Strategy #6: Observe the client's emotional state. Slow down; seek consultation if the client exhibits:
- Persistent resistance to addressing trauma symptoms.
- Repetitive flashbacks.
- Increase in dissociation.
- Regression.
- Difficulty in daily functioning (e.g., trouble maintaining everyday self-care tasks).
- Substance use relapses.
- Self-harm or suicidal thoughts/behaviors (e.g., talking about suicide).

Strategy #7: Use caution and avoid (Briere, 1996b, p. 115):
- Encouraging clients to describe traumatic material in detail before they can deal with the consequences of disclosure.
- Using overly stressful interventions (e.g., intensive role-plays, group confrontation, guided imagery).
- Confrontations or interpretations that are too challenging given the client's current functioning.
- Demanding that the client work harder and stop resisting.

balancing act for both the counselor and client as to when and how much should be addressed in any given session. Remember not to inadvertently give a message that it is too dangerous to talk about trauma; instead, reinforce the importance of addressing trauma without further retraumatization.

Length of Treatment

Many factors influence decisions regarding the length of treatment for a given client. Severity of addiction, type of substance abused, type of trauma, age at which the trauma occurred, level of social support, and the existence of

mental disorders all influence length of treatment. External factors, such as transportation and childcare, caps on insurance coverage, and limitations in professional resources, can also affect length of treatment. In general, longer treatment experiences should be expected for clients who have histories of multiple or early traumas, meet diagnostic criteria for multiple Axis I or Axis II diagnoses, and/or require intensive case management. Most of the empirically studied and/or manual-based models described in the next chapter are short-term models (e.g., lasting several months); however, ongoing care is indicated for clients with more complex co-occurring trauma disorders.

Traumatic Memories

One of the most controversial issues in the trauma field is the phenomenon of "recovered memories" or "traumatic amnesia" (Brewin, 2007). Practitioners working with traumatized individuals are particularly concerned about the possibility of new memories of the traumatic event emerging during the course of therapy and the possibility of these memories being induced by the clinician. Scientific reviews indicate that people can experience amnesia and delayed recall for some memories of a wide variety of traumas, including military combat and prisoner of war experiences, natural disasters and accidents, childhood sexual abuse, and political torture (Bowman & Mertz, 1996; Brewin, 2007; Karon & Widener, 1997; McNally, 2005). In some cases, the survivor will not remember some of what happened, and the counselor may need to help the client face the prospect of never knowing all there is to know about the past and accept moving on with what is known.

Legal Issues

Legal issues can emerge during treatment. A client, for instance, could seek to prosecute a perpetrator of trauma (e.g., for domestic violence) or to sue for damages sustained in an accident or natural disaster. The counselor's role is not to provide legal advice, but rather, to offer support during the process and, if needed, refer the client to appropriate legal help (see Advice to Counselors box on p. 131). A legal matter can dominate the treatment atmosphere for its duration. Some clients have difficulty making progress in treatment until most or all legal matters are resolved and no longer act as ongoing stressors.

Memories of Trauma

Points for counselors to remember are:

- Some people are not able to completely remember past events, particularly events that occurred during high-stress and destabilizing moments.
- In addition to exploring the memories themselves, it can be beneficial to explore how a memory of an event helps the client understand his or her feeling, thinking, and behaving in the present.
- Persistently trying to recall all the details of a traumatic event can impair focus on the present.

Forgiveness

Clients may have all sorts of reactions to what has happened to them. They may feel grateful for the help they received, joy at having survived, and dedication to their recovery. At the other extreme, they may have fantasies of revenge, a loss of belief that the world is a good place, and feelings of rage at what has happened. They may hold a wide variety of beliefs associated with these feelings.

One issue that comes up frequently among counselors is whether to encourage clients to forgive. The issue of forgiveness is a very delicate one. It is key to allow survivors their feelings, even if they conflict with the counselor's own responses. Some may choose to forgive the perpetrator, whereas others may remain angry or seek justice through the courts and other legal means. Early in recovery from

Advice to Counselors: Strategies To Manage Traumatic Memories

Strategy #1: Most people who were sexually abused as children remember all or part of what happened to them, although they do not necessarily fully understand or disclose it. Do not assume that the role of the clinician is to investigate, corroborate, or substantiate allegations or memories of abuse (American Psychiatric Association [APA], 2000b).

Strategy #2: Be aware that forgotten memories of childhood abuse can be remembered years later. Clinicians should maintain an empathic, nonjudgmental, neutral stance toward reported memories of sexual abuse or other trauma. Avoid prejudging the cause of the client's difficulties or the veracity of the client's reports. A counselor's prior belief that physical or sexual abuse, or other factors, are or are not the cause of the client's problems can interfere with appropriate assessment and treatment (APA, 2000b).

Strategy #3: Focus on assisting clients in coming to their own conclusions about the accuracy of their memories or in adapting to uncertainty regarding what actually occurred. The therapeutic goal is to help clients understand the impact of the memories or abuse experiences on their lives and to reduce their detrimental consequences in the present and future (APA, 2000b).

Strategy #4: Some clients have concerns about whether or not a certain traumatic event did or did not happen. In such circumstances, educate clients about traumatic memories, including the fact that memories aren't always exact representations of past events; subsequent events and emotions can have the effect of altering the original memory. Inform clients that it is not always possible to determine whether an event occurred but that treatment can still be effective in alleviating distress.

Strategy #5: There is evidence that suggestibility can be enhanced and pseudomemories can develop in some individuals when hypnosis is used as a memory enhancement or retrieval strategy. Hypnosis and guided imagery techniques can enhance relaxation and teach self-soothing strategies with some clients; however, use of these techniques is not recommended in the active exploration of memories of abuse (Academy of Traumatology, 2007).

Strategy #6: When clients are highly distressed by intrusive flashbacks of delayed memories, help them move through the distress. Teach coping strategies and techniques on how to tolerate strong affect and distress (e.g., mindfulness practices).

trauma, it is best to direct clients toward focusing on stabilization and a return to normal functioning; suggest that, if possible, they delay major decisions about forgiveness until they have a clearer mind for making decisions (Herman, 1997). Even in later stages of recovery, it's not essential for the client to forgive in order to recover. Forgiveness is a personal choice independent of recovery. Respect clients' personal beliefs and meanings; don't push clients to forgive or impose your own beliefs about forgiveness onto clients.

In the long-term healing process, typically months or years after the trauma(s), forgiveness may become part of the discussion for some people and some communities. For example, in South Africa, years after the bitter and bloody apartheid conflicts, a Truth and Reconciliation Commission was established by the Government. Public hearings created dialog and aired what had been experienced as a means, ultimately, to promote forgiveness and community healing. By addressing very difficult topics in public, all could potentially benefit from the discourse. Similarly, a parental survivor of the Oklahoma City bombing was, at first, bitter about his daughter's early, unfair, and untimely death. Today, he gives talks around the world about the abolition of the death penalty. He sat with convicted

Advice to Counselors: Strategies To Manage Legal Proceedings

Strategy #1: If you're aware of legal proceedings, you can play a key role in helping your client prepare emotionally for their impact, such as what it might be like to describe the trauma to a judge or jury, or how to cope with seeing the perpetrator in court. When helping a client prepare, however, be careful not to provide legal advice.

Strategy #2: Help clients separate a successful legal outcome from a successful treatment outcome. If clients connect these two outcomes, difficulties can arise. For example, a client may discontinue treatment after his or her assailant is sentenced to serve prison time, believing that the symptoms will abate without intervention.

Strategy #3: If clients express interest in initiating a civil or criminal suit, encourage them to consider the ways in which they are and are not prepared for this, including their own mental states, capacity for resilience, and inevitable loss of confidentiality (Pope & Brown, 1996). Inform clients coping with legal issues that involvement in the legal process can be retraumatizing.

Strategy #4: Emphasize, for trauma survivors who are involved in legal proceedings against an assailant, that "not guilty" is a legal finding—it is based on the degree of available evidence and is not a claim that certain events in question did not occur. They should also receive, from an attorney or other qualified individual, information on:

- The nature of the legal process as it pertains to the clients' specific cases.
- The estimated duration and cost of legal services, if applicable.
- What to expect during police investigations.
- Court procedures.
- Full information on all possible outcomes.
- What to expect during cross-examination.

