Hi!

I'm Alberto Zucconi,

a psychologist-psychotherapist

and President of the Person-Centred Approach Institute (IACP)

That was in charge of creating

first two modules of this course

I want to welcome you to.

First of all, would like to say two words

as Alberto Zucconi

citizen

and they are words of gratitude.

A sincere thank you to each one of you that works to support and protect

of minors

traumatized

your work is very important

sensitive, delicate, but sometimes

also very heavy

We know well

that

that working with people that are suffering

at times can cause

pain and can lead to burn-out

Therefore

a sincere thank you because your

work protects

of

a precious reality for a nation and for a community; human capital.

Every traumatised person needs all the care possible

to be helped to reenter, with full rights, to be

an active member of the community

and to

be constructive for themselves and for the other members of the community.

I would like to add one other thing, which is perhaps obvious, but is better underlined:

this course

is addressed to all of you who are from different backgrounds, professions and skills

and who - as you know - are bound by the existing laws, the ethical/deontological

codes of various professions

and the internal rules of the various organizations to which you belong,

to do everything that you already know how to do and to whom you are responsible for doing and not to cross

borders and limits, because this would not be in favor of your clients.

I add another obvious thing

to complicate things the laws are not the same

in all European nations and this is a course

addressed to various nations and in various languages

therefore

Obviously the expectation to that of delivering a course to aware people

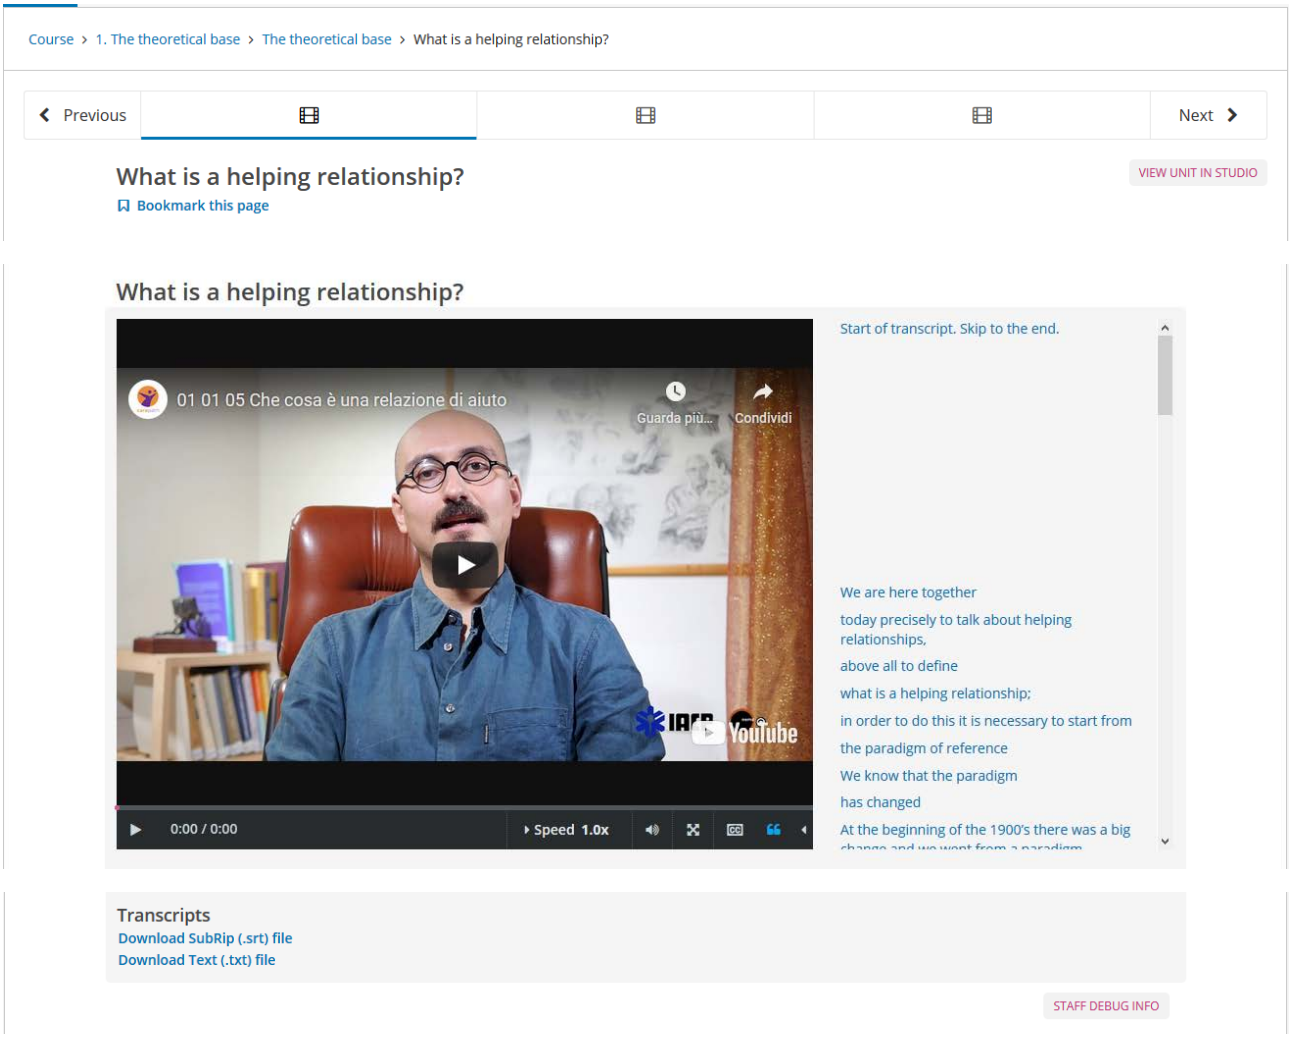
of the fact that also

respecting the limits means working effectively

And efficiently

Now thanks again for being on board this adventure and thanks for the daily work

that you do with passion.



Transcript

We are here together

today precisely to talk about helping relationships,

above all to define

what is a helping relationship;

in order to do this it is necessary to start from

the paradigm of reference

We know that the paradigm

has changed

At the beginning of the 1900's there was a big change and we went from a paradigm

reductionist mechanistic to a holistic and systemic .

The way of understanding a helping relationship has also changed, in fact in the mechanistic paradigm,

reductionist

a helping relationship was characterised by asymmetry; the professional was the agent of meaning

who imposed a reality onto his patient, his own vision of reality,

somehow making his patient passive.

And therefore passive with the professional

With the adoption of the new paradigm many things changed,

because we know that

relationships are central to our understanding: the importance is not in the single parts, but the relationships

in which these parts

make a whole.

With it to be qualified

So what is a helping relationship in the light of the new paradigm?

Which can be ?

To help us to define it let's read the words written by Carl Rogers in 1951, an author

who occupies a prominent place in helping us to understand the helping relationship in this new light.

Carl Rogers writes "A helping relationship is a relationship in which at least oneof the two

protagonists has the goal of promoting the growth, development,

maturity and achievement

of a more adequate and integrated way of acting of the other person.

Other in this sense could

be an individual or a group.

In other words, a helping relationship could be defined as a situation in which

one of the participants tries to favor, in one or others , a greater actualization

of the personal resources and a greater possibility of self-expression".

Here the words that stand out are valorization, promotion, resources

and therefore

this new light in which we see the helping relationships

is a light that places

the two protagonists

in a relation of parity,

in this way the professional will not be

the expert, the agent of meaning,

but will be the one that promotes the actualization of all the

resources that are intrinsic to the other person.

In doing so he will be able to facilitate a more functional process of co-construction of reality

for the client,

thus accompanying him in a process, accepting and respecting where the client is.

So today, what characteristics should a helping relationship professional have?

Certainly they should have knowledge, that is, must have a corpus to lean on

theoretical knowledge

must

moreover know how to apply this knowledge

and therefore the theories must be made concrete, be applied and know how to be applied in the relationship.

In addition to know how, given that the focus of the relationship is on the quality of the relationship itself,

it will be necessary for the professional also to know how to be, to know how to put into practice all of these conditions

and qualities that facilitate and make a helping relationship effective.

Among these, we know that surely authenticity is the first quality, that knowing how to see the world through the

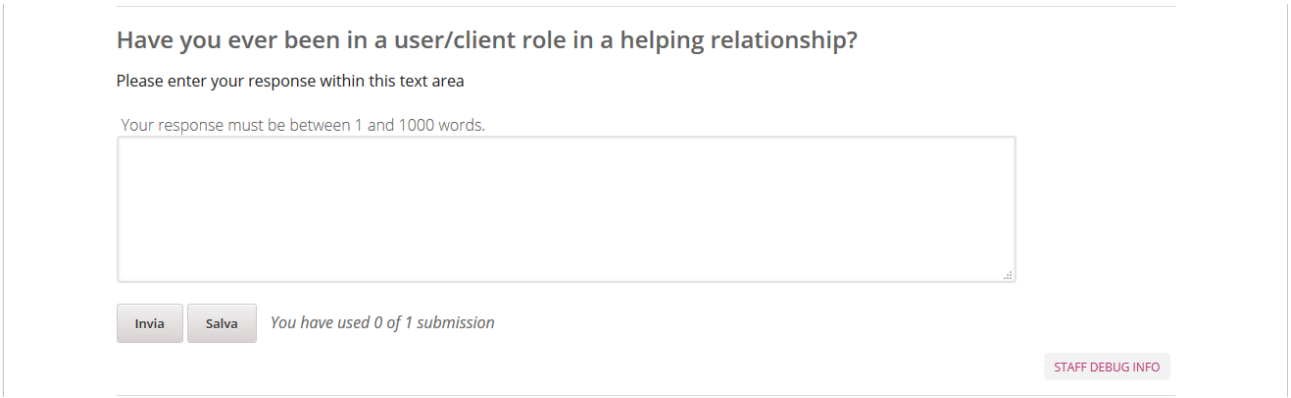
eyes of the other is the second, and the third is to not judge

the client, but to be able to respect and welcome them how they are.

If this is possible, if these three conditions are implemented by the professional,

this will facilitate a process of change

and improvement



If yes, what aspects of the helping relationship did you find particularly positive and facilitating?

Power is always present in human interactions.

Where two or more people interact, there is always

a power that can be obscured or highlighted.

In general, history teaches us that those who have lots of power do not particularly like to

discuss this topic as they fear having less power if there is transparency

over power differentials.

Power differentials

obviously are always existing in any helping relationships.

The professional, the expert,

those who offer a service have more power

over a service user, client, patient or how you want to define the person. Why?

Because the professional know something that the client doesn't exactly know,

and in addition the professional offers to their clients something they need.

They also design the rules

of the setting (i.e. the rules governing the design and management of the setting)

and can even suspend the provision of the service itself.

In short,

there is always a power difference between those who provide a service and those that receive it.

In the past, with the reductionist-mechanistic paradigm

power differences in the various helping relationships were very high.

We have seen, also in the light of the new paradigm of the Ottawa Charter and the biopsychosocial paradigm,

that this was not desirable as excessive

power differences can lead users of the service to assume a passive role that does not help to achieve

the objectives of the service itself.

Today, therefore, there is a tendency to focus on users, on the person of the client, and encourage

change through actions of empowerment that empower clients

to develop their skills, creativity and resilience.

This, the research highlights very clearly, is very useful

as the helping relationship facilitate better results in less time,

and for example in the field of health and wellbeing, secondary effects and relapses are lowered.

Therefore the world is increasingly orienting itself towards the evidence that everyone wins when

power is shared and if everyone contributes to achieving goals.

All of this is also true at a societal level, and therefore active, aware citizens

contribute much more to their social ecology and the communal construction of reality:

a sustainable reality for sustainable relationships.

This also true when providing services to children, who are small people, they are not children who don't understand or who are not responsible. This social construction of children as

"little cute things" is very obsolete.

What are helping

relationships for those who use them?

We pointed out earlier, when

we highlighted the objective of the

biopsychosocial paradigm that it is not only to cure diseases, but

but to protect and promote the potential for health

and wellbeing, the capacity for active learning and the development of creativity and resilience.

Another way to call this innate capacity of human organisms is

coping: An english term that in italian means knowing how to manage life's circumstances;

in other words, knowing how to better manage my relationship with myself,

with others and with the world around me.

We know that in helping relationships,

in regards to the qualities of the effective professional

regardless of the approach he uses, in order to to be effective they must know

how to relate with their clients with a high quality deep respect and without prejudice

to have an empathetic understanding not only of what the client says, but also what he feels, his

meanings, and relate to him honestly, authentically and transparently.

It is also necessary, however, for this process to work on the part of the user, client and patient to

actively get involved since this is a co-construed team game.

In helping relationships, clients that can be defined as “effective”

are clients that are sincere and motivated to change, perhaps because they are not feeling well

and want to stop suffering. They also need to have the ability to come

into psychological contact with the professional working with them and to perceive the relational qualities

that the professional puts into the relationship.

These capacities develop, as does the capacity to persevere, to be ready to learn from mistakes, with the courage that it takes to admit to errors, to let mistakes become teachers of wisdom.

ready to learn from mistakes, with the courage that it takes to admit to errors,

to let mistakes become teachers of wisdom

This underlines how coping is an optimal functioning process and the

result of the team work of the professional and their client to achieve the

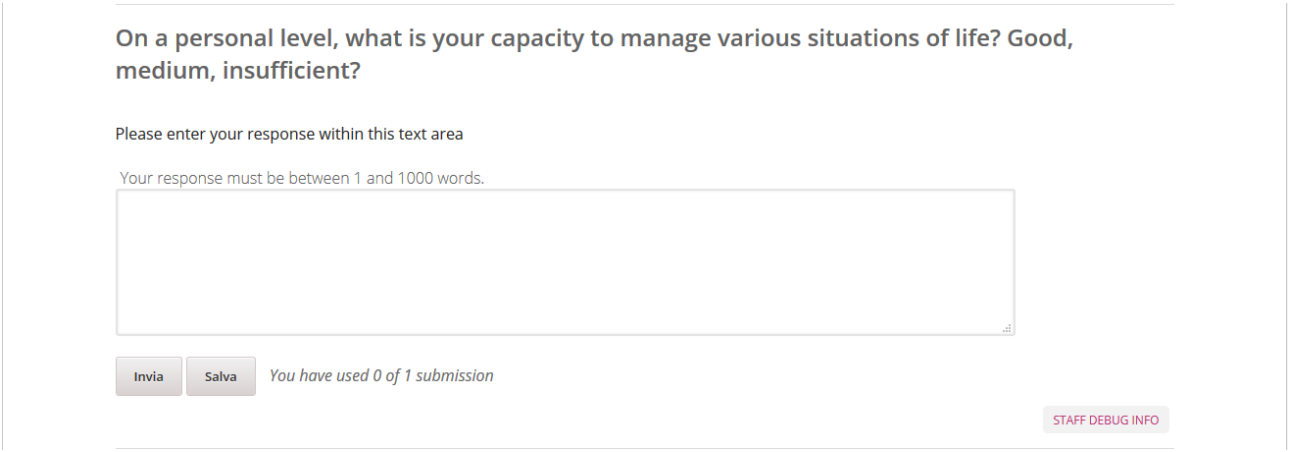
objectives of improved quality of life and greater realization of the intrinsic

potential

that each of us was born with and is written into our genetic code and then developed further,

more or less depending also by the environmental conditions in which we find ourselves, but also by the attitudes

that we have and by how we face life.



On a professional level, what is your capacity to manage various situations with clients, their families, colleagues and superiors? Good, medium, insufficient?

Please enter your response within this text area

Your response must be between 1 and 1000 words.

Focusing on the illness or on the development of human potential

Start of transcript. Skip to the end.

To concentrate on disease or health?
Research shows us that it is much better
concentrate on health
because greater successes are obtained
and it lowers costs.
Why does this happen?
Because in the previous mechanistic reductionist paradigm
the person who needed help was in a passive state, in fact to label somebody a patient can make him in a sense too

Transcript

I would like to say a few words about effective psychotherapeutic relationships

Psychotherapy is one of many helping relationships,

but regulated by law in a

specific way: for example, here in Italy only medical psychologists can - if they have

attended a school of specialization of at least four years or psychiatrists, offer psychotherapy services;

others cannot, it would be a crime of practicing Since every treatment that impacts the health of an organism

and therefore does good- can, if it is not properly understood how it is to be promoted, obviously do harm.

well

The vast body of research show that effectiveness in the field of psychotherapy does not derive from the belonging to the various psychotherapeutic approaches

specific theoretical approach; it derives much more from the relational qualities of psychotherapists

belonging to the various psychotherapeutic approaches and, as in any helping relationships,

the same variables, the same factors are operative.

A psychotherapist is effective not because he applies a certain theoretical model, but because

he or she have the ability to relate to his user with a large capacity of acceptance,

respect, not judging, with deep respect

and because he or she has

the capacity

the not only to listen to what his user / patient / customer say, but also empathy,

what meaning has for the specific client as an individual.

The professional is also able to relate to the client in a genuine, spontaneous and transparent way.

However, this is not enough because the psychotherapeutic relationship, as with any helping relationship, is a

team work, a co-construction in which the client, the user, the patient actively contributes,

otherwise it does not work.

And so?

The motivation is important, often provided by the client' feelings of discomfort - and therefore the motivation to change

and then the capacity for psychological contact with the psychotherapist 27

and, moreover,

the third condition: being able to perceive the quality of relationship offered by the professional possessing

the fundamental qualities of deep respect, empathic listening and the authenticity.

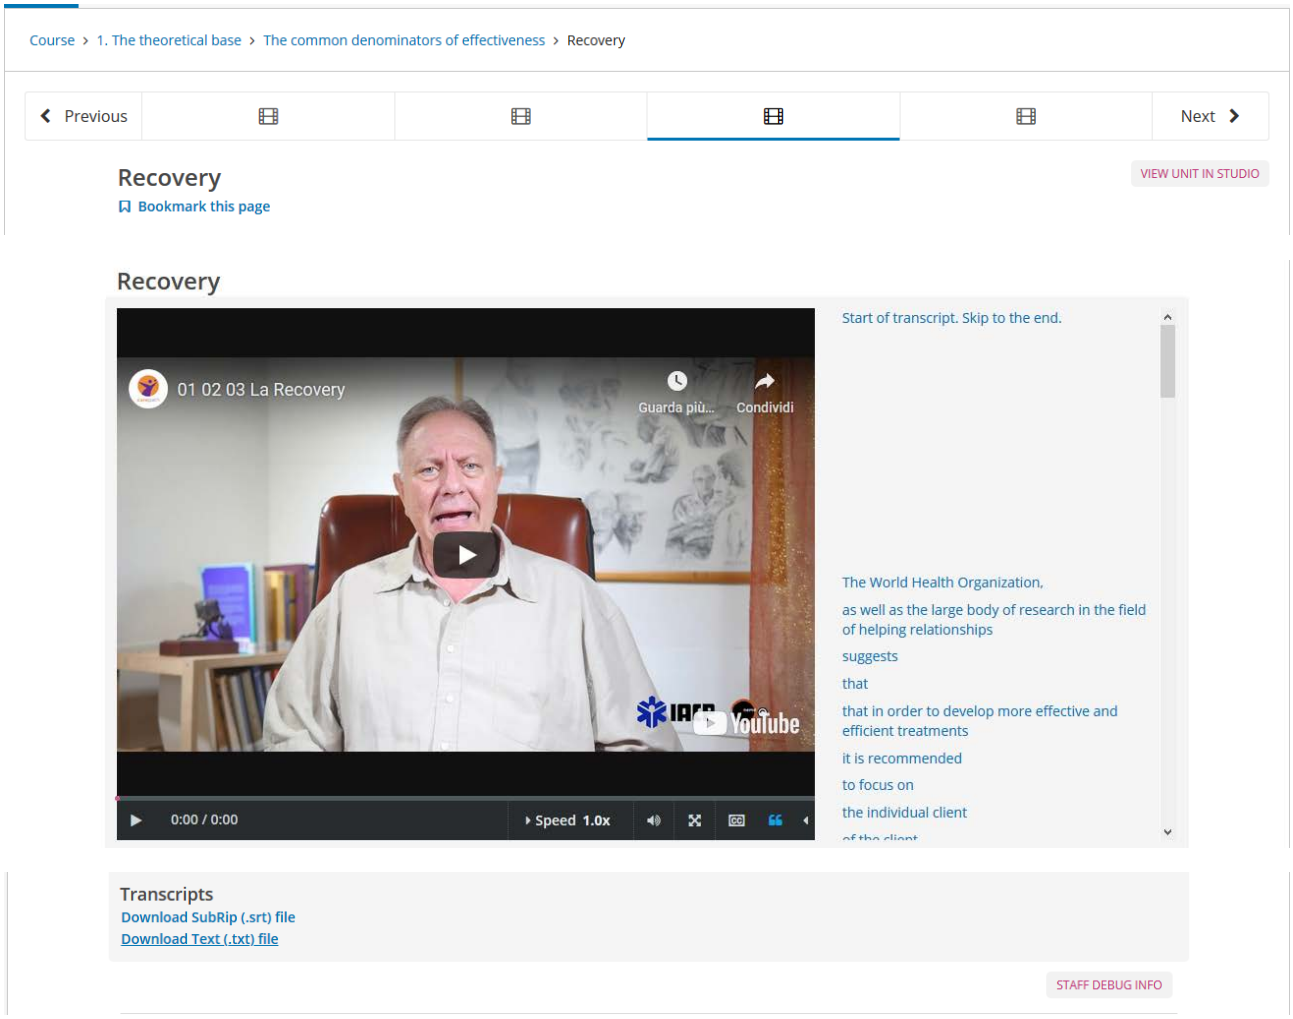
Of your psychotherapist

EIn this way the dyad can function with very positive and more effective results

than if the person with the same discomfort received only a drug treatment, or indeed.

no treatment.

In short, in the psychotherapeutic field and in the helping professions an effective relationship is good medicine



Transcript

The World Health Organization,

as well as the large body of research in the field of helping relationships

suggests

that

that in order to develop more effective and efficient treatments

it is recommended

to focus on

the individual client

of the client

we are taking care of.

In short, it is important to customize the treatments, not as if they were just a tin of white paint which allows us to paint white everybody, regardless of who the users are.

white paint which allows us to paint white everybody, regardless of who the users are.

Just as psychotherapy must be personalized, helping relationships must also be personalized

because this best helps Gino, Maria, Joseph, Mary, etc. .

Beacuse

We must

establish strong work alliances and engage in narratives

that sees the client as the protagonist in this adventure of change.

The Task Force 29 of the American Psychological Association

shows the importance of centering treatments on people

and

also recommends another important aspect:

that treatments and their philosophy must be

concepts of recovery

instead

of as was previously done

with a pessimistic

vision of pathology and chronicity

What is recovery?

In recent decades, recovery has developed a capacity –

of being more helpful by supporting and empowering clients -

and has dispelled some myths,

such as

that

schizophrenia

is a chronic pathology.

This was thought previously

but the very fact of thinking in this way also becomes to

a

certain extent a self-fulfilling prophecy

if we think about it - is rather obvious.

So true

Using the example of schizophrenia, we know that it

in every country, yet no culture treats it just the same way.

In some societies and cultures the schizophrenic is considered as a person

touched by the gods

and therefore the community treats them with respect, benevolence and offers

food and shelter

in other societies

they are instead treated as outcasts

banned from the community and chained to a tree in the forest.

In our western culture,

at different times, we treated

these people

in a very different way,

sometimes cruelly,

but obviously we did it for their own good, as when we believed

in turn that it was a phenomenon caused by a devil's possession and so we tortured these poor people

with hot irons, thinking that if their bodies are possessed by a devil,

if me make the body uncomfortable by torture the devil would come out.

or

We treated people by many other means,

but always making the prophecy of pathology and chronicity

and punctually these prophecies

come true

With a vision of recovery, which postulate that whatever your

situation, even as a serious one

as in schizophrenia, you can recover your capacities to function and be part of the community, in this way a positive prophecy

is formulated and realized: Like all prophecies, to some extent come true.

So today we see that when people are viewed with greater optimism, they satisfy these prophecies.

We therefore can witness people who still see things that others do not see, hear voices that

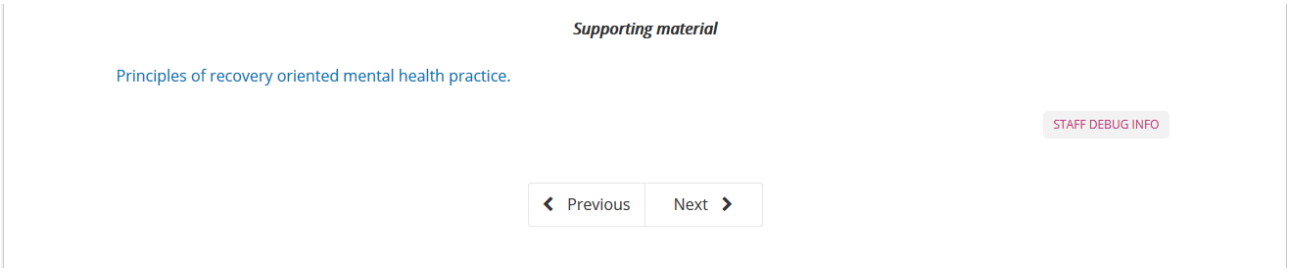
others do not hear, but nevertheless are working as paid consultants in an Local Health Agency advising how to treat

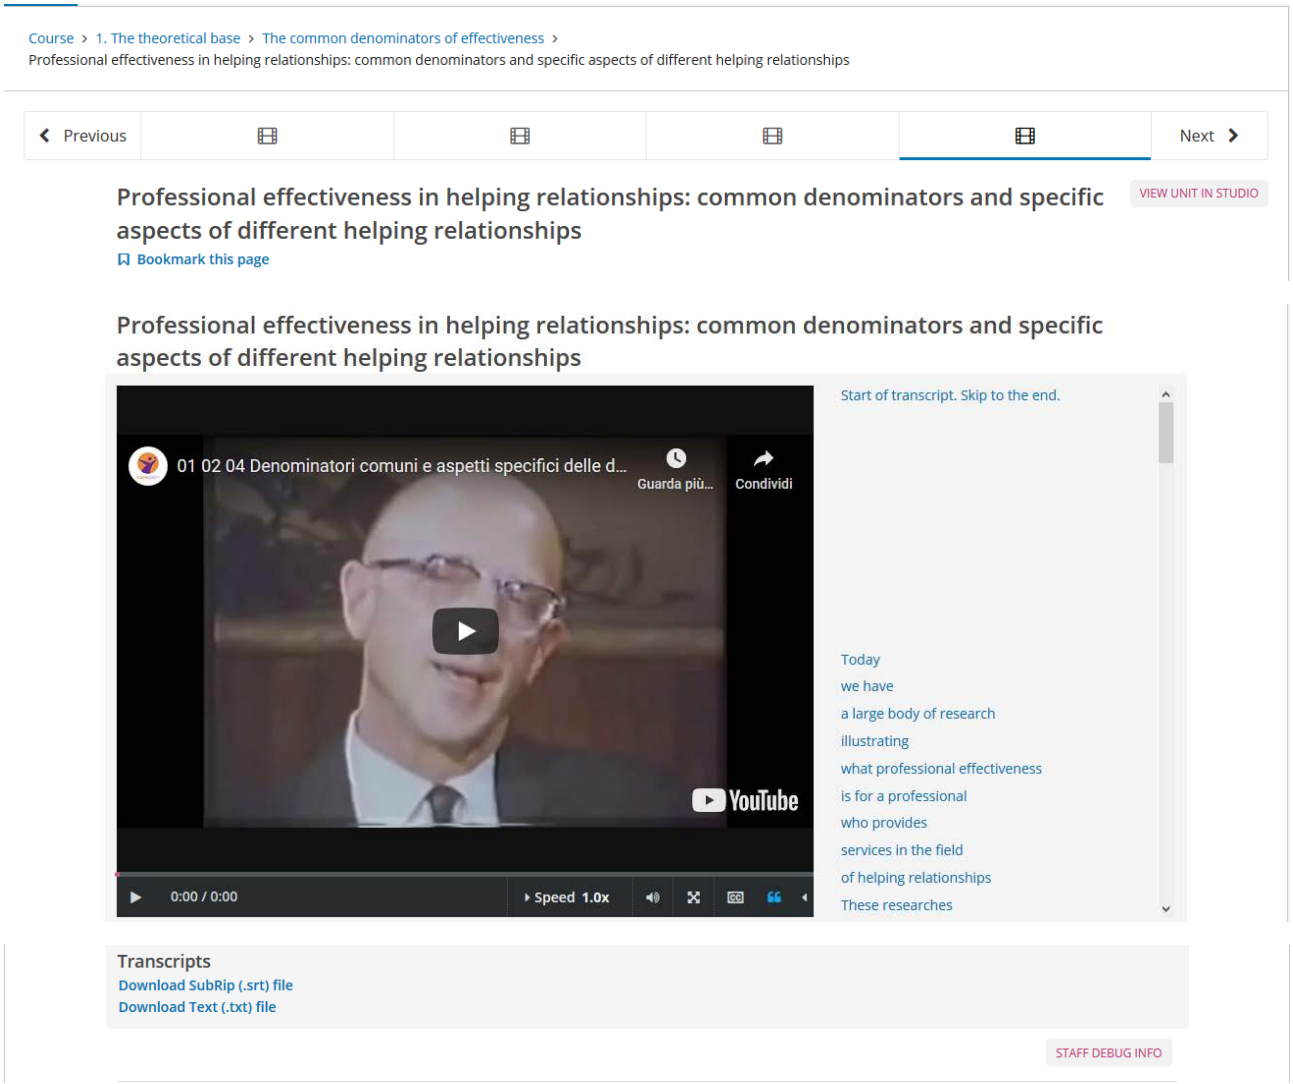
people with their afflictions in a more human and positive way, and to be able to realize

instead of negative prophecies - positive prophecies that are also

self-fulfilling

With prophecy, we must be careful what to choose and where this leads us.





Transcript

Today

we have

a large body of research

illustrating

what professional effectiveness

is for a professional

who provides

services in the field

of helping relationships

These researches

started long

time ago from the hypotheses formulated by Carl Rogers,

who is

the founder of the person-centered approach

and one of the fathers of humanistic psychology

Starting in 1942, Rogers scientifically formulated

hypotheses

and then moved on to his empirical

verification of what constituted the necessary and sufficient conditions for an effective professional to promote change.

These were and have been confirmed until today by research:

the ability to establish

a trusting relationship with the user/client,

with the professional having an attitude of non-judgement,

acceptance

and deep respect for the person of the client,

ability

a sensitive and accurate ability to listen empathetically - that is, to understand not only what the client says,

but also what it means for him/her

and also an attitude of authenticity, frankness

and honesty in the relationship.

These hypotheses, which were validated by research on psychotherapy ,

where later on proven effective

in all the helping relationships

none excluded

so in this

Rogers gave a great contribution made a significant

a step forward n the helping relationships, rooted them solidly

in science and not in metaphysics and made explicit the values that are at the base of any approach.

I think it will be clearer to listen directly to Carl Rogers in person,

who illustrates these three necessary and sufficient conditions in one of his famous films:

â€œFrom my own years of therapeutic experience I have come to feel that

If I can create the proper

climate, the proper relationship, the proper conditions,

the process of therapeutic movement will almost inevitably occur in my client.

You might ask, what is this climate?

What are these conditions?

Will they exist in the interview with the women Iâ€™m about to talk with whom I have

never seen before?

Well let me try to describe very briefly what these conditions are as I see them.

First of all, one question is,

can I be real in the relationship?

This has come to have an increasing amount of importance to me

over the years.

I feel that

the genuineness is another way of describing the quality I would like to have.

I like the term congruence, by which I mean, what Iâ€™m experiencing inside is present

in my awareness and comes out through in my communication.

In a sense,

when I have this quality,

Iâ€™m all in one piece in the relationship.

Thereâ€™s another word that describes it for me,

I feel that in the relationship

I would like to have a transparency, I would be quite willing for my client that sees all the way through me,

that there would be nothing hidden.

When Iâ€™m real in this fashion that Iâ€™m trying to describe then,

I know that my own feelings

will often bubble up into awareness and be expressed, but be expressed in ways

that wonâ€™t impose themselves on my client.

Then the

second question I would have is, will I find myself praising this person,

caring for this person.

I certainly donâ€™t want to pretend a caring that I donâ€™t feel.

In fact, if I dislike my client persistently, I feel itâ€™s better that I should express it.

But I know that the

process of therapy is much more likely to occur,

and constructive

change is much more likely,

if I feel a real spontaneous prising of this individual with whom I am working.

A prising of this person as a separate individual.

You can call it acceptance, you can call it caring,

you can call it a non-possessive love if you wish.

I think any of those terms tend to describe it.

I know that the relationship will prove more constructive if itâ€™s present.

And in the third quality, will I be able to understand the inner world of this individual,

from the inside,

will I be able to see it through her eyes,

will I be

sufficiently sensitive

to

move around inside the world of her feelings,

so that I know what it feels like to be her.

So that I can

sense not only the surface meanings but some of the meanings that lie

somewhat underneath the surface.

I know that If I can

let myself sensitively and accurately enter into her world of experience

than change and therapeutic change are much more likely.

What is trauma? How can we define it? Trauma is something that overwhelms the persons exposed to it.

Trauma, in reality, is an experience, a

stressful phenomenon

improvviso sudden

That

goes beyond the possibility of the person to react

of

defend herself from the trauma itself.

Trauma is something that overwhelms

the persons exposed to it.

Trauma has been studied in various ways

in various ways

there are acute traumas for example due

to natural or technological catastrophes there are chronic/repeated situations of trauma -

such as children are often exposed to

But

what can be

said is that the history of trauma, from a clinical point of view, begins

precisely with the study of post-traumatic neuroses, which have also been studied by Freud - and therefore in the

context of psychoanalysis - and then taken up again by other others.

What psychoanalysis has studied, since its origins, is the fact that a trauma

to the first world war and to the successive wars - many exposure disorders have been noted

to war traumas which they then involved of the psychological consequences and that later

have been taken from the classification systems psychiatric, therefore of psychopathology

as a post-traumatic stress disorder. This post-traumatic stress disorder

Is the only disorder in psychiatry that is certainly and certainly due to an external factor;

This factor is precisely the trauma

It is no therefore necessary for a person

it is exposed, for example, to an earthquake or to a flood, to be bearer of

its weakness, fragility or vulnerability, beacuse is so important and

overwhelming force of the individual which in itself is able to induce

consequences at the psychological level and at the level also physical. At the physical level as between the

symptoms more important than today it's called post-traumatic stress disorder

there are, of course, type symptoms neurovegetativo:

symptoms of alert, of increased

arousal, or increase in vigilance and reactivity to external stimuli.

Therefore means that a person carries within itself also some objectives signs and,

Not only of subjective symptoms, of impact that the trauma has had on her

Trauma has also been studied from the point of view of psychological mechanisms

very important

which are

What psychoanalyst is has studied, since its origins

is the fact that a trauma

in particular if it occurs early in childhood

is subject to a removal process.

This removal does not mean, however, that the trauma is forgotten,

denied or buried. It can be reappear, be reactivated at another time

for example in adult life

Perhaps

due to another trauma that somehow

recalls the previous trauma. This is a two-stage mechanism that Freud carefully studied

according to which there is a first trauma which, in a certain sense, sensitises

and a second trauma that

reproduces in the subject the condition of being a victim

of powerlessness and fragility

reproducing the situation and leading

to new

symptoms

and a clinical situation where the client feels it as though it was the first time.

This said, the trauma of post-

traumatic stress disorder instead occurs in a

punctual manner that endangers the subjects life

It can be caused by war, tortue

technological or environmental causes

but this trauma is a punctual type and easily recognisable

in the life of the subject

Let's analyze the types of trauma that can lead to eating disorders.

Classic trauma, which strikes once, which is a very serious event,

in reality is one of the least frequent cases, even if it is particularly important

due to the devastating effects it can produce on a person.

These are serious events that have a negative aspect,

that have a negative aspect, that can affect a

person's life

producing psychological or physical damage, or both of them,

and which can last

for several years in a person's life

Usually we find this trauma in what we call post-traumatic stress disorder,

but it is very common in eating disorders, in particular in some forms

of eating disorder.

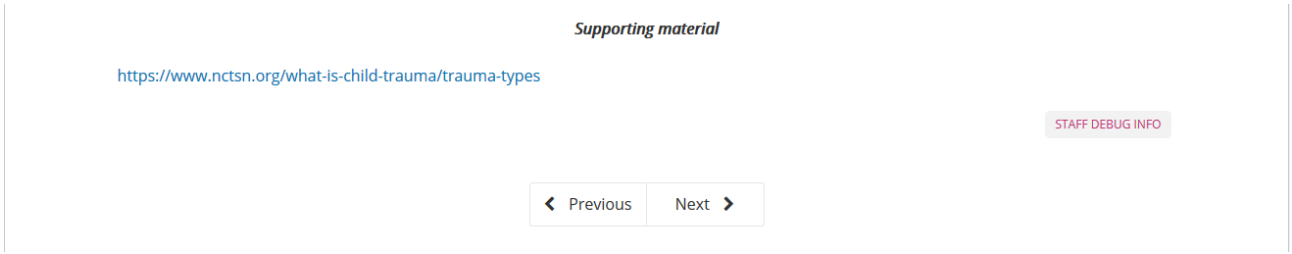
This can be divided into two parts: trauma, which can
can especially occur in particularly dramatic moments such
as rape, robbery, physical violence, wartime combat,
natural disasters (such as 18 00:01:12,820 --> 00:01:16,000 a tsunami or earthquake), a very serious car
or train accident.
Trauma of a predominantly psychological type: when someone's life is
under threat by someone, of a particular situation in which,
someone finds themself
where there are no physical injuries
physical injuries, but simply
a threat so extreme and strong that it is difficult for the person to erase it from their
mind in the near future.
For people subject to type I trauma, also called "focal trauma",
the trauma is called "single blow", that is,
that is, it strikes once,
but
leaves strong traces
and on symptoms
in eating-related symptoms,
has a very similar effect to post-traumatic stress disorder.
A trauma of the type I can have a series of consequences, among which eating disorders
are one of the most common,
and then a series of rather extensive symptoms
which can involve
that
a series
of traits
that are all present
in eating disorder behaviour.
That is to say that eating disorder behaviour isn't solely eating behaviour,
but the symptoms can accompany,
frequently

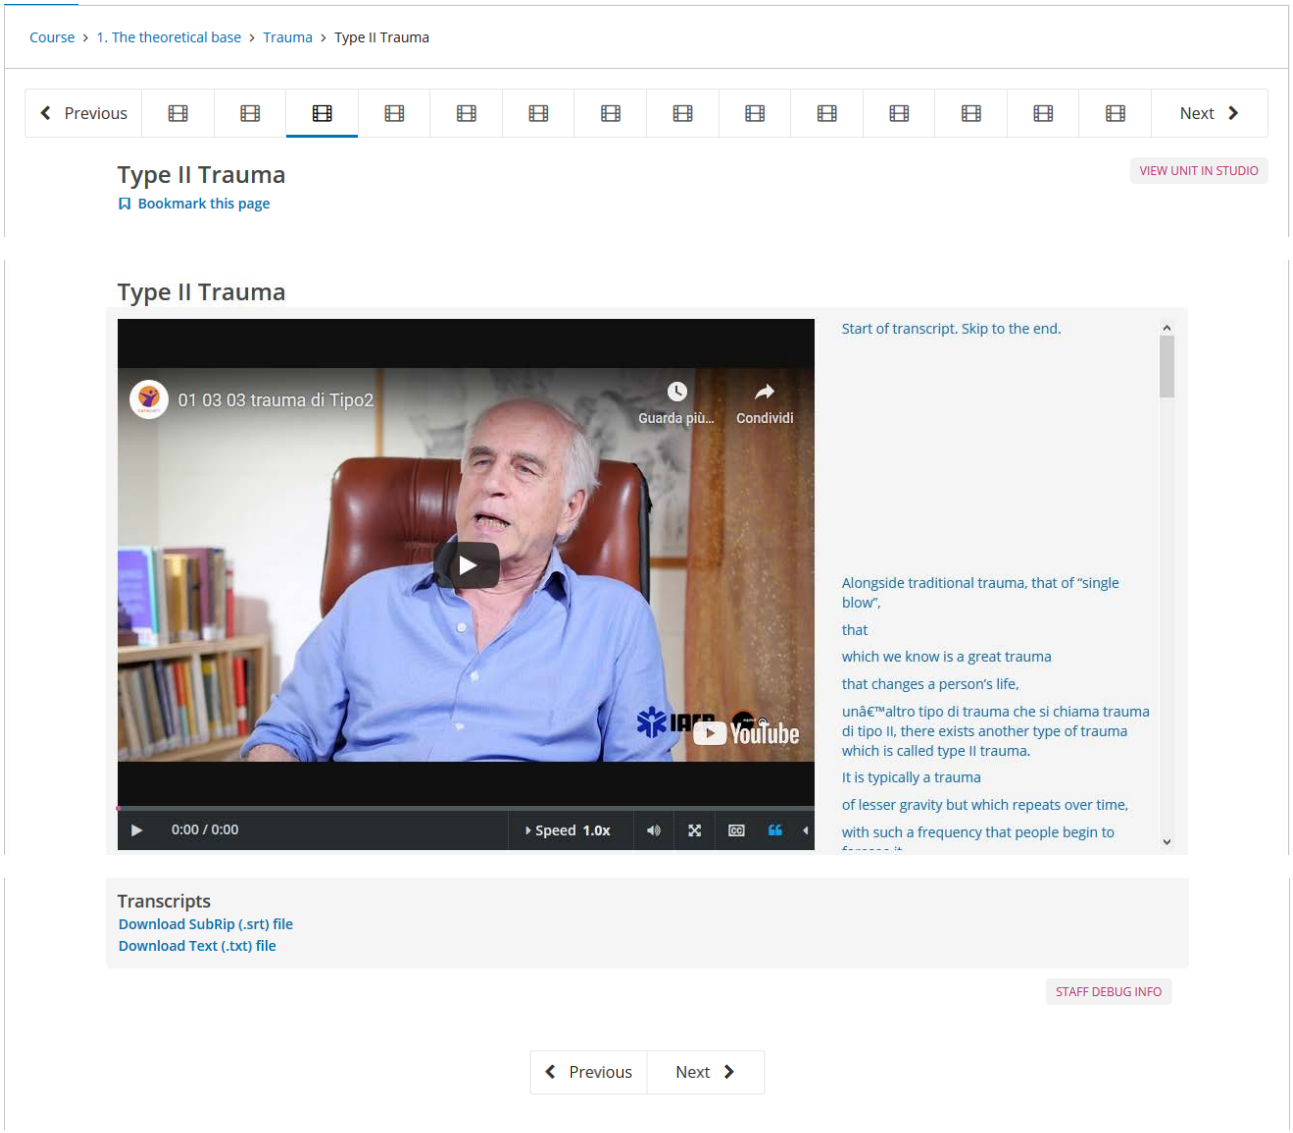
and in nearly all cases having this symptomatology,
each of the individual eating disorders. These traits are:
low self-esteem, a very strong tendency to depression,
a distorted image of one's body and sexuality
distorted peculiarites
high suicidal risk, anxiety disorders, alcohol abuse
sleep disorders, dissociative disorders, memory loss, aggressiveness and personality disorders.
It is a symptom logical procession that never surprises us
eating disorders never come alone, but are always accompanied by symptoms
of this kind or by real pathologies
that complete the picture of eating disorders
and
are rarely absent.
We have, in particular,
trauma that leaves a trace - as in this type I trauma
which occurs primarily
by producing alexithymia, which is an emotional disorder
that prevents a person from openly expressing their emotions
with words.
The tendency in this case, after a type I trauma, is to express emotions mainly
on a non-verbal level,
with one's own body,
and these sensations
can be 71 00:04:08,300 --> 00:04:09,320 very serious
and may involve
emotional dysregulation, also notable, to the point that the person
shows an impulse
at a certain level,
and
we know - because
this is one of the most
frequent feedback that we find

that there are some forms of bulimia nervosa in which this type of trauma
this type of trauma (for example abuse) are
are
of such gravity and magnitude as to produce
symptoms
that can lead to a considerable and widespread loss of control at
different levels.
In particular, what happens at an early stage of development,
when the trauma is dramatic
when there are serious variables in the family
to be sustained and supported,
in these cases
we run the risk of multi-impulsive bulimia:
form of bulimia
a very serious and dangerous
in which, together with bulimic behaviours,
alterations in the
character of eating behavior and above all impulsiveness,
which may concern
sexuality,
the
tendency
consume food in an uncontrolled manner, without tasting it,
which could, for example, lead to the
typical behaviours of those who carry
out thefts in supermarkets who consume food in the supermarket and cannot wait to
go back home to eat even if they could buy food.
A
A disinhibition of the impulses which we have seen regarding sexuality,
but above all, more importantly and more dangerously, self-injurious impulsiveness, self-injurious
behaviour such as cutting oneself or attempting suicide.
This type of bulimia, multicompulsive, is the most dangerous known, particularly

due to the high suicide rate

Concluding a type I trauma has the consequence, particularly if the environment is not supportive, of this form of bulimia which is certainly the most dangerous form known in particular for the very high suicide risk.





Transcript

Alongside traditional trauma, that of “single blow”,

that

which we know is a great trauma

that changes a person’s life,

unâ€™altro tipo di trauma che si chiama trauma di tipo II, there exists another type of trauma which is called type II trauma.

It is typically a trauma

of lesser gravity but which repeats over time,

with such a frequency that people begin to foresee it,

but cannot predict exactly when it will occur

This expectation has a wearying effect: it produces an extremely strong

feeling of powerlessness

in the subject that feels of not being able to master oneself.

able to master oneself.

In this type of trauma, where eating disorders are frequently found,

there may be a history

of violent conflicts in the home environment

which the

kid or adolescent,

sometimes the child, has been witness to for a long part of their life without knowing the

term. It may be that this violent conflict may lead to a real

violent behavior that can also produce

that can also produce serious damage or even loss

This type of repeating trauma

creates a very dramatic situation

a very dramatic situation where the person expects

there will be opposition even when its not necessarily the case.

even when it’s not necessarily the case.

Nevertheless the trauma is caused by such an extremely strong

and frequent repetition

that in the subsequent life of the person,

this same type of fear can occur

even after the trauma has ceased

In some cases, there is a tendency for people to repeat the type of trauma.

For example, in a

young woman

who has all her life witnessed the fighting between her parents

caused by them cheating on one another

in later life she only knew

how to choose

partners that expressed the same unfaithful behaviours

These betrayals increased her need to discover the cheating whether it had occurred or not. This type of

behaviour becomes,

in a certain way, a repetition of the prediction of a harmful event,

with the fear it could occur from one moment to the next,
as though the moment of childhood had never passed.
Type II trauma produces, among other things,
a tendency towards massive denial, affective numbness
as if the person tended to eliminate emotional feelings.
Therefore they tend to comport themselves as if they were “cooled”, as if they had no
other feelings
in certain moments of their lives.
This is called numbing, which is considered one
of the basic elements
of dissociative disorders: a disorder in which people lose the ability
to warn
to feel normal sensations
as if they had lost
significant sensory capacities
or as if they were absent or not
part of everyday life in certain moments
of their existence.
This is accompanied,
above all in eating disorders,
and even more
so in eating disorders
where there is a loss of control, therefore restricted anorexia
or anorexia and bulimic
behaviours
by a hidden and deep anger.
The subject is passive,
does not seem to react
but when they perform an action
you can perceive in them
a strong anger,
The manifestations of aggression towards the outside world

are very contained,

ma quando but when the subject feels strong emotions,

this strong anger can become explicit

and result in violent behaviour towards themselves and others.

The subject expresses an incessant sadness - not an intermittent type - which is stable

in the person

as if

there had been a childhood trauma that produces a constant pause

which in turn produces a sense of desperation

that extends

for the whole life

It is, as said, small traumas

that accumulate, but they have also been called

complex traumed or relational traumas because they depend on

a series of continuous relations one has with another.

Therefore it can happen that those who have experienced these traumas,

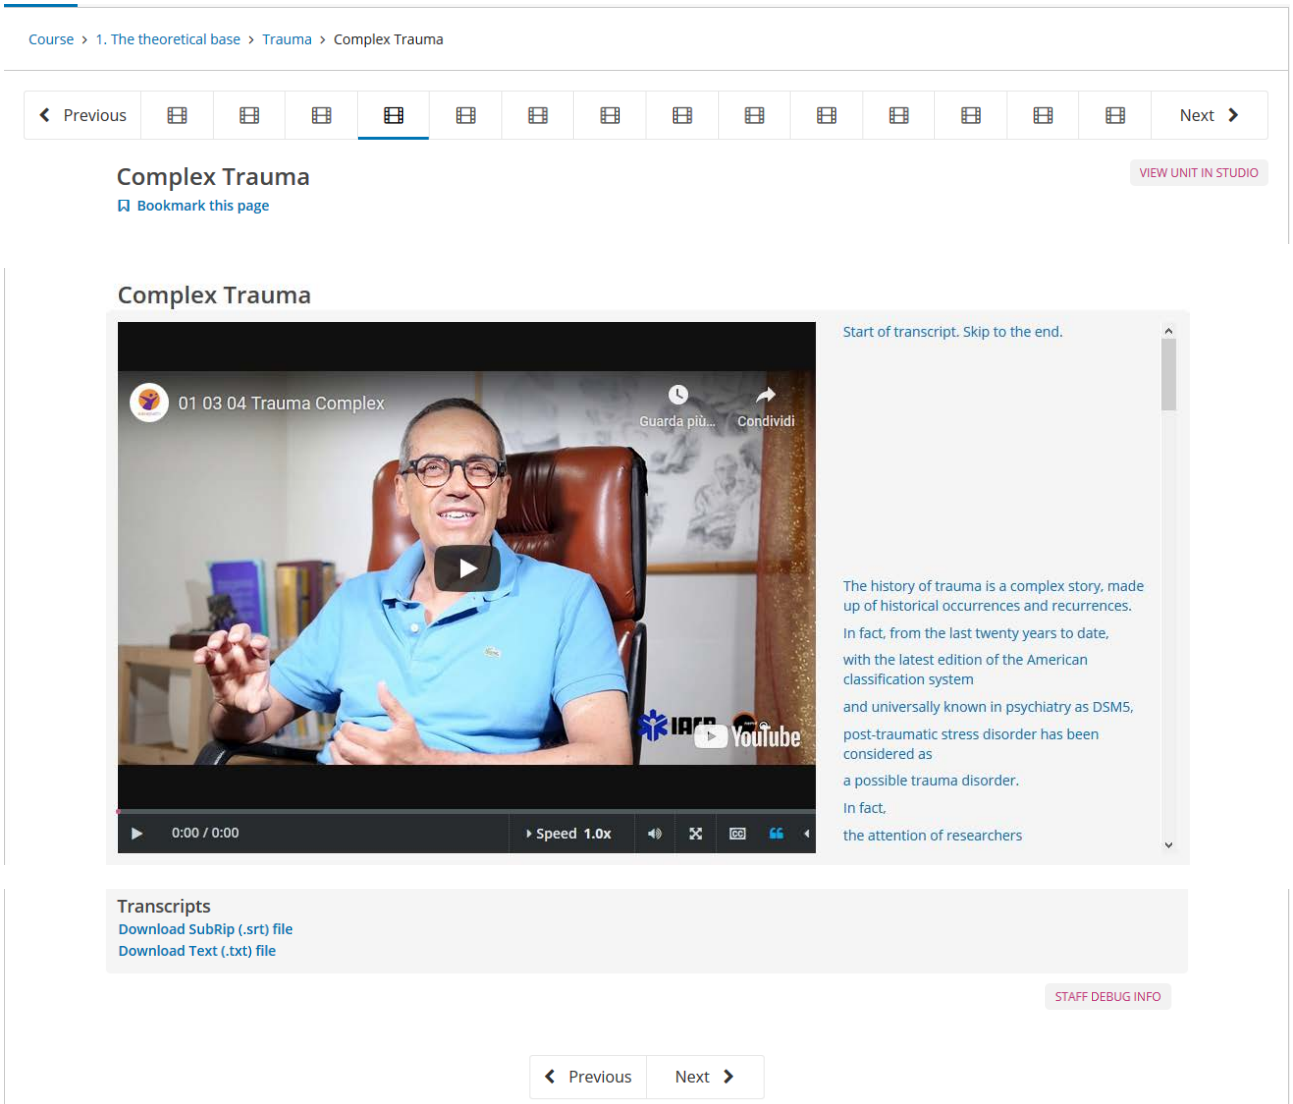
experience strong traumatic moments in the home environment, particularly

in the family environment

strong traumatic moments

They are, therefore, constant traumas that reappear and produce the dissociative symptoms

of which we have spoken or emotional regulation.



Transcript

The history of trauma is a complex story, made up of historical occurrences and recurrences.

In fact, from the last twenty years to date,

with the latest edition of the American classification system

and universally known in psychiatry as DSM5,

post-traumatic stress disorder has been considered as

a possible trauma disorder.

In fact,

the attention of researchers

primarily Van der Kolk, who launched the

question of complex trauma,

has turned to to childhood traumas.

Those which occurred at an age where the subject was in a

in which

these will be found in one

position of weakness, of inferiority - as children normally are.

This type of

of traumatic situation, of events that children are exposed to

from not only a psychopathological point of view,

but also a neurobiological one, are the possible causes of a predisposition to the development of psychiatric disorders

that go well beyond post-traumatic stress disorder.

These

phenomenons

of

childhood trauma

have different types: they can be acute,

they can be protracted and repeated during childhood

and go under the

name

abuses when traumatic phenomena are positive.

For example, when something is committed against the child, such as child abuse,

sexual or physical violence, or psychological violence.

Or they may be

emissive,

if they may be due to a type of neglect, neglect of both the psychological

and physical

of the child leading

to real events

and situations of abuse.

Thus maltreatment and abuse are the phenomena Therefore we are now dealing with

when we talk about complex trauma.

Complex trauma, or primary evolutionary trauma as some call it,

is often due to the failure

of the

primary

primary caregivers, parents for example, as well as cumulative trauma.

for example,

as well as cumulative trauma. The psychoanalyst Masud Khan deals precisely

with this type of trauma that is many small events or traumatic situations

of an omissive or commissive type that were repeated during childhood and which,

cumulatively, gives rise to a traumatic climate or dimension

that the subject will feel

during his adult life when they encounter difficulties,

problems, or another trauma that recalls the previous trauma.

However this previous trauma is a complex trauma which can be extended

over a very long

and important period of time, even a whole childhood.

Think of situations where there are families

that experience a

climate of fear or prolonged violence due to disturbances or problems affecting parents

of one or the other

and therefore do not guarantee that serenity, that sense

of security and protection that is very important for a child to develop basic trust

which is

necessary to encounter life and relationships

with others in a calm, open and confident way.

The subject may not notice this, because more or less all of these situations can

encounter phenomena of repression or forgetfulness,

and can

Therefore

Simply

work from within, in an underlying way,

until the “bill is presented” to the subject.

This is because these situations come to light, in a way

that can be explosive,

due to the effect of something in the environment of the subject that in adulthood helps

to deconstruct their emotional climate,

contributing to the discomfort of the subject and thus

reopening the scenario of the past trauma.

This is because, as previously mentioned, the current

trauma can attract and recall the past trauma, in a sort of fatal attraction

Re-victimisation in complex trauma

The

Re-traumatization

is an unfortunate event

that sees a person who has already suffered a trauma

have a relapse

this occurs mainly for two reasons.

One

due to natural

causes the previously

traumatized person

is exposed

to images or events

where other people are victims of trauma and this makes

the subject re-live

the previously experienced trauma

The other is

is

instead

a type of re-traumatization

that

has

iatrogenic origin

That is,

are delivered

in which provided in manner

dysfunctional

Maybe

not necessarily due to the bad intentions of the professionals

but out of simple ignorance

the traumatized person

that instead of being helped

by the treatment and care facilities

it comes

traumatized

in short

it would be like

a

Person

that

who arrives at an emergency room

with a broken leg

and the doctors handle it badly,

dropping the patient from the stretcher

He then finds himself with two broken legs, thus doubling the damage;

a true tragedy.

The history and the sociology

treatments

of trauma

reveal that unfortunately,

this was not at all infrequent in the past

obviously not for bad will, but ignorance

to produce

such damages

iatrogenic results

The whole world of care,

because offers treatments that impact a complex and delicate system like a human being,

risks not only impacting people in a good way, but - without wanting to - further damaging people;

this is true for drugs, for surgical procedures

and for any type of helping relationship. A service If not delivered

effectively, it

becomes

Counterproductive

Within the specificity of trauma this is particularly serious, as a traumatized person

is particularly

sensitive and

can be significantly damaged by a second traumatization

Today we have learned

from these mistakes, research has become more numerous

and accurate

a

developed significant knowledge - which of course will continue to develop in the future - thanks

to which precautions have been drawn up so as not to run the risk of

re-traumatising already traumatized people

These precautions are called

trauma-informed practices

they centre on the person of the traumatized service user

and

pay attention to what causes further damages.

You can skip doing this exercise if you do not work in any role in the field of offering services to traumatized minors.

Transcript

Adolescence is a period in our life cycle which, due to its evolutionary characteristics,

represents a period of increased vulnerability. This is because it exposes each individual to

important bio-psycho-social experiences of change that can be experienced with discomfort, suffering

and al thel illnesses that can be accentuated if the individual

is exposed to traumatic experiences

As illustrated by Rogers, if a child grows in a facilitating environment,

this will allow him to be in touch with his/her feelings, not to block them or to freeze traumatic experiences,

but to move on in life, satisfying his needs and evaluating experiences

and evaluating experiences as pleasant or unpleasant depending

on whether they are favorable or unfavorable to one's own development, that Rogers

calls this innate capacity of self regulation the actualizing tendency, which is the capacity to understand oneself, self-regulate and actualize oneself.

If instead the child lives in an environment where he feels that the acceptance of his care takers

depends entirely on how well he adheres to their expectations,

to forcefully amputate a part of his own self

and therefore to relate

and build an ideal self with rigid constructs.

Constructs that will be even more rigid if

built on a constant sense of ambiguity, threats and fear, if the child grows in an

unpredictable environment

it is precisely in this deep core of estrangement between perceiving, experiencing, symbolizing

and act that is created and strengthens that sense of estrangement on its own which is then at the base

Of the pathogenesis

We therefore see that our teenager, who grows up and is nurtured in his relational context,

is thus exposed to the evolutionary changes mentioned earlier.

All these changes of determinants requires a kind of internal reorganization,

a re-tuning that involves the individual image of himself and his most important relationships

All this requires, therefore, a redefinition of one’s sense of identity.

to the life experiences, but also constant compared to the sense of identity that has been built

and all this requires, therefore, a redefinition of one's own concept

Of

Lets see what these changes facing the teenager are.

the first concerns the body: the adolescent's body is an evolving body, with

growth in size, the appearance of secondary sexual organs,

reproductive organ Therefore a body that requires a new type of relationship with itself.

The body becomes a primary and intermediary vehicle to

communicate the teenagers experiences externally.

A body, therefore, that you can choose to maintain and beautify,

but also to scratch, cut

or to forget; a body that chooses to be talked about.

At the same time, it is a body that is seen from the outside, that captures the gaze of others,

with desire or derision and therefore exposes the adolescent to new experiences,

new opportunities, but also new risks.

Then there are changes at an interpersonal level.

Within the family the teenager is asked to move from dependence - the care and attachment phase to autonomy and the search for balance between these two apparently opposite evolutionary thrusts, which has social repercussions. In fact in the external environment, the role of the teenager within their group of peers and other significant relational figures, changes have shown, there are also changes at the level of the brain.

As the latest researches

The brain undergoes modifications, both structural and functional, especially in those cortical areas that are involved in the decision-making processes.

All this causes great vulnerability which, as mentioned before, is further undermined if the subject experiences traumatic experiences harm or compromise that sense of internal security, the secure base described by Bowlby

This is our emotional place of safety in which needs can be felt, named, fulfilled, which we cannot. always return, but which therefore allows us to have that valuable experience of developing autonomy without losing love. Instead enriching ourselves through the meetings we have with other people.

The person, on the other hand, who has suffered trauma has low metallization capacity and is not able to self-regulate his/her emotional states, can do nothing - as Bromberg tells us

Bromberg tells us to isolate the traumatic experience and all the experiences and contents associated with it, by dissociating it. The pathological dissociation - as illustrated by Caretti - leads to the depletion of the subject and its resources, because it prevents him from reconstructing these traumatic experiences in a coherent narrative with his own life story.

For this reason, if we work with adolescents who have emotional stress, what we can offer is to work with them at an important relational depth, offering them relationships that are profound, based on listening, empathic listening, with deep respect for who they are. Trying to understand the experiences from their point of view, trying to grasp the meanings of what they experience what they experience and, therefore, to offer relational contexts in which adolescents can, slowly, reestablish contact with those parts of themselves - those needs denied up to that point. Not only allowing them to re-feel them, but also to re-tune parts of themselves

to the external experiences that before they experienced as excessively dissonant.

This is possible by offering the adolescents a relational contexts in which we have

a different look towards them. Not just a look that leads us to label

them as boys or girls in perennial revolution and struggle with the outside world, or as apathetic figures awakened

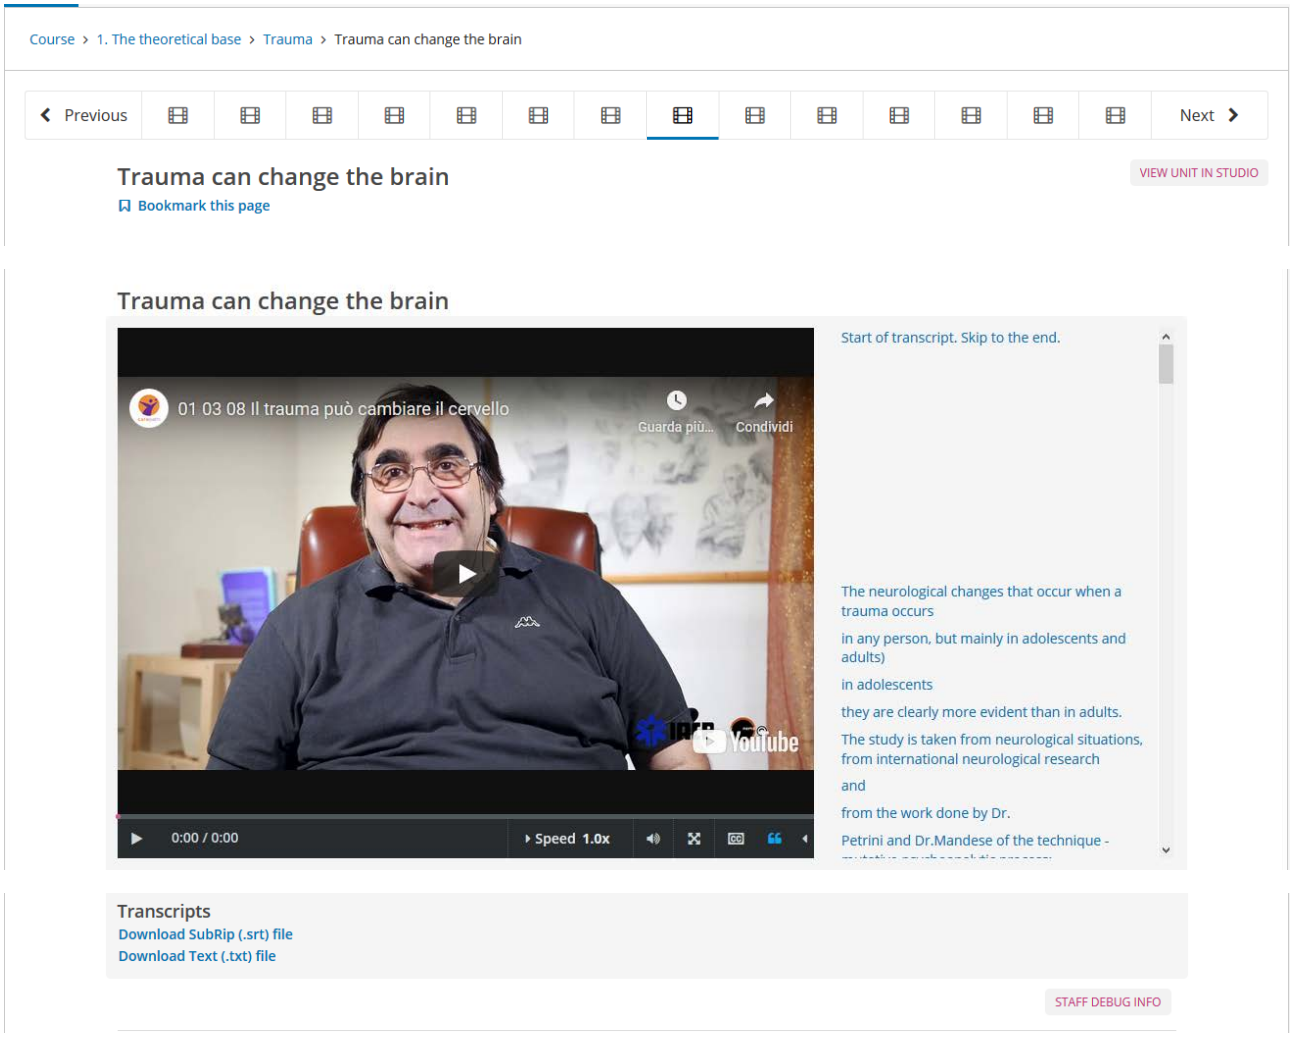
only by the world of social network, but to see them as children with characteristics

and tools typical of their evolutionary phases, that move around the world

ask questions, give answers, explore, try to give a personal meaning to their experiences.

Just as us we continue to act as adults for the rest of our lives

and therefore is very important that we will be rooting for them.



Transcript

The neurological changes that occur when a trauma occurs

in any person, but mainly in adolescents and adults)

in adolescents

they are clearly more evident than in adults.

The study is taken from neurological situations, from international neurological research

and

from the work done by Dr.

Petrini and Dr.Mandese of the technique - mutative psychoanalytic process:

a technique that clearly has

psychoanalytic and neurological parts, in

agreement

with the findings of

international neurological research and the relationship between neurology and psychoanalysis.

It is well known that every individual in a healthy

state develops 1400 new neurons

from estro- genic stem cells

on a daily basis, both at the hippocampus level

and at the olfactory level.

This is an important aspect because the hippocampus is the central part of the memory,

the organism

which recalls similar situations, thus in situations of trauma.

While at the

olfactory level

we observe our cerebral lobes

are nothing more than

an outlet of our olfactory lobe

the animals work with the sense of smell

we work with thought

therefore human being thought

no other than the olfactory

which has spread developed in these

brain cells

We believe that human beings have about 30,000 genes, too few to define all situations,

so family, sentimental, relational, cultural and religious situations come into play

Research shows that only 70% of genes are genetically determined

and only 30% are impacted by external factors.

The difference in genes

between a small man and a male bonobo is 5%,

however this

percentage is very important. A man and a bonobo are not comparable, at all.

comparable, at all. For humans,

culture, religion, all external situations, the family, the community

in which we live, are very important for the formation of an individual.

What happens

when stress occurs?

A stressful or neglectful situation neglect as we have seen is like a stress)
does nothing but block the activity of stem cells at the level of the hippocampus
and therefore it becomes impossible to replace neurons that are normally lost;
so there
is a loss of neurons
in the most important and deepest part of the brain which is the hippocampus
The cognitive emotion regulation that accompanies and sustains these
brain changes
is characterized
by anxiety and depression
related
to the amygdala:
a small cluster of nuclei inside the brain that supports
all our emotional-affective situations,
from love, to sexuality, to eating,
that is important from an emotional point of view.
An alteration occurs in the prefrontal cortex, which are the ones that direct our goals:
if I decide to go to the theater to see an actor it is the prefrontal cortex
that drives me to do this action, then the frontal cortex realizes it.
But the prefrontal cortex also drives impulses, for example when I have the impulse to leave or stay
in one place I owe it to the prefrontal cortex that the frontal then reacts and communicates
the need to remain, for instance due to a commitment.
The third part that will be damaged is
the hippocampus and memory (as we have already said,
the hippocampus is the seat of the memory).
Studies
Longitudinal studies have shown that traumas do not express themselves through a disorder
of DSM -5 or ICD - 10 which is called post traumatic stress disorder,
but is transmitted
through symptoms of anxiety and depression,
sometimes hallucination, but is highlighted
through changes in the sense of self in interpersonal relationships.

A person who has undergone a trauma
has behavioral limitations and mental limitations,
is the person seems unable
to express
herself in the world of work,
of affections
relationships, - it is
as if he or she have fallen to a lower level of functioning
This is
This is due to the HPA axis - hypothalamic-pituitary-adrenal axis.
At the brain-level there is a gland called
pituitary gland,
which all the hormones
of our body radiate from.
The connection between the hormonal (endocrine) parts
and the nervous part
is given by the
hypothalamic-
pituitary axis.
Everything that reaches the hypothalamus - an area of central importance, almost
a small brain
is transmitted to the pituitary gland and gives rise
to sensations, that is the nervous signal is transmitted with hormonal substances.
These hormonal substances
branch out throughout the body,
from the pituitary gland,
and control
the thyroid
sexuality through the genital glands, male
and female sexuality with the male hormone(which also determines female sexuality).
Then, especially,

the release of corticotrophin: the stress hormone, or rather the stress pre-hormone because the real stress hormone is ACTH

because the real stress hormone is ACTH,, the cortisol,

which is why cortisone is given to help the body react when there are physical malfunctions,

cortisol in fact has the same elements as cortin (POMC).

Even in the case of battles and wars the human organism is prepared, in fact cortisol - ACTH

to be precise - causes pain

to not be felt and gives rise to mechanisms of aggression (as happens in animals).

A clear situation of aggression

When this mechanism of activity

is repeated

it becomes chronic and protracted states of anxiety and anguish

occur

depending on the aforementioned amygdale.

The amygdale

is the chest of drawers

della nostra of our emotional memory, in the sense that it preserves all

our emotional memories, as if it were a camera of emotional reality.

So, for example, our first kiss, first work, first sensation of well-being

the first sporting victory - they are all photographed in the amygdale and re-emerge when

similar situations arise; when the hippocampus

begins

to secrete cortisol

This cortisol binds to the receptors of the hippocampus, amygdale and prefrontal area

and when it has reached a sufficient level, if the situation is not chronic,

it lowers the ACTH and CRF level.

In this way the hippocampus regulates our responses

to stress

When

we are well serotonin manages the area instead - serotonin is the hormone

of happiness, , when a person is depressed,

serotonergic drugs are prescribed.

Serotonin

inhibits aggressive behaviors and promotes socialization.

It is produced from tryptophan and is introduced into the diet.

Serotonin, together with oxytocin, which is the binding hormone, is the most positive

and useful hormone for the body, in the sense that while serotonin stimulates sociality

and relationship with others,

oxytocin - released after 5 seconds of hugging another person

is the hormone

that stimulates the bond.

The research is highlighting that loving activities,

important thoughts and feelings have

profound therapeutic effects on our bodies.

So

undoubtedly there exists,

in our way of being

a series of reactions that change the brain and modify the body,

in any situation where there are hormones related to neurohormones

and linked to nervous stimuli.

To talk about child

victims of witnessed violence we need to define what

is witnessed violence in the family.

We refer to witnessed violence when a child experiences any form of

of mistreatment

carried out through acts of physical, verbal, psychological,

sexual and economic violence to some person very important for them or to some people that are emotionally significant

for them, an adult or minor

This type of violence also includes those inflicted by minors to other minors,

but also by other family members to pets; they all

are highly traumatizing experiences for children.

The characteristics of these experiences may be different.

Violence can be indirect: violence is perceived

so it is not just a question of seeing violence, but also just hearing it.

This should be emphasized because many women victims of violence report that the children,

when they were beaten, were in another room; in reality even in these cases

it is a form of direct violence even if the child do not see and only hears it.

The experience can be indirect

when the child is aware that the violence

has occurred or is about to happen; in this sense children have "antennas":

they understand when there is the typical

tension in a house that precedes the burst of an episode of violence.

The experience is sometimes perceived not directly or indirectly,

but the child can perceive its effects;

for example seeing the mother with bruises

or feeling this air of violence in the house, and so in these cases we are dealing with witnessed violence

There are some false beliefs about witnessed violence.

Children

are not impervious to violence that occurs within their own family;

even if the violent act does not occur in their presence, they can grasp its implementation

this because the child is never a passive and unconscious spectator.

Witnessed violence increases the risk of direct violence against children.

The child who tries to defend the mother, getting in the way,

can be hit by the father: in this case

Dr. Annibali uses a gender perspective to

talk about witnessed violence, as in most cases violence is perpetrated

by men against women

This does not exclude that violence can be perpetrated

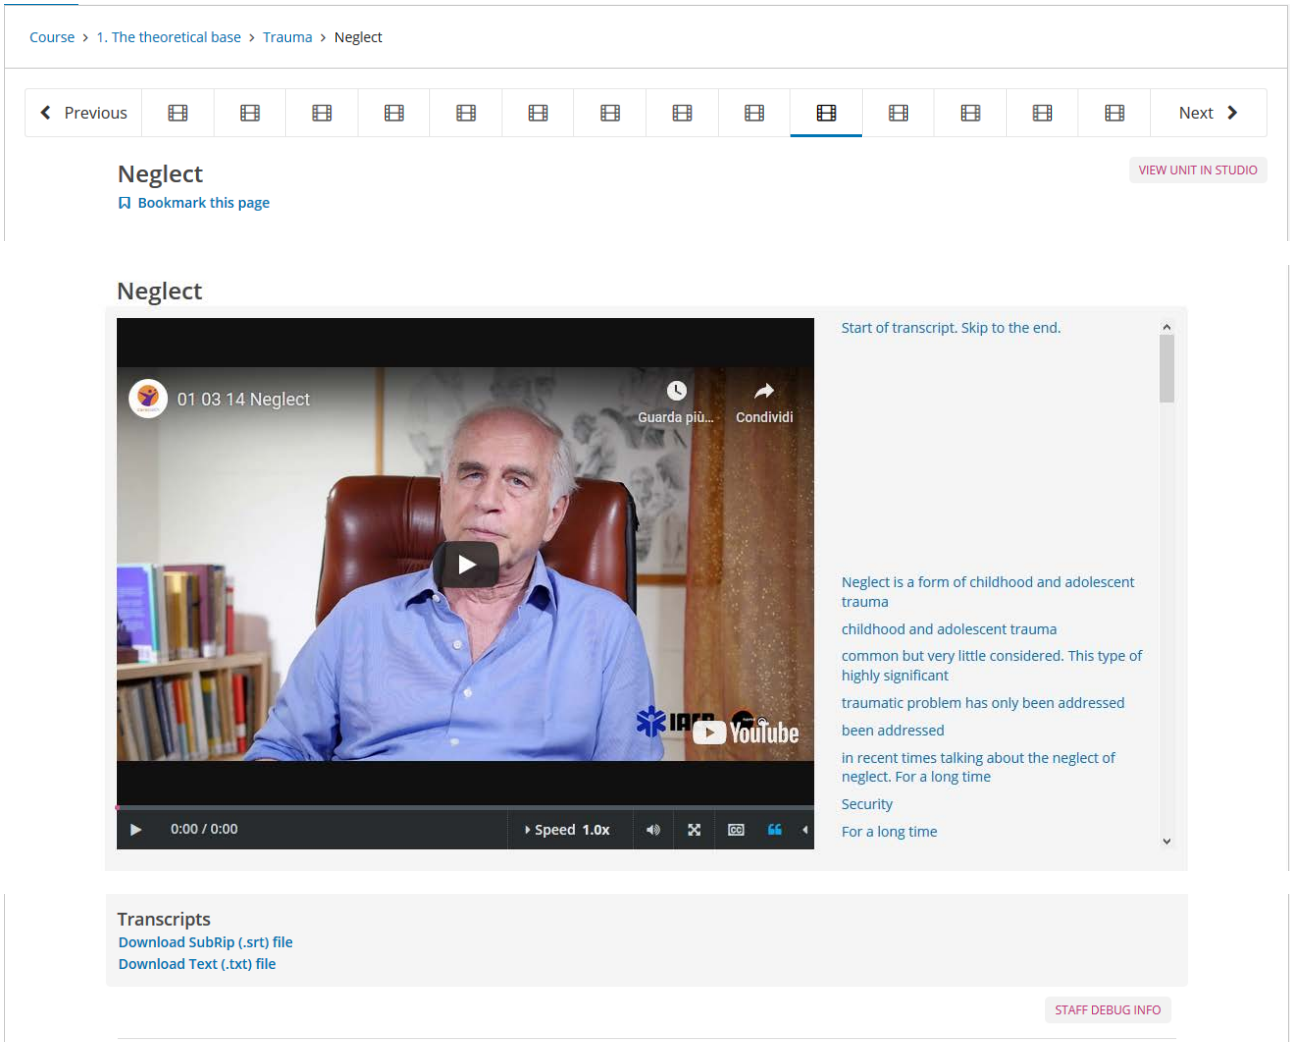
by a mother against the father, or at least by a woman

against a male, but statistically it occurs less frequently

Children exposed to violence are five times more at risk to become violent in adulthood compared to children

who have not witnessed violence.

The effects of witnessed violence are:
a feeling of fear, anxiety, overwhelmed, sadness,
serious depression, feelings of anger, guilt, inadequacy and shame.
Children lose confidence in them and in others, can develop
can develop psychosomatic disorders,
impulse control issues, academic difficulties, learning disabilities,
language,
loss of bowel control, relationship difficulties
and can also develop a post-traumatic stress
disorder if this traumatic experience occurs within a relationship of trust, such as the family.
At the biopsychosocial level,
the effects of witnessed violence are reflected in behavior,
emotions, cognition, the child's physicality, but also in relationships.
What the child experiences is a world in complete turmoil,
violence becomes normality
and consequently normality is violence
The child will recognize violent behavior
as normal and physiological
or, in this sense diminishing his dramatic experience and will probably repeat these
behaviors.
It is increasingly necessary to focus on witnessed violence and how it
affects children in the present and in their adult lives.



Neglect is a form of childhood and adolescent trauma

childhood and adolescent trauma

common but very little considered. This type of highly significant

traumatic problem has only been addressed

been addressed

in recent times talking about the neglect of neglect. For a long time

Security

For a long time

this aspect was not considered a true trauma

at most a small part of the existing trauma types

In reality today we think of this as the most widespread trauma, and the one

that has the worst consequences in terms of duration over time.

From this point of view, neglect indicates the perpetration of omission

behaviors on the part of those who should be offering care.

These omissions indicate, even if an imminent serious
risk of damage is missing, a series
of deficiencies that go on for a long period of time.
these are deficiencies that can, for example, accompany the presence of a type I trauma.
An abuse
could be well tolerated
or in a sufficiently adequate way,
but
much less so if you do not have a parent capable
of understanding
and helping, supporting and protecting
the child who has suffered this type of trauma.
to type I trauma
but also in of itself does real damage.
There are different types of neglect that can
concern healthcare,
education, child supervision,
protection with respect to environmental risks,
ai bisogni fisici, al sostegno emotivo physical needs, emotional
support that is given mainly by the family or at least
by those who take care of the child.
This kind of neglect

but in reality it
gives the person the feeling of having no protection from others
and therefore of living in a hostile environment that cannot guarantee them any kind of security.
Obviously
If we talk about the different types
of neglect, whether it is emotional or physical,
we find two completely different aspects.
In some situations the emotion is neglected as we are faced
with cold,

detached and poorly
involved caregivers. Physical neglect may instead concern
the strictly material aspect,
the basic needs,
and can also be extended to the educational needs
of the child who may not receive from parents
the information necessary
to live in a relational context.
There is also medical neglect,
which is when there is a need to treat an illness,
but those who should take care of the child do not
and consequently the illness can worsen
and become particularly dangerous
or harmful.
or harmful. There is moral neglect, or the lack of instructions for the ethical and moral aspects
of a person's ethical behavior.
The consequences of these types of neglect are damages to public health that has long been 64
underestimated.
Today we know
that long-term exposure
that long-term exposure
to neglect can involve
not only the aforementioned diseases, such as eating disorders
but also a reduction in the gray matter of the cortex
and therefore a much diminished
rispetto a soggetti normali.
capacity compared to normal subjects. This data thus reveals how important it is to deal with neglect
and
try to re-stabilize the familial and individual context
what kind of attention
to have that type of care
and attention that gives security to the individual and gives the feeling of being protected and understood.

At the conclusion of the overview of treated diseases, from eating disorders to neglect, 80
it is noted that the latter is particularly common in people who will develop an uncontrolled diet
that in the end advances to a complete loss of control.
It is necessary to think of a therapeutic relationship in which particular attention i
to the person - a sincere interest in them is manifested with an empathic attitude,
one of understanding., empathy
to understanding
This is one of the most important aspects to effectively deal
with this recently recognized, but particularly insidious trauma,
Importance compared to other major traumas.

In separations conflicts

parents

often "make war" by

investing a lot of energy

in fighting the other parent who is seen as an enemy;

In this context the most important thing

is to win

In these wars

they convey feelings of strong anger

that actually indicate how complex it is for these people

to face the feelings

experienced and linked to the separation process;

feelings of disappointment, pain,

abandonment, a perception of emptiness, loneliness and

and a sense of failure

These people are actually communicating how complex it is for them to process

what is called psychological divorce.

In this context

the figure of the child emerges

as the one that should be protected;

unfortunately this does not always happen because in reality

the minor becomes the fulcrum of the conflict.

It becomes the central element

and therefore

the parents begin to communicate through the minor

the child becomes

the bridge between the parents,

the reason for discussion as each parent argues trying

from

Finding

to declare what is good

for their child

this case the well-being of the child becomes an excuse

behind which disappointments,

jealousies

and personal annoyances

are hidden

What is missing is the protection of the child, which must always be present, but it is essential in contexts of ruptures

but

it is essential in contexts

of ruptures

What parents could and should do is to collaborate and cooperate in all aspects related to the parenting function,

to collaborate and cooperate in all aspects related to the parenting

What parents

with the aim of lightening the burden on the child, in reality,

children are loaded with a heavy burden as they feel guilty for the separation of their parents,

they feel responsible for their happiness

as they are also feel guilty for being the cause of their parents quarrels

At this point what happens is that the child

in reality, is not seen.

Here is where the trauma arises

in the moment of greatest vulnerability

the child is not

seen and therefore his needs and feelings are not recognized, accepted and fulfilled.

Separation is always a traumatic

event because it is damaging,

A parental couple in the mind of

the child is a single nucleus, which in a certain way

has to split.

This external split

of the father and mother

will produce an internal split

however in the mind of the child.

the parental couple

does not cease to exist, but remains,

only that it loses strength,

identity,

dignity,

and function as a guide.

In this case there are other factors

that have a charge

very strong

negative burden

There are aspects that indicate the extent of the trauma,

for example the temperament of the child

and his ability

to tolerate frustration

the quality of the relationship and the type of attachment that parents were

able to create

before their separation.

The factor that

tells us most about the trauma and its size, is the age of the child:

the smaller the child the greater the trauma;

it will be the extent truma

and parents

even unknowingly,

implement a series of dysfunctional dynamics that lock the child in a

in a rigid role

from which he is unable to free himself

because

given his

young age

he does not yet have that level of awareness

or even a solid personality

capable of freeing himself from this trap

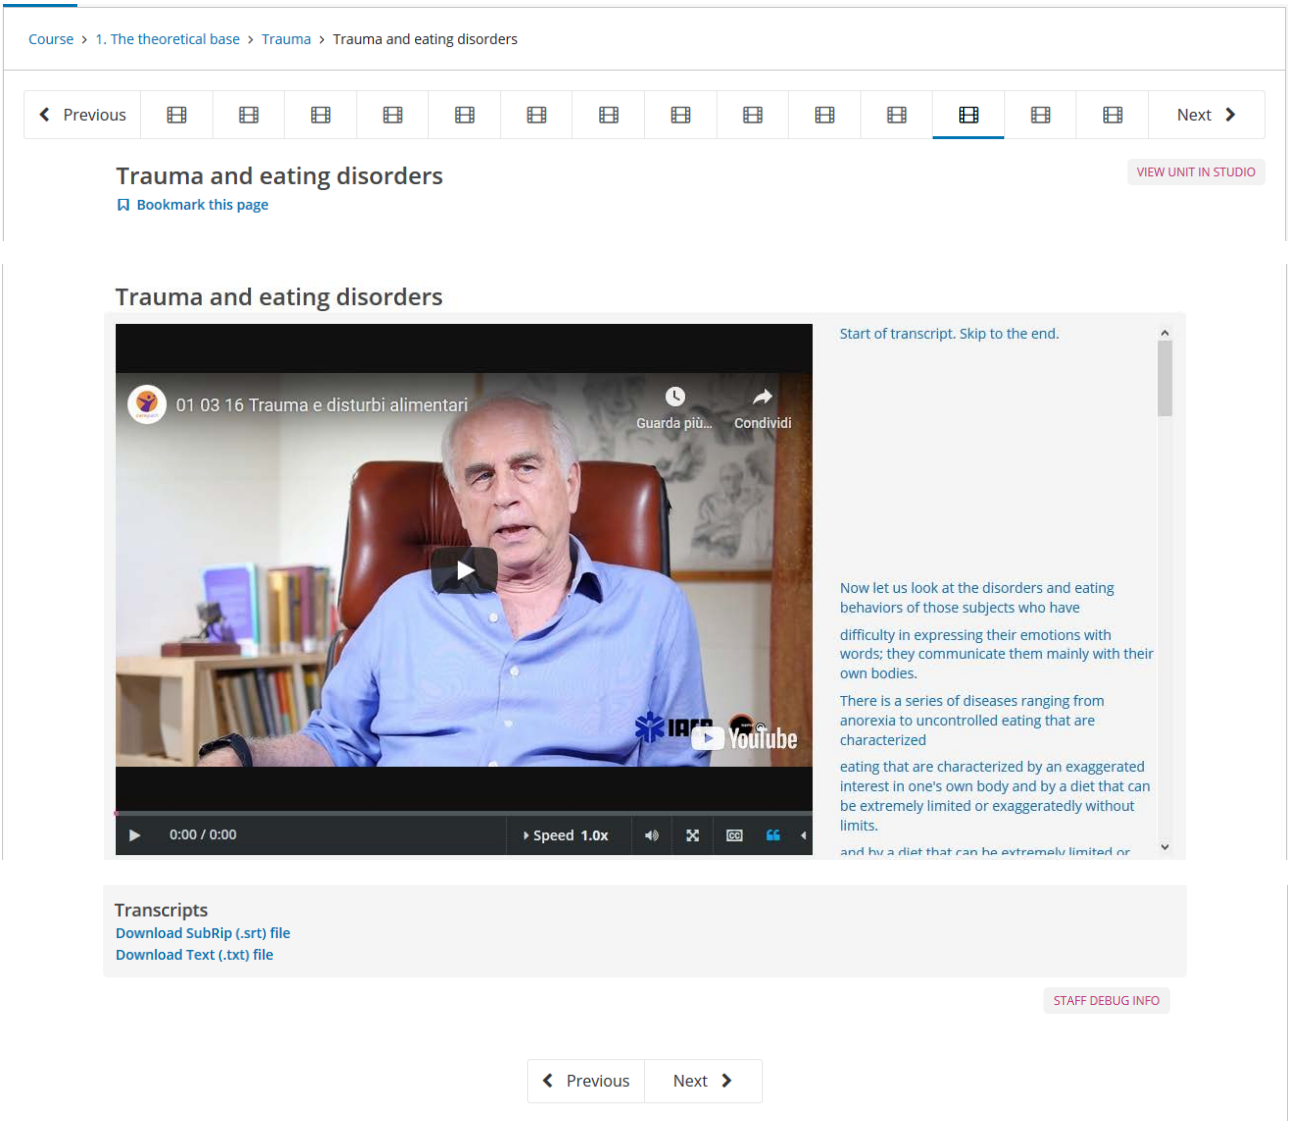
For this reason a technical consultant intervenes in these cases,

as he or she are able to identify

the type of dynamics that exists in the family

and to understand which interventions are needed to free the child

which interventions are needed to free the child.



Transcript

Now let us look at the disorders and eating behaviors of those subjects who have

difficulty in expressing their emotions with words; they communicate them mainly with their own bodies.

There is a series of diseases ranging from anorexia to uncontrolled eating that are characterized

eating that are characterized by an exaggerated interest in one's own body and by a diet that can be extremely limited or exaggeratedly without limits.

and by a diet that can be extremely limited or

Exaggeratedly

This type of patient,

in the case of anorexia, is

predominantly female

Anorexia nervosa is characterized by significant weigh

This weight loss is desired and sought after by the affected person who considers their body as having much larger proportions than is actually the case

In anorexia there may be a severe restriction. There is very limited food-intake, or

or the weight is kept low through food intake followed by strong elimination behaviors that lead

In anorexia there may be a severe restriction.

There is very limited food-intake

the weights come diverse after you inquire food

strong elimination behaviors that lead to

eliminating more than what was consumed

and consequently to lose weight.

Then comes

bulimia nervosa

a disease in which

diet is predominantly

conspicuous

Episodes of binge eating occur,

where the patient

the patient consumes a large quantity of food

great

this kind of patient has the ability to reduce

their body weight through the elimination

of food

especially by

resorting to inappropriate instruments or means such as vomiting

use of laxatives or diuretics,

the use of substances that eliminate appetite

or strenuous physical activity.

in this people balance of weight remains good

And physically it stays in shape

The opposite excess occurs

in the direction of uncontrolled eating also

called Bulimia nervosa or

binge eating disorder

Uncontrolled eating with constant food intake based on binge eating

the use of food on an ongoing basis for several hours of the day,

a diet without brakes

where the individual

or to reduce one's weight

to reduce food

Arriving at considerable weights, from 150 to 200 kg,

with all the related physical risks since

excessive body weight can.

cause serious physical illnesses

These diseases follow one another,

they have

the characteristic of

passing from one to the other as the control capacity decreases

In anorexia nervosa the

the control is very high

people are able to limit their diet

to maintain an extremely low body weight.

When control decreases,

we pass on to bulimia nervosa.

in which

Children or young people who have this

this problem feed themselves - even a lot

but maintain a good reward

but maintain a good reward

and have a capacity for control that emerges later after

food-intake, not before,

which allows them to keep

their weight at acceptable levels

In the third type, the uncontrolled diet, the day is spent eating,

the day is spent

eating,

often in front of the television, almost without awareness of

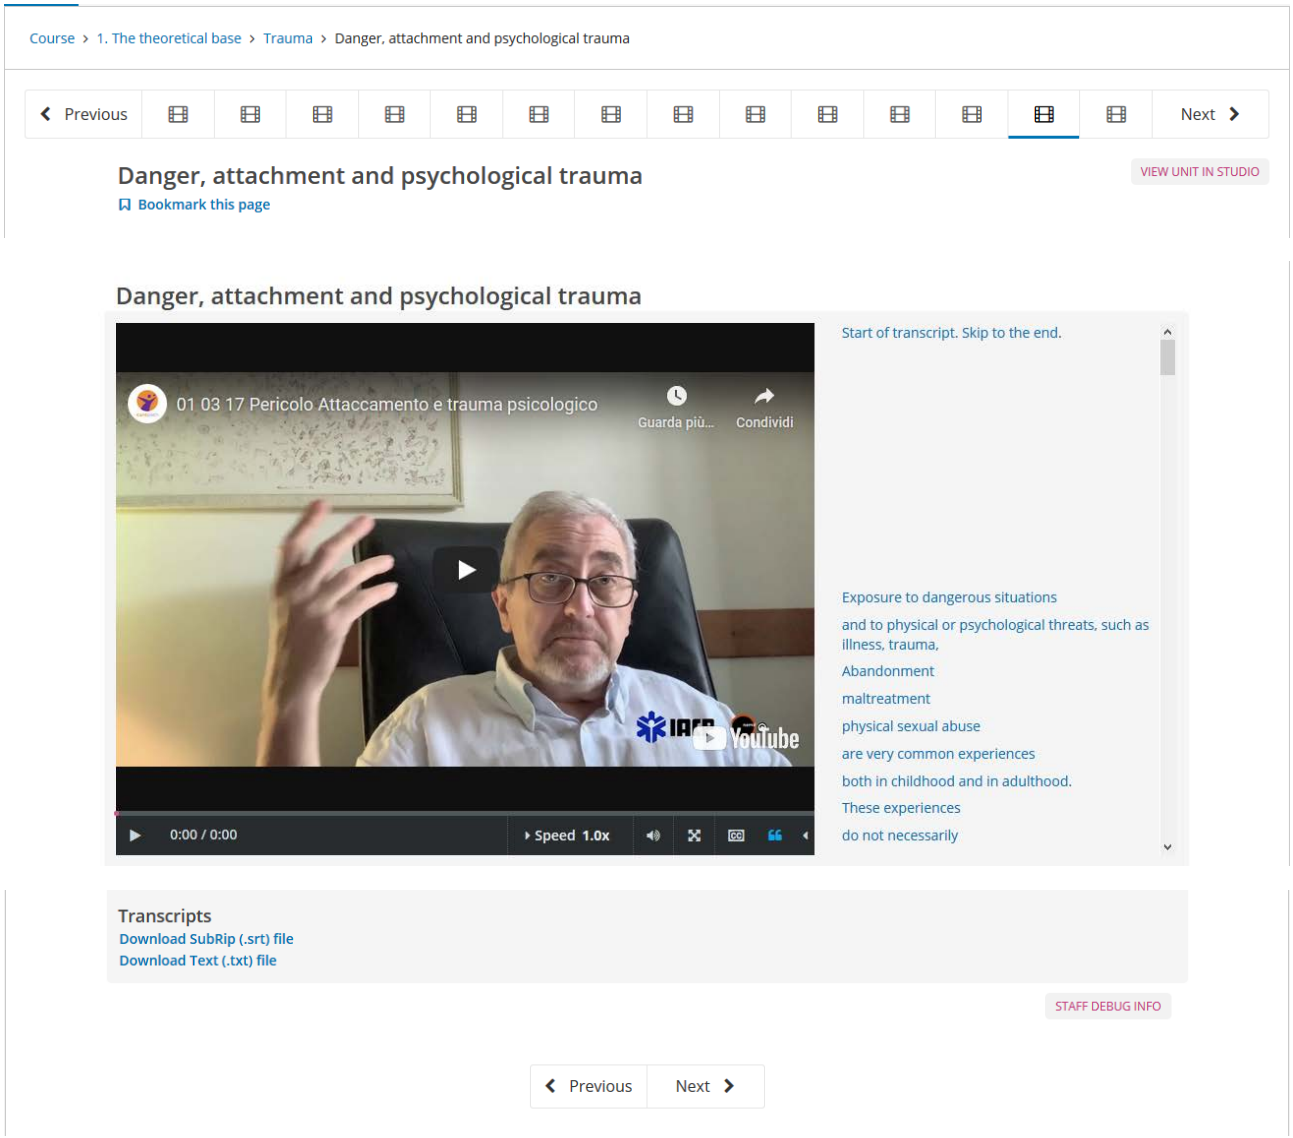
the repetitive and constant action of food intake

have a

any case, these diseases have a series of issues which concern the whole emotional

and the fact of exposing them to various types

of trauma that can occur in eating disorders.



Transcript

Exposure to dangerous situations

and to physical or psychological threats, such as illness, trauma,

Abandonment

maltreatment

physical sexual abuse

are very common experiences

both in childhood and in adulthood.

These experiences

do not necessarily

lead to the development of a psychological trauma

as the

human species has
extremely
sophisticated adaptive capacities
allowing us to face extreme situations
without necessarily
developing a condition of psychological trauma
If these dangerous situations are
dealt with effectively
they become
disarmed of their maladaptive potential
allowing
the individual to remain in a
healthy mental
and psychological condition
In particular, our species has developed
over time
the
interpersonal skills
and very sophisticated
behaviors that have the main function of protecting
us against dangers.
This
set of behaviors and attitudes
is defined
as our attachment system
The word attachment
comes from the attachment theory
that was first proposed in the 1950
by the English psychoanalyst John Bowlby.
Attachment theory holds that human
beings have an innate predisposition
to develop particular attachment relationships

with primary figures, often parents

who

perform the main

function of protecting against dangers.

In this theory we talk about attachment, whose main

but not sole

function is to protect us from dangerous conditions

when a person feels they are in sufficiently safe conditions

they are supported to explore the external

environment, discovering its resources

nd learning to prevent the

dangers that can be hidden in the environment

These attachment functions

have been studied in children of all ages

In this theory we talk about attachment

whose main, but not sole, function is to protect us from dangerous conditions:

when a person feels

in una condizione sufficientemente sicura they are in sufficiently safe conditions

they are supported

to

explore the external environment,

discovering

its resources

and learning to prevent the dangers that can be hidden in the environment.

These

attachment functions have been studied in children of all ages

particularly the relationship with their mother of one and two year-olds

and in primates, There are examples

of research from the 1950s on small

rhesus monkeys

that

that demonstrate how important

on small rhesus monkeys

how important the protective function

of the mother is

even more so than the nutritive function for primates

Attachment is usually divided into two categories: safe and insecure.

Safe attachment

is characterized by a sense

of security, trust in the environment

confidence in its resources

and the possibility of being helped and protected in the event of danger

Insecure attachment is

classically divided

Into

insecure-ambivalent and preoccupied attachment –

in children defined as type C -

characterized by

an overactivation of the body

with an emotional emphasis;

manifestations of anger

fear

complaints about

one's need for protection,

difficulties in separation from the mother

The other type of insecure attachment is the dismissive-

avoidant attachment - also known as type A

which

Un like the previous type, is characterized by hypoactivation. In particular

by distancing oneself from emotional

reactions that

occur in conditions of danger,

hence from one's fear,anger

sense of vulnerability

and
which are either inhibited in their expression
(for example with an attitude of apparent indifference)
or falsified and transformed
into expressions of opposing emotions (for example smiling when facing a frightening topic).
When these
modes of attachment are effective
they protect
against the dangers
that come from the environment
or from our relationships
If
these strategies are effective
and sufficiently protective,
conditions of psychological trauma do not occur
and the individual remains in a condition of relative safety.
The condition of psychological trauma manifests when these
strategies are
ineffective
for example when inhibiting the expression of fears, anger
or needs
is not sufficient to protect the individual
from environmental threats.
In the condition of psychological trauma, all mental processing
activities are negatively
affected by an experience of past or present danger.
This can come from a particularly intense and sudden event - for example
a physical trauma
or abuse
but it can also come from a repeated series of experiences
that cumulatively
traumatic value

In this case we are speaking of evolutionary trauma
a condition in which a child
for example, grows up in an
inadeguate
and neglecting family
environment and as a whole these prolonged experiences create a climate
of inadequate
development that can lead to a condition of psychological trauma.
The ability to adapt and rework a potentially traumatic situation of danger
depends on certain characteristics.
From the individual, his age, maturity,
personality
and the characteristics of his attachment, whether or not they are effective in protecting him;
his physical strength and state of health
as a sick person is more fragile
in the elaboration of a hazardous condition. 00:08:32,980 --> 00:08:34,840 It is very important, moreover,
the protective availability of the figures of attachment, which a person who does not have to
feel alone in the face of danger, but accompanied by protective relationships on the part of people
who are willing to make us feel like we're in the middle of something.
protégé
and accompanied in the elaboration
of a dangerous experience.
An important role is played from the social context: it is fundamental to find oneself
in a welcoming environment, with people who welcome and support
with
their culture,
rituals or personal presence (e.g. friends).
The process of adapting a traumatic condition is not immediate but needs time,
for instance
a significant bereavement - like that
of the spouse or parent -
usually requires

one or two years in order to be properly processed,

without turning into a condition

of traumatic grief.

When

an experience potentially traumatic is not processed,

usually, is accompanied by

excessive hyperactivation

emotional, with

dreams, nightmares,

fears,

I'm not sure I have a sense of threat,

uncontrolled reactions

- as in the case of post-traumatic stress disorder -

or from a situation of excessive hypoactivation, i.e. excessive distance being taken

from all that concerns the experience

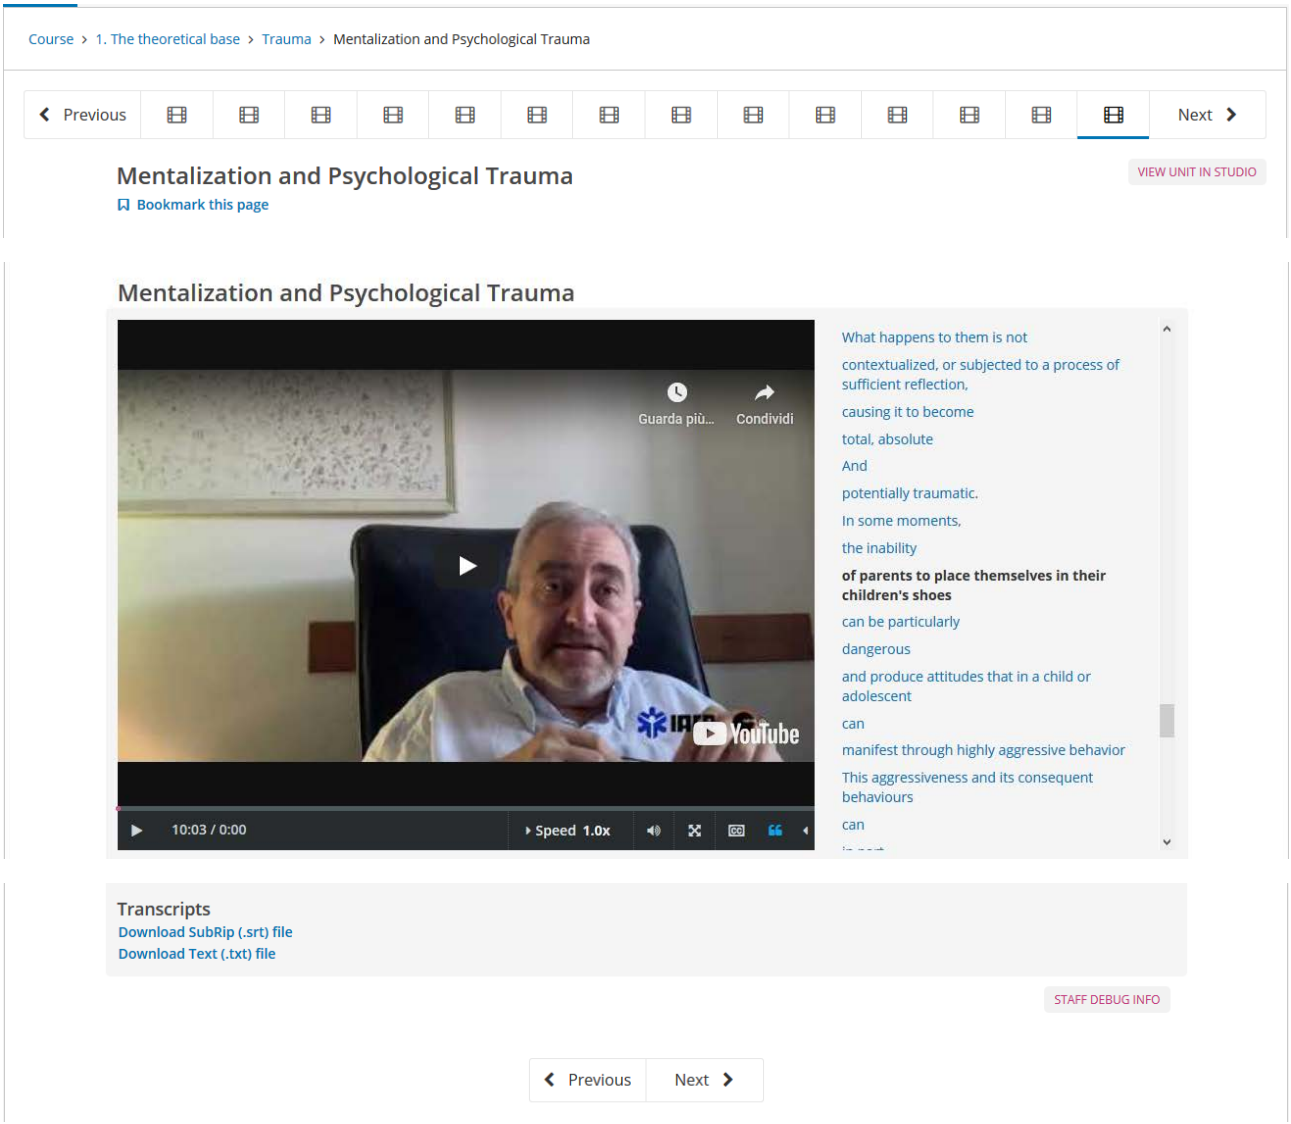
dangerous,

lack of memories,

affective inhibition,

avoid talking or places that are related to the traumatic experience.

In the presence of these two conditions we can speak of psychological trauma.



Transcript

When we talk about mentalization we talk about something that seems to be taken

for granted, which comes from far away

In fact every human being

even before

the

development of psychology,

faces mentalization problems at some point in their life.

That is

the problem of reflecting on oneself and others

of considering what we and others have

on our minds,

the thoughts,

the thoughts,

expectations and beliefs

that influence us

A simple way to understand the concept of

mentalization

Is to

Consider

oneself and others

in terms of mental states.

These abilities

begin to take shape in humans

at around 4 years of age

when a child becomes aware

that

what they think and feel

is not necessarily understood and shared by other people

for example that the mother may not know what is going on in the mind of the child

When children learn

his great novelty they also learn to use

a

very useful

and important

strategic mode of adaptation to problems

they

learn the importance of lying

Lying is possible if you think

that others minds have a different view of the world

and therefore cannot know the thoughts of another individual.

Mentalization

and its processes are based on a series

Of steps

The first regards our

relative

sensitivity to perceiving

Mental states

or of representing our own and others

of mental states (for example to understand being

cheerful, sad

having expectations

prejudices)

and

and the ability to interpret our own or others behavior

on the basis

of these mental states.

This is essential for our ability to be adaptive

(for example if a person is standing silently before us

we don’t think

they don’t have

we think their mind

is filled

with images and thoughts, that their silence is not an expression of emptiness, but of a series of mental states

that

are the basis of this silent behavior).

A second important aspect of mentalization is

that self-mentalization promotes

the regulation of our bodies

For example if

we realize we are

angry

and we begin to think

to think

the anger is related

to something that

was said

the very fact

of realizing it, of remembering

and making expectations and projections onto the consequences

of an action

opens up a psychological path to regulating the anger that has been activated in us.

The heart, our breathing, the production of hormones

linked to anger activation

begin to be regulated

by psychological mechanisms

For example, I could

feel guilty for having felt anger towards someone I love

this inhibits the expression of anger

and regulates the body

This is a fundamental function,

so much so that people with poor

mentalization skills are more exposed

to the dysregulation of the body

The heart

beats

faster and in an irregular way

emotional reactions are more uncontrolled,

and this can lead in the long term

to 100 00:05:32,000 --> 00:05:32,880 diseases

due to the constant dysregulation of the body).

One of the most important functions of the parents towards their children

Is to be

mentalizing:

To think

their children

also in relation to their needs

feelings, fears

putting

themselves - in a sense - in the shoes of their children

and perceiving things from their point of view

For example, a three year old child

will live certain topics

and interpret certain words or speeches within

their

childish abilities,

meaning it is important for the parent

to see things through their eyes.

This condition, which has been called (psychological) mindedness,

is one of the conditions most closely related

To the safe

development of children. It the condition of a

good parent

being

able to put themselves in the shoes of their children and perceive their needs

It is already observed in mothers of very young children

who, for example,

puts

themselves in the shoes of

their crying and agitated children, and therefore understand that they may be cold, or hungry, thus giving voice

to a child's state

if the son were able to have organized thoughts

and could express them.

The ability to represent the mental states of children

is a basic condition of being a parent.

Mentalization is also the basis of

the ability to cope with stress and potentially dangerous situations

by adapting

without developing conditions of psychological trauma.

for example
for a child faced with
the inconsistent behavior of the parent -
who perhaps acts angrily
or with physical violence
or says negative things towards the child -
the ability of this child to imagine the mental state of the parent
acts as a shock absorber and lets them consider
what the parent does
and says within a context. They can think, for example,
“father is
tired and what he says does not correspond to reality
father is usually
affectionate and loves me,
what is happening now
has value at this time and is linked to a particular
state of being, but it is not absolute the attitude described above protects against the mental states
of others
and makes the situation potentially less traumatic
It is clearly observed in adults with low
levels of mentalization
as in
people with borderline personality disorder
that they are much more exposed to continuous psychological trauma.
What happens to them is not
contextualized, or subjected to a process of sufficient reflection,
causing it to become
total, absolute
And
potentially traumatic.
In some moments,
the inability

of parents to place themselves in their children's shoes
can be particularly
dangerous
and produce attitudes that in a child or adolescent
can
manifest through highly aggressive behavior
This aggressiveness and its consequent behaviours
can
in part
Be interpreted
through the concept of mentalization.
If parents are constantly irritated
by the behavior of their child
for example, if the child
poses
a problem
or gives an attitude
the parent begins to turn
on the child in a negative way (perhaps stating that he is stupid, sick or worthless).
This leads the child
to have an image of themselves as a sick
disturbed
incapable person.
This attitude is kept at a distance
This attitude is kept at a distance from aggressive behaviors, meaning that every time an adult approaches
the child with the intention of getting to know them and getting them trust to him,
the child will probably have
a strong aggressive reaction
functioning to keep the adult
away as potentially traumatic
The case may be that for young people who are considered incapable
in the classroom and have to repeat,

the teachers consider

them

negative subjects

and at home these children have parents who reinforce

this negative idea of themselves.

Therefore these children have attitudes of strong reactivity and anger towards the adults who are trying

to help them (an educator, a teacher), aiming to keep

the other person

away

in order to not repeat the experience

of being painted as negative or incapable.

The System of Protection for

Asylum Seekers and Refugees (SPRAR)

has changed name to SIPROIMI,

due to the enactment of

law 113/2018 - therefore very

recently

After a series of changes, including regulations,

that the new government

which took office last May 2019

in Italy, has made to the whole

issue of immigration, the right to asylum and

therefore hospitality. SPRAR was

SPRAR was established in 2002 and is composed of a

network of municipalities and local authorities,
which in collaboration with
third sector organisations and NGOs, manage on a
voluntary basis (therefore of their own choice)
hospitality and integration projects for
asylum seeker applicants and
refugees.
Over the years, this network has
undergone a progressive and positive
Evolution:
from the initial 1,500 hospitality
places to the current 35 thousand
There have been several phases
in the history of the SPRAR
that have led to a number of changes.
The first was the moment
institutionalization by means
of a law, making it stable and regular
as a central system of integrated
reception in Italy, whereas in
whereas in previous years there were
no structured hospitality systems
but only.
emergency interventions
Another important moment was in
2003 when, during the so-called
North Africa Emergency,
the effectiveness
and efficiency of the SPRAR model
in terms of achieving
social inclusion and
integration objectives emerged

also at the European level.
The last phase is the most recent one
in which the identity of the SPRAR
was modified, meaning it can
No longer
accommodate
asylum seekers or humanitarian cases
because humanitarian protection
has been abolished)
and by law we can only accommodate
unaccompanied foreign minors
holders of international protection
(which constitutes a small number compared
to asylum requests) and some
new types of residence permits,
the so-called special cases.
SPRAR, which is
now called SIPROIMI, will now be able to accommodate
special cases for medical treatment,
victims of trafficking
victims of labor exploitation,
domestic violence, natural disasters
and people who have
distinguished themselves for particular acts of heroism,
always referring to foreigners,
not Italian citizens,
who have other social protection systems.
It can be said that SPRAR
now has a
welfare identity directed towards foreigner
and is no longer a hospitality and protective system
for people related

to the theme of the right to asylum.
These changes to its identity
and could represent, on paper
a partially positive passage,
in the sense that it is turning
to the protection of people with
some type of vulnerability.
At the moment, the difficulty is the fact
that the person in need is required
to have a residence permit
but is not required
in the case of
a victim of trafficking, that can automatically acquire the permit
by as a victim of trafficking, the same can be said
for a victim of exploitation and so forth.
There are no precise criteria
for how these procedures
should be, or how to bring together all people
with this type of vulnerability under
the definition, even legal
of a special case. Only through the
F ormalization of a special-case
residence permit will
person have access to SPAR and
be able to take advantage of all
the protection services
that the
SPRAR can provide
The criteria and requirements
for which a person
may be entitled to
medical care have not yet been defined

what type of mental or physical

discomfort, what level of severity,

and what timing does this take into account?

We are therefore

in a critical transitional moment as

many people who,

up until a few months ago

had the right of access to SPRAR projects

now no longer have it.

While on the other hand,

those who on paper seem to be

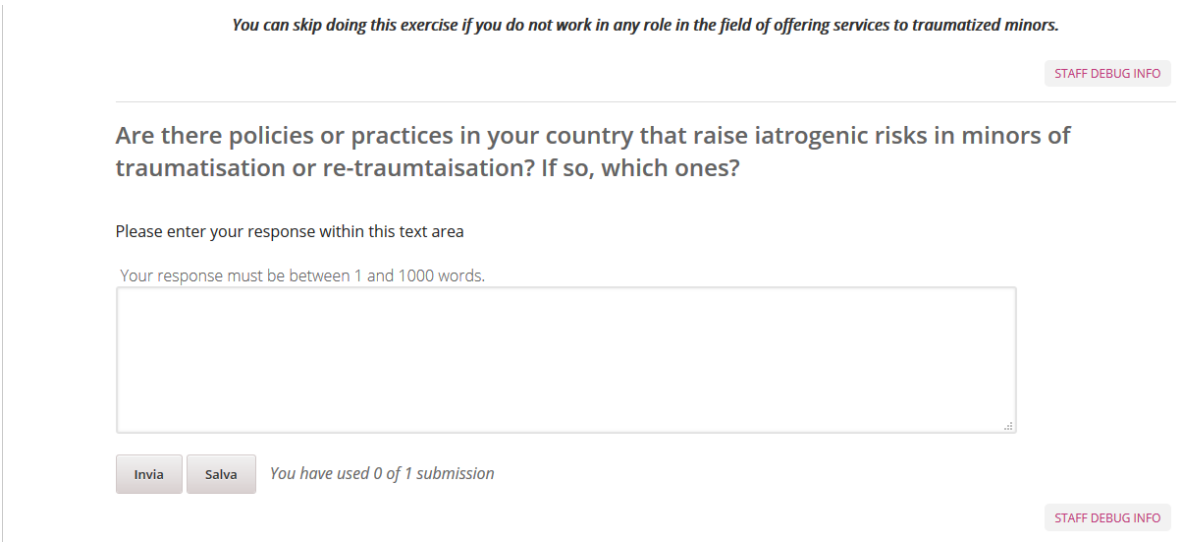
able to have the right to access to these services

in truth do not

know how to give the “supporting evidence”

to be able

use this right.



If you had the power to promote change in your country, what would you change in order to lower iatrogenic risks of traumtisation/re-traumatisation in policy level?

Please enter your response within this text area

Your response must be between 1 and 1000 words.

where being a homosexual is a crime
to ask for international protection in Italy.
However, the fear has remained the same
because homophobia has followed him to the hub of Mattea Street, Bologna
where he was welcomed along with his countrymen.
LGBTQI migrants, very often, are very young.
They cannot
count on the support of their own community of origin,
so they find themselves migrating,

but they are often culturally distinguished by the homophobia or transphobia that they have escaped from.
Nor can they be sure of coming into contact with multicultural realities
which allow them to live their sexual orientation or identity peacefully
As emphasized on several occasions in interviews by Vincenzo Bramato,
president of the Arcigay community of Bologna
in some European countries - such as Germany -
there are protected structures to welcome those who flee from persecution due to their sexual orientation
where the staff have received specific training
aimed at not reimposing judgmental or disparaging attitudes that would revive these people's stigma
And trauma
In Italy, at the moment, the hospitality model does not foresee these specificities,
but there are some positive examples such as the pilot experiment
launched in 2017 in Modena with a small six-person apartment
reserved just for LGBTQI asylum seekers
plus an LGBTQI migrant help desk in Verona.
For these
Migrant children
in a developmenting age in relation
to the LGBTQI community
to be part of an ethnic minority in a host country
it is only part of the problem
They are in fact, very often, a silent and frightened minority
even within their own community of reference
An invisible trauma, as Rogers puts it
is doubled.
Minority Stress - if we want to refer to Vittorio Lingiardi
there is a doubled
risk for the mental and physical health of
these people and thus a dramatic loss of human capital.
Getting trained in hospitality services means first of all training in human rights
and the specificities
that the

LGBTQI migrant brings with it to the helping relationship.

Training must therefore be centered on the person

and welcome and knowing these specificities in order to be truly inclusive.

Moreover the services addressed to migrants,

designed and provided very

often without considering the variable of sexual orientation and gender identity

can reduce their effectiveness,

both in regards to the relationship with the client

(and therefore these children that

cannot receive the welcome that they should have)

but also in regards to the usefulness of the training or preventive pathways

(for example, if we think of sexually transmitted diseases

and how

multidimensional formation is needed when we

have as clients adolescent migrants belonging to the LGBTQI community).

On the other hand, the services provided by the LGBT community

are strongly linked to a cultural model of Western gay men and lesbian women

and therefore very often these models

do not consider a model in which these youths who come from other cultures

can really recognize themselves.

The experience of the aforementioned realities

has proven that the support information

and counseling services provided by institutions, but also by non profit associations,

May not be effective for these children.

therefore

working with these populations of multiple minorities

will involve an interdisciplinary

reflection on the practice of the helping relations. Training in helping relationships

offered to these people should include the study of variables of homosexuality, bisexuality and transsexuality

in the history of psychiatry and psychology -

the concept of stigma,

homophobia, internalized homophobia,

but also to have a constant updating of the service providers

on the legislation

relating to these issues,

both in the host countries and in the countries of origin of the people you are going to serve.

In addition, everything

related to asylum-

related legislation should be continuously

deepened and learnt, because it

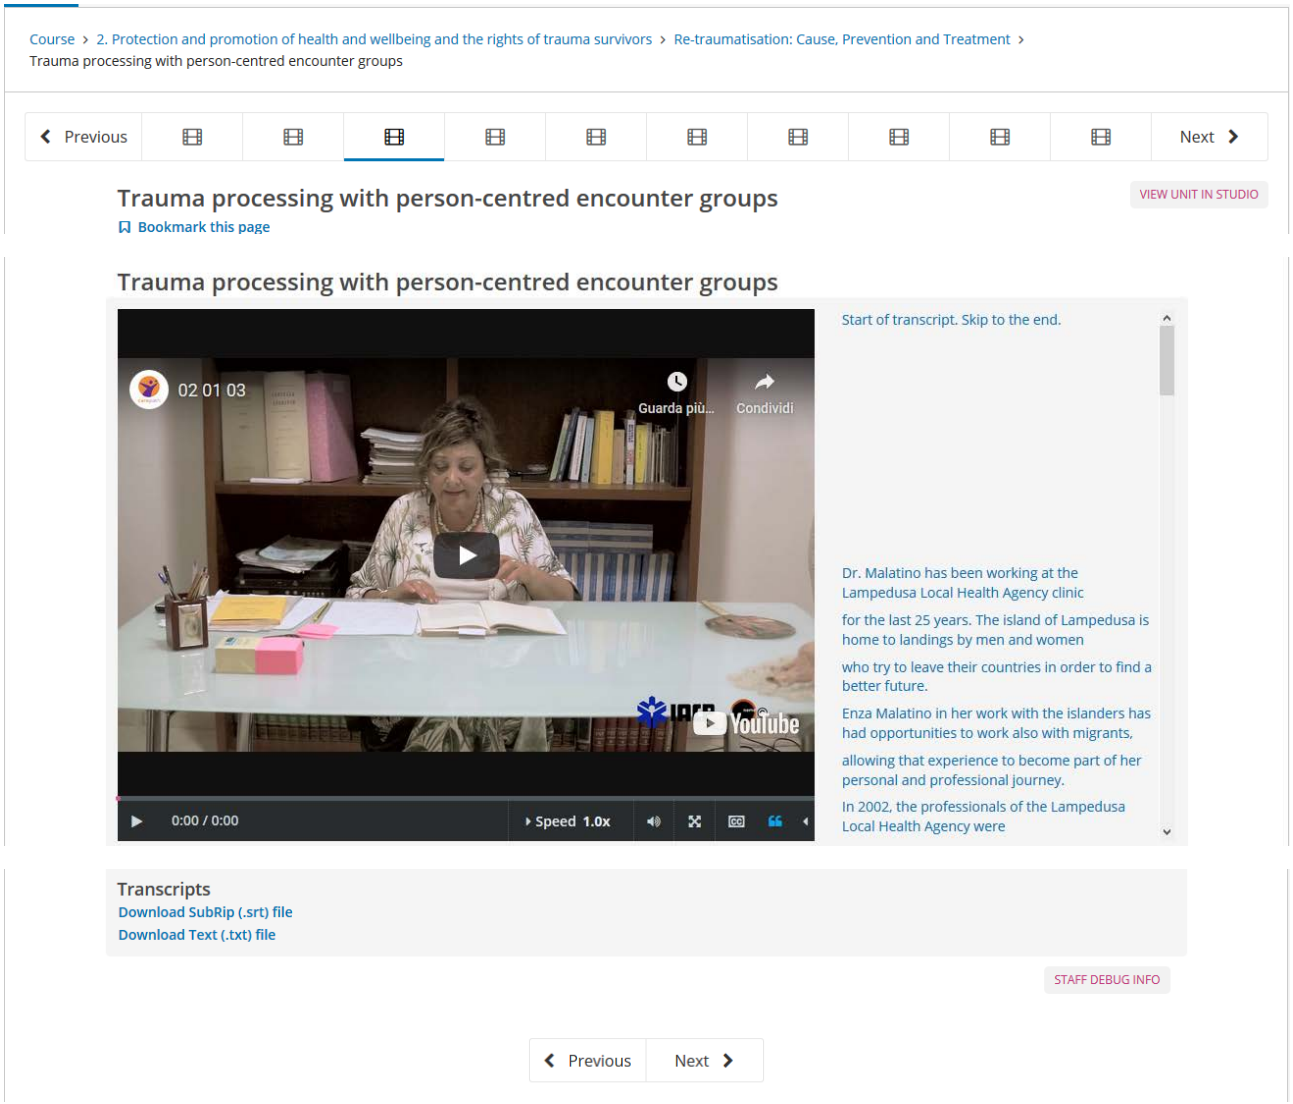
is constantly evolving and changing.

Together with the more technical skills, it will be necessary to develop and consolidate, from a more personal point of view,

a gender-sensitive approach and

maintaining, both within oneself and the working group

which offer services to these youths, a reflection on human rights.



Transcript

Dr. Malatino has been working at the Lampedusa Local Health Agency clinic

for the last 25 years. The island of Lampedusa is home to landings by men and women

who try to leave their countries in order to find a better future.

Enza Malatino in her work with the islanders has had opportunities to work also with migrants,

allowing that experience to become part of her personal and professional journey.

In 2002, the professionals of the Lampedusa Local Health Agency were

asked to offer support and therapy to the hospitality centre where people who had landed on the island after very difficult

long journeys, with severem l risk of death, needed treatment.

The head of the local Health Agency asked me to make a psychiatric evaluation of the subjects who landed on the island.

It was almost impossible to assess the psychiatric health

of subjects exposed and subjected to such serious traumatic events, as they came from different cultures

they did not request help or support of a pharmacological type, coming from contexts

which did not consider Western medicine as conventional medicine

What supported and helped these subjects in some cases

was to resort to magic rituals which were linked to the cultural beliefs that they held.

Offering help and support at the same time and people with all their sufferings was particularly complex

Thus I thought to organize some listening groups.

This was for me, a psychiatrist and psychotherapist trained in the person centered approach of Carl Rogers an extraordinary experience

In this type of group,

the encounter is characterized by people sitting in a circle

and listening to each other. The fundamental element is the total absence of judgment

and the profound respect for any topic that the group wants to discuss.

In this way, it is possible to create a climate of trust that greatly helps participants

even in very problematic emotional states to rework the experience

and at the same time find solidarity from the other participants:

becoming aware of one's personal experience is not necessarily only individual but can be shared and understood experience for the other people. 27 00:04:15,360 --> 00:04:23,360 This in of itself favors the resolution - sometimes - of suffering

conflict or painful event

That is what happened in these groups. An important and fundamental element was to find the balance with the cultural mediator

he translator - as the facilitator did not speak the participants' languages and the basic conditions

in which she was operating were absolutely prohibitive due to the lack

of materials (there were no chairs) or due to contingent situations (some groups had just escaped from the shipwreck

and some were only wearing rescue sheets).

Despite the unorthodox situation, to great surprise,

it was found that deep values live not in form but in substance.

Dealing with people who were sharing their stories

fter long and terrible journeys (crossing the desert in Libya, take the risk of drowning), the experiences

they shared were also highly traumatic for the professional who was listening to them,

experiencing the difficulty of getting out of this situation of suffering

and pain that had also become the daily experience of the professional

This experience for the professional reactivated of an event from childhood

- that had been forgotten - of when an aunt died and that loss had caused so much pain to me that this experience had been removed.

In light of all this, when you welcome

someone who has experienced drama like these, it is fundamental to offer empathic listening,

a fundamental element for offering some survivors the possibility of opening up

and sharing their experiences.It is also necessary to have a profound acceptance

of the person and an absence of judgment as this promotes trust.

Empathy is a balm for the soul, the feeling that another person puts

herself in your shoes and listens deeply and authentically feeling your own pain

These are the three basic conditions that Carl Rogers

research found necessary to facilitate change

in encounter groups and in helping relationships. At the conclusion of this reflection on the value of the Rogerian

encounter groups in the reworking of trauma with migrant people, it is possible to dwell on an interesting aspect: no one asked for pharmacological support

after participating in the listening groups.

The natural dimension of the group - its circular structure,

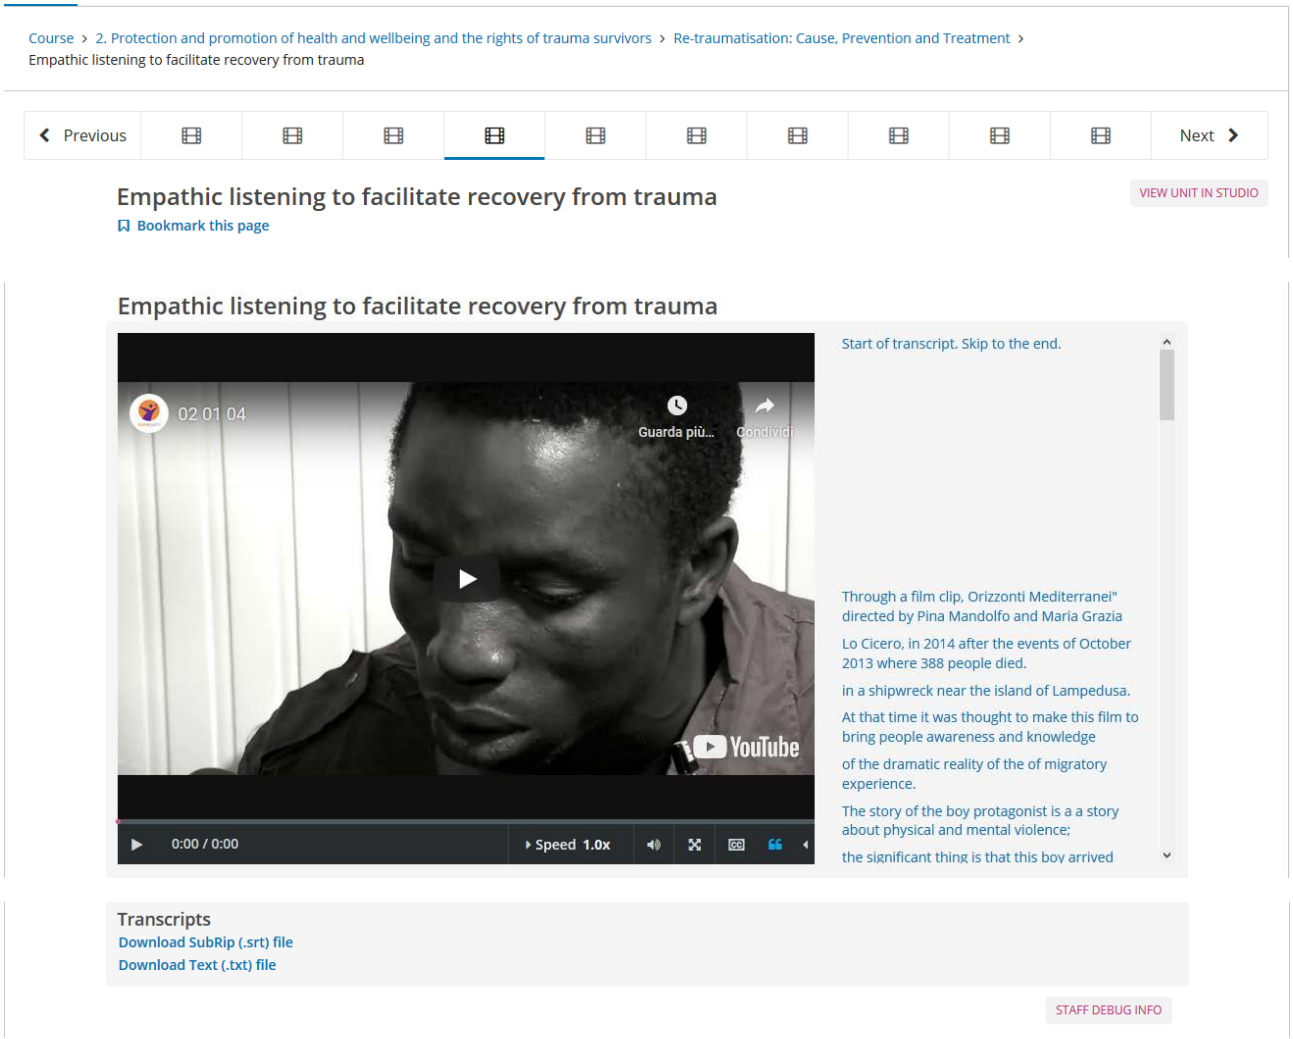
was quite appreciated. The circularity perhaps reproduced a little part of the experiences that the subjects live in their countries,

for example in Eritrea, where there is the custom of village

elders and males gathering in a circle around a large tree,

which is called the tree of words. In this meeting, the fabric of a torn narrative

is reconstructed through sharing words.



Transcript

Through a film clip, Orizzonti Mediterranei" directed by Pina Mandolfo and Maria Grazia

Lo Cicero, in 2014 after the events of October 2013 where 388 people died.

in a shipwreck near the island of Lampedusa.

At that time it was thought to make this film to bring people awareness and knowledge

of the dramatic reality of the of migratory experience.

The story of the boy protagonist is a a story about physical and mental violence;

the significant thing is that this boy arrived accompanied by his sister

and she was also a victim of of violence and rape - she'd never spoken to his brother...

about her experience, he had been raped as well but never talked about it

with his sister.

For him it was a source of shame to talk about this experience, so much so...

to request asked that his sister should not be present, because he didn't want her to...

learn about what had occurred to him, as he confessed afterwards- - feeling shame of being a man and being

a victim of such violence.

It should be noted that this boy was only 16 years old.

In the testimonial that the boy shares we learn about what happened to him

and to facilitate the flow of his sharing and to avoid the interruption of his emotional flow

he was simply listened to in order to not interrupt his narrative.

Only in a few instances, some nodding or exanging 20 00:02:15,160 --> 00:02:23,840 deeper glances , facilitated him in continuing to share

his story.

It is therefore observed that the empathic aspect takes the form of manifestation of empathy

that is more than situational than verbal, i.e. visual contact nods of the head, the body of the listener extending

towards him.

This is was necessary to help him sharing, without

touch him; for him the body contact was a source of shame, he was like a child.

unable to explore a difficult story and to endure it, he was younger

than his sister, but felt that he should nevertheless as a man, to be the one to offer support and encouragement to his sister.

Here, too, one observes how sensitivity, a respectful attitude, empathy and listening facilitate

the emergence of a sharing relationships.

The video has to do with the experience of

listening to two stories: one about a girl another of 33 00:08:23,080 --> 00:08:26,500 two brothers.

These two brothers, who left from Eritrea

and landed in Lampedusa in 2014, brought to the CARA center in Mineo...

they stayed at this facility to get their residence permits,

but when I tried to interview them in ordeer to have the opportunity to document ..

their experiences and stories we become aware that at the base of this kind of story 39 00:08:59,820 --> 00:09:08,360 there would have to be a lot of listening careful, delicate, because these two guys...

had been subjected to torture and very severe and dramatic violence.

Each of them had asked to speak without the presence of the other.

In the girl's story, her journey was motivated to give her brother

a chance of not to be forced at 16 years of age to do military service.

You can see in her narrative that she says... one fundamental thing: "I can't forget,

I can't find the strength to speak"; these are the keywords, and then the listening of her

was accompanied with a gentle contact between the the hands of the professional with the hands of the girl.

Using physical contact in the presence of these experiences is complex, indeed it is preferable

not to touch a traumatized person victim of trauma and physical violence; in this specific case

I somehow realized that the girl had the need to be deeply supported

in order to be able to share her story, so the professional he asked her if she could touch her hands.

Just the request, and not the action not accepted, has facilitated the possibility that she could give

her permission.

With this kind of contact you have created a strong channel of powerful energy was created , and every time

the girl had to talk about aspects particularly traumatic and painful she tended to stop and

so the professional would held her hands so the flow of sharing could continue

providing the necessary energy for the continuation of her story 57 00:11:39,760 --> 00:11:51,420 At the end of this experience one can say that never, listening to someone's story

that is a story of trauma, that can be minimalized trivialized or exaggerated

the most fundamental thing is listening to the story as it is told,

listening with great sensitivity and above all empathy and recognition of the suffering

other people's.

This was the fundamental element which gave access to the expression

more intense and deep emotionally in the sharing of this king of narratives.

Adopting a child means overcoming nature, and in particular sterility.

The gesture of a parent adopting a child is a great gift,

not only to the parent, because he finally has a child

but also to the child,because the child finally finds a family.

It is debated whether the parent should be called "adoptive parent", or whether to limit ourselves to the term "parent".

Clearly the adoptive parent is a 360-degree parent

who is nothing less than a biological parent, as the research says, but above all as the relationship that is generated

between child and parent says.

Having an adopted child has many overlaps with having a biological child.

For an adoptive parent, hearing himself called father is always a surprise,

while for a biological parent it is a given.

This means that perhaps adoptive parenting

is more intense than biological

parenting can be. However, the parent must pay attention to this: the adopted child

has the right to be happy and to be happy,

he must also consider what his story has been. Which we might not always know,

because no one has told us and the child does not remember.

However, care must be taken with sensitivity to the problems that

the child may carry with them.

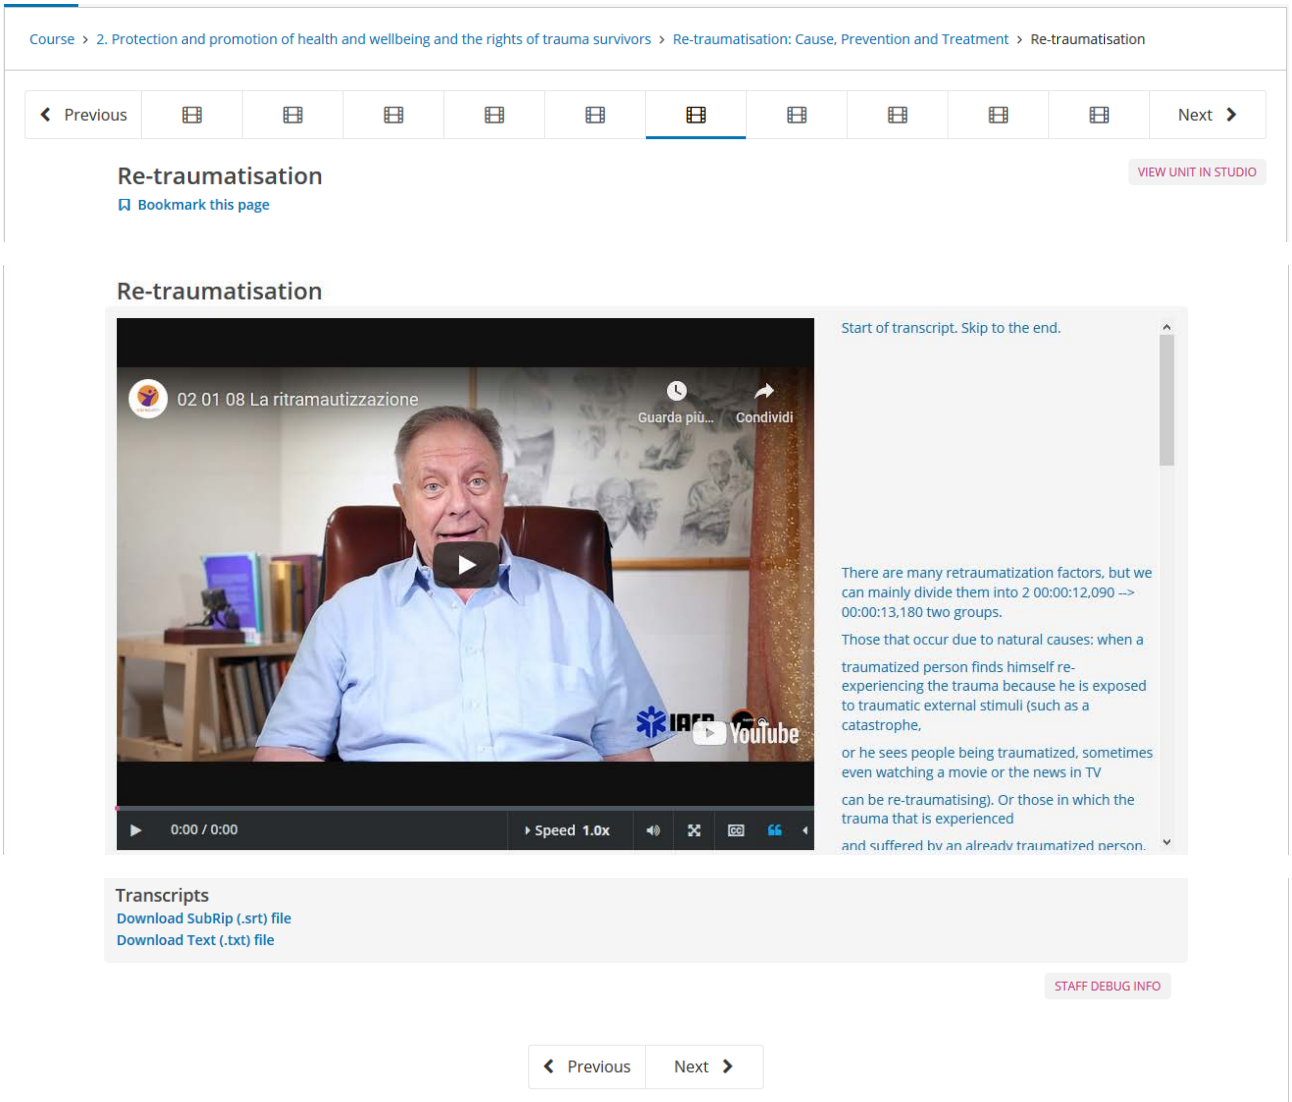
The adopted child, and then the adult, is often confronted with existential themes:

what are my origins?

Why was I abandoned?

These are answers that no one can give explanations to, but this does not exclude that life is beautiful

and we all have to strive to live better.



Transcript

There are many retraumatization factors, but we can mainly divide them into 2 00:00:12,090 --> 00:00:13,180 two groups.

Those that occur due to natural causes: when a

traumatized person finds himself re-experiencing the trauma because he is exposed to traumatic external stimuli (such as a catastrophe,

or he sees people being traumatized, sometimes even watching a movie or the news in TV

can be re-traumatising). Or those in which the trauma that is experienced

and suffered by an already traumatized person, is due to being offered services or care

by inexperienced people or in a non-trauma oriented organization, that even not wanting

to cause re-traumatizing still

not been trauma informed can damage the client. The safeguards and procedures that an operator, a professional

or an institution adopt to prevent the retraumatization of their clients is called trauma-informed care.

In the past, unfortunately, we have too often re-traumatized those who had already suffered a trauma, certainly not out

of a bad will, but out of ignorance.

It is thanks to the research and clinical evidence that we observed that these clients

if they were pressed to do things they did not want to do, if they were not respected

in their own times, if they were forced to remember their traumatic experiences -

obviously for a good cause - even without realizing it they received iatrogenic damage.

With the definition of informed trauma care we mean all those precautions,

that safety net developed through research, which have showed us how important

it is to protect already traumatised people against the danger of new traumatization.

To respect their pace to offer services centered on the person,

respecting their needs and sensitivity, and above all not forcing them to do something

they are not yet ready to do.

The reason is very simple: we have observed that already traumatised people need acceptance,

kindness and safe havens in which to regain their strength and resume

their rhythm of exploration which, precisely because they are traumatized, is necessarily cautious

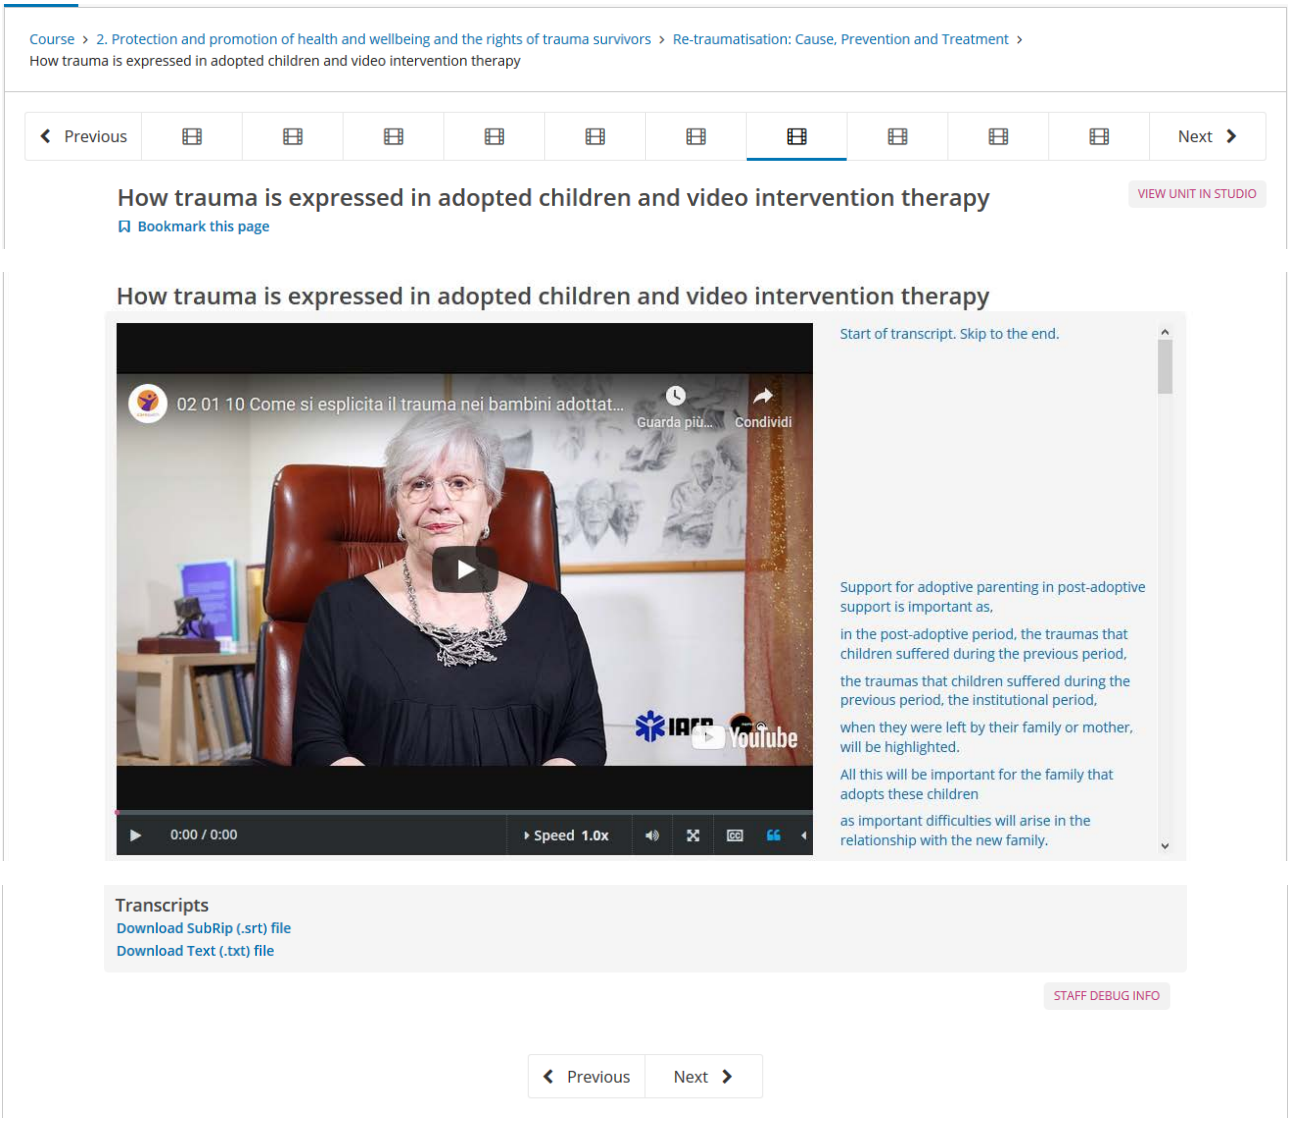
given their previous experience.

Therefore, trusting the self-regulating

abilities of

trauma survivors is essential aspect

of good care



Transcript

Support for adoptive parenting in post-adoptive support is important as,

in the post-adoptive period, the traumas that children suffered during the previous period,

the traumas that children suffered during the previous period, the institutional period,

when they were left by their family or mother, will be highlighted.

All this will be important for the family that adopts these children

as important difficulties will arise in the relationship with the new family.

From research we know that traumas have the ability to break relationships, 8 00:01:19,040 --> 00:01:24,540 to make them problematic and difficult, and children are no exception to this.

Becoming aware of the difficulty that the child finds in the new adoptive family

can make the path for parents easier -

- or at least more aware.

In the exchanges that make up the relationship, the interactive exchanges, children will be

difficult to manage, they can give confusing and unclear signs, seem not interested

Or absent

All these are aspects that will be analyzed point by point and that

will be part of the story of each adoption.

Accordingly we know, again from research, that every interactive

exchange is formed by micro events which, analyzed in detail,

influence the adult-to-child and child-to-adult response 20 00:02:49,100 --> 00:02:56,730 For this reason the use of videos becomes very important. Precisely in this situation

where the trauma has created conditions that make it difficult to read interactive micro-analytical aspects,

it becomes important to be able to film them, seeing them in exchanges and seeing where

and how the child moves in the interactive exchange and how the parent responds.

The use of video, therefore, is to be emphasized and recommended

It is a way to lay the foundations and look in detail in a specific way, moment

by moment, everything that happens in the exchange between child and parent.

The important thing to emphasize is that this particular use of the video must,

And should always be used and shown only by therapists specialized in this strategy;

it can not be used by those who do not have the specialization, given the particular

sensitivity of the subject.

It can be observed that, as has been said, adopted children have a way of sending signals

that are a little less evident, shorter and more confused than non- adopted children

In this sense, the use of video is extremely important as it allows the parent -

marking the interaction moment by moment - to see where and how the child

is able to relate to them.

This will be a milestone in the interactive exchange and begins the possibility

of constructing a new attachment bond.

Another important aspect is the child's hyper-vigilance

This is very important because it tells us about their history, fears, the lack

of care and neglect they have experienced, but especially if this child has suffered physical violence,

perhaps abuse, or at least witnessed violence.

Hyper-vigilance is where the child is extremely focused

on the adult's expression, monitoring him moment by moment to be able to read the adult's expression

to see if there is something that may be dangerous for him,

or if what they are doing may become dangerous or a source of threat.

Indica quindi chiaramente la mancanza di fiducia che il bambino presenta nei confronti dell'adulto, It therefore clearly indicates the lack of trust that the child has in the adult

will tend to slowly disappear by working on the adult-child relationship,

but not always permanently.

Another aspect that the child will present is an aspect of emotional clumsiness,

an aspect that will make the adoptive parents suffer greatly because he will feel this child is never

perfectly free to express his affection and emotional closeness to the adult.

This is not the responsibility of the child, this is also a fragment, which is expressed in

the report, of a particularly painful past story.

Children are used to not approaching adults, in order to make the adult

become less dangerous for them in the relationship.

So they are not used to touching them often, embracing them, which could happen in the new relationship.

We can therefore attend particularly closely to children, perhaps too close, sometimes clinging to themy,

but since they do not know how to modulate the way of approaching an adult,

do not know when it is too much or too little and are in complete disorientation and embarrassment.

Other times the child approaches with extreme clumsiness, in an almost false,

Unspontaneous way, which is immediately monitored by the parent who tends to label it

What is recommended is to always see it as the expression of a moment in the history of the child

- they were never free to approach as they would have liked and as they would have

felt to an adult, as such this still remains in an unspontaneous and rather clumsy way.

Another aspect that the parent will see will be fatigue and difficulties in sleeping...

an extremely restless sleep, not very restful and the difficulty to fall asleep.

A further aspect can be observed in the difficulty of concentration, often interpreted

as a learning disorder not better identified:

the child has no learning disability,

but his hypervigilance triggers such difficult, exhausting negative emotional traits...

and exhausting that distract him from the tasks assigned to him.

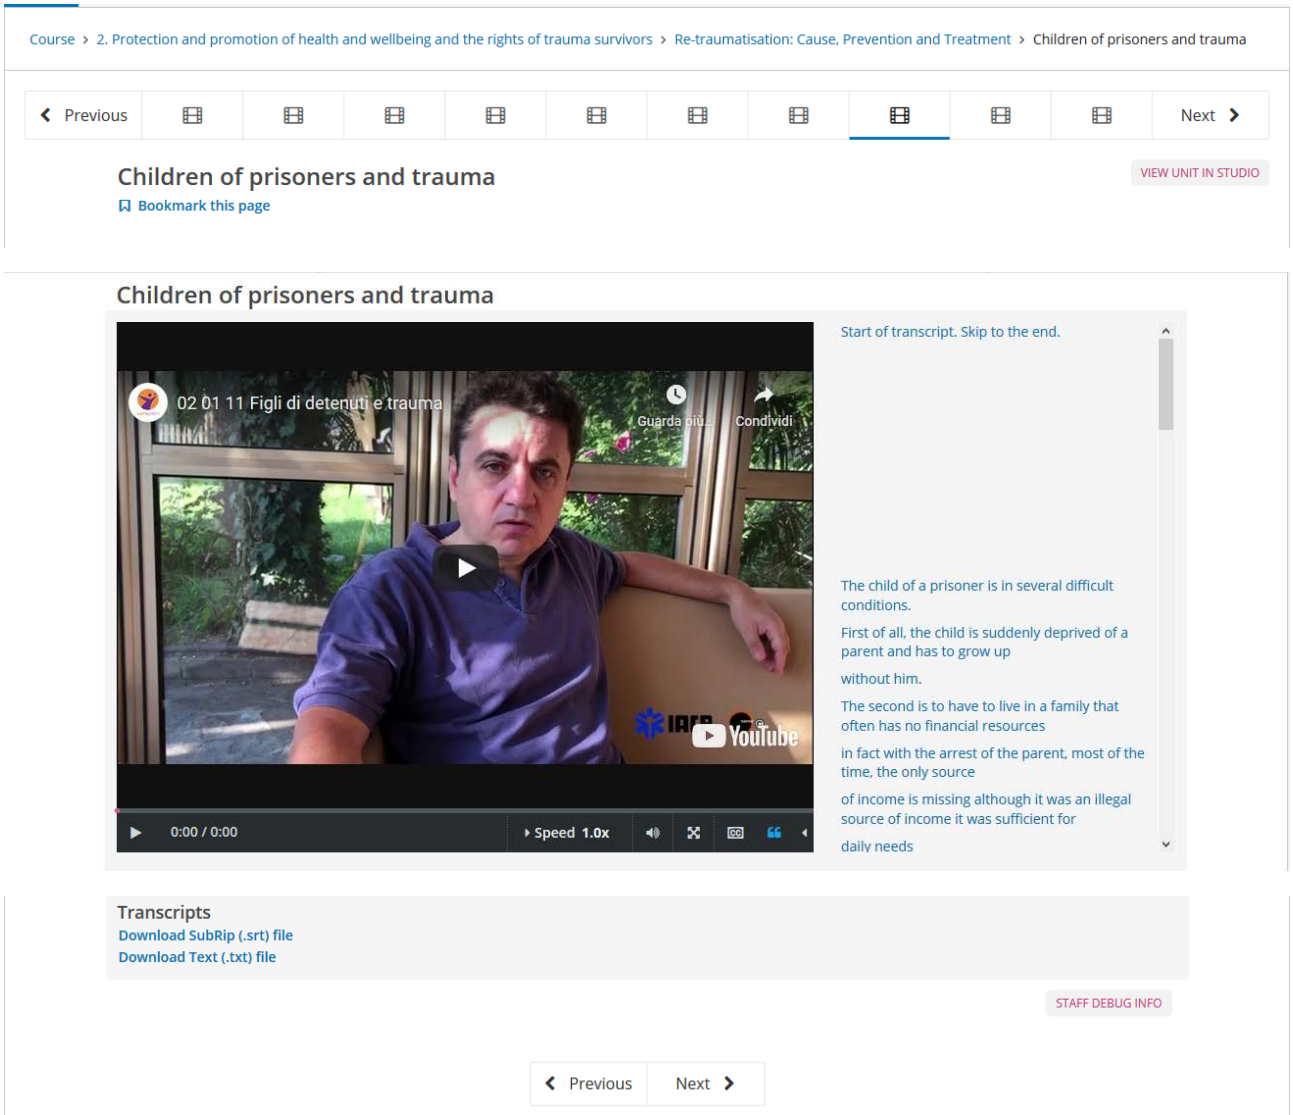
Once again we would see that the child is tuned to the face of the adult, his

expression, on what the adult expresses, about the danger he can pose;

all this will make it difficult for the child to be able to concentrate.

All these aspects however are extremely important, these behaviors are the narrative

of a past history, they'll tell the adoptive parent everything that is marked in the
child hystory that possibly this child can only express itself through
this kind of behaviors;
so maybe it's important to think that those are valuable information that
can put us in a position to understand that part of the child past, absolutely unknowable
for us, but who has created that change in that relationship as it is...
with the new foster parent.
More than situations to be corrected these are behaviors to be understood and accepted as
opportunities to understand what they can of a past history that could become,
along with this little child, today a shared narrative.
How the narrative of the past can create a bridge with the narrative of the present.



Transcript

The child of a prisoner is in several difficult conditions.

First of all, the child is suddenly deprived of a parent and has to grow up

without him.

The second is to have to live in a family that often has no financial resources

in fact with the arrest of the parent, most of the time, the only source

of income is missing although it was an illegal source of income it was sufficient for

daily needs

Another secondary tragedy, but no less important, is due to the fact that the child

finds himself victim of stigma

being children of prisoners means being

children of guilt

the child as he relates to this social pressure

makes his own judgment and may become convinced that he himself is a person worthy of punishment

Often the children of imprisoned parents are troubled children

this is also due to the fact that they do not have a parent - often the father - who educates and contains

in his excesses

They are children forced to live alone, as the mother cannot cope with all the problems 18 00:01:46,150 --> 00:01:54,200 and longer being able to rely on the support

of her husband

It is a whole new challenge to be managed, unfortunately even social workers sometimes fall into the trap

of stigmatizing the child that should be understood and facilitated even more than other children,

because living alone with a mother in difficulty is not a simple matter.

There is a discussion about how to tell the child that his or her parent has been

arrested

Many parents, out of shame or difficulty, tell the child the story of the absent parent

is not present since suddenly had to leave since he got hired for a new job

Clearly the lie quickly catches up with itself and the child is not convinced, because if up until

then the working father returned home every day, does not explain why he suddenly changed

job and left for so many days, months, years,

missing birthdays and holidays, so the child understands that it is a lie.

The best thing to say to the children in these cases is to tell the truth "...father has made some mistakes

and unfortunately must be in a place to answer for his behavior

but he's fine, stay calm

we will be able to visit him soon."

This is another issue related to the children of parents in prison

whether or not to show them the parent in prison

Some social workers say it is not appropriate because the prison environment

is not an environment tailored to the needs of the child

It is true that when you enter prison you have to deal with policemen, environments that are not always dignified

but it is also true that it is very important for a child

to be to see their parent

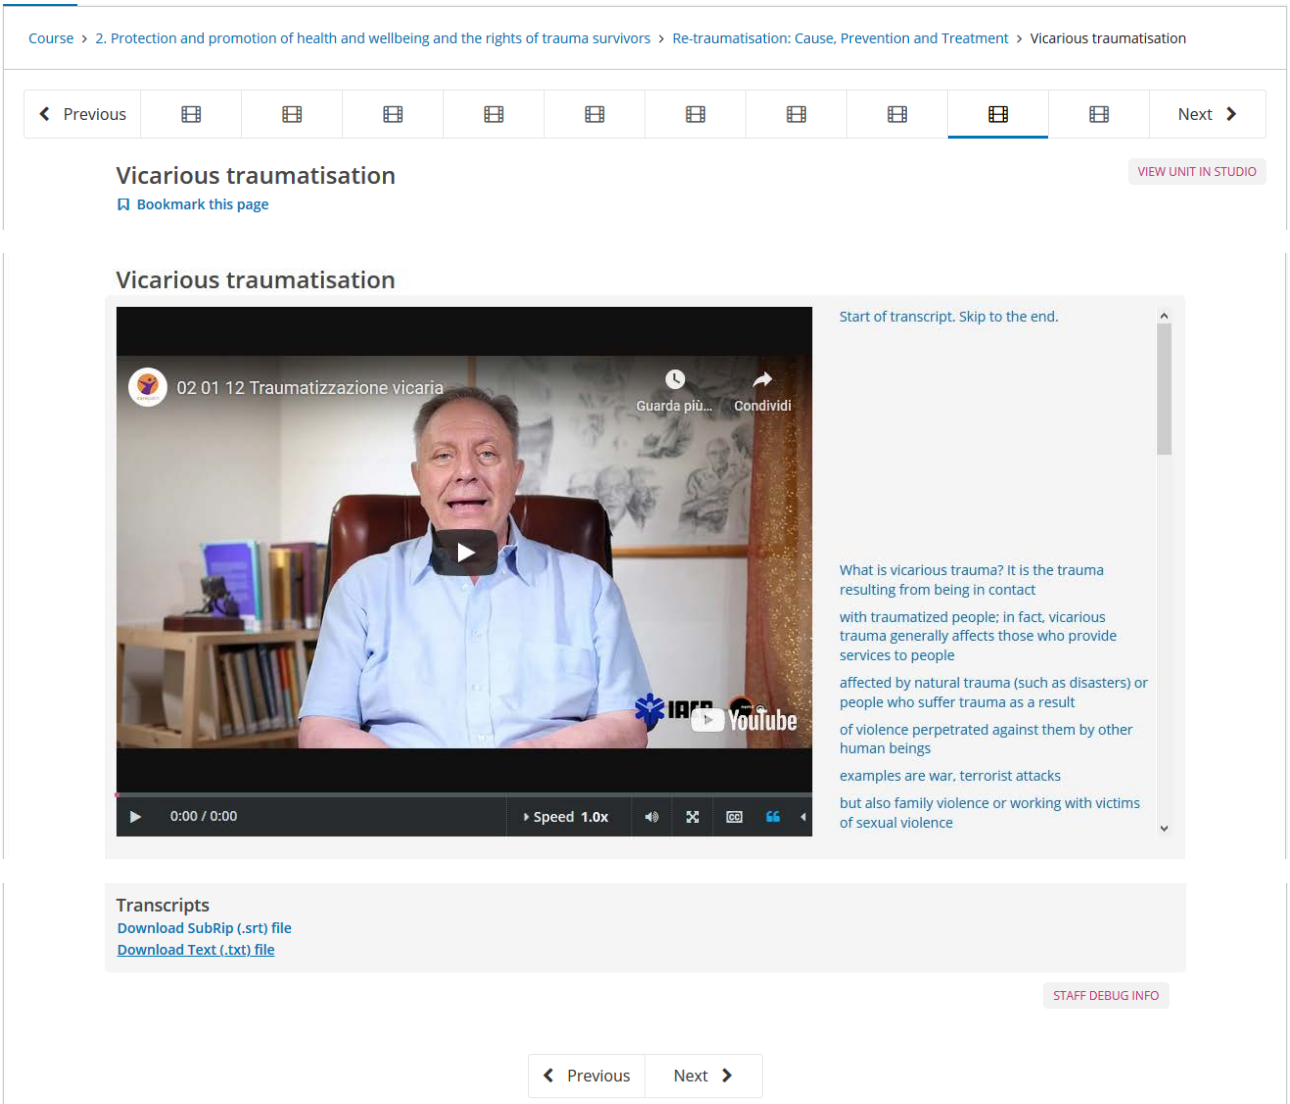
therefore, meetings between prisoners and their children should be facilitated.

Until a few years ago there were still walls that divided prisoners from visitors

today many things have changed: many prisons have a playroom or more colourful environments with games, and the same prison agents are much better prepared to welcome visiting children

However, this is not the primary topic, the issue is not whether the child goes into a suitable environment or not, but is to facilitate the meeting between parent and child

All this is said for all the cases were the parent is in prison not for a crime against his own child



Transcript

What is vicarious trauma? It is the trauma resulting from being in contact

with traumatized people; in fact, vicarious trauma generally affects those who provide services to people

affected by natural trauma (such as disasters) or people who suffer trauma as a result

of violence perpetrated against them by other human beings

examples are war, terrorist attacks

but also family violence or working with victims of sexual violence

In short, the operator relates daily to the trauma survivors with good will, offers assistance, support and psychological contact

but this, despite the profound significance of the openness, humanity

and the importance even at the existential level, can nevertheless affect the worker

mental health, and may develop in a source of real

trauma with all the consequences that trauma has on people.

Is very important to prevent and abate the impact of vicarious trauma that operators

and all those workers who are exposed to victims of trauma or violence

such as health personnel, policemen, firement, journalists, volunteers and all those people who for various reasons get in contact

with traumatized people.

It is important to prevent

vicarious trauma, also more generally termed burnout which also affects people

in helping relationships and that hits hard, in particular, when you cannot recharge

your batteries, or disconnect from work that is heavy and taxating as well as beautiful, and also is important to

have work -life balance, to keep to be an effective help worker one needs also to take care of personal life, spending time with family

friends and having some fun. In short, it is a challenge for all those who offer their

helping services with passion, generosity and empathy to also extend that kind of helping relationship

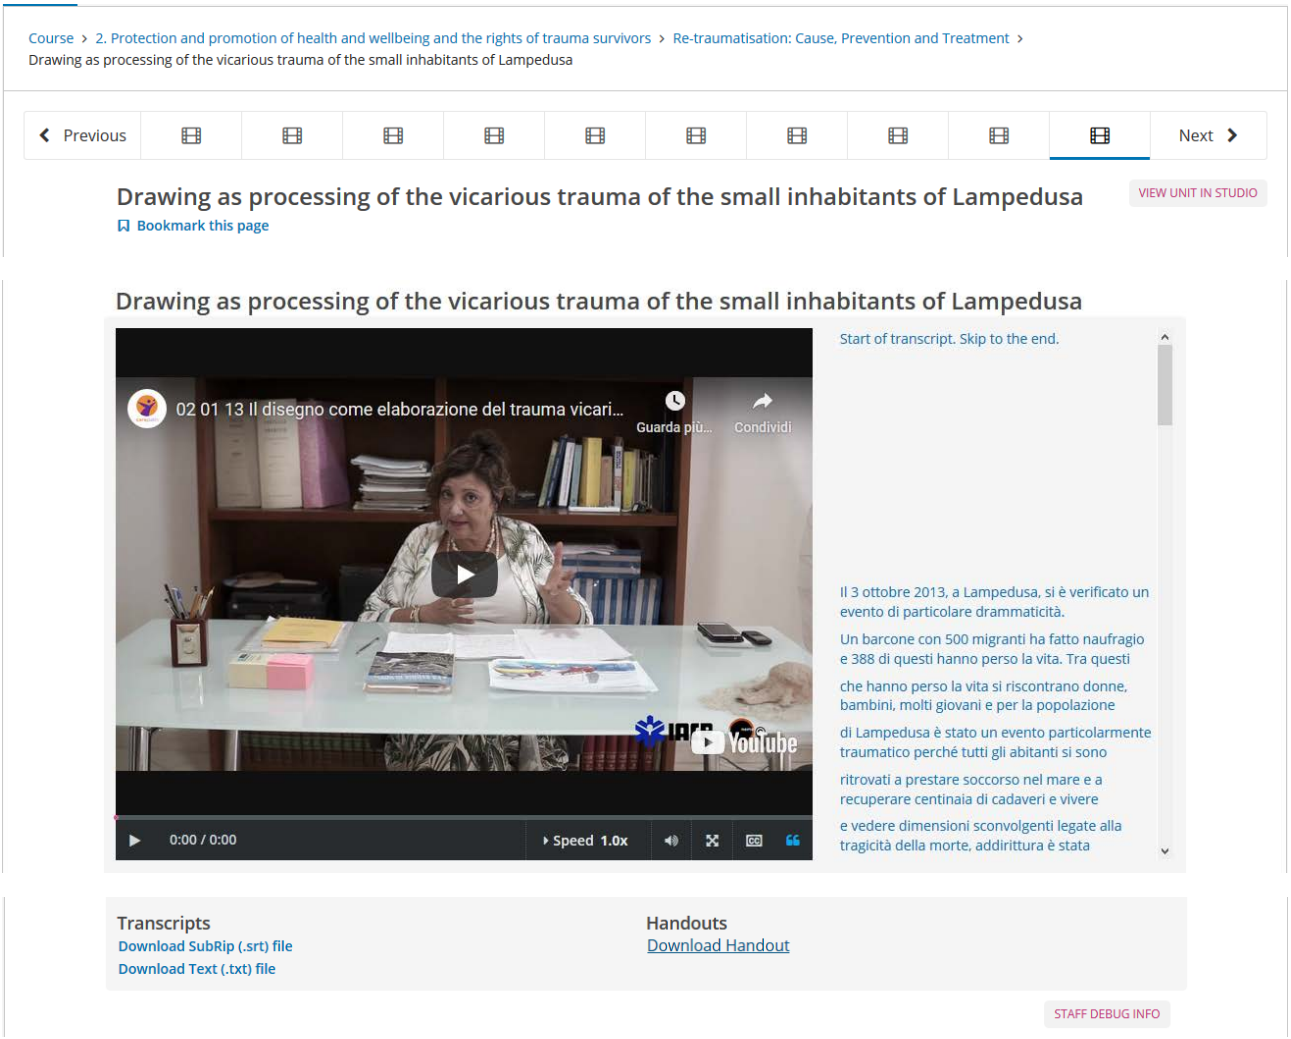
to themselves

because you can not give others what you do not have.

It is therefore morally, ethically and professionally necessary to promote our resilience, health and wellbeing,

because if we want to give a lot to people we help we must also relate generously with the person

with whom we will be spending each hour of our lives: ourselves.



Handout

Drawing as processing of the vicarious trauma of the small inhabitants of Lampedusa.

On October 3, 2013, a particularly dramatic event took place in Lampedusa. A boat with 500 migrants sank and 388 of them lost their lives. Among those who died there were women, children, many young people and for the population of the island of Lampedusa it was a particularly traumatic event because all the inhabitants found themselves rescuing people at sea and recovering hundreds of corpses and witnessing the shocking dimensions related to this tragedy. They even found a mother who was giving birth during the shipwreck with her son still attached to her umbilical cord.

An event of this kind produces a vicarious trauma on the population and therefore we tried, in some way, in the Local health Agency to offer help by listening and supporting people who had traumatic

experiences. One of the most difficult situations to handle was that related to the traumatic experience perceived by children, especially in primary schools.
Immigration in Lampedusa is a multi-year experience and everyone (including young people) knows that often journeys of hope end with the loss of life, but children 6 -7 years old are particularly sensitive to this type of experience and many of them have begun to have fears, anguish, phobias, all typical reactions of people exposed to traumatic experiences where lives are endangered and lost.

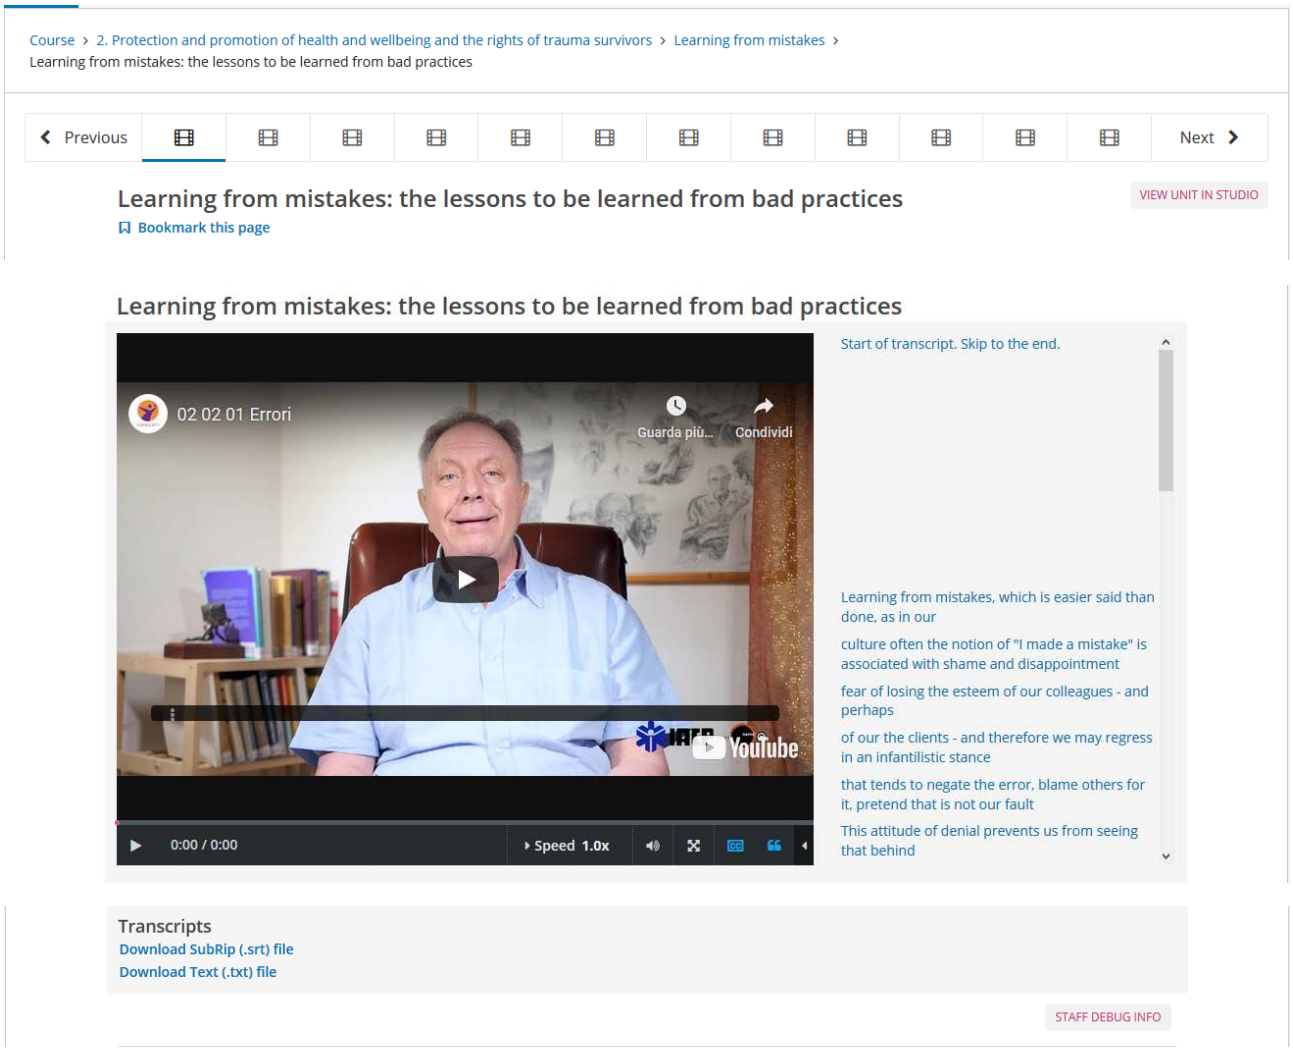
For the children of Lampedusa this tragic event had happened in their sea, a sea they experienced as a source of joy, play and fun; that sea that represented for them an element of joy and lightness suddenly turned into a sea of death. One of the possibilities that were put in place to deal with the processing of the children's vicarious trauma was to propose that they make drawings, these drawings now show how the children respond and react to this trauma.

A premise must be made: art is a powerful tool to make painful and frightening events tangible, in of itself art produces liberating effects and also reworks traumatic events. Next we must ask ourselves what is a traumatic event from the point of view of children. In this case it depends on the type of event, a traumatic event has different forms, it can be produced by humans (such as wars and terrorism) or by nature (hurricanes and earthquakes, tornados) and each of these events leaves specific traces and specific fears in the minds of children. From this point of view it was necessary, in the case of the shipwreck of Lampedusa, to recompose the emotional and internal fracture that the children had experienced, linked to the fact that this event could not only be resumed, but also affect their families, as for a child of 6 and 7 years it is difficult to understand the sense of death and we know how children bring everything back to themselves. These events and stories of death had the effect of producing in many children the fear of eating fish (the fish had eaten the dead children and mothers) or going to the sea side (in the sea there could be some corpses), it was necessary to rebuild this puzzle of their dimension of serenity in respect to the imagery that was being built on the island of Lampedusa.
As we said, this was possible with drawing.
Now I want to show you some of their drawing, here is the representation that the kids have made of their experiences: Here is the island of Lampedusa, a little distant from the sea that is full of dead bodies,
kids that died with their school back packs or mothers that lost their purses, the purses and back packs are the symbol of going to school. A mother that holds the hand of a little girl; the fathers are distant underwater and are going to die; the boat is a safety symbol.
In another drawing of another child there are only two subjects, like the mother and the father in danger of death and a big fire on the boat - in reality there was a boat that went on fire- and this father and mother are surrounded by a black sea and a sky full of crosses and of dead people.
This beautiful sea has become a sea of death.

Another child has the perception of death thought the very ordered sequence of coffins in the hangar of the Lampedusa airport, very often seen on television. What is noticeable, there are small coffins of different colors the adult coffins are brown but the death of a child is a blacker death and the sea is very dark sea.

This is another design where you can see the representation of anxiety is less intense, less strong ; may be due there is the possibility that the family, a family, can lose their child, so a death anxiety that is more personal, but this drawing is in some way cathartic may be due to the fact tin the sky there angels and stars like all the dead people and the children have been transformed.

Through the drawings it was possible to build a narrative of how each child individually perceived this event, because while the event was collective its perception was specific to each child. It was important not to offer elements of immediate consolation, but to let each child, by means of the graphic and verbal processing and the listening that followed the drawings, find personal solutions to what is anguished element such as the dimension of death and loss that at 6 - 7 years of age is the greatest anguish for a child.



Transcript

Learning from mistakes, which is easier said than done, as in our

culture often the notion of "I made a mistake" is associated with shame and disappointment

fear of losing the esteem of our colleagues - and perhaps

of our the clients - and therefore we may regress in an infantilistic stance

that tends to negate the error, blame others for it, pretend that is not our fault

This attitude of denial prevents us from seeing that behind

every error we can find a treasure of wisdom.

With the right attitude, being not defensive, we can open ourselves to learn from mistakes

mistakes becoming our as teachers that help us to become better professionals

by the way we often

facilitate this to our clients: to learn from experience.

It's funny and tragic: we helping professionals inspire

our clients to learn from their experiences and mistakes, but

we promote this awareness in our clients and less so for us; we are less enthusiastic

about not to defend ourselves and admit that the mistake is ours and in doing so

be open to learning.

A dysfunctional way of viewing errors generating loss of self esteem

when learning from mistakes should increase our self esteem: This is a little crazy,

like that those who feel afraid think they are a coward, ignoring that those who are brave experience fear but are not

frozen by it, and so those who are intelligent and wise accept their errors and learn from them.

We could learn from our clients that are sometimes more ready than us to humbly accept

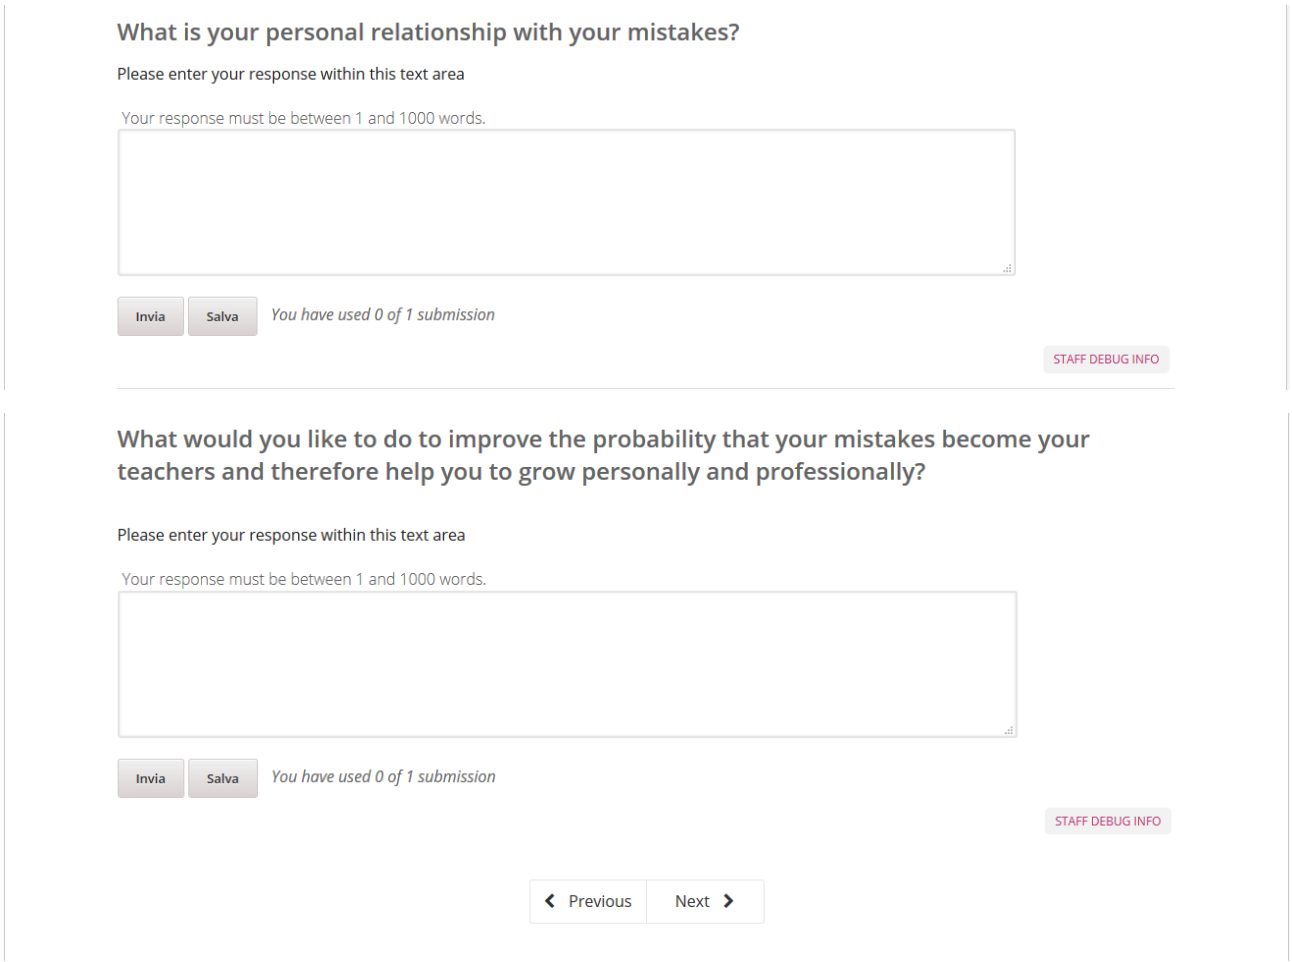
to learn from their experience and try to not make the same

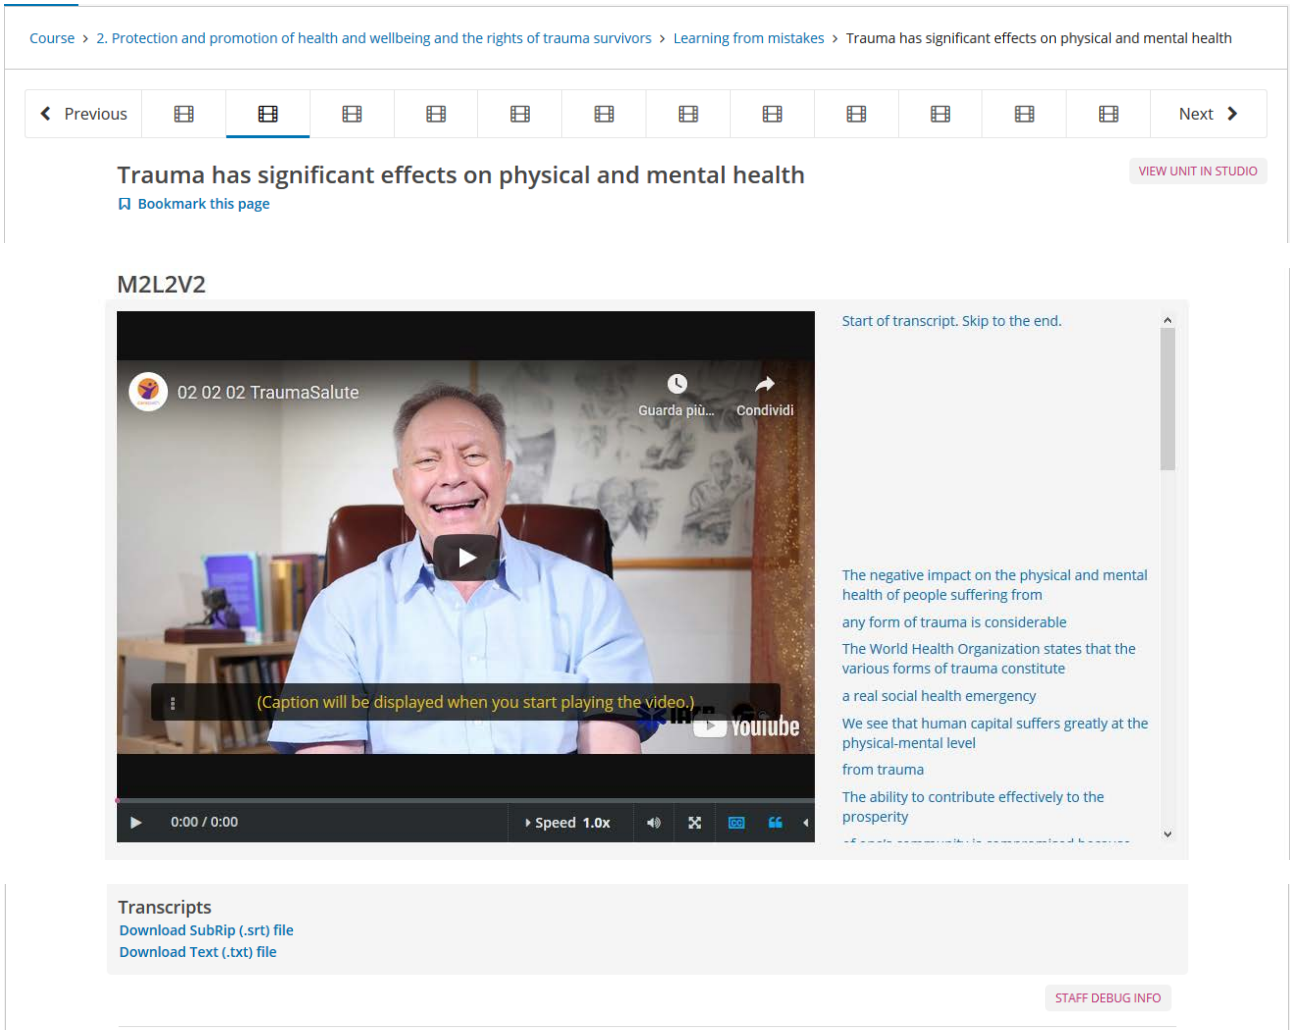
mistakes. However we are condemning ourselves to a compulsion to repeat our mistakes

if we refuse to admit that they are our mistakes, because by doing so we are describing ourselves as victims

and we create a situation of self-defined impotence.

Let's welcome our mistakes as masters of wisdom.





Transcript

The negative impact on the physical and mental health of people suffering from

any form of trauma is considerable

The World Health Organization states that the various forms of trauma constitute

a real social health emergency

We see that human capital suffers greatly at the physical-mental level

from trauma

The ability to contribute effectively to the prosperity

of one's community is compromised because those affected by trauma are in need of care

and this consume economic resources

and also by trauma is impaired the ability of trauma victims to produce prosperity

for themselves, their families, their communities and nations.

We can also observe another very worrying aspect for those who

That not only the victims of trauma

become a person with damage to their physical and mental health, but often,

especially for certain types of trauma (such as being victims of violence or sexual violence)

there is a high frequency of becoming perpetrators and thus traumatize other innocent people.

This shift from victims to perpetrators is a terrible thing that shows how trauma is like a virus

that expands if not combated, prevented and treated effectively in the community: a real pandemia.

One can speak of pandemics, that is, as something that is transmitted from individual to individual

quickly throughout the population which causes serious loss of human 21 00:02:45,390 --> 00:02:46,720 capital

In a bio-psycho-social approach we cannot leave the responsibility

of the prevention and treatment of trauma to the health sector alone, but it is a policy

task and therefore of all the institutions - families, schools, work organisations

the world of juvenile justice, legislation must become sensitive to these problems

and also become part of an effective network for the prevention and resolution of trauma

This is in the interest and for the good of all.

