed to be competent to make their own decisions: 'Gillick competent'[14] can give their own consent to involvement with a psychologist, and that if a young person gives consent under these circumstances, then parental consent is not required. Similarly, a young person who is 'Gillick competent' can give consent even if parents have declined to give consent; such young people can also ask that parents are not informed of any involvement, and this should be respected by the psychologist; an example here would be in a school setting where a young person may give their own consent to see a psychologist

and may ask for parents not to be informed. Psychologists also need to be aware that where separated or divorced parents share parental responsibility, one parent can give consent.

3.8 Working with people with intellectual disabilities and impaired cognitive abilities

Psychologists are likely to work at some point with a range of people whose cognitive abilities are either temporarily or permanently altered, either by organic or developmental changes. Appropriate assessment of the abilities and skills is required, so that adaptions can be made to further interventions, treatments or management. The implications of the cognitive abilities on the person, their family and the reason for psychology involvement, will need to be considered.

Psychologists working with people with intellectual (learning) disabilities will need to consider adaptations to their approach to ensure the service they are offering is clearly understood, and is adapted to the individual's preferences, strengths and needs. This can include considering adaptations to oral or written communication, psychological assessment, intervention, and outcome evaluation.

Psychologists will need to be flexible and to make reasonable adjustments to their usual practice to ensure an appropriate service is offered. Psychologists should ensure their work is person-centred and respectful of the individual's needs, whether that work involves working with the individual with intellectual disabilities directly, or whether it also includes, or even may predominantly involve, working indirectly with family, carer or professional systems around the individual.

Psychologists will need to be mindful of the range of complex factors that often affect people with intellectual disabilities (e.g. communication needs, poorer mental and physical health outcomes and healthcare service experiences, unemployment, disempowerment, social isolation and exclusion, including experiences of bullying, abuse and hate crime, being overrepresented in the prison population, among others) and, therefore, the specific policy and practice guidance that applies. Further information is available in ***Section 4.2: Safeguarding adults at risk of harm*** and ***Section 6.3: Informed consent with people who may lack capacity.***

3.9 Working with detained people

Where clients are detained involuntarily there will always be a legal framework within which professionals must practise, and they should be aware of how their work fits into that framework. Involuntary detention is not only covered by professional rules and national legislation, but also by international agreements.

Psychologists should be aware that having the approval of one's employer is not necessarily a guarantee that practice is either ethical or legal, as described for example in the Hoffman report[15]. Where practitioners have doubts about the legal or ethical acceptability of employer demands, they should seek advice from an accredited workplace trade union representative, a human resources department, or appropriate helpline. They should

follow their organisation's guidelines on raising concerns at work. Seeking advice outside the immediate setting is helpful as colleagues within the workplace may be subject to the same pressures as they are.

Under the headings below, the role of the practitioner can be seen to be key to the way that detained persons are understood, and this can have a great impact on the way that their cases are handled by the detaining authority. The practitioner therefore has considerable power, whereas the client has very little. This power imbalance should always be borne in mind by practitioners dealing with detained persons. They should also bear in mind that the imbalance can be implicit as well as explicit.

Prisoners

Putting psychological pressure on detained persons to obtain a confession to an offence is illegal under the UN Convention on Torture[16]. In this context, 'psychological pressure' could well include such things as telling indeterminate-sentence prisoners who maintain innocence that they are unlikely to be released unless they engage with an intervention that relies on acknowledgement of guilt. Decisions about release are not the role of the practitioner, unless they are directly involved with, or are a member of the release authority, with a delegated role in the formal decision-making process. An approach to engagement such as this would not be considered beneficial to the client. However, those instructed by any party to the formal Parole Board decision-making process may properly be asked to give an opinion on suitability for release.

Practitioners dealing with detained offenders who have committed violent or sexual offences should guard against being morally judgemental. It is routine for practitioners in this field to encounter offenders who have committed very unpleasant acts with whose victims they can readily identify. Psychologists should be mindful that their own views about a client do not impact on their work.

Care should be taken when working with detained persons whose literacy is poor or whose first language is not English, and who cannot read a report which has been written about them. Even clients who are literate in English will probably not be familiar with psychological terminology, and may need considerable time to read and fully digest a report. People who are detained can also have cognitive challenges or intellectual disabilities which might make this process more difficult.

Persons detained under immigration legislation

Detained people may be afraid of raising a particular topic in case it is misunderstood, or too embarrassed because of cultural standards. For example, in some cultures it is difficult or unacceptable to discuss sexual matters, but sexual violence has been suffered by many asylum seekers in conflict zones, and some discussion of it may be essential in assessing their case. Even within the same culture there can be considerable generational differences.

Psychologists should guard against unwarranted interpretations of psychological evidence by commissioners or authority figures. For example, reporting that someone's story shows inconsistencies may give the impression that they are lying. This may be the case, but inconsistencies alone are insufficient proof of this. It is commonplace for evidence to be

inconsistently reported when people have been through traumatising experiences in areas of conflict, as is often the case with persons detained under immigration legislation.

Practitioners should take particular care in dealing with detained persons whose first language is not English. The opportunities for misunderstanding in both directions should be obvious, and in many cases the correct procedure will be to interview with the help of an interpreter. Failing to use interpreters when it was clearly appropriate to do so could inappropriately compromise the quality of the psychologist's work.

Mental Health Detentions

Mental Health Act 1983 as amended 2007 (England and Wales)
Under the Mental Health Act (MHA) a person can only be detained for treatment if that person is suffering from a mental disorder of a nature of degree that makes it appropriate for them to receive medical treatment in hospital. In the Act 'mental disorder' is defined as 'any disorder or disability of mind'. This definition is very broad but the *Code of Practice* provides guidance on clinically recognised conditions that fall within its meaning. Major categories of mental illness (e.g. affective disorders, schizophrenia and organic mental disorders) are included along with personality disorders, autistic spectrum disorders and learning disabilities (the latter only if accompanied by abnormally aggressive or seriously irresponsible behaviour). Dependence on alcohol or drugs is not considered a mental disorder under the MHA.

In the Act, all 'medical treatment' including psychological interventions is for the purpose of alleviating, or preventing a worsening of a mental disorder or one or more of its symptoms or manifestations. The medical treatment must be required for the health and safety of the client or for the protection of others. This means that the primary purpose of psychological interventions offered and provided to detained persons has to be to reduce the risks that their mental disorder presents to the detained person or others; as once those risks are reduced or minimised the client will no longer require detention and can progress to a less restrictive environment. This requirement points to the importance of an individualised formulation of a client's treatment needs that includes a careful assessment of the risks to self and others (see section on Risk Assessment, p.32).

Under the MHA appropriate medical treatment must be available. This is described as the 'appropriate medical treatment test' in the *Code of Practice*. Such treatment must have the *purpose* of alleviating or preventing a worsening of the disorder or its symptoms or manifestations, even if it cannot be shown in advance that the treatment is likely to have an effect for a particular patient. Thus, appropriate medical treatment need not be likely to achieve those purposes. That is, purpose is not the same as likelihood. The nature and degree of the patient's mental disorder and all the patient's particular circumstances are all relevant to whether the treatment is appropriate.

The appropriate medical treatment test is designed to ensure that patients are not detained for treatment unless they are actually to be offered appropriate treatment for their mental disorder. Thus, the MHA requires only that appropriate treatment is available to a detained patient. The patient's refusal to accept treatment is not an obstacle to detention, so long as appropriate treatment is available.

This has particular relevance for psychological therapies. The Code at chapter 23.20 states:

> *In particular, psychological therapies and other forms of medical treatments which, to be effective, require the patient's cooperation are not automatically inappropriate simply because a patient does not currently wish to engage with them. Such treatments can potentially remain appropriate and available as long as it continues to be clinically suitable to offer them and they would be provided if the patient agreed to engage.*

Whilst the availability test of appropriate medical treatment applies to psychological interventions in the same way as for other forms of treatment, it is important for psychologists to avoid placing pressure on clients to participate in such treatment. In order for there to be an effective therapeutic alliance there needs to be trust and this only develops in the absence of coercion. Psychological therapy works when the client decides they are ready for therapy and freely consents to it. There is an inevitable power differential in favour of the clinician. Thus, every attempt should be made to emphasise patient involvement and choice and to avoid coercion in a manner consistent with the *Code of Practice* empowerment and involvement and respect and dignity principles. Further information is available in ***Section 6: Obtaining informed consent.***

The Mental Health Act 2007, which amended the MHA 1983, introduced approved clinicians (AC) who may be drawn from a defined group of professions, including practitioner psychologists listed in the register maintained by the Health and Care Professions Council. ACs are approved by the appropriate national authority to act as an approved clinician for the purposes of the MHA 1983. Responsible clinicians (RC) are ACs who have overall responsibility for an allocated patient's case. The Code of Practice at chapter 36.3 says that a patient's RC should be the available AC with the most appropriate expertise to meet the patient's main assessment and treatment needs. At chapter 36.5 the Code says that where psychological therapies are central to a patient's treatment then it may be appropriate for a professional with particular expertise in this area to act as the RC.

Chapter 39 of the *Code of Practice* provides guidance on the circumstances in which potential conflicts of interest may prevent designated professionals from making an application for or recommendations supporting a patient's detention or guardianship. The potential conflicts of interest dealt with in the Code involve financial, business, professional and personal issues.

The Mental Health (Scotland) Act 2015.

This act, together with the Mental Health (Care and Treatment) (Scotland) Act 2003 sets out the law for detaining patients and restricting patients. For patients to be detained, this has to be considered by the Mental Health Tribunal for Scotland. This applies, for example, to those detained in the NHS who are not subject to a court (forensic) decision.

Restricted patients are 'detained in hospital under a compulsion order with a restriction order'. They have usually committed an offence punishable by imprisonment but as a result of mental disorder are not imprisoned but ordered to be detained in hospital for treatment, without limit of time. They are dealt with through a programme of treatment and rehabilitation – the aim being to prevent recurrence of offending by dealing with the mental disorder'.

Risk assessment

When dealing with detained people seeking release, such as parole applicants or patients seeking release from a mental health tribunal, risk assessment (usually for violence risk) will be a prime consideration. Psychologists should bear in mind that risk assessment is not prediction. Risk assessment instruments are rarely more than about 70 per cent accurate when predicting reconviction and many items on commonly used risk-assessment schedules are of poor predictive value.[17] Psychologists should also bear in mind that risk-assessment instruments are better at identifying low-risk than high-risk individuals[18],[19]. A statement of risk is not a prediction about an individual, but a statement based on the behaviour of a criterion group with which that individual is being compared. Risk is statistical by its very nature, and the value of such comparisons depends upon the individual's similarity to the criterion group upon which the risk assessment instrument was developed. Accuracy may be greatly reduced if the similarity is low[20]. It may be better to think of risk assessment as a process of identifying those risk factors which need to be monitored and controlled if supervision of the individual is to be reduced or withdrawn.

3.10 Working with people who are, or would like to be employed

Psychologists are sometimes commissioned to deliver psychological assessment or training with employees and potential employees. Psychologists should take particular care over the advice provided in follow-up reports, as employers are not trained professionals and may misinterpret advice or psychometric testing results. For example, citing a reading ability level using age is misleading, and could be interpreted as incompetent for the role, when in reality the role does not require a high reading level or a reasonable adjustment could be provided.

Similarly, psychologists should ensure that the tools they are using to assess competence or suitability are appropriate for the role, and have good reliability and validity. Any tools devised by the psychologist are likely to be interpreted by the employer as professional and authoritative, where there is ambiguity or multiple interpretations, this must be made clear, so that decisions about peoples' employment are not made in error.

There are people who work or who would like to work, who may experience cognitive difficulties caused by a range of factors, for example intellectual disabilities, dementia, acquired brain injury. Sometimes this information is known and needs to be considered when assessing and advising. At other times, this possibility of a cognitive or intellectual impairment needs to be considered. The impact of this can be far reaching, in terms of ongoing or future employment, access to benefits and of course associated psychological adjustments for the person and the people around them. Further information is available in ***Section 7: Managing data and confidentiality*** and ***Society Document: Psychological Assessment of Adults with Specific Performance Difficulties at Work.***

3.11 Working with cultural difference

It is expected that all psychologists will have the necessary skills and abilities to work with all sections of the community.

Psychologists need to be aware of stereotypical beliefs and assumptions which manifest in thinking about culture and ethnic groups. Psychologists should bear in mind the history of racism and the early development of Western psychology[21] and culturally biased testing in favour of white, middle-class children. Psychologists need to recognise that multi-ethnic groups are not homogenous groups and there are wide regional and local differences among these groups which can be split by language, dialect and regional variations. Each ethnic community has a distinct identity and religious focus may also vary within and across communities.

Race is not a biologically meaningful concept to apply to people, and even the artificial divisions between the so-called racial groups are nebulous and unstable, biologically, socially and physically.[22]

Psychologists need to understand the discrimination suffered by people from diverse and/or minority ethnic and religious backgrounds as a result of:

- the interchangeable use of the terms race, culture and ethnicity leading either to the perception of black and minority culture, race and ethnicity as unitary or an assumption that knowing about these cultures solves the problem of equality, fairness and availability of services;
- the maintenance of the colour-blind approach in service where 'one size fits all', resulting in a lack of formal recognition of the varied diverse needs as well as these needs being ignored, unacknowledged or assumed to be the same;
- the lack of appropriate culturally relevant psychological therapy available to certain Black and Minority Ethnic (BME) communities;
- being discriminated against on grounds of 'special' needs, effectively considered as 'cultural pathology'; and
- experiencing instances of indirect, subtle, or unintentional discrimination often called 'micro-aggressions'.

It would be expected that all practising psychologists should develop a productive working relationship with culturally and linguistically diverse groups of people by:

- avoiding different types of biases and find new ways (verbally and non-verbally) to build rapport and respect;
- using and working with trained interpreters in assessment, formulation and intervention work as well as research work;
- being aware of the impact of culture, ethnicity and religion in assessment, formulation and intervention processes and the use of norm-referenced tests which do not include minority ethnic groups as part of their standardisation;
- pre-assessing and pre-incorporating ethnic identity (including its fine gradations, region, class and generation) which can have impacts on processes and outcomes of psychological work;
- acknowledging their own ethnocentricity and possible underlying socially conditioned prejudice to people who are 'different'; psychologists need to acknowledge that people can change, irrespective of their differences and psychological distress;
- relooking at current models of mental health which traditionally reflect Western

constructions, and incorporating other world views of psychological wellbeing; and
- understanding and respecting the different concepts of health and illness that exist within different ethnicities, including newly arrived people from Europe and refugees from Syria, Turkey, Somalia etc.

Psychologists need to: address the different life situations and life circumstances experienced by users who wish to use mental health services; hear their voices based on their personal experiences; and act and respond accordingly in a human way.

3.12 Working with people of faith, religion and spirituality

In working with clients who hold a variety of values and religious and spiritual beliefs which may be different from their own, psychologists should consider the following:

- Psychologists should respect clients' values and spiritual beliefs and need to be mindful that their personal beliefs should not be an impediment to engaging with the client.
- Spiritual beliefs are very often beneficial to the client's wellbeing and may be helpful to be incorporated into any intervention to achieve a positive impact where appropriate.
- In some circumstances the client's faith belief may be harmful or detrimental to themselves or others.

3.13 Working with sexual and gender minorities

Psychologists are committed to the fair treatment and inclusion of people who are intersex, people who do not identify as heterosexual and/or people who do not identify with their natally-assigned sex. This section provides guidance to address specific issues in support of these heterogeneous populations. In these guidelines we use the term 'sexual minority(ies)' to refer to individuals whose romantic attraction or sexual attraction is other than heterosexual (different from the majority in the surrounding society), and the term 'gender minorities' to refer to transgender, genderqueer and intersex individuals.

When working with gender and sexual minorities, psychologists are encouraged to:

- remember that sexual and gender minority identities are not indicative of mental health disorders;
- understand that attitudes towards sex, sexuality and gender are located in a changing social, cultural, and political context, and to reflect on their own understanding of these concepts and how it may impact their practice;
- reflect on the limits of their practice when working with certain sexual and gender minority clients, and to consider appropriate referral and training when necessary;
- understand how social stigmatisation (e.g. prejudice, discrimination and violence) poses risks to gender and sexual minority clients;
- consider engaging with the wider socio-political context regarding sexual and gender minorities in order to reduce social stigma;
- be knowledgeable about the diversity of sexual and gender minority identities and practices;

- use the preferred language of the sexual and gender minority individuals;
- understand the unique and particular circumstances and challenges facing clients with diverse gender and sexual identities and practices;
- understand the diversity of forms of relationships and families in gender and sexual minority clients;
- be aware of the potential challenges facing sexual and gender minority clients in their relationships and families;
- be mindful of the intersections between sexual and gender minority and socio-cultural/economic status;
- recognise the particular challenges experienced by gender and sexual minorities with physical and/or mental health difficulties;
- recognise the diversity of developmental pathways for sexual and gender minority children and adults;
- recognise the needs and issues of young people from gender and sexual minorities, and their particular vulnerabilities;
- support the self-determination of their clients in the development of their identities and practices; and
- avoid attempting to change gender or sexual minorities on the basis that they can be 'cured' or because of stigmatising theory, personal, religious and/or socio-cultural beliefs.

Working with racially and ethnically diverse Lesbian, Bisexual, Gay, Trans*, Queer (LGBTQ) populations

Black and minority ethnic (BME) LGBTQ people have to negotiate between the values and beliefs of the mainstream and minority ethnic cultures. Cultural differences in norms, beliefs, and values can be a source of psychological stress[23],[24],[25]. There may be no particular sexual and ethnic minority group to which a BME LGBTQ person can anchor their identity and obtain acceptance and support. This may be a particular issue for BME LGBTQ youth who are exploring their sexuality and sexual identity.

When offering psychological services to racially and ethnically diverse LGBTQ populations, it is not sufficient for a psychologist simply to identify the racial and ethnic identity and background of the client. Ethnic minority status can complicate and exacerbate the issues, challenges and difficulties the client experiences. The client can be affected by the way their ethno-culture community view and understand sex, sexuality and gender. The issue of racism within the LGBTQ community is also an important issue to consider[26],[27],[28],[29]. Sensitivity to the complex dynamics associated with factors such as cultural values about gender roles, religious and procreative beliefs, degree of individual and family acculturation, and the personal and cultural history of discrimination or oppression is also important. All of these factors may have a significant impact on identity integration and psychological and social functioning[30],[31],[32],[33],[34].

Further information is available in ***Society Document: Guidelines and Literature Review for Psychologists Working Therapeutically with Sexual and Gender Minority Clients.***

3.14 Working with people who may be socially excluded

Social exclusion refers to the extent to which individuals are denied access to the prevailing social system and the right to participate in key areas of social, economic and cultural life. This exclusion occurs due to constraints and restrictions rather than as a matter of choice. Exclusion is typically a result of poverty and/or belonging to a social minority group. The impact of social exclusion has been well documented and leads to the perpetuation of cycles of inequality for individuals and groups. These cycles of inequality are perpetuated in terms of income, health, opportunity, relationships and life-span. Further information is available in ***Society Document: Socially inclusive practice.***

Social inclusion is the process where the needs of all members of communities and the groups which constitute them are recognised, prioritised and met, resulting in these individuals feeling valued and respected. Promoting social inclusion is a broader task than promoting equality and tackling discrimination and stigma. It requires psychology professionals to address wider structural issues in society which maintain excluding processes and power differentials.

The range of individuals and groups who may experience disadvantage and exclusion is not limited to the protected characteristics outlined in the Equality Act. For example, people may also experience exclusion because of their age, they are a carer or are in care, they have a low income or low educational achievement, or their cognitive ability is compromised.

When working towards social inclusion psychologists are encouraged to:

- acknowledge, understand and respect the diversity of the communities in which they practise;
- make adjustments where possible and needed, to enable people to fully participate, e.g. to communication, access to services, adaptation to materials and psychological assessment and interventions;
- recognise that they have a professional duty actively to promote equality and opportunity;
- recognise the shame and distress caused by discrimination, and the impact of discrimination on wellbeing;
- acknowledge and respond to the trauma and distress caused by exclusion;
- move beyond the level of the individual and recognise that social exclusion is a structural issue, and that inclusion will be achieved only by structural changes in society and broad policy initiatives;
- acknowledge that there is a responsibility to highlight the links between structural societal factors and mental health problems;
- make employers, policy-makers, clients and the general public aware of situations where policies, practice and the distribution of resources are oppressive, unfair, harmful or illegal;
- challenge social conditions, both as individuals and collectively, that contribute to social exclusion and stigmatisation;
- make services accessible in terms of time, space, familiarity and comfort; make reasonable adjustments to services to meet individuals' needs; people need to be able

to get to places, get into places, feel welcomed to places and feel that they belong in places;

- recognise that inclusive services reflect the communities they serve in terms of the identities and diversity of the staff team;
- recognise the range of interventions that can improve clinical and social outcomes and use influence to ensure these services are commissioned;
- emphasise social outcomes and participation alongside clinical outcomes;
- maintain an emphasis on empowering clients to achieve their social goals; and
- identify natural sources of support and reciprocal relationships for individuals within their communities, and seek out opportunities to help individuals transition out of formal mental health services.

4. Safeguarding

Safeguarding means protecting people's health, wellbeing and human rights, and enabling them to live free from harm, abuse and neglect[35]. This guidance addresses safeguarding of both children and adults.

Abuse takes many forms and cuts through various domains of life. The categories below are often referred to in investigation/legislation context and are not mutually exclusive with e.g. emotional abuse featuring in the other domains of abuse. Abuse can be found across all sections of society, irrelevant of gender, age, ability, religion, race, ethnicity, personal circumstances, financial background or sexual orientation.

- Physical abuse – is the use of physical force or mistreatment of one person by another which may or may not result in actual physical injury. This could include hitting, poisoning, deprivation of food, water or liberty, rough handling or exposure to heat or cold, amongst other things.
- Sexual violence and abuse – sexual abuse is any behaviour perceived to be of a sexual nature which is unwanted or takes place without consent or understanding. Sexual violence and abuse can take many forms and may include non-contact sexual activities such as: indecent exposure, stalking, grooming or being made to look at, or be involved in the production of sexually abusive material, or being made to watch sexual activities.
- Psychological/emotional abuse is behaviour that is psychologically harmful or inflicts mental distress by threat, humiliation or other verbal/non-verbal conduct. This may include threats, blaming, controlling, intimidation or coercion amongst other things.
- Financial abuse is actual or attempted theft, fraud or burglary. It is the misappropriation or misuse of money, property, benefits, material goods or other asset transactions which the person did not, or could not, consent to, or which were invalidated by intimidation, coercion or deception. This may include exploitation, embezzlement, withholding pension or benefits or pressure exerted around wills, property of inheritance.
- Institutional abuse is the mistreatment or neglect by a regime or individuals, in settings which people who may be at risk reside in or use. Institutional abuse may occur when routines, systems and regimes result in poor standards of care, poor practice and behaviours, inflexible regimes and rigid routines which violate the dignity and human rights of the adults and place them at risk of harm. It may occur within a culture that denies, restricts or curtails privacy, dignity, choice and independence. It involves the collective failure of a service provider or an organisation to provide safe and appropriate services and includes a failure to ensure the necessary preventative and/or protective measures are in place.
- Neglect is the persistent failure to meet basic physical and/or psychological needs. It may involve a parent or carer failing to provide adequate food, clothing and shelter, failing to provide or unresponsiveness to, basic emotional needs or failing to protect from physical harm.

Psychologists are in a particularly relevant position to identify interactions or circumstances that affect health and development. This applies not only to psychologists who undertake direct work with children and vulnerable adults in a variety of settings; but also to those who work with clients, seen for instance in clinics, hospitals or prisons, who may make historical disclosures of abuse or raise concerns about child protection or the welfare of people within their families or communities. Safeguarding is thus the responsibility of all psychologists whatever their role.

4.1 Safeguarding children

The Society endorses *Working Together to Safeguard Children* – A guide to inter-agency working to safeguard and promote the welfare of children[36]. Safeguarding children is the responsibility of everyone.

The guidance defines safeguarding children as protecting children from maltreatment and preventing impairment of children's physical or mental health or development (physical, intellectual, emotional, social and behavioural). Promotion of welfare is defined as ensuring that children grow up in circumstances consistent with the provision of safe and effective care, and taking action to enable all children to have the best life chances.

Child protection within safeguarding refers to the activity that is undertaken to protect specific children who are suffering or likely to suffer significant harm. For the purposes of child protection legislation children are those who have not yet reached their 18th birthday. The child's needs are paramount, and the needs and wishes of each child be they a baby or infant or an older child, should be put first, so every child receives the support they need before a problem escalates.

The policy of Working Together is underpinned by two key principles: (a) safeguarding is everyone's responsibility and for services to be effective each professional and organisation should play their full part; and (b) safeguarding requires a child-centred approach based on a clear understanding of the needs and views of children.

Where there are concerns that a child is at risk of harm, such concerns should normally be communicated following the psychologist's work-place safeguarding protocol. Where this is not applicable, concerns about a child's welfare can be made directly to the local authority children's social care team.

Psychologists should:

- be alert to the heightened vulnerability/possible need for early intervention support for a child who: has a disability, has additional needs (including special educational needs), is a young carer, is showing signs of engaging in anti-social or criminal behaviour, has returned home from care and/or is showing early signs of abuse and/or neglect.
- be alert to heightened vulnerability where a child is in a family circumstance presenting challenges for the child, such as substance abuse, adult mental health problems and domestic violence.
- consider the potential impacts of parental/carer ill-health on the family and whether this creates any significant negative impacts or risks for children within that family;

- be aware that if an adult has responsibilities for children outside the home setting, such as working with children, their mental ill-health and/or their health more generally upon the adult's capacity to work safely;
- be aware that children within the same family can be treated differently (one child may be singled out for abuse);
- be aware/seek to understand how children can come to abuse other children;
- recognise that some professionals use their position to abuse children and vulnerable people; and
- challenge institutional abuse in its many forms.

Psychologists should be aware of situations of risk which require additional consideration, notably:

- sexual exploitation, which involves exploitative situations, contexts and relationships without the child recognising the harm on account of their age/understanding, social/economic and/or emotional vulnerability;
- internet abuse, which can involve cyber bullying, exposure to pornography or violence and exploitation of young people;
- domestic violence which may expose a child to violence directly or indirectly;
- shame-based abuse where children or young people may be physically assaulted or murdered because of bringing perceived 'shame' to their families or breaking cultural expectations of 'honour'; and
- Trafficking, any child transported for exploitative reasons is considered to be a trafficking victim, whether or not they have been forced or deceived. This is partly because it is not considered possible for children to give informed consent. Even when a child understands what has happened they may still appear to submit willingly to what they believe to be the will of their parents or accompanying adults.

Psychologists should have a knowledge and understanding of services for children in need and how to access them. Psychologists confronted with child abuse in any form should contribute to whatever actions are needed to safeguard children and promote their welfare. The needs/interests of adults should not be allowed to take precedence ahead of the needs of the child. Psychologists should work co-operatively with parents/carers unless this is inconsistent with ensuring the child's safety and ensure that the child's view is sought, heard and communicated. Psychologists should share appropriate information in a timely way, discuss any concerns and help analyse information so that an assessment can be made of the child's needs and circumstances. Psychologists should contact the children's services or social services department at the appropriate local authority (in some cases this role has been delegated to a multi-agency safeguarding hub) if they are concerned about a child or a vulnerable adult.

Managing cases of alleged historical abuse

There is a growing recognition that a disclosure of non-recent abuse may reveal current risks to others from an alleged perpetrator. Psychologists have a duty of care to their clients, and in the safeguarding of others. This may place psychologists in complex positions when trying to negotiate and balance their duties and responsibilities.

Psychologists who work with adult clients who disclose non-recent sexual abuse, should recognise that there may be current and ongoing risks posed by the alleged perpetrator to others. Not sharing concerns beyond the consulting room could mean that other children and young people could be at risk.

A client's allegations should be taken seriously, regardless of their presenting problems or mental health diagnosis.

Lack of access to children identified through familial relationships, work or volunteering roles should not eliminate concerns about risk, given opportunities for abuse to occur within communities.

It is crucial that psychologists seek advice from colleagues, particularly colleagues in safeguarding services, within the organisation and also from other agencies tasked with leading on safeguarding (i.e. social services). Psychologists working with clients without a referral and where no stakeholder agency is involved should seek advice from senior experienced colleagues on how to proceed. Psychologists need to be alert to the possibility that abuse may be organised, severe and complex.

There may be times when, in the interests of supporting a client's psychological readiness for disclosure, consultation may continue without requiring identifying details to be provided to the psychologist. It is important that a clients' lack of readiness to disclose does not become an obstacle to receiving psychological help. Further information is available in ***Society Document: Guidance document on the management of disclosures of non-recent (historic) child sexual abuse.***

Where the disclosure is made by the perpetrator of the abuse, risk assessment should be made regarding the context of the setting of the disclosure but there may be a professional obligation to disclose the criminal offence in order to safeguard other potential victims as above.

4.2 Safeguarding adults at risk of harm

The Care Act 2014 brought in new legislation regarding the safeguarding of all vulnerable adults. In some regions there is a move away from the term 'vulnerable adult' towards the concept of an adult at risk of harm.

An adult at risk of harm is a person aged 18 or over with need for care or support, who is experiencing, or is at risk of, abuse or neglect, and as a result of their needs is unable to protect himself or herself against the abuse or neglect or the risk of it. The needs referred to here may cover a variety of personal or life circumstances including (but not limited to) cognitive impairment, age, disability, illness, injury or mental health condition.

The legal context

There is no set piece of legislation for adult safeguarding. It is a mix of criminal law, case law and welfare law. The Care Act 2014, updated in 2016, brought in the first legal framework for safeguarding adults in a single act. It contains a range of regulations and statutory guidance, which form the base upon how social care will develop in the future.

It enshrines the new statutory principle of wellbeing and it makes it the responsibility of local authorities to promote wellbeing when carrying out any of their care and support functions. The act specifies the rights of those who need care and support, their carers, and the funding system for care and support. It recognises that this cannot be achieved by any single agency. Every organisation and person who comes into contact with a child or adult has a responsibility and a role to play to help to keep children and adults safe. Further information is available in ***Appendix 1: Relevant legislation.***

Modern slavery

An important area of concern is modern slavery. The Government website provides details about the government's work to end modern slavery, including details about how to refer victims into the national referral mechanism (NRM). Modern slavery is a serious crime. It encompasses slavery, servitude, and forced or compulsory labour and human trafficking. Modern slavery victims can often face more than one type of abuse and slavery, for example if they are sold to another trafficker and then forced into another form of exploitation.

A person is trafficked if they are brought to (or moved around) a country by others who threaten, frighten, hurt and force them to do work or other things they don't want to do.

A victim of slavery is entitled to help and protection from the UK Government (this is called the National Referral Mechanism), all support is provided on a confidential basis, and support to talk to the police. The National Referral Mechanism has been put in place to identify victims of trafficking and refer them to organisations that will offer help and support. Further information is available in ***Appendix 2: Websites and further information.***

Responding to concerns

Safeguarding adults means:

- Protecting the rights of adults to live in safety, free from abuse and neglect.
- People and organisations working together to prevent and stop both the risks and experience of abuse or neglect.
- People and organisations making sure that the adult's wellbeing is promoted including, where appropriate, taking fully into account their views, feelings and beliefs in deciding on any action.
- Recognising that adults sometimes have complex interpersonal relationships and may be ambivalent, unclear or unrealistic about their personal circumstances and therefore potential risks to their safety and wellbeing.

Providers' safeguarding arrangements should always promote the adult's wellbeing. Being safe is only one of many things that adults want for themselves and there can be challenges in balancing safety and freedom in a way which protects and fulfils human rights. Providers, and other professionals where relevant, should work with the adult to establish what being safe means to them and how that can be best achieved.

Care and support means different things in every case. The fundamental standard on safeguarding is that children and adults using services must be protected from abuse and improper treatment. Providers should establish and operate systems and processes

effectively to ensure this protection and to investigate allegations of abuse as soon as they are aware of them.

The standard states that care or treatment must not:

- Discriminate on the grounds of any of the protected characteristics of the Equality Act 2010;
- Include acts intended to control or restrain an adult or a child that are not necessary to prevent, or not a proportionate response to, a risk of harm to them or another person if the adult or child was not subject to control or restraint;
- Be degrading to the adult or the child;
- Significantly disregard the needs of the adult or the child for care or treatment.

The standard goes on to state that no adult or child must be deprived of their liberty for the purposes of receiving care or treatment without lawful authority.

Safeguarding Adults Boards were established to help and safeguard adults with care and support needs The Safeguarding Adult Board must lead adult safeguarding arrangements across its locality and oversee and coordinate the effectiveness of the safeguarding work of its member and partner agencies, according to the values of 'Making Safeguarding Personal' Guide 2014[37]. Making safeguarding personal is not just for people with capacity, it is just as important for people who lack capacity. The Guide specifies outcomes that people might want including to be and to feel safe, to maintain or get friends, to know that this won't happen to anyone else or to be able to protect self in the future.

The following are not outcomes:

- Harm or abuse is substantiated/unsubstantiated.
- The person is receiving increased monitoring or care.

The role of the Care Quality Commission[38] is to monitor, inspect and regulate services to make sure that they meet the fundamental standards of quality and care. The Commission works alongside Safeguarding Adults Boards and Safeguarding Children Boards to share information and intelligence where appropriate to help them identify risks. This includes providing appropriate advice and support to people at risk of radicalisation in sectors such as healthcare and education.

4.3 Terrorism and extremism

Section 26 of the Counter-Terrorism and Security Act 2015 (the Act) places a duty on certain bodies ('specified authorities' listed in Schedule 6 to the Act), in the exercise of their functions, to have 'due regard to the need to prevent people from being drawn into terrorism'. Depending on where the psychologist works, these duties may have relevance in the course of their employment. The term 'due regard' as used in the Act means that the authorities should place an appropriate amount of weight on the need to prevent people being drawn into terrorism when they consider all the other factors relevant to how they carry out their usual functions.

The current UK definition of 'terrorism' is given in the Terrorism Act 2000. In summary, this defines terrorism as an action that endangers or causes serious violence to a person/ people; causes serious damage to property; or seriously interferes or disrupts an electronic system. The use or threat must be designed to influence the government or to intimidate the public and is made for the purpose of advancing a political, religious or ideological cause. People suspected of being involved in such activity must be referred to the police.

'Extremism' is defined in the Prevent Strategy[39] as vocal or active opposition to fundamental British values, including democracy, the rule of law, individual liberty, and mutual respect and tolerance of different faiths and beliefs. Definitions of extremism can also include calls for the death of members of our armed forces, whether in this country or overseas.

While it is recognised there is no single profile associated with extremism, identity is considered to be central, and risk screening is based on assessment in relation to two general pathways into extremism – criminal and non-criminal. Disengagement follows a similar process. This is a contentious area of practice. Psychologists should ensure they focus on their core role, working in a non-stigmatising way, and avoiding profiling based on characteristics such as race, religion, ethnicity or any other aspect. The psychologist should carefully weigh relevant professional obligations and seek and follow appropriate local and employer guidance. Further information is available in ***Appendix 2: Websites and further information.***

5. Making and maintaining agreements

Both client and psychologist benefit by having arrangements for the work clearly set out from the start. Psychologists should be aware that all professional engagements are ultimately governed by the law of contract. A legally enforceable contract can arise as a result of the parties' entering into a written agreement, but can also arise as a result of a verbal agreement between the contracting parties.

A contract arises if the following are present:

- one of the parties (the offeror) had made an offer to the other party (the offeree);
- the offeree accepts the offeror's offer;
- there is consideration (i.e. something of value) passing from each party to the other, e.g. the offeror provide services to the offeree; the offeree pays the offeror;
- the parties intended to create a legal binding arrangement; and
- the terms of the contract are sufficiently certain.

While this does not mean that all client engagements are made subject to an agreed contract document, it does mean that in the worst-case scenario of a complaint against a psychologist being made, it will be very helpful for the psychologist to be able to demonstrate that they have met their professional obligations to their client. This will be best done by demonstrating that an agreement was made by both parties who knew what they were agreeing to, that the parties had the legal capacity to make such an agreement and that what they were agreeing to is permitted under the law. Where the client does not have the capacity, best interest decisions need to be made in accordance with the Mental Capacity Act. Further information is available in ***Section 6: Obtaining informed consent***.

Psychologists may wish to include the following when making agreements:

- the role and function of the psychologist;
- the psychologist's relevant qualifications, areas of expertise and ways of working;
- relevant limitations of the psychologist's practice, e.g. assessments not accepted or types of activity not undertaken;
- where the psychologist is appointed to work with a third party, the psychologist should make clear their obligations to each of the clients concerned and each client's obligations under the agreement and ensure that there are no conflicts or ambiguities;
- the extent of the psychologist's power and responsibilities when acting on behalf of other agencies;
- obligations in relation to duty of care and safeguarding, and related limitations to confidentiality;
- how confidentiality of client information and data is assured and any limitations to that confidentiality;
- how conflicts of interest will be managed if applicable;
- the client's, or other party's, rights of access to stored information;
- the use of any one-way viewing screens or video or audio recording and the security of any recorded material;

- the nature of psychological activities involved, the reasons for undertaking them and information about the likely outcomes;
- the availability of the psychologist to the client;
- details of fees, together with application of VAT if non-clinical services, or expenses to be billed in connection with the work undertaken;
- what is expected from the client as their contribution to the engagement with the psychologist, expectations for payment and consequences of non-payment;
- ownership of intellectual property rights;
- what might cause a breach of the agreement;
- the rights of each party to withdraw from the agreement and the consequences to any financial agreement;
- recourse to dispute resolution or law;
- the equality and justice aspects of social policies and their possible impact;
- external ethical scrutiny and approval of the engagement, where appropriate; and
- arrangements to terminate the retainer.

In advance of any psychological assessment, the client should be made aware of the availability of services, and the existence of any waiting lists for intervention.

For some approaches, intervention follows an evolving path, unique to each client and his or her life circumstances, which cannot be precisely predicted in advance. Clients should be made aware of this uncertainty, and predictions should be made on the best judgments. It is recognised that it is sometimes unrealistic and undesirable to provide detailed information on all aspects of psychological intervention, and consent should be obtained to a general strategy rather than specific procedures. Further information is available in this document or the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines.***

5.1 The practitioner's right to withdraw their service

There are circumstances in which a psychologist may decide to terminate the agreement for provision of psychological services. The circumstances may be personal or professional.

The personal circumstances may include but will not be restricted to leaving employment in a psychological service, incidences of illness or family commitments.

The professional issues may relate to service structural changes, safety, or provision of most appropriate service.

In these circumstances, psychologists will, as far as possible, work to ease the transition of service provision and give as much notice as is practical in the particular situation.

5.2 Referrals

Where a psychologist finds themselves unable to come to an agreement with a client, the psychologist may refer the client to a suitably qualified colleague. Psychologists will both make and receive referrals when working in services with other professionals.

In making referrals, psychologists should consider the needs of the client and to the best of their knowledge refer to another professional with the appropriate skills and experience.

In receiving referrals, the psychologist should consider whether the referral is appropriate for psychology, establish the client's understanding of the purpose of the referral, and consider as far as possible prior to meeting the client whether the referral falls appropriately within their own areas of practice.

5.3 Representation of the qualifications and status of the psychologist

HCPC registration and BPS Chartered Status

Psychologists are encouraged to state their registration with the HCPC and protected title(s). This will provide assurance that the psychologist meets national standards of training and professional skills.

Use of the 'consultant' title

The term 'consultant' generally does not have a formal definition. Within the medical field it is used by doctors who have considerable experience and proven expertise demonstrated through examination within their respective Royal Colleges.

While there is no clear comparable grading structure for psychologists outside the NHS (within the NHS, the consultant title is used by psychologists who are employed in Band 8C, 8D and 9 positions), the use of this title would be seen to reflect both seniority and specialist expertise.

There is a difference between a 'consultant' psychologist and a psychologist who provides consultations in their context of practice. The Society expects that psychologists should be honest and accurate in representing their professional affiliations and qualifications, including such matters as knowledge, skill, training, education and experience.

The Society's position is that this would be applicable in any situation where expert knowledge or skills is being marketed or promoted, whether or not this is for financial gain. Further information is available in ***Society Document: Guidance on the use of the title 'Consultant Psychologist'.***

6. Obtaining informed consent

Psychologists should always ensure that they have sought and received the consent of those they work with, given of their own free will, without undue influence.

The concept of informed consent relates to the client's right to choose whether to receive psychological services, and to make this choice on the basis of the best information available presented in the most appropriate way. The principles apply, whether the psychologist works in the public, private or voluntary sector or in independent practice.

Psychologists should obtain the informed consent of the client in an appropriate manner prior to undertaking any assessment, intervention or research activities. In all circumstances, common sense and ethical practice should apply when considering the approach to gaining informed consent from those with whom the psychologist is working.

This section refers, in the main, to consent with adults with capacity. Further information on informed consent with discrete communities where further consideration may be needed is available in ***Sections 6.1 to 6.4***.

Obtaining informed consent involves a process which is dynamic and is relevant to the specific assessment, intervention or decision being made at that time. When there are substantive changes in the intervention or when the psychologist has reason to consider the client may no longer consent, consent should be reviewed. Psychologists should ensure that their clients are enabled to play an active role in this process. Clients should be encouraged to ask questions whenever they are in doubt.

Psychologists should be aware that a client's desire for help, and the immediate impact of the psychologist's supportive listening, may affect the client's ability to make informed choices about the help they wish to receive. They should also be aware that their own desires to help a client may bias their presentation of information, such as the probability of successful outcomes.

Psychologists should be aware of the complexities of obtaining informed consent to treatment due to the perceived power, status and authority of the professional psychologist. It may not be clear if the consent given is freely given by the client or, for example, is part of a pattern of compliance towards authority figures. Equally, a client may say that they understand the explanation given by the psychologist, and accept a plan for intervention, in order to avoid the discomfort of being seen not to understand the psychologist's complex language and ideas.

Obtaining informed consent is particularly difficult when the client is obliged to undertake the psychological intervention as part of an employment process or performance measure where they may have obligations under their employment contract; or when detained.

There should ideally be an ongoing dialogue between client and psychologist, as part of the process of joint decision-making. At any point, the client should feel free to ask questions about the impact of the treatment and withdraw consent to continue.

Psychologists should attempt to intervene against the express wish of a client only after careful consideration and in line with relevant legislation, policies and professional practice.

Provision of information for informed consent

In order to ensure that the client has all the information necessary to make an informed decision about whether to take part or not in a psychological activity, they must be provided with relevant information, such as that listed below, in a format that is designed to meet their specific needs.

The psychologist should consider providing information about the following:

- what the psychological activity involves, as far as this is consistent with the model of interaction, e.g. there will be limits in the use of some non-directive therapies and psychometric assessments;
- the benefits of the activity, either directly to the client in the case of assessment or intervention, or indirectly in the case of systemic intervention, or to potential theoretical advances or service improvement;
- any alternative assessment or treatment options and their known availability;
- foreseeable risks and how minor or serious they may be, for example the potential to feel worse at stages during therapeutic interventions;
- what might be the benefits and potential costs and risks to them of engaging or not engaging in the proposed psychological activity; and
- the client's right to withdraw their consent from assessment, treatment or intervention at any stage, along with information about any likely consequences of such withdrawal.

Consent to involvement of others

Psychologists have an obligation to ensure that prospective clients are informed of the extent and limitations of confidentiality with respect to anticipated services, the purposes of any assessment, the nature of the procedures to be employed or the intended uses of any product such as notes or recordings, before the assessment or intervention starts. Further information is available in ***Section 7: Managing data and confidentiality.***

The psychologist should ask the prospective client: whom they would wish to be informed of their assessment or treatment, if anyone; and the information they are willing to share where communication is essential, for example to the referring agent or organisation, management or court. Wherever appropriate, including in the law, the client should have copies of reports or letters or be given feedback so that they are kept fully informed.

If it is deemed necessary to move from individual contact to include others this should where possible be done with the client's prior consent.

Psychologists may be asked to provide consultancy or advice to colleagues about an identified client, without that person's knowledge or when the client has indicated that they do not want to have direct contact with the psychologist. In these circumstances, the psychologist will need to consider their potential involvement and the need for consent.

A psychologist who draws upon the work of other professionals in preparing a report, should seek their consent, where possible and if not already in disclosed records, to include that material and should acknowledge its source in the report.

If a report is requested which draws upon previous or concurrent investigations of a client in other contexts, for example NHS records in the preparation of a report for the court, the client's consent or relevant authority's consent for that information to be used should be sought.

If psychologists wish to use reports on clients which have been compiled by other professionals, they should do so only with the consent of those professionals and use the reports only in the context for which the report was specifically provided.

Information on and consent to record-keeping

Express consent must be sought in advance for the use of video, audio recording or one-way screens, with a clear explanation of the purpose of these. Further information is available in ***Section 7.1: Information governance***

6.1 Informed consent for court

When a psychologist is instructed to give evidence in court, it is the court that should be informed and whose authority should be sought for the work undertaken. When serving as a witness in the legal arena, the psychologist is responsible to the court, rather than to either party.

6.2 Informed consent with children and young people

All children and young people, whatever their age or status, have a right to express their views freely and be involved in any decision-making that affects their lives, which includes judicial and administrative proceedings[40]. Therefore, psychologists who seek to work with children or young people must gain their informed consent. This applies whether the child or young person or another agent with legitimate responsibility for the child or young person has made the request for involvement. Any direction or guidance provided by parents or other caregivers must be 'in accordance with the child's evolving capabilities' and support the 'exercise by the child of his or her rights'[41]. The onus is then on the adults to provide appropriate support to enable the child or young person to express their views and contribute to decision-making.

Every psychologist should consider how they can:

- provide an accessible explanation to the child or young person about their work as a psychologist;
- offer a clear reason for their possible involvement;
- provide an opportunity for the child or young person to talk about what working with the psychologist might involve.
- discuss and agree how information is recorded and possibly shared with others with an awareness that young people who are 'Gillick competent' can consent to information not being shared with parents;

- discuss how the child or young person will be kept safe;
- ensure that the child or young person has understood the psychologist's role and has given their informed consent;
- ensure the child or young person understands they can withdraw their consent at any point;
- ensure their practice acknowledges and respects the culture, community and context of the child or young person.

Occasionally, a disagreement over consent may arise between parent/carer and child or young person and/or between parents/carers. The psychologist would make every effort to resolve the difference of views, perhaps seeking, with agreement, involvement of an appropriate family member and/or a colleague, although as discussed above, a young person who is 'Gillick competent' can legitimately request that family members (including parents) are not involved or informed of any involvement. If the disagreement is not resolved, the psychologist should draw on their professional experience to act in the best interest of the child or young person seeking consultation and support through appropriate channels, including safeguarding and legal departments, and consultation with appropriate colleagues including other professionals.

6.3 Informed consent with people who may lack capacity

It is likely that psychologists at some stage within their careers will be working with people who lack capacity to consent to assessment or treatment. This could be because of a wide range of difficulties such as intellectual disability, brain injury, dementia, severe mental health difficulties, and neurological conditions. As a result, it will often be necessary to make a judgment about a client's ability to give informed consent. This should include whether the person is able to:

- understand the information relevant to the decision (e.g. psychological treatment);
- retain that information;
- use or weigh that information as part of the process of making the decision; and
- communicate their decision (whether by talking, using sign language or any other means.)

The Mental Capacity Act 2005 contains 5 key principles which it is important to understand:

1. A presumption of capacity;
2. Individuals being supported to make their own decisions;
3. Individuals have the right to make 'unwise' decisions;
4. Anything done on behalf of a person with a mental capacity issue should be in their best interests; and
5. An intervention should be on the basis of the 'less restrictive option' weighed up in the particular circumstances of the case.

The Mental Capacity Act Code of Practice[42] expands upon these points (and indeed all aspects of the Act), highlighting the need to assist a client in making a decision for

themselves (with the use, for example, of memory aids, simplified resources, etc.). It should also be noted that the fact that a person is able to retain the information relevant to a decision for a short period does not prevent them from being regarded as able to make the decision.

The Mental Capacity Act (2005) provides a clear framework for what to do if a person lacks capacity to make a range of decisions, including consenting to treatment. The principle of 'best interest' must be followed, and the Act states clearly who needs to be consulted in relation to making such a decision and ensuring that the individual's wishes are considered.

It is good practice to give full information (possibly using adapted resources) to clients even when they are not deemed able to give informed consent. The psychologist must, so far as reasonably practicable, permit and encourage the client to participate, or to improve their clients' ability to participate, as fully as possible in any act done for the client and in any decision affecting them.

In some circumstances, it is possible that there may be others who have been given legal authority for decision-making on behalf of others, such as Power of Attorney for Health and Welfare or Deputyships for Health and Welfare. It is important to note that patients might also have created Property and Affairs Lasting Powers of Attorney. Those acting under a Property and Affairs power alone will not have authority to make decisions in relation to a patient's treatment. If someone is a Health and Welfare Attorney or Deputy, those persons will be able to make those decisions on behalf of others. It is also necessary to ensure that the client has not made an Advance Decision to refuse treatment prior to the loss of capacity, although this is unusual in relation to psychological treatment.

In some clinical contexts, particularly relating to brain injury, intellectual disabilities and dementia, issues related to capacity and best interest are particularly prevalent. Psychologists practising in these areas need to ensure sufficient knowledge and expertise. Further information is available in ***Society Document: Guidance on determining the best interests of adults who lack the capacity to make a decision for themselves.***

6.4 Informed consent with people as employees

Tripartite arrangements where an employer commissions and pays for an assessment or intervention, such as diagnostic assessments for neurodiversity and cognitive functioning return to work assessments, or coaching, potentially give the employer access to data that they will struggle to interpret, or may misinterpret, for example test scores and details of personal life. It is important that the psychologist protects the employee by giving the employer only what they need to know and can reasonably require for the purpose of employment.

The Psychologist should consider whether they will be gathering information that is not usually held by an employer, or is not held routinely for all employees, for example IQ scores and childhood experiences. If so, the psychologist should consider abridging documentation so that the employer receives only the information they 'need to know',

and the employee can if necessary hold a full copy for future reference. This prevents discrimination against employees who are subject to in depth assessment for reasons related to illness, neurodiversity or disability from being unfairly compared to their peers. It also prevents complex psychological information from being held by those who are not qualified to interpret it.

Agreements should be made explicitly about the information which can be shared with the commissioning organisation. In order to aid transparency, information should normally be sent to the client prior to being shared with the organisation.

6.5 Informed consent with detained persons

Prisoners

Informed consent may be harder to obtain when a client is detained. Psychologists working with detained persons should be aware that, as well as UK law, the UK is signatory to a number of conventions on the treatment of detained persons. These conventions not only outlaw physical ill-treatment, but also certain kinds of psychological pressure. For example, it is contrary to the UN Convention on Torture to apply psychological pressure to elicit a confession, or compliance with a regime. In this context, 'psychological pressure' could include making progression contingent on compliance with a particular aspect of the regime. Practitioners should be particularly mindful of the power imbalance in forensic contexts, which is far more acute than is generally found in non-justice system based settings. Only offenders detained in secure hospitals can be required to comply with assessments or treatments under involuntary detention sections of the Mental Health Act.

Mental Health Detentions

For psychologists there can be potential conflicts of interest or what could be better termed 'competing duties of care' between the roles of Responsible Clinician (RC) (for further information on this role see Section 3.5) (including the duty to detain or otherwise compel participation in treatment) and that of psychologist (including, principally, the duty to establish freely-given consent wherever possible to enhance the efficacy of the therapeutic intervention). The MHA Code at chapter 24.34 (medical treatment) states that permission given by a patient to a particular treatment 'under any unfair or undue pressure' is not consent (p.257).

Good outcomes for psychological therapies are associated with positive therapeutic alliances and good working relationships between therapists and patients. The potential for even perceived abuse of power and the inherent power differential between an RC and a detained patient subject to the MHA runs a risk of rupturing this relationship or it becoming coercive. Psychologist RCs must therefore remain aware of and give full consideration to any potential competing duties of care between the RC and psychological therapist roles when providing psychological treatments to patients over whom they have compulsory powers.

The main issues to be considered by psychologist RCs when addressing potential competing duties of care in this context include the following:

1. Psychological treatments (with the possible exception of indirect interventions delivered by proxies such as paid staff and carers) are more likely to be effective when informed consent is obtained. As such, RCs acting as psychological therapists should utilise all reasonable and ethical attempts to obtain consent from patients before proceeding with psychological treatment. The *Code* at chapter 24.34–24.39 (p.257) provides guidance on obtaining consent.
2. The Act permits psychological treatment to be given without consent and the Code provides guidance on how to proceed with treatment in these circumstances (chapter 24.40–24.44, pp.257–258). There may be circumstances, especially when significant risks to others or self have been identified, when it is considered to be necessary for a psychologist RC to proceed with providing psychological treatment without consent. In such circumstances then there should be, where practicable, prior discussion with the MDT involved in the patient's treatment and care about the risks involved. Careful consideration should be given to the availability and merits of another suitably qualified member of the team providing the psychological treatment required with the RC remaining in overall charge of the client's care.
3. There may be situations where it is judged that informed consent cannot be clearly obtained, or where it would appear another available practitioner would be more likely to achieve a more effective outcome (perhaps due to the power differential between patient and RC). In such situations the psychologist RC is advised to refer on to other members of the treatment team who are able to provide the psychological treatment needed, while the RC remains in charge of overall care.

7. Managing data and confidentiality

7.1 Information governance

Psychologists should follow local and national guidance and statutory responsibilities regarding management of data. Psychologists should make, keep and disclose information in records only in accordance with national policy and legislation, and the policies and procedures of the organisation(s) they are employed by/working in collaboration with. Further information is available in ***Section 1.1: Legal and professional obligations of psychologists, Appendix 1: Relevant legislation*** and ***Appendix 2: Websites and further information.***

Psychologists must bear in mind the potential impact of the information in their records on all who may have access to such records, for example, the client, other professionals, managers, authorised carers, etc. Where possible, distinction should be made between fact, observation and opinion, and judgemental comments should be avoided. Psychologists are responsible for holding their records securely to ensure the confidentiality of the information contained within them and to control access to them. Further information is available in ***Society Guidance: Guidelines on the use of Electronic Health Records.***

This guidance applies to all record-keeping on clients, their relatives, carers and/or associates, and their organisations, regardless of the media in which information is held, e.g. written notes and reports, audio- and video-recordings, paper and electronic records, etc.

Records made, kept or accessed by psychologists should be:

- systematic and appropriately detailed;
- in clear language/format;
- accurate;
- up to date; and
- relevant to professional work and to the purpose for which they were collected.

Clients have a legal right to access records concerning them, and this right is enshrined in legislation. Additionally, it is good practice for clients to be given feedback on their content. Sharing records with clients supports the collaborative approach of psychologists and enables clients to have full and effective involvement. Client access to records will be restricted to information about themselves and not third parties. Restrictions will also apply when disclosure would place the clients or others at risk of serious harm.

In tripartite arrangements involving an employer access to information should be governed by agreements made explicitly about the information which can be shared with the commissioning organisation.

Shared records

In some organisations in which psychologists work single, multi-professional, client-based records are held. Such records are designed as shared documents (paper or electronic),

the function of which is primarily to facilitate inter-professional communication to ensure the safe and effective delivery of high quality services. Such records may be shared among organisations/agencies to facilitate care and/or exceptionally, to safeguard the client or others, including the general public. In some contexts, clients have the right to object to their data being disclosed to a third party even someone who might provide essential healthcare. Psychologists should be aware of local codes and policies. Further information is available in ***Section 3.5: Working with other professionals***, ***Section 7: Managing data and confidentiality*** and ***Appendix 2: Websites and further information.***

Psychologists should include in the shared record all information about their work with clients and related others which is required to ensure appropriate multi-professional care and to safeguard the client and relevant others, including the general public.

Third-party and sensitive material should be clearly marked. There should be clarity/clear communication within the multi-professional team about what is and is not shared with the client if there are safeguarding concerns. A system needs to be established about how suspicions and causes of concern are recorded and/or shared.

Where shared records are held, other professionals involved with the clients will have access to such records. This should be explained to the clients at the onset of engagement with them.

The use of sealed envelopes is no longer considered good practice following the findings from serious untoward incident investigations where the existence of sealed envelopes compromised care.

Assessment materials

Psychologists should be mindful at all times of the confidential nature of assessment materials. Many assessment measures are invalidated by prior knowledge of their specific content and objectives. Psychologists who use these materials are required to respect their confidentiality and to avoid their release into the public domain (unless this is explicitly allowed in the nature of the instrument and by the test publisher). Psychologists should, therefore, take reasonable steps to prevent misuse of test data and materials by others. Further information is available from ***Appendix 2: Websites and further information.***

In many organisations, there is only one shared records system. In these cases, it is necessary for psychologists to be able to use the shared records system to hold raw data from psychometric assessment. The results of psychometric assessment will be incorporated into reports which explain their context and appropriate interpretation, and which are included in the shared institutional record. In relation to the visibility of the psychometric instrument and the raw data to other members of the multidisciplinary team who are not psychologists, the onus is on the other professionals not to interpret information where they are unqualified to do so, just as the psychologist would not interpret, for example, physical healthcare test results they are unqualified to interpret. Psychologists may consider whether it is appropriate to mark assessment materials so their nature is clear.

Additional data

Psychologists may wish to keep separate notes to aid their work but which are not intended for sharing with others or to be part of the permanent client record. These notes, often called process notes, which are written for the purposes of reflection on practice, should be anonymised with no other identifying links e.g. initials, appointment time, so that these notes therefore are clearly not part of the client record. Process notes may, for example, be used for reflection and supervision. If process notes are made to assist in compilation of a report, the material should be incorporated, as relevant, into the final report and the process notes then destroyed.

Long-term illness, incapacity or death of a psychologist

Most organisations will have procedures in place in the event of illness, incapacity or death of a psychologist. Psychologists in independent practice are advised to make a professional will and to appoint a professional executor, probably an experienced colleague, whose role it would be to take charge of client records, to inform the clients involved and, where appropriate and practicable, to make provision for continuity of the service provided.

Retention and destruction of records

Psychologists' records should be held securely for as long as they are required for the purpose of psychological work. Psychologists must follow legal requirements, national and local policy frameworks and procedures regarding the retention or disposal of records after the psychologist's work is concluded. Psychologists should ensure that they keep up to date with requirements.

For independent practitioners general guidance is that many independent psychologists keep records relating to contact with adults for 7 years, and follow NHS guidance in relation to children. Where the records derive from work undertaken within an organisation, the maintenance of these records is determined by the organisation's policies and legal requirements.

Retention and destruction of health records, both paper and electronic, is covered in the NHS code of practice for records management. Generally speaking, retention is until age 26 for people seen as children; 20 years after the last contact for adults, and 8 years after death if the death occurred while the person was in the care of the NHS. There are specific requirements for mental health services depending on the nature of the contact.

In education settings, Local authorities generally retain Education Health and Care Plans for 35 years after the case has been closed. Other records are retained until the child is 25.

All records must be destroyed under confidential conditions following organisational procedures or for independent practitioners using a destruction service or process which meets industry standards for document management and can provide the appropriate certification.

7.2 Confidentiality

Clients are entitled to expect that the information they give to psychologists about themselves and others will remain confidential. Psychologists have a duty not to disclose

such information except as discussed below and to bring their confidentiality practice to the attention of their clients, employers, managers and any other professionals involved.

Psychologists have a duty to inform involved parties of their confidentiality standards and practice at the point of first contact. Clients should be informed of the limits of confidentiality where information about them may be shared and confidentiality breached, for example for reasons of safeguarding, requirements of the law, and public protection.

Psychologists have a duty to be aware of the content of any other relevant guidelines and of any other policy guidelines which set out local expectations.

Use of client data for audit must follow the Caldicott principles, which, designed for the NHS, provide helpful guidance for any setting in terms of when it is appropriate to use with client-identifiable data and when anonymised data should be used[43]. Generally under data protection legislation, it is necessary to obtain specific informed consent for the use of client data for particular purposes, and to inform clients of the purposes for which their data is being collected and how it will be used. Further information is available in ***Appendix 2: Websites and further information.***

Disclosure of information

If disclosure of information is deemed necessary, psychologists should obtain specific informed consent from their clients, making the consequences of disclosure as clear and unbiased as possible. There are a number of circumstances where this might not be possible or may not apply: for example where the health, safety, security or welfare of the client or someone else may otherwise be put at risk; and if there are legal or safeguarding responsibilities, such as the need to avoid 'tipping off'. If confidentiality is broken without consent, the client should be told what has been said and to whom, unless such disclosure may expose the client or others to serious harm or is contrary to legal or safeguarding obligations.

Psychologists who are faced with the difficult decision as to whether to disclose information without a client's consent must weigh carefully the arguments for and against disclosure. The responsibility for this decision lies with the individual psychologist although they may seek advice and guidance from appropriate sources such as their employing organisation's Information Governance or Data Protection Lead, Clinical Governance Lead, Caldicott Guardian, Safeguarding named and designated professionals, or legal departments. These other professionals can be the most helpful sources of advice in difficult disclosure situations. Independent practitioners may wish to consult the legal helpline of their professional indemnity insurer.

Circumstances may emerge where clients may present a risk to others or to themselves, or be at risk from others whom they wish to protect. It is then necessary to discuss the importance of disclosure and to encourage it, for example to partners of HIV positive clients, and to employers if a client's mental health status presents a risk to others via driving, handling machinery or interaction in a working situation, for example, flight deck crew. Disclosure without consent, or against the client's expressed wish may be necessary in situations in which failure to disclose appropriate information would expose the client, or

someone else, to a risk of serious harm (including physical or sexual abuse) or death.

The psychologist must weigh up the needs and interests of their own client against the wider welfare, protection and safeguarding of the public.

Disclosure to clients' employers, insurance companies and others

Psychologists have a duty to ensure, at first contact, that clients understand the purpose of any assessment undertaken at the request of employers, the DVLA or insurance companies, and of the psychologist's obligation to disclose the results of that assessment. In the case of assessment for fitness to work or to drive, they should obtain the client's written consent.

Psychologists should consider what each party involved needs to know, gaining understanding and agreement on which aspects will be fed back, in advance. For example, the full detailed and raw scores obtained by a psychologist in recruitment assessment processes may be unsuitable for an employer to receive in full. The commissioning body should be made aware of the decision-making data that they originally requested, in the case of an employer this could include strengths and weaknesses, and recommendations for employer actions, for example.

Primary clients should be advised about and able to preview, with opportunity to ask questions first, any data that will be sent to an employer about them. Bear in mind that the informed consent difficulties still stand and that an employee or potential employee can withdraw consent for the employer to be informed of any part of their results.

This can be very difficult to manage in practice, and requires psychologists to make these agreements with their commissioners before they start the work, so that all are informed of the risks in the service delivery. Further information is available in ***Section 3.4: Working with multiple clients.***

Disclosure after a client's death

After a client's death, relatives or other authorities may seek access to the psychologist's records. In the first instance, the psychologist is advised to follow organisational procedures where they exist which usually deal with the administrative proofs required such as proof of death, proof of kinship and right to access the material requested.

A psychologist's duty of confidentiality continues after a client has died. The psychologist will need to weigh up the circumstances around the request for disclosure and what personal information is being sought. If there has been a specific request by the client for their information to remain confidential, their wishes should usually be respected. If the psychologist is unaware of any instructions from the client, when considering requests for information the following should be taken into account:

- the purpose of the disclosure;
- whether the disclosure of information is likely to cause distress to, or be of benefit to, the client's partner or families;
- the permission of a surviving relative or next of kin is not required, and does not authorise disclosure of confidential information, although the views of those who were close to the client may help the psychologist decide if disclosure is appropriate;

- whether the disclosure will also disclose information about the client's family or anyone else; and
- whether the information is already public knowledge or can be anonymised or coded.

There may be circumstances where the disclosure of information is required, for example:
- to support an inquest or fatal accident inquiry;
- where the disclosure is required by law, is authorised under section 251 of the NHS Act 2006, or is justified in the public interest, such as for education or research;
- in the case of national confidential inquiries or for local clinical audit; and
- when a person has a right of access to records under the Access to Health Records Act 1990 or Access to Health Records (Northern Ireland) Order 1993.

7.3 Confidentiality when safeguarding

In exceptional circumstances it may be necessary to breach the client's confidentiality with or without their immediate knowledge or consent. This would be the case where there are significant risks to the client's psychological wellbeing; where the alleged perpetrator may be a current risk to others or where there is risk of jeopardising a potential investigation. Any decision to breach confidentiality cannot be taken lightly, but can be justified and accounted for if made in good faith because of safeguarding concerns. This is supported by professional guidance. The focus of any intervention including any breach of confidentiality must be on promoting a proportionate, measured approach to balancing the risk of harm with respecting the client's capacity to consent, their choices and preferred outcome for their own life circumstances.

Specified authorities may need to share personal information to ensure, for example, that a person at risk of radicalisation is given appropriate support. When considering sharing personal information, the specified authority should take account of the following:
- necessity and proportionality: personal information should be shared only where it is strictly necessary to the intended outcome and proportionate to it. Key to determining the necessity and proportionality of sharing information will be the professional judgement of the risks to an individual or the public;
- consent: wherever possible the consent of the person concerned should be obtained before sharing any information about them;
- power to share: the sharing of data by public sector bodies requires the existence of the power to do so, in addition to satisfying the requirements of the Data Protection Act 1998 and the Human Rights Act 1998; and
- Data Protection Act and the Common Law Duty of Confidentiality: in engaging with non-public bodies, the specified authority should ensure that they are aware of their own responsibilities under the Data Protection Act and any confidentiality obligations that exist.

In relation to health sector staff, government guidance states it is important that staff understand how to balance client confidentiality with the duty to report. They should also be made aware of the information-sharing agreements in place for sharing information with other sectors, and get advice and support on confidentiality issues when responding

to potential evidence that someone is being drawn into terrorism, either during informal contact or consultation and treatment.

7.4 Confidentiality for the court

Psychologists acting as expert or professional witnesses have a duty to disclose all of the evidence used to reach their opinion where directed by the court to do so.

This could include:

- the details of any tests and assessments administered with professional colleagues;
- notes made during report writing; and
- referenced academic articles or studies.

No information relating to an assessment or report should be disclosed outside the relevant proceedings without agreement. Psychologists should normally seek permission from the instructing party to disclose any information to another health care professional.

Where instructed directly by the court, the Crown Prosecution Service, Procurator Fiscal or a solicitor, the psychologist is required to report or comment on any or all aspects of the case that appear to the psychologist, as an expert in the field, to be relevant or pertinent. In such circumstances, the psychologist is not in a position to offer confidentiality to any person, and should make this position clear to any party with whom they have contact during psychological investigations or assessment.

In these circumstances, it will be important that the psychologist makes sure they are up to date with the legislation and policy guidance regarding public and media access to information available to whichever court or tribunal their instruction arises from. The psychologist will need this awareness so that they can explain to the adult or child concerned what the limits of privacy are in these legal circumstances. They will need to make clear to the client which information needs to be made accessible, by whom and under what circumstances. Only when the client understands this, can they give informed consent.

There are different levels of access to sensitive information in different legal contexts; this will include testimony, documents and professional and expert reports. Many proceedings typically take place in open court, to which the public has access. In these cases, there is a presumption in favour of providing information and documents to third parties which were relied upon by the court in reaching its decision, though not the entire court file.

Where court papers and other materials are received in electronic format, psychologists should ensure that these are stored in a secure, password-protected format. This may require the addition of additional security for documents that arrive in an unsecured form. Where psychologists submit reports in an electronic format they should ensure that these are in a secure, password-protected format.

Psychologists working with clients who are the subject of court proceedings may need to be careful to ensure that they keep all records which may be of relevance to the court process until it is clear that the court has reached a final conclusion, including any appeal that may have been heard.

With few exceptions, applications in the family court are heard in private, with only those immediately involved being allowed to attend and access information. It is possible, however, for duly accredited members of the media to attend hearings in the family court, subject to the power to exclude them on specified grounds.

In most family court proceedings, media representatives have no entitlement to receive or peruse court documents referred to in the course of evidence, submissions or judgment. If media representatives wish to see documents referred to in the family court they may apply to the judge for disclosure but they are subject to strict guidance in terms of what information they can divulge into the public domain.

7.5 Confidentiality with children and young people

When beginning direct work with a child or young person, the psychologist should discuss and agree who will have access to the information arising from the work, with direct reference to principles of 'Gillick competence'. In undertaking this discussion it is helpful to acknowledge that there may be those adults (e.g. parents/carers, other relevant professionals such as teachers, social workers, counsellors) who may have a supportive interest in the work and may wish to have appropriate access to information but the wishes of a 'Gillick competent' young person should take precedence unless there are safeguarding concerns.

Parents or those with legal responsibility may be made aware of this agreement if appropriate, although a young person deemed to be Gillick competent is able to agree to work with a psychologist independently. Those with parental responsibility do not have an automatic right of access to the psychologist's records by making a subject access request under data protection legislation.

The nature and purposes of any work will vary and this will determine how and to whom information will be shared, however the child or young person should always be made aware of who will have access to what and for what purpose and due consideration given to the wishes of a 'Gillick competent' young person about who can have access to information about any involvement with a psychologist. The child or young person should be fully aware of the content of any shared information, including as appropriate, copies of the documents. Whatever is agreed about information sharing including work where information is confidential, the psychologist must ensure the child or young person knows and understands that if there is a risk of harm the psychologist must follow safeguarding procedures.

7.6 Confidentiality with detained persons

When detained persons give informed consent to the collection of information, they do so for a specific purpose and for use by specific people. The use of such information for a different purpose or for use by different people would require separate consent. Thus, although a psychologist may interview and write a report on a detained person, consent for that purpose cannot be taken as allowing a third party access to the psychologist's records on that person, such as notes on (or recordings of) the interview. If psychologists are

put under pressure to reveal such information, they should seek the advice of colleagues including for example those responsible for governance or data protection. They should bear in mind that they have a legal duty to be aware of and comply with data protection legislation and professional confidentiality rules.

7.7 Confidentiality obligations during training

During training, no academic/training documents should identify clients to whom they relate (even by means for example of initials, service name or date of appointment) as any such potential identifiers could be used to trace the client and therefore make the document a part of the clinical record and subject to the relevant provisions of data protection legislation. This includes published reports, case studies prepared for trainee assessments and any articles or publications. Tutors and supervisors should communicate this to their trainees. Trainees should be clearly instructed to both make and keep separately those records which are part of the provision of psychological service and which belong to the service organisation and are subject to its policies and procedures; and papers which are anonymised and are part of the trainee's academic learning, and belong to the trainee and are subject to the training provider's policies and procedures.

Express consent should be obtained by trainees before audio- or video-recording their interactions with clients. If the client is unable to give informed consent, it is unlikely to be appropriate for the recording to be made. Careful consideration should be given before any material is recorded if the client is party to any legal proceedings or family or employment disputes. If material is to be used for purposes other than client care (including teaching and research), the client should be informed of the purposes of the recording. It should be made clear to clients how the material will be used and to whom it will be disclosed, for example, trainee students, other researchers, and supervisors.

The trainee and the client should come to an agreement about how long recorded material should be kept. The general principle is that recordings will be kept for as long as needed to fulfil the purpose for which the client has given consent and no longer. The security of the material must be maintained, and it must be destroyed at the agreed time limit if no longer required.

Informed consent is required before client material in an identifiable format may be published in case studies, presentations or other research reports. It is becoming common practice for clinical material in professional doctorate portfolios to be stripped out before the thesis is placed in online institutional repositories.

8. How to respond when things go wrong

8.1 Managing conflict with a client

Conflict with a client suggests that someone's expectations are not being met. The first objective should be to restore agreement or agree to make changes. The well prepared psychologist will have a client agreement in place and will be able to review the experience against the agreement with the client to address this question. Further information is available in ***Section 5: Making and maintaining agreements***. Even in the absence of an agreement, the psychologist would be advised to enquire with the client where their expectations are unmet or raise their own unmet expectations with the client. This can be an opportunity to put a belated agreement in place.

It may be that the parties agree to set aside the agreement and bring it to an early close. Agreeing to disagree may be a better outcome for psychologist and client who cannot restore agreement. Take account of any need for onward referral either within the service or elsewhere or back to the original referrer, and depending on the nature of the work setting, any financial obligations in closing the work.

The psychologist may find it helpful to consult with appropriate colleagues in preparation for the conversations with the client, such as line or service managers, those with other relevant organisational responsibilities, and supervisors. There may be more general lessons to be drawn as part of reflective practice in relation to the quality of the client agreement for future use.

8.2 Transparency and duty of candour

The Health and Social Care Act 2008 (Regulated Activities) Regulations 2014 duty of candour (regulation 20) requires all health and adult social care providers registered with the Care Quality Commission to be open with people when things go wrong. Psychologists need to be aware of the terminology relating to this regulation including:

- openness – enabling concerns and complaints to be raised freely without fear and questions asked to be answered;
- transparency – allowing information about the truth about performance and outcomes to be shared with staff, patients, the public and regulators; and
- candour – any patient harmed by the provision of a healthcare service is informed of the fact and an appropriate remedy offered, regardless of whether a complaint has been made or a question asked about it.

Psychologists also have a responsibility to ensure that they engage in open and transparent communications with people who use services and other 'relevant persons' (people acting lawfully on their behalf) in relation to care and treatment. Guidance from the Care Quality Commission on duty of candour outlines the specific requirements that providers must follow when things go wrong with care and treatment, including informing people about

the incident, providing reasonable support, providing truthful information, and making an apology. Psychologists are instrumental in supporting organisations to promote a culture that encourages candour, openness and honesty at all levels. Further information is available in ***Appendix 2: Websites and further information.***

8.3 Managing conflict in team settings

Dealing with breakdowns in working relationships, professional disagreements and fitness to practise concerns

As far as possible, psychologists should seek to resolve any conflict with or between other professional colleagues (including relating to consultation/supervision or line management) by clear communication, relevant evidence and collaboratively working through the issues in reasoned argument within the context of respectful relationships.

The psychologist should first approach the colleague in confidence, if it is appropriate, with relevant information, in a manner that is collegiate and helpful. If misgivings continue, the psychologist should consult with an appropriate colleague to share concerns and to seek advice. Where appropriate they should keep a written record of the meetings and steps taken to resolve any difficulties.

Where there is serious or continual disagreement, both parties need to take whatever action is appropriate in their professional context, consulting other experienced professionals as necessary.

Supervisors and line managers have professional obligations concerning professional standards, ethical practice and 'fitness to practise' issues. If line managers or supervisors have any concerns regarding performance in these areas, they have a duty to discuss these with the psychologist and, if necessary, address the matters by in the first instance following appropriate employment policies and procedures, or in the case of an independent practitioner, making a report to the HCPC.

Working in multi-professional or multi-agency contexts

Psychologists may find themselves in conflict with the approaches to work taken by other individual colleagues or by the multi-professional team or agency.

Psychologists should bring to the awareness of the multi-professional team or agency any difficulty in the group working together which may impact on the psychologist's ability to function effectively and ethically in their role. Such issues are best addressed when guided by national and local policy and current legislation before proceeding with multi-professional/multi-agency collaboration. Further information is available in ***Appendix 1: Relevant legislation.***

The psychologist may also have cause for concern about the ability of the team to provide for the needs of the client owing to interpersonal difficulties between members of the multi-agency or multidisciplinary team that might have an indirect impact on the client. As far as possible, psychologists should seek to resolve any conflict with or between other professional colleagues by clear communication, relevant evidence and collaboratively

working through the issues in reasoned argument within the context of respectful relationships.

If the situation remains unresolved for any reason, for example because it is judged not to be an issue for active management, the psychologist must make a judgement about whether their involvement in the team is helpful to the client or the working of the team. If not, the psychologist should consult with an appropriate colleague about whether they should disengage from that team.

A psychologist may also experience concerns about the competence or ethical practice of individual colleagues involved in joint working. These concerns may relate to the competence of the colleague to carry out a particular intervention, the appropriateness of an intervention for a particular client or problem, the nature of the relationship between a colleague and his or her client (e.g. potential abuses of power).

The psychologist should first approach the colleague in confidence, if it is appropriate, with relevant information, in a manner that is collegiate and helpful. If misgivings continue, the psychologist should consult with an appropriate colleague to share concerns and to seek advice. Where appropriate they should keep a written record of the meetings and steps taken to resolve any difficulties.

If they conclude that misconduct has occurred, psychologists should bring the matter to the attention of those charged with the responsibility to investigate such concerns, generally in the first instance an employer or in the case of an independent practitioner, the HCPC. Further information is available in ***Section 2.1: Working environment.***

8.4 Supporting a colleague when a complaint has been made

The receipt of a complaint or allegation can be distressing for all concerned, not least for the person who is the subject of the complaint or allegation. It is important that they receive advice and support from appropriate persons. Any potential conflicts of interest should be considered. It may be that a psychologist is not best placed to offer support and guidance as they may be called as a witness in the complaints process. Encourage colleagues to seek advice from an experienced colleague or supervisor where appropriate.

The psychologist should also be encouraged to seek the support of an accredited workplace trade-union representative who is skilled at supporting people in these situations and can access legal advice if necessary. Legal advice can also be obtained from the professional indemnity insurance broker, and sometimes from household insurance policies where the householder has taken out the legal advice additional option.

Complaints are an increasingly normal occurrence and must be handled in a professional manner. The complaint investigator or professional body will need the psychologist's version of events and any evidence before any conclusions are reached. Psychologists should support colleagues to respond promptly, objectively, factually and honestly to the complaint. The content of the complaint should always be held in confidence.

8.5 If the client remains unhappy

If any conflict or issue as referred to in this section cannot be resolved, it may be appropriate to advise a client or other individual that that they have a right to raise any concerns about a psychologist with the Health and Care Professions Council, further details of which can be found at www.hcpc-uk.org

Acknowledgements

These guidelines were updated by a working group of the Professional Practice Board of the British Psychological Society. The working group was constituted to include all of the member networks of the Society whose members engage in practice, including the HCPC registered practitioners. It included representatives of the Society's national branches in Scotland, Wales and Northern Ireland, in order to ensure applicability to the different national contexts. It also included representation from the expert working groups of the Society's Professional Practice Board and others on specialist topics of practice. Thanks are due to the members of the working group, and to the founder authors of the first and second editions of the guidelines whose work is the core and the foundation stone of the current edition.

Appendix 1 – Relevant legislation

Unless otherwise stated, Acts can be found on the government website http://www.legislation.gov.uk/

United Kingdom and England

Care Act 2014

An Act to make provision to reform the law relating to care and support for adults and the law relating to support for carers; to make provision about safeguarding adults from abuse or neglect; to make provision about care standards; to establish and make provision about Health Education England; to establish and make provision about the Health Research Authority; to make provision about integrating care and support with health services; and for connected purposes.

Care Standards Act 2000

An Act to establish a National Care Standards Commission; to make provision for the registration and regulation of children's homes, independent hospitals, independent clinics, care homes, residential family centres, independent medical agencies, domiciliary care agencies, fostering agencies, nurses agencies and voluntary adoption agencies; to make provision for the regulation and inspection of local authority fostering and adoption services; to make provision for the registration, regulation and training of those providing child minding or day care' to make provision for the protection of children and vulnerable adults; to amend the law about children looked after in schools and colleges.

Children Act 1989

An Act to reform the law relating to children; to provide for local authority services for children in need and others; to amend the law with respect to children's homes, community homes, voluntary homes and voluntary organisations; to make provision with respect to fostering, child minding and day care for young children and adoption; and for connected purposes.

Children and Families Act 2014

An Act to make provision about children, families, and people with special educational needs or disabilities; to make provision about the right to request flexible working; and for connected purposes.

Data Protection Act 1998

An Act to make new provision for the regulation of the processing of information relating to individuals, including the obtaining, holding, use or disclosure of such information. The Act states that anyone who processes personal information must comply with eight principles, which make sure that personal information is:

- fairly and lawfully processed;

- processed for limited purposes;
- adequate, relevant and not excessive;
- accurate and up to date;
- not kept for longer than is necessary;
- processed in line with your rights;
- secure; and
- not transferred to other countries without adequate protection.

Equality Act 2010

An Act to make provision to require Ministers of the Crown and others when making strategic decisions about the exercise of their functions to have regard to the desirability of reducing socio-economic inequalities; to reform and harmonise equality law and restate the greater part of the enactments relating to discrimination and harassment related to certain personal characteristics; to enable certain employers to be required to publish information about the differences in pay between male and female employees; to prohibit victimisation in certain circumstances; to require the exercise of certain functions to be with regard to the need to eliminate discrimination and other prohibited conduct; to enable duties to be imposed in relation to the exercise of public procurement functions; to increase equality of opportunity; to amend the law relating to rights and responsibilities in family relationships; and for connected purposes.

Health and Social Care Act 2012

An Act to establish and make provision about a National Health Service Commissioning Board and clinical commissioning groups and to make other provision about the National Health Service in England; to make provision about public health in the United Kingdom; to make provision about regulating health and adult social care services; to make provision about regulating health and social care workers; to make provision about public involvement in health and social care matters, scrutiny of health matters by local authorities and co-operation of health care services; to make other provision about information relating to health or social care to make other provision about health care; and for connected purposes.

Mental Capacity Act 2005

An Act to make new provision relating to persons who lack capacity; to establish a superior court of record called the Court of Protection in place of the office of the Supreme Court called by that name; to make provision in connection with the Convention on the International Protection of Adults signed at the Hague on 13th January 2000; and for connected purposes.

Mental Health Act 1983 as amended 2007

An Act to consolidate the law relating to mentally disordered persons. The main purpose of the Mental Health Act 1983 as amended 2007 (MHA) is to allow compulsory action to be taken, where necessary, to ensure that people with mental disorders receive the care and treatment they require for their own health or safety, or for the protection of other people.

Offender Rehabilitation Act 2014

An Act to make provision about the release, and supervision after release, of offenders; to make provision about the extension period for extended sentence prisoners; to make provision about community orders and suspended sentence orders; and for connected purposes.

Official Secrets Act 1989

An Act to replace section 2 of the Official Secrets Act 1911 by provisions protecting more limited classes of official information.

Regulation of Investigatory Powers Act (RIPA) 2000/Investigatory Powers Act 2016

An Act to make provision for and about the interception of communications, the acquisitions and disclosure of data relating to communications, the carrying out of surveillance, the use of human intelligence sources and acquisitions of the means by which electronic data protected by encryption or passwords may be decrypted or accessed; equipment interference, bulk personal datasets and other information; to make provision about the treatment of material held as a result of such interception, equipment interference or acquisition or retention; to establish the Investigatory Powers Commissioner and other Judicial Commissioners and make provision about them and other oversight arrangements; to make further provision about investigatory powers and national security; to amend sections 3 and 5 of the Intelligence Services Act 1994.

Safeguarding Vulnerable Groups Act 2006

An Act to make provision in connection with the protection of children and vulnerable adults. Safeguarding means protecting people's health, wellbeing and human rights, and enabling them to live free from harm, abuse and neglect.

Northern Ireland

Children Act 1989 – NI has a Criminal Justice Children's Order 1998

An Act to reform the law relating to children; to provide for local authority services for children in need and others; to amend the law with respect to children's homes, community homes, voluntary homes and voluntary organisations; to make provision with respect to fostering, child minding and day care for young children and adoption; and for connected purposes.

Criminal Justice (Northern Ireland) Act 2013

An Act to amend the law relating to sex offender notification, sexual offences prevention orders and human trafficking; to provide for the destruction, retention, use and other regulation of certain fingerprints and DNA samples and profiles; to provide for the release on license of persons detained under Article 45(2) of the Criminal Justice (Children) (Northern Ireland) Order 1998.

Criminal Justice (Northern Ireland) Order 2008 and Public Protection Arrangements in Northern Ireland (PPANI)

The Criminal Justice (NI) Order 2008 introduced a new sentencing framework, including extended and indeterminate sentences for public protection to reduce the risk of dangerous sexual and violent offenders being released into the community until the risk they pose is considered by the parole commissioners to be at a manageable level. The Public Protection Arrangements in Northern Ireland (PPANI) contained within the Criminal Justice (NI) Order 2008, place a duty on a number of agencies, within the criminal justice sector and elsewhere, to cooperate in the interest of better assessment and management of risk posed by serious sexual and violent offenders.

Justice Act (Northern Ireland) 2015

An Act to provide for a single jurisdiction for county courts and magistrates' courts; to amend the law on committal for trial; to provide for prosecutorial fines; to make provision in relation to victims and witnesses in criminal proceedings and investigations; to amend the law on criminal records and live links; to provide for violent offences prevention orders; to make other amendments relating to the administration of civil and criminal justice; and for connected purposes.

Mental Capacity Act (Northern Ireland) 2016

This Act fused mental health and mental capacity law into a single piece of legislation. The Act provides a framework for broader decision-making which includes: a statutory presumption of capacity, a requirement to support decision-making, mechanisms to allow individuals to plan for times that they do not have capacity, and safeguards to protect the rights of individuals when compulsory interventions or substitute decisions are required. It will remove the ability for someone to be treated for a mental health condition against his or her wishes if he or she retains the capacity to refuse such treatment, thus putting it on a par with the rights that individuals currently enjoy to make decisions regarding physical health treatment.

The Parole Commissioners' Rules (Northern Ireland) 2009

The Parole Commissioners for Northern Ireland are an independent body responsible for making decisions on the release and recall of prisoners sentenced to life, indeterminate custodial sentences, and extended custodial sentences, as well as the recall of prisoners serving determinate sentences.

The Sexual Offences (Northern Ireland) Order 2008

The Sexual Offences (Northern Ireland) Order 2008 lowered the age of sexual consent from 17 to 16 and incorporated significant changes to the law in relation to sexual offences in Northern Ireland; better protection for young people and people with a mental disorder from sexual abuse and exploitation; and sought to clarify issues surrounding consent in sexual assault cases and rape.

Scotland

Adoption and Children (Scotland) Act 2007

An Act of the Scottish Parliament to restate and amend the law relating to adoption; to make other provision in relation to the care of children; to enable provision to be made in relation to allowances in respect of certain children; and for connected purposes.

Adults with Incapacity (Scotland) Act 2000

An Act of the Scottish Parliament to make provision as to the property, financial affairs and personal welfare of adults who are incapable by reason of mental disorder or inability to communicate; and for connected purposes.

Adult Support and Protection (Scotland) Act 2007

An Act of the Scottish Parliament to make provision for the purposes of protecting adults from harm; to require the establishment of committees with functions relating to the safeguarding of adults who are at risk of harm; to amend the law relating to incapable adults; to allow the Public Guardian to intervene in court proceedings; to amend the law relating to mentally disordered persons; and for connected purposes

Children (Scotland) Act 1995

An Act to reform the law of Scotland relating to children, to the adoption of children and to young persons who as children have been looked after by a local authority; to make new provision as respects the relationship between parent and child and guardian and child in the law of Scotland; to make provision as respects residential establishments for children and certain other residential establishments; and for connected purposes.

Children and Young People (Scotland) Act 2014

An Act of the Scottish Parliament to make provision about the rights of children and young people; to make provision about investigations by the Commissioner for Children and Young People in Scotland; to make provision for and about the provision of services and support for or in relation to children and young people; to make provision for an adoption register; to make provision about children's hearings, detention in secure accommodation and consultation on certain proposals in relation to schools; and for connected purposes.

Mental Health (Scotland) Act 2015

An Act of the Scottish Parliament to amend the Mental Health (Care and Treatment) (Scotland) Act 2003 in various respects; to make provision about mental health disposals in criminal cases; to make provision as to the rights of victims of crime committed by mentally-disordered persons; and for connected purposes.

Mental Health (Care and Treatment) (Scotland) Act 2003

An Act of the Scottish Parliament to restate and amend the law relating to mentally disordered persons; and for connected purposes.

Protection from Abuse (Scotland) Act 2001

An Act of the Scottish Parliament to enable a power of arrest to be attached to interdicts

granted to protect individuals from abuse; to regulate the consequences of such attachment; and for connected purposes.

Protection of Children and Prevention of Sexual Offences (Scotland) Act 2005

An Act of the Scottish Parliament to make it an offence to meet a child following certain preliminary contact and to make other provision for the purposes of protecting children from harm of a sexual nature, including provision for implementing in part Council Framework Decision 2004/68/JHA; and to make further provision about the prevention of sexual offences.

Protection of Vulnerable Groups (Scotland) Act 2007

An Act of the Scottish Parliament to bar certain individuals from working with children or certain adults; to require the Scottish Ministers to keep lists of those individuals; to make further provision in relation to those lists; to establish a scheme under which information about individuals working or seeking to work with children or certain adults is collated and disclosed; to amend Part 5 of the Police Act 1997; to amend the meaning of school care accommodation service in the Regulation of Care (Scotland) Act 2001; and for connected purposes

Public Bodies (Joint Working) (Scotland) Act 2014

An Act of the Scottish Parliament to make provision in relation to the carrying out of functions of local authorities and Health Boards; to make further provision about certain functions of public bodies; to make further provision in relation to certain functions under the National Health Service (Scotland) Act 1978; and for connected purposes.

Regulation of Care (Scotland) Act 2001

An Act of the Scottish Parliament to establish the Scottish Commission for the Regulation of Care and the Scottish Social Services Council; to make provision for the registration and regulation of care services and for the registration, regulation and training of social service workers; to enable local authorities to provide and maintain residential accommodation in which nursing is provided; to make further provision as respects persons who have been looked after by local authorities; to amend the definition of 'place of safety' in the Children (Scotland) Act 1995.

Smoking, Health and Social Care (Scotland) Act 2005

To amend the Regulation of Care (Scotland) Act 2001 as respects what constitutes an independent health care service, the implementation of certain decisions by the Scottish Commission for the Regulation of Care or the Scottish Social Services Council, the provision of information to the Council and the minimum frequency of inspection of care services by the Commission to amend the Adults with Incapacity (Scotland) Act 2000 as respects authorisation of medical treatment; to amend the Public Health (Scotland) Act 1897 to introduce a right of appeal in certain cases under that Act; to enable the Scottish Ministers to form, participate in and provide assistance to companies for the purpose of providing facilities or services for persons exercising functions under the National Health Service (Scotland) Act 1978 or of making money available to the health service in Scotland

Social Care (Self-directed Support) (Scotland) Act 2013

An Act of the Scottish Parliament to enable local authorities to provide support to certain carers; to make provision about the way in which certain social care services are provided by local authorities; and for connected purposes.

Vulnerable Witnesses (Scotland) Act 2004

An Act of the Scottish Parliament to make provision for the use of special measures for the purpose of taking the evidence of children and other vulnerable witnesses in criminal or civil proceedings; to make provision about the admissibility of expert psychological or psychiatric evidence as to subsequent behaviour of the complainer in criminal proceedings in respect of certain offences to make provision about the admissibility of certain evidence bearing on the character, conduct or condition of witnesses in proceedings before a sheriff relating to the establishment of grounds of referral to children's hearings; to abolish the competence test for witnesses in criminal and civil proceedings; and for connected purposes.

Wales

The Mental Health (Wales) Measure 2010

This measure places new legal duties on local health boards and local authorities in Wales in relation to the assessment and treatment of mental health problems. The Measure became law in December 2010 and there are 4 parts to it which are as follows:

- Part 1 ensures that there are more mental health services are available within primary care.
- Part 2 makes sure all patients in secondary services have a Care and Treatment plan.
- Part 3 enables all adults discharged from secondary services to refer themselves back to those services.
- Part 4 supports every in-patient to have help from an independent mental health advocate if wanted.

Social Services and Well-being (Wales) Act 2014

An Act of the National Assembly for Wales to reform social services law; to make provision about improving the wellbeing outcomes for people who need care and support and carers who need support; to make provision about co-operation and partnership by public authorities with a view to improving the wellbeing of people; to make provision about complaints relating to social care and palliative care; and for connected purposes.

Violence against women, Domestic Abuse and Sexual Violence (Wales) Act 2015

An Act of the National Assembly for Wales to improve arrangements for the prevention of gender-based violence, domestic abuse and sexual violence; to improve arrangements for the protection of victims of such abuse and violence; to improve support for people affected by such abuse and violence; and to require the appointment of a National Adviser on gender-based violence, domestic abuse and sexual violence.

Well-being of Future Generations (Wales) Act 2015

An Act of the National Assembly for Wales to make provision requiring public bodies to do things in pursuit of the economic, social, environmental and cultural wellbeing of Wales in

a way that accords with the sustainable development principle; to require public bodies to report on such action; to establish a Commissioner for Future Generations to advise and assist public bodies in doing things in accordance with this Act; to establish public services boards in local authority areas; to make provision requiring those boards to plan and take action in pursuit of economic, social, environmental and cultural wellbeing in their area; and for connected purposes.

Appendix 2 – Websites and further information

British Psychological Society – www.bps.org.uk

The Society website has guidance, advice and further information on many topics not covered in these guidelines as well as those mentioned.

Psychologists working in clinical fields will also need to take account of Clinical Guidelines produced by NICE in England and Wales https://www.nice.org.uk/ or SIGN in Scotland http://www.sign.ac.uk/

1.1 Legal and professional obligations of psychologists

HCPC – http://hcpc-uk.org
The Health and Care Professions Council website has lots of information about professional registration including the standards of proficiency for the seven protected titles and information about indemnity insurance

Information Commissioner's Office – https://ico.org.uk/
The ICO website contains lots of useful information for organisations, private practitioners and the public regarding the rights and responsibilities under the data protection and Freedom of Information Acts.

DBS Checks – https://www.gov.uk/disclosure-barring-service-check
The government website provides helpful information for employers regarding these checks.

1.2 Continuing professional development

The HCPC has provided guidance regarding CPD for registrants. http://www.hcpc-uk.org/cpd

2.1 Working environment

Lone Working

Suzy Lamplugh Trust – http://www.suzylamplugh.org/

The Suzy Lamplugh Trust campaigns for personal safety and has lots of advice for people working alone to help to keep safe. They have some good advices and resources available.

Harassment and Bullying

ACAS – http://www.acas.org.uk/
The Advisory, Conciliation and Arbitration Service (ACAS) is a statutory organisation providing help and advice for employers and employees. They have produced guidance on several topics including harassment and bullying aimed separately at employers and employees.

Whistleblowing

Whistleblowing for employees – https://www.gov.uk/whistleblowing

The government has produced some guidance for employees surrounding whistleblowing including what to do and what to expect.

2.2 Working in the digital age

Health Insurance Portability and Accountability Act of 1996 (HIPAA) – http://www.hhs.gov/hipaa/

This American act makes provisions for health information privacy. The government website provides information for professionals regarding this act.

N.B This Act is ONLY law for practice in America.

Social Media

The HCPC has provided guidance regarding the use of social media by professional psychologists.

http://www.hcpc-uk.org/Assets/documents/100035B7Social_media_guidance.pdf

3. Safeguarding

Statutory guidance Working together to safeguard children – https://www.gov.uk/government/publications/working-together-to-safeguard-children–2
Statutory guidance on inter-agency working to safeguard and promote the welfare of children.

Getting it Right for Every Child (GIRFEC) and the Early Years Framework – http://www.maternal-and-early-years.org.uk/getting-it-right-for-every-child-principles-and-values
This is an NHS Scotland approach which establishes the principle of giving all children and young people the best possible start in life as a priority for all services.

UK Government Guidance – https://www.gov.uk/government/publications/no-secrets-guidance-on-protecting-vulnerable-adults-in-care
No Secrets sets out a code of practice for the protection of vulnerable adults.

It explains how commissioners and providers of health and social care services should work together to produce and implement local policies and procedures. They should collaborate with the public, voluntary and private sectors and they should also consult clients, their carers and representative groups. Local authority social services departments should co-ordinate the development of policies and procedures.

Protection of vulnerable adults scheme (POVA) – http://www.scie.org.uk/publications/guides/guide03/law/adults.asp
Individuals should be referred to, and included on, the POVA list if they have abused, neglected or otherwise harmed vulnerable adults in their care or placed vulnerable adults

in their care at risk of harm. By making statutory checks against the list, providers of care must ensure they do not offer such individuals employment in care positions. POVA checks are requested as part of disclosures from the Criminal Records Bureau.

Prevention and Protection in Partnership 2015 – https://www.health-ni.gov.uk/sites/default/files/publications/dhssps/adult-safeguarding-policy.pdf

This policy from Northern Ireland is for all organisations working with, or providing services to, adults across the statutory, voluntary, community, independent and faith sectors. It sets clear and proportionate safeguarding expectations across the range of organisations.

Modern Slavery and the national referral mechanism (NRM) – https://www.gov.uk/government/collections/modern-slavery
These pages provide details about the government's work to end modern slavery, including details about how to refer victims into the NRM.

Let's talk about it – http://www.ltai.info/about/
Let's Talk About It is an initiative designed to provide practical help and guidance to the public in order to stop people becoming terrorists or supporting terrorism.

4. Managing data and confidentiality

Information Commissioners Office – https://ico.org.uk/
The Information Commissioners Office produces guidance with regards to data sharing and the Data protection and Freedom of information Acts.

HCPC guidance on confidentiality – http://www.hcpc-uk.co.uk/assets/documents/100023F1GuidanceonconfidentialityFINAL.pdf
The HCPC has provided guidance on confidentiality for registrants.

NHS – https://digital.nhs.uk/article/402/Information-Governance
The NHS has produced guidance regarding Information Governance and security for NHS and partner organisations. The NHS has codes of practice for Records management and Confidentiality.

Caldicott Report – https://www.gov.uk/government/publications/the-information-governance-review
A review was commissioned in 1997 by the Chief Medical Officer of England owing to increasing concern about the ways in which patient information is being used in the NHS in England and Wales and the need to ensure that confidentiality is not undermined. Such concern was largely due to the development of information technology in the service, and its capacity to disseminate information about patients rapidly and extensively. A committee was established under the chairmanship of Dame Fiona Caldicott. The Caldicott Report highlighted six key principles, and made 16 specific recommendations. In 2012 Dame Caldicott produced a follow up report which made 26 further recommendations including the addition of a seventh principle.

Psychological Testing Centre – http://ptc.bps.org.uk/ptc/guidelines-and-information

The PTC website contains lots of guidance about psychometric testing and the management of data generated from those tests.

5. Transparency and duty of candour

Care Quality Commission – http://www.cqc.org.uk/sites/default/files/20150327_duty_of_candour_guidance_final.pdf
The CQC has produced Information for all providers: NHS bodies, adult social care, primary medical and dental care, and independent healthcare with regards to duty of candour.

Appendix 3 – How this document has been developed

In developing these guidelines, the overall aim and scope of the guidelines was considered at length, and the decision arrived at that they should be applicable to all psychologists irrespective of registration status or practice context. The guidelines have therefore been written in a way which it is hoped is inclusive of the various contexts of practice. Drawing on a broad stakeholder group for the development work, the guidelines aim to cover all the important considerations for practice. It is however recognised they cannot cover every circumstance and also that new issues arise which will require careful consideration by the individual psychologist.

The Practice Guidelines development Working Group was constituted to include all of the member networks of the Society whose members engage in practice, including the HCPC registered practitioners. It included representatives of the Society's national branches in Scotland, Wales and Northern Ireland, in order to ensure applicability to the different national contexts. It also included representation from the expert working groups of the Society's Professional Practice Board and others on specialist topics of practice.

The content of the guidelines has been developed from a combination of revision of the previous edition in the light of professional consensus on current expectations of a good standard of practice of psychology; inclusion of key points from other Society guidance on specific topics with reference to further guidance; and in some cases development of new material drawing on the professional experience of our members or outside professionals in the field. The working group has not used systematic methods to search for or assess the evidence for the material included. Recommendations have been included based on working group consensus. Where there are known areas of professional difference of opinion this has been stated.

A draft of the guidelines was circulated for Society wide consultation and one month allowed for comment. This included circulation to Experts by Experience (psychology service user representatives) with whom the Society works in various contexts. The Guidelines were also sent for comment to the Health and Care Professions Council as the statutory regulator for practitioner psychologists. Comments received were considered carefully by the Working Group and changes made to the text of the guidelines where considered necessary. The annotated audit sheet of the comments received and disposal was provided to a meeting of the Society's Professional Practice Board to assist its consideration of the draft guidelines, by way of final peer scrutiny. The guidelines were reviewed by the Society's legal advisers prior to publication. Final approval of the guidelines was given by the Society's Board of Trustees.

The guidelines will be reviewed and updated in accordance with Society policy after five years or sooner if circumstances indicate this is needed.

To ensure clarity and presentation in a user friendly format, the Guidelines have been edited by professional staff within the Society and the format designed by the Society's Preparation for Print specialists. Where considered helpful, links have been made to

additional web based resources, both to assist practitioner development and to provide up to date information in areas where there is frequent change. Organisational providers of psychological services are encouraged to review how these guidelines are used in practice and feed back to the Society any barriers to application.

In ensuring an appropriate level of independence in the production of these Guidelines, the Society has ensured its conflict of interest policy has been complied with and that no member of the working group's input has been compromised by a conflict of interest. No member has received any form of remuneration other than reimbursement of travel and subsistence expenses in accordance with Society policy. The large size of the working group and peer scrutiny and challenge, as well as the robust consultation process, guards against the potential for any one member or small group of members inappropriately to bias the Guidelines.

INF115/08.17

“*RECOVERY* E SALUTE MENTALE”

Dr. Fabrizio Starace

Direttore
DSM-DP, AUSL Modena

Definizione

La Riabilitazione Psichiatrica e' quell'insieme di interventi mirati a migliorare il funzionamento di persone con disabilita' psichiche, in modo di essere in grado di svolgere un ruolo valido con successo e soddisfazione nell'ambiente di vita scelto con il minor sostegno continuativo possibile.

(Anthony, Farkas, Cohen, Gagne, 2002)

La Riabilitazione Psichiatrica

approccio atto a favorire i percorsi di ***Recovery*** dalla malattia mentale grave.

Recovery

Un processo di cambiamento attraverso cui l'individuo migliora la propria salute e benessere, vive in modo "self-directed" e si impegna a viere al meglio delle proprie potenzialità

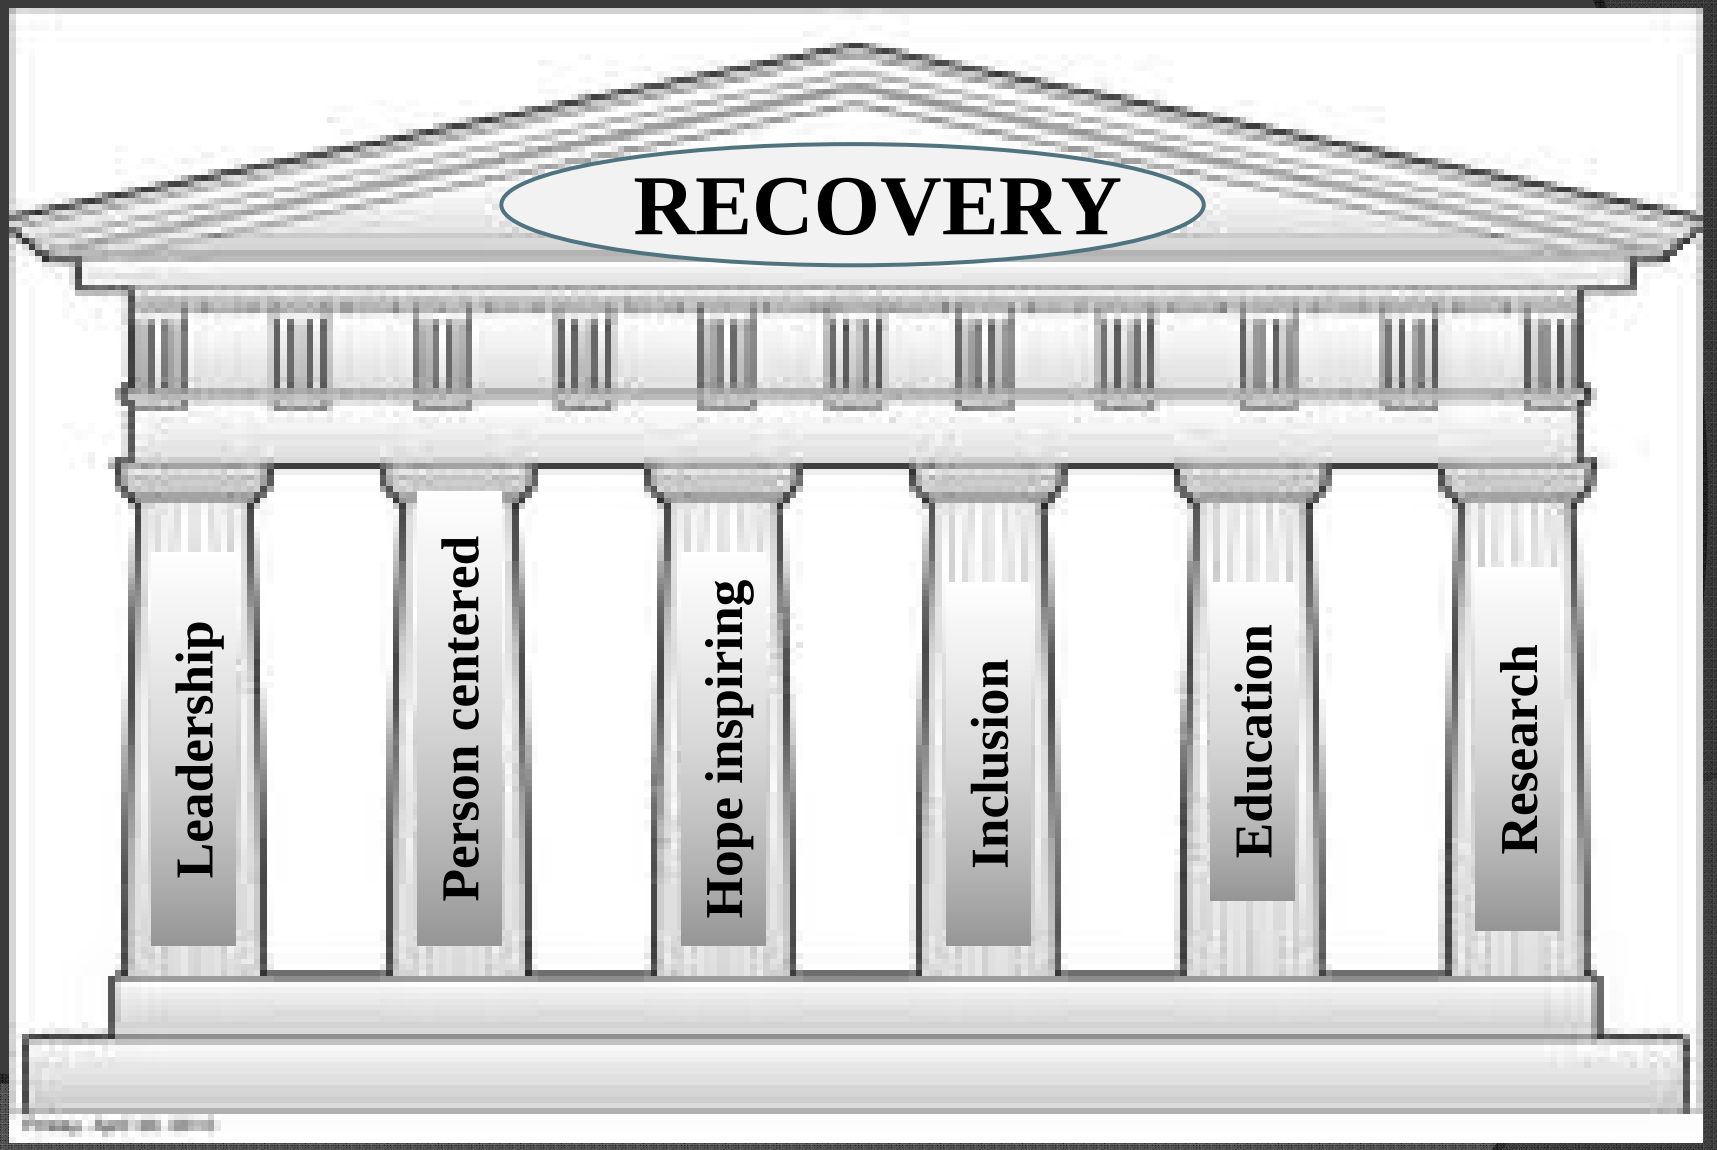
SAMHSA: Substance Abuse and Mental Health Services Administration, www.samhsa.gov

Recovery Support Strategic Initiative

SAMHSA ha individuato 4 maggiori dimensioni che supportano la Recovery

- Health: superare e gestire un disturbo/sintomi (i.e. astinenza da alcohol-sostanze, prendere decisioni consapevoli e per la propria salute)
- Home: un luogo sicuro dove vivere
- Purpose: attività significative (i.e. lavoro, studio, tempo libero)
- Community: sentirsi parte di una rete sociale (i.e. amici, famiglia)

The Irish Menatal Health Services MenataHealth Commission 2008



Principles Of Mental Health recovery-oriented practice

- Uncità dell'individuo
- Scelte individuali e indipendenti (*real choices*)
- Diritti e atteggiamento proattivo
- Dignità e rispetto
- Comunicazione e partnership con i Servizi
- Continua valutazione e misurazione della pratica clinica orientata alla recovery

Herefordshire partnership NHS Foundation Trust
«Recovery Principles in the UK»

La “Recovery” dalla malattia mentale grave

Esempi di “Recovery”:

- Ripresa dai danni di un terremoto
- Ripresa dalla crisi economica
- Ripresa da un infarto/ictus

E’ opinione diffusa che.....

L’esito della Schizofrenia sia:

- **20-30%** ritorno sostanziale al livello di funzionamento premorboso dopo un primo periodo di malattia acuta
- **20%** continuo e progressivo deterioramento
- **50-60%** decorso più variabile ma a lungo termine, senza miglioramenti né peggioramenti

Definizione di Recovery

“ Condurre una vita produttiva e soddisfacente anche in presenza delle limitazioni imposte dalla malattia mentale.

E’ lo sviluppo, personale e unico, di nuovi significati e propositi man mano che le persone evolvono oltre la catastrofe della malattia mentale.’

Anthony, 1993

- **Clinincal Recovery**

Concetto che deriva dall'esperienza degli operatori della Salute Mentale e prevede la remissione dei sintomi e il ripristino del funzionamento sociale. In altre parole «il ritorno alla *normalità*»

- **Personal Recovery**

Concetto che emerge dalle conoscenze di persone con esperienza diretta di disturbi mentali. Si focalizza sul processo attivo di costruzione di un'esperienza di vita significativa, così come definita dalle persone stesse.

Rethink Mental Illness (UK). www.rethink.org

Studi di follow-up a lungo termine

Il “Recovery Movement”

Soprattutto nei paesi anglosassoni, negli ultimi 30 anni una serie di fattori concomitanti hanno determinato la nascita e lo sviluppo del

“Recovery Movement”

Il “Recovery Movement”

1. La deistituzionalizzazione e l’integrazione nella vita comunitaria
2. Il desiderio degli utenti psichiatrici di avere maggior controllo sul proprio destino, sostenuto da ricerche scientifiche condotte da utenti sulle effettive possibilita’ di recovery dalla malattia mentale grave
3. Il crescente movimento per i diritti umani
4. La disponibilita’ di psicofarmaci meglio tollerati

REMISSIONE sintomatologica nella Schizofrenia

"Remission in Schizophrenia: Proposed Criteria and Rationale for Consensus"

Andreasen NC, Carpenter WT, Kane JM, Lasser RA, Marder SR, Weingerber DR., Am J Psychiatry, 2005; 162: 441-9

Criteri per la REMISSIONE nella Schizofrenia

La gravità dei sintomi è valutata per tutti gli 8 sintomi della PANSS come LIEVE (3), MOLTO LIEVE (2) o ASSENTE (1)

- **P1** Deliri
- **P2** Disorganizzazione concettuale
- **P3** Comportamento allucinatorio
- **N1** Ottusità affettiva
- **N4** Fuga sociale apatica/passiva
- **N6** Mancanza di spontaneità e di fluidità nell'eloquio
- **G5** Manierismi ed atteggiamenti abnormi
- **G9** Insolito contenuto del pensiero

1. Assente
2. Molto lieve
3. Lieve
4. Moderato
5. Media gravità
6. Grave
7. Molto grave

per ALMENO 6 MESI

Criteri operativi di Recovery

(Liberman, Kopelowitz, Ventura and Gutkind, 2002)

1. Remissione o stabilizzazione dei sintomi
2. Lavorare o studiare in contesti normali
3. Vivere indipendente: autoresponsabilizzazione per la gestione del denaro e dei farmaci
4. Attivita' di tempo libero in contesti normali
5. Relazioni sociali al di fuori dei "ghetti"/setting psichiatrici; buone relazioni con i familiari
6. Definire e raggiungere obiettivi ritenuti rilevanti per la persona

Miglioramenti mantenuti per almeno DUE ANNI

Recovery e Salute Mentale

- E’ possibile nel tempo;
- Rappresenta un processo multidimensionale, altamente individualizzato e non lineare che puo’ essere descritto ed obbiettivato;
- Puo’ essere raggiunto con o senza l’intervento professionale;
- Ha molteplici indicatori di esito sia soggettivi che oggettivi al di la’ della riduzione dei sintomi

Farkas: World Psychiatry, 2007

Ricerca sulla Recovery nella «malattia mentale grave»

QUALI-tativa:

Fattori FAVORENTI/OSTACOLANTI la Recovery

Fattori PREDITTIVI per la Recovery

QUANTI-tativa:

Si puo' misurare la Recovery?

Ricerca *QUALITATIVA* sulla RECOVERY

La prospettiva dei professionisti della salute mentale

Recovery come ESITO:

riduzione della sintomatologia causa di stress e “ritorno al livello di funzionamento premorboso”

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

1. Fattori familiari o abitativi
2. Abuso di sostanze
3. Durata ridotta del periodo di psicosi non trattata (DUP)
4. Buona risposta iniziale agli antipsicotici
5. Aderenza al trattamento
6. Terapia di supporto con una buona alleanza terapeutica
7. Buon funzionamento neurocognitivo
8. Assenza della Deficit Syndrome
9. Buona storia premorbosa
10. Possibilita' di un trattamento completo, coordinato e continuativo

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

1. Relazioni familiari – Fattori abitativi

Famiglia supportiva con aspettative di miglioramento realistiche e molti rinforzi per i sempre maggiori progressi

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

2. Abuso di sostanze

- Interruzione terapia farmacologica per paura di interazioni negative con sostanze assunte o per problemi di memoria (causati dalle sostanze)
- Saltare gli appuntamenti previsti dal programma di trattamento
- Minori risorse (casa, mezzo di trasporto) per recarsi agli appuntamenti
- Conseguenze sociali e finanziarie dell' uso di sostanze
- Aggravamento psicopatologia e ricadute

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

3. Durata della psicosi non trattata

E’ il piu’ importante predittore di recupero sintomatologico e funzionale tra le variabili precedenti l’inizio del trattamento

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

4. Risposta iniziale ai farmaci

Un miglioramento sintomatologico rapido (< 3 gg) rappresenterebbe un indicatore prognostico premorboso di minore compromissione del neurosviluppo

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

5. Aderenza al trattamento

Scarsa compliance impedisce la stabilizzazione a breve e medio termine nelle aree:

- Psicopatologia
- Riospedalizzazioni
- Rapporti interpersonali
- Uso di alcool sostanze
- Comportamenti violenti / criminali
- Qualita' della vita in generale

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

6. Sostegno da parte dei terapeuti

   Alleanza terapeutica, terapia di sostegno, sforzi e coinvolgimento personale da parte del terapeuta, con un approccio direttivo ma anche empatico

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

7. Fattori neurocognitivi

- Normali funzioni esecutive, memoria di lavoro verbale, abilita' visuopercettive
- Ridotti apprendimento verbale, fluenza verbale e processamento visivo precoce
- Sviluppo, da parte dei soggetti in recovery, di abilita', conoscenze e strategie necessarie per un adattamento al contesto comunitario, compensando il loro rallentamento delle suddette funzioni cognitive

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

8. Presenza di sintomi negativi

Deficit nel comportamento interpersonale relativamente alle aspettative sociali

Sintomi Negativi correlati al grado di disabilita' nel funzionamento di ruolo sociale e lavorativo

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

9. Storia premorbosa

Predittori di esito peggiore:

- Sesso maschile
- Eta' di esordio precoce
- Esordio graduale
- Scarsi precedenti lavorativi
- Scarso livello di funzionamento sociale precedente
- Lungo periodo prodromico

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

9. Storia premorbosa

Migliore prognosi di recovery per i soggetti con un piu' alto livello di funzionamento scolastico, lavorativo e sociale precedenti l'esordio.

FATTORI CHIAVE DELLA RECOVERY NELLA SCHIZOFRENIA
(LIBERMAN & KOPELOWITZ, 2005)

10. Accessibilita’ alle cure

Continuative, orientate alla persona, coordinate, integrate (antipsicotici e interventi psicosociali)

10 Guiding Principles to Recovery

SAMHSA's working definition

SAMHSA: Substance Abuse and Mental Health Services Administration. www.samhsa.gov

La prospettiva degli UTENTI

Recovery come ***PROCESSO***

Recovery

“ Condurre una vita produttiva e soddisfacente anche in presenza delle limitazioni imposte dalla malattia mentale.

Sviluppo, personale e unico, di nuovi significati e propositi man mano che le persone evolvono oltre la catastrofe della malattia mentale.’

Anthony, 1993

L'ESPERIENZA DI RECOVERY

L'esperienza di Recovery dalla malattia mentale implica non solo il recuperare un ruolo valido, ma anche il riprendersi dagli effetti dell' aver ricevuto una diagnosi di malattia mentale (es.: discriminazione, perdita della capacita' di autodeterminarsi, effetti negativi della disoccupazione, progetti di vita distrutti) al pari del riprendersi dagli effetti della malattia in se'

Anthony et al, 2002; Davidson et al, 2005

L'ESPERIENZA DI RECOVERY

Similmente ai sopravvissuti ad un trauma, i soggetti con malattie mentali gravi possono avere l'esperienza che le loro vite sono cambiate irrevocabilmente; tuttavia accettano la sfida di incorporare l'esperienza di malattia in una nuova identita'

Anthony et al, 2002; Davidson et al, 2005

RECOVERY:

DAL PUNTO DI VISTA DELL' UTENTE

RECOVERY: DAL PUNTO DI VISTA DEGLI UTENTI

1. Essere trattati con dignita’ e rispetto
2. Speranza di un futuro migliore
3. Soddisfazione per il fatto di condurre una vita significativa
4. Senso di benessere nonostante la persistenza di sintomi e disabilita’
5. Empowerment nel prendere decisioni sul trattamento
6. Autoefficacia e autostima
7. Esercitare i propri diritti/doveri di cittadino
8. Integrazione nella comunita’

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

1. Ricevere sostegno dagli altri
2. Rinnovata speranza e impegno
3. Accettare la malattia e ridefinire il Se'
4. Coinvolgimento in attivita' significative e sviluppo di ruoli sociali validi
5. Gestione dei sintomi
6. Controllo e responsabilita'
7. Superare lo stigma
8. Esercitare i diritti/doveri di cittadinanza

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

1. Ricevere sostegno dagli altri

Avere qualcuno che crede nella persona, la incoraggia e le e' vicina anche nei momenti piu' difficili

Sostegno da: persone, animali, FEDE

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

2. Rinnovata speranza e impegno

Avere speranza e credere nella possibilita’ di un rinnovato senso di se’ e in nuovi scopi.

La speranza va incanalata in desiderio e impegno di procedere, in Recovery

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

3. Accettare la malattia e ridefinire il Se'

Il Recovery ha un andamento curvilineo tra gli opposti della mancanza completa di insight e l'engulfment

Accettare la propria malattia ma non l'identita' (e lo stigma) di paziente psichiatrico, ridefinendosi e accettando la situazione come una delle sfide della vita

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

4. Coinvolgimento in attivita' significative e sviluppo di ruoli sociali validi

Attivita' significative e gratificanti che danno il senso di fare qualcosa che ha valore per la comunita' (trovare la propria "nicchia" nella comunita')

Maggiore significato e scopo della propria vita curando i propri interessi, studiando, lavorando, dedicandosi ad attivita' spirituali.

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

5. Gestione dei sintomi

Attraverso farmaci, terapie strategie personali di coping

Sintomi sotto controllo: senso di liberta’

La persona uasa i trattamenti, i servizi, i farmaci o le abilita’ di coping in maniera attiva

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

6. Controllo e responsabilita’

Riprendere il controllo sulla propria vita incrementa il senso di autoefficacia.

Per potersi di nuovo prendere delle responsabilita’ e’ fondamentale avere le opportunita’ e delle opzioni significative da cui scegliere

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

7. Superare lo stigma

Interno ed esterno

Devastanti conseguenze sociali dello stigma

Empowerment: aumento del senso di autoefficacia e dell'autostima. Sviluppo della capacita' di resilienza allo stigma e lotta contro di esso.

LA RICERCA QUALITATIVA SUL RECOVERY: ASPETTI COMUNI NELLE ESPERIENZE PERSONALI

8. Esercitare i diritti/doveri di cittadinanza

Partecipare come membro a pieno titolo della societa', con responsabilita' e dando contributi personali.

Lavorare, pagare le tasse, votare, fare volontariato, partecipare ad altre attivita' civiche.

Bisogno di Advocacy per le barriere legali, burocratiche, materiali che implica la partecipazione alla vita civile per una persona con disabilita'

La ricerca *QUANTITATIVA* sul RECOVERY

RICERCA *QUANTITATIVA* SUL RECOVERY

1. Recovery Assessment Scale

   RAS – Corrigan et al., 1999

   41 items – 5 costrutti

   1. Fiducia in se stessi e speranza
   2. Disponibilità a chiedere aiuto
   3. Orientamento ad obiettivi ed al successo
   4. Fiducia negli altri
   5. Non sentirsi dominati dai sintomi

SCALA DI VALUTAZIONE del RECOVERY (RAS)

Troverà ora alcune affermazioni su come a volte le persone si sentono rispetto a se stessi e alla propria vita.

Per favore legga con attenzione ogni frase e indichi se lei è completamente in disaccordo(1), in disaccordo(2), non è sicuro(3), d'accordo(4), o è completamente d'accordo(5).

	Completamente in disaccordo	In disaccordo	Non è sicuro	D'accordo	Completamente d'accordo
1. Desidero farcela	1	2	3	4	5
2. Ho un progetto riguardo a come star bene	1	2	3	4	5
3. Ho degli obiettivi nella vita che voglio raggiungere	1	2	3	4	5
4. Credo di poter raggiungere i miei attuali obiettivi	1	2	3	4	5
5. Ho uno scopo di vita.	1	2	3	4	5

Fattori psicologici del Recovery
indagati dalla RAS

1. Fiducia in se stessi e speranza (11, 14, 15, 16, 20, 22, 24, 25, 36)
2. Disponibilità a chiedere aiuto (30, 31, 32)
3. Orientamento ad obiettivi ed al successo (1, 2, 3, 4, 5)
4. Fiducia negli altri (6, 37, 39, 40)
5. Non sentirsi dominati dai sintomi (27, 28, 29)

Ricerca *QUANTITATIVA* sulla RECOVERY

Recovery Knowledge Inventory (Bedregal et al. 2006)

Valutazione della CONOSCENZA e delle ATTITUDINI dei professionisti della salute mentale riguardo alla Recovery

.

Aree valutate:

1) Ruoli e responsibilita' nel Recovery
2) Non linearita' del processo di Recovery
3) I ruoli della autodefinizione e dei pari nel Recovery
4) Aspettative rispetto al Recovery

Intervista semi-strutturata

1. **Come è cominciato tutto ciò?**
2. **In che modo si è accorto/a di avere un problema?**
3. **Come ha cercato di far fronte a questa situazione problematica? In quale modo ha cercato di aiutare se stesso/a a risolvere i suoi problemi? (pensieri e azioni)**
4. **Quali sono le persone a cui ha chiesto aiuto? Perché ha scelto loro? In che modo l'hanno aiutato/a?**
5. **Come ha vissuto la sua richiesta di aiuto al servizio?**
6. **Quale tipo di aiuto ricevuto è stato per lei più utile?**

Intervista semi-strutturata

7. Chi o cosa può influire/ha influito maggiormente nel suo percorso di guarigione?
8. Quali sono stati i fattori che hanno ostacolato il percorso di guarigione?
9. Ci può descrivere se ci sono stati degli eventi o momenti "speciali" che hanno contribuito al suo miglioramento?
10. Cosa significa per Lei "guarigione"?
11. Come è cambiata l'idea su se stesso durante il percorso di guarigione?

Intervista semi-strutturata

12. **Com’è cambiata, se è cambiata, l’idea degli altri su di Lei durante il percorso guarigione?**
13. **Come descriverebbe il Suo percorso dagli esordi del disturbo ad oggi?**
14. **Come immagina il Suo futuro?**

Temi comuni nelle interviste

1. L’esperienza di malattia
2. Aspettative e delusioni
3. Il cambiamento
4. Definizioni di “Recovery”
5. I fattori coinvolti
6. Descrizione del “viaggio”
7. Aspettative per il futuro

Temi comuni

1. L’esperienza di malattia
   a. i fattori scatenanti
   b. una strada scivolosa
   c. il crollo
   d. la richiesta di aiuto
   e. i supporti ricevuti (famiglia, amici, il servizio)
   f. il trauma del ricovero in reparto di psichiatria

Temi comuni

2. Aspettative e delusioni
    a. aspettare di venire aiutati
    b. rendersi conto del fallimento
    c. l’incertezza

Temi comuni

3. Il cambiamento
    a. Mettersi alla prova
    b. acquisire abilita’
    c. la scoperta di se’

Temi comuni

4. Definizioni di “Recovery”
    a. La frattura tra il “prima” e il “dopo”
    b. il benessere
    c. la resilienza

Temi comuni

5. I fattori coinvolti
    a. Il ruolo e il valore dei pari
    b. Raccontare e raccontare di se’
    c. Le connessioni

Temi comuni

6. Descrizione del “viaggio”
    a. Un viaggio continuo
    b. il tempo perduto
    c. La perdita di opportunita’

Temi comuni

7. Aspettative per il futuro
    a. mantenere il benessere
    b. la speranza di opportunita’
    c. un cauto ottimismo
    d. pragmatismo
    e. essere orientati a obiettivi a breve termine

Conclusioni

1. Gli utenti sono in grado di raccontare esperienze personali
2. Importanza della partecipazione consapevole degli utenti nella valutazione e nella trasformazione qualitativa dei servizi
3. La sicurezza in se' e le aspettative positive, insieme ad un atteggiamento orientato agli obiettivi, sono gli elementi maggiormente correlati al recovery

Conclusioni II

4. Il raccogliere le esperienze dirette di vita – di malattia e di recovery – rappresenta una modalita' insostituibile per avere veramente accesso a quel "laboratorio" dove, per la formula del Recovery, si mescolano ingredienti ancora in parte sconosciuti. Gli utenti e i carer sono gli esperti in parte inconsapevoli: anche grazie ai loro contributi i professionisti della salute mentale imparano come fornire i migliori interventi orientati al recovery.

Conclusioni III

5. La Recovery dalla malattia mentale grave, vivendo la vita con soddisfazione

e’ possibile !

VALORI-CHIAVE CHE SUPPORTANO IL PROCESSO DI RECOVERY

- *Orientamento alla persona*
- *Coinvolgimento della persona*
- *Autodeterminazione/scelta*
- *Potenziale di crescita*
- *Il servizio si focalizza su:*
  - *piena esperienza umana delle persone, non "casi"*
  - *Partnership, non compliance*
  - *Scelta, non coercizione*
  - *Impegno alla speranza, non rassegnazione*

Pratica orientata al Recovery

(Davidson et al., 2009)

- Primarieta' della partecipazione
- Favorire l'accesso e il coinvolgimento
- Garantire la continuita' della cura
- Utilizzare una valutazione basata sui punti di forza
- Offrire una pianificazione individualizzata del percorso di Recovery
- Fungere da "guida per il Recovery"
- Conoscere e sviluppare l'inclusione comunitaria
- Identificare e affrontare le barriere al Recovery

“La disabilita’ e’ da dove partiamo, la Recovery e’ la nostra destinazione e la Riabilitazione la strada che percorriamo”

(R.P. Liberman, 2008)

Refocus Project

RETHINK

Rethink è il principale ente nazionale benefico in UK per la Salute Mentale, opera per aiutare chiunque sia affetto da una grave patologia mentale ad ottenere una migliore qualità di vita, offrendo la speranza, la possibilità di acquisire autonomia attraverso servizi di assistenza efficaci, il sostegno, la promozione del cambiamento attraverso una maggiore consapevolezza e conoscenza della malattia mentale.

REFOCUS

è un programma di ricerca di 5 anni, fondato dal National Institute of Health Research (Ref RP-PG-0707-10040), allo scopo di sostenere lo sviluppo, all'interno dei Team di Salute Mentale sul territorio, di un orientamento teso alla Recovery del paziente. Una parte del programma REFOCUS è il REFOCUS Trial (ISRCTN02507940), che valuterà l'efficacia dell'intervento REFOCUS a livello dei Servizi di Salute Mentale di comunità. L'intervento previsto dal trial dura 18 mesi

© Section for Recovery, Institute of Psychiatry, King's College London, 2011

Recovery secondo Rethink

“Un processo di cambiamento profondamente personale e unico, delle proprie attitudini, dei valori, dei sentimenti, degli obiettivi, delle capacità e del ruolo. Consiste nel vivere la vita con soddisfazione, speranza e partecipazione, anche con le limitazioni causate dalla malattia”

Refocus Study

Lo studio REFOCUS implica la sperimentazione di un nuovo approccio volto ad aiutare i Servizi di Salute Mentale a diventare maggiormente orientati verso la Recovery del paziente.

- Prevede un training alla Recovery per i Team
- Rethink utilizza e coinvolge fra i suoi trainers anche utenti con esperienza diretta dei Servizi.
- Refocus prevede sessioni di riflessione, supervisione individuale e di gruppo all'interno dei Team, sessioni di riflessione che coinvolgono anche i responsabili dei Team

Authors: Victoria Bird, Mary Leamy, Clair Le Boutillier, Julie Williams and Mike Slade.

Refocus Study

Presuppone di comprendere meglio insieme agli utenti alcune cose che li riguardano

Dal manuale Refocus:

- I tuoi valori – ciò che vorresti noi conoscessimo di te, in modo che possiamo rispettarli nel nostro lavoro insieme
- Le tue preferenze di cura – come vorresti che noi impostassimo il tuo progetto terapeutico
- I tuoi punti di forza – così possiamo capire le tue specifiche abilità, quali supporti hai nella tua vita e quali ti piacerebbe avere
- I tuoi obiettivi – cosa ti interessa, così che possiamo lavorare insieme per ottenerlo

Le strategie:

Conoscenza della Recovery, approfondite informazioni cliniche e personali degli utenti, conoscenza dei valori personali degli utenti e del Team, lavoro in partnership, training individualizzati alla Recovery, applicazione del Coaching, valorizzazione delle capacità individuali (Skills-Talents), supporto al raggiungimento di obiettivi

cambio della pratica

RECOVERY INDIVIDUALE

Manuale Refocus:
Interventi in aggiunta alle cure standard

Relazioni che contribuiscono alla Recovery

- Sviluppo di conoscenza condivisa sul concetto di personal Recovery
- Approfondimento dei valori individuali (operatori, utenti)
- Progetti in partnership

Pratiche di lavoro

- Indagare valori e preferenze di trattamento
- Valutare le risorse e abilità degli utenti
- Supportare il raggiungimento degli oboettivi

Valori che supportano la Recovery (Refocus Project):

VALORE 1

Supportare la Recovery personale è il primo e il principale obiettivo dei Servizi di Salute Mentale. Intervenire in una situazione di crisi o dedicarsi ai fattori di rischio potrebbe talvolta essere prioritario, ma deve essere orientato sull'obiettivo principale di sostenere la Recovery.

VALORE 2

Interventi saranno principalmente indirizzati ad identificare, elaborare e supportare gli obiettivi personali del paziente

evitare di imporre significati e congetture cliniche su ciò che è importante, offrire un supporto che sia compatibile con i valori del paziente su cui lavorare per conseguire i suoi obiettivi di vita.

Valori che supportano la Recovery (Refocus Project):

VALORE 3

I Servizi di Salute Mentale svolgono adeguatamente la loro funzione se i pazienti sono responsabili delle loro stesse vite.

L'obiettivo primario degli operatori della Salute Mentale non consiste nel guarire i pazienti o condurli alla Recovery.

Il lavoro prioritario consiste nell'aiutare i pazienti a sviluppare e utilizzare capacità che li rendano autonomi nella loro vita.

Lavorare in Partnership

«Lavorare in partnership è una parte centrale dell'intervento finalizzato alla Recovery del paziente. Ciò comporta che i team sviluppino e sperimentino modi di relazionarsi agli utenti del servizio come se fossero loro collaboratori»

Esempi dal manuale Refocus:

- Attività Team-Utenti per aiutare la comunità, es.: un progetto di tutela o di rinnovo
- Collaborazione diretta con gli utenti per sostenere i cambiamenti pro-Recovery all'interno del team
- Facilitare il passaggio degli utenti dal partecipare ad un gruppo sociale al guidare il gruppo
- Audit o un progetto di formazione condotto da un utente
- Organizzare insieme un gruppo per la Recovery con l'aiuto di un membro dello staff e di un utente del servizio
- Sondare le abilità dello staff e degli utenti e quindi provare ad organizzare insieme un talent show

Il Coaching

Il Coaching è uno specifico stile interpersonale per incoraggiare e sostenere la Recovery del paziente. I vantaggi dell'approccio che utilizza coaching sono:

- Parte dal presupposto che il paziente sia o sarà in grado di gestire la sua vita. La capacità di essere responsabili di se stessi è un dato di fatto.
- L'attenzione è concentrata verso il facilitare il processo di Recovery piuttosto che sul paziente in sè. Coaching riguarda il modo in cui i pazienti possono vivere con il disturbo mentale, non la cura del disturbo stesso.

Il Coaching

Il Coaching è uno specifico stile interpersonale per incoraggiare e sostenere la recovery del paziente. I vantaggi dell'approccio che utilizza coaching sono:

- Lo scopo del coach è di attivare questa capacità di autogestirsi, piuttosto che di risolvere i problemi al posto del paziente. Questo induce ad amplificare i punti di forza e le relazioni di sostegno già esistenti, piuttosto che a creare dei deficit.
- Lo scopo del coaching è diretto a raggiungere gli obiettivi dell'utente del servizio, non quelli del coach.
- Entrambi i partecipanti devono fornire un contributo attivo affinché la relazione funzioni.

REACH© il coaching per l'approccio alla Recovery del paziente comporta 5 stadi:

- Riflessione: processo attivo nel quale un membro del team lavora con il paziente al fine consentirgli di analizzare e di prendersi le responsabilità per attività e cambiamenti
- Esplorare: esplorare la questione/problema/compito e le relative opzioni a disposizione
- Agree outcomes: concordare i risultati desiderati, utile "a far scattare" le risorse dell'utente
- Commitment to action: impegno diretto verso le azioni necessarie (come, quando etc.)
- Hold to account: presa di responsabilità da parte dell'utente; possibile utilità di dare feed-back

ABBONAMENTI 2015

• Privati: annuale € 48
biennale € 87 - triennale € 127
• Enti pubblici e privati, associazioni, cooperative: annuale € 75
biennale € 144 - triennale € 208
• Sostenitore € 100
• Studenti (attestato di frequenza) € 36
• Estero € 100
• Cumulativo Animazione Sociale + Narcomafie: Privati € 71 - Enti pubblici e privati, associazioni, cooperative € 93
Estero € 180

Ufficio abbonamenti
Da lunedì a venerdì, ore 10-13 e 14-17
tel. 011 3841046 - fax 011 3841047
e-mail: abbonamenti@gruppoabele.org

Modalità di abbonamento
• Conto corrente postale: conto nr. 155101 - Gruppo Abele Periodici - corso Trapani 95 - 10141 Torino.
• Carta di credito on-line (VISA, Mastercard): collegarsi al sito: www.animazionesociale.gruppoabele.org
• Bonifico bancario: presso Banca Popolare Etica - Filiale di Torino - conto nr. 000000001803 - intestato a Gruppo Abele ONLUS - IBAN: IT21 S050 1801 0000 0000 0001 803. Specificare nominativo e causale di versamento.
• La richiesta di fattura va fatta al momento dell'abbonamento.

Condizioni di abbonamento
• L'abbonamento decorre dal mese successivo al versamento. Chi sottoscrive l'abbonamento nel corso dell'anno e desidera farlo decorrere da gennaio, deve specificarlo nella causale e versare € 5 aggiuntivi per l'invio degli arretrati.
• I fascicoli non pervenuti devono essere reclamati entro 30 giorni dal ricevimento del fascicolo successivo. Oltre, dovranno essere acquistati a prezzo di copertina.

Una e-mail, un fax o un sms. E sei già abbonato
Invia una e-mail ad abbonamenti@gruppoabele.org o un fax a 011 3841047 in cui dichiari che ti abboni. Oppure un sms a 331 5753851 scrivendo «mi abbono ad Animazione Sociale»; entro 48 ore ti contatteremo per attivare l'abbonamento. Mentre tu provvedi a pagare, ti inviamo il numero in uscita della rivista.

Maestro è chi insegna l'amore per il sapere

Educare è questo: sospingere verso l'apertura di altri mondi

Intervista a
Massimo Recalcati
a cura di
Roberto Camarlinghi

Se c'è qualcosa che resta insostituibile della scuola, è la funzione di animare il rapporto del soggetto con il sapere. La posta in gioco dell'insegnamento è ancora tutta qui: nell'introdurre l'allievo in un rapporto vitale con il sapere. Nel rendere il sapere un oggetto in grado di muovere il desiderio: il desiderio di sapere, di approfondire, di capire. Se nella nostra vita ciò è accaduto, è perché abbiamo incontrato un maestro, un insegnante che ha amato il sapere e – amandolo – ce lo ha reso desiderabile. Un maestro che è stato capace di generare in noi quel trasporto amoroso verso la cultura che rimane il più grande antidoto per non smarrirsi nella vita.

Dalle scuole elementari all'università, tutti gli insegnanti che portiamo con noi nella memoria hanno un tratto fondamentale che li accomuna e che prescinde dai contenuti del loro insegnamento: amavano il sapere e – amandolo – ce lo hanno reso desiderabile. I maestri che hanno lasciato un segno nella nostra vita sono quelli che – incarnando il desiderio di sapere – hanno mobilitato in noi il desiderio di apprendere. Perché il gesto del maestro non è mai riempire le teste come recipienti, ma produrvi il vuoto e mantenere vivo il desiderio di sapere.
Per questo è insensato l'approccio che distingue l'istruzione dall'educazione. Educare è sospingere verso l'apertura di mondi, promuovendo in ognuno – bambino o ragazzo – la ricerca della propria via singolare di accesso al sapere e al mondo. Educare è accendere il desiderio, quel desiderio che non è da confondere con il godimento immediato, ma con l'amore per l'altro, per il sapere, per l'altrove.
Sono i temi della ricerca di Massimo Recalcati, tra i più noti psicoanalisti in Italia, contenuti nel suo ultimo libro *L'ora di lezione. Per un'erotica dell'insegnamento*, edito da Einaudi. Lo abbiamo seguito in alcune recenti conferenze, provando a cogliere le linee essenziali della sua ricerca.

Perché la scuola è centrale nell'educare

Negli ultimi tempi lei si è dedicato al tema della scuola, a come possiamo immaginarla, alla funzione educativa che malgrado tutto riveste. Inizierei da qui, dalla sua idea di educazione...

Il problema dell'educazione è «come si diventa soggetti». E la scuola svolge una funzione decisiva nell'aiutare bambini e ragazzi in questo percorso. Provo a spiegarmi partendo da un episodio che mi ha molto turbato.
Una collega francese mi ha raccontato che, in un asilo francese di periferia, un'educatrice aveva portato con sé il figlio molto piccolo. Lo aveva messo in una stanza a fianco a quella dove si svolgevano le attività quotidiane del gruppo classe, ma quando è rientrata nella stanza lo ha trovato morto, ucciso da un altro bambino che era stato lasciato fuori dalle attività.
Perché parto da questa scena? Perché esiste oggi una *cattiva retorica* che investe il tema dell'educare. La cattiva retorica consiste nel *ritenere che il bambino sia già un soggetto*. Invece non è così e quest'episodio lo mostra bene: il bambino lasciato solo è Caino, ammazza il fratello. I bambini – lo dico in modo brutale – non sono soggetti e il problema dell'educazione è *rendere possibile la loro soggettivazione*, a partire da una posizione che ci fa esistere inizialmente come oggetti, con tendenze che non riusciamo a governare, dove la violenza è parte costitutiva dell'essere umano.
Nella scena dell'asilo non dobbiamo vedere semplicemente una regressione dall'umano al bestiale, ma la presenza nell'umano di qualcosa che si manifesta come tendenza aggressiva, spinta all'odio invidioso, alla distruzione dell'altro. Il punto scabroso è che uccidere il proprio fratello non appartiene al mondo animale, ma al mondo umano.
E allora cos'è l'educazione se non educare a rinunciare alla violenza come soluzione delle difficoltà dei rapporti? Se non educare a passare *dalla violenza alla conversazione*, dalla legge brutale della forza a quella dialogica della parola?
Questo è il movimento dell'educazione o, come preferisco dire, il *movimento dell'umanizzazione della vita*, da cui dipende il nostro poter diventare soggetti. La nostra

vita si umanizza nella misura in cui rinuncia alla violenza e accoglie la legge della parola. È uno dei compiti più difficili che incombe sugli esseri umani: saper rinunciare alla violenza in nome del riconoscimento dell'Altro come prossimo, come essere singolare. È un riconoscimento che non è mai indolore perché ci obbliga ad accettare che «Io non sono tutto», che la mia vita non esaurisce quella del mondo e degli altri. Significa sopportare quella che Freud considerava una «frustrazione narcisistica», necessaria per riconoscersi appartenenti a una comunità umana.

Dal chiuso della famiglia all'aperto del mondo

In questo cammino di umanizzazione la scuola – lei dice – esercita una funzione insostituibile.

Sì, la funzione fondamentale della scuola risiede nel *promuovere la legge della parola*, l'incontro con altri mondi. Ed è qui che assume un senso la sua dimensione obbligatoria. La scuola – si sa – è scuola dell'obbligo. Si manifesta come obbligazione, dunque come trauma. Per tutti noi la scuola è stata un trauma, un trauma obbligatorio: il trauma della separazione dalla famiglia, il trauma – direbbe Jaques Lacan – della «dematernalizzazione della lingua». Andare a scuola significa infatti riconoscere che la lingua materna non esaurisce il mondo. E dunque la scuola è innanzitutto questo taglio traumatico, simbolico, che introduce il soggetto dal legame intimo, di sangue – che pure è fondamentale alla vita – a una dimensione più allargata di legame. La scuola sancisce l'obbligo di rivolgersi al mondo, staccandosi dal clan di appartenenza.
Il trauma della scuola è dunque *un trauma virtuoso*, benefico e necessario, perché obbliga il soggetto a decentrarsi, a non restare incapsulato nel proprio Io. La scuola porta dal chiuso della famiglia all'aperto del mondo, in cui tocca imparare a vivere. È veramente un passaggio – se si può dire così – dalla lingua materna all'alfabeto. C'è un libro di uno scrittore che amo molto, Andrea Bajani, che è proprio su questo valore straordinario delle lettere dell'alfabeto. S'intitola *La vita non è in ordine alfabetico*. Imparare le lettere dell'alfabeto – dice Bajani – significa imparare mondi, imparare a costruire mondi. L'apprendimento dell'alfabeto è lo svezzamento, è il vero svezzamento; avere in bocca non la tetta, ma la parola.
Allora la scuola non è solo il trauma di abbandonare la lingua materna, ma è anche *la possibilità dell'incontro*. Incontro con che cosa? Incontro con altri mondi, altre voci, altre parole. Qui sta veramente l'importanza della scuola, di ciò che resta della scuola, di ciò che deve restare della scuola.

Noi ci formiamo attraverso gli incontri

La scuola è fondamentalmente un luogo di incontri. E gli incontri sono decisivi per la nostra vita perché – lei ha detto recentemente – la forma della nostra vita è il risultato degli incontri che abbiamo fatto.

Che cosa dà forma a una vita? Attraverso cosa ci siamo formati? La vita si forma attraverso la contingenza pura degli incontri. Noi abbiamo la forma che gli incontri che abbiamo avuto hanno fabbricato. Ancora più precisamente, noi siamo – tutti noi siamo – il modo attraverso il quale abbiamo dato una forma agli incontri che ci hanno formato.
Da questo punto di vista, la scuola è *luogo elettivo della formazione*. Perché a scuola si

fanno incontri tra le generazioni, si fanno incontri con le istituzioni, si fanno incontri tra pari. La scuola è luogo di incontri, però gli incontri non sono tutti buoni. Ci sono buoni e cattivi incontri e sia i buoni che i cattivi incontri lasciano un segno. Noi siamo il segno che ha lasciato su di noi l'incontro buono o cattivo.
Se dovessimo dare una definizione molto semplice dell'incontro buono e dell'incontro cattivo, potremmo dire che il *cattivo incontro* è fondamentalmente l'incontro che chiude il mondo, che chiude la possibilità di accesso al mondo. Quando facciamo un cattivo incontro il mondo perde ossigeno, perde l'orizzonte. Il *buon incontro* invece è l'incontro che allarga l'orizzonte del mondo, cioè mi fa vedere – attraverso chi incontro – che il volto del mondo è un altro rispetto a quello che fino a quel momento avevo conosciuto.
Il buon incontro – e bisogna essere disponibili a fare buoni incontri – è l'incontro che apre e moltiplica i mondi. Da questo punto di vista ogni buon incontro è un incontro d'amore. Gli incontri formativi, gli incontri che danno forma alla vita, i buoni incontri, sono sempre incontri d'amore, perché sono incontri che, spalancando i mondi, spalancano la nostra vita. La nostra vita non è più come prima.
Questi incontri nella scuola si fanno attraverso gli insegnanti innanzitutto, ma si fanno anche attraverso i libri. La lettura di un libro può essere in sé un incontro che lascia il segno. Dopo la lettura che feci da ragazzino del mio primo libro, *Il sergente nella neve* di Mario Rigoni Stern, ho ancora nelle narici l'odore di grasso che lasciava la mitragliatrice arroventata. Quel libro per me è stato il libro che mi ha insegnato che esistono i libri, che esiste la letteratura, cioè che esiste la possibilità di fare esistere più mondi.
Dunque il buon incontro apre i mondi, li spalanca e spalancando i mondi apre la nostra vita.

Insegnare che il sapere si può amare

In questo contesto è fondamentale l'incontro con il maestro, con l'insegnante. Colui che ha la funzione insostituibile di mediare l'incontro con qualcosa di decisivo nel nostro percorso di umanizzazione: il sapere.

Insegnante significa «colui che sa lasciare il segno». C'è insegnamento quando qualcuno lascia in noi un segno: un segno che dà forma alla nostra vita. Ma di cosa è fatto questo segno, così decisivo nella formazione della vita? Di cosa è fatto il segno che un insegnante sa lasciare nell'allievo? Noi sappiamo che questo segno non è fatto di sapere. Cioè non è un contenuto, un concetto, una nozione, non è un oggetto teorico. Gli insegnanti che non abbiamo dimenticato, quelli che abbiamo incontrato e che hanno avuto un ruolo decisivo nella nostra formazione, noi li ricordiamo non per quello che ci hanno insegnato, non per il «cosa» hanno insegnato, ma per la *forma* con cui hanno insegnato, per lo stile con cui hanno insegnato.
Quello che è indimenticabile, negli insegnanti che non abbiamo mai dimenticato, nei segni che il loro insegnamento ha impresso nelle nostre anime, è il loro *stile*. Un insegnante che lascia un segno, un insegnante degno di questo nome, è un insegnante che innanzitutto ama quello che insegna, cioè entra in un rapporto fisico, corporeo, erotico con il sapere. E dunque fa del sapere non qualcosa di astratto, aereo, semplicemente intellettuale, mentale, ma fa del sapere un corpo, fa del sapere un corpo erotico.

Questa è una delle grandi doti di un insegnante: *trasformare tutti gli oggetti teorici* che trasmette ai suoi allievi – la serie di Fibonacci, la deriva dei continenti, una lingua straniera, le poesie di Giovanni Pascoli, i sette re di Roma... – *in corpi erotici*. Se questa trasformazione avviene, se avviene nella parola dell'insegnante, genera una seconda trasformazione che accade questa volta nell'allievo. L'allievo non è più un recipiente da riempire, la sua testa non è una zucca vuota da colmare, ma *l'allievo* – grazie alla trasformazione del libro in corpo, dell'oggetto teorico in corpo erotico – *si trasforma a sua volta in amante.*

Chi di noi non ha vissuto almeno una volta quest'esperienza: sentirsi amante del sapere che il maestro trasmette? Amante non significa «essere riempito», ma «essere svuotato e messo in movimento». Quando c'è un incontro – a qualunque livello – che è formativo per noi, noi ci sentiamo messi in movimento. Dove c'è un buon incontro c'è messa in moto della vita, la vita si anima. Allora l'allievo si forma attraverso il vuoto più che il pieno. Questo mi pare un punto importante.

La scena inaugurale del gesto del maestro

La buona scuola, scrive infatti nel suo libro, è quella che «sa testimoniare non soltanto di sapere il sapere, ma anche che il sapere si può amare, si può trasformare in corpo erotico» (p. 35).

Sì, il buon insegnante è colui che sa fare del sapere un oggetto del desiderio in grado di mettere in moto la vita, di allargarne l'orizzonte. È colui che introduce gli allievi in un rapporto vitale con il sapere, che rende possibile l'incontro con la dimensione erotica del sapere. In questo – credo – consiste tutta la posta in gioco della partita dell'insegnamento. E direi anche – ma su questo possiamo tornarci dopo – il ruolo che la scuola può giocare nella prevenzione delle tossicomanie o di qualunque altra forma di godimento immediato.

Il buon insegnante fa del sapere un oggetto del desiderio in grado di mettere in moto la vita e di allargarne l'orizzonte. Qui risiede anche il ruolo che la scuola può giocare nella prevenzione.

Nell'incontro tra insegnante e allievo, non si tratta di riempire le teste con un sapere già costituito, ma di aprire dei buchi in quelle teste perché si metta in moto un movimento verso il sapere. Questa è la *strategia educativa fondamentale*, che trova la sua matrice nel gesto che Socrate compie nei confronti di Agatone. Noi in Occidente, nella nostra tradizione, abbiamo infatti questa scena madre, da cui scaturisce veramente il gesto del maestro, il gesto dell'insegnante. La si trova in apertura di uno dei più bei e giustamente famosi dialoghi di Platone, *Il Simposio*.

Agatone dà un banchetto dove invita artisti, teatranti, intellettuali, scrittori, filosofi a parlare dell'amore, del mito di Eros. Socrate è uno degli ospiti più attesi, ma mentre si sta recando al banchetto si perde. Accade ogni tanto ai filosofi di perdersi nei propri pensieri. Socrate si è perduto in un cortile perché la Verità, come gli capitava spesso, lo ha visitato. Un servo assiste alla scena e riferisce ad Agatone. Così, quando Socrate

arriva al simposio, Agatone sa il perché del ritardo. La verità gli ha parlato, dunque Socrate sa. Perciò Agatone chiede a Socrate di sedersi vicino a lui affinché il sapere che la verità gli ha trasmesso possa essere travasato nella sua testa: «Stai vicino a me – gli dice Agatone – e parlami e travasa in me tutta la potenza del tuo sapere».
Questa è l'illusione che tutti noi, in quanto allievi, abbiamo attraversato con i nostri maestri. Questa è anche l'illusione della scuola quando pensa che la trasmissione del sapere sia fondamentalmente un'attività di riempimento. Ma Socrate – ecco il gesto – risponde ad Agatone: «Guarda che io sono vuoto come te, e come te desidero sapere». Socrate si offre dunque ad Agatone come amante del sapere, non come detentore del sapere. Ed è questo passaggio – dalla proprietà al desiderio, dal detenere il sapere al tendere al sapere – che costituisce il maestro. Agatone si trasforma così da coppa vuota ad amante del sapere: questo è il miracolo dell'insegnamento. Dove c'è insegnamento l'allievo diventa amante del sapere.

Il miracolo dell'ora di lezione

Questo miracolo può avvenire – e spesso avviene – nell'ora di lezione, che lei individua come «il vero cuore della scuola» (p. 7), fatto appunto di incontri col sapere che possono essere avventure profonde, esperienze non solo intellettuali ma emotive.

Sì, se dovessi dire che cosa rimane insostituibile della scuola, qual è il suo nucleo resistente, direi che è il tempo dell'ora di lezione. Perché il tempo dell'ora di lezione è *il tempo dell'incontro*, perché l'ora di lezione spalanca i corpi, spalanca le porte, spalanca le finestre, spalanca i libri, spalanca la vita. Un'ora di lezione può davvero cambiare la vita.
Spesso l'obiezione che raccolgo è: ma come si può far nascere il desiderio nel campo dell'obbligo? È un grande tema della scuola questo. Perché la scuola è sempre scuola dell'obbligo in fondo, però è lì che si gioca la partita del desiderio. Come si può far esperienza della libertà, dell'erotismo del sapere, laddove ci sono i programmi, ci sono i calendari, ci sono le verifiche, laddove esiste un dispositivo, un *automaton*, che imprigiona sia gli allievi che gli insegnanti? Come far emergere la luce dell'incontro nel grigiore del dispositivo obbligatorio?
Eppure, per quanto l'ora di lezione segua la scansione imposta dai programmi, non è mai prevedibile, nei suoi effetti, da nessun regolamento. Se noi esaminiamo più da vicino questo tema dell'insegnamento, dobbiamo riconoscere che *il miracolo può sempre avvenire,* nella misura in cui il maestro ama il sapere e – amandolo – lo rende desiderabile all'allievo, lo trasforma in corpo erotico. È la dimensione dialettica della didattica, capace di mobilitare il desiderio di sapere.
Invece cosa succede a volte nella scuola? Che valutiamo ottimi – parlo adesso come professore universitario – quegli esami in cui gli allievi riproducono, clonano, plagiano il sapere che devono studiare. A chi diamo 30? A chi riferisce con esattezza le mie parole o le parole del testo che ha studiato. La valutazione nella scuola si fonda sul *modello del plagio*, del conformismo. Ma in questo modo non c'è nessuna possibilità per gli allievi di apprendere in modo singolare, soggettivo, il sapere che viene trasmesso. La devianza, l'irregolarità, l'anomalia, la bizzarria, la stramberia, cioè lo stile singolare viene soffocato da questa modalità di concepire la valutazione. E invece dovrebbe essere valorizzato.

Favorire l'emergere dello stile singolare

Lo stile singolare, le attitudini, le vocazioni, le anomalie sono i punti di forza del soggetto, lo psicoanalista lo sa bene. Penso a uno dei miei primi casi: la madre che portava il figlio adolescente mi diceva: «Guardi, non fa altro che pensare alla morte, me lo faccia smettere di pensare». E io le rispondevo: «Signora, smettere di pensare è peggio della morte». Ecco, la ruminazione di questo ragazzo sulla morte, che può sembrare sintomatica, se non viene normalizzata, ma presa e girata nel verso giusto, si trasforma in un punto di forza.

I punti in cui le piante sono storte, non allineate, non sono i punti che noi dobbiamo raddrizzare, come riteneva una vecchia pedagogia autoritaria che aveva trasmesso questa *rappresentazione botanica dell'educazione*: raddrizzare le viti storte. Al contrario noi dobbiamo amare la stortura, amare l'anomalia, la bizzarria, la stramberia dei nostri figli perché lì c'è un tesoro. Lo dice anche il poeta: «Dai diamanti non nasce niente, dal letame nascono i fiori». In fondo l'educazione è dare la parola alla vite storta, non è produrre un tipo uniforme.

Il modello botanico dell'educazione era il modello a cui dichiarò di ispirarsi il mio maestro supplente di seconda elementare. Io sono stato forse uno degli ultimi bocciati agli esami di seconda elementare, allora esistevano ancora. E ho in mente quest'uomo che, il primo giorno in cui è entrato in classe, ci ha guardati – all'epoca eravamo solo bambini, non c'erano ancora le classi miste, tutti con la giubba nera – e ci ha detto: «Voi siete delle viti storte, io sono il paletto e il filo di ferro che vi raddrizzerà!».

Questo supplente non era da meno dell'altra maestra, una donna severa, sempre vestita di nero, che incarnava tutto quello che non deve fare un bravo insegnante. Ricordo che un giorno, nel tempo della conversazione, ci chiese: «Bambini, secondo voi che cosa rende bello il fuoco?». E allora ci fu un dibattito tra di noi, c'era chi alzava la mano e diceva «il fuoco è bello perché permette di stare attorno e di parlare», «il fuoco è bello perché si fanno le caldarroste», «il fuoco è bello perché porta la luce nel buio». Lei con disprezzo a ogni risposta scuoteva la testa e diceva «no, no, no». Scartava ogni tipo di interpretazione della bellezza del fuoco perché ci indicava di possedere lei la sola risposta possibile. Che alla fine, con aria saccente, ci svelò: «Il fuoco è bello... perché si muove!».

Cito questi due episodi perché sono esempi di un *modello disciplinare*, io dico botanico per riprendere la metafora della pianta della vite da raddrizzare. Questo modello – che era il modello educativo psicopedagogico pre '68 – contiene in sé l'idea che la soggettivazione sia mettere la divisa. Raddrizzare tutte le viti significa annullare la stortura che rende la vite – ma potremmo dire la vita – una vita unica.

Amare la stortura della vite

Il modello botanico per certi versi è tornato in auge nell'ultimo periodo. Del resto l'avversione per ciò che ha rappresentato il '68 è stata più volte dichiarata da chi ha fatto le recenti riforme della scuola...

Il '68 ha introdotto una discontinuità – per come la giudico io – vitale, positiva, fondamentale. Una generazione di figli ha preso la parola e ha introdotto nell'educazione il *tema della libertà*. Questo è stato un tempo decisivo nella nostra storia, sebbene in effetti l'eredità di questo grande passaggio si sia snaturata recentemente. Perché nel post

'68 – gli anni '70 in particolare – la scuola era un luogo di sperimentazione straordinario, un luogo di grandi trasformazioni collettive. Mentre oggi questa grande eredità del '68 è stata tradita.
Oggi siamo di fronte alla scuola delle «tre i», come sbandierava qualche tempo fa un ministro della Repubblica che fa il paio con i miei maestri delle elementari. Ma direi che nella scuola delle «tre i» – impresa, informatica, inglese – al centro non sono più tanto le viti storte da raddrizzare, ma le informazioni da immagazzinare. Il nuovo modello educativo psicopedagogico è fondato sul *principio di prestazione*: l'obiettivo è rafforzare le competenze a risolvere i problemi piuttosto che a saperseli porre. È un modello che implica una *rappresentazione* – diciamo così – *computeristica* della soggettivazione: le teste funzionano come computer e bisogna immettervi più *files* possibili. In questo modello il sapere non ha più rapporti con la vita, ma deve solo trasmettere le competenze per rendere quella vita capace di prestazioni.
Nella scuola di oggi abbiamo l'esasperazione del principio di prestazione, dove non c'è posto per la singolarità nel processo di apprendimento, ma predomina un sapere anonimo e robotizzato da assimilare. Qual è l'alternativa secondo me vitale? L'alternativa – dicevo – è *amare la stortura della vite*, pensare che là dove ciascun allievo è anomalo rispetto alla misura, lì è il tesoro. Questo è un grande insegnamento con i nostri ragazzi: dove un bambino, un ragazzino, mostra di essere diverso dagli altri, lì è il suo potenziale. Dove il soggetto soffre nei suoi sintomi, lì è la sua verità.
Si tratta di ribaltare la prospettiva con cui si guardano i bambini, i ragazzi, i giovani. L'educazione non è condurre l'anomalia alla normalità, ma *l'educazione è potenziare l'anomalia*, potenziare il sintomo, potenziare la stortura, potenziare la differenza. Ecco perché quando vedo ragazzi che hanno 10 in tutte le discipline resto sempre perplesso; per me quello è il segno che è in atto una macchinizzazione del sapere. Gli esseri umani hanno sempre attitudini e talenti, non possono eccellere in tutte le materie. Quando accade, è il segno che c'è un problema: un problema di prestazione, di conformismo, di far felici i genitori, di non saper tollerare una frustrazione.
Allora direi che uno dei compiti della scuola è far emergere i talenti, far emergere le attitudini, far emergere le differenze, far emergere i desideri. Favorire cioè una *soggettivazione del sapere* e non un'assimilazione passiva e conformistica.

Memorizzare il sapere e sospendere la memoria

A questo proposito nel libro lei richiama i due tempi fondamentali della didattica: la memoria e l'oblio: «Il movimento della conoscenza implica la memoria», ossia l'acquisizione del sapere che ci viene trasmesso, «ma solo al fine di sospenderla per rendere possibile un atto nuovo, una soggettivazione inedita del sapere» (pp. 61-62). Può spiegarci di più?

C'è un gesto di un grande pittore, Emilio Vedova, che merita qui raccontare. Vedova è stato anche professore all'Accademia di Belle Arti di Venezia. Quando notava uno dei suoi allievi paralizzato di fronte alla tela vuota, interveniva intingendo lo spazzolone in un secchio di colore e dando un deciso colpo sulla tela. Questo aveva l'effetto di mettere in moto l'allievo. Prima del colpo di spazzolone l'allievo era intimidito, oppresso, inibito dal bianco della tela. Dopo il colpo di spazzolone qualcosa si disinibisce, si mette in movimento, comincia a respirare.

Che cosa fa Vedova? Che cos'è questo gesto? Non è semplicemente un modo per togliere quel senso di venerazione che il soggetto ha nei confronti della tela bianca. Non è semplicemente questo, è qualcosa di più sottile. Il principio da cui Vedova parte è pensare che *la tela vuota, come la pagina bianca* – la tela vuota per un pittore, la pagina bianca per uno scrittore, il silenzio per un musicista – *sono in realtà stracolme*. Per uno scrittore la pagina non è mai bianca, ma nella pagina bianca si deposita tutta la storia della letteratura: Kafka, Joyce, Proust… E dunque l'inibizione è un effetto di questa stratificazione.
Come posso io scrivere qualcosa se tutto è già stato scritto? Se prima di me c'è Beckett, c'è Dante... Lo stesso vale per la pittura: come posso io osare dipingere se prima di me ci sono stati Picasso, Klee, Tintoretto? Impossibile! E allora l'operazione di Vedova è fare in modo che questo bianco sia davvero bianco, che questo vuoto sia davvero vuoto, che questo silenzio sia davvero silenzio. Rende dunque possibile il gesto creativo, perché qual è *la condizione del gesto creativo*? Non è la memoria di tutto quello che è stato fatto, perché se noi ricordiamo tutto il rischio è di non poter generare mai niente di nuovo.
Pennac sostiene che «è bello insegnare ai bambini le poesie a memoria». Io ero un bambino che non aveva mai voluto impararne una, però capisco la bellezza dell'imparare a memoria oggi. Imparare a memoria – dice Pennac – è come gettare i nostri figli nel fiume della lingua; non importa il contenuto, importa che capiscano che noi apparteniamo alla dimensione del linguaggio, che abbiamo una provenienza, una casa comune. Va bene, purché non si pensi che imparare a memoria esaurisca l'apprendimento. Anzi potremmo dire che per apprendere davvero bisogna dimenticare ciò che si impara. Perché ci sia davvero apprendimento bisogna che tutto ciò che abbiamo appreso a un certo punto venga disattivato per rendere possibile un gesto singolare, un gesto creativo.
Questa idea la troviamo in tanti diari. Van Gogh, Klee conoscevano perfettamente la storia dell'arte. La loro tela era popolata da una ragnatela di nomi, di citazioni, di opere già viste. Ma per poter generare il nuovo occorre che tutta questa memoria venga ad un certo punto disattesa. Questo riguarda anche i temi dei ragazzi al liceo o le tesi di laurea.
Finché è troppo presente l'ombra del padre, finché è troppo presente l'ombra della memoria, è impossibile generare il nuovo. E dunque la condizione della creazione è la possibilità di accedere ad un oblio, ad un punto di dimenticanza, che è ciò che Vedova realizza attraverso questo gesto.

Apprendere non è fare come il maestro

Ogni processo creativo, di apprendimento singolare – lei dice – eredita la memoria, ma non la ripete, bensì la sospende per provare a dire qualcosa di proprio.

Sì, potremmo esprimere questo punto anche dicendo che ci vuole un maestro, ma l'apprendimento non è fare *come* il maestro. Questo mi pare un punto decisivo. Il bravo insegnante non è colui che chiede di imitarlo, ma colui che *promuove un accesso soggettivo al sapere*.
C'è una scena sull'apprendimento che si trova in un grande libro di filosofia, *Differenza e ripetizione*, di Gilles Deleuze. La scena è questa. Sulla spiaggia c'è un maestro di nuoto con il suo piccolo allievo. Il maestro spiega al bambino gli stili: la rana, lo stile libero, il dorso. Il bambino ripete i mo-

vimenti – l'apprendimento è fatto anche di questo: trasmissione di competenze, di tecniche, di sapere. Però poi arriva il momento in cui il maestro dice al bambino: «Adesso entra nel mare». È questo momento, in cui il bambino sperimenta l'impatto con l'onda, che davvero gli fa acquisire il sapere che il maestro gli ha trasmesso.
Questo significa che non esiste trasmissione del sapere se l'allievo fa come il maestro. Non può fare come il maestro. Perché quando arriva l'onda cosa accade? Che l'allievo deve resettare tutto il sapere che ha immagazzinato, farlo proprio e rispondere – nella contingenza dell'incontro – all'onda che scompagina il sapere astratto della trasmissione. Chiaramente l'onda è un'immagine della vita. Noi abbiamo imparato sì gli stili, ma inventiamo un nostro stile – un nostro modo di fare la rana, il dorso, lo stile libero – solo quando impattiamo l'onda.
Allora ne deduciamo che non c'è trasmissione del sapere senza maestro, ci vuole il maestro; ma non c'è apprendimento se la trasmissione è fare come il maestro. Il maestro è fondamentale, ma non si tratta di fare come il maestro; si tratta di inventare un proprio stile, cioè di *dimenticare* – mentre lo riconosciamo – *il maestro*. Noi non possiamo fare senza il maestro, la formazione non è uccidere il maestro, come dicono alcuni. Fare a meno del maestro è qualcosa a cui possiamo arrivare solo se abbiamo avuto un maestro. Allora benedetto sia il maestro, benedetto sia l'incontro con un maestro, almeno uno nella vita, dalle scuole elementari sino all'università.
Devo dire che nella mia pratica di professore una delle cose che più mi emoziona ancor oggi è quando, nelle tesi di laurea o di dottorato, sento che qualche mio allievo – che io riconosco come allievo, dunque che parla la mia lingua fondamentalmente, nelle cui parole riconosco le mie fatalmente – a un tratto pronuncia parole nuove. Ci sono dei momenti in cui alzo gli occhi perché sento che lui parla, lei parla in un'altra lingua. A partire dalla mia lingua può parlare un'altra lingua. E questa è una grande emozione per un maestro, per un professore. L'emozione più grande è quando sentiamo sorgere dalla lingua della didattica un'altra lingua che è la lingua del soggetto, che è il soggetto come differenza assoluta.

Non aver paura di inciampare

Su questo punto lei, citando Pier Aldo Rovatti, afferma che «l'insegnamento ha a che fare con la soggettivazione» e che «insegnare significa, né più né meno, insegnare a qualcuno a divenire un soggetto» (p. 110). Questo significa che l'impronta del maestro non è e non dev'essere un calco, sebbene ogni insegnamento porti con sé questo rischio. Come evitarlo?

Direi trasmettendo, insieme al sapere, la consapevolezza che non si potrà mai dire né sapere tutto. Un bravo maestro sa, mentre trasmette il sapere, *preservare il limite del sapere*. Limite da intendere non come insufficienza del sapere, ma come condizione profonda, umana del sapere. Un bravo maestro, mentre insegna, mentre trasmette il sapere, coltiva questo punto centrale, questo mistero che abita il sapere, cioè l'impossibilità di sapere tutto il sapere. Che non si risolve assimilando tutti i libri di tutte le biblioteche del mondo, ma mantenendo una tensione costante verso il sapere. Perché se anche sapessimo a memoria tutti i libri di tutte le biblioteche del mondo, non avremmo comunque realizzato una appropriazione esaustiva del sapere. Perché il limite del sapere non è esterno al sapere. Il

limite del sapere abita il sapere, è un punto interno al sapere.
Un grande allievo di Lacan, Moustapha Safouan, racconta che un bravo insegnante si distingue da come reagisce quando, prima di salire in cattedra, inciampa. È un test, dice. C'è l'insegnante che immediatamente si ricompone, facendo finta che non sia accaduto nulla. Questo, dice Safouan, non è un modello interessante. Poi c'è l'insegnante che si ricompone e, nel mentre si ricompone, con sguardo sadico cerca nell'aula chi si è permesso di sorridere per bacchettarlo. Nemmeno questa, dice, è la posizione auspicabile. Il bravo insegnante, conclude, è quello che inciampa e fa dell'inciampo il tema della lezione. Ecco, qui abbiamo la qualità dell'insegnante. I bravi maestri sanno inciampare. Non temono la propria insufficienza, anche perché la mancanza, come detto, non è loro, ma del sapere. È il sapere che manca. E l'insegnante custodisce la mancanza del sapere.
Per questa ragione Giovanni Gentile ha potuto affermare che, solo quando usciva dall'aula con la sensazione di aver appreso qualcosa che a lui stesso sfuggiva prima di cominciare, poteva considerare che quella era stata davvero un'ora di lezione.

L'inciampo mette in ricerca

A proposito di questo inciampo voglio fare un'ultima, personale evocazione di maestro. Ricordo che quando entrai all'università Statale di Milano, agli inizi degli anni '80, volevo assolutamente frequentare il corso di Mario Dal Prà. Lui insegnava storia della filosofia, io arrivavo a filosofia con un curriculum scolastico tormentatissimo: bocciato più volte, con un diploma di esperto in coltivazioni di piante tropicali in serre calde, insomma un percorso totalmente irregolare. Mi si diceva che Dal Prà fosse all'ultimo anno di insegnamento, così inserii il suo corso sebbene la guida dell'università lo indicasse come «vivamente sconsigliato per le matricole».
Il corso era sulla *Scienza della logica* di Hegel e io che arrivavo dalla floricoltura non avevo gli strumenti concettuali per affrontare un simile argomento. Però decisi di frequentare lo stesso e ricordo questo omino piccolo, che arrivava con sottobraccio i testi di Hegel – in tedesco e in italiano – e li commentava. E il commento del maestro, come sempre accade, illumina anche il testo più incomprensibile. Dove c'è insegnamento, c'è la luce, bisogna diffidare degli insegnanti oscuri. Il bravo insegnante è chiaro, strutturalmente chiaro, perché porta la luce sul testo. E allora anche il testo più denso, più tortuoso, come la *Scienza della logica*, nelle parole di Dal Prà si scioglieva e diventava luminoso.
Ma non tutto, ecco la grandezza del maestro. C'erano dei momenti – mentre commentava il testo – in cui si fermava, alzava gli occhi al cielo e poi diceva: «Qui dobbiamo fermarci. Chissà Hegel cosa ha visto...». E non proseguiva, inciampava sul testo. L'effetto su di noi era che, appena finita la lezione, ci precipitavamo sul punto dove il maestro era inciampato. Perché l'inciampo rende prezioso l'oggetto su cui si inciampa, ancora più dell'oggetto che si trasmette. Perché è lì che si gioca la vera partita. Allora la forza del maestro è, per un verso, portare la luce nel testo, per l'altro preservare l'impossibile da dire nel testo. Ma è questo impossibile che mantiene vivo il desiderio di sapere.

La cultura al posto della droga

Per concludere, lei prima accennava che una scuola capace di rendere il sapere

un oggetto di desiderio è una scuola che fa prevenzione. Può argomentare quest'idea?

Dicevo prima che il primo miracolo che ogni insegnamento degno di questo nome opera è trasformare gli oggetti teorici in corpi erotici. Il bravo maestro è quello capace di erotizzare il rapporto con il sapere, di incarnare il desiderio di sapere, di trasformare il libro in un corpo, di far venire voglia di toccarlo, penetrarlo, annusarlo. Questo genera una seconda trasformazione: l'allievo diventa amante del sapere. Il maestro, incarnando il desiderio di sapere, mette in movimento l'allievo. Questa trasformazione dell'allievo in amante del sapere è fondamentale nell'insegnamento. L'ultima metamorfosi rappresenta la vera posta in gioco della formazione: *trasformare i corpi in libri*. È questa la sublimazione che accompagna le grandi e straordinarie trasformazioni dell'adolescenza.
Forse è un po' visionario quello che dico. Cosa vuol dire far diventare un corpo un libro? Vuol dire che il corpo dell'altro – sia esso il corpo sessuale della mia compagna di banco, sia esso il corpo del mondo, il corpo della città, ogni legame – diventa *qualcosa che merita la nostra attenzione*, la nostra cura, che non si può leggere in fretta, che non si può ridurre a strumento per il mio godimento immediato, ma *bisogna dedicargli tempo*. La lettura di un libro non è un mangiare ingordo, la lettura esige tempo, sospensione, pausa, e soprattutto cura. Allora trasformare il corpo, il corpo di chi amo, il corpo del mondo in un libro è l'effetto più alto di una formazione. E questo è – se vogliamo – un altro nome dell'amore, che in fondo è il nome più alto dell'incontro.
Pasolini diceva che c'è droga, cioè uso strumentale e dissipativo del corpo, dove non c'è cultura. La droga viene al posto della cultura, la droga è l'esito di un «desiderio di morte» che si afferma sullo sfondo di un grande «vuoto di cultura». Quando non c'è cultura, non c'è linguaggio, non c'è parola, non c'è insegnamento, noi abbiamo la droga. La droga come simbolo di una relazione con il corpo orientata solo dal godimento dissipativo. La funzione della scuola allora è *mettere la cultura sopra la droga*. È un podio strano, la cultura sopra la droga. Eppure educare è questo: mettere l'amore per l'*eteros*, per l'altro, per il sapere, per l'altrove in cima a tutto. Riccardo Massa, che è stato un grande pedagogista in Italia, insisteva su questa etimologia del termine educare: portare altrove, cioè sospingere verso l'eteros, verso l'apertura di mondi.
Allora direi che veramente, se c'è un ruolo che la scuola può giocare nella prevenzione, non è dato dai corsi e corsetti che si fanno sulle tossicomanie e sull'anoressia. Né è dato dal professore che si mette a fare lo psicologo con i ragazzi – questa è un'altra retorica cattivissima del nostro periodo. Ma a un professore direi: spiega Ungaretti, spiega Montale, spiega le equazioni, spiegale bene! Fa' in modo che questi oggetti siano vivi, appassionino, tengano sveglie le persone! Così previeni, così salvi. Non metterti a raccogliere in classe i segreti dei tuoi alunni, come ho sentito dire da un insegnante. No, spiega Hegel, spiega Spinoza, fa' in modo che l'insegnamento di Hegel e Spinoza sia un insegnamento vivo. Questo salva, per come vedo io le cose. Non l'insegnante psicologo del disagio, ma l'insegnante testimone del carattere erotico della cultura. Questa è per me la prevenzione primaria.

Massimo Recalcati psicoanalista, è membro dell'Associazione lacaniana italiana di psicoanalisi, direttore scientifico dell'IRPA (Istituto di ricerca di psicoanalisi applicata) e docente all'università di Pavia.

Produrre Servizi è tutelare diritti

Ritrovare nella storia dei Servizi le ragioni e le possibilità per andare oltre la crisi

di
Franca Olivetti Manoukian

I Servizi sociali e sanitari da troppi anni sembrano affannati da varie crisi collegate a riduzioni di finanziamenti e di organici, a delegittimazioni e contrapposizioni ideologiche, a nostalgie di un welfare mai raggiunto e incitamenti verso ri-organizzazioni di cui non si vede il senso. A chi sta dalla parte dei Servizi, a chi pensa che possano contribuire alla qualità della vita di singoli e famiglie, tocca oggi raccogliere idee, motivazioni, cooperazioni per andare oltre questa lunga epoca di crisi e per riaffermare la centralità dei Servizi pubblici e privati nel progetto di una società democratica. Perché produrre Servizi – non dimentichiamolo mai – è tutelare diritti.

Produrre servizi, tutelare diritti: due verbi e due complementi oggetto che potrebbero, dovrebbero in modo immediato sintetizzare in che cosa consistono le funzioni dei Servizi sociali territoriali, le ragioni della loro esistenza. Sono scritti separati da una virgola. Viene così simbolizzato che appaiono come due aspetti giustapposti. Potrebbero essere congiunti da una lettera «e»: connessione assai leggera, che pesa più o meno come una virgola. Preferirei inserire una «è», terza persona dell'indicativo presente del verbo essere che ha un significato affermativo. Produrre servizi è tutelare diritti.

La tutela di diritti è un bene per tutti

Questa è l'ipotesi che mi propongo di assumere e sviluppare: oggi più che mai, in tempi di trasformazioni che ci sovrastano, di crisi più subite che capite, ciò che i Servizi sono in grado di produrre costituisce un contributo centrale rispetto alle possibilità di garantire i diritti soggettivi, quelli più visibilmente violati perché inscritti in «indecenti» situazioni di svantaggio e quelli più normalmente disattesi per impliciti, taciti accordi di mantenere silenzio.
La salvaguardia di quelli che vengono anche qualificati come diritti umani (*human rights, droits de l'homme*) poggia solo in casi estremi su sanzioni (che comunque non possono intrinsecamente restituire l'integrità fisica e psichica della persona che porterà su di sé segni indelebili delle violazioni subite). Le modalità repressive con cui si tende in altri campi a ottenere il rispetto dei diritti hanno meno peso in questo ambito, probabilmente perché le prove di comportamenti lesivi sono più sottili e opinabili e varie e variabili (secondo le diverse culture) sono anche le stesse interpretazioni di ciò che è stato compiuto.
Per lo più accade che la tutela dei diritti soggettivi venga attivata in situazioni singolari, ma è bene ricordare che non è soltanto a vantaggio di un'unica situazione: riguarda tante situazioni analoghe, ma soprattutto costituisce una riaffermazione che ha un peso sociale e ha ricadute per tutta la società. Eppure siamo continuamente interpellati sulla domanda di quanto nelle nostre vite collettive sia diffusa *la convinzione che la tutela dei diritti soggettivi riguarda tutti* e non può trovare effettivo mantenimento e sostegno se non nel *riconoscimento dell'esistenza di legami intrinseci* e di una cultura condivisa inscritta nelle stesse differenze e dissimmetrie.

Un nuovo progetto sociale

I Servizi territoriali nelle loro diverse articolazioni sono stati istituiti con la finalità di tutelare diritti che, scritti nella Carta costituzionale italiana del 1948, non trovavano, con il trascorrere degli anni, effettiva considerazione e applicazione. Erano – e sono – diritti indicati nei *principi fondamentali* (art. 2, 3, 4) e ribaditi nei *rapporti etico-sociali* (in particolare art. 32 finalizzato alla tutela della salute come fondamentale diritto dell'individuo e interesse della collettività), ma la loro traduzione doveva misurarsi con un quadro sociale fortemente perturbato e segnato da blocchi e contrapposizioni di schieramenti cristallizzati per decenni.

* | Volentieri anticipiamo alcuni contenuti del volume di Franca Olivetti Manoukian, *Oltre la crisi. Cambiamenti possibili nei Servizi socio-sanitari*, in uscita presso Guerini e Associati, Milano 2015. Ringraziamo l'autrice e l'editore per la disponibilità e collaborazione.

Nel secondo dopoguerra, grazie anche alle nuove configurazioni delle relazioni internazionali, si andavano mobilitando aperture a evoluzioni modernizzanti rispetto agli assetti sociali consolidati, orientate allo sviluppo economico e politico in senso democratico.
In questo quadro, avanzano e si condensano tensioni verso una concezione più democratica della vita sociale. Un primo indizio di attenzione ai modi di vivere dei cittadini è presente in quella legge Fanfani del 1958 con cui la tutela della salute viene affidata a uno specifico Ministero (scorporata quindi dal Ministero dell'Interno).
L'istituzione della Scuola media unica agli inizi degli anni '60 dà un segnale forte di una scelta politica collettiva di rimuovere le barriere tendenti a separare, già nell'iter scolastico di base, le appartenenze a una classe sociale e a predefinire le scelte successive verso un lavoro operaio o impiegatizio modesto o verso studi e carriere professionali più elevati.
Alla fine di quel decennio viene approvato il decreto di liberalizzazione degli accessi all'università, grazie al quale qualsiasi titolo di scuola media superiore consente di iscriversi a tutte le facoltà universitarie. Le contestazioni studentesche e gli scioperi del '68 e '69 sono espressioni e conferme di movimenti che introducono e sostengono cambiamenti decisivi negli assetti legislativi e istituzionali tendenti a garantire a «tutti» i cittadini la tutela dei diritti di cittadinanza.
Si rende più legittima e improrogabile la definizione di un nuovo quadro normativo che renda più pregnante l'obbligo di considerare gli esseri umani «uguali», degni di godere delle stesse prerogative di dignità e di rispetto, al di là delle differenze di genere (uomini e donne), di età (adulti e «minori»), di integrità fisica e mentale, di razza e collocazione sociale; un quadro che dia nuova esigibilità ai cosiddetti diritti soggettivi – al lavoro, alla casa, alla salute, alla crescita e all'educazione e istruzione.
La ricostruzione e la ripresa economica nel nostro Paese hanno contribuito a maturare e promuovere una maggiore attenzione a come questi diritti potessero effettivamente essere esercitati: goduti.

La nascita dei Servizi territoriali

I Servizi nascono entro questo clima sociale [1]. Hanno pertanto le loro radici entro movimenti sociali evolutivi e costituiscono elementi di innovazione entro una dinamica sociale rivolta all'instaurare nuove interazioni, a socializzare nuovi modelli di convivenza, a introdurre nuove forme di regolazione dei rapporti tra singoli e gruppi.
Compaiono come *istituzioni* che hanno come scopo prioritario quello di dare consistenza e rappresentatività a forze vive presenti nel contesto sociale perché sia possibile creare e mantenere nel tempo un nuovo ordine che ci si propone di realizzare. Sono espressione e deposito di valori che marcano modi di pensare e di agire individuali e insieme tendono a rappresentare quello che è considerato «bene comune».
Con le forti spinte ideologiche che li sostengono, i Servizi in quegli anni rappresentano effettivamente la volontà diffusa di realizzare una società più umana e giusta, capace

1 | Una lettura delle premesse ideali e culturali da cui hanno preso vita i Servizi e una analisi dell'avvio delle loro attività è stata proposta da me stessa in un libretto a cui sono affezionata: *Stato dei Servizi* (il Mulino, Bologna 1988).

di contrastare emarginazioni e devianze e di promuovere inclusione e partecipazione verso un ben-essere accessibile a tutti: un sogno, un progetto sociale ideale e luminoso. Rappresentano e presentano forti istanze di trasformazione in particolare nei confronti di istituzioni educative, sanitarie e assistenziali, amministrative.

Non a caso si pongono e sono visti da vari gruppi come protagonisti di cambiamenti sociali: in particolare di cambiamenti rispetto ai modi con cui la società affronta – affrontava o non affrontava – devianze, emarginazioni, esclusioni, distanze dalla «normalità». Lottano per l'affermazione e la realizzazione di modalità più umane di trattare il disagio, per la creazione di condizioni più rispettosamente attente alle persone e alle dimensioni relazionali. Pongono in primo piano la tutela dei diritti di tutti coloro che sono portatori di «diversità», di mancanze-menomazioni rispetto alla «normalità», i diritti di tutte quelle persone che la società tende a porre ai margini e quindi a escludere dalla partecipazione.

L'idea guida è quella di contrastare delle pratiche tradizionalmente adottate per trattare situazioni di disabilità, come la cecità o la sordità, malattie mentali, disturbi dell'apprendimento e maltrattamenti in ambito familiare, discriminazioni e violenze sulle donne, tossicodipendenze, ecc. Non si deve più ricorrere a repressione e reclusione, istituzionalizzazione e isolamento; va contestata ogni impostazione amministrativa e tecnicistica, vanno esclusi interventi «autoritari», strutturalmente non rispettosi dei diritti alla crescita personale, alla partecipazione sociale, alla salute, al lavoro, alla famiglia. I Servizi si devono rivolgere a tutti: non solo ad alcune categorie sociali [(2)].

Una alternativa alle istituzioni totali

Allo «stato nascente» i Servizi socio-sanitari territoriali si pongono come *istituzioni anti-istituzionali*, come nuove formazioni sociali intermedie che tendono alla demolizione delle istituzioni più tradizionali e consolidate, chiuse e ingabbiate entro schemi di funzionamento dominati dalle esigenze di sottomissione dei singoli e di controllo totale dei comportamenti, di inibizione e schiacciamento di ogni autonomia e iniziativa individuale.

Appare più evidente che le varie istituzioni che si occupano di disagi sociali, nelle configurazioni rigide e autoritarie via via assunte nel tempo, sono sempre più lontane dalle evoluzioni culturali che si vanno affermando: tendono all'autoconservazione più che alla funzione di regolazione dei rapporti e di mantenimento di valori collettivi [(3)].

Per chi si trova a lavorare nei Servizi ogni apparato organizzativo rimanda agli assetti con cui le istituzioni funzionano e intervengono. Per contrastare le istituzioni sembra imprescindibile rifiutare disegni e funzionamenti organizzativi su cui si reggono quotidianamente i trattamenti dei disturbi, i rapporti con gli utenti e tra gli operatori, le attività

2 | Per una analisi della complessa funzione sociale delle istituzioni segnalo il libro di Ota de Leonardis, *Le istituzioni. Come e perché parlarne* (Carocci, Roma 2001).

3 | È proprio in quegli anni che ha tanto successo la traduzione italiana, curata da Franco e Franca Basaglia, del libro di Ervin Goffman, *Asylums. Le istituzioni totali: meccanismi dell'esclusione e della violenza* (Einaudi, Torino 1968). Parallelamente, finisce per essere posta in secondo piano la funzione positiva delle istituzioni, quella che consente di vivere in una società che non sia del tutto in balìa di rapporti di forza, che qualifica come civile la convivenza perché accetta l'esistenza dell'altro.

interne e con l'esterno. In questo senso, nella nascita dei Servizi sono inscritte diffidenze verso tutto ciò che presentifica la funzione repressiva delle istituzioni: la *struttura organizzativa* ne è la più immediata traduzione che va demolita o di cui si può fare a meno, per evitare di esserne condizionati.
Qualificare questi nuovi Servizi come «territoriali» esprime la scelta di ancorarli a una prossimità che possa rendere la loro attività ben vigile e pronta. Insediandosi nei diversi contesti sociali è possibile per i Servizi tradurre concretamente la tutela dei diritti soggettivi in iniziative collettive ben identificabili, di per se stesse «rivoluzionarie» rispetto all'esistente. Anche a fronte di interessi e posizioni contrastanti si tratta di abolire le scuole speciali, di chiudere orfanotrofi e brefotrofi, di svuotare gli istituti, di demolire i manicomi. Si tratta di instaurare modalità relazionali più aperte e simmetriche con le donne, con le famiglie e con i bambini stessi.
In prima linea sono i Servizi socio-sanitari come i consultori (istituiti con una legge specifica nel 1975) e in seguito i Servizi di salute mentale e quelli per le tossicodipendenze, che riuniscono professionisti di varie provenienze ed estrazioni: assistenti sociali, medici, psicologi, infermieri, psichiatri, a volte pedagogisti e sociologi. E si va anche a tentare di promuovere integrazioni tra sociale e sanitario.
Si costituiscono a livello locale, in qualche area del Nord Italia, alcuni Consorzi socio-sanitari di zona; si sostengono collegamenti tra Servizi dei Comuni e neo-nate Unità sanitarie locali; si attivano e vengono sostenute cooperative a cui vengono affidate attività da svolgere in strutture diurne e semi-residenziali ritenute opportune e necessarie per particolari situazioni, ad esempio di ragazzi difficili, di tossicodipendenti o di malati mentali.

La poca attenzione ai fattori organizzativi

Nelle considerazioni che sto aprendo sul decollo dei Servizi nel nostro Paese ho più volte fatto ricorso, non a caso, alle parole *istituzione* e *organizzazione*. Non sono sinonimi. Senza addentrarmi in approfondimenti, mi pare comunque opportuno indicare una distinzione di massima tra i due concetti.
Consideriamo le *istituzioni* come entità aventi un'esistenza sovra-individuale, collettiva, caratterizzate da una intrinseca permanenza, indipendente dagli individui che nel tempo le hanno fondate e ne fanno parte; rappresentano un immaginario in cui è depositato un bene comune; definiscono confini e appartenenze, cornici simboliche che strutturano comportamenti e interazioni. Esse tuttavia lasciano molti vuoti che diventano aree di marginalità ed esclusione sociale e nel loro perpetuarsi tendono a distanziarsi dalla realtà che cambia in modo disordinato e accelerato.
Possiamo riferirci alle *organizzazioni* come realtà sociali costituite da relazioni tra singoli e gruppi finalizzate al raggiungimento di obiettivi collegati ai mandati istituzionali in modi che possono variare nel tempo. Sono pertanto più direttamente connesse al produrre e a come produrre, e più esposte alle contingenze, al mutare di condizioni economiche e culturali, di competenze e tecnologie e all'esigenza di verificare il proprio funzionamento attraverso riscontri e rimandi rilevabili nel contesto sociale.
Nelle fasi iniziali di vita dei Servizi nel nostro Paese appare prevalente e dominante l'investimento per solidificare la loro esistenza sul piano *istituzionale*. È importante che ci siano e che in tal modo dimostrino l'impegno per la tutela dei diritti di tutti i cittadini, anche dei «diversi». Quello che producono è scontato, comunque positivo.

Non so se questa ipotesi che sto proponendo sia percorribile. Si può comunque constatare come il lavoro attribuito ai Servizi, tanto complesso e impegnativo per chi è direttamente implicato, in quegli anni sia *ben poco considerato dal punto di vista organizzativo*. La possibilità di introdurre azioni e interventi decisamente differenti da quelli tradizionalmente messi in atto sembra immediata, affidata alle condivisioni ideali e alle motivazioni militanti.

La sola articolazione per l'organizzazione del lavoro a cui si fa esplicito riferimento nelle definizioni normative è l'*équipe*, che viene richiamata e raccomandata come se fosse un dispositivo-chiave per il funzionamento del Servizio. Non è chiaro, tuttavia, quanto sia vista come dispositivo operativo necessario per lo svolgimento delle attività o quanto esprima l'idea di un funzionamento di gruppo concorde e armonico.

Non va dimenticato che in quegli anni il gruppo, il piccolo gruppo di lavoro, il gruppo faccia a faccia, è nell'immaginario collettivo la traduzione più immediata (privilegiata e da privilegiare) della possibilità di interagire in rapporti simmetrici, di prendere parte attiva, di riconoscersi ed emanciparsi e di sperimentare micro contesti «democratici» e anche di produrre in modo creativo ed efficace insieme. Sono diffuse varie idealizzazioni. Si sottolinea la *centralità del riconoscersi «noi» come determinante per il buon lavoro*.

Gli operatori sono animati da intense motivazioni ideali, che soprattutto nei primi tempi sembrano quasi poter sopperire a competenze professionali approssimative. Si teorizza persino l'opportunità che nei Servizi venga individuato un *operatore unico*, a garanzia di interazioni aperte ed empatiche con gli utenti, non condizionate da distanziazioni e asimmetrie che rischiano di riproporre prescrizioni e interventi autoritari.

Probabilmente all'epoca[4] ci si è appoggiati e fermati all'idea che *per la tutela dei diritti fosse essenziale e decisivo realizzare e mantenere l'esistenza dei Servizi,* la loro articolazione decentrata e diffusa, le sedi e le dotazioni di organici di cui potevano disporre, il sostegno che ottenevano dagli amministratori locali, la loro legittimazione: non altrettanti investimenti sembra che siano stati indirizzati a considerare gli aspetti di realizzazione del lavoro «produttivo di servizi» e delle relative esigenze di coordinamento e controllo.

La moltiplicazione di disagi e di servizi

Agli inizi degli anni '90 quando a livello politico e amministrativo sembra che si vada concretizzando la possibilità di instaurare anche in Italia un *welfare state* di cui si parla da anni come meta da raggiungere, gli assetti di prosperità economica cominciano a manifestare alcune crepe. La società mostra sempre più fragilità, squilibri, contraddizioni e mostra soprattutto l'emergere di fenomeni poco o nulla governabili.

Cresce il disagio; o meglio, non sappiamo bene se cresca in realtà o se non sia la sua rilevazione a essere più attenta, grazie anche alla diffusione dei Servizi sociali e socio-sanitari. Infatti, quando si diffondono dei modelli di benessere, di salute, di vita familiare, di successo lavorativo, si notano molto di più e si sopportano sempre di meno carenze,

4 | Mi riferisco in particolare alle concettualizzazioni introdotte dal libro di Richard Norman, *La gestione strategica dei servizi* (ETAS, Milano 1985), e che ho ripreso nel mio *Produrre servizi* (il Mulino, Bologna 1998).

disfunzioni e malesseri. Aumenta la percezione del disagio e corrispondentemente cresce la richiesta di eliminarlo.
In questo quadro va diffondendosi anche la *produzione di divulgazioni di saperi* di tipo medico, psicologico, pedagogico. Paradossalmente, il diffondersi di conoscenze in strati molto larghi di popolazione non porta maggiori capacità e competenze nell'affrontare la complessità di varie situazioni relazionali e familiari difficili, o meglio induce una *acculturazione ambigua.*
I disagi che si fanno avanti premono per una crescita dei Servizi, per un loro potenziamento attraverso sedi più numerose e adeguate, dislocazioni sempre più accessibili, attraverso l'apertura di nuovi e più specifici ambiti di intervento collegati a problematiche emergenti (consultori per la menopausa, per i disturbi del comportamento alimentare, per adolescenti, per preparazione alla nascita, per percorsi di IVG...), dotazioni di competenze professionali più approfondite e di strumentazioni più sofisticate .
L'accesso ai Servizi di persone e famiglie con disturbi e patologie gravi, disabilità motorie e intellettive notevolmente invalidanti, maltrattamenti e abusi – e non solo in condizioni di deprivazione economica e culturale – richiede competenze consistenti di operatori, assistenti sociali ed educatori dotati di motivazioni e capacità relazionali empatiche, ma anche specialisti preparati in campo diagnostico e terapeutico, psicologi, medici, psichiatri e neuropsichiatri, nonché terapisti della riabilitazione. Il funzionamento in équipe si va frammentando in diversi interventi specialistici, in ambulatori, ciascuno strutturato secondo specifiche impostazioni metodologiche e collocato più o meno implicitamente entro gerarchie che riservano maggior peso a chi ha posizioni professionali e istituzionali più forti e elevate.
Chi lavora nei Servizi si trova così investito sempre più di richieste, perché la società, l'opinione pubblica, «vede» queste difficoltà e insieme presenta pretese, esige «risposte adeguate». Questa locuzione (*risposte adeguate*) diventa quasi una parola d'ordine in tutti i Servizi, ma è carica di elementi ambigui. Nel complessificarsi delle situazioni di disagio che arrivano ai Servizi e, parallelamente, nella diversificazione dei servizi per farvi fronte, gli interventi rischiano di «rispondere» al destinatario che l'operatore tende a privilegiare perché questo corrisponde al mandato del Servizio in cui lavora. Ma in quest'ottica di individualizzazione scivola via l'attenzione alla tutela dei diritti, intesa come costruzione di condizioni sociali in cui *tutti* possano ritrovarsi considerati soggetti a pieno titolo.

La strada dell'aziendalizzazione

Per quel che mi è possibile ricostruire, credo che le leggi 502/1992 e 517/1993 segnino un punto di svolta nella vita dei Servizi socio-sanitari nel nostro Paese. Vengono emanate effettivamente come «riforma della riforma sanitaria». Più che per le singole definizioni in esse contenute sono significative per l'impostazione che le caratterizza. Esprimono una sorta di *inversione di tendenza* per molti aspetti riconducibile a una crescente preoccupazione per l'espandersi della spesa pubblica e per l'esigenza di porvi freno.
Non si intende rinunciare a una ipotetica politica di welfare, ma la si incanala su due binari che sembrano da un lato mantenere linee strategiche congruenti con la scelte passate e dall'altro corrispondere alle nuove esigenze. Si ridisegna per tutta l'area sanitaria e socio-assistenziale un governo decentrato, affidato alle Regioni, e al tempo stesso si definisce per i Servizi

un assetto organizzativo/amministrativo in grado di esercitare funzioni di controllo della spesa e di verifiche di efficienza, in modo analogo a quello che accade nelle imprese industriali e commerciali.
È a questo punto che si registra una *più consistente attenzione all'organizzazione* dei Servizi sanitari e socio-assistenziali. Già ci si era avviati su questa strada quando, tra la fine degli anni '80 e l'inizio degli anni '90, da parte di alcuni Comuni si era delegata l'attività qualificabile come sanitaria alle Unità socio-sanitarie locali e quando alcune Regioni si orientavano a togliere dalla denominazione degli enti l'aggettivazione «socio». È tuttavia diventata più visibile dopo le leggi 502 e 517 che richiedevano la trasformazione delle USSL o USL in ASL, *aziende sanitarie locali*, separandole dalle aziende ospedaliere. In seguito si è avuto un succedersi di disegni e ridisegni organizzativi collegati ad accorpamenti, a ritiri delle deleghe, a varie esternalizzazioni a enti e cooperative, a costituzione di aziende speciali con declinazioni differenti.
In questo clima si è diffusa una sorta di acculturazione all'impostazione organizzativa dominante in aziende industriali; si sono acquisiti nel linguaggio corrente dei termini come «obiettivi», «budget», «flow chart», «lay out», «core business», «vision» che presentificano la cosiddetta *aziendalizzazione*. La stessa parola «azienda» rimanda immediatamente a una sorta di *assimilazione della produzione di servizi a qualsiasi tipo di produzione industriale, produzione di beni con uso di impianti e macchinari*. E questo ha un duplice risvolto. Si assume e si diffonde un'impostazione complessiva che è incardinata su un modello fordista, impregnato di razionalità astratta, incentrato sulla divisione a tutti i livelli, in settori, in uffici, in competenze operative a seconda delle categorie e degli inquadramenti, sulla definizione di regolamenti e procedure sempre più minute, sui controlli formali, sul privilegiare le comunicazioni dall'alto al basso e scoraggiare le interazioni orizzontali: un'impostazione verticistica che induce deresponsabilizzazioni diffuse.
L'altra ricaduta è una sorta di *apprezzamento idealizzato del funzionamento delle organizzazioni «private»* come garante di efficienza e di capacità di innovazione/adattamento, e parallelamente una delegittimazione del «pubblico» come imprigionato in una corazza di inerzie e adempimenti inderogabili, inevitabilmente statico e autoreferenziale.
Ambedue questi aspetti si può ipotizzare che per alcuni anni abbiano contribuito a non sostenere le identificazioni degli operatori a livello di base con i Servizi pubblici, con i Comuni e con le ASL come enti locali finalizzati a tutelare salute e benessere. È come se si fosse alimentata una scissione tra «privato efficiente» e «pubblico inefficiente» e si fosse sottovalutata la centralità – per chi lavora in un'organizzazione che produce servizi – del condividerne le finalità, i valori che danno senso e qualità all'operare quotidiano con i destinatari.
È forse interessante ricordare che, nelle stesse imprese produttrici di beni, alla fine del secolo scorso si cominciava a mettere in discussione il modello aziendale tradizionalmente acquisito per ricercare assetti meno rigidi, più mobili e aperti, per introdurre e sviluppare una nuova cultura [5]. Allora perché è stato tanto privilegiato il

5 | Norman R., *Ridisegnare l'impresa. Quando la mappa cambia il paesaggio*, ETAS, Milano 2002.

riferimento all'azienda? Perché si è assunto un modello che stava per essere superato? Forse chiamare *azienda* una qualsiasi organizzazione produttiva significa imprimere un'impostazione in cui il risultato economico deve essere assunto come assolutamente prioritario.
Ma è questa la maggiore finalità delle organizzazioni dei Servizi, che anche quando sono private hanno comunque una funzione pubblica?