Strategy #5: Counselors can be called on to assist with a legal case involving trauma. The court may require you to provide treatment records, to write a letter summarizing your client's progress, or to testify at a trial. Always seek supervisory and legal advice in such situations and discuss with the client the possible repercussions that this might have for the therapeutic relationship. As a general rule, it is best practice to avoid dual roles or relationships.

bomber Timothy McVeigh's father while the man's son was executed in Indiana at a Federal prison several years after the bombing. For this man, forgiveness and acceptance helped him attain personal peace. Other trauma survivors may choose never to forgive what happened, and this, too, is a legitimate response.

Culturally and Gender Responsive Services

Culture is the lens through which reality is interpreted. Without an understanding of culture, it is difficult to gauge how individuals organize, interpret, and resolve their traumas. The challenge is to define how culture affects individuals who have been traumatized.

Increased knowledge of PTSD (Wilson & Tang, 2007), mental illness, and substance use disorders and recovery (Westermeyer, 2004) requires behavioral health practitioners to consider the complicated interactions between culture, personality, mental illness, and substance abuse in adapting treatment protocols. This section offers some general guidelines for working with members of cultures other than one's own. Treatment for traumatic stress, mental illness, substance use disorders, and co-occurring trauma-related symptoms is more effective if it is culturally responsive.

The U.S. Department of Health and Human Services (2003) has defined the term "cultural competence" as follows:

> Cultural competence is a set of values, behaviors, attitudes, and practices within a system, organization, program, or among individuals that enables people to work effectively across cultures. It refers to the ability to honor and respect the beliefs, language, interpersonal styles, and behaviors of individuals and families receiving services, as well as staff who are providing such services. Cultural competence is a dynamic, ongoing, developmental process that requires a long-term commitment and is achieved over time (p. 12).

Cultural competence is a process that begins with an awareness of one's own culture and beliefs and includes an understanding of how those beliefs affect one's attitudes toward people of other cultures. It is rooted in respect, validation, and openness toward someone whose social and cultural background is different from one's own. For a thorough review of cultural competence, see the planned TIP, *Improving Cultural Competence* (Substance Abuse and Mental Health Services Administration [SAMHSA], planned c).

Cultural Competence

Cultural competence includes a counselor's knowledge of:

- Whether the client is a survivor of cultural trauma (e.g., genocide, war, government oppression, torture, terrorism).
- How to use cultural brokers (i.e., authorities within the culture who can help interpret cultural patterns and serve as liaisons to those outside the culture).
- How trauma is viewed by an individual's sociocultural support network.
- How to differentiate PTSD, trauma-related symptoms, and other mental disorders in the culture.

For more specific information on cultural competence in trauma therapy, see Brown (2008).

In some cultures, an individual's needs take precedence over group needs (Hui & Triandis, 1986), and problems are seen as deriving from the self. In other cultures, however, complex family, kin, and community systems take precedence over individual needs. Considerable heterogeneity exists within and across most ethnic subcultures and across lines of gender, class, age, and political groups (CSAT, 1999b). Subcultures abound in every culture, such as gangs; populations that are homeless or use substances; orphaned or disenfranchised people; religious, ethnic, and sexual minorities; indigenous people; and refugee and immigrant populations. Some subcultures have more in common with similar subcultures in other countries than with their own cultures (e.g., nonheterosexual populations).

Trauma and substance abuse can themselves be a basis for affiliation with a subculture. De Girolamo (1993) reports that "disaster subcultures" exist within many cultures. These cultures of victimization, like all subcultures, have unique worldviews, codes of conduct, and perceptions of the larger society. In a disaster subculture, people are, to some extent, inured to disaster and heedless of warnings of impending disaster. For example, riverbank erosion in Bangladesh displaces thousands of people each year, yet few believe that it is a serious problem or that the displacement will be permanent (Hutton, 2000). Israelis who have lived with unpredictable violence for many years behave differently in public areas and have adapted to different norms than people who don't commonly experience violence (Young, 2001).

Many people identify with more than one subculture. Some identify with a particular culture or subculture, but not with all of its values. Individual identities are typically a mosaic of factors, including developmental achievements, life experiences, behavioral health histories, traumatic experiences, and

alcohol and illicit drug use; levels of acculturation and/or assimilation vary from one individual to the next as well.

Importance of the trauma aftermath

Counselors working in the immediate aftermath of trauma—whether individual, group, or community in nature—face many challenges. For example, survivors may be forced to adjust without access to other health services, employment, support, or insurance. In these instances, counselors must often work with individuals and communities coping with the trauma while struggling daily to meet basic needs. Research suggests that reestablishing ties to family, community, culture, and spiritual systems can not only be vital to the individual, but can also influence the impact of the trauma upon future generations. For example, Baker and Gippenreiter (1998) studied the descendants of people victimized by Joseph Stalin's purge. They found that families who were able to maintain a sense of connection and continuity with grandparents affected by the purge experienced fewer negative effects than did those who were emotionally or physically severed from their grandparents. The researchers also found that whether the grandparents survived was less important than the connection the grandchildren managed to keep to their past. Ties to family and community can also have an adverse effect, especially if the family or community downplays the trauma or blames the victim. Counselors need to have a full understanding of available support before advocating a particular approach.

Treatment strategies

Many traditional healing ways have been damaged, forgotten, or lost—yet much wisdom remains. Drawing on the best traditional and contemporary approaches to human distress and defining culturally competent curricula regarding identity and healing (Huriwai, 2002; Wilson & Tang, 2007) both require respect and appreciation for the many ways in which various people characterize and resolve trauma and how they use addictive substances to bear the burdens of human distress.

Community-Based Treatment for Native American Historical Trauma

Key beliefs in community healing:

- Clients carry childhood pain that has led to adult dysfunction.
- Childhood pain must be confronted, confessed, and addressed, if relief is to be obtained.
- Cathartic expression is the initial step in the healing journey toward a lifelong pursuit of introspection and self-improvement.
- The healing journey entails reclamation of indigenous heritage, identity, spirituality, and practices to remedy the pathogenic effects of colonization and other sources of historical trauma.

Source: Gone, 2009.

It is not yet known how well existing PTSD treatments work for individuals who identify primarily with cultures other than mainstream American culture. It is possible that such treatments do work for clients of other cultures, though some cultural adaptation and translation may be required. For example, some PTSD treatments that have been used with subculture groups without adaptation other than language translation and that appear to be effective across cultures include eye movement desensitization and reprocessing (Bleich, Gelkopf, & Solomon, 2003) and Seeking Safety (Daouest et al., 2012).

Gender

Gender differences exist in traumatic stress, mental disorders, and substance use disorders. For example, women have higher rates of PTSD, whereas men have higher rates of substance abuse (Kessler, Chiu, Demler, Merikangas, & Walters, 2005; Stewart, Ouimette, & Brown, 2002; Tolin & Foa, 2006).

Working With Clients From Diverse Cultures: Trauma and Substance Abuse

- In socially appropriate ways, educate clients, their loved ones, and possibly members of their extended community about the relationship between substance abuse and PTSD, how substance abuse is often used to cope with trauma, and what treatment entails.
- Make serious efforts to connect clients to supportive and understanding people (preferably within culturally identified groups).
- Help clients understand that many who have not experienced trauma or do not have substance use disorders will not understand the psychological, spiritual, and interpersonal insights that they have gained during their recovery processes.

The types of interpersonal trauma experienced by men and by women are often different. A number of studies (Kimerling, Ouimette, & Weitlauf, 2007) indicate that men experience more combat and crime victimization and women experience more physical and/or sexual assault—implying that men's traumas often occur in public, whereas the traumatization of women is more likely to take place in a private setting, such as a home. Men's abusers are more often strangers. Those who abuse women, on the other hand, are more often in a relationship with them. Women (and girls) often are told, "I love you," during the same time period when the abuse occurs. However, women now serve in the military and thus are increasingly subject to some of the same traumas as men and also to military sexual trauma, which is much more common for women to experience. Similarly, men can be subject to domestic violence or sexual abuse.