We will talk about the pervasiveness of trauma: it is becoming increasingly clear that

trauma has relevant impacts on the community and society

In the past, studies on trauma focused more on the acuity of a trauma

and the exposure to events of a certain importance.

Over time the concept of trauma has expanded to include many other aspects

Trauma is something that is pervasive in our 7 00:00:54,239 --> 00:01:01,129 societies, from research we know that an adult person has been exposed, or will be exposed in the future,

at least once to a traumatic event

From some studies, like the in-depth study of Benguet, we

we know that worldwide the percentage of trauma in various countries is very high, with variations,

but always in high percentages

It is therefore important today to know what are the aspects that protect people from trauma and what will

increase the risk of trauma exposure.

We know from studies on the subject that trauma is also at the root of many 15 00:01:47,440 --> 00:01:54,780 of the chronic disorders that today have major repercussions on the economy

and on public health, but above all trauma impairs the ability of the individual

to express their potentialities and therefore to become a fully

and effective citizen of the community and society in which he lives

Trauma is even more important if we consider all those traumas that occur during the period

of individual development

when a person is developing 22 00:02:31,160 --> 00:02:40,069 their emotional and social capacities; trauma can powerfully affect

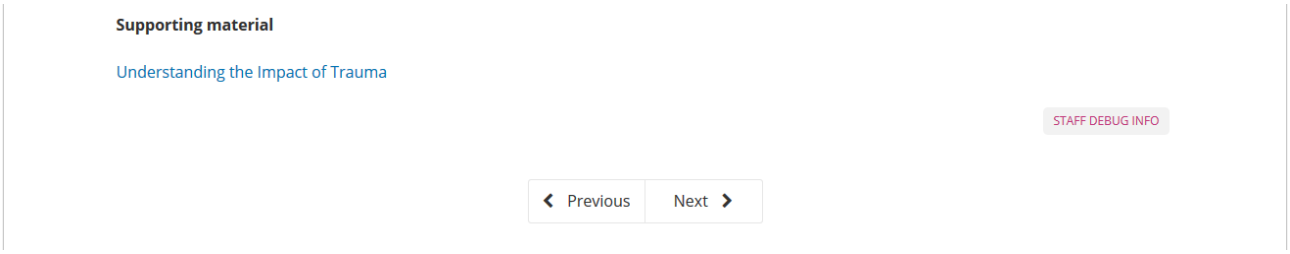
the development of these capabilities,

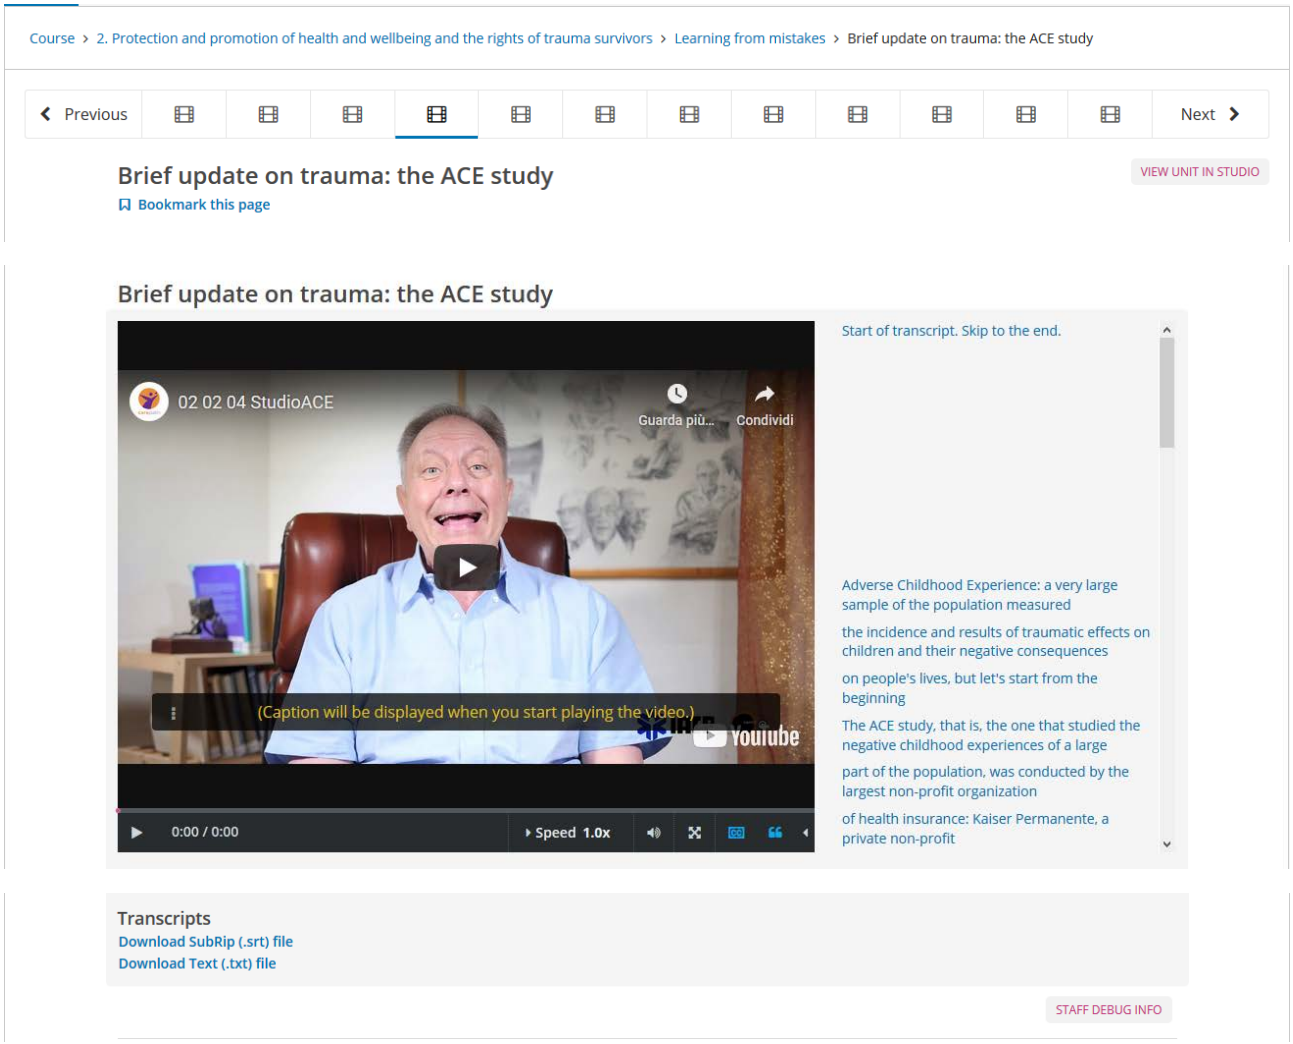
seriously undermining the

future development of the individual.

It will therefore be fundamental, and it is today, to deepen our knowledge of trauma

to be well informed about this topic, as we are doing through this course





Transcript

Adverse Childhood Experience: a very large sample of the population measured

the incidence and results of traumatic effects on children and their negative consequences

on people's lives, but let's start from the beginning

The ACE study, that is, the one that studied the negative childhood experiences of a large

part of the population, was conducted by the largest non-profit organization

of health insurance: Kaiser Permanente, a private non-profit

health insurance in California. They invested many millions of dollars 8 00:01:09,720 --> 00:01:16,970

to conduct this study that has benefited the entire scientific community, because we now know much more about this topic, replicas of this study have confirmed the original data

average in the population at least one third - therefore one third of citizens - is affected in their childhood

at least by experiencing an adverse episode, by a trauma

A smaller number of citizens is affected by two

types of trauma

and an even smaller number suffers a higher number of traumas

More a person is affected by multiple traumas, the more they suffer from the negative consequences

as if a knife stab will hurt a lot, but being stabbed several times is even worse

Traumas are worse than stab wounds, because they not only have negative consequences

such as stab wounds - on the physical and mental appearance of the victim of such violence

but they are also - in some way - a kind of virus that brings some people affected

by traumas

especially traumas in which you are a victim of violence, sexual abuse, etc

to become perpetrators in adulthood.

It has been said, then, of mental and physical problems

that often the two things are associated. To explain better: people

who are subject to trauma instinctively try to adjust to the trauma, that is to cope, to manage

the event, some aspects of this type of trauma management may be effective

but cost a lot in the long run. For example, some people

may - in order to manage the effects of trauma - mitigate their suffering with the use

of alcohol or drugs, this

creates another problem, aggravating

the situation, because they then become alcoholics or addicts. At the behavioural level

it is known that we tend to avoid contact with others, and by isolating ourselves we are cut off

from "recharging our batteries". Or becoming sexually promiscuous. In short,

adverse childhood experiences are a real social scourge and very costly, because the costs for

treatment and care alone are very expensive. Thus it is in the interest of everyone that we all strive to

prevent and treat the trauma we have suffered from childhood effectively

This not only

benefits the victims, but the whole society.

What Trauma informed means? Simply informed about the trauma. It is an approach focused

to prevent re-traumatization and to offer services and design structures that reduce

the risks of re-traumatization and maximize the possibility of providing effective services.

We have come to define good practices as trauma informed practices also thanks to

an attitude of openness and awareness of mistakes made in the past. Mistakes,

obviously, committed unintentionally, out of ignorance,

because we didn't know

that some aspects of the treatments offered in the past were part of the problem and not the

solution: for example pushing clients against their will to remember and reexperience traumas

of the past, re-experiencing some traumatic moments and so on.. 11 00:01:31,660 --> 00:01:38,260 Today, thanks to what we've learned from our past mistakes,

we have a set of guidelines,

of parameters that help us prevent damage and maximize the benefits in service 14 00:01:53,310 --> 00:01:54,340 delivery;

this is not only in the field of healthcare, of mental health,

but in every area of intervention

- for example, schools, organizations, juvenile justice regulations

or even the laws - in other words a Trauma Informed School is a school sensitive to

trauma issues and therefore also the teachers will be aware that not always an unruly student

is just being mischievous, but may be expressing a discomfort due to trauma, and therefore knowing

this will have a rereferral tool for the psychologist so that student can

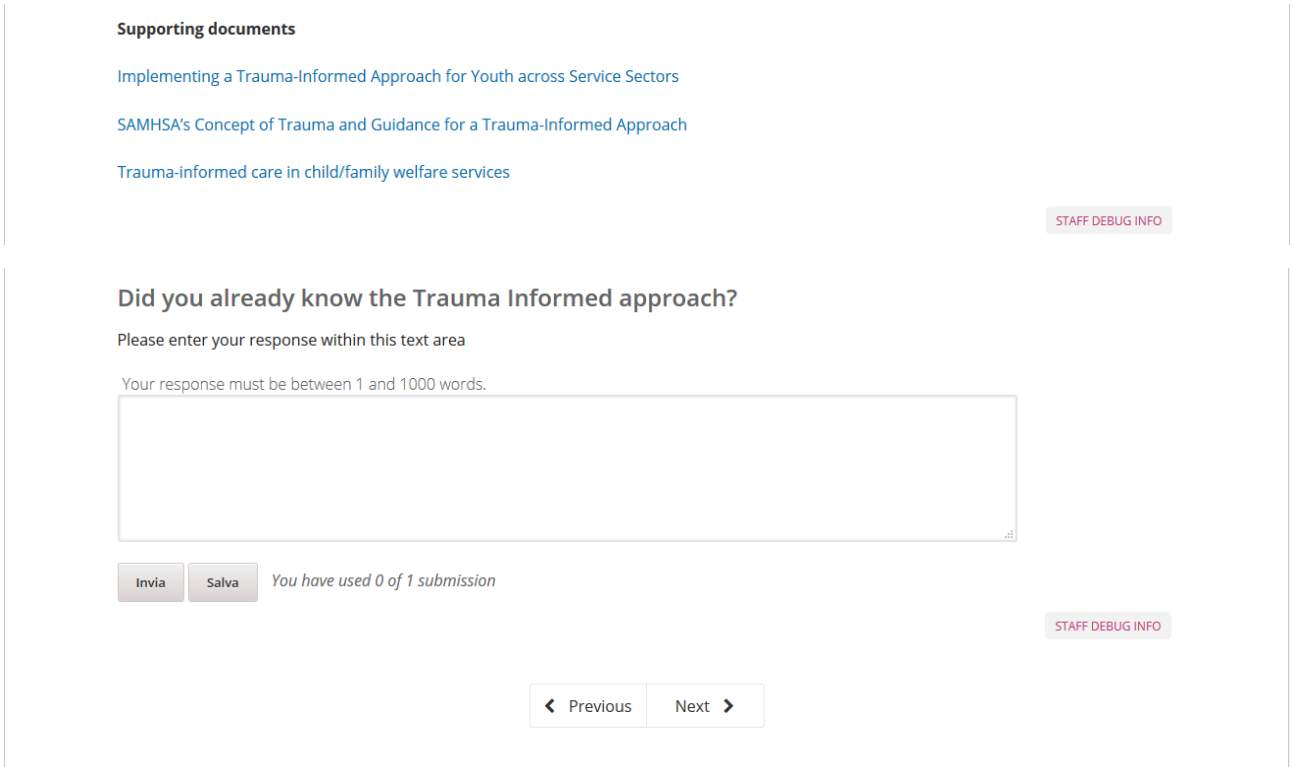
be helped if he/she needs to and the problem does not become more serious than it is already.

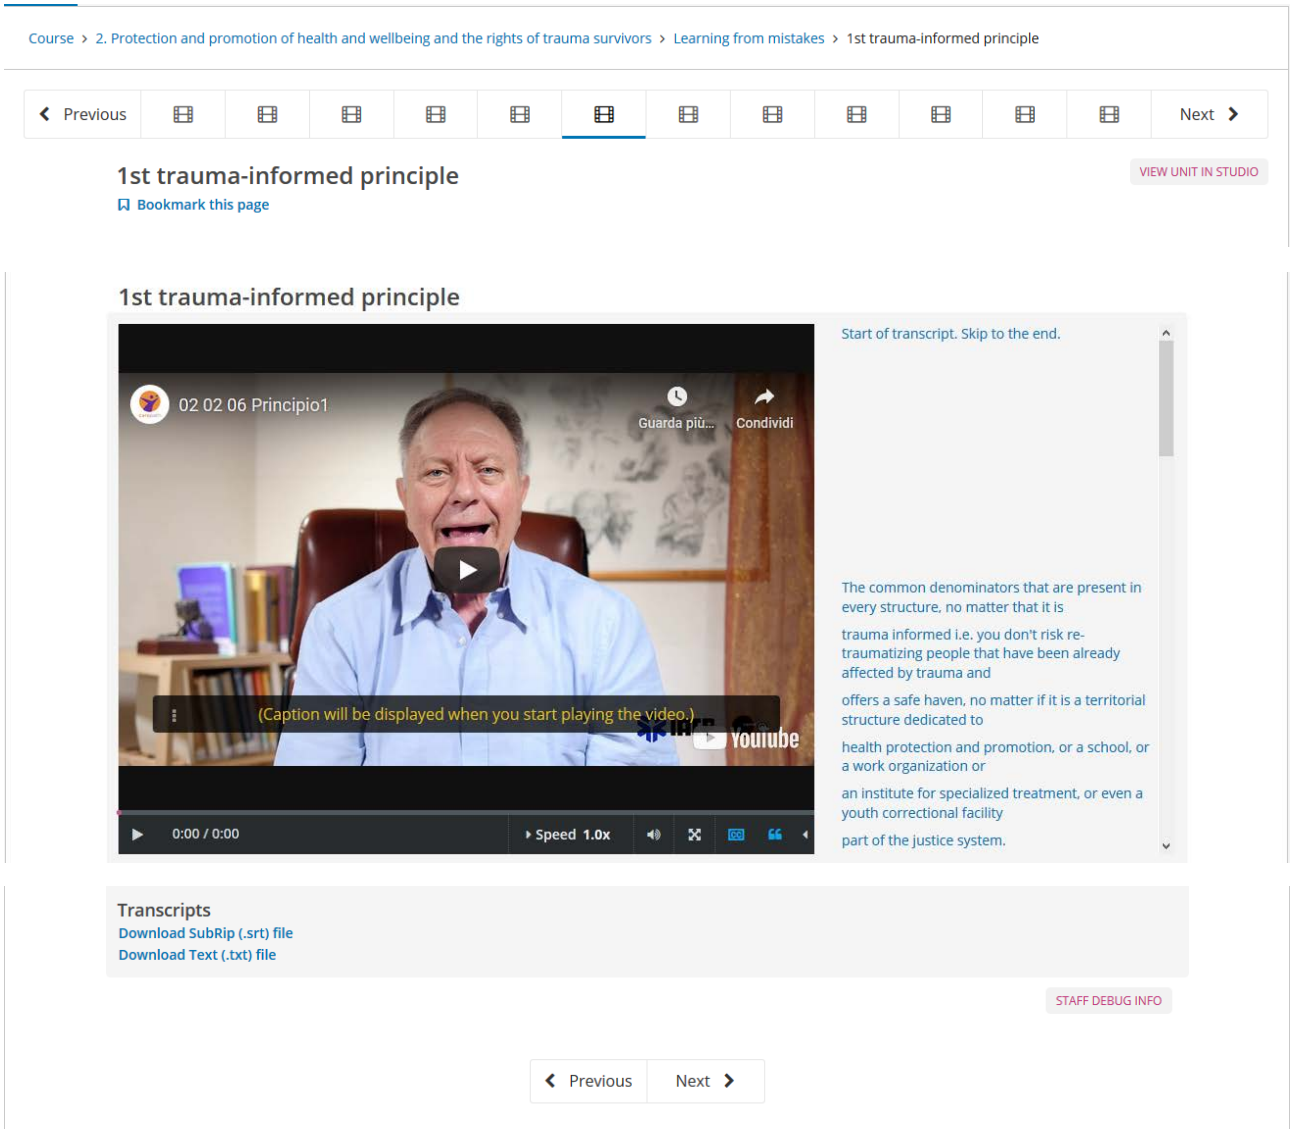
After all, having an informed trauma approach is not only dutiful, from one point of view

ethical, clinical and mental health perspectives, but it is cost-effective,

to deliver treatments that reduce the damage is in the interest not only of the victims

of trauma but of society as a whole.





Transcript

The common denominators that are present in every structure, no matter that it is

trauma informed i.e. you don't risk re-traumatizing people that have been already affected by trauma and

offers a safe haven, no matter if it is a territorial structure dedicated to

health protection and promotion, or a school, or a work organization or

an institute for specialized treatment, or even a youth correctional facility

part of the justice system.

Even a community, in order to be trauma informed, must have these common denominators that

have a red thread:

the common denominators are all focused in communicating 10 00:01:21,799 --> 00:01:26,340 and assuring to the traumatized person

a full sense of security,

physical and psychological, to be in a safe place.

The first trauma informed principle is that the structure must ensure the physical and emotional security and then the person will have the the certainty, because she knows about it, but also the experience that nothing will go wrong, no attack, can be aimed to damage her, it is a safe place where you do not have to to be on allert, in constant alarm, to live with axiety.

The trauma informed structure is also very comfortable, in all aspects of communication and metacommunication and therefore the service user is welcome, everybody say welcome, or welcome back and everybody that the client is a person is really welcomed. 22 00:02:50,780 --> 00:02:57,900 A structure to gain trust and giving security to service users must be coherent,

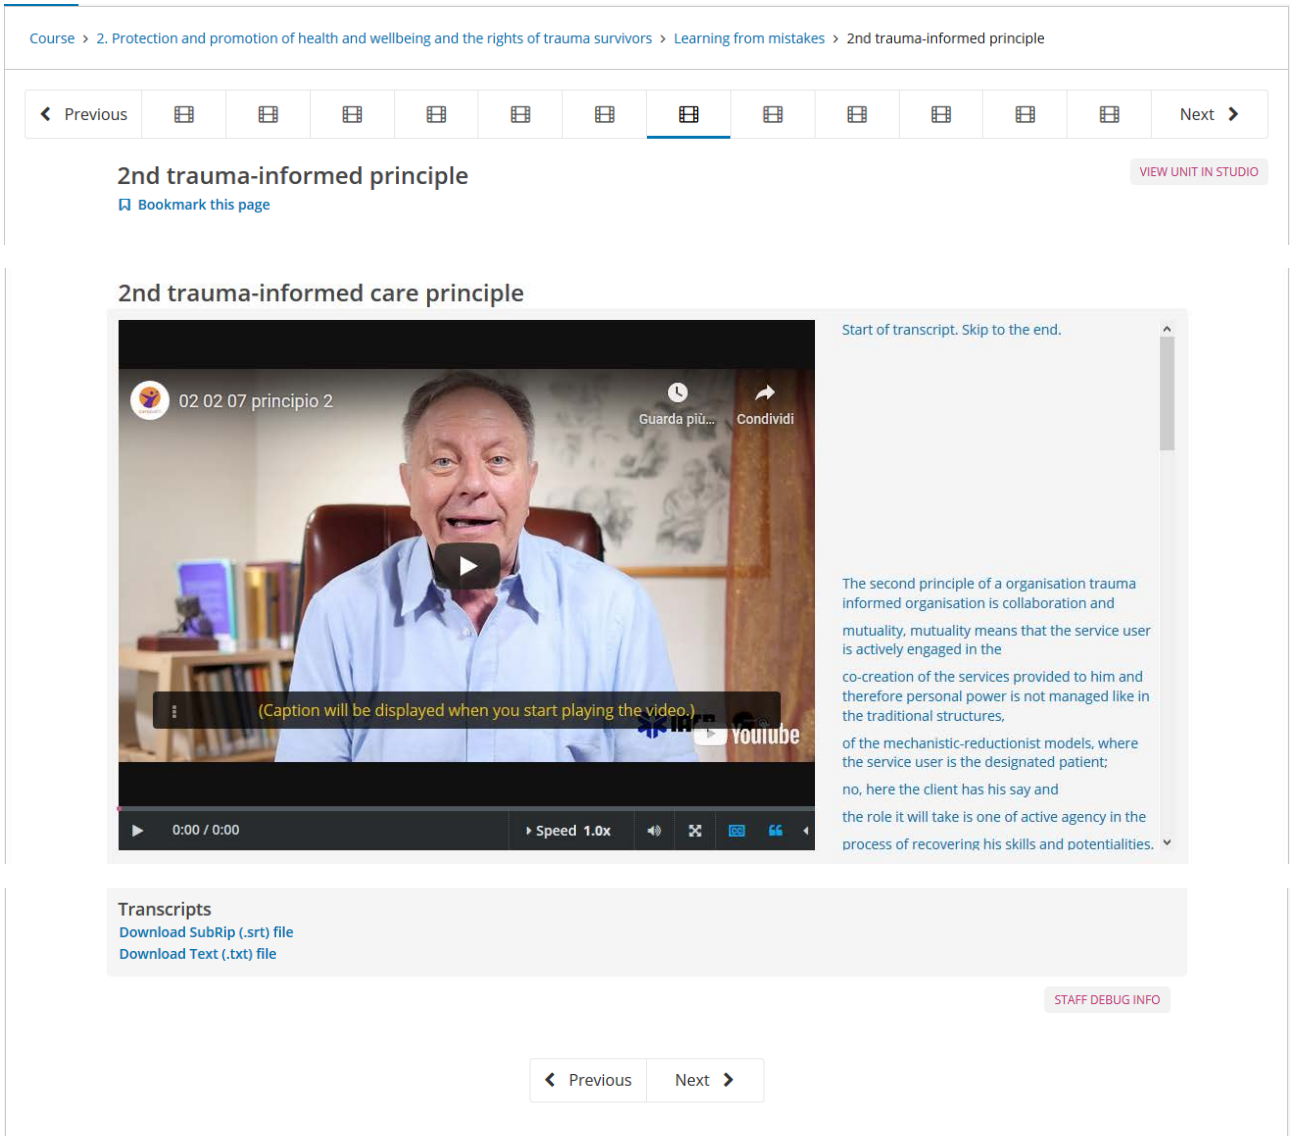
the messages at all levels must be congruent with the actions and constant in time.

Only in this way can the service user can develop real trust and feel that the structure is really welcoming and a safe place that can be relied on.

In a trauma informed facility there is no place, wheree violence, shame and guilt have space, very problematic aspects that can exacerbate or retraumatize those who have already suffered a trauma.

An informed trauma structure also ensures the confidentiality and professional secrecy, the privacy of the client, who will not be exposed to this kind of danger and violence.

In addition, the language of a trauma informed-person centered structure will speak clear, consistent language, that the client can understand and not any cryptic and professional language where one needs three university degrees to understand it.



Transcript

The second principle of a organisation trauma informed organisation is collaboration and

mutuality, mutuality means that the service user is actively engaged in the

co-creation of the services provided to him and therefore personal power is not managed like in the traditional structures,

of the mechanistic-reductionist models, where the service user is the designated patient;

no, here the client has his say and

the role it will take is one of active agency in the

process of recovering his skills and potentialities.

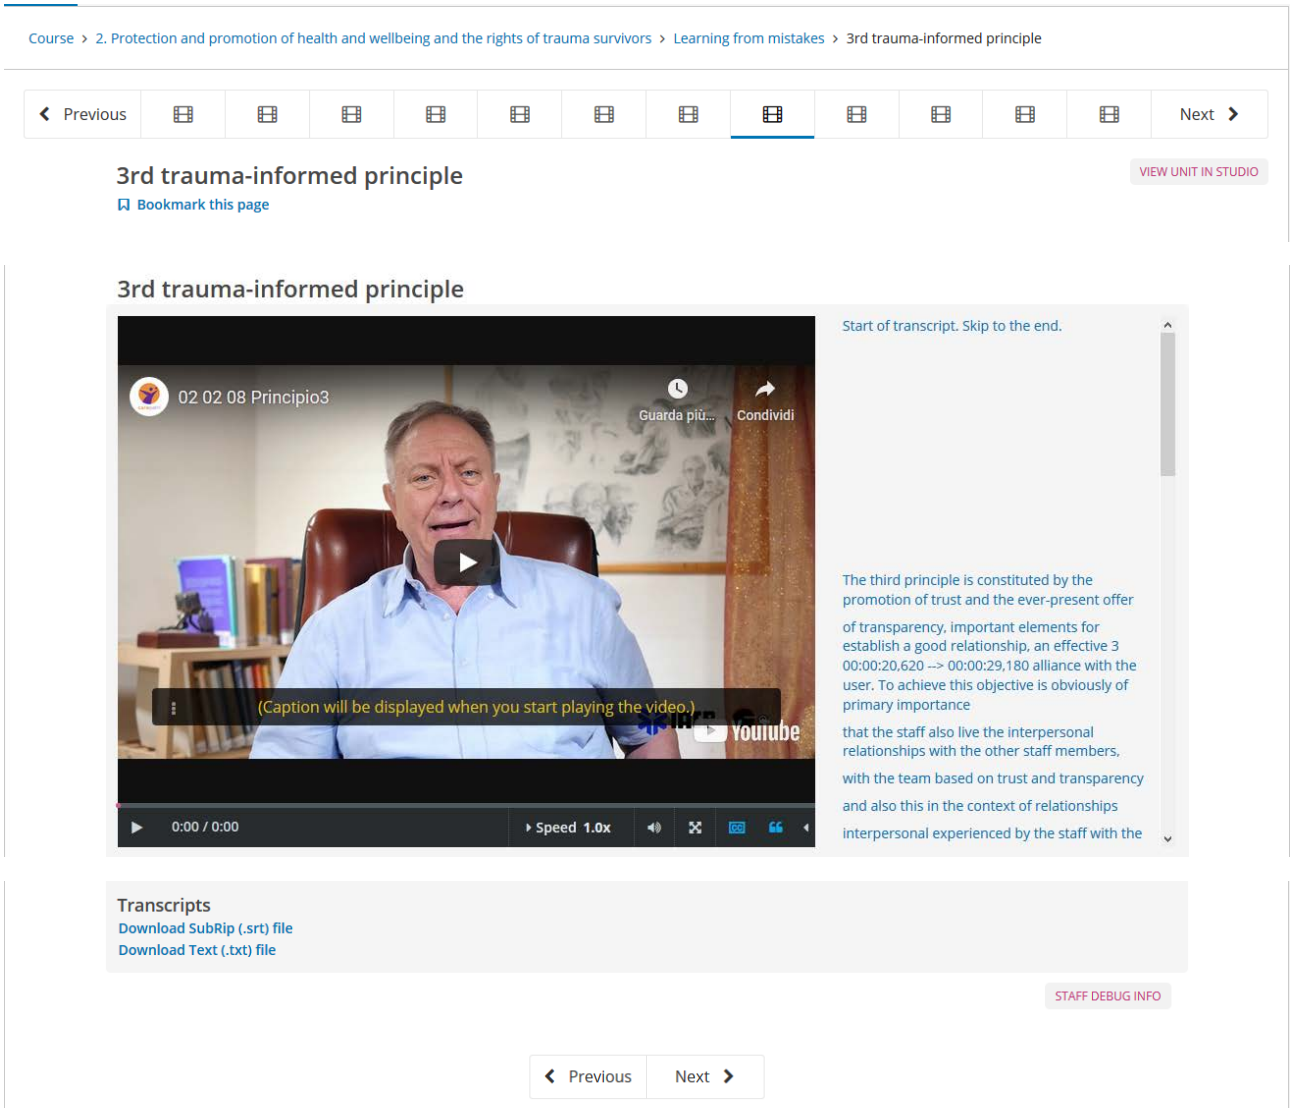
A trauma informed trauma structure will promote

the recovery of self-respect, a

crucial aspect for the victims of trauma,

and also recovery of hope, 12 00:01:17,040 --> 00:01:20,600 the recovery of one's potential.

A structure like this will always make clear, especially to itself, that the
recovery of health, functionality of a person with post 15 00:01:36,380 --> 00:01:37,909 traumatic stress,
from trauma, can only happen through effective relationships that staff members
of the structure can establish with the service user.
In short, good teamwork, a good working alliance.
Sharing the decision-making process is a central aspect to ensure the good functioning
of the services provided,
first of all we know well from the research of
Karasek about stress - if I have stressful stimuli but I also have a good deal of power of control,
the stress level will get lowered,
if I have little control on the situation the stress level rises; it's really
this principle at work.
So, to give decision-making power of control to the service user is already part of the cure,
in other words, the person with more control
is better able to overcome his condition.
A structure focused on providing trauma informed services is a structure that does not encourage
excessive disparity of power, excessive levels of power differential between structure
personnel and the clients, but takes active actions of empowerment and recognizes to the person
of the client the right to exercise control and a personal power in the co-construction
of a shared reality.
The trauma Informed structure is systemic and holistic in the sense
that is well aware
that what needs to work at is the social construction of a trauma informed reality;
all aspects contribute to making it as such
so everything, from alpha to omega,
from the beginning of the intake, from the welcoming
to the person of the client who will get treatment,
and how the client is accompanied and helped to live effectively
the aftercare phase.



Transcript

The third principle is constituted by the promotion of trust and the ever-present offer

of transparency, important elements for establish a good relationship, an effective 3 00:00:20,620 --> 00:00:29,180 alliance with the user. To achieve this objective is obviously of primary importance

that the staff also live the interpersonal relationships with the other staff members,

with the team based on trust and transparency

and also this in the context of relationships

interpersonal experienced by the staff with the users and their families.

Another important aspect is to respect the limits, keep the boundaries, because first and foremost

just by having clear boundaries we can create clear spaces, not respecting the boundaries

means polluting the settings and creating their dysfunction.

Transparency is fundamental and therefore the policies must be clear, formulated

not in bureaucratic language, but in a clear and transparent language

There is another reason

to be clear, everyone needs to know - especially the clients - in which place they are, which

are his rights and duties, what are the different aspect of the structure and of the staff

who works with him.

For this reason you also need to have a lot of clarity of roles and knowing that the various professionals that

work in a facility have various skills

and also provide various aspects of the treatment, none

is all-embracing and that therefore, as in an articulate society, the baker makes the bread, milkman

distributes the milk, the engineer makes his work and so on.

Essential for a trauma informed structure is respect for the rights, and the active promotion of the client rights, it is therefore fundamental

to ask and receive an real informed consent

explaining well to the client how they will be treated the procedures, service delivery and

doing everything possible to make sure that understanding and consent obtained

from the client are real and not mere formality.

4th trauma-informed principle

4th trauma-informed principle

Start of transcript. Skip to the end.

The fourth principle of trauma informed structures is based on actions of empowerment,

by giving right of choice and also to Co-creation of realities dedicated to the service users.

Everything in the structure gives messages

and meta-messages focused on promoting strengths, the

resilience of clients, the choice is to promote the change

focusing on the strengths

and not on the weakness or dysfunction of the clients.

Transcript

The fifth principle is about the support of peers, therefore a trauma informed organization

will do everything possible to encourage their clients to receive the support of 3 00:00:17,170 --> 00:00:18,170 their peers.

This is a very important variable.

To establish security and hope.

First, peer support helps

the people who receive it,to feel

more safe and also to arouse

their hope, that there's a chance of getting better;

in short the support of peers is important to build greater self-confidence

in their own potential, also self-esteem.

Peer support also promotes possibilities of collaboration and therefore everything

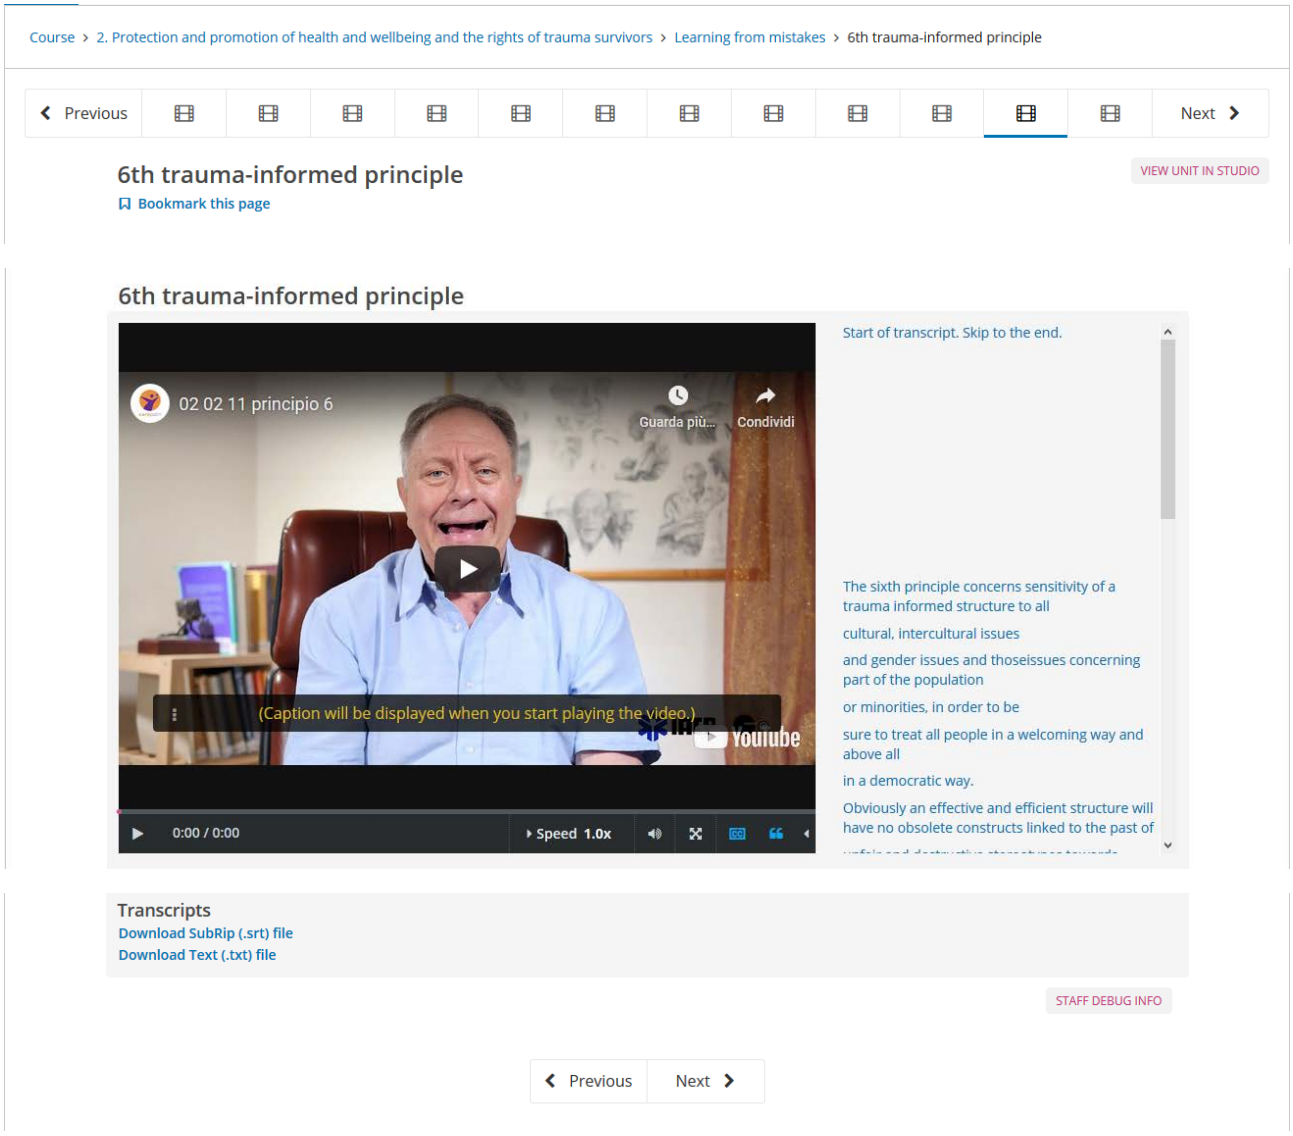
is positive in promoting the client social role and feel active.

It is undeniable that peer support brings an interpersonal communication that can

really take advantage of the construction of narratives

that I'm a part of a network

much richer and that can help the development of narratives of hope and healing.



Transcript

The sixth principle concerns sensitivity of a trauma informed structure to all

cultural, intercultural issues

and gender issues and thoseissues concerning part of the population

or minorities, in order to be

sure to treat all people in a welcoming way and above all

in a democratic way.

Obviously an effective and efficient structure will have no obsolete constructs linked to the past of

unfair and destructive stereotypes towards minorities.

The service provided will be, for example, realy

sensitive to gender diversity and respect

gender equality and then

such an effective approach will facilitate the use

of the cultural backgrounds, traditions,

of its clients cultures and countries of origin.

It will build a reality congruent to its own philosophy; the organization and the

procedures will all be

non-discriminatory and sensitive to diversity.

It will also be able to recognize and face efficiently the historical trauma. 19 00:01:43,060 --> 00:01:47,440 Historical traumas are made up of events

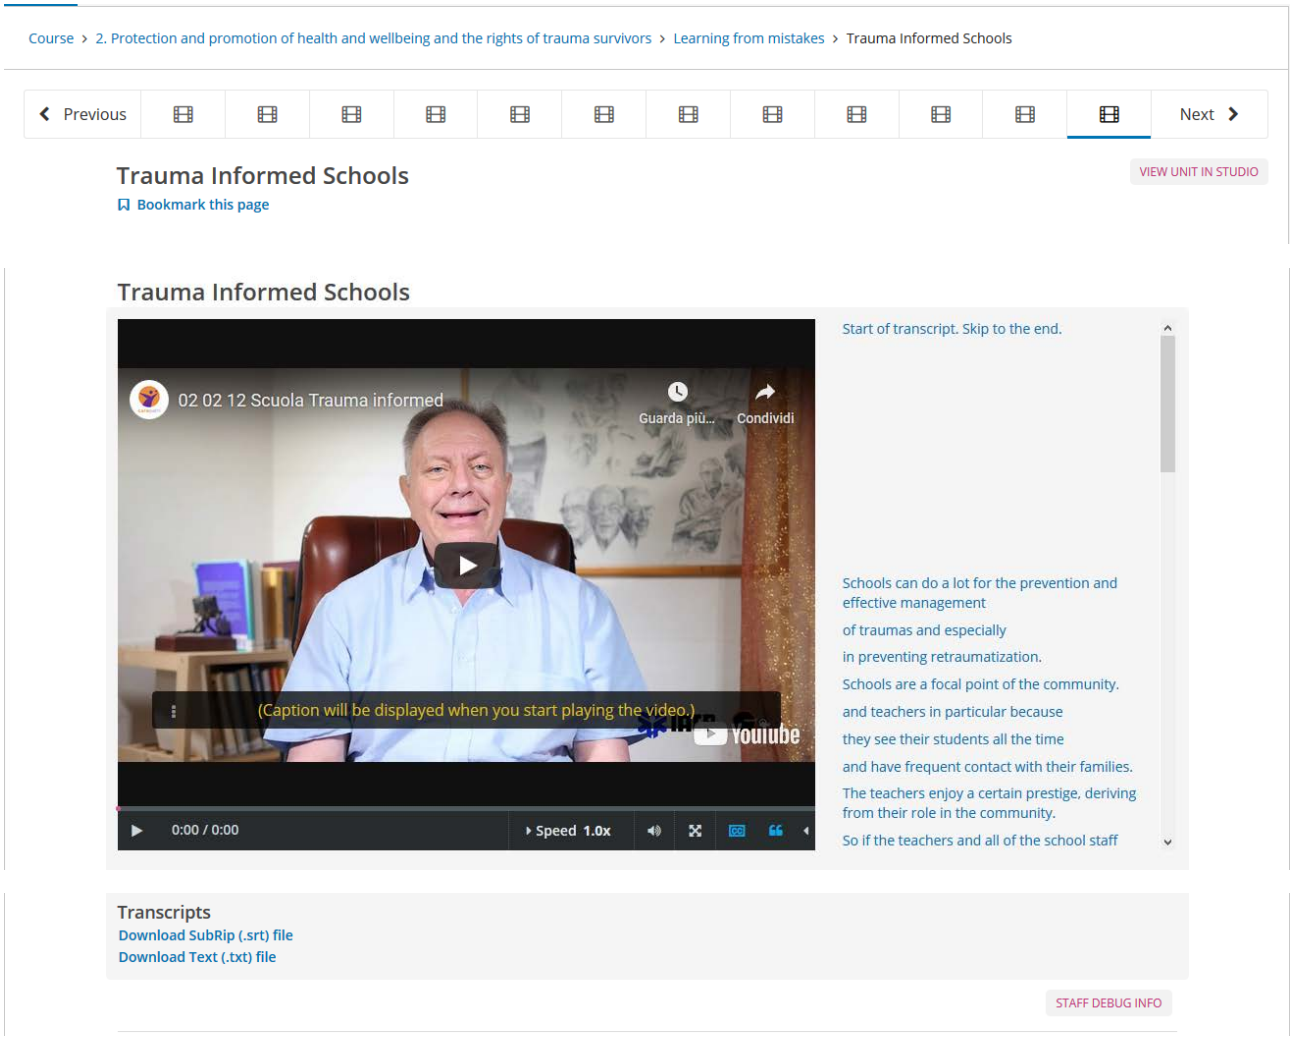
of mass trauma that also affect those

that have not experienced them directly, offering a dramatic example: the Holocaust; not only

millions of people have been victims

of the Nazi delirium, but also their children and grandchildren...

bear the burdens of the reverberation of such traumatic bestiality.



Transcript

Schools can do a lot for the prevention and effective management

of traumas and especially

in preventing retraumatization.

Schools are a focal point of the community.

and teachers in particular because

they see their students all the time

and have frequent contact with their families.

The teachers enjoy a certain prestige, deriving from their role in the community.

So if the teachers and all of the school staff

are sensitized to the

parameters of a trauma informed school , and also they have

available to them consultation services from

an expert who can help them make the improvements

that will make the school from a school ignorant

of the problem to school informed about trauma issues, well that school

will not be part of the problem, but part of the solution.

Not only because the teachers

sensitized to the issues of trauma may be

ready to pick up signals

that if they didn't have a trained eye they could interpret

as mere disciplinary problems, but instead - being trauma informed teachers - they will

be sensitive to refer to their

students to specialized professional and see if one

of their student needs professional support whether the student is or has been the victim of a

trauma.

Another significant influence teachers can exercise is with the parents,

that in that way could slowly become trauma-informed parents

and they can give a significant contribution

to this kind of problem.

In short, a trauma informed school

is the fullfilment of a school's vocation, which is to have

and effectively disseminate knowledge

that will allow their students to function as proactive citizens of the polis.

So, a trauma informed school

is fully prepared to fulfil its school' mission

in the best sense of the word.

We Will be illustrating some of the lessons learned from our experience of 20 years of work in the services aimed at minors and their families and that are focused on creating pathways to help, support and intervene in support of minors exposed to situations of violence, witnessing violence, abuse or other traumatic experiences.

Over time, the most important things

have been: the need and the importance to build - beyond scientific-technical expertise-

an appropriate relationship to create a safe environment for the child.

The term safe, should be declined in the dimension of listening

of needs and respect,

particularly important in situations in which the minor comes out of experiences that have violated the sense of security and respect and continuity of life, in these instances

a situation of profund respect is fundamental in order to resume an evolutionary path.

Wath means a dimension of respect? It means a real dimension of listening,

empathic listening and not centering
on protocols and operators' needs, but centering
on the inner world
of the minor, his needs, the pace of the child, which
must be respected since, often we find ourselves dealing with minors who have developed
a stance of self-defense and self-protection.
It is therefore important that the professional
does not try pry out defenses (wanting to know, asking questions)
but respecting the pace of the minor, being aware that the defense
are the best way found by the minor to cope with an impact that has been
overwhelming. So slowly, gently making the defenses less indispensable
we will be able to meet the core of the heart of that minor.
Experience shows us that it is important to be focused on the needs of the minor.
We will now discuss our experiences of our social assistance activities that
for eigth years we have spent at the Rome municipality dealing with prevention,
protection and support of minors and their families.
In accordance with the above mentioned importance to be focused on the needs
of the minor, we can broaden this reflection underlining the need to be centered on the characteristics
and the uniqueness of any situation, so... also centering on all those involved, in addition to
the minor definitely also his parents. In everyday work as a social assistant
is mainly focused on working with the parents, since the minors who suffer
or have suffered one or more traumas
are usually taken care of and followed up by some othe professionals
properly trained to support them.
With regard to the activity of the social worker, he or she is focused on accompanying the
families in the process of awareness
of their difficulties, criticalities, fragility,
but also the behaviors that have caused damage and suffering in their children, and also helping
to build support networks in order to support them in the acquisition and use
of adequate parental responsibility that guarantee
the child's right to grow up
quietly in his family,

in a context of protection and safeguard.

According to our experience, the elements preponderants one need as a professional

working in this area is with these clients are definitely the technical and scientific skills

schills of professionals, but surely also skills and abilities concerning

more the personal sphere, we refer to all that you can consider

of the "inner-world"of the professiona: his own emotions, prejudices,

resonances, projections that we tend to do and let's connect with each other;

as well as being helping professionals we are people

that encounter other people.

What happens when we work

with abusive parents? trying sometimes, even often,

feelings or emotions of anger, outrage, indignation and also sometimes

of fear; surely what

we want to say is that we don't have to pretend that these emotions don't exist, they're part

of us and they'd still be in the helping releshionship. the important thing is,

to know how to recognize them, so that we can manage and make sure that they don't affect

the reality in front of you, which is to do so that the personal subjectivity is not

the language through which one interprets what you have in front of you, confusing the

plans of reality or the roles. Sometimes the helping professional, confused by emotion, tends to assume the role

of the one who gives directives and the parent becomes simply the victim of the operator's decisions;

this certainly does not help the facilitation of the protection of minors, because

if you are not fully focused on the reality of the faced situation is not

possible to understand and perceive the needs of minors and thus effectively orienting the professional intervention.

for wat concerned the direct relationship with the minor, the intervention of the social worker

is in that case more reduced,

since there are strong emotional components

some times a social worker may want to respond to his personal need to give to the minors the affectivity

and the care they did not receive, other times attempting to overstep in the role of clinical professional helpers

who follow them and help them clinically in the processing of their own trauma.

Important note

You can skip doing this exercise if you do not work in any role in the field of helping professions.

properly trained to support them.
With regard to the activity of the social worker, he or she is focused on accompanying the
families in the process of awareness
of their difficulties, criticalities, fragility,
risks guidelines issued by folds in 2012 compared to practice
psychological with people lgbt line non the importance of taking in
considering the attitudes of speaker of help towards homosexuality
and bisexuality intended not only like knowledge of the effects of
stigma about these people but also how awareness of how much one's own

implicit and explicit attitudes compared to the hours of sexuality, and therefore...

personal expertise on these thematic but also personal

personal look at these issues may affect

evaluation and intervention

The commonalities that can be extrapolated from

all documents produced so far can be so summarized.

Offer acceptance and support

by respectfully listening unjudged and

empathetic that helps the user to reduce the discomfort caused by minority stress

Take appropriate measures in the phase of getting to know these people

the assessment must be directed to the knowledge of the

girl and in all her complexity considering the interactions and

interconnections between minority stress mental health and dimension

spiritual interior as well as the position sexual orientation occupies in the

general functioning of the individual.

Encourage and support active ways of

coping we know that for teenagers in general it is very important to feel

active agents in particular when it comes to

stressful events the rapporteur to help will have to try to

help the user to favour developmental strategies

cognitive and emotional of the same appreciate the dimension again

foundational in adolescence

the role played by friendships of municipalities and

the lgbt community will see that the minority stress can result in

marginalization and isolation

a fundamental objective is to increase the

ability to use the support social.

Explore and develop identity

and identity dynamics constitute a very important aspect

and founding adolescence and in the adolescence of

lgbt people it is important that these people can explore and integrate

without necessarily having to choose an identity at the expense of the expense

the other as in the case of the dichotomy male female.

Understanding conflicts and promoting their integration

the aid report should favour

dialogue and integration between the parties of if possibly conflicting as

This can happen for example in the case of sexual orientation and belief

religious understand meaning underlying requests to modify

sexual orientation or to make a restorative therapy

in such cases you need one trained psychotherapist

world with a demand analysis appropriate welcoming means and

exploring that desire and by bringing it back to complex dynamics

family and social psychology that could lead the boy with the

girl to consider unacceptable a constituent part of one's own

identity.

You'll buy exploring the walking process.

Catch the minority levels stress in relation to the conditions of

double minority where the individual is discriminated against not only because

of bisexuality homosexuality but also other conditions covered by

social stigma

Take into account the weight that the lesser of stress minority stress a

in torque dynamics and important to remember that gay couples

and lesbians are neither recognized nor by the main religions nor

by the legal system of many countries connected this is to be considered

everything related to homogeneity and lack to the

poor legal regulation of this type of family formation

Transcript

Growth after trauma refers to a phenomenon

of personal growth that some traumatized individuals

experience as a result of their trauma.

In other words, not only does the trauma cause considerable, serious damage to the body and the

psyche of the individuals affected,

but in addition to all the damage they suffer there is also this phenomenon,

that a significant number, even if not a majority, of trauma victims

experience.

We want to underline that this, once again is a clear example of the wonderful resilience

of the human species, or maybe we should talk about the resilience

of all life forms that have developed

by the evolution of life on our planet.

No matter what, the tragedy of trauma impacts the person, is a severe "smackdown",

it hurts and offends the person,

and therefore, is a real earthquake, the tremors of which impact both the

psychic and physical plane of an individual.

However, in such upheaval, as is often the case,

not all the results are destructive

because when a person is overwhelmed by a trauma

he or she needs to cope 21 00:02:13,920 --> 00:02:17,540 with the new reality and some individuals

adapt by growing from that experience.

On an existential level they have

a growth experience, in other words

they become more open, more rooted in their values, their moral and spiritual aspects, living in a

more significant and life affirming ways,

with themselves, others and the world with new

and deeper meanings.

A personal example: I remember the emotions that I experienced reading a book written

by a colleague - Victor Frankl - who experienced the tragedy and all the related traumas

to be captured, as a Jew, during Nazism

and imprisoned in a Nazi extermination camp;

in the extermination camps, before to kill the people, they would attack

the prisoners in their dignity, however a number - even a small number of

people not only survived on a physical level, but in spite of all the traumas, also at the 36 00:04:01,970 --> 00:04:09,670 psychic level, they became better people and therefore, as Frankl reports in his

book "A psychologist in a lager" prisoners like him would take every effort,

depriving themselves of the little food they had, to give

loving support to unluckier inmates

that being sick or weak, were in danger of be sent to the famous showers in the gas

chambers to be exterminated.

The people that survived and was freed at the end of this Nazi madness

had become a better person, in spite of their physical weakness, and psych traumas

with a more significant relationship at the existential level with himself, others, the

world; an aspect that makes us meditate and perhaps it gives us some hope.

In clinical work with traumatized children

through a psychotherapy model based

on play called play-therapy.

According to the model of Virginia Axline, an American psychotherapist.

That studied with f Carl Rogers and that has brought the basic principles developed

by Rogers in the field of adult psychotherapy in the clinical work with children.

Her work was first published in the book "Play therapy" in 1947.

The postulates highlighted and outlined by Rogers,

are the bases for understanding the inner world

of the child that Axline refers to, every child has an innate tendency

to actualize his inner potential 12 00:01:08,940 --> 00:01:10,890 and all his behaviors

are striving to achieve this goal.

A second postulate speaks of the child

Capacities for self-regulation, no one better than he knows what's best for himself.

A third postulate see the child

actively searching all those experiences

that may be conducive to his development, and the expression of his potential

while he will tend to refuse all those experiences that he consider unfavorable.

In this perspective, play therapy allows to the child to

express oneself in the best

possible conditions,

precisely because in a safe climate, containing and facilitating, the

child has better chances to express his potential.

The facilitating climate that

is provided by play therapy allows the child to grow stronger, to get to know himself

better and to correctly symbolize his experiences

in other words, to be able

to give expression to emotions and feelings.

Access to the child's inner world is

possible through so-called preferentials that are: The play, the drawing, the

fairy tale. Through these channels the child is able to express in a way

more spontaneous and free, as channels that belong to him , and that's the way it is...

able to express his needs, experiences and emotions.

In the play therapy process the therapist will be careful to

reflect to the child all that emerges through the play and then tuning in

with the child emotions.

This allows the child to broaden his awareness

Of his own behavior.

The availability of construction materials in play therapy

Is important because it is the way in which the child is involved. In that sense,

for example, to have a lot of material available of play allows the child to express himself

at liberty, to move at liberty inside

the environment, this becomes an experience for him...

highly significant:

the moment the child feels free is

facilitated in self-exploration

and, through this, does the change happen.

produces the use of personal power, the empowerment.

Returning to the construction of the setting, the

presence of many materials, for example, sheets of paper, various colors, plastiline

to model, sand trays for creating scenes or the presence of books,

fairy tales books that we can illustrate or read together;

along with the presence of puppets that allow

the child to express himself at his best: as an example, the use of two puppets that the child

and the therapist can wear, like puppets,

and wearing them the child makes them

parts of himself and can thus interact with the therapist, but making the puppet speak as a channel

of communication, which is important because by making the child can open up more

deeply and effectively.

In this sense the puppets can interact

as if they were autonomous entities, it's important for the therapist to look directly at the puppets

and not at the child, this facilitates

the use as a channel of expression that

he's not himself. The fact that they represent animals is a facilitating element because

for the child is easier to identify with the animal than with a human

figure. The therapist in this process with these

game materials will only accompany

the child in this path and - quoting

Axline - during a psychotherapy course the child will point the way

and the therapist won't direct it but follow it. In fact, the moment the child is free

to express himself, self-adjustment becames possible.

This is one of Rogers' earlier mentioned postulates.

In this perspective play therapy is effective in working with children who have undergone traumatic experiences

traumaticexperiences, since the creation of a climate of safety, containment and freedom

allows the traumatized client to express

himself at his best and start

processing his experience.

The importance of play 80 00:07:02,279 --> 00:07:10,349 is further underlined by research in the field neuroscience, particularly significant

is the contribution of Panksepp, which in its free "the ecology of the mind" identifies

seven basic emotional systems present in the mammals.

Among these systems the one that most

interests us is the identification of the circuit of play, a genetically determined circuit

which produces positive effects in the brain of mammals.

Panksepp found that

at the genetic level the play circuit is present in all mammals and therefore

they all have it in common. These researches enhance the importance of play for cognitive and emotional growth,

relational

and has proven itself that play facilitates coping skills,

e.g. social cooperation.

The fact that play has been confirmed

as a spontaneous, genetically rooted activity, allows us to do some thinking

when we're dealing with a child... who doesn't play. A child who doesn't play is

somehow indicative of a child who

at that moment it expressing a malaise.

Play therapy is a psychotherapeutic intervention highly effective with children

suffering,with discomfort, but

more with children who have 100 00:08:46,750 --> 00:08:48,840 ...traumatic experiences;

so play therapy underlines the point

that the child,

when is regarded as a person who

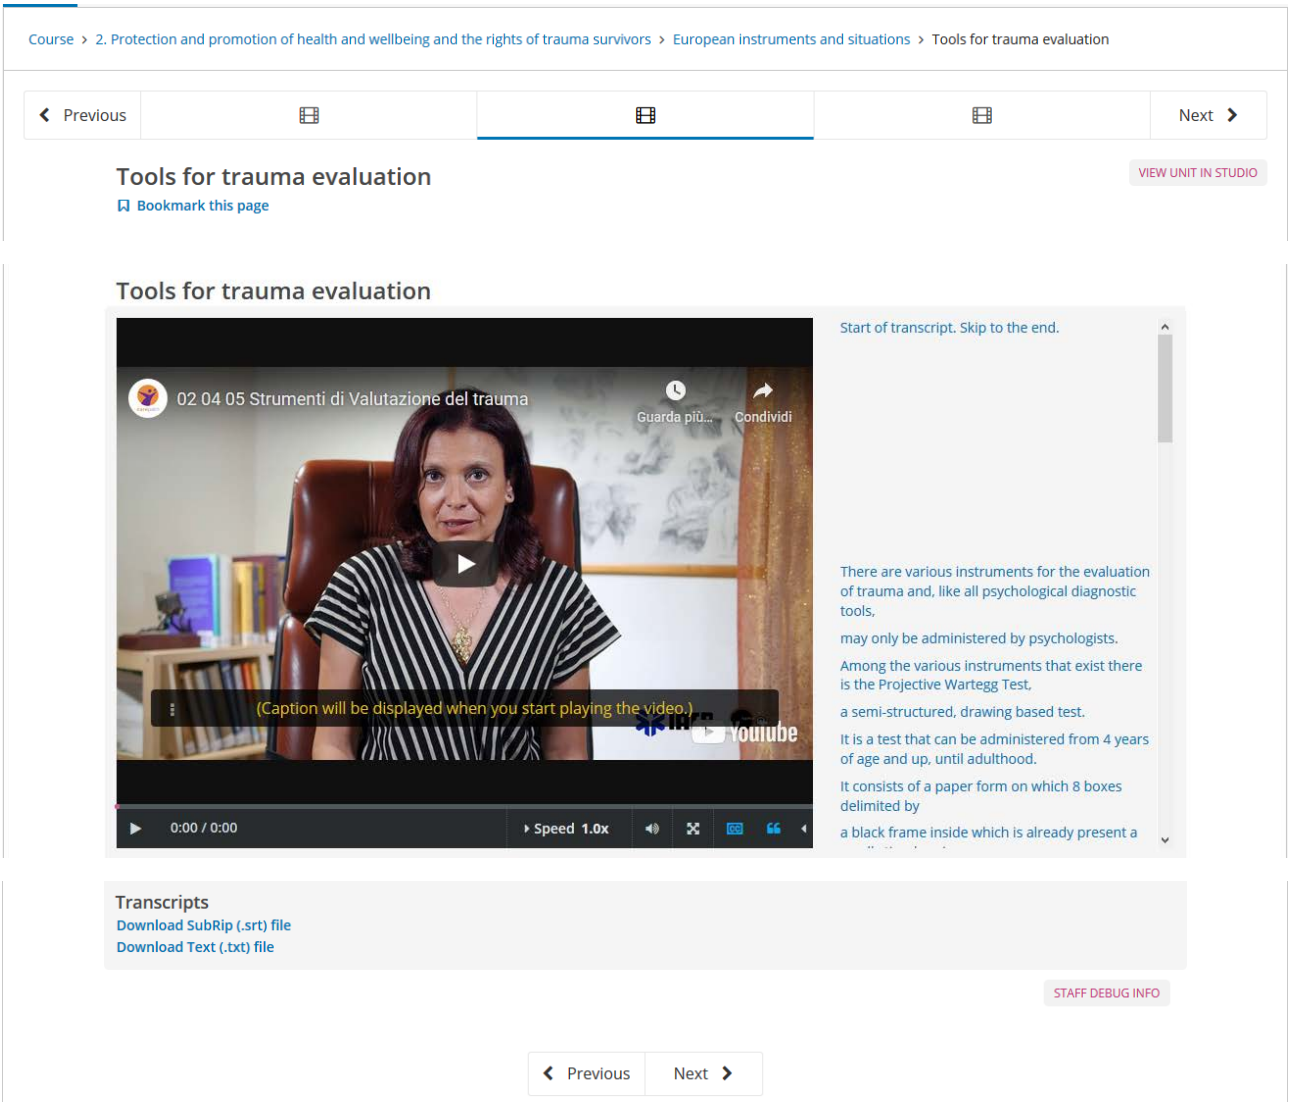
can tell, share and express all his emotions, feelings, anxieties.

and fears, but in a protected, secure environment. and respectful of the child himself and

his peculiarities.

All this can help the child to overcome the experience

traumatic experience and allow him to grow up in a way that is wholesome.



Transcript

There are various instruments for the evaluation of trauma and, like all psychological diagnostic tools, may only be administered by psychologists.

Among the various instruments that exist there is the Projective Wartegg Test,

a semi-structured, drawing based test.

It is a test that can be administered from 4 years of age and up, until adulthood.

It consists of a paper form on which 8 boxes delimited by

a black frame inside which is already present a small stimulus sign;

the person taking the test will have to complete a drawing inspired by what

is already present in the box, do it box to box and make eight drawings in total.

It is a very simple psychodiagnostic tool to administer, even in terms of timing,

and is based on drawing, a communication channel definitely preferential and facilitating for the child,

as mentioned earlier about play therapy.

Being a preferential channel for the child facilitates its realization.

The Wartegg test is based on a system of very accurate decoding and interpretation.

Despite the simplicity of administration the decoding system is very articulated

and accurate and refers to Crisis-Wartegg system: a procedure developed by the professor

Crisis, which, in general, allows to obtain a description of how personality works

of the individual to whom it was administered the test.

With respect to the specificity of the trauma the test allows, through the reading of certain

indexes, to identify in the presence of a trauma, in terms of its impact on the individual,

and everything that can come out of it... if you've been through a traumatic experience,

this on both a cognitive, emotional and a relational level.

The Wartegg test does not begin as a test specific for the assessment of the trauma, however

can make a significant contribution in this field

The report that comes out after decoding, which takes place through a first phase

where the drawings are translated into acronyms, the initials in indexes, and these read in configuration

of indexes that outline and describe aspects of functioning of the personality -

The strength of this test is in its simplicity. and immediacy and can give a description

of what the impact of the trauma was... on the psychological functioning of the individual

himself.

Next to Wartegg's test, which has a projective nature, there are also questionnaires

trauma assessment questionnaires, to name a few: the Hopkins Symptom Checklist - 2 which is a

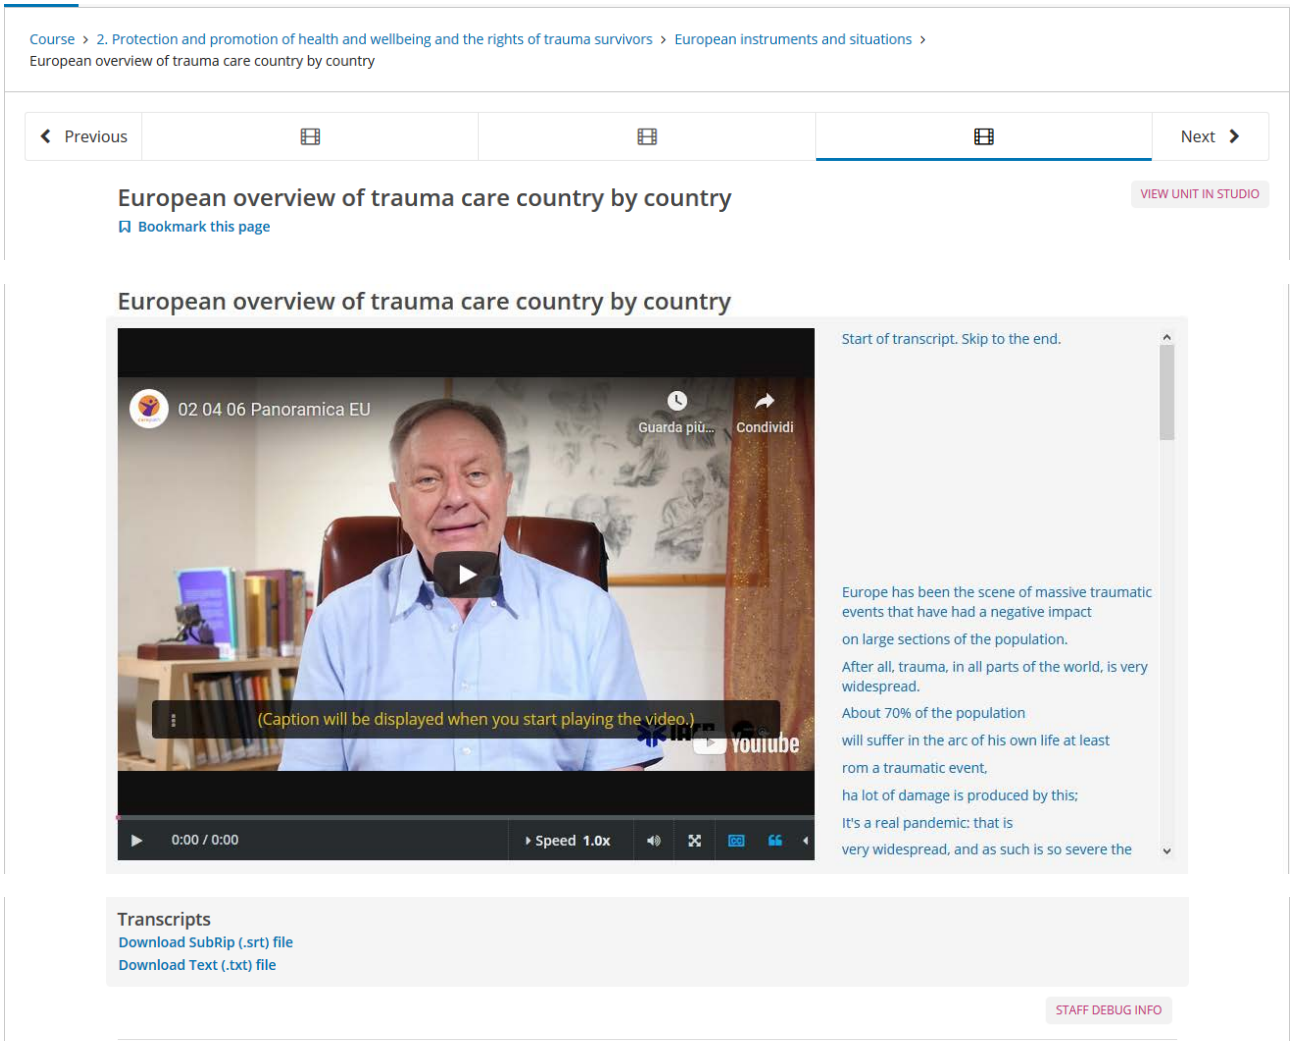
questionnaire developed by the University of Harvard and was created to 34 00:03:54,220 --> 00:04:03,470
assess the presence of symptoms in refugees children refugees (who have had this

experience), another questionnaire is the Trauma Symptoms Checklist for Young Children

a questionnaire which is not filled in directly by the subject but the caregiver, finally the Coping

Responses Inventory

which is administered from the age of 12 years and up and is a self report questionnaire



Transcript

Europe has been the scene of massive traumatic events that have had a negative impact

on large sections of the population.

After all, trauma, in all parts of the world, is very widespread.

About 70% of the population

will suffer in the arc of his own life at least

rom a traumatic event,

ha lot of damage is produced by this;

It's a real pandemic: that is

very widespread, and as such is so severe the damage at the mental,

physical, behavioral,

social, economic levels that trauma causes

that one would think this would have

alerted the nations of Europe,

among the most advanced countries in the world, to invest in research,

know-how, financing and skills development to manage effectively this pandemic - as we do

for many other phenomena -.

But, unfortunately, it's not the case; unbelievable. but true how little has been done.

There are exceptions to this , virtuos nations - like the Scandinavian countries- for example,

in Sweden they have equipped themselves not only at the level of of effective treatment of traumatized people, but

also at the social level, addressing with foresight

the problem; in every city there is present

a trauma task force;

professionals - such as social workers

- are well-trained on how to manage and prevent these

problems.

Many other European countries, however, have not been equally effective.

Suffice it to say that Belgium, where there is an excellent pro capita income, excellent capacities for

development, industry, services, etc, until a few years ago they had not developed

effective ways to train helping professionals with updated and effective skills.

At the university, the social construction of professional profiles was not sufficiently updated to help professionals to acquire the needed

skills to be really effective in dealing with this kind of problems. The situation, therefore, is not today absolutely satisfactory, with variables - such as

England and the Anglo-Saxon nations in general

which have developed in a

farsighted way the possibilities of training and investing resources in facility building

that can be of help and offer treatment to traumatized people, and also

carry out prevention.

However, in many countries, for example in Italy, there is still a long way to go

before we will have acceptable quality standard

to have the situation under control.

Positive work has been done, of course, by the trauma scientific societies that have been

created in recent decades; these have offered in part

a substitute for what would be the

task of the university educational process of the various health professions to create

and offer training, updates

and even the chances of obtaining qualifying diplomas

for the treatment of trauma.

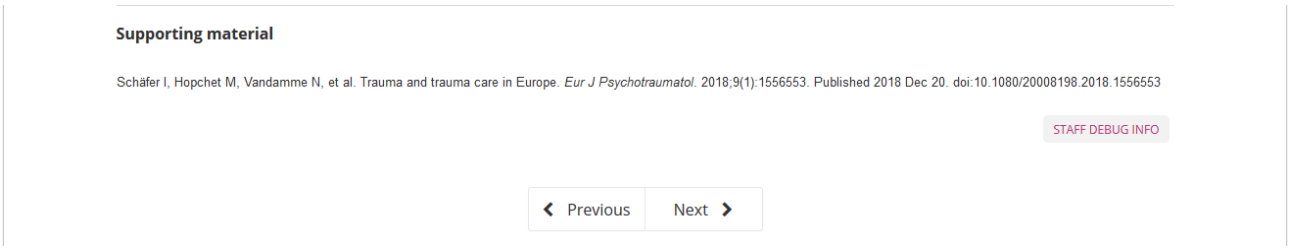
A lot is still is to be done and this is also an ethical, moral imperative, but

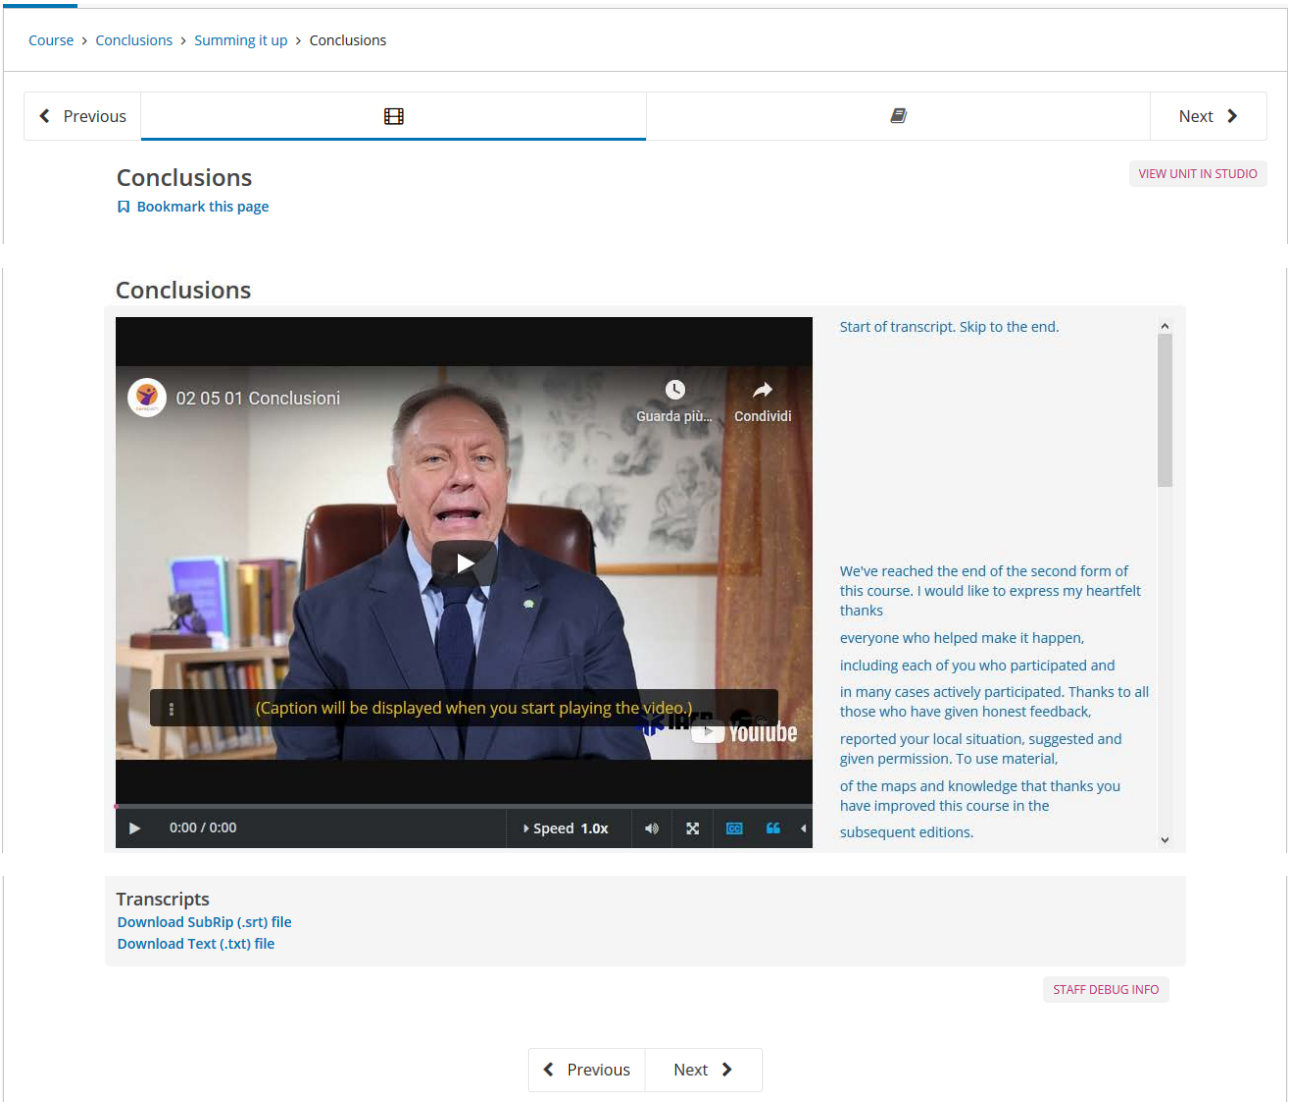
especially for social health and rights the health rights of individuals.

In Italy, art. 33 of the Constitution, like so many other European constitutions, says

that health is a right of every citizen, so we must protect and promote

Everyone's health: and this is a healthy imperative.





Transcript

We've reached the end of the second form of this course. I would like to express my heartfelt thanks

everyone who helped make it happen,

including each of you who participated and

in many cases actively participated. Thanks to all those who have given honest feedback,

reported your local situation, suggested and given permission. To use material,

of the maps and knowledge that thanks you have improved this course in the

subsequent editions.

A sincere thank you to the team that has worked

truly with great generosity and commitment to realize this work in which they believed,

in the aims and objectives.

Thanks to all colleagues outside the institute

who have agreed to work for free e

make your own image, your own contribution
and also your own material to be shared free of charge and disseminated through
the portal to this course.
Thanks to all the IACP staff who generously
has contributed as much with all their heart and their mind to share their
experiences in this difficult field of treatment of traumatized minors.
Thanks also to all the organizations who have collaborated with us and finally a
thanks to all Care project partners Path that have assisted us in every way and
even with their sympathy and affability.
Last thanks, icing on the cake,
is to the project manager and all colleagues of the University of Turin, Luca Rollè
is really is one of the best project managers that we have encountered in the various European projects
that we participated in;
also to his colleagues of the University of Turin, Faculty of
Psychology, they're wonderful and they've made
everything and more to facilitate our task.
So thank you, thank you all and good work. and good continuation with the other modules.

Quiz 1

15 points possible (graded)

1. What is a helping relationship?

- ○ An affective relationship based on the aid of one partner to another
- ○ A relationship established between a professional and a service user
- ○ A relationship that meets the needs of the professional and the service user
- ○ A doctor-patient relationship

2. The general systems theory was formulated by:

- ○ Wertheimer
- ○ Maslow
- ○ Rogers
- ○ Von Bertalanffy

3. What is the WHO?

- ○ World Science Organization
- ○ Social Medical Organization
- ○ World Health Organisation

4. The Person-centred Approach was founded by

- ○ C. Rogers
- ○ O. Rank
- ○ J. Bowlby
- ○ A. Maslow

5. Which of these conditions necessary for the establishment of an aid relationship was not theorized by C. Rogers?

- ○ Empathy
- ○ Unconditional positive acceptance
- ○ Resilience
- ○ Congruence

6. Working Alliance

- ○ It concerns the contractual arrangements between the worker and the employer.
- ○ does not concern the individual but only of the group
- ○ It is desirable form of collaboration in a helping relationship
- ○ This is the set of rules laid down by the professional and which the service user must comply with

7. Lack of empathy in the helping relationship

- ○ it is a professional quality
- ○ serves to better understand what the user is saying
- ○ is a recommended action to prevent burnout
- ○ it prevents a helping relationship from being effective

8. What is a complex post-traumatic stress disorder?

- ○ is an alternative term for post-traumatic stress disorder
- ○ is a disorder derived from chronically traumatic experiences
- ○ is a statement used when the symptoms of post-traumatic stress disorder persist for more than 6 months
- ○ it is a disturbance caused by a group trauma

9. Which of the following characteristics are not desirable in a "Trauma Informed Care" care system?

- ○ Valuing the patient in all aspects of care
- ○ Adopt neutral and supportive language
- ○ Make a correct screening on what experience can be defined as traumatic
- ○ Training staff on trauma and its effects

10. What is the most common etiopathogenic factor in the development of psychological trauma?

- ○ Repeated experience of physical and psychological neglect by caregivers
- ○ first-hand experience of natural disasters
- ○ First person experience of sudden death
- ○ Experience of child sexual abuse

11. Informed trauma care means:

- ○ A set of techniques that accompany the EMDR facilitates traumatic reworking
- ○ A type of psychotherapy
- ○ A systemic approach to the management and care of people with traumatic experiences
- ○ A specific hospital ward for people with traumatic experiences

12. Assisted violence is defined as:

- ○ Trauma from attending catastrophic events
- ○ Situation in which a minor assists, directly or indirectly, or perceives the effects of acts of violence committed on figures of reference affectively significant for him or her.
- ○ Type of violence inflicted by one parent to the other parent with the psychological and/or material support (obtained through psychological manipulation) of the child
- ○ The trauma derived from witnessing phenomena of general violence

13. What are the recommended intervention actions in case of witnessing violence?

- ○ Detection, Protection, Evaluation, Treatment
- ○ Observation, Evaluation, Treatment, Family Mediation
- ○ Detection, family accommodation, treatment, family mediation, family relocation
- ○ Removal from the family nucleus, Family mediation, family relocation

14. According to the WHO report published in 2013 on the prevention of child abuse in Europe, how many children under the age of 15 die from child abuse?

- ○ Between 800 and 900
- ○ Between 500 and 600
- ○ Between 900 and 1000
- ○ Between 400 and 500

15. The PTSD complex differs from the PTSD in that it:

- ○ the PTSD complex is typical of childhood
- ○ the PTSD complex is present in cases of violence within a relationship of trust
- ○ the PTSD complex is present if next to psychological symptoms there are motor symptoms
- ○ the c PTSD omplex is present exclusively in women and minors

Transcript

Welcome. In these two weeks we will be exploring the subject of scientific research in greater depth.

In particular, during the first week we will present some definitions of research, and try to enumerate its typologies

depending on its applications, its objectives and its techniques.

We will observe the process that leads us from the expression of a theoretical problem (from theory)

to the methods that allow us to explore it,

producing data that can be interpreted and used. We will then integrate and examine in depth

the fundamental principles, limits and benefits of Action-Research, as a starting point

and my colleagues will explain the meaning of Action-Research,

to then get to explaining Evidence-Based Research.

After that, we will delve into advantages and challenges of the integration of

Evidence-Based Research in

Trauma-Informed Care. In particular, the international relevance of the topic provides us with a transversal perspective

on the critical points and strengths of

transforming research into clinical practice. Here we will analyze

the main and related elements of good practices in scientific literature,

some of which are informative. We will ask ourselves,

and we will try to understand the meaning of training needs,

and how these can in some ways be supported, taken into account, by the organization.

We must not forget that a Trauma-Informed Care approach certainly has an aspect,

an impact, that is fundamental in both the organization

and in the individual members of the organization. From here, we will take advantage of this space to go and discuss

scientific dissemination in the development and implementation of specific interventions

in Trauma-Informed Care. Arriving towards the end of our journey this week,

we will go into the evaluative aspects in organizations

that develop or attempt to develop Trauma-Informed procedures or processes.

In fact, they can offer their employees,

their collaborators, their volunteers, training and information on Trauma-Informed Care,

as well as offering possibly effective interventions related to

research evidence in psychotherapy, or rather in Evidence-Based therapy.

From here we will accompany each other and move on to the second week,

that will allow us to examine further issues related to research.

I wish all of you a pleasant course week and a good lesson,

on my behalf and on behalf of all my colleagues.

Discovery, gathering and passion- Sharing, future.

Culture and knowledge.

Progress.

Discovery for a better future.

Anticipation.

Development and bravery.

Nice and stimulating.

Hard and exciting.

Passion, creativity and dedication.

Challenge.

Development.

Future. Innovation, perseverance.

Sacrifice, but a lot of satisfaction.

Opportunity.

Progress.

Comprehension.

Hard work, freedom and study.

Ambition.

Evolution.

Effort.

But also, fun.

Curiosity, innovation, prosperity.

Research is human nature, a man who does not do

research is a man who does not solve problems, he is a man who does not exist.

Research is curiosity, it is desire to know reality, and most of all,

for those who have done it, it is the priceless joy of discovery.

Teaching is a craft. It's both an art and a science. Which is why great teachers always

experiment and make tons of mistakes. But how do you know what's actually working?

Well one option is action research. Here you can identify a question, test out

a strategy, gather data and determine if it works. The end result is something

dynamic, innovative, and tied directly to your classroom.

Action research dissolves the barrier between the participants and the researchers.

In other words, the teacher actively participates in the situation while also conducting the

research. There are many action research frameworks

but they generally follow a similar process. You start out in Phase 1, planning for research.

Here you begin with inquiry, where you define a specific research question.

It needs to be something that can actually be tested.

Next, you conduct a literature review to gain a deeper understanding of the topic.

Finally, you move into the design process where you determine your data methods, consider ethical issues, get the required permissions, create deadlines, and set up the systems.
Next you move into the action phase. This is where you engage in multiple cycles of experimentation and data collection. Your data collection might include qualitative data like observations, artifacts, and interviews or quantitative data like rubric scores surveys, or achievement data. After where you move to analysis. You'll often start by organizing the data with charts or graphs and looking for specific trends.
You might also discuss it with peers, free write in a journal, or create a cluster map before eventually writing out your results. Finally you have your conclusion.
This is where you share your research with the world and reflect on your own practice.
This will ultimately lead to newer questions and the cycle will continue as you refine your craft as a better, more creative teacher.

Transcript

The term Action-Research was introduced by social psychologist Kurt Lewin in the 1940s
and indicates the encounter between worlds which until then
had been considered separate and opposed: research, which aims at reflecting on things,
and action, which instead aims
at changing things.
Action-Research therefore allows to create an alliance between the cognitive aspect,
Research, and the applicative aspect, Action, and expresses a transformation
in the way of conceiving, planning and doing research in Human Sciences, in which the complexity
of the studied phenomena is not simplified but, on the contrary, accepted and taken in account.
Action-Research is always carried out by Lewin in a group setting
as the group is that psycho-social place
within which people build their actions and is also a tool that can facilitate

processes of change.

Action-Research can be described as a family of research methodologies whose objective,

as we have said, is to simultaneously activate a path of action

(in other words, of change) and of research (in other words, of understanding phenomena).

This path takes place through a flexible process that consists of a spiral of cycles,

each of which is structured into three consecutive stages: planning, execution

and reconnaissance/inquiry; the latter stage is aimed at assessing the results of each phase,

to prepare a rational basis for the next phase and to change, if necessary,

the original plan of action.

What happens after the first cycle of Action-Research?

Once the results have been analysed (and the potential change that has been produced

in relation to the initial situation has also been analysed), a new cycle of the process begins,

in which the new elements that emerged from the activity

carried out in the previous cycle are inserted; these cycles are repeated until the problematic situation is exhausted.

Planning, execution and inquiry are supported by a critical assessment

in which participants ask themselves what worked, what did not work, what was learned,

and what can be done differently.

The critical evaluation of each cycle allows action-researchers to correct any errors

and to re-adjust the actions to the actual needs that emerged in the course of the research itself.

What is the goal of Action-Research?

The objective of Action-Research is to generate change:

change in behaviour, habits,

contexts and so on.

The basic assumption is that the status quo does not enable the well-being

of individuals and that only through change can the situation improve.

Change, therefore, must be provoked, then analysed and understood,

and it must be lasting.

According to Lewin, for change to be lasting, it must go through three phases:

the ‘unfreezing phase’, which is obtained by acting on the factors of resistance to change

which are often linked to adherence to social norms;

the ‘moving phase’, for example changing and developing new beliefs,

values and attitudes on the basis of new information,and shifting
from an old situation to a new one;
then, there is the ‘reconstruction phase’ or ‘refreezing’, in which the new situation that has been created
stabilizes around a new balance, that is, the new values, attutudes,
and behaviours which are established and integrated into the rest of the system.
An important aspect of Action-Research is the active involvement
of the recipient, who in actual fact is both the recipient and actor
of the intervention and must be put in a position to share the aims of the research itself.
The basic assumption of Action-Research is that the people with whom we work are active individuals,
with skills and competences that must be involved in the research process.
When adopting the Action-Research approach, one cannot ignore the active involvement of the people
to whom the intervention is addressed, and one must create a situation of collaboration
and confrontation with the recipient-actors of the intervention.
Another characteristic element of this family of research methodologies
that is Action-Research is the absence of a predefined intervention method to be applied.
In fact, this method is constructed together with the group starting from some crucial principles
and on the basis of the responses observed during the course of the work.
It often happens that the initial model is modified, since the choice of methodology
and actions to be implemented are built during the process.
So far, we have illustrated the aspects that define Action-Research.
Let's now check the elements that differentiate it from the experimental method.
We have said before that in the Action-Research there is no fixed intervention.
Those who adopt this approach therefore allow the hypothesis to emerge during the process
and change its course through continuous monitoring.
Another element of difference is that, in Action-Research, we do not try to define causal relationships,
verify hypotheses from the literature or determine the results of treatments on representative samples
with the aim of confirming or falsifying
general theories.
In Action-Research, throughout each cycle, the phenomenon on which we are intervening comes more
into focus.
We do not care about the measurability of variables and the objective is to solve problems
by examining different paths that cannot be anticipated a priori, but that become the result and also

a tool of the group.

Finally, a further element of differentiation is the way in which the final results are presented;

in the case of Action-Research, they are illustrated to the entire group

or the entire community in participatory ways, using simplified,

accessible language rather than the technical-scientific jargon which characterizes experimental research reports.

The objective to be achieved through the presentation of data is to generate new evaluations

that allow the definition of possible opportunities for improvement.

Lastly, on the basis of what has been said so far, we can summarize the main assumptions underlying Action-Research:

The fact that it is practical and contextual.

Action-Research takes on as its target the problems of a group or a community;

therefore, it is contextual in its natures, or in other words, it is localized research which takes place within a context;

it is aimed at change and focuses on the group dimension

rather than on the individual, both when it comes to analysing

processes and defining of solutions and results that have emerged;

Moreover, Action-Research features multiple stages

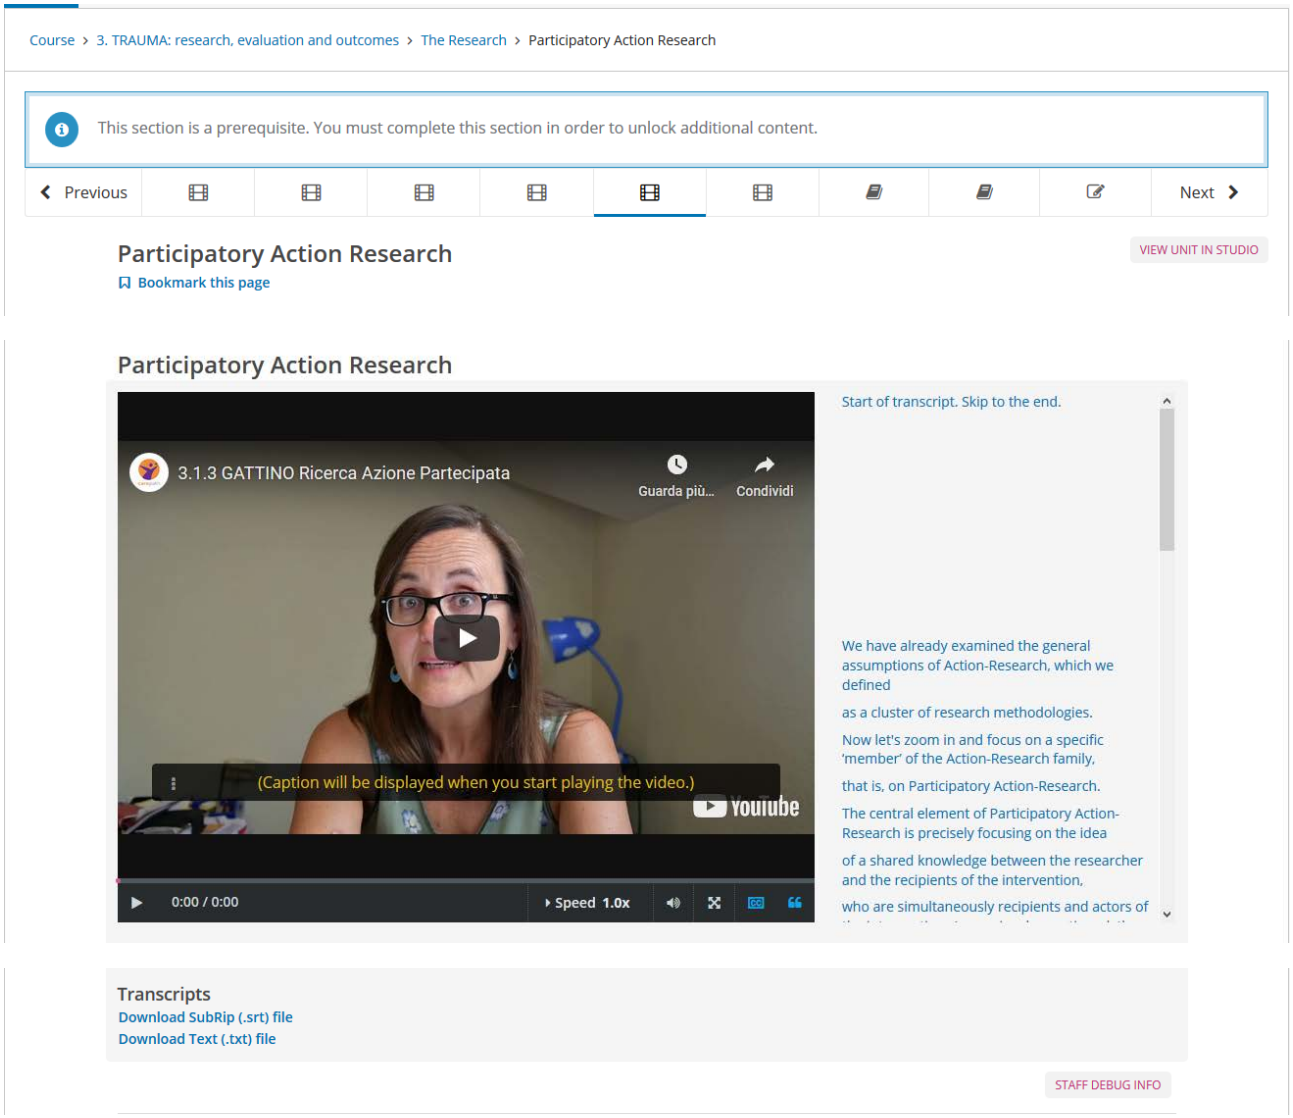
and a cyclical nature which is given by the design of the research, which is configured as an alternation of phases

of knowledge and action; it places participation at the centre,

in terms of cooperation and interdependence

between researchers and the group, or researchers and the community.

End of transcript. Skip to the start.



Transcript

We have already examined the general assumptions of Action-Research, which we defined

as a cluster of research methodologies.

Now let's zoom in and focus on a specific 'member' of the Action-Research family,

that is, on Participatory Action-Research.

The central element of Participatory Action-Research is precisely focusing on the idea

of a shared knowledge between the researcher and the recipients of the intervention,

who are simultaneously recipients and actors of the intervention. As previously mentioned, the focus of Participatory Action-Research

is to consider that there is a shared knowledge aimed to design and restore

the meaning of collective action.

Participatory Action-Research deems it important to design and conduct Action-Research

in a collective way through the participation of technical experts but also of people who belong to the context in which it intervenes,

and who are able to take advantage of local knowledge and expert knowledge by bringing out

the multiple points of view and perspectives that are present

within that specific context.

At the basis of Participatory Action-Research interventions there is the principle of participation,

intended as a tool and also as an objective of the social change of intervention.

Participatory Action-Research recognizes that a problem arises from a group that is in difficulty

in a specific context and at a precise and well-defined historical moment.

The researcher therefore notes the problem, he/she does not generate it, and his/her role is to help the group and the community

to identify the key aspects in order to be able

to continue with action.

Those who adopt the Participatory Action-Research approach must therefore create a situation of collaboration and discussion with citizens

and operators regarding the definition of the problems

to be investigated, the conduct of research, and the

preparation of change.

Transcript

Now, there are different types of research evidence out there, and it's really important that we understand the different types. There's quantitative research, and quantitative research is research that looks at interventional studies and outcomes research. It's the type of studies that you do a lot of statistical analyses with. These types of studies are things like clinical trials, randomized control trials, case control studies, and the highest levels would be meta-analyses and systematic reviews. Clinical practice guidelines for the most part are based off of quantitative research analysis. There's another type of research out there and it's called qualitative research, and qualitative research is really done to understand the human behavior, how people are responding to their situation. So the types of qualitative research you see done, and it's very often done in nursing and Social Sciences, are studies like

phenomenology, where you look at the phenomenon of being sick or having a certain condition. It also means looking at ethnographic groups, this is based out of anthropology, so we look at groups of people who have a certain condition. We know that qualitative research is very very important to how we deliver care today, because you need to make sure that your patients are having a good experience with the care they're receiving. Now, the highest level of research is considered secondary research and this is the thing that we call a systematic review or meta-analysis, and what is different about a systematic review and in meta-analyses is that it brings the same level of rigor to the review of all the research studies that have been done on a specific topic. It brings the same level of rigor to the analysis of all those studies. Here's another caveat: systematic reviews are very different than literature reviews because systematic reviews and meta-analyses actually have to be peer reviewed so that means two or more people have to be appraising all the studies that are included in a systematic review or a meta-analysis. When you do a systematic review you also need to look at a few other things to make sure that, it's important to how we provide care to our patients. You need to look at: is it really feasible the results of the systematic review? Can I really implement this with a specific patient population? Is it going to be appropriate? Is it meaningful to patient populations and to my practice as a health care provider? And is it going to be effective? Is it really going to make a difference? We do know though that research evidence is not created equal, so it's really important when healthcare providers take a look at the research that they get from a search, they need to determine what level of research they're looking at. At the base we have all the original research studies and these are the things like the randomized control studies and those type of things. The next level up would be the systematic reviews in the meta analyses: again, the systematic review meta analyses is done by a researcher looking at all the original research around a certain topic, doing a critical appraisal of it and a synthesis of it and then putting it together as a systematic review, so that's considered the higher level of research in the hierarchy of evidence. But at the very top is our clinical

decision support, and clinical decision support are tools that healthcare providers can use they read immediately and they go put into practice immediately. Now, why is this important? Because health care providers at the bedside do not have time to read a hundred, two-hundred, three-hundred-page systematic reviews or meta-analyses and then go make a decision about a patient: they have to read the evidence and put it into practice immediately and that's what clinical decision support tools do. All clinical decision support tools should be based on systematic reviews, meta analyses, evidence summaries or the best available evidence.

The following is an example of a survey method by Bean & Creswell (1980, p 321-322):

"The site of this study was a small (enrollment 1.000), religious, coeducational, liberal arts college in a Midwestern city with a population of 175.000 people. The dropout rate the previous year was 25%. Dropout rates tend to be highest among freshmen and sophomores, so an attempt was made to reach as many freshmen and sophomores as possible by distribution of the questionnaire through classes. Research on attrition indicates that males and females drop out of college for different reasons (Bean, 1978; Spady 1971). Therefore, only women were analyzed in this study. During April 1979, 169 women returned questionnaires. A homogeneous sample of 135 women who were 25 years old or younger, unmarried, full-time U.S. citizens, and Caucasian was selected for this analysis. Of these women, 71 were freshmen, 55 were sophomores, and 9 were juniors. Of the students, 95% were between the ages of 18 and 21. This sample is biased toward higher-ability students as indicated by scores on the ACT test. Data were collected by means of a questionnaire containing 116 items. [...] The majority of these were Likert-like items based on a scale from "a very small extent" to "a very great extent" Other questions asked for factual information, such as Act scores, high school grades, and parents' educational level. All information used in this analysis was derived from questionnaire data. This questionnaire ha benn developed and tested at three other institutions before its use at this college. [Authors discussed the instrument.] [...] Multiple regression and path analysis were used to analyze the data. [...]"

(Creswell, 2014, pp. 181-182)

The following is an example of a qualitative research (Cardano, Ortalda, pp. 242-243)

"The aim of the research was to study the initiation into smoking of pre-adolescents (Frohlich, Potvin, Chabot, Corin, 2002). After having reconstructed the prevalence of smoking among pre-adolescents in 32 territories of Quebec and having acquired relevant information on the constraints and "structural" resources that now hinder, now authorize the habit of smoking in this population - the presence of cigarette shops, the presence of public places where smoking is not allowed, the presence of subjects who monitor compliance with the rules governing the sale of cigarettes to adolescents and smoking in public places - the authors focus their attention on eight territories in which they lead focus groups. In each territory, the participants are recruited through the mediation of the teachers of the local school, thus putting them in charge of groups of boys and girls who - in all probability - knew each other and frequented each other before the focus group. In this study, the mutual knowledge of participants becomes a resource and not a limit, offering researchers the opportunity to access speeches that, perhaps less "domesticated", took shape in the context of the participants' lives. The latter, moreover, strengthened by mutual support, were able to deal with a topic - the habit of smoking - which was difficult to discuss in front of an adult interlocutor with greater serenity. Knowledge of the ethnographic context, of the linguistic codes of social practices widespread in the territories where the focus groups were anchored is what allowed the authors to face the difficulties commonly associated with the realization of a focus group with a natural group: the call to shared experiences not fully explained in the speech, the use of slang expressions, the use of index expressions."

(Cardano, Ortalda, pp. 242-243)

Quiz 3.1

4 points possible (graded)

1. A scientific research...

- ○ Should always take into account previously acquired knowledge
- ○ Starts with data collection
- ○ Always allows a faithful recording of reality
- ○ Always uses a single method

2. In Action-Research...

- ○ The researcher should be completely neutral towards the object of research
- ○ The participation and cooperation of researchers are encouraged
- ○ An attempt is made to extrapolate laws inscribed in nature through objective analysis of the phenomena
- ○ No social changes should be produced in the research context

3. Which of these steps is NOT part of every evidence-based research project?

- ○ Evaluation of the results
- ○ Validation of theory through practice
- ○ Formulation of research hypotheses
- ○ The systematic review of the literature

4. The central element of Participatory Action-Research is:

- ○ The focus on the idea of a knowledge not shared between the researcher and the beneficiary of the intervention
- ○ The clear and absolute separation between Action and Research
- ○ The a priori choice of the problems to be investigated and the tools to be used
- ○ The focus on the idea of a shared knowledge between the researcher and the beneficiary of the intervention

UNIT 1: EVIDENCE BASED RESEARCH IN TIC/TIP: INTERNATIONAL PERSPECTIVE

ARTICLE

One of the main themes in the organization of services dealing with traumatized minors and one of the major requests coming from these is how to guarantee adequate and effective training for professionals on evidence-based interventions (Ruzek & Rosen, 2009). When observing the situation of the implementation of treatments and evidence-based guidelines from a general perspective, despite the importance of this theme in the field of public health, an unevenness of implementation and limited attention on systematic evaluation and long-term effects of training programmes can be inferred (Ruzek & Rosen, 2009). Furthermore, from a comparative perspective, Delaney (2006) underlined another relevant aspect: on an international level, the guidelines and their implementation in elective treatments throughout clinical practice vary

Training needs in organizations dealing with trauma

Bryson and colleagues (2017) lay an interesting premise that is useful for distinguishing two levels of reflection applicable to the analysis and evaluation of the themes of this module. The authors separate trauma-specific treatments (that is, intervention techniques aimed at the reduction of trauma-related symptoms) from TIC as a general perspective which aims at a transformation of the care system, including in TIC an understanding of trauma-related stress responses on every level and in all aspects of the organization of services. Despite widespread request for the application of TIC principles in services and despite the advantages that it might bring, scientific contributions on the implementation of TIC for underage clients is, unfortunately, limited (Bryson et al., 2017). Ruzek & Rosen, in 2009, already observed that the dissemination of evidence-based treatments focusing on PTSD-related symptoms was one of the key elements to which organizations supporting people affected by trauma were committed, and that, as a result, we witnessed an increase of scientific literature dealing with organizational factors linked to the implementation and dissemination of best practices. Despite this, in a previous analysis introduced by Delaney (2006), confirmed by Ruzek & Rosen (2009) and by Bryson and colleagues (2017) themselves, a high volatility of practice use rates emerged, such as restraint and isolation. Furthermore, as highlighted by Valenkamp and colleagues (2014) and also by Bryson and colleagues (2017), few studies tested the effectiveness of these interventions when compared to alternative methods of admission.

The volatility of intervention methods, according to Ruzek & Rosen (2009), would open up the necessity of proceeding to a comparative analysis of guidelines and international best practices in order to make them more based in the field of organizational change proposals and more evidence-based oriented on a policy level. Bryson & colleagues (2017) attempt, through a systematic review of scientific literature, to highlight what factors make the application of TIC work, for what kind of user, in what circumstances, in what direction and why. The strategies considered most widely shared in scientific contributions are: 1) a change-oriented leadership; 2) the use of research data to inform practice; 3) staff development; 4) the use of tools that prevent restraint and isolation; 5) the role of users in the context of their stay; 6) debriefing techniques. In the face of the need to analyse the operational complexity of these elements while also linking them to the territorial and organizational peculiarities, the authors' invitation for services dealing with TIC application is to advance in the attempt of demonstrating, through the process of scientific research and in a longitudinal perspective, the effectiveness of both efforts and changes applied for the betterment of the safety of patients, as well as the long-term outcomes of treatments. Coherently with this perspective, Lang and colleagues (2016) underline how important it is to reach a consensus on what constitutes a trauma-informed service and how to effectively measure the factors involved. First of all, central issues are: how to reach an optimal screening procedure; how to best operationalize the founding principles of TIC in daily work with subjects exposed to potentially or certainly traumatic events and what the best methods may be to enhance services dealing with this population. Currently, there is little research dealing with the efficacy of changes in the admission of patients in a TIC-based organizational level and how/how much these changes are useful to the health outcomes for participating users.

A challenge underlined by the researchers could in fact be the integration of EBPs research and best practices, in order to enhance the quality of the implementation these services offer (while also considering the analysis of the scope of economic impact of these initiatives), through the development of staff competences, of screening procedures, of policy change capabilities. A critical role in this direction can be played by the leadership, who should support a process of change, sometimes radical, even on the level of organizational culture (emphasis, for example, on the importance of TIC). Training on trauma is an essential component, but it is not sufficient for an organization to be trauma-informed. Another important aspect, as specified by Kramer and colleagues (2013), is the collaboration between different agencies dealing with assistance for minors and their families, who should possibly share the principles of TIC. On this last aspect, the authors analyzed the efficacy of training oriented towards the acquisition of specific knowledge with longitudinal administering of adequate survey tools (before and after training) as well as a follow-up survey in order to analyze how much these acquired competences result in changes in the relevant service. On this specific aspect, an interesting theme is the analysis of barriers met by the whole staff and the structuring of comparative research (with randomized groups) meant to examine the usefulness of different strategies employed and further training needs, also longitudinally.

Dissemination of trauma research in organizational settings

VIEW UNIT IN STUDIO

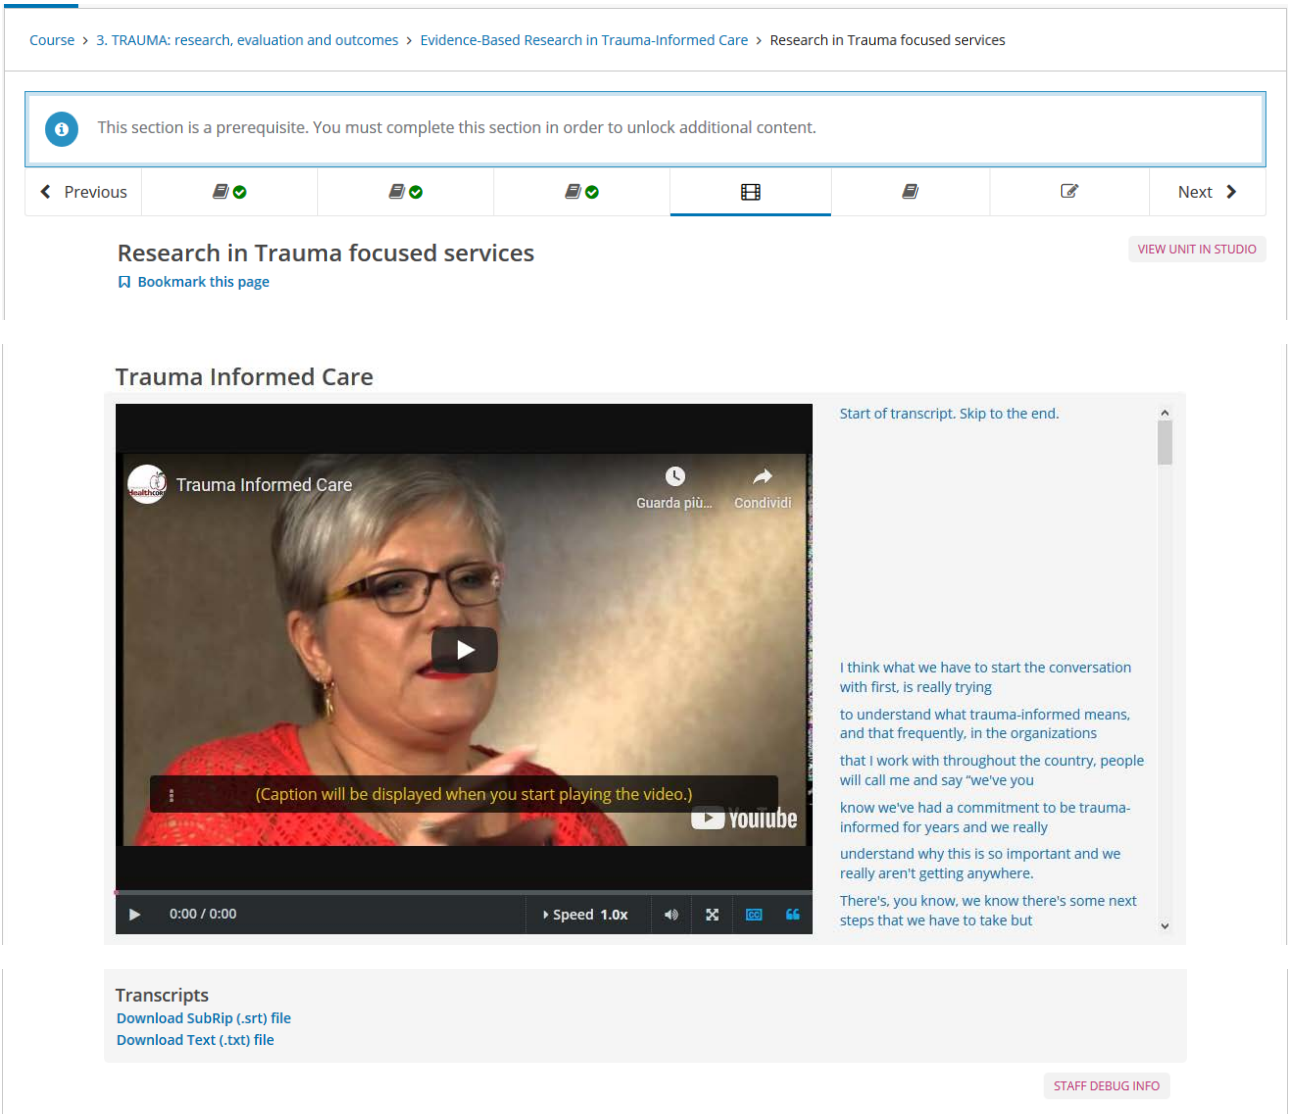
Bookmark this page

Reading Material - ARTICLE

When talking about the theme of dissemination of research in organizational settings, Ruzek & Rosen (2009) underline its complexity: the models dealing with dissemination highlighted how it depends on multiple factors interacting with each other on different levels (individual and organizational). Briggs and colleagues (2012) show how it is recognized that a change in knowledge represents the first step towards organizational change, but the verification of how much this is shown through or translates into an actual behavioral change is just as fundamental. Two aspects seem important: the systemic and multilevel complexity of the dissemination of scientific content in organizations, and the process that connects knowledge and practice through a complex mechanism of individual and organizational change. This process brings to the fore one of the most frequent resistances to the implementation of new best practices: the fact that the choice of their application in the organization is often experienced as "top-down" and, therefore, is not very well endorsed by clinicians (Rohrbach et al., 2006; Ruzek & Rosen, 2009). Indeed, in this case, the commitment of operators in changing their organizational praxis is a nodal dimension. As suggested by the scholars' contributions, an arrangement in which the agreement about change is negotiated by the leadership with subordinates, while keeping local needs in mind, contributes to success in its implementation (Durlak & DuPre, 2008; Ruzek & Rosen, 2009). Another central theme is the fact that healthcare organizations often do not have specialized personnel on their staff dedicated to EBP research, to studying of best practices and strategies for their application, and, in particular, to analysising and systematising continuous integration of scientific research's results (Berwick, 2003; Ruzek & Rosen, 2009).

With regard to this, Marvin & Volino Robinson (2018) highlight the need for organizations to have a vision that contemplates the analysis of the institution or service itself regarding the skill or the readiness in accomodating and sustaining interventions of change (literature calls it "organizational readiness", and it can be measured on an organizational, group or individual level). Dealing with this dimension in the planning phase is definitely relevant to sustaining the application of new practices, to analyzing the possible barriers in the process and sustaining the beliefs and positive attitudes towards organizational change. An across-the-board consideration for this theme is the centrality that should be assigned to the recommendation of building targeted strategies for change in a specific organization (Augustsson et al., 2017; Marvin & Volino Robinson, 2018). Research demonstrates the importance of leadership and of managerial vision in co-constructing the way of change in sync with professionals and in sharing a culture oriented towards the application of TIC, that is devoted, first of all, to the analysis of staff needs.

STAFF DEBUG INFO



Transcript

I think what we have to start the conversation with first, is really trying
to understand what trauma-informed means, and that frequently, in the organizations
that I work with throughout the country, people will call me and say "we've you
know we've had a commitment to be trauma-informed for years and we really
understand why this is so important and we really aren't getting anywhere.
There's, you know, we know there's some next steps that we have to take but
we've never really been able to get organized and never really begin able to
do that next thing", and what what we did at the National Council is, we developed
a tool called the "organizational self-assessment" and with that tool we
took the thoughts and the ideas from the leaders of the field, leaders in the
field such as Roger Fowler and Maxine Harris and Judith Herman and Sandy Blum,
and tried to synthesize their work in a way that expressed the practices and

principles of what it means to be trauma-informed, so for example “safety first” or transparency and, you know, mutuality and choice and voice and control and collaboration and giving people control back in their lives and, so, you know, what we did is we created an instrument called the “organizational self-assessment” using those those pieces of the practices and principles to operationalize what it looks like in an organization to move towards being trauma-informed, and it's, the OSA is a Likert scale of zero to four with a not applicable included, we took and created the seven domains of trauma-informed care and in those seven domains is where you capture those principles. Under each domain there are multiple standards and those standards are not the only standards, but the idea of the OSA is to get organizations to think a little bit differently about the work that they do. So, for example in the seven domains, the first domain is “screening and assessment”, so we want to to have an experience for
people upon entry into an agency where screening is done, but we also want to have people have the opportunity to talk about anything, any of their experiences, in a sensitive way and over time. If I'm someone coming into an organization and I may be very very scared or I may not trust you
if you're the intake coordinator but what I want to be at, what we want to be able to do is to to create an environment where people do feel comfortable answering some of those questions. And people need to be trained in how to ask the questions, they need to be trained in how to establish the relationship from the very very first time anybody walks through the door. The second domain is “consumer-driven care and services” and you know I'm so thrilled with Community HealthCore and the way they're thinking about the work they're doing and the numbers of peers that are being trained and are being utilized in really wonderful wonderful ways, and that's not the only piece. Peers are able to see services through a very very different lens: we know what it's like to go through a screening and assessment process, we know what it's like to be funneled into a group that really is not working for us, we know what it's like to be retraumatized by the system and being able to have that voice is part of all of the work, that's one piece of consumer

driven care and services, but it's looking at things from that real recovery-oriented perspective where it's consumer driven, it's person centered and that I have that if I'm the person receiving services I have an opportunity to say what works for me and what doesn't. I'm really bringing that voice and making sure that peers, consumers clients, but however you frame the language that people have an opportunity to really talk about what's working well in the organization and what doesn't work well. We also talked about workforce development in an educated trauma-informed workforce and that is including clinical training, clinicians need to have adequate training to do their jobs but if I'm the receptionist what does it mean for me to be a person working in a trauma-informed organization? Every person makes a difference, if I'm the van driver, if I'm the maintenance person, I make a difference in creating that community where people feel that they can begin to heal. And also thinking about compassion fatigue for staff, in our earlier work today we were talking about internal customer service, it's how every person in the organization treats each other. You cannot have a trauma-informed organization if staff is so overworked that they experience compassion fatigue, so you know, thinking about the needs of staff but also thinking about how that impacts if I'm not taking care of myself how can i really be there for another person? It's also about good clinical supervision are you supervising in a way that's trauma-informed rather than supervising in a punitive way? Domain 4 is evidence-based in emerging best practices, it's always looking at, it's not saying “this is the one thing that we're doing in is evidence-based and never looking at the new and emerging things that are happening”. It's always having an eye towards the good stuff, and really, you know, providing the training for staff, using peer delivered evidence-based best practices like “WHAM” Wellness, Whole Health Action Management, where peers are really helping other peers, you know, take control of their own physical health. Or “WRAP”, Wellness Recovery Action Planning, is a great trauma-informed tool to use that's evidence based, and then creating safe and secure environments. People cannot heal if they do not feel safe. If you're on hyper alert, if you feel like that you're walking into an

environment that does not welcome you where you do not feel safe,
nothing good is going to happen. I had somebody tell me, I was in a meeting, and
they repainted, they just repainted and updated their reception area, and one
of the clients came in and said “Are we moving?” and the person said “No, why?”
“Well we figured, if you were making it this
nice we were going to have to leave.” and that's an
indicator that people did not feel highly valued, it was a huge lesson for
them. People deserve to be treated in a place and in a way that says “I
respect you, you're valuable”, you can't begin to heal until you begin
to fill those things. And then domain six is about building community partnerships,
whoever we are in our community we have to work to make communities,
trauma-informed healing doesn't happen in a vacuum so if I receive great
services at your program but I go out to, you know, department whatever and they
treat me like I'm, you know, mud on the bottom of your shoe, it undoes all the
good work I did when I was working with you, so really really reaching out into
the community and help the community understand what it means to be
trauma-informed. And finally, domain seven is all about “Performance Improvement”:
How do you know what you're doing is making a difference?
If I do X is this going to work for me? Is this working for the people that we
serve? Am I doing client feedback surveys? Am I asking clients about the level of
safety that they feel? Am I surveying my staff? And then once I do the survey do I
do anything about what it was? I just surveyed so, you know, the way we use
the OSA is, we ask organizations, when they start the assessment, that's
their baseline, and then we ask them over a period of time to do it again, so they
can see the progress that they've made. And then we use a number of other tools,
a performance monitoring tool, and implementation guide to help
organizations move forward, but that's kind of the OSA in a snapshot, very quick
snapshot, because it's a long process, the OSA is not
designed for organizations to just say “okay we're done now”, it is not a
checklist, it's a way to guide conversations, to begin to make
significant change within the organization.

Quiz 3.2

3 points possible (graded)

1. A study by Ruzek and Rosen (2009) has shown that in the international context of trauma-related treatments:

- ○ The treatments were applied uniformly throughout various countries, highlighting the effectiveness of the approaches used
- ○ The needs of specific sub-groups were adequately addressed
- ○ The same treatments were equally effective in adults and children
- ○ The training programs were implemented in different ways, highlighting the need for the definition of core competencies

2. Trauma-Informed Care...

- ○ Aims to transform the care system, focusing on the ability of staff to participate in a vision of taking care of the traumatized patient
- ○ Aims to reduce only the symptoms related to trauma, focusing on intervention techniques
- ○ Implements techniques such as restraint and isolation
- ○ Is used exclusively with minors

3. One of the advantages of scientific dissemination in trauma-related organizations is:

- ○ The possibility of expressing exclusive interest in issues related to working groups
- ○ The implementation of evidence as a top-down decision by the leadership
- ○ The possibility of starting a process of implementation of the most recent evidence-based practices, aimed at improving the well-being of staff and patients
- ○ The transition to generic treatments that work for all patients

Learning material

Guyadeen & Seasons (2018) highlight how, similarly to many other disciplines, "the field of planning has its own brand of evaluation" (p. 98) that can be classified into two branches: "plan evaluation and planning evaluation. Traditionally, evaluation in planning was considered independent of program evaluation and involved the use of specific evaluation approaches. The planning discipline currently argues that there is a benefit to building stronger links between program evaluation and evaluation in planning" (p. 98). In the public health system, evaluation plays an important role in the development of policies and programmatic planning. "Both processes follow a problem identification and definition phase" (p. 99), followed by phases of formulation, implementation and, finally, evaluation. The last phase aims to assess the success of the intervention and to identify areas for improvement of the program (Pal, 2014; Guyadeen & Seasons, 2018). As specified by Guyadeen and Seasons (2018): "It is a structured process that aims to create and synthesize information about interventions in order to make judgments regarding resulting changes, the desirability of an intervention, and the degree of adaptation between intended and unintended outcomes (McDavid & Hawthorn, 2006)" (p. 99). The process of evaluation can also be focused on the cost-effectiveness of programmes and plans and it can be considered of particular relevance in public sector organisations: reasons of political or legislative responsibility imply that planners should demonstrate the benefits of their actions or proposals to the public and to the community (Vedung, 2010; Guyadeen & Seasons, 2018).

Craig and colleagues (2008) highlight "how complex interventions are widely used in health services, in public health practices and in areas of social policy that have important consequences on health" (p. 1). These initiatives present challenges for operators dealing with evaluation, which go beyond the applicative and methodological difficulties that evaluation processes about the success of an initiative must address. As a matter of fact, "complex interventions are usually described as interventions that contain several interacting components" and have multiple "characteristics that evaluators should take into account" (Craig at al., 2008, p. 1). In this, for example, key questions in the evaluation of complex interventions could be: are such interventions effective in daily practice? Do the effects vary according to the target group or context? How does the intervention work? What are the key elements and how do they exert their effects?

In general, from a procedural and processual point of view, best practice consists in systematically developing interventions. This means that: "Best practice is to develop interventions systematically, using the best available evidence and appropriate theory, then to test them using a carefully phased approach, starting with a series of pilot studies targeted at each of the key uncertainties in the design, and moving on to an exploratory and then a definitive evaluation. The results should be disseminated as widely and persuasively as possible, with further research to assist and monitor the process of implementation" (Craig et al., 2008, p. 2).

To begin clarifying the elements involved in this complex process, Rychetnik, Frommer, Hawe & Shiell (2002) provide us with the following definitions:

INTERVENTION: it can be conceptualised as a set of actions aimed at an objective that involves a change or produces identifiable outcomes. To promote greater well-being or to protect health status are the main objectives of public health interventions, which are distinct from clinical interventions that, generally, have the aim of preventing or treating distress in individuals.

CONTEXT: it refers to the social, political and/or organizational setting in which the intervention is planned/designed, implemented and evaluated. The contextual features that are considered relevant for an intervention vary according to the type of intervention. For public health interventions, political, organisational, socio-economic, demographic and environmental factors are important.

EVALUATION: it is the process of determining the value of an intervention by comparing it with predetermined and defined standards.

EVIDENCE: it implies the interpretative reading of the data collected through formal research or specific investigations implemented according to the standards of the scientific method. The Evidence-based practice highlights and deals with the desired consequences of an intervention and considers central effectiveness (also in terms of cost) considering the data on the implementation and the outcomes of the intervention.

Moreover, PROGRAMMES are composed of sets of activities aimed at achieving a specific related result or set of objectives (McDavid & Hawthorn, 2006; Pal, 2014; Guyadeen & Seasons, 2018). Programs are generally designed as means for transforming resources into activities to produce a desired result (McDavid & Hawthorn, 2006; Guyadeen & Seasons, 2018). PLANS, which can assume the feature of a guide, a sort of programmatic and planning vision, have a predominant role in the organization of interventions or initiatives for a community (Baer 1997; Ryan, 2011; Guyadeen & Seasons, 2018). They may have overarching goals as they offer a vision oriented to future developments: they incorporate facts, objectives and policies that can be translated into a physical or tangible development model and address multiple community problems (Berke et al., 2006). Programmes can be part of the implementation strategies of a plan (Guyadeen & Seasons, 2018). As described by Guyadeen & Seasons (2018): "It is important to note that plans are evolving tools that need to be continually reviewed and updated to remain relevant to evolving needs, knowledge and experiences (Brody 2003). In this respect, evaluation should play a key role in ensuring the applicability and relevance of plans and programmes" (p. 99).

First, evaluation could be considered "an empirically oriented discipline that generates information about programs" (Guyadeen & Seasons, 2018, p. 99) with the aim of improving them and/or guiding future decisions. Secondly, there is an emphasis on both the functioning of the programme and the results. That is, the evaluation is not only about the effectiveness of the programme, but also about the process. As a matter of fact, it is focused on the way in which programs are administered; it includes an analysis of the organisational methodologies used to deliver the programme, the inputs used (e.g. Resources), the results (e.g., the tangible measures), and cost-effectiveness (Howlett, Ramesh & Perl, 2009; Guyadeen & Seasons, 2018). Finally, programme evaluation is used to try to make programmes more efficient and effective (Weiss, 1998; Guyadeen & Seasons, 2018), and as a means of ensuring accountability and assuring quality (Cousins et al., 2014; Pal, 2014; Guyadeen & Seasons, 2018).

For these reasons, decisions on interventions in the public health field should be based on a deep assessment of the strength points regarding the innovations proposed, but also of the gaps and weakness aspects in the evidence supporting their application (Rychetnik et al., 2002). Critical guides in the field of intervention assessment, which identify and assess multiple dimensions of evidence, allow adequate consideration to be given to issues such as relevance and transferability, providing specific and justified recommendations for practice (Rychetnik et al., 2002). However, it is equally important to balance rigorous evaluation and overarching purposes to distinguish between a systematic assessment of the available evidence and the complex socio-political process that determines political and practical decisions (Rychetnik et al., 2002).

In addition, Rychetnik, Frommer, Hawe and Shiell (2002) underline "the distinction between the assessment of evidence and the process of policy-making or operational decisions on the implementation of interventions. Research-based evidence is only one of several factors taken into account in these decisions" (p. 119). The authors further specify:

"Public health interventions tend to be complex, programmatic, and context dependent. The evidence for their effectiveness must be sufficiently comprehensive to encompass that complexity. The evaluation of evidence must distinguish between the fidelity of the evaluation process in detecting the success or failure of an intervention, and the relative success or failure of the intervention itself. Moreover, if an intervention is unsuccessful, the evidence should help in understanding whether the intervention was inherently faulty (that is, failure of intervention concept or theory), or badly delivered (failure of implementation). Furthermore, proper interpretation of the evidence depends upon the availability of adequate descriptive information on the intervention and its context, so that the transferability of the evidence can be determined" (p. 119)

As Craig and colleagues (2008) pointed out, in practice, evaluation is carried out through a wide number of approaches that impact on the possibility of choice between interventions and assessment methods. Moreover, in the field of complex interventions, various sources (e. g. political acceptability) can significantly inform researchers and influence the adoption of an ideal evaluation program. Furthermore, experimental methods are increasingly accepted as methodologies for evaluating policies, but political or ethical objections can limit their use. Evaluation should play a central role in the critical approach to intervention. If planners decide to apply non-experimental methods, they should be aware of their methodological limitations and, consequently, interpret and disseminate results with caution. In this, researchers "should be prepared to explain to decision-makers the need for adequate development work, the pros and cons of experimental and non-experimental approaches, and the trade-offs involved in settling for weaker methods. They should be prepared to challenge decision makers when interventions of uncertain effectiveness are being implemented in a way that would make strengthening the evidence through a rigorous evaluation difficult, or when a modification of the implementation strategy would open up the possibility of a much more informative evaluation" (Craig et al., 2008 p. 2).

More specifically, researchers (Craig et al., 2008) stress that, to develop a complex intervention, the evaluation process should follow a series of steps:

Identification of existing evidence on the subject: what is already published or disseminated in the scientific community about similar interventions (systematic and high-quality review of the relevant evidence including methods used to evaluate process and results);

Identification and development of the theory: the rationale of complex programs of intervention, the expected outcomes and the way in which the change is to be achieved may not be completely clear from the start. One of the first key tasks is "to develop a theoretical understanding of the likely process of change by drawing on existing evidence and theory, supplemented if necessary by new primary research. This should be done whether the researcher is developing the intervention or evaluating one that has already been developed" (p. 2);

Modelling process: Structuring an accurate model of a complex intervention before making a full assessment enables planners to include and collect information useful for both the intervention design and the assessment. More studies may be needed to progressively refine the project before a full evaluation is carried out. Another useful aspect in the preliminary design phase is economic evaluation, which can help project proposers to identify weaknesses and fill in gaps.

Finally, researchers should pay attention to general statements about which models are suitable for the type of intervention for the different questions and circumstances, and choose a study design based on the specific characteristics, such as the expected effect size and the probability of selection or bias of allocation. "Awareness of the whole range of experimental and non-experimental approaches should lead to more appropriate methodological choices" (Craig et al., 2008, p. 3).

In the field of programme evaluation the main types of evaluation are the formative and the summative ones. Evaluations focused on improving the performance of a program are considered formative because they provide feedback aimed at improving the results of programs or increasing efficiency (McDavid & Hawthorn, 2006; Posavac & Carey, 2007; Guyadeen & Seasons, 2018). Training assessments produce information useful for making immediate decisions about a program, such as improving some parts and/or modifying processes (Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018). Evaluations focused on results, that occur once a program is finalized or almost complete, provide information about whether a program has achieved its goals and/or whether the process is worth continuing (McDavid & Hawthorn, 2006; Posavac & Carey 2007; Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018).

To summarise, as indicated by Wandersman and colleagues in 2000, the evaluation process is complex and articulated (Figure 1).

Efficiency and Experience Evaluation

Reading material

According to Guyadeen & Seasons (2018), "the historically dominant evaluation model is science-driven and highly technical with a strong emphasis on quantitative methods". Scientific research methods and techniques such as systematic randomized research designs and experiments are considered integral to the evaluation process (Alkin 2013). This approach to evaluation focuses on measuring effectiveness and efficiency (Greene 1994)" (p. 100).

Scholars have been working for a long time and not without disagreements on how to evaluate it, its objectives and contents, and its indicators (Jacobson et al., 1999). For example, a widespread practice in the field of evaluation concerns the analysis of how (mainly in quantitative terms) programmes promote or hinder the achievement of objectives. This approach requires clearly identified objectives and congruent indicators. The evaluation of effectiveness is a complex process and it is not free from the responsibility of undertaking relevant decisions: as Craig and colleagues (2008) point out, in assessing the effectiveness of an intervention, randomisation must always be considered as the method of choice (e. g. to prevent selection errors). If a conventional randomised trial between parallel groups is not appropriate, other randomised methodological study designs should be considered or, if an experimental approach is not feasible, quasi-experimental or observational projects could be considered.

Regarding the analysis of the outcomes of the intervention, if the research plan is carried out in accordance with the scientific method, it aims to confirm or disconfirm the existence of a causal relationship between the intervention and its effects and understand the reasons behind its effectiveness or lack thereof. The study design also defines the level of evidence arising from it. The systematic review of randomised controlled trials (RCTs) is one of the most widely used and recognised methods for providing the best level of evidence on the effects of prevention and/or treatment interventions (Rychetnik, Frommer, Hawe & Shiell, 2002). Long-term follow-up may be necessary to determine whether expected results occur or whether short-term changes persist: "although uncommon, such studies may be highly informative" (Craig et al., 2008, p. 3).

About the levels of evidence in the evaluation of public health interventions, these are the subject of further study in the scientific literature because of their dependence on the criteria established to assess their credibility. In this regard, controversy continues to exist in the field of RCTs applied to the analysis of public health interventions; it mainly concerns the difficulty in conducting these studies due to the programmatic complexity of the interventions, the analysis of the results and the underestimation of the contribution of observational studies. Due to their nature, many public interventions require multiple and flexible analysis strategies to which studies based on "classical" RCT models - according to the authors - are difficult to adapt (especially because they require a very rigid standardization of the intervention and the assumption of randomization on the basis of individual units). An important point of the researchers' analysis is that it is stressed that applying non-randomized methodologies where these would be possible, instead, can lead to a significant and unsustainable loss of relevance; but, following the words of Rychetnik and colleagues (2002):

"the design of the study alone cannot be sufficient as the main criterion for the credibility of evidence about public health interventions" (p. 121).

Interpretation of results

The evaluation process is a central aspect of the design and implementation of an intervention regardless of whether the results obtained on effectiveness are negative or positive. In fact, the proof of an adequate implementation of the procedures foreseen by the intervention programme and the use of effective indicators in monitoring the process are recognized as central in the scientific literature (Rychetnik et al., 2002).

The theories underlying interventions, their specification (explanation and plausibility) in relation to the underlying assumptions (hypotheses), related to the effectiveness and functionality of the measures of result and impact, are key criteria for the evaluation and interpretation of its quality in terms of public health (Rychetnik et al., 2002).

Following the analysis of Rychetnik and colleagues (2002), multidimensional approaches are available in the literature to evaluate research on outcomes. In the evaluation of evidence on the effectiveness of intervention three dimensions are important:

1) "the strength of evidence, determined by a combination of study design (level), methodological quality and statistical precision" (p. 122);

2) "the magnitude of the measured effects" (p. 122);

3) the "relevance of the measured effects (as observed in the evaluation) to the implementation context" (p. 122).

Empirical quality assessments are important, as they can influence decisions at a political or practical level in the field of public healthcare. It should be carefully ensured that the use of inadequate evaluation protocols does not result in unrealistic or excessively costly demands. Evaluation criteria should support the decision-making process as they should help determine whether the measured results include (a) the interests of those who might be involved in the decision or proposal of the intervention and the target audience; (b) whether the unforeseen and expected effects of the intervention result in benefits or not; and (c) the efficiency of the intervention and its effectiveness. About the first dimension, the contribution of all stakeholders is crucial, given the social and political nature of public health. For these reasons, important actors in the evaluation process include decision-makers and target groups.

As Guyadeen & Seasons (2018) pointed out, there are evaluation models that place a strong emphasis on pluralism and on the analysis of the different stakeholders involved in an evaluation. Moreover, qualitative methods are often used to improve the vision of programmes from the perspectives of stakeholders directly involved (Greene, 1994); as a matter of fact, they could be considered critical as they have a direct involvement (e.g. money and personal interests) in the evaluation.

Participatory evaluation (Cousins, 2004), empowerment evaluation (Fetterman, 2004), collaborative evaluation (Rodriguez-Campos, 2012), and more recently, development evaluation (Patton, 2011) could be considered good examples of effective methodologies in this field (Guyadeen & Seasons, 2018).

Evaluation of interventions' effectiveness and outcomes

Reading Material

As highlighted so far, the evaluation process should play a key role in ensuring that plans reflect the highest quality from both a conceptual and an applicational perspective (Guyadeen & Seasons, 2018; Berke and Godschalk, 2009; Baer, 1997). It can largely contribute to ensuring objectivity and systematization in the planning and analysis of the intervention, improving the process of programmatic preparation and giving the possibility of analyzing the congruence between the project's declaratory plan (declared objectives) and the results obtained (Guyadeen & Seasons, 2018). Through evaluation, it is also possible to document and empirically identify gaps and/or strengths (Berke, Smith & Lyles 2012; Guyadeen & Seasons, 2018). A basic premise is that, for plans to be effective and assessable, there must be a clear relationship between the main components of a plan (i.e. its objectives and policies) and the mechanisms of implementation (Oliveira & Pinho 2010b; Guyadeen & Seasons, 2018). Overall, there are two general forms of evaluation in planning: (a) evaluation of the plan (e.g. evaluation of the quality of the plan, evaluation of the implementation of the plan and evaluation of the results of the plan) and (b) evaluation of the planning (e.g. evaluation of the planning processes and planning practice) (Guyadeen & Seasons, 2018). While the evaluation of planning involves determining the effectiveness of the planning process, the evaluation of the intervention plan and its results involves evaluating the quality of the plan, the success of its implementation and the achievement of its objectives (Morckel, 2010; Guyadeen & Seasons, 2018). These forms of evaluation are similar to programme evaluation because they seek to improve decision-making, but differ because of their emphasis on the plan, how it was created, and the results generated by the activity of planning (Guyadeen & Seasons, 2018). In addition, there are generally three types of evaluation in planning: ex-ante (or a priori), ongoing and ex-post (Guyadeen & Seasons, 2018). According to Oliveira & Pinho (2010), these types of evaluation correspond to the different stages of planning, which include plan preparation, implementation and review (i.e., once implemented).

Evidence-based healthcare aims at taking into account efficiency and effectiveness, although until now efficiency issues have not been emphasized in evidence-based medicine. The assessment of evidence on public health interventions must inevitably determine whether efficiency has been assessed and, if so, the level of efficiency achieved (Rychetnik, Frommer, Hawe & Shiell, 2002). Furthermore, "evidence-based decisions on the value and applicability of an intervention drawn on knowledge of the effectiveness of identical, similar or analogous interventions, are usually carried out and evaluated in a different setting at a different time. To assess the transferability of evidence about an intervention, information is needed on (a) the intervention itself, (b) the evaluation context, and (c) interactions between the intervention and the context" (Rychetnik, Frommer, Hawe & Shiell, 2002, p. 123). In case of complex interventions, loyalty is not an easy issue. An element that adds complexity is the fact that rigorous standardisation of procedures sometimes undermines the specificity of the intervention when it is motivated by local needs (Craig et al., 2008). A key point that needs to be clarified is the amount of changes or adaptations allowed and the need to record changes in implementation so that fidelity can be assessed in relation to the degree of standardization required by the study protocol. Variability in implementation - whether planned or not - makes it all the more important that process and outcome evaluation procedures are fully reported and that a clear description of the intervention is provided to allow its replication (Craig et al., 2008).

Quiz 3.3

3 points possible (graded)

1. According to Rychetnik, Frommer, Hawe and Shiell (2002), evaluation can be defined as:

- ○ A set of changes and outcomes that can be defined in advance
- ○ Interpretative reading of the data collected through formal research or specific surveys
- ○ The social, political and/or organisational setting within which the intervention is planned
- ○ The process of determining the value of an intervention through comparison with predetermined and explicit standards

2. When evaluating the effectiveness of an intervention, which of these does NOT seem to be a significant factor? (Rychetnik et al., 2002)

- ○ The number of interventions carried out by the organisation
- ○ The relevance of the measured effects in the implementation context
- ○ The magnitude of the measured effects
- ○ The strength of evidence, determined by a combination of study design, methodological quality and statistical accuracy

3. Evaluation...

- ○ Does not require integration between evaluation methods and the plan to be evaluated
- ○ Allows empirical documentation of the weaknesses and strengths of the intervention plans
- ○ Should avoid taking into account the interest of the people involved in decisions on interventions.
- ○ Should only be carried out on outcomes

Welcome. Here we are again in a new week, with new aspects, new insights.

In this week we will discuss aspects related to best practices,

aspects related to observation and aspects related to indicators of child abuse and maltreatment.

Let's start with the first element. Together we will investigate

the elements related to the intervention of research and practice with particular attention to

the development of best practices. After that we will examine the methodological aspects

of research in Trauma-Informed Care, which we have now learned

to understand and read, and we will have the opportunity to further understand how these apply

to research planning, how to use the Trauma-Informed Care format

in research, and then understand the link from theory to practice.

We will then try to identify the elements that constitute

a good research proposal by examining aspects related to a good technique such as observation.

Observation as a clinical tool, observation as a tool that can allow an operator

who collaborates or intends to work or (for a thousand other reasons)

is willing to know and examine in depth the theme of Trauma-Informed Care can use observation as a method,

and to understand the person brought into that context

(keep in mind the meaning of Trauma-Informed Care).

And here we will investigate the requirements and possible applications of clinical observation and more.

We will then continue with examples

and concepts previously discussed such as good practices, observation and how these

can be applied to child abuse and maltreatment, while also trying to identify indicators,

taking into account that an indicator is, as such, just an indicator, and is certainly not

a fundamental and certain element of abuse and maltreatment, but a set of indicators

may be interesting for us as an element to keep in mind as there may be something to investigate.

From here we will examine screening procedures

on assessment of trauma and we will try to understand with colleagues how important a screening

of trauma can be for knowledge.

We will then close with aspects related to Trauma-Informed Care and links with research,

and how there can be an organized system of processes that goes from theory to practice.

If in the first part, in the first two weeks we discussed and examined with colleagues

perhaps the most theoretical aspect of trauma, with us today,

with these two weeks, we discussed research in Evidence-Based or Action-Research in Trauma-Informed Care,

from now on you will move towards a new path that will always have trauma

and Trauma-Informed Care as a central theme but from a slightly different point of view,

specifically the legislative one, to then address issues related to legislation, research and policies.

We wish you, on my behalf and on behalf of all my colleagues,

a good progression of the path; you have now reached the half, perhaps more than half of the path,

and at this point you are heading towards the closure of your MOOC.

Again, we wish you a good continuation, and we will see each other again at the end of the MOOC.

INTRODUCTION TO CORE METHODOLOGICAL ASPECTS OF RESEARCH IN TIC

As Newman & Ridenour (1998) suggested, the way in which researchers conduct a study and what conclusions they obtain from it are very different and depend on their approach to reality. Furthermore, epistemology concerns the study of how we know things while the method concerns the choice of the technique through which it is possible to proceed to the knowledge of phenomena (Bernard, 2006).

As Lastrucci (1963) pointed out, science is "an objective, logical and systematic method of analysing phenomena, designed to allow the accumulation of reliable knowledge" (p. 6). This is done through three objectives that guide the choices of the researcher (Bernard, 2006):

- Objectivity: this implies being explicit about measurements, attention to methodology and reference to peer review within the scientific community.
- The scientific method
- Reliability

The ethical dimension is part of the scientific method and, referring to research in the human sciences, a central question is how to operationalize phenomena that are complex by nature; this type of process is based on the definition of variables, on the search for associations or relationships between them and on the attempt to understand if and how the variation of one thing causes a variation in another (Bernard, 2006). In connection with these aspects, a founding element is the measurement and identification of valid and reliable indicators and is closely linked to the structuring of operational definitions that "consist of a set of instructions on how to measure a variable that has been conceptually defined" (p. 38).

RESEARCH IN TIC

In TIC, one of the key concepts is to use scientifically-validated procedures and concepts. From this point of view, it is essential to promote a synergistic interaction between clinical work and research in order to investigate the outcomes of treatment and to evaluate the functioning models of services in terms of effectiveness and efficiency, also by formalizing these aspects in specific guidelines and/or paying attention to the adherence of the specific protocol to the established elements in international research in this field (Schäfer et al., 2018).

In this respect, the contribution of scientific research to the analysis of TIC definitions and their underlying factors is significant.

In this regard, Becker-Blease (2017), Hanson & Lang (2016) and Johnson (2017) highlight a number of critical aspects related to TIC and application problems, including, for example, the existence of a very present focus in the scientific literature on theoretical aspects and fundamental principles to the detriment of attention to the tangible elements and their applicability in practice: "there is a gap in how practitioners can transform theory and principles into everyday practice and therefore assess their effectiveness" (Becker-Blease, 2017, p.3). The focus on research is therefore useful for the evaluation of trauma-informed application initiatives, programmes and services and whether these are related to significant positive results.

In trying to implement a fruitful and functional exchange between conceptual and theoretical aspects and those related to application, a relevant focus should be dedicated to the analysis of the applicability of standardised procedures and indicators both in terms of the process elements and the results obtained. The scientific literature on the subject urges organizations and institutions to consider particularly relevant the structuring of research projects, both basic and applicative, aimed at dealing with screening procedures (evidence-based screening), the analysis of assessment procedures aimed at identifying traumatic events and their peculiarities. Moreover, to this end, it is important that randomized, controlled studies are implemented on an experimental basis to test the effectiveness of trauma-oriented interventions.

Quiz 4.1

3 points possible (graded)

1. The operational definition:

- ○ Is carried out before the conceptual definition of a variable
- ○ Is carried out after the conceptual definition of a variable
- ○ Is processed during the measurement of a variable
- ○ Is not useful for measuring a variable

2. In the field of Trauma-Informed Care it is crucial to:

- ○ Impose a methodology of intervention on operators
- ○ Avoid taking into account the contributions of scientific research
- ○ Promote synergistic interaction between clinical work and research
- ○ Avoid taking into account critical aspects and application difficulties

3. At each stage of the design process:

- ○ The researcher should not ask himself important questions that also take into account the critical elements from a conceptual and practical point of view
- ○ The researcher should ask himself important questions that also take into account the critical elements from a conceptual and practical point of view
- ○ The data must always be analysed
- ○ There is need to plan for timing

Fundamental elements of good practices

Bookmark this page

VIEW UNIT IN STUDIO

FUNDAMENTAL ELEMENTS OF GOOD PRACTICES

By analysing literature and protocols for the evaluation of TIC practices, it is therefore possible to conclude that good practices (potentially transferable in different contexts) should include:

1) permanent training of all staff members on trauma and its correlates. This training should not only be provided to professionals who work directly at the clinical level with users, but to all those who are included in various capacities and with different functions in the organization;

2) a constant update of the internal staff on evidence-based practices (EBP) in the treatment of trauma and a focus on the attitude of professionals towards EBPs;

3) collaboration with experts in the field in order to increase the availability of trained clinical providers;

4) the inclusion of standardized and evidence-based screening procedures in clinical practice and the use of specific and validated evaluation measures/tools to identify traumatic events (ACEs);

5) shared attention to the history of users and its association with symptoms or difficulties related to trauma;

6) in line with the previous point, the recognition of the specificity of the life history of each user guaranteed through an active and empathetic listening on behalf of all personnel;

7) the inclusion and careful sharing of the history of children's trauma in the planning of intervention or in the conceptualization of cases;

8) an in-depth evaluation and constant monitoring of the staff's skills (use of specifically designed procedures);

9) in-depth monitoring to maintain the standards set for good TIC service and, possibly, to improve the deficit elements;

10) the implementation of procedures to reduce secondary trauma stress and increase staff well-being;

11) building and maintaining a good network of cooperation not only within the services but also with other agencies in the field;

12) attention to the centrality of the communicative dimension: the highest level objective should be to have attentive and collaborative professionals in pursuing objectives and applying shared and co-constructed procedures;

13) attention to procedures to reduce the risk of re-traumatization for users;

14) encouraging the participation of patients in the design of the treatment plan;

15) involvement of users in the planning of the service: attention to their feedback and suggestions to improve the organization and the services offered;

16) a particular focus on providing services based on strengths, aimed at promoting factors for positive development (e.g. resilience, empowerment);

17) training on strategies aimed at organising a positive environment for users and staff;

18) special attention to the physical and structural dimensions of the service;

19) adherence to and promotion of TIC principles with specific and clear policies;

20) a central role assigned to the leadership dimension and its functions in the organisation of the service.

VIEW UNIT IN STUDIO

CRITICAL ELEMENTS AND CHALLENGES

Although a particularly highlighted topic in the recommendations for the implementation of best practices, the use of evidence-based practices is still today an element of resistance on behalf of some professionals, organizations and researchers (Gray, Elhai, Schmidt, 2007). This should be the subject of analysis, discussion and attention on behalf of organizations that deal with clinical intervention on trauma, in order to create a cooperative definition of standards as well.

In fact, although the TIC approach is assuming an important role in the organization of services and the provision of care for traumatised people at the moment, there are still some obstacles in its application and, even before that, in its conceptualization (Baker, 2016). In particular, there are shortcomings in this regard:

- a clear operational definition
- the presence of psychometrically validated tools to assess TIC dimensions.

To fill this gap, Baker and colleagues (2016), for example, built and validated a tool -Attitudes Related to Trauma-Informed Care (ARTIC) Scale - to assess the TIC-related attitudes of staff working in different areas of intervention or contexts dealing with individuals with traumatic histories. Previously in their publication Creating cultures of trauma-informed care (CCTIC): a self-assessment and planning protocol, Fallot and Harris (2009) structured a Self-Assessment and Planning Protocol that includes six domains that involve changes at the service, administrative or system level. Attention to the complexity of the TIC application situation is increasingly becoming a challenging objective from a propulsive point of view both for individual operators and for social and health services in their daily interaction and in their relationship with the scientific community of reference.

[To become an adult is not simple. What are the everyday challenges?]

We're in Rome, interviewing people between 18 and 22 years-old

What is the TARI? [an Italian tax on garbage]

What is it?...

Oh, on savings...

A concept, like, about the economy...

The TARI is a thing, a political thing...

Yeah, right

What's the TARI?

The TARI? Is it a tax?

You need to look for a house: how do you do it?

What do you do? What's your move?

With public transport...

Giulia found it.

With an estate agency.

I live at home, with mom that's

always waiting for me

What kind of contract do you sign?

I mean, I just pay, I mean I gotta pay...

Contracts, ok, indefinite duration, long-term

contracts...

I mean, I just started law school...

but I just started! So...

You do the 4..? [4+4, a common housing contract]

4 Months?

Plus 5

Rent money is wasted money.

Like, water and electricity are included in the price

4?

The bank account

Like, a Latin interrogation is easier!

Eh, I dunno

Where you deposit..

If you want we can talk about Seneca

When you have any problem, who do you call?

Giulia

Dad

Seneca, who's dead.. so mom and

dad for now.

Some questions are hard to answer, but some young people turning 18 years

& one day old will have to face them alone.

Care Leavers

I don't know what that is

Health... needs?...

Who are they?

Liverpool players

I don't know what that is, never heard of them

I don't understand the question?

Clerics

They're young people that are turning 18,

they live in a foster home and need to leave their foster home and find an independent solution

Great!

[The future is built day by day]

What can we tell these young people, come on?!

What... Wish them well, what do we tell them?!

RESEARCH IN TIC AND ITS CONNECTION TO POLICIES

As a model that aims to structure the supply of services, TIC is implemented in a wide and varied contextual range; Bowen and Murshid (2016) underline how this paradigm can be applied equally, in its founding principles (security, reliability and transparency, collaboration, empowerment, choice and intersectionality), to social policies. This, according to the authors' proposal, since TIC offers mental health professionals (especially in the public sector) a path aimed at breaking the disparities through clinical-organizational action that, due to its ethical and deontological dimension, can also rise to a broader political dimension. Reeves (2015) had already highlighted how the widespread implementation of TIC-oriented care models can put at the centre of the intervention the response to the unique and peculiar needs of the people in charge of the rehabilitation services, reducing the welfare inequalities experienced by this vulnerable population.

Recently Levy-Carrick and colleagues (2019) have underlined the unequal treatment in the context of trauma as a critical issue in the national organization of health services to which the adoption of TIC can remedy, if not completely, at least widely. As a matter of fact, a central point stressed by the authors is that the effective application of this paradigm would be guaranteed by the full participation of carers in the planning and implementation of activities at each step. In their book "*Caring for the vulnerable: Perspectives in nursing theory, practice, and research*", De Chesnay and Anderson (2019) have also highlighted that mental health has a political and participatory nature (in particular on the part of users). In line with this, the World Health Organization has often urged policies in order to create a collaborative space in which practitioners and groups defending the rights of users of mental health services (advocacy groups) as well as a wide range of stakeholders can engage in the direction of a synergy attentive to mutual needs.

In addition, as is the case in some circumstances, it is important to make a political contribution to the decision to fund studies to analyse and promote evidence-based practices, to create and disseminate shared standards and to define the organisational ratio and community objectives of organisations and institutions involved in the provision of care models (Ko et al., 2008; Bateman & Anderson, 2013; Levy-Carrick et al., 2019).

What said thus far concerns the general dimension of health policy, but it also concerns the local dimension in response to specific territorial needs and, even more specifically, the policies of individual organisations or services. The literature dealing with TIC suggests that "to implement informed assistance on trauma, there is a need for preparation, evaluation and organizational change (Harris & Fallot, 2001, Rivard, Bloom, McCorkle, & Abramovitz, 2005) [...] The implementation of informed practices on trauma is therefore based on the use of individualized organizational data to inform planning and implementation" (Hummer et al., 2010, p. 82). The ability to support policies with data from effective research facilities is undoubtedly a priority and desirable strategic element (Levy-Carrick et al., 2019). For example, at the level of tools useful in analyzing how much organizational policies are oriented to the principles of TIC, the CCTIC protocol developed by Fallot and Harris (2009) could be particularly interesting to the extent that it enucleates domains and subdomains involved in the evaluation of organizational services and initiatives in the field of trauma care.

In conclusion, therefore, adopting a TIC-oriented perspective implies a sensitivity to what Levy-Carrick and colleagues stressed (2019): "Helping our patients and ourselves will require a critical change of perspective that must be introduced at the beginning of the training, strengthened in all, shaped by its older professionals and promoted by future generations" (p. 107).

Q4.2

3 points possible (graded)

1. The TIC approach:

- ○ Promotes caring for the person from a holistic point of view
- ○ Considers exclusively the psychological dimension of a person
- ○ Considers only the physical dimension of a person
- ○ Considers only the social dimension of a person

2. An intervention, in order to take into account best practices, should:

- ○ Avoid paying attention to the history of users and its association with symptoms or difficulties related to trauma
- ○ Avoid including standardized and evidence-based screening procedures in clinical practice
- ○ Make sure that the internal staff always continues to perform the procedures on which it was initially trained.
- ○ Promote an in-depth evaluation and a constant monitoring of the competences of the staff (use of specifically designed procedures)

3. A good research proposal...

- ○ Carries out a feasibility analysis and defines a timetable
- ○ Maintains its objectives as general as possible
- ○ Always formulates research hypotheses after data collection
- ○ Always provides for a stratified sample

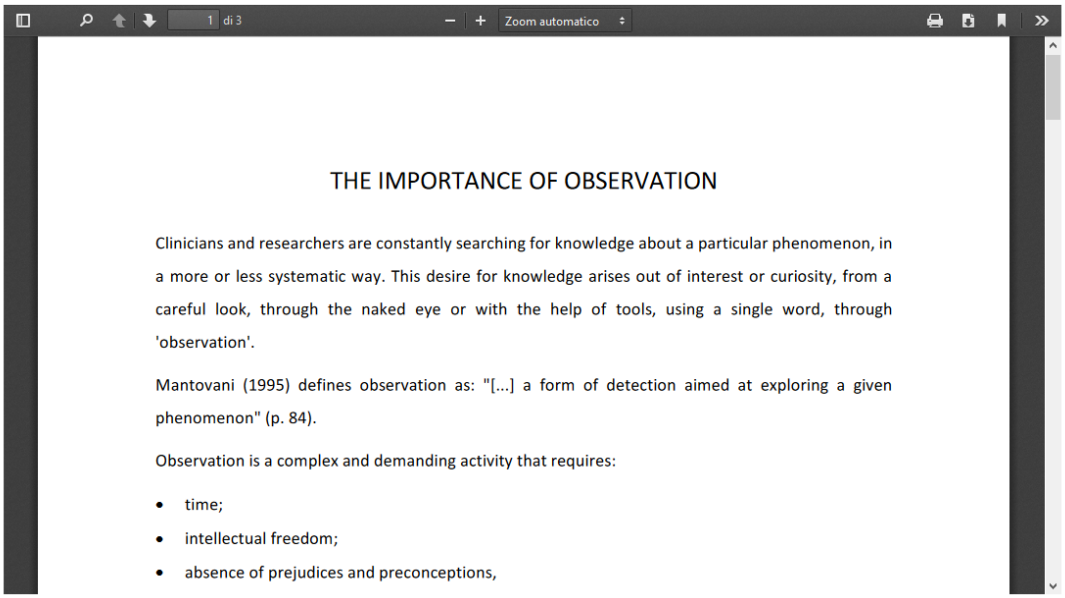
The importance of observation

VIEW UNIT IN STUDIO

Bookmark this page



THE IMPORTANCE OF OBSERVATION

Clinicians and researchers are constantly searching for knowledge about a particular phenomenon, in a more or less systematic way. This desire for knowledge arises out of interest or curiosity, from a careful look, through the naked eye or with the help of tools, using a single word, through 'observation'.

Mantovani (1995) defines observation as: "[...] a form of detection aimed at exploring a given phenomenon" (p. 84).

Observation is a complex and demanding activity that requires:

- time;
- intellectual freedom;
- absence of prejudices and preconceptions,

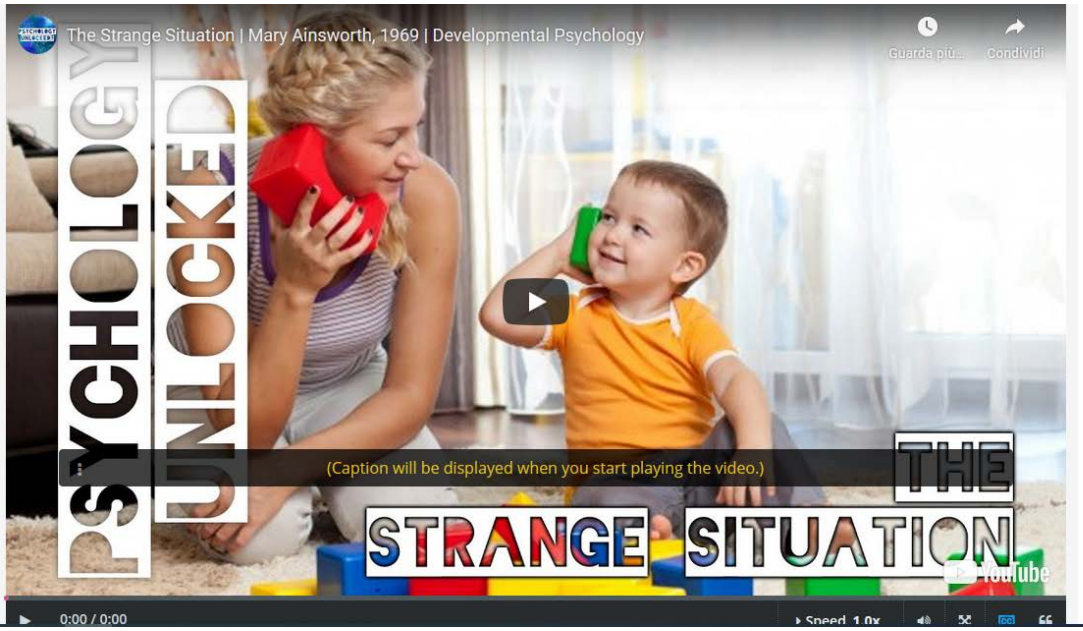
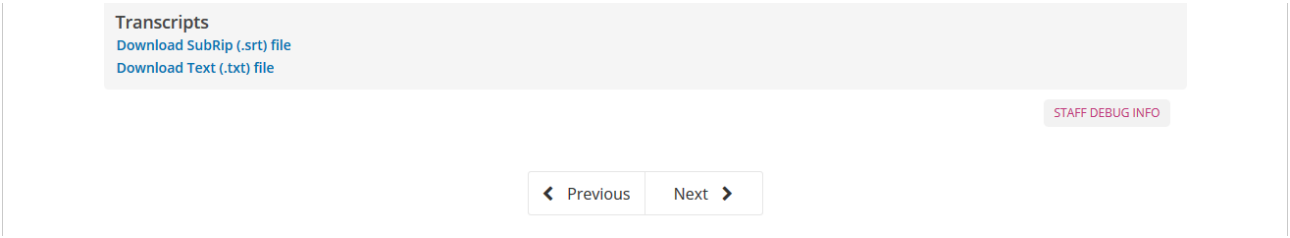
The importance of observation





Transcript

In 1969, american psychologist Mary Ainsworth gave developmental psychology
a new procedure for studying attachment in infants.
She called it the "Strange Situation classification" and it's widely referred to as simply "The
Strange Situation". As an adult, you know when you formed an attachment
with someone. You know how it feels, And you know how to express your feelings
in words. However, when it comes to babies and young
children, they haven't yet developed these skills
and therefore researchers must turn to more subtle techniques.
Such as the strange situation, which measures the security of an attachment
in one-to-two year olds. A 20-minute participatory observation during
which the researcher observes the infant's behavioral responses to a series of scenarios.
Ainsworth's Strange Situation includes eight stages, each lasting roughly three minutes.
To start with the mother, baby and researcher are all together in the room,
A small, neutrally colored space with some toys for the baby to play with.
The experimenter leaves after around a minute and the mother and baby are alone for approximately
three minutes. In this stage
researchers are watching to see whether the child is confident to explore the new environment
or whether she :01:41.280 A stranger joins the mother and baby in the
room. The researchers record the baby's response to this unfamiliar newcomer,
who is left alone with the baby when the mother leaves the room.
At this stage, the researchers are observing the baby's behavior for signs of separation
anxiety. Three minutes later, the mother returns, and
the researchers observe for the baby's reunion response. The stranger leaves the room.
A few minutes more and the mother leaves the room too - leaving the baby alone for the
first time in the experiment. The next person to enter the room is the stranger,
and finally, after three minutes, the mother returns and

the stranger leaves, all in all a perfectly strange situation for all involved.

So, what were the researchers measuring? When the mother was in the room with the baby, they scored the infant's behaviour on four measures:

"Proximity and contact seeking". "Contact maintaining".

"Avoidance of Proximity and contact" and "Resistance to contact and comforting".

The baby's exploratory behaviors were also recorded as she explored the environment.

Ainsworth reported that infants display one of three attachment types:

Securely attached infants showed distress when separated from their mother, were avoidant of the stranger when alone, but friendly in the presence of their mother and were happy when the mother returned from outside the room.

70% of children studied fell into this category. 15% of children demonstrated an ambivalent attachment with their mother. These children showed intense distress when the mother left the room and demonstrated a significant fear of the stranger.

When the mother returned to the room, ambivalent children approached the mother but rejected contact. Ainsworth reported that a final 15 percent had an avoidant attachment style. Such infants show no interest when the mother leaves the room and play happily with the stranger.

When the mother returns, avoidant children barely seem to notice.

In 1990, Maine and Solomon added that a very small percentage were Inconsistent in their behaviors and defined this attachment style as "disorganized".

Ainsworth's "caregiver sensitivity hypothesis" suggests that differences in infant attachment styles are dependent on the mother's behavior towards the baby during a critical period of development.

INDICATORS OF MALTREATMENT AND ABUSE

Schimmenti (2018) underlines how trauma constitutes a deep laceration for individuals that can impact on their psychological processes of conditioning, at multiple levels, and their functioning. In particular, it has consequences with regard to the concept of self, relational modalities and belief systems. Furthermore, the author points out that scientific studies have highlighted how often events that can be defined as traumatic are interrelated and that exposure to multiple traumatic experiences increases the risk of developing a psychopathology (cumulative trauma), especially if this occurs during childhood and, especially, in the context of family relationships. Curran and colleagues (2018) also highlight this aspect in the scientific literature, pointing out how this involves:

1. for children who have been victims of multiple traumatic experiences, an increase in the risk of experiencing depression and impotence (Arata et al., 2007);
2. on a longitudinal level in adulthood for subjects with stories of physical and psychological abuse, a decrease in self-esteem and coping skills compared to emotions (especially anger and aggression), an increase in deviant sexual behavior and difficulty in psychosocial adaptation (Sesar et al., 2010);
3. for victims of sexual or physical abuse, a higher risk of having psychosocial difficulties and displaying asocial or antisocial behaviour, chronic physical symptoms, anxious or depressive disorders, symptoms related to trauma and dissociation (Higgins & McCabe, 2000).
4. In addition, in adolescence, scientific research also shows an increased risk of development of delinquent behavior, substance abuse and self-harm, especially in individuals with PTSD or poly-victimization histories.

In general, research suggests, from an epidemiological point of view, the connection between trauma and severity of impairment; moreover, if suffered during childhood, it can have serious and debilitating consequences on the development of cognitive, emotional and social skills (Curran et al., 2018). One aspect that seems to have a particularly significant impact on the development and outcomes of traumatic experiences in childhood is the emotional neglect of attachment figures - particularly those with parental functions - for the child (Schimmenti, 2018). An adequate understanding of the mechanisms underlying individual variability in the psychological response to trauma is important both to identify children at risk of long-term distress and to structure appropriate and effective interventions (Ozer et al., 2003; Alisic et al., 2011). In particular, it is important to emphasize that children react to trauma in different ways than adults, in part because of their level of development and their skills including the management of mnestic content and emotional responses to events. Lonigan and colleagues (1998) had already stressed the need for scientific research to focus on the analysis of childhood reactions to trauma and the factors associated with it. One of the questions they raised was the need to investigate indicators - specifically valid and reliable for the child population and not simply borrowed from the conditions found in adult subjects - on normal versus psychopathological reactions of children to adverse events. An interesting area of investigation is, in fact, that concerning the distinction between typical reactions to trauma and those conditions in which it is possible to find a psychopathological response with a particular focus on which symptoms allow a differential vision between the two conditions and an improvement of the possibilities of effective assessment by clinicians (Lonigan et al., 1998).

The literature provides a lot of information on indicators of mistreatment and abuse, pointing out that these are often non-specific signals that should be read with care and caution, since they do not always point to maltreatment exclusively. In fact, it is necessary for the operators to improve their ability to grasp the child's suffering in the contexts in which they find themselves, offering them the appropriate conditions so that they can feel welcomed and helped to express their emotions and difficulties. Coupled with observation techniques, the operators can use grids of indicators to investigate the problem as much as possible. As an example, see the link to a document drawn up by CE.S.P.IM (Centro Servizi per il volontariato Provincia di Imperia) entitled "*Il Silenzio dei Passerotti. Project for combating and recovering abuse and mistreatment of children*", in which some examples of indicators of abuse and maltreatment can be viewed.

Transcript

There are many forms of child abuse. Online abuse: online abuse is any type of abuse that happens over the Internet. This can be in the form of cyber bullying, grooming, sexual abuse and exploitation or emotional abuse, from people they know as well as strangers. Online abuse can occur solely online or in addition to occurring in the real world. As technology is everywhere, children and young people suffering from this form of abuse may feel trapped with nowhere to turn as it follows them everywhere they, go like their bedroom which is meant to be a safe place for them. Grooming: grooming is when an adult builds a connection with a child for the purpose of abusing and/or exploiting them sexually. This can be done online, in the real world, by a stranger or someone they know. Sexual abuse: sexual abuse is where a child is forced or persuaded into participating in any sort of sexual act, and does not have to be physical. Sometimes the child may not be aware what is happening is abuse or that what is happening is wrong. Physical abuse: physical abuse is deliberately hurting a child, thus causing injuries such as broken ribs, burns or cuts. They could be kicked, punched, slapped, poisoned, burned or have objects thrown at them. Babies can be shaken sometimes so violently it leads to their death.

Neglect: neglect is a continuous failure to

provide the most basic needs to a child. Children left to go hungry, unbathed or adequately clothed, sheltered and supervised are all examples of neglected children. Neglect can also occur in the form of a parent or carer not protecting a child from other types of abuse. Bullying:
bullying is behavior that hurts someone else such as name-calling, hitting, pushing, spreading rumors, threatening or undermining someone. This can happen anywhere, even in their own home, and often over a long period of time.
Emotional abuse, also known as psychological abuse, when a parent or carer is constantly maltreating or neglecting
a child emotionally, which can involve deliberately trying to scare or humiliate a child or isolating or ignoring them. Harmful sexual behavior:
children and young people who develop harmful sexual behavior harm themselves and others by using sexually explicit words and phrases, inappropriate touching, using sexual violence and threats or engaging in full penetrative sex with other children or adults. Child sexual exploitation is another form of child abuse. Children and young people being sexually exploited are vulnerable people who have been tricked or manipulated into believing they're in a loving, safe relationship. They may be offered money or other rewards only to be trafficked into slavery. They may have been groomed online and become totally dependent on their abuser, making it even harder to leave.
Trafficking children is also child abuse. Children can be trafficked for cheap labor, sexual abuse, domestic servitude, benefit fraud and forced marriage.

Transcript

We are discussing child maltreatment and abuse, and before accessing what
the consequences of a traumatic event or exposure to specific forms of violence
according to behavioral indicators are, we will briefly mention the
categories of victimization in the area of abuse. Let's start from the international classifications:
first there's psychological abuse, also called "Emotional abuse" \ "Psychological abuse",
then there's physical abuse, and finally sexual abuse.
(CORRECTION: Physical) abuse is the exposure to forms of violence characterized
by physical harm which the child goes through; this is therefore
a very strong traumatic event, since it impacts on development; we will shortly see
which ones I'm referring to specifically. When speaking about forms of
psychological violence, we're referring to insults, denigrations, social isolation
and neglect; these are forms of violence that are less visible, but
which have a psychological impact nonetheless, and therefore constitute a traumatic event in the long term.

Finally, sexual abuse refers to all those acts related to victimization

which are linked to physical exposure to sexual violence, incest,

touching, or inappropriate touching on behalf of those who care for the child in a protected situation.

Let's analyse the consequences related to abuse

and violence against a child, taking into consideration both

behavioural and emotional indicators. The consequences that the child encounters

during his\her development are for example,

disturbances in the perception of the body, and therefore in his\her own body image;

the child cannot understand whether his\her body belongs to a child or an adult, because it has been eroticized

since a young age. Other consequences are chronic sleep-related difficulties; in other words, the traumatic event has

an impact on the regulation of the sleep-wake rhythm. Then there's attention disorders,

and difficulties in concentrating and paying attention when in school.

If the child is younger than 3-5 years old, there may also be evacuation disorders.

During adolescence, other manifestations of discomfort

that the child or young person may express are eating disorders,

including anorexia and bulimia, acts of explicit aggression towards

all subjects who tend to express a behavior of an attentional nature towards the child

(the child may defend himself with explicit aggression). Finally, acts of self-harm,

precisely because there is an inherent suffering, internal to the child

caused by the traumatic event; the child then reacts by causing harm to him/herself as well as other subjects.

These are some of the consequences of exposure to traumatic events in infancy,

childhood and adolescence, but many more are the ones investigated by literature:

learning difficulties, isolation and anti-social behavior

such as use and abuse of alcohol and drugs, promiscuous sexual behavior, exposure to

particular sexually transmitted diseases.

Therefore, this makes us understand how a normal developmental trajectory is not obtained

because those who care for the child and should have the function of child-carer

tend to express these forms of physical abuse previously established

linked to beating and voluntarily inflicting pain to the child, or sexual abuse,

that is, by eroticizing the body of the child for personal outbursts, or psychological abuse

such as humiliating, isolating and denigrating the child. All this has a traumatic impact on the child with the consequences we have just explored. These consequences are therefore indicators of a behavioral but also emotional nature and express a discomfort that the child experiences at a specific time and on which it is necessary to intervene early, before the consequences become increasingly traumatic and inherent in the development of the personality of the subject, with, of course, consequences of a psychopathological nature.

Quiz 4.3

4 points possible (graded)

1. Observation is defined as (Mantovani, 1995):

- ○ An intermediate moment between a phenomenon and its interpretation
- ○ A form of detection aimed at exploring a given phenomenon
- ○ The description of a species in a catalogue
- ○ An objective and faithful way to record reality

2. During observation, an important factor is:

- ○ To avoid involvement in the interaction with the object of observation at all costs
- ○ To always use structured observation tools
- ○ To avoid being influenced by prejudices and preconceptions
- ○ The speed of judgment

3. In a minor, the presence of indicators and signs associated with maltreatment and abuse...

- ○ Should be considered without taking behaviors into account
- ○ Can be deduced through the observation of emotions and behaviors
- ○ Corresponds, in any case, to situations of maltreatment and abuse.
- ○ Results in the immediate forfeiture of parental responsibility.

4. According to Schimmenti (2018), traumatic experiences...

- ○ Increase the probability of developing mental illness, especially when the subject is subject to multiple exposures (cumulative trauma).
- ○ Are always easy to overcome by talking to friends and family about the event.
- ○ Do not cause any damage at all if they are experienced as a single event, thanks to neuroplasticity
- ○ Should be repressed by trying not to think about them.

Learning objectives

- know briefly the socio-cultural and legal process that led to the worldwide and European recognition that children are subjects of rights and that States have an obligation to intervene promptly and effectively for their protection in case of violence, abuse or negligent treatment
- know the fundamental rights and principles set by the international and European legal framework on children's rights within which the Trauma Informed Care (ICT) can be applied. Specific attention will be devoted to the right of children to be informed and to take part in the decision affecting them, their care and their future after leaving care
- know and understand the legal instruments that guarantee the participation of traumatized children in proceedings (administrative and judicial) in which decisions are made for their protection (e.g. the right of the child capable of forming his or her own view to be heard and, in some cases, the duty to seek his or her consent)
- understand the operational effects of the children's rights based approach (and specifically of children's participation rights) on social and health policies
- know and master the legal terminology.

Transcript

The objective of this module is to examine the regulatory framework and the fundamental legal principles of Trauma Informed Care.

At the end of the module, it will be necessary to use correctly concepts such as abuse, mistreatment, prejudice, and abandonment.

The specific educational objective of this module is to understand the cultural and legal process that led, at global and European level, to the recognition that minors children are subjects of right and that there is there is an obligation for States to intervene promptly and effectively to protect them.

In this module, you will also learn the fundamental rights and principles established

by the international and European regulatory framework in the field of children's rights,

a framework that is fundamental for Trauma Informed Care.
In particular, you will focus on the right of children to be informed and
to be heard in proceedings concerning their assistance, care
their assistance, care the State has taken over.
You will also understand the measures
that guarantee the participation of minors, who have suffered abuse,
in decision-making procedures, whether administrative or judicial, concerning
their protection;
we will, therefore, focus on the right of the child
to be heard and on the duty, if necessary, to obtain his/her consent
to activate a protection measure.
The final part of the module will be dedicated
to the impact on social and health policies of the children's rights based approach,
through a general overview and some
case studies; for example, this part will focus on the analysis of the policies
against female genital mutilation and against the use of corporal punishment
in the family, or on the policies that many countries
have adopted to appoint a guardian for the care of abandoned foreign minors.

Legal glossary on childhood trauma

VIEW UNIT IN STUDIO

Bookmark this page

Legal glossary on childhood "trauma"

The term "trauma" is not commonly used in legal language.

The International Convention on the Rights of Children and Adolescents (CRC), for example, plans to "protect the child from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse" (Art. 19).

ABUSE and MALTREATMENT:

The Council of Europe defines as child abuse: "the acts and shortcomings that seriously disturb the child, threaten his bodily integrity, his physical, intellectual and moral development, whose manifestations are neglect and / or physical and / or mental and / or sexual injuries by a family member or others who care for the child" (IV Criminological Seminar - Strasbourg, 1978)

The World Health Organisation states that: "for child abuse and maltreatment (child abuse, maltreatment) all forms of physical and / or emotional ill-health, sexual abuse, neglect or negligence or commercial exploitation or anything else that involve a real or potential prejudice for the health of the child, for its survival, for its development or for its dignity in the context of a relationship characterized by responsibility, trust or power" (World Health Organisation, World Report on Violence and Health, 2002).

Both abuse and maltreatment can take the form of:

- active behaviour (for example, beatings, injuries, sexual acts, exploitation)
- omissive behaviour (for example, carelessness, negligence).

The absence of physical traumatic evidence does not exclude the hypothesis of mistreatment or abuse. For example, the conduct of the teacher / parent who humiliates, devalues, denigrates or psychologically violates a child or makes a threat may constitute abuse, when it consists of psychological violence that may cause damage to the child's psycho-physical health and may undermine their dignity.

The terms **VIOLENCE** and **EXPLOITATION** usually refer to active behaviours carried out against the child.

Exploitation, in particular, may be of economic or sexual nature

Article 32 (CRC): "States Parties recognise the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development."

Article 34, par. 1 (CRC): "States Parties undertake to protect the child from all forms of sexual exploitation and sexual abuse."

The United Nations Committee for the Rights of the Child determines that "violence" means "all forms of physical or mental violence, injury or abuse, negligent or neglectful treatment, abuse or exploitation, including sexual abuse". In common language the term violence is often used to designate only physical damage and/or intentional damage. However, the Committee places a strong emphasis on the fact that the choice of the term violence in this general comment should not be interpreted in any way as to minimise the impact or the need to deal with non-physical and/or unintentional forms of damage (such as, among others, abandonment and psychological mistreatment) (The right of the child to freedom from all forms of violence, General comment no. 13 (2011) CRC / C / GC / 13, 18 April 2011).

Finally, the expression **STATE OF ABANDONMENT** refers to a situation of serious and permanent inadequacy of the parents to take care of the child due to negligence, serious violence or exploitation.

Transcript

Good morning. The objective of this video is to provide some elements of knowledge on

the cultural and legal process that led, on the one hand, to the recognition

that are also subjects of rights; they are holders

of the rights usually recognised to every human, as well as the rights

di essere soggetti in formazione; specifically granted to them;

secondly, the path that led to the recognition of the existence of a State duty

to intervene to protect and promote the rights of children who

are victims of violence and mistreatment. To contextualise the topic, I will read a few

lines from a 2006 book, entitled “Life and the Rules”, published by Feltrinelli

in Italy. Its author is Stefano Rodotà, an Italian jurist and politician, who was one of the authors of the European Charter of Fundamental Rights. Rodotà writes:

“the legal rule cannot be thought of as what removes pain from the world, but as one of the criteria that mark the tolerable pain threshold, personally and socially”.

I think that this text helps provide us with a background to the theme of the State's reaction to child abuse as highlights, above all, that law is not omnipotent. This means that even if there are legal rules that repress violence and abuse against children and that try to prevent them, this does not mean, unfortunately, that violence and mistreatment do not occur in practice. In addition to this, it must be admitted that in practice, when this violence and mistreatment do the State is not always able to activate a timely and efficient intervention.

In addition, the brief lines of Rodotà’s text help us to reflect on the threshold for State intervention, in general for the protection of subjects who are in serious hardship and then, specifically, in support of children who are victims of mistreatment. Here, this threshold can be identified in the attack itself, in the violation of human dignity. Therefore, the State must intervene when the pain threshold is so high as to compromise the very dignity of the human being and the rationale of State intervention in these cases must be identified in the general duty of social solidarity, protection of individual liberties and specific protection of vulnerable individuals.

Let us turn now to the fundamental stages of this journey which has seen us identify the child as a subject of rights and has led to the recognition of the State's duty to protect children who are victims of abuse.

An initial fundamental date can be identified as the year 1874. In that year in the city of New York, United States, a trial took place against the mother of a child named Mary Ellen Wilson.

The case of Mary Ellen Wilson was one which raised a great deal of uproar as it highlighted the lack of existence of a public child protection system system and it was precisely this case that led to the creation of the first charity specialising in the subject: the New York Society for the Prevention

of Cruelty to Children. What were the circumstances of this case?
Neighbours had
reported to a Methodist missionary named Etta Wheeler that a child thought to be
5 years old (Mary Ellen, who was, in fact, 10 years old) was a victim of abuse
by her mother. Etta Wheeler entered the house under the pretence of requesting help for a neighbour
with a chronic disability. Under the excuse of requesting help from a neighbour,
Etta Wheeler entered the home of Mary Ellen's parents and thus personally verified
the situation of the child, who was actually a victim of abuse,
both of physical nature, as she presented burns, bruises, cuts to her body and even clothing
not suitable for the season, and also of psychological mistreatment, as the child,
for example, was locked in a closet for many hours a day
and could not go out into the street, except into the building's courtyard at night time.
Etta Wheeler contacted the local authority and asked them to remove the child
from the family home. However, the the local authorities refused, in the absence of a legal framework
that allowed for such removal. Etta Wheeler did not, however, give up: she requested and obtained
assistance from a lawyer specialising in protecting animals from cruelty and,
using this regulatory framework, she achieved the aim of removing the
child from the house. In 1874, the trial took place which ended
with the mother being sentenced to one year's imprisonment for the mistreatment suffered by Mary Ellen.
Some time later, another significant date in the process of affirming
children’s rights arose: 1924. This time we move to Europe, to the city of Geneva.
The League of Nations proclaimed the Charter, known as the “Geneva” declaration,
the Declaration of the Rights of the Child. This was still a Charter which focused strongly
on the material and affective needs of children, in which children were essentially seen
as passive recipients of rights. To give an example, the Declaration stated:
“The hungry child must be fed; the sick child must be treated”.
We would have to wait a few decades to reach a new Charter, the Universal
Declaration of the Rights of the Child, New York Declaration of 1959, this time in the context
of the United Nations. In this document children are recognised as
legal subjects, and the concept is thus introduced that children, like
every human being, can hold rights directly. In the first principle,
for example, we read: “the child must enjoy all the rights set forth in

this declaration". The third principle states: "the child has the right,
from birth, to a name and a nationality". This formulation of rights
was then taken up worldwide in most famous document on Children's Rights,
the United Nations Convention of 1989.
I have emphasised the word "convention"
as this was the first important change compared to the documents of 1924 and
1959. The 1989 Convention is a document that is binding for the States that
ratified it, unlike a Declaration which is an act having merely
programmatic and, therefore, persuasive efficacy for its recipient states.
The 1989 Convention is also noted for establishing a monitoring and control mechanism
centring on the Committee on the Rights of the Child which is based in Geneva and which
examines the periodic reports presented by Member States on the implementation
of the Convention within their national legal systems. Insofar as the Convention is concerned,
the child is granted all rights generally recognised by international charters
to humans, in addition to some specific rights pertaining to children as subjects
in formation. In relation to child maltreatment, it is worth noting, in particular, Article 19,
which protects "the child against all forms of violence" within the family;
then, Article 34, "Protection against exploitation and sexual violence"; Article 35 "child protection
against kidnapping, sale and trafficking"; Article 37 "protection against torture, inhuman and cruel
treatment";
and then Article 39,
which is very significant as it establishes that:
"States Parties shall take all appropriate measures to promote physical and psychological recovery
and social reintegration of a child victim of abuse."

Quiz 5.1

5 points possible (graded)

Quiz 5.1

1. In legal language, which of the following is considered "trauma" to childhood?:

- ○ any form of physical and non-physical violence, even if not committed with the intention of procuring it
- ○ only physical violence, committed with the intention of procuring it
- ○ only physical violence, even if not committed with the intention of procuring it
- ○ any form of physical or non-physical violence, if committed with the intention of procuring it

2. In the case of Mary Ellen Wilson the victim of child abuse received protection in application of:

- ○ prohibition of animal cruelty
- ○ prohibition of inhuman and degrading treatment
- ○ prohibition of corporal punishment
- ○ ban on child abuse

3. Which of the following statements is true?

- ○ Children are not subject to rights
- ○ Children hold specific rights granted to them as trainees
- ○ Children have only rights recognised to every human person as such
- ○ Children are subject to rights if they have the ability to discern

4. Which of the following represents a specific instrument developed within the Council of Europe for the protection of the child?

- ECHR
- European Social Charter
- Charter of Nice
- Lanzarote Convention

5. In the judgment of the ECHR Z. AND OTHERS against UNITED KINGDOM, which of the following is recognised?

- Article 5 of the ECHR (Right to freedom and security)
- Article 6 of the ECHR (Right to a fair trial)
- Article 3 of the ECHR (Prohibition of Torture)
- Article 8 of the ECHR (Right to respect for private and family life)

Legal glossary on international and European Union organisations and treaties

United Nations (UN) = international organisation founded in 1945, with the aim of maintaining international peace and security, developing friendly relations among nations, cooperating in resolving international problems and promoting respect for human rights; it represents a centre for the harmonisation of the various national initiatives. The members of the UN are sovereign states; the United Nations is not a world government and does not legislate.

However, the UN provides the means to help resolve international conflicts and formulates appropriate policies on issues of common concern.

International Convention on the Rights of the Child (CRC) = international treaty approved by the General Assembly of the United Nations in 1989 which expresses a consensus on the obligations of States and of the international community towards children and recognises for the first time that children also enjoy civil, social, political, cultural and economic rights .

UN Committee on the Rights of the Child = established by the UN Convention on the Rights of the Child in order to examine the progress made by the States Parties in executing the obligations deriving from the treaty, it is composed of 18 experts of high morality and in possession of recognised expertise in the sector covered by the Convention. The task of the Committee is to analyse periodic reports on the implementation of the Convention which the States Parties are committed to presenting on the basis of the provisions of art. 44 of the Convention.

European Convention on Human Rights (ECHR) = international treaty by which the member states of the Council of Europe guarantee fundamental civil and political rights not only to their own citizens but also to anyone under their jurisdiction. Signed in Rome on 4 November 1950, the Convention entered into force in 1953.

European Court of Human Rights (Strasbourg Court) = International court established in 1959 with headquarters in Strasbourg. It rules on individual or state appeals concerning alleged violations of civil and political rights established by the European Convention on Human Rights. Since 1998, the Court has been a permanent body and can be approached directly by individuals.

Council of Europe = international organisation whose purpose is to promote democracy, human rights, European cultural identity and the search for solutions to social problems in Europe. Founded on 5 May 1949 with the Treaty of London, it is based in Strasbourg and includes 47 Member States, including the 28 members of the European Union.

Watch out! The Council of Europe is outside the European Union and should not be confused with its bodies.

Council of Europe Convention for the Protection of Children against Sexual Exploitation and Sexual Abuse (Lanzarote Convention) = treaty by which member states agree to criminalise certain forms of sexual abuse of children. It is the first international treaty that deals with sexual abuse of children taking place within the family.

Council of Europe Convention on preventing and combating violence against women and domestic violence (Istanbul Convention) = international treaty that aims to prevent violence, promote the protection of victims and prevent impunity for perpetrators. It is the first legally binding international instrument to create a comprehensive legal framework to protect women against any form of violence.

European Union = economic and political organisation between 28 countries of the European continent, created after the Second World War with the aim of promoting greater economic cooperation between Member States; over time, it has become an organisation aimed at establishing the foundations of a Union among the European peoples, safeguarding the countries and seeking political unity, guaranteeing, through joint action, economic and social progress, such as the creation of a single European market and the strengthening of social cohesion.

Charter of Fundamental Rights of the European Union (Charter of Nice) = proclaimed during the Nice European Council of 20 December 2000, it collects all civil, political, economic and social rights valid within the European Union and establishes the fundamental nature and scope of human rights for EU citizens. Although it became legally binding only following the entry into force of the Lisbon Treaty, it inspired, from its origins, the activity of the European Parliament. With the entry into force of the Lisbon Treaty, the *Charter of Nice* has the same legal value as the treaties and is therefore fully binding for the European institutions and the Member States.

Court of Justice of the European Union (CJEU - Luxembourg Court) = established in 1952, it is based in Luxembourg and interprets EU law to ensure that it is applied in the same way in all Member States and it settles legal disputes between national governments and EU institutions.