La divaricazione dell'area sanitaria

È andata individuandosi un'area di Servizi qualificabile come «sanitaria» che, con differenze tra le diverse Regioni, è stata in vari modi separata e orientata in senso più specificamente aziendalistico. Essa ha un mercato entro cui sono presenti diversi soggetti privati e pubblici che erogano un'ampia gamma di attività, anche avvalendosi di competenze specialistiche, altamente specialistiche, a cui i cittadini si rivolgono potendo scegliere liberamente.
Il funzionamento organizzativo di quest'area è fortemente regolato da disposizioni normative cogenti che dovrebbero garantire la qualità dei servizi forniti da ospedali e case di riposo, da comunità e Servizi ambulatoriali. Per usufruirne è necessario che i cittadini seguano le procedure previste e dimostrino di avere le prerogative e le documentazioni che confermino le loro richieste.
Entro questa impostazione si erogano prestazioni, azioni/risposta entro un rapporto interindividuale tra singolo destinatario e singolo operatore che – psicologo o fisioterapista o infermiere della salute mentale – è comunque qualcuno che «cura» e pertanto prescrive, inquadra, definisce, decide. Al contempo, è proprio in questo contesto che si aprono nuove elaborazioni sui contenuti dell'attività sanitaria, verso una concezione olistica, che mette al centro la persona e che distingue il «curare» come mettere in campo terapie finalizzate alla guarigione e il «prendersi cura» come mobilitazione di ascolti e attenzioni in una comunicazione ravvicinata tra operatore e persona che soffre e che è portatrice di disturbi e problemi di salute fisica e psichica.
Non solo. Mentre si rafforzano regolamentazioni e moltiplicazioni dei controlli finalizzati a migliorare la produttività, cioè a ottenere a tutti i livelli interventi qualitativamente accettabili col minimo dei costi, ci si scontra con rigidità sostenute da varie istanze anche sindacali. Là dove per le inerzie inscritte nel settore pubblico risulta difficile introdurre variazioni specifiche nell'organizzazione del lavoro e nella retribuzione o in genere nel trattamento del personale, si ricorre alle cosiddette «esternalizzazioni».
Con questo neologismo (anche un po' astruso) si vuole indicare quella produzione che viene posta fuori dall'ambito in cui finora è stata realizzata. Gli interventi nei confronti di situazioni di sofferenza e malessere possono essere spostati dai Servizi pubblici per essere delegati ad altri sistemi produttivi, privati, gestiti con criteri di maggiore efficienza, ricorrendo ad altri contratti di lavoro, spesso precari, e a selezioni sommarie con scarse verifiche delle competenze professionali. Si pone l'interrogativo se questa sia una sorta di «privatizzazione che priva», nel senso che trascura il mandato istituzionale della tutela della salute psico-fisica e degli altri diritti soggettivi, o se sia invece una consegna di finalità pubbliche ad altri attori sociali con cui si collabora proprio per poterle realizzare in modo più efficace.

Le ambivalenze nelle regolamentazioni

Le diverse sfaccettature delle configurazioni che si vanno consolidando nei Servizi sono rese più evidenti dall'ampliarsi e complessificarsi delle malattie croniche, delle disabilità permanenti, delle patologie oncologiche, di tutte quelle situazioni in cui si vive con esigenze di cure molteplici e diversificate, messe a disposizione da più professionisti, specialisti, collocati anche in sedi differenti e con modalità di lavoro tra loro disomogenee per stili e strumenti, per documentazioni e orari. Vengono proposte e sviluppate, in più ambiti e da più gruppi, iniziative rivolte alla *umanizzazione* dei Servizi come se fosse necessario contrastare il funzionamento vigente per realizzare quello che sostanzialmente è il compito primario di queste organizzazioni.

In quest'area, cosiddetta della *cronicità*, che col passare del tempo, proprio grazie ai progressi della medicina, sta crescendo (e che secondo le stime dell'Oms costituisce circa la metà delle richieste di cura presenti oggi nella società occidentale), si avverte più chiaramente l'importanza dell'*integrazione* tra Servizi di cura e di riabilitazione, tra professionisti di area strettamente sanitaria e professionisti di area psico-sociale, tra ospedale e territorio, tra Servizi pubblici che forniscono attività diagnostiche, interventi su patologie in fasi acute e Servizi tendenzialmente messi a disposizione da cooperative per assistenza domiciliare, ospitalità residenziale o semi-residenziale di persone anziane e disabili.

Contemporaneamente ci si orienta anche ad attribuire a chi si rivolge ai Servizi contrattualità e capacità e, riservando soltanto alle situazioni più strettamente ospedaliere la denominazione di *pazienti,* si introduce l'idea che siano dei *clienti*, non tanto perché debbano avere sempre ragione, quanto per modificare il sostantivo più tradizionalmente utilizzato – *utenti* (denominazione più connotata entro una cultura amministrativa) – e richiamare uno stile di lavoro e di rapporto più simmetrico, più attento e sollecito.

Nell'evoluzione del sistema organizzativo dei Servizi sanitari sembrano pertanto presenti delle componenti ambivalenti se non quasi contrastanti: tra impianti lavorativi rivolti a standardizzare da un lato e iniziative per umanizzare e personalizzare dall'altro, tra spinta a modificare le organizzazioni pubbliche e adottare affidamenti di interventi al privato, tra classificazioni di categorie di destinatari e valorizzazione delle loro capacità di scelta.

Accanto a questi movimenti oscillanti va segnalato anche che da un lato si tendono a modificare i rapporti tra Servizi e cittadini per fare in modo che questi ultimi abbiano maggior voce in capitolo, siano più ascoltati nei loro desideri e nelle loro attese, siano sempre più «persone al centro»; d'altro lato gli operatori che sono poi in contatto diretto con loro sono inquadrati in tempi sempre più compressi, in procedure sempre più codificate, funzionali a verifiche e valutazioni ed esposte al rischio di diventare impersonali.

E la tutela dei diritti che i servizi sono chiamati a produrre, come si realizza in questo quadro? La domanda resta aperta. Probabilmente si è andata infiltrando una divaricazione tra produrre servizi e tutelare diritti.

La legge 328 e la riforma del Titolo V

La legge 328 del 2000, arrivata dopo molti anni di attesa di un atto istituzionale che riformasse tutto il sistema socio-assistenziale,

costituisce una presa di posizione forte per la legittimazione degli attori e degli interventi che si occupano di difficoltà sociali e per la definizione di orientamenti più aperti alle complessità che si tratta di affrontare. Si disegna un «sistema integrato di interventi e servizi sociali» e quindi è ben presente l'importanza di riconsiderare nell'insieme tutto ciò che si agita in questo campo. Al di là del richiamo ai diritti di cittadinanza che forse è un po' formale e un po' rapido, alcuni elementi mi sembrano da sottolineare come particolarmente rilevanti:

- la considerazione e il riconoscimento dell'esistenza nel contesto sociale di più soggetti istituzionali e non, pubblici e privati che possono farsi parte attiva nel contrasto ai disagi sociali;
- la gestione degli interventi in diverse forme, dirette e indirette;
- la valorizzazione delle iniziative e delle risorse che possono essere messe in campo da più parti e in più forme;
- la rappresentazione degli interventi nel sociale come realizzazioni che richiedono delle progettazioni, ovvero degli investimenti in idee ed elaborazioni, e anche delle verifiche e valutazioni di impatto;
- la centralità dell'integrazione tra diversi attori sociali e tra diversi interventi.

Si ha qui una ricomposizione di dimensioni istituzionali e organizzative che sembrerebbe poter orientare o ri-orientare positivamente delle ricomposizioni feconde per l'operatività dei Servizi. Costituisce un passaggio innovativo che probabilmente ha avuto ricadute meno importanti e penetranti di quel che ci si sarebbe potuti aspettare per diverse ragioni.

Soltanto un anno dopo, nel 2001, veniva promulgata la riforma del Titolo V della Costituzione che ricolloca sostanzialmente la legge 328 in un nuovo assetto istituzionale e ne indebolisce la portata e la pregnanza. L'area socio-assistenziale viene attribuita alle competenze delle Regioni che sono legittimate ad assumere delle scelte diverse anche rispetto alla allocazione delle risorse e alla definizione e programmazione degli interventi. Ogni Regione, dopo alcuni anni, predispone una legge di riordino delle politiche sociali che riprende e traduce la 328 con definizioni e interpretazioni differenti, ispirate a diversi indirizzi e rivolte a diverse declinazioni attuative, spesso orientate dai modelli di welfare già praticati e da visioni condivise dalle diverse componenti partitiche presenti nel governo locale.

La sorte dei Piani di zona

Ci si può chiedere quanto i Servizi e gli operatori, quelli appartenenti agli Enti pubblici ma anche quelli del terzo settore o del cosiddetto privato sociale e del volontariato, abbiano colto le componenti innovative del nuovo dettato istituzionale e abbiano visto la possibilità di farne leva per incrementare e migliorare i sottosistemi organizzativi e gli stessi interventi.

Pensiamo in particolare a un dato che potrebbe apparire un dettaglio, ma anche un indizio a cui ripensare: quanto e come è stata assunta la realizzazione del *Piano di zona*, un dispositivo in cui si condensano in modo significativo elementi caratterizzanti di una rinnovata prospettiva con cui intervenire nel sociale? Un Piano traduce in termini operativi delle linee di indirizzo rilevanti per dare nuovo impulso alla considerazione e alle strategie di azione rispetto ai problemi sociali: la prima è quella di ancorarsi al territorio, ovvero alla realtà socio-economica e culturale in cui si vive, di cui si può avere una conoscenza ravvicinata e con cui si può attivare e mantenere rapporti continuativi nel tempo. Questo dà confini all'operare ma

al tempo stesso facilita connessioni.
Il termine Piano può rimandare a processi di programmazione gerarchizzati e rigidi, ma si può anche ipotizzare che intenda esprimere l'importanza di una formalizzazione scritta di un lavoro programmatorio a cui nel testo si dà più volte il nome di *progettazione*. Si danno esplicite indicazioni per organizzare i servizi, per rilevare dati, per «stimolare le risorse locali di solidarietà e auto-aiuto», per «responsabilizzare i cittadini nella programmazione e nella verifica dei servizi», per realizzare integrazioni a livello operativo e di sistema.
Mi risulta, tuttavia, che i Piani di zona siano stati visti con diversi atteggiamenti: inizialmente, soprattutto da alcuni, con entusiasmo e con impegno a darne traduzione operativa, da altri come adempimenti a cui era necessario sottostare o come tavoli su cui cercare di attribuire (o accaparrare) risorse finanziarie. Ci si è scontrati con varie difficoltà, con Comuni portatori di interessi non univoci, con rapporti tra cooperative e ONLUS influenzati da giochi di potere, con associazioni di volontariato poco propense a inserirsi con contributi specifici.
Forse soltanto in alcuni casi felici, attraverso i Piani di zona, si è riusciti – mi sembra – a costituire un ambito realistico di ridefinizione di condizioni per garantire per tutti più adeguate tutele dei diritti soggettivi, proprio attraverso una migliore e più mirata organizzazione concordata e integrata.
Si può considerare questo un indizio con cui interrogare i Servizi?
Nel corso del tempo, sedimentate, affievolite e cristallizzate le originarie motivazioni ideali, non si è forse depositata una cultura in cui le dimensioni istituzionali hanno assunto un peso, più nel senso di mantenere attese di trovare sostegni e legittimazioni che di suscitare idee e iniziative, di far cogliere possibilità di intraprendere?

Le ricadute della «crisi»

Intorno al 2008 dagli Stati Uniti rimbalzano in Europa e nel nostro Paese una serie di fenomeni che vengono complessivamente descritti come «crisi» e che danno ulteriore accelerazione e ampiezza a trasformazioni già in corso, che scuotono un ordine sociale a cui si è abituati e che collegano immediatamente accadimenti a livello globale con vicende della quotidianità.
A livello individuale e familiare si avvertono come imminenti e possibili perdite di ricchezza, di collocazione sociale per sé e per i propri figli: si percepiscono con angoscia rischi incombenti del venir meno di condizioni di abitazione e di lavoro e anche di salute propria o dei propri parenti anziani. È serpeggiante un malessere sociale che sempre meno è prerogativa soltanto di alcuni strati sociali: sul piano collettivo tende a essere minimizzato o impacchettato (vi si dedicano infatti a livello governativo vari «pacchetti» di misure); ciascuno individualmente cerca di contrastarlo, anche di negarlo, in attesa che prima o poi il ciclone passi.
Tutto questo si riversa sui Servizi in termini di maggior numero di persone e famiglie che ad essi accedono (o cercano di accedere), di pesantezza dei problemi che vengono portati (intrecci di difficoltà economiche e relazionali), di diversi rapporti tra operatori e destinatari (manifestazioni di rivendicazioni cariche di aggressività), di attese che non trovano risposte. Forse soprattutto *si richiede ai Servizi di cambiare*. Da parte dei vertici organizzativi vengono sollecitate e talvolta anche imposte modificazioni sostanziali rivolte a ridurre la spesa e a far fronte comunque al malcontento diffuso. Da parte della gente sono sempre più forti le pretese di veder soddisfatti i propri diritti, da quelli di essere tempestivamente

ascoltati nelle proprie difficoltà a quelli di essere difesi dagli sfratti, aiutati a pagare un mutuo, ottenere un sussidio. I Servizi, costituitisi come fautori di cambiamenti per realizzare maggiore equità, diventano uno degli avamposti più attaccati per esprimere risentimenti e impotenze.

A fronte di un'esigenza di contenimento del debito pubblico tutte le organizzazioni dei Servizi vengono inglobate indistintamente entro quel sistema – o quell'aggregato – chiamato welfare, per anni considerato come una méta da raggiungere per ogni paese democratico e che oggi non appare più edificabile. Si cerca di qualificarlo in altri modi (welfare locale, welfare mix, welfare di comunità, welfare territoriale), forse per rendere meno laceranti tagli e riduzioni di spesa o anche per richiamare confini e riaggiustamenti con cui prospettare il raggiungimento di una maggior efficienza.

Gli irrigidimenti nel funzionamento

La riforma del Titolo V della Costituzione, che dà ampio spazio alle autonomie locali, se da un lato crea opportunità per nuove combinazioni, dall'altro ha avuto esiti imprevisti rispetto alle attese: le Regioni si sono rivelate nel tempo organismi governativi troppo distanziati dalle problematiche dei diversi territori e soprattutto troppo differenziate nell'ampiezza, nelle risorse da investire e negli orientamenti, creando disparità nelle possibilità di fruizione dei servizi da parte dei cittadini e probabilmente rendendo ancor più evidenti squilibri tra territori, inadempienze e assenze.

L'adozione del cosiddetto modello «aziendale» attraverso interventi di razionalizzazione definiti (imposti) dall'alto un po' in tutti gli enti pubblici e importato anche in cooperative e fondazioni, ha portato irrigidimenti nel funzionamento, appesantimento di rendicontazioni e controlli di tipo quantitativo/formale, attenzioni alle esecuzioni di quanto prescritto.

In particolare credo si sia sottovalutato quanto in tutto questo assetto abbia influito la considerazione dei singoli come variabile dipendente: personale classificato in categorie collocate entro linee gerarchiche e anche utenti, pazienti, clienti individuati per patologie e disturbi dei diversi organi e per aree corrispondenti a caratteristiche strutturali (anziani, adulti, minori...). L'investimento nelle relazioni con i destinatari rischia di essere deviato verso la preoccupazione di non conformarsi a procedure e protocolli, di essere colti in fallo e di subirne spiacevoli conseguenze.

A che cosa sono ispirati questi mutamenti organizzativi con cui ci si attrezza per rispondere ai mutamenti più generali?

È come se fossero acquisiti culturalmente come positivi e risananti dei criteri istituzionali e organizzativi già presenti e utilizzati. Non pare abbiano ottenuto riscontri interessanti – nel senso anche di aver segnalato scelte da scoraggiare –, ma si continua a privilegiare, confermare e quasi rinforzare:

- il *ridimensionamento delle funzioni pubbliche*, minimizzandone e sottovalutandone

la portata per la vita di tutti: si sostiene una sorta di spostamento di attività dai Servizi pubblici perché le medesime attività possono essere svolte da Servizi privati con maggiori competenze e soprattutto con maggiore attenzione ai costi. Il risparmio rimane il criterio per il funzionamento dei Servizi e la privatizzazione diventa la garanzia di una buona gestione. La funzione sociale di integrazione e ricomposizione resta in secondo piano;

• la *centralità della produttività:* si esige efficienza o più efficienza e non solo da parte dei vertici dell'organizzazione, che hanno il compito di promuoverne un buon funzionamento, ma anche da parte dell'opinione pubblica al cui giudizio direttamente o indirettamente l'organizzazione è esposta; per questo è necessario dimostrare tangibilmente che le spese diminuiscono o non aumentano e da qui si decidono limitazioni e valutazioni. È irrilevante se questo comporta *gravi disconoscimenti dei diritti soggettivi* e ricadute in termini di aumento di tensioni e stratificarsi di conflittualità.

Inedite prospettive di pensiero e azione

Contemporaneamente l'impoverimento generalizzato con cui si è costretti a confrontarsi apre altri scenari. *Arrivano segnali di nuove iniziative che introducono inedite e inaudite prospettive di pensiero e azione in diversi territori*, che costituiscono sperimentazioni molto interessanti e costruttive.

Nell'orizzonte generale, rispetto a quel che ho richiamato fin qui, sembrano avere un peso limitato perché appaiono come frammenti, come esperienze circoscritte sostenute da alcuni fattori, in particolare di tipo culturale e relazionale. Sono esperimenti di cui tenere attentamente conto per trarne apprendimenti. In particolare credo che abbiano messo in luce che:

• il lavoro nel sociale implica una *centratura sul territorio*, riguarda tutti coloro che lo abitano: è lì che si manifestano i disagi ed è lì che sono presenti *risorse non pensate* e non immaginate mobilitabili, *generative di ulteriori risorse*; questo porta a «scoprire» che tra Servizi e cittadini sono possibili diverse interazioni, diversi scambi tra ciò che può essere messo a disposizione e ciò di cui si può usufruire con vantaggio reciproco; è pertanto cruciale l'*investimento nelle relazioni di fiducia* e nelle comunicazioni tra cittadini e Servizi e tra Servizi;

• *i problemi* di singoli e famiglie *vanno identificati*, distinti con specifici accorgimenti conoscitivi e *collegati a questioni trasversali* con diverse elaborazioni: questo consente di disporre di rappresentazioni più realistiche delle difficoltà, di attivare responsabilizzazioni a livello individuale e collettivo, motivazioni e cooperazioni;

• sono pensabili e sviluppabili connessioni tra gruppi e aree anche molto diverse e distanti tra loro; *vanno costruite convergenze per affrontare i problemi* perché si può apprezzare l'efficacia (e non soltanto l'efficienza) di ciò che viene intrapreso solo attraverso visioni orientate da valori sufficientemente condivisi; la costruzione di legami è in divenire e va accompagnata nella ricerca di un «bene comune», che non si osa quasi neppur più nominare.

È a partire da riconsiderazioni e riletture di questi orientamenti che mi sembra possibile aprirsi a proposte evolutive.

Franca Olivetti Manoukian, psicosociologa, è formatrice e consulente dello studio Aps di Milano: olivettimanoukian@studioaps.it

A un giovane operatore della salute mentale

Lettera aperta per riconoscerci in una storia che parla al futuro

di
Peppe Dell'Acqua

Nel numero 286 di Animazione Sociale, Eugenio Borgna, maestro di una psichiatria dell'ascolto e del colloquio, ha invitato a «rifondare la psichiatria come scienza umana». E ha rivolto il suo appello alla nuova generazione di operatori della salute mentale, senza il cui apporto – ha detto – «la grande rivoluzione basagliana rischia di svuotarsi e di perdere le sue ragioni d'essere». Come rivista, ci è subito venuto in mente di chiedere a un altro maestro, Peppe Dell'Acqua, di proseguire il discorso. Ne è nata questa «lettera aperta», rivolta a chiunque operi nel campo della cura e anche a tutti i cittadini e le cittadine con cui sempre più bisogna imparare a parlare.

Marco Cavallo, che tu forse conosci, ha insistito molto perché ti scrivessi. Di recente abbiamo fatto visita agli internati dei sei OPG (Ospedali psichiatrici giudiziari) che ora stanno per chiudere, siamo stati in viaggio per due settimane e abbiamo incontrato tantissime persone.
Sono più di quarant'anni che andiamo in giro e di cose ne abbiamo viste, di storie ne abbiamo ascoltate, di persone belle e generose ne abbiamo conosciute tante. Abbiamo condiviso con loro l'attesa del cambiamento, la sorpresa per le impensabili scoperte, la commozione delle storie ritrovate.
Continuiamo a incontrare persone, e soprattutto giovani, che raccontano delle difficoltà quotidiane, di chiusure, di assenze, di vuoti, di solitudini. Ci dicono di rinnovate resistenze a un cambiamento semplicemente urgente e quanto mai ovvio. Lamentano la mancanza di una qualsiasi tensione etica, che suppongono essere stata il motore delle lotte di quegli anni.
La lettura della recente intervista a Eugenio Borgna sul numero 286 di questa rivista [1] mi ha stimolato a scriverti. Con Borgna condivido l'indignazione per una psichiatria indifferente ai valori dell'interiorità, ridotta alle psicofarmacologie, distante dai luoghi, dalle voci, dalla vita delle persone.

L'insostenibile grigiore delle psichiatrie

È da tempo che sento parlare del grigiore delle psichiatrie che oggi tengono il campo. «Le mani alla gola degli schizofrenici», per dirla con David Cooper, continuano a soffocare emozioni, parole, passioni. Una scena, questa, che oggi si mostra quasi ovunque senza veli e senza vergogna alcuna.
I giovani, più degli altri, rischiano di essere annientati (o di svanire) in questo scenario. Parlo dei giovani che vivono l'esperienza della psicosi e dei tanti giovani che come te si apprestano a fare questo mestiere. I primi rischiano la vita, i secondi, anche! E non ho bisogno di dirti cosa voglio intendere. Studenti di medicina, di psicologia, specializzandi, infermieri, tecnici, educatori quando scelgono di occuparsi dei *malati di mente* sono entusiasti, curiosi, disposti a mettersi in gioco.
Li vedo generosi e desiderosi di cogliere il senso etico, politico e umano di questo lavoro. Hanno occhi che guardano e orecchie che ascoltano.
Accade che al primo impatto con le accademie, con i servizi di salute mentale vuoti e insensati, come troppo spesso accade, con diagnosi e cura che divengono bunker e ricorrono routinariamente alla contenzione, con strutture residenziali e sedicenti comunità terapeutiche, dove domina la miseria della gerarchia, dell'infantilizzazione e dell'intrattenimento senza fine sono tentati di fuggire. Possono restare solo a costo di perdere la luce dei loro sguardi, diventare sordi e accettare la condanna a pratiche indicibili e alla solitudine quotidiana.
Nel corso del tempo, un tempo sempre più breve, rischiano di perdere ogni curiosità, ogni desiderio. Arrivando nei luoghi della psichiatria, sperimentano lo sgomento dell'assenza. Per poter sopravvivere, sono costretti a prendere distanza. L'*inferno* che si presenta quotidianamente ai loro occhi diventerà invisibile. Non si può sopportare di stare in quella scena se non c'è mai un

1 | Borgna E., *La terza rivoluzione che serve alla psichiatria*, in «Animazione Sociale», 286, 2014.

povero diavolo o un buon cristiano che condivide con noi quel dolore, quella fatica, che ci aiuti a continuare. Non si può che impedirsi quella visione, l'inferno non può che essere cancellato alla nostra vista e l'accettazione delle cose così come sono, immutabili e impenetrabili, diventa l'unica possibilità per sopravvivere. Ecco, per questo Marco Cavallo mi spinge a scriverti. Le cose che voglio dirti mi assalgono e rischio di essere confuso e di annoiarti. Ma un qualche punto in premessa devo segnarlo: riconoscerci in una storia che possiamo condividere e cogliere insieme il senso di quanto negli anni passati è accaduto.

Chissà se ti hanno mai parlato di Gorizia

Allora dicevo, nel corso del viaggio abbiamo attraversato 10 regioni e siamo stati accolti in 16 città. Nelle università, nelle piazze, negli ospedali abbiamo incontrato persone. Parlato e ascoltato tantissimi giovani che ci chiedevano di questo nostro mestiere desiderosi di cominciare. Il loro valore è inestimabile e pure, nella trascuratezza e nella disattenzione, rischiano di perdersi, di divenire invisibili. Avrebbero bisogno, per non scomparire nel grigiore delle psichiatrie, di sentirsi vicini gli uni agli altri. Fanno fatica a trovare luoghi e modi per raccontarsi; per dirsi delle incertezze, delle frustrazioni, dei successi inaspettati e della gioia che sempre il lavoro quotidiano con le persone è capace di restituire. Avrebbero bisogno di trovare parole intorno alle quali costruire un dialogo, un conflitto, uno scontro, la capacità stessa di confrontarsi, di condividere, di opporsi, di disobbedire. Abbiamo bisogno tutti di riflettere sulle nostre storie, di frequentare esperienze e conoscere pratiche che ci aiutino a vedere che «si può».

Ecco mi piacerebbe parlare con te, di come ricominciare. È urgente.

Ma forse prima sarebbe bene che tu mi dicessi delle tue esperienze, delle tue conoscenze, dei tuoi punti di vista. Chissà se ti hanno mai parlato di Gorizia. Nelle facoltà di medicina, di psicologia, di infermieristica, di assistenza sociale e nelle scuole di specializzazione e di riabilitazione psichiatrica è difficile trovare corsi, seminari, ricerche legati alla storia del cambiamento, alle possibilità di cura e di emancipazione che sono nate dalle prime porte aperte dell'ospedale goriziano. I riferimenti vengono cercati altrove, si studiano malattie, modelli di servizi, assetti sociali e politici che non tengono conto della scelta di campo che il nostro Paese ha fatto abbandonando il modello manicomiale, restituendo diritti, e scommettendo sulle possibilità dei singoli. Ovunque si insegna La Psichiatria e ovunque domina la freddezza del paradigma medico, troppo spesso mutuato da assetti culturali e sanitari di altri paesi.

Chissà cosa ti hanno raccontato della *storia della malattia mentale*? E del *malato*? Della legge 180? Della chiusura dei manicomi? Dei diritti? Delle ritrovate cittadinanze?

La salute mentale è altro dalla psichiatria

So per certo che nelle nostre scuole è raro sentire parlare di salute mentale, che non è psichiatria! L'insegnamento dominante delle psichiatrie la ignora, oppure la incorpora e la snatura. Così il dipartimento di salute mentale, in alcune regioni, diventa dipartimento di psichiatria e i servizi territoriali di salute mentale, ambulatori di psichiatria. È chiaro che non è la stessa cosa. I nomi tradiscono la persistenza di modelli che avremmo dovuto abbandonare

e comunque una sorda resistenza al cambiamento.
Salute mentale è mettere in campo le persone con le loro singolari esistenze; cogliere l'insieme delle relazioni, delle tensioni, dei conflitti di una comunità; portare le risorse e le cure dalle istituzioni, dagli ospedali (mi riferisco qui alle strutture residenziali, ai «repartini» ospedalieri e non ultimo oggi agli OPG) nel territorio; spostare l'attenzione dalla malattia all'individuo (alla persona, al cittadino) e alle sue peculiari dis/abilità; muovere da azioni individuali ad azioni collettive nei confronti delle persone con disturbo mentale e dei loro contesti. Incontrare e «creare» esistenze.
Quando ti parlo di cambiamento voglio intendere che i manicomi non ci sono più e siamo oggi impegnati, con la chiusura degli OPG, ad abbandonare per sempre gli ultimi residui dei dispositivi di internamento ottocenteschi; le persone che vivono l'esperienza del disagio mentale possono contare, se pure tra mille ostacoli, sui loro diritti riconquistati; le imprese sociali, le cooperative, nate proprio dalle macerie del manicomio, dove riescono a tener fede alle ragioni della loro origine e sono in grado di stare sul mercato e produrre lavoro, rendono concrete le speranze di crescita e di emancipazione di tantissimi; ovunque, bene o male, i servizi territoriali sono stati organizzati ed è possibile trovare Centri di salute mentale attivi e presenti quotidianamente a sostegno della vita delle persone; le associazioni di persone con disturbo mentale creano protagonismo, partecipazione e ripropongono la dimensione politica delle esperienze, delle diversità, delle fragilità; in tanti luoghi dell'abitare e in tanti laboratori, è possibile oggi coltivare il valore della relazione, la bellezza degli spazi e degli oggetti; la qualità dei lavori e delle produzioni dimostra che è possibile curare senza contenzioni, con le porte aperte, con programmi abilitativi personalizzati, con percorsi di formazione e di inserimento lavorativo reali, con il sostegno e il coinvolgimento dei familiari, con l'appoggio puntuale, anche economico, nella vita quotidiana, con la possibilità per le persone di vivere identità plurali. Con la possibilità di guarire.

Perché la legge 180 fa così fatica?

Molti mi chiedono: ma cosa è accaduto veramente, come mai dopo tanti anni la legge 180 fa tanta fatica, perché tante differenze? Non è semplice rispondere, ordini di discorso diversi si sovrappongono e creano grovigli difficili da sciogliere.
Che cosa è stata la riforma dell'assistenza psichiatrica in Italia, o meglio che cosa avrebbe dovuto essere se non un simultaneo tentativo di attraversare la dimensione etica, disciplinare, politica e amministrativa? Che cosa vediamo oggi, o dovremmo vedere, se non il radicale cambiamento delle organizzazioni del lavoro e delle pratiche, dei luoghi e dei tempi, delle tecniche e degli indirizzi disciplinari, della disposizione strategica delle risorse in campo?
A ben guardare, è la disposizione incerta, incompleta, approssimativa dei servizi di salute mentale nel territorio la chiave di lettura di ciò che è accaduto e accadde. La distanza (o la vicinanza) dalla vita delle persone, i riferimenti culturali e disciplinari im/mutati, in una sola parola l'organizzazione e le sue forme permettono di cogliere il senso e le ragioni delle buone pratiche (e ancora meglio dei fallimenti).
Ho avuto la fortuna di vivere a Trieste l'attenzione quotidiana, frenetica e ossessiva allo smontamento dell'ospedale psichiatrico.

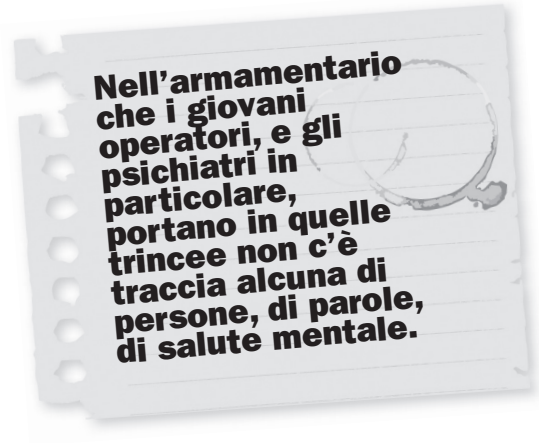
La rassicurante stabilità del sistema manicomiale si è dovuta tradurre nella ricerca incerta di modi e parole differenti, nella «banalità» del lavoro quotidiano, nel riconoscimento prima di tutto dell'irruzione dei bisogni delle *persone* sulla scena. I s*oggetti* non potevano più essere accantonati. È a partire da qui che sono nati i servizi di salute mentale e la loro capacità di radicarsi nel territorio e di operare criticamente sui modelli medici e psicologici dominanti, di produrre davvero protagonismo, di vedere la «persona non la malattia». È qui, credo, che bisogna giocare per uscire dal grigiore e dal pessimismo che oggi tanto si respira nei servizi e nelle accademie. L'organizzazione del lavoro ha dovuto piegarsi alla presenza dei soggetti e i linguaggi del quotidiano hanno cominciato a tessere un lessico *familiare,* capace di riconoscere e sostenere le molteplici identità, di ascoltare, di accogliere.

Il dottore domina ancora la scena

Sono sempre più convinto che è necessario trovare indirizzi, percorsi, visioni da condividere, alleanze e reti per formare associazioni, lavorare sempre insieme agli altri, fare gruppo. Bisogna avere la capacità di convergere e orientare lo sguardo verso orizzonti etici che insieme si riconoscono. I giovani operatori, al contrario, vengono avviati allo specialismo esasperato, all'accettazione acritica di tecniche e modelli, a «difendersi» all'ombra di mansionari, di posizioni di garanzia, di protocolli. L'idea che tu debba diventare il *bravo dottore* è ancora profondamente radicata nelle scuole e nei servizi. Si propone e si riproduce quotidianamente nella separazione di compiti e funzioni, in un circolo vizioso che porta a pensare che i centri di salute mentale debbano essere poco più che uno studio medico associato con un infermiere che risponde al telefono e tiene gli appuntamenti.

Per fortuna il tempo non è passato invano e le persone oggi chiedono di guarire. Mettono impietosamente in luce il fallimento di questi sistemi. Richiedono consapevolmente un ascolto singolare e un altrettanto singolare percorso di cura e di emancipazione. Chiedono di vedere valorizzati i loro faticosi e unici percorsi di ripresa. Vogliono essere aiutati e sostenuti nell'attraversare cruciali e rischiosi punti di svolta nella loro esistenza. Cominciano a disegnare, con la loro domanda, servizi popolati da una molteplicità di operatori, servizi che essi pretendono orientati alla guarigione, alla ripresa appunto, al sostegno delle loro vite e dei loro sogni. Anche nel tempo lungo.

In molti professionisti della salute mentale l'adesione entusiastica al processo di chiusura dell'ospedale psichiatrico si materializzò in un rafforzamento arrogante del modello medico, delle tecniche, dei farmaci, del dottore che domina la scena: finalmente psichiatri, psicologi, infermieri (con i loro sindacati) potevano liberarsi dal fardello del controllo sociale, proprio della psichiatria (manicomiale), della pericolosità, delle ruvidezze che da questo momento dovevano essere delegati a un confuso e misero sociale. Potevano finalmente ritrovare la *purezza della psichiatria medica* nel camice bianco inamidato di fresco, nei servizi ospedalieri, negli ambulatori, nelle cliniche private, negli istituti residenziali. Potevano affermare con l'ingannevole credibilità scientifica appena conquistata, fuori dal manicomio, l'indispensabile e irrinunciabile ricorso alle porte blindate, alle contenzioni, alle dosi eroiche dei trattamenti farmacologici.



Le evidenze contano più delle scelte di campo

Mi chiedi dei risultati oggettivi, degli esiti dei trattamenti, se le persone stanno meglio. Vuoi poter valutare i vantaggi dei modelli che ti vado proponendo. Mi richiami spesso all'*evidence based* per uscire dalle incertezze e dalle perplessità che ti assalgono.

Le possibilità nuove ed estese di ripresa, di integrazione, di emancipazione sono quanto mai evidenti. La presenza sulla scena, sempre più evidente, delle persone che vivono l'esperienza del disturbo mentale allude a prospettive inaspettate. Forme originali di abitare, di lavoro e di socialità possono realizzarsi ovunque. Ma più che le *evidenze*, sono le *scelte di campo* che danno conto dei cambiamenti e dei risultati. Potrei dirti per brevità della «porta aperta». La porta aperta, dicevamo in manicomio, e continuiamo a dire nel mondo di fuori, per l'esercizio della cittadinanza. La porta aperta per un'*etica* della dignità, dell'inviolabilità del corpo, del rifiuto della violenza. La porta aperta per un *lavoro di cura* che (finalmente) può farsi nella considerazione dell'altro, nell'incontro, nella conversazione.

I libri di psichiatria che devi studiare parlano di un mondo pulito, silenzioso, geometrico. La Ragione domina la follia dal giorno stesso della nascita della psichiatria. Nella copiosa letteratura psichiatrica non si trova ombra di una sofferenza, di un dolore umanamente comprensibile, non un odore, non un grido, non una voce, non un silenzio. Non una prepotenza subita o esercitata. Emozioni e sentimenti raggelano nel linguaggio della clinica, i sintomi si sostituiscono alle persone. Si costruiscono così spazi e trattamenti nella stessa rarefatta atmosfera di irrealtà dei manuali di psichiatria. La quotidianità dei luoghi dove vivono *veramente* gli operatori, chiusi negli ambulatori e impegnati in prima linea ad affrontare la domanda di aiuto delle persone con disturbo mentale scompare. I giovani vengono avviati a questo mestiere come uno scalcinato esercito mandato al fronte della normalità per difendere tutti noi dalla follia in trincee fangose, fredde e ingenerose. Nell'armamentario che i giovani operatori, e gli psichiatri in particolare, portano in quelle trincee non c'è traccia alcuna di persone, di parole, di salute mentale. Soltanto la presenza incontrastata di una Psichiatria che vuole apparire «moderna» senza riuscire a liberarsi dalle antiche impresentabili origini.

La non oggettivazione è il confine invalicabile

Bisognerebbe ampliare conoscenze sui diritti, sugli assetti normativi e legislativi, sulle politiche di salute mentale; si dovrà sempre più valorizzare il sapere disciplinare collegandolo a quanto accade in termini trasformativi nella realtà dei servizi; occorrerà essere capaci di attraversare gli ambiti scientifici anche per proporre visioni che si allontanino dall'abusato ricorso al paradig-

ma clinico-medico. Bisogna muovere dalla consapevolezza delle nostre esperienze e dichiarare che molti dei servizi di salute mentale, così come sono organizzati oggi, hanno scarsa valenza di cura e non sono in grado di dispiegare le enormi potenzialità dimostrate dalle buone esperienze innovative e da un assetto legislativo unico al mondo.

Ti sto dicendo che devi finalmente rischiare di diventare protagonista. Una vasta schiera di giovani operatori non ancora del tutto «contaminata» dalla psichiatria, deve poter entrare in gioco e maturare conoscenze anche in opposizione alla formazione accademica grigia e, per tanti di voi, mi dite, insoddisfacente.

Ci sono azioni, trattamenti, posizioni che segnano drammaticamente il campo e bisogna scegliere da quale parte stare. Il rifiuto ostinato della contenzione, della «porta chiusa» e più in generale di tutte le forme inerti e stupide di oggettivazione rappresenta il discrimine, il confine invalicabile.

Con umiltà e abbandonando la confortevolezza dei *luoghi comuni* occorre tornare sulle parole, ora a rischio di sparizione, che dettero inizio ai grandi cambiamenti negli Stati Uniti, in Europa e nel nostro paese. A fronte delle conoscenze certe apprese dallo studio della clinica dei disturbi mentali, bisogna ripensare al mondo dell'esperienza, a quanto accade veramente nella nostra quotidianità, alla fatica dell'incontro con l'altro. La *messa tra parentesi della malattia*, per esempio, ha restituito allo sguardo e all'ascolto uomini e donne nel divenire della loro esistenza; ha reso possibile narrare e ascoltare.

Essere con le persone rende finalmente *comprensibile* la loro sofferenza. Le sottrazioni e le miserie di tanti servizi di salute mentale, una volta svelate, non possono non diventare il punto di partenza, faticoso e contraddittorio, per impegnarsi in pratiche di cambiamento intorno alla corporeità, alla materialità, alla tangibilità delle persone.

Cerchiamo insieme come ricominciare

Uno psichiatra, ed è la prima volta che accadeva, cerca di prendere le distanze dalla cultura e dal paradigma biologico-clinico (che ha prodotto e riprodotto il manicomio). Insieme ad altri giovani, si sta interrogando sulla in/comprensibilità del malato di mente reso muto dalla rozzezza della persistenza dell'armamentario positivista. Quando gli toccherà di entrare nel manicomio non potrà non vedere.

Il 16 novembre 1961, Franco Basaglia entra nel manicomio di Gorizia.

Per me è l'inizio del cambiamento che sto cercando di dirti. Una storia che tutte le volte che la racconto si traduce in presente e comincia a parlarmi di futuro.

Peppe Dell'Acqua, psichiatra, collaboratore di Franco Basaglia dal 1971, per molti anni direttore del Dipartimento di salute mentale di Trieste, insegna psichiatria sociale all'Università di Trieste ed è direttore della Collana «180. Archivio critico della salute mentale» dell'editore alpha beta Verlag di Merano: peppedellacqua@alice.it.

Quest'inserto esplora un concetto innovativo nella salute mentale:

la *recovery*, un termine di difficile traduzione, ma di grande pregnanza. In italiano si può esprimere con «ripresa di sé». Non significa necessariamente guarigione clinica, bensì enfatizza il viaggio che ciascuno compie nel costruirsi una vita al di là della malattia. Proprio qui è il potenziale innovativo racchiuso in questo termine. Anche se i sintomi permangono, si può comunque star meglio, migliorare la propria vita. Come? A dircelo sono le stesse persone con esperienza di disturbo mentale severo: accettando la propria condizione, ridefinendo un senso di sé, imparando a chiedere aiuto nei momenti in cui si sente la crisi arrivare, negoziando coi servizi le cure, partecipando alla vita sociale con il lavoro e altre forme di inclusione.
Com'è intuibile, il concetto di recovery non nasce dalla psichiatria biologica, oggi dominante, di cui anzi rappresenta la sfida più grande. Nasce invece dal movimento degli ex utenti, dall'ascolto dei racconti delle persone che hanno fatto i conti con la sofferenza, dal riconoscere dignità ai mille modi con cui i soggetti provano a superare le loro crisi, psicotiche o depressive. È dunque un concetto che dalle frontiere della salute mentale prova a farsi strada. Incontrando fatalmente la resistenza della psichiatria medica, purtroppo ancora preda di quello che nell'inserto viene definito «pessimismo kraepeliniano».
Emil Kraepelin è lo psichiatra tedesco che, tra '800 e '900, ha sostenuto l'oggettività della malattia mentale, ritenendo irrilevante (ai fini della comprensione e della cura) il modo in cui essa viene soggettivamente interpretata. «Kraepelin – ha scritto Eugenio Borgna – è rimasto estraneo all'arcipelago infinito della vita interiore dei pazienti. Nell'orizzonte kraepeliniano del discorso, la schizofrenia si trasforma in una malattia, in una realtà clinica, che segue le sue proprie leggi naturali: insensibile, dolorosamente insensibile a qualsiasi articolazione, a qualsiasi sollecitazione, ambientale e interpersonale, psicoterapeutica e socioterapeutica».
Le «leggi naturali» della malattia mentale sono quelle della «prognosi negativa» e della «cronicità». Due miti che la recovery sfata, illuminando come le persone interagiscano attivamente col proprio disturbo (e nell'interagirvi ne influenzino il decorso) e coltivino il desiderio di costruirsi una vita *oltre e nonostante* il disturbo mentale. Per i servizi di cura è oggi vitale confrontarsi su questi terreni, per continuare a porsi a servizio della salute delle persone e dei territori.
Le riflessioni di quest'inserto riprendono e rielaborano i contenuti del prezioso volume *Guarire si può*, curato da Izabel Marin e Silva Bon (uscito presso l'editore alpha beta Verlag, nella collana «180»).

La recovery nella salute mentale

Costruirsi una vita al di là della «malattia mentale»

A cura di

Anita Eusebi,
Luca Negrogno,
Fabrizio Starace

Nella storia della salute e della malattia mentale, è successo che a un certo punto abbiano cominciato a parlare i diretti interessati. E quando i soggetti portatori del problema riescono a farsi sentire, il problema viene a ridefinirsi. Dai loro racconti emerge che il disturbo psichico è un'esperienza attraversabile e dunque la cronicità non è un destino. Che la salute mentale è la capacità di riprendere in mano la propria vita e non per forza l'assenza di sintomi. Che se è difficile arrivare alla guarigione clinica, è comunque indispensabile perseguire una miglior qualità della vita. E – non da ultimo – che ai servizi di salute mentale spetta accompagnare le persone nei loro viaggi verso la «riconquista di sé». Un'idea potente, che in questi anni abbiamo imparato a chiamare «recovery».

Roberto Mezzina

Vivere al di là della malattia
Il viaggio per riprendersi la propria vita

Nella salute mentale si è fatta strada in questi anni l'idea di recovery. Significa «ripresa di sé» e rimanda al viaggio compiuto da ciascuno per costruirsi una vita al di là del disturbo mentale, anche severo. È un concetto che nasce dall'ascolto delle persone che hanno imparato a convivere con la propria sofferenza, senza farsene inchiodare ma prendendo coscienza dei margini di libertà che comunque sempre rimangono. Costituisce una sfida all'ideologia medica perché non si focalizza sulla malattia, ma mette in luce quel che occorre per vivere fuori dalla sua ombra. Come tale interroga oggi i servizi, gli operatori, le politiche.

Il concetto di *recovery* attraversa oggi culture e pratiche della salute mentale e rappresenta la sfida più grande all'ideologia medica, nel momento in cui sottolinea il ruolo attivo delle persone e i fattori di significanza connessi alle loro storie, alle loro vite.
È un concetto ormai entrato con forza nelle politiche e nei documenti ufficiali, anche dell'Oms (dalla *Mental Health Declaration di Helsinki* 2005 al nuovo *Action Plan europeo*), e appare centrale nel saldare le esperienze nate dalla deistituzionalizzazione della psichiatria e delle sue istituzioni, con il sapere che emerge dai processi di *empowerment* (acquisizione di potere) ed emancipazione delle persone.
A partire dalla deistituzionalizzazione, a Trieste come in altre esperienze sul territorio nazionale, gli utenti dei servizi hanno infatti riguadagnato non solo un livello di potere, ma anche la possibilità di «dire», di avere la parola. E oggi chiedono che sia riconosciuto il valore dell'esperienza sofferente, sia pure come diversità.

Cosa si intende con recovery?

Vi sono miriadi di definizioni di recovery, che fanno sì che il significato del termine di volta in volta muti sulla base delle intuizioni di studiosi, ricercatori, operatori, esperti «per esperienza», familiari e formatori. In inglese il verbo *to recover* significa riaversi, ripren-

dersi, recuperarsi. E *recovering* è il percorso o processo che si compie. In italiano, nonostante l'origine latina del termine, non vi è nessuna parola che abbracci e in un lampo ci faccia cogliere questa accidentata polisemia.

Recovery non è la guarigione clinica

Si tende a identificare recovery con «guarigione», ma è corretto? In realtà la parola guarigione rimanda a un concetto forse ancora troppo medico, che non contiene nulla del *senso* dello star male. Benché la guarigione rappresenti la più alta aspirazione di coloro che soffrono, di qualunque malattia si tratti, questa parola rischia di risultare fuorviante in psichiatria in quanto nessuna lesione biologica o alterazione anatomica è dimostrata.
La psichiatria risulta inadeguata se propone una comprensione del fenomeno ancora all'interno del modello medico-biologico di malattia-menomazione (*illness-impairment*) e disabilità (*disability*). La sregolazione di alcuni circuiti neurotrasmettitoriali non spiega infatti nulla della complessa condizione di disturbo severo, della sua esperienza soggettiva e del suo oggettivo corso o decorso.
Da cosa si dovrebbe guarire ancora non è chiaro. Dalla malattia mentale, dalle psicosi, dalla schizofrenia in particolare? O dall'esperienza dell'essere paziente, ovvero dallo stigma, dagli esiti negativi e dagli aspetti disumanizzanti che i trattamenti psichiatrici troppo spesso comportano?
Guarigione richiama alla mente soprattutto un esito finale: un accadere biologico, favorito o addirittura determinato da terapie e cure, il che ripropone un nesso causale col lavoro terapeutico che non solo è difficile da dimostrare, ma che diventa ingiusto misconoscimento della complessità di tutti i fattori in gioco, in particolare di quelli soggettivi. In tal senso il concetto di guarigione mostra i suoi limiti, e giustamente la psichiatria inglese sottolinea che recovery non è cure, cioè non è il prodotto delle terapie psichiatriche quali esse siano.

Recovery è il viaggio nel ricostruirsi una vita al di là della malattia

Anche in senso psicodinamico, la psichiatria ha spesso delineato, utilizzando il suo linguaggio e i suoi codici, una psicogenesi della malattia. Ma non è descritto il processo attraverso cui la guarigione si realizza, e il tempo della guarigione rimane misterioso ancor più di quello dell'ammalamento. Su queste questioni non possiamo far altro che emettere ancora dei balbettii.
Cos'è allora recovery? Potremmo dire che questo termine enfatizza il viaggio compiuto da ciascuno nel ri-costruirsi una vita al di là della malattia. La recovery è presa di coscienza di sé e dei propri problemi, ma soprattutto dei propri obiettivi di esistenza. Il che significa uscire dal modello medico, di delega totale del corpo e della psiche ai tecnici per il trattamento della malattia.
Si tratta dunque di un concetto che dobbiamo riconoscere come emergente al di fuori del mondo professionale, che ci piaccia o no, e che solo in un secondo tempo e con non poche forzature si può inquadrare nei codici della psicologia o della psichiatria.

Riguadagnare controllo sulla propria vita

Quali sono gli indicatori della recovery? Scomparsa dei sintomi, oppure fiducia in se stessi, autostima, autodeterminazione, empowerment?

Alla base un diverso rapporto con il sintomo

Al di là della definizione medica di guarigione, il concetto di recovery pone il tema del cambiamento del rapporto col proprio problema o col proprio disturbo: riguadagnare il controllo su ciò che ti accade e in senso più ampio sulla tua vita, migliorarne la qualità, vivere la vita più positivamente. «Progetto di sé» è forse l'espressione che descrive nel modo migliore tale processo.

Il contributo scientifico maggiore all'idea di questo tipo di percorso lo si deve a John Strauss, che ha descritto il processo di elaborazione dell'esperienza psicotica come rapporto tra il sé e i sintomi, tra la soggettività del malato e l'oggettività, in un certo senso, della malattia. Nel percorso di recovery la persona in sé è il fattore determinante, con le sue capacità di *coping*, di resilienza e di affrontamento della malattia, ma anche di cambiamento personale, di accettazione di sé e di contemporanea assunzione di responsabilità.

A riguardo scrive Larry Davidson [(1)]

> L'esperienza di recovery dalla malattia mentale implica un processo di recupero o di sviluppo di un ruolo valido e di un senso di identità positivo al di là della propria disabilità, e quindi la ricostruzione della propria vita nella comunità più ampia nonostante le limitazioni imposte da tale disabilità.

È questa forse una delle migliori definizioni: in essa si compie il passaggio dal «riprendersi dal disturbo» al «riprendersi la propria vita», scompaginando le carte della psichiatria. Eppure nemmeno questa riesce a esprimere a fondo la complessità e la ricchezza del termine, l'ampio alone semantico di un oggetto scientifico che corre talora il rischio di essere interpretato come un costrutto contraddittorio, ambiguo e nebuloso.

Lo sviluppo di un nuovo senso del sé

La questione della recovery rende più chiaro il modo in cui i soggetti si relazionano alla malattia, la direzionano, non vi soggiacciono più passivamente. Vivere «fuori dalla malattia», dal suo alone, dalla sua ombra, ne è l'obiettivo vero. Anche nella catastrofe vissuta della crisi, nell'abisso dello star male, vengono descritti dalle persone come dialetticamente compresenti sentimenti positivi e ricostruttivi: la ripresa è già contenuta nella lotta contro la malattia, o meglio nelle capacità del soggetto di affrontarla.

Se la malattia è invariabilmente descritta come non-libertà e non-scelta, come trappola per il soggetto, la recovery non può che consistere in un processo di apertura

1 | Davidson L., Strauss J. S., *Sense of Self in Recovery from Severe Mental Illness*, in «British Journal of Medical Psychology», 65, 1992, pp. 131-145.

di possibilità. Vengono apprezzate le cose importanti per tutti: riavere una famiglia, avere amici con cui uscire, saper affrontare le relazioni interpersonali. E questo non coincide necessariamente con il superamento definitivo dei sintomi e con la sospensione delle terapie. Coincide invece con il riprendersi in mano la vita, ri-acquistare potere, assumere un nuovo ruolo come quello di «ex» paziente, quindi mettere alle spalle ma anche fare tesoro dell'esperienza, valorizzarla. Il tutto nel mentre si va a sviluppare «un nuovo sé» o meglio un «senso del sé», come afferma Strauss.
Spesso capita che questo processo comporti il lottare per la propria autoaffermazione anche contro la psichiatria: il malato «che si mette di traverso» al servizio rappresenta questa posizione in modo esemplare. Occorre in tal caso per gli operatori accogliere il conflitto come elemento di trasformazione, capire e negoziare, trovare altre strade.
Dove emerge il soggetto, dove si vede la persona e si assottiglia la malattia (e la psichiatria), si intravede così la possibilità di ridare valore all'esperienza sofferente come percorso personale e come significato interpersonale rivolto alla nostra vita sociale e alle possibilità di coesistenza.

Fenomenologia del percorso di recovery

Qual è la fenomenologia del percorso di recovery?

La recovery è un processo, come la vita

La recovery non è un esito, ma un processo, come la vita. Niente è definitivo, tutto è una lotta. Prima ancora che essere un costrutto psicologico o clinico, fa riferimento a *elementi di base dell'esperienza umana*, a ciò che ci unisce e ci rende partecipi dell'esperienza altrui. La recovery è il percorso che la gente compie nel superare eventi gravi dell'esistenza come lutti, malattie, separazioni: tutto ciò che cambia la vita in maniera irreversibile e rispetto a cui siamo chiamati a cambiare.
È un cambiamento, anche parziale ma definitivo, del rapporto con la malattia: i punti di svolta sono rappresentati di solito da eventi precisi, ma anche da cambiamenti di atteggiamento. La recovery non è pertanto un processo graduale e progressivo, ma va avanti a salti, a volte retrocede, per poi ripartire; ciò che conta è la corrente che spinge.
C'è dunque una *direzionalità, ma non una linearità,* ossia ci sono molte strade diverse che conducono a un diverso rapporto con la «malattia». La difficoltà per le persone, ma anche per chi cura, è saper riconoscere e valorizzare i passaggi, i salti qualitativi del percorso. Anche quando la persona sembra ferma, si arresta o arretra, può voler dire che sta raccogliendo le sue energie, in una progressiva accumulazione di risorse e di miglioramenti minimali non visibili, che rendono possibile poi un salto.

BOX
DOPO MESI DI SILENZIO GIANFRANCO INIZIA A RACCONTARE
È il caso dell'esperienza emblematica e straordinaria di Gianfranco, che dopo otto mesi di silenzio totale, improvvisamente, senza alcun motivo apparente e nessuna nostra aspet-

tativa, inizia a parlare e a raccontare come ha passato il suo tempo a guardare la vita che scorreva davanti ai suoi occhi e le persone che frequentavano il Centro. Questo l'ha aiutato a pensare a se stesso e poi a maturare il salto, a essere pronto a tornare. Abbiamo ripreso la sua narrazione stupefacente in una lunga video-intervista in cui ricapitola la sua vita e le sue relazioni, e ci dice quanto sia stato importante per lui quel periodo di apparente passività e immutabilità.

Il soggetto riemerge dalla malattia

I racconti delle persone, e a volte la nostra stessa esperienza nel lavoro che facciamo, sembrano così illuminare, in modi talora intuitivi, che cosa voglia dire ripresa, e in un certo senso guarigione.

Forse, in maniera pre-riflessiva, possiamo dire che la recovery «si vede» dal riemergere del soggetto, delle sue speranze, aspettative di vita, sogni, progetti. Pensiamo a tutte le volte che vediamo emergere delle persone dalla malattia, che sembra quasi assottigliarsi e scomparire. Ci sono persone che vediamo migliorare inaspettatamente, dopo molto tempo e molte sofferenze; e persone che prendono coscienza dei propri problemi e finalmente sono in grado di analizzarli e situarli nella propria storia. E poi ci sono i mille modi che le persone dimostrano di avere per uscire da una crisi, chiudendo capitoli della propria vita o riconnettendosi a temi lungamente dimenticati. A volte ci sorprendono, uscendo dal linguaggio dei sintomi e presentandoci una lunga lista di consapevolezze.

L'idea di recovery, ossia l'emersione del soggetto come evento che segna una svolta nel percorso terapeutico o nel rapporto col servizio o nella sua stessa esistenza, ci ha affascinato da quando a Trieste, postazione d'avanguardia delle trasformazioni anche della fenomenologia della domanda psichiatrica, abbiamo visto in essa l'esito di quella che Franco Rotelli ha chiamato la «deistituzionalizzazione della malattia» e non solo degli istituti che contenevano e oggettivavano il malato.

Che cosa rende possibile la recovery?

Si possono individuare diversi livelli che rendono possibile la recovery:

• *personale*: la recovery è qui vista come imparare a vivere «nonostante i sintomi», o comunque minimizzandone l'impatto, tentando di autogestirsi. «La vita nonostante i sintomi» era uno dei grandi insegnamenti della scuola della deistituzionalizzazione: le persone pur all'interno di condizioni di malattia e di diversità potevano stare nella comunità, avere una vita normale, avere diritto a una risposta ai propri bisogni primari e di relazione;

• *familiare*: questo livello sottolinea l'importanza del coinvolgimento della famiglia in un percorso di cambiamento che non riguarda soltanto il «paziente designato» ma i suoi familiari, che riconoscono che «il suo problema è – in qualche modo – anche il nostro». Spesso questo percorso mostra lo sviluppo di importanti consapevolezze sociali, partecipative e comunitarie, se non politiche in senso lato;

• *comunitario*: l'accento è qui sul riconoscimento della valenza partecipativa, del contributo di integrazione e di solidarietà che ogni membro di una comunità o di una data società può dare verso chi soffre o ha sofferto di problemi di salute mentale;

• *servizi e operatori*: le indicazioni al riguardo sono quelle di cambiare atteggiamenti,

sviluppare sensibilità, affiancare un percorso personale alla formazione professionale, ribellarsi a ciò che è dato per scontato, alle condizioni di lavoro talvolta disumanizzanti, all'istituzionalizzazione delle persone, alla lesione dei loro diritti difendendoli attivamente insieme alle persone stesse.

La recovery pone il tema del potere nel rapporto con i servizi

L'attraversare le esperienze dentro alvei protetti e aperti rappresenta per molti il terreno favorevole della recovery. Questo chiama in causa i servizi, i loro atteggiamenti, ciò che dovrebbero soprattutto garantire.

Il potere, tema ben noto in psichiatria

Oggi s'impone certamente un'ottica più ottimistica, una visione fondata sulla certezza che esistono opportunità che i servizi devono poter garantire, utili a favorire la «ripresa». Ne sono esempi le situazioni di convivenza promosse dai servizi di salute mentale, il sostegno spontaneo di pazienti ad altri in crisi, la presenza qualificata dei familiari come interlocutori, l'alto grado di coinvolgimento di tutti gli attori nei programmi terapeutici.

Queste opportunità chiedono ai servizi di muoversi *oltre la relazione istituzionale,* perché solo così si apre la possibilità per chi è curato di recuperare una reale decisionalità riguardo alla propria vita. Ciò implica dover affrontare la questione del potere: un tema ben noto in psichiatria – fin dal passaggio fondamentale dal rapporto di dominio/controllo all'assistenza e alla relazione terapeutica – ma che non smette mai di riproporsi.

Nel solco della deistituzionalizzazione, il rapporto istituzionale – soggetto-oggetto di trattamento, curante-curato – è diventato gradualmente un'interazione sempre più complessa. Si sono favorite tutte le modalità di partecipazione informale alla vita dei nuovi servizi di comunità, sulla base di una tendenziale reciprocità nei rapporti, includendo via via nel campo tutte le figure che potessero rendere più articolata tale bipolarità (familiari, cittadini, volontari...).

Così i servizi oggi spesso tessono una rete partecipativa a partire da sé: è un network di scambi e di processi di «adozione», dove sono scambiate non merci ma valori d'uso e relazioni, mettendoli a disposizione e facendoli arrivare a chi per solito ne è escluso. Del resto, solo una pratica psichiatrica in cui le persone siano valorizzate come soggetti, dotati di una loro contrattualità, e in cui i loro bisogni, le loro aspettative, i loro obiettivi siano la sostanza dei progetti terapeutici, può produrre consenso alle cure, fiducia, collaborazione, coinvolgimento nei programmi individuali da parte di ciascuno e dunque (ulteriore passaggio) opportunità di partecipazione collettiva alla vita di un servizio e alla sua trasformazione.

C'è una recovery dalla malattia, ma anche dai trattamenti

Il flusso comunicativo che viene così favorito nel servizio, in particolare nel Centro di salute mentale (nei momenti formali dei colloqui, degli incontri, delle riunioni,

nel lavoro terapeutico individuale, familiare o di gruppo, oppure in una molteplicità di situazioni e occasioni informali), innesca sicuramente forme di partecipazione. Si creano momenti di aggregazione spontanea ai quali si affiancano momenti di auto-aiuto tra persone, in cui spesso il servizio mette in campo risorse integrative. Il «bisogno di relazioni» si pone ormai come centrale. E nella dimensione della relazione, che sia formalmente definibile come terapeutica o di aiuto, il punto è *adoperarsi a trattare in modo paritario e reciproco*. L'assunzione del rischio, del trattare la persona «come se» fosse fino in fondo in grado di stare nelle regole della relazione, è spesso necessaria.
Al riguardo ha scritto Shula Ramon che c'è una recovery dalla malattia ma anche dai trattamenti, dalla mancanza di capacità personali ma anche dalla carenza di opportunità per attività valide. L'attenzione dei servizi va così alle esperienze vissute che si oppongono ai saperi degli esperti, al guardare le persone come attori, al considerare la qualità della loro vita sociale, con particolare riferimento alla vita quotidiana che è la dimensione dove accade la recovery.

Costruire l'accesso ai diritti

In tal senso la recovery non può essere vista come un percorso solo individuale, altrimenti vi sarebbe di nuovo sottesa un'etica del riscatto dell'individuo da una condizione, la malattia, vista ancora come colpa. Non diversamente da come – nel linguaggio del potere – la riabilitazione è rieducazione.
Nonostante l'enfasi sulla singolarità e sulla soggettività, recovery è certamente un *fatto interpersonale e sociale*. Proprio in quanto attiene all'individuo, si colloca nella globalità della sua esperienza di vita dentro un contesto sociale e culturale determinato. La dimensione sociale e partecipativa, in queste storie, indica che la persona sta emergendo dall'isolamento, dalla rottura di significato e comunicazione che si traduce in de-socializzazione.
Si può percepire allora l'emergere di un sé sociale, una condizione di cittadinanza «vissuta» che è l'intima natura sociale della recovery. Ovviamente (ma non tanto per la psichiatria) le risorse materiali – il reddito, la casa, il lavoro – ne sono veicolo fondamentale (neanche a dirlo) perché rappresentano opportunità e costruiscono identità e contrattualità sociale.
Ecco perché è preferibile legare insieme «recovery ed emancipazione», per sottolineare l'aspetto di non-libertà che è connesso alla condizione di malattia e di assenza di diritti. Benché forme di recovery siano possibili ovunque e anche nelle condizioni più estreme, essa si compie e s'invera solo là dove la libertà ha i suoi prerequisiti fondamentali (ossia in uno stato di godimento di diritti). Ecco perché «cittadinanza» è la parola che ormai viene più frequentemente associata a recovery per dotare il processo di senso e qualità.

Quanto devono ancora modificarsi i servizi?

Il problema è come oggi le pratiche di salute mentale e di riabilitazione possano contribuire alla piena realizzazione del diritto a una cura che non sia sanzione, del

diritto a un reddito, a una casa, a un lavoro, a una partecipazione attiva alla vita civile e sociale. Quanto debbono ancora modificarsi i servizi perché siano davvero «centrati sull'utente»?

Riconoscere la prospettiva dell'utente

Il lavoro di trasformazione delle pratiche e delle discipline appare lungo: è necessario stabilire forme di partecipazione attiva degli utenti ai servizi di comunità e rafforzare i legami con le istanze e i soggetti della vita sociale, per un pieno coinvolgimento nella promozione di salute mentale (dai familiari agli operatori dei servizi sociali, sanitari e giudiziari, via via fino al corpo sociale). Non è un'operazione indolore perché va a toccare il nodo dei poteri e deve pertanto partire dal riconoscimento che la prospettiva dell'utente, come soggetto e attore del proprio percorso di integrazione sociale e di emancipazione, è di fondamentale orientamento.
Nessuno spiega a sufficienza come buone linee guida basate sulla recovery siano in grado di trasformare i servizi, che sono istituzioni dominate in modo materiale dalla loro logica interna e dalle loro strutture di potere, ma soprattutto dal paradigma medico-biologico. Cosa occorre dunque per un loro cambiamento? Una buona dose di senso comune? Scelte etiche? Una formazione ad hoc? La sola risposta, a mio avviso, è ancora una volta nella possibilità di agire una deistituzionalizzazione, forse in forme nuove e differenti, basate sul riconoscimento del contributo dell'utente nel servizio e sulla spinta delle energie trasformative verso la salute possibile. Ma non è ancora abbastanza.

Assumere come centrale la qualità della vita

In servizi orientati alla recovery, i concetti di inclusione sociale e cittadinanza sono centrali. La partecipazione, i diritti, il potere e l'inclusione sociale sono strettamente intrecciati col ruolo dei servizi di salute mentale comunitari nel supportare i cambiamenti individuali, come agenzie che forniscono o catalizzano risorse e opportunità. Mentre l'approccio tradizionale al trattamento e alla guarigione enfatizza il sollievo dai sintomi e la prevenzione delle ricadute, per l'approccio orientato alla recovery la qualità della vita diventa centrale e il miglioramento sintomatico al contrario ha un ruolo variabile.
Certamente va precisato che la recovery può accadere con o senza l'aiuto professionale, o addirittura nonostante questo. I punti di svolta delle persone spesso coincidono comunque con aspetti dell'intervento del servizio, o del programma terapeutico personalizzato, o della presa in carico. E ciò ha certo a che fare con le *opportunità offerte e le risorse messe in moto*; ma si può inverare un senso terapeutico e riabilitativo solo se il servizio riesce a sostenere e potenziare il senso di autodirezione e responsabilità della persona nel percorso.

Diventare servizi «attraversabili»

Il servizio è orientato alla recovery se è «attraversabile», se cioè in esso la persona trova non le regole istituzionali che impoveriscono, sminuiscono e comprimono il soggetto in crisi, ma dei punti e delle persone di riferimento, un'accoglienza calda e

partecipe, una disponibilità a occuparsi dei problemi di vita e non solo dei disturbi. L'attraversamento del servizio è connesso alla recovery, nel senso che l'offerta terapeutica e di risorse strumentali è orientata a dare degli stimoli, che però, se non si è in grado di cogliere, restano imposti, estrinseci. Il servizio può allora fare emergere una rete di supporto e renderla utilizzabile oltre che visibile, sviluppando un intervento di mediazione importante, per attivare l'aiuto e fare avvicinare la rete. La cura implica a sua volta l'assunzione di me operatore come soggetto che opera in un campo comune (mio e dell'altro), dove l'altro può «avanzare» e acquistare potere. Ma ciò comporta accettare che questi sia depositario di un sapere di trasformazione, e quindi un mettersi di lato, di fianco, per permettere una soggettivazione dell'altro. Perché emerga il soggetto, occorre che si metta in discussione il terapeuta, con le sue certezze.
Ciò che deve guarire è allora innanzitutto la relazione tra chi assiste e chi è assistito. Recuperare il significato del termine *assistenza*: far da testimone, da segnapassi, da registratore del percorso, e al tempo stesso aiutare, sostenere. Non agire su, ma agire con. Per Basaglia tale «reciprocità» si basa sul fatto che il terapeuta è messo in discussione dal malato, come il malato dal terapeuta. Occorre che ognuno si renda riconoscibile all'altro, che anche l'operatore si metta in gioco e si soggettivizzi con il malato, uscendo dal rapporto istituzionale.

Mantenere un'apertura sul possibile

Agire la deistituzionalizzazione è cambiare i rapporti di potere: si dà centralità ai bisogni dell'utente, senso ai suoi gesti, e «per vederli» si riduce la distanza nella relazione curante-curato. Perché la soggettività dell'utente emerga, quella dell'operatore deve entrare in gioco, confrontarsi con essa: il progetto terapeutico-riabilitativo nasce all'interno di una nozione nuova di contratto tra l'utente e il servizio.
Per i servizi di salute mentale tutto ciò si traduce in accessibilità e flessibilità, tali da garantire un lungo periodo di sostegno se necessario, continuità di relazione e accesso a possibilità di scelta e opportunità (anche quelle di fallire e ritentare). Una relazione ispirata dunque non alla distanza «terapeutica», ma al coinvolgimento e alla personalizzazione nel cercare insieme un senso, al dare fiducia, al «rischiare» insieme e quindi al mantenere un'apertura sul possibile. Il che vuol dire offrire speranza e aspettative, ma anche riconoscere le competenze, i desideri e i valori.
La recovery non consiste nell'insegnare nuove tecniche in un processo di oggettivazione e omologazione dell'esperienza individuale in qualche modello preformato di guarigione, come hanno cercato di fare in questi anni tentativi maldestri di «meccanizzare» in un dispositivo semplice e schematico le «fasi del viaggio». L'idea che vi sia una sorta di «sciamano» o perfetto insegnante dev'essere rigettata: dobbiamo credere nella recovery come nella verità personale di ciascuno [(2)].

2 | È bene riflettere su come la recovery rischi di diventare una definizione accattivante, usata per creare l'illusione del cambiamento, e perciò una bella favola, un'ideologia (o peggio una sorta di religione), mentre i servizi psichiatrici restano chiusi nei loro paradigmi. Una parola aggiunta all'equivoco della riabilitazione, come riparazione dal danno iatrogeno operato dalle psichiatrie.

Saper riconoscere la salute nella malattia

Il processo dialettico della recovery/guarigione non accade senza rimarcare una linea d'ombra, un chiaroscuro, in una totalità d'esperienza, dove c'è salute e malattia, il cui fulcro è la possibilità di riappropriazione di entrambe da parte del soggetto. Salute e malattia: parole importanti, pilastri concettuali che rimandano al celebre testo di Franca Ongaro Basaglia: *Salute/malattia. Le parole della medicina*. In esso l'autrice afferma che la clinica ha precluso la presenza partecipe della soggettività del malato; e la malattia ha sostituito nella medicina la globalità sano-malato che siamo, ovvero ha separato la malattia dalla vita e dall'ambiente. Dice:

> Se la guarigione avviene, si tratta della guarigione di un corpo ignaro di sé, dei propri bisogni, delle proprie malattie e della propria salute, privato di ogni possibilità di partecipare e lottare per ottenerla […]. Una cura diversa non può che muoversi in questa direzione, offrendo una terapia che sia contemporaneamente stimolo a una riappropriazione di sé e alla comprensione della misura in cui abbiamo incorporato la logica che ci determina. Perché l'unica premessa a una possibilità di cura per la malattia dell'uomo è un rapporto diverso, soggettivo, partecipato nella vita e, quindi, nella malattia. Solo comprendendo che il valore dell'uomo – sano o malato – va oltre il valore della salute e della malattia, si può capire come la malattia, al pari di ogni altra contraddizione umana, può essere usata come strumento di appropriazione o di alienazione da sé, quindi come strumento di liberazione o di dominio [3].

Ciò che è peculiare per gli esseri umani, diceva Franco Basaglia, è che la salute e la malattia sono in una continua relazione e tensione dialettica. Saper riconoscere la salute nella malattia: in questo senso «una psichiatria di vita e non di morte» deve riconoscere la soggettività delle persone e aiutarle a scoprire un senso nella loro esperienza. Aiutarle non solo a recuperare un nuovo senso della propria vita, ma anche a chiedersi come si inscrive la malattia, come «crisi», nella propria storia e in quale continuità si pone, invece di intenderla come una frattura, come alienazione da se stessi.

Una persona con esperienza di disturbo psichico una volta ha detto: «La guarigione non esiste, esiste il miglioramento della propria vita». Queste parole ci indicano la strada da percorrere.

Izabel Marin

Se la prognosi negativa è un mito da sfatare

Gli elementi fondamentali del processo di recovery

Le pratiche della psichiatria sono ancora spesso ispirate dal famigerato «paradigma kraepeliniano», secondo il quale la schizofrenia è una malattia cronica e la prognosi è un deterioramento progressivo. In realtà, già negli anni della deistituzionalizzazione, alcune importanti ricerche hanno messo in luce come la cronicità e la prognosi negativa siano miti da sfatare. Ma è stato soprattutto quando hanno cominciato a prendere parola i diretti interessati che si è compreso quanto sia sbagliato congelare le persone nel ruolo di «malati». Dai loro racconti i servizi possono, debbono imparare.

Il termine inglese *recovery* ricopre un'ampia gamma di significati: per l'*Oxford Dictionary* spazia dal concetto di «riguadagnare possesso o controllo» a quello di mettersi al sicuro per via legale, fino a definire «il riprendersi» o «il riaversi», come quando si dice di una persona che dopo uno svenimento «si è riavuta» o dopo un'esperienza disabilitante «si è ripresa». In questi casi, in inglese si usa dire che la persona ha avuto una «recovery».

Quello che intendiamo oggi con recovery nel campo della salute mentale è un'idea di riappropriazione in prima persona del processo che porta le persone con un disturbo mentale severo ad attraversarlo e a superarne le maggiori difficoltà esistenziali, sociali, psichiche.

È un'idea emersa a partire dagli anni '90, che si è poi diffusa e consolidata nel primo decennio di questo secolo, entrando in uso a pieno diritto nell'ambito della salute mentale. Tant'è che si parla oggi di recovery da un disturbo mentale grave con un valore programmatico che la distingue dalle nozioni più tradizionali, come quella di «guarigione clinica».

* | I due articoli di Izabel Marin ospitati nell'«Inserto» riprendono e rielaborano contenuti pubblicati nel volume *Guarire si può*, curato insieme a Silva Bon e pubblicato dall'editore alpha beta Verlag di Merano nella collana «180. Archivio critico della salute mentale». Ringraziamo l'autrice, l'editore e i direttori della collana (in particolare Peppe Dell'Acqua) per la collaborazione nel produrre quest'inserto (*NdR*).

Gli studi epidemiologici di riferimento

L'attenzione al processo in prima persona e all'impegno del soggetto costituisce la novità e la particolarità dell'idea corrente di recovery, ma è bene ricordare quale sia stato il terreno preparatorio su cui si è innestata questa nuova prospettiva.

La cronicità non è un destino

Di recovery in salute mentale, infatti, si parlava già prima che emergesse la declinazione attuale di tale concetto; basti ricordare la celebre ricerca di Richard Warner (1991), intitolata *Recovery from Schizophrenia* e ormai considerata un classico. Ma in cosa si distingue l'uso della parola recovery da parte di Warner, nella stagione delle grandi ricerche epidemiologiche degli anni '80, dal significato attuale del termine? La differenza è che, allora, si parlava di «guarigione» dal punto di vista del ricercatore, cioè di un osservatore esterno che aveva il problema di definire in qualche modo una «misura di esito», di *outcome*. E infatti si adottavano criteri – condivisi tra i ricercatori – per definire la «funzionalità» di una persona o da un punto di vista clinico («guarigione clinica», misurata in base alla scomparsa di certi sintomi) o da un punto di vista sociale («guarigione sociale», secondo criteri occupazionali, abitativi o di autosufficienza).

In ogni caso, la definizione di recovery in quel contesto era un problema del ricercatore (epidemiologo, clinico o sociologo che fosse). Cionondimeno quella stagione di ricerca è stata molto importante come terreno preparatorio per il cambiamento di mentalità che ci interessa. Le ricerche di quel periodo, infatti, come quelle di Warner e Ciompi, Harding [(1)], Strauss, Carpenter, sono state una specie di colpo di grazia, dal punto di vista scientifico, all'idea di «cronicità» e/o di esito degenerativo come *destino* associato alla diagnosi di schizofrenia.

La cronicità è un «artefatto sociale»

Si può dire, insomma, che il famigerato «paradigma kraepeliniano» – la concezione della schizofrenia come malattia cronica per la quale la prognosi è un deterioramento progressivo – sia stato scientificamente affossato proprio in quegli anni.

Sempre nello stesso arco di tempo (seconda metà degli anni '80), studiosi come Ciompi e Harding hanno discusso l'idea di cronicità come «artefatto sociale» e McGlashan ha potuto concludere, sulla base di una revisione selettiva dei più importanti studi di *follow-up* del periodo (gli studi sul decorso a lungo termine), che «un gran numero di pazienti guarisce dalla schizofrenia» e che «la certezza della prognosi negativa nella schizofrenia è un mito».

1 | Lo studio condotto da Harding è il più lungo realizzato negli Stati Uniti. La ricerca è durata 32 anni e ha coinvolto 269 persone con disturbo psicotico severo, attraverso interviste periodiche nel loro contesto di vita e nell'ambito dei programmi di riabilitazione. I ricercatori hanno trovato che circa due terzi dei soggetti corrispondevano ai criteri oggettivi della recovery (che sono: la persona non assume farmaci, non presenta più sintomi né comportamenti che potrebbero indicarla come «paziente con disturbo mentale»; la persona lavora, ha buone capacità relazionali con gli altri e non è ricoverata in ospedale psichiatrico) e/o del miglioramento significativo (per cui le condizioni della persona rispettano tutti i suddetti criteri di inclusione tranne uno).

Nella loro analisi della nozione di «cronicità», Harding e i suoi collaboratori (1987) evidenziano la difficoltà di separare gli effetti residuali del disturbo mentale – ad esempio i sintomi negativi come l'apatia o il ritiro sociale – da una miriade di fattori ambientali e psicosociali, che vanno dagli effetti del processo di istituzionalizzazione all'identificazione con il ruolo del malato, dal mancato accesso ai programmi di riabilitazione alle ridotte opportunità economiche e sociali, dagli effetti collaterali dei trattamenti farmacologici al ruolo delle aspettative sfavorevoli degli operatori. Il *pessimismo kraepeliniano* continua a funzionare come una profezia che si autoavvera: la perdita della speranza costituisce il contesto esistenziale delle persone con disturbo mentale.

Un concetto emerso sull'onda lunga della de-istituzionalizzazione

Non va dimenticato che questa apertura di possibilità positive in campo scientifico ha risentito del clima di apertura di possibilità pratiche legate ai processi di de-istituzionalizzazione avviati in precedenza con la crisi del «paradigma dell'internamento».

Occorre inoltre sottolineare che, una volta che si sono aperte, tanto sul piano scientifico quanto sul piano pratico, le possibilità di uscita dalla rassegnazione, dalle stanze ammuffite e bloccate della «cronicità» e della istituzionalizzazione, il problema inevitabilmente si è spostato.

Non si tratta più di un problema di ricerca o di osservazione esterna su un «esito», un outcome (per quanto sia importante anche questo aspetto). Non è più soltanto un problema di cosa possano fare i soggetti di cura – i servizi, gli operatori – per colmare di buoni interventi quegli spazi di possibilità positive (sebbene anche questo sia rilevante). Ma è un problema che investe *chi* diventa soggetto, protagonista attivo e non ricettore, capace di muovere i passi necessari per sottrarsi al «mito» della cronicità e della «prognosi negativa» per il disturbo mentale severo.

Ed è qui, su questo punto, che si innesta l'emergere dell'idea di recovery come *assunzione su di sé* del percorso necessario per uscire dalla propria difficoltà, da parte del soggetto che vive in prima persona l'esperienza del disturbo mentale.

L'esperienza personale è oggi la prima fonte degli studi sulla recovery

A dare impulso all'idea della recovery come visione (e prassi) trasformativa è stato il movimento degli ex-utenti psichiatrici. La comparsa sulla scena sia di racconti di esperienze vissute in prima persona, sia dell'organizzazione degli utenti (con la costituzione di gruppi di auto mutuo aiuto e di *empowerment* collettivo) ha inciso fortemente su quella che oggi si può definire una pratica orientata alla recovery.

Quando si leggono gli scritti di una pioniera del movimento americano dei «sopravvissuti psichiatrici»[(2)] o ex utenti, come Judi Chamberlin, o di protagonisti

2 | Negli Stati Uniti il termine *survivor* (sopravvissuto) è stato utilizzato dal movimento degli ex utenti psichiatrici per distinguerlo dai termini «paziente» o «malato di mente», e connotarlo con una valenza attiva e politicizzata nella lotta contro lo stigma e gli effetti iatrogeni dell'istituzionalizzazione psichiatrica, di cui essi si sono sentiti profondamente vittime.

nell'elaborazione e diffusione dell'idea di recovery come Patricia Deegan o Ron Coleman, si percepisce la forza di persuasione di argomenti e analisi radicati nel profondo dell'esperienza vissuta.
Così, la prima fonte della letteratura sulla recovery è oggi colui o colei che ha attraversato dall'interno difficoltà mentali e ha *trovato la strada* per venirne fuori. Sono le persone stesse che, avendo vissuto sulla propria pelle prima l'esperienza della malattia e della istituzionalizzazione, poi l'esperienza del faticoso impegno per uscirne, hanno cominciato a descrivere l'esperienza e a comunicarla agli altri. D'altro canto, anche gli operatori che hanno cominciato a scrivere sul tema hanno sottolineato la decisività dell'ascolto, da parte loro, delle testimonianze in prima persona dei soggetti in recovery.

Cosa vuol dire essere in recovery?

La nozione di recovery da un disturbo mentale severo è diventata centrale in alcune esperienze innovative negli Stati Uniti e in Gran Bretagna, influenzando un cambiamento nella cultura dei servizi.

Un percorso di ridefinizione di sé

In un documento inglese di indirizzo programmatico degli anni '90 si legge la seguente definizione:

> La recovery da un disturbo mentale severo si riferisce a un processo attivo, dinamico e altamente individuale attraverso cui una persona assume la responsabilità della propria vita e sviluppa uno specifico insieme di strategie rivolte non solo a fronteggiare i sintomi, ma anche le minacce secondarie della disabilità, che comprendono stigma, discriminazione ed esclusione sociale. Un aspetto critico di tale processo è (…) lo sviluppo di un senso di se stessi come «altro dall'essere disabile».

Questa definizione di recovery offre dunque due importanti indicazioni: da un lato, i tentativi e le strategie per fronteggiare i sintomi e le difficoltà sono intesi come modalità attive sviluppate *dal soggetto*; dall'altro, tali modalità attive sono viste come parte di un più ampio insieme di abilità soggettive, dove il fuoco del problema si sposta dai «sintomi» in quanto tali alla possibilità che la persona ha di riappropriarsi di un'identità personale e sociale che vada oltre quella definita dal ruolo di «malato mentale» o «disabile».
Per usare le parole di Patricia Deegan (1988), leader del *Mental Health Consumer Movement* negli Stati Uniti, il processo di recovery non implica che le persone vengano «aggiustate», come si aggiusta una macchina; si tratta piuttosto di ristabilire attivamente un nuovo modo di ridefinirsi come persone. Il percorso di ridefinizione di sé è segnato da una nuova consapevolezza delle proprie condizioni, che non comporta il ripristino di quelle precedenti il disturbo, né tantomeno l'accettazione passiva del disturbo e delle sue limitazioni. I racconti «dal di dentro» dell'esperienza della sofferenza psichica indicano come sia possibile, nonostante il disturbo, riconquistare una identità sociale significativa e riprendere in mano la propria vita.

«Io non sono guarita: io ho vinto»

In questo cambio di prospettiva, sono le persone stesse a poter giudicare meglio l'estensione del loro processo di recovery. Per gli autori del movimento degli ex utenti o *survivors*, la «disabilità» psichica è soltanto *uno degli aspetti dell'intera vita* della persona. Nasce così l'espressione «essere in recovery» in riferimento alle persone con una condizione di disturbo mentale severo e prolungato che hanno superato del tutto o in parte gli effetti devastanti che ne conseguono, anche se non sono completamente scomparse le manifestazioni sintomatiche.
William Anthony (1993), uno dei primi ricercatori nel campo della riabilitazione psichiatrica a diffondere l'idea di recovery come valore programmatico per i servizi di salute mentale, la definisce così:

> La recovery è un modo soddisfacente di vivere la propria vita che comporta lo sviluppo di nuovi significati e motivazioni, nel crescere come persona al di là degli effetti catastrofici del disturbo mentale.

Questi effetti sono spesso di natura sociale e includono le barriere imposte da una condizione di svantaggio e di stigma, che vanno dalla mancanza di accesso alle opportunità, alla perdita di un ruolo socialmente valido, alla rottura dei legami affettivi più significativi. Per Sally Clay, che lavora come «difensore» (*advocate*) e sostenitrice del movimento degli ex utenti psichiatrici negli Stati Uniti, la lotta contro lo stigma è un elemento caratterizzante del proprio percorso. Lo stigma, scrive, non deve essere una vergogna per chi ne è segnato, ma un distintivo d'onore:

> L'esperienza della follia è una ferita che ha cambiato la mia vita e mi ha permesso di aiutare gli altri e di conoscere maggiormente me stessa. Sono orgogliosa di tali risultati. Io non sono guarita: io ho vinto.

Il paradosso della guarigione nonostante il persistere della malattia

Molte persone con esperienza di recovery indicano che il maggiore guadagno che hanno avuto nel loro processo di ripresa è stato quello di accettare il proprio disturbo e di incorporare la propria esperienza all'interno di un ridefinito senso di sé. Emblematico è l'esempio riportato da Patricia Deegan, docente e ricercatrice sul tema della recovery e dell'empowerment. Basandosi sulla propria esperienza condivisa con altre persone, afferma (1988, p. 98):

> Il nostro percorso di guarigione è profondamente segnato dall'accettazione delle nostre limitazioni. Ma adesso, invece che essere disperati, troviamo nelle limitazioni personali il terreno dal quale far nascere le nostre uniche possibilità. Questo è il paradosso della guarigione: accettando quello che non possiamo fare o essere, iniziamo a scoprire cosa possiamo fare e chi possiamo essere

Il ridefinirsi come persona implica la ridefinizione del problema mentale come *parte integrante* della propria vita. Lo sviluppo di una nuova percezione di se stessi e di una propria identità diventa uno degli aspetti chiave su cui verte tutto il processo

di guarigione. Il senso di sé è una componente fondamentale dell'essere umano ed è caratterizzato dallo sforzo attivo che le persone compiono per far fronte agli eventi e alle difficoltà, per sviluppare nuove competenze maturate dalla propria esperienza e per vivere la propria vita in modo soddisfacente.

Il processo che porta alla riconquista di sé

Se il disturbo mentale severo è stato descritto come «la malattia del sé», caratterizzata non soltanto da un profondo sconvolgimento cognitivo ed emotivo, ma anche da una trasformazione della propria identità percepita interiormente da sé ed esteriormente dagli altri (Estroff, 1989), nel processo di recovery la riscoperta e la riconquista di un sé attivo costituisce uno dei passaggi necessari da compiere.

Alla base un nuovo senso di sé

In una ricerca che è stata una pietra miliare in questo campo, condotta da Davidson e Strauss nel 1992 presso l'Università di Yale (in cui sono state intervistate 66 persone con diagnosi di schizofrenia), si è sottolineata l'importanza della ricostruzione del senso di sé nel processo di recovery da un disturbo mentale severo. Nell'articolo a compendio dell'intera ricerca (Davidson, Strauss, 1992) gli autori riprendono la nozione di «senso di sé» da un insieme di studi degli anni '80 in diversi settori che comprendono la psicologia medica, sociale e antropologica.
Queste ricerche suggeriscono, in particolare, che il senso di sé svolge una funzione nel modo in cui si affrontano malattie somatiche, eventi di vita stressanti e depressione. Un rafforzato senso di sé può aiutare a migliorare vari aspetti del disturbo e sostenere gli sforzi per fronteggiare e adattarsi a un contesto di malattie croniche o di eventi di vita critici; in questi casi, la persona sente di poter realizzare qualcosa (senso di autoefficacia), di avere un controllo sulle proprie emozioni (luogo interno di controllo) e di avere stima di sé.
Ma se ciò è vero nel caso di patologie non psichiatriche, a maggior ragione diventa imprescindibile esplorare questi elementi all'interno delle condizioni di interesse psichiatrico, visto che «lo scenario del sé» è il luogo stesso della sofferenza mentale. Gli autori sottolineano (*ivi,* p. 132):

> Lungi dall'essere soltanto una nozione teoretica (...), il senso di sé si presenta come la componente principale nell'esperienza quotidiana di chi soffre di un disturbo mentale grave. È una componente che le persone con questi disturbi spesso descrivono come un fattore chiave nei processi di sviluppo del disturbo e del suo cambiamento.

Scoprire parti di sé non toccate dal disturbo

Un *primo aspetto* del senso di sé nel processo di guarigione riguarda il fatto che la persona si rende conto di poter avere un senso attivo di sé anche se continua a esperire una disfunzione dovuta al proprio disturbo. Per alcune persone ciò può significare una riscoperta di parti di sé non toccate dal disturbo e che possono essere quindi utilizzate indipendentemente da esso.

Questo graduale risveglio comporta un'intuitiva apertura, un rudimentale «avvertire se stessi». La traccia comune nelle varie esperienze è una *nascente consapevolezza* di questi aspetti di se stessi finora sconosciuti, che può includere la sensazione di poter fare qualcosa *di più* e *di meglio* di quello che si sta facendo. In questa scoperta contano *le piccole cose che accadono,* come uscire dalla stanza dove si era rinchiusi a causa della propria paura e dei sintomi, guardarsi intorno, accettare un aiuto da parte delle persone «significative», come operatori, familiari, amici.
Tutto ciò è importante per rafforzare la fiducia nelle proprie potenzialità: una nuova consapevolezza di sé come persona potenzialmente capace comporta il progressivo sviluppo di un senso di speranza, che apre la strada alla sensazione di poter migliorare la propria condizione che accompagnerà poi l'intero processo di recovery.

Fare un inventario delle proprie forze e debolezze

Un *secondo aspetto* è il procedere a una sorta di inventario delle proprie forze e delle proprie debolezze: «prendere le misure» di quello che si può o non si può fare e sentirsi più sicuri nell'affrontare nuove situazioni che possono rappresentare una sfida. Un inventario personale si può fare inizialmente a livello elementare, immaginandosi in un'azione semplice («posso uscire dalla stanza e partecipare alla riunione?»), fino a un livello più elevato di riflessione («posso riprendere a lavorare a tempo pieno?»). Ciò può determinare l'inizio di un percorso in cui raffigurarsi mentalmente il proprio futuro o il recupero di abilità dimenticate, come per esempio riprendere in mano un progetto interrotto prima del disturbo. In questa situazione la persona incomincia a fare le «provviste di forze» e si attrezza gradualmente con gli «ingredienti necessari» per raggiungere i propri obiettivi, talvolta anche quelli all'apparenza più semplici.
Questo aspetto del processo di recovery, che rappresenta la preparazione a un'azione successiva, può anche avere un periodo di evoluzione lenta: dalla consapevolezza di poter essere una persona attiva alla realizzazione di un obiettivo desiderato. Il punto critico è rappresentato dal sostegno degli altri, in quanto la persona è ancora vulnerabile e ha bisogno di tempo, di essere compresa e sostenuta.

Esercitarsi nelle azioni e riflettere sui risultati ottenuti

A questo punto, il processo di riscoperta delle proprie capacità di riattivarsi comporta l'esercitarsi nelle azioni e il riflettere sui risultati ottenuti, incorporandoli nelle azioni successive. La persona può scoprire di essere capace di prendersi cura di sé e agire a proprio beneficio, smettendo di essere soltanto il «recettore» della volontà altrui. Comincia a percepire di essere una persona capace di scopo, azione e responsabilità mettendosi alla prova e svolgendo piccoli compiti che, anche se all'apparenza semplici o ordinari, implicano la scoperta di abilità e di aree di efficacia.
Sebbene il processo di scoperta di sé come persona più attiva e autonoma non appaia stabile e costante nella vita di chi attraversa un disturbo mentale severo, i piccoli successi agiscono a favore di una graduale costruzione di autonomia. Attraverso le esperienze di successo, la persona può scoprire di avere la capacità, anche

inaspettata, di allargare la propria rete di conoscenze, di condividere momenti di socialità, di prendere iniziative che riguardano la propria vita.

Imparare a conoscere e gestire le proprie risposte emotive

Come negli altri aspetti sopra indicati, lo sviluppo di una nuova capacità di avvalersi della propria esperienza serve come strumento prezioso per monitorare, governare e compensare il disturbo nel proprio contesto sociale. Sentirsi più solidi perché sostenuti dalla propria esperienza può avere la funzione di «rifugio» dal disturbo, per evitare di stare nuovamente male, oppure può servire per combattere gli effetti secondari come l'ansia, lo stress e lo stigma nel contesto sociale in cui si vive. Imparare dalla propria esperienza a distinguere se stessi dal disturbo porta a riconoscere quelli che possono essere definiti i «segnali» (o i «campanelli di allarme») derivanti dalla tensione e dai fattori di stress nello sforzo interattivo con gli altri.
Come nel campo delle malattie fisiche, il ruolo del senso di autoefficacia, del controllo sulle proprie emozioni e dell'autostima aiuta a combattere stati prolungati di disturbi somatici e di eventi di vita stressanti, così anche per la persona con un disturbo mentale severo l'autopercezione di essere capace di gestire l'ansia e lo stress può contribuire ad aumentare le competenze nel prendere parte più attiva nel proprio progetto di vita, nello sviluppare strategie quotidiane per fronteggiare i problemi, nell'imparare a esercitare autocontrollo sui sintomi, incrementando le proprie capacità di mantenere gli impegni nel contesto sociale e lavorativo.

Un cambio di atteggiamento verso il proprio disturbo

John Strauss è stato uno dei primi ricercatori a sostenere la cruciale importanza del ruolo attivo delle persone con un disturbo mentale severo nell'interagire e influenzare il decorso del loro disturbo.

Non ci si considera più vittime impotenti della malattia

In un suo recente scritto (2008), Strauss sostiene che sta ancora cercando di rispondere alla domanda che gli aveva posto, quindici anni prima, una donna intervistata per la sua ricerca: «Perché il medico non mi chiede mai cosa faccio «io» per aiutare me stessa?», vale a dire perché si informa soltanto sui sintomi, il lavoro, le relazioni sociali, il trattamento, senza chiederle mai quale sia il suo apporto personale nel far fronte al problema? Ecco il commento di Strauss:

> Questa donna ha sollevato la questione della soggettività. Non considera se stessa una vittima impotente della malattia, né tanto meno un oggetto i cui sentimenti e le cui azioni sono irrilevanti per il proprio percorso, sia nei momenti di crisi sia nel processo di ripresa.

L'*autodeterminazione* e *la volontà di stare meglio* sono entrambi elementi nello sviluppo di un senso di sé attivo e possono rappresentare un punto di svolta nel

processo di recovery. Questi aspetti di se stessi, sostiene Strauss, possono essere considerati come un cambiamento di atteggiamento verso il proprio disturbo: molte persone «dopo un prolungato periodo di sofferenza non si sono semplicemente rassegnate a dover convivere con un disturbo, ma desideravano costruirsi una vita oltre e nonostante il proprio disturbo mentale».

Si prende parte attiva alle decisioni che riguardano la propria salute

Nell'affrontare la questione del cambiamento nel modo di percepire se stessi in rapporto alla propria vita, ai propri sintomi e alle proprie condizioni, Ron Coleman considera «la scelta» una delle pietre miliari dell'esperienza di guarigione. Incrementare le decisioni che riguardano se stessi, assumere i rischi delle scelte che si fanno sono aspetti di un atteggiamento propositivo nell'interazione con i propri problemi, come pure nell'interazione con gli altri. Scrive Coleman (2001):

> Dobbiamo avere fiducia nello smettere di essere malati per cominciare a essere in guarigione. La strada della guarigione richiede non solo che facciamo le nostre scelte, ma anche che prendiamo la responsabilità di tutte le nostre scelte, buone e cattive.

Affinché le persone possano avere controllo sulla propria vita, in modo da riguadagnare un ruolo propositivo ed efficace, tuttavia, devono essere fornite loro opportunità di scelta e di contrattazione nel rapporto con i servizi e con le persone coinvolte nel processo di aiuto. Parlando dell'utilizzo dei farmaci nel suo percorso di recovery, Pat Deegan (2007) riassume così la sua visione delle cose: «l'esperto medico» e «l'esperto cliente» sono entrambi seduti in una stanza e nessuna delle due parti è meno importante dell'altra, devono condividere le informazioni in modo da poter arrivare alla migliore decisione possibile sul trattamento da intraprendere.
Le persone devono quindi essere coinvolte in tutti gli aspetti della pianificazione, dello sviluppo e dell'implementazione dei servizi che le riguardano, così come devono essere coinvolte anche negli aspetti della vita sociale che esulano dal trattamento e dalla riabilitazione. Solo questo coinvolgimento sostanziale può portare a un *empowerment* e a un senso di controllo sul proprio ambiente e sulla propria vita.

Il ruolo degli «altri significativi»

«La recovery è un'esperienza profondamente umana, facilitata dalle risposte profondamente umane degli altri», scrive William Anthony (1993). Se la comprensione del ruolo svolto dalla persona è essenziale per comprendere il suo processo di guarigione, è altrettanto fondamentale capire come gli altri possano avere un ruolo rilevante in tale processo.

Il sé non esiste senza la convalida degli altri

Nelle diverse ricerche sulla recovery, la presenza degli «altri significativi» è un denominatore comune per la capacità che essi hanno avuto di stimolare, sostenere

e mantenere una presenza costante, anche nei momenti più critici della vita delle persone che stanno lottando per riprendersi: «Il sé non esiste senza la convalida da parte degli altri», afferma Coleman.
Per le persone con esperienza di recovery i fattori decisivi dell'aiuto risultano essere il contenuto e la qualità percepita delle relazioni di vicinanza, sia per quanto riguarda i familiari che gli amici. I familiari rappresentano talvolta l'unico contatto sociale conservato dalla persona in grave difficoltà, che vive una condizione di isolamento.
Il sostegno dei familiari, anche quando è difficile da riconoscere, può essere d'aiuto nel superare la resistenza alla socialità (per esempio, vincere la vergogna di «essere diventate persone con una sofferenza mentale»), così come può essere utile nel cercare di ristabilire un contatto scandito dai semplici gesti della quotidianità ordinaria (anche se le circostanze non sono ordinarie).

Il supporto emotivo come fattore di svolta

Gli aspetti pratici, come base elementare del sostegno, vanno messi in relazione con i significati emotivi della presenza dell'altro. Molte persone con esperienza di recovery hanno sostenuto che la cosa più importante per loro nella relazione con un parente, un operatore sociale o un amico è avvenuta quando «si sono sentite prese sul serio» (Strauss, 2008).
In una prospettiva di reciprocità, il supporto emotivo viene a essere determinante quando il familiare è stato capace di cambiare se stesso durante il processo di recovery, sentendosi «maturare in qualche modo assieme» al proprio parente, mettendosi direttamente in gioco, in un percorso di crescita che coinvolge entrambe le parti.
Sia dalla letteratura sulla riabilitazione psichiatrica, sia da quella sulle esperienze vissute, risulta che uno dei «fattori di svolta» – tanto centrale quanto periferico – nel processo di recovery sia stata la presenza di persone capaci di «trasmettere la speranza». Saper trasmettere la speranza è quanto definisce la relazione di aiuto, che si tratti di familiari, amici, operatori o pari.
Come racconta Patricia Deegan (1993, p. 97):

> Potrei ricordarmi un momento specifico in cui una piccola e fragile fiamma di speranza e coraggio ha illuminato la nostra oscurità e la nostra disperazione. Anche quando abbiamo ceduto, là stavano quelli che ci amavano e che non cedevano. Loro non ci hanno mai abbandonato. (...) Il loro amore per noi è stato come un costante invito, un richiamo a essere qualcosa di più della nostra autocommiserazione e disperazione. Il miracolo è che gradualmente abbiamo incominciato a sentire e a rispondere a questo amorevole invito.

L'efficacia dell'approccio del sostegno paritario

L'«altro significativo» è rappresentato spesso dalla figura del «pari» (*peer support*), cioè dalle persone che hanno vissuto l'esperienza di un disturbo mentale e si sono riprese o si stanno riprendendo, e offrono il loro aiuto, appunto paritario, attraverso la testimonianza e la condivisione della propria esperienza.

L'efficacia dell'approccio del sostegno paritario passa attraverso l'esempio, che rende presente e concreta la speranza di farcela. Le persone che raccontano di questo aspetto dell'aiuto sottolineano come diventi molto difficile continuare a non nutrire speranze quando si è circondati da altre persone ugualmente in difficoltà che stanno facendo passi in avanti nel loro processo di guarigione.
Anche per Coleman (2001) la dimensione «condivisa» ha giocato un ruolo fondamentale nel proprio percorso, dal momento in cui è arrivato nel gruppo degli uditori di voci:

> Ho sentito valorizzato il mio sé. (...) Credo che il più grosso cambiamento che mi sia capitato nel gruppo sia stato che ho smesso di essere Ron Coleman lo schizofrenico e sono diventato Ron Coleman che sente le voci, e per quanto questo fosse solo l'inizio del processo di guarigione, era già un buon inizio.

Gli operatori non come tecnici, ma come alleati

Per quanto riguarda l'aiuto ricevuto dagli operatori di un servizio, nel racconto delle persone con esperienza di recovery, è determinante l'attenzione ricevuta, *genuina* e *diversa* rispetto a quella considerata convenzionale o formale, perché diretta alle persone in quanto tali e non come «pazienti». Come sostiene Davidson (2003):

> Il prendersi cura di qualcuno in modo genuino non è qualcosa che può essere prescritto, richiede che l'operatore offra se stesso in un modo che non deriva soltanto dalle sue responsabilità come operatore, ma è basato sul suo rendersi conto dell'umanità comune di entrambe le persone. Sebbene questa distinzione possa sembrare sfuggente o astratta, essa fa la differenza per chi si trova dal lato di chi riceve l'aiuto.

Per Alain Topor (2006), l'operatore fa «qualcosa di diverso» rispetto al ruolo atteso se stabilisce un rapporto di reciprocità e di condivisione di responsabilità e di interessi comuni. Significa che l'operatore va oltre quello che può essere considerato il suo compito istituzionale, non si comporta secondo un copione atteso, o secondo la solita routine formalizzata, bensì si mette in gioco sul piano personale e fa conoscere aspetti di se stesso. In altre parole, gli operatori sono considerati d'aiuto «quando costruiscono un rapporto positivo con la persona, un rapporto spesso descritto come di amicizia».
In ogni caso, quel che sembra caratterizzare l'aiuto dell'altro nel percorso di guarigione di una persona è la possibilità di diventare un suo «alleato», che si tratti di un pari o di un operatore.
Per spiegare il ruolo degli operatori nel gruppo di uditori di voci di cui fa parte, Ron Coleman (2001) scrive:

> Quando gli operatori conducono il gruppo, la cosa che cerco sempre di fargli comprendere è che loro sono «parte» del gruppo; se non sono uditori di voci, allora il loro ruolo è di essere degli alleati. Non sono lì come tecnici, sono lì come alleati.

Il ruolo delle risorse materiali e sociali

Nella letteratura recente, è stata sottolineata l'importanza dei fattori sociali e ambientali come facilitatori nei processi di recovery.
Come possono le persone riguadagnare potere sulla loro vita e un ruolo nella società, se non hanno adeguate possibilità materiali, risorse economiche e culturali per ricostruire la propria identità sociale?

Spesso le persone subiscono una perdita di ruolo e identità sociale

Come scrive Peppe Dell'Acqua (2013), per chi soffre di un disturbo mentale severo è molto difficile soddisfare l'elenco dei «normalissimi bisogni» che tutti abbiamo: avere un reddito o svolgere attività significative; avere una sistemazione abitativa; lavorare con soddisfazione; essere parte della comunità; non essere discriminati; dare senso alla propria esistenza.
I contesti sociali, nella misura in cui ostacolano l'accesso ai diritti di cittadinanza, favoriscono il processo di interiorizzazione del ruolo di malato e la condivisione dei pregiudizi della società. Di conseguenza, le persone diventano più isolate socialmente e più esposte allo stigma. Come afferma Deegan, riferendosi alla diagnosi di schizofrenia ricevuta a 18 anni:

> La mia identità era ridotta a una malattia agli occhi delle persone che si occupavano di me. Era soltanto una questione di tempo perché incominciassi a interiorizzare questa visione stigmatizzata e disumana di me stessa.

Il processo di identificazione nel ruolo del malato mentale è un processo sociale e interpersonale: implica che una persona che «ha» un disturbo mentale finisce per «diventare» il proprio disturbo.
Questa progressiva perdita di ruolo e di identità è segnalata come un cambiamento significativo da molte persone che attraversano un prolungato periodo di malessere. Le persone cessano di lavorare, si ritirano dalle scuole, perdono contatti con la famiglia e con gli amici. In questo modo perdono i loro ruoli sociali validi e le identità accettabili che ne derivano. Talvolta, quello di paziente è uno dei pochi ruoli che rimangono.

La centralità del lavoro nel percorso di recovery

Perciò, nel concettualizzare il processo di recovery, bisogna prestare attenzione anche alla dimensione sociale del processo di ricostruzione materiale dei diritti di cittadinanza. Essere disoccupato, non avere una casa, non avere una fonte minima di reddito costituiscono *evidenti ostacoli* per le persone che stanno lottando per riprendersi.
In questa prospettiva, il lavoro può essere considerato uno dei più importanti fattori di facilitazione del processo di guarigione: costituisce una risorsa estremamente importante in quanto permette alla persona di uscire dallo status di malato e di assistito. Il lavoro provvede non soltanto a un guadagno economico, ma offre struttura e scopo, opportunità di socializzazione e di sviluppo di nuove relazioni

sociali, di valori e significati e di piena cittadinanza [3]. Nel riguadagnare un senso di appartenenza nella comunità, va anche sottolineata l'importanza degli impegni delle persone nei «compiti di sviluppo sociale»: la lotta per fare fronte allo stigma e alla discriminazione sociale, l'aiuto agli altri e il lavoro di volontariato, la partecipazione a gruppi di auto-aiuto e per lo sviluppo e il cambiamento delle politiche in salute mentale sono attività altrettanto gratificanti e significative.

La guarigione come processo dinamico e aperto

In quanto detto finora, è implicita una concezione della recovery come processo aperto, complesso, che richiede del tempo. In contrasto con la dicotomia statica guarito/non guarito, si delinea un'idea di recovery come processo che concerne l'intera vita della persona.

La recovery è un processo, come la vita

Questa visione è stata sostenuta da un numero consistente di ricercatori, molti dei quali con un'esperienza personale di disagio mentale. Per esempio Rae Unzicker, nel suo resoconto autobiografico (1989), quando le chiedono che cosa le abbia cambiato la vita, risponde:

> Per me, e credo per molti altri, è raramente una sola cosa. La recovery è un processo, così come lo è la vita.

Nella prospettiva delle persone che hanno attraversato l'esperienza del disturbo mentale e di quanti hanno superato nel lungo periodo l'esperienza della istituzionalizzazione, la guarigione non è intesa quindi come un prodotto finale, ideale o statico. Spesso è descritta come un'attitudine, un modo di vivere e di sentire, una visione o un'esperienza, anziché un ritorno alla normalità o alla salute (Davidson, 2003). Questo modo di definire la recovery come un processo vitale e dinamico è espresso frequentemente, nella letteratura del movimento degli ex utenti psichiatrici, con l'espressione *essere in recovery* piuttosto che *essere recovered*, cioè essere guariti. Come sottolinea Patricia Deegan (1993), la recovery

> è un processo non perfettamente lineare, a volte il nostro percorso è fatto di errori e fallimenti, si scivola indietro, ci si riorganizza per ripartire da capo. L'obiettivo è affrontare la sfida delle nostre difficoltà e stabilire un nuovo e rafforzato senso di integrità e di scopo nella vita, all'interno e oltre i limiti del disturbo.

3 | Le opportunità di lavoro, di perseguire i propri interessi e disporre di denaro sufficiente per invitare un amico a cena, ad esempio, possono essere elementi di grande supporto. I movimenti per la deistituzionalizzazione hanno sottolineato l'importanza della restituzione dei diritti di cittadinanza e della costruzione di alternative nei contesti reali di vita delle persone. Perché quanto più le persone hanno accesso ai diritti di cittadinanza, tanto più possono ricostruire una identità sociale e riguadagnare un ruolo nelle relazioni sociali.

E, come la vita, può implicare passi avanti e ricadute

Secondo quanto afferma anche William Anthony (1993), parlare di processo dinamico e aperto offre un'immagine di costruzione continua, di percorsi basati su una serie di passi progressivi che possono

> implicare crescita e ricaduta, periodi di veloci e di lenti cambiamenti. Mentre la tendenza può essere verso l'alto, l'esperienza del giorno per giorno non è sempre direzionata. Intensi sentimenti possono sopraffare improvvisamente, così come momenti di introspezione o periodi di crescita possono accadere inaspettatamente. Il processo di recovery è tutt'altro che sistematico e pianificato.

Ma è nella concettualizzazione di Ron Coleman che l'idea di processo viene argomentata in modo più esplicito, quando l'autore propone la distinzione tra recovery e mantenimento (maintenance). Con quest'ultimo termine Coleman si riferisce alla pratica istituzionale della psichiatria, secondo cui l'esito migliore è visto come una condizione sostanzialmente statica, in cui la preoccupazione del servizio non va oltre la riduzione del rischio di «ricaduta» del paziente, «congelandolo» in tal modo nel ruolo di malato. Al contrario, la recovery come processo dinamico comporta lo sviluppo delle persone verso nuovi traguardi di appropriazione di sé e perciò anche di riduzione della dipendenza dal servizio.

La cittadinanza è ancora terapeutica
L'esperienza del Social point a Modena

Da Basaglia in poi abbiamo imparato a vedere le persone che vivono il dolore della mente come persone e non come diagnosi, come malattia. Persone che faticosamente guadagnano margini, a poco a poco più ampi, di libertà. Libertà intesa come possibilità di godere di diritti, di esprimere bisogni, di alimentare desideri, di scoprire i propri sentimenti, in una parola di vivere. Questa libertà è il singolare prodotto di quella stagione ed è quanto di più salutare si possa immaginare. «La libertà è terapeutica», si diceva allora. Oggi potremmo dire che lo è «la cittadinanza», la parola che meglio esprime l'idea di recovery.

Nella vita quotidiana delle persone con disagio psichico, dei loro familiari e degli operatori che lavorano per la salute mentale di comunità, temi come il lavoro, l'abitare, la qualità delle relazioni di vicinato e del «capitale sociale» assumono un ruolo fondamentale nel determinare un migliore decorso della malattia mentale.
A sua volta, il conseguimento di prognosi positive per la persona ha effetti trasformativi sull'immagine collettiva della malattia e della persona con disabilità, non più considerata un peso, ma una potenziale risorsa. È quindi indispensabile costruire progetti di cittadinanza, orientati alla recovery e al miglioramento della qualità della vita. Come *Social point*.

Un progetto d'inclusione nella comunità

Attivo a Modena dal 2006, Social point è un progetto nato dall'iniziativa delle realtà del terzo settore, attualmente finanziato dal Dipartimento di salute mentale e dipendenze patologiche (DSM-DP) dell'Azienda USL di Modena (dopo un periodo di sperimentazione quadriennale, finanziato dalla Fondazione Cassa di risparmio di Modena). L'AUSL ne ha assegnato la gestione al Consorzio di solidarietà sociale, in partnership con il Centro servizi del volontariato, l'associazione di familiari e amici di pazienti psichiatrici «Insieme a Noi»,

l'associazione di utenti «Idee in circolo» e l'ARCI. Inizialmente operativo solo nei comuni di Modena, Sassuolo e Castelfranco, dall'aprile 2012 è stato esteso a tutti i Distretti della provincia.
Nella fase di avvio l'obiettivo era *creare proposte di socializzazione e tempo libero* per gli utenti dei servizi di salute mentale la cui condizione non consentiva percorsi riabilitativi di tipo occupazionale, *in modo da alleggerire il carico assistenziale* dei centri diurni e delle famiglie. Negli anni successivi, Social point si è confrontato a tutto tondo sulla salute mentale come tema che riguarda non solo pochi «addetti ai lavori» o qualche utente e i suoi familiari, ma tutti i cittadini. Il progetto si è così sviluppato su *tre livelli di intervento*:
• facilitazione dell'inclusione sociale di persone con disagio psichico tramite attività di volontariato e tempo libero, mirando a valorizzare risorse individuali e collettive in modo che l'identità non sia monopolizzata dall'esperienza di malattia;
• sensibilizzazione, formazione e informazione del territorio sui temi legati alla salute mentale;
• diffusione di un'idea positiva di salute mentale come oggetto di responsabilità collettiva e creatrice di capitale sociale per il territorio.
Se dunque inizialmente il progetto rispondeva al bisogno di una riduzione del «carico», in una seconda fase si è diffusa la cultura per cui *il tempo libero e la cittadinanza attiva sono opportunità da offrire* alla popolazione che accede ai servizi di salute mentale, *indipendentemente* da quanto i singoli pesino sui servizi e sulle famiglie.

Da utenti dei servizi a volontari del territorio

Parallelamente a questa presa di consapevolezza da parte degli operatori, è stata necessaria una riflessione sulle modalità di lavoro sia con gli utenti che con il territorio. La prassi insegna che, se gli operatori del servizio vogliono lavorare in ottica di *empowerment* e *recovery,* sono inevitabilmente indotti a rivedere il modello operativo.
L'evoluzione del modello di lavoro ha riguardato innanzitutto gli obiettivi condivisi con gli utenti. Il cittadino con disagio psichico che arriva al servizio Social point è chiamato a riflettere – insieme agli operatori – sui propri interessi, su ciò che gli piace fare, sugli ambiti in cui sente di avere più esperienza.
In un primo incontro si valuta l'interesse a partecipare alle attività proposte dalle realtà del territorio; quindi si procede all'attivazione della rete di soggetti dell'associazionismo presente in modo capillare nella comunità (circoli, polisportive, associazioni di volontariato anche non direttamente interessate ai temi della salute mentale), verificando la possibilità di inserimento di nuovi volontari.
In termini di finalità, viene facilitato un processo di empowerment, *costruendo con l'utente una proposta di impegno attivo del tempo libero e valorizzando la scelta e la responsabilità individuale*.
Gli operatori favoriscono momenti in cui l'utente «mette tra parentesi» la propria situazione critica (che lo definisce in maniera univoca come soggetto di bisogno e oggetto di cure) e arricchisce la propria autorappresentazione attraverso momenti

di libero sviluppo di attitudini personali creative, in un contesto paritario e di «normalità».
Contemporaneamente, l'operatore lavora per promuovere e radicare nel territorio e nei servizi in rete un pensiero diffuso volto a valorizzare il sapere e le risorse, e non solo a evidenziare i problemi dei cittadini con disagio psichico. È fondamentale – in queste occasioni di incontro con le realtà del territorio – parlare di «guarigione possibile» e di «miglioramento della qualità di vita». Obiettivi – questi – che il lavoro degli operatori di Social point mostra essere concretamente raggiungibili.
Se infatti ci si prende cura dei contesti relazionali in cui le persone vengono inserite, si osserva come emergano da parte loro particolari abilità, risorse, capacità attive e propositive. Ciò fa sì che anche gli utenti portatori delle condizioni patologiche più gravi possano trarre grande beneficio, oltre che dalla realizzazione di progetti riabilitativi individuali, dal mutamento di percezione che il contesto sociale ha di loro.

Il lavoro con la rete delle risorse territoriali

L'operatore di Social point è chiamato quindi a intervenire sulla facilitazione di processi piuttosto che sulla creazione di singoli progetti, come accadeva prevalentemente in precedenza. Centrale diventa in questo senso il lavoro con la rete delle risorse territoriali.

Aiutare le associazioni ad accogliere le persone con disagio psichico

Un primo tema su cui ci si è concentrati nel lavoro con le risorse territoriali è stato l'accoglienza del disagio. Dai volontari delle organizzazioni aderenti emergeva la richiesta di approfondimento e sostegno.
In questa fase, in collaborazione con il Centro servizi per il volontariato, si sono svolti interventi formativi finalizzati alla decostruzione degli stereotipi sul disagio e a valorizzare la persona inserita in attività di volontariato.
Le associazioni di volontariato, superati i timori iniziali, hanno mostrato un significativo miglioramento delle modalità relazionali e di accoglienza. Si è reso evidente come le esperienze di cittadinanza attiva degli utenti abbiano permesso di costruire una competenza sul disagio psichico che diviene poi patrimonio del territorio e si restituisce alla comunità come capitale sociale permanente.
Questo crea una risorsa che il mondo del volontariato impiega per la propria *mission*: coltivare le proprie competenze relazionali permette infatti di essere più efficaci nel costruire comunità solidali e coese. Spesso, gli inserimenti di persone con disagio, *in virtù dell'incremento di riflessività* che richiedono sulle modalità comunicative dell'organizzazione, finiscono per *aumentare lo «stato di salute»* dell'organizzazione di volontariato stessa.
Emerge così la doppia finalità del lavoro di Social point: da un lato realizzare l'empowerment della persona con disagio psichico costruendo insieme a lei, con la massima personalizzazione possibile, una proposta di impegno attivo del tempo; dall'altro restituire consapevolezza al territorio della responsabilità condivisa nei confronti della salute della comunità.

Promuovere una diversa concezione del tempo libero

La funzione di «facilitatore di spazi relazionali» reali è diventata sempre più determinante nel qualificare la prassi operativa di Social point. Pur partendo da invii da parte dei Centri di salute mentale (Csm) – cui storicamente è affidato un mandato volto a evidenziare le «carenze» dell'utente, il dis-funzionamento, la dis-abilità – l'operatore di Social point lavora secondo un diverso approccio, volto a valorizzare le capacità invece delle disabilità delle persone e a lasciare spazio a ciascuno per esprimere scelte e responsabilità [(1)].

Questo cambio di approccio è avvenuto gradualmente da parte degli operatori di Social point. E quando è stato condiviso con gli operatori dei servizi di salute mentale nei tavoli di coordinamento (dove si definiscono le modalità di erogazione del servizio e si determinano le caratteristiche dei soggetti beneficiari, cioè si «oggettiva» il bisogno su cui si interviene) si è presentata talvolta una certa difficoltà di comunicazione.

In ambito psichiatrico è ancora diffusa una considerazione delle attività di socializzazione come strumenti per *riempire il tempo* di utenti dei centri diurni o come alternative a inserimenti lavorativi non praticabili. Una sorta di «intrattenimento», così come efficacemente descritto da Benedetto Saraceno [(2)]. Ma quest'ottica è sempre più stridente rispetto a una metodologia globale di progettualità sociosanitaria, coerente con i principi dell'empowerment e della recovery.

Inoltre in alcuni operatori dei servizi era presente l'idea secondo cui alcuni utenti, caratterizzati da un funzionamento troppo compromesso, non avrebbero mai potuto fruire delle possibilità offerte da Social point, «poco protette» perché realizzate sul territorio e non nei centri, e troppo «difficili» perché esposte alla partecipazione di «normali» cittadini, portatori di aspettative troppo alte rispetto alle «social skills» delle persone con disagio. Considerazioni e valutazioni che segnalavano, da un lato, una resistenza culturale e organizzativa al processo innovativo in corso, dall'altro una modalità assistenziale che rischiava di cristallizzare gli utenti ai livelli di disabilità associati alla malattia, anche quando la malattia era in remissione.

Certo è innegabile che alcune attività, che richiedono oggettivamente particolari caratteristiche per essere svolte, risultano inadatte per alcune persone. Nondimeno anche persone dalle abilità sociali gravemente compromesse hanno evidenziato gli effetti positivi dello sviluppo di una soggettività costruita sulle proprie risorse e sulla propria partecipazione attiva. Questo non ha invalidato le valutazioni tecniche e mediche sul funzionamento delle persone, ma le ha corredate di altre importanti considerazioni e prospettive [(3)].

---

1 | Il Dsm-Dp di Modena ha incluso il Progetto Social point in un più ampio programma di orientamento dei servizi alla recovery e di acquisizione e applicazione dei principi dell'*International Classification of Functioning*.

2 | Saraceno B., *La fine dell'intrattenimento. Manuale di riabilitazione psichiatrica*, Etas, Milano 1995.

3 | Anche alcuni inserimenti in progetti collettivi molto «difficili» per competenze richieste hanno ottenuto effetti inaspettati con persone segnate da diagnosi funzionali gravi, considerate «senza speranza» dagli operatori più «conservatori». Significativa in tal senso l'esperienza di emancipazione delle persone collocate in soluzioni abitative nell'ambito «Progetto residenze».

Tutti chiamati in causa come persone

In un percorso orientato a sostenere l'accesso ai diritti di cittadinanza attiva da parte dei cittadini con disagio psichico, è cruciale che questi possano riappropriarsi dell'esperienza che vivono, riconoscendosi soggetti e non semplicemente utenti del percorso.

Oltre lo stigma dell'identità di utente

Ciò costituisce una sfida assolutamente critica per la persona con disagio poiché, già nella costruzione sociale della propria «malattia», entrano in gioco elementi che definiscono in maniera asimmetrica la sua relazione con il contesto circostante, che sia familiare o di cura.

L'«identità» di utente porta con sé una carica stigmatizzante della quale il mondo della malattia mentale è inevitabilmente permeato: per questo, sul piano culturale, non ci si può esimere dall'affrontare le rappresentazioni collettive della salute mentale e della malattia.

In Social point, lontano dalle abitudini «istituzionalizzanti» che si sviluppano nei *setting* assistenziali di salute mentale tradizionali, le persone con disagio, indipendentemente dal loro «livello di funzionamento» e dalle loro etichette diagnostiche, sono stimolate e guidate nella realizzazione di finalità concrete e «vere», utili e positive, condivise da altri cittadini che partecipano a tali attività. In questi contesti tutti sono chiamati in causa in quanto «persone», al di là di una loro eventuale malattia. E ciascuno, in quanto consapevole della propria esperienza e di un proprio sapere, può contribuire a *innescare un processo di cambiamento culturale*.

Da utenti a soci: nasce «Idee in circolo»

In linea con queste premesse, si è sempre più accentuata, negli anni, la consapevolezza da parte degli operatori di Social point che il lavoro di sensibilizzazione, promozione, formazione e informazione del territorio non poteva più fare a meno del *coinvolgimento diretto* degli utenti, in particolare di quelli definiti «esperti», ossia di coloro che hanno attraversato l'esperienza di malattia e sono ora in grado di metterla a disposizione della comunità.

Così, nel 2011, si è deciso di costituire l'associazione «Idee in circolo», fondata e gestita da cittadini in maggior parte con disagio psichico, per promuovere assieme a chiunque abbia voglia di collaborare una cultura di inclusione e cittadinanza attiva nel territorio modenese. La decisione è maturata sulla base delle *assemblee periodiche* di un gruppo di lavoro, denominato «Le parole ritrovate» [4], composto da utenti, operatori, volontari, familiari.

Le assemblee sono state il luogo in cui, forse per la prima volta, utenti del servizio

4 | Nel 2009 Social point è entrato nel movimento «Le Parole ritrovate», nato a Trento nel 1993 con l'idea che «non si tratta semplicemente di dare la parola a chi non l'ha sinora avuta, si tratta piuttosto di ritrovare assieme le parole». Dal 2009 Social point partecipa ai coordinamenti nazionali e agli incontri annuali, organizzando a Modena assemblee e convegni (www.leparoleritrovate.com).

di salute mentale hanno sentito di poter pubblicamente e liberamente esprimere le proprie esperienze in maniera incisiva e determinante per gli altri. E la grande carica del movimento è cresciuta man mano che sono aumentate le occasioni di confronto: sapere che l'apporto di ciascuno modifica sensibilmente il risultato del lavoro di gruppo ha costituito un importante elemento di spinta per mettersi in gioco personalmente.
Il confronto di gruppo ha provocato inoltre un'apertura e una *consapevolezza del peso delle proprie parole* che risulta essere una novità dirompente nell'esperienza di alcuni degli utenti coinvolti: le parole assumono «un peso specifico», per alcuni mai provato.

Potenza delle assemblee: si ritrova insieme la voce

La dimensione assembleare e paritaria, come metodologia, influisce positivamente sul livello di stigma esterno e internalizzato, e dunque sulla capacità dei cittadini con disagio psichico di riappropriarsi di un proprio progetto di vita complessivo. Il confronto collettivo [5] permette infatti di sottrarre il «sintomo» all'oggettivazione tecnica e di ricostruirne il senso in un percorso di vita collettivamente dotato di significato, condiviso, dialettizzato dalla lettura e dall'ascolto comune, alla pari. Le esperienze personali, una volta raccontate e messe in circolo, diventano vettori di consapevolezze collettive nuove, che vanno a «scomporre» gli oggetti costruiti dalle istituzioni.
Accanto a questi momenti assembleari, gli operatori di Social point hanno cercato di facilitare anche l'avvio di alcuni *gruppi di auto mutuo aiuto*, con l'idea di formare, nel tempo, *utenti facilitatori*. Il metodo di base, definito del «fareassieme», costituisce una forza trasformatrice perché permette a ciascuno di realizzare quella partecipazione responsabile al lavoro collettivo e di aprire la propria visuale sull'altro come persona da accogliere con la propria esperienza.

Il recupero di una contrattualità sociale

Questo approccio rende protagonisti i soggetti coinvolti ed evita la riduzione degli utenti e della loro sofferenza a semplici «oggetti» nelle mani delle pratiche assistenziali. Di qui è maturata la consapevolezza sempre che il lungo e difficile percorso della cura verso la guarigione (recovery) non passa solo attraverso la presa in carico da parte dei servizi, ma anche attraverso il recupero di un proprio ruolo sociale.
L'azione sul contesto sociale e culturale di riferimento, che vede proprio i soggetti «esclusi» come protagonisti attivi, dotati di contrattualità sociale e impegnati a svolgere vari livelli di interlocuzione per realizzare iniziative di promozione della

5 | Nelle assemblee – sempre aperte a tutti e sempre in cerchio per potersi reciprocamente ascoltare – il confronto verte su temi scelti dalle persone, dentro un filo rosso che per il 2015 è «resistere». Nelle assemblee si dà voce alle storie delle persone, alle loro emozioni e forme di espressione, alle loro angosce e disperazioni, ma anche alle loro speranze e guarigioni possibili. Il confronto collettivo permette di distruggere l'infinita serie di pregiudizi e incomprensioni con cui si tende a svuotare di animo le esperienze di vita di chi attraversa la sofferenza psichica. Smarcandosi dal destino che l'etichetta di «persona con malattia mentale» disegna per molti.

propria condizione, è allora un'azione importante che ricolloca i soggetti deboli in una chiara posizione di cittadinanza attiva.
Il protagonismo di cui si è fatta e si continua a fare concretamente esperienza nelle assemblee diventa stimolo costante alla rivendicazione di una posizione di rilievo nei confronti di tutta la cittadinanza e di un ruolo di sensibilizzazione nei confronti della comunità. Nelle riflessioni collettive, l'attenzione passa così dalla malattia alle condizioni sociali, culturali ed economiche che favoriscono l'emarginazione e l'isolamento: diventa progressivamente chiaro a molti che lo sforzo per la riappropriazione della propria salute passa per un esercizio collettivo di organizzazione e di sensibilizzazione volto ad aumentare la coscienza comune.
Su questo terreno germogliano le iniziative pubbliche e si sviluppano le progettualità rivolte alla comunità, in cui gli utenti iniziano a esprimersi pubblicamente, portando il punto di vista dei cittadini che usufruiscono dei servizi di salute mentale.

Per una settimana in città si parla di salute mentale

Significativo, da questo di vista, il progetto «MÀT - Settimana della salute mentale», promossa dal Dipartimento di salute mentale e dipendenze patologiche dell'AUSL di Modena dal 2011 è collocata a cadenza annuale nella seconda metà di ottobre.
Si tratta di una settimana di dibattiti, conferenze, eventi artistici e culturali aperti a tutta la cittadinanza, dislocati in diverse aree di Modena e della provincia, per sensibilizzare il territorio sui temi della salute mentale e implementare la lotta al pregiudizio e allo stigma che gravano su chi soffre di disagio psichico.

La costruzione partecipata dell'iniziativa

L'evento si svolge sulla base di un percorso di progettazione partecipata, in collaborazione con le associazioni Idee in circolo e Insieme a Noi, e vede il coinvolgimento di partner istituzionali e di un'ampia rete di soggetti dell'associazionismo di utenti, familiari e operatori dei servizi di salute mentale, del volontariato, del privato sociale e imprenditoriale, della scuola e dell'università, delle fondazioni.
La prima edizione ha visto per la prima volta operatori del servizio di salute mentale e volontari delle associazioni collaborare fianco a fianco nelle fasi di ideazione, progettazione e realizzazione dell'iniziativa. L'edizione successiva ha registrato la definizione di una vera e propria convenzione tra il Dipartimento di salute mentale e le associazioni di utenti e familiari al fine di sviluppare un percorso partecipativo finalizzato alla costruzione «comunitaria» dell'evento, secondo una formula organizzativa via via più strutturata e organica.
L'iniziativa si pone come forma di «innovazione sociale» di grande importanza per il territorio: si tratta di un percorso di costruzione partecipata che ha stimolato empowerment organizzativo nel Dipartimento di salute mentale e promosso processi di integrazione tra i servizi pubblici e i soggetti del territorio a vario titolo interessati al tema della salute mentale nei suoi aspetti tecnici, scientifici, politico-sociali, artistici e culturali.

La malattia mentale smette di essere tabù

La Settimana rientra tra gli strumenti messi in campo per intervenire innanzitutto sulle rappresentazioni negative e stigmatizzanti della malattia mentale e delle persone che ne soffrono. La malattia mentale, di fronte agli utenti e ai familiari che si organizzano per promuovere eventi culturali e di sensibilizzazione, smette di essere un tabù per la comunità. Il disagio diviene piuttosto una condizione attraversabile, «che può colpire tutti» [6], dalla quale si può uscire facendo affidamento sulle risorse tecnico-professionali e solidaristiche presenti sul territorio.

MÀT costituisce un'occasione per sperimentare e mostrare pubblicamente la possibilità di percorsi di «empowerment» per le persone seguite dai servizi. È il momento culminante in cui assumono visibilità i progetti personalizzati di inclusione sociale e i progetti collettivi di cittadinanza attiva, rivolti a utenti, che quotidianamente arricchiscono il lavoro clinico e terapeutico dei servizi di salute mentale, conferendogli ampiezza di respiro e di prospettiva.

Più in generale, l'iniziativa si colloca all'interno di un'azione che va così a modificare la rappresentazione sociale dei disturbi mentali e l'espressione stessa della domanda di salute mentale da parte della popolazione.

Si delineano nuove politiche di salute mentale

Dal lavoro si è sviluppata una nuova consapevolezza delle pratiche rivolte all'inclusione di individui e gruppi in condizioni di esclusione sociale. È emersa una modalità nuova di rilevazione dei bisogni e di confronto pubblico sulle politiche di salute mentale, in cui il dialogo tra erogatori e utenti delle prestazioni risulta decisivo per la costruzione di politiche pubbliche più incisive e orientate alla promozione dell'inclusione sociale delle persone con disagio.

Dall'analisi condivisa dei bisogni è emerso infatti che l'articolazione tradizionale dei servizi terapeutici e riabilitativi non è ancora sufficientemente orientata a una reale «ri-contrattualizzazione» delle persone con disagio (ossia a sostenere la loro contrattualità) e queste spesso, anche anni dopo gli episodi più acuti, continuano a restare «a carico» delle famiglie o comunque «cronicizzate» in situazioni segnate da impossibilità di esercitare diritti di cittadinanza, da difficile accesso alle opportunità del territorio, da scarso capitale sociale, da esclusione dal mercato del lavoro, da poca disponibilità di beni e di risorse durevoli, da condizioni gravi di esclusione sull'asse della casa e del lavoro.

Insomma, per le persone trattate dai servizi psichiatrici c'è ancora il rischio che si prospettino traiettorie esistenziali fatte di cronicità, esclusione sociale, povertà, in una «spirale del disagio» che finisce spesso per inghiottire la maggior parte delle famiglie.

La Settimana, ma più ancora il lungo processo che porta alla sua costruzione, ha dunque anche l'obiettivo di incidere sui decisori pubblici. Mostrando che le poli-

6 | In effetti in questi anni nel territorio modenese vi è stato un incremento costante del numero di cittadini trattati dai servizi di salute mentale (fonte, *Relazione annuale,* Dipartimento salute mentale e dipendenze patologiche dell'AUSL di Modena).

tiche più adatte per affrontare la malattia mentale non sono l'istituzionalizzazione e la moltiplicazione di posti letto in istituzioni pubbliche o private, o residenze «protette» in cui collocare gli utenti per tutta la vita, bensì la creazione di luoghi, opportunità e competenze di inclusione sociale.

I segni di un nuovo welfare

La Settimana costituisce il laboratorio e la sintesi degli elementi di innovazione e cambiamento culturale che il Dipartimento di salute mentale ha condotto negli ultimi anni.

Màt è il prodotto concreto di quei principi di «sussidiarietà orizzontale e verticale» che dovrebbero caratterizzare il nuovo volto dei sistemi di welfare; sistemi capaci di superare impostazioni tradizionalmente (e sempre più insostenibilmente) assistenzialistiche e di implementare forme di partecipazione orientate alla promozione attiva del benessere collettivo. Il passaggio cioè da prestazioni «sanitarizzanti» a prestazioni indirizzate alla progettazione di comunità, alla creazione di prodotti relazionali e sociali, è il futuro cui allude questa sperimentazione.

L'impatto sulla riduzione dello stigma e sul cambiamento culturale nella comunità è perseguito a partire dal metodo ideativo, progettuale e organizzativo degli eventi, secondo cui utenti, volontari e familiari delle associazioni hanno assunto una posizione di protagonismo e insieme di collaborazione con gli operatori del Dipartimento di salute mentale.

Per i servizi si tratta di un modello di lavoro nuovo: coloro che ricevono prestazioni non sono più solo fruitori passivi, consumatori di prestazioni e determinanti di costi per l'amministrazione pubblica, ma divengono essi stessi promotori di processi, collaboratori dei servizi, figure di mediazione tra i professionisti e i cittadini che portano al servizio la loro domanda di salute.

L'impostazione di tale percorso di costruzione partecipata ha dovuto confrontarsi con gli inevitabili aspetti inerziali espressi da alcuni segmenti delle istituzioni, ma ha condotto allo sviluppo di una nuova forma di riflessione condivisa sui bisogni espressi e sulle prassi attraverso cui si erogano i servizi sanitari, di interlocuzione con chi direttamente fruisce di tali servizi, con setting e finalità diverse da quelle tradizionali della «cura», e la conseguente riformulazione della relazione tra tecnici e utenti.

Sempre più i servizi che vogliano rispondere ai nuovi bisogni di salute mentale dovranno essere accessibili a tutti, non evocare il timore associato all'immagine stereotipata del «paziente psichiatrico» socialmente escluso e pericoloso. La sperimentazione dei progetti di inclusione sociale sviluppati «dal basso», dalle associazioni di utenti e familiari, ha mostrato che un approccio non fondato sulla disabilità ma sulla valorizzazione della libertà di scelta e del recupero della contrattualità sociale riduce significativamente il livello di esclusione e attiva percorsi innovativi di socializzazione. È questo l'orizzonte verso cui incamminarsi.

Izabel Marin

Progettare servizi orientati alla recovery

Come i servizi possono favorire la «ripresa di sé»

Le persone con disturbi mentali anche gravi raccontano come sempre, persino nei momenti più bui, permanga comunque una parte di sé che resiste alla malattia, che cerca i modi per contenerne gli effetti catastrofici, che prova a ricercare nuove possibilità di vita. Questi racconti offrono indispensabili indicazioni ai servizi, che sempre più devono saper accompagnare il viaggio che le persone compiono per costruirsi una vita dentro e oltre la sofferenza. Orientarsi alla recovery significa, per un servizio, consentire ai soggetti di negoziare la propria cura, includersi nella società, abitare identità differenti.

C'è ancora molto da imparare sui processi di *recovery* e sui servizi orientati a sostenere le persone in tali processi. Tuttavia, in questi anni abbiamo iniziato a capire meglio che cosa favorisce e che cosa ostacola il possibile cambiamento nella vita delle persone, in particolare rispetto alla pratica dei servizi di salute mentale.

Se infatti da una parte le persone devono attingere alle proprie personali risorse per determinare un miglioramento della propria condizione, dall'altra un servizio consapevole di quali siano gli strumenti più utili da offrire faciliterà e renderà più rapida la loro ripresa.

Pertanto ci focalizzeremo ora sui fattori relazionali e sociali che sono apparsi più rilevanti nel contesto triestino, tenendo conto del ruolo che hanno avuto i servizi [(1)].

Il riferimento, oltre all'esperienza pratica dei servizi di salute mentale, è alle ricerche condotte in questi anni sulla recovery, basate sull'ascolto delle persone con esperienze di sofferenza mentale [(2)].

1 | Nel patrimonio di esperienze della deistituzionalizzazione a Trieste – dalla chiusura dell'ospedale psichiatrico in poi – si possono ritrovare alcuni prerequisiti per il funzionamento di un servizio territoriale orientato ai processi di ripresa e di guarigione.

2 | Nella rubrica «I diari degli operatori» di questo numero sono riportati alcuni stralci di storie di persone in recovery. Per una lettura più ampia e articolata si rimanda al volume *Guarire si può. Persone e disturbo mentale* (Edizioni alpha beta Verlag, Merano 2013), curato da Izabel Marin e Silva Bon (*NdR*).

Assumere un'altra idea di guarigione

Nella definizione che i soggetti intervistati danno della propria recovery è determinante l'aspetto processuale, che la caratterizza come «un cammino di ricerca e di costruzione ancora aperto», «un processo lungo, doloroso, e possibile».

Non più il contrario di malattia

Le persone si percepiscono nettamente migliorate rispetto a una condizione iniziale di perdita di sé, si ritrovano con una capacità nuova di vivere la propria realtà e le relazioni sociali.

Tra i significati che assume la recovery c'è quindi la capacità di controllo sulle crisi – e perciò dei sintomi – in un processo in cui si impara a «convivere con una debolezza». La guarigione non è più contrapposta a uno stato di «malattia». La ridefinizione di se stessi come persone, di cui il disturbo mentale è semplicemente una parte, può essere inteso come uno degli aspetti più profondi della recovery.

Quello che accomuna tutte le testimonianze raccolte è il ruolo del servizio di salute mentale nel sostenere e nello stimolare gli sforzi personali verso un processo di cambiamento della propria condizione. Dai racconti emerge che il servizio ha avuto un importante ruolo come promotore di processi ri-abilitativi, di *empowerment*, di svolte significative per la ripresa.

I punti di svolta sono associati spesso a eventi di natura sociale: incontri significativi con altre persone che stanno vivendo la stessa esperienza, ma anche con un operatore, uno psichiatra, un amico. Oppure sono legati a fattori strutturali, per esempio aver trovato un lavoro soddisfacente o aver ripreso un ruolo lavorativo abbandonato con la comparsa del disturbo, avere una casa per sé o essere tornati a vivere in famiglia.

Guarire è stare bene nel sociale

È altrettanto importante osservare quanto sia rilevante la dimensione sociale della recovery in tutti gli aspetti che riguardano la ricostituzione di uno stato di benessere psichico. La recovery non avviene nella solitudine: è un processo intersoggettivo in continuo cambiamento. È nel contesto sociale che la dimensione più strettamente soggettiva si convalida e diventa sostanziale.

Come viene rilevato da recenti ricerche in questo ambito, i contesti comunitari sono ambiti di potenziale sviluppo della partecipazione attiva che fanno guadagnare senso di appartenenza, diventando quindi fattori di recovery. I contesti di «rete» e di «comunità» rappresentano supporti sociali fondamentali dove sentirsi inclusi, accettati, agenti attivi e cittadini.

Per la maggior parte delle persone, la ricostruzione di una rete sociale avviene, in un primo tempo, a partire dal Centro di salute mentale (Csm): per alcuni, la rete di conoscenze si allarga poi effettivamente al di fuori del contesto del servizio, mentre altri hanno ancora bisogno di usufruire del suo supporto.

La dimensione sociale acquista significato in relazione al ruolo dei servizi nella

misura in cui essi riescono a sostenere le persone nel loro contesto di vita, sia nell'attivare l'aiuto della propria rete di persone significative, sia nell'attrarre risorse umane e materiali per la creazione di opportunità sociali miranti all'inserimento in contesti di normalità [3].

Attrezzarsi per accogliere la domanda di aiuto

Il primo contatto con un servizio psichiatrico è descritto dalla maggior parte degli intervistati come un'esperienza drammatica, perché strettamente connessa alla presenza di pregiudizi per i luoghi di cura, spesso percepiti come stigmatizzanti. La persona sembra andare incontro a una sorta di catastrofe personale prima di accettare un aiuto.

Questa esperienza, che può significare «varcare una soglia» e sancisce il proprio timore di essere pazzi, pone il servizio di fronte al bisogno di attrezzarsi per accogliere la domanda di aiuto in cui la costruzione di un rapporto di fiducia, necessario a stabilire un'alleanza terapeutica, è l'elemento essenziale.

In tal senso, un servizio orientato al dialogo e all'ascolto «va incontro» alla persona avvicinandosi concretamente ai suoi bisogni e la considera come soggetto attivo e corresponsabile nel trattamento, che passa attraverso una corretta informazione e una negoziazione su programmi e scelte terapeutiche da intraprendere.

I *luoghi* del contatto, nell'andare «verso la persona», sono i suoi luoghi di vita: l'abitazione, il quartiere, il posto di lavoro; i *contenuti* della presa in carico sono l'insieme di soggettività, rapporti sociali, condizioni materiali di vita [4].

Nel momento in cui la persona entra in contatto con il servizio di salute mentale, nonostante la drammaticità del vissuto di mancata speranza e di isolamento sociale in cui si trova, si apre nei suoi confronti una nuova costellazione di risposte necessarie per cominciare a ricomporre i tasselli della propria storia e a infrangere «il muro nella comunicazione con il mondo».

Questo spiraglio rappresenta spesso un punto di svolta nella propria condizione. Se il momento drammatico è caratterizzato dall'isolamento, la guarigione incomincia nella riscoperta della possibilità di comunicare.

Favorire l'accettazione del disturbo

In relazione allo stigma percepito nei confronti dei luoghi di cura, man mano che si sviluppano possibilità concrete e condivise sul piano dell'aiuto la drammaticità dell'impatto si attenua. Si deve anche tener conto del fatto che, nel linguaggio in uso

3 | Il ruolo dei servizi di salute mentale in relazione alla dimensione sociale della recovery è sottolineato in un documento importante, curato da Larry Davidson e colleghi: A *Practical Guide to Recovery-Oriented Practice. Tools for Transforming Mental Health Care*, Oxford University Press, Oxford 2008. Il documento individua principi guida per la pratica dei servizi orientati alla recovery.

4 | Cfr. Dell'Acqua P., Mezzina R., *Risposta alla crisi. Strategie ed intenzionalità dell'intervento nel servizio psichiatrico territoriale*, in «Per la salute mentale», 1, 1988.

nei servizi triestini, non ha un ruolo determinante quello che da Basaglia in poi si è chiamato «etichettamento» diagnostico. Ciò vuol dire che il problema dello stigma non è strettamente associato all' «etichetta» clinica sovrapposta alla singola persona. La situazione è diversa pertanto da quella prospettata nella tradizione anglosassone discussa dalla *labeling theory*. In quel caso, l'autostima della persona dipende dall'accettazione o dal rifiuto della diagnosi in quanto etichetta clinica: tra i soggetti che accettano l'etichettamento (diagnosi) si verifica una bassa autostima; per contro, nei soggetti che rifiutano la diagnosi del disturbo mentale grave, sono riscontrabili livelli più alti di autostima e maggiore indifferenza ai livelli dello stigma [(5)].

Se invece non prevale lo stigma «da etichettamento» diagnostico, la percezione della persona presa in carico può focalizzarsi sulle limitazioni concrete che il disturbo pone alla propria autostima e sulle difficoltà relazionali che possono essere affrontate nell'interazione con operatori che non hanno bisogno della tipica distanza difensiva rappresentata dall'etichettamento diagnostico.

Questo non vuol dire che le persone non possano scontrarsi con il rischio di invalidazione o discriminazione che anche all'interno di questo rapporto si genera. Tuttavia, il contesto più dialettico e diretto – non mediato dalla «distanza» diagnostica – permette che l'accettazione e la consapevolezza del disturbo e dei limiti a esso correlati aumentino in qualche misura la capacità di autodeterminazione e il senso di autocontrollo, nel riconoscimento e nella gestione delle difficoltà sul piano della funzionalità sociale.

Ricollocare la persona in una dimensione intersoggettiva e di opportunità

Un esempio di attenuazione dell'impatto con il servizio è dato dall'esperienza di Matteo, che per un periodo lavora come centralinista presso il Csm che lo ha in carico. Quell'esperienza a Matteo è servita per «sdrammatizzare il muro contro muro», dal momento che lui stesso diventa parte del servizio.

La nuova prospettiva permette di rompere e scardinare la resistenza tradotta nella polarità semplificata «psichiatra contro malato». Matteo rivendica la sua collocazione di «malato lontano dal credo psichiatrico», e tuttavia quella vicinanza attutisce il suo impatto con l'istituzione:

> Col tempo, iniziando a conoscerli, ho visto che sono meno fermi in questa loro convinzione, e lentamente anch'io ho attenuato i miei pregiudizi nei confronti della psichiatria.

Non per questo Matteo è meno critico rispetto ai suoi diritti e ai suoi problemi. Non per questo tutti devono lavorare come centralinisti in un Centro di salute mentale.

5 | Warner R. et al., *Acceptance of the Mental Illness Label by Psychotic Patients. Effects on Functioning*, in «American Journal of Orthopsychiatry», 3, 1989.

Le risposte del servizio, oltre al supporto medico farmacologico [6], vanno nella direzione dell'offerta di aiuti materiali, di mezzi e strumenti, di contesti e occasioni di aggregazione e di socializzazione, posti in connessione tra luoghi, attività e persone significative. Questi aspetti dell'aiuto, che determinano in parte il processo di ricostruzione di un «ritorno alla vita», sono mirati a ricollocare la persona in una dimensione intersoggettiva e di opportunità in cui compiere un percorso di riappropriazione di sé. Significano ritrovare un senso della possibilità di riavere ruoli e competenze sociali: per esempio aiuto nella ricerca o nel mantenimento di un lavoro, utilizzo del sussidio economico finalizzato alla formazione, supporto giuridico per la tutela della genitorialità.
Il servizio, nell'attivare e attrarre risorse materiali, umane e sociali, vuole offrire opportunità che la persona può cogliere e utilizzare, in una sorta di «attraversamento» personale che la stessa fa del servizio, in cui alcune risorse vengono «apprese» e utilizzate nel proprio percorso, e altre no. Attraversare il servizio può significare provare a fare un inventario personale delle proprie forze e delle proprie debolezze che, come affermano Davidson e Strauss [7], costituisce uno degli aspetti principali dello sviluppo del senso di sé: «prendere le misure» di quello che si può o non si può realizzare, per sentirsi più sicuri nell'affrontare nuove situazioni che possono rappresentare una sfida.

Sostenere le reti sociali informali

Circa il ruolo delle persone significative nel processo di recovery, è importante considerare i vari e diversi livelli di supporto della rete sociale. La chiave per comprendere il ruolo dell'altro sembra essere la qualità e l'intensità della relazione. Se parliamo della rete sociale estesa, la sua importanza va considerata in quanto «potenzialità» di rapporti e possibilità di scambio che la persona riconosce come un valore in particolari momenti di bisogno.
Ma la rete sociale ampia non è necessariamente una garanzia di supporto sociale. Il supporto dell'altro significativo spesso avviene all'interno di una relazione che ha componenti di intimità, spontaneità, durevolezza. Quando, all'interno di una rete, qualcuno viene considerato come persona significativa, si potrebbe dire che

6 | In relazione all'utilizzo degli psicofarmaci come supporto al percorso di ripresa, è importante conoscere, dal punto di vista delle persone, se e come sono stati utili per il loro miglioramento. Quello che risulta importante dai racconti è il modo in cui l'utilizzo dello psicofarmaco diventa una risorsa terapeutica: quando viene indicato come strumento di consapevolezza sul proprio percorso; quando esiste la possibilità di scegliere e decidere assieme al medico il dosaggio o la sospensione a seconda del bisogno; quando l'assunzione permette di avere una qualità di vita soddisfacente. Il racconto di Nina riassume tutte queste caratteristiche: «I farmaci di per sé, se non vengono usati bene o se vengono usati come unico aiuto, servono a ben poco. Però inseriti in un percorso di psicoterapia, o in un rapporto positivo con lo psichiatra, sono fondamentali, perché ti danno la possibilità di riuscire a fermarti e riprendere quel minimo di lucidità che serve per uscire dalla crisi. Quando uno non capisce assolutamente niente, ha delle allucinazioni, non può vivere la comprensione».
7 | Sono concetti sviluppati nel mio precedente articolo contenuto in quest'«Inserto»: *Se la prognosi negativa è un mito da sfatare.*

si è stabilita una relazione di confidenza, considerata come fattore di protezione della salute mentale.
Dai racconti emergono alcune figure che presentano tali caratteristiche relazionali: l'amica di Nina «che c'è e ci sarà sempre», il padre di Nicola e quello di Anna, come figure che offrono protezione e allo stesso tempo sono capaci di cambiare il proprio atteggiamento, creando situazioni di confidenza, di «intimità» e di «calore». Anche gli operatori sono menzionati quando riescono a stabilire una relazione autentica con la persona all'interno di un complesso di risposte ai bisogni, producendo, a partire dalla relazione, uno scatto nella situazione circostante.
Dalle capacità del servizio di innescare percorsi di inclusione sociale emersi dai racconti e, in generale, dalle esperienze delle persone in recovery che troviamo nelle pubblicazioni, si comprende la chiara necessità di continuare a sostenere le reti sociali informali e di rendere centrale lo sviluppo dell'empowerment di chi usufruisce o ha usufruito di un servizio.

Promuovere gruppi di condivisione

Nelle relazioni interne alla dimensione del servizio, per alcune persone è stato importante partecipare a momenti di interazione e di scambio informale, piccoli gruppi spontanei o facilitati dalla presenza attiva degli operatori. Questo contesto di accoglienza e di reciprocità permette alla persona di riaprirsi gradualmente, di guardarsi attorno, di misurarsi con gli altri attraverso il confronto e il dialogo, di riattivarsi come soggetto.
I momenti di incontro quotidiano possono svilupparsi nell'organizzazione di piccoli gruppi di auto-aiuto, dove poter condividere le proprie esperienze e trovare percorsi comuni per far fronte ai problemi. Le risorse che il servizio mette a disposizione per promuovere aggregazione e socializzazione sono state apprezzate quando hanno permesso ad alcune persone di sviluppare nuove conoscenze e amicizie, e di conseguenza maturare relazioni che esulano dal contesto stesso del servizio.
I gruppi talvolta possono diventare risorse sociali importanti per le persone in alcuni momenti del loro processo di recovery; possono inoltre svilupparsi in forme più organizzate di supporto tra pari.
Queste reti informali di sostegno reciproco nascono, si allargano, si differenziano e nell'evoluzione di questo processo includono e si fanno attraversare da chi ha bisogno di fare un percorso collettivo, di acquisire potere. I club di volontariato, i gruppi sportivi e culturali, e in particolar modo il gruppo di volontariato di donne hanno avuto un'importante risonanza per le persone: hanno significato ritrovarsi in una dimensione di accettazione e di condivisione di «orizzonti comuni» favorevoli alla ridefinizione di sé.

Supportare la rete familiare

Quanto agli interventi relativi alla rete familiare, essi possono essere incisivi fin dai primi contatti con le diverse situazioni.

Il contributo dei familiari è fondamentale per la ricostruzione della storia di vita del loro parente in quanto conoscono il «prima» del disturbo e possono aiutarlo a ricostruire un «dopo», il loro futuro.
Anche se sostenere i propri cari può rappresentare un'esperienza positiva, l'impatto in termini di gravosità, soggettiva e oggettiva, è molto alto. In *User Empowerment in Mental Health*, documento dell'Organizzazione Mondiale della Sanità del 2010, è stato rilevato che il 95% dei *carers* sono familiari, di cui l'82% donne (per il 90% madri). Il 29% dei carers familiari è impegnato nelle attività di supporto per più di cinquanta ore settimanali.
I familiari hanno dunque bisogno di sostegno, di informazioni condivise e di affidabilità. Il familiare può essere orientato all'inserimento in specifici programmi di supporto, come nel caso del gruppo di familiari di persone con disturbo mentale severo. Questi programmi possono essere utili, innanzitutto, per permettere di uscire da un isolamento della propria situazione e per con-dividere problemi in comune con gli altri familiari. In tal senso, l'aiuto alla famiglia va nella direzione di un orientamento psico-educativo, per favorire uno sviluppo di adeguate strategie per far fronte ai problemi, che permettano loro di poter avere:
• una migliore gestione dello stress relativo ai momenti di marcata difficoltà del proprio parente;
• un aumento della consapevolezza e del controllo sulle proprie capacità di dare risposte e sulle proprie emozioni;
• una riflessione sul proprio stile di vita e di relazione;
• la possibilità anche di prendere distanza da quei problemi che non sono capaci di risolvere da soli.
Il lavoro di supporto ai familiari di persone considerate ad alto carico è strutturato, oltre che da colloqui e consulenze, attraverso un programma di formazione e di riflessione a carattere psico-educativo, svolto in gruppo. Ogni anno il Dsm di Trieste, oltre a curare la pubblicazione di manuali e opuscoli informativi, organizza due corsi di formazione per circa venti familiari di persone con una storia più lunga di disturbo mentale, che durano ognuno dieci incontri con cadenza settimanale. Da circa dieci anni almeno una volta all'anno si organizza un corso di formazione e sostegno anche per familiari di persone all'esordio.
In particolare, nell'intervento con i familiari va considerato come specifico tema di intervento lo stigma connesso al disturbo mentale, per due motivi fondamentali: in primo luogo perché lo stigma può essere percepito dalla persona all'interno del proprio nucleo familiare, e in secondo luogo perché la famiglia può diventare protagonista nella lotta allo stigma e alla discriminazione, includendo la partecipazione e la promozione di attività orientate a modificare i pregiudizi e affermare il pieno diritto all'inclusione sociale dei propri parenti nella comunità.

Per una Carta dei servizi orientati alla recovery

In conclusione, desideriamo riportare l'esito di un lavoro che ha coinvolto – in un confronto ripetuto nel tempo – diversi soggetti che partecipano alla vita dei quattro

Centri di salute mentale del Dsm di Trieste: utenti, operatori, familiari e volontari. Risultato del lavoro è stata nel 2014 la realizzazione di un testo intitolato *Carta della Recovery. I servizi di salute mentale e la guarigione*[8].

Uno strumento per ripensare i servizi nel movimento della società

La Carta della Recovery vuol essere «un nuovo strumento dei servizi di salute mentale che si rinnovano, per rispondere alle nuove domande delle persone e alla realtà che si trasforma». Appare infatti necessario ripensare ai servizi di salute mentale nel movimento di una società in continua trasformazione. Servono una nuova creatività e capacità di progettare, di agire.

I ruoli e i bisogni delle persone con disagio mentale e delle loro famiglie si sono modificati nel tempo, grazie anche alle forme di associazionismo di utenti e familiari. Domande di aiuto più esplicite e chiare e la consapevolezza dell'importanza di tutelare i propri diritti sono effetti del cambiamento. Il protagonismo di persone e famiglie è parte integrante della complessità di un servizio orientato alla guarigione, e arricchisce l'offerta delle risposte che esso può dare. I servizi devono essere capaci di aiutare le persone ad attivare e utilizzare le risorse individuali e quelle esterne per conquistare uno stato di salute generale. Il tal senso, la guarigione diventa un diritto e acquista una dimensione sociale e politica.

Occorrono allora servizi, e i cittadini devono rivendicarli laddove essi non esistono o sono inefficienti, che garantiscano un'accoglienza e un percorso di cura adeguati, relazioni di aiuto fondate sulla reciprocità, risorse economiche per favorire inserimenti nella società, politiche sociali e culturali che contrastino lo stigma e la discriminazione, il pregiudizio tuttora dominante che l'individuo sofferente di un disturbo mentale sia «pericoloso», «incomprensibile», «inguaribile», «improduttivo» e «irresponsabile». È questa la dimensione sociale del concetto di recovery.

Una Carta nata dal desiderio di diffondere salute mentale

La Carta della Recovery nasce per essere uno strumento applicato dai servizi che si rinnovano a fronte di una maturazione delle persone conquistata nel tempo, che è pure maturazione delle domande, e delle risposte.

Nasce dai racconti delle persone le cui esperienze fanno capire che cosa aiuta e che cosa ostacola il processo di ripresa. Nasce dal fatto che nel tempo le persone siano riuscite ad assumersi delle responsabilità, a ricavare degli spazi di confronto riconosciuti, affrontando sfide come l'organizzazione del convegno annuale «Impazzire si può». Nasce dall'incontro con persone provenienti da altri paesi dove si parla di empowerment e di recovery non da ieri. Nasce dalla suggestione di creare un documento che si completi con le idee di molti e che possa servire a tutti.

8 | La *Carta della Recovery* è frutto di una ricerca partecipata iniziata nel 2011 quando a Trieste si imbastiva la seconda edizione del convegno annuale «Impazzire si può - viaggio nelle guarigioni possibili», condotta da un gruppo composto da esperti per esperienza ed esperti per professione. Nel 2013 i contenuti della Carta sono stati discussi e validati in un percorso di formazione congiunta nei quattro centri di salute mentale triestini, prendendo a modello il metodo del focus group, con la partecipazione di circa cento persone, per la maggior parte fruitori dei servizi.

Nasce da questo periodo complicato nel mondo che cambia velocemente e che porta via cose conquistate in tanti anni, con passione e fatica. Nasce dal desiderio di conoscere le realtà del nostro Paese dove le leggi per la salute mentale sono applicate in maniera disomogenea, determinando divergenze nelle pratiche a volte molto marcate. Nasce dal desiderio che la salute, compresa la salute mentale, rimanga pubblica, gratuita e per tutti.
Nasce per poter domandare che cosa pensano della guarigione anche ai più difficili, i ribelli, i riottosi, che non stanno poi così «meglio», i disperati.

Le dodici caratteristiche di un servizio orientato alla recovery

La Carta individua in dodici punti chiave le caratteristiche del servizio orientato alla recovery, ripercorrendo e riassumendo in modo efficace diversi argomenti di cui si è trattato poco sopra.

1. | **I servizi centrati sulla persona** Il servizio di salute mentale orientato alla recovery privilegia la soggettività della persona (utente) e interviene utilizzando un ampio ventaglio di risposte personalizzate. Il progetto personalizzato che mira a un cambiamento importante deve essere un «vestito tagliato su misura», che fa suoi i bisogni, i valori, le preferenze della persona. Condivisione del percorso e assunzione della responsabilità da parte di tutti gli attori coinvolti sono punti di forza del progetto. I servizi devono attrezzarsi per mettere in campo le necessarie risorse materiali, umane e relazionali affinché ogni decisione utile al processo di emancipazione della persona sia condivisa.

2. | **L'accoglienza** Il servizio di salute mentale orientato alla recovery si interroga quotidianamente sui luoghi, i modi, i gesti, le parole, i significati dell'accoglienza. Accogliere è aprire una porta, materiale o simbolica, e farlo in maniera accogliente è far sentire chi entra il benvenuto, in un posto ospitale, dove possa essere a suo agio.

3. | **La crisi e la ripresa** Il servizio di salute mentale orientato alla recovery è attrezzato per affrontare la crisi, quel momento quando la persona è sicura di non farcela. Fronteggiare la crisi è offrire accoglienza, vicinanza, ascolto, condivisione, aiuto farmacologico accompagnando la persona fino alla ripresa. È far sentire che ci si può appoggiare, che non si è soli, che è possibile uscirne.

4. | **La formazione per tutti** Il servizio di salute mentale orientato alla recovery investe nella formazione e la promuove. La formazione per tutti i soggetti coinvolti nei servizi intreccia i saperi e le pratiche, da quelli professionali acquisiti dagli operatori a quelli risultanti dall'esperienza diretta delle persone che hanno provato il disagio mentale. È necessario inserire nell'agenda della formazione per gli operatori dei moduli formativi che prevedano la partecipazione di «persone con esperienza» in veste di docenti, per condividere i saperi (sulle leggi, sui diritti, sulla comunicazione, sull'accoglienza, sulla valutazione dei servizi). L'operatore deve inoltre poter accedere a un tipo di formazione che lo stimoli ad ascoltare la persona senza determinarne i bisogni a priori, a usare parole che portino rispetto e non infantilizzino, e a investire passione e amore nel proprio lavoro. È necessario creare e

finanziare corsi formativi specifici per le persone con disagio mentale. In questo modo il sapere e gli strumenti tecnici rafforzano le conoscenze acquisite attraverso l'esperienza diretta, e si può creare una vera e propria professionalità.

5. | **L'inserimento lavorativo e l'inclusione sociale** Il servizio di salute mentale orientato alla recovery sostiene e promuove una cultura del lavoro vero, qualificato e remunerato, e dell'inclusione sociale. Le offerte lavorative per le persone che sono inserite in percorsi di formazione/lavoro devono ampliarsi e poter soddisfare le diverse capacità individuali. Il lavoro va quindi ulteriormente diversificato. Bisogna liberarsi dal preconcetto che le persone fragili siano destinate a svolgere lavori semplici. Per raggiungere tale obiettivo è necessario educare i potenziali datori di lavoro all'importanza di promuovere una cultura di inclusione all'interno del sistema lavorativo. Solo rinunciando a preconcetti stigmatizzanti il datore di lavoro è capace di scegliere bene anche per se stesso. Per le persone che attraversano l'esperienza del disagio mentale, inclusione sociale significa anche assumere un ruolo attivo rispetto agli strumenti e alle risorse necessarie a ricostruire una propria identità sociale e un senso di appartenenza e partecipazione alla vita della comunità, al di fuori dal contesto dei servizi di salute mentale.

6. | **Lo stigma e l'oppressione interiore** Il servizio di salute mentale orientato alla recovery deve saper contrastare situazioni in cui prevale lo stigma e il pregiudizio. Il pregiudizio sul disturbo mentale – e lo stigma che ne deriva – rimane un fenomeno devastante nella vita delle persone che stanno affrontando questo disagio. È talmente radicato nella società e nel modo di vedere e percepire le persone con problemi mentali, che le stesse lo interiorizzano come se fosse reale, convivendo con una sorta di oppressione interiore. I servizi devono perciò sviluppare una cultura della fragilità come risorsa, investendo nella formazione degli operatori, creando opportunità reali di inserimento nel lavoro e nella comunità, diffondendo la speranza che dal disturbo mentale si può guarire.

7. | **La rete sociale e le persone significative** Il servizio di salute mentale orientato alla recovery deve essere capace di sollecitare la formazione di una rete di persone significative attorno alla persona con disagio mentale, favorendo così la ricostruzione dei legami sociali. Supportare le persone nello sviluppare relazioni di fiducia e renderle in grado di recuperare il senso di appartenenza a una comunità, deve essere uno degli obiettivi fondamentali perseguiti dal servizio. Gli operatori di un servizio di salute mentale sono parte integrante della rete sociale degli utenti. L'attenzione offerta deve essere genuina e differire da quella considerata convenzionale o formale. Gli operatori sono di aiuto quando non danno risposte automatiche e predefinite, ma cercano di conoscere le persone, di venir loro incontro. I familiari vanno supportati come parte integrante del processo di ricostruzione di capacità relazionali e di aiuto genuino. L'importanza della dimensione collettiva del reciproco aiuto è ampiamente riscontrata nella letteratura sulla recovery. L'amicizia è parte di questa dimensione: occuparsi di qualcuno è il primo passo verso una relazione di reciprocità. Avere una relazione di amicizia, passare del tempo assieme, dedicare

la propria attenzione all'altro, sono tutti aspetti fondamentali per la persona che ha un'esperienza di prolungato disturbo mentale.

8. | **Il sostegno tra pari** Il servizio di salute mentale orientato alla recovery deve offrire spazi di ascolto e di accoglienza dove le persone che frequentano i servizi quotidianamente, e quelle che vi sono accolte temporaneamente, possano sentirsi a proprio agio e aprirsi al dialogo, recuperando la volontà di partecipare alla vita di gruppo. Le persone con esperienza di disagio mentale possono collaborare con i servizi in qualità di «facilitatori», mettendo a disposizione le proprie conoscenze e i saperi acquisiti al fine di aiutare chi sta compiendo i primi passi verso la guarigione. Il supporto tra pari (*peer work*) non si sostituisce, ma si affianca al servizio. Si agevola così la costruzione di un ponte comunicante tra la persona e il servizio, tra il dentro e il fuori, per tramite di un linguaggio più immediato e condiviso nella pratica. I gruppi di auto mutuo aiuto sono spesso fondamentali nel processo di guarigione. Permettono alle persone di imparare a raccontarsi, confrontarsi e condividere le proprie difficoltà con gli altri. Consentono inoltre di ricostruire reti sociali e legami di amicizia e di vincere il senso di inadeguatezza e di oppressione interiore. I servizi dovrebbero perciò favorirne l'avvio prevedendo la presenza di persone con esperienza che fungano da facilitatori.

9. | **Gli spazi** Il servizio di salute mentale orientato alla recovery ha tra le sue priorità la questione degli spazi. Gli spazi sono una conquista di libertà, come un luogo sempre aperto a tutti, dove però ciascuno può ritagliarsi un proprio angolo di intimità se sta male, può sentirsi protetto e al sicuro. Uno spazio dovrebbe essere bello e decoroso. Dovrebbe essere un ambiente di condivisione continua di interessi e passioni. Dovrebbe essere divertente, offrire possibilità di svago e distrazione, ma anche di impegno culturale e creativo che si conformi ai desideri di ognuno. È qui che si possono vincere la solitudine e la noia, investendo sia umanamente che economicamente nell'offerta di varie attività all'interno dei servizi. I servizi possono essere vissuti/visti come luoghi stigmatizzanti. Si sente la necessità di analizzare e mettere criticamente in discussione la percezione generale e culturale che «all'esterno» si ha del disagio mentale e delle persone che ne soffrono.

10. | **L'utilizzo degli psicofarmaci** Il servizio di salute mentale orientato alla recovery incoraggia le persone a fare un utilizzo consapevole dei farmaci, considerati un dispositivo transitorio del percorso. C'è una differenza tra l'assumere un farmaco, e utilizzarlo. L'assunzione implica passività, utilizzare è farne uso con consapevolezza, per stare meglio. Serve una farmacologia adeguata ai bisogni della persona, che non ne annulli i desideri e la volontà anche nel momento di crisi. Serve una farmacologia che non impedisca di esprimere i propri sentimenti, i propri pensieri, che permetta di crearsi la propria indipendenza senza soggiacere all'arbitrio di estranei.

11. | **L'advocacy e l'associazionismo** Il servizio di salute mentale orientato alla recovery promuove e sostiene la creazione di gruppi trasversali di protagonismo, le associazioni di cittadini utenti e di familiari, i comitati di partecipazione come interlocutori per il rinnovamento dei linguaggi e degli strumenti del lavoro nel

campo della salute mentale. È indispensabile che le istituzioni competenti tutelino i diritti delle persone che soffrono di un disagio mentale. Le associazioni di utenti e di familiari che si occupano della difesa dei diritti e della lotta per la promozione della salute mentale, sono cruciali per denunciare per esempio i soprusi, i servizi inefficienti, le misure di sottrazione e di contenzione. Nel processo di guarigione è di fondamentale importanza per le persone, soprattutto nei momenti di grave difficoltà, poter avere fiducia negli operatori dei servizi e nelle figure di supporto più significative. La persona deve poter scegliere di affidare a queste figure la cura dei propri figli, dei propri beni e la tutela delle proprie volontà da far rispettare nei momenti in cui non è in condizione di farlo da sé.

12. | **I comitati etici** Il servizio di salute mentale orientato alla recovery promuove e sostiene la costituzione di comitati etici formati anche da persone esperte per esperienza, che possano indicare e valutare che cosa faciliti e che cosa ostacoli i percorsi di guarigione, e garantire in tal modo il rispetto dei diritti delle persone negli interventi di salute mentale. Una delle attività del comitato etico dovrebbe essere quella di favorire una ricerca partecipata – esperti e persone con esperienza e loro familiari insieme – sui temi della salute mentale. Una ricerca critica e innovativa che aiuti a migliorare la comprensione dei problemi che riguardano da vicino le persone e, più generalmente, il funzionamento dei servizi stessi.

In conclusione, il testo vuole rappresentare un primo passo nel lungo percorso della definizione di linee guida che raccolgano idee, principi e pratiche condivise nei servizi orientati alla recovery/guarigione. Ci auguriamo che possa essere un viaggio che molti avranno voglia di intraprendere, nella convinzione che molto c'è ancora da imparare, condividere e mettere in pratica.

IL PROGETTO

Nel documento base del II Appuntamento nazionale degli operatori sociali (convocato da Animazione Sociale a Torino l'8-9 novembre 2013), pubblicato nel nr. 277 del 2013, si legge: «La logica della mancanza, del deficit, del danno ha creato distanze enormi. Per cui oggi chi ha un problema molte volte viene ai servizi solo se è costretto... perché la risposta che rischia di sentirsi dire è "adesso ti dico dove non funzioni". Ma le persone sanno già dove non funzionano, piuttosto hanno bisogno di sentirsi chiedere "dimmi in quale momento della tua vita sei riuscito a fare delle cose". Oggi allora diventa cruciale costruire interazioni che sostengano *processi di capacitazione* nei destinatari dei nostri servizi. Per cui chiediamoci: che spazio facciamo al loro sapere informale nel costruire i nostri servizi? Quanto li coinvolgiamo nel comprendere i loro problemi e nel cercare le risposte?» (p. 27). In questa logica di lavoro il concetto di *recovery* si rivela fecondo per riformulare le pratiche professionali quotidiane.

Il limite nella quotidianità dell'educare

Una risorsa a volte inaspettata dentro situazioni difficili

di
Giulia Zanardi

Chi svolge un lavoro educativo è spesso confrontato con i limiti: quelli emergenti nella propria storia, quelli dei contesti in cui opera, quelli delle persone con cui lavora quotidianamente in una prospettiva educativa. Di fronte ai limiti che nascono da un reale che ci resiste, per tutti il rischio è duplice: quello di negarli chiusi in un narcisismo onnipotente, ma anche di subirli in modo passivo. Ci può essere una terza via da percorrere come educatori, dotata di maggiore generatività, ed è quella di sostare nei limiti, esplorarli con lucidità, da ricercatori attenti a intravedere le possibilità non viste in ogni situazione, per aprirsi a nuovi mondi relazionali.

Quello del limite è divenuto solo di recente oggetto di una maggiore attenzione e di una comune riflessione su come, in quanto uomini e donne, possiamo misurarci con il reale e le sue resistenze alla nostra azione.
Osservando i contesti nei quali ci muoviamo risulta infatti evidente come il limite costituisca un tema «caldo» e assolutamente attuale, che chiama in causa, attraversa e interroga tanto le relazioni tra persone, gruppi e culture, quanto gli attuali stili di vita e il sistema socioeconomico su cui questi si reggono.
Per la nostra società, dunque, il limite costituisce un tema col quale è necessario confrontarsi e un varco da riconoscere e attraversare per poter immaginare scenari futuri possibili e sostenibili, uscendo da atteggiamenti di onnipotenza ma anche di impotenza.
In quest'ottica, le pagine che seguono vogliono essere un contributo alla riflessione sulla valenza attivante e generativa che il limite può assumere, in particolare in riferimento all'azione di quanti – come operatori sociali, e in particolare come educatori – si misurano quotidianamente col limite: quello che caratterizza i contesti di lavoro e le storie delle persone incontrate, ma prima ancora quello che impregna i loro vissuti umani e professionali.
Una riflessione al fianco di chi educa, dunque, alla luce della nuova ricerca multidisciplinare che, anche nell'ambito delle scienze umane, sempre più vede nel limite il doppio volto della «barriera insuperabile» e della «soglia di ingresso».

Fragili in quanto umani e figli del tempo

Il termine *limite* richiama, già nella sua etimologia [1], due dimensioni solo apparentemente inconciliabili: barriera *e* ingresso; via inaccessibile *e* via d'accesso privilegiata; invalicabilità *e* possibilità di superamento. Si tratta delle due facce del limite con cui chiunque è chiamato, prima o poi, a confrontarsi nei diversi ambiti, individuali e collettivi, della propria vita.
Tale doppio volto assume una grande rilevanza per chi, come l'educatore, lavora a stretto e quotidiano contatto con situazioni di estrema fragilità e delicatezza: in questi contesti, diventa fondamentale che l'incontro-scontro con la propria limitatezza – e con la percezione che il limite ci avvolge, ma al contempo ci apre ad altro – avvenga consapevolmente e sia accompagnato da quella capacità riflessiva che consente di fare della propria esperienza soggettiva, sociale e lavorativa un'imprescindibile fonte di conoscenza. Questo nella convinzione che «per guardare ai vissuti degli altri è indispensabile avere consapevolezza dei propri» [2]: l'educatore deve avere chiara l'importanza di lavorare innanzitutto su se stesso prima ancora che con l'altro.
Prima di addentrarci nello specifico della riflessione, per delinearne meglio i confini è importante ribadire che il limite si configura al tempo stesso come carattere fisiologico della condizione esistenziale umana (quindi intima e biografica) e come attributo del contesto socio-culturale nel quale come uomini e donne ci muoviamo.

1 | Il termine deriva dal latino *limes*, vocabolo utilizzato dai romani per indicare le pietre – considerate sacre e inamovibili – che segnavano i confini, e dunque la frontiera, la linea di demarcazione oltre la quale non era lecito spingersi; al contempo limes era la via che consentiva di penetrare nei territori di recente conquista o da conquistare. In questa accezione, si lega anche al latino *limen*, che indica la soglia.
2 | Iori V. (a cura di), *Quaderno della vita emotiva*, FrancoAngeli, Milano 2009, p. 43.

Dentro la fragilità prende forma l'esistenza

«I limiti sono propri di qualsiasi forma di esistenza» [3]. Così scriveva nel 1993 Piero Bertolini, padre della pedagogia fenomenologica, sottolineando con forza gli elementi di contingenza e necessità storica che caratterizzano ogni forma di vita. L'uomo è sempre e comunque un essere storicamente collocato e la sua libertà di scelta deve scendere a patti con l'insieme delle condizioni sociali e culturali, in fondo esistenziali, in cui si trova immerso [4].

La limitatezza, secondo Bertolini, è il fondamento della natura sociale dell'uomo, poiché evidenzia che egli non basta a se stesso e che l'altro gli è in qualche misura necessario per conoscere sé e la realtà esterna.

La tendenza a ricercare la relazione con l'altro sarebbe conseguenza e prova della «impossibilità per il singolo individuo di esistere autonomamente, ovvero al di fuori di un qualsiasi rapporto con l'altro» [5], poiché «è dall'incontro con l'altro che l'Io è in grado di cogliere o di comprendere tanto la realtà di se medesimo quanto la realtà del mondo» [6].

La nostra quotidianità, intessuta di relazioni, grida dunque sempre il nostro bisogno dell'altro. Per usare il linguaggio di Vittorino Andreoli, la fragilità è «origine della voglia di legame, di comprensione, di solidarietà e di amore» [7].

Lo scenario delineato chiama in causa l'educatore, fragile per professione in quanto inserito in una quotidianità lavorativa fatta, per l'appunto, di relazioni e in cui la relazione diviene il principale e «debole» – poiché non prescrittivo – strumento di intervento. «Limitato» in quanto essere umano e in quanto professionista dell'aiuto che si confronta quotidianamente con circostanze e storie di vita che lo mettono duramente alla prova, non è infrequente che l'educatore sperimenti un senso di inadeguatezza e impotenza, di fallimento e sconfitta: la percezione di fragilità può emergere prepotentemente per uno sbaglio, un percorso di recupero fallito, una scelta dell'utente non condivisa.

Il limite in una società che chiede perfezione

Se la limitatezza si configura come una caratteristica che accomuna tutti gli esseri umani, sorge spontanea una domanda: perché mai risulta oggi così difficile accettarla come parte integrante di sé?

Fra le molte motivazioni, una, alla quale molti autori [8] rivolgono la propria attenzione, spicca per importanza e influenza: si tratta dell'illusione di onnipotenza che abita e corrode ogni ambiente di vita. Esiste infatti un'implicita (anche se non così tanto) richiesta di perfezione da parte di una società impostata sull'idea che «vai bene» solo se hai successo, se spicchi fra i tanti.

Per rispondere alla domanda di perfezione (e meritare dunque affetto, stima, considerazione), si vive come «sotto la presenza di un giudice implacabile» [9], apprendendo fin dalla più tenera età a mascherare le proprie zone d'ombra e tutto ciò che in sé è indice di debolezza e fragilità.

Si tratta di meccanismi che lavorano in profondità e di cui raramente si è consapevoli e che fanno sì che, anche quando si raggiunge un certo grado di consapevolezza, riscoprire le parti di sé più scomode costituisca comunque una sofferenza: il limite, quando riemerge, può divenire totalizzante, poiché ci si identifica a tal punto con esso da non essere più in grado di vedere e valorizzare le risorse e gli aspetti positivi di sé, come anche dei contesti in cui si opera.

Volti del limite nel lavoro dell'educatore

Anche la quotidianità dell'educare e del prendersi cura dell'altro è fatta di una complessità di sentimenti ed esperienze che espongono l'educatore all'incontro con le proprie fragilità. Ragionando attorno alla difficile presa d'atto di questa nudità interiore, Alessandra Augelli [10] individua alcuni dei volti che il limite assume nella pratica dell'educare.

• *Il prevalere del senso di impotenza.* Si manifesta nelle situazioni in cui ci si sente privi di strumenti e risorse, dunque impreparati ad affrontare le richieste del contesto lavorativo. Come evidenzia Daniele Bruzzone, «non sempre si può fare tutto (non sempre, anzi, si può fare qualcosa), non sempre tutti ce la fanno» [11], e ciò genera una diffusa sensazione di inutilità e inadeguatezza.

• *L'inganno del dono totale di sé.* Può accadere, soprattutto agli inizi del percorso professionale, di venire talmente coinvolti dalle storie che si incontrano da spendersi totalmente per l'altro, dimenticando di tutelarsi e di avere cura anche di se stessi. È la questione della «giusta distanza». Un equilibrio (sempre da re-inventare) fra eccessivo coinvolgimento e freddo distacco – in altre parole, la capacità di tracciare sani confini fra sé e l'altro – è necessario per la riuscita di ogni percorso, oltre che per la salvaguardia della propria salute psicofisica.

• *L'abbandonarsi a sensi di colpa.* Non tutti i percorsi che un educatore intraprende hanno esito positivo. Concedersi di sbagliare, accettare anche le sconfitte è forse l'aspetto più difficile e controverso dell'educare. Si ha la sensazione di non aver fatto abbastanza e ci si assume in toto la responsabilità dell'accaduto, alimentando un'ansia di fallimento che porta a ingigantire gli ostacoli più che a favorire crescita e consapevolezza di sé.

• *La frustrazione per un «grazie» che non arriva.* Se in ogni relazione è insita la necessità di ricevere un riscontro rispetto al proprio manifestarsi in quanto persona, un ringraziamento è conferma e riconoscimento del lavoro svolto, la prova che si è

10 | Augelli A., *Tonalità emotive e paesaggi interiori*, cit., pp. 59-60.

11 | Iori V., *Quaderno della vita emotiva*, cit., p. 155.

agito correttamente. Quando i «grazie» vengono a mancare, la sensazione può divenire di grande frustrazione per l'educatore che, faticando a scorgere il risultato del lavoro, vede indebolirsi entusiasmo e motivazione e, di conseguenza, fiducia nel proprio quotidiano operare.

• *Il sentirsi falliti nel prendere atto delle scelte altrui.* L'educatore può offrire un'opportunità di cambiamento, ma esso si concretizza solo se l'utente accetta e sceglie di accoglierlo. L'azione educativa non può mai essere imposta con la forza e ciò implica, per l'educatore, la non scontata capacità di attenersi alle scelte fatte dall'utente anche quando non le condivide. In altri termini, la capacità di riconoscere all'altro il proprio spazio di autonomia e azione.

• *Il lasciarsi travolgere dalla mancanza di senso.* La sofferenza spesso rimane priva di senso e viene percepita come ingiusta e inaccettabile. Perché accadono certe cose? E perché a lui/lei e non a me? Sono domande che dicono la paura, la fragilità, la difficoltà di guardare in faccia un dolore che, privo di un perché, richiama al fatto che chiunque, educatore compreso, può esserne colpito. Rassegnazione e rinuncia all'azione si rivelano spesso diretta conseguenza dell'inconscio rifiuto di una sofferenza alla quale lo stesso educatore può rivelarsi impreparato.

Osservare sé e l'altro con tenerezza

Le esperienze e i sentimenti elencati in precedenza sono fortemente destabilizzanti, mettono cioè in crisi la propria immagine di sé, rendendo concreto il rischio di «rompersi». Di fronte a tale rischio, la reazione più frequente e immediata è la fuga, che porta a ignorare il proprio sentire, a metterlo a tacere e a comportarsi come se niente fosse. Qual è la conseguenza di questa modalità di relazionarsi col limite, in altre parole con un'immagine di sé che non coincide con le proprie aspettative? Augelli sostiene che

> « l'esperienza del limite e della fragilità, quando non è assunta, quando non è profondamente compresa, crea corazze, che apparentemente danno sicurezza e protezione, ma in realtà rischiano di fare ancor più male. [12] »

In un disperato e spesso vano tentativo di difesa, si creano corazze e si erigono barriere che apparentemente proteggono ma in realtà si frappongono fra sé e gli altri, intaccando la capacità di relazionarsi. Dal momento che, come visto, è proprio la relazione a richiamarci alla nostra umanità, e dunque alla nostra insufficienza, risulta chiaro che l'unico modo per preservare una determinata immagine di noi stessi sembra negare la relazione stessa, e con essa il nostro bisogno degli altri.

Queste corazze, per quanto riguarda il ruolo educativo, possono assumere forme diverse, come l'isolamento, la spersonalizzazione (che porta a dare una risposta meramente tecnica ai bisogni delle persone), la deresponsabilizzazione (che, di fronte agli insuccessi e agli ostacoli, porta a ricercarne le cause fuori da sé e per cui, di fatto, è sempre colpa di qualcun altro) [13].

L'esito comune è l'accumularsi di un malessere che rischia di compromettere la capacità di agire con consapevolezza il proprio ruolo. Non è un caso che questa professione sia oggi annoverata fra quelle maggiormente a rischio di *burn-out*, una sindrome da affaticamento ed esaurimento

12 | Ivi, p. 150.

13 | Gherardi V., *Le vie di fuga dalla professionalità*, in Gherardi V., Manini M., *Didattica generale*, Clueb, Bologna 2001, pp. 28-30.

psicofisico fra le cui cause possiamo immaginare un sentire negativo che, non trovando uno sbocco verso l'esterno e una possibilità di elaborazione, finisce per influenzare negativamente gesti, scelte e relazioni.

Fare del limite una chiave di comprensione dell'uomo

Cosa ha a che fare tutto questo con la professione educativa?
Un educatore che non sappia farsi carico delle proprie fragilità non sarà in grado di guardare con tenerezza alle fragilità dell'altro. Riconciliandosi con la propria umanità e debolezza saprà invece farsi vicino a chi soffre. Infatti, «perché uno si fermi vicino a un ammalato deve sapere di potersi ammalare» [14].
Non c'è modo di incontrare l'altro e di comprenderne il dolore, la sofferenza, le difficoltà se non riconoscendo la propria fragilità, il fatto che in quella stessa situazione ci si sarebbe potuti, ci si può e ci si potrà trovare a propria volta.
«Fuori del limite l'uomo perde ogni possibilità di comprensione» [15], infatti

> « si può capire che un altro si senta debole, fragile, diverso, tremante di sgomento, solo lasciando affiorare il ricordo di tutte le volte – o di almeno una volta – nelle quali noi stessi ci siamo sentiti deboli, fragili, diversi, tremanti di sgomento. [16] »

L'uomo «perfetto», che sottostà alle regole della società della perfezione, non è in grado di accogliere la propria e l'altrui fragilità, perché la fragilità è un'esperienza che gli è estranea. Ecco allora l'importanza, anche per l'educatore, di accettare i propri limiti: solo imparando a convivere serenamente con se stesso egli potrà stare serenamente con gli altri. L'accettazione del limite, in quest'ottica, è presupposto di relazioni sane, legami autentici, capacità di stare insieme. Etty Hillesum, in un contesto e in un'epoca diversi da quelli attuali, scriveva: «Avevo imparato a leggere in me stessa, e così ero in grado di leggere anche negli altri» [17]. L'educatore è chiamato a «leggere» se stesso, a intraprendere un percorso che, se portato a compimento, gli consentirà di comprendere dentro uno sguardo e un moto di tenerezza le persone che incontra.
In questo senso, il prendersi cura del proprio limite si presta a una doppia lettura: una interna (accogliere la naturale debolezza e fragilità che ci contraddistingue personalmente in quanto esseri umani) e una «esterna»: il limite, infatti, è anche il confine che separa e differenzia le persone le une dalle altre, e come tale richiede di essere accettato e rispettato, riconoscendo che si è tutti portatori di visioni del mondo, schemi mentali, valori assolutamente parziali e soggettivi, che possono anche non essere condivisi. Significa riconoscere che esiste qualcuno o qualcosa di «altro» da me, le cui caratteristiche ed esperienze di vita possono portare a scelte e comportamenti altri rispetto a quelli per me più adeguati.

L'intervento educativo accetta il vincolo che è l'altro

L'educatore deve essere consapevole del fatto che le persone che incontra e accompagna possiedono le proprie caratteristiche di personalità, le proprie idee e convinzioni, i propri valori di riferimento, che possono anche (e spesso accade) non coinci-

dere con i suoi. Il suo compito non è trasformare l'altro nella persona che crede debba essere, ma, invece, aiutarlo a trovare in sé gli strumenti e la forza per cambiare, in una direzione che non è l'educatore a stabilire, ma che il soggetto, pur accompagnato, dovrà trovare da solo.
In questo senso, il fallimento, il rifiuto, una scelta della persona non condivisa sono da leggere come espressione di un'alterità e di un'autonomia mai ingabbiabili .
La competenza dell'educatore implica la capacità di riconoscere che l'altro non è mai una «tabula rasa», un vaso vuoto da riempire o un pezzo di argilla da modellare, ma un soggetto che concorre nel determinare il risultato del percorso educativo: quest'ultimo, dunque, non dipende solo dall'azione dell'educatore, ma anche e soprattutto dalla disponibilità della persona, delle persone a co-partecipare, dal loro desiderio di cambiare, dai loro tempi di maturazione.
Riconoscere questo significa rinunciare alla presunzione di onnipotenza con cui tanti operatori si vivono in relazione alle persone che accompagnano, per restituire ad esse il ruolo di protagoniste del proprio percorso umano.
«Perché il suo lavoro si riveli efficace», scrive Bertolini in riferimento ai «ragazzi difficili» (ma il discorso è estendibile ai diversi campi d'azione), l'educatore «deve riconoscere nel ragazzo, nel ragazzo concreto e in carne e ossa, il primo vincolo ai suoi progetti e alle sue azioni» [18].
Ancora una volta siamo chiamati a rispettare i confini posti dalla natura e, fra essi, la libertà di scelta e le specificità delle decisioni prese dalle singole persone che affianchiamo.

Il fragile equilibrio fra superamento e accettazione

Finora si è argomentata l'importanza di rispettare i propri limiti naturali, di accettare di non poter sempre dare il meglio o fare ciò che ci si era prefissati. Ciò che si è voluto suggerire è che passare dal riconoscimento e dall'accettazione della propria limitatezza costituisce, per chi educa, una tappa imprescindibile della propria crescita umana e professionale. Tale predisposizione accettante non può, tuttavia, divenire pretesto per l'immobilità o per la passiva rassegnazione nei confronti degli eventi.
Come evidenziato, infatti, il termine «limite» sottende, oltre all'idea di invalicabilità, anche quella di soglia, passaggio e, dunque, di possibile evoluzione, spostamento, attraversamento. Se è innegabile che il limite sia costitutivo della condizione umana – e dunque non possa mai essere del tutto colmato – tuttavia è proprio il limite a delineare uno spazio in cui l'educatore può intervenire con passione e competenza per favorire l'evoluzione delle situazioni e alleggerirne le fatiche.
La constatazione della propria limitatezza, allora, non deve diventare una scusa, una giustificazione che esonera dallo spendersi in ciò che si fa, ma, al contrario, essa implica l'interrogarsi su cosa è possibile fare delle proprie fragilità, con l'obiettivo di imparare a discernere le situazioni in cui i limiti riservano uno spazio di intervento – e possono dunque essere «spostati» – da quelle in cui è preferibile non interferire, poiché ciò costituirebbe una forzatura.
Di fronte al limite, insomma, l'educatore può scegliere «tra lo slancio del superamento e la prudenza dell'accettazione» [19].
Anche «arrestarsi di fronte a un limite non

18 | Bertolini P., Caronia L., cit., p. 82.
19 | Iori V. (a cura di), *Quaderno della vita emotiva*, cit., p. 158.
20 | Ibidem.

è sempre indice di impotenza: talvolta esprime una sapienza che solo l'esperienza *pensata* della cura sa generare» [20].
In altre parole, invece che essere vissuto come un peso di cui disfarsi o farsi carico, il limite può diventare qualcosa di generativo, a patto, però, di guardarlo in faccia e lasciarsi interrogare, per comprendere come esso possa essere «maneggiato» e messo a frutto.
Alla luce di ciò, la consapevolezza del limite può costituire fonte di equilibrio rispetto ai rischi del delirio d'onnipotenza e del senso d'impotenza. Non esistono ricette o formule universalmente valide che consentano di raggiungere tale equilibrio; ognuno dovrà trovare la personale misura fra le due spinte opposte: l'impulso a oltrepassare i propri limiti da un lato e la capacità di capire quando fermarsi dall'altro.

Quali strumenti per la cura di sé

Alla luce di quanto detto, risulta evidente, per l'educatore, l'esigenza di prendersi cura di sé per poter aiutare gli altri. Questo implica un occhio di riguardo per i risvolti emotivi del lavoro, allo scopo di acquisire sempre più dimestichezza nel muoversi all'interno dei propri «paesaggi interiori» [21].
Micaela Filippini descrive la cura di sé come «un percorso di crescita interiore che spinge l'educatore a ripartire da sé per rilanciarsi nel mondo del lavoro educativo» [22].
È, dunque, innanzitutto un percorso di autoanalisi, che fa dell'esperienza soggettiva dell'educatore un'imprescindibile fonte di conoscenza. Concretamente significa sviluppare una riflessione sugli interventi educativi realizzati e sui loro effetti (positivi e negativi), sul proprio modo di relazionarsi con le persone in situazioni difficili, sui sentimenti, le fatiche, i successi e gli insuccessi, in modo che ogni aspetto del lavoro possa divenire fonte di crescita personale e professionale.
Promuovere la riflessione rispetto alla propria azione consente di prendere atto dei propri limiti, allo scopo di gestirli con attenzione e «tenerli sotto controllo». Ciò implica non fermarsi alle apparenze, ma scavare nelle cose e negli eventi e coglierne l'essenza, il significato più profondo.
Tale capacità va allenata e messa alla prova. A tal fine, l'educatore dispone di strumenti che implicano un continuo travaso tra riflessione in solitudine e lavoro di gruppo.

Condividere con altri l'esperienza del limite

Un primo strumento è la *supervisione professionale*, che dà la possibilità a un'*équipe* di riprendere e rielaborare – periodicamente e sotto la guida di un esperto – il proprio operato, riflettendo sulle situazioni, sulle emozioni di difficile espressione, sui fallimenti e sugli eventuali intoppi verificatisi. È un luogo di vera e propria «manutenzione» [23] che «permette di gestire consapevolmente le proprie azioni, affiancando alla dimensione del fare quella del *pensare insieme* suggerita dal gruppo di lavoro» [24]. Si rivela quindi uno strumento prezioso per lavorare in gruppo sul limite, fino a creare un clima di apertura e disponibilità fra gli operatori, essenziale affinché ciascuno si senta libero di esprimere dubbi

e difficoltà, senza paura di mostrare le proprie debolezze.
La condivisione delle fragilità può aprirsi anche a eventuali *occasioni di confronto esterne al contesto lavorativo*, con persone e gruppi non direttamente connessi al lavoro educativo. Le possibilità possono essere molteplici: una psicoterapia, un percorso spirituale, la pratica di una disciplina orientale, tutto ciò che risulti funzionale all'acquisizione di una maggiore familiarità con la natura umana del proprio limite. Può essere arricchente anche il confronto con le realtà sociali che si muovono alla ricerca di varchi per andare oltre, mettendo in discussione gli attuali stili di vita e di sviluppo socio-economico.

Un inesauribile percorso di apprendimento

Non meno importanti sono gli strumenti di *autoanalisi*: chi opera a contatto con la sofferenza e il disagio sociale, infatti, non può esimersi dal «lavorare» su se stesso. La scrittura è il primo, per importanza ed efficacia, di questi strumenti: la pratica del *diario professionale* è non a caso diffusa fra i professionisti dell'educazione. Oltre alle esigenze di natura pratica cui risponde, la scrittura ha una valenza formativa: trasferire sulla carta i pensieri e le emozioni consente, infatti, di dar loro una forma, di definirli con maggiore chiarezza, di guardarli dall'esterno e secondo nuove prospettive, di riprenderli con maturato distacco.
Secondo Duccio Demetrio, ripercorrendo la propria storia è possibile comprendere l'inevitabilità del dolore, la finitudine dell'umano e, in definitiva, riappacificarsi con se stessi, che non vuol dire mettere a tacere dubbi e inquietudini, ma piuttosto dare loro voce, esternarli per comprenderli nella loro essenza. L'autobiografia, insomma, come rivisitazione dei propri vissuti, riconciliazione con gli stessi e occasione di miglioramento, trasformazione e crescita personale.
La costante auto-formazione dell'educatore, tuttavia, non si limita al fare luce nei meandri della propria interiorità, ma guarda anche all'esterno, alla necessità di *formazione permanente* che caratterizza ogni ruolo che richieda una preparazione – la quale non può esaurirsi sui banchi di scuola o sui testi universitari, ma necessita di essere costantemente aggiornata e messa in discussione. In particolare, per quanto riguarda l'educatore, si tratta di documentarsi sui bisogni sociali e culturali emergenti, sulle situazioni di maggiore urgenza, sulle normative che regolano gli interventi, sulle teorie e sui modelli educativi recenti.

Un tempo per pensare nelle organizzazioni

Alla luce di quanto sottolineato, risulta fondamentale che le strutture lavorative immaginino e predispongano spazi, tempi e modalità che permettano agli operatori – che quotidianamente si fanno carico di parte delle sofferenze di chi accompagnano – di esprimere i propri vissuti. In altre parole, uno spazio di rielaborazione di quanto incontrato e sperimentato. Spesso e volentieri la centralità di questa dimensione non viene colta, e il lavoro dell'educatore si riduce a un qualcosa di meramente esecutivo e prestazionale. È invece rilevante che gli educatori rivendichino un

> « tempo per pensare e riflettere, per interrogare quello che si fa e discernere. Un tempo per pensare, non solo i singoli atti, bensì la relazione che li lega, che intreccia ogni filo del lavoro nel tessuto, intelligente e affettivamente connotato, della cura. [25] »

25 | Filippini M., *Aver cura di sé*, cit.

Il limite da peso a risorsa nel lavoro

In conclusione, alla luce delle riflessioni proposte, è possibile identificare *tre principali modalità* attraverso cui il limite può divenire risorsa del lavoro educativo.

Accettare la vulnerabilità Come più volte sottolineato, esiste un rapporto profondo e indissolubile fra vulnerabilità e relazione, per cui non esiste vera relazione senza previa e continua accettazione della vulnerabilità. Ciò significa che riconoscere la propria umanità – e con essa la possibilità della sofferenza e del fallimento nella propria vita – è l'unico vero modo per farsi vicini a chi soffre e, dunque, relazionarsi autenticamente. Solo imparando a stare serenamente con se stesso, e accettando la propria piccolezza e le proprie insufficienze, l'educatore potrà sviluppare un atteggiamento di autentica compassione (dal latino *cum* e *patior*, «patire con» l'altro) nei confronti dell'altrui fragilità.

Valorizzare il fallimento «A volte un limite o un fallimento ci dicono su cosa dobbiamo lavorare» [26]: modi di dire, un po' inflazionati ma certamente veritieri, vogliono che sia cadendo che si impara a rialzarsi e sbagliando che si impara a correggersi. Anche per l'educatore è importante comprendere e accettare che il suo percorso è un continuo «errare», fatto di successi, ma anche necessariamente di cadute – errori, insicurezze, sentimenti negativi – e che ciascuno di questi elementi è fondamentale per costruire e riaggiustare *in itinere* la prassi lavorativa. L'errore, allora, non è sbagliare, quanto piuttosto non trovare alcun valore nel fallimento. Il limite, se accolto, può aprire potenziali spazi di riflessione e mobilitazione delle proprie risorse in vista di un miglioramento, dinamiche di cui non ci sarebbe alcun bisogno se tutto andasse sempre per il meglio.

Aprirsi all'indefinitezza È importante sviluppare un atteggiamento di «autentica disponibilità all'esistenza» [27] e agli avvenimenti, belli e brutti, che possono caratterizzarla: l'assunzione del limite impone una rinnovata visione del mondo e delle cose, a partire dalla presa di coscienza che non è possibile tenere sempre tutto sotto controllo. Tale consapevolezza è centrale per l'educatore, poiché apre alla possibilità di vivere la progettazione educativa non come un qualcosa di definito meccanicamente, di stabilito dall'alto e calato sull'utente, ma come un evolversi continuo, aperto alle possibilità, ai mutamenti e alle deviazioni determinate da una molteplicità di variabili: prima fra tutte la presenza stessa delle persone nei loro contesti di vita, con le loro caratteristiche, scelte e visioni del mondo.
La missione dell'educatore, in definitiva, è educare al limite se stesso e, conseguentemente, l'altro, dando il proprio contributo affinché i soggetti incontrati sentano come importante e concreta la prospettiva di un cambiamento, ma allo stesso tempo sappiano anche amare la propria limitatezza, in quanto massima espressione della loro umanità. E vedere in essa non più una mancanza, ma la propria forza.

Il farsi del viaggio educativo con il bambino

Ancoraggi nella relazione educativa con storie di fatica di bambini e ragazzi

di
Gilda Vischia

Se ogni viaggio è un'esplorazione della vita, che viaggio è quello di un educatore professionale a fianco di bambini e ragazzi segnati da difficoltà? Per attraversare il corso dell'età evolutiva il bambino cerca adulti significativi che si mettano a servizio del suo irrinunciabile andare incontro al futuro. Dove sta la specificità del viaggio a fianco di un «adulto altro» come un educatore, e come si integra con la diversità degli interventi di altri operatori in un contesto sanitario? Quale mappa orienta le scelte dell'educatore nel cercare la strada insieme al bambino, se ogni viaggio di crescità è una storia da costruire?

Da circa vent'anni svolgo la mia attività in un servizio sanitario pubblico territoriale di neuropsichiatria dell'infanzia e dell'adolescenza, rivolto alla fascia evolutiva compresa tra gli 0 e i 18 anni con disagio nella relazione e nell'apprendimento e problematiche comportamentali.
L' esperienza professionale –, nell'aver osservato e accompagnato lo spirito iniziatico dei bambini, dai 3 agli 11 anni, e le tappe del loro processo di crescita che, tra gli 11 e i 14 anni, si apre all'adolescenza – ha suscitato in me domande, dubbi e pensieri nei termini di una viva *interrogatio*. Credo che la brezza del desiderio di testimoniare la complessa condizione umana di chi cerca la propria strada identitaria sia scaturita dall'esperienza di legame con loro.
Attingendo da questo sentimento di gratitudine, mi sono avvicinata a questo lavoro di ripensamento, di significazione:

« In fondo quello che dobbiamo fare per apprendere è diventare esploratori, e lo scopo dell'esplorazione non è di scoprire se l'esplorazione è una buona cosa, ma di ricavarne informazioni su ciò che si esplora. (Bateson,1984) »

Volevo ripercorrere la mia mappa di viaggio e ripensare ai «naviganti», ai luoghi e alle storie incontrate.