In treatment, gender considerations are relevant in a variety of ways, including, but not limited to, the role and impact of societal gender stereotypes upon assessment processes, treatment initiation, and engagement of services (e.g., peer support systems); the selection and implementation of gender-specific and gender-responsive approaches for both men and women at each level of intervention; and the best selection of trauma-related interventions that account for gender-specific differences related to traumatic stress. For an extensive review and discussion of gender-specific and gender-responsive care for traumatic stress and substance use, see the TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d), and TIP 56, *Addressing the Specific Behavioral Health Needs of Men* (SAMHSA, 2013a).

Beyond the complexities of gender considerations, one must also consider whether clients should be given the choice of working with a male or a female counselor. Some clients who have been traumatized have no preference, particularly if their trauma wasn't associated with gender (e.g., a natural disaster, act of terrorism, fire, serious accident). If gender did play a role in trauma (e.g., childhood sexual abuse), clients can have strong fears of working with a counselor who is the same gender as the perpetrator. Many women who experienced sexual abuse (whose perpetrators are typically men) feel uncomfortable being treated by men because of the intense emotions that can be evoked (e.g., anger, fear). Men who experienced sexual abuse (whose perpetrators are also typically men) can feel uncomfortable for the same reasons, or they may feel shame when talking to men due to feelings evoked about masculinity, homosexuality, and so forth. However, not all clients with trauma histories prefer female therapists.

Discuss with clients the possible risks (e.g., initial emotional discomfort) and benefits of being treated by a woman or man (e.g., developing a therapeutic relationship with a man might challenge a client's belief that all men are dangerous), and, if possible, let them then choose the gender of their counselor. Tell

them that if they experience initial emotional discomfort, and the discomfort does not decrease, they can switch to a counselor of the opposite gender. For group therapy that focuses on trauma, similar considerations apply. Generally, gender-specific groups are recommended when possible, but mixed-gender groups also work. Gender also comes into play in substance abuse treatment. Research and clinical observation indicate that significant gender differences occur in many facets of substance abuse and its treatment. For example, men and women experience different physical repercussions of substance use (e.g., women have more health problems), different trajectories (e.g., women become addicted more quickly), and different treatment considerations (e.g., traditional substance abuse treatment was designed for men).

Sexual orientation

Lesbian, gay, bisexual, and transgender (LGBT) clients face specific issues in behavioral health treatment settings, including histories of abuse and discrimination relating to sexual orientation, homophobia in treatment on the part of counselors or other clients, potential difficulty addressing traumatic experiences related to their sexuality or sexual orientation, and often, a significant lack of trust toward others. LGBT people sometimes think that others can't understand them and their specific needs and thus are reluctant to engage in treatment programs in which the clientele is predominantly heterosexual. Some clients react with judgment, anger, or embarrassment when an LGBT client attempts to describe sexual trauma relating to homosexual behavior, making it even harder for LGBT clients to describe their experiences.

Often, individual counseling can address issues the LGBT client isn't comfortable discussing in group treatment. "Providing one-on-one services may decrease the difficulty of mixing heterosexual and LGBT clients in treatment groups and decrease the likelihood that heterosexism or homophobia will become an issue" (CSAT, 2001, p. 56). For more on treating LGBT individuals, see *A Provider's Introduction to Substance Abuse Treatment for Lesbian, Gay, Bisexual, and Transgender Individuals* (CSAT, 2001).

Making Referrals to Trauma-Specific Services

Many people who experience trauma do not exhibit persistent traumatic stress symptoms. In fact, people do recover on their own. So how do you determine who is at higher risk for developing more persistent symptoms of traumatic stress, trauma-related disorders, and traumatic stress disorders? One main factor is the severity of symptoms at the time of screening and assessment. Other factors, beyond trauma characteristics and pretrauma individual characteristics, to consider in making referrals include (Ehlers & Clark, 2003):

- Cognitive appraisals that are excessively negative regarding trauma sequelae, including consequences, changes after the event(s), responses of other people to the trauma, and symptoms.
- Acknowledgment of intrusive memories.
- Engagement in behaviors that reinforce or prevent resolution of trauma, including avoidance, dissociation, and substance use.
- History of physical consequences of trauma (e.g., chronic pain, disfigurement, health problems).
- Experiences of more traumas or stressful life events after the prior trauma.
- Identification of co-occurring mood disorders or serious mental illness.

The next chapter provides an overview of trauma-specific services to complement this chapter and to provide trauma-informed counselors with a general knowledge of trauma-specific treatment approaches.

6 Trauma-Specific Services

IN THIS CHAPTER

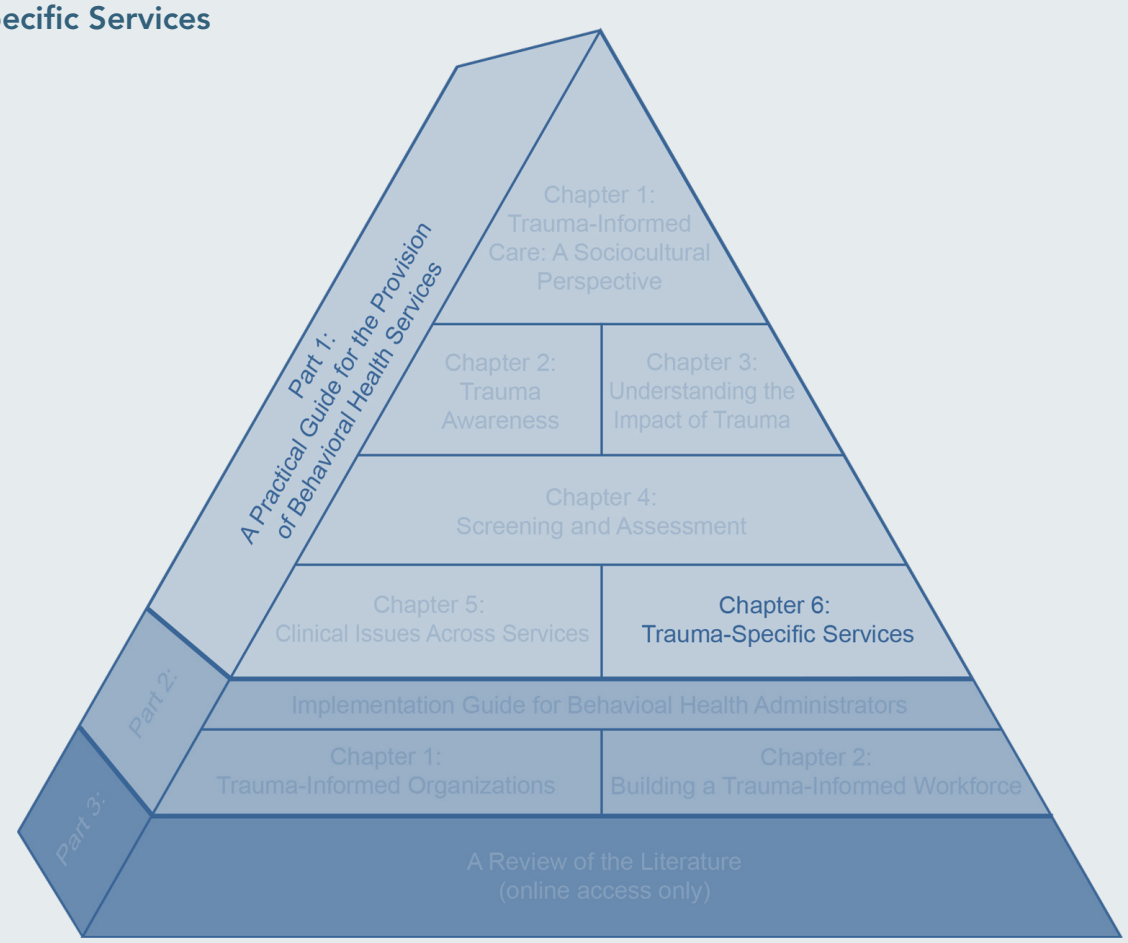
- Introduction
- Trauma Specific Treatment Models
- Integrated Models for Trauma
- Emerging Interventions
- Concluding Note

This chapter covers various treatment approaches designed specifically to treat trauma-related symptoms, trauma-related disorders, and specific disorders of traumatic stress. The models presented do not comprise an exhaustive list, but rather, serve as examples. These models require training and supervised experience to be conducted safely and effectively. The chapter begins with a section on trauma-specific treatment models, providing a brief overview of interventions that can be delivered immediately after a trauma, as well as trauma-specific interventions for use beyond the immediate crisis. The second segment focuses on integrated care that targets trauma-specific treatment for mental, substance use, and co-occurring disorders. Even though entry-level, trauma-informed behavioral health service providers are unlikely to be in a position to use these interventions, having some knowledge of them is nevertheless important. Currently, more research is needed to tease out the most important ingredients of early interventions and their role in the prevention of more pervasive traumatic stress symptoms. More science-based evidence is available for trauma-specific treatments that occur and extend well beyond the immediate reactions to trauma. The last part of the chapter provides a brief review of selected emerging interventions that have not been covered elsewhere in this Treatment Improvement Protocol (TIP).