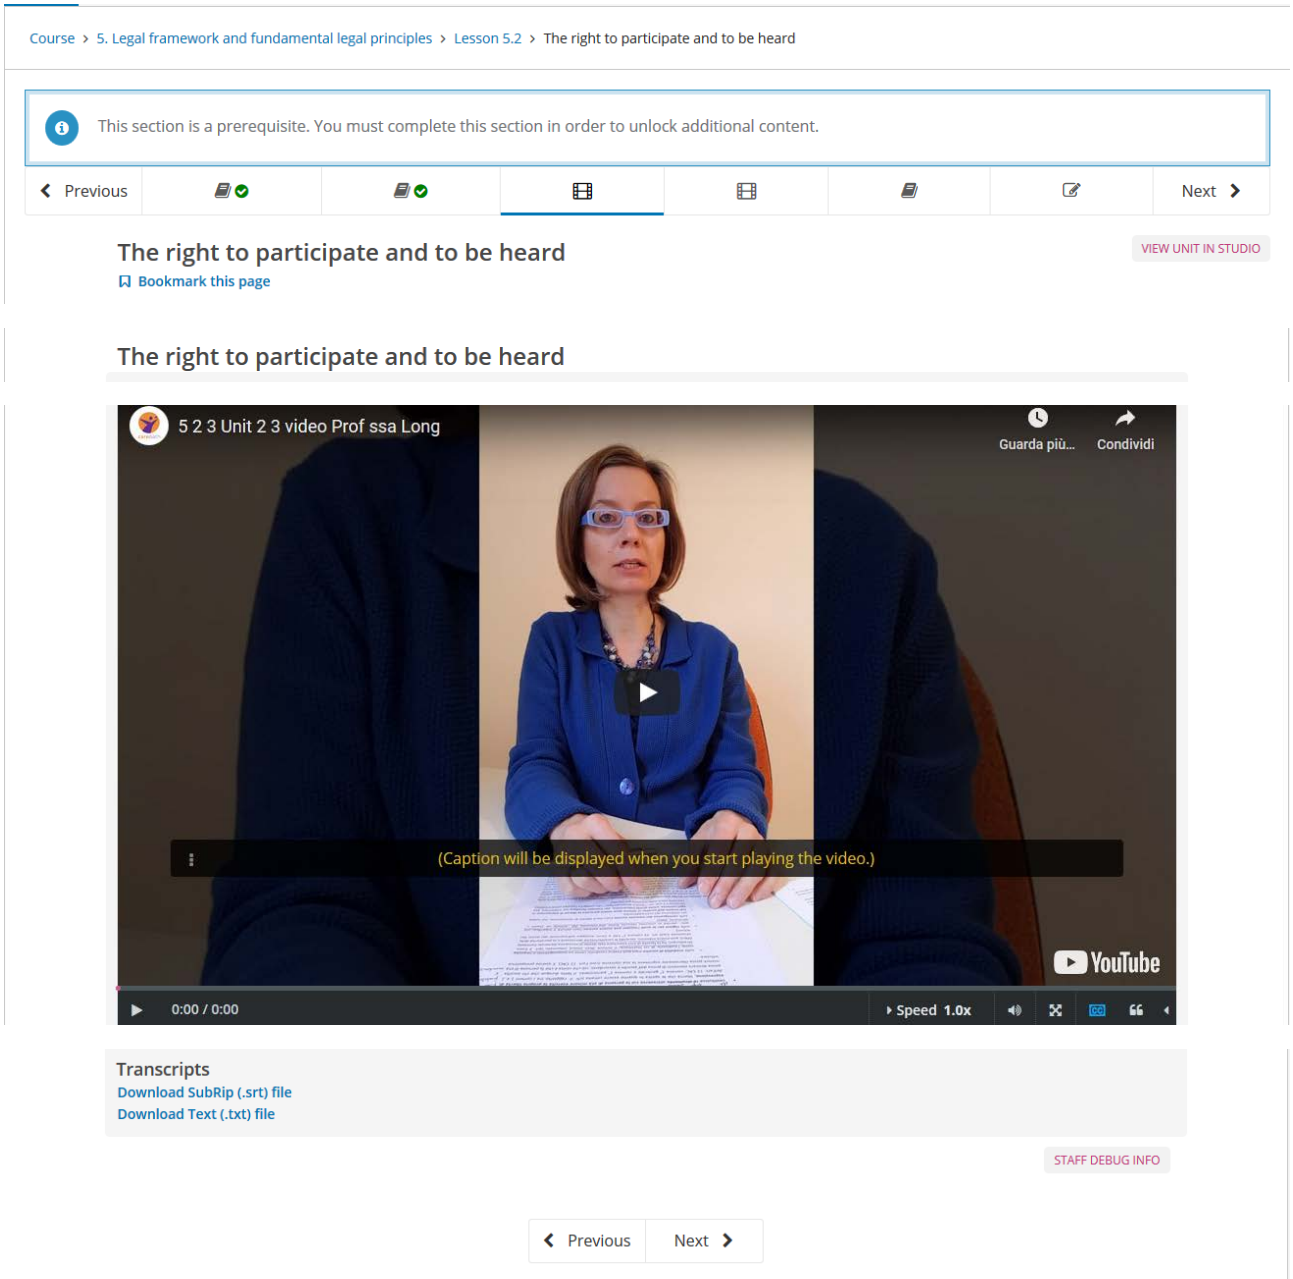
CHILDREN'S RIGHTS

Download the PDF

STAFF DEBUG INFO



Transcript

Good morning.

One of the pillars of the United Nations Convention on the Rights of the Child and, more generally, one of the principles opening the way to the realisation of children's rights is the participation of children and young people in procedures which result in decisions that could influence significantly their lives.

The UN Convention on the Rights of the Child recognises the right of the child, as a human being, to freedom of expression in Article 12, paragraph 1; and, in the next paragraph, it identifies one of the instruments that guarantees the child's participation

in the procedures, in particular, the right to be heard, by the judge or by the other administrative authorities that are to make decisions in the interest of the child.

However, being heard is not the only tool that guarantees the child's participation in the decisions concerning him/her.

The European Convention on the Exercise of Children's Rights, which specifically concerns judicial procedures, at Article 3 recognises the right of the child to "receive all relevant information" and, at Article 4, recognises the right of the child to "request [...] the designation of a special representative" and "if there is a conflict of interest between the persons exercising parental responsibility and the child, who operates, precisely in the judicial procedures".

What does it mean in practice to refer the child's right to be heard heard to his freedom of expression?

It means that, while it may be true that the decision-maker when listening to the child could obtain useful information for the final decision, this preliminary process of being heard is subordinated to the main value of being heard, which is to guarantee to the person the possibility of expressing himself/herself on a theme that is so important to his/her life.

There are some practical consequences that concern, for example, the methods of being heard: this means that this process cannot be conducted as an interrogation or as a hearing of a witness.

It also means, for example, that the child may refuse to be heard by the judge

Since being heard is a right, the right holder may choose not to exercise it.

Well, as regards the reasons why it may be impossible to proceed with being heard: the fact of not having heard a child cannot be motivated by claiming that this hearing was superfluous in the specific case.

The only reason why hearing the child could be ruled out is that being heard being heard would be contrary to the interests of the minor

Another of the pillars of the UN Convention on the Rights of the Child is in fact the protection of the child and the protection pillar must be balanced with the rights of the child to participate in procedures concerning him/her.

We find this need for balancing also in the role played by the will expressed by the child when being heard in the final decision taken by the authority.

The authority, in fact, cannot be considered bound by the will expressed by the child.
In fact, the authority may believe that the will expressed by the child is actually
contrary to his/her interest.
Consider, for example, a minor who, in the context of a civil procedure
concerning family maltreatment, insists on seeing the parent or, more
generally, the abusing adult.
In this case the authority may well deny
the visits and continue suspending the same even if this is contrary to the will expressed by the child.
This is different, therefore, to what happens in the case of adults.
Adults have the right to refuse medical treatment
even if death may result from that refusal.
This is not the case for a minor because, as I have noted, the right to participate,
and in general the right to self-determination, must be balanced with the principle of
the best interests of the child.
However, the need for balance requires the judicial authority and, in general, the
authorities that make decisions about the child's life, to inform the child of the decision
taken and also to motivate specifically the reasons why it was not possible
to adhere to the will expressed by the child himself or herself when being heard.

INTRODUCTION TO THE FILM "THE CHILDREN ACT"

The main characters of the film are Adam, a seventeen year old boy who refuses a life-saving blood transfusion for religious reasons in agreement with his parents, and Fiona Maye, an English judge in the field of family and minors, called upon to decide whether to authorise the doctors to proceed with the blood transfusion regardless.

The film allows us to reflect on two distinctive features of the discipline of minor rights to hearing, found in Art. 12 of the United Nations Convention of Child Rights (CRC).

- **Hearing is the means through which the minor exercises his own freedom of expression**. In fact, Fiona meets Adam because she wants to "know" him and does not "hear" him through the method of an interrogation or a witness hearing. She does not limit their meeting to looking in-depth at the reasons for his decision to refuse the transfusion but chats with him touching upon different topics, such as music and poetry.
- **Moreover, the hearing does not bind the judge to the minor's will. In fact, in the film Fiona decides to act against Adam's will.** As opposed to the adult – who has the right to decide on his own life even if that decision leads to death (e.g. typical of the refusal of a life-saving blood transfusion for religious reasons) – the minor does not hold this right in all cases: Art. 12 of the United Nation Convention of Child Rights (CRC) establishes that whoever decides has to take into consideration the minor's opinion along with growth based upon their age and maturity level, but this is not binding for the judge. Indeed, if the judge or the person called upon to make a decision regarding a minor believes that the will expressed during the hearing does not conform to the minor's interest, not only has he the right, but he must decide in the opposite manner.

Q5.2

5 points possible (graded)

Quiz 5.2

1. Does corporal punishment to the detriment of the child include?

- ○ Also non-physical actions, such as threats, aimed at the humiliation of the child
- ○ Only physical punishment intended to cause pain to the child
- ○ Exclusively physical punishment intended to cause pain or discomfort to the child
- ○ Physical or non-physical actions, except those carried out to educate children

2. Which of the following statements is false?

- ○ Unjustified differentiation by age is prohibited
- ○ Underage people have the right, as such, to differentiated treatment based on age
- ○ The treatment of children must be inspired by the principle of the best interests of the child
- ○ All treatments differentiated by age are prohibited

3. Which of the following statements about the child being heard is true?

- ○ It may be conducted like the hearing of a witness, but not as an interrogation
- ○ It must be guaranteed only in judicial and administrative procedures that concern him/her
- ○ It may be excluded when the child's opinion is superfluous
- ○ It must be guaranteed only in judicial and not in administrative procedures that concern him/her

4. For the case where the child is heard, is the opinion of the child binding for those who decide?

- ○ No, but the decision maker must take this into account
- ○ Yes
- ○ No, the decision maker can disregard it
- ○ Yes if the child has a high degree of maturity

5. In the judgment of the ECHR Z. AND OTHERS against UNITED KINGDOM, which of the following is recognised?

- ○ Article 5 of the ECHR (Right to freedom and security)
- ○ Article 6 of the ECHR (Right to a fair trial)
- ○ Article 3 of the ECHR (Prohibition of Torture)
- ○ Article 8 of the ECHR (Right to respect for private and family life)

Primary victimization = abuse or violence, which causes suffering and physical and/or psychological injuries.

Secondary victimization = further suffering caused by the stress of the proceedings itself, by the memory of the abuse suffered and by the possible contact with the author of the conduct, with the judge and with the lawyers.

Criminal proceeding = jurisdictional procedure through which the author of the conduct against the minor is punished, if his conduct is a crime.

Civil proceeding = jurisdictional procedure in which a judge assesses the adequacy of the child's family environment and takes any necessary measures.

Hearing of the minor = part of the civil/criminal proceedings in which the minor makes statements about the facts relevant to the judge's decision.

Consultation of the minor = part of the procedure (especially civil) in which the minor expresses his views, before the judge takes the decision.

Consent of the minor = further guarantee which consists in the obligation for the judge to obtain the favorable opinion of the minor in order to take a specific decision (for example, custody or adoption).

Representative = when parents are absent, unavailable, or in conflict of interest, representative is a person who identifies the interests of the child and protects them during the proceedings.

Lawyer = qualified person appointed to try to obtain a judge's decision as far as possible in accordance with the interests of the child. Social or health professional = expert in psychology, psychiatry or sociology, who assist the traumatized child during civil and criminal proceedings and help the judge to assess his psycho-physical conditions and his protection needs.

Precautionary measures = provisional measures, adopted by the judge, to protect the psycho-physical well-being of the minor, during the proceedings.

Transcript

The intervention of the Juvenile court for the protection of minors who are victims of abuse

takes place as follows: a request by the

public prosecutor is necessary, as the court does not act on its own;

the public prosecutor's request results from a report

by other persons of abuse suffered by a child

in the family environment.

These other persons, reporting the abuse to the public prosecutor,

are usually social services,

school authorities, or even police authorities

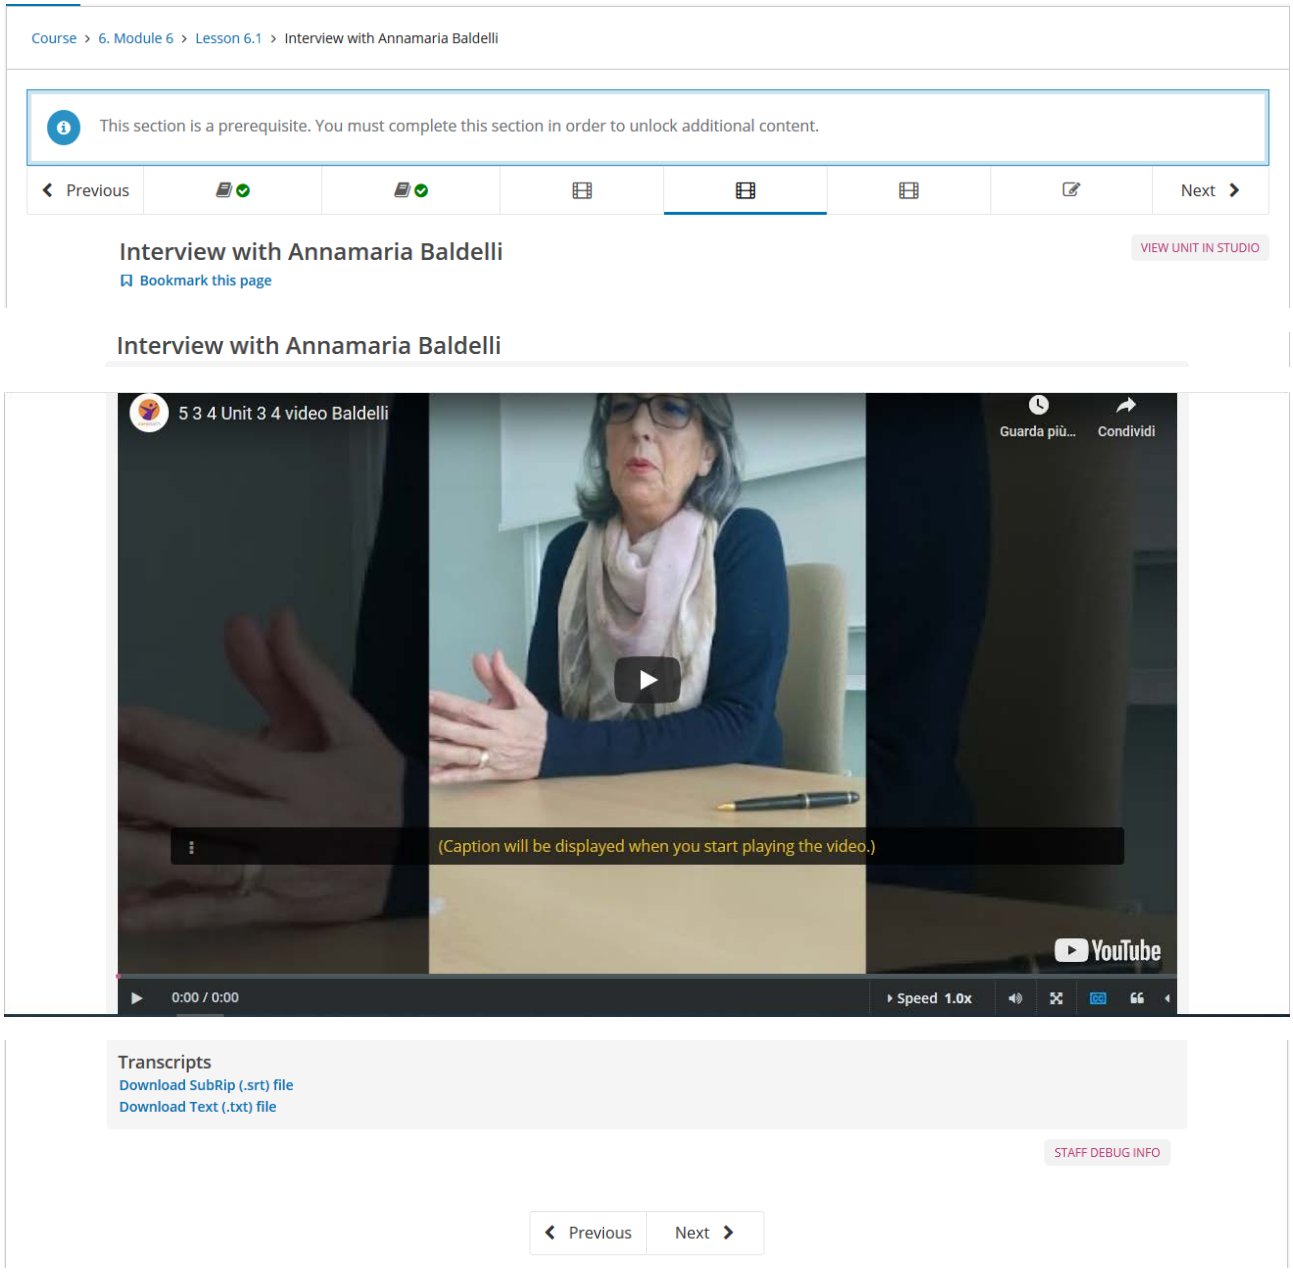
intervening when a crime is committed.
There is also then an intervention, obviously, by the criminal judicial authorities, but, very
often, when a crime has been committed, the interventions are simultaneous: the juvenile court
the interventions are simultaneous: the juvenile court and the criminal judicial authority
intervenes to ascertain the crime.
The Court's intervention is conditioned by the type of request by the public prosecutor.

There are situations in which the public prosecutor may request an immediate
and urgent intervention, in order to remove the child from his/her family environment;
or situations in which the public prosecutor
which the public prosecutor asks the court to carry out investigations to verify
the seriousness of the facts reported, their truthfulness
and gravity,and to identify the most appropriate measures to protect the child.
During these investigations,
or immediately after the removal order
- when the court found it essential to adopt it -
not only the reporting services are involved,
but also other services: the specialised psychology
services intervene and the parents themselves are necessarily involved,
although their intervention is obviously particular. However, the law states
that the parents must be heard prior to the court adopting definitive measures to protect
minors which would limit or
forfeit their parental responsibility,
if the public prosecutor has also requested this type
of decision.
has also requested this type of decision. these proceedings, if he/she is twelve years old or more,
or the judge considers him/her
capable of expressing his/her view.

Obviously it is an evaluation that the judge performs freely, in order to understand
the desires and also the real psychological situation of the minor.
I repeat: it is a real psychological situation of the child that is first

evaluated through the intervention of the specialised services which hear the child and report to the judge on what the child was able to say, also depending on his/her age.

This is a form of being heard which we can label mediated, performed by other persons having specific professional skills, which help the judge to take the decision.



Transcript

The juvenile public prosecutor has the task of activating the intervention of the

Family and Juvenile courts for the protection of minors.

Based upon this generic competence,

when a

crime involving the parents or other relatives of a minor is committed,

two problems immediately arise: the first problem is the coordination with the ordinary prosecutors,

who are responsible for the criminal proceedings, in order to avoid interference that

could damage the criminal investigations;

and the second problem is to collect information

about the prejudice suffered by the minor

and the

personal and family resources, possibly also of other relatives;

an appeal to the Family and Juvenile courts must then be prepared,

with adequate prospects for intervention.

The main difficulty is in containing the timescales,

as proceedings for the protection of the minor have their own timescales, but criminal proceedings also

have a duration that is not always governable. What we try to do

is to ask the police to report, simultaneously, both to the ordinary public prosecutor,

who is responsible for the criminal proceedings against the offender,

and to the juvenile public prosecutor, which holds the power to protect the victim of the crime,

in order to put these authorities in the position to coordinate promptly

and immediately, that is, from the very beginning of the investigation.

This method, also

supported by agreements between with the various prosecutors' offices, has allowed us to define

who does what, when and how, preserving the needs of

the criminal proceedings, but also the measures to protect the minor.

It may occur, especially when the child is admitted to hospital

and there is no disagreement between his/her parents on this admission,

that the protection intervention is delayed and therefore the intervention of the Family and Juvenile courts is delayed, as

the protection of the child is already ensured by

the hospitalisation, and the ordinary public prosecutor, responsible for theù

criminal proceedings against the offender, can carry out his/her own investigations

secretly and thus effectively.

If a decision

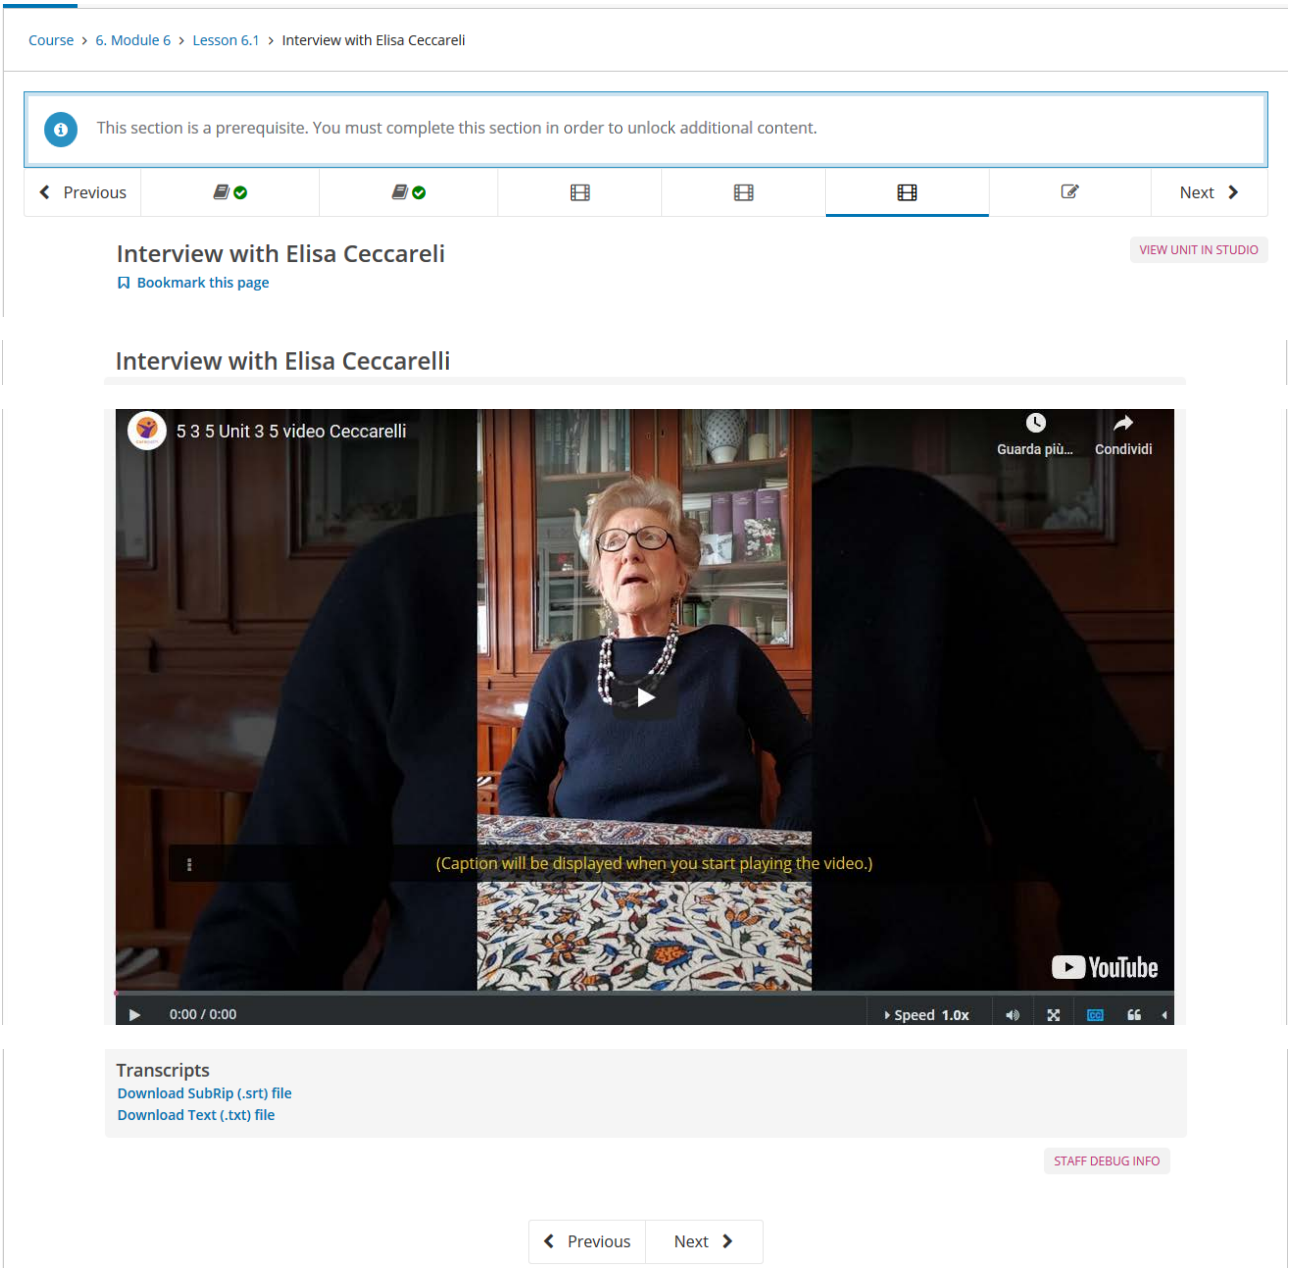
on the protection of the minor cannot be postponed, it may even be a colleague

at the office of the ordinary public prosecutor, responsible for the criminal proceedings, who issues an administrative protection order

through the police authorities, pursuant to article 403 of the civil code,

in order to protect the minor.

That temporary protection measure must then be ratified by the Family and Juvenile courts, with our appeal.



Transcript

I was a juvenile judge for many years and I often wondered what it meant

to hear children and teenagers.

I was never able to hear very young children, as I preferred their hearing to be conducted

in a different environment, by more competent people; in these cases, I only listened indirectly.

On the other hand, I heard many seven, eight, ten and eleven year old children.

They were, above all, children in extremely conflicting family environments, with parents who

did not decide to separate; separate, but in fact always united by conflicts

that had severe repercussions on their children.

What I always tried to communicate to the children
was first of all that there was a person
who was listening to them,
a person who had a specific task - to decide in the best way for them -
and that this decision
may even differ from what the children
wanted, from what they expressed.

The decision depends on the court, it depends on the judge. The judge has to decide;
so I will consider everything you tell me
and I will try to do
what is best for you.
However, the decision may not always
coincide with your wishes. This is something that always happens in life and
something you have to get used to.
I always tried to safeguard the positive aspects of the children's relationship with their parents.
In general, fathers are the
most aggressive in relationships with children
and they sometimes force children to do
things, thinking that this is useful in their conflicting relationship with their former partner.
I tried to
say: look at your father, he has nothing against you and it is right that you love your dad.
However, we know that he has some problems and that he does not accept the current situation.
In short, we must also be able to preserve the father figure.
Therefore, the judge must never adhere to the conflicting attitudes of the child;
however, it is also
necessary to safeguard
the possibility that the child may say
no, I can no longer stay with my father as he
does not understand.
I remember the case of a little girl who was ten years old with two parents;
her father was absolutely very pathological and the decision was:

okay we will wait for the dad to change, if he can change; and if he does not succeed in changing, it will certainly not be the child who will have to bear all this weight.

Q6.1

7 points possible (graded)

1) Secondary victimization is caused by:

- ○ the stress resulting from minor's participation in the proceedings
- ○ the abuse that made necessary the intervention of the judicial authority
- ○ the stress resulting from the placement into a new family
- ○ the repetition of the abuse originally suffered

2) The principle of the best interests of the child:

- ○ applies only to criminal proceedings
- ○ implies that the judge must always take into consideration, above all other interests, the psycho-physical well-being of the child
- ○ applies only to civil proceedings
- ○ obliges the States to avoid the participation of the minor in the proceedings following the abuse suffered

3) The hearing of the child as a witness:

- ○ must always be performed by the judge
- ○ it is preferable that it is carried out in the last part of the proceedings
- ○ it is better that it is repeated at least twice, to test the reliability of the child
- ○ it is preferable that it is carried out at the beginning of the proceedings

4) The opinion expressed by the minor during the proceedings:

- ○ is not binding, but the judge must take it into consideration in order to decide
- ○ is always binding for the judge
- ○ is binding for the judge, but only if the minor is at least 14 years old
- ○ is binding for the judge, but only if the minor has a sufficient understanding

5) Criminal and civil proceedings following child's abuse:

- ○ are separate, but the civil one can start only after the penal one
- ○ are separate, but the civil one can only start if, in the criminal one, parents have been convicted
- ○ address different issues and have different purposes
- ○ have the same purpose and the same object

6) When does the judge order a precautionary measure?

- ○ at the end of the proceedings
- ○ before the beginning of the proceedings
- ○ during the proceedings, to protect the psycho-physical well-being of the child
- ○ during the proceedings, to ensure the reasonable duration of the proceedings

7) Extrajudicial procedures:

- ○ are applied when the relationship between the perpetrator of the abuse and the minor appears to be recoverable
- ○ are applied only when the abuse is serious
- ○ must always be applied
- ○ are applied only when the mistreatment isn't very serious

Social services = range of services, provided by public or private bodies, which respond to collective and personal needs. While the term "services" means standardized services, universally provided to people as members of a category, "social services" respond to "specific needs" of the beneficiaries.

Social Services for children and families = series of measures and activities that meet the general or individual needs of a child and / or his family. These types of services are aimed at satisfying the different needs of children and families, such as specialized and intensive services .

Child-friendly social services = social services that respect, protect and realize the rights of every child, including the right of access to benefits, participation and protection and the principle of the best interests of the child. (Recommendation of the Council of Europe, November 16, 2011, No. 12, on the rights of children and social services for children and their families)

Child-friendly justice = judicial systems that guarantee the respect and effective implementation of all children's rights at the highest possible level, taking into account the degree of maturity and understanding of the child. It is an accessible justice, adapted to the age, rapid, diligent, adapted to the needs of the child and centered on them, in respect of the rights of the child, including the right to due process, participation and understanding of the proceedings, respect for private and family life, integrity and dignity. (See the Guidelines of the Committee of Ministers of the Council of Europe for child-friendly justice, adopted by the Committee of Ministers of the Council of Europe on 17 November 2010)

Early Childhood Education and Care (ECEC) = service offered to children from birth to primary education subject to a national regulatory framework and to compliance with a set of minimum standards and / or procedures for accreditation. The service includes private, public and volunteering services. European countries present different solutions to guarantee the education and care of children below the age of compulsory education. However, ECEC is increasingly becoming an integral part of education systems in Europe.

(See https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=COM:2011:0066:FIN:IT:PDF)

European Higher Education Area (European Higher Education Area - EHEA) = project that aims to achieve a process of convergence and strengthening of higher education or university studies in Europe. This process is in line with the strategies that the European Commission together with the Member States of the Union has launched in recent years to build a true Europe of knowledge and has the main purpose of promoting the mobility and employment of students, improving the quality and make education systems more competitive, attracting students (and teachers) from Europe and other parts of the world. The means to achieve this goal are the support for greater comparability and compatibility between the different systems and the different institutions of Higher Education in Europe, and the raising of their quality.(See https://ec.europa.eu/education/education-in-the-eu/european-education-area_en)

Child-friendly health care = health care policies and practices focused on children's evolving rights, needs, characteristics, resources and capacities, taking into account their opinion. (See https://rm.coe.int/168046ccef)

Child-friendly health care approach = integrated conceptual and operational framework that fully respects the rights and needs of children in the health sector.(See https://rm.coe.int/168046ccef)

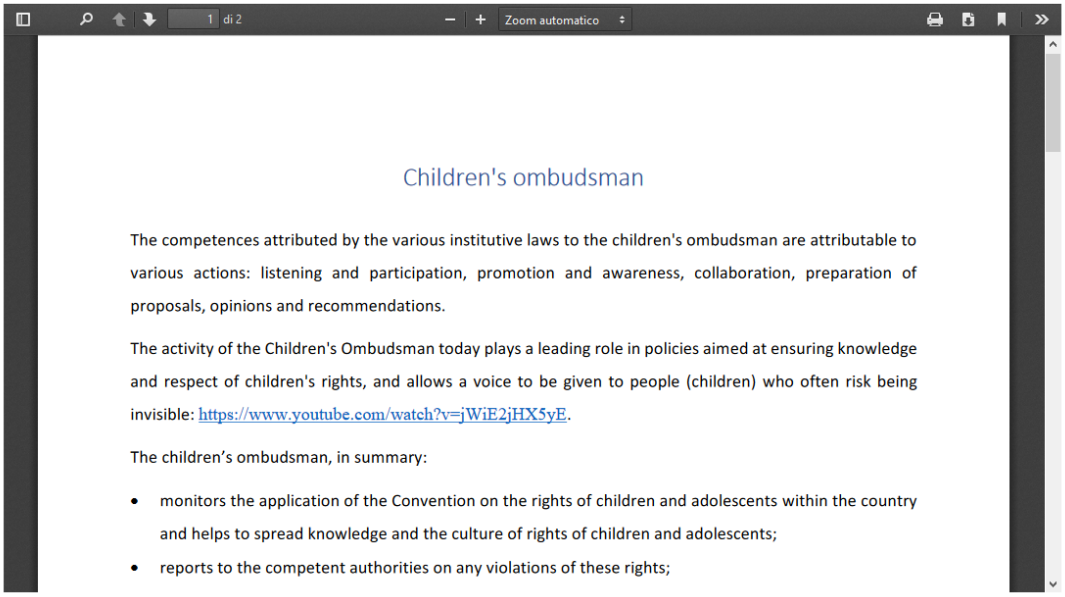
Children's Ombudsman



1 di 2 Zoom automatico

Children's ombudsman

The competences attributed by the various institutive laws to the children's ombudsman are attributable to various actions: listening and participation, promotion and awareness, collaboration, preparation of proposals, opinions and recommendations.

The activity of the Children's Ombudsman today plays a leading role in policies aimed at ensuring knowledge and respect of children's rights, and allows a voice to be given to people (children) who often risk being invisible: https://www.youtube.com/watch?v=jWiE2jHX5yE.

The children's ombudsman, in summary:

- monitors the application of the Convention on the rights of children and adolescents within the country and helps to spread knowledge and the culture of rights of children and adolescents;
- reports to the competent authorities on any violations of these rights;

The experience of a voluntary guardian of an unaccompagned child

VIEW UNIT IN STUDIO

Bookmark this page

The volunteer guardian as the “voice” of the unaccompanied minor

Many minors are forced to leave their country and experience their childhood and adolescence away from home, separated from their families and with no family to ensure that their interests are being protected. The large majority of them have suffered traumatic experiences related to the migratory journey, to their life before it or to leaving their family.

In EU law, the *European Parliament and Council Directive, no. 2011/95/EU*, defines the unaccompanied minor (UM) as: *“‘unaccompanied minor’ means a minor who arrives on the territory of the Member States unaccompanied by an adult responsible for him or her whether by law or by the practice of the Member State concerned, and for as long as he or she is not effectively taken into the care of such a person; it includes a minor who is left unaccompanied after he or she has entered the territory of the Member States”.*

In many European judicial systems the figure of the volunteer guardian is becoming more prevalent. This is a private citizen, highly qualified, asked to legally represent minors who have arrived in the State territory alone and to ensure that their interests are protected, their needs listened to and their potential nurtured. The institution of the volunteer guardian represents, in other words, an example of active citizenship and thus a social policy instrument for minors.

Carlo Infuso, a lawyer from Turin, describes his experience as a volunteer guardian.

“I met V, my guardianee, in an absolutely ordinary situation: he was introduced to me by the Community who was hosting him. I met this boy and I must say that after the mutual introduction we did not know what to talk about. So, I got him on my motorbike and we went for a ride, we talked a little bit and we slowly started to build this relationship which has today evolved into something pleasant, full of mutual trust and enjoyable.

V. is finally starting his life here in Italy. He benefits from international protection and he will therefore have a residency permit when he turns eighteen and even later, as he has got a two year permit. We will ask permission for him to go on to finish his studies.

He is finally starting to understand the importance of learning the Italian language - which he did not realise before - for himself, his relationships with others and with me, with my friends, with the people he sees through me, who he is getting to know better. He is also learning the importance of studying to work as a waiter. He had thought that being a waiter just involved bringing food to the table but, instead, he is now learning to make cappuccino, the cappuccino with the drawing on top, to serve with double cutlery, from the left, from the right, to provide water glasses, glasses for wine, how to place the napkin, and so on. He is discovering little by little the pleasure of learning, learning for its own sake.

He is very funny. He is young, a teenager, and he is mad about music. He has an earring, a trendy haircut... just like any other boy.

Something that amazed me in my guardian role was the fact that he does not get involved with the guardian role. When a decision had to be made, for instance, about what to study and where, V. told me: “I don’t have any parents, you are my Italian father. You decide for me, because I know that what you decide for me will be fine”.

Today, after a few months, I’m glad that V can say: “I’m glad that we chose this study together, as I really like this school”.

The fact that I was able, perhaps through small daily things, to trigger in him a mechanism of confidence towards others, has allowed him to build some self-esteem and today V. is more able to make decisions that he would not have been able to make before, with more awareness, levity and so much more commitment than before.

It is a relationship that grows (between guardian and guardianee) and it is a relationship that can either go well or go badly. In our case, it went well and allowed us to build something.

I can happily say that V. is a guest in my home this weekend; tonight he will probably cook some food and we are all really happy.

Q6.2

5 points possible (graded)

Quiz 6.2

1. In situations of domestic violence or in the case of conflict with parents, children and teenagers:

- ○ must have access to confidential medical advice and advice without parental consent if they are over 14 years old
- ○ must have access to confidential medical advice and advice without parental consent, regardless of their age
- ○ must have access to confidential medical advice and advice with the consent of their parents, regardless of their age
- ○ must have access to confidential medical advice and advice with the consent of their parents, if they have a high degree of maturity

2. The Bucharest Children's Declaration of the European Union is an instrument to mobilise the European institutions and the Member States to establish formal structures and mechanisms that promote the right of children and young people:

- ○ to be heard in any judicial or administrative procedure that concerns them
- ○ to receive or communicate information or ideas without interference from public authorities and without border restrictions
- ○ to benefit from particular protection and therefore to differentiated treatment on the basis of age
- ○ to participate in European Union decisions

3. When, according to the law, a child does not have capacity to give consent to a health intervention, this:

- ○ cannot be carried out
- ○ can be carried out even without the authorisation of his/her representative, authority, person or body designated by law
- ○ cannot be carried out without the authorisation of his/her representative, an authority, person or body designated by law
- ○ can be carried out even without the authorisation of his/her representative, authority, person or body designated by the law if it is possible to reconstruct the child's will

4. The video of the Council of Europe “Tell someone you trust” deals, through child-friendly methods, with the theme:

- ○ of sexual abuse
- ○ of bullying
- ○ of witness violence
- ○ of corporal punishment

5. The Children’s Ombudsman exercises:

- ○ incisive investigative powers
- ○ limitation and sanction powers
- ○ regulatory powers
- ○ powers of moral persuasion

Transcript

You have reached the end of these two weeks of training,

in which we have attempted to identify

and describe the legal and social measures

for the protection of minors who have suffered a trauma.

Therefore, in this short final video, I would like to summarise our course journey,

identifying the most important issues that we have discussed.

Firstly, it is important to remember that achieving the consecration of children's rights

has been a troubled path.

A clear testimony of that is certainly the case of Mary Ellen Wilson,

which only ended positively thanks to the tenacity of a Methodist missionary

and the intuition of a lawyer:

to remove a child

from an inadequate family environment, it was necessary to apply the

law concerning animal cruelty.

hat is certainly astonishing.

Even more surprising, however,

is the context of the decision of the European Court of Human Rights in Z vs. United Kingdom,

also as it occurred over a hundred years later.

Even

in the early nineties, the idea of a State's obligation

to remedy problematic family situations for a child's well-being was

not deeply rooted in the legal system.

Therefore, the European Court judges derived

this duty from the European Convention of Human Rights, recognising

it as a corollary of the prohibition of inhuman or degrading treatments established in art. 3 of the European Convention.

We must then remember that

international and supranational law offered a decisive impulse for overcoming

the legal gaps that

were present in every State.

internazionale e dal diritto sovranazionale.

We must certainly recall the New York Convention

and then the many acts adopted by the Council

of Europe and, more recently, by the European Union.

It was only through these acts the awareness of the minor

as an autonomous subject of rights, holder of a legal position, independent

from that of his/her parents, definitely spread;

thus, today

we can say that this idea belongs to the common heritage of every legal system.

In the same way, it is also

well-established that there is a duty of the State's authorities to prevent
and punish any abuse against children
and to assist effectively those who have suffered abuse towards the complete
recovery of their psycho-physical well-being.
Moreover, it must be stressed that
the minor is an individual with
remarkable peculiarities:
his/her personality is still evolving and,
proportionally to his/her age, he/she certainly requires attention that adults do not usually require;
this special attention is even more
necessary when the child has been the victim of abuse and violence,
perhaps even within the family context.
In other words, it could be said
that, with regard to minors, the rights that generally belong to each
individual have required independent development, taking into account their particular
conditions.
It is therefore true that the child
has the right to be heard and to express his/her opinion on any matter that concerns him/her.
However, it is also true that, if his/her superior interest must be achieved,
the decision may
even differ from what he/she expressed as preferable; it may
also be completely different from the will expressed by the minor.
There is a fourth remarkable issue.
The path towards
recovering the well-being of the traumatised child
may be equally as painful as
the violence and abuse suffered.
Criminal or civil proceedings
are often essential
for achieving numerous and important objectives: to punish those who committed
the crime, if the conduct constitutes a crime;
to prevent the reiteration of the abuse;

to compensate the damage suffered;
and, when necessary, also to restore an adequate family environment.
It should not be forgotten that there is another side of the coin,
represented by
the numerous sacrifices the minor must make to face all
stages of the proceedings.
It is often crucial, for example, for the child to participate
in these proceedings;
and participation is not only one of his/her rights,
but also a fundamental device for ascertaining the truth:
by expressing his/her opinion and telling of his/her experience, the victim can always offer
to the judge important elements for making the final decision.
However, as we have seen,
there are also important risks of secondary victimisation,
as,
during the proceedings,
the minor will probably have to remember the facts and traumas suffered;
he/she will probably
suffer the public exposure related to the case;
in all likelihood,
during the trial, he/she will also have to come into direct contact with the perpetrator of the abuse.
All these are important and relevant risks.
Then, when it is necessary to order the adoption
or even the custody of the minor, it should certainly not be forgotten how
it can be to relate to a new family.
Paradoxically, we could say that the overcoming of the first trauma,
caused by the abuse,
requires the child to face a path in which there may be a risk
of suffering many other smaller traumas.
The most important consideration remains to be made.
It often happens that new rights and safeguards
require a great deal of time and energy to succeed;

and this, as we seen, has also happened with regard to minors.
However, now that
these guarantees exist,
a further step must be taken:
we must realise that law alone is not enough;
that international and supranational Conventions, European directives
and laws of the single States alone are not enough.
These acts are starting points,
a basis on
which everything else must be built.
What matters most - in this field probably
more than in others - is how the guarantees, which are contained in law, are implemented
through efficient social policies.
Central and local administrations
must certainly promote respect of
minors' rights with concrete measures.
At the same time, they must invest
in and create specific services for children and adolescents,
services such as help desks, support groups,
supervisory authorities.
We must not forget the important role
of volunteering and of the associations promoting and protecting
the rights of minors;
these associations are certainly a fundamental element
for implementing effective and efficient social policies.
Public administrations must have
adequate sensitivity and make appropriate investments
to limit the risks of secondary victimisation:
for example, they must certainly set up
special rooms for the hearing,
sensitise judges and lawyers,
ensure the best conditions for the hearing of the minor,

and provide continuous psychological assistance

during the proceedings.

Of course, the contribution of the first users

of this course, that is, the professionals, who interact

with the minor, is fundamental.

You

are

the guardians of minors outside the proceedings,

for overcoming the trauma caused by primary victimisation;

you are the guardians of the minor within the proceedings,

as you can make

more bearable something

that can never be ordinary;

and then you are the guardians of the minors even after the proceedings,

as you have to ensure that the difficult path

towards recovering serenity does not stop when it should

accelerate and finally achieves its goals.

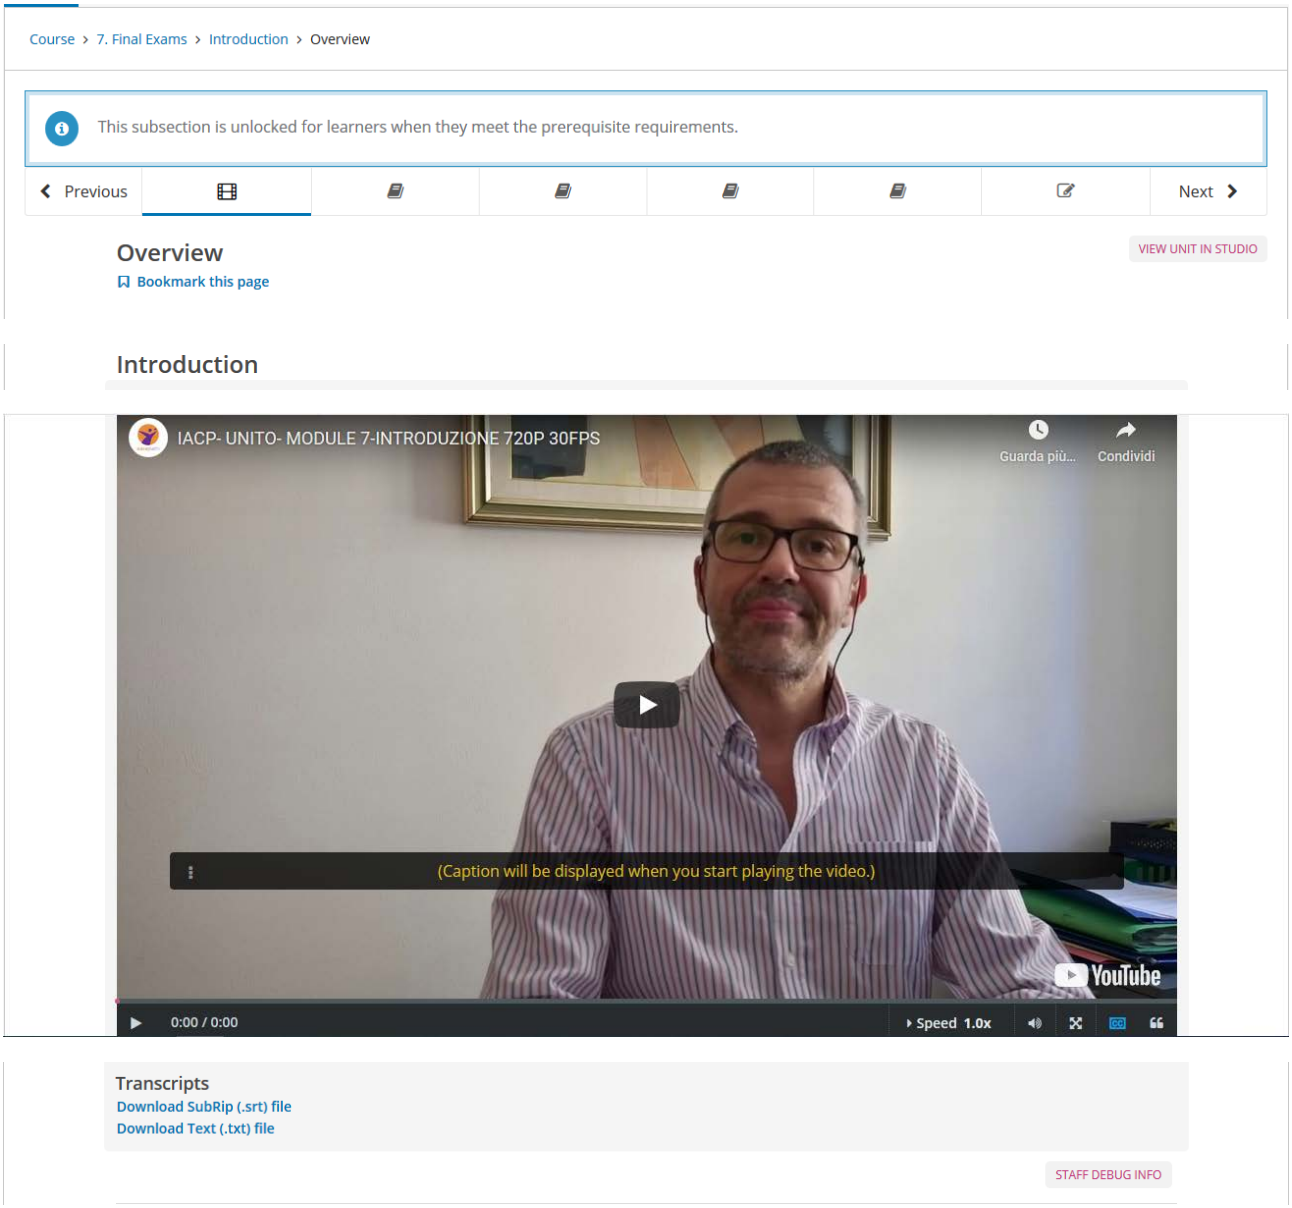
Ultimately, many difficulties await the child or adolescent victim

of abuse;

but, as we have tried to highlight, there are

also many devices to help him/her to face these challenges and to overcome them.

So I wish you all the best of luck in your careers.



Transcript

Welcome.

We are now in the last module, module 4.

This module was designed to evaluate and detect

the possible knowledge gained during the previous three modules.

How will this module work? We will propose three clinical cases, three scenarios.

You will have to choose one of these three scenarios and after that you have to

try to answer by putting together and integrating the skills learned in module one: the theory,

in module two: the research, and in module three, the legislative part; as well as

the relevant aspects of TIC, Trauma Informed Care, and how it can be applied to

the three scenarios.

How should you produce this short report?

You will have several options.

You may produce a PowerPoint file [NOTE: THIS IS NO LONGER SUPPORTED]; you may record a short video, so, you may use this format

or you may produce a Word document or a PDF file, or you may even use

other modes that come to mind.

The peculiarity of this last module

is that there will be a peer review, that is, you will evaluate the project made by another enrolled participant

and your project will be evaluated by a participant as well.

There will be a peer review. The last evaluation, however, will always be carried out

by a senior tutor, one of the project leaders.

This we could really call the last step that we ask of you in order to

obtain the certificate of participation of this MOOC.

Once you have finished your documents and your report, video or PowerPoint presentation [NO LONGER SUPPORTED],

you can submit it, there will be a random and anonymous match with another student,

after which you will be called to evaluate a document, a report or a video.

Then there will be the final submission of your work and after that

a senior will provide a further evaluation and decide whether or not to confirm the closure of your training.

We hope that this has been a pleasant path,

that you were able to learn something or otherwise confirm and value

additional knowledge about Trauma Informed Care. If you like, you can also leave short videos

at the end of your course, with your name and surname,

short documents where we will certify that you have been on this training course.

On my behalf, Luca Rollè, and on behalf of the entire Care Path project team, we would like to

thank you once again for being with us and we hope to see you again

in a future edition.

The PowerPoint (.ppt, .pptx) format is no longer supported due to technical issues. Please submit your final assignment directly in the form or in .pdf format. If your final assignment is a video, please upload your video on a streaming site of your choice and submit a link.

Instructions for peer assessment

VIEW UNIT IN STUDIO

Bookmark this page

During this activity you are requested to analyze the case (Choosing the Scenario you prefer) from a legal, psychological and/or scientific research point of view. You answer should contain your reflections in the light of fundamental principles of Trauma Informed Care.

1. Your can prepare your contribution in

- text (simply enter your answer in the respective area) OR
- you can upload a file containing your contributions. **Important note - the file should be in pdf format up to 5mb.**

In case you have prepared a video you can simply enter the link of your published video so it can be accessed for evaluation.

2. Each learner upon submission of his own contribution has to assess at least 1 contribution from other learners. This is a necessary step, in order to finish the activity.

Important note - In case you need to evaluate a response that is contained into a file, you need to download the file and open it in your desktop/mobile device. make sure that the file has the .pdf extension. If not, please rename your file adding the .pdf suffix at the end.

3. The final step includes the Staff evaluation of your contribution. Upon completion, the final grade will be available to you straight away.

VIEW UNIT IN STUDIO

Caro Clinico di Emanuela Tardioli

C.F. is 15 years old; she has been referred by the local hospitals to the local community service.

She irregularly attends high school with poor results and has been brought to the Hospital Emergency room for the ingestion of an excessive quantity of psychotropic drugs.

After the first-aid intervention, she was sent back home with the obligation for the whole family to follow a program of support and help.

The minor shows an angry attitude, she does not want to be at the interview or talk about her situation, she does not understand the reason for this referral. She claims to have done a stupid thing with her friend but certainly she will not repeat it.

After receiving empathic understanding of the fear, she experienced taking the overdose (she refers at the episode as doing a "bullshit") and receiving information of the terms of the services offered, the girl opens up, sharing her story and her fragility. She reports that her the parents have been separated-even if not officially- since few months ago and that the mother left their home.

C. reports that the mother leaving is a positive new development for her, since she has a very difficult relationship with her mother and the fact that mother is away from home makes her feel calmer; on the one hand, that entails not having any more around person who helped her to do things. For a long time, when C. went to elementary and high school, her mother was angry and beat and insulted her when C. did something wrong. The mother used psychological and physical violence to punish her; her typical insults where : " "stupid" "you're a bitch" However, in the last year C. began "finally" to no longer suffer passively this mistreatments, she started to respond to her mother attacks and sometimes she engaged in quarrels and even in physical fights with her mother. She experienced her new active behaviour with her mother as more satisfactory that the previous one. Her father is away all day for work, C. says that he is a good person, who nevertheless is returning at home only in the evening and does not seem interested in his family dynamics, probably because he comes home very tired from work. Things seem cold between her parents. In her family, people do not get together to carry out some common shared activities. Sundays are also spent at home or with her aunt (her father's sister). For C. the aunt is a significant adult and an important point of reference.

When C. was 13 years old, together with her friend started smoking tobacco and marijuana at school. She did like the feeling of relaxation and fun she experienced smoking marijuana and soon she started to hang out with a group of people who share the same "interest" in smoking grass.

After a few months of continuous difficulties at home, her mother started to be less present, every day in the afternoon her mother went out and this allowed C. to be free to invite her friends at home. Initially, she was happy with this new situation, she felt that it was an improvement of her life situation. Then one day she discovers, while travelling with a friend, that her mother is seeing another man and she see them sitting in a bar outside their neighbourhood in clear lovers' postures.

At this point, C. says, that she finally found herself in a position to get from her mother everything she wants, because her mother cannot escape her daughter' requests: C. wants to take her boyfriend home and be alone with him and asks her mother to leave her alone. Initially, the mother doesn't want to, but when C. tells her that she must, otherwise she will inform her father of her extramarital affair, her mother surrenders to her request. C.'s requests and her mother's concessions increase: C. takes whoever she wants home, smokes at home, and she is allowed to buy beer and to get all the money she asks for. The mother gives in to her requests, but C. receive from the mother her anger and insults and all her contempt.

The father's is not aware of all this. While talking about this C. shows an attitude of sad triumph and of great anger.

This state of affairs goes on for around a year, until in September, her father, discovers the wife's betrayal, ask her to leave their home.

At that point C. is even freer and she is alone until her father's return from work, she begins to be late at school or not to go to school at all, until, staying at her friend's house and finding a medicine of her friend's mother, they decide to try to take it together. After this episode, the father is called by the mother of the friend who has found C and her daughter deeply asleep on the bed and in a confusional state: "unfortunately" both girls are rushed to the hospital emergency room.

VIEW UNIT IN STUDIO

Case Study 2

B. is a 15 y.o. student, first of two; her mother is a businesswoman and her father is unemployed; the four of them live in a major city's suburb.

B. comes at consultation due to severe and invalidating physical pain, involving the lowest part of her body (legs and abdomen) that are not explained by any medical condition (her parents got her to examined by several professionals).

This pain impedes her from having a satisfying lifestyle, adequate for her age: going regularly to school is impossible for her, therefore she's risking to flunk and having to repeat the year; furthermore is really difficult for her going out with her friends or practicing some kind of sport because every plan could be shattered by this sudden, piercing pain.

At our first session she looks untidy, rather introverted (she lowers her gaze, whispers few words) and bent down (she spends all our time together crouched on her chair). She reports to have decided to ask for help because she's aware about the need to take care of this problem which "is shutting me in my house".

She possesses quite an extensive knowledge, great curiosity and a vivid intelligence, all of which seem to be the counterpart of her fix and folded body.

She says she has no idea of what may have started her symptoms, which appeared approximately at the time of her menarche.

She recounts she has wonderful relationships her family members, very few friends and to struggle a lot to be in groups, whether they be composed by peers or with adults. She loves to read and listen to music and studies several languages as an autodidact.

During our first year of psychotherapy, working on the invalidating meaning of her symptoms and focusing on empowering her, the pain is circumscribed and appeased: it appears just before her period and it makes her lose at most only 2 or 3 days of school. But there is still no consciousness about the origin of her symptoms and, moreover, she has frequent panic attacks.

In addition to B.'s individual sessions, periodically, I meet all the family which, even if they express concern about B.'s suffering, recognizes her great changes and the resources she was able to use to come back living a satisfying life.

After two years of psychotherapy, B. can manage her panic attacks, which had been becoming really sporadic and to use various strategies to manage pain (autogenous training, yoga, guided fantasies, breathing techniques).

However, while she's watching a movie in which there's a sexual assault scene, she experiences a sudden and intense anguish sensation, which she'll report to me at our next session as "an internal black out".

We begin to explore this feeling, trying to approach these "fragments of dream" as she initially refers to which later become blurry images hard to define as memories or fantasies borrowed from books or movies.

Working with respectful timing and modalities, not wanting to force her, her defensive strategies or her understandable fears, but meanwhile continuing to support her inner resources, slowly, B. recalls the memory of a person to whom she was entrusted while her parents were away (from age 3 to age 7) that sexually abused her.

Recalling the memory allows to start the process not only to report the abuser and to create a safe environment for herself (the abuser was still sporadically seeing her family) but also to make sense to her psychological suffering, up to that moment managed, but not signified or symbolized.

VIEW UNIT IN STUDIO

R, a minor of 13 years of age, is referred by the tribunal to a local health agency.

He attends elementary school and has been in a foster home since he was 9 years old.

At this first meeting he is accompanied by the educator of the family house and is open and interested in getting to know the people with whom he has an interview in order to have our service take him as a client. Initially he is sociable answers questions, interacts with people, jokes and is simpatico. When we start talking about the reasons of this colloquium he express confusion he doesn't understand why he is there, what he should do, what we want from him and he asks for answers to these questions giving voice to disorientation and different fears (of being obliged to be further away from his parents, of hurting them, of someone deciding that he won't be able to see them anymore, etc...).

His parents, after a period of separation now live together, just like when R. was removed from his family. The boy remembers several quarrels between his parents , they didn't get along very well, and several times the mother, from a different country than the country of residence, tried to return to her family of origins. When his mother left R. was sorry, but also happy because at the same time since his parents quarrels stopped for a while. He loves his parents and even now he is happy to spend time with them.

He speak with them everyday over the phone and sees them once a week when they visit him in the family house.

He's been there for a couple of years and he's fine, although he'd like to go back home, but he doesn't know if it's possible.

He doesn't remember well the day he entered the family home, but he knows that it was his father who accompanied him. Mom stayed home crying and he felt very sorry for her. Dad was stronger, because he accompanied him, and as always filled him with words, but he did not cry.

R. was scared when he entered the family home, but there he found some nice and funny people who made him feel less scared and it was easy to make friends with the rest of them too.

R. enters the foster home after a friend of his parents made sexual advances, violating him. He doesn't tell anyone, but at a certain point these things emerge (R. still doesn't know why) and he ended up in court. This man was a friend of his parents and he frequented his parents home quite often, he was fond of him and R. felt that he was important for him as well: In the evening this adult would read him some stories and sometimes R.' father would ask him to put R. to bed.

When those ugly things happened and came to light, his father accompanied R. to the foster home, wanting to protect him from this man.

R. doesn't really know how he feels about all this, maybe - he says - just a lot of confusion.

In the family home he's fine, but sometimes he feels a bit forced to obey to some hard rules, then he gets angry a lot and ends up acting out and damaging objects, but never people. In particular, R. can't stand the fact that in order to speak with his parents or to see them he has to follow rules that he doesn't understand; On the other hand, in this family home, he does interesting things (even practices sports), he feels good relating with the other people. He likes having friends around him even though, sometimes he wants to be left alone and would like to have space for himself.

R. has established a special relationship with and educator who takes care of him a lot and R. likes that quite a lot.

R. has many fears about what will happen when he leaves the foster home, not because he has to leave now, but he knows that eventually at some point this will happen and he doesn't want his parents to know that he experience these fears, since he is afraid they will feel sorry and think that he doesn't love them.

Empowering public authorities and professionals towards trauma-informed leaving care support

Training and assessment material
ANNEX 1
–
English Version

Co-funded by the European Union's Rights, Equality and Citizenship Programme (2014-2020)

UNIT 1: DEFINITION OF RESEARCH

ARTICLE

It is not easy to define the boundaries of what research is and is not. Over time, many definitions have been given. Let's take a look at some of the most recent:

"The research simply seeks the answer to certain questions to which it has not been given a response and the answers depend on human efforts. [...] In reality, research is simply the process to arrive at reliable solutions to a problem through the planned and systematic collection, analysis and interpretation of data." (Singh, 2006, p.1).

"Research is a creative process of discovery that develops according to a pre-established itinerary and according to pre-established procedures that have been consolidated within the scientific community" (Corbetta, 2015, p.15).

In general, research is being carried out "whenever curiosity and intuition are applied with a systematic approach to answer questions about day-to-day phenomena, taking advantage of the experiences and knowledge already acquired" (Research Italy, 2013).

There are different types of research that differ according to its application, objectives and methods of investigation. Research can in fact be "applied" or "pure". Applied research aims to find a solution to an application problem that needs to be addressed, while pure research mainly concerns generalizations and the formulation of a theory (Kothary, 2004; Singh & Masuku, 2013). Depending on its objectives, research can be descriptive, exploratory, correlational or explanatory. Descriptive research aims to describe a phenomenon, a problem, a situation.

Correlational research aims to explore a relationship between two or more variables.

Explanatory research aims to explain why certain things happen.

Exploratory research aims to examine the feasibility of a study or to explore a little-known thematic area.

The investigation to be started needs a work plan determined by procedural steps that must be carried out in relation to the investigation itself; these phases are known as "research design".

Depending on the techniques used, research can be divided into:

- Quantitative research: it uses a structured approach, aims to quantify the variation or diversity of a phenomenon, situation or attitude through a well-structured research design, which provides quantitative data that can be analyzed to verify hypotheses and test relationships between variables.
- Qualitative research: it uses an unstructured approach, it is explanatory, descriptive and inductive in nature with particular attention to context and aims to identify and describe as many variations as possible in a phenomenon, situation or attitude, understanding the reasons underlying the variations. The latter implies an "interpretative and naturalistic approach to the world; it means that qualitative researchers study phenomena in their natural contexts, trying to give them meaning or interpret them in terms of the meaning that people bring them" (Denzin & Lincoln, 2011, p. 3). The aim of qualitative research is to describe and understand phenomena rather than predict and/or control them (Streubert & Carpenter, 2005).

The mixed approach, on the other hand, combines both quantitative and qualitative research methods. "Social research is based on the definition of variables, the search for associations between them and the attempt to understand if and how the variation of one thing causes a variation in another. Some common variables that you will find in social research are age, gender, ethnicity, race, education, income, marital status and employment" (Bernard, 2006, pp. 28-29). First, then, we find the concept of variable: something that can take on more than one value. Secondly, there is the concept of "measurement": in fact, the variables are measured by their indicators, which are defined by the values of the variable itself. Measurement implies which value to record. Any search must also respect the principles of validity and reliability. Validity means that the search must have accurate measuring instruments, data and results; while reliability means that the same results are obtained by measuring them several times with the same instrument.

Bernard (2006) explains the four fundamental points that the research process follows:

1. First, a theoretical problem is formulated (scientific theory and literature);
2. Then, appropriate units of analysis and method are selected;
3. Then, the data is collected and analyzed;
4. Finally, the theoretical proposition with which the research was started is either contested or supported.

(Bernard, 2006, p.69)

UNIT 2: ACTION RESEARCH

ARTICLE

Traditionally, the task of research has been to extrapolate laws inscribed in the nature of the world by analyzing phenomena objectively. The researcher must face the phenomena he studies from an absolutely neutral position. Research is by definition addressed to theory; it tends to generality and to build models as universalistic as possible. Action, on the other hand, in common experience is imbued with motivations, desires, emotions and knowledge that are often not logical, are contradictory and aimed at doing, obtaining and transforming. Action is directed towards practice, it is linked to the particular and to the singular, localistic and situational, historicized, not always predictable in its origin and in its outcomes (Amerio, 2000). Action-research was born with the intent to combine these two dimensions that traditionally have been seen as separate and irreconcilable. The two cornerstones of action-research, which differentiate it from traditional research, are participation and cooperation. Elliot would define it this way:

"Action-research could be defined as the study of a social situation with the aim of improving the quality of action within it. In other words, it aims to introduce a practical evaluation in concrete situations; the validity of the "theories" or hypotheses it generates depends not so much on "scientific" verifications of the truth as on their usefulness in helping people to act more intelligently and skilfully. In action research, "theories" are not independently validated and then applied to practice. They are validated through practice." (Elliott, 1994, p.97)

And again:

"The situation-problem must be diagnosed and remedial action must be planned and implemented, the effects of which must be controlled if improvements are to be made. This overall process of Analysis-Diagnosis-Planning-Actuation-Effects checking is called action-research [...]". (Elliott, 1994, p.96)

The original model of action-research was developed by Lewin (1946) with the aim of understanding the problems existing in specific contexts through the sharing of knowledge between people who are both researchers and experimental subjects. Action takes on more and more value because it becomes a moment in which knowledge about the problem is built up. The process of change takes place in three stages:

1. Unfreezing: the initial balance is broken by acting on resistance factors linked to adherence to social norms.
2. Moving: new and existing elements in the field move according to the forces acting within the field.
3. Refreezing: the new situation stabilises around a new balance.

Action-research is therefore a 'systematic collection and analysis of data for the purpose of taking action and bringing about change', generating shareable practical knowledge (Gillis & Jackson, 2002, p. 264).

The aim of any action-research is to produce social change through action (or actions), which is in turn the ultimate goal of the research (Greenwood & Levin, 1998; McNiff & Whitehead, 2006; MacDonald, 2012).

Researchers who start an action-research, have in mind the assumption that reality is created and recreated by a continuous social process. They recognize that, according to Argyris et al (1982), the crucial elements in a research approach that works within a specific social situation are: collaboration between researchers and reference communities; a critical investigation process; focus on social practice; and a reflective learning process. This necessarily implies a different type of research from the verification of hypotheses, which places more attention on the themes of the research, necessarily declared and discussed, to allow anyone interested to submit the research to critical examination (Checkland & Holwell, 1998).

UNIT 3: PARTICIPATORY ACTION RESEARCH

ARTICLE

As Vargiu (2008) highlights, the field of action-research brings back very different experiences, but united by the fact that they pursue two main objectives: understanding and change. By analysing the literature, it is possible to define action-research as a "family of approaches" (Reason 1994, Reason - Bradbury 2006) oriented to "place research at the service of the community, through the activation of participatory practices for the purposes of social change. This implies substantial differences with respect to other forms of research, regarding the objectives that the researcher sets himself, his epistemological assumptions and his practices. (p. 206). According to the author, this "family" is associated with many approaches and practices, including: 1) action research, 2) participatory research, 3) participatory action research, 4) participatory action research, 5) action science, 6) action inquiry, 7) sociology of action or *sociologie de l'action* (Bartoletto, 2006). Vargiu (2008) also adds those experiences that can be traced back to the Community Based Research to the Community Based (Participatory) Action Research and observes that "participatory research and participatory action research can be brought within the category of research that Capecchi (2006) defines as "con-ricerca"". (p. 209). According to the author, what allows useful differentiation is the level of participation foreseen in the research process and how much, in the definition of the objectives, the procedural elements and the instruments, space is given to the subjective and collective dimension.

Participatory research and action-research are increasingly becoming central paradigms in the social sciences (Brydon-Miller et al., 2004; Greenwood and Levin, 1998; Kindon, Pain and Kesby, 2007; Jason et al., 2004; Park et al., 1993; Reason and Bradbury, 2006; Selener, 1997; Taggart, 1997). As indicated by Kindon, Pain and Kesby (2007) and by Mackenzie and colleagues (2012), Participatory Action Research (PAR) involves researchers and participants in an overall project, aimed at examining a problematic condition or action with the aim of modifying it in a better direction (Wadsworth, 1998). It is a collaborative process of research, education and action (Hall, 1981) oriented towards social transformation (McTaggart, 1997), starting from the recognition of the existence of a plurality of knowledge in a variety of institutions and contexts (Kindon, Pain and Kesby, 2007). The process is cyclical (based on reflection-action cycles): researchers and participants identify a problem or situation that needs changing and

initiate research that draws on skills and resources to accelerate relevant action. Both researchers and participants reflect on this action, learn from it and move on to a new cycle of research/action/reflection. As Kindon, Pain and Kesby (2007) specify, they also cooperate in the development of context-specific methods to facilitate these cycles. In summary, PAR focuses on the dialogical engagement between co-researchers (Kindon, Pain and Kesby, 2007) and PAR is, therefore, an orientation in doing research (Reason 2004; Kesby et al, 2005), which requires methodological innovation and considers the research process as well as its products: its effectiveness is not only inherent in the quality of the information generated, but is also defined by the extent to which the participants' skills, knowledge and abilities are developed through research experience (Cornwall and Jewkes 1995; Kesby et al., 2005, 2007; Maguire 1987).

Reason and Bradbury (2006) argue for the need to adopt a participatory perspective or world view, which "asks us to be both situated and reflective, to be explicit about the perspective from which knowledge is created, to see investigation as a process of knowledge, to serve the democratic and practical ethos of action research" (p. 7). In line with Kindon and colleagues (2007), the key is an ontological view that implies that human beings are dynamic agents, endowed with reflective skills and personal change, and an epistemology that embraces those skills within the research process.

In accordance with a fundamentally participatory perspective, in PAR, the choices on the modes and levels of participation are not only made *a priori* by the researcher, but negotiated with co-researchers and participants. The most common methods used in PAR focus on dialogue, storytelling and collective action and the most commonly used are (Kindon, Pain and Kesby, 2007):

- Surveys
- Participant observation
- Secondary data analysis
- Learning by doing
- Dialogue
- Political action

- Group work and discussions
- Interviewing
- Storytelling
- Mapping
- Community art and media
- Diagramming
- Educational camps
- Exchange programmes
- Ranking and scoring
- Shared analysis, writing and presentations

As already highlighted, active research becomes participatory action research depending on who is involved in each phase and to what extent. Participants as collaborators can inform the design, propose methods, facilitate some activities and, above all, review and evaluate the process as a whole (Mackenzie et al., 2012). From the planning phase PAR tends to involve the use of established research techniques adapted to the situation and considers it essential to develop a strategy (before the action) to monitor and evaluate the effects of the action. This should allow the identification of the extent of the changes, but also to "articulate a robust epistemology against which to assess the validity and salience of new or emerging knowledge, similarly to a systemic thinking system (Ison, 2008). Effective monitoring and evaluation procedures provide the rigour of the process to assess the effectiveness, appropriateness and relevance of the action-research intervention. It also provides a framework to establishing causality in determining to what extent the research activity "caused" or "contributed" to desired changes in the situation" (McAllister and Vernooy, 1999)". (pp. 12-13). The evaluation of the process and outcomes by the participants provides a further avenue to consolidate stakeholder engagement and offers the opportunity, collectively, to co-construct an active and critical commitment, in which alternative voices are indispensable and enriching. The PAR therefore requires the

researcher to abandon control and take on the role of facilitator of the process (Kindon, Pain and Kesby, 2007; Janssen et al., 2013).

As highlighted by Kangovi and colleagues (2014), PAR in the field of mental health can be considered a good strategy to make the patient's involvement in the design operational. Its cooperative and iterative nature allows researchers, healthcare staff and patients to collaborate in the design of interventions validated by end users. It can also be used to adapt an existing intervention to specific needs and, when it is disseminated, to new settings and/or patient groups. About the field of application to young populations, as indicated by Shamrova and Cummings (2017), the children's rights paradigm has providedgreat impetus for researchers to recognize children as active participants in building meaning. In this, PAR is a mechanism through which agency is distributed to participants, supporting the implementation of children's rights (Checkoway, 2011; Quijada Cerecer, Cahill and Bradley, 2013; Shamrova and Cummings, 2017). In addition, throughout literature, results regarding its application are also reported at an organizational level; the most frequent were the changes in the organizational culture aimed at: increasing the possibilities of participation, increasing the level of inclusiveness towards the child, and spreading greater awareness to make the programs better adapted to the needs of children and youth (Shamrova and Cummings, 2017). In this, the authors (Shamrova and Cummings, 2017), have identified some methodological choices that could help to support the participation of children as meaningful:

- training

- the construction and use of child-friendly data collection tools

- the active involvement of children in the analysis of data and in the reading of results

- the choice of significant locations for the dissemination of the results of the research.

With regard to research with vulnerable groups, as indicated by Lushey and Munro (2015), PAR can promote the rights of children participation and those who lose their care and, at the same time, inform the empirical basis resulting from studies on these populations.

On a conceptual level, particularly interesting is the Youth Participatory Action Research (YPAR) (Anyon et al., 2018; Rodriguez and Brown, 2009), which includes the following founding principles:

1. it is based on investigation
2. the areas explored are the experiences just as they are lived by young people
3. it is participatory
4. has a transformative nature

Its key processes are:

a) the sharing of power between young people and adults during the whole process

b) training and application of research and advocacy methods

c) the critical use of strategic thinking on how social change can be created;

d) building alliances with all stakeholders.

Finally, an example of research according to the PAR paradigm is the one carried out by Törrönen and Vornanen (2014) with care-leavers. In line with the above principles, as indicated by the authors, the professionals and researchers involved took on a supporting role, while the young people conducted interviews, collected data from their peers and encouraged the expression of opinions about the experiences (Törrönen & Vauhkonen, 2012). The central aspect was, in fact, the attention to the vision of minors involved as co-researchers; therefore, they were fully involved in the research process.

UNIT 4: EVIDENCE-BASED RESEARCH

ARTICLE

The term evidence-based research (EBR) was coined in 2009 to indicate the approach that counteracts the significant source of waste in biomedical research (Robinson, 2009) which was mainly due to primary studies performed without a systematic review of available evidence. This was considered neither ethical nor scientific (Lund, H. et al., 2017). Evidence-based research always starts from a systematic review (SR), which includes predefined research questions, inclusion criteria, research methods, selection procedures, quality evaluation, data extraction and statistical analysis (Lund, H. et al., 2017). Systematic reviews are used to understand and prioritise research and whether it is necessary and useful to the community or a possible source of wasted resources because it does not produce new scientific knowledge. The guidelines suggested by Evidence, an open access journal of the GIMBE Foundation (Italian Group for Evidence-Based Medicine), to create an evidence-based research project are as follows:

1. Formulate the preliminary research question and identify relevant systematic reviews;
2. Assess the adequacy of the purpose, quality and updating of the research;
3. Evaluate the details of: population, intervention, comparison, outcomes, and time range (PICOT);
4. Evaluate the method used and the results.

Ultimately, researchers should use systematic reviews to formulate the final question of the study they wish to promote; justify the need for it during the application for funding and approval by the ethics committee; interpret the results of the new study in the context of the available evidence; and make recommendations for future research. Over time, there has been an exponential growth in evidence-based research, which has led to the publication of about two million articles in over twenty thousand journals. There are many reasons for this growth, on the one hand its educational vocation (JAMA, 1992) and the paradigm shift (Pagliaro & Colli, 2014) that led to this practice, and on the other hand, the strengths that evidence-based research presents:

- it allows to produce knowledge and guide professional practice in areas where there is greater uncertainty about the interventions carried out in clinical practice;

- it reduces waste because it defines the priorities of research questions taking into account previous systematic reviews;

- it allows a clear description of research designs (target population, interventions, comparisons, outcomes);

- it produces updates and disseminate systematic reviews;

- it integrates evidence into clinical practice;

- it allows a continuous re-evaluation of one's knowledge (GIMBE).

UNIT 1: EVIDENCE BASED RESEARCH IN TIC/TIP: INTERNATIONAL PERSPECTIVE

ARTICLE

One of the main themes in the organization of services dealing with traumatized minors and one of the major requests coming from these is how to guarantee adequate and effective training for professionals on evidence-based interventions (Ruzek & Rosen, 2009). When observing the situation of the implementation of treatments and evidence-based guidelines from a general perspective, despite the importance of this theme in the field of public health, an unevenness of implementation and limited attention on systematic evaluation and long-term effects of training programmes can be inferred (Ruzek & Rosen, 2009). Furthermore, from a comparative perspective, Delaney (2006) underlined another relevant aspect: on an international level, the guidelines and their implementation in elective treatments throughout clinical practice vary considerably on a national level and throughout different nations (including public health regulations). Weiner, Schneider & Lyons (2009) studied the analysis of evidence-based methods for the treatment of trauma in minors. As specified by the authors, some of these have been tested through experimental or quasi-experimental methods, but most methods were structured for adult populations despite being applied to minors as well, and were evaluated with little to no attention paid to cultural variables and differentiation of subgroups based on factors impacting outcomes. From these observations, an interesting solicitation on cross-cultural validation of treatments can be derived, which would allow not only an expansion of efficacy, but also an exploration of which barriers hinder their implementation and of flexible adaptation requirements relative to specific subgroups or application circumstances. Courtois & Gold (2009) and Layne & colleagues (2014) highlighted the need to include a specific focus on trauma and its consequences in operators' training, starting from an awareness of the fact that trauma and its effects impact all phases of treatment such as, specifically, the patient's engagement, the assessment, and the response to treatment. Furthermore, they underline how, in this respect, a relevant role is played by the creation of international standards and shared training methods for operators in Evidence-Based Practice (EBP; Lyon et al., 2011). EBP allows the operator to choose the best actionable choices, validated and appropriate for that specific situation, based on the specific needs of the client, their strengths and their circumstances (Layne et al., 2014). In order to guarantee adequate training in this regard, it is imperative for the scientific community to create a definition of core competencies, that is, a base of knowledge that those dealing with a history of trauma should possess. In particular, this

kind of attention should allow a good quality of provided services, increase operators' responsibility and disseminate knowledge that is shared and, often, manualized throughout protocols between different branches (psychology, psychotherapy, social sciences, psychiatry, etc). The National Child Traumatic Stress Network (NCTSN) is a web of professionals, family members, researchers and international partners dealing with the betterment of standards of care and the opportunity of access to services for children and families. The NCTSN has created a training protocol named CCCT (Core Curriculum on Childhood Trauma) (Layne et al., 2011) that clarifies the main elements of intervention (by including them in an integrated evidence-based matrix), the fundamental concepts in trauma and essential therapeutic skills for the planning and implementation of an effective intervention for children affected by trauma and their families. Two elements appear foundational: the goals of the intervention (objectives that are expected to be met through the intervention) and practical elements (the actual procedures meant to be applied in order to obtain results). This attention to operators' training on core competencies passes through the definition of specific "gold standards" relative to EBP training and evidence-based treatments (EBTT, Evidence-Based Trauma Treatments). The CCCT includes 5 levels: a) Empirical Evidence Base; b) 12 Core Concepts for Understanding Traumatic Stress Responses in Children and Families; c) intervention goals; d) practical elements (observable actions put in action to reach goals); e) therapeutic skills\abilities (two sub-levels: 1) procedural and process-oriented; 2) evaluative). The aforementioned model supports evidence-based practices and competences such as routine assessment and information gathering, theory of practice, application of results derived from scientific literature to individual patient situations, conceptualization of cases, and intervention planning. In the process of examining and implementing the CCCT model, a task force has planned a specific enhancement session of statistical analysis competences and structuring of study protocols that are useful for clinical practice validation. What gets most underlined about this is the invitation for development of both theoretical aspects and evaluation methods (multidimensional), as well as the empirical base accessible to evaluation and validation of interventions (in particular, for outcomes, intervening factors, and the efficacy of interventions centered on the specific situation of a person). Briggs & colleagues (2012) further identify as a priority the betterment of standards through "[...] evidence-based development, implementation and dissemination" (p. 1). The structuring of intervention guidelines - meant to identify optimal targets and identification methods (what the best intervention may be given specific circumstances) and outcomes evaluation - is fundamental and useful for operators and for those dealing with the structuring of services. Research designs that may be useful are the

ones that consider the interconnection between risk factors and different outcomes in order to clarify on what elements the intervention might be focused, as well as, recursively, to include new aspects in theoretical understanding of trauma and to complexify the scientific framework. Particularly interesting, as a matter of fact, is the observation that treatments targeting the reduction of PTSD-related symptoms are also effective in reducing functional difficulties not directly related to the object of treatment;this highlights how a trauma-focused treatment can generate positive, wide-ranging effects (Layne et al., 2010).

RESEARCH IN TRAUMA-FOCUSED SERVICES

TIC could be defined as an evidence-based approach in reacting to trauma, which focuses on the ability (or lack thereof) of staff members to take part in a vision of care for a traumatized patient, as a critical precursor for success or failure in adopting strategies meant to reduce the risk of retraumatization of the user (Marvin & Volino Robinson, 2018). In this, it is fundamental to carefully take in the complexity of stories in which trauma is generated by different and individual experiences. Policies, procedures and daily operation could potentially be additionally traumatizing experiences or elicit responses linked to the individual functioning of the traumatized person, preventing them from receiving the care they need. In order to keep these situations from happening, and from generating frustration in staff members, turning to specially structured and internationally recognized best practices might be useful (see, for example, the strategies promoted by SAMHSA in 2014). In synergy with this, the TIC perspective invites organizations to consider the impact of working with subjects bearing traumatic stories to members flowing into clinical services (SAMHSA, 2014; Knight, 2015) and how operators could be helped, through training and a trauma-informed leadership, in maintaining a good level of wellbeing and efficacy/efficiency in interventions when working (Manderscheid, 2009). Ruzek & Rosen (2009) examined in depth the factors influencing the way in which services receive research results on evidence-based practices linked to trauma treatment. A careful evaluation of both practice dissemination and research implies the inclusion of a field of analysis composed by multiple factors that can influence the evolution of the care process, the patients' or potential users' relationship with the services, the method clinicians use to learn new treatment techniques, the changes in the organizations linked to behavioral transformation. Surely, according to the vision of the authors, an increasingly urgent priority in the application of empirical research in this field is the validation or support for treatment methods applicable in an economically convenient way. The researchers, in particular, analyzed the role of factors concerning the operators that the research highlighted when linked to outcomes. They observe that evaluations made by operators specialized in trauma-related stress (specifically, those dealing with PTSD) about a specific practice, their competences and features (e. g. their self-efficacy level), their willingness to change in operational practices (e. g. adopting a specific best practice by integrating it in their daily functioning) are influencing factors, but they are scarcely studied on an empirical level. Accessibility to training programmes on EBPs and worries about the applicability of

innovations in the field of research relevant to their specific relevant population (problem of generalization of results) seem to be the most influential variables on their attitude towards evidence-based practices, independently of their theoretical framework. The training method that seems particularly efficient towards promoting change in caring behavior seems to be intensive training courses, especially when they call for the demonstration of necessary competences and when they require that those be put to the test throughout interactive participation in lessons (with availability of supervision on a regular basis and, therefore, beyond the training moment itself and training-the-trainers events). With regard to innovation factors, the authors highlight that patients' and operators' perceptions on treatments are an essential element in their adoption, particularly pertaining to their proved efficacy (even on a comparative level with other methods). With regard to systemic factors, they observe how particularly relevant the availability of spaces for supervision and administrative-organizational support is for a successful application of a good practice (Fixsen et al., 2005). Even more important is the need to empirically support the creation of trauma-informed care systems (Ko et al., 2008; Ruzek & Rosen, 2009). Furthermore, the monitoring of treatment implementation is another key aspect for dissemination, effects, and faithfulness to procedure for fulfillment of EBPs (Rosenheck, 2001b; DuFrene, Noell, Gilbertson & Duhon, 2005; Durlak & DuPre, 2008; Ruzek e Rosen, 2009). A particularly interesting aspect is the one analyzed by Rosenheck (2001a), who highlights the mutually recursive process of interaction between EBPs (in their general and prescriptive dimension) and local experiences/needs for implementation. The purpose of monitoring, even in the face of its cost in terms of economical and time investment resources for services, should therefore be allowing [services] to focus on crucial elements for treatment outcomes and treatment efficacy (Ruzek & Rosen, 2009). One of the key questions might be how the clinician's modifications in response to specific needs might undermine, increase or leave unaltered the intervention's effects (Ruzek & Rosen, 2009).

UNIT 3: CORE ELEMENTS TO STRUCTURE A GOOD RESEARCH PROPOSAL

There are different approaches to the structuring of a project (Leone & Prezza, 1999) in the social and health field: a) synoptic-rational (which implies maximum pre-structuring of the contents), b) concertive-participatory or dialogical planning (in which continuous negotiation of the objectives between experts and recipients is central); c) heuristic (which provides for a minimum a priori structuring of the objectives).

From a general point of view, the following steps should be followed in the research process:

1. A theoretical problem is formulated (deriving from the analysis of scientific theory and literature);
2. Appropriate units of analysis and method are selected;
3. Data is collected and analysed;
4. The theoretical proposition with which the research was started is either contested or supported.

As indicated by Lanzara (1985): "Every actor who presents himself the problem of innovation, or simply of intervening in a situation to modify it, has a design problem in front of him" (p. 336). Planning is a process of systematization; in fact, the structuring of a research project is a critical and fundamental phase that involves important choices that condition its outcomes. Moreover, Leone & Prezza (1999) underline that: "To articulate a project among different subjects, to think about the coherence between different parts (aims, times, available operators...) means problematizing the practice and dealing with the limit, with the partiality, and this is exactly what in some contexts tends to be removed" (p. 23) or considered too complex from an applicative point of view.

From a transversal point of view, the authors point out the fundamental stages in the structuring of a project in the social field:

1. Ideation: the phase in which a project is supposed to be carried out or proposed
2. Activation: verification of resources, roles, problems and strategies, possible analysis of demand (clients)

3. Planning: elaboration of the project and structuring of the phases that compose it, establishing the times and defining the methodological choices
4. Implementation: start of activities, first check of hypotheses, ongoing changes
5. Verification: final analysis of the results

In addition, in the field of scientific research, important elements from the application point of view are:

- Definition and analysis of the research object from the point of view of the scientific literature, explanation of the theoretical framework
- Identification and explanation of the general aims and specific objectives of the study (research question: exploratory, evaluative, explanatory)
- Structuring of hypotheses
- Identification of target population, recruitment of participants and sampling procedures
- Evaluation procedures, definition of indicators, tools and techniques for analysing the data collected
- Time planning (timeline) and feasibility analysis (including criticality and limitations)

In doing so, methodological installations of a quantitative, qualitative or mixed matrix can be used according to the research question.

Each phase of the design process entails that the researcher asks important questions that also take into account the critical elements from a conceptual and practical point of view. The context in which the research is carried out is one of these, as are the resources.

Given this complexity, it is of fundamental importance to pay attention to the training of staff in this dimension, as well as the constant interaction between professionals engaged in clinical work and researchers involved in research in and on the clinic.

Moreover, an important sector that shows its centrality is the structuring and validation of tools that can be used starting from both intervention and research objectives. These can have different forms and be applicable to specific targets, which is why it is essential that all actors involved in the design and implementation of a project synergistically establish each stage of the project plan, including methodological choices.

UNIT 1: GOOD PRACTICE IN TIC

Given the great risks to physical and psychological health due to the impact of traumatic events (Adverse Childhood Experiences, ACEs), over the years many interventions have been developed to help institutions and practitioners assisting people with traumatic histories in order to emphasize the advantage of adopting a TIC-based approach (Baker et al., 2016). In particular, “a TIC approach looks at a person holistically, not just as a list of problems he or she is experiencing" (Hepburn, 2017, p. 7). As indicated by many authors (Bryson et al., 2017; Bridgett, Valentino & Hayden, 2012; Ellis & Boyce, 2011; Perry, 2002; Rothbart, Ziaie, O'Boyle, 1992), a protective effect (buffer effect) is played by good care and supportive relationships exerted by attentive and proactive caregivers: relational safety reduces the harmful effects of trauma in children. Traumatic stress is a common condition in the case of an ACE and often causes significant clinical manifestations (internalization and/or externalizing symptoms) frequently found in hospitals or residential facilities dedicated to adults and children (Bryson et al., 2017; Greenwald et al, 2012; Hummer, Dollard & Robst, 2010; Ko et al., 2008). Quoting Elliott and colleagues (2005), who stated that "Trauma informed services are those where service delivery is influenced by an understanding of the impact of interpersonal violence and victimisation on an individual's life and development" (p. 462) and that "Many common procedures and practices in service settings reactivate traumatic reactions and are experienced as unsafe emotions and a source of weakness for trauma survivors" (p. 446).

It is possible to further emphasize that good practices should be evaluated on the basis of specific criteria that are identified and detailed in the scientific literature and that include a careful evaluation of the complex factors involved in the traumatic stories. As a matter of fact, in situations where the service or organisation deals with people who have suffered trauma, a perspective in which public health and social care are oriented towards risk prevention and reduction is recommended (Bryson et al., 2017). In this field, promoting trauma-informed approaches is a central issue: trauma-informed care (TIC) and trauma-informed practice (TIP) are the chosen treatment paradigms because they aim to transform entire care systems by including an understanding of stress in response to trauma in all aspects of the service and focus on the priority of safety and choice. In addition, this philosophy aims to create a treatment culture focused on non-violence, learning and collaboration in which the emphasis is on all environmental and interpersonal interactions (Bryson et al., 2017). In the systematic review of literature, Bryson and colleagues (2017) included some important findings:

- The “reduction of physical coercion in routine and residential psychiatric care" (p. 11) is emphasized as the reduction/elimination of isolation or control and coercion strategies;
- A key aspect of TIC is "the fundamental importance of senior leaders giving priority to TIC [...] especially when the staff is required to adapt to new ways of working" (p. 11);
- researchers stress the need to support staff through advanced training - in particular on trauma sequences - continuous supervision, coaching and debriefing;
- in this, it is essential to listen to patients and families, paying particular attention to their experiences, needs, priorities regarding the treatment process;
- the importance attributed to the area of constantly updating research data and to the analysis of outcome indicators are transversal dimensions aimed at motivating and informing the performance of services and improving effectiveness;
- the literature deals extensively with "the need to align formal and informal policy and practice with the general principles of trauma-informed practice" (p. 11).

Despite its increasingly frequent application, scientific research on the effectiveness of this type of approach is still lacking (Bryson et al., 2017); as pointed out by Valenkamp, Delaney & Verheij (2014) and Chandler (2008), there is a lack of randomised controlled studies that test interventions and explore the critical factors involved in implementing TIC-oriented treatments. With respect to what is currently indicated on an international level, empirical studies have shown how important training is in providing staff with a common language to be used regarding the patient's experience and particular interventions to be used with trauma patients (Bryson et al., 2017). The centrality of this issue has also been highlighted earlier by Le Bel, Huckshorn & Caldwell (2008) and by Brown, Baker & Wilcox (2012). In addition, specific training on best practices and patient participation in staff training activities (e.g. by reporting on their experiences) has proved useful (Holstead, Lamond, Dalton, Horne & Crick, 2010), as has the involvement of children in debriefing on critical aspects or stages in the provision of care (Lebel et al., 2008), data sharing and continuous monitoring of performance/processes (at individual, collective and unit level) (Bryson et al., 2017).

Another emerging focus of the scientific literature on effective TIC strategies is the ability of organisations to align policies and practices with the principles of informed trauma care (Bryson et al., 2017). According to this vision, the environment and culture of organizations are therapeutic tools themselves and both contribute to building a "therapeutic community". Of particular relevance are: 1) the focus on creating a safe treatment space for both patients and staff and 2) the inclusion of TIC principles in mission and vision statements. In summary, the main TIC strategies spotlighted by Bryson and colleagues (2017) are aligned with those underlying the NASMHPD (National Association of State Mental Health Program Directors) and both are presented in Table 1.

Bryson and colleagues (2017)
Community inclusion
Leadership commitment
Model selection
Workforce transformation
Outcome orientation
Shared maintenance
NASMHPD
Leadership towards organizational change
Use of data to inform practice
Use of restraint and seclusion reduction tools
Workforce development
Improve consumer's role in an in-patient setting
Thorough debriefing techniques

Table 1 Core strategies in TIC

In addition, in a study by Azeem and colleagues (2011), these strategic elements were tested longitudinally to analyse the reduction in the use of restraint and isolation. In particular, the authors stressed that:

- Leadership plays a key role in bringing about cultural change, particularly when a TIC-oriented vision is shared by all staff.
- data collection and sharing has "a key role in performance improvement projects" (p. 12) and in monitoring processes
- Training and continuing education of staff in the principles of recovery-oriented care, personal-centred care and TIC with the associated performance evaluations have been shown to have significant positive effects;
- an important focus should be dedicated to the principles of primary prevention using individual treatment plans that include the history of trauma and communication with the strategies of the patient, family and staff;
- a good principle for TIC practice is the involvement of the patient and the family;
- support debriefing activities - particularly with regard to emotional aspects and necessary changes in treatment plans - such as interventions to mitigate traumatisation and traumatisation impact were effectively implemented.

By examining different approaches to TIC, Hanson and Lang (2016) and Johnson (2017) identified some issues that could be considered important to explore the approaches of services for children and concluded that it is possible to identify 15 key TIC components.

The identified components were organised into three levels (Hanson & Lang, 2016, p. 98):

1. Workforce Development (WD):
    - Training required for all staff in awareness and knowledge of the impact of abuse or trauma;
    - Measurement of staff competence in defined criteria to demonstrate knowledge / practice on trauma;
    - Strategies / procedures to deal with / reduce the stress associated with secondary trauma among staff;
    - Knowledge/skills on how to access and refer to evidence-based best practices focused on trauma.
2. Trauma Focused Services (TFS):
    - Use of standardised measures of screening / evidence-based assessment to identify history and trauma-related symptoms or problems;
    - Inclusion of the child's trauma history in the documentation / files / case service plan;
    - Availability of qualified clinicians for and trained in evidence-based practices focused on trauma;
3. Organizational Delivery (ORG):
    - Collaboration, coordination of services and sharing of information between professionals within the agency related to trauma-informed services;
    - Collaboration, coordination of services and sharing of information between professionals of other agencies related to trauma-informed services;
    - Procedures to reduce the risk of user re-traumatization;
    - Procedures for user involvement and input into service planning and development of a trauma-informed system;
    - Providing services based on strengths and promoting positive development;
    - Providing a positive and safe physical environment;
    - Written policies that explicitly include and support trauma-informed principles;
    - Presence of a defined leadership position or a job function specifically related to TIC.

THE IMPORTANCE OF OBSERVATION

Clinicians and researchers are constantly searching for knowledge about a particular phenomenon, in a more or less systematic way. This desire for knowledge arises out of interest or curiosity, from a careful look, through the naked eye or with the help of tools, using a single word, through 'observation'.

Mantovani (1995) defines observation as: "[...] a form of detection aimed at exploring a given phenomenon" (p. 84).

Observation is a complex and demanding activity that requires:

- time;
- intellectual freedom;
- absence of prejudices and preconceptions,
- self-awareness;
- ability to not get involved;
- ability to suspend judgement.

In clinical and research contexts, observation acquires considerable importance, transforming itself from a simple and unscientific method into a flexible, structured and reliable one (Venuti, 2001). With the progress of studies on children, for example, the use of "child biographies" has been abandoned, to give space to systematic observation and experimentation (Bornstein, 2001). As a matter of fact, over time naturalistic observations have left room for standardized observations (Bornstein, 2001). One could argue, in the words of Venuti (2001), that observation "[...] acts as a bridge between an explanatory model of reference and a subsequent process of analysis and interpretation of data" (p. 58). To observe, therefore, it is no longer enough to look at a group of children interacting or recorded video of the behavior between mother and child, as observation must always refer to a theoretical and explanatory model, which will guide the researcher to formulate hypotheses and analyze the data (Venuti, 2001). What to observe, how, where and when to do it, will depend on the purpose of the research and the theoretical approach of reference.

There are different types of observations:

- psychoanalytic observation, which has psychoanalysis as its theoretical model;
- piagetian observation, which has as its theoretical model the psychology of development;
- ethological observation, which has ethology as its theoretical model.

Piagetian observation is a quasi-experimental type of observation. It lays its foundations on the theoretical approaches of interactionism, structuralism, cognitivism and deepens the study of the path of mental life in the course of development (Vigna, 2002). It is not limited to the recording of everything that the child does, but is guided by some hypotheses that form the basis of piagetian theory. The observer tries to establish an interaction with the observed in a natural context (Petter, 1984; Vigna, 2002). The basic principles of this observation are two:

1. The observer adapts to the child's stage of development and, by interacting, modifies the very conditions of the observation;
2. The observer repeatedly reproduces the same play situation during an observation to assess whether the child's reaction is repeated in the presence of the same stimulus and is not attributable to randomness.

The main application contexts of this type of observation are playschool and kindergarten.

The ethological approach, on the other hand, is inspired by Darwin's theory of evolution and the work of the ethologist Lorenz. The observation is defined as ethological when the observers do not influence in any way the behavior that they are interested in studying and cancel their subjectivity as much as possible. Usually this technique is applied in the natural environment in which a given behavior manifests itself spontaneously. However, it is possible to use the laboratory as an environment, provided that it is equipped in such a way as to reproduce a familiar environment for the child (e.g. a playroom).

It is useful in the investigation of the early years of life, where verbal language is still absent or poor, for two reasons:

1. it is easier to define the natural living environment of young children;
2. young children do not always realise that they are being observed and, in any case, do not react by changing their behaviour.

This type of observation aims at the exclusion of subjectivity and the achievement of objectivity that alone allows us to draw conclusions that are not misleading (Lis & Venuti, 1986). In this type of observation, procedures are used that allow the recording and the objective and systematic cataloguing of behaviors, so as to be able to interpret them later in the light of the initial hypotheses. Among the strengths of ethological observation emerge:

- an increase in descriptive studies of childhood behaviour;
- an attribution of importance to longitudinal research, considered the most suitable to grasp the process of change and its evolutionary meaning.

However, the emphasis on objective description can make us forget that when we observe, it is inevitable to make choices. Moreover, the importance of detecting micro-behaviours, which can be described objectively, cannot make us lose sight of the meaning that a certain behaviour assumes in a particular moment and context.

Psychoanalytic observation, on the other hand, is a type of direct observation, a method that does not make use of any instrument outside the observer himself. According to the psychoanalytic model, when there are no phenomena foreseen on the basis of a theory, "the unexpected" (Bion, 1962) becomes relevant. Observation in this case has the main function of creating a space where the unexpected can express itself. This picture does not involve any intentionality on the part of the observer to allow us to grasp the conscious and unconscious intentionality of the person observed. The fields of application are:

- psychological research;
- clinical work;
- training of child psychotherapists and analysts.

The observer is an integral part of the situation and observes both behaviors and verbalisations, as well as moods and emotions. He must also carefully evaluate his own psychological states as a source of information about the observed subject, using his own similarity to differentiate the latter from himself and accepting his own presence.

Finally, one can observe the entire family nucleus through structured tasks in the clinical context or in one's own natural environment. This type of observation can be associated with an interview with the family and has the intention of understanding how the members of the nucleus interact with each other and understanding communications at the verbal and preverbal level (forms of implicit intersubjectivity).

Ultimately, observation is one of the cornerstones of the professionalism of those who work in the field of education and training, helping to build a "basic attitude" that becomes an integral part of the way of acting professionally, as a basic element of educational competence. It is not a simple tool, but a set of attitudes, methodologies and tools. These can be structured (video recording, grids, checklists, etc.) or unstructured (e.g. logbook). The observer should then be trained through a training phase, acquire specific skills and knowledge to be able to use these tools and to detect the phenomenon he intends to study (Venuti, 2001). The data obtained from observation can be both qualitative and quantitative. Qualitative data have a narrative structure (Hilliard, 1993), while quantitative data can be used for various measurements and analyses (e.g. frequency and duration measurements, sequential analyses, etc.).

COUR EUROPÉENNE DES DROITS DE L'HOMME
EUROPEAN COURT OF HUMAN RIGHTS

CASE OF Z AND OTHERS v. THE UNITED KINGDOM

(Application no. 29392/95)

JUDGMENT

STRASBOURG

10 May 2001

In the case of Z and Others v. the United Kingdom,

The European Court of Human Rights, sitting as a Grand Chamber composed of the following judges:

Mr L. WILDHABER, *President*,
Mrs E. PALM,
Mr C.L. ROZAKIS,
Mr J.-P. COSTA,
Mr L. FERRARI BRAVO,
Mr L. CAFLISCH,
Mr P. KŪRIS,
Mr J. CASADEVALL,
Mr B. ZUPANČIČ,
Mrs N. VAJIĆ,
Mr J. HEDIGAN,
Mrs W. THOMASSEN,
Mrs M. TSATSA-NIKOLOVSKA,
Mr E. LEVITS,
Mr K. TRAJA,
Mr A. KOVLER,
Lady Justice ARDEN, ad hoc *judge*,

and also of Mr P.J. MAHONEY, *Deputy Registrar*,

Having deliberated in private on 28 June and 11 October 2000 and on 4 April 2001,

Delivers the following judgment, which was adopted on the last-mentioned date:

PROCEDURE

1. The case was referred to the Court, in accordance with the provisions applicable prior to the entry into force of Protocol No. 11 to the Convention for the Protection of Human Rights and Fundamental Freedoms ("the Convention"), by the European Commission of Human Rights ("the Commission") on 25 October 1999 (Article 5 § 4 of Protocol No. 11 and former Articles 47 and 48 of the Convention).

2. The case originated in an application (no. 29392/95) against the United Kingdom of Great Britain and Northern Ireland lodged with the Commission under former Article 25 of the Convention by the applicants, Z, A, B, C and D, five British nationals, on 9 October 1995.

3. The applicants alleged that the local authority had failed to take adequate protective measures in respect of the severe neglect and abuse which they were known to be suffering due to their ill-treatment by their

parents and that they had no access to a court or effective remedy in respect of this. They relied on Articles 3, 6, 8 and 13 of the Convention.

4. The Commission declared the application admissible on 26 May 1998. On 6 September 1999, pursuant to the express wishes of D's adoptive parents, the Commission decided that D should no longer be an applicant. In its report of 10 September 1999 (former Article 31 of the Convention) [*Note by the Registry*. The report is obtainable from the Registry], it expressed the unanimous opinion that there had been a violation of Article 3 of the Convention, that no separate issue arose under Article 8, that there had been a violation of Article 6 and that no separate issue arose under Article 13.

5. Before the Court the applicants had been granted legal aid. The President of the Court acceded to their request not to have their names disclosed (Rule 47 § 3 of the Rules of Court).

6. On 6 December 1999 a panel of the Grand Chamber determined that the case should be decided by the Grand Chamber (Rule 100 § 1). The composition of the Grand Chamber was determined according to the provisions of Article 27 §§ 2 and 3 of the Convention and Rule 24. The President of the Court decided that in the interests of the proper administration of justice, the case should be assigned to the Grand Chamber that had been constituted to hear the case of *T.P. and K.M. v. the United Kingdom* ([GC], no. 28945/95, ECHR 2001-V) (Rules 24, 43 § 2, and 71). Sir Nicolas Bratza, the judge elected in respect of the United Kingdom, who had taken part in the Commission's examination of the case, withdrew from sitting in the Grand Chamber (Rule 28). The United Kingdom Government ("the Government") accordingly appointed Lady Justice Arden to sit as an *ad hoc* judge (Article 27 § 2 of the Convention and Rule 29 § 1).

7. The applicants and the Government each filed a memorial. Third-party comments were also received from Professor G. Van Bueren, Director of the Programme on International Rights of the Child, University of London, who had been given leave by the President to intervene in the written procedure (Article 36 § 2 of the Convention and Rule 61 § 3).

8. A hearing took place in public in the Human Rights Building, Strasbourg, on 28 June 2000 (Rule 59 § 2).

There appeared before the Court:

(a) *for the Government*

Ms S. McGRORY, Foreign and Commonwealth Office, *Agent*,
Mr D. ANDERSON QC, Foreign and Commonwealth Office,
Ms J. STRATFORD, Foreign and Commonwealth Office, *Counsel*,
Ms S. RYAN, Foreign and Commonwealth Office,
Ms J. GRAY, Foreign and Commonwealth Office,
Mr M. MURMANE, Foreign and Commonwealth Office, *Advisers*;

(b) *for the applicants*
Mr B. EMMERSON QC, *Counsel*,
Ms P. WOOD, Solicitor,
Mrs M. MAUGHAN, Solicitor,
Ms E. GUMBEL QC,
Ms N. MOLE, of the AIRE Centre, *Advisers*.

The Court heard addresses by Mr Emmerson and Mr Anderson.

THE FACTS

I. THE CIRCUMSTANCES OF THE CASE

9. The applicants are four full siblings:
– Z, a girl born in 1982;
– A, a boy born in 1984;
– B, a boy born in 1986;
– C, a girl born in 1988.

10. The applicants' parents were married in November 1981.

11. The family was first referred to social services in October 1987 by their health visitor due to concerns about the children and marital problems. Z was reported to be stealing food at night. Following the referral, a professionals' meeting, involving the relevant agencies, was held on 24 November 1987, at which it was decided that a social worker and health visitor should visit. The family were reviewed at a further meeting in March 1988 and as it appeared that concerns had diminished, the file was closed.

12. In September 1988 a neighbour reported that the children were locked outside the house for most of the day.

13. In April 1989 the police reported that the children's bedrooms were filthy. The family's general practitioner also reported that the children's bedrooms were filthy and that their doors were locked. The children's head-teacher, Mrs Armstrong, expressed concern in May 1989 and requested a case conference. In June 1989 the NSPCC (National Society for the Prevention of Cruelty to Children) and the emergency team made a referral after complaints by neighbours that the house was filthy and that the children spent most of the day in their bedrooms, rarely being allowed out to play, and crying frequently. In August 1989 the maternal grandmother complained to the social services about the mother's care and discipline of the children.

14. At a professionals' meeting on 4 October 1989, at which the social services, the applicants' head-teacher, the applicants' general practitioner

and health visitor attended, it was decided that no social worker would be allocated to the family. The school was to monitor the older children's weight and the health visitor was to continue to visit the family regularly. It was agreed that the problem was one of limited and neglectful parenting rather than a risk of physical abuse, and that the parents should be assisted to manage their responsibilities better.

15. In October 1989, whilst the applicants were on holiday, their house was burgled. On entering, the police found it in a filthy state. Used sanitary towels and dirty nappies were discarded in a cupboard and the children's mattresses were sodden with urine. At a professionals' meeting on 13 December 1989, the health visitor requested that the four older children be placed on the Child Protection Register as she felt that their mother could not offer consistent care. This suggestion was rejected. However, a social-work assistant, Ms M., was assigned to the family. It was not considered appropriate to convene a case conference at this stage. Prior to the meeting, Z and A had mentioned to the head-teacher that A had been hit with a poker. It was decided that this statement would be investigated.

16. At a professionals' meeting on 23 March 1990, an improvement was noted in respect of the cleanliness of the house, the children's bedding being clean save on two occasions. However, it was reported that Z and A were taking food from bins at the school. There was still considered to be cause for concern, especially since the birth of another child was expected.

17. At a professionals' meeting on 11 July 1990, the applicants' headmistress reported a deterioration in the children's well-being; Z and A were still taking food from bins and A was soiling himself. Ms M. was visiting weekly at this stage and said that she was checking the children's bedrooms. She had noted that the children ate at 4 or 4.30 p.m. and then did not eat again until the morning. The children were also sent to bed at 6 p.m. It was planned to give the applicant's mother further assistance through a voluntary agency.

18. In or about September 1990, A and B were both reported to have bruising on their faces. The police investigated after neighbours had reported screaming at the applicants' home but apparently found no signs of bruising. They reported to the social services that "the conditions of the house were appalling and not fit for [the] children to live in".

19. At a further professionals' meeting on 3 October 1990, the assistant social worker, Ms M., stated that she was concerned about the applicants' soiling and their mother's lack of interest. Apparently, the children were defecating in their bedroom and smearing excrement on their windows. The head-teacher expressed concern, particularly concerning the boys A and B, and stated that the children had described blocks of wood being placed against their bedroom doors. It was decided to continue monitoring the children.

20. At a professionals' meeting on 5 December 1990, a decision was made to arrange a case conference for January 1991 as a result of concern regarding the applicants' care and the state of their bedroom. Ms M. considered that standards in the boys' bedroom had dramatically dropped. She found the room to be damp and smelly. A's bed was broken and had a metal bar protruding from it. The bedding was damp and grubby with soil marks.

21. In a report dated 24 January 1991, the headmistress stated that A was shabby, ill-kempt and often dirty and that he had been raiding the playground bins for apple cores. Z was pathetic, lacking in vitality and frequently and inexplicably tearful, becoming increasingly isolated from the other girls in her peer group with unfortunate incidents in which detrimental remarks were made about her appearance. B presented as withdrawn, pathetic and bedraggled. He regularly arrived cold, was frequently tearful and craved physical contact from adult helpers. He also appeared to crave for food. She concluded that they were still concerned that the children's needs were not being adequately met and that home conditions and family dynamics were giving reasons for concern.

22. At the case conference held on 28 January 1991, Ms M. stated that the boys' bedroom had no light, carpet or toys and that their bedding was wet, smelly and soil-stained. Their mother did not change the beds. Their head-teacher stated that Z was tearful and withdrawn, A had been raiding school bins and was often dirty, and B was very withdrawn, craved attention and was ravenously hungry. The chairman of the conference concluded that, despite the many concerns about the parenting of the applicants and the conditions in the home, there was little evidence to support going to court. It was felt that the parents were not wilfully neglecting their children and, bearing in mind their own poor upbringing, it was considered that the applicants' parents were doing what they could and that continued support was required to try and improve the situation. It was decided not to place the children on the Child Protection Register.

23. On 5 March 1991 B was found to have “unusual” bruises on his back.

24. At a later social services meeting in April 1991, no change to the children's living conditions was noted. The head-teacher stated that Z and A were still taking food from bins and that A was becoming more withdrawn. Ms M. reported that the mother had stated that the children were taking food from the park bins on the way to school.

25. In July 1991 the applicants' mother informed social services that the children would be better off living in care. On 12 August 1991 the social services received a phone call from a neighbour who stated that the children were frequently locked outside in a filthy back garden, that they constantly screamed and that they were kept for long periods in their bedrooms where they smeared faeces on their windows. The maternal grandparents later told

the guardian *ad litem* that Z, who was treated by her mother as a little servant, was expected to clean the excrement from the windows.

26. From 19 to 28 August 1991, the three older children spent some time with foster carers in respite care. The foster carers reported that A did not know how to wash, bathe or clean his teeth on arrival. He wet his bed every night and stole food from his brother. B was described as being "very frightened. He could not understand how he could play in the garden and the door was left open for him to come back in, he expected to be locked out". He also had to be taught to use the toilet properly and to clean himself.

27. At a professionals' meeting on 18 September 1991, Ms M. stated that the conditions in which the boys were sleeping were deteriorating. The mattresses in the boys' bedroom were ripped and the springs were coming through. The boys were stealing food, and C had also been seen to do this. Their mother stated that she could not control them. It was decided not to arrange a child-protection meeting but to carry out a monthly weight check on the three older children at school, and for the health visitor to check the weight of the two younger children. It was also decided to arrange respite care for Z, A and B in the holidays as well as on one weekend in four.

28. In November-December 1991 C was found to have developed a squint. His mother failed to keep appointments at the eye-clinic over the following months.

29. At a professionals' meeting on 21 November 1991, it was reported that the applicants' mother had said that she could not control the applicants' behaviour which consisted of refusing to go to bed when asked and stealing food. It was considered that the home was in an acceptable condition, though the boys' room still needed attention. The children's weights were recorded. It was noted that Z had put on 2 lb in the previous two months whereas she had only put on 2.5 lb in the preceding two years. A had only put on 3 lb in a year. B had put on 0.5 lb in a year and was on the 50th centile for height. C was on the 25th centile for weight. There was a discussion about the three elder children being accommodated by the local authority to allow the mother "to get back on her feet". The social services considered a six-week period whilst the general practitioner envisaged a period of eighteen to twenty-four months.

30. In December 1991 a social worker was introduced to the applicants' mother with a view to assisting her with shopping, budgeting and cooking.

31. Z, A and B were accommodated by volunteers between January and March 1992, and showed to have gained weight. In March and again in April, their mother asked if the boys, A and B, could be placed for adoption.

32. On 14 January 1992 C started to attend a nursery group at a family centre. She was noted to be unsocialised, lacking in confidence, unable to share, and with poor speech.

33. At a further professionals' meeting on 9 March 1992, it was decided that further respite care would be considered. The children's weights were noted, increases being seen for Z, A and B.

34. The children's parents divorced in April 1992.

35. At another professionals' meeting on 30 April 1992 it was decided that the applicants' mother's request that A and B be placed for adoption be followed up. The headmistress voiced concern over the fundamental pattern of the mother's care of the children, in particular in relation to Z's role in the home and the mothering role which she played. Ms M. reported that conditions were deteriorating for A and B.

36. On 10 June 1992 the applicants' mother demanded that the children be placed in care as she could not cope. She stated that if they were not removed from her care she would batter them. The applicants were placed in emergency foster care. The applicants were entered onto the Child Protection Register under the categories of neglect and emotional abuse after a child-protection meeting on 22 June 1992.

37. The applicants were all fostered separately. Initially, Z was noted to have dirty, ill-fitting clothes. She stated that she did not like living with her siblings as she did not like having to look after them all the time. A wet the bed every night, shunned physical contact and suffered from nightmares. B did not know how to use the toilet or toilet paper. C bonded very quickly with her foster parents.

38. On 8 October 1992 the local authority decided to seek care orders in respect of the children. Interim care orders were made on 7 December 1992.

39. A guardian *ad litem*, who was appointed on 18 January 1993, recommended that all the applicants should be the subject of care orders in order to protect them from further harm. She stated that there was "an abundance of evidence that the children have been subjected to physical and mental ill-treatment". She noted that their health had also been neglected by their parents who frequently missed appointments with opticians and doctors.

40. All the applicants were seen by Dr Dora Black, a consultant child psychiatrist, in January 1993. Dr Black stated that the three older children were all showing signs of psychological disturbance. Z was exhibiting signs of serious depressive illness and had assumed responsibility for her family and for its breakdown. Her mother's behaviour towards her was described as cruel and emotionally abusive. A and B, who suffered from nightmares, were both identified as showing signs of post-traumatic stress disorder and A was also chronically under-attached. Dr Black noted that all children had been deprived of affection and physical care. She described their experiences as "to put it bluntly, horrific", and added that the case was the worst case of neglect and emotional abuse that she had seen in her professional career. In her opinion, social services had "leaned over backwards to avoid putting these children on the Child Protection Register

and had delayed too long, leaving at least three of the children with serious psychological disturbance as a result".

41. Full care orders were made in respect of the applicants on 14 April 1993 by Judge Tyrer sitting at Milton Keynes County Court.

42. In June 1993 the Official Solicitor, acting as the applicants' next friend, commenced proceedings against the local authority claiming damages for negligence and/or breach of statutory duty arguing that the authority had failed to have regard to their welfare as was required by statute and should have acted more quickly and more effectively when apprised of their condition. It was argued that the local authority's failure to act had resulted in psychological damage. The application was struck out as revealing no cause of action, by Mr Justice Turner on 12 November 1993.

43. The applicants appealed to the Court of Appeal, which, on 28 February 1994, upheld the decision of Mr Justice Turner to strike out the application.

44. The applicants appealed to the House of Lords. On 29 June 1995 the House of Lords rejected their appeal, finding that no action lay against the local authority in negligence or breach of statutory duty concerning the discharge of their duties relating to the welfare of children under the Children Act 1989 in respect of child care. The case is reported as *X and Others v. Bedfordshire County Council* [1995] 3 All England Law Reports 353.

45. Lord Browne-Wilkinson gave the leading judgment. In respect of claims for breach of statutory duty, he stated, *inter alia*:

> "... My starting point is that the Acts in question are all concerned to establish an administrative system designed to promote the social welfare of the community. The welfare sector involved is one of peculiar sensitivity, involving very difficult decisions how to strike the balance between protecting the child from immediate feared harm and disrupting the relationship between the child and its parents. In my judgment in such a context it would require exceptionally clear statutory language to show a parliamentary intention that those responsible for carrying out these difficult functions should be liable in damages if, on subsequent investigation with the benefit of hindsight, it was shown that they had reached an erroneous conclusion and therefore failed to discharge their statutory duties. ...
>
> When one turns to the actual words used in the primary legislation to create the duties relied upon in my judgment they are inconsistent with any intention to create a private law cause of action."

46. As regards the claims that the local authority owed a duty of care to the applicants pursuant to the tort of negligence, Lord Browne-Wilkinson stated, *inter alia*:

> "I turn then to consider whether, in accordance with the ordinary principles laid down in *Caparo* [1990] 2 AC 605, the local authority ... owed a direct duty of care to the plaintiffs. The local authority accepts that they could foresee damage to the plaintiffs if they carried out their statutory duties negligently and that the relationship between the authority and the plaintiffs is sufficiently proximate. The third

requirement laid down in *Caparo* is that it must be just and reasonable to impose a common law duty of care in all the circumstances ...

The Master of the Rolls took the view, with which I agree, that the public policy consideration that has first claim on the loyalty of the law is that wrongs should be remedied and that very potent counter considerations are required to override that policy (see [1994] 4 AER 602 at 619). However, in my judgment there are such considerations in this case.

First, in my judgment a common law duty of care would cut across the whole statutory system set up for the protection of children at risk. As a result of the ministerial directions contained in 'Working Together' the protection of such children is not the exclusive territory of the local authority's social services. The system is inter-disciplinary, involving the participation of the police, educational bodies, doctors and others. At all stages the system involves joint discussions, joint recommendations and joint decisions. The key organisation is the Child Protection Conference, a multi-disciplinary body which decides whether to place the child on the Child Protection Register. This procedure by way of joint action takes place, not merely because it is good practice, but because it is required by guidance having statutory force binding on the local authority. The guidance is extremely detailed and extensive: the current edition of 'Working Together' runs to 126 pages. To introduce into such a system a common law duty of care enforceable against only one of the participant bodies would be manifestly unfair. To impose such liability on all the participant bodies would lead to almost impossible problems of disentangling as between the respective bodies the liability, both primary and by way of contribution, of each for reaching a decision found to be negligent.

Second, the task of the local authority and its servants in dealing with children at risk is extraordinarily delicate. Legislation requires the local authority to have regard not only to the physical well-being of the child but also to the advantages of not disrupting the child's family environment. ... In one of the child abuse cases, the local authority is blamed for removing the child precipitately; in the other for failing to remove the children from their mother. As the Report of the Inquiry into Child Abuse in Cleveland 1987 (Cmnd. 412) ('Cleveland Report 1987') said, at p. 244:

> '... It is a delicate and difficult line to tread between taking action too soon and not taking it soon enough. Social services whilst putting the needs of the child first must respect the rights of the parents; they also must work if possible with the parents for the benefit of the children. These parents themselves are often in need of help. Inevitably a degree of conflict develops between those objectives.'

Next, if liability in damages were to be imposed, it might well be that local authorities would adopt a more cautious and defensive approach to their duties. For example, as the Cleveland Report makes clear, on occasions the speedy decision to remove the child is sometimes vital. If the authority is to be made liable in damages for a negligent decision to remove a child (such negligence lying in the failure properly first to investigate the allegations) there would be a substantial temptation to postpone making such a decision until further inquiries have been made in the hope of getting more concrete facts. Not only would the child in fact being abused be prejudiced by such delay, the increased workload inherent in making such investigations would reduce the time available to deal with other cases and other children.

> The relationship between the social worker and the child's parents is frequently one of conflict, the parent wishing to retain care of the child, the social worker having to consider whether to remove it. This is fertile ground in which to breed ill-feeling and litigation, often hopeless, the cost of which both in terms of money and human resources will be diverted from the performance of the social service for which they were provided. The spectre of vexatious and costly litigation is often urged as a reason for not imposing a legal duty. But the circumstances surrounding cases of child abuse make the risk a very high one which cannot be ignored.
>
> If there were no other remedy for maladministration of the statutory system for the protection of children, it would provide substantial argument for imposing a duty of care. But the statutory complaints procedures contained in section 76 of the 1980 Act and the much fuller procedures now available under the 1989 Act provide a means to have grievances investigated though not to recover compensation. Further, it was submitted (and not controverted) that the local authorities Ombudsman would have power to investigate cases such as these.
>
> Finally, your Lordships' decision in *Caparo* [1990] 2 AC 605 lays down that in deciding whether to develop novel categories of negligence the court should proceed incrementally and by analogy with decided categories. We were not referred to any category of case in which a duty of care has been held to exist which is in any way analogous to the present cases. Here, for the first time, the plaintiffs are seeking to erect a common law duty of care in relation to the administration of a statutory social welfare scheme. Such a scheme is designed to protect weaker members of society (children) from harm done to them by others. The scheme involves the administrators in exercising discretion and powers which could not exist in the private sector and which in many cases bring them into conflict with those who, under the general law, are responsible for the child's welfare. To my mind, the nearest analogies are the cases where a common law duty of care has been sought to be imposed upon the police (in seeking to protect vulnerable members of society from wrongs done to them by others) or statutory regulators of financial dealing who are seeking to protect investors from dishonesty. In neither of these cases has it been thought appropriate to superimpose on a statutory regime a common law duty of care giving rise to a claim in damages for failure to protect the weak against the wrongdoer. ... In my judgment, the courts should proceed with great care before holding liable in negligence those who have been charged by Parliament with the task of protecting society from the wrong doings of others."

47. Z and C, the two girls, were meanwhile adopted. The boys, A and B, were initially in foster care. Following the breakdown of B's adoptive placement, he was placed in a therapeutic residential placement in July 1995. After two years, he was again placed with foster parents where he remained, attending school in a special-needs group. In January 1996, A was placed in a therapeutic community, where he stayed for two years. He apparently had a number of foster placements which broke down. Records indicated that he had been in twelve different placements in eight years. He is currently in a children's home.

48. In March 1996, applications were made to the Criminal Injuries Compensation Board (CICB) on behalf of all the children by the adoption society to whom the local authority had delegated certain responsibilities. It was claimed on behalf of Z that she had suffered severe neglect and chronic

deprivation which rendered it likely that specialist care would be necessary during her adolescence, a time where emotional repercussions of the abuse might become apparent; on behalf of A that he had suffered physical deprivation, emotional abuse, physical abuse and possible sexual abuse – he had suffered permanent physical scarring and was still receiving treatment from a child psychiatrist; on behalf of B that he had suffered extreme physical and emotional deprivation and shown signs of sexual abuse – he also had suffered permanent physical scarring and was receiving therapy; and on behalf of C that she had suffered extreme physical and emotional deprivation, and in addition that her need for eye treatment was not being met by her parents.

49. In February 1997, the CICB awarded 1,000 pounds sterling (GBP) to Z, GBP 3,000 to A and GBP 3,000 to B for injuries suffered between 1987 and 1992; it awarded GBP 2,000 to C for injuries suffered between 1988 and 1992. In a letter dated 20 May 1998 from the CICB to the Official Solicitor, it was stated:

> "The Board Member who assessed these cases recognised that the children were exposed to appalling neglect over an extended period but explained to their advisers that the Board could not make an award unless it was satisfied on the whole available evidence that an applicant had suffered an injury – physical or psychological – directly attributable to a crime of violence ... He was nevertheless satisfied, that setting aside 'neglect' the children had some physical and psychological injury inflicted upon them as enabled him to make an award to each child ..."

II. RELEVANT DOMESTIC LAW

A. Local authority's duties in respect of child care

50. Prior to the coming into force of the current legislation, the Children Act 1989, on 14 October 1991, the local authority's duty in respect of child care was governed by the Child Care Act 1980.

Sections 1 and 2 of the Child Care Act 1980 provided that:

> "1. It shall be the duty of every local authority to make available such advice, guidance and assistance as may promote the welfare of children by diminishing the need to receive or keep them in care.
>
> 2. (1) Where it appears to a local authority with respect to a child in their area appearing to them to be under the age of seventeen -
>
> (a) that he has neither parent nor guardian or has been and remains abandoned by his parents or guardian or is lost;
>
> (b) that his parents or guardian are, for the time being or permanently, prevented by reason of mental or bodily disease or infirmity or other incapacity or any other

circumstances from providing for his proper accommodation, maintenance and upbringing; and

(c) in either case, that the intervention of the local authority under this section is necessary in the interests of the welfare of the child, it shall be the duty of the local authority to receive the child into their care under this section."

51. Section 17 of the Children Act 1989 has since provided, *inter alia*:

"17. Provision of services for children in need, their families and others

(1) It shall be the general duty of every local authority (in addition to the other duties imposed on them by this Part) -

(a) to safeguard and promote the welfare of children within their area who are in need; and

(b) so far as is consistent with that duty, to promote the upbringing of such children by their families,

by providing a range and level of services appropriate to those children's needs.

(2) For the purpose principally of facilitating the discharge of their general duty under this section, every local authority shall have the specific duties and powers set out in Part I of Schedule 2.

...

(10) For the purposes of this Part a child shall be taken to be in need if -

(a) he is unlikely to achieve or maintain, or to have the opportunity of achieving or maintaining a reasonable standard of health or development without the provision for him of services by a local authority under this Part;

(b) his health or development is likely to be significantly impaired or further impaired, without the provision for him of such services; or

(c) he is disabled ...

(11) ...; and in this Part

'development' means physical, intellectual, emotional, social or behavioural development; and

'health' means physical or mental health."

52. Part III of the Children Act 1989 deals with local authority support for children and families. The policy of the Act is made clear by paragraph 7 of Part I of Schedule 2, which requires local authorities to take reasonable steps designed to reduce the need to bring proceedings relating to children.

53. Section 20 provides that

"20(1) Every local authority shall provide accommodation for any child in need within their area who appears to them to require accommodation as a result of -

(a) there being no person who has parental responsibility for him;

(b) his being lost or having been abandoned; or

(c) the person who has been caring for him being prevented (whether or not permanently, and for whatever reason) from providing him with suitable accommodation or care.

...

(4) A local authority may provide accommodation for any child within their area (even though a person who has parental responsibility for him is able to provide him with accommodation) if they consider that to do so would safeguard or promote the child's welfare."

54. Part V of the Children Act 1989 deals with the protection of children. Section 47 provides as follows:

"47(1) Where a local authority -

...

(b) have reasonable cause to suspect that a child who lives or is found, in their area is suffering, or is likely to suffer, significant harm,

the authority shall make, or cause to be made, such enquiries as they consider necessary to enable them to decide whether they should take any action to safeguard or promote the child's welfare.

...

(8) Where, as a result of complying with this section, a local authority conclude that they should take action to safeguard or promote the child's welfare they shall take action (so far as it is within their power and reasonably practicable for them to do so)."

B. Complaints procedure

55. The complaints procedure is provided by section 26 of the Children Act 1989:

"Review of cases and inquiries into representations

...

(3) Every local authority shall establish a procedure for considering any representations (including any complaint) made to them by -

(a) any child ... who is not being looked after by them but is in need;

(b) a parent of his;

...

(e) such other person as the authority consider has a sufficient interest in the child's welfare to warrant his representations being considered by them,

about the discharge by the authority of any of their functions under this Part in relation to the child.

(4) The procedure shall ensure that at least one person who is not a member or officer of the authority takes part in -

(a) the consideration; and

(b) any discussions which are held by the local authority about the action (if any) to be taken in relation to the child in the light of this consideration.

...

(7) Where any representation has been considered under the procedure established by the local authority under this section, the authority shall -

(a) have due regard to the findings of those considering the representation; and

(b) take such steps as are reasonably practicable to notify (in writing) -

(i) the person making the representation;

(ii) the child (if the authority consider that he has sufficient understanding); and

(iii) such other persons (if any) as appear to the authority to be likely to be affected,

of the authority's decision in the matter and their reasons for taking that decision and of any action which they have taken, or propose to take.

(8) Every local authority shall give such publicity to their procedure for considering representations under this section as they consider appropriate."

56. The powers of the Secretary of State to investigate the actions of the local authority are set out in sections 81 and 84 of the Children Act 1989.

"81. (1) The Secretary of State may cause an inquiry to be held into any matter connected with -

(a) the function of the social services committee of a local authority, in so far as those functions relate to children;

...

84. Local authority failure to comply with statutory duty: default power of Secretary of State

(1) If the Secretary of State is satisfied that any local authority has failed, without reasonable excuse, to comply with any of the duties imposed on them by or under this Act he may make an order declaring that authority to be in default with respect to that duty.

...

(3) Any order under subsection (1) may contain such directions for the purpose of ensuring that the duty is complied with, within such period as may be specified in the order, as appears to the Secretary of State to be necessary.

(4) Any such directions shall, on the application of the Secretary of State, be enforceable by mandamus."

C. Actions for damages against the local authority

57. In England and Wales there is no single tort which imposes liability to pay compensation for civil wrongs. Instead there is a series of separate torts, for example, trespass, conversion, conspiracy, negligence and defamation.

58. Negligence arises in specific categories of situations. These categories are capable of being extended. There are three elements to the tort of negligence: a duty of care, breach of the duty of care, and damage. The duty of care may be described as the concept which defines the categories of relationships in which the law may impose liability on a defendant in damages if he or she is shown to have acted carelessly. To show a duty of care, the claimant must show that the situation comes within an existing established category of cases where a duty of care has been held to exist. In novel situations, in order to show a duty of care, the claimant must satisfy a threefold test, establishing:

– that damage to the claimant was foreseeable;

– that the claimant was in an appropriate relationship of proximity to the defendant; and,

– that it is fair, just and reasonable to impose liability on the defendant.

These criteria apply to claims against private persons as well as claims against public bodies. The leading case is *Caparo Industries plc v. Dickman* ([1990] 2 Appeal Cases 605).

59. If the courts decide that as a matter of law there is no duty of care owed in a particular situation, that decision will (subject to the doctrine of precedent) apply in future cases where the parties are in the same relationship.

60. The decision in *X and Others v. Bedfordshire County Council* ([1995] 3 All England Law Reports 353) is the leading authority in the United Kingdom in this area. It held that local authorities could not be sued for negligence or for breach of statutory duty in respect of the discharge of

their functions concerning the welfare of children. The leading judgment is reported at length in the facts above (see paragraphs 45-46 above).

61. Since *X and Others v. Bedfordshire County Council*, there have been two further significant judgments regarding the extent of liability of local authorities in child care matters.

62. The Court of Appeal gave judgment in *W. and Others v. Essex County Council* ([1998] 3 All England Law Reports 111). This case concerned the claims by a mother and father (first and second plaintiffs), who had agreed to act as foster parents, that the defendant local authority placed G., a 15-year-old boy, in their home although they knew that he was a suspect or known sexual abuser. During G.'s stay in their home, the plaintiffs' three children (fourth to sixth plaintiffs) were all sexually abused and suffered psychiatric illness. The plaintiffs brought an action against the local authority and the social worker involved, claiming damages for negligence and for negligent misstatement. On the defendants' application to strike out the statement of claim as disclosing no reasonable cause of action, the judges struck out the parents' claims but refused to strike out the claims of the children. The Court of Appeal upheld his decision. The headnote for the judgment summarised the Court of Appeal's findings as follows:

> "(1) Although no claim in damages lay in respect of decisions by a local authority in the exercise of a statutory discretion, if the decision complained of was so unreasonable that it fell outside the ambit of the discretion conferred, there was no *a priori* reason for excluding common law liability. In the instant case, the giving of information to the parents was part and parcel of the defendants' performance of their statutory powers and duties, and it had been conceded that it was arguable that those decisions fell outside the ambit of their discretion. Accordingly, since it had also been conceded that the damage to the children was reasonably foreseeable and that there was sufficient proximity, the question for the court was whether it was just and reasonable to impose a duty of care on the council or the social worker. Having regard to the fact that common law duty of care would cut across the whole statutory set up for the protection of children at risk, that the task of the local authority and its servants in dealing with such children was extraordinarily difficult and delicate, that local authorities might adopt a more defensive approach to their duties if liability in damages were imposed, that the relationship between parents and social workers was frequently one of conflict and that the plaintiff children's injuries were compensatable under the Criminal Injuries Compensation Scheme, it was not just and reasonable to do so. It followed that no duty of care was owed to the plaintiff parents who in any event were secondary victims in respect of their claim for psychiatric illness ...
>
> (2) (Stuart-Smith LJ dissenting) It was arguable that the policy considerations against imposing a common law duty of care on a local authority in relation to the performance of its statutory duties to protect children did not apply when the children whose safety was under consideration were those in respect of whom it was not performing any statutory duty. Accordingly, since in the instant case, the plaintiff children were not children for whom the council had carried out any immediate caring responsibilities under the child welfare system but were living at home with their parents, and express assurances had been given that a sexual abuser would not be placed in their home, their claim should proceed ..."

63. On further appeal by the parents, the House of Lords on 16 March 2000 held that it was impossible to say that the psychiatric injury allegedly suffered by the parents, flowing from a feeling that they had brought the abuser and their children together or from a feeling of responsibility for not having detected the abuse earlier, was outside the range of psychiatric injury recognised by the law, nor was it unarguable that the local authority had owed a duty of care to the parents. The parents' claim could not be said to be so certainly or clearly bad that they should be barred from pursuing it to trial and their appeal was allowed.

64. The House of Lords gave judgment on 17 June 1999 in *Barrett v. London Borough of Enfield* ([1999] 3 Weekly Law Reports 79). That case concerned the claims of the plaintiff, who had been in care from the age of ten months to 17 years, that the local authority had negligently failed to safeguard his welfare causing him deep-seated psychiatric problems. The local authority had applied to strike out the case as disclosing no cause of action. The House of Lords, upholding the plaintiff's appeal, unanimously held that the judgment in *X and Others v. Bedfordshire County Council* did not in the circumstances of this case prevent a claim of negligence being brought against a local authority by a child formerly in its care.

65. Lord Browne-Wilkinson, in his judgment in that case, commented as follows on the operation of the duty of care:

> "(1) Although the word 'immunity' is sometimes incorrectly used, a holding that it is not fair, just and reasonable to hold liable a particular class of defendants whether generally or in relation to a particular type of activity is not to give immunity from a liability to which the rest of the world is subject. It is a prerequisite to there being any liability in negligence at all that as a matter of policy it is fair, just and reasonable in those circumstances to impose liability in negligence. (2) In a wide range of cases public policy has led to the decision that the imposition of liability would not be fair and reasonable in the circumstances, e.g. some activities of financial regulators, building inspectors, ship surveyors, social workers dealing with sex abuse cases. In all these cases and many others the view has been taken that the proper performance of the defendant's primary functions for the benefit of society as a whole will be inhibited if they are required to look over their shoulder to avoid liability in negligence. In English law the decision as to whether it is fair, just and reasonable to impose a liability in negligence on a particular class of would-be defendants depends on weighing in the balance the total detriment to the public interest in all cases from holding such class liable in negligence as against the total loss to all would-be plaintiffs if they are not to have a cause of action in respect of the loss they have individually suffered. (3) In English law, questions of public policy and the question whether it is fair and reasonable to impose liability in negligence are decided as questions of law. Once the decision is taken that, say, company auditors though liable to shareholders for negligent auditing are not liable to those proposing to invest in the company (see *Caparo Industries plc v. Dickman* [1990] 1 All ER 568, [1990] 2 AC 605), that decision will apply to all future cases of the same kind. The decision does not depend on weighing the balance between the extent of the damage to the plaintiff and the damage to the public in each particular case."

D. Striking-out procedure

66. At the relevant time, Order 18, Rule 19 of the Rules of the Supreme Court provided that a claim could be struck out if it disclosed no reasonable cause of action. This jurisdiction has been described as being reserved for "plain and obvious cases", in which a claim was "obviously unsustainable".

67. In applications to strike out, the courts proceeded on the basis that all the allegations set out in the claimant's pleadings were true. The question for the courts was whether, assuming that the claimant could substantiate all factual allegations at trial, the claim disclosed a reasonable cause of action.

68. The striking out procedure, now contained in Part 3.4(2) of the Civil Procedure Rules in force since 1999, is regarded as an important feature of English civil procedure, performing the function of securing speedy and effective justice, *inter alia*, by allowing a court to decide promptly which issues need full investigation and trial, and disposing summarily of the others. By means of this procedure, it can be determined at an early stage, with minimal cost to the parties, whether the facts as pleaded reveal a claim existing in law.

THE LAW

I. ALLEGED VIOLATION OF ARTICLE 3 OF THE CONVENTION

69. The applicants alleged that the local authority had failed to protect them from inhuman and degrading treatment contrary to Article 3 of the Convention, which provides:

> "No one shall be subjected to torture or to inhuman or degrading treatment or punishment."

70. In its report the Commission expressed the unanimous opinion that there had been a violation of Article 3 of the Convention. It considered that there was a positive obligation on the Government to protect children from treatment contrary to this provision. The authorities had been aware of the serious ill-treatment and neglect suffered by the four children over a period of years at the hands of their parents and failed, despite the means reasonably available to them, to take any effective steps to bring it to an end.

71. The applicants requested the Court to confirm this finding of a violation.

72. The Government did not contest the Commission's finding that the treatment suffered by the four applicants reached the level of severity prohibited by Article 3 and that the State failed in its positive obligation,

under Article 3 of the Convention, to provide the applicants with adequate protection against inhuman and degrading treatment.

73. The Court reiterates that Article 3 enshrines one of the most fundamental values of democratic society. It prohibits in absolute terms torture or inhuman or degrading treatment or punishment. The obligation on High Contracting Parties under Article 1 of the Convention to secure to everyone within their jurisdiction the rights and freedoms defined in the Convention, taken in conjunction with Article 3, requires States to take measures designed to ensure that individuals within their jurisdiction are not subjected to torture or inhuman or degrading treatment, including such ill-treatment administered by private individuals (see *A. v. the United Kingdom*, judgment of 23 September 1998, *Reports of Judgments and Decisions* 1998-VI, p. 2699, § 22). These measures should provide effective protection, in particular, of children and other vulnerable persons and include reasonable steps to prevent ill-treatment of which the authorities had or ought to have had knowledge (see, *mutatis mutandis*, *Osman v. the United Kingdom*, judgment of 28 October 1998, *Reports* 1998-VIII, pp. 3159-60, § 116).

74. There is no dispute in the present case that the neglect and abuse suffered by the four applicant children reached the threshold of inhuman and degrading treatment (as recounted in paragraphs 11-36 above). This treatment was brought to the local authority's attention, at the earliest in October 1987. It was under a statutory duty to protect the children and had a range of powers available to them, including the removal of the children from their home. These were, however, only taken into emergency care, at the insistence of the mother, on 30 April 1992. Over the intervening period of four and a half years, they had been subjected in their home to what the consultant child psychiatrist who examined them referred as horrific experiences (see paragraph 40 above). The Criminal Injuries Compensation Board had also found that the children had been subject to appalling neglect over an extended period and suffered physical and psychological injury directly attributable to a crime of violence (see paragraph 49 above). The Court acknowledges the difficult and sensitive decisions facing social services and the important countervailing principle of respecting and preserving family life. The present case, however, leaves no doubt as to the failure of the system to protect these applicant children from serious, long-term neglect and abuse.

75. Accordingly, there has been a violation of Article 3 of the Convention.

II. ALLEGED VIOLATION OF ARTICLE 8 OF THE CONVENTION

76. The applicants alleged, in the alternative to their complaints under Article 3 of the Convention, that the circumstances in which they suffered

ill-treatment, causing them physical and psychological injury, disclosed a breach of Article 8 of the Convention, which under the principle of respect for private life, protected physical and moral integrity.

77. Having regard to its finding of a violation of Article 3, the Court considers that no separate issue arises under Article 8 of the Convention.

III. ALLEGED VIOLATION OF ARTICLE 6 OF THE CONVENTION

78. The applicants complained that they had been denied access to a court to determine their claims against the local authority in negligence. They relied on Article 6 of the Convention.

79. Article 6 § 1 provides in its first sentence:

> "In the determination of his civil rights and obligations or of any criminal charge against him, everyone is entitled to a fair and public hearing within a reasonable time by an independent and impartial tribunal established by law."

80. The Government denied that there was any civil right in issue in the case or any restriction on access, while the Commission found unanimously that there had been a breach of Article 6, in that the House of Lords had applied an exclusionary rule concerning the liability of local authorities in child care matters which constituted in the circumstances a disproportionate restriction on the applicants' access to a court.

A. Submissions of the parties

1. The applicants

81. The applicants submitted that their negligence claim was plainly arguable as a matter of domestic law, relying, *inter alia*, on *Osman*, cited above. The right to sue in negligence, a cause of action framed in general terms, was an established civil right in domestic law. The local authority had conceded that they could have foreseen damage to the applicants if they carried out their duties negligently and that there was a proximate relationship, thereby satisfying the first two limbs of the test for the duty of care. There was a strong argument that public policy considerations required a duty of care to be imposed and there was no prior decision excluding liability. The applicants also pointed to the fact that the judge who made the care orders specifically released the case papers to the Official Solicitor so that he could investigate and, if appropriate, pursue negligence claims; that the Official Solicitor considered that there were arguable claims in negligence; that the Legal Aid Board granted legal aid to pursue the claims to the House of Lords; and that the Court of Appeal which rejected the claims by a majority granted leave to appeal to the House of Lords, the precondition for such leave being that the claim was arguable in domestic

law; that the Master of the Rolls, in the Court of Appeal, found that there was duty of care, stating the contrary to be "an affront to common sense"; and that in previous cases, local authorities had paid settlements in negligence cases, on the basis that they were potentially liable. There was a serious dispute in domestic law, therefore, as to the existence of any exclusionary principle, which has continued since, and Article 6 was applicable.

82. The exclusionary rule applied by the House of Lords permitted the applicants' claims to be struck out without determining the facts and without a trial. This applied regardless of the merits or the seriousness of the harm suffered. Designed to protect local authorities from wasting resources on having to defend an action at all, this amounted in practical effect to an immunity and acted as a restriction on access to a court.

83. The application of a blanket rule which excluded the determination of the applicants' claims irrespective of the seriousness of the harm suffered, the nature and extent of negligence involved, or the fundamental rights which were at stake, constituted a disproportionate restriction on their right of access to a court. They emphasised the severity of the damage suffered by them due to prolonged exposure to abuse and neglect against which the public policy arguments against imposition of liability had little weight, namely, the alleged risk of frivolous litigation, the increased caution of social services in fulfilling their functions or the difficulty or sensitivity of the issues. Indeed, the requirement to investigate effectively cases of treatment contrary to Article 3 pointed strongly to the recognition of a right of access to a court where the State's responsibility had been engaged for inhuman or degrading treatment of vulnerable children. They referred to the Court's finding in *Osman* (cited above, p. 3170, § 151) that the domestic courts should be able to distinguish between degrees of negligence or harm and give consideration to the justice of a particular case. An exclusionary rule on that basis should be capable of yielding to competing human rights considerations on the facts of a particular case.

2. The Government

84. The Government submitted that Article 6 guaranteed a fair trial in the determination only of such civil rights and obligations as are (at least arguably) recognised in national law. It does not bear on the substantive question of whether a right to compensation exists in any given situation. The proceedings brought by the applicants established that no right existed. The decision to strike out their claim touched on the scope of the domestic law. By ruling that a right of action did not exist in a particular set of circumstances, the courts were applying substantive limits to tort liability, as the legislature might do in statute (see, for example, *Powell and Rayner v. the United Kingdom*, judgment of 21 February 1990, Series A no. 172,

pp. 16-17, § 36). There was no established cause of action which was restricted. Accordingly, they claimed that Article 6 § 1 was not applicable.

85. The Government argued in the alternative that there was no immunity applied which could be regarded as a restriction on access to a court. Even assuming that there was an arguable issue, there could in their view be no doubt that the dispute was subject to a fair and public hearing in compliance with the guarantees of Article 6. The striking-out procedure was an important way of securing the speedy and cost-effective determination of cases that were hopeless in law. It achieved those aims without inhibiting claimants' rights to present any arguments in their favour to a court. Thus, as factual matters were assumed to be those pleaded, the claimants were not prejudiced by the lack of hearing of evidence, while they could put forward any arguments in their favour to persuade the court that their claim was sustainable as a matter of law.

86. Assuming that their arguments on the above failed, the Government argued that any restriction on access to a court nonetheless pursued a legitimate aim and was proportionate. It aimed to preserve the efficiency of a vital sector of public service. The exclusion of liability was strictly limited in scope to the category of cases to which it applied, actions for misfeasance, vicarious liability for employees remaining unaffected. The domestic courts had themselves weighed up the public policy issues for and against liability in light of the principles of English tort law and the social and political philosophy underlying those principles. A very substantial margin of appreciation would therefore be appropriate in any international adjudication.

B. The Court's assessment

1. Applicability of Article 6 of the Convention

87. The Court recalls its constant case-law to the effect that "Article 6 § 1 extends only to '*contestations*' (disputes) over (civil) 'rights and obligations' which can be said, at least on arguable grounds, to be recognised under domestic law; it does not itself guarantee any particular content for (civil) 'rights and obligations' in the substantive law of the Contracting States" (see *James and Others v. the United Kingdom*, judgment of 21 February 1986, Series A no. 98, pp. 46-47, § 81; *Lithgow and Others v. the United Kingdom*, judgment of 8 July 1986, Series A no. 102, p. 70, § 192; and *The Holy Monasteries v. Greece*, judgment of 9 December 1994, Series A no. 301-A, pp. 36-37, § 80). It will however apply to disputes of a "genuine and serious nature" concerning the actual existence of the right as well as to the scope or manner in which it is exercised (see *Benthem v. the Netherlands*, judgment of 23 October 1985, Series A no. 97, pp. 14-15, § 32).

88. In the present case, the applicants were claiming damages on the basis of alleged negligence, a tort in English law which is largely developed through the case-law of the domestic courts. It is agreed by the parties that there was no previous court decision which indicated that liability existed in respect of damage caused negligently by a local authority in carrying out its child protection duties. It was in the applicants' case that the domestic courts were called on to rule whether this situation fell within one of the existing categories of negligence liability, or whether any of the categories should be extended to this situation (see paragraphs 57-65 above).

89. The Court is satisfied that at the outset of the proceedings there was a serious and genuine dispute about the existence of the right asserted by the applicants under the domestic law of negligence as shown, *inter alia*, by the grant of legal aid to the applicants and the decision of the Court of Appeal that their claims merited leave to appeal to the House of Lords. The Government's submission that there was no arguable (civil) "right" for the purposes of Article 6 once the House of Lords had ruled that no duty of care arose has relevance rather to any claims which were lodged or pursued subsequently by other plaintiffs. The House of Lords' decision did not remove, retrospectively, the arguability of the applicants' claims (see *Le Calvez v. France*, judgment of 29 July 1998, *Reports* 1998-V, pp. 1899-900, § 56). In such circumstances, the Court finds that the applicants had, on at least arguable grounds, a claim under domestic law.

90. Article 6 was, therefore, applicable to the proceedings brought by these applicants alleging negligence by the local authority. The Court must, therefore, examine whether the requirements of Article 6 were complied with in those proceedings.

2. Compliance with Article 6 of the Convention

91. The Court, in *Golder v. the United Kingdom* (judgment of 21 February 1975, Series A no. 18, pp. 13-18, §§ 28-36), held that the procedural guarantees laid down in Article 6 concerning fairness, publicity and expeditiousness would be meaningless if there were no protection of the pre-condition for the enjoyment of those guarantees, namely, access to a court. It established this as an inherent aspect of the safeguards enshrined in Article 6, referring to the principles of the rule of law and the avoidance of arbitrary power which underlie much of the Convention.

92. Article 6 § 1 "may ... be relied on by anyone who considers that an interference with the exercise of one of his (civil) rights is unlawful and complains that he has not had the possibility of submitting that claim to a tribunal meeting the requirements of Article 6 § 1" (see *Le Compte, Van Leuven and De Meyere v. Belgium*, judgment of 23 June 1981, Series A no. 43, p. 20, § 44). Where there is a serious and genuine dispute as to the lawfulness of such an interference, going either to the very existence or the scope of the asserted civil right, Article 6 § 1 entitles the individual "to have

this question of domestic law determined by a tribunal" (see *Sporrong and Lönnroth v. Sweden*, judgment of 23 September 1982, Series A no. 52, p. 30, § 81; see also *Tre Traktörer AB v. Sweden*, judgment of 7 July 1989, Series A no. 159, p. 18, § 40).

93. The right is not absolute, however. It may be subject to legitimate restrictions such as statutory limitation periods, security for costs orders, regulations concerning minors and persons of unsound mind (see *Stubbings and Others v. the United Kingdom*, judgment of 22 October 1996, *Reports* 1996-IV, pp. 1502-03, §§ 51-52; *Tolstoy Miloslavsky v. the United Kingdom*, judgment of 13 July 1995, Series A no. 316-B, pp. 80-81, §§ 62-67; and *Golder*, cited above, p. 19, § 39). Where the individual's access is limited either by operation of law or in fact, the Court will examine whether the limitation imposed impaired the essence of the right and, in particular, whether it pursued a legitimate aim and there was a reasonable relationship of proportionality between the means employed and the aim sought to be achieved (see *Ashingdane v. the United Kingdom*, judgment of 28 May 1985, Series A no. 93, pp. 24-25, § 57). If the restriction is compatible with these principles, no violation of Article 6 will arise.

94. It is contended by the applicants in this case that the decision of the House of Lords, finding that the local authority owed no duty of care, deprived them of access to a court as it was effectively an exclusionary rule, or an immunity from liability, which prevented their claims from being decided on the facts.

95. The Court observes, firstly, that the applicants were not prevented in any practical manner from bringing their claims before the domestic courts. Indeed, the case was litigated with vigour up to the House of Lords, the applicants being provided with legal aid for that purpose. Nor is it that any procedural rules or limitation periods had been relied on. The domestic courts were concerned with the application brought by the defendants to have the case struck out as disclosing no reasonable cause of action. This involved the pre-trial determination of whether, assuming the facts of the applicants' case as pleaded were true, there was a sustainable claim in law. The arguments before the courts were, therefore, concentrated on the legal issues, primarily whether a duty of care in negligence was owed to the applicants by the local authority.

96. Moreover, the Court is not persuaded that the House of Lords' decision that, as a matter of law, there was no duty of care in the applicants' case may be characterised as either an exclusionary rule or an immunity which deprived them of access to a court. As Lord Browne-Wilkinson explained in his leading speech, the House of Lords was concerned with the issue whether a novel category of negligence, that is a category of cases in which a duty of care had not previously been held to exist, should be developed by the courts in their law-making role under the common law

(see paragraph 46 above). The House of Lords, after weighing in the balance the competing considerations of public policy, decided not to extend liability in negligence into a new area. In so doing, it circumscribed the range of liability under tort law.

97. That decision did end the case, without the factual matters being determined on the evidence. However, if as a matter of law, there was no basis for the claim, the hearing of evidence would have been an expensive and time-consuming process which would not have provided the applicants with any remedy at its conclusion. There is no reason to consider the striking-out procedure which rules on the existence of sustainable causes of action as *per se* offending the principle of access to a court. In such a procedure, the plaintiff is generally able to submit to the court the arguments supporting his or her claims on the law and the court will rule on those issues at the conclusion of an adversarial procedure (see paragraphs 66-68 above).

98. Nor is the Court persuaded by the suggestion that, irrespective of the position in domestic law, the decision disclosed an immunity in fact or practical effect due to its allegedly sweeping or blanket nature. That decision concerned only one aspect of the exercise of local authorities' powers and duties and cannot be regarded as an arbitrary removal of the courts' jurisdiction to determine a whole range of civil claims (see *Fayed v. the United Kingdom*, judgment of 21 September 1994, Series A no. 294-B, pp. 49-50, § 65). As it has recalled above in paragraph 87, it is a principle of Convention case-law that Article 6 does not in itself guarantee any particular content for civil rights and obligations in national law, although other Articles such as those protecting the right to respect for family life (Article 8) and the right to property (Article 1 of Protocol No. 1) may do so. It is not enough to bring Article 6 § 1 into play that the non-existence of a cause of action under domestic law may be described as having the same effect as an immunity, in the sense of not enabling the applicant to sue for a given category of harm.

99. Furthermore, it cannot be said that the House of Lords came to its conclusion without carefully balancing the policy reasons for and against the imposition of liability on the local authority in the circumstances of the applicants' case. Lord Browne-Wilkinson, in his leading judgment in the House of Lords, acknowledged that the public policy principle that wrongs should be remedied required very potent counter-considerations to be overridden (see paragraph 46 above). He weighed that principle against the other public policy concerns in reaching the conclusion that it was not fair, just or reasonable to impose a duty of care on the local authority in the applicants' case. It may be noted that in subsequent cases the domestic courts have further defined this area of law concerning the liability of local authorities in child-care matters, holding that a duty of care may arise in other factual situations, where, for example, a child has suffered harm once

in local authority care, or a foster family has suffered harm as a result of the placement in their home by the local authority of an adolescent with a history of abusing younger children (see *W. and Others v. Essex County Council* and *Barrett*, both cited above, paragraphs 62-65 above).

100. The applicants, and the Commission in its report, relied on *Osman* (cited above) as indicating that the exclusion of liability in negligence, in that case concerning the acts or omissions of the police in the investigation and prevention of crime, acted as a restriction on access to a court. The Court considers that its reasoning in *Osman* was based on an understanding of the law of negligence (see, in particular, *Osman*, cited above, pp. 3166-67, §§ 138-39) which has to be reviewed in the light of the clarifications subsequently made by the domestic courts and notably by the House of Lords. The Court is satisfied that the law of negligence as developed in the domestic courts since the case of *Caparo Industries plc* (cited above) and as recently analysed in the case of *Barrett* (cited above, loc. cit.) includes the fair, just and reasonable criterion as an intrinsic element of the duty of care and that the ruling of law concerning that element in this case does not disclose the operation of an immunity. In the present case, the Court is led to the conclusion that the inability of the applicants to sue the local authority flowed not from an immunity but from the applicable principles governing the substantive right of action in domestic law. There was no restriction on access to a court of the kind contemplated in *Ashingdane* (cited above, loc. cit.).

101. The applicants may not, therefore, claim that they were deprived of any right to a determination on the merits of their negligence claims. Their claims were properly and fairly examined in light of the applicable domestic legal principles concerning the tort of negligence. Once the House of Lords had ruled on the arguable legal issues that brought into play the applicability of Article 6 § 1 of the Convention (see paragraphs 87-89 above), the applicants could no longer claim any entitlement under Article 6 § 1 to obtain any hearing concerning the facts. As pointed out above, such a hearing would have served no purpose, unless a duty of care in negligence had been held to exist in their case. It is not for this Court to find that this should have been the outcome of the striking-out proceedings since this would effectively involve substituting its own views as to the proper interpretation and content of domestic law.

102. It is nonetheless the case that the interpretation of domestic law by the House of Lords resulted in the applicants' case being struck out. The tort of negligence was held not to impose a duty of care on the local authority in the exercise of its statutory powers. Their experiences were described as "horrific" by a psychiatrist (see paragraph 40 above) and the Court has found that they were victims of a violation of Article 3 (see paragraph 74 above). Yet the outcome of the domestic proceedings they brought is that they, and any children with complaints such as theirs, cannot sue the local

authority in negligence for compensation, however foreseeable – and severe – the harm suffered and however unreasonable the conduct of the local authority in failing to take steps to prevent that harm. The applicants are correct in their assertions that the gap they have identified in domestic law is one that gives rise to an issue under the Convention, but in the Court's view it is an issue under Article 13, not Article 6 § 1.

103. The Court emphasises that the object and purpose underlying the Convention, as set out in Article 1, is that the rights and freedoms should be secured by the Contracting State within its jurisdiction. It is fundamental to the machinery of protection established by the Convention that the national systems themselves provide redress for breaches of its provisions, the Court exerting its supervisory role subject to the principle of subsidiarity. In that context, Article 13, which requires an effective remedy in respect of violations of the Convention, takes on a crucial function. The applicants' complaints are essentially that that they have not been afforded a remedy in the courts for the failure to ensure them the level of protection against abuse to which they were entitled under Article 3 of the Convention. The domestic courts referred to "the public-policy consideration that has first claim on the loyalty of the law" as being that "wrongs should be remedied" (see paragraph 46 above). As far as Convention wrongs are concerned, that principle is embodied in Article 13 (see, *inter alia*, *Kudła v. Poland* [GC], no. 30210/96, § 152, ECHR 2000-XI). It is under Article 13 that the applicants' right to a remedy should be examined and, if appropriate, vindicated.

104. Accordingly, the Court finds that there has been no violation of Article 6 of the Convention.

IV. ALLEGED VIOLATION OF ARTICLE 13 OF THE CONVENTION

105. The applicants submitted that they had not been afforded any remedy for the damage which they had suffered as a result of the failure of the local authority to protect them, relying on Article 13 of the Convention, which provides:

> "Everyone whose rights and freedoms as set forth in [the] Convention are violated shall have an effective remedy before a national authority notwithstanding that the violation has been committed by persons acting in an official capacity."

106. The applicants argued that the exclusionary rule established by the House of Lords in their case deprived them of any effective remedy within the national legal system for the violation of Article 3 which they suffered. While the remedy required by Article 13 need not always be judicial in character, in their case a judicial determination was required. This was because the tort of negligence was the only remedy in national law capable of determining the substance of their complaint and which (but for the

alleged immunity) would closely match the requirements of the Convention. Also the accountability of public officials, central to both Articles 3 and 13, required a right of access to a court whereby the individual could hold the responsible officials to account in adversarial proceedings and obtain an enforceable order for compensation if the claim was substantiated. The wording of Article 13 also prohibited the creation of immunities for public officials and any such immunity must be regarded as contrary to the object and purpose of the Convention.

107. The Government pointed out that there were a number of remedies available to the applicants which went some way towards providing effective redress. This included the payment of compensation from the Criminal Injuries Compensation Board (CICB), the possibility of complaining to the Local Government Ombudsman, and the complaints procedure under the Children Act 1989. However, the Government accepted that in the particular circumstances of this case, the remedies were insufficient, alone or cumulatively, to satisfy the requirements of Article 13. They conceded that there had been a serious violation of one of the most important Convention rights, that the CICB could only award compensation for criminal acts, not for the consequences of neglect, and that any recommendation by the Ombudsman would not have been legally enforceable. They had been under the obligation, in this case, to ensure that some form of compensation was made available for damage caused by the breach of Article 3, whether by a broader statutory compensation scheme, an enforceable Ombudsman's award, or through the courts. They pointed out that from October 2000, when the Human Rights Act 1998 came into force, a victim would be able to bring proceedings in the courts against a public authority for a breach of a substantive right, and the courts would be empowered to award damages.

108. As the Court has stated on many occasions, Article 13 of the Convention guarantees the availability at the national level of a remedy to enforce the substance of the Convention rights and freedoms in whatever form they might happen to be secured in the domestic legal order. Article 13 thus requires the provision of a domestic remedy to deal with the substance of an "arguable complaint" under the Convention and to grant appropriate relief, although the Contracting States are afforded some discretion as to the manner in which they conform to their Convention obligations under this provision. The scope of the obligation under Article 13 also varies depending on the nature of the applicant's complaint under the Convention. Nevertheless, the remedy required by Article 13 must be "effective" in practice as well as in law (see, among other authorities, *Aydın v. Turkey*, judgment of 25 September 1997, *Reports* 1997-VI, pp. 1895-96, § 103).

109. The Court has previously held that where a right with as fundamental an importance as the right to life or the prohibition against torture, inhuman and degrading treatment is at stake, Article 13 requires, in

addition to the payment of compensation where appropriate, a thorough and effective investigation capable of leading to the identification and punishment of those responsible, including effective access for the complainant to the investigation procedure (see *Kaya v. Turkey*, judgment of 19 February 1998, *Reports* 1998-I, pp. 330-31, § 107). These cases, however, concerned alleged killings or infliction of treatment contrary to Article 3 involving potential criminal responsibility on the part of security force officials. Where alleged failure by the authorities to protect persons from the acts of others is concerned, Article 13 may not always require that the authorities undertake the responsibility for investigating the allegations. There should, however, be available to the victim or the victim's family a mechanism for establishing any liability of State officials or bodies for acts or omissions involving the breach of their rights under the Convention. Furthermore, in the case of a breach of Articles 2 and 3 of the Convention, which rank as the most fundamental provisions of the Convention, compensation for the non-pecuniary damage flowing from the breach should in principle be part of the range of available remedies.

110. The applicants have argued that in their case an effective remedy could only be provided by adversarial court proceedings against the public body responsible for the breach. The Court notes that the Government have conceded that the range of remedies at the disposal of the applicants was insufficiently effective. They have pointed out that in the future, under the Human Rights Act 1998, victims of human rights breaches will be able to bring proceedings in courts empowered to award damages. The Court does not consider it appropriate in this case to make any findings as to whether only court proceedings could have furnished effective redress, though judicial remedies indeed furnish strong guarantees of independence, access for the victim and family, and enforceability of awards in compliance with the requirements of Article 13 (see, *mutatis mutandis*, *Klass and Others v. Germany*, judgment of 6 September 1978, Series A no. 28, p. 30, § 67).

111. The Court finds that in this case the applicants did not have available to them an appropriate means of obtaining a determination of their allegations that the local authority failed to protect them from inhuman and degrading treatment and the possibility of obtaining an enforceable award of compensation for the damage suffered thereby. Consequently, they were not afforded an effective remedy in respect of the breach of Article 3 and there has, accordingly, been a violation of Article 13 of the Convention.

V. APPLICATION OF ARTICLE 41 OF THE CONVENTION

112. Article 41 of the Convention provides:

> "If the Court finds that there has been a violation of the Convention or the Protocols thereto, and if the internal law of the High Contracting Party concerned allows only partial reparation to be made, the Court shall, if necessary, afford just satisfaction to the injured party."

A. Pecuniary damage

1. The applicants

113. The applicants submitted that they should be compensated for loss of future earnings and the costs of future medical expenses. Their experiences have, in different ways and to differing extents, blighted their lives. A substantial award should be made to enable them to enter life with a modicum of financial security, the potential to build an independent existence and the means to pay for therapeutic treatment and support.

114. The applicants provided updated medical reports dated 16 May 2000 by Dr Jean Harris-Hendriks concerning their progress and prognosis for the future.

(i) Z was described as having made a recovery from the serious depressive illness suffered at the time of her removal into care. While she was no longer suffering from any psychiatric illness, she had emotional, social and practical difficulties far beyond those normally affecting a girl of her age and was statistically vulnerable to anxiety and perhaps depressive illness in adult life. Her problems were classified as being of moderate severity. It was estimated that she would need psychotherapeutic treatment, outside the National Health Service, estimated at 60 to 100 sessions costing 70 to 90 pounds sterling (GBP) per session, to cope with her vulnerability, particularly at periods of transition. She was likely to remain vulnerable on the labour market, though it was anticipated that she would be able to take on further education, sustain her own mental health and enter the workforce. On her behalf, her representatives claimed GBP 9,000 for the cost of future psychiatric treatment, and GBP 40,000 to offset her handicap on the labour market, a total of GBP 49,000.

(ii) A had failed to appear for an interview with Dr Harris-Hendriks, who also commented on the lack of detailed information concerning periods spent by A in care. She had, however, interviewed him on behalf of the local authority in May 1993 and had some records concerning his past treatment and problems. On that basis, she concluded that he was suffering from long-term psychiatric illness and had a poor prognosis for recovery. His chances of fitting into the normal school system remained very poor. He

was prone to aggressiveness and had difficulty with everyday tasks. He was currently suffering from a reactive attachment disorder, resulting directly from severe parental neglect and abuse. The prognosis for the future was extremely bleak and he was likely to require intermittent hospitalisation. He was seriously handicapped on the labour market and was unlikely ever to be able to hold down a job. Assuming that he might otherwise have been able to obtain low-paid manual employment earning GBP 15,000 per year, and a normal working life to age 65, and taking into account uncertainties and early settlement, he claimed GBP 150,000 in loss of future earnings. As he had a substantial and continuing need for psychiatric treatment outside the National Health Service (NHS), he claimed GBP 50,000 as a minimum estimate for future treatment. This made a total of GBP 200,000.

(iii) B was still suffering from untreated post-traumatic stress disorder and a chronic, generalised anxiety disorder. He had horrific nightmares and, if left untreated, was likely to continue in the same disturbed emotional state. He required open-ended psychiatric treatment into adult life, outside the limited provision of the NHS. This was estimated at a cost of GBP 50,000 minimum. He is vulnerable in terms of both schooling and employment opportunities because of a chronic psychiatric disorder and limited social skills. His prospects of future employment were not as bleak as those of A, but he was likely to have substantial interruptions in his employment. On the assumption of six gaps of one year, on an average labourer's wage of GBP 15,000 per year, he claimed GBP 90,000. This made a total of GBP 140,000.

(iv) C was described as happy in her adoptive home, though carrying a substantial burden about her origins and reminders of them. She was recurrently angry and anxious about her natural mother. She had some remaining behavioural problems which were likely to be containable with good substitute parenting. She was, however, more liable than other children to anxiety and there was a statistical risk of depression in adult life. She did not currently require psychiatric treatment although provision should be made for treatment in adolescence and adulthood. At a recommended 30 to 50 sessions at GBP 70 to 90, a claim was made for GBP 4,500 for future psychiatric treatment. GBP 10,000 was claimed for loss of future earnings, making a total of GBP 14,500.

The reports commented that all the children would have benefited from compensation for their claims in 1994 as this would have allowed additional psychotherapeutic help, improving their prognosis. In A's case, his difficulties had been exacerbated by this lack of help while appropriate psychiatric, educational and environmental help might have substantially improved his prognosis. In B's case, more psychotherapeutic help could have reduced his current vulnerability and given a less gloomy prognosis. The reports also deplored that the psychotherapeutic referrals recommended for A and B in 1993 (for both) and 1998 (for B) had not been pursued by the

local authority on their behalf, and noted that one of the social workers had been told that there was no time or money for this work to be done.

2. The Government

115. The Government submitted that it was wrong to rely on domestic case-law and scales of assessment in just-satisfaction claims under Article 41 as the Court made its own assessment in accordance with principles in its own case-law. They emphasised that it must also be taken into account that the ill-treatment and neglect suffered by the applicants was not inflicted by the local authority but by their parents. It was also relevant that the breach of Article 3 arose only after there had been a failure to take effective steps when the situation in the home failed to show significant improvement – there was no ground for assuming that the children should have been removed from their home immediately. Nor should any award be made in respect of any alleged violation of Article 13 as that damage would be compensated by the award made under Article 3. In assessing what compensation would be equitable, it should also be taken into account that a number of compensatory remedies were available to the applicant, in particular, they received awards from the CICB.

116. As regards the recent medical reports, the Government considered that these were framed in largely identical terms with no attempt to distinguish the children's condition by reference to their age at the time of the violation, their sex and the duration of the treatment. No consideration was given either to what part was played by the temperament of the applicants, and by environmental factors including the care which they had received since 1992. Nor was any regard given to any harm which they might have suffered since being taken into care.

117. Turning to the specific claims made, the Government noted that Z had recovered from her depressive illness and had been doing remarkably well during her schooling, with no significant problems. There was nothing to substantiate the asserted claim for 60 to 100 sessions of psychotherapeutic treatment. Given her positive progress, the claim of statistical vulnerability to future anxiety and depressive illness was not substantiated either.

The report on A was in their view particularly unsatisfactory as it was issued without A having appeared for interview and without full information about his history. While he was not referred to a special clinic as suggested, he did receive therapeutic work in the community where he lived between 1996 and 1998. There was no or little basis for the assumption that his difficulties were exacerbated by the failure of his earlier compensation claim.

The report on B was similarly highly speculative and unsubstantiated, with regard to the alleged adverse impact of the lack of compensation. Its comments on his educational difficulties were inconsistent.

The report on C indicated that she was not psychiatrically ill and was coping well, rendering the conclusion that she had emotional and practical difficulties beyond the average girl of her age difficult to understand. The statements concerning likely future need and alleged impact of the failure of the compensation claim were unsupported by the evidence.

118. The Government submitted that in light of these considerations a reasonable sum of GBP 20,000 for Z, GBP 40,000 for A, GBP 30,000 for B, and GBP 10,000 for C would afford the applicants just satisfaction for both pecuniary and non-pecuniary damage.

3. The Court's assessment

119. As regards the applicants' claims for pecuniary loss, the Court's case-law establishes that there must be a clear causal connection between the damage claimed by the applicant and the violation of the Convention and that this may, in the appropriate case, include compensation in respect of loss of earnings (see, among other authorities, *Barberà, Messegué and Jabardo v. Spain* (Article 50), judgment of 13 June 1994, Series A no. 285-C, pp. 57-58, §§ 16-20, and *Çakıcı v. Turkey* [GC], no. 23657/94, § 127, ECHR 1999-IV).

120. A precise calculation of the sums necessary to make complete reparation (*restitutio in integrum*) in respect of the pecuniary losses suffered by the applicants may be prevented by the inherently uncertain character of the damage flowing from the violation (see *Young, James and Webster v. the United Kingdom* (Article 50), judgment of 18 October 1982, Series A no. 55, pp. 6-7, § 11). An award may still be made notwithstanding the large number of imponderables involved in the assessment of future losses, though the greater the lapse of time involved, the more uncertain the link becomes between the breach and the damage. The question to be decided in such cases is the level of just satisfaction, in respect of both past and future pecuniary losses, which it is necessary to award each applicant, the matter to be determined by the Court at its discretion, having regard to what is equitable (see The Sunday Times *v. the United Kingdom (no. 1)* (Article 50), judgment of 6 November 1980, Series A no. 38, p. 9, § 15, and *Smith and Grady v. the United Kingdom* (just satisfaction), nos. 33985/96 and 33986/96, §§ 18-19, ECHR 2000-IX). In that determination, the awards made in comparable domestic cases is a relevant but not decisive consideration.

121. Turning to the present case, the Court recalls that all four children suffered psychological and physical damage resulting from the abuse and neglect of their parents over a period of more than four years (see paragraphs 11-40 above). The breach of Article 3 concerned the failure of the local authority to take reasonable steps available to them to protect them from that damage. There is a direct causal link, therefore, between the breach and the damage suffered by the children. While it is correct, as

asserted by the Government, that there is no finding that the children should have immediately been taken into care and that they might have suffered damage even if effective steps had been taken at an earlier stage, the Court notes that the severity of the damage suffered by the children is inextricably linked to the long period of time over which the abuse persisted, which factor is also at the heart of the violation of Article 3 in this case.

122. The Court has taken into consideration the points made by the Government concerning the medical reports provided by the applicants, in particular, the lack of any attempt to compare the children's prospects in education and employment prior to their being taken into care. It cannot be excluded, for example, that A and B, who were identified as having educational difficulties, would have experienced some problems in any event. However, such assessments would inevitably be imprecise and based on some degree of speculation, as were the views expressed by Dr Harris-Hendriks concerning the future prognosis and effect on the educational and employment prospects. It may also be noted that the medical reports have not been tested in adversarial proceedings.

123. It is nonetheless possible, on the basis of the information available to the Court, to conclude that the four children will, in all probability, suffer from the effects of their experiences for the rest of their lives. Their capacity to cope with this past trauma will depend on their own personal abilities and the support to which they may have access.

124. It is clear that Z has made an excellent recovery from her depressive illness and, receiving support from her new family, is expected to do well at school and in the future in general. C, who, due to her young age, was less damaged by events, has also successfully integrated into a new family and is attending school without problem. In their case, the Court finds that it is not possible with any degree of certainty to draw conclusions as to future difficulties in the employment sphere. Notwithstanding their current positive prognosis, it may be considered as reasonably possible that in the future they will have some need of professional help in coping with problems which may arise as they grow older and in coming to terms with their childhood experience. An award to cover future psychotherapeutic care will assist in providing them with the support necessary to that process.

125. A was the most severely damaged of the children and suffers an ongoing psychiatric illness. Therapeutic care would help him now and will be necessary in the future. The Court is satisfied that the medical report may be relied on in this respect, Dr Harris-Hendriks having previously examined A and having access to sufficient information to support her opinion. Having integrated neither into a family nor into the education system, the prognosis for A may reasonably be described as bleak. In his case, it may be claimed that the damage suffered from the abuse will in all probability affect his prospects of gaining employment in the future. An award is appropriate to reflect this loss.

126. B is suffering from post-traumatic stress and anxiety disorders, which are likely to continue to affect him for some time to come. He requires both current and future psychiatric treatment. He is attending school, in a special-needs group. It is also probable, though to a lesser extent than A, that he will have problems in obtaining and sustaining employment in later life. An award is appropriate to reflect this.

127. Bearing in mind the uncertainties of the applicants' situations, and making an assessment on an equitable basis, the Court awards Z the sum of GBP 8,000 for future medical costs; A the sum of GBP 50,000 for future medical costs and GBP 50,000 for loss of employment opportunities; B the sum of GBP 50,000 for future medical costs and GBP 30,000 for loss of employment opportunities; and C the sum of GBP 4,000 for future medical costs.

B. Non-pecuniary damage

1. The applicants

128. The applicants claimed non-pecuniary damage in respect of the physical and psychiatric damage sustained. Z had suffered a serious depressive illness and severe malnutrition, and it was predicted that she would need long-term psychiatric care, probably into adulthood. A had suffered from post-traumatic stress disorder and was chronically under-attached. There was evidence to suggest that his father had hit him with a poker and that he had been sexually abused. He had suffered permanent scarring and was expected to require long-term psychiatric care. B had also suffered post-traumatic stress disorder, with some evidence of being beaten by a poker and being sexually abused. He suffered very bad nightmares and would wake up screaming. He was expected to require long-term psychiatric care. C had been less seriously damaged but was also expected to require some psychiatric treatment. Her health had been neglected by her mother and she had a squint as a result.

According to the assessment of Dr Black, Z, A and B had suffered psychiatric damage falling at the upper end of the severe bracket. They exhibited "marked problems" in their ability to cope with life and in their relationships with family, friends and those with whom they came into contact. A and B in particular had a poor prognosis and there was a likelihood of future vulnerability. C had suffered damage in the "moderately severe" bracket. Although she presented significant problems in the areas above, she had a more favourable prognosis.

Having regard to the levels of awards in such cases in the domestic courts, the applicants considered that a reasonable sum would be GBP 35,000 for Z, GBP 45,000 for A, GBP 40,000 for B, and GBP 25,000 for C.

2. The Government

129. As stated above, the Government considered that sums of GBP 20,000 for Z, GBP 40,000 for A, GBP 30,000 for B, and GBP 10,000 for C would afford the applicants just satisfaction for both pecuniary and non-pecuniary damage.

3. The Court's assessment

130. The children in this case suffered very serious abuse and neglect over a period of more than four years. Z, A and B suffered, and in the case of the two boys, still suffer psychiatric illness as a result. A and B also suffered physical injury and C suffered neglect in respect of an eye condition. The description of the conditions which they endured and the traumatic effects which this had on the children leave the Court with no doubt that a substantial award to reflect their pain and suffering is appropriate.

131. In making this assessment, the Court recalls that the rates applied in domestic cases, though relevant, are not decisive. It does not consider it appropriate or desirable to attempt to distinguish between the children in this context. Making an assessment on an equitable basis, the Court awards each child the sum of GBP 32,000.

C. Costs and expenses

132. The applicants claimed GBP 52,781.28 inclusive of value-added tax (VAT) by way of legal costs and expenses, which included fees for attendance at hearings before the Commission and the Court, fees for Dr Harris-Hendriks and submissions on Article 41 of the Convention.

133. The Government did not dispute the hourly rate or number of hours claimed by the applicants' principal legal advisers. They did query the involvement of a leading counsel as an expert on negligence law in addition to the leading counsel with human rights expertise. They also queried the involvement of the AIRE Centre in addition to an experienced counsel and solicitor, and noted that the AIRE Centre's fees for attending the hearing had also been billed in full in the second case, *T.P. and K.M. v. the United Kingdom* [GC], no. 28945/95, ECHR 2001-V, heard before the Court on the same day. They proposed that GBP 43,000 was a reasonable sum, taking these deductions into account. However, if no violation of Articles 6 and 8 of the Convention was found, they disputed the necessity for any of the fees incurred after April 2000 when the Government conceded a breach of Articles 3 and 13 of the Convention. In those circumstances, a reasonable sum would be GBP 36,000.

134. The Court recalls that only legal costs and expenses found to have been actually and necessarily incurred and which are reasonable as to

quantum are recoverable under Article 41 of the Convention (see, among other authorities, *Nikolova v. Bulgaria* [GC], no. 31195/96, § 79, ECHR 1999-II). It observes that the case involved important and complex issues, both concerning the facts which were established by the Commission, and the legal aspects. It does not consider that the costs incurred after April 2000 should be disallowed as such, as there were outstanding issues to be determined, including the claims of pecuniary and non-pecuniary damage arising out of the breaches conceded by the Government. As, however, the complaint made under Article 6, which was a significant part of the application, was unsuccessful, the costs and expenses allowed should be reduced. The Court has had regard to the fact that the Article 6 complaint was to some extent interconnected with the complaint about the inadequacy of remedies under Article 13.

135. In light of these matters, the Court awards the global sum of GBP 39,000 for legal costs and expenses, inclusive of VAT.

D. Default interest

136. According to the information available to the Court, the statutory rate of interest applicable in the United Kingdom at the date of adoption of the present judgment is 7.5% per annum.

FOR THESE REASONS, THE COURT

1. *Holds* unanimously that there has been a violation of Article 3 of the Convention.

2. *Holds* unanimously that no separate issue arises under Article 8 of the Convention.

3. *Holds* by twelve votes to five that there has been no violation of Article 6 of the Convention.

4. *Holds* by fifteen votes to two that there has been a violation of Article 13 of the Convention.

5. *Holds* unanimously
   (a) that the respondent State is to pay the applicants, within three months, the following amounts:
      (i) GBP 8,000 (eight thousand pounds sterling) to Z, GBP 100,000 (one hundred thousand pounds sterling) to A, GBP 80,000 (eighty

thousand pounds sterling) to B, and GBP 4,000 (four thousand pounds sterling) to C in respect of pecuniary damage;

(ii) GBP 32,000 (thirty-two thousand pounds sterling) to each applicant for non-pecuniary damage;

(iii) GBP 39,000 (thirty-nine thousand pounds sterling) in respect of costs and expenses, inclusive of VAT;

(b) that simple interest at an annual rate of 7.5% shall be payable from the expiry of the above-mentioned three months until settlement;

6. *Dismisses* unanimously the remainder of the applicants' claims for just satisfaction.

Done in English and in French, and delivered at a public hearing in the Human Rights Building, Strasbourg, on 10 May 2001.

Luzius WILDHABER
President

Paul MAHONEY
Deputy Registrar

In accordance with Article 45 § 2 of the Convention and Rule 74 § 2 of the Rules of Court, the following separate opinions are annexed to this judgment:

(a) concurring opinion of Lady Justice Arden as to Article 6;

(b) concurring opinion of Lady Justice Arden as to Article 41, joined by Mr Kovler;

(c) partly dissenting opinion of Mr Rozakis joined by Mrs Palm;

(d) partly dissenting opinion of Mrs Thomassen joined by Mr Casadevall and Mr Kovler.

L.W.
P.J.M.

CONCURRING OPINION OF LADY JUSTICE ARDEN AS TO ARTICLE 6

I agree that Article 6 of the Convention is applicable in this case and that it is not violated for the reasons given by the majority. I attach particular importance to the majority's affirmation of the well-established principle of Convention case-law that Article 6 does not guarantee any particular content for civil rights and obligations (see paragraphs 87, 98, 100 and 101 of the judgment). In the present case the applicants failed to obtain any remedy under the domestic law because the domestic courts held that they had no cause of action in English law (*X v. Bedfordshire County Council* [1995] 2 Appeal Cases 633).

Founding themselves upon the erroneous proposition as a matter of domestic law that they had some general right to sue in negligence where the defendant's act had caused damage and there was sufficient proximity, the applicants sought to argue that the decision of the English courts amounted to a sweeping or blanket immunity. I agree with the conclusion, in paragraph 98 of the judgment, that the facts of this case do not support that argument. In my view, when the courts in England, proceeding incrementally under the common law system of judicial law-making, hold that a hitherto unconsidered category of harm does not, as a matter of law, fall within the scope of the tort of negligence, they cannot properly be described as creating an "immunity", whether blanket or limited (see the speech of Lord Browne-Wilkinson in *Barrett v. the London Borough of Enfield* [1999] 3 Weekly Law Reports 79, paragraph 65 of the judgment in the present case). What the decision of the House of Lords in the present case did was to determine a legal issue fixing the limits on the substantive content of a domestic "civil right". In any event the decision was fully and carefully reasoned. It could not be regarded as the product of arbitrariness and it applied only to closely defined circumstances (see paragraphs 98-99 of the judgment).

Paragraph 98 of the judgment refers to *Fayed v. the United Kingdom* (judgment of 21 September 1994, Series A no. 294-B). In that case the Court contemplated the possibility that there might be a violation of the right of access to a court if, for example, a State could remove from the jurisdiction of the courts a whole range of civil claims, or confer immunities from civil liability on large groups or categories of persons (ibid., pp. 49-50, § 65). At the same time, however, the Court also stated that the Convention enforcement bodies could not create, by way of interpretation of Article 6, a substantive civil right which had no legal basis in the State concerned. Yet that is what the applicants are inviting the Court to do in the present case. Once the conclusion is reached that the right on which the applicants seek to rely has no legal basis in national law, the question of whether there was an

"immunity" such as to rely on the principle referred to in *Fayed* strictly does not arise.

In *Fayed* the Court did not settle the question whether the operation of a defence to a claim in defamation conferred by English law on a public officer was such as to attract the application of the right of access to a court under Article 6 § 1 or, rather, the substantive right to respect for one's private life under Article 8. Instead, it chose to "proceed on the basis that Article 6 § 1 [was] applicable to the facts of the case" (ibid., pp. 50-51, § 67). It explained that it did so as a matter of procedural convenience because the same central issues of legitimate aim and proportionality would have been raised under Article 8, and because the parties' arguments had been directed solely to Article 6 § 1. The result in that case does not, therefore, set any precedent for the applicability of Article 6 § 1 or detract from the principle to which, as stated, I attach particular importance, namely that Article 6 does not guarantee any particular content for civil rights and obligations (see paragraphs 87, 98, 100 and 101 of the present judgment).

CONCURRING OPINION OF LADY JUSTICE ARDEN AS TO ARTICLE 41, JOINED BY JUDGE KOVLER

Article 41 of the Convention enables the Court in appropriate cases to "afford just satisfaction to the injured party". The judgment of the Court awards two sums to each applicant by way of just satisfaction: one sum in respect of pecuniary damage and the other sum in respect of non-pecuniary damage. In the case of pecuniary damage, each applicant is awarded a different sum. However, in respect of non-pecuniary damage, each applicant is awarded an identical amount. Thus, with regard to non-pecuniary damage, the applicants' cases are not assessed individually. The applicants are treated as having suffered equal distress. In addition, no distinction is drawn between the suffering of any one applicant as against that of any other applicant, despite the differences between the cases of the applicants.

I agree that the just satisfaction which the Court awards to the applicants for the violation of Article 13 should include a sum on account of non-pecuniary damage in addition to the sums awarded in respect of pecuniary damage. I have no doubt that such an award is justified. However, in my opinion, the Court should not award the same sum to each applicant but rather should make a separate award to each applicant, reflecting the suffering of that applicant.

As paragraph 128 of the judgment shows, the applicants themselves have sought different amounts: GBP 35,000 for Z, GBP 45,000 for A, GBP 40,000 for B, and GBP 25,000 for C.

All the applicants endured suffering before they were taken into care. After they were taken into care they were assessed by consultant child psychiatrists: in 1993 by Dr Black, and in 2000 by Dr Harris-Hendriks. The diagnosis of A indicates that his case is the most serious. In 1993 he was diagnosed as suffering from post-traumatic stress disorder, and in 2000 he was diagnosed as suffering from a personality disorder for which the prognosis was unfavourable. B was considered to have a post-traumatic stress disorder in both 1993 and 2000, as well as social difficulties, and in addition in 2000 a generalised anxiety disorder, but the prognosis for him was uncertain rather than unfavourable. On the other hand, the initial diagnosis in 1993 of Z as suffering from a severe depressive illness has not been borne out, though it is considered that she may suffer anxiety and perhaps depressive illness in later life. In 2000 C's difficulties were described as moderate; she was regarded as vulnerable to anxiety and likely to need psychotherapeutic help in the future, but she had not suffered any psychiatric disorder.

In the circumstances my preferred course would have been to have performed a separate assessment of the amount to be awarded for non-pecuniary damage to each applicant. Having considered the evidence on the Article 41 issue, I consider that an appropriate amount would have been

GBP 25,000 for Z, GBP 40,000 for A, GBP 35,000 for B, and GBP 15,000 for C.

PARTLY DISSENTING OPINION OF JUDGE ROZAKIS JOINED BY JUDGE PALM

With great regret I am unable to follow the assessment and the conclusions of the majority of the Court that, in the instant case, there has been no violation of Article 6 § 1 of the Convention in so far as access of the applicants to a court of law is concerned. The reasons which have led me to depart from the majority's findings are as follows:

1. The majority is satisfied that the proceedings before the national courts, which culminated in a decision of the House of Lords, met the requirements of Article 6 § 1 as regards the applicants' right to have access to a court for the determination of their civil rights. As the Court observes in paragraph 101 of the judgment, the applicants may not "claim that they were deprived of any right to a determination on their merits of their negligence claims. Their claims were properly and fairly examined in the light of the applicable domestic principle concerning the tort of negligence". And, as it is also stated in paragraph 95, "[t]he arguments before the courts were, therefore, concentrated on the legal issues, primarily whether a duty of care in negligence was owed to the applicants by the local authority". It is difficult for one to accept this approach. The applicants' claims before the national courts did not, of course, refer to this preliminary issue. Their complaint was that the local authorities acted with gross negligence in a case involving a statutory duty of care and that, because of the damage inflicted on them by the failure of the authorities to properly discharge their responsibilities, compensation was due. They submitted this civil right to the courts and nurtured the legitimate expectation that it would be dealt with by the courts through an examination on the merits following an adversarial procedure that would enable them to prove the veracity of their claims. If it may be asserted that, as a general rule the question of access to a court is determined by the subject matter of the claims before the national courts, then the applicants never enjoyed access: at all stages of the domestic examination of their case, the national courts solely examined the jurisdictional problem of whether they could entertain the merits of the case before them, thus confining themselves to the preliminary question of whether an exclusionary rule exists, preventing them from examining the merits. An exclusionary rule which was eventually established by them, not on the basis of statutory requirements or specific precedents that were binding on them, but on the basis of a particular interpretation by them of the requirements of English law in the light of the circumstances of the case before them.