Interrogarsi per dare senso alla relazione

Il termine educatore dà adito a una rosa di possibilità di intendimenti o a un *mare magnum* di fraintendimenti. Educare a che cosa? Sembra ancora ignoto, misterioso, l'agognato complemento. Potrebbe essere semplice: l'educatore fa educazione. Ma questo non ci definisce ancora, condizionati dal fatto che oggi numerose strutture, oratoriali e ricreative, non poche volte usano il nome «educatore» per indicare un adulto che intrattiene i bambini: un adulto intrattenitore.
In questi anni si sono fatti vari bozzetti e ritratti dell'educatore professionale, a seconda del contesto in cui opera e a seconda delle trasformazioni avvenute nel panorama sociale o sanitario.
A volte, per «comodità», l'identificazione dell'educatore professionale è collocata dentro un ruolo pensato nel *binomio educatore-attività*, cosicché l'azione educativa viene fatta corrispondere a un elenco, una declinazione di «cose da fare». Il contenuto dei progetti educativi stilati corrisponde a un mansionario di operazioni e attività, dove la persona in crescita viene suddivisa in obiettivi ed elenchi di sotto-obiettivi a breve, medio e lungo termine, perdendo così di vista la globalità della persona e il suo tragitto personale di crescita. Fotocopie dell'essere umano, di cui si pietrificano aspirazione e desiderio. Di un ideale di essere umano.
Ma è davvero questo il senso del lavoro educativo? Stilare una cronaca di azioni? Sembra già tutto previsto dall'adulto, come in una biografia già tracciata.

Distinguere dove porta la corrente

La risposta delle istituzioni sanitarie e sociali, di fronte alla complessità di questa funzione educativa, si è orientata allo sforzo, a volte, di annacquarla, altre di demonizzarla, altre ancora di caricaturarla: l'educatore è quello che «bada all'altro» andando a domicilio, quello che fa fare i lavoretti, quello che accompagna sul territorio, che aiuta a fare i compiti e così via, con l'assegnazione di un ruolo di custodia. L'educatore ha avuto in alcuni casi e in alcuni ambiti le vicissitudini istituzionali dello «straniero» da integra-

re, con la sua cultura sconosciuta e quindi sospetta. In altre esperienze lavorative, l'educatore è stato inteso come un tuttologo dell'inventiva e del divertimento.
Queste sono alcune delle «onde emotive» che fremono nel viaggio educativo e che accomunano gli educatori. Non è sufficiente ripetere che educare è una questione complessa, possiamo dire invece che è complessa perché fa sviluppare intorno una complessità di movimenti, fantasie, aspettative, ideali, realtà, luoghi comuni, stereotipi. Onde in superficie che hanno in realtà correnti e mulinelli sotterranei, meno visibili ma più profondi, che fanno parte della vita professionale. In fondo, la profondità di una professione è data dallo spessore che le si evidenzia intorno.
La pluralità di queste domande ci sta aiutando sempre più a mettere a fuoco che il lavoro di definire e distinguere per individuarci è veramente un lavoro impegnativo. Sembra che le rappresentazioni mentali che ruotano intorno all'educatore, a volte, siano rimaste cristallizzate e abbiano influenzato le possibilità di un cambiamento reale. L'ambivalenza che ne deriva in alcuni casi non è rimasta solo a livello di rappresentazione mentale, ma ricade anche sulla realtà operativa della professione.
Se un educatore cammina sul filo delle rappresentazioni istituzionali e assume nel suo operato una posizione di ambivalenza, rischia di non avere un suo spazio interno chiaro, disponibile ad accogliere i movimenti evolutivi reali del bambino, costitutivi per la sua crescita. Il costante «mandato» del far fare attività, legato all'educatore, ci muove una domanda fondamentale che proviamo a esplorare: *come si pone l'educatore nella relazione con il bambino*? Cosa ne fa delle comunicazioni del bambino? Cosa ne fa dell'inattività del bambino, della iperattività? Che tipo di modello gli offre?

Il farsi soggetto di ogni bambino

Penso che l'educatore possa mettersi in contatto con le comunicazioni del bambino solamente quando riesce a tenere *distinte dentro di sé le sue emozioni e le emozioni del bambino*.
Il continuo lavoro di distinguere è quello che aiuta a differenziare via via l'adulto dal bambino, il bambino dall'adulto e a mantenere la relazione di legame. Legame che si specifica e si definisce nella sua vicinanza e distanza e nella sua temperatura.
Il lavoro educativo è fatto da questa capacità di entrare nel livello della comunicazione del bambino e uscire, cioè *identificarsi* per aiutare il bambino a cercare e a trovare i suoi spazi di definizione e *disidentificarsi* per mantenere un pensiero sulla relazione.
Viene rovesciata la prospettiva dell'intervento educativo: il bambino, in quest'ottica, non sarà «oggetto» destinatario di esperienze ludiche pensate e proposte dall'adulto, ma sarà il *soggetto autore di esperienze e pensieri*. Il bambino non sarà «a servizio» di atelier o laboratori strutturati, ma sarà l'*adulto «a servizio» della relazione* come esperienza: di come il bambino si separa e si ricongiunge con gli adulti, di come il bambino si mette in relazione con gli oggetti, del suo rapporto con il gioco, di come esprime i suoi moti d'animo, emozioni e sentimenti, di come si mette in relazione con l'adulto, di come utilizza il suo linguaggio espressivo, quale canale sceglie per investire le sue rappresentazioni, il corpo, il disegno, la parola, se interagisce con il gruppo dei pari.
I «materiali» educativi, gli «strumenti operativi», individuabili in questa nostra ricerca, sono quindi da rintracciare nelle dimensioni relazionali che si mettono «in gioco» e nei pensieri che via via vengono fuori e si costruiscono nel farsi della relazione.

È interessante notare come oggi spuntino tante figure professionali che si occupano di relazione. Come se la relazione fosse il male oscuro che ci preoccupa e ci fa sentire inadeguati, impreparati, incapaci e allora culturalmente *ci «togliamo fuori» dalla relazione continuando a delegare esperti.* Abbiamo comunque capito che la relazione è un bene su cui dobbiamo investire. E la relazione è qualcosa che sta in mezzo fra il bambino e l'adulto.

Per comprendere ci vuole risonanza

Allora, riprendendo il compito che ci siamo dati, possiamo delineare un adulto che vada verso una dimensione dell'*ascolto*. Un educatore che sia capace di mettere in sordina lo strumento verbale a vantaggio, per esempio, di modalità espressive corporee dei bambini. Non un educatore quindi che suggerisca norme di condotta o anticipi soluzioni per correggere il disagio o appianare la difficoltà, ma un educatore empatico che si metta in contatto con la sua capacità di *risonanza* e la utilizzi per comprendere cosa sta avvenendo, all'interno della comunicazione, attraverso la manifestazione della difficoltà del bambino. Un educatore, potremmo dire, che abbia il compito di accordare le corde dello strumento-relazione attraverso un'attitudine all'ascolto.
La scommessa e la complessità del lavoro dell'educatore professionale consistono in un delicato e paziente lavoro di tenere distinti e insieme i diversi livelli che si mettono in moto in una professione d'aiuto, il livello personale e il livello professionale che vengono messi «in gioco» nella dimensione relazionale.
In questo affascinante e complesso mestiere la cosa fondamentale è tenere viva *la disposizione ad andare incontro* all'Altro. Principio fondante delle professioni d'aiuto. Essere interessati all'Altro quindi, investendolo di un'aspettativa a ritrovare il suo corso d'acqua. Che c'è, sempre. Magari da sgelare o da far emergere, come un fiume carsico.
Costruire la competenza relazionale dell'educatore professionale significa essere disponibili a guardare dentro i livelli della relazione per ri-generarsi in atti di chiarezza, per scrollarsi di dosso quelle pigrizie e quegli indugi mentali che arrugginiscono i pensieri, rendendoli a volte anacronistici. Attraverso questi atti di riformulazione si rispetta il flusso di nuove forme di identità e si accolgono i cambiamenti e le metamorfosi che si generano dal di dentro della relazione, inaspettate e insospettate, cioè nuove: «Sono complessi i processi mentali che si devono compiere perché l'osservare diventi fonte di apprendimento» (Bick, 1964).
Dato lo strapazzamento e l'abuso della parola «educare», nell'intento di dar fede alla sua complessità, teniamo come punto di partenza la sua etimologia, che vuole dire «tirar fuori».

L'attesa è l'incipit di un pensiero fecondo

Nel corso della mia esperienza mi sono trovata più volte a chiedermi quale fosse, quale potesse essere, quale avrebbe dovuto essere, quale sarebbe diventato l'*ob-jectum* da tirar fuori.
Tradurlo, nel suo obiettivo e nella sua possibilità di dinamica, mi faceva pensare a un contenitore e a un contenuto, a una persona accolta e a una che accoglie. Istituzionalmente, a qualcuno che arriva da fuori e a qualcuno che aspetta dentro. A due. Metaforicamente, a un ambiente e a una materia. Una materia e una forma in un flusso continuo, in una vicendevole influenza costitutiva. Diceva Michelangelo che nella

pietra è già inscritta la forma. Rispettare la vena della pietra, nella relazione di cura, significa *respectare* nel senso pieno etimologico: volgersi a guardare il volto dell'Altro. Il maieuta falegname Geppetto non ha forse «tirato fuori» dalla materia del legno suo figlio Pinocchio? Non è questo il senso di dare alla luce? Non è questa l'azione del tirar fuori quando Geppetto scolpisce i sensi a Pinocchio? Geppetto *fa* Pinocchio partendo dall'ascolto della voce-sonorità del legno. È nell'accogliere quello stupore, quei picchiettii sonori, nel registrarlo dentro di sé, nel tenerlo in considerazione, nel tendere l'orecchio a dove proviene quella voce, nell'interrogarsi sul *chi è* che parla.; è dentro questo sussulto, questo stupore, questo sentimento di incredulità e di meraviglia, di sorpresa e di attesa, l'*incipit* di un pensiero educativo fecondo.
Poi, in un tempo successivo a questo, Geppetto comincia a osservare la materia legno da vicino. Solamente dentro queste premesse ha inizio l'*atto creativo* di intaglio della gemma educativa a lasciare che l'altro sia con la venatura del suo legno.
Ecco che allora l'*attesa* assume un valore, un senso. Non è forse l'azione educativa un'attesa? Qui si sustanzia la funzione educativa.

Riconoscere i movimenti trasformativi

Attualmente circola una cultura «educativa» che inseguendo *performances* è impegnata a sottolineare continue mancanze, a vedere il mezzo bicchiere vuoto, e trascura la consapevolezza di che cosa abbiamo e delle tappe di cammino che abbiamo percorso. Come osserva Donata Fabbri:

> « Forse non si è ancora a sufficienza capito che la complessità non è un qualcosa di così inoffensivo e tranquillo come altre teorie scientifiche, non si è ancora capito che la complessità tocca quello che c'è di più profondo o doloroso in noi: il nostro modo di ragionare e di conoscere. (Fabbri, 1990, p. 29) »

La collocazione degli educatori professionali nel comparto terapisti della riabilitazione, quali psicomotricisti, logopedisti, fisioterapisti, ha costituito un'altra tappa di messa a fuoco del ruolo educativo. Nei cambiamenti legislativi c'è dentro anche quello che ci si aspetta da un ruolo. Siamo invitati a fare un altro atto di de-costruzione per cercare di vedere, con l'aggiunta del compito riabilitativo, i pezzi di cui è fatto questo puzzle professionale.
Lo suggerisce la definizione stessa dell'azione di ri-abilitare, rendere abile, che potremmo decodificare orientativamente come *rendere capace*. Capacità è anche l'unità di misura di un liquido. Liquido pensato quindi dentro a qualcosa che contenga, dentro un contenitore. Contenitore che ha una forma propria. Liquido, quindi, che ha una misura. Aldo Carotenuto, nel libro *Le rose nella mangiatoia*, si chiede:

> « Cosa significa raccogliere acqua in un'ampolla? Raccoglierla in un'ampolla significa delimitare l'illimitato, dare forma a ciò che non ne ha, plasmare in una forma. La differenza tra l'uomo e l'animale risiede nel fatto che solo per il primo lo sforzo evolutivo è consistito nell'ordinare il mondo, nel dargli una forma. (Carotenuto, 1990, pp. 142-143) »

Capacità di avere una forma significa definirsi: non una forma costretta e imposta da condizionamenti, ma che prende corpo e si sviluppa nelle trasformazioni che si generano nel processo di cura. Processo che, teniamolo bene in mente, ha quindi una sua dinamica, ha un dentro e un fuori, parti visibili e forze invisibili, qualcosa di chiaro e qualcosa di misterioso, qualcosa che capiamo e qualcosa che si nasconde, qualcosa che vediamo e qualcosa che sentiamo. Può

aiutarci il linguaggio del cinema: c'è uno spazio inquadrato e c'è un fuori campo che dialogano con lo spettatore. Questi movimenti dialoganti del dentro e del fuori, nel processo di cura, sono la sua dinamica.

La fiducia per non perdere la rotta

La meta del compito educativo, da segnare sulla mappa del viaggio di cura, è quella di essere d'aiuto alla persona a trovare la propria capacità, l'unità di misura. La propria definizione-limite, che ne è anche il proprio contenuto. Il ruolo professionale educativo, in questo ambito istituzionale sanitario, è un ruolo di *accompagnamento all'evoluzione* dell'identità. Ribattezzare con se stessi questo patto educativo ci aiuta ad andare alla fonte del nostro compito professionale, per riattingervi una forza di consapevolezza che è il senso più vero e faticoso, doloroso e gioioso nell'esperienza del viaggiare con la storia degli altri.

Credo, con convinzione, che il sentimento che accompagna e caratterizza questa specifica professione d'aiuto sia, prendendo a prestito il titolo di un libro, *navigare l'incertezza* per farcene qualcosa. Non c'è una procedura delineata, il conforto di uno spartito musicale da seguire o di una ricetta. Il testo sacro, viene da dire, è la persona che incontreremo con la verità della sua storia, lo spartito sono le emozioni che, come le onde del mare, si muoveranno durante il viaggio della relazione educativa. Incontreremo sentimenti di sconcerto, di spiazzamento, ci sentiremo destabilizzati, inquieti, ma siamo chiamati a navigare tenendo il timone della barca, non perdendo di vista la rotta, e avendo cura dei passeggeri naviganti. Non ci è dato di sapere se l'imprevisto sarà una tempesta o una bonaccia di vento. Non si può sapere, *a priori*, la variabilità delle condizioni del mare durante l'intero viaggio. Non si sa quante volte dovremo buttare l'ancora e ormeggiare la barca. E aspettare, tremanti dell'incognita anche, ma fiduciosi.

Sappiamo che dentro a ogni persona esiste un bambino autentico e lì dobbiamo *curare* l'orientamento del nostro intervento educativo affinché diventi per ciascuno «evento educativo» di avveramento. In ciascuno di noi, bambino e adulto, esistono dei *luoghi* da cercare per ascoltarli e farli parlare, per poter comunicare e poterci capire.

« Ciò che abbellisce il deserto, disse il piccolo principe, è che nasconde un pozzo in qualche luogo... (Saint-Exupéry, 1987, p. 104) »

Questa fiducia di base è il *sapere* della premessa educativa dell'educatore professionale.

Il legame spazio dell'autonomia

Il paradigma del lavoro educativo è la competenza relazionale costituita dall'ascolto empatico, dalla capacità di distinguere, dalla capacità di attesa, dalla consapevo-

lezza e dall'assunzione dell'incertezza.
Costruire la competenza relazionale del lavoro educativo vuol dire aprire la prospettiva di una professione maieutica. L'identità dell'educatore poggia sulla competenza relazionale. Una relazione che *educe*, cioè «tira fuori» tracce, segni, forme, disegni, significati, punti di approdo, paesaggi mentali. Una relazione che riconosce le intenzioni, cioè le «tensioni verso» la coscienza del rappresentarsi dentro le differenze necessarie per individuarsi, cioè per riconoscersi come individui: io, io con l'altro, l'altro e non io, io e non l'altro, noi, l'altro, lui. Una relazione che accompagna i passaggi evolutivi della dipendenza, indipendenza e interdipendenza, volti a differenziarsi per individuarsi.
Dentro l'istituzione sanitaria il ruolo pensato come «specifico» per far raggiungere l'autonomia e la socializzazione del bambino è il ruolo dell'educatore. Se l'autonomia è qualcosa da raggiungere, è necessario pensare a un luogo di partenza da cui uscire, da cui muoversi, da cui partire. Il primo pensiero che ho incontrato in questi anni è stato questo *pensiero-scoglio*. Scoglio che può essere un luogo di partenza, di arrivo, di sosta o di salvataggio, a seconda del punto in cui il bambino si trova nella sua traversata.
Se l'autonomia è luogo di approdo, è impensabile non figurarsi un «da dove vengo?». Ecco, in questi anni mi è stato necessario accompagnare i bambini a cercare quel luogo di partenza, a vedere se c'era, se c'era stato, se c'era ancora, se rimaneva una traccia consapevole. Ancora un luogo di legame: l'attaccamento.
È in questa fase che l'educatore si può trovare *fra due sponde*: da una parte il bisogno del bambino, dall'altra il mandato di autonomia e socializzazione di cui, pur prescritto come punto di arrivo, non si scorge nemmeno l'orizzonte. Ci si può sentire come impigliati dentro una rete di bisogni: del bambino, dell'istituzione e del ruolo educativo. Come se la sopravvivenza di un bisogno dovesse farne morire un altro. Ci si sente dibattuti, come un pesce fuor d'acqua.
Qui si gioca la responsabilità dell'azione educativa che ha la funzione di *fare da ponte* tra, possiamo dire, il mandato istituzionale assegnato e il bisogno emotivo espresso dal bambino in quel momento. È necessario, quindi, porci domande sul bambino e sull'adulto: su quale bambino abbiamo in mente (che sia) e su quale adulto abbiamo in mente (di essere).
Una relazione è educativa e d'aiuto quando è portatrice consapevolmente della possibilità trasformativa ed espressiva del bambino in crescita, la accompagna, la sostiene e la riconosce.

Il rispetto per l'andatura del bambino

Per essere d'aiuto al bambino è necessario anche saper tenere emotivamente nella relazione: si profila un educatore che affina la capacità di *sopportare i momenti di confusione*, di sostare nei momenti di vuoto e nelle apparenti incrostazioni delle non ispirazioni, di accogliere gli intagli delle contraddizioni, le lacerazioni dei «non so», del patire i tempi morti, le densità dei silenzi come nebbie padane, la comparsa dei punti di luce, gli andirivieni delle incertezze, di cavalcare «il peregrino dubbio», di indossare le rabbie della solitudine, il timore del bello. La relazione educativa è fatta da tutti questi traghettamenti reali e interiori, tra esitazione e trepidazione, tra struggimento e felicità.
Orientarci a questo livello di riflessione aiuta a trasformare i luoghi comuni in

luoghi di senso per ridefinire la tappa di percorso evolutivo del bambino e specificare il progetto educativo, discutendolo e confrontandolo, passo dopo passo, con gli operatori coinvolti. È necessario *rispettare l'andatura del bambino* per evitare il rischio di uno scollamento fra quello che hanno in mente gli adulti e quello che sta già facendo il bambino.
Mi viene alla mente, per esempio, tutto il lavoro che fa il bambino nella fase iniziale di messa alla prova della relazione, quando è impegnato a «studiare» l'adulto, la sua affidabilità e capacità di tenuta: il bambino a volte esce ripetutamente dalla stanza, abbandonando l'adulto per andare a rifornirsi affettivamente della presenza del genitore o accompagnatore; spesso chiede di portare a casa un oggetto per sé, chiede che il suo gioco rimanga intatto e custodito per la volta seguente.
All'insegna di queste comunicazioni del bambino, l'educatore ha una funzione precisa da svolgere: creare *una base sicura* all'interno di un sentimento di continuità relazionale. Un lavoro educativo che legga costantemente i bisogni emotivi del bambino e che attraversi, simbolicamente, le prove della storia del «lupo e i tre porcellini», per sentire se la relazione tiene. E la relazione *tiene* solo dopo che si sono create queste condizioni di base: di stabilità e di sicurezza e un ambiente di fiducia di cui il bambino fa esperienza e in cui si sperimenta.

Nuovi significati verso nuove rappresentazioni

Ci sono delle *tappe da percorrere* prima di arrivare all'autonomia e perché questa autonomia sia un pensiero su di sé che parta realmente dal bambino: sono le tappe costitutive del processo di crescita del bambino.
La funzione educativa nella relazione con il bambino si sostanzia, inoltre, nel prendere in considerazione il gesto stereotipato del bambino per muoverlo alla rappresentazione.
Come *guardare con uno sguardo nuovo* la rappresentazione del bambino?
Per fare l'esperienza di questo sguardo «in movimento» è necessario ascoltare, con un orecchio interiore, il riverbero emotivo che il bambino ci com-muove. Questo riverbero diventa spazio di immagini, di significati che inaspettatamente emergono e si affacciano nella relazione. E la nutrono e la fanno vivere, la fanno esistere. Questo *spazio di significati* è il punto vitale della relazione educativa: il nodo d'innesto.
Possiamo pensare, per esempio, al momento in cui spontaneamente un oggetto di un gioco ricorrente, un segno grafico reiterato, una parola ripetuta, una mimica ostinata, muove una suscitazione o un'associazione inaspettata e insospettata, nuova. Come se quel «solito», quello «stesso» oggetto o segno o parola o silenzio o mimica si sganciano, si liberano dalla capsula, dal giogo di un significato, e ricevono la luce di uno sguardo nuovo che fa gemmare un'intuizione e risplendere un altro significato di senso: *un senso trovato*.
Di frequente, se si pensa all'esperienza educativa, si presentano momenti o incontri che paiono infiniti, dentro a un noto e conosciuto, come imprigionati in un fermo immagine, come se «nel gesto in cui ciascuna fu sorpresa, in quello restò fissata», come disse il poeta Ovidio.
Momenti che sembrano risentire di un *significato-incantesimo*, dove il tempo, il bambino e l'adulto paiono cristallizzati.
A questo punto, dobbiamo essere prudenti perché a volte i nostri stereotipi, i nostri sguardi spenti o stanchi, le nostre paure, le nostre difese ottuse, le nostre emozioni

congelate, ci impediscono di cogliere i movimenti insiti nella relazione o, semplicemente, di leggere il fermo immagine. Può esserci d'aiuto Eugenio Montale quando scrive:

> « Non domandarci la formula che mondi possa aprirti, sì qualche storta sillaba e secca come un ramo. Codesto solo oggi possiamo dirti, ciò che *non* siamo, ciò che *non* vogliamo. »

È proprio a *questo punto* che, per tacitare questi turbamenti, a volte spuntano le parole-targhette come palette di un vigile ammonitore: aggressivo, reattivo, ipercinetico, non collaborante e via di questo passo. Oppure è a *questo punto* che entriamo in contatto con questo spazio congelato in attesa che si sgeli. Come suggeriscono alcuni autori:

> « Questo spazio impone capacità di manutenzione e di salvaguardia e in cambio ci dà informazioni e testimonianze che nessuno strumentario scolastico di osservazione sistematica e di valutazione oggettiva potrà fornire. Gli elementi che permetterà di incontrare non potranno essere esportati se non dopo essere stati interrogati, compresi. (Cerioli, Antonietti, 1995, p. 96) »

È accompagnando questo tempo di «sgelamento» che potremo rinvenire il bambino: la funzione dell'intervento educativo a volte è nel riconoscere semplicemente che «per il momento è così», lasciando aperta però la possibilità di un cambiamento.
Per accompagnare i passaggi di crescita del bambino è necessario anche all'educatore osservarsi nei suoi cambiamenti, svilupparsi, crescere perché in una relazione educativa avviene una *trasformazione per entrambi*: il bambino e l'adulto. Questo paziente lavoro mentale di «ri-costruzione» va nel senso di far uscire una forma di rappresentazione condivisa e utile, affinché il bambino possa sapere dove mettersi e si possa «ritrovare». Tenere presenti e insieme questi piani differenti ci aiuta a vedere la complessità e la ricchezza di cui «è fatto» un bambino impegnato nell'impresa di crescere.

Un gruppo per pensare la progettualità

È necessario pensare al *contesto* in cui è inserito l'intervento educativo. Se l'istituzione sanitaria ha previsto l'inserimento dell'educatore nell'organico, ci sta in fondo dicendo che la strada della tutela della salute mentale deve integrare la via medico-clinica e la via educativa per andare verso la storia del bambino e comprenderla, per un progetto di cura pensato in funzione del suo processo di crescita.
La responsabilità dell'azione educativa non si esaurisce nel rapporto con il bambino, ma riguarda anche i «momenti di scalo» tra gli operatori coinvolti, per tenere a mente una rotta di navigazione che non perda di vista il bambino intero. Interagendo e confrontando in una dimensione dialettica e di reciprocità le differenze operative, si coltiva, all'interno dell'istituzione sanitaria, una cultura reale della diversità come risorsa, della differenza come occasione di arricchimento, come espressione della unicità e della molteplicità.
È auspicabile un gruppo di lavoro che si assuma la funzione di pensare ed elaborare. Quando il gruppo di lavoro, come quello a cui qui si fa riferimento, è composto da ruoli eterogenei, ha da tenere insieme più linguaggi: quello medico-clinico, quello educativo, quello tecnico-riabilitativo. Il lavoro di pensare, nella pratica operativa, si trasforma in un lavoro di «tenere nella mente» e di apprendere la differenza che fa la ricchezza e la ricchezza che fa la differenza. Sarà una responsabilità democratica, individuale e collegiale, nei confronti del gruppo operativo, fondata sul dialogo,

sull'ascolto e sulla pazienza per «fare una mente» intorno al progetto di cura. Una responsabilità non fondata sulle contrapposizioni, rigidità e atteggiamenti di potere e di disparità, ma che si mette in gioco in una relazione dinamica flessibile e trasformativa, che può crescere.

I bambini ci raccontano storie di vita

Uno strumento basilare nel lavoro educativo è *il lavoro di scrittura*: una trascrizione come atto di ripensamento, di rimessa a fuoco e di progettualità. Dov'è finito il taccuino delle annotazioni, fedele compagno di viaggio degli artisti di un tempo, di scrittori o poeti dell'anima? Chi parlerà più della biografia dei processi educativi?
Il lavoro educativo è, abbiamo visto, qualcosa che si costruisce nel tempo. Non avvalendoci di protocolli scientifici che ricavano un dato numerico tecnico espresso in percentuale, a servizio del processo personale svolto e compiuto dal bambino, sembra una fatica di Ercole individuare uno strumento riconosciuto a *misurare* quantificamente, quindi visibilmente, l'intervento educativo in ambito sanitario.
Scrivere ci consente di convertire l'esperienza vissuta in una forma di rappresentazione perché ci permette di de-scrivere le sequenze del processo di costruzione del bambino. Attraverso questo delicato lavoro di montaggio dei movimenti, delle scoperte, delle soste, degli andirivieni, degli spostamenti, dei paesaggi mentali del bambino, documentiamo la sua evoluzione e gli restituiamo la sua storia. In quest'ottica, il ruolo educativo circostanzia, attraverso il mezzo della scrittura, la sua funzione di costruire e restituire senso. Quindi una narrazione che utilizza un linguaggio che non assolutizzi il bambino, ma accompagni le sue immagini, le sue parole-frasi, i disordini, la confusione e la chiarezza, le difficoltà e le conquiste, che avvalori l'impresa del bambino che smonta e rimonta, disfa e costruisce. L'utilizzo della metafora, che fa lavorare insieme due mondi vicini e accosta campi di conoscenze, può essere nel nostro lavoro una risorsa per far nascere qualcosa che possiamo vedere figurativamente e per aiutarci a comunicare e condividere il processo del bambino.
Una narrazione, possiamo dire, che sostenga lo sforzo conoscitivo del bambino e rispetti il suo personale e autentico processo di crescita. In questa nostra riflessione *la metafora del navigare* è stata d'aiuto per cercare di individuare e non perdere «ancoraggi» possibili.
Il nostro viaggio ha esplorato la mappa della relazione che «si fa» ambiente educativo accompagnando le possibilità evolutive del bambino che «gioca» con i suoi pensieri, che si trasformano in punti di vista, idee, concetti e valori per crescere e comunicare.

punto 7 casorati

« Non ho mai capito la differenza tra un quadro astratto e uno figurativo.
Per me la pittura è sempre la stessa e quando guardo un quadro di un artista o dipingo una tela quello che conta sono la composizione delle immagini, i rapporti dei colori fra di loro, l'idea pittorica nel suo insieme e guardare il quadro da molto vicino per godermi l'andamento delle pennellate.
E se qualcuno mi domandasse perché io non faccia allora della pittura astratta, gli risponderei che forse non ne sarei capace, che sento la necessità di usare delle figurazioni, che, in fin dei conti, mi piace raccontare delle cose ed usare delle immagini tratte non dalla realtà ma da antiche memorie sovrapposte e che arrivano non so come nella mia testa. »

«Case» della coesione sociale nei territori/1

Il manifesto delle Case del quartiere

Coordinamento delle Case del quartiere di Torino

SOSTE DI **DISCUSSIONE**

La coesione sociale è una costruzione collettiva nei territori, nella quale convergono l'investimento pubblico, la competenza degli operatori professionali, la disponibilità delle reti sociali che innervano i territori, l'allestimento di luoghi fisici che i cittadini vedono come simboli della vivibilità dei territori. Il «manifesto delle Case del quartiere» di Torino ci permette di aprire un confronto, al di là delle etichette, tra le molteplici sperimentazioni in Italia.

Negli ultimi anni a Torino sono stati aperti spazi comuni, laboratori sociali e culturali in cui s'incrociano attività e persone, luoghi nei quali si esprimono pensieri e vissuti collettivi, che avviano esperienze di partecipazione, coinvolgimento e auto-organizzazione, spazi che oggi hanno un nome: Case del quartiere.

Luoghi che si abitano, si vivono e si usano, che nascono da una storia di una città attiva e creativa, che ha visto già nei decenni precedenti sperimentazioni di luoghi capaci di innescare pensieri e progetti e di coinvolgere parte della cittadinanza. Alla fine degli anni Novanta, dalle proposte di politiche urbane innovative e dagli stimoli delle istituzioni europee che spingevano ad adottare approcci nuovi, nascono spazi di uso pubblico che superano le politiche settoriali e lavorano insieme ai cittadini per mettere in comunicazione centri e periferie.

La Città di Torino raccoglie questi stimoli e nel 2007 nasce, in una zona periferica della città, la prima Casa del quartiere: Cascina Roccafranca. Negli anni seguenti si sviluppano nuove esperienze in altri quartieri della città, attraverso storie e percorsi diversi ma con una base comune: spazi a uso pubblico riqualificati, grazie alla collaborazione tra istituzioni pubbliche, fondazioni bancarie, imprese sociali, associazioni e cittadini, luoghi che diventano spazi per la cittadinanza.

Da maggio 2012 la Città ha invitato i soggetti gestori delle Case a *riunirsi intorno a un tavolo* con il proposito di coordinare le attività attraverso il consolidamento di una rete per mettere in comune saperi, esperienze e progetti.

Presente e futuro in un documento-manifesto

Un primo risultato del percorso di costruzione della rete è la stesura del «Manifesto delle Case del quartiere». Un documento che raccoglie gli elementi che caratterizzano questi nuovi spazi nella città, riaffermando l'importanza di pratiche sociali e culturali consolidate, ma soprattutto evidenziando quegli aspetti d'innovazione che le rendono caratteristiche e uniche nel ricco panorama delle offerte culturali che la città offre. Un manifesto che racconta il presente e nello stesso tempo le prospettive per il futuro, un utile strumento di lavoro, che consente alle Case di confrontarsi tra loro con quel che hanno realizzato fino a oggi e di tracciare un percorso per crescere e svilupparsi in futuro.

L'idea delle Case nasce da una convinzione: le persone sono portatrici di bisogni, ma anche di competenze e disponibilità che possono essere messe a disposizione della comunità per soddisfare esigenze collettive.

Sono esigenze che nascono dalle difficoltà di vivere in modo dignitoso, da bisogni primari insoddisfatti come il lavoro e la salute, dall'essere soli nell'affrontare le difficoltà della vita quotidiana, dalla mancanza di relazioni significative, dalla necessità di dare senso e significato alla propria vita; ma anche dal desiderio di continuare a sentirsi attivi, di partecipare alla socialità del quartiere, di essere protagonisti della propria vita, di poter contare nelle decisioni che riguardano la

Comunità, di vivere uno spazio politico dove costruire soluzioni possibili e condivise.
Le Case possono contribuire a creare una coscienza collettiva che renda consapevoli le persone della propria situazione, e possa stimolarle a essere cittadini attivi, autonomi, solidali e responsabili.
Essere cittadini oggi è, infatti, uno dei modi in cui si partecipa alla cosa pubblica, una modalità nuova che si realizza non nella sfera della rappresentanza istituzionale, bensì nel fare cose concrete, nella partecipazione alla soluzione dei problemi che interrogano il singolo e la collettività, nel cercare di dare risposte non solo alle proprie necessità, ma partendo da queste per comprenderle in quelle di altri.
Questo nuovo modo di concepire il rapporto fra città e cittadini, non più fondato sul rapporto dare/avere, operatore/utente, ideatore/utilizzatore, ma sullo scambio di competenze ed esperienze, trova espressione nelle Case in cui attività e iniziative non sono solo «per» i cittadini, ma anche «con» i cittadini, che si prendono cura dei propri bisogni, integrando le risorse pubbliche con quelle di tempo, di capacità, di relazioni, di vissuti e di idee di cui sono portatori.
Veniamo dunque ai *dieci punti* del Manifesto così come sono emersi da molteplici momenti di confronto fra gli operatori.

1 | **Luoghi aperti a tutti i cittadini**

Le Case sono organizzate per accogliere, attraverso attività interculturali, tutti i cittadini dai più piccoli agli anziani, senza discriminazione di genere, nazionalità, estrazione sociale e appartenenza religiosa. Si impegnano a soddisfare esigenze differenti, con un'attenzione specifica ai diversi livelli sociali e culturali delle persone. Esse promuovono iniziative popolari, curando la qualità delle proposte e coniugando cultura con socialità. Non si rifanno a un'ideologia con riferimenti a simboli, bandiere e movimenti, ma rispettano i differenti orientamenti culturali. Si riconoscono, invece, in valori universali come la libertà di espressione, il diritto di partecipare alla vita sociale e politica, l'uguaglianza tra le persone, la giustizia sociale, lo spirito di solidarietà e il rispetto dei diritti umani.

2 | **Spazi di partecipazione attiva**

Le Case promuovono la partecipazione alla vita sociale e culturale dei quartieri attraverso differenti forme di cittadinanza attiva e di volontariato. Sono luoghi in cui si ricercano e si sperimentano nuovi modi di fare welfare, sviluppando le reti di prossimità, attraverso la ricerca pratica di soluzioni collettive a bisogni e attese comuni.
Sono spazi capaci di accogliere e sostenere: la singola persona, valorizzandone le competenze e sostenendone il mettersi in gioco; i gruppi informali che sviluppano interessi comuni, favorendone la nascita, la crescita e l'autonomia; le associazioni, i gruppi di associazioni, gli enti e le istituzioni, rafforzandone l'identità e la missione.

3 | **Luoghi accessibili e generativi di incontri**

Le Case possono contribuire a creare una coscienza collettiva che stimoli gli abitanti a essere cittadini attivi, solidali e responsabili.

Accoglienti, curate e attrattive, le Case del quartiere sono innanzitutto costruite attorno a criteri di accessibilità.
• *Economica*, anzitutto. Offrono attività gratuite e praticano prezzi popolari e contenuti.
• *Organizzativa*, poi. Sono organizzate in modo «leggero», permettono cioè un accesso libero alle strutture, un contatto diretto con gli operatori e la possibilità di ottenere informazioni in modo semplice e non burocratico.
• *Culturale*, infine. Hanno una visione aperta, non ideologicamente schierata, rispettosa dei diversi orientamenti politici democratici, delle diversità culturali e di genere.
Trattasi dunque di luoghi della quotidianità, che permettono di sentirsi a casa, in una dimensione sociale aperta, dove è possibile «stare» socializzando e dove si può «fare» partecipando alle attività o diventando i promotori di progetti e iniziative.
Nell'insieme favoriscono in modo intenzionale le relazioni fra le persone, la conoscenza, l'incontro e il confronto fra le realtà che vi operano, fra i progetti che si realizzano, e creano le condizioni per far nascere sinergie e collaborazioni.

4 | **Spazi di tutti ma sede esclusiva di nessuno**
Come una piazza, aperta e ospitale, ogni centro accoglie numerose organizzazioni dando loro uno spazio per attività e incontri, con l'attenzione che non prevalga un uso esclusivo. I locali e gli spazi sono organizzati e strutturati per rispondere alle differenti necessità degli utilizzatori, mentre le attività dei gruppi si svolgono in libertà e autonomia, contribuendo nel loro insieme alla progettualità complessiva e alla costruzione di un'identità comunitaria.

5 | **Contenitori di progettualità molteplici**
Come vivi contenitori, pensati e organizzati, le Case sono in grado di raccogliere e valorizzare un mix di attività e iniziative culturali, artistiche, sociali e ricreative, sportelli d'informazione e consulenza, corsi a pagamento, laboratori gratuiti, servizi per famiglie, spettacoli, conferenze, mostre.
Le strutture accompagnano e supportano i soggetti che intendono promuovere al loro interno progetti ed eventi, mettendo a disposizione competenze, spazi, idee e risorse perché questi possano realizzarsi in modo adeguato e soddisfacente, con un sempre maggiore livello di autonomia e auto organizzazione. Più da vicino, sono un punto di formazione e promozione artistica e culturale, poiché riconoscono nella creatività e nell'espressione artigianale uno strumento potente per generare comunità e futuro.
Le diverse realtà della rete trovano la loro forza negli elementi che le uniscono e che le diversificano come la specificità che nasce dalle singole storie, territori e persone.

6 | **Gli operatori competenti artigiani sociali**
Ogni Casa è gestita da gruppi di lavoro in grado di svolgere funzioni progettuali e organizzative, coordinati da figure di responsabilità in grado di curare la regia complessiva attivando modelli gestionali partecipati.
Gli operatori sono artigiani sociali, che agiscono e sviluppano la propria professionalità attraverso l'apprendimento che nasce dall'esperienza e dalla sua analisi, da percorsi formativi, dall'attivazione di scambi e sperimentazioni. Essi sono stimolati a sviluppare competenze in diversi ambiti: sociale, relazionale, culturale, organizzativo e amministrativo, sviluppando le capacità di accogliere, ascoltare, accompagnare e motivare i cittadini a essere protagonisti della vita socio-culturale della comunità.

7 | **Luoghi intermedi fra il pubblico e il privato**
Le Case sono il risultato di azioni di «amministrazione condivisa» per la rigenerazione di beni comuni urbani, frutto della collaborazione tra Amministrazione comunale e cittadini attivi.
In tal modo svolgono un'importante funzione pubblica, essendo luoghi privilegiati di sviluppo di cittadinanza e di costruzione di reti sociali, di cui le Amministrazioni pubbliche condividono le azioni, le linee guida e le modalità di lavoro.
Luoghi di aggregazione ma anche strumento per costruire nuovo «welfare urbano», le Case del quartiere sono spazi condivisi in cui i bisogni personali possono essere soddisfatti in modo collettivo, in cui viene dunque sollecitata la partecipazione e la relazione, dove è più che mai evidente la produttività del fare insieme.

8 | **La sostenibilità economica fa leva sull'intraprendenza**
Le Case sono progettate per tendere alla sostenibilità economica. In tale logica sviluppano competenze imprenditoriali nella gestione delle risorse, nella lotta agli sprechi, nello sviluppo di attività commerciali accessorie e funzionali al progetto, nel coinvolgimento diretto dei cittadini, promuovendo iniziative di fundraising e di contribuzione collettiva.
Non sono, però, interessate a raggiungere la completa autosostenibilità economica, che comporterebbe il rischio di cadere in logiche economiche di mercato e di snaturare la vocazione popolare e sociale del progetto. Per queste ragioni e per la funzione pubblica che esse svolgono, è indispensabile un sostegno da parte di enti pubblici e privati nel finanziare parte dei servizi che rispondono ai diritti di uguaglianza e pari opportunità.

9 | **Il radicamento e le collaborazioni territoriali**
Le Case fanno parte del territorio in cui nascono e si determinano. Sviluppano – al loro interno e con le realtà con cui s'incontrano, siano esse profit o no profit – la capacità di generare ponti, confrontare pensieri e metodi, attivare sinergie

nuove. Esse creano l'ambiente adeguato per costruire relazioni e legami sociali: privilegiano l'attivazione delle reti attraverso il fare insieme, lo sviluppo di progettualità comuni, la relazione tra le persone, i gruppi e i progetti.
Nell'ottica di allargare la propria azione a tutto il territorio, esse cercano la collaborazione con le realtà e le strutture presenti nel quartiere in una prospettiva progettuale di «casa diffusa», capace di esprimersi al di là dei propri spazi.

10 | Governance condivisa con gli attori locali

Le Case sono gestite da diversi soggetti radicati nel territorio: associazioni di primo e di secondo livello, fondazioni o cooperative, in alcuni casi frutto di un vero e proprio percorso partecipativo che ha coinvolto nella fase istitutiva numerosi attori locali.
Sono strutture organizzative in grado di contribuire alla riqualificazione del quartiere coinvolgendo le diverse realtà locali, valorizzandone il lavoro, le iniziative, la capacità di rapportarsi con i cittadini, riconoscendo tutto questo come un effettivo patrimonio spendibile per costruire in modo corresponsabile una risposta locale orientata a migliorare e sviluppare il territorio.
In definitiva, una Casa è un modello gestionale capace di apprendere dall'esperienza, di verificare costantemente la rispondenza delle varie iniziative attivate, di cogliere e analizzare bisogni e aspettative, di aggiornare continuamente il proprio progetto adattandolo alle nuove esigenze.

Le Case del quartiere, attualmente nove, coprono quasi completamente il territorio della città di Torino: *Cascina Roccafranca* a Mirafiori Nord (www.cascinaroccafranca.it), *Casa del quartiere di San Salvario* (www.casadelquartiere.it), *Bagni pubblici di via Agliè* in Barriera di Milano (https://bagnipubblici.wordpress.com), *Hub Cecchi Point* nel quartiere Aurora (www.cecchipoint.it), *Casa nel Parco* a Mirafiori Sud (www.casanelparco.it), *SpazioQuattro* a San Donato (www.piuspazioquattro.it), *Barrito* in zona Nizza Millefonti (www.barrito.to.it), *Bossoli83* nella zona Lingotto (www.bossoli83.it) e *Casa di quartiere Vallette* (http://i74010.wix.com/casadiquartiere).

Storie di recovery

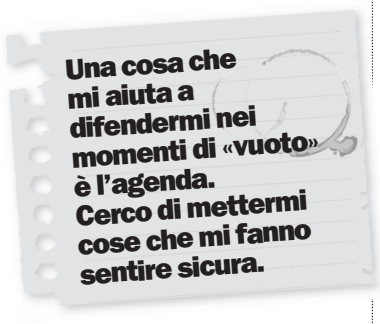
Il lungo viaggio verso la ripresa di sé

A cura di Izabel Marin

Le persone che hanno vissuto su di sé l'esperienza del disagio mentale hanno cose importanti da dire: sui propri percorsi individuali, sui momenti frammentati di malessere e di benessere, sull'esperienza acquisita attraverso la propria sofferenza. Da qui l'importanza di ascoltare le loro storie. Ne proponiamo due – quella di Silva e quella di Pietro – raccolte dopo e durante le loro esperienze di cura nei Centri di salute mentale di Trieste. Per quanto diverse, raccontano la possibilità di riconquistare la propria «salute mentale». Per un'ampia raccolta di storie si rimanda al volume *Guarire si può* (a cura di Izabel Marin e Silva Bon), nella collana «180. Archivio critico della salute mentale» dell'editore alpha beta Verlag di Merano (Bz).

Silva e l'importanza dell'agenda

Il trauma della mia vita è stata la separazione. Ho sempre dato molta importanza alla famiglia, e quindi, se fosse dipeso da me, non avrei mai rotto il matrimonio. In coincidenza con la separazione c'è stato il primo episodio di ricovero in ospedale.
Avevo incominciato ad avere un senso di insicurezza, a sentire voci, come se gli altri mi parlassero, mi guidassero. Tutto ciò è degenerato alla fine di un anno scolastico, l'anno in cui poi mi sono separata, a



settembre. Ero molto stanca per la fine del lavoro a scuola, ma soprattutto per un anno di tensione in famiglia.

Per motivi compositi e complessi in quel momento rappresentavo l'anello debole di una catena: i miei figli (uno di 14 anni, l'altro di 16) non hanno potuto scegliere di stare con me, in qualche modo sono stati ricattati e sono rimasti col padre. Ho subìto il dramma dell'abbandono della famiglia, dei figli, della casa. Ancora adesso non riesco a liberarmi da quel ricordo.
Tutta la solitudine nella quale ero piombata, pur vivendo in famiglia, ho cominciato a vincerla proprio nel momento del primo ricovero. Ho iniziato a riflettere e a parlare dei miei problemi. A ripensare al passato e a segnare mentalmente tutte le cose che avrei voluto fare in futuro per me, invece di vivere solo per gli altri.
Il periodo in cui ho cominciato a essere curata al Centro di salute mentale di Barcola (Ts) ha rappresentato un momento di ripresa. È stato un periodo molto faticoso, con un'andatura da gambero, un po' avanti e un po' indietro. Adesso ho l'impressione che anche questi momenti di crisi siano dei passaggi positivi, prima vissuti come una regressione, una sconfitta, ma dopo il recupero, alcuni giorni dopo, mi sembra che tutto sia comunque un andare avanti nel percorso di guarigione.

Mi è stato d'aiuto soprattutto il modo di parlare dei medici e degli operatori, per cui sono riuscita a capire il percorso della malattia, il senso dello stare bene e dello stare male, dell'andare a fondo. Sono stata aiutata prima di tutto a ricostruire un progetto per la mia vita. Ho ritrovato interessi intorno a cose già concretamente avviate e che durante gli ultimi anni del matrimonio avevo abbandonato.
Al Csm, oltre a una certa scansione temporale dei colloqui, più frequente rispetto a quelli che possono essere sostenuti con il medico privato, ho trovato tutto un insieme di agganci, di progetti, per esempio il «gruppo donne di Barcola», che portiamo avanti da tre anni. Il gruppo si è organizzato intorno a letture di testi che proponevamo io e un'amica, insegnante pure lei. Andavo là dopo una giornata faticosa di lavoro e mi chiedevo «ce la faccio ad andare a Barcola con l'autobus oggi pomeriggio?». Ma ogni volta ritornavo a casa molto più rilassata. Con alcune persone di questo gruppo ho costruito rapporti veri di amicizia, riuscendo a scoprire da un lato problemi simili ai miei, dall'altro possibilità diverse e nuove di farvi fronte.

Una cosa che mi aiuta a difendermi nei momenti di «vuoto» è l'importanza dell'agenda. Programmo la mia vita. Poi sono disposta anche a cambiare tutto: se c'è l'imprevisto magari tutto quello che ho programmato va a monte, però, da quando sono sola, ho raccolto tutta la mia vita nelle agende. Anno per anno sono sempre più fitte di appuntamenti e di cose da fare e che mi interessa fare. Questo mi aiuta a coprire certe assenze. Cerco di fare delle cose che mi piacciono, che mi fanno sentire sicura.
Ultimamente ho vissuto un piccolo episodio di sofferenza psichica in coincidenza con il capodanno. In questi casi, prima di stare male veramente cerco di rivolgermi a un medico, prendo delle medicine che ho a casa. Ho imparato. Quest'anno sono andata con il taxi, di mia scelta, al Servizio di diagnosi e cura, pensando molto consapevolmente che mi avrebbe aiutato. La mattina dopo sono tornata a casa e ho ripreso la vita normale. L'importante è riuscire a capire in anticipo che si ha bisogno di aiuto.

La timidezza mi condiziona moltissimo quando sto male. Fa parte di questo processo di ricostruzione impegnarsi per vincerla. Per esempio, arrossisco come una bambina e nei rapporti sociali questo inibisce anche l'interlocutore, quindi dopo mi colpevolizzo e dico: gli altri stanno male in mia compagnia. Adesso mi ascolto, mi analizzo, sono consapevole che i momenti di tensione, di imbarazzo accadono più frequentemente in concomitanza con le crisi.

Nei momenti in cui sono socialmente più debole, ho questo rossore, questo imbarazzo, magari mi viene la paura di uscire di casa. Ma se non esco il problema diventa più assillante, lo collego con la crisi e cerco di tenerlo sotto controllo. Il rossore è come un handicap, è come essere balbuziente. Quando si scatena, è più forte di me e mi fa sentire sconfitta. La mia autostima cade verticalmente. È un circolo vizioso: io mi disistimo e la paura del rossore diventa più assillante. Ora mi sembra un poco alla volta di saper controllarmi di più. Guarire per me è riuscire a vincere questa timidezza.

Leggo questo mio percorso come un cammino. Non ho raggiunto nessun traguardo, ma mi propongo, come un imperativo, la volontà di continuare a lavorare su me stessa, di migliorare. Mi piacerebbe moltissimo costruire un rapporto migliore con i miei figli, nel senso di far loro capire quel poco che io ho capito troppo tardi.

§§§

Pietro e l'addomesticamento della «cosa»

Per me è stato come combattere con una cosa che non si conosce. Non ti fa mangiare, non ti fa dormire. Stavo malissimo, non riuscivo nemmeno più a uscire di casa. Da oltre due anni avevo interrotto il lavoro, e nello stato mentale in cui mi trovavo non sentivo neppure il desiderio di tornare a lavorare. Solo l'idea di alzarmi, fare anche le più piccole cose, era diventato un ostacolo insormontabile. Per me la vita «normale» era finita. Il momento di rottura è stata la malattia di mio padre, ma forse anche prima c'era qualcosa che covava, un rapporto conflittuale con i genitori, un percorso non proprio imposto, ma mediato dalla loro volontà, per cui i figli vengono «costruiti», sono sempre un po' manipolati, e così è difficile che poi prendano la loro strada.

Il mio malessere, la mia depressione, e la malattia di mio padre erano strettamente legate, come in un circolo vizioso, perché dovevo accudirlo nelle sue esigenze primarie, in quanto invalido totale, e cercare di andare avanti con l'aiuto di mia madre. A un certo punto ho dovuto distaccarmi un po'. Distacco non vuol dire abbandono, è anche un processo interno. Sentivo che dovevo allontanarmi da mio padre, dalla pesante situazione che si presentava ventiquattr'ore al giorno. Credo sia stato questo il cambiamento più importante che ho fatto, la scelta che si è rivelata decisiva. Ho dovuto trovare un equilibrio tra la mia salute e quella di mio padre, in modo da non ricadere nel malessere. Qualche volta bisogna imparare a dire no, a guardarsi dentro. Se ritengo che qualcosa non vada bene per me, devo riuscire a dire di no, a costo di litigare. Darmi totalmente porterebbe a una ricaduta: posso dare fino a quando me la sento, poi devo pensare anche a me stesso. Ciò non significa non avere amore per i propri genitori, ma imparare a patteggiare.
Ho affittato una casa – e anche questo è stato uno sprone, un impegno da prendere con me stesso. Metterla a posto, farci dei lavori ha costituito infatti una responsabilità, un modo per non rimanere sempre bloccato con la testa al pensiero della malattia. Era uno spostamento d'attenzione, che mi ha fatto prendere un'altra strada. Ma fondamentale è stato l'aver trovato una soluzione sul lavoro.

In questo percorso il supporto del Centro di salute mentale si è rivelato determinante. Parlando col medico, infatti, abbiamo maturato insieme l'ipotesi di adottare un orario part-time, che mi avrebbe evitato una stanchezza eccessiva, cambiando al contempo sede di lavoro. Inizialmente c'era un po' di smarrimento da parte mia, ne parlavamo ma non ci potevo ancora credere. Poi, pian piano, sono cominciate ad arrivare le conferme che tutto il progetto era realizzabile.
Ho dovuto scontrarmi, però, con le opinioni degli altri. Ridurre l'orario lavorativo viene considerato un cedimento, una perdita, non solo di una parte dello stipendio. Tuttavia è un lavoro che devi fare con te stesso: devi vedere che cosa è meglio per te, perché non sempre ciò che va bene agli altri va bene anche a te.
In questo processo è stato di grande aiuto per me il sostegno del Centro di salute

Definirmi guarito no, credo sia sbagliato. Diciamo che ho imparato ad addomesticare «la cosa». Non la scaccio, ma l'accetto.

mentale. Soltanto la figura di un professionista può aiutare. I familiari non sanno cosa sia questa «cosa», non sanno come sostenerti. A volte possono addirittura creare una situazione peggiore, perché spronare può ottenere l'effetto opposto. Aiutare cercando di spronare l'altro ad andare avanti fa peggiorare, perché in quel momento ti senti sull'orlo di un burrone e uno che ti sprona è come se ti spingesse giù. E poi ognuno ha un proprio tempo per poter uscire dal malessere, se non completamente, almeno per migliorare. Ognuno a un certo punto sente uno scatto, un clic, come un interruttore che si accende. Sentirsi dire: «Dai, su che ce la fai...» non serve a niente.

Prima di rivolgermi ai servizi, per circa un anno sono andato privatamente da un dottore e anche da una psicologa. È stato forse l'anno più brutto, perché ancora non sapevo cosa fare, a chi rivolgermi. Inizialmente pensavo di avere un male fisico, non pensavo alla testa, per cui andavo a fare tutti gli esami a livello organico per vedere se c'era qualcosa che non andava: l'elettroencefalogramma, l'elettrocardiogramma, l'analisi del sangue, delle urine, tutti gli esami possibili e immaginabili. Ma risultava tutto regolare. Infine, dopo circa un anno, sono approdato al Centro di salute mentale, non ricordo bene per quale strada.

La prima sensazione non è stata negativa. Chi inizia ad affidarsi al servizio pubblico lo associa subito ai «matti», si pensa al manicomio, perché la malattia psichica è sempre vista con pregiudizio. Io ci sono andato con l'idea di voler conoscere anche quella dimensione, per vedere che aiuto potevo ricevere.

A quel punto ho potuto fare un confronto tra i colloqui con lo psicologo del Centro di salute mentale e quelli in privato. Si parla sempre di quello che è successo, ma nel privato ci sono orari precisi e quando scade il tempo ti devi alzare e andare via, anche se sei sotto pressione o se devi ancora concludere: e questo sicuramente non è una buona cosa. Uscendo ti dici: cosa ho capito oggi? Eppure devi pagare. Finisce l'ora e devi pagare.

Sono rimasto stupito invece con lo psicologo del Centro, perché mi dava la sua disponibilità, aveva pazienza, non guardava l'orologio, facevo con lui una chiacchierata, senza premura. Senti il lato umano, la calma e la disponibilità dell'altro. Non ho avuto bisogno del servizio per trovare casa, ma è stato di grande aiuto – come dicevo – per il rapporto con il lavoro. Nella mia impossibilità di gestire la situazione, i servizi sono stati un tramite, hanno fatto un po' le mie veci per poter portare avanti determinate istanze nell'ambito del lavoro: contatti, certificati medici sul mio stato di salute e poi l'avvio della procedura di domanda di part-time indicando un possibile lavoro alternativo.

Definirmi guarito no, credo sia sbagliato. Non direi mai una parola definitiva, è una cosa un po' così, di volta in volta, non si può dare una definizione esatta. Diciamo che va meglio di prima. Inizi a conoscere un po' la «cosa», a lavorare sul sintomo, sulle cose che prima ti colpivano, ti aggredivano e da cui non sapevi come difenderti. Si ripresentano situazioni che hai già conosciuto, però ora sai addomesticarle.

I sintomi si presentano comunque, non riesci a cacciarli via del tutto: l'ansia, come fattore psicosomatico, la paralisi, la perdita del tatto. I sintomi possono venire ancora a farti visita, ma li accogli, non li scacci; perché se li scacci via possono tornare con più forza, se invece li accetti dici: «Sei venuto a trovarmi? Va bene, accomodati». È una forma di maggiore controllo, cerchi di capire un po' meglio come intervenire. È terribile quando non conosci la «cosa». Però se è «addomesticata» fa male in maniera diversa, in un altro modo, è un altro tipo di sofferenza. La «cosa» ti abbatte, ti butta giù, ma impari a dire: «No, sono più forte di te, anche se ci sei io comunque vado avanti».

Il circolo No.à. nella Torino nascosta ai pellegrini

La piola social dove il pasto è a 1 euro

Roberto Camarlinghi

ANDAR PER **LOCANDE**

Quando in bici cerco il 154 di corso Regina Margherita, percorro la via che i pellegrini della Sindone non vedranno mai. Perché questo tratto di città, sulle mappe date ai turisti nei giorni di Ostensione (19 aprile-24 giugno), è segnato con una riga rossa. Come dire: «Di qui non passate».

A Porta Palazzo, nel grande ventre

Siamo a Porta Palazzo, cuore multietnico della città, da sempre il «grande ventre» che a Torino accoglie la migrazione. Un tempo dal Sud, oggi dal mondo. Qui hanno messo radici le grandi istituzioni caritatevoli della città, perché dove c'è migrazione c'è miseria. Il Cottolengo, l'Opera Giulia di Barolo, il Sermig poco distante. E i grandi santuari di devozione cittadina: Maria Ausiliatrice, dove Don Bosco iniziò le sue attività a favore dei ragazzi, la Consolata. Proprio di fronte, l'ex ospedale psichiatrico, il «manicomio delle donne» come si diceva fino agli anni '60. Un quartiere denso insomma, di storia e umanità.

Anche il Circolo *No.à. - Gioia e Rivoluzione* a suo modo prosegue una tradizione – su un versante laico e civile – di attenzione agli ultimi della città. Tentando la sfida di far convivere, in questo interno cortile dove sembra di entrare in una cartolina anni '20, le diverse anime della città. Quella emarginata, quella artistica, quella musicale. E quella che va matta per gli spaghetti alici e broccoli o per gli hamburger di fassone piemontese qui proposti a prezzi imbattibili. La sfida insomma di fare città, perché una città respira se le sue tante anime si parlano.

È la prima volta che entro in questo capannone di 300 mq che nei secoli è stato tante cose. A inizio '900 *boita* (in piemontese bottega artigiana), poi proprietà del Torino Calcio e dopo del Consolato di Birmania, quindi officina meccanica, oggi circolo Arci con cucina. Ci vengo perché ne ho sentito parlar bene. Qui si fa buon cibo, buona musica, buon teatro, e si produce socialità diffusa.

Su facebook gira un post che indica il No.à. tra le 10 migliori *piole* della città. Le piole, a Torino, sono le osterie di una volta, posti semplici, frequentati da ceti sociali molto diversi, con il pergolato (*tòpia*) e l'uva americana (*uva fròla*).

Una locanda che di giorno è mensa popolare

Proprio nella tòpia del No.à. mi siedo con Andrea Casa e Renato Piccolo, due dei soci fondatori, in una tiepida serata di primavera. E mi faccio raccontare anzitutto l'aspetto sociale del locale. Perché qui, ogni giorno, dal 15 dicembre al 30 aprile, si è dato da mangiare a 50 persone inserite nel programma Emergenza freddo del Comune di Torino.

«Nel progetto ci siamo capitati un po' per caso. All'ultimo il circolo Arci che doveva occuparsi dei pasti ha dato forfait. Così siamo subentrati noi. È un progetto impegnativo, ma che davvero ha senso. Del resto la nostra volontà è sempre stata quella di non essere solo circolo culturale e ludico-ricreativo, ma di attivarci nel sociale».

Gli orari di accoglienza sono legati agli orari dei dormitori: «Noi diamo merenda e cena. Merenda dalle 15 alle 17, cena dalle 17 alle 19. Perché alle 19 le persone devono già rientrare nei dormitori. Alle 20 apriamo il locale a tutti». Per la verità non tutte sono persone collegate ai dormitori. «Il Comune di Torino inizialmente ci ha chiesto di occuparci di 30 senza dimora, poi di aggiungere 10 persone del quartiere in difficoltà. Noi abbiamo accettato e abbiamo deciso di aprire ad altre 10, così siamo arrivati a 50».

Ma l'emergenza non finisce certo col freddo, è costante in questa zona. «Questo è un quartiere difficile, complesso.

«Offrire il pasto a un euro a disoccupati, anziani, persone in difficoltà. È un nostro vecchio sogno, una risposta alla povertà del quartiere».

Per questo terremo aperto anche nel mese di luglio e agosto, quando alcune mense comunali e private chiudono. L'obiettivo è dare da mangiare a 100 persone al giorno, stiamo attrezzando la cucina».

La vera novità, tuttavia, è in vista dopo l'estate. Offrire il pasto a un euro per disoccupati, anziani e persone in difficoltà economica. «È un nostro vecchio sogno. Il modo migliore per sostenere la popolazione qua intorno, che spesso viene a chiederci aiuto. Stiamo provando a realizzarlo grazie al sostegno del Banco alimentare, della Coop e di altri supermercati che ci danno i prodotti e con il finanziamento delle Fondazioni e del Comune. Un'ora fa abbiamo saputo che la Chiesa Valdese ha considerato questo progetto come destinatario dei fondi dell'8 x 1000».

Dialogo e fermezza con gli spacciatori

Sui muri sono scritte le due parole chiave del circolo. Gioia e rivoluzione. Chiediamo che senso abbiano oggi. «Noi siamo non violenti nel dna. Ci rifacciamo ai valori del nuovo umanesimo. *Gioia* è cercare di avere lo spirito positivo nonostante le difficoltà. *Rivoluzione* è trasmettere nel quotidiano modelli diversi di comportamento. Quando siamo arrivati qua, avevamo gli spacciatori di fronte. La popolazione ci diceva "siete pazzi, non cambierete mai nulla, sono 20 anni che proviamo a mandarli via". Dopo un anno sono venuti a dirci "vi chiediamo scusa, siete stati bravi"».

Cos'è cambiato? «La differenza l'ha fatta il nostro modo di comunicare. Siamo sempre intervenuti cercando il dialogo, pur mantenendo la fermezza nei principi. Poi è chiaro, questi sono spacciatori, mettersi in conflitto con noi non fa comodo a loro. Perché noi da subito abbiamo chiamato i carabinieri, però non li chiamavamo chiusi nel locale, siamo sempre usciti a dirglielo in faccia: "Ragazzi, o la smettete o dobbiamo chiamare le forze dell'ordine". Loro a volte facevano gli spavaldi: "Ma figurati, dai fallo". E noi per 2-3 volte l'abbiamo fatto davanti a loro».

«Siamo in una zona molto difficile. Molti si lamentano, ma questa è anche una zona piena di odori, di colori, di cultura, è bello star qua. Sei a Porta Palazzo, il mercato aperto più grande d'Europa, un'esperienza unica sul piano delle sensazioni e degli incontri. Sì ci sono aspetti negativi, ma dove non li trovi? Certo, per il circolo questa cosa non paga, "Io in quella zona non ci vengo perché è pericoloso", ci dicono alcuni. Hai voglia a dire "Guarda che io sono tre anni che esco alle 3 di notte in bicicletta, a volte con l'incasso addosso, e non mi è mai successo niente". Mai. Tutti i giorni in tre anni. In bici poi, neanche in macchina riparato dall'abitacolo».

Una programmazione aperta all'inatteso

Anche il No.à. si propone come spazio di incontri, di mescolanze. «Dalle 20 in poi si può venire a mangiare, a bere, ad ascoltare musica. Alle 21.30 di solito inizia una serata a tema. Al lunedì e mercoledì c'è la scuola di comicità. Facciamo tanti spettacoli di teatro il venerdì e sabato. E poi concerti, laboratori di danza, di yoga, di autodifesa. Il martedì si è formato un gruppo di lettura. L'idea però è di non predeterminare troppo gli spazi, altrimenti fai un circolo chiuso. Abbiamo sempre detto "gli spazi teniamoceli un po' liberi, così se arriva qualcuno e ci dice di aver bisogno del circolo per due ore per fare le prove, glielo dai e ti conosci". E dagli incontri nascono le novità. Per esempio adesso stiamo collaborando a un progetto di *Contact Improvisation*, che è la danza spontanea, libera, e nell'arco di 2-3 mesi siamo arrivati a 35-40 persone».

Si potrebbe definire il circolo No.à. una sorta di «Casa del quartiere», come a Torino ne sono sorte tante (nove) in questi anni. Un presidio di socialità e un ventilatore di energie fresche. Esco dal circolo che è sera, mi guardo intorno. E questo tratto di via che i pellegrini della Sindone non vedranno mai mi appare un pezzo di Torino che merita raccontare.

Circolo Arci No.à. (nonviolenza attiva) - Gioia e Rivoluzione - corso Regina Margherita 154 - Torino - infoarcinoa@gmail.com

ESPERIENZE SFAVOREVOLI INFANTILI
LE PREMESSE TEORICHE

1. La violenza all'infanzia[1]

L'Organizzazione Mondiale della Sanità ha presentato a Bruxelles il 3 ottobre 2002 il Primo Rapporto Mondiale su Violenza e Salute, che ha dato avvio alla Campagna globale per la prevenzione della violenza. Il principio base di questa iniziativa, che si profila come innovativa e importante quanto la Convenzione ONU sui diritti del fanciullo, è che *la violenza è un primario problema di salute pubblica nel mondo intero e che bisogna fare congrui investimenti in ogni nazione per prevenirla e curarne le conseguenze.*

Almeno 4 dei 7 capitoli di cui si compone il Rapporto[2] (Abuso e trascuratezza nell'infanzia da parte di genitori e datori di cure, Violenza sessuale, Violenza giovanile, Violenza da parte di partner intimi) attestano la centralità del problema della violenza sui minori. I principali messaggi del Rapporto, a partire dalla già citata affermazione di base, attestano che:

- in aggiunta alla morte e alla disabilità, la violenza contribuisce a una varietà di altre conseguenze sulla salute (alcool, droga, fumo, disturbi alimentari e del sonno, HIV e malattie sessualmente trasmesse)
- la violenza è prevenibile, non è un problema sociale intrattabile o una parte inevitabile della condizione umana
- la violenza è il risultato dell'interazione di fattori individuali, familiari, comunitari e strutturali
- un approccio scientifico di salute pubblica basato sulla prevenzione può contribuire a ridurre la violenza.

Colpisce innanzitutto la novità culturale costituita dalla determinazione a "dare il giusto nome alle cose", riconoscendo, in accordo con l'attuale ricerca che lo conferma ad ogni livello (sociologico, medico, psicologico), l'esistenza per gran parte dell'umanità di condizioni gravemente turbative del benessere e dei processi di sviluppo, non dovute a fatalità, ma a processi di trauma e vittimizzazione, tanto più pericolosi quanto più l'insidia risiede nelle relazioni, come quelle familiari, naturalmente preposte a dare benessere.

Come rileva lo stesso Rapporto su Violenza e Salute, esiste un'incontestabile correlazione tra culture locali dei popoli e principi di allevamento e cura dei piccoli per quanto concerne ciò che è ritenuto lecito e corretto per gli adulti che esercitano tali funzioni, e le differenze in proposito nel mondo sono certamente rilevanti; eppure c'è generale accordo trasversalmente alle culture che comportamenti di abuso nei confronti dell'infanzia non devono essere tollerati ed esiste anche una sostanziale unanimità che di abuso si tratti almeno quando si parla di pratiche disciplinari dure e di abuso sessuale.

[1] Si veda anche il sito www.centrotiama.it, sezione 'Perché TIAMA'.

[2] **RAPPORTO SU VIOLENZA E SALUTE** (WORLD HEALTH ORGANIZATION (2002) *World Report on Violence and Health*, Geneve, Switzerland)

- VIOLENZA GIOVANILE
- ABUSO E TRASCURATEZZA NELL'INFANZIA DA PARTE DI GENITORI E DATORI DI CURE
- VIOLENZA DA PARTE DI PARTNER INTIMI
- ABUSO DEGLI ANZIANI
- VIOLENZA SESSUALE
- VIOLENZA AUTODIRETTA
- VIOLENZA COLLETTIVA

Ricordiamo quindi la definizione ampia dell'Organizzazione Mondiale della Sanità, che nel 1999 dichiarava: *"Per maltrattamento all'infanzia (child abuse or maltreatment) si intendono tutte le forme di cattiva cura (ill-treatment) fisica e affettiva, di abusi sessuali, di trascuratezza o di trattamento trascurante, di sfruttamento commerciale o altre, che comportano un pregiudizio reale o potenziale per la salute del bambino, la sua sopravvivenza, il suo sviluppo o la sua dignità nel contesto di una relazione di responsabilità, di fiducia o di potere"*.

Si tratta di una definizione che ha il vantaggio di superare i problemi relativi sia alla intenzionalità o meno dei comportamenti commissivi od omissivi sia circa le cause o le conseguenze delle azioni e che, inoltre, non esclude forme di violenza che possono verificarsi in contesti anche extrafamiliari. E' tuttavia fuor di dubbio che la violenza e l'abuso assumono prevalentemente le caratteristiche di fenomeni intrafamiliari che come è noto restano spesso segreti e non visibili.

Con la consapevolezza che la violenza rappresenta un fenomeno composito e multiforme, le cui diverse manifestazioni non si presentano quasi mai separate o scindibili, analizziamone le principali forme: trascuratezza, maltrattamento fisico, maltrattamento psicologico e abuso sessuale.

Va posta inoltre attenzione all'emergenza di forme nuove di violenza quali la riduzione in schiavitù, la prostituzione, il coinvolgimento nella pornografia o la emarginazione derivante dalla immigrazione clandestina.

Per *trascuratezza* si intende la grave e/o persistente omissione di cure nei confronti del bambino o gli insuccessi in alcune importanti aree dell'allevamento che hanno come conseguenza un danno significativo per la salute o per lo sviluppo e/o un ritardo della crescita in assenza di cause organiche. L'estremo della trascuratezza è l'abbandono (morale e/o materiale).

Per *maltrattamento fisico*, si intende la presenza di un danno fisico dovuto ad aggressioni fisiche, maltrattamenti, punizioni corporali o gravi attentati all'integrità fisica e alla vita[3].

Per *maltrattamento psicologico*, si intende una relazione emotiva caratterizzata da ripetut**e** e continu**e** pressioni psicologiche, ricatti affettivi, indifferenza, rifiuto, denigrazione e svalutazioni che danneggiano o inibiscono lo sviluppo di competenze cognitivo-emotive fondamentali quali l'intelligenza, l'attenzione, la percezione, la memoria.

Per *abuso sessuale*, si intende il coinvolgimento di un minore in atti sessuali, con o senza contatto fisico, a cui non può liberamente consentire in ragione dell'età e della preminenza dell'abusante, lo sfruttamento sessuale di un bambino o adolescente, la prostituzione infantile e la pornografia.

Negli anni '90 un autore americano, Felitti[4], e il suo staff di ricerca, hanno opportunamente introdotto nel complesso dibattito su maltrattamenti e abusi nell'infanzia la nozione di *Esperienze Sfavorevoli Infantili* (ESI) per indicare quell'insieme di situazioni vissute nell'infanzia che incidono significativamente sui processi di attaccamento e che si possono definire come 'incidenti di percorso' negativi più o meno cronici rispetto all'ideale percorso evolutivo sia sul piano personale che relazionale. Esse comprendono tutte le forme di abuso all'infanzia subito in forma diretta, come abuso sessuale, maltrattamento psicologico, fisico, trascuratezza; e le condizioni subite in forma indiretta che rendono l'ambito familiare impredicibile e malsicuro, come per esempio alcolismo o tossicodipendenza dei genitori, malattie psichiatriche e soprattutto violenza assistita, cioè il coinvolgimento del minore, attivo e/o passivo, in atti di violenza compiuti su figure di riferimento per lui affettivamente significative.

Nella stessa linea si pone l'attenzione recentemente sviluppata dagli studiosi nei confronti dell'*abuso* e della *trascuratezza emozionale*, che sono definiti come modi di relazione pericolosi tra il datore di cura e il bambino, anche se non implicano contatto fisico. O'Hagan[5] (1995)

---

[3] Vedi www.centrotiama.it, sezione 'Centro di documentazione', tabella UNICEF.

[4] Felitti V.J., Anda R.F., Nordernberg D., Williamson D.F., Spitz A.M., Edwards V., Koss M.P., Marks J.S. (2001) Relationship of childhood abuse and household dysfunction to many of the leading causes of death in adults. In: Franey K., Geffner R., Falconer R. (Eds) *The cost of child maltreatment: who pays? We all do*, S.Diego, CA: Family Violence and Sexual Assault Institute.

[5] O'HAGAN, K.P. (1995) Emotional and psychological abuse: problems of definition, *Child Abuse and Neglect*, 19, 4, 449-461.

distingue opportunamente tra l'abuso emozionale e il maltrattamento psicologico: se il primo, infatti comporta da parte dell'adulto una reazione emozionale stabile, ripetitiva e inappropriata all'esperienza del bambino, il secondo, nella sua forma di denigrazione verbale, critiche e svalutazioni, si configura più come risposta comportamentale e attiva. L'intenzione di nuocere al bambino è irrilevante nella definizione. Si tratta di forme di mal-trattamento che non comportano interazioni segrete, e sono quindi facilmente oggetto di osservazione; nonostante la loro diffusione e frequenza, l'abuso e la trascuratezza emozionale sono forme spesso misconosciute e sottovalutate di abuso all'infanzia. Il maggiore problema nasce dal fatto che abuso e trascuratezza emozionale avvengono, in misura gravemente dannosa per il bambino, anche se i datori di cura (quasi sempre i genitori) non sono consapevoli della pericolosità del loro comportamento. Un altro problema è costituito dal fatto che non esiste, nel campo dell'abuso emozionale, una netta soglia tra ciò che è abuso e ciò che non lo è, a differenza da altre forme di abuso all'infanzia (pensiamo al maltrattamento fisico, o all'abuso sessuale). In questi casi esiste una sorta di continuum, all'interno della relazione genitori-figli, dal "buono" al "maladattivo" al dannoso al punto da meritare la definizione di "abuso". Per contro, studi mirati alla rilevazione del pensiero comune sia nei professionisti della legge o del sociale sia nella gente comune, all'interno di una condivisa appartenenza culturale, ha dimostrato sorprendentemente che c'è alta convergenza di pareri circa quali comportamenti o quali espressioni verbali costituiscano abuso emozionale.

Glaser[6] (2002) propone di passare da definizioni che individuano specifici comportamenti dei genitori con i figli a definizioni che implicano atteggiamenti più trasversali all'intera relazione genitori-figli. L'autrice individua le seguenti aree di rischio: indisponibilità, trascuratezza, non responsività emozionale; qualificazioni negative e mistificanti del bambino; interazioni con il bambino inappropriate o incongrue rispetto alla fase evolutiva; mancato riconoscimento e mancata consapevolezza dell'individualità del bambino e dei confini psicologici; mancata promozione dell'adattamento sociale del bambino.

. L'abuso emozionale è, abbastanza comprensibilmente, quasi una costante nei casi di maltrattamento e di trascuratezza fisica; alcuni autori hanno stimato al 90% la sua compresenza nelle altre forme di abuso (Claussen, Crittenden, 1991[7]). Il dato che più preoccupa è relativo al fatto che proprio la compresenza di tale componente è predittiva dei successivi danni evolutivi che il bambino maltrattato manifesterà, ben più della gravità del mal-trattamento subìto.

2. L'esperienza traumatica

Un'attenzione globale a tutte le forme di Esperienze Sfavorevoli Infantili è anche, e soprattutto, in linea con il più moderno sviluppo delle conoscenze sul complesso delle situazioni di cattiva cura nei confronti dei bambini e sulla patogenesi delle conseguenze dannose ad esse correlate.

Ciò che le accomuna, e rende anche così poco differenziabili le loro conseguenze in termini di sintomi e comportamenti, è il fatto che producendo un danno importante nei processi di attaccamento deformano traumaticamente l'assetto della personalità, con riflessi tangibili anche a livello organico.

Gli studi neurobiologici sullo sviluppo mentale infantile dicono con sicurezza che l'esperienza dà direttamente forma alle strutture cerebrali e che (al contrario di quanto si è per lungo tempo creduto) il cibo esperienziale per la mente non è la intensa stimolazione sensoria, ma l'esistenza di legami in cui, nella comunicazione collaborativa, si sviluppi la sintonizzazione tra la mente del bambino e quella del genitore (Siegel, 1999[8]; Siegel, in press[9]) e la mente impari le basi e i metodi

[9] SIEGEL, D.J. (in press) An interpersonal neurobiology of psychotherapy: the developing mind and the resolution of trauma.

dell'auto promozione e dell'auto organizzazione. Se proprio i legami sono invece fonte di esperienze negative e traumatiche, ne risulta una inadeguatezza del processo di sviluppo del bambino che può trovare espressione in tutte le aree di funzionamento cognitivo ed emotivo.

Perry (Perry et al[10], 1995) sottolinea la possibilità, soprattutto nei bambini piccoli, che i circuiti neuroendocrini attivati dal trauma divengano permanenti, alterando la plasticità cerebrale e condizionando la personalità del futuro adulto. Bremner[11] in un articolo recente (2003) riprende e dettaglia lo stesso concetto: lo stress in età precoce è associato con alterazione duratura nei circuiti cerebrali e nel sistema che media la risposta allo stress (asse ipotalamo-ipofisi-corticosurrenale sistema nor-adrenergico). Anche altri sistemi cerebrali di fondamentale importanza per gli esiti comportamentali vengono alterati, come i sistemi delle benzodiazepine, degli oppioidi endogeni, della dopamina e dei neuropeptidi, con ricadute sul funzionamento dell'ippocampo, dell'amigdala, della corteccia prefrontale. Proprio queste permanenti alterazioni starebbero alla base del mantenimento delle reazioni post traumatiche, che si manifestano come PTSD, depressione e altre psicopatologie.

Il problema che subito si pone è quello di definire in qualche modo che cosa si intenda per esperienza traumatica. Alcune precisazioni interessanti a questo proposito sono fornite da L. Terr[12] (1991), che definisce il trauma come il risultato mentale di un "colpo" o una serie di "colpi" improvvisi che destabilizzano temporaneamente il giovane, e che fanno fallire le ordinarie strategie con cui si affrontano gli eventi esterni e le operazioni difensive. Questo concetto non include solo quelle condizioni segnate da un'intensa reazione di sorpresa, ma anche quelle caratterizzate da una precedente previsione. Tutti i traumi infantili, che derivano ovviamente dall'esterno e non possono nascere esclusivamente nel pensiero del bambino, causano una serie di cambiamenti nelle modalità di funzionamento psicologico. L'autrice suddivide due tipologie di trauma con diverse caratteristiche: quello di primo tipo, che è la conseguenza di un evento unico e improvviso, e quello di secondo tipo, che invece deriva da un abuso prolungato e ripetuto. Mentre nei traumi di primo tipo c'è la tendenza a ritornare sul ricordo, di solito completo, dettagliato e ben impresso, per tentare un rimaneggiamento retrospettivo e una rivalutazione cognitiva, nei traumi di secondo tipo più facilmente la vittima ricorre al diniego e alla paralisi psicologica. Analoghe riflessioni emergono dal lavoro di Glaser (2000), che distingue invece tra trauma acuto (overwhelming experience) e stress cronico.

Si può affermare che mentre nel trauma acuto il soggetto si comporta nei confronti dell'esperienza traumatica come nei confronti di un corpo estraneo da espellere attraverso l'equivalente di una florida reazione infiammatoria, nel trauma o stress cronico ciò non avviene. Questa differenza è tanto più evidente quanto più è precoce l'esperienza sfavorevole. Infatti molte situazioni di abuso e trascuratezza, benché sicuramente produttrici di uno stato emozionale gravemente negativo, non vengono percepite dal bambino come sopraffacenti nel modo delle tipiche esperienze traumatiche. Ciò accade spesso proprio a causa della cronicità della vittimizzazione infantile, che rende l'esperienza paradossalmente predicibile e quindi perversamente funzionale alla continuità del sé, che, come è noto, è una componente fondamentale dello stato di benessere psichico. Ma l'assenza dello sconvolgimento acuto non ha alcuna valenza protettiva, anzi apre la strada a un effetto pervasivo a carico dei processi di regolazione psicologici e biologici presenti nel bambino, dando luogo a reazioni più complesse e ancor più nefaste del disturbo da stress post traumatico. Si parla in questi casi di "trauma interno all'identità" opposto al "trauma esterno all'identità" che caratterizza le situazioni di trauma acuto.

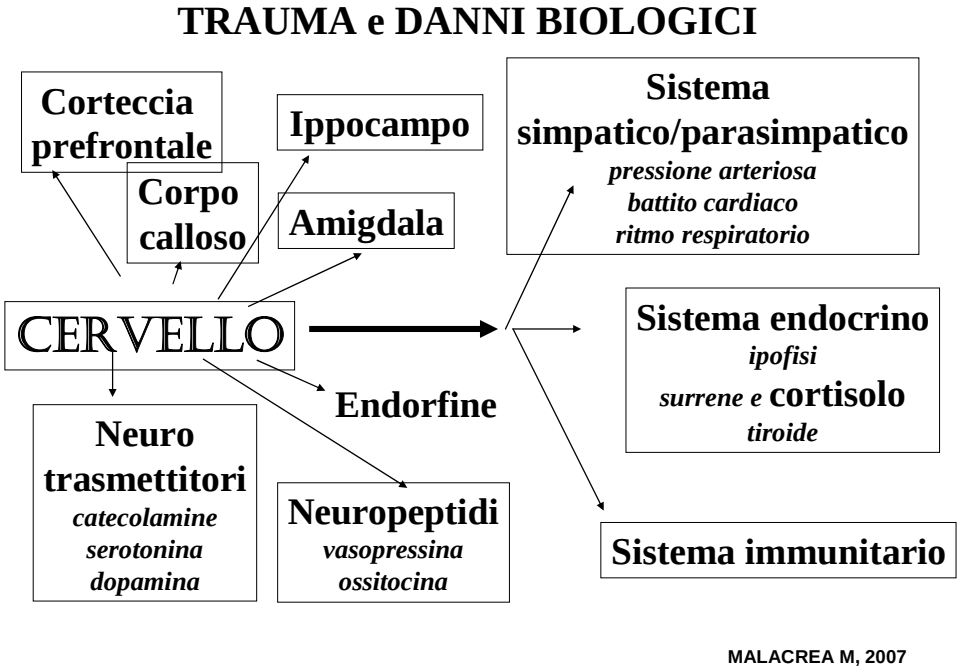
3. La biologia della risposta al trauma

Vale la pena di fare un accenno a questo tema (Glaser, 2000, Malacrea, 2004[13]), accenno forzatamente breve e superficiale.

3.1. Le esperienze negative - stress - in ragione della loro intensità e durata producono *effetti somatici registrabili*, a partire da una sostanziale e automatica modificazione degli equilibri fisiologici, con ricaduta sull'asse ipotalamo-pituitario-surrenalico, sul sistema nervoso autonomo (simpatico/parasimpatico), sul complesso dei neurotrasmettitori e sul sistema immunitario.



In particolare si producono importanti conseguenze a livello cerebrale:

3.1.1 Vengono sollecitati il sistema delle catecolamine (adrenalina e noradrenalina, dopamina) e della serotonina, centrali nella reazione 'fight or flight'. Se ripetuta, tale sollecitazione provoca un danno nel funzionamento della corteccia prefrontale, sede della memoria operativa, della concentrazione, dell'efficienza comportamentale sul versante cognitivo. Provoca anche una disregolazione del sistema attivazione/inibizione delle risposte comportamentali affettive. A causa della tossicità dovuta all'accumulo di catecolamine, la persistenza delle situazioni di stress provoca a lungo termine una diminuzione del volume cerebrale, di aree del corpo calloso (fondamentale connessione tra gli emisferi), con espansione dei ventricoli cerebrali.

3.1.2 Per diminuire l'esposizione all'iperattivazione di quei neurotrasmettitori, soprattutto quando alla loro presenza non può far seguito alcuna utile reazione di fuga dal pericolo o di attacco e neutralizzazione dell'agente traumatico (impotenza intrinseca delle situazioni di stress cronico), vengono messi in campo sistemi compensatori. Essi sono essenzialmente di due tipi:

a) prevale l'attivazione del sistema dopaminergico e poiché i recettori della dopamina coincidono in diverse aree cerebrali con quelli degli oppioidi, vengono sollecitati il

[13] Malacrea M. (2004) La terapia nell'abuso all'infanzia: le ragioni teoriche dell'evidenza clinica, *Connessioni*, anno VIII, n.14, 81-100.

nervo vago e il sistema parasimpatico, che agiscono sulla percezione dello stimolo traumatico. Attraverso la produzione paradossa di endorfine (solitamente attivate da esperienze di conforto, ma qui attivate paradossalmente in presenza di disagio e pericolo) si ottiene uno "spegnimento" della reazione 'fight or flight', con importanti conseguenze sul piano fisico ("congelamento", diminuzione del ritmo cardiaco) e mentale (dissociazione).

b) viene attivata l'iperproduzione di cortisolo e glucocortisolo, riconosciuto come l'"ormone dello stress", in quanto media il coping nelle situazioni traumatiche. Esso agisce deprimendo la reazione allo stress, provocando adattamento allo stesso. Nei casi in cui la situazione è dominabile tale reazione è temporanea fino alla risoluzione dell'esperienza negativa, ma nei casi cronici, in cui la fonte del disagio è forte e incontrollabile, avviene una pericolosa disregolazione della produzione di cortisolo, sia con sopraelevazione costante dei valori di base sia con lo slivellamento in basso degli stessi.

3.1.3 I sistemi compensatori, che sono facilmente connettibili a difese psichiche, sono anch'essi pericolosi, se eccessivi in quantità e durata: il primo perchè impedisce la reazione all'evento traumatico e quindi di sottrarsi ad esso, ma ancor più per il suo carattere massivo, che comporta da un lato grande dispiego di energie psichiche per ottenere il disimpegno dalla realtà e dall'altro inaccessibilità ai fattori relazionali di conforto; il secondo perchè, essendo l'eccesso di cortisolo tossico per i neuroni, provoca danni a vari livelli cerebrali, sia diminuendo globalmente il volume del cervello - sinergicamente alle catecolamine - sia rendendo inefficienti particolari aree come l'ippocampo, sede in cui vengono integrati i differenti aspetti della memoria. E' altresì evidente che i due sistemi di spegnimento competono l'uno con l'altro e non configurano scelte definitive ma due stati pronti a virare dando luogo automaticamente all'altro.

3.1.4 Lo stress cronico modifica in modo permanente la regolazione del sistema soglia - spegnimento - riattivabilità, dove 'soglia' concerne la quantità di stimolo necessaria a produrre una risposta da stress, 'spegnimento' riguarda la capacità del soggetto di estinguere la reazione, 'riattivabilità' rappresenta l'attitudine a tornare in stato di eccitazione dopo lo spegnimento anche in assenza di congruo stimolo. Per fare alcuni esempi, il soggetto che resta abitualmente in stato di allarme, a causa di esperienze traumatiche pregresse, potrà sviluppare nel tempo una sempre maggiore fragilità di fronte agli stimoli ambientali (abbassamento della soglia della reazione da stress) con conseguente instabilità psicofisica e incremento delle occasioni di riattivazione traumatica (aumento della riattivabilità). Al contrario, potrà anche avvenire che la cronicità degli eventi stressanti induca nel soggetto una depressione della reazione, che porta al misconoscimento della situazione minacciosa (innalzamento della soglia) con tardività delle reazioni di compenso; anche questo insieme può essere facilitato dalla ripetizione di situazioni simili, con diminuzione della possibilità di scegliere meccanismi di reazione diversi (aumento della riattivabilità). E' evidente che ogni distorsione, in più o in meno, del fisiologico sistema soglia - spegnimento - riattivabilità è dannoso.

3.1.5 Lo stress cronico attiva in modo permanente alcune aree cerebrali e ne disattiva altre. Ad esempio è stata dimostrata una maggiore sollecitazione del lobo frontale destro, specializzato per l'espressione di sentimenti negativi, di tristezza, a scapito del lobo frontale sinistro, connesso a emozioni positive, come la gioia; viene ipersollecitata l'amigdala, sede in cui viene percepita la paura; viene disattivato l'ippocampo, sede dell'integrazione dei ricordi.

3.2 *Sul piano psicologico* il riflesso di quanto sopra è costituito da modelli operativi interiorizzati (MOI) caratteristici e riconoscibili.

Ciò è vero sia sul piano del sistema di significati che determina il comportamento del soggetto traumatizzato, sia sul piano delle condotte relazionali, sia sul piano delle strategie difensive. Tipicamente chi è stato vittima di esperienze traumatiche, specie se croniche, ha interiorizzato una 'filosofia' basata sull'assunto di un "mondo malevolo", opposta quindi alla "fiducia di base" e orientata alla messa in atto di 'profezie che si autodeterminano' nelle relazioni significative, quanto più comportano intimità e dipendenza. Sentirsi impotenti e traditi dai più prossimi, induce un iperallarme che genera diffidenza e propensione a strumentalizzare, da un lato: con ovvie conseguenze di espulsione da parte della maggioranza degli altri; d'altro canto, la moltiplicazione delle esperienze negative conseguenti a quei comportamenti, porta il soggetto a ipotizzare una più o meno oscura colpa originaria, che se, da un certo punto di vista, dà qualche senso al proprio destino infausto, è fonte di un profondo e corrosivo malessere e di distonia con l'autoimmagine (il ‘sé come bene danneggiato/svalutato’). La 'cattiva stella' delle vittime di esperienze traumatiche comporta dunque che la distorsione dei modelli operativi interiorizzati le renda candidate ideali al ripetersi senza fine di altre, e congruenti, esperienze traumatiche (abbandono, tradimento, espulsione, aggressione e quant'altro) che perpetuano un quadro di 'deserto affettivo', se non di 'giungla affettiva', rinforzando a spirale per il soggetto la credibilità e l'impermeabilità proprio dei MOI distorti e funesti.

3.3 In tutti questi aspetti, si evidenzia che la *reazione al trauma* è pericolosa quanto il trauma stesso, non soltanto per la sua qualità, come vedremo poco oltre, ma per il fatto che essa scatta istantanea, automatica, ripetitiva, cortocircuitando la possibilità della mente di far fronte allo stimolo traumatico in modo non disfunzionale e condizionando le espressioni relazionali della vittima.

D'altro canto per convivere con l’idea di un "mondo malevolo", reso certo dai modelli operativi interiorizzati sopra descritti, e continua fonte di ripetitive esperienze traumatiche, è inevitabile l'adozione di movimenti difensivi. Sappiamo che anche tali movimenti difensivi sono, nelle vittime, caratteristici e riconoscibili: di più, privi di alternative sul piano neuropsicologico. Quanto già descritto in termini di mediatori chimici nel punto 1), si esprime, psicologicamente parlando, attraverso comportamenti improntati all'ipereccitazione (hyperarousal) o all'iperadattamento o al congelamento dissociativo:

3.3.1 Il primo può essere descritto come uno stato di allarme permanente, di attivazione e instabilità psichica continua, che non trova scarico in comportamenti utili e finalizzati di attacco o fuga, a cui fisiologicamente dovrebbe corrispondere: pensiamo all'immagine di un cavo elettrico scoperto, pronto a dare indifferenziatamente la scossa a chi si avvicini, con un alto grado di imprevedibilità. Spesso lo scarico è su se stessi, capace di produrre sintomi fisici e psichici, fissati o alternanti. In ogni caso gravemente deficitaria è la regolazione delle emozioni e dei comportamenti, i sistemi di autocontrollo sono permanentemente a rischio di scompenso. La sensibilizzazione del sistema noradrenergico condiziona la stimolazione di funzioni psicologiche, cognitive, comportamentali mediate dallo stesso sistema, e spiega la natura dei sintomi di questi bambini traumatizzati: iperattività, ansia, comportamento impulsivo, disturbi del sonno ecc. Questo tipo di risposta è più comunemente visto nei maschi adulti e nei bambini più grandi.

3.3.2 L’iperadattamento si basa sull'ipersecrezione di cortisolo, che abbassa la reazione allo stimolo stressante. Ne possono derivare apparenti equilibri, con serie conseguenze di depressione delle risorse cerebrali preziose per la crescita. I bambini sottoposti a gravi esperienze di deprivazione mantengono il livello di base del cortisolo elevato: si vedano ad esempio gli studi compiuti sui bambini ospiti dei brefotrofi della Romania, citati in Glaser, 2000. Questo stato è significativamente connesso a una aumentata vulnerabilità allo stress: paradossalmente, i soggetti iperadattati non hanno consolidato i propri sistemi omeostatici di fronte alle difficoltà della vita, ma sono sempre sull’orlo della sopraffazione degli stessi.

Hart et al.[14] (1995), studiando le reazioni dei bambini maltrattati ai conflitti in ambiente scolastico, hanno rilevato che, quando intervengano circostanze di stress momentaneo, questi soggetti sopprimono la secrezione del cortisolo. Resnik et al. (1995), studiando le donne vittime di stupro, hanno constatato che quelle portatrici di pregresse esperienze traumatiche avevano un livello di cortisolo basso dopo l'evento, al contrario di quelle non traumatizzate nell'infanzia, che avevano l'atteso aumento della secrezione di cortisolo. Se ne deduce che specie nei soggetti già sensibilizzati da precedenti esperienze traumatiche anche piccoli fattori aggiuntivi di stress possano travolgere la capacità di affrontarlo e indurre reazioni di 'spegnimento' massive, con soppressione anomala della secrezione del cortisolo. A quel punto accade il viraggio all'altro sistema di 'spegnimento' dell'attivazione post traumatica, mediato dal disimpegno psicologico dalla realtà attraverso difese di tipo dissociativo.

3.3.3 La terza via difensiva, quella che cortocircuita la percezione dell'evento stressante (attraverso la produzione paradossa di endorfine), impedendo allo stimolo di attivare qualsiasi risposta, si manifesta in varie forme, solo apparentemente contraddittorie. I bambini piccoli e le femmine, e più in generale quanto più impotente si sente l'individuo, più frequentemente attivano, con una iperreattività che porta fino alla sensibilizzazione, la risposta di "congelamento" fisico e di dissociazione mentale. Si ha quindi un aumento del tono vagale, con i correlati fisiologici che ne seguono (diminuzione della frequenza cardiaca, della pressione ecc.) e, in virtù della produzione paradossa di oppioidi, una alterazione della percezione del dolore, del senso del tempo, dello spazio, della realtà. È interessante che Perry utilizzi proprio la diminuzione della frequenza cardiaca come metodo non invasivo per misurare la dissociazione.

I bambini traumatizzati usano spesso meccanismi di congelamento come risposta all'angoscia. Quando il bambino sperimenta una situazione-stimolo connessa al trauma (connessione di cui egli spesso non è consapevole), si sente profondamente angosciato, e si immobilizza cognitivamente e spesso anche fisicamente. Quando l'adulto gli chiede qualcosa, si comporta come se non avesse sentito, o si rifiuta di aderire alla richiesta. Ciò solitamente attiva altre richieste da parte dell'adulto, spesso accompagnate da ostilità e minacce di punizioni. Queste caratteristiche verbali e non verbali della minaccia fanno sentire il bambino ancora più insicuro e impotente; l'ansia conseguente potrà attivare una più profonda dissociazione. Tutto questo processo spesso non è correttamente interpretato e ciò porta a errori diagnostici, per cui questi bambini sono etichettati come oppositivi e provocatori (cioè con disturbi della condotta). In altri casi la reazione di congelamento può essere male interpretata come assenza di sofferenza psicologica, o come indice di buon adattamento.

3.3.4 Ancora più interessante è notare che, al di là delle apparenze, non c'è sostanziale differenza tra i soggetti che mettono in atto comportamenti di estraniazione, di evitamento marcato, di dissociazione dei ricordi, dei pensieri, degli affetti, e persino delle funzioni fisiche (pensiamo a varie forme di scarico somatico fino a certi arresti della crescita verificatisi in circostanze di trauma nell'infanzia), mostrandosi congelati, e i soggetti che raggiungono lo stesso obiettivo di 'decerebrazione', di anestesia, di non pensiero ricorrendo a una iperattività non finalizzata od ostile. La verifica sul livello di cortisolo corrispondente a questi diversi comportamenti ci è di suggestivo aiuto, in quanto, come sopra detto, l'eccessiva soppressione dell'"ormone dello stress" in circostanze di per sé stressanti ci informa sul fatto che al tentativo di adattamento si è sostituita la fuga dalla realtà; e abbiamo dati certi che al basso livello di cortisolo corrisponde spesso un atteggiamento ritirato e distante, ma anche le esplosioni di aggressività si accompagnano alla stessa soppressione. Ciò accade ad esempio in molte situazioni che possono simulare il disturbo

[14] Hart J, Gunnar M, Cicchetti C (1995) Salivary cortisol in maltreated children. Evidence of relations between neuroendocrine activity and social competence, *Development and Psychopathology*, 7, 11-26.

da deficit attentivo (ADHD), ma anche nei casi in cui sembra persa la competenza sociale e il soggetto agisce aggressivamente in modo antisociale e oppositivo (Hart et al.,1995; McBurnett et al., 2000[15]). E' del resto ben comprensibile che il disimpegno mentale abbia un costo altissimo in termini di sensibilità agli altri, di sviluppo di intelligenza emotiva e di capacità di sintonizzazione con l'ambiente relazionale. Questo meccanismo difensivo non soltanto espone il soggetto all'esperienza traumatica senza resistenza, ma distoglie energie preziose dai loro fisiologici scopi.

3.3.5 Ancora più funesti appaiono poi tutti questi sistemi di difesa quando, come spesso avviene, si alternano nello stesso soggetto come in un vortice, rendendo il suo funzionamento incomprensibile e imprevedibile per chi deve prendersene cura e per il soggetto stesso, che non può che ricavarne una più acuta autosvalutazione. L'immagine di un'auto con acceleratore schiacciato a tavoletta (l'ipereccitazione), con il freno a mano contemporaneamente al massimo (l'iperadattamento) e magari con guidatore svenuto (dissociazione e scompenso della regolazione), può rendere abbastanza realisticamente l'idea dell'effetto dei meccanismi difensivi post traumatici. È importante notare che questo complesso intreccio di reazioni è evidente anche nei bambini, che contrariamente a quanto comunemente si crede, quanto più sono piccoli, tanto più sono sensibili al trauma: negli studi di Perry (Perry et al, 1995) la maggior parte di bambini traumatizzati con PTSD (Post-Traumatic Stress Disorder) mostrano un misto di risposte dissociative e di ipereccitazione.

3.4. Il funzionamento psicologico post traumatico è *riattivabile*. La sovrastimolazione, come avviene nel trauma, di importanti circuiti neuronali durante lo sviluppo, porta alla sensibilizzazione di alcuni di questi, che saranno attivati non solo dal trauma, ma anche da ricordi specifici, sotto varia forma, del trauma stesso. La reattività poi potrà generalizzarsi, sicché il sistema di risposta al trauma del cervello infantile sarà attivato in continuazione anche quando il pericolo non sarà effettivamente presente. Ciò avviene non soltanto a riguardo di esperienze o memorie in qualche modo affini a quelle precedenti negative, ma anche in circostanze che per altri soggetti non vittime non evocherebbero reazioni da stress, mentre nella vittima inducono allarme. E' noto come immagini, sensazioni, eventi non rievocativi della precedente esperienza traumatica e non nuovamente traumatici in sé, possano scatenare reazioni intense di malessere, con tutto il corteo difensivo descritto nel punto precedente. In particolare, persino esperienze in sé positive, ma che comportano intimità e intensità dei legami, e cioè circostanze in cui il soggetto traumatizzato sente aumentare la propria vulnerabilità, possono diventare non raramente riattivatori traumatici. Infatti, ciò è il riflesso comportamentale di quella distorsione del sistema soglia - spegnimento - riattivabilità descritto più sopra.

La riattivabilità del funzionamento post traumatico appare in tutta la sua gravità se aggiungiamo anche che esso neurofisiologicamente cortocircuita la corteccia frontale, e quindi l'elaborazione superiore, verbale, propria di questa sede. Suggestivi studi sperimentali comprovano che l'evocazione di vividi ricordi post traumatici taglia fuori l'attivazione dell'area di Broca dell'emisfero sinistro, connessa al linguaggio e quindi ai processi di simbolizzazione.

Se ne deduce che la possibilità di modificare il sistema soglia - spegnimento - riattivabilità è assai ridotta se vengono inabilitate proprio le funzioni superiori che sarebbero in grado di modularlo.

4. Le conseguenze patologiche

4.1 Ciò che accomuna le diverse situazioni sopra descritte è la loro capacità di produrre una *vasta gamma di esiti patologici*. Il fatto che la maggior parte delle ESI abbia come teatro la famiglia ha come corollario spesso la loro cronicità e quindi una maggiore possibilità di produrre

[15] McBurnett K, Lahey B, Rathouz P, Loeber R (2000) Low salivary cortisol and persistent aggression in boys referred for disruptive behavior, *Archives of General Psychiatry*, 57(1), 38-43.

in coloro che ne sono vittime gravi e invalidanti conseguenze sul piano fisico e psicologico Si tratta di esperienze spesso capaci di superare le naturali risorse di "resilienza" e adattamento dei soggetti, tanto più se ancora in formazione, e di dar luogo a importanti sofferenze che si trascinano nel tempo dando luogo a patologie che si manifestano dopo mesi, anni o nell'età adulta. Va inoltre tenuto conto che quegli adulti, diventati genitori, corrono un alto rischio di trasmissione intergenerazionale delle condotte maltrattanti/abusanti..

Le statistiche dimostrano che il 50% delle giovani tossicodipendenti e a condotta socialmente deviante e un terzo delle pazienti psichiatriche ambulatoriali è un ex-vittima di abuso sessuale non trattata (Gelinas,1983[16]; Malacrea, Lorenzini, 2002[17]). Possiamo da qui facilmente inferire quanto peso specifico sulla patologia adulta possa essere attribuito al complesso di tutte le forme di abuso nell'infanzia, e ancor più al complesso delle Esperienze Sfavorevoli Infantili, che magari non si sono concretizzate in maltrattamenti attivi e puntualmente riconoscibili, ma hanno dato luogo a un 'mal-trattamento' diffuso, attraversato spesso da tutti quei fattori più sopra individuati da Glaser per l'abuso emozionale. Si tratta di gruppi di popolazione certo molto più estesi delle sole vittime di abuso sessuale.

L'AACAP (American Academy of Child and Adolescent Psychiatry) propone uno schema dei sintomi e dei comportamenti che possono presentarsi nei bambini abusati (significativamente correlabili alle reazioni post traumatiche di hyperarousal, depressione, dissociazione), individuando le seguenti categorie:

- *sintomi da angoscia*, come paura, fobie, insonnia, incubi, problemi somatici (come enuresi, encopresi, prurito vaginale o anale, anoressia, obesità, cefalea, mal di stomaco), PTSD;
- *reazioni dissociative* e sintomi isterici, come periodi di amnesia, sogno ad occhi aperti, stati simili alla trance, attacchi isterici, disturbo da personalità multipla;
- *depressione*, manifestata sotto forma di bassa autostima, condotte suicidarie, automutilazioni;
- *disturbi del comportamento sessuale* (sia da 'preoccupation' sia da 'distress').

Rispetto invece alla fase temporale di comparsa, le conseguenze dell'abuso sono suddivise da Violato[18] (1994, ma anche da Malacrea e Vassalli, 1990[19]) in tre sottotipi: effetti iniziali (quelli che si manifestano entro i due anni dalla fine dell'abuso), effetti che si prolungano a medio termine, infine gli effetti a lungo termine (quelli che si manifestano dopo più di due anni dalla fine dell'abuso e non sono necessariamente presenti fin dall'inizio).

4.2 Ma vediamo più nel dettaglio le *conseguenze sintomatiche* delle esperienze sfavorevoli infantili.

Innanzitutto l'abuso può portare all'*aggravamento di comportamenti* che, se non sono preoccupanti in se stessi poiché si verificano nella maggior parte dei bambini, lo diventano se si presentano molto frequentemente. Pensiamo, a questo proposito, a difficoltà di addormentamento, fobie e paure, comportamenti regressivi (enuresi, ecc.), richiesta maggiore di attenzione, difficoltà scolastiche (Wells, McCann, et al., 1995[20] ; Hibbard e Hartman, 1992[21]).

In base alle ricerche più recenti, la *depressione* risulta essere il disturbo con maggiore incidenza tra i bambini e gli adolescenti che hanno subito esperienze sfavorevoli infantili (Chapman et al.,

[21] HIBBARD, R., HARTMAN, G. (1992), "Behavioral problems in alleged sexual abuse victims". In *Child Abuse and Neglect*, 4(1), pp. 223-230.

2004[22]). Può accadere che questo stato depressivo esiti in un suicidio o in un tentativo di suicidio: è stata riscontrata una frequenza di tentati suicidi 13 volte superiore alla frequenza relativa alla popolazione di pari età (il 32% degli abusati ha tentato il suicidio) e una frequenza ancora maggiore di pensiero suicidarlo (il 43% degli abusati). La tendenza suicidaria può poi comparire in forme più coperte: per esempio, le ricerche riguardo alla tossicodipendenza hanno rilevato che, nella popolazione di donne che hanno corso il pericolo di morire di overdose, il 72% ha riferito di aver subito una qualche forma di abuso sessuale.

L*'ansia* costituisce un altro dei principali sintomi appartenenti al gruppo delle disfunzioni emotive. Può prendere la forma di uno stato di *ipervigilanza* verso i pericoli nell'ambiente non sempre oggettivamente giustificato.

L'ansia può essere trasposta nell'eccessiva preoccupazione per il corpo. Spesso ci si riferisce a questi problemi con i termini psicosomatico o *somatizzazione*, che suggeriscono l'intreccio tra il disagio psicologico e la salute fisica. I problemi che sono più spesso associati agli episodi di abuso sono: cefalea, mal di stomaco, nausea, disturbi del sonno, anoressia, asma; ma molti altri sintomi di malessere fisico compaiono in questi casi e non trovano spiegazioni fisiologiche (Briere, 1992[23]). In un campione di quasi 5900 adolescenti e adulti Sachs-Ericsson et al. (2005) hanno rilevato la presenza di problemi di salute nell'anno precedente l'indagine. Nei soggetti che erano stati vittime di abuso fisico o sessuale o grave trascuratezza nell'infanzia è emersa una correlazione con i problemi di salute. Il fattore di mediazione tra l'esperienza infantile e il ripetuto accesso a prestazioni mediche era costituito dall'attribuzione a malattia fisica dei sintomi somatici conseguenti al funzionamento postraumatico. Tuttavia non è soltanto la 'lettura' che il paziente tende a dare dei suoi disturbi somatici a provocare una morbilità aumentata, a questo punto per lo più priva di base organica. Le complesse alterazioni post traumatiche del funzionamento cerebrale e, di conseguenza, di tutto l'albero di trasmissione dal cervello agli organi, possono ben rendere ragione di effettivi malfunzionamenti con base organica. Ben documentate, ad esempio, sono le disfunzioni tiroidee.

Anche la *dissociazione* è una delle possibili risposte al trauma. Si tratta di un meccanismo difensivo particolarmente funzionale in concomitanza con l'abuso. Consente di risolvere conflitti inconciliabili, di sfuggire dalle costrizioni della realtà, di isolarsi da esperienze catastrofiche, proteggendo il sé, di sfuggire al dolore, anche fisico, grazie all'effetto analgesico. Tuttavia quando diventa un meccanismo automatico si innesta la patologia, provocando una frattura nel senso dell'identità e della continuità della memoria e dell'integrazione del sé. I disturbi psicopatologici che ne derivano possono essere collocati in uno spettro che va dall'amnesia psicogena a stati di fuga e di depersonalizzazione fino alla grave sindrome da personalità multipla (Ross, 1985). *Il singolo sintomo che maggiormente definisce il disturbo dissociativo è la presenza di stati di simil trance*, in cui il bambino è assente, spesso a occhi sbarrati, e non sembra in contatto con l'ambiente

4.3 Già nel suo testo del 1992, Judith Herman[24] insisteva per la necessità di una nuova concettualizzazione delle conseguenze dei traumi non circoscritti (come quelli per cui si è definita la PTSD) ma ripetuti e prolungati, capaci perciò di provocare profonde deformazioni della personalità e grande vulnerabilità alla ripetizione di eventi simili. Propone quindi la definizione di *"disturbo post-traumatico da stress complesso"* per indicare il limite estremo di gravità di una vasta gamma di esiti, che vanno da quello fuggevole e non bisognoso di cura a quello derivante appunto da eventi traumatici ripetuti e prolungati.

Per la precisione e la completezza del quadro diagnostico che disegna e quindi per il prezioso contributo che fornisce a riguardo della comprensione dei soggetti vittime di abusi nell'infanzia, si

ritiene utile riportare nel dettaglio la descrizione data dall'autrice del Disturbo Post-Traumatico da Stress Complesso, che si articola sui seguenti *criteri*:

- Una storia di sottomissione a controllo totalitario per periodi prolungati (mesi o anni). Esempi includono: ostaggi, prigionieri di guerra, sopravvissuti a campi di concentramento e sopravvissuti di alcune sette religiose. Altri esempi includono coloro che sono soggetti a sistemi totalitari nella vita sessuale e domestica, inclusi i sopravvissuti alla violenza domestica, all'abuso sessuale o fisico subito nell'infanzia e allo sfruttamento sessuale organizzato.
- Alterazione nella regolazione degli affetti, inclusi
    - stato disforico continuo
    - preoccupazione suicidaria cronica
    - autolesionismo
    - rabbia esplosiva o eccessivamente inibita (possono alternarsi)
    - sessualità compulsiva o eccessivamente inibita (possono alternarsi)
- Alterazioni dello stato di coscienza, inclusi
    - amnesia o ricordi intrusivi degli eventi traumatici
    - episodi dissociativi transitori
    - depersonalizzazione/derealizzazione
    - rivivere esperienze, sia sotto forma di sintomi intrusivi da disturbo post-traumatico da stress sia sotto forma di ruminazione cognitiva e preoccupazione continua
- Alterazioni nella percezione del Sé, inclusi
    - senso d'impotenza o paralisi dell'iniziativa
    - vergogna, colpa e auto-denigrazione
    - senso di contaminazione o di stigmatizzazione
    - sensazione di essere completamente diversi dagli altri (può includere sentirsi speciali, estrema solitudine, credenza che nessuno possa comprenderci, o senso d'identità non umana)
- Alterazioni nella percezione dell'abusante, inclusi
    - preoccupazioni nella relazione con l'abusante (inclusi i pensieri di vendetta)
    - attribuzione irrealistica di potere assoluto all'abusante (attenzione: il giudizio di realtà sul potere dell'abusante da parte della vittima può essere più realistico di quello che ha il clinico)
    - idealizzazione o gratitudine paradossale
    - convinzione di intrattenere con l'abusante una relazione speciale o supernaturale
    - accettazione del sistema di credenze o delle razionalizzazioni dell'abusante
- Alterazioni nei rapporti con gli altri, inclusi
    - isolamento e ritiro
    - frantumazione delle relazioni intime
    - ricerca continua di un salvatore (può alternarsi con l'isolamento e il ritiro)
    - fallimenti ripetuti nella capacità di autoproteggersi
- Alterazioni nel sistema dei significati, inclusi
    - perdita di un senso di fiducia durevole

- senso d'impotenza e di disperazione

L'adozione di questo modello di comprensione e descrizione delle conseguenze psicopatologiche dei traumi gravi e continuativi permette, secondo Herman, di evitare il pericoloso 'balletto' dell'attribuzione di un'etichetta psichiatrica "altra" a questa complessa sindrome. L'autrice analizza le tre principali sindromi attribuite alle vittime di trauma, e cioè *il disturbo psicosomatico, il disturbo di personalità borderline e il disturbo di personalità multipla*, rilevando l'impossibilità di arrivare in questi casi a precise definizioni diagnostiche, rimanendo i quadri sintomatologici per molti aspetti embricati trasversalmente alle tre sindromi. Il maggior rischio di una diagnosi psichiatrica non corretta e specifica come disturbo post-traumatico complesso è il ritardo nel ritrovare la connessione tra sofferenza psichica e quadro originante degli eventi, chiave per il processo riparativo.

4.4 Possiamo domandarci se è possibile distinguere le conseguenze dannose di cui stiamo trattando correlandole a specifiche forme di mal-trattamento.

Un recente lavoro di Tamiazzo[25] (2006) analizza le principali conseguenze a breve, medio e lungo termine dei mal-trattamenti sullo sviluppo e adattamento dell'individuo suddivise in base alla tipologia di mal-trattamenti.

I dati presentati sono stati ottenuti dall'esame e integrazione dei risultati di diverse ricerche relative all'argomento (Trickett e McBride-Chang, 1995; Cole e Putnam, 1992; DiLillo, 2001; Walzer e coll., 1999; Coffey e coll., 1996a, 1996b; Liem e Boudewyn, 1999; Gibson e Hartshorne, 1996; Hildyard e Wolfe, 2002; Kendall-Tackett e Eckenrode, 1996; Hoffman-Plotkin e Twentyman, 1984; Salzinger e coll., 1993; Dodge e coll., 1995; Haskett e Kistner, 1991; Salzinger e coll., 2001; Lopez e Heffer, 1998; Malinosky-Rummel e Hansen, 1993)[26]. In realtà, si tratta di una suddivisione ancora incerta e provvisoria, in quanto, nonostante i numerosi studi, i vari autori non sono riusciti a dimostrare con certezza le specifiche conseguenze di ciascuna forma di mal-trattamento; in particolar modo a causa del fatto che raramente le varie tipologie si presentano isolatamente ed è quindi estremamente difficile studiare la loro singola manifestazione.

In quest'area di studio del mal-trattamento permane dunque una certa confusione e la tabella 1, riportata nel testo di Tamiazzo, ha come intento principale quello di chiarire il più possibile le idee relativamente a questo tema.

Tabella 1. Maltrattamenti ed esiti comportamentali

	MALTR. FISICO	**MALTR. PSICOLOGICO**	**TRASCURATEZZA**	**ABUSO SESSUALE**
1^ infanzia	Aggressività con rifiuto pari/Ritiro sociale con rifiuto pari. Atteggiamenti negativi e poco cooperativi. Comportamenti esternalizzati (maschi) e internalizzati (femmine)	Compromissione del legame di attaccamento (insicuro). Scarsa autostima e fiducia negli altri. Scarso sviluppo delle abilità adattive e sociali.	Compromissione del legame di attaccamento (insicuro). Comportamenti internalizzati (ritiro e isolamento sociale). Scarso controllo dell'emotività e impulsività. Problemi nel linguaggio espressivo.	Comportamen-ti internalizzati. Forti sentimenti di impotenza, vergogna e colpa. Disturbi psicosomatici.

[25] Tamiazzo G (2005) *Maltrattamento infantile e successive difficoltà di adattamento nel ciclo di vita*, tesi universitaria non pubblicata, in www.progettotiama.it .
[26] Vedi Tamiazzo G, 2005, in www.progettotiama.it.

2^ infanzia	Ai problemi già presenti nel periodo precedente si aggiungono le difficoltà scolastiche. Errori nel processamento dell'informazione sociale.	Si aggiungono i problemi scolastici, in particolare difficoltà cognitive e di problem-solving. Difficoltà e ritardi nello sviluppo fisico e intellettivo.	Si aggiungono i problemi scolastici (in misura maggiore rispetto alle altre forme), in particolare deficit cognitivi e mancanza di creatività e flessibilità nel problem-solving. Ritiro sociale.	Si aggiungono comportamenti esternalizzati e comportamenti sessuali inappropriati.
Adolescenza	Peggioramento dei problemi scolastici e delle difficoltà relazionali.	Peggioramento dei problemi scolastici, dell'autostima e della fiducia negli altri. Sviluppo di uno stile di interazione passivo, ritirato ed eccessivamente reattivo.	Peggioramento dei problemi scolastici (più che nelle altre tipologie) e in particolare dei deficit cognitivi. Rappresentazione negativa di sé e degli altri. Scarsità di interazioni sociali.	Idee suicide e comportamenti autolesivi. Si aggravano i problemi comportamentali e le difficoltà relazionali.
Età adulta	Permangono i comportamenti internalizzati ed esternalizzati, gli atteggiamenti aggressivi ed antisociali e si manifestano depressione ed ansia (in particolare nelle donne).	Lo stile relazionale evolve o nella depressione oppure nei disturbi della condotta (iperattività, impulsività). Ulteriore peggioramento della stima in sé stessi e della fiducia negli altri.	Isolamento e ritiro sociale. Incapacità di entrare in relazione con gli altri. Profondi deficit cognitivi.	Permangono i comportamenti internalizzati ed esternalizzati, gli atteggiamenti aggressivi ed antisociali e si manifestano depressione, ansia e disturbi somatici (in particolare nelle donne). Difficoltà nelle relazioni intime e nell'assunzione del ruolo parentale. Senso di solitudine e incapacità di utilizzare il supporto sociale.

5. Le conseguenze sull'adattamento sociale

5.1 Molte persone vittime di esperienze sfavorevoli infantili, pur non presentando gravi sintomi psicopatologici, sperimentano ugualmente *difficoltà in diverse aree sociali ed interpersonali* le quali, essendo meno visibili al mondo esterno, il più delle volte vengono sottovalutate e non vengono prese in considerazione (vedi punto 4.4) (Gentile, 2005[27]). Non solo nei macroscopici gruppi patologici sopra citati, ma anche in aree meno studiate, andrebbero ricercate correlazioni tra fallimenti e sofferenze e le Esperienze Sfavorevoli Infantili, adottando come 'chiave di lettura' delle difficoltà proprio la permanenza nel tempo dei modelli operativi interni distorti (il 'mondo malevolo') e dei funzionamenti post traumatici costanti e/o riattivabili conseguenti a tali esperienze, come già sopra descritto.

Ad esempio, chi opera nelle iniziative mirate al recupero scolastico e alla qualificazione finalizzata all'inserimento lavorativo di adolescenti e preadolescenti, incrocia in gran parte dell'utenza situazioni ascrivibili a questa tipologia di mal-trattamento. Ancora, sarebbe di grande interesse se a margine delle rilevazioni relative all'esclusione sociale e alla povertà, si facesse una specifica ricerca sull'esistenza, alla base dei multipli fallimenti sociali dei soggetti interessati, di condizioni antiche di forme multiple di abuso, che possano pesare come una sorta di 'marchio

[27] Gentile G (2005) *Abuso-maltrattamento all'infanzia e disagio sociale: proposta di intervento con ragazzi adolescenti*, tesi universitaria non pubblicata, in www.progettotiama.it. Per tutte le voci bibliografiche citate nel paragrafo 5 si veda la suddetta tesi.

negativo' che impedisce alle persone di fruire delle risorse, anche quando inserite in società affluenti.

L'effetto distruttivo, che la relazione precoce con un adulto mal-trattante ha su tutte le successive interazioni sociali, può portare a un aumento del rischio di isolamento e di rifiuto sociale nel bambino e nell'adulto. In questi soggetti verrebbero, infatti, a mancare le competenze sociali e un sistema emozionale equilibrato che, in situazioni normali, consentono di sperimentare quei sentimenti di fiducia, confidenza e tranquillità che, a loro volta, permettono di costruire legami sicuri e duraturi non solo per quanto riguarda le relazioni intime, ma anche in tutte le altre relazioni sociali, in modo particolare nell'ambito accademico e professionale. In particolare, quando le esperienze sfavorevoli sono state continue e frequenti nel corso dei primi anni di vita, nel percorso di crescita del bambino si registra una grande difficoltà a fidarsi delle altre persone, egli è particolarmente sensibile al rifiuto e tende ad agire in modo smisurato alle valutazioni negative, percezione questa che può portare al rifiuto relazionale e all'isolamento dell'individuo.

Queste gravi conseguenze, che si evidenziano già a un'età molto precoce, perdurano, il più delle volte, per tutto il corso della vita provocando enormi carenze nelle capacità di adattamento e di interazione sociale del soggetto adulto.

5.2 Questi bambini nel loro percorso di crescita sperimentano frequenti *insuccessi e fallimenti a livello scolastico* e relazionale e si ritrovano poi, nel mondo adulto, privi di quelle competenze cognitive, sociali e relazionali che sono fondamentali per affrontare le difficoltà della vita ed adattarsi ad esse.

Numerosi studi, infatti, dimostrano che i soggetti maltrattati hanno delle prestazioni scolastiche peggiori rispetto a quelli non maltrattati; in particolare essi vengono spesso descritti da genitori e insegnanti come carenti di motivazioni intrinseche, poco inclini ad apprendere e incapaci di stimare adeguatamente le proprie capacità.

Ad esempio, Leiter e Johnsen (1994) hanno analizzato gli effetti di abuso e trascuratezza sulle prestazioni scolastiche ed hanno dimostrato un sostanziale deficit tra i bambini maltrattati in un'ampia gamma di risultati scolastici: test standardizzati, media dei voti, probabilità di abbandono scolastico, assenza e velocità di apprendimento. In un'altra ricerca (1997), gli stessi autori, hanno condotto un'analisi longitudinale per indagare il declino delle prestazioni scolastiche tra bambini abusati e trascurati. Essi hanno individuato relazioni significative tra maltrattamento e declino in diverse prestazioni scolastiche. Con il passare degli anni hanno inoltre registrato un aumento del rischio di declino nelle prestazioni in particolar modo nell'apprendimento di compiti cognitivi e nel grado di partecipazione e di integrazione scolastica.

Un interessante studio di Shonk e Cicchetti (2001) suggerisce che è l'influenza negativa esercitata dal maltrattamento sullo sviluppo delle competenze individuali a provocare gli elevati livelli di insuccesso scolastico e i problemi comportamentali dei bambini maltrattati; successivamente, questo disadattamento scolastico e comportamentale aumenta il rischio di abbandono accademico e di fallimenti sociali e professionali a lungo termine.

I numerosi insuccessi scolastici a cui vanno incontro i bambini vittime di esperienze sfavorevoli infantili sono principalmente dovuti alla loro situazione di distonia, impredicibilità, violenza familiare che non consente un'adeguata acquisizione delle competenze scolastiche, sociali e di resilienza che consentono di impegnarsi e di affrontare i compiti che vengono proposti.

5.3 A questo punto è molto semplice comprendere perché spesso i bambini con esperienze di maltrattamento presentino grosse difficoltà nelle *interazioni sociali* con i propri pari e vengano rifiutati dai compagni di classe. Infatti, tra tutte le problematiche che questi soggetti presentano nel loro funzionamento, il più delle volte troviamo anche un modello interattivo, in genere, caratterizzato da alti livelli di aggressività, dalla carenza di atteggiamenti prosociali e di avvicinamento ai pari.

Alcuni autori (Haskett e Kistner, 1991; Darwish, Esquivel, Houtz e Alfonso, 2001) hanno dimostrato che l'effetto pervasivo del maltrattamento sulle relazioni con i pari si evidenzia già ad un'età molto precoce. Questi autori hanno infatti analizzato la qualità delle interazioni in bambini

in età prescolare. I loro risultati mostrano che i soggetti maltrattati appaiono più ritirati, possiedono scarse abilità nell'avviare interazioni con i pari, esibiscono una più alta proporzione di comportamenti negativi nell'interazione con gli altri bambini, presentano una certa difficoltà nel mantenere l'autocontrollo ed hanno un gran numero di problemi comportamentali. I pari, inoltre, considerano questi bambini poco desiderabili come compagni di gioco.

Il rifiuto da parte dei pari quindi è un'esperienza che i bambini maltrattati iniziano a sperimentare molto precocemente, sin dalle loro prime interazioni, e che, nella gran parte dei casi, si ripeterà durante tutto il loro percorso scolastico e, più tardi, anche nelle loro interazioni adulte.

A questo proposito, un interessante studio di Salzinger, Feldman, Hammer e Rosario (1993) ha messo in evidenza che esperienze sfavorevoli infantili sono fortemente associate ad una più alta probabilità di rifiuto da parte dei pari. All'interno della classe, i soggetti maltrattati ottengono spesso una bassa reputazione sociale, ricevono poche scelte positive da parte dei compagni e molte negative: hanno, quindi, pochi scambi positivi nelle relazioni con i pari e il loro comportamento sociale è spesso percepito come negativo.

Anche Bolger e Patterson (2001) hanno dimostrato la relazione tra maltrattamento e rifiuto dei pari e, in più, hanno trovato un'interessante legame tra il rifiuto e la cronicità del maltrattamento: più il maltrattamento è perdurato negli anni, più alta è la percentuale di rifiuto dei bambini.

Un dato importante che emerge da alcuni studi è quello della trascuratezza come la forma di esperienza sfavorevole infantile più devastante per lo sviluppo del bambino. Ad esempio, Hoffman-Plotkin e Twentyman (1984) hanno trovato che i bambini trascurati sono, in genere, caratterizzati da un più basso numero di interazioni sociali rispetto ai soggetti che hanno subito altre forme di maltrattamento. Anche lo studio di Kendall-Tackett e Eckenrode (1996) ha rivelato che i bambini trascurati hanno i risultati scolastici peggiori e che i loro problemi disciplinari e relazionali aumentano costantemente nel corso di tutti gli anni scolastici.

Per quanto riguarda la spiegazione dei motivi per cui questi bambini vengono spesso rifiutati dai propri compagni, la maggioranza degli autori chiama in causa i problemi comportamentali, l'aggressività, le condotte antisociali ed esternalizzate che caratterizzano questi soggetti. Altri, invece, vedono nella difficoltà di regolare gli stati emotivi e nella tendenza ad attribuire ad altri intenzioni ostili le cause principali del rifiuto. In realtà, è molto probabile che questi fattori agiscano insieme.

5.4 E' interessante notare come da molti studi emergano delle *differenze in base al genere* in relazione alle conseguenze del maltrattamento; sembra cioè che maschi e femmine reagiscano in modi diversi alle esperienze precoci di maltrattamento. In generale, si evidenzia un migliore adattamento e funzionamento per il genere femminile, l'unica eccezione si riscontra nell'area emotiva in cui i maschi appaiono più controllati rispetto alle femmine.

Ad esempio, Bolger e Patterson (2001) hanno trovato che gli effetti del maltrattamento sui comportamenti aggressivi sono molto più evidenti nei soggetti di sesso maschile e questo gioca sicuramente a sfavore dell'integrazione di questi bambini nell'ambiente scolastico e di gioco.

Invece, per quanto riguarda l'espressione dei propri sentimenti una ricerca interessante è quella di Alessandri e Lewis (1996) i quali hanno esaminato l'espressione di orgoglio e vergogna di bambini maltrattati e non maltrattati in età prescolare di fronte a successi o insuccessi nella risoluzione di compiti. I risultati hanno mostrato uno specifico effetto-genere: le bambine maltrattate esprimono più vergogna in caso di insuccesso e meno orgoglio in caso di successo, sia rispetto alle bambine non maltrattate, sia rispetto ai maschi, maltrattati e non. Per quanto riguarda i bambini, essi esprimono livelli inferiori sia di vergogna che di orgoglio rispetto a tutti gli altri soggetti.

Si potrebbe, quindi, affermare che gli esiti negativi del maltrattamento vadano ad incidere più profondamente sul sistema comportamentale nei maschi e su quello emotivo nelle femmine; in altre parole, i bambini maltrattati incorrerebbero più frequentemente in problemi di condotte esternalizzate, mentre le bambine in problemi di condotte internalizzate.

5.5 Le ricerche principalmente focalizzate sulle *conseguenze sull'adattamento sociale in età adolescenziale e adulta* sono ancora poche, ma studi recenti hanno dimostrato che i soggetti adulti sopravvissuti ad abuso e/o maltrattamento spesso presentano grandi difficoltà in quest'area, hanno relazioni di bassa qualità, soffrono di disfunzioni nelle relazioni intime e presentano un concetto di sé particolarmente distorto, soprattutto per quanto riguarda la stima in sé stessi.

Drapeau e Perry (2004) suggeriscono che importanti aspetti dei traumi infantili vengono spesso internalizzati andando a colpire desideri, affetti e comportamenti dell'adulto e possono, quindi, giocare un ruolo cruciale per lungo tempo.

Anche Cole e Putnam (1992) si sono concentrati sugli effetti dell'incesto sul sé e sul funzionamento sociale in una prospettiva di sviluppo che va dall'infanzia all'età adulta. Essi hanno dimostrato che l'abuso sessuale provoca delle importanti deviazioni nei processi di definizione, regolazione e integrazione del sé, oltre che una compromissione delle capacità di sperimentare sensazioni di fiducia e confidenza nelle relazioni interpersonali, determinandole in quantità e qualità. Anche Lopez ed Heffer (1998) hanno esaminato l'impatto dell'abuso fisico sul concetto di sé e sulle competenze sociali in studenti universitari ed hanno, inoltre, valutato il ruolo della percezione del supporto genitoriale come mediatore delle conseguenze dell'abuso sull'adattamento sociale. Come predetto dagli autori, le analisi rivelano che i soggetti con una storia di abuso fisico hanno un concetto di sé estremamente basso.

Si è visto in precedenza come lo sviluppo delle emozioni possa essere gravemente compromesso da esperienze di maltrattamento in età infantile e diversi studiosi hanno dimostrato che questo effetto si protrae per tutta la vita.

McGee, Wolfe e Olson (2001) hanno esaminato la relazione tra maltrattamenti multipli, attribuzioni di colpa e adattamento in soggetti adolescenti. I risultati della ricerca mostrano, nel loro insieme, che la percezione e le attribuzioni che il soggetto maltrattato costruisce sulla sua esperienza di maltrattamento sono fondamentali nel determinare l'adattamento successivo. In particolare, più sono confuse e conflittuali peggiori saranno i problemi comportamentali osservabili.

Anche Liem e Boudewyn (1999) hanno dimostrato che l'abuso infantile e tutte le sue conseguenze sullo sviluppo possono provocare nell'adulto sentimenti di autocolpevolizzazione che, a loro volta, predicono un orientamento interpersonale caratterizzato dal bisogno di controllo sugli altri, da ipersensibilità ai giudizi delle altre persone, da ostilità e paranoia interpersonali e dalla vulnerabilità allo sfruttamento da parte degli altri.

E' interessante notare come molti degli studi esaminati mettano in evidenza il fatto che le conseguenze evidenziate non possono essere attribuite al basso stato socioeconomico dei soggetti, in quanto, comparati con un gruppo di controllo di uguale stato socioeconomico, essi si differenziano ugualmente da quest'ultimo a causa delle esperienze sfavorevoli infantili subìte.

6. Le conseguenze sulla salute

Una rassegna della letteratura che dobbiamo a Kendall-Tackett [28] (2001) mette a fuoco il fatto che le vittime di ESI soffrono spesso di *problemi di salute* per molto tempo dopo che l'abuso è terminato: è evidente che tale condizione avrà *conseguenze importanti sull'attività scolastica e lavorativa*.

Questi soggetti sono malati più di frequente e vanno più spesso dal dottore, lamentano più sintomi, sono meno inclini a descrivere il loro stato di salute come buono, sono sottoposti a chirurgia più frequentemente, sono maggiormente a rischio di avere una o più sindromi da dolore cronico. Nel suo studio sulle Esperienze Sfavorevoli Infantili, Felitti et al. (2001) documentano che i soggetti che hanno sperimentato quattro o più eventi sfavorevoli nell'infanzia sono maggiormente

[28] Kendall-Tackett K. (2002) The health effects of childhood abuse: four pathways by which abuse can influence health, *Child Abuse and Neglect*, 26, 715-729.

a rischio di un'ampia gamma di condizioni che comprendono: l'ischemia cardiaca, il cancro, l'infarto, la bronchite cronica, l'enfisema, il diabete, le fratture ossee e l'epatite. Dopo aver documentato la frequenza più alta di questi problemi, il passo seguente è capire perché ciò accada. Kendall-Tackett adotta un modello di quattro percorsi attraverso cui le esperienze infantili traumatiche possono influenzare la salute: percorsi comportamentali, sociali, cognitivi ed emotivi. È possibile subire l'influenza da ciascuno dei quattro percorsi o da tutti, e i diversi tipi si influenzano a vicenda, formando una complessa matrice di inter-relazioni, ognuna delle quali ha ricadute significative sulla salute.

6.1 *I percorsi a livello comportamentale*

Gli adulti vittime di maltrattamenti nell'infanzia sono più inclini a intraprendere attività dannose e pericolose, tutte ovviamente dannose per la salute.

Corrono maggiori rischi di abusare di alcool e droghe: ad esempio donne sopravvissute all'abuso sessuale avevano 10 volte più probabilità di avere una storia di dipendenza da sostanze e 2 volte più probabilità di essere alcolizzate rispetto al gruppo di controllo. Anche il fumo è più diffuso fra coloro che hanno una storia di abusi infantili.

Anche l'obesità è più comune fra gli adulti vittime di abuso nell'infanzia. In uno studio di 131 pazienti con una storia di incesto, il 60% erano più di 22 kg in sovrappeso, rispetto al 28% del gruppo di controllo. Anche se i risultati degli studi non sono tutti concordi, emerge che un numero significativamente maggiore di donne con bulimia riporta episodi di abuso sessuale da parte del genitore.

Fra gli adulti sopravvissuti ad abusi infantili sono molto comuni anche i tentativi di suicidio e l'ideazione suicidaria. In un campione europeo, il 43% di vittime di CSA avevano ideazione suicidaria e il 14% aveva compiuto tentativi di suicidio.

I comportamenti sessuali ad alto rischio sono la forma più documentata di comportamenti autolesivi nelle vittime di abuso sessuale, dato valido per i maschi e per le femmine e coerente attraverso la varietà di orientamenti sessuali. Le giovani donne con un passato di abusi sessuali (particolarmente se con rapporto completo) riportavano età più precoci di inizio dell'attività sessuale consensuale e percentuali più alte di gravidanze in adolescenza, di aborti, di partner sessuali multipli, di rapporti non protetti e di malattie sessualmente trasmissibili.

Gli adulti vittime di abusi infantili spesso hanno problemi di sonno. In uno studio su vittime di abusi infantili di lingua tedesca, il 68% ha riportato di avere disturbi di sonno, con il 45% che raccontava di incubi ripetuti. Le persone che dormono poco in modo cronico sono più soggette a infezioni e malattie e hanno più probabilità di avere incidenti e difficoltà del sonno possono anche preannunciare il corso più grave e cronico di una depressione.

6.2 *I percorsi a livello sociale*

Per mantenere relazioni sociali positive e reciproche occorre saper interpretare i segnali sociali, farsi valere e trovare persone che non sfruttino e abusino degli altri. Queste capacità sono significativamente influenzate da esperienze infantili sfavorevoli, che portano spesso a vivere successivamente relazioni di sfruttamento o di vittimizzazione, isolamento dagli altri, insoddisfazione delle relazioni in corso.

Gli adulti che sopravvivono all'abuso possono adottare uno dei due seguenti stili interpersonali: evitante o intrusivo. Le persone con uno stile evitante hanno pochi legami interpersonali e pochi amici, sono meno inclini ad essere coinvolti in relazioni con gli altri e a sposarsi. Le persone con uno stile intrusivo hanno estremo bisogno di vicinanza. Questi due pattern comuni fra gli adulti vittime di abusi infantili sono stati anche connessi con i comportamenti relativi alla salute.

Le persone il cui stile primario è evitante, caratterizzato da una scarsa interdipendenza, da una bassa rivelazione di sé e da poco calore, possono avere problemi perché sono troppo arroganti e ostili per seguire prescrizioni mediche e consigli di promozione della salute (per esempio fare esercizio fisico) e di autoprotezione (come per esempio indossare le cinture di sicurezza). Quelle con uno stile di intrusivo, che comporta il focalizzarsi sugli altri ed escludere sé, possono avere problemi di salute perché non riescono ad occuparsi di sé.

Anche la rivittimizzazione è relativamente comune fra gli adulti che sopravvivono ad abusi infantili.

Per esempio, le donne con una storia di abusi sessuali nell'infanzia hanno più probabilità di essere violentate o abusate in ambito domestico e sul lavoro da adulte. Trascuratezza fisica e qualunque tipo di abuso sessuale sono le più frequenti premesse della rivittimizzazione. La rivittimizzazione è ancora più frequente nei campioni patologici. In uno studio con 93 donne adulte che si presentavano al pronto soccorso psichiatrico, viene messo in luce che l'abuso sessuale era correlato a rischi maggiori di tentativi di violenza, di stupri e di aggressioni fisiche.

Queste esperienze influenzano la salute nell'immediato attraverso le ferite e il rischio di morte e accrescono la possibilità di contrarre una serie di malattie sessualmente trasmissibili. Si può produrre anche uno stato cronico di stress, che può portare le vittime a cercare un'automedicazione attraverso l'abuso di sostanze, il cibo e il fumo. Inoltre lo stress cronico può portare all'elevazione dei livelli di trigliceridi nel sangue, di colesterolo, di glucosio e di insulina, i quali sono tutti legati a problemi cardiovascolari e al diabete.

All'estremo delle distorsioni comportamentali sta l'essere senza fissa dimora ('homeless'). Sono state trovate fra i senzatetto percentuali doppie di storie di abusi sessuali e quasi doppie di violenza fisica, rispetto a quelle rilevate fra gli intervistati con fissa dimora ugualmente sostenuti dall'assistenza pubblica. Questa condizione ha effetti negativi sulla salute in molti modi: fame e malnutrizione, esposizione all'inclemenza del tempo, mancanza di cure mediche, di igiene quotidiana, maggior rischio di lesioni fisiche e di abuso di sostanze sono significativamente correlate a maggiore incidenza di malattie del fegato, ictus, lesioni, traumi, deficienze alimentari, malattie mentali, ipertensione, malattie polmonari e circolatorie.

6.3 *I percorsi a livello cognitivo*

Le credenze e gli atteggiamenti che modellano l'esistenza quotidiana di una persona possono avere un impatto importante sulla salute.

Quando i bambini subiscono abusi sviluppano modelli operativi interni tali per cui vedono il mondo come un posto pericoloso. Poiché sono stati impotenti in passato, essi tendono a sovrastimare i pericoli e le avversità nel loro ambiente circostante e a sottostimare la loro percezione di autoefficacia e del proprio valore nell'affrontare pericoli reali o percepiti. Questi pensieri possono anche influenzare la salute: quando le persone vedono un evento o una circostanza come negativa, il loro corpo rilascia il cortisolo, che a livelli costantemente elevati può sopprimere il sistema immunitario, rallentare la cicatrizzazione delle ferite e danneggiare il cervello.

La fiducia interpersonale può anche influenzare quanto a lungo vive una persona. Alti livelli di fiducia aumentano le aspettative di vita, si associano con punteggi migliori di autovalutazione della salute e della soddisfazione di vita. In uno studio, le vittime di abusi sessuali manifestavano nel complesso una minore soddisfazione della loro condizione di salute. In diversi studi le vittime di abuso si descrivono in salute in percentuale minore rispetto al gruppo di controllo.

6.4 *I percorsi a livello emotivo*

Le emozioni negative sono potenziali minacce per la vita.

La depressione è una delle conseguenze più frequenti di abusi passati. Gli adulti che subiscono un abuso sessuale nell'infanzia hanno quattro volte più rischi di sviluppare una depressione maggiore rispetto agli altri. E' stato rilevato anche che l'abuso sessuale infantile forniva un contributo alla varianza nella depressione indipendentemente dagli altri eventi negativi nell'infanzia. I loro sintomi includono disturbi del sonno, fatica cronica, sconforto e attacchi di pianto.

La depressione è un immunosoppressore ben conosciuto ed è dimostrato che può influenzare il sistema immunitario anche a livello dei globuli bianchi, in modo particolare nei soggetti che hanno una depressione maggiore, che tendono ad avere livelli di cortisolo eccessivamente alti. La depressione può influenzare i comportamenti di prevenzione e autoprotezione, può avere anche un impatto negativo sul sonno, riducendo i tempi del sonno di quarta fase (delta) e incrementando il

sonno nella fase REM, che indica un accresciuto arousal. Le donne che soffrono di depressione maggiore sono più a rischio di problemi cardiaci come l'infarto. I soggetti depressi sono 3 volte più a rischio di mortalità cardiaca, di evoluzione da angina instabile ad infarto. Le persone depresse hanno le stesse probabilità di avere un attacco di cuore delle persone con disfunzione ventricolare o con grave arteriosclerosi coronarica. Un altro studio ha rilevato che la depressione è legata in modo significativo alla qualità di vita successiva a un infarto del miocardio. La depressione maggiore presenta spesso un alto indice di comorbilità con il PTSD.

Più dell'80% delle vittime di abusi sessuali nell'infanzia riportano di avere sintomi post-traumatici che comprendono: l'ipervigilanza, i pensieri intrusivi e improvvisi flashback intrusivi dell'esperienza di abuso. L'abuso nell'infanzia sembra rendere le persone più vulnerabili a sviluppare PTSD quando si trovano esposti nella vita presente ad eventi stressanti. Il PTSD è stato descritto come un disordine con alta comorbilità e si presenta frequentemente insieme alla depressione, ai disturbi di ansia, all'abuso di alcol o droghe, al fumo. Il PTSD può condizionare anche i legami sociali: le persone hanno più probabilità di divorziare e avere problemi familiari, di commettere o di tentare suicidio e hanno meno probabilità di completare gli studi. Il PTSD può anche portare a problemi di sonno (specialmente di insonnia e incubi cronici) che possono accrescere il rischio di ferite o di morte come conseguenza di incidenti in casa, sul lavoro o in auto.

6.5 *Implicazioni cliniche*

Come si vede, la "salute" dipende da una rete complessa di comportamenti, pensieri, emozioni e connessioni sociali che non solo si influenzano a vicenda, ma influenzano anche la salute stessa. Le esperienze sfavorevoli infantili possono influire sulla salute ad uno o più di questi livelli e questi percorsi possono variare in ciascun singolo paziente. Chi opera nel campo sanitario deve impegnarsi per trovare un approccio che affronti tutti questi percorsi, evitando l'attuale scissione fra i trattamenti per la salute mentale e comportamentale e le cure per la salute fisica.

- Valutazione del Trauma e Modelli di Cura

Che cosa è un trauma?

- Definizione (NASMHPD, 2004): *National Association of State Mental Health Program Directors*

Un'esperienza di violenza interpersonale come l'abuso sessuale, il maltrattamento fisico, la trascuratezza grave, perdita e / o violenza assistita, terrorismo e / o disastri

Vorrei attirare la vostra attenzione sul fatto che non stiamo parlando solo di violenza fisica, perché qui si noterà che in questa definizione sono inclusi l'abbandono e la perdita di persone significative.

Che cosa è un trauma?

DSM-IV-TR (APA, 2000)

"Un evento che la persona ha vissuto, cui ha assistito o con il quale si è confrontata che ha comportato morteo o minaccia di morte o lesioni gravi o pericolo per l'integrità fisica propria e/o di altri ".

La risposta della persona comprende paura intensa, impotenza o orrore (Ibid)

Tipi di trauma che hanno conseguente gravi e persistenti sulla salute mentale:

- Di solito non è un unico evento ad esempio stupro, calamità naturali
- Sono di natura interpersonale: intenzionali, prolungati, ripetuti e gravi
- Si verificano durante l'infanzia e l'adolescenza e possono protrarsi

(Terr, 1991; Giller, 1999)

La letteratura degli ultimi 5 anni converge nel ritenere che i traumi più dannosi sullo sviluppo e che provocano gravi e persistenti problemi di salute mentale di solito non hanno carattere episodico e non si tratta di singoli eventi. Piuttosto, sono eventi che si verificano spesso all'interno di uno schema ripetitivo. Ovviamente ciò non significa che uno stupro, la perdita improvvisa di un familiare, un terribile incidente o una catastrofe naturale non comportino conseguenze o segni e sintomi derivanti da quella specifica esperienza traumatica. Qui si vuole approfondire gli effetti, sullo sviluppo, di esperienze traumatiche ripetitive e non di singoli eventi. Il principio generale è che si devono collocare tali esperienze nel contesto della storia peculiare dell'individuo.
Questi eventi sono il più delle volte di natura interpersonale, sono intenzionali hanno cioè lo scopo di danneggiare l'altra persona.Sono prolungati, ripetuti, come ho detto prima, e gravi. Spesso iniziano durante l'infanzia, l'adolescenza e continuano in età adulta.

Definizione di Trauma Informed Care
Il trattamento Salute Mentale che è diretto a:
- una conoscenza approfondita degli effetti neurologici, biologici, psicologici e sociali del trauma e della violenza sul singolo
e,
- la constatazione di un'alta prevalenza di esperienze traumatiche nei pazienti in cura presso i servizi di salute mentale. (Jennings, 2004)

Il Trauma Informed Care è un termine relativamente recente in letteratura negli ultimi cinque o sei anni, anche se molti professionisti negli USA e in altri paesi hanno lavorato su questi problemi per molti anni. La cura dei traumi ha avuto un forte impulso dopo la seconda guerra mondiale, per l'elevata incidenza e prevalenza di PTSD nei soldati e dagli studi sulla violenza domestica.
Questi due diversi campi di studio si sono riuniti in questi ultimi anni per approfondire l'effetto complessivo del trauma e della violenza sugli esseri umani e sui pazienti con gravi e persistenti problemi di salute mentale.
Il Trauma Informed Care è una prospettiva di studi che intende approfondire la conoscenza degli effetti neurologici, biologici, psicologici e sociali del trauma e della violenza sull'essere umano, partendo dal presupposto che vi è un'alta prevalenza di esperienze traumatiche nelle persone in carico ai servizi di salute mentale.
Questo non è comunemente conosciuto e riconosciuto, quindi ho intenzione di spiegare meglio questa affermazione

Prevalenza del Trauma & Implicazioni

L'esposizione al Trauma nella Popolazione generale
- Fino a poco tempo, l'esposizione a eventi traumatici era concepito unilateralmente come un evento raro (guerra, disastro)
(Kessler et al., 1995)

La ricerca recente ha cambiato questa prospettiva. Gli studi compiuti negli ultimi dieci anni indicano che l'esposizione al trauma è comune anche nella classe media (Ibid)

- Il 56% della popolazione adulta riporta almeno un evento di natura traumatica (Ibid)

Ciò che noi ora sappiamo, in termini di popolazione generale, è che le esperienze di natura traumatica sono molto più diffuse di quanto abbiamo mai pensato. Gli studi effettuati nell'ultimo decennio indicano che l'esposizione trauma è abbastanza comune, anche nella classe media. Il 56% della popolazione adulta, in uno studio fatto da Kessler nel 1995, riporta almeno un evento traumatico

Prevalenza del Trauma nella popolazione in carico ai centri pubblici di salute metale
- 90% dei pazienti in carico ai servizi pubblici di salute mentale sono stati esposti (Muesar et al, in corso di stampa, Muesar et al, 1998.)
- La maggior parte ha molteplici esperienze di natura traumatica
(Ibid)
- Il 34-53% ha ricevuto abuso sessuale o fisico nell'infanzia
(Kessler et al, 1995; MHA NY & NYOMH 1995)
- Il 43-81% riferisce un certo tipo di vittimizzazione
(Ibid)

Muesar e colleghi riferiscono % allarmanti. Il 90% dei pazienti seguiti dai servizi pubblici di salute mentale sono stati esposti a traumi. La maggior parte ha avuto molteplici esperienze traumatiche.

Il 34% e fino al 53% delle persone che cercano un trattamento clinico riferisce un abuso sessuale e/o fisico e fino all'81% segnala un qualche tipo di vittimizzazione.

Prevalenza del Trauma sulla salute mentale
- Il 97% delle donne senza fissa dimora con SMI è reduce da esperienze di grave abuso sessuale e fisico – nell'87% dei casi l'abuso è accaduto sia in epoca infantile che in età adulta
(Goodman et al., 1997)
- Gli attuali tassi di PTSD nelle persone con SMI variano dal 29 al 43%
(CMHS / HRANE, 1995; Jennings & Ralph, 1997)
- Ci troviamo di fronte a una epidemia nella popolazione in cura presso il sistema sanitario statunitense
(Ibid)

Il 97% delle donne senza fissa dimora con gravi malattie mentali ha subito gravi abusi fisici e sessuali e l'87% di queste persone hanno avuto queste esperienze sia da bambini che da adulti. Gli attuali tassi di PTSD in persone con gravi malattie mentali in questo studio è salito al 43%, un dato significativamente superiore a quanto indicato nel DSM-IV. Sembra che il PTSD sia un'epidemia nella popolazione in cura nel sistema pubblico di salute mentale, in questo ampio studio fatto nella Carolina del Sud. Quindi, come potete vedere, la questione del trauma, anche se deve ancora essere ulteriormente studiata, sembra avere un impatto nella maggioranza dei nostri pazienti.

Prevalenza del Trauma
Che cosa questo significa ...
- La maggior parte di adulti e bambini in degenza nei reparti psichiatrici presenta storie di traumi
(Cusack et al, Muesar et al, 1998; Lipschitz et Al., 1999, NASMHPD, 1998)
"I professionisti potrebbero pensare che l'abuso costituisca un problema ulteriore per la persona, piuttosto che il problema centrale ... "
(Hodas, 2004)

Significa che ora abbiamo bisogno di integrare le nostre conoscenze con la constatazione che la maggior parte dei bambini, giovani e adulti che entrano nei nostri sistemi di cura hanno vissuto un trauma significativo nella loro vita e che esperienze traumatiche significative hanno probabilmente complicato i sintomi e i

segni del disagio psichico. I professionisti sanno constatando che il trauma, piuttosto che essere un problema aggiuntivo in realtà è il problema centrale.

Impatto del trauma nel ciclo di vita
- Gli effetti sono neurologici, biologici, psicologici e sociali in natura, tra cui:
- Cambiamenti nella neurobiologia del cervello
- Compromissione sociale, emotiva e cognitiva
- L'adozione di comportamenti a rischio per la salute (disturbi alimentari, tabagismo, tossicodipendenza, autolesionismo, promiscuità sessuale, esposizione a violenza)
- Deficit gravi e persistenti nel comportamento, nella salute e problemi sociali, morte precoce

(Felitti et al, 1998; Herman, 1992)

L'impatto del trauma sulla vita compre effetti neurologici, biologici psicologici e sociali. Ora siamo in grado di osservare i cambiamenti della neurobiologia del cervello. Una conseguenza è anche la generale riduzione delle abilità sociali, emotive e cognitive; in altre parole, il modo di relazionare con gli altri, il modo di sentire e il modo di pensare sono domini colpiti dal trauma. Le persone reduci da gravi traumi sembrano adottare tassi più alti di comportamenti a rischio per la salute. Solo poche settimane fa, il Consiglio Direttivo del NASMHPD ha avuto un incontro dove si è discusso dei tassi di morbosità e mortalità delle persone che sono in cura presso i servizi pubblici di salute mentale. Si è concluso che le persone con gravi malattie mentali sembrano morire molto prima (15-20 anni o forse più) rispetto alla popolazione generale. Questo è un problema significativo.

Impatto del trauma sullo sviluppo

La capacità di formare relazioni sane dipende in larga misura dalle competenze sociali apprese
- L'apprendimento di abilità sociali dei bambini è direttamente correlato alle caratteristiche del loro ambiente
- Ambienti caotici = competenze disfunzionali
- La violenza insegna ritiro, ansia, sfiducia, reazione eccessive e / o aggressività, problemi nel comportamento
- I comportamenti estremi sono radicati nella disregolazione degli stati emotivi

(NF Commission, 2003; SG Report, 1999; Hodas, 2004; Saxe, 2003)

Un paio di osservazioni riguardanti l'impatto del trauma sullo sviluppo. La ricerca ha dimostrato che la capacità di formare relazioni sane è fortemente dipendente dalle abilità sociali, di solito acquisite dai caregivers. L'apprendimento delle abilità sociali nei bambini è ovviamente direttamente correlato alle caratteristiche ambientali. Stiamo anche vedendo che la violenza, crescere in ambienti violenti produce ritiro sociale, ansia, sfiducia, reazione eccessive o ciò che noi chiamiamo iper-vigilanza e/o aggressività come meccanismi di adattamento, e che i comportamenti estremi, gravemente problematici sono radicati in stati emotivi disregolati. La persona non ha imparato a gestire le proprie emozioni, fondamentalmente un compito normale dello sviluppo che tutti abbiamo bisogno di apprendere precocemente.

Bambini traumatizzati: Osservazioni ed esperienze
- Appaiono trascurati e ansiosi
- Sono difficili da gestire e sostenere
- Sono emotivamente molto reattivi
- Hanno difficoltà "ad assestarsi" dopo le esplosioni
- Tendono a essere rivendicativi
- Non si assumono la responsabilità del comportamento
- Ripetono gli stessi errori più e più volte

(Hodas, 2004)

Desidero solo che vi ricordiate che molto spesso i pazienti adulti in cura nei centri di salute mentale provengono dai servizi per l'infanzia. Hodas, Direttore del State Medical for the Children's System in Pennsylvania, ritiene che trauma e comportamento abbiano una relazione diretta in molte di queste situazioni e che, molto spesso, le esperienze traumatiche e gli stili di vita caotici che questi bambini hanno appreso sono in effetti strategie comportamentali. Così è, anche se questi comportamenti ci appaiono (come adulti e professionisti) molto problematici e molto danneggianti, per quel bambino hanno un significato e sono stati incorporati come strategia di coping comportamentale.

Il Nucleo del problema: Evitamento della Vergogna e dell'Umiliazione
- Gilligan, nella sua ricerca sui detenuti ha identificato i vissuti di vergogna / umiliazione come elemento chiave della violenza. Egli dice:

"Il motivo psicologico alla base dei comportamenti violenti è il desiderio di allontanare o eliminare i sentimenti di vergogna e umiliazione – vissuti dolorosi che possono divenire intollerabili e sostituiti con ... un sentimento di orgoglio "

(Hodas, 2004

Un'altra questione fondamentale emersa di recente riguarda i vissuti prevalenti, come la vergogna e l'umiliazione. Gilligan, nella sua nota ricerca, ha identificato la vergogna e l'umiliazione come vissuti fondamentali nei comportamenti violenti. "... Talvolta, l'aggressività e la violenza sono una strategia con la quale i bambini o le persone dominate da vergogna e/o umiliazione riprendono il controllo del proprio ambiente.
James Garborino che ha scritto Lost Boys e altre pubblicazioni ha inoltre individuato questi vissuti come un problema molto critico in termini predittivi della violenza, spesso l'unico modo che un bambino o un adolescente ha a disposizione quando è dominato dal caos.

Cosa succede quando la vittima del trauma è isolata?
- Alcuni studi hanno rilevato che i bambini isolati hanno esperito trascuratezza, senso di vulnerabilità e di vergogna
- Sentirsi in balia dei ricordi del trauma (abuso) originale
- Esprime sentimenti di paura, rifiuto, rabbia e agitazione (verbale ed espressiva)
(Wadeson et al, 1976; Martinez, 1999; Mann et al, 1993; Ray et al, 1996)

Alcuni studi hanno rilevato che i bambini isolati e privi di adeguato sostegno hanno vissuto una rilevante condizione di vulnerabilità, abbandono e vergogna. La maggior parte di loro ha riferito di ricordare più volte l'abuso originale che avevano subito; che hanno sperimentato ed espresso sentimenti di paura, rifiuto e di rabbia dopo l'evento traumatico.

Cosa succede quando la vittima del trauma è isolata?
- Riferisce di aver ricevuto punizioni
- Confusione sull'uso personale della forza
- Non si sente protetta dai pericoli
- Nutre sentimenti di amarezza e di rabbia dopo circa 1 anno dall'esperienza
(Wadeson et al, 1976; Martinez, 1999; Mann et al 1993; Mohr, 1999; Ray et al., 1996)

Molti adulti riferiscono di essere stati puniti; di sentirsi confusi circa l'uso personale della forza, di non capire cosa stesse accadendo e di sentirsi spaventati e spaventosi.

Non si sono sentiti protetti e in alcuni casi documentano sentimenti di amarezza e di rabbia un anno dopo l'evento.

Trauma Informed Care Systems – Principi-Guida

- Integrano la filosofia di cura che guida tutti gli interventi clinici
- Sono basati sulla letteratura corrente
- Includono la prospettiva della vittima
- Sono orientati dalla ricerca scientifica e dalle prove di efficacia
- Riconoscono che gli interventi coercitivi producono ulteriore vittimizzazione e che pertanto devono essere evitati

(Fallot & Harris, 2002; Ford, 2003; Najavits, 2003)

Un sistema trauma informato di cura integra gli approcci filosofici sulla cura e pratica interventi che hanno finalità congruenti con i principi ispiratori. Le prassi di cura si basano sulla letteratura attuale e comprendono la prospettiva del superstite. Il sistema di assistenza Trauma informato dedica tempo e spazio al paziente per apprendere il modo in cui vive il trattamento, quali sono i problemi che sta affrontando e valuta assieme a lui/lei l'efficacia degli interventi attuati. Dedica tempo e spazio al bambino, all'adulto e alla famiglia per ottenere il loro feedback. I Sistemi TIC sono molto attenti ad attuare pratiche aggiornate ai risultati delle più recenti ricerche e alle prove di efficacia.
Con questo intendo il fatto di dare attenzione costante agli interventi attuati, al perché del loro utilizzo e all'importanza dell'evidenza scientifica.
Infine, i sistemi di assistenza trauma informati riconoscono che l'intervento coercitivo in quanto tale causa trauma e isolamento nelle persone che hanno già avuto esperienze traumatiche e che quindi sono da evitare a tutti i costi.

Trauma Informato sistemi di assistenza - Caratteristiche principali

- Riconoscimento degli alti tassi di PTSD e altri disturbi psichiatrici relativi a esposizione al trauma nei bambini e negli adulti con SMI / SED
- Valutazione diagnostica precoce e riflessiva mirata al trauma nei pazienti gravemente compromessi e refrattari al trattamento

(Fallot & Harris, 2002; Cook et al, 2002; Ford, 2003; Cusack et al)

La diagnosi trauma-focused è rivolta anche ai pazienti che non sono in grado di identificare una esperienza traumatica vita, nell'ottica della diagnosi differenziale.

Sistemi di assistenza Trauma Informati - Caratteristiche principali
- Riconoscimento che i pazienti in trattamento sono frequentemente reduci da esperienze traumatiche, sia apertamente che segretamente
- Riconoscimento che la maggior parte del personale sanitario che si occupa di salute mentale non è formata sul trauma e sulle sue conseguenze, non lo riconosce e non lo tratta

(Fallot & Harris, 2002; Cook et al, 2002; Ford, 2003; Cusack et al,; Jennings, 1998; Prescott, 2000)

In altre parole, il personale sanitario non è in grado di mentalizzare le prassi quotidiane d'intervento e la struttura in cui lavora con "gli occhi del paziente", mettendosi nei suoi panni o in quelli della famiglia. Inoltre che la maggior parte del personale che lavora nell'ambito della salute mentale è disinformata sul trauma, sui suoi effetti. Non riconosce il trauma e pertanto non lo affronta.

Sistemi di assistenza Trauma Informati - Caratteristiche principali
- Valorizzare il paziente in tutti gli aspetti della cura
- Adottare un linguaggio neutrale e di supporto
- Individuare approcci personalizzati e flessibili
- Evitare che il paziente si senta umiliato

(Fallot & Harris, 2002; Cook et al, 2002; Ford, 2003; Cusack et al, Jennings, 1998; Prescott, 2000)

Sistemi di assistenza Trauma informati mettono il paziente al centro della cura. Adottano un linguaggio neutro e solidale, centrato sulla persona e non sulle etichette diagnostiche. Creano progetti individuali e flessibili nel pieno rispetto della persona.

Sistemi di assistenza Trauma Informati - Caratteristiche principali
- Sensibilizzazione / formazione del personale sul trauma, le sue conseguenze e il trattamento
- I servizi sono aperti a soggetti esterni:
- avvocati e consulenti clinici
- Formazione e supervisione nella valutazione e nel trattamento delle persone con storie di traumi

(Fallot & Harris, 2002; Cook et al, 2002; Ford, 2003; Cusack et al, Jennings, 1998; Prescott, 2000)

I Sistemi di assistenza Trauma informati sviluppano una forte consapevolezza sulle prassi d'intervento con i pazienti reduci da esperienze traumatiche e provvedono a garantire una costante formazione del personale in merito a questo. Sono aperti a soggetti esterni come gli avvocati della difesa e i consulenti clinici favorendo una collaborazione e fornendo loro feedback sul lavoro svolto. Incentivano la supervisione in modo da fornire un trattamento aggiornato e appropriato.

Sistemi di assistenza Trauma Informati - Caratteristiche principali
- Concentrarsi su ciò che è successo piuttosto su ciò che è sbagliato in te (Bloom, 2002)
- Formulare domande su eventuali vittimizzazioni attuali
- Affrontare glia spetti relativi alla sicurezza e i rischi per aiutare la persona a e individuare un piano di sicurezza
- Formulare le domande in modo sensibile e rispettoso
- Valutare l'affidabilità di pazienti psicotici e deliranti, sapendo che se le domande sono formulate in modo appropriato, anch'essi sono in grado di riferire esperienze traumatiche
(Rosenburg, 2002)

(Fallot & Harris, 2002; Cook et al, 2002; Ford, 2003; Cusack et al, Jennings, 1998; Prescott, 2000)

Nei Sistemi di assistenza Trauma informati le persone vengono avvicinate alla loro esperienza traumatica attraverso domande rispettose e sensibili. Si chiede "cosa ti è successo". L'ambiente dovrebbe essere tranquillo e riservato perché molto spesso si tratta di eventi difficili da raccontare e a volte questa è la prima occasione in cui il

paziente avverte un interesse verso la sua esperienza traumatica. Domande esplorative sul trauma possono essere rivolte anche a pazienti psicotici e deliranti, ma esse devono essere adattate e potrebbe essere necessario più tempo a disposizione per compiere un follow-up completo.

Sistemi insensibili al trauma

- I pazienti sono etichettati come manipolativi, bisognosi, in cerca di attenzione
- Uso improprio o eccessivo del potere
- Cultura del segreto – chiusura verso l'esterno e scarso monitoraggio del personale
- Il personale ritiene di essere il garante delle regole o di avere un ruolo-chiave in questo

(Fallot & Harris, 2002)

Vi invito a leggere le cartelle cliniche di molti reparti psichiatrici per verificare come il personale è stato addestrato a scrivere sui pazienti: descritti spesso come eccessivamente dipendenti, bisognosi di cure e attenzione, manipolativi, non collaboranti, aggressivi, non conformi alle regole. Vorrei sostanzialmente richiamare la vostra attenzione sul fatto che il personale avrà bisogno di formazione in materia di cura dei traumi, sugli approcci umanistici e olistici centrati sulla persona e sui suoi punti di forza.

Sistemi insensibili al trauma

- Scarso uso di pratiche alternative (incluse quelle farmacologiche) meno restrittive
- Enfasi sulla "complicità" piuttosto che sulla collaborazione
- Tendenza a punire e a svalutare il personale che poi "trasferisce" la mancanza di rispetto ai destinatari degli interventi.

- (Fallot & Harris, 2002)

Vedrete poco uso di interventi non restrittivi e alternativi ad eccezione di farmaci e quando si chiede al personale che cosa intendono per intervento non restrittivo, il più delle volte indicheranno quello farmacologico.
Sono le istituzioni che enfatizzano il rispetto piuttosto che la collaborazione, che sono imprigionate in molte regole e procedure pretese da molti interlocutori. Le regole e il loro rispetto sono l'argomento principale con gli utenti. Sole le istituzioni che indeboliscono e svalutano il proprio personale che poi "trasferiscono" la mancanza di rispetto verso i destinatari del servizio.

Sistemi insensibili al trauma - Caratteristiche correlate
- Alti tassi di pregiudizio
- Minore adesione al trattamento
- Alti tassi di denunce dei pazienti
- Più elevati tassi di turnover del personale, insoddisfazione professionale e burn-out
- Prolungamento dei trattamenti / aumento della recidiva

(Fallot & Harris, 2002; Massachusetts DMH, 2001; Huckshorn, 2001)

Impegno organizzativo nei Sistemi di cura formati sul Trauma

L'adozione di una politica sul trauma include:
- Impegno a valutare in modo appropriato il trauma
- Attenzione a evitare prassi d'intervento traumatizzanti
- Il coinvolgimento attivo degli amministratori
- Risorse disponibili per modificare e migliorare il sistema delle prestazioni
- Dare priorità alla formazione del personale

(Fallot & Harris, 2002; Cook et al, 2002)

Per organizzare un sistema di cura formato sul trauma è necessario un impegno forte dell'apparato dirigenziale. Questo non può essere fatto dal personale.
Gli amministratori e i dirigenti devono fornire le direzione, l'attenzione e le risorse per sostenere questo processo di cambiamento di grandi dimensioni. La formazione del personale è una priorità per sostenere il cambiamento.

Impegno organizzativo nei Sistemi di cura formati sul Trauma

- Personale esperto in grado di fornire consulenza sul trauma
- Personale specializzato per il sostegno del personale, se indicato

(Fallot & Harris, 2002; Cook et al, 2002)

Il personale che lavora con pazienti traumatizzati ha la necessità di usufruire facilmente a consulenza o a sostegno. Quello che abbiamo trovato in molti casi, girando per il Paese, sono operatori a loro volta traumatizzati. Hanno assistito agli stessi tipi di violenza, a volte sono stati vittime di violenza e non hanno ricevuto aiutoo. Quindi, i sistemi di cura che sono trauma formati si prendono cura del loro personale.

Impegno organizzativo nei Sistemi di cura formati sul Trauma

- La valutazione dei dati orienta la pianificazione del trattamento nel quotidiano lavoro clinico
- La sicurezza del personale e dei pazienti è un obiettivo prioritario
- Potere e controllo sono ridotti al minimo per favorire il coinvolgimento e l'integrazione

(Fallot & Harris, 2002; Cook et al, 2002)

Trauma Assessment- Scopi

- Identifica un trauma passato o attuale, la violenza, gli abusi, e valuta le sequele correlate
- Fornisce linee guida cliniche per i sintomi attuali e il recupero
- Riduce al minimo il pericolo di ri-vittimizzazioni

(Cook et al, 2002; Fallot & Harris, 2002; Maine BDS, 2000)

Ci sono diversi tipi di valutazioni del trauma attualmente utilizzate. Una buona valutazione del trauma vi aiuterà a definire un contesto per comprendere e curare la sintomatologia attuale.

Valutazione del trauma - Strumenti di misurazione per aumentare l'affidabilità diagnostica
– Post-Traumatic Diagnostic Scale for adults (Foa et al., 1997)
– Child PTSD Symptom Scale (Foa et al., 2001)
– Trauma Symptom Checklist for Children (Briere, 1995)
– Child Stress Disorders Checklist, CSDC (Saxe, 2003)

Questi sono solo alcuni strumenti di valutazione del trauma validi e affidabili.

Valutazione del trauma
- Follow-up continuo, preferibilmente effettuato dallo stesso clinico

(Ibid)

La valutazione del trauma richiede follow-up, preferibilmente con lo stesso clinico o con qualcuno che ha sviluppato un rapporto con la persona. Questi non sono argomenti facili da discutere e per molti potrebbe essere la prima volta che qualcuno esplora il trauma.

Valutazione del trauma
Deve includere:
Type: sexual, physical, emotional abuse or neglect, exposure to disaster
Age: when the abuse occurred
Who: perpetrated the abuse

- Valutazione dei sintomi come: dissociazione, flashback, iper-vigilanza, intorpidimento, selfinjury, ansia, depressione, scarso rendimento scolastico, problemi della condotta, problemi della sfera alimentare ecc.

(Ibid)

Valutazione del trauma

- Risultati e "risposte positive" devono essere esplorati e inclusi nella pianificazione, altrimenti la valutazione è inutile
- Non enfatizzare l'importanza dell'impegno terapeutico durante intervista
- Per i bambini, la valutazione è effettuata attraverso il gioco e l'osservazione del comportamento

(Ibid)

Il colloquio dovrebbe essere effettuato poco dopo il ricovero o subito dopo.
A volte non è facile, ma in generale, la maggior parte dei pazienti ha bisogno di essere avvicinata molto rapidamente al momento del ricovero per molte ragioni. Una è quella di gestire il rischio. L'importanza di creare una alleanza terapeutica durante la valutazione del trauma non può essere sottovalutata e, di nuovo, è necessario ricorrere a personale abbastanza bravo a creare una buona accoglienza.

Valutazione del trauma Altri fattori da valutare

- Precedenti ricoveri e cure farmacologiche anche obbligatorie
- Esperienze individuali in regime di ricovero ospedaliero
- Vissuti di paura, rabbia, impotenza e dissociazione,
- Senzatetto, dipendenza, violenza domestica
- Reazioni alla rivelazione (abbandono, protezione, riconoscimento?)
- Interesse a collaborare per la propria sicurezza e provvedere alla propria protezione

Preoccupazioni immediate che richiedono un intervento
- Esperienze traumatiche in corso, partner violento
- Mancanza di sicurezza in casa, comunità o trattamento imposto
- Se necessario, collaborare con altri servizi e agenzie (abusi su bambini, anziani, violenza domestica)

CLINICAL RESEARCH ARTICLE

Personality, posttraumatic stress and trauma type: factors contributing to posttraumatic growth and its domains in a Turkish community sample

Ayse Nuray Karanci[1]*, Sedat Işıklı[2], Ahmet Tamer Aker[3], Ervin İzmit Gül[1], Burçak Başbuğ Erkan[4], Hivren Özkol[1] and Hayal Yavuz Güzel[2]

[1]Department of Psychology, Middle East Technical University, Ankara, Turkey; [2]Department of Psychology, Hacettepe University, Ankara, Turkey; [3]Medical School Department of Psychiatry & Centre for Psychological Trauma and Disaster Studies, Kocaeli University, Kocaeli, Turkey; [4]Department of Statistics, Middle East Technical University, Ankara, Turkey

Background: Posttraumatic growth (PTG) is conceptualized as a positive transformation resulting from coping with and processing traumatic life events. This study examined the contributory roles of personality traits, posttraumatic stress (PTS) severity and their interactions on PTG and its domains, as assessed with the Posttraumatic Growth Inventory Turkish form (PTGI-T). The study also examined the differences in PTG domains between survivors of accidents, natural disasters and unexpected loss of a loved one.
Methods: The Basic Personality Traits Inventory, Posttraumatic Diagnostic Scale, and PTGI-T were administered to a large stratified cluster community sample of 969 Turkish adults in their home settings.
Results: The results showed that conscientiousness, agreeableness, and openness to experience significantly related to the total PTG and most of the domains. The effects of extraversion, neuroticism and openness to experience were moderated by the PTS severity for some domains. PTG in relating to others and appreciation of life domains was lower for the bereaved group.
Conclusion: Further research should examine the mediating role of coping between personality and PTG using a longitudinal design.

Keywords: *Domains of posttraumatic growth*; *personality traits*; *posttraumatic stress*; *traumatic event types*

Received: 2 February 2012; Revised: 4 May 2012; Accepted: 11 May 2012; Published: 5 June 2012

Although negative aftermaths of traumatic events have been studied extensively, interest in the positive changes following traumatic events, referred to as posttraumatic growth, stress-related growth, or benefit finding, have captured the interest of researchers relatively more recently (Calhoun & Tedeschi, 1999; Helgeson, Reynolds, & Tomich, 2006; Larner & Blow, 2011; Park & Helgeson, 2006). Posttraumatic growth (PTG) is defined as positive psychological change experienced/reported as a result of an individual's struggle to cope with traumatic events (Calhoun & Tedeschi, 1999; Morris, Shakespeare-Finch, Rieck, & Newbery, 2005; Tedeschi, 1999; Tedeschi & Calhoun, 2004). Research showed that PTG is reported following various types of traumatic life events, such as natural disasters (e.g., Cieslak et al., 2009; Karanci & Acarturk, 2005), accidents (e.g., Nishi, Matsuoka, & Kim, 2010; Shakespeare-Finch & Armstrong, 2010) and loss of a loved one (e.g., Davis, Michael, & Vernberg, 2007; Taku, Calhoun, Cann, & Tedeschi, 2008a).

Citation: European Journal of Psychotraumatology 2012, **3:** 17303 - http://dx.doi.org/10.3402/ejpt.v3i0.17303

Tedeschi and Calhoun (2004), in their functional descriptive model, proposed that PTG results from a metaphorically seismic event, shaking the fundamental schemas, beliefs and goals of the individual. This is followed first by automatic ruminations about the event and later with more deliberate ruminations, which leads to schema change and narrative development, and potentially to PTG. The Posttraumatic Growth Scale (PTGI: Tedeschi & Calhoun, 1996) is one of the most frequently used instruments for the assessment of post-traumatic growth. It taps five domains of PTG, namely appreciation of life; relating to others; personal strength; new possibilities; and spiritual growth (Taku, Cann, Calhoun, & Tedeschi, 2008b; Tedeschi & Calhoun, 2004).

Schaefer and Moos (1992), offered a comprehensive model on the determinants of positive changes following traumatic events, which explains positive change with respect to different factor clusters, covering pre-trauma (i.e., individual and environmental) resources, trauma characteristics (i.e., severity of exposure, impact) and post trauma factors (i.e., coping and appraisals). Schaefer and Moos's (1992) model clearly points out that pre-trauma characteristics, such as personality traits will have an effect on how the trauma impacts the individual. Thus, the present study examined the role of personality traits as a pre-trauma variable and the impact of the trauma as manifested in posttraumatic symptomatology, and finally their joint effects in predicting PTG and its domains.

Research focusing on personality as a pre-trauma variable has shown that openness to experience (Linley & Joseph, 2004; Tedeschi & Calhoun, 1996; Zoellner, Rabe, Karl, & Maercker, 2008), agreeableness and conscientiousness (Garnefski, Kraaij, Schroevers, & Somsen, 2008; Linley & Joseph, 2004), extraversion (Garnefski et al., 2008; Sheikh, 2004; Tedeschi & Calhoun, 1996; Val & Linley, 2006), and neuroticism (Evers et al., 2001; Garnefski et al., 2008) are correlated with PTG. Tedeschi and Calhoun (1996) showed that the personality traits of extraversion, openness to experience and optimism are specifically positively related with the dimensions of new possibilities and personal strength. However, there are also some studies failing to find a relationship between personality and PTG, like for optimism (Bostock, Sheikh, & Barton, 2009). Helgeson et al. (2006), in their meta-analysis on benefit finding, failed to find a relationship between neuroticism and PTG. In other studies, however, an inverse significant relationship was found between neuroticism and PTG (Evers et al., 2001; Garnefski et al., 2008). Zoellner et al. (2008), found that for motor vehicle accident survivors with high PTSD higher levels of optimism, and lower levels of openness was related to higher PTG, whereas for those with low levels of PTSD, lower levels of optimism, and higher levels of openness were related to PTG. Thus, in general research seems to support the role of some personality traits in shaping PTG. However, the contributory roles of different personality traits in domains of PTG and the interaction of personality traits with traumatic stress in contributing to PTG and its domains has not been extensively researched, and this is one of the aims of the present study.

Tedeschi and Calhoun (2004), in their model of PTG proposed that the more seismic the event the more likely it is to experience positive outcomes. This is related to the necessity to process the event and to search for meaning. Several studies, in agreement with the PTG model, have shown that individuals may experience both posttraumatic stress and PTG at the same time (Levine, Laufer, Hamama-Raz, Stein, & Solomon, 2008; Loiselle, Devine, Reed-Knight, & Blount, 2011; Morrill et al., 2008; Tedeschi & Calhoun, 1996). Morris et al. (2005) showed that there are moderate to strong correlations between PTSD symptoms and each domain of PTG. Although the direction of the relationship was positive for most domains, only for the appreciation of life domain they noted a negative relationship between growth and post-traumatic symptomatology.

Thus, it is important to examine the relationship of PTS symptoms and different domains of PTG. In one study with motor vehicle accident survivors, it was found that survivors without PTSD reported higher growth in the perception of personal strength and survivors with PTSD reported higher growth in the perception of appreciation of life and spiritual change (Nishi et al., 2010). Zoellner et al. (2008) found no differences in PTG total score between respondents with different levels of distress (conceptualized with levels of PTSD as measured by Clinician-Administered PTSD Scale). However, for sub-domains of PTG, they reported that those without PTSD had higher scores in perception of personal strength than the PTSD group, whereas those with PTSD scored higher in appreciation of life and spiritual change as compared to the non-PTSD group. Thus, it seems that the level of posttraumatic stress may have an influence on which domain growth is experienced within. Lower posttraumatic distress seems to be related with higher growth in the personal strength domain, whereas higher distress seems to be related with more growth in the appreciation of life and spiritual change domains (Nishi et al., 2010; Zoellner et al., 2008). One of the aims of the present study was to examine how posttraumatic symptomatology relates to the domains of PTG.

Although PTG and its domains have been studied extensively with survivors of different kinds of traumatic events, to our knowledge there are very few studies (e.g., Shakespeare-Finch & Armstrong, 2010) examining survivors of different types of traumatic events in the same study. Thus, one aim of the present study is to examine growth in the domains of PTG amongst the survivors of different types of traumatic events (i.e., accidents, natural

Citation: European Journal of Psychotraumatology 2012, 3: 17303 - http://dx.doi.org/10.3402/ejpt.v3i0.17303

disasters and unexpected death of a loved one). Death of a loved one, physical threat and life transition problems seem to lead to higher levels of PTG (Cummings & Swickert, 2010; Ickovics et al., 2006). The only study in which survivors of three types of events were compared in the same study showed that the bereaved group had higher growth in relating to others and appreciation of life domains as compared to survivors of sexual assault.

The purpose of the present study was to examine the contributory roles of personality traits, posttraumatic symptomatology and their interactions in PTG and its domains in a large community sample of adults, from a predominantly Muslim country, Turkey, experiencing diverse traumatic events. A secondary aim was to examine whether the survivors of different types of traumatic events differ in the domains of PTG. For this aim, the most frequently experienced events by the current sample, namely accidents, natural disasters and unexpected death of a loved one were used.

Based on previous research, it was hypothesized that openness (e.g., Linley & Joseph, 2004), agreeableness, conscientiousness (e.g., Garnefski et al., 2008; Linley & Joseph, 2004) and extraversion (e.g., Garnefski et al., 2008; Sheikh, 2004; Tedeschi & Calhoun, 1996) will be positively, whereas neuroticism will be negatively (e.g., Evers et al., 2001) related to PTG total. We also predicted that posttraumatic symptoms will have a positive relationship with the PTG total (e.g., Loiselle et al., 2011; Tedeschi & Calhoun, 1996). Since the role of personality traits and PTS severity on sub-domains of PTG have not been extensively studied in the literature, we made no specific predictions for the sub-domains of PTG and also for the impact of the types of traumatic events on the sub-domains of PTG. Thus, we aimed to explore the impact of personality traits, posttraumatic symptoms and their interactions on PTG and its domains. Similarly, we aimed to evaluate differences in domains of PTG between the survivors of accidents, natural disasters, and bereavement.

Method

Participants and procedure

The present study is part of a large scale study on the prevalence of traumatic events, posttraumatic stress disorder, posttraumatic growth. The participants were 969 adults, from a stratified cluster community sample provided by the Turkish Statistical Institute (TURKSTAT) for Ankara, the capital city, Kocaeli, in the Marmara region devastated by the 1999 earthquakes and Erzincan, with an experience of a devastating earthquake in 1991, in eastern Turkey. TURKSTAT used the data from the address based census information to provide a random sample of households. The calculation of the sample size was based on an expectation of 60% trauma prevalence and 5% error rate, based on the method suggested by Sümbüloğlu and Sümbüloğlu (1987), 700 households from Ankara, 600 from Kocaeli and 500 from Erzincan, with a total of 1,800 were drawn. Demographic characteristics of the total sample and the three provinces are given in Table 1.

Instruments

The Socio-Demographic Information Form had questions on participants' demographic features (age, sex, years of education, marital status: single/engaged, married, widow/er, divorced, other), work status (employed, unemployed, other), income (rated on a 5-point scale by the participant; 1: very low to 5: very high), previous history of mental illness (Yes/No), if yes then the type of treatment received (psychological treatment; medication; other) and whether they are currently receiving psychiatric treatment (Yes/No).

The Posttraumatic Diagnostic Scale (PDS) is a 49-item self-report instrument, developed by Foa, Cashman, Jaycox, and Perry (1997), to assess posttraumatic stress symptoms, based on the criteria of the Diagnostic and Statistical Manual of Mental Disorders, Fourth Edition-Text Revision (APA, 2000). The scale assesses the lifetime experience of various traumatic events, the most distressing event for the individual, and the potential PTSD diagnosis. For the present study, the severity of posttraumatic stress symptoms, assessed with 17 items (posttraumatic symptom severity scale-PTS) rated on a 3-point scale (total score ranging between 0 and 51) was used. The psychometric properties of the scale have been reported to be adequate (Foa et al., 1997).

The scale was adapted into Turkish by Isikli (2006), with satisfactory psychometric properties (Duru, 2006; Isikli, 2006). For the present study, the Cronbach's alpha value for the PTS, which was used as an indicator of posttraumatic distress was 0.90. In the present study the type of most distressing traumatic event chosen by the participants was used as "the type of traumatic event", the PTS score (total of 17 items) was used as a measure reflecting the severity of posttraumatic stress symptoms as a potential predictor of PTG and its sub-domains.

The Posttraumatic Growth Inventory (PTGI) is a 21-item scale, designed to measure the positive changes experienced after major life stressors (Tedeschi & Calhoun, 1996). Items are rated on 6-point scales (0 = I did not experience this change, 5 = I experienced this change to a very great degree). The reliability (Cronbach's alpha) coefficients of each factor were reported to be satisfactory.

Dirik and Karanci (2008) provided the Turkish translated version of the scale. For the present study the original five-factor model of PTG was tested with Confirmatory Factor Analysis (CFA) using EQS6.1 (Bentler, 1995; Byrne, 2006). Based on the robust statistics, the

*Income was rated on a five point scale by the participants.

hypothesized model fit our data very well (S-Bχ^2(179, $N = 1{,}253$) = 829.876, $p < 0.001$, $CFI = 0.98$; $RMSEA = 0.054$; *C.I.* 0.050, 0.058). The reliability (Cronbach's alpha) coefficients for the present sample were, new possibilities ($\alpha = 0.81$), relating to others ($\alpha = 0.84$), personal strength ($\alpha = 0.79$), spiritual change ($\alpha = 0.63$), and appreciation of life ($\alpha = 0.83$).

The Basic Personality Traits Inventory (BPTI) was developed by Gençöz and Öncül (in press) after identifying 226 commonly used adjectives in the Turkish culture to define different personality traits obtained from a sample of 100 participants. These adjectives were then administered to 510 participants to rate their own personalities on a 5-point scale. Factor analysis with varimax rotation yielded five factors in agreement with the literature and a sixth factor reflecting negative valence (e.g., being rude; insincere, having no manners). Forty-five items which had the highest loadings on the factors were chosen to form the BPTI. The 45 items inventory was then administered to a sample of 454 university students to evaluate the factor structure and psychometric properties. The test–retest (3 weeks) coefficients were between 0.74 and 0.84. The correlations of the personality dimensions with self-esteem, coping strategies and social support, STAI-S and STAI-T and PANAS supported its validity. The reliability

Citation: European Journal of Psychotraumatology 2012, **3**: 17303 - http://dx.doi.org/10.3402/ejpt.v3i0.17303

(Cronbach's alpha) coefficients for each subscale were found to be adequate.

Since the scale was developed and validated originally in a university student sample, exploratory factor analysis, with varimax rotation was used for the present community sample. As in the original, six factors, accounting for 44.96% of the total variance were obtained. The factors were agreeableness (15.96%); conscientiousness (9.68%), extraversion (6.66%), neuroticism (4.76%), negative valence (4.53%) and openness to experience (3.37%). Cronbach's alpha internal consistency coefficients of agreeableness, conscientiousness extraversion, neuroticism, negative valence, and openness to experience were 0.83, 0.78, 0.78, 0.76, 0.59 and 0.67 respectively for the present sample. Since the Cronbach's alpha for the negative valence dimension was relatively low, and since it is not a dimension researched in the literature, it was not included in the analysis of the present study.

Procedure

After obtaining approval from the Ethics Committee of Middle East Technical University (METU), fourth year students of the Psychology Departments of METU, Hacettepe and Kocaeli Universities were trained in administering the instruments. Subsequently, participants were visited in their homes based on the addresses provided by the TURKSTAT and were informed about the purposes of the study. They were asked to sign an informed consent form. When the household was contacted, first a list of all individuals above the age of 18 living in the household was obtained. Using the number of adults in a household and the last digit of the survey instrument, the Kish Table (Kish, 1965), providing a method for the random selection of an individual from a household, was used to determine the participant to be included from each household. The inclusion criteria were living in the household for at least 1 year and being 18 or above. Only one adult from each household was included in the sample. When the person chosen was not at home, an appointment was made to visit the household again. If the participant could not be reached in three visits, the procedure was discontinued. A total of 1,800 households were visited in the three provinces over a 6 month period in 2009. We were successful in reaching 1,253 out of 1,800 (69.61%) who accepted to participate. This rate seems to be quite expectable since some could not be contacted after three separate visits and some addresses were not occupied. Out of these 1,253, 1,055 (58.6%) reported to have experienced at least one traumatic event in their lives based on the list of events given in the PDS of Foa et al. (1997), and finally 969 (53.8%) chose one traumatic event that distressed them the most and the present study sample is comprised of these 969 participants. The administration took about 30 min. Participants were informed that they could stop any time and for those who expressed that they were still very distressed due to a traumatic event, we gave a list of mental health facilities that had accepted to give support to study participants.

Statistical methods

After inspection of the data and data cleaning procedures, correlation analysis and hierarchical multiple regression analysis were conducted using the SPSS 15.0 program (SPSS Inc., 2006). Six separate hierarchical multiple regression analyses were conducted to evaluate how well personality traits, posttraumatic stress (PTS) severity and their interaction terms predicted the total PTG score and its sub-domains while statistically controlling for the socio-demographic variables. The criterion variables were the total PTG score and the scores of the five sub-domains. The socio demographic variables (age, sex, and years of education) were taken as control variables in order to control for their possible confounding effects on the predictors and were entered into the equation with enter method in the first block. Personality traits (extraversion, conscientiousness, agreeableness, neuroticism, and openness) were entered into the second block, with the stepwise method. In the third block, posttraumatic stress (PTS) severity was entered into the regression model. It was hypothesized that personality traits would moderate the relationship between PTS severity and PTG scores. Therefore, the five two-way interaction terms (personality traits $\times$ PTS) were entered as a set in the final step. If there would be a coefficient not equal to zero at 0.05 then the reduced model was conducted. Finally, a simple slope analysis was conducted for significant interaction terms (Aiken & West, 1991; Jose, 2008).

To evaluate the differences in PTG domains between survivors of three different kinds of traumatic events (i.e., accidents, natural disasters and bereavement) a one-way multivariate analysis of variance (MANOVA) was conducted.

Results

Predictors of PTG and its domains: regression analyses

The Pearson product–moment correlations among the major predictors and criterion measures are presented in Table 2. As can be seen from the table, among the personality traits conscientiousness and agreeableness had significant correlations with all the domains and the total PTG. PTS severity had significant positive correlations with the total PTG score and most of its sub-domains.

Six separate hierarchical multiple regression analyses were conducted to evaluate how well personality traits,

*$p < 0.05$, one-tailed.
Note: PTG, total score of posttraumatic growth; PTS, total score of posttraumatic stress.

posttraumatic stress severity and their interaction terms predicted the total PTG score and its sub-domains while statistically controlling for the socio-demographic variables (see statistical methods section for details).

Total PTG

The variables in the final model (Table 3) accounted for 14% of the total variance in the total PTG, $R^2 = 0.14$, $F_{(14,901)} = 10.4$, $p < 0.001$. Thus, in the overall model, personality traits, PTS severity, and their interactions accounted for a significant portion of the variance in the total PTG score, after controlling for the socio-demographic variables.

Conscientiousness, agreeableness, openness to experience, posttraumatic stress symptom severity appeared significantly related to the total PTG score. Of the five two-way interaction terms entered at block four of the hierarchical regression, only PTS × extraversion interaction was significant, indicating that the regression of PTS severity on total PTG score varies as levels of extraversion vary. The slopes of the high and low levels of extraversion (Fig. 1) were found to be significant (simple slope = 0.03, $t = 5.7$, $p < 0.001$; simple slope = 0.011, $t = 2.2$, $p < 0.05$, respectively).

New possibilities

The variables in the final model (Table 3) accounted for 18% of the total variance in the score of new possibilities, $R^2 = 0.18$, $F_{(14,901)} = 12.5$, $p < 0.001$. Thus, in the overall model, personality traits, PTS severity, and their interactions accounted for a significant portion of the variance in the score of new possibilities while controlling for the socio-demographic variables. Agreeableness, openness to experience and PTS severity appeared significantly related to new possibilities. Of the five two-way interaction terms entered at block four of the hierarchical regression, only PTS × extraversion interaction was significant, indicating that the regression of PTS severity on the score of new possibilities varies as levels of extraversion vary.

The slopes of high and low levels of extraversion (Fig. 2) were found to be significant (simple slope = 0.03, $t = 5.9$, $p < 0.001$; simple slope = 0.01, $t = 2.8$, $p < 0.01$, respectively).

Spiritual change

The variables in the final model (Table 3) accounted for 13% of the total variance in the score of spiritual change, $R^2 = 0.13$, $F_{(14,901)} = 9.3$, $p < 0.001$. Thus, in the overall model, personality traits, PTS severity, and their interactions together accounted for a significant portion of the variance in the score of spiritual change while controlling for the socio-demographic variables.

Conscientiousness, agreeableness, and posttraumatic stress symptom severity appeared significantly related to the score of spiritual change. Of the five two-way interaction terms, only PTS × extraversion and PTS × neuroticism interactions were significant, indicating that regression of PTS severity on the score of spiritual change varies as levels of extraversion and neuroticism vary.

The slopes of high and low level of extraversion (Fig. 3) were found to be significant (simple slope = 0.05, $t = 6.3$, $p < 0.001$; simple slope = 0.02, $t = 2.7$, $p < 0.01$, respectively).

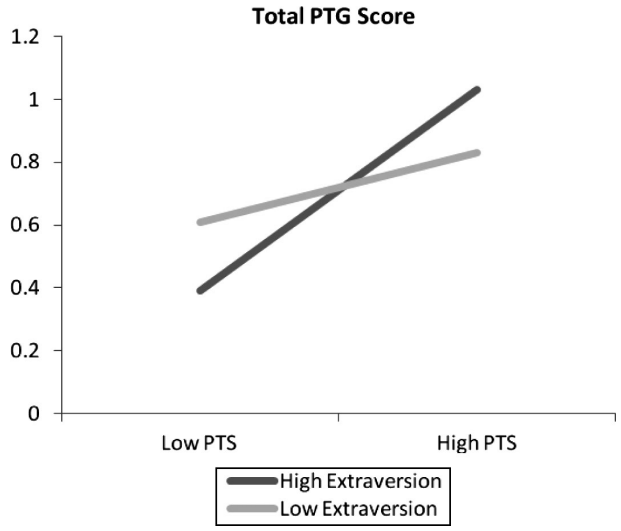

Fig. 1. The interaction of PTS severity and extraversion on the total PTG score.

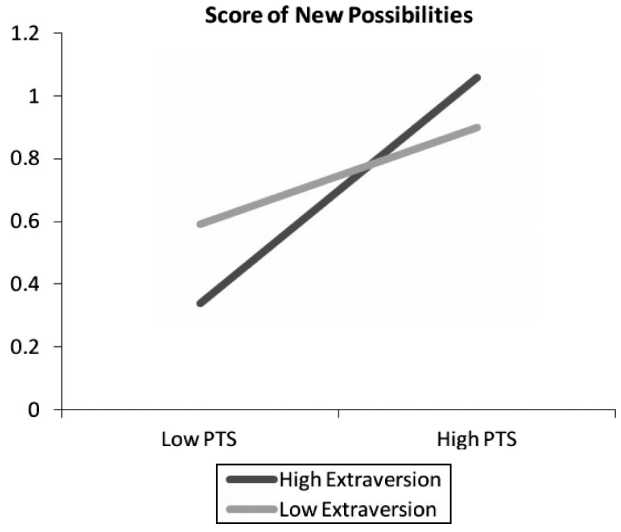

Fig. 2. The interaction of PTS severity and extraversion on the score of new possibilities.

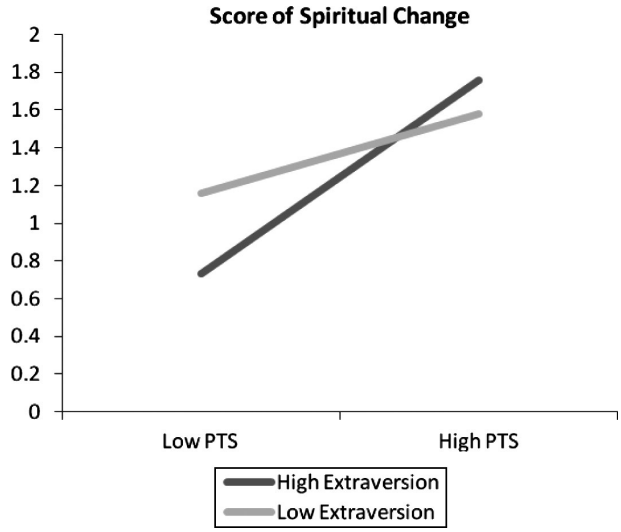

Fig. 3. The interaction of PTS severity and extraversion on the score of spiritual change.

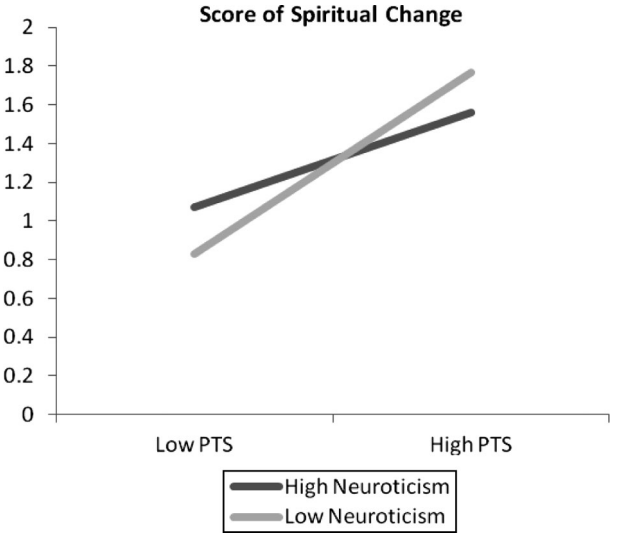

Fig. 4. The interaction of PTS severity and neuroticism on the score of spiritual change.

The slopes of high and low level of neuroticism (Fig. 4) were also found to be significant (simple slope $=0.02$, $t=3.6$, $p<0.001$; simple slope $=0.05$, $t=5.3$, $p<0.01$, respectively).

Relating to others

The variables in the final model (Table 4) accounted for 9% of the total variance of score of relating to others, $R^2=0.09$, $F_{(14,901)}=5.9$, $p<0.001$. Thus, in the overall model, personality traits, PTS severity, and their interactions together accounted for a significant portion of the variance in the score of relating to others while controlling for the socio-demographic variables.

Agreeableness, openness to experience and posttraumatic stress symptom severity appeared significantly related to the score of relating to others. Of the five two-way interaction terms entered at block four of the hierarchical regression, PTS $\times$ extraversion, PTS $\times$ conscientiousness and PTS $\times$ neuroticism interactions were significant, indicating that regression of PTS severity on the score of relating to others varies as levels of extraversion, conscientiousness and neuroticism varies.

The slope of high level of extraversion (Fig. 5) was found to be significant (simple slope $=0.02$, $t=3.3$, $p<0.001$). However, the slope of low level of extraversion was not significant (simple slope $=0.01$, $t=0.89$, $p>0.05$).

Result of the simple slope analysis (Fig. 6) revealed a significant slope of low level of conscientiousness (simple slope $=0.02$, $t=3.4$, $p<0.01$) but not for high

Table 4. Means and standard deviations on the dependent variables for the three groups

	Relating to others		Personal strength		Appreciation of life		Spiritual change		New possibilities	
Type of event	M	SD	M	SD	M	SD	M	SD	M	SD
A	1.6	1.3	2.3	1.5	2.7	1.6	2.2	1.5	1.5	1.4
ND	2.0	1.4	2.4	1.4	2.7	1.5	2.7	1.4	1.4	1.3
DLO	1.7	1.3	2.4	1.4	2.1	1.6	2.5	1.5	1.4	1.3

Note: A, accident; ND, natural disaster; DLO, death of loved one.

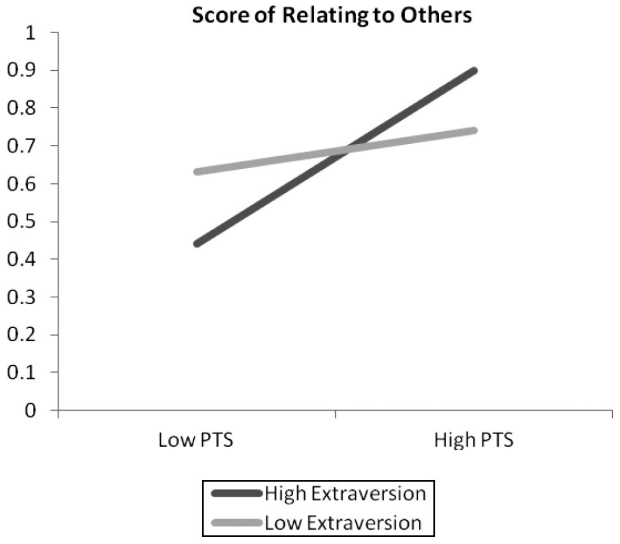

Fig. 5. The interaction of PTS severity and extraversion on the score of relating to others.

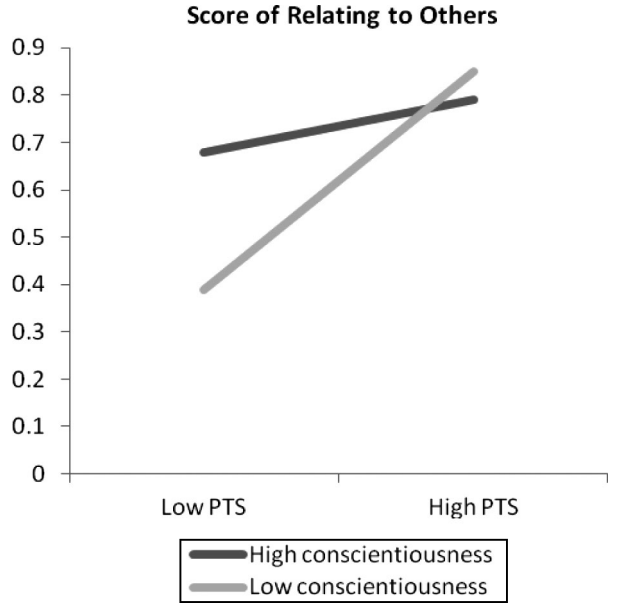

Fig. 6. The interaction of PTS severity and conscientiousness on the score of relating to others.