Introduction

Trauma-specific therapies vary in their approaches and objectives. Some are present focused, some are past focused, and some are combinations (Najavits, 2007a). Present-focused approaches primarily address current coping skills, psychoeducation, and managing symptoms for better functioning. Past-focused approaches primarily focus on telling the trauma story to understand the impact of the trauma on how the person functions today, experiencing emotions that were too overwhelming to experience in the past, and helping clients more effectively cope in the present with their

Trauma-Informed Care Framework in Behavioral Health Services—Trauma-Specific Services



traumatic experiences. Clients participating in present-focused approaches may reveal some of their stories; past-focused approaches emphasize how understanding the past influences current behavior, emotion, and thinking, thereby helping clients cope more effectively with traumatic experiences in the present.

The distinction between these approaches lies in the primary emphasis of the approach. Depending on the nature of the trauma and the specific needs of the client, one approach may be more suitable than the other. For instance, in short-term treatment for clients in early recovery from mental illness and/or substance abuse, present-focused, cognitive–behavioral, or psychoeducational approaches are generally more appropriate. For clients who are stable in their recovery and have histories of developmental trauma where much of the trauma has been repressed, a past-focused orientation may be helpful. Some clients may benefit from both types, either concurrently or sequentially.

This chapter discusses a number of treatment models, general approaches, and techniques. A treatment model is a set of practices designed to alleviate symptoms, promote psychological well-being, or restore mental health. Treatment techniques are specific procedures that can be used as part of a variety of models. Some models and techniques described in this chapter can be used with groups, some with individuals, and some with both. This chapter is selective rather than comprehensive; additional models are described in the literature. See, for example, the PILOTS database on the Web site of the National Center for PTSD

(NCPTSD; http://www.ptsd.va.gov) for treatment literature related to trauma and posttraumatic stress disorder (PTSD). For an overview of models for use with both adult and child populations, refer to *Models for Developing Trauma-Informed Behavioral Health Systems and Trauma-Specific Services* (Center for Mental Health Services, 2008).

Some treatments discussed in this chapter are described as evidence based. Because research on integrated treatment models is so new, many have only been examined in a few studies. Given these circumstances and the fact that an outcome study provides only limited evidence of efficacy, the term "evidence based" should be interpreted cautiously. Additional scientific study is needed to determine whether some treatments discussed herein are, in fact, evidence based. A good resource for evaluating evidence-based, trauma-specific treatment models is *Effective Treatments for PTSD* (Foa, Keane, Friedman, & Cohen, 2009). Although evidence-based interventions should be a primary consideration in selecting appropriate treatment models for people with symptoms of trauma that co-occur with mental and substance use disorders (see Allen, 2001, for an indepth discussion of trauma and serious mental illness), other factors must also be weighed, including the specific treatment needs of the client; his or her history of trauma, psychosocial and cultural background, and experiences in prior trauma treatment; the overall treatment plan for the client; and the competencies of the program's clinical staff. Although behavioral health counselors can prepare to help their clients address some of the issues discussed in Chapter 5, specialized training is necessary to provide treatment for co-occurring substance use and mental disorders related to trauma.

The Substance Abuse and Mental Health Services Administration (SAMHSA) has created the National Registry of Evidence-Based Programs and Practices (NREPP) as a resource for reviewing and identifying effective treatment programs. Programs can be nominated for consideration as co-occurring disorders programs or substance abuse prevention or treatment programs, and their quality of evidence, readiness for dissemination, and training considerations are then reviewed. For more detailed information, including details about several evidence-based co-occurring trauma treatment programs, visit the NREPP Web site (http://www.nrepp.samhsa.gov). Program models for specialized groups, such as adolescents, can also be found on the NREPP Web site. For specific research-oriented information on trauma-specific treatments, refer to Part 3 of this TIP, which provides a literature review and links to select abstracts (available online).

Federal Agencies

Both the American Red Cross and the Federal Emergency Management Agency (FEMA) respond to disasters. Behavioral health service providers should understand the basics about these major emergency response agencies. For example, the Red Cross can respond rapidly with funding for food, shelter, and immediate needs, whereas FEMA assistance requires a period of gearing up but provides for longer-term needs. SAMHSA, along with other Federal agencies, assists FEMA in a number of areas of emergency response planning activities. See also SAMHSA's Disaster Technical Assistance Center Web site (http://www.samhsa.gov/dtac) and Technical Assistance Publication 34, *Disaster Planning Handbook for Behavioral Health Treatment Programs* (SAMHSA, 2013).

Trauma-Specific Treatment Models

Immediate Interventions

Intervention in the first 48 hours

The acute intervention period comprises the first 48 hours after a traumatic event. In a

"One day I was called out of bed at 5:00 a.m. to go to a town approximately 30 miles away because a levee had broken…. By 6:00 a.m., my colleagues and I were there with many of the townspeople, with helicopters flying overhead, with trucks going in and out by the main road trying to empty the factories. When we got there, as far as you could see was farmland. By 11 a.m., you could see a 'lake' in the distance. By 2 p.m., the water was on the edge of the town. Being there, at that town, before, during, and after the water came was probably the most valuable function we performed. We were able to share in the grief of the hundreds of people as we stayed with them while their fields, houses, and workplaces were flooded. We witnessed the death of a town, and the people reacted with disbelief, anger, sadness, and numbness. Each person had a different story, but all grieved, and we provided many an opportunity to express it. People cried as the water started rising into their houses. Some had to watch. Some had to leave. At times it was utterly silent as we all waited. There was a woman whose parents sent her away during the floods of '43 and she had been angry for 50 years about it. She was determined that her children and grandchildren would see everything. I spent 12 hours that day just giving support, listening, giving information, and sometimes shedding a tear or two myself."

—Rosemary Schwartzbard, Ph.D., responder to floods along the Mississippi River in 1993

Source: Schwartzbard, 1997.

disaster, rescue operations usually begin with local agencies prior to other organizations arriving on the scene. Law enforcement is likely to take a primary role on site. Whether it is a disaster, group trauma, or individual trauma (including a trauma that affects an entire family, such as a house fire), a hierarchy of needs should be established: survival, safety, security, food, shelter, health (physical and mental), orientation of survivors to immediate local services, and communication with family, friends, and community (National Institute of Mental Health, 2002). In this crucial time, appropriate interventions include educating survivors about resources; educating other providers, such as faith-based organizations and social service groups, to screen for increased psychological effects including use of substances; and use of a trauma response team that assists clients with their immediate needs. No formal interventions should be attempted at this time, but a professionally trained, empathic listener can offer solace and support (Litz & Gray, 2002).

Basic needs

Basic necessities, such as shelter, food, and water, are key to survival and a sense of safety. It is important to focus on meeting these basic needs and on providing a supportive environment. Clients' access to prescribed medications may be interrupted after a trauma, particularly a disaster, so providers should identify clients' medication needs for preexisting physical and mental disorders, including methadone or other pharmacological treatment for substance use. For example, after September 11, 2001, substance abuse treatment program administrators in New York had to seek alternative methadone administration options (Frank, Dewart, Schmeidler, & Demirjian, 2006).