2. It is one matter, of course, to accept that there was no access to a court – which, unfortunately, the majority did not clearly accept – and another to say that, in the circumstances of a particular case, the absence of access is justified because it serves a particular purpose which is proportionate to the

damage done to an individual not enjoying the protection otherwise afforded to him by Article 6 of the Convention.

I am prepared to subscribe to this alternative approach, on which the majority has also embarked – without, however, making a clear distinction between the absence of access and the circumstances justifying a proportional denial of it. However, I am not prepared to accept that the facts of the case may lead us to the conclusion that the applicants were correctly and proportionately deprived of their right because the public-interest considerations prevailed over their legitimate expectation to have their claims examined on the merits.

First of all, it transpires clearly from the facts of the case that the right to sue in negligence was an established civil right in domestic law, that the public-care authorities accepted that they had been negligent in their behaviour, and that there was a proximate relationship in accordance with the criteria determined by national law. Further, the way that the judicial authorities dealt with the matter shows that the case presented serious issues that warranted serious examination: as the applicants pointed out, the judge who made the care orders specifically released the case papers to the Official Solicitor so that he could investigate and, if appropriate, pursue negligence claims; the Official Solicitor considered that there were arguable claims in negligence; the Legal Aid Board granted legal aid to pursue the claims to the House of Lords; and the Court of Appeal, which rejected the claims by a majority, granted leave to appeal to the House of Lords, the precondition for such leave being that the claim was arguable in domestic law; the Master of the Rolls in the Court of Appeal found that there was a duty of care, stating the contrary to be "an affront to common sense"; and, in previous cases, local authorities had settled negligence claims on the basis that they were potentially liable.

So, the only reason which eventually led to this case being struck out was an interpretation by the national courts, and particularly the House of Lords, based on an argument of expediency and as a matter of policy. Indeed, by applying the third test of the English law of torts on negligence – namely, whether it was fair, just and reasonable to impose liability on the public-care authorities in the circumstances of the case, the House of Lords found that it would be detrimental to the exercise of the duties of the public body in question to impose upon them the excessive burden of tortious liability for acts or omissions in the discharge of their duties. The position taken by the House of Lords in this matter was novel and tantamount to a refusal to extend tortious liability for civil wrongs arising out of a duty of care by local authorities for child care.

It is not the Court's task to enter into an examination of the social-policy considerations which led the national courts to interpret the third test in the way they did. Yet, it is its task to look at the circumstances surrounding the particular decisions taken and to assess their significance when applying its

own test of proportionality; and it seems difficult for me to accept that in view of the importance attached to the facts of the case by the various judicial and other bodies, and the novel character of the House of Lords' ruling, the creation of new case-law barring the examination of the case on its merits was proportionate to the need for adequate protection of individuals (and society generally) against negligence by public authorities.

Secondly, and more importantly, this Court has found a violation of Article 3 of the Convention on the basis of a finding that "the neglect and abuse suffered by the four applicant children reached the threshold of inhuman and degrading treatment" (see paragraph 74 of the judgment). Again it is difficult for me to accept that serious matters of public concern – as are all matters involving a violation of Article 3 – may be left outside the protection of independent and impartial tribunals established by law, and providing all the guarantees required by Article 6 of the Convention. The majority, however, holds a different view since it accepts that, even in circumstances where there has been a violation of the substance of Article 3, the Contracting States "are afforded some discretion as to the manner in which they conform to their Convention obligations ..." provided that some effective remedy exists to deal with individual complaints concerning inhuman and degrading treatment. Hence, they conclude that, in the present situation, Article 13, but not Article 6, has been violated.

It seems to me that the present case may be considered as the *locus classicus* of the limits afforded to States by the Convention to determine the modalities of access to domestic courts. Our case-law has repeatedly underlined the fact that the right to a tribunal is not unlimited – and rightly so. Yet, the Court is free to determine in which instances a Contracting State oversteps its freedom of choice and becomes liable under Article 6; and one criterion which can readily assist the Court in drawing the line between instances where a State retains its discretion, and instances where a State is bound to offer judicial guarantees to those falling under its jurisdiction, is the severity of the complaint before the national authorities. If the complaint may involve a violation of core Convention rights – such as Articles 2 and 3 – the Court is bound, to my mind, to find that the States are obliged not simply to offer an effective remedy (as required by Article 13), but a judicial remedy covering all the requirements of Article 6.

3. Most of the ideas put forward in the previous lines have as their source of inspiration *Osman v. the United Kingdom* (judgment of 28 October 1998, *Reports of Judgments and Decisions* 1998-VIII) which the majority has not followed in the present judgment. The main reason which has led the majority to depart from the established case-law is explained in paragraph 100 of the present judgment:

> "... The Court considers that its reasoning in *Osman* was based on an understanding of the law of negligence ... which has to be reviewed in the light of the clarifications subsequently made by the domestic courts and by notably the House of Lords. The

> Court is satisfied that the law of negligence as developed in the domestic courts since the case of *Caparo Industries plc* ... and as recently analysed in the case of *Barrett* ... includes the fair, just and reasonable criterion as an intrinsic element of the duty of care and that the ruling of law concerning that element in this case does not disclose the operation of an immunity. In the present case, the Court is led to the conclusion that the inability of the applicants to sue the local authority flowed not from an immunity but from the applicable principles governing the substantive right of action in domestic law. ..."

I do not think that in *Osman* the Court was very much concerned with this subtle issue raised by this judgment in the above-mentioned paragraph. The Court in *Osman* never said that the jurisdictional bar was an immunity to be distinguished from the applicable principles governing the substantive right of action in domestic law. It simply considered that "the application of the [exclusionary] rule in this manner without further enquiry into the existence of competing public interest considerations only serves *to confer a blanket immunity* on the police for their acts and omissions during the investigation and suppression of crime and amounts to an unjustifiable restriction on an applicant's right to have a determination on the merits of his or her claim against the police in deserving cases" (see *Osman*, cited above, p. 3170, § 151 – emphasis added). It went on to express the opinion that, in cases where the harm sustained by a complainant was of the most serious nature, examination of the merits could not be automatically excluded by the application of a rule which "*amounts to the grant of an immunity to the police*". In conclusion, the Court in *Osman* was mainly concerned with the fact that the applicants in a very serious case of possible substantive human-rights violations did not have the opportunity to air their grievances before a court of law; it was not concerned with whether the reason behind it being impossible to examine the case on the merits was or was not the result of an immunity provided for by national law acting as a procedural bar having such an effect. It simply found that the impossibility amounted to a grant of an immunity. Under these circumstances how can we distinguish between *Osman* and the present case?

For all the above reasons I believe that Article 6 (access to a court) has been violated and, hence, I consider that Article 13 does not raise a separate ground for violation, Article 6 being the *lex specialis* in this case.

PARTLY DISSENTING OPINION OF JUDGE THOMASSEN JOINED BY JUDGES CASADEVALL AND KOVLER

I am unable to agree with the majority that there has been no violation of Article 6 of the Convention in this case.

The Court is unanimous that the authorities failed to protect the applicants, young children, from inhuman and degrading treatment and its majority observes that the applicants were denied "a determination of their allegations that the local authority failed to protect them from inhuman and degrading treatment and the possibility of obtaining an enforceable award of compensation for the damage suffered thereby" (see paragraph 111 of the judgment).

Despite the severe negligence by the authorities, which allowed the ill-treatment of the applicants to continue for so many years and caused the applicants physical and psychiatric injuries amounting to a violation of Article 3, the applicants could not hold the authorities accountable in domestic court proceedings. By reference to policy factors (for example, difficulties of attributing responsibility between different agencies, sensitivity of decisions, risk of inculcating in local authorities a cautious and defensive approach to exercise of their duties, risk of costly and vexatious litigation) the domestic courts decided that the local authority could not be held liable in negligence in the exercise of their statutory powers to protect children. *De facto*, the local authority was thus declared to be immune for claims because they had acted in the exercise of their statutory powers to protect children.

In my view the applicants' rights under Article 6 were thereby violated as they had no access to a court in order to have a decision on their claims, which were arguable under national law. The facts of this case and the way in which domestic law operated are very similar to those in *Osman v. the United Kingdom* (judgment of 28 October 1998, *Reports of Judgments and Decisions* 1998-VIII) where the applicants' claims for negligence against the police were struck out for policy reasons relating to the perceived interests in preventing the efficiency of the police service being undermined by litigation. In *Osman* the Court found that the application of an exclusionary rule barring liability of the police for negligence in the exercise of their functions of investigating and preventing crime constituted a disproportionate restriction on access to a court for the applicants. The majority's reasons for not following the decisions in *Osman* (see paragraph 100 of the judgment) are not, to my mind, convincing. There seem to have been no striking or significant changes in the law of negligence since that case and all relevant matters concerning the content of domestic law had been brought to the attention of the Court by the parties in *Osman*. I am of the opinion that the conclusion under Article 6 in this case must be the same.

It is true that, as the majority observes in paragraph 95 of the judgment, the applicants were not prevented in any practical manner from bringing their claims before the domestic courts. The case was litigated up to the House of Lords, the applicants being provided with legal aid for that purpose. Nor is it the case that any procedural rules of limitation had been relied on. However, the notion of "access to a court" under Article 6 guarantees not only that the applicants have their claims brought before the courts, but implies also the right to have those claims examined on the basis of the facts before the courts and to have them decided on.

I agree with the majority saying in paragraph 98 that Article 6 does not in itself guarantee any particular content for civil rights and obligations in national law. But where there is an arguable claim under domestic tort law as in this case (see paragraph 89 of the judgment), requiring that the applicants obtain a decision by a court on the liability of those responsible for allowing their ill-treatment to continue for many years, cannot, in my opinion, be said to determine the content of domestic law.

I would observe that the Court's supervision of the activities of national courts in defining "access" or "liability" seems to take place on a wider basis. In *Fayed v. the United Kingdom* (judgment of 21 September 1994, Series A no. 294-B, pp. 49-50, § 65), the Court said:

> "Certainly the Convention enforcement bodies may not create by way of interpretation of Article 6 § 1 a substantive civil right which has no legal basis in the State concerned. However, it would not be consistent with the rule of law in a democratic society or with the basic principle underlying Article 6 § 1 – namely that civil claims must be capable of being submitted to a judge for adjudication – if, for example, a State could, without restraint or control by the Convention enforcement bodies, remove from the jurisdiction of the courts a whole range of civil claims or confer immunities from civil liability on large groups or categories of persons ..."

To reach its conclusion that the decision by the House of Lords did not amount to the granting of an immunity, the Court's majority observes, in paragraph 99, that in cases concerning the liability of local authorities in child-care matters brought after the applicants' case, the domestic courts have held that a duty of care may arise. But this does not change the fact that an immunity was conferred on the authorities in the applicants' case. Apparently the immunity applied in the applicants' case was found no longer appropriate in subsequent cases, the national courts taking into account, amongst other factors, the Court's approach in *Osman*, cited above.

While it has been alleged by the Government that a finding of a violation in this case would undermine the striking-out procedure used to avoid pointless litigation of baseless claims, I consider that this argument has not been substantiated by the material placed before the Court. The domestic courts have continued to strike cases out after the Court's judgment in *Osman*. A finding of a violation in this case would mean only that these applicants' claims, which involved serious ill-treatment contrary to a

fundamental human right, should not have been struck out on the basis of general policy arguments. This Court has found no denial of access to a court where judges have struck out cases where there has been no proximity or foreseeability (see, for example, *Powell v. the United Kingdom* (dec.), no. 45305/99, ECHR 2000-V, and *Bromiley v. the United Kingdom* (dec.), no. 33747/96, 23 November 1999, unreported).

The majority of the Court finds that the applicants were not afforded an effective remedy in respect of the breach of Article 3 and they conclude that Article 13, not Article 6, was violated.

My conclusion would be that the "remedy" to which the applicants were entitled should have been access to a court in order to have their damages settled. Restrictions to access to a court in order to protect the interests of the local authority exercising their powers to protect children may be necessary and justified under Article 6. However, I would say that in this case, where it is agreed that the child applicants were victims of the failure of the system to protect them from serious, long-term neglect and abuse, the immunity conferred on the local authority because of policy reasons cannot be seen as proportionate.

Therefore, I believe that Article 6 was violated.

I voted for a violation of Article 13 because I agree with the majority that the applicants, whose rights under Article 3 of the Convention were violated, had no effective remedy before the national authorities.

UN Convention on the Rights of the Child

In Child Friendly Language

"Rights" are things every child should have or be able to do. All children have the same rights. These rights are listed in the UN Convention on the Rights of the Child. Almost every country has agreed to these rights. All the rights are connected to each other, and all are equally important. Sometimes, we have to think about rights in terms of what is the best for children in a situation, and what is critical to life and protection from harm. As you grow, you have more responsibility to make choices and exercise your rights.

Article 1
Everyone under 18 has these rights.

Article 2
All children have these rights, no matter who they are, where they live, what their parents do, what language they speak, what their religion is, whether they are a boy or girl, what their culture is, whether they have a disability, whether they are rich or poor. No child should be treated unfairly on any basis.

Article 3
All adults should do what is best for you. When adults make decisions, they should think about how their decisions will affect children.

Article 4
The government has a responsibility to make sure your rights are protected. They must help your family to protect your rights and create an environment where you can grow and reach your potential.

Article 5
Your family has the responsibility to help you learn to exercise your rights, and to ensure that your rights are protected.

Article 6
You have the right to be alive.

Article 7
You have the right to a name, and this should be officially recognized by the government. You have the right to a nationality (to belong to a country).

Article 8
You have the right to an identity – an official record of who you are. No one should take this away from you.

Article 9
You have the right to live with your parent(s), unless it is bad for you. You have the right to live with a family who cares for you.

Article 10
If you live in a different country than your parents do, you have the right to be together in the same place.

Article 11
You have the right to be protected from kidnapping.

Article 12
You have the right to give your opinion, and for adults to listen and take it seriously.

Article 13
You have the right to find out things and share what you think with others, by talking, drawing, writing or in any other way unless it harms or offends other people.

Article 14
You have the right to choose your own religion and beliefs. Your parents should help you decide what is right and wrong, and what is best for you.

Article 15
You have the right to choose your own friends and join or set up groups, as long as it isn't harmful to others.

Article 16
You have the right to privacy.

Article 17
You have the right to get information that is important to your well-being, from radio, newspaper, books, computers and other sources. Adults should make sure that the information you are getting is not harmful, and help you find and understand the information you need.

Article 18
You have the right to be raised by your parent(s) if possible.

Article 19
You have the right to be protected from being hurt and mistreated, in body or mind.

Article 20
You have the right to special care and help if you cannot live with your parents.

Article 21
You have the right to care and protection if you are adopted or in foster care.

Article 22
You have the right to special protection and help if you are a refugee (if you have been forced to leave your home and live in another country), as well as all the rights in this Convention.

Article 23
You have the right to special education and care if you have a disability, as well as all the rights in this Convention, so that you can live a full life.

Article 24
You have the right to the best health care possible, safe water to drink, nutritious food, a clean and safe environment, and information to help you stay well.

Article 25
If you live in care or in other situations away from home, you have the right to have these living arrangements looked at regularly to see if they are the most appropriate.

Article 26
You have the right to help from the government if you are poor or in need.

Article 27
You have the right to food, clothing, a safe place to live and to have your basic needs met. You should not be disadvantaged so that you can't do many of the things other kids can do.

Article 28
You have the right to a good quality education. You should be encouraged to go to school to the highest level you can.

Article 29
Your education should help you use and develop your talents and abilities. It should also help you learn to live peacefully, protect the environment and respect other people.

Article 30
You have the right to practice your own culture, language and religion - or any you choose. Minority and indigenous groups need special protection of this right.

Article 31
You have the right to play and rest.

Article 32
You have the right to protection from work that harms you, and is bad for your health and education. If you work, you have the right to be safe and paid fairly.

Article 33
You have the right to protection from harmful drugs and from the drug trade.

Article 34
You have the right to be free from sexual abuse.Article 35No one is allowed to kidnap or sell you.

Article 36
You have the right to protection from any kind of exploitation (being taken advantage of).

Article 37
No one is allowed to punish you in a cruel or harmful way.

Article 38
You have the right to protection and freedom from war. Children under 15 cannot be forced to go into the army or take part in war.

Article 39
You have the right to help if you've been hurt, neglected or badly treated.

Article 40
You have the right to legal help and fair treatment in the justice system that respects your rights.

Article 41
If the laws of your country provide better protection of your rights than the articles in this Convention, those laws should apply.

Article 42
You have the right to know your rights! Adults should know about these rights and help you learn about them, too.

Articles 43 to 54
These articles explain how governments and international organizations like UNICEF will work to ensure children are protected with their rights.

Learning objectives

02 unit

- ✓ Knowledge of the fundamental rights and principles established by the international and European legal framework on children's rights within which Trauma Informed Care (ICT) can be applied.
- ✓ Specific understanding of children's participation rights

Who is the child?

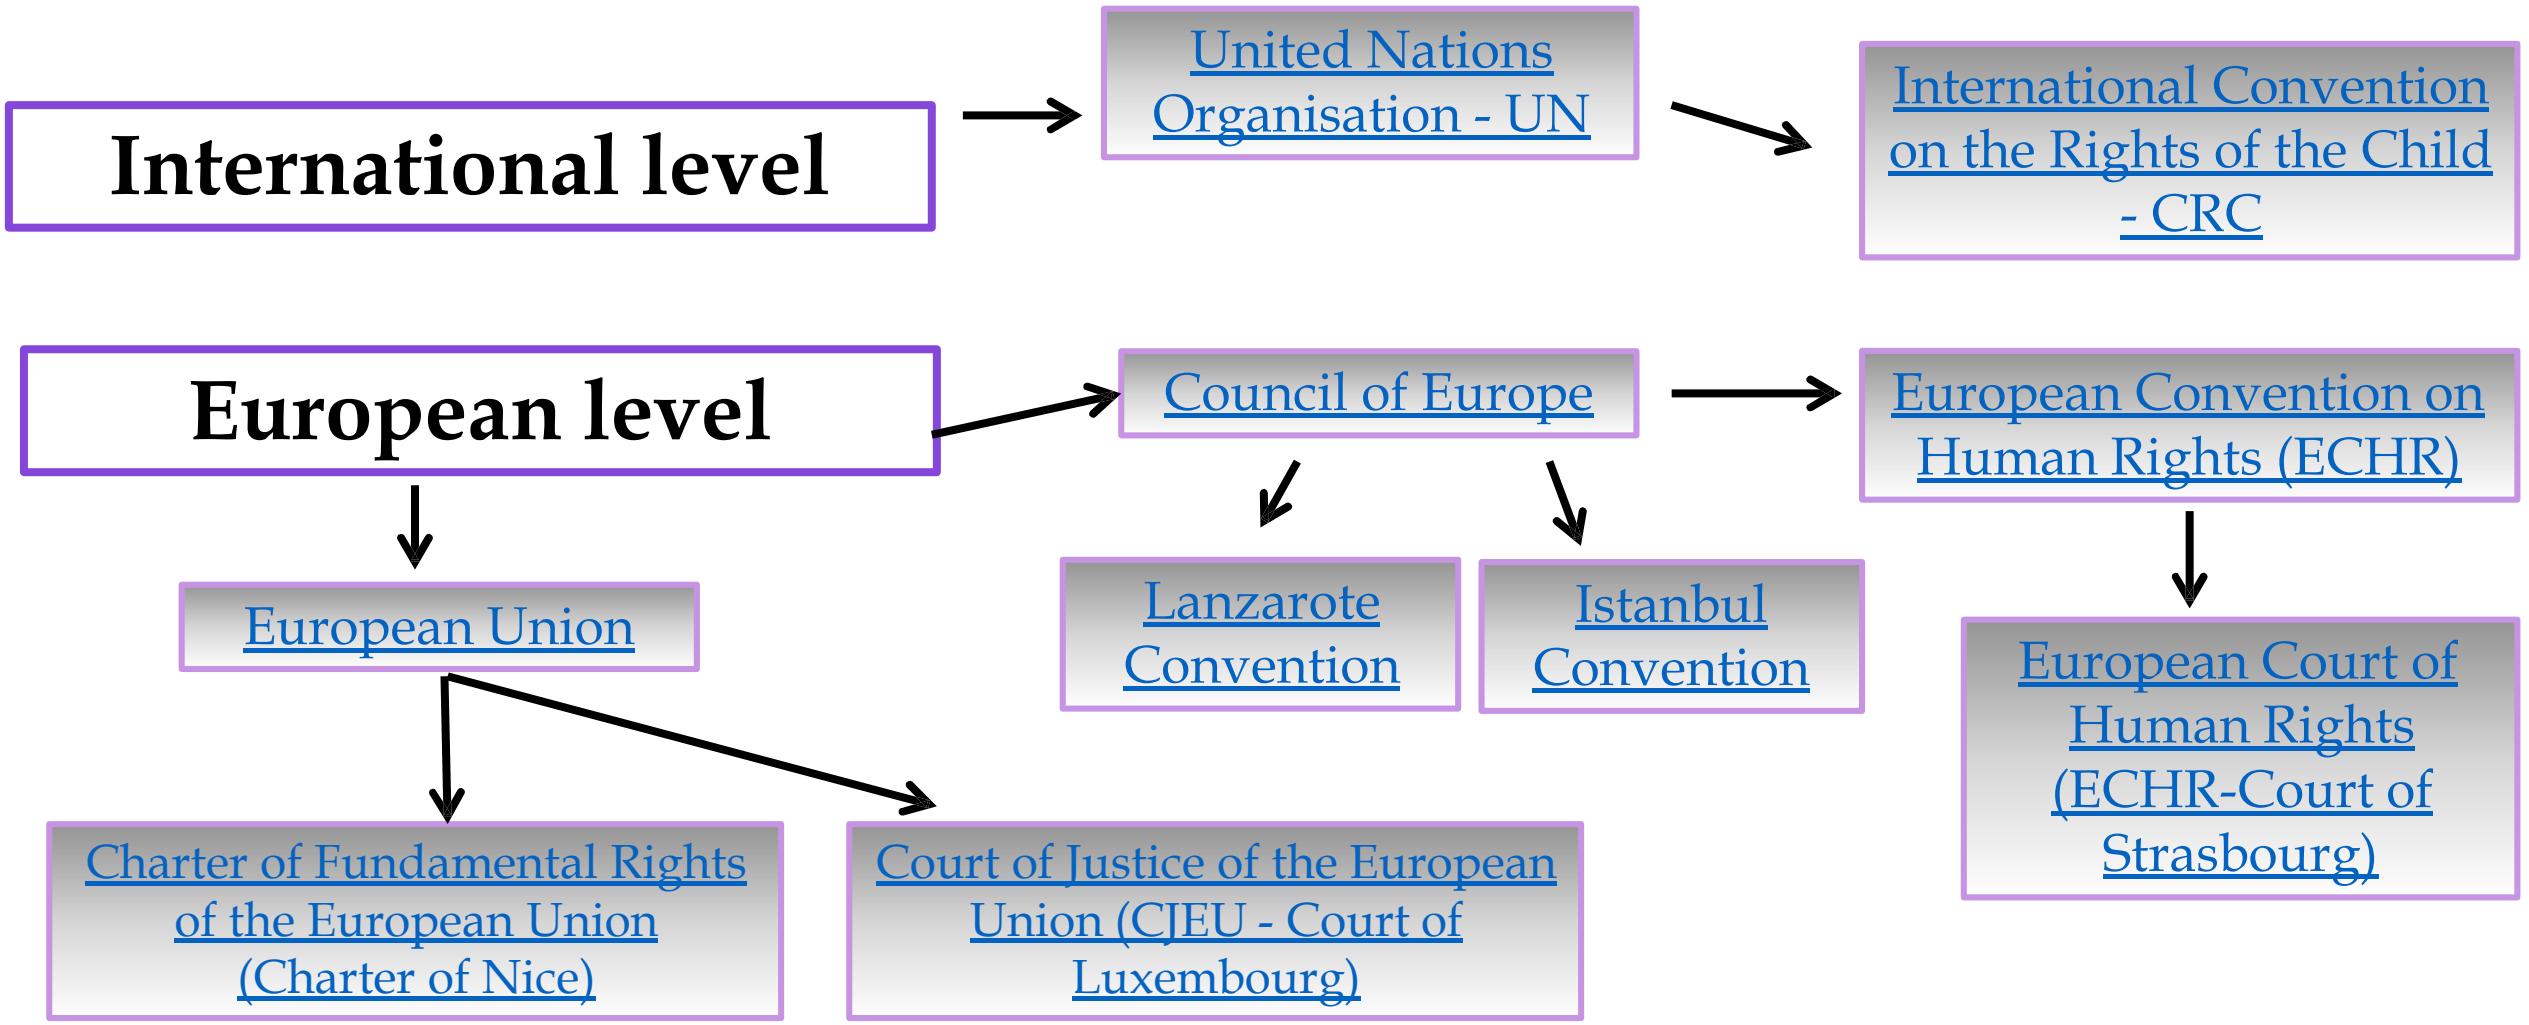
carepath

The International Convention on the Rights of the Child (CRC) establishes that “a child means every human being below the age of eighteen years” (article 1).

Similarly, most instruments of the Council of Europe concerning children adopt the definition established by the CRC.

Within the European Union there is no description of “child" and therefore the CRC definition is commonly used.

Legal framework



CHILDREN'S RIGHTS AND FREEDOMS

All individuals, including children, enjoy **freedoms and rights** recognised by legal instruments (conventions, treaties, declarations) on human rights, in particular, the European Union Charter of Fundamental Rights (*Charter of Nice*) and the European Convention of Human Rights (*ECHR*).

carepath

FUNDAMENTAL RIGHTS AND FREEDOMS

CIVIL RIGHTS

ECONOMIC, SOCIAL AND CULTURAL RIGHTS

FREEDOMS AND FUNDAMENTAL CIVIL RIGHTS

carepath

- They are called "first generation" rights and are considered fundamental as their violation profoundly damages the person's life.
- They require States both not to interfere in the private sphere of the individual, and to engage actively in an activity to secure the effective enjoyment of a fundamental right

For example, the right to respect for family life (art. 8 ECHR) calls for States not to separate children from their parents except when this is strictly necessary for the protection of the offspring themselves, but also to take measures to promote the development of relations between parents and children supporting the non-custodial parent in having access to his or her child and
overcoming the unjustified opposition of the other parent

Right to respect for family life

Everyone has the right to respect for "**family life**"

as experienced in practice

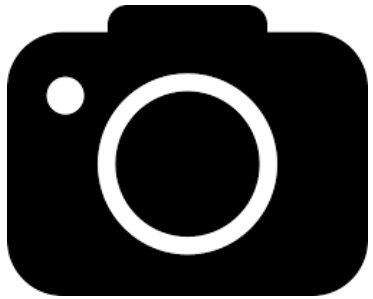
(for example, the child has the right to grow up in the family and to maintain contact with both parents after their separation)

Reference articles:

- Article 7 (right to respect for family life) Charter of Nice
- Article 8 (right to respect for family life) ECHR
- Articles 8 and 9 CRC

Right to respect for private life

The notion of "**private life**" developed by the case law of the Court of Strasbourg is broad and includes many aspects of an individual's identity
(for example, the physical and moral integrity of the person, the name, image, privacy and protection of personal data)

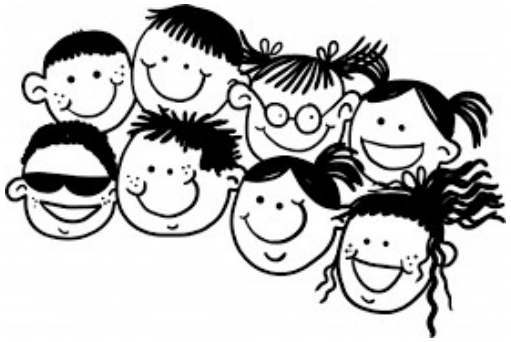


Reference articles:

- Article 7 (right to respect for private life) Charter of Nice
- Article 8 (right to respect for private life) ECHR
- Article 16 CRC

Non-discrimination

Different treatments based on gender, race, skin colour, ethnic or social origin, genetic characteristics, language, beliefs or religion, political or other opinions, belonging to a national minority, financial situation, birth, disability, age or sexual orientation **are considered discriminatory and prohibited** unless they serve a legitimate purpose



Reference articles:

- Article 7 (right to respect for private life), Articles 20 (equality before the law) and Article 21 (non-discrimination) Charter of Nice
- Article 14 ECHR; Article 1 of Protocol No. 12 of the ECHR (non-discrimination)
- Article E (non-discrimination) European Social Charter (ESC)
- Article 8 (right to respect for private life) ECHR
- Article 2 CRC

Principle of the best interests of the child

carepath

Children and young people have the right, being minors, to benefit from special protection and therefore to benefit from differentiated treatment based on age

Reference article:

Article 3 CRC

EXAMPLE 1

The judge asked to decide upon the custody of children after the separation / divorce of the parents must decide solely on the basis of what is best for the child and not for the parents

Freedom of expression

Everyone has the right to freedom of expression. This right shall include freedom to hold opinions and to receive and give information and ideas without interference by the public authority and regardless of borders.

(Article 10, paragraph 1 ECHR)

Reference articles:

- Article 11 and Article 24 paragraph 1 Charter of Nice
- Article 10 ECHR
- Article 12, paragraph 1 CRC

The right of the child to be heard

"The child shall be provided the opportunity to be heard in any judicial and administrative proceedings affecting the child, either directly, or through a representative or an appropriate body, in a manner consistent with the procedural rules of national law." (Article 12 CRC)

For more information on the child's right to be heard, see the contribution

Unit_2_3_video_Prof._Long

Reference articles:

- Article 12 CRC
- Articles 3 and 6 European Convention on the Exercise of Children's Rights

The right of the child to protection against violence and exploitation

"States Parties shall take all appropriate legislative, administrative, social and educational measures to protect the child from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse" (Article 19, paragraph 1, International Convention on the Rights of the Child - CRC)

Case Z. and Others vs. U.K.

Reference articles:

- Articles 2 (right to life), 3 (inhuman or degrading treatment) and 8 (physical integrity) ECHR; Protocol no. 1 to the ECHR, article 2 (right to education)
- Articles 7 (right to special protection against physical and moral hazards) and 17 (right to protection) European Social Charter (CSE)
- Convention on the protection of children against sexual exploitation and abuse (Lanzarote Convention).
- Convention on preventing and combating violence against women and domestic violence (Istanbul Convention)
- Directive on the fight against sexual abuse and sexual exploitation of children and child pornography (2011/93/EU)

EXAMPLE 2: Witnessing violence

Violence does not only produce damage when it is acted out, but also when children become witnesses to it.

Watching, listening, experiencing anguish, being invested, infected and overwhelmed without being able to do anything. It means exposing a child to any form of mistreatment, carried out through acts of physical, verbal, psychological, sexual and economic violence, on reference figures or on other emotionally significant figures within domestic and family environments. This is witnessing violence.

It is a phenomenon that is still submerged, almost "invisible", characterised by multiple signals, whose effects can be devastating on the physical, cognitive and behavioural development of children

(Save the Children https://www.savethechildren.it/campagne/abbattiamo-il-muro-del-silenzio)

Children who witness an act of violence suffer it

Reference articles:

Article 19 CRC

Article 17 European Social Charter (ESC)

The story of a child witness

https://www.youtube.com/watch?v=hYX8cRkiklE

EXAMPLE 3 : Corporal punishment

The following are considered to be corporal punishment:

- any punishment for which physical strength is used to inflict a certain level of pain or affliction, no matter how slight
- equally cruel and degrading forms of non-physical punishment, for example, punishments that aim to denigrate the child, humiliate him, diminish him, despise him, make him a scapegoat, threaten him, scare him or taunt him (UN Committee on the Rights of the Child, General Comment n. 8 of 2006)

Raise your hand against smacking!

Reference articles:

Article 3 ECHR.

Articles 19, 28, paragraph 2, and 37 CRC

EXAMPLE 4 : Sexual abuse

It is considered "sexual abuse" to engage in sexual activities with a child where:

- use is made of coercion, force or threats; or abuse is made of a recognised position of trust, authority or influence over the child, including within the family;
- abuse is made of a particularly vulnerable situation of the child, notably because of a mental or physical disability or a situation of dependence.

(Article 18, paragraph 1, Convention of the Council of Europe on the protection of children from sexual exploitation and sexual abuse - Lanzarote Convention)

You can't touch here!

ECONOMIC, SOCIAL AND CULTURAL RIGHTS

carepath

They represent the so-called “second generation” rights that each state is called upon to satisfy in order to overcome social inequalities, economic imbalances, disadvantages caused by nature, age, etc.

Their concrete realisation (unfortunately!) takes place gradually and compatibly with the economic-structural problems that every State faces.

Right to health

"Health is a state of complete physical, mental and social well-being and not simply an absence of disease or infirmity"

(World Health Organisation, 1948)

Reference articles:

- Article 35 (access to health care) Charter of Nice
- Article 25 Universal Declaration of Human Rights
- Articles 24, 25 and 26 CRC
- Article 2 (right to life) and article 3 (right to physical integrity) ECHR
- Article 11 (right to health protection) and article 13 (right to social and medical assistance) European Social Charter (CSE)
- Article 6 European Convention for the Protection of Human Rights and the Dignity of the Human Being with regard to the Applications of the biology and medicine, so-called “Oviedo Convention”

Right to education

"Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit."

(Article 26, Universal Declaration of Human Rights)

The right to education does not just refer to the learning of basic school subjects but must be conceived in a broader sense. Education must seek to foster the development of the child's personality, his mental and physical qualities and attitudes. (Article 29 CRC)

Handbook on European law relating to the rights of the child

Foreword

This handbook on European law relating to the rights of the child is jointly prepared by the European Union Agency for Fundamental Rights (FRA) and the Council of Europe together with the Registry of the European Court of Human Rights. It is the fourth in a series of handbooks on European law jointly prepared by our organisations. Previous handbooks were dedicated to European law relating to non-discrimination law, asylum, borders and immigration, and data protection.

We embarked on this new joint project in the context of the celebrations of the 25th anniversary of the United Nations Convention on the Rights of the Child – which all European states have ratified – to shed light on the role of European legal standards in securing the enjoyment by children of their universal rights.

Children are full-fledged holders of rights. This handbook thus aims to raise awareness and improve the knowledge of the legal standards that protect and promote these rights in Europe. The Treaty on European Union (TEU) sets forth the Union's obligation to promote the protection of the rights of the child. The Charter of Fundamental Rights of the European Union (EU), EU regulations and directives, as well as the jurisprudence of the Court of Justice of the EU (CJEU), have contributed to further determining the protection of the rights of children. In the Council of Europe, a large number of conventions focus on specific aspects of the protection of the rights of the child, ranging from their rights and safety in cyberspace to the adoption of children. These conventions contribute to enriching the protection granted to children under the European Convention on Human Rights and the European Social Charter, including the jurisprudence of the European Court of Human Rights (ECtHR) and the decisions of the European Committee of Social Rights (ECSR).

This handbook is designed for non-specialist legal professionals, judges, public prosecutors, child protection authorities, and other practitioners and organisations responsible for ensuring the legal protection of the rights of the child.

We would like to thank Prof. Ton Liefaard, LL.M. Simona Florescu, JD. Margaret Fine, Prof. Karl Hanson, Prof. Ursula Kilkelly, Dr. Roberta Ruggiero, Prof. Helen Stalford and Prof. Wouter Vandenhole for their contribution in drafting this handbook. We would also like to thank all those who provided input and support throughout its preparation.

FOREWORD 3

ACRONYMS 11

HOW TO USE THIS HANDBOOK 13

1 INTRODUCTION TO EUROPEAN CHILDREN'S RIGHTS LAW: CONTEXT AND KEY PRINCIPLES 15

1.1. Core concepts 17

Key point 17

1.1.1. Scope of European children's rights law 17

1.1.2. 'Child' as a holder of rights 17

1.2. Background to European children's rights law 19

1.2.1. European Union: development of children's rights law and the areas of protection covered 20

1.2.2. Council of Europe: development of children's rights law and the areas of protection covered 23

1.3. European children's rights law and the UN Convention on the Rights of the Child 26

Key point 26

1.4. Role of the European courts in interpreting and enforcing European children's rights 28

1.4.1. The Court of Justice of the European Union 28

1.4.2. The European Court of Human Rights 30

1.5. European Committee of Social Rights 31

2 BASIC CIVIL RIGHTS AND FREEDOMS 33

2.1. Freedom of thought, conscience and religion 35

Key points 35

2.1.1. The child's right to freedom of religion 35

2.2. Parents' rights and the freedom of religion of their children 37

2.3. Freedom of expression and information 39

Key points 39

2.4. Right to be heard 41

Key points 41

2.5. Right to freedom of assembly and association 44

Key points 44

3 EQUALITY AND NON-DISCRIMINATION 47
3.1. European non-discrimination law 48
Key points 48
3.2. Non-discrimination based on race or ethnic origin 51
Key points 51
3.3. Non-discrimination based on nationality and immigration status 54
Key points 54
3.4. Non-discrimination based on age 56
Key point 56
3.5. Non-discrimination based on other protected grounds 57
Key point 57
4 PERSONAL IDENTITY ISSUES 61
4.1. Birth registration and the right to a name 63
Key point 63
4.2. Right to personal identity 65
Key points 65
4.2.1. Establishing paternity 66
4.2.2. Establishing maternity: anonymous birth 68
4.3. Establishing one's origin: adoption 68
4.4. Identity theft 69
Key point 69
4.5. Right to citizenship 70
Key points 70
4.6. Identity of children belonging to national minorities 72
Key point 72
5 FAMILY LIFE 73
5.1. Right to respect for family life 75
Key points 75
5.2. Right of the child to be cared for by his/her parents 76
Key points 76
5.3. Right to maintain contact with both parents 78
Key points 78
5.4. Improper removal of children across borders – child abduction 86
Key points 86

6 ALTERNATIVE CARE TO FAMILY CARE AND ADOPTION 93
6.1. Alternative care: general principles 95
Key points 95
6.2. Placing children in alternative care 99
Key points 99
6.3. Adoption 104
Key points 104
7 CHILD PROTECTION AGAINST VIOLENCE AND EXPLOITATION 111
7.1. Violence at home, in schools or other settings 114
Key points 114
7.1.1. Scope of state responsibility 114
7.1.2. Corporal punishment 118
7.1.3. Sexual abuse 120
7.1.4. Domestic violence and child neglect 122
7.2. Child exploitation, pornography and grooming 124
Key points 124
7.2.1. Forced labour 124
7.2.2. Child trafficking 127
7.2.3. Child pornography and grooming 130
7.3. High risk groups 132
Key point 132
7.3.1. Children belonging to a minority 132
7.3.2. Children with disabilities 133
7.4. Missing children 134
8 ECONOMIC, SOCIAL AND CULTURAL RIGHTS AND ADEQUATE STANDARD OF LIVING 137
8.1. Approaches to economic, social and cultural rights 139
Key points 139
8.2. Right to education 141
Key points 141
8.2.1. Right to education of migrant children 144
8.3. Right to health 149
Key points 149
8.4. Right to housing 154
Key points 154

8.5. Right to an adequate standard of living and right to social security 157
Key points 157

9 MIGRATION AND ASYLUM 161
9.1. Entry and residence 164
Key points 164
9.2. Age assessment 166
Key points 166
9.3. Family reunification for separated children 168
Key points 168
9.4. Detention 171
Key points 171
9.5. Expulsion 174
Key points 174
9.6. Access to justice 178
Key point 178

10 CONSUMER AND PERSONAL DATA PROTECTION 181
10.1. Protection of children as consumers 183
Key points 183
10.1.1. Consumer rights 183
10.1.2. Unfair commercial practices on children 185
10.1.3. Products' safety 185
10.1.4. Clinical trials on children 186
10.1.5. Food intended for infants and young children 187
10.1.6. Toy safety 187
10.1.7. Children and advertising 188
10.2. Children and personal data protection 189
Key points 189
10.2.1. European data protection law 189

11 CHILDREN'S RIGHTS WITHIN CRIMINAL JUSTICE AND ALTERNATIVE (NON-JUDICIAL) PROCEEDINGS 195
11.1. Fair trial guarantees 197
Key points 197
11.1.1. Effective participation 202
11.1.2. Access to a lawyer 203

11.2. Rights of young offenders in relation to detention 205
Key points 205
11.2.1. Forms of detention (substantive and procedural guarantees) 206
11.2.2. Conditions of detention 209
11.2.3. Protection against abuse and ill-treatment 211
11.3. Protection of child victims and witnesses 212
Key point 212

How to use this handbook

This handbook provides an overview of the fundamental rights of children in the European Union (EU) and the Council of Europe (CoE) member states. It is broad in scope. It acknowledges children as beneficiaries of all human/fundamental rights, as well as subjects of special regulation given their specific characteristics. Children's rights is a cross-sectorial field of law. In this handbook the emphasis is on the areas of law which are of specific importance to children.

This handbook is designed to assist legal practitioners who are not specialised in the field of children's rights. It is intended for lawyers, judges, prosecutors, social workers and others working with national authorities, as well as non-governmental organisations (NGOs) and other bodies that may be confronted with legal questions relating to these subjects. It is a point of reference on both EU and CoE law related to these subject areas, explaining how each issue is regulated under EU law as well as under the European Convention on Human Rights (ECHR), the European Social Charter (ESC) and other instruments of the CoE. Each chapter first includes a single table of applicable law under the two separate European legal systems. Then the law under each system is presented consecutively in relation to each topic covered. This allows the reader to see where the two legal systems converge and where they differ. Where relevant, there are also references to the United Nations (UN) Convention on the Rights of the Child (CRC) and other international instruments.

Practitioners in non-EU states that are member states of the CoE and thereby parties to the ECHR can access the information relevant to their own country by going straight to the CoE sections. Practitioners in EU Member States will need to use both sections as those states are bound by both legal orders. For readers who need more information on a particular issue, a list of references to more specialised material can be found in the 'Further reading' section of the handbook.

ECHR law is presented through short references to selected European Court of Human Rights (ECtHR) cases related to the handbook topic covered. These have been chosen from existing ECtHR judgments and decisions on children's rights issues.

EU law is found in legislative measures that have been adopted, in relevant provisions of the Treaties and in particular in the Charter of Fundamental Rights

of the European Union, as interpreted in the case law of the Court of Justice of the European Union (CJEU – known before December 2009 as the European Court of Justice (ECJ)).

The case law described or cited in this handbook provides examples of an important body of both ECtHR and CJEU case law. The handbook includes, as far as possible given its limited scope and introductory nature, legal developments until 1 January 2015, although later developments have also been included when possible.

The handbook includes an introductory chapter, which briefly explains the role of the two legal systems as established by CoE and EU law, and contains 10 substantive chapters covering the following issues:

- civil rights and freedoms;
- equality;
- personal identity issues;
- family life;
- alternative care and adoption;
- child protection against violence and exploitation;
- economic, social and cultural rights;
- migration and asylum;
- consumer and data protection;
- children's rights within criminal justice and alternative proceedings.

Each chapter covers a distinct subject while cross-references to other topics and chapters provide a fuller understanding of the applicable legal framework. Key points are presented at the beginning of each section.

1 Introduction to European children's rights law: context and key principles

EU	Issues covered	CoE
Free Movement Directive (2004/38/EC), Article 2 (2) (c)	'Child' as a holder of rights	Convention on Action against Trafficking in Human Beings, Article 4 (d) Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse (Lanzarote Convention), Article 3 (a) ECtHR, *Marckx v. Belgium*, No. 6833/74, 1979 (the applicant child was six years old when the Court delivered judgment)
Young Workers Directive (94/33/EC), Article 3	Protection of young people at work	ESC (revised), Article 7 (right of children and young persons to protection)
Charter of Fundamental Rights, Article 14 (2) (right to education)	Right to receive free compulsory education	
Charter of Fundamental Rights, Article 21 (non-discrimination)	Prohibition of discrimination on grounds of age	
Charter of Fundamental Rights, Article 32 (prohibition of child labour and protection of young people at work) Directive on combating the sexual abuse and sexual exploitation of children and child pornography (2011/93/EU) Anti-Trafficking Directive (2011/36/EU)	Prohibition of exploitative child labour	ESC (revised), Article 7 (right of children and young persons to protection)

EU	Issues covered	CoE
Charter of Fundamental Rights, Article 24 (rights of the child) Treaty on European Union, Article 3 (3)	Protection of children's rights (general)

London Borough of Lambeth and Secretary of State for the Home Department*, 2010	Freedom of movement	

This introductory chapter explains how children's rights law has developed at the European level, which key principles guide its application, and which key aspects of children's rights European law addresses. It sets the background for the subject-specific analysis of the following chapters.

1.1. Core concepts

Key point

- European children's rights law builds on existing measures at the national and international level.

1.1.1. Scope of European children's rights law

In referring to 'European children's rights law', the focus is on primary sources of law (treaties, conventions, secondary legislation and case law) introduced by the Council of Europe (CoE) and the European Union (EU). Where relevant, reference is made to other European sources that influence the development of European children's rights law, including key policy documents, guidelines or other non-binding/soft-law instruments.

Children are holders of rights, rather than just objects of protection. They are beneficiaries of all human/fundamental rights and subjects of special regulations, given their specific characteristics. Much European case law derives from litigation initiated by parents or other legal representatives of children, given the limited legal capacity of children. While this handbook aims to illustrate how the law accommodates the specific interests and needs of children, it also illustrates the importance of parents/guardians or other legal representatives and makes reference, where appropriate, to where rights and responsibilities are most prominently vested in children's carers. In such instances, the United Nations (UN) Convention on the Rights of the Child (CRC)[1] approach is adopted, namely that parental responsibilities need to be exercised with the best interests of the child as their primary concern and in a manner consistent with the evolving capacities of the child.

1.1.2. 'Child' as a holder of rights

Under international law, the CRC establishes in its Article 1 that "a child means every human being below the age of eighteen years". This is the legal parameter currently used, also in Europe, to define what a child is.

1 UN, General Assembly (1989), Convention on the Rights of the Child, 20 November 1989.

Under EU law, there is no single, formal definition of 'child' set out in any of the treaties, their subordinate legislation or case law. The definition of a child can vary considerably under EU law, depending on the regulatory context. For example, EU law governing the free movement rights of EU citizens and their family members defines 'children' as "direct descendants who are under the age of 21 or are dependent",[2] essentially endorsing a biological and economic notion as opposed to one based on minority.

Some EU laws ascribe different rights to children according to their age. Directive 94/33/EC on the protection of young people at work (Young Workers Directive),[3] for example, which regulates children's access to and conditions of formal employment across the EU Member States, distinguishes between 'young people' (a blanket term for all persons under the age of 18 years), 'adolescents' (any young person of at least 15 years of age, but less than 18 years of age – who is no longer subject to compulsory full-time schooling) and 'children' (defined as those under the age of 15 – who are largely prohibited from undertaking formal employment).

Other areas of EU law, particularly those areas in which EU action complements that of Member States (such as social security, immigration and education), defer to national law to determine who is a child. In these contexts the CRC definition is generally adopted.

Under CoE law, most instruments relating to children adopt the CRC definition of a child. Examples include Article 4 (d) of the Council of Europe Convention on Action against Trafficking in Human Beings[4] or Article 3 (a) of the Council of Europe Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse (Lanzarote Convention).[5]

2 Directive 2004/38/EC of the European Parliament and of the Council of 29 April 2004 on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States amending Regulation (EEC) No. 1612/68 and repealing Directives 64/221/EEC, 68/360/EEC, 72/194/EEC, 73/148/EEC, 75/34/EEC, 75/35/EEC, 90/364/EEC, 90/365/EEC and 93/96/EEC, OJ L 158, 30 April 2004 and OJ L 158, 29 April 2004, Art. 2 (2) (c).

3 Directive 94/33/EC of 20 August 1994 on the protection of young people at work, OJ 1994 L 216, Art. 3.

4 Council of Europe, Convention on Action against Trafficking in Human Beings, CETS No. 197, 15 May 2005.

5 Council of Europe, Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse, CETS No. 201, 25 October 2007.

The European Convention on Human Rights (ECHR) does not contain a definition of a child, but its Article 1 obliges states to secure Convention rights to "everyone" within their jurisdiction. Article 14 of the ECHR guarantees the enjoyment of the rights set out in the Convention "without discrimination on any ground", including grounds of age.[6] The European Court of Human Rights (ECtHR) has accepted applications by and on behalf of children irrespective of their age.[7] In its jurisprudence, it has accepted the CRC definition of a child,[8] endorsing the "below the age of 18 years" notion.

The same applies to the European Social Charter (ESC) and its interpretation by the European Committee of Social Rights (ECSR).[9]

1.2. Background to European children's rights law

The majority of European children's rights law to date has been developed by the EU and the CoE. In addition to the UN, other international institutions, such as the Hague Conference on Private International Law, have also adopted important instruments that continue to inform the development of European law. Although these international frameworks have operated separately from one another, links are increasingly being drawn between them.[10] Inter-institutional cooperation is particularly strong between the CoE and the EU.

6 ECtHR, *Schwizgebel v. Switzerland*, No. 25762/07, 10 June 2010. See also FRA and ECtHR (2010), p. 102.

7 See, for example, ECtHR, *Marckx v. Belgium*, No. 6833/74, 13 June 1979, where the applicant child was six years old when the Court delivered the judgment.

8 ECtHR, *Güveç v. Turkey*, No. 70337/01, 20 January 2009; ECtHR, *Çoşelav v. Turkey*, No. 1413/07, 9 October 2012.

9 ECSR, *Defence for Children International (DCI) v. the Netherlands*, No. 47/2008, 20 October 2009, para. 25.

10 See, for instance, Chapter 5, which illustrates how EU family law regulating cross-border child abduction works with the Convention of 25 October 1980 on the Civil Aspects of International Child Abduction (Hague Child Abduction Convention).

1.2.1. European Union: development of children's rights law and the areas of protection covered

In the past, children's rights developed in the EU in a piecemeal fashion. Historically, European child law was largely aimed at addressing specific child-related aspects of broader economic and politically driven initiatives, for example in the field of consumer protection[11] and the free movement of persons.[12] More recently, however, children's rights have been addressed as part of a more coordinated EU agenda, based on three key milestones:

- the introduction of the Charter of Fundamental Rights of the European Union;
- the entry into force of the Treaty of Lisbon in December 2009;
- the adoption of the European Commission Communication on a special place for children in EU external action, and of the Council EU Guidelines for the promotion and protection of the rights of the child.

The first milestone was the introduction of the EU Charter of Fundamental Rights in 2000.[13] With the entry into force of the Treaty of Lisbon, on 1 December 2009, the Charter enjoys the same legal status as the EU treaties (Article 6 of the Treaty on European Union (TEU)). It obliges the EU and its Member States to protect the rights enshrined in it when implementing EU law. The EU Charter of Fundamental Rights contains the first detailed references to children's rights at the EU constitutional level, including through the recognition of children's right to receive free compulsory education (Article 14 (2)), a prohibition of discrimination on grounds of age (Article 21), and a prohibition of exploitative child labour (Article 32). Significantly, the Charter contains a dedicated provision on children's rights (Article 24). This articulates three key children's rights principles: the right to express their views freely in accordance with their age and maturity (Article 24 (1)); the right to have their best interests taken as

11 For example, Directive 2009/48/EC of the European Parliament and of the Council of 18 June 2009 on the safety of toys, OJ 2009 L 170, which enforces safety measures for children's toys.

12 For example, Directive 2004/38/EC.

13 EU (2012), Charter of Fundamental Rights of the European Union, OJ 2012 C 326.

a primary consideration in all actions relating to them (Article 24 (2)); and the right to maintain on a regular basis a personal relationship and direct contact with both parents (Article 24 (3)).

The second key milestone was the Lisbon Treaty, which, as noted above, entered into force on 1 December 2009.[14] This instrument made important institutional, procedural and constitutional changes to the EU by amending the TEU and the former European Community Treaty (now the Treaty on the Functioning of the European Union (TFEU)).[15] These changes enhanced the EU's potential to advance children's rights, not least by identifying the "protection of the rights of the child" as a general stated objective of the EU (Article 3 (3) of the TEU) and as an important aspect of the EU's external relations policy (Article 3 (5) of the TEU). More specific references to children are included within the TFEU as well, enabling the EU to enact legislative measures aimed at combating sexual exploitation and human trafficking (Article 79 (2) (d) and Article 83 (1)).

This has led to the adoption of the directives on combating child sexual abuse, child sexual exploitation and child pornography,[16] and on preventing and combating trafficking in human beings and protecting its victims,[17] which also contain provisions addressing specific needs of child victims. The more recent directive establishing minimum standards on the rights, support and protection of victims of crime similarly devotes many of its provisions to children.[18]

The third important milestone occurred at a more strategic, policy level, initially in the context of the EU's external cooperation agenda and latterly in relation to internal issue**s**. Specifically, the Council of the EU adopted 'EU Guidelines for the promotion and protection of the rights of the child'[19] and the European Commission adopted its Communication on *A special place*

14 EU (2007), Treaty of Lisbon amending the Treaty on European Union and the Treaty establishing the European Community, signed at Lisbon, OJ 2007 C 306, pp. 1–271.

15 See consolidated versions of European Communities (2012), Treaty on European Union (TEU) and Treaty on the Functioning of the European Union (TFEU), OJ 2012 C 326.

16 Directive 2011/93/EU, OJ 2011 L 335, p. 1.

17 Directive 2011/36/EU, OJ 2011 L 101, p. 1.

18 Directive 2012/29/EU, OJ 2012 L 315, p. 57.

19 Council of the European Union (2007), *EU Guidelines for the promotion and protection of the rights of the child*, Brussels, 10 December 2007.

for children in EU external action[20] to mainstream children's rights into all EU activities with non-EU Member States. Similarly, in 2011, the European Commission adopted the EU Agenda for the rights of the child, setting out key priorities for the development of children's rights law and policy across the EU Member States.[21] The agenda also included the targeting of the legislative processes relevant to child protection, such as the aforementioned adoption of the directive on victim's rights.

Most recently, this has been complemented with the Commission's adoption of a comprehensive strategy to support Member States in addressing poverty and social exclusion through a range of early-years interventions (for children of pre-school and primary school age).[22] While this particular initiative, like the agenda, is not legally binding, both are significant insofar as they establish the blueprint for the EU's normative and methodological approach to children's rights law – a blueprint that is firmly associated with the CRC and located within an ethic of child protection, participation and non-discrimination.

The EU may legislate only where it has been given competence under the treaties (Articles 2 to 4 of the TFEU). As children's rights is a cross-sectorial field, EU competence needs to be determined on a case-by-case basis. To date, areas relevant for children's rights where the EU has extensively legislated are:

- data and consumer protection;
- asylum and migration;
- cooperation in civil and criminal matters.

Articles 6 (1) of the TEU and 51 (2) of the EU Charter of Fundamental Rights provide that the Charter does not extend the competences of the EU, nor does it modify or establish a new power or task for the EU. The Charter provisions

20 European Commission (2008), *A special place for children in EU external action: Communication from the Commission to the Council, the European Parliament, the European Economic And Social Committee and the Committee of the Regions*, COM (2008) 55 final, Brussels, 5 February 2008.

21 European Commission (2011), *An EU agenda for the rights of the child: Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions*, COM (2011) 0060 final, Brussels, 15 February 2011.

22 European Commission (2013), *Investing in children: breaking the cycle of disadvantage*, Recommendation 2013/112/EU, Brussels.

are addressed to the EU institutions and to Member States only when they are implementing EU law. While always binding on the EU, the Charter provisions become legally binding for the Member States only where they act within the scope of EU law.

Each of the following chapters includes a brief overview of the EU's competence in areas dealt with under the respective chapter.

1.2.2. Council of Europe: development of children's rights law and the areas of protection covered

In contrast to the EU, ever since its establishment, the CoE has a clear mandate to protect and promote human rights. Its primary human rights treaty, ratified by all CoE member states, is the Convention for the Protection of Human Rights and Fundamental Freedoms, or European Convention on Human Rights (ECHR), which contains specific references to children. The main ones are as follows: Article 5 (1) (d) provides for the lawful detention of a child for the purposes of educational supervision; Article 6 (1) restricts the right to a fair and public hearing where this is in the interest of juveniles; Article 2 of Protocol No. 1 provides for the right to education and requires states to respect parents' religious and philosophical convictions in the education of their children. Moreover, all the other general provisions of the ECHR are applicable to everyone, including children. Some have been shown to have particular relevance to children, namely Article 8, which guarantees the right to respect for private and family life, and Article 3, which prohibits torture, inhuman and degrading treatment and punishment. By using interpretative approaches that focus on the positive obligations inherent in the ECHR provisions, the ECtHR has developed a large body of case law dealing with children's rights, including frequent references to the CRC. That said, the ECtHR analyses applications on a case-by-case basis and therefore does not offer a comprehensive overview of children's rights under the ECHR.

The CoE's other main human rights treaty, the European Social Charter (ESC[23] – revised in 1996[24]), provides for the protection of social rights, with specific

23 Council of Europe, European Social Charter, CETS No. 35, 18 October 1961.

24 Council of Europe, European Social Charter (revised), CETS No. 163, 3 May 1996.

provision for children's rights. It contains two provisions of particular importance for children's rights. Article 7 sets out the obligation to protect children from economic exploitation. Article 17 requires states to take all appropriate and necessary measures designed to ensure that children receive the care, assistance, education and training they need (including free primary and secondary education), to protect children and young persons from negligence, violence or exploitation and to provide protection for children deprived of their family's support. Implementation of the ESC is overseen by the European Committee of Social Rights (ECSR), which is composed of independent experts who rule on the conformity of national law and practice with the ESC either by way of a collective complaints procedure or a national reporting procedure.

In addition, the CoE has adopted a number of treaties that address a range of specific children's rights issues. These include the:

- Convention on the Legal Status of Children born out of Wedlock;[25]
- Convention on the Adoption of Children, revised in 2008;[26]
- Convention on Contact Concerning Children;[27]
- Convention on the Exercise of Children's Rights;[28]
- Council of Europe Convention on Protection of Children against Sexual Exploitation and Sexual Abuse (Lanzarote Convention).[29]

Finally, at the policy level it is important to note that in 2006, the CoE launched its programme 'Building a Europe for and with Children' – a transversal plan of action for addressing children's rights issues, including the adoption of

25 Council of Europe, European Convention on the Legal Status of Children born out of Wedlock, CETS No. 85, 15 October 1975.

26 Council of Europe, Convention on the Adoption of Children (Revised), CETS No. 202, 27 November 2008.

27 Council of Europe, Convention on Contact concerning Children, CETS No. 192, 15 May 2003.

28 Council of Europe, European Convention on the Exercise of Children's Rights, CETS No. 160, 25 January 1996.

29 Council of Europe, Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse, CETS No. 201, 25 October 2007.

standard setting instruments across a range of areas.[30] Current priorities are focused on four key areas:[31]

- promoting child-friendly services and systems;
- eliminating all forms of violence against children;
- guaranteeing the rights of children in vulnerable situations;
- promoting child participation.

The principal aim of the CoE's children's rights programme is to support the implementation of international standards in the field of children's rights by all CoE member states, and in particular to promote the implementation of the CRC, highlighting its main principles: non-discrimination, the right to life and development, the best interests of the child as a primary consideration for decision-makers, and the right of children to be heard.[32]

The programme has overseen the adoption of several children's rights instruments offering practical guidance to complement binding European legal measures, including:

- Guidelines on child-friendly justice;[33]
- Guidelines on child-friendly healthcare;[34]
- Recommendation on integrated national strategies for the protection of children from violence;[35]

30 For more information, see http://www.coe.int/t/dg3/children/.

31 Council of Europe, Committee of Ministers (2011), Council of Europe Strategy for the Rights of the Child (2012–2015), CM (2011)171 final, 15 February 2012.

32 *Ibid.*

33 Council of Europe, Committee of Ministers (2010), *Guidelines on child friendly justice*, 17 November 2010.

34 Council of Europe, Committee of Ministers (2011), *Guidelines on child-friendly health care*, 21 September 2011.

35 Council of Europe, Committee of Ministers (2009), Recommendation CM/Rec(2009)10 of the Committee of Ministers to member states on integrated national strategies for the protection of children from violence, 18 November 2009.

- Recommendation on children's rights and social services friendly to children and families;[36]

- Recommendation on participation of children and young people under the age of 18.[37]

In doing so, the programme has ensured that Europe is at the heart of standard-setting in children's rights and has also led the way, through various means, to ensure that children's voices are central to that process. The programme also aims to support the implementation of the ECHR and of the ESC and to promote other existing CoE legal instruments in relation to childhood (participation, protection and rights), youth and family.[38]

1.3. European children's rights law and the UN Convention on the Rights of the Child

Key point

- European children's rights law is largely based on the UN Convention on the Rights of the Child (CRC).

The fact that all EU and CoE member states are parties to the CRC gives the CRC important standing at the European level. It effectively imposes common legal obligations on European states with a knock-on effect on the way European institutions develop and apply children's rights.

In this way, the CRC has become the touchstone for the development of European children's rights law, with the result that the CoE and the EU increasingly draw on its influence. In particular, the integration of CRC principles and provisions into

36 Council of Europe, Committee of Ministers (2011), Recommendation Rec (2011)12 on children's rights and social services friendly to children and families, 16 November 2011.

37 Council of Europe, Committee of Ministers (2012), Recommendation Rec(2012)2 on the participation of children and young people under the age of 18, 28 March 2012.

38 Council of Europe, Committee of Ministers (2011), *Council of Europe Strategy for the Rights of the Child (2012–2015)*, CM (2011)171 final, 15 February 2012.

binding instruments and case law at the European level gives the CRC greater force, and opens up more effective channels of enforcement for those seeking to invoke children's rights in Europe. Specific examples of this are provided throughout this handbook.

The EU is not and cannot become a party to the CRC, since there is no legal mechanism within the CRC to allow entities other than states to accede to it. However, the EU relies on "general principles of EU law" (written and unwritten principles drawn from the common, constitutional traditions of the Member States) to supplement and guide interpretations of the EU Treaties (Article 6 (3) of the TEU). Court of Justice of the European Union (CJEU) rulings have confirmed that any obligation arising from EU membership should not conflict with Member States' obligations derived from their domestic constitutions and international human rights commitments.[39] As all EU Member States have ratified the CRC, the EU is bound to adhere to the principles and provisions enshrined therein, at least in relation to matters that fall within the scope of the EU's competence (as defined by the EU treaties).

This obligation is reinforced by other EU treaties and in particular by the EU Charter of Fundamental Rights. Article 24 of the Charter is directly inspired by CRC provisions, including some that have acquired the rank of 'CRC principles', notably the best interests of the child principle (Article 3 of the CRC), the child participation principle (Article 12 of the CRC) and the child's right to live with and/or enjoy a relationship with his or her parents (Article 9 of the CRC).

The importance of the CRC in guiding the development of EU children's rights is expressed in the Commission's Agenda for the Rights of the Child, which asserts that "the standards and principles of the UNCRC must continue to guide EU policies and actions that have an impact on the rights of the child".[40] In this spirit, child-related legislative instruments, almost without exception, are accompanied by either explicit reference to the CRC or more implicit reference to children's rights principles, such as 'best interests', the child's right to participate in decisions that affect him or her, or the right to be protected from discrimination.

39 For example CJEU, C-4/73, *J. Nold, Kohlen- und Baustoffgroßhandlung v. Commission of the European Communities*, 14 May 1974.

40 European Commission (2011), *An EU Agenda for the Rights of the Child*, COM (2011) 0060 final, Brussels.

The CoE, similarly to the EU, is not as an organisation legally bound to the CRC, although all CoE member states are individual parties to this convention. Nevertheless, the ECHR cannot be interpreted in a vacuum, but must instead be interpreted in harmony with the general principles of international law. Any relevant rules of international law applicable in the relations between the States Parties to the ECHR should be taken into account, in particular the rules concerning the universal protection of human rights. The obligations that the ECHR lays on its States Parties in the field of children's rights more specifically must be interpreted in light of the CRC.[41] The ECSR has also explicitly referred to the CRC in its decisions.[42] Moreover, the standard-setting and treaty-making activities of the CoE are influenced by CRC principles and provisions. For example, the *Guidelines on child friendly justice*[43] are directly informed by a range of CRC provisions, not to mention the accompanying General Comments of the UN Committee on the Rights of the Child.[44]

1.4. Role of the European courts in interpreting and enforcing European children's rights

1.4.1. The Court of Justice of the European Union

The CJEU issues decisions regarding many types of legal actions. In children's rights cases, the CJEU has so far mainly reviewed preliminary references (Article 267 of the TFEU).[45] These are procedures where a national court or tribunal asks the CJEU for an interpretation of primary EU law (i.e. treaties) or secondary

41 ECtHR, *Harroudj v. France*, No. 43631/09, 4 October 2012, para. 42.

42 ECSR, *World Organisation against Torture (OMCT) v. Ireland*, Complaint No. 18/2003, 7 December 2004, paras. 61–63; ECSR, *Defence for Children International (DCI) v. the Netherlands*, Complaint No. 47/2008, 20 October 2009.

43 Council of Europe, Committee of Ministers (2010), *Guidelines on child friendly justice*, 17 November 2010.

44 See UN, Committee on the Rights of the Child (2007), *General Comment No. 10 (2007): Children's rights in juvenile justice*, CRC/C/GC/10, 25 April 2007; UN, Committee on the Rights of the Child (2009), *General Comment No. 12 (2009): The right of the child to be heard*, CRC/C/GC/12, 1 July 2009; and UN, Committee on the Rights of the Child (2013), *General Comment No. 14 (2013) on the right of the child to have his or her best interest taken as a primary consideration (art.3, para.1)*, CRC/C/GC/14, 29 May 2013.

45 The only exception is an action for annulment: CJEU, C-540/03, *European Parliament v. Council of the European Union* [GC], 27 June 2006.

EU law (i.e. decisions and legislation) that is of relevance to a national case pending before that national court or tribunal.

Until recent years, the CJEU had only adjudicated a few children's rights cases. With the adoption of more explicit children's rights legislative measures and a more prominent children's rights agenda, however, it is likely that children's rights will feature more regularly on the CJEU's listings in the future.

The CJEU has delivered most of its judgments concerning children's rights in the context of free movement and EU citizenship – areas in which the EU has enjoyed long-standing competence. Here the CJEU has expressly acknowledged that children enjoy the benefits associated with EU citizenship in their own right, thereby extending independent residence as well as both social and educational entitlement to children, on grounds of EU nationality.[46]

There is only one instance in which the CJEU directly used the CRC to determine how EU law should be interpreted in relation to children, namely in the *Dynamic Medien GmbH v. Avides Media AG* case. This case concerns the lawfulness of German labelling restrictions on imported DVDs and videos, which were already subject to similar controls in the United Kingdom. The CJEU concluded that the German labelling checks constituted a lawful restriction of the EU's free movement of goods provisions (which otherwise preclude double regulatory processes of this nature), given that they aimed to protect the welfare of children. The CJEU supported its decision by reference to Article 17 of the CRC, which encourages signatory states to develop appropriate guidelines for the protection of children from media-generated information and material injurious to their well-being.[47] Requirements of proportionality apply, however, with regard to the examination procedures established to protect children, which should be readily accessible, and possible to complete within a reasonable period.[48]

46 See CJEU, C-413/99, *Baumbast and R v. Secretary of State for the Home Department*, 17 September 2002; CJEU, C-200/02, *Kunqian Catherine Zhu and Man Lavette Chen v. Secretary of State for the Home Department*, 19 October 2004; CJEU, C-148/02, *Carlos Garcia Avello v. Belgian State*, 2 October 2003; CJEU, C-310/08, *London Borough of Harrow v. Nimco Hassan Ibrahim and Secretary of State for the Home Department* [GC], 23 February 2010; CJEU, C-480/08, *Maria Teixeira v. London Borough of Lambeth and Secretary of State for the Home Department*, 23 February 2010. These cases are revisited in Chapters 8 and 9.

47 CJEU, C-244/06, *Dynamic Medien Vertriebs GmbH v. Avides Media AG*, 14 February 2008, paras. 42 and 52.

48 *Ibid.*, paras. 49 and 50.

In other cases, the CJEU has alluded to general children's rights principles also encapsulated in CRC provisions (such as the child's best interests and the right to be heard) to inform its judgments, particularly in the context of cross-border child abduction cases.[49]

That aside, the EU has traditionally been circumspect in attaching decisive force to the CRC, particularly in more politically sensitive areas such as immigration control,[50] although this is changing in recent jurisprudence, as discussed in the chapters that follow. Since the adoption of the EU Charter of Fundamental Rights, CJEU references to its articles on children's rights often resonate with references to the CRC, given the similarity between provisions.

1.4.2. The European Court of Human Rights

The ECtHR mainly decides on individual applications lodged in accordance with Articles 34 and 35 of the ECHR. ECtHR jurisdiction extends to all matters concerning the interpretation and application of the ECHR and its Protocols (Article 32 of the ECHR).

In contrast to the CJEU, the ECtHR has a vast jurisprudence on children's rights. Although many cases under Article 8 of the ECHR on the right to respect for private and family life are considered from a parents' rather than children's rights perspective, cases under other substantive provisions do not necessarily involve parents and have a clearer focus on the rights of the children concerned, such as the right to protection from inhuman and degrading treatment (Article 3 of the ECHR) or the right to a fair trial (Article 6 of the ECHR).

Although the ECtHR often refers to the CRC when addressing claims pursued either by or on behalf of children, it does not systematically attach decisive weight to it. In some cases, the children's rights principles, as articulated by the CRC, have had a profound influence on the ECtHR's reasoning, notably as concerns the Court's interpretation of Article 6 of the ECHR (right to a fair trial) in relation to the treatment of children in conflict with the law (see Chapter 11). In other areas, the approach of the ECtHR may vary slightly from that of the CRC,

49 CJEU, C-491/10 PPU, *Joseba Andoni Aguirre Zarraga v. Simone Pelz*, 22 December 2010. See further Chapter 5.

50 CJEU, C-540/03, *European Parliament v. Council of the European Union* [GC], 27 June 2006.

for example as regards hearing children in court (see Chapter 2). And in some cases, the ECtHR has explicitly relied on the CRC.

> Example: *Maslov v. Austria*[51] concerns the deportation of the applicant, who had been convicted of a number of criminal offences as a minor. The ECtHR held that where expulsion measures against a juvenile offender were concerned, the obligation to take the best interests of the child into account included an obligation to facilitate the child's reintegration, in line with Article 40 of the CRC. In the ECtHR's view, reintegration would not be achieved by severing the child's family or social ties through expulsion.[52] The CRC is thus one of the grounds used to find that the expulsion was a disproportionate interference with the applicant's rights under Article 8 of the ECHR (respect for family life).

1.5. European Committee of Social Rights

The ECSR comprises 15 independent and impartial experts who rule on the conformity of national law and practice with the ESC, either through the collective complaints procedure or the national reporting procedure.[53] Designated national and international organisations can engage in collective complaints against states that are party to the ESC and have accepted the complaints procedure. To date, complaints have involved whether states have violated children's rights under the ESC on issues including the economic exploitation of children,[54] the physical integrity of children,[55] the health rights of migrant children[56] and access to education by children with disabilities.[57]

51 ECtHR, *Maslov v. Austria* [GC], No. 1638/03, 23 June 2008.

52 *Ibid.*, para. 83.

53 For more information, see the ECSR website: www.coe.int/t/dghl/monitoring/socialcharter/ECSR/ECSRdefault_en.asp.

54 ESCR, *International Commission of Jurists (ICJ) v. Portugal*, Complaint No. 1/1998, 9 September 1999.

55 ESCR, *World Organisation Against Torture (OMCT) v. Greece*, Complaint No. 17/2003, 7 December 2004.

56 ESCR, *Defence for Children International (DCI) v. Belgium*, Complaint No. 69/2011, 23 October 2012.

57 ECSR, *Mental Disability Advocacy Center (MDAC) v. Bulgaria*, Complaint No. 41/2007, 3 June 2008, para. 35.

Example: In *International Commission of Jurists (ICJ) v. Portugal*,[58] it was alleged that although Portuguese legislation respected the minimum age of 15 years for admission to employment established by Article 7 (1) of the ESC, it was not adequately enforced. The ECSR held that the aim and purpose of the ESC was to protect rights not only in theory but also in fact, and thus that legislation must be applied effectively. Noting that a large number of children were employed illegally in Portugal, it found this situation to be in violation of Article 7 (1) of the ESC.

58 ESCR, *International Commission of Jurists (ICJ) v. Portugal*, Complaint No. 1/1998, 9 September 1999.

All persons enjoy the civil rights and freedoms laid down in various instruments, most notably the EU Charter of Fundamental Rights and the European Convention on Human Rights (ECHR) as interpreted by the European Court of Human Rights (ECtHR). Other than the Charter, no EU legal instrument deals specifically with the civil rights discussed in this chapter as they apply to children. At CoE level, however, the scope and interpretation of these civil rights have been developed extensively over the years, in particular through ECtHR case law.

This chapter presents an overview of the freedoms listed in Title II of the EU Charter of Fundamental Rights insofar as they have an impact on children's rights. It analyses the right of the child to freedom of thought, conscience and religion (Section 2.1), to freedom of expression and information (Section 2.3), the child's right to be heard (Section 2.4), and the right to freedom of assembly and of association (Section 2.5).

2.1. Freedom of thought, conscience and religion

Key points

- Freedom of thought, conscience and religion, as guaranteed under the EU Charter of Fundamental Rights and the ECHR, includes the right to change religion or belief and the freedom to manifest religion or belief in worship, teaching, practice and observance.
- Parents have the right to ensure the education and teaching of their children in conformity with their religious, philosophical and pedagogical convictions.
- Parents have the right and duty to provide direction to the child in the exercise of the child's right to freedom of thought, conscience and religion in a manner consistent with the evolving capacities of the child.

2.1.1. The child's right to freedom of religion

Under EU law, Article 10 of the EU Charter of Fundamental Rights guarantees to everyone the freedom of thought, conscience and religion. This right includes the freedom to change one's religion or belief and the freedom, either alone or in community with others and in public or in private, to manifest one's religion or belief in worship, teaching, practice and observance. The right to conscientious objection is recognised in accordance with the national laws (Article 10 (2) of the Charter).

Under CoE law, Article 9 of the ECHR provides the right to freedom of thought, conscience and religion. Three dimensions of the right to freedom of religion have been distilled from the ECtHR's case law: the internal dimension; the freedom to change one's religion or belief; and the freedom to manifest one's religion or belief. The first two dimensions are absolute, and states may not limit them under any circumstance.[59] The freedom to manifest one's religion or belief may be limited if such limitations are prescribed by law, pursue a legitimate aim and are necessary in a democratic society (Article 9 (2) of the ECHR).

In its case law, the ECtHR has dealt with children's freedom of thought, conscience and religion, mainly in relation to the right to education and the state school system. A topic of much public debate in European countries is religion in schools.

59 ECtHR, *Darby v. Sweden*, No. 11581/85, 23 October 1990.

Example: The cases of *Dogru v. France* and *Kervanci v. France*[60] concern the exclusion from the first year of a French state secondary school of two girls, aged 11 and 12 years, as a result of their refusal to remove their headscarves during physical education classes. The ECtHR observed that the purpose of the restriction on the applicants' right to manifest their religious convictions was to adhere to the requirements of secularism in state schools. According to the national authorities, wearing a veil, such as the Islamic headscarf, was incompatible with sports classes for health and safety reasons. The ECtHR deemed this reasonable, as the school balanced the applicants' religious convictions against the requirements of protecting the rights and freedoms of others and the public order. Accordingly, it concluded that the interference with the freedom of the pupils to manifest their religion was justified and proportionate to the aim pursued. It therefore found no violation of Article 9 of the ECHR.

Example: The case *Grzelak v. Poland*[61] concerns the failure to provide a pupil excused from religious instruction with ethics classes and associated marks. During his entire schooling at primary and secondary level (between the ages of seven and 18 years), the applicant did not receive religious instruction, in conformity with the wishes of his parents, who were declared agnostics. As too few pupils were interested, no class in ethics was ever organised, and he received school reports and certificates that contained a straight line instead of a mark for 'religion/ethics'. According to the ECtHR, the absence of a mark for 'religion/ethics' on the boy's school reports fell within the ambit of the negative aspect of freedom of thought, conscience and religion, as the reports could point to his lack of religious affiliation. It therefore amounted to a form of unwarranted stigmatisation. The difference in treatment between non-believers who wished to follow ethics classes and pupils who followed religious classes was thus not objectively and reasonably justified, nor was there a reasonable relationship of proportionality between the means used and the aim pursued. The state's margin of appreciation was exceeded in this matter, as the very essence of the applicant's right not to manifest his religion or convictions was infringed, in violation of Article 14 of the ECHR taken in conjunction with Article 9 of the ECHR.

60 ECtHR, *Dogru v. France*, No. 27058/05, 4 December 2008; ECtHR, *Kervanci v. France*, No. 31645/04, 4 December 2008 (available in French).

61 ECtHR, *Grzelak v. Poland*, No. 7710/02, 15 June 2010.

2.2. Parents' rights and the freedom of religion of their children

The rights of parents in the context of the freedom of religion of their children are addressed differently in European law compared to the CRC.

Under EU law, due respect must be given to the right of parents to ensure the education and teaching of their children in conformity with their religious, philosophical and pedagogical convictions, in particular in the context of the freedom to found educational establishments (Article 14 (3) of the Charter).

Under CoE law, in particular Article 2 of Protocol No. 1 to the ECHR, states must take into account the parent's (religious) convictions in the exercise of every function they undertake in the sphere of education and teaching. According to the ECtHR, this duty is broad, as it applies not only to the content and implementation of school curricula, but also to the performance of all functions a state assumes.[62] It includes the organisation and financing of public education, the setting and planning of the curriculum, the conveying of information or knowledge included in the curriculum in an objective, critical and pluralistic manner (hence forbidding the state to pursue an aim of indoctrination that might be considered as not respecting parents' religious and philosophical convictions), as well as the organisation of the school environment, including the presence of crucifixes in state-school classrooms.

Example: The case *Lautsi and Others v. Italy*[63] concerns the display of crucifixes in state-school classrooms. A parent complained that the presence of crucifixes in the classrooms of the state school attended by her children infringed the principle of secularism according to which she sought to educate her children. The ECtHR Grand Chamber found that it was up to the state, as part of its functions in relation to education and teaching, to decide whether or not crucifixes should be present in state-school classrooms, and that this fell within the scope of the second

62 See the relevant ECtHR case law: ECtHR, *Kjeldsen, Busk Madsen and Pedersen v. Denmark*, Nos. 5095/71, 5920/72 and 5926/72, 7 December 1976; ECtHR, *Valsamis v. Greece*, No. 21787/93, 18 December 1996; ECtHR, *Folgerø and Others v. Norway* [GC], No. 15472/02, 29 June 2007; ECtHR, *Hasan and Eylem Zengin v. Turkey*, No. 1448/04, 9 October 2007; ECtHR, *Lautsi and Others v. Italy* [GC], No. 30814/06, 18 March 2011.

63 ECtHR, *Lautsi and Others v. Italy* [GC], No. 30814/06, 18 March 2011.

sentence of Article 2 of Protocol No. 1 to the ECHR. The Court argued that in principle this decision falls within the margin of appreciation of the respondent state, and that there is no European consensus on the presence of religious symbols in state schools. It is true that the presence of crucifixes in state-school classrooms – a sign which undoubtedly refers to Christianity – gives visible prominence in the school environment to a country's majority religion. However, this is not in itself sufficient to denote a process of indoctrination on the respondent state's part. In the ECtHR's view, a crucifix on a wall is an essentially passive symbol that cannot be deemed to have an influence on pupils comparable to that of speech or participation in religious activities. Accordingly, the Grand Chamber concluded that, in deciding to keep crucifixes in the state-school classrooms the applicant's children attended, the authorities had acted within the limits of their margin of appreciation and thus respected the right of parents to ensure education and teaching in conformity with their own religious and philosophical convictions.

Under international law, Article 14 (2) of the CRC requires States Parties to respect the rights and duties of parents to provide direction to their child in the exercise of his/her right to freedom of thought, conscience and religion in a manner consistent with the evolving capacities of the child. Thus, as opposed to Article 14 (3) of the EU Charter of Fundamental Rights, the CRC focuses on the exercise of the freedom of the child him/herself. Under the CRC, parents have the right to provide guidance and direction not in accordance with their own convictions, but in accordance with the convictions held by the children. The wording of Article 14 (2) of the CRC is in line with the CRC's general conception of parental responsibilities: that parental responsibilities must be exercised consistently with the evolving capacities of the child (Article 5 of the CRC), and based on the best interests of the child (Article 18 (1) of the CRC).

2.3. Freedom of expression and information

Key points

- Both the EU Charter of Fundamental Rights and the ECHR guarantee the right to freedom of expression, which includes the freedom to hold opinions and to receive and impart information and ideas without interference by public authorities.
- The right to freedom of information does not include the right of access to childcare records.
- Making access to childcare records dependent on the consent of the contributor of the information may be compatible with Article 8 (the right to respect for private and family life) of the ECHR, provided that an independent authority has the final say in deciding whether access should be granted.

Under EU law, the right to freedom of expression includes the freedom to hold opinions and to receive and impart information and ideas without interference by public authority and regardless of frontiers (Article 11 of the EU Charter of Fundamental Rights).

Under CoE law, freedom of expression is guaranteed by Article 10 of the ECHR and may be limited only if the limitation is prescribed by law, pursues one of the legitimate aims listed in Article 10 (2) and is necessary in a democratic society.

In its case law, the ECtHR stressed that "[f]reedom of expression constitutes one of the essential foundations of [a democratic] society, one of the basic conditions for its progress and for the development of every man [...] it is applicable not only to 'information' or 'ideas' that are favourably received or regarded as inoffensive or as a matter of indifference, but also to those that offend, shock or disturb the State or any sector of the population".[64]

64 See, for example, ECtHR, *Handyside v. the United Kingdom*, No. 5493/72, 7 December 1976, para. 49.

Example: In *Handyside v. the United Kingdom*,[65] the ECtHR found that a ban imposed by the authorities on a book called *Little Red School Book* was in accordance with the exception laid down in Article 10 (2) of the ECHR on the protection of morals. The case deals with the right to receive information appropriate for a child's age and maturity – an aspect of the right to freedom of expression that is particularly relevant for children. The book, which was translated from Danish, was written for school-age children and questioned a series of social norms, including sexuality and drugs. Young people could interpret certain passages of the book at a critical stage of their development as an encouragement to indulge in precocious activities harmful for them or even to commit certain criminal offences. Therefore, according to the ECtHR, the competent English judges "were entitled, in the exercise of their discretion, to think at the relevant time that the book would have pernicious effects on the morals of many of the children and adolescents who would read it".[66]

Other child cases referencing Article 10 of the ECHR concern the right of access to information of children placed in care.

Example: The case *Gaskin v. the United Kingdom*[67] concerns a person who was placed in care for most of his childhood, during which period the local authority kept confidential records. These included various reports by medical practitioners, school teachers, police and probation officers, social workers, health visitors, foster parents and residential school staff. When the applicant sought access to those records for the purpose of proceeding for personal injuries against the local authority, he was refused. The confidentiality of such records had been warranted in the public interest for the proper operation of the childcare service, which would be jeopardised if contributors to the records were reluctant to be frank in their reports in the future. The ECtHR accepted that persons who were in state care as children had a vital interest "in receiving the information necessary to know and to understand their childhood and early development".[68] While the confidentiality of public records needs to be guaranteed, a system like the British one, which made access to records dependent on the consent of

65 *Ibid.*

66 *Ibid.*, para. 52.

67 ECtHR, *Gaskin v. the United Kingdom*, No. 10454/83, 7 July 1989.

68 *Ibid.*, para. 49.

the contributor, could in principle be compatible with Article 8 of the ECHR if the interests of the individual seeking access to records were secured when a contributor to the records was unavailable or improperly refused consent. In such a case, an independent authority should ultimately decide whether access should be granted. No such procedure was available to the applicant in the present case and the Court found a violation of the applicant's rights under Article 8 of the ECHR. The ECtHR, however, found no violation of Article 10 of the ECHR, reiterating that the right to freedom to receive information prohibits a government from restricting a person from receiving information that others wish or may be willing to impart, but does not oblige a state to impart the information in question to the individual.

2.4. Right to be heard

Key points

- Under EU law, children have the right to express their views freely. Their views shall be taken into consideration on matters which concern them in accordance with their age and maturity.
- Under the ECHR, there is no absolute requirement to hear a child in court. Whether or not to do so has to be assessed in light of the specific circumstances of each case and is dependent on the child's age and maturity.
- Under UN law, children's right to express their own views freely in all matters affecting them has been recognised as one of the general principles of the Convention on the Rights of the Child.

Under EU law, Article 24 (1) of the EU Charter of Fundamental Rights provides that children may express their views freely, and that such views shall be taken into consideration on matters which concern them in accordance with their age and maturity. This provision is of general applicability, and is not restricted to particular proceedings. The CJEU interpreted the meaning of this provision in conjunction with the Brussels II bis Regulation.

Example: *Joseba Andoni Aguirre Zarraga v. Simone Pelz*[69] concerns the removal of a minor child from Spain to Germany in breach of custody rulings. The CJEU was asked whether the German court (i.e. the court of the country the child was removed to) could oppose the enforcement order by the Spanish court (the country of origin) on the basis that the child had not been heard, thereby infringing Article 42 (2) (a) of Regulation No. 2201/2003 (Brussels II bis) and Article 24 of the EU Charter of Fundamental Rights. The child had opposed the return when she expressed her views within proceedings before the German court. The CJEU reasoned that hearing a child is not an absolute right, but that if a court decides it is necessary, it must offer the child a genuine and effective opportunity to express his or her views. It also held that the right of the child to be heard, as provided in the Charter and Brussels II bis Regulation, requires legal procedures and conditions which enable children to express their views freely to be available to them, and the court to obtain those views. The court also needs to take all appropriate measures to arrange such hearings, with regard to the children's best interests and the circumstances of each individual case. According to the CJEU's ruling, however, the authorities of the country the child had been removed to (Germany) could not oppose a return of the child on the basis of a breach of the right to be heard in the country of origin (Spain).

Under CoE law, the ECtHR does not interpret the right to respect for private and family life (Article 8 of the ECHR) as always requiring the child to be heard in court. As a general rule, it is for the national courts to assess the evidence before them, including the means used to ascertain the relevant facts. Domestic courts are not always required to hear a child in court on the issue of access to a parent who does not have custody rights. This issue has to be assessed in light of the specific circumstances of each case, having due regard to the age and maturity of the child concerned. Moreover, the ECtHR will often ensure, under the procedural limb of Article 8, that the authorities have taken appropriate steps to accompany their decisions with the necessary safeguards.

69 CJEU, C-491/10 PPU, *Joseba Andoni Aguirre Zarraga v. Simone Pelz*, 22 December 2010; see also Section 5.4, which discusses further details of this ruling and the operation of the Brussels II bis regulation.

Example: In the case of *Sahin v. Germany*,[70] the mother prohibited all contact between the applicant and his four-year old daughter. The German regional court decided that granting the father access to his daughter would be harmful to the child because of the serious tensions between the parents. It did so without hearing the child whether she wanted to continue seeing her father. On the question of hearing the child in court, the ECtHR referred to the expert's explanation before the regional court in Germany. After several meetings with the child, her mother and the applicant, the expert considered that the process of questioning the child could have entailed a risk for her, which could not have been avoided by special arrangements in court. The ECtHR found that, in these circumstances, the procedural requirements implicit in Article 8 of the ECHR – to hear a child in court – did not amount to obliging the direct questioning of the child on her relationship with her father.

Example: In *Sommerfeld v. Germany*,[71] the applicant's 13-year-old daughter had expressed a clear wish not to see the applicant and had done so for several years. The domestic courts were of the view that forcing her to see the applicant would seriously disturb her emotional and psychological balance. The ECtHR accepted that the decision-making process provided the applicant with the required protection of his interests.[72]

The European Convention on the Exercise of Children's Rights deals with the right of children to express their views freely.[73] This convention aims to promote children's rights by granting them specific procedural rights in family proceedings before a judicial authority, in particular for proceedings involving the exercise of parental responsibilities, such as residence and access to children. Article 3 of the convention grants children the right to be informed and to express their views in proceedings as a procedural right. In Article 4, the child is granted the right to apply for the appointment of a special representative in proceedings before a judicial authority affecting her or him. In line with Article 6, authorities must ensure that the child has received all relevant in-

70 ECtHR, *Sahin v. Germany* [GC], No. 30943/96, 8 July 2003, para. 73. On the specific aspect of national courts having to assess the evidence they have obtained, as well as the relevance of the evidence that defendants seek to adduce, see also ECtHR, *Vidal v. Belgium*, No. 12351/86, 22 April 1992, para. 33.

71 ECtHR, *Sommerfeld v. Germany* [GC], No. 31871/96, 8 July 2003.

72 *Ibid.*, paras. 72 and 88.

73 Council of Europe, European Convention on the Exercise of Children's Rights, CETS No. 160, 1996.

formation, consult her or him in person, if appropriate, and allow the child to express her or his views.

Under international law, Article 12 (1) of the CRC affirms that a child who is capable of forming her or his own views has the right to express these views freely in all matters affecting her or him. The child's views should be given due weight in accordance with her or his age and maturity. Article 12 (2) of the CRC furthermore prescribes that the child must be provided the opportunity to be heard in any judicial and administrative proceedings affecting her or him, either directly, or through a representative or an appropriate body, in a manner consistent with the procedural rules of national law.

The UN Committee on the Rights of the Child stressed that States Parties should either directly guarantee this right, or adopt or revise laws so that this right can be fully enjoyed by the child.[74] Furthermore, they must ensure that the child receives all necessary information and advice to make a decision in favour of her or his best interests. The committee also notes that a child has the right not to exercise this right; expressing views is a choice, not an obligation.

2.5. Right to freedom of assembly and association

Key points

- Both the EU Charter of Fundamental Rights and the ECHR guarantee the freedom of peaceful assembly and association.
- This right enables and protects individuals to further their causes together with others.

Under EU law, Article 12 of the EU Charter of Fundamental Rights provides that everyone has the right to freedom of peaceful assembly and association at all levels, in particular in political, trade union and civic matters. This implies the

74 UN, Committee on the Rights of the Child, *General Comment No. 14 (2013) on the right of the child to have his or her best interest taken as a primary consideration (art.3, para.1)*, CRC/C/GC/14, 29 May 2013.

right of everyone to form and to join trade unions for the protection of his or her interests.

Under CoE law, Article 11 (1) of the ECHR guarantees the right to freedom of assembly and association subject to the restrictions of Article 11 (2).

The ECtHR has explicitly asserted the right of children to attend gatherings in a public space. As the Court noted in *Christian Democratic People's Party v. Moldova*, it would be contrary to the parent's and children's freedom of assembly to prevent them from attending events, in particular to protest against government policy on schooling.

Under international law, individual children as well as children's organisations can rely on the protection offered by Article 15 of the CRC, which contains the right to freedom of association and of peaceful assembly. A large variety of associational forms in which children are engaged have been granted international protection based on this provision.

3 Equality and non-discrimination

Freedom from discrimination is one of the basic principles of a democratic society. Both the EU and the CoE have been instrumental in interpreting this principle. EU institutions have adopted a series of directives which are highly relevant for children's issues. The European Court of Human Rights (ECtHR) has developed a substantial body of case law on the freedom from discrimination under Article 14 of the ECHR on the prohibition of discrimination, in conjunction with other Convention articles.

The European Committee of Social Rights (ECSR) considers the function of Article E of the European Social Charter (ESC) on non-discrimination to be similar to that of Article 14 of the European Convention on Human Rights (ECHR): it has no independent existence and must be combined with one of the ESC's substantive provisions.[75]

This chapter addresses the principles of equality and non-discrimination, with a focus on those grounds where child-specific case law has been developed. It first provides general information on European non-discrimination law (Section 3.1), and then presents the issue of equality and discrimination of children based on ethnic origin (Section 3.2), nationality and immigration status (Section 3.3), age (Section 3.4), and other protected grounds, including gender, language and personal identity (Section 3.5).

3.1. European non-discrimination law

Key points

- EU and CoE law prohibit discrimination on the grounds of sex, race, colour, ethnic or social origin, genetic features, language, religion or belief, political or any other opinion, membership of a national minority, property, birth, disability, age and sexual orientation.[76]
- When the ECtHR establishes that persons have been treated differently in a relevantly similar situation, it will investigate whether there is an objective and reasonable justification. If not, it will conclude that the treatment was discriminatory, in breach of Article 14 of the ECHR on the prohibition of discrimination.

75 ECSR, *Syndicat des Agrégés de l'Enseignement Supérieur (SAGES) v. France*, Complaint No. 26/2004, 15 June 2005, para. 34.

76 For an overview of European non-discrimination law, as constituted by the EU non-discrimination directives and Art. 14 of and Protocol 12 to the ECHR, see: FRA and ECtHR (2011), and its case law update July 2010–December 2011.

Under EU law, the prohibition of discrimination in Article 21 of the EU Charter of Fundamental Rights is a free-standing principle that also applies to situations not covered by any other Charter provision. The grounds on which discrimination is explicitly prohibited in this provision include sex, race, colour, ethnic or social origin, genetic features, language, religion or belief, political or any other opinion, membership of a national minority, property, birth, disability, age and sexual orientation. By contrast, Article 19 of the TFEU only covers the grounds of sex, racial or ethnic origin, religion or belief, disability, age and sexual orientation.

Several EU directives prohibit discrimination in the areas of employment, the welfare system and goods and services, all of which are potentially relevant to children. Council Directive 2000/78/EC, which establishes a general framework for equal treatment in employment and occupation (Employment Equality Directive),[77] prohibits discrimination on the grounds of religion or belief, disability, age and sexual orientation. Council Directive 2000/43/EC, implementing the principle of equal treatment between persons irrespective of racial or ethnic origin (Racial Equality Directive), prohibits discrimination on the basis of race or ethnicity not only in the context of employment and access to goods and services, but also in relation to the welfare system (including social protection, social security and healthcare) and to education.[78] Further directives implement the principle of equal treatment between men and women in matters of employment and occupation (Gender Equality Directive)[79] and in the access to and supply of goods and services (Gender Goods and Services Directive).[80]

Under CoE law, the prohibition of discrimination applies to the exercise of any of the substantive rights and freedoms set forth in the ECHR (Article 14), as well as to the exercise of any right guaranteed under domestic law or in any act by a public authority (Article 1 of Protocol No. 12 to the ECHR). Protocol 12, however, is of limited applicability, since it has only been ratified by a small number of countries and no child-related cases have yet been decided on its basis. The provisions set forth in both instruments include a non-exhaustive list of grounds on which discrimination is prohibited: sex, race, colour, language,

77 Council Directive 2000/78/EC, OJ 2000 L 303. All EU legal instruments are available on the EU's online portal providing access to EU law eur-lex: http://eur-lex.europa.eu/homepage.html.

78 Council Directive 2000/43/EC of 29 June 2000 implementing the principal of equal treatment between persons irrespective of racial or ethnic origin, OJ 2000 L 180, 29 June 2000.

79 Directive 2006/54/EC (recast), OJ 2006 L 204.

80 Council Directive 2004/113/EC, OJ 2004 L 373, p. 37.

religion, political or other opinion, national or social origin, association with a national minority, property, birth or other status. Where the ECtHR finds that persons in relevantly similar positions have been treated differently, it will investigate whether this can be objectively and reasonably justified.[81]

Article E of the ESC also includes a non-exhaustive list of grounds on which discrimination is prohibited: race, colour, sex, language, religion, political or other opinion, national extraction or social origin, health, association with a national minority, or birth. The appendix to this article clarifies that differential treatment based on an objective and reasonable justification includes requiring a certain age or capacity for access to some forms of education[82] – and that this is therefore not discriminatory.

Under Article 4 of the Framework Convention for the Protection of National Minorities[83] (FCNM), States Parties guarantee to persons belonging to national minorities the right of equality before the law and equal protection by the law, and prohibit discrimination based on belonging to a national minority. They also undertake to adopt, where necessary, adequate measures to promote, in all areas of economic, social, political and cultural life, full and effective equality between persons belonging to a national minority and those belonging to the majority.

The following sections analyse specific grounds of discrimination which have proven of particular relevance for children.

82 Council of Europe, European Social Charter (revised) (1996), Explanatory report, para. 136.

83 Council of Europe, Framework Convention for the Protection of National Minorities (FCNM), CETS No. 157, 1995.

3.2. Non-discrimination based on race or ethnic origin

Key points

- Race and ethnic origin are prohibited grounds of discrimination.
- Both the EU and the CoE tackle discrimination of the Roma in the areas of education, employment, healthcare and housing.
- The over-representation or segregation of children belonging to a specific ethnic group in special schools or classes can only be objectively justified if appropriate safeguards for referring children to these schools or classes are put in place.

Under EU law, the Racial Equality Directive prohibits discrimination on the basis of race or ethnicity not only in the context of employment and goods and services, but also in accessing the welfare system, education and social security. The Roma, as a particularly sizeable and vulnerable ethnic group, fall squarely within the scope of the directive. A key element of the drive to tackle discrimination of the Roma at EU level was the adoption of an EU Framework for National Roma Integration Strategies up to 2020.[84] This has been followed by the European Commission's annual monitoring of the national strategies developed by EU Member States. The Racial Equality Directive covers at least four key areas that are important for Roma children: education, employment, healthcare and housing. Achieving full equality in practice may in certain circumstances warrant Roma-specific positive action, in particular in these four key areas.[85]

Under CoE law, the ECtHR has ruled in several landmark cases on the differential treatment of Roma children in the educational system. These cases were analysed under Article 14 taken together with Article 2 of Protocol No. 1 to the

84 European Commission (EC) (2011), *An EU framework for national Roma integration strategies up to 2020: Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions*, COM(2011) 173 final, Brussels, 5 April 2011.

85 European Commission (2014), *Joint Report on the application of Council Directive 2000/43/EC of 29 June 2000 implementing the principle of equal treatment between persons irrespective of racial or ethnic origin and of Council Directive 2000/78/EC of 27 November 2000 establishing a general framework for equal treatment in employment and occupation*, Report from the Commission to the European Parliament and the Council, COM(2014) 2 final, Brussels, 17 January 2014.

ECHR. The ECtHR held that the over-representation or segregation of Roma children in special schools or classes could only be objectively justified by putting in place appropriate safeguards for referring children to these schools or classes, such as tests specifically designed for and sensitive to the needs of Roma children; appropriate evaluation and monitoring of progress so that integration in ordinary classes takes place as soon as learning difficulties have been remedied; and positive measures to address learning difficulties. In the absence of effective anti-segregationist measures, prolonging the educational segregation of Roma children in a mainstream school with a regular program could thus not be justified.[86]

Example: In *D.H. and Others v. the Czech Republic,*[87] the ECtHR found that a disproportionate number of Roma children were placed in special schools for children with learning difficulties without justification. The Court was concerned about the more basic curriculum offered in these schools and the segregation that the system caused. Roma children thus received an education that compounded their difficulties and compromised their subsequent personal development instead of helping them to integrate into the mainstream education system and develop the skills that would facilitate life among the majority population. Consequently, the ECtHR found a violation of Article 14 of the ECHR in conjunction with Article 2 of Protocol No. 1 to the ECHR.

Example: In *Oršuš and Others v. Croatia*,[88] the ECtHR examined the existence of Roma-only classes within ordinary primary schools. As a matter of principle, temporarily placing children in a separate class due to their inadequate command of the language of instruction is not discriminatory as such. Such a placement can be seen as adapting the educational system to the special needs of children with language difficulties. However, as soon as this placement disproportionally or exclusively affects members of a specific ethnic group, safeguards have to be put in place. For the initial placement in separate classes, the ECtHR noted that the placement was not part of a general practice to address the problems of children with an

87 ECtHR, *D.H. and Others v. the Czech Republic* [GC], No. 57325/00, 13 November 2007, paras. 206–210.

88 ECtHR, *Oršuš and Others v. Croatia* [GC], No. 15766/03, 16 March 2010, para. 157.

inadequate command of the language, and that no specific testing of the children's command of the language had taken place. As to the curriculum offered to them, some children were not offered any specific programme (i.e., special language classes) to acquire the necessary language skills in the shortest time possible. There was neither a transferral nor a monitoring procedure in place to ensure the immediate and automatic transfer to the mixed classes as soon as the Roma children attained adequate language proficiency. Consequently, the Court found that this was in violation of Article 14 of the ECHR in conjunction with Article 2 of Protocol No. 1.

The ECSR holds that, even though educational policies of Roma children may be accompanied by flexible structures to meet the diversity of the group and may take into account the fact that some groups lead an itinerant or semi-itinerant lifestyle, there should be no separate schools for Roma children.[89]

Under Article 4 (2) and (3) FCNM, special measures adopted to promote the effective equality of persons belonging to national minorities shall not be regarded as discriminatory. In accordance with Article 12 (3) FCNM, States Parties moreover expressly undertake to promote equal opportunities for access to education at all levels for persons belonging to national minorities. The Advisory Committee on the FCNM has regularly examined the equal access to education of Roma children in line with this provision.[90]

89 ECSR, European Social Charter (revised) – Conclusions 2003 (Bulgaria), Art. 17, para. 2, p. 53.

90 See Council of Europe, Advisory Committee on the FCNM, *Commentary on Education under the Framework Convention for the Protection of National Minorities* (2006), ACFC/25DOC(2006)002.

3.3. Non-discrimination based on nationality and immigration status

Key points

- Protection against discrimination based on nationality is more limited in scope under EU law than under CoE law.
- Under EU law, protection against discrimination based on nationality is only granted to citizens of EU Member States, as enshrined in Article 45 (freedom of movement and of residence) of the EU Charter of Fundamental Rights.
- The ECHR guarantees the enjoyment of rights to all persons within the jurisdiction of a member state.

Under EU law, protection against discrimination based on nationality is particularly prominent in the context of the free movement of persons. Third-country nationals (i.e. persons who are citizens of a state that is not a member of the EU) enjoy a right to equal treatment in broadly the same areas as those covered by the non-discrimination directives when they qualify as 'long-term residents'. For qualifying as such, the Third-Country Nationals Directive requires, among other conditions, a period of five years of lawful residence.[91] In addition, Directive 2003/86/EC on the right to family reunification (Family Reunification Directive) [92] allows for third-country nationals lawfully residing in a Member State to be joined by family members, under certain conditions (see also Section 9.5).

Example: The *Chen* case[93] concerns the question of whether a child of a third-country national had the right to reside in one EU Member State when she was born in a different Member State and held the citizenship of the latter. Her mother, on whom she depended, was a third-country national. The CJEU determinedthat, when a Member State imposes require-

91 Directive 2003/109/EC of 23 January 2004 concerning the status of third-country nationals who are long-term residents, OJ 2004 L 16, p. 44.

92 Directive 2003/86/EC of 3 October 2003 on the right to family reunification, OJ 2003 L 251, p. 12.

93 CJEU, C-200/02, *Kunqian Catherine Zhu and Man Lavette Chen v. Secretary of State for the Home Department*, 19 October 2004.

ments on individuals seeking citizenship, and these are met, it is not open to a different Member State to then challenge that entitlement when the mother and the child apply for residence. The CJEU confirmed that a Member State cannot refuse a right of residence to a parent who is the carer of a child who is an EU citizen, as this would deprive the child's right of residence of any useful effect.

Under CoE law, the ECHR guarantees the enjoyment of rights to all those living within the jurisdiction of a member state, whether they are citizens or not, including those living beyond the national territory, in areas under the effective control of a member state. Regarding education, the ECtHR therefore holds that differential treatment on grounds of nationality and immigration status could amount to discrimination.

Example: *Ponomaryovi v. Bulgaria*[94] concerns the issue of foreign nationals lacking permanent residence permits having to pay school fees for their secondary education. As a matter of principle, the normally wide margin of appreciation in cases of general measures of economic or social strategy needed to be qualified in the field of education, for two reasons:

- the right to education enjoys direct protection under the ECHR;
- education is a very particular type of public service, which serves broad societal functions.

According to the ECtHR, the margin of appreciation increases with the level of education, in inverse proportion to the importance of that education for those concerned and for society at large. So, while for primary schooling (higher) fees for foreigners are hard to justify, they may be fully justified at the university level. Given the importance of secondary education for personal development, and social and professional integration, a stricter scrutiny of the proportionality of the differential treatment applies for that level of education. The Court clarified that it did not take any position on whether or not a state is entitled to deprive all irregular migrants from the educational benefits it provides to nationals and certain limited categories of foreigners. In assessing the particular circumstances of the case, it found that no "considerations relating to the need to stem or reverse the flow of illegal immigration" applied. The applicants had not tried to abuse

94 ECtHR, *Ponomaryovi v. Bulgaria*, No. 5335/05, 21 June 2011, para. 60.

the Bulgarian educational system, as they had come to live in Bulgaria at a very young age following their mother's marriage with a Bulgarian, so they had no choice but to go to school in Bulgaria. There had accordingly been a violation of Article 14 of the ECHR in conjunction with Article 2 of Protocol No. 1 to the ECHR.

3.4. Non-discrimination based on age

Key point

- Under both EU law and the ECHR, discrimination on the grounds of age is prohibited.

Under EU law, the EU Charter of Fundamental Rights in Article 21 explicitly mentions 'age' as a ground on which discrimination is prohibited. Article 24 includes the rights of the child among the protected fundamental rights. Under current EU legislation on non-discrimination, protection from discrimination on the basis of age is more limited than protection on the basis of race and ethnicity or on the basis of sex. Age is currently only protected in the context of access to employment, similarly to sexual orientation, disability and religion or belief.

The Employment Equality Directive is applicable to children who are legally entitled to work. While the International Labour Organization Convention concerning Minimum Age for Admission to Employment,[95] ratified by all EU Member States, establishes a minimum age of 15 years, differences regarding this minimum age persist among the EU Member States.[96] According to Article 6 of the Employment Equality Directive, Member States may provide justifications for differences of treatment on grounds of age. These differences do not constitute discrimination if they are objectively and reasonably justified by a legitimate aim, and if the means of achieving that aim are appropriate and necessary. Concerning children and young people, such differences of treat-

96 European Network of Legal Experts in the non-discrimination field, O'Dempsey, D. and Beale, A. (2011), *Age and employment*, European Commission, Directorate-General for Justice, Luxembourg, Publications Office.

ment may, for instance, include the setting of special conditions on access to employment and vocational training, employment and occupation, to promote their vocational integration or ensure their protection.

Under CoE law, Article 14 of the ECHR and Article 1 of Protocol 12 to the ECHR do not explicitly mention 'age' in the list of grounds on which discrimination is prohibited. The ECtHR, however, has examined issues of age discrimination in relation to various rights protected by the ECHR, and thereby implicitly analysed age as being included among 'other status'. In *D.G. v. Ireland*[97] and *Bouamar v. Belgium*,[98] for instance, the ECtHR found that there was a difference in treatment between adults and children in the countries' respective justice systems regarding detention, relevant to the application of the Convention. This difference in treatment stemmed from the punitive purpose of detention as regards adults and its preventive purpose in respect of children. Hence, the Court accepted 'age' as a possible ground for discrimination.

3.5. Non-discrimination based on other protected grounds

Key point

- Further grounds of discrimination, such as disability or birth, have been addressed in European jurisprudence pertaining to children.

Under EU law, Article 21 of the EU Charter of Fundamental Rights also prohibits discrimination based on other grounds particularly relevant to children, such as sex, genetic features, language, disability or sexual orientation. At least for disability, the CJEU has accepted that EU law also protects against so-called 'discrimination by association', i.e. discrimination against a person who is associated with another who has the protected characteristic (such as the mother of a child with disabilities).

97 ECtHR, *D.G. v. Ireland*, No. 39474/98, 16 May 2002 (see also Section 11.2.2).

98 ECtHR, *Bouamar v. Belgium*, No. 9106/80, 29 February 1988 (see also Section 11.2.2).

Example: In *S. Coleman v. Attridge Law and Steve Law*,[99] the CJEU noted that the Employment Equality Directive includes certain provisions designed to specifically accommodate the needs of persons with disabilities. This, however, does not lead to the conclusion that the principle of equal treatment enshrined in the directive must be interpreted strictly, as prohibiting only direct discrimination on the grounds of disability and relating exclusively to persons with disabilities. According to the CJEU, the directive applies not to a particular category of persons but to the very nature of the discrimination. An interpretation limiting its application to persons with disabilities wouldd**e**prive the directive of an important element of its effectiveness and reduce the protection that it is intended to guarantee. The CJEU concluded that the directive must be interpreted as meaning that the prohibition of direct discrimination laid down therein is not limited to persons with disabilities. Consequently, where an employer treated an employee who did not have a disability less favourably than another employee in a comparable situation, based on the disability of the former employee's child, whose care was provided primarily by that employee, such treatment was contrary to the prohibition of direct discrimination laid down by the directive.

Under CoE law, the ECtHR has dealt with discrimination against children in a variety of situations other than those already mentioned, such as discrimination based on language[100] or affiliation.[101]

Example: In *Fabris v. France*, [102] the applicant complained that he had been unable to benefit from a law introduced in 2001 granting children 'born of adultery' identical inheritance rights to those of legitimate children, a law passed following the ECtHR's judgment in *Mazurek v. France*[103] in 2000. The Court held that the legitimate aim of protecting the inheritance rights of the applicant's half-brother and half-sister did not outweigh his claim to a share of his mother's estate. In this case, the difference in treatment had

102 *Ibid.*

103 ECtHR, *Mazurek v. France*, No. 34406/97, 1 February 2000.

been discriminatory, since it had no objective and reasonable justification. The Court found that it was in breach of Article 14 of the ECHR taken in conjunction with Article 1 of Protocol No. 1 to the ECHR.[104]

For children with disabilities, the ECSR holds that in the application of Article 17 (2) of the ESC it is acceptable to make a distinction between children with and without disabilities. It should, nevertheless, be the norm to integrate children with disabilities into mainstream schools, in which arrangements are made to cater for their special needs, and specialised schools should be the exception.[105] In addition, children attending special education schools that conform with Article 17 (2) of the ESC must be given sufficient instruction and training, so that proportionally an equivalent number of children in specialised schools and in mainstream schools complete their schooling.[106] The rights of children in relation to education are further addressed in Section 8.2.

Under UN law, Article 2 of the CRC prohibits discrimination against children on a non-exhaustive list of grounds, specifically listing 'birth' as one of them. Article 2 provides that:

> *1. States Parties shall respect and ensure the rights set forth in the present Convention to each child within their jurisdiction without discrimination of any kind, irrespective of the child's or his or her parent's or legal guardian's race, colour, sex, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status.*
>
> *2. States Parties shall take all appropriate measures to ensure that the child is protected against all forms of discrimination or punishment on the basis of the status, activities, expressed opinions, or beliefs of the child's parents, legal guardians, or family members.*

EU	Issues covered	CoE
CJEU, C-200/02, *Kunqian Catherine Zhu and Man Lavette Chen v. Secretary of State for the Home Department*, 2004 (residence right of the primary care giver of a child, citizen of the EU) CJEU, C-34/09, *Gerardo Ruiz Zambrano v. Office National de l'Emploi (ONEm)*, 2011 (residence rights of TCN with minor EU citizen children)	**Citizenship**	ECtHR, *Genovese v. Malta*, No. 53124/09, 2011 (arbitrary denial of citizenship to child born out of wedlock) European Convention on Nationality CoE Convention on the Avoidance of Statelessness in Relation to State Succession
	Identity as member of national minority	FCNM, Article 5 (1) (preservation of the essential elements of the identity)

Issues of personal identity have generally not been addressed at EU level, in view of the EU's limited competence in that area. However, the CJEU has incidentally ruled on the right to a name (particularly the right to have the name which has been recognised in one EU Member State also recognised in others) from the perspective of the freedom of movement principle. Citizenship and residency aspects have also been adjudicated in light of Article 20 of the TFEU. The CoE, on the other hand, in particular through the case law of the ECtHR, has interpreted and developed the application of several fundamental rights in the area of personal identity. Therefore, with the exception of several areas in which issues of personal identity have been addressed at EU level, the following sections deal only with CoE law.

This chapter does not refer to a specific fundamental right. Rather, it provides a cross-section of fundamental rights issues that are related to identity, such as birth registration and the right to a name (Section 4.1); the right to personal identity (Section 4.2); identity theft (Section 4.4); the right to citizenship (Section 4.5); and the identity of children belonging to national minorities (Section 4.6). Several related issues are dealt with in other chapters, in particular concerning sexual abuse (Section 7.1.3) or data protection (Chapter 10). Some of these rights, such as the right to a name, have mainly been claimed as parental rights, but the approach could easily be transposed to children themselves, given the implications for their own rights.

4.1. Birth registration and the right to a name

Key point

- Refusal to register a first name not unsuitable for a child which has already gained acceptance may be in breach of Article 8 of the ECHR (right to respect for private and family life).

Unlike UN treaties (e.g. Article 24 (2) of the International Covenant on Civil and Political Rights (ICCPR), Article 7 (1) of the CRC and Article 18 of the Convention on the Rights of Persons with Disabilities (CRPD)), the European instruments on fundamental rights do not explicitly provide for the right to birth registration immediately after birth or the right to a name from birth.

Under EU law, the right to a name has been addressed from the perspective of the freedom of movement. The CJEU holds that freedom of movement precludes an EU Member State from refusing to recognise a child's surname as registered in another Member State of which the child is a national or where the child was born and had resided.[107]

Under CoE law, refusal of birth registration of children may raise an issue under Article 8 of the ECHR.

First, the ECtHR found that the name as "a means of identifying persons within their families and the community" falls within the scope of the right to respect for private and family life as enshrined in Article 8 of the ECHR.[108] The parents' choice of their child's first name[109] and family name[110] is part of their private life. The Court has held that the refusal of state authorities to register a chosen forename based on the likely harm or prejudice that the name might cause the

child did not violate Article 8 of the ECHR.[111] Refusal to register a first name, however, that is not unsuitable for a child and that has already gained acceptance may be in breach of Article 8 of the ECHR.

> Example: In *Johansson v. Finland*,[112] the authorities refused to register the forename "Axl Mick", because the spelling did not comply with the Finnish naming practice. The ECtHR accepted that due regard had to be given to the child's best interests, and that the preservation of the national naming practice was in the public interest. It found, however, that the name had been accepted for official registration in other cases and could therefore not be considered unsuitable for a child. Since the name had already gained acceptance in Finland and it had not been contended that this name had negatively affected the cultural and linguistic identity of the state, the ECtHR concluded that the public-interest considerations did not outweigh the interest of having the child registered under the name chosen. The Court thus found that there had been a violation of Article 8 of the ECHR.

The ECtHR has also found that a rule stating that the husband's family name should be given to legitimate children at the moment of birth registration does not in itself violate the ECHR. However, the impossibility to derogate from this general rule was found to be excessively rigid and discriminatory for women, and therefore in violation of Article 14, taken in conjunction with Article 8 of the ECHR.[113]

Article 11 of the FCNM provides that every person belonging to a national minority has the right to use his or her surname (patronym) and first names in his or her minority language, as well as the right to have it officially recognised, albeit subject to modalities provided for in the legal system.

Article 11 (3) of the Revised European Convention on the Adoption of Children provides for the possibility for States Parties to keep the original surname of an adopted child (Adoption Convention).[114] This is an exception to the general principle that the legal relationship between the adopted child and his or her original family is severed.

114 Council of Europe, European Convention on the Adoption of Children (Revised), CETS No. 202, 2008.

4.2. Right to personal identity

Key points

- The right to know one's origins falls within the scope of a child's private life.
- The establishment of paternity requires carefully balancing the child's interest in knowing his or her identity with the interest of the presumed or alleged father, and with the general interest.
- Anonymous births may be permissible under Article 8 of the ECHR (right to respect for private and family life) provided that the child can at least obtain non-identifying information about the mother and that there is a possibility of seeking a confidentiality waiver by the mother.
- An adopted child has the right to access information concerning his or her origins. Biological parents may be granted a legal right not to disclose their identity, but this does not amount to an absolute veto.

Under CoE law, according to the ECtHR, Article 8 of the ECHR includes the right to identity and personal development. Details of a person's identity and the interest "in obtaining information necessary to discover the truth concerning important aspects of one's personal identity, such as the identity of one's parents"[115] have been considered relevant to personal development. Birth and the circumstances of birth form part of a child's private life. "[I]nformation concerning highly personal aspects of [one's] childhood, development and history" can constitute a "principal source of information about [one's] past and formative years",[116] so that lack of access to that information by the child raises an issue under Article 8 of the ECHR.

Under international law, Article 8 of the CRC provides for a high and rather detailed level of protection of the right to preserve a child's identity. It protects against unlawful interference with the preservation of identity, including nationality, name and family relations, as recognised by law. It also guarantees "appropriate assistance and protection" where a child is illegally deprived of some or all elements of his or her identity, with a view to speedily re-establish that identity.

115 ECtHR, *Odièvre v. France* [GC], No. 42326/98, 13 February 2003, para. 29.

116 ECtHR, *Gaskin v. the United Kingdom*, No. 10454/83, 7 July 1989, para. 36.

4.2.1. Establishing paternity

Under CoE law, children have complained to the ECtHR about the impossibility of determining the identity of their natural fathers. The ECtHR held that the determination of the legal relationship between a child and the alleged natural father was part of the scope of private life (Article 8 of the ECHR). Affiliation is a fundamental aspect of one's identity.[117] A child's interest in establishing paternity, however, must be balanced against the interests of the presumed father as well as the general interest. Indeed, a child's interest in having legal certainty about his or her paternal affiliation does not trump a father's interest in rebutting the legal presumption of paternity.

Example: In *Mikulić v. Croatia*,[118] the applicant was born out of wedlock and instituted proceedings for establishment of paternity against her presumed father. The respondent refused to appear on several occasions for court-ordered DNA testing, which led to unnecessary protraction of the paternity proceedings for about five years. The ECtHR held that if under domestic law alleged fathers could not be compelled to undergo medical testing, states had to provide for alternative means allowing for the swift identification of natural fathers by an independent authority. It found a violation of Article 8 of the ECHR in the applicant's case.

Example: In *Mizzi v. Malta*,[119] the presumed father was unable to deny paternity of a child born by his wife since the legally prescribed six-month time limit had elapsed. The ECtHR examined the case under both Articles 6 (right to a fair trial) and 8 (respect of private and family life) of the ECHR. It noted that introducing a time-limit within which a presumed father must take action to disavow a child aims to ensure legal certainty and protect the interest of the child to know his or her identity. These aims, however, do not outweigh the right of the father to have the opportunity to deny paternity. The practical impossibility of denying paternity since birth had in this case put an excessive burden on the presumed father, in violation of his right of access to a court and a fair trial as enshrined in Article 6 of

117 ECtHR, *Mennesson v. France*, No. 65192/11, 26 June 2014, para. 96.

118 ECtHR, *Mikulić v. Croatia*, No. 53176/99, 7 February 2002, paras. 64–65.

119 ECtHR, *Mizzi v. Malta*, No. 26111/02, 12 January 2006.

the ECHR. It had also disproportionately interfered with his rights under Article 8 of the ECHR.[120]

The interests of a child seeking to ascertain paternity and the interests of the biological father may sometimes coincide. This occurred in a situation where a father, due to his lack of legal capacity, was unable to institute proceedings at the domestic level to establish affiliation with his child. The ECtHR found that it was not in the best interests of a child born out of wedlock that his biological father was unable to institute proceedings to have his paternity established, and that the child was therefore entirely dependent on the discretion of state authorities to have its affiliation established.[121]

Authorities may have a positive obligation to intervene in proceedings to establish paternity in the best interests of the child when the legal representative (in this case the mother) of the child is unable to properly represent the child, for instance because of a serious disability.[122]

With regard to the specific case of recognition of affiliation between intended parents and children born out of surrogacy, the Court accepted in principle that states have a wide margin of appreciation, since there is no European consensus on allowing or recognising affiliation in surrogacy arrangements. The fact, however, that affiliation is a fundamental aspect of a child's identity reduces that margin of appreciation.

Example: *Mennesson v. France*[123] concerns the refusal of French authorities to register children born out of surrogacy in the United States in the French birth register on public policy grounds. The ECtHR found no violation of the applicants' right to respect for family life, concluding that they were in no way prevented from enjoying family life in France and that administrative obstacles they might have faced had not been insurmountable. With regard to the right to respect for the private life of the children, the Court attached great importance to their best interests. It particularly emphasised that the man who was intended to be registered as the children's father on the certificate was also their biological father. To deny a child

120 *Ibid.*, paras. 112–114.

121 ECtHR, *Kruškovic v. Croatia*, No. 46185/08, 21 June 2011, paras. 38–41.

122 ECtHR, *A.M.M. v. Romania*, No. 2151/10, 14 February 2012, paras. 58–65 (available in French).

123 ECtHR, *Mennesson v. France*, No. 65192/11, 26 June 2014.

legal affiliation when a biological affiliation is established and when the parent concerned claims full recognition cannot be held to be in conformity with the best interests of the children. The Court therefore found a violation of Article 8 of the ECHR in respect of the "private life" complaint of the children.[124]

4.2.2. Establishing maternity: anonymous birth

Under CoE law, a child's interest in knowing his or her origins, and in particular his or her mother, must be balanced with other private and public interests, such as the interests of the family or families involved, the public interest of preventing illegal abortions, child abandonment or the protection of health. Cases where the birth mother decides to remain anonymous, but the child can at least obtain non-identifying information about the birth mother and the child has the possibility to seek a confidentiality waiver from the mother, might be in conformity with Article 8 of the ECHR.[125]

Example: In *Godelli v. Italy*,[126] the applicant was abandoned at birth by her mother, who did not consent to being named on the birth certificate. The applicant could not access non-identifying information concerning her origins nor could she obtain disclosure of her mother's identity. The ECtHR found a violation of Article 8 of the ECHR, because the state did not strike a proper balance between the competing interests of birth mother and child.

4.3. Establishing one's origin: adoption

A child's right to know his or her origins has gained particular prominence in the context of adoption. The substantive guarantees related to adoption, outside the right to know one's origins, are dealt with in Section 6.3.

Under CoE law, Article 22 (3) of the European Convention on the Adoption of Children (revised) is a fairly robust provision on the adopted child's right to access information held by the authorities concerning his or her origins. It allows

124 *Ibid*., para. 100; see also ECtHR, *Labassee v. France*, No. 65941/11, 26 June 2014, para. 79.

125 ECtHR, *Odièvre v. France* [GC], No. 42326/98, 13 February 2003, paras. 48–49.

126 ECtHR, *Godelli v. Italy*, No. 33783/09, 25 September 2012, para. 58.

for States Parties to grant the parents of origin a legal right not to disclose their identity, as long as it does not amount to an absolute veto. The competent authority must be able to determine whether it overrides the parents of origin's right and can disclose identifying information in light of the circumstances and the respective rights at stake. In the case of full adoption, the adopted child must at least be able to obtain a document attesting the date and place of birth.[127]

Under international law, the Hague Convention on Inter-Country Adoption provides for the possibility for an adopted child to access information about the identity of his or her parents "under appropriate guidance", but leaves it to each State Party to allow for it, or not.[128]

4.4. Identity theft

Key point

- Practical and effective protection must be ensured against identity theft of children.

Identity theft concerns situations where a child's name is used without his or her knowledge.

Under CoE law, the ECtHR has dealt with identity theft under Article 8 of the ECHR on the right to respect for private and family life. It held that states are obliged to ensure the practical and effective protection of children against identity theft, and that states must take effective steps to identify and prosecute the perpetrator.[129]

127 Council of Europe, European Convention on the Adoption of Children (Revised), CETS No. 202, 2008, Art. 22.

128 Hague Conference on Private International Law, Convention on Protection of Children and Cooperation in Respect of Intercountry Adoption, 29 May 1993, Art. 30 (2).

129 ECtHR, *K.U. v. Finland*, No. 2872/02, 2 December 2008, para. 49.

Example: In *K.U. v. Finland*,[130] an advertisement was placed on an internet dating website in the name of a 12-year-old boy, without his knowledge. It mentioned his age, telephone number, physical description and contained a link to a webpage containing his picture. The advertisement was of a sexual nature, suggesting that the boy was looking for an intimate relationship with a boy of his age or older, thus making him a target for paedophiles. The identity of the person who placed the advertisement could not be obtained from the internet provider due to the legislation in place. The ECtHR held that the positive obligation under Article 8 of the ECHR not only to criminalise offences but also to effectively investigate and prosecute them, assumes even greater importance when the physical and moral welfare of a child is threatened. In this case, the Court found that by being exposed as a target for paedophiliac approaches on the internet the child's physical and moral welfare was threatened. There was consequently a breach of Article 8 of the ECHR.

Aspects related to identity theft are closely related to child pornography and grooming. These are dealt with in Section 7.2.

4.5. Right to citizenship

Key points

- The right of residence within the EU of children who are EU citizens should not be deprived of any useful effect by refusing residence rights to their parent(s).
- The ECHR does not guarantee the right to citizenship, but an arbitrary refusal of citizenship may fall under Article 8 of the ECHR (right to respect for private and family life) due to its impact on an individual's private life.

Under EU law, Article 20 (1) of the TFEU grants the status of EU citizen to every Member State national of the EU. The CJEU ruled on the effectiveness of the right of residence of children who have EU citizenship but not the nationality of the EU Member State where they reside. At stake was the refusal of residence rights within the EU to a parent who was the carer of a child with EU citizenship. The CJEU held that the refusal of residence rights to a parent who is the

130 ECtHR, *K.U. v. Finland*, No. 2872/02, 2 December 2008.

primary caregiver of a child deprives the child's right of residence of any useful effect. Hence, the parent who is the primary caregiver has the right to reside with the child in the host state.[131] These aspects are addressed in more detail in Section 9.5.

Under CoE law, the ECHR does not guarantee the right to citizenship.[132] An arbitrary refusal of citizenship, however, may come within the scope of Article 8 of the ECHR because of its impact on an individual's private life, which embraces aspects of a child's social identity[133] – which here refers to the identity a child has in society.

> Example: In *Genovese v. Malta*, Maltese citizenship was denied to a child born out of wedlock outside of Malta to a non-Maltese mother and a judicially-recognised Maltese father. The refusal of citizenship as such did not violate Article 8 of the ECHR. The arbitrary denial of citizenship on the ground of birth out of wedlock, however, raised questions of discrimination. Arbitrary differential treatment on this ground requires weighty reasons by way of justification. In the absence of such reasons, a violation of Article 8 together with Article 14 of the ECHR was found.[134]

A key concern in treaty provisions on the right to acquire citizenship is the avoidance of statelessness. The European Convention on Nationality contains detailed provisions on children's legal acquisition of nationality, and restricts the possibilities for children to lose citizenship.[135] The CoE Convention on the Avoidance of Statelessness in Relation to State Succession contains an obligation to avoid statelessness at birth (Article 10) and provides for the right to the nationality of the successor state in case of statelessness (Article 2).[136] Article 12 of the Revised European Convention on Adoption also echoes the concern to avoid statelessness; states have to facilitate the acquisition of their nationality by a child adopted by one of their nationals, and loss of nationality

as a consequence of adoption is conditional upon possession or acquisition of another nationality.

Under international law, Article 7 of the CRC guarantees the right to acquire a nationality, as does Article 24 (3) of the ICCPR.

4.6. Identity of children belonging to national minorities

Key point

- A child belonging to a national minority has the right to enjoy his or her own culture, profess and practice his or her own religion, and use his or her own language.[136]

Under EU law, no particular attention has been paid to the identity of children belonging to national minorities from a fundamental rights' perspective. Furthermore, there is no leading jurisprudence in the EU that adds to the CoE standards.

Under CoE law, Article 5 (1) of the FCNM explicitly mentions that States Parties undertake to preserve the essential elements of the identity of persons belonging to national minorities, i.e. their religion, language, traditions and cultural heritage. There is no child-specific provision in the FCNM. The question of language in education is dealt with in Section 8.2.

Under international law, Article 30 of the CRC guarantees to a child belonging to a national minority or an indigenous child the right "to enjoy his or her own culture, to profess and practise his or her own religion, or to use his or her own language" in community with other members of his or her group.

137 On other aspects of economic, social and cultural rights, see further Chapter 8.

European law – both EU and CoE – provides for the right to respect for family life (Article 7 of the EU Charter of Fundamental Rights; Article 8 of the ECHR). The EU's competence in matters of family life relates to cross-border disputes, including recognition and enforcement of judgments across Member States. The CJEU deals with matters such as the child's best interests and the right to family life as laid down in the EU Charter of Fundamental Rights, relative to the Brussels II bis Regulation. ECtHR case law relating to family life recognises interdependent rights, such as the right to family life and the right of the child to have their best interests, as a primary consideration. It acknowledges that children's rights are sometimes conflicting. The right of the child to respect for family life, for instance, may be limited to secure their best interests. Further, the CoE has adopted various other instruments which deal with matters related to contact, custody and exercise of children's rights.

This chapter examines the child's right to respect for family life and associated rights, especially the content and scope of these rights as well as the associated legal obligations and their interaction with other rights. Specific aspects addressed include the right to respect for family life and its limitations (Section 5.1), the right of the child to be cared for by his/her parents (Section 5.2), the right to maintain contact with both parents (Section 5.3) and child abduction (Section 5.4).

5.1. Right to respect for family life

Key points

- States have positive obligations to ensure children's effective enjoyment of their right to respect for family life.
- Under both EU and CoE law, judicial and administrative authorities should take into account the child's best interests in any decision related to the child's right to respect for his/her family life.

The child's right to respect for family life includes a number of composite rights, such as: the child's right to be cared for by his/her parents (Section 5.2); the right to maintain contact with both parents (Section 5.3); the right not to be separated from parents except where it is in the child's best interests (Section 5.4 and Chapter 6); and the right to family reunification (Chapter 9).

Under both EU law and CoE law, the right to respect for family life is not absolute, and subject to a number of limitations. These limitations, as the explanatory note to the EU Charter of Fundamental Rights[138] clarifies, are the same as for the corresponding provision of the ECHR, specifically Article 8 (2), that is: in accordance with the law and necessary in a democratic society in the interests of national security, public safety or the economic well-being of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others.[139]

The EU Charter of Fundamental Rights expressly incorporates within this right an obligation to consider the best interests of the child (Article 24 (2)).[140] Even though the obligation to observe the child's best interests is not expressly laid down under the ECHR, the ECtHR incorporates that obligation in its case law.[141]

138 European Parliament, Council of the European Union, European Commission (2007), "*Explanations relating to the Charter of Fundamental Rights*", 2007/C 303/02, OJ 2007 C 303, 14 December 2007, pp. 17–35, see explanation relating to Art. 7.

139 Council of Europe, Convention for the Protection of Human Rights and Fundamental Freedoms, CETS No. 5, 1950, Art. 8.

141 See, for example, ECtHR, *Ignaccolo-Zenide v. Romania*, No. 31679/96, 25 January 2000, para. 94.

5.2. Right of the child to be cared for by his/her parents

Key points

- EU law regulates procedural aspects of the child's right to be cared for by his/her parents.
- Under the ECHR, states have negative and positive duties to respect children's and parents' rights to family life.

The right of children to know the identity of their parents and the right to be cared for by them are two core components of children's right to respect for family life. They are to an extent interdependent: children's right to know their parents is ensured through parental care. Sometimes, however, these rights are distinct - for example, for children who are adopted or born as a result of medically-assisted procreation. Here the right is more closely associated with the child's right to identity, as expressed by knowing his/her biological parentage, and is therefore considered in Chapter 4. The focus of this section is on the second right: the right of the child to be cared for by his/her parents.

Under EU law, there are no provisions dealing with the substantive scope of the right to be cared for by parents. EU instruments may deal with cross-border aspects, such as recognition and enforcement of judgements across Member States. Regulation 4/2009 on jurisdiction, applicable law, recognition and enforcement of decisions and cooperation in matters relating to maintenance (Maintenance Regulation), for instance, covers cross-border maintenance applications arising from family relationships.[142] It establishes common rules for the entire EU, aiming to ensure the recovery of maintenance claims even where the debtor or creditor is in another country.

Under CoE law, the ECtHR has underscored that Article 8 of the ECHR primarily establishes the duty of the state not to intervene in family life.[143] However, states

142 Council of the European Union (2008), Council Regulation (EC) No. 4/2009 of 18 December 2008 on jurisdiction, applicable law, recognition and enforcement of decisions and cooperation in matters relating to maintenance, OJ 2008 L 7 (Maintenance Regulation).

143 ECtHR, *R.M.S. v. Spain*, No. 28775/12, 18 June 2013, para. 69.

also have a positive obligation to take the necessary measures to both support parents and families and to protect children against potential abuse.[144] Children should only be separated from their parents in exceptional circumstances. In these cases, everything must be done to preserve personal relations and, when appropriate, to 'rebuild' the family. States enjoy a wide margin of appreciation when taking the initial decision to separate children from their parents.[145] However, stricter scrutiny is called for regarding any further limitations, such as restrictions placed on parental rights of access, and any legal safeguards designed to secure the effective protection of the right of parents and children to respect for their family life. Such further limitations entail the danger that the family relations between a young child and one or both parents would be effectively curtailed. Equally, when it comes to separating mothers from new-born babies, the reasons put forth by the state must be extraordinarily compelling.[146]

The margin of appreciation decreases with the amount of time children are separated from their parents, and state authorities should put forward strong reasons to support their decision to maintain the separation.[147] The ECtHR analyses whether the decision-making process was fair and whether all parties involved were given the opportunity to present their case.

Example: In *R.M.S. v. Spain*[148], the applicant argued that she had been deprived of all contact with her daughter from the age of three years and 10 months onwards on the basis of her socio-economic status. In finding a violation of Article 8 of the ECHR, the Court stressed that "the Spanish administrative authorities should have considered other less drastic measures than taking the child into care". It also stated that: "The role of the social welfare authorities is precisely to help persons in difficulty [...], to provide them with guidance and to advise them on matters such as the different types of benefits available, the possibility of obtaining social housing and other means of overcoming their difficulties, such as those originally sought by the applicant." Accordingly, the ECtHR held "that the Spanish authorities failed to undertake appropriate and sufficient efforts to secure the applicant's right to live with her child".[149]

144 *Ibid.*, para. 69 and following.

145 ECtHR, *Y.C. v. the United Kingdom*, No. 4547/10, 13 March 2012, para. 137.

146 ECtHR, *K. and T. v. Finland* [GC], No. 25702/94, 12 July 2001, para. 168.

147 ECtHR, *Y.C. v. the United Kingdom*, No. 4547/10, 13 March 2012, para. 137.

148 ECtHR, *R.M.S. v. Spain*, No. 28775/12, 18 June 2013.

149 *Ibid.*, paras. 86 and 93.

Under international law, Article 5 of the CRC provides that "States Parties shall respect the responsibilities, rights and duties of parents, [...] to provide, in a manner consistent with the evolving capacities of the child, appropriate direction and guidance in the exercise by the child of the rights recognised in the present Convention". Furthermore, Article 9 of the CRC states that a child shall not be separated from his/her parents against his/her will, and that all parties must be given the opportunity to participate in any proceedings relating to this situation. The UN Guidelines on Alternative Care further substantiate the rights of children in these circumstances and the corresponding duties of states.[150]

5.3. Right to maintain contact with both parents

Key points

- The right of the child to maintain contact with both parents subsists in all forms of parental separation: family-related and state-sanctioned.
- The process of ensuring the right of the child to maintain contact with his/her parents and family reunification requires regard for the best interests of the child as a primary consideration, giving due weight to the views of the child in accordance with his/her age and maturity.

The scope of the right to maintain contact with parents differs depending on the context. In the event of a decision of the parents to separate from each other, the scope is broader and normally limited only by the best interests of the child. In the context of a state-sanctioned separation resulting from, for instance, expulsion or imprisonment of a parent, state authorities act in furtherance of a protected interest, and must strike a fair balance between the interests of the parties and the obligation to ensure the best interests of the child. The right of children to maintain contact with both parents is applicable in both instances.

Under EU law, Article 24 (3) of the EU Charter of Fundamental Rights expressly recognises every child's right to maintain contact with both parents. The

150 UN, Human Rights Council (2009), *UN Guidelines for the Alternative Care of Children*, UN Doc. A/HRC/11/L.13, 15 June 2009.

provision's wording clarifies the content of the right, particularly the meaning of contact, which must: occur on a *regular basis*; allow the development of a *personal relationship*; and be in the form of *direct contact*. There is, however, a caveat: the right of each child to maintain contact with her or his parents is expressly limited by their best interests. This provision, as the explanatory note to the Charter clarifies, is expressly informed by Article 9 of the CRC.

In line with EU competences (see Chapter 1), there has been a specific focus on judicial cooperation (with the objective of creating an area of freedom, security and justice in which the free movement of persons is ensured). Two EU instruments are of particular relevance: Council Regulation (EC) No. 2201/2003[151] (Brussels II bis), and European Parliament and Council Directive 2008/52/EC (Mediation Directive).[152] From a rights perspective, the Brussels II bis Regulation is significant. First, it applies to *all* decisions on parental responsibility, irrespective of marital status. Second, the rules relating to jurisdiction (determined for the most part by the child's habitual residence) are expressly informed by the best interests of the child; and third, there is particular regard for ensuring the respect of children's views.[153]

CJEU jurisprudence in cases of wrongful removal of a child following a decision taken unilaterally by one of the parents has primarily aimed to uphold the fundamental right of the child to maintain on a regular basis a personal relationship and direct contact with both parents (Article 24 (3) of the Charter), as the Court asserts that this right undeniably merges into the best interests of any child. In the CJEU's view, a measure that prevents the child to maintain on a regular basis a personal relationship and direct contact with both parents can be justified only by another interest of the child of such importance that it takes priority over the interest underlying that fundamental right.[154] This includes provisional, including protective, measures under Article 20 of the Brussels II bis Regulation. The Court ruled that a balanced and reasonable

153 See, for example, Council Regulation (EC) No. 2201/2003, Preamble (paras. 5, 12, 13 and 19) and Articles 8, 41 (2) (c) and 42 (2) (a).

154 CJEU, C-403/09 PPU, *Jasna Detiček v. Maurizio Sgueglia*, 23 December 2009, para. 59.

assessment of all the interests involved, which must be based on objective considerations relating to the actual person of the child and his or her social environment, must in principle be performed in proceedings in accordance with the provisions of Brussels II bis Regulation.[155]

> Example: The case of *E. v. B.*[156] concerns proceedings between Mr. E. (the father) and Ms. B. (the mother), in relation to the jurisdiction of the courts of the United Kingdom to hear and determine the usual place of residence of their child, S., and the rights of access of the father. The parents had signed an agreement before a Spanish court whereby the mother had custody, and access was granted to the father. Subsequently, the mother sought to reduce the rights of access which had been granted to the father by that agreement. The father submitted an application before the High Court seeking the enforcement of the Spanish agreement. The mother submitted that she had prorogued the jurisdiction of the Spanish court and sought to transfer the prorogued jurisdiction to the courts of England and Wales. On the father's appeal, the Court of Appeal referred several questions to the CJEU concerning the interpretation of Article 12 (3) of the Brussels II bis Regulation. The CJEU held that where a court is seized of proceedings in accordance with Article 12 (3) of the Brussels II bis Regulation, the best interests of the child can only be safeguarded by a review, in each specific case, of the question of whether the prorogation of jurisdiction which is sought is consistent with the child's best interests. A prorogation of jurisdiction is valid only in relation to the specific proceedings for which the court whose jurisdiction is prorogued is seized. After the final conclusion of the proceedings from which the prorogation of jurisdiction derives, that jurisdiction comes to an end, in favour of the court benefiting from a general jurisdiction under Article 8 (1) of the Brussels II bis Regulation.

With regard to parental responsibility, Brussels II bis co-exists with the Hague Convention on jurisdiction, applicable law, recognition, enforcement and cooperation in respect of parental responsibility and measures for the protection of children.[157] Pursuant to Article 61, Brussels II bis shall take precedence over

155 *Ibid.*, para. 60.

156 CJEU, C-436/13, *E. v. B.*, 1 October 2014 (summary adjusted from http://cases.iclr.co.uk).

157 The World Organisation for Cross-border Cooperation in Civil and Commercial Matters (1996), Hague Conference on private international law, Convention on Jurisdiction, Applicable Law, Recognition, Enforcement and Co-Operation in respect of Parental Responsibility and Measures for the Protection of Children, 19 October 1996.

the Hague Convention: (a) if the child concerned has her or his habitual residence on the territory of a Member State or (b) as concerns the recognition and enforcement of a judgment rendered in a court of a Member State on the territory of another Member State, even if the child concerned has her or his habitual residence on the territory of a third state which is a contracting Party to the Hague Convention. Therefore, a key issue under the Brussels II bis Regulation is the determination of the habitual residence of the child.

Example: In *Mercredi v. Chaffe,*[158] the Court of Appeal of England and Wales referred a case to the CJEU concerning the removal of a two-month-old child from the United Kingdom to the French island of Réunion. The CJEU ruled that the concept of habitual residence, for the purposes of Articles 8 and 10 of the Brussels II bis Regulation corresponds to the place which reflects some degree of integration by the child in a social and family environment. Where the situation concerns an infant who has been staying with his/her mother only a few days in a Member State – other than that of his/her habitual residence – to which he/she was removed, the factors that must be taken into consideration include: first, the duration, regularity, conditions and reasons for the stay in the territory of that EU Member State and for the mother's move to that state; and second, with particular reference to the child's age, the mother's geographic and family origins, and the family and social connections which the mother and child have with that Member State.

Also of particular relevance for the enjoyment of the right to maintain contact with both parents in cross-border disputes are the instruments related to regulating access to justice that clarify how to handle complex disputes, such as Council Directive 2002/8/EC (Access to Justice Directive), which requires "improv[ing] access to justice in cross-border disputes by establishing minimum common rules relating to legal aid for such disputes".[159] The purpose of this directive is to: improve access to justice in cross-border civil cases by establishing common minimum rules relating to legal aid; ensure that appropriate legal aid is granted, under certain conditions, to persons who cannot meet the cost of proceedings on account of their financial situation; and facilitate compatibil-

159 Council of the European Union (2003), Council Directive 2002/8/EC of 27 January 2003 to improve access to justice in cross-border disputes by establishing minimum common rules relating to legal aid for such disputes, OJ 2003 L 026 (Access to justice directive).

ity of national laws in this matter and to provide for cooperation mechanisms between the authorities of the Member States.

Under CoE law, the right of each child to maintain contact with both parents is implicit in Article 8 of the ECHR. The ECtHR affirms that "the mutual enjoyment by parent and child of each other's company constitutes a fundamental element of family life".[160] It also emphasises, however, that this right may be limited by the best interests of the child (see Section 5.4 and Chapter 6). This right is at the centre of judicial decision-making about custody of and contact with children.

In a series of cases, the ECtHR has either expressly or implicitly referred to the best interests of the child within the context of custody and contact.

> Example: In *Schneider v. Germany*,[161] the applicant had a relationship with a married woman and claimed to be the biological father of her son, whose legally recognised father was the mother's husband. The applicant argued that the decision of the domestic courts to dismiss his application for contact with the child and information about the child's development on the basis that he was neither the child's legal father nor had a relationship with the child violated his rights under Article 8 of the ECHR. In finding a violation, the ECtHR focused on the failure of the domestic courts to give any consideration to the question of whether, in the particular circumstances of the case, contact between the child and the applicant would have been in the child's best interest.[162] As regards the applicant's request for information about the child's personal development, the Court held that the domestic courts failed to give sufficient reasons to justify their interference for the purposes of Article 8 (2)[163] and that, therefore, the interference had not been "necessary in a democratic society".

160 ECtHR, *K. and T. v. Finland* [GC], No. 25702/94, 12 July 2001, para. 151.

161 ECtHR, *Schneider v. Germany*, No. 17080/07, 15 September 2011.

162 See also ECtHR, *Anayo v. Germany*, No. 20578/07, 21 December 2010, paras. 67 and 71.

163 ECtHR, *Schneider v. Germany*, No. 17080/07, 15 September 2011, para. 104.

Example: In *Levin v. Sweden*[164] the applicant, a mother of three children in alternative non-family based care, argued that the restrictions on her right to maintain contact with her children violated her right to respect for family life. The ECtHR focused on the objective of the contact restrictions, i.e. protecting the best interests of the children. In that particular case, the children had been neglected while in the care of the applicant, and contact with her revealed strong negative reactions on the part of the children. In holding that there had been no violation of Article 8 of the ECHR, the Court found that the interference with the applicant's rights had been "proportionate to the legitimate aim pursued [the best interests of the children] and within the margin of the domestic authorities".

Example: In *Sommerfeld v. Germany*[165] the applicant complained about the restrictions on his right to maintain contact with his daughter, who had consistently expressed that she did not wish to remain in contact with him. In particular, the applicant argued that the failure of the domestic courts to obtain a psychological expert opinion constituted a flaw in the domestic proceedings. In finding no violation of Article 8 of the ECHR, the ECtHR concluded that the domestic court had been well placed to evaluate the daughter's statements and to establish whether or not she had been able to make up her own mind.

Example: In *Mustafa and Armağan Akin v. Turkey*,[166] the applicants – a father and a son – argued that the terms of a custody order by the domestic court had violated their rights under Article 8 of the ECHR. These terms prevented the son from having contact with his sister, who was in the custody of their mother. Moreover, the father could not have contact with both of his children together because his son's contact with his mother coincided with his own contact with his daughter. The ECtHR held that the decision of the domestic court separating the two siblings constituted a violation of the applicants' right to respect for their family life, as it not only prevented the two siblings from seeing each other, but also made it impossible for their father to enjoy the company of both his children at the same time.

164 ECtHR, *Levin v. Sweden*, No. 35141/06, 15 March 2012, paras. 57 and 69; ECtHR, *K. and T. v. Finland* [GC], No. 25702/94, 12 July 2001, para. 151.

165 ECtHR, *Sommerfeld v. Germany* [GC], No. 31871/96, 8 July 2003, para. 72.

166 ECtHR, *Mustafa and Armağan Akin v. Turkey*, No. 4694/03, 6 April 2010.

In the context of custody and contact decision-making, the ECtHR also prohibits discrimination incompatible with Article 14 of the ECHR.

Example: In the case of *Vojnity v. Hungary*,[167] the applicant argued that he had been denied access to his son due to his religious convictions.[168] In finding a violation of Article 14 in conjunction with Article 8 of the ECHR, the ECtHR observed that there was no evidence that the applicant's religious convictions involved dangerous practices or exposed his son to physical or psychological harm.[169] The domestic courts' decisions on the removal of the applicant's access rights rendered any form of contact and the establishment of any kind of further family life impossible, despite the fact that total severance of contact could be justified only in exceptional circumstances.[170] The ECtHR, therefore, held that there had been no reasonable relationship of proportionality between a total ban on the applicant's access rights and the aim pursued, namely the protection of the best interest of the child.[171]

Example: The case of *Salgueiro da Silva Mouta v. Portugal*[172] was brought by a father who claimed parental responsibility over his child. He alleged that, in the national proceedings, the Portuguese authorities had dismissed his claim and awarded parental responsibility to the mother on the basis of his sexual orientation. The ECtHR found that the domestic authorities indeed refused custody on the ground that he was homosexual – a decision that does not have an objective and reasonable justification. The Court concluded that Article 8 taken together with Article 14 of the ECHR were violated.

167 ECtHR, *Vojnity v. Hungary*, No. 29617/07, 12 February 2013; see also ECtHR, *P.V. v. Spain*, No. 35159/09, 30 November 2010 (available in French and Spanish).

Furthermore, the right of the child to maintain contact with both parents is expressly cited within the CoE Convention on Contact Concerning Children.[173] Article 4 (1) of this convention states that "a child and his or her parents shall have the right to obtain and maintain regular contact with each other". The general principles to be applied in jurisprudence about contact emphasise the right of a child to be informed, consulted and to express his or her views, and for these views to be given due weight. Article 6 of the CoE Convention on the Exercise of Children's Rights[174] further identifies requisites of judicial decision-making, including the legal obligations to: consider whether the judicial authority has sufficient information to determine the best interests of the child; ensure the right of the child to information about the process and outcomes; and open a safe space for affected children to freely express their views in an age/maturity appropriate manner.

Situations may arise in which children are otherwise separated from a parent, for example as a result of the parent's imprisonment. The ECtHR was faced with such a situation in *Horych v. Poland*,[175] where it addressed the issue of the conditions in which the applicant, categorised as a dangerous prisoner, had received visits from his minor daughters. It noted that "visits from children [...] in prison require special arrangements and may be subjected to specific conditions depending on their age, possible effects on their emotional state or well-being and on the personal circumstances of the person visited".[176] The Court went on to say that "positive obligations of the State under Article 8, [...] include a duty to secure the appropriate, as stress-free for visitors as possible, conditions for receiving visits from his children, regard being had to the practical consequences of imprisonment". [177]

Finally, the right of children deprived of the liberty to maintain contact with their parents is reinforced by selected provisions of the CoE Guidelines on

173 Council of Europe, Convention on Contact Concerning Children, CETS No. 192, 2003. See also The World Organisation for Cross-border Cooperation in Civil and Commercial Matters (1996), Hague Conference on private international law, Convention on Jurisdiction, Applicable Law, Recognition, Enforcement and Co-Operation in respect of Parental Responsibility and Measures for the Protection of Children.

174 Council of Europe, European Convention on the Exercise of Children's Rights, CETS No. 160, 1996.

175 ECtHR, *Horych v. Poland*, No. 13621/08, 17 April 2012.

176 *Ibid.*, para. 131.

177 *Ibid.*, para. 131.

child-friendly justice.[178] The guidelines expressly affirm the right of children deprived of their liberty "to maintain regular meaningful contact with parents [and] family" (Article 21 (a)) (see also Chapter 11).

Under international law, the right to maintain contact with both parents is affirmed in Article 9 (3) of the CRC: "State Parties shall respect the right of the child who is separated from one or both parents to maintain personal relations and direct contact with both parents on a regular basis, except if it is contrary to the child's best interests."

5.4. Improper removal of children across borders — child abduction

Key points

- The ECtHR requires a child rights-based approach to improper removals in breach of custody arrangements: Article 8 of the ECHR (right to respect for private and family life) must be interpreted in connection with the Hague Convention and the CRC.
- EU law requires more specifically that the child be heard during the proceedings relating to his/her return following wrongful removal or retention.

Child abduction refers to a situation in which a child is removed or retained across national borders in breach of existing custody arrangements (Article 3 of the Hague Convention on the Civil Aspects of International Child Abduction[179] (Hague Convention)). Under the Hague Convention, wrongfully removed or retained children are to be returned speedily to their country of habitual residence (Article 11 (1)). The courts of the country of habitual residence determine the merits of the custody dispute. The courts of the country from which the child has been removed should order the return within six weeks from the date that the return application is made (Article 11). The Hague Convention is underpinned by the principle of the child's best interests. In the context of this convention, the presumption is that the unlawful removal of a child is in itself

178 Council of Europe, Committee of Ministers (2010), *Guidelines on child friendly justice*.

179 The World Organisation for Cross-border Cooperation in Civil and Commercial Matters (1980), Hague conference on private international law, Hague Convention of 25 October 1980 on the civil aspects of international child abduction, 25 October 1980.

harmful and that the *status quo ante* should be restored as soon as possible to avoid the legal consolidation of wrongful situations. Issues of custody and access should be determined by the courts that have jurisdiction in the place of the child's habitual residence rather than those of the country to which the child has been wrongfully removed. There are several limited exceptions to the return mechanism, established in Articles 12, 13, and 20 of the Hague Convention. Article 13 includes the provisions that have generated most of the litigation, both at a domestic and at an international level. It establishes that the country the child has been removed to may refuse to return a child, where the return would expose him/her to a grave risk of harm or otherwise place him/her in an intolerable situation (Article 13 (b)). A return may equally be refused if the child objects to the return if he or she has attained the level of maturity to express his/her views (Article 13 (2)).

Under EU law, the most important instrument regulating child abduction between EU Member States is the Brussels II bis Regulation,[180] largely based on the provisions of the Hague Convention. This regulation complements and takes precedence over the Hague Convention in intra-EU abduction cases (Recital 17 of the Preamble and Article 60 (e)). Although the Hague Convention remains the main child-abduction instrument, in certain respects Brussels II bis has 'tightened' the jurisdictional rules in favour of the courts of origin/habitual residence. Similar to the Hague Convention, the courts of the state where the child was habitually resident immediately prior to improper removal/retention retain the jurisdiction in cases of child abduction. The regulation maintains the same exceptions to the return as those included in the Child Abduction Convention.

However, under Brussels II bis, as opposed to the Hague Convention, the state of habitual residence retains jurisdiction to adjudicate the merits of the custody dispute, even after a non-return order is issued in application of Article 13 (b) of the Hague Convention (Article 11 (6)–(8) of the Brussels II bis Regulation). The change of jurisdiction to the state the child has been removed to may only occur in two situations, provided for under Article 10 of the Brussels II bis Regulation. The first situation stipulates that the courts of the state of refuge shall have jurisdiction if the child has acquired habitual residence in that state

180 Council of the European Union (2003), Council Regulation (EC) No. 2201/2003 of 27 November 2003 concerning jurisdiction and the recognition and enforcement of judgments in matrimonial matters and the matters of parental responsibility, repealing Regulation (EC) No 1347/2000, OJ 2003) L 338.

and each person having right of custody has acquiesced in the removal or retention.[181] The second situation arises where the child: has acquired habitual residence in the state he/she has been removed to; a period of one year has elapsed since the parent left behind had or should have had knowledge of the whereabouts of the child; the child is settled into his new environment; and at least one of the four further conditions listed in Article 10 (b) of the Brussels II bis Regulation are met.[182]

As with all other EU legal instruments, Brussels II bis must be interpreted in accordance with the provisions of the EU Charter of Fundamental Rights, in particular Article 24. The CJEU has had the opportunity to clarify the interpretation of Article 24 in the context of child abductions. As discussed in Section 2.4, in the *Aguirre Zarraga Case*, the CJEU ruled that the right of the child to be heard, enshrined in Article 24 of the Charter, requires that the legal procedures and conditions which enable children to express their views freely be made available to them, and that those views be obtained by the court.[183] According to the CJEU however, it is only for the courts of the child's habitual residence to examine the lawfulness of their own judgments in the light of the EU Charter of Fundamental Rights and the Brussels II bis Regulation. According to the mutual trust principle, Member States' legal systems should provide effective and equivalent protection of fundamental rights. Therefore, the interested parties have to bring any human rights-based challenge before the courts which have jurisdiction over the merits of the custody dispute pursuant to the regulation. The CJEU ruled that the court of the Member State to which the child had been wrongfully removed could not oppose the enforcement of a certified judgement, ordering the return of the child, since the assessment of whether there was an infringement of these provisions fell exclusively within the jurisdiction of the state from which the child had been removed.

181 Art. 10 (a) of the Brussels II bis Regulation.

182 Art. 10 (b) of the Brussels II bis Regulation provides for four alternative conditions as follows: (i) within one year after the holder of rights of custody has had or should have had knowledge of the whereabouts of the child, no request for return has been lodged before the competent authorities of the Member State where the child has been removed to or is being retained; (ii) a request for return lodged by the holder of rights of custody has been withdrawn and no new request has been lodged within the time limit set in paragraph (i); (iii) a case before the court in the Member State where the child was habitually resident immediately before the wrongful removal or retention has been closed pursuant to Art. 11 (7); (iv) a judgment on custody that does not entail the return of the child has been issued by the courts of the Member State where the child was habitually resident immediately before the wrongful removal or retention.

183 CJEU, C-491/10 PPU, *Joseba Adoni Aguirre Zarraga v. Simone Pelz*, 22 December 2010. On aspects concerning child participation in this case, see further the analysis in Section 2.4.

Example: The case of *Povse v. Alpago*[184] concerns the unlawful removal of a girl to Austria by her mother. The Austrian courts dismissed the father's application for return of his daughter to Italy on the ground that there was a grave risk of harm to the child. Meanwhile, upon the request of the father, the Italian court ruled that it retained jurisdiction to adjudicate the merits of the custody dispute and issued an order for the return of the child to Italy and an enforcement certificate on the basis of Article 42 of Brussels II bis. The case was referred to the CJEU by an Austrian court following the mother's appeal against the application for enforcement of the certificate and the ensuing return order of the child to Italy. The CJEU ruled that once a certificate of enforcement has been issued there are no possibilities of opposing the return in the country the child has been removed to (in this case Austria), as the certificate is automatically enforceable. Further, the CJEU decided that, in this case, only the Italian courts were competent to adjudicate on the serious risk to the child's best interests entailed by the return. Assuming that these courts were to consider such a risk justified, they retained sole competence to suspend their own enforcement order[185].

Under CoE law, the CoE European Convention on Recognition and Enforcement of Decisions Concerning Custody of Children and on Restoration of Custody[186]and the Convention on Contact concerning Children[187] include safeguards to prevent the improper removal of children and ensure the return of children.[188]

The ECtHR often deals with child abduction cases, and is in such instances generally guided by provisions of the Hague Convention when interpreting Article 8 of the ECHR. However, the ECtHR inevitably conducts an analysis of the child's best interests in these cases. Two leading Grand Chamber judgments reflect the court's position on this matter.

184 CJEU, C-211/10, *Doris Povse v. Mauro Alpago*, 1 July 2010.

185 An application based on the same facts was later lodged with the ECtHR and declared inadmissible. See ECtHR, *Povse v. Austria*, Decision of inadmissibility, No. 3890/11, 18 June 2013.

186 Council of Europe, European Convention on Recognition and Enforcement of Decisions concerning Custody of Children and on Restoration of Custody of Children, CETS No. 105, 1980.

187 Council of Europe, Convention on Contact Concerning Children, CETS No. 192, 2003.

188 *Ibid.*, Arts. 10 (b) and 16, respectively; Council of Europe, European Convention on Recognition and Enforcement of Decisions concerning Custody of Children and on Restoration of Custody of Children, CETS No. 105, 1980, Art. 8.

Example: The case *Neulinger and Shuruk v. Switzerland*[189] was brought by a mother, who had removed her son from Israel to Switzerland in breach of existing guardianship arrangements. Upon the father's application under the Hague Convention, the Swiss authorities ordered the child's return to Israel. In the opinion of the national courts and experts, the child's return to Israel could be envisaged only if he was accompanied by his mother. The measure in question remained within the margin of appreciation afforded to national authorities in such matters. Nevertheless, to assess compliance with Article 8 of the ECHR, it was also necessary to take into account any developments since the Federal Court's judgment ordering the child's return. In the present case, the child was a Swiss national and had settled well in the country, where he had been living continuously for about four years. Although he was at an age where he still had a significant capacity for adaptation, being uprooted again would probably have serious consequences for him and had to be weighed against any benefit he was likely to gain from it. It was also noteworthy that restrictions had been imposed on the father's right of access before the child's removal. Moreover, the father had remarried twice since then and was now a father again, but failed to pay maintenance for his daughter. The ECtHR doubted that such circumstances would be conducive to the child's well-being and development. As to the mother, her return to Israel could expose her to a risk of criminal sanctions, such as a prison sentence. It was clear that such a situation would not be in the child's best interests, given that his mother was probably the only person to whom he related. The mother's refusal to return to Israel was not, therefore, totally unjustified. Moreover, the father had never lived alone with the child and had not seen him since the child's departure at the age of two. The ECtHR was thus not convinced that it would be in the child's best interests to return to Israel. As to the mother, a return to Israel would mean a disproportionate interference with her right to respect for her family life. Consequently, there would be a violation of Article 8 of the ECHR in respect of both applicants if the decision ordering the second applicant's return to Israel were to be enforced.

189 ECtHR, *Neulinger and Shuruk v. Switzerland* [GC], No. 41615/07, 6 July 2010.

Example: In *X v. Latvia*,[190] the mother argued that the return of her daughter to Australia, from where she had been wrongfully removed, would expose her to serious harm. In determining whether the decisions of the national courts had struck a fair balance between the competing interests at stake – within the margin of appreciation afforded to states in such matters – the best interests of the child had to be a primary consideration. To achieve a harmonious interpretation of the ECHR and the Hague Convention, the factors capable of constituting an exception to the child's immediate return under Articles 12, 13 and 20 of the Hague Convention had to be genuinely taken into account by the requested state, which had to issue a decision that was sufficiently reasoned on this point, and then evaluated in light of Article 8 of the ECHR. This Article imposed a procedural obligation on the domestic authorities, requiring that when assessing an application for a child's return, the courts had to consider arguable allegations of a "grave risk" for the child in the event of return and make a ruling giving specific reasons. As to the exact nature of the "grave risk", the exception provided for in Article 13 (b) of the Hague Convention concerned only situations which go beyond what a child could reasonably bear. In the present case, the applicant had submitted to the Latvian Appeal Court a psychologist's certificate concluding that there existed a risk of trauma for the child in the event of immediate separation from her mother. Although it was for the national courts to verify the existence of a "grave risk" for the child, and the psychological report was directly linked to the best interests of the child, the regional court refused to examine the conclusions of that report in light of the provisions of Article 13 (b) of the Hague Convention. At the same time, the national courts also failed to deal with the issue of whether it was possible for the mother to follow her daughter to Australia and to maintain contact with her. As the national courts had failed to carry out an effective examination of the applicant's allegations, the decision-making process under domestic law did not satisfy the procedural requirements inherent in Article 8 of the ECHR, and the applicant had therefore suffered a disproportionate interference with her right to respect for her family life.

Every child has the right to respect for family life, a right recognised under Article 7 of the EU Charter of Fundamental Rights and Article 8 of the European Convention on Human Rights (ECHR) (see Chapter 5). Both EU and Council of Europe law reflect the importance to the child of family relationships, and this includes the child's right not to be deprived of contact with his/her parents, except when this is contrary to the child's best interests.[191] Finding a balance between ensuring the child remains with his/her family – in line with the respect for family life – and ensuring the child is protected from harm is difficult. Where a child is removed from his/her family, he/she may be placed in either foster care or residential care. Family life does not end with this separation and requires that contact continues to support family reunification if it is in the child's best interests. In certain circumstances, permanent removal, through adoption, will take place. The finality of adoption means that stringent requirements must be followed.

The purpose of this chapter is to consider European law on alternative care. EU law, mainly through the Brussels II bis Regulation, deals with cross-border procedural aspects related to placing children in alternative care. This regulation should be interpreted according to the EU Charter of Fundamental Rights, in particular Article 24. The ECtHR has also developed an extensive body of case law dealing with both substantive and procedural matters of placing children into alternative care.

191 EU (2012), Charter of Fundamental Rights of the European Union, OJ 2012 C 326, Art. 24 (3).

Section 6.1 begins by introducing some of the general principles governing the situation of children deprived of family care, Section 6.2 outlines the law concerning the child's removal into alternative care and Section 6.3 considers the European standards on adoption.

6.1. Alternative care: general principles

Key points

- Alternative care is a temporary protective measure.
- International law confirms that family-based care should be preferred over residential care.
- Children have the right to information and to express their view with respect to placement into alternative care.

Under EU, CoE and international law, viewed together, six broad principles relating to alternative care emerge.

First, alternative care is a protective measure that ensures children's interim safety and facilitates children's return to their families where possible.[192] Ideally, it is thus a temporary solution. Sometimes, it is a protective measure pending family reunification, for example of unaccompanied or separated child migrants with their families.[193] Other times it is a protective measure pending developments in family life, for example, improvements in the health of a parent or provision of support to parents.

Second, international law confirms that family-based care (such as foster care) is the optimal form of alternative care for securing children's protection and development. This is affirmed by the UN Guidelines for the Alternative

192 UN, General Assembly (2010), *Guidelines for the alternative care of children*, A/RES/64/142, 24 February 2010, paras. 48–51; Committee on the Rights of the Child (2013), *General Comment No. 14 (2013) on the right of the child to have his or her best interests taken as a primary consideration (art. 3 para. 1)*, UN Doc. CRC/C/GC/14, 29 May 2013, paras. 58–70.

193 UN, General Assembly, Convention on the Rights of the Child, 20 November 1989, Art. 22; Committee on the Rights of the Child (2005), *General Comment No. 6 (2005): Treatment of unaccompanied and separated children outside their country of origin*, UN Doc. CRC/GC/2005/6, 1 September 2005, paras. 81–83.

Care of Children and the UN Convention on the Rights of Persons with Disabilities (CRPD), to which the EU is a party.[194] The CRPD expressly states that "States Parties shall, where the immediate family is unable to care for a child with disabilities, undertake every effort to provide alternative care within the wider family, and failing that, within the community in a family setting".[195] Non-family based care (e.g. residential care) "should be limited to cases where such a setting is specifically appropriate, necessary and constructive for the individual child concerned and in his/her best interests".[196]

Third, the child's right to a guardian or representative is key to securing his or her broader rights.[197] Although there is no explicit general obligation in EU law to appoint a guardian for children without parental care, at least seven EU directives require Member States to appoint a guardian for children within different contexts, some directly related to children without parental care.[198] Further, this body of law is substantiated by the UN Guidelines for the Alternative Care of Children (generally regarding children without parental care), the CRC (specifically regarding unaccompanied children) and the CoE Convention on Action against Trafficking in Human Beings.[199] Most often the mandate of a legal guardian is to safeguard the child's best interests, ensure his or her overall well-being and complement his/her limited legal capacity (and also sometimes to exercise legal representation).[200]

Fourth, implicit within Article 24 of the EU Charter of Fundamental Rights is the legal obligation to take positive measures to ensure that decision-making

194 UN, General Assembly (2010), *Guidelines for the alternative care of children*, A/RES/64/142, 24 February 2010, paras. 20–22; UN, Committee on the Rights of the Child (2006), *General Comment No. 7 (2005): Implementing child rights in early childhood*, UN Doc. CRC/C/GC/7/Rev.136 (b), 20 September 2006, para. 18. UN, Convention on the rights of persons with disabilities (CRPD), 13 December 2006, Art. 23 (5) (see also Art. 7).

195 UN, Convention on the Rights of Persons with Disabilities (CRPD), 13 December 2006, Art. 23 (5).

197 FRA (2014a), p. 31.

198 *Ibid.*, p. 14.

199 UN, General Assembly (2010), *Guidelines for the alternative care of children*, 24 February 2010, A/RES/64/142, paras. 100–103; UN, Committee on the Rights of the Child, *General Comment No. 6, (2005): Treatment of unaccompanied and separated children outside their country of origin*, UN Doc. CRC/GC/2005/6, 1 September 2005, paras. 33–38; Council of Europe, Convention on Action against Trafficking in Human Beings, CETS No. 197, 2005, Art. 10 (4).

200 FRA (2014a), p. 15.

about a child's placement is guided by his/her best interests[201] and views.[202] General Comments No. 5 and 14 of the Committee on the Rights of the Child[203] as well as the UN Guidelines for the Alternative Care of Children emphasise the need to ensure the child's right to information, including on his/her rights and options, as well as the child's right "to be consulted and to have his/her views duly taken into account in accordance with his/her evolving capacities".[204]

Fifth, children's broader rights within the EU Charter of Fundamental Rights, the ECHR and the CRC remain applicable to cases of alternative care (foster or residential care). This includes their civil and political rights (e.g. their rights to privacy, freedom of expression and freedom of religion and protection from all forms of violence) and their socio-economic rights (including their rights to education, healthcare and participation in cultural life).[205]

Finally, Article 4 of the CRC requires states to take "all appropriate legislative, administrative, and other measures" to implement the convention. This applies equally to the context of alternative care. Article 17 (1) (c) of the revised European Social Charter (ESC) similarly requires states to take all appropriate and necessary measures designed to provide protection and special aid for children and young persons temporarily or definitively deprived of their family's support.

Under EU law, the CJEU ruled that the Brussels II bis Regulation applies to decisions to place a child in alternative care. As noted in Chapter 5, Brussels II bis incorporates children's rights principles in its approach, emphasising that the equality of all children, the best interests of the child and the right to be heard, amongst others, should be taken into account.[206] Here the

206 Brussels II bis, Preamble. See also Chapter 5.

"grounds of non-recognition for judgments relating to parental responsibility", as expressed in Article 23 of the Brussels II bis Regulation, are instructive. Article 23 states that judgments shall not be recognised:

> *"(a) if such recognition is manifestly contrary to the public policy of the Member State in which recognition is sought taking into account the best interests of the child;*
> *(b) if it was given, except in case of urgency, without the child having been given an opportunity to be heard, in violation of fundamental principles of procedure of the Member State in which recognition is sought […]."*

Under the regulation, jurisdiction is determined on the basis of the child's habitual residence, with several limited exceptions, including the child's best interests (Articles 8, 12 and 15 of Brussels II bis).

Under CoE law, the ECtHR affirms that the family is the natural environment for the growth and well-being of children. However, where the family cannot provide the child with the requisite care and protection, removal to an alternative care setting may be required. Such removal interferes with the respect for family life. The ECtHR has explained that in most cases the placement of a child in alternative care should be intended as a temporary measure and that the child must ultimately be reunited with his/her family in fulfilment of the right to respect for private and family life under Article 8 of the ECHR.[207]

Although the ECHR does not impose any specific duty on states to provide children with care and protection, Article 17 of the ESC requires that states "take all appropriate and necessary measures designed to provide protection and special aid from the state for children and young persons temporarily or definitively deprived of their family's support".[208]

207 ECtHR, *K.A. v. Finland*, No. 27751/95, 14 January 2003. The Committee of Ministers of the Council of Europe has endorsed this approach in its Recommendation on the rights of children living in residential institutions, adopted on 16 March 2005.

208 Council of Europe, European Social Charter (revised), CETS No. 163, 1996, Art. 17 (1) c.

6.2. Placing children in alternative care

Key points

- Under the CoE law, placing a child in alternative care should be provided for by law, pursue a legitimate aim and be necessary in a democratic society. Relevant and sufficient reasons must be put forward by the competent authority.
- Under CoE law, the decision-making process must follow certain procedural safeguards.

Under CoE law,[209] the child's placement in alternative care is only compatible with Article 8 of the ECHR when it is in accordance with the law, pursues a legitimate aim (such as the protection of the child's best interests) and is considered necessary in a democratic society. This last aspect requires that the courts give reasons that are both relevant and sufficient to support the means used to pursue the desired aim.

Example: In *Olsson v. Sweden (No. 1)*,[210] the applicants complained about the decision to place their three children into care. Finding that the care decision fell within the state's margin of appreciation, the ECtHR focused on the manner in which the care order was implemented. According to the Court, the care decision should have been regarded as a temporary measure, to be discontinued as soon as circumstances permitted, given that adoption was not being considered. Measures taken should thus have been consistent with the ultimate aim of reuniting the natural family. In this light, the ECtHR noted that the national authorities had placed the children in separate foster homes, at a significant distance from each other and their parents. Although the authorities had acted in good faith in implementing the care order, the Court noted that it was unacceptable for administrative difficulties, such as the lack of appropriate foster families or placements, to determine where the children would be placed. In such a fundamental area as respect for family life, such considerations could not be allowed to play more than a secondary role. Thus, in finding a violation

209 The placement of children in alternative care has also been a topic of political debate in the CoE for many years. See for instance the Committee of Ministers Resolution (77) 33 on the placement of children, adopted on 3 November 1977.

210 ECtHR, *Olsson v. Sweden (No. 1)*, No. 10465/83, 24 March 1988.

of Article 8 of the ECHR, the ECtHR stated that the measures taken by the authorities in the implementation of the care order were not supported by sufficient reasons to render them proportionate to the legitimate aim pursued under Article 8.

More recently, the ECtHR considered the merits of decisions to place children in alternative care under Article 8 of the ECHR.

Example: In *Wallová and Walla v. the Czech Republic*[211] the applicants complained about the placement of their five children in two separate children's homes due to their poor housing situation. Custody of the children was given to the children's homes in 2002 on the basis of the parents' economic instability and the care orders were later lifted when their economic and housing situation improved. The ECtHR found that the underlying reason for the decision to place the children in care had been a lack of suitable housing and as such a less drastic measure could have been used to address their situation. Under Czech law, there was a possibility to monitor the family's living and hygiene conditions, and to advise them on how to improve their situation, but this option was not used. While the reasons given for placing the children in care were relevant, they were not sufficient, and the authorities did not make enough efforts to help the applicants overcome their difficulties through alternative measures. In concluding that there had been a violation of Article 8 of the ECHR, the Court also took note of the conclusions of the UN Committee on the Rights of the Child, which observed that the principle of primary consideration of the best interests of the child was still not adequately defined and reflected in all Czech legislation, court decisions and policies affecting children.

Example: In *Saviny v. Ukraine*,[212] the applicants' children were placed in care due to the parents' lack of financial means and the domestic court's conclusion that their personal qualities endangered their children's lives, health and moral upbringing. In assessing the case, the ECtHR questioned the adequacy of the evidence on which the domestic authorities had based their findings and considered that there was insufficient information available on the extent of social assistance made available. This would

211 ECtHR, *Wallová and Walla v. the Czech Republic*, No. 23848/04, 26 October 2006 (available in French).

212 ECtHR, *Saviny v. Ukraine*, No. 39948/06, 18 December 2008.

have been pertinent in evaluating whether the authorities had discharged the duty to keep the family together and whether they had sufficiently explored the effectiveness of less drastic alternatives before seeking to separate the children from their parents. Furthermore, at no stage of the proceedings had the children been heard by the judges. In sum, although the reasons given by the national authorities for removal of the applicants' children were relevant, they were not sufficient to justify such a serious interference with the applicants' family life. Therefore, the Court found that there had been a violation of Article 8 of the ECHR.

The ECtHR requires under Article 8 of the ECHR that decision-making concerning respect for family life must adhere to certain procedural safeguards. It states that the decision-making process (administrative and judicial proceedings) leading to measures of interference with family life must be fair and afford due respect to the interests protected by Article 8. What is considered under Article 8 is whether "the parents have been involved in the decision-making process [...] to a degree sufficient to provide them with [a] requisite protection of their interests".[213] This includes keeping them informed about developments, ensuring that they can participate in decisions made about them[214] and, in certain circumstances, hearing from the children concerned.[215]

Example: In *B. v. Romania (No. 2)*,[216] the applicant had been diagnosed with paranoid schizophrenia and taken by the police on a number of occasions to psychiatric institutions for treatment. Her children no longer lived with her and were placed in a care home because of their mother's illness. The ECtHR had to examine whether, having regard to the serious nature of the decisions to be taken as regards placing children into care, the decision-making process, seen as a whole, provided the parents to a sufficient degree with the requisite protection of their interests. In that connection, the Court observed that the applicant, who was suffering from a severe mental disorder, had not been assigned either a lawyer or a guardian *ad litem* to represent her during the proceedings, so that it had been impossible for her to take part in the decision-making process concerning her

214 ECtHR, *McMichael v. the United Kingdom*, No. 16424/90, 24 February 1995.

215 ECtHR, *B. v. Romania (No. 2)*, No. 1285/03, 19 February 2013; ECtHR, *B.B. and F.B. v. Germany*, Nos. 18734/09 and 9424/11, 14 March 2013.

216 ECtHR, *B. v. Romania (No. 2)*, No. 1285/03, 19 February 2013.

minor children. In addition, the applicant's situation and the situation of her children had been examined by a court on only two occasions over a period of 12 years before both children had reached majority, and there was no evidence of regular contact between social workers and the applicant, which may otherwise have provided suitable means of representing her views to the authorities. In light of these facts, the Court concluded that the decision-making process around her children's placement in care had not adequately protected her interests, and that there had thus been a violation of her rights under Article 8 of the ECHR.

Example: In *B.B. and F.B. v. Germany*,[217] following allegations from the applicants' 12-year-old daughter that she and her eight-year-old brother had been repeatedly beaten by their father, the parental rights in respect of the two children were transferred to the Youth Court and the children were placed in a children's home. The District Court made a full order transferring parental authority from the applicants to the Youth Office, reaching its decision on the basis of direct evidence from the children. About a year later, at the first subsequent meeting with their parents, the daughter admitted that she had lied about having been beaten, and the children were eventually returned to their parents. In considering the applicants' complaint that the authorities had failed to adequately examine the relevant facts, the ECtHR emphasised that mistaken assessments by professionals did not necessarily mean that measures taken would be incompatible with Article 8 of the ECHR. The placement decision could only be assessed in light of the situation as presented to the domestic authorities at the time. In the ECtHR's assessment, the fact that the District Court had relied only on the statements of the children, while the applicants had submitted statements from medical professionals who had not noticed any signs of ill-treatment, combined with the fact that the Court of Appeal had not re-examined the children, were significant. As the children were in a safe placement at the time of the full hearing, there had been no need for haste, and the courts could have established an investigation into the facts of their own motion, which they failed to do. In sum, the German courts failed to give sufficient reasons for their decision to withdraw the applicants' parental authority, in breach of Article 8 of the ECHR.

217 ECtHR, *B.B. and F.B. v. Germany*, Nos. 18734/09 and 9424/11, 14 March 2013.

Even when placed in alternative care, children retain the right to maintain contact with their parents. This right has been recognised under the ECHR,[218] as the ECtHR holds that mutual contact between parents and children is a fundamental part of family life under Article 8. Given that placement in alternative care should normally be a temporary measure, maintaining family relationships is essential to ensure the successful return of the child to his/her family.[219] Under the ECHR, positive duties flow from these principles, as illustrated by the following cases.

Example: In *T. v. the Czech Republic*,[220] the ECtHR considered whether the rights of a father and daughter (applicants) had been violated by the placement of the child in care and the failure of the authorities to support contact between them. The child had been placed in a specialist institution after the death of her mother and after the father's applications for custody of his daughter had been denied due to concerns about his personality. Further requests to spend holidays with his daughter were denied and a therapeutic centre concluded that the visits were not beneficial to the child as she was afraid of him, at which time all contact was terminated. Later on, the courts decided that contact between the two applicants should only take place in writing, in accordance with the wishes of the child. The ECtHR emphasised *inter alia* a child's interests in maintaining ties with his/her family, except in particularly extreme cases where this would not be in the child's best interest. In examining the decision to place the child into care, the ECtHR noted with approval that the domestic authorities had given careful consideration to their decision, which was made after hearing expert psychological and psychiatric opinions as well as taking into account the wishes of the child. There had thus been no violation of Article 8 of the ECHR in relation to the decision to place the child in care. However, the Court went on to find that Article 8 had been violated as a result of the restrictions imposed on the contact between the applicants, in particular due to the lack of oversight of decisions by the child's residential institution to deny contact, given that these decisions ultimately reduced the chances of family reunification.

218 ECtHR, *Olsson v. Sweden (No. 1)*, No. 10465/83, 24 March 1988.

219 ECtHR *Eriksson v. Sweden*, No. 11373/85, 22 June 1989.

220 ECtHR, *T. v. the Czech Republic*, No. 19315/11, 17 July 2014 (available in French).

Example: In *K.A. v. Finland*,[221] the applicant's children were placed in alternative care due to allegations that they were being sexually abused. During the children's placement in care, little contact took place between them and their parents and little effort was made to plan for their reunification. Examining the case, the ECtHR noted that the state has a positive duty to facilitate family reunification as soon as reasonably feasible, taking into account the duty to protect the best interests of the child. According to the ECtHR, the severe restrictions on the applicant's right to visit his children reflected the social welfare authority's intention to strengthen the ties between the children and the foster family, rather than to reunite the original family. This was made notwithstanding a noted improvement in the father's circumstances. Accordingly, there was a violation of Article 8 of the ECHR.

6.3. Adoption

Key points

- Adoption ensures alternative care for children who cannot remain with their biological families.
- The best interests of the child must be the paramount consideration in adoption.
- There is no right to adopt under EU or CoE law, but the adoption process must adhere to certain criteria to ensure that it is in the best interests of the child.[220]

Under international law, the best interests of the child must be the paramount consideration in cases of adoption. Aside from the best interests principle, other general principles of the CRC also guide and inform its implementation in the context of adoption: non-discrimination, the right to life, survival and development and respect for children's views.[223] Of particular relevance is

221 ECtHR, *K.A. v. Finland*, No. 27751/95, 14 January 2003.

222 On the interest of the child to know his/her origins in the context of adoption, see Chapter 4.

223 CRC, Arts. 2, 3, 6 and 12. See also, UN, Committee on the Rights of the Child (2010), Treaty-specific guidelines regarding the form and content of periodic reports to be submitted by States Parties under Article 44, paragraph 1 (b), of the Convention on the Rights of the Child, UN Doc. CRC/C/58/Rev.2, 23 November 2010, paras. 23–27.

the UN Committee on the Rights of the Child's General Comment No. 14 on the "right of the child to have his or her best interests taken as a primary consideration".[224]

Similarly, one of the objectives of the Hague Convention on Protection of Children and Co-operation in respect of Intercountry Adoption is to "to establish safeguards to ensure that intercountry adoptions take place in the best interests of the child and with respect for his or her fundamental rights as recognised in international law".[225]

Under EU law, the rights and associated legal obligations in Article 24 of the EU Charter of Fundamental Rights are applicable to adoption in so far as it is addressed by the EU.

Under CoE law, the right to respect for family life as expressed in Article 8 of the ECHR is applicable and relied on in adoption cases. There are also two specific CoE conventions on this subject: the European Convention on the Adoption of Children[226] and the European Convention on the Adoption of Children (revised).[227] These instruments require a child rights-based approach to adoption. The European Convention on the Adoption of Children (revised), for instance, states that "[t]he competent authority shall not grant an adoption unless it is satisfied that the adoption will be in the best interests of the child".[228] Likewise, the ECtHR emphasises that the best interests of the child may override those of the parent in certain circumstances, including in adoption.[229] The European Convention on the Adoption of Children (revised) also requires that adoption should not be granted by the competent authority without "the consent of the child considered by law as having sufficient understanding".[230] Moreover, the child not deemed to understand this shall "as far as possible, be consulted

and his or her views and wishes shall be taken into account having regard to his or her degree of maturity".[231]

Example: In *Pini and Others v. Romania*,[232] two Italian couples complained about the failure of the Romanian authorities to execute the decision of a Romanian court concerning their adoption of two Romanian children. In breach of court orders, the private institution in which the children resided in Romania had refused to hand them over to the applicants. The ECtHR held that the relationship between the applicants and their adopted children fell within the scope of family life under Article 8 of the ECHR, even though they had never lived together or established emotional ties. Considering the case, the ECtHR interpreted Article 8 in light of the CRC and the Hague Convention in finding that the positive obligation on the authorities to enable the applicants to establish family ties with their adopted children was circumscribed by the best interests of the child.[233] In this regard, it held that the child's interests may, depending on their nature and seriousness, override those of the parent. Furthermore, in finding that there was no violation of Article 8, the Court emphasised that in a relationship based on adoption it is important that the child's interests should prevail over those of the parents, since adoption meant providing a child with a family, not a family with a child.[234]

Example: In *Kearns v. France*,[235] the ECtHR found it compatible with the ECHR that an Irish woman, who had placed her child for adoption in France, could not revoke her formal consent to adoption after the expiry of a two-month period. The ECtHR first underlined that the national authorities' refusal of the request for the child's return pursued the legitimate aim of protecting the rights and freedoms of others, in this case the child.[236] In relation to the imposition of a time-limit for the withdrawal of consent, the French law sought to strike a fair balance and ensure proportionality between the conflicting interests of the biological mother, the child and the adoptive family. In this process, the child's best interests

231 *Ibid.*, Art. 6.

232 ECtHR, *Pini and Others v. Romania*, Nos. 78028/01 and 78030/01, 22 June 2004.

233 *Ibid.*, para. 155.

234 *Ibid.*, para. 156.

235 ECtHR, *Kearns v. France*, No. 35991/04, 10 January 2008.

236 *Ibid.*, para. 73.

had to be paramount.[237] From the evidence presented to the Court, it was in the child's best interests to enjoy stable relations within a new family as quickly as possible and all of the necessary steps had been taken to ensure that the applicant understood the precise implications of her action. In light of these considerations, the Court held that France had not failed in its positive obligations towards the applicant under Article 8 of the ECHR.

The ECtHR also affirms that decision-making about adoption must take place in a manner consistent with the prohibition of discrimination established in Article 14 of the ECHR. In particular, the ECtHR considered whether the applicants' exclusion from eligibility to adopt on the grounds of either sexual orientation or age was compatible with Article 14, in conjunction with Article 8. In doing so, it reaffirms that the duty to take proportionate action with a view to protecting the best interests of the child is of central importance.

Example: In *Schwizgebel v. Switzerland*,[238] the applicant, a single 47-year-old woman, was unable to adopt a second child given the age gap between her and the child she wished to adopt. The applicant claimed to be a victim of discrimination on the grounds of age. The ECtHR considered that the denial of authorisation to receive a child with a view to adoption in the applicant's case pursued the legitimate aim of protecting the well-being and rights of the child.[239] Given the lack of European consensus concerning the right to adopt as a single parent, the lower and upper age-limits for adopters and the age-difference between the adopter and the child, and the state's consequent broad margin of appreciation in this area as well as the need to protect children's best interests, the refusal to authorise the placement of a second child did not contravene the proportionality principle.[240] The Court therefore found that the justification given by the government appeared objective and reasonable and that the difference in treatment complained of had not been discriminatory within the meaning of Article 14 of the ECHR.

237 *Ibid.*, para. 79.

238 ECtHR, *Schwizgebel v. Switzerland*, No. 25762/07, 10 June 2010.

239 *Ibid.*, para. 86.

240 *Ibid.*, para. 97.