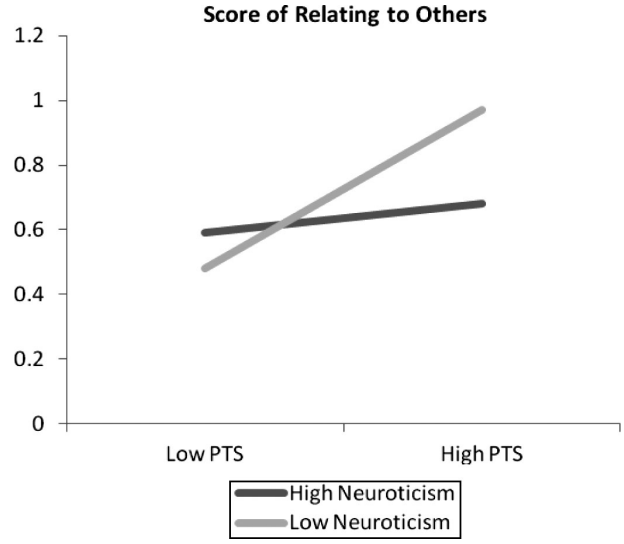

Fig. 7. The interaction of PTS severity and neuroticism on the score of relating to others.

level of conscientiousness (simple slope $=0.01$, $t=0.83$, $p>0.05$).

The slope of low level of neuroticism (Fig. 7) was found to be significant (simple slope $=0.02$, $t=4.2$, $p<0.001$). However, the slope of high level of neuroticism was not found to be significant (simple slope $=0.004$, $t=0.63$, $p>0.05$).

Personal strength

The final model (Table 3) accounted for 13% of the total variance of the score of personal strength, $R^2=0.13$, $F_{(14,901)}=9.1$, $p<0.001$. Conscientiousness, openness to experience and posttraumatic stress symptom severity were related to personal strength. Only the PTS $\times$ extraversion interaction was significant, indicating that regression of PTS severity on the score of personal strength varies as levels of extraversion vary.

The slopes of high and low level of extraversion (Fig. 8) were found to be significant (simple slope $=0.04$, $t=5.8$, $p<0.001$; simple slope $=0.02$, $t=2.7$, $p<0.01$, respectively).

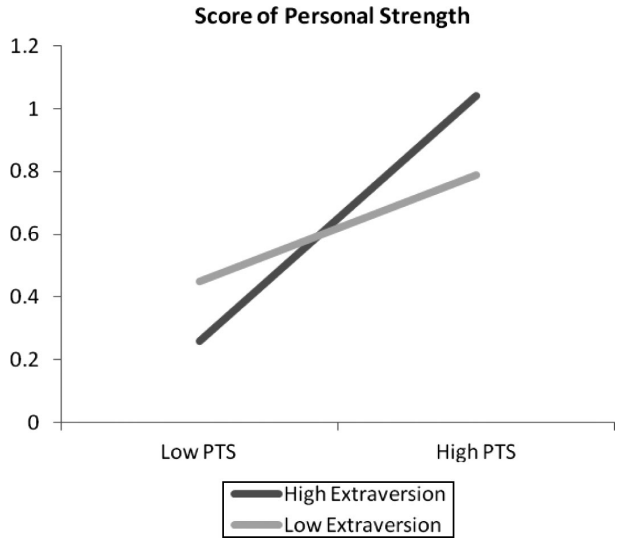

Fig. 8. The interaction of PTS severity and extraversion on the score of personal strength.

Appreciation of life

The variables in the final model (Table 3) accounted for 7% of the total variance of score of appreciation of life, $R^2 = 0.07$, $F_{(14,901)} = 5.1$, $p < 0.001$. Thus, in the overall model, personality traits, PTS severity, and their interaction together accounted for a significant portion of the variance in the score of appreciation of life while controlling for the socio-demographic variables.

Conscientiousness and agreeableness appeared significantly related to the score of appreciation of life. Of the five two-way interaction terms only PTS × openness was significant, indicating that regression of PTS severity on the score of appreciation of life varies as levels of openness to experience vary.

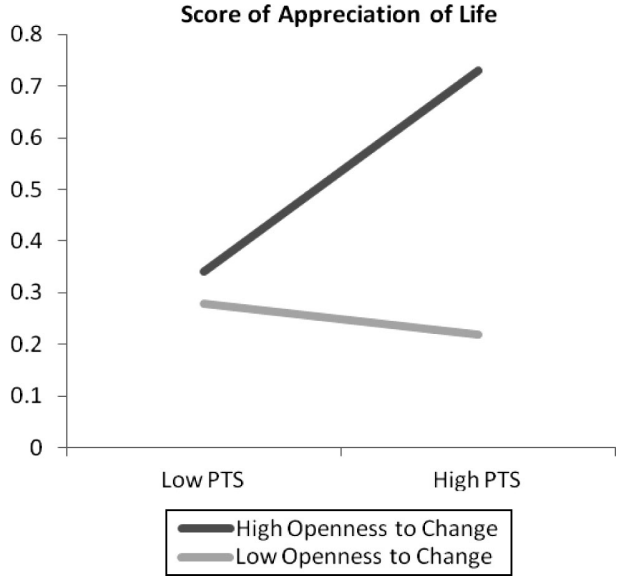

Fig. 9. The interaction of PTS severity and openness to change on the score of appreciation of life.

The slope of the high level of openness to change (Fig. 9) was found to be significant (simple slope = 0.02, $t = 2.3$, $p < 0.01$). However, the slope of the low level of openness to experience was not found to be significant (simple slope = −0.002, $t = 0.45$, $p > 0.05$).

Effects of the type of event experienced

The three most frequently experienced traumatic events by our sample were, accidents (11%; $N = 107$), natural disasters (28.1%; $N = 272$) and unexpected death of a loved one (40.6%; $N = 393$). A one-way multivariate analysis of variance (MANOVA) was conducted to determine the effect of being a survivor of these three types of traumatic events on the five domains of the PTG. Significant differences were found among the three types of events on the dependent measures, Wilks' $\Lambda = 0.89$, $F_{(10,1518)} = 8.8$, $p < 0.001$. The multivariate η^2 based on Wilks' Λ was not found to be strong, 0.06. Table 4 contains the means and the standard deviations of the dependent variables for the three groups.

Analysis of variances (ANOVA) on each dependent variable was conducted as follow-up test to the MANOVA. Using the Bonferroni method, each ANOVA was tested at the 0.01 level. The ANOVA on relating to others and appreciation of life score were significant, $F_{(2,763)} = 6.1$, $p < 0.01$, $\eta^2 = 0.02$; $F_{(2,763)} = 16.5$, $p < 0.01$, $\eta^2 = 0.04$, respectively. On the other hand the ANOVA on personal strength, spiritual change and new possibilities were not significant.

Post hoc analysis to the univariate ANOVA for relating to others and appreciation of life scores consisted of conducting pairwise comparisons to find significant differences between types of events in terms of the score of two sub-domains of PTG. Each pairwise comparison was tested at the 0.01 divided by 3 or 0.003 level. There were significant differences between group of natural disaster and group of death of loved one in terms of relating to other score (Table 4). Additionally, the group of accident and the group of natural disaster had significantly higher scores on appreciation of life than the group of death of loved one.

Discussion

The primary goal of the current study was to explore the contributory roles of personality traits, posttraumatic stress severity (PTS) and their interactions on PTG and especially its domains in a large community sample from Turkey exposed to various types of traumatic events. A secondary aim was to examine the differences in PTG domains in individuals exposed to three different kinds of traumatic events. The results revealed that some personality traits do have a facilitative role on PTG total and its domains. PTS severity also had a contributory role in PTG total and all the domains except for the appreciation of life. Furthermore, an important contribution of the

Citation: European Journal of Psychotraumatology 2012, **3**: 17303 - http://dx.doi.org/10.3402/ejpt.v3i0.17303

present study was to show that some personality traits have a contributory role on the total PTG and its domains depending on PTS severity.

Personality traits are posited to be important in shaping ones' responses to traumatic events (Morris et al., 2005; Tedeschi & Calhoun, 1996). Our findings indeed supported this view by showing that conscientiousness, agreeableness and openness are robust predictors of the total PTG and almost all of the domains. When we examine the relationship of specific personality traits with specific domains of PTG, extraversion seems to exert an influence on all domains except the appreciation of life domain moderated by the PTS severity. For all the domains, participants with high extraversion experience more growth when they also experience high PTS severity. This may be related to the coping strategies of individuals with extraversion, using more support-seeking, problem-solving and cognitive restructuring (Connor-Smith & Flachsbart, 2007). Thus, under high PTS severity, extraversion may help individuals to cope with the traumatic aftermaths of an event by using more functional coping strategies and thus lead to higher growth in almost all domains. However, when the PTS severity is low, extraversion seems to have a suppressing effect on PTG. Under low PTS severity, individuals with high extraversion may not feel the need to activate their coping resources and thus not achieve much growth because they do not feel the need to engage in problem-solving or seeking-social support. It is important to note that the beneficial effect of having high extraversion under high PTS severity or having the trait of extraversion is not related to the appreciation of life domain, which may imply that this domain is related to some other personality traits.

Conscientiousness appeared significant for the spiritual change, personal strength and appreciation of life domains. Furthermore, for the relating to others domain, conscientiousness interacted with PTS severity, showing that high conscientiousness is facilitative of growth in relating to others domain irrespective of PTS severity, whereas for low conscientiousness high PTS severity is needed for growth in this domain. Conscientiousness involves high levels of self-regulation, persistence, impulse control, achievement orientation, and self-discipline (McCrae & John, 1992). This trait has been found to be related to problem-solving and cognitive restructuring coping styles (Connor-Smith & Flachsbart, 2007). Thus, it is understandable that conscientiousness will facilitate the processing of the traumatic event and directly coping with the event, rather than avoiding and thus relate to growth perceptions in the relating to others domain irrespective of level of PTS severity. However, individuals who are low on this trait seem to need a high traumatic impact to try to deal with the event and thus report PTG only when they experience high distress.

Agreeableness was related to all domains of PTG, except the personal strength domain. Agreeableness involves trust, altruism, compliance, and tenderminded-ness (McCrae & John, 1992). It has been shown to be related with high levels of both perceived and received social support (Bowling, Beehr & Swader, 2005; Tong et al., 2004). Thus, it seems that, except for the personal strength domain, this trait likely facilitates PTG by making the individual accept the traumatic event and seek social support in order to deal with its aftermath.

Neuroticism, which involves negative emotionality, self-consciousness, physiological reactivity to stress, and behavioral inhibition (McCrae & John, 1992) appeared significant for the spiritual change and relating to others domains moderated by PTS severity. Connor-Smith and Flachsbart (2007), in their meta-analysis reported that neuroticism predicted wishful thinking, withdrawal and emotion focused coping. All these strategies point to the fact that individuals high on neuroticism may use avoidance coping that may hinder the processing of the event which is essential for growth. For both the spiritual change and the relating to others domains low neuroticism facilitated growth under high PTS severity. For the relating to others domain individuals high in neuroticism showed the same PTG irrespective of PTS severity levels. However, those with low neuroticism had a higher PTG under high PTS severity. Thus, low neuroticism seems to facilitate coping and processing under high PTS severity for relating to others. However, interestingly for the spiritual change domain, both high and low neuroticism related to higher PTG under high PTS severity. Although future research needs to focus on the coping strategies of individuals with low and high neuroticism, our findings seem to point out that this trait has a negative impact on growth in the spiritual and the relating to others domains as distinct from other domains of growth.

Openness related to new possibilities, relating to others, personal strength domains. Furthermore, those with high openness showed higher levels of growth in the appreciation of life domain under high PTS severity. Openness entails being interested in new situations, new experiences and ideas. Individuals who are high on openness are intellectually curious, imaginative and emotionally responsive (Costa & McCrae, 1985). Since cognitive processing is essential for PTG (Tedeschi & Calhoun, 2004), it can be expected that individuals showing openness are more likely to be ready to cognitively process the traumatic event and its meaning and thus show more growth in all domains. For the appreciation of life, openness seems to facilitate growth only when PTS severity is high, indicating that this trait helps individuals to process the event related struggles when there is a higher traumatic impact. However, when the PTS severity is low, high openness does not seem to have a facilitative effect on the appreciation of life.

Taken together the findings relating personality traits to domains of growth seem to point out that rather than having very distinct effects on specific domains, conscientiousness, agreeableness and openness are facilitators of growth in almost all domains of PTG. Therefore, in future research it will be valuable to examine how these personality traits relate to PTG by examining cognitive processing and coping strategies unique to these traits. However, the effects of extraversion and neuroticism seems to depend on PTS severity. High extraversion is facilitative for growth in all domains, except for appreciation of life under high PTS severity. Similarly, neuroticism has a role on two domains of PTG, namely spiritual change and the relating to others, and this effect depends on the level of PTS severity. High neuroticism seems to be unfavourable under both high and low PTS severity, whereas when PTS severity is high low neuroticism fosters growth in these two domains. These findings modify previous findings of a negative relationship between neuroticism and PTG (Evers et al., 2001; Garnefski et al., 2008) by showing that this negative relationship is more pronounced only under high PTS severity conditions and only for some domains of growth.

PTS severity appeared significant for the total PTG and all the domains, except the appreciation of life. This finding supports the model of PTG, positing a role for the seismicity of the event to create room for processing and thus positive transformations (Tedeschi & Calhoun, 2004) and is in line with previous research findings (Levine et al., 2008; Morrill et al., 2008; Tedeschi & Calhoun, 1996). PTS severity was not significant only for the appreciation of life domain. Morris et al. (2005) reported a negative relationship between PTS severity and the appreciation of life domain, whereas the relationship was positive for all the other domains. In the present study, although PTS severity did not directly relate to this domain, openness to experience interacted with PTS severity only for this domain, showing that under high PTS severity individuals who are high in openness report more growth. Thus, it seems that growth in appreciation of life occurs when high PTS severity is experienced by individuals who are more open to process their experiences.

In the current sample we compared growth in the five domains of PTG among individuals who experienced three distinct types of events, namely accidents, natural disasters and unexpected death of a loved one. Previous research on the impact of different kinds of events on the domains of PTG is quite rare (e.g., Shakespeare-Finch & Armstrong, 2010) and thus it was difficult to make specific predictions. The only study comparing survivors of different types of events in the same study, showed that the bereaved group had higher growth than survivors of sexual assault in relating to others and appreciation of life domains (Shakespeare-Finch & Armstrong, 2010). Our results also showed that the type of event had a significant impact on only two domains, namely the relating to others and the appreciation of life domains. Natural disaster survivors had significantly higher growth in relating to others as compared to those who lost a loved one. Also, natural disaster and accident survivors had higher scores in the appreciation domain as compared to the bereaved group. Since in our sample reporting of sexual assault or other types of physical assault were very low we ended up comparing events which are relatively less benign as compared to assault victimization. Therefore, within our three groups, it is understandable that the bereaved group showed less growth in the relating to others and the appreciation of life domains. It seems less likely to endorse growth in the appreciation of life after experiencing the sudden loss of a loved one, since the bereaved may be struggling with feelings of guilt, knowing that the loved one can no longer enjoy life. On the other hand, the 1999 Marmara earthquake was followed by extensive media coverage of devastation and help from volunteers (Dogan, 2011; Sumer, Karanci, Berument & Gunes, 2005), and thus it is understandable that those who survived a natural disaster report more growth in the appreciation of life and relating to others domains. Similarly, survivors of accidents experience a threat to life and thus may feel that life is a gift and thus show more growth in the appreciation of life.

Since the types of events were not purposefully selected in the present study to yield differences in PTG domains, and the types of events most frequently endorsed by a community sample were analyzed the results do not seem to provide a clear distinction between the survivors of these three types of events.

Study limitations

The present study has some shortcomings that should be acknowledged. Firstly, due to the cross-sectional design no causal inferences can be drawn from the results. The study utilized a self-report instrument administered face to face with trained interviewers. This face to face reporting may have increased the report of some more benign events like accidents and natural disasters and may have suppressed the reporting of certain other types of events like violence and sexual abuse which are more difficult to report to interviewers who are complete strangers to the respondent. Another limitation was the use of a personality measure specifically developed to be used in Turkey. Although our results on personality traits were in line with previous research findings, the use of a newly developed personality scale can be considered a limitation. Lastly, although we have used the Kish method to ensure a random sampling from households, our sample had an overrepresentation of women and the unemployed. This may be related to fact that males and

Citation: European Journal of Psychotraumatology 2012, **3**: 17303 - http://dx.doi.org/10.3402/ejpt.v3i0.17303

the employed were more reluctant to accept participation due to time constraints.

Conclusions

The current study involved a large community sample, representing adults from different walks of life and thus provides valuable insights into the positive transformations in the aftermath of diverse traumatic events and the effects of personality and posttraumatic stress severity on domains of growth. As a whole, our findings supported the importance of some personality traits, like openness, agreeableness and conscientiousness in facilitating PTG and some of its domains. Furthermore, the results showed that the impacts of extraversion, neuroticism and openness on growth depends on the survivor's PTS severity. Thus, the results show that some personality traits are unique predictors of some domains, and that some personality traits are only helpful under high or low PTS severity conditions. In order to understand how personality relates to PTG and its sub-domains the possible mediating roles of coping strategies and types of traumatic events using longitudinal designs are recommended. An understanding of coping processes can provide useful guidelines for clinicians for facilitating PTG in survivors of traumatic events.

LE RELAZIONI PERICOLOSE

QUANDO LA FAMIGLIA DIVENTA UN AMBIENTE OSTILE ALLO SVILUPPO LIBERO E POSITIVO DI BAMBINI E BAMBINE

Indagine sullo stato del maltrattamento e dell'abuso intrafamiliare

INDICE

p.4 **INTRODUZIONE E RINGRAZIAMENTI**
a cura Di Raffaela Milano, Direttore programmi Italia Europa di Save the Children

p.5 **LAVORARE SUL MALTRATTAMENTO IN ITALIA**
a cura di Gloria Soavi, Presidente CISMAI

p.6 **I PEDIATRI DI FAMIGLIA: RESPONSABILITÀ E DIFFICOLTÀ**
a cura di Federica Zanetto, Presidente ACP

p.7 **NOTA SUL METODO DI LAVORO**

p.8 Capitolo 1
DEFINIZIONE E ANALISI DEL FENOMENO

p.9 1.1 Fenomenologia e fisionomia del maltrattamento

p.9 1.2 I limiti e gli indicatori per l'identificazione precoce

p.10 1.3 Donne incinte e bambini sotto i tre anni

p.14 Capitolo 2
PANORAMICA SU DATI E INIZIATIVE

p.15 2.1 Oltre la metà dei bambini nel mondo subisce qualche forma di violenza

p.15 2.2 USA: i più colpiti sono i piccolissimi

p.16 2.3 Troppi bambini e bambine maltrattati in Europa rispetto alle possibilità di risposta dei servizi

p.18 2.4 In Italia: molte iniziative e molto sommerso
- La prima porta di accesso: i pronto soccorso e le strutture sanitarie
- Un passo importante: imparare a riconoscere
- Quasi 100mila le piccole vittime di maltrattamento. Un tema di salute pubblica
- Il lavoro di campo. Tre storie italiane
- Pediatri che sospettano
- Quando a essere colpite sono le mamme

p.32 Capitolo 3
CON LE MANI IN PASTA. CONVERSAZIONI CON ALCUNI PROFESSIONISTI SU REGOLE, PRASSI, NODI DOLENTI

p.33 3.1 La babele dei protocolli e delle linee guida
- Donne colpite e bambini testimoni
- Bambine e bambini: tracce di maltrattamento che rischiano di perdersi

p.37 3.2 Osservare, ascoltare, verificare. La centralità della diagnosi
- Riconoscere i segni
- Consapevolezza e collaborazione per diagnosi e presa in carico

p.38 3.3 Che succede dopo?
- Le fasi di intervento
- I nodi della presa in carico terapeutica

p.40 3.4 Se i servizi non parlano tra loro

p.44 Capitolo 4
SCHEDE DI LAVORO DA TORINO, MILANO, SPOLETO, FOLIGNO, ORVIETO E BARI

p.45 4.1 Un ambulatorio per loro
a cura di Elena Coppo, pediatra, Ambulatorio BAMBI - Torino

p.46 4.2 Il maltrattamento dei più piccoli al centro dell'azione della Rete interaziendale milanese
a cura di Gian Vincenzo Zuccotti, pediatra, Ospedale dei bambini, V. Buzzi - Milano

p.46 4.3 Ospedali in rete. Le cose semplici possono essere le migliori
a cura di Sara Ceccarelli, pediatra, Ospedale di Terni

p.48 4.4 Fare emergere il sommerso. L'esperienza di GIADA in Puglia
a cura di Maria Grazia Foschino Barbaro, psicologa-psicoterapeuta responsabile del Servizio di Psicologia – GIADA, Ospedale Pediatrico "Giovanni XXIII" - Bari

p.52 Capitolo 5
SCIOGLIERE QUALCHE NODO. CONCLUSIONI E RACCOMANDAZIONI

p.56 Appendice

INTRODUZIONE E RINGRAZIAMENTI

Le relazioni familiari rappresentano una componente molto rilevante nel determinare la qualità della crescita di un bambino o di una bambina nei primissimi anni di vita. Nella complessità che contraddistingue le azioni umane all'interno di una piccola comunità di affetti si possono identificare comportamenti che hanno un contenuto potenzialmente dannoso, non solo per l'integrità fisica e psicologica immediata di una persona, ma anche per le condizioni di sviluppo e di crescita futura. Alcuni comportamenti maltrattanti nell'ambito familiare hanno effetti traumatici e irreversibili sullo sviluppo di bambini e bambine e la maggior parte dei danni indotti da questi comportamenti può avvenire nei primissimi anni di vita.

Le relazioni pericolose da questo punto di vista sono spesso quelle più intime: quelle tra partner e quelle tra genitori e figli. Nell'ambito della strategia 2016-2018 di Save the Children il fenomeno della violenza ai danni dei bambini e delle bambine nelle sue diverse forme e manifestazioni ha assunto un peso centrale.

L'attenzione pubblica in questi anni si è molto e giustamente concentrata sulle forme di sfruttamento e violenza che hanno per vittime bambini e ragazzi durante i percorsi migratori, negli ambienti educativi, in rete, nei rapporti tra pari.
Più complesse e opache sono la dinamica e la diagnosi di comportamenti a rischio che maturano all'interno delle mura domestiche, specie quando le vittime sono persone che non sono in grado di rappresentare verbalmente il proprio disagio anche perché ancora non inserite in un circuito di servizi educativi e sociali che ne possa monitorare il benessere e l'equilibrio.

Il termine stesso di violenza può risultare riduttivo e non evocare condizioni che di fatto, magari in modo più sottile e ambiguo, sono violente a tutti gli effetti. L'Organizzazione Mondiale della Sanità[1] nel termine **maltrattamento infantile** include tutte le forme di maltrattamento fisico ed emotivo, abuso sessuale, trascuratezza (neglect) e sfruttamento: qualsiasi comportamento che implichi un **danno immediato o potenziale alla salute, alle possibilità di sviluppo e alla dignità** del bambino. In questo quadro la ricerca condotta da Save the Children si propone tre principali obiettivi:

- **capire e conoscere** meglio il fenomeno, giovandosi del lavoro di analisi e di ricerca che molti attori a diversi livelli hanno prodotto sia in Italia sia in Europa;
- **rafforzare la potenza della luce già accesa su questo fenomeno** ancora in larga parte sommerso: la diffusione del maltrattamento è da quantificare nella sua reale estensione, facendo emergere situazioni grigie, migliorando e affinando gli strumenti di analisi, coordinando le competenze, collaborando con gli attori chiave;
- **identificare linee di azione pertinenti alla sua natura e alla sua mission istituzionale**, anche con lo scopo di accrescere le competenze di analisi e di intervento dei suoi operatori sul campo.

Per questa ragione il testo si rivolge a un pubblico vasto, composto da persone che lavorano a fianco dei bambini e delle bambine, a istituzioni e servizi, a professionisti e ricercatori che sanno bene quanto questa materia sia al tempo stesso cruciale e sfuggente. L'intento è quello di contribuire a migliorare il coordinamento tra i professionisti e gli operatori del settore, accrescere la sensibilità e potenziare gli strumenti di sostegno mirato e personalizzato alle famiglie in difficoltà.

Un ringraziamento a tutte le persone che a vario titolo e nei diversi centri o nell'ambito delle loro attività hanno dedicato il loro tempo e condiviso con noi la loro esperienza, attraverso incontri diretti, contatti telefonici o via mail, uniti dal desiderio comune di lavorare affinché più nessun bambino e bambina, e adulto, sia costretto a subire maltrattamento o abuso in una qualunque delle forme possibili.
Un particolare ringraziamento all'Associazione Culturale Pediatri (ACP) e al Coordinamento Italiano dei Servizi contro il Maltrattamento e l'Abuso all'Infanzia (CISMAI), che hanno offerto a questo lavoro più di un semplice contributo, impegnandosi a definire un profilo di collaborazione pratica e produttiva.

Non è stato possibile raggiungere e prendere contatto con tutti coloro – e sono davvero numerosi – che in questi anni hanno lavorato sull'argomento in Italia raccogliendo dati o attivando procedure e progetti. Ce ne scusiamo e proprio per la natura dinamica e flessibile di questo lavoro di ricerca, procederemo ad aggiornamenti e integrazioni delle informazioni in nostro possesso, nella speranza di un continuo e progressivo approfondimento, allargamento della rete e della collaborazione e ottenimento, insieme, di obiettivi comuni e risultati concreti.

Raffaela Milano
Direttore Programmi Italia Europa, Save the Children

LAVORARE SUL MALTRATTAMENTO IN ITALIA

Il maltrattamento sui bambini e le bambine è un problema di salute pubblica (OMS, 2012) che colpisce in Italia quasi 100.000 fra bambini e ragazzi. Si consuma nella maggior parte dei casi in famiglia, quindi in un contesto di relazioni intime e affettive, che dovrebbero costituire le basi della sicurezza e dell'attaccamento di ogni essere umano; proprio per questo le conseguenze sono più gravi sulle personalità in evoluzione perché compromettono la possibilità di sviluppare fiducia in sé stessi e nel mondo degli adulti.

Le conseguenze traumatiche della violenza sono inversamente proporzionali all'età: più un bambino è piccolo, più gravi sono i danni sullo sviluppo psico-fisico ed emotivo. Lo sappiamo dalle ricerche internazionali e nazionali, dai dati, anche se spesso non confrontabili nel nostro Paese, dalle varie fonti e dall'esperienza diretta degli operatori dei servizi socio-sanitari. Questo aspetto pone l'attenzione sull'assoluta necessità di intercettare precocemente le situazioni di violenza e di valutare attentamente il rischio per poter intervenire adeguatamente sul contesto familiare. I dati dell'ultima ricerca Cismai-Terres des Homme (2015) rilevano purtroppo che i bambini e ragazzi in carico ai servizi sociali perché a rischio o vittime di maltrattamento arrivano all'attenzione dei servizi in età adolescenziale (11-17 anni: 54,2 ‰), mentre la fascia di età più delicata 0-3 anni è quella che arriva in percentuale più bassa: solo il 29‰. Questo significa che i bambini piccoli, vittime di maltrattamento o in gravi situazioni di rischio, non vengono intercettati precocemente e si consumano quindi già danni significativi in questa fascia di età particolarmente delicata e importante per lo sviluppo evolutivo.

Il CISMAI da più di 20 anni cerca di mantenere viva l'attenzione sul fenomeno della violenza ai danni dei bambini e dei ragazzi promuovendo cultura, formazione e stimolando la politica su questi temi.
Lavorare sul maltrattamento significa prima di tutto investire sulla cultura del contrasto alla violenza, che si concretizza nel mettere in atto interventi di prevenzione. In questa direzione la capacità di intercettare i segnali di rischio deve essere sempre più attenta e competente: è indispensabile una formazione più adeguata sulla violenza a tutte quelle professioni che sono in prima linea – medici, insegnanti, educatori, già all'interno dei programmi universitari e delle scuole di specializzazione.
Il CISMAI sottolinea la **ineludibilità della prevenzione** e della protezione dei bambini attraverso la promozione di una proposta di una legge, presentata al VII Congresso, come passo concreto per portare il nostro Paese in linea con gli stati che hanno previsto da tempo una politica organica su questo tema. Una legge che sistematizzi in maniera strutturale a livello nazionale le misure su questa materia, le azioni e gli interventi da mettere in atto per contrastare efficacemente il **maltrattamento**. L'attivazione di un sistema nazionale di sorveglianza non è più procrastinabile, come è stato sottolineato da tempo dal CISMAI e da altri soggetti, per la costruzione di servizi orientati alla prevenzione e l'applicazione degli strumenti di sostegno alla genitorialità fragile, come l'Home Visiting, su cui una Commissione CISMAI ha lavorato, identificando i requisiti di qualità necessari per questi interventi e stilando delle apposite linee guida.
L'altro cardine su cui investire è la formazione **mirata e specialistica che garantisca la cura dei bambini che hanno vissuto esperienze traumatiche**. Una grande risorsa è rappresentata infatti dalla competenza degli operatori, e in questo il CISMAI continuerà il suo impegno promuovendo formazione, linee guida per gli operatori, confronto scientifico sulle tecniche più aggiornate di protezione e cura dei bambini maltrattati, collaborazioni con altri soggetti che perseguono le stesse finalità nel contrasto del maltrattamento all'infanzia in tutte le sue forme. Bisogna investire sulla qualità dei percorsi protettivi e riparativi; questo significa anche contrastare il rischio del maltrattamento istituzionale: evitare percorsi di tutela farraginosi, mancanza di progettazione, interventi tardivi, permanenze senza fine in comunità.
Per questo deve continuare ed essere garantita la formazione degli operatori che si occupano di maltrattamento e abuso, in particolare nel diffondere la cultura dell'approccio al trauma, per favorirne il riconoscimento e scegliere i trattamenti più adeguati.
I nostri 100 centri, pubblici e privati, molti dei quali hanno partecipato attivamente a questo lavoro, rappresentano una realtà attenta e competente, in grado, non solo di riconoscere precocemente nei bambini più piccoli segnali di disagio e di danno che esperienze familiari inadeguate possono provocare, ma anche di attivare percorsi di sostegno e cura mirati per loro e per le loro famiglie.

Gloria Soavi
Presidente CISMAI

I PEDIATRI DI FAMIGLIA: RESPONSABILITÀ E DIFFICOLTÀ

Noi pediatri siamo presenti in questa ricognizione di dati, storie e prassi di prevenzione, riconoscimento e cura.
Ci siamo perché abbiamo collaborato a mettere insieme informazioni, anche se in alcuni casi solo parziali, per cercare di avere un quadro di modalità di lavoro e possibilità concrete di azione contro il maltrattamento infantile nell'ambito della nostra attività ambulatoriale e nelle diverse realtà regionali.
Ma ci siamo anche con tutte le nostre responsabilità e tutte le nostre difficoltà rispetto alla capacità di promuovere interventi tempestivi, di organizzare una prevenzione primaria e secondaria intelligente, di passare dalla cultura del sospetto a quella della solidarietà, di sostenere e amplificare responsabilità parentali e genitoriali.

Sappiamo quali siano gli effetti dell'abuso e del maltrattamento con cui fare i conti quando l'adulto di riferimento viola confini mentali e corporei del bambino. Ci hanno spiegato più volte l'esperienza di umiliazione, di mortificazione, di morte psichica vissuta anche in casi non estremi. Ci hanno detto che l'umiliazione è in grado di sconfiggere rabbia e dolore, forze vive con le quali si può riorganizzare una speranza di crescita. Abbiamo capito che la vergogna ammutolisce, distrugge, toglie la parola.

Sappiamo bene anche che dobbiamo essere parte di una rete che deve essere strutturata, intelligente, preparata, motivata, dove lo spazio di ascolto deve affinarsi ed essere capace di intuire, di mettere insieme indizi. Ma anche di immaginare il dolore, oltre la violenza o il sopruso.
Siamo consapevoli di luoghi comuni che fanno fatica a sradicarsi nei servizi, nella società, nei media, sempre più spesso coinvolti in questo ambito, sempre più disattenti alla profondità dei problemi, sempre alla ricerca di scoop e situazioni plateali. Spesso anche noi ci nascondiamo per non vedere o perché diventa troppo complesso vedere.

L'indagine ci interpella fortemente come singoli, ma anche in quanto appartenenti a gruppi di lavoro o a società scientifiche. È una sollecitazione ulteriore a una professionalità che deve comprendere non solo l'approfondita conoscenza di fenomeni e problemi, ma anche il confronto diretto, continuo, costante, ravvicinato, attento, profondo con tutto quello che c'è sul territorio e che può essere di aiuto in situazioni sempre difficili, complesse, dolorose.

Ci rammenta anche che i bambini hanno il diritto di trovare professionisti in ogni momento consapevoli dei loro bisogni: "il bisogno di sviluppare costanti relazioni di accudimento; il bisogno di protezione fisica e sicurezza, e relativa normativa; il bisogno di esperienze modellate sulle differenze individuali; il bisogno di esperienze appropriate al grado di sviluppo; il bisogno di definire dei limiti, di fornire una struttura e delle aspettative; il bisogno di comunità stabili e di supporto, e di continuità culturale; il bisogno di un futuro" (B. Brazelton, *Medico e Bambino,* 2004;7:458).

Federica Zanetto
Presidente Associazione Culturale Pediatri

NOTA SUL METODO DI LAVORO

Save the Children ha approfondito, attraverso una **ricognizione di tipo qualitativo e documentario**, la conoscenza della fenomenologia riguardante il maltrattamento ai danni di donne in gravidanza e di bambini e bambine nei primi tre anni di vita.

Obiettivi della ricognizione:

- **rafforzare la conoscenza** del fenomeno;
- **ampliare l'area e la qualità della sensibilizzazione** sociale nei confronti del maltrattamento nel contesto familiare;
- **identificare aree di intervento** programmatico, di advocacy e di ulteriore approfondimento.

In questo quadro, il lavoro si è concentrato su 4 azioni:

- **raccogliere materiale** e acquisire una base di documentazione riguardante dati (anche di livello territoriale), analisi, progetti, ricerche e iniziative;
- **definire un quadro degli attori** che lavorano sul maltrattamento in Italia quanto più possibile articolato e completo;
- **identificare le prassi** e approfondire singoli aspetti ed esperienze di lavoro, con il contributo di personalità e istituzioni che abbiano sviluppato un patrimonio rilevante di conoscenze e interventi sull'argomento;
- **approfondire il periodo 0-3 anni** focalizzando l'attenzione verso i maltrattamenti commessi nella fase precedente all'ingresso nella scuola dell'infanzia, nella quale possono prodursi danni per la salute e lo sviluppo fisico, psicologico ed emotivo e l'identificazione può essere ancora più difficile.

Il documento, che nasce con l'idea di una continua possibilità di aggiornamento, è il frutto dell'integrazione di più fasi di lavoro.

- **Consultazioni preliminari:** sono stati organizzati incontri e confronti con figure di rilievo in questo ambito sul piano nazionale ed è stata organizzata una consultazione permanente con un gruppo di lavoro[2]. Al lavoro di questo gruppo di consultazione si è integrato il lavoro della costituenda Rete Fiocchi in Ospedale che, tra gli altri obiettivi, ha quello di coordinare risorse professionali e prassi positive per la tutela dei diritti dei più piccoli, a cominciare dalla prevenzione di ogni forma di abuso e maltrattamento[3].
- **Raccolta dati e consultazione di professionisti e organizzazioni:** è stata avviata una raccolta di dati sui casi di maltrattamento in gravidanza e nei primi tre anni di vita, con particolare riferimento al territorio italiano. La raccolta ha incluso sia una ricerca di dati disponibili online e pubblicazioni scientifiche sia il contatto diretto con organizzazioni e professionisti del settore[4].
- **Elaborazione di profili tematici su:** maltrattamento in gravidanza, maltrattamento tra 0 e 3 anni, diagnostica del maltrattamento, gestione del trauma del bambino, depressione post-partum e maltrattamento.
- **Inventario di prassi:** nell'assenza di un sistema applicato di protocolli nazionali, è sembrato utile focalizzare l'attenzione su alcune prassi di lavoro messe in atto da realtà ospedaliere e servizi di diagnosi e recupero post-traumatico.

CAPITOLO 1

1. DEFINIZIONE E ANALISI DEL FENOMENO

1.1 FENOMENOLOGIA E FISIONOMIA DEL MALTRATTAMENTO

Il termine "maltrattamento", nell'impostazione di questa ricognizione, racchiude in sé diversi aspetti e si riferisce ad azioni indirizzate sia alle donne incinte sia alle bambine e ai bambini di età da 0 a 3 anni.
Secondo l'Organizzazione Mondiale della Sanità "l'abuso infantile o il maltrattamento comprendono tutte le forme di maltrattamento fisico e/o psico-emozionale, di abuso sessuale, di trascuratezza o di trattamento negligente, di sfruttamento commerciale od altro, con conseguente danno reale o potenziale alla salute, alla sopravvivenza, allo sviluppo o alla dignità del bambino nel contesto di un rapporto di responsabilità, di fiducia o di potere"[5].
Come indicato nell'aggiornamento più recente della Classificazione Internazionale delle Malattie (ICD10), si possono così individuare le principali forme di maltrattamento:

- la trascuratezza grave e l'abbandono, in cui non si segue lo sviluppo del bambino nei diversi aspetti (salute, educazione e formazione, sviluppo psico-emozionale, nutrimento, protezione, ambiente di vita sicuro);
- il maltrattamento fisico, con un danno fisico attuale o potenziale causato da azioni o mancanza delle stesse, e può esprimersi attraverso l'aggressione fisica, anche accompagnata dall'uso di armi e oggetti contundenti, l'utilizzo di punizioni corporali. Fra le forme di maltrattamento fisico rientra il trauma cranico abusivo, che comprende la sindrome del bambino scosso (*Shaken Baby Syndrome*) tra le sotto-forme e può essere causa di danni anche molto gravi, a volte mortali;
- l'abuso sessuale;
- l'abuso psico-emozionale, che include il non provvedere a un ambiente d'appoggio e adatto allo sviluppo del minore, in modo che il bambino possa sviluppare le competenze sociali e psico-emozionali;
- le altre forme di maltrattamento, fra cui:
  - la Sindrome di Munchausen per Procura, in cui l'adulto simula sintomi o produce una malattia (con la somministrazione di farmaci o altro) nel bambino comportando indagini ed esami;
  - la violenza assistita, a cui possono associarsi il trauma della perdita o della grave infermità del genitore, oltre che effetti derivanti dalla scarsa attitudine all'esercizio delle cure parentali riscontrato nelle mamme soggette a continui accessi di violenza da parte del proprio compagno/marito[6];
  - lo sfruttamento, commerciale o di altro genere;
  - il *chemical abuse* (abuso di sostanze) riferito all'assunzione da parte dei bambini di sostanze tossiche (come farmaci, droghe, alcol).

1.2 I LIMITI E GLI INDICATORI PER L'IDENTIFICAZIONE PRECOCE

Il termine maltrattamento evoca un pensiero diverso dal termine violenza, più facilmente associato a quadri di aggressione fisica o abuso grave, e allarga lo sguardo a comportamenti che forse un tempo non venivano considerati come maltrattanti. Quando un comportamento può configurarsi come maltrattamento? Ci sono indicatori di effetto, intensità, ripetitività, durata? Il tema del limite assume importanza nel riconoscimento del confine tra un comportamento maltrattante e un comportamento non a rischio, e nel far uscire da un quadro di "normalità" atteggiamenti e azioni che normali non sono e possono produrre effetti dannosi, anche irreversibili. Lo stesso concetto di limite rappresenta un tema cruciale in chiave di consapevolezza della persona maltrattante circa la natura e le conseguenze, anche gravi, delle sue azioni.

I confini stabiliti dal codice penale e dalla giurisprudenza in tema di maltrattamento fanno riferimento a uno "stato di sofferenza e mortificazione inflitto alla persona offesa in regime di continuità temporale (abitualità)"[7]. Tuttavia, trattandosi di una condizione non sempre riscontrabile in termini di parametri obiettivi, qualora il maltrattamento si produca senza lesioni fisiche diagnosticabili *prima facie* e indiscutibilmente in sede clinica, è molto importante un lavoro di definizione quanto più possibile chiaro e condiviso di che cosa si intenda per comportamenti maltrattanti e abusanti, quali siano le conseguenze di tali comportamenti e come si possano prevenire, riconoscere e gestire.

1.3 DONNE INCINTE E BAMBINI SOTTO I TRE ANNI

I maltrattamenti interni alla vita familiare si configurano come un sistema coordinato di azioni di attacco e difesa che non si esauriscono nei singoli gesti o comportamenti, ma tendono a permeare la quotidianità della vita, influenzando le interazioni, indebolendo la concentrazione sui compiti di cura, ingenerando spirali ritorsive e producendo conseguenze irreversibili sullo sviluppo dei bambini e delle bambine.

Donne incinte e bambini fino a 3 anni risultano essere un target particolarmente esposto quando si parla di maltrattamento.

Quello della gravidanza è un periodo che si è rivelato cruciale per il manifestarsi di forme di insofferenza e aggressività intra-familiare, proprio in ragione di una condizione di maggiore vulnerabilità della donna, con una riduzione della sua autonomia tanto emotiva che finanziaria, che può essere vissuta dal partner come un'opportunità per affermare più agevolmente potere e controllo sulla compagna. Si stima che oltre il 20% dei maltrattamenti intra-familiari ai danni delle donne abbia inizio proprio in gravidanza specie nel secondo e terzo trimestre, ed essi, se iniziati prima, continuino nel 70% e si verifichino episodi più frequenti e gravi di quelli già in precedenza avvenuti nel 17% dei casi[8].

Relazioni pericolose con il proprio compagno #storiedaiservizi*

Veronica è una giovane donna che da poco è diventata mamma di due gemelli: già dagli ultimi mesi della gravidanza si rivolgeva alle operatrici di Fiocchi in Ospedale, inviata dalla ginecologa dell'ospedale, perché si sentiva soffocata dal marito che controllava ogni suo spostamento e le impediva di uscire per fare la spesa, chiamare le amiche e muoversi in autonomia. La vita di coppia si era complicata da quando lei era rimasta incinta e lei stessa si era stupita di come premure e attenzioni del compagno si fossero, nel giro di poche settimane, trasformate in divieti e soprusi, dando vita a una situazione di ansia e preoccupazione che raggiungeva per la ragazza momenti davvero critici. Con Veronica sono state promosse fin da subito attività di incontro e supporto psicologico e il suo caso è stato portato all'attenzione dei servizi antiviolenza, ma un parto leggermente pre-termine non ha permesso l'incontro faccia a faccia tra la donna e l'operatrice del centro antiviolenza. Quando Giovanni e Mirko sono venuti al mondo, Veronica è entrata in difficoltà nella gestione dei bambini: agli incontri fissati in ospedale per monitorare la crescita adeguata dei gemelli da parte dell'équipe medica, la donna si è presentata trasandata e i bambini, a loro volta, apparivano poco curati nell'aspetto e nell'igiene personale. Così è stata inserita in un percorso di incontri di supporto psicologico. Ma quella stessa notte Veronica è arrivata in pronto soccorso in ambulanza perché uno dei gemelli era diventato cianotico: il neonato aveva ingerito un rigurgito e, nonostante il padre fosse intervenuto in maniera corretta disostruendo le vie respiratorie, Mirko aveva bisogno di rimanere in osservazione per escludere l'insorgenza di danni cerebrali. A un mese dall'accaduto, Veronica è rientrata in un programma di assistenza domiciliare fornito dal Comune di residenza della famiglia, in cui operatrici perinatali si recano a casa per aiutarla nella gestione dei neonati. Veronica ha incontrato l'operatrice del centro antiviolenza della sua città e ha iniziato un percorso di sostegno, condiviso con i servizi sociali. Mirko, fortunatamente, non ha subito alcun danno dall'episodio.

* Tutti i nomi riportati nelle storie sono di fantasia.

Altrettanto significativo e critico è il periodo delle prime fasi di sviluppo del bambino, nel corso del quale il maltrattamento può causare danni allo sviluppo del cervello[9], con effetti negativi sulla crescita dal punto di vista fisico, cognitivo, emotivo e sociale[10].

Il maltrattamento può avere un impatto diverso a seconda del momento della vita e di sviluppo del bambino: vi possono essere rischi e danni durante la gravidanza e la nascita, da una crescita ridotta ed effetti sullo sviluppo del cervello, a un basso peso alla nascita fino alla morte; nei primi anni di vita vi possono essere sia danni indiretti conseguenti ad atti violenti contro la madre, sia maltrattamenti intenzionali, con danni sullo sviluppo del cervello, rischi di ritardo nello sviluppo e altri possibili problemi di salute collegati allo stress che si possono presentare in epoche successive della vita[11].

Il maltrattamento in questo periodo rischia di rimanere ancora più nascosto, perché agìto contro persone con una fragilità maggiore o un margine di autonomia molto basso. Inoltre, i comportamenti violenti nei confronti della donna possono iniziare o peggiorare durante la gravidanza[12].

Vi sono dunque diversi elementi di rischio e conseguenze dei maltrattamenti subìti sia per la mamma sia per il bambino/a in questo particolare arco temporale, che vanno identificati tempestivamente per la messa in opera di interventi pertinenti di prevenzione e presa in carico.

DAL PUNTO DI VISTA DELLA MAMMA, CON RIPERCUSSIONI SUL BAMBINO/A:

- azioni violente, abusi e maltrattamenti che si compiono nel contesto familiare ai danni della **futura o neomamma** possono compromettere l'integrità fisica (di mamma e bambino/a), la salute fetale e le possibilità di sviluppo del nascituro, la capacità della mamma di vivere in modo sereno e positivo la gravidanza, il parto e le fasi successive alla nascita del bambino, nonché la sua capacità di esercitare la sua funzione di protezione e cura, e avere danni indiretti sul bambino che si trova ad assistere e/o a essere coinvolto;

- azioni rivolte contro la donna durante il **periodo della gravidanza**, con episodi che possono essere acuiti dal presentarsi della gravidanza o insorgere per la prima volta in questo periodo;

- "omicidi di genere" o femminicidi ai danni di donne madri, ovvero violenze sulle donne con esito fatale, che nel caso di donne madri comporta la delicata e drammatica conseguenza dei cosiddetti **"orfani di femminicidio"**, doppiamente vittime, sia di possibile violenza assistita sia in quanto resi orfani di mamma, e con un padre che potrebbe esserne il responsabile;

- fenomeno della **depressione post-partum**, che può essere un fattore di rischio di maltrattamento da parte della mamma nei confronti del figlio (incapacità genitoriale; difficoltà di gestione dello stress e delle richieste del bambino/a; trascuratezza collegata a mancanza di cure anche rispetto a se stesse).

DAL PUNTO DI VISTA DEL BAMBINO E DELLA BAMBINA:

- il maltrattamento fino ai tre anni di vita nelle sue diverse forme si verifica in un **periodo considerato cruciale per lo sviluppo** psicofisico e di tutte le potenzialità[13]; a questo si aggiunge la possibile maggiore difficoltà nell'individuazione di maltrattamenti in questa fascia di età in cui la relazione del bambino con il mondo esterno è ancora molto limitata, dal punto di vista della verbalizzazione e comunicazione, e in cui i contatti con soggetti esterni alla famiglia sono più ristretti (si consideri che il tasso medio di copertura della domanda per quanto riguarda gli asili nido e le altre strutture integrative non arriva al 13%, con punte al di sotto del 3% come in Calabria[14]), e si limitano, quando contattati, ai pediatri e/o ai pronto soccorso e agli ospedali in caso di ricoveri;

- le **conseguenze a medio e lungo termine del trauma** sulla salute, come prima riportato, ma anche l'influenza sul comportamento successivo dei bambini vittima di maltrattamento, con rischio maggiore sia di comportamenti maltrattanti sia di esserne vittime[15].

CAPITOLO 2

2. PANORAMICA SU DATI E INIZIATIVE

2.1 OLTRE LA METÀ DEI BAMBINI NEL MONDO SUBISCE QUALCHE FORMA DI VIOLENZA

Complessivamente viene stimato che ogni anno, nel mondo, i bambini sottoposti a una qualche forma di violenza siano fra 500 milioni e 1,5 miliardi[16]. Se si considera che i bambini e gli adolescenti nel mondo ammontano a circa 2 miliardi e 200 milioni[17], si può capire l'enormità di questa cifra.

Ogni 5 minuti, secondo altre stime, un bimbo muore a causa di un evento violento, 120 milioni di ragazze e 73 milioni di ragazzi sono vittime di violenza sessuale e circa 1 miliardo di bambini subisce con regolarità punizioni fisiche[18].

La cifra di oltre 1 miliardo di bambini ritorna anche in un lavoro pubblicato nel 2016, che ha preso in esame 112 studi con dati provenienti da quasi la metà dei Paesi nel mondo (96) e ha indicato una stima di oltre 1 miliardo di bambini da 2 a 17 anni che ha sperimentato situazioni di violenza nell'anno 2014. Da notare che non è stato possibile formulare stime nei piccoli da 0 a 1 anno per il numero troppo ridotto di studi che riportavano questo gruppo di età[19].

2.2 USA: I PIÙ COLPITI SONO I PICCOLISSIMI

Una pubblicazione statunitense[20] sul maltrattamento infantile negli USA riferita al 2015 dice che sono state 680.000 le vittime di abuso e trascuratezza tra i bambini. I più piccoli sembrano essere i più vulnerabili (più di un quarto, 27,7%, con meno di 3 anni), e i tassi maggiori sono nella fascia di età sotto l'anno (24,2 per 1.000 bambini nella popolazione della stessa età); le forme di maltrattamento più comuni sono la trascuratezza (75,3%) e l'abuso fisico (17,2%); gli abusi sessuali rappresentano l'8,4%. Aumentano i casi mortali rispetto all'anno precedente, con una stima nazionale di 1.670 morti per abuso e trascuratezza (in quattro casi su cinque era coinvolto un genitore, 77,7%), nella maggior parte dei casi in bambini con meno di 3 anni (74,8%, una percentuale leggermente superiore al 2014).

La ricerca mostra una crescita del fenomeno negli ultimi 5 anni.

Maltrattamento dei bambini e delle bambine negli USA - anni 2011 e 2015 [21]

Fenomeno	2011	2015	variazione %
Bimbi/e considerati dai servizi	3.081.000	3.358.000	+9
Bimbi/e vittime di maltrattamento	658.000	683.000	+3,8

Tipologia di maltrattamento bambini e bambine USA - anno 2015

Fenomeno	%
Trascuratezza	75,3
Abusi fisici di tipo non sessuale (lesioni, fratture, ustioni, intossicazioni)	17,2
Abusi sessuali	8,4

2.3 TROPPI BAMBINI E BAMBINE MALTRATTATI IN EUROPA RISPETTO ALLE POSSIBILITÀ DI RISPOSTA DEI SERVIZI

Spostando l'attenzione al panorama europeo, l'Ufficio Regionale Europeo dell'Organizzazione Mondiale della Sanità (OMS) ha pubblicato nel 2013 l'*European report on preventing child maltreatment*[22]. Il testo sottolinea il carico rappresentato dal maltrattamento infantile, le sue cause, le sue conseguenze, si sofferma sulla prevenzione e sulla strada da percorrere in Europa, sottolineando come il maltrattamento sia una questione non solo sociale ma anche di salute pubblica, e propone un approccio di salute pubblica per prevenirlo.

Vengono riportati alcuni dati sull'estensione del maltrattamento: ogni anno nella regione europea muoiono a causa di maltrattamenti almeno 850 bambini con meno di 15 anni e questa cifra potrebbe essere una sottostima dei numeri reali; inoltre i tassi di mortalità sono più alti nei bambini sotto i 5 anni. La prevalenza del maltrattamento dei bambini nella regione europea avrebbe percentuali del 9,6% per l'abuso sessuale, 22,9% per quello fisico e 29,1% per quello psicologico, mentre la prevalenza della trascuratezza fisica sarebbe del 16,3% e di quella emotiva del 18,4%. Viene anche calcolato che, considerando la popolazione di bambini in Europa, queste cifre suggerirebbero che 18 milioni di bambini abbiano subito abuso sessuale, 44 milioni fisico e 55 milioni mentale.

Il tema viene ripreso l'anno successivo sempre dall'OMS Europa nel documento *Investing in children: the European child maltreatment prevention action plan* 2015-2020[23], che commenta come i numeri percentuali riferiti ai bambini sottoposti ai diversi tipi di maltrattamento superino le possibilità di una risposta efficace da parte dei servizi di protezione dell'infanzia.

Lo stesso documento sottolinea come il maltrattamento, insieme con altre condizioni difficili nell'infanzia, sia una causa possibile di livelli di stress dannosi con effetti negativi sullo sviluppo cerebrale e possa portare a comportamenti dannosi per la salute fisica e mentale, risultati peggiori dal punto di vista educativo e sociale e trasmissione intergenerazionale della violenza.

Foto: Stuart Sia per Save the Children

Inoltre un bambino maltrattato può maturare un rischio maggiore di essere sia vittima sia autore di violenza. Il documento pone poi tre obiettivi da perseguire, che coprono gli ambiti della maggiore visibilità e raccolta di informazioni (misurazione di incidenza e prevalenza, indagini sul maltrattamento infantile, relazioni sulla sua riduzione e sul miglioramento del benessere mentale dei bambini), di un rinforzo nelle azioni di prevenzione con piani nazionali attraverso partnership e azioni multisettoriali, e di una riduzione del rischio di maltrattamento dei bambini e delle sue conseguenze con un rinforzo dei sistemi sanitari, con azioni declinate su diversi aspetti e ambiti.

Nel 2015 un ulteriore documento, sempre dell'OMS Europa, ha focalizzato l'attenzione sui **programmi di prevenzione, in supporto all'implementazione delle attività di prevenzione nei sistemi sanitari e attraverso attività multisettoriali**[24].

Impegni e alleanze internazionali contro il maltrattamento di bambini e bambine

Sul versante delle iniziative volte a contrastare la violenza nell'infanzia, a luglio del 2016 è stata presentata la Global Partnership to End Violence Against Children, un'**alleanza globale perché abbia fine la violenza nei confronti dei bambini** con lo scopo di sostenere le iniziative di prevenzione della violenza, protezione dell'infanzia e aiuto a rendere le società sicura per i bambini[25]. Il tutto in linea con gli impegni dell'Agenda 2030, l'impegno degli Stati nei confronti delle diverse forme di violenza nell'ambito degli Obiettivi di Sviluppo Sostenibile (Sustainable Develpment Goals).

Sempre nel 2016 è stato presentato INSPIRE[26], una risorsa per tutti coloro che lavorano per contrastare la violenza contro l'infanzia, governi, società civile, settore privato. Si tratta di una selezione di **sette strategie basate sulle prove migliori disponibili** per aiutare Paesi e comunità nei programmi di prevenzione e servizi per ridurre la violenza contro l'infanzia: implementazione e rinforzo delle leggi; norme e valori; ambienti sicuri; supporto a genitori e a chi si prende cura dei bambini; sostegno al reddito delle famiglie; servizi di risposta e supporto; competenze educative e di vita.

2.4 IN ITALIA: MOLTE INIZIATIVE E MOLTO SOMMERSO

Anche in Italia vi sono una **diffusa sensibilità e interesse** sul tema e **numerose iniziative** sui versanti della rilevazione/epidemiologia del fenomeno, della prevenzione, del riconoscimento, della presa in carico, della formazione di operatori, della nascita di reti fra ospedali.
Negli ultimi anni sono stati prodotti studi e ricerche che hanno provato a dare un quadro della situazione dal punto di vista quantitativo, arrivando a stime campionarie sui casi di maltrattamento. Ma sussiste la difficoltà di una raccolta dati di livello nazionale, che sia rappresentativa di tutto il territorio; inoltre i dati raccolti si riferiscono ai casi considerati certi o comunque arrivati a una segnalazione o a una presa in carico, comunque di accertamento del maltrattamento. Resta fuori il sommerso rappresentato dai casi che non vengono intercettati o che non sono neanche riconosciuti come maltrattamento.

Il **IV Piano nazionale di azione e di interventi per la tutela dei diritti e lo sviluppo dei soggetti in età evolutiva**[27] riporta come "Purtroppo sul fenomeno del maltrattamento e dell'abuso all'infanzia non si dispone di dati raccolti stabilmente nel quadro di un sistema di sorveglianza nazionale"[28].

Qui di seguito vengono riportati alcuni **dati e informazioni tratti da pubblicazioni, ricerche e attività in ambito nazionale o in alcune aree italiane** realizzate negli ultimi anni, dove, quando possibile, viene isolata la componente relativa alla fascia di età 0-3 anni. Si tratta di dati difficilmente comparabili, per diverse modalità di approccio o finalità della ricerca, o diversa classificazione e suddivisione delle fasce di età interessate o delle tipologie di maltrattamento, che tuttavia forniscono un quadro, seppur parziale, delle molteplici attività svolte o in atto e di alcune lacune e necessità comuni riscontrate. Accanto alle ricerche mirate a definire e quantificare la diffusione del maltrattamento sul territorio italiano, vi sono **progetti e campagne che coprono l'area della formazione, della sensibilizzazione, del miglioramento degli strumenti di rilevazione e di intercettazione**.

LA PRIMA PORTA DI ACCESSO: I PRONTO SOCCORSO E LE STRUTTURE SANITARIE

Alcuni studi effettuati in Italia sul maltrattamento hanno valutato **i casi dei bambini arrivati in pronto soccorso**.
Un lavoro retrospettivo pubblicato nel 1999 aveva riscontrato, tramite questionario sull'attività del 1997 in 68 pronto soccorso pediatrici di 16 regioni italiane, oltre 400.000 casi di maltrattamento sospettati o segnalati, e le tipologie più frequenti erano il maltrattamento fisico, l'abuso sessuale e la trascuratezza[29].
Uno studio dell'Italian Child Maltreatment study group (IChilMa) sui pronto soccorso di alcuni ospedali italiani, pubblicato nel 2005, ha riscontrato una prevalenza del 2% di bambini fra quelli arrivati in pronto soccorso in cui vi era un sospetto di maltrattamento[30].
Infine, in un lavoro pubblicato nel 2016 è stata verificata l'efficacia di una formazione specifica degli operatori e costituzione di un gruppo interdisciplinare in un ospedale italiano sul miglioramento dell'intercettazione dei casi di maltrattamento[31].
La frequenza dei casi identificati prima (fra gennaio 2010 e dicembre 2011) e dopo l'intervento (tra gennaio 2013 e dicembre 2014) è passata da 7 casi su 10.000 a 8 casi su 10.000. Nel periodo post formazione i bambini arrivati al pronto soccorso pediatrico sono stati quasi 54.000, di età media 2,1 + 0,9 anni, poco meno della metà maschi, e fra questi sono stati diagnosticati 45 casi di maltrattamento, di cui circa un terzo maschi e di età media 9,1 + 3,6 anni[32].

Il progetto REVAMP-Repellere Vulnera Ad Mulierem et Puerum ("Controllo e risposta alla violenza su persone vulnerabili: la donna e il bambino, modelli di intervento nelle reti ospedaliere e nei servizi socio-sanitari in una prospettiva europea" CCM 2014 finanziato dal Ministero della Salute) si è posto come obiettivo quello di armonizzare e valutare l'efficacia dei protocolli che vengono seguiti per riconoscere, accogliere, prendere in carico e accompagnare i casi di violenza su donne e bambini, dato il ruolo svolto dai servizi sanitari nella rilevazione e contrasto al maltrattamento[33] attraverso l'identificazione di elementi minimi comuni, conformi alle linee guida dell'Organizzazione Mondiale della Sanità e alle prove di efficacia[34].
Nell'ambito del materiale prodotto dal progetto REVAMP vi è anche un'analisi delle Schede di Dimissione Ospedaliera per i ricoveri (SDO) e dei flussi di Emergenza Urgenza (EMUR) per i pronto soccorso (per questi ultimi quelli relativi a Piemonte, Toscana, Abruzzo e Sardegna)[35].

Sotto l'anno di vita il rischio è più alto

Nelle Schede di Dimissione Ospedaliera (SDO) del 2012 vi sono stati **in Italia 485 casi di aggressione o abuso in età pediatrica (0-14 anni) con ricovero ospedaliero, di cui 183 con diagnosi di abuso o maltrattamento su minore (circa il 38%); di questi il 48,8% aveva meno di 5 anni e il gruppo con rischio maggiore era quello con meno di 1 anno** (tasso medio di ricovero pari a 53,0 per milione di residenti, a fronte di 26,6 per milione nella fascia 1-4 anni e alla media generale pediatrica pari a 21,4 per milione).

Dalle SDO, nelle diagnosi di abuso le forme più frequenti erano l'abuso sessuale e fisico, anche se il maltrattamento, l'abuso emotivo e quello psicologico insieme erano simili come frequenza all'abuso fisico; la frequenza di *Shaken Baby Syndrome* era di 1 caso ogni 20 ricoveri per abuso.

Dai flussi emergenza e urgenza – **EMUR del 2012**, relativi a Piemonte, Toscana, Abruzzo (anche se parziali) e Sardegna nel 2012 risultano accertati **682 casi di violenza interpersonale o abuso su minore in età da 0 a 14 anni e di questi il 17% (116 casi) aveva diagnosi di maltrattamento o abuso**. Il tasso medio era 96,7 accessi l'anno al pronto soccorso per milione di residenti da maltrattamento o abuso (considerando solo Piemonte, Toscana e Sardegna); questo dato **proiettato alla popolazione porta a 805 accessi in pronto soccorso di bambini da 0 a 14 anni per abuso o maltrattamento**. Non sono purtroppo ancora stati elaborati dati specifici per la fascia di età 0-3 anni.

Rispetto alle tipologie, oltre **un terzo dei bambini aveva subito violenza sessuale, circa 1 su 5 abuso fisico, quasi 1 su 10 maltrattamento o trascuratezza e 1 su 20 *Shaken Baby Syndrome***. Gli autori del lavoro sottolineano la questione della sottorilevazione, valutando i dati rilevati attraverso i flussi EMUR rispetto alle prevalenze di violenza su bambini riportate da lavori pubblicati.

La sottorilevazione è pari al 90%

Secondo quanto calcolato dagli autori, considerando la regione con una maggiore completezza nella rilevazione, ci sarebbe una sottorilevazione pari al 90%, e quindi sarebbe registrato solo un caso ogni 10 di quelli attesi della prevalenza d'abuso osservabile in pronto soccorso secondo i dati di letteratura scientifica (compreso lo studio IChilMa).

Infine, sempre attraverso il Progetto REVAMP, nel 2014 sono stati registrati i dati relativi a 4 centri di pronto soccorso (due a Genova, uno a Forlì e uno a Torino)[36] secondo lo standard europeo Injury Data Base (IDB) in modalità analitica (Full Data Set – FDS). Le rilevazioni sono state realizzate utilizzando un modulo specifico (Modulo FDS IDB – Violenza) con una raccolta di informazioni sulla causa dell'incidente che ha portato al pronto soccorso insieme con una caratterizzazione dell'evento violento e del contesto[37]. Sono stati rilevati 47 casi di aggressione o maltrattamenti in bambini da 0 a 14 anni (29 maschi e 18 femmine), con i casi più numerosi nei bambini di età maggiore. Rispetto alla fascia di età di interesse della presente indagine, **tra i bambini da 0 a 1 anno vi era un solo caso, mentre tra quelli da 2 a 5 anni sono stati registrati 4 casi**. Rispetto all'autore dell'aggressione, andando a cercare i casi verificatisi in ambito domestico, **quelli da parte del genitore rappresentavano il 27% e quelli da parte di un altro parente o familiare il 7%**. Nel 2015 la rilevazione IDB violenza è stata estesa a tutti i centri di Pronto Soccorso del REVAMP. I dati sono in fase di analisi.

UN PASSO IMPORTANTE: IMPARARE A RICONOSCERE

Il Progetto Europeo Intovian[38], avviato alla fine del 2012 e concluso nel 2015, si poneva l'obiettivo di migliorare l'efficacia dei servizi sanitari europei nella prevenzione e diagnosi precoce di abuso e trascuratezza nei bambini e neonati. In questa direzione ha sviluppato uno strumento di screening, con una specificità di interesse rispetto alla presente indagine in quanto focalizzato in particolare sulla fascia di età 0-3 anni.

La proposta del progetto partiva dal fatto che in questo primo periodo della vita sono previsti in diversi Paesi protocolli di medicina preventiva che offrono occasioni di contatto fra la famiglia e i più piccoli e gli operatori sanitari, e costituiscono conseguentemente una favorevole opportunità per l'osservazione e la rilevazione di eventuali situazioni di sospetto[39]. È stato quindi prodotto lo "Strumento di screening per l'identificazione di famiglie a rischio o con problemi già accertati di abuso e trascuratezza nei confronti di bambini e neonati", o Strumento "Intovian". Tale strumento è formato da una lista di controllo di 5 elementi su fattori di rischio per violenza fisica e/o psicologica, trascuratezza e modelli relazionali disfunzionali o di abuso fra il bambino o neonato e chi si prende cura di lui (*caregiver*).

L'obiettivo generale è che lo Strumento Intovian venga utilizzato come supporto (senza sostituire altri strumenti o esami) nella prima fase di valutazione dei piccoli in età 0-3 anni nel corso della visita presso i servizi sanitari ed è stato ideato e sperimentato per un utilizzo nell'ambito delle cure primarie, come pediatria di famiglia e consultori, o terziarie, come ospedali e pronto soccorso.

In Italia la sperimentazione dello Strumento Intovian è stata realizzata presso **l'ospedale di Pescara, per 6 mesi, nel pronto soccorso**, dove in media ogni anno vi sono circa 3.600 accessi di bambini nella fascia di età 0-3 anni, dopo un corso di formazione per il personale medico e infermieristico del pronto soccorso stesso; viene riferita l'identificazione di **18 casi (14 maschi e 4 femmine), con diagnosi e/o sospetto di maltrattamento fisico (11 casi, di cui 2 *Shaken Baby Syndrome*), trascuratezza (6 casi) e sindrome di Munchausen (1 caso)**[40].

Foto:Adam Hinton per Save the Children

QUASI 100MILA LE PICCOLE VITTIME DI MALTRATTAMENTO. UN TEMA DI SALUTE PUBBLICA

Nel **2012** è stata realizzata da CISMAI e Terres des Hommes una prima quantificazione nazionale del maltrattamento sui minori[41]. Il lavoro è stato effettuato nei primi sei mesi del 2012 con l'invio di un questionario ai Comuni, che lo hanno successivamente inviato ai Servizi Sociali. **I dati si riferiscono al 31 dicembre 2011**. È stato possibile raccogliere e utilizzare **le risposte di 31 Comuni**, raggiungendo una popolazione di quasi 50.000 minori in carico ai Servizi Sociali: circa 1 minore su 6 fra quelli assistiti dai Servizi Sociali è vittima di maltrattamento, 1 su 100 della popolazione di minori residenti, da cui gli autori dell'indagine affermano essere plausibile vi fossero quasi 100.000 minori vittime di maltrattamento, considerando la popolazione al momento dell'indagine.

Il maltrattamento era la causa dell'intervento dei Servizi Sociali nel 15,46% dei minori presi in carico. Rispetto alle tipologie, la percentuale maggiore era rappresentata dai casi di **trascuratezza materiale e/o affettiva (52,7%), seguita da violenza assistita (16,6%), maltrattamento psicologico, abuso sessuale, patologia delle cure e maltrattamento fisico**.

Più ampia e articolata l'indagine promossa dall'Autorità Garante per l'Infanzia e realizzata dalle due organizzazioni nel **2015** con la collaborazione dell'ANCI e dell'ISTAT[42].
In questo caso il lavoro ha coinvolto **oltre 200 Comuni, coprendo un quarto della popolazione minorile residente in Italia (2,4 milioni)**. È stato rilevato che 47,7 minorenni su 1.000 erano seguiti dai Servizi Sociali (un totale di 457.453) e, selezionando fra i dati la fascia 0-3, i bambini di età fino ai 3 anni presi in carico dai Servizi sarebbero 29 su 1.000.
In totale viene stimato in 91.272 il numero di minorenni vittime di maltrattamento: circa 1 bambino ogni 5 di quelli seguiti dai Servizi Sociali sarebbe vittima di maltrattamento. Rispetto alle tipologie, tenendo conto della possibile compresenza, **la causa più frequente di maltrattamento (47,1%) è rappresentata da trascuratezza materiale e affettiva, che unita alla patologia delle cure come discura o ipercura (8,4%) supera il 50%, quindi più di un bambino su due; la seconda forma più comune è la violenza assistita, quasi un bambino su cinque (19,4%); seguono il maltrattamento psicologico (13,7%) e fisico (6,9%) e l'abuso sessuale (4,2%)**[43].

L'ultima indagine nazionale nell'ambito dell'attività diagnostica del maltrattamento e abuso sui bambini realizzata da Terre des Hommes e pubblicata alla fine del **2016**[44] ha puntato l'attenzione in particolare su **cinque centri italiani** che si sono distinti per l'impegno e la qualità del lavoro di prevenzione, diagnostica e trattamento dei casi di maltrattamento materno e infantile in Italia[45].
Sono state raccolte informazioni su organizzazione e modalità di lavoro dei diversi centri e alcuni dati relativi ai **casi esaminati nel periodo 2011-2015**. La suddivisione in fasce di età non contempla quella 0-3 anni, ma è possibile isolare i dati relativi al primo anno di vita e quelli da 1 a 5 anni.
A Torino sono stati confermati in quel periodo 39 casi nel primo anno di vita e 200 casi fra 1 e 5 anni (che coprono insieme il 46% dei casi, 7% bambini con meno di 1 anno); a Milano i casi valutati sono stati 24 sotto l'anno e 222 da 1 a 5 anni (28% dei casi, 3% nel primo anno); a Padova valutati 90 casi con meno di 1 anno e confermati 86, valutati 158 casi da 1 a 5 anni e confermati 133 (in totale la percentuale di casi confermati è pari al 45% di cui 18% sotto l'anno); a Firenze confermati 42 casi di meno di 1 anno e 110 da 1 a 5 anni (39%, di cui 11% sotto l'anno di vita); a Bari sono stati valutati 25 casi di meno di 1 anno e 120 da 1 a 5 anni (27%, di cui 5% sotto l'anno).

I più piccoli nei casi rilevati dai 5 centri esaminati 2011-2015

Centri	1-5 anni	≤ 1 anno
Ambulatorio BAMBI – Torino	46%	7%
SVSeD Policlinico – Milano	28%	3%
CRDBM – Padova	45%	18%
GAIA, Meyer – Firenze	39%	11%
GIADA, Policlinico – Bari	27%	5%

Pur considerando che in due centri erano i casi valutati (non quelli confermati) e quindi una possibile parziale sovrastima, unendo questi dati, **fra il 2011 e il 2015 ci sono stati 216 casi di maltrattamento o abuso in piccoli con meno di 1 anno e 785 casi da 1 a 5 anni (1.001 casi complessivi sotto i 5 anni). Quindi circa 1.000 casi in cinque anni, che significa in media ogni anno circa 200 bambini con meno di 5 anni maltrattati o abusati giunti all'attenzione di personale sanitario**, e questo solo in cinque aree circoscritte, per quanto punti di riferimento anche regionali, del territorio italiano. Rispetto alle tipologie di maltrattamento le percentuali sono abbastanza variabili da centro a centro e non è possibile estrapolare il dato sul tipo di maltrattamento più frequente nelle diverse fasce di età[46].

IL LAVORO DI CAMPO. TRE STORIE ITALIANE

Milano, Servizio Soccorso Violenza Sessuale e Domestica (SVSeD), Fondazione IRRCS Ca' Granda Ospedale Maggiore Policlinico

Il SVSeD di Milano **ha collaborato a questa raccolta di informazioni elaborando i dati relativi alla fascia di età 0-3 anni nel periodo compreso fra il 2011 e il 2015**. I casi provenivano per la maggior parte dalla città di Milano (84), ma anche dalla provincia (38 casi) e da fuori provincia (16 casi). In totale **nei cinque anni sono stati accertati 138 casi, 48 maschi e 90 femmine, di cui 24 fino a 1 anno di età** (tab. 1).
La forma di **maltrattamento più frequente** (tenendo presente che in alcuni casi sono presenti insieme più tipi di maltrattamento) è rappresentata dall'**abuso sessuale (64 casi), seguito dalla violenza assistita (51 casi)** (tab. 2). Tuttavia, se vengono considerati solo **i casi in cui vi è stata una singola forma di violenza, quella assistita diventa la tipologia prevalente** (44 casi, rispetto ai 34 di violenza sessuale) (tab. 3).

Il numero di casi di maltrattamento e di violenza sessuale sulle donne ha subito un costante incremento negli ultimi anni. Nel 2015 sono state viste presso il SVSeD per violenza sessuale e domestica 806 donne e 1.037 nel 2016. Per quanto riguarda le **donne in gravidanza**, sono stati isolati i dati per l'anno 2015 e 2016. **Tra queste, le donne in gravidanza erano 25 nel 2015 e 34 nel 2016, per un totale di 59 su 1.843. Inoltre, 354 donne nel 2015 e 445 nel 2016 che si erano presentate al Servizio SVSeD avevano figli (799 su 1.843, pari al 43%** delle donne arrivate per episodi di violenza), dato che può fare presumere condizioni di violenza assistita e rischio di maltrattamento anche dei bambini.

Tab. 1 - Policlinico di Milano. Casi di maltrattamento per età tra il 2011 e il 2015

	Età				Sesso	
	0-12 mesi	1 anno	2 anni	3 anni	Maschi	Femmine

Padova, Centro Regionale per la Diagnostica del Bambino Maltrattato[47]

Ogni anno giungono all'attenzione del Centro Regionale per la Diagnostica del Bambino Maltrattato (CRDBM) circa 120-150 tra bambini e ragazzi per una valutazione, per un totale di 564 casi nel quinquennio 2011-2015. Tra questi, circa 1 bambino su 4 ha meno di 3 anni e il maltrattamento è sospettato nel primo anno di vita (categoria 0 anni) in circa 30 casi su 100.
I piccoli sono distribuiti per sesso con un rapporto maschi/femmine[48] di 92 (si consideri che tale dato ha valore 105 nella popolazione generale) con una lieve prevalenza del sesso femminile (52% femmine).
Quasi la metà dei casi (42%) proviene da territori al di fuori del bacino di riferimento (provincia di Padova), quali altre province della Regione Veneto o altre Regioni. Il fenomeno dell'attrazione da altre province o regioni si osserva nei casi più gravi, oppure in casi particolarmente complessi in cui la definizione della diagnosi richiede l'ausilio di un centro specialistico di III livello, per esempio per una *second opinion* su di un caso.
Il maltrattamento viene confermato nell'87% dei casi ed escluso nel restante 13%. Le forme di maltrattamento più frequentemente diagnosticate nella primissima infanzia sono l'*Abusive Head Trauma* (trauma cranico abusivo, comprensivo di altre forme di maltrattamento quali la sindrome del bambino scosso, *Shaken Baby Syndrome*, o la sindrome da scuotimento-impatto, *Shaken-Impact Baby Syndrome*) nel 22% dei casi, il *Chemical Abuse* (che consiste nella somministrazione di sostanze al bambino, farmaci, sostanze stupefacenti o altre sostanze tossiche) nel 19% e la trascuratezza grave nel 18%.
Secondo l'esperienza maturata al Centro, quanto più precoce è il maltrattamento, tanto più gravi saranno gli esiti in termini di danno alla salute, allo sviluppo e alla stessa sopravvivenza del bambino. I bambini che subiscono un maltrattamento in questi periodi critici per lo sviluppo potranno presentare un ritardo dello sviluppo ed esiti permanenti sia motori che cognitivi. È conoscenza consolidata che tali alterazioni si osservano non solo nei bambini che subiscono violenza fisica (*Abusive Head Trauma*) o violenza psicologica (Abuso Psicoemozionale o Violenza Assistita), ma anche nei casi in cui c'è una mancanza o assenza di cure amorevoli adeguate, come nei casi di trascuratezza grave (*child neglect*).

Tab.4 - Casi esaminati dal CRDBM di Padova nel periodo 2011 - 2015

	n° Casi di sospetto	n° Casi confermati
Totale casi 0-18	564	490
Casi 0-3 anni (% sul totale dei casi)	138 (25%)	118 (24%)
Distribuzione per età in anni (n° assoluto e %)		
0	41 (30%)	33 (28%)
1	36 (26%)	34 (29%)
2	25 (18%)	20 (17%)
3	36 (26%)	31 (26%)
Tot.	138 (100%	118 (100%)
Distribuzione per sesso (n° assoluto e %)		
F	72 (52%)	61 (52%)
M	66 (48%)	57 (48%)
Distribuzione per residenza		
Provincia	80	66
Fuori Provincia	58	52
Distribuzione per numero di maltrattamenti (casi)		
Singolo	_	97 (82%)
Multiplo	_	21 (18%)
Distribuzione per tipo di maltrattamento (forme)		
Abusive Head Trauma	28 (20%)	33 (22%)
Maltrattamento fisico	33 (24%)	17 (11%)
Chemical Abuse	10 (7%)	29 (19%)
Asfissia	0	2 (1%)
Abuso sessuale	20 (15%)	5 (3%)
Abuso psicoemozionale	2 (1%)	4 (3%)
Trascuratezza grave	19 (14%)	28 (19%)
Sindrome di Muchausen per Procura	0	2 (1%)
Violenza Assistita	17 (12%)	17 (11%)
Bambino conteso/conflittualità di coppia	4 (3%)	15 (10%)
Altro	6 (4%)	0
Totale forme di maltrattamento	139 (100%)	152* (100%)

* Il numero delle forme di maltrattamento confermate è superiore alle forme sospettate, poiché vengono sospettate meno forme di maltrattamento di quante ne vengano diagnosticate, con casi in cui vengono diagnosticate più forme di maltrattamento contemporaneamente.

Grosseto, Codice Rosa

In Toscana, dal 2014 il Codice Rosa è attivo in tutte le Aziende sanitarie e ospedaliere. Indica un percorso di accesso al pronto soccorso specifico per le vittime di maltrattamento o abuso, donne, uomini, bambini, persone vulnerabili. Una volta assegnato questo codice viene attivato un gruppo formato da personale sanitario (composto da medici, infermieri, psicologi, assistenti sociali, centro antiviolenza, eccetera) e dalle forze dell'ordine. Nella tabella 5 sono riportati i dati estratti dagli accessi Codice Rosa negli anni dal 2012 al 2015. Da tenere presente, nella lettura della tabella, che il numero di ASL e aziende ospedaliere i cui dati sono inseriti (e quindi il campione di riferimento) si è modificato nel corso degli anni, aumentando di numero (nel 2012 i dati si riferiscono solo a cinque ASL, nel 2013 a otto ASL e due Aziende Ospedaliere, nel 2014 e 2015 al totale delle Aziende Sanitarie e Ospedaliere della Toscana) e che nel 2012 si parlava di casi pediatrici, mentre negli anni successivi di minori. Pur tenendo presenti i limiti di cui sopra, complessivamente **dal 2012 al 2015 vi sono stati 1.268 accessi Codice Rosa di casi pediatrici/minori** (542 maschi e 675 femmine, 2 non noto, dati riferiti solo al 2013, 2014 e 2015, quindi su 1.219 casi). Nella tabella 6 è mostrata un'estrapolazione dei dati, dove disponibili (dal 2013 dunque), rispetto alle fasce di età. Non vi è una divisione fino ai 3 anni, ma da 0 a 2 e da 3 a 6 anni; tuttavia è possibile evincere un quadro del numero dei casi di maltrattamento nei bambini piccoli (ricordando sempre che nel 2013 la rilevazione non copre ancora tutte le ASL e Aziende Ospedaliere). Considerando la **fascia 0-2 anni, sono stati rilevati in totale 113 casi** (di cui **17 fra 0-1 anno** negli **anni 2014 e 2015**, dato non disponibile per il 2013 in cui erano raggruppati i casi nella fascia di età 0-2 anni), e un totale di **296 casi di maltrattamento o abuso in età 0-6 anni**.
I dati preliminari di Codice Rosa relativi al primo semestre del 2016 indicano 254 accessi in pronto soccorso di minori (nel 2015 erano stati in totale 426 nei 12 mesi), ma non ci sono ancora le specifiche per età[49].

Tab. 5 - Casi pediatrici/minori, Regione Toscana

	Maltrattamento	Abuso	Totale	Maschi	Femmine
2012	37	12	49	–	–
2013	293	59	352	152	200
2014	355	86	441	205	236
2015	373	53	426	187	239
Totale	1.058	210	1.268	542	675

2014	7	34	41	69	110
2015	10	30	40	69	109
Totale	17	64	113	183	296

Shaken Baby Syndrome

Fra le diverse possibili forme di maltrattamento, nella fascia 0-3 anni assume importanza quella che viene **definita sindrome da scuotimento (*Shaken Baby Syndrome*)**, o ***Abusive Head Trauma*** a includere insieme con lo scuotimento la possibilità di trauma da impatto. Nell'aprile del 2016 la Società italiana di neonatologia (SIN), Terre des Hommes e SVS DAD onlus (SVS Donna Aiuta Donna) hanno lanciato una **campagna di sensibilizzazione**[50], con materiale informativo e locandine per far capire i rischi e le conseguenze dello scuotimento del bambino, scatenato per esempio dal pianto, che rappresenta nei neonati e piccini l'unica forma di comunicazione per diverse necessità e disagi. Le conseguenze neurologiche dello scuotimento possono essere molto gravi, anche mortali, e viene riportata, non essendo disponibili dati certi, una **stima di incidenza in Italia di 3 casi ogni 10.000 bambini con meno di 1 anno** (negli Stati Uniti circa 50.000 bambini l'anno)[51]. La SIN indica come in genere le vittime siano bambini tra i 4 e i 6 mesi, sia perché questo è un periodo che richiede cure costanti che possono esasperare chi si occupa del piccolo sia perché da un lato la testa è pesante rispetto al corpo e dall'altro i muscoli del collo non sono ancora in grado di sostenerla. La SIN riporta inoltre che il **25-30% delle vittime muore e il 15% sopravvive senza esiti**[52].
Sempre nel 2016 un lavoro italiano che ha preso in considerazione gli aspetti clinici e medico-legali dell'*Abusive Head Trauma* ha indicato che quest'ultimo rappresenta la **causa di morte per maltrattamento in età infantile più comune nei Paesi industrializzati**. Viene indicato come al momento non siano disponibili in Italia dati pubblicati su incidenza e prevalenza e che la **maggior parte delle vittime abbia meno di 1 anno, più spesso meno di 6 mesi**[53].

Depressione post-partum

La depressione post-partum rappresenta una condizione della madre che può avere ripercussioni negative anche sul benessere dei figli e risulta importante il riconoscimento tempestivo e la gestione adeguata. Nel 2014 nell'ambito delle attività del Progetto biennale *Depressione in gravidanza e post-partum*: *modello organizzativo in ambito clinico, assistenziale e riabilitativo*, progetto finanziato dalla Regione Lombardia e svolto dall'Azienda Ospedaliera Fatebenefratelli e Oftalmico di Milano in collaborazione con l'Osservatorio Nazionale sulla salute della Donna (O.N.Da) e con la partecipazione dell'Associazione Progetto Itaca, sono state realizzate Linee Guida per la gestione della depressione in gravidanza e nel post-partum[54]. Il progetto si era avviato con un'**indagine conoscitiva in Lombardia su 500 uomini e 500 donne** e ha riportato che **1 genitore su 3 ha detto di aver sofferto o che la propria partner ha avuto una depressione post-partum**, soprattutto con il primo figlio, ma **meno del 50% ne ha parlato con il proprio medico**. Gli obiettivi comprendevano far nascere un modello organizzativo di presa in carico per la depressione perinatale (per rilevare e trattare rapidamente ed efficacemente), sensibilizzare l'opinione pubblica, supportare i papà e promuovere attività di formazione degli operatori sanitari. Nell'ambito dell'iniziativa vi era anche l'offerta di un'**assistenza domiciliare specialistica alle neomamme e ai neonati, attraverso un'équipe multidisciplinare** (psichiatra, psicologo, pediatra, volontaria)[55].

PEDIATRI CHE SOSPETTANO

La capacità di medici e pediatri di riconoscere i segnali di un possibile maltrattamento ai danni di bambini e bambine rappresenta un aspetto cruciale. Forse ancora più importante nella fascia di età 0-3 anni, quando il pediatra può essere l'unica o una delle poche figure all'esterno della famiglia a venire in contatto con il bambino o la bambina e in generale con il nucleo familiare.

2012, una verifica sui pediatri a Milano. Alla fine del 2012 Terre des Hommes e SBAM-Sportello Bambino Adolescente Maltrattato della Clinica Mangiagalli di Milano hanno condotto un'indagine che ha coinvolto medici di famiglia, pediatri di base e ospedalieri[56]. È stato inviato un questionario a 1.000 medici e 170 pediatri a Milano e dintorni per raccogliere informazioni sull'esperienza di casi di maltrattamento o abuso e sulla conoscenza del tema. I questionari raccolti utilizzabili sono stati **259, di cui 72 di pediatri**, pari al 42,3% del campione di questa categoria professionale (contro i 134, pari al 13,4%, dei questionari utilizzabili dei medici); in 53 questionari non era indicata la professione.

Oltre la metà degli intervistati ha dichiarato di sospettare situazioni di maltrattamento. Fra le risposte raccolte si segnala che il **65,63% degli intervistati ha dichiarato di sospettare situazioni di maltrattamento, abuso o trascuratezza/incuria** e per il 78,63% la fascia di età più a rischio di fratture da maltrattamento fisico è quella da 0 a 5 anni. **In totale vengono segnalati 318 casi** (3 casi circa per ciascun medico) e **la tipologia di maltrattamento più frequente è la patologia delle cure (175 casi), seguita dal maltrattamento fisico (81 casi) e dall'abuso sessuale (62 casi)**.

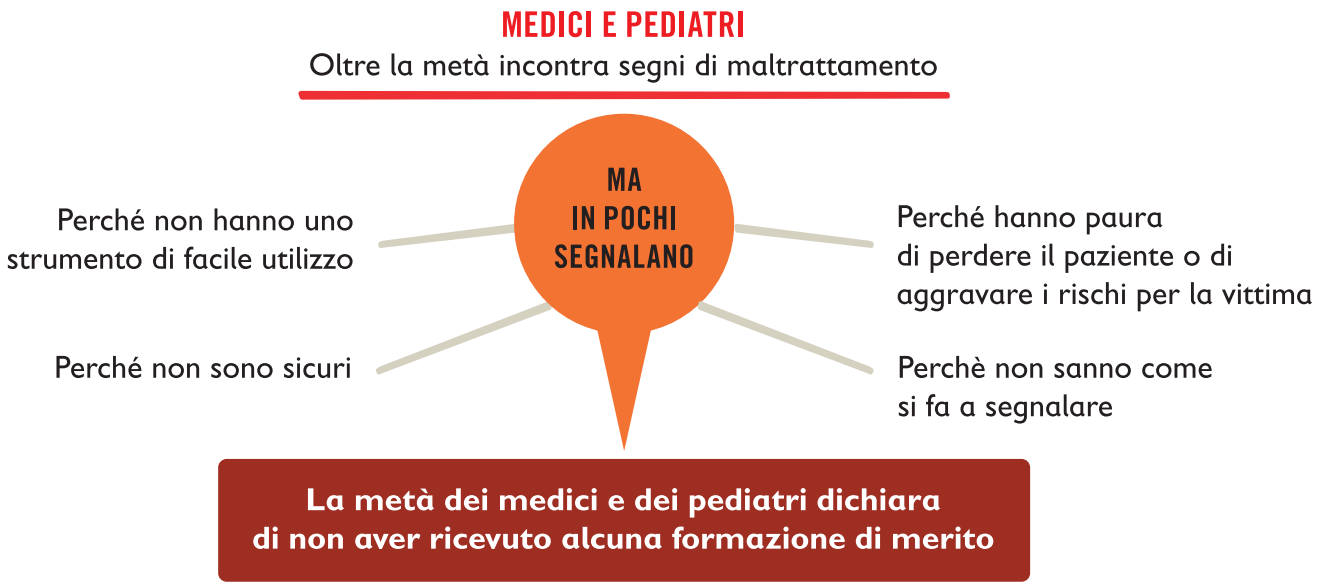
Fra gli intervistati che hanno risposto affermativamente alla domanda sull'aver mai sospettato situazioni di maltrattamento, abuso o trascuratezza/incuria, il **51,49% ha segnalato la situazione, mentre il 48,51% non lo ha fatto** e i motivi principali per cui è stato deciso di non segnalare erano il non avere elementi di sospetto sufficientemente forti (55,1%), non sapere a chi segnalare e come (18,3%) e avere timore delle conseguenze sul contesto familiare (13,6%).

Viene indicato che se la quasi totalità degli intervistati non ha a disposizione un modulo prestampato per la segnalazione (94,04%), la maggior parte afferma che averne uno potrebbe essere di aiuto (89,34%). Inoltre, un approfondimento sulla **formazione scientifica** ha fatto emergere che **circa la metà degli intervistati negli ultimi tre anni non ha partecipato ad alcun evento formativo sul tema e il 75,59% non ha mai partecipato a un corso di formazione sul maltrattamento, nonostante l'89,05% senta il bisogno di essere aggiornato**.

2013-2014, una verifica sui pediatri di Perugia. Nel 2013-2014 è stata svolta un'indagine, analoga a quella appena descritta, nella provincia di Perugia che ha coinvolto **134 operatori sanitari partecipanti a corsi di formazione specifici sul maltrattamento infantile**[57] cui è stata chiesta la compilazione di un questionario[58]. **Il 17% circa (23 su 134) ha segnalato un sospetto caso di abuso, e sempre al 17% circa è capitato di sospettare un caso di abuso ma di decidere di non segnalarlo. Nella maggioranza dei casi (43,48%) non si segnala perché le conoscenze nel merito non sono adeguate per avere la certezza**; in secondo luogo non si segnala perché non si è certi che la segnalazione sia adeguata (21,74%) o perché non emerge una storia di abuso familiare in modo chiaro (17,39%); **il 4,35% ha risposto di non aver segnalato perché non sapeva a chi indirizzare la segnalazione**.

Rispetto all'avere un modulo guida prestampato per la diagnosi, la risposta è stata negativa per la quasi totalità dei partecipanti (99,25%). Infine, il 96,27% sente la necessità di aggiornamento su cause, diagnosi e cura dell'abuso nel bambino, forse anche perché **negli ultimi tre anni l'82,09% non ha partecipato ad alcun corso o conferenza e il 57,46% non ha letto nessun articolo**; inoltre **il 95,52% degli intervistati non ha mai partecipato a un corso di perfezionamento sul maltrattamento**.

2015, un test nazionale. Nel 2015 è stata condotta un'ulteriore ricerca da Terre des Hommes, Società Italiana di Cure Primarie Pediatriche (SICuPP) e SVSeD su 500 medici in tutta Italia[59]. Sono stati raccolti **398 questionari da cui emerge che il 61% degli intervistati ha avuto casi di sospetto maltrattamento e il 57% di chi si è confrontato con questa situazione ha attivato la segnalazione**; viene riportato che il **16% teme che segnalare equivalga a perdere il paziente**. Inoltre il **59% vede positivamente la possibilità di avere un collega esperto cui inviare i casi sospetti** sia per sentirsi più sicuro (59%) sia per una protezione più completa dei bambini (76%). **Sulla formazione, la metà circa dice di non averne mai avuta e il 93% la vorrebbe**.



QUANDO A ESSERE COLPITE SONO LE MAMME

Nel 2015 l'**ISTAT** ha pubblicato un'indagine sulla sicurezza delle donne[60]. All'interno del quadro fornito vi sono i dati riguardanti la violenza assistita e la violenza in gravidanza. Nel totale delle violenze subìte da donne con figli, l'ISTAT segnala un **aumento della percentuale dei figli che erano presenti e hanno assistito alla violenza** del padre contro la madre rispetto a un'indagine precedente del 2006, che **passa dal 60,3% al 65,2% del 2014**, un dato che l'ISTAT definisce preoccupante poiché questi figli maschi hanno una probabilità maggiore di essere loro stessi violenti con le loro compagne e le figlie femmine di essere vittime. Nel 22,2% dei casi hanno assistito spesso alla violenza (21,4% nel 2006) e nel 25% dei casi ne sono stati anche coinvolti. E anche in questo caso assistiamo a un aumento di quasi 10 punti percentuali rispetto al 15,9 del 2006.

Quando più fattori di rischio si combinano. Una trascuratezza con tanti responsabili #storiedaiservizi

Dora è cresciuta in una casa famiglia da cui è scappata quando aveva 17 anni insieme a un uomo da cui ha avuto un figlio: oggi Teo ha 3 anni ed è cardiopatico per cui, fin da neonato, ha richiesto un'attenzione particolare in termini di cure, medicinali, nutrizione e regolarità dei ritmi della sua giornata. Il papà di Teo non l'ha riconosciuto alla nascita e pertanto Dora è sola nell'affrontare la crescita del bambino: non c'è una rete di riferimento, una famiglia che la sostenga e quindi Dora ricerca e accetta relazioni con uomini, sperando di trovare in questi un sostegno e una garanzia anche per Teo. Ma fino a oggi tali relazioni sono risultate in qualche caso pericolose per Dora e anche per Teo che ha assistito a momenti di litigio violento con percosse agìte e subìte da parte della sua mamma.

Considerando i dati sulle donne in gravidanza, **se nel 2006 nel 10,2% dei casi le donne sono state sottoposte a violenza da parte del partner anche quando erano incinte, la percentuale nella rilevazione del 2014 sale all'11,8%**. Nei casi di violenza **durante la gravidanza** l'ISTAT riporta inoltre **nel 5,9% dei casi la violenza è iniziata e nell'11,3% è aumentata**.

Orfani di omicidio di genere o femminicidio

Nell'ambito della violenza domestica e assistita si inserisce il drammatico capitolo degli orfani di femminicidio, che oltre a essere stati testimoni, o a essere direttamente coinvolti negli episodi di violenza, perdono la madre. Nella sola **Toscana in 10 anni (dal 2006) sono 30 i minori rimasti senza mamma** uccisa dal padre nell'ambito degli 88 casi di femminicidio[61] e a settembre 2016 è stato presentato alla Camera dei Deputati il primo studio su questi casi, bambini rimasti senza madre, morta, e senza padre, perché suicida (30% dei casi) o in carcere. Dal **2000, in 15 anni, è stato stimato un numero di circa 1.600 orfani di femminicidio** (417 negli ultimi tre anni, 180 minori), affidati a nonni, zii, servizi[62]. I dati sono stati presentati da Anna Costanza Baldry, responsabile scientifica del **progetto Switch-off**[63], del Dipartimento di Psicologia della Seconda Università di Napoli con la collaborazione di DiRe (Donne in rete contro la violenza) e due partner stranieri, dati presentati insieme con le Linee Guida prodotte dal progetto stesso.
Nell'ambito delle Linee Guida vengono anche riportati i risultati di un lavoro di ricerca in Italia con **interviste realizzate a 123 orfani: nell'81% dei casi gli intervistati avevano già assistito a violenze contro la madre e nel 41% dei casi i figli erano presenti al momento della morte** (di cui il 71% ha ascoltato quello che succedeva, il 52% ha visto e il 44% ha poi visto il corpo senza vita della mamma).
Sempre sugli orfani di femminicidio nel 2015 è stato pubblicato uno studio italiano che ha valutato il numero di **femminicidi in Italia fra l'1 gennaio 2012 e il 31 ottobre 2014** con ricerche online e sui giornali, contandone 319, circa 1 ogni 3 giorni (126 nel 2012, 134 nel 2013 e 59 nel 2014)[64]. Complessivamente i figli delle donne uccise rimasti **orfani erano 417** (153 nel 2012, 173 nel 2013 e 91 nel 2014), di cui **180 minorenni. Il 12,47% dei figli ha assistito all'omicidio e più della metà di questi (57,69%) era minorenne; in alcuni casi è stato ucciso anche il figlio (18 casi, 4,32%), e fra questi uno su due era un minorenne. L'omicidio è stato commesso dal padre nel 38,56% dei casi e i figli il cui padre è a sua volta morto dopo aver ucciso la madre erano l'11,75% (gli orfani minorenni il 42,86%)**. Nello studio viene inoltre sottolineato il tema del **destino di questi orfani** e l'importanza di studi per capire cosa succeda loro, quale sia il trattamento psicologico più adeguato e quali le decisioni migliori rispetto ai contatti con il padre, se autore dell'omicidio, e su dove farli vivere.

Orfani di crimini domestici: la legge

Il 21 aprile 2016 è stata presentata alla Camera dei Deputati la proposta di legge n.3772 "Modifiche al codice civile, al codice di procedura penale e altre disposizioni in favore degli orfani di crimini domestici".

La proposta, come emendata in Commissione Giustizia a gennaio 2017, prevede una serie di agevolazioni per "*i figli minori o i figli maggiorenni economicamente non autosufficienti rimasti orfani di un genitore a seguito di omicidio commesso in danno del genitore dal coniuge, anche legalmente separato o divorziato, dalla parte dell'unione civile, anche se l'unione civile è cessata, o da persona che è o è stata legata da relazione affettiva e stabile convivenza*".

Tra le altre cose, la proposta prevede che gli orfani di crimini domestici abbiano accesso al patrocinio a spese dello Stato anche in deroga ai limiti di reddito previsti dalla legge, per le spese legali di tutti i procedimenti derivanti dal reato; che possano vedersi liquidare, a titolo di "provvisionale", il 50% del presumibile danno da parte del giudice penale al momento della condanna del responsabile, senza dover attendere l'esito del successivo procedimento civile; che l'indagato per il delitto sia sospeso dalla pensione di reversibilità e dalla successione ereditaria e che tale esclusione sia resa definitiva dalla sentenza di condanna.

La proposta prevede inoltre una dotazione di 2 milioni di euro annui da dedicare a borse di studio, iniziative di orientamento, formazione, assistenza sanitaria e psicologica agli orfani, il 70% della quale sarebbe destinata ad interventi in favore dei minori. Al momento di chiudere il testo si è in attesa dell'approvazione da parte della Camera.

CAPITOLO 3

3. CON LE MANI IN PASTA. CONVERSAZIONI CON ALCUNI PROFESSIONISTI SU REGOLE, PRASSI, NODI DOLENTI

In Italia sono numerose e molto interessanti le storie di persone, organizzazioni e progetti che, soprattutto nell'ultimo decennio, hanno segnato l'intervento di contrasto al maltrattamento di donne incinte, bambine e bambini piccoli e piccolissimi. Come spesso capita, in un sistema molto frastagliato sul piano territoriale, si distinguono esperimenti di successo e tentativi coraggiosi fatti da persone che lavorano in ambiente sociale e sanitario.

Intento di questa parte del lavoro è quello non solo di dare riconoscimento a questo lavoro, ma anche di accendere una luce di ottimismo programmatico su una materia delicata e complessa come quella dei comportamenti maltrattanti in contesti particolarmente opachi e impermeabili allo sguardo sociale, come sono le famiglie.

Naturalmente, le persone e le storie che andremo a raccontare non sono esaustive del panorama italiano. Non è sempre semplice raggiungere le esperienze concrete specie quando non hanno l'opportunità di essere particolarmente pubblicizzate e visibili. La natura di questo lavoro è tuttavia proprio quella di uno slancio conoscitivo iniziale, al quale dovranno poi con pazienza e sistematicità aggiungersi e integrarsi nuove informazioni e materiale.

Grazie alle testimonianze professionali di:

Giussy Barbara, ginecologa, SVSeD, Milano.

Carla Berardi, pediatra di famiglia, Associazione Culturale Pediatri, Perugia.

Paola Di Blasio, psicologa, Dipartimento di Psicologia, Università Cattolica, Milano.

Vittoria Doretti, medico, anestesia e rianimazione, Codice Rosa, Grosseto.

Sabrina Farci, psicologa e psicoterapeuta, Cooperativa PARADIGMA, Torino.

Alessandra Kustermann, ginecologa, SVSeD, Milano.

Melissa Rosa-Rizzotto, medico di comunità, Centro Regionale per la Diagnostica del Bambino Maltrattato Unità di Crisi di Bambini e Famiglia, Azienda Ospedaliera di Padova.

Santo Rullo, psichiatra, Roma.

3.1 LA BABELE DEI PROTOCOLLI E DELLE LINEE GUIDA

In Italia esiste una legislazione piuttosto ricca riguardante la tutela delle vittime effettive e potenziali di comportamenti maltrattanti che si rifà ad accordi quadro e convenzioni internazionali di tutela dei diritti dei bambini o di contrasto alla violenza e allo sfruttamento di donne e minori.

Le fattispecie di reato perseguibili e previste dalle leggi nazionali hanno a che vedere con maltrattamenti in famiglia o verso fanciulli; omicidio; istigazione o aiuto al suicidio; percosse; lesione personale; pratiche di mutilazione degli organi genitali femminili; sequestro di persona; violenza sessuale; violenza sessuale di gruppo; violenza privata; minaccia; atti persecutori (*stalking*).

L'Italia ha ratificato nel 2013 la cosiddetta Convenzione di Istanbul sulla prevenzione e la lotta contro la violenza nei confronti delle donne e la violenza domestica. Nello stesso anno ha varato la legge 119/2013 «Disposizioni urgenti in materia di sicurezza e per il contrasto della violenza di genere, nonché in tema di protezione civile e di commissariamento delle Province»; il Piano d'azione nazionale straordinario contro la violenza sessuale e di genere 2015/2017. Per non parlare dei diritti dei bambini e del contrasto a ogni forma di violenza, abuso e sfruttamento di bambini e ragazzi, per i quali fin dal 1991 l'Italia ha ratificato la Convenzione ONU sui diritti dell'infanzia con apposita legge 176.

Tuttavia, le linee guida e i protocolli attuativi di questa vasta materia legislativa trovano un'applicazione molto discontinua

sul territorio nazionale e sovente anche nell'ambito del medesimo territorio regionale o della stessa città. Spesso l'iniziativa è affidata alla buona volontà o allo spirito d'iniziativa del singolo ed è molto complicato attivare procedure di sorveglianza e di monitoraggio dei casi sospetti.

DONNE COLPITE E BAMBINI TESTIMONI

Il piano regionale antiviolenza della Regione Lombardia, ci dicono Alessandra Kustermann e Giussy Barbara, ginecologhe del Soccorso violenza sessuale e domestica (SVSeD) di Milano, è stato approvato nel novembre 2015 dal Consiglio regionale e ha due obiettivi principali: 1) prevenire e far emergere il fenomeno della violenza contro le donne; 2) accogliere, sostenere, proteggere e accompagnare all'autonomia le donne vittime di violenza. È stato inoltre formalizzato e reso operativo nel piano quadriennale antiviolenza **l'Osservatorio Regionale Antiviolenza** (O.R.A.) per il monitoraggio del fenomeno e la conoscenza del percorso di valutazione e presa in carico delle donne che si rivolgono ai centri antiviolenza. Il sistema O.R.A. prevede la compilazione di una scheda per ogni donna che viene presa in carico dal Centro Antiviolenza. Le informazioni e i dati inseriti nel sistema informatico sono resi anonimi e accessibili solo alle operatrici dei centri antiviolenza. I dati raccolti consentono alla Regione Lombardia una conoscenza specifica del bisogno sul territorio per una migliore valutazione degli interventi, dell'appropriatezza dei servizi erogati e per la programmazione/pianificazione delle azioni.

Nel centro antiviolenza SVSeD di Milano, dicono ancora Alessandra Kustermann e Giussy Barbara, si utilizza un **sistema cartaceo e informatico di registrazione ed elaborazione dei dati** dei casi di violenza che giungono in valutazione, per fini statistici e di studio/ricerca. Nel database sono registrati anche episodi di maltrattamento in gravidanza. Attraverso il sistema O.R.A. i dati sugli accessi per violenza vengono trasmessi alla Regione Lombardia. In pronto soccorso **l'assegnazione di uno specifico codice SDO (Schede Dimissione Ospedaliera) identifica gli accessi delle donne vittime di violenza sessuale o domestica. Un ulteriore codice identifica lo stato di gravidanza.**

La segnalazione della presenza di figli è prevista sia dal sistema O.R.A. sia dal database cartaceo/informatico del Centro. Il follow-up dei casi è gestito in accordo con la donna vittima di violenza e si avvale della collaborazione di psicologhe, assistenti sociali, medici legali, avvocati, ed è anche previsto un follow-up dei figli che hanno assistito alla violenza.

La Regione Toscana, racconta Vittoria Doretti, medico anestesista della ASL di Grosseto e promotrice di Codice Rosa, utilizza il cosiddetto **Codice Rosa** per la raccolta dei dati sulle violenze ai danni delle donne. Il **Codice Rosa scatta al livello ospedaliero**. Nei casi di maltrattamento avviene immediatamente l'attivazione di un percorso "Codice Rosa", con un lavoro di squadra che prevede la collaborazione, tra l'altro, di ostetriche adeguatamente formate. Lo sforzo principale è quello di ragionare insieme su quale possa essere il percorso e quali le soluzioni e alternative da proporre anche e soprattutto alle donne che non dichiarano la violenza subìta, persone con cui stabilire un contatto, una confidenza e un rapporto di fiducia.

Per quanto riguarda le segnalazioni, dice Doretti, si registrano ancora difficoltà di tipo tecnico sulle quali si sta lavorando. Infatti, al momento non c'è nell'applicativo di pronto soccorso la possibilità di segnalazione della violenza di genere (certa o sospetta); quindi tutto ciò che non viene registrato con la dicitura "violenza altrui" sfugge alle statistiche. Per esempio, se una donna accede in pronto soccorso riferendo di aver urtato contro un mobile, nel verbale di triage si riferirà un accesso per "incidente domestico"; in questo caso se l'operatore ha il dubbio che si tratti di violenza domestica, non ha comunque la possibilità di segnalarlo. **La segnalazione della presenza di figli avviene al momento della valutazione iniziale** di pronto soccorso, al fine di regolamentare e ottimizzare la presa in carico successiva da parte dei Servizi Sociali, che si occupano del percorso di aiuto e supporto dopo la dimissione e provvedono al follow-up dei casi seguiti.

Per quanto riguarda il **follow-up**, prosegue Doretti, la preoccupazione è alta per il periodo successivo al parto. Il modello organizzativo di Codice Rosa, che è essenzialmente una rete, promuove un raccordo forte anche con pediatri e ostetriche per la gestione del dopo parto. Se c'è stata una segnalazione all'autorità giudiziaria, di solito si tratta di situazioni talmente gravi che le donne in genere sono già ospiti di una casa rifugio. Ma negli altri casi la difficoltà del follow-up è altissima: dopo il parto si allontanano, si perdono, quindi occorre attivare una rete forte di sorveglianza e sostegno. È un lavoro molto delicato, perché è difficile capire quando si entra in una situazione di maltrattamenti perseguibili d'ufficio, che mettono a rischio anche il bambino. È una linea di confine estremamente delicata e il pediatra, o l'ostetrica, o il ginecologo che sospetta non può prendere la decisione da solo.

BAMBINE E BAMBINI: TRACCE DI MALTRATTAMENTO CHE RISCHIANO DI PERDERSI

Il maltrattamento dei bambini come tema di salute pubblica rappresenta il cuore dell'azione del Centro Regionale per la diagnostica del Bambino Maltrattato di Padova. Secondo Melissa Rosa-Rizzotto, medico di comunità presso

Foto: Jonathan Hyams per Save the Children

il Centro, il nuovo approccio al maltrattamento quale problema di salute e l'inserimento delle sindromi da maltrattamento all'interno della Classificazione Internazionale delle Malattie dell'Organizzazione Mondiale della Sanità, già a partire dagli anni Ottanta, e successivamente la ridefinizione delle diverse forme del 1993, hanno fatto sì che la comunità scientifica internazionale, analogamente ad altre patologie che colpiscono i bambini, ne individuasse i sintomi e i segni clinici caratteristici e definisse i protocolli diagnostici e diagnostico-terapeutici che permettessero di formulare la diagnosi di maltrattamento e di escludere possibili diagnosi differenziali.
A livello nazionale non esistono linee guida condivise per il percorso diagnostico in ambito sanitario[65], soprattutto per quanto riguarda i percorsi assistenziale dei pazienti e delle loro famiglie, che prevedono l'integrazione tra i servizi ospedalieri e di cure primarie e i servizi sanitari e sociali, spesso limitando le indicazioni al problema della segnalazione all'Autorità.

In Italia non esistono vere e proprie linee guida nazionali sul maltrattamento e abuso nell'infanzia, spiega Carla Berardi, pediatra di Perugia, anche se alcune indicazioni in merito sono contenute nel Piano Sanitario Nazionale e nel Progetto Obiettivo Materno Infantile. **Esistono diverse linee guida regionali** – che tuttavia non specificano in dettaglio le modalità di azione per la fascia 0-3 anni – che riguardano la diagnosi – come formulare il sospetto e come poi confermarlo – e la presa in carico. Sulla modalità di segnalazione le linee guida regionali danno indicazioni diverse a seconda dell'organizzazione delle risorse del territorio. Un esempio può essere rappresentato dal progetto PIUMA nato nella Regione Umbria (ma ce ne sono altri in Italia), con l'intento di rendere disponibile un'**équipe multidisciplinare a cui si possa fare riferimento per la segnalazione**. Se il professionista, per esempio il pediatra di libera scelta, si trova di fronte a un sospetto di maltrattamento e non osa fare la denuncia ai Servizi Sociali o al Tribunale per i Minorenni o alla Procura, può usare come intermediaria questa équipe, che ha la **funzione di esaminare il caso, confermare/avvalorare il sospetto e quindi facilitare la segnalazione: viene così data più forza al singolo professionista, maggiore sicurezza per segnalare**.

Figure cruciali: il pediatra di famiglia

Nella fascia di età 0-3 anni il pediatra svolge un importante compito di educazione della coppia genitoriale su tutti gli aspetti dell'accudimento del bambino. Questa è un'ottima opportunità per sostenere i genitori anche nell'affrontare condizioni di stress determinate da quelli che Barton Schmitt chiama "i sette peccati mortali del bambino", mortali nel senso che possono provocarne il maltrattamento e la morte: il pianto, i risvegli notturni, l'ansia da separazione, i normali comportamenti esplorativi, il normale comportamento oppositivo, il normale rifiuto del cibo e le difficoltà nel toilet-training[67]. Il bambino che non dorme o che rifiuta il cibo è un bambino che stressa chi si prende cura di lui e quindi rischia di essere maltrattato. Schmitt propone che **il pediatra anticipi ai genitori che potrebbero incontrare queste difficoltà e dia indicazioni su come affrontarle**, in modo che sappiano come comportarsi senza andare in stress, con il rischio di far del male al bimbo. Per fare un esempio, rispetto al pianto del bambino la letteratura dimostra chiaramente che la sindrome del bambino scosso (*Shaken Baby Syndrome*) è collegata al pianto[68]. È molto importante che il pediatra sappia che c'è questo rischio e prima ancora che il bambino inizi a piangere, già dalla prima visita, informi i genitori che il piccolo piangerà, e piangerà molto e non andrà scosso.
La letteratura ha dimostrato che questo intervento è efficace[69].
Oltre a queste azioni preventive sulla popolazione generale, **il pediatra dovrebbe saper individuare l'eventuale esistenza di fattori di rischio aggravanti**, legati alle condizioni sociali (come isolamento sociale, conflitto genitoriale, perdita del lavoro) o alle caratteristiche dei genitori (dipendenze, depressione, comportamenti violenti, essere stati maltrattati da piccoli, eccetera) e inviare la famiglia ai servizi territoriali per ricevere aiuto.
Un altro aspetto fondamentale è la **formazione del pediatra sui segni e sintomi con cui può manifestarsi il maltrattamento**, così da renderlo capace di riconoscere il fenomeno e di segnalarlo, perché siano messe in atto tutte le misure necessarie perché il bambino sia tutelato e sfugga a ulteriori episodi di violenza, realizzando quella che si può definire prevenzione secondaria.
Il pediatra deve quindi essere formato a individuare i fattori di rischio, a intervenire su questi con guide anticipatorie[70] o inviando le famiglie ai servizi territoriali, a riconoscere i segni e sintomi del maltrattamento e a compilare una corretta segnalazione. Inoltre è necessario che lavori in rete con i servizi sul territorio per ricevere tutte le informazioni utili a una conoscenza adeguata delle famiglie.

Carla Berardi

Se un bambino arriva all'ospedale di Perugia con una frattura sospetta, prosegue Berardi, **il medico di pronto soccorso può compiere una ricerca per controllare se è già stato ricoverato negli altri ospedali territoriali per altri traumi, ma non c'è una segnalazione specifica**. Nella scheda di accesso al pronto soccorso (PS) se c'è una lesione traumatica di solito è prevista la possibilità di segnalarne la dinamica, sottolineando se è compatibile con la lesione, ma raramente viene fatto. Se l'abuso sessuale, fisico, la trascuratezza causano lesioni fisiche importanti, il bambino viene portato in PS. Qui non viene dedicata attenzione alla diagnosi differenziale tra lesione da

trauma accidentale o da trauma intenzionale, mentre **è dimostrato che l'utilizzo di una scheda specifica, dettagliata, facile da compilare con una crocetta ma che cattura l'attenzione degli operatori, aumenta moltissimo la capacità di riconoscimento e la segnalazione dei casi di maltrattamento**[66]. Non solo: qualora la scheda venisse a mancare, l'attenzione del personale, ormai abituato a usarla, rimane alta.

I casi di abuso noti purtroppo sono pochi, conclude Berardi, **perché raramente vengono sospettati, o addirittura non segnalati anche in caso di sospetto e quindi non diagnosticati**. Di conseguenza non c'è una situazione a regime, una prassi codificata rispetto al follow-up. A Perugia nei casi di maltrattamento l'ospedale di solito informa il pediatra, poi il bambino segue il suo percorso e sarà il pediatra a tenersi informato ma, molto spesso, il follow-up che il pediatra riesce a fare è piuttosto scarso: le informazioni che tornano sul proseguo della situazione del bambino sono scarsissime e raramente è coinvolto nel percorso di recupero e di cura.

3.2 OSSERVARE, ASCOLTARE, VERIFICARE. LA CENTRALITÀ DELLA DIAGNOSI

Uno dei nodi cruciali del maltrattamento delle bambine e dei bambini, specie in età molto precoci, è quello della diagnostica. Avere a disposizione un'adeguata sensibilità alla diagnosi significa essere in grado di esplorare il quadro clinico, stabilendo collegamenti significativi e profondi con le informazioni riguardanti l'ambiente, le relazioni, le condizioni socio-economiche, le dinamiche di conflittualità e le tensioni interne al nucleo familiare.

Foto: Save the Children

RICONOSCERE I SEGNI

Secondo la definizione generale, spiega Melissa Rosa-Rizzotto, **si parla di maltrattamento quando è possibile diagnosticare "un danno alla salute, allo sviluppo, alla dignità e alla sopravvivenza del bambino"** dovuto ad agìti o a mancanza di cure amorevoli, adeguate e sufficienti a garantire lo sviluppo del bambino. In questa logica, non c'è maltrattamento se non c'è un danno documentabile, che si possa rilevare o mediante un esame clinico accurato o mediante l'esecuzione di indagini e accertamenti bio-umorali, strumentali o funzionali (comportamentali).

Ci sono segni, sintomi, aspetti comportamentali e/o funzionali che, non singolarmente, ma considerati nel loro insieme, possono portare a una diagnosi differenziale di maltrattamento, anche molto precocemente. Per esempio, nel caso della sindrome del bambino scosso un segno che si osserva abbastanza precocemente quando si instaura tale forma di maltrattamento è un aumento disarmonico della circonferenza

cranica che cresce abnormemente, se messa a confronto coi restanti parametri di crescita (lunghezza e peso). Poiché tali parametri vengono abitualmente valutati dal pediatra al bilancio di salute del lattante, **con la semplice misurazione della circonferenza della testa è possibile sospettare uno scuotimento e avviare il bambino a un percorso diagnostico per confermare o escludere la diagnosi e per prevenire nuovi episodi di maltrattamento, che potrebbero essere anche letali**.

Un'altra sindrome molto frequente nella fascia di età 0-3 anni è il cosiddetto *neglect*, cioè la trascuratezza. Tale sindrome, che ha esiti gravissimi sullo sviluppo del bambino se non diagnosticata, presenta quale segno precoce la scarsa crescita e, dal punto di vista funzionale, la difficoltà ad alimentarsi: tali segni sono comuni a molte patologie della primissima infanzia ed è richiesto anche in questo caso un percorso di diagnosi differenziale accurato, che comprenda il maltrattamento tra le ipotesi diagnostiche.

CONSAPEVOLEZZA E COLLABORAZIONE PER DIAGNOSI E PRESA IN CARICO

Per migliorare il riconoscimento dei casi, prosegue Melissa Rosa-Rizzotto, è necessario prima di tutto che il medico specialista che osserva il bambino che presenta un segno o un sintomo specifico (per esempio crescita della circonferenza cranica, scarsa crescita, sanguinamento vaginale, emorragie retiniche) inserisca il maltrattamento all'interno delle possibili diagnosi differenziali e possa eventualmente **avvalersi di strutture specialistiche o équipe di riferimento con cui confrontarsi per la diagnosi definitiva**.
Una possibile strada è **introdurre nel curriculum formativo delle scuole di Medicina un corso sulla diagnosi del maltrattamento**[71]. Nell'esperienza di Padova, un corso di questo tipo – che l'Università di Padova ha proposto e propone tra i corsi a scelta libera degli studenti del IV e V anno di corso, a partire dal 2004 – ha sensibilmente aumentato la consapevolezza dei giovani medici sul tema e ha reso più precoce il sospetto diagnostico.
Una volta formulata la diagnosi, conclude Rosa-Rizzotto, per i singoli casi si avviano percorsi e trattamenti sanitari specifici, presa in carico integrata sanitaria e socio-sanitaria, azioni di tutela e conseguenti follow-up specifici, sia per valutare l'evoluzione del quadro clinico a distanza mediante controlli sanitari periodici, sia per attivare, se necessario, adeguati progetti terapeutico riabilitativi, sia infine per valutare le risorse del nucleo familiare e per prevenire le ricadute. **Questi percorsi** possono in taluni casi risultare difficoltosi poiché **richiedono una stretta collaborazione tra le diverse istituzioni coinvolte e una forte integrazione tra sociale e sanitario**.

3.3 CHE SUCCEDE DOPO?

Uno degli elementi critici rilevati nelle conversazioni e negli incontri con i professionisti del contrasto al maltrattamento e abuso sui bambini, riguarda gli esiti di una diagnosi di maltrattamento. Che cosa succede dopo che a un bambino o a una bambina sono stati diagnosticati danni da maltrattamento agìto all'interno della famiglia? Esistono percorsi stabiliti e facilmente accessibili? Quanto durano le prese in carico e che cosa occorre perché la presa in carico scatti effettivamente? Chi verifica che le prese in carico siano o meno andate a buon fine?

Purtroppo non è semplice dare risposte univoche a queste domande. Ma si è cercato almeno di identificare alcuni passi essenziali tra quelli che vanno compiuti una volta che il sospetto di maltrattamento si è trasformato in diagnosi.

LE FASI DI INTERVENTO

Sabrina Farci, psicologa e psicoterapeuta della Cooperativa Paradigma di Torino spiega che **esistono linee guida a cui fanno riferimento i centri Italiani sia pubblici sia privati aderenti al CISMAI (Coordinamento Italiano dei Servizi contro il Maltrattamento e l'Abuso all'Infanzia) e che offrono riferimenti uniformi per la presa in carico e la terapia dei casi di maltrattamento**[72].

Ci possono poi essere a livello regionale protocolli sulla presa in carico operativa per cercare di coordinare il lavoro delle varie istituzioni che entrano in campo: scuola, servizi sociali, istituzioni giudiziarie. In Piemonte, come in altre regioni, esistono, all'interno dei servizi, équipe specialistiche sul maltrattamento e l'abuso ai minori. C'è un'accurata letteratura e un'ampia casistica sugli esiti post traumatici del maltrattamento[73].

I NODI DELLA PRESA IN CARICO TERAPEUTICA

La terapia delle vittime di abuso e maltrattamento, dice ancora Farci, **è il segmento della presa in carico purtroppo più carente sul piano operativo**. Infatti se il livello di intervento per la segnalazione, protezione e valutazione delle vittime può essere ritenuto sufficientemente adeguato, non è così per la presa in carico terapeutica. Purtroppo i servizi territoriali riescono a farsi carico della prima parte di intervento di valutazione e protezione della vittima, in alcuni casi della valutazione della recuperabilità genitoriale; molto meno, se non quasi mai, riescono a far fronte alla presa in carico terapeutica. In alcuni casi la cura è delegata a centri convenzionati (del privato sociale) oppure a professionisti privati, soltanto una piccola parte riesce a essere presa in carico dal servizio pubblico. **Questo significa che molte delle vittime non hanno una terapia psicologica**. È ampiamente documentato[74], tuttavia, che l'unico strumento per contenere gli esiti post traumatici dell'abuso e del maltrattamento è proprio la terapia dei soggetti traumatizzati. Se questo non avviene il rischio della trasmissione intergenerazionale dell'abuso è considerevole.
Anche il follow-up è previsto, ma non in modo strutturato, per i soggetti che hanno avuto una presa in carico terapeutica, non per gli altri. Di solito si tratta di una rivalutazione clinica del soggetto attraverso una batteria di test psicologici. Quello che si cerca di fare con il centro di Paradigma, conclude Farci, è una **valutazione all'ingresso dei bambini in comunità e una valutazione in uscita dalla comunità** (al termine del percorso educativo e terapeutico). I servizi pubblici, solitamente, fanno una rivalutazione nel passaggio di scuola (da elementari a medie per esempio), ma questo vale praticamente solo per i bambini che hanno una certificazione secondo la legge 104 del 1992 per il sostegno scolastico.

Per quanto attiene **i disturbi più frequenti che si riscontrano nei bambini e nelle bambine vittime di maltrattamento**, Farci indica che il quadro clinico che spesso manifestano i bambini vittime di maltrattamento e abuso è il **disturbo post traumatico da stress** (semplice o complesso), che presenta sintomi di riattivazione traumatica quali: aggressività, disturbi del sonno, disturbi dell'attenzione e della concentrazione, flashback traumatici, sessualizzazione traumatica, sintomi dissociativi, problematiche alimentari e altri. Le patologie che questi soggetti possono sviluppare da adulti, in particolare laddove non sia stata effettuata una terapia psicologica, possono essere problemi nella sfera della sessualità, disturbi alimentari e del sonno, abuso di sostanze alcoliche o stupefacenti, tentativi anticonservativi, disturbi di personalità.

Foto: Riccardo Venturi per Save the Children

3.4 SE I SERVIZI NON PARLANO TRA LORO

Un ultimo nodo che emerge dalle conversazioni, è quello della comunicazione e del coordinamento tra i diversi servizi. Questo elemento si delinea con particolare chiarezza sia nel lavoro dei pediatri sia nel lavoro psicologico e psichiatrico di chi si occupa, per esempio, di depressione perinatale. La depressione perinatale, che si distingue dal *maternity blues* per la sua persistenza nel tempo e per l'importanza dei suoi sintomi, colpisce le neo mamme in una percentuale che varia tra il 5 e il 15%[75]. Tra gli elementi che contribuiscono ad accrescere il rischio di maltrattamento alcuni possono essere rintracciati precocemente favorendo il coordinamento tra i servizi che si occupano per esempio di dipendenze, di patologie neurologiche, di sostegno socio-economico, di contrasto della violenza domestica.

Rompere il circolo vizioso dell'isolamento #storiedaiservizi

Sara è una bimba di tre anni e nel parlare con la maestra della scuola materna racconta del pomeriggio in cui ha trovato la mamma svenuta in bagno. Daniela infatti, fortemente dipendente dall'alcool, era entrata in coma etilico e aveva perso coscienza mentre era a casa con la bambina. Quando Sara ha cominciato a gridare, sono arrivati i vicini di casa che hanno prestato i primi soccorsi e chiamato l'ambulanza. Dopo la degenza, Daniela è stata presa in carico dai servizi sociali su indicazione e con il sostegno dalla dirigente scolastica della scuola di Sara: il percorso è stato lungo e non facile. La donna infatti ha più volte interrotto la frequenza del nucleo operativo alcolisti, trovandosi così costretta a cominciare ogni volta la terapia dall'inizio. Il marito di Daniela, una persona disponibile, ma molto povera di strumenti economici e culturali, lavora fuori città e non riesce a supportare la moglie come pure vorrebbe. Un giorno Daniela si è resa conto che la piccola Sara iniziava a manifestare insofferenza e disagio attraverso comportamenti molto aggressivi, sia nei confronti dei coetanei, sia nei confronti della mamma. E che proprio a causa di questo atteggiamento la bambina, dopo essere stata completamente isolata dai compagni dell'asilo, era stata segnalata dalla scuola ai servizi di neuropsichiatria territoriali. Daniela ha cercato quindi aiuto presso lo Spazio Mamme e ha ripreso in modo più continuativo e fruttuoso il percorso di fuoriuscita dalla dipendenza, lasciandosi guidare dagli assistenti sociali e attivandosi nella ricerca di supporto psicologico per lei e Sara.

In caso di famiglie con condizioni di rischio per maltrattamento già in carico ai servizi, dice Carla Berardi, sarebbe utilissimo che questi informassero il pediatra che segue i bambini e i ragazzi di queste famiglie. Il pediatra deve essere informato di ogni condizione di rischio dei suoi pazienti. **Se si ha in cura un bambino i cui genitori sono tossicodipendenti, il Servizio Sociale o il SerT devono informare il pediatra**, come pure se c'è una situazione di povertà, di isolamento sociale, di violenza familiare, in modo che sappia come comportarsi con quella famiglia e come muoversi per lavorare sui fattori di rischio. L'esperienza di coordinamento tra un piccolo gruppo di pediatri/servizi sociali che si sta facendo a Perugia – e che probabilmente esiste in altre realtà italiane – sarebbe da realizzare, oltre che con gli assistenti sociali, anche con il SerT-Servizi per le Tossicodipendenze e con le forze dell'ordine (se intervengono in casi di violenza familiare, se ci sono bambini avvisino il pediatra così che possa valutare se i minorenni sono vittime a loro volta di maltrattamento e/o di violenza assistita).

La letteratura scientifica, sostiene Paola Di Blasio, psicologa dell'Università Cattolica di Milano, ha dimostrato una **correlazione tra psicopatologia della madre e del padre (tra cui depressione materna) e rischio di violenza**. Tutta la letteratura parla però di fattori di rischio che possono concorrere e non di fattori causali.
Una revisione della letteratura pubblicata nel 2015 su questo tema[76] illustra bene l'inter-gioco tra fattori di rischio e di protezione nella processuale maltrattante, evidenziando come siano necessarie diverse condizioni di rischio e l'assenza di fattori protettivi per poter predire l'insorgenza di un eventuale maltrattamento.

Mamme che non parlano del loro dolore #storiedaiservizi

Marco è nato agli inizi di dicembre: pochi giorni dopo le dimissioni, è stato ricoverato d'urgenza perché aveva avuto convulsioni notturne di cui non erano chiare le cause. Attraverso il colloquio con i medici dell'ospedale e le operatrici di Fiocchi in Ospedale, la mamma, Giovanna, ha ricostruito gli avvenimenti che hanno portato poi alla crisi del neonato: il latte artificiale era stato preparato in maniera scorretta, con pochissima acqua rispetto alle dosi previste, causando crisi fortunatamente rientrate grazie all'intervento dei sanitari. Giovanna, incontrando le psicologhe, è stata poi in grado di raccontare che, nonostante momenti di sconforto e agitazione, pianti notturni e momenti di stanchezza, non era riuscita a chiedere aiuto né al marito, né a professionisti esterni. Gli stati di malessere erano già iniziati dalla gravidanza e il marito, spesso fuori casa per lavoro, non si era accorto di quanto la donna si trovasse in difficoltà e

aveva semmai addebitato i momenti di stanchezza al fatto che Marco arrivasse a pochi anni di distanza dal primogenito. Sia Giovanna che il marito sono stati poi supportati nel trovare momenti di ascolto e di confronto che li aiutassero a superare i sensi di colpa causati dal grave pericolo che avevano fatto correre al bambino e dal non essersi resi conto in tempo di una situazione che necessitava di sostegno: Marco è stato dimesso dalla terapia intensiva neonatale dopo due settimane di degenza, nascendo una seconda volta, insieme con i suoi genitori.

Secondo Santo Rullo, psichiatra romano, **è dimostrato in letteratura** – **ma ancor più nella prassi clinica** – **che molti casi di infanticidio sono connessi alla depressione post-partum**, così come esistono conseguenze in età adolescenziale della depressione post-partum della mamma, soprattutto in termini di disregolazione emotiva e di sviluppo di competenze relazionali ed empatiche. Le strade da percorrere sono essenzialmente un ampliamento e un miglioramento delle attività di accompagnamento alla nascita con attività mirate oltre che a informare e sensibilizzare anche a riconoscere eventuali segni di depressione perinatale; sensibilizzazione e formazione dei padri sulle modalità migliori per supportare le proprie compagne; aumento dell'informazione e della sensibilizzazione sulla possibilità di parto in anonimato nel caso di gravi problematiche neurologiche che possono essere aggravate dall'interazione con un neonato; sensibilizzazione dei servizi di salute mentale e maggiore coordinamento tra i servizi di salute mentale e i servizi sociali e i servizi per la salute riproduttiva.

Il progetto Slalom
Un esperimento di sostegno coordinato a mamme vittime di depressione perinatale

Il progetto[77], realizzato a Milano, ha intercettato **circa 30 nuclei familiari a rischio** segnalati dai servizi sociali con madri affette da depressione post-partum, nuclei che sono poi stati seguiti nel progetto nell'arco di due anni (2011-2013). Sono state attuate azioni coordinate (approccio multidimensionale) su diverse aree di bisogno, rivolte sia al/ai minori e ai singoli genitori sia al nucleo familiare allargato. I risultati dell'intervento – anche in considerazione della casistica particolarmente grave a causa di problemi mentali, tossicodipendenza, esperienze traumatiche presenti spesso in entrambi i genitori – sono stati positivi e molto incoraggianti, poiché hanno evidenziato non solo un miglioramento nello stato di salute psichica di uno o entrambi i genitori ma anche la riduzione o la scomparsa di ansia, stress, insicurezza e frustrazione nella relazione col bambino.

Il Progetto Slalom ha previsto una serie di azioni, secondo un approccio multidisciplinare, al fine di:

1. prevenire i rischi di evoluzione del *baby blues* verso la depressione post-partum e il rischio di maltrattamenti nei confronti dei neonati alla luce della letteratura scientifica secondo cui circa il 70% di donne sperimenta[78], nei primi giorni dopo il parto, sintomi di baby blues (che provocano tristezza, pianto, irritabilità, ansia, aumento della sensibilità, affaticamento, disturbi del sonno, dell'appetito e cambiamenti nell'umore) e secondo cui le donne con tali sintomi sono a rischio di sviluppare una depressione[79] con conseguente rischio di trascurare o maltrattare i propri bambini;

2. sostenere l'instaurarsi di una buona relazione di attaccamento tra madre e figlio, evitando che i genitori (padre o madre) – a causa delle loro fragilità – vengano "sostituiti" da altre figure della rete familiare estesa; favorire inoltre la ricostituzione e il riequilibrio delle reti di supporto informali e amicali;

3. favorire la condivisione dell'esperienza della nascita e della genitorialità con altri genitori, l'acquisizione delle competenze educative e il rinforzo della stima di sé.

Sono stati realizzati percorsi di supporto ai genitori, attraverso diversi interventi, riassumibili in attività di supporto a domicilio (*home visiting*) nei mesi prima e dopo la nascita del bambino "intrecciata" e connessa con:

- un ciclo di consultazione psicologica rivolto al genitore, alla coppia e/o alla famiglia allargata, allo scopo di valutare i fattori critici e sostenere i processi riequilibranti, offrendo un trattamento terapeutico specifico volto al superamento delle riattivazioni traumatiche, laddove necessario;
- una consulenza sociale, al fine di sostenere la riacquisizione di autostima e capacità di agire in un nuovo equilibrio esistenziale che comprende il figlio (inserimento al nido del bambino, il ritorno al lavoro della madre, individuazione e attivazione di reti di supporto *ad hoc*);
- la realizzazione di uno spazio di incontro in cui si svolgono diverse attività rivolte ai genitori/neogenitori, madri o padri con bambini, altri *caregiver* (zii/zie, nonni/e, affidatari eccetera), incontri di gruppo per genitori (scuola genitori – *self help*) gruppi di parola. Queste attività sono rivolte sia ai genitori in situazione di rischio sostenuti dalle azioni di cui sopra sia ai genitori/neogenitori per i quali non viene identificata una specifica fragilità.

CAPITOLO 4

4. SCHEDE DI LAVORO DA TORINO, MILANO, SPOLETO, FOLIGNO, ORVIETO E BARI

Un tentativo interessante è stato quello di identificare alcuni esperimenti di lavoro – progetti o servizi – che sembrerebbero funzionanti, accessibili sul piano operativo, sostenibili sul piano economico e organizzativo e abbastanza stabili nel tempo. Le persone che ce li hanno raccontati, e che ringraziamo per la disponibilità, sono professionisti della sanità ma con una grande capacità di guardare oltre l'aspetto clinico per identificare linee strategiche di più vasta portata.

4.1 UN AMBULATORIO PER LORO

Elena Coppo, pediatra, Ambulatorio BAMBI - Torino

Il servizio BAMBI è nato nel 2002 per iniziativa di Fulvia Negro, pediatra del pronto soccorso dell'Ospedale Infantile Regina Margherita di Torino, per soddisfare la necessità di prestare assistenza mirata a bambini e bambine che giungevano in pronto soccorso (PS) perché vittime di maltrattamento e abuso. Questi bambini necessitano, infatti, di spazi dedicati diversi dal PS e di tempi più lunghi, che spesso non sono quantificabili a priori. A volte è necessario molto tempo per ottenere la fiducia di un bambino che è stato violato o maltrattato e quindi il suo consenso a essere visitato. È molto importante che il bambino acconsenta alla visita e non si proceda ad alcuna manovra forzandolo e quindi sottoponendolo a ulteriore violenza.

Attualmente lavorano nell'ambulatorio BAMBI due pediatri del pronto soccorso e un medico legale, una psicologa dedicata. L'ambulatorio si avvale della collaborazione del servizio di psicologia ospedaliero, degli infermieri pediatrici, del servizio di Assistenza Sociale e della Direzione Sanitaria; in caso di necessità l'ambulatorio usufruisce del servizio di Neuropsichiatria Infantile dell'ospedale. Il servizio è operativo 24h/24h. Durante il giorno dispone di un medico di guardia attivo, quindi si avvale degli infermieri dedicati che sono disponibili anche in reperibilità 24h/24h e dell'équipe dei medici di PS che sono comunque stati formati a gestire queste situazioni di emergenza.

In fase di triage al PS l'infermiere è stato formato a riconoscere e segnalare al medico di guardia quelli che in letteratura specifica si chiamano "red flags", bandiere rosse, cioè i segni di allarme che devono porre in allerta su un ipotetico problema di maltrattamento (per esempio ritardo al ricorso alle cure, incongruenza del racconto, incongruenza tra le lesioni e il racconto o incongruenza tra l'età del bambino e le lesioni riportate). Non vi è purtroppo una rete informatica con gli altri ospedali, per cui l'unico modo per sapere se i bambini siano già stati visitati in altri ospedali è contattare direttamente i colleghi, cosa che viene fatta nei casi in cui non è chiaro il quadro sanitario, o se il bambino sia stato visitato molte volte in PS per traumi ripetuti. Se il bambino vittima di violenza ha bisogno di cure sanitarie, queste vengono proseguite in ospedale; se è necessario fare una segnalazione all'Autorità Giudiziaria, l'ambulatorio Bambi se ne occupa direttamente. Vi sono inoltre accordi con il territorio per cui i bambini, una volta dimessi dall'ospedale, sono presi in carico

dai servizi territoriali. La stessa cosa accade quando i bambini vengono inviati in famiglie affidatarie. I pediatri di famiglia contattano l'ambulatorio anche per dirimere un dubbio, per condividere un pensiero. Sono inoltre in atto progetti di formazione specifica per i pediatri di famiglia sul maltrattamento e l'abuso. Nell'ambito della formazione, per anni sono stati realizzati e vengono svolti tuttora corsi di formazione per personale sanitario.
Dall'inizio delle attività nel 2002 il personale di BAMBI ha visitato circa 1.900 bambini, e quest'anno sono stati valutati 148 bambini. Si tratta di un numero considerevole se si pensa che la maggior parte di loro è stata segnalata all'Autorità Giudiziaria.
I bambini che giungono in osservazione sono inviati dal PS, da altri ospedali, dai medici di famiglia, dalle forze di polizia o direttamente dall'Autorità Giudiziaria. Sotto molti punti di vista l'ambulatorio è considerato un punto di riferimento regionale per i casi di violenza, anche se non va dimenticato l'enorme contributo che hanno altri centri territoriali, come per esempio Cappuccetto Rosso.
Fra i casi arrivati al BAMBI, la percentuale dei più piccoli, fra 0-1 anno, è del 7%. Se si considera la fascia di età 1-5 anni la percentuale è del 39%.
Le tipologie di maltrattamento più comuni nei bambini piccoli vedono al primo posto quello di tipo fisico: si tratta di fratture, lividi, morsicature e varie forme di trauma cranico non accidentale compresa la *Shaken Baby Syndrome*. Vi sono inoltre le forme di grave incuria e nell'ultimo periodo anche casi di lattanti con intossicazione da droghe. Penso che il numero maggiore di casi non rifletta un reale aumento di incidenza del fenomeno, ma sia dovuto alla maggiore attenzione che si pone al problema e alla maggiore sensibilità degli operatori.

4.2 IL MALTRATTAMENTO DEI PIÙ PICCOLI AL CENTRO DELL'AZIONE DELLA RETE INTERAZIENDALE MILANESE

Gian Vincenzo Zuccotti, pediatra, Ospedale dei Bambini, V. Buzzi - Milano

A Milano è stata avviata l'esperienza della RIMMI, la Rete Interaziendale Milano Materno Infantile, che ha diverse funzioni. Una è quella di evitare le ridondanze, cioè non far ripetere accertamenti, visite, esami già eseguiti. Un'altra funzione è far emergere le eccellenze e quelle che sono le criticità presenti nella città e nella Regione. Sicuramente fra le criticità c'è quella del maltrattamento, nel senso che non c'è ancora un vero e proprio servizio che si faccia carico della prevenzione e della gestione del maltrattamento infantile, di ordine psicologico, fisico e quant'altro. Si sta lavorando su questo aspetto con il progetto di un centro che si dovrà occupare appunto del maltrattamento infantile, per provare a dare una risposta ed entrare in rete. Questo centro è rappresentato dall'Ospedale dei Bambini, V. Buzzi, che si vuole mettere a disposizione di tutta la rete cominciando da Milano, per poi ampliare il servizio a tutta la Regione Lombardia.
Il progetto dovrebbe essere a regime entro la fine 2017. È prevista una fase di formazione, che partirà dai pronto soccorso e dalle pediatrie, anche con qualche pediatria di famiglia, sui segni, su come dare rilievo a queste situazione e su come gestirle. Quindi attualmente non c'è ancora nulla, ma è una delle criticità che sono state rilevate ed è una delle prime cose che si sta cercando di far partire all'interno della RIMMI. I casi di maltrattamento sono intercettati solo se molto evidenti; ma c'è una vastissima area di sommerso che è molto più difficile da intercettare, quindi è importante un percorso che si occupi di capire i diversi casi e come occorre muoversi, perché vengano posti in atto i passi adeguati.

4.3 OSPEDALI IN RETE. LE COSE SEMPLICI POSSONO ESSERE LE MIGLIORI

Sara Ceccarelli, pediatra, Ospedale di Terni

La rete dei pronto soccorso di alcuni ospedali in Umbria è ancora una struttura *in fieri* partita ufficialmente nel 2013-14 all'interno dell'ospedale di Spoleto, dove è stata riorganizzata un'équipe multidisciplinare già presente da anni, che però nell'ultimo periodo, dato il turnover del personale, aveva visto una riduzione della sua attività almeno a livello ospedaliero. Dell'équipe fanno parte un pediatra, un'assistente sociale, una psicologa, un pediatra di territorio e di volta in volta i vari specialisti di riferimento da attivare nei singoli casi. L'équipe di contrasto al maltrattamento e abuso all'infanzia, questo il suo nome, cerca di collaborare con la rete sociale territoriale – assistenti sociali dei vari Comuni e servizi sanitari, pediatri di libera scelta, scuole, eccetera – così da poter effettuare una gestione a 360 gradi del soggetto vittima di abuso a partire dalla sua intercettazione/diagnosi, fino alla sua presa in carico con la creazione di un piano assistenziale *ad hoc* e la possibilità di avere poi un feedback delle varie situazioni trattate.

Foto: Francesco Alesi per Parallelozero

Essendo il territorio dell'USL Umbria2 molto vasto (di essa fanno parte gli ospedali di Foligno, Spoleto e Orvieto, logisticamente distanti tra loro) si è pensato che il progetto potesse diventare più ambizioso, mettendo in "Rete" tutto il territorio di riferimento. Sono stati istituiti corsi di formazione annuali nei quali sono stati cooptati sia pediatri di libera scelta, sia assistenti sociali, sia specialisti ospedalieri medici, infermieri, ostetriche delle varie branche specialistiche (pronto soccorso, pediatria, radiologia, ginecologia, eccetera), così da creare nelle varie sedi nuovi punti di riferimento, esportando il modello spoletino, anche se la prima équipe sarebbe rimasta poi l'elemento trainante e il riferimento per tutti.
Questo esperimento ha portato alla produzione di un documento aziendale che vuole regolamentare tale *modus operandi* così da chiarire bene le modalità di attivazione dell'équipe, della diagnosi, dell'eventuale segnalazione, della presa in carico, della creazione di un sistema di protezione per il minore con vari livelli di controllo dell'operato.

Attualmente quindi gli ospedali in rete sono tre, ma si sta verificando la possibilità di un ampliamento a un quarto ospedale. Il passo avanti che si è potuto fare è chiedere una piccola modifica sul programma utilizzato per il pronto soccorso che evidenzi accessi multipli in modo tale che questo risulti facilmente evidente all'operatore per favorire l'intercettazione dei casi, che come è noto tendono a peregrinare tra i vari ospedali. Rimangono scoperti però tutti gli altri pronto soccorso della Regione.

Altro obiettivo fondamentale è andare avanti con la formazione; in medicina non esiste diagnosi se non si conosce e il maltrattamento e l'abuso all'infanzia non esulano da questa regola. Laddove la formazione è stata fatta, è stato più alto il numero delle diagnosi effettuate o almeno dei casi di sospetto venuti a galla. La formazione deve coinvolgere tutto il personale che ha la possibilità di entrare in contatto con il paziente pediatrico, così da aumentare le possibilità di diagnosi. Tutto questo lavoro ha portato a un incremento dei casi diagnosticati e presi in carico. Fino a oggi i casi intercettati nella fascia di età 0-3 anni sono stati circa 15, per lo più trascuratezza, abuso psicologico, 3 casi di sospetto abuso sessuale al vaglio della magistratura.

La forza dell'équipe è la multidisciplinarità. Il progetto prevede per l'équipe di riferimento una reperibilità di 12 ore dal lunedì al venerdì, in cui può essere contattata per eventuali dubbi o segnalazioni dal pediatra territoriale, o dalla scuola, o dai servizi che si prendono carico dei bambini.

4.4 FARE EMERGERE IL SOMMERSO. L'ESPERIENZA DI GIADA IN PUGLIA

Maria Grazia Foschino Barbaro, psicologa-psicoterapeuta responsabile del Servizio di Psicologia, GIADA, Ospedale Pediatrico "Giovanni XXIII" - Bari

Nella Regione Puglia da anni è attiva una rete di contrasto alla violenza all'infanzia organizzata in due distinte componenti, una interna all'Azienda Ospedaliera Policlinico "Giovanni XXIII" di Bari e l'altra esterna che copre il territorio regionale. La rete intraospedaliera, in particolare, è tesa alla rilevazione delle condizioni di sommerso del maltrattamento e si avvale del lavoro di vari soggetti e, in particolare:

1) del **gruppo funzionale** interdisciplinare composto da diversi medici specialisti (dirigente psicologo come responsabile scientifico, medico di direzione sanitaria, pediatra, ortopedico, radiologo, medico di pronto soccorso, ginecologo, neonatologo, chirurgo, medico legale) che si occupa di effettuare revisioni sui percorsi diagnostico-terapeutici nonché della definizione dei percorsi formativi e degli indirizzi strategici;

2) dell'**équipe dedicata** (composta da quattro psicologi, due assistenti sociali e un informatico) attiva all'interno del servizio di psicologia dell'ospedale pediatrico "Giovanni XXIII" di Bari dal 2009 grazie a finanziamenti regionali, che svolge, oltre all'attività di diagnosi e trattamento delle forme di violenza all'infanzia, anche funzione di collegamento tra i vari specialisti attivati e la rete dei referenti aziendali;

3) della **rete interdisciplinare di referenti** costituita da un medico e un infermiere di tutte le Unità Operative del "Giovanni XXIII" e da alcune Unità Operative del Policlinico (Neonatologia e Terapia Intensiva, Ginecologia e Ostetricia, Medicina Legale e Pronto Soccorso); da diversi anni i referenti delle varie UU.OO. vengono inseriti in percorsi formativi aziendali tesi a potenziare le abilità dei vari referenti nell'individuazione dei casi sommersi di violenza all'infanzia.

La sua funzione principale è quella di rilevare il sommerso, anche attraverso l'identificazione precoce dei fattori di rischio della genitorialità e l'avvio tempestivo di interventi di supporto; in aggiunta a questo lavoro, in una percentuale inferiore di casi, il gruppo è chiamato a intervenire su bambini o adolescenti che giungono in ospedale a seguito di violenze subìte; in questi casi, sin dall'accesso al pronto soccorso, viene attivato un codice di accesso preferenziale alle prestazioni erogate.

Foto: Louise Dyring Mbae per Save the Children Denmark

Nell'ambito del servizio di psicologia sono stati messi a punto diversi protocolli, alcuni dei quali indipendenti alla violenza, che consentono di rilevare alcuni indicatori di disagio dei bambini; per esempio, è stato definito un protocollo diagnostico-terapeutico per i piccoli pazienti che presentano ritardo dell'accrescimento, disturbi della minzione, dolori di varia natura e sintomi psicosomatici che prevede, oltre agli accertamenti di natura medica, una consulenza psicologica poiché tali quadri clinici potrebbero essere associati a condizioni di violenza e/o inadeguatezza genitoriale. Sono stati predisposti anche protocolli per le malattie croniche in quanto alcune patologie di questo tipo rappresentano condizioni che affaticano la genitorialità e che possono determinare condizioni di violenza all'infanzia.

Nei casi di particolare trascuratezza, oltre all'avvio di procedure osservative tese a valutare la relazione genitore-bambino, si prende contatto con il pediatra di famiglia, per verificare se il piccolo sia stato regolarmente sottoposto ai bilanci di salute e per avere il suo punto di vista, oppure si contattano i servizi sociali del territorio, per verificare se vi sia già una presa in carico.
Nei casi in cui in ospedale venga ricoverato un bambino adottato o collocato in comunità, che in quanto tale è stato esposto a esperienze infantili sfavorevoli, si provvede all'attivazione di un particolare protocollo intraospedaliero che prevede la valutazione della qualità della vita del piccolo e l'eventuale avvio di un supporto in favore dei genitori teso a potenziare le loro capacità di affrontare in maniera adeguata le esperienze traumatiche vissute dal bambino.
Tra le azioni messe in atto, ci sono le segnalazioni ai servizi territoriali, nei casi di fragilità familiare, mentre nei casi di particolare gravità e rischio vengono rivolte alla Procura presso il Tribunale per i Minorenni e/o Procura Ordinaria così che possano essere avviate tutte le azioni di tutela.

La definizione e attuazione di questi protocolli intraospedalieri ha permesso di affinare e potenziare le capacità di rilevazione del sommerso passando dal 4% dei casi riferibili a condizione di violenza sull'intera popolazione dei casi osservati, al 26% dei casi dopo l'istituzione dell'équipe dedicata e l'avvio di una metodologia di lavoro che prevede un sistematico raccordo con i referenti delle varie UU.OO. dell'Azienda; se si considera che l'80% dei dati deriva da rilevazioni effettuate nel contesto ospedaliero e il restante 20% da bambini che vengono osservati in regime ambulatoriale, si comprende la forza della rete intraospedaliera costruita negli anni.

Nel 2009 è stata costituita una rete sanitaria extraospedaliera su tutto il territorio regionale. È stata creata una rete con gli ospedali di tutta la Regione dotati di pediatrie, attorno alle quali sono state inserite tutte le specialità rilevanti: Direzione Medica di Presidio, ginecologia, chirurgia, ortopedia, radiologia, pronto soccorso, medicina legale, psicologia e servizi sociali ospedalieri. Pertanto, in ogni ospedale dove è presente la pediatria, a cui è stata affidata la funzione di coordinamento, sono state costituite le Unità Funzionali Interdisciplinari Ospedaliere GIADA (UFIO) composte da un medico e un infermiere referenti già in servizio, opportunamente formati, che svolgono funzione di osservatori. Nei territori dove sono presenti ospedali con le pediatrie, inoltre, sono state costituite le Unità Funzionali Interdisciplinari Territoriali (UFIT) con pediatri di famiglia, psicologi e assistenti sociali dei consultori familiari e neuropsichiatri infantili.
In favore delle reti UFIO e UFIT sono stati realizzati, per i primi anni, percorsi formativi sulla violenza all'infanzia coinvolgendo le varie ASL, nonché percorsi formativi specialistici interdisciplinari che hanno favorito la costituzioni delle reti informali, prezioso strumento di lavoro in un ambito così delicato quale quello della violenza all'infanzia. Negli anni sono state, inoltre, realizzate formazioni specialistiche rivolte ad alcune discipline sanitarie quali, per esempio, quella sull'abuso sessuale rivolta ai ginecologi e quella sul maltrattamento fisico e sulla *Shaken Baby Syndrome* per i radiologi.

Con D.G.R. n. 1878 del 30.11.2016, la Regione Puglia ha approvato le "Linee guida regionali in materia di maltrattamento e violenza nei confronti delle persone minori per età", patrocinate dal CISMAI, con l'obiettivo di rendere omogeneo, sul territorio regionale, il percorso di presa in carico di bambine e bambini, di adolescenti vittime di violenza attraverso l'implementazione degli assetti organizzativi che favoriscono ed agevolano il confronto e l'integrazione tra professionisti e servizi per il raggiungimento di obiettivi condivisi negli interventi di rilevazione, protezione, tutela, cura. Il Documento rappresenta il frutto di un lavoro di approfondimento scientifico ed operativo che ha visto la collaborazione concreta e fattiva, oltre che degli Uffici regionali, della Garante regionale per i diritti dell'infanzia e dell'adolescenza e del Gruppo GIADA.

Le Linee guida hanno previsto una riorganizzazione, su scala regionale, dei servizi che si occupano di violenza all'infanzia; nello specifico ha predisposto tre livelli di intervento, di seguito riportati:

- I LIVELLO - **EQUIPE INTEGRATE MULTIDISCIPLINARI TERRITORIALI**, presenti in ogni Ambito Territoriale/ Distretto sociosanitario e costituite da 1 assistente sociale di ambito territoriale, 1 psicologo del Consultorio familiare del Distretto e 1 educatore. L'équipe potrà avvalersi, in base alla specificità di ogni caso, delle competenze di altri professionisti dei servizi (NPI, Ser.D., UEPE, CSM, USSM, eccetera) e/o ospedalieri e della collaborazione degli insegnanti di riferimento del minorenne. Tale équipe svolge un primo livello di presa in carico nonché interventi di prevenzione e contrasto della violenza e, nei casi più complessi, attiva il Centro Specialistico di riferimento per la cura del trauma, per gli approfondimenti diagnostici della situazione traumatica, la supervisione, l'elaborazione e la realizzazione del progetto di intervento psicoterapeutico.

- II LIVELLO - **CENTRI SPECIALISTICI PER LA CURA DEL TRAUMA INTERPERSONALE**, presente in ogni ASL della Regione, composte da psicologi-psicoterapeuti con riconosciuta esperienza pluriennale e formazione specifica in materia di maltrattamento/violenza, prevedendo in ogni caso la presenza di almeno uno psicologo dell'età evolutiva. Tale équipe svolge funzioni di consulenza, supporto e supervisione alle équipe territoriali di riferimento già costituite con particolare attenzione alla fase di valutazione diagnostica, di costruzione del progetto di intervento e della realizzazione degli interventi psicoterapeutici. L'équipe potrà avvalersi di altre competenze, quali quelle del medico pediatra, del neuropsichiatra infantile, del ginecologo.

- III LIVELLO - **STRUTTURE E CENTRI ALTAMENTE SPECIALIZZATI PER IL TRATTAMENTO DEI MINORENNI VITTIME DI VIOLENZA**, individuato nell'équipe GIADA (della quale sono già stati sopra descritte composizione e funzioni) attiva presso il Servizio di Psicologia dell'Ospedale Pediatrico "Giovanni XXIII" dell'Azienda Ospedaliero Universitaria Policlinico "Giovanni XXIII" di Bari. GIADA oltre a essere componente del Coordinamento regionale in materia di violenza nei confronti dei minorenni garantisce la presa in carico delle situazioni che presentano particolare complessità.

CAPITOLO 5

5. SCIOGLIERE QUALCHE NODO. CONCLUSIONI E RACCOMANDAZIONI

In Italia non mancano iniziative e solide basi di appoggio di tipo legislativo per prevenire e contrastare il maltrattamento di bambine e bambini. Mentre quello che sembra **più carente è la macchina attuativa, il coordinamento delle risorse e dei servizi, l'armonizzazione delle politiche sanitarie con quelle sociali**.
La mole di opacità del fenomeno del maltrattamento infantile è tale che sembrerebbe quasi una conseguenza involontaria della consapevolezza che, una volta identificato un caso sospetto, non si sappia bene come andare avanti, o non si abbia la certezza del percorso. Il nostro Paese sarebbe in grado di gestire questo tipo di fenomeno e come dovrebbe attrezzarsi per farlo?

Sulla base di questa considerazione generale, si possono indicare **quattro livelli** prioritari sui quali lavorare per cominciare a sciogliere qualche nodo.

1. **IL LIVELLO SANITARIO:** il maltrattamento dei bambini e della bambine va considerato **una questione di salute pubblica**, e quindi trattato in termini di informazione, prevenzione, formazione di profili professionali, approfondimento diagnostico, ricerca e tecnologia, protocolli di intervento sanitario e investimenti economici e finanziari in ricerca, professionalità, coordinamento.

2. **IL LIVELLO SOCIALE:** il maltrattamento dei bambini e delle bambine richiede un'azione di cura sociale sulla riduzione della solitudine della famiglie, sull'accoglienza, sul sostegno alla genitorialità, alle neomamme e neopapà, alle famiglie che hanno già figli e si allargano, al delicato periodo del post-partum, di prevenzione di forme di depressione, di intervento precoce su fragilità esistenti o potenziali, di accompagnamento.

3. **IL LIVELLO CULTURALE:** il maltrattamento delle bambine e dei bambini è una questione di conoscenza, di consapevolezza, di competenza e di cultura sociale. Conoscenza da parte dei genitori, e di chi si prende cura delle bambine e dei bambini, dei comportamenti a rischio; formazione da parte di chi a vario titolo si relaziona con la bambina e il bambino e con le famiglie, come pediatri, medici, operatori sociali, educatori, insegnanti; cultura sociale nel senso di cambiamento della cultura pubblica e del modo di intendere, di sentire, della sensibilità nei confronti di tali comportamenti, che deve portare a una maggiore capacità di cogliere segnali, di osservare con una lente diversa il proprio comportamento e quello altrui, di indirizzare e chiedere aiuto.

4. **IL LIVELLO POLITICO:** il maltrattamento di bambine e bambini richiede un'attenzione e una continuità di azione di contrasto a ogni livello – nazionale, regionale e locale – che non può risentire dei capovolgimenti di fronte di un governo nazionale o di una giunta. Il contrasto a ogni forma di maltrattamento, anche interno alla famiglia talora più nascosto, rappresenta oltre che una forma di tutela di diritti fondamentali anche un ambito di salvaguardia del benessere di un Paese, uno strumento per emancipare le generazioni, un investimento sul futuro delle classi dirigenti politiche, culturali, economiche, scientifiche del Paese. Una priorità analoga a quella dell'istruzione e della salute.

A partire dai risultati della ricerca e da queste considerazioni Save the Children raccomanda:

AL GOVERNO, AL PARLAMENTO E ALL'AUTORITÀ GARANTE PER L'INFANZIA E L'ADOLESCENZA

- di **garantire in tempi rapidi l'istituzione di un sistema nazionale di rilevazione**, analisi e distribuzione dei dati relativi al maltrattamento dei bambini in Italia;
- di **sviluppare una strategia generale nazionale di contrasto** e presa in carico riguardante tutte le forme di violenza e di maltrattamento contro i bambini;
- di **incentivare riforme che promuovano una continuità di intervento** sulle politiche di prevenzione e contrasto al maltrattamento intrafamiliare ai danni di donne incinte e bambini, garantendo la costanza e la certezza delle azioni sul piano regionale e locale, anche nei periodi di crisi politica, di vacanza degli organi elettivi e di quelli nominati, anche in presenza di piani di rientro che gravino sui bilanci sanitari delle Regioni.

AL MINISTERO DELLA SALUTE E ALLE REGIONI NELL'AMBITO DELLE RISPETTIVE COMPETENZE:

- di introdurre la prevenzione del maltrattamento nel Piano Sanitario Nazionale e nel Piano nazionale di prevenzione sanitaria e di garantire, su tutto il territorio nazionale, il diritto a cure tempestive, di alto livello qualitativo e di durata congrua alla gravità del problema, ai minori vittime di maltrattamento, così come indicato tra l'altro, nei nuovi LEA firmati dal Presidente del Consiglio lo scorso gennaio;
- di promuovere la creazione di sistemi di vigilanza – sul modello delle *red flags* sperimentate in alcune esperienze locali – condivisi; dal sistema sanitario regionale e/o dalle singole ASL territoriali, per favorire il monitoraggio di casi di **maltrattamento** attraverso l'uso di strumenti semplici fin dal momento della refertazione di pronto soccorso;
- di incentivare – anche con forme di premialità per le Regioni virtuose – la creazione di reti interospedaliere tra i pronto soccorso – specie quelli pediatri e ostetrici – per favorire il controllo dei pellegrinaggi ospedalieri nei casi di bimbi o donne incinte soggetti con frequenza ad accettazione per traumi/lesioni sospette;
- di incentivare, con adeguate azioni di riforma e investimento, la promozione quantitativa e qualitativa dei consultori familiari in modo omogeneo sul territorio nazionale, così da garantire l'azione efficace di questi presidi territoriali, eccellenti in termini di prevenzione della violenza;
- di favorire l'omogeneizzazione delle procedure di accertamento, diagnosi e segnalazione all'interno dei pronto soccorso – a cominciare da quelli ostetrici e pediatrici – attraverso la messa in atto di specifici protocolli e l'utilizzo di modulistiche dedicate e facilmente applicabili che favoriscano la segnalazione e promuovano tutte le dovute forme di accertamento, dal punto di vista sia diagnostico sia giuridico;
- di diffondere i contenuti di piani regionali, protocolli, linee guida riguardanti il contrasto alla violenza di genere intra ed extra familiare e al maltrattamento di bambini e bambine, attraverso campagne di informazione, sensibilizzazione a tappeto nelle scuole, nei luoghi di grande affluenza di pubblico come centri commerciali, grandi store alimentari, centri sportivi, strutture ricreative, ecc.

AL MINISTERO DELL'ISTRUZIONE, DELL'UNIVERSITÀ E DELLA RICERCA:

- di rendere obbligatoria nella definizione dei percorsi curricolari di medici e personale sanitario della medicina di emergenza, neonatologia, pediatria, ostetricia e ginecologia, psichiatria e psicologia un'azione formativa specifica sul tema del maltrattamento di bambini, bambine e donne incinte sui temi della diagnostica, presa in carico e recupero.

ALL'ANCI E AGLI ENTI LOCALI:

- di monitorare con apposite mappature territoriali l'offerta di servizi e opportunità per il contrasto alle situazioni di disagio familiare;
- di identificare, di concerto con Regioni e Governo, risorse aggiuntive per il potenziamento e la qualificazione dei servizi sociali territoriali e per la creazione di vere e proprie Conferenze dei servizi territoriali; tali Conferenze permetterebbero l'incontro periodico e il coordinamento territoriale dei servizi che sovrintendono alla sicurezza e al benessere sociale sul territorio cittadino (servizi di contrasto alle dipendenze, servizi sociali, consultori familiari, pediatri di famiglia, servizi del privato sociale, presidi delle forze dell'ordine);
- di promuovere – di concerto con Regioni e Governo – modalità innovative di servizio all'infanzia che contemplino la possibilità di veri e propri hub educativi, dove alla componente strettamente educativa si integri un'attività costante di sostegno e promozione della genitorialità, anche a scopo di prevenzione di comportamenti maltrattanti e violenti all'interno della famiglia.

Gli abusi sulle donne in gravidanza e sui minori nella legislazione penale

Gli abusi fisici e psicologici sulla madre in gravidanza e sul minore sono penalmente perseguibili e i diversi comportamenti in cui essi si sostanziano vengono puntualmente definiti dalla legislazione penale.

Per gli **ABUSI FISICI** rilevano, tra gli altri, i seguenti reati:

PERCOSSE (ART. 581 C.P.)

"Chiunque percuote taluno, se dal fatto non deriva una malattia nel corpo o nella mente, è punito, a querela della persona offesa, con la reclusione fino a sei mesi o con la multa fino a euro 309. Tale disposizione non si applica quando la legge considera la violenza come elemento costitutivo o come circostanza aggravante di un altro reato."

Questo reato si ha quando dal fatto non deriva un'alterazione dello stato psico-fisico della vittima, contrariamente a quanto avviene per le lesioni. Vengono quindi considerate percosse le azioni violente che producono soltanto sensazioni fisiche di dolore, ma non alterazioni, sia pure lievi, all'integrità della persona, ad esempio schiaffi che non provocano ecchimosi.

LESIONE PERSONALE E CIRCOSTANZE AGGRAVANTI (ARTT. 582 E 583 C.P.)

"Chiunque cagiona ad alcuno una lesione personale, dalla quale deriva una malattia nel corpo o nella mente, è punito con la reclusione da sei mesi a tre anni. (…)"

"La lesione personale è grave e si applica la reclusione da tre a sette anni:

1. *se dal fatto deriva una malattia che metta in pericolo la vita della persona offesa, ovvero una malattia o un'incapacità di attendere alle ordinarie occupazioni per un tempo superiore ai quaranta giorni;*
2. *se il fatto produce l'indebolimento permanente di un senso o di un organo;*

La lesione personale è gravissima, e si applica la reclusione da sei a dodici anni, se dal fatto deriva:

1. *una malattia certamente o probabilmente insanabile;*
2. *la perdita di un senso;*
3. *la perdita di un arto, o una mutilazione che renda l'arto inservibile, ovvero la perdita dell'uso di un organo o della capacità di procreare, ovvero una permanente e grave difficoltà della favella;*
4. *la deformazione, ovvero lo sfregio permanente del viso;"*

Evento del reato è la lesione personale, la quale non deve essere necessariamente derivare da un'azione violenta, potendo essere stata causata anche da omissione o contagio.

ABUSO DEI MEZZI DI CORREZIONE E DISCIPLINA (ART.571 C.P.)

"Chiunque abusa dei mezzi di correzione o di disciplina in danno di una persona sottoposta alla sua autorità, o a lui affidata per ragione di educazione, istruzione, cura, vigilanza o custodia, ovvero per l'esercizio di una professione o di un'arte, è punito, se dal fatto deriva il pericolo di una malattia nel corpo o nella mente, con la reclusione fino a sei mesi. Se dal fatto deriva una lesione personale, si applicano le pene stabilite negli articoli 582 e 583, ridotte a un terzo; se ne deriva la morte, si applica la reclusione da tre a otto anni."

Per la consumazione del reato è previsto il dolo specifico, ossia la volontà, da parte dell'agente, di commettere il fatto per un fine educativo.

MALTRATTAMENTO CONTRO FAMILIARI E CONVIVENTI (ART. 572 C.P.)

"Chiunque, fuori dei casi indicati nell'articolo precedente, maltratta una persona della famiglia o comunque convivente, o una persona sottoposta alla sua autorità o a lui affidata per ragioni di educazione, istruzione, cura, vigilanza o custodia, o per l'esercizio di una professione o di un'arte, è punito con la reclusione da due a sei anni.
Se dal fatto deriva una lesione personale grave [c.p. 583], si applica la reclusione da quattro a nove anni; se ne deriva una lesione gravissima, la reclusione da sette a quindici anni; se ne deriva la morte, la reclusione da dodici a ventiquattro anni."

L'elemento oggettivo del reato è costituito da sofferenze fisiche e morali reiterate, tali che i singoli atti vessatori siano uniti tra loro da un legame di abitualità e sostenuti da una costante volontà di porli in essere da parte dell'agente. Quest'ultimo è una persona che fa parte del nucleo familiare della vittima o che comunque è convivente con la stessa, o al quale la vittima è affidata per ragioni di cura o custodia. Responsabili di questo reato possono quindi essere anche insegnati ed educatori.

INFANTICIDIO IN CONDIZIONI DI ABBANDONO MATERIALE E MORALE (ART. 578 C.P.)

"La madre che cagiona la morte del proprio neonato immediatamente dopo il parto, o del feto durante il parto, quando il fatto è determinato da condizioni di abbandono materiale e morale connesse al parto, è punita con la reclusione da quattro a dodici anni.
A coloro che concorrono nel fatto di cui al primo comma si applica la reclusione non inferiore ad anni ventuno. Tuttavia, se essi hanno agito al solo scopo di favorire la madre, la pena può essere diminuita da un terzo a due terzi.
Non si applicano le aggravanti stabilite dall'articolo 61 del codice penale."

Questa norma individua un reato specifico, per il quale, date le condizioni descritte, è previsto un minor rigore rispetto all'omicidio.

OMICIDIO PRETERINTENZIONALE (ART. 584 C.P.)

"Chiunque, con atti diretti a commettere uno dei delitti preveduti dagli articoli 581 e 582, cagiona la morte di un uomo, è punito con la reclusione da dieci a diciotto anni."

Il caso previsto da questo reato è quello in cui la morte scaturisce da atti miranti a provocare percosse o lesioni, quindi come conseguenza che va oltre le intenzioni dell'agente.

OMICIDIO (ART.575 C.P.)

"Chiunque cagiona la morte di un uomo è punito con la reclusione non inferiore ad anni ventuno."

Aggravante per i reati commessi in danno di minori, in loro presenza (violenza assistita) o in danno di donne in gravidanza (art. 61, n. 11-quinquies c.p.).

"Aggravano il reato quando non ne sono elementi costitutivi o circostanze aggravanti speciali le circostanze seguenti:
(…) 11-quinquies) l'avere, nei delitti non colposi contro la vita e l'incolumità individuale, contro la libertà personale nonché nel delitto di cui all'articolo 572, commesso il fatto in presenza o in danno di un minore di anni diciotto ovvero in danno di persona in stato di gravidanza."

Questa aggravante, che include la violenza assistita, è stata introdotta dalla c.d. Legge sul femminicidio (DL n. 93/2013 convertito in L. 119/2013 "disposizioni urgenti in materia di sicurezza e per il contrasto della violenza di genere, nonché in tema di protezione civile e di commissariamento delle province") ed è applicabile a tutti i reati sopra previsti.

Relativamente agli **ABUSI PSICOLOGICI** rilevano in particolare, ma non esclusivamente, le seguenti figure di reato:

VIOLENZA PRIVATA (ART. 610 C.P.):

"Chiunque, con violenza o minaccia, costringe altri a fare, tollerare, od omettere qualche cosa è punito con la reclusione fino a quattro anni.
La pena è aumentata se concorrono le condizioni prevedute dall'articolo 339."

Il reato punisce condotte che minacciano la libertà psicologica dell'individuo a fronte di una minaccia intimidatoria, di conseguenza si realizza quando la volontà della vittima è limitata o condizionata dal comportamento violento o intimidatorio dell'agente. È prevista un'aggravante se il reato è commesso in determinate circostanze, ad esempio con l'uso di armi o da più persone.

RIDUZIONE IN SCHIAVITÙ (ART. 600 C.P.):

"Chiunque esercita su una persona poteri corrispondenti a quelli del diritto di proprietà ovvero chiunque riduce o mantiene una persona in uno stato di soggezione continuativa, costringendola a prestazioni lavorative o sessuali ovvero all'accattonaggio o comunque al compimento di attività illecite che ne comportino lo sfruttamento ovvero a sottoporsi al prelievo di organi, è punito con la reclusione da otto a venti anni.
La riduzione o il mantenimento nello stato di soggezione ha luogo quando la condotta è attuata mediante violenza, minaccia, inganno, abuso di autorità o approfittamento di una situazione di vulnerabilità, di inferiorità fisica o psichica o di una situazione di necessità, o mediante la promessa o la dazione di somme di denaro o di altri vantaggi a chi ha autorità sulla persona."

Un riferimento a parte meritano le principali norme rilevanti in materia di **ABUSO SESSUALE**:

VIOLENZA SESSUALE E AGGRAVANTI (ART. 609-BIS E 609-TER C.P.)

"Chiunque, con violenza o minaccia o mediante abuso di autorità, costringe taluno a compiere o subire atti sessuali è punito con la reclusione da cinque a dieci anni.
Alla stessa pena soggiace chi induce taluno a compiere o subire atti sessuali:

1. abusando delle condizioni di inferiorità fisica o psichica della persona offesa al momento del fatto;

2. traendo in inganno la persona offesa per essersi il colpevole sostituito ad altra persona.

Nei casi di minore gravità la pena è diminuita in misura non eccedente i due terzi."

"La pena è della reclusione da sei a dodici anni se i fatti di cui all'articolo 609-bis sono commessi:

1. nei confronti di persona che non ha compiuto gli anni quattordici;

2. con l'uso di armi o di sostanze alcoliche, narcotiche o stupefacenti o di altri strumenti o sostanze gravemente lesivi della salute della persona offesa;

3. da persona travisata o che simuli la qualità di pubblico ufficiale o di incaricato di pubblico servizio;

4. su persona comunque sottoposta a limitazioni della libertà personale;

5. nei confronti di persona che non ha compiuto gli anni sedici della quale il colpevole sia l'ascendente, il genitore anche adottivo, il tutore;

5 bis. all'interno o nelle immediate vicinanze di istituto d'istruzione o di formazione frequentato dalla persona offesa;

5 ter. nei confronti di donna in stato di gravidanza;

5 quater. nei confronti di persona della quale il colpevole sia il coniuge, anche separato o divorziato, ovvero colui che alla stessa persona è o è stato legato da relazione affettiva, anche senza convivenza;

5 quinquies. se il reato è commesso da persona che fa parte di un'associazione per delinquere e al fine di agevolarne l'attività;

5 sexies. se il reato è commesso con violenze gravi o se dal fatto deriva al minore, a causa della reiterazione delle condotte, un pregiudizio grave.

La pena è della reclusione da sette a quattordici anni se il fatto è commesso nei confronti di persona che non ha compiuto gli anni dieci."

ATTI SESSUALI CON MINORENNE (ART. 609-QUATER C.P.)

"Soggiace alla pena stabilita dall'articolo 609-bis chiunque, al di fuori delle ipotesi previste in detto articolo, compie atti sessuali con persona che, al momento del fatto:

1. non ha compiuto gli anni quattordici;

2. non ha compiuto gli anni sedici, quando il colpevole sia l'ascendente, il genitore, anche adottivo, o il di lui convivente, il tutore, ovvero altra persona cui, per ragioni di cura, di educazione, di istruzione, di vigilanza o di custodia, il minore è affidato o che abbia, con quest'ultimo, una relazione di convivenza.

Fuori dei casi previsti dall'articolo 609-bis, l'ascendente, il genitore, anche adottivo, o il di lui convivente, il tutore, ovvero altra persona cui, per ragioni di cura, di educazione, di istruzione, di vigilanza o di custodia, il minore è affidato, o che abbia con quest'ultimo una relazione di convivenza, che, con l'abuso dei poteri connessi alla sua posizione, compie atti sessuali con persona minore che ha compiuto gli anni sedici, è punito con la reclusione da tre a sei anni.
Non è punibile il minorenne che, al di fuori delle ipotesi previste nell'articolo 609-bis, compie atti sessuali con un minorenne che abbia compiuto gli anni tredici, se la differenza di età tra i soggetti non è superiore a tre anni.
Nei casi di minore gravità la pena è diminuita in misura non eccedente i due terzi.
Si applica la pena di cui all'articolo 609-ter, secondo comma, se la persona offesa non ha compiuto gli anni dieci."

Questa norma parifica nella punizione alla violenza sessuale i rapporti sessuali tra chiunque e un minore di 14 anni. L'età del minore sale a 16 anni se il responsabile ha con lo stesso rapporti di ascendenza, tutela, affidamento, educazione o cura o convivenza. Esclusi dalla punibilità i minorenni che compiono atti sessuali con minorenni ultratredicenni se la differenza di età non supera i tre anni.

CORRUZIONE DI MINORENNE (ART. 609-QUINQUIES C.P.)

"Chiunque compie atti sessuali in presenza di persona minore di anni quattordici, al fine di farla assistere, è punito con la reclusione da uno a cinque anni.
Salvo che il fatto costituisca più grave reato, alla stessa pena di cui al primo comma soggiace chiunque fa assistere una persona minore di anni quattordici al compimento di atti sessuali, ovvero mostra alla medesima materiale pornografico, al fine di indurla a compiere o a subire atti sessuali.
La pena è aumentata:

a. se il reato è commesso da più persone riunite;

b. se il reato è commesso da persona che fa parte di un'associazione per delinquere e al fine di agevolarne l'attività;

c. se il reato è commesso con violenze gravi o se dal fatto deriva al minore, a causa della reiterazione delle condotte, un pregiudizio grave.

La pena è aumentata fino alla metà quando il colpevole sia l'ascendente, il genitore, anche adottivo, o il di lui convivente, il tutore, ovvero altra persona cui, per ragioni di cura, di educazione, di istruzione, di vigilanza o di custodia, il minore è affidato, o che abbia con quest'ultimo una relazione di stabile convivenza."

Organizzazioni regionali: l'esperienza dei pediatri

Il materiale, le testimonianze e i racconti raccolti parlano di numerose attività e iniziative nei confronti del maltrattamento che possono trovare declinazioni diverse in diverse Regioni del territorio italiano. Nell'ambito del maltrattamento nei primissimi anni di vita la figura del pediatra di famiglia può assumere un ruolo determinante, proprio per il suo rapporto privilegiato non solo con il suo assistito ma anche con il contesto familiare, nel riconoscimento di situazioni di rischio o nel sospetto di condizioni di maltrattamento, intercettazione precoce e segnalazione, per una presa in carico del bambino e gestione adeguata e tempestiva.

È stata quindi svolta una piccola indagine attraverso la raccolta delle risposte a quattro domande da parte di alcuni referenti regionali dell'Associazione Culturale Pediatri (ACP)[1], che hanno potuto mettere insieme informazioni, in alcuni casi solo parziali, rispetto al territorio regionale, per cercare di avere un quadro delle modalità di lavoro e possibilità concrete di azione contro il maltrattamento infantile nell'ambito della loro attività ambulatoriale.

Pediatri di famiglia e maltrattamento

Nella sua Regione:
1. Ci sono linee guida/protocolli/indicazioni di prassi da seguire per l'intercettazione/rilevazione/gestione dei casi di maltrattamento? Quali/a quando risalgono?
2. Cosa deve fare un pediatra di fronte a un caso sospetto o evidente di maltrattamento?
3. Cosa viene realmente fatto/è possibile fare nei casi sospetti o evidenti di maltrattamento?
4. Quali prassi vengono seguite dal pediatra nei casi con condizioni che espongono al rischio di maltrattamento, per prevenire?

Qui di seguito vengono riportate le risposte relative alla situazione da loro percepita e vissuta in alcune Regioni italiane.

A) Emilia Romagna

Dal 2013 nella Regione Emilia Romagna sono disponibili le "Linee di indirizzo regionali per l'accoglienza e la cura di bambini e adolescenti vittime di maltrattamento/abuso", adottate con Delibera della Giunta Regionale n.1677/28 novembre 2013 e presentate agli operatori il 24 febbraio 2014. Successivamente sono stati prodotti i primi due "Quaderni del professionista", strumenti di lavoro a supporto dei sanitari: 1 - Maltrattamento e abuso sul minore. Raccomandazioni per la valutazione clinica e medico-legale; 2 - Fratture e abuso. Raccomandazioni per il percorso diagnostico, entrambi presentati e distribuiti agli operatori il 1 ottobre 2014[2]. Nelle Linee è indicato come e quando si devono attivare i diversi nodi della rete dei servizi, fra cui il pediatra di famiglia, per il contrasto al maltrattamento/abuso sul minore, e che cosa devono fare. A cascata, ciascuna ASL ha aggiornato i protocolli/le procedure/le istruzioni operative nel proprio territorio, o li ha prodotti nei rari casi in cui non fossero presenti, in modo da rendere concretamente applicate le Linee di indirizzo. La Regione ha seguito/sta seguendo questa ricaduta monitorandola, e rendendo l'applicazione delle Linee e la formazione degli operatori su di esse oggetto di verifica per il raggiungimento degli obiettivi di budget delle ASL.

L'azione del pediatra, di fronte a un caso sospetto o evidente di maltrattamento, dipende dalla situazione, cioè dalla gravità e urgenza dell'intervento, come indicato nelle stesse Linee:
a. può prendere contatto con il Servizio Sociale (SS) competente per territorio e insieme con il SS verificare ed eventualmente condividere i passi successivi (eventuale segnalazione all'Autorità Giudiziaria);
b. può prendere contatto con il pronto soccorso (PS) pediatrico ospedaliero di riferimento ed effettuare un invio del minore con motivazione formale di "necessità di effettuare approfondimenti diagnostici urgenti nell'interesse del minore", preavvisando dell'arrivo, segnalando i propri sospetti e verificando poi che il minore sia puntualmente pervenuto in PS;
c. a Bologna, ove è presente un Centro Specialistico di II° livello ("Il Faro") incardinato nel Dipartimento di cure primarie dell'AUSL di Bologna cui gli operatori possono rivolgersi, il pediatra può prendere contatto direttamente con il centro per una consulenza sul caso, eventualmente concordando anche il percorso successivo.
Nella maggior parte dei casi il percorso scelto dai pediatri di famiglia è l'invio in ospedale, al PS pediatrico. A Bologna in special modo, anche perché il PS pediatrico del S. Orsola è quello di riferimento per il maltrattamento/abuso sul minore per l'Area Metropolitana, sancito anche da una Procedura interaziendale fra AUSL di Bologna e Az. Ospedaliero Universitaria di Bologna Policlinico S. Orsola relativo alla violenza sessuale ("Percorso Sanitario integrato in caso di violenza sessuale/sospetto abuso sessuale a carico di minori") la cui ultima revisione risale al 28.01.2013. Numerosi sono anche i raccordi con il Centro specialistico "Il Faro". Decisamente più rari, per quanto risulta, i rapporti di attivazione diretta dei SS non mediati attraverso l'ospedale o "Il Faro".
Nei casi che presentano maggiore rischio di maltrattamento i percorsi rimangono gli stessi anche nel caso di attivazione dei Servizi con finalità di prevenzione: fondamentalmente l'attivazione dell'Ospedale (e/o in alternativa del Centro specialistico "Il Faro" a Bologna, soprattutto nei casi più sfumati) resta la via preferenziale seguita dal Pediatra di famiglia.

B) Lazio

Non ci sono linee guida regionali ufficiali. Esistono però materiali on line, protocolli, linee guida, indicazioni, anche di elevata qualità, prodotti da enti o associazioni, purtroppo applicati in realtà limitate e in genere poco pubblicizzate e di conseguenza poco conosciute[3]. Alcune ottime iniziative attuate si sono interrotte e non sono più operative. Esistono prassi in alcune ASL o territori, nate da rapporti personali o da corsi di formazione locali, da cui sono nate alcune "reti" più o meno formali, note a pochi, ma comunque utili (per esempio rapporti tra Pediatri ASL RM3 exD e un Commissario referente del Commissariato di zona) e altre più strutturate (Azienda USL Roma D- Area Tutela Salute della Donna e del Bambino - Servizio Prevenzione e Cura Abuso e Maltrattamento all'Infanzia, dal 2004 a oggi - Centro "Il Mandorlo"- Corsi di formazione).
Di fronte a un caso sospetto o evidente di maltrattamento il pediatra deve informare l'Autorità Giudiziaria, riferendo alla Procura presso il Tribunale per i Minorenni (e/o il Servizio Sociale) a seconda della situazione che si trova davanti. Deve riferire solo ciò che gli è stato comunicato, riportandolo fedelmente, per iscritto, specificando che il paziente/genitore (o altri) riferisce che "..." senza aggiungere interpretazioni personali o commenti. È opportuno inoltre specificare che "si sta riferendo quanto venuto a conoscenza nell'esercizio della propria professione, nell'esclusivo interesse del minore senza volere recare nocumento ad alcuno". Qualsiasi dubbio, anche minimo, andrebbe condiviso. Non è il pediatra a decidere se sia importante o no, devono solo segnalare. Indicazioni precise per i pediatri sono contenute in pubblicazioni su riviste scientifiche accreditate[4].
Tutto quanto appena indicato può essere fatto dal pediatra, ma la realtà è che viene fatto molto poco. La stragrande maggioranza dei pediatri di famiglia non ha sufficienti conoscenze sull'argomento e non sa con certezza a quale organismo rivolgersi. Può aver timore di compromettere il rapporto con la famiglia in caso di errore. Di fatto le segnalazioni da parte di pediatri su eventuali sospetti di abuso sono pochissime[5]. I pediatri che hanno seguito una qualche formazione sull'argomento (pochi in realtà) cercano di seguire le indicazioni ricevute dai docenti: effettuare un attento esame obiettivo davanti a un testimone; rivolgersi al servizio TSMREE (Tutela Salute Mentale e Riabilitazione in Età Evolutiva); segnalare ai Servizi Sociali; stilare il referto; rivolgersi a un centro di secondo livello per approfondire. La variabilità delle situazioni però è tale che ne è difficile l'applicazione. È fondamentale agire all'interno di una rete, che si è riusciti a costruire, o in cui ci si è inseriti. La rete serve a sostenere il pediatra, che non può e non deve essere lasciato solo, e a inserire il bambino in un percorso prestabilito che lo accompagni e lo protegga da traumi durante accoglienza, sorveglianza, diagnosi e presa in carico. A Roma, nella RM3-ex RMD, da qualche anno una Neuropsichiatra Infantile è il riferimento, contattabile telefonicamente, che "aiuta" a gestire il caso. Nel sospetto di un danno fisico o psichico ci si rivolge (per visite, radiografie, eccetera), ai servizi dedicati dell'Ospedale Pediatrico Bambino Gesù, del Policlinico Umberto I o di altra struttura pediatrica. Anche il pediatra più formato e aggiornato, nel sospetto di maltrattamento ha bisogno di aiuto da chiunque possa supportarlo in un momento così delicato per il bambino (l'ospedale, i servizi sociali, la ASL, eccetera).
Nei casi con condizioni che espongano al rischio di maltrattamento, sulla base alle risposte ricevute, i comportamenti appaiono molto variabili, cambiano a seconda delle situazione, delle conoscenze, delle competenze e della sensibilità dei pediatri: contattare il Tribunale per i Minorenni, parlare con l'Assistente sociale, gli psicologi che sono stati consultati, l'Asilo Nido o la Scuola; effettuare un accurato esame obiettivo; aprire un colloquio per cercare di capire; avere la massima disponibilità con i genitori e accogliere eventuali segnalazioni; sorvegliare per intercettare i segnali del bambino; collaborare strettamente coi servizi territoriali.
Il pediatra dovrebbe essere solo un facilitatore, una figura percepita dai genitori come positiva, alleata del bambino.
I genitori stessi dovrebbero esser resi consapevoli della forte rilevanza del problema "violenza sui minori".

C) Lombardia

Vi sono linee-guida NICE (National Institute for Health and Care Excellence) abbastanza recenti alle quali si fa riferimento. Di fronte a un caso sospetto o evidente di maltrattamento, per quanto riguarda i fatti di rilevanza penale (maltrattamenti in famiglia, abuso sessuale, corruzione di minorenne, violenza assistita, trascuratezza grave, eccetera) ci si deve attenere al Codice di P.P. (obbligo di denuncia e/o referto), per quanto riguarda questioni di pregiudizio l'interlocutore è costituito dai Servizi Sociali che sono il tramite col Tribunale per i Minorenni. Di solito la procedura standard viene seguita.
Il problema è semmai a monte, cioè la rilevazione, si stanno facendo continui momenti formazione, c'è un gruppo di lavoro all'interno dell'ACP nazionale. Nei casi con condizioni che espongono al rischio di maltrattamento, sul territorio vi sono diverse opportunità per aiutare le famiglie e, in particolare, le mamme di bambini piccoli. Opportunità inserite in progetti più articolati di promozione della salute.

D) Sicilia

Ci sono le Linee Guida della Regione Sicilia del 2012. Il pediatra di fronte a un caso sospetto o evidente di maltrattamento deve fare la segnalazione alla Procura minorile presso il Tribunale per i Minorenni, che avvierà il percorso giudiziario. Parallelamente il Tribunale attiva i Servizi Sociali del Comune e i servizi di NPIA (Neuropsichiatria dell'Infanzia e dell'Adolescenza) dedicati alla presa in carico del minore e del nucleo familiare. Nei casi con condizioni che espongono al rischio di maltrattamento il pediatra deve segnalare all'équipe dell'ASL che si occupa del maltrattamento e che dovrebbe essere attiva in ogni distretto. Presso ASP Palermo e Messina è attiva e si occupa proprio della prevenzione del maltrattamento. Se già in atto va segnalato come prima indicato.

E) Toscana

In tutta la Regione Toscana è attivo il Codice Rosa nei pronto soccorso (PS) con coinvolgimento in particolare, oltre al personale di PS, ai pediatri del PS, del 118, delle UU.OO. di Pediatria, delle ginecologie e in raccordo con gli assistenti sociali le attività consultoriali e i Centri antiviolenza. Codice Rosa prevede un protocollo con le Forze dell'Ordine e la Procura che ogni ASL ha siglato. Punto di riferimento per la Regione per quanto riguarda i minori è l'Azienda Ospedaliera Meyer.
Diverse realtà hanno attivo il progetto MIRIAM e a Livorno c'è il Centro di Coordinamento Zonale (CCZ) sulla violenza situato presso il Consultorio, che coinvolge un po' tutti i settori ASL che possono incontrare situazioni di violenza o si occupano della presa in carico (in particolare per i minori il gruppo Abusi della UFSMIA-Unità Funzionale Salute Mentale Infanzia e Adolescenza). In caso di situazioni di violenza su un minore le indicazioni sono quella di segnalazione immediata alla Procura; in caso di maltrattamenti gravi o abusi sessuali è sufficiente il sospetto. Sarà poi la Procura a predisporre gli accertamenti necessari. In questa fase infatti c'è il rischio di inquinare le prove o compromettere comunque indagini delicatissime. Nei casi più incerti o dove ci sono situazioni nell'immediato meno gravi che consentono un'indagine da parte dei Servizi Sociali (violenza assistita, bambini trascurati, eccetera) il riferimento è il Servizio Sociale o il responsabile del Centro di coordinamento zonale. Azioni di prevenzione importante sono indirizzare ai Servizi Consultoriali per un sostegno alla genitorialità in particolare nel post-partum e in caso di conflittualità familiare dato che sono i momenti più delicati per lo sviluppo di situazioni di violenza. Da non sottovalutare il problema della violenza nelle coppie di giovani adolescenti dove si cerca come CCZ di fare un'opera di prevenzione in raccordo con le Scuole, in quanto è altamente predittiva di violenza familiare in futuro. Fondamentale la formazione, che dove è stata fatta ha consentito una sensibilizzazione e un'attenzione altissima da parte dei colleghi di segnali che altrimenti sarebbero passati inosservati. Intervenire in fasi molto iniziali aiuta a evitare situazioni più gravi e soprattutto ha più probabilità di successo. È uscita recentemente una delibera regionale (5 dicembre 2016 del.1260) che riorganizza il Codice Rosa facendolo passare da Progetto a Rete Clinica e che prevede nuclei operativi in ogni PS, ma anche un referente della rete territoriale. In questa riorganizzazione sarebbe opportuno coinvolgere sia le pediatrie ospedaliere sia i pediatri di famiglia sia quelli di Comunità (là dove sono presenti).

F) Umbria

Non ci sono linee guida regionali. In Umbria, nel piano sanitario 2009-2011, si è tentato di promuovere un progetto organizzativo a cui è stato dato il nome PIUMA (Progetto Integrato Unità Multidisciplinare Abuso), realizzato con il contributo del Dipartimento per le Pari Opportunità. Il progetto promuoveva la costruzione, nel rispetto delle reciproche competenze, di stabili forme di intesa, comuni e condivise, tra il sistema integrato dei Servizi Sociali comunali e dei Servizi Sanitari delle ASL con il sistema giudiziario per rendere sempre più tempestivi e congrui i percorsi di tutela da attivare.
Gli obiettivi generali del Progetto PIUMA erano:

1. individuare le attività di protezione, di cura e di sostegno (sociali, educative, psicologiche, sanitarie) in favore di minori vittime di abuso e sfruttamento sessuale, da realizzare in modo integrato;
2. garantire un adeguato coordinamento inter istituzionale fra i soggetti pubblici;
3. assicurare un'appropriata integrazione tra i vari sistemi dei servizi e le professionalità coinvolte nella gestione del modello di intervento, a favore delle vittime di abuso e sfruttamento sessuale.

Nell'ambito del Progetto PIUMA c'è stato un momento formativo rivolto a medici e infermieri del pronto soccorso e della clinica pediatrica dell'azienda ospedaliera di Perugia. Sono stati svolti altri percorsi formativi rivolti a psicologi, pediatri e altri operatori territoriali. Dal progetto PIUMA doveva nascere un'équipe multidisciplinare (assistente sociale, psicologo, neuropsichiatra infantile, radiologo, pediatra, ortopedico, eccetera) a cui si potesse fare riferimento per la segnalazione. L'obiettivo era favorire la segnalazione e individuare i percorsi assistenziali. Attualmente l'équipe è composta da uno psicologo e un assistente sociale con efficacia limitata: non è reperibile 24 ore su 24 né tutti i giorni della settimana. Non tutti i pediatri sono stati informati dell'attività di questa équipe e i colleghi della provincia di Terni non ne conoscono l'esistenza. Non esiste un metodo comune e/o un protocollo condiviso per l'intercettazione, rilevazione e gestione del bambino maltrattato (abuso fisico, psichico e *neglect*).

G) Valle d'Aosta

Come linee guida/protocolli/indicazioni di prassi da seguire per l'intercettazione/rilevazione/gestione dei casi di maltrattamento vi sono diversi documenti[6]. In Valle d'Aosta, su una popolazione totale circa 128.000 abitanti, la popolazione in età 0-18 anni è pari a circa 19.000 e quella in età 0-6 anni circa 6.000. Il numero di casi segnalati di maltrattamento e abuso conclamati negli ultimi anni è di poche unità/anno. Da notare che sono prevalentemente segnalati dalla scuola, poi dalla pediatria ospedaliera e, in maniera eccezionale, dalla pediatria di famiglia. A quest'ultima spetta soprattutto il compito di individuare un'area grigia più estesa di situazioni di trascuratezza, disagio sociale e/o psicologico del minore in assenza di segni di maltrattamento, in modo da poter attivare tutte le risorse che la comunità può offrire a sostegno di una famiglia "critica". La difficoltà per tutti gli operatori è rappresentata dalla delicatezza del distinguere e mettere in atto un ventaglio più o meno esteso di azioni, dal caso che necessita di monitoraggio e accompagnamento, fino a quello di vero e proprio maltrattamento o abuso. Per questo la Regione Aut. Valle d'Aosta ha istituito un Gruppo di Coordinamento Interistituzionale composto da: 2 assistenti sociali, 2 dirigenti scolastici, 1 coordinatore di Asilo Nido, 2 psicologi, 2 pediatri (di cui uno ospedaliero e uno territoriale), 1 assistente sanitaria, 1 ginecologo, 1 medico di pronto soccorso, 1 medico legale, 1 operatore dell'Ufficio Minori della Divisione Anticrimine della Questura e 1 operatore della Sezione Minori della Squadra Mobile della Questura. Ha il compito di sostenere e accompagnare il singolo operatore sociale, sanitario, scolastico e socio educativo nel difficile percorso di valutazione, segnalazione e denuncia, eventualmente anche in urgenza, del caso di minore in situazione critica. In caso di dubbio o di necessità di approfondimento, è possibile richiedere una consulenza in merito al Gruppo di Coordinamento Interistituzionale, attraverso un contatto telefonico o e-mail[7].

Notizie biografiche e informazioni sui Centri consultati

Giussy Barbara

Dirigente medico, Specialista in Ostetricia e Ginecologia. Ha seguito un Corso di formazione in consulenza sessuale e sessuologia clinica, Scuola AISPA (Associazione Italiana sessuologia e psicologia Applicata), Milano. Lavora presso la Fondazione IRCCS CA' Granda Ospedale Maggiore Policlinico di Milano e presso il Servizio Soccorso Violenza Sessuale e Domestica (SVSeD).

Carla Berardi

Pediatra di libera scelta presso la AUSL di Perugia, è presidente della Associazione Culturale Pediatri (ACP) "Umbria", socia CISMAI e referente per il Maltrattamento e l'Abuso all'infanzia del Centro per la Salute del Bambino-Onlus di Trieste. Specializzata in Pediatria presso l'Università Cattolica del Sacro Cuore di Roma, ha conseguito il Corso di Perfezionamento in Pediatria di Comunità presso l'Università di Padova e il Master Internazionale in Protezione della Comunità e Promozione della Sicurezza presso le Università di Padova, Oporto, Parigi XII e Karolinska Institutet di Stoccolma. Ha svolto uno stage presso il Suspected Child Abuse and Neglect Program del Sick Children Hospital di Toronto. È stata consulente scientifico della Provincia di Perugia per il progetto "Prevenzione, trattamento e recupero nei casi di maltrattamento e abuso di minori" e consulente del Comune di Perugia su progetti per la prevenzione del maltrattamento. Ha istituito e coordinato l'Équipe multidisciplinare di riferimento per i casi di maltrattamento e abuso ai minori della AUSL di Perugia. Ha coordinato il Censimento Multifonte sul maltrattamento ai minori nel comune di Perugia, ricerca presentata alla Conferenza Mondiale sulla prevenzione della Violenza Familiare tenutasi a Banff, Canada. Autrice del volume "Prevenzione trattamento e recupero dei casi di maltrattamento e abuso ai minori" e di varie pubblicazioni sul tema del maltrattamento; relatore a congressi e docente in corsi di formazione sul tema dell'abuso ai minori; è stata consulente scientifico, coordinatore e docente nel progetto formativo della Provincia di Perugia per la prevenzione, trattamento e recupero dei casi di abuso ai minori; è docente presso il Settore Formazione Specifica in medicina Generale sul tema maltrattamento.

Ha fatto parte della Commissione Consultiva per la prevenzione e la cura del maltrattamento sui minorenni dell'Autorità Garante per l'infanzia e l'adolescenza.

Sara Ceccarelli

Medico chirurgo, specializzata in pediatra, ha lavorato presso l'azienda Usl Umbria 2, PO Spoleto, UO Pediatria e da settembre 2016 lavora presso S.C. Terapia Intensiva Neonatale, Neonatologia, Pediatria Azienda Ospedaliera S. Maria di Terni in qualità di Dirigente Medico di primo livello disciplina neonatologia/pediatria. Da maggio 2012 è segretario della sezione regionale della Società Italiana di Pediatria (SIP). Nel 2013-2014 ha seguito il Corso di perfezionamento post laurea: "I Maltrattamenti e gli abusi sui minori: Prevenzione, individuazione precoce, presa in carico" presso l'Università Cattolica del Sacro Cuore, Ospedale A. Gemelli, Roma. Nel 2014 è stata organizzatrice e docente del I corso aziendale "Maltrattamenti e abuso in età pediatrica" e nel 2015 docente e nella segreteria scientifica del II corso aziendale sul maltrattamento e l'abuso all'infanzia. Fa parte della Società Italiana di Pediatria (SIP) e della Società Italiana di Neonatologia (SIN).

Federica Collini

Medico chirurgo, specialista in Medicina Legale, è consulente Medico Legale presso il Servizio SVSeD, Fondazione IRCCS Ca' Granda Ospedale Maggiore Policlinico, Milano. Ha frequentato il V.I.P. (Violence Intervention Center) diretto dalla Prof.ssa Heger Heppenstall Astrid, Los Angeles (CA). Dal 2013 consulente Tecnico per conto del Tribunale Ordinario di Milano, successivamente del Tribunale Ordinario di Monza e del Tribunale per i Minorenni di Brescia. Sempre dal 2013 svolge attività di collaborazione per il "Sistema di Protezione Internazionale per Richiedenti Asilo e Rifugiati" del Comune di Milano e per la Stima dell'Età.

Elena Coppo

Medico Chirurgo specialista in Pediatria, dal 2002 è Dirigente medico a tempo indeterminato presso Azienda Ospedaliera Città della Salute e della Scienza di Torino - Presidio OIRM. Dal 2006 fa parte dell'équipe multidisciplinare "Bambi" abuso e maltrattamento, di cui è responsabile dal 2014. Nel 2010 ha conseguito il Master di I livello di Criminologia e Psicologia investigativa presso SSF Rebaudengo. È docente del corso di formazione aziendale ASO OIRM-S.Anna su abuso e maltrattamento all'infanzia ed è stata docente di diversi corsi di formazione su abuso e maltrattamento all'infanzia per operatori sanitari e insegnanti. Ha inoltre partecipato al tavolo di coordinazione progetto "Care and Protect" del Comune di Torino per la coordinazione di Intervento delle Forze dell'Ordine nei casi di abuso su minore.

Paola Di Blasio

Psicologa e Psicoterapeuta, perito del Tribunale, è direttore del Dipartimento di Psicologia dell'Università Cattolica di Milano dal 2014 e professore ordinario di Psicologia dello Sviluppo presso la Facoltà di Psicologia dell'Università Cattolica di Milano dal 1994; è componente del collegio docenti del Dottorato di Ricerca in Psicologia della comunicazione e dei processi linguistici dell'Università Cattolica di Milano dal 1999 e incaricata dell'insegnamento di Psicologia delle relazioni Traumatiche, Laurea Magistrale in Psicologia dello Sviluppo e della Comunicazione dell'Università Cattolica di Milano dal 2009.
È direttore del CRIdee, Centro di Ricerca sulle Dinamiche Evolutive ed Educative, e coordinatore della Laurea Magistrale in Psicologia delle Sviluppo e della Comunicazione.
Dal 1999 è direttore della rivista "Maltrattamento e abuso all'infanzia", Franco Angeli e dal 2000 condirettore con G. Attili della Collana "Psicologia dello sviluppo sociale e clinico", Unicopli, Milano. Dal 2010 è componente del comitato di direzione della rivista Psicologia Clinica dello Sviluppo, Il Mulino, Bologna.
È componente del Comitato Esecutivo dell'Associazione Italiana di Psicologia (AIP) e ha coordinato per l'unità italiana il programma di ricerca Europeo Concerted Actn on the Preention of Child Abuse in Europe promosso dal Comitato Biomedical and Health Research Programme della Comunità Europea.
È componente dei seguenti gruppo di consulenti: Regione Lombardia, per l'elaborazione di Linee guida in materia di trascuratezza, maltrattamenti e abuso sessuale in danno all'infanzia e all'adolescenza; Prefettura di Milano, per la elaborazione di un protocollo d'intesa per l'adozione di interventi coordinati nell'attività di contrasto all'abuso sessuale di minori e nella tutela dei minori vittime di abuso sessuale; Centro Nazionale di Documentazione e Analisi per l'Infanzia e l'Adolescenza, Ministero del Lavoro e delle Politiche Sociali, Istituto degli Innocenti di Firenze, per l'elaborazione di un piano di lavoro per attività informative e di formazione sul tema della prevenzione e della protezione dalla violenza all'infanzia e per la messa a punto di una metodologia di monitoraggio per la raccolta dati nazionale sulla violenza ai danni dell'infanzia.