Psychological first aid

The psychological first aid provided in the first 48 hours after a disaster is designed to ensure safety, provide an emotionally supportive environment and activities, identify those with high-risk reactions, and facilitate communication, including strong, reassuring leadership immediately after the event. The primary helping response of psychological first aid is to provide a calm, caring, and supportive environment to set the scene for psychological recovery. It is also essential that all those first responding to a trauma—rescue workers, medical professionals, behavioral health workers (including substance abuse counselors), journalists, and volunteers—be familiar with relevant aspects of traumatic stress. Approaching

Advice to Counselors: Core Actions in Preparing To Deliver Psychological First Aid

- Contact and engagement

survivors with genuine respect, concern, and knowledge increases the likelihood that the caregiver can (NCPTSD, 2002):

- Answer questions about what survivors may be experiencing.
- Normalize their distress by affirming that what they are experiencing is normal.
- Help them learn to use effective coping strategies.
- Help them be aware of possible symptoms that may require additional assistance.
- Provide a positive experience that will increase their chances of seeking help if they need it in the future.

Clinical experience suggests that care be taken to respect a survivor's individual method of coping; some may want information, for example, whereas others do not. Similarly, some may want to talk about the event, but others won't. An excellent guide to providing psychological first aid is available online from the Terrorism and Disaster Branch of the National Child Traumatic Stress Network (http://www.nctsn.org/content/psychological-first-aid).

Critical incident stress debriefing

Initially developed for work with first responders and emergency personnel, critical incident stress debriefing (CISD; Mitchell & Everly, 2001) is now widely used and encompasses various group protocols used in a variety of settings. This facilitator-led group intervention is for use soon after a traumatic event with exposed people. The goal is to provide psychological closure by encouraging participants to talk about their experiences and then giving a didactic presentation on common stress reactions and management.

The widespread use of CISD has occurred despite the publication of conflicting results regarding its efficacy. Claims that single-session psychological debriefing can prevent development of chronic negative psychological sequelae are not empirically supported (van Emmerik, Kamphuis, Hulsbosch, & Emmelkamp, 2002). Some controlled studies suggest that it may impede natural recovery from trauma (McNally, Bryant, & Ehlers, 2003). Other research suggests emphasizing screening to determine the need for early interventions. Mitchell and Everly (2001) point out that many of the studies showing negative

Advice to Counselors: Evidence Related to Immediate Interventions

Evidence related to immediate interventions suggests that:

- Early, brief, focused psychotherapeutic intervention provided in an individual or group format can reduce distress in bereaved spouses, parents, and children.
- Selected cognitive–behavioral approaches may help reduce the incidence, duration, and severity of acute stress disorder (ASD), PTSD, and depression in trauma survivors.
- A one-session individual recital of events and expression of emotions evoked by a traumatic event does not consistently reduce risk of later developing PTSD. In fact, it may increase the risk for adverse outcomes. Perhaps CISD hinders the natural recovery mechanisms that restore pretrauma functioning (Bonanno, 2004).
- The focus initially should be upon screening with follow-up as indicated.

results were not conducted with first responders; that is, CISD may be appropriate for some, but not all, groups. A recent study of 952 U.S. peacekeepers and CISD by the U.S. Army Research Unit–Europe (Adler et al., 2008) found mixed results.

Interventions Beyond the Initial Response to Trauma

In the interest of increasing your overall familiarity with relevant approaches, the following sections review several traumatic stress treatment approaches that counselors will most likely encounter when collaborating with clinicians or agencies that specialize in trauma-specific services and treating traumatic stress.

Cognitive–behavioral therapies

Most PTSD models involve cognitive–behavioral therapy (CBT) that integrates cognitive and behavioral theories by incorporating two ideas: first, that cognitions (or thoughts) mediate between situational demands and one's attempts to respond to them effectively, and second, that behavioral change influences acceptance of altered cognitions about oneself or a situation and establishment of newly learned cognitive–behavioral interaction patterns. In practice, CBT uses a wide range of coping strategies.

There are many different varieties of CBT. CBT originated in the 1970s (Beck, Rush, Shaw & Emery, 1979; Ellis & Harper, 1975) and has expanded since then to address various populations, including people who use substances, people who experience anxiety, people with PTSD or personality disorders, children and adolescents, individuals involved in the criminal justice system, and many others. CBT has also been expanded to include various techniques, coping skills, and approaches, such as dialectical behavior therapy (DBT; Linehan, 1993), Seeking Safety (Najavits, 2002a), and mindfulness (Segal, Williams, & Teasdale, 2002). Traditional CBT emphasizes symptom reduction or resolution, but recent CBT approaches have also emphasized the therapeutic relationship, a particularly important dynamic in trauma treatment (Jackson, Nissenson, & Cloitre, 2009).

A widely accepted framework in treating trauma, substance use disorders, and mental illness categorizes therapies as single (treatment of only one disorder), sequential (treatment of one disorder first, then the other), or parallel (concurrent treatment of multiple disorders delivered by separate clinicians or in separate programs that do not necessarily address the interactions between symptoms and disorders).

CBT has been applied to the treatment of trauma and has also been widely and effectively used in the treatment of substance use. A review of efficacy research on CBT for PTSD is provided by Rothbaum, Meadows, Resick, and Foy (2000). Najavits and colleagues (2009) and O'Donnell and Cook (2006) offer an overview of CBT therapies for treating PTSD and substance abuse. In addition, a free online training resource incorporating CBT for traumatized children within the community, Trauma-Focused CBT, is available from the Medical University of South Carolina (http://tfcbt.musc.edu/).

Cognitive processing therapy

Cognitive processing therapy (CPT) is a manualized 12-session treatment approach that can be administered in a group or individual setting (Resick & Schnicke, 1992, 1993). CPT was developed for rape survivors and combines elements of existing treatments for PTSD, specifically exposure therapy (see the "Exposure Therapy" section later in this chapter) and cognitive therapy. The exposure therapy component of treatment consists of

Advice to Counselors: Relaxation Training, Biofeedback, and Breathing Retraining Strategies

Relaxation training, biofeedback, and breathing retraining strategies may help some clients cope with anxiety, a core symptom of traumatic stress. However, no evidence supports the use of relaxation and biofeedback as effective standalone PTSD treatment techniques (Cahill, Rothbaum, Resick, & Follete, 2009). Both are sometimes used as complementary strategies to manage anxiety symptoms elicited by trauma-related stimuli. Breathing retraining uses focused or controlled breathing to reduce arousal. Breathing retraining and relaxation, along with other interventions when necessary, can help clients with ASD. An important caution in the use of breath work with trauma clients is that it can sometimes act as a trigger—for example, given its focus on the body and its potential to remind them of heavy breathing that occurred during assault. Biofeedback, which requires specialized equipment, combines stress reduction strategies (e.g., progressive muscle relaxation, guided imagery) with feedback from biological system measures (e.g., heart rate, hand temperature) that gauge levels of stress or anxiety reduction. Relaxation training, which requires no specialized equipment, encourages clients to reduce anxiety responses (including physiological responses) to trauma-related stimuli; it is often part of more comprehensive PTSD treatments (e.g., prolonged exposure and stress inoculation training [SIT]).

clients writing a detailed account of their trauma, including thoughts, sensations, and emotions that were experienced during the event. The client then reads the narrative aloud during a session and at home. The cognitive therapy aspect of CPT uses six key PTSD themes identified by McCann and Pearlman (1990): safety, trust, power, control, esteem, and intimacy. The client is guided to identify cognitive distortions in these areas, such as maladaptive beliefs.

Results from randomized, placebo-controlled trials for the treatment of PTSD related to interpersonal violence (Resick, 2001; Resick, Nishith, Weaver, Astin, & Feuer, 2002) support the use of CPT. CPT and prolonged exposure therapy models are equally and highly positive in treating PTSD and depression in rape survivors; CPT is superior in reducing guilt (Nishith, Resick, & Griffin, 2002; Resick et al., 2002; Resick, Nishith, & Griffin, 2003). CPT has shown positive outcomes with refugees when administered in the refugees' native language (Schulz, Marovic-Johnson, & Huber, 2006) and with veterans (Monson et al., 2006). However, CPT has not been studied with high-complexity populations such as individuals with substance dependence, homelessness, current domestic violence, serious and persistent mental illness, or suicidality. CPT requires a 3-day training plus consultation (Karlin et al., 2010). Resick and Schicke (1996) published a CPT treatment manual, *Cognitive Processing Therapy for Rape Victims: A Treatment Manual*.