Example: The case of *E.B. v. France*[241] concerns the refusal of the national authorities to grant approval for the purposes of adoption to the applicant, a lesbian living with her partner who sought to adopt as a single person.[242] The Court reiterated that Article 8 of the ECHR did not in itself confer a right to found a family or adopt. However, a discrimination complaint could fall within the broader scope of a particular right, even if the issue in question did not relate to a specific entitlement granted by the ECHR.[243] Given that French law allowed single persons to adopt, such a right could not be denied to an individual on discriminatory grounds. As established by domestic courts, the applicant presented undoubted personal qualities and an aptitude for bringing up children, which were assuredly in the child's best interests, a key notion in the relevant international instruments.[244] The Court formed the view that the applicant's sexual orientation played a determinative role in the refusal of the authorities to allow her to adopt, amounting to discriminatory treatment by comparison to other single individuals who were entitled to adopt under national law.[245]

Example: The case of *Gas and Dubois v. France*[246] concerns the question of whether same-sex couples should have an equal right to second-parent adoption as heterosexual couples. The applicants were a same-sex couple who had entered into a civil partnership. Together they had brought up a daughter, who was conceived by artificial insemination and borne by one of them in 2000. The other partner's application for a simple adoption was rejected on the grounds that the adoption would deprive the child's biological mother of her parental rights, which would run counter to both the applicant's intentions and the child's best interests. Under French law, the only situation in which a simple adoption does not result in the removal of the biological parents' rights in favour of the adoptive parent is when an individual adopts his/her spouse's child. The applicants alleged that they had been discriminated against compared with both married and unmarried heterosexual couples. Examining whether they had been discriminated against compared with a married couple, the

241 ECtHR, *E.B. v. France* [GC], No. 43546/02, 22 January 2008.

242 *Ibid.*, para. 49.

243 *Ibid.*, paras. 41–48.

244 *Ibid.*, para. 95.

245 *Ibid.*, para. 96.

246 ECtHR, *Gas and Dubois v. France*, No. 25951/07, 15 March 2012.

ECtHR concluded that marriage conferred a special status, giving rise to social, personal and legal consequences; for that reason, the applicants could not be said to be in a relevantly similar situation to married couples. Concerning the comparison with unmarried couples of opposite sex, the Court concluded that a comparable heterosexual couple in a civil partnership would also have their application for a simple adoption refused under the provisions of French law. The ECtHR consequently concluded that there had been no difference in treatment based on sexual orientation and thus no violation of the applicants' Convention rights.

Example: The case of *X and Others v. Austria*[247] concerns a complaint from a same-sex couple that it had been discriminated against in comparison with different-sex couples as regards second-parent adoption. The first and third applicants were in a stable relationship and the first applicant sought to adopt the second applicant, who was the son of the third applicant. As in *Gas and Dubois*, the ECtHR rejected the notion that the applicants were in an analogous position to a married couple in which one spouse wants to adopt the child of the other spouse. However, the ECtHR accepted that the applicants were in a comparable situation to an unmarried heterosexual couple. While second-parent adoption for unmarried heterosexual couples is permissible under Austrian law, the Austrian Civil Code provides that anyone who adopts a child would replace the biological parent of the same sex, meaning that second-parent adoption for same-sex couples is a legal impossibility. The Court concluded that in such circumstances there had been a difference in treatment of the applicants on the grounds of their sexual orientation and that no sufficiently weighty and convincing reasons had been advanced by the Government, in breach of Article 14 in conjunction with Article 8 of the ECHR.

Finally, the ECtHR also focuses its attention on the merits of abiding by the spirit and purpose of international law with respect to decision-making about adoption.

247 ECtHR, *X and Others v. Austria* [GC], No. 19010/07, 19 February 2013.

Example: In *Harroudj v. France*,[248] the French authorities refused the applicant's request for the full adoption of an Algerian girl who had been abandoned at birth and placed in the applicant's care under *kafala* – guardianship under Islamic law. The reasons for such a refusal were the fact that the French Civil Code does not allow for the adoption of a child whose adoption would be prohibited under the law of his/her country of origin (which is the case for Algerian law), and the fact that *kafala* already gave the applicant parental authority allowing her to take decisions in the child's best interests. A subsequent appeal was rejected on the basis that the domestic law was consistent with the Hague Convention on the Protection of Children and Co-operation in Respect of Intercountry Adoption and that Article 20 of the CRC recognised *kafala* as being on a par with adoption in preserving the child's best interests. In examining the applicant's complaint, the ECtHR recalled the principle that, once a family tie is established, the state has to act in a manner calculated to enable that tie to be developed and establish legal safeguards that render possible the child's integration in the family, as well as the need to interpret the ECHR harmoniously with the general principles of international law. In its assessment, the ECtHR underlined the French courts' concern to abide by the spirit and purpose of international conventions, including the UN Convention on the Rights of the Child. *Kafala* was recognised under French law and the applicant was allowed to exercise parental authority and take decisions in the child's interest. It was open to her, for example, to draw up a will in the child's favour, overcoming difficulties stemming from the restriction on adoption. In conclusion, by gradually obviating the prohibition of adoption in this manner, the respondent state, which sought to encourage the integration of children of foreign origin without cutting them off immediately from the rules of their country of origin, showed respect for cultural pluralism and struck a fair balance between the public interest and that of the applicant. The ECtHR thus found no violation of the applicant's rights.

248 ECtHR, *Harroudj v. France*, No. 43631/09, 4 October 2012.

Child protection in the broad sense relates to all measures designed to ensure the exercise of children's rights. In the narrow sense, it relates to the rights of children to be free from all forms of violence. Under international law, states must take measures to ensure children benefit from adequate protection and their rights to physical integrity and dignity are effectively observed. The duty of the state to protect may take various forms, depending on the specific risk of violence a child is exposed to and the perpetrator thereof. Thus, states' duties are more evident where children are under the authority and control of the state, for example where they are placed in public institutions. This happens when the risk of violence is high. The state's duty to protect may prove more difficult in cases where children are exposed to violence by private actors, such as their family members.

The European Union's main competence in the area relates to cross-border crimes (Article 83 of the Treaty on the Functioning of the European Union (TFEU)). Particular legislative measures have therefore been enacted with respect to child pornography and human trafficking. The EU has also passed legislation requiring Member States to criminalise several forms of sexual abuse. At the Council of Europe (CoE) level, the European Convention on Human Rights (ECHR) – mainly under Articles 2, 3 and 8 – has elaborated on states' duties in relation to a wide range of acts constituting violence against children. The ECSR has also been active in the field, both through its reporting procedure and its collective complaint mechanism. Further, specific CoE conventions, most notably the Council of Europe Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse (Lanzarote Convention),[249] are now in place and monitoring bodies in charge of supervising their implementation.

This chapter analyses specific aspects of violence against children and the response of the international community. Section 7.1 looks at violence at home, school and other settings and focuses on issues such as corporal punishment, child abuse and neglect, and sexual violence. Section 7.2 looks at cases of child exploitation which have a marked cross-border dimension, including human trafficking (for the purposes of forced labour or sexual exploitation), child pornography and grooming. Finally, Section 7.3 deals with instances of abuse where children are in particularly vulnerable situations.

249 Council of Europe, Council of Europe Convention on the Protection of Children against Sexual Exploitation and Sexual Abuse, CETS No. 201, 2007.

7.1. Violence at home, in schools or other settings

Key points

- States have the duty to ensure that children are effectively protected against violence and harm in all settings.
- States have the duty to provide an adequate legal framework for child protection.
- States must conduct effective investigations into arguable allegations of child abuse, violence against children and harm to children.

Under EU law,[250] the main legal instrument in this field, enacted on the basis of Articles 82 and 83 of the TFEU, is Directive 2011/93/EU on combating sexual abuse and sexual exploitation of children and child pornography.[251]

Under CoE law, the ECtHR and the ECSR have developed a substantial body of case law regarding the protection of children against violence in all settings. In addition, specific CoE conventions (e.g. the Lanzarote Convention) provide detailed guarantees to protect children against specific forms of violence.

7.1.1. Scope of state responsibility

Under CoE law, the ECtHR has analysed the most severe forms of violence against children under various articles of the ECHR, most notably Articles 2 and 3. The Court has identified clear duties incumbent on states whenever children are placed in institutions under their authority.[252] Likewise, if a certain conduct or situation reaches the level of severity after which it qualifies as inhuman or degrading treatment under Article 3, the state has positive obligations to protect children against ill-treatment, including treatment administered by private individuals. Situations such as long-term neglect by parents,[253] repeated sexual

abuse by school teachers,[254] rape,[255] or corporal punishments[256] have all been found to fall within the scope of Article 3 of the ECHR.

In the case of a death, a state may be held responsible under Article 2 of the ECHR, even if the death was inflicted by a private person, and not by an agent of the state. States' positive obligations vary from case to case, the core duty being to secure the *effective* protection of children against violence. In cases of serious forms of ill-treatment, positive obligations include the duty to enact effective criminal law provisions which are backed by the law-enforcement machinery.[257] States must also adopt special measures and safeguards for protecting children.[258]

The ECHR was faced on several occasions with cases concerning violence against children administered by private individuals in schools, private homes or other establishments which were ran by non-state actors, where it was questionable whether state responsibility could arise. More importantly, the ECtHR ruled that a state may not absolve itself of the duty to protect children by delegating the administration of important public services – such as education – to private individuals.[259] In cases concerning the determination of state responsibility, the ECtHR generally distinguished between the states' general obligation to protect, when the risk was not clearly identifiable, and a specific obligation to protect, in cases where the victim was clearly identifiable. In the former case, the ECtHR analysed whether the absence of state intervention resulted in a real risk of violence for the child victim.

Example: The case of *Kayak v. Turkey*[260] concerns the stabbing to death of a 15-year-old boy by another teenager, in the vicinity of a school. The ECtHR found that schools have an obligation to protect those enrolled from all forms of violence. In this specific case the ECtHR ruled that Turkey was responsible under Article 2 of the ECHR for failing to protect the right to life

254 ECtHR, *O'Keeffe v. Ireland* [GC], No. 35810/09, 28 January 2014.

259 *Ibid.*, para. 150; ECtHR, *Costello-Roberts v. the United Kingdom*, No. 13134/87, 25 March 1993, para. 27.

260 ECtHR, *Kayak v. Turkey*, No. 60444/08, 10 July 2012 (available in French).

of the applicants' son and brother, as there was no effective surveillance system in place at the time. In the absence of such a system, it was possible for a teenager to take a knife from the kitchen school, which he used to stab the victim.

Example: The case of *O'Keeffe v. Ireland*[261] concerns acts of abuse committed in the 1970s in an Irish National School. At the time, national schools in Ireland were recognised and paid for by the state, whereas the management and administration was entrusted to the Church. The applicant, a pupil at the time, was subjected to approximately 20 acts of sexual abuse by one of the school teachers. She only complained to the state authorities about these acts in 1998, after finding out about other acts of sexual abuse committed by the same teacher. The ECtHR had to determine whether the state could be held liable for acts of abuse which were not reported at the time to the authorities. The Court first found that the acts of abuse to which the applicant had been subjected fell within the scope of Article 3 of the ECHR. Then, based on various reports, the ECtHR found that the state should have been aware of the potential risks of sexual abuse in schools. At the time, there was no adequate procedure in place which would have allowed a child or a parent to complain directly to the state about acts of abuse. There was also no supervision mechanisms of the teachers' treatment of children. The ECtHR therefore concluded that Ireland had failed to fulfil its positive obligations under Article 3 of the ECHR, since it did not provide an effective protection mechanism for acts of abuse against minors in schools.

Pursuant to the ECtHR, states must also conduct effective investigations into allegations of ill-treatment or loss of life, irrespective of whether the acts were perpetrated by state agents[262] or by private persons. An investigation is effective if, upon the receipt of complaints from victims or their successors, states put in place a procedure capable of leading to the identification and punishment of those responsible for acts of violence contrary to either Articles 2 or 3 of the ECHR.

Under the ESC, children's rights to protection from abuse and ill-treatment fall mainly under Articles 7 and 17.

261 ECtHR, *O'Keeffe v. Ireland* [GC], No. 35810/09, 28 January 2014.

262 ECtHR, *Assenov and Others v. Bulgaria*, No. 24760/94, 28 October 1998.

Further, under the Lanzarote Convention, states are required to criminalise various forms of sexual abuse and sexual exploitation against children.[263] This convention also requires states to take legislative or other measures to prevent sexual abuse of children, by organising awareness-raising campaigns, training specialist staff, informing children on the risks of abuse, and providing specialist help to individuals who risk committing child abuse crimes. Furthermore, under Articles 4 and 5 of the Council of Europe Convention on preventing and combating violence against women and domestic violence (Istanbul Convention),[264] states undertake to enact special legislative measures and to investigate acts of violence against women. Under Article 22 of the Istanbul Convention, states are obliged to ensure specialist support services to women and children who are victims of domestic violence.

Under international law, the CRC is the key legal instrument for ensuring child protection at state level. Pursuant to Article 19, States Parties have the duty to take legislative, administrative, social and educational measures to protect children against all forms of violence. The UN Committee on the Rights of the Child has issued an important number of General Comments and recommendations interpreting states' obligations under the CRC. For instance, General Comment No. 13 describes measures to protect children against all forms of violence.[265] General Comment No. 5 refers to measures to implement and monitor the CRC in national laws and policies.[266]

7.1.2. Corporal punishment

Corporal punishment is generally defined as any form of physical punishment intended to cause someone pain or discomfort. It mostly relates to hitting children with the hand or with an object, but it may also involve non-physical acts, such as threats, which have the same end result – the humiliation of the child.[267]

Under CoE law, the ECtHR has analysed complaints about corporal punishment as a form of disciplinary measure mainly under Article 3 of the ECHR. Where the measure reached the level of severity required under Article 3, the ECtHR found that the treatment violated that provision.[268] Where measures of corporal punishment do not reach the threshold of severity required under Article 3, they may nevertheless fall under Article 8 as part of the right to physical and moral integrity. However, the ECtHR has to date not found a violation on the merits of Article 8 in corporal punishment cases. The use of corporal punishment in state schools may also breach the rights of the parents to raise their children according to their philosophical convictions, as provided for under Article 2 of Protocol No. 1 to the ECHR.[269]

Example: The cases of *Campbell and Cosans v. the United Kingdom*[270] concern the suspension from school of two boys for refusing to accept corporal punishment. The ECtHR found no violation of Article 3 of the ECHR as the children had not actually been subjected to corporal punishment. It found, however, a violation of Article 2 of Protocol No. 1 to the ECHR on the grounds that, by allowing for corporal punishment, the respondent state had failed to respect the parents' philosophical convictions. The ECtHR also found a violation of one of the boys' right to education provided for under Article 2 of Protocol No. 1 to the ECHR, on account of his suspension from school.

267 UN, Committee on the Rights of the Child (2007), *General Comment No. 8 (2006): The right of the child to protection from corporal punishment and other cruel or degrading forms of punishment' (Arts. 19; 28, para. 2; and 37 inter alia)*, CRC/C/GC/8, 2 March 2007.

268 ECtHR, *Tyrer v. the United Kingdom*, No. 5856/72, 25 April 1978.

269 ECtHR, *Campbell and Cosans v. the United Kingdom*, Nos. 7511/76 and 7743/76, 25 February 1982, para. 38.

270 ECtHR, *Campbell and Cosans v. the United Kingdom*, Nos. 7511/76 and 7743/76, 25 February 1982.

The ESC does not include any direct prohibition against corporal punishment. Nevertheless, the ECSR has read such an obligation into Article 17 of the ESC.[271] By virtue of its supervision, both through the reporting procedure and the collective complaints procedure of states' compliance with Article 17, the ECSR has found that several contracting states breach this provision by not prohibiting all forms of corporal punishment. In three similar cases filed by the Association for the Protection of All Children (APPROACH) Ltd. against Belgium,[272] the Czech Republic,[273] and Slovenia[274] respectively, the ECSR found a violation of Article 17 of the ESC, as these states lacked legislation setting out "an express and comprehensive prohibition on all forms of corporal punishment of children that is likely to affect their physical integrity, dignity, development or psychological well-being".[275] The ECSR also established that laws prohibiting the corporal punishment of children must be applicable to such forms of alternative care as institutional care, foster care and kindergartens. It should also be recalled in this regard that the Council of Europe's Parliamentary Assembly issued in 2004 a recommendation requesting all contracting states to ban corporal punishment.[276]

Under international law, corporal punishment is indirectly considered a form of violence against children falling under Articles 19, 28 (2) and 37 of the CRC. Moreover, the Committee on the Rights of the Child has issued General Comment No. 8/2006, calling on states to take appropriate measures against all forms of corporal punishment.[277]

271 See, for example, ECSR, *World Organisation against Torture (OMCT) v. Belgium*, Complaint No. 21/2003, 7 December 2004; ECSR, Conclusions XVI-2, Poland, Art. 17, p. 65.

277 UN, Committee on the Rights of the Child (2007), *General Comment No. 8 (2006): The right of the child to protection from corporal punishment and other cruel or degrading forms of punishment (arts. 19; 28, para. 2; and 37, inter alia)*, CRC/C/GC/8, 2 March 2007.

7.1.3. Sexual abuse

Human trafficking and child pornography is dealt with in Sections 7.2.2 and 7.2.3 respectively.

Child sexual abuse may take many forms, including harassment, touching, incest or rape. Child sexual abuse can take place in various settings, including homes, schools, care-institutions, churches, etc. Children are particularly vulnerable to sexual abuse, as they often find themselves under the authority and control of adults and have less access to complaint mechanisms.

Under EU law, Directive 2011/93/EU – largely reflecting the approach of the Lanzarote Convention – seeks to harmonise minimum criminal sanctions for various child sexual abuse offences between Member States.[278] Under Article 3 of this directive, Member States must take criminal law measures to ensure the sanctioning of various forms of sexual abuse, including causing children to witness sexual activities or sexual abuse, and engaging in sexual activities with children. The directive provides for increased penalties if the acts are committed by persons in a position of trust against particularly vulnerable children and/or through the use of coercion. Further, Member States must ensure that the prosecution of suspects of child abuse takes place automatically and that persons convicted of sexual abuse crimes are prevented from exercising any professional activities involving direct or regular contact with children. The directive also includes provisions on child-friendly proceedings and ensures the protection of child victims in courts.

Directive 2011/93/EU is linked to the Framework Decision 2009/315/JHA[279] on the organisation and content of the exchange of information extracted from the criminal record between Member States. Despite not being child-specific, this Framework Decision fills an important gap in the protection system, ensuring that Member States' authorities have access to the criminal records of convicted persons. This facilitates the identification of individuals convicted of sexual abuse looking for a job in institutions working with children in other Member States.

278 Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on combating the sexual abuse and sexual exploitation of children and child pornography, OJ 2011 L 335/1.

279 Council Framework Decision 2009/315/JHA of 26 February 2009 on the organisation and content of the exchange of information extracted from the criminal record between Member States, OJ 2009 L 93, pp. 23–32.

Under CoE law, the ECtHR has examined cases of sexual abuse under Articles 3 and 8 of the ECHR. Complaints generally concern the failure of states to take appropriate measures to protect children from abuse. In the context of Article 3, the ECtHR has also examined whether states conducted effective investigations into allegations of sexual abuse. Child-abuse claims made under Article 8 concern the impact of such acts on the physical integrity of the victim and on the right to respect for family life. At times, the distinction between states' obligations under Articles 3 and 8 is rather blurred, the ECtHR using similar reasoning for finding violations of both Articles. It should be noted, however, that Article 8 cases have been more common in situations concerning undue removal/taking into care and the impact of allegations of child abuse on the family. These situations are analysed in Chapter 5.

Example: In *M.C. v. Bulgaria*[280] the applicant was a 14-year-old girl, who claimed to have been raped by two individuals after she had gone out one evening. Her complaint before the domestic authorities had been dismissed mainly as no form of physical violence had been found. The ECtHR noted that allegations of rape fell under Article 3 of the ECHR and that the respondent state had to conduct an effective investigation into such allegations. In finding that the Bulgarian authorities failed to conduct such an investigation, the ECtHR relied on evidence that the authorities generally dismissed cases where the victim could not show physical opposition to the act of rape. The Court found that such a standard of proof was not in accordance with factual realities concerning victims of rape and was therefore capable of rendering the authorities' investigation ineffective in breach of Article 3 of the ECHR.

Further, the Lanzarote Convention regulates in detail the right of children to be protected from sexual abuse. This convention adopted in the framework of the CoE, is open to ratification by states outside Europe. This binding instrument is backed by a plethora of non-legally binding instruments aimed at further ensuring that states enact effective measures against child sexual abuse.[281]

280 ECtHR, *M.C. v. Bulgaria*, No. 39272/98, 4 December 2003.

281 Examples include: Council of Europe, Committee of Ministers (2001), Recommendation Rec (2001) 16 on the protection of children against sexual exploitation, 31 October 2001; Council of Europe, Parliamentary Assembly (1996), Resolution 1099 (1996) on the sexual exploitation of children, 25 September 1996; Council of Europe, Parliamentary Assembly (2000), Resolution 1212 (2000) on rape in armed conflicts, 3 April 2000; Council of Europe, Parliamentary Assembly (2002), Resolution 1307 (2002) on sexual exploitation of children: zero tolerance, 27 September 2002.

7.1.4. Domestic violence and child neglect

Many cases of domestic violence include allegations of sexual abuse. In this sense, states' obligations under international law are similar to those listed in Section 7.1.3 above.

Under CoE law, it has usually been mothers who have complained to the ECtHR that the state has failed to adequately discharge its obligation – established by the ECHR – to protect against harm. Domestic violence cases raised issues under Articles 2, 3 and 8 of this Convention. States must comply with their positive obligation to take effective measures against domestic violence and conduct an effective investigation into arguable allegations of domestic violence or child neglect.

Example: In the case of *Kontrová v. Slovakia*,[282] the applicant had on several occasions been physically assaulted by her husband. She complained to the police, but later withdrew her complaint. Her husband subsequently threatened to murder their children. A relative reported this incident to the police. Nevertheless, several days after the incident, the applicant's husband shot himself and their two children dead. The ECtHR held that a state's positive obligations arise in the sphere of Article 2 of the ECHR whenever the authorities know or ought to know of the existence of a real and immediate risk to the life of an identified individual. In this case, the Slovak authorities should have known of such a risk by virtue of the pre-existing communications between the applicant and the police. The positive obligations of the police should have entailed registering the applicant's criminal complaint, launching a criminal investigation and initiating criminal proceedings, keeping a proper record of the emergency calls and taking action in respect of the allegations that the applicant's husband had a shotgun. The police, however, failed to meet its obligations and the direct consequence of those failures was the death of the applicant's children, in breach of Article 2 of the ECHR.

282 ECtHR, *Kontrová v. Slovakia*, No. 7510/04, 31 May 2007.

Example: The case of *Eremia v. the Republic of Moldova*[283] concerns the complaint of a mother and her two daughters about the authorities' failure to protect them from the violent and abusive behaviour of their husband and father. The ECtHR held that, despite their knowledge of the abuse, the authorities failed to take effective measures to protect the mother from further domestic violence. It also considered that, despite the detrimental psychological effects on the daughters witnessing their father's violence against their mother in the family home, little or no action had been taken to prevent the recurrence of such behaviour. The Court found that the Moldovan authorities had not properly complied with their obligations under Article 8 of the ECHR.

Cases of child neglect, either in state institutions or at home, have also been raised under the ECHR. The obligations of the authorities in situations of parental child neglect are similar to those in the cases presented previously. On the one hand, the state needs to put in place effective mechanisms for child protection, while on the other, state authorities must take action for protecting children in cases of reported child neglect, or where there is enough evidence of child neglect at their disposal, be it in homes or in privately-run institutions.[284] Cases of neglect in state institutions impose direct obligations on the authorities to protect children by ensuring that they receive adequate (medical) care, that the facilities where they are placed are adequate and/or the staff is trained to deal with the needs of children.[285]

The Istanbul Convention is also relevant.[286] Though not child-specific, it includes several references to children. First, under Article 3 (f), girls below the age of 18 are to be considered 'women', therefore, all the provisions of the convention apply to them. Secondly, under Article 2 (2), States Parties are encouraged to apply the convention to all victims of domestic violence, which can include children. In fact, in most cases children are witnesses to and are severely affected by domestic violence within the home.[287] Finally, child-specific provisions of the convention include obligations for states to take measures to address the needs of child victims, raise awareness among children, and protect child witnesses.

In the same vein, under Article 17 of the ESC, states are obliged to prohibit all forms of violence against children and to adopt adequate criminal and civil law provisions.

The issues of domestic violence and child neglect have been addressed in various non-legally binding instruments of the CoE.[288]

7.2. Child exploitation, pornography and grooming

Key points

- State authorities have a duty to cooperate and effectively work together to protect children against violence, including in the conduct of investigations.

7.2.1. Forced labour

Under EU law, slavery, servitude, forced or compulsory labour are prohibited (Article 5 (2) of the EU Charter of Fundamental Rights). The employment of children is also prohibited (Article 32 of the Charter). Directive 94/33/EC is the main legal instrument prohibiting child labour.[289] Only in exceptional circumstances are states allowed to set the minimum age for employment below the minimum school leaving age (Article 4 (2)). States have to ensure that young people admitted to work benefit from appropriate working conditions (Articles 6 and 7). Furthermore, children can only be employed for certain activities, such as light domestic work or social and cultural activities (Articles 2 (2) and 5). The directive also sets out specific protection measures to be taken in cases of child labour (Section III).

288 Examples include: Council of Europe, Committee of Ministers (1985), Recommendation No. R (85) 4 on violence in the family, 26 March 1985; Council of Europe, Committee of Ministers (1990), Recommendation No. R (90) 2 on social measures concerning violence in the family, 15 January 1990; Council of Europe, Parliamentary Assembly (1998), Recommendation 1371 (1998) on abuse and neglect of children, 23 April 1998.

289 Council Directive 94/33/EC of 22 June 1994 on the Protection of Young People at Work, OJ 1994 L 216.

In many instances, forced child labour cases involve trafficked children.[290] Directive 2011/36/EU on preventing and combating trafficking in human beings recognises forced labour as a form of child exploitation (Article 2 (3)).[291] Children trafficked for the purposes of forced labour are protected under the directive in the same way as victims of trafficking for other purposes (such as sexual exploitation, see Section 7.1.3).[292]

Under CoE law, Article 4 of the ECHR prohibits in absolute terms all forms of slavery, servitude, forced and compulsory labour. The ECtHR defines "forced or compulsory labour" as "work or service which is exacted from any person under the menace of any penalty against the will of the person concerned and for which the said person has not offered himself voluntarily".[293] Servitude includes, in addition, "the obligation for the 'serf' to live on another person's property and the impossibility of altering his condition".[294] Servitude is therefore an aggravated form of compulsory labour.

In cases concerning allegations of forced labour, the ECtHR first determines whether the allegations fall within the scope of Article 4 of the ECHR.[295] It then analyses whether states have complied with their positive obligations to put in place a legislative and administrative framework that prohibits, punishes and effectively prosecutes cases of forced or compulsory labour, servitude and slavery.[296] As regards the procedural aspect of Article 4, the ECtHR examines whether the domestic authorities conducted an effective investigation into arguable allegations of forced labour or servitude.[297]

290 Recital 11, Directive 2011/36/EU of the European Parliament and of the Council of 15 April 2011 on preventing and combating trafficking in human beings and protecting its victims, OJ 2011 L 101/1.

291 Directive 2011/36/EU of the European Parliament and of the Council of 15 April 2011 on preventing and combating trafficking in human beings and protecting its victims, OJ 2011 L 101/1.

294 *Ibid.*, para. 123.

295 ECtHR, *C.N. and V. v. France*, No. 67724/09, 11 October 2012, para. 70.

296 *Ibid.*, para. 104 and following.

297 ECtHR, *C.N. v. the United Kingdom*, No. 4239/08, 13 November 2012, paras. 70–82.

Example: The case of *C.N. and V. v. France*[298] concerns the forced-labour claims of two sisters of Burundian origin. After the death of their parents, they were taken to live with their aunt and her family in France. They were accommodated for four years in the basement of the house in allegedly very bad conditions. The older sister did not attend school and spent all her time doing household chores and taking care of her aunt's disabled son. The younger sister attended school and worked for the aunt and her family after school and after having been given time to do her homework. Both sisters lodged a complaint with the ECtHR that they had been held in servitude and subjected to forced labour. The ECtHR found that the first applicant had indeed been subject to forced labour as she had to work seven days a week with no remuneration and no holiday. Moreover, she had been held in servitude because she had the feeling that her situation was permanent, with no likelihood of change. The ECtHR further found that the state did not meet its positive obligations, since the legal framework in place did not offer effective protection to victims of compulsory labour. Concerning the procedural obligation to investigate, the ECtHR held that the requirements of Article 4 of the ECHR had been met, as the authorities had conducted a prompt independent investigation capable of leading to the identification and punishment of those responsible. The ECtHR dismissed the second applicant's allegations of forced labour, reasoning that she had been able to go to school and was given time to do her homework.

The ESC guarantees the right of children to be protected against physical and moral dangers within and outside the working environment (Article 7 (10)). The ECSR observed that domestic/labour exploitation of children, including trafficking for the purposes of labour exploitation, must be prohibited at state level.[299] States Parties to the ESC must ensure not only that they have the necessary legislation to prevent exploitation and protect children and young persons, but also that this legislation is effective in practice.[300]

The Lanzarote Convention also stipulates that states should criminalise all forms of child sexual exploitation.

7.2.2. Child trafficking

Under EU law, Article 83 of the TFEU identifies trafficking in human beings as a field where the EU Parliament and Council have legislative powers. Article 5 (3) of the EU Charter of Fundamental Rights contains an express prohibition of trafficking in human beings. The contribution of the EU is valued here, as this is an area with cross-border dimensions.

Directive 2011/36/EU on preventing and combating trafficking in human beings and protecting its victims is the first instrument passed by the European Parliament and the Council based on Article 83 of the TFEU.[301] Under Article 2 (1) of this directive, trafficking is defined as "the recruitment, transportation, transfer, harbouring or reception of persons, including the exchange or transfer of control over those persons, by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation". The purpose of the directive is to set out minimum rules for the definition and sanctioning of human trafficking-related offences (Article 1). The directive as a whole is relevant for children, and it also includes several child-specific provisions relating to assistance and support of child victims of trafficking and protection in criminal investigations (Articles 13–16).[302] Specific support measures are to be taken pursuant to a specialist assessment of each individual victim (Article 14 (1)). States should appoint a guardian to represent the child's best interests (Article 14 (2)) and provide support to the family of the child (Article 14 (3)). During criminal proceedings, children have the right to a representative, free legal counselling, and the right to be heard in adequate premises and by trained professionals (Article 15 (1)–(3)). Further protection measures include the possibility to conduct hearings without the presence of the public and the possibility to hear the child indirectly via communication technologies (Article 15 (5)).[303]

301 Directive 2011/36/EU of the European Parliament and of the Council of 15 April 2011 on preventing and combating trafficking in human beings and protecting its victims, OJ 2011 L 101/1.

302 Provisions detailed in FRA and ECtHR (2014), p. 222.

303 See FRA (2015b), p. 79.

Directive 2004/81/EC is also relevant for trafficked children.[304] Under this instrument, victims of trafficking may be issued residence permits by the host Member States, provided they cooperate in the criminal investigation. Nevertheless, the directive only applies to children to the extent decided by Member States.[305]

When it comes to enforcement, the EU's law enforcement agency (Europol) and the EU's Judicial Cooperation Unit (Eurojust) play important roles in ensuring cooperation between Member States to identify and prosecute organised trafficking networks. The relevant provisions for the protection of child victims at EU level are addressed in Section 11.3 of this handbook.

Under CoE law, the ECHR does not include any express provision on trafficking. Nevertheless, the ECtHR interprets Article 4 of the ECHR as including a prohibition of trafficking.[306] The Court has adopted the same definition of trafficking as laid down in Article 3 (a) of the Protocol to prevent, suppress and punish trafficking in persons, especially women and children, supplementing the UN Convention against Transnational Organized Crime (Palermo Protocol) and Article 4 (a) of the CoE Convention on Action against Trafficking in Human Beings.[307] The ECtHR first identifies whether a particular situation involves a credible allegation of trafficking and thus falls under the scope of Article 4. If it does, the ECtHR's analysis will follow the patterns described in Section 7.2.1: the Court looks into whether the legal framework of the respondent state offers effective protection against trafficking, whether the state has discharged its positive obligations in the particular circumstances of the case and whether the authorities have conducted an effective investigation into arguable allegations of trafficking.

304 Council Directive 2004/81/EC of 29 April 2004 on the residence permit issued to third-country nationals who are victims of trafficking in human beings or who have been the subject of an action to facilitate irregular immigration, who cooperate with the competent authorities, OJ 2004 L 261, pp. 19–23.

305 *Ibid.*, Art. 3.

306 ECtHR, *Rantsev v. Cyprus and Russia*, No. 25965/04, 7 January 2010, para. 282.

307 UN, Protocol to Prevent, Suppress and Punish Trafficking in Persons, Especially Women and Children, supplementing the United Nations Convention against Transnational Organized Crime (UNCTOC), New York, 15 November 2000; Council of Europe, Council of Europe Convention on Action against Trafficking in Human Beings, CETS No. 197, 2005.

Example: The case of *Rantsev v. Russia and Cyprus*[308] was lodged by the father of a young Russian girl who died under suspicious circumstances in Cyprus. She had entered Cyprus on a cabaret artist visa. After what appeared to be an escape attempt, she died by falling off the balcony of an apartment belonging to acquaintances of her employer. Her father lodged a complaint against both Russia and Cyprus, essentially claiming that the authorities had not appropriately investigated the death of his daughter. The ECtHR held for the first time that trafficking in human beings falls under the scope of Article 4 of the ECHR. Although Cyprus had an adequate legal framework to combat trafficking, Article 4 was violated, as the administrative practice of requiring employers to issue financial guarantees for cabaret dancers did not offer effective protection against trafficking and exploitation. Further, in the particular circumstances of the case, the Cypriot authorities should have known that the applicant's daughter was at risk of being trafficked. The Court ruled that the police failed to take measures to protect Ms Rantseva against exploitation. Finally, it found a violation of Article 4 by Russia, since the Russian authorities did not appropriately investigate the allegations of trafficking.

The ECSR considers trafficking in human beings to constitute a grave violation of human rights and human dignity, and to amount to a new form of slavery.[309] Under Article 7 (10), states must enact legislation to criminalise it.[310] This legislation must be backed by an adequate supervisory mechanism, sanctions, and an action plan to combat child trafficking and sexual exploitation. [311]

At treaty level, the CoE Convention on Action against Trafficking in Human Beings is the key instrument addressing human trafficking.[312] In view of the broader membership of the CoE and the fact that the Anti-Trafficking Convention is open to accession by non-CoE member states,[313] it complements the

308 ECtHR, *Rantsev v. Cyprus and Russia*, No. 25965/04, 7 January 2010. The case does not concern the death of a child; however, this case is worth mentioning in absence of ECtHR child-specific trafficking cases and in view of the particular threat of trafficking to children.

313 For example, Belarus acceded to the convention on 26 November 2013.

EU Directive 2011/36/EU and is instrumental in combating trafficking in states party to the convention, whether EU members or not, on the basis of common standards and obligations. The implementation of the convention is monitored by a group of independent experts (the Group of Experts on Action against Trafficking in Human Beings GRETA), who periodically assess the situation in each country and publish reports. On the basis of these reports, the Committee of the Parties to the Convention, the political pillar of the monitoring mechanism under the convention, adopts recommendations to States Parties concerning measures to be taken to implement GRETA's conclusions and follows up on progress.

7.2.3. Child pornography and grooming

Under EU law, Directive 2011/93/EU is the main legal instrument addressing child pornography.[314] Pornography is defined as: "(i) any material that visually depicts a child engaged in real or simulated sexually explicit conduct; (ii) any depiction of the sexual organs of a child for primarily sexual purposes; (iii) any material that visually depicts any person appearing to be a child engaged in real or simulated sexually explicit conduct or any depiction of the sexual organs of any person appearing to be a child, for primarily sexual purposes; or (iv) realistic images of a child engaged in sexually explicit conduct or realistic images of the sexual organs of a child, for primarily sexual purposes."[315] Article 5 of this directive introduces an obligation for EU Member States to take all necessary measures to ensure that the intentional production, acquisition, possession, distribution, dissemination, transmission, offering, supplying or making available of child pornography as well as knowingly obtaining access to this type of content is punishable.

Under CoE law, the ECtHR has on several occasions analysed cases concerning child pornography under Article 8 of the ECHR.

Example: The case of *Söderman v. Sweden* was brought by a girl whose stepfather attempted to film her while she was taking a shower.[316] She alleged that the Swedish legislative framework did not adequately protect

314 Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on combating the sexual abuse and sexual exploitation of children and child pornography, OJ 2011 L 335/1, pp. 1–14.

315 *Ibid.*, Art. 2 (c).

316 ECtHR, *Söderman v. Sweden* [GC], No. 5786/08, 12 November 2013.

her private life. The ECtHR held that the state has positive obligations to set up a legislative framework offering adequate protection to victims such as the applicant. As this case concerns only an attempt to film the applicant, the ECtHR held that such legislative framework does not necessarily have to include criminal sanctions. The remedies offered to a victim – either civil or criminal – have to be effective. On the facts of the case, the ECtHR held that the applicant did not benefit from effective criminal or civil remedies against her stepfather's attempt to film her, in breach of Article 8 of the ECHR.

Article 9 of the CoE Convention on Cybercrime[317] requires States Parties to criminalise the conduct of offering, making available, distributing, transmitting, procuring or possessing child pornography or producing such material through a computer system. An important requirement is that this conduct must be intentional. The Explanatory Report of the Convention states that the term 'pornographic material' is dependent on national standards concerning materials classified as "obscene, inconsistent with public morals or similarly corrupt".[318] Nevertheless, this obligation to criminalise should not only apply to material if it visually depicts a child, but also if it depicts a person appearing to be one or realistic images representing a child who is engaged in sexually explicit conduct.[319]

Further, pursuant to Articles 21 to 23 of the Lanzarote Convention, states are required to take legislative measures to criminalise various forms of child pornography. Under Article 21, recruiting, coercing and participating in child pornography activities should be criminalised. Under Article 22, causing children to witness sexual (abuse) acts must equally be criminalised. Finally, Article 23 requires that criminal legislation be enacted in relation to acts of solicitation of children for sexual purposes through information and communication technologies. The Lanzarote Committee has adopted an opinion on this provision, which invites the States Parties to the convention to consider extending the criminalisation of solicitation to cases when the sexual abuse is not the result of a meeting in person but committed online.[320]

320 Lanzarote Committee Opinion on Art. 23 of the Lanzarote Convention and its explanatory note, 17 June 2015.

7.3. High risk groups

Key point

- Children victims of forced disappearance (known as 'enforced disappearance' in international law) have the right to preserve or to re-establish their identity.

7.3.1. Children belonging to a minority

Under CoE law, ECtHR cases dealing specifically with violence against minority children – outside the context of human trafficking and forced labour – are rather sparse. They mainly concern segregation in schools and discrimination, which is analysed in Section 3.2.

Example: In the case of *Centre of Legal Resources on behalf of Valentin Câmpeanu v. Romania*, an NGO lodged an application in the name of a young Roma boy who died in a state institution.[321] He was HIV-positive and had a severe intellectual disability. The conditions in the institution where he lived were appalling: there was no heating, no bedding or clothes, no support from staff, etc. In the absence of any close relative of the victim, an NGO alleged on his behalf the infringement of the rights established by Articles 2, 3, 5, 8, 13 and 14 of the ECHR. The Grand Chamber decided that, in the exceptional circumstances of the case (the extreme vulnerability and lack of any known next-of-kin of the young Roma), the NGO had standing to represent the deceased applicant. On the merits, the ECtHR found a violation of the substantive limb of Article 2. The domestic authorities were found liable for the death of Mr. Câmpeanu as they had placed him in an institution where he died due to the lacked adequate food, accommodation and medical care. The ECtHR also found a violation of Article 2 due to the fact that the Romanian authorities did not conduct an effective investigation into the death of Mr. Câmpeanu.

321 ECtHR, *Centre for Legal Resources on behalf of Valentin Câmpeanu v. Romania* [GC], No. 47848/08, 17 July 2014.

With respect to children living in institutions, the CoE Recommendation Rec(2005)5 supports the decision that the placement of a child should not be based on discriminatory grounds.[322]

7.3.2. Children with disabilities

Under EU law, the EU has become a party to the CRPD, the first international treaty in the field of human rights to which the EU has acceded.[323] The CRPD includes specific provisions related to children. EU Member States and the EU have undertaken to ensure the enjoyment of human rights by children with disabilities on an equal basis with other children. Under Article 16 of the CRPD, they must take specific measures to protect children with disabilities from abuse and exploitation.[324]

Under CoE law, ECtHR cases concerning children with disabilities have raised several issues, including consent, states' positive obligations to protect from death and ill-treatment, and living conditions in state-run facilities.

Example: The case of *Nencheva and Others v. Bulgaria*[325] concerns the death of 15 children and young adults in a home for people with mental and psychical disabilities. The ECtHR held that the children had been placed in a specialised public institution under the sole control of the state. The living conditions of the children in the institution were appalling: they lacked food, medicine, clothing and heating. The competent authorities had been alerted to this situation on several occasions, and were consequently aware or should have been aware of the risks of death. The ECtHR found a violation of the substantive limb of Article 2 of the ECHR, as the authorities did not take measures to protect the lives of children placed under their control. Further, the Bulgarian authorities did not conduct an effective investigation into the deaths of the applicants' children. In the particular circumstances of the case, the Bulgarian authorities should have launched an *ex officio* criminal investigation. The investigation was

322 Council of Europe, Committee of Ministers (2005), Recommendation Rec (2005)5 on the rights of children living in residential institutions, 16 March 2005.

323 Council of the European Union (2009), Council Decision 2010/48/EC of 26 November 2009 concerning the conclusion, by the European Community, of the United Nations Convention on the Rights of Persons with Disabilities, OJ 2010 L 23/35.

324 See also Section 3.5.

325 ECtHR, *Nencheva and Others v. Bulgaria*, No. 48609/06, 18 June 2013 (available in French).

deemed ineffective for several reasons: it had started two years after the death of the children, it had lasted unreasonably long, it did not cover the death of all the children and it did not clarify all the relevant factors in the matter.

7.4. Missing children

Under EU law, the EU Commission has launched a hotline number (116000) for missing children.[326] This service takes calls reporting missing children and passes them on to the police authorities, offers guidance to and supports the persons responsible for the missing child, and supports the investigation.

Under CoE law, the enforced disappearance of children has been addressed under Article 8 of the ECHR.

Example: In *Zorica Jovanović v. Serbia*,[327] a new-born baby allegedly died in hospital shortly after birth, but his body was never transferred to the parents. The mother complained that the state had failed to provide her with any information about the fate of her son, including the cause of his alleged death or time and place of his burial. The ECtHR held that a state's "continuing failure to provide [the mother] with credible information as to the fate of her son" amounted to a violation of her right to respect for family life.[328]

Under UN law, Article 25 (1) (b) of the International Convention for the Protection of All Persons from Enforced Disappearance[329] stipulates that states must prevent and punish the "falsification, concealment or destruction of documents attesting to the true identity" of children that are themselves or whose parents are subjected to enforced disappearance. States must also take the necessary measures to search for and identify these children, and to return them to their families of origin. In light of these children's right to preserve,

326 Commission Decision (2007), Commission Decision 2007/698/EC of 29 October 2007 amending Decision 2007/116/EC as regards the introduction of additional reserved numbers, OJ 2007, L 284/31.

328 *Ibid.*, para. 74.

329 UN, International Convention for the Protection of All Persons from Enforced Disappearance, 20 December 2006.

or to have re-established, their identity, including their nationality, name and family relations as recognised by law, states need to have legal procedures in place to review and annul any adoption or placement of children involved in enforced disappearances (Article 25 (4)). The convention reiterates two of the general principles underpinning children's rights: the best interests of the child as a primary consideration and the right of the child to express his/her views (Article 25 (5)). Whereas a relatively low number of European states have ratified this convention, its relevance to the European normative framework should not be dismissed.[330]

330 As at 19 February 2015, nine out of the 28 EU Member States had ratified this convention (Austria, Belgium, Spain, France, Germany, Lithuania, Netherlands, Portugal and Slovakia). In addition, the following CoE member states have ratified the convention: Serbia, Montenegro, Bosnia and Herzegovina, Armenia and Albania.

Economic, social and cultural rights (ESC rights), more often referred to as socio-economic rights or social rights in a European context, include work-related rights as well as the right to education, health, housing, social security and, more generally, an adequate standard of living. Cultural rights have remained largely underdeveloped and unaddressed in scholarship and litigation. Aspects of them are addressed in Section 4.6 on the identity of children belonging to a minority and in Section 8.2 under the right to education.

Explicit standards on ESC rights in the European context can mainly be found in the European Social Charter and the EU Charter of Fundamental Rights, although the ECHR and its protocols also include several relevant provisions, for instance the prohibition of forced labour and the right to education. Moreover, the ECtHR has argued that there is "no water-tight division separating [the] sphere [of social and economic rights] from the field covered by the Convention"[331] and has read ESC rights into the civil rights guaranteed by the ECHR. In that way, for example, access to health care has been dealt with under the prohibition of torture, inhuman and degrading treatment and punishment (Article 3 of the ECHR).[332]

This chapter analyses ESC rights that are of specific relevance to children: the right to education (Section 8.2); the right to health (Section 8.3); the right to housing (Section 8.4); and the right to an adequate standard of living and social security (Section 8.5).

8.1. Approaches to economic, social and cultural rights

Key points

- Securing the availability of adequate resources is key to ensure the protection of social rights.
- Essential elements of social rights are availability, accessibility, adaptability and acceptability.

Under EU law, ESC rights have been included in the EU Charter of Fundamental Rights on par with civil and political rights. However, Article 52 of the Charter distinguishes between rights and principles, with the latter being limited in the way they are "judicially cognisable".

331 ECtHR, *Airey v. Ireland*, No. 6289/73, 9 October 1979, para. 26.

332 See, for example, ECtHR, Factsheet on Prisoners' health-related rights, February 2015, and Factsheet on Health, April 2015.

Under CoE law, the ECSR notes that when the realisation of a right is "exceptionally complex and particularly expensive to resolve", it assesses progressive realisation against three criteria: measures must be taken "to achieve the objectives of the Charter within a reasonable time, with measurable progress and to an extent consistent with the maximum use of available resources".[333] It also introduces a prioritisation, in that it reminds states of "the impact that their choices will have for groups with heightened vulnerabilities as well as for others persons affected".[334]

The ECSR, albeit in the specific context of the right to social security, argues that retrogressive steps "in order to ensure the maintenance and sustainability of the existing social security system" are permissible provided they do not "undermine the core framework of a national social security system or deny individuals the opportunity to enjoy the protection it offers against serious social and economic risk".[335] The ECtHR also accepts the possibility of retrogressive steps, but examines whether the method chosen is reasonable and suitable to the achievement of the legitimate aim pursued.[336]

In the context of the right to education, the ECSR, in line with the approach of the UN Committee on Economic, Social and Cultural Rights, has adopted the analytical framework of availability, accessibility, acceptability and adaptability.[337] The distinction between availability and accessibility also features in the case law of the ECtHR. The criteria or essential elements of availability, accessibility, acceptability and adaptability guide the analysis that follows, to the extent that relevant case law is available.

336 ECtHR, *Markovics and Others v. Hungary*, Decision of inadmissibility, Nos. 77575/11, 19828/13 and 19829/13, 24 June 2014, paras. 37 and 39.

337 ECSR, *Mental Disability Advocacy Center (MDAC) v. Bulgaria*, Complaint No. 41/2007, 3 June 2008, para. 37.

8.2. Right to education

Key points

- Limitations to the accessibility of education must be foreseeable, pursue a legitimate aim and must be justified and non-discriminatory.
- Acceptability of education, which requires respect for the religious and philosophical convictions of parents, does not exclude the possibility of religious or sexual education in schools.
- Adaptability requires special measures for children with disabilities and the possibility for children belonging to a minority to learn and be taught in their own language.
- Children have the right to education regardless of their nationality or migration status.

Under EU law, Article 14 (2) of the EU Charter of Fundamental Rights guarantees the right to education, including "the possibility to receive free compulsory education". In its third paragraph, Article 14 ensures the freedom to found educational establishments and the right of parents to ensure the education and teaching of their children in conformity with their religious, philosophical and pedagogical convictions.

Under CoE law, Article 2 of Protocol No. 1 to the ECHR guarantees the right to education. The ECtHR clarifies that this article does not oblige states to make education available; it provides "a right of access to educational institutions existing at a given time".[338] In addition, the right to education also includes "the possibility of drawing profit from the education received, that is to say, the right to obtain, in conformity with the rules in force in each state, and in one form or another, official recognition of the studies [...] completed".[339] However, this is not an absolute right; limitations must be foreseeable for those concerned and must pursue a legitimate aim. Disciplinary measures, including suspension or expulsion from an educational institution, are allowed, provided they meet the conditions for permissible limitations. To assess whether these forms of exclusion from education result in a denial of the right to ed-

338 ECtHR, *Case "Relating to certain aspects of the laws on the use of languages in education in Belgium" v. Belgium*, Nos. 1474/62, 1677/62, 1691/62, 1769/63, 1994/63 and 2126/64, 23 July 1968, para. 4.

339 *Ibid.*

ucation, factors such as the procedural safeguards, duration of the exclusion, reintegration efforts and adequacy of alternative education provided will be considered.[340]

> Example: In *Catan and Others v. Moldova and Russia*,[341] the ECtHR looked into the language policy introduced in schools by the separatist authorities in Transdniestria. The objective of this language policy was Russification. Following the forced closure of Moldovan-language schools (using the Latin alphabet), parents had to choose between sending their children to schools where they were taught in an artificial combination of language and Cyrillic alphabet and with teaching materials produced in Soviet times, or to sending their children to schools that were less well equipped and less conveniently situated, on their way to which they were subjected to harassment and intimidation. The forced closure of schools and subsequent harassment was held to be an unjustified interference with the children's right to education that amounted to a violation of Article 2 of Protocol No. 1 to the ECHR.[342]

As part of the right to education, parents have the right to respect for their religious and philosophical convictions. However, "the setting and planning of the curriculum fall in principle within the competence" of the state.[343] They can also integrate information or knowledge of a religious or philosophical kind in the school curriculum, on condition that it is "conveyed in an objective, critical and pluralistic manner".[344] To safeguard pluralism, quantitative and qualitative differences in teaching a particular religion or philosophy must be balanced by offering parents the possibility of either partially or fully exempting their children from such teaching, namely the possibility not to attend certain classes or the religious course as a whole.[345] For the ECtHR's way of dealing with the issue from a non-discrimination angle, see Section 2.1.[346]

341 ECtHR, *Catan and Others v. Moldova and Russia* [GC], Nos. 43370/04, 8252/05 and 18454/06, 19 October 2012.

342 *Ibid.*, paras. 141–144.

343 ECtHR, *Folgerø and Others v. Norway* [GC], No. 15472/02, 29 June 2007, para. 84.

344 *Ibid.*, para. 84.

345 *Ibid.*, paras. 85–102 and Dissenting opinion.

346 ECtHR, *Grzelak v. Poland*, No. 7710/02, 15 June 2010.

Pursuant to Article 17 (2) of the revised ESC, states undertake "to take all appropriate and necessary measures designed [...] to provide to children and young persons a free primary and secondary education as well as to encourage regular attendance at schools".[347] Additionally, the ECSR ruled that under this provision, contracting states should ensure that children unlawfully present in their territory also have access to education.[348]

Furthermore, educational institutions have to be accessible to everyone without discrimination.[349] The ESCR held that the "integration of children with disabilities into mainstream schools [...] should be the norm and teaching in specialised schools must be the exception".[350] States do not enjoy a wide margin of appreciation regarding the choice of the type of school for persons with disabilities; it must be a mainstream school.[351]

Situations concerning differential treatment in education on grounds such as nationality, immigration status or ethnic origin are dealt with in Chapter 3.

Under the ECSR case law, sexual and reproductive health education must be part of the ordinary curriculum.[352] Whereas states enjoy a wide margin of appreciation in determining the cultural appropriateness of the educational material used, they must ensure non-discriminatory sexual and reproductive health education "which does not perpetuate or reinforce social exclusion and the denial of human dignity". Educational materials must not "reinforce demeaning stereotypes", for instance concerning persons of non-heterosexual orientation.[353]

347 The ESC of 1961 does not contain a provision on the right to education.

348 ECSR, *Médecins du Monde – International v. France*, Complaint No. 67/2011, 11 September 2012.

349 On the issue of children with disabilities, see further Chapters 3 and 7.

352 ECSR, *International Centre for the Legal Protection of Human Rights (INTERIGHTS) v. Croatia*, Complaint No. 45/2007, 30 March 2009, para. 47.

353 *Ibid.*, paras. 59 and 61.

Finally, adaptability of education requires, for example, that for children with disabilities who are integrated into mainstream schools, "arrangements are made to cater for their special needs"[354] (see also Section 3.5).

In addition, under Article 12 (3) of the FCNM, States Parties undertake to promote equal opportunities for access to education at all levels for persons belonging to national minorities (see also Chapter 3).[355] For children belonging to national minorities, Article 14 of the FCNM contains the right to learn and be taught one's own language.[356] The ECtHR has confirmed that the right to education implies the right to be educated in (one of) the national language(s).[357]

8.2.1. Right to education of migrant children

Under EU law, children's fundamental right to education, regardless of their migration status, is recognised in virtually all aspects of EU migration law.[358] That said, the EU does not have the competence to determine the content or scope of national educational provisions. Rather, the EU protects migrant children's right to access education on the same or, depending on their status, similar basis as nationals. The Students Directive (2004/114/EC) regulates the conditions of admission of third-country nationals for the purposes of studies, pupil exchange, unremunerated training or voluntary service.[359] This admission

357 ECtHR, *Catan and Others v. Moldova and Russia* [GC], Nos. 43370/04, 8252/05 and 18454/06, 19 October 2012, para. 137.

358 E.g. Art. 27 Directive 2011/95/EU of the European Parliament and of the Council of 13 December 2011 on standards for the qualification of third-country nationals or stateless persons as beneficiaries of international protection, for a uniform status for refugees or for persons eligible for subsidiary protection, and for the content of the protection granted (Recast) (Qualification Directive), OJ 2011 L 337/9, pp. 9–268.

359 Council Directive 2004/114/EC on the conditions of admission of third-country nationals for the purposes of studies, pupil exchange, unremunerated training or voluntary service (Students Directive).

covers the entry and residence of the third-country national for a period exceeding three months. The general conditions of admission for children include the presentation of a valid travel document, parental authorisation for the planned stay, sickness insurance and, if the Member State so requests, the payment of a fee for processing the application for admission.[360] School pupils for instance are required to provide evidence of participation in a pupil exchange scheme operated by an organisation recognised by the Member State.[361] Unremunerated trainees are subject to providing the evidence the Member State requires to ensure that during their stay they will have sufficient resources to cover their subsistence, training and return travel costs.[362] Access to economic activities, including employment, by higher education students are subject to restrictions.[363]

The children of EU migrants who move to another EU Member State under free movement law benefit from the most favourable entitlement in this context. They have a right to be admitted to that state's general educational, apprenticeship and vocational training courses under the same conditions as nationals.[364] This includes public and private, and compulsory and non-compulsory education. The CJEU has always interpreted this entitlement broadly to ensure equal access to education, but also to broader, education-related social benefits, as well as to any benefits intended to facilitate educational attendance. For example, in the *Casagrande* case, the child of a migrant worker was able to access a means-tested educational grant under EU free movement law.[365]

360 *Ibid.*, Art, 6.

361 *Ibid.*, Art. 7.

362 *Ibid.*, Art. 10.

363 *Ibid.*, Art. 17.

364 Regulation (EU) 492/2011 of the European Parliament and of the Council of 5 April 2011 on freedom of movement for workers within the Union, OJ 2011 L 141/1, pp. 1–12, Art. 10; and Directive 2004/38 of the European Parliament and of the Council of 29 April 2004 on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States amending Regulation (EEC) No. 1612/68 and repealing Directives 64/221/EEC, 68/360/EEC, 72/194/EEC, 73/148/EEC, 75/34/EEC, 75/35/EEC, 90/364/EEC, 90/365/EEC and 93/96/EEC (Free Movement Directive), OJ 2004 L 158, pp. 77–123, Art. 24 (1).

365 CJEU, C-9/74, *Donato Casagrande v. Landeshauptstadt München*, 3 July 1974. Subsequently confirmed in cases such as CJEU, C-3/90, *M.J.E. Bernini v. Minister van Onderwijs en Wetenschappen*, 26 February 1992.

Moreover, legislation introduced in the 1970s requires Member States to provide supplementary language tuition for children of EU migrant workers, in both the host state language and in their mother tongue, with a view to facilitate their integration in the host state and in their country of origin should they subsequently return.[366] While this seems to offer quite generous and valuable supplementary support to children following their admission to a school in the host state, its implementation across different countries has been notoriously patchy and increasingly impractical given the range of different languages to accommodate.[367]

Example: The issue in *Baumbast and R v. Secretary of State for the Home Department*[368] was whether the two daughters of a German migrant worker who moved to the United Kingdom with his Colombian wife and daughters, could continue to attend school there after he left the United Kingdom for a non-EU Member State, leaving his wife and daughters behind. The CJEU was faced with the question of whether his wife and daughters could remain in the host state independently, notwithstanding the fact that Mr Baumbast (from whom the family derived their residence rights) had effectively relinquished his status as an EU migrant worker. The decisive factor for the CJEU was that the children were integrated into the education system of the host state and it would have been both harmful and disproportionate to uproot them at such a crucial point in their education. The Court confirmed that such is the importance of achieving continuity in children's education that it can effectively 'anchor' the (otherwise non-qualifying) family's residence in the host state for the duration of a migrant child's studies.

366 Council Directive 77/486/EEC on the education of the children of migrant workers, OJ 1977 L 199, pp. 32–33. Note that third-country national migrant children are excluded from its scope.

367 Commission reports on the implementation of Directive 77/486/EEC, COM(84) 54 final and COM(88) 787 final.

368 CJEU, C-413/99, *Baumbast and R v. Secretary of State for the Home Department*, 17 September 2002.

The *Baumbast* decision was followed in successive cases[369] and has been codified in Article 12 (3) of Directive 2004/38/EC (Free Movement Directive).[370]

Third-country national children can generally only access *publicly-funded* education under the same conditions as nationals, and are excluded from associated benefits such as maintenance grants.[371] Some EU immigration instruments, however, go further than granting mere equality of access, requiring Member States to implement mechanisms to ensure due recognition and transferability of foreign qualifications, even in the absence of documentary evidence (Article 28 of the Qualification Directive).[372]

The educational rights of asylum-seeking children are weaker still; they must be granted access to the host state's education system on *similar,* but not necessarily the *same* terms as those that apply to nationals.[373] As such, education may be provided in accommodation centres rather than schools, and the authorities can postpone asylum-seeking children's full access to a school for up to three months from the date of application for asylum. Where access to the education system is impossible due to the specific situation of the child, Member States are obliged to offer alternative education arrangements (Article 14 (3) of the Reception Conditions Directive).[374]

369 CJEU, C-480/08, *Maria Teixeira v. London Borough of Lambeth and Secretary of State for the Home Department*, 23 February 2010; CJEU, C-310/08, *London Borough of Harrow v. Nimco Hassan Ibrahim and Secretary of State for the Home Department* [GC], 23 February 2010.

370 Directive 2004/38/EC of the European Parliament and of the Council of 29 April 2004 on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States amending Regulation (EEC) No. 1612/68 and repealing Directives 64/221/EEC, 68/360/EEC, 72/194/EEC, 73/148/EEC, 75/34/EEC, 75/35/EEC, 90/364/EEC, 90/365/EEC and 93/96/EEC, OJ 2004 L 158, Art. 2 (2) (c) and Art. 12 (3).

371 Refugee Qualification Directive 2011/95/EU, Art. 11; Long-Term Residents Directive (Directive 2003/109/EC), Art. 14; Directive 2003/86/EC on the right to family reunification, Art. 14; Temporary Protection Directive (2001/55/EC); Reception Directive (2013/33/EU), Art 14(c); and Return Directive (2008/115/EC).

372 Directive 2011/95/EU of the European Parliament and of the Council of 13 December 2011 on standards for the qualification of third-country nationals or stateless persons as beneficiaries of international protection, for a uniform status for refugees or for persons eligible for subsidiary protection, and for the content of the protection granted (Recast) (Qualification Directive), OJ 2011 L 337/9.

373 Reception Conditions Directive (2013/33/EU). Note that, under the Refugee Qualification Directive (2011/95/EU, Art. 27), child refugees (who have acquired longer term residence rights) can access education under the same conditions as nationals.

374 Directive 2013/33/EU of the European Parliament and of the Council of 26 June 2013 laying down standards for the reception of applicants for international protection (Recast) (Reception Directive), OJ 2013 L 180/96, pp. 96–116.

Under CoE law, Article 2, Protocol No. 1 has been used in conjunction with Article 14 to secure migrant children's access to education (see also Section 3.3).

> Example: In *Ponomaryovi v. Bulgaria*,[375] the ECtHR considered the requirement for two Russian school children without permanent residence to pay secondary school fees. The Court concluded that imposing fees for secondary school in their case had been discriminatory and thus contrary to Article 14 of the ECHR taken together with Article 2 of Protocol No. 1 to the ECHR.[376].

The ESC protects migrant children's educational rights both directly (Article 17, paragraph 2) and indirectly, imposing restrictions on children's employment rights with a view to enabling them to obtain the full benefits of compulsory education (Article 7).

Furthermore, the European Convention on the Legal Status of Migrant Workers[377] endorses migrant children's right to access "on the same basis and under the same conditions as nationals", general education and vocational training in the host state (Article 14 (1)).

Under international law, migrant children's equality of access to education is supported by the International Convention on the Protection of the Rights of all Migrant Workers and Members of Their Families (Article 30).[378]

Article 28 of the CRC provides that all children have the right to free compulsory education. According to Article 29 (1) (c), this right extends far beyond equality of access to education and includes provisions concerning the development of the child's cultural identity, language and values of the child's country of origin.

378 UN, Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families, 18 December 1990.

8.3. Right to health

Key points

- States have positive obligations to take measures against life-endangering health risks that the authorities are or ought to be aware of.
- State authorities must undertake an effective investigation in case of a person's death.
- Under the ESC, children who are unlawfully in the country are entitled to healthcare beyond urgent medical assistance.
- Acceptability of healthcare requires informed consent or authorisation.
- Under EU law and the ESC, subject to several limitations, migrant children are entitled to access social assistance and healthcare.

Under EU law, Article 35 of the EU Charter of Fundamental Rights guarantees a right of access to healthcare.

Children of EU migrant nationals can access social welfare and health support on the same basis as nationals, following three months of residence in the host state.[379] Similar rights are extended to the children of third-country nationals who have acquired permanent residence in a Member State, although these may be restricted to so-called 'core benefits'.[380] As far as refugee and asylum-seeking children are concerned, Member States have to provide access to appropriate social assistance on an equal basis as nationals of the host state, but, again, this can be limited to 'core benefits' (Article 29 of the Qualification Directive). The legislation requires Member States to provide vulnerable migrant children with access to sufficient healthcare support. For instance, children who have suffered violence or torture must be provided with sufficient support to address their physical and mental needs (Chapter IV Recast Reception Directive, Articles 21, 23 (4) and 25). The Qualification Directive contains similar provisions for vulnerable child migrants.

379 Free Movement Directive, Art. 24.

380 Council Directive 2003/109/EC of 25 November 2003 concerning the status of third-country nationals who are long-term residents, OJ L 16, 23.1.2004, Art. 11 (4)).

Under CoE law, the ECHR does not expressly guarantee a right to healthcare or a right to health. However, the ECtHR has dealt with a number of health-related cases in a variety of circumstances. First, the Court examines life-endangering health issues for children. It identifies positive obligations incumbent on the state to take preventive measures against life-endangering health risks that it knows or should know about.

Example: In *Oyal v. Turkey*, the state failed to take preventive measures against the spread of HIV through blood transfusions. As a consequence, a new-born baby was infected with the HIV virus during blood transfusions at a state hospital. While some redress was offered, the ECtHR found that, in the absence of full medical cover for treatment and medication during the lifetime of the child concerned, the state had failed to offer satisfactory redress and thereby violated the right to life (Article 2 of the ECHR).[381] In addition, it ordered the Turkish State to provide free and full medical cover during the lifetime of the victim.

Example: In *Iliya Petrov v. Bulgaria*,[382] a 12-year old boy got seriously injured in an electricity substation. The substation was located in an outdoor park where children and young people often met, and the door was not locked. The ECtHR held that the exploitation of an electricity grid is an activity that poses a heightened risk to persons who are close to the installations. The state has an obligation to put adequate regulation in place, including a system to control the proper application of security rules. The Court ruled that the failure of the state to ensure that the electricity substation was secured, although it knew about the safety problems, amounted to a violation of the right to life (Article 2 of the ECHR).[383]

Moreover, states have positive obligations to account for the treatment of children in a vulnerable situation who are in the care of state authorities (see also Chapter 6 and Section 7.3).

381 ECtHR, *Oyal v. Turkey*, No. 4864/05, 23 March 2010, paras. 71–72.

382 ECtHR, *Iliya Petrov v. Bulgaria*, No. 19202/03, 24 April 2012 (available in French).

383 *Ibid.*

Example: The case of *Centre for Legal Resources on behalf of Valentin Câmpeanu v. Romania*[384] concerned an HIV-positive Roma teenager who had a severe intellectual disability and also suffered from tuberculosis, pneumonia and hepatitis, and died at the age of 18. He had been in state care throughout his life. The ECtHR found serious shortcomings in the decision-making concerning the provision of medication and care, and a continuous failure of the medical staff to provide him with appropriate care and treatment. Article 2 of the ECHR had therefore been violated.[385]

Furthermore, in the absence of an emergency, the ECtHR found that medical treatment without parental consent is in breach of Article 8 of the ECHR.

Example: In *Glass v. the United Kingdom*,[386] diamorphine had been administered to a child with severe disability, notwithstanding firm objections by his mother. The ECtHR found that the decision of the hospital authorities to override the mother's objection to the proposed treatment in the absence of authorisation by a Court resulted in a breach of Article 8 of the ECHR.[387]

Example: In *M.A.K. and R.K. v. the United Kingdom*,[388] a nine year old girl underwent a blood test and photographs without parental consent, notwithstanding her father's express instructions not to carry out any further tests while the girl was alone in the hospital. In the absence of any medical urgency, these medical interventions without parental consent were held to be in violation of her right to physical integrity under Article 8 of the ECHR.[389]

In accordance with Articles 6 and 8 of the Convention on Human Rights and Biomedicine,[390] when a child does not have the legal capacity to consent to

384 ECtHR, *Centre for Legal Resources on behalf of Valentin Câmpeanu v. Romania* [GC], No. 47848/08, 17 July 2014. See further the description of this ECHR ruling in Chapter 7.

385 See also Section 7.

386 ECtHR, *Glass v. the United Kingdom*, No. 61827/00, 9 March 2004.

387 *Ibid.*, para. 83.

388 ECtHR, *M.A.K. and R.K. v. the United Kingdom*, Nos. 45901/05 and 40146/06, 23 March 2010.

389 *Ibid.*, para. 79.

390 Council of Europe, Convention for the Protection of Human Rights and Dignity of the Human Being with regard to the Application of Biology and Medicine: Convention on Human Rights and Biomedicine, CETS No. 164, 1997.

a medical intervention, that intervention may only be carried out with the authorisation of his or her representative, save in an emergency situation. Whereas this convention does not require the consent of the child if he or she is legally incapable of consenting, it does hold that the opinion of the child must be taken into consideration "as an increasingly determining factor in proportion to his or her age and degree of maturity" (Article 6 (2)).

Furthermore, under Article 11 of the ESC, States Parties agree to take appropriate measures to provide for advisory and educational facilities for the promotion of health and the encouragement of individual responsibility in matters of health.[391] Medical assistance and care is guaranteed under Article 13 of the ESC to those who are without adequate resources and unable to secure those resources by their own efforts or from other sources. Finally, in 2011 the Committee of Ministers adopted child-specific guidelines on child-friendly healthcare.[392]

As indicated in the following examples, the ECSR holds that migrant children staying irregularly in a country are entitled to healthcare beyond urgent medical assistance. The ESC includes many references to children's rights to social welfare and health services (Articles 11, 12, 13, 14, 16 and 17), which apply regardless of their migration status.

Example: The ECSR decision in *International Federation of Human Rights Leagues (FIDH) v. France*[393] concerns France passing a law which ended the exemption of immigrants in an irregular situation with very low incomes from paying for medical treatment, and imposed health care charges. The ECSR ruled that individuals who have not reached the age of majority, including unaccompanied children, must be provided with free medical care.

391 On sexual and reproductive health education, see also under education (Section 8.2).

392 Council of Europe, Committee of Ministers (2011), Guidelines on child-friendly health care, 21 September 2011.

393 ECSR, *International Federation of Human Rights Leagues (FIDH) v. France*, Complaint No. 14/2003, 8 September 2004, paras. 35–37.

Example: In *Defence for Children International (DCI) v. Belgium*,[394] the ECSR found a violation of Article 17 of the ESC because of restrictions on medical assistance to undocumented migrant children. The Committee confirmed "the right of migrant minors unlawfully in a country to receive health care extending beyond urgent medical assistance and including primary and secondary care, as well as psychological assistance".[395] It also stated that the lack of reception facilities for foreign minors unlawfully in the country made access to health care difficult. Moreover, it found that causes of ill-health can only be removed to the extent that children are provided with housing and foster homes. Accordingly, it held that there was a violation of Article 11 (1) and (3) of the ESC due to the lack of housing and foster homes.[396]

The European Convention on the Legal Status of Migrant Workers[397] similarly provides that migrant workers who are lawfully employed in the territory of another state, as well as their families, should receive equal access to social and medical assistance (Article 19).

Under international law, more comprehensive provisions on the right to health can be found in Article 12 of the International Covenant on Economic, Social and Cultural Rights (ICESCR)[398] and in Article 24 of the CRC. These instruments emphasise prevention and treatment. The UN Committee on the Rights of the Child emphasises the importance of access to the highest attainable standard of healthcare and nutrition during early childhood,[399] and access for adolescents to sexual and reproductive information.[400] It has also clarified that children's right to health entails "the right to control one's health and body,

including sexual and reproductive freedom to make responsible choices".[401] It encourages states to "consider allowing children to consent to certain medical treatments and interventions without the permission of a parent, caregiver, or guardian, such as HIV testing and sexual and reproductive health services, including education and guidance on sexual health, contraception and safe abortion".[402]

8.4. Right to housing

Key points

- The right to adequate housing is guaranteed in Article 31 of the ESC.
- The ECSR holds that adequate shelter is to be provided to children residing irregularly in a country and that the living conditions in shelters must be in keeping with human dignity.
- According to the ECtHR, inadequate housing does not justify placement into public care.

Under EU law, Article 34 (3) of the EU Charter of Fundamental Rights contains a reference to the right to housing assistance as part of the struggle against social exclusion and poverty. The Racial Equality Directive highlights housing among the goods and services available to the public to which non-discriminatory access and supply should be granted.[403] Non-differential treatment regarding housing benefits applies to long-term residents. However, EU law tries to ensure, regarding family reunification for instance, that family members will not constitute a burden for the Member States' social assistance systems.[404] The Family Reunification Directive requires applications for family reunification to provide evidence that a valid sponsor of family reunification (i.e. a third-country national allowed to reside for a period of one year or more and with a reasonable prospect of obtaining the right of permanent residence)

401 UN, Committee on the Rights of the Child (2013), *General Comment No. 15 on the right of the child to the enjoyment of the highest attainable standard of health (art. 24)*, UN Doc. CRC/C/GC/15, para. 24.

402 *Ibid.*, para. 31.

404 See further FRA and ECtHR (2014), p. 201.

has accommodation regarded as normal for a comparable family in the same region. The accommodation should meet the general health and safety standards in force in the Member State concerned.[405]

Under CoE law, there is no right to be provided with housing under the ECHR, but if a state decides to provide housing, it must do so in a non-discriminatory way.

> Example: In *Bah v. the United Kingdom*[406] the applicant, who was lawfully residing in the UK, was allowed to be joined by her son on the condition that he did not have recourse to public funds. Shortly after her son's arrival, the applicant sought assistance in finding accommodation. However, because her son was subject to immigration control, she was refused the priority to which her status as an unintentionally homeless person with a minor child would ordinarily have entitled her. The authorities ultimately helped her find new accommodation and later provided her with social housing. The applicant complained that the refusal to grant her priority had been discriminatory. The ECtHR held that it was legitimate to put in place criteria for the allocation of limited resources such as social housing, provided that such criteria were not arbitrary or discriminatory. There had been nothing arbitrary in the denial of priority to the applicant, who had brought her son into the country in full awareness of the condition attached to his leave to enter. Moreover, the applicant had never in fact been homeless and there were other statutory duties which would have required the local authority to assist her and her son had the threat of homelessness actually manifested itself. Consequently, there had been no violation of Article 14 taken in conjunction with Article 8 of the ECHR.

The ECtHR also examines cases of eviction of Roma families from caravan sites.[407] The ECtHR has indirectly dealt with the issue of the quality of housing, stating that inadequate housing does not justify placing children into public care[408] (see also Sections 5.2. and 6.2.).

405 Council Directive 2003/86/EC on the right to family reunification of 22 September 2003 (Family Reunification Directive) Art. 7 (1) (a).

406 ECtHR, *Bah v. the United Kingdom*, No. 56328/07, 27 September 2011.

407 ECtHR, *Connors v. the United Kingdom*, No. 66746/01, 27 May 2004.

408 ECtHR, *Wallová and Walla v. the Czech Republic*, No. 23848/04, 26 October 2006, paras. 73–74 (available in French); ECtHR, *Havelka and Others v. the Czech Republic*, No. 23499/06, 21 June 2007, paras. 57–59 (available in French).

The right to adequate housing is guaranteed in Article 31 of the ESC. The ECSR holds that "[a]dequate housing under Article 31 (1) means a dwelling which is safe from a sanitary and health point of view, i.e. it must possess all basic amenities, such as water, heating, waste disposal, sanitation facilities and electricity and must also be structurally secure, not overcrowded and with secure tenure supported by the law".[409] Evictions are permissible if justified, carried out in conditions that respect dignity, and if alternative accommodation is made available.[410] Living conditions in a shelter "should be such as to enable living in keeping with human dignity [...] [and] must fulfil the demands for safety, health and hygiene, including basic amenities, i.e. clean water, sufficient lighting and heating. The basic requirements of temporary housing include also security of the immediate surroundings."[411]

With regard to housing for foreign children in an irregular situation, the ECSR holds that both the failure to provide any form of accommodation and the provision of inappropriate accommodation in hotels amount to a violation of Article 17 (1) of the ESC.[412] Moreover, under Article 31 (2) of the ESC on the prevention of homelessness, states are required to provide adequate shelter to children in an irregular situation without resorting to detention.[413]

8.5. Right to an adequate standard of living and right to social security

Key points

- Access to child allowances and parental leave must be non-discriminatory.
- Under EU law, the social security coverage of young workers in apprenticeship contracts should not be so low that it excludes them from the general range of protection.
- Under the ESC, the suspension of family allowances in case of truancy is a disproportionate limitation to the right of the family to economic, social and legal protection.

Under EU law, Article 34 (1) of the EU Charter of Fundamental Rights stipulates that the "Union recognises and respects the entitlement to social security benefits and social services" in cases that correspond to the traditional branches of social security (maternity, illness, industrial accidents, dependency or old age, and loss of employment). Entitlement extends to everyone residing and moving legally within the EU. The right to social assistance is recognised to ensure a decent existence for those who lack sufficient resources and to combat social exclusion and poverty. All these aspects are qualified by the "rules laid down by Union Law and national laws and practices" (Article 34 (1) of the Charter).

The CJEU holds that, where a Member State's own nationals are only required to reside in the Member State to access a child-raising allowance, nationals of other EU Member States cannot be made to produce a formal residence permit to access the same benefits.[414] The refusal of parental leave to certain categories of persons, such as commissioning mothers who have a baby through a surrogacy arrangement, is discriminatory.[415] The same applies to male civil servants who are refused parental leave if their wives do not work or exercise any profession, unless the wives are unable to meet the needs related to the upbringing of the child due to serious illness or injury.[416] Similarly, Member States have to establish a parental leave regime in the event of the birth of

414 CJEU, C-85/96, *María Martínez Sala v. Freistaat Bayern*, 12 May 1998, paras. 60–65.

415 CJEU, C363/12, *Z v. A Government Department, The Board of Management of a Community School* [GC], 18 March 2014.

twins that ensures these parents receive treatment particular to their needs. This can be ensured through basing the length of parental leave on the number of children born, and providing for other measures, such as material assistance or financial aid.[417]

Under CoE law, the ECtHR examined alleged discrimination in the granting of parental leave and parental allowances in Russia.

> Example: In *Konstantin Markin v. Russia*,[418] parental leave was refused to a serviceman in the Russian army, while servicewomen were entitled to such leave. In the Court's view, the exclusion of servicemen from the entitlement to parental leave could not be reasonably justified. Neither the special armed forces context and assertions about the risk to operational effectiveness, nor the arguments about the special role of women in raising children or the prevailing traditions in the country were found to justify the differential treatment. The Court found that Article 14 in conjunction with Article 8 of the ECHR had been violated.

More extensive provisions on the right to social security, the right to social and medical assistance, and the right to benefit from social welfare services can be found in Articles 12–14 of the ESC. Article 16 of the ESC explicitly mentions social and family benefits as a way the economic, legal and social protection of the family life can be promoted. Article 30 of the ESC provides for a right to protection against poverty and social exclusion. Certain social security claims may fall within the scope of Article 1, Protocol No. 1 to the ECHR, provided that national legislation generates a proprietary interest by providing for the payment as of right of a welfare benefit, whether conditional or not on the prior payment of contributions.[419]

Article 12 of the ESC requires states to establish or maintain a social security system, and to endeavour to raise it progressively to a higher level.

Article 16 of the ESC requires states to ensure the economic, legal and social protection of the family by appropriate means. The primary means should be family or child benefits, provided as part of social security and available either

417 CJEU, C-149/10, *Zoi Chatzi v. Ypourgos Oikonomikon*, 16 September 2010, paras. 72–75.

418 ECtHR, *Konstantin Markin v. Russia* [GC], No. 30078/06, 22 March 2012.

419 ECtHR, *Stummer v. Austria* [GC], No. 37452/02, 7 July 2011, para. 82.

universally or subject to a means-test. These benefits must constitute an adequate income supplement for a significant number of families. The ECSR assesses the adequacy of family (parental) benefits with respect to the median equivalised income (Eurostat).[420] The ECSR finds that the absence of any general system of family benefits is not in conformity with the ESC.[421]

The ECSR accepts, however, that the payment of child benefits may be made conditional based on the child's residence.[422] It holds that the introduction of only very limited protection against social and economic risks given to children (15–18 years old) in special apprenticeship contracts (they were only entitled to sickness benefits in kind and to occupational accident coverage at a rate of 1 %) effectively excludes a distinct category of (minor) workers from the "general range of protection offered by the social security system at large". It is hence in violation of the state's obligation to progressively raise the system of social security.[423]

The suspension of family allowances in cases of truancy is also a disproportionate limitation on the right of the family to economic, social and legal protection.

Example: In a complaint against France, the European Committee for Home-Based Priority Action for the Child and the Family (EUROCEF) argued that suspending family allowances as a measure to address truancy was a violation of the right of families to social, legal and economic protection under Article 16 of the ESC. In finding the measure disproportionate to the aim pursued, the Committee noted that "the contested measure of suspending and possibly suppressing family allowances makes parents exclusively responsible for pursuing the aim of reducing truancy and increases the economic and social vulnerability of the families concerned".[424]

420 ECSR, Conclusions 2006, Estonia, p. 215

424 ECSR, *European Committee for Home-Based Priority Action for the Child and the Family (EUROCEF) v. France*, Complaint No. 82/2012, 19 March 2013, para. 42.

The European Convention on the Legal Status of Migrant Workers[425] provides that migrant workers lawfully employed in another state as well as their families should receive equal access to social security (Article 18), and other "social services" that facilitate their reception in the host state (Article 10). Similarly, the European Convention on Social Security protects refugees and stateless persons' rights to access social security provision in the host state (including family benefits for children).[426]

Under international law, the right to an adequate standard of living is guaranteed in Article 11 of the ICESCR and Article 27 of the CRC.

Greece*, No. 8687/08, 2011 (effective remedies to challenge conditions of detention)

The EU has clear competence to legislate in the area of migration and asylum. Provisions covering migrant children govern a range of migration situations, including long-term work-related migration, asylum, and subsidiary protection, and also addresses the situation of migrants in an irregular situation. In addition to the protection migrant children are entitled to under Article 24 of the EU Charter of Fundamental Rights, Articles 18 and 19 of the Charter deal with the right to asylum and protection in the event of removal, expulsion or

extradition. The EU has also paid attention to the specific needs of unaccompanied children, including regarding legal aspects such as legal guardianship and legal representation, age assessment, family tracing and reunification, asylum procedures, detention, and expulsion, as well as aspects relating to the living conditions of the children, including accommodation, healthcare, education and training, religion, cultural norms and values, recreation and leisure and social interaction and experiences of racism.[427]

Within the CoE system, four conventions in particular support the rights of migrant children in different contexts: the ECHR, the ESC, the European Convention on the Legal Status of Migrant Workers and the European Convention on Nationality. This chapter mainly focuses on the implementation of ECHR provisions, notably Article 3 (protection against inhuman, degrading treatment), Article 5 (deprivation of liberty), and Article 8 (right to respect for private and family life), taken alone or in conjunction with Article 14 (non-discrimination). These provisions are used to support migrant, refugee and asylum seeking children's and their family members' rights to family reunification, access to justice and ongoing residence in the host state.

At the international level, a number of CRC provisions uphold children's rights in the context of migration and asylum and have informed the development of legal measures at the European level. Specifically, Article 7 protects children's right to birth registration, nationality, and parental care; Article 8 protects the child's right to identity, including nationality, name and family relations; Article 9 ensures that separated children should maintain contact with both parents where it is in their best interests; and Article 22 provides refugee children with the right to special protection and help. Further, the UN Convention Relating to the Status of Refugees[428] along with its 1967 Protocol are universally regarded as the centrepiece of international refugee protection.

The following sections focus on entry and residence (Section 9.1); age assessment (Section 9.2); family reunification for separated children (Section 9.3); detention (Section 9.4); expulsion (Section 9.5) and access to justice (Section 9.6).

9.1. Entry and residence

Key points

- EU nationals enjoy the right to freedom of movement within the EU.
- Decisions on child entry and residence should be taken in the framework of appropriate mechanisms and procedures and in the child's best interests.

Under EU law, the nature and scope of children's rights differs largely according to the nationality of the child and the child's parents and according to whether the child is migrating with his/her parents or independently.

The migration of EU nationals is regulated by various legal instruments. The rights granted to EU nationals are far-reaching and aim to stimulate optimum mobility across the EU. First, Article 21 of the TFEU provides that EU citizens and their family members have a right to move and reside freely within the territory of any EU Member State. Moreover, once they arrive in the host state, they have a right to be treated equally to nationals of that state in relation to their access to and conditions of work, social and welfare benefits, school, healthcare, etc.[429] Article 45 of the EU Charter of Fundamental Rights equally guarantees the freedom of movement of EU citizens.

Further, the rights of children who move with EU-national parents/carers are also governed by the Free Movement Directive.[430]This stipulates that family members have a right to enter and reside in the host state either with or following the primary EU migrant's move there (Article 5 (1)). Family members, for the purposes of this instrument, include any biological children of either the EU migrant or their spouse or partner, provided they are under the age of 21 or are "dependent" (Article 2 (2)). They may be both EU and non-EU nationals, provided the primary migrant with whom they have moved is an EU

429 Some restrictions have been imposed on migrants from Croatia, the most recent country to accede to the EU, for a transitional period up until June 2015, with the possibility for Member States of extending the period in which restrictions will be imposed until 2020.

430 Please note that relevant provisions of the directive also apply in the EEA. See further Agreement on the European Economic Area, 2 May 1992, Part III, Free Movement of Persons, Services and Capital and Agreement between the European Community and its Member Sates, on the one part, and the Swiss Confederation, on the other, on the free movement of persons, signed in Luxembourg on 21 June 1999, entered into force on 1 June 2002, OJ 2002 L 114/6.

national. For the first three months following their move, the family's right of residence is unconditional, but thereafter EU citizens who wish their children to remain with them in the host state must demonstrate that they have sufficient financial resources and comprehensive sickness insurance to support them (Article 7). Children and other family members automatically acquire permanent residence after a period of five consecutive years of residence in the host state with the EU citizen (Articles 16 (2) and 18). At that point, they are no longer subject to any resources/sickness insurance conditions.

The freedom of movement of third-country nationals who do not belong to the family of an EU migrant is subject to more restrictions. This area is partially regulated by EU law and partially regulated by national immigration laws.

In the context of international protection procedures, children are regarded as "vulnerable persons" whose specific situation Member States are required to take into account when implementing EU law.[431] This requires states to identify and accommodate any special provision that asylum-seeking children in particular might need when they enter the host state. Article 24 of the EU Charter of Fundamental Rights applies to the entry and residence requirements of the EU asylum *acquis* as it relates to children. It requires that in all actions relating to children, whether taken by public authorities or private institutions, EU Member States ensure that the best interests of the child are a primary consideration. More specifically, the best interests principle underpins the implementation of Directive 2013/32/EU on common procedures for granting and withdrawing international protection (Asylum Procedures Directive)[432] and the Regulation establishing the criteria and mechanisms for determining the Member State responsible for examining an application for international protection lodged in one of the Member States by a third-country national or a stateless person (Dublin Regulation) as they relate to children.[433] Both texts also contain specific guarantees for unaccompanied children, including their legal representation. The Regulation (562/2006) on the Schengen Borders Code

431 See specifically Reception Conditions Directive 2013/33/EU, Art. 21 and Return Directive 2008/115/EC, Art. 3 (9).

432 Directive 2013/32/EU of the European Parliament and of the Council of 26 June 2013 on common procedures for granting and withdrawing international protection (recast), 29 June 2013, L 180/60, Art. 25(6).

433 Regulation (EU) No. 604/2013 of the European Parliament and of the Council of 26 June 2013 establishing the criteria and mechanisms for determining the Member State responsible for examining an application for international protection lodged in one of the Member States by a third-country national or a stateless person (recast), OJ 2013 L. 180/31-180/59, Art. 6.

requires border guards to check that the persons accompanying children have parental care over them, especially where children are accompanied by only one adult and there are serious grounds for suspecting that the children may have been unlawfully removed from the custody of their legal guardian(s). In this case, the border guard must investigate further to detect any inconsistencies or contradictions in the information given. If children are travelling unaccompanied, border guards must ensure, by means of thorough checks on travel and supporting documents, that the children are not leaving the territory against the wishes of the person(s) responsible for their parental care.[434]

Under CoE law, states have the right, as a matter of well-established international law and subject to their treaty obligations, including the ECHR, to control the entry, residence and expulsion of aliens. The right to respect for private and family life in Article 8 of the ECHR is often invoked as a safeguard against expulsion in cases concerning children who otherwise would have been assessed as not in need of international protection, including subsidiary protection. Article 8 violations have been found in cases involving children, as forced separation from close family members is likely to have an acute impact on their education, social and emotional stability and identity.[435]

9.2. Age assessment[436]

Key points

- Age assessment procedures must take account of the child's rights.
- Age assessment refers to the procedures through which authorities seek to establish the legal age of a migrant to determine which immigration procedures and rules need to be followed.

Under EU law, Article 25 (5) of the Asylum Procedures Directive allows Member States to resort to medical examinations, but requires that these be performed

434 Regulation (562/2006) of the European Parliament and the Council of 15 March 2016 establishing a Community Code on the rules governing the movement of persons across borders (Schengen Borders Code) Annex VII, 6.

435 ECtHR, *Şen v. the Netherlands*, No. 31465/96, 21 December 2001 (available in French); ECtHR, *Tuquabo-Tekle and Others v. the Netherlands*, No. 60665/00, 1 December 2005.

436 See also FRA and ECtHR (2014), Section 9.1.2.

"with full respect for the individual's dignity, shall be the least invasive examination, and shall be carried out by qualified medical professionals". This provision also requires that individuals are informed in a language they can understand that such an assessment may be carried out and their consent to examination should be obtained. The refusal to undergo age assessment cannot result in a rejection of the application for international protection.

There is significant variation in the nature and scope of age assessment methods applied across the EU.[437] In the UK for instance, the judiciary has reviewed domestic procedures on age assessment, and in the case of *Merton* it determined the minimum procedural requirements for assessing age when an individual claims to be an unaccompanied child.[438] Such requirements include, among others, the right of the asylum seeker to be informed about the reasons for rejection or objections of the interviewer.[439] National courts have also stated the need to apply the benefit of doubt in age assessment cases, although this has been interpreted by some national courts as a mere "sympathetic assessment of evidence" rather than a formal "benefit of doubt" principle.[440]

Under CoE law, there is no specific provision or ECtHR case law relating to children's rights in the context of age assessment procedures. However, particularly invasive practices used to this end might raise an issue under Articles 3 or 8 of the ECHR. Article 3 has been interpreted to include a broad range of scenarios that might be considered inhumane or degrading, including invasive physical examinations of children.[441] Under Article 8, applied to an immigration context, the authorities could legitimately interfere with a child's right to privacy and conduct age assessments if in accordance with the law and necessary to protect one of the legitimate aims listed in Article 8 (2) of the ECHR.

Under international law, Article 8 of the CRC obliges states to respect the child's right to identity. This implies an obligation to assist a child in asserting

437 For an overview of the various methods applied in each country, see the European Asylum Support Office Guidelines on Age Assessment Practice in Europe, Luxembourg, 2014. See further, FRA (2010), pp. 53–55.

441 ECtHR, *Yazgül Yilmaz v. Turkey*, No. 36369/06, 1 February 2011 (available in French).

his or her identity, which may involve confirming the child's age. Age assessment procedures, however, should be a last resort.

In any case, the best interests principle should underpin national procedures on age assessment. The UN Committee on the Rights of the Child affirms that age assessment should take into account the physical appearance of the child and his or her psychological maturity. The assessment must be conducted in a scientific, safe, child- and gender-sensitive and fair manner, avoiding any risk of violation of the physical integrity of the child, and giving due respect to human dignity.[442]

9.3. Family reunification for separated children[443]

Key points

- European-level provisions focus mainly on reuniting children safely with their parents, either in the host country or their country of origin.
- Preference will be given to the child's parents and/or primary carers when determining which family members should be reunited with the family.
- The child's best interests must guide family reunification cases.

Under EU law, the most notable instrument is the Family Reunification Directive, which requires Member States to authorise the entry and residence of the unaccompanied child's parents who are third-country nationals – in those situations where it is not in the child's best interest to join his/her parents abroad instead. In the absence of a parent, Member States have the discretion to authorise the entry and residence of the child's legal guardian or any other member of the family.[444] The definition and rights attached to 'family' are therefore more generous in the context of unaccompanied children than for most other categories of child migrants.

442 UN, Committee on the Rights of the Child, *General Comment No. 6 (2005): Treatment of unaccompanied and separated children outside their country of origin*, UN Doc. CRC/GC/2005/6, 1 September 2005, (V)(a)(31)(A).

443 See also FRA and ECtHR (2014), Section 5.3 on family reunification.

444 Arts. 10 (3) (a) and (b), respectively.

As to asylum-seeking children, the Qualification Directive emphasises the need to ensure, where possible, that an unaccompanied child is placed with adult relatives in the host state, that he or she remains with any siblings, and that absent family members are located in a sensitive and safe manner as soon as practicable (Article 31). The Reception Conditions Directive makes similar provisions for unaccompanied children who have not yet acquired refugee status (Article 24).

Council Directive 2001/55/EC on minimum standards for giving temporary protection in the event of a mass influx of displaced persons and on measures promoting a balance of efforts between Member States in receiving such persons and bearing the consequences thereof (Temporary Protection Directive) also seeks to expedite the reunification of family members (including children) who have been separated from one another following a sudden evacuation from their country of origin (Article 15).[445] However, this directive has to date not been applied; for it to be 'triggered', a Council decision is required – and such a decision has not yet been taken.

Article 24.3 of the Reception Conditions Directive (Recast) also requires that Member States start tracing the members of the unaccompanied child's family, where necessary. This is done with the assistance of international or other relevant organisations as soon as possible after an application for international protection is made, whilst protecting the child's best interests. In cases of a possible threat to the life or integrity of a child or his/her close relatives, particularly if they have remained in the country of origin, care must be taken to ensure that the collection, processing and circulation of information concerning them is undertaken on a confidential basis to avoid jeopardising their safety. Further, in accordance with Article 31 (5) of the Qualifications Directive (Recast), the granting of international protection to the child should not interfere with the start or continuation of the tracing process.

The Dublin Regulation provides, in addition, that if an unaccompanied child has a relative or relatives living in another Member State who can take care of him or her, Member States are obliged, where possible, to unite the child with them, unless this is contrary to the child's best interests (Article 8). In addition,

445 Council Directive 2001/55/EC of 20 July 2001 on minimum standards for giving temporary protection in the event of a mass influx of displaced persons and on measures promoting a balance of efforts between Member States in receiving such persons and bearing the consequences thereof, OJ 2001 L 212.

the Regulation contains an obligation to trace the relatives on the territory of Member States, while protecting the best interests of the child (Article 6). Furthermore, the Reception Conditions Directive contains an obligation to start tracing the members of the child's family, where necessary with the assistance of international or other relevant organisations (Article 24). The latter type of assistance is also envisaged under the Dublin Regulation (Article 6).

The best interests principle must always be applied when considering a decision concerning family reunification. For example, parents must be able to prove that they are capable of exercising their parental duties to the benefit of the child. National courts will find a child's return to his or her country of origin unlawful when authorities have failed to gather evidence that there are adequate arrangements for the child's reception and care in that country (Return Directive, Article 10 (2)).

Under CoE law, Article 8 of the ECHR does not allow migrant parents and their children an absolute right to choose where they want to live. National authorities can legitimately deport or refuse entry to family members provided there are no insurmountable obstacles to establishing family life elsewhere.[446] Such decisions must always be a proportionate response to wider public policy concerns, including the desire to deport or prevent the entry of a parent who has been involved in criminal activity.

Example: In *Şen v. Netherlands* the ECtHR confirmed that in striking a balance between the rights of the child/family and wider public policy interests, three key factors must be taken into account: the age of the children; their situation in the country of origin; and the degree to which they actually depend on their parents.

Example: The case of *Jeunesse v. the Netherlands*[447] concerns the Dutch authorities' refusal to allow a Surinamese woman married to a Dutch national, with whom she had three children, to reside in the Netherlands on the basis of her family life in the country. The ECtHR considered that the authorities had not paid enough attention to the impact of their re-

446 ECtHR, *Bajsultanov v. Austria*, No. 54131/10, 12 June 2012; ECtHR, *Latifa Benamar and Others v. the Netherlands*, Decision of inadmissibility, No. 43786/04, 5 April 2005.

447 ECtHR, *Jeunesse v. the Netherlands* [GC], No. 12738/10, 3 October 2014.

fusal on the applicant's children and their best interests. The ECtHR found a violation of Article 8 of the ECHR on account that a fair balance had not been struck between the personal interests of the applicant and her family in maintaining their family life in the Netherlands and the public order interests of the Government in controlling immigration.

Under international law, a child has the right not to be separated from his or her family unless separation is deemed to be in the child's best interests (Article 9 (1) CRC). Article 10 of the CRC provides that a child whose parents live in different countries should be allowed to move between those countries to stay in contact with them both, or to reunify, subject to national immigration law. The best interests principle, as enshrined in Article 3 of the CRC, underpins all decisions relating to family reunification with a child or unaccompanied child.[448]

9.4. Detention

Key points

- European law authorises the detention of children in an immigration context only as a measure of last resort.
- National authorities are obliged to place children in appropriate alternative accommodation.

Under EU law, Article 11 of the Reception Conditions Directive (Recast) requires that children should only be detained as a last measure and only if less coercive measures cannot be applied effectively. Such detention should be for the shortest period of time possible, and all efforts made to release those detained and to place them in a suitable accommodation. Where children are detained, they should have the possibility to engage in leisure activities, including play and recreational activities appropriate to their age. According to the same article, unaccompanied children too should only be detained in exceptional circumstances, and all efforts should be made to release them as soon as

448 According to UNICEF, in relation to claims to reunite the child with his/her family in the host state, national courts must also ensure that parents are not exploiting their children in order to obtain residence permits for that country. See UNICEF, Judicial implementation of Art. 3 of the CRC in Europe, p. 104. See also UNHCR (2008), *Guidelines on Determining the Best Interests of the Child*, May 2008.

possible. They should never be detained in prison accommodation, but rather be provided with accommodation in institutions equipped with personnel and age-appropriate facilities. Their accommodation should be separate from adults.

Article 17 of the Return Directive envisages the detention of children and families whose asylum application has been rejected subject to certain conditions. With regard to unaccompanied children, however, it requires that they be placed in institutions provided with staff and facilities which respond to the needs of persons of their age. There is as of yet no CJEU case law relating specifically to the detention of children.

Under CoE law, the detention of migrant children has been addressed in the context of Articles 3 and 5 of the ECHR.

> Example: *Mubilanzila Mayeka and Kaniki Mitunga v. Belgium*,[449] concerns an unaccompanied child held in detention. A five year old child was detained in a transit centre for adults for two months without appropriate support. The child had travelled from the Democratic Republic of Congo without the necessary travel papers in the hope of being reunited with her mother, who had obtained refugee status in Canada. The child was subsequently returned to the Democratic Republic of Congo, despite the fact that she had no family members waiting there to care for her. The ECtHR ruled that in the absence of any risk of the child seeking to evade the supervision of the Belgian authorities, detaining her in a closed centre for adults had been unnecessary. The ECtHR also noted that other measures – such as placing her in a specialised centre or with foster parents – could have been taken that would have been more conducive to the best interest of the child as enshrined in Article 3 of the CRC. The ECtHR found violations of Articles 3, 5 and 8 of the ECHR.

Other cases have highlighted the illegality of detention, even where the child in question was accompanied by a parent.

449 ECtHR, *Mubilanzila Mayeka and Kaniki Mitunga v. Belgium*, No. 13178/03, 12 October 2006.

Example: In *Muskhadzhiyeva and Others v. Belgium*,[450] the ECtHR ruled that the month-long detention in a closed transit centre of a mother and her four children, aged between seven months and seven years, constituted a violation of Article 3 of the ECHR. In reaching its conclusions, the Court drew attention to the fact that the centre was "ill-equipped to receive children", with serious consequences for their mental health.

Example: *Popov v. France*[451] concerns the administrative detention of a family for two weeks pending their deportation to Kazakhstan, confirms this ruling. The ECtHR found a violation of Article 3 of the ECHR insofar as the French authorities had not measured the inevitably harmful effects on the two children (who were five months and three years old) of being held in a detention centre in conditions that were "ill-adapted to the presence of children".[452] The Court also found a violation of Article 5 and Article 8 in respect of the whole family and referred to Article 37 of the CRC, which provides that "[e]very child deprived of liberty shall be treated with humanity and respect for the inherent dignity of the human person, and in a manner which takes into account the needs of persons of his or her age".[453]

Example: Similarly, in *Kanagaratnam and Others v. Belgium*,[454] the detention of an asylum-seeking mother and her three children in a closed centre for aliens in an irregular situation for four months amounted to a breach of Articles 3 and 5 of the ECHR. Despite the fact that the children were accompanied by their mother, the Court considered that, by placing them in a closed centre, the Belgian authorities had exposed them to feelings of anxiety and inferiority and had, in full knowledge of the facts, risked compromising their development. [455]

450 ECtHR, *Muskhadzhiyeva and Others v. Belgium*, No. 41442/07, 19 January 2010 (available in French).

451 ECtHR, *Popov v. France*, Nos. 39472/07 and 39474/07, 19 January 2012.

452 *Ibid.*, para. 95.

453 *Ibid.*, para. 90.

454 ECtHR, *Kanagaratnam and Others v. Belgium*, No. 15297/09, 13 December 2011 (available in French).

455 The European Committee for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment (CPT), in its 19th General Report has described safeguards for irregular migrants deprived of their liberty, and additional safeguards for children; see further: *20 years of combating torture, 19th General Report of the European Committee for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment (CPT)*, 1 August 2008 to 31 July 2009.

Under international law, Article 9 (4) of the CRC provides that when a child is detained, state authorities must inform the child's parents of his or her whereabouts.[456]

9.5. Expulsion[457]

Key points

- The vulnerability of migrant children to expulsion is intrinsically linked with their parents' residence status in the host state.
- The best interests principle should guide all decisions relating to the expulsion of immigrant children and their family/primary carers.
- Under EU law, there are circumstances in which migrant children can remain in a host state notwithstanding their parents' legal status, particularly with a view to completing their education or where establishing family life elsewhere would be difficult.

Under EU law, as with other areas of EU migration law, rules governing the expulsion of children differ according to their nationality, their parents' nationality and the context of their migration. Once a child obtains access to a Member State under EU free movement law, he/she is likely to be able to remain there, even if the EU migrant parent he/she originally moved with no longer qualifies for ongoing residence or decides to leave.

Specifically, under the Free Movement Directive**,** children and other family members can remain in the host state following the death of the EU citizen parent they initially moved with (Article 12 (2)), provided they lived in the host state for at least 12 months before their parent's death. Similarly, they can, in principle, remain in the host state following their parent's departure. However, in both cases, if the child/family member is a third-country national, their ongoing residence is contingent on their being able to demonstrate they have

456 On international safeguards for children in situation of detention see *Report of the Special Rapporteur on torture and other cruel, inhuman or degrading treatment or punishment*, 5 March 2015, A/HRC/28/68.

457 Otherwise referred to as return, removal, repatriation, extradition, or deportation, depending on the legal context. For the purposes of this chapter, the term expulsion will be used to define the lawful removal of a non-national or other person from a state. See also FRA and ECtHR (2014), Section 5.4 on maintaining the family – protection from expulsion.

enough money to support themselves. They must also have sickness insurance (Article 7).

The rules are even more permissive for children enrolled in education facilities in the host state. In such cases, they and their custodial parent or carer are entitled to remain in the host state following the death or departure of the primary EU migrant citizen, irrespective of the child's nationality (Article 12 (3)). While originally it was thought that this education-related concession only applied to children in families with sufficient money to support themselves,[458] later case law has confirmed that it extends to children in education who may be dependent on social welfare support.[459]

Furthermore, family members and particularly third-country national parents also enjoy a right to remain in the host state following divorce from the partner who was an EU citizen, if they have primary custody of the couple's children or have been awarded rights of access to the children that must be exercised in the host state (Articles 13 (2) (b) and 13 (2) (d)).

The CJEU has referred to a child's status as an EU citizen under Article 20 of the TFEU to grant the child's third-country national parents a permit to work and reside in the EU Member State of the child's citizenship. This enables the child to enjoy the rights attached to his/her status as an EU citizen, in so far as the child would otherwise have to leave the EU to accompany his/her parents.[460] Subsequent CJEU jurisprudence indicates, however, that "the mere fact that it might appear desirable to a national of a Member State, for economic reasons or in order to keep his family together in the territory of the Union, for the members of his family who do not have the nationality of a Member State to be able to reside with him in the territory of the Union, is not sufficient in itself to support the view that the Union citizen will be forced to leave Union territory if such a right is not granted".[461]

458 CJEU C-413/99, *Baumbast and R v. Secretary of State for the Home Department*, 17 September 2002.

Nimco Hassan Ibrahim and Secretary of State for the Home Department* [GC], 23 February 2010. The education of migrant children is considered further in Section 8.2.

460 CJEU, C-34/09, *Gerardo Ruiz Zambrano v. Office National de l'Emploi (ONEm)*, 8 March 2011.

461 CJEU, C-256/11, *Murat Dereci and Others v. Bundesministerium für Inneres* [GC], 15 November 2011, para. 68. See also CJEU, C-40/11, *Yoshikazu Iida v. Stadt Ulm*, 8 November 2012. See further, FRA and ECtHR (2014), pp. 125–127.

The Free Movement Directive explicitly provides that any exceptional expulsion of children should be in line with the provisions of the CRC (Recital 24). Moreover, Article 28 (3) (b) endorses children's immunity from expulsion unless it is deemed to be in their best interests and in accordance with the CRC.

As far as asylum seeking children whose claim has been rejected are concerned, the Return Directive specifies that the best interests of the child should inform decisions relating to the return of unaccompanied children (Article 10). Moreover, before removing an unaccompanied child from a Member State, the authorities of that Member State must be satisfied that the child will be returned to a member of his/her family, a nominated guardian or adequate reception facilities in the state of return (Article 10 (2)).

In circumstances where asylum seeking children are returned to another Member State to have their asylum claim assessed, the Dublin Regulation stipulates that the best interests principle must guide the application of such decisions (Article 6). Furthermore, the regulation provides a checklist of factors to assist the authorities' determination of what is in the child's best interests. This includes due account for the child's family reunification possibilities; the child's well-being and social development; safety and security considerations, in particular where there is a risk of the child being a victim of human trafficking; and the views of the child, in accordance with his or her age and maturity.

Example: In *The Queen, on the application of MA and Others v. Secretary of State for the Home Department*,[462] the CJEU had to determine which state was responsible in the case of an unaccompanied child who had submitted asylum applications in different EU Member States and who had no family or relatives in other EU Member States. The CJEU clarified that in the absence of a family member legally present in a Member State, the state in which the child is physically present is responsible for examining such a claim. In doing so, it relied on Article 24 (2) of the EU Charter of Fundamental Rights, whereby in all actions relating to children, the child's best interests are to be a primary consideration.

Under CoE law, states are, in principle, permitted to interfere with the right to respect for family life in accordance with Article 8 (2) of the ECHR.

462 CJEU, C-648/11, *The Queen, on the application of MA and Others v. Secretary of State for the Home Department*, 6 June 2013.

Example: *Gül v. Switzerland*[463] concerns an applicant who lived in Switzerland with his wife and daughter, who were all granted residence permits on humanitarian grounds. He also wished to bring to Switzerland their minor son, whom they had left behind in Turkey, but the Swiss authorities refused to grant him this request, mainly on the grounds that he had insufficient means to provide for his family. The ECtHR held that by leaving Turkey the applicant had himself caused the separation with his son. His recent visits to Turkey showed that his initial reasons for applying for political asylum in Switzerland were no longer valid. There were no obstacles preventing the family from establishing themselves in their country of origin, where their minor son had always lived. While acknowledging that their family's situation was very difficult from the human point of view, the Court found no breach of Article 8 of the ECHR.

Example: In *Üner v. The Netherlands*[464] it was confirmed that consideration should be given to the impact that expulsion would have on any children in a family when determining whether it was a proportionate response. This involved considering: "the best interests and well-being of the children, in particular the seriousness of the difficulties which any children [...] are likely to encounter in the country to which the applicant is to be expelled; and the solidity of social, cultural and family ties with the host country and with the country of destination".

Example: The case of *Tarakhel v. Switzerland*[465] concerns the refusal of the Swiss authorities to examine the asylum application of an Afghan couple and their six children, and their decision to send them back to Italy. The ECtHR found that, in view of the current situation regarding the reception system in Italy, and in the absence of detailed and reliable information concerning the specific facility of destination, the Swiss authorities did not possess sufficient assurances that, if returned to Italy, the applicants would be taken charge of in a manner adapted to the age of the children. The ECtHR therefore found that there would be a violation of Article 3 of the ECHR if the Swiss authorities were to send the applicants back to Italy under the Dublin II Reg-

463 ECtHR, *Gül v. Switzerland*, No. 23218/94, 19 February 1996.

464 *ECtHR*, *Üner v. The Netherlands* [GC], No. 46410/99, 18 October 2006, paras. 57–58. See also *Boultif v. Switzerland*, No. 54273/00, 2 August 2001.

ulation without having first obtained individual assurances from the Italian authorities that the applicants would be taken charge of in a manner adapted to the age of the children and that the family would be kept together.

Under international law, a state shall upon request provide the parent(s) or the child with essential information concerning the whereabouts of the absent family member(s) in instances of detention, imprisonment, exile, deportation or death, unless it would be detrimental to the well-being of the child (Article 9 (4) of the CRC).

9.6. Access to justice[466]

Key point

- Migrant children have the right to an effective remedy.

Under EU law, children's rights to access justice in an immigration context are set out in a range of different instruments. First, the right to an effective legal remedy and to a fair trial is set out in Article 47 of the EU Charter of Fundamental Rights. This includes a right to a fair and public hearing within a reasonable time by an independent and impartial tribunal, including having the possibility of advice, a defence and appropriate legal representation under Article 48. For child migrants, this is reinforced by a range of secondary legislative provisions. In particular, the Dublin Regulation obliges Member States to ensure that an unaccompanied child is represented by an appropriately qualified professional who has access to all of the relevant information in the child's file (Article 6). Parallel provisions are found in the Qualification Directive (Article 31) and in the Asylum Procedures Directive (Article 25). Children's right to legal representation is also supported by their right to access victim services and special confidential support services under Article 8 of Directive 2012/29/EU establishing minimum standards on the rights, support and protection of victims of crime (Victims' Directive).[467]

466 See also FRA and ECtHR (2014), Section 4.5 on legal assistance in asylum and return procedures.

467 Directive 2012/29/EU of the European Parliament and of the Council of 25 October 2012 establishing minimum standards on the rights, support and protection of victims of crime, OJ 2012 L 315/55.

Rights associated with access to justice are not without their limitations, however, and may be subject to certain age conditions. For example, the Asylum Procedures Directive allows Member States to "refrain from appointing a [legal] representative where the unaccompanied minor will in all likelihood reach the age of 18 before a decision at first instance is taken" (Article 25 (2)).

Under CoE law, the ECtHR ruled out the applicability of Article 6 (right to a fair trial) in cases concerning decisions on entry, stay and deportation of aliens.[468] However, Article 13 of the ECHR (the right to an effective remedy) may be relied on in certain circumstances.

Example: *Rahimi v. Greece*[469] concerns the conditions in which a migrant child from Afghanistan, who had entered Greece irregularly, was held in a detention centre and subsequently released with a view to his expulsion. In finding a violation of Article 13 of the ECHR, the ECtHR noted that the information brochure provided to the applicant did not indicate the procedure to be followed to make a complaint to the chief of police. Moreover, the applicant was not informed in a language which he understood of the available remedies he could use to complain about the conditions of his detention. Relying on the reports of the European Committee for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment (CPT), the ECtHR noted the absence in Greece of an independent authority for the inspection of detention facilities of the law-enforcement agencies. It also noted that there was no impartial authority to make the remedy effective. Accordingly, it found violations of Article 3, Article 5 paragraphs 1 and 4, and Article 13 of the ECHR.

The ESC requires states to promote the legal (as well as social and economic) development of the family (Article 16). Moreover, Article 19 (1) requires states to maintain "adequate and free services" and to ensure that migrant workers and their families receive accurate information relating to emigration and immigration. A similar 'information' requirement (central to migrants' access to justice) is contained in Article 6 of the European Convention on the legal status of migrant workers, but the more extensive provisions governing "right

469 ECtHR, *Rahimi v. Greece*, No. 8687/08, 5 April 2011 (available in French).

of access to the courts and administrative authorities" (Article 26) are directed exclusively at migrant workers rather than their family members.[470]

In addition, it is worth noting that the CoE has developed very comprehensive guidelines on child-friendly justice, which set out how all justice and administrative proceedings, including immigration proceedings, should be adapted to meet the needs of children.[471]

Under international law, Article 37 of the CRC is particularly relevant for migrant children deprived of their liberty, as it ensures these children the right to prompt access to legal and other appropriate assistance, as well as the right to challenge the legality of the deprivation of their liberty before a court or other competent, independent and impartial authority, whose decision must furthermore be prompt.

Russia*, No. 1585/09, 2013 (disclosure of medical records) Convention for the Protection of Individuals with regard to Automatic Processing of Personal Data

This chapter addresses European legislation and case law in the field of consumer and data protection. There is an abundance of legislation and case law at the EU level, as the TFEU expressly lays down the EU's competence in these matters. The CoE's contribution in this field is more limited. At treaty level there are two main conventions on media and data protection. The ECtHR has also decided on a number of cases concerning the data protection of individuals.

The following sections shall concentrate on specific aspects of consumer law relating to children (Section 10.1) and data protection (Section 10.2). For each of these issues, the general legal framework and its applicability for children is analysed, as well as the specific norms for the protection of children, where relevant.

10.1. Protection of children as consumers

Key points

- According to the CJEU, child consumers' best interests and the protection of their rights override requirements of public interest justifying limits to the free movement of goods, persons, services and capital.
- Children as consumers should be provided with relevant information so as to be able to consider all relevant facts and make an informed choice.
- Unfair commercial practices are those that do not comply with the principle of professional diligence and may influence adult and child consumers' transactional decisions.
- Children can be included in clinical trials only if the administered medicinal product is expected to be of direct benefit to them, thereby outweighing the risks.
- EU and CoE law limit the amount of marketing children may be exposed to, without banning it as such.
- Children are entitled to specific protection, which implies protection against any advertising as well as tele-shopping programmes which could cause moral or physical harm to them.
- The placement of products advertisements in children's programmes is forbidden.

10.1.1. Consumer rights

Under EU law, the main pillars of consumer protection are laid down in Article 169 (1) of the TFEU and Article 38 of the EU Charter of Fundamental Rights. The CJEU has recognised that the best interests of the child override requirements of public interest, justifying limits to the common market freedoms.

Example: The case of *Dynamic Medien*[472] concerns the sale over the internet in Germany of DVDs of Japanese cartoons. The cartoons had been approved for children over 15 years of age in the United Kingdom. They had not been rated as appropriate by the relevant German authority. The main question before the CJEU was whether the prohibition in Germany was contrary to the freedom of movement principle. The CJEU found that the

472 CJEU, C-244/06, *Dynamic Medien Vertriebs GmbH v. Avides Media AG*, 14 February 2008.

main purpose of the German law was to protect children from information that would be detrimental to their well-being. It ruled that the restriction on the freedom of movement of goods was not disproportionate as long as it did not go beyond what was necessary to attain the objective of protecting children pursued by the Member State concerned.

Example: The case of *Omega*[473] concerns the operation of a 'laserdrome' in Germany. The game played in the 'laserdrome' included hitting sensory targets placed on the jackets worn by players. The equipment for the game was supplied by a British company and both the game and the equipment had been lawfully marketed in the United Kingdom. The game was prohibited in Germany on the ground that it was contrary to fundamental values such as human dignity. The CJEU found that the restriction imposed by the German authorities was not contrary to EU law, as it had been duly justified on public policy grounds.

The most recent review process of the EU consumer law resulted in the adoption of the Consumer Rights Directive 2011/83/EU (CRD), which aims to fully harmonise national laws on distance-selling and off-premises contracts, as well as other types of consumer contracts.[474] The intention is to balance a high level of consumer protection and the competitiveness of enterprises. As per Article 3 (3) (a), the CRD is not applicable to contracts for social services, including social housing, childcare and support of families and persons permanently or temporarily in need, including of long-term care. Social services include services for children and youth, assistance services for families, single parents and older persons, and services for migrants. The CRD dedicates specific attention to pre-contractual information. It bases its 'information requirements' on the assumption that if consumers, including children, are provided with due information, they will be able to consider all relevant facts and make an informed choice.

473 CJEU, C-36/02, *Omega Spielhallen- und Automatenaufstellungs-GmbH v. Oberbürgermeisterin der Bundesstadt Bonn*, 14 October 2004.

474 Directive 2011/83/EU of the European Parliament and the Council of 25 October 2011 on consumer rights, amending Council Directive 93/13/EEC and Directive 1999/44/EC of the European Parliament and of the Council and repealing Council Directive 85/577/EEC and Directive 97/7/EC of the European Parliament and of the Council, OJ 2011 L 304/64 (it should have been implemented by 13 December 2013).

10.1.2. Unfair commercial practices on children

Under EU law, Directive 2005/29/EC, concerning unfair business-to-consumer commercial practices in the internal market (UCPD),[475] covers the totality of business-to-consumer transactions (whether operated offline or online, involving both goods and services). Children are included in the UCPD in the category of 'vulnerable consumers' (Article 5 (3)). Transactional decisions cannot be taken following harassment, coercion or undue influence or misleading information, and child consumers have the right to make these decisions freely. The directive prohibits product marketing and advertising activities which create confusion with another product or with a competitor's trademark, and requires that all the necessary information for consumers be provided to them in a clear and comprehensible manner, and at a suitable time to enable them to make a transactional decision (Articles 6 and 7).

10.1.3. Products' safety

Under EU law, there is a comprehensive framework to ensure that only safe and otherwise compliant products find their way on to the market. In particular, Directive 2001/95/EC on general product safety (GPSD) dedicates specific attention to the safety of children by including them in the category of consumers who can be particularly vulnerable to the risks posed by the products under consideration (Recital 8 of the GPSD). Therefore, the safety of the product needs to be assessed, taking into account all the relevant aspects, in particular the categories of consumers to which the product is destined.

Council Directive 87/357/EEC is a specific product safety directive on the approximation of the laws of the Member States concerning products which, appearing to be other than they are, endanger the health or safety of consumers.[476] It prohibits the marketing, importing and manufacturing of products that look like foodstuffs, but that are not edible. Member States must carry out checks to ensure that no such products are marketed. If a Member State bans

475 Directive 2005/29/EC of European Parliament and of the Council of 11 May 2005 concerning unfair business-to-consumer commercial practices in the internal market and amending Council Directive 84/450/EEC, Directives 97/7/EC, 98/27/EC and 2002/65/EC of the European Parliament and of the Council and Regulation (EC) No. 2006/2004 of the European Parliament and of the Council, OJ 2005 L 149/22.

476 Council Directive 87/357/EEC of 25 June 1987 on the approximation of the laws of the Member States concerning products which, appearing to be other than they are, endanger the health or safety of consumers, OJ 1987 L 192/49.

a product under the terms of this directive, it must inform the Commission and provide details to inform the other Member States. The question of toy safety in particular is discussed in more detail under Section 10.1.6.

10.1.4. Clinical trials on children

Under EU law, Directive 2001/20/EC[477] on the approximation of national provisions relating to the implementation of 'good clinical practice' in the conduct of clinical trials on medicinal products for human use includes children among vulnerable persons who are incapable of giving legal consent to clinical trials (Recital 3). Children may only be included in clinical trials if they directly benefit from receiving the medicinal product and if such benefits outweigh the risks (Recital 3). Clinical trials should afford subjects the best possible protection (Article 4).

Similarly, Regulation (EU) No. 536/2014 on clinical trials on medicinal products for human use includes specific provisions for children in the vulnerable population category (Article 10 (1)). This regulation aims to gradually replace Directive 2001/20/EC.[478] It requires that applications for the authorisation of clinical trials involving children be carefully assessed. A child's legal representative must consent to a clinical trial taking place, as must the child if he/she is capable of forming an opinion (Article 29 (1) and (8)). The regulation lays down specific conditions for conducting safe clinical trials on children and ensuring their informed consent (Article 32). These conditions are that: no incentives are given to the subject except for compensation for expenses and loss of earnings directly related to the participation in the clinical trial; the clinical trial is intended to investigate treatments for a medical condition that only occurs in children; and there are scientific grounds for expecting that participation in the clinical trial will produce: a direct benefit for the minor concerned outweighing the risks and burdens involved; or some benefit for the population represented by the minor concerned and such a clinical trial will pose only minimal risk to, and will impose minimal burden on, the minor concerned in comparison with the standard treatment of the minor's condition. Only in emergency situations may

477 Directive 2001/20/EC of the European Parliament and of the Council of 4 April 2001 on the approximation of the laws, regulations and administrative provisions of the Member States relating to the implementation of good clinical practice in the conduct of clinical trials on medicinal products for human use, OJ 2001 L 121/34.

478 Regulation (EU) 536/2014 of the European Parliament and the Council of 16 April 2014 on clinical trials on medicinal products for human use, and repealing Directive 2001/20/EC, OJ 2014 L 158/1.

clinical trials be performed on children without having previously obtained their consent or the consent of their legal representatives (Article 35 (1)).

10.1.5. Food intended for infants and young children

Under EU law, Directive 2009/39/EC on foodstuffs intended for particular nutritional uses[479] focuses on the nutritional composition and safety of foods specifically manufactured for infants and young children under the age of 12 months. Its rules concern infant and follow-on formulae, processed cereal-based foods and baby foods and additives in foods for infants and young children. The directive aims to guarantee product safety and to provide the consumer with suitable products and appropriate information. It specifies, amongst other things, that a particular nutritional use shall fulfil the particular nutritional requirements of certain categories of persons, including those of infants or young children in good health (Article 1 (3) (c)).

10.1.6. Toy safety

Under EU law, Directive 2009/48/EC on the safety of toys (TSD)[480] defines toys in its Article 2 as "products designed or intended, whether or not exclusively, for use in play by children under 14 years of age".[481] Annex I provides a non-exhaustive list of items that are not considered toys, but that could be subject to confusion. Article 2 (2) also lists some toys that are excluded from its range of action. The TSD also reinforces health and safety standards by limiting the amounts of certain chemicals that may be contained in the material used for toys (Article 10).[482]

479 Directive 2009/39/EC of the European Parliament and of the Council of 6 May 2009 on foodstuffs intended for particular nutritional uses, OJ 2009 L 124/21.

480 Directive 2009/48/EC of the European Parliament and of the Council of 18 June 2009 on the safety of toys, OJ 2009 L 170.

481 *Ibid.*, Art. 2 (1).

482 The European Commission has also concluded 'voluntary agreements' with European toys industries/traders in order to improve toy safety. See further: http://ec.europa.eu/growth/sectors/toys/safety/index_en.htm.

10.1.7. Children and advertising

Under EU law, Directive 2010/13/EU on Audiovisual Media Services (AVMS Directive)[483] expanded the scope of legal regulation of the Directive 89/552/EEC on the coordination of certain provisions laid down by law, regulation or administrative action in Member States concerning the pursuit of television broadcasting activities (Television Without Frontiers (TWF) Directive). The AVMS Directive deals with the limitation of the amount, quality and content of marketing children may be exposed to, regulating the duration of advertisement (Articles 20, 24 and 27). It forbids product placement in children's programmes (Article 11) and authorises Member States to prohibit the display of sponsorship logos during programmes for children (Article 10 (4)).[484] The AVMS Directive balances the protection of children with other important democratic values, such as the freedom of expression, supporting the idea that such protection is possible through the essential involvement of parental responsibility (Recitals 48 and 59).

The effective implementation of the AVMS Directive is supplemented by the 1998[485] and 2006[486] recommendations on the protection of children and human dignity.

483 Directive 2010/13/EU of the European Parliament and the Council of 10 March 2010 on the coordination of certain provisions laid down by law, regulation or administrative action in Member States concerning the provision of audiovisual media services (Audiovisual Media Services Directive), OJ 2010 L 95/1.

484 For a more general overview of the functioning of the AMS Directive, please refer to: COM(2012) 203 final, Report from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions, on the application of Directive 2010/13/EU ('Audiovisual Media Service Directive'), Brussels, 4 May 2012 and SWD(2012) 125 final, Commission Staff Working Document attached to the First Report from the Commission to the European Parliament, the Council, The European Economic And Social Committee And The Committee of the Regions on the Application of Directive 2010/13/EU 'Audiovisual Media Services' accompanying the document, Brussels, 4 May 2012.

485 Council Recommendation 98/560/EC of 24 September 1998 on the development of the competitiveness of the European audiovisual and information services industry by promoting national frameworks aimed at achieving a comparable and effective level of protection of minors and human dignity, OJ 1998 L 270.

486 Recommendation 2006/952/EC of the European Parliament and of the Council of 20 December 2006 on the protection of minors and human dignity and on the right of reply in relation to the competitiveness of the European audiovisual and on-line information services industry, OJ 2006 L 378.

Under CoE law, the European Convention on Transfrontier Television[487] was the first international treaty to create a legal framework for the free circulation of transfrontier television programmes in Europe. It specifically protects children and youth (Article 7 (2)), for instance forbidding the screening of pornographic and violent material and of programmes inciting to racial hatred. It identifies advertising standards and regulates advertising time and advertising breaks.

10.2. Children and personal data protection

Key points

- Under EU and CoE law, personal data protection has been acknowledged as a fundamental right.
- The right to respect for private and family life, home and correspondence (Article 8 of the ECHR) includes the right to protection of personal data.
- Children have, among other rights relating to their personal data, the right to object to the processing of their data, except on compelling legitimate grounds.

10.2.1. European data protection law

Under EU law, the EU has competence to legislate on data protection matters (Article 16 of the TFEU).[488] Article 8 (2) of the EU Charter of Fundamental Rights contains key data protection principles (fair processing, consent or legitimate aim prescribed by law, right to access and rectification), whereas Article 8 (3) requires that compliance with data protection rules be subject to control by an independent authority. The right to the protection of personal data established in Article 8 may be limited in accordance with the law and for the respect of the principles of a democratic society such as the freedoms and rights of others (Article 52 of the Charter).[489]

487 Council of Europe, European Convention on Transfrontier Television, CETS No. 132, 1989. Amended according to the provisions of the Protocol, CETS No. 171, 2002.

488 For a general overview of European data protection law, see: FRA and CoE (2014).

489 CJEU, Joined cases C-468/10 and C-469/10, *Asociación Nacional de Establecimientos Financieros de Crédito (ASNEF) and Federación de Comercio Electrónico y Marketing Directo (FECEMD) v. Administración del Estado*, 24 November 2011, para. 48; CJEU, C-275/06, *Productores de Música de España (Promusicae) v. Telefónica de España SAU* [GC], 29 January 2008, para. 68.

Personal data protection has emerged as one of the key areas of European law relating to privacy. Directive 95/46/EC on the protection of individuals with regard to the processing of personal data and on the free movement of such data (Data Protection Directive)[490] is the main instrument in this field.

Because data processing is operated in closed spaces not open to the public, children as well as other data subjects are usually unaware of the processing of their own personal data. To counteract the vulnerability of data subjects, European law guarantees children (and other data subjects) specific individual rights, such as the right to be informed that their data are being collected, the right to access the stored data and to learn about the details of the processing operation, the right to object in case of unlawful processing, the rights to rectification, erasure and blocking of data.

Controllers of processing operations must provide adequate information with regard to processing of data (Articles 10 and 11 of the Data Protection Directive). Interpreted in a child-friendly manner, this implies that the language and the form of the information need to be adapted to the level of maturity and understanding of children. As a minimum requirement, the information must include the purpose of processing, as well as the identity and contact details of the controller (Articles 10 (a) and (b) of the Data Protection Directive).

The Data Protection Directive provides for the consent of data subjects, regardless of the sensitivity of the data processed (Articles 7, 8 and 14). A child-friendly consent procedure would entail taking into account the child's evolving capacities, progressively involving him or her. The first step entails a child being consulted by his/her legal representative prior to providing consent, before moving on to a parallel consent of the child and his or her legal representative, to the sole consent of the adolescent child.

Data subjects have the right to erasure of data, which entails the possibility of having their personal data removed or deleted upon their request, and also the right to object to the processing of their personal data. The latter has become increasingly important for children because of the massive amount of children's personal data circulated and available through social networking. Although the CJEU has not yet addressed cases concerning children, in a recent

490 Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data (Data Protection Directive), OJ 1995 L 281.

case concerning an adult applicant, it held that the right to object applies to data and information, "in particular where they appear to be inadequate, irrelevant or no longer relevant, or excessive in relation to those purposes and in the light of the time that has elapsed".[491] The CJEU also held that the applicability of the right to object needs to be balanced against other fundamental rights.

Under CoE law, the ECtHR has read the right to protection of personal data into Article 8 of the ECHR. The Court examines situations where the issue of data protection arises, including the interception of communications,[492] various forms of surveillance[493] and the protection against storage of personal data by public authorities.[494] Furthermore, the ECtHR ruled that national law must set out appropriate measures to ensure judicial remedies against infringements of data protection rights.

Example: In *K.U. v. Finland*,[495] the applicant was a child who complained that an advertisement of a sexual nature had been posted in his name on an internet dating site. The service provider refused to reveal the identity of the person who had posted the information because of confidentiality obligations under Finnish law. The applicant claimed that domestic law did not provide sufficient protection against the actions of a private person placing incriminating data about the applicant on the internet. The ECtHR held that states have positive obligations which involve adopting measures designed to secure respect for private life even in the sphere of relations between individuals. In the applicant's case, his practical and effective protection required that effective steps be taken to identify and prosecute the perpetrator. However, such protection was not afforded by the state, and the Court found a violation of Article 8 of the ECHR.[496]

491 CJEU, C-131/12, *Google Spain SL and Google Inc. v. Agencia Española de Protección de Datos (AEPD) and Mario Costeja González* [GC], 13 May 2014, para. 93.

492 See, for example: ECtHR, *Malone v. the United Kingdom*, No. 8691/79, 2 August 1984; ECtHR, *Copland v. the United Kingdom*, No. 62617/00, 3 April 2007.

493 See, for example: ECtHR, *Klass and Others v. Germany*, No. 5029/71, 6 September 1978; ECtHR, *Uzun v. Germany*, No. 35623/05, 2 September 2010.

494 See, for example: ECtHR, *Leander v. Sweden*, No. 9248/81, 26 March 1987; ECtHR, *S. and Marper v. the United Kingdom* [GC], Nos. 30562/04 and 30566/04, 4 December 2008.

495 ECtHR, *K.U. v. Finland*, No. 2872/02, 2 December 2008. See further Chapter 4.

496 FRA and CoE (2014), p. 122.

Example: *Avilkina and Others v. Russia*[497] concerns the disclosure of a two year old girl's medical files to the prosecutor, following his request to be informed about all refusals by Jehovah's Witnesses concerning blood transfusions. Acknowledging that the interests of a patient and the community as a whole in protecting the confidentiality of medical data might be outweighed by the interests of investigating crime, the Court noted that the applicant was not a suspect or accused in any criminal proceedings. In addition, the medical professionals providing treatment to the applicant could have applied for judicial authorisation for a blood transfusion, had they believed her to be in a life-threatening situation. In the absence of any pressing social need for requesting the disclosure of the confidential medical information concerning the applicant, the ECtHR found a violation of Article 8 of the ECHR.

Example: In *S. and Marper v. the United Kingdom*,[498] an eleven year old's fingerprints and DNA taken in relation with the suspicion of attempted robbery were retained without a time limit, even though he was ultimately acquitted. Given the nature and amount of personal information contained in cellular samples and DNA profiles, their retention in itself amounted to an interference with the first applicant's right to respect for private life. The core principles of the relevant instruments of the Council of Europe and the law and practice of the other contracting states require the retention of data to be proportionate in relation to the purpose of collection and limited in time, particularly in the police sector. The protection afforded by Article 8 of the ECHR would be unacceptably weakened if the use of modern scientific techniques in the criminal justice system were allowed at any cost and without carefully balancing their potential benefits against important private-life interests. In that respect, the blanket and indiscriminate nature of the power of retention in England and Wales was particularly striking, since it allowed data to be retained for an unlimited period of time and irrespective of the nature or gravity of the offence or of the age of the suspect. Retention could be especially harmful in the case of minors, given their special situation and the importance of their development and integration in society. In conclusion, the retention of data constituted a disproportionate interference with the applicant's right to respect for private life.

497 ECtHR, *Avilkina and Others v. Russia*, No. 1585/09, 6 June 2013.

498 ECtHR, *S. and Marper v. the United Kingdom* [GC], Nos. 30562/04 and 30566/04, 4 December 2008.

The Council of Europe Convention for the Protection of Individuals with regard to Automatic Processing of Personal Data[499] (Convention 108) applies to all data processing carried out both in the private and public sectors, and protects the individual, children included, against abuses which may accompany the processing of personal data. Convention 108 has an additional protocol which regulates the establishment of supervisory authorities and cross-border flow of personal data to non-Parties to the convention.[500]

The principles laid down in Convention 108 related to the processing of personal data concern fair and lawful collection and automatic processing of data, stored for specified legitimate purposes and not for use for ends incompatible with those purposes, nor kept for longer than is necessary. They also concern the quality of the data. In the absence of proper legal safeguards, the processing of 'sensitive' data, such as on a person's race, politics, health, religion, sexual life or criminal record, is prohibited. The convention also enshrines the individual's right, children included, to know that information is stored on him or her and, if necessary, to have it corrected. Restrictions on the rights laid down in the convention are possible only when overriding interests, such as state security or defence, are at stake.

Under international law, the right to data protection is part of the child's right to privacy contained in Article 16 of the CRC. This article provides that a child shall not be subject to arbitrary or unlawful interference with his or her privacy, family, home or correspondence, nor to unlawful attacks on his or her honour and reputation. This right must be respected by everybody, including the child's legal representative.

Hungary*, No. 19400/11, 2012 (exclusion of family from the witness protection programme)

Children's rights in the context of juvenile justice proceedings concern children accused of, prosecuted for or sentenced for having committed criminal offences, as well as children who participate in justice or related proceedings as victims and/or witnesses. The position of children in the context of juvenile justice is regulated by general human rights provisions relevant to both adults and children.

This chapter presents an overview of the European norms relevant to children involved in judicial and alternative proceedings. It addresses fair trial guarantees, including effective participation and access to a lawyer, the rights of detained young offenders, including pre-trial detention (substantive and procedural safeguards), conditions of detention and protection against ill-treatment, and the protection of child witnesses and victims. Protection aspects are especially relevant for non-adversarial, alternative proceedings, which should be used whenever these may best serve the child's best interests.[501] In the case of children, objectives of criminal justice, such as social integration, education and prevention of re-offending, are basic principles that are valued.[502]

501 Council of Europe, Committee of Ministers (2010), *Guidelines on child friendly justice*, 17 November 2010, para. 24.

502 See further, Council of Europe, Committee of Ministers (2008), Recommendation CM/Rec (2008)11 of the Committee of Ministers to member states on the European Rules for juvenile offenders subject to sanctions or measures, 5 November 2008, Part I.A.2.

11.1. Fair trial guarantees

Key points

- Children in criminal proceedings are entitled to be treated fairly and in a child-friendly manner.
- Court proceedings should be adjusted to children's needs to ensure their effective participation.
- Children have the right to access a lawyer from the initial stages of the criminal proceedings and from the first police interrogation.

While briefly outlining the general requirements for a fair trial at both the EU and CoE level, this section places particular emphasis on child-specific fair trial guarantees.

The right to a fair trial is a core pillar of a democratic society. Children suspected or accused of a crime have the right to a fair trial, and they benefit from the same guarantees as any other person in conflict with the law. Fair trial guarantees apply from the child's first interrogation and subsist during the trial. Children in conflict with the law are, however, particularly vulnerable and may therefore need additional protection. European bodies have developed specific requirements to ensure that these children's needs are effectively met.

Under EU law, several provisions of the EU Charter of Fundamental Rights establish basic rights of access to justice which sustain fair trial guarantees for both adults and children. Article 47 deals specifically with the right to an effective remedy and to fair trial, establishing requirements of particular relevance for children, such as the reasonability of time in having a fair and public hearing, and the rights to be defended, represented and advised as well as to legal aid. Similarly, the principles of legality and proportionality of criminal offences and penalties established in Article 49 are particularly relevant for children. In addition, several EU directives lay down specific fair trial guarantees in criminal proceedings: the Right to Interpretation and Translation Directive,[503] the Right

503 Directive 2010/64/EU of the European Parliament and of the Council of 20 October 2010 on the right to interpretation and translation in criminal proceedings, OJ 2010 L 280/1.

to Information Directive,[504] and the Access to a Lawyer Directive.[505] The first two directives do not include child-specific guarantees, although the Right to Information Directive contains provisions addressing the situation of vulnerable suspects or accused persons more generally. The child-related provisions of the Access to a Lawyer Directive are elaborated upon in Section 11.2.2.

Even in the absence of child-specific provisions, Member States must observe the EU Charter of Fundamental Rights when implementing the provisions of the aforementioned directives. Therefore, principles such as the child's best interests, enshrined in Article 24, should be given due weight in cases where children are the subject of any of the provisions of the directives. To date, no cases have been brought to the CJEU concerning the interpretation of Article 24 of the Charter in conjunction with one the mentioned directives.[506]

Of specific importance is the European Commission proposal for a directive on procedural safeguards for criminally suspected or accused children,[507] which aims to provide children mandatory access to a lawyer at all stages of criminal proceedings. It also provides that children should benefit from prompt information about their rights, the assistance of parents (or other appropriate persons) and questioning behind closed doors. In addition, children deprived of liberty should be entitled to receive appropriate education, guidance, training, and medical care, and to be kept separate from adults.[508]

Under CoE law, the ECHR fair trial guarantees are laid down in Article 6, which generates the most extensive case law of the ECtHR. Article 6 (1) of the ECHR includes some express fair trial guarantees: the right to a fair public hearing/

504 Directive 2012/13/EU of the European Parliament and of the Council of 22 May 2012 on the right to information in criminal proceedings, OJ 2012 L 142/1.

505 Directive 2013/48/EU of the European Parliament and of the Council of 22 October 2013 on the right of access to a lawyer in criminal proceedings and in European arrest warrant proceedings, and on the right to have a third party informed upon deprivation of liberty and to communicate with third persons and with consular authorities while deprived of liberty, OJ 2013 L 294/1.

506 The CJEU has dealt with the interpretation of Art. 24 in proceedings relating to international child abduction (see Section 5.4).

507 European Commission (2013), Proposal for a Directive of the European Parliament and of the Council on procedural safeguards for children suspected or accused in criminal proceedings, COM(2013) 822 final, Brussels, 27 November 2013.

508 See further Section 11.2. Of relevance for child protection can also be the European Commission (2013), Proposal for a Directive of the European Parliament and of the Council on provisional legal aid for suspects or accused persons deprived of liberty and legal aid in European arrest warrant proceedings, COM(2013) 824 final, Brussels, 27 November 2013.

pronouncement (unless it is contrary to, among others, the interests of juveniles); the right to a trial within reasonable time; the right to a trial by an independent and impartial tribunal; [509] and the right to a trial by a tribunal established by law. Inherent in the concept of a fair trial, the ECtHR has developed guarantees: equality of arms and adversarial proceedings; the right to remain silent; access to a lawyer; effective participation; presence at the hearing; and reasoned decisions. In addition, everyone must be presumed innocent until proven guilty, according to law (Article 6 (2) of the ECHR).

Everyone charged with a criminal offence shall have the following minimum rights: the right to be informed promptly about the charges in a language she/he understands (Article 6 (3) (a) of the ECHR); the right to have adequate time and facilities for the preparation of her/his defence (Article 6 (3) (b) of the ECHR); the right to have legal assistance of her/his own choosing (Article 6 (3) (c) of the ECHR); the right to examine or have witnesses examined (Article 6 (3) (d) of the ECHR); and the right to have the free assistance of an interpreter (Article 6 (3) (e) of the ECHR). These guarantees apply to adults and children alike. However, aspects of particular importance to children which have generated child-specific case law include the right to effective participation, as well as the right to access a lawyer. These two specific fair trial guarantees are therefore further elaborated upon in this chapter.

Of high importance for child suspects/accused are the CoE's *Guidelines on child friendly justice*.[510] Even if the guidelines are not legally binding, they represent a stepping stone in ensuring that justice proceedings, including those part of the criminal justice system, take into account the specific needs of children. They are built on existing ECtHR case law and other European and international legal standards, such as the UN Convention on the Rights of the Child. They are a useful tool for professionals dealing with children. According to Section I (1), the guidelines apply to children in judicial (criminal or non-criminal) proceedings or in alternatives to such proceedings. Of specific importance for children in criminal proceedings is the right to have the information on criminal charges explained to both the child and the parents in a way that they understand the exact charge (Section IV.A.1.5); the right to be questioned only in the presence of the lawyer/parents or a person of trust (Section C (30)); the right to

509 ECtHR, *Nortier v. the Netherlands*, No. 13924/88, 24 August 1993; ECtHR, *Adamkiewicz v. Poland*, No. 54729/00, 2 March 2010.

510 Council of Europe, Committee of Ministers (2010), *Guidelines on child friendly justice*, 17 November 2010.

speedy proceedings (Section D (4)) and the right to child-sensitive interviews or hearings (Section D (5)).

In June 2014, PACE adopted a resolution on child-friendly juvenile justice, with which it underscores the need for a rights-based and child-specific treatment of children in conflict with the law.[511] PACE calls upon Member States to implement international human right standards regarding juvenile justice, including the CoE's Guidelines on child friendly justice, and to bring national laws and practice in conformity with these standards. PACE suggests using liberty deprivation only as a measure of last resort and for the shortest possible period of time, setting the minimum age of criminal responsibility at 14 years old, without allowing for exceptions in cases of serious offences, and establishing a specialised juvenile justice system, including diversion mechanisms, non-custodial measures and specialised professionals.

Under international law, Article 40 of the CRC acknowledges that every child alleged as, accused of, or recognised as having infringed penal law is entitled to be treated fairly and in a manner that takes into account his/her age. The key objective of juvenile justice according to Article 40 of the CRC is to reintegrate children in society, in which they can play a constructive role. Article 40 (2) of the CRC recognises children's right to a fair trial and that children have some additional entitlements, including the right to be assisted by parents, the right to appeal and the right to have their privacy fully protected at all stages of the proceedings.

Further, other instruments have developed the CRC principles of fair trial and the right to be treated in a child-specific way, including the use of liberty deprivation as a measure of last resort and only for the shortest appropriate period of time (see Article 37 (b) of the CRC). Of particular importance are the UN Standard Minimum Rules for the Administration of Juvenile Justice (Beijing Rules),[512] the UN Guidelines for the Prevention of Juvenile Delinquency (Riyadh Guidelines)[513] and the UN Rules for the Protection of Juveniles Deprived

511 Parliamentary Assembly of the Council of Europe, Resolution 2010 (2014), "Child-friendly juvenile justice: from rhetoric to reality".

of their Liberty (also known as the 'Havana Rules').[514] The Beijing Rules provide detailed guidance on the implementation of Article 40 of the CRC's fair trial requirements and child-specific treatment, including the aims of juvenile justice, protection of privacy, investigation and prosecution, pre-trial detention, adjudication and disposition, and institutional and non-institutional treatment. The Havana Rules concern the treatment of juveniles deprived of their liberty and include rules regarding the definition of liberty deprivation, police custody and pre-trial detention, juvenile institution conditions, disciplinary procedures, screening methods and the use of force or restraint, complaint mechanisms, inspection and monitoring mechanisms and the reintegration of juveniles. Finally, the Riyadh Guidelines provide detailed guidelines regarding policies aiming at the prevention of juvenile delinquency.

The UNCRC issued one General Comment (No. 10)[515] on children and juvenile justice, which offers detailed guidance on how to interpret and implement the CRC as far as juvenile justice is concerned. This comment deals with important juvenile justice principles, including the right to effective participation as part of the right to a fair trial (see further in Section 11.1.1), the use of deprivation of liberty as a measure of last resort and for the shortest appropriate period of time, the use of diversion and prevention of juvenile delinquency, the embedment of the best interests of the child principle and the principle of non-discrimination in the juvenile justice system, and age limits. The UNCRC recommends to set the minimum age of criminal responsibility at 12, or preferably higher. It also recommends to grant all children the right to be dealt with in the context of juvenile justice and prohibits transferring 16 and 17 year olds to the adult criminal system in cases of serious offences. Other general comments, e.g. regarding the right to be heard (which is connected to the right to participate effectively in justice proceedings), and the protection against all forms of violence, are also relevant for juvenile justice.[516]

11.1.1. Effective participation

Under EU law, Article 47 of the EU Charter of Fundamental Rights lays down similar guarantees to those provided under Article 6 of the ECHR, including the right to a fair and public hearing within a reasonable time by an independent and impartial tribunal, the right to legal representation and the right to effective remedies. The proposed directive on procedural safeguards for criminally suspected or accused children includes the right to effective participation, as well as the right to legal representation.[517]

Under CoE law, the ECtHR has elaborated under Article 6 specific requirements for ensuring children's effective participation in criminal trials. As a general rule, proceedings should ensure that account is taken of the child's age, level of maturity and emotional capacities.[518] Concrete examples of 'effective participation' requirements include the child's presence during the hearings, holding of *in camera* hearings, limited publicity, ensuring that the child understands what is at stake and limited formality of court sessions. So far the ECtHR has not held that setting the age of criminal responsibility too low constitutes in itself a violation of Article 6 of the ECHR. When assessing whether a child was able to participate effectively in the national proceedings the ECtHR looks at the concrete circumstances of each case.

Example: The case of *T. v. the United Kingdom*[519] concerns the murder of a two year old by two ten year olds. They were committed to public trial under big media attention. The court procedure was partly modified, in that shorter sessions were held, the applicant's parents were placed close to him, a playing area was available during breaks, etc. Nevertheless, the applicant and his co-accused were tried in an adult court, and most of the rigors of a criminal trial were preserved. The ECtHR held that the applicant had not been able to participate effectively in the proceedings due to the publicity of the sessions combined with the high level of media attention and to his limited capacity to instruct his lawyers and to provide adequate testimonies. His rights under Article 6 of the ECHR were therefore violated.

517 European Commission (2013), Proposal for a Directive of the European Parliament and of the Council on procedural safeguards for children suspected or accused in criminal proceedings, COM(2013) 822 final, Brussels, 27 November 2013.

518 ECtHR, *T. v. the United Kingdom* [GC], No. 24724/94, 16 December 1999, para. 61.

519 ECtHR, *T. v. the United Kingdom* [GC], No. 24724/94, 16 December 1999.

The recognition of the right to effective participation is also at the core of the Council of Europe's Guidelines on child-friendly justice. Justice for children, including juvenile justice, should be "accessible, age appropriate, speedy, diligent, adapted to and focused on the needs and rights of the child, respecting the rights of the child including the right to due process, to participate in and to understand the proceedings, to respect for private and family life and to integrity and dignity".[520] The guidelines provide specific guidance on how children should be treated during juvenile justice or other justice proceedings. Children should have access to court and judicial proceedings, and their rights to legal counsel and representation and to be heard and express their views should be safeguarded; undue delay should be avoided, proceedings should be organised in a child-friendly way (which affects the environment and language) and special safeguards should be in place to take and respond to evidence/statements provided by children.[521]

11.1.2. Access to a lawyer

Under EU law, the Access to a Lawyer Directive 2013/48/EU[522] – to be implemented by 27 November 2016 – includes direct references to children in Recitals 52 and 55 of its preamble, as well as in Article 5 (2)–(4). Pursuant to Recital 55 and Article 5 (2), if a child is deprived of liberty, the holder of parental responsibility shall be notified and be given reasons thereof, unless this would be contrary to the child's best interests. In the latter case, another appropriate adult shall be informed. According to Article 2, the directive applies from the moment suspects or accused are made aware of having committed a criminal offence until the conclusion of the proceedings by a final determination of guilt or innocence. Further, Article 3 (3) lays down that access to a lawyer includes the right of suspects/accused to meet and communicate with the lawyer in private, including before the first interrogation, the presence and effective participation of the lawyer during questioning and the lawyer's presence during several investigative or evidence gathering acts.

520 Council of Europe, Committee of Ministers (2010), *Guidelines on child friendly justice*, 17 November 2010, para. II. C.

521 *Ibid.*, Section D.

522 Directive 2013/48/EU of the European Parliament and of the Council of 22 October 2013 on the right of access to a lawyer in criminal proceedings and in European arrest warrant proceedings, and on the right to have a third party informed upon deprivation of liberty and to communicate with third persons and with consular authorities while deprived of liberty, OJ 2013 L 294/1.

Under CoE law, the ECtHR considers access to a lawyer to be one of the fundamental elements of the right to a fair trial.[523] Individuals charged with a criminal offence have the right to access a lawyer from the early stages of a police investigation. That right may be limited in exceptional circumstances, provided that the limitation does not unduly prejudice the rights of the accused. The ECtHR has found that this could occur when statements given without having had access to a lawyer are used for conviction.[524] The ECtHR's scrutiny of whether an applicant had effective access to a lawyer is stricter in cases involving children.[525]

Example: The case of *Panovits v. Cyprus*[526] concerns a 17 year old who was charged with murder and robbery. He was brought to the police station, accompanied by his father. He was then arrested and taken to a separate room for questioning, in the absence of the father or a lawyer. While the applicant was being questioned, his father was informed of the applicant's right to contact a lawyer. Several minutes later, the father was told that his son had meanwhile confessed to having committed the crime. The ECtHR found that, in view of his age, the applicant could not have been considered to be aware of his right to legal representation before making any statement. It was also unlikely that he could reasonably have appreciated the consequences of him being questioned without the assistance of a lawyer in criminal proceedings concerning a murder. Even though the authorities appeared to have at all times been willing to allow the applicant to be assisted by a lawyer if he so requested, they had failed to make him aware of his right to request the assignment of a lawyer free of charge if necessary. There was no evidence that the applicant or his father expressly and unequivocally waived their right to legal assistance. Consequently, the Court found a violation of Article 6 (3) (c) in conjunction with Article 6 (1) of the ECHR.

11.2. Rights of young offenders in relation to detention

Key points

- Children may only be deprived of their liberty as a last resort and for the shortest appropriate period of time.
- If detained, children are to be treated age-appropriately and with respect for their dignity.
- Children should not be detained together with adults.

Every person has the right to liberty. Deprivation of liberty therefore constitutes an exception and includes any form of placement in an institution by decision of a judicial or administrative authority, from which the juvenile is not permitted to leave at will.[527] Given the importance of safeguarding the rights of the child, including their best interests, situations of liberty-deprivation should be considered from that particular angle when concerning children.

While detention occurs in various circumstances, this section focuses on children in contact with the criminal justice systems.

International instruments universally affirm that detention must be a measure of last resort. This means that state authorities faced with the question of placing a child in detention should first give adequate consideration to alternatives to protect the best interests of the child, as well as to further the reintegration of the child (Article 40 (1) of the CRC). Alternatives can include, for example: "care, guidance and supervision orders; counselling; probation; foster care; education and vocational training programmes" (Article 40 (4) of the CRC). Only where alternatives are not feasible should detention be considered. Moreover, detention should only be ordered for the shortest period of time and under appropriate substantive and procedural guarantees. In view of their age and vulnerability, children benefit from special rights and guarantees when placed in detention.

527 Rule 21.5 of Council of Europe, Committee of Ministers (2008), Recommendation CM/Rec(2008)11 on the European Rules for juvenile offenders subject to sanctions or measures, 5 November 2008.

11.2.1. Forms of detention (substantive and procedural guarantees)

Under EU law, the current legal framework for criminal justice proceedings does not include a binding instrument regarding the detention of children.

Under CoE law, Article 5 of the ECHR provides that everyone has the right to liberty. Detention is an exception which should be provided for by national law and should not be arbitrary. In addition, detention has to be justified under one of the six exhaustive situations listed under Articles 5 (1) (a) to (f). Detention of children in contact with the criminal justice system can be justified under paragraphs (a) detention after conviction by a competent court; (c) pre-trial detention; or (d) detention for the purpose of educational supervision in particular. The latter two shall be analysed, as they have given rise to specific duties on the part of the state authorities.

Pre-trial detention

'Pre-trial detention' refers to situations where individuals are taken into police custody on suspicion of having committed a criminal offence, or are held in remand. It starts when an individual is taken into custody and ends with the determination on the merits of the case by a court of first instance.[528] While children benefit from the same guarantees as adults, the ECtHR has laid down several additional principles to strengthen the position of children in domestic criminal proceedings.

The ECtHR has generally interpreted Article 5 (1) (c) and Article 5 (3) as requiring that a person be placed in pre-trial detention only if there is a reasonable suspicion of him/her having committed a criminal offence. Further, pre-trial detention should not exceed a reasonable time and should be reviewed at reasonable intervals. The longer the period of detention, the stronger the reasons put forward by the authorities to justify it need to be. According to ECtHR case law, a person charged with an offence must always be released pending trial, unless the state can show that there are "relevant and sufficient" reasons to justify the continued detention.[529]

528 ECtHR, *Idalov v. Russia* [GC], No. 5826/03, 22 May 2012, para. 112.

529 ECtHR, *Smirnova v. Russia*, No. 46133/99 and 48183/99, 24 July 2003, para. 58.

The ECtHR developed four basic acceptable reasons for refusing bail to the detainee in cases of pre-trial detention: the risks of absconding, of prejudicing the administration of justice, of committing further offences or of causing public disorder. In addition, the continuation of pre-trial detention should be strictly necessary, and the state must examine all the facts arguing for or against the existence of a genuine requirement of public interest justifying a continued deprivation of liberty.[530]

In cases involving children, the ECtHR mandates that state authorities should pay particular attention to the child's age when balancing the relevant arguments for and against pre-trial detention; it should be used as a measure of last resort and for the shortest possible period.[531] This implies that the authorities should consider alternatives to pre-trial detention.[532]Furthermore, state authorities should display special diligence in bringing children to trial within a reasonable time.[533]

Example: In *Nart v. Turkey*,[534] the 17 year old applicant was arrested on suspicion of having robbed a grocery shop. He was placed in pre-trial detention, in an adult prison, for 48 days. With particular reference to the fact that the applicant was a child, the ECtHR stated that "pre-trial detention of minors should be used only as a measure of last resort; it should be as short as possible and, where detention is strictly necessary, minors should be kept apart from adults".[535] In this particular case the authorities attempted to justify the pre-trial detention on the basis of the 'state of evidence', but the ECtHR found that this reason alone could not justify the length of the applicant's detention. Consequently, the ECtHR found a violation of Article 5 (3) of the ECHR.

535 *Ibid.*, para. 31.

Detention for the purpose of educational supervision

This form of detention has been ordered in situations where the child has a particular need for educational supervision because of a disturbed personality and violent behaviour. Article 5 (1) (d) of the ECHR primarily targets forms of detention outside the scope of the juvenile justice system.

Example: The case of *Bouamar v. Belgium*[536] concerns the placement of a child in a remand prison on nine occasions for periods of around 15 days. The applicant was an adolescent considered to have a disturbed personality and violent behaviour. The Belgian Government submitted that he had been placed in the remand prison for the purpose of educational supervision. The ECtHR noted that interim placements in a remand prison are not in themselves contrary to Article 5 (1) (d), as long as the authorities pursue the purpose of placing the juvenile under educational supervision. However, the ECtHR found that in the applicant's case the authorities failed to show that they had the intention or possibility to place him in an institution where he could benefit from educational supervision. Consequently, the ECtHR found a violation of Article 5 (1) (d) of the ECHR.

Example: *D.G. v. Ireland*[537] concerns the placement of a violent child in a detention centre. The ECtHR held that the notion of 'educational supervision' should not be equated strictly with classroom teaching. Educational supervision entails many aspects of the exercise of parental rights by the local authority for the benefit and protection of the person concerned. The ECtHR held that it is permissible for domestic authorities to place juveniles in detention facilities on a temporary basis until suitable accommodation is found, as long as this happens speedily. In the applicant's case the speediness requirement was not met as he was only placed in a suitable accommodation more than six months after his release from detention. The ECtHR therefore found a violation of Article 5 (1) (d) of the ECHR.

536 ECtHR, *Bouamar v. Belgium*, No. 9106/80, 29 February 1988.

537 ECtHR, *D.G. v. Ireland*, No. 39474/98, 16 May 2002.

Appeals to detention, speediness of review and access to a lawyer

The ECtHR requires particular diligence from national authorities in cases involving children in detention. In addition to the guarantees mentioned above, state authorities must ensure that children have the right to challenge the lawfulness of the detention at reasonable intervals, and that they have access to a lawyer during the proceedings determining the lawfulness of their detention. Furthermore, these legal challenges need to be decided speedily by domestic courts. The ECtHR derives these procedural guarantees from the text of Article 5 (4) of the ECHR.

> Example: In *Bouamar v. Belgium*,[538] the ECtHR found a violation of Article 5 (4) because: the hearings for the determination of the applicant's detention took place in the absence of his lawyers; they were not decided speedily; there was no actual decision on the 'lawfulness of the detention', since the domestic courts dismissed the applicant's appeals as devoid of purpose.

11.2.2. Conditions of detention

Under EU law, Article 4 of the EU Charter of Fundamental Rights prohibits torture and inhuman or degrading treatment. However, as the Charter only applies within the scope of EU law, this provision has to be linked to another EU legal instrument dealing with detention in order to bind Member States in this respect. So far, there have not been any cases before the CJEU in relation to Article 4 of the Charter.

Under CoE law, the ECtHR found that detaining children together with adults might lead to a breach of Article 3[539] or Article 5 of the ECHR.[540] Further, lack of adequate medical care in detention could also raise issues under Article 3.[541] Other aspects which may potentially raise issues under Article 3 include available cell space, lighting, and recreational activities.[542] In assessing the compatibility of conditions of detention with the standards of Article 3 of

538 ECtHR, *Bouamar v. Belgium*, No. 9106/80, 29 February 1988.

539 ECtHR, *Güveç v. Turkey*, No. 70337/01, 20 January 2009.

540 ECtHR, *Nart v. Turkey*, No. 20817/04, 6 May 2008.

541 ECtHR, *Güveç v. Turkey*, No. 70337/01, 20 January 2009; ECtHR, *Blokhin v. Russia*, No. 47152/06, 14 November 2013 (referred to the GC on 24 March 2014).

542 ECtHR, *Kuptsov and Kuptsova v. Russia*, No. 6110/03, 3 March 2011, para. 70.

the ECHR, the ECtHR often relies on the set of standards developed by the European Committee for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment (CPT), which monitors prison conditions under the umbrella of the European Convention for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment by conducting site visits to CoE member states.[543]

Example: In *Güveç v. Turkey*,[544] a fifteen year old boy was arrested on suspicion of membership of the Kurdistan Working Party (PKK). He was detained by the State Security Court in a prison for adults for five years. The ECtHR observed that his detention contravened Turkish regulations and obligations under international treaties, including, among others, Article 37 (c) of the CRC, which requires that children are kept separately from adults. The Court also noted that the applicant began to have psychological problems in prison, as a result of which he repeatedly attempted to commit suicide. In addition, the authorities failed to provide the applicant with adequate medical care. Consequently, given the applicant's age, the length of his detention in prison together with adults, the failure of the authorities to provide adequate medical care for his psychological problems, and their failure to take steps to prevent his repeated attempts to commit suicide, the ECtHR had no doubt that the applicant was subjected to inhuman and degrading treatment. There had accordingly been a violation of Article 3 of the ECHR.

The ECSR has consistently interpreted Article 17 of the ESC to the effect that if children are detained or imprisoned, they should be separated from adults.

The CoE European Rules for juvenile offenders subject to sanctions or measures provide detailed guidance on conditions of detention. They also provide that juveniles should not be held in institutions for adults, but in institutions specially designed for them.[545]

543 See, for example, ECtHR, *Güveç v. Turkey*, No. 70337/01, 20 January 2009.

544 *Ibid*.

545 Council of Europe, Committee of Ministers (2008), CM/Rec(2008)11 on the European Rules for juvenile offenders subject to sanctions or measures, 5 November 2008, Rule 59.1.

Under international law, the CRC contains a separate provision on deprivation of liberty of children. which states that children must be separated from adults, unless it is not in their best interest to do so (Article 37 (c) of the CRC). This article also stipulates that children, in principle, have the right to maintain contact with their family through correspondence or visits.

11.2.3. Protection against abuse and ill-treatment

Under CoE law, the ECtHR has repeatedly held that domestic authorities are responsible for protecting persons in detention from death, abuse or ill-treatment caused by other inmates or the authorities themselves. States' obligations in this respect are particularly strong, since detainees are under the authority and control of the state.[546] In addition to taking reasonable measures to protect inmates, state authorities must also conduct effective investigations into arguable allegations of ill-treatment or death.

Example: The case of *Çoşelav v. Turkey* concerns the suicide of an adolescent in prison,[547] who had previously unsuccessfully attempted to commit suicide on several occasions. Following those attempts, the authorities transferred him from a wing for juveniles to a detention facility for adults. Having first established that the authorities knew or ought to have known of the existence of a real and immediate risk to the life of the applicants' son, the Court then noted that the authorities failed to take reasonable measures to prevent the risk of suicide. The ECtHR placed a strong emphasis on the age of the deceased and the fact that he had been detained together with adults. Consequently, the ECtHR found a violation of the substantive aspect of Article 2 of the ECHR. In addition, the Court also found a violation of the procedural limb of Article 2 due to the authorities' failure to conduct an effective investigation into the death of the applicants' son. The reasons supporting these findings include: the failure of the authorities to promptly inform the applicants of their son's death; the failure of the prosecution to examine the alleged failures in preventing the suicide; and the excessive length of the ensuing administrative proceeding.

11.3. Protection of child victims and witnesses

Key point

- Child victims and witnesses are entitled to protection against further victimisation, to recovery and reintegration and to effective participation in criminal and alternative proceedings.

Under both EU and CoE law, the position of child victims and witnesses has been recognised.

Under EU law, the Victim's Rights Directive 2012/29/EU[548] explicitly recognises the position of child victims. It provides that, when the victim is a child, his or her best interests are a primary consideration and must be assessed on an individual basis. In addition, a child-sensitive approach must prevail, which means the child's age, maturity, views, needs and concerns must be taken into account. Moreover, the directive aims to ensure that the child and the holder of parental responsibility (or another legal representative) will be informed of any measures or rights specifically focused on the child (Article 1 (2)). Child victims also have the right to be heard during criminal proceedings, and Member States must ensure that they can also provide evidence. Due account must be taken of the child's age and maturity (Article 10 (1)). Furthermore, the directive aims to protect the privacy and identity of child victims during criminal proceedings, to prevent secondary victimisation, among other reasons (Article 21 (1), see also Article 26). Moreover, the directive establishes a special provision on the right to protection of child victims during criminal proceedings (Article 24), which deals with the audiovisual recording of interviews with child victims and its use as evidence in criminal proceedings, the appointment of special representatives, and the right to legal representation in the child's own name if there is a conflict of interests between the child victim and the holders of parental responsibility. The directive furthermore contains various provisions for the protection of victims in general, such as access to victim support services. In the case of children or other vulnerable groups, specialist support

548 Directive 2012/29/EU of the European Parliament and of the Council of 25 October 2012 establishing minimum standards on the rights, support and protection of victims of crime, OJ 2012 L 315/55.

services should be made available (see Section 38 of the resolution accompanying the directive).[549]

Before being replaced by the Victims' Directive, Framework Decision 2001/220/JHA on the standing of victims in criminal proceedings covered among other things the participation of victims, their rights and fair treatment. It recognised the special position of vulnerable victims, although it did not explicitly refer to children. Pursuant to this framework decision, the CJEU has ruled that children can be qualified as vulnerable when taking into account their age and the offences of which they consider themselves to have been victims. This consequently entitles them to special measures of protection, such as hearing them outside the trial court and before the trial takes place.[550] The CJEU has also ruled that all measures taken to protect victims must be designed in a way that the accused still receives a fair trial. In other words, the protection of victims and witnesses may not jeopardise the right of the accused person to a fair trial (see also the examples of case law of the ECtHR).[551]

Example: In the *Pupino* case,[552] an Italian school teacher was prosecuted for maltreating a pupil. Under the Italian Code of Criminal Procedure, witnesses must, as a rule, testify in court during the trial. In certain circumstances, however, their evidence may be taken before a judge ahead of trial through a special procedure (*incidente probatorio*). In this case, the public prosecutor asked the national court to allow the testimonies of the young children given in advance as evidence, but the national court refused. For the first time, the CJEU gave its interpretation of some of the provisions relevant to the standing of children as victims and witnesses in criminal proceedings. It underscored that the Framework Decision 2001/220/JHA requires Member States to ensure the specific protection of vulnerable victims, which means that the national court must be able to authorise vulnerable victims to testify in a way that guarantees their protection, for example outside the trial and before it takes place. The CJEU stated: "However, independently of whether a victim's minority is as a general rule sufficient to classify such a victim as particularly vulnerable

549 See FRA (2014b), p. 36.

550 CJEU, C-105/03, *Criminal proceedings against Maria Pupino* [GC], 16 June 2005, para. 53.

551 CJEU, C-105/03, *Criminal proceedings against Maria Pupino* [GC], 16 June 2005. See also CJEU, C-507/10, *Criminal proceedings against X*, 21 December 2011.

552 CJEU, C-105/03, *Criminal proceedings against Maria Pupino* [GC], 16 June 2005.

within the meaning of the Framework Decision, it cannot be denied that where, as in this case, young children claim to have been maltreated, and maltreated, moreover, by a teacher, those children are suitable for such classification, having regard in particular to their age and to the nature and consequences of the offences of which they consider themselves to be a victim".[553] Furthermore, the CJEU ruled that all measures concerning the protection and prevention of secondary victimisation must be designed in such a way that the defendant is still granted a fair trial.[554]

Under CoE law, the ECtHR ruled that there is a duty of the state to protect victims' interests. This is true for victims who participate as witnesses in criminal proceedings. Their interests under ECHR provisions, such as Article 2 and Article 8, must be balanced against the interests of the defence.[555] The ECtHR has a number of rulings concerning sexual offences in which children testified against the alleged perpetrators. This case law shows that the Court recognised that criminal proceedings concerning sexual offences "are often conceived of as an ordeal by the victim, in particular when the latter was unwillingly confronted with the defendant" and that this was even more prominent when children were concerned.[556] Consequently, the Court accepted that in such cases certain measures may be taken for the purpose of protecting the child victims. However, it also noted that such measures may not jeopardise the adequate and effective exercise of the rights of the defence, and the judicial authorities may therefore be required to take measures which counterbalance the handicaps under which the defence operates.[557]

Example: In *Kovač v. Croatia*,[558] a 12 year old girl testified before an investigating judge that the applicant had committed indecent acts on her. The applicant had not been present or represented during the said testimony, nor was he given the opportunity to contest the victim's statement The ECtHR reiterated that, as a rule, all evidence must be provided in

558 ECtHR, *Kovač v. Croatia*, No. 503/05, 12 July 2007.

the presence of the accused at a public hearing with a view to adversarial arguments. If statements at the stage of the police inquiry or the judicial investigation are used as evidence, this is not in itself inconsistent with Article 6 of the ECHR, provided that the defendant is given an adequate and proper opportunity to challenge and question the witness concerned, either at the time of making the statements or at a later stage of the proceedings. In the applicant's case, the victim's statements were the only direct evidence of the facts held against the applicant, and this evidence was decisive in the court's decision to issue a guilty verdict. However, the applicant had been unable to contest or obtain a reply from the domestic courts concerning his complaint in that respect. What is more, the victim's actual statement had never been read out before the trial court. Instead, the judge merely noted that the victim upheld her statement made before the investigating judge. Therefore, the ECtHR concluded that the applicant had not been afforded a fair trial, a breach of Article 6 (1) in conjunction with Article 6 (3) (d) of the ECHR.

Example: In *S.N. v. Sweden*,[559] a ten-year-old boy testified to the police that he was sexually abused by the applicant. The boy was interviewed twice by a police inspector with significant experience in child abuse cases. The first interview was videotaped, the second audiotaped. The lawyer of the applicant did not attend the second interview, but agreed with the police-inspector on the issues that needed to be discussed. During the trial, the District Court played the recordings of the child's interviews, but did not examine him in person. The court ultimately convicted the applicant, relying almost entirely on the child's testimonies. The Court of Appeal upheld the conviction. It found that the police interviews provided sufficient evidence for the applicant's guilt to be established, even though it acknowledged that there was no technical evidence supporting the child's allegations, which were sometimes imprecise. The ECtHR accepted that, in sexual offence cases, cross-examination of a witness is not always possible and that, in such cases, witness testimonies should be treated with extreme care. Although the statements made by the child were virtually the sole evidence against the accused, the proceedings as a whole were fair. The videotape was shown during the trial and appeal hearings and the transcript of the second interview was read out before the District Court; the audiotape was also played before the Court of Appeal. This gave the

559 ECtHR, *S.N. v. Sweden*, No. 34209/96, 2 July 2002.

applicant sufficient opportunity to challenge the child's testimony and his credibility in the course of the criminal proceedings. Consequently, there had been no violation of Article 6 (3) (d) of the ECHR.

The case law of the ECtHR is not only about balancing the protection of child victims and the right of the defendant to a fair trial, but also about the protection of the right to life of witnesses and their families, including children, under Article 2 of the ECHR, as shown by the following example.

Example: *R.R. and Others v. Hungary*[560] concerns a prisoner who testified in open court about his drug-trafficking activities and who was, along with his wife and two children, put in the official witness-protection programme for risk of retribution. When the authorities realised that the prisoner was still in contact with criminal circles, they removed him and his family from the witness protection programme for having breached its terms. Under Article 2 of the ECHR, the family claimed that their exclusion from the witness-protection programme had put their lives at risk of mafia retribution. The Court accepted that the applicants' inclusion in the witness protection programme and the father's collaboration with the authorities meant that the applicants' lives had been at risk when the measure was originally put in place. As the cancellation of their protection by the programme was not motivated by a reduction of that risk, but by a breach of its terms, the Court was not persuaded that the authorities had proven that the risk had ceased to exist. Furthermore, it was not unreasonable to suppose that, following the withdrawal of the family's cover identities, their identities and whereabouts became accessible to anyone wishing to harm them. In that way, the authorities potentially exposed the family to a life-threatening danger, in breach of Article 2 of the ECHR.

Article 31 of the Lanzarote Convention indicates which general measures of protection Member States should take to protect the rights and interests of victims, including their special needs as witnesses, at all stages of investigations and criminal proceedings (Article 31 (1)). These measures include information about their rights as victims, the availability of services and the general progress of the investigation or proceedings, the protection of their privacy and safety (including information on the release of the person prosecuted or convicted) and the avoidance of contact between victims and perpetrators in

560 ECtHR, *R.R. and Others v. Hungary*, No. 19400/11, 4 December 2012.

court and law enforcement agency premises. In addition, Article 31 provides that victims must have access to legal aid (Article 31 (3)). The information provided must be adapted to children's age and maturity and be in a language he or she understands (Article 31 (6)).

The CoE's *Guidelines on child friendly justice*[561] also pay attention to the position of the child victim and witness, particularly when he or she gives evidence in judicial proceedings. The guidelines call upon member states to make "'[e]very effort […] for children to give evidence in the most favourable settings and under the most suitable conditions, having regard to their age, maturity and level of understanding and any communication difficulties they may have".[562] To this end, trained professionals should be involved, and, for example, audiovisual statements encouraged. Children should also have the opportunity to give evidence in criminal cases without the presence of the alleged perpetrator. The guidelines also recognise that this child-friendly approach should respect the right of other parties to contest the content of the child's statements. In addition, the guidelines provide that the privacy and family life of child witnesses should be protected (Section IV (a) (9)) and proceedings should preferably be held *in camera*.

Under international law, the position of child victims has been explicitly recognised in Article 39 of the CRC. This provision stipulates that States Parties must take all appropriate measures to promote physical and psychological recovery and social reintegration of child victims. This recovery and reintegration must take place in an environment which fosters the health, self-respect and dignity of the child.

It is also important to note that the UN has adopted the Guidelines on Justice in Matters involving Child Victims and Witnesses of Crime.[563] These guidelines call for child victims and witnesses to be treated in a "child-sensitive manner", which "denotes an approach that balances the child's right to protection and that takes into account the child's individual needs and views".[564] The guide-

564 *Ibid.*, para. 9 (d).

lines provide very detailed guidance on how to implement these aspects. The UN Committee on the Rights of the Child has also underscored the relevance of these UN Guidelines under Article 12 of the CRC (right to be heard) in its General Comment.[565] According to the committee, child victims and child witnesses of a crime must be given an opportunity to fully exercise their rights to freely express their views, which in particular "means that every effort has to be made to ensure that a child victim and/or witness is consulted on the relevant matters with regard to involvement in the case under scrutiny, and enabled to express freely, and in her or his own manner, views and concerns regarding her or his involvement in the judicial process".[566] The Committee also argues that "the right of the child victim and witness is [...] linked to the right to be informed about issues such as availability of health, psychological and social services, the role of a child victim and/or witness, the ways in which 'questioning' is conducted, existing support mechanisms in place for the child when submitting a complaint and participating in investigations and court proceedings, the specific places and times of hearings, the availability of protective measures, the possibilities of receiving reparation, and the provisions for appeal".[567]

United Kingdom, Upper Tribunal, *R (on the application of MK) v. Wolverhampton City Council* [2013] UKUT 00177 (IAC), 26 March 2013 167

How to find case law of the European Courts

European Court of Human Rights: HUDOC case law database

The **HUDOC database** provides free access to ECtHR case law: http://HUDOC.echr.coe.int.

The database is available in English and French and provides a user-friendly search engine that makes it easy to find case law.

Video tutorials and user manuals are available on the HUDOC **Help** page. For details and examples of how to use filters and search fields, the user can place the mouse pointer on the ? at the right of every search tool in the Hudoc interface.

The case law references in this handbook provide the reader with comprehensive information that will enable them to easily find the full text of the judgment or decision cited.

Before starting a search, please note that the default settings show the Grand Chamber and Chamber judgments in the order of the latest judgment published. To search in other collections such as decisions, the user should tick the appropriate box in the **Document Collections** field appearing on the upper left side of the screen.

The simplest way to find cases is by entering the application number into the **Application Number** field under the **Advanced Search** on the upper right side of the screen and then clicking the blue 'Search' button.

To access further case law pertaining to other issues, for example, children-related issues, the user can use the **Search field** indicated with a magnifying glass on the top right part of the screen. In the search field, the user can search in the text using a:

- single word (e.g. child)
- phrase (e.g. "migrant children")
- case title
- State
- Boolean phrase (e.g. child IN alternative care)

To help the user perform a text search, the **Simple Boolean search** is available by clicking on the arrow appearing inside the **Search field**. The Simple Boolean search offers six search possibilities: this exact word or phrase, all of these words, any of these words, none of these words, near these words, free Boolean search.

Once the search results appear, the user can easily narrow the results using the filters appearing in the **Filters** field on the left side of the screen, for example, "Language" or "State". Filters can be used individually or in combination to further narrow the results. The "Keywords" filter can be a useful tool, as it often comprises terms extracted from the text of the ECHR and is directly linked to the Court's reasoning and conclusions.

Example: Finding the Court's case law on the issue of expulsion of asylum seekers putting them at risk of torture or inhuman or degrading treatment or punishment under Article 3 ECHR

1) The user first enters the phrase "asylum seekers" into the **Search field** and clicks the blue **Search button**.

2) After the search results appear, the user then selects the "3" under the **Violation filter** in the **Filters field** to narrow the results to those related to a violation of Article 3.

3) The user can then select the relevant keywords under the **Keywords filter** to narrow the results to those relevant to Article 3, such as the keyword "(Art. 3) Prohibition of torture".

For more significant cases, a legal summary is available in HUDOC. The summary comprises a descriptive head note, a concise presentation of the facts and the law, with emphasis on points of legal interest. If a summary exists, a link **Legal Summaries** will appear in the results together with the link to the judgment text or decision. Alternatively, the user can search exclusively for legal summaries by ticking the "Legal Summaries" box in the **Document Collections** field.

If non-official translations of a given case have been published, a link **Language versions** will appear in the results together with the link to the judgment text or decision. HUDOC also provides links to third-party internet sites that host other translations of ECtHR case law. For more information, see "Language versions" under the HUDOC "Help" section.

Court of Justice of the European Union: CURIA case law database

The **CURIA case law database** provides free access to ECJ/CJEU case law: http://curia.europa.eu.

The search engine is available in all official EU languages.[568] The **language** can be selected on the upper right side of the screen. The search engine can be used to search for information in all documents related to concluded and pending cases by the Court of Justice, the General Court and the Civil Service Tribunal.

There is a **Help** section available at http://curia.europa.eu/common/juris/en/aideGlobale.pdf#. Each search box also has a help page that can be accessed by clicking the icon and contains useful information to help the user make the best possible use of the tool.

The simplest way to find a specific case is to enter the full case number into the search box entitled **Case number** and then clicking the green 'Search' button. It is also possible to search for a case using a part of the case number. For example, entering 122 in the 'Case number' field will find Case No. 122 for

568 Available since 30 April 2004: Spanish, Danish, German, Greek, English, French, Italian, Dutch, Portuguese, Finnish and Swedish; since 1 May 2004: Czech, Estonian, Latvian, Lithuanian, Hungarian, Polish, Slovak and Slovene; since 1 January 2007: Bulgarian and Romanian; since 30 April 2007: Maltese; since 31 December 2011: Irish; temporary derogations have been laid down by Regulation (EC) No. 920/2005 and Regulation (EU) No. 1257/2010. Secondary legislation in force at the date of accession is being translated into Croatian and will gradually be published in the Special edition of the Official Journal of the European Union.

cases from any year and before any of the three courts: Court of Justice, the General Court and/or the Civil Service Tribunal.

Alternatively, one can also use the **Name of parties** field to search with the common name of a case. This is usually the simplified form of the names of the parties to the case.

There are a total of 16 multi-functional search fields available to help narrow the search results. The different search fields are user-friendly and can be used in various combinations. The fields often have search lists that can be accessed by clicking the icon and selecting available search terms.

For more general searches, using the **Text** field produces results based on keyword searches in all documents published in the European Court Reports since 1954, and since 1994 for the European Court Reports – Staff Cases (ECR-SC).

For more subject-specific searches, the **Subject-matter** field can be used. This requires clicking the icon to the right of the field and selecting the relevant subject(s) from the list. The search results will then produce an alphabetised list of selected documents related to the legal questions dealt with in the decisions of the Court of Justice, the General Court, the Civil Service Tribunal and in the Opinions of the Advocates General.

The CURIA website also has additional case law tools:

Numerical access: this section is a collection of case information for any case brought before one of the three courts. The cases are listed by their case number and in the order in which they were lodged at the relevant registry. Cases can be consulted by clicking on their case number. The 'Numerical access' section is available at: http://curia.europa.eu/jcms/jcms/Jo2_7045/.

Digest of the case-law: this section offers a systematic classification of case law summaries on the essential points of law stated in the decision in question. These summaries are based as closely as possible on the actual wording of that decision. The 'Digest' section is available at: http://curia.europa.eu/jcms/jcms/Jo2_7046/.

Annotation of judgments: this section contains references to annotations by legal commentators relating to the judgments delivered by the three courts

since they were first established. The judgments are listed separately by court or tribunal in chronological order according to their case number, while the annotations by legal commentators are listed in chronological order according to their appearance. References appear in their original language. The 'Annotation of judgments' section is available at: http://curia.europa.eu/jcms/jcms/Jo2_7083/.

National case-law database: this external database can be accessed through the CURIA website. It offers access to relevant national case law concerning EU law. The database is based on a collection of case law from EU Member State national courts and/or tribunals. The information has been collected by a selective trawl of legal journals and direct contact with numerous national courts and tribunals. The 'National case-law database' is available in English and in French and is available at: http://curia.europa.eu/jcms/jcms/Jo2_7062/.

EU legal instruments

All EU legal instruments are available online at http://eur-lex.europa.eu.

Short-hand name	Title
Non-discrimination	
Racial Equality Directive (2000/43/EC)	Council Directive 2000/43/EC of 29 June 2000 implementing the principle of equal treatment between persons irrespective of racial or ethnic origin, OJ L 180, 19.7.2000, pp. 22–26.
Employment Equality Directive (2000/78/EC)	Council Directive 2000/78/EC of 27 November 2000 establishing a general framework for equal treatment in employment and occupation, OJ L 303, 2.12.2000, pp. 16–22.
Gender Goods and Services Directive (2004/113/EC)	Council Directive 2004/113/EC of 13 December 2004 implementing the principle of equal treatment between men and women in the access to and supply of goods and services, OJ L 373, 21.12.2004, pp. 37–43.
Family life and parental care	
Brussels II bis Regulation (EC) No. 2201/2003	Council Regulation (EC) No. 2201/2003 of 27 November 2003 concerning jurisdiction and the recognition and enforcement of judgments in matrimonial matters and the matters of parental responsibility, repealing Regulation (EC) No. 1347/2000, OJ L 338, 23.12.2003, pp. 1–29.
Maintenance Regulation (EC) No. 4/2009	Council Regulation (EC) No. 4/2009 of 18 December 2008 on jurisdiction, applicable law, recognition and enforcement of decisions and cooperation in matters relating to maintenance obligations, OJ L 7, 10.1.2009, pp. 1–79.
Mediation Directive (2008/52/EC)	Directive 2008/52/EC of the European Parliament and of the Council of 21 May 2008 on certain aspects of mediation in civil and commercial matters, OJ L 136, 24.5.2008, pp. 3–8.
Access to Justice Directive (2002/8/EC)	Council Directive 2002/8/EC of 27 January 2003 to improve access to justice in cross-border disputes by establishing minimum common rules relating to legal aid for such disputes, OJ L 26, 31.1.2003, pp. 41–47.
Child protection against violence and exploitation	
Young Workers Directive (94/33/EC)	Council Directive 94/33/EC of 22 June 1994 on the protection of young people at work, OJ L 216, 20.8.1994, pp. 12–20.
Anti-Trafficking Directive (2011/36/EU)	Directive 2011/36/EU of the European Parliament and of the Council of 5 April 2011 on preventing and combating trafficking in human beings and protecting its victims, and replacing Council Framework Decision 2002/629/JHA, OJ L 101, 15.4.2011, pp. 1–11.

Directive on combating the sexual abuse and sexual exploitation of children and child pornography (2011/93/EU)	Directive 2011/93/EU of the European Parliament and of the Council of 13 December 2011 on combating the sexual abuse and sexual exploitation of children and child pornography, and replacing Council Framework Decision 2004/68/JHA, OJ L 335, 17.12.2011, pp. 1–14.
Victims' Directive (2012/29/EU)	Directive 2012/29/EU of the European Parliament and of the Council of 25 October 2012 establishing minimum standards on the rights, support and protection of victims of crime, and replacing Council Framework Decision 2001/220/JHA, OJ L 315, 14.11.2012, pp. 57–73.
Residence Permits for Victims of Anti-Trafficking Directive (2004/81/EC)	Council Directive 2004/81/EC of 29 April 2004 on the residence permit issued to third-country nationals who are victims of trafficking in human beings or who have been the subject of an action to facilitate illegal immigration, who cooperate with the competent authorities, OJ L 261, 6.8.2004, pp. 19–23.
Commission Decision 2007/698/EC	Commission Decision of 29 October 2007 amending Decision 2007/116/EC as regards the introduction of additional reserved numbers beginning with 116 (notified under document number C(2007) 5139) (Text with EEA relevance), OJ L 284, 30.10.2007, pp. 31–32.
Migration and asylum, including social rights of migrant children	
Asylum Procedures Directive (2013/32/EU)	Directive 2013/32/EU of the European Parliament and of the Council of 26 June 2013 on common procedures for granting and withdrawing international protection, OJ L 180, 29.6.2013, pp. 60–95.
Dublin Regulation (EU) No. 604/2013	Regulation (EU) No. 604/2013 of the European Parliament and of the Council of 26 June 2013 establishing the criteria and mechanisms for determining the Member State responsible for examining an application for international protection lodged in one of the Member States by a third-country national or a stateless person, OJ L 180, 29.6.2013, pp. 31–59.
Qualification Directive (2011/95/EU)	Directive 2011/95/EU of the European Parliament and of the Council of 13 December 2011 on standards for the qualification of third-country nationals or stateless persons as beneficiaries of international protection, for a uniform status for refugees or for persons eligible for subsidiary protection, and for the content of the protection granted, OJ L 337, 20.12.2011, pp. 9–26.
Regulation (EU) No. 492/2011	Regulation (EU) No. 492/2011 of the European Parliament and of the Council of 5 April 2011 on freedom of movement for workers within the Union Text with EEA relevance, OJ L 141, 27.5.2011, pp. 1–12.

Free Movement Directive (2004/38/EC)	Directive 2004/38/EC of the European Parliament and of the Council of 29 April 2004 on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States amending Regulation (EEC) No. 1612/68 and repealing Directives 64/221/EEC, 68/360/EEC, 72/194/EEC, 73/148/EEC, 75/34/EEC, 75/35/EEC, 90/364/EEC, 90/365/EEC and 93/96/EEC (Text with EEA relevance), OJ L 158, 30.4.2004, pp. 77–123.
Council Directive 77/486/EEC on the education of the children of migrant workers	Council Directive 77/486/EEC of 25 July 1977 on the education of the children of migrant workers, OJ L 199, 6.8.1977, pp. 32–33.
Family Reunification Directive (2003/86/EC)	Council Directive 2003/86/EC of 22 September 2003 on the right to family reunification, OJ L 251, 3.10.2003, pp. 12–18.
Temporary Protection Directive (2001/55/EC)	Council Directive 2001/55/EC of 20 July 2001 on minimum standards for giving temporary protection in the event of a mass influx of displaced persons and on measures promoting a balance of efforts between Member States in receiving such persons and bearing the consequences thereof, OJ L 212, 7.8.2001, pp. 12–23.
Reception Conditions Directive (2013/33/EU)	Directive 2013/33/EU of the European Parliament and of the Council of 26 June 2013 laying down standards for the reception of applicants for international protection, OJ L 180, 29.6.2013, pp. 96–116.
Return Directive (2008/115/EC)	Directive 2008/115/EC of the European Parliament and of the Council of 16 December 2008 on common standards and procedures in Member States for returning illegally staying third-country nationals, OJ L 348, 24.12.2008, pp. 98–107.
Long-Term Residents Directive (2003/109/EC)	Council Directive 2003/109/EC of 25 November 2003 concerning the status of third-country nationals who are long-term residents, OJ L 16, 23.1.2004, pp. 44–53.
Schengen Borders Code Regulation (EC) No. 562/2006	Regulation (EC) No. 562/2006 of the European Parliament and of the Council o f15 March 2006 establishing a Community Code on the rules governing the movement of persons across borders (Schengen Borders Code), OJ L 105, 13.4.2006, pp. 1–32.
Consumer and personal data protection	
Consumer Rights Directive (2011/83/EU)	Directive 2011/83/EU of the European Parliament and of the Council of 25 October 2011 on consumer rights, amending Council Directive 93/13/EEC and Directive 1999/44/EC of the European Parliament and of the Council and repealing Council Directive 85/577/EEC and Directive 97/7/EC of the European Parliament and of the Council Text with EEA relevance, OJ L 304, 22.11.2011, pp. 64–88.