È socio fondatore nel 1984 del Centro per il Bambino Maltrattato e la Cura della Crisi Familiare (C.b.M.) di Milano, Presidente dello stesso dal 1994 al 2003 e componente del Consiglio di Amministrazione dal 2004 al 2016.

Vittoria Doretti

Laureata in Medicina e Chirurgia e specializzata in Cardiologia e in Anestesia e Rianimazione, è Direttore f.f. UOC Promozione ed Etica della Salute - Direzione Sanitaria, Azienda USL Toscana sud est, Referente Salute e Medicina di Genere Azienda USL Toscana sud est e Referente Scientifico Progetto Regionale Codice Rosa - Regione Toscana. Ha conseguito un Master di II livello in "Bioetica- L'incontro di filosofia, medicina, diritto, biologia" facoltà di Lettere e Filosofia, e un Master Interfacoltà di II Livello in SCIENZE FORENSI (Criminologia-Investigazione-Security-Intelligence) presso La Sapienza Università di Roma abilitata come "Criminologa Esperta in Scienze Forensi. È docente nel percorso formativo regionale (L.R. 259 "Dalla affettività alla maternità e paternità consapevole) che coinvolge oltre 500 operatori consultoriali toscani e fa parte del Gruppo di Coordinamento aziendale (delibera AUSL 9 n° 202 del 21/04/2008) per la "Predisposizione di azioni strategiche per la prevenzione e l'assistenza alle vittime della violenza di genere" e del Tavolo di lavoro Regionale presso la Direzione Regionale all'Assessorato al Diritto alla politiche di Solidarietà sulla Violenza alle Donne. Fra i diversi incarichi ricoperti, dal I° gennaio 2010 dirige la fase sperimentale per il "Progetto Codice Rosa" e nel giugno 2011 il Codice Rosa diviene Progetto Regionale con diffusione alle altre ASL toscane, prima in forma sperimentale (2012) e poi a regime con il nuovo Piano socio sanitario regionale, processo a cui ha collaborato ed è Referente Scientifico e Membro del Gruppo di lavoro Regionale. In seguito alla del.reg. 1260 del 5/12/2016 che ha istituito la rete clinica di codice rosa, è stata nominata Responsabile della Rete Regionale di Codice Rosa.

Paola Facchin

Professore Associato di Pediatria presso l'Università degli Studi di Padova, Responsabile dell'Unità di Epidemiologia e Medicina di Comunità della stessa Università, del Programma Regionale della Patologia in Età Pediatrica, del Coordinamento Regionale delle Malattie Rare e del Centro Regionale per la Diagnostica del Bambino Maltrattato. Docente di Medicina di Comunità nel corso di laurea di Medicina e Chirurgia dell'Università di Padova. Direttore della Scuola Medica di Specializzazione in Medicina di Comunità, Università di Padova, Coordinatrice dell'indirizzo Scienze della Programmazione Sanitaria della Scuola di Dottorato in Medicina dello Sviluppo e Scienze della Programmazione Sanitaria, della stessa Università. Coordinatrice del Master Internazionale Congiunto "International Master on Community Protection and Safety Promotion" con le Università di Stoccolma, Parigi, Porto e Padova. Membro del Consiglio Superiore di Sanità dal 2006 al 2009, di più Commissioni ministeriali e regionali sulla salute e i servizi per l'infanzia ed età evolutiva, sulla sicurezza, sul contrasto del maltrattamento e per la protezione del bambino e adolescente, sulle cure palliative. Coordinatore del Tavolo tecnico interregionale permanente sulle Malattie Rare. Membro dell'Organismo Nazionale di Coordinamento e Monitoraggio per lo sviluppo delle reti di riferimento europee ERN per le malattie rare.
Ha ricoperto e ricopre numerosi incarichi a livello internazionale, tra i quali: Rappresentante per l'Italia presso il Gruppo di esperti sulle malattie rare della Commissione Europea. Membro del Working Group on Health Indicators, European Union Rare Diseases Task Force, DG SANCO European Commission; Membro dei Gruppi di Partner della Joint Action Europea Coding and classification sulla Classificazione e codifica della Malattie Rare per la stesura del nuovo ICD11; Membro del Comité Scientifique Directeur de la Fondation Euromediterranée sur les Droits de l'Enfant et la Securité Humaine, Fondazione supportata dalla Fondazione Hariri (Libano), Casa Reale del Marocco, Presidenza della Repubblica Francese, Unione Europea, con la partecipazione di OMS e UNESCO; Councilor for Education and Training dell'ISPCAN (International Society Prevention Child Abuse and Neglect); Consultant dell'OMS per il tema Human Security, Head Quarter di Ginevra e Regione Est-Mediterraneo; Membro quale contributor dei surveys "World Perspective on Child Abuse", della società ISPCAN (International Society Prevention Child Abuse and Neglect).
Responsabile di numerosi progetti di ricerca finanziati dal CNR, MURST, ISS, OMS, Unione Europea, Ministero della Salute, Regione Veneto e Fondazioni private. Lecturer, Invited Speeker e Chairperson in numerosi convegni e meeting internazionali. Membro del Scientific Board di numerosi Congressi Scientifici internazionali. Autore di circa 350 pubblicazioni edite a stampa.

Sabrina Farci

Psicologa psicoterapeuta, specializzata in psicoterapia dell'età evolutiva, ha una formazione sul maltrattamento e l'abuso e da quasi 20 vent'anni si occupa di questi temi sul versante clinico, terapeutico, forense e della formazione. Ha lavorato dal 1997 al 2005 presso il Centro studi Hansel e Gretel di Moncalieri, dal 2007 collabora in qualità di psicoterapeuta presso la Cooperativa Paradigma, nel 2008 socio fondatore dell'associazione Il Melo, centro studi per la cura del bambino e della famiglia di Torino.

Maria Grazia Foschino Barbaro

Psicologa-psicoterapeuta, dal 1983 lavora presso l'Ospedale Pediatrico Giovanni XXIII di Bari e dal 1999 è Responsabile del Servizio di Psicologia. Nel 2000 costituisce GIADA (Gruppo Interdisciplinare Assistenza Donne e bambini Abusati) per la diagnosi e l'intervento precoce delle condizioni di abuso infantile e dal 2009 ne è la responsabile scientifica. Dirige la scuola di Psicoterapia Cognitiva (AIPC, Associazione Italiana di Psicoterapia Cognitiva) di Bari e svolge da anni attività di formazione a livello regionale e nazionale sul tema della violenza all'infanzia e del disagio infantile. È componente del Consiglio Direttivo CISMAI, al cui interno si è occupata prevalentemente delle attività di formazione. Recentemente ha contribuito alla redazione delle Linee guida della Regione Puglia in materia di maltrattamento ai danni delle persone di minore età. Si occupa prevalentemente di: special needs adoptions, disturbi traumatici dello sviluppo, psicopatologia dell'infanzia e dell'adolescenza, cure palliative pediatriche, sostegno alla genitorialità, psicoterapia. Autrice di numerosi articoli e libri sul maltrattamento infantile, ha vinto diversi premi scientifici nazionali.

Alessandra Kustermann

Dirigente medico specialista in ostetricia e ginecologia, è direttore della Ginecologia e Ostetricia dell'U.O.C. PS, accettazione ostetrico-ginecologica e Soccorso Violenza Sessuale e Domestica – Fondazione Irccs Ca' Granda Ospedale Maggiore Policlinico di Milano. In precedenza è stata Responsabile dell'Unità Semplice di Diagnosi Prenatale e del Soccorso Violenza Sessuale e Domestica Fondazione IRCCS Ospedale Maggiore Policlinico, Mangiagalli e Regina Elena. È stata membro del Comitato Scientifico contro "la violenza sulle donne" dell'ordine degli avvocati di Milano (2015-2016), del "Tavolo Regionale Antiviolenza" per Regione Lombardia per il Soccorso Violenza Sessuale e Domestica (2015) e del comitato scientifico per "Premio per tesi di laurea e dottorato sul tema del contrasto alla violenza contro le donne" presso la segreteria della Delegazione CDE - Camera dei Deputati (2015). Dal 2012 è membro del "Gruppo di approfondimento tecnico (GAT) di Medicina di genere" per Regione Lombardia per il Pronto Soccorso Ostetrico/Ginecologico. Dal 2006 al 2009 è stata membro del Consiglio Superiore di Sanità. È stata relatrice o docente a oltre 350 congressi scientifici e corsi di formazione nazionali e internazionali sui temi di diagnosi prenatale, patologia della gravidanza, medicina di genere, violenza sessuale e domestica e ha oltre 100 pubblicazioni sui temi della diagnosi prenatale, della patologia della gravidanza, della violenza sessuale e domestica. Ha ricevuto i seguenti premi e riconoscimenti: nel 2016 premiazione Rosa Camuna della Regione Lombardia per il Soccorso Violenza Sessuale e Domestica, Fondazione IRCCS CA' Granda ospedale Maggiore Policlinico di Milano; nel 2010 Medaglia d'oro del Comune di Milano consegnata in occasione della festività di Sant'Ambrogio; nel 2008 Premio "SIGILLO LONGOBARDO" dal Consiglio Regionale della Lombardia; nel 2007 Medaglia d'oro di Riconoscenza della Provincia di Milano al Soccorso Violenza Sessuale della Clinica Mangiagalli, Fondazione IRCCS Ospedale Maggiore Policlinico, Mangiagalli e Regina Elena.

Melissa Rosa Rizzotto

Medico chirurgo, specialista in Medicina di Comunità e Dottore di Ricerca in Medicina dello Sviluppo e Scienze della Programmazione, presso l'Università degli Studi di Padova. Dirigente medico presso l'Azienda Ospedaliera di Padova, Coordinamento Malattie Rare; medico referente del Centro Regionale per la Diagnostica del Bambino Maltrattato della stessa Azienda. Membro del Gruppo di lavoro per l'abuso e il maltrattamento dell'infanzia che ha prodotto il documento "L'abuso sessuale nei bambini prepuberi. Requisiti e raccomandazioni per una valutazione appropriata", patrocinato dal Ministero per la Salute. Membro del Comitato Tecnico Scientifico dell'Indagine promossa da Terre des Hommes "Maltrattamento e abuso sui bambini: una questione di salute pubblica" il cui dossier è stato presentato nel novembre 2015, alla Biblioteca Giovanni Spadolini, Senato della Repubblica a Roma.
Dal 2004, Tutor ai corsi curricolari per la facoltà di Medicina e Chirurgia dell'Università degli Studi di Padova "Diagnosticare il maltrattamento ai minori: dalla teoria alla pratica" e "La famiglia maltrattante e i bambini maltrattati". Responsabile scientifico di numerosi corsi di formazione per personale sanitario (medici, infermieri, altre professioni sanitarie) in tema di maltrattamento e abuso. Junior e Senior researcher in progetti di ricerca nazionali (maltrattamento, paralisi cerebrali infantili, organizzazione delle scuole di specializzazione di Medicina (MIUR)). Ha partecipato a convegni scientifici nazionali e internazionali in qualità di relatore (ISPCAN, AHT, International Society on Brain Injury).
Autore di più di 100 pubblicazioni edite a stampa.

Giovanni Visci

Medico chirurgo, specializzato in Clinica Pediatrica e in Neuropsichiatria Infantile. Ha lavorato come pediatra ospedaliero e ha diretto l'UOC di Pediatria dell'Ospedale di Pescara e il Dipartimento Materno – infantile della ASL di Pescara fino al 2011. Attualmente lavora presso l'Associazione Focolare di Maria Regina onlus Scerne di Pineto (TE), è consulente scientifico dei progetti-obiettivo europei Daphne contro l'abuso sui minori (INTOVIAN e SPEAK-UP) e contro la violenza

alle donne e lo stalking (Progetti nazionali SUPPORT, ADRIA e PARES); ha diretto per anni il "Corso di formazione per operatori di contrasto alla violenza contro le donne e i bambini"; docente di corsi di formazione e aggiornamento professionale per pediatri e personale sanitario. È coordinatore dell'équipe terapeutica del Centro Primavera.
Collabora in qualità di tecnico con l'Assessorato alla Sanità della Regione Abruzzo dove ha partecipato a diverse commissioni tecnico–scientifiche, tra le quali quella che ha messo a punto il programma vaccinale regionale. Ha collaborato con la stesura del capitolo "La rilevazione precoce del maltrattamento infantile in pronto soccorso" al volume "La prevenzione del maltrattamento all'infanzia" pubblicato nel 2017 da F. Angeli editore. Ha pubblicato diversi lavori di argomento pediatrico, alla stesura di un volume sulla "Programmazione Sanitaria dell'assistenza pediatrica regionale" (1993) e di un volume su "Infanzia maltrattata" (G.P. Di Nicola, autrice) pubblicato da Edizioni Paoline nel 2001.

Gian Vincenzo Zuccotti

Laureato in Medicina e Chirurgia, specializzato in Pediatria, in Neonatologia-Patologia Neonatale e in Malattie Infettive, è Direttore della Clinica Pediatrica dell'Università di Milano, Ospedale dei Bambini V. Buzzi, Direttore del Dipartimento Pediatrico Ospedale dei Bambini V. Buzzi e Direttore ad interim della Clinica Pediatrica Ospedale Luigi Sacco. Prorettore ai rapporti con le Istituzioni Sanitarie. Ha ricoperto il ruolo di presidente della Società Italiana di Pediatria (SIP) lombarda.
È stato componente AIFA, Working Group dedicato all'età pediatrica, membro del Ministero della Salute per la Commissione Unica per la Dietetica e la Nutrizione, membro della Commissione Nazionale AIDS e membro della Commissione Nazionale per la Sicurezza Alimentare dal 2011.

Ambulatorio BAMBI

L'Ambulatorio BAMBI su abusi e maltrattamento sull'infanzia è nato nel 2002 presso l'Ospedale Infantile Regina Margherita di Torino. È stato fondato da Fulvia Negro, pediatra del pronto soccorso, per assistere i bambini vittime di maltrattamento e abuso. Presso il servizio BAMBI lavorano due pediatri che afferiscono al pronto soccorso e un medico legale, una psicologa dedicata e la collaborazione del servizio di psicologia ospedaliero, infermieri pediatrici; BAMBI collabora strettamente con il servizio di Assistenza Sociale e la Direzione Sanitaria; in caso di necessità può usufruire del servizio di NPI Ospedaliero.
Il servizio è operativo 24h/24h. Durante il giorno dispone di un medico di guardia attivo, quindi si avvale degli infermieri dedicati che sono disponibili anche in reperibilità 24h/24h e dell'équipe dei medici di pronto soccorso che sono comunque stati formati a gestire queste situazioni di emergenza. Dall'inizio delle attività nel 2002 in BAMBI sono stati visitati circa 1.900 bambini e la maggior parte di loro è stata segnalata all'Autorità Giudiziaria. I bambini che giungono all'osservazione di BAMBI sono inviati direttamente dal pronto soccorso, da altri ospedali, dai medici di base, dalle Forze di Polizia o direttamente dall'Autorità Giudiziaria.

Associazione Culturale Pediatri-ACP

L'Associazione Culturale Pediatri (ACP) è una libera associazione, costituita a Milano il 5/9/1974, che ha come finalità l'aggiornamento, la formazione professionale e la diffusione della cultura dell'età evolutiva.
Raccoglie 1.500 pediatri italiani. La composizione percentuale dei soci ACP vede una prevalenza di pediatri di famiglia (circa il 65%), accanto a pediatri ospedalieri, universitari e di comunità.
Gli iscritti sono riuniti in gruppi affiliati distribuiti nelle diverse realtà regionali.
ACP partecipa a tavoli istituzionali e gruppi di lavoro multidisciplinari.
Si è dotata di un codice etico di comportamento che investe sia i singoli pediatri sia l'Associazione stessa. Dal 1994 pubblica Quaderni acp, rivista di politica sanitaria e sociale dell'infanzia e di aggiornamento e strumenti didattici di ausilio per il pediatra nella risoluzione dei problemi clinici.
La rivista viene pubblicata senza introiti pubblicitari. I gruppi locali ACP svolgono, sia autonomamente sia in collaborazione con l'Associazione Nazionale, attività di formazione, ricerca, educazione sanitaria, definizione di protocolli diagnostico-terapeutici, valutazione di qualità delle cure, supporto a programmi di cooperazione nazionale e internazionale.

Centro Regionale per la Diagnostica del Bambino Maltrattato - Unità di Crisi per Bambini e Famiglie

La storia del Centro Regionale per la Diagnostica del Bambino Maltrattato (CRDBM)–Unità di Crisi per Bambini e Famiglie (Azienda Ospedaliera di Padova, Dipartimento per la Salute della Donna e del Bambino) inizia nel 1986, quando viene creata la prima Unità di Crisi per Bambini Maltrattati, all'interno del Dipartimento di Pediatria.
Il primo gruppo di lavoro è formato da 2 pediatri, 1 neuropsichiatra infantile e 1 medico legale che, in stretta collaborazione con i colleghi di altri Reparti del Dipartimento e dell'Ospedale, forniscono consulenza e supporto nei casi in cui si sospetti

una forma di maltrattamento o abuso ai minori. Tale prima Unità, nel corso degli anni, è stata ampliata, arricchita di specializzazioni nella delicata materia e il personale dedicato ha guadagnato riconoscimento a livello nazionale e internazionale.
Dall'organizzazione del congresso dell'ISPCAN nel 1993 ad Abano (congresso durante il quale si costituisce in Italia il CISMAI), all'incarico di occuparsi, per l'ufficio di Copenaghen della Regione Europea dell'Organizzazione Mondiale della Sanità (OMS), del tema della protezione del bambino nei 57 Paesi della Regione nel 1996, e in seguito alla realizzazione a Padova del First Meeting On Strategies for Child Protection nel 1998, in cui si comincia ad affrontare il maltrattamento come priorità di sanità pubblica. Le politiche definite nel corso di tali incontri vengono assunte dall'Head Quarter OMS di Ginevra per le linee guida mondiali in tema di maltrattamento e di violenza. All'Unità di Crisi di Padova viene conferito il riconoscimento di Best Practice di riferimento per l'approccio clinico medico ai bambini maltrattati e riceve l'incarico di predisporre l'istruttoria tecnica per la realizzazione della World Consultation on Child Abuse Prevention nel 1999, che ha ridefinito la nosologia delle sindromi da maltrattamento.
Con l'aumentare progressivo dell'attività e sulla base dell'esperienza nazionale e internazionale maturata, a partire dal 2000 e negli anni a seguire viene istituito con apposita normativa regionale e poi implementato e avviato un servizio specifico, l'attuale Centro per la Diagnostica del Bambino Maltrattato, che viene dotato di personale specializzato e struttura dedicata, per la diagnosi e cura delle vittime di maltrattamento, all'interno di una struttura ospedaliera di III livello.
Unitamente all'attività clinica, sono stati avviati e implementati specifici percorsi sia di formazione universitaria a livello internazionale e locale, sia di formazione continua per i professionisti sanitari in diverse regioni italiane.
Il Centro è dotato di una struttura di due piani dedicata, all'interno del perimetro dell'Azienda Ospedaliera di Padova, con ambulatori e stanze di degenza per attività di outpatient e di inpatient. Gestisce 3 letti di degenza ordinaria specifica per maltrattamento e 1 letto di day-hospital (al di fuori delle degenze pediatriche), oltre che tutta l'attività ambulatoriale e di consulenza in loco e a distanza per la rete ospedaliera regionale e sovraregionale. Il funzionamento della rete di assistenza regionale è regolato da apposite delibere regionali, che definiscono la tipologia di prestazioni erogabili, la modalità di esecuzione; livelli di responsabilità e compensi tariffari. Svolge attività clinica di diagnosi di sospetto maltrattamento e di presa in carico delle vittime. Il personale operante è in parte appartenente a un'équipe dedicata, in parte ad altri reparti o servizi dell'ospedale, ma si è nel tempo specializzato nella materia.
I casi provengono da Reparti di pronto soccorso o da altri reparti ospedalieri dell'Azienda Ospedaliera di Padova, della rete ospedaliera regionale ed extraregionale, Servizi per minori e famiglia del Distretto Territoriale dell'Azienda Sanitaria di residenza, Medico di Medicina Generale, Pediatra di Libera Scelta, Servizi Sociali dei Comuni, Servizi Scolastici, Forze dell'Ordine, Autorità Giudiziaria (Tribunale Ordinario e/o Tribunale per i Minorenni), un membro della rete familiare (accesso diretto con preselezione dei casi).
Presso il Centro vengono svolti progetti e attività di ricerca epidemiologici sulla frequenza delle forme di maltrattamento e sulle conseguenze a breve, medio e lungo termine, oltre che ricerche sperimentali sullo sviluppo cerebrale e dei tratti di sostanza bianca e sulla regolazione dell'asse ipotalamo-ipofisi-corticosurrene e la catena dello stress. Vengono svolti corsi di formazione pre-laurea (esiste dal 2004 un corso specifico sul maltrattamento nel piano di studi degli studenti di Medicina e Chirurgia con 4CFU) e post-laurea nonché di formazione continua per le professioni sanitarie.

Codice Rosa

Il Codice Rosa è un percorso dedicato di accesso e accoglienza al pronto soccorso per tutte le vittime di violenza: donne, minori, anziani, omosessuali. Secondo un'ottica Gender Sensitive. Viene assegnato insieme a quello di gravità (che non sostituisce) e la sua assegnazione attiva il gruppo operativo formato dal personale sanitario e non (medici, infermieri, assistenti sociali, psicologi, Centro antiviolenza, etc.) e dalle forze dell'ordine. Vengono prestate immediatamente cure mediche e supporto psicologico, nel rispetto della riservatezza, e avviata se necessario una presa in carico territoriale che coinvolge assistenti sociali, consultorio e centro antiviolenza, vi è inoltre un'azione sinergica con la Procura della Repubblica e le forze dell'ordine, per avviare indagini o monitorare situazioni a rischio.
Nato nel 2010 nell' ex Azienda USL 9 di Grosseto, si è progressivamente esteso ad altre aziende sanitarie, fino al completamento della diffusione a livello regionale da gennaio 2014.
Lo scopo principale di Codice Rosa è il coordinamento e la messa in rete delle istituzioni e delle competenze in gioco per garantire una risposta efficace alle vittime fin dal pronto soccorso. Vi sono inoltre collaborazioni per la prevenzione e il contrasto alla violenza.
Dal 2012 (anno in cui è iniziata la sperimentazione di Codice Rosa in cinque Aziende sanitarie, di Arezzo, Lucca, Prato, Viareggio e Grosseto) al primo semestre del 2016 sono stati registrati oltre 12.000 accessi in pronto soccorso, di cui poco più di 1.600 bambini[8].

Cooperativa Paradigma

Cooperativa Paradigma onlus di Torino, dal 1987, sviluppa sia modelli scientifici di intervento sia progetti sociali a favore di persone disabili e di minori. Il costante sviluppo parallelo delle due prospettive di lavoro garantisce la promozione di una cultura sociale attenta a fornire risposte puntuali, soddisfacenti e continuative alle persone di cui si prende cura. Tre sono le aree sviluppate in quasi 30 anni di attività: tutela dei minori, che con il progetto Casa Base, si occupa di bambini e

adolescenti che hanno subìto maltrattamenti nell'ambito familiare con due comunità di accoglienza per minori, un'équipe clinica e terapeutica che si occupa della presa in carico psicologica dei bambini e della valutazione di recuperabilità dei genitori; disabilità che racchiude i servizi dedicati alle persone con disabilità e le loro famiglie e che ha sviluppato il progetto "La Fabbrica del Chinino" e formazione che tramite l'Agenzia Riflessi promuove percorsi formativi per medici, psicologi e operatori sociali.

Coordinamento Italiano dei Servizi contro il Maltrattamento e l'Abuso all'Infanzia-CISMAI

Il Coordinamento Italiano dei Servizi contro il Maltrattamento e l'Abuso all'Infanzia (CISMAI) è stato costituito nel 1993 su iniziativa di alcuni centri attivi in Italia nella tutela e cura dei minori. Si tratta di un'associazione con caratteristiche di pluridisciplinarità e di riflessione teorica a partire dalla pratica dell'esperienza sul campo. L'obiettivo è "costituire una sede permanente di carattere culturale e formativo nell'ambito delle problematiche inerenti le attività di prevenzione e trattamento della violenza contro i minori, con particolare riguardo all'abuso intrafamiliare" (art.1 Statuto).
Le attività del CISMAI comprendono il coordinamento e lo scambio fra centri, servizi pubblici e privati che lavorano nella prevenzione e trattamento e abuso contro i minori; l'identificazione di linee guida per la presa in carico e la definizione di protocolli di intervento, la promozione di contatti e scambi con forze politiche ed istituzionali per la segnalazione di priorità di azione; la promozione di convegni, seminari, dibattiti, ricerche, pubblicazioni, corsi di formazione; il contatto e la collaborazione con Associazioni nazionali e internazionali impegnate nella difesa dei diritti dei bambini e delle bambine.
Fanno parte del CISMAI oltre 60 centri e servizi del settore pubblico e del terzo settore e oltre 70 professionisti soci individuali.
Il CISMAI partecipa a organismi per l'indirizzo nazionale della politica sull'infanzia, quali il primo Osservatorio Nazionale Minori, la Commissione nazionale contro gli Abusi all'Infanzia, il Comitato ex art. 17 L. 269/98 sorto per coordinare le attività contro lo sfruttamento e gli abusi sessuali sui minori nel biennio 1999-2000; ha partecipato ai lavori dell'Osservatorio Nazionale Infanzia e a riunioni di consultazione e a progetti del Centro Nazionale di Documentazione sull'Infanzia e l'Adolescenza e con l'Istituto degli Innocenti di Firenze: è stato consulente della Regione Abruzzo per le linee guida regionali su abuso e maltrattamento all'infanzia; fa parte del PIDIDA – Per I Diritti dell'Infanzia e Dell'Adolescenza (coordinamento di associazioni curato dall'UNICEF); partecipa al Gruppo di lavoro per la Convenzione sui Diritti dell'Infanzia e dell'Adolescenza, coordinato da Save the Children; è socio del Child Rights Information Network (CRIN); è partner nazionale dell'International Society Prevention Child Abuse and Neglect (ISPCAN).

Gruppo Interdisciplinare Assistenza Donne e bambini Abusati - GIADA

GIADA nasce nel 2000 come unità funzionale trasversale all'Unità Operativa di Ostetricia e Ginecologia dell'Ospedale "Di Venere" e al Servizio di Psicologia dell'Ospedale Pediatrico "Giovanni XXIII". Nel 2005 si è sviluppato trasversalmente a tutte le unità operative dell'Ospedale Pediatrico e ad alcune Unità Operative del Policlinico (Neonatologia e Terapia Intensiva, Ginecologia e Ostetricia, Medicina Legale e Pronto Soccorso).
Nel 2009, la Giunta regionale ha adottato GIADA inserendolo fra gli obiettivi strategici della Regione finanziando un'équipe dedicata, al fine di potenziare le attività di prevenzione, diagnosi precoce e cura dei bambini/adolescenti e famiglie in condizioni di rischio e/o di violenza, oltre che per mettere in atto un'esperienza pilota di rete regionale interdisciplinare e interistituzionale sanitaria in grado di fronteggiare il fenomeno della violenza sui minorenni.
Le attività di GIADA riguardano: assistenza psicologica e sociale, pediatrica e specialistica delle condizioni di rischio e di violenza sui minorenni; osservatorio ospedaliero sullo stress interpersonale acuto e cronico; accompagnamento giudiziario; consulto specialistico, anche a distanza, agli operatori dell'area materno–infantile su specifici e qualificati quesiti critici; ricerca e formazione di base e specialistica, anche con AUDIT clinici; attività di prevenzione dei pericoli per la salute associati alle violenze online; campagne di sensibilizzazione sui diritti dell'infanzia.
L'accesso all'assistenza può avvenire in condizione di: urgenza-emergenza, ricovero programmato e regime ambulatoriale, anche su invio dei servizi territoriali (sociali e sanitari) o dell'autorità giudiziaria.
Dal 2013 condivide un protocollo operativo con la Procura Ordinaria e Minorile di Bari e con le Forze dell'Ordine per la raccolta di sommarie informazioni (L. 172/2012) e assicura assistenza psicologica nel corso dell'escussione delle vittime e dei testimoni di minore età; tale azione ha permesso di arricchire la collaborazione già avviata con il Tribunale per i Minorenni di Bari per la presa in carico dei minori e delle loro famiglie.
Dal 2013 nell'ambito del Piano Strategico Regionale per la Promozione della Salute nelle Scuole è stato strutturato un Progetto di formazione e prevenzione sulle tematiche della violenza sessuale online, cyber bullismo, adescamento online.
Le azioni progettuali svolte in collaborazione con i referenti regionali GIADA e la Polizia Postale, sono rivolte alle scuole della Regione e coinvolgono insegnanti, alunni e genitori.
Dal 2016 GIADA è Centro di Riferimento Regionale ("Linee guida regionali in materia di maltrattamento e violenza nei confronti delle persone minori per età" D.G.R. n. 1878 del 30.11.2016).
GIADA è inserito all'interno di una rete regionale di servizi sanitari ospedalieri e territoriali, di servizi sociali, di servizi scolastici e servizi del privato sociale.

Rete Interaziendale Milano Materno Infantile-RIMMI

La Rete Interaziendale Milano Materno Infantile (RIMMI) è formata da tutte le strutture, i servizi e le risorse professionali con attività significativa di prevenzione e assistenza nell'area materno-infantile di Milano. Si propone di progettare e sperimentare una modalità organizzativa per integrare le risorse nell'assistenza materno infantile presenti nella città di Milano. La mission è "sviluppare un'offerta di servizi sanitari e sociosanitari attraverso un'organizzazione a rete in grado di coinvolgere tutte le componenti del processo assistenziale, in risposta ai bisogni delle donne, delle madri, dei neonati, dei bambini e degli adolescenti (età pediatrica da 0 a 18 anni)". La RIMMI coinvolge i servizi del territorio e i centri specialistici e vi partecipano: ATS Città Metropolitana di Milano; ASST (Aziende Socio Sanitarie Territoriali) e IRCCS (Istituti di Ricovero e Cura a Carattere Scientifico): ASST Fatebenefratelli Sacco, ASST Pini/Cto; ASST Grande ospedale metropolitano Niguarda, ASST Santi Paolo e Carlo, Fondazione IRCCS Ca' Granda Ospedale Maggiore Policlinico, Fondazione IRCCS Istituto Nazionale dei Tumori, Fondazione IRCCS Istituto Neurologico Carlo Besta. Un'altra componete della RIMMI è rappresentata dagli ambulatori dei pediatri di libera scelta e dei medici di medicina generale, con pazienti da 0 a 18 anni, e collaborano con collegamenti funzionali e la condivisione di Percorsi diagnostico terapeutici e assistenziali.

Soccorso Violenza Sessuale e Domestica-SVSeD

Il centro Soccorso Violenza Sessuale e Domestica (SVSeD) di Milano è attivo dal 1996 presso la Fondazione IRRCS Ca' Granda Ospedale Maggiore Policlinico (Clinica Ostetrico Ginecologica, "Luigi Mangiagalli"). SVSeD è il primo centro antiviolenza pubblico in Italia e dal 1998 è centro di riferimento regionale per i problemi della violenza alle donne e ai minori. Il servizio offre supporto sanitario, psicologico e sociale a favore delle persone, di qualunque età, che hanno subito violenza sessuale e domestica. SVSeD è un centro antiviolenza pubblico dove chi subisce violenza trova soccorso, comprensione e aiuto in emergenza e viene seguito nel lungo periodo da un'équipe multidisciplinare composta da operatori esperti. Offre assistenza sanitaria 24/24h per 365 gg/anno, accoglienza e informazioni da parte del personale sanitario e psicosociale.
L'équipe multidisciplinare del Centro è composta da ginecologhe, medici legali, chirurghi pediatrici, psicologhe, psicoterapeute, assistenti sociali, infermiere, ostetriche (tutti gli specialisti coinvolti hanno una specifica esperienza nella diagnosi e nella terapia delle vittime di violenza adulte e minori).
Grazie all'ausilio degli avvocati penalisti e civilisti di SVS Donna Aiuta Donna onlus, SVSeD è in grado di garantire a tutte le vittime, che non abbiano già consultato un avvocato, una consulenza e un'assistenza legale gratuita. I minori che arrivano a SVSeD, specialmente se la violenza sessuale e il maltrattamento sono avvenuti in ambito familiare, hanno bisogno di un percorso psicosociale dedicato, che spesso richiede anche il successivo coinvolgimento dei servizi territoriali in base alle decisioni del Tribunale per i Minorenni. Anche per tale motivo i rapporti con Forze dell'Ordine, Polizia Locale e Procura presso il Tribunale Ordinario e presso il Tribunale per i Minorenni sono tenuti costantemente dai collaboratori del Centro.
Complessivamente, dal 1996 a tutto il 2015, SVSeD ha offerto assistenza a 7.815 vittime di violenza sessuale e domestica.
Nel 2016 le vittime di violenza assistite dal personale SVSeD sono state 1.037.

Save the Children
è la più importante organizzazione internazionale indipendente, dedicata dal 1919 a salvare i bambini in pericolo e a promuovere i loro diritti, subito e ovunque, con coraggio, passione, efficacia e competenza.

Opera in oltre 120 Paesi per garantire a tutti i bambini salute, protezione, educazione, sviluppo economico, sicurezza alimentare e promuovere la partecipazione di tutti i minori. Inoltre risponde alle emergenze causate da conflitti o catastrofi naturali.
Save the Children è stata costituita in Italia alla fine del 1998 come Onlus e ha iniziato le sue attività nel 1999. Oggi è una Ong riconosciuta dal Ministero degli Affari Esteri.

Oltre all'importante impegno a livello internazionale Save the Children Italia sviluppa programmi che hanno l'obiettivo di migliorare la vita dei bambini e delle bambine che vivono sul nostro territorio con interventi nell'ambito della lotta alla povertà minorile, della protezione dei minori a rischio di sfruttamento (come i minori stranieri non accompagnati), dell'educazione e della scuola, dell'uso sicuro delle nuove tecnologie, della tutela dei minori nelle emergenze.

ABSTRACT

The European countries have a long history of exposure to large-scale trauma. In the early 1990s the increasing awareness of the consequences of trauma within the mental health community led to the foundation of local societies for psychotraumatology across Europe and the European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary in 2018. The focus of this article is to describe the current state of care for survivors of trauma in the 15 European countries where ESTSS member societies have been established. Brief descriptions on the historical burden of trauma in each country are followed by an overview of the care system for trauma survivors in the countries, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in the future. The reports from the different countries demonstrate how important steps towards a better provision of care for survivors of trauma have been made in Europe. Given the cultural and economic diversity of the continent, there are also differences between the European countries, for instance with regard to the use of evidence-based treatments. Strategies to overcome these differences, like the new ESTSS training curricula for care-providers across Europe, are briefly discussed.

Trauma y Atenciones de Trauma en Europa

Los países Europeos tienen una larga historia de exposición a traumas de larga escala. A principios de la década de 1990, la creciente conciencia de las consecuencias del trauma dentro de la comunidad de salud mental condujo a la fundación de las sociedades locales para la psicotraumatología en Europa y la Sociedad Europea de Estudios de Estrés Traumático (ESTSS), la cual celebra en el 2018 su 25° aniversario. El enfoque de este artículo es describir el estado actual de la atención de los sobrevivientes de traumas en los 15 países Europeos, donde las sociedades miembros de la ESTSS se han establecido. Las descripciones breves sobre la carga histórica de trauma en cada país son seguidas por una descripción general del sistema de atención para sobrevivientes de trauma en el país, el estado de la técnica de las intervenciones, los desafíos actuales en el cuidado de sobrevivientes y los temas que necesitan ser abordados con mayor urgencia en el futuro. Los reportes de los diferentes países demuestran los pasos importantes que se han dado en Europa en la entrega de atención para los sobrevivientes de trauma. Dada la diversidad cultural y económica del continente, hay también diferencias entre los países Europeos, por ejemplo en relación al uso de tratamientos basados en la evidencia. Las estrategias para

HIGHLIGHTS

- Important steps towards a better provision of care for victims of trauma were made in the European countries.
- In 2018, ESTSS celebrates its 25th anniversary.
- Strategies to promote a better practice include new ESTSS curricula for professionals across Europe.

resolver estas diferencias, como el nuevo curriculum de entrenamiento de la ESTSS para los proveedores de atención a lo largo de Europa son discutidas brevemente.

欧洲的创伤和创伤护理

欧洲国家有遭受大规模创伤的久远历史。在20世纪90年代早期，精神卫生界内越来越意识到创伤的后果，导致了在欧洲各个地区性创伤心理学会和欧洲创伤应激研究学会（European Society of Traumatic Stress Studies；ESTSS）的成立，该学会将于2018年庆祝其成立25周年。本文旨在描述在已建立ESTSS子协会的15个欧洲国家中创伤幸存者护理的当前状况。首先是对每个国家创伤的历史负担的简要描述，之后概述了各国创伤幸存者的护理系统的概述，干预措施的最新技术，护理幸存者面临的的当前挑战以及将来最迫切需要解决的问题。来自不同国家的报告展示了，在欧洲是如何实现为创伤幸存者提供更好的护理。鉴于大陆的文化和经济多样性，欧洲国家之间也存在差异，例如在循证治疗的使用上。我们简要讨论了克服这些差异的策略，例如为跨欧洲的护理服务提供者的新ESTSS培训课程。

1. Introduction

Exposure to trauma is common (Kessler et al., 2017) and its consequences on the individuals and communities affected can hardly be overestimated. In Europe, as in other regions of the world, a high burden of trauma is related to human-made events. In the twentieth century, military conflict took place during every single year in the European region and many of them affected numerous countries (see Table 1). Mass traumatization was also related to military conflicts associated with European colonialism, or conflicts in other continents where European military forces were involved in conflicts (see Table 2). Another massive burden of trauma across Europe resulted from the Holocaust and, throughout most of the twentieth century, from the political oppression by the Soviet communism. Trauma has occurred and still occurs in many societal contexts. For example, these include the familial and institutional abuse of children, different forms of gender-based violence in the European societies, various forms of institutional violence (i.e. in detention facilities of some countries) and also large-scale disasters and terror attacks that struck individual countries. Finally, over the last decades, an increasing number of migrants have reached the European countries, due to war and violence in their homeland (Hall & Olff, 2016; Kartal & Kiropoulos, 2016; Knaevelsrud, Stammel, & Olff, 2017; Munz & Melcop, 2018).

In the last two decades of the twentieth century, the increasing awareness of the consequences of trauma in the mental health community led to the foundation of local working groups and societies for psychotraumatology in several European countries. The European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary this year, was founded in 1993. Over two decades, ESTSS was an organization that included both member societies and individual members, which in the first years mainly came from western European countries. Recently, ESTSS has developed into an umbrella organization of the European societies for traumatic stress. This change is the result of a strategic plan that has been pursued over a longer period of time (Gersons, 2013). The ESTSS board consists of representatives from all member societies, which facilitates the work towards common strategic aims, such as promoting a standard curriculum for training in psychotrauma across Europe. In 2018, ESTSS com-

Table 1. Examples of military conflicts in Europe.

Year	Military conflict	Countries affected
1914–1918	First World War	Paneuropean
1917–1922	Soviet revolution	Former Soviet countries
1936–1939	Spanish civil war	Spain
1939–1945	Second World War	Paneuropean
1944–1953	Lithuanian partisan war against Soviet occupation	Lithuania
1968–1998	The Northern Ireland Troubles	UK, Republic of Ireland
1991–2000	Wars following the dissolution of former Yugoslavia	Slovenia, Croatia, Bosnia and Herzegovina Serbia, Montenegro, Kosovo
Since 1990	Military conflicts/wars in the South and North Caucasus	Georgia, Armenia, Azerbaijan and Russia (including North Caucasian region of Russia)
2008	Russian-Georgian war	Georgia, Russia
Since 2014	Conflict in East Ukraine	Ukraine, Russia

The list of military conflicts and countries involved is not all inclusive.

Table 2. Examples of military conflicts outside of Europe.

Year	Military conflict	European countries affected
1945–1949	War in the former Dutch East Indies	The Netherlands
1946–1954	Vietnam war	France
1954–1962	Algeria war	France
1950–1953	Korean war	Belgium, France, Greece, Luxembourg, Netherlands, UK
1961–1974	Portuguese Colonial War in Africa	Portugal
1979–1987	Afghanistan war	Former Soviet countries, UK
1990–1991	Gulf war	Belgium, Denmark, France, Germany, Greece, Hungary, Italy, Netherlands, Norway, Poland, Portugal, Romania, Spain, Sweden, UK
2001–2014	Afghanistan war	Albania, Belgium, Croatia, Czech Republic, Denmark, France, Georgia, Germany, Italy, Lithuania, Norway, Poland, Portugal, Romania, Russia, Spain, Sweden, UK, etc.

The list of military conflicts and countries involved is not all inclusive.

prised of 13 member societies that included 15 European countries and regions. These included Austria, Belgium, Croatia, Georgia, Germany, Lithuania, Italy, The Netherlands, Poland, Portugal, Sweden, the German-speaking and the French-speaking part of Switzerland, Ukraine and the UK (www.estss.org). Moreover, ESTSS had 12 additional affiliated societies and institutions in 2018. The society is constantly working towards the inclusion of further European societies and actively supports the formation of new societies in countries where they do not exist yet, as currently happened in Finland where the Finish Society for Psychotraumatology was launched in 2018.

While a series of articles at the occasion of ESTSS' twentieth anniversary focused on the inspiring and often also entertaining recollections of former presidents on the development of ESTSS (Lueger-Schuster, 2013b), the focus of this article is on the current member societies of ESTSS and on the development of trauma care in the respective countries. After some reflections on the historical burden of trauma in each country, representatives from all the national societies describe the structure of care organizations for trauma survivors, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in their countries in the future.

2. Psychotraumatology in Belgium

Five to eight million deaths, perhaps even 10: this was the devastating toll of the conquest and colonial exploitation of the Belgian Congo with King Leopold II, between the 1880s and the First World War (Hochshild, 1998). All traces of this Genocide remained secret until the early 1980s. Concerning the historical burden of the two World Wars (Manfred, 2015), it is the First World War more than the Second World War which, in the collective memory, constitutes a great trauma because of the looting of the country and the massacre of more than six thousand civilians. Recent events that stay more broadly in the mind of the Belgian people include the Heysel Drama in 1985 and the Dutroux affair with the sexual abuse, sequestration and death of young children and adolescents in 1996. In March 2016, the terrorist attacks at the national airport and in the metro of Brussels caused the death of 35 persons (Deschepper et al., 2018). Psychosocial structures vary across the country and have little or no coordination between them. One of the reasons is a difference between the functioning of French- and Flemish-speaking communities. Some structures can be found in both the French- and the Flemish-speaking communities. For instance, Public Welfare Centres and police victim services can be found in both of them. The integration of a psychosocial dimension into emergency and intervention plans was formalized in 2006. For the last 20 years, psychotherapists and other clinicians working in private practices started to specialize in trauma care for survivors. More and more specifically trained psychologists are working in hospitals and mental health centres. Recently, the development of outpatient trauma treatment centres linked to hospitals is evident. Some centres for the provision of trauma care for refugees were established in Brussels and cover the Dutch- as well as the French-speaking part of the country. In 2017, the High Council on Health received a Ministerial request for an opinion on the psychological care and support of persons following terrorist incidents or related disasters.

Until recently, there were no trauma-focused intervention methods in use in Belgium. The main therapeutic currents, for instance cognitive behavioural therapy (CBT) and psychodynamic therapies, were putting their own accents on working with trauma. In 2006, the BIP (Belgian Institute for Psychotraumatology) started the first psychotraumatology course. More trauma centres were created in the following years in principle cities, mainly Antwerp and Brussels. The course is organized in collaboration with two Universities. BIP organizes conferences in collaboration with other institutes or centres in Belgium. An independent Belgian trauma society needs to be created in the near future.

Current challenges in caring for trauma survivors concern the coordination of different support services. The political system in Belgium involves varying responsibilities at several levels, which makes decision-making complex. More visibility through studies on the positive impact and benefits of qualified trauma-focused care will be important. Finally, a well-structured national accreditation system should be put in place in order to continue provision of quality care for trauma survivors.

Among the topics to be most urgently addressed in the future is accessibility of services which is limited due to long waiting lists before survivors get access to psychological care in the Belgium mental health care system. Moreover, new ways of thinking about specialized trauma-care structures are needed.

3. Psychotraumatology in Croatia

The still living burden of the Second World War psychotrauma in Croatia has merged with the trauma of the Homeland War (1991–1995). Throughout the whole post-World War period there was no awareness of the consequences of trauma exposure, the issue was present neither in the health nor in public discourse. Consequently, no specific care was developed and provided. In contrast, the war in the 1990s brought about a high level of awareness of trauma and posttraumatic stress disorder (PTSD). Decades later the war-affected population reports 18% prevalence of PTSD (Priebe et al., 2010). This may be

partly due to lack of effective early trauma interventions and a number of hindering social factors, such as the prolonged economic crisis that affected more the vulnerable populations. The spin-off effect of massive trauma at the social level is a new understanding of the impact of traumatic events on physical and psychological health, as well as on communities (Corkalo Biruski, Ajdukovic, & Löw Stanic, 2014; Lončar & Henigsberg, 2007), which in turn facilitates access to specialized services by people exposed to trauma in everyday life.

Trauma survivors have access to psychiatric services in major hospitals, while veterans receive help within the three specialized regional centres and the National Centre for Psychotrauma. The cost of services are covered by universal national health insurance. Several non-governmental organizations with qualified staff provide supportive therapy to survivors of sexual assault, traffic accidents and other life threatening incidents, as well as domestic violence. The Polyclinic for the Protection of Children based in Zagreb specializes in working with traumatized children. Other facilities focus on prevention and support in the immediate aftermath of traumatic incidents, such as the Crisis Response Network maintained by the Society for Psychological Assistance (SPA).

The psychiatrists' first treatment choice is psychopharmacology. The prevalent therapeutic approach in psychiatric services for veterans is group therapy. Some veterans have been attending such groups for over 25 years. Low use of evidence-based trauma-focused therapies reflects (Schnyder et al., 2015) the prevailing traditional approach in Croatian psychiatry. Hence, traumatized populations still have poor access to effective, evidence-based trauma treatments. Training in trauma-focused CBT and EMDR is offered to practitioners, but this is not fully integrated into the helping system. With the existing high level of competencies in dynamic psychotherapy and psychopharmacology (Britvić et al., 2012), the challenge remains to develop a more stepwise approach to trauma-informed services, increase public awareness of risk and resilience factors, and to expand treatment choices to include evidence-based trauma-focused therapies and make them more available to the general populations in need. The Croatian Society for Traumatic Stress (CSTS) has been working on this challenge since it was founded in 2011 by organizing training workshops. It is currently promoting the ESTSS certified training in psychotrauma for mental health providers. One of the ambitions is to further integrate such training into university curricula so that future generations of mental health professionals are able to provide state-of-the-art care to traumatized people. Similarly, basic and intermediate levels of trauma-related knowledge and skills will be made more available to first responders and other health professionals.

4. Psychotraumatology in France

According to the World Mental Health survey, 72.7% of the French population has been exposed to traumatic events in their lifetime (Husky, Lépine, Gasquet, & Kovess-Masfety, 2015). Intimate partner violence, serious illness of a child and rape were the events associated with highest risk of PTSD. While rape is underreported in France, each year nearly 100,000 individuals claim to be survivors of rape or attempted rape and 500,000 claim to be survivors of intimate partner violence. A fifth of the French population was exposed to war-related events (mainly the Second World War). The twenty-first century was scarred by numerous Islamism extremist attacks, of which the November 2015 Paris attacks have been the bloodiest to date, resulting in more than 264 dead and 914 injured individuals. Traffic fatalities decreased in the past decades, reaching 5.1 per 100,000 inhabitants per year.

Since 1995, medico-psychological emergency units (CUMP for 'Cellules d'Urgence Médico-Psychologiques') are deployed in the case of mass casualty situations and provide immediate psychological support and care. These units were very effective after terror attacks in Paris and Nice, supporting thousands of survivors over many weeks (Hirsch et al., 2015). Psychological assistance aims at providing survivors with an entry point to psychological health care and giving them a first sense of relief, even though they do not provide psychological follow-up care (Vandentorren et al., 2018). In order to ensure long-term high-quality trauma care to all survivors in need across the country, President Emmanuel Macron in November 2017 announced the creation of about 10 ambulatory services specialized in trauma care. These services are aimed at providing medical and psychological care to survivors (minors or adults) that have experienced violence or any traumatic event during their lifetime.

The traditional psychodynamic approach is gradually but slowly replaced by structured trauma-focused psychotherapies, such as CBT or EMDR, and also new technologies (e-PTSD) are being introduced (Bourla, Mouchabac, El Hage, & Ferreri, 2018). However, the provision and access to treatment remain limited by the fact that there is a limited number of experienced trained trauma therapists and that care centres are not always clearly identified or equitably distributed across the country.

The challenges in caring for survivors are to achieve universal access to prevention, improve access to trauma-focused psychotherapies and ensure coordination of specialized care and support. One major challenge is to expand public funding of structured psychotherapies by trained psychologists. It is advisable to ease access to structured trauma-focused

therapies as part of mental health care programmes in compliance with international guidelines. In the end, patients should benefit from personalized treatment strategies for their trauma-related disorders, based on objective information.

The future ambulatory care services specialized in trauma will have to structure the organization of care, to establish a single French umbrella society (involving the national trauma centre and psychotrauma societies such as AFORCUMP-SFP, ALFEST and ABC des Psychotraumas), to be involved in qualifying training curricula, and to set up a French certification committee connected to the ESTSS accreditation committee, in order to meet modern European and international standards.

5. Psychotraumatology in Georgia

Georgia is a post-Soviet country, with a population of approximately 3.3 million. Since becoming independent in the early 1990s, it went through a prolonged series of civil war and ethnic-political conflicts followed by a war with Russia in 2008 and loss of control over more than 20% of the country's territory. Ongoing social, political and economic crises create pressure on the population, 20.6% of whom live under the poverty level and 7.3% of whom are internally displaced. Among the conflict-affected population, 23.3% suffer from PTSD symptoms, 14.0% from depression, 10.4% from anxiety and 12.4% have more than one mental health condition (Makhashvili et al., 2014). In addition, the population still suffers from the inter-generational effects of trauma related to the Soviet invasion and totalitarian past (Javakhishvili, 2014, 2018).

The large proportion of conflict-affected population led to the build-up of trauma care capacities and corresponding institutional developments, i.e. trauma-focused torture victim rehabilitation centres (GCRT), functional since 2000, with the head office in the capital city Tbilisi and branches in eastern and western Georgia. The multidisciplinary teams provide free of charge care for their clients that include forced migrants, ex-prisoners and others. There are a number of non-governmental organizations providing trauma-informed psychosocial services to socially disadvantaged groups, including forced migrants, domestic violence survivors and other target groups.

The Georgian Society of Psychotrauma (GSP) was founded in 2007 with the support of ESTSS. GSP builds capacity within the local professional community and has introduced such evidence-based treatment methods as Trauma-Focused CBT, Brief Eclectic Psychotherapy for PTSD (BEPP) and EMDR, as well as other relevant psychosocial interventions. Since 2008, GSP regularly conducts an annual international multidisciplinary conference 'Trauma and Society'. To assure capacity building and good quality care, an innovative Master Program in Mental Health was founded in 2012 at Ilia State University in Tbilisi, under the lead and with a main perspective on psychotraumatology.

The mental health treatment gap is about 90% in the country. There is a predominant focus on hospital care; community-based services are under-developed. Common mental disorders are under-recognized and under-treated by the state services. There is a need to develop a trauma-informed primary health care system, enlarge the trauma care infrastructure and establish corresponding referral pathways. Another challenge is low awareness of one's own mental health condition. According to a recent study, of those who suffered from mental health symptoms, only 24.8% sought care, 19.6% acknowledge mental health problems but did not seek care, and 54% did not acknowledge mental health problems (Chikovani et al., 2015).

Since most trauma survivors belong to socially disadvantaged groups who are often exposed to multiple traumatization as well as a series of everyday life stressors, we rarely find among these patients simple PTSD. The most widespread trauma-related condition are complex posttraumatic disorders. Therefore, the most urgent need is to evaluate effective methods of addressing complex trauma conditions. From 2016 to 2018, within the framework of an Erasmus Plus cooperation, the Trauma-Focused Cognitive-Behavioural Therapy Train of Trainers (ToT) module was developed, piloted and adapted to the Georgian cultural context in cooperation with Cardiff University. It has proved its effectiveness in the treatment of not only simple but also complex trauma-related disorders. There is a need to collect strong evidence to further prove the effectiveness of these approaches.

6. Psychotraumatology in the German-speaking countries

As in many European countries, the largest historical burden of trauma in Austria, Germany and Switzerland comes from the two twentieth century World Wars and the Holocaust. Over the decades, the different roles of the three countries in these catastrophic events had an influence on the perception of their traumatic impact. In contrast to Switzerland, discourses in Germany and Austria had been more focused on their role as perpetrators and their responsibility for these events. In general, Switzerland has been much less concerned by the two twentieth century World Wars than Germany and Austria. It took a longer time before the trans-generational consequences of war and displacement on parts of the German and Austrian population were also discussed (e.g. Glück, Tran, & Lueger-Schuster, 2012,

Kuwert, Brähler, Glaesmer, Freyberger, & Decker, 2009). Another population that requires expertise on psychotraumatology in the three countries is that of the refugees (e.g. Knaevelsrud et al., 2017; Spiller et al., 2017).

Services for trauma survivors are organized in a similar way in the three German-speaking countries. Non-governmental organizations play an important role in the psychosocial response to disaster and other mass incidents. Some of them also provide care for survivors of individual trauma in the form of local 'crisis intervention units' that closely collaborate with other emergency services. Specialized counselling agencies, usually funded by the local municipal authorities, offer low-threshold services for survivors of childhood abuse, sexual assault and domestic violence. In all three countries, there are also growing networks of clinical outpatient services for survivors of interpersonal violence that are frequently located at psychiatric hospitals. Psychotherapists in private practice play an important role for the treatment of posttraumatic disorders in both children and adults. Moreover, in each of the three German-speaking countries, a larger number of hospitals offer specialized inpatient care for patients with posttraumatic disorders.

The German-speaking Society for Psychotraumatology (DeGPT), the common trauma society of the three German-speaking countries (Germany, Austria and Switzerland), has developed curricula for the training of professionals in different settings (e.g. staff in counselling services, psychotherapists for children and adults) in trauma-related practices. The curricula for psychotherapists have been recognized by important national bodies, like the national chambers of physicians and psychotherapists in Germany. At present, about 50 training institutes in Germany, Austria and Switzerland offer the curricula. The society also coordinates the national German guideline for the treatment of PTSD. Such activities have contributed to the dissemination of evidence-based practices in different settings. However, as in other European countries (Kazlauskas et al., 2016), many psychotherapists still do not feel competent to deal with traumatized populations. As a result, patients can face substantial problems to find adequate help, for instance in the form of trauma-focussed interventions for individuals with PTSD.

The prevention of trauma in different settings remains a challenge. Recently, initiatives in all three German-speaking countries addressed the problem of institutional violence, e.g. in foster care settings, but more efforts are needed to sustainably implement preventive efforts and bodies like the independent commissioner into childhood sexual abuse in Germany (Bergmann, 2011). The dissemination of trauma-informed practices in all parts of the health care system and the social sector is another urgent issue. Finally, the provision of adequate care for the considerable number of migrants from contexts of war and persecution in the German-speaking countries is a challenge for the years to come.

7. Psychotraumatology in Italy

Trauma permeates the history of Italy: war, terrorism, major mass disasters, abuse and maltreatment deeply affected the Italian society across time and generations. During the Second World War, many Italians experienced the effects of torture and deportation leaving a scattered society (Favaro, Rodella, Colombo, & Santonastaso, 1999). In the 1970s, the Italian society faced the 'dark period' of *Brigate Rosse*, a terroristic group who caused many deaths and created a deep sense of fear in the population. Domestic violence is the most common crime against children; indeed, child abuse and maltreatment is a major public health problem. A recent report (Autorità Garante per l'Infanzia, CISMAI and Terre des Hommes, 2016) revealed that each year 950 children are exposed to sexual abuse. In the past year, the percentage of maltreatment and abuse increased by 6%. Italy has also experienced a significant number of natural disasters, like floods and earthquakes, that potentially increased the prevalence of post-traumatic syndromes in the communities. There are no robust data about the actual burden of such traumatic experiences and their effects on the society today.

Italian health and social care systems have not yet fully embraced a trauma-informed approach. This led to fragmented responses to the needs of survivors, especially in terms of preventive initiatives. There is some resistance to implement routine screening and assessment tools for the early detection and prevention of post-traumatic syndromes. For this reason, the system responds late and mainly to traumatization that became complex as a result of missed accurate diagnoses. It is a challenge to acquire a systemic vision of care for traumatized populations, with shared policies and protocols.

Exposure-based therapies are rarely used; EMDR is the only widely implemented intervention in the social care system at all levels. Other trauma-focused therapies (Ehring et al., 2014) – such as trauma-focused CBT or Narrative Exposure Therapy (NET; Schauer, Neuner, & Elbert, 2011) – struggle to be disseminated. Clinicians are asked to integrate different treatment approaches with a good understanding of assessment and psychoeducation techniques. Training of health and social care professionals is a key issue. In Italy, trauma is still seen as a 'psychologist/psychotherapist business', undermining the importance of multidisciplinarity. Furthermore, a synergy between clinical work and research should be

promoted to investigate the outcomes of treatment and to adapt service models accordingly.

There are a few important strategic points the Italian Society of Traumatic Stress Studies (SISST) should consider for the future. Highly traumatized migrants and refugees are one of the priorities requiring a long-term preventive plan to fight longer-term consequences for the society. The second point is the promotion of a more articulated reasoning about the implementation of evidence-based therapies. Furthermore, epidemiological studies are warranted to determine the actual prevalence and incidence of traumatic events in Italian society. Finally, another crucial issue is a comprehensive training in psychotraumatology. The new ESTSS certification represents a good opportunity for trauma-informed capacity building initiatives in the near future.

8. Psychotraumatology in Lithuania

The burden of trauma in Lithuania was largely influenced by the political situation in Europe in the twentieth century. Large-scale traumas associated with the two World Wars, the Holocaust and the prolonged Soviet occupation had a significant impact on the Lithuanian population, marked with suffering and oppression for several generations. Interest in trauma and trauma research in Lithuania was started soon after the collapse of the Soviet Union in the 1990s and several studies explored posttraumatic effects of political violence in the country (Kazlauskas & Zelviene, 2016).

Survivors of traumatic events can seek treatment for mental disorders in the public mental health care system, which includes about 100 primary mental health centres spread across the country, and in more severe cases in psychiatric hospitals. Several non-governmental organizations and crisis centres in the biggest cities in Lithuania are providing help for survivors of interpersonal violence, including psychosocial support and psychotherapy. Additionally, psychotherapists in private practice are also available for trauma survivors. Despite these positive developments, care organizations for trauma survivors are not developed in Lithuania and evidence-based trauma-focused treatments for trauma survivors are not available in the public mental health care system.

Mental health professionals are increasingly aware of the negative effects of trauma on individuals and are interested in learning new ways to help trauma survivors. There is significant progress regarding the implementation of evidence-based trauma-focused treatments, such as EMDR and BEPP, in Lithuania recently. The numbers of therapists trained in trauma-focused treatments are growing, but these treatments are not offered in the public health care system and are available predominantly in private practice which is expensive and not covered by national health care insurance.

Despite the high prevalence of traumatic experiences in Lithuania (Kazlauskas & Zelviene, 2016), it was reported that PTSD is not identified in the Lithuanian national health care system (Kazlauskas, Zelviene, & Eimontas, 2017). The lack of acknowledgment of trauma and PTSD in Lithuania is a major barrier for the development of treatments for trauma survivors in the country.

Future directions of the trauma field in Lithuania include ensuring access to evidence-based treatments for trauma survivors. There is a need of trainings for practitioners to update their knowledge about the impact of trauma, with a particular focus on how to diagnose stress-related disorders and how to provide trauma-focused treatments. Finally, health care and social policy changes on the national level are needed to acknowledge trauma survivors and include evidence-based treatments in the health care of survivors exposed to various traumas, particularly children and adolescents. The Lithuanian trauma society is taking an active role in raising awareness about the effects of trauma to facilitate the further development of care for trauma survivors.

9. Psychotraumatology in the Netherlands

The Second World War marks the largest historical burden and the starting point for psychotrauma care in the Netherlands. Occupation by German and Japanese (in the former Dutch East Indies) armed forces and subsequent post-colonial wars led to over 250,000 military and civilian lives lost. Public awareness for the psychological effects of wartime and other traumatic experiences started around 1975, with the awareness of the Holocaust. In response, Foundation Center ’45 was funded, first focusing on Second World War concentration camp survivors, but soon extending their services to other traumatized populations. The focus on post-war reconstruction, tensions between interest groups and an emphasis on heroics and the resistance, together with a poorly developed mental health care, contributed to this late societal response (Vermetten & Olff, 2013). Subsequent national and international disasters, such as the 1992 Bijlmermeer airplane disaster and the 2000 Enschede fire explosion, further increased professional and public awareness of psychotrauma, and fuelled the establishment of the Dutch Society of Psychotraumatology in 2006.

Mental health care for trauma-related disorders is covered by health insurance at little or no additional personal costs. Facilities for trauma care have been integrated at many levels of health care. Routinely, the first step for individuals with trauma-related symptoms is to consult their general practitioner for referral to secondary health care organizations.

A national standard of care for trauma- and stressor-related disorders is currently underway (Kwaliteitsontwikkeling GGZ, 2018).

Trauma-focused treatment is increasingly offered next to interventions directed at emotion regulation, day-night structure and social support (Vermetten & Olff, 2013). Examples are EMDR, CBT, NET, BEPP and Imagery Rescripting. There is a growing role for E-health interventions (e.g. Olff, 2015). Some institutions use treatment intensification (EMDR or CBT), with preliminary positive effects (Van Woudenberg et al., 2018; Zepeda Méndez, Nijdam, Ter Heide, van der Aa, & Olff, 2018). Although not yet implemented, other treatment innovations include hormonal enhancers (D-cycloserin, cortisol, oxytocin; e.g. Thomaes et al., 2016).

Effective treatment for PTSD due to events in adulthood in fairly well functioning patients seems available, as well as special services and care for the military and the police. One of the greatest practical challenges are the long waiting lists in secondary mental health care, limiting accessibility to care for vulnerable patient groups, such as individuals with multiple (childhood) traumatization, patients with severe physical, neurocognitive and/or psychiatric comorbidities or severe psychosocial problems, and (asylum seeking) refugees. The latter in particular experience difficulties accessing evidence-based care due to stigma, requirement of referral by general practitioners, and language and cultural barriers. Moreover, research on the (cost-)effectiveness of treatments for these target groups is relatively lacking (e.g. Sijbrandij et al., 2017), as well as on improving symptom recovery and treatment adherence of current PTSD treatments.

Topics which should be urgently addressed in the future include improving treatment outcome for specific target groups, i.e. patients with childhood trauma; implementing treatment for target groups that are currently excluded from regular PTSD treatments; family- or system-oriented interventions to prevent inter-generational consequences of trauma and enhance opportunities for social support; evaluation of e-mental health interventions for PTSD and comorbid disorders, including blended treatment options administered within routine clinical practice; increased use of transdiagnostic treatment options for trauma-exposed patients targeting a variety of psychopathology limiting psychosocial functioning; and the use of low-intensity interventions, carried out by non-professional helpers to increase coverage of mental health interventions.

10. Psychotraumatology in Poland

The recognition of the socio-psychological consequences of the Second World War in Poland is an extremely important issue. Poland belongs to the part of Europe which Snyder (2010) called the 'Bloodlands'. The number of ethnic Poles and Polish Jews who died or were murdered in connection to the Second World War amounted to about six million. Poland lost about 17% of its pre-war population (Materski & Szarota, 2009). Moreover, the Soviet invasion and the subsequent imposition of a communist regime led to large groups of people being persecuted. Many survivors of the war (e.g. resistance movement members, people deported to Siberia) were not even recognized as survivors, and speaking about many aspects of war experiences could lead to prosecution. Very little attention has been paid to Second World War issues in medicine and psychology, in comparison to the volume of analogous research in western countries (Lis-Turlejska, Szumiał, & Drapała, 2018). Psychological help for survivors of the war was practically absent, and the need is still not recognized today. Since the collapse of communism, neither war nor other traumas have been recognized on a broader scale. Research has been conducted on the consequences of the great flood of 1997 (Strelau & Zawadzki, 2005), however, other traumatic events, including the death of the president and other governmental officials in the Smolensk plane crash in 2010, have not yet been the subject of psychological research.

There is no coherent care system in Poland for survivors of various traumatic events. A number of crisis intervention centres provide help for 'families in crisis' – mainly for survivors of domestic violence (www.spoleczenstwoobywatelskie.gov.pl). There are non-governmental organizations working with survivors of trauma (e.g. battered women, abused children, survivors of crime). However, they are all underfunded and their capacity is limited. Access to psychotherapy under national health insurance is also limited. Despite the fact that there are many psychotherapists working privately, mainly in larger cities, there are still very few professionals who are specialized in psychotraumatology.

Crisis intervention is probably the most widely offered help to trauma survivors. Practitioners have the opportunity to be trained in different approaches in psychotherapy, including CBT, prolonged exposure therapy and EMDR. However, there is no clear emphasis on evidence-based treatments and they are not widely used in practice. There is also a lack of research on the effectiveness of trauma therapy. The issue of prevention is neglected in general, except training for professional groups (e.g. flight crews, emergency services).

Currently, the most important challenge is to increase access to professional care, specifically increasing access to therapists who offer evidence-based interventions. However, education of the general population about the importance of help seeking and potential benefits out of it is also crucial. It is necessary to further develop research on the

psychosocial consequences of both the Second World War and other large-scale traumatic events. It is also important to encourage the teaching of contemporary curricula on abnormal psychology, including content specific to trauma. This seems to be the most urgent task, alongside further development of the trauma care system and promotion of good practices in psychological care and psychotherapies for trauma survivors.

11. Psychotraumatology in Portugal

A colonial war of 13 years has left to Portugal an individual and collective traumatic heritage (Maia, McIntyre, Pereira, & Ribeiro, 2011). The consequences remain to this day through the intergenerational transmission of trauma (Dias, Sales, Cardoso, & Kleber, 2014). Throughout the years, clinicians, academics and other professionals discussed the psychosocial consequences and reactions to this trauma. Later, the coordinated response to two major accidents promoted a national approach to survivors of crisis and disaster. In 2009, the Centre for Social Studies of the University of Coimbra created the Centre of Trauma (CT), a society that brings together the country's leading organizations who directly deal with potentially traumatic events. Since 2010, CT is a full member of ESTSS.

In Portugal, the National Authority for Civil Protection provides central technical guidance to the organizations who deliver services to survivors of disasters or catastrophes. It is a governmental entity which coordinates the interventions developed and implemented by the different professional groups and organizations (fire fighters, medical emergency services, etc.). Clinical care to trauma survivals is provided by the National Health Service in the first place, but in cooperation with organizations (both non-governmental and governmental) who are specialized in trauma therapies and relevant psychosocial interventions. There is a core team of trained and certificated psychotherapists within CT whose service is accessible to people in need.

The most widespread therapy methods in Portugal are CBT, EMDR, Psychodrama and brief supportive psychotherapeutic strategies. Psychopharmacotherapy is also frequently used alone or in combination with psychological interventions. Treatment takes place in public and private health institutions. A number of governmental and non-governmental organizations currently invests in building the capacity of their staff in trauma care and designing and implementation of preventive interventions. CT is responsible for regular organization of conferences, seminars and the delivery of a biannual psychotrauma course. The course equips professionals from different fields with relevant knowledge and skills.

Professional and organizational preparation and knowledge to treat trauma consequences at the individual, family and social level needs to be optimized and updated. Minorities and refugees at risk may benefit from more integrated assistance. The ability to effectively respond to disasters and catastrophes through the provision of acute trauma care and coordination among the different organizations that are involved in disaster management has to be improved. There is room for improvement regarding the identification of populations at risk, screening for trauma related disorders and responding to the needs of the health care system. Family doctors and nurses, firemen and other professional groups have to be trained to assure their trauma-informed professional performance.

The topics to be addressed in the near future include creating a national plan for PTSD prevention and psychosocial interventions in case of crisis and disaster, as well as founding a network for specific treatment responses to trauma-related disorders, namely PTSD. Good practices have to be disseminated and young researchers and clinicians need to be motivated to work in the field of psychotraumatology. Finally, more effective and organized strategies to address potentially traumatic contexts such as unemployment, marital violence, cyber bulling and road accidents need to be developed, and the cooperative and coordinated work with national and European entities needs to be further increased.

12. Psychotraumatology in Sweden

The Swedish population has enjoyed peace for over 200 years. For a long time, the country did not experience the same increase in attention to psychotraumatology as other European countries with afflicted veteran soldiers from the nineteenth century wars. The impetus for trauma-informed services has instead come from disasters, large accidents and the increased attention to interpersonal abuse. A harrowing bus crash involving 12-year-olds on a school trip in 1988 (Arnberg et al., 2011) became the initiating event for the public organization of crisis support after large-scale events. Events such as the 1994 Estonia ferry disaster in the Baltic sea (e.g. Arnberg, Hultman, Michel, & Lundin, 2013) and the 2004 Southeast Asia tsunami (e.g. Michélsen, Therup-Svedenlöf, Backheden, & Schulman, 2017), both leading to hundreds of Swedish casualties, as well as the recent deployment of Swedish peacekeeping forces around the world, have highlighted the psychosocial consequences of trauma. More recently, the refugee crisis has set off many activities related to culturally informed trauma services.

In Sweden, every municipality has a psychosocial crisis team and there are psychosocial disaster contingency teams at the larger hospitals. A major step forward was the legislation passed in 2000 that

mandates employers to ensure that they have adequate knowledge of and plans for crisis support for their employees. Beyond the acute crisis support, however, access to qualified treatment of chronic traumatization varies across the country. In some regions there are dedicated trauma clinics; in others, there are trauma teams within the psychiatric services. Some regions lack both dedicated trauma clinics and teams.

The acute crisis interventions that are available in Sweden include Psychological First Aid, various forms of unstructured crisis support and a variety of debriefing methods including psychological debriefing (Witteveen et al., 2012). As for the treatment of PTSD, the Swedish National Board of Health and Welfare issues guidelines for public health care. In their latest guidelines from 2017 (The Swedish National Board of Health and Welfare, 2017), trauma-focused psychological treatments were given the highest priority; selective serotonin reuptake inhibitors (SSRIs) were prioritized as a potential but not necessary option for adults with PTSD, although they probably are the most widely used treatment in the country.

Several challenges lie ahead. The use of ineffective preventative interventions remains and the provision of psychosocial support beyond the acute phase is very limited, partly due to compartmentalized organizations. Further development of acute interventions in health care would benefit from robust evidence for early interventions. Trauma-related problems in patients too often go undetected in health care assessments (Al-Saffar, Borgå, & Hällström, 2002). In addition, access to prioritized treatments is underdeveloped in many parts of Sweden: the concentration of relevant competence in metropolitan areas is a salient issue in this country due to its large rural areas.

Another challenge related to the treatment of PTSD is that a large proportion of therapists are due for retirement in the next five years. It will become important for the field to continue to attract younger professionals. It is hoped that a stronger professional community, aided by the Swedish Society for Psychotrauma, can prevent fragmentation of the many regional initiatives, particularly in light of the many refugees across the country, and serve as a force for increasing the quality of and access to trauma treatments.

13. Psychotraumatology in Ukraine

The historical burden of trauma in Ukraine mainly consists of man-made catastrophes. They include the famines in the years 1933 and 1947, the Second World War, the explosion of the Chernobyl nuclear power station, and the current military conflict with Russia, which is officially called 'Anti Terrorist Operation (ATO)'. All events that happened during the Soviet times were hushed up and psychological support has never been provided to the people in need. It was not until the Maidan revolution and the beginning of the current war that psychological services in Ukraine were organized for victims of mass violence.

In Ukraine, care organizations for trauma survivors are currently under development. It presupposes an effective coordination of governmental and non-governmental organizations and professional institutions. The non-governmental organization Ukrainian Society for Overcoming the Consequences of Traumatic Events (USOCTE) was created to reach that aim. This professional organization aims at the development of crisis intervention services as well as capacity for provision of trauma-focused psychological therapies in Ukraine, in accordance with the international standards. Currently, USOCTE provides psychological help to wounded ATO soldiers and veterans, as well as other people who suffer from consequences of the ATO: those living in the ATO zone, internally displaced persons, families of killed soldiers and participants of the Maidan revolution. USOCTE is also engaged in developing training programmes for psychologists and psychoeducational materials for the general population. The methods used in trauma care are EMDR, CBT and the SEE FAR CBT treatment protocol of the Israeli coalition of trauma.

These treatments are offered in a strictly structured way. All clients sign an agreement, which determines the focus of the therapy. According to that agreement, a client has a right to attend 12 free-of-charge sessions. The first sessions are devoted to a detailed diagnostic interview, psycho-education on the signs and nature of posttraumatic disorders and providing information on therapeutic approaches. The following stabilization phase is intended to create a sense of safety by means of different techniques. It is followed by the trauma-focused interventions mentioned above. The final phase of treatment has the aim to integrate the experiences into daily life, assess the results and adapt to the achieved changes.

Challenges in this work are the very high level of psychological disturbance among the people living close to the conflict zone, and their reluctance to acknowledge this and to ask for psychological support (Roberts et al., 2017). It should also be mentioned that women are especially vulnerable on the front-line territory, and suffer multiple problems including high levels of psychological violence. These problems are often not recognized and the population has a tendency to believe that the end of military activities will solve all problems.

To overcome the consequences of the current military conflict in Ukraine, USOCTE is confronted with a number of tasks. They include building up a multilevel system of psychological assistance with the support of governmental and non-governmental organizations as well as monitoring and evaluating the activities of specialists in the psychological field on a regular basis. Moreover, the local communities need to be involved in supporting the aggrieved. Finally, there is a need for a more intensive cooperation and sharing of experiences with international organizations.

14. Psychotraumatology in the UK and Northern Ireland

The 2014 Adult Psychiatric Morbidity Study (APMS) provides the most comprehensive estimates of PTSD within the UK, although the sample is of English residents only (Fear, Bridges, Hatch, Hawkins, & Wessely, 2014). APMS found a PTSD prevalence of 4.4%, with similar rates observed between men and women. PTSD rates in women declined with increasing age; 12.5% of 16–24-year-old women had PTSD. In contrast, in men PTSD remained roughly consistent until declining from age 65. Northern Ireland (NI) has historically experienced a sustained period of political conflict known as the Troubles. The NI Study of Health and Stress identified that NI has one of the highest global rates of PTSD with lifetime and 12 month prevalence rates of 8.8 and 5.1%, respectively (Bunting et al. 2013). Lifetime prevalence in NI females (11%) was substantially higher than the rates in NI men (6.4%). Although there is no specific information on prevalence rates in Scotland and Wales, it is anticipated they are similar to English rates.

The UK's mental health services are provided by the National Health Service (NHS). Although regional variations exist, the first point of access is via family doctors. Community services, often available via self-referral, typically treat survivors of single incident traumas where a diagnosis of PTSD is present without co-morbid problems (e.g. substance misuse). Treatment of more complex cases (e.g. survivors of child abuse, refugees, etc.) is via specialist mental health teams. NHS treatment complies with best practice guidelines compiled by the National Institute for Health Care and Excellence. A range of other non-governmental organizations exist that are staffed by qualified health professionals and offer support to sub-populations of trauma survivors (e.g. survivors of domestic abuse, veterans, etc.). In NI, a Regional Trauma Service is under development to address the mental health legacy of the Troubles.

Interventions to treat PTSD in the UK are typically trauma-focused psychological therapies such as, but not limited to, trauma-focused CBT, EMDR and prolonged exposure (NICE, 2005). In addition, psychopharmacology support is given to manage co-morbid mental health presentations. Increasingly, e-technologies are being developed to help provide cost-effect support that also promote accessibility. For example, an online guided self-help tool for PTSD has been developed and internet-based video technologies have been successfully used to deliver PTSD treatments with much reduced therapist time required. Some providers also utilize compressed therapy where 16–-20 hours of TF-CBT are delivered over a week.

Currently, whilst there is often some delay in accessing specialist mental health assessment services, the biggest bottleneck is in the provision of specialist services for more complex cases of PTSD. Also, whilst APMS has shown that help-seeking for PTSD is improving, the majority of people with PTSD in the UK still do not seek any help.

Whilst, the UK has made considerable efforts to improve the public understanding of mental health, more needs to be done. Additionally, organizations which routinely expose staff to trauma (such as the emergency services, military and child social workers) need to address the issue of PTSD as a result of chronic trauma exposure as there has been limited work done on this topic.

15. Conclusion

The perspectives above show that important steps towards a better provision of care for survivors of trauma have been taken in the European countries. Given the cultural and economic diversity of the continent, there are still some differences between the countries, for instance with regard to the use of evidence-based treatments. Effective treatments have many elements in common (Schnyder et al., 2015) and the treatment of choice is often based on culture and history. The dissemination of evidence-based knowledge and skills has always been a priority of ESTSS (Ajdukovic, 2013, Bisson, 2013, Olff, 2013) and further strategic steps towards this aim have been made recently. In 2018, the first of a series of new ESTSS curricula, the 'Advanced Training in Treating Posttraumatic Disorders in Adults', was approved by the board. The curriculum comprises 120 hours of training and 20 hours of case supervision. It has a strong focus on evidence-based approaches and provides knowledge and skills for the treatment of acute stress disorder, non-complex PTSD and complex posttraumatic disorders (for more detail see www.estss.org). The curriculum has already been adopted by several member societies who are building up local structures to offer the trainings or adopt their national curricula to meet the requirements of the ESTSS curriculum. Other

curricula, for instance for the treatment of trauma-related disorders in children and adolescents, and more basic curricula to promote the idea of trauma-informed care among different groups of professionals, are currently being developed.

The country reports presented in this paper show that many countries share similar challenges and have topics in common that need to be addressed. These topics include, among others, the prevention of trauma, the promotion of trauma-informed practices in the whole health care system and standards of care for groups with special needs, including refugees and internally displaced people. Of increasing importance in the field of mental health is the involvement of trauma survivors in mental health care teams (Van der Schrieck-De Loos, 2013). It was beyond the scope of this paper to describe the large amount of research in the field of psychotraumatology in the European countries, which represents a significant proportion of the global research activities in this field (Olff, 2018). However, similar to the differences with regard to the use of evidence-based treatments, these activities are not evenly distributed between the different European countries. It is part of ESTSS's mission to stimulate and promote research Europe wide.

The current structure of ESTSS allows for a more direct exchange between the member societies and thereby provides the opportunity to effectively address such common issues. It has always been the aim of the society to provide a platform for all professionals in Europe in the field of psychotraumatology to connect, to develop together training and research, guidelines and actions where needed. ESTSS is constantly working towards this aim, for instance by identifying successful models in individual countries or regions and disseminating these experiences among all others. A recent example of this exchange is a series of movies providing information on the consequences of trauma and effective treatments tailored to the needs of the public, professionals from the health care system and trauma survivors that can be downloaded from the ESTSS website. They were developed by a national society (DeGPT) and translated into 10 European languages with the help of other member societies.

ESTSS can look back on 25 years of advocacy for the field of psychotraumatology in Europe. The first European Conference on Traumatic Stress, which can be considered one of the roots of ESTSS, was held three decades ago (Ørner, 2013). During these years, ESTSS has developed a unique profile as a truly international professional society that integrates the diversity of the European countries and greatly benefits from their cultural richness (Lueger-Schuster, 2013a; Olff, 2013). An important part of the society's success story are the ESTSS conferences that attract delegates from all parts of the world. Other important activities included projects like the European Network of Traumatic Stress (TENTS; Bisson, 2013) and the *European Journal of Psychotraumatology* (EJPT). EJPT has become an important platform for the dissemination of knowledge related to psychological trauma and, thanks to the relentless efforts of its founding editor Miranda Olff, has become one of the journals with the highest impact in the field (Olff, 2018).

Over the years, ESTSS had fruitful collaborations with large societies from other regions of the world. There is also a strong involvement of ESTSS in the global collaboration of trauma societies, an initiative that had initially been proposed by the International Society for Traumatic Stress Studies (ISTSS; Schnyder et al., 2017) and developed to a collaboration of all large trauma societies on an equal basis. It already has the function of a global umbrella for defined projects and holds promise to become a more formal global structure.

Only about half of the more than 40 countries on the European continent have established local trauma societies so far, most of which are members of ESTSS. In the coming decades, it will remain one of the most important aims of ESTSS to support the formation of new societies in countries where they do not exist yet, and to provide a common platform and a professional home for trauma specialists from the whole European region.

In their articles at the occasion of the twentieth anniversary of ESTSS, several former presidents described what some of them called the 'infancy and adolescence' of the society (Schnyder, 2013, Turner, 2013). At the age of 25 years, ESTSS has become a young adult. The society has 'grown up' and, with the latest change of its structure, has completed a developmental process that made it stronger and prepared it for the tasks ahead. This would not have been possible without the enthusiasm of a large number of dedicated colleagues from all over Europe. They invested their time and energy over the last 25 years to make the society what it is today. We congratulate ESTSS on its 25th birthday and strongly believe that it will successfully continue its 'adult life' for the good of psychotraumatology in Europe.

Acknowledgments

We wish to thank the Elfriede Dietrich Foundation, Freiburg, Germany, for supporting the production of the movie series 'Through memories – the road to trauma therapy' and the translations to a range of different European languages.

MODULAZIONE DELL'AROUSAL, MEMORIA PROCEDURALE ED ELABORAZIONE DEL TRAUMA: IL CONTRIBUTO CLINICO DEL MODELLO POLIVAGALE E DELLA PSICOTERAPIA SENSOMOTORIA

Giovanni Tagliavini

Centro di Salute Mentale, via San Carlo 7 – Arona (NO)

Riassunto

La disregolazione degli stati emozionali e di *arousal* (attivazione corporea) è un problema ubiquitario, spesso grave nei pazienti con traumi complessi e puo' essere considerata uno dei segni distintivi di avvenuta traumatizzazione. Le radici profondamente somatiche della disregolazione dell'arousal richiedono interventi clinici specifici, non mediati in senso esclusivo dalla parola e che si basino su riflessioni cliniche differenti dagli usuali fondamenti delle *talking therapies*.

In questo articolo si prenderanno in considerazione un vertice di osservazione prettamente neuroanatomico/psicofisiologico (la teoria polivagale di Stephen Porges) ed un vertice clinico/operativo (la psicoterapia sensomotoria di Pat Ogden) che rappresentano due tra le proposte più convincenti per affrontare efficacemente i problemi della disregolazione affettiva e delle "tracce somatiche" rappresentate dalle memorie traumatiche di tipo procedurale.

Parole chiave: teoria polivagale, psicoterapia sensomotoria, trauma complesso, disregolazione dell'arousal, memorie traumatiche, memoria procedurale, elaborazione del trauma

AROUSAL MODULATION, PROCEDURAL MEMORY, AND TRAUMA PROCESSING: CLINICAL INSIGHTS FROM THE POLYVAGAL MODEL AND SENSORIMOTOR PSYCHOTHERAPY

Abstract

Arousal and emotional disregulation is a common and often serious problem in complex trauma patients: it can be considered as one of the most significant signs of traumatization. The somatic roots of arousal disregulation need specific clinical interventions which go beyond the exclusive use of words. These interventions are based on ideas which differ from those coming from the traditional "talking therapies".

In this paper I will focus on two main topics: the first one, Stephen Porges' Polyvagal theory, is more anatomically and psychobiologically oriented; the second one, Pat Ogden's Sensorimotor Psychotherapy, is more oriented to clinical work. Both of them represent convincing and useful approaches that deal with the arousal disregulation and the "somatic traces" of the procedurally-stored traumatic memories.

Key-words: polyvagal theory, sensorimotor psychotherapy, complex trauma, arousal disregulation, traumatic memories, procedural memory, trauma processing

Scopo del presente articolo è presentare alcune osservazioni: a) sull'importanza della disregolazione dell'arousal nei disturbi legati a traumi; b) sul fatto che tale disregolazione rappresenti un segno specifico di traumatizzazione ed una delle manifestazioni del ricordo traumatico, non elaborato e inscritto nel corpo come "memoria somatica" implicita, procedurale; c) sulle possibilità di elaborazione del trauma attraverso una specifica attenzione agli stati di arousal, modulandoli tramite approcci terapeutici specifici, centrati sul corpo.

Nella mia personale esperienza il modello polivagale di Porges e la psicoterapia sensomotoria rappresentano strumenti operativi molto efficaci: il primo come descrizione dei substrati anatomici e delle manifestazioni di regolazione e disregolazione dell'arousal, la seconda come modalità di cura *body-centred* esauriente e convincente per tali tipi di disturbi.

Gli osservatorî dai quali opero sono due: il primo è un Centro di Salute Mentale che permette ancora agli psichiatri (in termini di tempo, riflessione, collaborazione tra colleghi ed équipe multiprofessionale) di agire anche come psicoterapeuti; il secondo è una piccola pratica ambulatoriale privata di alcune ore settimanali. Nella prima situazione gli aspetti sintomatologici legati a traumi si presentano in modo multiforme e trasversalmente a molti differenti quadri diagnostici[1]: solo alcuni pazienti che vedo in tale contesto sono quindi "primariamente post-traumatici" e con disturbi dissociativi; nella seconda situazione clinica mi è invece possibile selezionare situazioni di franchi disturbi traumatici complessi e dissociativi, lavorando in modo più selettivo.

In entrambe le popolazioni di pazienti, si è dimostrato di grande utilità clinica valutare in modo dinamico gli stati di arousal, utilizzando la loro regolazione e disregolazione a scopi terapeutici.

1. Sintomi post-traumatici e disregolazione dell'arousal

Il termine arousal (traducibile in italiano, ma non in modo soddisfacente, con "attivazione" o "stato di attivazione") si riferisce alla possibilità e alle modalità dell'organismo di essere reattivo rispetto a stimoli di varia natura, modificando parametri che sono solitamente misurabili, come la frequenza cardiaca, il ritmo respiratorio, la vasodilatazione e la vasocostrizione, la motilità intestinale, l'increzione ormonale, la conducibilità elettrica della cute, il diametro pupillare, ecc.

La vigilanza, ovvero il "rimanere svegli", è strettamente correlata all'arousal, così come ad uno dei principali substrati anatomici della vigilanza, rappresentato dalla formazione reticolare ascendente (FRA). La FRA è una proiezione verso la corteccia dei centri regolatori dell'arousal che sono collocati anatomicamente nel tronco dell'encefalo, cioè nella parte cerebrale che secondo la descrizione di MacLean di cervello trino (*triune brain*) definiamo protorettiliana, deputata alle reazioni più viscerali di conservazione e di sopravvivenza (MacLean 1984).

Il cervello protorettiliano è capace di reagire in modo rapido a stimoli di tipo pericolo/minaccia; per comunicare con il corpo utilizza il sistema nervoso autonomo o neurovegetativo,

[1] Colgo l'occasione per sottolineare che il problema di una diagnosi formale, più specifica e più sensibile, dei disturbi traumatici complessi e dissociativi in ambiti ad accesso universale come un CSM o un Pronto Soccorso Psichiatrico è ancora un tema aperto, che acutamente necessita di ricerche e di trial clinici, soprattutto per evitare l'utilizzo improprio e superficiale di altre diagnosi (in particolare quella di psicosi e di disturbo borderline di personalità) e di strumenti di cura non idonei.

formato da una parte (orto-)simpatica e da una parte parasimpatica. Ciò può avvenire senza che sia strettamente necessario coinvolgere le strutture superiori, rappresentate dal sistema limbico (o cervello paleomammaliano) e dalla corteccia (o cervello neomammaliano). Tuttavia gli stimoli che raggiungono una sufficiente intensità saranno processati non solo dal cervello protorettiliano nel senso di una modulazione dell'arousal fisiologico, ma anche a livello limbico, nel senso dell'arousal emozionale, e a livello corticale, nel senso dell'attivazione cognitiva e associativa.

Ad esempio, un forte ed improvviso rumore causerà una velocissima attivazione nel sistema simpatico, scatenata dal cervello rettiliano, seguita temporalmente da una emozione di paura (cervello paleomammaliano) attivata dal sistema limbico, seguita da una valutazione consapevole della situazione da parte della corteccia (cervello neomammaliano). È a partire dalla corteccia che iniziano una serie di azioni legate alla valutazione consapevole del livello di pericolosità del rumore percepito: una cosa sarà rendersi conto che il rumore è stato causato da un aereo di passaggio, altra cosa sarà rendersi conto che il rumore è quello del soffitto che sta crollando per un terremoto.

Il cervello in toto si sviluppa nel senso di una ricchissima connettività all'interno di ogni struttura e tra questi tre differenti "cervelli". Si sviluppa anche nel senso di una capacità regolatoria, soprattutto inibitoria, agita dalle strutture superiori su quelle inferiori, come già definito da John Hughlings Jackson nella seconda metà del XIX secolo.

È ormai assodato, anche empiricamente, che l'evento o gli eventi traumatici esercitano il loro potenziale patogeno alterando la reciproca e armonica connessione tra differenti strutture cerebrali, alterando innanzitutto le capacità auto-regolatorie del sistema nervoso sia centrale che autonomo (per una trattazione dell'argomento vedi Frewen e Lanius 2006).

La disregolazione degli stati di arousal è uno dei segni più chiari di avvenuta traumatizzazione. L'evento traumatico acuto causa un sovraccarico imponente e patogeno (meccanismo del "troppo in troppo poco tempo") per i sistemi neurobiologici di regolazione, mediante le note caratteristiche di situazione soverchiante, minacciosa per la vita e che causa impotenza. Anche sistemi biologicamente sani e maturi hanno un punto di rottura: ovvero ogni persona è potenzialmente traumatizzabile all'aumentare dell'intensità dell'evento traumatico (Herman 1992).

Se l'evento accade in età precoce non è necessario che abbia una grande intensità, in quanto il sistema nervoso è ancora in una fase di sviluppo (un neonato ha ad esempio ancora ampie parti di sistema nervoso da mielinizzare) ed eventi "meno traumatici" agiranno comunque in modo traumatizzante. Allo stesso modo, sono da considerare patogeni in infanzia gli eventi persistenti di maltrattamento, i pattern di attaccamento disfunzionale o la trascuratezza grave in quanto interferiscono con l'obiettivo maturativo fondamentale del sistema nervoso: quello di creare connessioni (*wiring*) che permettano un funzionamento il più possibile capace di essere stabile in modo dinamico, riuscendo a rispondere in modo efficace e armonico a vari tipi di stimoli potenzialmente disregolanti.

In quest'ottica, quindi, è traumatizzante ciò che causa una disregolazione cronica, più o meno intensa, dell'arousal fisiologico, emotivo, comportamentale: ciò può avvenire sia attraverso una sorta di "rottura" su sistemi regolatori in precedenza abbastanza maturi, sia attraverso un danno allo sviluppo di tali sistemi (eventi precoci).

L'arousal disregolato causa una dissociazione di aree cerebrali normalmente collegate tra loro, obiettivabile con gli strumenti di neuroimaging (Lanius et al. 2005) e in alcuni casi anche all'EEG (Teicher et al. 1997). Solitamente questa dissociazione è funzionale e transitoria, come ad esempio nei *flashbacks*. Nei casi di grave e precoce traumatizzazione, maltrattamento e neglect,

è ipotizzabile che tale dissociazione abbia anche basi organiche a livello di alterata connettività e sviluppo del sistema nervoso centrale (Perry 2005).

Troviamo all'opera un meccanismo dissociativo nel senso di "non associazione", di mancata connessione tra aree cerebrali deputate (ma impossibilitate) ad elaborare efficacemente lo stimolo, che rimarrà quindi, a vario titolo e in vario modo, memoria traumatica iscritta nel corpo, non processata, "corpo estraneo" non integrabile (Freud 1893-5).

Questi funzionamenti cerebrali dissociati (o non associati) sono stati visualizzati mediante risonanza magnetica funzionale e gli stati caratterizzati da disregolazione dell'arousal nel senso dell'iperattivazione (iperarousal) sono neurologicamente distinguibili dagli stati di ipoattivazione (ipoarousal) (v. infra e cfr. Lanius et al. 2003). In entrambi i casi è compromessa la connettività tra corteccia prefrontale e strutture sottocorticali, con conseguenti problemi di inibizione dell'iperattivazione sottocorticale (in particolare dell'amigdala), difficoltà nella discriminazione dello stimolo e nella mentalizzazione dell'esperienza. L'area di Broca, deputata al linguaggio, risulta inoltre funzionalmente disattivata. Ogni volta che, in seduta, emergono a vario titolo frammenti dell'esperienza traumatica si verificherà nel paziente un riproporsi di questi pattern di funzionamento cerebrale, durante i quali la verbalizzazione non potrà essere un elemento terapeutico efficace, in quanto non è realmente a disposizione, vista la disconnessione prefrontale e la disattivazione dell'area di Broca: da qui l'osservazione già freudiana di non integrabilità (attraverso la parola) di parti dell'esperienza traumatica.

Per ipotizzare di raggiungere tale scopo è necessario percorrere strade che non passino attraverso un'impossibile elaborazione verbale, ma che piuttosto osservino e aiutino il corpo a trovare modalità di elaborazione e integrazione somatica del trauma, visto innanzitutto come fattore di dissociazione e di disregolazione dell'arousal. Se utilizziamo quest'ultimo elemento come marker, la distinzione tra PTSD, o trauma semplice, e Complex Trauma è soprattutto di tipo quantitativo più che qualitativo ed è legata alla valutazione di quanto intensa e pervasiva sia la disregolazione (Ford et al. 2005).

Per questi motivi le terapie orientate sul corpo, come la Sensorimotor Psychotherapy, che identificano nella regolazione dell'arousal uno degli obiettivi di cura principali, sono applicabili ed efficaci rispetto a tutto lo spettro dei disturbi legati a traumatizzazione. Inoltre, a differenza delle psicoterapie "tradizionali", non richiedono in modo obbligato l'utilizzo della verbalizzazione, consapevoli del fatto che una parte profonda dell'effetto patogeno del trauma risiede proprio nel fatto che la possibilità di verbalizzazione è ostacolata.

2. Il modello polivagale di Porges

Secondo la visione neurofisiologica classica il sistema nervoso autonomo viene suddiviso in sistema (orto-)simpatico e sistema parasimpatico. In questo modello i due sistemi hanno funzioni opposte e tra loro equilibrantisi, come i due piatti di una bilancia.

Il sistema simpatico ha funzione attivante e catabolica (utilizzo dell'energia), aumenta l'arousal, attiva le reazioni di orientamento verso il pericolo (focalizzazione dell'attenzione e dello stato di coscienza), predisponendo il corpo alle reazioni dette di "evitamento attivo" come quelle di attacco o fuga (*fight or flight*) mediate da adrenalina e noradrenalina: avverranno quindi tutte le concomitanti reazioni fisiologiche da stimolo adrenergico a partire dall'aumento della frequenza cardiaca. A livello emozionale (limbico) tale attivazione è legata a paura, terrore (fuga) o rabbia (attacco). La situazione di iperattivazione simpatica, detta iperarousal, può arrivare fino al cosidetto *freeze ipertonico* con completo blocco e irrigidimento muscolare, descritto come la

situazione "dell'alce illuminato dai fari della macchina", che resta paralizzato dalla luce improvvisa degli abbaglianti e rimane bloccato in mezzo alla carreggiata, incapace di muoversi.

Il sistema parasimpatico, all'opposto, ha funzioni di risparmio e ripristino dell'energia (anaboliche), diminuisce l'arousal, rallenta la frequenza cardiaca, facilita il riposo e la digestione. Agisce attraverso il nervo vago, a trasmissione colinergica. Facilita i sistemi d'azione dell'attaccamento, della socializzazione e della sottomissione, inibendo le reazioni di difesa a mediazione simpatica. La situazione di iperattivazione parasimpatica, detta ipoarousal, attiva le reazioni dette di "evitamento passivo", con senso di distacco, abbassamento del livello e restrizione del campo di coscienza con *numbing* emozionale e sensoriale. L'ipoarousal può arrivare fino a stati dissociativi franchi con grave alterazione o perdita delle sensazioni somatiche, depersonalizzazione, derealizzazione, perdita di coscienza. Altra reazione da ipoarousal intenso è la cosiddetta immobilità tonica, o "finta morte" (*feigned death*) scatenata da situazioni di estremo pericolo, senza possibilità di fuga, durante la quale l'animale sembra senza vita. Essendo una reazione spesso utilizzata dall'opossum è detta anche "*playing possum*". Tale reazione è presente anche negli esseri umani ed è alla base delle situazioni di totale passività e incapacità di reagire di fronte ad un'aggressione o ad un pericolo vissuto come assolutamente soverchiante e insormontabile. Tale reazione è automatica, non è legata in alcun modo ad una scelta consapevole e non va scambiata per un atteggiamento consenziente di accettazione della situazione di aggressione che si sta vivendo (Clerici e Veneroni 2011; Nijenhuis et al. 1998). A livello emozionale, l'attivazione parasimpatica è correlabile alla colpa e alla vergogna.

Potremmo definire "binario" questo modello classico del sistema nervoso autonomo, mentre Stephen Porges, neuroscienziato e psicofisiologo di Chicago, ha proposto nel 1994 un modello tripartito, detto polivagale, utilizzando dati di laboratorio e seguendo linee di argomentazione che hanno basi di tipo anatomico, filogenetico e neurofisiologico (Porges 2007).

La teoria polivagale presuppone una separazione in due parti del sistema vagale (vedi **tabella 1**). La prima parte è filogeneticamente più antica, viene detta tratto dorso-vagale e nasce dal nucleo motore dorsale del vago nel midollo allungato. Corrisponde, per distribuzione e funzioni, al sistema vagale come descritto dalla neurofisiologia "classica".

Tabella 1. *I tre stadi filogenetici del sistema polivagale (da Porges 2001)*

Stadio filogenetico	Componenti del Sistema Nervoso Autonomo	Funzione comportamentale	Sede dei neuroni motori inferiori
III	Vago mielinizzato (*complesso ventro-vagale*)	Comunicazione sociale, autoregolazione ed effetto calmante, inibisce l'influenza adrenergica del sistema simpatico	Nucleo ambiguo
II	Sistema simpatico-adrenergico	Mobilizzazione (evitamento attivo)	Gangli paravertebrali
I	Vago non mielinizzato (*complesso dorso-vagale*)	Immobilizzazione (evitamento passivo, fino a immobilità tonica/ *feigned death*)	Nucleo motore dorsale del vago

Il secondo sistema, detto ventro-vagale, è presente solo nei mammiferi ed è quindi molto più recente in senso evolutivo. A differenza del sistema dorso-vagale è composto soprattutto da fibre mielinizzate, funzionalmente più efficaci, origina dal nucleo ambiguo e innerva il viso, la laringe e il cuore. Ha una funzione fondamentale nel modulare gli stati affettivi e il comportamento sociale, essendo coinvolto nella mimica e nella regolazione della voce, legandole allo stato neurovegetativo, in particolare alla variabilità della frequenza cardiaca e ad alcune funzioni dell'asse ipotalamo-ipofisi. Diminuisce la reattività del sistema simpatico e dei sistemi di azione legati a difesa, attacco e fuga. Possiamo quindi dire che mediante il contatto con l'altro (vista/voce/udito) il sistema ventro-vagale regola, calmandolo, il sistema simpatico.

Per questi motivi Porges parla delle diverse parti del sistema nervoso autonomo come "substrati filogenetici di un sistema nervoso sociale" (Porges 2001) e, in particolare, definisce l'innervazione ventro-vagale come "*social engagement system*" (sistema di coinvolgimento sociale; Porges 2003). Tale sistema è gia presente alla nascita ed è evidente la sua importanza nella regolazione dell'interazione diadica tra madre-neonato, mediando parte delle modalità di attaccamento.

Poiché il sistema ventro-vagale necessita di maturazione (mielinizzazione), cioé di un ambiente favorevole, è ipotizzabile che la qualità delle cure precoci del caregiver influenzi la qualità del funzionamento futuro dell'individuo anche a livello di regolazione del sistema nervoso autonomo. In effetti, in bambini molto precocemente maltrattati o trascurati sono rilevabili, anche a distanza di anni, alterazioni talora gravi a livello di funzioni viscerali coordinate dal cervello protorettiliano (disregolazione dell'arousal, della frequenza cardiaca e respiratoria, alterate percezioni ed elaborazioni degli stimoli, in particolare fame, sonno, sete, dolore, propriocezione; Perry 2005).

Dal punto di vista dell'interpretazione dei comportamenti, il sistema polivagale propone la presenza di 3 livelli di attivazione (per una analisi più approfondita, con schemi grafici e descrizione delle vie anatomiche e dei neurotrasmettitori coinvolti, vedi Porges 2001):

1) *Situazione di ambiente sicuro:* vi è una prevalenza del sistema ventro-vagale sul sistema simpatico e sul sistema dorso-vagale. Non sono necessarie reazioni di evitamento né di tipo attivo né di tipo passivo. L'interazione sociale è il mediatore fondamentale della modulazione autonomica. Vengono facilitati i sistemi d'azione dell'attaccamento, della socializzazione, del gioco e dell'esplorazione (van der Hart et al. 2006) che permettono una maturazione e una crescita del sistema nervoso, attraverso la neuroplasticità cerebrale, presente anche in età adulta (Doidge 2007);
2) *Situazione di ambiente insicuro:* il pericolo percepito attiva il sistema simpatico, facilitando le reazioni di evitamento attivo, in quel momento adattive in quanto danno la possibilità di attaccare o di fuggire in modo più efficace. Il sistema ventro-vagale viene inibito in quanto le reazioni che media non sono adattive in questa situazione: non serve stare vis á vis con il caregiver se un predatore incombe e mi minaccia. In caso di eccessiva attivazione il sistema simpatico può portare a reazioni disadattive nel senso dell'iperarousal (paura incontrollabile, panico, blocco/*freezing* ipertonico);
3) *Situazione di pericolo di vita:* in tali situazioni le reazioni attacco o fuga non sono una opzione percorribile in quanto la minaccia è soverchiante e insormontabile. Viene facilitata l'antica via vagale (sistema dorso-vagale) con le reazioni di evitamento passivo (sottomissione, *freezing* passivo, *numbing*, dissociazione, immobilità tonica e *feigned death*) che talora possono essere adattive in quanto i predatori tendono a non attivarsi o a non infierire

nei confronti di prede ferme o morte, fino addirittura a non notarle. La iperattivazione disadattiva di tale sistema viene detta ipoarousal.

Da tale descrizione è evidente come il modello polivagale offra una descrizione molto interessante, basata su aspetti neurofisiologici e neuroanatomici, anche quando applicata alla disregolazione traumatica dell'arousal,. Attraverso la tripartizione di Porges è possibile descrivere le reazioni che avvengono durante molte situazioni traumatizzanti e che traumaticamente si ripetono nel corpo ad ogni riattivazione delle memorie traumatiche (sedute di terapia comprese).

Il modello polivagale offre altresì una modalità di comprensione e sviluppo di possibilità terapeutiche legate alla possibilità di "agganciare" il paziente a livello dello stato di arousal che sta vivendo, comprendendone, almeno in parte, manifestazioni e dinamiche. Si possono così proporre modalità di cura *body-centred* e fondate neurofisiologicamente: questo è il caso della Psicoterapia Sensomotoria.

3. La Psicoterapia Sensomotoria (Sensorimotor Psychotherapy) per la cura del trauma

La Psicoterapia Sensomotoria (da qui in avanti, per brevità: PS) è un approccio clinico centrato sul corpo (*body-oriented*) sviluppato da Pat Ogden negli anni '80. Un'importante parte delle radici della PS si fonda, in termini di ispirazione concettuale e di modalità operative, sulla collaborazione avuta con Ron Kurtz, pioniere delle terapie centrate sul corpo e fondatore negli anni '70 della Hakomi Therapy (Kurtz 1997).

La PS presenta grande flessibilità e versatilità clinica e può essere utilizzata come strumento a sé stante oppure in collegamento all'approccio clinico preferito dal terapeuta. È applicabile a molteplici problemi e diagnosi cliniche, dai disturbi di personalità ai disturbi di asse I. Ha ottenuto particolare successo in campo psicotraumatologico, grazie alle solide basi teoriche e alla capacità di rimanere agganciata ai principali caposaldi epistemologici del settore, dandone un'interpretazione e un'applicazione originale ed efficace. I più grandi esperti di trauma a livello mondiale hanno accolto entusiasticamente nel 2006 la pubblicazione del volume Trauma and the Body (Ogden et al. 2006; di prossima pubblicazione la traduzione italiana) nel quale Ogden, Pain e Minton hanno raccolto e sistematizzato i concetti fondamentali della PS e la loro esperienza clinica e didattica.

Come il balletto classico e la meditazione buddista, entrambe praticate per anni da Pat Ogden, la PS presenta aspetti di notevole efficacia, uniti a grande eleganza pratica ed attenzione alle *nuances* del rapporto terapeutico: tutto ciò necessita di un training specifico[2] e di una certa esperienza (anche pregressa) nel clinico, che deve coltivare caratteristiche personali di attenzione, capacità di osservazione, ascolto e *mindfulness*.

[2] Gli standard per il training sono stati fissati dal Sensorimotor Psychotherapy Institute e prevedono 3 livelli di formazione (Livello I: Training per la cura del trauma; Livello II: Attaccamento, Sviluppo e Trauma; Livello III: Training per la Certificazione delle Abilità Cliniche). Nel dicembre 2010 è iniziata a Milano la prima parte del primo corso italiano di Livello I, organizzato da Psicosoma di Michele Giannantonio e Maria Puliatti (vedi Risorse Internet). Nel presente scritto non mi propongo in alcun modo di dare informazioni sulla PS che possano sostituire anche in minima parte un training formale, a cui rimando i lettori.

3a. Psicoterapia Sensomotoria e approccio bottom-up

In un bell'articolo su PS ed elaborazione del ricordo traumatico, Ogden e Minton (2000) affermano che i due aspetti essenziali della PS sono: "1) regolare gli stati emozionali e sensomotori attraverso la relazione terapeutica; 2) insegnare al paziente ad autoregolarsi attraverso il contatto, il *tracking* e l'articolazione dei processi sensomotori attraverso la *mindfulness*".

In una seduta di PS il paziente è invitato dal terapeuta a dare meno importanza al flusso narrativo degli eventi (che spesso per i pazienti traumatizzati sregola intensamente l'arousal), a entrare in uno stato di *mindfulness,* tener conto delle proprie sensazioni corporee (contatto) e, invece che parlarne, a osservarne modalità di espressione, qualità e intensità (*tracking*), permettendone lo sviluppo o in senso libero e spontaneo oppure attraverso piccoli "esperimenti" (articolazione).

La regolazione che il terapeuta offre costantemente attraverso il *social engagement* presente nella relazione diadica permette la creazione di un contenitore nel quale il paziente pian piano scopre che può contattare le proprie sensazioni profonde in modo sempre più sicuro e non minaccioso, fino a sviluppare una capacità di attenzione, osservazione e curiosità per le dinamiche delle proprie sensazioni, emozioni e pensieri, che va sotto la nota definizione di *mindfulness*.

Questo tipo di lavoro è definito, anatomicamente, *bottom-up* (dal basso in alto), in quanto il focus dell'attenzione è basato innanzitutto sugli aspetti "bottom" legati alle manifestazioni del cervello proto-rettiliano (troncoencefalico) in termini di sensazioni, movimenti involontari e impulsi al movimento volontario. Viene preferita un'elaborazione che parte dalle sensazioni e ne studia, a salire, gli influssi sulle emozioni (sistema limbico) e sugli aspetti cognitivi (neocorteccia), al contrario delle "*talking therapies*" tradizionali che invece hanno una direzione top-down (dall'alto in basso), corteccia → sistema limbico → tronco dell'encefalo.

Utilizzare come chiave d'accesso le sensazioni somatiche significa dirigersi direttamente verso le memorie procedurali, cioè verso quelle modalità di funzionamento del sistema nervoso che percepiscono e strutturano il momento presente senza richiedere aspetti consapevoli: l'esempio classico è quello di andare in bicicletta, azione complessa (ciclo a feedback percezione-valutazione-movimento) che solo all'inizio, quando stavamo imparando, era sotto un minuzioso e poco efficace controllo consapevole, ma che poi è diventata via via "automatica", sotto il controllo di memorie procedurali sottocorticali.

Caratteristica nota degli eventi traumatizzanti è la capacità di rimanere inscritti all'interno del corpo attraverso memorie procedurali difficilmente elaborabili, cariche di una sensorialità eccessiva e disregolante: gli aspetti fondanti della PS sono in sintonia con possibilità efficaci di raggiungere ed elaborare, attraverso il corpo, gli aspetti procedurali traumatici.

3b. La finestra di tolleranza dell'arousal e il Modulation Model

La definizione proposta da Siegel (1999) di "finestra di tolleranza" (*window of tolerance*) della regolazione dell'arousal, viene sviluppata in Psicoterapia Sensomotoria aggiungendo una più precisa prospettiva clinica, che Ogden ribattezza "Modulation Model".

Secondo Siegel lo stato di arousal può venire reso graficamente come in **figura 1**: al di sopra o al di sotto delle linee parallele in grassetto vi sono stati di disregolazione (iper- o ipo-arousal), che non portano ad alcuna elaborazione del trauma, ma anzi favoriscono il riesperire traumatico (l' "eterno ricominciare" di Janet) e/o ne sono l'epifenomeno psicofisiologico.

Tra le 2 righe in grassetto abbiamo invece uno stato ottimale di regolazione dell'arousal,

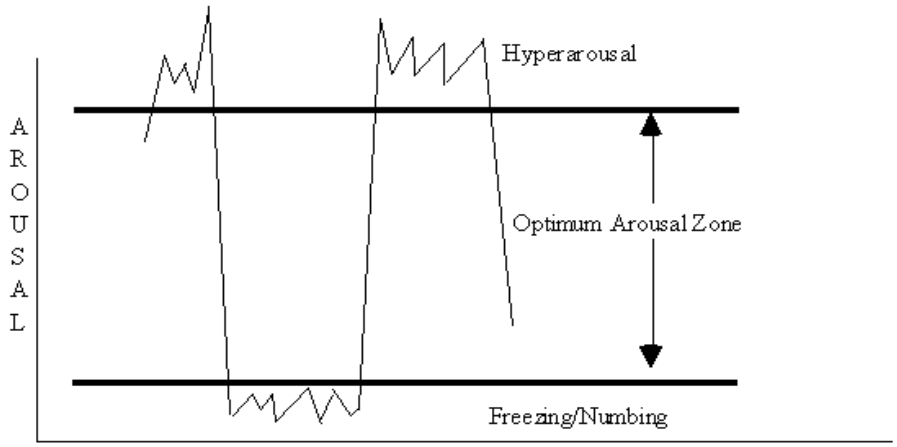

Figura 1. *La finestra di tolleranza (Optimum Arousal Zone), da Ogden e Minton (2000)*

caratterizzato innanzitutto dalla possibilità del soggetto di mantenere un atteggiamento *mindful* rispetto al momento presente, extra- e intra-corporeo.

La parte superiore della figura rappresenta gli stati di iperarousal, nei quali un'eccessiva attività simpatica rende disponibili solo le modalità di evitamento attivo, o di attacco/fuga. La corteccia prefrontale diventa funzionalmente scollegata dalle strutture sottocorticali e non riesce a modularle in senso inibitorio. Il paziente può trovarsi bloccato in sensazioni di paura e terrore, di necessità di fuggire letteralmente dal posto in cui si trova (studio del terapeuta compreso), con tachicardia, sudorazione, agitazione, contrazione muscolare e altri segni di iperattivazione adrenergica. È spesso in questo stato che avvengono i fenomeni di riviviscenza o *flashbacks*, che sono sintomi dissociativi positivi. Il collegamento corticale compromesso e la eccessiva focalizzazione dell'attenzione su aspetti di pericolo imminente impediscono tuttavia l'elaborazione delle memorie traumatiche.

Nella parte inferiore della figura localizzaziamo invece la disregolazione nel senso dell'ipoarousal, con freeze, numbing, dissociazione, immobilità tonica. Il paziente si sente progressivamente o improvvisamente distante, non in contatto, separato dalla presenza dell'altro (terapeuta compreso) da sensazioni varie che vanno dalla vista sfocata, alla presenza di una nebbia o di un vetro trasparente, alla vista telescopica "a cannocchiale". Aumentando di intensità si possono avere sensazioni di progressiva derealizzazione e depersonalizzazione, fino alla autoscopia (visione di se stessi e della situazione dall'esterno del proprio corpo) o a stati confusionali e angosciosi. Se la disattivazione somatica prevale sulla componente dissociativa si possono avere sbadigli, capogiri, nausea, sonnolenza, fino ad uno stato di torpore, di sonno o di collasso/svenimento. La documentazione RMN presentata da Lanius, Hopper e Menon (2003) su uno stato di ipoarousal mostra un cervello quasi completamente "spento", come una città di notte, vista dall'alto durante un black-out.

L'aspetto di non partecipazione, resa, dissociazione e disattivazione rende impossibile una seppur minima elaborazione dei contenuti traumatici che si stanno intensamente manifestando:

è da ricordare infatti che l'ipoarousal rappresenta una situazione di totale sopraffazione, agita dal ricordo o dall'emozione traumatica sui sistemi di difesa, per cui "saltano" sia le possibilità di autoregolarsi attraverso il sistema del *social engagement* (sistema ventro-vagale) che le possibilità offerte dal sistema simpatico (evitamento attivo). Il paziente si trova nella situazione della preda senza via di scampo e, somaticamente, si arrende.

L'ipoarousal si può manifestare subito dopo momenti di iperarousal, secondo la cosiddetta risposta bifasica al trauma, oppure può emergere in via diretta, tramite una disregolazione primaria nel senso dell'ipoarousal. Alcuni pazienti, avendo avuto traumatizzazioni cariche di ipoarousal (confinamento, prigionia, abusi sotto l'influsso di alcool o sedativi) rivivono nuovamente la scena traumatica attraverso la ipoattivazione/disattivazione.

3c. Stabilizzazione, accesso alle memorie traumatiche ed elaborazione

Compito primario di cura è la stabilizzazione (fase 1 della terapia del trauma), evitando che il paziente "esca" dalla finestra di tolleranza. Come succede per una utile cassetta degli attrezzi, la PS offre varie modalità per espandere la finestra di tolleranza, aumentandone l'ampiezza e permettendo così al paziente di avere una maggior tolleranza di sensazioni, emozioni e ricordi e pensieri legati al trauma, riuscendo sempre meglio ad evitare gli stati di franca disregolazione dell'arousal. Una finestra più ampia significa anche la possibilità di mantenere un buon livello di *mindfulness* anche a fronte di sensazioni intense, come quelle evocate dalle componenenti traumatiche.

Obiettivo terapeutico è altresì non rimanere bloccati in un'eterna fase di stabilizzazione e, sviluppando l'idea di finestra di tolleranza all'interno del Modulation Model della PS, Ogden giustamente nota che la zona perfettamente centrale, che sembrerebbe una posizione ideale, è, ai fini dell'elaborazione traumatica (fase 2 del trattamento), una situazione "troppo sicura" (vedi **figura 2**) in quanto permette stabilità, a costo però di rimanere fissati nello *statu quo*, senza progressi.

Questo stato dell'arousal descrive una situazione di sostanziale non elaborazione del trauma che Myers nei primi anni del XX secolo, lavorando con i soldati della prima guerra mondiale, e più recentemente van der Hart e colleghi hanno definito "personalità apparentemente normale", una parte dissociativa della personalità che si prende cura delle faccende quotidiane ma che evita di avvicinarsi e di integrarsi a una o più parti emozionali della personalità che contengono ricordi e sentimenti traumatici (Myers 1916a, 1916b; van der Hart et al. 2006).

Dal punto di vista della PS, se vogliamo favorire momenti di elaborazione delle memorie traumatiche durante una seduta, dovremo lavorare somaticamente in modo che la situazione dell'arousal risulti, mutuando una definizione di Bromberg (2006), "sicura, ma non troppo sicura" (vedi **figura 2**).

Grazie alle possibilità di regolazione tramite la relazione terapeutica precedentemente sviluppate, si lavorerà insieme al paziente per raggiungere la zona ai margini della finestra di tolleranza (sia in alto, al confine dell'iper-arousal, che in basso, al confine dell'ipo-arousal), restando sul "confine", stabilito da un livello di sufficiente *mindfulness*: tale situazione, oltre ad ampliare ulteriormente la finestra, è la più feconda per l'elaborazione dei ricordi traumatici in quanto facilita l'attivazione stato-specifica delle memorie procedurali legate al trauma (Ogden 2009).

La memoria procedurale, detta anche implicita, funziona in modo completamente diverso dalla memoria esplicita, consapevole, detta anche narrativa o autobiografica. Come Siegel (1999) ha ben descritto, la memoria procedurale è rappresentata da stati somatici ed emozionali

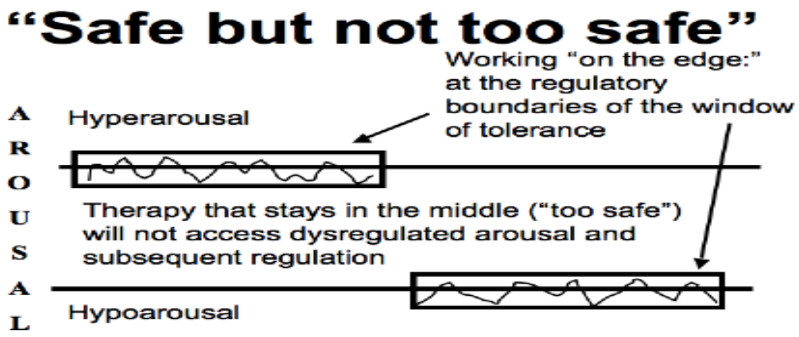

Figura 2. *"Sicuro ma non troppo sicuro": una terapia che resta al centro ("troppo sicura") non riuscirà ad accedere all'arousal disregolato e alle successive possibilità di regolazione. È necessario lavorare "sul limite", ai confini della regolazione della finestra di tolleranza (da Ogden 2009)*

sottocorticali "che non portano con sé la sensazione che stiamo ricordando qualcosa […]: agiamo, sentiamo, immaginiamo senza riconoscere l'influenza della passata esperienza sulla nostra realtà presente".

La modalità stato-specifica di attivazione della memoria (non necessariamente traumatica) è esemplificata da un esperimento abbastanza noto durante il quale è stato chiesto a volontari in uno stato di ebbrezza alcoolica di svolgere quattro compiti mnemonici. I soggetti, tornati sobri, svolgevano male tre compiti su quattro, ma i risultati miglioravano e ricordavano meglio se bevevano nuovamente alcool, se tornavano cioè nel precedente, specifico, stato somatico (Goodwin et al. 1969).

Allo stesso modo, *mutatis mutandis,* possiamo affermare che restando al centro della regolazione dell'arousal ("da sobri") non è possibile avere un accesso completo alla memoria traumatica. Al contrario, nel momento in cui il paziente osserva in modo sufficientemente consapevole e non giudicante (*mindful*) le sensazioni corporee legate ad un ricordo traumatico e raggiunge, senza sregolarsi, uno stato di arousal simile a quello allora sperimentato, si attiva uno specifico pattern psicofisiologico stato-specifico che agisce come la chiave giusta per "aprire le porte" della memoria procedurale legata a quello specifico evento traumatizzante.

Ciò rappresenta una situazione preziosissima a livello terapeutico in quanto potremmo dire che ci si trova di fronte alla memoria procedurale traumatica nella sua interezza, vissuta in uno stato che è plasmabile e trattabile, nella misura in cui si riesca a restare insieme al paziente in uno stato di arousal sufficientemente regolato e si utilizzino strategie specifiche.

Si apre a questo punto la fase di vera e propria elaborazione del trauma (fase 2), che la PS affronta ritornando a Janet e all'idea di "ricordo traumatico come azione incompleta", così come esposto anche da Van der Hart, Nijenhuis e Steele (2006):

> [L'ultimo] obiettivo, forse il più difficile, è completare le azioni con lo scopo di risolvere i ricordi traumatici. I ricordi traumatici sono una forma speciale ed estremamente costosa di azioni incomplete:

"Questi pazienti ... stanno continuando l'azione, o meglio un tentativo di azione che iniziò quando successe l'evento; e si esauriscono in un eterno ricominciare" (Janet 1919/1925, p. 663). La risoluzione dei ricordi traumatici può essere un compito lungo e arduo e necessita di molti passi, piccoli e ripetuti.

Con la sua carica devastante e soverchiante, l'evento traumatizzante ha impedito in passato un pieno ed efficace dispiegarsi di azioni di difesa e di protezione da parte della vittima. La sequenza di tali azioni è rimasta abortita e rimane bloccata in memorie somatiche procedurali, recuperabili nel momento in cui si riattivano stati di arousal specifici. In PS le strategie terapeutiche da utilizzare in questa fase sono raggruppate sotto la definizione di *sequencing* (sequenziamento).

Aiutare il corpo a completare e terminare tali sequenze di azioni porta il paziente a realizzare ciò che Janet (1919) definisce "atti di trionfo", che si concretizzano in movimenti specifici agiti dal paziente. Quando vengono messi in atto con *mindfulness e* all'interno di un adatto contenitore terapeutico *body-oriented* come la Psicoterapia Sensomotoria, gli atti di trionfo hanno un potente, profondo e talora risolutivo effetto terapeutico, altrimenti non raggiungibile.

CTIPP
Campaign for Trauma-Informed Policy and Practice

November 2018 | Number 2 | www.ctipp.org

CTIPP Position on Evidence-Supported Practices and Policies

Why does CTIPP need a position on this issue?

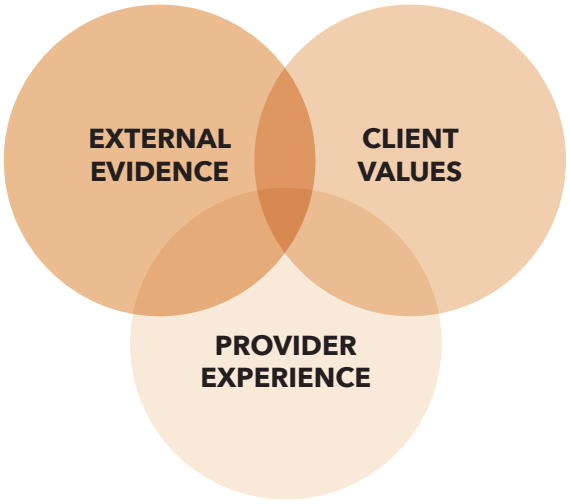
Policymakers and practitioners are often faced with deciding between different options. Scientific evidence is an important criteria for making policy and resource allocation decisions. Even when answers are incomplete, the best course of action is generally to use what we *do* know while we are gathering additional information.

However, real life situations are messy and complicated. Interventions designed to address this complexity are hard to evaluate using traditional methods - controlling the environment, changing one variable at a time, measuring the results, and seeking causal relationships. As a result, much research is conducted on problems and solutions that can be studied in controlled environments. This can skew the evidence base and subsequent policy decisions towards those options. In addition, potentially profitable interventions often receive far more research attention than equally promising interventions that hold less potential for profit.

Moreover, the field of trauma and resilience is in a period of experimentation. The evidence connecting toxic stress and trauma and a range of health and social problems is strong enough to warrant action. Addressing trauma can be beneficial in a wide variety of settings, as can efforts to prevent trauma and build resilience. However, we are not yet in a position to determine exactly what interventions are most effective for what groups under what conditions. Even well-studied interventions have often not been tested in a variety of populations or settings. At this stage, innovative solutions should be encouraged and evaluated as rigorously as possible.

What is CTIPP's position on evidence-supported practices?

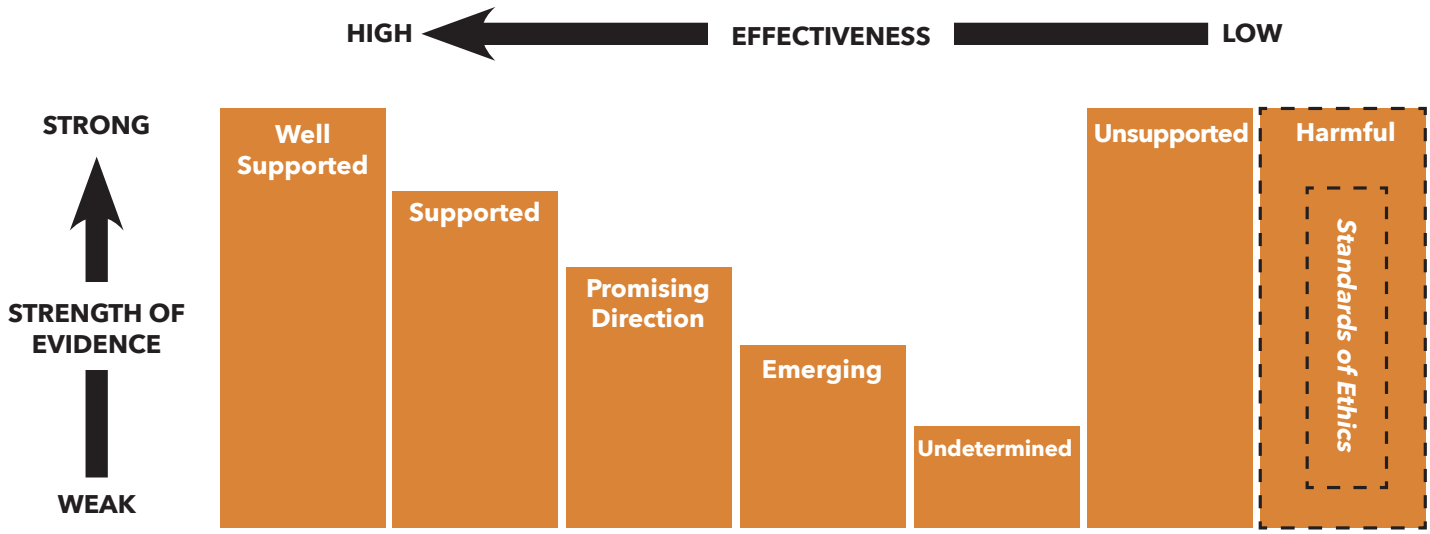
CTIPP understands that evidence-supported practice requires the integration of the current best available evidence with individual practitioner expertise and the values and preferences of service recipients. Clearly, even well-researched interventions will not be successful if providers or service recipients find them unacceptable on other grounds. When funding decisions are being made, CTIPP supports the use of the best available evidence relevant to the context and desired outcomes as expressed by providers and service recipients. When available evidence is insufficient, as determined by a thoughtful and thorough exploration, modification of existing approaches or development of novel strategies is warranted.



Evidence-supported practice requires integration of evidence, provider experience, and client values and preferences.

Evaluation of new or adapted approaches is highly desirable, and should be tailored to intervention characteristics, population served, and setting. Because resources to conduct formal evaluations are not always available, a range of methodologies should be promoted, including collection of experiential evidence from practitioners (sometimes called "practice-based evidence.")

What framework for evidence does CTIPP use?



Centers for Disease Control and Prevention continuum of evidence-supported practices

There are a variety of terms used to indicate different levels of *evidence*, depending on the rigor of evaluation methods used and capacity to rule out competing possibilities. The most common term, "evidence-based practice," indicates that the intervention has been tested for a particular application using the most rigorous design possible in the circumstances. An intervention is called *effective* if it can reliably produce the effect in a given setting. Evidence of effectiveness for one application does not necessarily generalize to others. For example, an intervention found to be effective in preventing addiction relapse is not necessarily effective in preventing people from initiating use. Likewise, a program that is effective with white men will not necessarily work with women or people of color. Since programs vary on both *strength of evidence* and *effectiveness*, CTIPP uses the continuum recommended by the Centers for Disease Control. This continuum shows varying levels of evidence that can be relevant in different situations. It also reminds us to be aware that potentially harmful consequences should always be factored into policy decisions.

> *"Evidence of effectiveness for one application does not necessarily generalize to others."*

What does CTIPP recommend to policymakers?

CTIPP recommends that:

- *Public policy should reflect the highest level of research evidence available* and appropriate for a given application of an intervention in a given set of circumstances, taking into consideration the history and context of the group to be impacted and the desired outcomes.
- *Policymakers should avoid mandating particular program or intervention models*. Instead, local flexibility in selection or development of models consistent with available evidence should be encouraged to allow for cultural, historical, geographic, and resource diversity.
- *If a community determines that available evidence-based programs are not applicable* to their circumstances, a waiver of evidence-based requirements should be available, with appropriate proviso to evaluate the approach that is adopted and sufficient resources to do so.
- *Service recipient values and preferences and provider experience* should be factored into the selection of approaches.
- *Standards for evidence should reflect research methods feasible* for the particular research question, resources available and population involved.
- *New program initiatives should encourage innovation to meet local needs*, and should include funding to gather data on effectiveness, feasibility, acceptance, and utility.
- *Potentially harmful effects* of an intervention should always be considered in making policy and resource allocation decisions.

Eye Movement Desensitization and Reprocessing (E.M.D.R.) e psicoterapia del Disturbo Post-Traumatico da Stress: considerazioni critiche e linee di tendenza

Sito Internet: www.psicotraumatologia.com
Questo articolo è stato pubblicato sulla **"Rivista di psicoterapia Cognitiva e Comportamentale", 2001, 1: 5-23**

Riassunto

L'Eye Movement Desensitization and Reprocessing (EMDR) è una forma di psicoterapia relativamente recente nota soprattutto per la sua discussa efficacia nella psicoterapia del Disturbo Post-Traumatico da Stress (PTSD), ma anche per l'accesa polemica che ruota attorno ad essa. Nel presente articolo viene valutata la più recente letteratura sull'efficacia dell'EMDR nella psicoterapia del PTSD, prestando una particolare attenzione alla comparazione con altre forme di psicoterapia ed alle critiche concettuali e metodologiche che sono state rivolte a questa metodica. Una review della letteratura porta con un ragionevole grado di certezza ad affermare l'efficacia dell'EMDR nella psicoterapia del PTSD. È invece necessaria ancora molta ricerca per dipanare le incertezze relative ai meccanismi specifici sui quali si basa l'efficacia dell'EMDR. Vengono infine accennate alcune attuali linee di tendenza nell'evoluzione dell'EMDR.

Summary

Eye Movement Desensitization and Reprocessing (EMDR) is a relatively recent model of psychotherapy known especially for its controversial effectiveness in Post-Traumatic Stress Disorder (PTSD) psychotherapy, but also for the intense polemic centred on it. In the present article the most recent literature about effectiveness of EMDR in PTSD psychotherapy is evaluated, paying a particular attention to the comparison with other forms of psychotherapy and to the conceptual and methodological criticisms addressed

to this psychotherapeutic approach. A review of literature leads to assert - with a reasonable degree of certainty - EMDR efficacy. On the contrary, extensive research is still required to dispel doubts concerning the specific mechanisms on which the efficacy of EMDR is based. Finally, some of the current trends in EMDR development are mentioned.

Cenni storici

L'Eye Movement Desensitization and Reprocessing (EMDR) è un approccio psicoterapico creato dalla Psicologa americana Francine Shapiro nel 1987. Chiamato inizialmente "EMD", era originariamente concepito come uno strumento utile a persone con Disturbo Post-Traumatico da Stress (PTSD) in quanto l'impiego di determinati movimenti oculari sembrava consentire un rapido ed efficace effetto decondizionante nei confronti delle memorie traumatiche presentate dai reduci di guerra e dalle vittime di stupro. Successivamente la metodica è stata via via affinata concettualmente ed empiricamente, mutando il nome in "EMDR" nel momento in cui la Shapiro si è resa conto che la procedura da lei creata produceva molto di più di una semplice desensibilizzazione, modificando profondamente la rete di informazioni e ricordi connessa al trauma oggetto dell'intervento (Shapiro, 1995). Questa comprensione si è accompagnata ad una più fine articolazione della metodica. L'EMDR, inoltre, si è trasformata progredendo su due versanti: 1) da un lato, con un approccio estremamente pragmatico, ha incorporato al suo interno spunti teoretici ed applicativi provenienti da differenti paradigmi psicoterapeutici allo scopo di potenziarne l'efficacia e la flessibilità (Shapiro, 1995); 2) dall'altro lato, il punto precedente ha consentito l'applicabilità della metodica ben oltre i limiti dell'originario ambito del PTSD.

Attualmente nei differenti Paesi del mondo le persone che hanno effettuato un training organizzato dall'EMDR Institute sono circa 30.000. In Italia i primi corsi

sull'EMDR sono stati condotti nel febbraio 1999 e sono attualmente coordinati dall'Associazione per l'EMDR in Italia[1], a sua volta riconosciuta e patrocinata dalla EMDR Europe.

Il dibattito attuale sull'EMDR

L'EMDR è - per così dire - nell'occhio del ciclone. Sono ormai moltissimi i clinici che la utilizzano, aumentano le pubblicazioni che la riguardano, ma contemporaneamente prolificano le critiche rivolte alla metodica ed alle ricerche orientate a valutarne l'efficacia terapeutica, comparendo saltuariamente toni indecorosi. Probabilmente si tratta di una questione mutifattoriale, ed alcuni degli elementi più importanti coinvolti nella diatriba mi paiono essere i seguenti. Innanzitutto, il dibattito pro o contro l'EMDR sembra avere assunto per molte persone un aspetto ideologico e, si sa, l'ideologia non va d'accordo con la ricerca scientifica. Inoltre, sono state prodotte alcune critiche sulla base dell'applicazione dell'EMDR, ma senza seguire i protocolli previsti dalla ricerca, portando a risultati negativi circa l'efficacia della metodica (Shapiro, 1999). A molti clinici l'EMDR è sembrata una tecnica troppo fredda, meccanicistica e semplicistica, laddove si tratta invece di un approccio creativo alla psicoterapia (Goldwurm, 2000). Altri autori, poi, hanno pensato che si volesse proporre l'EMDR come una psicoterapia magica sempre funzionante in una sola seduta; tale equivoco si è generato probabilmente a causa della prima pubblicazione della Shapiro (Shapiro 1989), laddove l'autrice sosteneva di avere appunto ottenuto risultati importanti nei confronti del PTSD con interventi di una sola seduta nel 100% dei soggetti (risultati, però, mai più replicati). Tale visione parziale dei fatti sarebbe poi

[1] Associazione per l'EMDR in l'Italia, Via Paganini n° 50 – 20030 – Bovisio Masciago (MI), tel/fax

stata ulteriormente avvallata dall'autorevole consenso di Joseph Wolpe (cit. in Butler, 1993; Shapiro, 2000). Una tale concezione eccessivamente magnanima nei confronti dell'EMDR, però, non è certo quella più attuale e condivisa (Shapiro, 1995, 1999). Molto recentemente è stata nuovamente pubblicata una ricerca che compara una singola seduta di EMDR con una singola seduta di intervento comportamentale basato sull'esposizione (Rogers et al., 1999). Questa non fa che fomentare le incomprensioni ed i settarismi, qualunque siano i risultati a cui portano ricerche concepite in questo modo.

Dai fautori dell'EMDR, inoltre, sono anche state pubblicate alcune ricerche metodologicamente dubbie o francamente fragili, che non hanno fatto altro che attirare gli strali dei critici.

Per ultimo, ma non per importanza, è da osservare che un metodo che si propone come più efficace o più rapido nella terapia di alcuni disturbi psicologici e che è supportato da un efficacissimo meccanismo di diffusione commerciale non può non essere valutato come un rivale, soprattutto in una realtà sociale, come il Nord America, dove le spese per la psicoterapia sono pagate dalle assicurazioni.

Alcuni basi teoriche e cliniche dell'EMDR

L'impiego dell'EMDR ha portato la sua creatrice ad adottare come modello esplicativo dei cambiamenti ottenuti quello della *elaborazione accelerata dell'informazione*. Impiegando l'EMDR in psicoterapia, ed in particolare nel trattamento del PTSD, si ha frequentemente l'impressione che la metodica riattivi un meccanismo innato ed ecologico, presente in ogni persona, di elaborazione delle informazioni a contenuto emotivamente pregnante. Il caso ipotetico migliore, quello al

quale la "filosofia" dell'intervento si ispira, è rappresentato dalla situazione in cui il terapeuta rappresenta solamente un *facilitatore* di un processo che il paziente gestisce in modo completamente autonomo, senza interferenze di sorta. Si presume, cioè, che il paziente possieda potenzialmente tutte le risorse necessarie per rielaborare emotivamente e cognitivamente un evento traumatico. In realtà, in molte situazioni cliniche, questo è semplicemente un modello di ispirazione al quale bisogna tendere asintoticamente. Un intervento terapeutico più direttivo e ben più supportato teoreticamente è infatti indispensabile laddove la rielaborazione del target di intervento non proceda autonomamente ed efficacemente (i.e.: Manfield, 1998, Parnell, 1999). A tale scopo, sono state create molteplici tecniche d'intervento che vengono racchiuse sotto l'unico termine di "cognitive interwave", ovvero "intervento cognitivo integrativo". Lo scopo di queste strategie è molteplice: rendere i ricordi emotivamente meno disturbanti e quindi rielaborabili; introdurre informazioni mancanti che producano una differente comprensione degli eventi sui quali si lavora; aiutare la persona a fruire di risorse delle quali dispone ma che risultano di accesso difficoltoso o al momento impossibile; accelerare il processo terapeutico; agevolare cambiamenti terapeutici che stentano a generalizzarsi (Lipke, 2000; Shapiro, 1995, 1999).

La ricerca ha dimostrato come alcuni tipi di stimolazione prodotti dal terapeuta attivino il processo della elaborazione accelerata delle informazioni. In particolare, i movimenti oculari orizzontali generati seguendo il movimento delle dita del terapeuta, sono stati il primo tipo di stimolazione individuata, casualmente, per questo scopo. È per questo motivo che l'EMDR deve il suo nome ai movimenti oculari. In realtà, il prosieguo della ricerca e della pratica clinica sta dimostrando come siano efficaci anche altri tipi di stimolazione alternata, ovvero rivolta contemporaneamente al target di intervento e ad uno stimolo esterno ritmico bilaterale proposto dal terapeuta: altri tipi di

movimento oculare, tamburellamenti sul dorso o sul palmo delle mani, rumori proposti alternatamente ad entrambe le orecchie, l'osservazione di una luce che scorre su una barra luminosa (per una rassegna sulla ricerca sulla stimolazione alternata, Lipke, 2000). L'individuazione di questi dispositivi elicitatori di un'accelerazione nell'elaborazione delle informazioni è certamente la caratteristica distintiva maggiore dell'EMDR, quella che ha attirato l'interesse ma anche lo scetticismo di molti clinici. L'utilità di stimolazioni duali è una scoperta di notevole rilevanza clinica per almeno due motivi: 1) si sono dimostrate notevolmente efficaci e 2) sono provviste di notevole flessibilità. Il terapeuta, infatti, può modificarle molto liberamente adattandole all'andamento del processo terapeutico, sostituendole con altri tipi di stimolazione se ciò è utile a risolvere difficoltà nel processo rielaborativo. Durante la continua calibrazione del processo terapeutico, inoltre, al terapeuta è consentito verificare direttamente o indirettamente l'efficacia del dispositivo impiegato. L'osservazione della comunicazione metaverbale del paziente, unitamente ai riscontri verbali che egli fornisce, sono le fonte sulle quali la stimolazione duale viene continuamente calibrata.

La procedura d'intervento per il Disturbo Post-Traumatico da Stress (PTSD): il protocollo standard per adulti e adolescenti

L'EMDR è nata come terapia elettiva del PTSD ed ha modellato la struttura fondante della propria procedura di intervento (nonché le proprie basi teoriche) su questa patologia. I protocolli di intervento rivolti ad altre patologie (adeguatamente validati o meno) sono l'adattamento dell'originale protocollo per il PTSD. Non si tratta però di un limite metodologico dell'EMDR o di un residuo storico della sua evoluzione. L'EMDR, infatti, è e resta innanzitutto un intervento efficace sugli eventi traumatici o altamente stressanti, e come tale interviene su questi target di intervento adattando le

proprie procedure alle peculiarità con le quali gli eventi traumatici o altamente stressanti si manifestano all'interno delle differenti manifestazioni psicopatologiche. Il trauma, infatti, più che essere connesso in modo privilegiato al PTSD, sembra doversi considerare un elemento trasversale di parte significativa della psicopatologia (Bremner, Vermetten, Southwich, Krystal, Charney, 1998; Briere, 1997; Williams, Joseph, 1999). Considerando, infine, che il protocollo EMDR per il PTSD negli adulti e negli adolescenti connesso ad un singolo evento traumatico è senza dubbio quello maggiormente consolidato e verificato sperimentalmente, farò riferimento dettagliatamente solo a questo protocollo, semplicemente accennando in seguito ad ulteriori applicazione dell'EMDR.

La procedura-tipo o algoritmo di intervento consta di otto fasi specifiche, composte di elementi "non specifici" (relazione terapeutica, elementi psicoeducazionali, etc.), di elementi genuinamente specifici (movimenti oculari o altri tipi di stimolazione adeguata, sequenzialità degli interventi effettuati) ed elementi mutuati – direttamente o indirettamente - da altre tradizioni di ricerca (assessment cognitivo e ristrutturazione, esposizione graduale, abreazione, assecondamento delle libere associazioni, valorizzazione di immagini a contenuto simbolico, manipolazione delle immagini mentali, tecniche provenienti dalla tradizione della terapia ipnotica ed altro ancora).

Nelle fasi iniziali viene raccolta l'anamnesi del paziente, viene valutata l'opportunità dell'intervento e la presenza di condizioni indispensabili per evitare di ritraumatizzare il paziente o generare un *drop-out*. In seguito viene spiegato e calibrato il procedimento terapeutico, e viene verificata la possibilità di raggiungere una condizione di sicurezza psicofisiologica, eventualmente in sinergia con tecniche di rilassamento, di ipnosi e/o di autoipnosi (esercizio del "luogo sicuro").

La fase dell'assessment è di particolare importanza, ed è caratterizzata dalla

costruzione di un'accurata *baseline* articolata sulle componenti cognitive, emotive, sensoriali del trauma, con una particolare attenzione rivolta alle sensazioni fisiche. Un accesso olistico alla memoria traumatica massimizza la probabilità che abbia effetto l'intervento terapeutico successivo. In particolare, l'enfasi posta sulle sensazioni fisiche è in accordo con la ricerca traumatologica attuale che evidenzia un massiccia e cruciale presenza della componente cenestesica e, in senso lato, *implicita*, nella memorizzazione dei traumi (Bremner, et al., 1998; van der Kolk, 1996; van der Kolk, Fisler, 1995). Le difficoltà di acceso ai ricordi (evitamento, dissociazione, intrusività, frammentazione, razionalizzazione, banalizzazione, etc.) sono elementi decisivi nella calibrazione delle modalità d'intervento.

La fase della desensibilizzazione consiste nell'applicazione della stimolazione alternata più adeguata al paziente che ha avuto accesso al materiale traumatico. All'interno di questa fase si deve includere ogni forma di risposta che il paziente esibisce nei confronti dell'intervento, e tipicamente: associazioni verso altri ricordi, prese di coscienza, cambiamento delle differenti componenti sensoriali costitutive del ricordo del trauma, modificazione di convinzioni, abreazioni, e così via. Il compito del terapeuta è di stimolare la rielaborazione spontanea del trauma, intervenendo solo se strettamente necessario, evitando interpretazioni o commenti interferenti, ma anche arbitrarie manipolazioni della direzione della rielaborazione autonoma del trauma. Esistono alcune importanti eccezioni a questa regola di procedura: 1) se il paziente è in difficoltà ed in particolare se il processo rielaborativo è in stallo; 2) se il paziente è sopraffatto dalle emozioni; 3) se il paziente manca delle risorse cognitive ed emotive per affrontare il problema; 4) se, piuttosto che eliminare "chirurgicamente" un trauma, dobbiamo anche ricorrere ad un modello "riparativo" o "integrativo" relativamente ad esperienze di vita assenti, come nel caso dell'incuria e dell'abuso, sessuale, fisico o

psicologico (Giannantonio, 2000, a, b; Leeds, 1998). Durante il processo di rielaborazione il terapeuta si ferma periodicamente, calibrando il proprio procedimento su quanto può comprendere della rielaborazione che sta avvenendo nel paziente, fermandosi tipicamente quando ha l'impressione che sia terminato uno *step* rielaborativo oppure se il paziente appare essere in stallo. A questo punto il paziente viene invitato a verbalizzare quanto sta accadendo dentro di lui sotto forma di pensieri, sensazioni, emozioni e connessioni ad altri ricordi. Questo consente normalmente di comprendere la modalità e la direzione della rielaborazione in atto, fornendo inoltre le informazioni necessarie al terapeuta per agevolare la ripresa del processo nell'eventualità che questi sia impossibilitato.

Quando il coinvolgimento emotivo è notevolmente ridotto o eliminato si interviene agevolando la ristrutturazione cognitiva delle cognizioni disfunzionali (o inadeguate rispetto al tempo presente) che usualmente sono associate ad un trauma. Nello specifico, viene utilizzata una "cognizione positiva" già evidenziata nella fase di assessment, ovvero quello che il paziente vorrebbe realisticamente riuscire a pensare su di sé mentre accede al trauma (i.e.: "Ora sono al sicuro" oppure "Non è stata colpa mia", mentre accede al ricordo di un incidente automobilistico). Attraverso la stimolazione alternata si intende integrare il materiale mnestico originario con nuove informazioni che precedentemente erano inaccessibili emozionalmente e/o cognitivamente (Lipke, 2000). Effettuata l'installazione si verifica l'eventuale presenza residua di sensazioni negative presenti mentre il paziente accede al trauma originario unitamente alla cognizione positiva. Se la ristrutturazione cognitiva non è completa viene ripetuta o modificata. Se sussistono ancora ricordi percepibili somaticamente, questi diventano il target d'intervento da stimolare per mezzo della stimolazione alternata. Spesso l'intervento su questi residui sensoriali connette il paziente a ricordi variamente collegati al trauma dal

quali si è partiti, portando l'intervento a dirigersi su una rete mnestica coinvolta nel disturbo presentato dal paziente. Ottenuto questo obiettivo o, come più comunemente avviene, al termine della seduta, il paziente viene invitato ad interrompere la fase di rielaborazione orientando la piena attenzione verso il proprio luogo sicuro. In questo modo si intende evitare che la rielaborazione del trauma proceda senza soluzione di continuità al termine della seduta, magari in presenza di ricordi altamente disturbanti. Il paziente viene infine invitato a monitorare sé stesso fra una seduta e l'altra e a riferire successivamente l'eventuale presenza di elementi connessi alla rielaborazione in atto del trauma (pensieri, emozioni, sensazioni, ricordi, sogni, etc.).

L'inizio di ogni seduta di EMDR dovrebbe poi iniziare con una rivalutazione dell'opportunità di proseguire il lavoro sul target di intervento della seduta precedente. In particolare, è necessario effettuare un nuovo assessment cognitivo, emotivo, percettivo e sensoriale del target sul quale si sta lavorando, per valutare l'opportunità di un intervento ulteriore o di uno spostamento del focus d'intervento. Potrebbe essere che l'intervento termini con la rielaborazione di un singolo evento traumatico, ma in realtà questa eventualità non è certo la più frequente. Il trattamento di un evento traumatico sovente porta il paziente a riferire di altri episodi stressanti o francamente traumatici variamente connessi al target di partenza, all'interno di una vera e propria rete mnestica.

Il protocollo standard di intervento per il PTSD prevede, inoltre, che sia clinicamente necessario rielaborare gli eventi traumatici passati, ma intervenire anche sulle situazioni contingenti attuali che fungono da *triggers* nei confronti degli eventi traumatici e, infine, sulle ipotetiche situazioni future che si presumano possano riattivare i comportamenti disfunzionali connessi alle originarie esperienze traumatiche. Di conseguenza, è teoreticamente corretto e clinicamente efficace considerare come target d'intervento non tanto il singolo evento che il paziente riferisce - appunto - come

traumatico, quanto piuttosto il ricordo in questione all'interno di una specifica rete mnestica, con connessioni al passato, al presente ed al futuro. Questa non è un'opzione teoretica arbitraria, ma la formalizzazione di una necessità metodologica evidenziata regolarmente dai pazienti. Di fatto, l'EMDR consente frequentemente di potere ripercorrere gli elementi costituitivi nella produzione di ciò che definiamo comunemente "traumatico", ovvero di evidenziarne l'etiologia psicobiologica multifattoriale (Briere, 1997; Carlson, Dalemberg, 2000).

Efficacia dell'EMDR nella psicoterapia del PTSD: certezze, dubbi e prospettive di ricerca

Fino a pochi anni fa la ricerca sull'efficacia della psicoterapia del PTSD era estremamente esigua (Shapiro, 1995). Negli ultimi anni, invece, questo settore ha collezionato un crescente numero di pubblicazioni sull'efficacia delle psicoterapie, e l'EMDR è uno degli approcci terapeutici che vanta il maggior numero di conferme di efficacia nella psicoterapia del PTSD. Nonostante le vivaci polemiche ed incomprensioni, questo stato di cose ha consentito all'EMDR nel 1995 di essere considerata "trattamento probabilmente efficace" (valutazione A/B) nella terapia del PTSD dalla Task Force on Psychological Intervention dell'American Psychological Association. Questa attribuzione di efficacia è spartita solo con lo Stress Inoculation Training e con le terapie basate sull'esposizione (Chambless et al., 1998). Più recentemente, l'EMDR è stata riconosciuta efficace nel trattamento del PTSD anche dall'International Society for Traumatic Stress Studies all'interno della pubblicazione delle sue linee guida per il trattamento del PTSD (Chemtob, Tolin, van der Kolk, Pitman, 2000).

Al di là di ogni ragionevole dubbio, l'EMDR risulta essere una psicoterapia efficace per il PTSD, come dimostrano innanzitutto recenti reviews sull'efficacia dell'EMDR e studi meta-analitici sull'efficacia di differenti approcci terapeutici al PTSD, sia farmacologici che psicoterapeutici (Cahill, Carrigan, Frueh, 1999; Maxfield, 2000; Shepherd, Stein, Milne, 2000; Van Etten, Taylor, 1998), sebbene il meccanismo esatto del suo funzionamento sia al momento oscuro ed oggetto di speculazione (vedi oltre; per una rassegna sulle teorie al riguardo, Shapiro, 1995). A tale conclusione si arriva anche se vengono adottati rigidi criteri di selezione nella valutazione della metodologia delle ricerche (Shepherd, et al., 2000). Infatti, sono attualmente disponibili alcune ricerche ben strutturate sull'efficacia dell'EMDR nel PTSD, che sembrano non essere vanificate da sostanziali critiche metodologiche (i.e.: Marcus, Marquis, Sakai, 1997; Rothbaum, 1997; Scheck et al., 1998; Wilson, Becker, Tinker, 1995, 1997), con follows-up fino a 15 mesi (Wilson et al., 1997); con ciò tali studi si differenziano da una parte non irrilevante di letteratura sull'EMDR, anedottica o sprovvista di adeguata o verificabile evidenza sperimentale (Shepherd et al., 2000), diventata bersaglio (a volte correttamente) di alcuni critici. Fra le ricerche più accreditate alcune sono caratterizzate dalla presenza di valutatori indipendenti dell'efficacia dell'intervento con l'EMDR o con altri interventi o dell'inclusione in una lista d'attesa (Carlson, Chemtob, Rusnak, Hedlund, Muraoka, 1998; Rogers et al., 1999; Rothbaum, 1997; Scheck et al., 1998; Vaughan et al., 1994). Le ricerche, globalmente considerate, hanno dimostrato l'efficacia dell'EMDR in una grande varietà di situazioni traumatiche connesse al PTSD: guerre recenti o lontane nel tempo, incidenti e ustioni, violenze sessuali attuali o pregresse, calamità naturali, lutti, azioni terroristiche.

Sintetizzo succintamente alcuni dati provenienti da alcune fra le pubblicazioni di maggior rilievo e che non verranno ripresi nel prosieguo.

Rothbaum (1997). Un campione di 21 donne vittime di stupro è stato trattato con quattro sedute di EMDR da 90 minuti a cadenza settimanale. L'assessment pre- e post-trattamento (a tre mesi) è stato effettuato da un valutatore indipendente all'oscuro sul tipo di intervento effettuato. Strumenti psicodiagnostici utilizzati: PTSD Symptom Scale (PSS; Foa, Riggs, Dancu, Rothbaum, 1993), Impact of Event Scale (IES; Horowitz, Wilner, Alvarez, 1979), Rape Aftermath Symptom Test (RAST; Kilpatrick, 1988), State-Trait Anxiety Inventory (STAI; Spielberger, Goruch, Lushene, 1970), Back Depression Inventory (BDI; Beck, Ward, Mendelsohn, Mock, Erbaugh, 1961), Dissociative Experience Scale (DES; Bernstein, Putnam, 1986) più altri reattivi psicodiagnostici meno noti. Il 90% dei soggetti non ha più soddisfatto i criteri per la diagnosi di PTSD, contro il 12% dei soggetti di controllo, cioè una lista di attesa. Un valutatore esterno ha valutato l'elevato grado di adeguamento al protocollo EMDR.

Wilson et al. (1995, 1997). Un campione di 80 soggetti vittime di traumi (di cui 37 con diagnosi di PTSD) sono stati trattati con tre sedute da 90 minuti di EMDR, con attribuzione randomizzata ad un terapeuta, con assessment pre- e post-trattamento effettuato da un valutatore indipendente. Strumenti psicodiagnostici utilizzati: IES, STAI, Symptom Check List (SCL 90-R; Derogatis, 1992), misurazioni soggettive di intensità del disagio e della ristrutturazione cognitiva (SUDS: Subjective Units of Disturbance Scale e VOC: Validity of Cognition Scale) e Post-Traumatic Stress Disorder Interview (PTSD-I; Watson, Juba, Manifold, Kucala, Anderson, 1991). L'EMDR è risultata globalmente efficace rispetto ai soggetti in attesa di trattamento nei controlli effettuati a 30 e 90 giorni. A 15 mesi di distanza è stata registrata una riduzione dell'84% delle diagnosi di PTSD.

Marcus et al. (1997). Un campione di 67 soggetti con diagnosi di PTSD è stato trattato con assegnazione randomizzata con tre sedute da 90 minuti di EMDR. Un

valutatore indipendente ha valutato la condizione pre- e post-trattamento attraverso: SCL-90, BDI, STAI, SUD, IES, Modified PTSD-Scale (Falsetti, Resnick, Resnick, Kilpatrik, 1993). Il 100% dei soggetti vittime di un solo trauma e l'80% dei soggetti pluritraumatizzati non hanno più soddisfatto i criteri per la diagnosi di PTSD, risultati molto superiori rispetto al controllo, ovvero al trattamento standard del Kaiser Permanente Hospital, composto da terapia individuale (o cognitiva, o comportamentale o psicodinamica) più terapia farmacologica, più terapia di gruppo (riferirsi alla pubblicazione per maggiori precisazioni).

Scheck et al. (1998). 60 donne di età compresa fra i 16 ed i 25 anni, vittime di stupro, sono state assegnate in modo randomizzato a due sedute di EMDR o di "ascolto attivo" (Gordon, 1974). La valutazione pre- e post-trattamento è stata effettuata in modo indipendente attraverso i seguenti strumenti: BDI, STAI, Penn Inventory for Posttraumatic Stress Disorder (Hammarberg, 1992), IES, The Posttraumatic Stress Disorder Interview (PTSD-I; Watson et al., 1991), Tennessee Self-Concept Scale (Roid, Fitts, 1991). L'EMDR si è dimostrata più efficace dell'ascolto attivo su tutti i parametri. Nonostante la brevità dell'intervento, i valori registrati dai soggetti trattati con EMDR sono risultati, per tutti gli strumenti utilizzati, non significativamente diversi da quelli della popolazione generale o da quelli dei gruppi normativi trattati con successo.

Le ricerche citate sono alcune fra quelle che hanno contribuito ad ottenere i recenti ed autorevoli riconoscimenti dell'efficacia dell'EMDR. Ciò che invece è più controverso relativamente all'EMDR nella psicoterapia del PTSD riguarda i seguenti ambiti:

1. Presenza di studi che indicano l'EMDR come inefficace o di efficacia dubbia.
2. Supposta maggiore efficacia dell'EMDR rispetto ad altre psicoterapie.
3. Supposta maggiore velocità di intervento dell'EMDR rispetto ad altre psicoterapie.

4. Specificità delle componenti dell'EMDR e loro efficacia terapeutica.

Risultati dubbi o assenti dell'EMDR

A parte le pubblicazioni fondate su presupposti ideologi contrari all'EMDR o su conoscenze di terza mano - che non verranno prese in considerazione (i.e.: Thaler, Lalich, 1996) - esistono alcune pubblicazioni che indicano l'EMDR come inefficace o di efficacia dubbia nella psicoterapia del PTSD, specialmente nel trattamento dei reduci del Vietnam (i.e. Boudewyns, Hyer, 1996; Boudewyns, Stwertka, Hyer, Albrecht, Sperr, 1993; Devilly, Spence, Rapee, 1998; Pitman et al., 1996). In realtà questi studi, globalmente considerati, incappano in uno o più dei seguenti problemi: 1) impiegano solo una o due sedute di EMDR nel trattamento di reduci del Vietnam, ottenendo - ovviamente - risultati nulli o dubbi, oppure 2) trattano con l'EMDR solo uno o due episodi traumatici in soggetti che devono essere considerati, intrinsecamente, pluritraumatizzati (Shapiro, 1999). Studi ben condotti impieganti 12 sedute per ogni soggetto (Carlson et al., 1998), dimostrano la notevole efficacia dell'EMDR con i reduci del Vietnam, poiché ad un follow-up di nove mesi il 75% dei soggetti trattati non soddisfavano più i criteri per la diagnosi di PTSD. Diversi altri studi, invece, sembrano dimostrarne l'inefficacia o l'efficacia dubbia dell'EMDR, ma impiegando protocolli di intervento per il PTSD o le per fobie errati o liberamente modificati (cfr. Shapiro, 1999, 2000 per una rassegna più approfondita) o, infine, ci sono dubbi sulle competenze professionali impiegate (Shapiro, 1995, 1999, 2000). Alcuni autori, aprioristicamente, valutano negativamente le riserve mostrate dalla Shapiro quando sostiene che l'inefficacia di alcune ricerche può essere dovuta all'incompetenza dei terapeuti. Ma questo, invece, può essere verosimile. L'EMDR è solo apparentemente una tecnica di facile applicazione (Goldwurm, 2000), ed anche terapeuti che hanno seguito l'iter di

formazione ufficiale possono essere inefficaci o dannosi, come si evince anche alla ricerca di Wilson et al. (1995, 1997) laddove, nonostante si confermi globalmente un'ottima efficacia dell'EMDR nel trattamento del PTSD e delle memorie traumatiche in generale, un'analisi dell'efficacia per ogni singolo terapeuta ha mostrato che uno di essi è stato in parte poco efficace ed in parte dannoso (Wilson, 2000).

EMDR ed altre psicoterapie nella psicoterapia del PTSD

Lo studio meta-analitico di Van Etten e Taylor (1998) indica che l'EMDR ha una efficacia uguale a quella dello *Stress Inoculation Training*, ma porta i pazienti a non soddisfare più la diagnosi di PTSD in un tempo minore (4.6 contro 14.8 sedute). L'EMDR sembra essere ugualmente efficace delle terapie comportamentali basate sull'*esposizione* (Boudewyns et al., 1993) e del *training di abituazione immaginativa* accoppiato al rilassamento muscolare (Vaughan et al. 1994), più efficace del *biofeedback* (Foa, Meadows, 1997; Carlson et al, 1998) e dello *ascolto attivo* nella tradizione di Carl Rogers (Scheck et al., 1998), meno efficace della variante cognitivo-comportamentale rappresentata dal *Trauma Treatment Protocol* (Devilly, Spence, 1999). L'EMDR è risultata meno efficace degli *SSRIs* nel trattamento della depressione associata al PTSD (Van Etten, Taylor, 1998), ed inoltre la sua efficacia in questo ambito varia notevolmente all'interno degli studi (Maxfield, 2000) e non è ancora adeguatamente compresa (Cahill et al., 1999). Rispetto alla terapia comportamentale basata sull'esposizione, l'EMDR si è dimostrata superiore nel ridurre i sintomi intrusivi (Van Etten, Taylor, 1998; Rogers et al., 1999) e più confortevole per i pazienti (Rogers et al., 1999). Nello studio di Van Etten, Taylor (1998), attraverso la confrontazione fra 61 studi sulla psicoterapia e la farmacoterapia del PTSD, emerge che l'EMDR, insieme alla terapia comportamentale (esposizione in vivo, immaginativa e mista), sembra essere

l'intervento più efficace se paragonato ad un ampio spettro di altre forme di intervento: supporto psicologico, ascolto attivo, psicoterapia psicodinamica, ipnotica e training di rilassamento (Van Etten, Taylor, 1998); le pubblicazioni utilizzate per la comparazione con gli ultimi tre di questi approcci sono comunque estremamente ridotte, e quindi i risultati non possono assolutamente considerarsi definitivi. Nonostante l'apparenza di una sostanziale equivalenza rispetto ai risultati delle terapie comportamentali o cognitivo-comportamentali, l'EMDR sembra ottenere i medesimi risultati in tempi sensibilmente inferiori (i.e.: Foa, Rothbaum, Riggs, Murdock, 1991; per una rassegna di comparazioni: Shapiro, 1995, 1999, 2000). In ogni caso, l'evidenziazione di definitive ed univoche differenze in quest'ultimo ambito è attualmente impossibile poiché l'EMDR è stata confrontata con differenti modelli di intervento comportamentale o cognitivo-comportamentale a causa dell'assenza di omogeneità fra questi approcci terapeutici (Shapiro, 2000). L'EMDR, invece, dal 1995 in poi ha adottato un unico protocollo di intervento per il PTSD (anche se Rosen, 1999, nega tale evidenza) e quindi, laddove tale protocollo sia stato applicato correttamente e da terapeuti adeguatamente formati, gli studi degli ultimi cinque anni rappresentano un corpus di letteratura omogeneo. Inoltre, la quasi totalità delle affermazione sulla differente efficacia fra EMDR e tecniche cognitivo-comportamentali si basa su comparazioni effettuate paragonando molteplici ricerche dove si applica uno o l'altro metodo (Cahill et al., 1999).

Valutazione di componenti specifiche dell'EMDR

Sono state effettuate ricerche impiegando alcune varianti dell'EMDR allo scopo di valutare l'efficacia di alcune sue componenti specifiche, innanzitutto i movimenti oculari.

Sanderson e Carpenter (1992), hanno confrontato il risultato del trattamento di alcuni soggetti fobici sottoposti 1) a EMDR e 2) ad una situazione simile all'EMDR, ma con l'istruzione di tenere gli occhi chiusi. Hanno riscontrato risultati positivi paragonabili in entrambe le condizioni. Dalla descrizione della ricerca, però, sembra si possa dedurre che il protocollo EMDR non sia stato correttamente impiegato, in particolare non rispettando per la prescrizione di applicare i movimenti oculari ad ogni nuova associazione mentale prodotta dal soggetto (Lipke, 2000). Agli stessi risultati di Sanderson e Carpenter (1992) porta lo studio di Acierno et al. (1994) condotto su un soggetto sofferente di molteplici fobie, ma applicando l'EMDR con la prescrizione al soggetto di restare ancorato all'immagine target durante i movimenti oculari, processo che non è EMDR. Da altri problemi procedurali sembra essere affetto lo studio di Boudewyns e Hyer (1996), che porta agli stessi risultati dei due precedenti (Lipke, 2000).

Gosselin e Mattews (1995) e Feske e Goldstein (1997) hanno confrontato il trattamento dell'ansia in generale, nel primo lavoro, e del Disturbo di Panico, nel secondo, trattate con EMDR e EMDR con la variante rappresentata dalla fissazione delle dita del terapeuta, senza che venissero mai mosse. In entrambi gli studi i soggetti hanno ottenuto miglioramenti da entrambe le condizioni sperimentali, ma con una differenza significativa di efficacia dei movimenti oculari rispetto alla fissazione delle dita. Nello studio di Boudewyns et al. (1993) con i reduci del Vietnam, invece, la sottrazione dei movimenti oculari non ha prodotto risultati clinici positivi nei soggetti, come si deduce anche da Montgomery e Ayllon (1994).

Sono a conoscenza di un unico studio che manipoli volontariamente la componente cognitiva e, nello specifico, che elimini la ricerca della cognizione positiva dal protocollo EMDR e la conseguente fase di installazione della cognizione positiva. La

ricerca di Cusack, Spates (1999) effettua questa operazione e non trova una differenza significativa rispetto all'efficacia del protocollo standard, giungendo alla conclusione che l'aspetto cognitivo è superfluo nel protocollo standard EMDR. In effetti, avviene non di rado, specialmente con un PTSD legato ad un episodio singolo e senza comorbilità (come nel campione degli autori), che l'installazione della cognizione positiva risulti ridondante per l'efficacia dell'intervento. Se però il soggetto ha vissuto più esperienze traumatiche e/o si è in presenza di comorbilità (tipicamente, in presenza di Disturbi di Personalità), si nota frequentemente che l'installazione della cognizione positiva è una fase cruciale dell'intervento, in quanto porta il soggetto a rivolgere spontaneamente la direzione della propria attenzione verso altri ricordi traumatici oppure verso problematiche che rendono impossibile la completa risoluzione del target di intervento. Di conseguenza, ritengo errata la deduzione di Cusack e Spates, poiché è corretto che il protocollo standard includa la fase da loro eliminata in quanto massimizza la probabilità di efficacia dell'intervento nel PTSD in generale.

Altre forme di stimolazione alternata

Devilly, Spence e Rapee (1998) hanno sottoposto alcuni reduci del Vietnam con PTSD a due sedute di EMDR e ad una variante di EMDR, senza movimenti oculari, ma con l'attenzione rivolta ad una fonte luminosa lampeggiante ad intervalli irregolari. In entrambi i casi si sono raggiunti miglioramenti rispetto ai controlli, con una differenza non significativa di maggiore efficacia dei movimenti oculari.

Renfrey e Spates (1994) in soggetti con PTSD hanno paragonato l'efficacia di tre diverse condizioni: 1) EMD (la vecchia modalità di applicazione dell'attuale EMDR), 2) EMD senza movimenti oculari provocati dall'osservazione delle dita bensì provocati dall'osservazione di una barra luminosa con una luce oscillante tra i due lati e 3) EMD

con osservazione di una luce fissa. Nell'immediato, tutte le e tre le condizioni hanno prodotto risultati positivi, ma senza differenze significative fra le tre condizioni. Al follow-up la condizione EMD standard si è dimostrata superiore, ma il campione esiguo non consente conclusioni definitive.

Wilson, Silver, Covi, Foster (1996) hanno applicato a soggetti portatori di memorie traumatiche tre differenti condizioni: EMDR, movimenti alternati delle dita dei pazienti al tempo di un metronomo al posto dei movimenti oculari e condizione di quiete al posto dei movimenti oculari. Solo la prima condizione ha prodotto risultati positivi. Al contrario, Bauman e Melynk (1994) riportano risultati positivi nella riduzione dell'ansia ottenuti dalla sostituzione dei movimenti oculari con il tamburellamento alternato su un tavolo delle dita indice dei soggetti, sincronicamente ad un metronomo. In modo simile, Pitman et al. (1996), non hanno riscontrato differenze di efficacia fra i movimenti oculari e il tamburellamento alternato da parte del terapeuta sulle dita del paziente.

Alcuni autori (i.e. Lohr, Lilienfed, Tolin, Herbert, 1999), constatando differenze dubbie o assenti fra EMDR e EMDR senza movimenti oculari, ma provvisto di altre forme di stimolazione alternata (tamburellamenti) o con fissazione dell'attenzione, concludono che i movimenti oculari non sono necessari per l'EMDR. La conclusione è errata per il fatto che molte situazioni scelte per studiare l'aspetto specifico dei movimenti oculari, ovvero la loro sostituzione con altre stimolazioni ritmiche, dimenticano che le medesime stimolazione sono impiegate dai terapeuti EMDR in alternativa ai movimenti oculari, in quanto ritenute efficaci (Shapiro, 1995; Lipke, 2000). Inoltre, il fatto che sia possibile ottenere risultanti anche con la semplice fissazione di un punto luminoso (Devilly et al., 1998), invece di portare inevitabilmente a pensare che i movimenti oculari siano inutili, dovrebbe indurre alla valutazione della

eventualità che l'accesso ad un ricordo traumatico congiuntamente ad un elemento nuovo con funzione distraente (la luce luminosa) possa contribuire alla parziale modificazione di un evento traumatico, per esempio intervenendo a livello dello rigida associazione esistente fra elementi percettivi ricordati e risposte emozionali e psicofisiologiche. In effetti, ci sono indicazioni che portano a considerare realistica questa eventualità, come ad esempio la tecnica messa a punto da F. Ochenberg, laddove il terapeuta conta a voce alta da 1 a 100 mentre il paziente ha accesso al trauma, tecnica che sembra avere un effetto parzialmente decondizionante nei confronti di un trauma (Ochenberg, 1996). La tradizione della psicoterapia ipnotica, inoltre, impiega da molti anni e con efficacia la rottura di schemi associativi come strumento di desensibilizzazione nei confronti di un trauma (Phillips, Frederick, 1995). In attesa di verifiche sperimentali più precise, sembra verosimile che la funzione distraente sia una componente non specifica dell'EMDR, parzialmente responsabile della sua efficacia.

Non mi sembra quindi lecito concluedere, come Lohr et al. (1999), che l'efficacia dell'EMDR sia semplicemente dovuta 1) a fattori non specifici e 2) ad elementi mutuati dalla tradizione cognitivo-comportamentale, nello specifico l'esposizione immaginativa presente nella desensibilizzazione sistematica e nel flooding e 3) ad elementi di immaginazione mentale guidata, propria di altre tradizioni, mentre 4) i movimenti oculari sarebbero semplicemente stati aggiunti per creare una caratteristica distintiva della metodica. Infatti, sebbene sia estremamente verosimile che parte dell'efficacia dell'EMDR sia dovuta ad elementi non specifici (come avviene per ogni forma di psicoterapia), l'esposizione immaginativa impiegata dall'EMDR nel protocollo standard per il PTSD è diversa significativamente da quella della tradizione cognitivo-comportamentale, che tende ad essere ininterrotta e con elevati livelli emozionali (Rogers et al., 1999). Nell'EMDR, infatti, l'immagine del trauma viene adottata come

punto di partenza delle libere associazioni mentali del paziente che, di norma, si rivolgono a molte altre immagini, contenuti di pensiero ed emozioni. Non si tratta, cioè, di un meccanismo di abituazione o di inibizione reciproca rivolto ad una sequenza fissa di immagini, dalla quale non ci si deve spostare. Ciò che addirittura succede con relativa frequenza è che il pazienti si distacchi molto rapidamente dall'immagine scelta come target per rivolgersi ad altro, producendo comunque una desensibilizzazione nei confronti dell'immagine di partenza. Quindi, sebbene sia verosimile che l'abituazione generata dall'esposizione sia in parte implicata nel processo terapeutico dell'EMDR, non può essere considerata l'elemento fondamentale della sua efficacia.

L'eventualità che l'efficacia dell'EMDR sia dovuta all'impiego di tecniche di immaginazione guidata, poi, è priva di ogni sostegno. Tali tecniche possono essere impiegate ed anche con grande efficacia (i.e.: Parnell, 1999) ma solo quando il processo rielaborativo spontaneo del paziente si è bloccato o il paziente è sovrastato dalle emozioni. Nei casi rimanenti, da parte del terapeuta non è prevista alcuna manipolazione dell'immaginazione del paziente, che può per giunta essere anche assente, senza compromissione del processo.

Non mi sembra neppure che si possa concludere, come Lohr et al. (1999), che in attesa della piena, perfetta e completa comprensione di ogni elemento costitutivo dell'EMDR, non ci sia giustificazione clinica per la sua applicabilità. Se pure è vero che ci sia ancora molto da comprendere circa i meccanismi di funzionamento dell'EMDR, la sua efficacia è sostenuta da molte pubblicazioni, e non si vede perché si debbano richiedere all'EMDR prerogative mai pretese nei confronti di nessun altro approccio psicoterapeutico affinché lo si possa impiegare. D'altronde, come affermano gli stessi autori, **la forza e la precisione delle verifiche che vengono richieste all'EMDR è commensurabile alla forza del clamore che ha suscitato la sua presunta efficacia**

(ibid., p. 200), ma questa, più che scienza, è ideologia.

Considerando globalmente gli studi effettuati per valutare l'efficacia di alcune componenti specifiche dell'EMDR emerge un quadro complesso e contraddittorio che necessita certamente di ulteriori approfondimenti. In ogni caso, ciò che invece si evince con chiarezza è che i movimenti oculari prodotti dal movimento delle dita del terapeuta non sono certamente l'unico tipo di stimolazione alternata capace di produrre l'accelerazione dell'informazione comportante decondizionamento e rielaborazione delle memorie traumatiche. È possibile che si sia solo all'inizio della scoperta di dispositivi induttori di elaborazione accelerata delle informazioni (Lipke, 2000). In particolare, sarà forse opportuno considerare acceleratori di informazioni a valenza traumatica anche particolari stati di coscienza modificati (Giannantonio, 2000b; Parnell, 1999).

Riferendomi esclusivamente all'EMDR, la ricerca futura dovrà certamente sottoporre a controllo i tipi di stimolazione alternata che vengono abitualmente utilizzati dai terapeuti EMDR in alternativa ai movimenti oculari, attualmente supportati dall'evidenza sperimentale in modo variabile.

Nodi teoretici e limiti delle ricerche

1) Innanzitutto il problema della comorbilità. La maggior parte delle ricerche esclude dai campioni di trattamento molti soggetti che presentano diagnosi o problemi addizionali oltre al PTSD (i.e.: disturbi psicotici in atto o recenti o schizofrenia: Carlson et al., 1998; Cusack, Spates, 1999; Devilly et al., 1998; Rogers et al., 1999; Vaughan et al., 1994; rischio di suicidio: Devilly et al., 1998; Marcus et al., 1997; Wilson et al., 1995, 1997; Disturbo Ossessivo-Compulsivo: Carlson et al., 1998; Cusack, Spates, 1999; Rogers et al., 1999; Vaughan et al., 1994; Disturbi di Personalità: Carlson et al.,

1998; Rogers et al., 1999; Vaughan et al. 1994; Disturbo Borderline di Personalità: Cusack, Spates, 1999; Disturbi Dissociativi: Marcus et al., 1997; Rogers et al., 1999; Wilson et al, 1995, 1997; abuso di alcool e/o di stupefacenti in atto o recente: Carlson et al., 1998; Cusack, Spates, 1999; Marcus et al., 1995; Rothbaum, 1997; Wilson et al., 1995, 1997). I casi in cui la comorbilità è riportata in modo quantificabile (anche per i Disturbi dell'Umore e per ulteriori Disturbi d'Ansia oltre al PTSD) rappresentano una percentuale troppo esigua per permettere conclusioni anche semplicemente provvisorie (Van Etten, Taylor, 1998). Le scelte metodologiche di restrizione dei campioni sono certamente corrette, nel momento in cui si vuole rendere il campione il più omogeneo possibile, ma in questo modo non esistono ancora elementi indiscutibili che affermino l'efficacia dell'EMDR in presenza di comorbilità. Considerando, inoltre, che la presenza di comorbilità nel PTSD è piuttosto elevata (Briere, 1997; Yule, Williams, Joseph, 1999), ciò induce a considerare in modo condizionale i risultati relativi alla terapia del PTSD, che potrebbero variare anche considerevolmente e poliedricamente in funzione della presenza di altre patologie. Inoltre, potrebbero essere necessari importanti cambiamenti nel protocollo terapeutico.

A ciò si deve aggiungere, infine, la considerazione che non è affatto detto che l'algoritmo diagnostico impiegato dal DSM-IV per la diagnosi di PTSD sia effettivamente esaustivo per la sua valutazione e comprensione (Bremner et al., 1998; Briere, 1997). Queste ultime due precisazioni valgono, ovviamente, per ogni forma di psicoterapia che voglia verificare la propria efficacia nella psicoterapia del PTSD.

2) Il punto 1) si collega necessariamente ad una esigenza di ampio respiro, ovvero alla necessità di effettuare assessment molto più articolati ed approfonditi allo scopo di enucleare le differenze di risposta all'EMDR presentate da differenti gruppi di individui. Ciò richiede anche campioni consistenti (Shapiro, 2000).

3) Nell'ambito dell'applicazione dell'EMDR in età infantile, e quindi con importanti adeguamenti procedurali della metodica, attualmente non esiste ancora la stessa mole di evidenze cliniche disponibile invece per i soggetti adulti.

4) È necessario che si inizino a pubblicare ricerche che non si riferiscano solo all'obiettivo di non soddisfare più i criteri per la diagnosi di PTSD. Se per questo obiettivo l'EMDR è verificata, non lo è affatto per il **completo** superamento delle articolate conseguenze dei traumi abitualmente presenti in soggetti con PTSD. Ciò renderà molto più complessa la ricerca in quanto l'ottenimento di ambiziosi obiettivi a vasto raggio comporta l'adozione di maggiore creatività e deviazione dai protocolli standard di intervento (Manfield, 1998; Parnell, 1999). Queste precisazioni si intendono rivolte anche ad ogni altro approccio terapeutico rivolto al PTSD.

5) Deve essere ancora abbondantemente compreso attraverso quali meccanismi si esplica l'efficacia dell'EMDR, poiché le molte teorie attualmente esistenti non sembrano essere totalmente convincenti o esaustive (per una rassegna, Shapiro, 1995). Anche le recenti ricerche e i tentativi di interpretazione di tipo psicobiologico (i.e. Levin, Lazrove, van der Kolk, 1999), per quanto utili ed affascinanti, sembrano condurci verso la comprensione di *cosa* succede quando si supera un trauma, *come* è organizzato cerebralmente un evento traumatico, ma non ci dicono nulla della natura dello specifico intervento impiegato a scopo terapeutico, ovvero l'EMDR, se non che è efficace. Gli stessi cambiamenti a livello psicobiologico, infatti, potrebbero essere raggiunti con differenti dispositivi psicoterapeutici (Giannantonio, 2000b).

6) Deve essere dimostrato se il protocollo EMDR per il PTSD ha la medesima efficacia in presenza di PTSD parziale o subclinico (Yule, Williams, Joseph, 1999). Pur essendo estremamente verosimile, tale assunto deve essere maggiormente verificato, anche se ci sono certamente importanti conferme in questo senso (i.e.: Scheck et al.,

1998; Wilson et al., 1995, 1997). Molto meno verificata è l'efficacia dell'EMDR nei confronti degli eventi traumatici o altamente stressanti presenti in modo trasversale in molte altre patologie, ma in assenza di PTSD o di PTSD subclinico.

7) È necessaria una maggiore quantità di ricerche che utilizzi follows-up a lunga distanza.

Sviluppi contemporanei dell'EMDR

Osservando la letteratura recente sull'EMDR fino ad arrivare al congresso dell'EMDR International Association tenutosi a Toronto nel settembre 2000, sembra si possano scorgere le seguenti linee di tendenza nell'evoluzione dell'EMDR.

1) Approfondimento della tecnica di intervento nel PTSD e attenzione rivolta ad una maggiore accuratezza nella metodologia della ricerca.
2) Ricerche orientate all'indagine della componente psicobiologica del meccanismo di funzionamento dell'EMDR.
3) Pubblicazioni essenzialmente finalizzate a difendere l'EMDR dalle frequenti critiche che le vengono rivolte.
4) Approfondimento di ulteriori ambiti clinici in cui l'EMDR sembra dimostrarsi efficace: Disturbo di Panico, Fobia Sociale e Specifica, Disturbo di Dismorfismo Corporeo, Disturbo Ossessivo-Compulsivo, Disturbi dell'Alimentazione, Disturbi Sessuali, Disturbi Dissociativi, Disturbi di Personalità, comportamenti di addiction (per una elencazione più analitica degli ambiti di applicazione e di ricerca attuali: Shapiro, 1995, 1999; Lipke, 2000).
5) Si stanno sempre più evidenziando i limiti intrinseci di un approccio alla psicoterapia essenzialmente rivolto alla rielaborazione di singoli eventi

traumatici ed avente la pretesa di essere virtualmente compatibile con ogni tradizione di psicoterapia. Il confronto con soggetti pluritraumatizzati, con frequente comorbilità con Disturbi Dissociativi e di Personalità, per esempio, sta portando molti autorevoli esponenti del mondo dell'EMDR ad incorporare nelle proprie procedure operative e nella comprensione teoretica del processo clinico le risorse provenienti dalla migliore tradizione della psicoterapia ipnotica (i.e.: Phillips, Frederick, 1995). In particolare, il modello della "Terapia degli Stati dell'Io" (Watkins, Watkins, 1997), implementato dall'EMDR, viene attualmente sperimentato nella terapia dei Disturbi Dissociativi, di Personalità, di Panico, Ossessivo-Compulsivo, Alimentari. In definitiva, l'EMDR sembra stia mutando, implicitamente o esplicitamente, in un vero approccio alla psicoterapia in senso lato, con un sempre maggiore apporto teoretico necessario per la sua applicazione, ed in questo modo diventando probabilmente un corpus di conoscenze e procedure incommensurabile con alcune tradizioni cliniche.

Sono veramente efficaci le psicoterapie *evidence-based*?

Paolo Migone
Condirettore della rivista *Psicoterapia e Scienze Umane*

Sappiamo che negli ultimi tempi si parla sempre più della necessità di verificare empiricamente l'efficacia della psicoterapia, cioè di differenziare il più possibile le terapie che "funzionano" da quelle che "non funzionano" (o la cui efficacia non è ancora stata dimostrata - cosa, tra l'altro, ben diversa dalla *dimostrata inefficacia*). Una delle conseguenze di questi sviluppi è la compilazione degli elenchi dei cosiddetti *Empirically Supported Treatments* (EST), cioè dei trattamenti supportati empiricamente o *evidence-based* (basati sulle evidenze), che sarebbero le uniche terapie che funzionano mentre tutte le altre non dovrebbero più essere praticate (inutile dire che tra queste terapie dichiarate "inutili" vi sarebbero quasi tutte le terapie psicoanalitiche). Vorrei discutere qui questa problematica, della quale mi sono sempre interessato, e riporterò parti di relazioni che ho tenuti a vari convegni o corsi su questo argomento (ad esempio al XI Congresso Nazionale della *Società Italiana di Terapia Cognitiva e Comportamentale* [SITCC] tenuto a Bologna il 19-22 settembre 2002, al convegno "Una svolta nella validazione dei risultati e dei processi delle psicoterapie" organizzato dal Dipartimento di Psicologia dell'Università di Firenze il 17 maggio 2003, a un corso di formazione organizzato dal CEFPAS della Regione Sicilia a Caltanissetta il 16-18 marzo 2004, alla IX Riunione Scientifica Annuale della *Società Italiana di Epidemiologia Psichiatrica* [SIEP] a Nocera Inferiore il 28-29 ottobre 2004, e così via).
La mia posizione è che occorre molta cautela nell'aderire alla logica della *Evidence-Based Medicine* (EBM) trasferita troppo acriticamente o frettolosamente ad una "psicoterapia basata sulle evidenze", in quanto è alto il rischio che si trascurino alcuni importanti problemi che possono generare fraintendimenti e ricadute pericolose per la pratica della psicoterapia. Gli EST infatti stanno diffondendosi sempre di più tra gli operatori e amministratori della salute mentale, come uno dei tentativi di risposta al comprensibile bisogno di *accountability*, di maggiore *cost-effectiveness* e di altre importanti esigenze etiche e scientifiche.
Tra gli autori che hanno maggiormente approfondito questa problematica vi è Drew Westen, un ricercatore estremamente attento sia alle questioni metodologiche e statistiche delle ricerche sperimentali che alle *nuances* della clinica (si veda ad esempio il suo articolo del 1999 sullo statuto scientifico dei processi inconsci, dal titolo "Freud è davvero morto?", uscito nel n. 4/2001 di *Psicoterapia e Scienze Umane*). In un recente lavoro pubblicato su una rivista molto autorevole [Westen D. & Morrison K., A multidimensional meta-analysis of treatments for depression, panic, and generalized anxiety disorder: An empirical examination of the status of empirically supported therapies, *Journal of Consulting and Clinical Psychology*, 2001, 69, 6: 875-899] ha

preso in considerazione gli studi sperimentali sulla psicoterapia della depressione, del panico e dell'ansia generalizzata ed ha riesaminato la base empirica delle psicoterapie brevi manualizzate, distinguendo la risposta iniziale dalla genuina efficacia, e la terapia degli "stati" psicologici dalla terapia dei disturbi o delle diatesi. La sua conclusione è che questi trattamenti brevi manualizzati tendono a produrre una notevole risposta positiva iniziale di indubbia significatività clinica, ma che la maggior parte dei pazienti rimangono subclinicamente sintomatici, hanno ricadute o richiedono un ulteriore trattamento entro due anni. Inoltre è dimostrato che i tipici studi di efficacia escludono ben i 2/3 dei pazienti che nella pratica clinica reale si presentano per richiedere una terapia, a causa della comorbilità (cioè della presenza simultanea di più diagnosi) che peraltro è molto frequente e che inevitabilmente porta a terapie più lunghe.
Io prenderò in esame non solo questo articolo di Westen, ma anche alcune parti di un altro suo lavoro di natura più concettuale che è uscito pochi mesi fa [Westen D., Morrison K. & Thompson-Brenner H., The empirical status of empirically supported psychotherapies: assumptions, findings, and reporting in controlled clinical trials. *Psychological Bulletin*, 2004, 130: 631-663]. Come scrivevo a p. 8 del mio editoriale del n. 1/2004 di *Psicoterapia e Scienze Umane*, l'aspetto interessante è che "Westen non si pone contro gli EST o contro la psicoterapia basata sulle prove di efficacia, anzi, si muove all'interno della stessa cornice scientifica. Ed è proprio con la rigorosa logica della ricerca empirica che Westen dimostra la fallacia di molte conclusioni a cui il movimento della psicoterapia *evidence-based* rischia di arrivare. Westen cioè non si pone scioccamente contro l'esigenza di ricerca empirica sull'efficacia della psicoterapia, anzi, ne è uno dei più accesi sostenitori, e muove la sua critica proprio allo scopo di perfezionare questo campo di ricerca, per arrivare ad individuare psicoterapie che siano ancor più efficaci, 'veramente efficaci', se così si può dire".
Conoscendo Westen, ho seguito la stesura di questo secondo articolo avvenuta nel corso degli ultimi cinque anni (tanto ci è voluto per scrivere questo lungo articolo), e, come avevo preannunciato nel mio editoriale del n. 1/2004 prima citato, abbiamo deciso di farlo uscire in italiano sul n. 1/2005 di *Psicoterapia e Scienze Umane*. Questo articolo di Westen serve anche da discussione critica del documento ufficiale dell'*American Psychological Association* (APA) in cui sono stati pubblicati appunto gli elenchi degli EST, documento che avevo tradotto in italiano e fatto uscire nel n. 3/2001 [Chambless D.L. & Ollendick T.H., Gli interventi psicologici validati empiricamente: controversie ed evidenze empiriche. *Psicoterapia e scienze umane*, 2001, XXXV, 3: 5-46 - una sintesi di questo lavoro è su Internet]. Si voleva cioè far conoscere al lettore italiano questa problematica nel modo più completo possibile, per poi facilitare un dibattito approfondito (la stessa operazione fu fatta una ventina di anni fa per un altro importante fenomeno che allora irrompeva nel mondo della psichiatria, il DSM-III, che fu presentato in anteprima nel n. 4/1983 e poi discusso criticamente nei numeri successivi della rivista).
Va ricordato che l'esigenza di compilare e diffondere elenchi di tecniche psicoterapeutiche supportate empiricamente è nata in realtà da esigenze comprensibili e ammirevoli, soprattutto dalla realistica preoccupazione che, anche a causa della *managed care*, per la terapia di disturbi come la depressione e l'ansia venissero utilizzate linee guida che prediligevano solo trattamenti farmacologici, mentre esistevano prove documentate in favore delle psicoterapie. Fu così che nel 1995

l'APA pubblicò due controversi rapporti di una *Task Force* che separavano gli EST dalle terapie a lungo termine e meno strutturate, praticate in genere dai clinici nella pratica reale, e da allora vari autori raccomandarono che i clinici dovessero ricevere un training primariamente in questi trattamenti di breve durata e supportati empiricamente, dato che le altre forme di terapia erano "meno essenziali e superate".
Sempre in questo contesto, Seligman, analizzando il famoso "Progetto del *Consumer Report* sulla psicoterapia" del 1995 [tradotto in italiano in *Integrazione nelle psicoterapie e nel counseling*, 1997, I, 1/2 - vedi segnalazione su *Psicoterapia e Scienze Umane*, n. 2/1998, pp. 171-172], portò alla attenzione della comunità psicoterapeutica la distinzione tra "efficacia" ed "efficienza". Come è noto, gli studi sulla efficacia (*efficacy*) misurano il risultato di una terapia sotto condizioni strettamente controllate, come in laboratorio, usando gruppi di controllo, distribuzione randomizzata dei pazienti nei gruppi, accurato training dei terapeuti secondo un manuale psicoterapeutico, durata standardizzata della terapia, ecc. Gli studi sulla efficienza (*effectiveness*) invece misurano il risultato di una terapia sotto le condizioni meno controllate della pratica clinica reale di tutti i giorni, non nel laboratorio. Mentre gli studi sulla efficacia enfatizzano la validità "interna", gli studi sulla efficienza enfatizzano la validità "esterna" o ecologica, cioè la generalizzabilità dei risultati alla popolazione generale, nella pratica clinica reale. Uno dei più grossi problemi incontrati dai ricercatori in psicoterapia infatti è quello di mantenere alta non solo la efficacia ma anche la efficienza, poiché una terapia che risulta efficace solo in laboratorio ma non nella pratica clinica reale è inutile, dato che lo scopo della ricerca empirica non è certo quello di pubblicare articoli su riviste scientifiche ma di contribuire, tramite questi, alla disseminazione di tecniche efficaci nella pratica clinica quotidiana, con beneficio di tutti i potenziali pazienti e non solo di quelli inclusi negli studi sperimentali.
Vediamo ora in che cosa consiste la metodologia degli EST. Gli EST condividono le seguenti caratteristiche: 1) i pazienti vengono scelti per l'inclusione nello studio allo scopo di massimizzare la omogeneità e minimizzare la presenza di condizioni concomitanti che potrebbero aumentare la variabilità della risposta terapeutica; 2) le tecniche terapeutiche vengono designate tipicamente per disturbi in Asse I (cioè per sindromi cliniche e non per disturbi di personalità - per chi non avesse familiarità con il DSM-III e il DSM-IV, nell'Asse I sono elencate le sindromi cliniche, ad esempio la depressione, l'ansia ecc., mentre nell'Asse II vi sono i disturbi di personalità); 3) le valutazioni del risultato mettono a fuoco soprattutto il sintomo che è al centro di interesse della rispettiva ricerca; 4) le terapie sono di durata breve e prefissata; 5) vengono seguiti fedelmente manuali di psicoterapia. In genere si dice che queste caratteristiche rendono lo studio "pulito", che questa è "buona scienza", e che l'esperimento è neutrale rispetto alla teoria di ogni singolo approccio terapeutico.
Ma in realtà, sostiene Westen, gli assunti su cui poggia la ricerca sugli EST non sono teoricamente neutri e, paradossalmente, alcuni di essi non solo *non sono supportati empiricamente*, ma anche *sono stati dimostrati falsi* proprio sulla base della stessa ricerca empirica. Vediamo quindi come Westen argomenta questa sua tesi, discutendo uno per uno quelli che lui ritiene essere gli assunti di base impliciti nella metodologia degli EST. Questi assunti sono i seguenti:
1) I processi psicologici sono altamente malleabili (mentre è dimostrato che non lo sono, nel senso che occorre molto tempo per modificarli)

Se i disturbi psicologici non fossero modificabili facilmente essi non sarebbero candidati per una terapia breve. I dati raccolti dalla meta-analisi condotta da Westen sugli EST per i disturbi depressivi e l'ansia generalizzata suggeriscono che gran parte delle vulnerabilità psicologiche è resistente al cambiamento. Inoltre, mentre fino a tempi relativamente recenti vi erano ancora dati equivoci sulla differenza tra terapie lunghe e brevi, ora è dimostrato che più lungo è il trattamento (due anni o più), più esso è efficace, cioè più i risultati si consolidano.

2) La maggior parte dei pazienti hanno un solo sintomo o possono essere trattati come se lo avessero (mentre presentano sintomi plurimi e comorbilità)

Il fatto che i pazienti possano avere un solo sintomo è un assunto fondamentale della metodologia degli EST. Non solo non è vero che la maggior parte dei pazienti hanno solo un sintomo, ma è vero il contrario, cioè che la maggior parte dei pazienti che vediamo presentano comorbilità. La comorbilità Asse I-Asse II (cioè la compresenza di sindromi cliniche e disturbi di personalità) varia dal 50% al 90% a seconda gli studi, per la maggior parte dei disturbi.

Questo fatto è inquietante anche alla luce del fatto che la metodologia degli EST implicitamente adotta un modello della comorbilità che quasi tutti i ricercatori in psicoterapia e psicopatologia di fatto rinnegherebbero, e precisamente che la maggior parte dei pazienti presentano disturbi multipli a caso, non correlati l'uno con l'altro. Può ben essere che, come molti difensori della metodologia degli EST sostengono, il miglior modo di trattare la comorbilità sia quello di affrontare un disturbo per volta usando manuali in sequenza, uno dopo l'altro fino a che vengono "estirpati" tutti i sintomi (ad esempio uno per la depressione, uno per l'ansia, uno per il disturbo da stress post-traumatico [PTSD], e così via). Ma questa può non essere la strategia migliore nelle seguenti condizioni: a) nel caso che disturbi in Asse I apparentemente diversi siano il riflesso di una sottostante causa comune, come ad esempio nel caso di depressione o ansia entrambe originate da vulnerabilità al rifiuto interpersonale o dalla tendenza a provare umore negativo; b) nel caso che disturbi in Asse I sorgano da tratti di personalità in Asse II che creano vulnerabilità alle ricadute; c) nel caso che la compresenza di sintomi multipli possa generare proprietà emergenti non riducibili alla somma delle caratteristiche dei singoli sintomi. I dati raccolti da Westen suggeriscono che queste condizioni sono molto frequenti.

Un altro fattore problematico è il fatto che condizioni subcliniche sono altrettanto frequenti delle condizioni cliniche in Asse I per le quali sono stati formulati i manuali, e non è ancora chiaro in che misura condizioni cliniche e subcliniche rispondono agli stessi interventi. La presenza di condizioni subcliniche rende indispensabile che il ricercatore osservi non solo le diagnosi categoriali in Asse I (ad esempio una depressione) ma anche la varietà di condizioni subcliniche che permangono dopo il trattamento. Queste condizioni subcliniche non solo sono variabili importanti per il risultato, ma la loro conoscenza permette di capire meglio se il trattamento ha inciso sulla diatesi (cioè la predisposizione) che rende il paziente vulnerabile alle ricadute. Per esempio, se si studia l'efficacia della terapia della anoressia nervosa bisognerebbe anche osservare il comportamento della paziente in generale, dato che, ad esempio, pazienti "guarite" dall'anoressia possono continuare a mostrare peculiarità nello stile alimentare (spezzettare il cibo in piccoli pezzi, mangiare solo certi alimenti, ecc.), nella dieta (monitorare eccessivamente le calorie della dieta), nell'immagine corporea, e così via.

In conclusione, occorrerebbe conoscere meglio i reali problemi che hanno i pazienti e che li motivano a chiedere aiuto, e questa relativa assenza di informazioni è un problema per la ricerca in psicoterapia. Di fatto, la tendenza a focalizzare la ricerca solo su disturbi definiti dal DSM-IV ha virtualmente eliminato tutta quella ricerca in psicoterapia su problemi minori come l'ansia di parlare in pubblico o l'assertività che una volta dominavano praticamente tutta la ricerca in psicoterapia.

3) I sintomi psicologici possono essere trattati a prescindere dalla personalità di chi li presenta (mentre è dimostrato che la personalità gioca un ruolo rilevante)

Anche questo assunto, come il precedente, è essenziale per la metodologia degli EST, soprattutto a causa della manualizzazione (che, tranne eccezioni, non permette un trattamento dei problemi della personalità) e della brevità del trattamento (che è indispensabile per esigenze di ricerca) [per un approfondimento sui manuali di psicoterapia, vedi la mia rubrica del n. 51/1989 del *Ruolo Terapeutico*]. Ma, come ben sappiamo, non esiste alcuna teoria della personalità che suggerisca che importanti tratti della personalità possano essere modificati in una terapia che dura poche sedute (ad esempio da 6 a 20) di 45 minuti l'una. Si prenda ad esempio l'unica terapia per i disturbi di personalità che rientra negli EST, la *Dialectical Behavior Therapy* (DBT) della Linehan per i borderline: questa tecnica dura un anno, ma in questo anno si riesce soprattutto a ridurre i sintomi parasuicidari (ad esempio le automutilazioni), mentre la depressione, l'angoscia e i sentimenti di vuoto non diminuiscono in un anno, e non vi sono dati che dimostrino l'efficacia a lungo termine della DBT (per ammissione della stessa Linehan, la DBT dovrebbe durare almeno un altro anno - per un approfondimento sulla DBT della Linehan, vedi il mio articolo sul n. 3/2004 di *Psicoterapia e Scienze Umane*).

Se l'assunto quindi è che un disturbo in Asse I può essere trattato indipendentemente dalla personalità sottostante, abbiamo dati che dimostrano il contrario: i disturbi d'ansia e dell'umore sono correlati a variabili che da sempre vengono considerate variabili di personalità (come ad esempio l'umore negativo), e diverse diatesi di personalità (come vulnerabilità alla perdita e all'insuccesso) predispongono alla depressione. Non solo, ma vi sono indicazioni secondo cui la presenza di comorbilità in Asse I è un indicatore della presenza di patologia in Asse II, nel senso che più vi sono disturbi multipli in Asse I più aumenta la probabilità che siano presenti disturbi in Asse II.

Inoltre, il significato dei sintomi in Asse I varia considerevolmente a seconda del tipo di disturbo di personalità sottostante. Ad esempio, la depressione in un borderline è diversa non solo quantitativamente, ma anche qualitativamente dalla depressione in un paziente non borderline. Riguardo al trattamento, come è noto i pazienti trattati per un disturbo in Asse I migliorano meno se hanno un disturbo in Asse II, soprattutto borderline. Questo problema spesso è stato concettualizzato in termini di comorbilità in Asse II che funge da variabile moderatrice, ma il concetto di comorbilità qui può essere fuorviante perché implica che le variabili di personalità siano una aggiunta ai sintomi di Asse I che sono essenzialmente distinti da esse. Sarebbe come studiare l'effetto della aspirina come terapia della febbre e considerare "comorbide" la meningite, l'influenza o l'appendicite, che verrebbero concepite come variabili che moderano il rapporto tra la terapia (l'aspirina) e il risultato (l'abbassamento della febbre). Più corretto invece è considerare la depressione e l'ansia come segnali che qualcosa non va, a causa ad esempio di *life*

events (come una perdita), o variabili temperamentali o di personalità di lunga durata (come l'attivazione di vulnerabilità caratterologiche).