Exposure therapy

Exposure therapy for PTSD asks clients to directly describe and explore trauma-related memories, objects, emotions, or places. Intense emotions are evoked (e.g., sadness, anxiety) but eventually decrease, desensitizing clients through repeated encounters with traumatic material. Careful monitoring of the pace and appropriateness of exposure-based interventions is necessary to prevent retraumatization (clients can become conditioned to fear the trauma-related material even more). Clients must have ample time to process their memories and integrate cognition and affect, so some sessions can last for 1.5 hours or more. For simple cases, exposure can work in as few as 9 sessions; more complex cases may require 20 or more sessions (Foa, Hembree, & Rothbaum, 2007). Various techniques can

Advice to Counselors: Steps for Introducing a Breathing Exercise

Use the following statements to lead clients through a breathing exercise:

- Place your hands on your stomach. As you inhale, breathe deeply but slowly so that your hands rise with your stomach. As you exhale slowly, practice breathing so that your hands drop with your stomach.
- Inhale slowly through your nose with your mouth closed; don't rush or force in the air.
- Exhale slowly through your mouth with your lips in the whistling position.
- Breathe out for twice as long as you breathe in.

expose the client to traumatic material. Two of the more common methods are exposure through imagery and in vivo ("real life") exposure.

The effectiveness of exposure therapy has been firmly established (Rothbaum et al., 2000); however, adverse reactions to exposure therapy have also been noted. Some individuals who have experienced trauma exhibit an exacerbation of symptoms during or following exposure treatments. Even so, the exacerbation may depend on counselor variables during administration. Practitioners of exposure therapy need comprehensive training to master its techniques (Karlin et al., 2010); a counselor unskilled in the methods of this treatment model can not only fail to help his or her clients, but also cause symptoms to worsen.

Exposure therapy is recommended as a first-line treatment option when the prominent trauma symptoms are intrusive thoughts, flashbacks, or trauma-related fears, panic, and avoidance. However, counselors should exercise caution when using exposure with clients who have not maintained stability in managing mental illness symptoms or abstinence from substance use disorders. Studies and routine use of exposure have consistently excluded high-complexity clients such as those with substance dependence, homelessness, current domestic violence, serious and persistent mental illness, or suicidality. The only trial of exposure therapy with a substance dependence sample found that it did not outperform standard substance abuse treatment on most variables (Mills et al., 2012).

Prolonged exposure therapy for PTSD is listed in SAMHSA's NREPP. For reviews of exposure therapy, also see Najavits (2007a) and Institute of Medicine (2008). In addition to prolonged exposure therapy, other therapies incorporate exposure and desensitization techniques, including eye movement desensitization and reprocessing (EMDR; Shapiro, 2001), cognitive processing, and systematic desensitization therapies (Wolpe, 1958).

Eye movement desensitization and reprocessing

EMDR (Shapiro, 2001) is one of the most widely used therapies for trauma and PTSD. The treatment protocols of EMDR have evolved into sophisticated paradigms requiring training and, preferably, clinical supervision. EMDR draws on a variety of theoretical

A Brief Description of EMDR Therapy

Treatment involves three main concentrations (past memories, present disturbances, future actions) and eight phases. Counselors may work with several phases in one session. Each phase is meant to be revisited either in every session or when appropriate (e.g., the closure process is meant to be conducted at the end of every session, in preparation for the next).

- Phase 1: History and Treatment Planning (1-2 sessions)
- Phase 2: Preparation
- Phase 3: Assessment and Reprocessing
- Phase 4: Desensitization
- Phase 5: Installation
- Phase 6: Body Scan
- Phase 7: Closure
- Phase 8: Reevaluation

Source: EMDR Network, 2012.

frameworks, including psychoneurology, CBT, information processing, and nonverbal representation of traumatic memories. The goal of this therapy is to process the experiences that are causing problems and distress. It is an effective treatment for PTSD (Seidler & Wagner, 2006) and is accepted as an evidence-based practice by the U.S. Department of Veterans Affairs (VA), the Royal College of Psychiatrists, and the International Society for Traumatic Stress Studies (Najavits, 2007a); numerous reviews support its effectiveness (e.g., Mills et al., 2012). EMDR values the development of "resource installation" (calming procedures) and engages in exposure work to desensitize clients to traumatic material, using external tracking techniques across the visual field to assist in processing distressing material. Training in EMDR, available through the EMDR Institute, is required before counselors use this treatment. It is listed in SAMHSA's NREPP (EMDR Network, 2012). Thus far, there is no study examining the use of EMDR with clients in substance abuse treatment. See Part 3 of this TIP, available online, to review empirical work on EMDR.

Narrative therapy

Narrative therapy is an emerging approach to understanding human growth and change; it is founded on the premise that individuals are the experts on their own lives and can access their existing intrapsychic and interpersonal resources to reduce the impact of problems in their lives. Developed for the treatment of PTSD resulting from political or community violence, narrative therapy is based on CBT principles, particularly exposure therapy (Neuner, Schauer, Elbert, & Roth, 2002; Neuner, Schauer, Klaschik, Karunakara, & Elbert, 2004). This approach views psychotherapy not as a scientific practice, but as a natural extension of healing practices that have been present throughout human history. For a trauma survivor, the narrative, as it is told and retold, expresses the traumatic experience, puts the trauma in the context of the survivor's life, and defines the options he or she has for change. Narrative structure helps clients connect events in their lives, reveals strings of events, explores alternative expressions of trauma, evokes explanations for clients' behaviors, and identifies their knowledge and skills. The use of stories in therapy, with the client as the storyteller, generally helps lessen suffering (McLeod, 1997; White, 2004).

In the substance abuse treatment field, many clients will see a connection between narrative therapy and the process of telling their stories in 12 Step programs, in which reframing life stories of feeling trapped, despairing, and hopeless leads to stories of strength, joy, and hope. Key storytelling points at a 12 Step speaker meeting include describing what an experience was like, what happened, and what it is like now.

Skills training in affective and interpersonal regulation

Skills training in affective and interpersonal regulation (STAIR) is a two-phase cognitive–behavioral model that adapts therapies developed by others into a new package (Cloitre, Koenen, Cohen, & Han, 2002). Phase 1 consists of eight weekly sessions of skills training in affect and interpersonal regulation derived from general CBT and DBT (Linehan, 1993) and adapted to address trauma involving childhood abuse. Session topics are labeling and identifying feelings, emotion management, distress tolerance, acceptance of feelings, identifying trauma-based interpersonal schemas, identifying conflict between trauma-generated feelings and current interpersonal goals, role-plays on issues of power and control, and role-plays on developing flexibility in interpersonal situations. Phase 2 features eight

STAIR Steps

Phase 1, tailored to individual clients, is called Skills Training in Affect Regulation and consists of the following components:

- Psychoeducation: Describe the symptoms of PTSD and explain the treatment rationale.
- Training in experiencing and identifying feelings, triggers, and thoughts, as well as training in mood regulation strategies.
- Learning history: Ask the client the following questions—How did the client deal with traumas past and present? How did the client's family deal with feelings? How did the client's family life affect his or her present difficulty experiencing and identifying feeling?
- Emotion regulation skills: Identify the cognitive, behavioral, and social support modalities for coping. Use data gathered with self-monitoring forms to identify strengths and weaknesses in each coping modality. Teach skills such as breathing retraining, self-statements to reduce fear, and social skill training to improve social support.
- Acceptance and tolerance of negative affect: Motivate clients to face distressing situations related to the trauma that are important to them. Review negative repercussions of avoidance. Discuss tolerating negative affect as a step toward achieving specific goals.
- Schema therapy for improved relationships: Identify relevant schemas learned in childhood. Suggest alternative ways of viewing self and others in current relationships. Use role-playing to teach assertiveness, emphasizing response flexibility based on relative power in each relationship.

Once Phase 1 of STAIR is well learned, clients move to Phase 2, which involves exposure therapy.

Source: Mollick & Spett, 2002.

sessions of modified prolonged exposure using a narrative approach.