Directive 87/357/EEC concerning products which, appearing to be other than they are, endanger the health or safety of consumers	Council Directive 87/357/EEC of 25 June 1987 on the approximation of the laws of the Member States concerning products which, appearing to be other than they are, endanger the health or safety of consumers, OJ L 192, 11.7.87, pp. 49–50.
Distance Selling Directive (97/7/EC)	Directive 97/7/EC of the European Parliament and of the Council of 20 May 1997 on the protection of consumers in respect of distance contracts – Statement by the Council and the Parliament re Article 6 (1) – Statement by the Commission re Article 3 (1), first indent, OJ L 144, 4.6.1997, pp. 19–27.
General Product Safety Directive (2001/95/EC)	Directive 2001/95/EC of the European Parliament and of the Council of 3 December 2001 on general product safety (Text with EEA relevance), OJ L 11, 15.1.2002, pp. 4–17.
Directive 2009/39/EC on foodstuffs intended for particular nutritional uses	Directive 2009/39/EC of the European Parliament and of the Council of 6 May 2009 on foodstuffs intended for particular nutritional uses (recast) (Text with EEA relevance), OJ L 124, 20.5.2009, pp. 21–29.
Toy Safety Directive (2009/48/EC)	Directive 2009/48/EC of the European Parliament and of the Council of 18 June 2009 on the safety of toys (Text with EEA relevance), OJ L 170, 30.6.2009, pp. 1–37.
Television Without Frontiers Directive (89/552/EEC)	Council Directive 89/552/EEC of 3 October 1989 on the coordination of certain provisions laid down by Law, Regulation or Administrative Action in Member States concerning the pursuit of television broadcasting activities, OJ L 298, 17.10.1989, pp. 23–30.
Audiovisual Media Services Directive (2010/13/EU)	Directive 2010/13/EU of the European Parliament and of the Council of 10 March 2010 on the coordination of certain provisions laid down by law, regulation or administrative action in Member States concerning the provision of audiovisual media services (Text with EEA relevance), OJ L 95, 15.4.2010, pp. 1–24.
Data Protection Directive (95/46/EC)	Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data, OJ L 281, 23.11.95, pp. 31–50.
Directive 2002/58/EC concerning the processing of personal data and the protection of privacy in the electronic communications sector	Directive 2002/58/EC of the European Parliament and of the Council of 12 July 2002 concerning the processing of personal data and the protection of privacy in the electronic communications sector (Directive on privacy and electronic communications), OJ L 201, 31.7.2002, pp. 37–47.

Unfair Business-to-Consumer Commercial Practices Directive (2005/29/EC)	Directive 2005/29/EC of the European Parliament and of the Council of 11 May 2005 concerning unfair business-to-consumer commercial practices in the internal market and amending Council Directive 84/450/EEC, Directives 97/7/EC, 98/27/EC and 2002/65/EC of the European Parliament and of the Council and Regulation (EC) No. 2006/2004 of the European Parliament and of the Council ('Unfair Commercial Practices Directive') (Text with EEA relevance), OJ L 149, 11.6.2005, pp. 22–39.
Clinical Trials Directive (2001/20/EC)	Directive 2001/20/EC of the European Parliament and of the Council of 4 April 2001 on the approximation of the laws, regulations and administrative provisions of the Member States relating to the implementation of good clinical practice in the conduct of clinical trials on medicinal products for human use, OJ L 121, 1.5.2001, pp. 34–44.
Regulation 536/2014 on clinical trials on medicinal products for human use	Regulation (EU) No. 536/2014 of the European Parliament and of the Council of 16 April 2014 on clinical trials on medicinal products for human use, and repealing Directive 2001/20/EC (Text with EEA relevance), OJ L 158, 27.5.2014, pp. 1–76.
Criminal justice and alternative proceedings	
Right to Interpretation and Translation Directive (2010/64/EU)	Directive 2010/64/EU of the European Parliament and of the Council of 20 October 2010 on the right to interpretation and translation in criminal proceedings, OJ L 280, 26.10.2010, pp. 1–7.
Right to Information Directive (2012/13/EU)	Directive 2012/13/EU of the European Parliament and of the Council of 22 May 2012 on the right to information in criminal proceedings, OJ L 142, 1.6.2012, pp. 1–10.
Access to a Lawyer Directive (2013/48/EU)	Directive 2013/48/EU of the European Parliament and of the Council of 22 October 2013 on the right of access to a lawyer in criminal proceedings and in European arrest warrant proceedings, and on the right to have a third party informed upon deprivation of liberty and to communicate with third persons and with consular authorities while deprived of liberty, OJ L 294, 6.11.2013, pp. 1–12.
Charter of Fundamental Rights	Charter of Fundamental Rights of the European Union, OJ C 326, 26.10.2012, pp. 391–407.
Children with disabilities	
Council Decision 2010/48/EC	Council Decision 2010/48/EC concerning the conclusion, by the European Community, of the United Nations Convention on the Rights of Persons with Disabilities, OJ L 23, 27.1.2010, pp. 35–61.

A great deal of information on the European Union Agency for Fundamental Rights is available on the internet. It can be accessed through the FRA website at fra.europa.eu.

Further information on the case law of the European Court of Human Rights is available on the Court's website: echr.coe.int. The HUDOC search portal provides access to judgments and decisions in English and/or French, translations into additional languages, legal summaries, press releases and other information on the work of the Court.

How to obtain EU publications?

Free publications:

- one copy:
  via EU Bookshop (http://bookshop.europa.eu);
- more than one copy or posters/maps:
  from the European Union's representations (http://ec.europa.eu/represent_en.htm);
  from the delegations in non-EU countries (http://eeas.europa.eu/delegations/index_en.htm);
  by contacting the Europe Direct service (http://europa.eu/europedirect/index_en.htm) or calling 00 800 6 7 8 9 10 11 (freephone number from anywhere in the EU) (*).

  (*) The information given is free, as are most calls (though some operators, phone boxes or hotels may charge you).

Priced publications:

- via EU Bookshop (http://bookshop.europa.eu);

How to obtain Council of Europe publications

Council of Europe Publishing produces works in all the Organisation's spheres of reference, including human rights, legal science, health, ethics, social affairs, the environment, education, culture, sport, youth and architectural heritage. Books and electronic publications from the extensive catalogue may be ordered online (http://book.coe.int/).

A virtual reading room enables users to consult excerpts from the main works just published or the full texts of certain official documents at no cost.

Information on, as well as the full text of, the Council of Europe Conventions is available from the Treaty Office website: http://conventions.coe.int/.

EUROPEAN UNION AGENCY FOR FUNDAMENTAL RIGHTS

EUROPEAN COURT OF HUMAN RIGHTS
COUR EUROPÉENNE DES DROITS DE L'HOMME

COUNCIL OF EUROPE
CONSEIL DE L'EUROPE

Children are full-fledged holders of rights. They are beneficiaries of all human and fundamental rights and subjects of special regulations, given their specific characteristics. This handbook aims to illustrate how European law and case law accommodate the specific interests and needs of children. It also illustrates the importance of parents and guardians or other legal representatives and makes reference, where appropriate, to where rights and responsibilities are most prominently vested in children's carers. This handbook aims to raise awareness and improve the knowledge of the legal standards that protect and promote children's rights in Europe. It is a point of reference on both European Union (EU) and Council of Europe (CoE) law related to these subjects, explaining how each issue is regulated under EU law, including the Charter of Fundamental Rights of the European Union, as well as under the European Convention on Human Rights (ECHR), the European Social Charter (ESC) and other CoE instruments. The handbook is designed for non-specialist legal professionals, judges, public prosecutors, child protection authorities, and other practitioners and organisations responsible for ensuring the legal protection of the rights of the child. It explains key jurisprudence, summarising major rulings of both the Court of Justice of the European Union (CJEU) and the European Court of Human Rights (ECtHR).

Unit 03

Learning objectives

To describe the participatory powers of the traumatised child in civil and criminal proceedings concerning him/her
and the measures that aim to ensure his/her
safety and psycho-physical well-being

Main international and European sources

carepath

COUNCIL OF EUROPE

CONSEIL DE L'EUROPE

- Convention on the Rights of the Child (CRC)
- European Convention on the Exercise of Children's Rights (Strasbourg Conv.)
- Lanzarote Convention
- European Convention on Human Rights (ECHR)

- Charter of Fundamental Rights of the European Union
- Directive 2011/36/EU on trafficking in human beings
- Directive 2012/29/EU on the rights of victims of crime
- Directive 2011/93/EU on combating the sexual abuse and sexual exploitation of children and child pornography

Proceedings in which the child may be involved

1. Criminal proceedings

State's obligation to prevent and punish violence and abuse against minors (primary victimisation) *Art. 3-7 CRC; Art. 3 ECHR; Art. 18 Lanzarote; Art. 2-10 Directive 36; Art. 3-17 Directive 93*

Prevention

Introduction of criminal offences related to violence and abuse against children

Punishment

Punishment of perpetrators of violence and abuse against minors

2. Civil Proceedings

When one or both parents are direct perpetrators of the abuse, or have otherwise allowed it

To guarantee a safe and peaceful family environment

Art. 9 CRC; Art. 8 ECHR

Restrictions for parents

Custody of the child to another family

Placement in facilities for traumatised children

Adoption of the minor

- Video Baldelli
- Video Ceccarelli
- Video Cibinel

- Video Cibinel
- Video Baldelli

Relations between criminal and civil proceedings

carepath

Criminal proceedings

objective → to identify and punish the perpetrator of conduct against the minor, if that conduct is a crime

Civil proceedings

objective → to verify the adequacy of the child's family and to prevent any further injury

These proceedings are separate and independent → conduct that is not a crime can compromise the family environment, justifying the judge's intervention

3. Extrajudicial procedures

When the relationship between the perpetrator of the abuse and the minor appears to be recoverable

Art. 13 Strasbourg Conv.; Art. 12 Directive 29

The aim is to avoid intrusive procedures, which could definitively compromise the recovery of the relationship

- Mediation
- Conciliation attempt
- Additional measures for rapprochement

carepath

The best interests of the child

This principle applies to every proceeding and requires the child's psycho-physical wellbeing to be put before any other interest worthy of protection

Art. 3 CRC; Art. 6 Strasbourg Conv.

The Judge must gather all information necessary to know the facts at issue and the child's family environment

The Judge's decision must always be oriented towards protecting the minor's interests

- Video Ceccarelli
- Video Long

Child's right to be consulted

The child's views must be known by the judge and taken into account in the decision

Art. 12 CRC; Art. 3 Conv. Strasbourg

Participatory guarantees for the child

BUT

Protection measures to avoid "secondary victimisation"

Participatory guarantees for the child

1. The right to be informed

Art. 31 Lanzarote; Art. 3 Strasbourg Conv.; Art. 3-4 Directive 29

carepath

Only a child with adequate knowledge can profitably participate in the decision-making process

About What?

- meaning of the proceedings
- facts at issue
- rights and protections
- child's role
- possible consequences of his/her views

Who?

- judicial authority
- lawyer
- representative
- expert

How?

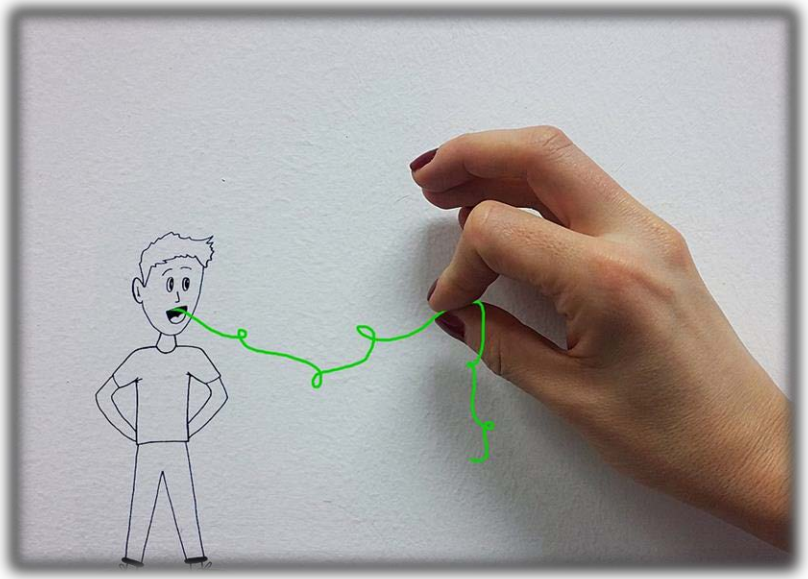
use of language and concepts suitable to the age and understanding of the child

2. Right to be heard about facts at issue

The minor may be asked to testify about facts relevant for the decision

Criminal proceedings

Child as witness of violence and abuse suffered, in order to ascertain the guilt of the accused



Civil proceedings

Child as witness of violence and abuse suffered, in order to assess the adequacy of the family

High risk of secondary victimisation

- Video Ceccarelli
- Video Cibinel
- Video Long

3. Right to be consulted before judge's decision

Before the decision, the child has the right to express his/her views on the issues addressed in the proceedings

Art. 12 CRC; Art. 3 Strasbourg Conv.

Criminal proceedings

- beginning of the proceedings
- precautionary measures
- probation and other special proceedings
- assessment of evidence

Civil proceedings

- removal from the family
- removal of one of the parents
- child custody
- adoption

Often opinion is replaced by the stronger guarantee of consent

Extrajudicial procedures

Consent for mediation or conciliation attempt

The weight of opinion depends on the child's understanding

Protection tools in the proceedings

1. Support persons

Art. 12 CRC; Art. 31 Lanzarote; Art. 9-10 Strasbourg Conv.; Art. 24 Directive 29

Representative (if parents are unavailable, or in conflict of interest)

He identifies and protects the child's interests

Lawyer

He adopts the most appropriate legal strategy to obtain a decision in accordance with the child's interests

Social or health professionals (psychologists, psychiatrists, social workers)

- protection against secondary victimisation
- support to the judge, parents and lawyers, to understand the needs and fragility of the child
- contribution to overcoming the trauma resulting from the violence suffered

These figures may be designated by the Judge

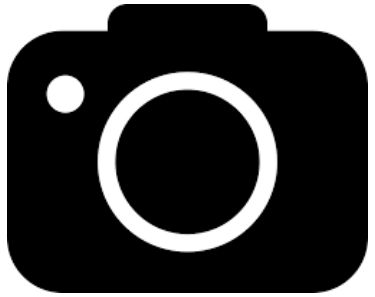
2. Privacy

Art. 16 CRC; Art. 8 ECHR; Art. 21 Directive 29

carepath

Hearing in closed session, without presence of the public

Limits to the dissemination of images and information



Limits to the questions about private life that can be addressed to the child during the hearing

3. Reasonable duration of the proceedings

Secondary victimisation is also linked to the length of the proceedings *Art. 7 Strasbourg Conv.*

conflict between different values

the decision must be taken as soon as possible to avoid prolonged stress

the other interests of the minor and of the other persons involved in the decision cannot be completely sacrificed

need for balancing

4. Protection measures during the hearing (part I)

When the child testifies about the abuse, about his relations with the perpetrator, about his family *Art. 31 Lanzarote; Art. 18 Directive 29; ECHR, 2.7.2002, S.N. c. Sweden*

⇩

Measures to avoid the risk of secondary victimisation

Venue of the hearing

hearing may take place outside the courtroom

⇩

Minor's house, judge's office, lawyer's office, special room

Who asks the questions?

the questions may not be addressed directly by the lawyers of the parties, but by the judge, or by an expert

⇩

Lawyers could be aggressive, or more simply they might not have experience in examining minors

4. Protection measures during the hearing (part II)

carepath

It is necessary to proceed as soon as possible to the hearing and to avoid repetitions

The wait for the hearing and repetitions increase stress

⇩

The hearing of the child must take place in the early stages of the procedure, and then it must no longer be repeated

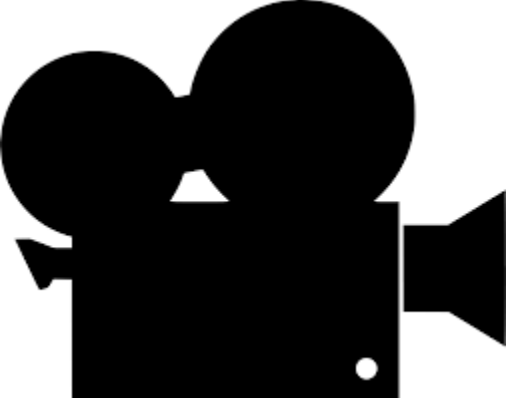
No contact with the accused, parents in conflict of interest and their lawyers

Eye contact can stress and intimidate the child

⇩

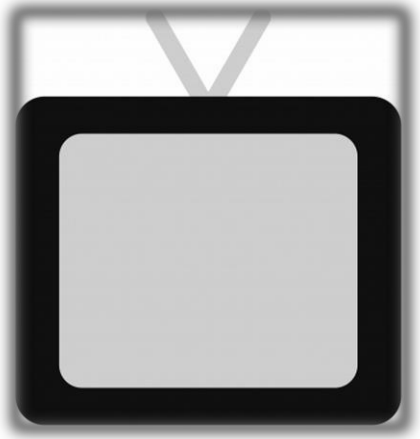
- intercom system with mirrored glass
- video conference
- questions prepared by the lawyers but addressed by the judge or by an expert in a special room

need to balance the interests of the child with the rights of the defence



carepath

Videos of child's hearing



Example of a special room in Italy

Preparation of the child before testifying
(video 1 and video 2)

A child's testimony about his sister's murder

5. Protection measures for the expression of the child's views or consent

Art. 6 Strasbourg Conv.

Free expression of opinion or consent could be affected by the presence of other persons such as parents, accused and lawyers

The Judge can hear what the child wants to say outside the courtroom, or not in the presence of those persons

- Video Ceccarelli
- Video Long

- Video Baldelli
- Video Cibinel

6. Well-being protection during the proceedings

Art. 20-21 CRC; Art. 31 Lanzarote; Art. 18 Directive 29

carepath

Before the final decision is taken, provisional precautionary measures can be adopted in order to protect the child

Measures against the perpetrator

- precautionary detention/house arrest
- restrictions against parents
- removal from the family home
- prohibition on approaching the child

Measures for the minor

- provisional custody with another family
- removal from the family home

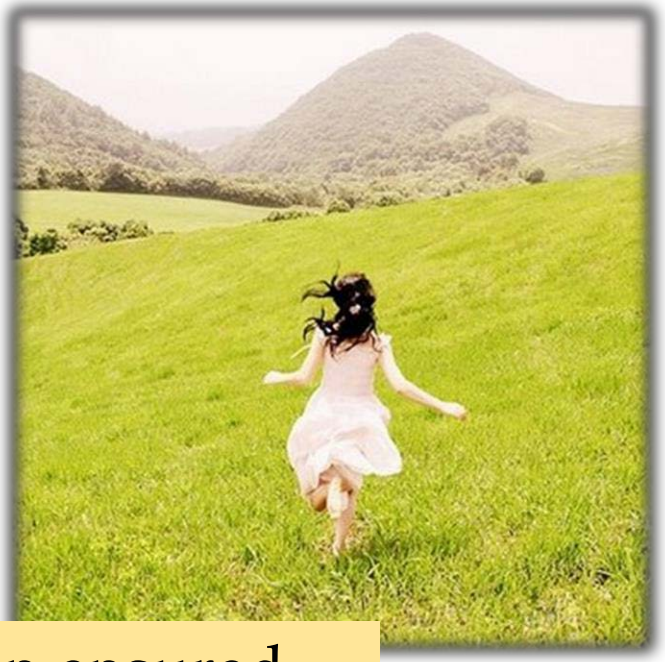
7. Assistance outside the proceedings

Art. 39 CRC; Art. 31 Lanzarote; Art. 8-9 Directive 29

Video Cibinel

Psychological and emotional support outside the proceedings

Secondary victimisation must be combated also before and after the hearing



These needs are often ensured through the work of social services

The punishment of the guilty and the recovery of family serenity are not enough

it is necessary to support the child to overcome the trauma resulting from the abuse suffered (primary victimisation)

Summary on the role of social or health professionals

carepath

Inside the proceedings

- Individual assessment of specific protection needs
- assistance during the child's participation in procedural activities
- assessment of the child's reliability
- participation in conciliation attempts
- assessment of the understanding
- evaluation of the family conditions

main objective → to prevent secondary victimisation and to provide the judge with useful knowledge for his decision

Outside the proceedings

- psychological and emotional support for the child
- checks on the conditions of the new family

main objective → to overcome the trauma caused by the violence and the abuse suffered and to restore family serenity

Unit 04

Learning objectives

To understand the operational effects on social and health policies of an approach centred on the fundamental rights of children and in particular on their participation rights

Legal framework vs. policies

carepath

Policies are an essential part of the framework for combating violence against children: the presence of adequate legislation that prohibits such violence is NOT sufficient!

"Too often, we see that legislation is on the books but that many children remain on the margins of society (...), all the more vulnerable to violence and abuse
(Rima Salah, Deputy Executive Director, UNICEF. cit., in United Nations Secretary-General's Study on Violence against Children)"

Social and health policies & participation rights

carepath

Children contribute to policies:

- ✓ actively participating in the decision-making process **in their specific case** (e.g. through interviews/letters to the social worker or judge responsible for their case, direct participation in meetings where decisions are made about their case, presence of a special representative)

- ✓ participating **as a group** in the definition of priorities and actions to combat violence against children (e.g. the establishment of advisory councils for children, involvement of young people in the training of childcare professionals, involvement of children in studies and research on the functioning of childcare services)

In the family

"A family where children can freely express views and be taken seriously from the earliest ages… **plays a preventive role against all forms of violence in the home and family**"

Parent education programmes addressing:
- the relationship of mutual respect between parents and children;
- the involvement of children in decision-making;
- ways of dealing with conflicting views within the family

Source: General Comment No. 12 (2009) *The right of the child to be heard*

EXAMPLE NO. 1

At global and European level there are multiple awareness-raising initiatives, several specifically aimed at parents, to affirm the illegitimacy of any corporal punishment of children

In alternative care

carepath

"Mechanisms must be introduced to ensure that children in all forms of alternative care, including in institutions, are able to express their views and that those views be given due weight in matters of their placement, the regulations of care in foster families or homes and their daily lives" (General Comment No. 12 (2009) *The right of the child to be heard*)

For instance, they must be heard in decisions concerning:

- the choice of the time and place of their placement in alternative care
- family members with whom to maintain contact during alternative care, the frequency and methods of such contacts
- projects about their future
- periodic reviews of their situation

(See SOS, Children's Villages International/ISS, Guidelines for the Alternative Care of Children: A UN Framework, Geneva, 2009)

General mechanisms could include:

- a **monitoring institution** (such as *ombudsman* for children) with unimpeded access to care facilities to hear the views and concerns of the child directly
- a **representative council** for children in the residential care facility, with a mandate to participate in the development and implementation of the policy and rules of the institution
- specific **training of professionals**, also involving children as trainers

Source: General Comment No. 12 (2009) *The right of the child to be heard*

Example No. 2

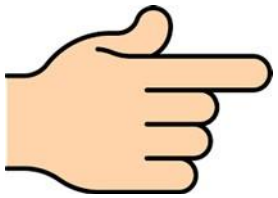
In several European countries, **informal networks of care leavers and former care leavers** placed in care facilities or foster families promote participation and active citizenship:

- creating moments of aggregation, discussion and mutual enrichment among the participants
- contributing to the improvement of social policies related to alternative care and to the need to specifically support young people leaving State care.

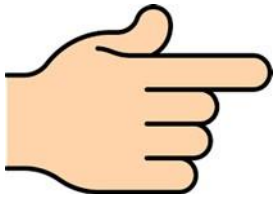
A *European Care Leavers Network* is currently being established.

Source: *http://www.agevolando.org/leavecare-livelife/*

One of the most recurrent concerns of children in alternative care is **the future after the coming of age**, which is often followed by the end of the State's specific obligation to care for them



For a concrete action of the Italian Care Leavers Network to raise awareness on the difficulty of care leavers becoming autonomous at the age of majority: see the video "18 years and (not) feeling it"



For the concrete action of an ombudsman, see the video of the Irish Ombudsman "Young person in residential care makes complaint to Ombudsman for Children"

Healthcare

carepath

Children should always be involved in discussions and decisions related to their health

(Unicef- Save The Children, *Every child's right to be heard* , 2009)

They have the "right to be **informed** in a manner appropriate to age and understanding" (art. 4 EACH – European Association for Children in Hospital – Charter)

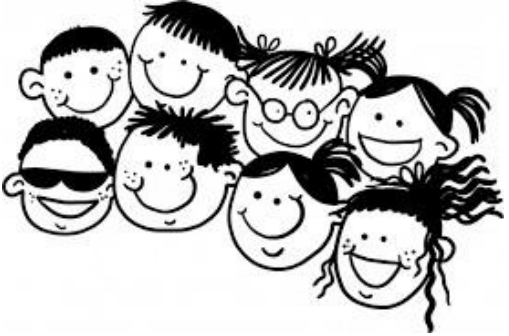
carepath

"Where, according to law, a minor does not have the capacity to consent to an intervention, the intervention may only be carried out with the **authorisation of his or her representative** or an authority or a person or body provided for by law.
The **opinion of the minor** shall be taken into consideration as an increasingly determining factor in proportion to his or her age and degree of maturity."

(art. 6 par. 2 Convention for the Protection of Human Rights and Dignity of the Human Being with regard to the Application of Biology and Medicine)

When they are experiencing violence or abuse at home, children may need "access to **confidential medical counselling and advice** without parental consent, irrespective of the child's age"

General Comment No. 12 (2009) *The right of the child to be heard*



carepath

The child's participation in decisions concerning his or her health not only promotes his or her personal well-being, but also improves health polices and health and safety practices

General mechanisms can include:

- feedback systems for all users of services
- research and consultative processes with children as respondents and/or researchers
- participation of children's councils in the development of standards and indicators for health services that respect children's rights
- involvement of children in inspections and monitoring

[Unicef- Save The Children, *Every child's right to be heard* , 2009, p.98]

In situations of violence

States are encouraged to:

- consult with children, including marginalised and disadvantaged groups, in the development and implementation of legislative, policy, educational and other measures to address all forms of violence. (General Comment No. 12 (2009) *The right of the child to be heard*)
- ease access to individuals or organisations to which children can report in confidence and safety (General Comment No. 12 (2009) *The right of the child to be heard*)
- establish independent authorities to guarantee the rights of all minors and in particular those who have suffered violence (General comment No. 13 (2011) The right of the child to freedom from all forms of violence)

EXAMPLE NO. 3

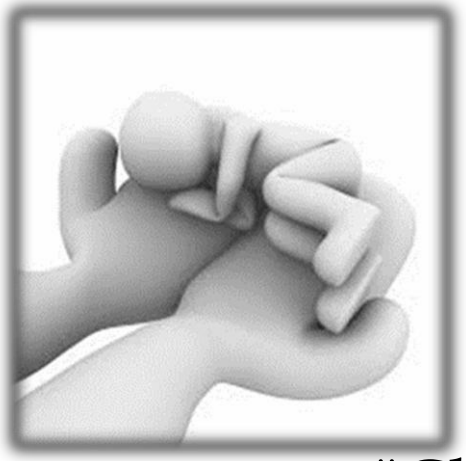
The video of the Council of Europe "Tell someone you trust" deals with sexual abuse using a language and methods suitable for children, **encouraging them to report the violence they have suffered**

EXAMPLE NO. 4

The Italianaire is a video cartoon made with the participation of five young adults living in Italy and originating from Egypt, facilitated by Save the Children, aimed at informing and raising awareness among Egyptian children living in areas with a high rate of child emigration about the **real living conditions in Italy** of Egyptian migrant children

EXAMPLE NO. 5

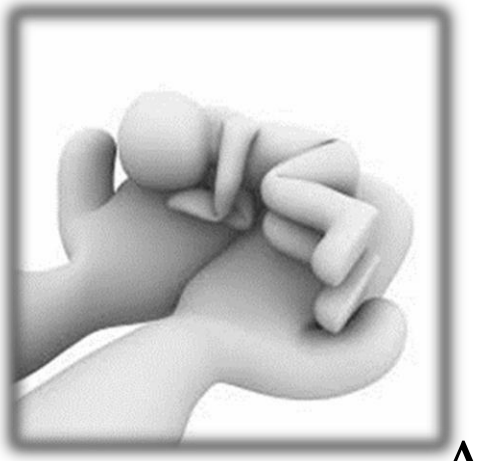
The Council of Europe's video "Beat Bullying" shows the effects of bullying using child-friendly contents and language and encourages children to take a leading role in combating bullying



carepath

"Children and young people's right to be heard can also play a preventive role against all forms of violence in the home, family, schools and institutions"

(European Network of Ombudspersons for Children (ENOC), *Position Statement on 'Violence against Children'*, 2015)



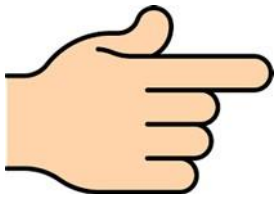
Adults should guarantee the child's participation in decision-making processes, taking every precaution to minimise the risk of violence or any other negative consequence that may derive from the participation itself

(General Comment No. 12 (2009) *The right of the child to be heard*)

Conclusions

An **integrated approach** is needed and should include:

- ✓ not only contrast but **prevention** of violence against children
- ✓ promoting a **culture of respect** for children's rights
- ✓ **specific training** for professionals working in contact with children on protection and participation rights
- ✓ children's services created and managed on a **child-friendly basis**
- ✓ **help desks/help lines** easily accessible to children who experience violence



Source: Council of Europe, *Policy Guidelines on Integrated National Strategies for the Protection of Children from Violence*, 2009. See also European Network of Ombudspersons for Children (ENOC), *Position Statement on 'Violence against Children"*, 2015.

"Children have a unique body of knowledge about their lives, needs and concerns, together with ideas and views derive from their direct experience... **Decisions that are fully informed by children's own perspectives will be more relevant, more effective and more sustainable"**

carepath

Children's ombudsman

The competences attributed by the various institutive laws to the children's ombudsman are attributable to various actions: listening and participation, promotion and awareness, collaboration, preparation of proposals, opinions and recommendations.

The activity of the Children's Ombudsman today plays a leading role in policies aimed at ensuring knowledge and respect of children's rights, and allows a voice to be given to people (children) who often risk being invisible: https://www.youtube.com/watch?v=jWiE2jHX5yE.

The children's ombudsman, in summary:

- monitors the application of the Convention on the rights of children and adolescents within the country and helps to spread knowledge and the culture of rights of children and adolescents;
- reports to the competent authorities on any violations of these rights;
- verifies that persons of minor age have full access to their rights;
- expresses opinions on regulatory proposals concerning minors and on the protection of the rights and development of subjects in the developmental age.

More specifically, the functions and powers of the Guarantor Authorities (children's ombudsmen) can be divided into two main areas:

- The first is of general nature and can be identified as interventions to promote children's rights. The children's ombudsman, for example, promotes the knowledge and affirmation of the individual and the social and political rights of childhood and adolescence, taking forward every initiative aimed at concretely realising the same; monitors the application within the country of the Convention on the Rights of the Child; expresses, at the request of the competent local bodies, opinions, proposals and observations on draft laws, regulations and administrative acts concerning the possible impact on children and young people.
- The second area of intervention is specific and concerns responses to reports of situations of individual children in difficulty. The children's ombudsman, in fact, accepts notifications even originating from underage people (for an example, see here), from families, from schools, from associations and institutions, in relation to cases of violation of rights; reports to the competent public administrations any cases of violation of rights, consequent to deeds or facts delayed, omitted or otherwise irregularly performed, of which it has obtained knowledge from public and private subjects, or from individual persons, including children.

As for its *modus operandi*, the children's ombudsman is not granted direct and incisive powers of investigation, prescription and sanction. The action of the Guarantors is essentially expressed by way of so-

called moral suasion, that is, in the persuasion exercised towards public subjects (political decision-makers, local administrations, social-assistance territorial services, judicial authorities) and private entities (conflicting parents, third sector bodies) based on its status as a guarantee authority. Thus, for example, the children's ombudsman can recommend to the competent administrations the adoption of aid and support interventions, as well as the adoption, in the case of their omissive conduct, of specific measures; to promote, within the competent administrations, the modification or reform of measures deemed prejudicial to children and young people; to call upon the competent administrations to consider as preeminent the superior interest of the child.

The children's ombudsman can exist both nationally and locally.

In Europe we find The European Network of Child and Adolescent Guarantors (European Network of Ombudsman for Children - website: https://enoc.eu/?page_id=174) which meets at least once a year to discuss issues of common interest at European level and to identify lines of shared intervention.

The national supervisory authorities constantly collaborate with the international network of children's guarantors, with international organisations and institutions for the protection and promotion of children's rights and with non-profit organisations.

The exchange with different subjects allows the authorities to develop proposals in line with the times and with the needs of young people.

One of the areas of intervention of the Guarantors concerns the phenomena of violence and maltreatment to the detriment of underage people (psychological mistreatment, physical abuse, violence, sexual behaviour, neglect, assisted violence). On this point see the ENOC contribution Position Statement on "Violence against Children",

http://enoc.eu/wp-content/uploads/2014/12/ENOC-position-statement-on-Violence-against-children-2015-FV.pdf

Preface

This Third Edition of the Practice Guidelines replaces the second edition published in 2009. Legislation, practice and technology have moved on since then and these changes are captured in the new guidance.

This edition of the guidelines was produced through the British Psychological Society's Professional Practice Board by a working group drawn from the range of Member Networks across The Society whose members are engaged in professional practice, as well as representatives from relevant expert reference groups of The Society, in particular areas of practice. Further information is available in ***Appendix 3: How this document has been developed.***

These Practice Guidelines aim to define good practice for all psychologists whether registered, chartered or in training and offer guidance for decision making. The Guidelines have been designed for broad application across the full range of applied psychology.

The first part of the guidance (sections 1–3) set out considerations for psychologists on different contexts of practice. The second part of the guidance (sections 4–8) sets out guidance for psychologists on how to manage work with clients.

It is recognised that in addition psychologists may require more detailed guidance for some particular roles and responsibilities or for particular situations in which they work. Further information is available in the ***Appendices***.

The Society expects that the guidelines will be used to form a basis for consideration, with the principles being taken into account in the process of decision-making, together with the needs of others and the specific circumstances. No guidance can replace the need for psychologists to use their own professional judgement. Effective practice means exercising this professional judgement in a defensible way that does not put clients or the public at risk, or undermine, or call into question the reputation of the profession as a whole.

The Guidelines will be reviewed in accordance with Society policy within a maximum period of five years in order to reflect current legislation, evidence and practice contexts. Psychologists using the Practice Guidelines should do so in conjunction with the ***BPS Code of Ethics and Conduct*** and the ***BPS Code of Human Research Ethics***, as necessary.

Glossary of terms

Client

The Society's *Code of Ethics and Conduct* uses the term person or people throughout, this is in recognition of the fact that the document is generic and may be used by all psychologists; academics, researchers, students and practitioners alike.

Throughout this Practice Guidelines document the term 'client' is used and refers to any person or persons with whom a psychologist interacts on a professional basis.

For example, the 'client' may be a couple, a family group, an educational institution, a community organisation or group or a private or public organisation including a court, an individual (sometimes referred to as, for example, athlete, child/young person, patient, prisoner, coachee, service user, stakeholder, leader, or student), who are in receipt of the services of the psychologist.

Psychologist

Throughout this Practice Guidelines document the term 'psychologist' is used and refers to all psychologists whether registered, chartered or in training who provide psychological services across the full range of applied psychology, in any context of practice.

1. How psychologists work

1.1 Legal and professional obligations of psychologists

Psychologists' professional practice is impacted upon and governed by a range of legislation and regulation. Particular psychological disciplines may also need to consider additional legislation, regulation and guidelines. It is the psychologist's responsibility to ensure they are aware of the legislation and guidelines that govern their particular area of practice as well as the terms of their employment or terms contracted with a commissioner of their services.

Psychologists are also advised to consider membership of a union or similar body to ensure they have access to appropriate representation, support and legal advice should they be subject to a complaint or disciplinary action, or require support for example with an employment grievance, which may be related to concerns over quality and standards of psychological service provision.

Further information is available in the ***Appendices***. Important examples to note are:

Health and Care Professions Council (HCPC) Registration

It is a statutory requirement for all psychologists wishing to practice using one of the titles protected by the HCPC to register with the HCPC. Unregistered psychologists offering services to the public in any of the domains regulated by the HCPC may commit an offence by doing so, even if they refrain from using protected titles, provided intent to deceive can be proved. The Society's position is that it is in the interests of both the public and the profession for all psychologists providing services in a regulated domain to be registered with the HCPC.

Professional competence

Psychologists should value the continuing development and maintenance of high standards of competence in their practice and the importance of working within the recognised limits of their knowledge, skill, training, education, and experience. Psychologists should consider advances in the evidence base, the need to maintain technical and practical skills and knowledge and the limits of their competence. This is stipulated in both the ***BPS Code of Ethics and Conduct*** and the ***HCPC Standards of Proficiency***.

Professional indemnity insurance

The UK Government has introduced legislation (The Health Care and Associated Professions (Indemnity Arrangements) Order 2014) which now makes it mandatory for health professionals to have a professional indemnity arrangement in place. The HCPC has made having such an arrangement in place a condition of registration.

This may be achieved either through the employer or through a privately arranged policy. An employer's insurance may provide cover only for a negligence claim but not for the costs of a disciplinary hearing. It is the psychologist's responsibility to check carefully that

they have cover in place that meets their personal/professional needs. Further information is available in the ***Society document: Career Support and Development***

Disclosure and Barring Service (DBS) Checks

Psychologists working in certain fields, for example with children or in healthcare, will need to demonstrate they have had a satisfactory criminal records check at the appropriate level for the nature of the work undertaken.

Applicants will be provided with a certificate to demonstrate this. Applicants cannot request a check personally, this can be requested by a psychologist's employer. For psychologists practising independently the Society offers this as a service to members. Further information is available on the ***Society Website: https://beta.bps.org.uk/Practice-Guidelines***

Equality Act 2010

This Act protects people against unfair treatment, promotes equality and prevents discrimination against any of nine protected characteristics: age, disability, gender reassignment, marriage and civil partnership, pregnancy and maternity, race, religion and belief, sex, and sexual orientation. Respect is a core ethical value for psychologists and a commitment to equality of opportunity is embedded in all aspects of psychological practice. Psychologists, where they operate in an organisational context, must also seek to encourage and influence others in ensuring that equality of opportunity is embedded in all thinking and all practice relating to access to services for client groups and recruitment and employment practices.

Providers of service to the public must also make reasonable adjustments for people who have a disability under the Act. This requirement is anticipatory so requires consideration, and adjustment where reasonable, of any barriers which may prevent a person with a disability from using a service.

Data Protection Act 1998

The Data Protection Act defines personal and sensitive personal data, and data must be processed in accordance with eight principles. It gives individuals the right to know what information is held about them and provides a framework to ensure that personal information is handled properly.

Good information governance is at the heart of safe practice. It encompasses physical data security, access controls and acceptable use, data quality, and records management, among other things. Psychologists must have appropriate security to prevent any personal data held from being accidentally or deliberately compromised. In most circumstances, independent practitioners will also need to register as a data controller with the Information Commissioner's Office.

Further information is available in ***Section 7.1: Information governance, Appendix 1: Relevant legislation*** and ***Society Document: Data Protection Act 1998 – Guidelines for Psychologists.***

Freedom of Information Act 2000

The Freedom of Information Act 2000 provides public access to information held by public authorities. Public authorities include government departments, local authorities, the NHS, State schools and police forces.

It does this in two ways:

- public authorities are obliged to publish certain information about their activities; and
- members of the public are entitled to request information from public authorities.

The Act covers any recorded information that is held by a public authority in England, Wales and Northern Ireland, and by UK-wide public authorities based in Scotland. Information held by Scottish public authorities is covered by Scotland's own Freedom of Information (Scotland) Act 2002.

This legislation permits information to be withheld from disclosure in certain prescribed circumstances, for example information provided in confidence, related to law enforcement or where it relates to personal matters.

Health and Safety at Work Act 1974

This Act places a duty on all employers 'to ensure, so far as is reasonably practicable, the health, safety and welfare at work' (Part 1, Section 2.1) of all their employees. Employees themselves also have obligations under the legislation.

Working together to safeguard children guidance

The Government website provides statutory guidance on inter-agency working to safeguard and promote the welfare of children. Statutory guidance is issued by law; it must be followed unless there is a good reason not to. All organisations, including charities, are expected to comply with this government inter-agency statutory guidance. Psychologists have a duty of care to both their clients and the public. Any allegations of abuse, either ongoing or historic, must be taken seriously and consideration must be given about breaking confidentiality especially in cases where other vulnerable people may be at risk. Further information is available in ***Section 4: Safeguarding***.

Mental Capacity Act 2005

The Mental Capacity Act (2005) provides a clear and comprehensive framework with regard to capacity and consent for all individuals aged 16 years and above in England and Wales.

There are five key principles set out in the Act which underpin practice (quoted from legislative source):

(i) A person must be assumed to have capacity unless it is established that he lacks capacity.

(ii) A person is not to be treated as unable to make a decision unless all practicable steps to help him to do so have been taken without success.

(iii) A person is not to be treated as unable to make a decision merely because he makes an unwise decision.

(iv) An act done, or decision made, under this Act for or on behalf of a person who lacks capacity must be done, or made, in his best interests.
(v) Before the act is done, or the decision is made, regard must be had to whether the purpose for which it is needed can be as effectively achieved in a way that is less restrictive of the person's rights and freedom of action.

In Scotland the Adults with Incapacity (Scotland) Act 2000 applies and in Northern Ireland the Mental Capacity Act (Northern Ireland) 2016 is used.

Mental Health Act 1983 as amended 2007

The main purpose of the Mental Health Act 1983 as amended 2007 (MHA) is to allow compulsory action to be taken, where necessary, to ensure that people with mental disorders receive the care and treatment they require for their own health or safety, or for the protection of other people.

The Act sets out the criteria that must be met before compulsory measures can be taken, along with protections and safeguards for patients. The Code of Practice[1] provides statutory guidance for mental health professionals on how they should carry out their responsibilities in practice under the MHA. Although the Act allows for people to be compulsorily detained and treated without their consent if required, empowerment and involvement of patients as far as is possible is required by the Code of Practice.

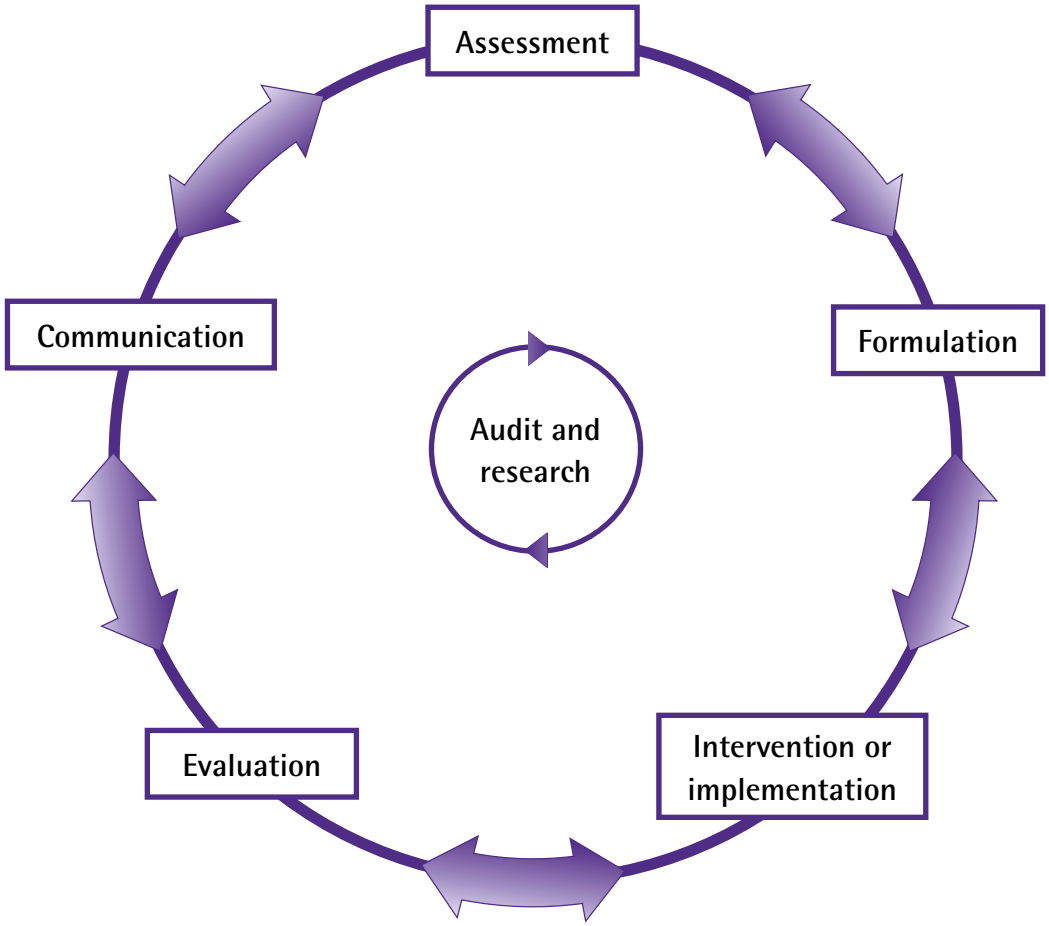
Those involved in working with people subject to provisions of the MHA, including psychologists, must understand and give consideration to the five key principles set out in the Code:
(i) least restrictive option and maximising independence;
(ii) empowerment and involvement;
(iii) respect and dignity;
(iv) purpose and effectiveness; and
(v) efficiency and equity.

1.2 Cycle of professional practice

The professional practice of psychologists is underpinned by four key ethical values – Respect, Competence, Responsibility and Integrity – and five core skills:

- **assessment** and establishment of agreements with the client;
- **formulation** of client needs and problems;
- **intervention or implementation** of solutions;
- **evaluation** of outcomes; and
- **communication** through reporting and reflecting on outcomes.

These core competencies flow and inform each other as illustrated below.



Assessment and establishment of agreements with the client

Assessment of psychological processes and behaviour is derived from the theory and practice of both academic and applied psychology. It includes both assessing change and stability, and comparison with others. Assessment procedures used will depend heavily on the practice context and may include:

- the development and use of psychometric tests following best practice;
- the application of systematic observation and measurement of behaviour in a range of contexts and settings;
- devising structured assessment strategies for individual clients, teams and organisations; and
- the use of a range of interview processes with clients, carers, other stakeholders and other professionals.

Results of these assessments are integrated within the context of the historical, dynamic and developmental processes that will have shaped the client as well as future aspirations or needs. Psychologists have the ability to assess the suitability of different measurement procedures, depending on the purpose for which the assessment is needed, as well as being competent to devise and use context-specific procedures.

Formulation of client needs and problems

Formulation is the summation and integration of the knowledge that is acquired by the assessment process. This will draw on psychological theory and research to provide a framework for describing a client's needs. Because of their particular training in the relationship of theory to practice, psychologists will be able to draw on a number of models to meet needs or support decision-making. This process provides the foundation from which actions derive. What makes this activity unique to psychologists is the knowledge base, experience and information on which they draw. The ability to access, review, critically evaluate, analyse and synthesise data and knowledge from a psychological perspective is one that is distinct to psychologists, both academic and applied.

Intervention or implementation of solutions

This will be the stage where the client's needs, as described by formulation, begin to be met. This may involve the use of psychological models or approaches to, for example, facilitate change, solve a problem or improve the quality of a relationship. All these interventions, or implementation of solutions, are tests of the provisional hypotheses contained in the formulation, and are subject to repeated modification in the light of experience and new data.

Evaluation of and reflecting on outcomes

Evaluation is used to measure the effectiveness of activities and interventions both during and after their implementation. The results of any evaluation and reflection will impact the next steps taken by a psychologist.

Although employers and others may demand certainty about outcomes, psychologists should always be careful to make it clear that they are able to provide only interpretations of behaviour, and advice and guidance, rather than necessarily predicting future behaviours.

Communication through reporting

Communication skills are integral to all aspects of a psychologist's role. Effective communication skills are essential in relation to all aspects of work with others. Communication skills include communication with clients, all forms of electronic and verbal communication, professional letters and reports, and the dissemination of research findings.

Audit and research

Audit and research underpin the cycle, as they help to inform all stages of professional practice.

Audit aims to evaluate how close assessment, formulation, intervention and implementation are against a set of previously given standards of practice. Audit also evaluates how protocols and procedures, for example related to consent or recording of activity, have been followed.

Research provides the evidence base for the practice of psychology. Research methods in psychology vary from qualitative observation to quantitative scientific method, so it is important to distinguish the nature and quality of the evidence underpinning any knowledge or techniques being applied. In general, basic research develops theories, models and data to describe and explain psychological processes and structures, while primary research develops and evaluates ways of using psychological knowledge to intervene with people, organisations, processes or technologies to achieve desired effects. Secondary research consolidates other research to identify higher order trends and directions.

1.3 Reflective practice

One of the key processes that should be encouraged for psychologists is having a complex understanding of self in the context of others. The HCPC requires reflection in the record of continued professional development in order to retain continued registration.

Psychologists will need to make decisions about clients which may have a profound impact on their lives. Decision-making is often subject to various competing biases. Psychologists should be aware of the possibility that they may be influenced by considerations which are not driven by professional knowledge, skills or experience. Maintaining awareness of these biases is important when trying to think through dilemmas.

Sources of influence and bias may include:

- **Cognitive Biases –** Over 150 have been described[2,3,4] including salience (how readily something comes to mind), confirmation bias (the human tendency to look for evidence that confirms their belief and to ignore other evidence), loss aversion (risky behaviour to avoid loss), beliefs about disclosure (tendency to be more honest when they believe their actions will be known by others), and dissonance reduction (justifying actions if consequences are considered worth it).
- **Personal Experience –** the experience of the psychologist may affect how they view or treat a client or situation. This may include current or historical trauma, or the kind of organisation and culture with which they are most familiar. Interventions which may be appropriate in one context may be ineffective and cause distress in another.
- **Motivation –** the original reasons for undertaking the profession may change or be challenged due to fatigue or experience within the profession which may affect the psychologist's viewpoint.
- **Health –** psychologists should be mindful of the potential effect of health conditions or medications which they may be taking, on their practice.
- **Control over the psychologist's own practice –** this refers to clarity and openness in the management of the psychologist's business and maintaining the professional's autonomy in their interactions with clients.
- **Pro bono public work –** psychologists are encouraged, and personally motivated to

engage with such work, while being mindful of impact on the value that is placed on the profession as a whole.

- **An unethical environment –** maintaining self-recognition of what the appropriate ethical standard should be, irrespective of the prevailing situation.
- **Environment –** political realities may lead the psychologist to make compromises; while there is nothing wrong with compromises, their constant use may mean a decline in overall standards.

The literature is generally pessimistic about the ability of practitioners to overcome some of these biases, considering them to be inherent in human thinking patterns. By being aware of and acknowledging them, it can be possible to manage their influence. For example, biases can be levelled out by presenting information in different ways, by engaging the perspectives of people with different experiences and expectations, or by priming thinking with different examples.

A key factor in developing and maintaining these skills is the use of consultation or supervision and having a space where it is possible to open up thinking to the mind of another with a view to extending knowledge about the self.

It is important that psychologists from all disciplines look after their own wellbeing. This is not only important for them as individuals, but also for the quality of the care they give their clients. In their practice and, for example, within their CPD plans and supervision psychologists should consider self-care and how they can maintain their own wellbeing.

It is also important for psychologists to evaluate effectiveness of practice, by welcoming feedback from clients. This can be difficult due to fears of criticism but reflective practitioners are eager to improve and welcome any feedback that will support this process.

1.4 Continuing professional development

Continuing professional development (CPD) is the professional and work-related aspect of lifelong learning. It is an integral part of the process of adapting to change, and essential for maintaining and enhancing professionalism and competence. The Society provides an online facility to record CPD, further information is available on the ***Society website: http://beta.bps.org.uk/Practice-Guidelines***.

- CPD is both a professional expectation and an individual responsibility to taking a structured and self-managed approach to further learning through:
  - actively engaging in a range of CPD
  - maintaining a record of CPD
  - applying learning from CPD to professional practice.
- There is a range of formal and informal learning activities that may be used for CPD and it is recommended that psychologists engage in a mix of CPD activities.
- Professional development is not purely about inputs (i.e. undertaking CPD activities); it also requires a reflective, outcomes-based approach which focuses on the learning gained from CPD and its application to current or future practice, together with the associated benefits for clients and the services provided.

- All members who are registered with the HCPC are required to comply with their CPD requirements as a condition of continued professional registration. Further information is available in ***Appendix 2: Websites and further information***

Mentoring

Psychologists may seek a mentoring relationship with colleagues in order to focus their attention on skills to add to their competencies. Psychologists taking on the role of mentor often support the psychologist with their career path. Early career psychologists may find it beneficial to be mentored by a more experienced psychologist.

1.5 Consultation/supervision

Consultation or supervision is considered an essential part of good practice as a psychologist. There is no legal requirement for supervision, although it is considered an ethical and professional expectation to engage in appropriate consultation in order to support effective practice. Provision of this is therefore an important underpinning to good quality service delivery. The Society's position is, for safe and effective practice in clinical and mental health settings, or with other vulnerable groups, supervision is a requirement of practice.

The objectives of consultation/supervision are:

- to provide practitioners with consultation on their work with clients;
- to enhance the quality and competence of practice offered to all clients;
- to offer psychologists intellectual challenge enabling reflection, transformational learning and psychological support to maximise their responsibility for appropriate self-care; and
- to contribute to the CPD of both psychologist and supervisor by developing competence in the use and practise of supervision.

All aspects of practice are appropriate for discussion in supervision, including research activity, administrative and managerial work, service developments, team working, teaching and the process of supervising others. Supervision is not personal therapy and nor is it a form of, or substitute for, line management or appropriate training.

For psychologists working in a wide range of settings such as therapeutic and organisational settings, supervision is a core component of the psychologist's CPD. For some areas of practice, the nature of supervision changes over time. This may be unique to each psychologist and the context of their application. Expectations should be agreed from the outset and reviewed at appropriate intervals.

Forms of consultation/supervision

Supervision may take the form of clinical supervision, mentoring, coaching, supervision on placement/work setting, tutorials and peer support. Psychologists may engage in one to one supervision; group supervision (facilitated or non-facilitated) or peer supervision and any of these may be face to face or virtual. Whilst it should not be a substitute for line management, a psychologist's supervisor may also be their line manager.

Those working in independent practice, or in the absence of service-based supervision, should seek supervision from appropriately qualified and experienced personnel as appropriate. Peer supervision (individual or group) may be an appropriate way to find collegial support.

Psychologists may select different supervisors, depending on their preferred supervisory style, nature, orientation and their needs at the time. Particularly for experienced psychologists, this may be from an experienced colleague from outside their profession, professional specialty or organisation. Psychologists could also invite supervision from experts by experience for whom they provide services, where appropriate to the context of practice.

The Society maintains the Register of Applied Psychology Practice Supervisors (RAPPS), which recognises psychologists with special expertise in supervision and supervisory practice. Further information is available on the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines***.

Amount of supervision

While there is a specified number of supervision sessions for trainees (e.g. for their Chartered status) which varies across different sub-disciplines of psychology, no definitive amount of supervision is specified as part of CPD. To determine both the quantity and nature of the supervision, the psychologist may consider their need for supervision from various perspectives: their own assessment of need, the competencies required for their practice; the context of their work; organisational requirements; and the support available. For psychologists in employment the arrangements for consultation/supervision should be agreed after considering these factors in consultation with the employer.

Roles and responsibilities of the supervisor

Psychologists undertaking supervision should ensure that they are sufficiently experienced, competent and appropriately trained to provide supervision. Psychologists are often called upon to supervise non-psychologists, in which case these guidelines would also apply.

In supervision, the psychologist as supervisor needs be aware of their own competence in relation to the work of the psychologist and, where necessary, recommend additional supervisors who may have the appropriate level of expertise. Psychologists may offer consultancy supervision to professional colleagues, organisations and stakeholders in line with their competencies.

Psychologists should avoid personal relationships between the supervisor and psychologist which could adversely affect integrity and objectivity.

Psychologists providing consultation/supervision should do so in line with the guidance in other relevant sections of these Practice Guidelines.

Issues of power and control

The nature of supervision itself creates a power imbalance, even between peers. Both the person providing supervision and the person receiving it need to be aware of this.

The supervisory leadership relationship should be both informative and reflective. Psychologists in leadership roles as supervisors should provide regular, informative feedback to the psychologist as well as motivating them to reflect on their own practice, continue to self-assess and improve self-awareness.

1.6 Leadership

Psychologists at any stage of their career are likely to find themselves in a position where they are required to demonstrate or model leadership. This may be an integral part of their practitioner work or may arise through being a leader of a team, including leading in Society work. Leadership is widely quoted and described in the context of leading change as, *'accepting responsibility to create conditions that enable others to achieve shared purpose in the face of uncertainty'*[5]. Furthermore, leaders 'can create conditions interpersonally, structurally, and/or procedurally'[6]. These descriptors highlight the often complex process of psychological change through clinical intervention and also through leading others.

Contemporary leadership styles are generally more aligned to working *within* a team or a system rather than being directive. Leading as a psychologist is likely to include dealing with highly complex information and systems whatever the context. Leading in this way demands high levels of skill in developing, managing and maintaining professional relationships. This may include communicating complex and sensitive information, and reflexivity to enable individuals and teams to co-formulate around difficulty and challenge.

2. Where psychologists work

2.1 Working environment

When undertaking work with clients, psychologists need to give consideration to providing an environment which is welcoming, accessible, safe, and offers privacy. Although choice of workspace is not always available, it is important wherever work takes place with clients that psychologists consider:

- whether lighting, acoustics, heating and seating are comfortable;
- whether confidential conversations may be audible to others;
- whether there are arrangements to ensure client and practitioner safety, for example through easy access to another member of staff if a difficulty arises;
- whether access and exits are safe, well-lit and in areas which are likely to be overseen;
- that reasonable adjustments can be made to support effects of special needs and/or disability;
- whether the setting is culturally acceptable to clients; and
- whether there are facilities and equipment suitable for the clients, for example lavatories, play materials for children.

Where context of practice allows, psychologists could seek the assistance of relevant workplace representatives, for example their trade union representative or human resources staff, in situations where appropriate workplace conditions are not being provided. However, it is acknowledged that sometimes the ideal workspace may not be available or that psychologists may not have access to these workplace representatives due to their context of practice and psychologists should, within the limits of safe practice, be able to adapt to situations within local constraints in order to provide the best service for clients.

Sometimes, it is important to work with clients in representative environments in order to understand behavioural drivers. This will apply if the psychologist's task is to understand behaviours in such environments and provide support, for example through the use of technology, design of procedures, training or team design. Psychologists should consider carefully how to create representative conditions without causing harm. Equally it may sometimes be necessary for psychologists to work in a client's own context as that is where any intervention may be formulated or put in place. Psychologists should ensure they follow the relevant health and safety guidelines in place at their working location even if that location is not their usual place of work.

There may be a temptation to make assumptions about what sort of environment is most suitable, comfortable and culturally appropriate for clients, however it is helpful to ask them and endeavour to make appropriate adjustments to meet their needs.

Lone working

Many psychologists practise in a lone worker workplace and on occasion visit clients in their own homes. When working at home, it is necessary to ensure the proper insurance

and protocols for this type of work, as well as manage boundaries between personal and private space. When working alone, the Suzy Lamplugh Trust recommends always ensuring that someone else has access to schedules and contact details for clients. Psychologists may also want to put in place a 'code word call', where should they fail to answer or speak the correct code word, the police are alerted. This is just an example of an additional safety practice, and there may be different ideas for ensuring personal safety when lone working. However, the important point is to think about keeping safe, have a plan and stick to it. Further information is available in ***Appendix 2: Websites and further information.***

Harassment and bullying

Bullying is behaviour that may take the form of actions or comments that are offensive, which are intended to humiliate, undermine, demean or injure the recipient. It may target an individual or group of individuals and is a form or abuse that may be explicit and therefore obvious, or it may be insidious, an experience recognised only by the recipient and harder to notice by others. Bullying may be vertical (i.e. between managers/supervisors and staff) or horizontal (i.e. between colleagues). Clients may also experience bullying by professionals. While bullying may involve a misuse of power and be committed in the workplace by a manager, supervisor or senior colleagues (sometimes known as downwards bullying), it should be borne in mind that it is not uncommon for senior staff to be bullied by those whose work they oversee.[7] What can be legitimately classified as bullying may take into account the particular personal sensitivities and characteristics of the person suffering the alleged bullying.

Harassment can be defined as actions or comments that are unwanted and which may be related to age, disability, gender reassignment, race, sex, sexual orientation, religion or belief or any other personal characteristic of the recipient. Harassment occurs when someone engages in unwanted conduct in relation to the aforementioned characteristics and that conduct has the purpose or effect of violating the other person's dignity or creating an intimidating, hostile, degrading, humiliating or offensive environment for the other person.

The Society is a charity and bound by its objects which do not include providing direct assistance to individual psychologists in these situations by offering advice. Psychologists with concerns over the above behaviour should seek the support of their supervisor, line manager or other appropriate senior staff member, accredited trade union workplace representative or human resources department. Further information is available in ***Appendix 2: Websites and further information.***

Whistleblowing

Whistleblowing is the disclosure of wrong doing (beyond normal managerial channels) and is important as it is a critical way not only of seeking justice for the individual or individuals affected, but also of developing inside information within organisations about incorrect or unfair practices,[8] thereby increasing the evidence required for corrective action to take place.

A whistle-blower is protected by law (the Public Interest (Disclosure) Act 1998) if:

1. They are a worker (this includes trainees and can include self-employed personnel servicing an organisation in certain circumstances).
2. They are acting in the public interest.
3. The disclosure relates to past, present or likely future wrongdoing which involves one or more of the following:
    - criminal offences (which may include fraudulent actions);
    - a person has failed, is failing or is likely to fail to comply with any legal obligation to which he is subject;
    - a miscarriage of justice has occurred, is occurring or is likely to occur;
    - the health or safety of any individual has been, is being or is likely to be endangered;
    - the environment has been, is being or is likely to be damaged; or
    - information tending to show any matter falling within any one of the preceding paragraphs has been, is being or is likely to be deliberately concealed.

If the individual has been victimised or if they have lost their job due to whistleblowing, the legislation provides them with the right to take a case to an employment tribunal. Whistleblowing is a complex legal area and it is important that anyone considering it considers appropriate advice, for example from an accredited trade union workplace representative or helpline. The relevant human resources department which will have a policy relating to this, or it may be appropriate to seek formal legal advice. Some organisations such as NHS Trusts have a nominated Director responsible for dealing with disclosure issues who may be contacted directly. The Society is a charity and bound by its objects which do not include providing direct assistance to individual psychologists in these situations by offering advice. Further information is available in ***Appendix 2: Websites and further information.***

Psychologists can inform on all aspects of the establishment of workplace cultural norms that promote positive managerial and leadership behaviour and can help facilitate the development of cultures that support the disclosure of inappropriate practices. Psychologists are also appropriately qualified to support workers who have been subject to bullying or harassment or who are contemplating or indeed have already 'blown the whistle'. Whistleblowing, and even the prospect of such, can create traumatic responses in workers[9] and can lead to retaliation as a consequence. Empirical evidence highlights the link between whistleblowing and the devastating effects on health that may follow, such as depression, anxiety and symptoms relating to post-traumatic stress[10]. Psychologists are able to work with affected employees and in a consultative capacity with organisations to manage work-related stress disorders caused by these incidents of bullying, harassment and whistleblowing to lessen the risk of absenteeism and to facilitate a return to work following a period of absence. Further information is available in ***Section 8: How to respond when things go wrong.***

2.2 Working in the digital age

Digital media continues to advance in terms of choice and functionality. It is becoming increasingly common for psychologists in particular when working with clients to make use of the internet and/audio-visual technology. These technologies require the psychologist to ensure that the network used is as secure as reasonably possible and, as far as is feasible, assures privacy to their clients.

There can be no guarantee of security when using the internet, and voice over internet protocol (VOIP) services such as 'Skype' or 'FaceTime' are no different, as they use the same data infrastructure as the rest of the internet.

Most, if not all, VOIP systems encrypt the voice into waveforms during digital transit across the internet, and it would be impossible to eavesdrop on these data packets in real time. However, the information is potentially vulnerable to eavesdropping/compromise before encryption by the speaker's system, and after decryption by the listener's system. This will depend upon the security measures in place for the end user's (speaker and listener) own networking infrastructures, be that a company, institution or home user. If an end user's computer has been compromised by any form of malware, then there will be a risk of eavesdropping, data theft and/or denial of service.

The risk for eavesdropping on VOIP systems is no more or less than that of traditional analogue phone systems, and both would require specialist knowledge, equipment and software to be achieved. However, it is recommended that only fit-for-purpose VOIP systems are used, and that public networks, such as Social Media sites, are avoided for VOIP communications. Further information is available on the ***Society website: http://beta.bps.org.uk/Practice-Guidelines***.

Some employers may have their own rules about which media are acceptable to use. The USA has the Health Insurance Portability and Accountability Act (HIPAA) which sets standards for security for electronic data. There is no such provision in the UK to date, and so psychologists must satisfy themselves that any media used to communicate personal data is secure. This is a rapidly changing area and so technology-specific guidance has not been provided in this document. Further information is available in ***Section 7.1: Information governance*** and ***Appendix 2: Websites and further information.***

The use of online 'Apps', computer assisted decision-making and artificial intelligence in psychological practice and research is evolving rapidly. When recommending or using computerised systems psychologists should pay due regard to peoples' health, wellbeing and safety being mindful of Clinical Safety Evaluations, Medical Device Evaluations and other relevant guidance such as NICE.

Use of social media

Many psychologists are using social media, networking sites or blogs to communicate with friends, family, professionals, colleagues and clients. This specific guidance therefore addresses the use of social media by psychologists, and provides practical advice for using them responsibly. Further information is available in ***Appendix 2: Websites and further information.***

Psychologists should:

- Remember that social networking sites are generally public and permanent. Once something is posted online, it remains traceable even if it is later deleted.
- Keep their professional and personal life as separate as possible. This may be best achieved by having separate accounts for work-related communications to those for friends/family.
- Consider whether, in their context of practice, it is appropriate to accept 'friend' requests from current or past clients, if necessary, decline the request via more formal means of communication. It is highly unlikely to be appropriate to accept in a clinical or forensic context.
- Be minded to act responsibly at all times and uphold the reputation of the profession, whether identified as a psychologist or not on the social media platform.
- Be aware that social networking sites may update their services and that privacy settings can be reset to a default that deletes personalised settings.
- Remember that images posted online by family or friends may be accessible, as they may not have set privacy settings as tightly.
- Be minded that social networking sites can make it easier to engage (intentionally or unintentionally) in professional misconduct.
- Report the misconduct of other psychologists on such social networking sites to any relevant parties (such as the employer or the HCPC).
- Be aware of their employer's social media policy.

Psychologists should not:

- Establish inappropriate relationships with clients online.
- Discuss work-related or confidential issues online in any non-secure medium.
- Publish pictures of clients online, where they are classified as clinical records.
- Use social networking sites for whistle-blowing or raising concerns.
- Post defamatory comments about individuals or institutions. Defamation law can apply to any comments posted on the web, irrespective of whether they are made in a personal or professional capacity.

2.3 Working for the court

Psychologists may be asked to act as professional or expert witnesses in court. The main difference between an expert witness and an ordinary witness (i.e. a witness to fact), is that the former are able to give an opinion, whereas ordinary witnesses can give only factual evidence. A professional witnesses' remit can cross the boundary of both fact and opinion.

Psychologists are responsible for ensuring they are sufficiently competent and expert in offering an opinion. It is not appropriate for trainee or assistant psychologists to act as expert witnesses. Indications of competence in respect of the knowledge required by the court, and expertise within a specialised field, may include:

- qualifications and/or degree(s) in the areas(s) in question;
- a number of years of post-doctoral/post-qualification experience;
- academic, professional and scientific publications in relevant areas;
- demonstrations of professional practice, competence, specialist knowledge and expertise with a bearing upon the issues in the case; and

- current experience in applying psychology in the area of claimed expertise.

It follows that a psychologist with trainee or assistant status is unlikely to have the necessary experience and qualifications to be retained as an expert witness by a legal firm. However, trainees or assistants who have written reports on individuals in the course of their employment may be required to give evidence (for example, at a tribunal). If so, they should bear in mind that only qualified psychologists should give evidence of opinion, and that their supervisor is responsible for the professional quality of their work in this situation as in all others.

Psychologists instructed as experts need to ensure that they can provide an independent and impartial opinion, and that their independence is clear to all. Any potential conflicts of interest should be made explicit and should be reported as soon as they arise. This can extend to being asked to provide an expert report on someone the psychologist is providing with therapy as an 'Applicant', 'Claimant' or 'Complainer'. This dual relationship is an unacceptable conflict.

When lawyers seek to introduce expert psychological evidence, it is the judge in the case who decides whether an individual has the requisite expertise to give evidence with the potential to be relevant to the case. The judge also decides whether what the expert asserts is relevant and, therefore, admissible in law.

Expert evidence in civil court proceedings is governed by Part 35 of the Civil Procedure Rules 1998, and its associated practice direction. This rule makes clear that an expert's overriding duty is to help the court on matters within their expertise and that this duty overrides the expert's duty to the person from whom they are receiving instructions. Any report must be written in accordance with the criteria in Practice Direction 35.

Further information is available in ***Society documents: Psychologists as Expert Witnesses: Guidelines and Procedure*** and ***Psychologists as Expert Witnesses in the Family courts in England and Wales.***

2.4 Working for defence and security organisations

Psychologists may work with defence and security interests in many different capacities. This may include supporting military or security personnel to perform their roles through the development of skills and behaviours, supporting the mental health and wellbeing of people affected by threats, activities and events in this context, and offering advice and consultancy. It is also UK Defence practice to enlist uniformed psychologists for roles associated with psychology. However, in general, psychologists in defence will be in a civilian role and therefore not under military command.

While there is a strong sense of common culture within the defence and security sectors, there are also important variations. For example, each of the armed forces has its own organisational culture resulting in different attitudes and behaviours. There are also differences within different sectors of each organisation. All these differences are very important to the individuals concerned, forming a large part of their sense of identity.

Psychologists working with these populations should ensure they investigate and acknowledge cultural differences, particularly when working with other national cultures. They should also take careful account of the environments in which people are living and working. Psychologists can be working with civilians and/or members of the armed forces who are operating in life threatening environments and are required to make decisions under extraordinary pressure. It is usually invalid to extrapolate from behaviour in benign conditions to behaviour under threat, hardship and stress.

3. Who psychologists work with

3.1 Working with Experts by Experience

In relevant services it is best practice for psychologists to work collaboratively with clients and Experts by Experience in developing and delivering all aspects of psychological services. In mental health, the Government is committed to shared decision-making and the principle 'no decision about me without me'[11]. This applies from work with an individual client through to changes in government policy relevant to the services provided by psychologists. Psychologists should develop services, policies and guidelines in collaboration with the people who use their services.

In professional practice it is important and helpful to work collaboratively with clients and, where relevant, others in order to ensure that the application of psychological research and theory is understood by and adapted appropriately to the client group and context, which may differ from the populations on which the research was based.

3.2 Working with assistants/interns

Many graduate psychologists take up assistant psychologist positions on either a paid or an unpaid basis.

The following (non-exhaustive) list provides examples of activities which can be carried out by assistant psychologists/interns. This list can guide those who are working as assistant psychologists/interns to request or refuse a task or assignment, as well as assist those who are practising and supervising to observe boundaries and limitations:

- research, audit and service evaluation;
- literature searches, developing and maintaining training packs, information leaflets, libraries of equipment, and other tasks necessary to the efficient running of the service;
- assessment of individuals and groups, for example, direct observations, formal psychometric testing, semi-structured interviews, and writing appropriate reports;
- delivery of interventions with individuals, groups and organisations;
- undertaking supportive work with carers, family members, employers, human resources professionals, team members, health staff and other professionals;
- delivering training for other professionals (if and when competent to do so); or
- promoting applied psychology services by providing relevant information to referrers, commissioners and others.

An assistant psychologist/intern should not be employed to:

- substitute for qualified applied psychologists; or
- undertake solely administrative or clerical duties for which a clerical assistant should be employed.

In occupational settings, the issue of appropriate supervision and guidance is of particular importance when the needs of individuals and organisational demands need to be balanced. Appropriate mechanisms need to be in place to ensure that no assistant psychologist/intern is, for instance, put in a position where they have to design or decide on any materials or processes which could have a potential harmful impact on individuals or groups or to an organisation (such as potential loss of profit or revenue).

In clinical and forensic settings, there are some additional limitations, related to the clear delineation between qualified and assistant psychologist/intern, as follows:

- An assistant psychologist should carry out only prescribed interventions with individuals or in groups, and should write reports only when under close supervision of the primary, qualified psychologist. Any report should be signed as having been written 'under the supervision of' followed by the name, registration status and job title of the qualified psychologist.
- When an assistant psychologist is called to give evidence in a legal setting, such as a tribunal, the qualified psychologist remains responsible for the professional quality of the assistant's work. This means the qualified psychologist should attend the hearing also, as there may be questions which an assistant cannot answer. Both should bear in mind that an assistant is not qualified to give evidence of opinion.
- An assistant psychologist should not undertake tasks in areas where there is not a competent supervisor.
- An assistant psychologist should not carry out the duties of a care assistant.

The managing or supervising psychologist has a responsibility to ensure that assistant psychologists are not given work to do that is over and above their level of competence. Further information is available in ***Society Document: Applied practitioner psychologist internship programmes and unpaid voluntary assistant psychologist posts.***

3.3 Working with trainee psychologists

The Society's standards related to working with trainees across the domains of applied psychology are set out in the Standards for accreditation of training programmes. These set out: the required core competencies that trainees need to develop, the curriculum and assessment requirements that programme providers need to deliver against, and the requirements of supervised practice; expectations around trainees' understanding of and ability to work ethically and legally; selection and recruitment of trainees; personal and professional development of trainees whilst in training; academic staffing and leadership for accredited programmes; and expectations in relation to quality management. Psychologists working with trainees as practice educators should familiarise themselves with these standards and adhere to them in their work with trainees. Further information is available on the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines.***

3.4 Working with multiple clients

Psychologists will sometimes be in situations where their client will not be one clear individual or group, for example, a psychologist may be employed by an organisation to

provide assessment or psychological support for employees. Psychologists need to consider and be mindful of the demands that this might place on their ethical practice and how this might lead to conflicts of interest.

Identification of the following client hierarchy may be considered[12],[13]:

- Primary client – the person or persons with whom the psychologist is interacting directly: the recipient of a psychological service.
- Commissioning stakeholders – the organisation or overall commissioning body that has sought the psychologist.
- Others affected by the primary client's actions – the customers of the organisation or service, or the personal acquaintances, friends and family of the primary client. In some circumstances, this will be the general public or larger groups interested in the outcomes of the intervention.

The psychologist's role will be mainly to the primary client and then the commissioning stakeholder. It is paramount that issues around boundaries and sharing of information are made explicit and addressed appropriately through a clear contracting agreement. Further information is available in ***Section 3.5: Working with other professionals***, ***Section 5: Making and maintaining agreements*** and ***Section 7: Managing data and confidentiality.***

Within each of the levels of the hierarchy, varying allegiances to associates (friends, family, acquaintances, colleagues) will need to be attended to, as will consideration of the impact of professional activity on the reputation of the profession and all those concerned.

3.5 Working with other professionals (including in multi-agency settings)

In order to meet the complex needs of clients fully, psychologists will often be required to work collaboratively with other professionals from their own or other agencies.

Such collaborative working will be for the benefit of clients and/or the promotion of the safety and protection of the public or the benefit of the organisation, and is required by national policy and legislation in a number of areas in which psychologists work. Engaging in partnerships drawing on a wide range of services and agencies enables psychologists to address identified community issues with the optimum use of resources.

Where appropriate to their context of practice, and consistent with the requirements of psychological practice, psychologists should:

- Work together with colleagues to develop a shared view of the aims and objectives of work at all levels. They should respect the professional standing and views of other colleagues and commit themselves to joint working.
- Make it clear to other professional colleagues what can be expected of them in collaborative work, the work that will be done, and the point at which the work will be terminated.
- Ensure that there are explicit agreements about information-sharing and confidentiality and its limits, and that these are adhered to.

- Practise and encourage in others full and open communication with colleagues/ agencies to support effective collaboration within the boundaries of the agreed limits on information-sharing and confidentiality,
- Demonstrate their commitment to involving clients in multi-agency work, finding ways to engage them and retaining the central principle of better outcomes for clients as the rationale for multi-professional and multi-agency work, as long as this is consistent with public safety.
- Be sensitive to the effects of clients receiving contradictory advice from different professionals or agencies and should work towards a co-ordinated view wherever possible.

3.6 Boundaries in professional relationships

Psychologists seek to establish good relationships and trust with their clients, other professionals, organisations and the community. They are aware of the complexity of professional relationships and the need to observe their boundaries. Multiple relationships occur when a psychologist is in a professional role with a client or colleague and at the same time is in another role with the same person or group e.g. as a supervisor, sports club member or co-author in a publication or where a psychologist is asked to work at a school where their child is a pupil.

Psychologists should:

- Ensure that the relationship reflects the appropriate context within which the practice is taking place.
- Be aware of the issues of multiple relationships and professional boundaries which may lead to (real or perceived) conflicts of interest or ethical considerations.
- Clarify for clients and other relevant stakeholders when these issues might arise.

When acting as leaders in practitioner or managerial roles, psychologists should maintain an awareness of the importance of respect for boundary and power issues within leadership relationships. In particular, an awareness of the possible abuse of these relationships should be maintained at all times. It is important that psychologists explicitly define the boundary of the relationship and negotiate and respect the responsibility that each holds in relation to it. Where psychologists are in a position of power/leadership with individuals, it is particularly important that they exercise caution and consider the possible issues which may arise from developing a personal relationship with these individuals. It may be necessary to seek further supervision where appropriate, with additional peers as necessary.

Psychologists have a duty of care towards their clients, who may be vulnerable, and should maintain a professional emotional distance from clients, services users or relatives and should not enter into an intimate or sexual relationship with any clients, service users or relatives they come into contact with as part of practice. Psychologists should also be aware that their duty of care can continue after a client practitioner relationship has ended.

As far as is reasonably practical, psychologists should not enter into a professional relationship with someone with whom they already have, or have had, a close personal

relationship. This includes family members and friends. Where there is no reasonable alternative, such as a lack of availability of other professionals, and it is acceptable in the particular context of practice, the psychologist should make every effort to remain professional and objective while working with the individual they know or have known. In such circumstances, at the earliest possible opportunity, this should be disclosed and discussed with a manager, where there is one, and supervisor and a note should be made in client records.

A range of psychologists work with people who initially have accessed the services in a dependent position, and have then transitioned to becoming partners and colleagues in service and policy development and design. The nature of the work becomes more collegiate and the psychologist holds multiple roles including facilitating participation, adapting communication and advocacy.

3.7 Working with children and young people

When seeking to work with children and young people, psychologists should consider how they can develop ways of communicating with the child or young person that will be most effective in ensuring they can express their views and feelings.

In most instances psychologists will use their specialist professional training and experience working with children, young people and families in order to understand the developmental needs of the child or young person in question; where a psychologist does not have specialist training that has included children and young people then there would be an expectation that advice or supervision should be sought before working with a child, young person, or their family. Similarly, work with children, young people and their families should take account of wider systemic factors outside of the child or young person; this will usually involve the child's family and may also include their school, and other settings.

As with adult clients, there can be misunderstandings and confusions about the role of a psychologist, the nature of the work being undertaken, and the possible outcomes of the work. It is essential to ask the children and young people about their understanding of what is happening on a regular basis (this may be appropriate at each session) and address any confusion that has arisen.

When working with children and young people, psychologists are advised to ensure that they have ascertained who has parental responsibility and that those with parental responsibility are aware of their planned involvement, if this is appropriate. Psychologists working with children, young people and families need to be aware that young people who are deemed to be competent to make their own decisions: 'Gillick competent'[14] can give their own consent to involvement with a psychologist, and that if a young person gives consent under these circumstances, then parental consent is not required. Similarly, a young person who is 'Gillick competent' can give consent even if parents have declined to give consent; such young people can also ask that parents are not informed of any involvement, and this should be respected by the psychologist; an example here would be in a school setting where a young person may give their own consent to see a psychologist

and may ask for parents not to be informed. Psychologists also need to be aware that where separated or divorced parents share parental responsibility, one parent can give consent.

3.8 Working with people with intellectual disabilities and impaired cognitive abilities

Psychologists are likely to work at some point with a range of people whose cognitive abilities are either temporarily or permanently altered, either by organic or developmental changes. Appropriate assessment of the abilities and skills is required, so that adaptions can be made to further interventions, treatments or management. The implications of the cognitive abilities on the person, their family and the reason for psychology involvement, will need to be considered.

Psychologists working with people with intellectual (learning) disabilities will need to consider adaptations to their approach to ensure the service they are offering is clearly understood, and is adapted to the individual's preferences, strengths and needs. This can include considering adaptations to oral or written communication, psychological assessment, intervention, and outcome evaluation.

Psychologists will need to be flexible and to make reasonable adjustments to their usual practice to ensure an appropriate service is offered. Psychologists should ensure their work is person-centred and respectful of the individual's needs, whether that work involves working with the individual with intellectual disabilities directly, or whether it also includes, or even may predominantly involve, working indirectly with family, carer or professional systems around the individual.

Psychologists will need to be mindful of the range of complex factors that often affect people with intellectual disabilities (e.g. communication needs, poorer mental and physical health outcomes and healthcare service experiences, unemployment, disempowerment, social isolation and exclusion, including experiences of bullying, abuse and hate crime, being overrepresented in the prison population, among others) and, therefore, the specific policy and practice guidance that applies. Further information is available in ***Section 4.2: Safeguarding adults at risk of harm*** and ***Section 6.3: Informed consent with people who may lack capacity.***

3.9 Working with detained people

Where clients are detained involuntarily there will always be a legal framework within which professionals must practise, and they should be aware of how their work fits into that framework. Involuntary detention is not only covered by professional rules and national legislation, but also by international agreements.

Psychologists should be aware that having the approval of one's employer is not necessarily a guarantee that practice is either ethical or legal, as described for example in the Hoffman report[15]. Where practitioners have doubts about the legal or ethical acceptability of employer demands, they should seek advice from an accredited workplace trade union representative, a human resources department, or appropriate helpline. They should

follow their organisation's guidelines on raising concerns at work. Seeking advice outside the immediate setting is helpful as colleagues within the workplace may be subject to the same pressures as they are.

Under the headings below, the role of the practitioner can be seen to be key to the way that detained persons are understood, and this can have a great impact on the way that their cases are handled by the detaining authority. The practitioner therefore has considerable power, whereas the client has very little. This power imbalance should always be borne in mind by practitioners dealing with detained persons. They should also bear in mind that the imbalance can be implicit as well as explicit.

Prisoners

Putting psychological pressure on detained persons to obtain a confession to an offence is illegal under the UN Convention on Torture[16]. In this context, 'psychological pressure' could well include such things as telling indeterminate-sentence prisoners who maintain innocence that they are unlikely to be released unless they engage with an intervention that relies on acknowledgement of guilt. Decisions about release are not the role of the practitioner, unless they are directly involved with, or are a member of the release authority, with a delegated role in the formal decision-making process. An approach to engagement such as this would not be considered beneficial to the client. However, those instructed by any party to the formal Parole Board decision-making process may properly be asked to give an opinion on suitability for release.

Practitioners dealing with detained offenders who have committed violent or sexual offences should guard against being morally judgemental. It is routine for practitioners in this field to encounter offenders who have committed very unpleasant acts with whose victims they can readily identify. Psychologists should be mindful that their own views about a client do not impact on their work.

Care should be taken when working with detained persons whose literacy is poor or whose first language is not English, and who cannot read a report which has been written about them. Even clients who are literate in English will probably not be familiar with psychological terminology, and may need considerable time to read and fully digest a report. People who are detained can also have cognitive challenges or intellectual disabilities which might make this process more difficult.

Persons detained under immigration legislation

Detained people may be afraid of raising a particular topic in case it is misunderstood, or too embarrassed because of cultural standards. For example, in some cultures it is difficult or unacceptable to discuss sexual matters, but sexual violence has been suffered by many asylum seekers in conflict zones, and some discussion of it may be essential in assessing their case. Even within the same culture there can be considerable generational differences.

Psychologists should guard against unwarranted interpretations of psychological evidence by commissioners or authority figures. For example, reporting that someone's story shows inconsistencies may give the impression that they are lying. This may be the case, but inconsistencies alone are insufficient proof of this. It is commonplace for evidence to be

inconsistently reported when people have been through traumatising experiences in areas of conflict, as is often the case with persons detained under immigration legislation.

Practitioners should take particular care in dealing with detained persons whose first language is not English. The opportunities for misunderstanding in both directions should be obvious, and in many cases the correct procedure will be to interview with the help of an interpreter. Failing to use interpreters when it was clearly appropriate to do so could inappropriately compromise the quality of the psychologist's work.

Mental Health Detentions

Mental Health Act 1983 as amended 2007 (England and Wales)
Under the Mental Health Act (MHA) a person can only be detained for treatment if that person is suffering from a mental disorder of a nature of degree that makes it appropriate for them to receive medical treatment in hospital. In the Act 'mental disorder' is defined as 'any disorder or disability of mind'. This definition is very broad but the *Code of Practice* provides guidance on clinically recognised conditions that fall within its meaning. Major categories of mental illness (e.g. affective disorders, schizophrenia and organic mental disorders) are included along with personality disorders, autistic spectrum disorders and learning disabilities (the latter only if accompanied by abnormally aggressive or seriously irresponsible behaviour). Dependence on alcohol or drugs is not considered a mental disorder under the MHA.

In the Act, all 'medical treatment' including psychological interventions is for the purpose of alleviating, or preventing a worsening of a mental disorder or one or more of its symptoms or manifestations. The medical treatment must be required for the health and safety of the client or for the protection of others. This means that the primary purpose of psychological interventions offered and provided to detained persons has to be to reduce the risks that their mental disorder presents to the detained person or others; as once those risks are reduced or minimised the client will no longer require detention and can progress to a less restrictive environment. This requirement points to the importance of an individualised formulation of a client's treatment needs that includes a careful assessment of the risks to self and others (see section on Risk Assessment, p.32).

Under the MHA appropriate medical treatment must be available. This is described as the 'appropriate medical treatment test' in the *Code of Practice*. Such treatment must have the *purpose* of alleviating or preventing a worsening of the disorder or its symptoms or manifestations, even if it cannot be shown in advance that the treatment is likely to have an effect for a particular patient. Thus, appropriate medical treatment need not be likely to achieve those purposes. That is, purpose is not the same as likelihood. The nature and degree of the patient's mental disorder and all the patient's particular circumstances are all relevant to whether the treatment is appropriate.

The appropriate medical treatment test is designed to ensure that patients are not detained for treatment unless they are actually to be offered appropriate treatment for their mental disorder. Thus, the MHA requires only that appropriate treatment is available to a detained patient. The patient's refusal to accept treatment is not an obstacle to detention, so long as appropriate treatment is available.

This has particular relevance for psychological therapies. The Code at chapter 23.20 states:

> *In particular, psychological therapies and other forms of medical treatments which, to be effective, require the patient's cooperation are not automatically inappropriate simply because a patient does not currently wish to engage with them. Such treatments can potentially remain appropriate and available as long as it continues to be clinically suitable to offer them and they would be provided if the patient agreed to engage.*

Whilst the availability test of appropriate medical treatment applies to psychological interventions in the same way as for other forms of treatment, it is important for psychologists to avoid placing pressure on clients to participate in such treatment. In order for there to be an effective therapeutic alliance there needs to be trust and this only develops in the absence of coercion. Psychological therapy works when the client decides they are ready for therapy and freely consents to it. There is an inevitable power differential in favour of the clinician. Thus, every attempt should be made to emphasise patient involvement and choice and to avoid coercion in a manner consistent with the *Code of Practice* empowerment and involvement and respect and dignity principles. Further information is available in ***Section 6: Obtaining informed consent.***

The Mental Health Act 2007, which amended the MHA 1983, introduced approved clinicians (AC) who may be drawn from a defined group of professions, including practitioner psychologists listed in the register maintained by the Health and Care Professions Council. ACs are approved by the appropriate national authority to act as an approved clinician for the purposes of the MHA 1983. Responsible clinicians (RC) are ACs who have overall responsibility for an allocated patient's case. The Code of Practice at chapter 36.3 says that a patient's RC should be the available AC with the most appropriate expertise to meet the patient's main assessment and treatment needs. At chapter 36.5 the Code says that where psychological therapies are central to a patient's treatment then it may be appropriate for a professional with particular expertise in this area to act as the RC.

Chapter 39 of the *Code of Practice* provides guidance on the circumstances in which potential conflicts of interest may prevent designated professionals from making an application for or recommendations supporting a patient's detention or guardianship. The potential conflicts of interest dealt with in the Code involve financial, business, professional and personal issues.

The Mental Health (Scotland) Act 2015.

This act, together with the Mental Health (Care and Treatment) (Scotland) Act 2003 sets out the law for detaining patients and restricting patients. For patients to be detained, this has to be considered by the Mental Health Tribunal for Scotland. This applies, for example, to those detained in the NHS who are not subject to a court (forensic) decision.

Restricted patients are 'detained in hospital under a compulsion order with a restriction order'. They have usually committed an offence punishable by imprisonment but as a result of mental disorder are not imprisoned but ordered to be detained in hospital for treatment, without limit of time. They are dealt with through a programme of treatment and rehabilitation – the aim being to prevent recurrence of offending by dealing with the mental disorder'.

Risk assessment

When dealing with detained people seeking release, such as parole applicants or patients seeking release from a mental health tribunal, risk assessment (usually for violence risk) will be a prime consideration. Psychologists should bear in mind that risk assessment is not prediction. Risk assessment instruments are rarely more than about 70 per cent accurate when predicting reconviction and many items on commonly used risk-assessment schedules are of poor predictive value.[17] Psychologists should also bear in mind that risk-assessment instruments are better at identifying low-risk than high-risk individuals[18],[19]. A statement of risk is not a prediction about an individual, but a statement based on the behaviour of a criterion group with which that individual is being compared. Risk is statistical by its very nature, and the value of such comparisons depends upon the individual's similarity to the criterion group upon which the risk assessment instrument was developed. Accuracy may be greatly reduced if the similarity is low[20]. It may be better to think of risk assessment as a process of identifying those risk factors which need to be monitored and controlled if supervision of the individual is to be reduced or withdrawn.

3.10 Working with people who are, or would like to be employed

Psychologists are sometimes commissioned to deliver psychological assessment or training with employees and potential employees. Psychologists should take particular care over the advice provided in follow-up reports, as employers are not trained professionals and may misinterpret advice or psychometric testing results. For example, citing a reading ability level using age is misleading, and could be interpreted as incompetent for the role, when in reality the role does not require a high reading level or a reasonable adjustment could be provided.

Similarly, psychologists should ensure that the tools they are using to assess competence or suitability are appropriate for the role, and have good reliability and validity. Any tools devised by the psychologist are likely to be interpreted by the employer as professional and authoritative, where there is ambiguity or multiple interpretations, this must be made clear, so that decisions about peoples' employment are not made in error.

There are people who work or who would like to work, who may experience cognitive difficulties caused by a range of factors, for example intellectual disabilities, dementia, acquired brain injury. Sometimes this information is known and needs to be considered when assessing and advising. At other times, this possibility of a cognitive or intellectual impairment needs to be considered. The impact of this can be far reaching, in terms of ongoing or future employment, access to benefits and of course associated psychological adjustments for the person and the people around them. Further information is available in ***Section 7: Managing data and confidentiality*** and ***Society Document: Psychological Assessment of Adults with Specific Performance Difficulties at Work.***

3.11 Working with cultural difference

It is expected that all psychologists will have the necessary skills and abilities to work with all sections of the community.

Psychologists need to be aware of stereotypical beliefs and assumptions which manifest in thinking about culture and ethnic groups. Psychologists should bear in mind the history of racism and the early development of Western psychology[21] and culturally biased testing in favour of white, middle-class children. Psychologists need to recognise that multi-ethnic groups are not homogenous groups and there are wide regional and local differences among these groups which can be split by language, dialect and regional variations. Each ethnic community has a distinct identity and religious focus may also vary within and across communities.

Race is not a biologically meaningful concept to apply to people, and even the artificial divisions between the so-called racial groups are nebulous and unstable, biologically, socially and physically.[22]

Psychologists need to understand the discrimination suffered by people from diverse and/or minority ethnic and religious backgrounds as a result of:

- the interchangeable use of the terms race, culture and ethnicity leading either to the perception of black and minority culture, race and ethnicity as unitary or an assumption that knowing about these cultures solves the problem of equality, fairness and availability of services;
- the maintenance of the colour-blind approach in service where 'one size fits all', resulting in a lack of formal recognition of the varied diverse needs as well as these needs being ignored, unacknowledged or assumed to be the same;
- the lack of appropriate culturally relevant psychological therapy available to certain Black and Minority Ethnic (BME) communities;
- being discriminated against on grounds of 'special' needs, effectively considered as 'cultural pathology'; and
- experiencing instances of indirect, subtle, or unintentional discrimination often called 'micro-aggressions'.

It would be expected that all practising psychologists should develop a productive working relationship with culturally and linguistically diverse groups of people by:

- avoiding different types of biases and find new ways (verbally and non-verbally) to build rapport and respect;
- using and working with trained interpreters in assessment, formulation and intervention work as well as research work;
- being aware of the impact of culture, ethnicity and religion in assessment, formulation and intervention processes and the use of norm-referenced tests which do not include minority ethnic groups as part of their standardisation;
- pre-assessing and pre-incorporating ethnic identity (including its fine gradations, region, class and generation) which can have impacts on processes and outcomes of psychological work;
- acknowledging their own ethnocentricity and possible underlying socially conditioned prejudice to people who are 'different'; psychologists need to acknowledge that people can change, irrespective of their differences and psychological distress;
- relooking at current models of mental health which traditionally reflect Western

constructions, and incorporating other world views of psychological wellbeing; and
- understanding and respecting the different concepts of health and illness that exist within different ethnicities, including newly arrived people from Europe and refugees from Syria, Turkey, Somalia etc.

Psychologists need to: address the different life situations and life circumstances experienced by users who wish to use mental health services; hear their voices based on their personal experiences; and act and respond accordingly in a human way.

3.12 Working with people of faith, religion and spirituality

In working with clients who hold a variety of values and religious and spiritual beliefs which may be different from their own, psychologists should consider the following:

- Psychologists should respect clients' values and spiritual beliefs and need to be mindful that their personal beliefs should not be an impediment to engaging with the client.
- Spiritual beliefs are very often beneficial to the client's wellbeing and may be helpful to be incorporated into any intervention to achieve a positive impact where appropriate.
- In some circumstances the client's faith belief may be harmful or detrimental to themselves or others.

3.13 Working with sexual and gender minorities

Psychologists are committed to the fair treatment and inclusion of people who are intersex, people who do not identify as heterosexual and/or people who do not identify with their natally-assigned sex. This section provides guidance to address specific issues in support of these heterogeneous populations. In these guidelines we use the term 'sexual minority(ies)' to refer to individuals whose romantic attraction or sexual attraction is other than heterosexual (different from the majority in the surrounding society), and the term 'gender minorities' to refer to transgender, genderqueer and intersex individuals.

When working with gender and sexual minorities, psychologists are encouraged to:

- remember that sexual and gender minority identities are not indicative of mental health disorders;
- understand that attitudes towards sex, sexuality and gender are located in a changing social, cultural, and political context, and to reflect on their own understanding of these concepts and how it may impact their practice;
- reflect on the limits of their practice when working with certain sexual and gender minority clients, and to consider appropriate referral and training when necessary;
- understand how social stigmatisation (e.g. prejudice, discrimination and violence) poses risks to gender and sexual minority clients;
- consider engaging with the wider socio-political context regarding sexual and gender minorities in order to reduce social stigma;
- be knowledgeable about the diversity of sexual and gender minority identities and practices;

- use the preferred language of the sexual and gender minority individuals;
- understand the unique and particular circumstances and challenges facing clients with diverse gender and sexual identities and practices;
- understand the diversity of forms of relationships and families in gender and sexual minority clients;
- be aware of the potential challenges facing sexual and gender minority clients in their relationships and families;
- be mindful of the intersections between sexual and gender minority and socio-cultural/economic status;
- recognise the particular challenges experienced by gender and sexual minorities with physical and/or mental health difficulties;
- recognise the diversity of developmental pathways for sexual and gender minority children and adults;
- recognise the needs and issues of young people from gender and sexual minorities, and their particular vulnerabilities;
- support the self-determination of their clients in the development of their identities and practices; and
- avoid attempting to change gender or sexual minorities on the basis that they can be 'cured' or because of stigmatising theory, personal, religious and/or socio-cultural beliefs.

Working with racially and ethnically diverse Lesbian, Bisexual, Gay, Trans*, Queer (LGBTQ) populations

Black and minority ethnic (BME) LGBTQ people have to negotiate between the values and beliefs of the mainstream and minority ethnic cultures. Cultural differences in norms, beliefs, and values can be a source of psychological stress[23],[24],[25]. There may be no particular sexual and ethnic minority group to which a BME LGBTQ person can anchor their identity and obtain acceptance and support. This may be a particular issue for BME LGBTQ youth who are exploring their sexuality and sexual identity.

When offering psychological services to racially and ethnically diverse LGBTQ populations, it is not sufficient for a psychologist simply to identify the racial and ethnic identity and background of the client. Ethnic minority status can complicate and exacerbate the issues, challenges and difficulties the client experiences. The client can be affected by the way their ethno-culture community view and understand sex, sexuality and gender. The issue of racism within the LGBTQ community is also an important issue to consider[26],[27],[28],[29]. Sensitivity to the complex dynamics associated with factors such as cultural values about gender roles, religious and procreative beliefs, degree of individual and family acculturation, and the personal and cultural history of discrimination or oppression is also important. All of these factors may have a significant impact on identity integration and psychological and social functioning[30],[31],[32],[33],[34].

Further information is available in ***Society Document: Guidelines and Literature Review for Psychologists Working Therapeutically with Sexual and Gender Minority Clients.***

3.14 Working with people who may be socially excluded

Social exclusion refers to the extent to which individuals are denied access to the prevailing social system and the right to participate in key areas of social, economic and cultural life. This exclusion occurs due to constraints and restrictions rather than as a matter of choice. Exclusion is typically a result of poverty and/or belonging to a social minority group. The impact of social exclusion has been well documented and leads to the perpetuation of cycles of inequality for individuals and groups. These cycles of inequality are perpetuated in terms of income, health, opportunity, relationships and life-span. Further information is available in ***Society Document: Socially inclusive practice.***

Social inclusion is the process where the needs of all members of communities and the groups which constitute them are recognised, prioritised and met, resulting in these individuals feeling valued and respected. Promoting social inclusion is a broader task than promoting equality and tackling discrimination and stigma. It requires psychology professionals to address wider structural issues in society which maintain excluding processes and power differentials.

The range of individuals and groups who may experience disadvantage and exclusion is not limited to the protected characteristics outlined in the Equality Act. For example, people may also experience exclusion because of their age, they are a carer or are in care, they have a low income or low educational achievement, or their cognitive ability is compromised.

When working towards social inclusion psychologists are encouraged to:

- acknowledge, understand and respect the diversity of the communities in which they practise;
- make adjustments where possible and needed, to enable people to fully participate, e.g. to communication, access to services, adaptation to materials and psychological assessment and interventions;
- recognise that they have a professional duty actively to promote equality and opportunity;
- recognise the shame and distress caused by discrimination, and the impact of discrimination on wellbeing;
- acknowledge and respond to the trauma and distress caused by exclusion;
- move beyond the level of the individual and recognise that social exclusion is a structural issue, and that inclusion will be achieved only by structural changes in society and broad policy initiatives;
- acknowledge that there is a responsibility to highlight the links between structural societal factors and mental health problems;
- make employers, policy-makers, clients and the general public aware of situations where policies, practice and the distribution of resources are oppressive, unfair, harmful or illegal;
- challenge social conditions, both as individuals and collectively, that contribute to social exclusion and stigmatisation;
- make services accessible in terms of time, space, familiarity and comfort; make reasonable adjustments to services to meet individuals' needs; people need to be able

to get to places, get into places, feel welcomed to places and feel that they belong in places;

- recognise that inclusive services reflect the communities they serve in terms of the identities and diversity of the staff team;
- recognise the range of interventions that can improve clinical and social outcomes and use influence to ensure these services are commissioned;
- emphasise social outcomes and participation alongside clinical outcomes;
- maintain an emphasis on empowering clients to achieve their social goals; and
- identify natural sources of support and reciprocal relationships for individuals within their communities, and seek out opportunities to help individuals transition out of formal mental health services.

4. Safeguarding

Safeguarding means protecting people's health, wellbeing and human rights, and enabling them to live free from harm, abuse and neglect[35]. This guidance addresses safeguarding of both children and adults.

Abuse takes many forms and cuts through various domains of life. The categories below are often referred to in investigation/legislation context and are not mutually exclusive with e.g. emotional abuse featuring in the other domains of abuse. Abuse can be found across all sections of society, irrelevant of gender, age, ability, religion, race, ethnicity, personal circumstances, financial background or sexual orientation.

- Physical abuse – is the use of physical force or mistreatment of one person by another which may or may not result in actual physical injury. This could include hitting, poisoning, deprivation of food, water or liberty, rough handling or exposure to heat or cold, amongst other things.
- Sexual violence and abuse – sexual abuse is any behaviour perceived to be of a sexual nature which is unwanted or takes place without consent or understanding. Sexual violence and abuse can take many forms and may include non-contact sexual activities such as: indecent exposure, stalking, grooming or being made to look at, or be involved in the production of sexually abusive material, or being made to watch sexual activities.
- Psychological/emotional abuse is behaviour that is psychologically harmful or inflicts mental distress by threat, humiliation or other verbal/non-verbal conduct. This may include threats, blaming, controlling, intimidation or coercion amongst other things.
- Financial abuse is actual or attempted theft, fraud or burglary. It is the misappropriation or misuse of money, property, benefits, material goods or other asset transactions which the person did not, or could not, consent to, or which were invalidated by intimidation, coercion or deception. This may include exploitation, embezzlement, withholding pension or benefits or pressure exerted around wills, property of inheritance.
- Institutional abuse is the mistreatment or neglect by a regime or individuals, in settings which people who may be at risk reside in or use. Institutional abuse may occur when routines, systems and regimes result in poor standards of care, poor practice and behaviours, inflexible regimes and rigid routines which violate the dignity and human rights of the adults and place them at risk of harm. It may occur within a culture that denies, restricts or curtails privacy, dignity, choice and independence. It involves the collective failure of a service provider or an organisation to provide safe and appropriate services and includes a failure to ensure the necessary preventative and/or protective measures are in place.
- Neglect is the persistent failure to meet basic physical and/or psychological needs. It may involve a parent or carer failing to provide adequate food, clothing and shelter, failing to provide or unresponsiveness to, basic emotional needs or failing to protect from physical harm.

Psychologists are in a particularly relevant position to identify interactions or circumstances that affect health and development. This applies not only to psychologists who undertake direct work with children and vulnerable adults in a variety of settings; but also to those who work with clients, seen for instance in clinics, hospitals or prisons, who may make historical disclosures of abuse or raise concerns about child protection or the welfare of people within their families or communities. Safeguarding is thus the responsibility of all psychologists whatever their role.

4.1 Safeguarding children

The Society endorses *Working Together to Safeguard Children* – A guide to inter-agency working to safeguard and promote the welfare of children[36]. Safeguarding children is the responsibility of everyone.

The guidance defines safeguarding children as protecting children from maltreatment and preventing impairment of children's physical or mental health or development (physical, intellectual, emotional, social and behavioural). Promotion of welfare is defined as ensuring that children grow up in circumstances consistent with the provision of safe and effective care, and taking action to enable all children to have the best life chances.

Child protection within safeguarding refers to the activity that is undertaken to protect specific children who are suffering or likely to suffer significant harm. For the purposes of child protection legislation children are those who have not yet reached their 18th birthday. The child's needs are paramount, and the needs and wishes of each child be they a baby or infant or an older child, should be put first, so every child receives the support they need before a problem escalates.

The policy of Working Together is underpinned by two key principles: (a) safeguarding is everyone's responsibility and for services to be effective each professional and organisation should play their full part; and (b) safeguarding requires a child-centred approach based on a clear understanding of the needs and views of children.

Where there are concerns that a child is at risk of harm, such concerns should normally be communicated following the psychologist's work-place safeguarding protocol. Where this is not applicable, concerns about a child's welfare can be made directly to the local authority children's social care team.

Psychologists should:

- be alert to the heightened vulnerability/possible need for early intervention support for a child who: has a disability, has additional needs (including special educational needs), is a young carer, is showing signs of engaging in anti-social or criminal behaviour, has returned home from care and/or is showing early signs of abuse and/or neglect.
- be alert to heightened vulnerability where a child is in a family circumstance presenting challenges for the child, such as substance abuse, adult mental health problems and domestic violence.
- consider the potential impacts of parental/carer ill-health on the family and whether this creates any significant negative impacts or risks for children within that family;

- be aware that if an adult has responsibilities for children outside the home setting, such as working with children, their mental ill-health and/or their health more generally upon the adult's capacity to work safely;
- be aware that children within the same family can be treated differently (one child may be singled out for abuse);
- be aware/seek to understand how children can come to abuse other children;
- recognise that some professionals use their position to abuse children and vulnerable people; and
- challenge institutional abuse in its many forms.

Psychologists should be aware of situations of risk which require additional consideration, notably:

- sexual exploitation, which involves exploitative situations, contexts and relationships without the child recognising the harm on account of their age/understanding, social/economic and/or emotional vulnerability;
- internet abuse, which can involve cyber bullying, exposure to pornography or violence and exploitation of young people;
- domestic violence which may expose a child to violence directly or indirectly;
- shame-based abuse where children or young people may be physically assaulted or murdered because of bringing perceived 'shame' to their families or breaking cultural expectations of 'honour'; and
- Trafficking, any child transported for exploitative reasons is considered to be a trafficking victim, whether or not they have been forced or deceived. This is partly because it is not considered possible for children to give informed consent. Even when a child understands what has happened they may still appear to submit willingly to what they believe to be the will of their parents or accompanying adults.

Psychologists should have a knowledge and understanding of services for children in need and how to access them. Psychologists confronted with child abuse in any form should contribute to whatever actions are needed to safeguard children and promote their welfare. The needs/interests of adults should not be allowed to take precedence ahead of the needs of the child. Psychologists should work co-operatively with parents/carers unless this is inconsistent with ensuring the child's safety and ensure that the child's view is sought, heard and communicated. Psychologists should share appropriate information in a timely way, discuss any concerns and help analyse information so that an assessment can be made of the child's needs and circumstances. Psychologists should contact the children's services or social services department at the appropriate local authority (in some cases this role has been delegated to a multi-agency safeguarding hub) if they are concerned about a child or a vulnerable adult.

Managing cases of alleged historical abuse

There is a growing recognition that a disclosure of non-recent abuse may reveal current risks to others from an alleged perpetrator. Psychologists have a duty of care to their clients, and in the safeguarding of others. This may place psychologists in complex positions when trying to negotiate and balance their duties and responsibilities.

Psychologists who work with adult clients who disclose non-recent sexual abuse, should recognise that there may be current and ongoing risks posed by the alleged perpetrator to others. Not sharing concerns beyond the consulting room could mean that other children and young people could be at risk.

A client's allegations should be taken seriously, regardless of their presenting problems or mental health diagnosis.

Lack of access to children identified through familial relationships, work or volunteering roles should not eliminate concerns about risk, given opportunities for abuse to occur within communities.

It is crucial that psychologists seek advice from colleagues, particularly colleagues in safeguarding services, within the organisation and also from other agencies tasked with leading on safeguarding (i.e. social services). Psychologists working with clients without a referral and where no stakeholder agency is involved should seek advice from senior experienced colleagues on how to proceed. Psychologists need to be alert to the possibility that abuse may be organised, severe and complex.

There may be times when, in the interests of supporting a client's psychological readiness for disclosure, consultation may continue without requiring identifying details to be provided to the psychologist. It is important that a clients' lack of readiness to disclose does not become an obstacle to receiving psychological help. Further information is available in ***Society Document: Guidance document on the management of disclosures of non-recent (historic) child sexual abuse.***

Where the disclosure is made by the perpetrator of the abuse, risk assessment should be made regarding the context of the setting of the disclosure but there may be a professional obligation to disclose the criminal offence in order to safeguard other potential victims as above.

4.2 Safeguarding adults at risk of harm

The Care Act 2014 brought in new legislation regarding the safeguarding of all vulnerable adults. In some regions there is a move away from the term 'vulnerable adult' towards the concept of an adult at risk of harm.

An adult at risk of harm is a person aged 18 or over with need for care or support, who is experiencing, or is at risk of, abuse or neglect, and as a result of their needs is unable to protect himself or herself against the abuse or neglect or the risk of it. The needs referred to here may cover a variety of personal or life circumstances including (but not limited to) cognitive impairment, age, disability, illness, injury or mental health condition.

The legal context

There is no set piece of legislation for adult safeguarding. It is a mix of criminal law, case law and welfare law. The Care Act 2014, updated in 2016, brought in the first legal framework for safeguarding adults in a single act. It contains a range of regulations and statutory guidance, which form the base upon how social care will develop in the future.

It enshrines the new statutory principle of wellbeing and it makes it the responsibility of local authorities to promote wellbeing when carrying out any of their care and support functions. The act specifies the rights of those who need care and support, their carers, and the funding system for care and support. It recognises that this cannot be achieved by any single agency. Every organisation and person who comes into contact with a child or adult has a responsibility and a role to play to help to keep children and adults safe. Further information is available in ***Appendix 1: Relevant legislation.***

Modern slavery

An important area of concern is modern slavery. The Government website provides details about the government's work to end modern slavery, including details about how to refer victims into the national referral mechanism (NRM). Modern slavery is a serious crime. It encompasses slavery, servitude, and forced or compulsory labour and human trafficking. Modern slavery victims can often face more than one type of abuse and slavery, for example if they are sold to another trafficker and then forced into another form of exploitation.

A person is trafficked if they are brought to (or moved around) a country by others who threaten, frighten, hurt and force them to do work or other things they don't want to do.

A victim of slavery is entitled to help and protection from the UK Government (this is called the National Referral Mechanism), all support is provided on a confidential basis, and support to talk to the police. The National Referral Mechanism has been put in place to identify victims of trafficking and refer them to organisations that will offer help and support. Further information is available in ***Appendix 2: Websites and further information.***

Responding to concerns

Safeguarding adults means:

- Protecting the rights of adults to live in safety, free from abuse and neglect.
- People and organisations working together to prevent and stop both the risks and experience of abuse or neglect.
- People and organisations making sure that the adult's wellbeing is promoted including, where appropriate, taking fully into account their views, feelings and beliefs in deciding on any action.
- Recognising that adults sometimes have complex interpersonal relationships and may be ambivalent, unclear or unrealistic about their personal circumstances and therefore potential risks to their safety and wellbeing.

Providers' safeguarding arrangements should always promote the adult's wellbeing. Being safe is only one of many things that adults want for themselves and there can be challenges in balancing safety and freedom in a way which protects and fulfils human rights. Providers, and other professionals where relevant, should work with the adult to establish what being safe means to them and how that can be best achieved.

Care and support means different things in every case. The fundamental standard on safeguarding is that children and adults using services must be protected from abuse and improper treatment. Providers should establish and operate systems and processes

effectively to ensure this protection and to investigate allegations of abuse as soon as they are aware of them.

The standard states that care or treatment must not:

- Discriminate on the grounds of any of the protected characteristics of the Equality Act 2010;
- Include acts intended to control or restrain an adult or a child that are not necessary to prevent, or not a proportionate response to, a risk of harm to them or another person if the adult or child was not subject to control or restraint;
- Be degrading to the adult or the child;
- Significantly disregard the needs of the adult or the child for care or treatment.

The standard goes on to state that no adult or child must be deprived of their liberty for the purposes of receiving care or treatment without lawful authority.

Safeguarding Adults Boards were established to help and safeguard adults with care and support needs The Safeguarding Adult Board must lead adult safeguarding arrangements across its locality and oversee and coordinate the effectiveness of the safeguarding work of its member and partner agencies, according to the values of 'Making Safeguarding Personal' Guide 2014[37]. Making safeguarding personal is not just for people with capacity, it is just as important for people who lack capacity. The Guide specifies outcomes that people might want including to be and to feel safe, to maintain or get friends, to know that this won't happen to anyone else or to be able to protect self in the future.

The following are not outcomes:

- Harm or abuse is substantiated/unsubstantiated.
- The person is receiving increased monitoring or care.

The role of the Care Quality Commission[38] is to monitor, inspect and regulate services to make sure that they meet the fundamental standards of quality and care. The Commission works alongside Safeguarding Adults Boards and Safeguarding Children Boards to share information and intelligence where appropriate to help them identify risks. This includes providing appropriate advice and support to people at risk of radicalisation in sectors such as healthcare and education.

4.3 Terrorism and extremism

Section 26 of the Counter-Terrorism and Security Act 2015 (the Act) places a duty on certain bodies ('specified authorities' listed in Schedule 6 to the Act), in the exercise of their functions, to have 'due regard to the need to prevent people from being drawn into terrorism'. Depending on where the psychologist works, these duties may have relevance in the course of their employment. The term 'due regard' as used in the Act means that the authorities should place an appropriate amount of weight on the need to prevent people being drawn into terrorism when they consider all the other factors relevant to how they carry out their usual functions.

The current UK definition of 'terrorism' is given in the Terrorism Act 2000. In summary, this defines terrorism as an action that endangers or causes serious violence to a person/ people; causes serious damage to property; or seriously interferes or disrupts an electronic system. The use or threat must be designed to influence the government or to intimidate the public and is made for the purpose of advancing a political, religious or ideological cause. People suspected of being involved in such activity must be referred to the police.

'Extremism' is defined in the Prevent Strategy[39] as vocal or active opposition to fundamental British values, including democracy, the rule of law, individual liberty, and mutual respect and tolerance of different faiths and beliefs. Definitions of extremism can also include calls for the death of members of our armed forces, whether in this country or overseas.

While it is recognised there is no single profile associated with extremism, identity is considered to be central, and risk screening is based on assessment in relation to two general pathways into extremism – criminal and non-criminal. Disengagement follows a similar process. This is a contentious area of practice. Psychologists should ensure they focus on their core role, working in a non-stigmatising way, and avoiding profiling based on characteristics such as race, religion, ethnicity or any other aspect. The psychologist should carefully weigh relevant professional obligations and seek and follow appropriate local and employer guidance. Further information is available in ***Appendix 2: Websites and further information.***

5. Making and maintaining agreements

Both client and psychologist benefit by having arrangements for the work clearly set out from the start. Psychologists should be aware that all professional engagements are ultimately governed by the law of contract. A legally enforceable contract can arise as a result of the parties' entering into a written agreement, but can also arise as a result of a verbal agreement between the contracting parties.

A contract arises if the following are present:

- one of the parties (the offeror) had made an offer to the other party (the offeree);
- the offeree accepts the offeror's offer;
- there is consideration (i.e. something of value) passing from each party to the other, e.g. the offeror provide services to the offeree; the offeree pays the offeror;
- the parties intended to create a legal binding arrangement; and
- the terms of the contract are sufficiently certain.

While this does not mean that all client engagements are made subject to an agreed contract document, it does mean that in the worst-case scenario of a complaint against a psychologist being made, it will be very helpful for the psychologist to be able to demonstrate that they have met their professional obligations to their client. This will be best done by demonstrating that an agreement was made by both parties who knew what they were agreeing to, that the parties had the legal capacity to make such an agreement and that what they were agreeing to is permitted under the law. Where the client does not have the capacity, best interest decisions need to be made in accordance with the Mental Capacity Act. Further information is available in ***Section 6: Obtaining informed consent***.

Psychologists may wish to include the following when making agreements:

- the role and function of the psychologist;
- the psychologist's relevant qualifications, areas of expertise and ways of working;
- relevant limitations of the psychologist's practice, e.g. assessments not accepted or types of activity not undertaken;
- where the psychologist is appointed to work with a third party, the psychologist should make clear their obligations to each of the clients concerned and each client's obligations under the agreement and ensure that there are no conflicts or ambiguities;
- the extent of the psychologist's power and responsibilities when acting on behalf of other agencies;
- obligations in relation to duty of care and safeguarding, and related limitations to confidentiality;
- how confidentiality of client information and data is assured and any limitations to that confidentiality;
- how conflicts of interest will be managed if applicable;
- the client's, or other party's, rights of access to stored information;
- the use of any one-way viewing screens or video or audio recording and the security of any recorded material;

- the nature of psychological activities involved, the reasons for undertaking them and information about the likely outcomes;
- the availability of the psychologist to the client;
- details of fees, together with application of VAT if non-clinical services, or expenses to be billed in connection with the work undertaken;
- what is expected from the client as their contribution to the engagement with the psychologist, expectations for payment and consequences of non-payment;
- ownership of intellectual property rights;
- what might cause a breach of the agreement;
- the rights of each party to withdraw from the agreement and the consequences to any financial agreement;
- recourse to dispute resolution or law;
- the equality and justice aspects of social policies and their possible impact;
- external ethical scrutiny and approval of the engagement, where appropriate; and
- arrangements to terminate the retainer.

In advance of any psychological assessment, the client should be made aware of the availability of services, and the existence of any waiting lists for intervention.

For some approaches, intervention follows an evolving path, unique to each client and his or her life circumstances, which cannot be precisely predicted in advance. Clients should be made aware of this uncertainty, and predictions should be made on the best judgments. It is recognised that it is sometimes unrealistic and undesirable to provide detailed information on all aspects of psychological intervention, and consent should be obtained to a general strategy rather than specific procedures. Further information is available in this document or the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines.***

5.1 The practitioner's right to withdraw their service

There are circumstances in which a psychologist may decide to terminate the agreement for provision of psychological services. The circumstances may be personal or professional.

The personal circumstances may include but will not be restricted to leaving employment in a psychological service, incidences of illness or family commitments.

The professional issues may relate to service structural changes, safety, or provision of most appropriate service.

In these circumstances, psychologists will, as far as possible, work to ease the transition of service provision and give as much notice as is practical in the particular situation.

5.2 Referrals

Where a psychologist finds themselves unable to come to an agreement with a client, the psychologist may refer the client to a suitably qualified colleague. Psychologists will both make and receive referrals when working in services with other professionals.

In making referrals, psychologists should consider the needs of the client and to the best of their knowledge refer to another professional with the appropriate skills and experience.

In receiving referrals, the psychologist should consider whether the referral is appropriate for psychology, establish the client's understanding of the purpose of the referral, and consider as far as possible prior to meeting the client whether the referral falls appropriately within their own areas of practice.

5.3 Representation of the qualifications and status of the psychologist

HCPC registration and BPS Chartered Status

Psychologists are encouraged to state their registration with the HCPC and protected title(s). This will provide assurance that the psychologist meets national standards of training and professional skills.

Use of the 'consultant' title

The term 'consultant' generally does not have a formal definition. Within the medical field it is used by doctors who have considerable experience and proven expertise demonstrated through examination within their respective Royal Colleges.

While there is no clear comparable grading structure for psychologists outside the NHS (within the NHS, the consultant title is used by psychologists who are employed in Band 8C, 8D and 9 positions), the use of this title would be seen to reflect both seniority and specialist expertise.

There is a difference between a 'consultant' psychologist and a psychologist who provides consultations in their context of practice. The Society expects that psychologists should be honest and accurate in representing their professional affiliations and qualifications, including such matters as knowledge, skill, training, education and experience.

The Society's position is that this would be applicable in any situation where expert knowledge or skills is being marketed or promoted, whether or not this is for financial gain. Further information is available in ***Society Document: Guidance on the use of the title 'Consultant Psychologist'.***

6. Obtaining informed consent

Psychologists should always ensure that they have sought and received the consent of those they work with, given of their own free will, without undue influence.

The concept of informed consent relates to the client's right to choose whether to receive psychological services, and to make this choice on the basis of the best information available presented in the most appropriate way. The principles apply, whether the psychologist works in the public, private or voluntary sector or in independent practice.

Psychologists should obtain the informed consent of the client in an appropriate manner prior to undertaking any assessment, intervention or research activities. In all circumstances, common sense and ethical practice should apply when considering the approach to gaining informed consent from those with whom the psychologist is working.

This section refers, in the main, to consent with adults with capacity. Further information on informed consent with discrete communities where further consideration may be needed is available in ***Sections 6.1 to 6.4***.

Obtaining informed consent involves a process which is dynamic and is relevant to the specific assessment, intervention or decision being made at that time. When there are substantive changes in the intervention or when the psychologist has reason to consider the client may no longer consent, consent should be reviewed. Psychologists should ensure that their clients are enabled to play an active role in this process. Clients should be encouraged to ask questions whenever they are in doubt.

Psychologists should be aware that a client's desire for help, and the immediate impact of the psychologist's supportive listening, may affect the client's ability to make informed choices about the help they wish to receive. They should also be aware that their own desires to help a client may bias their presentation of information, such as the probability of successful outcomes.

Psychologists should be aware of the complexities of obtaining informed consent to treatment due to the perceived power, status and authority of the professional psychologist. It may not be clear if the consent given is freely given by the client or, for example, is part of a pattern of compliance towards authority figures. Equally, a client may say that they understand the explanation given by the psychologist, and accept a plan for intervention, in order to avoid the discomfort of being seen not to understand the psychologist's complex language and ideas.

Obtaining informed consent is particularly difficult when the client is obliged to undertake the psychological intervention as part of an employment process or performance measure where they may have obligations under their employment contract; or when detained.

There should ideally be an ongoing dialogue between client and psychologist, as part of the process of joint decision-making. At any point, the client should feel free to ask questions about the impact of the treatment and withdraw consent to continue.

Psychologists should attempt to intervene against the express wish of a client only after careful consideration and in line with relevant legislation, policies and professional practice.

Provision of information for informed consent

In order to ensure that the client has all the information necessary to make an informed decision about whether to take part or not in a psychological activity, they must be provided with relevant information, such as that listed below, in a format that is designed to meet their specific needs.

The psychologist should consider providing information about the following:

- what the psychological activity involves, as far as this is consistent with the model of interaction, e.g. there will be limits in the use of some non-directive therapies and psychometric assessments;
- the benefits of the activity, either directly to the client in the case of assessment or intervention, or indirectly in the case of systemic intervention, or to potential theoretical advances or service improvement;
- any alternative assessment or treatment options and their known availability;
- foreseeable risks and how minor or serious they may be, for example the potential to feel worse at stages during therapeutic interventions;
- what might be the benefits and potential costs and risks to them of engaging or not engaging in the proposed psychological activity; and
- the client's right to withdraw their consent from assessment, treatment or intervention at any stage, along with information about any likely consequences of such withdrawal.

Consent to involvement of others

Psychologists have an obligation to ensure that prospective clients are informed of the extent and limitations of confidentiality with respect to anticipated services, the purposes of any assessment, the nature of the procedures to be employed or the intended uses of any product such as notes or recordings, before the assessment or intervention starts. Further information is available in ***Section 7: Managing data and confidentiality.***

The psychologist should ask the prospective client: whom they would wish to be informed of their assessment or treatment, if anyone; and the information they are willing to share where communication is essential, for example to the referring agent or organisation, management or court. Wherever appropriate, including in the law, the client should have copies of reports or letters or be given feedback so that they are kept fully informed.

If it is deemed necessary to move from individual contact to include others this should where possible be done with the client's prior consent.

Psychologists may be asked to provide consultancy or advice to colleagues about an identified client, without that person's knowledge or when the client has indicated that they do not want to have direct contact with the psychologist. In these circumstances, the psychologist will need to consider their potential involvement and the need for consent.

A psychologist who draws upon the work of other professionals in preparing a report, should seek their consent, where possible and if not already in disclosed records, to include that material and should acknowledge its source in the report.

If a report is requested which draws upon previous or concurrent investigations of a client in other contexts, for example NHS records in the preparation of a report for the court, the client's consent or relevant authority's consent for that information to be used should be sought.

If psychologists wish to use reports on clients which have been compiled by other professionals, they should do so only with the consent of those professionals and use the reports only in the context for which the report was specifically provided.

Information on and consent to record-keeping

Express consent must be sought in advance for the use of video, audio recording or one-way screens, with a clear explanation of the purpose of these. Further information is available in ***Section 7.1: Information governance***

6.1 Informed consent for court

When a psychologist is instructed to give evidence in court, it is the court that should be informed and whose authority should be sought for the work undertaken. When serving as a witness in the legal arena, the psychologist is responsible to the court, rather than to either party.

6.2 Informed consent with children and young people

All children and young people, whatever their age or status, have a right to express their views freely and be involved in any decision-making that affects their lives, which includes judicial and administrative proceedings[40]. Therefore, psychologists who seek to work with children or young people must gain their informed consent. This applies whether the child or young person or another agent with legitimate responsibility for the child or young person has made the request for involvement. Any direction or guidance provided by parents or other caregivers must be 'in accordance with the child's evolving capabilities' and support the 'exercise by the child of his or her rights'[41]. The onus is then on the adults to provide appropriate support to enable the child or young person to express their views and contribute to decision-making.

Every psychologist should consider how they can:

- provide an accessible explanation to the child or young person about their work as a psychologist;
- offer a clear reason for their possible involvement;
- provide an opportunity for the child or young person to talk about what working with the psychologist might involve.
- discuss and agree how information is recorded and possibly shared with others with an awareness that young people who are 'Gillick competent' can consent to information not being shared with parents;

- discuss how the child or young person will be kept safe;
- ensure that the child or young person has understood the psychologist's role and has given their informed consent;
- ensure the child or young person understands they can withdraw their consent at any point;
- ensure their practice acknowledges and respects the culture, community and context of the child or young person.

Occasionally, a disagreement over consent may arise between parent/carer and child or young person and/or between parents/carers. The psychologist would make every effort to resolve the difference of views, perhaps seeking, with agreement, involvement of an appropriate family member and/or a colleague, although as discussed above, a young person who is 'Gillick competent' can legitimately request that family members (including parents) are not involved or informed of any involvement. If the disagreement is not resolved, the psychologist should draw on their professional experience to act in the best interest of the child or young person seeking consultation and support through appropriate channels, including safeguarding and legal departments, and consultation with appropriate colleagues including other professionals.

6.3 Informed consent with people who may lack capacity

It is likely that psychologists at some stage within their careers will be working with people who lack capacity to consent to assessment or treatment. This could be because of a wide range of difficulties such as intellectual disability, brain injury, dementia, severe mental health difficulties, and neurological conditions. As a result, it will often be necessary to make a judgment about a client's ability to give informed consent. This should include whether the person is able to:

- understand the information relevant to the decision (e.g. psychological treatment);
- retain that information;
- use or weigh that information as part of the process of making the decision; and
- communicate their decision (whether by talking, using sign language or any other means.)

The Mental Capacity Act 2005 contains 5 key principles which it is important to understand:

1. A presumption of capacity;
2. Individuals being supported to make their own decisions;
3. Individuals have the right to make 'unwise' decisions;
4. Anything done on behalf of a person with a mental capacity issue should be in their best interests; and
5. An intervention should be on the basis of the 'less restrictive option' weighed up in the particular circumstances of the case.

The Mental Capacity Act Code of Practice[42] expands upon these points (and indeed all aspects of the Act), highlighting the need to assist a client in making a decision for

themselves (with the use, for example, of memory aids, simplified resources, etc.). It should also be noted that the fact that a person is able to retain the information relevant to a decision for a short period does not prevent them from being regarded as able to make the decision.

The Mental Capacity Act (2005) provides a clear framework for what to do if a person lacks capacity to make a range of decisions, including consenting to treatment. The principle of 'best interest' must be followed, and the Act states clearly who needs to be consulted in relation to making such a decision and ensuring that the individual's wishes are considered.

It is good practice to give full information (possibly using adapted resources) to clients even when they are not deemed able to give informed consent. The psychologist must, so far as reasonably practicable, permit and encourage the client to participate, or to improve their clients' ability to participate, as fully as possible in any act done for the client and in any decision affecting them.

In some circumstances, it is possible that there may be others who have been given legal authority for decision-making on behalf of others, such as Power of Attorney for Health and Welfare or Deputyships for Health and Welfare. It is important to note that patients might also have created Property and Affairs Lasting Powers of Attorney. Those acting under a Property and Affairs power alone will not have authority to make decisions in relation to a patient's treatment. If someone is a Health and Welfare Attorney or Deputy, those persons will be able to make those decisions on behalf of others. It is also necessary to ensure that the client has not made an Advance Decision to refuse treatment prior to the loss of capacity, although this is unusual in relation to psychological treatment.

In some clinical contexts, particularly relating to brain injury, intellectual disabilities and dementia, issues related to capacity and best interest are particularly prevalent. Psychologists practising in these areas need to ensure sufficient knowledge and expertise. Further information is available in ***Society Document: Guidance on determining the best interests of adults who lack the capacity to make a decision for themselves.***

6.4 Informed consent with people as employees

Tripartite arrangements where an employer commissions and pays for an assessment or intervention, such as diagnostic assessments for neurodiversity and cognitive functioning return to work assessments, or coaching, potentially give the employer access to data that they will struggle to interpret, or may misinterpret, for example test scores and details of personal life. It is important that the psychologist protects the employee by giving the employer only what they need to know and can reasonably require for the purpose of employment.

The Psychologist should consider whether they will be gathering information that is not usually held by an employer, or is not held routinely for all employees, for example IQ scores and childhood experiences. If so, the psychologist should consider abridging documentation so that the employer receives only the information they 'need to know',

and the employee can if necessary hold a full copy for future reference. This prevents discrimination against employees who are subject to in depth assessment for reasons related to illness, neurodiversity or disability from being unfairly compared to their peers. It also prevents complex psychological information from being held by those who are not qualified to interpret it.

Agreements should be made explicitly about the information which can be shared with the commissioning organisation. In order to aid transparency, information should normally be sent to the client prior to being shared with the organisation.

6.5 Informed consent with detained persons

Prisoners

Informed consent may be harder to obtain when a client is detained. Psychologists working with detained persons should be aware that, as well as UK law, the UK is signatory to a number of conventions on the treatment of detained persons. These conventions not only outlaw physical ill-treatment, but also certain kinds of psychological pressure. For example, it is contrary to the UN Convention on Torture to apply psychological pressure to elicit a confession, or compliance with a regime. In this context, 'psychological pressure' could include making progression contingent on compliance with a particular aspect of the regime. Practitioners should be particularly mindful of the power imbalance in forensic contexts, which is far more acute than is generally found in non-justice system based settings. Only offenders detained in secure hospitals can be required to comply with assessments or treatments under involuntary detention sections of the Mental Health Act.

Mental Health Detentions

For psychologists there can be potential conflicts of interest or what could be better termed 'competing duties of care' between the roles of Responsible Clinician (RC) (for further information on this role see Section 3.5) (including the duty to detain or otherwise compel participation in treatment) and that of psychologist (including, principally, the duty to establish freely-given consent wherever possible to enhance the efficacy of the therapeutic intervention). The MHA Code at chapter 24.34 (medical treatment) states that permission given by a patient to a particular treatment 'under any unfair or undue pressure' is not consent (p.257).

Good outcomes for psychological therapies are associated with positive therapeutic alliances and good working relationships between therapists and patients. The potential for even perceived abuse of power and the inherent power differential between an RC and a detained patient subject to the MHA runs a risk of rupturing this relationship or it becoming coercive. Psychologist RCs must therefore remain aware of and give full consideration to any potential competing duties of care between the RC and psychological therapist roles when providing psychological treatments to patients over whom they have compulsory powers.

The main issues to be considered by psychologist RCs when addressing potential competing duties of care in this context include the following:

1. Psychological treatments (with the possible exception of indirect interventions delivered by proxies such as paid staff and carers) are more likely to be effective when informed consent is obtained. As such, RCs acting as psychological therapists should utilise all reasonable and ethical attempts to obtain consent from patients before proceeding with psychological treatment. The *Code* at chapter 24.34–24.39 (p.257) provides guidance on obtaining consent.
2. The Act permits psychological treatment to be given without consent and the Code provides guidance on how to proceed with treatment in these circumstances (chapter 24.40–24.44, pp.257–258). There may be circumstances, especially when significant risks to others or self have been identified, when it is considered to be necessary for a psychologist RC to proceed with providing psychological treatment without consent. In such circumstances then there should be, where practicable, prior discussion with the MDT involved in the patient's treatment and care about the risks involved. Careful consideration should be given to the availability and merits of another suitably qualified member of the team providing the psychological treatment required with the RC remaining in overall charge of the client's care.
3. There may be situations where it is judged that informed consent cannot be clearly obtained, or where it would appear another available practitioner would be more likely to achieve a more effective outcome (perhaps due to the power differential between patient and RC). In such situations the psychologist RC is advised to refer on to other members of the treatment team who are able to provide the psychological treatment needed, while the RC remains in charge of overall care.

7. Managing data and confidentiality

7.1 Information governance

Psychologists should follow local and national guidance and statutory responsibilities regarding management of data. Psychologists should make, keep and disclose information in records only in accordance with national policy and legislation, and the policies and procedures of the organisation(s) they are employed by/working in collaboration with. Further information is available in ***Section 1.1: Legal and professional obligations of psychologists, Appendix 1: Relevant legislation*** and ***Appendix 2: Websites and further information.***

Psychologists must bear in mind the potential impact of the information in their records on all who may have access to such records, for example, the client, other professionals, managers, authorised carers, etc. Where possible, distinction should be made between fact, observation and opinion, and judgemental comments should be avoided. Psychologists are responsible for holding their records securely to ensure the confidentiality of the information contained within them and to control access to them. Further information is available in ***Society Guidance: Guidelines on the use of Electronic Health Records.***

This guidance applies to all record-keeping on clients, their relatives, carers and/or associates, and their organisations, regardless of the media in which information is held, e.g. written notes and reports, audio- and video-recordings, paper and electronic records, etc.

Records made, kept or accessed by psychologists should be:

- systematic and appropriately detailed;
- in clear language/format;
- accurate;
- up to date; and
- relevant to professional work and to the purpose for which they were collected.

Clients have a legal right to access records concerning them, and this right is enshrined in legislation. Additionally, it is good practice for clients to be given feedback on their content. Sharing records with clients supports the collaborative approach of psychologists and enables clients to have full and effective involvement. Client access to records will be restricted to information about themselves and not third parties. Restrictions will also apply when disclosure would place the clients or others at risk of serious harm.

In tripartite arrangements involving an employer access to information should be governed by agreements made explicitly about the information which can be shared with the commissioning organisation.

Shared records

In some organisations in which psychologists work single, multi-professional, client-based records are held. Such records are designed as shared documents (paper or electronic),

the function of which is primarily to facilitate inter-professional communication to ensure the safe and effective delivery of high quality services. Such records may be shared among organisations/agencies to facilitate care and/or exceptionally, to safeguard the client or others, including the general public. In some contexts, clients have the right to object to their data being disclosed to a third party even someone who might provide essential healthcare. Psychologists should be aware of local codes and policies. Further information is available in ***Section 3.5: Working with other professionals***, ***Section 7: Managing data and confidentiality*** and ***Appendix 2: Websites and further information.***

Psychologists should include in the shared record all information about their work with clients and related others which is required to ensure appropriate multi-professional care and to safeguard the client and relevant others, including the general public.

Third-party and sensitive material should be clearly marked. There should be clarity/clear communication within the multi-professional team about what is and is not shared with the client if there are safeguarding concerns. A system needs to be established about how suspicions and causes of concern are recorded and/or shared.

Where shared records are held, other professionals involved with the clients will have access to such records. This should be explained to the clients at the onset of engagement with them.

The use of sealed envelopes is no longer considered good practice following the findings from serious untoward incident investigations where the existence of sealed envelopes compromised care.

Assessment materials

Psychologists should be mindful at all times of the confidential nature of assessment materials. Many assessment measures are invalidated by prior knowledge of their specific content and objectives. Psychologists who use these materials are required to respect their confidentiality and to avoid their release into the public domain (unless this is explicitly allowed in the nature of the instrument and by the test publisher). Psychologists should, therefore, take reasonable steps to prevent misuse of test data and materials by others. Further information is available from ***Appendix 2: Websites and further information.***

In many organisations, there is only one shared records system. In these cases, it is necessary for psychologists to be able to use the shared records system to hold raw data from psychometric assessment. The results of psychometric assessment will be incorporated into reports which explain their context and appropriate interpretation, and which are included in the shared institutional record. In relation to the visibility of the psychometric instrument and the raw data to other members of the multidisciplinary team who are not psychologists, the onus is on the other professionals not to interpret information where they are unqualified to do so, just as the psychologist would not interpret, for example, physical healthcare test results they are unqualified to interpret. Psychologists may consider whether it is appropriate to mark assessment materials so their nature is clear.

Additional data

Psychologists may wish to keep separate notes to aid their work but which are not intended for sharing with others or to be part of the permanent client record. These notes, often called process notes, which are written for the purposes of reflection on practice, should be anonymised with no other identifying links e.g. initials, appointment time, so that these notes therefore are clearly not part of the client record. Process notes may, for example, be used for reflection and supervision. If process notes are made to assist in compilation of a report, the material should be incorporated, as relevant, into the final report and the process notes then destroyed.

Long-term illness, incapacity or death of a psychologist

Most organisations will have procedures in place in the event of illness, incapacity or death of a psychologist. Psychologists in independent practice are advised to make a professional will and to appoint a professional executor, probably an experienced colleague, whose role it would be to take charge of client records, to inform the clients involved and, where appropriate and practicable, to make provision for continuity of the service provided.

Retention and destruction of records

Psychologists' records should be held securely for as long as they are required for the purpose of psychological work. Psychologists must follow legal requirements, national and local policy frameworks and procedures regarding the retention or disposal of records after the psychologist's work is concluded. Psychologists should ensure that they keep up to date with requirements.

For independent practitioners general guidance is that many independent psychologists keep records relating to contact with adults for 7 years, and follow NHS guidance in relation to children. Where the records derive from work undertaken within an organisation, the maintenance of these records is determined by the organisation's policies and legal requirements.

Retention and destruction of health records, both paper and electronic, is covered in the NHS code of practice for records management. Generally speaking, retention is until age 26 for people seen as children; 20 years after the last contact for adults, and 8 years after death if the death occurred while the person was in the care of the NHS. There are specific requirements for mental health services depending on the nature of the contact.

In education settings, Local authorities generally retain Education Health and Care Plans for 35 years after the case has been closed. Other records are retained until the child is 25.

All records must be destroyed under confidential conditions following organisational procedures or for independent practitioners using a destruction service or process which meets industry standards for document management and can provide the appropriate certification.

7.2 Confidentiality

Clients are entitled to expect that the information they give to psychologists about themselves and others will remain confidential. Psychologists have a duty not to disclose

such information except as discussed below and to bring their confidentiality practice to the attention of their clients, employers, managers and any other professionals involved.

Psychologists have a duty to inform involved parties of their confidentiality standards and practice at the point of first contact. Clients should be informed of the limits of confidentiality where information about them may be shared and confidentiality breached, for example for reasons of safeguarding, requirements of the law, and public protection.

Psychologists have a duty to be aware of the content of any other relevant guidelines and of any other policy guidelines which set out local expectations.

Use of client data for audit must follow the Caldicott principles, which, designed for the NHS, provide helpful guidance for any setting in terms of when it is appropriate to use with client-identifiable data and when anonymised data should be used[43]. Generally under data protection legislation, it is necessary to obtain specific informed consent for the use of client data for particular purposes, and to inform clients of the purposes for which their data is being collected and how it will be used. Further information is available in ***Appendix 2: Websites and further information.***

Disclosure of information

If disclosure of information is deemed necessary, psychologists should obtain specific informed consent from their clients, making the consequences of disclosure as clear and unbiased as possible. There are a number of circumstances where this might not be possible or may not apply: for example where the health, safety, security or welfare of the client or someone else may otherwise be put at risk; and if there are legal or safeguarding responsibilities, such as the need to avoid 'tipping off'. If confidentiality is broken without consent, the client should be told what has been said and to whom, unless such disclosure may expose the client or others to serious harm or is contrary to legal or safeguarding obligations.

Psychologists who are faced with the difficult decision as to whether to disclose information without a client's consent must weigh carefully the arguments for and against disclosure. The responsibility for this decision lies with the individual psychologist although they may seek advice and guidance from appropriate sources such as their employing organisation's Information Governance or Data Protection Lead, Clinical Governance Lead, Caldicott Guardian, Safeguarding named and designated professionals, or legal departments. These other professionals can be the most helpful sources of advice in difficult disclosure situations. Independent practitioners may wish to consult the legal helpline of their professional indemnity insurer.

Circumstances may emerge where clients may present a risk to others or to themselves, or be at risk from others whom they wish to protect. It is then necessary to discuss the importance of disclosure and to encourage it, for example to partners of HIV positive clients, and to employers if a client's mental health status presents a risk to others via driving, handling machinery or interaction in a working situation, for example, flight deck crew. Disclosure without consent, or against the client's expressed wish may be necessary in situations in which failure to disclose appropriate information would expose the client, or

someone else, to a risk of serious harm (including physical or sexual abuse) or death.

The psychologist must weigh up the needs and interests of their own client against the wider welfare, protection and safeguarding of the public.

Disclosure to clients' employers, insurance companies and others

Psychologists have a duty to ensure, at first contact, that clients understand the purpose of any assessment undertaken at the request of employers, the DVLA or insurance companies, and of the psychologist's obligation to disclose the results of that assessment. In the case of assessment for fitness to work or to drive, they should obtain the client's written consent.

Psychologists should consider what each party involved needs to know, gaining understanding and agreement on which aspects will be fed back, in advance. For example, the full detailed and raw scores obtained by a psychologist in recruitment assessment processes may be unsuitable for an employer to receive in full. The commissioning body should be made aware of the decision-making data that they originally requested, in the case of an employer this could include strengths and weaknesses, and recommendations for employer actions, for example.

Primary clients should be advised about and able to preview, with opportunity to ask questions first, any data that will be sent to an employer about them. Bear in mind that the informed consent difficulties still stand and that an employee or potential employee can withdraw consent for the employer to be informed of any part of their results.

This can be very difficult to manage in practice, and requires psychologists to make these agreements with their commissioners before they start the work, so that all are informed of the risks in the service delivery. Further information is available in ***Section 3.4: Working with multiple clients.***

Disclosure after a client's death

After a client's death, relatives or other authorities may seek access to the psychologist's records. In the first instance, the psychologist is advised to follow organisational procedures where they exist which usually deal with the administrative proofs required such as proof of death, proof of kinship and right to access the material requested.

A psychologist's duty of confidentiality continues after a client has died. The psychologist will need to weigh up the circumstances around the request for disclosure and what personal information is being sought. If there has been a specific request by the client for their information to remain confidential, their wishes should usually be respected. If the psychologist is unaware of any instructions from the client, when considering requests for information the following should be taken into account:

- the purpose of the disclosure;
- whether the disclosure of information is likely to cause distress to, or be of benefit to, the client's partner or families;
- the permission of a surviving relative or next of kin is not required, and does not authorise disclosure of confidential information, although the views of those who were close to the client may help the psychologist decide if disclosure is appropriate;

- whether the disclosure will also disclose information about the client's family or anyone else; and
- whether the information is already public knowledge or can be anonymised or coded.

There may be circumstances where the disclosure of information is required, for example:
- to support an inquest or fatal accident inquiry;
- where the disclosure is required by law, is authorised under section 251 of the NHS Act 2006, or is justified in the public interest, such as for education or research;
- in the case of national confidential inquiries or for local clinical audit; and
- when a person has a right of access to records under the Access to Health Records Act 1990 or Access to Health Records (Northern Ireland) Order 1993.

7.3 Confidentiality when safeguarding

In exceptional circumstances it may be necessary to breach the client's confidentiality with or without their immediate knowledge or consent. This would be the case where there are significant risks to the client's psychological wellbeing; where the alleged perpetrator may be a current risk to others or where there is risk of jeopardising a potential investigation. Any decision to breach confidentiality cannot be taken lightly, but can be justified and accounted for if made in good faith because of safeguarding concerns. This is supported by professional guidance. The focus of any intervention including any breach of confidentiality must be on promoting a proportionate, measured approach to balancing the risk of harm with respecting the client's capacity to consent, their choices and preferred outcome for their own life circumstances.

Specified authorities may need to share personal information to ensure, for example, that a person at risk of radicalisation is given appropriate support. When considering sharing personal information, the specified authority should take account of the following:
- necessity and proportionality: personal information should be shared only where it is strictly necessary to the intended outcome and proportionate to it. Key to determining the necessity and proportionality of sharing information will be the professional judgement of the risks to an individual or the public;
- consent: wherever possible the consent of the person concerned should be obtained before sharing any information about them;
- power to share: the sharing of data by public sector bodies requires the existence of the power to do so, in addition to satisfying the requirements of the Data Protection Act 1998 and the Human Rights Act 1998; and
- Data Protection Act and the Common Law Duty of Confidentiality: in engaging with non-public bodies, the specified authority should ensure that they are aware of their own responsibilities under the Data Protection Act and any confidentiality obligations that exist.

In relation to health sector staff, government guidance states it is important that staff understand how to balance client confidentiality with the duty to report. They should also be made aware of the information-sharing agreements in place for sharing information with other sectors, and get advice and support on confidentiality issues when responding

to potential evidence that someone is being drawn into terrorism, either during informal contact or consultation and treatment.

7.4 Confidentiality for the court

Psychologists acting as expert or professional witnesses have a duty to disclose all of the evidence used to reach their opinion where directed by the court to do so.

This could include:

- the details of any tests and assessments administered with professional colleagues;
- notes made during report writing; and
- referenced academic articles or studies.

No information relating to an assessment or report should be disclosed outside the relevant proceedings without agreement. Psychologists should normally seek permission from the instructing party to disclose any information to another health care professional.

Where instructed directly by the court, the Crown Prosecution Service, Procurator Fiscal or a solicitor, the psychologist is required to report or comment on any or all aspects of the case that appear to the psychologist, as an expert in the field, to be relevant or pertinent. In such circumstances, the psychologist is not in a position to offer confidentiality to any person, and should make this position clear to any party with whom they have contact during psychological investigations or assessment.

In these circumstances, it will be important that the psychologist makes sure they are up to date with the legislation and policy guidance regarding public and media access to information available to whichever court or tribunal their instruction arises from. The psychologist will need this awareness so that they can explain to the adult or child concerned what the limits of privacy are in these legal circumstances. They will need to make clear to the client which information needs to be made accessible, by whom and under what circumstances. Only when the client understands this, can they give informed consent.

There are different levels of access to sensitive information in different legal contexts; this will include testimony, documents and professional and expert reports. Many proceedings typically take place in open court, to which the public has access. In these cases, there is a presumption in favour of providing information and documents to third parties which were relied upon by the court in reaching its decision, though not the entire court file.

Where court papers and other materials are received in electronic format, psychologists should ensure that these are stored in a secure, password-protected format. This may require the addition of additional security for documents that arrive in an unsecured form. Where psychologists submit reports in an electronic format they should ensure that these are in a secure, password-protected format.

Psychologists working with clients who are the subject of court proceedings may need to be careful to ensure that they keep all records which may be of relevance to the court process until it is clear that the court has reached a final conclusion, including any appeal that may have been heard.

With few exceptions, applications in the family court are heard in private, with only those immediately involved being allowed to attend and access information. It is possible, however, for duly accredited members of the media to attend hearings in the family court, subject to the power to exclude them on specified grounds.

In most family court proceedings, media representatives have no entitlement to receive or peruse court documents referred to in the course of evidence, submissions or judgment. If media representatives wish to see documents referred to in the family court they may apply to the judge for disclosure but they are subject to strict guidance in terms of what information they can divulge into the public domain.

7.5 Confidentiality with children and young people

When beginning direct work with a child or young person, the psychologist should discuss and agree who will have access to the information arising from the work, with direct reference to principles of 'Gillick competence'. In undertaking this discussion it is helpful to acknowledge that there may be those adults (e.g. parents/carers, other relevant professionals such as teachers, social workers, counsellors) who may have a supportive interest in the work and may wish to have appropriate access to information but the wishes of a 'Gillick competent' young person should take precedence unless there are safeguarding concerns.

Parents or those with legal responsibility may be made aware of this agreement if appropriate, although a young person deemed to be Gillick competent is able to agree to work with a psychologist independently. Those with parental responsibility do not have an automatic right of access to the psychologist's records by making a subject access request under data protection legislation.

The nature and purposes of any work will vary and this will determine how and to whom information will be shared, however the child or young person should always be made aware of who will have access to what and for what purpose and due consideration given to the wishes of a 'Gillick competent' young person about who can have access to information about any involvement with a psychologist. The child or young person should be fully aware of the content of any shared information, including as appropriate, copies of the documents. Whatever is agreed about information sharing including work where information is confidential, the psychologist must ensure the child or young person knows and understands that if there is a risk of harm the psychologist must follow safeguarding procedures.

7.6 Confidentiality with detained persons

When detained persons give informed consent to the collection of information, they do so for a specific purpose and for use by specific people. The use of such information for a different purpose or for use by different people would require separate consent. Thus, although a psychologist may interview and write a report on a detained person, consent for that purpose cannot be taken as allowing a third party access to the psychologist's records on that person, such as notes on (or recordings of) the interview. If psychologists are

put under pressure to reveal such information, they should seek the advice of colleagues including for example those responsible for governance or data protection. They should bear in mind that they have a legal duty to be aware of and comply with data protection legislation and professional confidentiality rules.

7.7 Confidentiality obligations during training

During training, no academic/training documents should identify clients to whom they relate (even by means for example of initials, service name or date of appointment) as any such potential identifiers could be used to trace the client and therefore make the document a part of the clinical record and subject to the relevant provisions of data protection legislation. This includes published reports, case studies prepared for trainee assessments and any articles or publications. Tutors and supervisors should communicate this to their trainees. Trainees should be clearly instructed to both make and keep separately those records which are part of the provision of psychological service and which belong to the service organisation and are subject to its policies and procedures; and papers which are anonymised and are part of the trainee's academic learning, and belong to the trainee and are subject to the training provider's policies and procedures.

Express consent should be obtained by trainees before audio- or video-recording their interactions with clients. If the client is unable to give informed consent, it is unlikely to be appropriate for the recording to be made. Careful consideration should be given before any material is recorded if the client is party to any legal proceedings or family or employment disputes. If material is to be used for purposes other than client care (including teaching and research), the client should be informed of the purposes of the recording. It should be made clear to clients how the material will be used and to whom it will be disclosed, for example, trainee students, other researchers, and supervisors.

The trainee and the client should come to an agreement about how long recorded material should be kept. The general principle is that recordings will be kept for as long as needed to fulfil the purpose for which the client has given consent and no longer. The security of the material must be maintained, and it must be destroyed at the agreed time limit if no longer required.

Informed consent is required before client material in an identifiable format may be published in case studies, presentations or other research reports. It is becoming common practice for clinical material in professional doctorate portfolios to be stripped out before the thesis is placed in online institutional repositories.

8. How to respond when things go wrong

8.1 Managing conflict with a client

Conflict with a client suggests that someone's expectations are not being met. The first objective should be to restore agreement or agree to make changes. The well prepared psychologist will have a client agreement in place and will be able to review the experience against the agreement with the client to address this question. Further information is available in ***Section 5: Making and maintaining agreements***. Even in the absence of an agreement, the psychologist would be advised to enquire with the client where their expectations are unmet or raise their own unmet expectations with the client. This can be an opportunity to put a belated agreement in place.

It may be that the parties agree to set aside the agreement and bring it to an early close. Agreeing to disagree may be a better outcome for psychologist and client who cannot restore agreement. Take account of any need for onward referral either within the service or elsewhere or back to the original referrer, and depending on the nature of the work setting, any financial obligations in closing the work.

The psychologist may find it helpful to consult with appropriate colleagues in preparation for the conversations with the client, such as line or service managers, those with other relevant organisational responsibilities, and supervisors. There may be more general lessons to be drawn as part of reflective practice in relation to the quality of the client agreement for future use.

8.2 Transparency and duty of candour

The Health and Social Care Act 2008 (Regulated Activities) Regulations 2014 duty of candour (regulation 20) requires all health and adult social care providers registered with the Care Quality Commission to be open with people when things go wrong. Psychologists need to be aware of the terminology relating to this regulation including:

- openness – enabling concerns and complaints to be raised freely without fear and questions asked to be answered;
- transparency – allowing information about the truth about performance and outcomes to be shared with staff, patients, the public and regulators; and
- candour – any patient harmed by the provision of a healthcare service is informed of the fact and an appropriate remedy offered, regardless of whether a complaint has been made or a question asked about it.

Psychologists also have a responsibility to ensure that they engage in open and transparent communications with people who use services and other 'relevant persons' (people acting lawfully on their behalf) in relation to care and treatment. Guidance from the Care Quality Commission on duty of candour outlines the specific requirements that providers must follow when things go wrong with care and treatment, including informing people about

the incident, providing reasonable support, providing truthful information, and making an apology. Psychologists are instrumental in supporting organisations to promote a culture that encourages candour, openness and honesty at all levels. Further information is available in ***Appendix 2: Websites and further information.***

8.3 Managing conflict in team settings

Dealing with breakdowns in working relationships, professional disagreements and fitness to practise concerns

As far as possible, psychologists should seek to resolve any conflict with or between other professional colleagues (including relating to consultation/supervision or line management) by clear communication, relevant evidence and collaboratively working through the issues in reasoned argument within the context of respectful relationships.

The psychologist should first approach the colleague in confidence, if it is appropriate, with relevant information, in a manner that is collegiate and helpful. If misgivings continue, the psychologist should consult with an appropriate colleague to share concerns and to seek advice. Where appropriate they should keep a written record of the meetings and steps taken to resolve any difficulties.

Where there is serious or continual disagreement, both parties need to take whatever action is appropriate in their professional context, consulting other experienced professionals as necessary.

Supervisors and line managers have professional obligations concerning professional standards, ethical practice and 'fitness to practise' issues. If line managers or supervisors have any concerns regarding performance in these areas, they have a duty to discuss these with the psychologist and, if necessary, address the matters by in the first instance following appropriate employment policies and procedures, or in the case of an independent practitioner, making a report to the HCPC.

Working in multi-professional or multi-agency contexts

Psychologists may find themselves in conflict with the approaches to work taken by other individual colleagues or by the multi-professional team or agency.

Psychologists should bring to the awareness of the multi-professional team or agency any difficulty in the group working together which may impact on the psychologist's ability to function effectively and ethically in their role. Such issues are best addressed when guided by national and local policy and current legislation before proceeding with multi-professional/multi-agency collaboration. Further information is available in ***Appendix 1: Relevant legislation.***

The psychologist may also have cause for concern about the ability of the team to provide for the needs of the client owing to interpersonal difficulties between members of the multi-agency or multidisciplinary team that might have an indirect impact on the client. As far as possible, psychologists should seek to resolve any conflict with or between other professional colleagues by clear communication, relevant evidence and collaboratively

working through the issues in reasoned argument within the context of respectful relationships.

If the situation remains unresolved for any reason, for example because it is judged not to be an issue for active management, the psychologist must make a judgement about whether their involvement in the team is helpful to the client or the working of the team. If not, the psychologist should consult with an appropriate colleague about whether they should disengage from that team.

A psychologist may also experience concerns about the competence or ethical practice of individual colleagues involved in joint working. These concerns may relate to the competence of the colleague to carry out a particular intervention, the appropriateness of an intervention for a particular client or problem, the nature of the relationship between a colleague and his or her client (e.g. potential abuses of power).

The psychologist should first approach the colleague in confidence, if it is appropriate, with relevant information, in a manner that is collegiate and helpful. If misgivings continue, the psychologist should consult with an appropriate colleague to share concerns and to seek advice. Where appropriate they should keep a written record of the meetings and steps taken to resolve any difficulties.

If they conclude that misconduct has occurred, psychologists should bring the matter to the attention of those charged with the responsibility to investigate such concerns, generally in the first instance an employer or in the case of an independent practitioner, the HCPC. Further information is available in ***Section 2.1: Working environment.***

8.4 Supporting a colleague when a complaint has been made

The receipt of a complaint or allegation can be distressing for all concerned, not least for the person who is the subject of the complaint or allegation. It is important that they receive advice and support from appropriate persons. Any potential conflicts of interest should be considered. It may be that a psychologist is not best placed to offer support and guidance as they may be called as a witness in the complaints process. Encourage colleagues to seek advice from an experienced colleague or supervisor where appropriate.

The psychologist should also be encouraged to seek the support of an accredited workplace trade-union representative who is skilled at supporting people in these situations and can access legal advice if necessary. Legal advice can also be obtained from the professional indemnity insurance broker, and sometimes from household insurance policies where the householder has taken out the legal advice additional option.

Complaints are an increasingly normal occurrence and must be handled in a professional manner. The complaint investigator or professional body will need the psychologist's version of events and any evidence before any conclusions are reached. Psychologists should support colleagues to respond promptly, objectively, factually and honestly to the complaint. The content of the complaint should always be held in confidence.

8.5 If the client remains unhappy

If any conflict or issue as referred to in this section cannot be resolved, it may be appropriate to advise a client or other individual that that they have a right to raise any concerns about a psychologist with the Health and Care Professions Council, further details of which can be found at www.hcpc-uk.org

Acknowledgements

These guidelines were updated by a working group of the Professional Practice Board of the British Psychological Society. The working group was constituted to include all of the member networks of the Society whose members engage in practice, including the HCPC registered practitioners. It included representatives of the Society's national branches in Scotland, Wales and Northern Ireland, in order to ensure applicability to the different national contexts. It also included representation from the expert working groups of the Society's Professional Practice Board and others on specialist topics of practice. Thanks are due to the members of the working group, and to the founder authors of the first and second editions of the guidelines whose work is the core and the foundation stone of the current edition.

Appendix 1 – Relevant legislation

Unless otherwise stated, Acts can be found on the government website http://www.legislation.gov.uk/

United Kingdom and England

Care Act 2014

An Act to make provision to reform the law relating to care and support for adults and the law relating to support for carers; to make provision about safeguarding adults from abuse or neglect; to make provision about care standards; to establish and make provision about Health Education England; to establish and make provision about the Health Research Authority; to make provision about integrating care and support with health services; and for connected purposes.

Care Standards Act 2000

An Act to establish a National Care Standards Commission; to make provision for the registration and regulation of children's homes, independent hospitals, independent clinics, care homes, residential family centres, independent medical agencies, domiciliary care agencies, fostering agencies, nurses agencies and voluntary adoption agencies; to make provision for the regulation and inspection of local authority fostering and adoption services; to make provision for the registration, regulation and training of those providing child minding or day care' to make provision for the protection of children and vulnerable adults; to amend the law about children looked after in schools and colleges.

Children Act 1989

An Act to reform the law relating to children; to provide for local authority services for children in need and others; to amend the law with respect to children's homes, community homes, voluntary homes and voluntary organisations; to make provision with respect to fostering, child minding and day care for young children and adoption; and for connected purposes.

Children and Families Act 2014

An Act to make provision about children, families, and people with special educational needs or disabilities; to make provision about the right to request flexible working; and for connected purposes.

Data Protection Act 1998

An Act to make new provision for the regulation of the processing of information relating to individuals, including the obtaining, holding, use or disclosure of such information. The Act states that anyone who processes personal information must comply with eight principles, which make sure that personal information is:

- fairly and lawfully processed;

- processed for limited purposes;
- adequate, relevant and not excessive;
- accurate and up to date;
- not kept for longer than is necessary;
- processed in line with your rights;
- secure; and
- not transferred to other countries without adequate protection.

Equality Act 2010

An Act to make provision to require Ministers of the Crown and others when making strategic decisions about the exercise of their functions to have regard to the desirability of reducing socio-economic inequalities; to reform and harmonise equality law and restate the greater part of the enactments relating to discrimination and harassment related to certain personal characteristics; to enable certain employers to be required to publish information about the differences in pay between male and female employees; to prohibit victimisation in certain circumstances; to require the exercise of certain functions to be with regard to the need to eliminate discrimination and other prohibited conduct; to enable duties to be imposed in relation to the exercise of public procurement functions; to increase equality of opportunity; to amend the law relating to rights and responsibilities in family relationships; and for connected purposes.

Health and Social Care Act 2012

An Act to establish and make provision about a National Health Service Commissioning Board and clinical commissioning groups and to make other provision about the National Health Service in England; to make provision about public health in the United Kingdom; to make provision about regulating health and adult social care services; to make provision about regulating health and social care workers; to make provision about public involvement in health and social care matters, scrutiny of health matters by local authorities and co-operation of health care services; to make other provision about information relating to health or social care to make other provision about health care; and for connected purposes.

Mental Capacity Act 2005

An Act to make new provision relating to persons who lack capacity; to establish a superior court of record called the Court of Protection in place of the office of the Supreme Court called by that name; to make provision in connection with the Convention on the International Protection of Adults signed at the Hague on 13th January 2000; and for connected purposes.

Mental Health Act 1983 as amended 2007

An Act to consolidate the law relating to mentally disordered persons. The main purpose of the Mental Health Act 1983 as amended 2007 (MHA) is to allow compulsory action to be taken, where necessary, to ensure that people with mental disorders receive the care and treatment they require for their own health or safety, or for the protection of other people.

Offender Rehabilitation Act 2014

An Act to make provision about the release, and supervision after release, of offenders; to make provision about the extension period for extended sentence prisoners; to make provision about community orders and suspended sentence orders; and for connected purposes.

Official Secrets Act 1989

An Act to replace section 2 of the Official Secrets Act 1911 by provisions protecting more limited classes of official information.

Regulation of Investigatory Powers Act (RIPA) 2000/Investigatory Powers Act 2016

An Act to make provision for and about the interception of communications, the acquisitions and disclosure of data relating to communications, the carrying out of surveillance, the use of human intelligence sources and acquisitions of the means by which electronic data protected by encryption or passwords may be decrypted or accessed; equipment interference, bulk personal datasets and other information; to make provision about the treatment of material held as a result of such interception, equipment interference or acquisition or retention; to establish the Investigatory Powers Commissioner and other Judicial Commissioners and make provision about them and other oversight arrangements; to make further provision about investigatory powers and national security; to amend sections 3 and 5 of the Intelligence Services Act 1994.

Safeguarding Vulnerable Groups Act 2006

An Act to make provision in connection with the protection of children and vulnerable adults. Safeguarding means protecting people's health, wellbeing and human rights, and enabling them to live free from harm, abuse and neglect.

Northern Ireland

Children Act 1989 – NI has a Criminal Justice Children's Order 1998

An Act to reform the law relating to children; to provide for local authority services for children in need and others; to amend the law with respect to children's homes, community homes, voluntary homes and voluntary organisations; to make provision with respect to fostering, child minding and day care for young children and adoption; and for connected purposes.

Criminal Justice (Northern Ireland) Act 2013

An Act to amend the law relating to sex offender notification, sexual offences prevention orders and human trafficking; to provide for the destruction, retention, use and other regulation of certain fingerprints and DNA samples and profiles; to provide for the release on license of persons detained under Article 45(2) of the Criminal Justice (Children) (Northern Ireland) Order 1998.

Criminal Justice (Northern Ireland) Order 2008 and Public Protection Arrangements in Northern Ireland (PPANI)

The Criminal Justice (NI) Order 2008 introduced a new sentencing framework, including extended and indeterminate sentences for public protection to reduce the risk of dangerous sexual and violent offenders being released into the community until the risk they pose is considered by the parole commissioners to be at a manageable level. The Public Protection Arrangements in Northern Ireland (PPANI) contained within the Criminal Justice (NI) Order 2008, place a duty on a number of agencies, within the criminal justice sector and elsewhere, to cooperate in the interest of better assessment and management of risk posed by serious sexual and violent offenders.

Justice Act (Northern Ireland) 2015

An Act to provide for a single jurisdiction for county courts and magistrates' courts; to amend the law on committal for trial; to provide for prosecutorial fines; to make provision in relation to victims and witnesses in criminal proceedings and investigations; to amend the law on criminal records and live links; to provide for violent offences prevention orders; to make other amendments relating to the administration of civil and criminal justice; and for connected purposes.

Mental Capacity Act (Northern Ireland) 2016

This Act fused mental health and mental capacity law into a single piece of legislation. The Act provides a framework for broader decision-making which includes: a statutory presumption of capacity, a requirement to support decision-making, mechanisms to allow individuals to plan for times that they do not have capacity, and safeguards to protect the rights of individuals when compulsory interventions or substitute decisions are required. It will remove the ability for someone to be treated for a mental health condition against his or her wishes if he or she retains the capacity to refuse such treatment, thus putting it on a par with the rights that individuals currently enjoy to make decisions regarding physical health treatment.

The Parole Commissioners' Rules (Northern Ireland) 2009

The Parole Commissioners for Northern Ireland are an independent body responsible for making decisions on the release and recall of prisoners sentenced to life, indeterminate custodial sentences, and extended custodial sentences, as well as the recall of prisoners serving determinate sentences.

The Sexual Offences (Northern Ireland) Order 2008

The Sexual Offences (Northern Ireland) Order 2008 lowered the age of sexual consent from 17 to 16 and incorporated significant changes to the law in relation to sexual offences in Northern Ireland; better protection for young people and people with a mental disorder from sexual abuse and exploitation; and sought to clarify issues surrounding consent in sexual assault cases and rape.

Scotland

Adoption and Children (Scotland) Act 2007

An Act of the Scottish Parliament to restate and amend the law relating to adoption; to make other provision in relation to the care of children; to enable provision to be made in relation to allowances in respect of certain children; and for connected purposes.

Adults with Incapacity (Scotland) Act 2000

An Act of the Scottish Parliament to make provision as to the property, financial affairs and personal welfare of adults who are incapable by reason of mental disorder or inability to communicate; and for connected purposes.

Adult Support and Protection (Scotland) Act 2007

An Act of the Scottish Parliament to make provision for the purposes of protecting adults from harm; to require the establishment of committees with functions relating to the safeguarding of adults who are at risk of harm; to amend the law relating to incapable adults; to allow the Public Guardian to intervene in court proceedings; to amend the law relating to mentally disordered persons; and for connected purposes

Children (Scotland) Act 1995

An Act to reform the law of Scotland relating to children, to the adoption of children and to young persons who as children have been looked after by a local authority; to make new provision as respects the relationship between parent and child and guardian and child in the law of Scotland; to make provision as respects residential establishments for children and certain other residential establishments; and for connected purposes.

Children and Young People (Scotland) Act 2014

An Act of the Scottish Parliament to make provision about the rights of children and young people; to make provision about investigations by the Commissioner for Children and Young People in Scotland; to make provision for and about the provision of services and support for or in relation to children and young people; to make provision for an adoption register; to make provision about children's hearings, detention in secure accommodation and consultation on certain proposals in relation to schools; and for connected purposes.

Mental Health (Scotland) Act 2015

An Act of the Scottish Parliament to amend the Mental Health (Care and Treatment) (Scotland) Act 2003 in various respects; to make provision about mental health disposals in criminal cases; to make provision as to the rights of victims of crime committed by mentally-disordered persons; and for connected purposes.

Mental Health (Care and Treatment) (Scotland) Act 2003

An Act of the Scottish Parliament to restate and amend the law relating to mentally disordered persons; and for connected purposes.

Protection from Abuse (Scotland) Act 2001

An Act of the Scottish Parliament to enable a power of arrest to be attached to interdicts

granted to protect individuals from abuse; to regulate the consequences of such attachment; and for connected purposes.

Protection of Children and Prevention of Sexual Offences (Scotland) Act 2005

An Act of the Scottish Parliament to make it an offence to meet a child following certain preliminary contact and to make other provision for the purposes of protecting children from harm of a sexual nature, including provision for implementing in part Council Framework Decision 2004/68/JHA; and to make further provision about the prevention of sexual offences.

Protection of Vulnerable Groups (Scotland) Act 2007

An Act of the Scottish Parliament to bar certain individuals from working with children or certain adults; to require the Scottish Ministers to keep lists of those individuals; to make further provision in relation to those lists; to establish a scheme under which information about individuals working or seeking to work with children or certain adults is collated and disclosed; to amend Part 5 of the Police Act 1997; to amend the meaning of school care accommodation service in the Regulation of Care (Scotland) Act 2001; and for connected purposes

Public Bodies (Joint Working) (Scotland) Act 2014

An Act of the Scottish Parliament to make provision in relation to the carrying out of functions of local authorities and Health Boards; to make further provision about certain functions of public bodies; to make further provision in relation to certain functions under the National Health Service (Scotland) Act 1978; and for connected purposes.

Regulation of Care (Scotland) Act 2001

An Act of the Scottish Parliament to establish the Scottish Commission for the Regulation of Care and the Scottish Social Services Council; to make provision for the registration and regulation of care services and for the registration, regulation and training of social service workers; to enable local authorities to provide and maintain residential accommodation in which nursing is provided; to make further provision as respects persons who have been looked after by local authorities; to amend the definition of 'place of safety' in the Children (Scotland) Act 1995.

Smoking, Health and Social Care (Scotland) Act 2005

To amend the Regulation of Care (Scotland) Act 2001 as respects what constitutes an independent health care service, the implementation of certain decisions by the Scottish Commission for the Regulation of Care or the Scottish Social Services Council, the provision of information to the Council and the minimum frequency of inspection of care services by the Commission to amend the Adults with Incapacity (Scotland) Act 2000 as respects authorisation of medical treatment; to amend the Public Health (Scotland) Act 1897 to introduce a right of appeal in certain cases under that Act; to enable the Scottish Ministers to form, participate in and provide assistance to companies for the purpose of providing facilities or services for persons exercising functions under the National Health Service (Scotland) Act 1978 or of making money available to the health service in Scotland

Social Care (Self-directed Support) (Scotland) Act 2013

An Act of the Scottish Parliament to enable local authorities to provide support to certain carers; to make provision about the way in which certain social care services are provided by local authorities; and for connected purposes.

Vulnerable Witnesses (Scotland) Act 2004

An Act of the Scottish Parliament to make provision for the use of special measures for the purpose of taking the evidence of children and other vulnerable witnesses in criminal or civil proceedings; to make provision about the admissibility of expert psychological or psychiatric evidence as to subsequent behaviour of the complainer in criminal proceedings in respect of certain offences to make provision about the admissibility of certain evidence bearing on the character, conduct or condition of witnesses in proceedings before a sheriff relating to the establishment of grounds of referral to children's hearings; to abolish the competence test for witnesses in criminal and civil proceedings; and for connected purposes.

Wales

The Mental Health (Wales) Measure 2010

This measure places new legal duties on local health boards and local authorities in Wales in relation to the assessment and treatment of mental health problems. The Measure became law in December 2010 and there are 4 parts to it which are as follows:

- Part 1 ensures that there are more mental health services are available within primary care.
- Part 2 makes sure all patients in secondary services have a Care and Treatment plan.
- Part 3 enables all adults discharged from secondary services to refer themselves back to those services.
- Part 4 supports every in-patient to have help from an independent mental health advocate if wanted.

Social Services and Well-being (Wales) Act 2014

An Act of the National Assembly for Wales to reform social services law; to make provision about improving the wellbeing outcomes for people who need care and support and carers who need support; to make provision about co-operation and partnership by public authorities with a view to improving the wellbeing of people; to make provision about complaints relating to social care and palliative care; and for connected purposes.

Violence against women, Domestic Abuse and Sexual Violence (Wales) Act 2015

An Act of the National Assembly for Wales to improve arrangements for the prevention of gender-based violence, domestic abuse and sexual violence; to improve arrangements for the protection of victims of such abuse and violence; to improve support for people affected by such abuse and violence; and to require the appointment of a National Adviser on gender-based violence, domestic abuse and sexual violence.

Well-being of Future Generations (Wales) Act 2015

An Act of the National Assembly for Wales to make provision requiring public bodies to do things in pursuit of the economic, social, environmental and cultural wellbeing of Wales in

a way that accords with the sustainable development principle; to require public bodies to report on such action; to establish a Commissioner for Future Generations to advise and assist public bodies in doing things in accordance with this Act; to establish public services boards in local authority areas; to make provision requiring those boards to plan and take action in pursuit of economic, social, environmental and cultural wellbeing in their area; and for connected purposes.

Appendix 2 – Websites and further information

British Psychological Society – www.bps.org.uk

The Society website has guidance, advice and further information on many topics not covered in these guidelines as well as those mentioned.

Psychologists working in clinical fields will also need to take account of Clinical Guidelines produced by NICE in England and Wales https://www.nice.org.uk/ or SIGN in Scotland http://www.sign.ac.uk/

1.1 Legal and professional obligations of psychologists

HCPC – http://hcpc-uk.org
The Health and Care Professions Council website has lots of information about professional registration including the standards of proficiency for the seven protected titles and information about indemnity insurance

Information Commissioner's Office – https://ico.org.uk/
The ICO website contains lots of useful information for organisations, private practitioners and the public regarding the rights and responsibilities under the data protection and Freedom of Information Acts.

DBS Checks – https://www.gov.uk/disclosure-barring-service-check
The government website provides helpful information for employers regarding these checks.

1.2 Continuing professional development

The HCPC has provided guidance regarding CPD for registrants. http://www.hcpc-uk.org/cpd

2.1 Working environment

Lone Working

Suzy Lamplugh Trust – http://www.suzylamplugh.org/

The Suzy Lamplugh Trust campaigns for personal safety and has lots of advice for people working alone to help to keep safe. They have some good advices and resources available.

Harassment and Bullying

ACAS – http://www.acas.org.uk/
The Advisory, Conciliation and Arbitration Service (ACAS) is a statutory organisation providing help and advice for employers and employees. They have produced guidance on several topics including harassment and bullying aimed separately at employers and employees.

Whistleblowing

Whistleblowing for employees – https://www.gov.uk/whistleblowing

The government has produced some guidance for employees surrounding whistleblowing including what to do and what to expect.

2.2 Working in the digital age

Health Insurance Portability and Accountability Act of 1996 (HIPAA) – http://www.hhs.gov/hipaa/

This American act makes provisions for health information privacy. The government website provides information for professionals regarding this act.

N.B This Act is ONLY law for practice in America.

Social Media

The HCPC has provided guidance regarding the use of social media by professional psychologists.

http://www.hcpc-uk.org/Assets/documents/100035B7Social_media_guidance.pdf

3. Safeguarding

Statutory guidance Working together to safeguard children – https://www.gov.uk/government/publications/working-together-to-safeguard-children–2
Statutory guidance on inter-agency working to safeguard and promote the welfare of children.

Getting it Right for Every Child (GIRFEC) and the Early Years Framework – http://www.maternal-and-early-years.org.uk/getting-it-right-for-every-child-principles-and-values
This is an NHS Scotland approach which establishes the principle of giving all children and young people the best possible start in life as a priority for all services.

UK Government Guidance – https://www.gov.uk/government/publications/no-secrets-guidance-on-protecting-vulnerable-adults-in-care
No Secrets sets out a code of practice for the protection of vulnerable adults.

It explains how commissioners and providers of health and social care services should work together to produce and implement local policies and procedures. They should collaborate with the public, voluntary and private sectors and they should also consult clients, their carers and representative groups. Local authority social services departments should co-ordinate the development of policies and procedures.

Protection of vulnerable adults scheme (POVA) – http://www.scie.org.uk/publications/guides/guide03/law/adults.asp
Individuals should be referred to, and included on, the POVA list if they have abused, neglected or otherwise harmed vulnerable adults in their care or placed vulnerable adults

in their care at risk of harm. By making statutory checks against the list, providers of care must ensure they do not offer such individuals employment in care positions. POVA checks are requested as part of disclosures from the Criminal Records Bureau.

Prevention and Protection in Partnership 2015 – https://www.health-ni.gov.uk/sites/default/files/publications/dhssps/adult-safeguarding-policy.pdf

This policy from Northern Ireland is for all organisations working with, or providing services to, adults across the statutory, voluntary, community, independent and faith sectors. It sets clear and proportionate safeguarding expectations across the range of organisations.

Modern Slavery and the national referral mechanism (NRM) – https://www.gov.uk/government/collections/modern-slavery
These pages provide details about the government's work to end modern slavery, including details about how to refer victims into the NRM.

Let's talk about it – http://www.ltai.info/about/
Let's Talk About It is an initiative designed to provide practical help and guidance to the public in order to stop people becoming terrorists or supporting terrorism.

4. Managing data and confidentiality

Information Commissioners Office – https://ico.org.uk/
The Information Commissioners Office produces guidance with regards to data sharing and the Data protection and Freedom of information Acts.

HCPC guidance on confidentiality – http://www.hcpc-uk.co.uk/assets/documents/100023F1GuidanceonconfidentialityFINAL.pdf
The HCPC has provided guidance on confidentiality for registrants.

NHS – https://digital.nhs.uk/article/402/Information-Governance
The NHS has produced guidance regarding Information Governance and security for NHS and partner organisations. The NHS has codes of practice for Records management and Confidentiality.

Caldicott Report – https://www.gov.uk/government/publications/the-information-governance-review
A review was commissioned in 1997 by the Chief Medical Officer of England owing to increasing concern about the ways in which patient information is being used in the NHS in England and Wales and the need to ensure that confidentiality is not undermined. Such concern was largely due to the development of information technology in the service, and its capacity to disseminate information about patients rapidly and extensively. A committee was established under the chairmanship of Dame Fiona Caldicott. The Caldicott Report highlighted six key principles, and made 16 specific recommendations. In 2012 Dame Caldicott produced a follow up report which made 26 further recommendations including the addition of a seventh principle.

Psychological Testing Centre – http://ptc.bps.org.uk/ptc/guidelines-and-information

The PTC website contains lots of guidance about psychometric testing and the management of data generated from those tests.

5. Transparency and duty of candour

Care Quality Commission – http://www.cqc.org.uk/sites/default/files/20150327_duty_of_candour_guidance_final.pdf
The CQC has produced Information for all providers: NHS bodies, adult social care, primary medical and dental care, and independent healthcare with regards to duty of candour.

Appendix 3 – How this document has been developed

In developing these guidelines, the overall aim and scope of the guidelines was considered at length, and the decision arrived at that they should be applicable to all psychologists irrespective of registration status or practice context. The guidelines have therefore been written in a way which it is hoped is inclusive of the various contexts of practice. Drawing on a broad stakeholder group for the development work, the guidelines aim to cover all the important considerations for practice. It is however recognised they cannot cover every circumstance and also that new issues arise which will require careful consideration by the individual psychologist.

The Practice Guidelines development Working Group was constituted to include all of the member networks of the Society whose members engage in practice, including the HCPC registered practitioners. It included representatives of the Society's national branches in Scotland, Wales and Northern Ireland, in order to ensure applicability to the different national contexts. It also included representation from the expert working groups of the Society's Professional Practice Board and others on specialist topics of practice.

The content of the guidelines has been developed from a combination of revision of the previous edition in the light of professional consensus on current expectations of a good standard of practice of psychology; inclusion of key points from other Society guidance on specific topics with reference to further guidance; and in some cases development of new material drawing on the professional experience of our members or outside professionals in the field. The working group has not used systematic methods to search for or assess the evidence for the material included. Recommendations have been included based on working group consensus. Where there are known areas of professional difference of opinion this has been stated.

A draft of the guidelines was circulated for Society wide consultation and one month allowed for comment. This included circulation to Experts by Experience (psychology service user representatives) with whom the Society works in various contexts. The Guidelines were also sent for comment to the Health and Care Professions Council as the statutory regulator for practitioner psychologists. Comments received were considered carefully by the Working Group and changes made to the text of the guidelines where considered necessary. The annotated audit sheet of the comments received and disposal was provided to a meeting of the Society's Professional Practice Board to assist its consideration of the draft guidelines, by way of final peer scrutiny. The guidelines were reviewed by the Society's legal advisers prior to publication. Final approval of the guidelines was given by the Society's Board of Trustees.

The guidelines will be reviewed and updated in accordance with Society policy after five years or sooner if circumstances indicate this is needed.

To ensure clarity and presentation in a user friendly format, the Guidelines have been edited by professional staff within the Society and the format designed by the Society's Preparation for Print specialists. Where considered helpful, links have been made to

additional web based resources, both to assist practitioner development and to provide up to date information in areas where there is frequent change. Organisational providers of psychological services are encouraged to review how these guidelines are used in practice and feed back to the Society any barriers to application.

In ensuring an appropriate level of independence in the production of these Guidelines, the Society has ensured its conflict of interest policy has been complied with and that no member of the working group's input has been compromised by a conflict of interest. No member has received any form of remuneration other than reimbursement of travel and subsistence expenses in accordance with Society policy. The large size of the working group and peer scrutiny and challenge, as well as the robust consultation process, guards against the potential for any one member or small group of members inappropriately to bias the Guidelines.

Principles of recovery oriented mental health practice

From the perspective of the individual with mental illness, recovery means gaining and retaining hope, understanding of ones abilities and disabilities, engagement in an active life, personal autonomy, social identity, meaning and purpose in life, and a positive sense of self.

> *It is important to remember that recovery is not synonymous with cure. Recovery refers to both internal conditions experienced by persons who describe themselves as being in recovery—hope, healing, empowerment and connection—and external conditions that facilitate recovery—implementation of human rights, a positive culture of healing, and recovery-oriented services. (Jacobson and Greenley, 2001 p. 482)*

The purpose of principles of recovery oriented mental health practice is to ensure that mental health services are being delivered in a way that supports the recovery of mental health consumers.

1. UNIQUENESS OF THE INDIVIDUAL

Recovery oriented mental health practice:

- recognises that recovery is not necessarily about cure but is about having opportunities for choices and living a meaningful, satisfying and purposeful life, and being a valued member of the community
- accepts that recovery outcomes are personal and unique for each individual and go beyond an exclusive health focus to include an emphasis on social inclusion and quality of life
- empowers individuals so they recognise that they are at the centre of the care they receive.

2. REAL CHOICES

Recovery oriented mental health practice:

- supports and empowers individuals to make their own choices about how they want to lead their lives and acknowledges choices need to be meaningful and creatively explored
- supports individuals to build on their strengths and take as much responsibility for their lives as they can at any given time
- ensures that there is a balance between duty of care and support for individuals to take positive risks and make the most of new opportunities.

3. ATTITUDES AND RIGHTS

Recovery oriented mental health practice:

- involves listening to, learning from and acting upon communications from the individual and their carers about what is important to each individual
- promotes and protects individual's legal, citizenship and human rights
- supports individuals to maintain and develop social, recreational, occupational and vocational activities which are meaningful to the individual
- instils hope in an individual's future and ability to live a meaningful life.

4. DIGNITY AND RESPECT

Recovery oriented mental health practice:

- consists of being courteous, respectful and honest in all interactions
- involves sensitivity and respect for each individual, particularly for their values, beliefs and culture
- challenges discrimination and stigma wherever it exists within our own services or the broader community.

5. PARTNERSHIP AND COMMUNICATION

Recovery oriented mental health practice:

- acknowledges each individual is an expert on their own life and that recovery involves working in partnership with individuals and their carers to provide support in a way that makes sense to them
- values the importance of sharing relevant information and the need to communicate clearly to enable effective engagement
- involves working in positive and realistic ways with individuals and their carers to help them realise their own hopes, goals and aspirations.

6. EVALUATING RECOVERY

Recovery oriented mental health practice:

- ensures and enables continuous evaluation of recovery based practice at several levels
- individuals and their carers can track their own progress
- services demonstrate that they use the individual's experiences of care to inform quality improvement activities
- the mental health system reports on key outcomes that indicate recovery including (but not limited to) housing, employment, education and social and family relationships as well as health and well being measures.

These Recovery Principles have been adapted from the Hertfordshire Partnership NHS Foundation Trust Recovery Principles in the UK.

How important are the common factors in psychotherapy? An update

Bruce E. Wampold

Department of Counseling Psychology, University of Wisconsin, Madison, WI, USA; Modum Bad Psychiatric Center, Vikersund, Norway

The common factors have a long history in the field of psychotherapy theory, research and practice. To understand the evidence supporting them as important therapeutic elements, the contextual model of psychotherapy is outlined. Then the evidence, primarily from meta-analyses, is presented for particular common factors, including alliance, empathy, expectations, cultural adaptation, and therapist differences. Then the evidence for four factors related to specificity, including treatment differences, specific ingredients, adherence, and competence, is presented. The evidence supports the conclusion that the common factors are important for producing the benefits of psychotherapy.

Key words: Common factors, contextual model, psychotherapy, alliance, empathy, expectations, cultural adaptation, therapist differences, specific ingredients

(World Psychiatry 2015;14:270–277)

The so-called common factors have a long history in psychiatry, originating with a seminal article by S. Rosenzweig in 1936 (1) and popularized by J. Frank in the various editions of his book *Persuasion and Healing* (2-4). During this period, the common factors have been both embraced and dismissed, creating some tension (5-9). The purpose of this paper is not to review or discuss the debate, but to provide an update, summarizing the evidence related to these factors.

To understand the evidence for the common factors, it is important to keep in mind that these factors are more than a set of therapeutic elements that are common to all or most psychotherapies. They collectively shape a theoretical model about the mechanisms of change in psychotherapy.

A particular common factor model, called the contextual model, has been recently proposed (8,10). Although there are other common factor models (e.g., 4,11), based on different theoretical propositions, the predictions made about the importance of various common factors are similar and the choice of the model does not affect conclusions about the impact of these factors. The contextual model is presented below, followed by a review of the evidence for the common factors imbedded in the model.

THE CONTEXTUAL MODEL

The contextual model posits that there are three pathways through which psychotherapy produces benefits. That is, psychotherapy does not have a unitary influence on patients, but rather works through various mechanisms. The mechanisms underlying the three pathways entail evolved characteristics of humans as the ultimate social species; as such, psychotherapy is a special case of a social healing practice.

Thus, the contextual model provides an alternative explanation for the benefits of psychotherapy to ones that emphasize specific ingredients that are purportedly beneficial for particular disorders due to remediation of an identifiable deficit (8).

The three pathways of the contextual model involve: a) the real relationship, b) the creation of expectations through explanation of disorder and the treatment involved, and c) the enactment of health promoting actions. Before these pathways can be activated, an initial therapeutic relationship must be established.