4) I pazienti sono capaci e disponibili a riferire all'inizio della terapia quale è il loro problema (mentre spesso il problema responsabile del disturbo viene compreso a trattamento avanzato)

Questo aspetto è essenziale per la metodologia degli EST, che prevede che i pazienti si presentino con un insieme di sintomi identificabili (che tipicamente soddisfano i criteri di una diagnosi in Asse I). In realtà i pazienti spesso presentano quadri sfumati, che richiedono una formulazione diagnostica più approfondita che non semplicemente contare un numero minimo di criteri diagnostici. In un tipico studio di EST, il paziente viene valutato due volte, una prima volta brevemente al telefono quando vi è il primo contatto dove si valuta la sua appropriatezza per lo studio in questione, e una seconda volta in modo più esteso per la valutazione pre-trattamento. Poi il paziente va nello studio del terapeuta assegnatogli che inizia a trattarlo convinto che la diagnosi sia corretta e primaria.

Nella realtà clinica invece le cose vanno in modo abbastanza diverso. Se il paziente ha più di un sintomo, e se i sintomi sono collegati a un problema di personalità, il clinico deve cominciare con una valutazione approfondita non solo dei sintomi e della loro storia, ma del paziente e della sua storia. Il sintomo o i sintomi che il paziente identifica inizialmente possono non diventare affatto il *focus* del trattamento nel tempo. Tanto per fare un esempio, molti giovani omosessuali che non hanno ancora accettato o riconosciuto la loro omosessualità soffrono di depressione, ansia o idee suicidarie, e questi sintomi possono sembrare i sintomi bersaglio. In questi casi, possono passare settimane o mesi prima che il paziente sia capace di riconoscere o accettare la fonte stressante sottostante (la non accettazione della propria omosessualità e i relativi conflitti con le pressioni ambientali). Tutti abbiamo visto giovani omosessuali trattati da medici generici o psichiatri che cercavano di curare la loro depressione con dei farmaci, come pure abbiamo visto tanti pazienti che si lamentavano di depressione o ansia per poi scoprire, solo in seguito, che essi non avevano mai elaborato la perdita di un importante rapporto affettivo. Non sappiamo in che misura situazioni come queste sono responsabili di gran parte della sintomatologia manifesta incontrata nella pratica clinica quotidiana, ma la metodologia degli EST non prevede la loro esistenza o le ritiene irrilevanti per due motivi: 1) limitare il numero di sedute (ad esempio a un numero che va da 6 a 16) e prescrivere quel numero in anticipo è utile per standardizzare la terapia e poter quindi fare ricerca, ma rende molto difficile una esplorazione approfondita e una flessibilità nell'approccio terapeutico e quindi anche una sua maggiore efficacia; 2) la manualizzazione presuppone che la stessa tecnica (ad esempio identificare e combattere le credenze patogene) funzionerà indipendentemente dalla specificità del caso. Sebbene questo possa funzionare per certi sintomi e terapie (soprattutto in trattamenti basati sulla esposizione comportamentale per sintomi d'ansia), è difficile immaginare che le stesse tecniche utili per aiutare una persona con sentimenti cronici di inadeguatezza sarà sempre ottimale per un paziente che lotta con una omosessualità non accettata, che è stato abbandonato dalla moglie, che soffre per le sequele di un abuso sessuale, che lotta contro i significati dell'invecchiamento nel contesto di una personalità narcisistica e così via, anche se tutti condividono la diagnosi di "Depressione maggiore".

Un corollario dell'assunto che i pazienti possano effettivamente conoscere e riferire cosa li faccia soffrire è che i sintomi devono essere compresi letteralmente, cioè che il *focus* della terapia deve essere sulla sintomatologia manifesta. Secondo questa concezione, un disturbo alimentare è un problema col cibo e non con il controllo egli impulsi o con la regolazione affettiva, un disturbo depressivo è un problema con l'umore e con una cognitività depressiva e non un problema con un lutto non risolto o con il mantenimento di una relazione significativa, e così via. Questo assunto, come si può ben vedere, non è teoricamente neutrale ma deriva dalla teoria della terapia comportamentale.

5) Gli elementi di una terapia efficace sono separabili gli uni dagli altri e possono essere sommati (mentre è dimostrato che una psicoterapia non può essere "smantellata", nel senso che il suo significato è diverso dalla semplice somma delle sue parti)

L'assunto secondo cui gli ingredienti di una terapia possano essere separati gli uni dagli altri permette ad esempio che i ricercatori paragonino un approccio strettamente comportamentale per curare il panico ad un approccio combinato cognitivo-comportamentale. Questo assunto può anche andare bene per certi disturbi ma non per altri. Meno la terapia è strutturata (come ad esempio una terapia dinamica a lungo termine), e meno utile può essere la strategia dello smantellamento perché il corso della terapia non può essere prescritto così facilmente. Il problema è che più un manuale diventa una guida generale e non un insieme di prescrizioni "passo dopo passo" che insegna "cosa fare" in ogni momento quasi in modo algoritmico, meno i ricercatori possono trarre inferenze utili dai dati.

Le cose si complicano ulteriormente se in una terapia riuscita sono implicate le variabili relazionali tra paziente e terapeuta, cosa peraltro dimostrata da tutte le ricerche sul processo di cui si è a conoscenza. Per esempio, i ricercatori non possono misurare facilmente quanto i pazienti si sentono capiti, contenuti, criticati ecc., perché queste variabili interazionali dipendono dalle interpretazioni del comportamento del terapeuta da parte del paziente.

6) Gli elementi efficaci di una terapia possono essere manualizzati e gli interventi specificati nel manuale sono causalmente correlati al risultato (mentre alcuni studi, utilizzando il *Psychotherapy Process Q-set* [PQS], hanno dimostrato non solo che vengono usati interventi appartenenti a manuali diversi, ma anche che spesso non vi è correlazione tra il risultato e gli interventi prescritti dal manuale)

La manualizzazione è indispensabile nella metodologia degli EST, perché permette la standardizzazione del trattamento e il controllo delle variabili potenzialmente confondenti. Ma sappiamo che la manualizzazione può rendere gli interventi del terapeuta rigidi e difficili da correggere.

Alcune ricerche recenti, per esempio, utilizzando il PQS hanno misurato alcune variabili del processo dalle trascrizioni di terapie brevi sia psicodinamiche che cognitive. Uno dei meriti del PQS è quello di misurare quanto una terapia aderisce in realtà all'approccio psicodinamico, cognitivo-comportamentale o altro, correlando il processo terapeutico osservato con quello di sedute prototipiche, ideali, come descritte da esperti di ciascun approccio. Alcuni autori, ad esempio, hanno trovato non solo che terapeuti di entrambi gli approcci usano tecniche dell'altro approccio, ma che in entrambi i tipi di terapia il risultato positivo era associato all'uso di tecniche proprie del prototipo empirico della

psicoterapia psicodinamica. In questo studio cioè l'uso da parte di terapeuti cognitivi di tecniche cognitive non era correlato col risultato.

Le conclusioni di Westen: gli assunti di base degli EST non sono teoricamente neutrali e non sono stati testati o sono stati testati ma dimostrati falsi

Dopo aver preso in rassegna la discussione critica di questi assunti impliciti della metodologia degli EST, colpiscono due fatti, dice Westen: 1) essi non sono teoricamente neutrali, ma rispecchiano gli assunti fondamentali della terapia cognitivo-comportamentale, per lo meno della terapia cognitivo-comportamentale degli anni 1960-70 quando questi assunti cominciarono a definire cosa poteva essere considerato un valido studio sul risultato e quindi a influenzare le decisioni per la pubblicazione e il finanziamento delle ricerche (e questi assunti oggi non sono più accettati, anche in modo esplicito, da molti esponenti stessi del movimento di terapia cognitivo-comportamentale); 2) gran parte di questi assunti sono empiricamente testabili, ma molti di essi non sono stati mai testati o sono stati testati e in un modo o nell'altro sono stati dimostrati falsi.

Dopo aver discusso gli assunti di base impliciti nella metodologia degli EST, vediamo ora i risultati empirici di questi studi, e prendiamo come esempio paradigmatico uno studio sulla psicoterapia della depressione ben progettato, condotto con la metodologia degli EST.

Riesame di un tipico studio su un EST per la depressione

I ricercatori di questo studio condotto con la metodologia degli EST [Thase *et al*., Relapse after cognitive behavior therapy of depression: Potential implications for longer courses of treatment. *American Journal of Psychiatry*, 1992, 149: 1046-1052] hanno valutato 130 pazienti depressi, dei quali 54 sono stati scartati e 76 sono stati considerati adatti allo studio e inclusi nella ricerca. Il tasso di inclusione in questo caso quindi è stato del 58%, che, come sanno bene i ricercatori, è abbastanza alto perché è circa il doppio di quello tipico di questo ricerche controllate. Tra i pazienti inclusi, 64 (81%) hanno completato lo studio. Di questi 64, alla fine della terapia 23 sono stati considerati "totalmente guariti" e 27 "parzialmente guariti", raggiungendo un tasso di guarigione completa di circa il 36% e un tasso di guarigione parziale leggermente maggiore, del 42% (mentre gli insuccessi erano il 22%). Leggendo i dati in un altro modo, si può dire che circa il 18% dei pazienti depressi inizialmente valutati (che erano 130) hanno completato la terapia e sono guariti completamente, e che il 21% hanno completato la terapia e sono guariti parzialmente (i pazienti guariti, totalmente [23] o parzialmente [27], sono stati 50, il 38,5% dei 130 iniziali, e gli insuccessi il 61,5%).

A un anno di *follw-up*, 16 dei 50 pazienti totalmente o parzialmente guariti hanno avuto una ricaduta di depressione maggiore, riducendo quindi a 34 i pazienti guariti almeno parzialmente dopo un anno. Questi sono il 26% del campione iniziale dei 130 esaminati, e il 45% di quelli che sono stati inclusi nello studio (dopo averne escluso cioè circa la metà a causa di condizioni concomitanti sfavorevoli che li rendevano candidati non adatti). Se poi si allarga la definizione di ricaduta, e la si intende non solo come una ricaduta di depressione maggiore, ma anche come un disturbo dell'umore diagnosticabile che comunque necessita di ulteriore trattamento, il numero dei pazienti che rimanevano guariti totalmente o parzialmente cade a 29, cioè il 38% di quelli che iniziarono la terapia e il 22% di quelli inizialmente valutati (ma andrebbe qui visto attentamente anche come reagirono al placebo i pazienti del gruppo di controllo dopo un anno, cosa accadde

ai pazienti dopo due anni, cosa accadde ai pazienti non trattati neanche col placebo cioè esclusi dallo studio, come era il funzionamento sociale e lavorativo di questi pazienti dopo la terapia, e così via).
Potremmo chiederci come reagirebbe un consumatore della psicoterapia se sapesse che ha solo il 22% di probabilità di migliorare dalla depressione dopo un anno dalla fine della terapia. Eppure questo reperto non è raro, e questo è un esempio di uno studio tra i meglio progettati. E' un prototipo di tutti gli studi di questo tipo, ma differisce solo in un aspetto dagli altri studi: il tasso di successo qui trovato è *circa il doppio* di quello trovato in un normale studio ben progettato per l'efficacia della terapia manualizzata a breve termine per la depressione.

Conclusioni

Come accennavo all'inizio, è consigliabile molta prudenza nell'usare il termine di psicoterapie "validate" o "supportate empiricamente", in quanto questo termine si riferisce solo a un determinato tipo di terapie studiate in laboratorio, per disturbi spesso monosintomatici o senza la comorbilità tipica di gran parte dei pazienti che si incontrano nella pratica reale, quindi la loro generalizzabilità è dubbia [vedi anche il libro di Roth & Fonagy del 1996 *Psicoterapie a prova di efficacia* (Roma: Il Pensiero Scientifico, 1997) e il mio editoriale del n. 4/1999 della *Rivista Sperimentale di Freniatria*, intitolato "Psicoterapia e servizi di salute mentale"]. Ironicamente, si può dire che i pazienti che vediamo nella nostra pratica clinica quotidiana assomigliano molto di più ai pazienti che vengono esclusi dagli studi sugli EST che a quelli che vengono inclusi. La metodologia degli EST (sperimentazioni randomizzate e controllate, utilizzo di campioni omogenei, standardizzazione della tecnica tramite manuali, e verifica delle ipotesi causali tramite strategie di "smantellamento") ha costituito il *gold standard* della ricerca in psicoterapia per un paio di decenni, ma questa metodologia riflette un misto di buona scienza (applicazione sofisticata del disegno sperimentale) e di una serie di assunti empiricamente non corretti per molti disturbi e tipi di terapie. Non è un caso che molti di questi studi ci hanno ripetutamente messo di fronte al "verdetto di Dodo" (da *Alice nel paese delle meraviglie*) di cui ci ha parlato Luborsky - "Tutti hanno vinto e ognuno deve ricevere un premio" - cioè al paradosso della equivalenza tra tutte le psicoterapie [per un approfondimento, rimando alla mia rubrica del n. 66/1994 del *Ruolo Terapeutico*, e a una mia *review* sulla ricerca in psicoterapia, che è anche su Internet al sito http://www.psychomedia.it/spr-it/artdoc/migone96.htm].
La meta-analisi di Westen sugli studi sperimentali sulla psicoterapia della depressione, del panico e dell'ansia generalizzata ha mostrato che se è vero che vi è una iniziale risposta positiva, i pazienti rimangono subclinicamente sintomatici e hanno ricadute entro due anni di *follw-up*, per cui richiedono ulteriore trattamento. Vi è ragione di ritenere quindi che questi pazienti abbiano bisogno di terapie più prolungate di quelle accettabili dalla metodologia degli EST, e del resto chi ha esperienza clinica sa che tratti di personalità e stati affettivi generalizzati (come la depressione e l'ansia) non possono essere modificati nel giro di poche ore. Una ricerca del gruppo di Maj, pubblicata nel 1992 sull'*American Journal of Psychiatry*, ha rilevato che il tasso di ricadute oltre i 5 anni nei pazienti con depressione maggiore è ben superiore del 50%, e colpisce a questo riguardo come siano pochi gli studi di *follw-up* che vadano oltre i 5 anni, in modo da poter capire le reale efficacia di un trattamento. In certe aree della medicina la risposta terapeutica a breve termine viene chiamata "risposta iniziale", e occorrono ulteriori

ricerche per stabilire la effettiva guarigione, mentre nella ricerca in psicoterapia una buona risposta iniziale è stata spesso confusa con una genuina efficacia. Nessun ricercatore sul cancro ad esempio oserebbe dire che una terapia è efficace senza un *follow-up* di almeno 5-10 anni. Questa analogia tra la ricerca sul cancro e sulla psicoterapia qui non viene fatta in modo casuale, perché alcuni sostenitori degli EST hanno affermato che nessuno avrebbe dubbi se scegliere tra un oncologo che segue la letteratura sulla *Evidence-Based Medicine* e un altro che invece si basa solo sulla propria esperienza clinica. Ma, se si guarda bene a questa analogia, è anche vero che una terapia contro il cancro che non garantisce risultati oltre i due anni viene subito scartata, cosa che non avviene in psicoterapia.

Quale può essere dunque una possibile soluzione ai problemi qui discussi, in che modo può essere migliorato il campo della ricerca in psicoterapia? Una possibilità, suggerisce Westen, è di implementare anche studi di tipo diverso da quelli tipici degli EST. Una volta Cronbach, in un articolo del 1957 su *American Psychologist*, disse che vi sono due discipline di psicologia scientifica, una di ricerca "sperimentale" e una di ricerca "correlazionale". La prima metodologia, sperimentale, che si può definire "dal basso all'alto" (*bottom-up*), è quella propria degli EST e di gran parte della ricerca in psicoterapia degli ultimi due decenni. La seconda metodologia prevede invece un approccio alternativo, "dall'alto al basso" (*top-down*), secondo il quale si osservano le strategie terapeutiche usate da clinici esperti nella loro pratica clinica quotidiana, e tramite strumenti sofisticati e ben validati le si correlano con specifiche variabili del risultato. Si possono poi esaminare variabili potenzialmente moderatrici come la comorbilità o i tratti di personalità, e *solo in un secondo momento* studiare sperimentalmente, uno per uno, con la metodologia tradizionale, quegli interventi che sembrano correlati con un risultato positivo. Questa metodologia implicherebbe quindi l'utilizzo della pratica clinica reale come laboratorio iniziale da cui partire, e poi in un secondo momento il ricorso a ricerche più sofisticate per affinare le indagini e verificare singole ipotesi [sul rapporto tra clinica e ricerca, vedi anche la mia rubrica del n. 88/2001 del *Ruolo Terapeutico*, dal titolo "La dicotomia tra clinica e ricerca in psicoterapia: due scienze separate?"].

La proposta di Westen quindi è di percorrere entrambe le strade della ricerca in psicoterapia, in modo sinergico e dialettico, perché entrambe possono essere portatrici di dati utili: a volte la ricerca dovrebbe guidare la pratica clinica, e altre volte la pratica clinica dovrebbe guidare la ricerca, avendo entrambe limiti e pregi.

Evidence-Based Therapy Relationships: Research Conclusions and Clinical Practices

John C. Norcross
University of Scranton

Bruce E. Wampold
University of Wisconsin, Madison

In this closing article of the special issue, we present the conclusions and recommendations of the interdivisional task force on evidence-based therapy relationships. The work was based on a series of meta-analyses conducted on the effectiveness of various relationship elements and methods of treatment adaptation. A panel of experts concluded that several relationship elements were demonstrably effective (alliance in individual psychotherapy, alliance in youth psychotherapy, alliance in family therapy, cohesion in group therapy, empathy, collecting client feedback) while others were probably effective (goal consensus, collaboration, positive regard). Three other relationship elements (congruence/genuineness, repairing alliance ruptures, and managing countertransference) were deemed promising but had insufficient evidence to conclude that they were effective. Multiple recommendations for practice, training, research, and policy are advanced.

Keywords: psychotherapy relationship, treatment outcome, meta-analysis, alliance, evidence-based practice

We shall not cease from exploration
And the end of all our exploring
Will be to arrive where we started
And know the place for the first time.
—T. S. Eliot (*Little Gidding* in *Four Quartets*)

Having traversed more than a dozen meta-analyses and arrived at the end of this special issue, we have a final opportunity to present the interdivisional task force conclusions and to reflect on its work. Like the tireless traveler in Eliot's poem, we have rediscovered the therapy relationship and know it, again, for the first time.

This closing article presents the conclusions and recommendations of the second Task Force on Evidence-Based Therapy Relationships. These statements reaffirm and, in several instances, update those of the earlier task force (Norcross, 2001, 2002). We then offer some final thoughts on what works, what does not work, and clinical practice.

Conclusions of the Task Force

◆ The therapy relationship makes substantial and consistent contributions to psychotherapy outcome independent of the specific type of treatment.

◆ The therapy relationship accounts for why clients improve (or fail to improve) at least as much as the particular treatment method.

◆ Practice and treatment guidelines should explicitly address therapist behaviors and qualities that promote a facilitative therapy relationship.

◆ Efforts to promulgate best practices or evidence-based practices (EBPs) without including the relationship are seriously incomplete and potentially misleading.

◆ Adapting or tailoring the therapy relationship to specific patient characteristics (in addition to diagnosis) enhances the effectiveness of treatment.

◆ The therapy relationship acts in concert with treatment methods, patient characteristics, and practitioner qualities in determining effectiveness; a comprehensive understanding of effective (and ineffective) psychotherapy will consider all of these determinants and their optimal combinations.

◆ Table 1 summarizes the task force conclusions regarding the evidentiary strength of (a) elements of the therapy relationship primarily provided by the psychotherapist and (b) methods of adapting psychotherapy to particular patient characteristics.

◆ The conclusions do *not* by themselves constitute a set of practice standards but represent current scientific knowledge to be understood and applied in the context of all the clinical evidence available in each case.

Recommendations of the Task Force

General Recommendations

1. We recommend that the results and conclusions of this second task force be widely disseminated in order to enhance awareness and use of what "works" in the therapy relationship.

Table 1
Task Force Conclusions

	Elements of the relationship	Methods of adapting
Demonstrably effective	Alliance in individual psychotherapy	Reactance/resistance level
	Alliance in youth psychotherapy	Preferences
	Alliance in family therapy	Culture
	Cohesion in group therapy	Religion and spirituality
	Empathy	
	Collecting client feedback	
Probably effective	Goal consensus	Stages of change
	Collaboration	Coping style
	Positive regard	
Promising but insufficient	Congruence/genuineness	Expectations
Research to judge	Repairing alliance ruptures	Attachment style
	Managing countertransference	

2. Readers are encouraged to interpret these findings in the context of the acknowledged limitations of the task force's work.

3. We recommend that future task forces be established periodically to review these findings, include new elements of the relationship, incorporate the results of non-English language publications (where practical), and update these conclusions.

Practice Recommendations

4. Practitioners are encouraged to make the creation and cultivation of a therapy relationship, characterized by the elements found to be demonstrably and probably effective, a primary aim in the treatment of patients.

5. Practitioners are encouraged to adapt or tailor psychotherapy to those specific patient characteristics in ways found to be demonstrably and probably effective.

6. Practitioners are encouraged to routinely monitor patients' responses to the therapy relationship and ongoing treatment. Such monitoring leads to increased opportunities to reestablish collaboration, improve the relationship, modify technical strategies, and avoid premature termination.

7. Concurrent use of evidence-based therapy relationships *and* evidence-based treatments adapted to the patient is likely to generate the best outcomes.

Training Recommendations

8. Training and continuing education programs are encouraged to provide competency-based training in the demonstrably and probably effective elements of the therapy relationship.

9. Training and continuing education programs are encouraged to provide competency-based training in adapting psychotherapy to the individual patient in ways that demonstrably and probably enhance treatment success.

10. Accreditation and certification bodies for mental health training programs should develop criteria for assessing the adequacy of training in evidence-based therapy relationships.

Research Recommendations

11. Researchers are encouraged to progress beyond correlational designs that associate the frequency of relationship behaviors with patient outcomes to methodologies capable of examining the complex associations among patient qualities, clinician behaviors, and treatment outcome. Of particular importance is disentangling the patient contributions and the therapist contributions to relationship elements and, ultimately, outcome.

12. Researchers are encouraged to examine the specific mediators and moderators of the links between the relationship elements and treatment outcome.

13. Researchers are encouraged to address the observational perspective (i.e., therapist, patient, or external rater) in future studies and reviews of "what works" in the therapy relationship. Agreement among observational perspectives provides a solid sense of established fact; divergence among perspectives holds important implications for practice.

Policy Recommendations

14. APA's Division of Psychotherapy, Division of Clinical Psychology, and other practice divisions are encouraged to educate its members in the benefits of evidence-based therapy relationships.

15. Mental health organizations as a whole are encouraged to educate their members about the improved outcomes associated with using evidence-based therapy relationships, as they frequently now do about evidence-based treatments.

16. We recommend that the American Psychological Association and other mental health organizations advocate for the research-substantiated benefits of a nurturing and responsive human relationship in psychotherapy.

17. Finally, administrators of mental health services are encouraged to attend to the relational features of those services. Attempts to improve the quality of care should account for treatment relationships and adaptations.

What Works

The process by which the preceding conclusions on which relationship elements are demonstrably and probably effective require some elaboration, as these tend to be the most cited and controversial findings of the task force. These conclusions represent the consensus of expert panels composed of five judges who independently reviewed and rated the empirical evidence. They evaluated, for each relationship element, the previous research summary and the new meta-analysis according to the following criteria: number of empirical studies; consistency of empirical results; independence of supportive studies; magnitude of association between the relationship element and outcome; evidence for causal link between relationship element and outcome; and the ecological or external validity of research. Their respective ratings of demonstrably effective, probably effective, or promising but insufficient research to judge were then combined to render a consensus. In this way, we added a modicum of rigor and consensus to the process, which was admittedly less so in the first task force.

The consensus deemed six of the relationship elements as demonstrably effective, three as probably effective, and three as promising but insufficient research to judge. As members of that consensus panel, we were impressed by the skepticism and precision of the raters (as scientists ought to be). At the same time, were also impressed by the disparate and perhaps elevated standards against which these relationship elements were evaluated.

Consider the evidentiary strength required for psychological treatments to be considered demonstrably efficacious in two influential compilations of evidence-based practices. The Division of Clinical Psychology's Subcommittee on Research-Supported Treatments (www.div12.org/PsychologicalTreatments/index.html) requires two between-groups design experiments demonstrating that a psychological treatment is either (a) statistically superior to pill or psychological placebo or to another treatment or (b) equivalent to an already established treatment in experiments with adequate sample sizes. The studies must have been conducted with treatment manuals and conducted by at least two different investigators. The typical effect size of those studies was often smaller than the effects for the relationship elements reported in this special issue. For listing in SAMHSA's National Registry of Evidence-based Programs and Practices (www.nrepp.samhsa.gov), only evidence of statistically significant behavioral outcomes demonstrated in at least one study, using an experimental or quasi-experimental design, that has been published in a peer-reviewed journal or comprehensive evaluation report is needed. The intervention must be accompanied by implementation materials, training, and support resources that are ready to use by the public. By these standards, practically all of the dozen relationship elements in this journal issue would be considered demonstrably effective, if not for the requirement of a randomized clinical trial, which is neither clinically nor ethically feasible for the vast majority of these elements (as explicated in the introductory article in this issue).

In important ways, the criteria for relationship elements are more rigorous. Whereas the criteria for designating treatments as evidence-based relies on only one or two studies, the evidence for relationship elements discussed here are based on comprehensive meta-analyses of many studies (in excess of 50 in several cases), spanning various treatments and research groups. The studies used to establish evidence-based treatments are, however, clinical trials, which are often designated as the "gold standard" for establishing evidence. Nevertheless, these studies are often plagued by confounds, such as researcher allegiance and bogus comparisons. The point here is not to denigrate the criteria used to establish evidence-based treatments but to underscore the robust scientific standards by which the relationship elements have been evaluated.

A further research complication, but a clinical strength, concerns responsiveness. Research on the effectiveness of the psychotherapy relationship is constrained by therapist responsiveness—the ebb and flow of clinical interaction. Responsiveness refers to therapist behavior that is affected by emerging context and occurs on many levels, including choice of a treatment method, case formulation, strategic use of the self, and then adjusting those to meet the emerging, evolving needs of the client at any given moment (Stiles, Honos-Webb, & Surko, 1998). Effective psychotherapists are responsive to the different needs of their clients, providing varying levels of relationship elements in different cases, and within the same case, at different moments. Successful responsiveness can confound attempts to find naturalistically observed linear relations of outcome with therapist behaviors (e.g., cohesion, positive regard). Because of such problems, the statistical relations between the relationship and outcome cannot always be trusted. By being clinically attuned and flexible, psychotherapists make it more difficult in research studies to discern what works.

What Does Not Work

Translational research is both prescriptive and proscriptive—it tells us what works and what does not. In the following section, we

highlight those therapist relational behaviors that are ineffective, perhaps even hurtful, in psychotherapy.

One means of identifying ineffective qualities of the therapeutic relationship is to simply reverse the effective behaviors. Thus, what does not work includes a low quality alliance in individual psychotherapy, lack of cohesion in group therapy, and discordance in couple and family therapy. Paucity of empathy, collaboration, consensus, and positive regard predict treatment drop out and failure. The ineffective practitioner will resist client feedback, ignore alliance ruptures, and discount his or her countertransference.

Another means of identifying ineffective qualities of the relationship is to scour the research literature and conduct polls of experts. Here are six behaviors to avoid according to that research (Duncan, Miller, Wampold, & Hubble, 2010) and a Delphi poll (Norcross, Koocher, & Garofalo, 2006):

◆ *Confrontations.* Controlled research trials, particularly in the addictions field, consistently find a confrontational style to be ineffective. In one review (Miller, Wilbourne, & Hettema, 2003), confrontation was ineffective in all 12 identified trials. By contrast, expressing empathy, rolling with resistance, developing discrepancy, and supporting self-efficacy, characteristic of motivational interviewing, have demonstrated large effects with a small number of sessions (Lundahl & Burke, 2009).

◆ *Negative processes.* Client reports and research studies converge in warning therapists to avoid comments or behaviors that are hostile, pejorative, critical, rejecting, or blaming (Binder & Strupp, 1997; Lambert & Barley, 2002). Therapists who attack a client's dysfunctional thoughts or relational patterns need, repeatedly, to distinguish between attacking the person versus her behavior.

◆ *Assumptions.* Psychotherapists who assume or intuit their client's perceptions of relationship satisfaction and treatment success are frequently inaccurate. By contrast, therapists who specifically and respectfully inquire about their client's perceptions frequently enhance the alliance and prevent premature termination (Lambert & Shimokawa, pp. 72–79, this issue).

◆ *Therapist-centricity.* A recurrent lesson from process-outcome research is that the client's observational perspective on the therapy relationship best predicts outcome (Orlinsky, Ronnestad, & Willutzki, 2004). Psychotherapy practice that relies on the therapist's observational perspective, while valuable, does not predict outcome as well. Therefore, privileging the client's experiences is central.

◆ *Rigidity.* By inflexibly and excessively structuring treatment, the therapist risks empathic failures and inattentiveness to clients' experiences. Such a therapist is likely to overlook a breach in the relationship and mistakenly assume she has not contributed to that breach. Dogmatic reliance on particular relational or therapy methods, incompatible with the client, imperils treatment (Ackerman & Hilsenroth, 2001).

◆ *Procrustean bed.* As the field of psychotherapy has matured, using an identical therapy relationship (and treatment method) for all clients is now recognized as inappropriate and, in select cases, even unethical. The efficacy and applicability of psychotherapy will be enhanced by tailoring it to the unique needs of the client, not by imposing a Procrustean bed onto unwitting consumers of psychological services. We should all avoid the crimes of Procrustes, the legendary Greek giant who would cut the long limbs of clients or stretch short limbs to fit his one-size bed.

We can optimize therapy relationships by simultaneously using what works *and* studiously avoiding what does not work.

Concluding Thoughts

In the culture wars of psychotherapy that pit the therapy relationship against the treatment method (Norcross & Lambert, pp. 4–8, this issue), it is easy to chose sides, ignore disconfirming research, and lose sight of our superordinate commitment to patient benefit. Instead, let us conclude, like T. S. Eliot, by "arriving where we started" and underscoring three incontrovertible but oft-neglected truths about psychotherapy relationships.

First, the interdivisional taskforce was commissioned in order to augment patient benefit. We continue to explore what works in the therapy relationship and what works when we adapt that relationship to (nondiagnostic) patient characteristics. That remains our collective aim: improving patient success, however measured and manifested in a given case.

Second, psychotherapy is at root a human relationship. Even when "delivered" via distance or on a computer, psychotherapy is an irreducibly human encounter. Both parties bring themselves—their origins, culture, personalities, psychopathology, expectations, biases, defenses, and strengths—to the human relationship. Some will judge that relationship a precondition of change and others a process of change, but all agree that it is a relational enterprise.

Third, how we create and cultivate that powerful human relationship can be guided by the fruits of research. As Carl Rogers (1980) compellingly demonstrated, there is no inherent tension between a relational approach and a scientific one. Science can, and should, inform us about what works in psychotherapy, be it a treatment method, an assessment measure, a patient behavior, or, yes, a therapy relationship.

Evidence-Based Therapy Relationships: Research Conclusions and Clinical Practices

John C. Norcross
University of Scranton

Bruce E. Wampold
University of Wisconsin, Madison

In this closing article of the special issue, we present the conclusions and recommendations of the interdivisional task force on evidence-based therapy relationships. The work was based on a series of meta-analyses conducted on the effectiveness of various relationship elements and methods of treatment adaptation. A panel of experts concluded that several relationship elements were demonstrably effective (alliance in individual psychotherapy, alliance in youth psychotherapy, alliance in family therapy, cohesion in group therapy, empathy, collecting client feedback) while others were probably effective (goal consensus, collaboration, positive regard). Three other relationship elements (congruence/genuineness, repairing alliance ruptures, and managing countertransference) were deemed promising but had insufficient evidence to conclude that they were effective. Multiple recommendations for practice, training, research, and policy are advanced.

Keywords: psychotherapy relationship, treatment outcome, meta-analysis, alliance, evidence-based practice

We shall not cease from exploration
And the end of all our exploring
Will be to arrive where we started
And know the place for the first time.
—T. S. Eliot (*Little Gidding* in *Four Quartets*)

Having traversed more than a dozen meta-analyses and arrived at the end of this special issue, we have a final opportunity to present the interdivisional task force conclusions and to reflect on its work. Like the tireless traveler in Eliot's poem, we have rediscovered the therapy relationship and know it, again, for the first time.

This closing article presents the conclusions and recommendations of the second Task Force on Evidence-Based Therapy Relationships. These statements reaffirm and, in several instances, update those of the earlier task force (Norcross, 2001, 2002). We then offer some final thoughts on what works, what does not work, and clinical practice.

Conclusions of the Task Force

◆ The therapy relationship makes substantial and consistent contributions to psychotherapy outcome independent of the specific type of treatment.

◆ The therapy relationship accounts for why clients improve (or fail to improve) at least as much as the particular treatment method.

◆ Practice and treatment guidelines should explicitly address therapist behaviors and qualities that promote a facilitative therapy relationship.

◆ Efforts to promulgate best practices or evidence-based practices (EBPs) without including the relationship are seriously incomplete and potentially misleading.

◆ Adapting or tailoring the therapy relationship to specific patient characteristics (in addition to diagnosis) enhances the effectiveness of treatment.

◆ The therapy relationship acts in concert with treatment methods, patient characteristics, and practitioner qualities in determining effectiveness; a comprehensive understanding of effective (and ineffective) psychotherapy will consider all of these determinants and their optimal combinations.

◆ Table 1 summarizes the task force conclusions regarding the evidentiary strength of (a) elements of the therapy relationship primarily provided by the psychotherapist and (b) methods of adapting psychotherapy to particular patient characteristics.

◆ The conclusions do *not* by themselves constitute a set of practice standards but represent current scientific knowledge to be understood and applied in the context of all the clinical evidence available in each case.

Recommendations of the Task Force

General Recommendations

1. We recommend that the results and conclusions of this second task force be widely disseminated in order to enhance awareness and use of what "works" in the therapy relationship.

John C. Norcross, Department of Psychology, University of Scranton; Bruce E. Wampold, Department of Counseling Psychology, University of Wisconsin, Madison.

Portions of this article are adapted, by special permission of Oxford University Press, from a chapter of the same title by the same authors in J. C. Norcross (Ed.), 2011, *Psychotherapy relationships that work* (2nd ed.). New York, NY: Oxford University Press. The book project was cosponsored by the APA Division of Psychotherapy.

Correspondence regarding this article should be addressed to John C. Norcross, PhD, Department of Psychology, University of Scranton, Scranton, PA 18510-4596. E-mail: norcross@scranton.edu

Table 1
Task Force Conclusions

	Elements of the relationship	Methods of adapting
Demonstrably effective	Alliance in individual psychotherapy	Reactance/resistance level
	Alliance in youth psychotherapy	Preferences
	Alliance in family therapy	Culture
	Cohesion in group therapy	Religion and spirituality
	Empathy	
	Collecting client feedback	
Probably effective	Goal consensus	Stages of change
	Collaboration	Coping style
	Positive regard	
Promising but insufficient	Congruence/genuineness	Expectations
Research to judge	Repairing alliance ruptures	Attachment style
	Managing countertransference	

2. Readers are encouraged to interpret these findings in the context of the acknowledged limitations of the task force's work.

3. We recommend that future task forces be established periodically to review these findings, include new elements of the relationship, incorporate the results of non-English language publications (where practical), and update these conclusions.

Practice Recommendations

4. Practitioners are encouraged to make the creation and cultivation of a therapy relationship, characterized by the elements found to be demonstrably and probably effective, a primary aim in the treatment of patients.

5. Practitioners are encouraged to adapt or tailor psychotherapy to those specific patient characteristics in ways found to be demonstrably and probably effective.

6. Practitioners are encouraged to routinely monitor patients' responses to the therapy relationship and ongoing treatment. Such monitoring leads to increased opportunities to reestablish collaboration, improve the relationship, modify technical strategies, and avoid premature termination.

7. Concurrent use of evidence-based therapy relationships *and* evidence-based treatments adapted to the patient is likely to generate the best outcomes.

Training Recommendations

8. Training and continuing education programs are encouraged to provide competency-based training in the demonstrably and probably effective elements of the therapy relationship.

9. Training and continuing education programs are encouraged to provide competency-based training in adapting psychotherapy to the individual patient in ways that demonstrably and probably enhance treatment success.

10. Accreditation and certification bodies for mental health training programs should develop criteria for assessing the adequacy of training in evidence-based therapy relationships.

Research Recommendations

11. Researchers are encouraged to progress beyond correlational designs that associate the frequency of relationship behaviors with patient outcomes to methodologies capable of examining the complex associations among patient qualities, clinician behaviors, and treatment outcome. Of particular importance is disentangling the patient contributions and the therapist contributions to relationship elements and, ultimately, outcome.

12. Researchers are encouraged to examine the specific mediators and moderators of the links between the relationship elements and treatment outcome.

13. Researchers are encouraged to address the observational perspective (i.e., therapist, patient, or external rater) in future studies and reviews of "what works" in the therapy relationship. Agreement among observational perspectives provides a solid sense of established fact; divergence among perspectives holds important implications for practice.

Policy Recommendations

14. APA's Division of Psychotherapy, Division of Clinical Psychology, and other practice divisions are encouraged to educate its members in the benefits of evidence-based therapy relationships.

15. Mental health organizations as a whole are encouraged to educate their members about the improved outcomes associated with using evidence-based therapy relationships, as they frequently now do about evidence-based treatments.

16. We recommend that the American Psychological Association and other mental health organizations advocate for the research-substantiated benefits of a nurturing and responsive human relationship in psychotherapy.

17. Finally, administrators of mental health services are encouraged to attend to the relational features of those services. Attempts to improve the quality of care should account for treatment relationships and adaptations.

What Works

The process by which the preceding conclusions on which relationship elements are demonstrably and probably effective require some elaboration, as these tend to be the most cited and controversial findings of the task force. These conclusions represent the consensus of expert panels composed of five judges who independently reviewed and rated the empirical evidence. They evaluated, for each relationship element, the previous research summary and the new meta-analysis according to the following criteria: number of empirical studies; consistency of empirical results; independence of supportive studies; magnitude of association between the relationship element and outcome; evidence for causal link between relationship element and outcome; and the ecological or external validity of research. Their respective ratings of demonstrably effective, probably effective, or promising but insufficient research to judge were then combined to render a consensus. In this way, we added a modicum of rigor and consensus to the process, which was admittedly less so in the first task force.

The consensus deemed six of the relationship elements as demonstrably effective, three as probably effective, and three as promising but insufficient research to judge. As members of that consensus panel, we were impressed by the skepticism and precision of the raters (as scientists ought to be). At the same time, were also impressed by the disparate and perhaps elevated standards against which these relationship elements were evaluated.

Consider the evidentiary strength required for psychological treatments to be considered demonstrably efficacious in two influential compilations of evidence-based practices. The Division of Clinical Psychology's Subcommittee on Research-Supported Treatments (www.div12.org/PsychologicalTreatments/index.html) requires two between-groups design experiments demonstrating that a psychological treatment is either (a) statistically superior to pill or psychological placebo or to another treatment or (b) equivalent to an already established treatment in experiments with adequate sample sizes. The studies must have been conducted with treatment manuals and conducted by at least two different investigators. The typical effect size of those studies was often smaller than the effects for the relationship elements reported in this special issue. For listing in SAMHSA's National Registry of Evidence-based Programs and Practices (www.nrepp.samhsa.gov), only evidence of statistically significant behavioral outcomes demonstrated in at least one study, using an experimental or quasi-experimental design, that has been published in a peer-reviewed journal or comprehensive evaluation report is needed. The intervention must be accompanied by implementation materials, training, and support resources that are ready to use by the public. By these standards, practically all of the dozen relationship elements in this journal issue would be considered demonstrably effective, if not for the requirement of a randomized clinical trial, which is neither clinically nor ethically feasible for the vast majority of these elements (as explicated in the introductory article in this issue).

In important ways, the criteria for relationship elements are more rigorous. Whereas the criteria for designating treatments as evidence-based relies on only one or two studies, the evidence for relationship elements discussed here are based on comprehensive meta-analyses of many studies (in excess of 50 in several cases), spanning various treatments and research groups. The studies used to establish evidence-based treatments are, however, clinical trials, which are often designated as the "gold standard" for establishing evidence. Nevertheless, these studies are often plagued by confounds, such as researcher allegiance and bogus comparisons. The point here is not to denigrate the criteria used to establish evidence-based treatments but to underscore the robust scientific standards by which the relationship elements have been evaluated.

A further research complication, but a clinical strength, concerns responsiveness. Research on the effectiveness of the psychotherapy relationship is constrained by therapist responsiveness—the ebb and flow of clinical interaction. Responsiveness refers to therapist behavior that is affected by emerging context and occurs on many levels, including choice of a treatment method, case formulation, strategic use of the self, and then adjusting those to meet the emerging, evolving needs of the client at any given moment (Stiles, Honos-Webb, & Surko, 1998). Effective psychotherapists are responsive to the different needs of their clients, providing varying levels of relationship elements in different cases, and within the same case, at different moments. Successful responsiveness can confound attempts to find naturalistically observed linear relations of outcome with therapist behaviors (e.g., cohesion, positive regard). Because of such problems, the statistical relations between the relationship and outcome cannot always be trusted. By being clinically attuned and flexible, psychotherapists make it more difficult in research studies to discern what works.

What Does Not Work

Translational research is both prescriptive and proscriptive—it tells us what works and what does not. In the following section, we

highlight those therapist relational behaviors that are ineffective, perhaps even hurtful, in psychotherapy.

One means of identifying ineffective qualities of the therapeutic relationship is to simply reverse the effective behaviors. Thus, what does not work includes a low quality alliance in individual psychotherapy, lack of cohesion in group therapy, and discordance in couple and family therapy. Paucity of empathy, collaboration, consensus, and positive regard predict treatment drop out and failure. The ineffective practitioner will resist client feedback, ignore alliance ruptures, and discount his or her countertransference.

Another means of identifying ineffective qualities of the relationship is to scour the research literature and conduct polls of experts. Here are six behaviors to avoid according to that research (Duncan, Miller, Wampold, & Hubble, 2010) and a Delphi poll (Norcross, Koocher, & Garofalo, 2006):

◆ *Confrontations.* Controlled research trials, particularly in the addictions field, consistently find a confrontational style to be ineffective. In one review (Miller, Wilbourne, & Hettema, 2003), confrontation was ineffective in all 12 identified trials. By contrast, expressing empathy, rolling with resistance, developing discrepancy, and supporting self-efficacy, characteristic of motivational interviewing, have demonstrated large effects with a small number of sessions (Lundahl & Burke, 2009).

◆ *Negative processes.* Client reports and research studies converge in warning therapists to avoid comments or behaviors that are hostile, pejorative, critical, rejecting, or blaming (Binder & Strupp, 1997; Lambert & Barley, 2002). Therapists who attack a client's dysfunctional thoughts or relational patterns need, repeatedly, to distinguish between attacking the person versus her behavior.

◆ *Assumptions.* Psychotherapists who assume or intuit their client's perceptions of relationship satisfaction and treatment success are frequently inaccurate. By contrast, therapists who specifically and respectfully inquire about their client's perceptions frequently enhance the alliance and prevent premature termination (Lambert & Shimokawa, pp. 72–79, this issue).

◆ *Therapist-centricity.* A recurrent lesson from process-outcome research is that the client's observational perspective on the therapy relationship best predicts outcome (Orlinsky, Ronnestad, & Willutzki, 2004). Psychotherapy practice that relies on the therapist's observational perspective, while valuable, does not predict outcome as well. Therefore, privileging the client's experiences is central.

◆ *Rigidity.* By inflexibly and excessively structuring treatment, the therapist risks empathic failures and inattentiveness to clients' experiences. Such a therapist is likely to overlook a breach in the relationship and mistakenly assume she has not contributed to that breach. Dogmatic reliance on particular relational or therapy methods, incompatible with the client, imperils treatment (Ackerman & Hilsenroth, 2001).

◆ *Procrustean bed.* As the field of psychotherapy has matured, using an identical therapy relationship (and treatment method) for all clients is now recognized as inappropriate and, in select cases, even unethical. The efficacy and applicability of psychotherapy will be enhanced by tailoring it to the unique needs of the client, not by imposing a Procrustean bed onto unwitting consumers of psychological services. We should all avoid the crimes of Procrustes, the legendary Greek giant who would cut the long limbs of clients or stretch short limbs to fit his one-size bed.

We can optimize therapy relationships by simultaneously using what works *and* studiously avoiding what does not work.

Concluding Thoughts

In the culture wars of psychotherapy that pit the therapy relationship against the treatment method (Norcross & Lambert, pp. 4–8, this issue), it is easy to chose sides, ignore disconfirming research, and lose sight of our superordinate commitment to patient benefit. Instead, let us conclude, like T. S. Eliot, by "arriving where we started" and underscoring three incontrovertible but oft-neglected truths about psychotherapy relationships.

First, the interdivisional taskforce was commissioned in order to augment patient benefit. We continue to explore what works in the therapy relationship and what works when we adapt that relationship to (nondiagnostic) patient characteristics. That remains our collective aim: improving patient success, however measured and manifested in a given case.

Second, psychotherapy is at root a human relationship. Even when "delivered" via distance or on a computer, psychotherapy is an irreducibly human encounter. Both parties bring themselves—their origins, culture, personalities, psychopathology, expectations, biases, defenses, and strengths—to the human relationship. Some will judge that relationship a precondition of change and others a process of change, but all agree that it is a relational enterprise.

Third, how we create and cultivate that powerful human relationship can be guided by the fruits of research. As Carl Rogers (1980) compellingly demonstrated, there is no inherent tension between a relational approach and a scientific one. Science can, and should, inform us about what works in psychotherapy, be it a treatment method, an assessment measure, a patient behavior, or, yes, a therapy relationship.

Michael J. Lambert
Brigham Young University

This article introduces the journal issue devoted to the most recent iteration of *evidence-based psychotherapy relationships* and frames it within the work of the Third Interdivisional American Psychological Association Task Force on Evidence-Based Relationships and Responsiveness. The authors summarize the overarching purposes and processes of the Task Force and trace the devaluation of the therapy relationship in contemporary treatment guidelines and evidence-based practices. The article outlines the meta-analytic results of the subsequent 16 articles in the issue, each devoted to the link between a particular relationship element and treatment outcome. The expert consensus deemed 9 of the relationship elements as demonstrably effective, 7 as probably effective, and 1 as promising but with insufficient research to judge. What works—and what does not—in the therapy relationship is emphasized throughout. The limitations of the task force work are also addressed. The article closes with the Task Force's formal conclusions and 28 recommendations. The authors conclude that decades of research evidence and clinical experience converge: The psychotherapy relationship makes substantial and consistent contributions to outcome independent of the type of treatment.

Clinical Impact Statement

Question: What, specifically, is effective in the powerful psychotherapy relationship? ***Findings:*** Clinicians can use these meta-analytic conclusions and the practice recommendations of the Task Force on Evidence-Based Relationships and Responsiveness to provide what works in the relationship and simultaneously to avoid what does not work. ***Meaning:*** Based on original meta-analyses, experts deemed nine of the relationship elements as demonstrably effective, seven as probably effective, and one as promising. ***Next Steps:*** Future directions are to disseminate these findings to practice communities, to implement them in training programs, and to examine the interrelations of the effective elements of the relationship.

Keywords: psychotherapy, therapeutic relationship, psychotherapy outcome, meta-analysis, evidence-based practice

Ask patients what they find most helpful in their psychotherapy. Ask practitioners which component of psychotherapy ensures the highest probability of success. Ask researchers what the evidence favors in predicting effective psychological treatment. Ask psychotherapists what they are most eager to learn about (Tasca et al., 2015). Ask proponents of diverse psychotherapy systems on what point they can find commonality. The probable answer, for all these questions, is the *psychotherapy relationship*, the healing alliance between the client and the clinician.

In 1999, the American Psychological Association (APA) Division of Psychotherapy first commissioned a task force to identify, operationalize, and disseminate information on empirically supported therapy relationships. That task force summarized its findings and detailed its recommendations in a 2001 special issue of this journal, *Psychotherapy*, and in a 2002 book (Norcross, 2002). In 2009, the APA Division of Psychotherapy along with the Division of Clinical Psychology commissioned a second task force on evidence-based therapy relationships to update the research base and clinical practices on the psychotherapist–patient relationship. A second edition of the book (Norcross, 2011) and a second special issue of this journal, appearing in 2011, did just that.

Our aim for the third task force and the third iteration of this special journal issue, *Evidence-Based Psychotherapy Relationships III*, is to build upon and update the first two task forces in the research evidence for the impacts of relational elements, the number of those elements reviewed, and the rigor of the meta-analyses. In short, this issue summarizes the best available

research and clinical practices on numerous facets of the therapy relationship.

In this article, we frame this special issue on evidence-based psychotherapy relationships within the work of the Third Interdivisional APA Task Force on Evidence-Based Relationships and Responsiveness, which was cosponsored by the Society for the Advancement of Psychotherapy (APA Division 29) and the Society for Counseling Psychology (APA Division 17). We begin by summarizing the overarching purposes and processes of the Task Force and trace the devaluation of the therapy relationship in contemporary treatment guidelines and evidence-based practices. We provide a numerical summary of the meta-analytic results and the evidentiary strength of the subsequent 16 articles in the issue, each devoted to a particular relationship element. We then emphasize what works—and what does not—in the relationship. Prominent limitations of the task force work are highlighted. We present the formal conclusions and recommendations of the Third Interdivisional Task Force. Those statements, approved by the 10 members of the Steering Committee, refer to the work in both this special issue on therapy relationships and another volume on treatment adaptations or relational responsiveness (Norcross & Wampold, 2019).

The Third Interdivisional Task Force

The dual purposes of the Interdivisional APA Task Force on Evidence-Based Relationships and Responsiveness were to identify effective elements of the therapy relationship and to determine effective methods of adapting or tailoring therapy to the individual patient on the basis of his or her transdiagnostic characteristics. In other words, the Task Force was interested in both what works in general and what works for particular patients.

For the purposes of our work, we again adopted Gelso and Carter's (1985, 1994) operational definition of the relationship: The *therapeutic relationship* is the feelings and attitudes that the therapist and the client have toward one another, and the manner in which these are expressed. This definition is quite general, and the phrase "the manner in which it is expressed" potentially opens the relationship to include everything under the therapeutic sun (for an extended discussion, see Gelso & Hayes, 1998). Nonetheless, it serves as a concise, consensual, theoretically neutral, and sufficiently precise definition.

Treatment methods and the therapeutic relationship constantly shape and inform each other. Both clinical experience and research evidence point to a complex, reciprocal interaction between the interpersonal relationship and the instrumental methods. The relationship does not exist apart from what the therapist does in terms of method, and we cannot imagine any treatment methods that would not have some relational impact. Put differently, treatment methods are relational acts (Safran & Muran, 2000).

For historical and research convenience, the field has distinguished between relationships and techniques. Words like "relating" and "interpersonal behavior" describe *how* therapists and clients behave toward each other. By contrast, terms like "technique" or "intervention" describe *what* is done by the therapist. In research and theory, we often treat the how and the what—the relationship and the intervention, the interpersonal and the instrumental—as separate categories. In reality, of course, what one does and how one does it are complementary and inseparable. Trying to remove the interpersonal from the instrumental may be acceptable in research, but it is a fatal flaw when the aim is to extrapolate research results to clinical practice (see the 2005 special issue of *Psychotherapy* on the interplay of techniques and therapeutic relationship). In other words, the value of a treatment method is inextricably bound to the relational context in which it is applied.

The Task Force applies psychological science to the identification and promulgation of effective psychotherapy. It does so by expanding or enlarging the typical focus of evidence-based practice to therapy relationships. Focusing on one area—in this case, the therapeutic relationship—may unfortunately convey the impression that this is the only area of importance. We review the scientific literature on the therapy relationship and provide clinical recommendations based on that literature in ways, we trust, that do not degrade the simultaneous contributions of treatment methods, patients, or therapists to outcome.

An immediate challenge to the Task Force was to establish the inclusion and exclusion criteria for the elements of the therapy relationship. We readily agreed that the traditional features of the therapeutic relationship—the alliance in individual therapy, cohesion in group therapy, and the Rogerian facilitative conditions, for example—would constitute core elements. We further agreed that discrete, relatively nonrelational techniques were not part of our purview; therapy methods were considered for inclusion if their content, goal, and context were inextricably interwoven into the emergent therapy relationship. We settled on several "relational" methods (e.g., collecting real-time client feedback, repairing alliance ruptures, facilitating emotional expression, and managing countertransference) because these methods are deeply embedded in the interpersonal character of the relationship itself. As "methods," it also proves possible to randomly assign patients to one treatment condition with the method (for instance, feedback or rupture repairs) and other patients to a treatment without them. But which relational behaviors to include and which to exclude under the rubric of the *therapy relationship* bedeviled us, as it has the field.

We struggled on how finely to slice the therapy relationship. As a general rule, we opted to divide the meta-analytic reviews into smaller chunks so that the research conclusions were more specific and the practice and training implications more concrete.

We consulted psychotherapy experts, the research literature, and potential authors to discern whether there were sufficient numbers of studies on a particular relationship element to conduct a systematic review and meta-analysis. Three relational elements—therapist humor, self-doubt/humility, and deliberate practice—exhibited initial research support but not a sufficient number of empirical studies for a meta-analysis. Five new relationship behaviors surpassed our research threshold, and thus, we added the real relationship, self-disclosure, immediacy, emotional expression, and treatment credibility.

Once these decisions were finalized, we commissioned original meta-analyses on the relationship elements. Authors followed a comprehensive chapter structure and specific guidelines for their meta-analyses. The analyses quantitatively linked the relationship element to psychotherapy outcome. Outcome was primarily defined as distal posttreatment outcomes. Authors specified the outcome criterion when a particular study did not use a typical end-of-treatment measure; indeed, the type of outcome measure was frequently analyzed as a possible moderator of the overall

effect size. This emphasis on distal outcomes sharpened our focus on "what works" and countered the partial truth that some of the meta-analyses examining predominantly proximal outcome measures in earlier iterations of the task force merely illustrated that "the good stuff in session correlates with other good stuff in session." We have responded to that criticism in these articles while also explicating several consequential process linkages.

When the meta-analyses were finalized, the 10-person Steering Committee (identified in the Appendix) independently reviewed and rated the evidentiary strength of the relationship element according to the following criteria: number of empirical studies, consistency of empirical results, independence of supportive studies, magnitude of association between the relationship element and outcome, evidence for causal link between relationship element and outcome, and the ecological or external validity of research. Using these criteria, experts independently judged the strength of the research evidence as *demonstrably effective*, *probably effective*, *promising but insufficient research to judge*, *important but not yet investigated*, or *not effective*.

We then aggregated the individual ratings to render a consensus conclusion on each relationship element. These conclusions are presented later in this article, as are 28 recommendations approved by all members of the Steering Committee. Our deliberations relied on expert opinion referencing best practices, professional consensus using objective rating criteria, and, most importantly, meta-analytic reviews of the research evidence. But these were all human decisions—open to cavil, contention, and revision.

This Issue

Following this introductory article are 16 articles on particular facets of the psychotherapy relationship and their relation to treatment outcome. Except for this introduction, each article uses identical major headings and consistent structure, as follows:

Introduction (untitled): Introduce the relationship element in a couple of reader-friendly paragraphs.

Definitions and Measures: Define in theoretically neutral language the relationship element. Identify any highly similar constructs from diverse theoretical traditions. Review the popular measures used in the research and included in the ensuing meta-analysis.

Clinical Examples: Provide a couple of concrete examples of the relationship behavior under consideration.

Results of Previous Reviews: Offer a quick synopsis of the findings of previous meta-analyses and systematic reviews on the topic.

Meta-Analytic Review: Compile all available empirical studies linking the relationship behavior to treatment outcome (distal, end-of-treatment outcome); report results of the literature search, preferably by means of a PRISMA flowchart if space allows; include only actual psychotherapy studies (not analogue studies); use a random-effects model; report the effect size as both weighted *r* and *d* (or *g*); provide a summary table for individual studies (if <50; if >50, provide a supplemental online appendix); perform and report a test of homogeneity (*Q* and *I*); include a fail-safe statistic to address the file-drawer problem; and provide a table or funnel plot for each study in the meta-analysis (if fewer than 50 studies).

Mediators and Moderators: Present the results of the potential mediators and moderators of the association between the relationship element and treatment outcome.

Patient Contributions: Address the patient's contribution to that relationship and the distinctive perspective he or she brings to the interaction.

Limitations of the Research: Point to the major limitations of the research conducted to date.

Diversity Considerations: Outline how diversity (e.g., gender, race/ethnicity, sexual orientation, and socioeconomic status) fares in the research studies and the meta-analytic results.

Therapeutic Practices: Highlight the practice implications from the foregoing research, primarily in terms of the therapist's contribution and secondarily in terms of the patient's perspective. Go beyond the numerical data to provide practical, bulleted clinical practices.

(Three sections of the book chapters—landmark studies, evidence for causality, and training implications—were jettisoned for these journal articles in the interest of space. Readers can access these sections and more methodological details in the book itself; Norcross & Lambert, 2019).

Insisting on quantitative meta-analyses for all articles (with one exception) enables direct estimates of the magnitude of association in the form of effect sizes. These are standardized difference between two group means, say psychotherapy and a control, divided by the (pooled) standard deviation. The resultant effect size is in standard deviation units. Both Cohen's *d* and Hedges's *g* estimate the population effect size.

The meta-analyses in this issue used the weighted *r* and its equivalent *d* or *g*. Most of the articles analyzed studies that were correlational in nature; for example, studies that correlated the patient's ratings of empathy during psychotherapy with their outcome at the end of treatment. The correlation coefficients (*r*) were then converted into *d* or *g*. We did so for consistency among the meta-analyses, enhancing their interpretability (square *r* for the amount of variance accounted for) and enabling direct comparisons of the meta-analytic results to one another as well as to *d* (the effect size typically used when comparing the relative effects of two treatments). In all of these analyses, the larger the magnitude of *r* or *d*, the higher the probability of patient success in psychotherapy based on the relationship variable under consideration.

Table 1 presents several practical ways to interpret *r* and *d* in behavioral health care. By convention (Cohen, 1988), an *r* of .10 in the behavioral sciences is considered a small effect, .30 a medium effect, and .50 a large effect. By contrast, a *d* of .30 is considered a small effect, .50 a medium effect, and .80 a large effect. Of course, these general rules or conventions cannot be dissociated from the context of decisions and comparative values. There is little inherent value to an effect size of 2.0 or 0.2; it depends on what benefits can be achieved at what cost (Smith, Glass, & Miller, 1980).

Table 1
Practical Interpretation of d and r Values

d	*r*	Cohen's benchmark	Type of effect	Percentile of treated patients[a]	Success rate of treated patients (%)[b]
1.00			Beneficial	84	72
.90			Beneficial	82	70
.80	.50	Large	Beneficial	79	69
.70			Beneficial	76	66
.60			Beneficial	73	64
.50	.30	Medium	Beneficial	69	62
.40			Beneficial	66	60
.30			Beneficial	62	57
.20	.10	Small	Beneficial	58	55
.10			No effect	54	52
.00	0		No effect	50	50
−.10			No effect	46	48
−.20	.10		Detrimental	42	45
−.30			Detrimental	38	43

Note. Adapted from Cohen (1988); Norcross, Hogan, Koocher, and Maggio (2017); and Wampold and Imel (2015).
[a] Each effect size can be conceptualized as reflecting a corresponding percentile value; in this case, the percentile standing of the average treated patient after psychotherapy relative to untreated patients. [b] Each effect size can also be translated into a success rate of treated patients relative to untreated patients; a *d* of .80, for example, would translate into approximately 70% of patients being treated successfully compared with 50% of untreated patients.

Given the large number of factors contributing to patient success, and the inherent complexity of psychotherapy, we do not expect large, overpowering effects of any one relationship behavior. Instead, we expect to find a number of helpful facets. And that is exactly what we find in the following articles—beneficial, small-to-medium-sized effects of several elements of the complex therapy relationship.

For example, Elliott, Bohart, Watson, and Murphy (2018) conducted a meta-analysis of 82 studies that investigated the association between therapist empathy and patient success at the end of treatment. Their meta-analysis, involving a total of 6,138 patients, found a weighted mean *r* of .28. As shown in Table 1, this is a medium effect size. The corresponding *d* was .58. Relative to studies that compare one psychotherapy with another psychotherapy (where typical *d*s tend to be less than .20; Lambert, 2013; Wampold & Imel, 2015), a *d* of .58 is quite high. These numbers translate into happier and healthier clients; that is, clients with more empathic therapists tend to progress more in treatment and experience greater improvement.

Therapy Relationship

Recent decades have witnessed the controversial compilation of practice guidelines and evidence-based treatments in mental health. In the United States and other countries, the introduction of such guidelines has provoked practice modifications, training refinements, and organizational conflicts. Insurance carriers and government policymakers increasingly turn to such guidelines to determine which psychotherapies to approve and fund. Indeed, along with the negative influence of managed care, there is probably no issue more central to clinicians than the evolution of evidence-based treatments in psychotherapy (Barlow, 2000; Norcross, Hogan, Koocher, & Maggio, 2017).

Efforts to promulgate evidence-based psychotherapies have been noble in intent and timely in distribution. They are praiseworthy efforts to distill scientific research into clinical applications and to guide practice and training. They wisely demonstrate that, in a climate of accountability, psychotherapy stands up to empirical scrutiny with the best of health-care interventions. And within psychology, these have proactively counterbalanced documents that accorded primacy to biomedical treatments for mental disorders and largely ignored the outcome data for psychological therapies. On many accounts, then, the extant efforts addressed the realpolitik of the socioeconomic situation (Messer, 2001; Nathan & Gorman, 2015).

At the same time, many practitioners and researchers alike have found these recent efforts to codify evidence-based treatments seriously incomplete. Although scientifically laudable in their intent, these efforts largely ignored the therapy relationship and the person of the therapist. Practically all treatment guidelines have followed the antiquated medical model of identifying only particular treatment methods for specific diagnoses: Treatment A for Disorder Z. If one reads the documents literally, disembodied providers apply manualized interventions to discrete *DSM* and ICD disorders. Not only is the language offensive on clinical grounds to some practitioners, but the research evidence is weak for validating treatment methods in isolation from specific therapists, the therapy relationship, and the individual patient.

Suppose we asked a neutral scientific panel from outside the field to review the corpus of psychotherapy research to determine what is the most powerful phenomenon we should be studying, practicing, and teaching. Henry (1998, p. 128) concluded that such a panel,

> would find the answer obvious, and *empirically validated*. As a general trend across studies, the largest chunk of outcome variance not attributable to preexisting patient characteristics involves individual therapist differences and the emergent therapeutic relationship between patient and therapist, regardless of technique or school of therapy. This is the main thrust of decades of empirical research.

What is missing in treatment guidelines, now across 5 decades of research, are the person of the therapist and the therapeutic relationship.

Person of the Therapist

Most practice or treatment guideline compilations depict interchangeable providers performing treatment procedures. This stands in marked contrast to the clinician's and the client's experience of psychotherapy as an intensely interpersonal and deeply emotional experience. Although efficacy research has gone to considerable lengths to eliminate the individual therapist as a variable that might account for patient improvement, the inescapable fact of the matter is that it is simply not possible to mask the person and the contribution of the therapist (Castonguay & Hill, 2017; Orlinsky & Howard, 1977). The curative contribution of the person of the therapist is, arguably, as evidence based as manualized treatments or psychotherapy methods (Hubble, Wampold, Duncan, & Miller, 2011).

This article is intended solely for the personal use of the individual user and is not to be disseminated broadly.

Multiple and converging sources of evidence indicate that the *person* of the psychotherapist is inextricably intertwined with the outcome of psychotherapy. A large, naturalistic study estimated the outcomes attributable to 581 psychotherapists treating 6,146 patients in a managed care setting. About 5% of the outcome variation was due to therapist effects and 0% was due to specific treatment methods (Wampold & Brown, 2005).

Quantitative reviews of therapist effects in psychotherapy outcome studies show consistent and robust therapist effects, probably accounting for 5%–8% of psychotherapy outcome effects (Barkham, Lutz, Lambert, & Saxon, 2017; Crits-Christoph et al., 1991). The Barkham study combined data from four countries, 362 therapists, 14,254 clients, and four outcome measures. They found that about 8% of the variance in outcome was due to the therapist, so-called *therapist effects*. Moreover, the size of the therapist effect was strongly related to initial client severity. The more disturbed a client was at the beginning of therapy, the more it mattered which therapist the client saw.

A controlled study examining therapist effects in the outcomes of cognitive–behavioral therapy is instructive (Huppert et al., 2001). In the Multicenter Collaborative Study for the Treatment of Panic Disorder, considerable care was taken to standardize the treatment, the therapist, and the patients to increase the experimental rigor of the study and to minimize therapist effects. The treatment was manualized and structured, the therapists were identically trained and monitored for adherence, and the patients were rigorously evaluated and relatively uniform. Nonetheless, the therapists significantly differed in the magnitude of change among caseloads. Effect sizes for therapist impact on outcome measures ranged from 0% to 18%. Despite impressive attempts to experimentally render individual practitioners as controlled variables, it is simply not possible to mask the person and the contribution of the therapist.

Even when treatments are effectively delivered with minimal therapist contact (King, Orr, Poulsen, Giacomantonio, & Haden, 2017), their relational context includes interpersonal skill, persuasion, warmth, and even, on occasion, charisma. Self-help resources typically contain their developers' self-disclosures, interpersonal support, and normalizing concerns. Thus, it is not surprising that the relation between treatment outcome and the therapeutic alliance in Internet-based psychotherapy is of the same strength as that for the alliance–outcome association in face-to-face psychotherapy (Flückiger, Del Re, Wampold, & Horvath, 2018). Therapist effects are strong, ubiquitous, and sadly ignored in most guidelines on what works.

Therapeutic Relationship

A second omission in most treatment guidelines has been the decision to validate only the efficacy of treatment methods or technical interventions, as opposed to the therapy relationship or therapist interpersonal skills. This decision both reflects and reinforces the ongoing movement toward high-quality, comparative effectiveness research on brand-name psychotherapies. "This trend of putting all of the eggs in the 'technique' basket began in the late 1970s and is now reaching the peak of influence" (Bergin, 1997, p. 83).

Both clinical experience and research findings underscore that the therapy relationship accounts for as much, and probably more, of the outcome variance as particular treatment methods. Meta-analyses of psychotherapy outcome literature consistently reveal that specific treatment methods account for 0%–10% of the outcome variance (Lambert, 2013; Wampold & Imel, 2015), and much of that is attributable to the investigator's therapy allegiance (Cuijpers et al., 2012; Luborsky et al., 1999).

Even those practice guidelines enjoining practitioners to attend to the therapy relationship do not provide specific, evidence-based means of doing so. For example, the scholarly and comprehensive review on treatment choice from Great Britain (Department of Health, 2001) devotes a single paragraph to the therapeutic relationship. Its recommended principle is that "Effectiveness of all types of therapy depends on the patient and the therapist forming a good working relationship" (p. 35), but no evidence-based guidance is offered on which therapist behaviors contribute to or cultivate that relationship.

All of this is to say that treatment guidelines give short shrift—some would say lip service—to the person of the therapist and the emergent therapeutic relationship. The vast majority of current attempts are thus seriously incomplete and potentially misleading, both on clinical and empirical grounds.

Limitations of the Work

A single task force can accomplish only so much work and cover only so much content. As such, we wish to acknowledge publicly several necessary omissions and unfortunate truncations in our work.

The products of the third Task Force probably suffer first from content overlap. We may have cut the "diamond" of the therapy relationship too thin at times, leading to a profusion of highly related and possibly redundant constructs. Goal consensus, for example, correlates highly with collaboration, which is considered in the same article, and both of those are considered parts of the therapeutic alliance. Collecting client feedback and repairing alliance ruptures, for another example, may represent different sides of the same therapist behavior, but these too are covered in separate meta-analyses. Thus, to some the content may appear swollen; to others, the Task Force may have failed to make necessary distinctions.

Another lacuna in the Task Force work is that we may have neglected, relatively speaking, the productive contribution of the client to the therapy relationship. Virtually all of the relationship elements in this issue represent mutual processes of shared communicative attunement (Orlinsky, Ronnestad, & Willutzki, 2004). They exist in the human connection, in the transactional process, rather than solely as a therapist (or client) variable. We encouraged authors to attend to the chain of events among the therapist's contributions, the patient processes, and eventual treatment outcomes. Nevertheless, this limitation proves especially ironic in that the moderator analyses of several meta-analyses in this special issue indicated the patient's perspective of the relationship proves more predictive of their treatment outcome than the therapist's.

As with the previous two task forces, the overwhelming majority of research studies meta-analyzed were conducted in Western developed nations and published in English-language journals. The literature searches are definitely improving in accessing studies conducted internationally, but most authors did not translate articles published in other languages. An encouraging exception were

the authors of the alliance meta-analysis (this issue), who included studies published in English, Italian, German, and French languages.

Researcher allegiance may have also posed a problem in conducting and interpreting the meta-analyses. Of course, we invited authors with an interest and expertise in a relationship element, but in some cases, the authors might have experienced conflicts of interest due to their emotional, academic, or financial interests. The use of objective meta-analytic guidelines, peer review, and transparent data reporting may have attenuated the effects of their allegiance, but it remains a strong human propensity in any discipline.

Another prominent limitation across these research reviews is the difficulty of establishing causal connections between the relationship behavior and treatment outcome. The only meta-analyses that contain randomized clinical trials (RCTs) capable of demonstrating a causal effect are collecting client feedback and repairing appliance ruptures. With these two exceptions, all of the meta-analyses in this issue reported the association and prediction of the relationship element to psychotherapy outcome. These were overwhelmingly correlational designs. It is methodologically difficult to meet the three conditions needed to make a causal claim: nonspuriousness, covariation between the process variable and the outcome measure, and temporal precedence of the process variable (Feeley, DeRubeis, & Gelfand, 1999). We still need to determine when the therapeutic relationship is a mediator, moderator, or mechanism of change in psychotherapy (Kazdin, 2007).

There is much confusion between relational factors related to outcome and those are characteristics or actions of effective therapists. Consider the example of empathy. There are dozens of studies and several meta-analyses now that indicate that empathy, as expressed or perceived in a session, is reliably related to psychotherapy outcome; that is called a total correlation. We do not know if that correlation is due to the patient (verbal and cooperative patients elicit empathy from their therapist and also get better) or the therapist (some therapists are generally more empathic than others, across patients, and these therapists achieve better outcomes).

Of all the relationship behaviors reviewed in this journal issue, only two (feedback and alliance ruptures) have addressed this disaggregation by means of RCTs and only one (alliance in individual therapy; Del Re, Flückiger, Horvath, Symonds, & Wampold, 2012) by other statistical means. And it turns out, the evidence is strong that it is the therapist who is important—therapists who generally form stronger alliances generally have better outcomes, but not vice versa (Del Re et al., 2012). It is largely the therapist's contribution, not the patient's contribution, that relates to therapy outcome (Baldwin, Wampold, & Imel, 2007; Wampold & Imel, 2015). Unfortunately, we do not know if this is true of empathy or most of the other relational elements.

At the same time as we acknowledge this limitation, let us remain mindful of several considerations about causation. First, in showing that these facets of a therapy relationship precede positive treatment outcome, we can certainly state that the relationship is, at a minimum, an important predictor and antecedent of that outcome. Second, dozens of lagged correlational, unconfounded regression, structural equation, and growth curve studies suggest that the therapy relationship probably casually contributes to outcome (Barber, Connolly, Crits-Christoph, Gladis, & Siqueland, 2000; Klein et al., 2003; alliance article, this issue). Third, some of the most precious behaviors in life are incapable on ethical grounds of random assignment and experimental manipulation. Take parental love as an exemplar. Not a single RCT has ever been conducted to conclusively determine the causal benefit of parents' love on their children's functioning, yet virtually all humans aspire to it and practice it. Nor can we envision an institutional review board ever approving a grant proposal to randomize patients in a psychotherapy study to an empathic, collaborative, and supportive therapist versus a nonempathic, authoritarian, and unsupportive therapist. We warn against an either/or conclusion on the ability of the therapy relationship to cause patient improvement.

A final interesting drawback to the present work involves the paucity of attention paid to the disorder-specific and treatment-specific nature of the therapy relationship. It is premature to aggregate the research on how the patient's primary disorder or the type of treatment impacts the therapy relationship, but there are early links. For example, in the treatment of severe anxiety disorders (generalized anxiety disorder and obsessive–compulsive disorder) and substance abuse, the relationship may well exert less impact (Flückiger et al., 2012; Graves et al., 2017) than in other disorders, such as depression. The therapeutic alliance in the National Institute of Mental Health Treatment of Depression Collaborative Research Program, in both psychotherapy and pharmacotherapy, emerged as the leading force in reducing a patient's depression (Krupnick et al., 1996). The therapeutic relationship probably exhibits more impact in some disorders and in some therapies than others (Beckner, Vella, Howard, & Mohr, 2007; Bedics, Atkins, Harned, & Linehan, 2015). As with research on specific psychotherapies, it may no longer suffice to ask, "Does the relationship work?" but "How does the relationship work for this disorder and this treatment method?"

Conclusions of the Task Force on Evidence-Based Relationships and Responsiveness

The psychotherapy relationship makes substantial and consistent contributions to patient outcome independent of the specific type of psychological treatment.

The therapy relationship accounts for client improvement (or lack of improvement) as much as, and probably more than, the particular treatment method.

Practice and treatment guidelines should explicitly address therapist behaviors and qualities that promote a facilitative therapy relationship.

Efforts to promulgate best practices and evidence-based treatments without including the relationship and responsiveness are seriously incomplete and potentially misleading.

Adapting or tailoring the therapy relationship to specific patient characteristics (in addition to diagnosis) enhances the effectiveness of psychological treatment.

Adapting psychological treatment (or responsiveness) to transdiagnostic client characteristics contributes to successful outcomes at least as much as, and probably more than, adapting treatment to the client's diagnosis.

This document is copyrighted by the American Psychological Association or one of its allied publishers.
This article is intended solely for the personal use of the individual user and is not to be disseminated broadly.

The therapy relationship acts in concert with treatment methods, patient characteristics, and other practitioner qualities in determining effectiveness; a comprehensive understanding of effective (and ineffective) psychotherapy will consider all of these determinants and how they work together to produce benefit.

Table 2 summarizes the Task Force conclusions regarding the evidentiary strength of (a) elements of the therapy relationship primarily provided by the psychotherapist and (b) methods of adapting psychotherapy to patient transdiagnostic characteristics.

The preceding conclusions do *not* constitute practice or treatment standards but represent current scientific knowledge to be understood and applied in the context of the clinical evidence available in each case.

Recommendations of the Task Force on Evidence-Based Relationships and Responsiveness

General Recommendations

1. We recommend that the results and conclusions of this third Task Force be widely disseminated to enhance awareness and use of what "works" in the psychotherapy relationship and treatment adaptations.

2. Readers are encouraged to interpret these findings in the context of the acknowledged limitations of the Task Force's work.

3. We recommend that future task forces be established periodically to review these findings, include new elements of the relationship and responsiveness, incorporate the results of non-English language publications (where practical), and update these conclusions.

Practice Recommendations

4. Practitioners are encouraged to make the creation and cultivation of the therapy relationship a primary aim of treatment. This is especially true for relationship elements found to be demonstrably and probably effective.

5. Practitioners are encouraged to assess relational behaviors (e.g., alliance, empathy, and cohesion) vis-à-vis cutoff scores on popular clinical measures in ways that lead to more positive outcomes.

6. Practitioners are encouraged to adapt or tailor psychotherapy to those specific client transdiagnostic characteristics in ways found to be demonstrably and probably effective.

7. Practitioners will experience increased treatment success by regularly assessing and responsively attuning psychotherapy to clients' cultural identities (broadly defined).

8. Practitioners are encouraged to routinely monitor patients' satisfaction with the therapy relationship, comfort with responsiveness efforts, and response to treatment. Such monitoring leads to increased opportunities to reestablish collaboration, improve the relationship, modify technical strategies, and investigate factors external to therapy that may be hindering its effects.

9. Practitioners are encouraged to concurrently use evidence-based relationships *and* evidence-based treatments adapted

Table 2
Task Force Conclusions Regarding the Evidentiary Strength of Elements of the Therapy Relationship and Methods of Adapting Psychotherapy

Evidentiary strength	Elements of the relationship	Methods of adapting
Demonstrably effective	Alliance in individual psychotherapy Alliance in child and adolescent psychotherapy Alliances in couple and family therapy Collaboration Goal consensus Cohesion in group therapy Empathy Positive regard and affirmation Collecting and delivering client feedback	Culture (race/ethnicity) Religion/spirituality Patient preferences
Probably effective	Congruence/genuineness Real relationship Emotional expression Cultivating positive expectations Promoting treatment credibility Managing countertransference Repairing alliance ruptures	Reactance level Stages of change Coping style
Promising but insufficient research	Self-disclosure and immediacy	Attachment style
Important but not yet investigated		Sexual orientation Gender identity

This article is intended solely for the personal use of the individual user and is not to be disseminated broadly.

to the whole patient, as that is likely to generate the best outcomes in psychotherapy.

Training Recommendations

10. Mental health training and continuing education programs are encouraged to provide competency-based training in the demonstrably and probably effective elements of the therapy relationship.

11. Mental health training and continuing education programs are encouraged to provide competency-based training in adapting psychotherapy to the individual patient in ways that demonstrably and probably enhance treatment success.

12. Psychotherapy educators and supervisors are encouraged to train students in assessing and honoring clients' cultural heritages, values, and beliefs in ways that enhance the therapeutic relationship and inform treatment adaptations.

13. Accreditation and certification bodies for mental health training programs are encouraged to develop criteria for assessing the adequacy of training in evidence-based therapy relationships and responsiveness.

Research Recommendations

14. Researchers are encouraged to conduct research on the effectiveness of therapist relationship behaviors that do not presently have sufficient research evidence, such as self-disclosure, humility, flexibility, and deliberate practice.

15. Researchers are encouraged to investigate further the effectiveness of adaptation methods in psychotherapy, such as to clients' sexual orientation, gender identity, and attachment style, that do not presently have sufficient research evidence.

16. Researchers are encouraged to proactively conduct relationship and responsiveness outcome studies with culturally diverse and historically marginalized clients.

17. Researchers are encouraged to assess the relationship components using in-session observations in addition to postsession measures. The former track the client's moment-to-moment experience of a session and the latter summarize the patient's total experience of psychotherapy.

18. Researchers are encouraged to progress beyond correlational designs that associate the frequency and quality of relationship behaviors with client outcomes to methodologies capable of examining the complex causal associations among client qualities, clinician behaviors, and psychotherapy outcomes.

19. Researchers are encouraged to examine systematically the associations among the multitude of relationship elements and adaptation methods to establish a more coherent and empirically based typology that will improve clinical training and practice.

20. Researchers are encouraged to disentangle the patient contributions and the therapist contributions to relationship elements and ultimately outcome.

21. Researchers are encouraged to examine the specific moderators between relationship elements and treatment outcomes.

22. Researchers are encouraged to address the observational perspective (i.e., therapist, patient, or external rater) in future studies and reviews of "what works" in the therapy relationship. Agreement among observational perspectives provides a solid sense of established fact; divergence among perspectives holds important implications for practice.

23. Researchers are encouraged to increase translational research and dissemination on those relational behaviors and treatment adaptations that already have been judged effective.

24. Researchers are encouraged to examine the effectiveness of educational, training, and supervision methods used to teach relational skills and treatment adaptations/responsiveness.

Policy Recommendations

25. APA's Society for the Advancement of Psychotherapy, the APA Society for Counseling Psychology, and all divisions are encouraged to educate their members on the benefits of evidence-based therapy relationships and responsiveness.

26. Mental health organizations as a whole are encouraged to educate their members about the improved outcomes associated with higher levels of therapist-offered evidence-based therapy relationships, as they frequently now do about evidence-based treatments.

27. We recommend that the APA and other mental health organizations advocate for the research-substantiated benefits of a nurturing and responsive human relationship in psychotherapy.

28. Finally, administrators of mental health services are encouraged to attend to and invest in the relational features and transdiagnostic adaptations of their services. Attempts to improve the quality of care should account for relationships and responsiveness, not only the implementation of evidence-based treatments for specific disorders.

What Works

Table 3 summarizes the meta-analytic associations between the relationship elements and psychotherapy outcomes. As seen there,

This document is copyrighted by the American Psychological Association or one of its allied publishers.
This article is intended solely for the personal use of the individual user and is not to be disseminated broadly.

Table 3
Summary of Meta-Analytic Associations Between Relationship Components and Psychotherapy Outcomes

Relationship element	Number of studies (*k*)	Number of patients (*N*)	Effect size		Consensus on evidentiary strength
			r	*d* or *g*	
Alliance in individual psychotherapy	306	30,000+	.28	.57	Demonstrably effective
Alliance in child and adolescent therapy	43	3,447	.20	.40	Demonstrably effective
Alliances in couple and family therapy	40	4,113	.30	.62	Demonstrably effective
Collaboration	53	5,286	.29	.61	Demonstrably effective
Goal consensus	54	7,278	.24	.49	Demonstrably effective
Cohesion in group therapy	55	6,055	.26	.56	Demonstrably effective
Empathy	82	6,138	.28	.58	Demonstrably effective
Positive regard and affirmation	64	3,528		.28	Demonstrably effective
Congruence/genuineness	21	1,192	.23	.46	Probably effective
The real relationship	17	1,502	.37	.80	Probably effective
Self-disclosure and immediacy	21	~140	NA	NA	Promising but insufficient research
Emotional expression	42	925	.40	.85	Probably effective
Cultivating positive expectation	81	12,722	.18	.36	Probably effective
Promoting treatment credibility	24	1,504	.12	.24	Probably effective
Managing countertransference	9	392 therapists	.39	.84	Probably effective
Repairing alliance ruptures	11	1,318	.30	.62	Probably effective
Collecting and delivering client feedback	24	10,921		.14–.49[a]	Demonstrably effective

Note. NA = not applicable; the chapter used qualitative meta-analysis, which does not produce effect sizes.
[a] The effect sizes depended on the comparison group and the feedback method; feedback proved more effective with patients at risk for deterioration and less effective for all patients.

This document is copyrighted by the American Psychological Association or one of its allied publishers.
This article is intended solely for the personal use of the individual user and is not to be disseminated broadly.

the expert consensus deemed nine of the relationship elements as demonstrably effective, seven as probably effective, and one as promising but insufficient research to judge. We were heartened to find the evidence base for all research elements had increased, and in some cases substantially, from the second edition (Norcross, 2011). We were also impressed by the disparate and perhaps elevated standards against which these relationship elements were evaluated.

Compare the evidentiary strength required for psychological treatments to be considered demonstrably efficacious in two influential compilations of evidence-based practices. The Division of Clinical Psychology's Subcommittee on Research-Supported Treatments (www.div12.org/PsychologicalTreatments/index.html) requires two between-groups design experiments demonstrating that a psychological treatment is either (a) statistically superior to pill or psychological placebo or to another treatment or (b) equivalent to an already established treatment in experiments with adequate sample sizes. The studies must have been conducted with treatment manuals and conducted by at least two different investigators. The typical effect size of those studies was often smaller than the effects for the relationship elements reported in this series of articles. For listing in SAMHSA's National Registry of Evidence-Based Programs and Practices (www.nrepp.samhsa.gov), which will be soon discontinued, only evidence of statistically significant behavioral outcomes demonstrated in at least one study, using an experimental or quasi-experimental design, that has been published in a peer-reviewed journal or comprehensive evaluation report is needed. By these standards, practically all of the relationship elements in this journal issue would be considered demonstrably effective, if not for the requirement of an RCT, which proves neither clinically nor ethically feasible for most of the relationship elements.

In several ways, the effectiveness criteria for relationship elements are more rigorous. Whereas the criteria for designating treatments as evidence-based rely on only one or two studies, the evidence for relationship elements presented here is based on comprehensive meta-analyses of many studies (in excess of 40 studies in the majority of meta-analyses), spanning various treatments, a wide variety of treatment settings, patient populations, treatment formats, and research groups. The studies used to establish evidence-based treatments are, however, RCTs. RCTs are often plagued by confounds, such as researcher allegiance, cannot be blinded, and often contain bogus comparisons (Luborsky et al., 1999; Mohr et al., 2009; Wampold, Baldwin, Holtforth, & Imel, 2017; Wampold et al., 2010). The point here is not to denigrate the criteria used to establish evidence-based treatments, but to underscore the robust scientific standards by which these relationship elements have been operationalized and evaluated. The evolving standards to judge evidence-based treatment methods are now moving away from the presence of an absolute number of studies to the presence of meta-analytic evidence (Tolin, McKay, Forman, Klonsky, & Thombs, 2015), a standard demonstrated repeatedly in this journal issue.

Consider as well the strength or magnitude of the therapy relationship. Across thousands of individual outcome studies and hundreds of meta-analytic reviews, the typical effect size difference (*d*) between psychotherapy and no psychotherapy averages .80–.85 (Lambert, 2010; Wampold & Imel, 2015), a large effect size. The effect size (*d*) for any *single* relationship behavior in Table 3 ranges between .24 and .80. The alliance in individual psychotherapy, for example, demonstrates an aggregate *r* of .28 and a *d* of .57 with treatment outcome, making the quality of the alliance one of the strongest and most robust predictors of successful psychotherapy. These relationship behaviors are robustly effective components and predictors of patient success. We need to proclaim publicly what decades of research have discovered and what hundreds of thousands of practitioners have witnessed: The relationship can heal.

This article is intended solely for the personal use of the individual user and is not to be disseminated broadly.

It would probably prove advantageous to both practice and science to sum the individual effect sizes in Table 3 to arrive at a total of relationship contribution to treatment outcome, but reality is not so accommodating. Neither the research studies nor the relationship elements contained in the meta-analyses are independent; thus, the amount of variance accounted for by each element or construct cannot be added to estimate the overall contribution. For example, the correlations among the person-centered conditions (empathy, warmth/support, and congruence/genuineness) and the therapeutic alliance are typically in the .50s (Nienhuis et al., 2018; Watson & Geller, 2005). Many of the studies within the adult alliance meta-analysis also appear in the meta-analyses on collaboration and goal consensus, perhaps because a therapeutic alliance measure, subscale, or item was used to operationalize collaboration. Unfortunately, the degree of overlap between all the measures (and therefore relationship elements) is not available but bound to be substantial (Norcross & Lambert, 2014). Whether each relationship element is accounting for the same outcome variance or whether some of the elements are additive remains to be determined.

We present the relationship elements in this journal issue as separate, stand-alone practices, but every seasoned psychotherapist knows this is certainly never the case in clinical work. The alliance in individual therapy and cohesion in group therapy never act in isolation from other relationship behaviors, such as empathy or support. Nor does it seem humanly possible to cultivate a strong relationship with a patient without ascertaining her feedback on the therapeutic process and understanding the therapist's countertransference. All the relationship elements interconnect as we try to tailor therapy to the unique, complex individual. While these relationship elements "work," they work together and interdependently.

In any case, the meta-analytic results in this book probably underestimate the true effect due to the responsiveness problem (Kramer & Stiles, 2015; Stiles, Honos-Webb, & Surko, 1998). It is a problem for researchers but a boon to practitioners, who flexibly adjust the amount and timing of relational behaviors in psychotherapy to fit the unique individual and singular context. Effective psychotherapists responsively provide varying levels of relationship elements in different cases and, within the same case, at different moments. This responsiveness tends to confound attempts to find naturalistically observed linear relations of outcome with therapist behaviors (e.g., cohesion and positive regard). As a consequence, the statistical relation between therapy relationship and outcome cannot always be trusted and tends to be lower than it actually is. By being clinically attuned and flexible, psychotherapists ironically make it more difficult in research studies to discern what works.

The profusion of research-supported relationship elements proves, at once, encouraging and disconcerting. Encouraging because we have identified and measured potent predictors and contributions of the therapist that can be taught and implemented. Disconcerting because of the large number of potent relational behaviors that are highly intercorrelated and are without much organization or rationale.

Several researchers have clamored for a more coherent organization of relationship behaviors that could guide practice and training. One proposal would arrange the relational elements in a conceptual hierarchy of helping relationships (Horvath, Symonds, Flückiger, Del Re, & Lee, 2016). Superordinate, high-level *Descriptive Constructs* describe the way of therapy. Featured here are the alliance, cohesion, and empathy as global ways of being in therapy. Below that are *Strategies* for managing the relationship, such as positive regard, self-disclosure, managing emotional expression, promoting credibility, collecting formal feedback, and resolving ruptures. Then there are *Therapist Qualities*—more about the person than a strategy or skill. Exemplars are flexibility, congruence, and reactivity in responding to countertransference. The Strategies and the Therapist Qualities overlap of course, for example, in the personal quality of reactivity in responding to countertransference and in the Strategy of managing countertransference. Finally, on the bottom of the hierarchy, come *Client Contributions*. These describe the client's attachment style, preferences, expectations, coping styles, culture, reactance level, and diagnosis (all these may serve as reliable markers to adapt therapy and are featured in Volume 2 of *Psychotherapy Relationships That Work*; Norcross & Wampold, 2019). Horvath and colleagues' (2016) four-level structure of the helping relationship provides greater organization and perhaps clarity.

That organization will assuredly benefit from multivariate meta-analyses conducted on several relationship constructs simultaneously. However, too few studies exist to allow meta-analytic reviews of multiple relationship elements (e.g., measures of the therapeutic alliance, therapist empathy, and client expectations for improvement). Future multivariate meta-analyses could elevate the expectations for future scholarship, as most of these relationship variables share substantial variance and could inform conceptual schemes on their interrelations.

As the evidence base of therapist relationship behaviors develops, we will know more about their effectiveness for particular circumstances and conditions. A case in point is the meta-analysis on collecting and delivering client feedback (Lambert, 2018). The evidence is quite clear that adding formal feedback helps clinicians effectively treat patients at risk for deterioration ($d = .49$), whereas it is not needed in cases that are progressing well (see Table 3). How well, then, does relationship feedback work in psychotherapy? It depends; it depends on the purpose and the circumstances.

The strength of the therapy relationship also depends in some instances on the client's principal disorder. The meta-analyses occasionally find some relationship elements less efficacious with some disorders, usually substance abuse, severe anxiety, and eating disorders. Most moderator analyses usually find the relationship equally effective across disorders, but that conclusion may be due to the relatively small number of studies for any single disorder and the resulting low statistical power to find actual differences. And, of course, it gets more complicated as patients typically present with multiple, comorbid disorders.

Our point is that each context and patient needs something different. "We are differently organized," as Lord Byron wrote. Empathy is demonstrably effective in psychotherapy, but suspicious patients respond negatively to classic displays of empathy, requiring therapist responsiveness and idiosyncratic expressions of empathy. The need to adapt or personalize therapy to the individual patient is covered in detail in the other half of the Task Force's work on evidence-based responsiveness (Norcross & Wampold, 2019).

What Does Not Work

Translational research is both prescriptive and proscriptive; it tells us what proves effective and what does not. We can optimize therapy relationships by simultaneously using what works and studiously avoiding what does not work. Here, we briefly highlight those therapist relational behaviors that are ineffective, perhaps even hurtful, in psychotherapy.

One means of identifying ineffective qualities of the therapeutic relationship is to reverse the effective behaviors identified in these meta-analyses. Thus, what does not work are poor alliances in adult, adolescent, child, couple, and family psychotherapy, as well as low levels of cohesion in group therapy. Paucity of collaboration, consensus, empathy, and positive regard predict treatment drop out and failure. The ineffective practitioner will not seek or be receptive to formal methods of providing client feedback on progress and relationship, will ignore alliance ruptures, and will not be aware of his or her countertransference. Incongruent therapists, discreditable treatments, and emotional-less sessions detract from patient success.

Another means of identifying ineffective qualities of the relationship is to scour the research literature (Duncan, Miller, Wampold, & Hubble, 2010; Lambert, 2010) and conduct polls of experts (Koocher, McMann, Stout, & Norcross, 2015; Norcross, Koocher, & Garofalo, 2006). In a previous review of that literature in 2011 (Norcross & Wampold, 2011), we recommended that practitioners avoid several behaviors: Confrontations, negative processes, assumptions, therapist–centricity, and rigidity. To that list we add *cultural arrogance*. Psychotherapy is inescapably bound to the cultures in which it is practiced by clinicians and experienced by clients. Arrogant impositions of therapists' cultural beliefs in terms of gender, race/ethnicity, sexual orientation, and other intersecting dimensions of identity are culturally insensitive and demonstrably less effective (Soto, Smith, Griner, Rodriguez, & Bernal, 2019). By contrast, therapists expressing cultural humility and tracking clients' satisfaction with cultural responsiveness markedly improve client engagement, retention, and eventual treatment outcome.

Concluding Reflections

The future of psychotherapy portends the integration of the instrumental and the interpersonal, of the technical and the relational in the tradition of evidence-based practice (Norcross, Freedheim, & VandenBos, 2011). *Evidence-based psychotherapy relationships* align with this future and embody a crucial part of evidence-based practice, when properly conceptualized. We can imagine few practices in all of psychotherapy that can confidently boast that they integrate as well "the best available research with clinical expertise in the context of patient characteristics, culture, and preferences" (APA Presidential Task Force on Evidence-Based Practice, 2006) as the relational behaviors in this special issue. We are reminded daily that research can guide how to create, cultivate, and customize that powerful human relationship.

Of course, that research knowledge serves little practical purpose if psychotherapists do not know it and if they do not enact the specific behaviors to enhance these relationship elements. The meta-analyses are complete now, but not the tasks of dissemination and implementation. Members of the Task Force Steering Committee plan to share these results widely in journal articles, public presentations, training workshops, and professional websites. A Society for the Advancement of Psychotherapy initiative, *Teaching and Learning Evidence-Based Relationships: Interviews with the Experts* (societyforpsychotherapy.org/teaching-learning-evidence-based-relationships), is underway to assist students and educators in these evidence-based therapy relationships.

The three interdivisional APA task forces originated to augment patient benefit. We continue to explore what works in the therapy relationship (and what works when we adapt that relationship to transdiagnostic patient characteristics). That remains our goal: improving patient outcomes, however measured and manifested in a given case. A dispassionate analysis of the avalanche of meta-analyses in this journal issue reveals that multiple relationship behaviors positively associate with, temporally predict, and perhaps causally contribute to client outcomes. This is reassuring news in a technology-driven and drug-filled world (Greenberg, 2016).

To repeat one of the Task Force's conclusions: The psychotherapy relationship makes substantial and consistent contributions to outcome independent of the type of treatment. Decades of research evidence and clinical experience converge: The relationship works! These effect sizes concretely translate into healthier and happier people.

Üdvözlöm Önöket!

Alberto Zucconi vagyok

pszichológus és pszichoterapeuta

a Személyközpontú Intézet (IACP) elnöke.

Én írtam

a kurzus első két modulját,

és szeretném köszönteni Önöket.

Először is állampolgárként szeretnék

pár szót

szólni

méghozzá a hálámat szeretném kifejezni

Őszintén szeretnék köszönetet mondani mindnyájuknak,

akik a traumatizált kiskorúak védelméért

és segítéséért dolgoznak.

Ez egy nagyon fontos,

érzékeny, és olykor igen

nehéz munka.

Mind tisztában vagyunk

azzal,

hogy a szenvedő emberekkel való munka

olykor fájdalmat okozhat

és kiégéshez vezethet.

Ezért

őszinte hálámat szeretném kifejezni,

hiszen

az Önök munkája

a nemzet és a közösség nagy értékű erőforrását védi: a humántőkét, azaz az embereket.

A traumatizált embereknek szükségük van

minden lehetséges gondoskodásra és segítségre ahhoz,

hogy teljes jogú és aktív tagként visszakerülhessenek a közösségbe,

és

hasznosak lehessenek mind saját maguk, mint a közösség többi tagja számára.

Szeretnék kiemelni valamit, ami talán egyértelmű, de jobb kihangsúlyozni:

ez a kurzus

sok igen különböző hátterű, szakmai előtörténetű és készségű szakembernek szól,

akiket a hatályos törvények, a különböző szakterületek

etikai kódexei

és a szervezeteik belső szabályzatai kötnek.

Arra kérem Önöket, hogy tegyenek mindent úgy, ahogyan tudják, hogy tenniük kell, annak az iránymutatása alapján, akinek felelősséggel tartoznak,

és ne lépjék át a határokat, mert azzal biztosan nem segítenek az ügyfeleiknek.

Hadd adjak mindehhez még egy magától értetődő dolgot

hogy a helyzet még komplikáltabb legyen, a jogi szabályozás nem egységes

az egyes európai államok között, ez a kurzus pedig

különböző országoknak szól, különböző nyelveken.

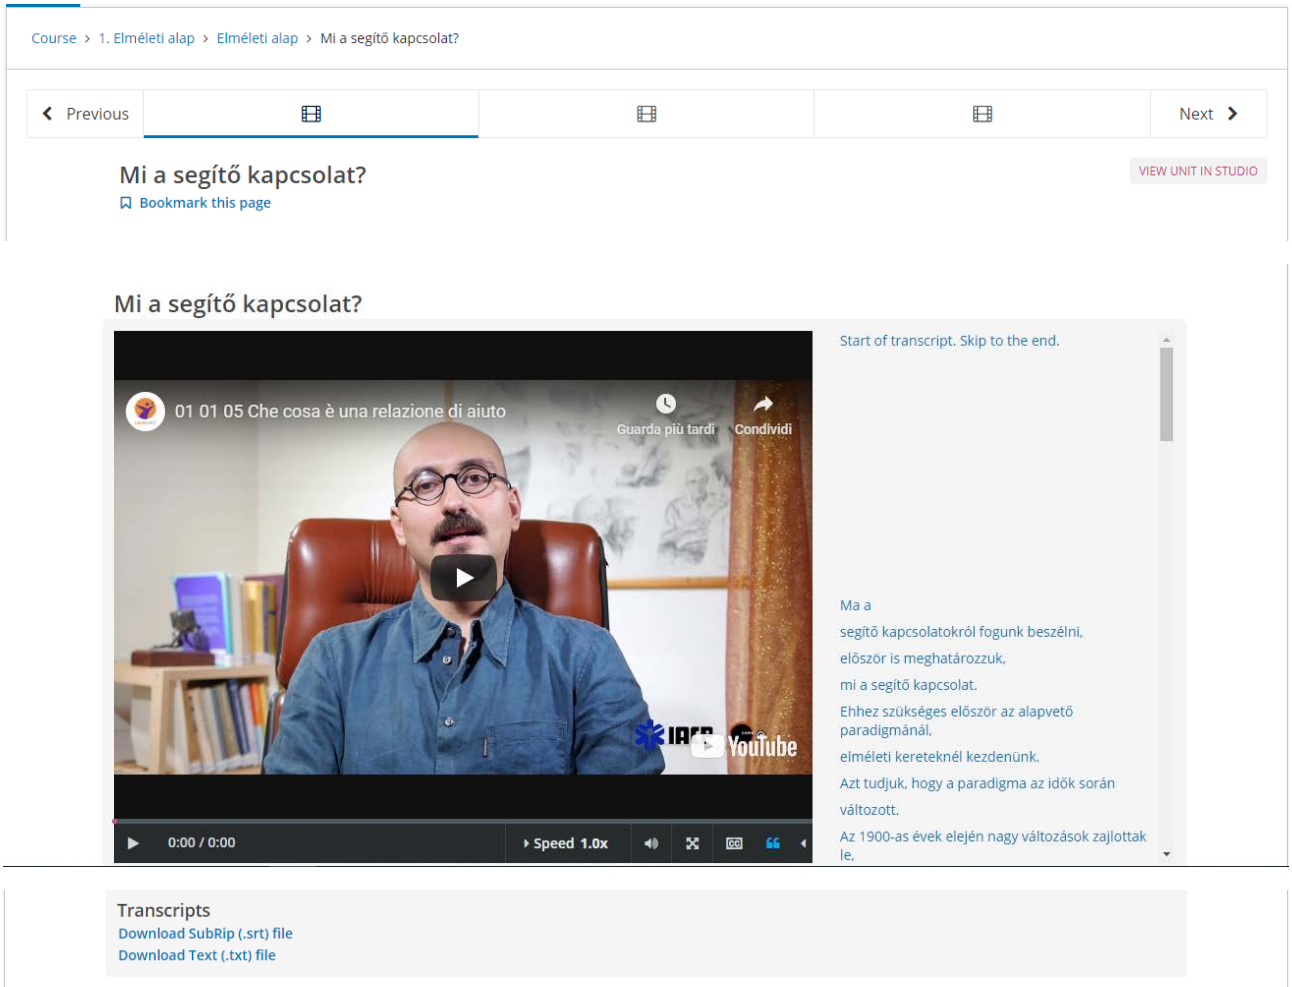
A cél az, hogy a szakemberek azt is megtanulják,

hogy a határok betartása azt is jelenti, a hatékony. unkavégzés előfeltétele.

Még egyszer köszönöm,

hogy velünk tartanak ebben a kalandban, és köszönöm a napi munkájukat,

amit odaadással végeznek.



Transcript

Ma a

segítő kapcsolatokról fogunk beszélni,

először is meghatározzuk,

mi a segítő kapcsolat.

Ehhez szükséges először az alapvető paradigmánál,

elméleti kereteknél kezdenünk.

Azt tudjuk, hogy a paradigma az idők során

változott.

Az 1900-as évek elején nagy változások zajlottak le,

és egy redukcionista-mechanisztikus paradigmáról a holisztikus és rendszerszemléletű paradigmára váltottunk.

A segítő kapcsolat értelmezése is változott.

A redukcionista-mechanisztikus paradigmában

a segítő kapcsolat aszimmetrikus volt: az értelemalkotás lehetősége a szakember kezében volt,

aki a saját valóságát kényszerítette rá a páciensére,

ezáltal passzívvá téve őt.

Az új paradigma meghonosodásával

sok minden megváltozott.

Mivel tudjuk,

hogy a megértéshez a kapcsolatok központi fontosságúak: nem az egyes részek fontosak, hanem azok a kapcsolatok,

amelyekben ezek a részek

egy egésszé állnak össze.

Mi a segítő

kapcsolat az új paradigma alapján?

Mi lehet ?

Ennek meghatározásában segítenek Carl Rogers 1951-ben írott szavai.

Rogers munkássága nagyban hozzájárul ahhoz, hogy a segítő kapcsolatot az új szemlélet alapján tudjuk értelmezni.

A következőket írja: „A segítő kapcsolat egy olyan kapcsolat, amelyben a résztvevők

legalább egyikének a célja, a másik fejlődésének,

érésének támogatása

és annak előmozdítása,

hogy az illető megfelelőbb és integráltabb

módon tudjon cselekedni és viselkedni.

A segítő kapcsolatot egy olyan szituációként is meg lehet határozni,

amelyben az egyik résztvevő megpróbálja a másik személy(ek)ből nagyobb mértékben előhívni

a személyes erőforrásait, és számára az önkifejezés teljesebb fokát elősegíteni.

A fő gondolatok itt a lehetőségek kiaknázása, a támogatás és az erőforrások.

Így az

új szemlélet, amellyel a segítő kapcsolatokra

tekintünk,

a két résztvevőt

egyenrangú kapcsolatba helyezi,

amiből az következik, hogy a szakember nem szakértő,

az értelemalkotás nem az ő kezében van,

hanem a szerepe a másik emberben már meglévő

erőforrások előhívásának támogatása.

Így a segítő képes egy működőképesebb, közös valóságkonstruálási folyamatot előmozdítani

a kliens számára,

amelyben elkíséri őt, elfogadva és tiszteletben tartva azt, ahol az ügyfél tart.

Mikre van szüksége egy segítő kapcsolattal dolgozó szakembernek?

Mindenképpen szükségünk van tudásra, egy olyan elméleti tudásanyagra,

amelyre támaszkodhatunk,

illetve

tudnunk kell azt is, hogy hogyan alkalmazzuk ezt a tudást.

Tehát az elméleteket konkréttá kell tenni, alkalmazni kell, illetve azt is tudnunk kell, hogy miként alkalmazzuk őket a kapcsolatban.

Emellett, mivel a kapcsolat fókusza magának a kapcsolatnak a minőségén van,

a szakembernek azt is szükséges tudnia, hogy hogyan legyen jelen, hogy hogyan ültesse gyakorlatba mindezeket a feltételeket

és minőségeket, amelyek a segítő kapcsolatot működtetik és hatékonnyá teszik.

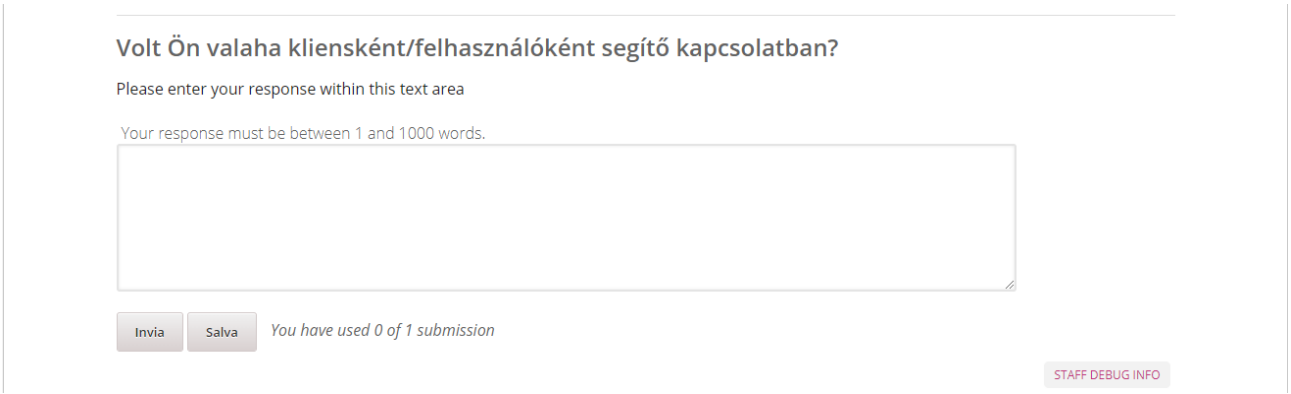
Ezek közül az első minőség az önazonosság;

a második az arra való képesség, hogy a világot másnak a nézőpontjából lássuk; a harmadik pedig,

hogy az ügyfelet ne ítéljük meg, hanem képesek legyünk tisztelni és befogadni őt úgy, ahogy van.

Ha mindez lehetséges, ha ezt a három feltételt a szakember foganatosítja, az az ügyfélben

előmozdítja a változás és a benne rejlő lehetőségek 63 00:04:45,400 --> 00:04:46,360 megvalósításának folyamatát.



Ha igen, a segítő kapcsolat mely aspektusait találta különösen pozitívnak és előre mozdítónak?

A hatalom kérdése mindig jelen van az emberi interakciókban.

Ha két vagy több ember interakcióba lép egymással, mindig van

egy olyan hatalmi tényező, amelyet vagy háttérbe szorítanak, vagy kiemelnek.

Általánosságban véve, ha a történelmet nézzük, azt láthatjuk, hogy azok, akiknek sok hatalma van,

nem igazán szeretnek erről a témáról beszélni, mivel attól félnek, hogy ha a hatalmi különbségekre fény derül

akkor kevesebb hatalmuk lesz.

Nyilvánvaló módon mindig,

minden segítői kapcsolatban vannak hatalmi különbségek.

A szakembernek, a szakértőnek,

annak, aki a szolgáltatást nyújtja, több hatalma van van a szolgáltatás

felhasználójánál /az ügyfélnél / a páciensnél, vagy bárhogy is nevezzük az adott személyt. Miért?

Mivel a szakember olyasmit tud, amit az ügyfél nem tud pontosan,

illetve mivel a szakember olyasvalamit kínál az ügyfélnek, amire annak szüksége van.

Továbbá a szakember határozza meg

a feltételeket (a segítő kapcsolat működésére és kialakítására vonatkozó szabályokat),

és akár magát a szolgáltatásnyújtást is felfüggesztheti.

Összefoglalva,

mindig van hatalmi különbség a szolgáltatás nyújtói és igénybe vevői között.

A múltban, a redukcionista-mechanisztikus paradigmában,

a különböző segítő kapcsolatokban a hatalmi különbségek igen nagyok voltak.

Láthattuk, az Ottawai Karta által lefektetett új paradigma és a biopszichoszociális paradigma fényében is,

hogy ez nem volt célravezető,

mivel a túlzott hatalmi különbségek a szolgáltatás igénybevevőit passzív szerepbe helyezik, ami pedig nem segíti

a szolgáltatás céljainak elérését.

Így ma a tendencia az, hogy a felhasználóra, az ügyfél személyére fókuszálunk,

és az ügyfelek készségének, kreativitásának és ellenállóképességének fejlesztését ösztönző

tevékenységek által támogatjuk a változást.

A kutatások egyértelműen azt mutatják, hogy ez nagyon hasznos,

mivel így a segítő kapcsolat jobb eredményeket képes produkálni kevesebb idő alatt,

és például az egészség és jólét területén alacsonyabb lesz a mellékhatások és visszaesések aránya.

A világ is egyre inkább képes befogadni azt a bizonyított tényt, hogy mindenki nyer azzal,

ha a hatalmat megosztják, és ha a célok eléréséhez mindenki hozzájárul.

Mindez társadalmi szinten is igaz:

az aktív, tudatos polgárok jóval nagyobb mértékben járulnak hozzá a társadalmi környezetükhöz és a valóság közösségi konstruálásához,

egy fenntartható valóság és fenntartható kapcsolatok építéséhez.

Ez a gyermekeknek nyújtott szolgáltatások esetén is igaz. A gyerekek kis emberek, nem olyan valakik,

akik nem értik a dolgokat és nem képesek válaszolni. Az a társadalmi konstrukció, amely szerint a gyerekek csak

„kis aranyos emberkék”, igen elavult.

Mi a segítő kapcsolat

az azt igénybevevő személy számára?

Ahogy azt a

biopszichoszociális paradigma bemutatásakor hangsúlyoztuk,

a segítő kapcsolat célja nem csak a betegségek gyógyítása,

hanem az egészség és jólét, az aktív tanulásra való képesség,

és a kreativitás és ellenállókészség fejlesztésének, mint lehetőségeknek a támogatása.

Az emberi lények e veleszületett képességét más néven

megküzdési képességnek nevezhetjük. Ez tulajdonképpen azt jelenti, hogy tudjuk, hogyan kezeljük az élet által adott körülményeket,

még pontosabban, hogy hogyan kezeljük jobban a kapcsolatunkat saját magunkkal,

másokkal és a körülöttünk lévő világgal.

Az köztudott, hogy a segítő kapcsolatok területén,

ami a hatékony szakembert illeti,

az alkalmazott megközelítés másodlagos. Amire a hatékonysághoz szükség van, azok olyan minőségek,

mint a képesség arra, hogy őszinte, mély tisztelettel és előítélet nélkül tudjanak az ügyfelükhöz viszonyulni;

hogy empatikusan megértsék nem csak azt, amit az ügyfél mond, hanem az érzéseit,

és az általa alkotott értelmezéseket is; illetve hogy önazonosan és őszintén tudjanak hozzá kapcsolódni.

Ám ahhoz, hogy ez a folyamat hasznos legyen a felhasználó/ügyfél/páciens számára,

neki is részt kell vennie ebben a közösen alakított csapatjátékban.

A segítő kapcsolatokban azokat az ügyfeleket lehet „hatékonynak” tekinteni,

akik őszinték és motiváltak a változásban, talán mivel nem érzik jól magukat,

és nem akarnak tovább szenvedni. Továbbá képesnek kell lenniük

pszichológiai kapcsolatot létesíteni a velük dolgozó szakemberrel, és érzékelni azokat a kapcsolati minőségeket,

amiket a szakember tesz bele a kapcsolatba.

Ezek a készségek idővel fejlődnek, ahogy a kitartás

és a hibákból való tanulás képessége is, illetve a bátorság, hogy belássuk hibáinkat,

és a bölcsesség forrásává alakítsuk őket.

Látható tehát, hogy a megküzdés egy optimális működési folyamat,

és a szakember és az ügyfél csapatmunkájának eredménye, akik azért dolgoznak,

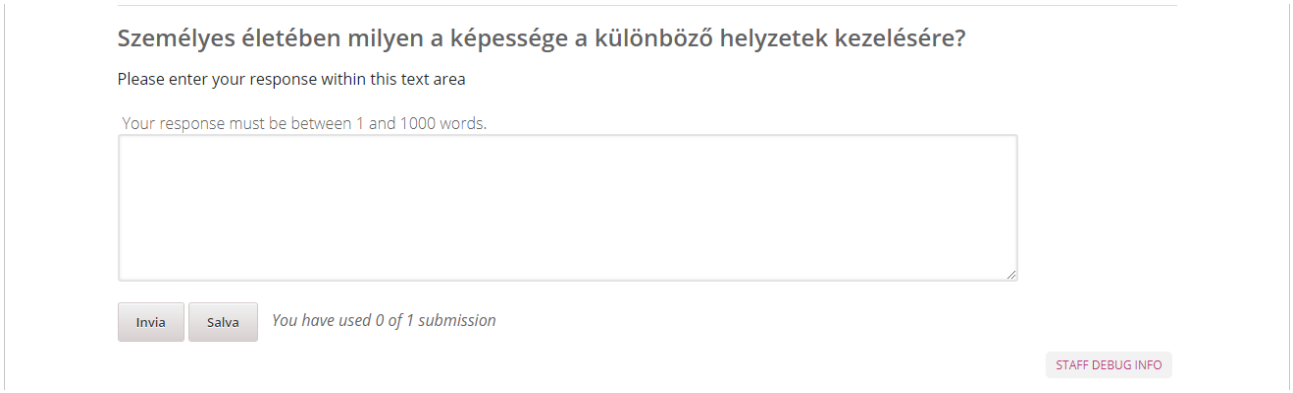
hogy az ügyfél elérje az olyan kitűzött célokat, mint a jobb életminőség, és a mindannyiunkban

ott rejlő,

velünk született, a génjeinkbe kódolt belső lehetőségek nagyobb mértékű megvalósítása.

Ezt a minket körülvevő környezeti hatások, illetve az élethez való hozzáállásaink függvényében

tudjuk jobban, vagy kevésbé megvalósítani.



Személyes életében milyen a képessége a különböző helyzetek kezelésére?

A betegségre vagy az egészségre fókuszáljunk?

A kutatások azt mutatják, hogy sokkal jobban megéri

az egészségre fókuszálni,

mert így nagyobb sikereket érhetünk el,

alacsonyabb költségek mellett.

Ez miért van így?

A korábbi, mechanisztikus-redukcionista paradigmában

a személy, akinek segítségre volt szüksége, túlságosan passzív állapotba,

szerepbe került

ez egy fajta

felvett passzivitás volt. Ennek a kockázata sokkal alacsonyabb

az új paradigmában, mivel az arra ösztönzi az embert, hogy használja a saját erejét,

és lépjen olyan partneri kapcsolatra a szakemberrel, amelyben a döntéshozási hatalmat

megosztják.

A kutatások azt is szemléltetik, hogy az egészséget és jólétet védelmező

és támogató

megközelítés

jobb eredményeket hoz az igénybevevők számára.

Példa lehet

műtét előtt álló

páciensek proaktív, jó kapcsolata a kórházi dolgozókkal.

Az új modellel az eredmény

kevesebb kórházban töltött nap,

és a műtét utáni negatív következmények alacsonyabb aránya,

erősebb immunrendszer,

és nagyobb fokú együttműködés az orvosokkal és nővérekkel az előírások tekintetében,

pl. gyógyszer rendszeres bevétele, stb.

Az új modellben az egészségügyi intézményekkel pereskedő,

és orvosokat váltogató

felhasználók aránya is csökkent.

Ez az új modell nem csak a felhasználók és családjaik számára pozitív,

hanem a társadalom egésze számára, hiszen az olyan társadalom, amelyben az emberek nagyobb mértékben meg tudják valósítani a belső lehetőségeiket

azt vonja maga után, hogy az emberek kevésbé betegek, hosszabb ideig élnek, és kevésbé hajlamosak a betegségekre – végső soron egy jobb életminőségű társadalmat hozva létre.

Összefoglalva, az egészség és jólét támogatásával mindenki nyer,

és az eredmények magukért beszélnek.

You can skip the following exercise in case you are not working in any role in the field of helping relationships.

Szeretnék pár szót szólni a hatékony pszichoterápiás kapcsolatokról.

A pszichoterápia egy a sok segítő kapcsolat közül,

ám ezt a jog sajátos módon

szabályozza: például Olaszországban csak ún. „orvosi pszichológusok" kínálhatnak pszichoterápiás szolgáltatást,

olyan szakemberek, akik vagy pszichiáterek, vagy elvégeztek egy legalább négy éves szakképzést.

Mások nem végezhetnek ilyen tevékenységet, bűncselekménynek számít, ha valaki engedély nélkül űz segítő foglalkozást,

mivel minden olyan kezelés, ami – jó – hatással van egy ember egészségére, kárt is okozhat, ha az azt végző nincs megfelelően tisztában annak alkalmazásával.

tehát

Rengeteg kutatás mutatja azt, hogy a pszichoterápia hatékonysága nem az alkalmazott elméleti megközelítéstől függ,

hanem sokkal inkább a különböző pszichoterápiás irányzatokban dolgozó terapeuták kapcsolódási képességeitől,

a kapcsolatba beletett minőségektől, és itt is ugyanazok a változók,

tényezők fontosak, mint más segítő kapcsolatokban.

Egy pszichoterapeuta nem az általa alkalmazott konkrét elméleti modell miatt hatékony,

hanem akkor, ha képes ügyfeléhez nagy fokú elfogadással,

tisztelettel, ítéletnélküliséggel kapcsolódni,

illetve

ha nem csak

meghallgatja, amit a felhasználó/páciens/ügyfél mond, hanem tud empátiával fordulni felé

és nyitott az kliens személyes értelmezéseire.

A hatékony szakember továbbá képes őszinte, spontán és transzparens módon kapcsolódni az ügyfélhez.

Ám mindez önmagában nem elég, mivel, mint minden segítő kapcsolat, a pszichoterápiás kapcsolat is

csapatmunka, egy olyan közös építkezés, amelyhez az ügyfél aktívan hozzájárul

– enélkül nem működik.

Mindamelett

Fontos a motiváció is, amit gyakran az biztosít, hogy az ügyfél nem érzi jól magát, így motivált a változásra;

a képesség a pszichoterapeutával kialakítható pszichológiai kapcsolatban való részvételre;

valamint

a képesség arra, hogy az ügyfél érzékelje, hogy a szakember

rendelkezik a tisztelet, empatikus figyelem és őszinteség

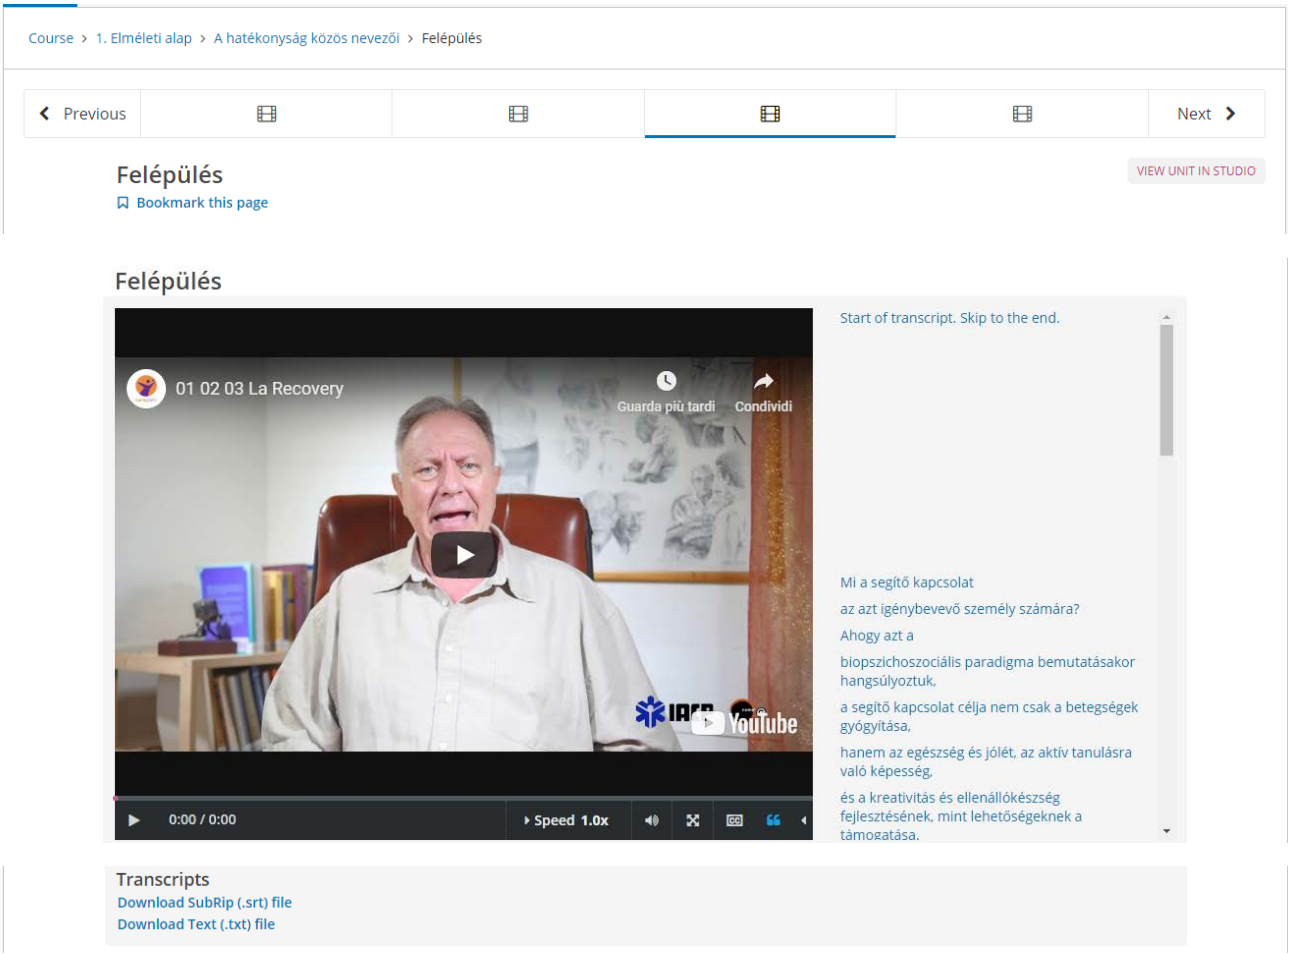
alapvető minőségeivel.

Így a kapcsolat igen pozitív és jóval hatékonyabb eredményeket hozhat,

mint ha az ugyanazon problémával rendelkező embert pusztán gyógyszerekkel,

vagy sehogy nem kezeljük.

Összefoglalva, a pszichoterápia és a segítő kapcsolatok területén az igazán jó orvosság a hatékony kapcsolat.



Transcript

Manapság

Nagy mennyiségű

kutatási anyag

illusztrálja,

hogy a szakmai hatékonyság

mit jelent

a segítő kapcsolatok

területén dolgozó, szolgálatás nyújtó szakemberek

esetében.

Ezeket a kutatásokat

jóval ezelőtt indították,

Carl Rogers hipotézisei alapján,

aki az

személyközpontú megközelítés megalkotója

és a humanisztikus pszichológia egyik atyja.

1942-től kezdődően Rogers először hipotéziseket

állított fel

majd empirikusan kezdte bizonyítani,

hogy milyen feltételek szükségesek alapvetően egy szakember számára ahhoz, hogy hatékonyan tudja

a változást elősegíteni.

Ezeket időközben

kutatások is alátámasztották: képesség a bizalomteli

kapcsolat kialakítására a klienssel;

a szakember ítélkezéstől mentes,

elfogadó és

mély tiszteletet tanúsító hozzáállása a kliens személye irányába;

képesség

az érzékeny és pontos, empatikus odafigyelésre és meghallgatásra – ami azt jelenti, hogy nem csak azt értjük meg, amit a kliens mond,

hanem azt is, hogy mindaz számára mit jelent;

illetve végül, de nem utolsósorban, az autentikusság

és őszinteség a kapcsolatban.

Ezek a hipotézisek, amelyeket a pszichoterápiával kapcsolatos kutatások megerősítettek,

később hatékonynak bizonyultak

az összes

segítő kapcsolat

esetén.

Rogers nagymértékben hozzájárult

a segítő kapcsolatok jelentős fejlődéséhez, elgondolásai stabilan, a tudományban gyökereznek, nem a metafizikában,

és egyértelművé tette azt az értékrendet, ami ennek a szemléletnek az alapját képezi.

Úgy vélem, a legtisztább forrás az, ha magának Carl Rogers-nek a gondolatait olvassuk,

aki ezt a három alapvetően szükséges feltételt egyik ismert filmjében mutatja be:

„Sokéves terápiás tapasztalatom során azt kezdtem érezni, hogy ha képes vagyok

megteremteni a megfelelő légkört

a megfelelő kapcsolatot, és a megfelelő feltételeket,

a fejlődés majdnem mindig megtörténik a kliensben.

Megkérdezhetik, hogy mi ez a légkör

és mik ezek a feltételek.

Létrejönnek-e egy olyan nővel folytatott beszélgetésben,

akivel még soha nem találkoztam?

Engedjék meg, hogy röviden összefoglaljam, mik is ezek a feltételek, ahogy én látom őket.

Az első kérdés,

hogy lehetek-e természetes egy ilyen kapcsolatban.

Ez különösen fontossá vált számomra az évek folyamán.

Úgy érzem,

hogy a

hitelesség a minőségi munka fontos tényezője

A kongruencia kifejezést szeretem használni, ami azt jelenti, hogy amit belül megtapasztalok,

az jelen van a tudatomban és a kommunikációm során jön a felszínre.

Bizonyos értelemben,

amikor ez megtörténik,

teljes mértékben jelen vagyok a kapcsolatban.

Van egy másik szavam is ennek kifejezésére,

ez pedig a transzparencia.

Úgy érzem, hogy a terápiás kapcsolatban szeretnék transzparens lenni. Szeretném biztosítani a klienseimnek, hogy „átlássanak” rajtam

hogy semmi, de semmi ne maradjon rejtve.

És ha ilyen természetes vagyok... megpróbálom leírni...

akkor a saját érzéseim gyakran tudatossá válnak,

és anélkül jutnak kifejezésre,

hogy a kliensre rakódnának.

A

második kérdés az, hogy észreveszem-e magamon, hogy dicsérem ezt a személyt,

gondoskodom róla.

Természetesen nem akarok színlelni olyasmit, amit nem érzek.

Sőt, ha tartósan nem kedvelem a kliensem, úgy érzem, hogy jobb, ha ezt ki is fejezem.

De tudom,

hogy a terápiás fejlődés sokkal nagyobb valószínűséggel történik meg,

és az építő jellegű

változásnak is nagyobb a valószínűsége,

ha valódi, spontán nagyrabecsülést érzek azzal a személlyel kapcsolatban, akivel dolgozom.

A független egyén nagyrabecsülését értem ezalatt.

Nevezhetjük elfogadásnak. Nevezhetjük gondoskodásnak.

Vagy nevezhetjük birtoklás nélküli szeretetnek is, ha úgy tetszik.

Azt hiszem, hogy ezen meghatározások bármelyike használható.

Tudom, hogy az a kapcsolat fog építőnek bizonyulni, ami a jelen pillanaton alapul.

És a harmadik kérdés, hogy képes leszek-e megérteni ennek az egyénnek

a belső világát kívülről?

Képes leszek-e az ő szemén keresztül látni a dolgokat?

Kellően érzékeny

leszek-e

ahhoz,

hogy érzelemvilágát megértsem,

hogy tudjam, milyen érzés lehet most „neki lenni”?

Hogy ne csak

a felszíni jelentést érzékeljem, hanem azokból is néhányat, melyek valahol mélyen,

az alatt rejtőzködnek.

Tudom, hogy ha

érzékenyen és pontosan engedem bele magamat a kliens élményvilágába,

akkor a változásnak és a terápia működésének sokkal nagyobb a valószínűsége.”

Mi a trauma? Hogyan határozhatjuk meg?

A trauma egy olyan élmény

stresszt kiváltó,

gyakran hirtelen

bekövetkező jelenség,

amely meghaladja a személy azon képességét, hogy reagáljon,

vagy

megvédje magát a traumától.

A trauma olyan élmény, ami úgymond „elsöpri" az embert,

túllép a tűrőképességén.

A traumát sokféleképpen

tanulmányozták már.

Vannak akut traumák – például a

természeti vagy technológiai katasztrófák által előidézettek; és vannak a krónikus/ismétlődő traumatikus helyzetek –

aminek például gyakran vannak kitéve gyerekek.

Klinikai

szempontból

a trauma története a poszttraumás neurózisok kutatásával kezdődött,

amelyekkel Freud – a pszichoanalízis keretében foglalkozott – majd később mások is tanulmányoztak.

A pszichoanalitikusok, a kezdetek óta sok, az I. Világháború és az azt követő háborúk traumái

által okozott mentális zavart figyeltek meg, amit aztán a pszichiátriai klasszifikációs rendszerek beépítettek és a poszttraumás stressz zavar pszichopatológiájaként írták le.

később.

A poszttraumás stressz zavar

az egyetlen olyan pszichiátriai zavar, amelyet bizonyosan külső hatás vált ki.

Ez a hatás pedig maga a trauma.

A személy számára nem természetes, hogy gyenge, törékeny vagy sérülékeny – hiszen mindez önmagában elég ahhoz, hogy

pszichés és fiziológiai következményei legyenek.

Ha váratlanul éri a trauma, például egy földrengés vagy egy árvíz, elsöpri az alkalmazkodó képességet.

A fizikai szinten megjelenő tüneteknél ma azonban az a lényeg, hogy – bár vannak neurovegetatív tünetek, mint a

készenlét, az emelkedett izgalmi szint, az éberség, a külső ingerekre adott reakciókészség megemelkedett szintje – ezek a poszttraumás stressz zavart alkotják.

Mindez azt jelenti, hogy a személy objektív tüneteket, jeleket is hordoz és nem csak szubjektíveket a trauma következményeként.

A trauma pszichés mechanizmusait is vizsgálták

amelyek igen

fontosak.

A pszichoanalízis a kezdetektől fogva azt tanulmányozta,

hogy a trauma

– főleg, ha korai gyerekkorban következik be –

egy elfojtási folyamaton megy át.

Ez az elfojtás azonban nem jelenti azt, hogy a traumát az azt elszenvedő elfelejti,

tagadja vagy végleg magába temeti. A trauma később újra jelentkezhet, újra aktiválódhat,

például felnőtt korban,

esetleg

egy másik trauma miatt, amely valahogy

előhívja az előző traumát. Ez egy kétlépéses mechanizmus, amit Freud behatóan vizsgált.

Eszerint van egy elsődleges trauma, ami bizonyos értelemben érzékenyíti az embert,

és van egy másodlagos trauma

ami az elszenvedőben újrateremti az áldozattá válás,

erővesztettség és törékenység állapotát.

Így ez újrateremti a helyzetet, és új

tünetekhez

vezet.

Mindez egy olyan helyzetet eredményez, amelyben a kliens úgy érzi, mintha az lenne az első alkalom, hogy a traumát megéli.

Ugyanakkor a poszttraumás stressz zavar esetén

a trauma egy egyszeri konkrét alkalom hatására következik be,

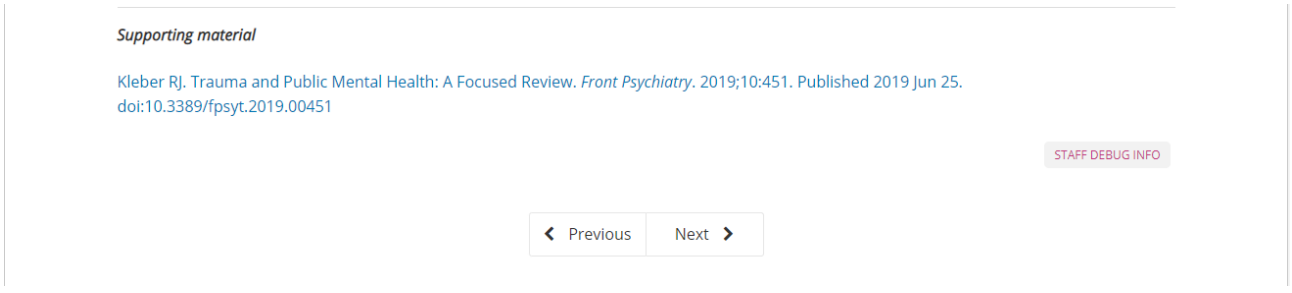
általában olyan módon, ami veszélyezteti az elszenvedő életét

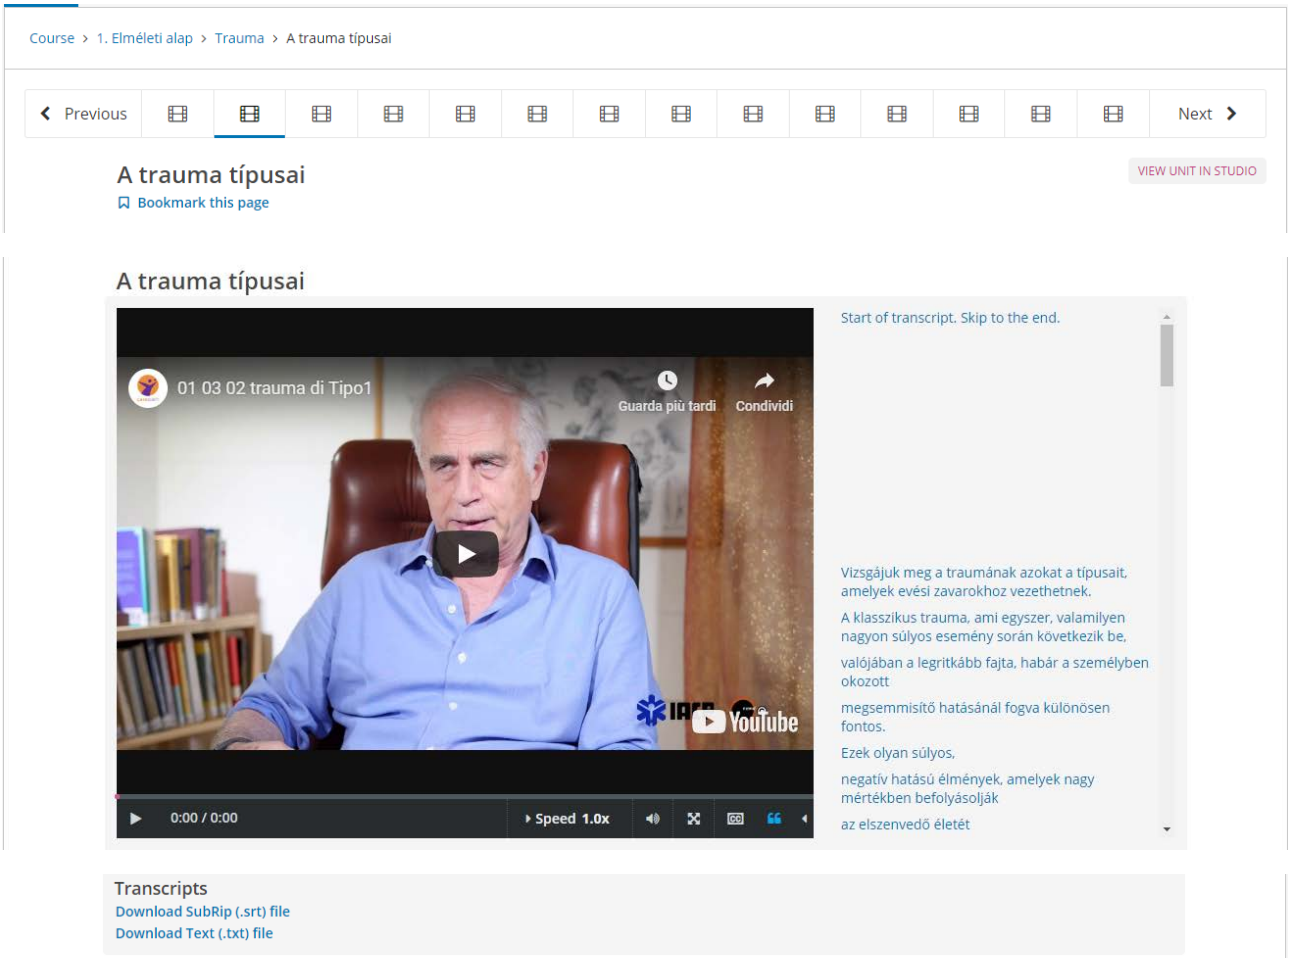
Kiválthatja háború, kínzás,

technológiai vagy környezeti katasztrófák.

Az ilyen trauma egyszeri előfordulású, és könnyen azonosítható

az elszenvedő életében.





Transcript

Vizsgájuk meg a traumának azokat a típusait, amelyek evési zavarokhoz vezethetnek.

A klasszikus trauma, ami egyszer, valamilyen nagyon súlyos esemény során következik be,

valójában a legritkább fajta, habár a személyben okozott

megsemmisítő hatásánál fogva különösen fontos.

Ezek olyan súlyos,

negatív hatású élmények, amelyek nagy mértékben befolyásolják

az elszenvedő életét

olyan pszichés és/vagy fizikai károkat okoznak,

amelyek

több évig is eltarthatnak.

Általában ezzel a fajta traumával találkozunk a poszttraumás stressz zavar esetén,

de az evési zavarok bizonyos típusainál is

igen gyakori.

Ezt a típusú traumát két részre lehet osztani: fizikai trauma,
amely különösen nehéz helyzetekben fordul elő,
mint pl. nemi erőszak, rablás, fizikai erőszak, háborús harc,
természeti katasztrófák
(pl. cunami vagy földrengés), vagy súlyos autó -
vagy vasúti baleset esetén.
Az elsősorban pszichés típusú trauma lehet: ha valaki
fenyegetve érzi magát valaki más által
egy olyan helyzetben,
ahol nincsen
fizikai sérülés, ám a
fenyegetettség érzése annyira szélsőségesen erős, hogy az illetőnek nehéz azt a közeli jövőben
kitörölnie az elméjéből.
Az első típusú trauma vagy „fókuszált trauma”
esetén a trauma egy egyszeri élmény,
az illető csak egyszer tapasztalja meg,
de
mély nyomokat hagy.
Az evéssel
kapcsolatos tünetek esetén
nagyon hasonló a hatása a poszttraumás stressz zavaréhoz.
Az I. típusú traumának több következménye lehet, amelyek közül az evési zavar
az egyik leggyakoribb,
de jelentkezhet egy sor olyan más,
igen sokféle
tünet
formájában
is
amelyek az
evészavaros viselkedésben is megtalálhatóak.
Más szóval az evészavaros viselkedés nem csak kifejezetten az evéssel kapcsolatos viselkedésben
nyilvánul meg,

hanem azt gyakran,
az esetek túlnyomó többségében kíséri sok egyéb tünet
és jellemző is. Ezek a következők lehetnek:
alacsony önértékelés, nagyon erős hajlam a depresszióra,
torzult önkép az illető saját testét és
szexualitását illetően,
magas öngyilkossági kockázat, szorongásos zavarok, alkoholhasználat,
alvászavarok, disszociatív zavarok, emlékezetvesztés, agresszió és személyiségzavarok.
A tünetek ezen hosszú sora nem meglepő;
az evészavarok sosem léteznek csak önmagukban, mindig ilyen és
ehhez hasonló tünetekkel vagy olyan egyéb patológiákkal járnak együtt,
amelyek kiegészítik őket.
Nagyon ritka,
hogy ezek ne lennének jelen.
Van egy bizonyos
trauma, amely
elsősorban alexitímiát
okoz: egy olyan érzelmi zavart,
amely meggátolja az embert a érzelmek szavakban történő
kifejezésében.
A tendencia ebben az esetben, I. típusú trauma elszenvedése után az, hogy az illető az érzelmeket főként
nonverbálisan fejezi ki,
a testével.
Ezek az érzetek
nagyon erősek
lehetnek,
és az érzelmi
önreguláció̱ra való képesség súlyos hiányával járhatnak. Olyannyira, hogy az illető
egy impulzust fejez ki
egy bizonyos szinten
illetve
mivel

az egyik
leggyakrabban kapott visszajelzés,
a bulimia nervosa egyes eseteiben
ez a típusú trauma (pl. bántalmazás)
annyira
súlyos és erőteljes,
hogy a tünetei
nagy mértékű és széles körű kontrollvesztéshez vezethetnek,
több szinten.
Ha a trauma súlyos és a fejlődés korai szakaszában következik be,
ha komoly
változók vannak
a támogatandó családban,
felmerül a
multiimpulzív bulimia veszélye is
Ez a bulimiának egy igen súlyos
és veszélyes formája,
amelyben a bulimiás viselkedés váltakozhat
vagy együtt járhat
más evészavaros viselkedésekkel, valamint erős impulzivitással,
főleg a
szexualitásra
és a
kontrollálhatatlan
evési kitörésekre vonatkozóan. Mindez pl.
olyan viselkedésekhez is vezethet,
hogy az illető lop a boltban,
és az ételt ott helyben, a boltban el is fogyasztja – nem képes megvárni, hogy
hazaérjen vele, akkor is, ha lenne rá módja, hogy az ételt megvásárolja.
Ez az
impulzusok feletti kontroll elvesztése, ami a szexualitás terén is megnyilvánulhat,
de legfőként és legveszélyesebben az önkárosító késztetések formájában jelentkezik,

mint pl. a falcolás vagy öngyilkossági kísérletek.

Ez, a multiimpulzív bulimia a bulimia legveszélyesebb ismert formája főként

a hozzá kapcsolódó magas öngyilkossági arány miatt.

Összefoglalva, az I. típusú trauma következménye lehet az ilyen típusú bulimia, főleg ha az illető környezete nem támogató.

A bulimiának ez a legveszélyesebb ismert formája, főként a hozzá kapcsolódó

igen magas öngyilkossági arány miatt.

A hagyományosan ismert trauma mellett, ami egy egyszer bekövetkező,

az

ember életét megváltoztató

súlyos esemény,

létezik egy másik, a II. típusú trauma is

Ez általában egy kevésbé súlyos trauma,

ami azonban az idő során többször ismétlődik, 8

olyan gyakorisággal, hogy az elszenvedő előre tudja, hogy újra be fog következni,

csak azt nem tudja, hogy pontosan mikor.

Ez a várakozás erős „korróziós” hatással van az elszenvedőre: : az erőtlenség

és tehetetlenség szélsőségesen erős érzéseket kelt benne,

az önrendelkezés teljes

hiányát okozva.

Az ilyen típusú trauma esetén – az evészavarok itt is gyakran megtalálhatóak következményként –

az előtörténetben előfordulhat,

hogy a gyerek vagy kamasz hosszú időn keresztül

szemtanúja volt

erőszakos konfliktusoknak

az otthoni környezetben, anélkül, hogy tisztában lett volna azzal, hogy mi történik.

Előfordulhat, hogy ez az erőszakos konfliktus erőszakos viselkedéshez vezet,

amely komoly károkat

vagy veszteségeket okozhat

Az ilyen fajta ismétlődő trauma

súlyos következménye,

hogy az elszenvedő előre látja és várja a traumatikus eseményt,

és aztán olyan helyzetekben is ellenségességet vár,

ahol az nem feltétlenül áll fenn.

A traumát a nagyon erős

és gyakori ismétlődés okozza

amely az illető életében

ugyanazt a félelmet aktiválja azután is 32

hogy a traumatikus, ismétlő esemény már megszűnt. 33

Egyes esetekben az elszenvedők hajlamosak megismételni a traumát.

Például ha egy

fiatal nő

egész gyerekkorában azt látta, hogy a szülei hogyan veszekednek egymással amiatt,

hogy egyikőjük megcsalta a másikat,

felnőttként csak olyan partnereket

választ,

akik ugyanúgy megcsalják.

Ezek a cserben hagyások felerősítik a nő igényét arra, hogy kiderítse, a hűtlenség valóban megtörtént-e vagy sem.

Az ilyen viselkedés

a kárt okozó esemény, azaz a megcsalás előrevetítését okozza,

és a fiatal nő folyamatosan attól fél, hogy az egyik pillanatról a másikra, bármikor megtörténhet;

mintha azokat a pillanatokat élné át újra, amiket gyerekként elszenvedett.

Az ilyen II. típusú trauma többek között

a tagadásra való nagyon erős hajlamot és érzelmi érzéketlenséget vonja maga után –

mintha az illető az érzelmeit megszüntetné.

Így az ilyen emberek hajlamosak úgy viselkedni, mintha nagyon „hűvösek" lennének,

mintha az életük

bizonyos pillanataiban nem lennének érzéseik.

Ezt az érzelmek beszűkülésének hívjuk, ami a

disszociatív zavarok egyik alapeleme

Az ilyen zavar esetén az ember elveszti a képességét a hétköznapi érzések érzékelésére

mintha fontos

érzékelési

képességét

vesztené el

vagy mintha nem lenne jelen,

élete bizonyos pillanataiban nem lenne

ott az életében.

Ezt egy elfojtott,

mély düh kíséri,

főként az evészavarok esetén, azon belül is

legfőképp az olyan esetekben,

ahol kontrollvesztés áll fenn, úgymint a korlátozó anorexia

a bulimiás viselkedéssel társuló anorexia

vagy

bulimia esetén

Az elszenvedő passzív,

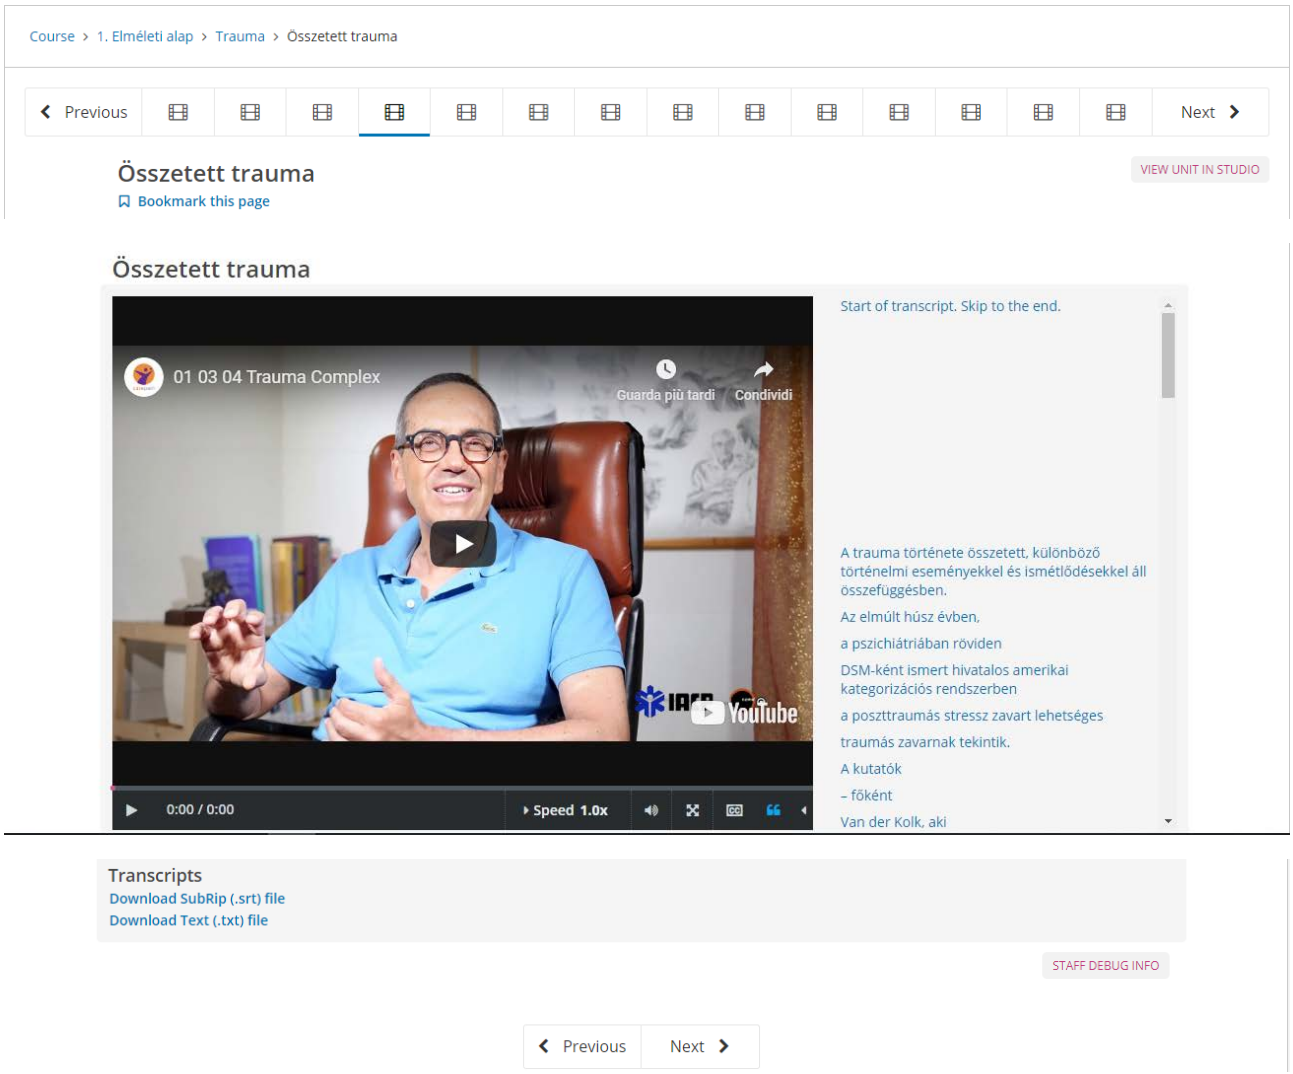
láthatólag nem reagál,

de ha csinálnak valamit,

erős düh figyelhető

meg bennük.

A külvilág elleni agresszió megnyilvánulásait erősen
magában tartja,
de ha az illető erős érzelmeket él át,
ez az erős harag kifejeződést nyerhet
és erőszakos viselkedést eredményezhet önmaga vagy mások irányában.
Az elszenvedő folyamatos, nem múló – nem időszakos – szomorúságot érez,
mintha
egy olyan
gyerekkori trauma történt volna, amely
az egész életére
kiterjedő kétségbeesést
okoz.
Ahogy korábban leírtuk,
ezek összegyűlő, egymásra rakódó
kisebb traumák. Nevezik ezt komplex vagy kapcsolati traumának is,
mivel az illetőnek másokkal kialakított folyamatos kapcsolataival állnak összefüggésben.
Előfordulhat, hogy az ilyen traumákat átélők
erősen traumatikus pillanatokat élnek át
az otthoni környezetben, főként
a családban.
Így ezek folyamatos traumák, amelyek újra és újra felbukkannak, és disszociatív tüneteket
vagy túlzott érzelmi regulációt vonnak maguk után, ahogy ezt korábban leírtuk.



Transcript

A trauma története összetett, különböző történelmi eseményekkel és ismétlődésekkel áll összefüggésben.

Az elmúlt húsz évben,

a pszichiátriában röviden

DSM-ként ismert hivatalos amerikai kategorizációs rendszerben

a poszttraumás stressz zavart lehetséges

traumás zavarnak tekintik.

A kutatók

– főként

Van der Kolk, aki

komplex trauma kérdését útjára indította

– figyelmet a gyerekkori traumákra fordította.

Azokra, amelyek olyan életkorban történtek,

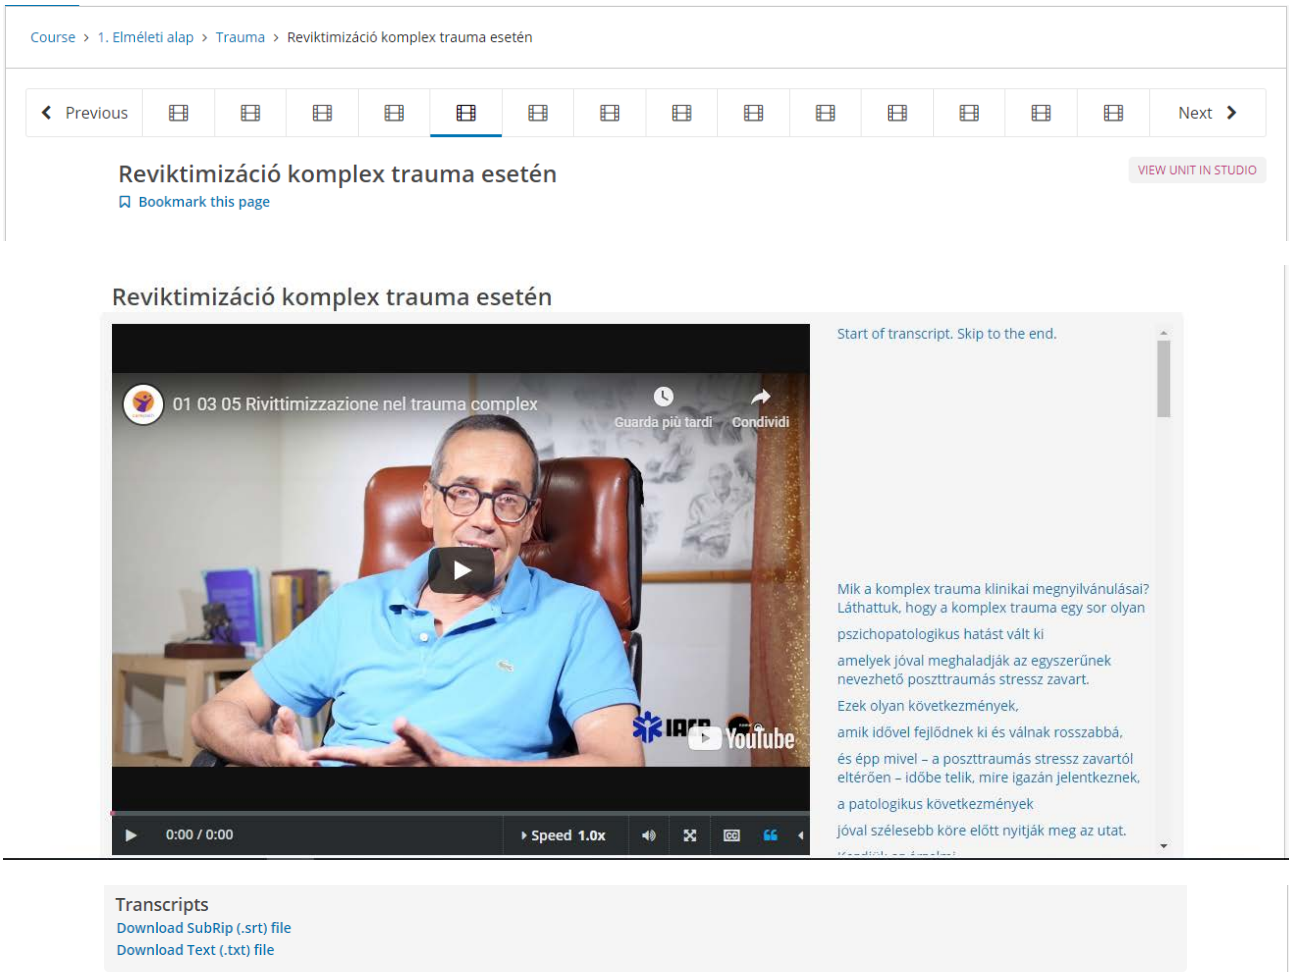
amikor
az elszenvedő
egy gyenge vagy alárendelt helyzetben volt – ahogy a gyermekek általában.
Az ilyen típusú
traumatikus helyzetek és események, amelyeket gyerekek szenvednek el,
pszichopatológiai és
neurobiológiai szempontból is okai lehetnek a poszttraumás stressz zavaron túl
még rengeteg más pszichiátriai zavarra való hajlam kialakulásának.
A
gyermekkori
trauma
több
típusú lehet: lehet akut,
lehet időben elhúzódó vagy ismétlődő a gyermekkor során,
és általában
bántalmazás formáját öltik,
az „elkövető” traumatikus események esetén.
Példái ennek, ha szexuális, fizikai vagy pszichés erőszakot
követnek el a gyermek ellen.
A „elhanyagoló
típusú traumák
példái az elhanyagolás különböző formái,
legyen szó
a gyermekről való
pszichés vagy fizikai gondoskodás hiányáról,
amelyek bántalmazó eseményekhez vagy helyzetekhez vezetnek.
A komplex trauma esetén
rossz bánásmódról és bántalmazásról beszélünk.
A komplex trauma, vagy ahogy egyesek hívják, az elsődleges fejlődési trauma,
gyakran
az elsődleges
gondozók,

pl. szülők alkalmatlanságának a következménye.
Ez gyakran
halmozott trauma. Masud Khan pszichoanalitikus épp ezzel a típusú traumával foglalkozik:
amely a gyermekkor során ismétlődő több kisebb eseményből
vagy elhanyagoló/elkövető típusú traumatikus helyzetből tevődik össze,
és amely egy olyan traumatikus alapzöngét vagy dimenziót teremt,
amit az elszenvedő egész
életében érezni fog, amikor nehézségekkel, 53
problémákkal, vagy elsődleges traumát előhívó más traumával találja szembe magát. 54
Ám ez az első trauma olyan komplex trauma, 55 00:03:55,400 --> 00:03:57,400 ami egy nagyon hosszú
és meghatározó időszakon át húzódhat, akár az ember egész gyerekkorán át.
Olyan családokban például,
ahol a szülők
(az egyik vagy mindkettő) problémái miatt a gyerek/ek hosszú időn keresztül
félelemmel és erőszakkal teli légkörben élnek.
Az a légkör nem biztosítja számukra azt a nyugalmat, védelmet és biztonságérzetet,
amire egy gyereknek óriási szüksége van az alapvető bizalom kialakításához-
ez pedig
elengedhetetlen ahhoz, hogy a gyerek később nyugalommal, nyitottan és magabiztosan
nézzenek szembe az élettel és a kapcsolataikkal.
Az is előfordulhat, hogy az elszenvedő mindennek nincs tudatában,
mert az ilyen élményeket a psziché gyakran elfojtja vagy a felejtés fátylát borítja rá,
így
azok
csak belül,
a felszín alatt fejtik ki hatásukat, amíg egyszer csak
„be nem nyújtják a számlát” az illetőnek.
Ezek az élmények gyakran robbanásszerűen
törnek a felszínre,
valami olyan körülmény miatt, ami destabilizálja
az elszenvedő érzelmi állapotát,
kellemetlen számára,

és általa újraéli a múltbeli traumatikus helyzetet.

Ennek az oka az, hogy amint korábban is említettük,

az aktuális trauma felidézheti a múltban elszenvedett traumát.



Transcript

Mik a komplex trauma klinikai megnyilvánulásai? Láthattuk, hogy a komplex trauma egy sor olyan

pszichopatologikus hatást vált ki

amelyek jóval meghaladják az egyszerűnek nevezhető poszttraumás stressz zavart.

Ezek olyan következmények,

amik idővel fejlődnek ki és válnak rosszabbá,

és épp mivel – a poszttraumás stressz zavartól eltérően – időbe telik, mire igazán jelentkeznek,

a patologikus következmények

jóval szélesebb köre előtt nyitják meg az utat.

Kezdjük az érzelmi

szabályozás,

az érzelmek

és a viselkedés zavaraival.

A komplex trauma által

érintett emberek
gyakran olyan mértékben és módon impulzívak,
ami nem pusztán személyiségjegy, hanem pszichés zavarnak, az impulzusokat érintő zavarnak felel meg.
Megnyilvánulhat
erőszakos viselkedésben önmaga vagy mások felé,
vagy különböző
szerek impulzív használatában úgymint drogfüggőség
vagy alkoholizmus.
Egy másik igen fontos terület
az érzelmi önszabályozás képessége az önértékelés formájában
Képesség arra,
hogy az ember kifejlesszen
egy alapvető bizalmat önmaga irányába,
illetve a gyerekkor óta többé-kevésbé látensen hordozott bűntudat.
Fontos észben tartani,
hogy a bántalmazást, főleg pl. szexuális bántalmazást elszenvedő gyermek gyakran érez bűntudatot,
amiért valami mocskosat tett, és nem lesz képes a felelősséget megfelelő módon a felnőttnek,
a bántalmazás elkövetőjének tulajdonítani.
Az ilyen bűntudat depresszióra való hajlamot
hozhat létre az emberben.
A komplex trauma egyik lehetséges felnőttkori következménye
a major depresszió.
További fontos, lehetséges következmények
a különböző pszichoszomatikus zavarok. A traumának a hatásai fizikai szinten is jelentkezhetnek,
pl.: fiziológiai reaktivitás, hiperreaktivitás,
szív- és érrendszeri problémák (pl. szívproblémák, magas vérnyomás)
a fájdalomszabályozás és fájdalomküszöb zavarai
(pl. az egész testben elszórt fájdalomérzés),
hiperérzékenység a fájdalmas behatásokra,
illetve különböző szexuális zavarok,
amik
pszichoszomatikus szempontból szexuális impulzuskontroll-zavarok

és a perverzió változatos formáiban
nyilvánulhatnak meg.
Végezetül pedig meg kell említenünk a disszociatív zavarokat,
mint pl. a deperszonalizáció-derealizáció, amely jelenséget ma még relatíve nehezen ismerik fel.
Az ebben szenvedő ember egy fajta idegenséget,
elkülönültséget él meg
önmagával és a valósággal szemben.
Ez tulajdonképpen egy védelmi mechanizmus
egy olyan valóság ellen, amit az illető valamiért annyira elviselhetetlennek él meg,
hogy úgy érzi, nem képes visszatérni az életbe,
és a disszociáció által inkább egy távolságot ékel be önmaga és a valóság közé.
Freud leírta továbbá az ismétlési kényszer
alapvető mechanizmusát,
amely nem más, mint hogy az ember újra és újra megpróbálja szembetalálni magát a traumával
– nem azért, hogy
újra elszenvedje
a negatív következményeit, hanem hogy megpróbálja azt feloldani.
A trauma feloldására irányuló ilyen típusú késztetés következménye, hogy az illetőt a viselkedése olyan helyzetekbe sodorja,
amelyekben újraéli a traumatikus helyzeteket. A klasszikus esetben az elkövető áldozata egy gyermek
ám ezt felnőttkorban ugyanilyen vagy fordított
szerepleosztásban
is újra átélheti.
A felnőtt tehát vagy megpróbálja újra-
legitimizálni magát azzal, hogy olyan helyzeteket hoz létre,
amelyekben más emberek tettei következményének
az áldozata
lesz
vagy ő maga lesz az elkövető,
aki egy áldozat ellenében cselekszik.
Ez történhet pl.
a gyerekként elszenvedett szexuális bántalmazás esetében

amely később, kamasz- és felnőttkorban válik inkább

ismétlődő helyzetté.

Például

szexuális erőszak

esetén azt

megélheti

elkövetőként vagy újrateremtheti áldozatként.

A lényeg, hogy még fordított szerepleosztásban is

a psziché célja, hogy a helyzet újraélése által megpróbálja feloldani

az elszenvedett traumát. Freud ezt nevezi ismétlési kényszernek.

Milyen szerepet tölt be a munkahelye struktúrájában?

Az

újratraumatizáció

az a sajnálatos jelenség,

amikor valaki, aki korábban traumát szenvedett el,

újra átéli azt.

Általában két fő oka lehet az újratraumatizációnak

Egyrészt

az ember

találkozhat

olyan

képekkel

vagy eseményekkel, amelyekben

más személyek szenvednek el traumát,

de amelyek következtében
az illető újraéli a saját, korábban elszenvedett traumáját.
A másik
a jatrogén,
azaz
gyógyítást célzó
kezelés
következtében
kialakuló újratraumatizáció.
Ez
olyankor
fordul elő,
ha a
kezelést
helytelenül végzik a szakemberek vagy
intézményi dolgozók,
nem feltétlenül rossz szándékból, inkább tudatlanságból.
Így a kezelés és a segítő
intézmény ahelyett, hogy támogatná,
újratraumatzálja a
35
a már eredetileg 36
is traumatizált személyt.
Egyszerű példa
lehet
az a helyzet,
amikor
valaki törött lábbal érkezik a sürgősségi osztályra,
ám az orvosok
rosszul kezelik,
leejtik a hordozóágyról,
aminek következtében már nem egy, hanem két törött lába lesz,

dupla sérülés: kész tragédia.

A trauma kezelésének

eddigi

történetéből

kiderül hogy sajnos a

múltban egyáltalán nem volt ritka dolog, hogy –

természetesen tudatlanságból, nem pedig rossz szándékból –

a gyógyítást célzó

kezelés

újratraumatizációt okozott.

A teljes segítő intézményrendszer esetén,

mivel az embert, mint rendkívül komplex és érzékeny lényt próbálja kezelni,

fennáll a veszélye annak, hogy nem csak pozitív, de negatív módon is hatással lehet az ellátottakra, és akaratán kívül további sérüléseket okozhat számukra.

Ez vonatkozik a gyógyszerekre, a műtétekre

és minden fajta segítő kapcsolatra. Az olyan szolgáltatás, amelyet

nem megfelelően hajtanak végre

ellenkező

hatást válthat ki.

A trauma esetében ez kifejezetten komoly kérdés, hiszen a traumatizált ember

különösen

érzékeny és

nagy mértékben sérülhet egy második traumatizáció által.

Szerencsére mára már

tanultunk ezekből a hibákból, egyre

több

és több

és pontosabbak a kutatáoks, és jelentős tudásra tettünk szert – amelyet a jövőben tovább bővítünk – ennek köszönhetően

elővigyázatosabban tudunk eljárni, meg tudjuk állapítani a kényes pontokat,

hogy elkerüljük az eleve traumatizált emberek újbóli traumatizálását.

Ezek az óvintézkedések

a traumatudatos gyakorlatok,

amik a szolgáltatás traumatizált igénybe vevőjét helyezik a középpontba,

és

figyelnek arra, hogy mi okozhat esetleg további sérüléseket.

Ön úgy érzi, elég szakmai képzést kapott ahhoz, hogy megvédje klienseit a munkája során esetlegesen fellépő újratraumatizációs kockázatoktól?

Transcript

A kamaszkor, fejlődéslélektani jellegzetességeiből kifolyólag,

különösen érzékeny életszakasz. Ilyenkor az ember olyan fontos

biopszichoszociális változásokon megy keresztül, amelyek kényelmetlenséget és szenvedést okozhatnak,

és a kellemetlen hatásokat csak fokozza,

ha az illető traumatikus élményeket is átél.

Ahogy azt Rogers leírja, ha egy gyermek építő környezetben nevelkedik,

ez lehetővé teszi számára, hogy kapcsolatban legyen az érzéseivel, és ne fojtsa el vagy „fagyassza le” a traumatikus élményeket,

hanem túllendüljön és folytassa az életet

miközben kielégíti a saját szükségleteit és kellemesként vagy kellemetlenként értékeli az élményeit attól függően,

hogy azok jótékony hatással vannak-e a fejlődésére, vagy sem. Rogers ezt a veleszületett képességet

hívja aktualizáló vagy önmegvalósító tendenciának, ami nem más, mint a képesség önmagunk megértésére, az önszabályozásra és a bennünk rejlő lehetőségek kibontakoztatására.

Ezzel szemben, ha egy gyermek az őt körülvevő környezetben azt érzékeli, hogy a róla gondoskodók elfogadása

teljes mértékben annak a függvénye, hogy megfelel-e az ő elvárásaiknak, , akkor internalizálhatja ezeket az elvárásokat,

erőszakkal lehasítva önnön énje egyes részeit,

egy ideális,

mereven felépített én érdekében.

Ez a folyamatos bizonytalanságra,

fenyegetettségre és félelemre épült „én-építmény" egyre merevebbé válik, ahogy a gyermek

a kiszámíthatatlan környezetben nevelkedik.

És pontosan ebben a mély elidegenedettség érzésben – az érzékelés és a tapasztalás között - a cselekvés és a tett jön létre, ami

Pontosan ez a mély, a tapasztalás, megélés, szimbolizálás közötti elidegendettség az, amely

a patogenezis alapját képezi

Láthatjuk tehát, hogy az a tizenéves, aki támogató kapcsolati környezetben nevelkedik,

a korábban említett fejlődési változásokon megy keresztül.

A meghatározó tényezők ezen változásai egy fajta belső újrarendeződést tesznek szükségessé,

egy olyan áthangolódást, ami magában foglalja az önmagáról és a legfontosabb kapcsolatairól alkotott képet.

Ez tulajdonképpen az egyén identitásának újradefiniálása.

Lássuk, milyen változásokkal néz szembe a kamasz.

Legelőször ezek a testen jelentkeznek. Egy kamasz teste folyamatos fejlődésben van:

a dolgok mérete megnő, a nemi szervek kinézete és a másodlagos nemi jellegek kialakulásával a teste megváltozik.

Ezek olyan változások, amelyek hatására a kamasznak új fajta kapcsolatra van szüksége a testével és önmagával.

A test válik a tizenéves fiatal elsődleges és közvetlen eszközévé,

hogy az élményeit kommunikálja a külvilág felé.

Ez a változó test olyan, amit lehet gondozni és kicsinosítani,

vagy karcolni, vagdosni,

esetleg megfeledkezni róla: olyan test ez, ami a figyelem középpontjába helyezi magát.

Ugyanakkor ez a test kívülről mások számára is látható, magára vonja mások tekintetét,

vágyakat vagy gúnyolódást vált ki, és így a kamaszt új élményeknek,

új lehetőségeknek és új veszélyeknek teszi ki.

Vannak továbbá az interperszonális szintű változások.

A családon belül a kamasztól azt várják, hogy mozduljon el a függéstől – a gondoskodás és ragaszkodás szakaszától –

az önállóság irányába. Az e között a két,

látszólag ellentétes fejlődési állapot közötti egyensúly keresésének megvannak a társas következményei.

A külső környezetben a fiatalnak a kortársai között és más fontos

kapcsolati személyek viszonylatában betöltött szerepe változni kezd.

A kutatások azt is

láthatóvá teszik, hogy agyi szinten is bekövetkeznek változások, mind strukturálisan, mind funkcionálisan, főként

a döntéshozatali folyamatokban érintett agykérgi területeken.

Mindez természetesen nagy fokú sebezhetőséget teremt, amit, ahogy korábban említettük, tovább fokoz,

ha az illető traumatikus élményeket él át, amelyek károsítják vagy aláássák

a Bowlby által leírt belső biztonságérzetet, biztonságos bázist.

Ez a belső, érzelmi biztonsági középpontunk, amit éreznünk, megneveznünk, táplálnunk kell, ahova nem térhetünk

mindig vissza, de ami lehetővé teszi számunkra, hogy átéljük azt a fontos élményt,

hogy a szeretet elvesztése nélkül fejleszthetjük önállóságunkat, és a más emberekkel való kapcsolatok során

gazdagíthatjuk önmagunkat.

Ám ha valaki traumát él át, akkor gyenge mentalizációs képessége lesz, és nem képes

az érzelmi állapotai önszabályozására; ahogy Bromberg írja,

semmi mást nem tud tenni a traumatikus élmény és az ahhoz kapcsolódó élmények és tartalmak kizárása érdekében,

mint hogy disszociálja magát tőlük. Ez a patológiás disszociáció – ahogy Caretti bemutatja –

az illető állapotának romlásához és erőforrásai kimerüléséhez vezet, mivel nincs meg a lehetősége arra, hogy a traumatikus élményeket

egy koherens narratíva segítségével valahogy átdolgozza és beépítse az élete történetébe.

Ezért ha

érzelmi stresszel küzdő tizenévesekkel dolgozunk,

a legjobb és a legfontosabb,

amit nyújthatunk nekik, az egy igazán mély, empatikus odafigyelésen

és meghallgatáson alapuló kapcsolat, illetve mély tisztelet a személyük iránt. Továbbá az,

hogy megpróbáljuk az élményeiket az ő szemszögükből megérteni, megérteni azokat a jelentéseket,

amiket ők hoztak létre az élményeik értelmezésére, illetve hogy egy olyan kapcsolati környezetet nyújtunk számukra,

amelyben a kamasz lassanként újra kapcsolatba léphet azokkal a részeivel, szükségleteivel, amiket addig megtagadott.

Így nem csak újra érezhetik, hanem újra is hangolhatják ezeket a részeiket

és azokat a külső élményeket, amiket korábban túlságosan kellemetlennek éltek meg.

Ez úgy lehetséges, ha a kamasznak egy olyan kapcsolati környezetet nyújtunk,

amiben másként tekintünk rájuk. Nem csak folyamatos fejlődésben lévő,

a külvilággal küszködő fiúkként és lányokként, vagy csak közösségi média iránt érdeklődő apatikus figurákként látjuk őket,

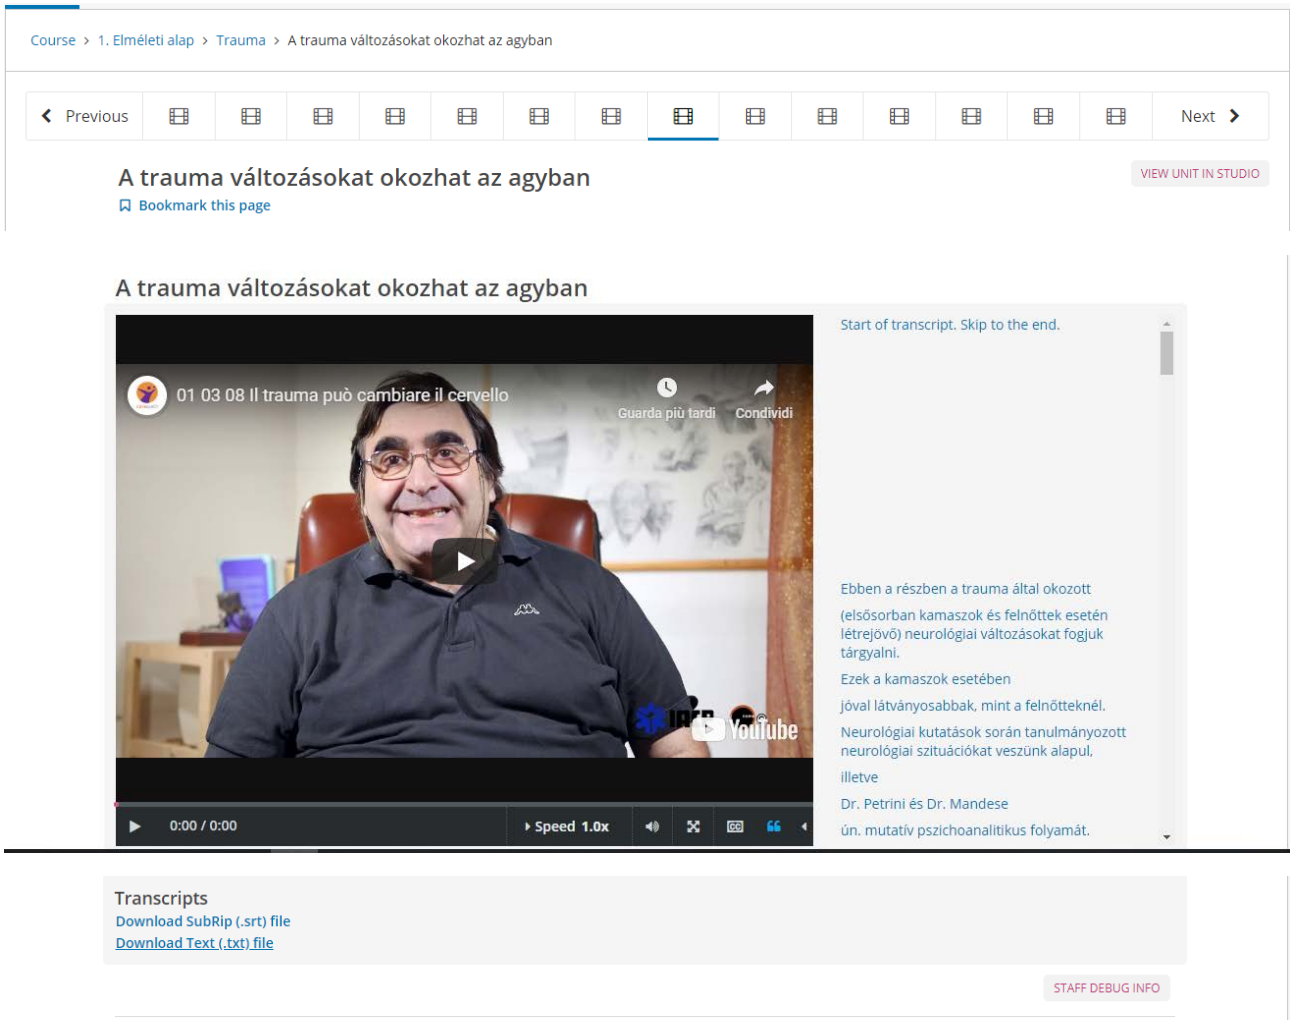
hanem olyan gyermekekként, akik a fejlődési szakaszuknak megfelelő jellemzőkkel

és eszközökkel rendelkeznek, akik aktívan mozognak a világban,

kérdeznek, válaszolnak, felfedeznek, és próbálnak személyes értelmet találni az élményeiknek.

Ahogy mi, felnőttek is tesszük ezt egész hátralévő életünkben,

és ezért nagyon fontos az, hogy szurkoljunk nekik.



Transcript

Ebben a részben a trauma által okozott

(elsősorban kamaszok és felnőttek esetén létrejövő) neurológiai változásokat fogjuk tárgyalni.

Ezek a kamaszok esetében

jóval látványosabbak, mint a felnőtteknél.

Neurológiai kutatások során tanulmányozott neurológiai szituációkat veszünk alapul,

illetve

Dr. Petrini és Dr. Mandese

ún. mutatív pszichoanalitikus folyamat.

Ez egy olyan módszer, ami

mind pszichoanalitikus, mind neurológiai elemekkel rendelkezik,

figyelembe veszi

a

nemzetközi neurológiai kutatások eredményeit, valamint a neurológia és a pszichoanalízis közötti kapcsolatot.

Közismert, hogy egészséges állapotban

az ember naponta 1400 új neuront fejleszt

ösztrogén-alapú őssejtekből,

hippokampusz és érzékszervi

szinten egyaránt.

Ez fontos tényező, mivel a hippokampusz a memória központi eleme,

az a terület,

ami előhívja az ismerős helyzeteket, így a traumatikusakat is.

Míg

érzékszervi szinten

megfigyelünk, az agylebenyek

nem többek,

mint az érzékszervi lebenyünk kivezető csatornái.

Az állatok a szagérzékelésüket használják,

mi a gondolkodásunkat

Ebből következően, az emberi gondolkodás

nem különbözik a szaglószervi érzékeléstől

amely továbbfejlődött ezekben az agysejtekben

Úgy hisszük, hogy az ember körülbelül 30.000 génnel rendelkezik, ami túl kevés ahhoz,

hogy minden helyzetet meghatározzunk, beleértve a lehetséges családi, érzelmi, kapcsolati, kulturális és vallási helyzeteket.

A kutatások szerint a géneknek csak 70%-a genetikailag meghatározott,

míg 30%-át külső tényezők alakítják.

Egy kistermetű férfi

és egy hím bonobó között a genetikai különbség csupán 5%,

ám ez a

kevés rendkívül fontos. Egy emberi férfit és egy bonobót aligha lehetne

összetéveszteni egymással. Az emberek számára

a személyes fejlődéshez rendkívül fontos a kultúra, a vallás,

a külső helyzetek, a család és a közösség, amiben élünk.

Mi történik

stressz hatására?

A stressz vagy az elhanyagolás (ahogy láthattuk, az elhanyagolás is stressznek számít)

blokkolja az őssejtek aktivitását a hippokampuszban,

így lehetetlenné válik a szokványos módon elvesző neuronok pótlása;

így

neuronveszteség jön létre

az agy legfontosabb és legmélyebb területén, a hippokampuszban.

Az ezeket az agyi változásokat kísérő kognitív és érzelmi

szabályozó folyamatokat

az amigdalához

köthető szorongás

és a depresszió

jellemzi:

ez sejtek egy kisebb csoportja az agyban,

ez támogatja az összes érzelmi-kapcsolati helyzetet,

a szeretettől a szexualitáson át az evésig,

beleértve mindent, ami érzelmi szempontból fontos a számunkra.

Változás történik a prefrontális kéregben is, ami a céljaink irányításával függ össze:

ha úgy döntök, hogy színházba megyek megnézni egy előadást, akkor a prefrontális kéreg

adja a késztetést, majd a homloklebeny (frontális lebeny) végzi el a cselekvést.

A prefrontális kéreg vezérli az impulzusokat is, például ha arra van késztetésem, hogy elmenjek valahonnan, vagy ott maradjak,

akkor ezért a prefrontális kéreg a felelős, a homloklebeny pedig reagál erre és kommunikálja

a szükségét annak, hogy maradjak, például valamilyen kötelezettség miatt.

A harmadik, károsodást elszenvedő terület

a hippokampusz és a memória (ahogy korábban már említettük

a hippokampusz a memória központja).

Longitudinális

vizsgálatok bebizonyították, hogy a traumák nem feltétlenül jelentkeznek

a DSM-5 vagy az ICD-10 által meghatározott poszttraumás stressz zavarnak nevezett zavar formájában,

hanem megnyilvánulhatnak

szorongás és depresszió,

olykor hallucinációk útján is,

illetve láthatóvá válnak az énérzet, énkép és az interperszonális kapcsolatok szintjén bekövetkező változásokként is.

A traumát elszenvedett személy

viselkedési és mentális korlátozásokkal él,

pl. az illető nem tűnik képesnek

az önkifejezésre

a munka

vagy a kapcsolatok

területén –

– mintha egy alacsonyabb szinten tudna csak funkcionálni.

Ez a

HPA (hipotalamusz-agyalapi mirigy-mellékvesekéreg) tengely miatt van.

Az agyalapi mirigyből indulnak

ki a hormonok

és jutnak el

a test különböző részeibe.

A hormonális (endokrin) rész

és az idegi rész

közötti összeköttetést

a hipotalamusz-

agyalapi mirigy tengely biztosítja. 97

Minden, ami eljut a hipotalamuszba – ami egy központi fontosságú terület, olyan,

mintha külön kis agy lenne az agyban –

utána átkerül az agyalapi mirigybe,

és érzeteket okoz, azaz az idegi jel hormonanyagok által közvetítve jut el a céljába.

Ezek a hormonanyagok

átszövik a testet,

az agyalapi mirigytől kiindulva,

és ezek irányítják

a pajzsmirigyet,

a szexualitást a nemi mirigyeken keresztül – a férfi
és női szexualitást egyaránt a férfi hormonon keresztül (ami a női szexualitást is meghatározza).
Illetve a
kortikotropin felszabadulását, ami egy stresszhormon, jobban mondva egy stressz előhormon,
mivel maga a stresszhormon az ACTH – a kortizol.
Ezért adnak a betegeknek kortizont a testi reakciók elősegítésére fizikai zavarok esetén;
a kortizol ugyanazokból az összetevőkből áll, mint a pro-opiomelanokortin (POMC).
Az ember szervezete a háborúkra is fel tud készülni: a kortizol (pontosabban az ACTH) egyik hatása,
hogy az ember nem érzi a fájdalmat,
illetve az agresszió mechanizmusait váltja ki
(ahogy állatoknál is).
Ha ezek a mechanizmusok és folyamatok
ismétlődnek,
krónikussá válhatnak, és elhúzódó szorongásos és félelemteli állapotot
okozhatnak,
a korábban említett amigdalától függően.
Az amigdala
a memóriánk „fiókos szekrénye”
abban az értelemben, hogy itt raktározódik
az összes érzelmi töltettel bíró emlékünk – mintha az érzelemvilágunk fényképezőgépe lenne.
Például az első csók, az első munkahely, a jólét első érzései,
az első sportgyőzelem – ezeket az amigdala mind lefényképezi, majd előhívja,
ha hasonló helyzetekben találjuk magunkat; pl., ha a hippokampusz
elkezd
kortizolt termelni.
Ez a kortizol hozzákapcsolódik a hippokampusz, az amigdala és a prefrontális kéreg receptoraihoz,
és ha eléri a megfelelő szintet – ha a helyzet nem krónikus –,
akkor a hatására csökken az ACTH és CRF szint.
Így tehát a stresszre adott válaszainkat a hippokampusz
szabályozza.
Amikor
jól vagyunk, a szerotonin veszi át az irányítást a terület fölött,

ami a boldogságérzés hormon – depresszió esetén

szerotonerg gyógyszereket írnak fel a betegnek.

A szerotonin

gátolja az agresszív viselkedést és elősegíti a szocializációt.

Triptofánból állítják elő, és napi szinten szedni kell.

A szerotonin a oxitocinnal együtt – ami a kötődési hormon – a legpozitívabb

és leghasznosabb hormon a szervezet számára. A szerotonin elősegíti a szocializációt

és a társas kapcsolatokat,

az oxitocin pedig – ami egy 5 másodperces öleléstől is felszabadul –

a kötődést

támogatja.

A kutatások azt mutatják, hogy a szeretetteli tevékenységek,

fontos gondolatok és érzések

mélyen gyógyító hatással lehetnek a testünkre is.

A

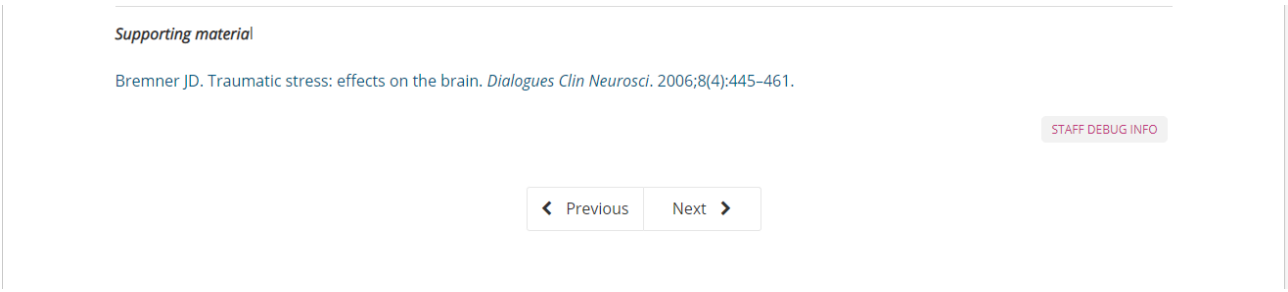
lényünkben

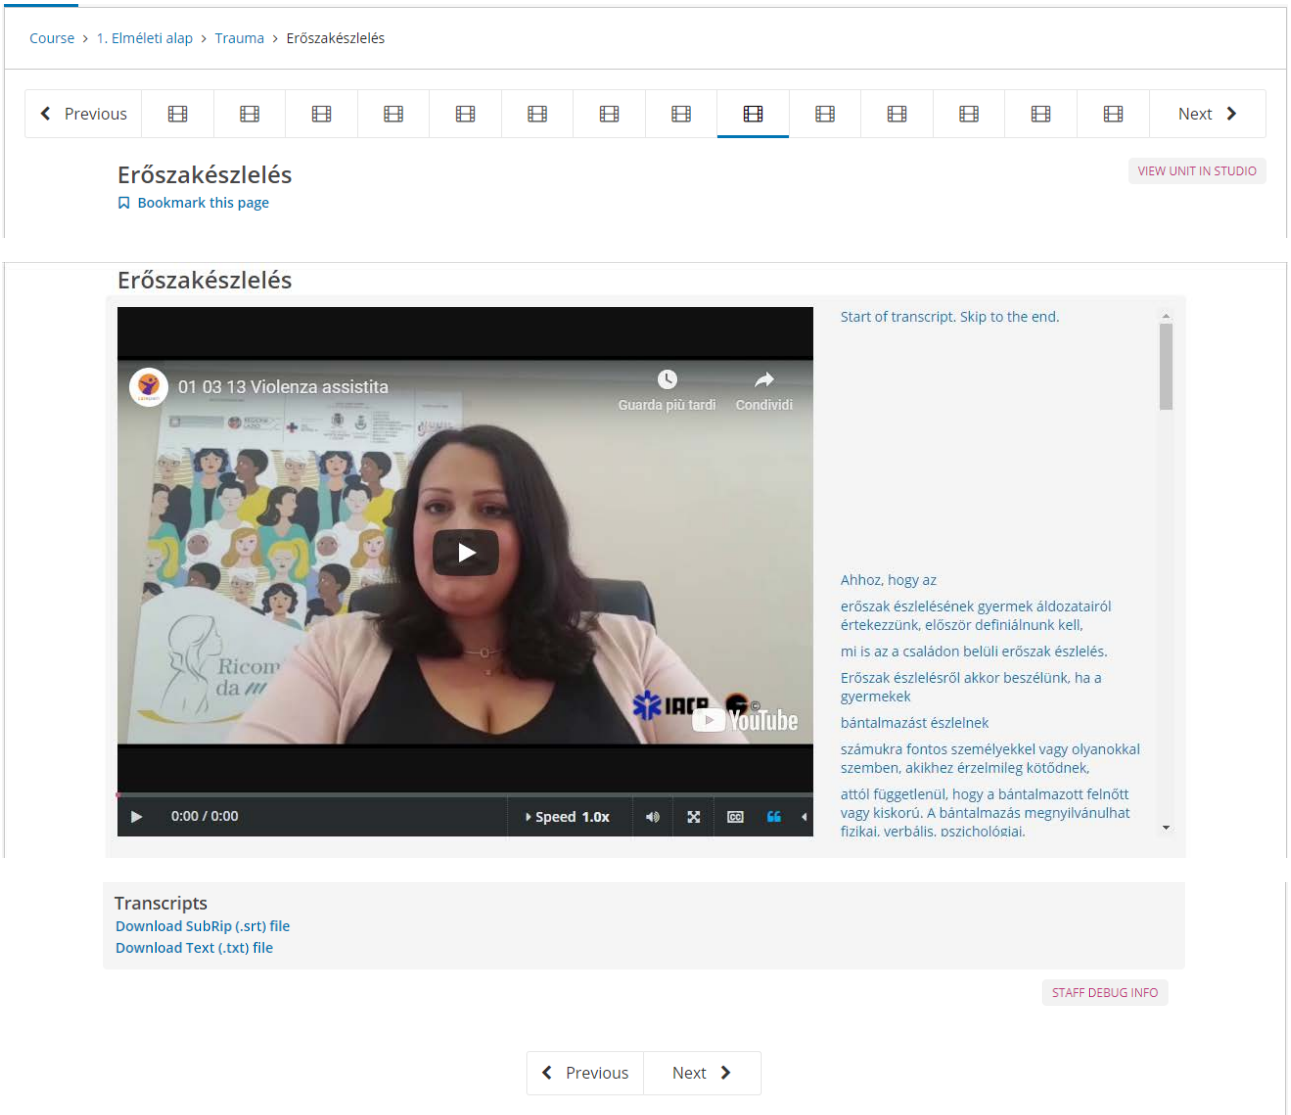
tehát

egy sor olyan reakció játszódik le amik megváltoztatják az agyat, és egyben a testet is,

minden olyan helyzetben, amikor neurohormonokhoz

és idegi ingerekhez kötődő hormonok vannak jelen.





Transcript

Ahhoz, hogy az

erőszak észlelésének gyermek áldozatairól értekezzünk, először definiálnunk kell,

mi is az a családon belüli erőszak észlelés.

Erőszak észlelésről akkor beszélünk, ha a gyermekek

bántalmazást észlelnek

számukra fontos személyekkel vagy olyanokkal szemben, akikhez érzelmileg kötődnek,

attól függetlenül, hogy a bántalmazott felnőtt vagy kiskorú. A bántalmazás megnyilvánulhat fizikai, verbális, pszichológiai,

szexuális vagy gazdasági erőszak formájában.

Ide tartozik a kiskorúak által kiskorúak ellen elkövetett bántalmazás,

de az is, ha valamelyik családtag a háziállatot bántalmazza. Ezek mind

olyan hatással vannak a gyermekekre, amelyek nagy mértékben traumatizálják őket.

Ezen hatások jellege eltérő lehet.

Az erőszaknak van közvetett formája is. Mivel az erőszak észlelhető dolog,

nemcsak szemtanúja, de fültanúja is lehet valaki.

Ezt azért kell hangsúlyozni, mert sok bántalmazott nő állítja, hogy gyermeke

egy másik szobában volt, amikor elszenvedte az ütéseket. A valóságban azonban

ezek az esetek is a közvetlen erőszak változatai, még akkor is, ha a gyermekek nem látják, csak hallják.

Ezek az átélt helyzetek akkor lehetnek közvetettek

ha a gyermekek tisztában vannak azzal,

hogy erőszak történt vagy fog történni. A gyermekeknek ugyanis „antennájuk" van ehhez:

érzékelik azt a tipikus feszültséget a házban,

amely az erőszakos események kirobbanásának előfutára szokott lenni.

Ezeket az eseményeket néha nem közvetlenül vagy közvetve észlelhetik,

hanem akár a bántalmazás hatásai is feltűnhetnek nekik:

például, ha ütésnyomokat látnak az édesanyjukon,

vagy ha megérzik az erőszak atmoszféráját a házban. Így ezekben az esetekben is erőszak észlelésről van szó.

Van néhány tévhit az erőszak észleléssel kapcsolatban.

A gyermekek

nem immunisak a saját családjukon belül történő erőszakkal szemben.

Még akkor is érzékelik az erőszakos cselekedetet, ha az nem az ő jelenlétükben történik,

hiszen a gyermekek sohasem csak passzív, öntudatlan megfigyelők.

Az erőszak észlelés a gyermekek ellen elkövetett közvetlen bántalmazás kockázatát is növeli.

Például az édesanyját védeni próbáló gyermeket

könnyen megütheti az apa, amikor a gyermek a szülei közé áll.

Dr. Annibali az erőszak észlelés esetében

ezt a nemi felosztást használja, ugyanis a legtöbb esetben férfiak

követnek el erőszakot nők ellen.

Ez nem zárja ki azt,

hogy anyák is bántalmazhatnak apákat, vagy általánosságban nők

férfiakat, de statisztikai szempontból ez sokkal ritkább eset.

A bántalmazásnak kitett gyermekek ötször nagyobb valószínűséggel lesznek erőszakos felnőttek azon társaikhoz képest,

akik nem voltak bántalmazás szemtanúi gyermekként.

Az erőszak észlelés hatásai a következők lehetnek:

félelemérzet, szorongás, túlterheltség érzése, szomorúság,

komoly depresszió, düh, bűntudat, alkalmatlanság vagy szégyen érzete.

A gyermekek elvesztik a bizalmat magukkal és másokkal szemben,

különböző pszichoszomatikus zavarok alakulhatnak ki náluk,

valamint indulatkezelési problémákkal, tanulási nehézségekkel,

nyelvi gondokkal,

székletvisszatartási és szociális nehézségekkel,

de akár poszttraumás stressz zavarral is küzdhetnek,

ha ez a traumatikus esemény egy olyan bizalmi közegben történik, mint a család.

Biopszichológiai szinten

az erőszak észlelés visszatükröződik a gyermek viselkedésében,

érzelmeiben, kognitív készségeiben, fizikalitásában és kapcsolataiban is.

A gyermek a teljes zűrzavar világában nő fel és az

erőszak természetessé

válik számára.

A gyermek az erőszakos viselkedést

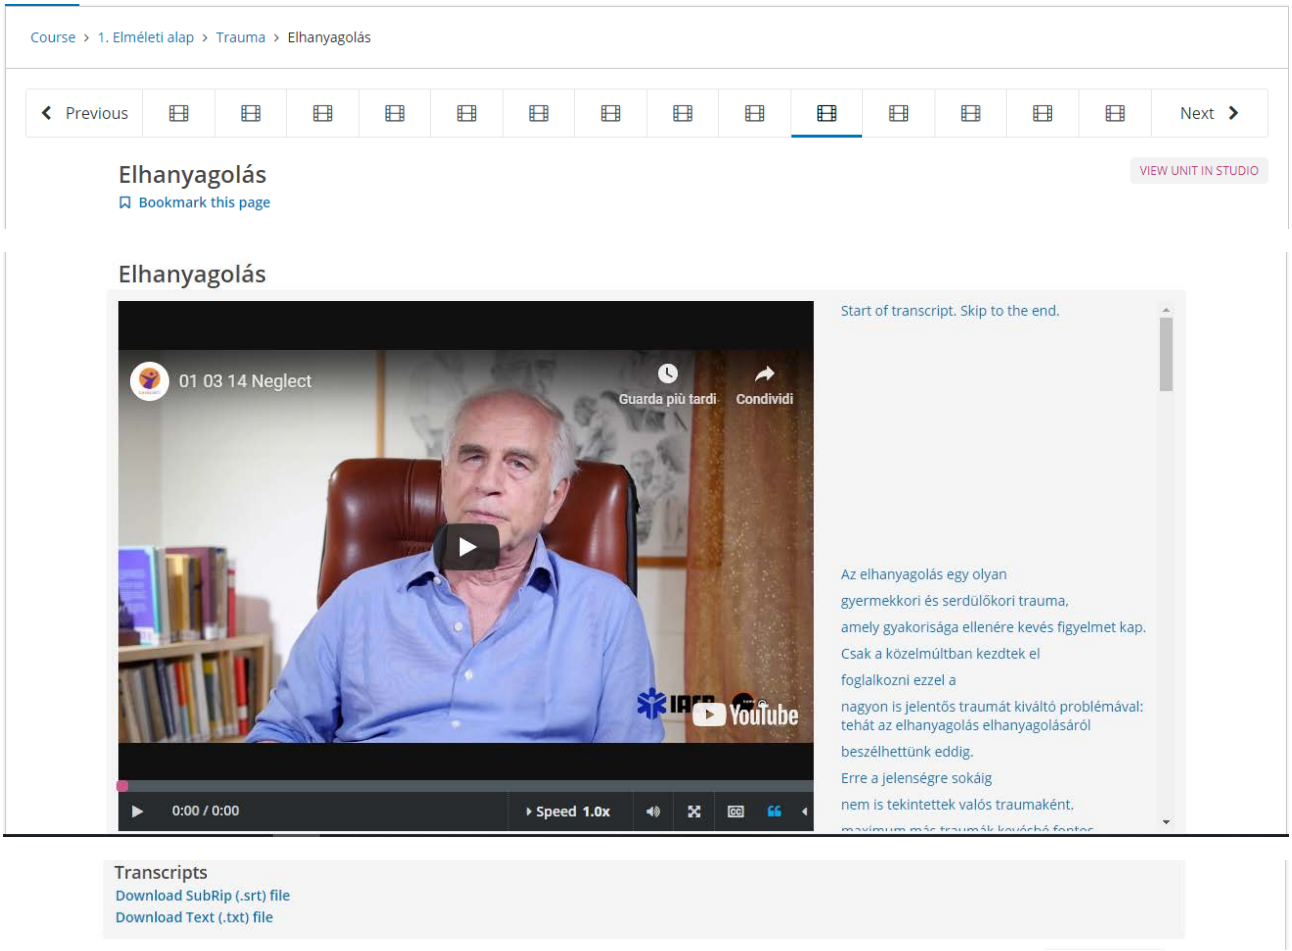
normálisnak és szükségszerűnek fogja tartani,

vagy saját nehéz tapasztalatait redukálva, maga is meg fogja ismételni ezeket a

viselkedési mintákat.

Egyre inkább szükséges figyelmet fordítani az erőszak észlelésre, és arra,

milyen hatással van ez a gyermek jelenére, és a későbbi felnőtt énjére.



Transcript

Az elhanyagolás egy olyan

gyermekkori és serdülőkori trauma,

amely gyakorisága ellenére kevés figyelmet kap.

Csak a közelmúltban kezdtek el

foglalkozni ezzel a

nagyon is jelentős traumát kiváltó problémával: tehát az elhanyagolás elhanyagolásáról

beszélhettünk eddig.