Cloitre and colleagues (2002) assigned women with PTSD related to childhood abuse randomly to STAIR or a minimal attention waitlist, excluding clients with current substance dependence as well as other complexities. STAIR participants showed significantly greater gains in affect regulation, interpersonal skills, and PTSD symptoms than the control participants. These gains were maintained through follow-up at 3 and 9 months. However, it is not clear from this study whether DBT and exposure were both needed. Phase 1 therapeutic alliance and negative mood regulation skills predicted Phase 2 exposure success in reducing PTSD, suggesting the importance of establishing a strong therapeutic relationship and emotion regulation skills before conducting exposure work with people who have chronic PTSD.

Stress inoculation training

SIT was originally developed to manage anxiety (Meichenbaum, 1994; Meichenbaum & Deffenbacher, 1988). Kilpatrick, Veronen, and Resick (1982) modified SIT to treat rape survivors based on the idea that the anxiety and fear that rape survivors experience during their trauma generalizes to other objectively safe situations. SIT treatment components include education, skills training (muscle relaxation training, breathing retraining, role-playing, guided self-talk, assertiveness training, and thought stopping [i.e., actively and forcefully ending negative thoughts by thinking

SIT has been used to help individuals cope with the aftermath of exposure to stressful events and on a preventative basis to "inoculate" individuals to future and ongoing stressors (Meichenbaum, 1996). This practice as a preventive strategy is similar to promoting disease resistance through immunizations.

Advice to Counselors: SIT Phases

SIT is a prevention and treatment approach that has three overlapping phases. It is often seen as a complementary approach to other interventions for traumatic stress.

Phase 1: Conceptualization and education. This phase has two main objectives. The initial goal is to develop a collaborative relationship that supports and encourages the client to confront stressors and learn new coping strategies. The next objective is to increase the client's understanding of the nature and impact of his or her stress and awareness of alternative coping skills. Many cognitive strategies are used to meet these objectives, including self-monitoring activities, Socratic questioning, identifying strengths and evidence of resilience, and modeling of coping strategies.

Phase 2: Skill acquisition and rehearsal. This phase focuses on developing coping skills and using coping skills that the individual already possesses. This process includes practice across settings, so that the individual begins to generalize the use of his or her skills across situations through rehearsal, rehearsal, and more rehearsal.

Phase 3: Implementation and following through. The main objective is to create more challenging circumstances that elicit higher stress levels for the client. By gradually increasing the challenge, the client can practice coping strategies that mimic more realistic circumstances. Through successful negotiation, the client builds a greater sense of self-efficacy. Common strategies in this phase include imagery and behavioral rehearsal, modeling, role-playing, and graded in vivo exposure.

Source: Meichenbaum, 2007.

"STOP" and then redirecting thoughts in a more positive direction]), and skills application. The goal is to help clients learn to manage their anxiety and to decrease avoidant behavior by using effective coping strategies. Randomized controlled clinical trials have indicated that SIT reduces the severity of PTSD compared with waitlist controls and shows comparable efficacy to exposure therapy. At follow-up (up to 12 months after treatment), gains were maintained (Foa et al., 1999; Foa, Rothbaum, Riggs, & Murdock, 1991).

Other therapies

Numerous interventions introduced in the past 20 years focus on traumatic stress. For some interventions, the evidence is limited, and for other others, it is evolving. One example is the traumatic incident reduction (TIR) approach. This brief memory-oriented intervention is designed for children, adolescents, and adults who have experienced traumatic stress (Valentine & Smith, 2001). Listed in SAMHSA's NREPP, the intervention is designed to process specific traumatic incidents or problematic themes related to the trauma, including specific feelings, emotions, sensations, attitudes, or pain. It involves having clients talk through the traumatic incident repeatedly with the anticipation that changes in affect will occur throughout the repetitions. TIR is a client-centered approach.

Integrated Models for Trauma

This section covers models specifically designed to treat trauma-related symptoms along with either mental or substance use disorders at the same time. Integrated treatments help clients work on several presenting problems simultaneously throughout the treatment, a promising and recommended strategy (Dass-Brailsford & Myrick, 2010; Najavits, 2002b; Nixon & Nearmy, 2011). Thus far, research is limited, but what is available suggests that integrated treatment models effectively reduce

substance abuse, PTSD symptoms, and other mental disorder symptoms. TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (Center for Substance Abuse Treatment, 2005c), offers a detailed description of integrated treatment. In contrast with integrated models, other model types include single (treatment of only one disorder), sequential (treatment of one disorder first, then the other), or parallel (concurrent treatment of multiple disorders delivered by separate clinicians or in separate programs that do not necessarily address the interactions between symptoms and disorders).

Similar to single models, integrated treatment models are designed for use in a variety of settings (e.g., outpatient, day treatment, and/or residential substance abuse and mental health clinics/programs). Most models listed are manual-based treatments that address trauma-related symptoms, mental disorders, and substance use disorders at the same time. Additional approaches and further details on the selected approaches can be found at NREPP (http://www.nrepp.samhsa.gov).

Addiction and Trauma Recovery Integration Model

The Addiction and Trauma Recovery Integrated Model (ATRIUM; Miller & Guidry, 2001) integrates CBT and relational treatment through an emphasis on mental, physical, and spiritual health. This 12-week model for individuals and groups blends psychoeducational, process, and expressive activities, as well as information on the body's responses to addiction and traumatic stress and the impact of trauma and addiction on the mind and spirit. It helps clients explore anxiety, sexuality, self-harm, depression, anger, physical complaints and ailments, sleep difficulties, relationship challenges, and spiritual disconnection. It was designed primarily for women and focuses on developmental (childhood) trauma and interpersonal violence, but it recognizes that other types of traumatic events occur.

The ATRIUM model consists of three phases of treatment. The first stage, or "outer circle," consists of the counselor collecting data from the client about his or her trauma history, offering psychoeducation on the nature of trauma, and helping the client assess personal strengths. ATRIUM actively discourages the evocation of memories of abuse or other trauma events in this phase. The second stage, or "middle circle," allows clients and counselors to address trauma symptoms more directly and specifically encourages clients to reach out to and engage with support resources in the community. The middle circle also emphasizes learning new information about trauma and developing additional coping skills. The third stage of the program, the "inner circle," focuses on challenging old beliefs that arose as a result of the trauma. For instance, the concept of "nonprotecting bystander" is used to represent the lack of support that the traumatized person experienced at the time of the trauma. This representation is replaced with the "protective presence" of supportive others today.

ATRIUM was used in one of the nine study sites of SAMHSA's Women, Co-Occurring Disorders and Violence Study. Across all sites, trauma-specific models achieved more favorable outcomes than control sites that did not use trauma-specific models (Morrissey et al., 2005). There has not yet been a study of ATRIUM per se, however. A manual describing the theory behind this model in greater depth, as well as how to implement it, is published under the title *Addictions and Trauma Recovery: Healing the Body, Mind, and Spirit* (Miller & Guidry, 2001).

Beyond Trauma: A Healing Journey for Women

Beyond Trauma (Covington, 2003) is a curriculum for women's services based on theory, research, and clinical experience. It was developed for use in residential, outpatient, and correctional settings; domestic violence programs; and mental health clinics. It uses behavioral techniques and expressive arts and is based on relational therapy. Although the materials are designed for trauma treatment, the connection between trauma and substance abuse in women's lives is a theme throughout. Beyond Trauma has a psychoeducational component that defines trauma by way of its process as well as its impact on the inner self (thoughts, feelings, beliefs, values) and the outer self (behavior and relationships, including parenting). Coping skills are emphasized; specific exercises develop emotional wellness.

Concurrent Treatment of PTSD and Cocaine Dependence

Concurrent Treatment of PTSD and Cocaine Dependence (CTPCD) is a 16-session, twice-weekly individual outpatient psychotherapy model designed to treat women and men with co-occurring PTSD and cocaine dependence (Coffey, Schumacher, Brimo, & Brady, 2005). CTPCD combines imagery and in vivo exposure therapy (in which the client becomes desensitized to anxiety-producing stimuli through repeated exposure to them) for the treatment of PTSD with elements of CBT for substance dependence. To balance the dual needs of abstinence skill building and prompt trauma treatment, the first five sessions focus on coping skills for cocaine dependence. Session six transitions into exposure therapy, which begins in earnest in session seven and is combined with CBT for the treatment of substance abuse.