Initial therapeutic relationship

Before the work of therapy can begin, an initial bond between therapist and patient needs to be created. E. Bordin stated in 1979 that "some basic level of trust surely marks all varieties of therapeutic relationships, but when attention is directed toward the more protected recesses of inner experience, deeper bonds of trust and attachment are required and developed" (12, p. 254). The initial meeting of patient and therapist is essentially the meeting of two strangers, with the patient making a determination of whether the therapist is trustworthy, has the necessary expertise, and will take the time and effort to understand both the problem and the context in which the patient and the problem are situated.

The formation of the initial bond is a combination of bottom-up and top-down processing. Humans make very rapid determination (within 100 ms), based on viewing the face of another human, of whether the other person is trustworthy or not (13), suggesting that patients make very rapid judgments about whether they can trust their therapist. More than likely, patients make rapid judgments about the dress of the therapist, the arrangement and decorations of the room (e.g., diplomas on the wall), and other features of the therapeutic setting (14). However, patients come to therapy with expectations about the nature of psychotherapy as

well, due to prior experiences, recommendations of intimate or influential others, cultural beliefs, and so forth. The initial interaction between patient and therapist is critical, it seems, because more patients prematurely terminate from therapy after the first session than at any other point (15).

Pathway 1: The real relationship

The real relationship, defined psychodynamically, is "the personal relationship between therapist and patient marked by the extent to which each is genuine with the other and perceives/experiences the other in ways that befit the other" (16, p. 119). Although the psychotherapeutic relationship is influenced by general social processes, it is an unusual social relationship in that: a) the interaction is confidential, with some statutory limits (e.g., child abuse reporting), and b) disclosure of difficult material (e.g., of infidelity to a spouse, of shameful affect, and so forth) does not disrupt the social bond. Indeed, in psychotherapy, the patient is able to talk about difficult material without the threat that the therapist will terminate the relationship.

The importance of human connection has been discussed for decades, whether is it called attachment (17), belongingness (18), social support (19), or the lack of loneliness (20,21). In fact, perceived loneliness is a significant risk factor for mortality, equal to or exceeding smoking, obesity, not exercising (for those with chronic cardiac disease or for healthy individuals), environmental pollution, or excessive drinking (22-24). Psychotherapy provides the patient a human connection with an empathic and caring individual, which should be health promoting, especially for patients who have impoverished or chaotic social relations.

Pathway 2: Expectations

Research in a number of areas documents that expectations have a strong influence on experience (25). Indeed, the purported price of a bottle of wine influences rating of pleasantness as well as neural representations (26). The burgeoning research on the effects of placebos documents the importance of expectations, as placebos have robustly shown to alter reported experience as well as demonstrating physiological and neural mechanisms (27,28).

Expectations in psychotherapy work in several possible ways. Frank (4) discussed how patients present to psychotherapy demoralized not only because of their distress, but also because they have attempted many times and in many ways to overcome their problems, always unsuccessfully. Participating in psychotherapy appears to be a form of remoralization.

However, therapy has more specific effects on expectations than simple remoralization. According to the contextual model, patients come to therapy with an explanation for their distress, formed from their own psychological beliefs, which is sometimes called "folk psychology" (29-31). These beliefs, which are influenced by cultural conceptualizations of mental disorder but also are idiosyncratic, are typically not adaptive, in the sense that they do not allow for solutions. Psychotherapy provides an explanation for the patient's difficulties that is adaptive, in the sense that it provides a means to overcome or cope with the difficulties. The patient comes to believe that participating in and successfully completing the tasks of therapy, whatever they may be, will be helpful in coping with his or her problems, which then furthers for the patient the expectation that he or she has ability to enact what is needed. The belief that one can do what is necessary to solve his or her problem has been discussed in various ways, including discussions of mastery (4,32), self-efficacy (33), or response expectancies (25).

Critical to the expectation pathway is that patients believe that the explanation provided and the concomitant treatment actions will be remedial for their problems. Consequently, the patient and therapist will need to be in agreement about the goals of therapy as well as the tasks, which are two critical components of the therapeutic alliance (34,35). Hatcher and Barends described the alliance as "the degree to which the therapy dyad is engaged in collaborative, purposive work" (36, p. 293). Creating expectations in psychotherapy depends on a cogent theoretical explanation, which is provided to the patient and which is accepted by the patient, as well as on therapeutic activities that are consistent with the explanation, and that the patient believes will lead to control over his or her problems. A strong alliance indicates that the patient accepts the treatment and is working together with the therapist, creating confidence in the patient that the treatment will be successful.

Pathway 3: Specific ingredients

The contextual model stipulates that there exists a treatment, particularly one that the patient finds acceptable and that he or she thinks will be remedial for his or her problems, creating the necessary expectations that the patient will experience less distress. Every treatment that meets the conditions of the contextual model will have specific ingredients, that is, each cogent treatment contains certain well-specified therapeutic actions.

The question is how the specific ingredients work to produce the benefits of psychotherapy. Advocates of specific treatments argue that these ingredients are needed to remediate a particular psychological deficit. The contextual model posits that the specific ingredients not only create expectations (pathway 2), but universally produce some salubrious actions. That is, the therapist induces the patient to enact some healthy actions, whether that may be thinking about the world in less maladaptive ways and relying less on dysfunctional schemas (cognitive-behavioral treatments), improving interpersonal relations (interpersonal psychotherapy and some dynamic therapies), being more accepting

of one's self (self-compassion therapies, acceptance and commitment therapy), expressing difficult emotions (emotion-focused and dynamic therapies), taking the perspective of others (mentalization therapies), and so forth. The effect of lifestyle variables on mental health has been understated (37). A strong alliance is necessary for the third pathway as well as the second, as without a strong collaborative work, particularly agreement about the tasks of therapy, the patient will not likely enact the healthy actions.

According to the contextual model, if the treatment elicits healthy patient actions, it will be effective, whereas proponents of specific ingredients as remedial for psychological deficits predict that some treatments – those with the most potent specific ingredients – will be more effective than others (8).

EVIDENCE FOR VARIOUS COMMON FACTORS

Now that the contextual model has been briefly presented, attention is turned toward an update of the evidence for the common factors. Each factor reviewed is imbedded in the contextual model, although each of them is more generically considered atheoretically as an important one. As will be apparent, many of the common factors are not theoretically or empirically distinct.

To present the evidence succinctly and with as little bias and error as possible, we rely on meta-analyses of primary studies. Studies that examine the association of levels of a common factor and outcome are typically reported by some type of correlation statistic (such as Pearson's product-moment correlation), whereas studies that experimentally manipulate and compare conditions typically report some standardized mean difference (such as Cohen's d). For comparison purposes, correlational statistics are converted to Cohen's d. All meta-analyses reported aggregate statistics, corrected for bias, based on the effects of individual studies appropriated weighted. To understand the importance of effects, Cohen (38) classified a d of 0.2 as small, 0.5 as medium, and 0.8 as large. The evidence is summarized in Figure 1, where the effects of various common factors are compared to those of various specific factors.

Alliance

The alliance is composed of three components: the bond, the agreement about the goals of therapy, and the agreement about the tasks of therapy (12). As discussed above, alliance is a critical common factor, instrumental in both pathway 2 and pathway 3.

Alliance is the most researched common factor. Typically the alliance is measured early in therapy (at session 3 or 4) and correlated with final outcome. The most recent meta-analysis of the alliance included nearly 200 studies involving over 14,000 patients and found that the aggregate correlation between alliance and outcome was about .27, which is equivalent to a Cohen's d of 0.57 (39), surpassing the threshold for a medium sized effect.

There have been a number of criticisms of the conclusion that alliance is an important factor in psychotherapy (40), most of which have focused on the correlational nature of alliance research. However, each of the criticisms has been considered and has been found not to attenuate the importance of the alliance (see 8).

First, it could well be that early symptom relief causes a strong alliance at the third or fourth session – that is, early responders report better alliances and have better outcomes. To address this threat, early therapy progress must be statistically controlled or longitudinal research is needed to examine the association of alliance and symptoms over the course of therapy. The studies that have examined this question have found evidence to support either interpretation, but the better designed and more sophisticated studies are converging on the conclusion that the alliance predicts future change in symptoms after controlling for already occurring change.

Second, it could be that the correlation between alliance and outcome is due to the patients' contributions to the alliance. According to this line of thinking, some patients may come to therapy well prepared to form a strong alliance and it is these patients who also have a better prognosis, so the alliance-outcome association is due to the characteristics of the patients rather than to something that therapists provide to the patients. Disentangling the patient and therapist contributions involves the use of multilevel modeling. Recently, Baldwin et al (41) performed such an analysis and found that it was the therapist contribution which was important: more effective therapists were able to form a strong alliance across a range of patients. Patients' contribution did not predict outcome: patients who are able to form better alliances, perhaps because they have secure attachment histories, do not have better prognoses. Indeed, patients with poor attachment histories and chaotic interpersonal relationships may well benefit from a therapist who is able to form alliances with difficult patients. These results have been corroborated by meta-analyses (42).

Third, there may be a halo effect if the patient rates both the alliance and the outcome. However, meta-analyses have shown that the alliance-outcome association is robust even when alliance and outcome are rated by different people. It also appears that the alliance is equally strong for cognitive-behavioral therapies as it is for experiential or dynamic treatments, whether a manual is used to guide treatment or not, and whether the outcomes are targeted symptoms or more global measures.

There are other threats to validity of the alliance as a potent therapeutic factor, but the evidence for each of them is nonexistent or weak (8). The research evidence, by and large, supports the importance of the alliance as an important aspect of psychotherapy, as predicted by the contextual model.

As mentioned above, distinctions between certain common factors are difficult to make. A distinction has been

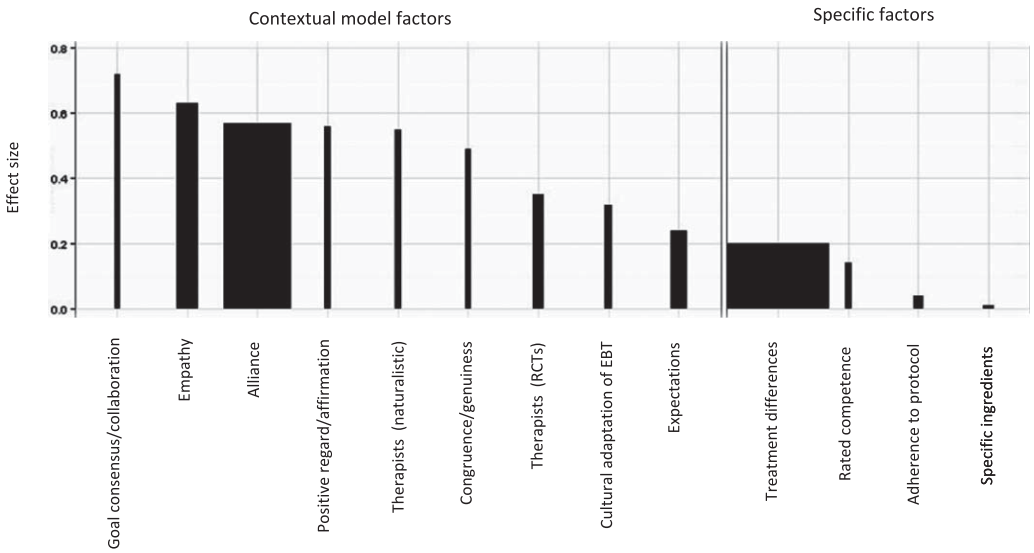

Figure 1 Effect sizes for common factors of the contextual model and specific factors. Width of bars is proportional to number of studies on which effect is based. RCTs – randomized controlled trials, EBT – evidence-based treatments

made between the bond, as defined as a component of the alliance, which is related to purposeful work, and the real relationship, which is focused on the transference-free genuine relationship (8,16). There is some evidence that the real relationship is related to outcome, after controlling for the alliance (16), and, although the evidence is not strong, it does support the first pathway of the contextual model.

A second construct related for the alliance is labeled goal consensus/collaboration. Although related to agreement about the goals and tasks for therapy, goal consensus/collaboration is measured with different instruments. As shown in Figure 1, the effect for goal consensus and collaboration is strong (d=0.72), based on a meta-analysis of 15 studies (43).

Empathy and related constructs

Empathy, a complex process by which an individual can be affected by and share the emotional state of another, assess the reasons for another's state, and identify with the other by adopting his or her perspective, is thought to be necessary for the cooperation, goal sharing, and regulation of social interaction. Such capacities are critical to infant and child rearing, as children, who are unable to care for themselves, signal to the caregiver that care is needed, a process that is then put to use to manage social relations among communities of adult individuals. Therapist expressed empathy is a primary common factor, critical to pathway 1 of the contextual model, but which also augments the effect of expectations.

The power of the empathy in healing was beautifully revealed in a study of placebo acupuncture for patients with irritable bowel syndrome (44). Patients with this syndrome were randomly assigned to a limited interaction condition, an augmented relationship condition, or treatment as usual (waiting list for acupuncture). In the limited interaction condition, the acupuncturist met with the patient briefly, but was not allowed to converse with him or her, and administered the sham acupuncture (a device that gives the sensation of having needles pierce the skin, but they do not). In the augmented relationship condition, the practitioner conversed with the patient about the symptoms, the relevance of lifestyle and relationships to irritable bowel syndrome, as well as the patient's understanding of the cause and meaning of her disorder. All this was done in a warm and friendly manner, using active listening, appropriate silences for reflection, and a communication of confidence and positive expectation. For the four dependent variables (global improvement, adequate relief, symptom severity, and quality of life), the two sham acupuncture conditions were superior to treatment as usual. However, the augmented relationship condition was superior to the limited interaction condition, particularly for quality of life.

The above study is noteworthy because it was an experimental demonstration of the importance of a warm, caring, empathic interaction within a healing setting. Unfortunately, experimental manipulation of empathy in psychotherapy studies is not possible, for design and ethical reasons. Nonetheless, there have been numerous studies (n=59) that have correlated ratings of therapist empathy with outcome, which have been meta-analytically summarized (45), resulting in a relatively large effect (d=0.63; see Figure 1). Constructs related to empathy have also been meta-analyzed and found to be related to outcome, including positive regard/affirmation (d=0.56, n=18; see Figure 1) (46) and congruence/genuineness (d=0.49, n=18; see Figure 1) (47).

It should be recognized that several of the threats to validity for the alliance are also present with regard to empathy. For example, it is clearly easier for a therapist to be warm and

caring toward a motivated, disclosing and cooperative patient than to one who is interpersonally aggressive, and the former types of patients will most likely have better outcomes than the latter, making the empathy/outcome correlation an artifact of patient characteristics rather than therapist action. Unfortunately, studies such as the ones conducted to rule out these threats to validity for the alliance have not been conducted for empathy and related constructs.

Expectations

Examining the role of expectations in psychotherapy is difficult. In medicine, expectations can be induced verbally and then physicochemical agents or procedures can be administered or not, making the two components (creation of expectations and the treatment) independent. In psychotherapy, creating the expectations, through explanation of the patient's disorder, presenting the rationale for the treatment, and participating in the therapeutic actions, is part of therapy. It is difficult to design experimental studies of expectations in psychotherapy (not impossible, but not yet accomplished in any important manner).

The typical way to assess the effect of expectations in psychotherapy is to correlate patient ratings of their expectations with outcomes, but we have seen that such correlational studies produce threats to validity. Furthermore, in many studies, expectations are measured *prior* to when the rationale for the treatment is provided to the patient, when it is the explanation given to the patient that is supposed to create the expectations. Assessing expectations after the explanation has been given (i.e., during the course of treatment) is also problematic, as those patients who have made significant progress in therapy will naturally respond that they think therapy will be helpful.

Despite the difficulties with investigating expectations in psychotherapy, this is a topic of much interest (48-50). Recently, a meta-analysis of expectations showed that there was a relatively small, but statistically significant, relationship between rated expectations and outcome ($d=0.24$, $n=46$; see Figure 1) (49). The best evidence for expectations in the context of healing is derived from studies of the placebo effect, where exquisite care has been taken to experimentally manipulate variables of interest and to control for threats to validity, by using physiological and neurological variables as well as subjective reports. A summary of this literature is beyond the scope of this article, but many excellent reviews are available (8,27,28).

Cultural adaptation of evidence-based treatments

The contextual model emphasizes that the explanation given for the patient's distress and the therapy actions must be acceptable to the patient. Acceptance is partly a function of consistency of the treatment with the patient's beliefs, particularly beliefs about the nature of mental illness and how to cope with the effects of the illness. This suggests that evidence-based treatments that are culturally adapted will be more effective for members of the cultural group for which the adapted treatment is designed. There are many ways to adapt treatments, including those involving language, cultural congruence of therapist and patient, cultural rituals, and explanations adapted to the "myth" of the group.

A recent meta-analysis demonstrated that adapting evidence-based treatments by using an explanation congruent with the cultural group's beliefs (i.e., using the cultural "myth" as the explanation) was more effective than unadapted evidence-based treatments, although the effect was modest ($d=0.32$, $n=21$; see Figure 1) (51).

Therapist effects

Therapist effects are said to exist if some therapists consistently achieve better outcomes with their patients than other therapists, regardless of the nature of the patients or the treatment delivered. Therapist effects have been studied in clinical trials and in naturalistic settings. In both designs, the measure of therapist effects is an intraclass correlation coefficient. Technically, this coefficient indexes the degree to which two patients from the same therapist have similar outcomes relative to two patients from two different therapists. To compare therapist effects to other common factors, the intraclass correlation coefficient is converted to Cohen's d.

The contextual model predicts that there will be differences among therapists *within* a treatment. That is, even though the therapists are delivering the same specific ingredients, some therapists will do so more skillfully and therefore achieve better outcomes than other therapists delivering the same treatment. Evidence for this conjecture is found in clinical trials. A meta-analysis of therapist effects in clinical trials found modest therapist effects ($d=0.35$, $n=29$; see Figure 1) (52). Keep in mind that the therapists in clinical trials generally are included because of their competence and then they are given extra training, supervised, and monitored. Moreover, the patients in such trials are homogeneous, as they have a designated diagnosis and are selected based on various inclusionary/exclusionary criteria. In such designs, patients are randomly assigned to therapists. Consequently, consistent differences among therapists in such trials, although modest, are instructive.

Not surprisingly, therapist effects in naturalistic settings are greater than in clinical trials. In the former settings, therapists are more heterogeneous, patients may not be randomly assigned to therapists, patients are heterogeneous, and so forth. A meta-analysis of therapist effects in such settings found a relatively large effect ($d=0.55$, $n=17$; see Figure 1) (52).

The finding of robust therapist effects raises the question about what are the characteristics or actions of more effective therapists. Recent research has begun to address this

question. Studies have shown that effective therapists (vis-à-vis less effective therapists) are able to form stronger alliances across a range of patients, have a greater level of facilitative interpersonal skills, express more professional self-doubt, and engage in more time outside of the actual therapy practicing various therapy skills (8).

SPECIFIC EFFECTS

Evidence for the common factors is also collected by examining the evidence for specific aspects of psychotherapy. The contextual model makes several predictions about specific effects, which will be discussed as each specific effect is considered.

Treatment differences

When pathway 3 of the contextual model was discussed earlier, it was emphasized that the model contends that all therapies with structure, given by empathic and caring therapists, and which facilitate the patient's engagement in behaviors that are salubrious, will have approximately equal effects. That is, the specific ingredients, discussed in pathway 3, are not critical because they remediate some psychological deficit.

The question of whether some treatments are superior to others has long been debated, with origins at the very beginning of the practice of psychotherapy (think about the disagreements amongst Freud, Adler and Jung, for example). Today, there are claims that some treatments, in general or for specific disorders, are more effective than others. Others, however, claim that there are no differences among psychotherapies, in terms of their outcomes.

The literature addressing this issue is immense and summarizing the results of relative efficacy is not possible. Nevertheless, the various meta-analyses for psychotherapies in general or for specific disorders, if they do find differences among various types of treatment, typically find at most differences of approximately d=0.20, the value shown in Figure 1.

Specific effects from dismantling studies

To many, the dismantling design is the most valid way to identify the effects of specific ingredients. In this design, a specific ingredient is removed from a treatment to determine how much more effective the treatment is in total compared to the treatment without the ingredient that is purportedly remedial for the psychological deficit.

Two meta-analyses have examined dismantling designs and both found minimal differences between the total treatment and the treatment without one or more critical ingredients (d=0.01, n=30, see Figure 1) (53,54). The most recent of these meta-analyses did find that adding an ingredient to an existing treatment increased the effect for targeted variables by a small amount (d=0.28) (53).

Adherence and competence

In clinical trials, it is required that adherence to the protocol and the competence at delivering the treatment are rated. This makes sense: if the goal is to make inferences about a particular treatment, then it is necessary to ensure that the treatment was delivered with the necessary components and not with extraneous components (i.e., with *adherence* to the protocol) and that the treatment components were delivered skillfully (i.e., given *competently*).

It would seem logical theoretically that adherence to the protocol and competence would be related to outcome. That is, for cases where the therapist followed the protocol and did so skillfully, there should be better outcomes. However, this is not the case. In a meta-analysis of adherence and competence (55), effects were small (d=0.04, n=28 for adherence; d=0.14, n=18 for competence; see Figure 1).

The results for adherence and competence demand further explanation. If the specific ingredients of a treatment are critical, then adherence should make a difference – actually delivering those ingredients should be related to outcome. There is evidence that rigid adherence to a protocol can attenuate the alliance and increase resistance to the treatment (i.e., failing to accept the treatment, a contextual model tenet) (8), and that flexibility in adherence is related to better outcomes (56), results consistent with prediction of the contextual model.

The findings for competence are a bit more difficult to understand. Competence in these trials typically is rated by experts in the treatment being given, based on watching therapy sessions. Why can't experts differentiate between "good" therapy and "bad" therapy? If this were indicative of experts' abilities to judge competence, then the notion of psychotherapy supervision would be turned upside down, because what is observed and evaluated would have no relation to outcomes – how could the supervisor then make a case for providing input to the supervisee? But the clue to the resolution of this mystery is found in the definition of competence. Most psychotherapy trials rate the competence *for a specific treatment*. That is, what is rated is the skill in providing the elements of the treatment protocol, rather than common factors, such as empathy, alliance, affirmation, and so forth – aspects of therapy that do predict outcome and seem to differentiate more effective therapists from less effective therapists.

CONCLUSIONS

Although the common factors have been discussed for almost a century, the focus of psychotherapy is typically on the development and dissemination of treatment models. If

not discounted, then the common factors are thought of as perhaps necessary, but clearly not sufficient. The evidence, however, strongly suggests that the common factors must be considered therapeutic and attention must be given to them, in terms of theory, research and practice.

One of the criticisms of the common factors is that they are an atheoretical collection of commonalities. In this paper, the contextual model was presented to convey a theoretical basis for these factors.

Trauma and Public Mental Health: A Focused Review

Rolf J. Kleber[1,2]*

[1] Utrecht University, Utrecht, Netherlands, [2] Arq Psychotrauma Expert Group, Diemen, Netherlands

Psychological trauma has developed into a very common concept in the scientific community, in mental health care, as well as in popular language and mass media. The purpose of this article is to show the relevance of the discipline of traumatic stress studies to the field of public mental health by examining central concepts and findings concerning trauma and its aftermath and examining implications for public mental health. Attention is paid to the diagnosis of posttraumatic stress disorder (PTSD) and the construct of resilience as well as to specific areas of public mental health activities. A public mental health perspective will help to develop preventive approaches to trauma and extend the impact of various forms of interventions. It will also make clear that trauma care will have to consider the community and the society at large.

Keywords: trauma, posttraumatic stress disorder, resilience, public mental health, war, disasters, violence

INTRODUCTION

Psychological trauma has developed into a very popular concept in the scientific community, in the world of mental health care, as well as in common language and mass media. The consequences of various shocking events—violence, disasters, acts of terrorism, accidents, and war—receive frequent and enduring attention. The number of scientific and clinical publications has increased enormously and in many media programs ample attention is paid to victims and others affected by these events. The purpose of this article is to show the relevance of the discipline of traumatic stress studies to the field of public mental health by examining central concepts and findings concerning trauma and its aftermath and examining implications for public mental health.

WHAT IS A TRAUMATIC EVENT?

Traumatic events involve the confrontation with war, violence, disasters, sudden loss, serious illness, and other overwhelming and disturbing events. According to the psychiatric classifications [of the *International Classification of Diseases* of the World Health Organization (ICD-11) and the *Diagnostic and Statistical Manual of Mental Disorders*, fifth edition (DSM-5)], a traumatic event is defined as the exposure to: death, threatened death, actual or threatened serious injury, or actual or threatened sexual violence (1, 2).

Phenomenologically such an event can be characterized by an extreme sense of powerlessness as well as a disruption of beliefs and expectations. The individual has lost control over the situation and is to a large extent a victim of the circumstances and/or other people (i.e. the perpetrator). In "Jenseits des Lustprinzips" (1920), Freud already posed: "the essence of a traumatic situation is an experience of helplessness that is brought about either externally or internally." At the same time, he or she is confronted with a shattering of basic assumptions. The self-evidence of one's life is gone. The sense of invulnerability,

the idea of the benevolence of the world, and the idea that other people can be trusted are devastated. The obvious certainties of life have disappeared. The images one holds of oneself and the environment no longer adequately fit the new situation. In the words of Janoff-Bulman (3), basic assumptions have been shattered.

Exposure to traumatic events is not rare, as has been consistently found in epidemiological studies. The World Mental Health Surveys of adults were carried out among nearly 70,000 participants from 24 countries ranging in economic status from low to high (4). These data showed that at some time in their life 70.4% of the respondents had experienced at least one type of a traumatic event. The specific rates were: 14% had experienced intimate partner or sexual violence, 34.3% accidents or injuries, 22.9% physical violence, 13.1% war-related events, 34.1% the unexpected or traumatic death of a loved one, and 35.7% experienced traumas that happened to loved ones (e.g., serious illness of a child). As Kessler et al. (4) stated, these findings make clear that it is rather normal to be exposed to a very upsetting event in one's lifetime.

RISE AND BLOOM OF THE CONCEPT OF POST-TRAUMATIC STRESS DISORDER

The concept of *posttraumatic stress disorder* (PTSD) is nowadays so much used that it dominates most thinking about the consequences of violence, disaster, and being a refugee. That development is quite unique as the attention for trauma was very meager just 40, 50 years ago. In the 1970s, the United States became increasingly confronted with the psychological and social difficulties of the nearly three million veterans who had fought in Vietnam. They suffered from nightmares, depression, relationship problems, et cetera. However, because of the ambivalent perspective on the Vietnam War, authorities and professionals were rather reluctant to acknowledge these difficulties, but the increasing concern led to the introduction of the term post-traumatic stress disorder in the anxiety disorders section of the *Diagnostic and Statistical Manual of Mental Disorders* (DSM-III) (5).

The diagnosis of PTSD is directly linked to experiencing or witnessing a traumatic event such as a natural disaster, a serious accident, a terrorist act, war/combat, rape, or other violent assault (criterion A). According to DSM-5 (1), PTSD consists of four categories of symptoms. Re-experiencing the traumatic event (criterion B) is manifested in symptoms such as intrusive memories, distressing dreams, flashbacks, or distress or physiological reactions upon exposure to cues of the trauma. The other categories are symptoms of avoidance of the reminders of the trauma (criterion C), alterations in memories or mood associated with the trauma (criterion D), and finally clear alterations in physiological arousal and reactivity [criterion E; see further Ref. (1)].

Recently a relatively different definition of PTSD has been introduced in the new version of the International Classification of Diseases of the World Health Organization (2018). It consists of three categories (reexperiencing, avoidance, hyperarousal) with only two core symptoms in each category. The definition may be more flexible to use (allowing for cultural variation and clinical judgment) but is less detailed and comprehensive. Empirical studies have found that prevalence rates may vary between the two classifications and there is often a lack of overlap (i.e., not the same individuals are classified as PTSD patients by the two classifications). This is a major concern for the field of traumatic stress studies. It is a challenge for future research to unravel the differences and to create order (6), as most research is conducted with the DSM definition while most countries in the world use instead ICD.

Prevalence figures for PTSD vary enormously, according to the nature of the events, various risk factors, the time of measurement, and the instruments used. In general, PTSD occurs more when an aggressor is involved (in the case interpersonal violence), for persistent and extended events (e.g., internment, sexual abuse) and for socially charged events (e.g., rape). Among Dutch veterans who were confronted with war violence during deployment in Iraq, the figures of current prevalence varied between 3 and 4% (7). Nine percent of American Vietnam veterans had current PTSD 20 years after the war (8). Figures on PTSD in studies of disasters (man-made, technological, as well as natural) varied mostly around 5% to 15% (9). The prevalence findings also fluctuated strongly in studies of sexual violence, although the rates are generally higher than after other events: between 3.7% and 65%. The already mentioned World Mental Health Surveys (4, 10) determined that intimate partner or sexual violence (such as rape) was a very frequent cause of PTSD. Nevertheless, the unexpected death of loved ones represented the most frequent cause of event-related psychopathology within the general population because of the high frequency with which people experience such a loss. About this last mentioned finding, it is relevant to remark that there is a close relationship between trauma and loss and consequently between PTSD and complicated grief, but they are not similar (11). The concepts of Persistent Complex Bereavement Disorder (1) and Prolonged Grief Disorder (2) as result of the death of a family member or a close friend are included in DSM-5 and ICD-11, respectively.

In a comprehensive and systematic analysis (12) prevalence rates of PTSD and depression were identified from 181 surveys comprising 81,866 refugees and other conflict-affected persons from 40 countries exposed to humanitarian emergencies. Again, rates of reported PTSD and depression showed large inter-survey variability. The prevalence estimates derived from the methodologically most robust surveys provided rates between 13% and 25% for PTSD, as assessed by Steel et al. (12). The risk of PTSD among refugees was increased by experiencing torture and sexual violence, having a higher age, being a woman, and through a long stay in different asylum seekers centers.

Despite the increased knowledge about PTSD and despite the positive results of therapeutic treatments for PTSD, there are various dilemmas and challenges. First, there is a large comorbidity, as most patients also suffer from depression, substance abuse, or other disorders (6). Furthermore, defining the borderline between normal and abnormal behavior after trauma is difficult. Moreover, although this is matter of heavy debate among researchers and clinicians, PTSD is sometimes an overstretched concept in the sense that normal responses to stressful life events are labelled as disorder. Difficulties of diverse groups—from refugees to veterans—are attributed too much or too easily to traumatic events and their resilience is underestimated (13).

IMPACT ON THE INDIVIDUAL

Regarding a public mental health perspective, it is highly relevant to understand that the majority of people exposed to serious live events does not develop disorders. However, this does not mean that they will not suffer from symptoms and difficulties. Most people will experience responses such as intrusions, nightmares, startle reactions, and numbness (14). Findings from large epidemiological studies of disaster victims have made this clear. In 2000 the Netherlands were confronted with a disastrous explosion of a fireworks container area in the middle of a neighborhood. A comprehensive and longitudinal study was conducted among the inhabitants. In the investigation of post-disaster reactions (15) it was found that most inhabitants suffered from various serious symptoms (especially depression, fears, re-experiences, physical symptoms) in the first 2 to 3 weeks after the explosion. At least 87% of the affected residents were highly affected in those first weeks after the disaster.

These responses can be considered functional and normal, as has been made clear in emotion theories (16). People are afraid that it will happen again. They do not feel safe anymore and are constantly alert for danger. They are angry because of the neglect of the responsible authorities or they feel rage in the direction of the perpetrator. They react easily irritated at remarks of other people. They blame themselves for being there at the moment of the disaster or having not done anything to prevent the situation. They feel despaired because of the death of loved ones and the loss of material goods. They have the impression that other people do not understand their distress and sorrow and feel estranged from others. Nevertheless, the intensity and frequency of these distressing and painful responses do not reach the level of disorder.

Although DSM-5 recognizes the possibility of the occurrence of Acute Stress Disorder (ASS) in the first days after an event, a diagnosis that overlaps with PTSD, this diagnosis is rarely used in clinical practice as well as research. Patients with ASS usually report numbness, problems with memory, sleep and concentration, irritability, fears, or anxiety and have frequent re-experiences of the event. The usefulness of acute stress disorder as a classification is controversial in the literature (17). The difference with normal reactions to a major life event and with PTSS, apart from the time criterion (ASS can only be used for disturbances in the first 4 weeks after the experience), is not yet confirmed adequately.

As mentioned above, the world does not make sense any more after such a traumatic experience. Already in the 1940s the psychiatrist and concentration camp survivor Victor Frankl stated that the search for meaning played a crucial role in adaptation to threatening events (18). Cognitive approaches to trauma (e.g., 19) state that successful processing of the traumatic experience takes place when new information (e.g., the implication of the traumatic experience) is assimilated into existing structures or models. Unsuccessful processing occurs when the trauma-related information is not integrated into existing beliefs concerning self-image and world views (20). In low control situations not amenable to direct repair or problem-solving, such as trauma, loss, and serious illness, meaning-making is often the most adaptive strategy. As Schok et al. (20) have argued, meaning can be created by answering the question why an event occurred and why it happened to the person. It can also be operationalized as considering the ways in which one's life changed because of the event and assessing the extent to which one has "made sense of" the experience. Research findings have indicated that these two processes of finding a cause for the extreme event and finding personal benefits in the traumatic experience play independent roles in adjustment after trauma (21, 22). Therefore, the attempt to find meaning discloses itself twofold: in searching for an answer to the question why it happened as well as in rethinking one's attitudes and priorities to restructure one's life along more satisfying lines (23).

IMPACT ON THE COMMUNITY

Violence, disasters, accidents, and war are also stressful events for the community. Consequently, the impact of traumatic events goes beyond those who are directly exposed to the event and affects close relationships, the social environment, and the society at large. A human being does not live in a vacuum. He or she is surrounded by others. And those others will be confronted with the traumatic event and its aftermath too. This holds true for an event that struck an individual, such as a rape. Others hear about the event, perceive the suffering of the victims, and must cope with the implications. Naturally, it holds also true for events that struck a large group of people. For instance, a disaster undermines the social fabric of a community. It can lead to dissolution of social networks and to forced or voluntary migration. Regarding the health care system, it can lead to a disruption of the provision of social services and an erosion of the health care infrastructure (24, 25).

On the other hand, the social environment can stimulate recovery after trauma. The perception of social support has been found to be an influential factor for the effects of traumatic events on the individual as well as the community. For instance, studies undertaken after disasters have shown that social support had a significant stress-buffering effect for post-traumatic problems. Furthermore, a comprehensive meta-analysis (26) has shown that lack of social support systems and lack of sharing of emotions are significant risk factors for mental health disturbances.

THE OTHER SIDE OF TRAUMA: RESILIENCE

The finding that most people confronted with extreme life events did not develop disturbances like PTSD created interest in the phenomenon of *resilience*. This concept has been widely used in recent years in the scientific and clinical world. Resilience refers to a dynamic process involving positive adaptation to one's circumstances in the face of significant adversity, as defined by Luthar and Cicchetti (27). However, there are various understandings of resilience [see Ref. (28)]. Resilience may be treated as a quality, a personal trait, a process, and an outcome. While, for example, some researchers conceive of resilience

as a multiply determined developmental process that is not fixed, others use measures of trait resilience, which favors the assumption that resilience is a personality attribute [see for the different views Ref. (29)].

Investigation of resilience can lead to useful avenues for intervention. The concept offers a different perspective on risk and protection. Focusing on what makes individuals strong rather that what makes them weak may aid to understand what helps them to maintain their mental health. Sleijpen and colleagues examined strategies of young refugees in dealing with negative experiences (28). Their findings revealed that young refugees living in the Netherlands were affected by memories of traumatic events experienced in their country of origin or during the flight, but that current stressors, especially for young people without a residence permit, played a more significant role in determining their psychological well-being. The participants in this study used the following four strategies to deal with traumatic experiences and current stressors: (1) acting autonomously, (2) performing at school, (3) perceiving support from peers and parents, and (4) participating in the new society. These strategies helped the young refugees to strengthen their sense of power and control, they gave them some distraction, and they supported or sustained their spirit within the family unit and the new society [see Ref. (28)].

PROLONGED AFTERMATH

For public mental health initiatives, it is important to realize on the one hand the significance of the resilience of people affected, but at the other hand also the fact that disturbances can last for a very long period. Difficulties do not always disappear in time. Sometimes they may last for a very long time. 10 years after the Enschede Fireworks disaster still 6.7% of a representative sample of the inhabitants of the neighborhood had an indication of chronic disaster-related PTSD (30). 40 years after the Vietnam War (31), prevalence rates of PTSD were 4.5% (male USA veterans) and 6.1% (female veterans). In the World Mental Health Surveys (4), it was also found that PTSD symptoms typically were quite persistent.

The long-term aftermath of trauma can be illustrated with the following research finding. A large community-based sample of child survivors from World War II was compared with a reference group from the Dutch population as well as with clinical groups (32). These children survived internment in the Japanese camps in the former colony of the Dutch East Indies (now Indonesia) during the period 1942–1945 (and afterwards). Most of them were forced to migrate to the Netherlands in the 1940s and 1950s. Long-term sequelae of the persecution were studied by standardized questionnaires on posttraumatic responses, general health, and dissociation. Compared with control individuals of the same age that lived through the German occupation in the Netherlands during World War II, the child survivors from the former Dutch Indies reported significantly more traumatic experiences and mental health disturbances approximately 50 years after the war. 23 percent of these now adult child survivors in the community sample had an indication of PTSD related to the events in World War II [see Ref. (32)].

These results underline the long-term aftermath of traumatic experiences. This conclusion is also relevant for the many war refugees who migrated to Europe in recent years. In the field of psychotraumatology, there has been a continuing debate about the extent to which diagnostic criteria for PTSD adequately cover the posttraumatic symptomatology experienced by individuals exposed to prolonged, repeated, and interpersonal traumatic events, such as occurring in situations of domestic violence, war, and torture (33). This symptomatology is more complex, more severe, and more invasive than that captured by the classic PTSD diagnosis. This manifestation of psychopathology is referred to as *complex PTSD* (CPTSD). In the 11th version of the ICD (2), this concept is added as a formal diagnosis comorbid to PTSD. It consists of impairments in three domains: difficulties in emotion regulation, negative beliefs about oneself, and difficulties in sustaining relationships. The concept is attractive as it focuses on personal changes due to the confrontation with enduring violence and oppression, but it is as such also rather (too) close to personality disorders while it is not clear whether the addition of this new diagnostic concept is really required beyond PTSD. Research is also still indecisive about these matters. Because of these reasons, a concept such as complex PTSD was not included in DSM-5.

PUBLIC HEALTH STRATEGIES

Public health strategies are aimed at preventing or diminishing mental health problems and addressing the causes of these conditions (see also 10). These strategies are active on multiple levels: individual, family, community, and society. Unfortunately, public health care of trauma is a rather underdeveloped area (see Magruder et al., 2107), especially in contrast to the field of treatment of trauma-related disorders, in particular PTSD. Psychotherapies of PTSD have been found successful, as has been shown by many RCT's (randomized controlled trials) and meta-analyses, in comparison with control groups and placebo treatments [e.g., Ref. (34)]. Most evidence has been found for trauma-focused cognitive behavioral therapy and Eye Movement Desensitization and Reprocessing (EMDR), and to a somewhat lesser extent Narrative Exposure Therapy and Brief Eclectic Psychotherapy for PTSD [e.g., Ref. (35)]. However, here we focus only on public health strategies relevant to trauma care. They are all explicitly aimed at preventing the emergence of health problems or preventing the aggravation of these difficulties.

Preventing adversity. First, although it is a truism, one should bear in mind that stopping or avoiding exposure to events that can be experienced as traumatic is a sensible public health strategy. If disasters, accidents, or wars can be prevented by concrete measures, the chance on traumatic experiences and on their negative consequences is, by definition, taken away.

Creating awareness and recognition. Secondly, creating awareness and acknowledgment concerning the impact of trauma on the population is a strategy by which difficulties can be prevented. Psycho-education with the help of brochures is an obvious example of this. Similarly, so-called silent journeys by a community after a violent crime in their neighborhood

and creating monuments ("lieux de memoire") are just as exemplary regarding recognition and appreciation for the people affected by trauma.

The increase of awareness through public health campaigns has been suggested for combatting child sexual abuse (36). Public health campaigns serve to help the identification of affected children and to facilitate the recognition of their difficulties by adults. Such services imply the awareness of the impact of traumatic experiences in diverse domains (individual, societal), the recognition of signs and symptoms, the integration of knowledge about trauma in public health programs, and the prevention of re-traumatization for their users. In this respect, technology-based interventions (e.g., online platforms, social media, mobile applications) can be advantageous. Such campaigns of awareness and recognition should be accompanied by mental health services with adequate interventions for abused persons looking for care. Nevertheless, despite their positive aims and effects, at the same time, all these campaigns may have a downside: they can lead to complications, such as the risks of promoting an unnecessary victim status and medicalizing complaints of the affected persons, resulting in a reduction of the potential for spontaneous recovery (36, 37).

Strengthening resilience. The third group of strategies is focused on bolstering resilience and stimulating self-efficacy. For example, training programs have been developed in the armies of the USA and several European countries to allow military soldiers to deal with the stress of war and to be more resistant to the intense and overwhelming events they will be confronted with.

Counseling. Fourth, counseling people confronted with traumatic events is a well-known intervention in the field of trauma care. Various forms of secondary preventive interventions providing practical care, support, and information have been designed for employees of organizations confronted with extreme events in the work setting, such as the police and banks, but also for victims of large-scale acts of terrorism. These interventions consist of a couple of protocolled sessions in the first 2 or 3 months after a calamity [see for an overview Ref. (38)]. They are considered as quite helpful, although controlled research is mostly lacking. This intervention should not be confused with so-called psychological debriefing, a typically single session of group counseling directly after a disaster or an act of violence. If this form of support is focused too much on the ventilation of emotions, debriefing has been found to have a negative impact: posttraumatic reactions and depressive feelings are worsened and very early exposure to the trauma material may interfere with natural recovery processes (9, 38).

Reconciliation. A related form of post-trauma care are large-scale programs to reconcile people after large-scale conflicts. For instance, a civil war divides families, communities, and nations, often pitting one neighbor against another. Distrust, resentment, and anger dominate post-war society, just as much as passivity and emotional numbness. That is why programs are designed to reconcile people (perpetrators and victims) and to restore trust, connectedness, and social cohesion.

Such truth and reconciliation efforts were conducted in Sierra Leone (39). Community-level forums in 200 villages were set up in which victims detailed war atrocities and perpetrators confessed to war crimes. Research using a randomized control trial among more than 2,000 individuals showed that reconciliation led to greater forgiveness of perpetrators and strengthened social capital: social networks were larger, and people contributed more to public goods in treated villages. However, there were also negative psychological costs next to the positive societal benefits. The reconciliation intervention also worsened psychological health, increasing depression, anxiety, and PTSD in the same villages. For a subset of villages, outcomes were measured 9 months and 31 months after the intervention. Results showed that both positive and negative effects persisted into the longer time horizon. These findings suggest that policy-makers should be careful with reconciliation processes and must find ways to restrict the emphasis on emotions.

Policy making. Finally, there is the overarching field of policy making, a rather underdeveloped topic in trauma care. As Magruder et al. (40) stated, public policies should be formulated to prevent traumatic events, to understand risk and protective factors, to provide early intervention services for individuals and communities at risk of post-trauma maladjustment, and to shape societal norms to eliminate stigma. Extra priorities for improving mental health include a focus on adequately training researchers and professionals, supporting international collaborations, and encouraging scientists to share their expertise with policymakers. Furthermore, integration of physical and mental health care is especially important, as trauma-exposed individuals often seek help in primary care rather than mental health settings. Consequently, posttraumatic disturbances may go undiagnosed.

FINALLY

A public mental health perspective will help to develop preventive approaches to trauma and extend the impact of various forms of interventions. It will also make clear that trauma care will have to consider the community and the society at large. The concept of trauma is an attractive concept. It refers to both spectacular and shocking events that receive huge attention, such as acts of terrorism and large-scale calamities. Something dramatic happens that could happen to anyone: the cause appears to be clear and the responsibility appears to lay elsewhere. One could argue that traumatic experiences show us the limits of our abilities to master our lives and that they defy our efforts to control the circumstances. However, the concept of trauma is also a dangerous concept. It is often used too easy and too quick. Not every stressful event is a traumatic experience and not every person confronted with war, disaster, or terror is traumatized. Overstretching the concept may create the risk of medicalization of regular difficulties of the afflicted people and ignoring the self-reliance and the adaptive skills of them.

Traumatic stress: effects on the brain

J. Douglas Bremner, MD

Brain areas implicated in the stress response include the amygdala, hippocampus, and prefrontal cortex. Traumatic stress can be associated with lasting changes in these brain areas. Traumatic stress is associated with increased cortisol and norepinephrine responses to subsequent stressors. Antidepressants have effects on the hippocampus that counteract the effects of stress. Findings from animal studies have been extended to patients with post-traumatic stress disorder (PTSD) showing smaller hippocampal and anterior cingulate volumes, increased amygdala function, and decreased medial prefrontal/anterior cingulate function. In addition, patients with PTSD show increased cortisol and norepinephrine responses to stress. Treatments that are efficacious for PTSD show a promotion of neurogenesis in animal studies, as well as promotion of memory and increased hippocampal volume in PTSD.

Effects of traumatic stress

Traumatic stressors such as early trauma can lead to post-traumatic stress disorder (PTSD), which affects about 8% of Americans at some time in their lives,[1] as well as depression,[2,3] substance abuse,[1,4] dissociation,[5] personality disorders,[6,7] and health problems.[8] For many trauma victims, PTSD can be a lifelong problem.[9] The President's New Freedom Commission Report highlights the importance of providing services for mental disorders related to early trauma.[10-12] However, the development of effective treatments is limited by gaps in knowledge about the underlying neurobiological mechanisms that mediate symptoms of trauma-related disorders like PTSD. This paper reviews preclinical and clinical studies on the effects of traumatic stress on the brain.

Normal development of the brain across the lifespan

To understand how traumatic stress occurring at different stages of the life cycle interacts with the developing brain, it is useful to review normal brain development. The normal human brain undergoes changes in structure and function across the lifespan from early childhood to late life. Understanding these normal developmental changes is critical for determining the difference between normal development and pathology, and how normal development and pathology interact.

Although the bulk of brain development occurs in utero, the brain continues to develop after birth. In the first 5 years of life there is an overall expansion of brain volume related to development of both gray matter and white

matter structures; however, from 7 to 17 years of age there is a progressive increase in white matter (felt to be related to ongoing myelination) and decrease in gray matter (felt to be related to neuronal pruning) while overall brain size stays the same.[13-16] Gray matter areas that undergo the greatest increases throughout this latter developmental epoch include frontal cortex and parietal cortex.[17,18] Basal ganglia decrease in size, while corpus callosum,[19,20] hippocampus, and amygdala[21-23] appear to increase in size during childhood, although there may be developmental sex-laterality effects for some of these structures.[24] Overall brain size is 10% larger in boys than girls during childhood.[24]

During the middle part of life (from age 20 to 70) there is a gradual decrease in caudate,[25] diencephalon,[25] and gray matter,[25,26] which is most pronounced in the temporal[27] and frontal cortex,[26] with enlargement of the ventricles[26,27] and no change in white matter.[25,26] Studies have not been able to document changes in hippocampal volume in normal populations during this period.[27] After menopause in women at about the age of 50, however, there are changes in reproductive hormones, such as decreased levels of estrogen. Since estrogen promotes neuronal branching in brain areas such as the hippocampus,[28] a loss of estrogen may lead to changes in neuronal structure. Although the effects of menopause on the brain have not been well studied, it is known that sex hormones also affect brain function and circuitry[29]; therefore, the changes in sex hormones with menopause will presumably affect brain function, as well as possibly structure. There is some evidence in super-elderly individuals (age >70) for modest reductions in hippocampal volume with late stages of aging.[27,30] More robust findings have included increased ventricular volume and reduction in gray matter, temporal lobe, and cerebellum volumes with normal aging, that begins before the age of 70.[25,27,31-33]

Therefore, trauma at different stages in life will presumably have different effects on brain development. The few studies that have looked at this issue do suggest that there are differences in the effects of trauma on neurobiology, depending on the stage of development at which the trauma occurs. Studies in this area, however, have been limited.

Neurobiology of PTSD

PTSD is characterized by specific symptoms, including intrusive thoughts, hyperarousal, flashbacks, nightmares, and sleep disturbances, changes in memory and concentration, and startle responses. Symptoms of PTSD are hypothesized to represent the behavioral manifestation of stress-induced changes in brain structure and function. Stress results in acute and chronic changes in neurochemical systems and specific brain regions, which result in long-term changes in brain "circuits," involved in the stress response.[34-37] Brain regions that are felt to play an important role in PTSD include hippocampus, amygdala, and medial prefrontal cortex. Cortisol and norepinephrine are two neurochemical systems that are critical in the stress response *(Figure 1)*.

The corticotropin-releasing factor (CRF)/hypothalamic-pituitary-adrenal (HPA) axis system plays an important role in the stress response. CRF is released from the hypothalamus, with stimulation of adrenocorticotropic hormone (ACTH) release from the pituitary, resulting in glucocorticoid (cortisol in man) release from the adrenal, which in turn has a negative feedback effect on the axis at the level of the pituitary, as well as central brain sites including hypothalamus and hippocampus. Cortisol has a number of effects which facilitate survival. In addition to its role in triggering the HPA axis, CRF acts centrally to mediate fear-related behaviors,[38] and triggers other neurochemical responses to stress, such as the noradrenergic system via the brain stem locus coeruleus.[39] Noradrenergic neurons release transmitter throughout the brain; this is associated with an increase in alerting and vigilance behaviors, critical for coping with acute threat.[40-42]

Studies in animals showed that early stress has lasting effects on the HPA axis and norepinephrine. A variety of early stressors resulted in increased glucocorticoid

response to subsequent stressors.[43-45] Maternally deprived rats had decreased numbers of glucocorticoid receptors in the hippocampus, hypothalamus, and frontal cortex.[46] Stressed animals demonstrated an inability to terminate the glucocorticoid response to stress,[47,48] as well as deficits in fast-feedback of glucocorticoids on the HPA axis, which could be related to decreased glucocorticoid receptor binding in the hippocampus.[49] Early postnatal adverse experiences increase hypothalamic CRF messenger ribonucleic acid (mRNA), median eminence CRF content, and stress-induced glucocorticoid[50] and ACTH release.[46] These effects could be mediated by an increase in synthesis of CRH mRNA following stress.[51] In nonhuman primates, adverse early experiences resulted in long-term effects on behaviors, as well as elevated levels of CRF in the cerebrospinal fluid.[52] Exposure to chronic stress results in potentiation of noradrenergic responsiveness to subsequent stressors and increased release of norepinephrine in the hippocampus and other brain regions.[42]

Preclinical and clinical studies have shown alterations in memory function following traumatic stress,[53] as well as changes in a circuit of brain areas, including hippocampus, amygdala, and medial prefrontal cortex, that mediate alterations in memory.[54] The hippocampus, a brain area involved in verbal declarative memory, is very sensitive to the effects of stress. Stress in animals is associated with damage to neurons in the CA3 region of the hippocampus (which may be mediated by hypercortisolemia, decreased brain-derived neurotrophic factor (BDNF), and/or elevated glutamate levels) and inhibition of neurogenesis.[55-60] High levels of glucocorticoids seen with stress were also associated with deficits in new learning.[61,62]

Antidepressant treatments have been shown to block the effects of stress and/or promote neurogenesis.[58,63-66] Animal studies have demonstrated several agents with

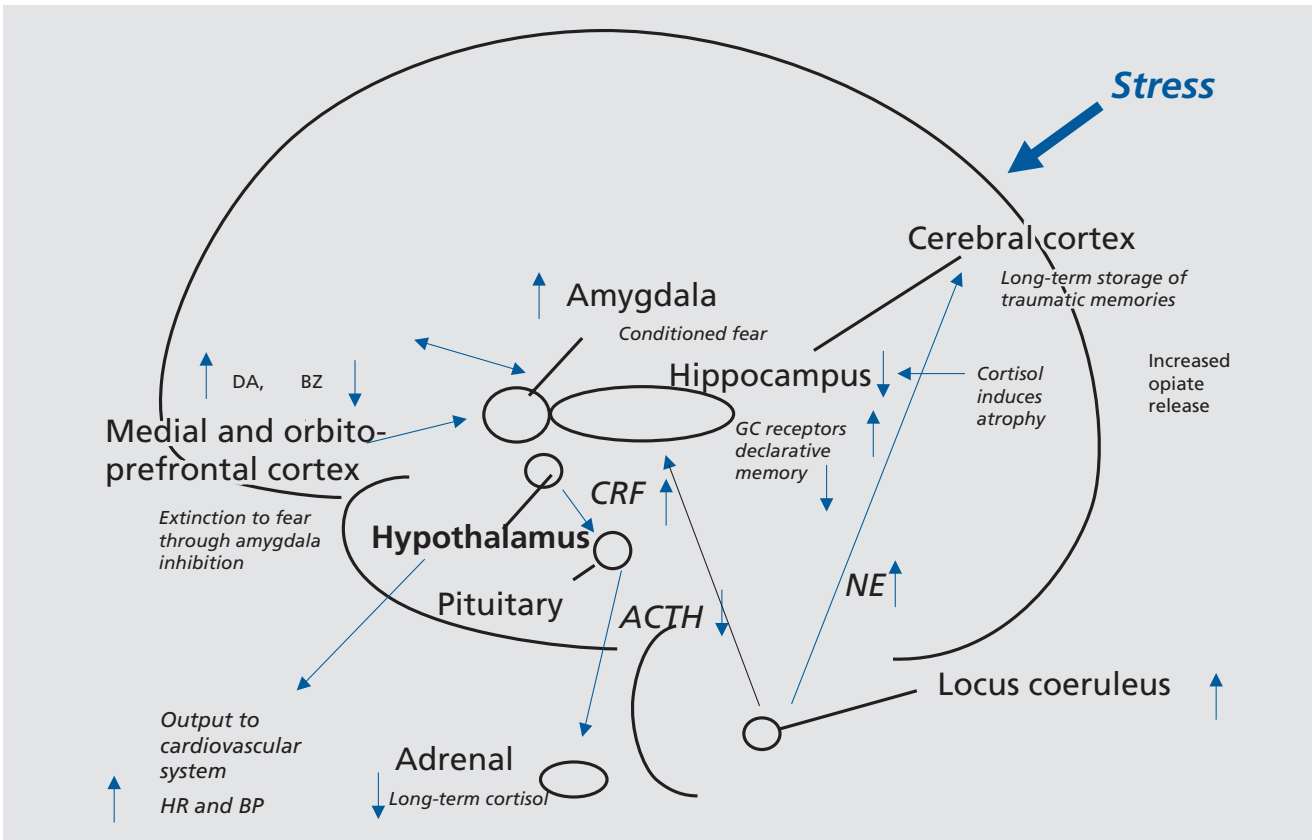

Figure 1. Lasting effects of trauma on the brain, showing long-term dysregulation of norepinephrine and cortisol systems, and vulnerable areas of hippocampus, amygdala, and medial prefrontal cortex that are affected by trauma. GC, glucocorticoid; CRF, corticotropin-releasing factor; ACTH, adrenocorticotropin hormone; NE, norepinephrine; HR, heart rate; BP, blood pressure; DA, dopamine; BZ, benzodiazapine; GC, glucocorticoid

potentially beneficial effects on stress-induced hippocampal damage. It has been found that phenytoin blocks the effects of stress on the hippocampus, probably through modulation of excitatory amino acid-induced neurotoxicity.[67] Other agents, including tianeptine, dihydroepiandosterone (DHEA), and fluoxetine have similar effects.[63,64,66,68-73] These medications may share a common mechanism of action through upregulation of cyclic adenosine monophosphate (cAMP) response element binding protein (CREB) that may lead to regulation of expression of specific target genes involved in structural modeling of the hippocampus. Such treatment effects on BDNF and trkB messenger ribonucleic acid (mRNA), can have long-term effects on brain structure and function. There is new evidence that neurogenesis is necessary for the behavioral effects of antidepressants,[74,75] although this continues to be a source of debate.[72,76]

The hippocampus demonstrates an unusual capacity for neuronal plasticity and regeneration. In addition to findings noted above related to the negative effects of stress on neurogenesis, it has recently been demonstrated that changes in the environment, eg, social enrichment or learning, can modulate neurogenesis in the dentate gyrus of the hippocampus, and slow the normal age-related decline in neurogenesis.[77,78] Rat pups that are handled frequently within the first few weeks of life (picking them up and then returning them to their mother) had increased type II glucocorticoid receptor binding which persisted throughout life, with increased feedback sensitivity to glucocorticoids, and reduced glucocorticoid-mediated hippocampal damage in later life.[79] These effects appear to be due to a type of "stress inoculation" from the mothers' repeated licking of the handled pups.[80] Considered together, these findings suggest that early in the postnatal period there is a naturally occurring brain plasticity in key neural systems that may "program" an organism's biological response to stressful stimuli. These findings may have implications for victims of childhood abuse.

Long-term dysregulation of the HPA axis is associated with PTSD, with low levels of cortisol found in chronic PTSD in many studies[81-86] and elevations in CRF.[82,87] Not all studies, however, have found lower cortisol levels in PTSD.[88-91] Exposure to a traumatic reminder appears to be associated with a potentiated release of cortisol in PTSD.[92]

The few studies of the effects of early stress on neurobiology conducted in clinical populations of traumatized children have generally been consistent with findings from animal studies. Research in traumatized children has been complicated by issues related to psychiatric diagnosis and assessment of trauma.[93] Some studies have not specifically examined psychiatric diagnosis, while others have focused on children with trauma and depression, and others on children with trauma and PTSD. Sexually abused girls (in which effects of specific psychiatric diagnosis were not examined) had normal baseline cortisol and blunted ACTH response to CRF,[94] while women with childhood abuse-related PTSD had hypercortisolemia.[95] Another study of traumatized children in which the diagnosis of PTSD was established showed increased levels of cortisol measured in 24-hour urines.[96] Emotionally neglected children from a Romanian orphanage had elevated cortisol levels over a diurnal period compared with controls.[97] Maltreated school-aged children with clinical-level internalizing problems had elevated cortisol compared with controls.[98] Depressed preschool children showed increased cortisol response to separation stress.[99] Adult women with a history of childhood abuse showed increased suppression of cortisol with low-dose (0.5 mg) dexamethasone.[100] Women with PTSD related to early childhood sexual abuse showed decreased baseline cortisol based on 24-hour diurnal assessments of plasma, and exaggerated cortisol response to stressors (traumatic stressors[101] more than neutral cognitive stressors).[102] We also found that patients with PTSD had less of an inhibition of memory function with synthetic cortisol (dexamethasone) than normal subjects.[103] Adult women with depression and a history of early childhood abuse had an increased cortisol response to a stressful cognitive challenge relative to controls,[104] and a blunted ACTH response to CRF challenge.[105] These findings show long-term changes in stress responsive systems. Early in development, stress is associated with increased cortisol and norepinephrine responsiveness, whereas with adulthood, resting cortisol may be normal or low, but there continues to be increased cortisol and norepinephrine responsiveness to stressors. In addition, early stress is associated with alterations in hippocampal morphology which may not manifest until adulthood, as well as increased amygdala function and decreased medial prefrontal function.

Cognitive function and brain structure in PTSD

Studies in PTSD are consistent with changes in cognition and brain structure. Multiple studies have demonstrated verbal declarative memory deficits in PTSD.[53,106-108]

Patients with PTSD secondary to combat[109-113] and childhood abuse[114,115] were found to have deficits in verbal declarative memory function based on neuropsychological testing. Studies, using a variety of measures (including the Wechsler Memory Scale, the visual and verbal components of the Selective Reminding Test, the Auditory Verbal Learning Test, Paired Associate Recall, the California Verbal New Learning Test, and the Rivermead Behavioral Memory Test), found specific deficits in verbal declarative memory function, with a relative sparing of visual memory and IQ.[109-113,115-124] These studies have been conducted in both patients with PTSD related to Vietnam combat,[109-113,116,119-121,123] rape,[117] the Holocaust,[124-126] adults with early childhood abuse,[115] and traumatized children.[118] One study in adult rape survivors showed that verbal declarative memory deficits are specifically associated with PTSD, and are not a nonspecific effect of trauma exposure.[117] Another study of women with early childhood sexual abuse in which some, but not all, of the patients had PTSD, showed no difference between abused and nonabused women,[127] while another study was not able to show a difference between Vietnam veterans with and without PTSD.[128] Other types of memory disturbances studied in PTSD include gaps in memory for everyday events (dissociative amnesia),[129] deficits in autobiographical memory,[130] an attentional bias for trauma-related material,[131-140] and frontal lobe-related impairments.[141] These studies suggest that traumas such as early abuse with associated PTSD result in deficits in verbal declarative memory. It is not clear if cognitive deficits in early abuse survivors are specific to PTSD and are not related to the nonspecific effects of abuse.

These effects were specific to verbal (not visual) memory, and were significant after controlling for IQ. Some of these studies used neuropsychological tests of declarative memory, such as the Wechsler Memory Scale (WMS) and Selective Reminding Test (SRT), that have been validated as sensitive to loss of neurons in the CA3 region of the hippocampus in epileptics who underwent hippocampal resection.[142,143] Vietnam veterans with PTSD were originally shown by us to have 8% smaller right hippocampal volume based on magnetic resonance imaging (MRI) relative to controls matched for a variety of factors such as alcohol abuse and education ($P<0.05$); smaller volume was correlated with deficits in verbal declarative memory function as measured with the Wechsler Memory Scale.[144] A second study from our group showed a 12% reduction in left hippocampal volume in 17 patients with childhood abuse-related PTSD compared with 17 case-matched controls, that was significant after controlling for confounding factors.[145] Smaller hippocampal volume was shown to be specific to PTSD within the anxiety disorders, and was not seen in panic disorder.[146] Gurvits et al[147] showed bilateral hippocampal volume reductions in combat-related PTSD compared with combat veterans without PTSD and normal controls. Combat severity was correlated with volume reduction. Stein et al[148] found a 5% reduction in left hippocampal volume. Other studies in PTSD have found smaller hippocampal volume and/or reductions in *N*-acetyl aspartate (NAA), a marker of neuronal integrity.[149-153] Studies in childhood[154-156] and new-onset[157,158] PTSD did not find hippocampal volume reduction, although reduced NAA (indicating loss of neuronal integrity) was found in medial prefrontal cortex in childhood PTSD.[159] In a recent meta-analysis we pooled data from all of the published studies and found smaller hippocampal volume for both the left and the right sides, equally in adult men and women with chronic PTSD, and no change in children.[160] More recent studies of holocaust survivors with PTSD did not find a reduction in hippocampal volume, although PTSD patients who developed PTSD in response to an initial trauma had smaller hippocampal volume compared with those who developed PTSD after repeated trauma, suggesting a possible vulnerability of smaller hippocampal volume.[161] Two independent studies have shown that PTSD patients have deficits in hippocampal activation while performing a verbal declarative memory task,[149,162] although it is unclear if this is a deficit in activation or higher hippocampal blood flow at baseline. Both hippocampal atrophy and hippocampal-based memory deficits reversed with treatment with the selective serotonin reuptake inhibitor (SSRI) paroxetine, which has been shown to promote neurogenesis (the growth of neurons) in the hippocampus in preclinical studies.[163] In addition, treatment with the anticonvulsant phenytoin led to an improvement in PTSD symptoms[164] and an increase in right hippocampal and right cerebral volume.[165] We hypothesize that stress-induced hippocampal dysfunction may mediate many of the symptoms of PTSD which are related to memory dysregulation, including both explicit memory deficits as well as fragmentation of memory in abuse survivors. It is unclear at the current time whether these changes are specific to PTSD, whether certain common environmental events (eg, stress) in different disorders lead to similar brain changes, or whether common genetic traits lead to similar outcomes.

The meaning of findings related to deficits in memory and the hippocampus in PTSD, and questions related to the relative contribution of genetic and environmental factors, has become an important topic in the field of PTSD and stress research. There are three possible models, taking into account genetic or environmental factors, which have been proposed to explain smaller hippocampal volume in PTSD: Model A (Environment), Model B (Environment and Genetic), and Model C (Genetic).[166-169] In Model C (Genetic), smaller hippocampal volume represents a premorbid risk factor for PTSD. In support of this model Pitman and colleagues[170] have demonstrated that lower premilitary IQ is associated with combat-related PTSD, as well as finding a correlation between PTSD symptoms and hippocampal volume in twin brothers.[151] Model A (Environment) states that stress leads to damage or inhibition of neurogenesis via hypercortisolemia, decreased BDNF, or increased glutamate. Model B (Environment/Genetic) states that a combination of environmental and genetic factors leads to deficits in hippocampal function and structure. Showing that an intervention like medication changes hippocampal volume and cognition would provide support for at least a partial contribution of the environment to the outcomes of interest.

In addition to the hippocampus, other brain structures have been implicated in a neural circuitry of stress, including the amygdala and prefrontal cortex. The amygdala is involved in memory for the emotional valence of events, and plays a critical role in the acquisition of fear responses. The medial prefrontal cortex includes the anterior cingulate gyrus (Brodmann's area [BA] 32) and subcallosal gyrus (area 25) as well as orbitofrontal cortex. Lesion studies demonstrated that the medial prefrontal cortex modulates emotional responsiveness through inhibition of amygdala function. Conditioned fear responses are extinguished following repeated exposure to the conditioned stimulus in the absence of the unconditioned (aversive, eg, electric shock) stimulus. This inhibition appears to be mediated by medial prefrontal cortical inhibition of amygdala responsiveness.

Animal studies also show that early stress is associated with a decrease in branching of neurons in the medial prefrontal cortex.[171] Rauch and colleagues found smaller volume of the anterior cingulate based on MRI measurements in PTSD[172]; we have replicated these findings in women with abuse and PTSD.[160] An important question is whether these effects are reversible with treatment.

Neural circuits in PTSD

Brain imaging studies have shown alterations in a circuit including medial prefrontal cortex (including anterior cingulate), hippocampus, and amygdala in PTSD. Many of these studies have used different methods to trigger PTSD symptoms (eg, using traumatic cues) and then look at brain function. Stimulation of the noradrenergic system with yohimbine resulted in a failure of activation in dorsolateral prefrontal, temporal, parietal, and orbitofrontal cortex, and decreased function in the hippocampus.[173] Exposure to traumatic reminders in the form of traumatic slides and/or sounds or traumatic scripts was associated with an increase in PTSD symptoms, decreased blood flow, and/or failure of activation in the medial prefrontal cortex/anterior cingulate, including Brodmann's area 25, or subcallosal gyrus, area 32 and 24, as measured with positron emission tomography (PET) or functional MRI (fMRI).[174-183] Other findings in studies of traumatic reminder exposure include decreased function in hippocampus,[176] visual association cortex,[176,180] parietal cortex,[176,179,180,184] and inferior frontal gyrus,[176,179,180,184] and increased function in amygdala,[181,184] posterior cingulate,[174,176,177,180] and parahippocampal gyrus.[174,176,178] Shin and colleagues found a correlation between increased amygdala function and decreased medial prefrontal function with traumatic reminders,[181] indicating a failure of inhibition of the amygdala by the medial prefrontal cortex that could account for increased PTSD symptoms with traumatic reminders. Other studies found increased amygdala and parahippocampal function and decreased medial prefrontal function during performance of an attention task,[182] increased posterior cingulate and parahippocampal gyrus and decreased medial prefrontal and dorsolateral prefrontal function during an emotional Stroop paradigm,[185] and increased amygdala function with exposure to masked fearful faces.[186] Retrieval of emotionally valenced words[187] (eg "rape-mutilate") in women with PTSD from early abuse resulted in decreases in blood flow in an extensive area which included orbitofrontal cortex, anterior cingulate, and medial prefrontal cortex (BA 25, 32, and 9), left hippocampus, and fusiform gyrus/inferior temporal gyrus, with increased activation in posterior cingulate, left inferior parietal cortex, left middle frontal gyrus, and visual association and motor cortex.[188] Another study found a failure of medial prefrontal cortical/anterior cingulate activation, and decreased visual association and parietal

cortex function, in women with abuse and PTSD relative to women with abuse without PTSD, during performance of the emotional Stroop task (ie, naming the color of a word such as "rape").[189] We recently found increased amygdala activation with classical fear conditioning (pairing a shock and a visual stimulus), and decreased medial prefrontal cortex function with extinction, in abuse-related PTSD.[190] The findings described above point to a network of related regions mediating symptoms of PTSD, including medial prefrontal cortex, anterior cingulate, hippocampus, amygdala, posterior cingulate, parietal, visual association, and dorsolateral prefrontal cortex.[191]

Fewer brain imaging studies have been performed in children with PTSD. Several studies have shown alterations in electroencephalogram (EEG) measures of brain activity in children with a variety of traumas who were not selected for diagnosis compared with healthy children. About half of the children in these studies had a psychiatric diagnosis. Abnormalities were located in the anterior frontal cortex and temporal lobe and were localized to the left hemisphere.[192,193] Two studies have found reductions in brain volume in children with trauma and PTSD symptoms.[154,155] One group did not find reductions in hippocampal volume, either at baseline or over a longitudinal period,[154,156] while another group found an 8.5% reduction in hippocampal volume that was not significant after controlling for smaller brain volumes in the PTSD group.[155] One study used single-voxel proton magnetic resonance spectroscopy (proton MRS) to measure relative concentration of NAA and creatinine (a marker of neuronal viability) in the anterior cingulate of 11 children with maltreatment-related PTSD and 11 controls. The authors found a reduction in the ratio of NAA to creatinine in PTSD relative to controls.[159] Studies have also found smaller size of the corpus callosum in children with abuse and PTSD relative to controls.[154] as well as larger volume of the superior temporal gyrus.[194] In a study of abused children in whom diagnosis was not specified, there was an increase in T2 relaxation time in the cerebellar vermis, suggesting dysfunction in this brain region.[195] The reason for differences in findings between adults and children are not clear; however, factors such as chronicity of illness or interaction between trauma and development may explain findings to date.

In summary, dysfunction of a circuit involving the medial prefrontal cortex, dorsolateral prefrontal cortex, and possibly hippocampus and amygdala during exposure to traumatic reminders may underlie symptoms of PTSD. These studies have primarily assessed neural correlates of traumatic remembrance, while little has been done in the way of utilizing cognitive tasks as probes of specific regions, such as memory tasks as probes of hippocampal function.

MRI assessment of brain abnormalities in PTSD and trauma spectrum disorders

Findings of smaller hippocampal volume appear to be associated with a range of trauma related psychiatric disorders, as long as there is the presence of psychological trauma. We have used MRI to show smaller hippocampal volume in PTSD,[144,145,149,196] depression,[197] depression with early abuse,[198] borderline personality disorder (BPD) with early abuse,[199] and Dissociative Identity Disorder (DID) with early abuse.[200] The greatest magnitude of difference was seen in the DID patients, who had unusually severe early childhood sexual abuse histories. We did not find changes in hippocampal volume in patients with panic disorder without a history of abuse (suggesting that findings are not generalized to other anxiety disorders).[201] We found smaller amygdala volume in BPD with early abuse[199] and increased amygdala volume in depression.[197,202] Patients with depression had smaller orbitofrontal cortex volume with no changes in anterior cingulate (BA 32) or medial prefrontal cortex (BA 25).[203] More recently, we found smaller anterior cingulate volume in women with abuse and PTSD relative to controls.[204]

Neural circuits in women with abuse and PTSD

We have used PET to study neural circuits of trauma-related disorders in women with early abuse and a variety of trauma spectrum mental disorders. Initially we studied women with abuse and PTSD.[54,205-208] We initially measured brain activation with a paragraph-encoding task in conjunction with PET O-15 water measurement of brain blood flow. Women with abuse and PTSD showed a failure of hippocampal activation during the memory task relative to controls.[149] Women with abuse and PTSD in this study also had smaller hippocampal volume measured with MRI relative to both women with abuse without PTSD and nonabused non-PTSD women. The failure of hippocampal activation was significant

after controlling differences in hippocampal volume as well as accuracy of encoding. In another study we measured neural correlates of exposure to a personalized script of childhood sexual abuse. Women with abuse and PTSD showed a failure of medial prefrontal and hippocampal activation relative to abused women without PTSD.[176] Women with abuse and PTSD also showed a failure of medial prefrontal and hippocampal function during recall of paired word associates with traumatic-emotional content (eg, "rape-mutilate"),[188] and decreased medial prefrontal function during an emotional Stroop task with trauma-content words.[209] Other studies showed a failure of medial prefrontal activation in women with BPD and early abuse during an abandonment script.[210] Women with BPD and abuse had increased psychophysiological responses to abandonment scripts relative to trauma scripts, while women with PTSD and abuse had the opposite pattern,[211] indicating differential responding in those two disorders in spite of the common exposure to early abuse.

In another project we studied 19 physically healthy women including women with a history of severe childhood sexual abuse and the diagnosis of current PTSD (N=8) and women without childhood abuse or PTSD (N=11).[212] All subjects underwent PET measurement of cerebral blood flow and psychophysiology measurement of heart rate and skin conductance during habituation, acquisition, and extinction conditions, on a single day, with scanning during a control condition on another day separated by 1 week from the active condition. Subjects were randomly assigned to undergo either the active condition or the control condition first (ie, active-control or control-active). Subjects were told at the beginning of the study that they would be exposed to electric shocks and viewing images on a screen during collection of PET and psychophysiology data. During habituation subjects were exposed to a blue square on a screen (conditioned stimulus [CS]), 4 seconds in duration, followed by 6 seconds of a blank screen. CS exposure was repeated eight times at regular intervals over 80 seconds in two separate blocks separated by 8 minutes. One PET image of brain blood flow was obtained starting from the beginning of each of the blocks. During active fear acquisition exposure to the blue square (CS) was paired with an electric shock to the forearm (unconditioned stimulus [UCS]). Subjects had 8 paired CS-UCS presentations at 10-second intervals for each of two blocks. With extinction subjects were again exposed to the blue squares (CS) without shock ("active" extinction). On a second day subjects went through the same procedure with electric shocks delivered randomly when the blue square was not present (unpaired CS-UCS) (an equal number as on day 1) during scans 3 and 4, which served as a control for active fear acquisition.

PTSD subjects had increased symptoms of anxiety, fear, dissociation, distress, substance use disorders (SUDs), and PTSD at all time points during both study days relative to non-PTSD. Acquisition of fear was associated with increased skin conductance (SC) responses to CS exposure during the active versus the control conditions in all subjects. There was increased SC for PTSD during the first CS-UCS presentation. Extinction of fear was associated with increased skin conductance (SC) responses to CS exposure during the active versus the control conditions in all subjects. When PTSD and non-PTSD subjects were examined separately, SC levels were significantly elevated in non-PTSD subjects undergoing extinction following the active compared with the control condition during session one.

PTSD subjects showed activation of the bilateral amygdala during fear acquisition compared with the control condition. Non-PTSD subjects showed an area of activation in the region of the left amygdala. When PTSD subjects and control subjects were directly compared, PTSD subjects showed greater activation of the left amygdala during the fear conditioning condition (pairing of US and CS) relative to the random shock control than healthy women. Other areas that showed increased activation with fear acquisition in PTSD included bilateral superior temporal gyrus (BA 22), cerebellum, bilateral inferior frontal gyrus (BA 44, 45), and posterior cingulate (BA 24). Fear acquisition was associated with decreased function in medial prefrontal cortex, visual association cortex, and medial temporal cortex, inferior parietal lobule function, and other areas. Extinction of fear responses was associated with decreased function in the orbitofrontal and medial prefrontal cortex (including subcallosal gyrus, BA 25, and anterior cingulate BA 32), visual association cortex, and other areas, in the PTSD subjects, but not in the controls. Amygdala blood flow with fear acquisition was negatively correlated with medial prefrontal blood flow with fear extinction (increased blood flow in amygdala correlated with decreased blood flow in medial prefrontal cortex) in all subjects (r=-0.48; P<0.05). Increased amygdala blood flow with fear acquisition was positively correlated with PTSD (r=0.45), anxiety (r=0.44) and disso-

ciative (r=0.80) symptom levels in PTSD (but not non-PTSD) subjects. There was a negative correlation between medial prefrontal blood flow during extinction and anxiety as measured with the Panic Attack Symptom Scale (PASS) during extinction in the PTSD group only, which was significant after correction for multiple comparisons (r=-0.90; P=0.006).[190] This study was consistent with increased amygdala function with fear acquisition, and decreased medial prefrontal (anterior cingulate) function during extinction in PTSD. This is consistent with the model of an overactive amygdala and a failure of medial prefrontal cortex to extinguish, or shut off, the amygdala, when the acute threat is no longer present.

Treatment of PTSD

Intervening soon after the trauma is critical for long-term outcomes, since with time traumatic memories become indelible and resistant to treatment.[213] Early treatments are not necessarily effective. For instance, studies have shown that Critical Incident Stress Debriefing (CISD) can be associated with a worsening of outcome relative to no treatment at all.[214] Pharmacological treatment of chronic PTSD has shown efficacy originally for imipramine,[215] amitriptyline,[216] and phenalzine,[215] and later for brofaramine,[217] paroxetine,[218,219] and sertraline.[220] Selective serotonin reuptake inhibitors (SSRIs) and tianeptine are now recommended as first-line treatment for PTSD.[221-226]

The utility of early treatment is also demonstrated by animal studies showing that pretreatment before stress with antidepressants reduces chronic behavioral deficits related to stress.[227,228] Antidepressants, including both norepinephrine and serotonin reuptake inhibitors, as well as gabapentine and phenytoin, promote nerve growth (neurogenesis) in the hippocampus, while stress inhibits neurogenesis.[63,64,66,69,71,75,229] This is important because hippocampal neurogenesis has been shown to be required for antidepressant response.[74]

Few studies have examined the effects of pharmacological treatment on brain structure and function in patients with trauma-related mental disorders. We studied a group of patients with depression and found no effect of fluoxetine on hippocampal volume, although there were increases in memory function[230] and hippocampal activation measured with PET during a memory encoding task. Depressed patients with a history of childhood trauma were excluded, and we subsequently have found hippocampal volume reductions at baseline in women with early abuse and depression but not in women with depression without early abuse;[198] this suggests that the study design of excluding patients with early trauma may account for the negative result. Other studies in depression showed that smaller hippocampal volume was a predictor of resistance to antidepressant treatment.[231] Smaller orbitofrontal cortex volume is associated with depression; one study in geriatric depression found smaller orbitofrontal cortex volume, while length of antidepressant exposure was correlated with larger orbitofrontal volume.[232]

Several studies have looked at functional brain imaging response to antidepressants in depression. Single photon-emission computed tomography (SPECT) blood flow studies in depression showed that antidepressants increased anterior cingulate, right putamen, and right thalamus function.[233] SPECT Xenon-133 studies showed reduced prefrontal function at baseline in depression, with treatment responders showing reduced perfusion in prefrontal cortex compared with nonresponders after treatment.[234] In a fluorodeoxyglucose (FDG) PET study of brain function patients with depression treated with fluoxetine who had a positive response to treatment had limbic and striatal decreases (subgenual cingulate, hippocampus, insula, and pallidum) and brain stem and dorsal cortical increases (prefrontal, parietal, anterior, and posterior cingulate) in function. Failed response was associated with a persistent 1-week pattern and absence of either subgenual cingulate or prefrontal changes.[235] Sertraline resulted in an increase in middle frontal gyrus activity in depression measured with PET FDG, as well as increased function in right parietal lobe and visual association cortex.[236] Successful paroxetine therapy of depression was associated with increased glucose metabolism measured with PET in dorsolateral, ventrolateral, and medial aspects of the prefrontal cortex, parietal cortex, and dorsal anterior cingulate. Areas of decreased metabolism were noted in both anterior and posterior insular regions (left) as well as right hippocampal and parahippocampal regions.[237] In another PET FDG study, at baseline, subjects with depression had higher normalized metabolism than controls in the prefrontal cortex (and caudate and thalamus), and lower metabolism in the temporal lobe. With treatment with paroxetine, subjects with depression had metabolic changes in the direction of normalization in these regions.[238] A PET FDG study of patients with depression and controls showed that at baseline, the mean metabolism was increased in the left and right lateral orbital cortex/ventrolateral prefrontal cortex (PFC), left amygdala,

and posterior cingulate cortex, and decreased in the subgenual anterior cingulate cortex (ACC) and dorsal medial/dorsal anterolateral PFC in depressives relative to controls. Following treatment with antidepressants, metabolism significantly decreased in the left amygdala and left subgenual ACC. The metabolic reduction in the amygdala and right subgenual ACC appeared largely limited to those subjects who both responded to treatment and remained well at 6 months' follow-up.[239] Another study showed that antidepressant treatment of depression resulted in a decrease in amygdala activation with emotional faces as measured with fMRI.[240] In summary, studies show changes in limbic and prefrontal cortical regions with successful antidepressant treatment of depression.

Fewer studies have looked at the effects of pharmacological treatment on the brain in anxiety disorders. One PET FDG study showed that caudate function decreased with treatment of obsessive compulsive disorder with antidepressants.[241] Paroxetine resulted in a decrease in glutamate/glutamine measured with magnetic resonance spectroscopy (MRS) in children with obsessive-compulsive disorder (OCD).[242] Patients with PTSD were shown to have an increase in hippocampal volume and memory function with paroxetine,[163] and increased right hippocampal and right cerebral volume with phenytoin.[165] No published studies have looked at the effects of pharmacological treatment on brain function in PTSD, or on sensitive markers of brain chemistry like NAA.

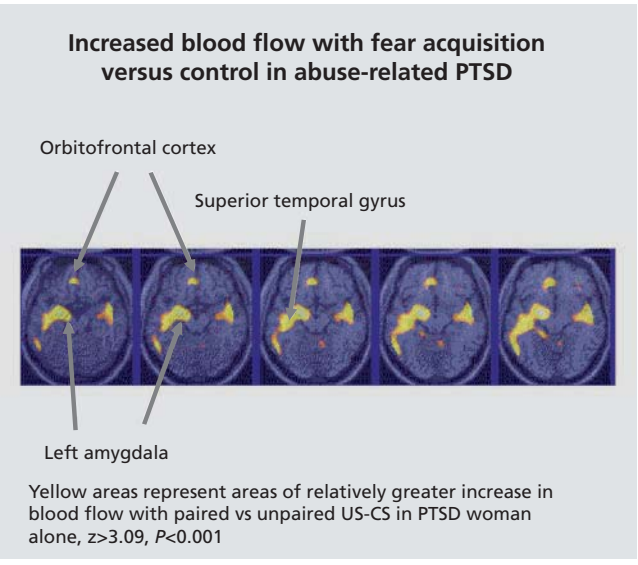

Figure 2. Neural correlates of fear conditioning in women with abuse and PTSD. There was increased amygdala activation with fear acquisition using a classical conditioning paradigm relative to non-PTSD abused women. PTSD, post-traumatic stress disorder

Brain biomarkers like NAA represent an objective marker of neural plasticity. To date psychiatry has relied on subjective reports as the gold standard. However, this is limited by self-reporting and the subjective interpretations of symptoms and response to treatment. Brain markers of antidepressant response may provide a complementary approach to assessing response to treatment, as well as providing insight into the mechanisms of treatment response. Our group is trying to look at mechanisms in the brain underlying treatment response in PTSD.

Effects of pharmacotherapy on brain function and structure in PTSD

We have begun to assess the effects of pharmacotherapy on brain structure and function in PTSD.[243] We recently assessed the effects of phenytoin on brain structure and function. Studies in animals show that phenytoin, which is used in the treatment of epilepsy and is known to modulate glutamatergic function, blocks the effects of stress on the hippocampus.[67] We studied nine patients with PTSD in an open-label function before and after treatment with phenytoin. Phenytoin resulted in a significant improvement in PTSD symptoms.[164] Phenytoin also resulted in increases in both right hippocampal volume and right hemisphere volume.[165] These findings indicate that phenytoin has an effects on PTSD symptoms as well as brain structure in PTSD patients.

We have assessed the effects of open-label paroxetine on memory and the hippocampus in PTSD. Male and female patients with symptoms of PTSD were medication-free for at least 4 weeks before participation in the study. Twenty-eight patients were found to be eligible and started the medication phase. Of the total patient sample five patients did not finish due to noncompliance; 23 patients completed the study.

Before patients started the medication phase, neuropsychological tests were administered, including the *Wechsler Adult Intelligence Scale – Revised*, WAIS-R (arithmetic, vocabulary, picture arrangement, and block design test), two subtests of the *Wechsler Memory Scale-Revised*, WMS-R, including logical memory (free recall of two story narratives, which represents verbal memory) and figural memory (which represents visual memory and involved reproduction of designs after a 6-second presentation); and the verbal and visual components of

the *Selective Reminding Test*, SRT.

Paroxetine was prescribed in the first visit after the pre-treatment assessments. All patients started open-label with a dose of 10 mg daily and were titrated up to 20 mg in 4 days.

Paroxetine treatment resulted in a mean 54% reduction in PTSD symptoms as measured with mean changes from baseline on the CAPS total score ($P<0.005$) among study completers. Improvement was equally strong on all symptom cluster scores (Re-experiencing, Avoidance/Numbing, Hyperarousal). Treatment also resulted in significant improvements in verbal declarative memory as measured with the WMS-R paragraph recall for delayed recall ($P<0.005$) and percent retention (80.2 to 91.1; $P=0.003$), but not immediate recall. Improvements were significant on all subscales of the Verbal Component of the SRT; including long-term recall and delayed recall.

Repeated measures ANOVA with side as the repeated measure showed a main effect for treatment related to a 4.6% increase in mean hippocampal volume (1857.3 mm^3 [SD 225.6] to 1906.2 mm^3, [SD 243.2]) with treatment (F=8.775 df=1. 36; $P=0.005$). Increased hippocampal volume was seen for both left (5.6%) (1807.6 mm^3 [SD 255.5] to 1909.3 mm^3 [SD 236.9]) and right (3.7%) (1906.9 mm^3 [SD 195.8] to 1976.7 mm^3 (SD 249.6]) hippocampus. There was no change in whole brain volume with treatment. Increase in hippocampal volume was significant after adding whole brain volume before and after treatment to the model.

Discussion

Traumatic stress has a broad range of effects on brain function and structure, as well as on neuropsychological components of memory. Brain areas implicated in the stress response include the amygdala, hippocampus, and prefrontal cortex. Neurochemical systems, including cortisol and norepinephrine, play a critical role in the stress response. These brain areas play an important role in the stress response. They also play a critical role in memory, highlighting the important interplay between memory and the traumatic stress response. Preclinical studies show that stress affects these brain areas. Furthermore, antidepressants have effects on the hippocampus that counteract the effects of stress. In fact, promotion of nerve growth (neurogenesis) in the hippocampus may be central to the efficacy of the antidepressants. Studies in patients with PTSD show alterations in brain areas implicated in animal studies, including the amygdala, hippocampus, and prefrontal cortex, as well as in neurochemical stress response systems, including cortisol and norepinephrine. Treatments that are efficacious for PTSD show a promotion of neurogenesis in animal studies, as well as promotion of memory and increased hippocampal volume in PTSD. Future studies are needed to assess neural mechanisms in treatment response in PTSD. ❑

Estrés traumático: efectos en la cerebro

El estrés traumático surte efectos muy diversos sobre la función y la estructura cerebrales. Las regiones cerebrales implicadas en la respuesta al estrés son la amígdala (núcleo amigdalino), el hipocampo y la corteza prefrontal. Los sistemas neuroquímicos, como el cortisol y la noradrenalina, desempeñan una misión crítica en la respuesta al estrés. Estas regiones cerebrales influyen sobre la respuesta al estrés y sobre la memoria, lo que subraya la interrelación entre la memoria y la respuesta al estrés traumático. Los antidepresivos actúan sobre el hipocampo y contrarrestan el efecto del estrés. Los estudios sobre pacientes con trastorno por estrés postraumático (TEPT) revelan alteraciones en las regiones cerebrales implicadas en los estudios con animales como la amígdala, el hipocampo y la corteza prefrontal, así como en los sistemas neuroquímicos de respuesta al estrés, entre ellos el cortisol y la noradrenalina. Los tratamientos con eficacia frente al TEPT promueven la neurogénesis en los estudios con animales y también aumentan la memoria, y el volumen hipocámpico en el TEPT. Se requieren nuevos estudios para evaluar los mecanismos neurales de la respuesta terapéutica en el TEPT.

Effets du stress traumatique sur le cerveau

Le stress traumatique exerce une grande variété d'effets sur la fonction et la structure cérébrales. Les aires cérébrales impliquées dans la réponse au stress comprennent l'amygdale, l'hippocampe et le cortex préfrontal. Les systèmes neurochimiques, incluant le cortisol et la norépinéphrine, jouent un rôle critique dans la réponse au stress. Ces aires cérébrales influent sur la mémoire et sur la réponse au stress traumatique, soulignant ainsi les interactions existant entre les deux. Les effets des antidépresseurs sur l'hippocampe compensent les effets du stress. Les études chez les patients atteints de trouble stress post-traumatique (ESPT) montrent des modifications des aires cérébrales impliquées au cours des études animales, telles l'amygdale, l'hippocampe et le cortex préfrontal, ainsi que des modifications des systèmes neurochimiques de réponse au stress comme le cortisol et la noradrénaline. Les traitements efficaces dans l'ESPT entraînent une activation de la neurogenèse chez l'animal de même qu'une amélioration de la mémoire et une augmentation du volume de l'hippocampe dans l'ESPT. Il faudra d'autres études pour évaluer les mécanismes neuronaux dans la réponse thérapeutique au cours de l'ESPT.

Contents

Consensus Panel ..... **vii**

KAP Expert Panel and Federal Government Participants ..... **ix**

What Is a TIP? ..... **xi**

Foreword ..... **xiii**

How This TIP Is Organized ..... **xv**

Terminology xvi

PART 1: A PRACTICAL GUIDE FOR THE PROVISION OF BEHAVIORAL HEALTH SERVICES **1**

Chapter 1—Trauma-Informed Care: A Sociocultural Perspective **3**

Scope of the TIP 4
Intended Audience 4
Before You Begin 4
Structure of the TIP 6
What Is Trauma? 7
Trauma Matters in Behavioral Health Services 7
Trauma-Informed Intervention and Treatment Principles 11
As You Proceed 32

Chapter 2—Trauma Awareness **33**

Types of Trauma 33
Characteristics of Trauma 46
Individual and Sociocultural Features 52

Chapter 3—Understanding the Impact of Trauma **59**

Sequence of Trauma Reactions 60
Common Experiences and Responses to Trauma 61
Subthreshold Trauma-Related Symptoms 75
Specific Trauma-Related Psychological Disorders 77
Other Trauma-Related and Co-Occurring Disorders 85

Chapter 4—Screening and Assessment 91

Screening and Assessment 92
Barriers and Challenges to Trauma-Informed Screening and Assessment 99
Cross-Cultural Screening and Assessment 103
Choosing Instruments 104
Trauma-Informed Screening and Assessment 106
Concluding Note 110

Chapter 5—Clinical Issues Across Services 111

Trauma-Informed Prevention and Treatment Objectives 111
Treatment Issues 127
Making Referrals to Trauma-Specific Services 135

Chapter 6—Trauma-Specific Services 137

Introduction 137
Trauma-Specific Treatment Models 139
Integrated Models for Trauma 147
Emerging Interventions 153
Concluding Note 155

PART 2: AN IMPLEMENTATION GUIDE FOR BEHAVIORAL HEALTH PROGRAM ADMINISTRATORS 157

Chapter 1—Trauma-Informed Organizations 159

Strategy #1: Show Organizational and Administrative Commitment to TIC 161
Strategy #2: Use Trauma-Informed Principles in Strategic Planning 162
Strategy #3: Review and Update Vision, Mission, and Value Statements 162
Strategy #4: Assign a Key Staff Member To Facilitate Change 163
Strategy #5: Create a Trauma-Informed Oversight Committee 163
Strategy #6: Conduct an Organizational Self-Assessment of Trauma-Informed Services ... 164
Strategy #7: Develop an Implementation Plan 164
Strategy #8: Develop Policies and Procedures To Ensure Trauma-Informed Practices and To Prevent Retraumatization 166
Strategy #9: Develop a Disaster Plan 166
Strategy #10: Incorporate Universal Routine Screenings 167
Strategy #11: Apply Culturally Responsive Principles 167
Strategy #12: Use Science-Based Knowledge 169
Strategy #13: Create a Peer-Support Environment 169
Strategy #14: Obtain Ongoing Feedback and Evaluations 170
Strategy #15: Change the Environment To Increase Safety 171
Strategy #16: Develop Trauma-Informed Collaborations 171

Chapter 2—Building a Trauma-Informed Workforce 173

Introduction 173
Workforce Recruitment, Hiring, and Retention 174

Training in TIC 177
Trauma-Informed Counselor Competencies 181
Counselor Responsibilities and Ethics 182
Clinical Supervision and Consultation 191
Secondary Traumatization 193
Counselor Self-Care 205

APPENDICES 215

Appendix A—Bibliography 215

Appendix B—Trauma Resource List 247

Appendix C—Historical Account of Trauma 267

Appendix D—Screening and Assessment Instruments 271

Appendix E—Consumer Materials 285

Appendix F—Organizational Assessment for Trauma-Informed Care 287

Appendix G—Resource Panel 289

Appendix H—Field Reviewers 293

Appendix I—Cultural Competence and Diversity Network Participants 299

Appendix J—Acknowledgments 300

Consensus Panel

Note: Each panelist's information reflects his or her affiliation at the time of the Consensus Panel meeting and may not reflect that person's most current affiliation.

Chair

Lisa M. Najavits, Ph.D.
Research Psychologist
Veterans Affairs Boston Healthcare System
Professor of Psychiatry
Boston University School of Medicine
Boston, MA

Co-Chair

Linda B. Cottler, Ph.D., M.P.H.
Professor of Epidemiology in Psychiatry
Department of Psychiatry
Washington University–St. Louis
St. Louis, MO

Workgroup Leaders

Stephanie S. Covington, Ph.D., LCSW, MFCC
Co-Director
Center for Gender and Justice
Institute for Relational Development
La Jolla, CA

Margaret Cramer, Ph.D.
Clinical Psychologist/Clinical Instructor
Harvard Medical School
Boston, MA

Anne M. Herron, M.S.
Director
Treatment Programming
New York State Office of Alcoholism and Substance Abuse Services
Albany, NY

Denise Hien, Ph.D.
Research Scholar
Social Intervention Group
School of Social Work
Columbia University
New York, NY

Dee S. Owens, M.P.A.
Director
Alcohol-Drug Information
Indiana University
Bloomington, IN

Panelists

Charlotte Chapman, M.S., LPC, CAC
Training Director
Division of Addiction Psychiatry
Mid-Atlantic Addiction Technology Transfer Center
Virginia Commonwealth University
Richmond, VA

Scott F. Coffey, Ph.D.
Associate Professor
Department of Psychiatry and Human Behavior
University of Mississippi Medical Center
Jackson, MS

Renee M. Cunningham-Williams, M.S.W., M.P.E., Ph.D.
Research Assistant/Professor of Social Work
Department of Psychiatry
Washington University
St. Louis, MO

Chad D. Emrick, Ph.D.
Administrative Director
Substance Abuse Treatment Program
Denver VA Medical Center (116A1)
Denver, CO

Charles R. Figley, Ph.D.
Professor
Director of the Traumatology Institute
Florida State University
Tallahassee, FL

Larry M. Gentilello, M.D., FACS
Professor and Chairman
Division of Burn, Trauma, and Critical Care
University of Texas Southwestern Medical School
Dallas, TX

Robert Grant, Ph.D.
Trauma Consultant
Oakland, CA

Anthony (Tony) Taiwai Ng, M.D.
Disaster Psychiatrist
Washington, DC

Pallavi Nishith, Ph.D.
Associate Research Professor
Center for Trauma
Department of Psychology
University of Missouri–St. Louis
St. Louis, MO

Joseph B. Stone, Ph.D., CACIII, ICADC
Program Manager and Clinical Supervisor
Confederated Tribes of Grand Ronde Behavioral Health Program
Grand Ronde, OR

Michael Villanueva, Ph.D.
Research Professor
Center on Alcoholism, Substance Abuse, and Addiction
Albuquerque, NM

KAP Expert Panel and Federal Government Participants

Barry S. Brown, Ph.D.
Adjunct Professor
University of North Carolina–Wilmington
Carolina Beach, NC

Jacqueline Butler, M.S.W., LISW, LPCC, CCDC III, CJS
Professor of Clinical Psychiatry
College of Medicine
University of Cincinnati
Cincinnati, OH

Deion Cash
Executive Director
Community Treatment and Correction Center, Inc.
Canton, OH

Debra A. Claymore, M.Ed.Adm.
Owner/Chief Executive Officer
WC Consulting, LLC
Loveland, CO

Carlo C. DiClemente, Ph.D.
Chair
Department of Psychology
University of Maryland–Baltimore County
Baltimore, MD

Catherine E. Dube, Ed.D.
Independent Consultant
Brown University
Providence, RI

Jerry P. Flanzer, D.S.W., LCSW, CAC
Chief, Services
Division of Clinical and Services Research
National Institute on Drug Abuse
Bethesda, MD

Michael Galer, D.B.A.
Independent Consultant
Westminster, MA

Renata J. Henry, M.Ed.
Director
Division of Alcoholism, Drug Abuse and Mental Health
Delaware Department of Health and Social Services
New Castle, DE

Joel Hochberg, M.A.
President
Asher & Partners
Los Angeles, CA

Jack Hollis, Ph.D.
Associate Director, Center for Health Research
Kaiser Permanente
Portland, OR

Mary Beth Johnson, M.S.W.
Director
Addiction Technology Transfer Center
University of Missouri–Kansas City
Kansas City, MO

Eduardo Lopez
Executive Producer
EVS Communications
Washington, DC

Holly A. Massett, Ph.D.
Academy for Educational Development
Washington, DC

Diane Miller
Chief
Scientific Communications Branch
National Institute on Alcohol Abuse and Alcoholism
Bethesda, MD

Harry B. Montoya, M.A.
President/Chief Executive Officer
Hands Across Cultures
Española, NM

Richard K. Ries, M.D.
Director/Professor
Outpatient Mental Health Services
Dual Disorder Programs
Seattle, WA

Gloria M. Rodriguez, D.S.W.
Research Scientist
Division of Addiction Services
New Jersey Department of Health and Senior Services
Trenton, NJ

Everett Rogers, Ph.D.
Center for Communications Programs

What Is a TIP?

Treatment Improvement Protocols (TIPs) are developed by the Substance Abuse and Mental Health Services Administration (SAMHSA) within the U.S. Department of Health and Human Services (HHS). Each TIP involves the development of topic-specific best practice guidelines for the prevention and treatment of substance use and mental disorders. TIPs draw on the experience and knowledge of clinical, research, and administrative experts of various forms of treatment and prevention. TIPs are distributed to facilities and individuals across the country. Published TIPs can be accessed via the Internet at http://store.samhsa.gov.

Although each consensus-based TIP strives to include an evidence base for the practices it recommends, SAMHSA recognizes that behavioral health is continually evolving, and research frequently lags behind the innovations pioneered in the field. A major goal of each TIP is to convey "front-line" information quickly but responsibly. If research supports a particular approach, citations are provided.

Foreword

The Substance Abuse and Mental Health Services Administration (SAMHSA) is the agency within the U.S. Department of Health and Human Services that leads public health efforts to advance the behavioral health of the nation. SAMHSA's mission is to reduce the impact of substance abuse and mental illness on America's communities.

The Treatment Improvement Protocol (TIP) series fulfills SAMHSA's mission to improve prevention and treatment of substance use and mental disorders by providing best practices guidance to clinicians, program administrators, and payers. TIPs are the result of careful consideration of all relevant clinical and health services research findings, demonstration experience, and implementation requirements. A panel of non-Federal clinical researchers, clinicians, program administrators, and patient advocates debates and discusses their particular area of expertise until they reach a consensus on best practices. This panel's work is then reviewed and critiqued by field reviewers.

The talent, dedication, and hard work that TIP panelists and reviewers bring to this highly participatory process have helped bridge the gap between the promise of research and the needs of practicing clinicians and administrators to serve, in the most scientifically sound and effective ways, people in need of behavioral health services. We are grateful to all who have joined with us to contribute to advances in the behavioral health field.

How This TIP Is Organized

This Treatment Improvement Protocol (TIP) is divided into three parts:

- Part 1: *A Practical Guide for the Provision of Behavioral Health Services*
- Part 2: *An Implementation Guide for Behavioral Health Program Administrators*
- Part 3: *A Review of the Literature*

Part 1 is for behavioral health service providers and consists of six chapters. Recurring themes include the variety of ways that substance abuse, mental health, and trauma interact; the importance of context and culture in a person's response to trauma; trauma-informed screening and assessment tools, techniques, strategies, and approaches that help behavioral health professionals assist clients in recovery from mental and substance use disorders who have also been affected by acute or chronic traumas; and the significance of adhering to a strengths-based perspective that acknowledges the resilience within individual clients, providers, and communities.

Chapter 1 lays the groundwork and rationale for the implementation and provision of trauma-informed services. It provides an overview of specific trauma-informed intervention and treatment principles that guide clinicians, other behavioral health workers, and administrators in becoming trauma informed and in creating a trauma-informed organization and workforce. Chapter 2 provides an overview of traumatic experiences. It covers types of trauma; distinguishes among traumas that affect individuals, groups, and communities; describes trauma characteristics; and addresses the socioecological and cultural factors that influence the impact of trauma. Chapter 3 broadly focuses on understanding the impact of trauma, trauma-related stress reactions and associated symptoms, and common mental health and substance use disorders associated with trauma. Chapter 4 provides an introduction to screening and assessment as they relate to trauma and is devoted to screening and assessment processes and tools that are useful in evaluating trauma exposure, its effects, and client intervention and treatment needs. Chapter 5 covers clinical issues that counselors and other behavioral health professionals may need to know and address when treating clients who have histories of trauma. Chapter 6 presents information on specific treatment models for trauma, distinguishing integrated models (which address substance use disorders, mental disorders, and trauma simultaneously) from those that treat trauma alone.

Advice to Counselors and/or Administrators boxes in Part 1 provide practical information for providers. Case illustrations, exhibits, and text boxes further illustrate information in the text by offering practical examples.

Part 2 provides an overview of programmatic and administrative practices that will help behavioral health program administrators increase the capacity of their organizations to deliver

trauma-informed services. Chapter 1 examines the essential ingredients, challenges, and processes in creating and implementing trauma-informed services within an organization. Chapter 2 focuses on key development activities that support staff members, including trauma-informed training and supervision, ethics, and boundaries pertinent to responding to traumatic stress, secondary trauma, and counselor self-care.

Advice to Administrators and/or Supervisors boxes in Part 2 highlight more detailed information that supports the organizational implementation of trauma-informed care (TIC). In addition, case illustrations, organizational activities, and text boxes reinforce the material presented within this section.

Part 3 is a literature review on TIC and behavioral health services and is intended for use by clinical supervisors, interested providers, and administrators. Part 3 has three sections: an analysis of the literature, links to select abstracts of the references most central to the topic, and a general bibliography of the available literature. To facilitate ongoing updates (performed periodically for up to 3 years from first publication), the literature review is only available online at the Substance Abuse and Mental Health Services Administration (SAMHSA) Publications Ordering Web page (http://store.samhsa.gov).

Terminology

Behavioral health: Throughout the TIP, the term "behavioral health" is used. Behavioral health refers to a state of mental/emotional being and/or choices and actions that affect wellness. Behavioral health problems include substance abuse or misuse, alcohol and drug addiction, serious psychological distress, suicide, and mental and substance use disorders. This includes a range of problems from unhealthy stress to diagnosable and treatable diseases like serious mental illness and substance use disorders, which are often chronic in nature but from which people can and do recover. The term is also used in this TIP to describe the service systems encompassing the promotion of emotional health, the prevention of mental and substance use disorders, substance use and related problems, treatments and services for mental and substance use disorders, and recovery support. Because behavioral health conditions, taken together, are the leading causes of disability burden in North America, efforts to improve their prevention and treatment will benefit society as a whole. Efforts to reduce the impact of mental and substance use disorders on America's communities, such as those described in this TIP, will help achieve nationwide improvements in health.

Client/consumer: In this TIP, the term "client" means anyone who seeks or receives mental health or substance abuse services. The term "consumer" stands in place of "client" in content areas that address consumer participation and determination. It is not the intent of this document to ignore the relevance and historical origin of the term "consumer" among individuals who have received, been subject to, or are seeking mental health services. Instead, we choose the word "client," given that this terminology is also commonly used in substance abuse treatment services. Note: This TIP also uses the term "participant(s)" instead of "client(s)" for individuals, families, or communities seeking or receiving prevention services.

Complex trauma: This manual adopts the National Child Traumatic Stress Network (NCTSN) definition of complex trauma. The term refers to the pervasive impact, including developmental

consequences, of exposure to multiple or prolonged traumatic events. According to the NCTSN Web site (http://www.nctsn.org/trauma-types), complex trauma typically involves exposure to sequential or simultaneous occurrences of maltreatment, "including psychological maltreatment, neglect, physical and sexual abuse, and domestic violence…. Exposure to these initial traumatic experiences—and the resulting emotional dysregulation and the loss of safety, direction, and the ability to detect or respond to danger cues—often sets off a chain of events leading to subsequent or repeated trauma exposure in adolescence and adulthood" (NCTSN, 2013).

Co-occurring disorders: When an individual has one or more mental disorders as well as one or more substance use disorders (including substance abuse), the term "co-occurring" applies. Although people may have a number of health conditions that co-occur, including physical problems, the term "co-occurring disorders," in this TIP, refers to substance use and mental disorders.

Cultural responsiveness and cultural competence: This TIP uses these terms interchangeably, with "responsiveness" applied to services and systems and "competence" applied to people, to refer to "a set of behaviors, attitudes, and policies that…enable a system, agency, or group of professionals to work effectively in cross-cultural situations" (Cross, Bazron, Dennis, & Isaacs, 1989, p. 13). Culturally responsive behavioral health services and culturally competent providers "honor and respect the beliefs, languages, interpersonal styles, and behaviors of individuals and families receiving services…. [C]ultural competence is a dynamic, ongoing developmental process that requires a long-term commitment and is achieved over time" (U.S. Department of Health and Human Services, 2003, p. 12).

Evidence-based practices: There are many different uses of the term "evidence-based practices." One of the most widely accepted is that of Chambless and Hollon (1998), who say that for a treatment to be considered evidence based, it must show evidence of positive outcomes based on peer-reviewed randomized controlled trials or other equivalent strong methodology. A treatment is labeled "strong" if criteria are met for what Chambless and Hollon term "well-established" treatments. To attain this level, rigorous treatment outcome studies conducted by independent investigators (not just the treatment developer) are necessary. Research support is labeled "modest" when treatments attain criteria for what Chambless and Hollon call "probably efficacious treatments." To meet this standard, one well-designed study or two or more adequately designed studies must support a treatment's efficacy. In addition, it is possible to meet the "strong" and "modest" thresholds through a series of carefully controlled single-case studies. An evidence-based practice derived from sound, science-based theories incorporates detailed and empirically supported procedures and implementation guidelines, including parameters of applications (such as for populations), inclusionary and exclusionary criteria for participation, and target interventions.

Promising practices: Even though current clinical wisdom, theories, and professional and expert consensus may support certain practices, these practices may lack support from studies that are scientifically rigorous in research design and statistical analysis; available studies may be limited in number or sample size, or they may not be applicable to the current setting or population. This TIP refers to such practices as "promising."

Recovery: This term denotes a process of change through which individuals improve their health and wellness, live a self-directed life, and strive to reach their full potential. Major dimensions that support a life in recovery, as defined by SAMHSA, include:

- ***Health:*** overcoming or managing one's disease(s) as well as living in a physically and emotionally healthy way.
- ***Home:*** a stable and safe place to live.
- ***Purpose:*** meaningful daily activities, such as a job, school, volunteerism, family caretaking, or creative endeavors, and the independence, income, and resources to participate in society.
- ***Community:*** relationships and social networks that provide support, friendship, love, and hope.

Resilience: This term refers to the ability to bounce back or rise above adversity as an individual, family, community, or provider. Well beyond individual characteristics of hardiness, resilience includes the process of using available resources to negotiate hardship and/or the consequences of adverse events. This TIP applies the term "resilience" and its processes to individuals across the life span.

Retraumatization: In its more literal translation, "retraumatization" means the occurrence of traumatic stress reactions and symptoms after exposure to multiple events (Duckworth & Follette, 2011). This is a significant issue for trauma survivors, both because they are at increased risk for higher rates of retraumatization, and because people who are traumatized multiple times often have more serious and chronic trauma-related symptoms than those with single traumas. In this manual, the term not only refers to the effect of being exposed to multiple events, but also implies the process of reexperiencing traumatic stress as a result of a current situation that mirrors or replicates in some way the prior traumatic experiences (e.g., specific smells or other sensory input; interactions with others; responses to one's surroundings or interpersonal context, such as feeling emotionally or physically trapped).

Secondary trauma: Literature often uses the terms "secondary trauma," "compassion fatigue," and "vicarious traumatization" interchangeably. Although compassion fatigue and secondary trauma refer to similar physical, psychological, and cognitive changes and symptoms that behavioral health workers may encounter when they work specifically with clients who have histories of trauma, vicarious trauma usually refers more explicitly to specific cognitive changes, such as in worldview and sense of self (Newell & MacNeil, 2010). This publication uses "secondary trauma" to describe trauma-related stress reactions and symptoms resulting from exposure to another individual's traumatic experiences, rather than from exposure directly to a traumatic event. Secondary trauma can occur among behavioral health service providers across all behavioral health settings and among all professionals who provide services to those who have experienced trauma (e.g., healthcare providers, peer counselors, first responders, clergy, intake workers).

Substance abuse: Throughout the TIP, the term "substance abuse" has been used to refer to both substance abuse and substance dependence. This term was chosen partly because behavioral health professionals commonly use the term substance abuse to describe any excessive use of addictive substances. In this TIP, the term refers to the use of alcohol as well as other substances of abuse. Readers should attend to the context in which the term occurs to determine what possible range of meanings it covers; in most cases, it will refer to all varieties of substance-related

disorders as found in *Diagnostic and Statistical Manual of Mental Disorders,* Fifth Edition (American Psychiatric Association, 2013a).

Trauma: In this text, the term "trauma" refers to experiences that cause intense physical and psychological stress reactions. It can refer to "a single event, multiple events, or a set of circumstances that is experienced by an individual as physically and emotionally harmful or threatening and that has lasting adverse effects on the individual's physical, social, emotional, or spiritual well-being" (SAMHSA, 2012, p. 2). Although many individuals report a single specific traumatic event, others, especially those seeking mental health or substance abuse services, have been exposed to multiple or chronic traumatic events. See the "What Is Trauma" section in Part 1, Chapter 1, for a more indepth definition and discussion of trauma.

Trauma-informed: A trauma-informed approach to the delivery of behavioral health services includes an understanding of trauma and an awareness of the impact it can have across settings, services, and populations. It involves viewing trauma through an ecological and cultural lens and recognizing that context plays a significant role in how individuals perceive and process traumatic events, whether acute or chronic. In May 2012, SAMHSA convened a group of national experts who identified three key elements of a trauma-informed approach: "(1) realizing the prevalence of trauma; (2) recognizing how trauma affects all individuals involved with the program, organization, or system, including its own workforce; and (3) responding by putting this knowledge into practice" (SAMHSA, 2012, p 4).

Trauma-informed care: TIC is a strengths-based service delivery approach "that is grounded in an understanding of and responsiveness to the impact of trauma, that emphasizes physical, psychological, and emotional safety for both providers and survivors, and that creates opportunities for survivors to rebuild a sense of control and empowerment" (Hopper, Bassuk, & Olivet, 2010, p. 82). It also involves vigilance in anticipating and avoiding institutional processes and individual practices that are likely to retraumatize individuals who already have histories of trauma, and it upholds the importance of consumer participation in the development, delivery, and evaluation of services.

Trauma-specific treatment services: These services are evidence-based and promising practices that facilitate recovery from trauma. The term "trauma-specific services" refers to prevention, intervention, or treatment services that address traumatic stress as well as any co-occurring disorders (including substance use and mental disorders) that developed during or after trauma.

Trauma survivor: This phrase can refer to anyone who has experienced trauma or has had a traumatic stress reaction. Knowing that the use of language and words can set the tone for recovery or contribute to further retraumatization, it is the intent of this manual to put forth a message of hope by avoiding the term "victim" and instead using the term "survivor" when appropriate.

Part 1: A Practical Guide for the Provision of Behavioral Health Services

1 Trauma-Informed Care: A Sociocultural Perspective

IN THIS CHAPTER

- Scope of the TIP
- Intended Audience
- Before You Begin
- Structure of the TIP
- What Is Trauma?
- Trauma Matters in Behavioral Health Services
- Trauma Informed Intervention and Treatment Principles
- As You Proceed

Many individuals who seek treatment in behavioral health settings have histories of trauma, but they often don't recognize the significant effects of trauma in their lives; either they don't draw connections between their trauma histories and their presenting problems, or they avoid the topic altogether. Likewise, treatment providers may not ask questions that elicit a client's history of trauma, may feel unprepared to address trauma-related issues proactively, or may struggle to address traumatic stress effectively within the constraints of their treatment program, the program's clinical orientation, or their agency's directives.

By recognizing that traumatic experiences and their sequelae tie closely into behavioral health problems, front-line professionals and community-based programs can begin to build a trauma-informed environment across the continuum of care. Key steps include meeting client needs in a safe, collaborative, and compassionate manner; preventing treatment practices that retraumatize people with histories of trauma who are seeking help or receiving services; building on the strengths and resilience of clients in the context of their environments and communities; and endorsing trauma-informed principles in agencies through support, consultation, and supervision of staff.

This Treatment Improvement Protocol (TIP) begins by introducing the scope, purpose, and organization of the topic and describing its intended audience. Along with defining trauma and trauma-informed care (TIC), the first chapter discusses the rationale for addressing trauma in behavioral health services and reviews trauma-informed intervention and treatment principles. These principles serve as the TIP's conceptual framework.

Scope of the TIP

Many individuals experience trauma during their lifetimes. Although many people exposed to trauma demonstrate few or no lingering symptoms, those individuals who have experienced repeated, chronic, or multiple traumas are more likely to exhibit pronounced symptoms and consequences, including substance abuse, mental illness, and health problems. Subsequently, trauma can significantly affect how an individual engages in major life areas as well as treatment.

This TIP provides evidence-based and best practice information for behavioral health service providers and administrators who want to work more effectively with people who have been exposed to acute and chronic traumas and/or are at risk of developing traumatic stress reactions. Using key trauma-informed principles, this TIP addresses trauma-related prevention, intervention, and treatment issues and strategies in behavioral health services. The content is adaptable across behavioral health settings that service individuals, families, and communities—placing emphasis on the importance of coordinating as well as integrating services.

Intended Audience

This TIP is for behavioral health service providers, prevention specialists, and program administrators—the professionals directly responsible for providing care to trauma survivors across behavioral health settings, including substance abuse and mental health services. This TIP also targets primary care professionals, including physicians; teams working with clients and communities who have experienced trauma; service providers in the criminal justice system; and researchers with an interest in this topic.

Before You Begin

This TIP endorses a trauma-informed model of care; this model emphasizes the need for behavioral health practitioners and organizations to recognize the prevalence and pervasive impact of trauma on the lives of the people they serve and develop trauma-sensitive or trauma-responsive services. This TIP provides key information to help behavioral health practitioners and program administrators become trauma aware and informed, improve screening and assessment processes, and implement science-informed intervention strategies across settings and modalities in behavioral health services. Whether provided by an agency or an individual provider, trauma-informed services may or may not include trauma-specific services or trauma specialists (individuals who have advanced training and education to provide specific treatment interventions to address traumatic stress reactions). Nonetheless, TIC anticipates the role that trauma can play across the continuum of care—establishing integrated and/or collaborative processes to address the needs of traumatized individuals and communities proactively.

Individuals who have experienced trauma are at an elevated risk for substance use disorders, including abuse and dependence; mental health problems (e.g., depression and anxiety symptoms or disorders, impairment in relational/social and other major life areas, other distressing symptoms); and physical disorders and conditions, such as sleep disorders. This TIP focuses on specific types of prevention (Institute of Medicine et al., 2009): selective prevention, which targets people who are at risk for developing social, psychological, or other conditions as a result of trauma or who are at greater risk for experiencing trauma due to behavioral health disorders or conditions; and indicated prevention, which targets people who display early signs of trauma-related

symptoms. This TIP identifies interventions, including trauma-informed and trauma-specific strategies, and perceives treatment as a means of prevention—building on resilience, developing safety and skills to negotiate the impact of trauma, and addressing mental and substance use disorders to enhance recovery.

This TIP's target population is adults. Beyond the context of family, this publication does not examine or address youth and adolescent responses to trauma, youth-tailored trauma-informed strategies, or trauma-specific interventions for youth or adolescents, because the developmental and contextual issues of these populations require specialized interventions. Providers who work with young clients who have experienced trauma should refer to the resource list in Appendix B. This TIP covers TIC, trauma characteristics, the impact of traumatic experiences, assessment, and interventions for persons who have had traumatic experiences. Considering the vast knowledge base and specificity of individual, repeated, and chronic forms of trauma, this TIP does not provide a comprehensive overview of the unique characteristics of each type of trauma (e.g., sexual abuse, torture, war-related trauma, murder). Instead, this TIP provides an overview supported by examples. For more information on several specific types of trauma, please refer to TIP 36, *Substance Abuse Treatment for Persons With Child Abuse and Neglect Issues* (Center for Substance Abuse Treatment [CSAT], 2000b), TIP 25, *Substance Abuse Treatment and Domestic Violence* (CSAT, 1997b), TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d), and the planned TIP, *Reintegration-Related Behavioral Health Issues in Veterans and Military Families* (Substance Abuse and Mental Health Services Administration [SAMHSA], planned f).

This TIP, *Trauma-Informed Care in Behavioral Health Services*, is guided by SAMHSA's Strategic Initiatives described in *Leading Change: A Plan for SAMHSA's Roles and Actions 2011–2014* (SAMHSA, 2011b). Specific to Strategic Initiative #2, Trauma and Justice, this TIP addresses several goals, objectives, and actions outlined in this initiative by providing behavioral health practitioners, supervisors, and administrators with an introduction to culturally responsive TIC.

Specifically, the TIP presents fundamental concepts that behavioral health service providers can use to:

- Become trauma aware and knowledgeable about the impact and consequences of traumatic experiences for individuals, families, and communities.
- Evaluate and initiate use of appropriate trauma-related screening and assessment tools.
- Implement interventions from a collaborative, strengths-based approach, appreciating the resilience of trauma survivors.
- Learn the core principles and practices that reflect TIC.
- Anticipate the need for specific trauma-informed treatment planning strategies that support the individual's recovery.
- Decrease the inadvertent retraumatization that can occur from implementing standard organizational policies, procedures, and interventions with individuals, including clients and staff, who have experienced trauma or are exposed to secondary trauma.
- Evaluate and build a trauma-informed organization and workforce.

The consensus panelists, as well as other contributors to this TIP, have all had experience as substance abuse and mental health counselors, prevention and peer specialists, supervisors, clinical directors, researchers, or administrators working with individuals, families, and

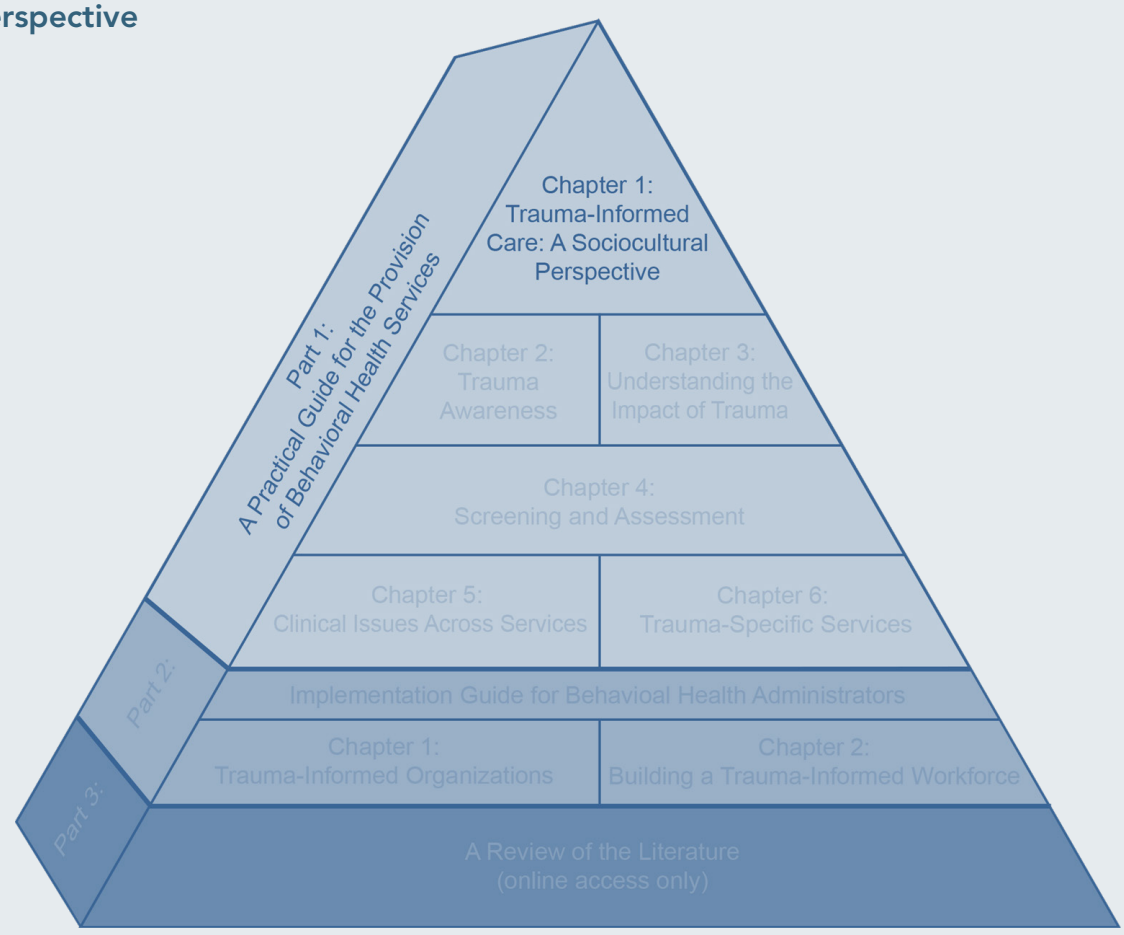
communities who have experienced trauma. The material presented in this TIP uses the wealth of their experience in addition to the available published resources and research relevant to this topic. Throughout the consensus process, the panel members were mindful of the strengths and resilience inherent in individuals, families, and communities affected by trauma and the challenges providers face in addressing trauma and implementing TIC.

Structure of the TIP

Using a TIC framework (Exhibit 1.1-1), this TIP provides information on key aspects of trauma, including what it is; its consequences; screening and assessment; effective prevention, intervention, and treatment approaches; trauma recovery; the impact of trauma on service providers; programmatic and administrative practices; and trauma resources.

Note: To produce a user-friendly but informed document, the first two parts of the TIP include minimal citations. If you are interested in the citations associated with topics covered in Parts 1 and 2, please consult the review of the literature provided in Part 3 (available online at http://store.samhsa.gov). Parts 1 and 2 are easily read and digested on their own, but it is highly recommended that you read the literature review as well.

Exhibit 1.1-1: TIC Framework in Behavioral Health Services—Sociocultural Perspective



What Is Trauma?

According to SAMHSA's Trauma and Justice Strategic Initiative, "trauma results from an event, series of events, or set of circumstances that is experienced by an individual as physically or emotionally harmful or threatening and that has lasting adverse effects on the individual's functioning and physical, social, emotional, or spiritual well-being" (SAMHSA, 2012, p. 2). Trauma can affect people of every race, ethnicity, age, sexual orientation, gender, psychosocial background, and geographic region. A traumatic experience can be a single event, a series of events, and/or a chronic condition (e.g., childhood neglect, domestic violence). Traumas can affect individuals, families, groups, communities, specific cultures, and generations. It generally overwhelms an individual's or community's resources to cope, and it often ignites the "fight, flight, or freeze" reaction at the time of the event(s). It frequently produces a sense of fear, vulnerability, and helplessness.

See Appendix C to read about the history of trauma and trauma interventions.

Often, traumatic events are unexpected. Individuals may experience the traumatic event directly, witness an event, feel threatened, or hear about an event that affects someone they know. Events may be human-made, such as a mechanical error that causes a disaster, war, terrorism, sexual abuse, or violence, or they can be the products of nature (e.g., flooding, hurricanes, tornadoes). Trauma can occur at any age or developmental stage, and often, events that occur outside expected life stages are perceived as traumatic (e.g., a child dying before a parent, cancer as a teen, personal illness, job loss before retirement).

It is not just the event itself that determines whether something is traumatic, but also the individual's experience of the event. Two people may be exposed to the same event or series of events but experience and interpret these events in vastly different ways. Various biopsychosocial and cultural factors influence an individual's immediate response and long-term reactions to trauma. For most, regardless of the severity of the trauma, the immediate or enduring effects of trauma are met with resilience—the ability to rise above the circumstances or to meet the challenges with fortitude.

For some people, reactions to a traumatic event are temporary, whereas others have prolonged reactions that move from acute symptoms to more severe, prolonged, or enduring mental health consequences (e.g., posttraumatic stress and other anxiety disorders, substance use and mood disorders) and medical problems (e.g., arthritis, headaches, chronic pain). Others do not meet established criteria for posttraumatic stress or other mental disorders but encounter significant trauma-related symptoms or culturally expressed symptoms of trauma (e.g., somatization, in which psychological stress is expressed through physical concerns). For that reason, even if an individual does not meet diagnostic criteria for trauma-related disorders, it is important to recognize that trauma may still affect his or her life in significant ways. For more information on traumatic events, trauma characteristics, traumatic stress reactions, and factors that heighten or decrease the impact of trauma, see Part 1, Chapter 2, "Trauma Awareness," and Part 1, Chapter 3, "Understanding the Impact of Trauma."

Trauma Matters in Behavioral Health Services

The past decade has seen an increased focus on the ways in which trauma, psychological distress, quality of life, health, mental illness,

and substance abuse are linked. With the attacks of September 11, 2001, and other acts of terror, the wars in Iraq and Afghanistan, disastrous hurricanes on the Gulf Coast, and sexual abuse scandals, trauma has moved to the forefront of national consciousness.

Trauma was once considered an abnormal experience. However, the first National Comorbidity Study established how prevalent traumas were in the lives of the general population of the United States. In the study, 61 percent of men and 51 percent of women reported experiencing at least one trauma in their lifetime, with witnessing a trauma, being involved in a natural disaster, and/or experiencing a life-threatening accident ranking as the most common events (Kessler et al., 1999). In Wave 2 of the National Epidemiologic Survey on Alcohol and Related Conditions, 71.6 percent of the sample reported witnessing trauma, 30.7 percent experienced a trauma that resulted in injury, and 17.3 percent experienced psychological trauma (El-Gabalawy, 2012). For a thorough review of the impact of trauma on quality of life and health and among individuals with mental and substance use disorders, refer to Part 3 of this TIP, the online literature review.

Rationale for TIC

Integrating TIC into behavioral health services provides many benefits not only for clients, but also for their families and communities, for behavioral health service organizations, and for staff. Trauma-informed services bring to the forefront the belief that trauma can pervasively affect an individual's well-being, including physical and mental health. For behavioral health service providers, trauma-informed practice offers many opportunities. It reinforces the importance of acquiring trauma-specific knowledge and skills to meet the specific needs of clients; of recognizing that individuals may be affected by trauma regardless of its acknowledgment; of understanding that trauma likely affects many clients who are seeking behavioral health services; and of acknowledging that organizations and providers can retraumatize clients through standard or unexamined policies and practices. TIC stresses the importance of addressing the client individually rather than applying general treatment approaches.

TIC provides clients more opportunities to engage in services that reflect a compassionate perspective of their presenting problems. TIC can potentially provide a greater sense of safety for clients who have histories of trauma and a platform for preventing more serious consequences of traumatic stress (Fallot & Harris, 2001). Although many individuals may not identify the need to connect with their histories, trauma-informed services offer clients a chance to explore the impact of trauma, their strengths and creative adaptations in managing traumatic histories, their resilience, and the relationships among trauma, substance use, and psychological symptoms.

Two Influential Studies That Set the Stage for the Development of TIC

The Adverse Childhood Experiences Study (Centers for Disease Control and Prevention, 2013) was a large epidemiological study involving more than 17,000 individuals from United States; it analyzed the long-term effects of childhood and adolescent traumatic experiences on adult health risks, mental health, healthcare costs, and life expectancy.

The Women, Co-Occurring Disorders and Violence Study (SAMHSA, 2007) was a large multisite study focused on the role of interpersonal and other traumatic stressors among women; the interrelatedness of trauma, violence, and co-occurring substance use and mental disorders; and the incorporation of trauma-informed and trauma-specific principles, models, and services.

Implementing trauma-informed services can improve screening and assessment processes, treatment planning, and placement while also decreasing the risk for retraumatization. The implementation may enhance communication between the client and treatment provider, thus decreasing risks associated with misunderstanding the client's reactions and presenting problems or underestimating the need for appropriate referrals for evaluation or trauma-specific treatment. Organizational investment in developing or improving trauma-informed services may also translate to cost effectiveness, in that services are more appropriately matched to clients from the outset. TIC is an essential ingredient in organizational risk management; it ensures the implementation of decisions that will optimize therapeutic outcomes and minimize adverse effects on the client and, ultimately, the organization. A key principle is the engagement of community, clients, and staff. Clients and staff are more apt to be empowered, invested, and satisfied if they are involved in the ongoing development and delivery of trauma-informed services.

An organization also benefits from work development practices through planning for, attracting, and retaining a diverse workforce of individuals who are knowledgeable about trauma and its impact. Developing a trauma-informed organization involves hiring and promotional practices that attract and retain individuals who are educated and trained in trauma-informed practices on all levels of the organization, including board as well as peer support appointments. Trauma-informed organizations are invested in their staff and adopt similar trauma-informed principles, including establishing and providing ongoing support to promote TIC in practice and in addressing secondary trauma and implementing processes that reinforce the safety of the staff. Even though investing in a trauma-informed workforce does not necessarily guarantee trauma-informed practices, it is more likely that services will evolve more proficiently to meet client, staff, and community needs.

Advice to Counselors: The Importance of TIC

The history of trauma raises various clinical issues. Many counselors do not have extensive training in treating trauma or offering trauma-informed services and may be uncertain of how to respond to clients' trauma-related reactions or symptoms. Some counselors have experienced traumas themselves that may be triggered by clients' reports of trauma. Others are interested in helping clients with trauma but may unwittingly cause harm by moving too deeply or quickly into trauma material or by discounting or disregarding a client's report of trauma. Counselors must be aware of trauma-related symptoms and disorders and how they affect clients in behavioral health treatment.

Counselors with primary treatment responsibilities should also have an understanding of how to recognize trauma-related reactions, how to incorporate treatment interventions for trauma-related symptoms into clients' treatment plans, how to help clients build a safety net to prevent further trauma, how to conduct psychoeducational interventions, and when to make treatment referrals for further evaluations or trauma-specific treatment services. All treatment staff should recognize that traumatic stress symptoms or trauma-related disorders should not preclude an individual from mental health or substance abuse treatment and that all co-occurring disorders need to be addressed on some level in the treatment plan and setting. For example, helping a client in substance abuse treatment gain control over trauma-related symptoms can greatly improve the client's chances of substance abuse recovery and lower the possibility of relapse (Farley, Golding, Young, Mulligan, & Minkoff, 2004; Ouimette, Ahrens, Moos, & Finney, 1998). In addition, assisting a client in achieving abstinence builds a platform upon which recovery from traumatic stress can proceed.

Trauma and Substance Use Disorders

Many people who have substance use disorders have experienced trauma as children or adults (Koenen, Stellman, Sommer, & Stellman, 2008; Ompad et al., 2005). Substance abuse is known to predispose people to higher rates of traumas, such as dangerous situations and accidents, while under the influence (Stewart & Conrod, 2003; Zinzow, Resnick, Amstadter, McCauley, Ruggiero, & Kilpatrick, 2010) and as a result of the lifestyle associated with substance abuse (Reynolds et al., 2005). In addition, people who abuse substances and have experienced trauma have worse treatment outcomes than those without histories of trauma (Driessen et al., 2008; Najavits et al., 2007). Thus, the process of recovery is more difficult, and the counselor's role is more challenging, when clients have histories of trauma. A person presenting with both trauma and substance abuse issues can have a variety of other difficult life problems that commonly accompany these disorders, such as other psychological symptoms or mental disorders, poverty, homelessness, increased risk of HIV and other infections, and lack of social support (Mills, Teesson, Ross, & Peters, 2006; Najavits, Weiss, & Shaw, 1997). Many individuals who seek treatment for substance use disorders have histories of one or more traumas. More than half of women seeking substance abuse treatment report one or more lifetime traumas (Farley, Golding, Young, Mulligan, & Minkoff, 2004; Najavits et al., 1997), and a significant number of clients in inpatient treatment also have subclinical traumatic stress symptoms or posttraumatic stress disorder (PTSD; Falck, Wang, Siegal, & Carlson, 2004; Grant et al., 2004; Reynolds et al., 2005).

Trauma and Mental Disorders

People who are receiving treatment for severe mental disorders are more likely to have histories of trauma, including childhood physical and sexual abuse, serious accidents, homelessness, involuntary psychiatric hospitalizations, drug overdoses, interpersonal violence, and other forms of violence. Many clients with severe mental disorders meet criteria for PTSD; others with serious mental illness who have histories of trauma present with psychological symptoms or mental disorders that are commonly associated with a history of trauma, including anxiety symptoms and disorders, mood disorders (e.g., major depression, dysthymia, bipolar disorder; Mueser et al., 2004), impulse control disorders, and substance use disorders (Kessler, Chiu, Demler, & Walters, 2005).

Traumatic stress increases the risk for mental illness, and findings suggest that traumatic stress increases the symptom severity of mental illness (Spitzer, Vogel, Barnow, Freyberger & Grabe, 2007). These findings propose that traumatic stress plays a significant role in perpetuating and exacerbating mental illness and suggest that trauma often precedes the development of mental disorders. As with trauma and substance use disorders, there is a bidirectional relationship; mental illness increases the risk of experiencing trauma, and trauma increases the risk of developing psychological symptoms and mental disorders. For a more comprehensive review of the interactions among traumatic stress, mental illness, and substance use disorders, refer to Part 3 of this TIP, the online literature review.

Trauma-Informed Intervention and Treatment Principles

TIC is an intervention and organizational approach that focuses on how trauma may affect an individual's life and his or her response to behavioral health services from prevention through treatment. There are many definitions of TIC and various models for incorporating it across organizations, but a "trauma-informed approach incorporates three key elements: (1) *realizing* the prevalence of trauma; (2) *recognizing* how trauma affects all individuals involved with the program, organization, or system, including its own workforce; and (3) *responding* by putting this knowledge into practice" (SAMHSA, 2012, p. 4).

TIC begins with the first contact a person has with an agency; it requires all staff members (e.g., receptionists, intake personnel, direct care staff, supervisors, administrators, peer supports, board members) to recognize that the individual's experience of trauma can greatly influence his or her receptivity to and engagement with services, interactions with staff and clients, and responsiveness to program guidelines, practices, and interventions. TIC includes program policies, procedures, and practices to protect the vulnerabilities of those who have experienced trauma and those who provide trauma-related services. TIC is created through a supportive environment and by redesigning organizational practices, with consumer participation, to prevent practices that could be retraumatizing (Harris & Fallot, 2001c; Hopper et al., 2010). The ethical principle, "first, do no harm," resonates strongly in the application of TIC.

> "A program, organization, or system that is trauma informed realizes the widespread impact of trauma and under stands poten tial paths for healing; recognizes the signs and symptoms of trauma in staff, clients, and others involved with the system; and responds by fully integrating knowledge about trauma into policies, procedures, practices, and settings."
>
> (SAMHSA, 2012, p. 4)

TIC involves a commitment to building competence among staff and establishing programmatic standards and clinical guidelines that support the delivery of trauma-sensitive services. It encompasses recruiting, hiring, and retaining competent staff; involving consumers, trauma survivors, and peer support specialists in the planning, implementation, and evaluation of trauma-informed services; developing collaborations across service systems to streamline referral processes, thereby securing trauma-specific services when appropriate; and building a continuity of TIC as consumers move from one system or service to the next. TIC involves reevaluating each service delivery component through a trauma-aware lens.

The principles described in the following subsections serve as the TIP's conceptual

Advice to Counselors: Implementing Trauma-Informed Services

Recognizing that trauma affects a majority of clients served within public health systems, the National Center for Trauma-Informed Care (NCTIC) has sought to establish a comprehensive framework to guide systems of care in the development of trauma-informed services. If a system or program is to support the needs of trauma survivors, it must take a systematic approach that offers trauma-specific diagnostic and treatment services, as well as a trauma-informed environment that is able to sustain such services, while fostering positive outcomes for the clients it serves. NCTIC also offers technical assistance in the implementation of trauma-informed services. For specific administrative information on TIC implementation, refer to Part 2, Chapters 1 and 2, of this TIP.

framework. These principles comprise a compilation of resources, including research, theoretical papers, commentaries, and lessons learned from treatment facilities. Key elements are outlined for each principle in providing services to clients affected by trauma and to populations most likely to incur trauma. Although these principles are useful across all prevention and intervention services, settings, and populations, they are of the utmost importance in working with people who have had traumatic experiences.

Promote Trauma Awareness and Understanding

Foremost, a behavioral health service provider must recognize the prevalence of trauma and its possible role in an individual's emotional, behavioral, cognitive, spiritual, and/or physical development, presentation, and well-being. Being vigilant about the prevalence and potential consequences of traumatic events among clients allows counselors to tailor their presentation styles, theoretical approaches, and intervention strategies from the outset to plan for and be responsive to clients' specific needs. Although not every client has a history of trauma, those who have substance use and mental disorders are more likely to have experienced trauma. Being trauma aware does not mean that you must assume everyone has a history of trauma, but rather that you anticipate the possibility from your initial contact and interactions, intake processes, and screening and assessment procedures.

Even the most standard behavioral health practices can retraumatize an individual exposed to prior traumatic experiences if the provider implements them without recognizing or considering that they may do harm. For example, a counselor might develop a treatment plan recommending that a female client—who has been court mandated to substance abuse treatment and was raped as an adult—attend group therapy, but without considering the implications, for her, of the fact that the only available group at the facility is all male and has had a low historical rate of female participation. Trauma awareness is an essential strategy for preventing this type of retraumatization; it reinforces the need for providers to reevaluate their usual practices.

> "Trauma informed care embraces a perspective that highlights adaptation over symptoms and resilience over pathology."
>
> (Elliot, Bjelajac, Fallot, Markoff, & Reed, 2005, p. 467)

Becoming trauma aware does not stop with the recognition that trauma can affect clients; instead, it encompasses a broader awareness that traumatic experiences as well as the impact of an individual's trauma can extend to significant others, family members, first responders and other medical professionals, behavioral health workers, broader social networks, and even entire communities. Family members frequently experience the traumatic stress reactions of the individual family member who was traumatized (e.g., angry outbursts, nightmares, avoidant behavior, other symptoms of anxiety, overreactions or underreactions to stressful events). These repetitive experiences can increase the risk of secondary trauma and symptoms of mental illness among the family, heighten the risk for externalizing and internalizing behavior among children (e.g., bullying others, problems in social relationships, health-damaging behaviors), increase children's risk for developing posttraumatic stress later in life, and lead to a greater propensity for traumatic stress reactions across generations of the family. Hence, prevention and intervention services can provide education and age-appropriate programming tailored to develop coping skills and support systems.

So too, behavioral health service providers can be influenced by exposure to trauma-related affect and content when working with clients. A trauma-aware workplace supports supervision and program practices that educate all direct service staff members on secondary trauma, encourages the processing of trauma-related content through participation in peer-supported activities and clinical supervision, and provides them with professional development opportunities to learn about and engage in effective coping strategies that help prevent secondary trauma or trauma-related symptoms. It is important to generate trauma awareness in agencies through education across services and among all staff members who have any direct or indirect contact with clients (including receptionists or intake and admission personnel who engage clients for the first time within the agency). Agencies can maintain a trauma-aware environment through ongoing staff training, continued supervisory and administrative support, collaborative (i.e., involving consumer participation) trauma-responsive program design and implementation, and organizational policies and practices that reflect accommodation and flexibility in attending to the needs of clients affected by trauma.

Recognize That Trauma-Related Symptoms and Behaviors Originate From Adapting to Traumatic Experiences

A trauma-informed perspective views trauma-related symptoms and behaviors as an individual's best and most resilient attempt to manage, cope with, and rise above his or her experience of trauma. Some individuals' means of adapting and coping have produced little difficulty; the coping and adaptive strategies of others have worked in the past but are not working as well now. Some people have difficulties in one area of life but have effectively negotiated and functioned in other areas.

Individuals who have survived trauma vary widely in how they experience and express traumatic stress reactions. Traumatic stress reactions vary in severity; they are often measured by the level of impairment or distress that clients report and are determined by the multiple factors that characterize the trauma itself, individual history and characteristics, developmental factors, sociocultural attributes, and available resources. The characteristics of the trauma and the subsequent traumatic stress reactions can dramatically influence how individuals respond to the environment, relationships, interventions, and treatment services, and those same characteristics can also shape the assumptions that clients/consumers make about their world (e.g., their view of others, sense of safety), their future (e.g., hopefulness, fear of a foreshortened future), and themselves (e.g., feeling resilient, feeling incompetent in regulating emotions). The breadth of these effects may be observable or subtle.

Once you become aware of the significance of traumatic experiences in clients' lives and begin to view their presentation as adaptive, your identification and classification of their presenting symptoms and behaviors can shift from a "pathology" mindset (i.e., defining clients strictly from a diagnostic label, implying that something is wrong with them) to one of resilience—a mindset that views clients' presenting difficulties, behaviors, and emotions as responses to surviving trauma. In essence, you will come to view traumatic stress reactions as *normal* reactions to *abnormal* situations. In embracing the belief that trauma-related reactions are adaptive, you can begin relationships with clients from a hopeful, strengths-based stance that builds upon the belief that their responses to traumatic experiences reflect creativity, self-preservation, and determination.

This will help build mutual and collaborative therapeutic relationships, help clients identify what has worked and has not worked in their attempts to deal with the aftermath of trauma from a nonjudgmental stance, and develop intervention and coping strategies that are more likely to fit their strengths and resources. This view of trauma prevents further retraumatization by not defining traumatic stress reactions as pathological or as symptoms of pathology.

View Trauma in the Context of Individuals' Environments

Many factors contribute to a person's response to trauma, whether it is an individual, group, or community-based trauma. Individual attributes, developmental factors (including protective and risk factors), life history, type of trauma, specific characteristics of the trauma, amount and length of trauma exposure, cultural meaning of traumatic events, number of losses associated with the trauma, available resources (internal and external, such as coping skills and family support), and community reactions are a few of the determinants that influence a person's responses to trauma across time. Refer to the "View Trauma Through a Sociocultural Lens" section later in this chapter for more specific information highlighting the importance of culture in understanding and treating the effects of trauma.

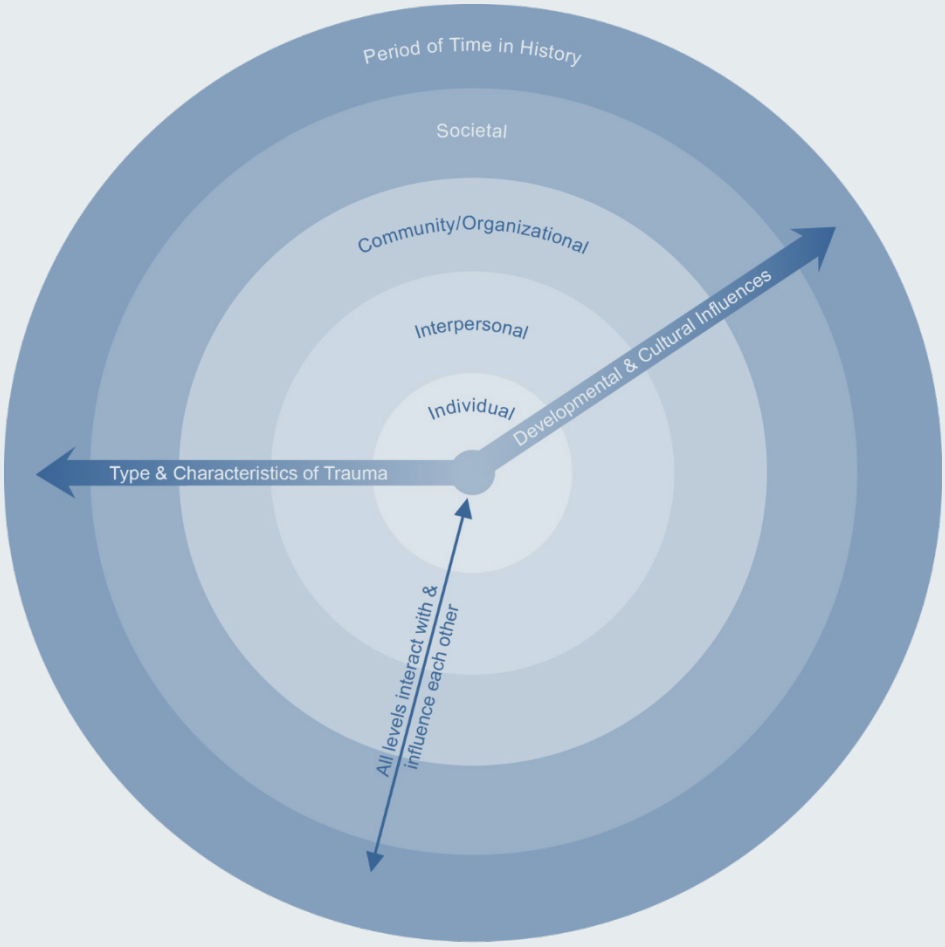
Trauma cannot be viewed narrowly; instead, it needs to be seen through a broader lens—a contextual lens integrating biopsychosocial, interpersonal, community, and societal (the degree of individualistic or collective cultural values) characteristics that are evident preceding and during the trauma, in the immediate and sustained response to the event(s), and in the short- and long-term effects of the traumatic event(s), which may include housing availability, community response, adherence to or maintenance of family routines and structure, and level of family support.

To more adequately understand trauma, you must also consider the contexts in which it occurred. Understanding trauma from this angle helps expand the focus beyond individual characteristics and effects to a broader systemic perspective that acknowledges the influences of social interactions, communities, governments, cultures, and so forth, while also examining the possible interactions among those various influences. Bronfenbrenner's (1979) and Bronfenbrenner and Ceci's (1994) work on ecological models sparked the development of other contextual models. In recent years, the social-ecological framework has been adopted in understanding trauma, in implementing health promotion and other prevention strategies, and in developing treatment interventions (Centers for Disease Control and Prevention, 2009). Here are the three main beliefs of a social-ecological approach (Stokols, 1996):

- Environmental factors greatly influence emotional, physical, and social well-being.
- A fundamental determinant of health versus illness is the degree of fit between individuals' biological, behavioral, and sociocultural needs and the resources available to them.
- Prevention, intervention, and treatment approaches integrate a combination of strategies targeting individual, interpersonal, and community systems.

This TIP uses a social-ecological model to explore trauma and its effects (Exhibit 1.1-2). The focus of this model is not only on negative attributes (risk factors) across each level, but also on positive ingredients (protective factors) that protect against or lessen the impact of trauma. This model also guides the inclusion of certain targeted interventions in this text, including selective and indicated

Exhibit 1.1-2: A Social-Ecological Model for Understanding Trauma and Its Effects



prevention activities. In addition, culture, developmental processes (including the developmental stage or characteristics of the individual and/or community), and the specific era when the trauma(s) occurred can significantly influence how a trauma is perceived and processed, how an individual or community engages in help-seeking, and the degree of accessibility, acceptability, and availability of individual and community resources.

Depending on the developmental stage and/or processes in play, children, adolescents, and adults will perceive, interpret, and cope with traumatic experiences differently. For example, a child may view a news story depicting a traumatic event on television and believe that the trauma is recurring every time they see the scene replayed. Similarly, the era in which one lives and the timing of the trauma can greatly influence an individual or community response. Take, for example, a pregnant woman who is abusing drugs and is wary of receiving medical treatment after being beaten in a domestic dispute. She may fear losing her children or being arrested for child neglect. Even though a number of States have adopted policies focused on the importance of treatment for pregnant women who are abusing drugs and of the accessibility of prenatal care, other States have approached this issue from a criminality standpoint (e.g., with child welfare and criminal laws) in the past few decades. Thus, the traumatic event's timing is a significant

component in understanding the context of trauma and trauma-related responses.

The social-ecological model depicted in Exhibit 1.1-2 provides a systemic framework for looking at individuals, families, and communities affected by trauma in general; it highlights the bidirectional influence that multiple contexts can have on the provision of behavioral health services to people who have experienced trauma (see thin arrow). Each ring represents a different system (refer to Exhibit 1.1-3 for examples of specific factors within each system). The innermost ring represents the individual and his or her biopsychosocial characteristics. The "Interpersonal" circle embodies all immediate relationships including family, friends, peers, and others. The "Community/Organizational" band represents social support networks, workplaces, neighborhoods, and institutions that directly influence the individual and his/her relationships. The "Societal" circle signifies the largest system—State and Federal policies and laws, such as economic and healthcare policies, social norms, governmental systems, and political ideologies. The outermost ring, "Period of Time in History," reflects the significance of the period of time during which the event occurred; it influences each other level represented in the circle. For example, making a comparison of society's attitudes and responses to veterans' homecomings across different wars and conflicts through time shows that homecoming environments can have either a protective or a negative effect on healing from the psychological and physical wounds of war, depending on the era in question. The thicker arrows in the figure represent the key influences of culture, developmental characteristics, and the type and characteristics of the trauma. All told, the context of traumatic events can significantly influence both initial and sustained responses to trauma; treatment needs; selection of prevention, intervention, and other treatment

Exhibit 1.1-3: Understanding the Levels Within the Social-Ecological Model of Trauma and Its Effects

Individual Factors	Interpersonal Factors	Community and Organizational Factors	Societal Factors	Cultural and Developmental Factors	Period of Time in History
Age, biophysical state, mental health status, temperament and other personality traits, education, gender, coping styles, socioeconomic status	Family, peer, and significant other interaction patterns, parent/family mental health, parents' history of trauma, social network	Neighborhood quality, school system and/or work environment, behavioral health system quality and accessibility, faith-based settings, transportation availability, community socioeconomic status, community employment rates	Laws, State and Federal economic and social policies, media, societal norms, judicial system	Collective or individualistic cultural norms, ethnicity, cultural subsystem norms, cognitive and maturational development	Societal attitudes related to military service members' homecomings, changes in diagnostic understanding between DSM-III-R* and DSM-5**

***Diagnostic and Statistical Manual of Mental Disorders,* Fifth Edition (APA, 2013a)

Case Illustration: Marisol

Marisol is a 28-year-old Latina woman working as a barista at a local coffee shop. One evening, she was driving home in the rain when a drunk driver crossed into her lane and hit her head on. Marisol remained conscious as she waited to be freed from the car and was then transported to the hospital. She sustained fractures to both legs. Her recovery involved two surgeries and nearly 6 months of rehabilitation, including initial hospitalization and outpatient physical therapy.

She described her friends and family as very supportive, saying that they often foresaw what she needed before she had to ask. She added that she had an incredible sense of gratitude for her employer and coworkers, who had taken turns visiting and driving her to appointments. Although she was able to return to work after 9 months, Marisol continued experiencing considerable distress about her inability to sleep well, which started just after the accident. Marisol describes repetitive dreams and memories of waiting to be transported to the hospital after the crash. The other driver was charged with driving under the influence (DUI), and it was reported that he had been convicted two other times for a DUI misdemeanor.

Answering the following questions will help you see how the different levels of influence affect the impact and outcome of the traumatic event Marisol experienced, as well as her responses to that event:

1. Based on the limited information provided in this illustration, how might Marisol's personality affect the responses of her family and friends, her coworkers, and the larger community?
2. In what ways could Marisol's ethnic and cultural background influence her recovery?
3. What societal factors could play a role in the car crash itself and the outcomes for Marisol and the other driver?

Explore the influence of the period of time in history during which the scenario occurs—compare the possible outcomes for both Marisol and the other driver if the crash occurred 40 years ago versus in the present day.

strategies; and ways of providing hope and promoting recovery.

Minimize the Risk of Retraumatization or Replicating Prior Trauma Dynamics

Trauma-informed treatment providers acknowledge that clients who have histories of trauma may be more likely to experience particular treatment procedures and practices as negative, reminiscent of specific characteristics of past trauma or abuse, or retraumatizing—feeling as if the past trauma is reoccurring or as if the treatment experience is as dangerous and unsafe as past traumas. For instance, clients may express feelings of powerlessness or being trapped if they are not actively involved in treatment decisions; if treatment processes or providers mirror specific behavior from the clients' past experiences with trauma, they may voice distress or respond in the same way as they did to the original trauma. Among the potentially retraumatizing elements of treatment are seclusion or "time-out" practices that isolate individuals, mislabeling client symptoms as personality or other mental disorders rather than as traumatic stress reactions, interactions that command authority, treatment assignments that could humiliate clients (such as asking a client to wear a sign in group that reflects one of their treatment issues, even if the assignment centers on positive attributes of the client), confronting clients as resistant, or presenting treatment as conditional upon conformity to the provider's beliefs and definitions of issues.

Clients' experiences are unique to the specific traumas they have faced and the surrounding

circumstances before, during, and after that trauma, so remember that even seemingly safe and standard treatment policies and procedures, including physical plant operations (e.g., maintenance, grounds, fire and safety procedures), may feel quite the contrary for a client if one or more of those elements is reminiscent of his or her experience of trauma in some way. Examples include having limited privacy or personal space, being interviewed in a room that feels too isolating or confining, undergoing physical examination by a medical professional of the same sex as the client's previous perpetrator of abuse, attending a group session in which another client expresses anger appropriately in a role play, or being directed not to talk about distressing experiences as a means of deescalating traumatic stress reactions.

Although some treatment policies or procedures are more obviously likely to solicit distress than others, *all* standard practices should be evaluated for their potential to retraumatize a client; this cannot be done without knowing the specific features of the individual's history of trauma. Consider, for instance, a treatment program that serves meals including entrees that combine more than one food group. Your client enters this program and refuses to eat most of the time; he expresses anger toward dietary staff and claims that food choices are limited. You may initially perceive your client's refusal to eat or to avoid certain foods as an eating disorder or a behavioral problem. However, a trauma-aware perspective might change your assumptions; consider that this client experienced neglect and abuse surrounding food throughout childhood (his mother forced him to eat meals prepared by combining anything in the refrigerator and cooking them together).

Advice to Counselors and Administrators: Sending the Right Message About Trauma

How often have you heard "We aren't equipped to handle trauma" or "We don't have time to deal with reactions that surface if traumatic experiences are discussed in treatment" from counselors and administrators in behavioral health services? For agencies, staff members, and clients, these statements present many difficulties and unwanted outcomes. For a client, such comments may replicate his or her earlier encounters with others (including family, friends, and previous behavioral health professionals) who had difficulty acknowledging or talking about traumatic experiences with him or her. A hands-off approach to trauma can also reinforce the client's own desire to avoid such discussions. Even when agencies and staff are motivated in these sentiments by a good intention—to contain clients' feelings of being overwhelmed—such a perspective sends strong messages to clients that their experiences are not important, that they are not capable of handling their trauma-associated feelings, and that dealing with traumatic experiences is simply too dangerous. Statements like these imply that recovery is not possible and provide no structured outlet to address memories of trauma or traumatic stress reactions.

Nevertheless, determining how and when to address traumatic stress in behavioral health services can be a real dilemma, especially if there are no trauma-specific philosophical, programmatic, or procedural processes in place. For example, it is difficult to provide an appropriate forum for a client to address past traumas if no forethought has been given to developing interagency and intra-agency collaborations for trauma-specific services. By anticipating the need for trauma-informed services and planning ahead to provide appropriate services to people who are affected by trauma, behavioral health service providers and program administrators can begin to develop informed intervention strategies that send a powerful, positive message:

- Both clients and providers can competently manage traumatic experiences and reactions.
- Providers are interested in hearing clients' stories and attending to their experiences.
- Recovery is possible.

As a treatment provider, you cannot consistently predict what may or may not be upsetting or retraumatizing to clients. Therefore, it is important to maintain vigilance and an attitude of curiosity with clients, inquiring about the concerns that they express and/or present in treatment. Remember that certain behaviors or emotional expressions can reflect what has happened to them in the past.

Foremost, a trauma-informed approach begins with taking practical steps to reexamine treatment strategies, program procedures, and organizational polices that could solicit distress or mirror common characteristics of traumatic experiences (loss of control, being trapped, or feeling disempowered). To better anticipate the interplay between various treatment elements and the more idiosyncratic aspects of a particular client's trauma history, you can:

- Work with the client to learn the cues he or she associates with past trauma.
- Obtain a good history.
- Maintain a supportive, empathetic, and collaborative relationship.
- Encourage ongoing dialog.
- Provide a clear message of availability and accessibility throughout treatment.

In sum, trauma-informed providers anticipate and respond to potential practices that may be perceived or experienced as retraumatizing to clients; they are able to forge new ways to respond to specific situations that trigger a trauma-related response, and they can provide clients with alternative ways of engaging in a particularly problematic element of treatment.

Create a Safe Environment

The need to create a safe environment is not new to providers; it involves an agency-wide effort supported by effective policies and procedures. However, creating safety within a trauma-informed framework far exceeds the standard expectations of physical plant safety (e.g., facility, environmental, and space-related concerns), security (of staff members, clients, and personal property), policies and procedures (including those specific to seclusion and restraint), emergency management and disaster planning, and adherence to client rights. Providers must be responsive and adapt the environment to establish and support clients' sense of physical and emotional safety.

Beyond anticipating that various environmental stimuli within a program may generate strong emotions and reactions in a trauma survivor (e.g., triggers such as lighting, access to exits, seating arrangements, emotionality within a group, or visual or auditory stimuli) and implementing strategies to help clients cope with triggers that evoke their experiences with trauma, other key elements in establishing a safe environment include consistency in client interactions and treatment processes, following through with what has been reviewed or agreed upon in sessions or meetings, and dependability. Mike's case illustration depicts ways in which the absence of these key elements could erode a client's sense of safety during the treatment process.

Neither providers nor service processes are always perfect. Sometimes, providers

Case Illustration: Mike

From the first time you provide outpatient counseling to Mike, you explain that he can call an agency number that will put him in direct contact with someone who can provide further assistance or support if he has emotional difficulty after the session or after agency hours. However, when he attempts to call one night, no one is available despite what you've described. Instead, Mike is directed by an operator to either use his local emergency room if he perceives his situation to be a crisis or to wait for someone on call to contact him. The inconsistency between what you told him in the session and what actually happens when he calls makes Mike feel unsafe and vulnerable.

unintentionally relay information inaccurately or inconsistently to clients or other staff members; other times, clients mishear something, or extenuating circumstances prevent providers from responding as promised. Creating safety is not about getting it right all the time; it's about how consistently and forthrightly you handle situations with a client when circumstances provoke feelings of being vulnerable or unsafe. Honest and compassionate communication that conveys a sense of handling the situation together generates safety. It is equally important that safety extends beyond the client. Counselors and other behavioral health staff members, including peer support specialists, need to be able to count on the agency to be responsive to and maintain their safety within the environment as well. By incorporating an organizational ethos that recognizes the importance of practices that promote physical safety and emotional well-being, behavioral health staff members may be more likely to seek support and supervision when needed and to comply with clinical and programmatic practices that minimize risks for themselves and their clients.

Beyond an attitudinal promotion of safety, organizational leaders need to consider and create avenues of professional development and assistance that will give their staff the means to seek support and process distressing circumstances or events that occur within the agency or among their clientele, such as case consultation and supervision, formal or informal processes to debrief service providers about difficult clinical issues, and referral processes for client psychological evaluations and employee assistance for staff. Organizational practices are only effective if supported by unswerving trauma awareness, training, and education among staff. Jane's case illustration shows the impact of a minor but necessary postponement in staff orientation for a new hire—not an unusual circumstance in behavioral health programs that have heavy caseloads and high staff turnover.

Identify Recovery From Trauma as a Primary Goal

Often, people who initiate or are receiving mental health or substance abuse services don't identify their experiences with trauma as a significant factor in their current challenges or problems. In part, this is because people who have been exposed to trauma, whether once or repeatedly, are generally reluctant to revisit it. They may already feel stuck in repetitive memories or experiences, which may add to their existing belief that any intervention will make matters worse or, at least, no better. For some clients, any introduction to their trauma-related memories or minor cues reminiscent of the trauma will cause them to experience strong, quick-to-surface emotions, supporting their belief that addressing trauma is dangerous and that they won't be able to handle the

Case Illustration: Jane

Jane, a newly hired female counselor, had a nephew who took his own life. The program that hired her was short of workers at the time; therefore, Jane did not have an opportunity to engage sufficiently in orientation outside of reviewing the policies and procedure manual. In an attempt to present well to her new employer and supervisor, she readily accepted client assignments without considering her recent loss. By not immersing herself in the program's perspective and policies on staff well-being, ethical and clinical considerations in client assignments, and how and when to seek supervision, Jane failed to engage in the practices, heavily supported by the agency, that promoted safety for herself and her clients. Subsequently, she felt emotionally overwhelmed at work and would often abruptly request psychiatric evaluation for clients who expressed any feelings of hopelessness out of sheer panic that they would attempt suicide.

emotions or thoughts that result from attempting to do so. Others readily view their experiences of trauma as being in the past; as a result, they engage in distraction, dissociation, and/or avoidance (as well as adaptation) due to a belief that trauma has little impact on their current lives and presenting problems. Even individuals who are quite aware of the impact that trauma has had on their lives may still struggle to translate or connect how these events continue to shape their choices, behaviors, and emotions. Many survivors draw no connection between trauma and their mental health or substance abuse problems, which makes it more difficult for them to see the value of trauma-informed or trauma-specific interventions, such as creating safety, engaging in psychoeducation, enhancing coping skills, and so forth.

As a trauma-informed provider, it is important that you help clients bridge the gap between their mental health and substance-related issues and the traumatic experiences they may have had. All too often, trauma occurs before substance use and mental disorders develop; then, such disorders and their associated symptoms and consequences create opportunities for additional traumatic events to occur. If individuals engage in mental health and substance abuse treatment without addressing the role that trauma has played in their lives, they are less likely to experience recovery in the long run. For example, a person with a history of trauma is more likely to have anxiety and depressive symptoms, use substances to self-medicate, and/or relapse after exposure to trauma-related cues. Thus, collaboration within and between behavioral health agencies is necessary to make integrated, timely, trauma-specific interventions available from the beginning to clients/consumers who engage in substance abuse and mental health services.

Support Control, Choice, and Autonomy

Not every client who has experienced trauma and is engaged in behavioral health services wants, or sees the need for, trauma-informed or trauma-specific treatment. Clients may think that they've already dealt with their trauma adequately, or they may believe that the effects of past trauma cause minimal distress for them. Other clients may voice the same sentiments, but without conviction—instead using avoidant behavior to deter distressing symptoms or reactions. Still others may struggle to see the role of trauma in their presenting challenges, not connecting their past traumatic experiences with other, more current difficulties (e.g., using substances to self-medicate strong emotions). Simply the idea of acknowledging trauma-related experiences and/or stress reactions may be too frightening or overwhelming for some clients, and others may fear that their reactions will be dismissed. On the other hand, some individuals want so much to dispense with their traumatic experiences and reactions that they hurriedly and repeatedly disclose their experiences before establishing a sufficiently safe environment or learning effective coping strategies to offset distress and other effects of retraumatization.

As these examples show, not everyone affected by trauma will approach trauma-informed services or recognize the impact of trauma in their lives in the same manner. This can be challenging to behavioral health service providers who are knowledgeable about the impact of trauma and who perceive the importance of addressing trauma and its effects with clients. As with knowing that different clients may be at different levels of awareness or stages of change in substance abuse treatment services, you should acknowledge that people affected by trauma

present an array of reactions, various levels of trauma awareness, and different degrees of urgency in their need to address trauma.

Appreciating clients' perception of their presenting problems and viewing their responses to the impact of trauma as adaptive—even when you believe their methods of dealing with trauma to be detrimental—are equally important elements of TIC. By taking the time to engage with clients and understand the ways they have perceived, adjusted to, and responded to traumatic experiences, providers are more likely to project the message that clients possess valuable personal expertise and knowledge about their own presenting problems. This shifts the viewpoint from "Providers know best" to the more collaborative "Together, we can find solutions."

How often have you heard from clients that they don't believe they can handle symptoms that emerge from reexperiencing traumatic cues or memories? Have you ever heard clients state that they can't trust themselves or their reactions, or that they never know when they are going to be triggered or how they are going to react? How confident would you feel about yourself if, at any time, a loud noise could initiate an immediate attempt to hide, duck, or dive behind something? Traumatic experiences have traditionally been described as exposure to events that cause intense fear, helplessness, horror, or feelings of loss of control. Participation in behavioral health services should not mirror these aspects of traumatic experience. Working collaboratively to facilitate clients' sense of control and to maximize clients' autonomy and choices throughout the treatment process, including treatment planning, is crucial in trauma-informed services.

For some individuals, gaining a sense of control and empowerment, along with understanding traumatic stress reactions, may be pivotal ingredients for recovery. By creating opportunities for empowerment, counselors and other behavioral health service providers help reinforce, clients' sense of competence, which is often eroded by trauma and prolonged traumatic stress reactions. Keep in mind that treatment strategies and procedures that prioritize client choice and control need not focus solely on major life decisions or treatment planning; you can apply such approaches to common tasks and everyday interactions between staff and consumers. Try asking your clients some of the following questions (which are only a sample of the types of questions that could be useful):

- What information would be helpful for us to know about what happened to you?
- Where/when would you like us to call you?
- How would you like to be addressed?
- Of the services I've described, which seem to match your present concerns and needs?
- From your experience, what responses from others appear to work best when you feel overwhelmed by your emotions?

Likewise, organizations need to reinforce the importance of staff autonomy, choice, and sense of control. What resources can staff members access, and what choices are available to them, in processing emotionally charged content or events in treatment? How often do administrators and supervisors seek out feedback on how to handle problematic situations (e.g., staff rotations for vacations, case consultations, changes in scheduling)? Think about the parallel between administration and staff members versus staff members and clients; often, the same philosophy, attitudes, and behaviors conveyed to staff members by administrative practices are mirrored in staff–client interactions. Simply stated, if staff members do not feel empowered, it will be a challenge for them to value the need for client empowerment. (For more information on administrative and workforce development issues, refer to Part 2, Chapters 1 and 2.)

Case Illustration: Mina

Mina initially sought counseling after her husband was admitted to an intensive outpatient drug and alcohol program. She was self-referred for low-grade depression, resentment toward her spouse, and codependency. When asked to define "codependency" and how the term applied to her, she responded that she always felt guilty and responsible for everyone in her family and for events that occurred even when she had little or no control over them.

After the intake and screening process, she expressed interest in attending group sessions that focused primarily on family issues and substance abuse, wherein her presenting concerns could be explored. In addition to describing dynamics and issues relating to substance abuse and its impact on her marriage, she referred to her low mood as frozen grief. During treatment, she reluctantly began to talk about an event that she described as life changing: the loss of her father. The story began to unfold in group; her father, who had been 62 years old, was driving her to visit a cousin. During the ride, he had a heart attack and drove off the road. As the car came to stop in a field, she remembered calling 911 and beginning cardiopulmonary resuscitation while waiting for the ambulance. She rode with the paramedics to the hospital, watching them work to save her father's life; however, he was pronounced dead soon after arrival.

She always felt that she never really said goodbye to her father. In group, she was asked what she would need to do or say to feel as if she had revisited that opportunity. She responded in quite a unique way, saying, "I can't really answer this question; the lighting isn't right for me to talk about my dad." The counselor encouraged her to adjust the lighting so that it felt "right" to her. Being invited to do so turned out to be pivotal in her ability to address her loss and to say goodbye to her father on her terms. She spent nearly 10 minutes moving the dimmer switch for the lighting as others in the group patiently waited for her to return to her chair. She then began to talk about what happened during the evening of her father's death, their relationship, the events leading up to that evening, what she had wanted to say to him at the hospital, and the things that she had been wanting to share with him since his death.

Weeks later, as the group was coming to a close, each member spoke about the most important experiences, tools, and insights that he or she had taken from participating. Mina disclosed that the group helped her establish boundaries and coping strategies within her marriage, but said that the event that made the most difference for her had been having the ability to adjust the lighting in the room. She explained that this had allowed her to control something over which she had been powerless during her father's death. To her, the lighting had seemed to stand out more than other details at the scene of the accident, during the ambulance ride, and at the hospital. She felt that the personal experience of losing her father and needing to be with him in the emergency room was marred by the obtrusiveness of staff, procedures, machines, and especially, the harsh lighting. She reflected that she now saw the lighting as a representation of this tragic event and the lack of privacy she had experienced when trying to say goodbye to her father. Mina stated that this moment in group had been the greatest gift: "…to be able to say my goodbyes the way I wanted… I was given an opportunity to have some control over a tragic event where I couldn't control the outcome no matter how hard I tried."

Create Collaborative Relationships and Participation Opportunities

This trauma-informed principle encompasses three main tenets. First, **ensure that the provider–client relationship is collaborative**, regardless of setting or service. Agency staff members cannot make decisions pertaining to interventions or involvement in community services autocratically; instead, they should develop trauma-informed, individualized care plans and/or treatment plans collaboratively with the client and, when appropriate, with family and caregivers. The nonauthoritarian approach that characterizes TIC views clients

as the experts in their own lives and current struggles, thereby emphasizing that clients and providers can learn from each other.

The second tenet is to **build collaboration beyond the provider–client relationship**. Building ongoing relationships across the service system, provider networks, and the local community enhances TIC continuity as clients move from one level of service to the next or when they are involved in multiple services at one time. It also allows you to learn about resources available to your clients in the service system or community and to connect with providers who have more advanced training in trauma-specific interventions and services.

The third tenet emphasizes the need to **ensure client/consumer representation and participation in behavioral health program development, planning, and evaluation as well as in the professional development of behavioral health workers**. To achieve trauma-informed competence in an organization or across systems, clients need to play an active role; this starts with providing program feedback. However, consumer involvement should not end there; rather, it should be encouraged throughout the implementation of trauma-informed services. So too, clients, potential clients, their families, and the community should be invited to participate in forming any behavioral health organization's plans to improve trauma-informed competence, provide TIC, and design relevant treatment services and organizational policies and procedures.

Trauma-informed principles and practices generated without the input of people affected by trauma are difficult to apply effectively. Likewise, staff trainings and presentations should include individuals who have felt the impact of trauma. Their participation reaches past the purely cognitive aspects of such education to offer a personal perspective on the strengths and resilience of people who have experienced trauma. The involvement of trauma survivors in behavioral health education lends a human face to subject matter that is all too easily made cerebral by some staff members in an attempt to avoid the emotionality of the topic.

Consumer participation also means giving clients/consumers the chance to obtain State training and certification, as well as employment in behavioral health settings as peer specialists. Programs that incorporate peer support services reinforce a powerful message—that provider–consumer partnership is important, and that consumers are valued. Peer support specialists are self-identified individuals who have progressed in their own recovery from alcohol dependence, drug addiction, and/or a mental disorder and work within behavioral health programs or at peer support centers to assist others with similar disorders and/or life experiences. Tasks and responsibilities may include leading a peer support group; modeling effective coping, help-seeking, and self-care strategies; helping clients practice new skills or monitor progress; promoting positive self-image to combat clients' potentially negative feelings about themselves and the discrimination they may perceive in the program or community; handling case management tasks; advocating for program changes; and representing a voice of hope that views recovery as possible.

Familiarize the Client With Trauma-Informed Services

Without thinking too much about it, you probably know the purpose of an intake process, the correct way to complete a screening device, the meaning of a lot of the jargon specific to behavioral health, and your program's expectations for client participation; in fact, maybe you're already involved in facilitating these processes in behavioral health services every day, and they've become almost

automatic for you. This can make it easy to forget that nearly everything clients and their families encounter in seeking behavioral health assistance is new to them. Thus, introducing clients to program services, activities, and interventions in a manner that *expects* them to be unfamiliar with these processes is essential, regardless of their clinical and treatment history. Beyond addressing the unfamiliarity of services, educating clients about each process—from first contact all the way through recovery services—gives them a chance to participate actively and make informed decisions across the continuum of care.

Familiarizing clients with trauma-informed services extends beyond explaining program services or treatment processes; it involves explaining the value and type of trauma-related questions that may be asked during an intake process, educating clients about trauma to help normalize traumatic stress reactions, and discussing trauma-specific interventions and other available services (including explanations of treatment methodologies and of the rationale behind specific interventions). Developmentally appropriate psychoeducation about trauma-informed services allows clients to be informed participants.

Incorporate Universal Routine Screenings for Trauma

Screening universally for client histories, experiences, and symptoms of trauma at intake can benefit clients and providers. Most providers know that clients can be affected by trauma, but universal screening provides a steady reminder to be watchful for past traumatic experiences and their potential influence upon a client's interactions and engagement with services across the continuum of care. Screening should guide treatment planning; it alerts the staff to potential issues and serves as a valuable tool to increase clients' awareness of the possible impact of trauma and the importance of addressing related issues during treatment.

Nonetheless, screenings are only as useful as the guidelines and processes established to address positive screens (which occur when clients respond to screening questions in a way that signifies possible trauma-related symptoms or histories). Staff should be trained to use screening tools consistently so that all clients are screened in the same way. Staff members also need to know how to score screenings and when specific variables (e.g., race/ethnicity, native language, gender, culture) may influence screening results. For example, a woman who has been sexually assaulted by a man may be wary of responding to questions if a male staff member or interpreter administers the screening or provides translation services. Likewise, a person in a current abusive or violent relationship may not acknowledge the interpersonal violence in fear of retaliation or as a result of disconnection or denial of his or her experience, and he or she may have difficulty in processing and then living between two worlds—what is acknowledged in treatment versus what is experienced at home.

In addition, staff training on using trauma-related screening tools needs to center on how and when to gather relevant information after the screening is complete. Organizational policies and procedures should guide staff members on how to respond to a positive screening, such as by making a referral for an indepth assessment of traumatic stress, providing the client with an introductory psychoeducational session on the typical biopsychosocial effects of trauma, and/or coordinating care so that the client gains access to trauma-specific services that meet his or her needs. Screening tool selection is an important ingredient in incorporating routine, universal screening practices into behavioral health services. Many screening tools are available, yet they differ in format

and in how they present questions. Select tools based not just on sound test properties, but also according to whether they encompass a broad range of experiences typically considered traumatic and are flexible enough to allow for an individual's own interpretation of traumatic events. For more information on screening and assessment of trauma and trauma-related symptoms and effects, see Chapter 4, "Screening and Assessment," in this TIP.

View Trauma Through a Sociocultural Lens

To understand how trauma affects an individual, family, or community, you must first understand life experiences and cultural background as key contextual elements for that trauma. As demonstrated in Exhibit 1.1-2, many factors shape traumatic experiences and individual and community responses to it; one of the most significant factors is culture. It influences the interpretation and meaning of traumatic events, individual beliefs regarding personal responsibility for the trauma and subsequent responses, and the meaning and acceptability of symptoms, support, and help-seeking behaviors. As this TIP proceeds to describe the differences among cultures pertaining to trauma, remember that there are numerous cross-cutting factors that can directly or indirectly influence the attitudes, beliefs, behaviors, resources, and opportunities within a given culture, subculture, or racial and/or ethnic group (Exhibit 1.1-4). For an indepth

Exhibit 1.1-4: Cross-Cutting Factors of Culture

Culture and Trauma

- Some populations and cultures are more likely than others to experience a traumatic event or a specific type of trauma.
- Rates of traumatic stress are high across all diverse populations and cultures that face military action and political violence.
- Culture influences not only whether certain events are perceived as traumatic, but also how an individual interprets and assigns meaning to the trauma.
- Some traumas may have greater impact on a given culture because those traumas represent something significant for that culture or disrupt cultural practices or ways of life.
- Culture determines acceptable responses to trauma and shapes the expression of distress. It significantly influences how people convey traumatic stress through behavior, emotions, and thinking immediately following a trauma and well after the traumatic experience has ceased.
- Traumatic stress symptoms vary according to the type of trauma within the culture.
- Culture affects what qualifies as a legitimate health concern and which symptoms warrant help.
- In addition to shaping beliefs about acceptable forms of help-seeking behavior and healing practices, culture can provide a source of strength, unique coping strategies, and specific resources.

exploration of these cross-cutting cultural factors, refer to the planned TIP, *Improving Cultural Competence* (SAMHSA, planned c).

When establishing TIC, it is vital that behavioral health systems, service providers, licensing agencies, and accrediting bodies build culturally responsive practices into their curricula, standards, policies and procedures, and credentialing processes. The implementation of culturally responsive practices will further guide the treatment planning process so that trauma-informed services are more appropriate and likely to succeed.

Use a Strengths-Focused Perspective: Promote Resilience

Fostering individual strengths is a key step in prevention when working with people who have been exposed to trauma. It is also an essential intervention strategy—one that builds on the individual's existing resources and views him or her as a resourceful, resilient survivor. Individuals who have experienced trauma develop many strategies and/or behaviors to adapt to its emotional, cognitive, spiritual, and physical consequences. Some behaviors may be effective across time, whereas others may eventually produce difficulties and disrupt the healing process. Traditionally, behavioral health services have tended to focus on presenting problems, risk factors, and symptoms in an attempt to prevent negative outcomes, provide relief, increase clients' level of functioning, and facilitate healing. However, focusing too much on these areas can undermine clients' sense of competence and hope. Targeting only presenting problems and symptoms does not provide individuals with an opportunity to see their own resourcefulness in managing very stressful and difficult experiences. It is important for providers to engage in interventions using a balanced approach that targets the strengths clients have

> "Trauma informed care recognizes symptoms as originating from adaptations to the traumatic event(s) or context. Validating resilience is important even when past coping behaviors are now causing problems. Understanding a symptom as an adaptation reduces a survivor's guilt and shame, increases their self esteem and provides a guideline for developing new skills and resources to allow new and better adaptation to the current situation."
>
> (Elliot et al., 2005, p. 467)

Advice to Counselors and Administrators: Using Strengths-Oriented Questions

Knowing a client's strengths can help you understand, redefine, and reframe the client's presenting problems and challenges. By focusing and building on an individual's strengths, counselors and other behavioral health professionals can shift the focus from "What is wrong with you?" to "What has worked for you?" It moves attention away from trauma-related problems and toward a perspective that honors and uses adaptive behaviors and strengths to move clients along in recovery.

Potential strengths-oriented questions include:

- The history that you provided suggests that you've accomplished a great deal since the trauma. What are some of the accomplishments that give you the most pride?
- What would you say are your strengths?
- How do you manage your stress today?
- What behaviors have helped you survive your traumatic experiences (during and afterward)?
- What are some of the creative ways that you deal with painful feelings?
- You have survived trauma. What characteristics have helped you manage these experiences and the challenges that they have created in your life?
- If we were to ask someone in your life, who knew your history and experience with trauma, to name two positive characteristics that help you survive, what would they be?
- What coping tools have you learned from your _____ (fill in: cultural history, spiritual practices, athletic pursuits, etc.)?
- Imagine for a moment that a group of people are standing behind you showing you support in some way. Who would be standing there? It doesn't matter how briefly or when they showed up in your life, or whether or not they are currently in your life or alive.
- How do you gain support today? (Possible answers include family, friends, activities, coaches, counselors, other supports, etc.)
- What does recovery look like for you?

developed to survive their experiences and to thrive in recovery. A strengths-based, resilience-minded approach lets trauma survivors begin to acknowledge and appreciate their fortitude and the behaviors that help them survive.

Foster Trauma-Resistant Skills

Trauma-informed services build a foundation on which individuals can begin to explore the role of trauma in their lives; such services can also help determine how best to address and tailor interventions to meet their needs. Prevention, mental health, and substance abuse treatment services should include teaching clients about how trauma can affect their lives; these services should also focus on developing self-care skills, coping strategies, supportive networks, and a sense of competence. Building trauma-resistant skills begins with normalizing the symptoms of traumatic stress and helping clients who have experienced trauma connect the dots between current problems and past trauma when appropriate.

Nevertheless, TIC and trauma-specific interventions that focus on skill-building should not do so at the expense of acknowledging individual strengths, creativity in adapting to trauma, and inherent attributes and tools clients possesses to combat the effects of trauma. Some theoretical models that use skill-building strategies base the value of this approach on a deficit perspective; they assume that some individuals lack the necessary tools to manage specific situations and, because of this deficiency, they encounter problems that others with effective skills would not experience. This type of perspective further assumes that, to recover, these individuals must learn new coping skills and behavior. TIC, on the other hand, makes the assumption that clients

Advice to Administrators: Self-Assessment for Trauma-Informed Systems

NCTIC has developed a self-assessment package for trauma-informed systems to help administrators structurally incorporate trauma into programs and services. The self-assessment can be used by systems of care to guide quality improvement with the goal of establishing fully trauma-informed treatment and recovery efforts (NCTIC, Center for Mental Health Services, 2007). Behavioral health treatment program administrators can use these materials and NCTIC as resources for improvement in delivering TIC.

are the experts in their own lives and have learned to adapt and acquire skills to survive. The TIC approach honors each individual's adaptations and acquired skills, and it helps clients explore how these may not be working as well as they had in the past and how their current repertoire of responses may not be as effective as other strategies.

Demonstrate Organizational and Administrative Commitment to TIC

Becoming a trauma-informed organization requires administrative guidance and support across all levels of an agency. Behavioral health staff will not likely sustain TIC practices without the organization's ongoing commitment to support professional development and to allocate resources that promote these practices. An agency that wishes to commit to TIC will benefit from an organizational assessment of how staff members identify and manage trauma and trauma-related reactions in their clients. Are they trauma aware—do they recognize that trauma can significantly affect a client's ability to function in one or more areas of his or her life? Do the staff members understand that traumatic experiences and trauma-related reactions can greatly influence clients' engagement, participation, and response to services?

Agencies need to embrace specific strategies across each level of the organization to create trauma-informed services; this begins with staff education on the impact of trauma among clients. Other agency strategies that reflect a trauma-informed infrastructure include, but are not limited to:

- Universal screening and assessment procedures for trauma.
- Interagency and intra-agency collaboration to secure trauma-specific services.
- Referral agreements and networks to match clients' needs.
- Mission and value statements endorsing the importance of trauma recognition.
- Consumer- and community-supported committees and trauma response teams.
- Workforce development strategies, including hiring practices.
- Professional development plans, including staff training/supervision focused on TIC.
- Program policies and procedures that ensure trauma recognition and secure trauma-informed practices, trauma-specific services, and prevention of retraumatization.

TIC requires organizational commitment, and often, cultural change. For more information on implementing TIC in organizations, see Part 2, Chapter 1 of this TIP.

Develop Strategies To Address Secondary Trauma and Promote Self-Care

Secondary trauma is a normal occupational hazard for mental health and substance abuse professionals, particularly those who serve populations that are likely to include survivors of trauma (Figley, 1995; Klinic Community Health Centre, 2008). Behavioral health staff members who experience secondary trauma present a range of traumatic stress reactions

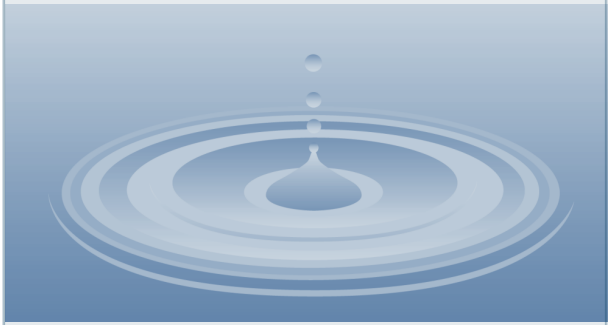
and effects from providing services focused on trauma or listening to clients recount traumatic experiences. So too, when a counselor has a history of personal trauma, working with trauma survivors may evoke memories of the counselor's own trauma history, which may increase the potential for secondary traumatization.

The range of reactions that manifest with secondary trauma can be, but are not necessarily, similar to the reactions presented by clients who have experienced primary trauma. Symptoms of secondary trauma can produce varying levels of difficulty, impairment, or distress in daily functioning; these may or may not meet diagnostic thresholds for acute stress, posttraumatic stress, or adjustment, anxiety, or mood disorders (Bober & Regehr, 2006). Symptoms may include physical or psychological reactions to traumatic memories clients have shared; avoidance behaviors during client interactions or when recalling emotional content in supervision; numbness, limited emotional expression, or diminished affect; somatic complaints; heightened arousal, including insomnia; negative thinking or depressed mood; and detachment from family, friends, and other supports (Maschi & Brown, 2010).

Working daily with individuals who have been traumatized can be a burden for counselors and other behavioral health service providers, but all too often, they blame the symptoms resulting from that burden on other stressors at work or at home. Only in the past 2 decades have literature and trainings begun paying attention to secondary trauma or compassion fatigue; even so, agencies often do not translate this knowledge into routine prevention practices. Counselors and other staff members may find it difficult to engage in activities that could ward off secondary trauma due to time constraints, workload, lack of agency resources, and/or an organizational culture that disapproves of help-seeking or provides inadequate staff support. The demands of providing care to trauma survivors cannot be ignored, lest the provider become increasingly impaired and less effective. Counselors with unacknowledged secondary trauma can cause harm to clients via poorly enforced boundaries, missed appointments, or even abandonment of clients and their needs (Pearlman & Saakvitne, 1995).