Erre a jelenségre sokáig

nem is tekintettek valós traumaként.

maximum más traumák kevésbé fontos részeként.

A valóságban azonban mára már ez számít a legelterjedtebb traumatípusnak, és úgy gondoljuk,

hosszútávon ennek vannak a legsúlyosabb következményei.

Ebből a szempontból az elhanyagolás pont azok részéről jelez mulasztást,

akiknek a törődés lenne a fő feladatuk.
Ezek a mulasztások – még ha nincs is
fenyegető kár kockázata – számos
hiányosságot jelezhetnek, amelyek hosszú ideig elhúzódhatnak.
Ezen hiányosságok sok, egyes típusú trauma kísérői lehetnek.
Egy bántalmazást
például többé-kevésbé el lehet viselni,
akkor viszont már nem,
ha hiányzik
az olyan szülő, aki képes
megérteni,
segíteni vagy támogatni
a traumát elszenvedő gyermekét.
Az elhanyagolás tehát az egyes típusú trauma része lehet,
de önmagában is nagy károkat okozhat.
Az elhanyagolásnak különböző típusai vannak,
amelyek vonatkozhatnak az egészségre,
oktatásra, gyermekfelügyeletre,
védelemre – figyelembe véve a környezeti kockázatokat –,
a fizikai szükségletekre, valamint az érzelmi támogatásra,
amely legtöbbször vagy a családtól, vagy azoktól érkezik,
akik a gyermek gondját viselik.
Az ilyen típusú elhanyagolás

talán nem tűnik olyan jelentősnek,
de valójában azt az érzést közvetíti az adott személy felé, hogy senki sem védi meg őt,
emiatt pedig azt érzi, hogy egy elutasító közegben van, ahol nincs számára garantálva a biztonság.
Tehát
Ha az elhanyagolás különböző
típusairól beszélünk, legyen az érzelmi vagy fizikai,
két teljesen különböző aspektust figyelhetünk meg.
Néhány esetben a gondviselő hanyagolja el a gyermek érzelmeit

a hideg,

közönyös és nemtörődöm

viselkedésével. A fizikai elhanyagolás ezzel szemben

az anyagi szempontokra vonatkozik,

továbbá az alapvető szükségletek kielégítésére,

vagy a gyermek oktatására,

a gyermek

elegendő információval

való ellátására.

Létezik az orvosi elhanyagolás is,

amelyről akkor beszélünk, ha fennáll egy kezelést igénylő betegség,

azonban azok a személyek, akik a gyermek ellátásért felelősek nem foglalkoznak ezzel.

Ennek következtében a betegség súlyosbodhat,

emiatt pedig különösen veszélyes

vagy ártalmas lehet

Emellett beszélhetünk morális elhanyagolásról, vagy máshogy fogalmazva arról, ha egy gyermek nem kapja meg a viselkedésére vonatkozó

etikai és morális instrukciókat.

Az ilyesfajta típusú elhanyagolások következményei a közegészségre mért károk, amelyeket sokáig

alábecsültek.

Mára már tudjuk,

hogy a hosszútávú

elhanyagolás

nem csupán a korábban említett betegségekhez vezethet, mint például a táplálkozási zavarok,

hanem az agykérgi szürkeállomány csökkenéséhez is,

ezáltal pedig alacsonyabb

kognitív képességekhez

a normál populációhoz képest. Ez az adat bizonyítja, mennyire fontos, hogy foglalkozzunk az elhanyagolással,

hogy újra

stabilizálhassuk az érintettek családi és egyéni környezetét.

Továbbá olyan

ellátással és

figyelemmel rendelkezzünk, amely biztonságérzetet ad a gyerekeknek, akik ezáltal érzik, hogy megvédik és megértik őket.

A kezelt betegségek (a táplálkozási zavaroktól kezdve az elhanyagolásig) összefoglalásának konklúziójaként meg kell említeni,

hogy az elhanyagolás rendkívül gyakori probléma olyan embereknél, akik a későbbiekben valamilyen kontroll nélküli étrendet alakítanak ki,

amely végül az önuralom teljes elvesztésébe torkollik.

Náluk fontos lehet egy terápiás kapcsolat, amely keretén belül különös figyelmet fordítanak

az adott személyre: az irántuk mutatott őszinte érdeklődéshez

empatikus hozzáállás párosul, amely segíti

a kliens problémáinak megértését.

Ez az egyik legfontosabb aspektusa annak, hogyan lehet hatékonyan bánni ezzel

a nemrég felismert, de különösen alattomos traumával,

amely nem kevésbé jelentős, mint bármely más nagy trauma.

A válási procedúra

során a szülők

gyakran háborút vívnak egymás ellen,

és sok energiát fektetnek abba,

hogy legyőzzék a másik szülőt, akit ellenségnek gondolnak.

Ebben a helyzetben a győzelem 7 00:00:55,440 --> 00:00:56,180 a legfontosabb számukra.

Ezen háborúk során

erős dühöt közvetítenek kifelé

amely már önmagában mutatja,

milyen nehéz szembenézniük

a váláshoz köthető érzelmeikkel.

Olyan érzelmekről beszélünk,

mint a csalódás, fájdalom, elhagyatottság, üresség érzése, magány

és a kudarc.

Gyakran hangoztatják is, mennyire bonyolult számukra feldolgozni

az úgynevezett pszichológiai válás folyamatát.

Ebben az esetben

a gyermek lesz az a szereplő,

aki leginkább védelemre szorul.

Sajnos azonban ez sokszor nem valósul meg,

ugyanis a gyermek gyakran a konfliktus gyújtópontjába kerül.

Központi szereplő lesz

emiatt pedig

a szülők a kiskorún keresztül kezdenek kommunikálni.

A gyermek így

a híd szerepét tölti be a két szülő között,

de egyben ő lesz a vita forrása is, hiszen mindkét szülő

azt állítja,

hogy a

gyermek érdekében

harcolnak egymással.

Az ilyen esetekben a gyermek jóléte kifogássá válik,

amely mögött a csalódás,

a féltékenykedés

és a személyes harag

rejtőzik.

Ezzel pont a gyermek védelmezése marad el, amelyre mindig szükség lenne,

különösen

ilyen nehéz

időszakban.

A szülőknek ideális esetben együtt kellene működniük az összes olyan területen, amelyek a szülői szerepeket érintik,

annak érdekében, hogy könnyítsenek a gyermekre nehezedő terheken.

Hiszen a gyermek

vállára hatalmas teher nehezedik:

bűnösnek érzi magát a szülei válása miatt,

úgy gondolja, neki kellene gondoskodnia a szülei boldogságáról,

valamint abban is vétkesnek érzi magát, hogy ő ad okot a szülők vitáira.

Így a valóságban ennél a pontnál az történik

hogy a gyermekre senki sem figyel igazán.

És itt kezdődik a trauma.

Ebben a rendkívül sebezhető pillanatban

a gyermek nem kap elég figyelmet,

szükségleteit és érzéseit nem ismerik fel, nem fogadják el és nem teljesítik.

A válás mindig traumatikus esemény,

hiszen károkat és törést okoz.

A szülői pár a gyermek elméjében

mindig egy egybefüggő entitás, amelyet valahogy hirtelen

ketté kell szakítani.

Az apa és az anya

részre történő szakítása

egy belső szakadást is eredményez.

A gyermek elméjében azonban 64 00:04:02,940 --> 00:04:04,140 a szülői pár

nem szűnik meg létezni, hanem fennmarad.

Csupán veszít az erejéből,

identitásából,

méltóságából

és elveszti az iránymutató szerepét.

Ilyenkor vannak más tényezők is

amelyek

további

terhet jelenthetnek.

Ezek a tényezők – mint például a

gyermek természete,

frusztrációtűrő

képessége

a szülőkkel való kapcsolat minősége, valamint a kötődés típusa,

amelyet a szülők még a válás előtt

alakítottak ki – befolyásolják a trauma mértékét

Az összes tényező közül

a gyermek kora árulkodik leginkább a traumáról és annak mértékéről:

minél kisebb a gyerek, annál nagyobb

a trauma.

A szülők

– akár öntudatlanul is

számos diszfunkcionális dinamikát indítanak be, amelyek a gyermeket

előre meghatározott szerepbe kényszerítik.

Ebből nem tudja kiszabadítani magát,

hiszen

korából

adódóan

még nincs meg az ahhoz szükséges öntudata

vagy szilárd személyisége,

hogy ki tudjon törni ebből a csapdából.

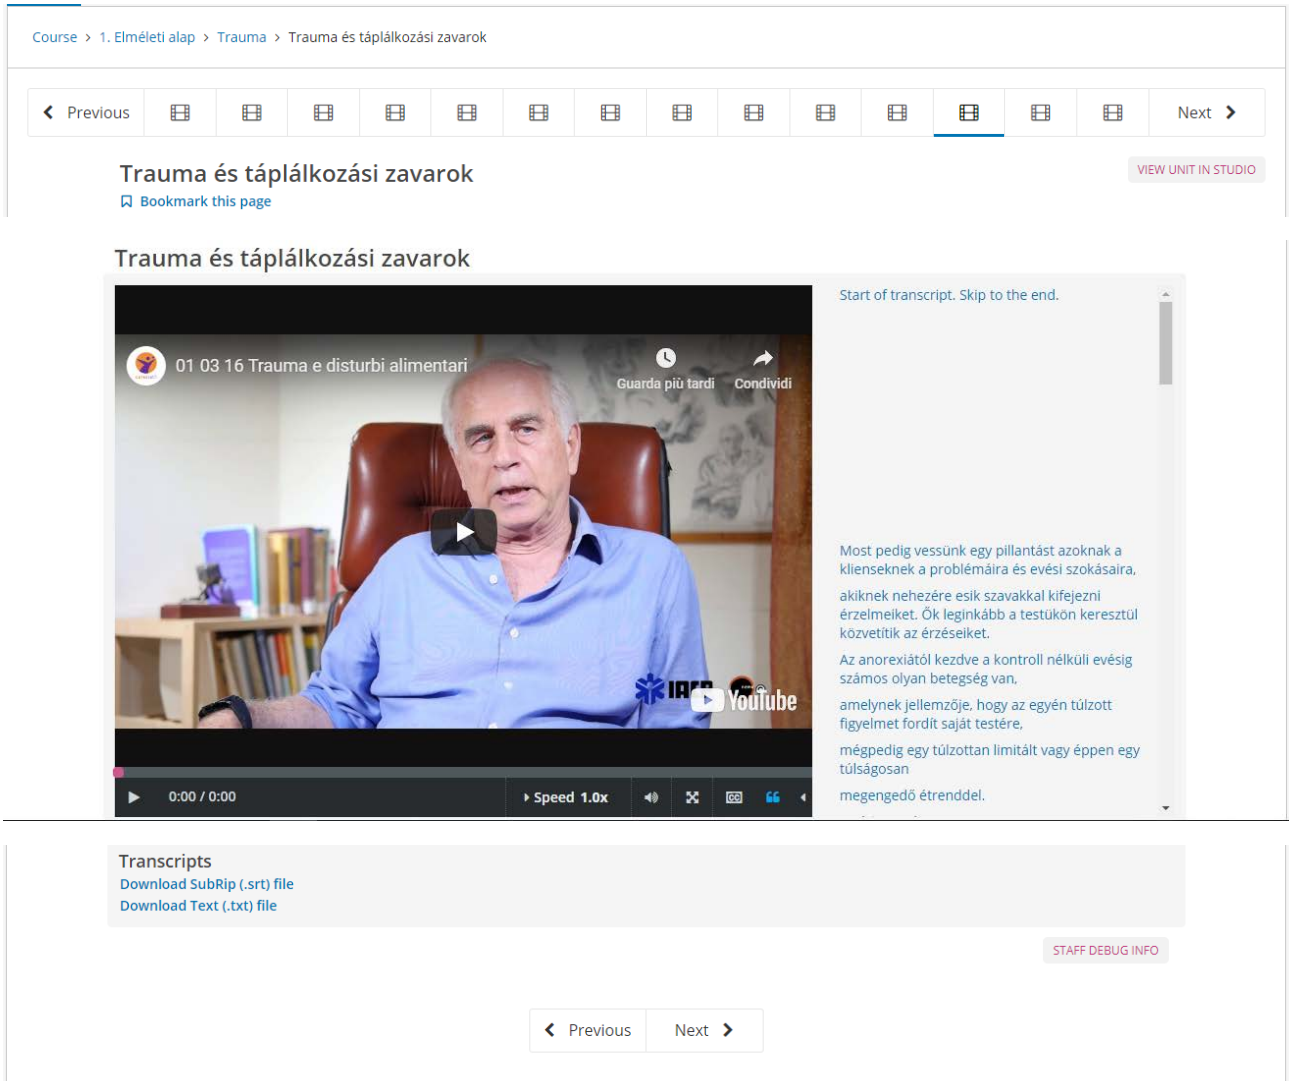
Ilyen esetekben szakmai tanácsadásra van szükség.

A tanácsadó felismeri a családban

jelen lévő dinamikákat és látja,

milyen típusú közbelépésre van szükség ahhoz,

hogy a gyermek megszabaduljon terheitől.



Transcript

Most pedig vessünk egy pillantást azoknak a klienseknek a problémáira és evési szokásaira,

akiknek nehezére esik szavakkal kifejezni érzelmeiket. Ők leginkább a testükön keresztül közvetítik az érzéseiket.

Az anorexiától kezdve a kontroll nélküli evésig számos olyan betegség van,

amelynek jellemzője, hogy az egyén túlzott figyelmet fordít saját testére,

mégpedig egy túlzottan limitált vagy éppen egy túlságosan

megengedő étrenddel.

Az érintettek

– különösen az anorexia esetében –

túlnyomórészt nők.

Az anorexia nervosa jellemzője a jelentős fogyás, amely rendkívül súlyos, akár életveszélyes súlyvesztéshez is vezethet.

Az érintett személy vágyik erre a súlyvesztésre, hiszen úgy gondolja, hogy testének mérete sokkal nagyobb, mint valójában.

Az anorexiában érintetteket számos korlátozás jellemzi. Erősen limitált az élelmiszer-bevitel, esetenként

pedig a testsúlyukat azzal akarják alacsonyan tartani, hogy evés után kompenzálni próbálnak.

Az anorexiában érintetteket számos korlátozás jellemzi.

Erősen limitált az élelmiszer-bevitel,

esetenként pedig a testsúlyukat azzal akarják alacsonyan tartani, hogy evés után kompenzálni próbálnak.

Ennek célja,

hogy több kalóriától szabaduljanak meg, mint amennyit elfogyasztottak,

ezzel pedig súlyvesztést érjenek el.

Ebbe a témakörbe

tartozik a bulimia nervosa is.

Ez egy olyan betegség,

amely nagyban hat

a táplálkozásra.

A betegség mértéktelen evési szakasszal kezdődik,

melyben a beteg

nagy mennyiségű ételt fogyaszt el

rövid időn belül.

A beteg testsúlyt

a bevitt étel

kiürítésével tud veszíteni.

Ehhez

különböző módszereket használ, mint például hánytatás,

hashajtó vagy vizelethajtó használata,

étvágycsökkentő gyógyszerek,

illetve kimerítő fizikai tevékenységek végzése.

in this people balance of weight remains good

And physically it stays in shape

Pont ellenkező irányú folyamat történik,

a kontroll nélküli evés,

a falászavar

esetében.
Mértéktelen evés, folyamatos, rohamokban jelentkező falási kényszer,
az étel folyamatos bevitele a nap jelentős részében,
és megállás nélküli étkezés jellemzi ezt a betegséget,
amely során az egyén
képtelen arra, hogy csökkentse az élelmiszer-bevitelt
vagy a testsúlyát.
A végén akár a 150 – 200 kg-t is elérhetik,
ez pedig rengeteg egészségügyi kockázatot rejt magában,
hiszen a túlsúly számos komoly
testi betegséget okozhat.
Ezek a betegségek egymás után jelentkeznek.
Jellemző rájuk,
hogy egymásnak adják át
a kilincset hiszen az önkontroll egyre csökken.
Az anorexia nervosánál ezzel ellentétben
a kontroll nagyon erős,
így az érintettek képesek minimalizálni az élelmiszer-bevitelt
annak érdekében, hogy megőrizzék extrém alacsony testsúlyukat.
Ha az önkontroll elkezd csökkenni,
akkor Bulimia nervosáról beszélhetünk.
Az ezzel küzdő
gyerekek vagy fiatalok
esznek – néha akár sokat is –,
jól működő jutalmazási rendszert tartanak fenn,
jól működő jutalmazási rendszert tartanak fenn,
és képesek a kontrollra, amely azonban csak
az étkezés után jelentkezik.
Ez lehetővé teszi számukra,
hogy súlyukat a számukra megfelelő szinten tartsák.
A harmadik típusú kontroll nélküli evési zavarnál
az egész napot evéssel

töltik,

gyakran a televízió előtt anélkül, hogy tudatában lennének

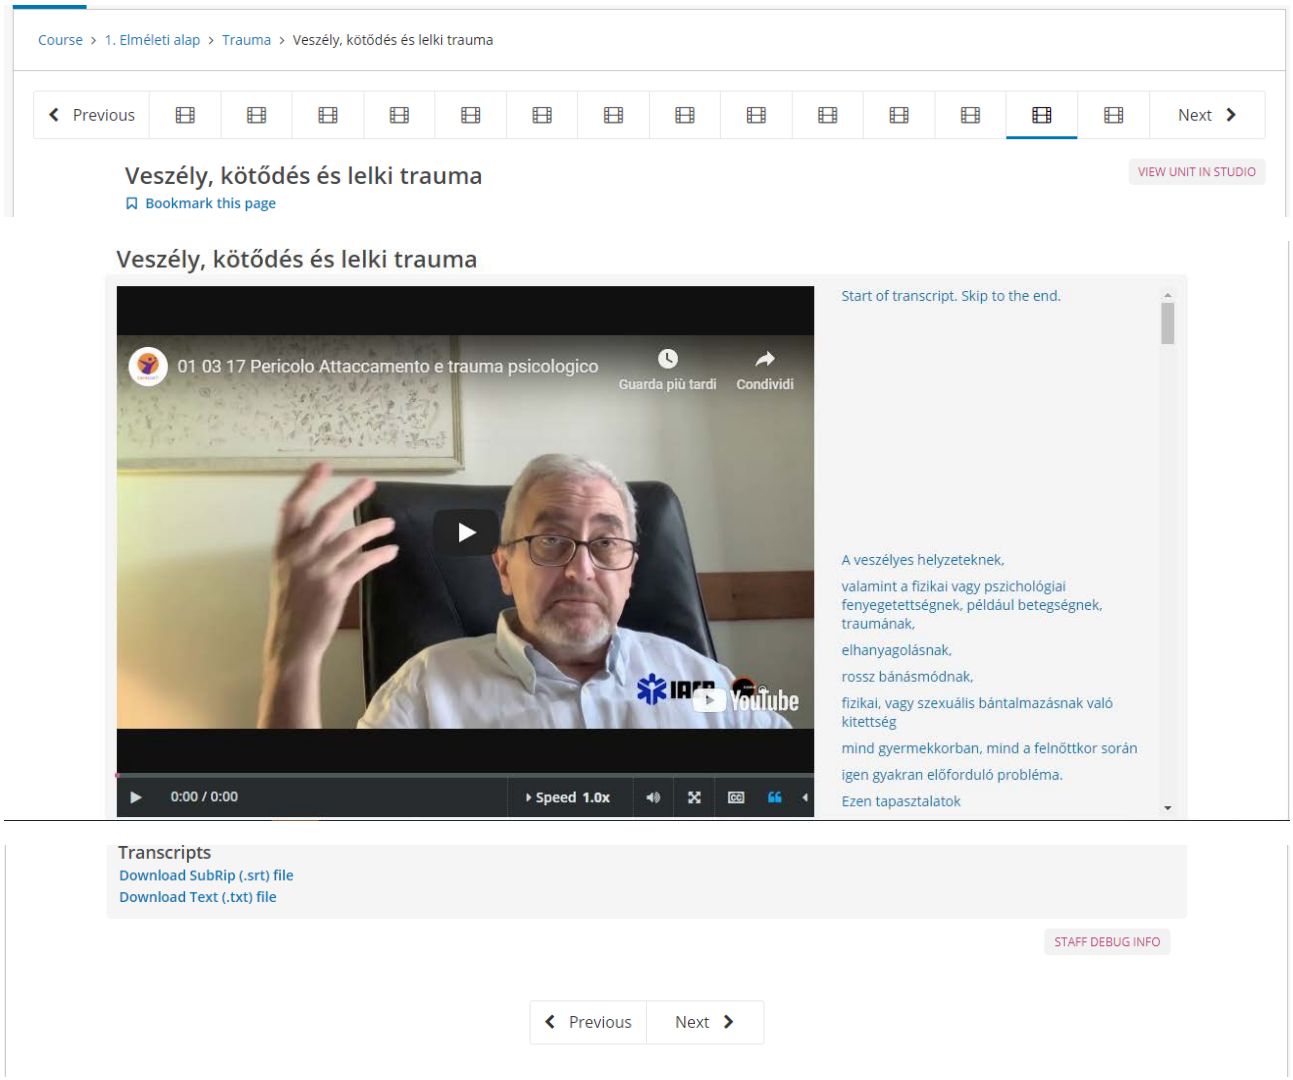
a repetitív és folyamatos élelmiszer-bevitelnek.

Mindegyik

betegségről elmondható, hogy számos, súlyos következménnyel járhatnak a beteg érzelmi világára,

és számos különböző traumára mutathatnak rá,

amelyek a táplálkozási zavarokhoz vezethettek.



Transcript

A veszélyes helyzeteknek,

valamint a fizikai vagy pszichológiai fenyegetettségnek, például betegségnek, traumának,

elhanyagolásnak,

rossz bánásmódnak,

fizikai, vagy szexuális bántalmazásnak való kitettség

mind gyermekkorban, mind a felnőttkor során

igen gyakran előforduló probléma.

Ezek a tapasztalatok

nem szükségszerűen

vezetnek trauma kialakulásához

Az

emberi faj

rendkívül kifinomult
alkalmazkodóképességgel rendelkezik,
ami lehetővé teszi, hogy szélsőséges helyzetekkel
nézzünk szembe anélkül,
hogy lelki trauma alakulna ki azok hatására.
Ha a veszélyt jelentő helyzeteket
hatékonyan kezeljük,
meg tudjuk
akadályozni a helytelen alkalmazkodást,
ezzel
lehetővé téve az egészséges
mentális és
pszichológiai állapot fenntartását.
Fajunk,
az idő múlásával,
személyes
készségeket
és igazán kifinomult
viselkedést fejlesztett ki, amelyeknek fő feladata,
hogy megóvjon minket a különböző veszélyektől.
Ezeket a
viselkedési és magatartási mintákat
nevezzük
kötődési rendszernek.
A kötődés szó
a kötődéselméletből származik,
amelyet először az 1950-es években javasolt
az angol pszichoanalitikus John Bowlby.
A kötődéselmélet szerint az emberek
olyan veleszületett hajlammal jönnek a világra,
amely elősegíti a kötődési kapcsolatok kialakulását
az elsődleges személyekkel – elsősorban a szülőkkel –,

akiknek

fő feladata

a veszély elleni védelem.

Ebben az elméletben kötődésről beszélünk, amelynek fő,

de nem kizárólagos

funkciója a veszélyes helyzetek elleni védelem nyújtása:

amikor az egyén úgy érzi, hogy kellően biztonságos helyzetben van

és támogatják őt külső környezete felderítésében,

felfedezheti azt

és megtanulhatja hogyan előzheti meg

meg annak esetleges rejtett veszélyeit.

Ezeket a kötődési mintákat

minden korosztályú gyereknél – különös tekintettel az egy-, kétévesek és anyjuk kapcsolatára – valamint főemlősöknél is vizsgálták.

Ebben az elméletben kötődésről beszélünk

amelynek fő, de nem kizárólagos funkciója a veszélyes helyzetek elleni védelem: 60 00:03:03,640 --> 00:03:05,260 amikor az egyén úgy érzi,

hogy kellően biztonságos helyzetben van

és támogatják

őt

külső környezete felderítésében,

felfedezheti

azt

és megtanulhatja hogyan előzheti meg annak esetleges rejtett veszélyeit.

Ezeket a

kötődési mintákat minden korosztályú gyereknél

– különös tekintettel az egy-, kétévesek és anyjuk kapcsolatára –

valamint főemlősöknél is vizsgálták.

Az 1950-es évektől kezdve végeznek kutatásokat

kis rézuszmajmokon.

Ezek a

kutatások bizonyították

mennyire fontos
az anya védelmező szerepe –
a főemlősök esetében
még fontosabb, mint a táplálási funkciója.
A kötődési típusokat két kategóriába tudjuk sorolni: biztonságos és bizonytalan.
A biztonságos kötődést
a biztonság érzése,
a környezet és források
iránti bizalom,
valamint veszély esetén segítség és védelem jellemzi.
A bizonytalan kötődés
egyik fajtája
a
bizonytalan-ambivalens/ellenálló –
C típusú –
kötődési forma
Ebben az esetben a test túlzott
érzelmi aktivitással reagál;
jellemzőek a düh és félelem
megnyilvánulásai,
panaszkodás a
védelem hiányára,
nehézségek az anyától való szeparáció során.
A bizonytalan kötődés másik típusa a bizonytalan-elkerülő kötődés –
más néven A típusú –,
amelyet,
az előzőtől eltérően, hipoaktiváció jellemez. Különösen azáltal,
hogy a gyermekek elhatárolódnak
a veszélyes körülmények
hatására megjelenő érzelmi reakcióktól –
így a félelemtől, a haragtól,
a sebezhetőség érzésétől –,

továbbá
ezek kimutatását gátolják kifejezéseikben is
(például látszólagos közömbös viselkedés),
vagy megmásítják azokat és ellentétes
érzelmi kifejezésekké alakítják őket (például mosolyognak, amikor ijesztő témával szembesülnek).
A hatékony
kötődés
megvéd
minket a
környezetünkből
vagy a kapcsolatainkból jövő veszélyekkel szemben.
Ha ezek
a stratégiák megfelelően működnek
és kellően védelmezők,
nem áll fenn a lelki trauma lehetősége,
és az egyén viszonylagos biztonságban marad.
Lelki trauma akkor alakulhat ki, amikor ezek
a stratégiák
nem működnek megfelelően.
Például amikor félelem, harag
vagy a szükségletek kifejezésének gátoltsága
nem tudja megfelelően védelmezni az egyént
a környezeti veszélyekkel szemben.
Lelki trauma esetén a mentális folyamatokat
negatívan befolyásolja
a múltbeli vagy jelenlegi veszélyek tapasztalata.
Ezt kiválthatja egy különösen intenzív és hirtelen esemény – például
fizikai trauma
vagy bántalmazás elszenvedése –,
de olyan tapasztalatok sorozatából is származhat,
amelyek együttesen
traumatikus értéket képviselnek.

Ebben az esetben fejlődési traumáról beszélünk.

Ez olyan helyzetben állhat fenn,

amikor például a gyermek

nem megfelelő,

elhanyagoló családi környezetben

nő fel, és ezek az elhúzódó tapasztalatok összességében

olyan alkalmatlan

fejlődési környezetet teremtenek, amely lelki trauma kialakulásához vezet.

A veszélyhelyzet okozta potenciálisan traumatikus helyzethez való alkalmazkodás és annak

feldolgozásának képessége

bizonyos személyes jellemzőitől függ.

Ilyenek az egyén életkora, érettsége, személyisége és

kötődésének jellemzői, függetlenül attól, hogy ezek megvédik-e az őt;

fizikai ereje és egészségi állapota is fontosak, hisz

egy beteg ember sérülékenyebb, könnyebben alakulnak ki nála

veszélyeztető helyzetek.

Nagyon fontos továbbá

a védelmet nyújtó kötődések rendelkezésre állása, az olyan személynél, akinek veszélyhelyzetben nem kell egyedül éreznie magát, hanem olyan emberekkel

van körülvéve, akik védelmező kapcsolatot tudnak nyújtani, akik biztosítják, hogy valamilyen védett helyzetben vagyunk és velünk vannak, hogy egy veszélyes élményt feldolgozzunk.

A társas kontextus is jelentős szerepet játszik: alapvető fontosságú, hogy

az egyén barátságos környezetben találja magát, olyan emberek között,

akik barátsággal fogadják és kultúrájukkal, rituáléiikkal, vagy személyes jelenlétükkel

nyújtanak támogatást (pl. barátok)

A traumatikus helyzethez való alkalmazkodás nem azonnal történik, időre van

szükség például a gyász folyamatához.

A házastárs vagy szülő elvesztése okozta gyász megfelelő feldolgozásához,

ahhoz, hogy az ne váljon traumás gyásszá,

általában egy-két év szükséges

Ha

egy potenciálisan traumás élmény nem kerül feldolgozásra,

azt jellemzően túlzó érzelmi hiperaktiváció jellemzik

álmokkal, rémálmokkal,

félelmekkel

„Nem tudom, fenyegetettség érzésem van”

kontrollálhatatlan reakciók –

ahogyan az a poszttraumás stressz zavar esetén is jelentkezik –

vagy pedig szélsőséges hipoaktivitást vált ki, pl. túlzó távolság tartása

mindentől, ami a veszélyes helyzettel kapcsolatos,

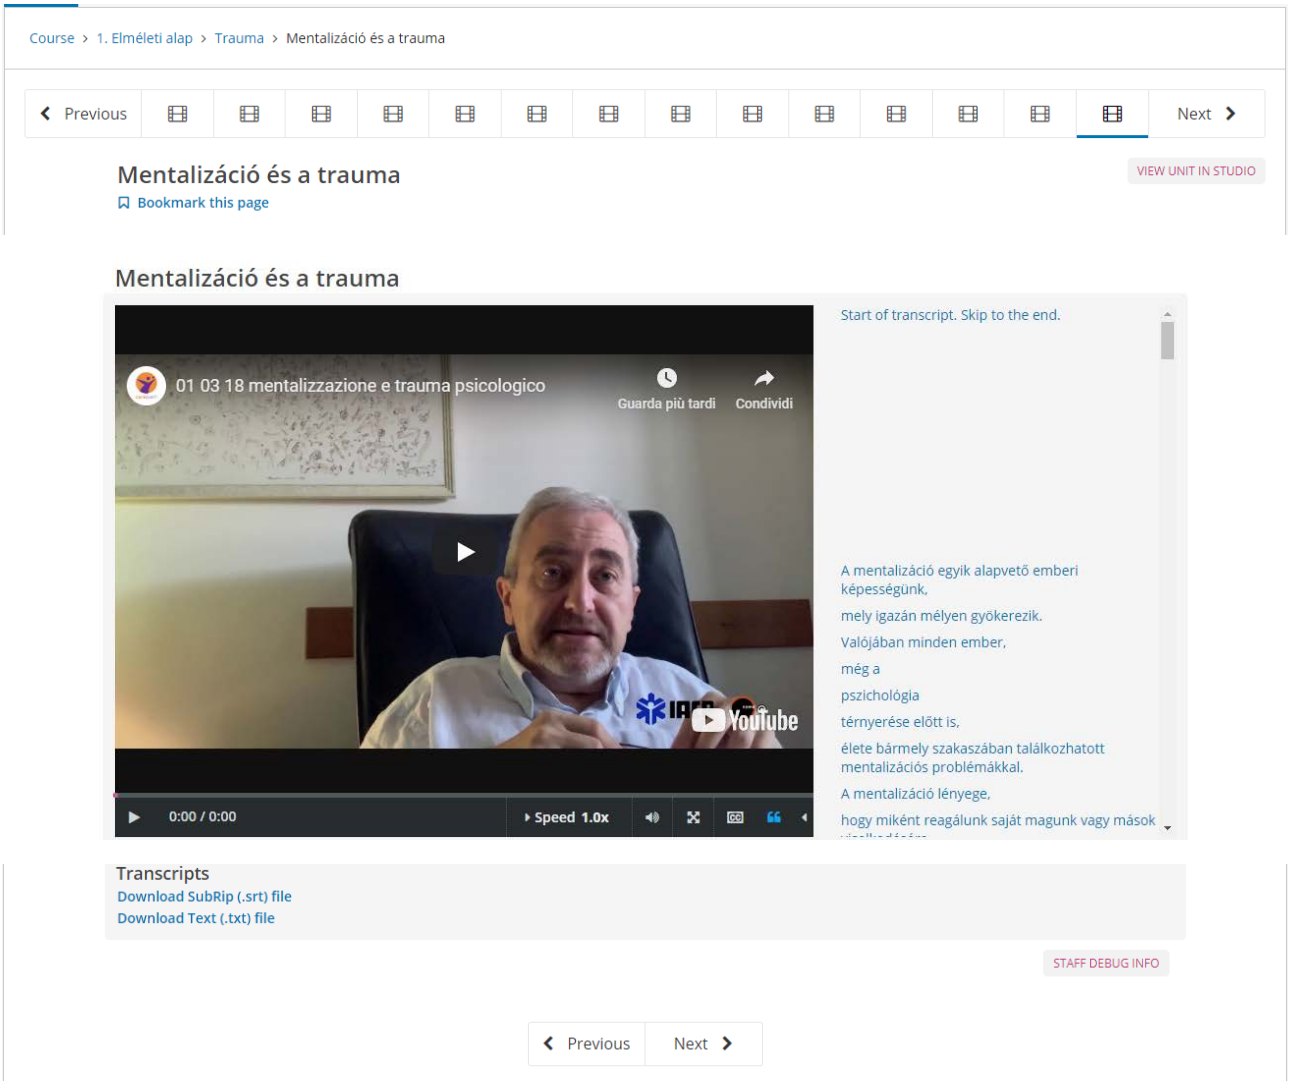
emlékek hiánya

affektív gátlás,

a traumatizáló helyzettel kapcsolatos beszéd, vagy helyszínek kerülése.

Ennek a két tényezőnek (hyper- vagy hypoaktiváció) a jelenléte esetén beszélhetünk pszichés traumáról.

A két feltétel valamelyikének a teljesülése esetén beszélünk pszichés traumáról.



Transcript

A mentalizáció egyik alapvető emberi képességünk,

mely igazán mélyen gyökerezik.

Valójában minden ember,

még a

pszichológia

térnyerése előtt is,

élete bármely szakaszában találkozhatott mentalizációs problémákkal.

A mentalizáció lényege,

hogy miként reagálunk saját magunk vagy mások viselkedésére

átgondolva azt, hogy éppen

mi jár saját magunk

és a másik fejében.
gondolataink, érzéseink,
szükségleteink, elvárásaink és meggyőződéseink is
mind befolyásolnak bennünket.
A mentalizáció fogalmát úgy lehet könnyen
megérteni,
hogy magunk
és mások aktuális állapotára
egy mentális állapotként
tekintünk.
Ez a képesség
körülbelül
négyéves korban alakul ki,
amikor a gyermek rájön,
hogy
mások nem feltétlenül tudják és értik,
mit gondol és érez.
Például az anya nem mindig tudja, hogy mi zajlik gyermeke fejében.
Amikor a gyerekek
elsajátítják ezt a képességet,
megtanulják a
problémákhoz való alkalmazkodás
nagyon hasznos
és fontos stratégiai módját is;
megtanulják
a hazugság fontosságát.
Akkor alakul ki a hazudás képessége, amikor már tudjuk,
hogy mások eltérően látják a világot,
emiatt pedig nem tudhatjuk mi jár a másik fejében.
A mentalizáció
és folyamatai egymásra épülő lépések sorozatán
alapszanak.

Érzékenységünk alakulásának
első állomása
a különböző mentális állapotok
felismerése,
saját és mások mentális állapotának
értelmezése (például megértjük, hogy mit jelent
boldognak és
szomorúnak lenni, elvárásokkal rendelkezni,
vagy előítéletesnek lenni)
illetve
olyan képességekkel való rendelkezés,
amelyek segítségével értelmezni tudjuk magunk
és mások viselkedését mentális állapotuk alapján.
Mindezek szükségesek másokhoz való adaptívitásunk kialakításához
(például, ha valaki csendben áll előttünk,
nem arra gondolunk rögtön,
hogy nincs mondanivalója,
hanem sokkal inkább arra,
hogy az elméje
tele van képekkel és gondolatokkal. Így a hallgatásuk nem az üresség egyik kifejezőeszköze,
hanem egy sor mentális állapot,
amely alapja a csendes viselkedés).
A mentalizáció egy másik fontos aspektusa,
hogy saját magunk mentalizációja segíthet
testünk szabályozásában.
Például ilyen az a szituáció,
amikor realizáljuk,
hogy mérgesek vagyunk,
és rájövünk,
hogy
a haragunk abból ered,
mert valaki

mondott valamit, ami rosszul esett.
Maga a tény,
hogy ezt sikerült felismernünk, emlékeznünk rá,
elvárásokat támasztanunk és kivetítenünk a következményeket,
egy teljesen új
pszichológiai utat nyit meg bennünk a haragkezelés terén.
Harag érzetekor a szívműködést, a légzést és a hormontermelést
pszichológiai folyamatok
kezdik el
irányítani.
Például, ha
lelkiismeret-furdalást érzünk amiért megharagudtunk valakire,akit szeretünk,
a bűntudat szabályozza testünk működését és
meggátolja a harag érzetének kimutatását.
Ez olyannyira alapvető funkciója szervezetünknek,
hogy a rossz mentalizációs
képességekkel rendelkezők jobban ki vannak téve
a különböző testi rendellenességeknek
(pl. gyorsabb,
szabálytalan
szívverés,
kontrollálatlan érzelmi reakciók,
melyek a test folyamatos szabályozási zavarai miatt
hosszú
távon
betegségek kialakulásához vezethetnek).
A szülők egyik legfontosabb funkciója
gyermekeik
mentalizációja.
Nagyon fontos, hogy úgy tudjanak tekinteni
gyermekeikre,
mint szükségletekkel,

érzésekkel és félelmekkel
rendelkező lényekre,
bele tudják képzelni magukat gyerekeik helyébe
és megpróbálják a világot az ő szemszögükből nézni.
Például, egy hároméves gyereket
csak bizonyos témák érdekelnek,
különböző szavakat és beszélgetéseket pedig 115 00:06:10,860 --> 00:06:12,080 csak az ő,
gyermeki képességei keretein belül fog tudni értelmezni.
Ezért fontos, hogy a szülő bele tudja
képzelni magát a gyerek helyébe.
Ezt az állapotot (pszichológiai) tudatosságnak is nevezik,
amely szorosan összefügg
a gyerek
egészséges fejlődésével. Ehhez pedig
az is szükséges,
hogy a
szülő képes legyen gyereke helyébe képzelni magát és megértse igényeit.
Megfigyelték, hogy a kisgyermekes édesanyák,
akik
azonosulni
tudnak
síró vagy nyugtalan gyermekük állapotával, megértik, hogy a kicsi valószínűleg fázik vagy éhes.
A gyermekek így közvetítik állapotukat,
mintha képesek lennének gondolatok rendezésére
és kifejezésére.
A gyermek mentális állapotának megértése
a szülőség egyik alapvető feltétele.
A mentalizáció olyan alapvető képesség,
amely segít megbirkózni a stresszel és a potenciálisan
veszélyes helyzetekkel anélkül,
hogy kialakulna bármiféle lelki trauma.
Például,

ha egy gyermek
a szülő következetlen viselkedésével szembesül,
aki talán dühösen,
fizikai erőszakkal reagál,
vagy negatív üzenetet közvetít a gyermek felé,
a gyermek képessége, hogy megértse a szülő mentális állapotát
lengéscsillapítóként működik számára. Rávezeti a gyereket arra,
hogy a szülő miért viselkedik
úgy az adott pillanatban. Ezt gondolhatja például:
„Apa fáradt,
és amit mond, nem felel meg a valóságnak.
Apa általában
gyengéd és szeret engem.
A most zajló
események csak a jelen pillanatban igazak
és az adott állapotához kapcsolódnak, de ez nem állandó.” Ez a hozzáállás megvédheti a gyermeket
mások mentális állapotának
negatív hatásaitól és így az adott helyzet kevésbé marad traumatikus élmény.
Az alacsony
mentalizációjú
felnőtteknél
és a borderline személyiségzavarban szenvedőknél
egyértelműen megállapítható, hogy sokkal jobban ki vannak téve a folyamatos traumáknak.
A velük történteket nem teszik
kontextusba, nem veszik megfelelően górcső alá,
így az események
traumatizálóként
is
hathatnak rájuk.
Bizonyos esetekben
különösen veszélyes lehet,
ha a szülő nem képes a gyermeke

helyébe képzelni

magát.

Ezzel olyan magatartást válthat ki a gyermekben vagy a serdülőben,

amely

rendkívül agresszív viselkedésben nyilvánulhat meg.

Ez az agresszivitás és az azt követő magatartás

értelmezhető

részben

a mentalizáció

fogalmán keresztül.

Ha a szülőket folyamatosan irritálja

a gyermek viselkedése –

például, ha a gyermek

problémát

okoz

vagy rosszul viselkedik –,

akkor a szülő

negatív módon befolyásolhatja a gyermeket, ha azt mondja, hogy a gyermek buta, pszichésen beteg vagy értéktelen.

Ez azt a képet

alakítja ki a gyerekben,

hogy ő zavart,cselekvőképtelen és

nincs rendben.

Emiatt a hozzáállás miatt távol tartja magát másoktól.

Lehet, hogy amikor egy felnőtt közel szeretne kerülni a gyerekhez,

meg szeretné ismerni őt, azt szeretné, hogy a gyerek megbízzon benne,

a gyerek

agresszívan fog reagálni,

hogy távol tartsa magától a felnőttet

és ezzel együtt elkerülje a lehetséges traumák ismétlődését.

Ez előfordulhat olyan fiatalok körében, akiknek problémái vannak a

tanulással, osztályt kell ismételniük

és a tanárok

visszahúzó erőként

tekintenek rájuk,

ráadásul otthon a szüleik is

ráerősítenek erre a negatív képre.

Ezért ezek a gyerekek igen hevesen, haraggal reagálnak arra, ha egy felnőtt –

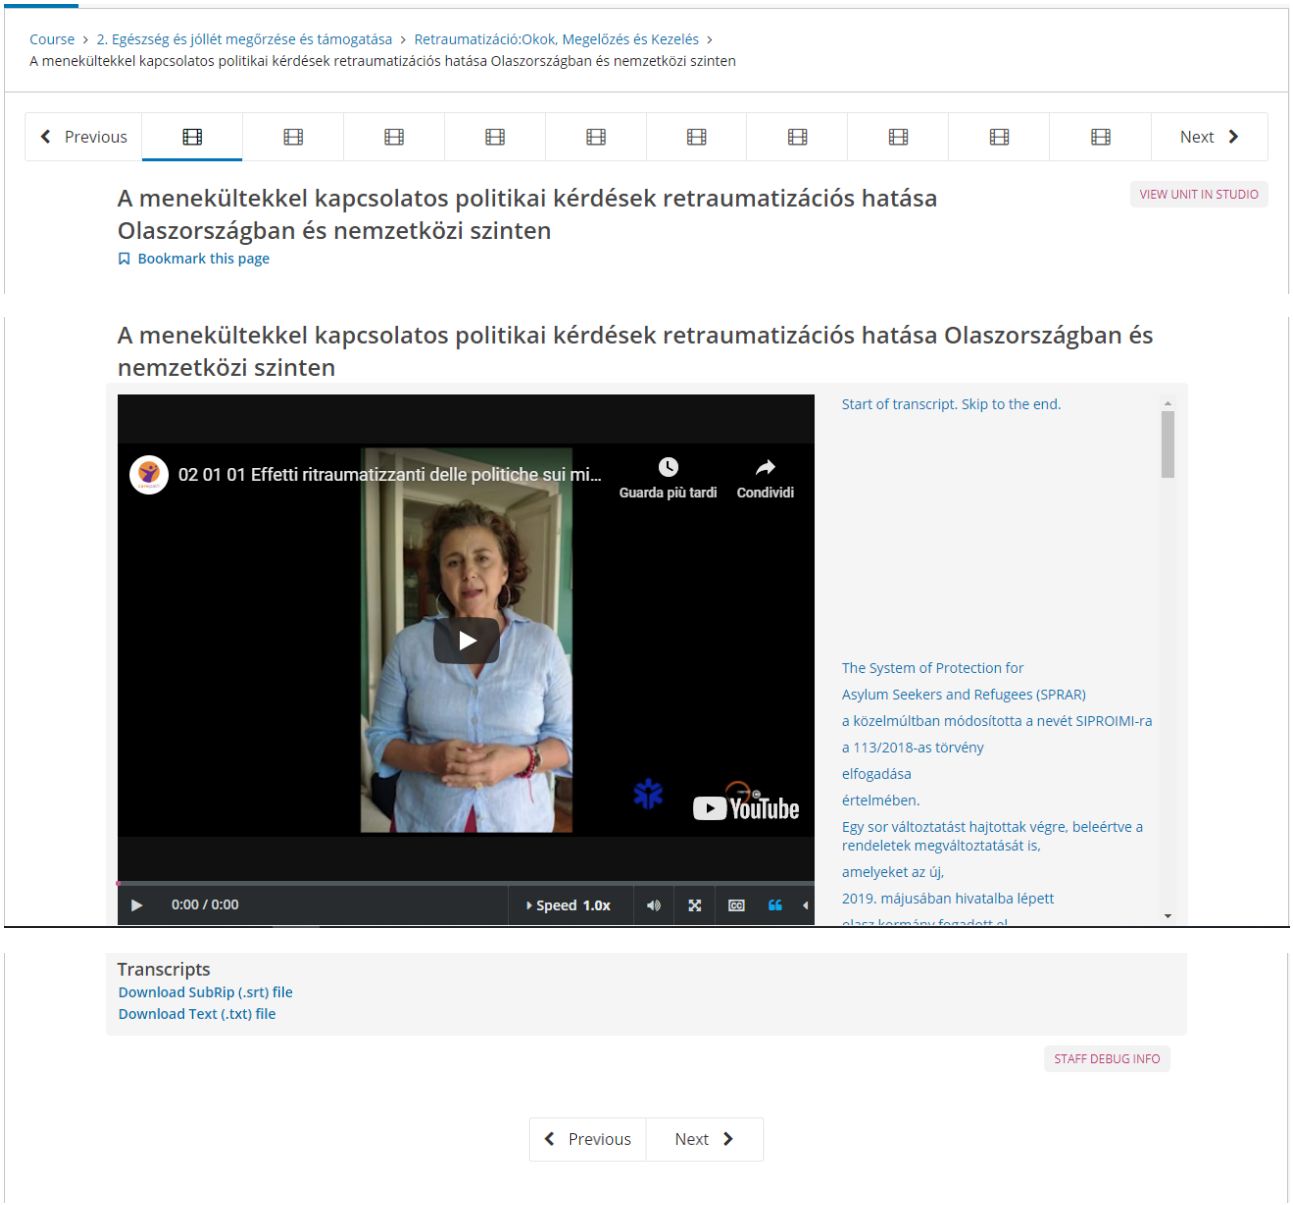
például egy nevelő vagy tanár -– segíteni akar nekik.

A céljuk,

hogy távol tartsák maguktól

a felnőttet és ne ismétlődjön meg

az a negatív tapasztalat, miszerint ők értéktelenek.



Transcript

The System of Protection for

Asylum Seekers and Refugees (SPRAR)

a közelmúltban módosította a nevét SIPROIMI-ra

a 113/2018-as törvény

elfogadása

értelmében.

Egy sor változtatást hajtottak végre, beleértve a rendeletek megváltoztatását is,

amelyeket az új,

2019. májusában hivatalba lépett

olasz kormány fogadott el

a bevándorlás, a menekültek jogai és a befogadás
kérdéseivel kapcsolatban.
A SPRAR-t 2002-ben hozta létre
a helyi önkormányzatok és hatóságok hálózata,
harmadik szektorbeli
és a nem kormányzati szervezetekkel együttműködve.
A SPRAR önkéntes alapon (saját belátása szerint)
intézi a menedékkérők és
menekültek befogadását és integrációját
célzó projekteket.
Az évek során a hálózat
progresszív és pozitív fejlődésen
ment keresztül:
a kezdeti 1500 befogadóhely
jelenleg 35 000-ra tehető.
A SPRAR történetében
több szakasz is volt,
amely jelentős számú változást hoztak magukkal.
Az első egy olyan törvényi
intézményesítés volt,
amely stabilabbá és szabályszerűbbé tette
az integrált befogadási központi rendszert
Olaszországban. Azt megelőzően
nem voltak strukturált
befogadói rendszerek,
csupán
sürgősségi intézkedések.
Egy másik fontos momentum
2003-ban volt, amikor az
úgynevezett észak-afrikai szükséghelyzet során
a SPRAR modell hatékonysága
és eredményessége

kiemelkedett a
társadalmi integráció és az integráció célkitűzéseinek
elérése szempontjából,
európai szinten is.
Az utolsó szakasz a legfrissebb,
amely során a SPRAR profilját is
módosítani kellett. E szerint
a menedékkérőket
többé
már nem lehet befogadni,
mert megszüntették a humanitárius
védelem intézményét.
A törvény szerint csak a
kísérő nélküli külföldi kiskorúakat,
a nemzetközi védelem alatt állókat
(akiknek száma a menedékjogi kérelmezőkéhez
viszonyítva igen kevés) és néhány
új típusú tartózkodási engedéllyel
rendelkezőket fogadhatnak be.
A SPRAR,
jelenlegi nevén SIPROIMI
speciális gyógykezeléseket nyújt,
az emberkereskedelem,
munkaerő-kizsákmányolás,
családon belüli erőszak és természeti katasztrófák áldozatainak,
valamint azoknak,
akik kitűntek valamilyen hőstettel.
Főleg a külföldieket segítik,
nem az olaszokat,
hiszen nekik saját társadalmi védőhálójuk van.
Elmondható, hogy a SPRAR
jelenlegi célja

a külföldiek jólétének biztosítása,
és nem a menedékkérők
befogadása
és a védelmezése.
A szervezet profiljában
bekövetkező ezen változások
pozitív képet tükröznek,
hiszen fő motivációjuk
az elesettek
védelme.
Jelenleg a legnagyobb nehézséget az okozza,
hogy a rászorulóknak
tartózkodási engedéllyel kell rendelkezniük,
ám ez akkor nem szükséges,
ha valaki
embercsempészet áldozata. Ebben az esetben automatikusan
megkapja az engedélyt. Ugyanez a helyzet
a kizsákmányolás áldozataival is.
Nincs pontos kritérium,
hogy az eljárásoknak miként kellene zajlaniuk,
vagy hogyan lehetne 96 00:04:02,389 --> 00:04:09,200 ezekre az áldozatokra,
akár jogilag is, 98 00:04:09,200 --> 00:04:13,920 „speciális esetként” tekinteni.A rászorulók
csak egy különleges tartózkodási
engedély megkapása után
férhetnek hozzá a SPRAR-hoz
és vehetik igénybe a szervezett nyújtotta
szolgáltatásokat.
Még nem
határozták meg
azokat a kritériumokat és feltételeket,
amelyek alapján egy személy
jogosult lehet

egészségügyi ellátásra:

mikor, milyen szellemi vagy fizikai

probléma és milyen súlyossági szint

esetén láthatnak el valakit.

Ezért a szervezet

egy igen kritikus, átmeneti időszakot él át,

mivel sokak,

akik pár hónappal ezelőtt

részvételi jogosultsággal rendelkeztek a SPRAR projektekben,

mára elvesztették azt.

Másrészről,

azok, akik

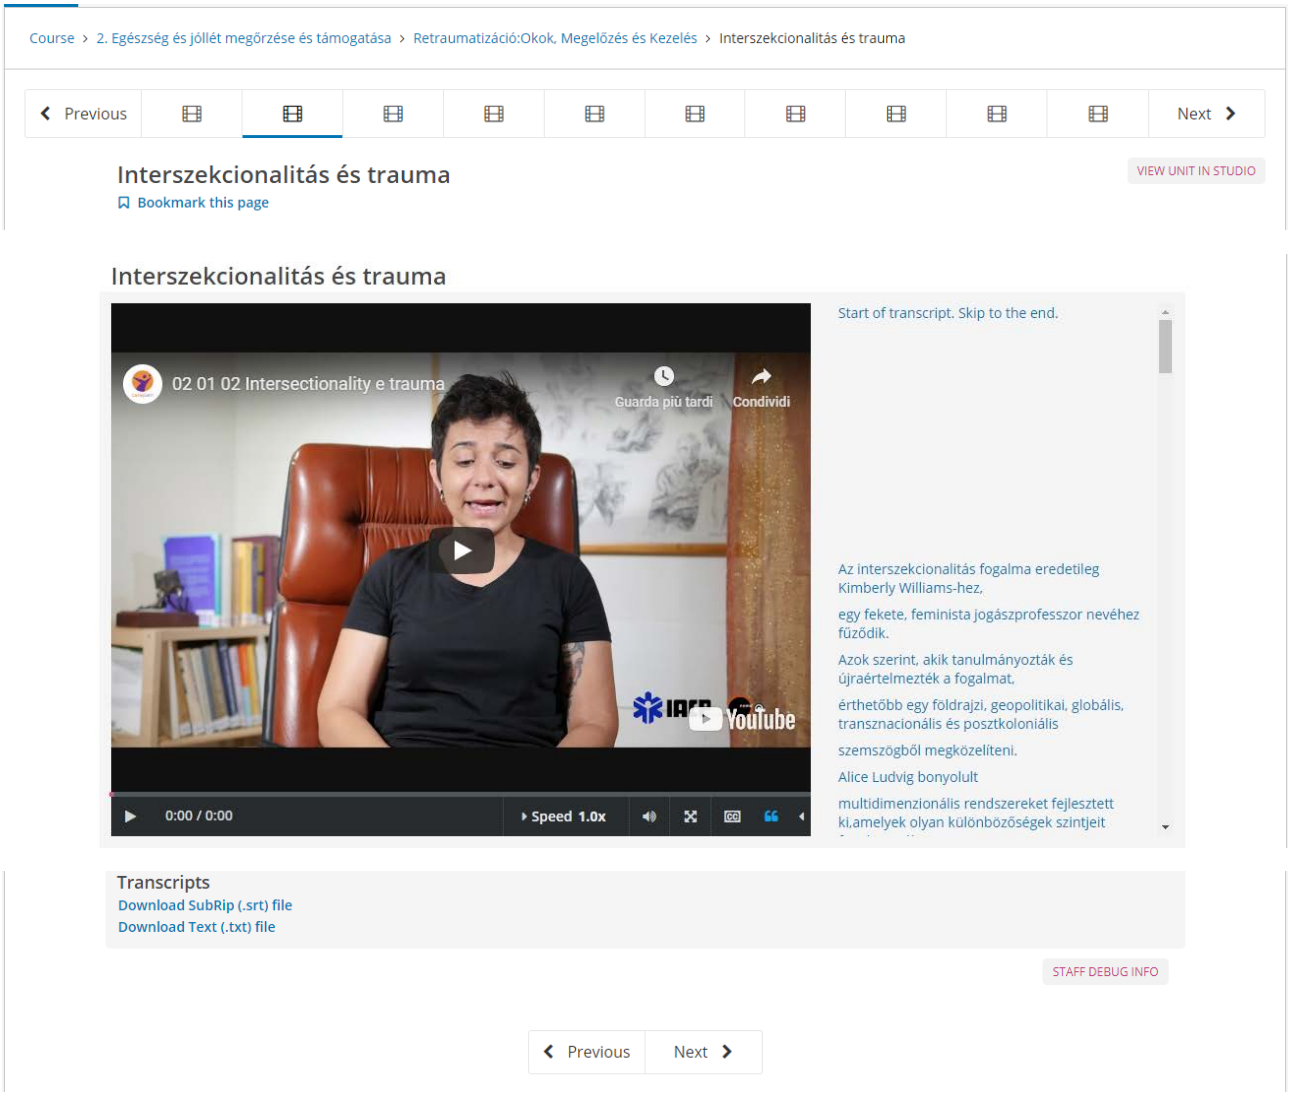
jogosultak lennének a szolgáltatás használatára,

valójában nem tudják

miként nyújtsanak „megfelelő bizonyítékokat”,

hogy megkaphassák

a szolgáltatás igénybevételének jogát.



Transcript

Az interszekcionalitás fogalma eredetileg Kimberly Williams-hez,

egy fekete, feminista jogászprofesszor nevéhez fűződik.

Azok szerint, akik tanulmányozták és újraértelmezték a fogalmat,

érthetőbb egy földrajzi, geopolitikai, globális, transznacionális és posztkoloniális

szemszögből megközelíteni.

Alice Ludvig bonyolult

multidimenzionális rendszereket fejlesztett ki,amelyek olyan különbözőségek szintjeit fogalmazzák meg,

mint a nem, szexualitás, faj, bőrszín, etnikai hovatartozás, státusz, osztály, kultúra stb.

Ezzel azt a számtalan szintet mérjük,

amelyet figyelembe kell vennünk és amelyre ügyelnünk kell, ha segítő kapcsolatban

állunk olyan személyekkel, akik kisebbségekhez tartoznak.

Audre Lorde-t idézve

we could say that there is no struggle to do azt mondhatjuk, hogy nincs olyan, hogy egyetlen problémával kűzdünk,

With one problem, because we don' lives made of one dimension mivel az életünk sem egyetlen dimenzióbol áll"

Az Egyesült Nemzetek Szövetségének

és az Európai Uniónak hála,

az esélyegyenlőségi politika alakulásának egyre fontosabb eleme a nemzetköziség.

Gondoljunk csak a megkülönböztetés elleni küzdelemre irányuló irányelvekre,

az összes nemzeti, regionális és helyi szintű kezdeményezésre,

politikára és diverzitás-menedzsmentre,

amelyet minden nyugati ország

és számos vállalat is

magáévá tett már.

Ez természetesen nem jelenti azt, hogy megszűnt a bizonytalanság és a szenvedés azok számára,

akik egyszerre több kisebbséghez is tartoznak,

és akik ebből fakadóan traumatikus helyzeteket élnek át.

2018. május 17-én a „napilapban" megjelent

egy kameruni fiú mondata:

„egyik nap a konyhában voltunk, és egy LMBTQI bevándorlókról szóló TV-műsort néztük,

mire az afrikai barátaim azt mondták,

hogy Olaszország egy szar ország, teli homoszexuálisokkal.

Újból azt éreztem, hogy nem vagyok szabad."

Allen 22 éves, aki elmenekült azok elől, akik megverték és démonnak nevezték,

így hátrahagyva Kamerunt -

ahol bűnnek számít homoszexuálisnak lenni

írja az újság -,

hogy nemzetközi védelmet kérjen Olaszországban.

Ugyanakkor nem tűnt el a félelme,

mert a homofóbia egészen a Bolognában található Mattea utcáig követte őt,

ahol honfitársaival együtt szállást kaptak.

Az LMBTQI migránsok gyakran nagyon fiatalok.

Nem számíthatnak

a származási országukban lévő közösség támogatására,

így kivándorlásra kényszerülnek,

de a homofóbia és transzfóbia, ami elől menekültek, gyakran kulturális szempontól is megkülönbözteti őket.

Abban sem lehetnek biztosak, hogy olyan multikulturális világgal találkoznak,

amely megengedi nekik, hogy békében megélhessék szexuális orientációjukat vagy nemi identitásukat.

Vincenzo Bramato, a bolognai Arcigay közösség elnöke

már számos interjúban hangsúlyozta,

hogy néhány európai országban, pl. Németországban,

olyan védett intézmények fogadják azokat,akiket üldöznek a szexuális orientációjuk miatt és emiatt menekülésre kényszerülnek,

ahol a dolgozók speciális képzést kapnak.

A képzés során megtanulják, hogyan kerüljék az ítélkező viselkedést,amely újraélesztené ezekben az emberekben a

stigmatizációt és a traumát.

Jelenleg Olaszországban nem írja elő a menekülteket fogadó rendszer az ehhez hasonló képzéseket,

azonban van néhány pozitív példa,

ilyen például a 2017-ben indított modenai teszt program,

amely keretében kizárólag LMBTQI menedékkérőknek biztosítottak egy 6 fős apartmant,

és ilyen az LMBTQI bevándorlási segélyszolgálat Veronában.

Ezeknek a menekülésre kényszerült,

fejlődésben lévő gyermekeknek,

akik tagjai

az LMBTQI közösségnek,

a probléma csak egy szeletét képezi az,

hogy ők egy etnikai kisebbséghez tartoznak egy befogadó országban.

Sono infatti, molto spesso una minoranza silenzio e spaventata, Ők nagyon gyakran származási országukban is egy néma és

megfélemlített kisebbségnek számítanak.

Ahogy Rogers fogalmaz,

ez a dupla láthatatlan trauma.

A kisebbségi stressz miatt – Vittorio Lingiardira hivatkozva –

dupla akkora

kockázatnak van kitéve ezek az embereknek a mentális és fizikai egészségüket tekintve.

Megvan annak a kockázata, hogy értékes embereket veszítünk el személyükben.

A befogadással kapcsolatos oktatásba

elsősorban

az emberi jogi oktatás

és az LMBTQI menekülteknek a segítő kapcsolat keretében biztosított speciális bánásmód tartozik.

Az oktatásnak emberközpontúnak kell lennie,

üdvözölnie kell az egyes emberek sajátosságokait, és tisztában kell lenni velük ahhoz, hogy valóban befogadók lehessenek.

A migránsokat célzó szolgáltatások,

amelyeket gyakran a

különböző szexuális orientációk és nemi identitások figyelembevétele nélkül alakítanak ki,

nem lesznek kellőképpen hatásosak

a kliens és segítő kapcsolatát tekintve.

(ez a fajta többlettudás nélkül nem részesülnek

megfelelő fogadtatásban ezek a gyerekek),

Ugyanez a helyzet az oktatás és megelőzés terén is

(például ha a szexuális úton terjedő betegségekről beszélünk,

akkor

szükséges a többszempontú megközelítés,

ha klienseink között vannak olyanok, akik egyben az LMBTQI közösség tagjai).

Másrészről, az LMBT közösség által kínált szolgáltatások

erősen kapcsolódnak a nyugati meleg férfiak és leszbikus nők kulturális modelljéhez,

és ezek a modellek nem feltétlenül olyanok,

amellyel ezek, a más kultúrából érkező fiatalok teljes mértékben

azonosulni tudnak.

A korábban említett valóságok megélése

bebizonyította, hogy az intézmények vagy akár

nonprofit szervezetek által kínált támogató tájékoztatási és tanácsadói szolgáltatások

nem igazán hatékonyak ezek a gyerekek esetében.

Ezért

szükséges a segítő kapcsolatok gyakorlatára

interdiszciplinárisan reflektálni,

főleg, ha olyan emberekkel dolgozunk, akik egyszerre több kisebbség tagjai. A segítő kapcsolatokról szóló oktatási anyagnak

tartalmaznia kell a homoszexualitás, biszexualitás és transzszexualitás különböző formáit

a pszichiátria és pszichológia fogalomtárát is felhasználva.

Szót kell ejteni a stigma,

homofóbia, internalizált homofóbia fogalmakról,

ugyanakkor folyamatosan tájékoztatni kell a szolgáltatókat

az ehhez kapcsolódó

jogszabályokról,

a fogadó országban és a kliensek származási országában egyaránt.

Emellett el kell mélyíteni

a menedék kérelemmel kapcsolatos

jogszabályi tudást,

mert az folyamatosan

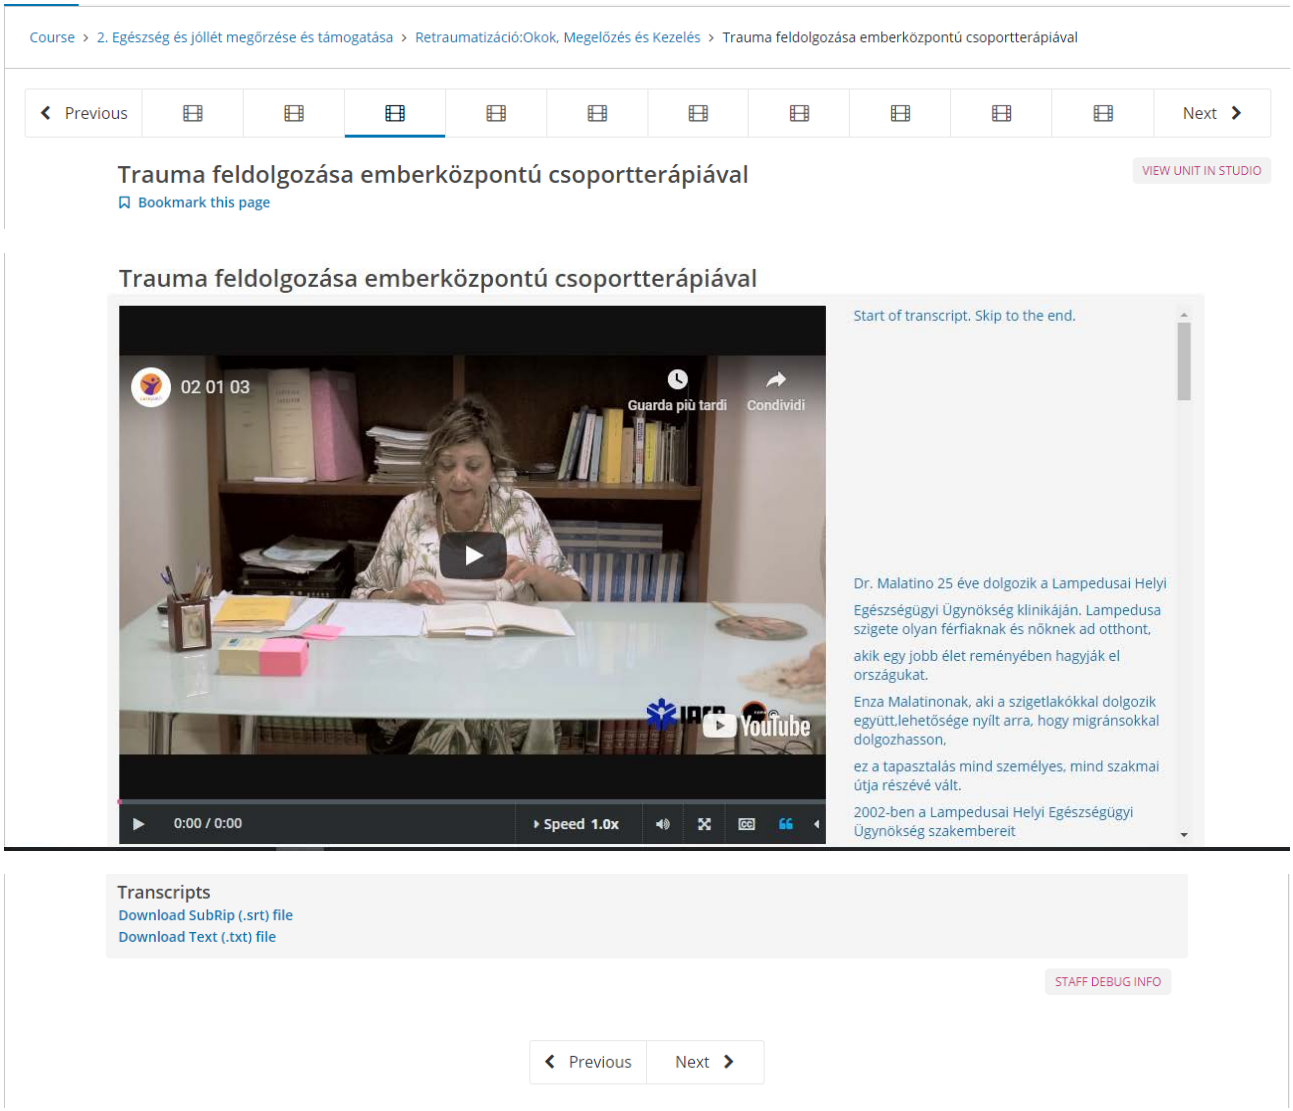
változik.

A gyakorlati képességek mellett fontos fejleszteni és beépíteni egy nemi szempontból érzékeny megközelítést

egy személyesebb szemszögből is,

és reflektálni az emberi jogokra, saját magunkban illetve a munkacsoporton belül is,

amely a szolgáltatást nyújtja a fiataloknak.



Transcript

Dr. Malatino 25 éve dolgozik a Lampedusai Helyi

Egészségügyi Ügynökség klinikáján. Lampedusa szigete olyan férfiaknak és nőknek ad otthont,

akik egy jobb élet reményében hagyják el országukat.

Enza Malatinonak, aki a szigetlakókkal dolgozik együtt,lehetősége nyílt arra, hogy migránsokkal dolgozhasson,

ez a tapasztalás mind személyes, mind szakmai útja részévé vált.

2002-ben a Lampedusai Helyi Egészségügyi Ügynökség szakembereit

arra kérték, hogy biztosítsanak támogató szolgáltatásokat és terápiás lehetőséget befogadóközpontokban, ahol olyan embereknek van szüksége kezelésre, akik nagyon nehéz

és hosszú út után kötöttek ki a szigeten, és akik közül voltak olyanok, akik halálos veszélynek is ki voltak kitéve.

A helyi egészségügyi ügynökség arra kért fel, hogy adjak pszichiátriai szakvéleményt azokról az emberekről, akik a szigeten kötöttek ki.

Szinte lehetetlen volt megállapítani azoknak a klienseknek a pszichiátriai egészségügyi állapotát,

akiket ennyire súlyos traumák értek. Mivel más kultúrkörből érkeztek,

nem kértek farmakológiai segítséget vagy támogatást, hiszen olyan kontextusból jöttek,

ahol a nyugati orvoslás számukra nem számított konvencionálisnak.

Ehelyett a saját kultúrájukon alapuló

bizonyos esetekben mágikus rituálék segítették és támogatták az klienseket.

Rendkívül összetett feladatnak bizonyult a rengeteg szenvedést átélt klienseknek segítséget és támogatást nyújtani.

Ezért döntöttem úgy, hogy olyan csoportokat szervezek,ahol meghallgathatják egymást.

Ez nekem, mint pszichiáterként és pszichoterapeutaként végzett szakembernek, aki a Carl Rogers emberközpontú megközelítést tanulta, rendkívüli élmény volt.

Ezeken a csoportterápiákon

az emberek körben ülnek,

és meghallgatják egymást. Az alapelv az ítélkezés teljes mellőzése

és a mély tisztelet bármely téma iránt, amit a csoport meg kíván vitatni.

Így lehetővé válik egy olyan bizalmi légkör megteremtése, amely nagyban segíti a résztvevőket,

még rendkívül problematikus érzelmi állapotban is, hogy újra feldolgozhassák az élményt,

és egyben szolidaritásra leljenek a többi résztvevőben.

nem feltétlenül egyéni élmény az, ha valaki tisztába kerül saját személyes tapasztalataival, de, ha másokkal is megoszthatja, az közös élménnyé válik.

Már ez önmagában néha elhozza a szenvedés,

a konfliktus vagy a fájdalmas esemény feloldását.

Ez történt ezekben a csoportokban is. Fontos és alapvető eleme volt a csoportos terápiának, hogy megtalálják a közös hangot a kulturális mediátorral

- a tolmáccsal - mivel a facilitátor nem beszélte a résztvevők nyelvét, és a körülmények,

amelyek között dolgoznia kellett, rendkívül korlátozottak voltak. Többek között azért, mert nem álltak rendelkezésükre

eszközök (székek), vagy az aktuális helyzet miatt (néhány csoport nem sokkal azelőtt élt túl egy hajótörést,

néhányan pedig csak pokrócban voltak).

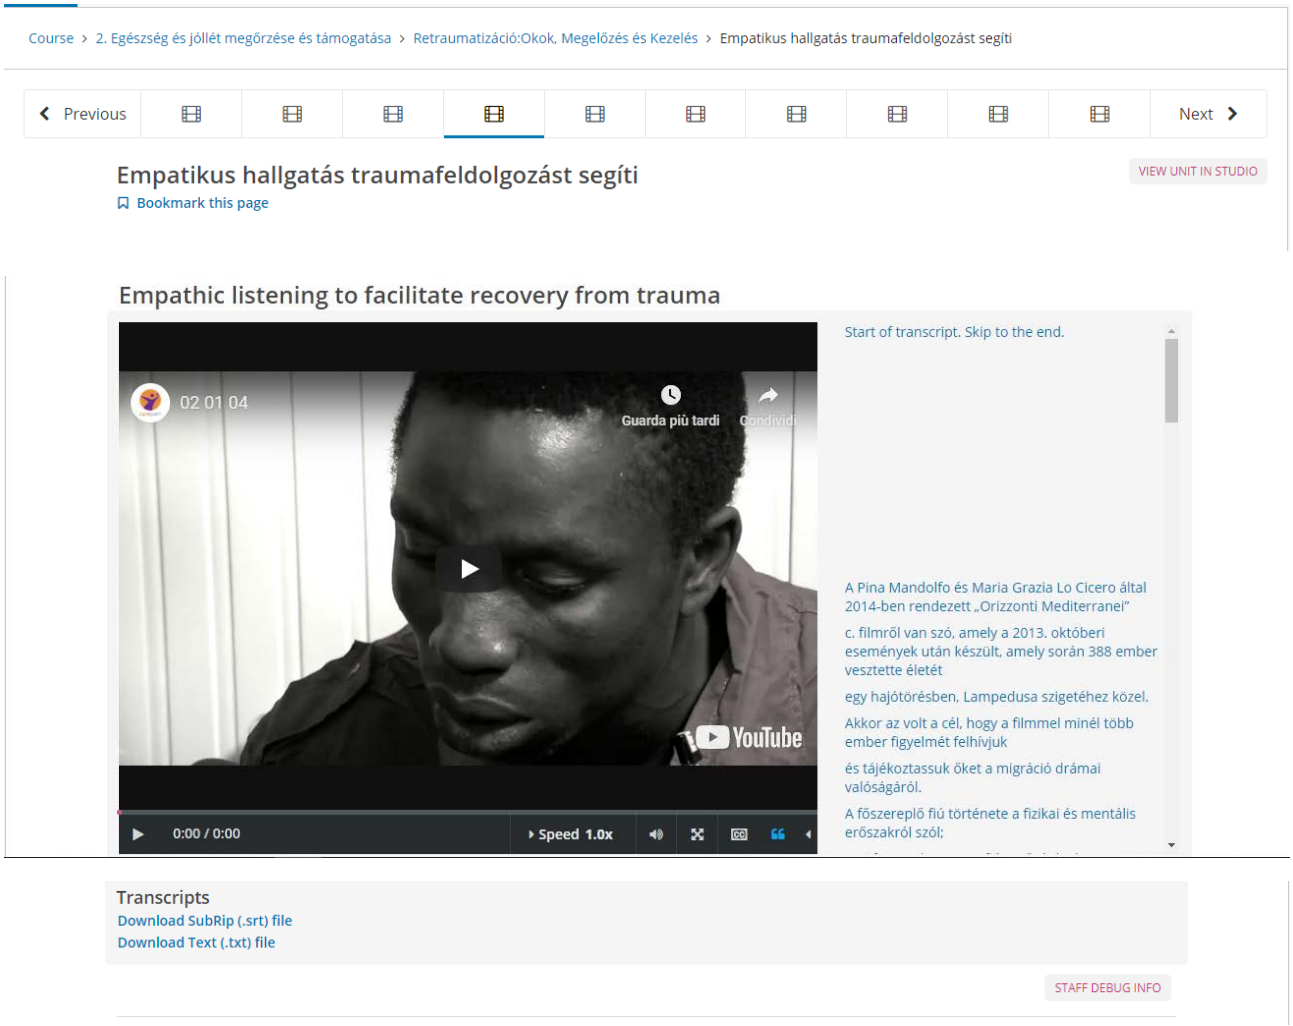
A szokatlan helyzet ellenére meglepetten tapasztaltam,

hogy a mély értékek nem a külsőségekben, hanem a tartalomban rejtőznek.

Amikor olyan emberekkel dolgozunk, akik megosztják történeteiket

hosszú és borzalmas útjaikról (átkelés a líbiai sivatagon, vállalni a fulladás kockázatát), a megosztott élmények

azon szakemberek számára is rendkívül traumatikusak, akik meghallgatják őket.
Számukra az okoz nehézséget, hogy hogyan tudnak kikerülni ezekből, a gondolatban megélt helyzetekből,
miután napi szinten hallgatták a nehézségekről és szenvedésről szóló beszámolókat.
Nekem pl. felszínre jött egy elfeledett gyermekkori élményem,
amikor az egyik nagynéném meghalt, és annyira fájdalmas volt a veszteség, hogy kitöröltem az élményt.
Mindezek fényében, amikor befogadunk valakit,
aki ehhez hasonló traumát élt át, létfontosságú az empatikus hallgatás felajánlása,
hogy felkínáljuk a lehetőségét annak, hogy megnyíljanak a túlélők
és megosszák élményeiket. Továbbá fontos, hogy mély elfogadással legyünk
a személy iránt és ne ítélkezzünk, mert ezáltal tudunk feléjük bizalmat kiépíteni.
Az empátia pedig a lélek balzsamja, az az érzés, amikor egy másik ember
megpróbál belehelyezkedni a helyzetünkbe, meghallgat minket és megpróbálja átérezni a fájdalmunkat.
Carl Rogers kutatása szerint ez a három alapállapot szükséges ahhoz,
hogy változást érjünk el segítő kapcsolatokban és csoportterápiában is.
A migránsok traumafeldolgozására irányuló Rogers-i csoportterápiának értékét szemléltetheti az a tény,
hogy senki sem kért gyógyszeres támogatást, miután részt vett az egymást meghallgatására
épülő csoportos foglalkozásokon.
Értékelték a csoport természetességét, a kerek formát.
A köralakúság talán egy kicsit reprodukálta azt az élményt, amit a kliensek saját országukban tapasztaltak,
például Eritreában, ahol az idős falubéliek
és férfiak összegyűlnek egy körben egy hatalmas fa körül,
amit ők a szavak fájának neveznek. Ennél a találkozásnál állítják újra helyre szavakkal
a félbeszakadt történeteket.



Transcript

A Pina Mandolfo és Maria Grazia Lo Cicero által 2014-ben rendezett „Orizzonti Mediterranei”

c. filmről van szó, amely a 2013. októberi események után készült, amely során 388 ember vesztette életét

egy hajótörésben, Lampedusa szigetéhez közel.

Akkor az volt a cél, hogy a filmmel minél több ember figyelmét felhívjuk

és tájékoztassuk őket a migráció drámai valóságáról.

A főszereplő fiú története a fizikai és mentális erőszakról szól;

ami fontos, hogy ez a fiú a nővérével együtt érkezett,

aki szintén erőszak és nemi erőszak áldozata lett - de ezt az öccsének sosem mondta el...

Ahogy a fiú is átesett nemi erőszakon, de sosem mondta el a

nővérének.

Neki nagyon szégyenteli volt erről az élményről beszélni, annyira, hogy

amikor erről beszélt, azt kérte, hogy a nővére ne legyen jelen, mert nem akarta, hogy

megtudja, mi történt vele. Ezt később mondta el nekünk. Szégyenkezett, hogy férfi létére

ilyen erőszak áldozata lett.

Azt fontos tudni, hogy egy 16 éves fiúról van szó.

A történetében megtudjuk, hogy mi történt vele, és hogy

hogyan tudjuk őt hagyni szabadon megosztani, az érzelmei áramlásának megszakítása nélkül

és nem beleszólni az ő narratívájába.

Néhány apró gesztus, bólintás, vagy

mély pillantás elég volt neki ahhoz,

hogy meg tudja osztani a történetét.

Ezáltal azt figyeltük meg, hogy az empátia inkább szituációs mint verbális,

pl. szemkontaktus, bólintások, testünkkel a fiú felé fordulás formájában

tudta őt segíteni.

Ez fontos volt abban, hogy segítsük a megosztását,

érintés nélkül; számára a testi kontaktus a szégyen forrása volt, olyan volt, mint egy gyerek.

Ugyan ő volt a két testvér közül a fiatalabb,

úgy érezte, hogy neki kéne a férfinak lennie, az erős félnek, aki támaszt és bátorítást nyújt a nővére számára.

Jól megfigyelhető, hogy az érzékenység, a tiszteletteli hozzáállás, az empátia és a meghallgatás

hogyan segíti a megosztást a segítő kapcsolatban.

A videóban két történet meghallgatásának

az élménye szerepe: az egyik egy lányról szól, a másik

két fivérről.

A két fivér Eritreából indult el

és 2014-ben érkezett Lampedusa-ra, ahol Mineo-ba kerültek a CARA

központba. Ott maradtak, hogy letelepedési engedélyt kapjanak,

és amikor megpróbáltuk meginterjúvolni őket a célból, hogy dokumentálhassuk

a történeteiket és élményeiket, rá kellett jönnünk, hogy az ilyen típusú történeteket

figyelmes hallgatással, óvatos, érzékeny figyelemmel lehet csak megközelíteni,

mert ez két fiú kínzást és szörnyű, drámai erőszakot szenvedett el.

Mindketten azt kérték, hogy a másik ne legyen jelen, amikor elmondja, mi történt vele.

A lány azért akart útnak indulni, hogy az öccsét ne kényszerítsék

16 évesen katonai szolgálatra.

A narratívájának van egy alapvető, visszatérő központi eleme: „Nem tudom elfelejteni,

De nem találom az erőt ahhoz, hogy elmondjam”. Ezek kulcsszavak voltak. A meghallgatást nála a segítő finom kontaktussal, kézfogással kísérte.

Ilyen élmények esetén a fizikai kontaktus használata összetett kérdés, általában nem javasolt fizikai és nemi erőszak áldozatai esetén, de ebben a konkrét helyzetben valahogy ráéreztem, hogy a lánynak mély megtartásra volt szüksége ahhoz, hogy elmondja a történetét. Ezért a szakember megkérdezte, hogy megfoghatja-e finoman a kezét. Az érintés előtt a kérdés létrehozta a lehetőségét annak, hogy a lány megengedje.

Az ilyen kontaktussal egy erős energiacsatornát hoztunk létre, és minden olyan részletnél, ami kifejezetten traumatikus és fájdalmas volt, a lány általában megállt, hogy a szakember megfogja a kezét, és az érzései tovább áramolhassanak.

Az érintés energiát adott neki ahhoz, hogy folytassa a történetét.

Egy ilyen tapasztalat után az ember rádöbben, hogy mennyire erőteljes dolog az, ha valakit, aki traumát szenvedett el, meghallgatunk; ennek a jelentőségét nem lehet túlbecsüli, és nem szabad trivializálni.

Ez a legfontosabb: meghallgatni a történetet úgy, ahogyan azt elmondják.

Nagy fokú érzékenységgel, és mindenek felett a másik szenvedése iránti empátiával, annak elismerésével.

Ez volt az az alapvető tényező, amely lehetővé tette az ilyen mélységű érzelmi megnyílást és az ilyen típusú történetek megosztását.

Az örökbefogadás annyit jelent, mint megküzdeni a természettel, ezen belül is a meddőséggel.

A szülő örökbefogadási vágya nagy ajándék,

nem csak a szülő számára, mert végre gyermeke lehet,

hanem a gyermek számára is, mert végre családra lelhet.

Vitatott, hogy a szülőt „örökbefogadó szülőnek" kell-e hívni, vagy csak simán „szülőnek".

Nem csak a kutatások eredményei alapján mondjuk, de a kialakult szülő-gyermek-kapcsolatok is mutatják,

hogy teljes értékű szülők az örökbefogadó szülők is, és semmivel sem kevesebbek,

mint a biológiai szülők.

Rengeteg átfedés van az örökbefogadott gyermek és a biológiai gyermek között.

Az örökbefogadó szülőnek mindig meglepő, ha apának szólítják,

míg a biológiai szülőnél ez adott.

Ez azt is jelentheti, hogy örökbefogadó szülőnek lenni intenzívebb élmény,

mint biológiai szülőnek lenni.

Mindenesetre arra kell figyelnie a szülőnek,

hogy az örökbefogadott gyermeknek joga van a boldogsághoz,

és hogy ehhez figyelembe kell vennie a gyermek történetét. Amit nem ismerhetünk mindig,

mert senki sem mondta el nekünk, a gyermek pedig nem emlékszik rá.

Érzékenyen kell megközelíteni a problémákat,

amelyeket a gyermek magával hozhatott.

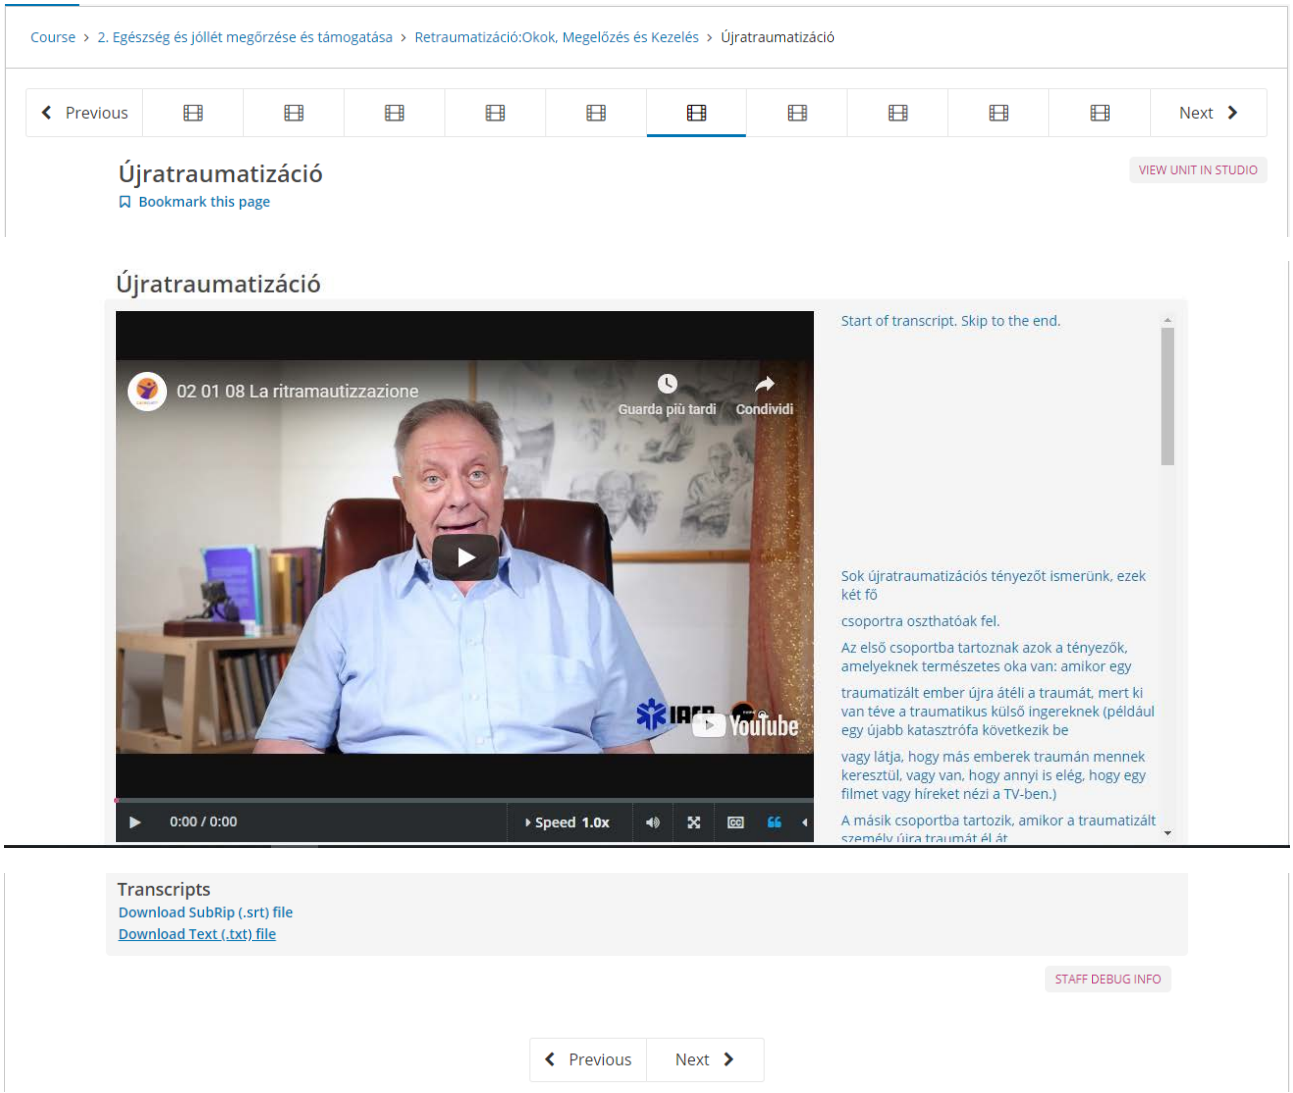
Az örökbefogadott gyermek gyerekkorában és felnőttként is gyakran szembesül a léte körüli kérdésekkel:

mik a gyökereim?

Miért hagytak el?

Ezek olyan kérdések, amelyeket senki sem tud megválaszolni, azonban nem zárják ki azt, hogy az élet szép,

és küzdenünk kell a jobb életért.



Transcript

Sok újratraumatizációs tényezőt ismerünk, ezek két fő

csoportra oszthatóak fel.

Az első csoportba tartoznak azok a tényezők, amelyeknek természetes oka van: amikor egy

traumatizált ember újra átéli a traumát, mert ki van téve a traumatikus külső ingereknek (például egy újabb katasztrófa következik be

vagy látja, hogy más emberek traumán mennek keresztül, vagy van, hogy annyi is elég, hogy egy filmet vagy híreket nézi a TV-ben.)

A másik csoportba tartozik, amikor a traumatizált személy újra traumát él át,

mert a szolgáltatást vagy ellátást tapasztalatlan személy

vagy nem traumákra szakosodott szervezet végzi, és akaratlanul is 9 00:01:19,020 --> 00:01:22,620 újratraumatizálja a hozzá fordulót.

Azokat a biztosítékokat és folyamatokat, amelyeket az szervezők, szakemberek

vagy egy intézmény elfogadnak annak érdekében, hogy megakadályozzák klienseik újraumatizációját, trauma tudatos ellátásnak nevezzük.

A múltban sajnos, nem rosszindulatból, hanem tudatlanságból, túl gyakran újratraumatizálódtak azok,

akik korábban már elszenvedtek traumát.

A kutatásoknak és klinikai bizonyítékoknak köszönhetően megfigyeltük,

hogy a kliensek tudtuk nélkül jatrogén sérülést szenvedtek el, amikor

olyasmire kényszerítették őket, amit nem akartak megtenni; ha nem tartották tiszteletben azt,

ha még nem álltak készen valamire, vagy sürgették őket; vagy kényszerítették, hogy traumatikus élményeket idézzenek fel, természetesen jó cél érdekében.

A trauma tudatos ellátás definíciója alatt azt, a kutatás során kialakított biztonsági hálót, illetve

mindazokat az óvintézkedéseket értjük,amik rávilágítottak arra, hogy mennyire fontos

a traumatizált embereket újabb traumáktól megvédeni.

A trauma tudatos ellátás alapja, hogy tiszteljük a kliensek tempóját, hogy emberközpontú szolgáltatásokat kínáljunk,

tiszteletben tartsuk a szükségleteiket és érzékenységüket, és mindenekfelett ne kényszerítsük őket olyasmire,

amire nem állnak még készen.

Ennek oka nagyon egyszerű: megfigyeltük, hogy a már traumatizált személyeknek elfogadásra,

kedvességre és biztonságos menedékre van szükségük, ahol újra erőre kaphatnak,

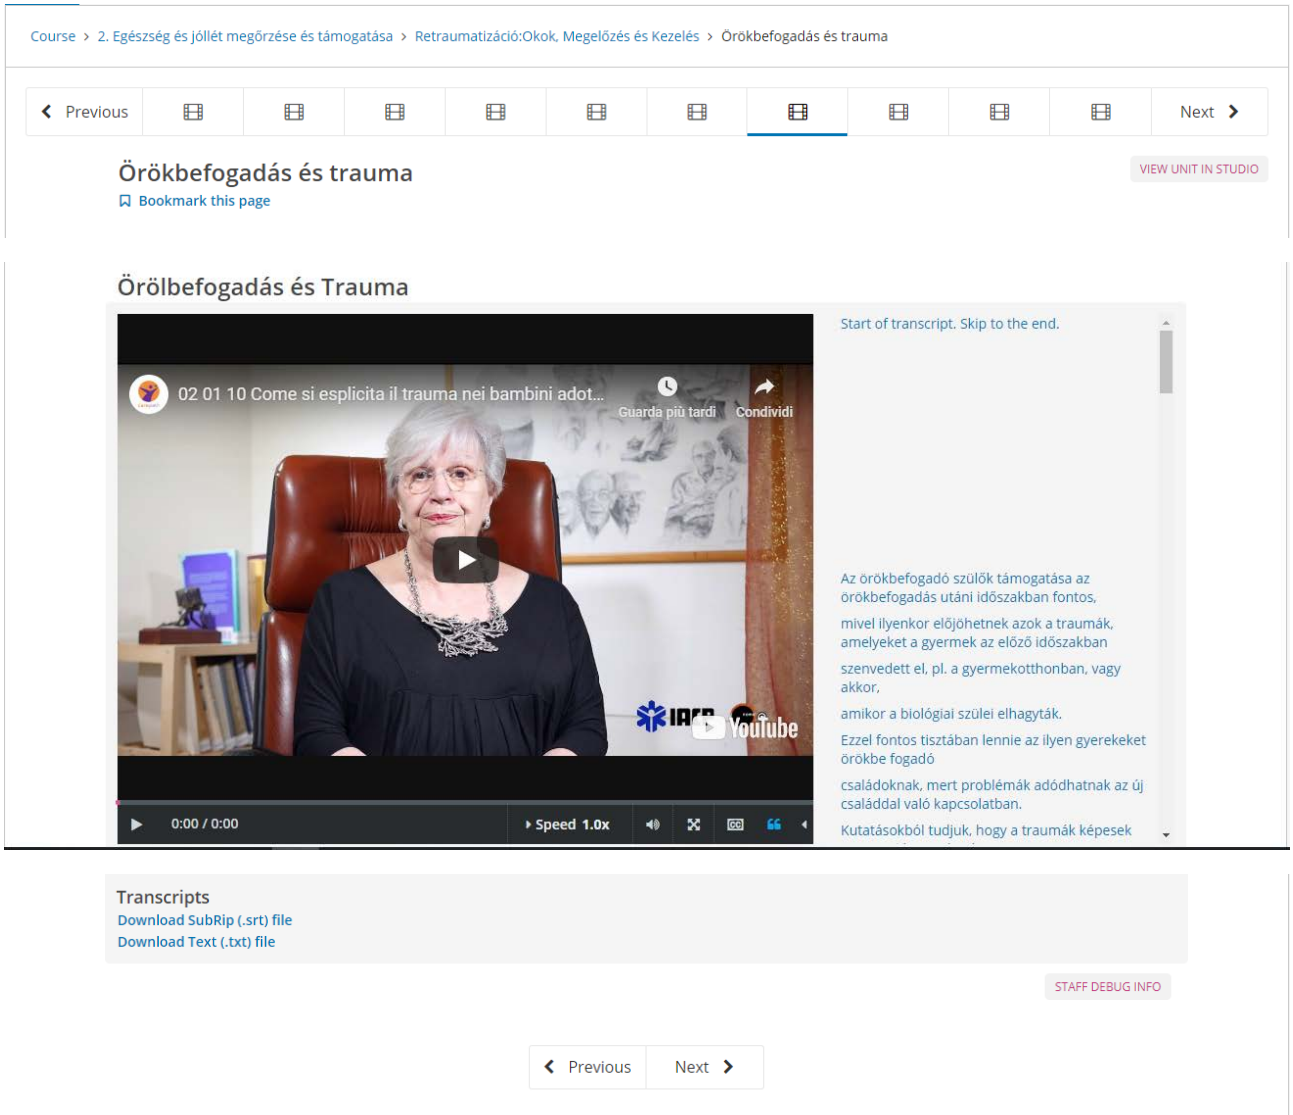
hogy saját ritmusukban tudják folytatni a felfedezést, és pontosan azért, mert traumatizáltak, 27 00:03:42,019 --> 00:03:44,620 körültekintőnek kell lennünk.

A jó ellátás érdekében

fontos bíznunk

a traumatúlélők

önszabályozási képességében.



Transcript

Az örökbefogadó szülők támogatása az örökbefogadás utáni időszakban fontos,

mivel ilyenkor előjöhetnek azok a traumák, amelyeket a gyermek az előző időszakban

szenvedett el, pl. a gyermekotthonban, vagy akkor,

amikor a biológiai szülei elhagyták.

Ezzel fontos tisztában lennie az ilyen gyerekeket örökbe fogadó

családoknak, mert problémák adódhatnak az új családdal való kapcsolatban.

Kutatásokból tudjuk, hogy a traumák képesek megtörni kapcsolatokat,

problémássá és nehézzé tenni őket; ez alól a gyerekek sem kivételek.

Ha az örökbefogadó szülők tisztában vannak azokkal a nehézségekkel, amiken a gyermek

az új családban keresztülmegy, az megkönnyítheti a dolgukat -

vagy legalább tisztábban láthatják, mi történik.

Az interakciókban - amikből a kapcsolat felépül - a gyermek

nehezen kezelhetővé válhat, zavaros, nem egyértelmű jeleket adhatnak, úgy tűnhet, hogy nem érdeklődnek,

vagy nincsenek jelen.

Az összes ilyen tényezőt pontról pontra át kell venni, ez

hozzátartozik minden örökbefogadás történetéhez.

Tudjuk azt is, szintén kutatásokból, hogy minden interakciós

esemény kisebb mikroeseményekből áll, amiket ha részletesen elemzünk,

látható, hogy hatással vannak a felnőtt-gyerek és gyerek-felnőtt válaszokra.

Ilyenkor a videók használata nagyon hasznos lehet. Az ilyen helyzetekben,

amelyekben a trauma olyan körülményeket hozott létre, amelyek megnehezítik az interakciók mikortényezőinek „leolvasását”,

fontos és hasznos videóval rögzíteni őket, hogy utólag meg lehessen figyelni az interakciókat,

és látni lehessen, hogy a gyermek hogyan mozdul, és a szülő hogyan reagál.

A videó használata tehát fontos és ajánlott eszköz.

Segít lefektetni az alapokat, és részleteiben, mozzanatról-mozzanatra

megfigyelni mindent, ami a gyermek és a szülő közötti interakcióban történik.

Fontos azonban hangsúlyozni, hogy az ilyen típusú videót

mindig csak ennek az eszköznek a használatában kifejezetten képzett terapeuta használja;

akik nem végeztek ilyen irányú szakképzést, azok a helyzet érzékenységéből fakadóan,

ne használják.

Ahogy korábban említettük, megfigyelhető az, hogy az örökbe fogadott gyerekek máshogy

küldenek jeleket; kevésbé egyértelműek, rövidebbek és zavarosabbak a nem örökbefogadott társaikhoz képest.

Ezért a videó rendkívül fontos lehet a szülőnek, mert lehetővé teszi a számára -

az inteakciók pillanatról-pillanatra megfigyelésével - hogy lássa,

a gyermek mikor és hogyan tud kapcsolódni hozzá.

Ez mérföldkő lesz a köztük lévő interakciókban és kapcsolatban, és lehetővé válik

az új szülői kötődés kialakítása.

Egy másik fontos tényező a gyermek hiperébersége,

Ami a hátteréről, a félelmeiről, a gondoskodás hiányáról,

az elhanyagolásról szolgál információval. Főleg akkor markáns, ha a gyermek fizikai erőszakot,

bántalmazást élt át, vagy annak volt szemtanúja.

A hiperébersége az, amikor a gyermek szélsőséges mértékben,

minden pillanatban figyeli a felnőtt minden rezdülését, mozdulatát, hogy le tudja olvasni,

ha valami számára veszélyeset lát,

hogy olyasmit csinál-e a felnőtt, ami számára fenyegető.

Egyértelműen jelzi azt, hogy a gyermek nem bízik a felnőttben.

Ez lassanként elmúlik, ahogy dolgoznak a szülő-gyermek kapcsolaton,

de nem mindig tűnik el teljesen.

A gyermekre ezen kívül jellemző lehet egy fajta érzelmi esetlenség,

ami az örökbefogadó szülőknek sok fájdalmat okozhat, mert úgy érezhetik, hogy a gyermek

soha nem fogja tudni teljesen szabadon kifejezni az érzéseit, az érzelmi közelségét a felnőtthöz.

Ez nem a gyermek felelőssége; ezt is múltból, a korábbi élményeiből hozza,

főleg, ha kimondottan fájdalmas történetet élt át.

A gyermekek hozzászoknak ahhoz, hogy ne közelítsenek a felnőtthöz, hogy így

a felnőtt kevesebb veszélyt jelentsen számukra.

Nincsenek hozzászokva a gyakori érintésekhez, ölelgetéshez, ami pedig az új kapcsolatban megtörténhet.

Így lehet, hogy az új szülő közeledése túl sok nekik.

De mivel nem tudják, hogyan navigálják a felnőttel a kapcsolatot, hogyan közelítsék meg,

ahogy azt sem, hogy mikor túl sok vagy túl kevés a közelség, teljesen dezorientáltak lesznek és zavarban érzik magukat.

Máskor a gyermek lehet, hogy nagyon esetlenül, szinte mesterkéltnek ható módon közeledik,

amit a szülő azonnal érzékel, és hajlamos ezt megcímkézni.

Fontos az, hogy az ilyen megnyilvánulást is mindig a gyermek hátterének a tükrében lássuk:

sosem volt meg a szabadságuk ahhoz, hogy úgy és akkor közeledjenek

a felnőtthöz, ahogy és amikor akartak, ezért ebben még igen esetlenek és kicsit mesterkéltek lehetnek.

További tényező, amivel a szülők találkozhatnak, a fáradtság és az alvási nehézségek:

nyugtalan alvás, elalvási nehézség, és a kipihentség hiánya.

Jelentkezhetnek koncentrációs nehézségek is, amiket gyakran,

jobb híján, tanulási zavarnak titulálnak:

pedig a gyermeknek nem lenne baja a tanulással,

csak a hiperébersége sok nehéz, kimerítő érzelmi lenyomatot aktivál,

amik elvonják a figyelmét a rá bízott feladatokról.

Az látható, hogy a gyermek a felnőttet nézi, az arcát, az

arckifejezését fürkészi, hogy letapogassa, ha esetleg veszély fenyeget;

és emiatt persze nehéz neki koncentrálni.

Az összes ilyen jelenség rendkívül fontos: ezek a viselkedések a gyermek múltjának a történetét

hordozzák, mindent elmondanak az örökbefogadó szülőnek a gyermek hátteréről, amit a gyermek

talán máshogy nem, csak ezeken a viselkedéseken keresztül

tud kifejezni.

Hasznos tehát úgy tekinteni ezekre, mint értékes információkra, amik

hozzásegítenek bennünket a gyermek múltja egy részének megértéséhez, amiről egyébként

semmit nem tudhatunk azon kívül, ahogy az új szülővel való

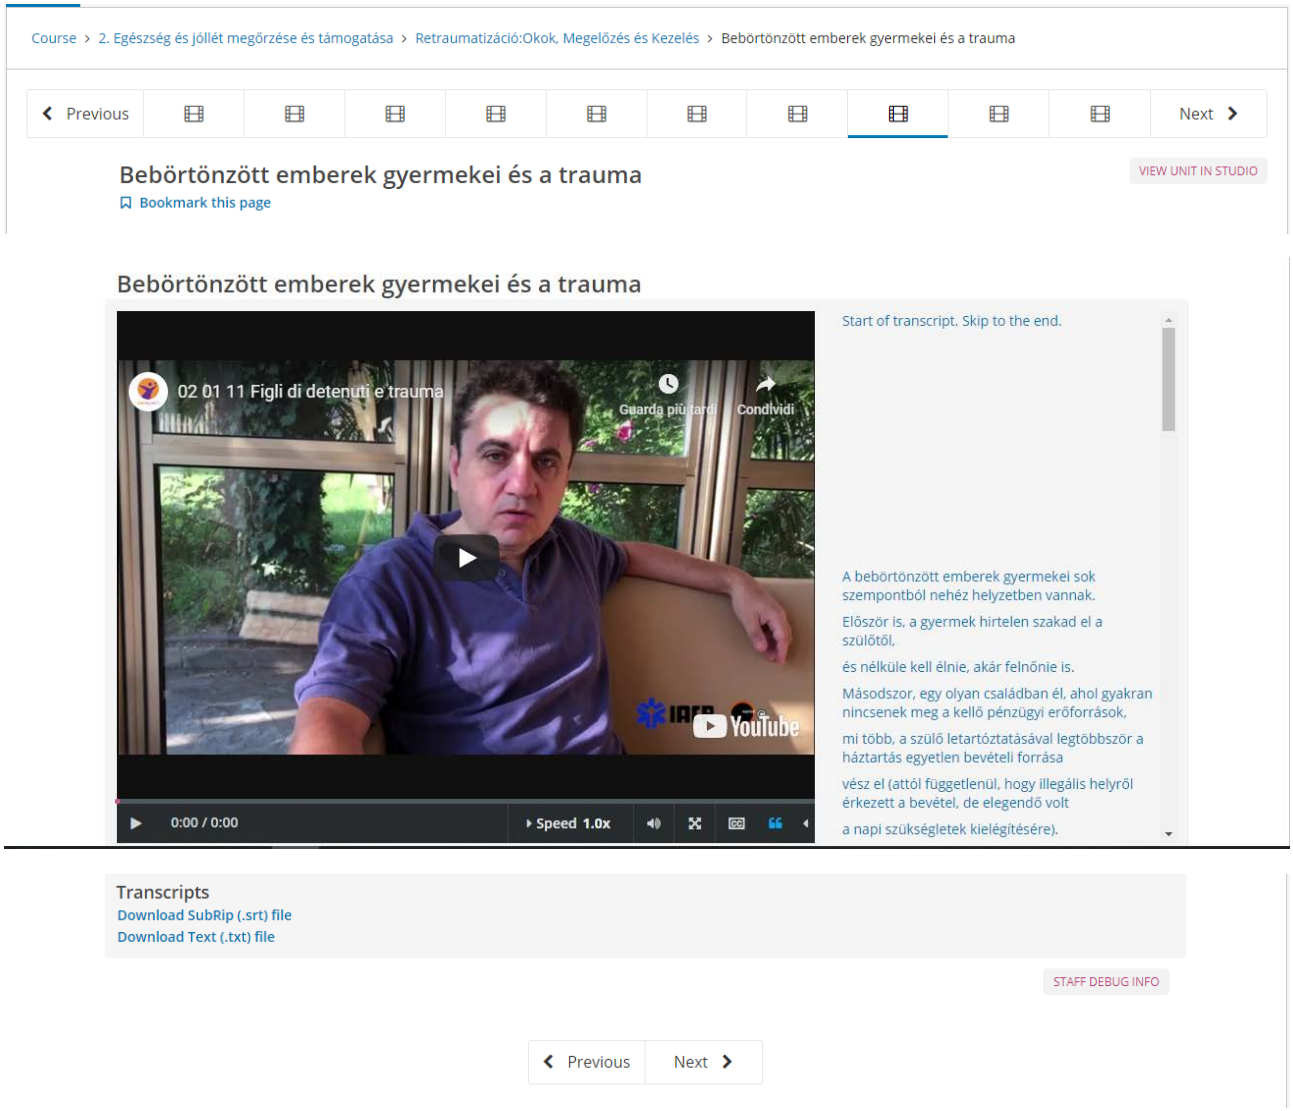
kapcsolatban megnyilvánul.

Korrigálandó helyzetek helyett ezekre a viselkedésekre tekintsünk inkább lehetőségként a gyermek múltjának

megértésére és elfogadására, amikkel együtt szőhetünk

egy új, közös történetet.

A múltbeli történet így köthető össze az új történettel.



Transcript

A bebörtönzött emberek gyermekei sok szempontból nehéz helyzetben vannak.

Először is, a gyermek hirtelen szakad el a szülőtől,

és nélküle kell élnie, akár felnőnie is.

Másodszor, egy olyan családban él, ahol gyakran nincsenek meg a kellő pénzügyi erőforrások,

mi több, a szülő letartóztatásával legtöbbször a háztartás egyetlen bevételi forrása

vész el (attól függetlenül, hogy illegális helyről érkezett a bevétel, de elegendő volt

a napi szükségletek kielégítésére).

Egy újabb másodlagos, de ugyanolyan fontos 9 00:00:50,420 --> 00:00:55,160 tragédia pedig az, hogy a gyermek

stigmatizáció áldozatává válik.

Bebörtönzött ember gyermekének lenni annyit jelent,

mint a bűntudat gyermekének lenni. Ahogy a gyermek elkezd a társadalmi nyomásnak engedni,

saját maga is ítéletet hoz, és úgy érezheti, hogy ő is megérdemli a büntetést.

A bebörtönzött szülők gyermekei gyakran problémás gyermekek,

ami többek között azért van, mert nincsen velük szülő - gyakran az apa -,

aki nevelné őket.

Ők olyan gyermekek, akik arra kényszerülnek, hogy egyedül éljenek, mert az anya gyakran nem tud megbirkózni a problémákkal

és nem támaszkodhat többé

a férje támogatására.

Ez egy teljesen új kihívás, és sajnos a szociális munkások is néha abba a hibába esnek,

hogy stigmatizálják a gyermeket, akinek pedig megértésre és még több odafigyelésre lenne szüksége,

mert nem könnyű nehézségek közepette egyedül élni az anyával.

Különböző vélemények vannak arról, hogy hogyan kell elmondani a gyermeknek,

hogy letartóztatták a szülőjét.

Sok szülő szégyenből vagy nehézségből kitalál egy történetet a gyermekeinek arról, hogy a távol lévő szülő

egy új munkahely miatt nem tud velük lenni.

Természetesen a hazugság gyorsan lelepleződik, mivel a gyermeket nem lehet arról meggyőzni,

hogy egy munkahelyváltás miatt miért ment el az apja hirtelen

több napra, hónapra, évre, és hagy ki születésnapokat és ünnepeket, mikor előtte minden nap hazament a munkából.

A gyermek megérzi, hogy hazudtak neki.

A legjobb dolog, ha elmondjuk neki az igazságot „...apa hibát követett el,

ami miatt egy olyan helyen kell lennie, ahol felelnie kell a tetteiért. Nem kell megijedned,

mert jól van,

és hamarosan meglátogathatjuk.”

Egy újabb nehéz kérdés merül fel a bebörtönzött emberek gyermekeinél:

látogassák-e a szülőt a börtönben vagy sem.

Néhány szociális munkás azt mondja, hogy a látogatás nem helyénvaló, mert a börtönbeli környezet

nem olyan hely, ami egy gyerek szükségleteinek megfelelő. 39 00:03:46,960 --> 00:03:54,920 Ha az ember belép a börtönbe, rendőrökkel és méltatlan környezettel találkozik.

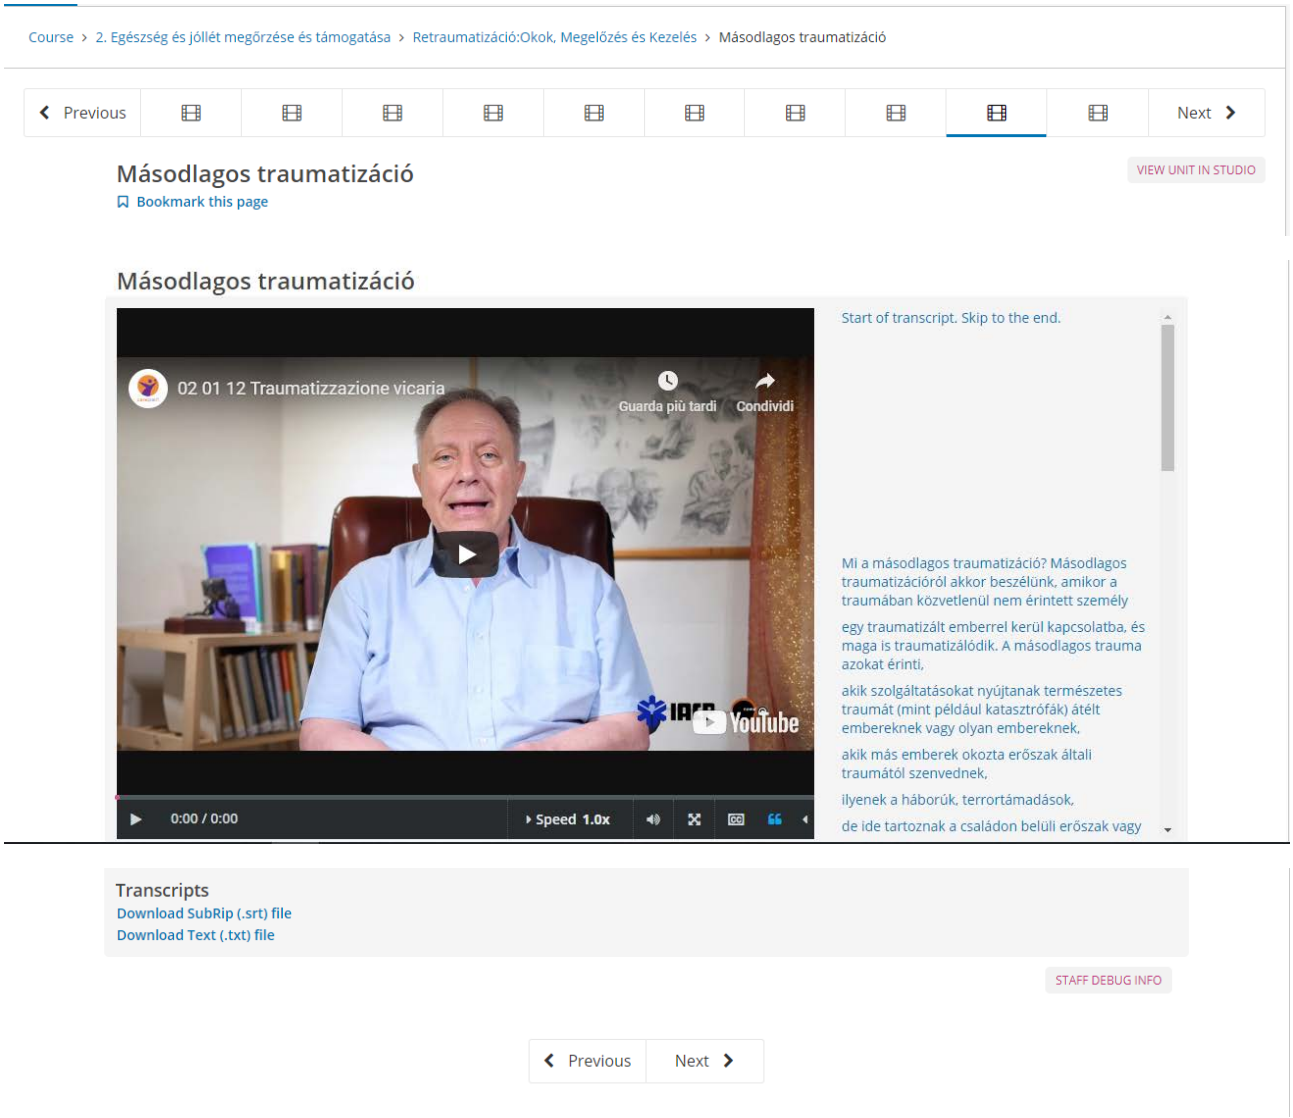
Ugyanakkor fontos a gyermek számára,

hogy lássa a szülőt,

ezért meg kell teremteni a bebörtönzött ember és gyermeke találkozásának megfelelő körülményeit.

Pár évvel ezelőtt még egy fal választotta el a bebörtönzött embereket a látogatóiktól,

de mára sok minden megváltozott: sok börtönnek van játékszobája vagy színesebb terme játékokkal, és a börtönőrök is sokkal jobban fel vannak készítve
a gyermeklátogatókra.
Mégsem az a legfontosabb kérdés, hogy a gyermek egy megfelelő környezetben találkozzon szülőjével, hanem az, hogy létre jöhessen ez a találkozás.
Ez igaz minden olyan esetre, ahol a szülő nem azért van börtönben, mert bántotta volna gyermekét.



Transcript

Mi a másodlagos traumatizáció? Másodlagos traumatizációról akkor beszélünk, amikor a traumában közvetlenül nem érintett személy

egy traumatizált emberrel kerül kapcsolatba, és maga is traumatizálódik. A másodlagos trauma azokat érinti,

akik szolgáltatásokat nyújtanak természetes traumát (mint például katasztrófák) átélt embereknek vagy olyan embereknek,

akik más emberek okozta erőszak általi traumától szenvednek,

ilyenek a háborúk, terrortámadások,

de ide tartoznak a családon belüli erőszak vagy pl. a szexuális erőszak áldozatainak esetei is.

Összefoglalva, a segítő szakember napi szinten jóindulattal kapcsolódik a trauma túlélőihez, segítséget, támogatást nyújt, pszichológiai kapcsolatot teremt,

de az általa segítettek történetei mély nyitottsága, embersége

következtében hatással lehetnek a segítő saját

mentális egészségére, és traumatizálhatják

őt magát is.

Fontos megelőznünk és csökkentenünk a másodlagos trauma hatását, amelynek azok a szakemberek és szociális munkások vannak kitéve,

akik trauma vagy erőszak áldozataival dolgoznak.

Ilyenek például az egészségügyi dolgozók, rendőrök, tűzoltók, újságírók, önkéntesek és mindazok, akik különböző okok miatt

kapcsolatba kerülnek traumatizált emberekkel.

A másodlagos trauma, és általánosabban

a kiégés megelőzése rendkívül fontos, amely szintén hatással van 18 00:02:34,800 --> 00:02:43,000 a segítő szakmákban dolgozókra. Főleg akkor nehéz megbirkózni vele,

ha nem tudunk feltöltődni vagy határt szabni a munkának, amit egyszerre élünk meg nehéznek és gyönyörűnek. Fontos megtalálnunk

a munka és a magánélet közti egyensúlyt, és ahhoz, hogy hatékony segítő szakemberek legyünk, ápolnunk kell a saját magánéletünket is, és hagynunk kell időt a családra,

barátokra és arra, hogy jól érezzük magunkat. Kihívást jelent mindazoknak, akik szenvedéllyel,

nagylelkűen és empátiával segítő szolgáltatásokat nyújtanak,

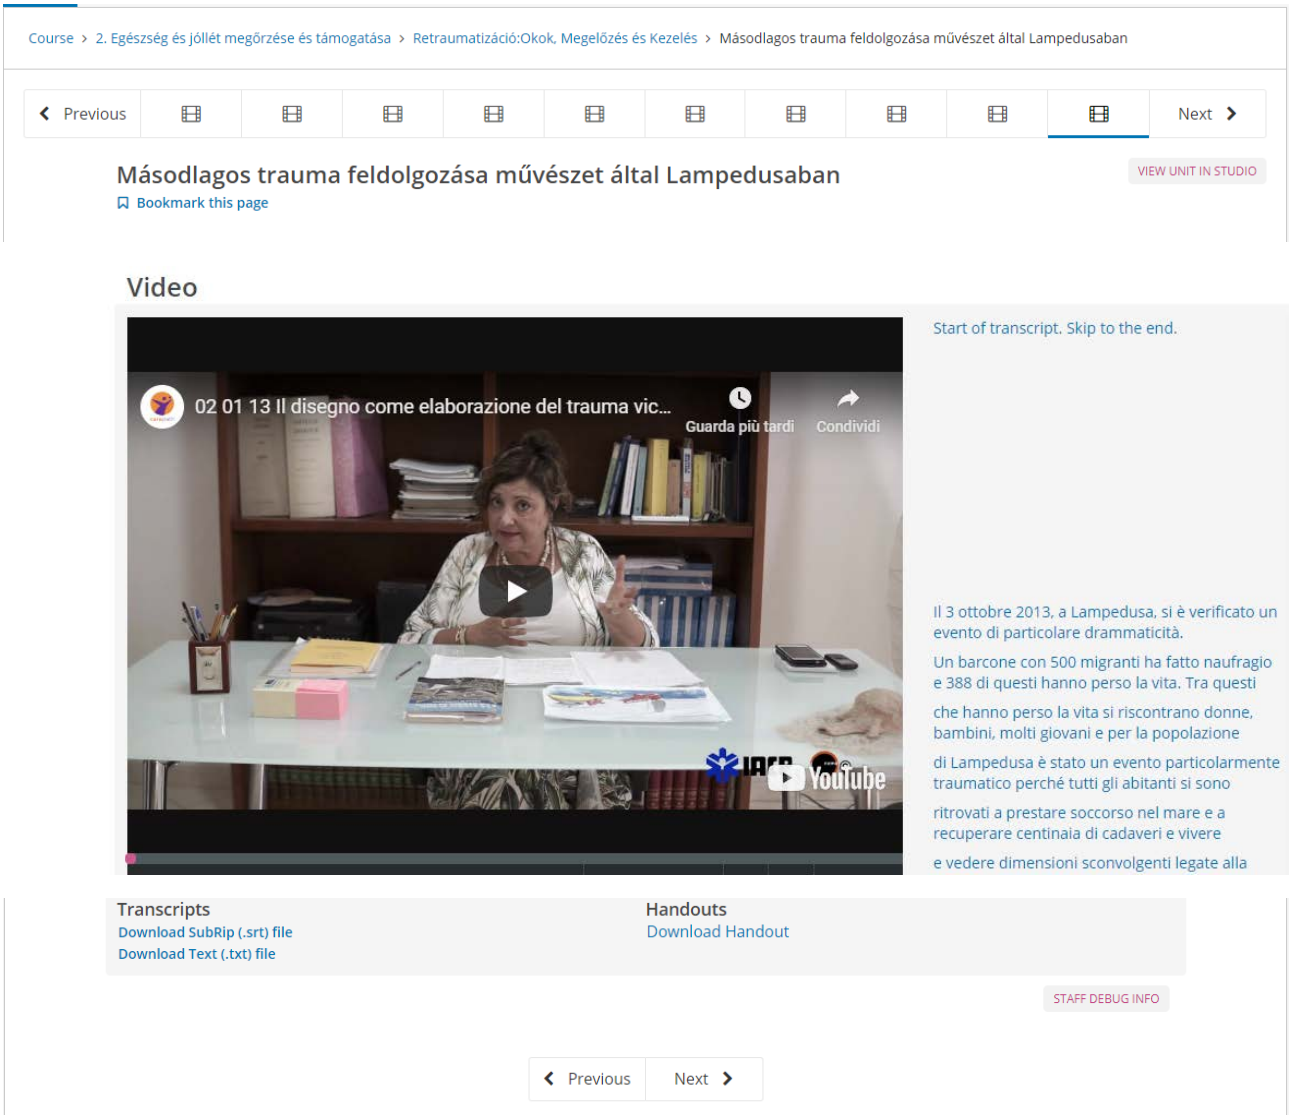
hogy önmagukkal is foglalkozzanak,

mert csak akkor lehet adni, ha van miből.

Éppen ezért fontos erkölcsileg, etikailag és szakmailag is, hogy megőrizzük ellenállóképességünket, egészségünket és jóllétünket:

ha sokat szeretnénk adni azoknak, akikkel dolgozunk, akkor azzal az emberrel is jól kell bánnunk,

akivel életünk minden egyes óráját töltjük – magunkkal.



Handhout

A rajzolás, mint a Lampedusa gyermeknépessége által elszenvedett másodlagos trauma feldolgozásának eszköze/

2013. október 3-án megrázóan drámai események történtek Lampedusán. Egy 500 bevándorlót szállító hajó elsüllyedt, és 388-an életüket vesztették a balesetben. Az elhunytak között sok nő, gyermek és fiatal volt. Lampedusa lakosságát különösen megviselték az események, miután hiába próbálkoztak a fuldoklók mentésével, ugyanakkor több száz holttestet kellett kiemelniük a vízből. Az áldozatok között egy édesanyát is találtak, akit épp szülés közben ért a hajótörés, a nőt a köldökzsinór még összekötötte a babával.

Hasonló tragédia szemtanújának lenni sokkoló tapasztalat, mely másodlagos traumát okozott azokban, akik látták a borzasztó eseményeket. Alapítványunk a helyi egészségügyi szolgálattal együtt igyekezett segítséget nyújtani a traumatizált lakosságnak úgy, hogy meghallgatta és támogatta az embereket. Az egyik legnehezebb feladat a traumát elszenvedett gyermekek, különösen az általános iskolások kezelése volt.

A lampedusaiak mindennapjaihoz (beleértve a fiatalokat is) több éve hozzátartozik a bevándorlás, és mindenki tisztában van vele, hogy az utazások, melyekbe nagy reményekkel vágnak bele a menekülők, gyakran halállal végződnek. De a 6-7 évesek különösen ki vannak téve az ilyen tragédiákkal való szembesülésből adódó traumáknak: sokuk félni kezd, aggódik, fóbiái lesznek. Ezek a gyerekek tehát olyan, tipikus reakciókat produkálnak, melyek az életveszélyes helyzetekkel történő találkozásokból adódnak.

A helyzetet súlyosbítja, hogy a tragikus események színterévé az a tenger vált, melyet addig az öröm, a játék és a szórakozás megtestesítőjeként érzékeltek. A tenger, amely addig a könnyedséget és a boldogságot jelentette a legtöbbüknek, hirtelen a halál tengerévé változott.

Ezen másodlagos traumák feldolgozására a rajz lehet az egyik lehetséges eszköz. A gyerekrajzok képet adnak arról, hogyan reagálnak és válaszolnak a kicsik a traumára.

Itt meg kell említeni azt az előfeltevést, mely szerint a művészet segítségével hatékonyan alakíthatók kézzelfoghatóvá a fájdalmas és félelmetes események, az alkotásnak ugyanakkor felszabadító hatása van, és általa átdolgozhatók a traumatikus események.

A következő lépésben azt a kérdést kell feltennünk, hogy mi számít traumának a gyermek szempontjából. Ez függ az esemény típusától, illetve attól, hogy milyen formában jelenik meg: lehet olyasmi, amit emberek okoznak (mint például a háború és a terrorizmus), és lehet olyasmi, amit a természet idéz elő (mint a hurrikánok, földrengések, tornádók). Ezen események specifikus nyomokat és félelmeket hagynak maguk után a gyermekek lelkében.

A lampedusai tragédia kapcsán szükséges volt begyógyítani azokat az érzelmi töréseket, melyeket a gyerekek elszenvedtek. Egy ilyen esemény után az élet nem folytatódhatott a régi kerékvágásban, és ez minden családot érintett. A gyerekek nehezen értik a halál fogalmát, emellett hajlamosak mindent magukra venni. Többen például nem mertek halat enni, arra gondolva, hogy a halak korábban megették az elhunyt gyerekeket és szüleiket. Voltak, akik nem mertek többet lemenni a partra, mert féltek, hogy esetleg újabb holttesteket látnak. Fontos feladat volt tehát megnyugtatóan újrarendezni a valóságról alkotott, széttöredezett képzeteiket, ebben pedig a rajzolás segített.

Most pedig szeretnénk bemutatni néhányat a gyerekek rajzai közül. Íme, a reprezentációk, amelyeket a kicsik az élményeikből alkottak: Ez itt Lampedusa szigete, nem messze pedig a tenger, tele halottakkal. Halott gyerekek, hátukon iskolatáskával, és anyák, akik elvesztették a pénztárcájukat. A hátizsák és a pénztárca mint az iskolába járás szimbóluma jelenik meg. Egy anya, aki egy kislány kezét fogja, míg az apák távolabb, a víz alatt fuldokolnak. A csónak, mely a biztonságot jelenti.

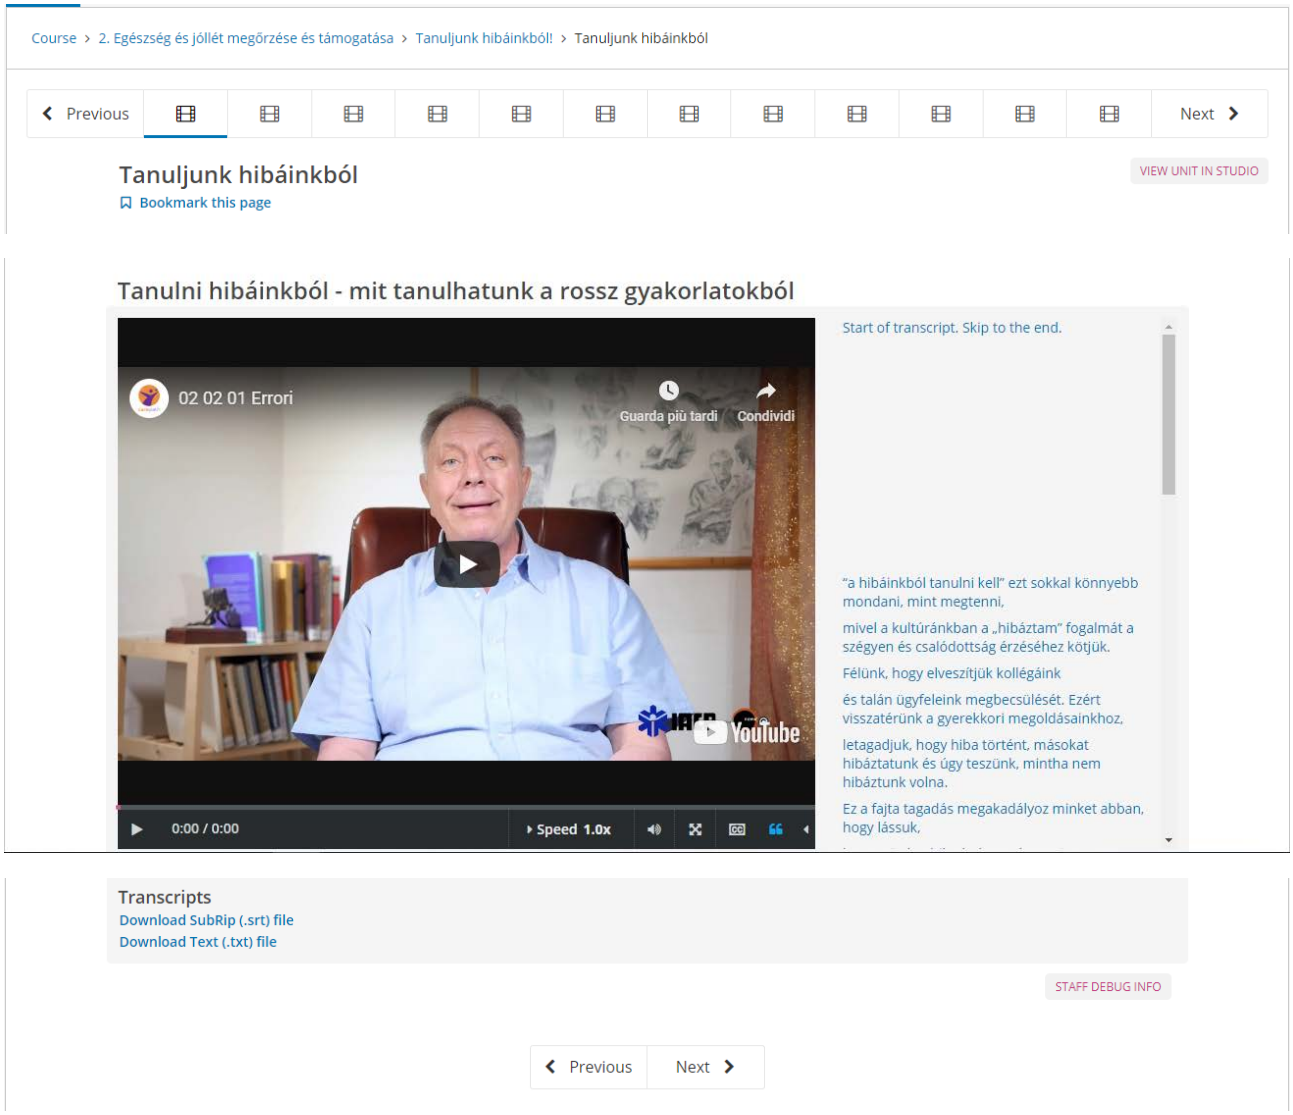
Egy másik gyermek rajzán csak két alakot látunk: mintha egy anya és egy apa lenne életveszélyben, miközben a csónak lángokban áll. (Az eset tényleg megtörtént, valóban kigyulladt egy csónak.) Az apát és az

anyát fekete színű tenger veszi körül, az ég tele van keresztekkel és halottakkal. Láthatjuk, hogy a tenger a halál tengerévé változott.

Egy másik gyermek a lampedusai reptéren sorakozó koporsókon keresztül érzékelte a halált, ilyen képsorokat gyakran mutattak a tévében. Feltűnik, hogy a koporsók különböző színűek és méretűek, a gyerekekéi kisebbek és sötétebbek, és a tenger is nagyon sötét.

Ez egy másik rajz, melyen megjelenik a szorongás, azonban kevésbé intenzív és erőteljes formában. Lehetséges, hogy a családban korábban is felmerült már a halál témája, és az, hogy egy család elveszthet egy gyermeket. Itt a halál személyesebb és egyben katartikusabb formát ölt. Az égen angyalok és csillagok láthatók, mintha ezekké alakulnának azok, akik eltávoztak.

A rajzokon keresztül láthatóvá vált az a narratíva, melybe az egyes gyerekek a tapasztalataikat rendezték. Míg magát az eseményt kollektíven élték át, mindenki különféleképpen, egyedien érzékelte a történéseket. Fontos volt, hogy ne ajánljuk fel az azonnali vigasz elemeit, hanem megengedjük a gyermekeknek, hogy megtalálják személyes megoldásaikat a rajzbéli, beszédbeli kifejezésen és feldolgozáson, és annak meghallgatásán keresztül, így képesek legyenek választ adni arra, ami egy 6-7 éves gyermek egyik legnagyobb szorongása: a halál és a veszteség miatti félelem.



Transcript

“a hibáinkból tanulni kell” ezt sokkal könnyebb mondani, mint megtenni,

mivel a kultúránkban a „hibáztam” fogalmát a szégyen és csalódottság érzéséhez kötjük.

Félünk, hogy elveszítjük kollégáink

és talán ügyfeleink megbecsülését. Ezért visszatérünk a gyerekkori megoldásainkhoz,

letagadjuk, hogy hiba történt, másokat hibáztatunk és úgy teszünk, mintha nem hibáztunk volna.

Ez a fajta tagadás megakadályoz minket abban, hogy lássuk,

hogy minden hiba bölcsességet rejt.

Akkor, ha megfelelő hozzáállással nem védekezünk, hanem nyitottak vagyunk arra, hogy tanuljunk hibáinkból.

Hibáink tanítóinkká válhatnak és segíthetnek nekünk jobb szakemberekké válni.

Ezt az üzenetet,

hogy tanuljunk hibáinkból, gyakran közvetítjük klienseink felé is.

Egyben humoros és tragikus, hogy mi, segítő szakemberekként arra biztatjuk

klienseinket, hogy tanuljanak hibáikból,

és ezt a hozzáállást sokkal inkább képviseljük feléjük, mint saját magunk felé. Kevésbé vagyunk lelkesek,

ha rólunk van szó, hogy ne védjük magunkat, és valljuk be, hogy hibáztunk,

és mindeközben maradjunk nyitottak a tanulásra.

Kissé ellentmondásos, hogy a hibákhoz úgy viszonyulunk, hogy azok csökkentik önbizalmunkat, miközben annak,

hogy tanulunk a hibáinkból, növelnie kéne azt.

Hasonlóképpen, akik félnek, gyávának hiszik magukat, pedig akik bátrak, azok is félnek,

csak ez nem tántorítja el őket a cselekvéstől; a bölcsek pedig elfogadják ha hibáznak és tanulnak belőle.

Tanulhatnánk a klienseinktől, ők gyakran sokkal készségesebbek, alázatosan elfogadják hibáikat

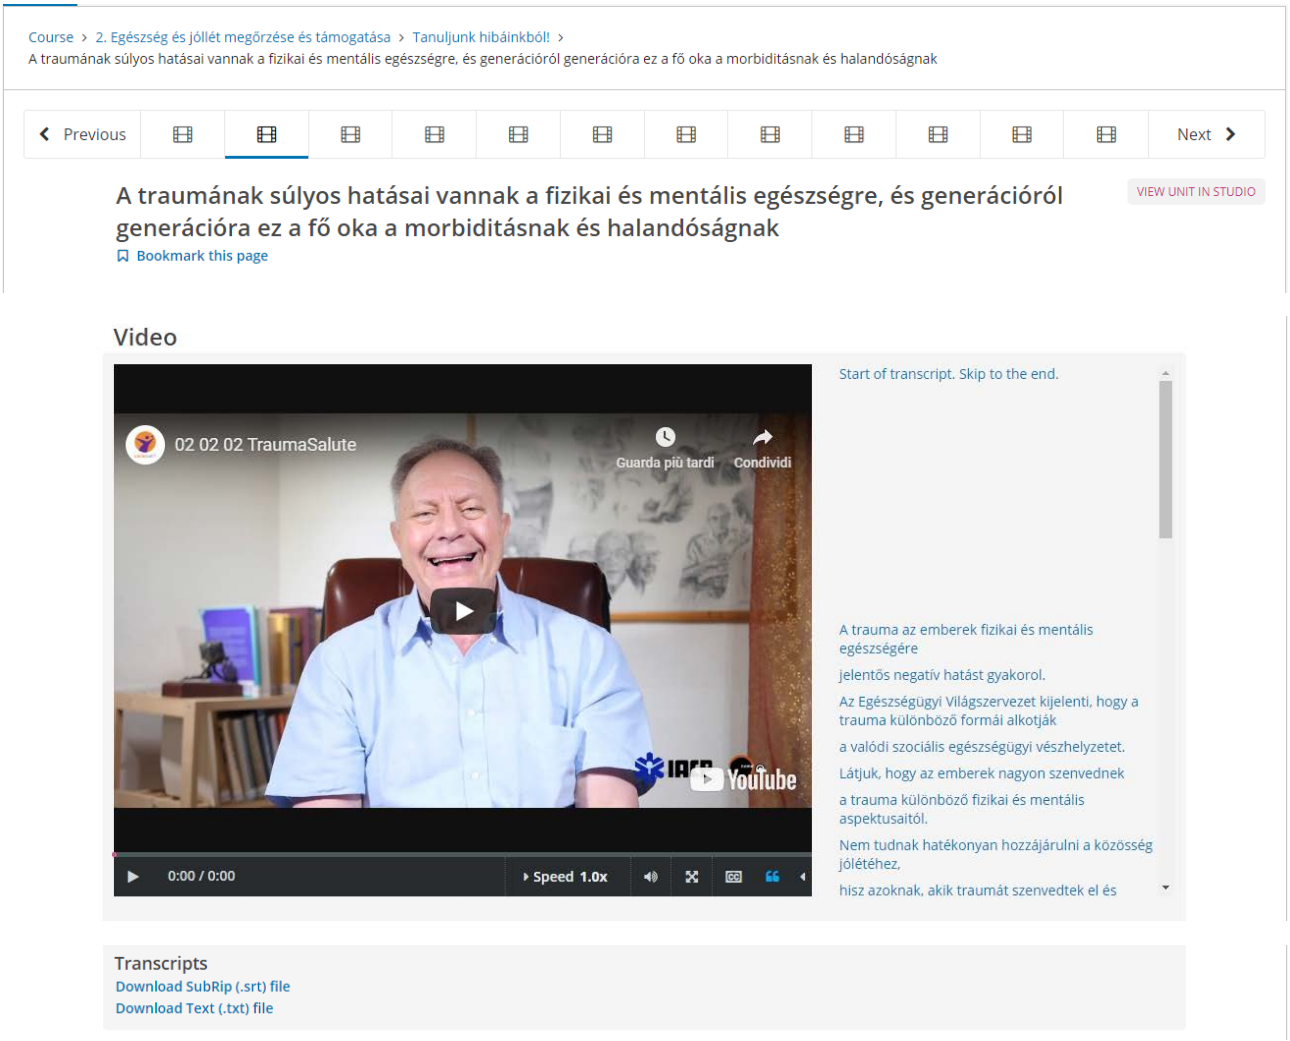
és tanulnak belőlük, megpróbálják legközelebb nem újra elkövetni azokat.

Újra és újra ugyanabba a hibába esünk,

ha nem ismerjük el, hogy hibáztunk. Attól félünk, hogy, ha bevalljuk a hibáinkat, akkor áldozatként határozzuk meg magunkat,

és így tehetetlen helyzetbe kerülünk.

Üdvözöljük hibáinkat a bölcsesség mestereiként!



Transcript

A trauma az emberek fizikai és mentális egészségére

jelentős negatív hatást gyakorol.

Az Egészségügyi Világszervezet kijelenti, hogy a trauma különböző formái alkotják

a valódi szociális egészségügyi vészhelyzetet.

Látjuk, hogy az emberek nagyon szenvednek

a trauma különböző fizikai és mentális aspektusaitól.

Nem tudnak hatékonyan hozzájárulni a közösség jólétéhez,

hisz azoknak, akik traumát szenvedtek el és szenvednek annak hatásától, ellátásra van szüksége.

Ez jelentős gazdasági erőforrásokat emészt fel,

és a trauma által az áldozatok azon képessége is sérül,ami által

családjuk, közösségük és nemzetük jólétéhez hozzájárulhatnak.

Egy másik fontos jelenséget is megfigfyelhetünk a trauma áldozatainál:

nem csak az áldozat fizikai

és mentális egészsége romlik, de gyakran,

főleg a trauma bizonyos típusainál (mint például fizikai és szexuális erőszak áldozatainál)

nagy a valószínűsége annak, hogy ők maguk válnak elkövetőkké, és ők maguk traumatizálnak aztán más embereket.

Az áldozatból elkövetővé válás borzalmas, ami alapján mondjuk hogy a trauma olyan, mint egy vírus,

amely terjed, ha nem küzdenek ellene, nem kezelik és nem előzik meg hatékonyan a közösségben: valódi járványként működik.

A járvány egyénről egyénre fertőz,

és gyorsan elterjed a lakosság körében, ami nagy emberi veszteségekhez

vezet.

A bio-pszichoszociális megközelítés esetén, nem tolhatjuk a trauma

megelőzésének és kezelésének felelősségét egyedül az egészségügyi szektorra.

Politikai feladatról lévén szó minden intézménynek: családoknak, iskoláknak, szakszervezetnek,

a fiatalkorúak igazságszolgáltatási rendszerének és a jogszabályoknak is érzékennyé kell válnia ezekre a problémákra,

és részesévé kell válniuk a hatékony megelőzési és gyógyítási hálózatnak.

Ez mindenki érdeke és mindenki jólétét szolgálja.

Foglalkozunk a trauma átható-képességével: egyértelműen elmondható,

hogy a trauma kihat a közösségre és a társadalomra egyaránt.

Korábbi, traumával foglalkozó tanulmányok inkább a trauma élességére

és bizonyos fontos események feltárására koncentráltak.

Idővel a trauma fogalma kiterjedt, és már sok egyéb aspektust is magába foglal.

Társadalmunkban a trauma mindent áthat:

kutatásokból tudjuk, hogy egy felnőtt élete során vagy már átélt, vagy át fog élni a jövőben

legalább egy traumatikus eseményt.

Néhány tanulmányból, mint például a Benguet részletes tanulmányából

megtudtuk, hogy ugyan nagy a változatosság abban, hogy milyen traumáról van szó,de világ összes országában

rendkívül magas az emberek által átélt trauma aránya.

Ezért fontos tudnunk, hogy jelenleg milyen tényezők védik az embereket a traumáktól,

és mi növeli a traumának való kitettséget.

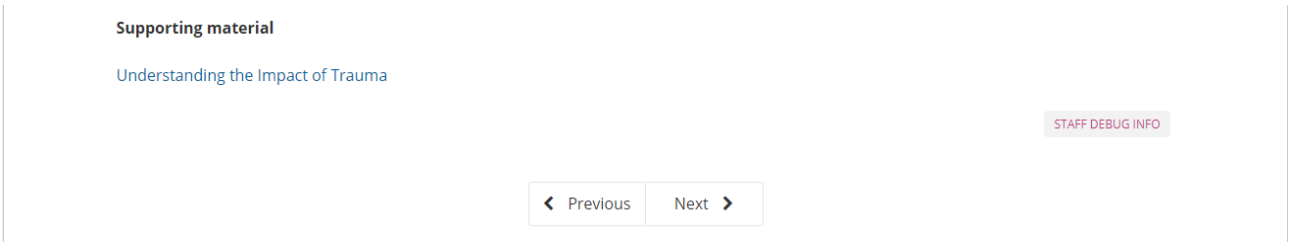
Tanulmányokból tudjuk, hogy sok, a gazdaságra és a közegészségre mérhető hatással bíró krónikus betegség gyökerezik valamilyen traumában.

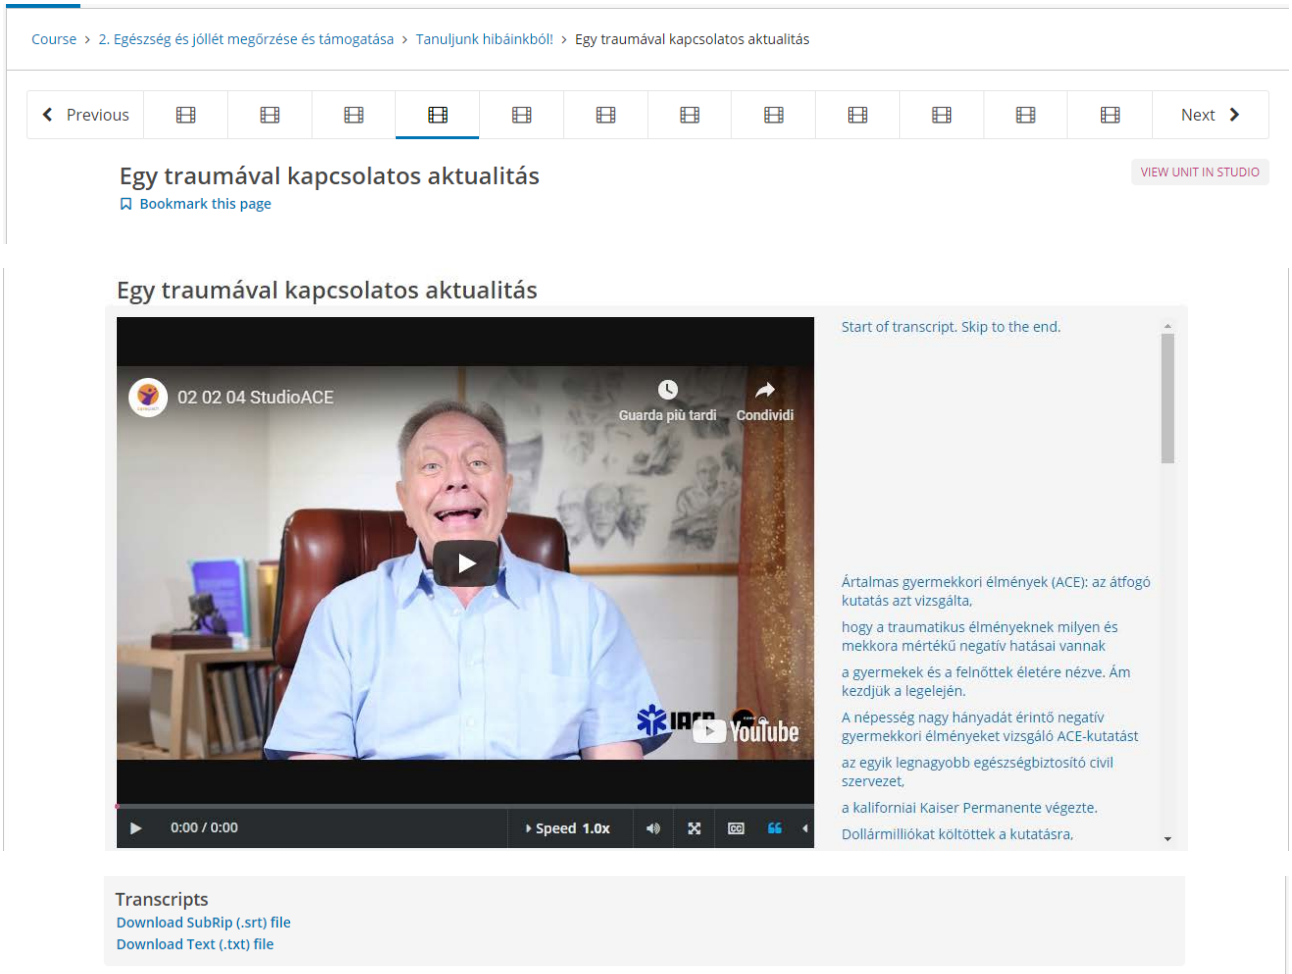
A legrosszabb mégis az, hogy a trauma hátráltatja az egyén abban,
hogy megvalósítsa belső lehetőségeit, és ezáltal tudatos,
teljes értékű tagjává váljon a közösségnek és a társadalomnak, amelyben él.

A trauma még fontosabb, ha figyelembe vesszük azokat a traumákat,melyek a pszichológiai fejlődés azon érzékeny időszaka során merülnek fel,
amikor az ember érzelmi és
szociális készségei kifejlődnek.

A trauma erőteljesen befolyásolhatja ezen képességek fejlődését,
súlyosan megnehezítve
az egyén jövőbeni fejlődését.

Ezért létfontosságú ma, hogy elmélyítsük a traumáról való tudásunkat,
és hogy tisztában legyünk a témával, mint ahogy azt ebben a képzésben is tesszük.





Transcript

Ártalmas gyermekkori élmények (ACE): az átfogó kutatás azt vizsgálta,

hogy a traumatikus élményeknek milyen és mekkora mértékű negatív hatásai vannak

a gyermekek és a felnőttek életére nézve. Ám kezdjük a legelején.

A népesség nagy hányadát érintő negatív gyermekkori élményeket vizsgáló ACE-kutatást

az egyik legnagyobb egészségbiztosító civil szervezet,

a kaliforniai Kaiser Permanente végezte.

Dollármilliókat költöttek a kutatásra,

amely az egész tudóstársadalom javára válik, mivel már most sokkal többet tudunk erről a témáról, és a megismételt kutatások is bizonyították az eredeti adatokat:

átlagosan a társadalom harmadát - tehát minden harmadik embert - ért gyermekkora során

valamilyen káros élmény vagy trauma.

Valamivel kevesebben vannak azok,

akiket kétfajta trauma ért,

és még kevesebben azok, akiket kettőnél több trauma ért gyermekkorában.

Minél több trauma ér egy embert, annál jobban fog szenvedni a negatív következményektől.

Akár egy késszúrás: már egy szúrás is rettenetesen fáj, nem hogy több.

A traumák rosszabbak, mint a heget hagyó késszúrások,

mert nem csak hogy az áldozat fizikai és mentális állapotára nézve járnak negatív következményekkel,

hanem akár vírusnak is nevezhetnénk őket,

amelyek miatt

a főleg erőszak, szexuális bántalmazás, stb. áldozatai

könnyebben válhatnak maguk is elkövetővé.

A mentális és fizikai problémákról sokszor elhangzott már,

hogy összefüggésben állnak. Mit is jelent ez?

Azok az emberek, akik valamilyen traumát éltek át, ösztönösen próbálnak azzal megbirkózni.

Az elején lehet, hogy hatásos ez a fajta traumakezelés,

de hosszú távon ára van. Egyesek például

annak reményében, hogy kezelni tudják az átélt trauma hatásait,

alkoholhoz vagy kábítószerekhez nyúlnak,

ami aztán további problémákhoz vezet:

a helyzet még súlyosabbá válik, fennáll annak veszélye, hogy alkoholistává vagy drogfüggővé válnak.

Ami a viselkedést illeti, köztudott, hogy az áldozat ilyenkor kerüli a kapcsolatot másokkal, elszigeteli magát,

így „nem tud feltöltődni”. A nemi élet is háttérbe szorul. Röviden

elmondható, hogy a káros gyermekkori élmények valós és igen költséges társadalmi terhet jelentenek,

mivel a kezelés és ellátás rendkívül drága. Ezért mindenkinek érdeke, hogy megelőzzük,

vagy legalábbis hatékonyan kezeljük a gyermekkor során átélt traumákat.

Ez nem csak

az áldozatoknak jó, hanem a társadalomnak is.

Mit jelent az, hogy „traumatudatos"? Annyit, hogy tudatában lenni a traumának. Ez egy olyan szemlélet,

aminek a fő célja az újratraumatizáció megelőzése, és olyan szolgáltatások és ellátási struktúrák létrehozása,

amelyek csökkentik az újratraumatizáció veszélyét, és maximalizálják a hatékony szolgáltatásnyújtás lehetőségét.

A traumatudatos gyakorlat fontosságának felszínre jutásában nagy szerepe volt a

múltban elkövetett hibák iránti nyitottságnak és tudatosságnak. Ezeket a hibákat

természetesen nem szándékosan követtük el, hanem tudatlanságból,

mivel akkor még nem tudtuk,

hogy a kínált kezelések bizonyos aspektusai a probléma, és nem a megoldás része voltak:

például amikor azt erőltettük, hogy a kliensek az akaratuk ellenére felidézzék és újra átéljék

a múltbeli traumáikat, stb.

Ma már, köszönhetően mindannak, amit a múltbéli hibákból tanultunk,

új irányelvekre támaszkodhatunk,

amelyek összetevői segítenek nekünk megelőzni a károkozást és maximalizálni a nyújtott szolgáltatás

jótékony hatását.

Ez nem csak az egészségügyre, a mentális egészségre vonatkozik,

hanem az intervenciók minden területére:

pl. iskolák, szervezetek, a fiatalkorúak igazságszolgáltatása,

sőt, még a törvényekre is. A traumatudatos iskola olyan iskola, ami

érzékeny a traumával kapcsolatos problémákra, és ahol a tanárok tisztában vannak vele, hogy egy rossz magatartású diák

nem feltétlenül szimplán rossz, hanem esetleg valamilyen traumából fakadó diszkomfortot fejez ki,

és így pl. beajánlhatja az iskolai pszichológushoz, hogy a diák

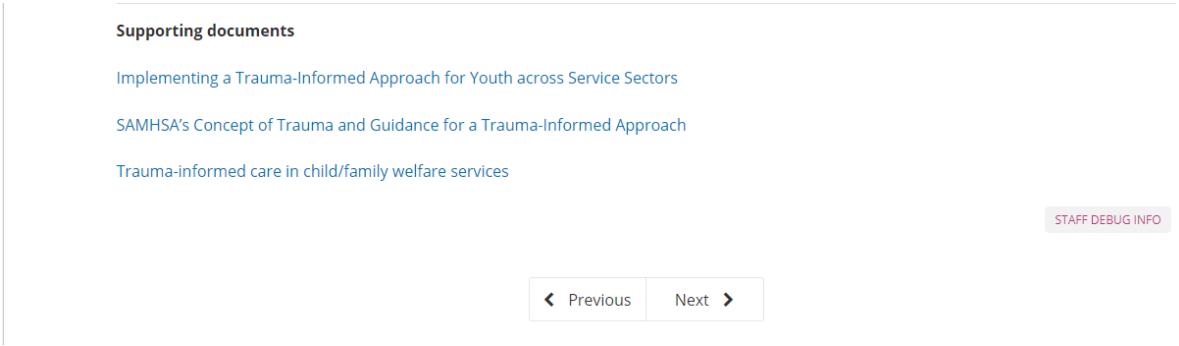
segítséget kapjon, ha szüksége van rá, megelőzve ezzel, hogy a probléma még nagyobbá váljon.

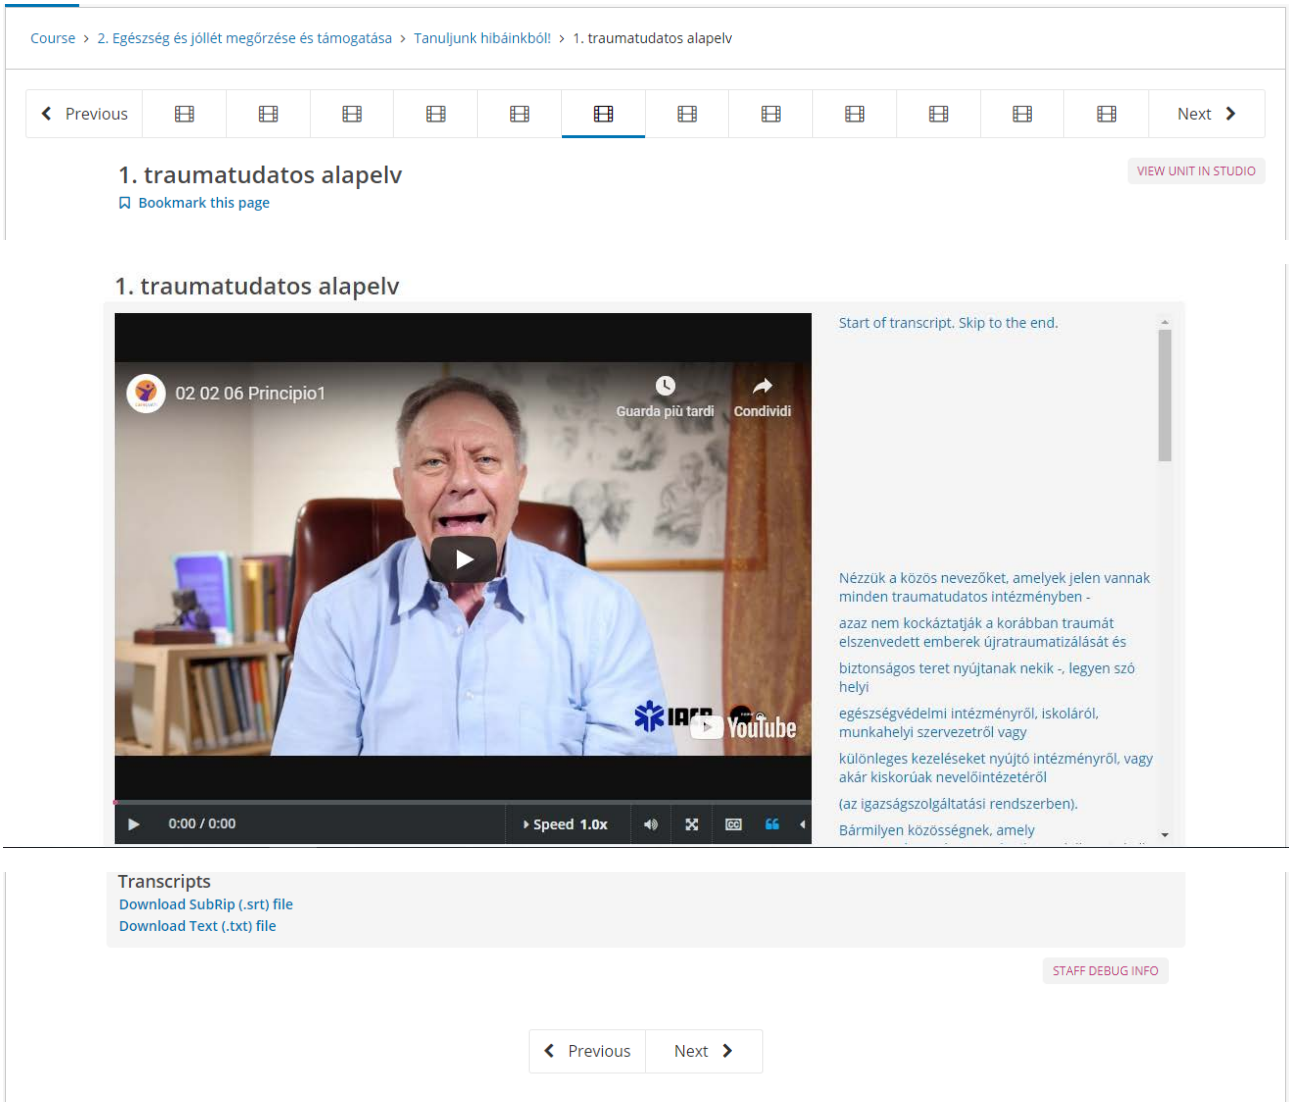
A traumatudatos szemlélet tehát nem csak kötelesség etikai, klinikai és

mentális egészségügyi szempontból, hanem költséghatékony is:

a károkat minimalizáló kezelések nem csak az áldozatok, hanem

a szélesebb társadalom javát is szolgálják.





Transcript

Nézzük a közös nevezőket, amelyek jelen vannak minden traumatudatos intézményben -
azaz nem kockáztatják a korábban traumát elszenvedett emberek újratraumatizálását és
biztonságos teret nyújtanak nekik -, legyen szó helyi
egészségvédelmi intézményről, iskoláról, munkahelyi szervezetről vagy
különleges kezeléseket nyújtó intézményről, vagy akár kiskorúak nevelőintézetéről
(az igazságszolgáltatási rendszerben).
Bármilyen közösségnek, amely traumatudatosságra törekszik, rendelkeznie kell
ezekkel a közös nevezőkkel.
Ezeknek az alapelveknek a célja, hogy kommunikálják
és biztosítsák a traumatizált személy részére,
hogy pszichésen és fizikailag is teljesen biztonságban érezze magát,
hogy ez egy megbízható, biztonságos tér.

A traumatudatosság első alapelve az, hogy az adott intézménynek biztosítania kell egy olyan fizikai és érzelmi biztonságot, amiben az illető megbízhat, amire támaszkodhat, és azt érezheti, hogy semmi rossz nem fog történni, senki nem fogja megtámadni, bántani. Hogy egy olyan biztonságos helyen van, ahol nem kell folyamatos készültségben, szorongásban léteznie.

A traumatudatos intézményben a kommunikáció minden aspektusa kedves, kényelmes, a metakommunikációt is beleértve; a klienst szívesen látják, és mindenki szívélyesen üdvözli, és érezteti vele, hogy szívesen látják.

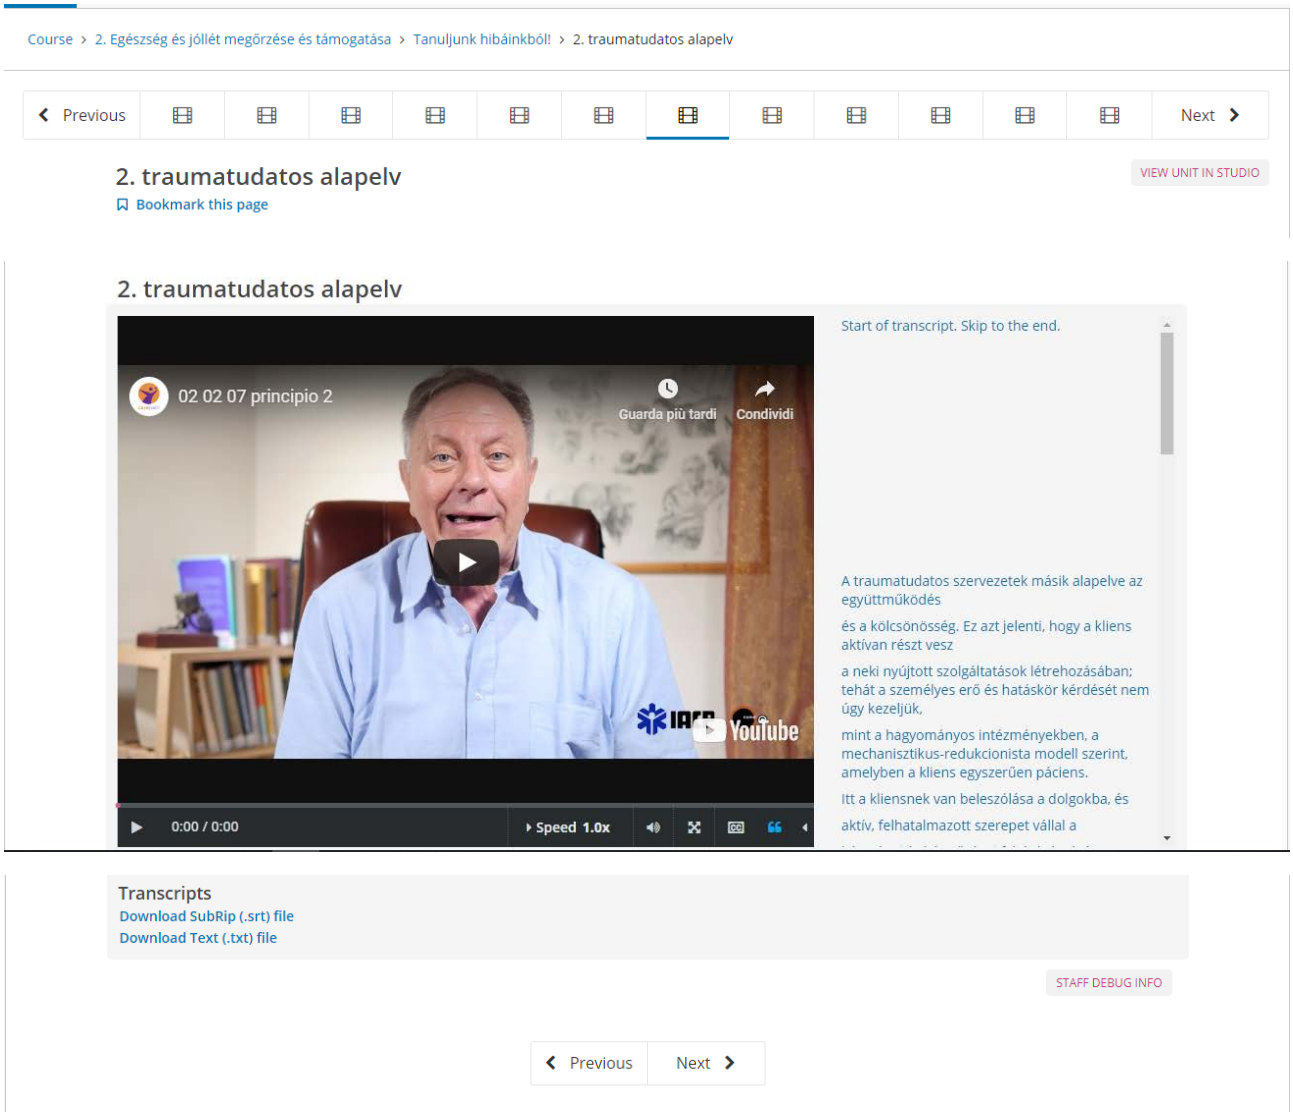
Az intézményben ahhoz, hogy az elnyerje a kliensek bizalmát és biztonságérzetet nyújtson számukra, nagy fokú integritásnak kell jelen lennie, és a közvetített üzeneteknek mindig összhangban kell lenniük a cselekedetekkel.

A kliens csak így tud valódi bizalmat kifejleszteni, és azt érezni, hogy az intézmény valóban szívesen látja, és hogy az egy olyan biztonságos hely, amelyre támaszkodhat.

A traumatudatos intézményben nincs helye az erőszaknak, a szégyennek, bűntudatnak és más problematikus dolgoknak, amik csak ronthatnak a kliens állapotán vagy újratraumatizálhatják.

Egy traumatudatos intézmény a szakmai titoktartást is garantálja: hogy a klienssel kapcsolatos bizalmas, érzékeny információkat nem oszt meg másokkal.

Végezetül pedig a traumatudatos intézmény egyértelmű, könnyen érthető nyelven kommunikál a klienssel, amit az könnyen megért, nem pedig olyan szakmai nyelven, amit csak képzett szakemberek értenek.



Transcript

A traumatudatos szervezetek másik alapelve az együttműködés

és a kölcsönösség. Ez azt jelenti, hogy a kliens aktívan részt vesz

a neki nyújtott szolgáltatások létrehozásában; tehát a személyes erő és hatáskör kérdését nem úgy kezeljük,

mint a hagyományos intézményekben, a mechanisztikus-redukcionista modell szerint, amelyben a kliens egyszerűen páciens.

Itt a kliensnek van beleszólása a dolgokba, és

aktív, felhatalmazott szerepet vállal a

készségei és lehetőségei feltárásának és visszaszerzésének folyamatában.

A traumatudatos szervezet támogatja

az öntisztelet visszaszerzését,

ami a traumaáldozatok esetében rendkívül fontos,

ahogy a remény és

a személyben rejlő lehetőségek tudatának visszaszerzése is.

Az ilyen intézmény tisztában van azzal, hogy

a poszttraumás stresszel élő emberek esetében az egészség és a

működőképes élet visszaszerzése

csak a szervezet munkatársai és a kliens között kialakított

jól működő kapcsolatok által lehetséges:

tehát csapatmunka, hatékony együttműködés által.

A döntéshozatali folyamat megosztása a klienssel központi fontosságú abban,

hogy a nyújtott szolgáltatások valóban hatékonyak lehessenek.

Karasek kutatásaiból tudjuk, hogy a stressz úgy működik,

hogy ha stresszes impulzusok érnek, de ugyanakkor kellő mértékben irányítani tudjuk a dolgokat,

a stresszszint lecsökken;

ám ha kicsi a beleszólásunk a helyzet alakulásába, a stresszszint megemelkedik. Itt is

ezzel az alapelvvel dolgozunk.

Tehát az, hogy a döntéshozás erejét a kliens kezébe is adjuk, már önmagában a kezelési-gyógyulási folyamat

része; más szóval, a több irányítási lehetőséggel rendelkező

ember jobban képes felülkerekedni a nehézségein.

A traumatudatos szolgáltatásokra törekvő intézmény nem támogatja

a nagy hatalmi különbségeket az intézmény munkatársai

és a kliensek között, hanem aktívan és tudatosan a kliens megerősítésére törekszik

és elismeri a jogát arra, hogy önrendelkezően irányítson és személyes erejét gyakorolja

a közös valóság együttes létrehozásának folyamatában.

A traumatudatos intézmény rendszerszinten és holisztikusan gondolkozik abban az értelemben,

hogy tisztában van azzal, hogy

a traumatudatosság létrehozásához

az intézmény minden szintjét és részét be kell vonni,

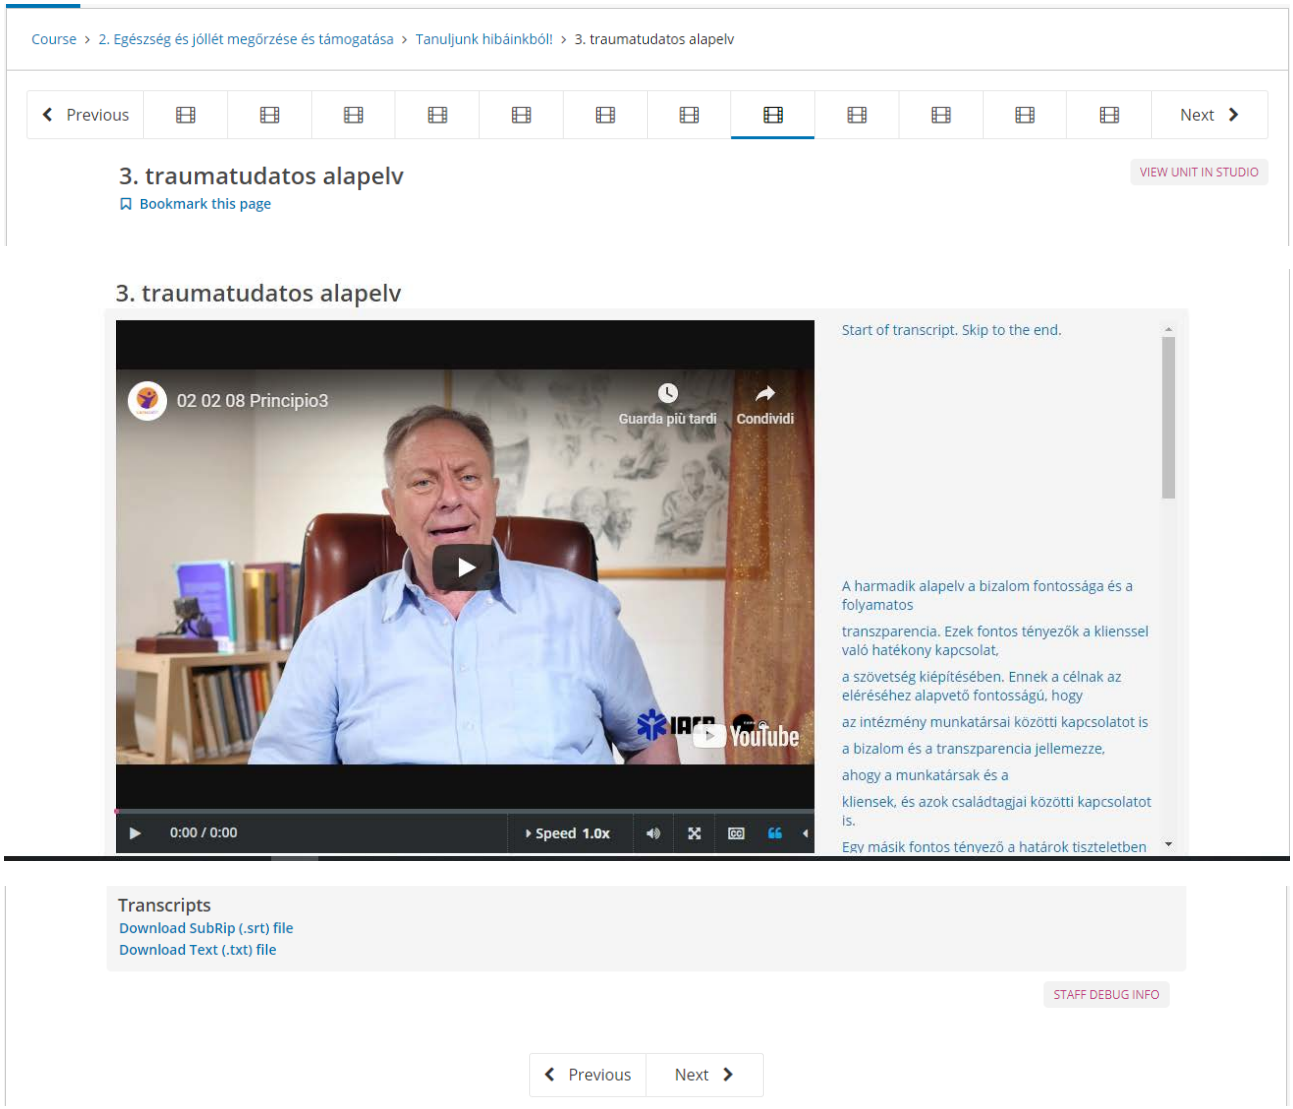
a kezdetektől a folyamatok végéig:

a kliensek felvételének kezdetétől, a fogadástól

kezdve a kezelést végző személyeken át

a kezelés utáni jó funkcionálást biztosító

utógondozási szakaszig.



Transcript

A harmadik alapelv a bizalom fontossága és a folyamatos
transzparencia. Ezek fontos tényezők a klienssel való hatékony kapcsolat,
a szövetség kiépítésében. Ennek a célnak az eléréséhez alapvető fontosságú, hogy
az intézmény munkatársai közötti kapcsolatot is
a bizalom és a transzparencia jellemezze,
ahogy a munkatársak és a
kliensek, és azok családtagjai közötti kapcsolatot is.
Egy másik fontos tényező a határok tiszteletben tartása, mivel elsősorban
az egyértelmű határok által tudunk tiszta bizalmi teret létrehozni. A határok
tiszteletben tartásának hiánya megmérgezi a környezetet és diszfunkciót teremt.
A transzparencia alapvető fontosságú, ezért a szabályoknak egyértelműeknek kell lenniük,
és bürokratikus nyelvezet helyett érthető, transzparens nyelven kell őket megfogalmazni.

Az egyértelműség amiatt is

fontos, hogy mindenki - főleg a kliens – tudja, hogy mi a szerepe,

mik a jogai és kötelességei, mik az intézmény és a vele dolgozó

munkatársak jellemzői.

Tehát a szerepeknek is tisztáknak kell lenniük, és észben kell tartani, hogy az intézményben dolgozó

különböző szakemberek különböző készségekkel rendelkeznek,

a kezelés más-más részeivel foglalkoznak, és senki nem

foglalkozik mindennel egyszerre. Ahogy a pék a kenyeret süti, a tehenész

tejet termel, a mérnök műszaki terveket készít, stb.

Alapvető fontosságú még a traumatudatos intézményben a jogok tiszteletben tartása és a kliens

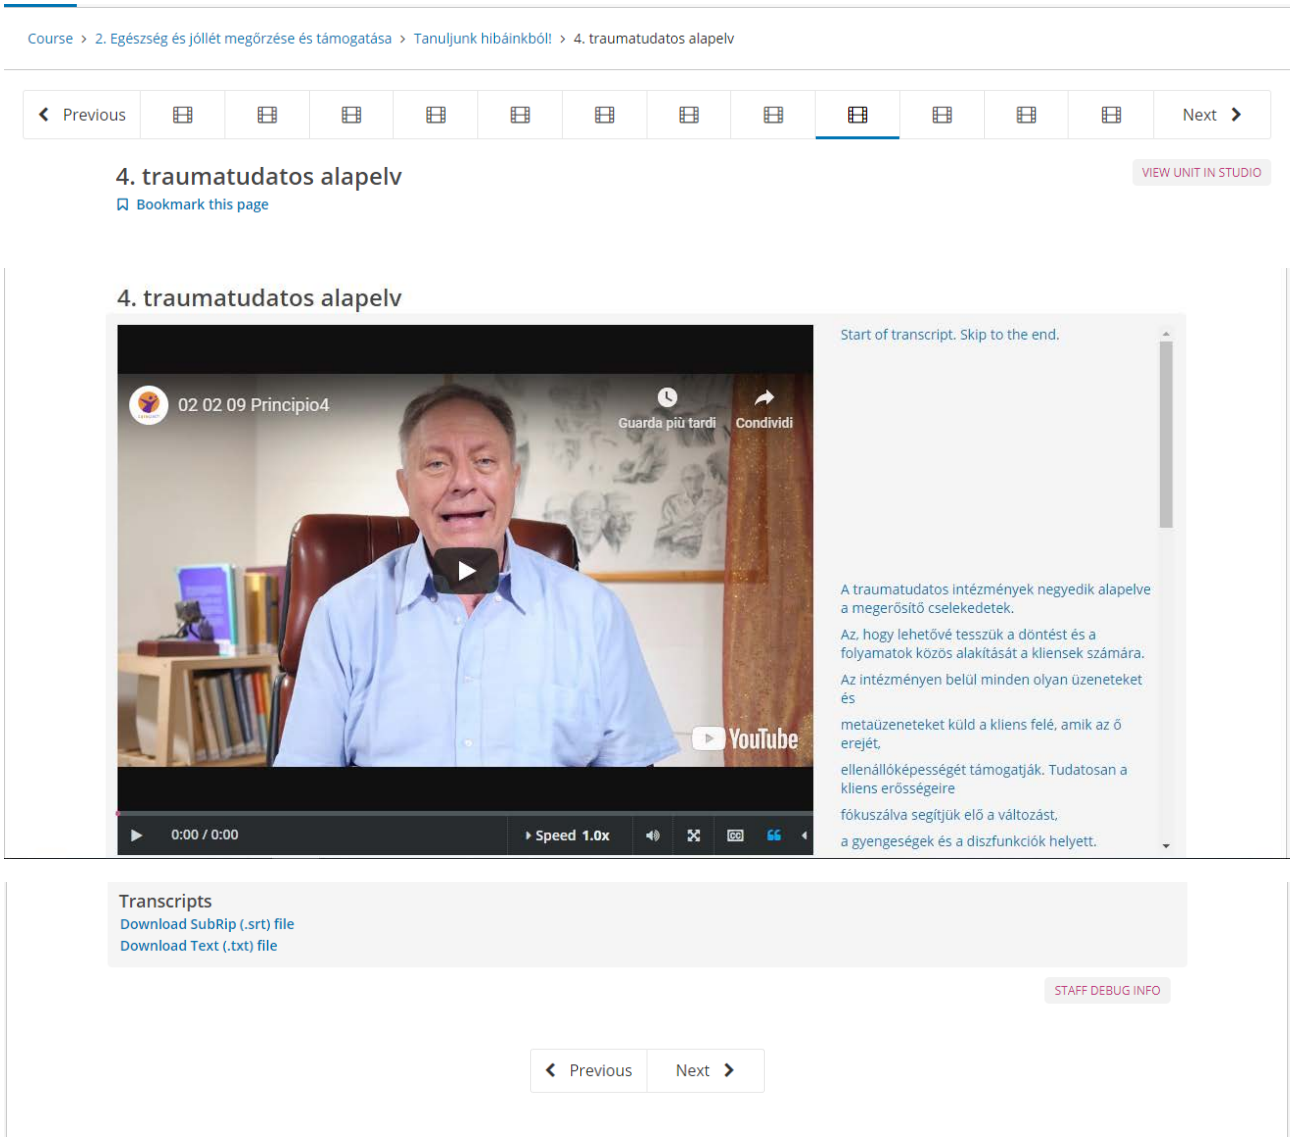
jogainak aktív támogatása. Ezért mindenképpen

ki kell kérni a kliens tájékozott hozzájárulását,

alaposan el kell neki magyarázni, hogy milyen kezelésben fog részesülni, a különböző eljrásokat, a kezelés menetét;

mindent meg kell tenni annak érdekében, hogy valóban megértse és úgy adja a hozzájárulását,

ne pedig puszta formalitásként.



Transcript

A traumatudatos intézmények negyedik alapelve a megerősítő cselekedetek.

Az, hogy lehetővé tesszük a döntést és a folyamatok közös alakítását a kliensek számára.

Az intézményen belül minden olyan üzeneteket és

metaüzeneteket küld a kliens felé, amik az ő erejét,

ellenállóképességét támogatják. Tudatosan a kliens erősségeire

fókuszálva segítjük elő a változást,

a gyengeségek és a diszfunkciók helyett.

A hangsúly a megküzdésen, annak tudatosításán van, hogy

a kliens a múltban hogyan kezelte a különböző

helyzeteket, ha hatékonyan, ha nem.

Azt a filozófiát alkalmazzuk tehát, hogy a kliens

erős pontjaira fókuszálunk. A múltban a fókusz inkább a patológiákon és

azok csökkentésén volt;

most viszont az egészségre, az erősségekre koncentrálunk, és igyekszünk a fejlődésüket, jobbulásukat elősegíteni.

Ez a társadalomban betöltött szerepet is erősíti, és mivel szociális lények vagyunk,

ez alapvető fontosságú a megfelelő identitás kialakításában és a belső lehetőségeink kibontakoztatásában.

Folyamatosan azért a célért dolgozunk,

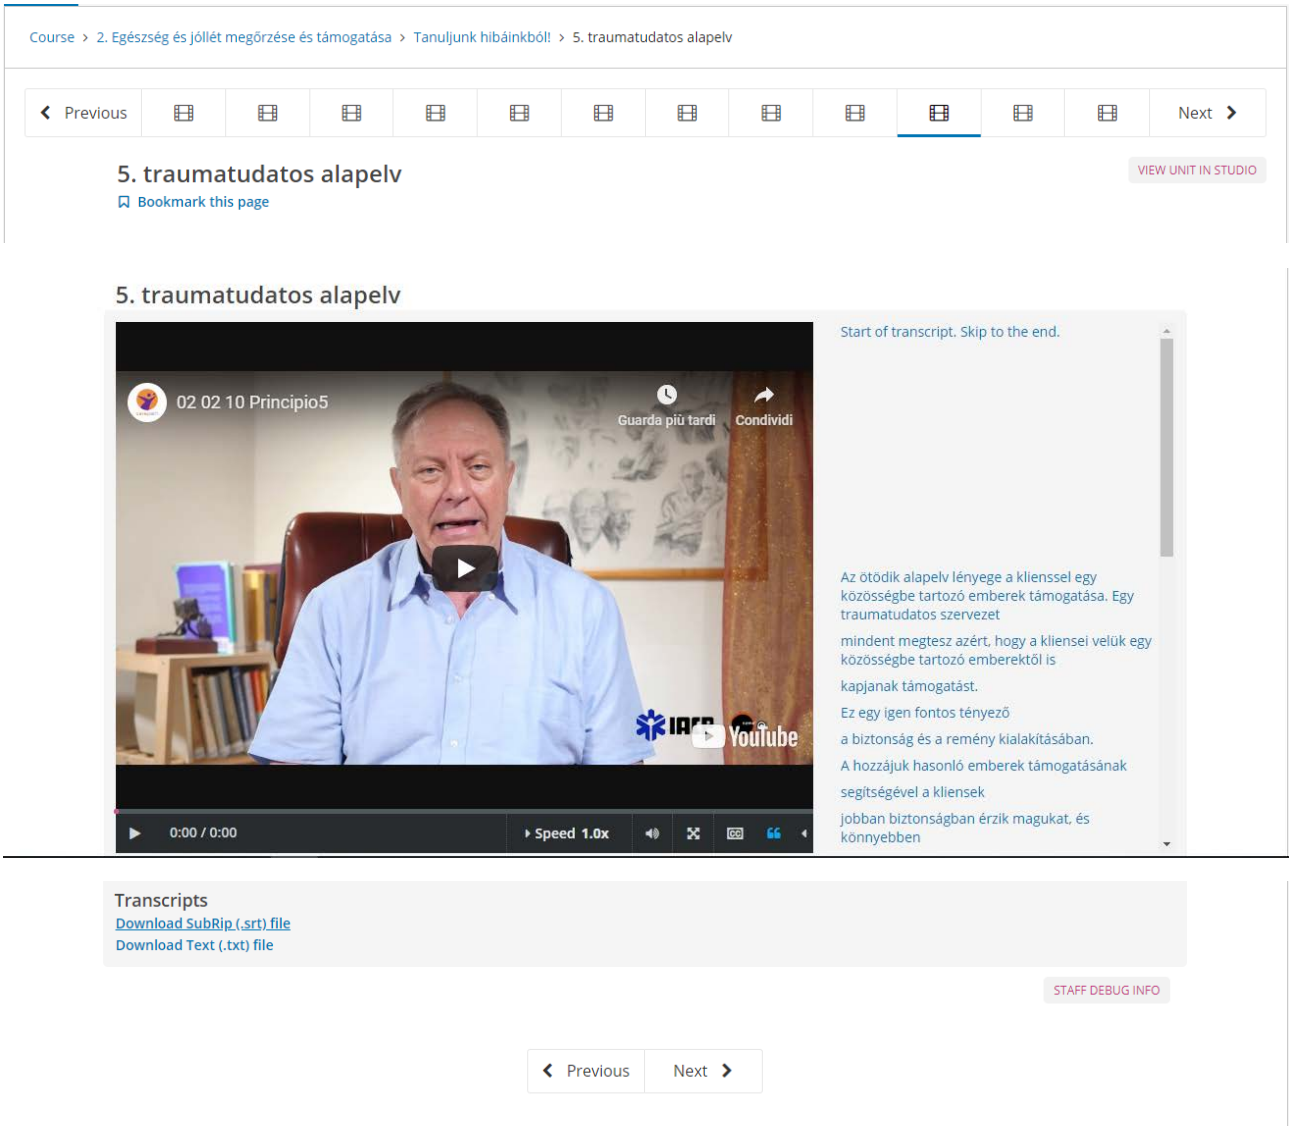
hogy erősítsük a kliens készségeit és önregulációs képességét,

az önállóságát, és önmaga és az élete ellátásának és menedzselésének képességét. Ez a hangsúlyt a

traumatikus élmények utáni továbblépésre helyezi:

nem azt hangsúlyozzuk, hogy ő egy szerencsétlen áldozat,

hanem az ellenállóképességét.



Transcript

Az ötödik alapelv lényege a klienssel egy közösségbe tartozó emberek támogatása. Egy traumatudatos szervezet

mindent megtesz azért, hogy a kliensei velük egy közösségbe tartozó emberektől is

kapjanak támogatást.

Ez egy igen fontos tényező

a biztonság és a remény kialakításában.

A hozzájuk hasonló emberek támogatásának

segítségével a kliensek

jobban biztonságban érzik magukat, és könnyebben

megszületik bennük a remény arra, hogy van javulás.

Az ilyen típusú támogatás fontos a megfelelő önbizalom és magabiztosság kiépítéséhez,

ahhoz, hogy a kliens bízni tudjon magában.

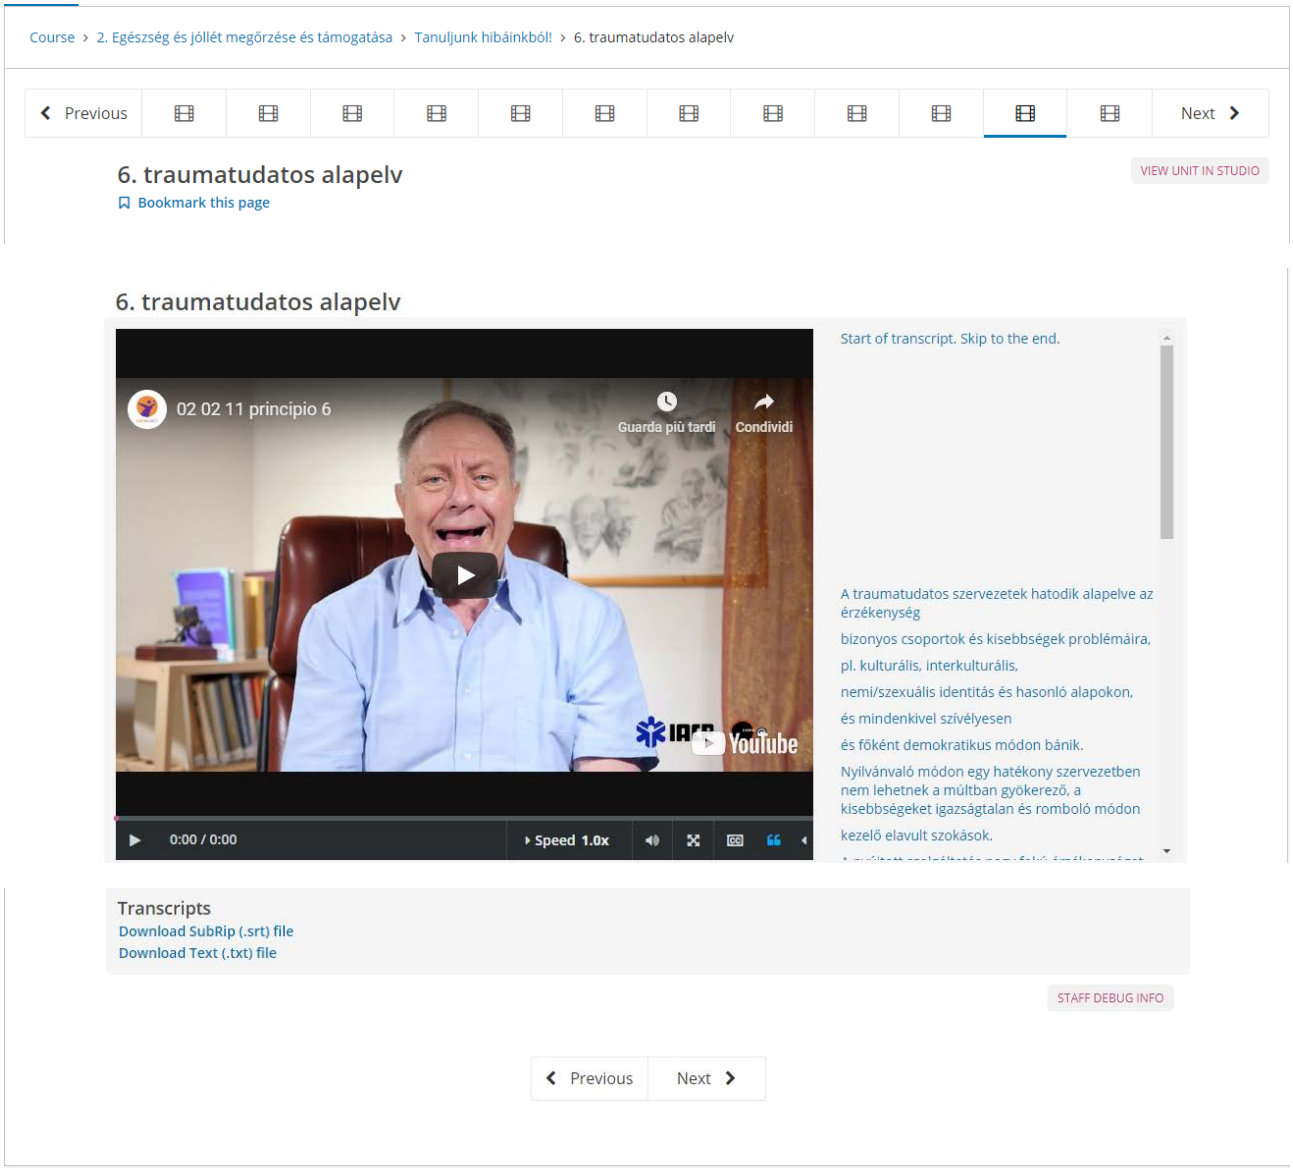
A klienssel egy közösségbe tartozó emberek támogatása elősegíti az együttműködések kialakulását, illetve általában véve a kliens társadalmi beágyazódását és aktivitását.

Egyértelmű, hogy az ilyen típusú támogatás olyan interperszonális kommunikációra teremt lehetőséget, amelynek segítségével támogató narratívák születhetnek:

hogy egy nagyobb háló,

közösség része vagyok, és hogy

van remény a javulásra, gyógyulásra.



Transcript

A traumatudatos szervezetek hatodik alapelve az érzékenység

bizonyos csoportok és kisebbségek problémáira,

pl. kulturális, interkulturális,

nemi/szexuális identitás és hasonló alapokon,

és mindenkivel szívélyesen

és főként demokratikus módon bánik.

Nyilvánvaló módon egy hatékony szervezetben nem lehetnek a múltban gyökerező, a kisebbségeket igazságtalan és romboló módon

kezelő elavult szokások.

A nyújtott szolgáltatás nagy fokú érzékenységet tanúsít

a nemi diverzitás felé,

tiszteletben tartja a nemi egyenjogúságot,

valamint a kliensek kultúrájának és

származási országának kultúráját,

hagyományait.

Az ilyen szervezet a saját filozófiájával harmóniában lévő teret hoz létre:

a szervezet és az eljárások

diszkriminációmentesek és érzékenyek a diverzitásra.

Továbbá képes felismerni és hatékonyan kezelni a történelmi traumákat is.

A történelmi traumák

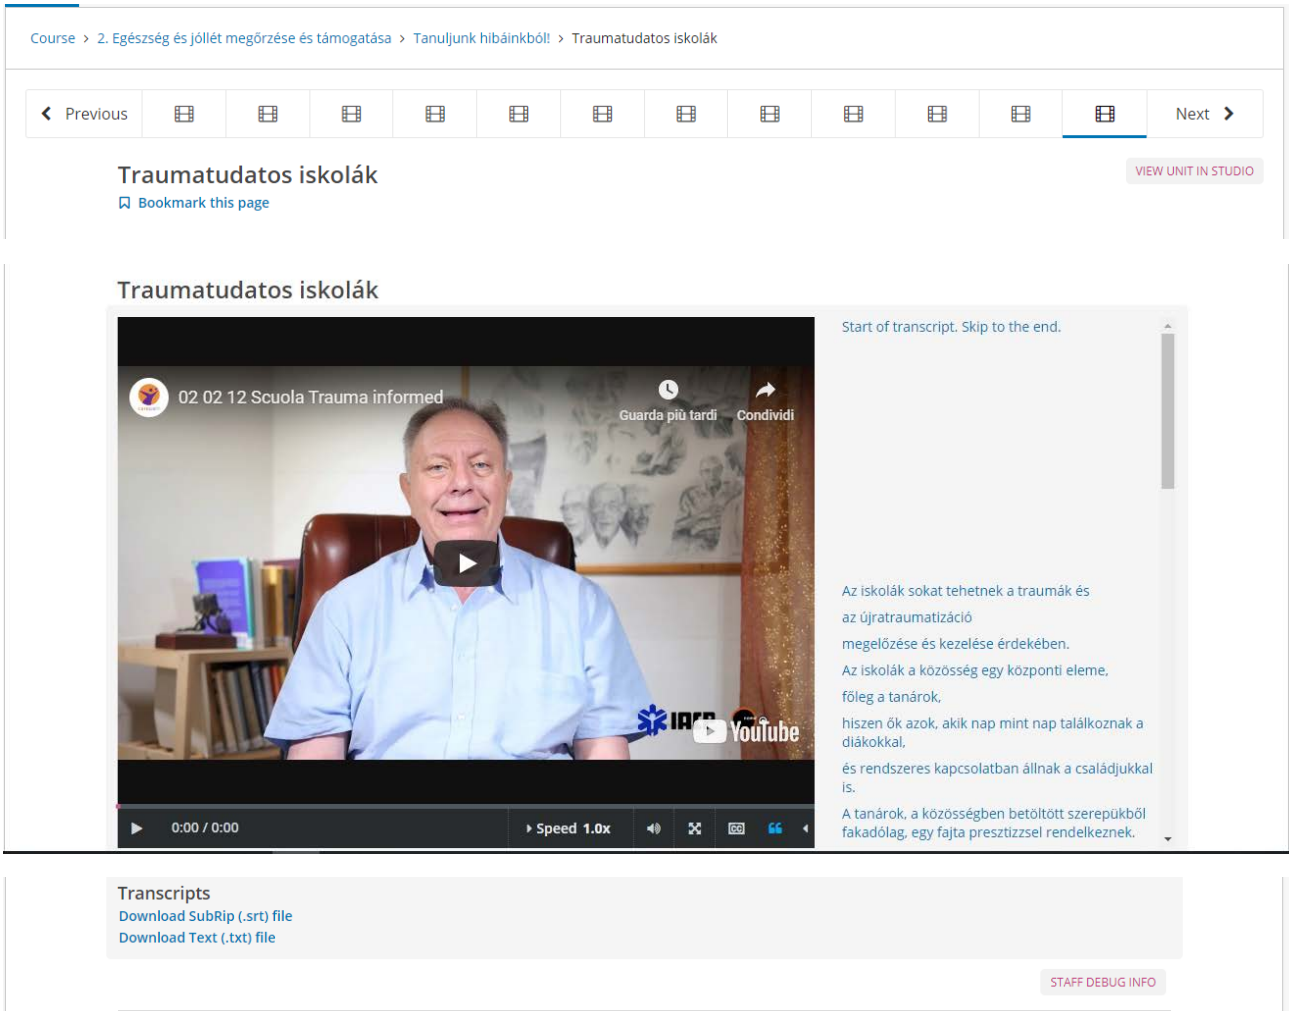
traumatikus közösségi eseményekben gyökereznek, és

azokra is hatással vannak, akik nem élték át őket közvetlenül. Egy drámai példa erre pl. a Holokauszt,

ami nem csak az annak közvetlenül áldozatul esett milliókra hatott,

hanem az ő gyermekeik és unokáik is

viselik az eredeti traumatikus esemény kigyűrűző hatásait.



Transcript

Az iskolák sokat tehetnek a traumák és

az újratraumatizáció

megelőzése és kezelése érdekében.

Az iskolák a közösség egy központi eleme,

főleg a tanárok,

hiszen ők azok, akik nap mint nap találkoznak a diákokkal,

és rendszeres kapcsolatban állnak a családjukkal is.

A tanárok, a közösségben betöltött szerepükből fakadólag, egy fajta presztizzsel rendelkeznek.

Ezért ha a tanárokat és minden iskolai munkatársat

érzékenyítünk és tájékoztatunk a

traumatudatos iskola jellemzőiről, és emellé

egy olyan szakember segítségét és tanácsait

ajánljuk fel számukra, aki segít nekik fejlesztéseket, változtatásokat bevezetni

(annak érdekében, hogy a traumákra vak iskola

traumatudatossá váljon), akkor az az iskola

onnantól kezdve a probléma helyett a megoldás részévé válik.

Nem csak amiatt, hogy az arra

érzékenyített tanárok

észlelni fogják azokat a jeleket,

amiket a megfelelő tudás nélkül pusztán

magatartásbeli problémáknak értelmeznének, hanem mert - traumatudatos tanárként -

a diákjaikat beajánlhatják

a megfelelő szakemberhez, aki

meg tudja állapítani, hogy a diák valóban

szenvedett-e el traumát.

A másik terület, ahol a tanároknak nagy hatása lehet, a szülők.

Lassanként ők is traumatudatos szülőkké válhatnak,

és nagyban hozzájárulhatnak

ennek az egész kérdéskörnek a megoldásához.

Összefoglalva, a traumatudatos iskola

valóban teljesíti az iskolák kitűzött feladatát:

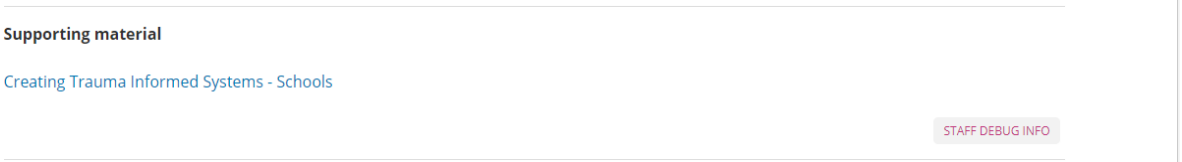
hogy rendelkezzen azzal a tudással és megossza azt,

amellyel a diákok a társadalom proaktív tagjaivá válhatnak.

Tehát a traumatudatos iskola

képes teljes mértékben, a lehető legjobb formában

betölteni az iskola küldetését.



Vannak traumatudatos iskolák az Ön helyi közösségében, vagy az országában?

Bemutatjuk a kiskorúakkal és családjaikkal végzett 20 éves munkánk főbb tanulságait,

amelynek fókusza az erőszakos helyzeteknek kitett,

vagy azokat szemtanúként átélő, bántalmazott, vagy egyéb traumát átélt

kiskorúaknak való segítségnyújtás és intervenció.

E hosszú idő alatt azt szűrtük le, hogy

a tudományos/szakmai tudás mellett a legfontosabb és legszükségesebb

a megfelelő kapcsolat kiépítése annak érdekében, hogy biztonságos környezetet hozzunk létre a gyermek számára.

A biztonságos környezet alappillérei

a szükségeletek figyelmes meghallgatása és a tisztelet.

Ezek még inkább fontosak olyan esetekben, ha a kiskorú

a biztonságérzetét, önmaga tiszteletét és az életbe vetett hitét romboló helyzeteket élt át.

Ilyenkor mindennél fontosabb a mélységes tisztelet ahhoz, hogy a pszichés és személyes fejlődés folytatódhasson.

Mit jelent ez a tisztelet? Ebben a kontextusban a tisztelet nem más, mint a figyelem,

az empatikus figyelem és meghallgatás.

Azt jelenti, hogy a protokollok és a szakember igényeinek priorizálása helyett

a kiskorú belső világára helyezzük

a hangsúlyt: a szükségleteire, a saját tempójára,

amit tiszteletben kell tartani, hiszen sok esetben olyan gyerekekről van szó,

akik erős önvédelmi mechanizmusokat fejlesztettek ki.

Ezért fontos, hogy a szakember ne akarjon

beférkőzni a védelmi határok mögé (kérdések erőltetésével, stb.),

hanem tartsa tiszteletben a gyermek saját tempóját, annak tudatában,

hogy az adott védelmi mechanizmus a gyermek legjobb stratégiája olyan élmények ellen,

amelyek túl erősek voltak a számára. Ezt betartva, lassan haladva a védelmi vonalak egyre kevésbé lesznek szükségesek,

és el fogunk jutni a gyermek szívének, érzéseinek a közepébe.

A tapasztalat azt mutatja, hogy fontos a gyermek szükségleteire fókuszálni.

Most pedig bemutatjuk a Róma tartományban élő kiskorúak és családjaik

körében, megelőzés, védelem és támogatás formájában

80 éve végzett szociális segítségnyújtási munkánk tapasztalatait.

Ahogy az imént is elmlítettük, fontos a gyermek szükségleteire fókuszálni,

ám legalább ugyanilyen fontos és szükséges figyelembe venni azt, hogy

minden helyzet, minden eset más és más. Szintén fontos

tekintetbe venni a gyermek szüleit is. Szociális asszisztensként a mindennapi munkánk

középpontjában elsősorban a szülők állnak, mivel a traumát elszenvedett

kiskorúakkal általában más,

az ő segítésükben megfelelően képzett

szakember foglalkozik.

A szociális munkás feladata, hogy kísérje a családokat

a nehézségeikre, kríziseikre,

törékenységükre való reflektálás folyamatában,

ahogy annak tudatosításában is, hogy mely viselkedéseik okoztak károkat és szenvedést a gyermeküknek.

Segít nekik továbbá kapcsolatokat kiépíteni, hogy támogassa őket a

megfelelő szülői felelősség kifejlesztésében,

amely lehetővé teszi a gyermek számára, hogy

egy nyugodt, biztonságos,

támogató környezetben nőjön fel.

Tapasztalatunk szerint az e területen dolgozó szakembereknek

a feltétlenül szükséges tudományos és szakmai tudáson és képességeken túl

személyes készségekkel, önismerettel is

rendelkezniük kell. Ez a szakember saját

belső világával kapcsolatos: a saját érzései, előítéletei,

benyomásai, projekciói, amik nekünk is vannak.

Hiszen amellett, hogy segítő szakemberek vagyunk,

mi is emberek vagyunk, akik másik emberekkel találkoznak.

Mi történik, amikor bántalmazó

szülőkkel kell dolgoznunk? Ez nehéz lehet számunkra is:

haragot, felháborodást, megotránkozást,

és olykor félelmet érezhetünk; a lényeg, hogy

nem kell úgy tennünk, mintha nem éreznénk ezeket. Ezek

a részünk, és belekerülnek a segítő kapcsolatba is. Ami fontos, az az,

hogy megtanuljuk felismerni őket, hogy kezelni tudjuk őket, hogy ne vigyük bele őket

a helyzetekbe, amikkel dolgozunk. Fontos, hogy ne a szubjektív érzéseinken

keresztül értelmezzük azt, amivel dolgozunk,

ne keverjük össze a szerepeket. Előfordul, hogy a segítő, akin eluralkodnak az érzései, olyan szerepet vesz fel,

amelyben utasításokat ad, és a szülő alárendelődik a szakember döntéseinek.

Ez semmiképpen nem segíti elő a gyermekek védelmét, hiszen

ha nem fókuszálunk teljes mértékben a helyzetre, amivel dolgozunk,

akkor nem tudjuk megérteni és felmérni a gyermek szükségleteit, és megfelelően megtervezni a szakmai intervenciót.

Ami a gyermekkel való közvetlen kapcsolatot illeti, a szociális munkás intervenciós hatásköre

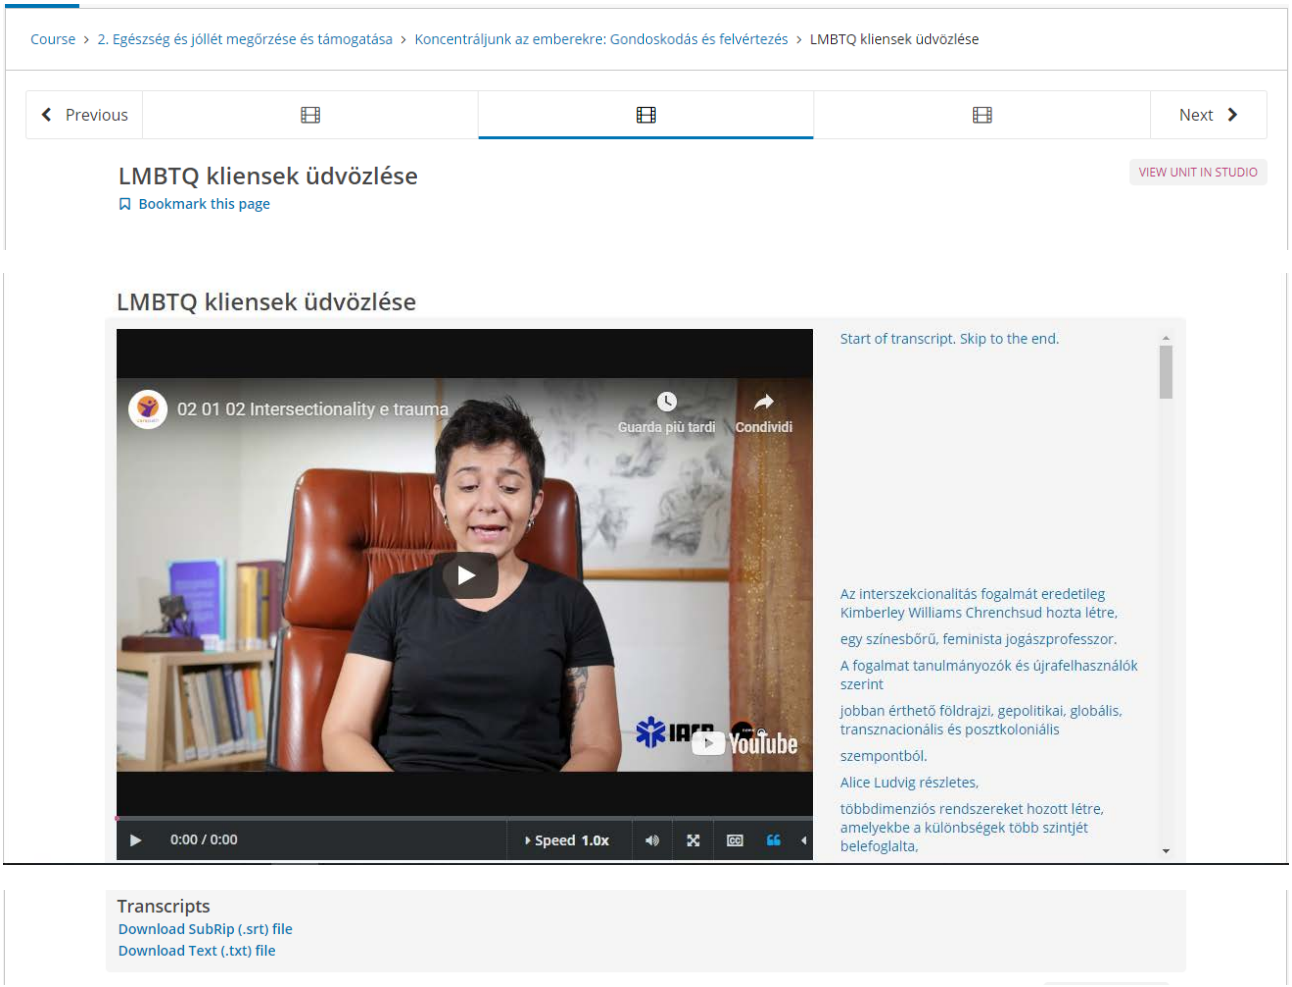
limitáltabb.

Erős érzelmi töltet lehet jelen ezekben a helyzetekben;

előfordulhat, hogy a szociális munkás a saját személyes szükségletére akar azzal válaszolni, hogy gyengédséget és törődést ad

azoknak a gyerekeknek, akiknek nem volt részük ilyenben; máskor pedig lehet, hogy túlságosan

hangsúlyozza a klinikai szaksegítő szerepét, aki klinikailag segít a gyermeknek feldolgozni a traumáit.



Transcript

Az interszekcionalitás fogalmát eredetileg Kimberley Williams Chrenchsud hozta létre,

egy színesbőrű, feminista jogászprofesszor.

A fogalmat tanulmányozók és újrafelhasználók szerint

jobban érthető földrajzi, gepolitikai, globális, transznacionális és posztkoloniális

szempontból.

Alice Ludvig részletes,

többdimenziós rendszereket hozott létre, amelyekbe a különbségek több szintjét belefoglalta,

úgymint a nemi identitás, szexuális orientáció, rassz, bőrszín, etnicitás, státusz, társadalmi osztály, kultúra, stb.

Ez az a számtalan tényező,

amelyet figyelembe kell vennünk és amire oda kell figyelnünk, amikor az általánosságban kisebbségeknek

nevezett csoportokba tartozó emberekkel vagyunk segítői kapcsolatban.

Audre Lorde-t idézve

azt mondhatnánk, hogy az élet

nem csak egyetlen tengely mentén zajlik, hanem többdimenziósan.
A nemzetköziség egyre inkább a része az
egyenlőségi szakpolitikáknak,
hála az ENSZ és az Európai Unió munkájának is.
Egyre több a diszkriminációellenes
irányelv nemzeti, regionális és helyi szinteken egyaránt,
és a nyugati államokban
egyre több vállalat tesz megáévá a diverzitást
figyelembe vevő
szabályzatokat.
Ez persze nem közömbösíti azoknak a bizonytalanságát és szenvedését,
akik többszörösen kisebbségi helyzetben élnek,
és adott esetben épp a kisebbségi státuszuk miatt kellett traumatikus eseményeket átélniük.
Egy 2018. másuj 17-i „napilapban”
egy kameruni fiútól idéznek:
„egyik nap a könyhában ültünk és egy tévéműsort néztünk LMBTQI migránsokról,
amikor az afrikai társaim azt mondták:
- Olaszország egy szar ország, tele homokosokkal -
én pedig ismét nem éreztem magam szabadnak.
Allen 22 éves, és azért hagyta el Kamerunt, mert megverték és démonnak nevezték.
Az újság szerint
Kamerunban
a homoszexualitás bűnnek számít,
ezért kért nemzetközi védelmet Olaszországban.
Ám sajnos ugyanazzal a félelemmel kell élnie,
mivel a homofóbia egészen a bolognai Mattea utcáig követte,
ahol más kameruniakkal együtt fogadták.
Az LMBTQI migránsok igen gyakran igen fiatalok.
Nem számíthatnak
a származási országuk támogatására,
ezért kell útnak indulniuk,
de sokszor megkülönbözteti őket az a homofóbia vagy transzfóbia, amitől menekülnek.

Nem lehetnek benne biztosa, hogy olyan multikulturális helyzetbe fognak kerülni,

ami lehetővé teszi, hogy békésen megéljék a szexuális orientációjukat vagy nemi identitásukat.

Ahogy a Vicenzo Bramato által készített interjúkban többször hangsúlyozták,

aki a bolognai Arcigay közösség elnöke,

egyes európai országokban - pl. Németországban -

léteznek olyan védett intézmények, ahol kifejezetten a szexuális/nemi hovatartozásuk miatti üldözés elől menekülő embereket fogadnak.

Ezeken a helyeken a munkatársak speciális képzést kapnak annak biztosítására,

hogy nehogy ítélkező vagy lealacsonyító hozzáállással közeledjenek ezekhez az emberekhez, ami újraélesztené az áldozaták által átélt stigmát

és traumát.

Olaszországban jelenleg a fogadórendszer nincs felkészülve az ilyen esetekre,

de hálisten vannak pozitív kezdeményezések. Ilyen pl. az a 2017-ben

Modenában indított kísérleti eljárás, ahol egy hat fős lakást hoztak létre

kifejezetten LMBTQI menedékkérők számára,

illetve van egy LMBTQI migránssegítő szolgáltatás Veronában.

Az ilyen LMBTQI migráns gyerekek számára,

akik

még egy érzékeny korban

vannak,

az, hogy egy befogadó országban etnikai kisebbségnek számítanak,

csak része a problémának.

Ők gyakran még a saját származási országukban is

egy félelemben élő, néma kisebbségnek számítanak.

A Rogers által megfogalmazott láthatatlan trauma

így megduplázódik.

Vittorio Lingiardi által megfogalmazott kisebbségi stressz

duplán érinti őket:

így a mentális és fizikai egészségük is duplán veszélyeztetett,

az eredmény pedig humántőke szempontból óriási veszteség.

A fogadó szolgálatokban való munkára felkészítés elsősorban emberi jogi képzést jelent,

amibe beletartoznak

azok a speciális helyzetek és igények is,

amiket az LMBTQI migránsok hoznak magukkal a segítő kapcsolatba.

A képzésnek tehát személyközpontúnak kell lennie,

és ahhoz, hogy igazán befogadó legyen, a szakembernek ismernie kell és pozitívan kell hozzáállnia az ilyen speciális körülményekhez.

Az, hogy a migránsoknak szóló szolgáltatások

tervezésénél és nyújtásánál

nem veszik figyelembe a szexuális orientáció és nemi idetitiás lehetséges sokféleségét,

csökkenti a szolgáltatás hatékonyságát,

mind a klienssel való kapcsolat

(sok olyan gyerek és fiatal van,

akik nem kapnak olyan fogadást, amilyet kapniuk kellene),

mind a képzések és megelőzési utak hasznosságának tekintetében

(pl. gondoljunk a szexuális úton terjedő

betegségekre, vagy arra, hogy

többdimenziósan kell tudnunk kezelni egy esetet,

ha a kliens egy LMBTQI, kamasz korú migráns).

Másrészt viszont azt is fontos megjegyezni, hogy az LMBTQI közösség által

nyújtott szolgáltatások a legtöbbször egy nyugati meleg férfiakon és leszbikus nőkön alapuló kulturális modellel dolgoznak,

ami gyakran

nem veszi figyelembe azt, hogy ezek a fiatalok más kulturális modelleket hoznak magukkal,

és nem tudnak a szolgáltatással azonosulni.

Mindezen okok miatt

az ilyen intézmények és civil szervezetek

által nyújtott információk és segítő szolgáltatások

nem feltétlenül hasznosak az ilyen gyermekek számára.

Az ilyen, többszörösen kisebbségi

státuszú emberekkel való munka

szükségessé teszi az interdiszciplináris reflexiót

a segítő kapcsolatok gyakorlatára. A segítő kapcsolatokra felkészítő, szakembereknek szóló képzéseknek

ki kéne térnie az olyan eshetőségekre, mint a homoszexualitás, biszexualitás, transzneműség;

a stigma a fogalma a pszichiátria és pszichológia történetében;

a homofóbia,

internalizált homofóbia,

valamint a szolgáltatást nyújtóknak folyamatosan

továbbképzéseket kéne nyújtani

az ezekhez a témákhoz kötődő jogszabályi változásokról,

mind a befogadó, mind a származási ország tekintetében.

Végezetül pedig folyamatosan követni kellene

a menedékkérőkkel kapcsolatos

jogszabályi környezet

változásait, mivel

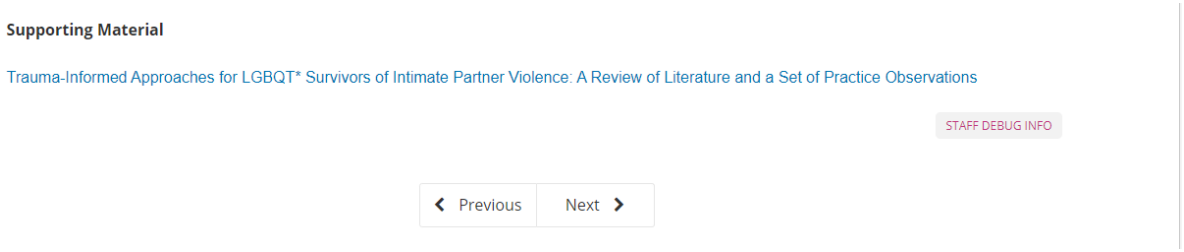
az folyamatosan fejlődik és változik.

A konkrétabb szakmai készségek mellett szükséges személyes szinten is kifejleszteni és elsajátítani egy

olyan szemléletet, ami érzékeny a nemi és szexuális identitások sokszínűségére, és tisztában az emberi jogokkal,

mind az ilyen fiatalokkal dolgozó egyéni szakemberek,

mind a szervezetek számára.



Transcript

A trauma utáni fejlődés arra a jelenségre utal,

amit egyes traumatizált emberek

a trauma eredményeképp átélnek.

Tehát a trauma nem csak jelentős testi és pszichés károkat okoz az

érintettek számára,

hanem emellett létezik ez a jelenség is,

amelyről a traumatúlélők nagy része, ha nem a többsége,

szintén beszámol.

Ez egyértelmű példája az emberi faj rezilienciájának;

habár a bolygónkon kifejlődött

összes életforma

rezilienciájáról is beszélhetnénk.

Ettől függetlenül a trauma tragédiája súlyos hatással van az azt átélőre; nagy csapás lehet,

ami fájdalmat és károkat okoz az illetőnek.

Egy valóságos földrengés, amelynek az utóhatásai

kihatnak az emberre pszichés és fizikai síkon egyaránt.

Ám még az ilyen nagy megrázkódtatásokról is

elmondható, hogy nem kizárólag

romboló hatással rendelkeznek. A trauma által súlytott

embernek meg kell küzdenie az élménnyel,

az az által létrehozott új élethelyzetekkel,

és így az alkalmazkodás által fejlődést is átélhet az élmény hatására.

Az áldozatok egzisztenciális

fejlődésen mennek keresztül, más szóval

nyitottabbakká válnak, szorosabban kapcsolódnak az értékrendjükhöz, a számukra fontos morális és spirituális dimenziókhoz;

jobban jelen vannak az életben, életigenlőbbek lesznek,

és jelentőségtelibben, mélyebben kapcsolódnak

önmagukhoz, másokhoz és a világhoz.

Egy példa: emlékszem azokra az érzésekre, amiket egy

egy kollégám, Victor Frankl könyve olvasása közben éltem át, aki súlyos tragédiát és traumákat élt át:

zsidóként a nácik elfogták

és koncentrációs táborba zárták.

Ezekben a táborokban, mielőtt az embereket megölték, a maradék

emberi méltóságuktól is megfosztották őket. Ám volt néhány ember,

aki nem csak fizikailag élte ezt túl, hanem az összes tauma ellenére

pszichésen is; és jobb emberekké váltak. És ahogy Frankl leírja,

„Az ember az értelemre irányuló kérdéssel szemben” c. könyvében, a hozzá hasonló foglyok mindent megtettek,

a saját kevés kis élelmüket is odaadták azért,

hogy szerető gondoskodást nyújtsanak

a náluk szerencsétlenebb foglyoknak, akik, mivel betegek vagy gyengék voltak, jobban ki voltak téve a veszélynek,

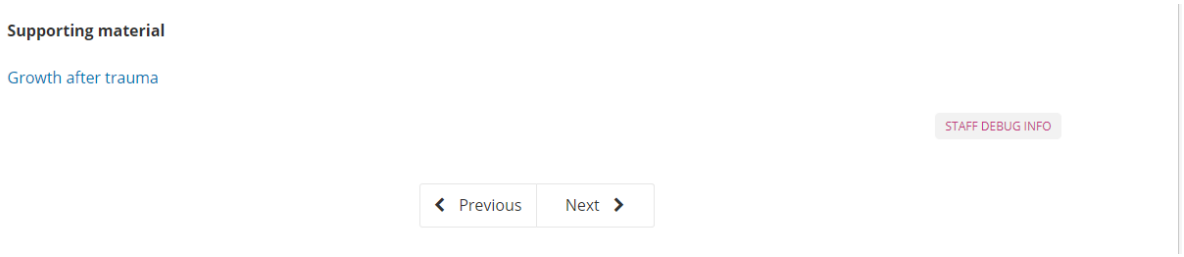
hogy elviszik őket a gázkamrába.

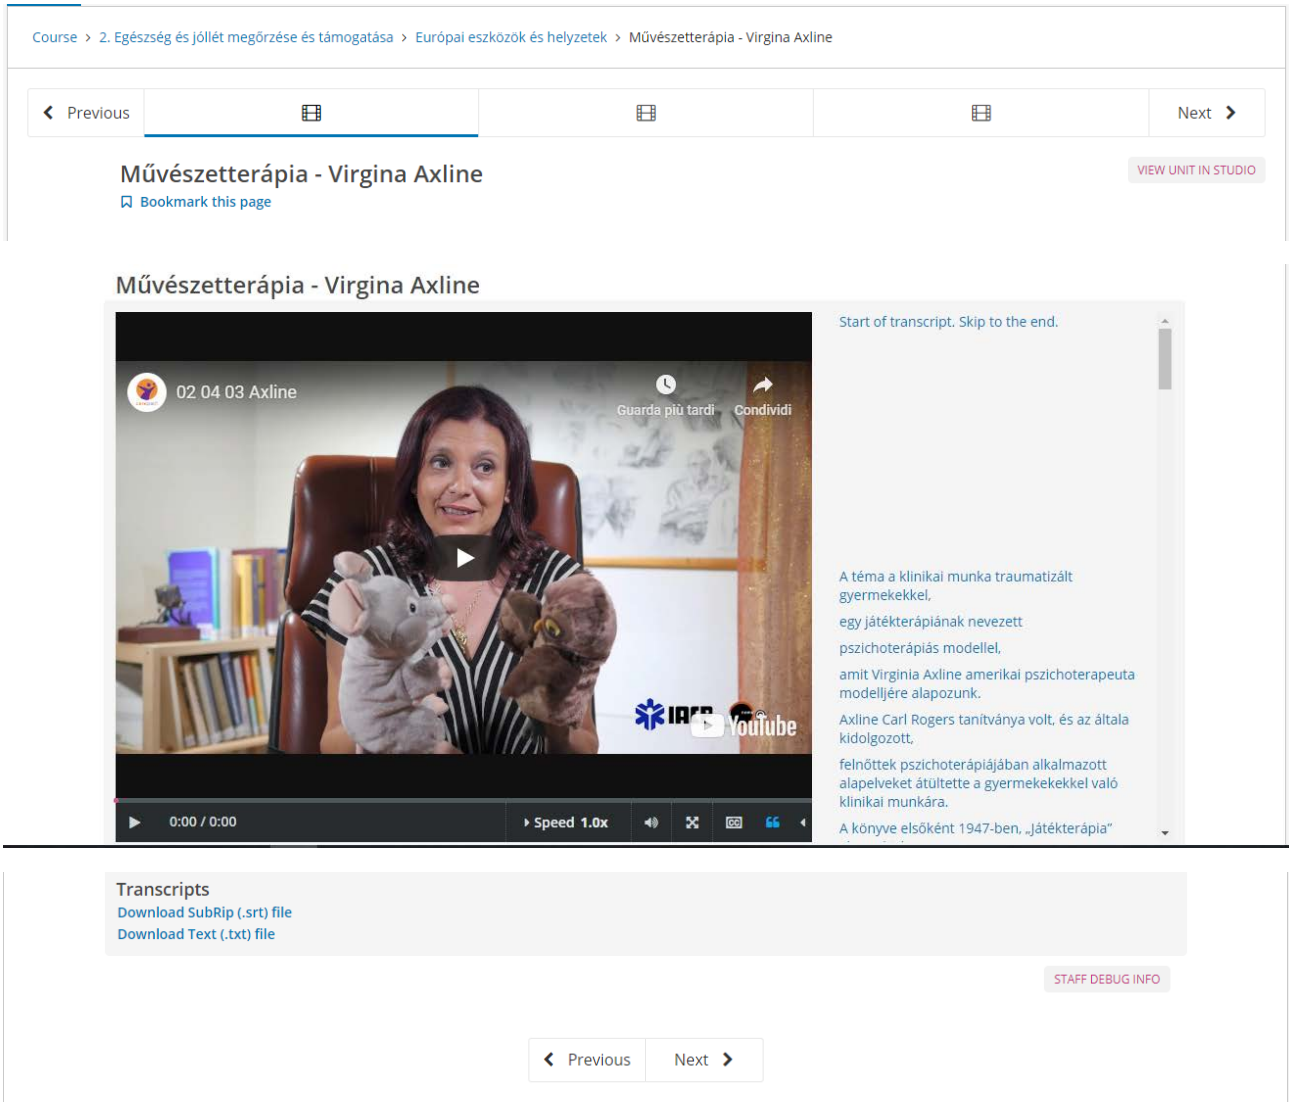
Azok, akik túlélték, és felszabadultak a nácik ámokfutása végén,

jobb emberekké váltak. A fizikai gyengeségük és pszichés traumáik ellenére

mélyebb kapcsolatot alakítottak ki egzisztenciális szinten magukkal, másokkal

és a világgal. Ez elgondolkodtató és reménykeltő mindannyiunk számára.





Transcript

A téma a klinikai munka traumatizált gyermekekkel,

egy játékterápiának nevezett

pszichoterápiás modellel,

amit Virginia Axline amerikai pszichoterapeuta modelljére alapozunk.

Axline Carl Rogers tanítványa volt, és az általa kidolgozott,

felnőttek pszichoterápiájában alkalmazott alapelveket átültette a gyermekekkel való klinikai munkára.

A könyve elsőként 1947-ben, „Játékterápia” címmel jelent meg.

Az alaptétel, amit Rogers is kifejez,

és ami Axline a gyermekek belső világának megértésére irányuló munkáját is megalapozza az,

hogy minden gyermekben ott van a veleszületett késztetés

a belső lehetőségei kibontakoztatására, 12 00:01:08,940 --> 00:01:10,890 és minden viselkedéssel

efelé a cél felé törekszik.

A második alaptétel a gyermek
önregulációra való képességéről szól: senki nem tudhatja rajta kívül, hogy mi a legjobb neki.
A harmadik pedig az, hogy a gyermek
aktívan keresni fogja az olyan élményeket,
amelyek előmozdítják a fejlődését és a lehetőségei kibontakoztatását;
miközben a számára kedvezőtlennek ítélt élményeket kerülni igyekszik.
A játékterápia lehetővé teszi a gyermeknek,
hogy a lehető legjobb
körülmények között fejezze ki magát.
A biztonságos, megtartó, őt szolgáló térben
a gyermeknek több esélye van a lehetőségei kifejezésére.
Ez a megengedő környezet,
amit a játékterápia hoz létre, lehetővé teszi a gyermeknek, hogy megerősödjön, hogy jobban
megismerje magát, és hogy megfelelően szimbolizálja az élményeit:
más szóval, hogy
kifejezést találjon az érzéseinek.
A gyermek belső világához
a játékon, a rajzoláson, a mesén keresztül
férhetünk hozzá. Ezeken a csatornákon keresztül a gyermek spontánabb,
szabadabb módon, számára ismerős médiumokon keresztül
tudja kifejezni a szükségleteit, az élményeit és az érzéseit.
A játékterápia során a terapeuta figyelmesen
visszatükrözi a gyermeknek mindazt, ami belőle a játék közben felszínre jön, és
ráhangolódik a gyermek érzéseire.
Így fejlődik a gyermek tudatossága
a saját viselkedésére.
Fontos, hogy minél több féle játékanyag legyen elérhető
a játékterépia során a gyermek számára. Ez teszi lehetővé, hogy a gyermek igazán
szabadon fejezze ki magát,
hogy szabadon mozogjon
a terápia helyszínét adó környezetben.
Ami igazán fontos:

a változás akkor történik meg,
amikor az önfelfedezés folyamata által
szabadnak érzi magát,
és megszületik benne egy fajta önrendelkezés, személyes erő.
Visszatérve a terápiás környezet kialakítására:
fontos, hogy legyenek különböző játékeszközök, pl. papírlapok, különböző színes rajzeszközök, gyurma,
homoktálcás jelenetfelállító eszköz, könyvek,
mesekönyvek, színezők, amiket együtt színezhetünk vagy olvashatunk;
illetve babák, amik a legjobban
lehetővé teszik a gyermeknek, hogy kifejezze magát. Pl. az egyik babát ő fogja,
a másikat odaadja a terapeutának,
és így a babák közvetítésén keresztül
gyakran könnyebben tud a gyermek kommunikálni a terapeutával.
A baba válik a kommunikációs csatornává, és a segítségével a gyermek
mélyebben és jobban meg tud nyílni.
A babák önálló lényekként
vannak interakcióban egymással. Fontos, hogy a terapeuta közvetlenül a babákat
figyelje, ne a gyermeket: ez megerősíti
a babák közvetett kifejezőeszközként
betöltött szerepét. Az, hogy ezek állatfigurák, szintén segítő tényező,
mert a gyermeknek könnyebb egy állattal azonosulni,
mint egy emberfigurával. Ebben a folyamatban a terapeuta
ezekkel a játékeszközökkel a gyermeket
követi. Axline szavaiva élve,
a pszichoterápiás folyamatban a gyermek mutatja az utat,
a terapeuta nem kitűzi azt, hanem követi. Sőt, az önszabályozás akkor válik lehetővé,
amikor a gyermek szabaddá válik kifejezni magát.
Ez Rogers korábban említett alaptételeinek egyike.
A játékterápia azért hatékony a traumatikus élményeket átélt gyermekek esetén,
mert a biztonságos, megtartó és szabadságot támogató tér
lehetővé teszi a traumatizált gyermek számára,
hogy a lehető legjobban kifejezze magát

és elkezdje feldolgozni az élményeit.

A játék fontosságát 80 00:07:02,279 --> 00:07:10,349 tovább hangsúlyozzák egyes neurológiai kutatások, főként

Panksepp eredményei, aki „az elme ökológiájáról” szóló anyagában

az emlősök hét alapvető érzelmi rendszerét határozza meg.

Ezek közül minket most leginkább

a "játék-idegpálya" érdekel, amely egy olyan, genetikailag meghatározott idegpálya,

ami pozitív hatásokat generál az emlősök agyában.

Panksepp arra jött rá, hogy

genetikailag a játék-idegpálya

minden emlősnél megtalálható. Ezek a kutatások a játéknak a kognitív, érzelmi

és kötődési fejlődésben betöltött

fontos szerepét hangsúlyozzák. Fejleszti továbbá

a megküzdési képességet és a társas együttműködés készségét is.

Az, hogy tudományosan bizonyított tény az, hogy

a játék egy spontán, genetikailag kódolt tevékenység, elgondolkodtatja a szamekbert,

ha olyan gyermekkel van dolga, aki nem akar játszani. Az, hogy egy gyermek nem akar játszani,

egyértelműen valamilyen

belső nehézségre mutat rá.

A játékterápia olyan pszichoterápiás intervenciós eszköz, ami valamivel enyhébb

nehézségekkel küzdő gyermekeknél is

hatékony, de még inkább hatékony 100 00:08:46,750 --> 00:08:48,840 traumát átélt gyermekek esetén.

A játékterápia arra hívja fel a figyelmet, hogy

a gyermeket hasznos olyan személyként kezelni,

aki egy védett, biztonságos környezetben

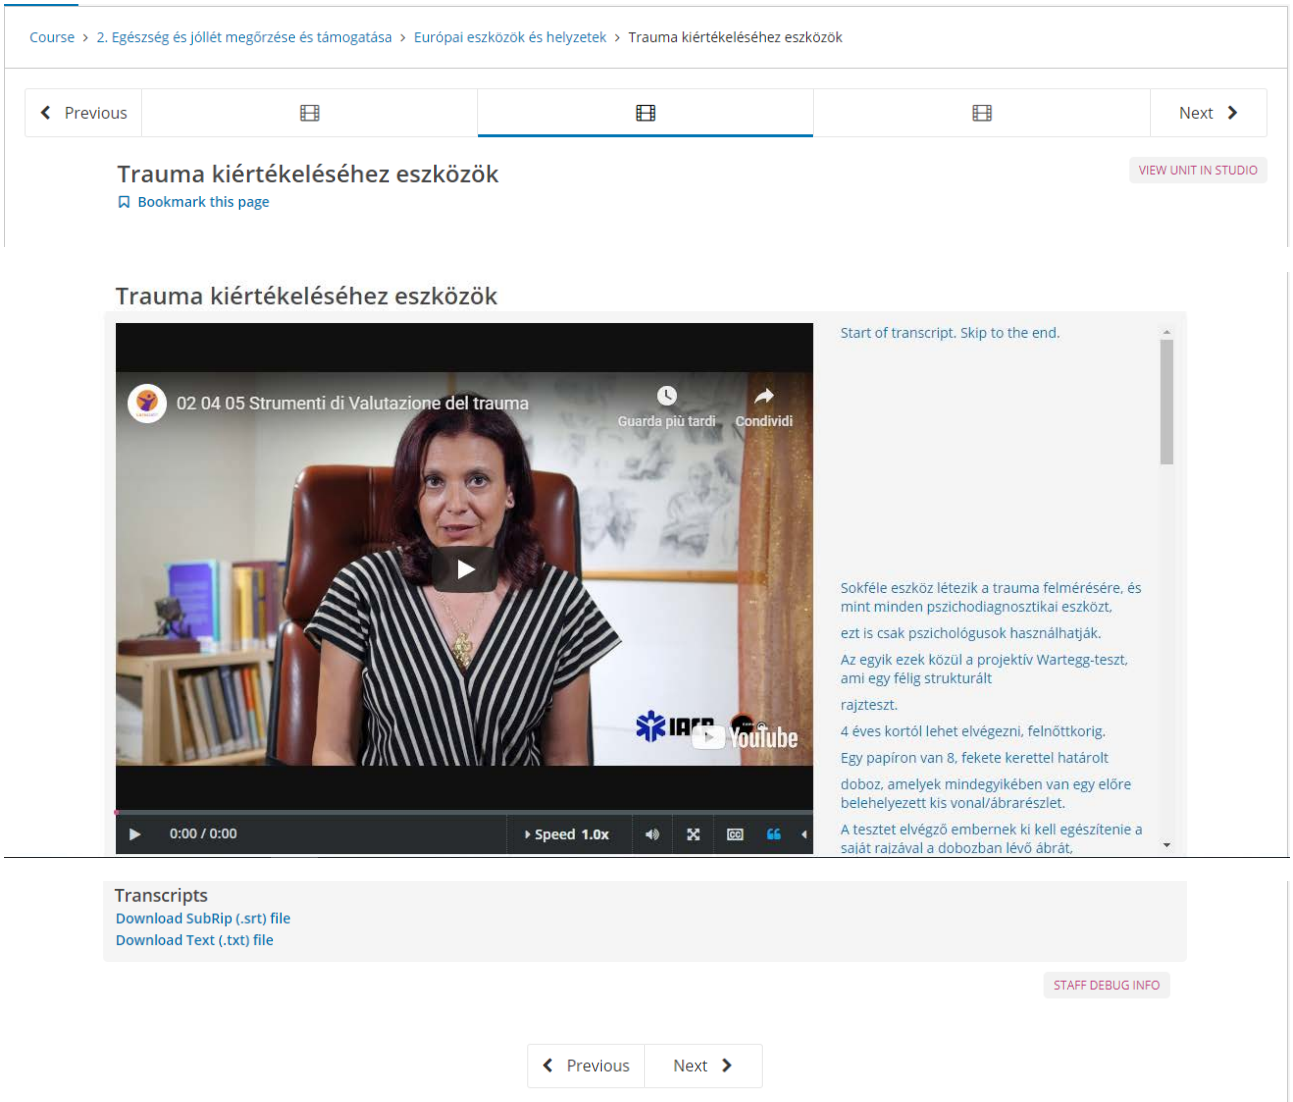
képes elmondani, megosztani, kifejezni az érzéseit,

félelmeit, szorongásait, ha őt és a személyes

szükségleteit, jellemzőit tiszteletben tartják.

Mindez segít a gyermeknek feldolgozni a traumatikus élményt,

és egészséges felnőtté válni.



Transcript

Sokféle eszköz létezik a trauma felmérésére, és mint minden pszichodiagnosztikai eszközt,

ezt is csak pszichológusok használhatják.

Az egyik ezek közül a projektív Wartegg-teszt, ami egy félig strukturált

rajzteszt.

4 éves kortól lehet elvégezni, felnőttkorig.

Egy papíron van 8, fekete kerettel határolt

doboz, amelyek mindegyikében van egy előre belehelyezett kis vonal/ábrarészlet.

A tesztet elvégző embernek ki kell egészítenie a saját rajzával a dobozban lévő ábrát,

annak felhasználásával, ami már eleve a dobozban volt. Ezt mind a nyolc dobozzal el kell végeznie.

Nagyon könnyen használható pszichodiagnosztikai eszköz, az időt tekintve is,

és mivel rajz-alapú, ami a gyermekek egyik kedvelt kommunikációs formája, a játékterápiához hasonlóan

nagyon jól használható gyerekeknél.

Az, hogy a rajz eleve egy gyerekek által kedvelt eszköz, elősegíti a használatát.

A Wartegg-teszt nagyon pontos és alapos értelmezés és dekódolás alapján működik.

Az eszköz használatának egyszerűsége ellenére az értelmezése nagyon specifikus,

és a Crisi Wartegg-rendszerre alapul, amit Crisi professzor dolgozott ki.

A lényege röviden, hogy segít egy képet alkotni arról, hogy hogyan működik a tesztet elvégző

ember személyisége.

A teszt segítségével, bizonyos jelek leolvasása által

meg lehet állapítani a trauma jelenlétét, annak az illetőre gyakorolt hatása által,

illetve annak a lehetséges következményeit. Ha az ember traumát él át,

az kognitív, érzelmi és szociális szinteken is hatással van rá.

A Wartegg-tesztet eredetileg nem kifejezetten a trauma felmérésére hozták létre,

de ehhez a területhez is képes nagyban hozzájárulni.

A teszt alapján egy jelentés készül; ennek az első fázisa

során a rajzokat betűszavakra „fordítják le”,

és ezek konfigurációi adnak információt a személyiség működéséről.

A teszt erőssége az egyszerűsége és könnyen elérhetősége, illetve az,

hogy betekintést nyújt abba, hogy milyen hatása volt a traumának az illető

pszichés működésére.

A Wartegg-teszt mellett léteznek traumaspecifikus kérdőívek is,

mint pl. a Hopkins Tünetellenőrző Lista (Hopkins Symptom Checklist - HSCL) - 2, amit a Harvard

Egyetemen fejlesztettek ki

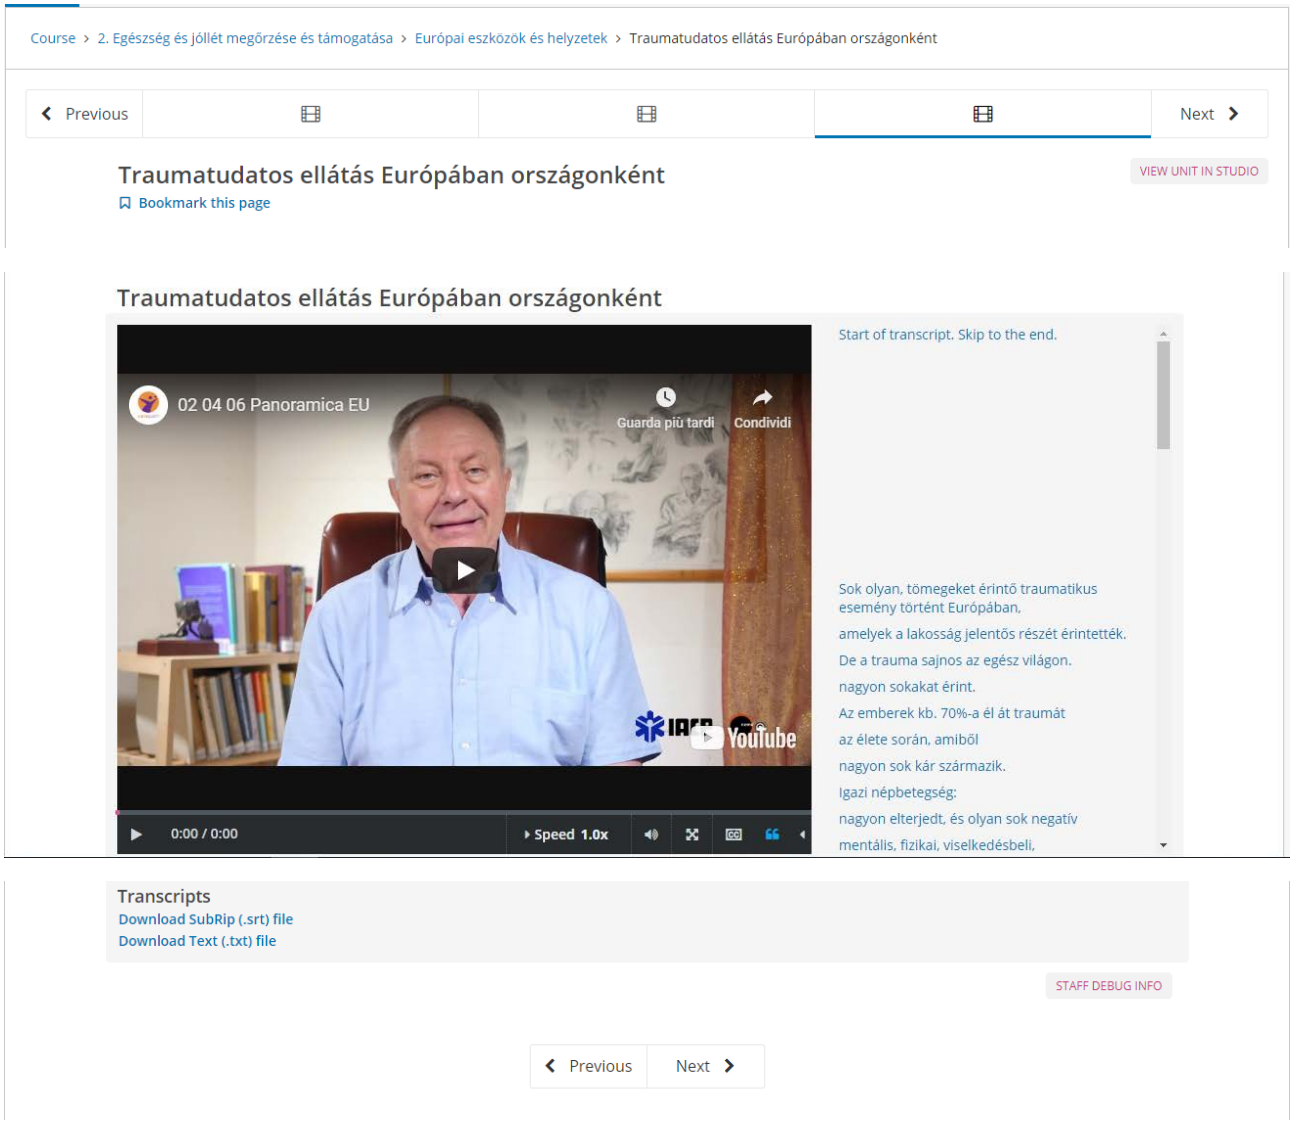
a trauma tüneteinek felmérésére menekült gyerekeknél (akik éltek át traumát).

Egy másik ilyen kérdőív a Traumatünetek Ellenőrző Listája Kisgyermekek számára (Trauma Symptom Checklist for Young - TSCYC),

amit nem a közvetlenül a vizsgált gyermek, hanem a gondozója tölt ki; végül pedig a Megküzdési Válaszok Listája

(Coping Responses Inventory),

amit 12 éves kortól lehet elvégezni, és amely egy önellenőrző kérdőív.



Transcript

Sok olyan, tömegeket érintő traumatikus esemény történt Európában,

amelyek a lakosság jelentős részét érintették.

De a trauma sajnos az egész világon.

nagyon sokakat érint.

Az emberek kb. 70%-a él át traumát

az élete során, amiből

nagyon sok kár származik.

Igazi népbetegség:

nagyon elterjedt, és olyan sok negatív

mentális, fizikai, viselkedésbeli,

szociális és gazdasági hatása van,

hogy az emberben felmerül a kérdés:

vajon Európa országai, amelyek a világ

legfejlettebb országai közé tartoznak, miért nem fektetnek több erőforrást

olyan kutatásokba, készségfejlesztésekbe, amelyekkel hatékonyan lehetne kezelni ezt a népbetegséget -

ahogy ezt sok más jelenséggel meg is tesszük.

Ám sajnos a trauma esetében ez nem így van. Szinte hihetetlen, hogy mennyire kevés intézkedés történt ezügyben.

Vannak azért kivételek, pl. a skandináv országok:

Svédországban nem csak a traumatizált emberek hatékony kezelése terén vannak jól felkészüve, hanem

társadalmi szinten is előrelátóan

kezelik a problémát. Minden városban működik egy

traumaszolgálat, ahol

a szakemberek - pl. a szociális munkások - jól képzettek

az ilyen típusú problémák

megelőzésében.

Ám sok más európai ország nem volt ugyanilyen hatékony.

Például Belgium, ahol remek az egy főre jutó átlagjövedelem, jó a fejlettség,

az ipar, a szolgáltatások, stb., pár évvel ezelőttig nem fejlesztett ki

hatékony képzési módokat arra, hogy friss, hatékony tudással és készségekkel ruházza fel a segítő szakembereket.

Az egyetemeken a megszerezhető szaktudás nem volt kellőképpen korszerű ahhoz,

hogy a segítő szakembereket olyan tudással lássa el, amelyel igazán hatékonyan tudnák kezelni az ilyen típusú problémákat.

Tehát a helyzet nem teljesen kielégítő, olyan kivételekkel, mint pl. Anglia és általában az angolszász országok,

amelyek előrelátó módon kellő erőforrásokat fektettek be

a szakemberek képzésébe és a képzési lehetőségek tágításába.

Ennek köszönhetően megfelelő ellátást tudnak biztosítani a traumatizált embereknek,

és a prevencióban is hatékonyak.

Ám sok országban, mint pl. Olaszországban is, még hosszú utat kell megtenni

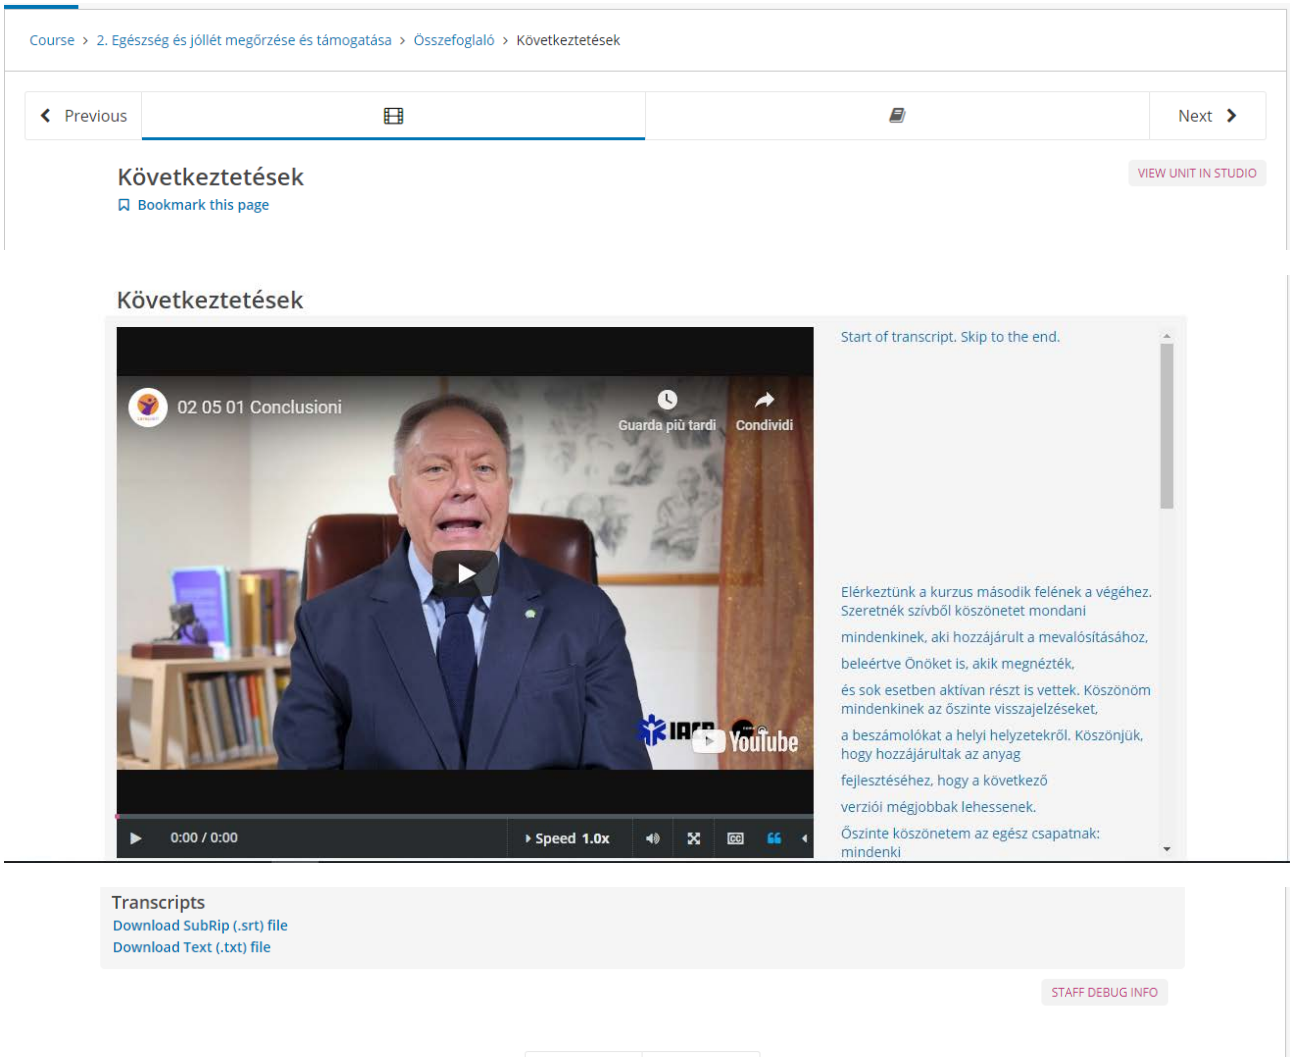
az elfogadható színvonalú szolgáltatásokig

és a helyzet kellő lefedettségéig.

Történtek persze pozitív előrelépések, pl. az elmúlt évtizedekben létrejött

traumaorientált szervezetek formájában; ezek részben

kiváltották azt az oktatási munkát, aminek
az egyetemeken kellene zajlania a különböző egészségügyi szakemberek képzésében.
Ezek képzéseket, továbbképzéseket,
és képesítést adó kurzusokat kínálnak
a traumakezelés témájában.
Sok munka van még hátra, ám mindez morális kötelességünk,
ugyanakkor a szociális, egészséghez kapcsolódó jogokról is szó van.
Az olasz alaptörvény 33. cikke sok más európai alaptörvényhez hasonlóan kimondja,
hogy minden polgárnak joga van az egészséghez, ezért kötelességünk megvédeni és fejleszteni
Európa egészségét: ez egy egészséges kötelesség.



Transcript

Elérkeztünk a kurzus második felének a végéhez. Szeretnék szívből köszönetet mondani

mindenkinek, aki hozzájárult a mevalósításához,

beleértve Önöket is, akik megnézték,

és sok esetben aktívan részt is vettek. Köszönöm mindenkinek az őszinte visszajelzéseket,

a beszámolókat a helyi helyzetekről. Köszönjük, hogy hozzájárultak az anyag

fejlesztéséhez, hogy a következő

verziói mégjobbak lehessenek.

Őszinte köszönetem az egész csapatnak: mindenki

teljes erőbedobással és odaadással dolgozott azért, hogy létrejöhessen ez a projekt,

hogy megvalósuljnanak azok a célok, amikben hiszünk.

Köszönet minden, az intézeten kívüli kollégának,

aki pro bono munkájával,

vagy egyéb hozzájárulással tett hozzá az anyaghoz,

pl. megengedte, hogy a kurzus portálján
ingyenesen közzétegyük az általa létrehozott anyagokat.
Köszönet az IACP minden munkatársának, akik teljes szívvel
dolgoztak, hogy megosszák tudásukat és tapasztalatukat
a traumatizált gyermekek ellátása terén.
Köszönet a velünk együttműködő szervezeteknek is,
illetve a CarePath projektpartnereinknek, akik a teljes folyamat alatt
támogattak bennünket.
Végezetül pedig nagy köszönet a Torinói Egyetem
munkatársainak és a projektmenedzsernek, Luca Rollè-nek,
aki az egyik legjobb projektmenedzser, akikkel a különböző európai projektek során
együtt dolgoztunk.
Köszönjük a Torinói Egyetem pszichológia kara
többi fantasztikus munkatársának is,
akik mindent megtettek a munkánk megkönnyítése és előmozdítása érdekében.
Egy szó mint száz, köszönjük a sok befektetett munkát, és jó tanulást kíánunk a többi a modulhoz!

Q.1

15 points possible (graded)

1. Mi a segítő kapcsolat?

- Érzelmi alapú kapcsolat, amelynek alapja, hogy az egyik partner segíti a másikat
- Egy szakember és a szolgáltatás igénybevevője közötti kapcsolat
- Olyan kapcsolat, amely kielégíti mind a szakember, mind a szolgáltatás igénybevevőjének szükségleteit
- Orvos-páciens kapcsolat

2. Az általános rendszerelmélet megalkotója:

- Wertheimer
- Maslow
- Rogers
- Von Bertalanffy

3. Mi a WHO?

- Tudományos Világszervezet
- Társadalmi Orvosi Szervezet
- Egészségügyi Világszervezet

4. A személyközpontú szemlélet megalapítója:

- C. Rogers
- O. Rank
- J. Bowlby
- A. Maslow

5. A következő, a segítő kapcsolat kialakításához szükséges feltételek melyikét nem C. Rogers határozta meg?

- Empátia
- Feltétel nélküli pozitív elfogadás
- Reziliencia
- Önazonosság, hitelesség

6. Munkaszövetség

- Alkalmazott és munkaadó közötti szerződéses megállapodásra utal
- Csak a csoporthoz van köze, az egyénhez nincs
- A segítő kapcsolatban a kívánatos együttműködési forma
- A szakember által lefektetett szabályok, amelyeket a szolgáltatás igénybevevőjének be kell tartania

7. A segítő kapcsolatban az empátia hiánya

- a professzionalitásra utaló minőség
- segít annak jobb megértésében, amit a kliens mond
- javasolt a kiégés megelőzése érdekében
- ellehetetleníti a segítő kapcsolat hatékonyságát

8. Mi a komplex poszttraumás stressz zavar?

- Egy másik kifejezés a poszttraumás stressz zavarra
- Krónikusan traumatikus élmények miatt létrejövő kórkép
- Akkor használatos kifejezés, ha a poszttraumás stressz zavar tünetei több, mint 6 hónapja fennállnak
- Csoportos trauma által kiváltott rendellenesség

9. A következő jellemzők közül melyek nem kívánatosak egy traumatudatos ellátórendszerben?

- A páciens értékelése az ellátás minden aspektusában
- Semleges és támogató nyelvezet használata
- Megfelelő szűrés elvégzése annak megállapítására, hogy mely élményeket lehet traumatikusként meghatározni
- A munkatársak képzése a traumáról és annak hatásairól

10. Melyek a pszichés trauma létrejöttében szerepet játszó leggyakoribb kórtörténeti tényezők?

- A gondviselők általi fizikai és pszichés elhanyagolás ismételt élménye
- Természeti katasztrófák átélése
- Váratlan elhalálozás az illető közvetlen közelében
- Gyermekkori szexuális bántalmazás átélése

11. A tudatos traumaellátás jelentése:

- Egy sor olyan technika, amely kiegészíti az EMDR traumaátdolgozást
- A pszichoterápia egy típusa
- A traumát átélt személyek ellátására és kezelésére vonatkozó rendszerszintű szemlélet
- A taumát átélt személyek részére fenntartott külön kórházi részleg

12. Az asszisztált erőszak definíciója:

- Katasztrófák átéléséből fakadó trauma
- Olyan helyzet, amely során egy kiskorú közvetlenül vagy közvetetten részt vesz számára érzelmileg fontos személyek elleni erőszakos cselekményekben, vagy szemtanúja annak
- Az erőszak azon típusa, amelyet az egyik szülő követ el a másik ellen, a gyermek (pszichés manipuláció útján elért) pszichológiai és/vagy materiális támogatásával
- Abból fakadó trauma, ha valaki általános erőszakos jelenségek szemtanúja

13. Mik a javasolt intervenciós lépések akkor, ha valaki erőszak szemtanúja lesz?

- Felismerés, védelem, értékelés, kezelés
- Megfigyelés, értékelés, kezelés, családi közvetítés
- Felismerés, család elhelyezése, kezelés, családi közvetítés, család áthelyezése
- A családból való eltávolítás, családi közvetítés, család áthelyezése

14. A 2013-ban megjelent, a gyermekbántalmazás ellen Európában témájú WHO jelentés szerint hány 15 év alatti gyermek hal meg gyermekbántalmazás következtében?

- 800-900
- 500-600
- 900-1000
- 400-500

15. A komplex PTSD a PTSD-től a következőkben különbözik:

- A komplex PTSD a gyermekkorra jellemző
- A bizalmi kapcsolatokban fellépő erőszak esetében alakul ki
- Akkor van szó komplex PTSD-ről, ha a pszichés tünetek mellett motoros tünetek is jelentkeznek
- A komplex PTSD kizárólag nőknél és kiskorúaknál jelentkezik

A kutatás az emberi természet szerves része.

Aki nem kutat, az nem old meg problémákat, és szinte nem is létezik.

A kutatás kíváncsiság, vágy a valóság megismerésére, és azoknak,

akik csinálják, a felfedezés végtelen öröme.

Nem könnyű definiálni a határait annak, hogy mi a kutatás és mi nem az. Az idők során sok definíció született. Nézzünk néhányat az utóbbiak közül:

A kutatás egyszerűen keresi a választ bizonyos kérdésekre, amikre eddig nem volt válasz és a válaszok emberi erőfeszítéstől függenek (.....) Valójában a kutatás az a folyamat, amíg megérkezünk egy probléma megbízható megoldásaihoz az adatok tervezett és szisztematikus gyűjtésén, analizálásán és értelmezésén keresztül. „ (Singh, 2006.1.o.).

A kutatás a felfedezés kreatív folyamata, ami egy előre megállapított utiterv alapján fejlődik ki, , amely a tudományos közösségen belül konszolidálódott (szilárdult meg).” (Corbetta, 2015,15.o.)

Általában kutatást végeznek „amikor kíváncsiságot és intuíciót alkalmaznak szisztematikus megközelítéssel, hogy mindennapi jelenségekkel kapcsolatos kérdéseket megválaszoljanak, kihasználva a tapasztalatok és tudás előnyeit, melyek már összegyűltek. (Reseach Italy, 2013)

Különböző típusú kutatások vannak, melyek különbözhetnek alkalmazásukban, a vizsgálat célkitűzéseiben és módszereiben. A kutatás valójában lehet „alkalmazott” vagy „tiszta”. Az alkalmazott kutatás célja, hogy megoldást találjon egy alkalmazási problémára, amit szükséges megnevezni, míg a tiszta kutatás főleg általánosításokra és elméleti megállapításokra vonatkozik. (Kothary, 2004; Singh & Masuku, 2013). Célkitűzéseitől függően a kutatás lehet leíró, felderítő, korrelációs és magyarázó. A leíró kutatás célja, hogy meghatározzon egy jelenséget, egy problémát, egy szituációt.

A korrelációs kutatás célja, hogy megfigyelje a kapcsolatot két vagy több változó között.

A felderítő kutatás célja, hogy megmagyarázza, miért történnek bizonyos dolgok.

A magyarázó kutatás célja egy tanulmány használhatóságát megvizsgálni vagy felfedezni egy kevéssé ismert területet.

A vizsgálat megkezdéséhez szükség van egy munkatervre, meghatározott eljárási lépésekkel, amelyeket a vizsgálattal magával kell kivitelezni. Ezeket a fázisokat úgy nevezzük, hogy „kutatási terv".

Attól függően, hogy milyen technikát alkalmazunk, a kutatás szétválasztható:

> Kvantitatív kutatásra: mely strukturált megközelítést használ, célja számszerűsíteni egy jelenség, egy szituáció vagy attitűd variációit és sokféleségét egy jól strukturált kutatási terven keresztül. Ezzel számszerű adatokat kaphatunk, melyeket analizálva igazolhatunk hipotéziseket és tesztelhetünk változók közti kapcsolatokat.
>
> Kvalitatív kutatásra: mely nem strukturált megközelítést alkalmaz, magyarázó, leíró és következtetéses természetű, különös figyelemmel a tartalomra és a célra. Meghatároz és leír annyi lehetséges változót, amennyit csak lehet a jelenséggel, szituációval vagy attitűddel kapcsolatban. Megértésre törekszik a változók hátterében lévő okokkal. Az utóbbi magában foglalja „a világ értelmező és naturalisztikus szemléletét, ami azt jelenti, hogy a kvalitatív kutatók a jelenséget a saját természetes környezetében tanulmányozzák, megpróbálnak neki jelentést adni vagy az emberek által adott jelentést kifejezésekben értelmezik." (Denzin & Lincoln, 2011,3.o.) A kvalitatív kutatás célja, hogy inkább leírja és megértse a jelenségeket, minthogy megjósolja és/vagy kontrollálja őket. (Streubert &Carpenter, 2005)
>
> A kevert megközelítés másrészről, kombinálja a kvalitatív és a kvantitatív kutatási módszert. „A szociális kutatás a változók definícióján alapszik, keresi a kapcsolatokat közöttük, és megkísérli megérteni, hogy egy dolog változtatása okoz-e és hogyan változást a másik dologban. Néhány gyakori változó, amit szociális kutatásokban találni lehet a kor, a nem, az etnikai faj, a tanulmányok, a bevételek, a családi állapot, a foglalkoztatottság." (Bernard, 2006, 28-29.o.) Először kitaláljuk a változás koncepcióját: valamit, aminek több mint egy értéke van. Másodszor van a „mérés" koncepciója: valójában a változók a saját indikátoraik szerint lesznek mérve, amik a változók értékei szerint definiáltak. A mérés magában foglalja, hogy melyik értéket jegyzi meg. Minden kutatásnak tiszteletben kell tartani az érvényesség (validitás) és megbízhatóság elveit. Az érvényesség azt jelenti, hogy a kutatásnak pontos mérőeszközzel, adatokkal és eredményekkel kell rendelkeznie. Míg a megbízhatóság jelentése, hogy ugyanolyan eredményekhez jutunk, ha több alkalommal, ugyanazzal az eszközzel mérünk.

Bernard (2006) megmagyarázza a négy alappontot, amit a kutatás folyamata követ:

1. Először egy teoretikus probléma fogalmazódik meg (tudományos elmélet és irodalom)

2. Aztán kiválasztódik a megfelelő módszer és analizálási egység

3. Aztán összegyűlnek és analizálódnak az adatok

4. Végül az elméleti javaslat, amivel a kutatás indult, vagy támogatódik, vagy elvetődik.

(Bernard, 2006.69.o.)

Transcript

Az akciókutatás kifejezést Kurt Lewin szociálpszichológus vezette be az 1940-es években.

Addig különállónak és ellentétesnek hitt világokat egyesített:

a kutatást, aminek a célja, hogy reflektáljon dolgokra,

és a cselekvést (=akció), aminek a célja

a dolgok megváltoztatása.

Az akciókutatás tehát szövetség az elméleti aspektus: a kutatás, és

az alkalmazott aspektus: a cselekvés között. Egy átalakulást képvisel

abban, ahogy a humántudományok terén a kutatásokat elképzeljük, eltervezzük és végezzük - a tanulmányozott jelenségek

összetettségének leegyszerűsítése nélkül, azok elfogadásával, figyelembevételével.

Az akciókutatást Lewin mindig csoportban végezte,

mivel a csoport az a pszichoszociális tér,

amelyben az emberek cselekedeteket hajtanak végre, és egyben egy eszköz a változási folyamatok

előmozdítására.

Az akciókutatás leírható a kutatási módszerek azon csoportjaként, amelyeknek célja,

ahogy már említettük, hogy egyszerre aktiváljon utakat, lehetőségeket a cselekvés

(más szóval: változás) és a kutatás (más szóval: jelenségek megértése) számára.

Ez az út egy spirálisan váltakozó ciklusokból álló rugalmas folyamaton át vezet,

és minden ciklus három egymást követő szakaszból áll: tervezés, végrehajtás

és vizsgálat: az utóbbi célja az egyes fázisok eredményeinek kiértékelése,

a következő fázis racionális alapjának előkészítése, és, ha szükséges, az eredeti cselekvési terv

megváltoztatása.

Mi történik az akciókutatás első ciklusa után?

Az eredmények kiértékelése után (és az eredeti kiindulópont esetleges megváltoztatásának

mérlegelése után) a folyamat új ciklusa kezdődik,

amelybe beépítjük a korábban elvégzett tevékenységek

nyomán felmerülő új elemeket is; majd ezeket a ciklusokat addig ismételjük, amíg a problémás helyzet meg nem oldódik.

A tervezést, kivitelezést és vizsgálatot támogatja, ha a résztvevők

kritikusan felmérik, hogy mi működött jól, mi nem, mit tanultak,

és mit lehetne másképp csinálni.

Az egyes ciklusok kritikus kiértékelése lehetővé teszi a kutatónak az esetleg hibák kijavítását,

és hogy a tevékenységeket a kutatás során felmerült konkrét szükségletekhez igazítsa.

Mi az akciókutatás célja?

Az akciókutatás célja a változás elősegítése:

változás a viselkedésben, szokásokban,

kontextusokban, stb.

Az alapfeltevés az, hogy a jelenlegi helyzet nem támogatja az emberek jóllétét,

és hogy a helyzeten csak változtatással lehet javítani.

A változást tehát elő kell idézni, azután elemezni és megérteni,

és tartósnak kell lennie.

Lewin szerint ahhoz, hogy a változás tartós legyen, három fázison kell átmennie:

a "kiolvasztás", ami a változásnak ellenálló tényezők kezelését jelenti,

melyek gyakran köthetőek társadalmi normákhoz;

az "elmozdulási fázis", például hiedelmek, értékrendek és attitűdök megváltoztatása

és újak kifejlesztése új információk alapján, illetve

a régi helyzetből az újba való elmozdulás;

harmadrészt, az "újjáépítő fázis" vagy "újrafagyasztás", amelyben az újonnan létrehozott helyzet

egy új egyensúlyi állapotban stabilizálódik, vagyis az új értékrendet, attitűdöket

és viselkedéseket megszilárdítjuk és beépítjük a teljes rendszer egészébe.

Az akciókutatás egyik fontos aspektusa az intervenciót igénybevevő fél aktív részvétele;

ő tulajdonképpen az intervenció befogadója és cselekvője is

egy személyben, és olyan helyzetbe kell őt helyezni, hogy megoszthassa magának a kutatásnak a céljait.

Az akciókutatás alapfeltevése az, hogy az emberek, akikkel dolgozunk, aktív személyek,

olyan készségekkel és kompetenciákkal, amiket be kell vonnunk a kutatási folyamatba.

Ha akciókutatási szemlélettel dolgozunk, aktívan be kell vonnunk azokat az embereket is,

akiknek az intervenció szól, és egy olyan helyzetet kell létrehozni, amelyben

az intervenció befogadói-cselekvői együttműködnek és konfrontálódnak.

Az akciókutatási módszer másik jellemző eleme az,

hogy nincs előre meghatározott intervenciós metódus.

Ezt a módszert a csoporttal együtt építjük fel bizonyos lényegi alapelvekből kiindulva,

és a munka során megfigyelt reakciókra alapozva.

Gyakran előfordul, hogy az eredeti elképzelés útközben változik, mivel a kivitelezendő módszereket

és tevékenységeket a folyamat közben rakjuk össze.

Végigvettük tehát, mi jellemzi az akciókutatást.

Most vizsgáljuk meg, mik azok az elemek, amelyek megkülönböztetik a kísérleti módszertől.

Ahogy már említettük, az akciókutatásban nincs fix intervenció.

Akik tehát ezzel a szemlélettel dolgoznak, hagyják, hogy a hipotézis magától jelenjen meg a folyamat közben,

és akár változtassa az irányát, ha a megfigyelések szerint szükséges.

Egy másik különbség, hogy az akciókutatásban nem akarunk ok-okozati kapcsolatokat felállítani,

a szakirodalomban szereplő hipotéziseket bizonyítani, vagy kezelések eredményességét vizsgálni reprezentatív mintákon

azért, hogy általános elméleteket erősítsünk vagy

cáfoljunk meg.

Az akciókutatásban, minden ciklus során inkább arra a jelenségre fókuszálunk, amire az intervencióval

szeretnénk reagálni.

Nem foglalkozunk a változók mérhetőségével, és a cél az, hogy olyan, előre nem látható különböző utak vizsgálatával próbáljunk problémákat megoldani, amelyek a csoport eredményévé és egyszersmind eszközévé válnak.

Végezetül, további különbség található abban, ahogy a kutatás eredményei bemutatásra kerülnek; az akciókutatás esetén azokat megosztjuk az egész csoporttal, közösséggel, bevonva őket, a kísérleti kutatások beszámolóira jellemző bonyolult tudományos szakzsargon helyett egyszerű, könnyen érthető nyelvezettel.

Az adatok bemutatásának célja egy olyan reflexió, értékelés, amely elősegíti a lehetséges fejlődési, javítási irányok meghatározását.

Foglaljuk akkor össze az eddig elhangzottak alapján az akciókutatás alapvetéseit:

Az akciókutatás praktikus és kontextushoz igazodó.

Célja egy csoport vagy közösség problémáinak kezelése; tehát ez egy kontextusfüggő, az adott környezethez, helyzethez, közösséghez igazodó kutatási forma; célja a változás előmozdítása, fókusza pedig az egyén helyett a csoport szinten van, mind a folyamatok elemzésekor, mind a feltáruló eredmények és megoldások meghatározásakor.

Továbbá az akciókutatás több szakaszból áll, és kialakításából fakadóan ciklikus, mivel a tudás és a cselekvés fázisai váltogatják egymást benne. Központjában a részvétel áll, valamint a kutató és a csoport, a közösség közötti együttműködés és kölcsönös egymásra utaltság.

Hagyományosan a kutatás témája, hogy objektíven analizáljon jelenségeket a világ lejegyzett természeti törvényeinek következtetéseivel. A kutatónak teljesen semlegesen kell az általa tanulmányozott jelenséghez állnia. A kutatás definíciója szerint az elmélethez tartozik, az általánosítás felé tart és annyira univerzális modelleket épít, amennyire csak lehetséges. Az akció másrészről, az általános tapasztalat szerint át van itatva motivációkkal, vágyakkal, érzelmekkel és tudással, ami sokszor nem logikus, ellentmondásos és a célja a cselekvés, a teremtés és a változás. Az akció a gyakorlatra irányul, kapcsolódik a különlegeshez és egyedülállóhoz, lokális és szituációs, történetileg kezelt, nem mindig kiszámítható az eredete és a kimenetele. (Amerio, 2000) Az akciókutatás azzal a szándékkal született, hogy kombinálja ezt a két dimenziót, ami hagyományosan elválasztott és összeegyeztethetetlen. A két sarokpont, ami megkülönbözteti az akciókutatást a hagyományos kutatástól, a részvétel és a kooperáció. Elliot így határozza meg:

„Az akciókutatás egy szociális szituáció tanulmányozásaként definiálható, melynek célja, hogy fejlessze a benne lévő akciók minőségét. Más szavakkal, az a célja, hogy bevezessen egy praktikus értékelést a konkrét szituációkba; az „elméletek" érvényessége vagy a hipotézisek, amiket generál nem annyira az igazság „tudományos" érvényességétől függ, inkább attól, hogy mennyire használható segítség az emberek számára, hogy intelligensebben és ügyesebben cselekedjenek. Az akciókutatásban az „elméletek" nem függetlenül értékelhetők, hanem gyakorlatban alkalmazottak és a gyakorlatban értékelődnek. (Elliot, 1994, 97.o.)

És újra:

„A helyzet-problémát diagnosztizálni kell és a gyógyító cselekvést meg kell tervezni és végre kell hajtani, a hatásokat kontrollálni kell, ha előrelépés következett be. Ez a teljes folyamat, Analízis-Diagnózis-Tervezés-Cselekvés-Hatás ellenőrzés, amit úgy hívunk akciókutatás (.....) . (Elliot, 1994, 96.o.)

Az akciókutatás eredeti modelljét Lewin fejlesztette ki (1946), azzal a céllal, hogy megértse azokat a problémákat, amik speciális összefüggésekben merültek fel, mikor megosztották tapasztalataikat azok az emberek, akik egyben kutatók és a vizsgálat alanyai is voltak. Az akció egyre több és több értéket képvisel, mert eljön a pillanat, mikor a probléma megismerése felépül. A változás folyamata három fázisban megy végbe:

1. Felolvasztás: a kezdeti egyensúly felborul a szociális normákhoz való ragaszkodásnak ellenálló cselekvéseken keresztül.

2. Mozdulás: új és meglévő elemek cselekvési erőt kapnak a területen belül.

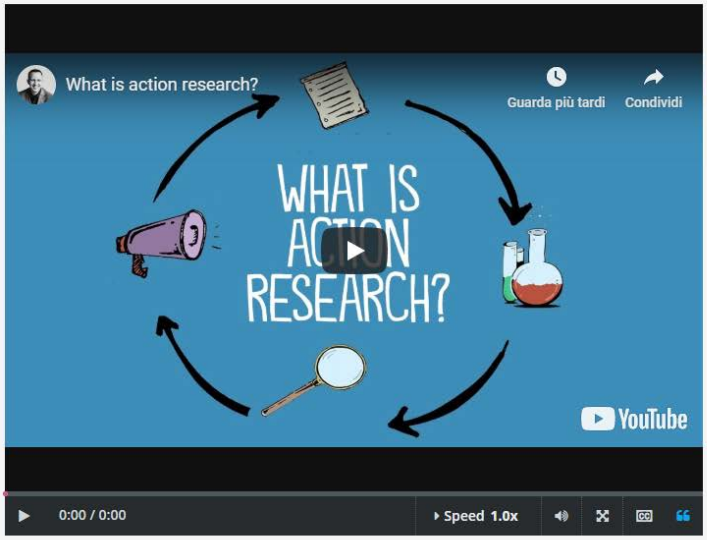
3. Megszilárdulás: az új szituáció stabilizálódik az új egyensúly körül.

Az akciókutatás ezért egy „szisztematikus adatgyűjtés és analizálás, abból a célból, hogy cselekedjünk és változást hozzunk létre", megosztható, gyakorlati ismereteket generáljunk. (Gillis & Jackson, 2002, 264.o.)

Bármilyen akciókutatás célja, hogy szociális változást produkáljon a cselekvés (vagy cselekvések) által, ami megfordítva a végső eredménye a kutatásnak. (Greenwood & Levin, 1998, McNiff & Whitehead, 2006, MacDonald, 2012).

A kutatók, akik elkezdték az akciókutatást, észben tartják a feltevést, hogy a valóság egy folyamatos szociális folyamat által teremtődik és újrateremtődik. Felismerik, Argyris (1982) alapján, hogy egy kutatási megközelítésnek, ami egy szociális szituációban működik, alapvető elemei: az együttműködés a kutatók és a résztvevő közösségek között, kritikus vizsgálati folyamat, fókusz a szociális gyakorlaton és reflektív tanulási folyamat. Ez szükségszerűen magában foglalja a különböző típusú kutatásokat a hipotézisek igazolásától, ami több figyelmet fordít a kutatás témáira, természetesen kifejtve és megvitatva, megengedvén bárkinek, akit érdekel, hogy előterjesszen egy kritikai vizsgálatot (Checkland & Holwell, 1998)

Definition of Action Research



Start of transcript. Skip to the end.

A tanítás külön mesterség. Egyszerre művészet és tudomány. A kitűnő tanárok sokat kísérleteznek,

és rengeteget hibáznak. De honnan tudhatjuk, hogy mi az, ami tényleg működik?

Az egyik opció az akciókutatás, amivel azonosíthatjuk a kérdést, tesztelhetjük

a stratégiát, adatot gyűjthetünk és megnézhetjük, hogy működik-e. A végeredmény

egy dinamikus, innovatív, közvetlenül a tanteremhez kötődő dolog.

Az akciókutatás lebontja a falat a résztvevők és a kutatók között.

A tanítás külön mesterség. Egyszerre művészet és tudomány. A kitűnő tanárok sokat kísérleteznek,

és rengeteget hibáznak. De honnan tudhatjuk, hogy mi az, ami tényleg működik?

Az egyik opció az akciókutatás, amivel azonosíthatjuk a kérdést, tesztelhetjük

a stratégiát, adatot gyűjthetünk és megnézhetjük, hogy működik-e. A végeredmény

egy dinamikus, innovatív, közvetlenül a tanteremhez kötődő dolog.

Az akciókutatás lebontja a falat a résztvevők és a kutatók között.

Más szóval a tanár aktívan részt vesz a vizsgált helyzetben, miközben a kutatást

végzi. Sok különböző akciókutatási keretrendszer létezik,

de általában hasonló folyamatra épülnek. Az első szakasz a kutatás előkészítése.

Itt vizsgálódással kezdünk, és meghatározunk egy konkrét kutatási kérdést.

Ennek olyasminek kell lennie, amit lehet tesztelni.

Következő lépésként egy szakirodalmi áttekintést végzünk el, hogy mélyebb rálátást szerezzünk a témára.

Végül következik a tervezési folyamat, amely során meghatározzuk az adatgyűjtési módszereket,

etikai kérdéseket fontolunk meg, ha kell, engedélyeket szerzünk be, határidőket tűzünk ki, és felállítjuk a rendszert.

Ezután következik az akció-szakasz. Itt kezdünk bele a kísérletezés és adatgyűjtés

több ciklusból álló folyamatába. Az adatgyűjtés vonatkozhat

kvalitatív adatokra, úgymint megfigyelések, tárgyak, interjúk; vagy

kvantitatív adatokra, mint kategóriapontos kérdőívek vagy teljesítményadatok. Ezek után

következik az elemzés. Az adatokat gyakran rendezzük

grafikonokba vagy táblázatokba, hogy konkrét tendenciákat állapíthassunk meg.

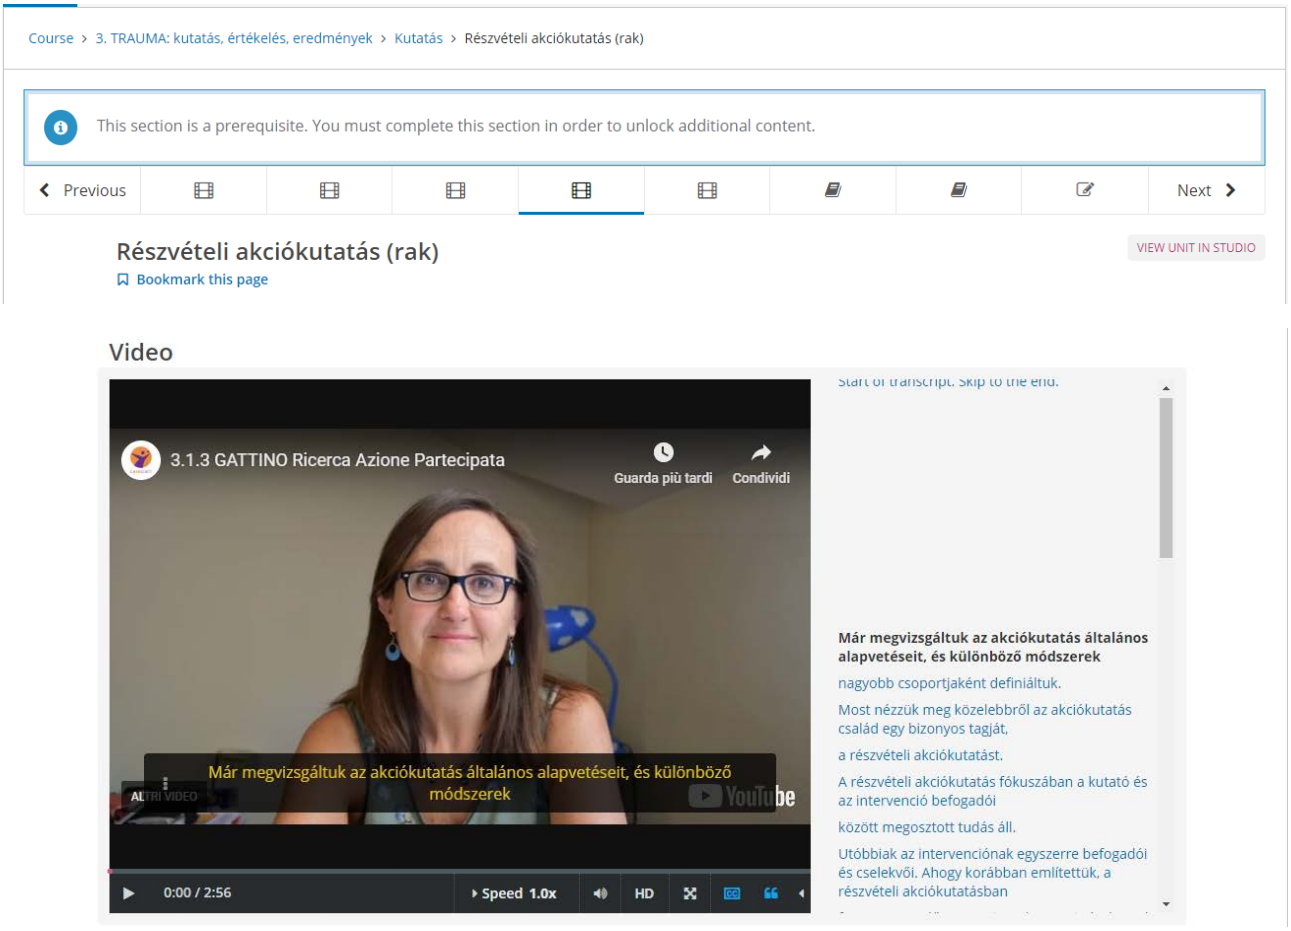
Meg is tárgyalhatjuk más szakmabeliekkel, szabadon írhatunk róla naplót, vagy klasztertérképet is

készíthetünk, mielőtt leírjuk a végleges eredményeket. Végezetül elértünk az összegzéshez.

Itt osztjuk meg a világgal a kutatásunkat, és reflektálunk a gyakorlatunkra.

Ez végül újabb kérdésekhez fog vezetni, és egy újabb ciklus indul, miközben

folyamatosan finomítjuk mesterségünket, és egyre jobb és kreatívabb tanárokká válunk.



Transcript

Már megvizsgáltuk az akciókutatás általános alapvetéseit, és különböző módszerek

nagyobb csoportjaként definiáltuk.

Most nézzük meg közelebbről az akciókutatás család egy bizonyos tagját,

a részvételi akciókutatást.

A részvételi akciókutatás fókuszában a kutató és az intervenció befogadói

között megosztott tudás áll.

Utóbbiak az intervenciónak egyszerre befogadói és cselekvői. Ahogy korábban említettük, a részvételi akciókutatásban

fontos szem előtt tartani azt, hogy mind a kutató, mind a résztvevők

hozzájárulnak a közös cselekvés megtervezéséhez és értelmének visszaállításához.

Tehát a részvételi akciókutatásban fontos, hogy az akciókutatást együtt tervezze meg és végezze el

a szakember az intervenció célját képező közösség/csoport tagjaival,

akik kontextusspecifikus, a helyzetet tekintve szakértői tudással járulhatnak hozzá a kutatáshoz azáltal,

hogy hozzáteszik az adott kontextusban jelen lévő

sokféle különböző szempontot és meglátást.

A részvételi akciókutatás intervencióiban az egyik alapelv a részvétel,

ami egyszerre funkcionál eszközként és a társadalmi változást előidézni hivatott intervenció céljaként.

A részvételi akciókutatás felismeri azt, hogy az adott probléma a csoportban egy konkrét kontextusban

és egy konkrét, jól definiálható időpillanatban jelentkezik.

A kutató tehát a problémára csak felhívja a figyelmet, nem generálja, és a szerepe az, hogy segítsen a csoportnak/közösségnek

megálapítani azokat a legfőbb tényezőket, amik

segíthetnek nekik cselekvéssel továbblépni.

Így hát azoknak, akik a részvételi akciókutatás szemléletével szeretnének dolgozni, egy kollaborációs, együttműködésen alapuló helyzetet kell teremteniük,

amelyben párbeszéd zajlik a közösség tagjai és a szakemberek között a megvizsgálandó

problémák, a kutatás módja, és a változás

előkészítése tekintetében.

Ahogy Vargiu (2008) kiemeli, Az akciókutatás területe nagyon különböző tapasztalatokat hoz létre, de ezeket egyesíti a tény, hogy két fő tárgyra törekszenek: a megértésre és a változásra. Az irodalmat elemezve, lehetséges úgy definiálni az akciókutatást, mint a „megközelítések családját" (Reason 1994, Reason – Bradbury 2006), mely arra irányul, hogy a kutatást a közösség szolgálatába helyezze. Aktiválja a részvételi gyakorlatot, hogy szociális változást érjen el. Ez lényeges különbségeket foglal magában, amellett hogy tiszteletben tartja a kutatás más formáit, tekintettel a célkitűzésekre, ahová a kutató irányítja magát, ismeretelméleti hipotéziseit és gyakorlatát. (p.206). A szerző szerint ez a „család" összekapcsolódik olyan megközelítésekkel és gyakorlattal, mint:

1) akciókutatás, 2) részvételi kutatás, 3) részvételi akciókutatás, 4) akció tudomány, 5) akció vizsgálat, 6) az akció szociológiája vagy sociologie de l'action (Bartoletto, 2006). Vargiu (2008) szintén hozzátette, azokat a tapasztalatokat, amik visszavezethetők a Közösség Alapú Kutatáshoz, a Közösség Alapú (Részvételi) Akciókutatáshoz és megfigyelte, hogy a részvételi kutatás és a részvételi akciókutatás behozható abba a kutatási kategóriába, amit Capecchi (2006) úgy definiál, mint "con-ricerca" (209.o.) A szerző szerint, ami hasznos megkülönböztetés lehet, az hogy a részvétel szintje előre látható a kutatási folyamatban, hogy a tárgyak definíciójában mennyi az eljárási elem és eszköz, a szubjektív és kollektív dimenziónak adott tér.

A részvételi kutatás és az akciókutatás egyre inkább központi paradigmájává válik a szociális tudományoknak (Brydon-Miller et al. 2004, Greenwood & ílevin, 1998, Kindon, Pain & Kesby, 2007, Jason et al., 2004, Park et al., 1993, Reason & Bradbury, 2006, Selener, 1997; Taggart, 1997). Ahogy jelezték Kindon, Pain and Kesby (2007) és Mackenzie és kollegái (2012), a Részvételi Akciókutatás (RAK) magában foglalja a kutatókat és résztvevőket a teljes projectben, célja megvizsgálni a problematikus feltételeket vagy akciókat és jobb irányba módosítani őket. (Wadsworth, 1998). Ez egy együttműködő kutatási, tanítási és akciós folyamat (Hall, 1981), szociális transzformáció felé irányul (McTaggart, 1997), kezdve a sokféle tudás jelenlétének felismerésétől, változó szervezetekben és kontextusokban (Kindon, Pain and Kesby, 2007). A folyamat ciklikus (reflekció-akció ciklusokon alapszik): a kutatók és a résztvevők meghatároznak egy problémát vagy szituációt, ami változást igényel és kezdeményeznek egy kutatást, amely készségeket és forrásokat hív fel, hogy felgyorsítsa a megfelelő cselekvést. A kutatók és a résztvevők is reflektálnak erre az akcióra, tanulnak belőle és tovább mozdulnak a kutatás/akció/reflekció új ciklusára. Ahogy Kindon, Pain and Kesby (2007) meghatározza, ők kooperálnak is a kontextus-specifikus módszerek fejlődésében, hogy facilitálják ezeket a ciklusokat. Összefoglalva, a RAK a párbeszédre fókuszál a kutatók között (Kindon, Pain és Kesby, 2007) és a RAK ezért egy orientáció a kutatás végzése során (Reason 2004; Kesby et al, 2005), ami módszertani fejlesztést igényel és a kutatási folyamatot úgy tekinti, mint az eredményét: a hatékonysága nem csak vele jár az összegyűjtött információk minőségével, de a résztvevők készségeinek, tudásának, képességeinek mértéke határozza meg, amik a kutatási tapasztalat alatt fejlődtek. (Cornwall és Jewkes 1995; Kesby et al., 2005, 2007; Maguire 1987).

Reason and Bradbury (2006) érvelnek egy részvételi perspektíva vagy világ szemlélet adoptálásának szükségessége mellett, ami „arra kér minket, hogy legyünk helyben lévők és reflektívek együttal, legyünk határozottak a perspektívával kapcsolatban, ahonnan az ismeret létre jött, a vizsgálatot tekintsük a tudás folyamatának, hogy szolgáljuk az akciókutatás demokratikus és praktikus erkölcsi világképét." (7.o.) Összhangban Kindonnal és kollegáival (2007), a kulcs egy ontológiai nézet, mely azt vallja, hogy az emberi lények dinamikus tényezők, felruházva reflektív készségekkel és személyes változással, és egy ismeretelmélet, mely megragadja ezeket a készségeket a kutatási folyamaton belül.

Egy alapvetően részvételi perspektiva alapján, a RAK-ban a részvétel módjának és szintjének kiválasztása nem csak elsődlegesen a kutatók által történhet, hanem megtárgyalják a társ-kutatókkal és a résztvevőkkel. A leggyakrabban használt módszerek a RAK-ban a párbeszédre, a történetmesélésre és a közösségi akciókra fókuszálnak. A leggyakrabban használt módszerek (Kindon, Pain and Kesby, 2007):

- Felmérések
- Résztvevő megfigyelés
- Másodlagos adat analízis
- Csinálva tanulás
- Párbeszéd
- Politikai akció
- Csoport munka és megbeszélés
- Interjú
- Történetmesélés
- Leképezés
- Közösségi művészet és média
- Diagram készítés
- Oktató táborok
- Csere programok
- Besorolás és pontozás
- Megosztott analízis, írás és prezentációk

Ahogy már kiemelték, az akciókutatás részvételi akciókutatássá válik, attól függően, hogy ki vesz részt az egyes fázisokban és milyen mértékben. A résztvevők és a társkutatók tájékoztathatják a tervezést, javasolhatnak módszereket, facilitálhatnak néhány aktivitást és mindenekfelett áttekinthetik és értékelhetik az egész folyamatot. (Mackenzie et al., 2012). A tervezési fázistól kezdve a RAK igyekszik használni a megalapozott kutatási technikákat, adaptálni a szituációhoz és úgy véli lényeges felépíteni egy stratégiát (az akció előtt), hogy monitorozni és értékelni lehessen az akció hatékonyságát. Ennek meg kell engedni az a változás mértékének felismerését, de ugyanakkor ki kell fejtenie egy erős ismeretelméleti tudást azzal szemben, ami a kapcsolat az érvényesség és kiugrás az új vagy feltörekvő tudásban, hasonlóan a szisztematikus gondolkodási szisztémához (Ison, 2008). A hatékony monitorozás és az értékelő eljárások biztosítják a folyamat szigorát, hogy értékelje az akciókutatás közbenjárásának hatékonyságát, alkalmasságát és jelentőségét. Ez egy keretmunkát is biztosít az okozati összefüggések megállapításához, hogy meghatározza a szituációban vágyott változások kutatás „okozta" vagy „hozzájárult" mértékét. (McAllister és Vernooy, 1999)". (12-13.o.). A résztvevők értékelése a folyamatról és a kimenetről egy további utat biztosít arra, hogy az érdekelt felek bevonását megszilárdítsa és lehetőséget ajánljon kollektíven arra, hogy közösen hozzanak létre egy aktív és kritikus szerződést, amiben alternatív hangok nélkülözhetetlenek és gazdagítóak. A RAK ezért azt kívánja a kutatótól, hogy adja fel az irányítást és a folyamat facilitátorának szerepét vegye fel. (Kindon, Pain és Kesby, 2007; Janssen et al., 2013).

Ahogy Kangovi és kollegái kiemelték (2014), a mentális egészség területén a RAK jó stratégiának bizonyult, hogy működőképesen vonják be a pácienseket a tervezésbe. A RAK kooperatív és ismétlődő természete megengedi a kutatóknak, az egészségügyi stábnak és a pácienseknek, hogy együttműködjenek a beavatkozások tervezésében, amit a végső felhasználók értékelnek. Arra is használható, hogy adaptálják egy meglévő beavatkozásra speciális igényekhez, és amikor elterjedt, új beállításokhoz és/vagy páciens csoportokhoz. Fiatal populáción való alkalmazás területén, ahogy Shamrova és Cummings (2017) mondják, a gyermekjogok paradigma nagy ösztönző erővel bírt a kutatók számára, hogy felismerjék a gyerekeket, mint a jelentés felépítésében lévő aktív résztvevőket. Ebben a RAK egy olyan mechanizmus, amin keresztül a képviseletet kiosztották a résztvevőknek, támogatva a gyermekjogok végrehajtását. (Checkoway, 2011; Quijada Cerecer, Cahill és Bradley, 2013; Shamrova és Cummings, 2017). Továbbá az irodalomban, az eredmények alkalmazásának vonatkozásában, a szervezési szinten is jelentik, hogy a leggyakoribb változást a szervezési kultúrában érték el: a részvételi lehetőségek növelésével, a gyerek bevonódási szintjének növelésével és nagyobb figyelmet fordítottak arra, hogy a programok jobban illeszkedjenek a gyerekek és a fiatalok igényeihez. (Shamrova és Cummings, 2017). Ebben a szerzők leírnak néhány módszertani választást, ami segíthet a gyerekek hatékony részvételének támogatásában:

- tréning
- gyerekbarát adatgyűjtési módszerek kidolgozása és használata
- gyerekek aktív bevonása az adatok analizálásába és az eredmények értelmezésébe
- szignifikáns helyszínek választása a kutatás eredményeinek terjesztésére

Sérülékeny csoportokkal végzett kutatás tekintetében, amint azt Lushey és Munro (2015) jelzi a RAK a gyerekek részvételi jogát hirdetheti és azokét akik elvesztették a gondozásukat, egyúttal informálhat a tapasztalati alap eredményekről a tanulmányokból, melyeket ezzel a populációval végeztek.

Egy konceptuális szinten különösen érdekes a Fiatalok Részvételi Akciókutatása (FRAK) (Anyon et al., 2018; Rodriguez és Brown, 2009), amely magában foglalja a következő alapelveket:

1. vizsgálaton alapszik

2. a megfigyelt területek a fiatal emberek által megélt tapasztalatok

3. részvételi

4. átváltoztató természete van

A kulcs folyamatok a következőek:

a) az erő megosztás a fiatalok és a felnőttek között az egész folyamat alatt

b) tréning és a kutatás és az érdekképviseleti módszerek alkalmazása

c) a stratégiai gondolkodás kritikai használata azon, hogy szociális változást hogyan lehet elérni

d) szövetségek kiépítése minden érdekelttel

Végül egy RAK paradigmán alapuló kutatási példa, amit Törrönen és Vornanen (2014) végzett ápolás-elhagyókkal. A fenti elvek sorrendjében, ahogy a szerzők jelzik, a szakmabeliek és a kutatók bevonódtak egy támogató szerepbe, míg a fiatalok lefolytatták az interjúkat, összegyűjtötték az adatokat a párjaiktól és bátorították a vélemények megosztását a tapasztalatokról (Törrönen & Vauhkonen, 2012). A központi aspektus valójában a figyelem a segédkutatók csekély bevonódásának a víziójára, ezért ők teljesen bevonódtak a kutatási folyamatba.

Transcript

Többféle kutatási bizonyíték létezik, és nagyon fontos,

hogy értsük a köztük lévő különbségeket. Van a kvantitatív

kutatás, ami intervenciós tanulmányokat

és kutatások eredményeit vizsgálja. Ez az a fajta kutatás, amellyel

sok statisztikai elemzést lehet végezni. Ide tartoznak pl. a klinikai vizsgálatok,

a randomizált, kontrollált vizsgálatok, eset-kontroll vizsgálatok; a legmagasabb szintűek pedig

a metaanalízis és a szisztematikus áttekintés. A klinikai gyakorlat irányelveit a legtöbb

esetben a kvantitatív kutatások eredményeire alapozzák. A másik típusú kutatás

a kvalitatív kutatás, aminek a célja

az emberi viselkedés megértése, hogy az emberek hogyan

reagálnak egy-egy helyzetre. A leggyakrabban olyan területeken

találkozunk ezzel a típussal, mint az ápolás és a társadalomtudányok,

pl. fenomenológiai tanulmányok formájában, ahol azt a jelenséget vizsgálják, hogy az ember beteg,

vagy valamilyen egészségi gonddal küzd. Beletartozik ebbe az etnográfiai
csoportok tanulmányozása, ami az antropológiában gyökerezik. Tehát megvizsgálunk egy csoportot,
akik egy bizonyos egészségügyi gonddal küzdenek. A kvalitatív kutatás nagyon fontos ahhoz,
hogy hogyan végezzük a segítő foglalkozásokat, mert biztosítanunk kell azt, hogy
a páciensek jó élményben részesüljenek azáltal a segítő szolgáltatás által, amit kapnak.
A legmagasabb szintű kutatásnak a szekunder kutatást tartják, ami
a szisztematikus áttekintés vagy metaanalízis. Amik ebben mások, az többek között az, hogy
egyformán szigorú szempontok alapján
tekinti át egy bizonyos tudományos témában elvégzett összes kutatási tanulmányt.
Mindegyiket egyforma szigorral ellenőrzi és elemzik.
Egy szisztematikus áttekintés egészen más, mint egy
szakirodalmi áttekintés, mivel a szisztematikus áttekintésnek és a metaanalízisnek
át kell mennie szakértői felülvizgálaton, vagyis két vagy három másik embernek is
értékelnie kell a szisztematikus áttekintésben vagy meta-analízben szereplő tanulmányokat.
Szisztematikus áttekintés készítésekor továbbá néhány más dolgot is
biztosítani kell annak érdekében, hogy a pácienseknek a megfelelő ellátást
biztosítsuk. Meg kell vizsgálni, hogy az áttekintés eredményei valóban
kivitelezhetőek-e. Valóban meg lehet valósítani az adott, konkrét páciensállományon?
Megfelelő lesz? Értelmezhető az általam kezelt betegek esetén,
az én egészségügyi szolgáltatási gyakorlatomban? És valóban hatásos lesz?
Valóban segíteni fog? Azt is tudni kell, hogy nem minden kutatási eredmény egyforma,
ezért nagyon fontos, hogy egy egészségügyi szolgáltatásnyújtó
alaposan megnézze az általa talált tanulmányokat. Meg kell vizsgálnia, hogy
milyen szintű kutatásról van szó. Az alap szinten vannak az eredeti
kutatási tanulmányok, mint például a randomizált, kontrollált tanulmányok
és a hasonló dolgok. A következő szint a szisztematikus áttekintések
a metaanalízisekben: mint mondtam, ez úgy készül, hogy a kutató
az összes, egy adott témában készült kutatási anyagot áttekinti,
kritikusan értékeli és szintetizálja őket, majd mindezt szisztematikus
áttekintésként illeszti össze egy egésszé. Ezt egy magasabb szintű kutatásnak
tekintjük a bizonyítékok hiararchikus sorában. A legmagasabb szintű pedig a klinkai
döntéstámogatás. Ezek olyan eszközök, amelyeket az egészségügyi

szolgáltatásnyújtók azonnal használni tudnak, azonnal gyakorlatba ültethetnek, miután elolvasták őket. Ez miért fontos? Mert az egészségügyi szolgáltatásnyújtóknak legtöbbször nincs idejük elvolasni száz, kétszáz, háromszáz oldalas szisztematikus áttekintéseket és metaanalíziseket, mielőtt döntést hoznak egy páciensről: a bizonyítékokat kell elolvasniuk, és azt azonnal gyakorlatba ültetniük. Ebben segítenek a klinikai döntéstámogató eszközök.
A klinikai döntéstámogató eszközöknek szisztematikus áttekintéseken, metaanalíziseken, bizonyítékösszegzéseken, vagy az elérhető legjobb bizonyítékon kell alapulniuk.

A bizonyítékokon alapuló kutatás terminus (BAK) 2009-ben jött létre, hogy jelezze a megközelítést, ami ellensúlyozza a biomedikai kutatás jelentős veszteségforrását (Robinson, 2009), ami az elsődleges tanulmányok következtében jelentek meg, a rendelkezésre álló bizonyítékok szisztematikus áttekintése nélkül. Ez sem etikus sem tudományos nem volt. (Lund, H. et al., 2017) A bizonyítékokon alapuló kutatás mindig szisztematikus áttekintéssel (SÁ) kezdődik, amely magában foglalja aez lőre meghatározott kutatási kérdéseket, bevonási kritériumokat, kutatási módszereket, kiválasztási eljárásokat, minőség értékelést, adat kivonást és statisztikai analízist (Lund, H. et al., 2017). Az SÁ-eket használják a kutatások megértésére és rangsorolására és hogy valyon szükséges és hasznos a közösség számára vagy lehetséges forrása az elvesztegetett erőforrásoknak, mert nem hoz létre új tudományos ismeretet. A vezérfonalakat a Bizonyíték irányítja, ezt a GIMBE Alapítvány nyitott hozzáférésű újságja (Bizonyítékokon Alapuló Orvostudomány Olasz Csoportja) mutatja be a következő bizonyítékokon alapuló kutatási projektben:

1. Kialakítja az előzetes kutatási kérdéseket és azonosítja a megfelelő szisztematikus áttekintéseket

2. Értékeli a cél adekvátságát, minőségét és a kutatás időszerűségét

3. Részleteiben értékeli: a populációt, a beavatkozásokat, összevetéseket, kimeneteleket éa az időtartományt (PICOT/PBÖKI)

4. Értékeli a módszert és az eredményeket

Végül a kutatóknak a tanulmány végső kérdésének megfogalmazásához is alkalmazniuk kell a SÁ-t, amit szeretnének hirdetni, igazolni a szükségességét a támogatás kéréséhez és az etikai bizottság jóváhagyásához, az új tanulmány eredményeinek értelmezéséhez a rendelkezésre álló bizonyítékok kontextusában , és a jövőbeli kutatások ajánlásában. Az idők során egy exponenciális növekedés történt a bizonyítékokon alapuló kutatásban, ami oda vezetett, hogy körülbelül 2 millió cikk jelent meg, több mint 20 ezer újságban. Sok oka van ennek a növekedésnek, egyik oldalról az oktatási hivatás (JAMA, 1992) és a paradigma váltás (Pagliaro & Colli, 2014) ami ehheza gyakorlathoz vezetett, másrészről a bizonyítékokon alapuló kutatás erősségének jelenléte:

- olyan területeken is, aholnagyobb a bizonytalanság az értelmezésben, elérhető tudást és iránymutatást hozhat létre a szakmai gyakorlatban, mint a klinikusi gyakorlat
- csökkenti a veszteséget, mert definiálja a kutatási kérdések fontossági sorrendjét az előzetes szisztematikus áttekintés használata által.
- a kutatási tervek tiszta megfogalmazását hozza (célpopuláció, értelmezések, összevetések, kimenetelek)
- frissítéseket hoz létre és elterjeszti a szisztematikus áttekintéseket
- integrálja a bizonyítékokat a klinikai gyakorlatban

A következő példa egy felmérési módszerről Bean & Creswell (1980, 321-322.o.) által:

„A tanulmány helyszine egy kis (1000-es felvétel), vallásos, koedukált, liberális művészeti főiskola volt egy 175 ezres lakosú Közép-nyugati városban. Az előző év lemorzsolódási aránya 25% volt. A lemorzsolódási arány legmagasabb szokott lenni a gólyák és a másodévesek között, így megpróbáltak elérni annyi gólyát és másodévest, amennyit csak lehetett, amikor szétosztották a kérdőíveket az osztályok között. A veszteség vizsgálata azt mutatta, hogy a főiskolai lemorzsolódás okai különbözőek férfiaknál és nőknél (Bean, 1978; Spady 1971). Ezért ebben a tanulmányban csak nőket analizáltak. 1979 áprilisban 169 nő küldte vissza a kérdőívet. 135 nőből álló homogén csoportot választottak ki közűlük erre a vizsgálatra, akik 25 éves vagy fiatalabb, hajadon, teljes idős, amerikai állampolgár és kaukázusi volt. Közűlük 71 volt gólya, 55 másodéves és 9 harmadéves. A tanulók 95 %-a 18 és 21 év közötti volt. Ez a példa elfogult a magasabb képességű diákok irányában, ahogy az ACT teszt értékei mutatják. Az adatokat egy 116 elemből álló kérdőív segítségével gyűjtötték össze [...] ezek nagy többsége Likert-szerű elem volt, ami egy skálán alapult a „nagyon kis mértékben"-től a „nagyon nagy mértékben"-ig. Más kérdések tényekre kérdeztek rá, mint az ACT pontszámok, gimnáziumi jegyek és szülők iskolai végzettsége. Minden információ, amit az analízisben használtak a kérdőívek adataiból származott. A kérdőívet három másik intézménynél fejlesztették ki és tesztelték, mielőtt ebben a főiskolában használták. [A szerzők megtárgyalták az eszközt.] [...] Többszörös regressziós elemzést és út analízist használtak az adatok elemzésére [...]"

(Creswell, 2014,181-182.o.)

A következő egy kvalitatív kutatás példája (Cardano, Ortalda, 242-243.o.)

„ A kutatás célja a pre-adolescensek bevezetése a dohányzásba volt. (Frohlich, Potvin, Chabot, Corin, 2002). Miután rekonstruálták a pre-adolescensek közt a dohányzás elterjedtségét Quebec 32 tartományában és szereztek releváns információkat a fizikai kényszerről és „strukturális" forrásokról, amik hol akadályozzák, hol engedélyezik a dohányzási szokást ebben a populációban – a dohányboltok jelenléte, olyan közterületek jelenléte, ahol nem engedett meg a dohányzás, olyanok jelenléte, akik monitorozzák a kormányzati szabályozás betartását, ami a fiatalok számára árusított cigarettára és a közterületen való dohányzásra vonatkozik – a szerzők figyelmüket 8 tartományra fordították, melyekben fókusz csoportokat vezettek. Minden tartományban a helyi iskolák tanárainak közvetítésével toborozták a résztvevőket, ők tettek be őket, fiúkat és lányokat egy csoportba, ahol a tagok – lehetőség szerint – ismerték egymást és gyakran találkoztak a fókusz csoport előtt. Ebben a tanulmánybana résztvevők közös tudása egy forrássá vált, nem egy korláttá, felajánlva a kutatóknak a lehetőséget, hogy hozzáférjenek a beszélgetésekhez, amik talán kevésbé szelídek, a résztvevők életének kontextusában formálódtak. Az utóbbi ráadásul erősödött a közösségi támogatástól, képes volt kezelni a témát – a dohányzási szokást – amit nehéz volt megtárgyalni egy felnőtt résztvevő előtt, nagyobb nyugalommal. Az etnográfiai kontextus ismerete, a tartományban elterjedt nyelvi kódok a szociális gyakorlatban voltak azok a fókusz csoportok, lehorgonyzások, amik lehetővé tették a kutatók számára, hogy szembe nézzenek a nehézségekkel. Általában társították a főkusz csoportok megvalósulását a természetes csoportokkal: a felhívás a tapasztalatok megosztására nem volt teljesen megmagyarázva a beszélgetésben, a szleng kifejezések használata, index kifejezések használata.

Q3.1

4 points possible (graded)

1. Egy tudományos kutatás....

- Adat gyűjtéssel kezdődik
- Mindig lehetőséget ad a realitás hiteles vizsgálatára
- Mindig egy egyszerű módszert használ
- Mindig be kell számoljon a korábban megszerzett ismeretekről

2. Az akciókutatásban....

- A kutatónak teljesen semlegesnek kell lennie a kutatás tárgya iránt
- Megpróbáltak természeti törvényeket kikövetkeztetni a jelenség objektív analízisén keresztül.
- Nem kell szociális változást produkálni a kutatási kontextusban
- Bátorítják a kutatók részvételét és kooperációját

3. Mely lépések NEM részei minden bizonyítékon alapuló kutatási projektnek?

- Az eredmények értékelése.
- Az elmélet értékelése a gyakorlaton keresztül.
- Kutatási hipotézisek megszövegezése
- Az irodalom szisztematikus áttekintése

4. A központi eleme a Részvételi Akciókutatásnak:

- A fókusz a megosztott ismeret gondolatán van a kutató és a beavatkozás kedvezményezettje között.
- A fókusz a nem megosztott ismeret gondolatán van a kutató és a beavatkozás kedvezményezettje között.
- A tiszta és teljes elkülönítés az Akció és a kutatás között.
- A megvizsgálandó problémák és a használandó eszközök eleve kiválasztottsága

Bizonyítékokon alapuló kutatás a tic/tip-ben: nemzetközi perspektíva

A traumatizált kiskorúakkal foglakozó szervezetek egyik fő témája és az egyik legnagyobb kérdése az, hogyan garantáljon adekvát és hatékony tréninget a szakmabelieknek a bizonyítékokon alapuló értelmezések alapján (Ruzek & Rosen, 2009). Amikor megfigyeljük a kezelések végrehajtásának helyzetét és a bizonyítékokon alapuló vezérelveket egy általános perspektívából, annak ellenére, hogy ez a téma nagyon fontos a közegészségügy területén, a megvalósítás egyenlőtlen, korlátozott figyelem a szisztémás értékelésen, és a tréning programok hosszú távú hatásai vonhatók le. (Ruzek & Rosen, 2009). Ráadásul egy összehasonlító perspektívából Delaney (2006) kiemelt egy másik lényeges aspektust: nemzetközi szinten a vezérelvek és megvalósításaik a klinikai gyakorlat választható kezeléseiben nagymértékben változatos a nemzetek szintjén és a különböző népeknél (beleértve a közegészségügyi szabályozásokat). Weiner, Schneider & Lyons (2009) a traumatizált kiskorúak kezelésének bizonyítékokon alapuló módszereinek analízisét tanulmányozták. Ahogy a szerzők meghatározták, néhány ezek közül a tapasztalati vagy kvázi-tapasztalati módon tesztelt módszer, de a legtöbb módszer felnőtt populációra lett kialakítva, bár kiskorúak számára is használták őket és az értékelésben nem vagy kevéssé vették figyelembe a kulturális különbségeket és változatosságot az alcsoportokban, mint a kimenetelt befolyásoló faktorokat.

Ezekből a megfigyelésekből a kezelések kultúrközi értékelésének egy érdekes gyűjteménye származott, ami nem csak a hatékonyság növelését tette lehetővé, hanem megmagyarázza azt is, hogy milyen korlátok akadályozzák a kezelések kivitelezését és a rugalmas adaptációs követelményeket a speciális alcsoportok vagy alkalmazások körülményei közt. Courtois & Gold (2009) és Layne & kollegái (2014) kiemelték azt az igényt, hogy bevegyenek egy speciális fókuszt a trauma és következményei vonatkozásában a kezelők tréningjébe, kezdve azzal, hogy tudatosítsák a tényt, hogy a trauma és annak hatásai befolyással vannak a kezelés minden részére, különösen a páciens elköteleződésére, az értékelésre, és a kezelésre való reagálásra. Továbbá aláhúzzák, hogy ebben a tekintetben, hogyan játszik jelentős szerepet a nemzetközi standardok alkotása és a megosztott tréning módszerek a Bizonyítékokon Alapuló Gyakorlat kezelői számára. (BAG, Lyon et al., 2011). A BAG lehetővé teszi a kezelő számára, hogy a legműködőképesebb megoldást válassza, speciális szituációra érvényesítve és alkalmassá téve, a kliens speciális igényeire, erősségeire és körülményeire alapozva. (Layne et al., 2014). Azért, hogy a megfelelő tréninget tudják garantálni, ebben a tekintetben, szükségszerű a tudományos közösség számára, hogy létrehozzanak egy definíciót a központi kompetenciák számára, ami egy alaptudás arról, amit a trauma történetének kezelésében alkalmazni kell. Ennek a fajta figyelemnek különösképpen lehetővé kell tennie, hogy az ajánlott szolgáltatások jó minőségűek legyenek, a kezelők felelőssége növekedjen és terjedjen a tudás, amit megosztanak, gyakran protokollokon keresztül, vagy különböző csoportokon keresztül (pszichológia, pszichoterápia, szociális tudományok, pszichiátria, stb.) A Nemzeti Gyermek Traumás Stressz Network (NGTSN/NCTSN) egy szakmabelieknek, családtagoknak, kutatóknak és nemzetközi partnereknek szánt honlap, ami a gondozási standardok javulásával foglalkozik és hozzáférést biztosít a gyerekekkel és családokkal foglalkozó szolgáltatóknak. Az NTCSN létrehozott egy tréning protokollt CCCT (Gyermekkori Trauma Alap Tanterv/Curriculum) (Layne et al., 2011), amely tisztázza a beavatkozások főbb elemeit (egy integrált, bizonyítékokon alapuló mátrixba foglalva őket), a trauma alap koncepcióit, a tervezéshez szükséges lényegi terápiás készségeket, és egy hatékony beavatkozás végrehajtása traumatizált gyerekek és családjaik számára. Alapvetően két elem tűnik fel: a beavatkozás célja (azok a célkitűzések, amelyek várhatóan megfelelnek majd a beavatkozással kapcsolatos elvárásoknak) és a gyakorlati elemek (a ténylegesen alkalmazott folyamatok az eredmények eléréséhez). Az alapkompetenciákra összpontosuló figyelem a kezelők tréningjében, a specifikus „arany standardokban" definiálódik, az EBP tréninghez és a bizonyítékokon alapuló kezelésekhez képest.

A CCCT 5 szintet tartalmaz: a) empirikus bizonyítékok alapja; b) a gyermekek és családjaik traumatikus stresszválaszának megértésére alkotott 12 alapkoncepció; c) a beavatkozás céljai; d) gyakorlati elemek (a ténylegesen alkalmazott folyamatok az eredménynek eléréséhez); e) terápiás készségek és képességek (két alkategória: 1) procedurális és folyamatorientált; 2) kiértékelő). A fent említett modell támogatja a bizonyítékon alapuló gyakorlatokat és kompetenciákat, a rutinszerű kiértékelést és információgyűjtést, a gyakorlat elméletét, a tudományos irodalomból származó eredmények egyéni szituációkban való alkalmazását, az esetek konceptualizálását, és a beavatkozás megtervezését. A CCCT modell vizsgálata és alkalmazása során az egyik munkacsoport külön alkalmat tervezett a statisztikai analitikai készségek fejlesztésére és olyan tanulási protokollok létrehozására, amelyek hasznosak a klinikai gyakorlatban való értékeléshez. Ami a leginkább hansúlyozható ezzel kapcsolatban, az a mind az elméleti aspektusok, mind a kiértékelési módszerek (multidimenzionális) fejlesztése, valamint a bizonyíték hozzáférhetősége a beavatkozások kiértékelése és érvényesítése során (különösen figyelembe véve azok kimenetelét, a beavatkozó tényezőket, a személyek speciális helyzetére fókuszáló beavatkozások hatékonyságát). Briggs és kollégái (2012) továbbá prioritásként jelölik meg a standardek emelését a „[...] bizonyítékokon alapuló módszerek fejlesztésén, alkalmazásán és elterjesztésén" keresztül (p.1). A beavatkozás vezérfonalainak struktúrálása – azonosítani és a módszereket (mi a lehető legjobb beavatkozás a speciális körülmények között), és a kimenetel értékelése – alapvető és hasznos a kezelők számára és azoknak, akik a szolgáltatások kialakításával foglalkoznak. A kutatás tervezés hasznos lehet azoknak, akik fontolgatják, hogy összekapcsolják a rizikó faktorokat és különböző kimeneteket, abból a célból, hogy tisztázzák a beavatkozás mely elemeire lehetne fókuszálni, továbbá, ismétlődően, bevonjanak új aspektusokat a trauma teoretikus megértésébe és a tudományos keretrendszert tágítsák. Különösen érdekes tény, az a megfigyelés, hogy a PTSD-vel összefüggő tünetek enyhítését célzó kezelések a funkcionális nehézségek csökkentésében is hatékonyak, nem közvetlenül kapcsolódva a kezelés tárgyához. Ez megvilágítja, hogy a traumára fókuszált kezelés pozitív, széles körű hatást tud generálni. (Layne et al., 2010).

Tic-vel foglalkozó szervezetek tréning igénye

VIEW UNIT IN STUDIO

Bookmark this page

Bryson és kollegái (2017) lefektettek egy érdekes premisszát, hogy hasznos megkülönböztetni a visszatükrözés két szintjét. A modul témáinak analízisére és értékelésére alkalmazva a szerzők külön választják a trauma-specifikus kezeléseket (ezek a traumával kapcsolatos tünetek csökkentését célzó beavatkozások) a TIC-től, ami egy általános perspektíva, aminek a célja a gondozói rendszer átváltozása, a TIC magában foglalja a traumával kapcsolatos stressz válaszok minden szinten való megértését a szolgáltatások szervezetének minden aspektusában. A széles körű kérés ellenére, hogy a TIC elveit alkalmazzák a szolgáltatások, az előnyök ellenére, amivel ez járhatna, a tudományos hozzájárulás a TIC végrehajtására fiatalkorúaknál, sajnos korlátozott. (Bryson et al., 2017). Ruzek & Rosen, 2009-ben, már megfigyelte, hogy a PTSD-vel kapcsolatos tünetekre fókuszáló, bizonyítékokon alapuló kezelések elterjesztése volt az egyik kulcs elem, amihez a traumát átélt embereket támogató szervezetek elköteleződtek. Ezt, mint eredményt mi is tanúsítottuk a tudományos irodalom növekedésével, ami a szervezeti faktorokkal foglalkozik és ez együtt járt a legjobb gyakorlatok megvalósításával és elterjesztésével. Ennek ellenére egy korábbi analízis, amit Delaney (2006) mutatott be, megerősítve Ruzek & Rosen (2009) és Bryson és kollégái (2017) által, egy erős bizonytalanságú tényező jelent meg a gyakorlatban, mint a korlátozás és az izoláció. Továbbá, ahogy Valenkamp és kollégái (2014) és szintén Bryson és kollégái (2017), néhány tanulmány tesztelte ezeknek a beavatkozásoknak a hatékonyságát, mikor összevetették más alternatív elfogadó módszerekkel. A beavatkozási módszerek bizonytalansága, Ruzek & Rosen (2009) szerint, feltárja egy összehasonlító analízis eljárásának szükségességét, a vezérelvekről és a legjobb nemzetközi gyakorlatokról, azért, hogy még inkább megalapozzák a szervezeti változtatási javaslatokat a területen és az irányelvek szintjén még inkább bizonyítékokon alapulóak legyenek. Bryson & kollégái (2017) a tudományos irodalom szisztematikus áttekintésén keresztül megpróbálták kiemelni, hogy milyen faktorok teszik lehetővé a TIC alkalmazásának működését. Milyen felhasználók, milyen körülmények között, milyen irányban, és miért.

A legszélesebb körben figyelembe vett stratégiák, amiket megosztottak tudományos leírásokban: 1) változás-orientált vezetés, 2) kutatási adatok használata a gyakorlat informálásában, 3) stáb fejlesztés, 4) eszközök használata a korlátozás és izoláció megelőzése érdekében, 5) a felhasználók szerepe a tartózkodásuk kontextusában, 6) kérdezési technikák. Figyelembe véve a szükségletet , hogy analizálják ezeknek az elemeknek a működési komplexitását, miközben össze is kapcsolják őket helyi és szervezeti sajátosságokkal, a szerzők meghívása a TIC alkalmazással foglalkozó szolgáltatók számára, megelőlegezve a demonstráció megkísérlését, a tudományos kutatás folyamatán keresztül, egy hosszú távú perspektívában, az erőfeszítés és a változás hatékonyságát alkalmazták a páciensek biztonságának javulásáért, úgy mint a kezelések hosszú távú kimenetele. Összefüggően ezzel a perspektívával, Lang és kollégái (2016) aláhúzzák, hogy milyen fontos egy konszenzust elérni abban, hogy mi minősül egy trauma- fókuszú szolgáltatásnak és hogyan lehet hatékonyan mérni a bevonódott faktorokat. Mindenekelőtt, a központi kérdések: hogyan lehet elérni egy optimális titoktartási folyamatot, hogyan lehet legjobban működésbe hozni a TIC alap princípiumait a napi munkában a potenciálisan vagy biztosan traumának kitett alanyokkal és mik lehetnek a legjobb módszerek arra, hogy fejlesszék a szolgáltatókat, akik ezzel a populációval foglalkoznak. Jelenleg kevés kutatás foglalkozik a változások hatékonyságával a TIC alapú szervezetekbe bekerülő pácienseknél, és hogy ezeknek a változásoknak milyen része hasznos az egészségre nézve a résztvevő felhasználóknál. A kutatók kihangsúlyozták, hogy valójában egy kihívás lehetne a EBP (bizonyítékokon alapuló gyakorlat) kutatás és a legjobb gyakorlatok integrációja, acélból, hogy a szolgáltatók által felajánlott beavatkozások minősége javuljon (miközben figyelembe veszik ezeknek a kezdeményezéseknek a gazdasági hatás elemzését is), a stáb kompetenciáinak fejlődésén keresztül, a szűrési eljárásokon és az irányelvek változási képességein át. Ez irányban a vezetőség játszhat kritikus szerepet, amely támogathatja a változás folyamatát, néha radikálisan, még a szervezeti kultúra szintjén is (kihangsúlyozva, például a TIC fontosságát).

A trauma tréning egy központi alkotóelem, de ez nem elégséges, hogy egy szervezet trauma-érzékeny legyen. Egy másik fontos aspektus, ahogy Kramer és kollégái (2013) meghatározták, a különböző szervezetek együttműködése, amelyek a kiskorúakkal és családjaikkal foglalkoznak, akiknek meg kell egyezniük a TIC alapelveiben. Ebben az utolsó aspektusban a szerzők analizálták a tréning hatékonyságát, mely speciális tudás megszerzésére törekszik adekvát felmérési eszközök hosszútávú alkalmazásáról (tréning előtt és után), úgy mint egy követő felmérés, hogy analizálják mennyire voltak eredményesek ezek a szerzett képességek változást eredményezni a kérdéses szolgáltatónál. Ennél a speciális aspektusnál, egy érdekes téma a korlátok analízise, melyek az egész stábot érintették. Az összehasonlító kutatási struktúra (randomizált csoportokkal), azt akarta megvizsgálni, hogy mennyire hasznosak az alkalmazott stratégiák és vannak e további tréning igények hosszú távon.

A trauma kutatás elterjesztése szervezeti helyzetekben

VIEW UNIT IN STUDIO

Bookmark this page

Amikor a kutatás elterjesztéséről beszélünk, szervezeti körülmények között, Ruzek & Rosen (2009) aláhúzza ennek komplexitását: mikor a modellek az elterjesztéssel foglalkoznak, kiemelik hogyan függ ez sokféle faktor interakciójától, különböző szinteken (egyénilag és szervezetileg). Briggs és kollégái (2012) bemutatják hogyan ismerhető fel, ha a tudásban történt változás megjelenik az első lépésben a szervezeti változás felé, de annak az értékelése, hogy ez hogyan mutat tovább vagy fordítódik át aktuális viselkedésbeli változásba ugyanolyan alapvető. Két aspektus tűnik fontosnak: a tudományos tartalom elterjedésének szisztémás és többszintű komplexitása a szervezetekben, és az a folyamat, ami összeköti a tudást és a gyakorlatot az egyéni és szervezeti változás komplex mechanizmusán keresztül. Ez a folyamat előhozza az egyik leggyakoribb ellenállást az új, legjobb gyakorlatok alkalmazásával szemben: a tény, hogy az alkalmazásukat választották a szervezetben gyakran „felülről lefele"-ként tapasztalják, és ezért a klinikusok nem nagyon támogatják. (Rohrbach et al., 2006; Ruzek & Rosen, 2009). Valójában ebben az esetben a kezelők elköteleződése a szervezeti praxisukban történő változáshoz egy központi dimenzió. Ahogy a tudósok hozzájárulása javasolja, a változásról történő megegyezést megtárgyalása a vezetőség és a beosztottak között, szem előtt tartva a helyi igényeket, hozzájárul a sikeres alkalmazáshoz. (Durlak & DuPre, 2008; Ruzek & Rosen, 2009). Egy másik központi téma az a tény, hogy az egészségügyi szervezetekben sokszor nincs speciális EBP (bizonyítékokon alapuló kutatás)-ban jártas személy a stábban, hogy tanulmányozza a legjobb gyakorlatokat és stratégiákat az alkalmazásban, és különösen, hogy analizálja és rendszerezze a tudományos kutatások eredményeinek folyamatos integrációját. (Berwick, 2003; Ruzek & Rosen, 2009).

Erre tekintettel, Marvin & Volino Robinson (2018) kiemelték a szervezetek szükségletét arra, hogy legyen egy elképzelésük, mely úgy szemléli az intézmény vagy szolgáltató analízisét magát, mint a képességet vagy készséget a változtató beavatkozás befogadására és fenntartására (az irodalom ezt „szervezeti felkészültségnek" hívja, és mérni lehet, szervezeti, csoport vagy egyéni szinten). Ezzel a dimenzióval foglalkozni a tervezési fázisban teljesen helyénvaló, hogy fenntartsák az új gyakorlatok alkalmazását, hogy analizálják a korlátokat a folyamatban és fenntartsák a hitet és a pozitív attitűdöt a szervezeti változás iránt. Egy széleskörű megfontolása ennek a témának a központiság, hozzá kell rendelni az ajánláshoz, mikor a célzott változási stratégiát felépítik egy speciális szervezetnél (Augustsson et al., 2017; Marvin & Volino Robinson, 2018). A kutatás bizonyítja, hogy a vezetői és manageri elképzelések közös konstrukciója milyen fontos a változás útján, szinkronban a szakemberekkel és kultura-orientált módon megosztva a TIC alkalmazást, először is a stáb igények

Kutatás a trauma-fókuszált szolgálatoknál

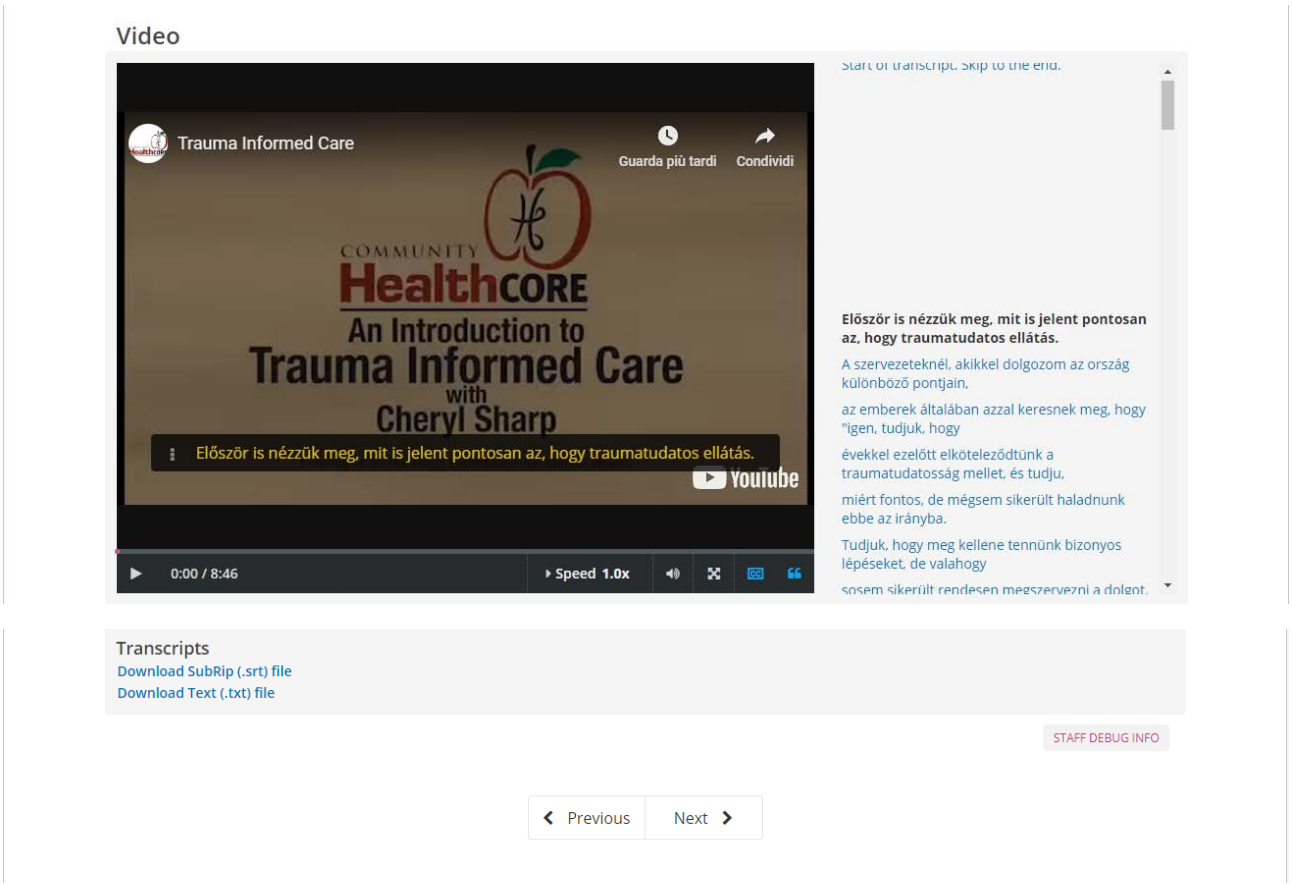
A TIC-et lehet úgy definiálni, mint egy bizonyítékokon alapuló megközelítést a traumára való reagálásban, ami a stábtagok képességeire (vagy képtelenségeire) fókuszál, akik részt vesznek a traumatizált páciensek kezelésének elképzelésében. Egy kritikus előjele az adoptált startégiák sikerének vagy a kudarcának, az hogy lecsökkentsék a kliens újra traumatizálódásának kockázatát.(Marvin & Volino Robinson, 2018). Ebben alap, hogy óvatosan tárjuk fel a történetek komplexitását, amiben a trauma történt, a különböző és egyéni tapasztalatokat. Az irányelvek, eljárások és a napi működés lehet egy hozzáadott traumatizáló élmény vagy a traumatizált személynél olyan egyéni funkcionális kapcsolt reakciókat provokálhat, ami megakadályozza, hogy a számára szükséges gondozást elfogadja. Azért, hogy megelőzzük ezeket a szituációkat és hogy stresszt generáljunk a stáb tagokban, hasznos lehet, ha speciálisan strukturált és nemzetközileg kipróbált legjobb gyakorlatokra váltunk. (lásd például SAMHSA által 2014-ben ajánlott stratégiák). Szinergikus kapcsolatban ezzel, a TIC megközelítés arra invitálja a szervezeteket, hogy vegyék figyelembe azt a hatást, amit a klinikai szolgálatokba ömlő traumatikus történetek gyakorolnak a tagokra (SAMHSA, 2014; Knight, 2015) és hogy a kezelők hogyan kaphatnak segítséget tréningeken keresztül és trauma-érzékeny vezetőség által, hogy egy magas szintű jóllétet és a munkában hatékony beavatkozásokat tudjanak elérni. (Manderscheid, 2009). Ruzek & Rosen (2009) mélységében vizsgálták azokat a faktorokat, amik hatással vannak annak a módjára, ahogy a szervezetek megkapják a kutatási eredményeket a a trauma kezeléshez kapcsolódó, bizonyítékokon alapuló gyakorlatokról. Egy gondos értékelés mind a gyakorlat elterjedéséről, mind a kutatásról magában foglalja a sokrétű faktorok elemzési területének összefoglalását, melyek hatással lehetnek a gondozási folyamat fejlődésére, a páciensek vagy potenciális felhasználók kapcsolatára a szolgáltatóval, a klinikusok új kezelési technikákat tanuló szokásaira, a szervezeti változásokra kapcsolódva a viselkedésbeli átalakulásra.

Bizonyára, a szerzők elképzeléseinek megfelelően, egy egyre sürgetőbb prioritás a tapasztalati kutatás alkalmazása ezen a területen, az értékelés vagy támogatás a kezelési módok alkalmazására, egy gazdaságilag megfelelő módon. A kutatók, általában, a kezelőkhöz kapcsolódó faktorok szerepét analizálták, amit a kutatás kiemelt a kimenetelhez kapcsolódóan. Megfigyelték, hogy a kezelők értékelései, különösen a traumához kapcsolódó stresszben (különösen, akik PTSD-vel foglalkoznak) egy speciális gyakorlatról, a kompetenciáik és jellemzőik (pl. a hatékonysági szintjük) a hajlandóságuk a változásra a konkrét gyakorlatban (pl. adoptálni egy legjobb gyakorlatot és bevezetni a napi működésbe) a befolyásoló tényezők, de alig tanulmányozzák őket empirikus szinten. Az EBP-s tréning programok megközelíthetősége és az aggodalom a fejlesztés alkalmazhatóságát illetően, hogy a kutatási terület megfeleő-e a ő speciális populációjára (az eredmények generalizálásának problémája) látszik a leg befolyásolóbb tényezőnek a bizonyítékokon alapuló gyakorlatok iránti attitúdjeikben, függetlenül az elméleti keretrendszerüktől. A tréning módszer, ami különösen hatékonynak tűnik, hogy változtasson a gondozói viselkedésen, az intenzív tréning kurzus, különösen, amikor a szükséges kompetenciák demonstrálásáról van szó, és amikor megkívánják ezek letesztelését az interaktív részvételen keresztűl az órákon (rendszeresen elérhető szuperízió mellett, a tréning eseményeken túl, és tréningezd a trénert- eseményeken). Üdvözölve az újítási faktorokat, a szerzők kiemelik, hogy a kliensek és kezelők észlelése a kezelésről egy lényegi eleme az adoptációnak, különösen vonatkoztatva ezt a bizonyított hatékonyságukra (összehasonlítva más módszerekkel). Üdvözölve a szisztémás tényezőket, megfigyelték hogy mennyire fontos a szupervízió elérhetősége és az adminisztratív-szervezeti támogatás egy jó gyakorlat sikeres alkalmazásához. (Fixsen et al., 2005) Még fontosabb szükséglet a tapasztalati támogatás a trauma-érzékeny gondozói rendszerek megalkotásában. (Ko et al., 2008; Ruzek & Rosen, 2009) Továbbiakban a kezelés alkalmazásának monitorozása egy másik kulcspontja az elterjedésnek, hatékonyságnak, a bizalomnak az EBP-s eljárás kiteljesedésében (Rosenheck, 2001b; DuFrene, Noell, Gilbertson & Duhon, 2005; Durlak & DuPre, 2008; Ruzek e Rosen, 2009). Egy különösen érdekes aspektus, amit Rosenheck elemzett (2001a), aki kiemelte a kölcsönösen rekurzív folyamatot a EBP-s interakciókban (az általános és előíró dimenzióiban) és a helyi tapasztalatokat/szükségleteket a kivitelezésben. A monitorozás célja, még annak a költségeivel szemben is, gazdasági és idő befektetési értelemben erőforrások a szolgálatok számára, ezért meg kell engedni a szolgálatoknak, hogy a kezelések kimenetelének lényegi elemeire és a hatékonyságára fókuszáljanak. (Ruzek & Rosen, 2009). Az egyik kulcskérdés lehet, hogy a klinikusok módosult válasza a speciális igényekre hogyan áshatja alá, növelheti vagy hagyhatja érintetlenűl a beavatkozás hatásait. (Ruzek & Rosen, 2009).



Transcript

Először is nézzük meg, mit is jelent pontosan az, hogy traumatudatos ellátás.

A szervezeteknél, akikkel dolgozom az ország különböző pontjain,

az emberek általában azzal keresnek meg, hogy "igen, tudjuk, hogy

évekkel ezelőtt elköteleződtünk a traumatudatosság mellet, és tudju,

miért fontos, de mégsem sikerült haladnunk ebbe az irányba.

Tudjuk, hogy meg kellene tennünk bizonyos lépéseket, de valahogy

sosem sikerült rendesen megszervezni a dolgot, megtenni azt a következő lépést."

A Nemzeti Tanácsnál kifejlesztettünk egy eszközt,

amit "szervezeti önfelmérésnek" neveztünk el.

Vettük a terület vezető szakembereinek ötleteit, olyan emberekét, mint

például Roger Fowler, Maxine Harris, Judith Herman és Sandy Blum,

és próbáltuk a munkásságukat oly módon szintetizálni, hogy az bemutassa, mik valójában

a traumatudatosságot képviselő gyakorlatok és alapelvek. Például az

"első a biztonság", az őszinteség, a kölcsönösség, a választás lehetősége,

a véleményalkotás, az irányítás, a közös munka, az, hogy az életük feletti kontrollt visszaadjuk az

emberek kezébe. Tehát összegyúrtunk egy "szervezeti önfelmérés" nevű eszközt

ezekből a gyakorlatokból és alapelvekből annak érdekében,
hogy a működés szintjére lehozzuk, hogyan is néz ki, ha egy szervezet elkezd mozdulni
a traumatudatosság irányába. Ez az önfelmérés egy 1-4 közötti Likert skálával dolgozik,
és van benne "nem alkalmazható" opció is. A traumatudatos ellátás
hét területét különítettük el, és ezen a hét területen belül lehet követni az
alapelveket. Minden területhez több szabvány, irányelv tartozik, de
ezek nem kizárólagosak; az önfelmérés lényege az, hogy a szervezetek
elkezdjenek kicsit másképp gondolkodni a munkáról, amit végeznek.
A hét terület közül az első a "szűrés és felmérés", amivel a célunk az,
hogy a kliensek, amikor egy szervezethez
fordulnak, akkor menjenek át egy szűrésen, de ugyanakkor
legyen lehetőségük bármiről beszélni,
bármilyen élményükről, kényes dologról, bizalmas módon. Ha valaki segítségért fordul
egy szervezethez, és nagyon fél, akkor lehet, hogy nem bízik az
ott dolgozókban. A célunk az, azt szeretnénk elérni, hogy
olyan környezetbe érkezzenek a segítséget kérő emberek, ahol nem kellemetlen nekik
egyes kérdések megválaszolása. A szakembereket pedig képezni kell arra,
hogy hogyan tegyék fel ezeket a kérdéseket, hogyan alakítsanak ki egy kapcsolatot
valakivel, a legelső alkalommal, amint az illető belép ajtón.
A második terület a "kliens-központú ellátás és szolgáltatások".
Nagyon örülök a Community HealthCore-nak, annak, ahogy az általuk végzett munkáról
gondolkodnak, annak, hogy sok embert képeznek ki és alkalmaznak
azok közül az közösségek közül, akiknek a szolgáltatás szól, ami igazán nagyszerű,
de nem ez az egyetlen eleme. Az ilyen segítők egész más szemmel látják a szolgáltatást:
tudják, milyen érzés átmenni a szűrési és felmérési folyamaton,
hogy milyen érzés, ha egy olyan csoportba teszik be az embert, ami nagyon nem neki való,
hogy milyen az, amikor maga a rendszer újratraumatizálja őket.
Az ő nézőpontjuk és véleményük fontos része ennek a munkának,
a kiensközpontú ellátásnak és szolgáltatásoknak. Akkor lesz valami igazán kliensközpontú,
ha felépülés-orientált és emberközpontú szemlélettel dolgozik,
ha a szolgáltatás igénybevevőinek van lehetősége elmondani,
hogy mi az, ami működik, jó nekik, és mi nem. Nagyon fontos az ő véleményük,

hogy biztosítva legyen az, hogy a célcsoport, a felhasználók, igénybevevők, kliensek
lehetőséget kapjanak elmondani, hogy mi az, amiben jól működik a szervezet,
és miben nem. Beszéltünk a munkaerőfejlesztésről is,
hogy a segítők megfelelően képzettek legyenek a taumatudatosság területén.
Ebbe beletartozik a klinikai képzés is, az orvosoknak megfelelő képzésre van szükségük,
hogy a munkájukat végezhessék, de pl. a recepciós számára mit jelent
egy traumatudatos szervezetnél dolgozni? Minden ember számít,
a gépkocsivezető, a karbantartó, a gondnok; mind hozzájárulnak
egy olyan közösség létrehozásához, amelyben az emberek azt érzik, hogy
elkezdhetnek gyógyulni. De gondolni kell a munkatársak érzelmi kimerülésére is.
Korábban ma már beszéltünk a belső ügyfélszolgálatról, hogy
a szervezetnél dolgozó minden ember így kezelje egymást. Nem lehet
traumatudatos szervezetet létrehozni, ha a dolgozók annyira túlterheltek,
hogy érzelmileg ki vannak égve. Tehát gondolni kell a dolgozók szükségleteire is,
és arra, hogy ha saját magamról nem gondoskodom kellőképpen,
hogyan tudnék igazán segíteni egy másik embernek? A klinikai szupervíziót
is meg kell vizsgálni: traumatudatos módon végezzük a szupervíziót, vagy
büntető módon? A 4. terület a bizonyítékokon alapuló jó gyakorlatok,
ami azt jelenti, hogy az ember nyitott szemmel jár, nem az a hozzállása, hogy "mi ezt így és így csináljuk,
mert ez bizonyítottan működik, és soha nem nézzük meg a szakmán belül
történő új dolgokat." Azt jelenti, hogy nyitottak vagyunk a jól működő dolgokra,
és képzést biztosítunk a dolgozók számára, és a célcsoport által jóváhagyott,
bizonyítékokon alapuló jó gyakorlatokat használunk, mint pl. a “WHAM” Wellness,
Whole Health Action Management, ahol a célcsoport tagjai segítenek egymásnak, és
kezükbe veszik a fizikai egészségük irányítását. Vagy a “WRAP”: Wellness Recovery Action Planning,
ami szintén egy remekül használható, bizonyíték-alapú traumatudatos eszköz,
a biztonságos környezet létrehozásához. Az emberek nem tudnak úgy gyógyulni, ha
nam érzik magukat biztonságban. Ha az ember folyamatosan kiélezett figyelemmel figyeli a környezetét,
ha olyan környezetbe érkezik, ami nem látja szívesen, és nem érzi magát biztonságban,
abból nem fog semmi jó kisülni. Valaki elmesélte, hogy a szervezeténél átfestették
és kicsit megszépítették a recepció területét, és az egyik kliens
ezt látva megkérdezte: "Mennünk kell, költözünk?" Válaszoltak neki, "Nem, miért?"

"Azt gondoltam, hogy ha ilyen szépre megcsinálják a helyet,
akkor biztos el kell mennünk innen." Ez nagyon jól jelzi, hogy
az emberek, a kliensek nem érezték igazán értékelve magukat, ami jó lecke volt
a szervezetnek. Az emberek megérdemlik, hogy olyan környezetben és módon foglalkozzanak velük, ami
azt üzeni: "Tisztellek, értékes vagy". Nem kezdődhet el a gyógyulás addig,
amíg az ember nem érzi ezt. A hatodik terület a közösségi partneri kapcsolatok építése.
Bárkik is legyünk, dolgoznunk kell a közösségek kialakításán.
A traumatudatos gyógyulás nem vákuumban történik. Lehet, hogy a te programodban
remek szolgáltatást kapok, de ha átmenve az XY részlegre
méltatlanul bánnak velem, akkor az sajnos visszafordítja mindannak
a jó munkának a hatását, amit veled elértünk. Ezért fontos felvenni a kapcsolatot
a közösséggel, és segíteni nekik megérteni, mit jelent a traumatudatosság.
Végezetül, a hetedik terület a "teljesítményjavítás".
Honnan tudhatjuk, hogy valóban van hatása a munkánknak?
Hogy ha csinálok egy bizonyos dolgot, az működni fog számomra és az emberek számára, akikkel dolgozom?
Kérek visszajelzést kérdőív formájában a kliensektől? Megkérdezem a klienseket, mennyire
érzik magukat biztonságban? Kérek ugyanígy visszajelzést a dolgozóimtól? És ha igen,
teszek-e bármit az eredmények alapján? A szervezeti önfelmérést
úgy végezzük, hogy az első felmérés után, ami a kiindulópont,
egy idő után megkérjük őket, hogy végezzék el újra,
hogy láthassák a fejlődést, a haladást. Használunk még más eszközöket is,
egy teljesítményellenőrző eszközt, és egy megvalósítási útmutatót, ami
segít a szervezeteknek a haladásban. Röviden ezt jelenti a szervezeti önfelmérés,
dióhéjba sűrítve, hiszen ez egy hosszabb folyamat. A szervezeti önfelmérés
lényege nem az, hogy a szervezetek elmondhassák, hogy "oké, megvolt",
nem csak egy kipipálandó feladat, hanem egy irány a beszélgetések számára,
hogy jelentős változások indulhassanak el a szervezetben.

Q3.2

3 points possible (graded)

1. Ruzek és Rosen (2009) tanulmánya megmutatta, hogy a traumával kapcsolatos kezelések nemzetközi kontextusában:

- A kezeléseket egységesen végezték a különböző országokban, kiemelve a használt megközelítés hatékonyságát
- A speciális alcsoportok igényeit adekvátan kezelték.
- Ugyanaz a kezelés egyformán hatékony volt felnőtteknél és gyerekeknél
- A tréning programokat különböző módokon hajtották végre, kiemelve a központi kompetenciák definíciójának szükségességét

2. Trauma-érzékeny gondozás...

- Célja csak a traumához kapcsolódó tünetek enyhítése, beavatkozó technikákra fókuszál.
- Megvalósít olyan technikákat, mint a korlátozás és elkülönítés
- Különösen fiataloknál alkalmazzák.
- Célja átalakítani a gondozási szisztémát, a stáb képességére fókuszálni, hogy részt vegyenek a traumatizált páciensek gondozásának elképzelésében.

3. Az egyik előnye a tudományos elterjesztésnek a traumával foglalkozó szervezeteknél:

- Lehetőség különleges érdeklődést kifejezni dolgozó csoportokkal kapcsolatos témákban.
- A lehetőség, hogy a legújabb bizonyítékokon alapuló gyakorlatok alapján kezdjenek meg egy végrehajtási folyamatot, célja a stáb és a páciens jóllétének növelése.
- A bizonyíték végrehajtása, mint egy felülről-lefelé döntés a vezetőség részéről.
- Az átmenet a generikus kezelésekre, ami minden páciensnél működik.

Guyadeen & Seasons (2018) kiemelik hogy, hasonlóan sok más tudományhoz, „a tervezés területének megvan a maga saját értékelési minősége" (98. o.) ami két csoportra osztható: „ a terv kiértékelése és tervezési értékelés". Hagyományosan, az értékelés a tervezésben független volt a program értékeléstől és speciális értékelési megközelítéseket foglalt magában. A tervezési disciplina jelenleg vitatja, hogy előnyös lenne, ha szorosabb kapcsolat épülne a program értékelés és a tervezési értékelés között. (98.o.) A közegészségügyi rendszerben, az értékelés fontos szerepet játszik az alapelvek kifejlesztésében és az elvi tervezésben. „Mindkét folyamat egy probléma azonosító és definiáló fázist követ" (99.o.) ezután a megszövegezés, megvalósítás fázisai és végül az értékelés következik. Az utolsó fázis célja, hogy felmérje a beavatkozás sikerességét és azonosítsa a program javulási területeit (Pal, 2014; Guyadeen & Seasons, 2018). Ahogy Guyadeen and Seasons (2018) meghatározták: „Ez egy struktúrált folyamat, aminek a célja, hogy a beavatkozásokról szóló információkat hozzon létre és szintetizáljon, azért, hogy megítélhesse az okozott változásokat, a beavatkozás kívánatosságát, és az alkalmazhatóság mértékét a szándékos és szándéktalan kimenetelek közt. (McDavid & Hawthorn, 2006)" (99.o.) Az értékelési folyamat fókuszálhat a programok és tervek költséghatékonyságára is, és ez különleges jelentőségű lehet az állami szektor szervezeteinél: a politikai és törvényhozói felelősség okai magukban foglalják, hogy a tervezőknek demonstrálniuk kel a cselekedeteik vagy javaslataik előnyeit a nyilvánosság és a közösség számára. (Vedung, 2010; Guyadeen & Seasons, 2018). Craig és kollegái (2008) kiemelik „hogy a komplex beavatkozások széles körben használatosak az egészségügyi szolgáltatók körében, a népegészségügyi gyakorlatban, a szociálpolitika területein, ami fontos következményekkel jár az egészségre" (1.o.). Ezek a kezdeményezések kihívást jelentenek az értékelést végző kezelők számára, ami túlmegy az értékelési folyamat alkalmazási és módszertani nehézségein a sikerről, amit a kezdeményezésnek érintenie kell. Ami azt illeti, „a komplex beavatkozásokat úgy írják le, mint olyan beavatkozásokat, amik sok interakciós komponenst tartalmaznak" és „sokféle karaktervonásuk van, amiket az értékelőknek számba kell venniük" (Craig at al., 2008, 1.o.). Ebben például kulcskérdés tud lenni a komplex beavatkozások értékelésében: - az ilyen beavatkozások hatékonyak a mindennapi praxisban? - Tud a hatékonyság változni a célcsoport vagy a tartalom vonatkozásában? - Hogyan működik a beavatkozás? - Mik a kulcs elemek és hogyan fejtik ki hatásukat?

Általában egy eljárási és folyamatbeli nézőpontból a legjobb gyakorlat állandóan szisztematikusan fejlődik a beavatkozásokban. Ez azt jelenti, hogy „a legjobb gyakorlat szisztematikusan fejleszti a beavatkozásokat, használja a legjobb, elérhető bizonyítékokat és megfelelő elméletet, aztán teszteli őket egy gondosan szakaszolt megközelítésben, kezdve egy kísérleti tanulmány sorozattal, megcélozva minden egyes bizonytalanságot a tervezésben, és továbbmenve egy felderítői és később egy végleges értékeléssel. Az eredményeket olyan széles körben é.s meggyőzően kell elterjeszteni, ahogy csak lehetséges további kutatással segíteni és monitorozni a végrehajtás folyamatát" (Craig et al., 2008, 2.o.).

Elkezdve tisztázni az elemeket, amik ebben a komplex folyamatban szerepelnek Rychetnik, Frommer, Hawe & Shiell (2002) ellátnak minket a következő definíciókkal:

- BEAVATKOZÁS: úgy lehet gondolni rá, mint egy cselekvési csomag, melynek célja az a tárgy, mely magában foglalja a változást vagy azonosítható kimenetelt hoz létre. Nagyobb jóllétet mozdítani elő vagy támogatni az egészségügyi státuszt a közegészségügyi beavatkozások fő tárgya, ami különbözik a klinikai beavatkozásoktól, amiknek általában az a célja, hogy megelőzze vagy kezelje az egyéni distresszt.
- KONTEXTUS: ez a szociális, politikai és/vagy szervezeti helyzetre utal, melyben a beavatkozásokat tervezik, végrehajtják és értékelik. A kontextuális vonások, melyek relevánsnak tekinthetők egy beavatkozásnál, a beavatkozás tipusa szerint változnak. A közegészségügyi beavatkozásoknál a politikai, szervezeti, szocio-ökonomikus, demografikus és környezeti faktorok fontosak.
- ÉRTÉKELÉS: ez az a folyamat, mely meghatározza az értékeket, melyek alapján a beavatkozások összehasonlíthatóak az előre meghatározott és definiált standardokkal.
- BIZONYÍTÉK: ez magában foglalja az adatok értelmező olvasását, melyeket a hagyományos kutatással gyűjtöttek össze vagy speciálisan végrehajtott vizsgálatokkal a tudományos módszerek standarjaival. A Bizonyítékokon-alapuló gyakorlat kiemeli és foglalkozik a beavatkozás vágyott következményeivel és gondol a központi hatékonyságra (a költségeket tekintve is), figyelembe véve a beavatkozás végrehajtásának és kimenetelének adatait is.

Ráadásul, a PROGRAMOK olyan aktivitás csoportokból vannak összeállítva, melyeknek célja egy speciális eredmény elérése vagy célkitűzések halmaza (McDavid & Hawthorn, 2006; Pal, 2014; Guyadeen & Seasons, 2018). A programokat általában olyan eszköznek tervezik, ami a forrásokat cselekvésbe fordítja, hogy a kívánt eredményt elérjék. (McDavid & Hawthorn, 2006; Guyadeen & Seasons, 2018). A TERVEK, amik betölthetik az irányító funkciót, egyfajta programozást és tervezési elképzelést, uralkodó szerepük van a a beavatkozások vagy kezdeményezések szervezésében a közösség számára. (Baer 1997; Ryan, 2011; Guyadeen & Seasons, 2018). Nekik lehetnek átfogó céljaik, ahogy felajánlják a jövőbeli fejlődés felé irányuló elképzeléseiket: egyesítik a tényeket, tárgyakat és irányelveket, ami lefordítható egy fizikai vagy kézzel fogható fejlődési modellre és megérint sokrétű közösségi problémát. (Berke et al., 2006). A programok egy terv végrehajtási stratégiáinak részei lehetnek. (Guyadeen & Seasons, 2018). Ahogy ők írják: „Fontos megjegyezni, hogy a tervek fejlődő eszközök, melyeket folyamatosan szükséges áttekinteni és felújítani a fejlődő szükségleteknek, tudásnak és tapasztalatoknak megfelelően. (Brody 2003). Ebben a vonatkozásban, az értékelésnek kulcsszerepet kell játszania a tervek és programok alkalmazhatóságának és megfelelőségének erősítésében." (99.o.)

Először, az értékelés megfontolható „egy tapasztalat orientált elvként, ami információkat hoz létre a programról" (Guyadeen & Seasons, 2018, 99.o.) fejlesztési céllal és/vagy a jövőbeli döntések irányadójaként. Másodszor, nyomaték van mindkettőn, a program működésén és az eredményeken. Tehát, az értékelés nem csak a program hatékonyságáról szól, de a folyamatról is. Ami azt illeti, ez arra a módra fókuszál, ahogy a programokat kezelik, ez magában foglal egy szervezeti módszertani analízist, amit a program fejlesztésére, a használt inputokra (pl. források), az eredményekre (pl. kézzelfogható mérések) és a költséghatékonyságra használnak (Howlett, Ramesh & Perl, 2009; Guyadeen & Seasons, 2018). Végül, a program értékelés arra is használható, hogy megpróbálják a programot hatékonyabbá és eredményesebbé tenni (Weiss, 1998; Guyadeen & Seasons, 2018), és mint a biztosíték, kiszámíthatóság és minőségbiztosítás eszközeként is (Cousins et al., 2014; Pal, 2014; Guyadeen & Seasons, 2018).

Ezen okok miatt a közegészségügyi területen a beavatkozásokról szóló döntéseknek a fejlesztések által javasolt, mély értékelés erős pontjain kell alapulniuk, de ugyanúgy a csapdákon és a gyengeségi aspektusokonis, a bizonyíték támogatott alkalmazásaikban (Rychetnik et al., 2002). Kritikus útmutatók a beavatkozás értékelésének területén, amik azonosíthatók és és értékelhetők a többdimenziós bizonyítékok mentén, lehetővé teszi olyan kérdések megfelelő figyelembevételét, mint a fontosság és az átadhatóság, speciális és igazolt gyakorlati javaslatokról gondoskodik (Rychetnik et al., 2002). Bár ugyanolyan fontos kiegyensúlyozni a szigorú értékelést és az átívelő célokat, és különbséget tenni az elérhető bizonyítékok szisztematikus értékelése és a komplex szociál-politikai folyamat között, mely meghatározza a politikai és gyakorlati döntéseket (Rychetnik et al., 2002).

Továbbá, Rychetnik, Frommer, Hawe és Shiell (2002) aláhúzzák „a különbségtevést a bizonyíték értékelése és a politikai döntéshozatal vagy operatív döntések között, a beavatkozások megvalósításakor. A kutatás-alapú bizonyíték csak egy a számtalan faktor között, amire számítanak az ilyen döntéseknél" (119.o.) A szerzők tovább részletezik:

„A közegészségügyi beavatkozások általában komplexek, programozottak, és tartalom függőek. A hatékonyságuk bizonyítékának kellően átfogónak kell lennie, hogy megerősítse ezt a komplexitást. A bizonyíték értékelésének különbséget kell tenni aközött, hogy az értékelési folyamat ragaszkodik a beavatkozás sikerének vagy kudarcának észleléséhez és a beavatkozásnak magának a relatív sikere vagy kudarca között. Továbbá, ha egy beavatkozás sikertelen, a bizonyítéknak segíteni kell a megértésben, hogy vajon a beavatkozás eredendően hibás (ez a koncepció vagy elmélet hibája), vagy rosszul lett kivitelezve (az alkalmazás hibája). Mégtovább, a bizonyíték helyes értelmezése az adekvát leírt információk elérhetőségétől függ, a beavatkozásról és annak tartalmáról, tehát meghatározhatja a bizonyíték átruházhatóságát. (119.o.)

Ahogy Craig and kollegái (2008) kimutatták, a gyakorlatban, az értékelés számos megközelítésen keresztül kerül kivitelezésre és ez hatással van a választási lehetőségekre a beavatkozások és értékelési módszerek között. Továbbá, a komplex beavatkozások területén, különböző források (pl. politikai elfogadhatóság) jelentősen tudja tájékoztatni és befolyásolni a kutatókat, hogy az ideális értékelési programot fogadják el. Mégtovább, a tapasztalati modellek sokkal jobban elfogadottak az értékelési módszertanban, de politikai vagy etikai dolgok limitálhatják a használatukat. Az értékelésnek központi szerepet kell játszania a beavatkozások kritikai megközelítésében. Ha a tervezők úgy döntenek, hogy egy nem-tapasztalati módszert alkalmaznak, akkor tudatában kell lenniük a módszertani korlátaiknak és konzekvensen óvatosan kell értelmezni és terjeszteni az eredményeket. Ebben a kutatóknak „felkészültnek kell lenniük, hogy megmagyarázzák a döntéshozóknak a megfelelő fejlesztési munka szükségességét, a tapasztalati és nem-tapasztalati megközelítések előnyeit és hátrányait, és a kompromisszumokat a gyengébb módszerek alkalmazásakor. Fel kell készíteniük a döntéshozókat arra a kihívásra, hogy ha a beavatkozások bizonytalan eredményeket hoznak egy módon, akkor egy szigorú értékelési módszerrel erősíteni a bizonyítékot nehéz lesz, vagy a végrehajtási stratégia módosítása feltárhatja a lehetőségét egy sokkal informatívabb értékelésnek." (Craig et al., 2008. 2.o.).

Még pontosabban, a kutatók (Craig et al., 2008) hangsúlyozzák hogyegy komplex beavatkozás kifejlesztéséhez az értékelési folyamatnak speciális lépéseket kell követnie:

1. A meglévő bizonyítékok azonosítása a témában: amit már publikáltak vagy megosztottak a tudományos közösségben a hasonló beavatkozásokról (szisztematikus és magas minőségű beszámoló az ide vonatkozó bizonyítékokról, beleértve az értékelési módszert a folyamatról és az eredményekről)

2. Az elmélet azonosítása és fejlesztése: a beavatkozás komplex programjának indoklása, az elvárt kimenetel, és az a mód, ahogy a változás elérhetővé válik talán nem teljesen tiszta a kezdettől fogva. Az egyik első kulcs feladat „kifejleszteni egy elméleti megértést a kedvelt változási folyamatról a létező bizonyítékok és elméletek segítségével, kiegészítve, ha szükséges, új, elsődleges kutatással. Ezt meg kell csinálni akkor is, ha a kutató fejleszt ki egy beavatkozást vagy értékel egy már kifejlesztettet." (2.o.)

3. Modellezési folyamat: egy komplex beavatkozás megfelelő modelljének kialakítása mielőtt egy teljes értékelést csinálnának, a kutatóknak lehetővé teszi, hogy hasznos információkat gyűjtsenek és vegyenek bele mind a beavatkozás tervezésébe, mind az értékelésbe. Több tanulmánynak szüksége lenne fokozatosan finomítani a projektet, mielőtt egy teljes értékelést csinálnak. Egy másik hasznos aspektus a tervezési szakaszban a gazdasági értékelés, ami segíthet a projekt ajánlóinak, hogy azonosítsák a gyengeségeket és kitöltsék a hiányosságokat.

Végül a kutatóknak figyelmet kell fordítaniuk az általános kijelentésekre, hogy melyik modell illeszkedik a beavatkozás tipusához a különböző kérdések és körülmények terén, és választani egy tanulmány tervet a speciális karakterek alapján. Ilyen az elvárt hatás mértéke és a kiválasztás valószínűsége vagy az eloszlási hajlam. „A tapasztalati és nem-tapasztalati megközelítések teljes tárházának ismerete megfelelőbb módszertani választásokhoz fog vezetni."(Craig et al., 2008, 3.o.).

A program értékelések területén a főbb tipusok a formatív és összegző értékelési tipus. a program teljesítményének javítására fókuszáló értékelés formatív, mert ők abból a célból adnak visszajelzést, hogy a program eredményei javuljanak vagy a hatékonyság nőjön. (McDavid & Hawthorn, 2006; Posavac & Carey, 2007; Guyadeen & Seasons, 2018). Képzési értékelések hasznos információkat produkálnak a programról való azonnali döntésekhez, úgy mint fejleszteni néhány részt és/vagy módosítani folyamatokat (Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018). Az értékelések az eredményekre fókuszálnak, amik akkor jönnek létre mikor a program véglegesítődik és majdnem teljes, információt ad arról, hogy a program elérte-e a célját és/vagy vajon a folyamat érdemes-e a folytatásra (McDavid & Hawthorn, 2006; Posavac & Carey 2007; Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018).

Összefoglalva, ahogy Wandersman és kollégái 2000-ben jelezték, az értékelési folyamat komplex és összetett (1. ábra)

Hatékonyság és tapasztalat értékelése (eredmények)

VIEW UNIT IN STUDIO

Bookmark this page

Guyadeen & Seasons (2018) szerint, „a történelmileg domináns értékelési modell tudomány-vezérelt és technikailag magas minőségű, eerős hangsúllyal a kvantitatív módszereken.". A tudományos kutatási módszerek és technikák, mint a szisztematikus randomizált kutatás tervek és tapasztalatok az értékelési folyamat szerves részeinek tekinthetők. (Alkin 2013). Ez az értékelési megközelítés a hatékonyság és az eredményesség mérésére fókuszál (Greene 1994)" 100.o.

A tudósok hosszú ideje dolgoznak azon, és nem nézeteltérések nélkül, hogy hogyan értékeljenek, célokat, tartalmakat és indikátorokat (Jacobson et al., 1999). Például széleskörű gyakorlat az értékelési területen annak analízise, hogy a programok hogyan (főleg kvantitatív terminusokban) segítik elő vagy akadályozzák a célkitűzések elérését. Ez a megközelítés tisztán megfogalmazott célokat és kongruens indikátorokat kíván meg. A hatékonyság értékelése egy komplex folyamat és nem mentes a vonatkozó döntések felvállalásának felelősségétől: ahogy Craig és kollégái (2008) kimutatták, egy beavatkozás hatékonyságának értékelésében a randomizálást, mint módszert mindig választani kell (pl. hogy elkerüljük a kiválasztási hibákat). Ha egy hagyományos randomizált vizsgálat két párhuzamos csoport között nem megfelelő, akkor más randomizált módszerű tanulmány tervezetet kell megfontolni, vagy ha egy tapasztalati megközelítés nem megvalósítható, akkor kvázi-tapasztalati vagy megfigyelési projektek jöhetnek szóba.

Tekintettel a beavatkozás eredményének analízisére, ha a kutatási tervet kivitelezték, összhangban a tudományos módszerrel, aminek célja, hogy megerősítse vagy elvesse az ok-okozati összefüggés létezését a beavatkozás és az eredmény között és megértse az okokat a hatékonyság vagy a hiánya mögött. A kutatási terv is meghatározza a bizonyíték szintjét, ami ebből keletkezik. A randomizált, kontrollált vizsgálatok szisztematikus felülvizsgálata a legszéleskörűbben használt és elismert módszerek, amik a legjobb szintű bizonyítékokat hozzák létre a megelőzés hatásain és/vagy a kezelési beavatkozásokon. (Rychetnik, Frommer, Hawe & Shiell, 2002). hosszútávú követés szükséges lehet, annak meghatározásához, hogy vajon a várt eredmények születtek vagy vajon a rövid távú változások tartanak: „bár nem gyakori, de ilyen tanulmányok nagyon informatívak" (Craig et al., 2008, 3.o.).

A közegészségügyi beavatkozások értékelésében a bizonyítékok szintjéről további tanulmányok vannak a tudományos irodalomban, mert ezek kritérium függősége megalapozta a hitelességüket. Ebben a tekintetben a vita folytatódik a randomizált, kontrollált vizsgálatok (RKV) területén, aközegészségügyi beavatkozások analízisénél. Ez főleg a nehézségeket érinti ezeknek a kutatásoknak a véghez vitelében, a beavatkozások programadó komplexitása következtében, az eredmények analízise és a megfigyelő kutatások közreműködésének alábecsülése. A természetük következtében, sok közéleti beavatkozás sokrétű és rugalmas analizis stratégiát igényel, amihez a kutatások a a „Klasszikus RKV modellekre alapoznak - a szerzők alapján – nehéz alkalmazni (különösen mert nagyon rigid standardizálási eljárást igényelnek és a randomizálás feltételezése az alapja az egyedi egységeknek).A kutatók analízisének egyik fontos pontja, hogy hangsúlyozzák a nem randomizált módszerek alkalmazását, ahol lehetséges, különben szignifikáns és fenntarthatatlan veszteséghez jutnak, de Rychetnik és kollégái (2002) szavait követve:

„ a kutatás tervezése egyedül nem lehet elégséges, mint a bizonyítékok hitelességének fő kritériuma a közegészségügyi beavatkozásoknál" (121.o.)

Az eredmények értelmezése

Az értékelési folyamat egy központi aspektusa a beavatkozás tervezésének és alkalmazásának, tekintet nélkül arra, hogy vajon a hatékonysági eredmények pozitívak vagy negatívak. Valójában, egy adekvát alkalmazás bizonyítéka a beavatkozási program által előírt eljárásoknál és a hatékony indikátorok használata a folyamat monitorozásában központi szerepet játszik a tudományos irodalomban (Rychetnik et al., 2002).

A beavatkozások mögött húzódó elméletek, a specialitásaik (magyarázat és valószínűség) kapcsolatban a mögöttes feltételezésekkel (hipotézisek) kapcsolódnak az eredmények és hatások mérésének hatékonyságához és működőképességéhez, a kulcs kritériumok az értékelés és értelmezés minőségét tekinteve a közegészségügy területén.(Rychetnik et al., 2002).

Rychetnik kollégái (2002) analízisét követve többdimenziós megközelítések érhetők el az irodalomban, hogy értékeljük a kutatást és az eredményeit. Három fontos dimenzió van a beavatkozás hatékonysági bizonyítékainak értékelésében:

1. „a bizonyíték erőssége,a kutatás tervezés kombinációja által meghatározva, módszertani minőség és statisztikai precizitás” (122.o.)
2. „a mért hatások nagyságrendje” (122.o.)
3. a „mért hatások jelentősége (ahogy az értékelésben megfigyelt) az alkalmazás kontextusában” (122.o.)

Empirikus minőségi értékelések szükségesek, mivel tudják befolyásolni a döntéseket a politikai vagy gyakorlati szinteken a közegészségügyi területen. Óvatosan ki kell emelni, hogy a nem megfelelő értékelési protokollok nem eredményeznek irreális vagy túl sok költséggel járó igényeket. Az értékelési szempontoknak támogatniuk kell a döntéshozói folyamatot, segíteniük kell meghatározni, hogy vajon a mért eredmények magukban foglalják-e (a) azok érdeklődését, akik bevonódhatnak a döntésbe vagy javasolhatnak beavatkozást és a célközönség; (b) vajon a beavatkozás vártlan és várt hatásai előnyökkel járnak vagy sem; és (c) a beavatkozás eredményessége és hatékonysága. Az első dimenzióról, az összes érdekelt fél hozzájárulása alapvető, adott a közegészségügy szociális és politikai természete. Ezen okok miatt, az értékelési folyamatban fontos szereplők a döntéshozók és a célcsoportok.

Ahogy Guyadeen & Seasons (2018) kimutatták, vannak értékelési folyamatok, melyek erős hangsúlyt helyeznek a pluralizmusra és az analízisre, ahol különböző érdekel felek bevonódnak az értékelésbe. Továbbá kvalitatív módszereket gyakran használnak, hogy fejlesszék a programok elképzeléseit az érdekelt felek közvetlen nézőpontjából (Greene, 1994); ami azt illeti, kritikusak is tudnak lenni, ha közvetlenül bevonódnak (pl. anyagi és személyes érdekeltségek) az értékelésbe.

Az intervenciók hatékonyságának értékelése: folyamatok értékelése

Ahogy eddig is hangsúlyoztuk, az értékelési folyamatnak központi szerepet kellene játszania annak biztosításában, hogy a tervek mind elméleti, mind gyakorlati szempontból a lehető legjobb minőségűek legyenek (Guyadeen & Seasons, 2018; Berke and Godschalk, 2009; Baer, 1997). Ez nagyban hozzájárulhat az objektivitáshoz és a szisztematikussághoz az intervenció tervezésében és elemzésében, javítva ezáltal a rendszerszintű előkészületi folyamatot, és lehetőséget nyújt a projekt szándékolt terve (az elérni kívánt célkitűzések) és az elért eredmények összhangjának vizsgálatára (Guyadeen & Seasons, 2018). Az értékelésen keresztül továbbá dokumentálni és empirikusan azonosítani lehet a hiányosságokat és/vagy erősségeket (Berke, Smith & Lyles 2012; Guyadeen & Seasons, 2018). Az alapvető kiindulási pont az, hogy ahhoz, hogy a tervek hatékonyak és értékelhetőek legyenek, egyértelmű kapcsolatnak kell lennie a terv fő elemei (pl. célkitűzései és a benne foglalt szabályzatok) és a megvalósítási mechanizmusok között (Oliveira & Pinho 2010b; Guyadeen & Seasons, 2018). Összességében két általános értékelési mód létezik a tervezésben: (a) a terv értékelése (pl. a terv színvonalának értékelése, a terv megvalósításának értékelése és a terv eredményeinek értékelése) és (b) a tervezés értékelése (pl. a tervezési folyamat és tervezési gyakorlat értékelése) (Guyadeen & Seasons, 2018). Míg a tervezés értékelésébe beletartozik a tervezési folyamat hatékonyságának megállapítása, az intervenciós terv és annak eredményeinek értékelése a terv színvonalának, a megvalósítás sikerének, és a kitűzött célok elérésének értékelését jelenti (Morckel, 2010; Guyadeen & Seasons, 2018). Az értékelés ezen formái hasonlóak a programértékeléshez, mivel a céljuk a döntéshozatal javítása, ám különböznek is attól, mivel itt a hangsúly a terven van: hogy azt hogyan hozták létre, illetve hogy a tervezés tevékenysége milyen eredményeket ért el (Guyadeen & Seasons, 2018). Ezen kívül általában három értékelési típus létezik a tervezés területén: előzetes, folyamatos és utólagos (Guyadeen & Seasons, 2018). Oliveira & Pinho (2010) szerint ezek az értékelési típusok megfeleltethetőek a tervezés különböző fázisainak, úgymint a terv előkészítése, megvalósítása és értékelése (a megvalósítás után).

A bizonyítékokon alapuló egészségügyi ellátás célja, hogy figyelembe vegye a hatékonyságot és eredményességet, habár a hatékonysági problémákra a bizonyítékokon alapuló orvoslás eddig nem fektetett nagy hangsúlyt. A közegészségügyi intervenciókra vonatkozó bizonyítékok értékelésének elkerülhetetlenül meg kell állapítania, hogy hatékony-e a vizsgálat tárgya, és ha igen, mennyire (Rychetnik, Frommer, Hawe & Shiell, 2002). Továbbá „egy adott intervenció értékére és alkalmazhatóságára vonatkozó, bizonyítékokon alapuló döntéseket, amelyeket azzal megegyező, hasonló vagy azzal rokon intervenciók ismeretére alapoznak, általában más környezetben és más időben visznek véghez és értékelnek. Ahhoz, hogy értékeljük egy adott intervencióra vonatkozó bizonyítékok átvehetőségét, információkra van szükség (a) magáról az intervencióról, (b) a értékelési kontextusról, és (c) az intervenció és a kontextus közötti interakciókról" (Rychetnik, Frommer, Hawe & Shiell, 2002, 123. o.). Komplex intervenciók esetén az eredetihez való hűség nem könnyű kérdés. Az egyik tényező, amely összetetté teszi a kérdést az, hogy az eljárások szigorú szabványosítása olykor megakadályozza az intervenció igényre szabását, amelyet a konkrét helyi szükségletek tehetnek szükségessé (Craig et al., 2008). Az egyik fő dolog, amelyet egyértelművé kell tenni az, hogy milyen mértékben megengedettek a változtatások és az intervenciók egyedi igényekre szabása, illetve hogy miként/mennyire szükséges a megvalósításbeli változásokat nyilvántartani ahhoz, hogy az eredetihez való hűséget értékelni lehessen a szabványosság kutatási terv által előírt mértékéhez képest. A megvalósítás változékonysága - ha tervezett, ha nem - még fontosabbá teszi azt, hogy a folyamat- és eredményértékelő eljárásokról teljes körű beszámolók készüljenek, és hogy egy-egy intervenció reprodukálásának engedélyezéséhez szükség legyen az intervenció egyértelmű leírására (Craig et al., 2008).

Q3.3

3 points possible (graded)

1. Rychetnik, Frommer, Hawe és Shiell (2002) szerint az értékelést a következőképpen lehet definiálni:

- Egy sor olyan változtatás és eredmény, amelyeket előre meg lehet határozni
- Hivatalos kutatás vagy specifikus kérdőívek formájában gyűjtött adatok értelmező kiértékelése
- Egy intervenció értékének megállapítása, előre meghatározott, konkrét szabványokkal való összevetés által
- Az a társadalmi, politikai és/vagy szervezeti környezet, amelyben az intervenciót megvalósítani tervezik

2. Egy intervenció hatékonyságának kiértékelésekor a következők közül melyik NEM fontos tényező? (Rychetnik et al., 2002)

- A mért hatások relevanciája a megvalósítási kontextusban
- A mért hatások mértéke
- A szervezet által megvalósított intervenciók száma
- A bizonyíték erőssége, amelyet a kutatás tervének, a módszertan színvonalának és a statisztikák pontosságának kombinációja határoz meg

3. Az értékelésre igaz a következő:

- Lehetővé teszi az intervenciós tervek gyengeségeinek és erősségeinek empirikus dokumentálását
- Nem követeli meg, hogy az értékelési módszerek a kiértékelni kívánt tervhez igazodjanak
- Kerülnie kell az intervenciókkal kapcsolatos döntésekben részt vevő emberek érdekeinek figyelembevételét
- Kizárólag az eredményeket kell kiértékelni

Jó napot, üdvözlöm Önöket az eheti tananyagban. Új szempontok, új meglátások következnek.

Ezen a héten a követezőket tekintjük át: jó gyakorlatok,

megfigyelés, illetve a gyermekbántalmazás és rossz bánásmód indikátorai.

Kezdjük az első elemmel. Együtt megvizsgáljuk a kutatás és a gyakorlat intervencióhoz kötődő elemeit,

különös tekintettel a jó gyakorlatok

kialakítására. Ezután a traumatudatos ellátás területén végzett kutatás

metodológiai aspektusait vizsgáljuk meg, amit már megtanultunk

megérteni és felismerni, illetve még jobban kifejtjük, hogy mindezek hogyan

alkalmazhatóak a kutatástervezésre, hogy hogyan használjuk a

traumatudatos ellátás formátumát a kutatásban. Végül megnézzük az elmélet és a gyakorlat közötti kapcsolatot.

Ezután megpróbáljuk meghatározni, hogy mitől

lesz jó egy kutatási pályázat, azáltal, hogy megvizsgáljuk, mik egy jó módszer, mint pl. a megfigyelés jellemzői.

A megfigyelés klinikai eszköz. A megfigyelés lehetővé teszi az olyan szakember számára,

aki a traumatudatos ellátás szemléletével dolgozik, tervez dolgozni vagy hajlandó azt mélyebben megismerni,

hogy a megfigyelést módszerként használja, és megértse az embert, akivel az

adott kontextusban dolga van

(tartsuk szem előtt a traumatudatos ellátás jelentését).

Itt pedig szemügyre vesszük a klinikai megfigyelés követelményeit és lehetséges alkalmazási területeit, egyebek mellett.

Ezután korábban tárgyalt fogalmak, úgymint

a jó gyakorlatok és a megfigyelés példáival és meghatározásával folytatjuk,

és megnézzük, mindezt hogyan lehet a gyermekbántalmazás és rossz bánásmód esetén alkalmazni. Továbbá megpróbáljuk

azonosítani ezeknek az indikátorait, szem előtt tartva, hogy az indikátor nem több, mint indikátor, és nem a bántalmazás

és rossz bánásmód alapvető és biztos jele/eleme. Ugyanakkor

az indikátorok jelenléte érdekes lehet számunkra, mert olyasmit jelölhetnek, amit érdemes közelebbről megvizsgálni.

Ezután következnek a trauma felméréséhez kapcsolódó

szűrési módszerek, és kollégáimmal együtt megpróbáljuk megérteni, hogy a tudás szempontjából milyen fontos

az esetleges trauma kiszűrése, észrevétele.

A hetet a traumatudatos ellátás és annak a kutatással való kapcsolata vizsgálatával zárjuk, illetve annak feltárásával, miként lehet

létrehozni egy olyan szisztematikus rendszert különböző folyamatokból, ami az elmélettől a gyakorlat felé vezet.

Az első részben, az első két hétben kollégáimmal együtt megvizsgáltuk a traumának talán a leginkább elméleti

aspektusát, az elmúlt két hétben

megnéztük a bizonyítékokon alapuló kutatást és az akciókutatást a traumatudatos ellátás területén,

mostantól pedig továbbra is a traumára és a

traumatudatos ellátásra fókuszálunk, ám egy kissé más nézőpontból.

Ez pedig a jogi szabályozás kérdése. Tehát megvizsgáljuk a terület jogi, kutatási és szakpolitikai aspektusait.

Saját és kollégáim nevében kívánok

további jó tanulást Önöknek; már több, mint a felét átvettük a tananyagnak,

és hamarosan az online kurzus végéhez érünk.

További minden jót kívánok, és újra találkozunk majd a kurzus végén.

Bevezetés a traumatudatos ellátás kutatási módszertanának szempontjaiba

Bookmark this page

Newman és Ridenour (1998) kiemelik, hogy a kutatók nagyban eltérő módszerekkel végeznek tanulmányokat és vonnak le belőlük következtetéseket, amelyeket jelentősen befolyásol a valósághoz való hozzáállásuk. Ezen túl, míg az ismeretelmélet (episztemológia) a dolgok megismerésének lehetséges változataival foglalkozik, addig a módszer azknak az eljárásmódoknak a kiválasztására fókuszál, amiken keresztül jobban megismerhetünk egy adott jelenséget (Bernard, 2006).

Ahogyan Lastrucci (1963) megfogalmazta, a tudomány "objektív, logikus és szisztematikus eszköz a jelenségek elemzésére, célja a megbízható tudás felhalmozása" (6. oldal). Mindez három célkitűzés mentén valósul meg, amik a kutatói munka során meghozott döntéseket irányítják (Bernard, 2006):

- Objektivitás: explicit mérések végzése, módszertan figyelembevétele, hivatkozás a tudományos közösségen belüli kollegiális lektorálásra
- Tudományos módszerek
- Megbízhatóság

Az etikai dimenzió a tudományos módszer egy része. A humántudományok kutatására hivatkozva felmerül a központi kérdés, miszerint miként lehet a természetüknél fogva összetett jelenségeket működőképessé tenni. Ez a fajta folyamat a változók meghatározásán, a közöttük levő asszociációk és kapcsolatok keresésén, valamint annak megkísérlésén alapul, hogy valamely dolog variációja okoz-e variációt egy másikban (Bernard, 2006). A fenti szempontokkal összefügg, hogy a kutatások egyik alapelve az érvényes és megbízható mutatók felmérése és beazonosítása, valamint a szoros kapcsolódás az operatív meghatározások strukturálásához. Ezek a meghatározások "utasításokból állnak, amelyek a fogalmilag meghatározott változó mérésére szolgálnak" (38. o.).

A traumatudatos ellátás kutatása

VIEW UNIT IN STUDIO

Bookmark this page

A traumatudatos ellátás esetében kimondottan fontos a tudományosan bizonyított eljárások és elméletek használata. Ebből a szempontból elengedhetetlen a klinikai munka és a kutatások közötti szinergikus kölcsönhatás elősegítése. Mindez azért fontos, hogy a kezelések eredményeit tanulmányozni lehessen a szolgáltatások működő modelljeinek hatékonyságának és eredményességének értékelésével együtt, konkrét iránymutatásokon keresztül szabályozva a fenti szempontokat és/

vagy annak figyelembevételével, hogy a speciális protokoll milyen mértékben ragaszkodik a területen végzett nemzetközi kutatás bevett elemeihez (Schäfer et al., 2018).

Ebből a szempontból kiemelten fontos az olyan tudományos kutatásokban való részvétel, amelyeknek célja a traumatudatos ellátás meghatározásainak és alapvető tényezőinek elemzése.

E tekintetben Becker-Blease (2017), Hanson & Lang (2016) és Johnson (2017) számos kritikus szempontot emelnek ki a traumatudatos ellátással és annak alkalmazási problémáival kapcsolatban. Ide érthetjük például a tudományos irodalomban az elméleti szempontokról alkotott, kizárólag a jelenre irányuló fókusz meglétét, valamint azkat az alapelveket, amelyek szerint a figyelmet negatívan befolyásolják az alávető elemek és a gyakorlati alkalmazásuk: „szakadék van a gyakorló szakemberek munkájában az elméleti alapelvek és a mindennapi gyakorlat között, és abban, ahogy a saját eredményességüket felmérik" (Becker-Blease, 2017, 3. o.). A kutatási fókusz ezért igazán hasznos a traumatudatosság módszerét alkalmazó kezdeményezések, programok és szolgáltatások értékeléséhez, valamint annak megállapításához, hogy vajon mindez összefüggésbe hozható-e a jelentős számú pozitív eredménnyel.

Annak érdekében, hogy a fogalmi, elméleti és a használati szempontok között hasznos és működőképes váltást lehessen végrehajtani, nagy figyelmet kellene fordítani a szabványosított eljárások és mutatók alkalmazásának vizsgálatára, mind a folyamat elemei, mind a kapott eredmények szempontjából. A témával kapcsolatos tudományos irodalom arra készteti a szervezeteket és az intézményeket, hogy fontolják meg a különösen releváns kutatási projektek alapvető és alkalmazható strukturálását, amelyeknek célja a szűrési eljárások (bizonyítékokon alapuló szűrés) kezelése, valamint a traumatikus események és azok jellemzőinek beazonosítását célzó értékelési eljárások elemzése. Ezen túlmenően fontos, hogy a véletlenszerű, ellenőrzött tanulmányokat kísérleti alapon hajtsák végre, hogy tesztelhessék a trauma-orientált beavatkozások hatékonyságát.

Bookmark this page

A szociális és az egészségügy területén különböző lehetőségek vannak(Leone & Prezza, 1999) egy projekt felépítésére: a) szinoptikus-racionális (a tartalom lényegénekelőzetes felépítése), b) összehangolt-részvétel vagy párbeszédes tervezés (a szakértők és a résztvevőkfolyamatosan egyeztetnek a célkitűzésekről); c) heurisztikus (a célkitűzések minimális előzetes strukturálása).

Legtöbbször a következő lépéseket kell követni egy kutatási folyamat során:

1. Először meg kell fogalmazni egy elméleti problémát (ami a tudományos elmélet és az irodalom elemzéséből származik);
2. Meg kell határozni a megfelelő elemzési egységeket és a metodológiát;
3. Adatgyűjtés és elemzés;
4. A kutatást elindító javaslatot vagy megcáfolják, vagy elfogadják.

Ahogyan azt Lanzara (1985) is írja: „Mindenki, aki az innováció problémájával találkozik, vagy egyszerűencsak változtatni szeretne rajta, a tervezés problémájával szembesül" (336 o.). A tervezés a rendszerezés folyamata. A kutatási projekt felépítése kritikus, mégis elengedhetetlen szakasz. Fontos döntéseket kell ilyenkor meghozni, amik befolyásolhatják a kutatás végkimenetelét. Leone és Prezza (1999) is hangsúlyozza, hogy: „Egy projekt kiemelése a különféle témák közül, valamint az összefüggések megtalálása a különböző részek (célok, idő, rendelkezésre álló személyek...) között azt jelenti, hogy problémának minősítjük a gyakorlatot, valamint szembe kell nézni a korlátokkal, elfogultsággal. És pontosan ez az a probléma, amelyet bizonyos összefüggésekben hajlamosak vagyunk figyelmen kívül hagyni"(23. o.), vagy alkalmazhatósági szempontból túl bonyolultnak ítélni.

Transzverzális szempontból, a szerzők részletezik egy társadalomtudományi projekt felépítésének alapvető szakaszait:

1. Ötletelés: a projekt kivitelezése vagy tervezése.
2. Aktiválás: erőforrások, szerepek, problémák és stratégiák felülvizsgálata, igények (kliensek) lehetséges elemzése.
3. Tervezés: a projekt kidolgozása, a projekt szakaszainak megállapítása, az idő és a módszertan meghatározása.
4. Kivitelezés: a kutatás megkezdése, a hipotézisek első ellenőrzése, folyamatban lévő változások követése.
5. Ellenőrzés: az eredmények végső elemzése.

Ezenkívül a tudományos kutatás területén, az alkalmazás szempontjából további fontos elemek a következők

- A kutatás tárgyának meghatározása és tudományos irodalmi elemzése, az elméleti váz magyarázata,
- A tanulmány általános és konkrét céljainak meghatározása és magyarázata (a kutatás kérdése feltáró, értékelő vagy magyarázó),
- Hipotézisek felépítése,
- A célcsoport beazonosítása, részvevők toborzása és mintavétel,
- Értékelési eljárások, a mutatók, az összegyűjtött adatok elemzésére szolgáló eszközök és technikák meghatározása,
- Időtervezés (ütemterv) és megvalósíthatósági elemzés (a kritikákat és a korlátozásokat is beleértve).

Mindezek során – a kutatási kérdéstől függően – kvantitatív, kvalitatív vagy kevert mátrixú módszertani alkalmazást lehet használni.

A tervezési folyamat minden szakaszában a kutató fontos kérdéseket tesz fel, amelyek fogalmi és gyakorlati szempontból is figyelembe veszik a kritikus elemeket. A kutatás körülményei és a források is ide sorolhatók.

A fentiek összetettsége miatt alapvető, hogy ebből a szempontból is figyelmet fordítsunk a munkatársak képzésére, valamint a klinikai munkában részt vevő szakemberek és a kutatásban részt vevő kutatók közötti kapcsolattartásra.

Központi fontosságú azoknak az eszközöknek a strukturálása és érvényesítése, amik mind a beavatkozási, mind a kutatási célkitűzéstől kezdve felhasználhatóak. Ezeknek különböző formái lehetnek, és sajátos célokra alkalmazhatóak. Ezért alapvető, hogy a projekt megtervezésében és végrehajtásában részt vevő összes szereplő szinergikusan alakítsa ki a projektterv minden egyes szakaszát, beleértve a módszertani döntéseket is.

Q4.1

3 points possible (graded)

1. Az operatív meghatározás:

- A változó fogalmi meghatározása előtt kerül megállapításra
- A változó fogalmi meghatározása után kerül megállapítása
- Nem lehet használni a változó mérésére
- A változó mérése során dolgozzák ki

2. A traumatudatos ellátás területén fontos:

- A beavatkozási módszertan előírása az irányítók részére
- A tudományos kutatások hozzájárulásának figyelmen kívül hagyása
- Kritikus szempontok és alkalmazási nehézségek figyelmen kívül hagyása
- A klinikai munka és a kutatás közötti szinergikus interakció előmozdítása

3. A tervezési folyamat minden egyes szakaszában:

- A kutatónak fel kell tenni magának olyan fontos kérdéseket, amelyek fogalmi és gyakorlati szempontból is figyelembe veszik a kritikus elemeket
- A kutatónak nem kell feltennie magának olyan fontos kérdéseket, amelyek fogalmi és gyakorlati szempontból is figyelembe veszik a kritikus elemeket
- Az adatokat mindig elemezni kell
- Az időzítést tervezni kell

Jó gyakorlatok a trauma tudatos ellátásban

VIEW UNIT IN STUDIO

Bookmark this page

Mivel a traumatikus események (ártalmas gyermekkori élmények) nagy mértékben veszélyeztethetik a fizikai és pszichés egészséget, az évek során számos intervenció született a traumatikus hátterű embereknek segítséget nyújtó intézmények és szakemberek támogatására, illetve, hogy ezzel a traumatudatos szemlélet alkalmazásának előnyei előtérbe kerüljenek (Baker et al., 2016). Kiemelendő az, hogy „a traumatudatos szemlélet holisztikusan szemléli az embert, nem csak az általa tapasztalt problémák halmazának" (Hepburn, 2017, p. 7) látja. Ahogy azt számos szerző megfogalmazta (Bryson et al., 2017; Bridgett, Valentino & Hayden, 2012; Ellis & Boyce, 2011; Perry, 2002; Rothbart, Ziaie, O'Boyle, 1992), a jó ellátás, valamint a figyelmes és proaktív ellátó szakemberek által létrehozott támogató kapcsolatok védő hatással (pufferhatással) bírnak: a kapcsolati biztonság csökkenti a trauma hatásait a gyermekeknél. A traumatikus stressz gyakori velejárója az ártalmas gyermekkori élményeknek, és sok esetben okoz olyan komoly klinikai problémákat (internalizáció és/vagy tünetek externalizációja), amik rendszeresen megtalálhatóak mind a felnőtteket, mind a gyermekeket ellátó kórházakban és bentlakásos intézményekben (Bryson et al., 2017; Greenwald et al, 2012; Hummer, Dollard & Robst, 2010; Ko et al., 2008). Elliott és társai (2005) szerint: „a traumatudatos ellátás olyan ellátás, amely tisztában van az interperszonális erőszak és a viktimizáció az ember életére és fejlődésére tett hatásával", illetve: „az ellátási környezetben megtalálható számos elterjedt eljárás és gyakorlat újraaktiválja a traumatikus reakciókat, illetve a biztonság hiánya és a gyengeség érzéseit váltja ki a traumatúlélőkből" (p. 446).

Tovább kell hangsúlyoznunk, hogy a jó gyakorlatokat a szakirodalomban meghatározott, és a traumatikus történeteket alkotó komplex tényezők elemzését magukban foglaló konkrét kritériumok alapján kell értékelni. Ha a szolgálat vagy szervezet traumát elszenvedett emberekkel dolgozik, kockázatcsökkentésen és -megelőzésen alapuló szemlélet javasolt a közegészségügyben és szociális ellátási rendszerben. Ezen a területen a traumatudatos szemlélet központi fontosságú: a traumatudatos ellátás és gyakorlat a javasolt paradigma, mivel ezek célja teljes ellátási rendszerek átalakítása a traumára adott stresszválasz figyelembevételének beépítése által, melyet a szolgáltatási rendszer minden szintjébe és részébe be kell építeni, a biztonságos környezet és a választás lehetőségének előtérbe helyezésével párhuzamosan. Ez a megközelítés továbbá egy erőszakellenességen, tanuláson és együttműködésen alapuló kezelési kultúrát is kíván létrehozni, amelyben egyformán hangsúlyos minden környezeti és interperszonális interakció (Bryson et al., 2017). A szakirodalom szisztematikus áttekintése során Bryson és kollégái (2017) fontos konklúziókat találtak:

· A „fizikai kényszerítés csökkentése az általános és bentlakásos pszichiátriai ellátásban" (11. o.)

hangsúlyos; az elzárási, kontrolláló és kényszerítési stratégiák csökkentésének/elhagyásának fontossága;

· A traumatudatos ellátás egyik legjelentősebb aspektusa az, hogy „alapvető fontosságú, hogy a vezetők előnyben részesítsék a traumatudatos ellátást [...], főként, ha a munkatársaknak új munkamódokat kell elsajátítaniuk" (11. o.);
· a kutatók nagyban hangsúlyozzák annak fontosságát, hogy a munkatársak haladó képzésekben részesüljenek (főleg a traumára adott reakciók tekintetében), illetve a folyamatos szupervíziót, coachingot és beszámolókat;
· elengedhetetlen, hogy meghallgassuk a pácienseket és családjukat, különös figyelmet fordítva a kezelési folyamattal kapcsolatos élményeikre, szükségleteikre, prioritásaikra;
· a kutatási adatok folyamatos frissítésének és az eredményindikátorok elemzésének fontossága, melyek olyan transzverzális tengelyek, amelyek célja a szolgáltatásnyújtás motiválása, kutatási alapokra helyezése, és hatékonyságának növelése;
· a szakirodalom rengeteget foglalkozik „annak szükségességével, hogy a formális és informális szabályok és gyakorlat összhangba kerüljenek a traumatudatos gyakorlat általános alapelveivel" (11. o.).

Annak ellenére, hogy egyre szélesebb körben alkalmazzák, még mindig kevés a traumatudatos szemlélet hatékonyságát vizsgáló tudományos kutatás (Bryson et al., 2017); ahogy azt Valenkamp, Delaney & Verheij (2014), valamint Chandler (2008) kiemelik, kevés az olyan ellenőrzött, randomizált vizsgálat, amely az intervenciókat teszteli, és a traumatudatos személeten alapuló kezeléseket meghatározó legfontosabb tényezőket vizsgálja. Ám ahogy az jelenleg nemzetközi szinten előtérbe kerül, empirikus kutatások bizonyítják a szakemberek részvételének fontosságát olyan képzésekben, amelyek a páciensek élményeit leíró egységes nyelvezettel, valamint a traumatizált pácienseknél alkalmazható konkrét intervenciós lehetőségekkel látják el őket (Bryson et al., 2017). Ennek a központi fontosságát korábban Le Bel, Huckshorn & Caldwell (2008), valamint Brown, Baker & Wilcox (2012) is hangsúlyozták. Ezen kívül a jó gyakorlatokat bemutató képzések, és páciensek részvétele a képzésekben (pl. beszámolók az élményeikről) is hasznosnak bizonyult (Holstead, Lamond, Dalton, Horne & Crick, 2010), ahogy a gyermekek bevonása az ellátásnyújtás kritikus tényezőinek vagy szakaszainak beszámolóiba (Lebel et al., 2008), az adatmegosztás, valamint a teljesítmény/folyamatok folyamatos ellenőrzése is (egyéni, kollektív és osztály-szinteken egyaránt) (Bryson et al., 2017).

A szakirodalom egy másik újonnan fókuszba kerülő témája a hatékony traumatudatos stratégiák területén a szervezetek képessége arra, hogy szabályzataikat és gyakorlataikat összehangolják a tájékozott traumaellátással (Bryson et al., 2017). E szerint a szemlélet szerint a szervezetek belső környezete és kultúrája önmagukban is terápiás eszközként funkcionálnak, és hozzájárulnak a „terápiás közösség" felépítéséhez. Különösen relevánsak:
1) a biztonságos kezelési tér létrehozásának fontossága mind a páciensek, mind a munkatársak számára, valamint 2) a traumatudatos ellátás alapelveinek belefoglalása a szervezet küldetési és jövőkép-nyilatkozatába. Összefoglalva, a Bryson és kollégái (2017) által kiemelt fő traumatudatos ellátási stratégiák összhangban vannak a NASMHPD (National Association of State Mental Health Program Directors - Állami Mentális Egészségügyi Programigazgatók Nemzeti Szövetsége) alapelveivel; mindkettő megtalálható az alábbi 1. táblázatban.

Bryson és kollégái (2017)
Közösségi befogadás
Vezetőség elköteleződése
Modell kiválasztása
Munkaerő átalakítása
Eredmény-orientáltság
Közös fenntartás

NASMHPD
Vezetés a szervezeti változás felé
Információ-alapú gyakorlat
Korlátozás és elzárás alkalmazását csökkentő eszközök használata
Munkaerő fejlesztése
A felhasználó szerepének fejlesztése a bentlakásos környezetekben
Alapos beszámolási technikák

1. táblázat - A traumatudatos ellátás alapstratégiái

Ezen kívül egy Azeem és kollégái (2011) által elvégzett kutatásban ezeket a stratégiai fontosságú elemeket hosszú távon is tesztelték, a korlátozás és elzárás alkalmazásának csökkentését elemezendő. A szerzők főként a következőket emelték ki:

- a vezetésnek kulcsszerepe van a kulturális átalakulás megvalósításában, főleg, ha a traumatudatos szemléleten az összes munkatárs osztozik;
- az adatgyűjtésnek és -megosztásnak „kulcsszerepe van a teljesítmény javítását célzó projektekben" (12. o.) és az ellenőrzési folyamatokban;