Essential components of TIC include organizational and personal strategies to address

The Impact of Trauma



Trauma is similar to a rock hitting the water's surface. The impact first creates the largest wave, which is followed by ever-expanding, but less intense, ripples. Likewise, the influence of a given trauma can be broad, but generally, its effects are less intense for individuals further removed from the trauma; eventually, its impact dissipates all around. For trauma survivors, the impact of trauma can be far-reaching and can affect life areas and relationships long after the trauma occurred. This analogy can also broadly describe the recovery process for individuals who have experienced trauma and for those who have the privilege of hearing their stories. As survivors reveal their trauma-related experiences and struggles to a counselor or another caregiver, the trauma becomes a shared experience, although it is not likely to be as intense for the caregiver as it was for the individual who experienced the trauma. The caregiver may hold onto the trauma's known and unknown effects or may consciously decide to engage in behaviors that provide support to further dissipate the impact of this trauma and the risk of secondary trauma.

Advice to Counselors: Decreasing the Risk of Secondary Trauma and Promoting Self-Care

- **Peer support.** Maintaining adequate social support will help prevent isolation and depression.
- **Supervision and consultation.** Seeking professional support will enable you to understand your own responses to clients and to work with them more effectively.
- **Training.** Ongoing professional training can improve your belief in your abilities to assist clients in their recoveries.
- **Personal therapy.** Obtaining treatment can help you manage specific problems and become better able to provide good treatment to your clients.
- **Maintaining balance.** A healthy, balanced lifestyle can make you more resilient in managing any difficult circumstances you may face.
- **Setting clear limits and boundaries with clients.** Clearly separating your personal and work life allows time to rejuvenate from stresses inherent in being a professional caregiver.

secondary trauma and its physical, cognitive, emotional, and spiritual consequences. In agencies and among individual providers, it is key for the culture to promote acceptability, accessibility, and accountability in seeking help, accessing support and supervision, and engaging in self-care behaviors in and outside of the agency or office. Agencies should involve staff members who work with trauma in developing informal and formal agency practices and procedures to prevent or address secondary trauma. Even though a number of community-based agencies face fiscal constraints, prevention strategies for secondary trauma can be intertwined with the current infrastructure (e.g., staff meetings, education, case consultations and group case discussions, group support, debriefing sessions as appropriate, supervision). For more information on strategies to address and prevent secondary trauma, see Part 2, Chapter 2 of this TIP.

Provide Hope—Recovery Is Possible

What defines recovery from trauma-related symptoms and traumatic stress disorders? Is it the total absence of symptoms or consequences? Does it mean that clients stop having nightmares or being reminded, by cues, of past trauma? When clients who have experienced trauma enter into a helping relationship to address trauma specifically, they are often looking for a cure, a remission of symptoms, or relief from the pain as quickly as possible. However, they often possess a history of unpredictable symptoms and symptom intensity that reinforces an underlying belief that recovery is not possible. On one hand, clients are looking for a message that they can be cured, while on the other hand, they have serious doubts about the likely success of any intervention.

Clients often express ambivalence about dealing with trauma even if they are fully aware of trauma's effects on their lives. The idea of living with more discomfort as they address the past or as they experiment with alternative ways of dealing with trauma-related symptoms or consequences is not an appealing prospect, and it typically elicits fear. Clients may interpret the uncomfortable feelings as dangerous or unsafe even in an environment and relationship that is safe and supportive.

How do you promote hope and relay a message that recovery is possible? First, maintain consistency in delivering services, promoting and providing safety for clients, and showing respect and compassion within the client–provider relationship. Along with clients' commitment to learning how to create safety for themselves, counselors and agencies need

to be aware of, and circumvent, practices that could retraumatize clients. Projecting hope and reinforcing the belief that recovery is possible extends well beyond the practice of establishing safety; it also encompasses discussing what recovery means and how it looks to clients, as well as identifying how they will know that they've entered into recovery in earnest.

Providing hope involves projecting an attitude that recovery is possible. This attitude also involves viewing clients as competent to make changes that will allow them to deal with trauma-related challenges, providing opportunities for them to practice dealing with difficult situations, and normalizing discomfort or difficult emotions and framing these as manageable rather than dangerous. If you convey this attitude consistently to your clients, they will begin to understand that discomfort is not a signal to avoid, but a sign to engage—and that behavioral, cognitive, and emotional responses to cues associated with previous traumas are a normal part of the recovery process. It's not the absence of responses to such triggers that mark recovery, but rather, how clients experience and manage those responses. Clients can also benefit from interacting with others who are further along in their recovery from trauma. Time spent with peer support staff or sharing stories with other trauma survivors who are well on their way to recovery is invaluable—it sends a powerful message that recovery is achievable, that there is no shame in being a trauma survivor, and that there is a future beyond the trauma.

As You Proceed

This chapter has established the foundation and rationale of this TIP, reviewed trauma-informed concepts and terminology, and provided an overview of TIC principles and a guiding framework for this text. As you proceed, be aware of the wide-ranging responses to trauma that occur not only across racially and ethnically diverse groups but also within specific communities, families, and individuals. Counselors, prevention specialists, other behavioral health workers, supervisors, and organizations all need to develop skills to create an environment that is responsive to the unique attributes and experiences of each client. As you read this TIP, remember that many cross-cutting factors influence the experiences, help-seeking behaviors, intervention responses, and outcomes of individuals, families, and populations who have survived trauma. Single, multiple, or chronic exposures to traumatic events, as well as the emotional, cognitive, behavioral, and spiritual responses to trauma, need to be understood within a social-ecological framework that recognizes the many ingredients prior to, during, and after traumatic experiences that set the stage for recovery.

2 Trauma Awareness

IN THIS CHAPTER

- Types of Trauma
- Characteristics of Trauma
- Individual and Sociocultural Features

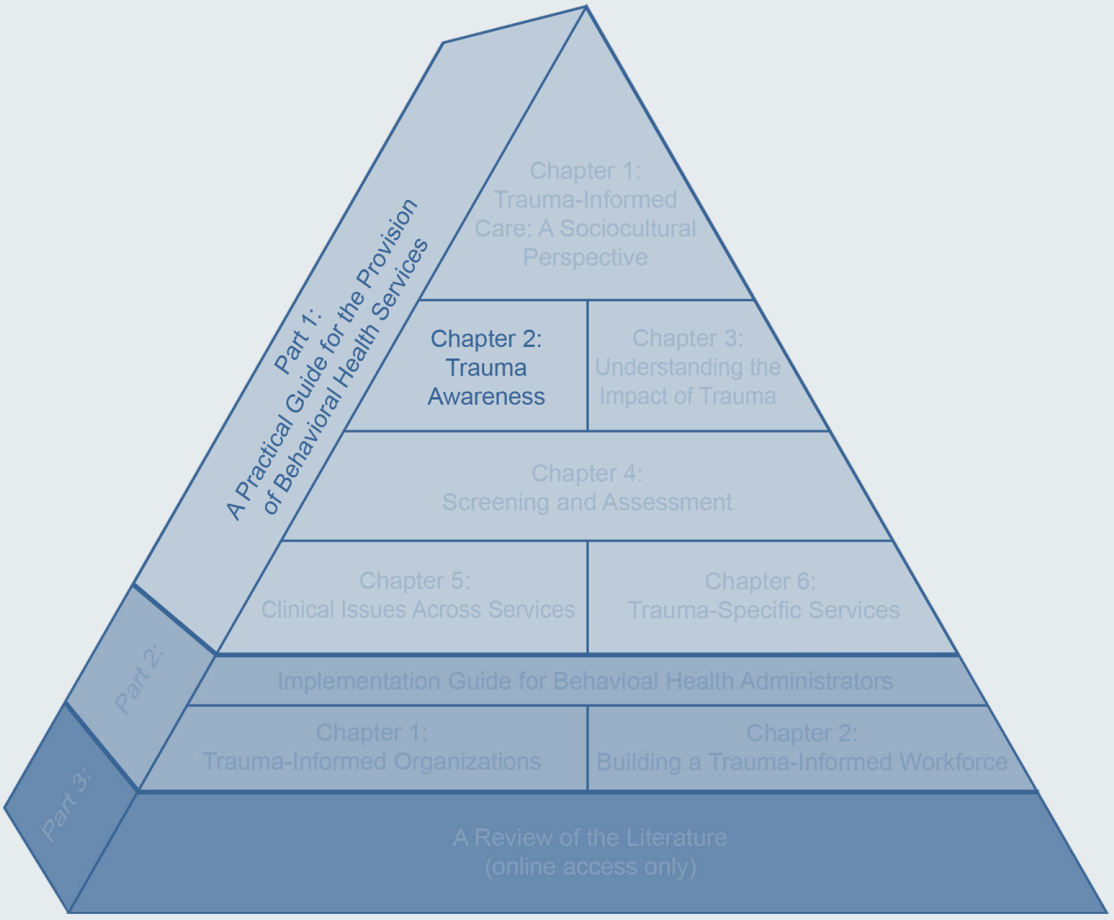
Traumatic experiences typically do not result in long-term impairment for most individuals. It is normal to experience such events across the lifespan; often, individuals, families, and communities respond to them with resilience. This chapter explores several main elements that influence why people respond differently to trauma. Using the social-ecological model outlined in Part 1, Chapter 1, this chapter explores some of the contextual and systemic dynamics that influence individual and community perceptions of trauma and its impact. The three main foci are: types of trauma, objective and subjective characteristics of trauma, and individual and sociocultural features that serve as risk or protective factors.

This chapter's main objective is to highlight the key characteristics of traumatic experiences. Trauma-informed behavioral health service providers understand that many influences shape the effects of trauma among individuals and communities—it is not just the event that determines the outcome, but also the event's context and the resultant interactions across systems.

Types of Trauma

The following section reviews various forms and types of trauma. It does not cover every conceivable trauma that an individual, group, or community may encounter. Specific traumas are reviewed only once, even when they could fit in multiple categories of trauma. Additionally, the order of appearance does not denote a specific trauma's importance or prevalence, and there is no lack of relevance implied if a given trauma is not specifically addressed in this Treatment Improvement Protocol (TIP). The intent is to give a broad perspective of the various categories and types of trauma to behavioral health workers who wish to be trauma informed.

TIC Framework in Behavioral Health Services—Trauma Awareness



Natural or Human-Caused Traumas

The classification of a trauma as natural or caused by humans can have a significant impact on the ways people react to it and on the types of assistance mobilized in its aftermath (see Exhibit 1.2-1 for trauma examples). Natural traumatic experiences can directly affect a small number of people, such as a tree falling on a car during a rainstorm, or many people and communities, as with a hurricane. Natural events, often referred to as "acts of God," are typically unavoidable. Human-caused traumas are caused by human failure (e.g., technological catastrophes, accidents, malevolence) or by human design (e.g., war). Although multiple factors contribute to the severity of a natural or human-caused trauma, traumas perceived as intentionally harmful often make the event more traumatic for people and communities.

For information on resources to prepare States, Territories, and local entities to deliver effective mental health and substance abuse responses during disasters, contact the Substance Abuse and Mental Health Services Administration's (SAMHSA's) Disaster Technical Assistance Center:

4350 East West Hwy, Suite 1100
Bethesda, MD 20814 6233
Phone: 1 800 308 3515
Fax: 1 800 311 7691
Email: DTAC@samhsa.hhs.gov

Exhibit 1.2-1: Trauma Examples

Caused Naturally	Caused by People	
	Accidents, Technological Catastrophes	Intentional Acts
Tornado	Train derailment	Arson
Lightning strike	Roofing fall	Terrorism
Wildfire	Structural collapse	Sexual assault and abuse
Avalanche	Mountaineering accident	Homicides or suicides
Physical ailment or disease	Aircraft crash	Mob violence or rioting
Fallen tree	Car accident due to malfunction	Physical abuse and neglect
Earthquake	Mine collapse or fire	Stabbing or shooting
Dust storm	Radiation leak	Warfare
Volcanic eruption	Crane collapse	Domestic violence
Blizzard	Gas explosion	Poisoned water supply
Hurricane	Electrocution	Human trafficking
Cyclone	Machinery-related accident	School violence
Typhoon	Oil spill	Torture
Meteorite	Maritime accident	Home invasion
Flood	Accidental gun shooting	Bank robbery
Tsunami	Sports-related death	Genocide
Epidemic		Medical or food tampering
Famine		
Landslide or fallen boulder		

How survivors of natural trauma respond to the experience often depends on the degree of devastation, the extent of individual and community losses, and the amount of time it takes to reestablish daily routines, activities, and services (e.g., returning to school or work, being able to do laundry, having products to buy in a local store). The amount, accessibility, and duration of relief services can significantly influence the duration of traumatic stress reactions as well as the recovery process.

Alongside the disruption of daily routines, the presence of community members or outsiders in affected areas may add significant stress or create traumatic experiences in and of themselves. Examples include the threat of others stealing what remains of personal property, restrictions on travel or access to property or living quarters, disruption of privacy within shelters, media attention, and subsequent exposure to repetitive images reflecting the devastation. Therefore, it isn't just the natural disaster or event that can challenge an individual or community; often, the consequences of the event and behavioral responses from others within and outside the community play a role in pushing survivors away from effective coping or toward resilience and recovery.

Human-caused traumas are fundamentally different from natural disasters. They are either intentional, such as a convenience store robbery at gunpoint, or unintentional, such as the technological accident of a bridge collapse (as occurred in Minneapolis, Minnesota, in 2007; U.S. Fire Administration, 2007). The subsequent reactions to these traumas often depend on their intentionality. However, a person or group of people is typically the target of the survivors' anger and blame. Survivors of an unintentionally human-caused traumatic event may feel angry and frustrated because of the lack of protection or care offered by the responsible party or government, particularly if there has been a perceived act of omission. After intentional human-caused acts, survivors often struggle to understand the

Case Illustrations: Quecreek Mine Flood and Greensburg's Tornado

Quecreek Mine Flood

The year following the rescue of nine miners from the Quecreek mine in western Pennsylvania in 2002 was a difficult one for residents of Somerset County. The dazzle of publicity surrounding a handful of workers from a small town, tension between miners and rescuers, and animosity over money for movie and book deals, in addition to the trauma itself, resulted in a rescuer's suicide, a number of miners having trauma-related symptoms, and several rescuers needing to seek treatment for posttraumatic stress disorder (PTSD; Goodell, 2003).

Greensburg's Tornado

Greensburg, a small town in southern Kansas, was hit by a large tornado in 2007 that killed 11 residents and leveled 95 percent of the town while causing severe damage to the remaining 5 percent. Families and community members experienced significant grief and traumatic stress after the disaster. Yet today, Greensburg is rebuilding with a focus on being "green"—that is, environmentally responsible—from design to construction and all the way through demolition. This town has the highest number of Leadership in Energy and Environmental Design–certified buildings in the world. A reality television show about the town's reinvention ran for three seasons, demonstrating the town's residents and business owners working with local government and various corporations to make their home an even better place than it was before the tornado.

motives for performing the act, the calculated or random nature of the act, and the psychological makeup of the perpetrator(s).

Individual, Group, Community, and Mass Traumas

In recognizing the role of trauma and understanding responses to it, consider whether the trauma primarily affected an individual and perhaps his or her family (e.g., automobile accident, sexual or physical assault, severe illness); occurred within the context of a group (e.g., trauma experienced by first responders or those who have seen military combat) or community (e.g., gang-related shootings); transpired within a certain culture; or was a large-scale disaster (e.g., hurricane, terrorist attack). This context can have significant implications for whether (and how) people experience shame as a result of the trauma, the kinds of support and compassion they receive, whether their experiences are normalized or diminished by others, and even the kinds of services they are offered to help them recover and cope.

Individual trauma

An individual trauma refers to an event that only occurs to one person. It can be a single event (e.g., mugging, rape, physical attack, work-related physical injury) or multiple or prolonged events (e.g., a life-threatening illness, multiple sexual assaults). Although the trauma directly affects just one individual, others who know the person and/or are aware of the trauma will likely experience emotional repercussions from the event(s) as well, such as recounting what they said to the person before the event, reacting in disbelief, or thinking that it could just as easily have happened to them, too.

Survivors of individual trauma may not receive the environmental support and concern that members of collectively traumatized groups and communities receive. They are less likely to reveal their traumas or to receive validation of their experiences. Often, shame distorts their perception of responsibility for the trauma. Some survivors of individual traumas, especially those who have kept the trauma secret, may not receive needed comfort and

Advice to Counselors: Working With Clients Who Have Experienced Individual Traumas

In working with clients who have histories of individual trauma, counselors should consider that:

- Empathy, or putting oneself in the shoes of another, is more potent than sympathy (expressing a feeling of sorrow for another person).
- Some clients need to briefly describe the trauma(s) they have experienced, particularly in the early stages of recovery. Strategies that focus on reexperiencing the trauma, retrieving feelings related to the trauma, and bringing past experiences to the forefront should only be implemented if trauma-specific treatment planning and services are available.
- Understanding the trauma, especially in early recovery, should begin with educating the client about and normalizing trauma-related symptoms, creating a sense of safety within the treatment environment, and addressing how trauma symptoms may interfere with the client's life in the present.
- It is helpful to examine how the trauma affects opportunities to receive substance abuse and/or mental health treatment as well as treatment for and recovery from the trauma itself (e.g., by limiting one's willingness to share in or participate in group counseling).
- Identifying and exploring strengths in the client's history can help the client apply those strengths to his or her ability to function in the present.

acceptance from others; they are also are more likely to struggle with issues of causation (e.g., a young woman may feel unduly responsible for a sexual assault), to feel isolated by the trauma, and to experience repeated trauma that makes them feel victimized.

Physical injuries

Physical injuries are among the most prevalent individual traumas. Millions of emergency room (ER) visits each year relate directly to physical injuries. Most trauma patients are relatively young; about 70 percent of injury-related ER cases are people younger than 45 years old (McCaig & Burt, 2005). Dedicated ER hospital units, known as "trauma centers," specialize in physical traumas such as gunshot wounds, stabbings, and other immediate physical injuries. The term "trauma" in relation to ERs does not refer to psychological trauma, which is the focus of this TIP, yet physical injuries can be associated with psychological trauma. Sudden, unexpected, adverse health-related events can lead to extensive psychological trauma for patients and their families.

Excessive alcohol use is the leading risk factor for physical injuries; it's also the most promising target for injury prevention. Studies consistently connect injuries and substance use (Gentilello, Ebel, Wickizer, Salkever, & Rivara, 2005); nearly 50 percent of patients admitted to trauma centers have injuries attributable to alcohol abuse and dependence (Gentilello et al., 1999). One study found that two thirds of ambulatory assault victims presenting to an ER had positive substance use urinalysis results; more than half of all victims had PTSD 3 months later (Roy-Byrne et al.,

Acute stress disorder (ASD) prevalence among patients at medical trauma centers is very high, making trauma related disorders some of the most common complications seen in physically injured patients. Clients who have sustained serious injuries in car crashes, fires, stabbings, shootings, falls, and other events have an increased likelihood of developing trauma related mental disorders. Research suggests that PTSD and/or problem drinking is evident in nearly 50 percent of patients 1 year after discharge from trauma surgical units.

(Zatzick, Jurkovich, Gentilello, Wisner, & Rivara, 2002)

2004). Nearly 28 percent of patients whose drinking was identified as problematic during an ER visit for a physical injury will have a new injury within 1 year (Gentilello et al., 2005). For further information, see TIP 16, *Alcohol and Other Drug Screening of Hospitalized Trauma Patients* (Center for Substance Abuse Treatment [CSAT], 1995a).

Group trauma

The term "group trauma" refers to traumatic experiences that affect a particular group of people. This TIP intentionally distinguishes group trauma from mass trauma to highlight the unique experiences and characteristics of trauma-related reactions among small groups. These groups often share a common identity and history, as well as similar activities and concerns. They include vocational groups who specialize in managing traumas or who routinely place themselves in harm's way—for example, first responders, a group including police and emergency medical personnel. Some examples of group trauma include crews and their families who lose members from a commercial fishing accident, a gang whose members experience multiple deaths and injuries, teams of firefighters who lose members in a roof collapse, responders who attempt to save flood victims, and military service members in a specific theater of operation.

Survivors of group trauma can have different experiences and responses than survivors of individual or mass traumas. Survivors of group trauma, such as military service members and first responders, are likely to experience repeated trauma. They tend to keep the trauma experiences within the group, feeling that others outside the group will not understand; group outsiders are generally viewed as intruders. Members may encourage others in the group to shut down emotionally and repress their traumatic experiences—and there are some occupational roles that necessitate the repression of reactions to complete a mission or to be attentive to the needs at hand. Group members may not want to seek help and may discourage others from doing so out of fear that it may shame the entire group. In this environment, members may see it as a violation of group confidentiality when a member seeks assistance outside the group, such as by going to a counselor.

Group members who have had traumatic experiences in the past may not actively support traumatized colleagues for fear that acknowledging the trauma will increase the risk of repressed trauma-related emotions surfacing. However, groups with adequate resources for helping group members can develop a stronger and more supportive environment for handling subsequent traumas. These main group features influence the course of short- and long-term adjustments, including the development of traumatic stress symptoms associated with mental and substance use disorders.

Certain occupational groups are at greater risk of experiencing trauma—particularly multiple traumas. This TIP briefly reviews two main groups as examples in the following sections: first responders and military service members. For more detailed information on the impact of trauma and deployment, refer to the planned TIP, *Reintegration-Related Behavioral Health Issues in Veterans and Military Families* (SAMHSA, planned f).

First responders

First responders are usually emergency medical technicians, disaster management personnel, police officers, rescue workers, medical and behavioral health professionals, journalists, and volunteers from various backgrounds. They also include lifeguards, military personnel, and clergy. Stressors associated with the kinds of traumatic events and/or disasters first responders are likely to experience include

exposure to toxic agents, feeling responsible for the lives of others, witnessing catastrophic devastation, potential exposure to gruesome images, observing human and animal suffering and/or death, working beyond physical exhaustion, and the external and internal pressure of working against the clock.

Military service members

Military personnel are likely to experience numerous stressors associated with trauma. Service members who have repeatedly deployed to a war zone are at a greater risk for traumatic stress reactions (also known as combat stress reaction or traumatic stress injury), other military personnel who provide support services are also at risk for traumatic stress and secondary trauma (refer to the glossary portion of the "How This TIP Is Organized" section that precedes Part 1, Chapter 1, of this TIP). So too, service members who anticipate deployment or redeployment may exhibit psychological symptoms associated with traumatic stress. Some stressors that military service members may encounter include working while physically exhausted, exposure to gunfire, seeing or knowing someone who has been injured or killed, traveling in areas known for roadside bombs and rockets, extended hypervigilance, fear of being struck by an improvised explosive device, and so forth.

Trauma affecting communities and cultures

Trauma that affects communities and cultures covers a broad range of violence and atrocities that erode the sense of safety within a given community, including neighborhoods, schools, towns, and reservations. It may involve violence in the form of physical or sexual assaults, hate crimes, robberies, workplace or gang-related violence, threats, shootings, or stabbings—for example, the school shooting at Virginia Polytechnic Institute and State University in 2007. It also includes actions that attempt to dismantle systemic cultural practices, resources, and identities, such as making boarding school attendance mandatory for Native American children or placing them in non-Native foster homes. Cultural and/or community-based trauma can also occur via indifference or limited responsiveness to specific communities or cultures that are facing a potential catastrophe. Cultural traumas are events that, whether intentionally or not, erode the heritage of a culture—as with prejudice, disenfranchisement, and health inequities (e.g., late prenatal care, inability to afford medications, limited access to culturally appropriate health education, vicinity and quality of affordable medical services), among other examples.

"The excitement of the season had just begun, and then, we heard the news, oil in the water, lots of oil killing lots of water. It is too shocking to understand. Never in the millennium of our tradition have we thought it possible for the water to die, but it is true."

—Chief Walter Meganack, Port Graham, 1989

Of all the groups negatively affected by the Exxon Valdez oil spill, in many ways Alaska Natives were the most devastated. The oil spill destroyed more than economic resources; it shook the core cultural foundation of Native life. Alaska Native subsistence culture is based on an intimate relationship with the environment. Not only does the environment have sacred qualities for Alaska Natives; their survival also depends on the well-being of the ecosystem and the maintenance of cultural norms of subsistence. The spill directly threatened the well-being of the environment, disrupted subsistence behavior, and severely disturbed the sociocultural milieu of Alaska Natives.

Source: Gill & Picou, 1997, pp. 167–168.

Historical trauma

Historical trauma, known also as generational trauma, refers to events that are so widespread as to affect an entire culture; such events also have effects intense enough to influence generations of the culture beyond those who experienced them directly. The enslavement, torture, and lynching of African Americans; the forced assimilation and relocation of American Indians onto reservations; the extermination of millions of Jews and others in Europe during World War II; and the genocidal policies of the Hutus in Rwanda and the Khmer Rouge in Cambodia are examples of historical trauma.

In the past 50 years, research has explored the generational effects of the Holocaust upon survivors and their families. More recent literature has extended the concept of historical or generational trauma to the traumatic experiences of Native Americans. Reduced population, forced relocation, and acculturation are some examples of traumatic experiences that Native people have endured across centuries, beginning with the first European presence in the Americas. These tragic experiences have led to significant loss of cultural identity across generations and have had a significant impact on the well-being of Native communities (Whitbeck, Chen, Hoyt, & Adams, 2004). Data are limited on the association of mental and substance use disorders with historical trauma among Native people, but literature suggests that historical trauma has repercussions across generations, such as depression, grief, traumatic stress, domestic violence, and substance abuse, as well as significant loss of cultural knowledge, language, and identity (Gone, 2009). Historical trauma can increase the vulnerability of multiple generations to the effects of traumas that occur in their own lifetimes.

Mass trauma

Mass traumas or disasters affect large numbers of people either directly or indirectly. It is beyond the scope of this TIP to cover any specific disaster in detail; note, however, that mass traumas include large-scale natural and human-caused disasters (including intentional acts and accidents alike). Mass traumas may involve significant loss of property and lives as well as the widespread disruption of normal routines and services. Responding to such traumas often requires immediate and extensive resources that typically exceed the capacity of the affected communities, States, or countries in which they occur. Recent examples of such large-scale catastrophes include:

- In January 2010, a massive earthquake hit Haiti, killing hundreds of thousands of people and leaving over a million homeless.
- A nuclear reactor meltdown in the Ukraine in 1986 resulted in a technological and environmental disaster that affected tens of millions of people.
- The tsunami in the Indian Ocean in 2005 left hundreds of thousands dead in nine countries.

One factor that influences an individual's response to trauma is his or her ability to process one trauma before another trauma occurs. In mass traumas, the initial event causes considerable destruction, the consequences of which may spawn additional traumas and other stressful events that lead to more difficulties and greater need for adjustments among survivors, first responders, and disaster relief agencies. Often, a chain reaction occurs. Take, for example, Hurricane Katrina and its impact on the people of Louisiana and other coastal States. After the initial flooding, people struggled to obtain basic needs, including food, drinking water, safe shelter, clothing, medicines, personal hygiene items, and so forth, all as concern mounted about the safety of children and

other relatives, friends, and neighbors. In this and similar cases, the destruction from the initial flooding led to mass displacement of families and communities; many people had to relocate far from New Orleans and other badly affected areas, while also needing to gain financial assistance, reinitiate work to generate income, and obtain stable housing. People could not assimilate one stressor before another appeared.

Nevertheless, mass traumas can create an immediate sense of commonality—many people are "in the same boat," thus removing much of the isolation that can occur with other types of trauma. People can acknowledge their difficulties and receive support, even from strangers. It is easier to ask for help because blame is often externalized; large-scale disasters are often referred to as "acts of God" or, in cases of terrorism and other intentional events, as acts of "evil." Even so, survivors of mass trauma often encounter an initial rally of support followed by quickly diminishing services and dwindling care. When the disaster fades from the headlines, public attention and concern are likely to decrease, leaving survivors struggling to reestablish or reinvent their lives without much outside acknowledgment.

The experience of mass trauma can lead to the development of psychological symptoms and substance use at either a subclinical or a diagnostic level (refer to Part 3 of this TIP, available online, for more information highlighting the relationship between trauma and behavioral health problems). Likewise, one of the greatest risks for traumatic stress reactions after a mass tragedy is the presence of preexisting mental and co-occurring disorders, and individuals who are in early recovery from substance use disorders are at greater risk for such reactions as well. Nonetheless, people are amazingly resilient, and most will not develop long-term mental or substance use disorders after an event; in fact, most trauma-related symptoms will resolve in a matter of months (Keane & Piwowarczyk, 2006).

Interpersonal Traumas

Interpersonal traumas are events that occur (and typically continue to reoccur) between people who often know each other, such as spouses or parents and their children. Examples include physical and sexual abuse, sexual assault, domestic violence, and elder abuse.

Intimate partner violence

Intimate partner violence (IPV), often referred to as domestic violence, is a pattern of actual or threatened physical, sexual, and/or emotional abuse. It differs from simple assault in that multiple episodes often occur and the perpetrator is an intimate partner of the victim. Trauma associated with IPV is normally ongoing. Incidents of this form of violence are rarely isolated, and the client may still be in contact with and encountering abuse from the perpetrator while engaged in treatment.

Intimate partners include current and former spouses, boyfriends, and girlfriends. The majority of all nonfatal acts of violence and intimate partner homicides are committed against women; IPV accounts for over 20 percent of nonfatal violence against women but only 3.6 percent of that committed against men (Catalano, 2012). Children are the hidden casualties of IPV. They often witness the assaults or threats directly, within earshot, or by being exposed to the aftermath of the violence (e.g., seeing bruises and destruction of property, hearing the pleas for it to stop or the promises that it will never happen again).

Substance abuse, particularly involving alcohol, is frequently associated with IPV. It is the presence of alcohol-related problems in either partner, rather than the level of alcohol consumption itself, that is the important factor.

Drinking may or may not be the cause of the violence; that said, couples with alcohol-related disorders could have more tension and disagreement within the relationship in general, which leads to aggression and violence. The consumption of alcohol during a dispute is likely to decrease inhibitions and increase impulsivity, thus creating an opportunity for an argument to escalate into a physical altercation. More information on domestic violence and its effects on partners and families, as well as its connection with substance use and trauma-related disorders, is available in TIP 25, *Substance Abuse Treatment and Domestic Violence* (CSAT, 1997b), and from the National Online Resource Center on Violence Against Women (http://www.vawnet.org/).

Developmental Traumas

Developmental traumas include specific events or experiences that occur within a given developmental stage and influence later development, adjustment, and physical and mental health. Often, these traumas are related to adverse childhood experiences (ACEs), but they can also result from tragedies that occur outside an expected developmental or life stage (e.g., a child dying before a parent, being diagnosed with a life-threatening illness as a young adult) or from events at any point in the life cycle that create significant loss and have life-altering consequences (e.g., the death of a significant other in the later years that leads to displacement of the surviving partner).

Adverse childhood experiences

Some people experience trauma at a young age through sexual, physical, or emotional abuse and neglect. The Adverse Childhood Experiences Study (Felitti et al., 1998) examined the effects of several categories of ACEs on adult health, including physical and emotional abuse; sexual abuse; a substance-dependent parent; an incarcerated, mentally ill, or suicidal household member; spousal abuse between parents; and divorce or separation that meant one parent was absent during childhood. The National Comorbidity Studies examined the prevalence of trauma and defined childhood adversities as parental death, parental divorce/separation, life-threatening illness, or extreme economic hardship in addition to the childhood experiences included in the Adverse Childhood Experiences Study (Green et al., 2010).

ACEs can negatively affect a person's well-being into adulthood. Whether or not these experiences occur simultaneously, are time-limited, or recur, they set the stage for increased vulnerability to physical, mental, and substance use disorders and enhance the risk

Child Neglect

Child neglect occurs when a parent or caregiver does not give a child the care he or she needs according to his or her age, even though that adult can afford to give that care or is offered help to give that care. Neglect can mean not providing adequate nutrition, clothing, and/or shelter. It can mean that a parent or caregiver is not providing a child with medical or mental health treatment or is not giving prescribed medicines the child needs. Neglect can also mean neglecting the child's education. Keeping a child from school or from special education can be neglect. Neglect also includes exposing a child to dangerous environments (e.g., exposure to domestic violence). It can mean poor supervision for a child, including putting the child in the care of someone incapable of caring for children. It can mean abandoning a child or expelling him or her from home. Lack of psychological care, including emotional support, attention, or love, is also considered neglect—and it is the most common form of abuse reported to child welfare authorities.

Source: dePanfilis, 2006.

for repeated trauma exposure across the life span. Childhood abuse is highly associated with major depression, suicidal thoughts, PTSD, and dissociative symptoms. So too, ACEs are associated with a greater risk of adult alcohol use. When a person experiences several adverse events in childhood, the risk of his or her heavy drinking, self-reported alcohol dependence, and marrying a person who is alcohol dependent is two to four times greater than that of a person with no ACEs (Dube, Anda, Felitti, Edwards, & Croft, 2002).

A detailed examination of the issues involved in providing substance abuse treatment to survivors of child abuse and neglect is the subject of TIP 36, *Substance Abuse Treatment for Persons With Child Abuse and Neglect Issues* (CSAT, 2000b).

Political Terror and War

Political terror and war are likely to have lasting consequences for survivors. In essence, anything that threatens the existence, beliefs, well-being, or livelihood of a community is likely to be experienced as traumatic by community members. Whether counselors are working with an immigrant or refugee enclave in the United States or in another country, they should be aware of local events, local history, and the possibility that clients have endured trauma. (For international information about the clinical, historical, and theoretical aspects of trauma and terrorism, see Danieli, Brom, & Sills, 2005.) Terrorism is a unique subtype of human-caused disasters. The overall goal of terrorist attacks is to maximize the uncertainty, anxiety, and fear of a large community, so the responses are often epidemic and affect large numbers of people who have had direct or indirect exposure to an event (Silver et al., 2004; Suvak, Maguen, Litz, Silver, & Holman, 2008). Terrorism has a variety of results not common to other disasters, such as reminders of the unpredictability of terrorist acts; increases in security measures for the general population; intensified suspicion about a particular population, ethnicity, or culture; and heightened awareness and/or arousal.

Refugees

According to the World Refugee Survey, there are an estimated 12 million refugees and asylum seekers, 21 million internally displaced people, and nearly 35 million uprooted people (U.S. Committee for Refugees and Immigrants, 2006). Many of these people have survived horrendous ordeals with profound and lasting effects for individuals and whole populations. In addition to witnessing deaths by execution, starvation, or beatings, many survivors have experienced horrific torture.

Refugees are people who flee their homes because they have experienced or have a reasonable fear of experiencing persecution. They

Torture and Captivity

Torture traumatizes by taking away an individual's personhood. To survive, victims have to give up their sense of self and will. They become the person the torturer designs or a nonperson, simply existing. Inevitably, the shame of the victim is enormous, because the focus of torture is to humiliate and degrade. As a result, victims often seek to hide their trauma and significant parts of their selfhood long after torture has ended and freedom has been obtained. According to Judith Herman, "the methods of establishing control over another person are based upon the systematic, repetitive infliction of psychological trauma. They are organized techniques of disempowerment and disconnection. Methods of psychological control are designed to instill terror and helplessness and to destroy the victim's sense of self in relation to others."

Source: Herman, 1997, p. 77.

differ from immigrants who willingly leave their homes or homeland to seek better opportunities. Although immigrants may experience trauma before migrating to or after reaching their new destination, refugees will often have greater exposure to trauma before migration. Refugees typically come from war-torn countries and may have been persecuted or tortured. Consequently, greater exposure to trauma, such as torture, before migrating often leads to more adjustment-related difficulties and psychological symptoms after relocation (Steel et al., 2009).

Refugees typically face substantial difficulties in assimilating into new countries and cultures. Moreover, the environment can create a new set of challenges that may include additional exposure to trauma and social isolation (Miller et al., 2002). These as well as additional factors influence adjustment, the development of mental illness (including PTSD), and the occurrence of substance use disorders. Additional factors that influence outcomes after relocation include receptivity of the local community, along with opportunities for social support and culturally responsive services.

Among refugee populations in the United States, little research is available on rates of mental illness and co-occurring substance use disorders and traumatic stress among refugee populations. Substance use patterns vary based on cultural factors as well as assimilation, yet research suggests that trauma increases the risk for substance use among refugees after war-related experiences (Kozarić-Kovačić, Ljubin, & Grappe, 2000). Therefore, providers should expect to see trauma-related disorders among refugees who are seeking treatment for a substance use disorder and greater prevalence of substance use disorders among refugees who seek behavioral health services.

Vietnamese Refugees

"Wars always have consequences, both immediate and remote, and the consequences are often tragic. One tragic circumstance often caused by war is the forceful, disorganized, and uncontrollable mass movement of both civilians and soldiers trying to escape the horrors of the wars or of an oppressive regime.…

"Vietnamese communists, by taking power in the North in 1954 and then in the South in 1975, caused two major upheavals in the Land of the Small Dragon, as Vietnam was once called. The first Vietnam War led to the 1954 exodus during which 1 million people fled from the North to the South. The second Vietnam War resulted in the dispersion, from 1975-1992, of approximately 2 million Vietnamese all over the world. These significant, unplanned, and uncoordinated mass movements around the world not only dislocated millions of people, but also caused thousands upon thousands of deaths at sea.…

"The second and third wave of refugees from 1976 onward went through a more difficult time. They had to buy their way out and to hide from soldiers and the police who hunted them down. After catching them, the police either asked for brides or threw the escapees into jails. Those who evaded police still had to face engine failures, sea storms, pirates…They then had to survive overcrowded boats for days or weeks, during which food and water could not be replenished and living conditions were terrible… Many people died from exhaustion, dehydration, and hunger. Others suffered at the hands of terrifying pirates… After the sea ordeal came the overcrowded camps where living conditions were most often substandard and where security was painfully lacking.…

"In the United States, within less than 3 decades, the Vietnamese population grew from a minority of perhaps 1,000 persons to the second largest refugee group behind Cubans."

System-Oriented Traumas: Retraumatization

Retraumatization occurs when clients experience something that makes them feel as though they are undergoing another trauma. Unfortunately, treatment settings and clinicians can create retraumatizing experiences, often without being aware of it, and sometimes clients themselves are not consciously aware that a clinical situation has actually triggered a traumatic stress reaction. Agencies that anticipate the risk for retraumatization and actively work on adjusting program policies and procedures to remain sensitive to the histories and needs of individuals who have undergone past trauma are likely to have more success in providing care, retaining clients, and achieving positive outcomes.

Staff and agency issues that can cause retraumatization include:

- Being unaware that the client's traumatic history significantly affects his or her life.
- Failing to screen for trauma history prior to treatment planning.
- Challenging or discounting reports of abuse or other traumatic events.
- Using isolation or physical restraints.
- Using experiential exercises that humiliate the individual.
- Endorsing a confrontational approach in counseling.
- Allowing the abusive behavior of one client toward another to continue without intervention.
- Labeling behavior/feelings as pathological.
- Failing to provide adequate security and safety within the program.
- Limiting participation of the client in treatment decisions and planning processes.
- Minimizing, discrediting, or ignoring client responses.
- Disrupting counselor–client relationships by changing counselors' schedules and assignments.
- Obtaining urine specimens in a nonprivate setting.

Advice to Counselors: Addressing Retraumatization

- Anticipate and be sensitive to the needs of clients who have experienced trauma regarding program policies and procedures in the treatment setting that might trigger memories of trauma, such as lack of privacy, feeling pushed to take psychotropic medications, perceiving that they have limited choices within the program or in the selection of the program, and so forth.
- Attend to clients' experiences. Ignoring clients' behavioral and emotional reactions to having their traumatic memories triggered is more likely to increase these responses than decrease them.
- Develop an individual coping plan in anticipation of triggers that the individual is likely to experience in treatment based on his or her history.
- Rehearse routinely the coping strategies highlighted in the coping plan. If the client does not practice strategies prior to being triggered, the likelihood of being able to use them effectively upon triggering is lessened. For example, it is far easier to practice grounding exercises in the absence of severe fear than to wait for that moment when the client is reexperiencing an aspect of a traumatic event. (For more information on grounding exercises, refer to *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse*; Najavits, 2002a, pp. 125–131.)
- Recognize that clinical and programmatic efforts to control or contain behavior in treatment can cause traumatic stress reactions, particularly for trauma survivors for whom being trapped was part of the trauma experience.
- Listen for the specific trigger that seems to be driving the client's reaction. It will typically help both the counselor and client understand the behavior and normalize the traumatic stress reactions.
- Make sure that staff and other clients do not shame the trauma survivor for his or her behavior, such as through teasing or joking about the situation.
- Respond with consistency. The client should not get conflicting information or responses from different staff members; this includes information and responses given by administrators.

- Having clients undress in the presence of others.
- Inconsistently enforcing rules and allowing chaos in the treatment environment.
- Imposing agency policies or rules without exceptions or an opportunity for clients to question them.
- Enforcing new restrictions within the program without staff–client communication.
- Limiting access to services for ethnically diverse populations.
- Accepting agency dysfunction, including lack of consistent, competent leadership.

Characteristics of Trauma

The following section highlights several selected characteristics of traumatic experiences that influence the effects of traumatic stress. Objective characteristics are those elements of a traumatic event that are tangible or factual; subjective characteristics include internal processes, such as perceptions of traumatic experiences and meanings assigned to them.

Objective Characteristics

Was it a single, repeated, or sustained trauma?

Trauma can involve a single event, numerous or repeated events, or sustained/chronic experiences. A *single trauma* is limited to a single point in time. A rape, an automobile accident, the sudden death of a loved one—all are examples of a single trauma. Some people who experience a single trauma recover without any specific intervention. But for others—especially those with histories of previous trauma or mental or substance use disorders, or those for whom the trauma experience is particularly horrific or overwhelming—a single trauma can result in traumatic stress symptoms and trauma- and stress-related disorders. Single traumas do not necessarily have a lesser psychological impact than repeated traumas. After the terrorist attacks on September 11, 2001—a significant single trauma—many Manhattan residents experienced intrusive memories and sleep disruption whether they were at the site of the attacks or watched television coverage of it (Ford & Fournier, 2007; Galea et al., 2002).

A series of traumas happening to the same person over time is known as *repeated trauma*. This can include repeated sexual or physical assaults, exposure to frequent injuries of others, or seemingly unrelated traumas. Military personnel, journalists covering stories of mass tragedies or prolonged conflicts, and first responders who handle hundreds of cases each year typify repeated trauma survivors. Repetitive exposure to traumas can have a cumulative effect over one's lifetime. A person who was assaulted during adolescence, diagnosed with a life-threatening illness in his or her thirties, and involved in a serious car accident later in life has experienced repeated trauma.

Some repeated traumas are sustained or chronic. Sustained trauma experiences tend to wear down resilience and the ability to adapt. Some examples include children who endure ongoing sexual abuse, physical neglect, or emotional abuse; people who are in violent relationships; and people who live in chronic poverty. Individuals in chronically stressful, traumatizing environments are particularly susceptible to traumatic stress reactions, substance use, and mental disorders.

Bidirectional relationships exist between trauma and substance use as well as trauma and mental illness. For example, abuse of alcohol and drugs increases the risk of a traumatic experience and creates greater vulnerability to the effects of trauma; substance abuse reduces a person's ability to take corrective and remedial actions that might reduce the impact of the trauma. Likewise, traumatic stress leads to a greater likelihood of

Case Illustration: Yourself

Think of a time that was particularly stressful (but not traumatic) in your life. Revisit this period as an observer watching the events unfold and then ask yourself, "What made this time particularly stressful?" It is likely that a part of your answer will include the difficulty of managing one situation before another circumstance came along demanding your time. Stressful times denote being bombarded with many things at one time, perceived or actual, without sufficient time or ability to address them emotionally, cognitively, spiritually, and/or physically. The same goes for trauma—rapid exposure to numerous traumas one after another lessens one's ability to process the event before the next onslaught. This creates a cumulative effect, making it more difficult to heal from any one trauma.

substance abuse that, in turn, increases the risk for additional exposure to trauma. Paralleling this bidirectional relationship, mental illness increases vulnerability to the effects of trauma and raises the risk for substance use disorders and for encountering additional traumatic events. So too, early exposure to ACEs is associated with traumatic stress reactions and subsequent exposure to trauma in adult years.

People who have encountered multiple and longer doses of trauma are at the greatest risk for developing traumatic stress. For example, military reservists and other military service members who have had multiple long tours of duty are at greater risk for traumatic stress reactions (see the planned TIP, *Reintegration-Related Behavioral Health Issues in Veterans and Military Families;* SAMHSA, planned f). In addition, people are more likely to encounter greater impairment and distress from trauma if that trauma occurs with significant intensity and continues sporadically or unceasingly for extended periods.

Was there enough time to process the experience?

A particularly severe pattern of ongoing trauma, sometimes referred to as "cascading trauma," occurs when multiple traumas happen in a pattern that does not allow an individual to heal from one traumatic event before another occurs. Take, for example, California residents—they repeatedly face consecutive and/or simultaneous natural disasters including fires, landslides, floods, droughts, and earthquakes. In other cases, there is ample time to process an event, but processing is limited because people don't have supportive relationships or environments that model preventive practices. This can lead to greater vulnerability to traumas that occur later in life.

How many losses has the trauma caused?

Trauma itself can create significant distress, but often, the losses associated with a trauma have more far-reaching effects. For instance, a child may be forced to assume adult responsibilities, such as serving as a confidant for a parent who is sexually abusing him or her, and lose the opportunity of a childhood free from adult worries. In another scenario, a couple may initially feel grateful to have escaped a house fire, but they may nevertheless face significant community and financial losses months afterward. In evaluating the impact of trauma, it is helpful to access and discuss the losses associated with the initial trauma. The number of losses greatly influences an individual's ability to bounce back from the tragedy.

In the case illustration on the next page, Rasheed's losses cause him to disconnect from his wife, who loves and supports him. Successful confrontation of losses can be difficult if the losses compound each other, as with Rasheed's loss of his friend, his disability, his employment struggles, and the threats to his marriage and liberty. People can cite a specific

Case Illustration: Rasheed

Rasheed was referred to an employee assistance program by his employer. He considered quitting his job, but his wife insisted he talk to a counselor. He is a 41-year-old auto mechanic who, 4 years ago, caused a head-on collision while attempting to pass another vehicle. A close friend, riding in the passenger's seat, was killed, and two young people in the other vehicle were seriously injured and permanently disabled. Rasheed survived with a significant back injury and has only been able to work sporadically. He was convicted of negligent homicide and placed on probation because of his physical disability. He is on probation for another 4 years, and if he is convicted of another felony during that time, he will have to serve prison time for his prior offense.

While still in the hospital, Rasheed complained of feeling unreal, numb, and disinterested in the care he received. He did not remember the crash but remembers waking up in the hospital 2 days later. He had difficulty sleeping in the hospital and was aware of feelings of impending doom, although he was unaware of the legal charges he would later face. He was diagnosed with ASD.

He was discharged from the hospital with a variety of medications, including pain pills and a sleep aid. He rapidly became dependent on these medications, feeling he could not face the day without the pain medication and being unable to sleep without sleep medicine in larger doses than had been prescribed. Within 3 months of the accident, he was "doctor shopping" for pain pills and even had a friend obtain a prescription for the sleeping medication from that friend's doctor. In the 4 intervening years, Rasheed's drug use escalated, and his blunted emotions and detachment from friends became more profound. He became adept at obtaining pain pills from a variety of sources, most of them illegal. He fears that if he seeks treatment for the drug problem, he will have to admit to felony offenses and will probably be imprisoned. He also does not believe he can manage his life without the pain pills.

In the past 2 years, he has had recurring dreams of driving a car on the wrong side of the road and into the headlights of an oncoming vehicle. In the dream, he cannot control the car and wakes up just before the vehicles crash. At unusual times—for instance, when he is just awakening in the morning, taking a shower, or walking alone—he will feel profound guilt over the death of his friend in the accident. He becomes very anxious when driving in traffic or when he feels he is driving faster than he should. His marriage of 18 years has been marked by increasing emotional distance, and his wife has talked about separating if he does not do something about his problem. He has been unable to work consistently because of back pain and depression. He was laid off from one job because he could not concentrate and was making too many mistakes.

The counselor in the employee assistance program elicited information on Rasheed's drug use, although she suspected Rasheed was minimizing its extent and effects. Knowledgeable about psychological trauma, the counselor helped Rasheed feel safe enough to talk about the accident and how it had affected his life. She was struck by how little Rasheed connected his present difficulties to the accident and its aftermath. The counselor later commented that Rasheed talked about the accident as if it had happened to someone else. Rasheed agreed to continue seeing the counselor for five additional visits, during which time a plan would be made for Rasheed to begin treatment for drug dependence and PTSD.

event as precipitating their trauma, or, in other cases, the specific trauma can symbolize a series of disabling events in which the person felt his or her life was threatened or in which he or she felt emotionally overwhelmed, psychologically disorganized, or significantly disconnected from his or her surroundings. It will be important for Rasheed to understand how his losses played a part in his abuse of prescription medications to cope with symptoms associated with traumatic stress and loss, (e.g., guilt, depression, fear). If not addressed, his trauma could increase his risk for relapse.

Was the trauma expected or unexpected?

When talking about a trauma, people sometimes say they didn't see it coming. Being unprepared, unaware, and vulnerable often increases the risk of psychological injury, but these are common components of most traumas, given that most traumatic events do occur without warning (e.g., car crashes, terrorist attacks, sexual assaults). People with substance use disorders, mental illness, and/or cognitive disabilities may be especially vulnerable in that they may attend less or have competing concerns that diminish attention to what is going on around them, even in high-risk environments. However, most individuals attempt to gain some control over the tragedy by replaying the moments leading up to the event and processing how they could have anticipated it. Some people perseverate on these thoughts for months or years after the event.

Sometimes, a trauma is anticipated but has unexpected or unanticipated consequences, as in the case of Hurricane Katrina. Learning about what is likely to happen can reduce traumatization. For instance, training military personnel in advance of going to combat overseas prepares them to handle traumas and can reduce the impact of trauma.

Were the trauma's effects on the person's life isolated or pervasive?

When a trauma is isolated from the larger context of life, a person's response to it is more likely to be contained and limited. For instance, military personnel in combat situations can be significantly traumatized by what they experience. On return to civilian life or noncombat service, some are able to isolate the traumatic experience so that it does not invade ordinary, day-to-day living. This does not mean that the combat experience was not disturbing or that it will not resurface if the individual encounters an experience that triggers memories of the trauma; it just means that the person can more easily leave the trauma in the past and attend to the present.

Conversely, people who remain in the vicinity of the trauma may encounter greater challenges in recovery. The traumatic event intertwines with various aspects of the person's daily activities and interactions, thus increasing the possibility of being triggered by surrounding cues and experiencing subsequent psychological distress. However, another way to view this potential dilemma for the client is to reframe it as an opportunity—the repetitive exposure to trauma-related cues may provide vital guidance as to when and which treatment and coping techniques to use in the delivery of trauma-informed and trauma-specific behavioral health services.

Who was responsible for the trauma and was the act intentional?

If the severity of a trauma is judged solely by whether the act was intentional or not, events that reflect an intention to harm would be a primary indicator in predicting subsequent difficulties among individuals exposed to this form of trauma. For most survivors, there is an initial disbelief that someone would conceivably intend to harm others, followed by considerable emotional and, at times, behavioral investment in somehow making things right again or in making sense of a senseless, malicious act. For instance, in the wake of the World Trade Center attacks in New York City, people responded via renewed patriotism, impromptu candlelight vigils, attacks on people of Arab and Muslim descent, and unprecedented donations and willingness to wait in long lines to donate blood to the Red Cross. Each example is a response that in some way attempts to right the perceived wrong or attach new meaning to the event and subsequent consequences.

When terrible things happen, it is human nature to assign blame. Trauma survivors can become heavily invested in assigning blame or finding out who was at fault, regardless of the type of trauma. Often, this occurs as an attempt to make sense of, give meaning to, and reestablish a sense of predictability, control, and safety after an irrational or random act. It is far easier to accept that someone, including oneself, is at fault or could have done something different than it is to accept the fact that one was simply in the wrong place at the wrong time.

For some trauma survivors, needing to find out why a trauma occurred or who is at fault can become a significant block to growth when the individual would be better served by asking, "What do I need to do to heal?" Behavioral health professionals can help clients translate what they have learned about responsibility in recovery to other aspects of their lives. For instance, someone in treatment for co-occurring disorders who has internalized that becoming depressed or addicted was not his or her fault, but that recovery *is* a personal responsibility, can then apply the same principle to the experience of childhood abuse and thereby overcome negative judgments of self (e.g., thinking oneself to be a bad person who deserves abuse). The individual can then begin to reassign responsibility by attaching the blame to the perpetrator(s) while at the same time assuming responsibility for recovery.

Was the trauma experienced directly or indirectly?

Trauma that happens to someone directly seems to be more damaging than witnessing trauma that befalls others. For example, it is usually more traumatic to be robbed at gunpoint than to witness someone else being robbed or hearing someone tell a story about being robbed. Yet, sometimes, experiencing another's pain can be equally traumatic. For instance, parents often internalize the pain and suffering of their children when the children are undergoing traumatic circumstances (e.g., treatments for childhood cancer).

There are two ways to experience the trauma of others. An individual may witness the event, such as seeing someone killed or seriously injured in a car accident, or may learn of an event that happened to someone, such as a violent personal assault, suicide, serious accident, injury, or sudden or unexpected death. For many people, the impact of the trauma will depend on a host of variables, including their proximity to the event as eyewitnesses, the witnesses' response in the situation, their relationship to the victims, the degree of helplessness surrounding the experience, their exposure to subsequent consequences, and so on.

Case Illustration: Frank

Frank entered substance abuse treatment with diagnoses of co-occurring PTSD and substance use disorder. While on a whitewater kayak trip with his wife, her kayak became pinned on a rock, and Frank could only watch helplessly as she drowned. His drinking had increased markedly after the accident. He acknowledged a vicious cycle of sleep disturbance with intrusive nightmares followed by vivid memories and feelings of terror and helplessness after he awoke. He drank heavily at night to quiet the nightmares and memories, but heavy alcohol consumption perpetuated his trouble sleeping. He withdrew from contact with many of his old "couple friends" and his wife's family, with whom he had been close. At treatment entry, he described his life as "going to work and coming home." The trauma occurred 3 years before he sought treatment, but Frank continued to feel numb and disconnected from the world. His only emotion was anger, which he tried to keep in check. Integrated treatment for PTSD and substance abuse helped him sleep and taught him coping skills to use when the memories arose; it fostered his engagement and retention in long-term care for both disorders.

The effects of traumas such as genocide and internment in concentration camps can be felt across generations—stories, coping behaviors, and stress reactions can be passed across generational lines far removed from the actual events or firsthand accounts. Known as historical trauma, this type of trauma can affect the functioning of families, communities, and cultures for multiple generations.

What happened since the trauma?

In reviewing traumatic events, it is important to assess the degree of disruption after the initial trauma has passed, such as the loss of employment, assets, community events, behavioral health services, local stores, and recreational areas. There is typically an initial rally of services and support following a trauma, particularly if it is on a mass scale. However, the reality of the trauma's effects and their disruptiveness may have a more lasting impact. The deterioration of normalcy, including the disruption of day-to-day activities and the damage of structures that house these routines, will likely erode the common threads that provide a sense of safety in individual lives and communities. Hence, the degree of disruption in resuming normal daily activities is a significant risk factor for substance use disorders, subclinical psychological symptoms, and mental disorders. For example, adults displaced from their homes because of Hurricanes Katrina or Rita had significantly higher rates of past-month cigarette use, illicit drug use, and binge drinking than those who were not displaced (Office of Applied Studies, 2008).

Subjective Characteristics

Psychological meaning of trauma

An important clinical issue in understanding the impact of trauma is the meaning that the survivor has attached to the traumatic experience. Survivors' unique cognitive interpretations of an event—that is, their beliefs and assumptions—contribute to how they process, react to, cope with, and recover from the trauma. Does the event represent retribution for past deeds committed by the individual or his or her family? How does the individual attach meaning to his or her survival? Does he or she believe that it is a sign of a greater purpose not yet revealed? People who attempt to share their interpretation and meaning of the event can feel misunderstood and sometimes alienated (Paulson & Krippner, 2007; Schein, Spitz, Burlingame, & Muskin, 2006).

> It is important to remember that what happened is not nearly as important as what the trauma means to the individual.

People interpret traumatic events in vastly different ways, and many variables shape how an individual assigns meaning to the experience (framing the meaning through culture, family beliefs, prior life experiences and learning, personality and other psychological features, etc.). Even in an event that happens in a household, each family member may interpret the experience differently. Likewise, the same type of event can occur at two different times in a person's life, but his or her interpretation of the events may differ considerably because of developmental differences acquired between events, current cognitive and emotional processing skills, availability of and access to environmental resources, and so forth.

Disruption of core assumptions and beliefs

Trauma often engenders a crisis of faith (Frankl, 1992) that leads clients to question basic assumptions about life. Were the individual's core or life-organizing assumptions (e.g., about safety, perception of others, fairness, purpose of life, future dreams) challenged or disrupted during or after the traumatic event? (See the seminal work,

Resilience: Connection and Continuity

Research suggests that reestablishing ties to family, community, culture, and spiritual systems is not only vital to the individual, but it also influences the impact of the trauma upon future generations. For example, Baker and Gippenreiter (1998) studied the descendants of survivors of Joseph Stalin's purge. They found that families who were able to maintain a sense of connection and continuity with grandparents directly affected by the purge experienced fewer negative effects than those who were emotionally or physically severed from their grandparents. Whether the grandparents survived was less important than the connection the grandchildren felt to their pasts.

Shattered Assumptions, by Janoff-Bulman, 1992.) For example, some trauma survivors see themselves as irreparably wounded or beyond the possibility of healing. The following case illustration (Sonja) explores not only the importance of meaning, but also the role that trauma plays in altering an individual's core assumptions—the very assumptions that provide meaning and a means to organize our lives and our interactions with the world and others.

Cultural meaning of trauma

Counselors should strive to appreciate the cultural meaning of a trauma. How do cultural interpretations, cultural support, and cultural responses affect the experience of trauma? It is critical that counselors do not presume to understand the meaning of a traumatic experience without considering the client's cultural context. Culture strongly influences the perceptions of trauma. For instance, a trauma involving shame can be more profound for a person from an Asian culture than for someone from a European culture. Likewise, an Alaska Native individual or community, depending upon their Tribal ancestry, may believe that the traumatic experience serves as a form of retribution. Similarly, the sudden death of a family member or loved one can be less traumatic in a culture that has a strong belief in a positive afterlife. It is important for counselors to recognize that their perceptions of a specific trauma could be very different from their clients' perceptions. Be careful not to judge a client's beliefs in light of your own value system. For more information on culture and how to achieve cultural competence in providing behavioral health services, see SAMHSA's planned TIP, *Improving Cultural Competence* (SAMHSA, planned c).

Individual and Sociocultural Features

A wide variety of social, demographic, environmental, and psychological factors influence a person's experience of trauma, the severity of traumatic stress reactions following the event, and his or her resilience in dealing with the short- and long-term environmental, physical, sociocultural, and emotional consequences. This section addresses a few known factors that influence the risk of trauma along with the development of subclinical and diagnostic traumatic stress symptoms, such as mood and anxiety symptoms and disorders. It is not meant to be an exhaustive exploration of these factors, but rather, a brief presentation to make counselors and other behavioral health professionals aware that various factors influence risk for and protection against traumatic stress and subsequent reactions. (For a broader perspective on such factors, refer to Part 1, Chapter 1.)

Individual Factors

Several factors influence one's ability to deal with trauma effectively and increase one's risk for traumatic stress reactions. Individual factors pertain to the individual's genetic, biological, and psychological makeup and history as they influence the person's experience and

Case Illustration: Sonja

Sonja began to talk about how her life was different after being physically assaulted and robbed in a parking lot at a local strip mall a year ago. She recounts that even though there were people in the parking lot, no one came to her aid until the assailant ran off with her purse. She sustained a cheekbone fracture and developed visual difficulties due to the inflammation from the fracture. She recently sought treatment for depressive symptoms and reported that she had lost interest in activities that typically gave her joy. She reported isolating herself from others and said that her perception of others had changed dramatically since the attack.

Sonja had received a diagnosis of major depression with psychotic features 10 years earlier and received group therapy at a local community mental health center for 3 years until her depression went into remission. She recently became afraid that her depression was becoming more pronounced, and she wanted to prevent another severe depressive episode as well as the use of psychotropic medications, which she felt made her lethargic. Thus, she sought out behavioral health counseling.

As the sessions progressed, and after a psychological evaluation, it was clear that Sonja had some depressive symptoms, but they were subclinical. She denied suicidal thoughts or intent, and her thought process was organized with no evidence of hallucinations or delusions. She described her isolation as a reluctance to shop at area stores. On one hand, Sonja was self-compassionate about her reasons for avoidance, but on the other hand, she was concerned that the traumatic event had altered how she saw life and others. "I don't see people as very caring or kind, like I used to prior to the event. I don't trust them, and I feel people are too self-absorbed. I don't feel safe, and this bothers me. I worry that I'm becoming paranoid again. I guess I know better, but I just want to have the freedom to do what I want and go where I want."

Two months after Sonja initiated counseling, she came to the office exclaiming that things can indeed change. "You won't believe it. I had to go to the grocery store, so I forced myself to go the shopping center that had a grocery store attached to a strip mall. I was walking by a coffee shop, quickly browsing the items in the front window, when a man comes out of the shop talking at me. He says, 'You look like you need a cup of coffee.' What he said didn't register immediately. I looked at him blankly, and he said it again. 'You look like you need a cup of coffee. I'm the owner of the shop, and I noticed you looking in the window, and we have plenty of brewed coffee left before we close the shop. Come on in, it's on the house.' So I did! From that moment on, I began to see people differently. He set it right for me—I feel as if I have myself back again, as if the assault was a sign that I shouldn't trust people, and now I see that there is some goodness in the world. As small as this kindness was, it gave me the hope that I had lost."

For Sonja, the assault changed her assumptions about safety and her view of others. She also attached meaning to the event. She believed that the event was a sign that she shouldn't trust people and that people are uncaring. Yet these beliefs bothered her and contradicted how she saw herself in the world, and she was afraid that her depressive symptoms were returning.

For an inexperienced professional, her presentation may have ignited suspicions that she was beginning to present with psychotic features. However, it is common for trauma survivors to experience changes in core assumptions immediately after the event and to attach meaning to the trauma. Often, a key ingredient in the recovery process is first identifying the meaning of the event and the beliefs that changed following the traumatic experience. So when you hear a client say "I will never see life the same," this expression should trigger further exploration into how life is different, what meaning has been assigned to the trauma, and how the individual has changed his or her perception of self, others, and the future.

(Continued on the next page.)

Case Illustration: Sonja (continued)

Sometimes, reworking the altered beliefs and assumptions occurs with no formal intervention, as with Sonja. In her situation, a random stranger provided a moment that challenged an assumption generated from the trauma. For others, counseling may be helpful in identifying how beliefs and thoughts about self, others, and the world have changed since the event and how to rework them to move beyond the trauma. It is important to understand that the meaning that an individual attaches to the event(s) can either undermine the healing process (e.g., believing that you should not have survived, feeling shame about the trauma, continuing to engage in high-risk activities) or pave the road to recovery (e.g., volunteering to protect victim rights after being sexually assaulted). The following questions can help behavioral health staff members introduce topics surrounding assumptions, beliefs, interpretations, and meanings related to trauma:

- In what ways has your life been different since the trauma?
- How do you understand your survival? (This is an important question for clients who have been exposed to ACEs or cumulative trauma and those who survived a tragedy when others did not.)
- Do you believe that there are reasons that this event happened to you? What are they?
- What meaning does this experience have for you?
- Do you feel that you are the same person as before the trauma? In what ways are you the same? In what ways do you feel different?
- How did this experience change you as a person? Would you like to return to the person you once were? What would you need to do, or what would need to happen, for this to occur?
- Did the traumatic experience change you in a way that you don't like? In what ways?
- How do you view others and your future differently since the trauma?
- What would you like to believe now about the experience?

interpretation of, as well as his or her reactions to, trauma. However, many factors influence individual responses to trauma; it is not just individual characteristics. Failing to recognize that multiple factors aside from individual attributes and history influence experiences during and after trauma can lead to blaming the victim for having traumatic stress.

History of prior psychological trauma

People with histories of prior psychological trauma appear to be the most susceptible to severe traumatic responses (Nishith, Mechanic, & Resick, 2000; Vogt, Bruce, Street, & Stafford, 2007), particularly if they have avoided addressing past traumas. Because minimization, dissociation, and avoidance are common defenses for many trauma survivors, prior traumas are not always consciously available, and when they are, memories can be distorted to avoid painful affects. Some survivors who have repressed their experiences deny a history of trauma or are unable to explain their strong reactions to present situations.

Remember that the effects of trauma are cumulative; therefore, a later trauma that outwardly appears less severe may have more impact upon an individual than a trauma that occurred years earlier. Conversely, individuals who have experienced earlier traumas may have developed effective coping strategies or report positive outcomes as they have learned to adjust to the consequences of the trauma(s). This outcome is often referred to as posttraumatic growth or psychological growth.

Clients in behavioral health treatment who have histories of trauma can respond negatively to or seem disinterested in treatment efforts. They may become uncomfortable in groups that emphasize personal sharing; likewise, an individual who experiences brief bouts of dissociation (a reaction of some trauma survivors) may be misunderstood by others in treatment and seen as uninterested. Providers need to

attend to histories, adjust treatment to avoid retraumatization, and steer clear of labeling clients' behavior as pathological.

History of resilience

Resilience—the ability to thrive despite negative life experiences and heal from traumatic events—is related to the internal strengths and environmental supports of an individual. Most individuals are resilient despite experiencing traumatic stress. The ability to thrive beyond the trauma is associated with individual factors as well as situational and contextual factors. There are not only one or two primary factors that make an individual resilient; many factors contribute to the development of resilience. There is little research to indicate that there are specific traits predictive of resilience; instead, it appears that more general characteristics influence resilience, including neurobiology (Feder, Charney, & Collins, 2011), flexibility in adapting to change, beliefs prior to trauma, sense of self-efficacy, and ability to experience positive emotions (Bonanno & Mancini, 2011).

History of mental disorders

The correlations among traumatic stress, substance use disorders, and co-occurring mental disorders are well known. According to the *Diagnostic and Statistical Manual of Mental Disorders*, Fifth Edition (American Psychiatric Association, 2013a), traumatic stress reactions are linked to higher rates of mood, substance-related, anxiety, trauma, stress-related, and other mental disorders, each of which can precede, follow, or emerge concurrently with trauma itself. A co-occurring mental disorder is a significant determinant of whether an individual can successfully address and resolve trauma as it emerges from the past or occurs in the present. Koenen, Stellman, Stellman, and Sommer (2003) found that the risk of developing PTSD following combat trauma was higher for individuals with preexisting conduct disorder, panic disorder, generalized anxiety disorder, and/or major depression than for those without preexisting mental disorders. For additional information on comorbidity of trauma and other mental disorders, see TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c).

Sociodemographic Factors

Demographic variables are not good predictors of who will experience trauma and subsequent traumatic stress reactions. Gender, age, race and ethnicity, sexual orientation, marital status, occupation, income, and education can all have some influence, but not enough to determine who should or should not receive screening for trauma and traumatic stress symptoms. The following sections cover a few selected variables. (For more information, please refer to Part 3 of this TIP, the online literature review.)

Gender

In the United States, men are at greater risk than women for being exposed to stressful events. Despite the higher prevalence among men, lifetime PTSD occurs at about twice the rate among women as it does in men. Less is known about gender differences with subclinical traumatic stress reactions. There are also other gender differences, such as the types of trauma experienced by men and women. Women are more likely to experience physical and sexual assault, whereas men are most likely to experience combat and crime victimization and to witness killings and serious injuries (Breslau, 2002; Kimerling, Ouimette, & Weitlauf, 2007; Tolin & Foa, 2006). Women in military service are subject to the same risks as men and are also at a greater risk for military sexual trauma. Men's traumas often occur in public; women's are more likely to take place in private settings. Perpetrators of traumas against men are often strangers, but women are more likely to know the perpetrator.

Age

In general, the older one becomes, the higher the risk of trauma—but the increase is not dramatic. Age is not particularly important in predicting exposure to trauma, yet at no age is one immune to the risk. However, trauma that occurs in the earlier and midlife years appears to have greater impact on people for different reasons. For younger individuals, the trauma can affect developmental processes, attachment, emotional regulation, life assumptions, cognitive interpretations of later experiences, and so forth (for additional resources, visit the National Child Traumatic Stress Network; http://www.nctsn.org/). For adults in midlife, trauma may have a greater impact due to the enhanced stress or burden of care that often characterizes this stage of life—caring for their children and their parents at the same time. Older adults are as likely as younger adults to recover quickly from trauma, yet they may have greater vulnerabilities, including their ability to survive without injury and their ability to address the current trauma without psychological interference from earlier stressful or traumatic events. Older people are naturally more likely to have had a history of trauma because they have lived longer, thus creating greater vulnerability to the effects of cumulative trauma.

Race, ethnicity, and culture

The potential for trauma exists in all major racial and ethnic groups in American society, yet few studies analyze the relationship of race and ethnicity to trauma exposure and/or traumatic stress reactions. Some studies show that certain racial and ethnic groups are at greater risk for specific traumas. For example, African Americans experienced higher rates of overall violence, aggravated assault, and robbery than Whites but were as likely to be victims of rape or sexual assault (Catalano, 2004). Literature reflects that diverse ethnic, racial, and cultural groups are more likely to experience adverse effects from various traumas and to meet criteria for posttraumatic stress (Bell, 2011).

Sexual orientation and gender identity

Lesbian, gay, bisexual, and transgender individuals are likely to experience various forms of trauma associated with their sexual orientation, including harsh consequences from families and faith traditions, higher risk of assault from casual sexual partners, hate crimes, lack of legal protection, and laws of exclusion (Brown, 2008). Gay and bisexual men as well as transgender people are more likely to experience victimization than lesbians and bisexual women. Dillon (2001) reported a trauma exposure rate of 94 percent among lesbian, gay,

Resilience: Cultural, Racial, and Ethnic Characteristics

The following list highlights characteristics that often nurture resilience among individuals from diverse cultural, racial, and ethnic groups:

- Strong kinship bonds
- Respect for elders and the importance of extended family
- Spirituality and religious practices (e.g., shrine visitations or the use of traditional healers)
- Value in friendships and warm personal relationships
- Expression of humor and creativity
- Instilling a sense of history, heritage, and historical traditions
- Community orientation, activities, and socialization
- Strong work ethic
- Philosophies and beliefs about life, suffering, and perseverance

"Fortune owes its existence to misfortune, and misfortune is hidden in fortune."

–Lao-Tzu teaching, Taoism (Wong & Wong, 2006)

and bisexual individuals; more than 40 percent of respondents experienced harassment due to their sexual orientation. Heterosexual orientation is also a risk for women, as women in relationships with men are at a greater risk of being physically and sexually abused.

People who are homeless

Homelessness is typically defined as the lack of an adequate or regular dwelling, or having a nighttime dwelling that is a publicly or privately supervised institution or a place not intended for use as a dwelling (e.g., a bus station). The U.S. Department of Housing and Urban Development (HUD) estimates that between 660,000 and 730,000 individuals were homeless on any given night in 2005 (HUD, 2007). Two thirds were unaccompanied persons; the other third were people in families. Adults who are homeless and unmarried are more likely to be male than female. About 40 percent of men who are homeless are veterans (National Coalition for the Homeless, 2002); this percentage has grown, including the number of veterans with dependent children (Kuhn & Nakashima, 2011).

Rates of trauma symptoms are high among people who are homeless (76 to 100 percent of women and 67 percent of men; Christensen et al., 2005; Jainchill, Hawke, & Yagelka, 2000), and the diagnosis of PTSD is among the most prevalent non-substance use Axis I disorders (Lester et al., 2007; McNamara, Schumacher, Milby, Wallace, & Usdan, 2001). People who are homeless report high levels of trauma (especially physical and sexual abuse in childhood or as adults) preceding their homeless status; assault, rape, and other traumas frequently happen while they are homeless. Research suggests that many women are homeless because they are fleeing domestic violence (National Coalition for the Homeless, 2002). Other studies suggest that women who are homeless are more likely to have histories of childhood physical and sexual abuse and to have experienced sexual assault as adults. A history of physical and/or sexual abuse is even more common among women who are homeless and have a serious mental illness.

Youth who are homeless, especially those who live without a parent, are likely to have experienced physical and/or sexual abuse. Between 21 and 42 percent of youth runaways report having been sexually abused before leaving their homes; for young women, rates range from 32 to 63 percent (Administration on Children, Youth and Families, 2002). Additionally, data reflect elevated rates of substance abuse for youth who are homeless and have histories of abuse.

More than half of people who are homeless have a lifetime prevalence of mental illness and substance use disorders. Those who are homeless have higher rates of substance abuse (84 percent of men and 58 percent of women), and substance use disorders, including alcohol and drug abuse/dependence, increase with longer lengths of homelessness (North, Eyrich, Pollio, & Spitznagel, 2004).

For more information on providing trauma-informed behavioral health services to clients who are homeless, and for further discussion of the incidence of trauma in this population, see TIP 55-R, *Behavioral Health Services for People Who Are Homeless* (SAMHSA, 2013b).

3 Understanding the Impact of Trauma

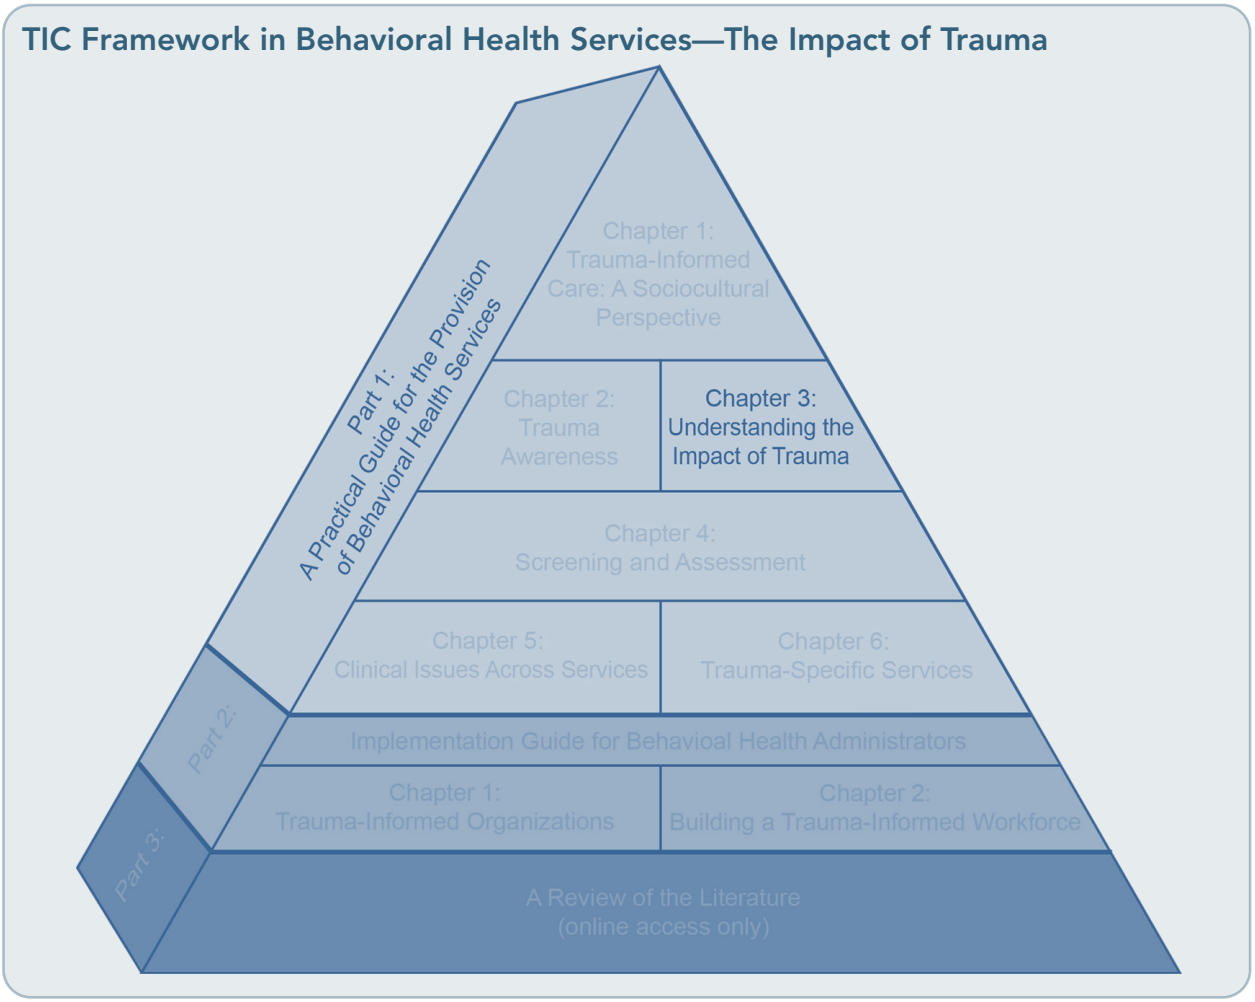
IN THIS CHAPTER

- Sequence of Trauma Reactions
- Common Experiences and Responses to Trauma
- Subthreshold Trauma Related Symptoms
- Specific Trauma Related Psychological Disorders
- Other Trauma Related and Co Occurring Disorders

Trauma-informed care (TIC) involves a broad understanding of traumatic stress reactions and common responses to trauma. Providers need to understand how trauma can affect treatment presentation, engagement, and the outcome of behavioral health services. This chapter examines common experiences survivors may encounter immediately following or long after a traumatic experience.

Trauma, including one-time, multiple, or long-lasting repetitive events, affects everyone differently. Some individuals may clearly display criteria associated with posttraumatic stress disorder (PTSD), but many more individuals will exhibit resilient responses or brief subclinical symptoms or consequences that fall outside of diagnostic criteria. The impact of trauma can be subtle, insidious, or outright destructive. How an event affects an individual depends on many factors, including characteristics of the individual, the type and characteristics of the event(s), developmental processes, the meaning of the trauma, and sociocultural factors.

This chapter begins with an overview of common responses, emphasizing that traumatic stress reactions are normal reactions to abnormal circumstances. It highlights common short- and long-term responses to traumatic experiences in the context of individuals who may seek behavioral health services. This chapter discusses psychological symptoms not represented in the *Diagnostic and Statistical Manual of Mental Disorders,* Fifth Edition (DSM-5; American Psychiatric Association [APA], 2013a), and responses associated with trauma that either fall below the threshold of mental disorders or reflect resilience. It also addresses common disorders associated with traumatic stress. This chapter explores the role of culture in defining mental illness, particularly PTSD, and ends by addressing co-occurring mental and substance-related disorders.



Sequence of Trauma Reactions

Survivors' immediate reactions in the aftermath of trauma are quite complicated and are affected by their own experiences, the accessibility of natural supports and healers, their coping and life skills and those of immediate family, and the responses of the larger community in which they live. Although reactions range in severity, even the most acute responses are natural responses to manage trauma—they are not a sign of psychopathology. Coping styles vary from action oriented to reflective and from emotionally expressive to reticent. Clinically, a response style is less important than the degree to which coping efforts successfully allow one to continue necessary activities, regulate emotions, sustain self-esteem, and maintain and enjoy interpersonal contacts. Indeed, a past error in traumatic stress psychology, particularly regarding group or mass traumas, was the assumption that all survivors need to express emotions associated with trauma and talk about the trauma; more recent research indicates that survivors who choose not to process their trauma are just as psychologically healthy as

Foreshortened future: Trauma can affect one's beliefs about the future via loss of hope, limited expectations about life, fear that life will end abruptly or early, or anticipation that normal life events won't occur (e.g., access to education, ability to have a significant and committed relationship, good opportunities for work).

those who do. The most recent psychological debriefing approaches emphasize respecting the individual's style of coping and not valuing one type over another.

Initial reactions to trauma can include exhaustion, confusion, sadness, anxiety, agitation, numbness, dissociation, confusion, physical arousal, and blunted affect. Most responses are normal in that they affect most survivors and are socially acceptable, psychologically effective, and self-limited. Indicators of more severe responses include continuous distress without periods of relative calm or rest, severe dissociation symptoms, and intense intrusive recollections that continue despite a return to safety. Delayed responses to trauma can include persistent fatigue, sleep disorders, nightmares, fear of recurrence, anxiety focused on flashbacks, depression, and avoidance of emotions, sensations, or activities that are associated with the trauma, even remotely. Exhibit 1.3-1 outlines some common reactions.

Common Experiences and Responses to Trauma

A variety of reactions are often reported and/or observed after trauma. Most survivors exhibit immediate reactions, yet these typically resolve without severe long-term consequences. This is because most trauma survivors are highly resilient and develop appropriate coping strategies, including the use of social supports, to deal with the aftermath and effects of trauma. Most recover with time, show minimal distress, and function effectively across major life areas and developmental stages. Even so, clients who show little impairment may still have subclinical symptoms or symptoms that do not fit diagnostic criteria for acute stress disorder (ASD) or PTSD. Only a small percentage of people with a history of trauma show impairment and symptoms that meet criteria for trauma-related stress disorders, including mood and anxiety disorders.

The following sections focus on some common reactions across domains (emotional, physical, cognitive, behavioral, social, and developmental) associated with singular, multiple, and enduring traumatic events. These reactions are often normal responses to trauma but can still be distressing to experience. Such responses are not signs of mental illness, nor do they indicate a mental disorder. Traumatic stress-related disorders comprise a specific constellation of symptoms and criteria.

Emotional

Emotional reactions to trauma can vary greatly and are significantly influenced by the individual's sociocultural history. Beyond the initial emotional reactions during the event, those most likely to surface include anger, fear, sadness, and shame. However, individuals may encounter difficulty in identifying any of these feelings for various reasons. They might lack experience with or prior exposure to emotional expression in their family or community. They may associate strong feelings with the past trauma, thus believing that emotional expression is too dangerous or will lead to feeling out of control (e.g., a sense of "losing it" or going crazy). Still others might deny that they have any feelings associated with their traumatic experiences and define their reactions as numbness or lack of emotions.

Emotional dysregulation

Some trauma survivors have difficulty regulating emotions such as anger, anxiety, sadness, and shame—this is more so when the trauma occurred at a young age (van der Kolk, Roth, Pelcovitz, & Mandel, 1993). In individuals who are older and functioning well

Exhibit 1.3-1: Immediate and Delayed Reactions to Trauma

Immediate Emotional Reactions	Delayed Emotional Reactions
Numbness and detachment Anxiety or severe fear Guilt (including survivor guilt) Exhilaration as a result of surviving Anger Sadness Helplessness Feeling unreal; depersonalization (e.g., feeling as if you are watching yourself) Disorientation Feeling out of control Denial Constriction of feelings Feeling overwhelmed	Irritability and/or hostility Depression Mood swings, instability Anxiety (e.g., phobia, generalized anxiety) Fear of trauma recurrence Grief reactions Shame Feelings of fragility and/or vulnerability Emotional detachment from anything that requires emotional reactions (e.g., significant and/or family relationships, conversations about self, discussion of traumatic events or reactions to them)
Immediate Physical Reactions	**Delayed Physical Reactions**
Nausea and/or gastrointestinal distress Sweating or shivering Faintness Muscle tremors or uncontrollable shaking Elevated heartbeat, respiration, and blood pressure Extreme fatigue or exhaustion Greater startle responses Depersonalization	Sleep disturbances, nightmares Somatization (e.g., increased focus on and worry about body aches and pains) Appetite and digestive changes Lowered resistance to colds and infection Persistent fatigue Elevated cortisol levels Hyperarousal Long-term health effects including heart, liver, autoimmune, and chronic obstructive pulmonary disease
Immediate Cognitive Reactions	**Delayed Cognitive Reactions**
Difficulty concentrating Rumination or racing thoughts (e.g., replaying the traumatic event over and over again) Distortion of time and space (e.g., traumatic event may be perceived as if it was happening in slow motion, or a few seconds can be perceived as minutes) Memory problems (e.g., not being able to recall important aspects of the trauma) Strong identification with victims	Intrusive memories or flashbacks Reactivation of previous traumatic events Self-blame Preoccupation with event Difficulty making decisions Magical thinking: belief that certain behaviors, including avoidant behavior, will protect against future trauma Belief that feelings or memories are dangerous Generalization of triggers (e.g., a person who experiences a home invasion during the daytime may avoid being alone during the day) Suicidal thinking
Immediate Behavioral Reactions	**Delayed Behavioral Reactions**
Startled reaction Restlessness Sleep and appetite disturbances Difficulty expressing oneself Argumentative behavior Increased use of alcohol, drugs, and tobacco Withdrawal and apathy Avoidant behaviors	Avoidance of event reminders Social relationship disturbances Decreased activity level Engagement in high-risk behaviors Increased use of alcohol and drugs Withdrawal

(Continued on the next page.)

Exhibit 1.3-1: Immediate and Delayed Reactions to Trauma (continued)

Immediate Existential Reactions	Delayed Existential Reactions
Intense use of prayer	Questioning (e.g., "Why me?")
Restoration of faith in the goodness of others (e.g., receiving help from others)	Increased cynicism, disillusionment
Loss of self-efficacy	Increased self-confidence (e.g., "If I can survive this, I can survive anything")
Despair about humanity, particularly if the event was intentional	Loss of purpose
Immediate disruption of life assumptions (e.g., fairness, safety, goodness, predictability of life)	Renewed faith
	Hopelessness
	Reestablishing priorities
	Redefining meaning and importance of life
	Reworking life's assumptions to accommodate the trauma (e.g., taking a self-defense class to reestablish a sense of safety)

Sources: Briere & Scott, 2006b; Foa, Stein, & McFarlane, 2006; Pietrzak, Goldstein, Southwick, & Grant, 2011.

prior to the trauma, such emotional dysregulation is usually short lived and represents an immediate reaction to the trauma, rather than an ongoing pattern. Self-medication—namely, substance abuse—is one of the methods that traumatized people use in an attempt to regain emotional control, although ultimately it causes even further emotional dysregulation (e.g., substance-induced changes in affect during and after use). Other efforts toward emotional regulation can include engagement in high-risk or self-injurious behaviors, disordered eating, compulsive behaviors such as gambling or overworking, and repression or denial of emotions; however, not all behaviors associated with self-regulation are considered negative. In fact, some individuals find creative, healthy, and industrious ways to manage strong affect generated by trauma, such as through renewed commitment to physical activity or by creating an organization to support survivors of a particular trauma.

Traumatic stress tends to evoke two emotional extremes: feeling either too much (overwhelmed) or too little (numb) emotion. Treatment can help the client find the optimal level of emotion and assist him or her with appropriately experiencing and regulating difficult emotions. In treatment, the goal is to help clients learn to regulate their emotions without the use of substances or other unsafe behavior. This will likely require learning new coping skills and how to tolerate distressing emotions; some clients may benefit from mindfulness practices, cognitive restructuring, and trauma-specific desensitization approaches, such as exposure therapy and eye movement desensitization and reprocessing (EMDR; refer to Part 1, Chapter 6, for more information on trauma-specific therapies).

Numbing

Numbing is a biological process whereby emotions are detached from thoughts, behaviors, and memories. In the following case illustration, Sadhanna's numbing is evidenced by her limited range of emotions associated with interpersonal interactions and her inability to associate any emotion with her history of abuse. She also possesses a belief in a foreshortened future. A prospective longitudinal study (Malta, Levitt, Martin, Davis, & Cloitre, 2009) that followed the development of PTSD in disaster workers highlighted the importance of understanding and appreciating numbing as a traumatic stress reaction. Because numbing

Case Illustration: Sadhanna

Sadhanna is a 22-year-old woman mandated to outpatient mental health and substance abuse treatment as the alternative to incarceration. She was arrested and charged with assault after arguing and fighting with another woman on the street. At intake, Sadhanna reported a 7-year history of alcohol abuse and one depressive episode at age 18. She was surprised that she got into a fight but admitted that she was drinking at the time of the incident. She also reported severe physical abuse at the hands of her mother's boyfriend between ages 4 and 15. Of particular note to the intake worker was Sadhanna's matter-of-fact way of presenting the abuse history. During the interview, she clearly indicated that she did not want to attend group therapy and hear other people talk about their feelings, saying, "I learned long ago not to wear emotions on my sleeve."

Sadhanna reported dropping out of 10th grade, saying she never liked school. She didn't expect much from life. In Sadhanna's first weeks in treatment, she reported feeling disconnected from other group members and questioned the purpose of the group. When asked about her own history, she denied that she had any difficulties and did not understand why she was mandated to treatment. She further denied having feelings about her abuse and did not believe that it affected her life now. Group members often commented that she did not show much empathy and maintained a flat affect, even when group discussions were emotionally charged.

symptoms hide what is going on inside emotionally, there can be a tendency for family members, counselors, and other behavioral health staff to assess levels of traumatic stress symptoms and the impact of trauma as less severe than they actually are.

Physical

Diagnostic criteria for PTSD place considerable emphasis on psychological symptoms, but some people who have experienced traumatic stress may present initially with physical symptoms. Thus, primary care may be the first and only door through which these individuals seek assistance for trauma-related symptoms. Moreover, there is a significant connection between trauma, including adverse childhood experiences (ACEs), and chronic health conditions. Common physical disorders and symptoms include somatic complaints; sleep disturbances; gastrointestinal, cardiovascular, neurological, musculoskeletal, respiratory, and dermatological disorders; urological problems; and substance use disorders.

Somatization

Somatization indicates a focus on bodily symptoms or dysfunctions to express emotional distress. Somatic symptoms are more likely to occur with individuals who have traumatic stress reactions, including PTSD. People from certain ethnic and cultural backgrounds may initially or solely present emotional distress via physical ailments or concerns. Many individuals who present with somatization are likely unaware of the connection between their emotions and the physical symptoms that they're experiencing. At times, clients may remain resistant to exploring emotional content and remain focused on bodily complaints as a means of avoidance. Some clients may insist that their primary problems are physical even when medical evaluations and tests fail to confirm ailments. In these situations, somatization may be a sign of a mental illness. However, various cultures approach emotional distress through the physical realm or view emotional and physical symptoms and well-being as one. It is important not to assume that clients with physical complaints are using somatization as a means to express emotional pain; they may have specific conditions or disorders that require medical attention. Foremost, counselors need to refer for medical evaluation.

Advice to Counselors: Using Information About Biology and Trauma

- Educate your clients:
  - Frame reexperiencing the event(s), hyperarousal, sleep disturbances, and other physical symptoms as physiological reactions to extreme stress.
  - Communicate that treatment and other wellness activities can improve both psychological and physiological symptoms (e.g., therapy, meditation, exercise, yoga). You may need to refer certain clients to a psychiatrist who can evaluate them and, if warranted, prescribe psychotropic medication to address severe symptoms.
  - Discuss traumatic stress symptoms and their physiological components.
  - Explain links between traumatic stress symptoms and substance use disorders, if appropriate.
  - Normalize trauma symptoms. For example, explain to clients that their symptoms are not a sign of weakness, a character flaw, being damaged, or going crazy.
- Support your clients and provide a message of hope—that they are not alone, they are not at fault, and recovery is possible and anticipated.

Biology of trauma

Trauma biology is an area of burgeoning research, with the promise of more complex and explanatory findings yet to come. Although a thorough presentation on the biological aspects of trauma is beyond the scope of this publication, what is currently known is that exposure to trauma leads to a cascade of biological changes and stress responses. These biological alterations are highly associated with PTSD, other mental illnesses, and substance use disorders. These include:

- Changes in limbic system functioning.
- Hypothalamic–pituitary–adrenal axis activity changes with variable cortisol levels.
- Neurotransmitter-related dysregulation of arousal and endogenous opioid systems.

As a clear example, early ACEs such as abuse, neglect, and other traumas affect brain development and increase a person's vulnerability to encountering interpersonal violence as an adult and to developing chronic diseases and other physical illnesses, mental illnesses, substance-related disorders, and impairment in other life areas (Centers for Disease Control and Prevention, 2012).

Hyperarousal and sleep disturbances

A common symptom that arises from traumatic experiences is hyperarousal (also called hypervigilance). Hyperarousal is the body's way of remaining prepared. It is characterized by sleep disturbances, muscle tension, and a lower threshold for startle responses and can persist years after trauma occurs. It is also one of the primary diagnostic criteria for PTSD.

Hyperarousal is a consequence of biological changes initiated by trauma. Although it

Case Illustration: Kimi

Kimi is a 35-year-old Native American woman who was group raped at the age of 16 on her walk home from a suburban high school. She recounts how her whole life changed on that day. "I never felt safe being alone after the rape. I used to enjoy walking everywhere. Afterward, I couldn't tolerate the fear that would arise when I walked in the neighborhood. It didn't matter whether I was alone or with friends—every sound that I heard would throw me into a state of fear. I felt like the same thing was going to happen again. It's gotten better with time, but I often feel as if I'm sitting on a tree limb waiting for it to break. I have a hard time relaxing. I can easily get startled if a leaf blows across my path or if my children scream while playing in the yard. The best way I can describe how I experience life is by comparing it to watching a scary, suspenseful movie—anxiously waiting for something to happen, palms sweating, heart pounding, on the edge of your chair."

serves as a means of self-protection after trauma, it can be detrimental. Hyperarousal can interfere with an individual's ability to take the necessary time to assess and appropriately respond to specific input, such as loud noises or sudden movements. Sometimes, hyperarousal can produce overreactions to situations perceived as dangerous when, in fact, the circumstances are safe.

Along with hyperarousal, sleep disturbances are very common in individuals who have experienced trauma. They can come in the form of early awakening, restless sleep, difficulty falling asleep, and nightmares. Sleep disturbances are most persistent among individuals who have trauma-related stress; the disturbances sometimes remain resistant to intervention long after other traumatic stress symptoms have been successfully treated. Numerous strategies are available beyond medication, including good sleep hygiene practices, cognitive rehearsals of nightmares, relaxation strategies, and nutrition.

Cognitive

Traumatic experiences can affect and alter cognitions. From the outset, trauma challenges the just-world or core life assumptions that

Cognitions and Trauma

The following examples reflect some of the types of cognitive or thought-process changes that can occur in response to traumatic stress.

Cognitive errors: Misinterpreting a current situation as dangerous because it resembles, even remotely, a previous trauma (e.g., a client overreacting to an overturned canoe in 8 inches of water, as if she and her paddle companion would drown, due to her previous experience of nearly drowning in a rip current 5 years earlier).

Excessive or inappropriate guilt: Attempting to make sense cognitively and gain control over a traumatic experience by assuming responsibility or possessing survivor's guilt, because others who experienced the same trauma did not survive.

Idealization: Demonstrating inaccurate rationalizations, idealizations, or justifications of the perpetrator's behavior, particularly if the perpetrator is or was a caregiver. Other similar reactions mirror idealization; traumatic bonding is an emotional attachment that develops (in part to secure survival) between perpetrators who engage in interpersonal trauma and their victims, and Stockholm syndrome involves compassion and loyalty toward hostage takers (de Fabrique, Van Hasselt, Vecchi, & Romano, 2007).

Trauma-induced hallucinations or delusions: Experiencing hallucinations and delusions that, although they are biological in origin, contain cognitions that are congruent with trauma content (e.g., a woman believes that a person stepping onto her bus is her father, who had sexually abused her repeatedly as child, because he wore shoes similar to those her father once wore).

Intrusive thoughts and memories: Experiencing, without warning or desire, thoughts and memories associated with the trauma. These intrusive thoughts and memories can easily trigger strong emotional and behavioral reactions, as if the trauma was recurring in the present. The intrusive thoughts and memories can come rapidly, referred to as flooding, and can be disruptive at the time of their occurrence. If an individual experiences a trigger, he or she may have an increase in intrusive thoughts and memories for a while. For instance, individuals who inadvertently are retraumatized due to program or clinical practices may have a surge of intrusive thoughts of past trauma, thus making it difficult for them to discern what is happening now versus what happened then. Whenever counseling focuses on trauma, it is likely that the client will experience some intrusive thoughts and memories. It is important to develop coping strategies before, as much as possible, and during the delivery of trauma-informed and trauma-specific treatment.

help individuals navigate daily life (Janoff-Bulman, 1992). For example, it would be difficult to leave the house in the morning if you believed that the world was not safe, that all people are dangerous, or that life holds no promise. Belief that one's efforts and intentions can protect oneself from bad things makes it less likely for an individual to perceive personal vulnerability. However, traumatic events—particularly if they are unexpected—can challenge such beliefs.

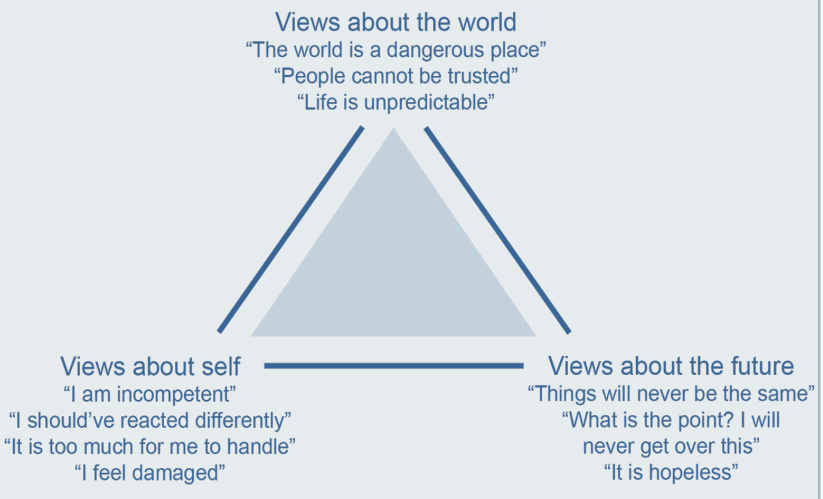
Let's say you always considered your driving time as "your time"—and your car as a safe place to spend that time. Then someone hits you from behind at a highway entrance. Almost immediately, the accident affects how you perceive the world, and from that moment onward, for months following the crash, you feel unsafe in any car. You become hypervigilant about other drivers and perceive that other cars are drifting into your lane or failing to stop at a safe distance behind you. For a time, your perception of safety is eroded, often leading to compensating behaviors (e.g., excessive glancing into the rearview mirror to see whether the vehicles behind you are stopping) until the belief is restored or reworked. Some individuals never return to their previous belief systems after a trauma, nor do they find a way to rework them—thus leading to a worldview that life is unsafe. Still, many other individuals are able to return to organizing core beliefs that support their perception of safety.

Many factors contribute to cognitive patterns prior to, during, and after a trauma. Adopting Beck and colleagues' cognitive triad model (1979), trauma can alter three main cognitive patterns: thoughts about self, the world (others/environment), and the future. To clarify, trauma can lead individuals to see themselves as incompetent or damaged, to see others and the world as unsafe and unpredictable, and to see the future as hopeless—believing that personal suffering will continue, or negative outcomes will preside for the foreseeable future (see Exhibit 1.3-2). Subsequently, this set of cognitions can greatly influence clients' belief in their ability to use internal resources and external support effectively. From a cognitive–behavioral perspective, these cognitions have a bidirectional relationship in sustaining or contributing to the development of depressive and anxiety symptoms after trauma. However, it is possible for cognitive patterns to help protect against debilitating psychological symptoms as well. Many factors contribute to cognitive patterns prior to, during, and after a trauma.

Feeling different

An integral part of experiencing trauma is feeling different from others, whether or not the trauma was an individual or group experience. Traumatic experiences typically feel surreal and challenge the necessity and value of mundane activities of daily life. Survivors

Exhibit 1.3-2: Cognitive Triad of Traumatic Stress



often believe that others will not fully understand their experiences, and they may think that sharing their feelings, thoughts, and reactions related to the trauma will fall short of expectations. However horrid the trauma may be, the *experience* of the trauma is typically profound.

The type of trauma can dictate how an individual feels different or believes that they are different from others. Traumas that generate shame will often lead survivors to feel more alienated from others—believing that they are "damaged goods." When individuals believe that their experiences are unique and incomprehensible, they are more likely to seek support, if they seek support at all, only with others who have experienced a similar trauma.

Triggers and flashbacks

Triggers

A trigger is a stimulus that sets off a memory of a trauma or a specific portion of a traumatic experience. Imagine you were trapped briefly in a car after an accident. Then, several years later, you were unable to unlatch a lock after using a restroom stall; you might have begun to feel a surge of panic reminiscent of the accident, even though there were other avenues of escape from the stall. Some triggers can be identified and anticipated easily, but many are subtle and inconspicuous, often surprising the individual or catching him or her off guard. In treatment, it is important to help clients identify potential triggers, draw a connection between strong emotional reactions and triggers, and develop coping strategies to manage those moments when a trigger occurs. A trigger is any sensory reminder of the traumatic event: a noise, smell, temperature, other physical sensation, or visual scene. Triggers can generalize to any characteristic, no matter how remote, that resembles or represents a previous trauma, such as revisiting the location where the trauma occurred, being alone, having your children reach the same age that you were when you experienced the trauma, seeing the same breed of dog that bit you, or hearing loud voices. Triggers are often associated with the time of day, season, holiday, or anniversary of the event.

Flashbacks

A flashback is reexperiencing a previous traumatic experience as if it were actually happening in that moment. It includes reactions that often resemble the client's reactions during the trauma. Flashback experiences are very brief and typically last only a few seconds, but the emotional aftereffects linger for hours or longer. Flashbacks are commonly initiated by a trigger, but not necessarily. Sometimes, they occur out of the blue. Other times, specific physical states increase a person's vulnerability to reexperiencing a trauma, (e.g., fatigue, high

Advice to Counselors: Helping Clients Manage Flashbacks and Triggers

If a client is triggered in a session or during some aspect of treatment, help the client focus on what is happening in the here and now; that is, use grounding techniques. Behavioral health service providers should be prepared to help the client get regrounded so that they can distinguish between what is happening now versus what had happened in the past (see Covington, 2008, and Najavits, 2002b, 2007b, for more grounding techniques). Offer education about the experience of triggers and flashbacks, and then normalize these events as common traumatic stress reactions. Afterward, some clients need to discuss the experience and understand why the flashback or trigger occurred. It often helps for the client to draw a connection between the trigger and the traumatic event(s). This can be a preventive strategy whereby the client can anticipate that a given situation places him or her at higher risk for retraumatization and requires use of coping strategies, including seeking support.

Source: Green Cross Academy of Traumatology, 2010.

stress levels). Flashbacks can feel like a brief movie scene that intrudes on the client. For example, hearing a car backfire on a hot, sunny day may be enough to cause a veteran to respond as if he or she were back on military patrol. Other ways people reexperience trauma, besides flashbacks, are via nightmares and intrusive thoughts of the trauma.

Dissociation, depersonalization, and derealization

Dissociation is a mental process that severs connections among a person's thoughts, memories, feelings, actions, and/or sense of identity. Most of us have experienced dissociation—losing the ability to recall or track a particular action (e.g., arriving at work but not remembering the last minutes of the drive). Dissociation happens because the person is engaged in an automatic activity and is not paying attention to his or her immediate environment. Dissociation can also occur during severe stress or trauma as a protective element whereby the individual incurs distortion of time, space, or identity. This is a common symptom in traumatic stress reactions.

Dissociation helps distance the experience from the individual. People who have experienced severe or developmental trauma may have learned to separate themselves from distress to survive. At times, dissociation can be very pervasive and symptomatic of a mental disorder, such as dissociative identity disorder (DID; formerly known as multiple personality disorder). According to the DSM-5, "dissociative disorders are characterized by a disruption of and/or discontinuity in the normal integration of consciousness, memory, identity, emotion, perception, body representation, motor control, and behavior" (APA, 2013a, p. 291). Dissociative disorder diagnoses are closely associated with histories of severe childhood trauma or pervasive, human-caused, intentional trauma, such as that experienced by concentration camp survivors or victims of ongoing political imprisonment, torture, or long-term isolation. A mental health professional, preferably with significant training in working with dissociative disorders and with trauma, should be consulted when a dissociative disorder diagnosis is suspected.

Potential Signs of Dissociation

- Fixed or "glazed" eyes
- Sudden flattening of affect
- Long periods of silence
- Monotonous voice
- Stereotyped movements
- Responses not congruent with the present context or situation
- Excessive intellectualization

(Briere, 1996a)

The characteristics of DID can be commonly accepted experiences in other cultures, rather than being viewed as symptomatic of a traumatic experience. For example, in non-Western cultures, a sense of alternate beings within oneself may be interpreted as being inhabited by spirits or ancestors (Kirmayer, 1996). Other experiences associated with dissociation include depersonalization—psychologically "leaving one's body," as if watching oneself from a distance as an observer or through derealization, leading to a sense that what is taking place is unfamiliar or is not real.

If clients exhibit signs of dissociation, behavioral health service providers can use grounding techniques to help them reduce this defense strategy. One major long-term consequence of dissociation is the difficulty it causes in connecting strong emotional or physical reactions with an event. Often, individuals may believe that they are going crazy because they are not in touch with the nature of their reactions. By educating clients on the resilient qualities of dissociation while also emphasizing that it prevents them from addressing or

validating the trauma, individuals can begin to understand the role of dissociation. All in all, it is important when working with trauma survivors that the intensity level is not so great that it triggers a dissociative reaction and prevents the person from engaging in the process.

Behavioral

Traumatic stress reactions vary widely; often, people engage in behaviors to manage the aftereffects, the intensity of emotions, or the distressing aspects of the traumatic experience. Some people reduce tension or stress through avoidant, self-medicating (e.g., alcohol abuse), compulsive (e.g., overeating), impulsive (e.g., high-risk behaviors), and/or self-injurious behaviors. Others may try to gain control over their experiences by being aggressive or subconsciously reenacting aspects of the trauma.

Behavioral reactions are also the consequences of, or learned from, traumatic experiences. For example, some people act like they can't control their current environment, thus failing to take action or make decisions long after the trauma (learned helplessness). Other associate elements of the trauma with current activities, such as by reacting to an intimate moment in a significant relationship as dangerous or unsafe years after a date rape. The following sections discuss behavioral consequences of trauma and traumatic stress reactions.

Reenactments

A hallmark symptom of trauma is reexperiencing the trauma in various ways. Reexperiencing can occur through reenactments (literally, to "redo"), by which trauma survivors repetitively relive and recreate a past trauma in their present lives. This is very apparent in children, who play by mimicking what occurred during the trauma, such as by pretending to crash a toy airplane into a toy building after seeing televised images of the terrorist attacks on the World Trade Center on September 11, 2001. Attempts to understand reenactments are very complicated, as reenactments occur for a variety of reasons. Sometimes, individuals reenact past traumas to master them. Examples of reenactments include a variety of behaviors: self-injurious behaviors, hypersexuality, walking alone in unsafe areas or other high-risk behaviors, driving recklessly, or involvement in repetitive destructive relationships (e.g., repeatedly getting into romantic relationships with people who are abusive or violent), to name a few.

Self-harm and self-destructive behaviors

Self-harm is any type of intentionally self-inflicted harm, regardless of the severity of injury or whether suicide is intended. Often, self-harm is an attempt to cope with emotional or physical distress that seems overwhelming or to cope with a profound sense of dissociation or being trapped, helpless, and "damaged" (Herman, 1997; Santa Mina & Gallop, 1998). Self-harm is associated with past childhood sexual abuse and other forms of trauma as well as substance abuse. Thus,

Resilient Responses to Trauma

Many people find healthy ways to cope with, respond to, and heal from trauma. Often, people automatically reevaluate their values and redefine what is important after a trauma. Such resilient responses include:

- Increased bonding with family and community.
- Redefined or increased sense of purpose and meaning.
- Increased commitment to a personal mission.
- Revised priorities.
- Increased charitable giving and volunteerism.

Case Illustration: Marco

Marco, a 30-year-old man, sought treatment at a local mental health center after a 2-year bout of anxiety symptoms. He was an active member of his church for 12 years, but although he sought help from his pastor about a year ago, he reports that he has had no contact with his pastor or his church since that time. Approximately 3 years ago, his wife took her own life. He describes her as his soulmate and has had a difficult time understanding her actions or how he could have prevented them.

In the initial intake, he mentioned that he was the first person to find his wife after the suicide and reported feelings of betrayal, hurt, anger, and devastation since her death. He claimed that everyone leaves him or dies. He also talked about his difficulty sleeping, having repetitive dreams of his wife, and avoiding relationships. In his first session with the counselor, he initially rejected the counselor before the counselor had an opportunity to begin reviewing and talking about the events and discomfort that led him to treatment.

In this scenario, Marco is likely reenacting his feelings of abandonment by attempting to reject others before he experiences another rejection or abandonment. In this situation, the counselor will need to recognize the reenactment, explore the behavior, and examine how reenactments appear in other situations in Marco's life.

addressing self-harm requires attention to the client's reasons for self-harm. More than likely, the client needs help recognizing and coping with emotional or physical distress in manageable amounts and ways.

Among the self-harm behaviors reported in the literature are cutting, burning skin by heat (e.g., cigarettes) or caustic liquids, punching hard enough to self-bruise, head banging, hair pulling, self-poisoning, inserting foreign objects into bodily orifices, excessive nail biting, excessive scratching, bone breaking, gnawing at flesh, interfering with wound healing, tying off body parts to stop breathing or blood flow, swallowing sharp objects, and suicide. Cutting and burning are among the most common forms of self-harm.

Self-harm tends to occur most in people who have experienced repeated and/or early trauma (e.g., childhood sexual abuse) rather than in those who have undergone a single adult trauma (e.g., a community-wide disaster or a serious car accident). There are strong associations between eating disorders, self-harm, and substance abuse (Claes &Vandereycken, 2007; for discussion, see Harned, Najavits, & Weiss, 2006). Self-mutilation is also associated with (and part of the diagnostic criteria for) a number of personality disorders, including borderline and histrionic, as well as DID, depression, and some forms of schizophrenia; these disorders can co-occur with traumatic stress reactions and disorders.

It is important to distinguish self-harm that is suicidal from self-harm that is not suicidal and to assess and manage both of these very serious dangers carefully. Most people who engage in self-harm are not doing so with the intent to kill themselves (Noll, Horowitz, Bonanno, Trickett, & Putnam, 2003)—although self-harm can be life threatening and can escalate into suicidality if not managed therapeutically. Self-harm can be a way of getting attention or manipulating others, but most often it is not. Self-destructive behaviors such as substance abuse, restrictive or binge eating, reckless automobile driving, or high-risk impulsive behavior are different from self-harming behaviors but are also seen in clients with a history of trauma. Self-destructive behaviors differ from self-harming behaviors in that there may be no immediate negative impact of the behavior on the individual; they differ from suicidal behavior in that there is no intent to cause death in the short term.

Advice to Counselors: Working With Clients Who Are Self-Injurious

Counselors who are unqualified or uncomfortable working with clients who demonstrate self-harming, self-destructive, or suicidal or homicidal ideation, intent, or behavior should work with their agencies and supervisors to refer such clients to other counselors. They should consider seeking specialized supervision on how to manage such clients effectively and safely and how to manage their feelings about these issues. The following suggestions assume that the counselor has had sufficient training and experience to work with clients who are self-injurious. To respond appropriately to a client who engages in self-harm, counselors should:

- Screen the client for self-harm and suicide risk at the initial evaluation and throughout treatment.
- Learn the client's perspective on self-harm and how it "helps."
- Understand that self-harm is often a coping strategy to manage the intensity of emotional and/or physical distress.
- Teach the client coping skills that improve his or her management of emotions without self-harm.
- Help the client obtain the level of care needed to manage genuine risk of suicide or severe self-injury. This might include hospitalization, more intensive programming (e.g., intensive outpatient, partial hospitalization, residential treatment), or more frequent treatment sessions. The goal is to stabilize the client as quickly as possible, and then, if possible, begin to focus treatment on developing coping strategies to manage self-injurious and other harmful impulses.
- Consult with other team members, supervisors, and, if necessary, legal experts to determine whether one's efforts with and conceptualization of the self-harming client fit best practice guidelines. See, for example, Treatment Improvement Protocol (TIP) 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (Center for Substance Abuse Treatment [CSAT], 2005c). Document such consultations and the decisions made as a result of them thoroughly and frequently.
- Help the client identify how substance use affects self-harm. In some cases, it can increase the behavior (e.g., alcohol disinhibits the client, who is then more likely to self-harm). In other cases, it can decrease the behavior (e.g., heroin evokes relaxation and, thus, can lessen the urge to self-harm). In either case, continue to help the client understand how abstinence from substances is necessary so that he or she can learn more adaptive coping.
- Work collaboratively with the client to develop a plan to create a sense of safety. Individuals are affected by trauma in different ways; therefore, safety or a safe environment may mean something entirely different from one person to the next. Allow the client to define what safety means to him or her.

Counselors can also help the client prepare a safety card that the client can carry at all times. The card might include the counselor's contact information, a 24-hour crisis number to call in emergencies, contact information for supportive individuals who can be contacted when needed, and, if appropriate, telephone numbers for emergency medical services. The counselor can discuss with the client the types of signs or crises that might warrant using the numbers on the card. Additionally, the counselor might check with the client from time to time to confirm that the information on the card is current.

TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment* (CSAT, 2009a), has examples of safety agreements specifically for suicidal clients and discusses their uses in more detail. There is no credible evidence that a safety agreement is effective in preventing a suicide attempt or death. Safety agreements for clients with suicidal thoughts and behaviors should only be used as an adjunct support accompanying professional screening, assessment, and treatment for people with suicidal thoughts and behaviors. Keep in mind that safety plans or agreements may be perceived by the trauma survivor as a means of controlling behavior, subsequently replicating or triggering previous traumatic experiences.

All professionals—and in some States, anyone—could have ethical and legal responsibilities to those clients who pose an imminent danger to themselves or others. Clinicians should be aware of the pertinent State laws where they practice and the relevant Federal and professional regulations.

However, as with self-harming behavior, self-destructive behavior needs to be recognized and addressed and may persist—or worsen—without intervention.

Consumption of substances

Substance use often is initiated or increased after trauma. Clients in early recovery—especially those who develop PTSD or have it reactivated—have a higher relapse risk if they experience a trauma. In the first 2 months after September 11, 2001, more than a quarter of New Yorker residents who smoked cigarettes, drank alcohol, or used marijuana (about 265,000 people) increased their consumption. The increases continued 6 months after the attacks (Vlahov, Galea, Ahern, Resnick, & Kilpatrick, 2004). A study by the Substance Abuse and Mental Health Services Administration (SAMHSA, Office of Applied Studies, 2002) used National Survey on Drug Use and Health data to compare the first three quarters of 2001 with the last quarter and reported an increase in the prevalence rate for alcohol use among people 18 or older in the New York metropolitan area during the fourth quarter.

Interviews with New York City residents who were current or former cocaine or heroin users indicated that many who had been clean for 6 months or less relapsed after September 11, 2001. Others, who lost their income and could no longer support their habit, enrolled in methadone programs (Weiss et al., 2002). After the Oklahoma City bombing in 1995, Oklahomans reported double the normal rate of alcohol use, smoking more cigarettes, and a higher incidence of initiating smoking months and even years after the bombing (Smith, Christiansen, Vincent, & Hann, 1999).

Self-medication

Khantzian's self-medication theory (1985) suggests that drugs of abuse are selected for their specific effects. However, no definitive pattern has yet emerged of the use of particular substances in relation to PTSD or trauma symptoms. Use of substances can vary based on a variety of factors, including which trauma symptoms are most prominent for an individual and the individual's access to particular substances. Unresolved traumas sometimes lurk behind the emotions that clients cannot allow themselves to experience. Substance use and abuse in trauma survivors can be a way to self-medicate and thereby avoid or displace difficult emotions associated with traumatic experiences. When the substances are withdrawn, the survivor may use other behaviors to self-soothe, self-medicate, or avoid emotions. As likely, emotions can appear after abstinence in the form of anxiety and depression.

Avoidance

Avoidance often coincides with anxiety and the promotion of anxiety symptoms. Individuals begin to avoid people, places, or situations to alleviate unpleasant emotions, memories, or circumstances. Initially, the avoidance works, but over time, anxiety increases and the perception that the situation is unbearable or dangerous increases as well, leading to a greater need to avoid. Avoidance can be adaptive, but it is also a behavioral pattern that reinforces perceived danger without testing its validity, and it typically leads to greater problems across major life areas (e.g., avoiding emotionally oriented conversations in an intimate relationship). For many individuals who have traumatic stress reactions, avoidance is commonplace. A person may drive 5 miles longer to avoid the road where he or she had an accident. Another individual may avoid crowded places in fear of an assault or to circumvent strong emotional memories about an earlier assault that took place in a crowded area. Avoidance can come in many forms. When people can't tolerate strong affects associated with traumatic memories, they avoid, project,

deny, or distort their trauma-related emotional and cognitive experiences. A key ingredient in trauma recovery is learning to manage triggers, memories, and emotions without avoidance—in essence, becoming desensitized to traumatic memories and associated symptoms.

Social/Interpersonal

A key ingredient in the early stage of TIC is to establish, confirm, or reestablish a support system, including culturally appropriate activities, as soon as possible. Social supports and relationships can be protective factors against traumatic stress. However, trauma typically affects relationships significantly, regardless of whether the trauma is interpersonal or is of some other type. Relationships require emotional exchanges, which means that others who have close relationships or friendships with the individual who survived the trauma(s) are often affected as well—either through secondary traumatization or by directly experiencing the survivor's traumatic stress reactions. In natural disasters, social and community supports can be abruptly eroded and difficult to rebuild after the initial disaster relief efforts have waned.

Survivors may readily rely on family members, friends, or other social supports—or they may avoid support, either because they believe that no one will be understanding or trustworthy or because they perceive their own needs as a burden to others. Survivors who have strong emotional or physical reactions, including outbursts during nightmares, may pull away further in fear of being unable to predict their own reactions or to protect their own safety and that of others. Often, trauma survivors feel ashamed of their stress reactions, which further hampers their ability to use their support systems and resources adequately.

Many survivors of childhood abuse and interpersonal violence have experienced a significant sense of betrayal. They have often encountered trauma at the hands of trusted caregivers and family members or through significant relationships. This history of betrayal can disrupt forming or relying on supportive relationships in recovery, such as peer supports and counseling. Although this fear of trusting others is protective, it can lead to difficulty in connecting with others and greater vigilance in observing the behaviors of others, including behavioral health service providers. It is exceptionally difficult to override the feeling that someone is going to hurt you, take advantage of you, or, minimally, disappoint you. Early betrayal can affect one's ability to develop attachments, yet the formation of supportive relationships is an important antidote in the recovery from traumatic stress.

Developmental

Each age group is vulnerable in unique ways to the stresses of a disaster, with children and the elderly at greatest risk. Young children may display generalized fear, nightmares, heightened arousal and confusion, and physical symptoms, (e.g., stomachaches, headaches). School-age children may exhibit symptoms such as aggressive behavior and anger, regression to behavior seen at younger ages, repetitious traumatic play, loss of ability to concentrate, and worse school performance. Adolescents may display depression and social withdrawal, rebellion, increased risky activities such as sexual acting out, wish for revenge and action-oriented responses to trauma, and sleep and eating disturbances (Hamblen, 2001). Adults may display sleep problems, increased agitation, hypervigilance, isolation or withdrawal, and increased use of alcohol or drugs. Older adults may exhibit increased withdrawal and isolation, reluctance to leave home, worsening of chronic illnesses, confusion, depression, and fear (DeWolfe & Nordboe, 2000b).

Neurobiological Development: Consequences of Early Childhood Trauma

Findings in developmental psychobiology suggest that the consequences of early maltreatment produce enduring negative effects on brain development (DeBellis, 2002; Liu, Diorio, Day, Francis, & Meaney, 2000; Teicher, 2002). Research suggests that the first stage in a cascade of events produced by early trauma and/or maltreatment involves the disruption of chemicals that function as neurotransmitters (e.g., cortisol, norepinephrine, dopamine), causing escalation of the stress response (Heim, Mletzko, Purselle, Musselman, & Nemeroff, 2008; Heim, Newport, Mletzko, Miller, & Nemeroff, 2008; Teicher, 2002). These chemical responses can then negatively affect critical neural growth during specific sensitive periods of childhood development and can even lead to cell death.

Adverse brain development can also result from elevated levels of cortisol and catecholamines by contributing to maturational failures in other brain regions, such as the prefrontal cortex (Meaney, Brake, & Gratton, 2002). Heim, Mletzko et al. (2008) found that the neuropeptide oxytocin—important for social affiliation and support, attachment, trust, and management of stress and anxiety—was markedly decreased in the cerebrospinal fluid of women who had been exposed to childhood maltreatment, particularly those who had experienced emotional abuse. The more childhood traumas a person had experienced, and the longer their duration, the lower that person's current level of oxytocin was likely to be and the higher her rating of current anxiety was likely to be.

Using data from the Adverse Childhood Experiences Study, an analysis by Anda, Felitti, Brown et al. (2006) confirmed that the risk of negative outcomes in affective, somatic, substance abuse, memory, sexual, and aggression-related domains increased as scores on a measure of eight ACEs increased. The researchers concluded that the association of study scores with these outcomes can serve as a theoretical parallel for the effects of cumulative exposure to stress on the developing brain and for the resulting impairment seen in multiple brain structures and functions.

The National Child Traumatic Stress Network (http://www.nctsn.org) offers information about childhood abuse, stress, and physiological responses of children who are traumatized. Materials are available for counselors, educators, parents, and caregivers. There are special sections on the needs of children in military families and on the impact of natural disasters on children's mental health.

Subthreshold Trauma-Related Symptoms

Many trauma survivors experience symptoms that, although they do not meet the diagnostic criteria for ASD or PTSD, nonetheless limit their ability to function normally (e.g., regulate emotional states, maintain steady and rewarding social and family relationships, function competently at a job, maintain a steady pattern of abstinence in recovery). These symptoms can be transient, only arising in a specific context; intermittent, appearing for several weeks or months and then receding; or a part of the individual's regular pattern of functioning (but not to the level of DSM-5 diagnostic criteria). Often, these patterns are termed "subthreshold" trauma symptoms. Like PTSD, the symptoms can be misdiagnosed as depression, anxiety, or another mental illness. Likewise, clients who have experienced trauma may link some of their symptoms to their trauma and diagnose themselves as having PTSD, even though they do not meet all criteria for that disorder.

Combat Stress Reaction

A phenomenon unique to war, and one that counselors need to understand well, is combat stress reaction (CSR). CSR is an acute anxiety reaction occurring during or shortly after participating in military conflicts and wars as well as other operations within the war zone, known as the theater. CSR is not a formal diagnosis, nor is it included in the DSM-5 (APA, 2013a). It is similar to acute stress

Case Illustration: Frank

Frank is a 36-year-old man who was severely beaten in a fight outside a bar. He had multiple injuries, including broken bones, a concussion, and a stab wound in his lower abdomen. He was hospitalized for 3.5 weeks and was unable to return to work, thus losing his job as a warehouse forklift operator. For several years, when faced with situations in which he perceived himself as helpless and overwhelmed, Frank reacted with violent anger that, to others, appeared grossly out of proportion to the situation. He has not had a drink in almost 3 years, but the bouts of anger persist and occur three to five times a year. They leave Frank feeling even more isolated from others and alienated from those who love him. He reports that he cannot watch certain television shows that depict violent anger; he has to stop watching when such scenes occur. He sometimes daydreams about getting revenge on the people who assaulted him.

Psychiatric and neurological evaluations do not reveal a cause for Frank's anger attacks. Other than these symptoms, Frank has progressed well in his abstinence from alcohol. He attends a support group regularly, has acquired friends who are also abstinent, and has reconciled with his family of origin. His marriage is more stable, although the episodes of rage limit his wife's willingness to commit fully to the relationship. In recounting the traumatic event in counseling, Frank acknowledges that he thought he was going to die as a result of the fight, especially when he realized he had been stabbed. As he described his experience, he began to become very anxious, and the counselor observed the rage beginning to appear.

After his initial evaluation, Frank was referred to an outpatient program that provided trauma-specific interventions to address his subthreshold trauma symptoms. With a combination of cognitive–behavioral counseling, EMDR, and anger management techniques, he saw a gradual decrease in symptoms when he recalled the assault. He started having more control of his anger when memories of the trauma emerged. Today, when feeling trapped, helpless, or overwhelmed, Frank has resources for coping and does not allow his anger to interfere with his marriage or other relationships.

reaction, except that the precipitating event or events affect military personnel (and civilians exposed to the events) in an armed conflict situation. The terms "combat stress reaction" and "posttraumatic stress injury" are relatively new, and the intent of using these new terms is to call attention to the unique experiences of combat-related stress as well as to decrease the shame that can be associated with seeking behavioral health services for PTSD (for more information on veterans and combat stress reactions, see the planned TIP, *Reintegration-Related Behavioral Health Issues for Veterans and Military Families*; SAMHSA, planned f).

Although stress mobilizes an individual's physical and psychological resources to perform more effectively in combat, reactions to the stress may persist long after the actual danger has ended. As with other traumas, the nature of the event(s), the reactions of others, and the survivor's psychological history and resources affect the likelihood and severity of CSR. With combat veterans, this translates to the number, intensity, and duration of threat factors; the social support of peers in the veterans' unit; the emotional and cognitive resilience of the service members; and the quality of military leadership. CSR can vary from manageable and mild to debilitating and severe. Common, less severe symptoms of CSR include tension, hypervigilance, sleep problems, anger, and difficulty concentrating. If left untreated, CSR can lead to PTSD.

Common causes of CSR are events such as a direct attack from insurgent small arms fire or a military convoy being hit by an improvised explosive device, but combat stressors encompass a diverse array of traumatizing events, such as seeing grave injuries, watching others

Advice to Counselors: Understanding the Nature of Combat Stress

Several sources of information are available to help counselors deepen their understanding of combat stress and postdeployment adjustment. Friedman (2006) explains how a prolonged combat-ready stance, which is adaptive in a war zone, becomes hypervigilance and overprotectiveness at home. He makes the point that the "mutual interdependence, trust, and affection" (p. 587) that are so necessarily a part of a combat unit are different from relationships with family members and colleagues in a civilian workplace. This complicates the transition to civilian life. *Wheels Down: Adjusting to Life After Deployment* (Moore & Kennedy, 2011) provides practical advice for military service members, including inactive or active duty personnel and veterans, in transitioning from the theater to home.

The following are just a few of the many resources and reports focused on combat-related psychological and stress issues:

- *Invisible Wounds of War: Psychological and Cognitive Injuries, Their Consequences, and Services to Assist Recovery* (Tanielian & Jaycox, 2008)
- *On Killing* (Grossman, 1995), an indepth analysis of the psychological dynamics of combat
- *Haunted by Combat* (Paulson & Krippner, 2007), which contains specific chapters on Reserve and National Guard troops and female veterans
- *Treating Young Veterans: Promoting Resilience Through Practice and Advocacy* (Kelly, Howe-Barksdale, & Gitelson, 2011)

die, and making on-the-spot decisions in ambiguous conditions (e.g., having to determine whether a vehicle speeding toward a military checkpoint contains insurgents with explosives or a family traveling to another area). Such circumstances can lead to combat stress. Military personnel also serve in noncombat positions (e.g., healthcare and administrative roles), and personnel filling these supportive roles can be exposed to combat situations by proximity or by witnessing their results.

Specific Trauma-Related Psychological Disorders

Part of the definition of trauma is that the individual responds with intense fear, helplessness, or horror. Beyond that, in both the short term and the long term, trauma comprises a range of reactions from normal (e.g., being unable to concentrate, feeling sad, having trouble sleeping) to warranting a diagnosis of a trauma-related mental disorder. Most people who experience trauma have no long-lasting disabling effects; their coping skills and the support of those around them are sufficient to help them overcome their difficulties, and their ability to function on a daily basis over time is unimpaired. For others, though, the symptoms of trauma are more severe and last longer. The most common diagnoses associated with trauma are PTSD and ASD, but trauma is also associated with the onset of other mental disorders—particularly substance use disorders, mood disorders, various anxiety disorders, and personality disorders. Trauma also typically exacerbates symptoms of preexisting disorders, and, for people who are predisposed to a mental disorder, trauma can precipitate its onset. Mental disorders can occur almost simultaneously with trauma exposure or manifest sometime thereafter.

Acute Stress Disorder

ASD represents a normal response to stress. Symptoms develop within 4 weeks of the trauma and can cause significant levels of distress. Most individuals who have acute stress reactions never develop further impairment or PTSD. Acute stress disorder is highly associated with the experience of one specific trauma rather than the experience of long-term exposure to chronic traumatic stress. Diagnostic criteria are presented in Exhibit 1.3-3.

Exhibit 1.3-3: DSM-5 Diagnostic Criteria for ASD

A. Exposure to actual or threatened death, serious injury, or sexual violation in one (or more) of the following ways:
   1. Directly experiencing the traumatic event(s).
   2. Witnessing, in person, the event(s) as it occurred to others.
   3. Learning that the event(s) occurred to a close family member or close friend. **Note:** In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental.
   4. Experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g., first responders collecting human remains, police officers repeatedly exposed to details of child abuse). **Note:** This does not apply to exposure through electronic media, television, movies, or pictures, unless this exposure is work related.

B. Presence of nine (or more) of the following symptoms from any of the five categories of intrusion, negative mood, dissociation, avoidance, and arousal, beginning or worsening after the traumatic event(s) occurred:

Intrusion Symptoms:
   1. Recurrent, involuntary, and intrusive distressing memories of the traumatic event(s). **Note:** In children, repetitive play may occur in which themes or aspects of the traumatic event(s) are expressed.
   2. Recurrent distressing dreams in which the content and/or affect of the dream are related to the event(s). **Note:** In children, there may be frightening dreams without recognizable content.
   3. Dissociative reactions (e.g., flashbacks), during which the individual feels or acts as if the traumatic event(s) were recurring. Such reactions may occur on a continuum, with the most extreme expression being a complete loss of awareness of present surroundings. **Note:** In children, trauma-specific reenactment may occur in play.
   4. Intense or prolonged psychological distress or marked physiological reactions in response to internal or external cues that symbolize or resemble an aspect of the traumatic event(s).

Negative Mood:
   5. Persistent inability to experience positive emotions (e.g., inability to experience happiness, satisfaction, or loving feelings).

Dissociative Symptoms:
   6. An altered sense of the reality of one's surroundings or oneself (e.g., seeing oneself from another's perspective, being in a daze, time slowing).
   7. Inability to remember an important aspect of the traumatic event(s) (typically due to dissociative amnesia and not to other factors, such as head injury, alcohol, or drugs).

Avoidance Symptoms:
   8. Efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).
   9. Efforts to avoid external reminders (e.g., people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).

Arousal Symptoms:
   10. Sleep disturbance (e.g., difficulty falling or staying asleep, restless sleep).
   11. Irritable behavior and angry outbursts (with little or no provocation), typically expressed as verbal or physical aggression toward people or objects.
   12. Hypervigilance.
   13. Problems with concentration.
   14. Exaggerated startle response.

(Continued on the next page.)

Exhibit 1.3-3: DSM-5 Diagnostic Criteria for ASD (continued)

C. Duration of the disturbance (symptoms in Criterion B) is 3 days to 1 month after trauma exposure. **Note:** Symptoms typically begin immediately after the trauma, but persistence for at least 3 days and up to a month is needed to meet disorder criteria.

D. The disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning.

E. The disturbance is not attributable to the physiological effects of a substance (e.g., medication or alcohol) or another medical condition (e.g., mild traumatic brain injury) and is not better explained by brief psychotic disorder.

Source: APA, 2013a, pp. 280–281.

The primary presentation of an individual with an acute stress reaction is often that of someone who appears overwhelmed by the traumatic experience. The need to talk about the experience can lead the client to seem self-centered and unconcerned about the needs of others. He or she may need to describe, in repetitive detail, what happened, or may seem obsessed with trying to understand what happened in an effort to make sense of the experience. The client is often hypervigilant and avoids circumstances that are reminders of the trauma. For instance, someone who was in a serious car crash in heavy traffic can become anxious and avoid riding in a car or driving in traffic for a finite time afterward. Partial amnesia for the trauma often accompanies ASD, and the individual may repetitively question others to fill in details. People with ASD symptoms sometimes seek assurance from others that the event happened in the way they remember, that they are not "going crazy" or "losing it," and that they could not have prevented the event. The next case illustration demonstrates the time-limited nature of ASD.

Differences between ASD and PTSD

It is important to consider the differences between ASD and PTSD when forming a diagnostic impression. The primary difference is the amount of time the symptoms have been present. ASD resolves 2 days to 4 weeks after an event, whereas PTSD continues beyond the 4-week period. The diagnosis of ASD can change to a diagnosis of PTSD if the condition is noted within the first 4 weeks after the event, but the symptoms persist past 4 weeks.

ASD also differs from PTSD in that the ASD diagnosis requires 9 out of 14 symptoms from five categories, including intrusion, negative mood, dissociation, avoidance, and arousal. These symptoms can occur at the time of the trauma or in the following month. Studies indicate that dissociation at the time of trauma is a good predictor of subsequent PTSD, so the inclusion of dissociative symptoms makes it more likely that those who develop ASD will later be diagnosed with PTSD (Bryant & Harvey, 2000). Additionally, ASD is a transient disorder, meaning that it is present in a person's life for a relatively short time and then passes. In contrast, PTSD typically becomes a primary feature of an individual's life. Over a lengthy period, PTSD can have profound effects on clients' perceptions of safety, their sense of hope for the future, their relationships with others, their physical health, the appearance of psychiatric symptoms, and their patterns of substance use and abuse.

There are common symptoms between PTSD and ASD, and untreated ASD is a possible predisposing factor to PTSD, but it is unknown whether most people with ASD are likely to develop PTSD. There is some suggestion that, as with PTSD, ASD is more

Case Illustration: Sheila

Two months ago, Sheila, a 55-year-old married woman, experienced a tornado in her home town. In the previous year, she had addressed a long-time marijuana use problem with the help of a treatment program and had been abstinent for about 6 months. Sheila was proud of her abstinence; it was something she wanted to continue. She regarded it as a mark of personal maturity; it improved her relationship with her husband, and their business had flourished as a result of her abstinence.

During the tornado, an employee reported that Sheila had become very agitated and had grabbed her assistant to drag him under a large table for cover. Sheila repeatedly yelled to her assistant that they were going to die. Following the storm, Sheila could not remember certain details of her behavior during the event. Furthermore, Sheila said that after the storm, she felt numb, as if she was floating out of her body and could watch herself from the outside. She stated that nothing felt real and it was all like a dream.

Following the tornado, Sheila experienced emotional numbness and detachment, even from people close to her, for about 2 weeks. The symptoms slowly decreased in intensity but still disrupted her life. Sheila reported experiencing disjointed or unconnected images and dreams of the storm that made no real sense to her. She was unwilling to return to the building where she had been during the storm, despite having maintained a business at this location for 15 years. In addition, she began smoking marijuana again because it helped her sleep. She had been very irritable and had uncharacteristic angry outbursts toward her husband, children, and other family members.

As a result of her earlier contact with a treatment program, Sheila returned to that program and engaged in psychoeducational, supportive counseling focused on her acute stress reaction. She regained abstinence from marijuana and returned shortly to a normal level of functioning. Her symptoms slowly diminished over a period of 3 weeks. With the help of her counselor, she came to understand the link between the trauma and her relapse, regained support from her spouse, and again felt in control of her life.

prevalent in women than in men (Bryant & Harvey, 2003). However, many people with PTSD do not have a diagnosis or recall a history of acute stress symptoms before seeking treatment for or receiving a diagnosis of PTSD.

Effective interventions for ASD can significantly reduce the possibility of the subsequent development of PTSD. Effective treatment of ASD can also reduce the incidence of other co-occurring problems, such as depression, anxiety, dissociative disorders, and compulsive behaviors (Bryant & Harvey, 2000). Intervention for ASD also helps the individual develop coping skills that can effectively prevent the recurrence of ASD after later traumas.

Although predictive science for ASD and PTSD will continue to evolve, both disorders are associated with increased substance use and mental disorders and increased risk of relapse; therefore, effective screening for ASD and PTSD is important for all clients with these disorders. Individuals in early recovery—lacking well-practiced coping skills, lacking environmental supports, and already operating at high levels of anxiety—are particularly susceptible to ASD. Events that would not normally be disabling can produce symptoms of intense helplessness and fear, numbing and depersonalization, disabling anxiety, and an inability to handle normal life events. Counselors should be able to recognize ASD and treat it rather than attributing the symptoms to a client's lack of motivation to change, being "dry drunk" (for those in substance abuse recovery), or being manipulative.

Posttraumatic Stress Disorder

The trauma-related disorder that receives the greatest attention is PTSD; it is the most

Case Illustration: Michael

Michael is a 62-year-old Vietnam veteran. He is a divorced father of two children and has four grandchildren. Both of his parents were dependent on alcohol. He describes his childhood as isolated. His father physically and psychologically abused him (e.g., he was beaten with a switch until he had welts on his legs, back, and buttocks). By age 10, his parents regarded him as incorrigible and sent him to a reformatory school for 6 months. By age 15, he was using marijuana, hallucinogens, and alcohol and was frequently truant from school.

At age 19, Michael was drafted and sent to Vietnam, where he witnessed the deaths of six American military personnel. In one incident, the soldier he was next to in a bunker was shot. Michael felt helpless as he talked to this soldier, who was still conscious. In Vietnam, Michael increased his use of both alcohol and marijuana. On his return to the United States, Michael continued to drink and use marijuana. He reenlisted in the military for another tour of duty.

His life stabilized in his early 30s, as he had a steady job, supportive friends, and a relatively stable family life. However, he divorced in his late 30s. Shortly thereafter, he married a second time, but that marriage ended in divorce as well. He was chronically anxious and depressed and had insomnia and frequent nightmares. He periodically binged on alcohol. He complained of feeling empty, had suicidal ideation, and frequently stated that he lacked purpose in his life.

In the 1980s, Michael received several years of mental health treatment for dysthymia. He was hospitalized twice and received 1 year of outpatient psychotherapy. In the mid-1990s, he returned to outpatient treatment for similar symptoms and was diagnosed with PTSD and dysthymia. He no longer used marijuana and rarely drank. He reported that he didn't like how alcohol or other substances made him feel anymore—he felt out of control with his emotions when he used them. Michael reported symptoms of hyperarousal, intrusion (intrusive memories, nightmares, and preoccupying thoughts about Vietnam), and avoidance (isolating himself from others and feeling "numb"). He reported that these symptoms seemed to relate to his childhood abuse and his experiences in Vietnam. In treatment, he expressed relief that he now understood the connection between his symptoms and his history.

commonly diagnosed trauma-related disorder, and its symptoms can be quite debilitating over time. Nonetheless, it is important to remember that PTSD symptoms are represented in a number of other mental illnesses, including major depressive disorder (MDD), anxiety disorders, and psychotic disorders (Foa et al., 2006). The DSM-5 (APA, 2013a) identifies four symptom clusters for PTSD: presence of intrusion symptoms, persistent avoidance of stimuli, negative alterations in cognitions and mood, and marked alterations in arousal and reactivity. Individuals must have been exposed to actual or threatened death, serious injury, or sexual violence, and the symptoms must produce significant distress and impairment for more than 4 weeks (Exhibit 1.3-4).

Certain characteristics make people more susceptible to PTSD, including one's unique personal vulnerabilities at the time of the traumatic exposure, the support (or lack of support) received from others at the time of the trauma and at the onset of trauma-related symptoms, and the way others in the person's environment gauge the nature of the traumatic event (Brewin, Andrews, & Valentine, 2000).

People with PTSD often present varying clinical profiles and histories. They can experience symptoms that are activated by environmental triggers and then recede for a period of time. Some people with PTSD who show mostly psychiatric symptoms (particularly depression and anxiety) are misdiagnosed and go untreated for their primary condition. For many people, the trauma experience and diagnosis

Exhibit 1.3-4: DSM-5 Diagnostic Criteria for PTSD

Note: The following criteria apply to adults, adolescents, and children older than 6 years. For children 6 years and younger, see the DSM-5 section titled "Posttraumatic Stress Disorder for Children 6 Years and Younger" (APA, 2013a).

A. Exposure to actual or threatened death, serious injury, or sexual violence in one (or more) of the following ways:
   1. Directly experiencing the traumatic event(s).
   2. Witnessing, in person, the event(s) as it occurred to others.
   3. Learning that the traumatic event(s) occurred to a close family member or close friend. In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental.
   4. Experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g., first responders collecting human remains; police officers repeatedly exposed to details of child abuse). **Note:** Criterion A4 does not apply to exposure through electronic media, television, movies, or pictures, unless this exposure is work related.

B. Presence of one (or more) of the following intrusion symptoms associated with the traumatic event(s), beginning after the traumatic event(s) occurred:
   1. Recurrent, involuntary, and intrusive distressing memories of the traumatic event(s). **Note:** In children older than 6 years, repetitive play may occur in which themes or aspects of the traumatic event(s) are expressed.
   2. Recurrent distressing dreams in which the content and/or affect of the dream are related to the traumatic event(s). **Note:** In children, there may be frightening dreams without recognizable content.
   3. Dissociative reactions (e.g., flashbacks) in which the individual feels or acts as if the traumatic event(s) were recurring. (Such reactions may occur on a continuum, with the most extreme expression being a complete loss of awareness of present surroundings.) **Note:** In children, trauma-specific reenactment may occur in play.
   4. Intense or prolonged psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event(s).
   5. Marked physiological reactions to internal or external cues that symbolize or resemble an aspect of the traumatic event(s).

C. Persistent avoidance of stimuli associated with the traumatic event(s), beginning after the traumatic event(s) occurred, as evidenced by one or both of the following:
   1. Avoidance of or efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).
   2. Avoidance of or efforts to avoid external reminders (people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).

D. Negative alterations in cognitions and mood associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following:
   1. Inability to remember an important aspect of the traumatic event(s) (typically due to dissociative amnesia, and not to other factors such as head injury, alcohol, or drugs).
   2. Persistent and exaggerated negative beliefs or expectations about oneself, others, or the world (e.g., "I am bad," "No one can be trusted," "The world is completely dangerous," "My whole nervous system is permanently ruined").
   3. Persistent, distorted cognitions about the cause or consequences of the traumatic event(s) that lead the individual to blame himself/herself or others.
   4. Persistent negative emotional state (e.g., fear, horror, anger, guilt, or shame).
   5. Markedly diminished interest or participation in significant activities.
   6. Feelings of detachment or estrangement from others.
   7. Persistent inability to experience positive emotions (e.g., inability to experience happiness, satisfaction, or loving feelings).

(Continued on the next page.)

Exhibit 1.3-4: DSM-5 Diagnostic Criteria for PTSD (continued)

E. Marked alterations in arousal and reactivity associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following:
   1. Irritable behavior and angry outbursts (with little or no provocation), typically expressed as verbal or physical aggression toward people or objects.
   2. Reckless or self-destructive behavior.
   3. Hypervigilance.
   4. Exaggerated startle response.
   5. Problems with concentration.
   6. Sleep disturbance (e.g., difficulty falling or staying asleep or restless sleep).

F. Duration of the disturbance (Criteria B, C, D and E) is more than 1 month.

G. The disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning.

H. The disturbance is not attributable to the physiological effects of a substance (e.g., medication, alcohol) or another medical condition.

Specify whether:

With dissociative symptoms: The individual's symptoms meet the criteria for posttraumatic stress disorder, and in addition, in response to the stressor, the individual experiences persistent or recurrent symptoms of either of the following:

1. **Depersonalization:** Persistent or recurrent experiences of feeling detached from, and as if one were an outside observer of, one's mental processes or body (e.g., feeling as though one were in a dream; feeling a sense of unreality of self or body or of time moving slowly).
2. **Derealization:** Persistent or recurrent experiences of unreality of surroundings (e.g., the world around the individual is experienced as unreal, dreamlike, distant, or distorted). **Note**: To use this subtype, the dissociative symptoms must not be attributable to the physiological effects of a substance (e.g., blackouts, behavior during alcohol intoxication) or another medical condition (e.g., complex partial seizures).

Specify whether:

With delayed expression: If the full diagnostic criteria are not met until at least 6 months after the event (although the onset and expression of some symptoms may be immediate).

Source: APA, 2013a, pp. 271–272.

are obscured by co-occurring substance use disorder symptoms. The important feature of PTSD is that the disorder becomes an orienting feature of the individual's life. How well the person can work, with whom he or she associates, the nature of close and intimate relationships, the ability to have fun and rejuvenate, and the way in which an individual goes about confronting and solving problems in life are all affected by the client's trauma experiences and his or her struggle to recover.

Posttraumatic stress disorder: Timing of symptoms

Although symptoms of PTSD usually begin within 3 months of a trauma in adulthood, there can be a delay of months or even years before symptoms appear for some people. Some people may have minimal symptoms after a trauma but then experience a crisis later in life. Trauma symptoms can appear suddenly, even without conscious memory of the original trauma or without any overt provocation. Survivors of abuse in childhood can have a delayed response triggered by something that happens to them as adults. For example, seeing a movie about child abuse can trigger symptoms related

Advice to Counselors: Helping Clients With Delayed Trauma Responses

Clients who are experiencing a delayed trauma response can benefit if you help them to:

- Create an environment that allows acknowledgment of the traumatic event(s).
- Discuss their initial recall or first suspicion that they were having a traumatic response.
- Become educated on delayed trauma responses.
- Draw a connection between the trauma and presenting trauma-related symptoms.
- Create a safe environment.
- Explore their support systems and fortify them as needed.
- Understand that triggers can precede traumatic stress reactions, including delayed responses to trauma.
- Identify their triggers.
- Develop coping strategies to navigate and manage symptoms.

to the trauma. Other triggers include returning to the scene of the trauma, being reminded of it in some other way, or noting the anniversary of an event. Likewise, combat veterans and survivors of community-wide disasters may seem to be coping well shortly after a trauma, only to have symptoms emerge later when their life situations seem to have stabilized. Some clients in substance abuse recovery only begin to experience trauma symptoms when they maintain abstinence for some time. As individuals decrease tension-reducing or self-medicating behaviors, trauma memories and symptoms can emerge.

Culture and posttraumatic stress

Although research is limited across cultures, PTSD has been observed in Southeast Asian, South American, Middle Eastern, and Native American survivors (Osterman & de Jong, 2007; Wilson & Tang, 2007). As Stamm and Friedman (2000) point out, however, simply observing PTSD does not mean that it is the "best conceptual tool for characterizing posttraumatic distress among non-Western individuals" (p. 73). In fact, many trauma-related symptoms from other cultures do not fit the DSM-5 criteria. These include somatic and psychological symptoms and beliefs about the origins and nature of traumatic events. Moreover, religious and spiritual beliefs can affect how a survivor experiences a traumatic event and whether he or she reports the distress. For example, in societies where attitudes toward karma and the glorification of war veterans are predominant, it is harder for war veterans to come forward and disclose that they are emotionally overwhelmed or struggling. It would be perceived as inappropriate and possibly demoralizing to focus on the emotional distress that he or she still bears. (For a review of cultural competence in treating trauma, refer to Brown, 2008.)

Methods for measuring PTSD are also culturally specific. As part of a project begun in 1972, the World Health Organization (WHO) and the National Institutes of Health (NIH) embarked on a joint study to test the cross-cultural applicability of classification systems for various diagnoses. WHO and NIH identified apparently universal factors of psychological disorders and developed specific instruments to measure them. These instruments, the Composite International Diagnostic Interview and the Schedules for Clinical Assessment in Neuropsychiatry, include certain criteria from the DSM (Fourth Edition, Text Revision; APA, 2000a) as well as criteria from the International Statistical Classification of Diseases and Related Health Problems, 10th revision (ICD-10; Exhibit 1.3-5).

Exhibit 1.3-5: ICD-10 Diagnostic Criteria for PTSD

A. The patient must have been exposed to a stressful event or situation (either brief or long-lasting) of exceptionally threatening or catastrophic nature, which would be likely to cause pervasive distress in almost anyone.

B. There must be persistent remembering or "reliving" of the stressor in intrusive "flashbacks," vivid memories, or recurring dreams, or in experiencing distress when exposed to circumstances resembling or associated with the stressor.

C. The patient must exhibit an actual or preferred avoidance of circumstances resembling or associated with the stressor, which was not present before exposure to the stressor.

D. Either of the following must be present:
   1. Inability to recall, either partially or completely, some important aspects of the period of exposure to the stressor.
   2. Persistent symptoms of increased psychological sensitivity and arousal (not present before exposure to the stressor), shown by any two of the following:
      a. Difficulty in falling or staying asleep.
      b. Irritability or outbursts of anger.
      c. Difficulty in concentrating.
      d. Exaggerated startle response.

E. Criteria B, C, and D must all be met within 6 months of the stressful event or at the end of a period of stress. (For some purposes, onset delayed more than 6 months can be included, but this should be clearly specified.)

Source: WHO, 1992.

Complex trauma and complex traumatic stress

When individuals experience multiple traumas, prolonged and repeated trauma during childhood, or repetitive trauma in the context of significant interpersonal relationships, their reactions to trauma have unique characteristics (Herman, 1992). This unique constellation of reactions, called complex traumatic stress, is not recognized diagnostically in the DSM-5, but theoretical discussions and research have begun to highlight the similarities and differences in symptoms of posttraumatic stress versus complex traumatic stress (Courtois & Ford, 2009). Often, the symptoms generated from complex trauma do not fully match PTSD criteria and exceed the severity of PTSD. Overall, literature reflects that PTSD criteria or subthreshold symptoms do not fully account for the persistent and more impairing clinical presentation of complex trauma. Even though current research in the study of traumatology is prolific, it is still in the early stages of development. The idea that there may be more diagnostic variations or subtypes is forthcoming, and this will likely pave the way for more client-matching interventions to better serve those individuals who have been repeatedly exposed to multiple, early childhood, and/or interpersonal traumas.

Other Trauma-Related and Co-Occurring Disorders

The symptoms of PTSD and other mental disorders overlap considerably; these disorders often coexist and include mood, anxiety,

The term "**co occurring disorders**" refers to cases when a person has one or more mental disorders as well as one or more substance use disorders (including sub stance abuse). Co occurring disorders are common among individuals who have a history of trauma and are seeking help.

Advice to Counselors: Universal Screening and Assessment

Only people specifically trained and licensed in mental health assessment should make diagnoses; trauma can result in complicated cases, and many symptoms can be present, whether or not they meet full diagnostic criteria for a specific disorder. Only a trained assessor can distinguish accurately among various symptoms and in the presence of co-occurring disorders. However, behavioral health professionals without specific assessment training can still serve an important role in screening for possible mental disorders using established screening tools (CSAT, 2005c; see also Chapter 4 of this TIP). In agencies and clinics, it is critical to provide such screenings systematically—for each client—as PTSD and other co-occurring disorders are typically underdiagnosed or misdiagnosed.

substance use, and personality disorders. Thus, it's common for trauma survivors to be underdiagnosed or misdiagnosed. If they have not been identified as trauma survivors, their psychological distress is often not associated with previous trauma, and/or they are diagnosed with a disorder that marginally matches their presenting symptoms and psychological sequelae of trauma. The following sections present a brief overview of some mental disorders that can result from (or be worsened by) traumatic stress. PTSD is not the only diagnosis related to trauma nor its only psychological consequence; trauma can broadly influence mental and physical health in clients who already have behavioral health disorders.

People With Mental Disorders

MDD is the most common co-occurring disorder in people who have experienced trauma and are diagnosed with PTSD. A well-established causal relationship exists between stressful events and depression, and a prior history of MDD is predictive of PTSD after exposure to major trauma (Foa et al., 2006).

Many survivors with severe mental disorders function fairly well following trauma, including disasters, as long as essential services aren't interrupted. For others, additional mental health supports may be necessary. For more information, see *Responding to the Needs of People With Serious and Persistent Mental Illness in Times of Major Disaster* (Center for Mental Health Services, 1996).

Co-occurrence is also linked with greater impairment and more severe symptoms of both disorders, and the person is less likely to experience remission of symptoms within 6 months.

Generalized anxiety, obsessive–compulsive, and other anxiety disorders are also associated with PTSD. PTSD may exacerbate anxiety disorder symptoms, but it is also likely that preexisting anxiety symptoms and anxiety disorders increase vulnerability to PTSD. Preexisting anxiety primes survivors for greater hyperarousal and distress. Other disorders, such as personality and somatization disorders, are also associated with trauma, but the history of trauma is often overlooked as a significant factor or necessary target in treatment.

The relationship between PTSD and other disorders is complex. More research is now examining the multiple potential pathways among PTSD and other disorders and how various sequences affect clinical presentation. TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c), is valuable in understanding the relationship of substance use to other mental disorders.

People With Substance Use Disorders

There is clearly a correlation between trauma (including individual, group, or mass trauma) and substance use as well as the presence of posttraumatic stress (and other trauma-related disorders) and substance use disorders. Alcohol and drug use can be, for some, an effort to

Co-Occurring PTSD and Other Mental Disorders

- Individuals with PTSD often have at least one additional diagnosis of a mental disorder.
- The presence of other disorders typically worsens and prolongs the course of PTSD and complicates clinical assessment, diagnosis, and treatment.
- The most common co-occurring disorders, in addition to substance use disorders, include mood disorders, various anxiety disorders, eating disorders, and personality disorders.
- Exposure to early, severe, and chronic trauma is linked to more complex symptoms, including impulse control deficits, greater difficulty in emotional regulation and establishing stable relationships, and disruptions in consciousness, memory, identity, and/or perception of the environment (Dom, De, Hulstijn, & Sabbe, 2007; Waldrop, Back, Verduin, & Brady, 2007).
- Certain diagnostic groups and at-risk populations (e.g., people with developmental disabilities, people who are homeless or incarcerated) are more susceptible to trauma exposure and to developing PTSD if exposed but less likely to receive appropriate diagnosis and treatment.
- Given the prevalence of traumatic events in clients who present for substance abuse treatment, counselors should assess all clients for possible trauma-related disorders.

manage traumatic stress and specific PTSD symptoms. Likewise, people with substance use disorders are at higher risk of developing PTSD than people who do not abuse substances. Counselors working with trauma survivors or clients who have substance use disorders have to be particularly aware of the possibility of the other disorder arising.

Timeframe: PTSD and the onset of substance use disorders

Knowing whether substance abuse or PTSD came first informs whether a causal relationship exists, but learning this requires thorough assessment of clients and access to complete data on PTSD; substance use, abuse, and dependence; and the onset of each. Much current research focuses solely on the age of onset of substance use (not abuse), so determining causal relationships can be difficult.

The relationship between PTSD and substance use disorders is thought to be bidirectional and cyclical: substance use increases trauma risk, and exposure to trauma escalates substance use to manage trauma-related symptoms. Three other causal pathways described by Chilcoat and Breslau's seminal work (1998) further explain the relationship between PTSD and substance use disorders:

1. The "self-medication" hypothesis suggests that clients with PTSD use substances to manage PTSD symptoms (e.g., intrusive memories, physical arousal). Substances such as alcohol, cocaine, barbiturates, opioids, and amphetamines are frequently abused in attempts to relieve or numb emotional pain or to forget the event.
2. The "high-risk" hypothesis states that drug and alcohol use places people who use substances in high-risk situations that increase their chances of being exposed to events that lead to PTSD.
3. The "susceptibility" hypothesis suggests that people who use substances are more susceptible to developing PTSD after exposure to trauma than people who do not. Increased vulnerability may result from failure to develop effective stress management strategies, changes in brain chemistry, or damage to neurophysiological systems due to extensive substance use.

PTSD and substance abuse treatment

PTSD can limit progress in substance abuse recovery, increase the potential for relapse, and complicate a client's ability to achieve success in various life areas. Each disorder can mask or hide the symptoms of the other, and both need

Case Illustration: Maria

Maria is a 31-year-old woman diagnosed with PTSD and alcohol dependence. From ages 8 to 12, she was sexually abused by an uncle. Maria never told anyone about the abuse for fear that she would not be believed. Her uncle remains close to the family, and Maria still sees him on certain holidays. When she came in for treatment, she described her emotions and thoughts as out of control. Maria often experiences intrusive memories of the abuse, which at times can be vivid and unrelenting. She cannot predict when the thoughts will come; efforts to distract herself from them do not always work. She often drinks in response to these thoughts or his presence, as she has found that alcohol can dull her level of distress. Maria also has difficulty falling asleep and is often awakened by nightmares. She does not usually remember the dreams, but she wakes up feeling frightened and alert and cannot go back to sleep.

Maria tries to avoid family gatherings but often feels pressured to go. Whenever she sees her uncle, she feels intense panic and anger but says she can usually "hold it together" if she avoids him. Afterward, however, she describes being overtaken by these feelings and unable to calm down. She also describes feeling physically ill and shaky. At these times, she often isolates herself, stays in her apartment, and drinks steadily for several days. Maria also reports distress pertaining to her relationship with her boyfriend. In the beginning of their relationship, she found him comforting and enjoyed his affection, but more recently, she has begun to feel anxious and unsettled around him. Maria tries to avoid sex with him, but she sometimes gives in for fear of losing the relationship. She finds it easier to have sex with him when she is drunk, but she often experiences strong feelings of dread and disgust reminiscent of her abuse. Maria feels guilty and confused about these feelings.

to be assessed and treated if the individual is to have a full recovery. There is a risk of misinterpreting trauma-related symptoms in substance abuse treatment settings. For example, avoidance symptoms in an individual with PTSD can be misinterpreted as lack of motivation or unwillingness to engage in substance abuse treatment; a counselor's efforts to address substance abuse–related behaviors in early recovery can likewise provoke an exaggerated response from a trauma survivor who has profound traumatic experiences of being trapped and controlled. Exhibit 1.3-6 lists important facts about PTSD and substance use disorders for counselors.

Sleep, PTSD, and substance use

Many people have trouble getting to sleep and/or staying asleep after a traumatic event; consequently, some have a drink or two to help them fall asleep. Unfortunately, any initially helpful effects are likely not only to wane quickly, but also to incur a negative rebound effect. When someone uses a substance before going to bed, "sleep becomes lighter and more easily disrupted," and rapid eye movement sleep (REM) "increases, with an associated increase in dreams and nightmares," as the effects wear off (Auerbach, 2003, p. 1185).

People with alcohol dependence report multiple types of sleep disturbances over time, and it is not unusual for clients to report that they cannot fall asleep without first having a drink. Both REM and slow wave sleep are reduced in clients with alcohol dependence, which is also associated with an increase in the amount of time it takes before sleep occurs, decreased overall sleep time, more nightmares, and reduced sleep efficiency. Sleep during withdrawal is "frequently marked by severe insomnia and sleep fragmentation…a loss of restful sleep and feelings of daytime fatigue. Nightmares and vivid dreams are not uncommon" (Auerbach, 2003, pp. 1185–1186).

Confounding changes in the biology of sleep that occur in clients with PTSD and substance use disorders often add to the problems of

Exhibit 1.3-6: PTSD and Substance Use Disorders: Important Treatment Facts

Profile Severity

- PTSD is one of the most common co-occurring mental disorders found in clients in substance abuse treatment (CSAT, 2005c).
- People in treatment for PTSD tend to abuse a wide range of substances, including opioids, cocaine, marijuana, alcohol, and prescription medications.
- People in treatment for PTSD and substance abuse have a more severe clinical profile than those with just one of these disorders.
- PTSD, with or without major depression, significantly increases risk for suicidality (CSAT, 2009a).

Gender Differences

- Rates of trauma-related disorders are high in men and women in substance abuse treatment.
- Women with PTSD and a substance use disorder most frequently experienced rape or witnessed a killing or injury; men with both disorders typically witnessed a killing or injury or were the victim of sudden injury or accident (Cottler, Nishith, & Compton, 2001).

Risk of Continued Cycle of Violence

- While under the influence of substances, a person is more vulnerable to traumatic events (e.g., automobile crashes, assaults).
- Perpetrators of violent assault often are under the influence of substances or test positive for substances at the time of arrest.

Treatment Complications

- It is important to recognize and help clients understand that becoming abstinent from substances does not resolve PTSD; in fact, some PTSD symptoms become worse with abstinence for some people. Both disorders must be addressed in treatment.
- Treatment outcomes for clients with PTSD and a substance use disorder are worse than for clients with other co-occurring disorders or who only abuse substances (Brown, Read, & Kahler, 2003).

recovery. Sleep can fail to return to normal for months or even years after abstinence, and the persistence of sleep disruptions appears related to the likelihood of relapse. Of particular clinical importance is the vicious cycle that can also begin during "slips"; relapse initially improves sleep, but continued drinking leads to sleep disruption. This cycle of initial reduction of an unpleasant symptom, which only ends up exacerbating the process as a whole, can take place for clients with PTSD as well as for clients with substance use disorders. There are effective cognitive–behavioral therapies and nonaddictive pharmacological interventions for sleep difficulties.

4 Screening and Assessment

IN THIS CHAPTER

- Screening and Assessment
- Barriers and Challenges to Trauma Informed Screening and Assessment
- Cross Cultural Screening and Assessment
- Choosing Instruments
- Trauma Informed Screening and Assessment
- Concluding Note

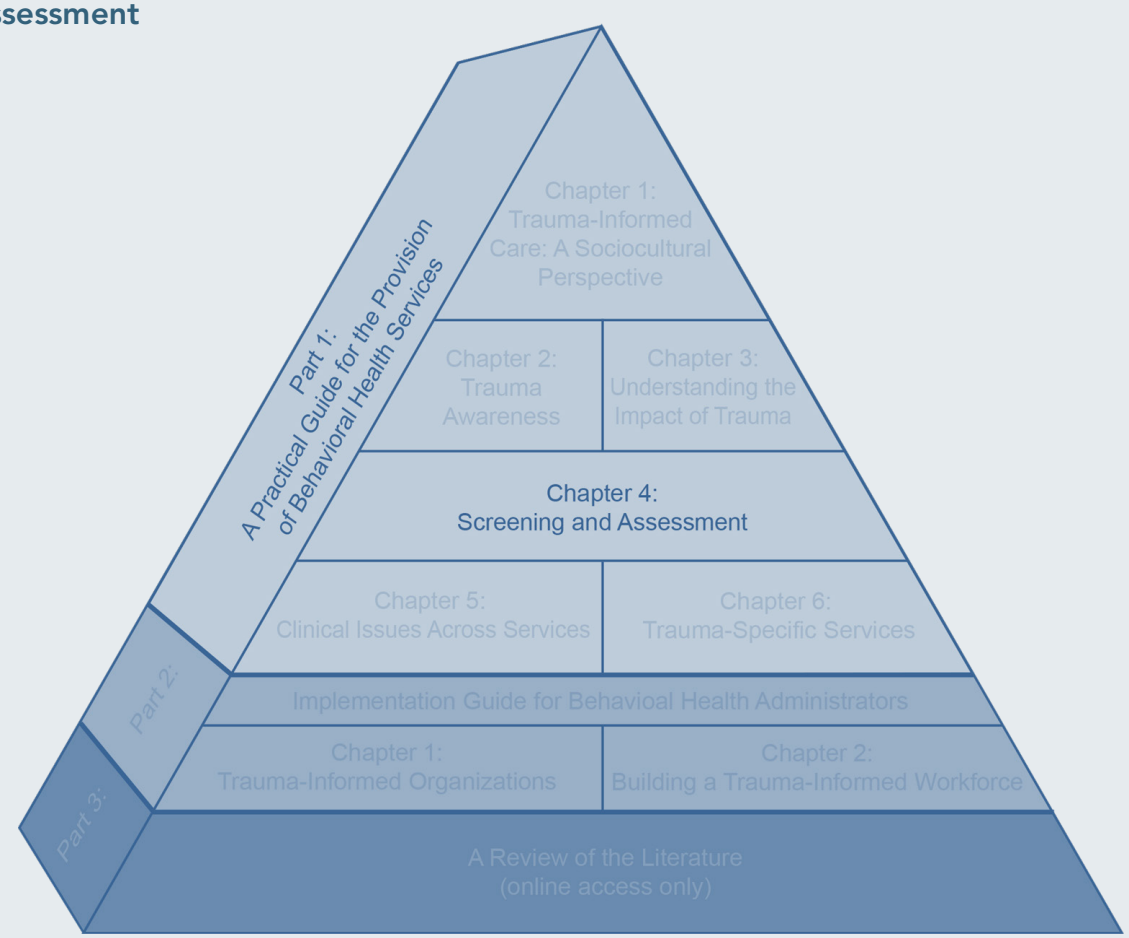
Why screen universally for trauma in behavioral health services? Exposure to trauma is common; in many surveys, more than half of respondents report a history of trauma, and the rates are even higher among clients with mental or substance use disorders. Furthermore, behavioral health problems, including substance use and mental disorders, are more difficult to treat if trauma-related symptoms and disorders aren't detected early and treated effectively (Part 3, Section 1, of this Treatment Improvement Protocol [TIP], available online, summarizes research on the prevalence of trauma and its relationship with other behavioral health problems).

Not addressing traumatic stress symptoms, trauma-specific disorders, and other symptoms/disorders related to trauma can impede successful mental health and substance abuse treatment. Unrecognized, unaddressed trauma symptoms can lead to poor engagement in treatment, premature termination, greater risk for relapse of psychological symptoms or substance use, and worse outcomes. Screening can also prevent misdiagnosis and inappropriate treatment planning. People with histories of trauma often display symptoms that meet criteria for other disorders.

Without screening, clients' trauma histories and related symptoms often go undetected, leading providers to direct services toward symptoms and disorders that may only partially explain client presentations and distress. Universal screening for trauma history and trauma-related symptoms can help behavioral health practitioners identify individuals at risk of developing more pervasive and severe symptoms of traumatic stress. Screening, early identification, and intervention serves as a prevention strategy.

Screening to identify clients who have histories of trauma and experience trauma related symptoms is a prevention strategy.

Trauma-Informed Care Framework in Behavioral Health Services—Screening and Assessment



The chapter begins with a discussion of screening and assessment concepts, with a particular focus on trauma-informed screening. It then highlights specific factors that influence screening and assessment, including timing and environment. Barriers and challenges in providing trauma-informed screening are discussed, along with culturally specific screening and assessment considerations and guidelines. Instrument selection, trauma-informed screening and assessment tools, and trauma-informed screening and assessment processes are reviewed as well. For a more research-oriented perspective on screening and assessment for traumatic stress disorders, please refer to the literature review provided in Part 3 of this TIP, which is available online.

Screening and Assessment

Screening

The first two steps in screening are to determine whether the person has a history of trauma and whether he or she has trauma-related symptoms. Screening mainly obtains answers to "yes" or "no" questions: "Has this client experienced a trauma in the past?" and "Does this client at this time warrant further assessment regarding trauma-related symptoms?" If someone acknowledges a trauma history, then further screening is necessary to determine whether trauma-related symptoms are present. However, the presence of such symptoms does not necessarily say anything about their severity, nor does a positive screen indicate that a disorder actually exists. Positive

Screening is often the first contact between the client and the treatment provider, and the client forms his or her first impression of treatment during this intake process. Thus, how screening is conducted can be as important as the actual information gathered, as it sets the tone of treatment and begins the relationship with the client.

screens only indicate that assessment or further evaluation is warranted, and negative screens do not necessarily mean that an individual doesn't have symptoms that warrant intervention.

Screening procedures should always define the steps to take after a positive or negative screening. That is, the screening process establishes precisely how to score responses to screening tools or questions and clearly defines what constitutes a positive score (called a "cut-off score") for a particular potential problem. The screening procedures detail the actions to take after a client scores in the positive range. Clinical supervision is helpful—and sometimes necessary—in judging how to proceed.

Trauma-informed screening is an essential part of the intake evaluation and the treatment planning process, but it is not an end in itself. Screening processes can be developed that allow staff without advanced degrees or graduate-level training to conduct them, whereas assessments for trauma-related disorders require a mental health professional trained in assessment and evaluation processes. The most important domains to screen among individuals with trauma histories include:

- Trauma-related symptoms.
- Depressive or dissociative symptoms, sleep disturbances, and intrusive experiences.
- Past and present mental disorders, including typically trauma-related disorders (e.g., mood disorders).
- Severity or characteristics of a specific trauma type (e.g., forms of interpersonal violence, adverse childhood events, combat experiences).
- Substance abuse.
- Social support and coping styles.
- Availability of resources.
- Risks for self-harm, suicide, and violence.
- Health screenings.

Assessment

When a client screens positive for substance abuse, trauma-related symptoms, or mental disorders, the agency or counselor should follow up with an assessment. A positive screening calls for more action—an assessment that determines and defines presenting struggles to develop an appropriate treatment plan and to make an informed and collaborative decision about treatment placement. Assessment determines the nature and extent of the client's problems; it might require the client to respond to written questions, or it could involve a clinical interview by a mental health or substance abuse professional qualified to assess the client and arrive at a diagnosis. A clinical assessment delves into a client's past and current experiences, psychosocial and cultural history, and assets and resources.

Assessment protocols can require more than a single session to complete and should also use multiple avenues to obtain the necessary clinical information, including self-assessment tools, past and present clinical and medical records, structured clinical interviews, assessment measures, and collateral information from significant others, other behavioral health professionals, and agencies. Qualifications for conducting assessments and clinical interviews are more rigorous than for screening. Advanced degrees, licensing or certification, and special training in administration, scoring, and interpretation of specific assessment instruments and interviews are often

Advice to Counselors: Screening and Assessing Clients

- Ask all clients about any possible history of trauma; use a checklist to increase proper identification of such a history (see the online Adverse Childhood Experiences Study Score Calculator [http://acestudy.org/ace_score] for specific questions about adverse childhood experiences).
- Use only validated instruments for screening and assessment.
- Early in treatment, screen all clients who have histories of exposure to traumatic events for psychological symptoms and mental disorders related to trauma.
- When clients screen positive, also screen for suicidal thoughts and behaviors (see TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment*; Center for Substance Abuse Treatment [CSAT], 2009a).
- Do not delay screening; do not wait for a period of abstinence or stabilization of symptoms.
- Be aware that some clients will not make the connection between trauma in their histories and their current patterns of behavior (e.g., alcohol and drug use and/or avoidant behavior).
- Do not require clients to describe emotionally overwhelming traumatic events in detail.
- Focus assessment on how trauma symptoms affect clients' current functioning.
- Consider using paper-and-pencil instruments for screening and assessment as well as self-report measures when appropriate; they are less threatening for some clients than a clinical interview.
- Talk about how you will use the findings to plan the client's treatment, and discuss any immediate action necessary, such as arranging for interpersonal support, referrals to community agencies, or moving directly into the active phase of treatment. It is helpful to explore the strategies clients have used in the past that have worked to relieve strong emotions (Fallot & Harris, 2001).
- At the end of the session, make sure the client is grounded and safe before leaving the interview room (Litz, Miller, Ruef, & McTeague, 2002). Readiness to leave can be assessed by checking on the degree to which the client is conscious of the current environment, what the client's plan is for maintaining personal safety, and what the client's plans are for the rest of the day.

required. Counselors must be familiar with (and obtain) the level of training required for any instruments they consider using.

For people with histories of traumatic life events who screen positive for possible trauma-related symptoms and disorders, thorough assessment gathers all relevant information necessary to understand the role of the trauma in their lives; appropriate treatment objectives, goals, planning, and placement; and any ongoing diagnostic and treatment considerations, including reevaluation or follow-up.

Overall, assessment may indicate symptoms that meet diagnostic criteria for a substance use or mental disorder or a milder form of symptomatology that doesn't reach a diagnostic level—or it may reveal that the positive screen was false and that there is no significant cause for concern. Information from an assessment is used to plan the client's treatment. The plan can include such domains as level of care, acute safety needs, diagnosis, disability, strengths and skills, support network, and cultural context. Assessments should reoccur throughout treatment. Ongoing assessment during treatment can provide valuable information by revealing further details of trauma history as clients' trust in staff members grows and by gauging clients' progress.

Timing of Screening and Assessment

As a trauma-informed counselor, you need to offer psychoeducation and support from the outset of service provision; this begins with explaining screening and assessment and with proper pacing of the initial intake and evaluation process. The client should understand the screening process, why the specific questions are important, and that he or she may choose to delay a response or to not answer a question

at all. Discussing the occurrence or consequences of traumatic events can feel as unsafe and dangerous to the client as if the event were reoccurring. It is important not to encourage avoidance of the topic or reinforce the belief that discussing trauma-related material is dangerous, but be sensitive when gathering information in the initial screening. Initial questions about trauma should be general and gradual. Taking the time to prepare and explain the screening and assessment process to the client gives him or her a greater sense of control and safety over the assessment process.

Clients with substance use disorders

No screening or assessment of trauma should occur when the client is under the influence of alcohol or drugs. Clients under the influence are more likely to give inaccurate information. Although it's likely that clients in an active phase of use (albeit not at the assessment itself) or undergoing substance withdrawal can provide consistent information to obtain a valid screening and assessment, there is insufficient data to know for sure. Some theorists state that no final assessment of trauma or posttraumatic stress disorder (PTSD) should occur during these early phases (Read, Bollinger, & Sharkansky, 2003), asserting that symptoms of withdrawal can mimic PTSD and thus result in overdiagnosis of PTSD and other trauma-related disorders. Alcohol or drugs can also cause memory impairment that clouds the client's history of trauma symptoms. However, Najavits (2004) and others note that underdiagnosis, not overdiagnosis, of trauma and PTSD has been a significant issue in the substance abuse field and thus claim that it is essential to obtain an initial assessment early, which can later be modified if needed (e.g., if the client's symptom pattern changes). Indeed, clinical observations suggest that assessments for both trauma and PTSD—even during active use or withdrawal—appear robust (Coffey, Schumacher, Brady, & Dansky, 2003). Although some PTSD symptoms and trauma memories can be dampened or increased to a degree, their overall presence or absence, as assessed early in treatment, appears accurate (Najavits, 2004).

Conduct Assessments Throughout Treatment

Ongoing assessments let counselors:

- Track changes in the presence, frequency, and intensity of symptoms.
- Learn the relationships among the client's trauma, presenting psychological symptoms, and substance abuse.
- Adjust diagnoses and treatment plans as needed.
- Select prevention strategies to avoid more pervasive traumatic stress symptoms.

The Setting for Trauma Screening and Assessment

Advances in the development of simple, brief, and public-domain screening tools mean that at least a basic screening for trauma can be done in almost any setting. Not only can clients be screened and assessed in behavioral health treatment settings; they can also be evaluated in the criminal justice system, educational settings, occupational settings, physicians' offices, hospital medical and trauma units, and emergency rooms. Wherever they occur, trauma-related screenings and subsequent assessments can reduce or eliminate wasted resources, relapses, and, ultimately, treatment failures among clients who have histories of trauma, mental illness, and/or substance use disorders.

Creating an effective screening and assessment environment

You can greatly enhance the success of treatment by paying careful attention to how you approach the screening and assessment process. Take into account the following points:

- ***Clarify for the client what to expect in the screening and assessment process.*** For example, tell the client that the screening and assessment phase focuses on identifying issues that might benefit from treatment. Inform him or her that during the trauma screening and assessment process, uncomfortable thoughts and feelings can arise. Provide reassurance that, if they do, you'll assist in dealing with this distress—but also let them know that, even with your assistance, some psychological and physical reactions to the interview may last for a few hours or perhaps as long as a few days after the interview, and be sure to highlight the fact that such reactions are normal (Read et al., 2003).
- ***Approach the client in a matter-of-fact, yet supportive, manner.*** Such an approach helps create an atmosphere of trust, respect, acceptance, and thoughtfulness (Melnick & Bassuk, 2000). Doing so helps to normalize symptoms and experiences generated by the trauma; consider informing clients that such events are common but can cause continued emotional distress if they are not treated. Clients may also find it helpful for you to explain the purpose of certain difficult questions. For example, you could say, "Many people have experienced troubling events as children, so some of my questions are about whether you experienced any such events while growing up." Demonstrate kindness and directness in equal measure when screening/assessing clients (Najavits, 2004).
- ***Respect the client's personal space.*** Cultural and ethnic factors vary greatly regarding the appropriate physical distance to maintain during the interview. You should respect the client's personal space, sitting neither too far from nor too close to the client; let your observations of the client's comfort level during the screening and assessment process guide the amount of distance. Clients with trauma may have particular sensitivity about their bodies, personal space, and boundaries.
- ***Adjust tone and volume of speech to suit the client's level of engagement and degree of comfort in the interview process.*** Strive to maintain a soothing, quiet demeanor. Be sensitive to how the client might hear what you have to say in response to personal disclosures. Clients who have been traumatized may be more reactive even to benign or well-intended questions.
- ***Provide culturally appropriate symbols of safety in the physical environment.*** These include paintings, posters, pottery, and other room decorations that symbolize the safety of the surroundings to the client population. Avoid culturally inappropriate or insensitive items in the physical environment.
- ***Be aware of one's own emotional responses to hearing clients' trauma histories.*** Hearing about clients' traumas may be very painful and can elicit strong emotions. The client may interpret your reaction to his or her revelations as disinterest, disgust for the client's behavior, or some other inaccurate interpretation. It is important for you to monitor your interactions and to check in with the client as necessary. You may also feel emotionally drained to the point that it interferes with your ability to accurately listen to or assess clients. This effect of exposure to traumatic stories, known as secondary traumatization, can result in symptoms similar to those experienced by the client (e.g., nightmares, emotional numbing); if necessary, refer to a colleague for assessment (Valent, 2002). Secondary traumatization is addressed in greater detail in Part 2, Chapter 2, of this TIP.
- ***Overcome linguistic barriers via an interpreter.*** Deciding when to add an interpreter requires careful judgment. The interpreter should be knowledgeable of behavioral

health terminology, be familiar with the concepts and purposes of the interview and treatment programming, be unknown to the client, and be part of the treatment team. Avoid asking family members or friends of the client to serve as interpreters.

- ***Elicit only the information necessary for determining a history of trauma and the possible existence and extent of traumatic stress symptoms and related disorders.*** There is no need to probe deeply into the details of a client's traumatic experiences at this stage in the treatment process. Given the lack of a therapeutic relationship in which to process the information safely, pursuing details of trauma can cause retraumatization or produce a level of response that neither you nor your client is prepared to handle. Even if a client wants to tell his or her trauma story, it's your job to serve as "gatekeeper" and preserve the client's safety. Your tone of voice when suggesting postponement of a discussion of trauma is very important. Avoid conveying the message, "I really don't want to hear about it." Examples of appropriate statements are:
  - "Your life experiences are very important, but at this early point in our work together, we should start with what's going on in your life currently rather than discussing past experiences in detail. If you feel that certain past experiences are having a big effect on your life now, it would be helpful for us to discuss them as long as we focus on your safety and recovery right now."
  - "Talking about your past at this point could arouse intense feelings—even more than you might be aware of right now. Later, if you choose to, you can talk with your counselor about how to work on exploring your past."
  - "Often, people who have a history of trauma want to move quickly into the details of the trauma to gain relief. I understand this desire, but my concern for you at this moment is to help you establish a sense of safety and support before moving into the traumatic experiences. We want to avoid retraumatization—meaning, we want to establish resources that weren't available to you at the time of the trauma before delving into more content."
- ***Give the client as much personal control as possible during the assessment by:***
  - Presenting a rationale for the interview and its stress-inducing potential, making clear that the client has the right to refuse to answer any and all questions.
  - Giving the client (where staffing permits) the option of being interviewed by someone of the gender with which he or she is most comfortable.
  - Postponing the interview if necessary (Fallot & Harris, 2001).
- ***Use self-administered, written checklists rather than interviews when possible to assess trauma.*** Traumas can evoke shame, guilt, anger, or other intense feelings that can make it difficult for the client to report them aloud to an interviewer. Clients are more likely to report trauma when they use self-administered screening tools; however, these types of screening instruments only guide the next step. Interviews should coincide with self-administered tools to create a sense of safety for the client (someone is present as he or she completes the screening) and to follow up with more indepth data gathering after a self-administered screening is complete. The Trauma History Questionnaire (THQ) is a self-administered tool (Green, 1996). It has been used successfully with clinical and nonclinical populations, including medical patients, women who have experienced domestic violence, and people with serious mental illness (Hooper, Stockton,

Krupnick, & Green, 2011). Screening instruments (including the THQ) are included in Appendix D of this TIP.

- ***Interview the client if he or she has trouble reading or writing or is otherwise unable to complete a checklist.*** Clients who are likely to minimize their trauma when using a checklist (e.g., those who exhibit significant symptoms of dissociation or repression) benefit from a clinical interview. A trained interviewer can elicit information that a self-administered checklist does not capture. Overall, using both a self-administered questionnaire and an interview can help achieve greater clarity and context.
- ***Allow time for the client to become calm and oriented to the present if he or she has very intense emotional responses when recalling or acknowledging a trauma.*** At such times, avoid responding with such exclamations as "I don't know how you survived that!" (Bernstein, 2000). If the client has difficulty self-soothing, guide him or her through grounding techniques (Exhibit 1.4-1), which are particularly useful—perhaps even critical—to achieving a successful

Exhibit 1.4-1: Grounding Techniques

Grounding techniques are important skills for assessors and all other behavioral health service providers who interact with traumatized clients (e.g., nurses, security, administrators, clinicians). Even if you do not directly conduct therapy, knowledge of grounding can help you defuse an escalating situation or calm a client who is triggered by the assessment process. Grounding strategies help a person who is overwhelmed by memories or strong emotions or is dissociating; they help the person become aware of the here and now. A useful metaphor is the experience of walking out of a movie theater. When the person dissociates or has a flashback, it's like watching a mental movie; grounding techniques help him or her step out of the movie theater into the daylight and the present environment. The client's task is not only to hold on to moments from the past, but also to acknowledge that what he or she was experiencing is from the past. Try the following techniques:

1. **Ask the client to state what he or she observes.**
   Guide the client through this exercise by using statements like, "You seem to feel very scared/angry right now. You're probably feeling things related to what happened in the past. Now, you're in a safe situation. Let's try to stay in the present. Take a slow deep breath, relax your shoulders, put your feet on the floor; let's talk about what day and time it is, notice what's on the wall, etc. What else can you do to feel okay in your body right now?"
2. **Help the client decrease the intensity of affect.**
   - "Emotion dial": A client imagines turning down the volume on his or her emotions.
   - Clenching fists can move the energy of an emotion into fists, which the client can then release.
   - Guided imagery can be used to visualize a safe place.
   - Distraction (see #3 below).
   - Use strengths-based questions (e.g., "How did you survive?" or "What strengths did you possess to survive the trauma?").
3. **Distract the client from unbearable emotional states.**
   - Have the client focus on the external environment (e.g., name red objects in the room).
   - Ask the client to focus on recent and future events (e.g., "to do" list for the day).
   - Help the client use self-talk to remind himself or herself of current safety.
   - Use distractions, such as counting, to return the focus to current reality.
   - Somatosensory techniques (toe-wiggling, touching a chair) can remind clients of current reality.
4. **Ask the client to use breathing techniques.**
   - Ask the client to inhale through the nose and exhale through the mouth.
   - Have the client place his or her hands on his or her abdomen and then watch the hands go up and down while the belly expands and contracts.

interview when a client has dissociated or is experiencing intense feelings in response to screening and/or interview questions.

- ***Avoid phrases that imply judgment about the trauma.*** For example, don't say to a client who survived Hurricane Katrina and lost family members, "It was God's will," or "It was her time to pass," or "It was meant to be." Do not make assumptions about what a person has experienced. Rather, listen supportively without imposing personal views on the client's experience.
- ***Provide feedback about the results of the screening.*** Keep in mind the client's vulnerability, ability to access resources, strengths, and coping strategies. Present results in a synthesized manner, avoiding complicated, overly scientific jargon or explanations. Allow time to process client reactions during the feedback session. Answer client questions and concerns in a direct, honest, and compassionate manner. Failure to deliver feedback in this way can negatively affect clients' psychological status and severely weaken the potential for developing a therapeutic alliance with the client.
- ***Be aware of the possible legal implications of assessment.*** Information you gather during the screening and assessment process can necessitate mandatory reporting to authorities, even when the client does not want such information disclosed (Najavits, 2004). For example, you can be required to report a client's experience of child abuse even if it happened many years ago or the client doesn't want the information reported. Other legal issues can be quite complex, such as confidentiality of records, pursuing a case against a trauma perpetrator and divulging information to third parties while still protecting the legal status of information used in prosecution, and child custody issues (Najavits, 2004). It's essential that you know the laws in your State, have an expert legal consultant available, and access clinical supervision.

Barriers and Challenges to Trauma-Informed Screening and Assessment

Barriers

It is not necessarily easy or obvious to identify an individual who has survived trauma without screening. Moreover, some clients may deny that they have encountered trauma and its effects even after being screened or asked direct questions aimed at identifying the occurrence of traumatic events. The two main barriers to the evaluation of trauma and its related disorders in behavioral health settings are clients not reporting trauma and providers overlooking trauma and its effects.

Concerning the first main barrier, some events will be experienced as traumatic by one person but considered nontraumatic by another. A history of trauma encompasses not only the experience of a potentially traumatic event, but also the person's responses to it and the meanings he or she attaches to the event. Certain situations make it more likely that the client will not be forthcoming about traumatic events or his or her responses to those events. Some clients might not have ever thought of a particular event or their response to it as traumatic and thus might not report or even recall the event. Some clients might feel a reluctance to discuss something that they sense might bring up uncomfortable feelings (especially with a counselor whom they've only recently met). Clients may avoid openly discussing traumatic events or have difficulty recognizing or articulating their experience of trauma for other reasons, such as feelings of shame, guilt, or fear of retribution by others associated with the event (e.g., in cases of interpersonal or

Common Reasons Why Some Providers Avoid Screening Clients for Trauma

Treatment providers may avoid screening for traumatic events and trauma-related symptoms due to:

- A reluctance to inquire about traumatic events and symptoms because these questions are not a part of the counselor's or program's standard intake procedures.
- Underestimation of the impact of trauma on clients' physical and mental health.
- A belief that treatment of substance abuse issues needs to occur first and exclusively, before treating other behavioral health disorders.
- A belief that treatment should focus solely on presenting symptoms rather than exploring the potential origins or aggravators of symptoms.
- A lack of training and/or feelings of incompetence in effectively treating trauma-related problems (Salyers, Evans, Bond, & Meyer, 2004).
- Not knowing how to respond therapeutically to a client's report of trauma.
- Fear that a probing trauma inquiry will be too disturbing to clients.
- Not using common language with clients that will elicit a report of trauma (e.g., asking clients if they were abused as a child without describing what is meant by abuse).
- Concern that if disorders are identified, clients will require treatment that the counselor or program does not feel capable of providing (Fallot & Harris, 2001).
- Insufficient time for assessment to explore trauma histories or symptoms.
- Untreated trauma-related symptoms of the counselor, other staff members, and administrators.