CTPCD helps reduce substance use and PTSD symptoms. The use of any illicit drug, as measured by urine screens, was quite low during the 16-week treatment trial and didn't escalate during the second half of treatment—when most exposure sessions occurred. PTSD symptoms dropped significantly over the course of treatment, as did self-reported depressive symptoms; however, the dropout rate was high (Coffey, Dansky, & Brady, 2003). CTPCD was reformulated into Concurrent Prolonged Exposure (COPE; Mills et al., 2012), which was compared with treatment as usual in a high-complexity clinical sample of individuals who had PTSD and substance dependence. Both treatment conditions resulted in improvements in PTSD with no difference at 3 months (though COPE showed significantly greater improvement at 9 months); moreover, the two conditions did not differ in impact on substance use outcomes, depression, or anxiety.

Integrated CBT

Integrated CBT is a 14-session individual therapy model designed for PTSD and substance use. It incorporates elements such as psychoeducation, cognitive restructuring, and breathing retraining (McGovern, Lamber-Harris, Alterman, Xie, & Meier, 2011). A randomized controlled trial showed that both integrated CBT and individual addiction treatment achieved improvements in substance use and other measures of psychiatric symptom severity with no difference between the treatments.

Seeking Safety

Seeking Safety is an empirically validated, present-focused treatment model that helps clients attain safety from trauma and substance abuse (Najavits, 2002a). The Seeking Safety manual (Najavits, 2002b) offers clinician guidelines and client handouts and is available in

several languages. Training videos and other implementation materials are available online (http://www.seekingsafety.org). Seeking Safety is flexible; it can be used for groups and individuals, with women and men, in all settings and levels of care, by all clinicians, for all types of trauma and substance abuse.

Seeking Safety covers 25 topics that address cognitive, behavioral, interpersonal, and case management domains. The topics can be conducted in any order, using as few or as many as are possible within a client's course of treatment. Each topic represents a coping skill relevant to both trauma and substance abuse, such as compassion, taking good care of yourself, healing from anger, coping with triggers, and asking for help. This treatment model builds hope through an emphasis on ideals and simple, emotionally evocative language and quotations. It attends to clinician processes and offers concrete strategies that are thought to be essential for clients dealing with concurrent substance use disorders and histories of trauma.

More than 20 published studies (which include pilot studies, randomized controlled trials, and multisite trials representing various investigators and populations) provide the evidence base for this treatment model. For more information, see SAMHSA's NREPP Web site (http://www.nrepp.samhsa.gov) as well as the "Outcomes" section of the Seeking Safety Web site (http://www.seekingsafety.org/3-03-06/studies.html). Study samples included people with chronic, severe trauma symptoms and substance dependence who were diverse in ethnicity and were treated in a range of settings (e.g., criminal justice, VA centers, adolescent treatment, homelessness services, public sector). Seeking Safety has shown positive outcomes on trauma symptoms, substance abuse, and other domains (e.g., suicidality, HIV risk, social functioning, problem-solving, sense of meaning); consistently outperformed treatment as usual; and achieved high satisfaction ratings from both clients and clinicians. It has been translated into seven languages, and a version for blind and/or dyslexic individuals is available.

The five key elements of Seeking Safety are:

1. Safety as the overarching goal (helping clients attain safety in their relationships, thinking, behavior, and emotions).
2. Integrated treatment (working on trauma and substance abuse at the same time).
3. A focus on ideals to counteract the loss of ideals in both trauma and substance abuse.
4. Four content areas: cognitive, behavioral, interpersonal, and case management.
5. Attention to clinician processes (addressing countertransference, self-care, and other issues).

Substance Dependence PTSD Therapy

Substance Dependence PTSD Therapy (Triffleman, 2000) was designed to help clients of both sexes cope with a broad range of traumas. It combines existing treatments for PTSD and substance abuse into a structured, 40-session (5-month, twice-weekly) individual therapy that occurs in two phases. Phase I is "Trauma-Informed, Addictions-Focused Treatment" and focuses on coping skills and cognitive interventions as well as creating a safe environment. Phase I draws on CBT models, anger management, relaxation training, HIV risk reduction, and motivational enhancement techniques. Phase II, "Trauma-Focused, Addictions-Informed Treatment," begins with psychoeducation about PTSD followed by "Anti-Avoidance I," in which a modified version of stress inoculation training is taught in two to four sessions. Following this is "Anti-Avoidance II," lasting 6 to 10 sessions, in which in vivo exposure is used.

Trauma Affect Regulation: Guide for Education and Therapy

Trauma Affect Regulation: Guide for Education and Therapy (TARGET; Ford & Russo, 2006; Frisman, Ford, Lin, Mallon, & Chang, 2008) uses emotion and information processing in a present-focused, strengths-based approach to education and skills training for trauma survivors with severe mental, substance use, and co-occurring disorders across diverse populations. TARGET helps trauma survivors understand how trauma changes the brain's

TARGET: The Seven-Step FREEDOM Approach

Focus: Being focused helps a person pay attention and think about what's happening right now instead of just reacting based on alarm signals tied to past trauma. This step teaches participants to use the SOS skill (Slow down, Orient, Self-check) to pay attention to body signals and the immediate environment and to use a simple scale to measure stress and control levels.

Recognize triggers: Recognizing trauma triggers enables a person to anticipate and reset alarm signals as he or she learns to distinguish between a real threat and a reminder. This step helps participants identify personal triggers, take control, and short-circuit their alarm reactions.

Emotion self-check: The goal of this skill is to identify two types of emotions. The first are "alarm" or reactive emotions such as terror, rage, shame, hopelessness, and guilt. Because these emotions are the most noticeable after trauma, they are the alarm system's way of keeping a person primed and ready to fend off further danger. The second type of emotion, "main" emotions, include positive feelings (e.g., happiness, love, comfort, compassion) and feelings that represent positive strivings (e.g., hope, interest, confidence). By balancing both kinds of emotions, a person can reflect and draw on his or her own values and hopes even when the alarm is activated.

Evaluate thoughts: When the brain is in alarm mode, thinking tends to be rigid, global, and catastrophic. Evaluating thoughts, as with identifying emotions, is about achieving a healthier balance of positive as well as negative thinking. Through a two-part process, participants learn to evaluate the situation and their options with a focus on how they choose to act—moving from reactive thoughts to "main" thoughts. This is a fundamental change from the PTSD pattern, which causes problems by taking a person straight from alarm signals to automatic survival reactions.

Define goals: Reactive goals tend to be limited to just making it through the immediate situation or away from the source of danger. These reactive goals are necessary in true emergencies but don't reflect a person's "main" goals of doing worthwhile things and ultimately achieving a good and meaningful life. This step teaches one how to create "main" goals that reflect his or her deeper hopes and values.

Options: The only options that are available when the brain's alarm is turned on and won't turn off are automatic "flight/fight" or "freeze/submit" reactive behaviors that are necessary in emergencies but often unhelpful in ordinary living. This step helps identify positive intentions often hidden by the more extreme reactive options generated by the alarm system. This opens the possibility for a greater range of options that take into consideration one's own needs and goals as well as those of others.

Make a contribution: When the brain's alarm is turned on and reacting to ordinary stressors as if they were emergencies, it is very difficult for a person to come away from experiences with a feeling that they have made a positive difference. This can lead to feelings of alienation, worthlessness, or spiritual distress. The ultimate goal of TARGET is to empower adults and young people to think clearly enough to feel in control of their alarm reactions and, as a result, to be able to recognize the contribution they are making not only to their own lives, but to others' lives as well.

Source: Advanced Trauma Solutions, 2012.

normal stress response into an extreme survival-based alarm response that can lead to PTSD, and it teaches them a seven-step approach to making the PTSD alarm response less distressing and more adaptive (summarized by the acronym FREEDOM: Focus, Recognize triggers, Emotion self-check, Evaluate thoughts, Define goals, Options, and Make a contribution).

TARGET can be presented in individual therapy or gender-specific psychoeducational groups, and it has been adapted for individuals who are deaf; it has also been translated into Spanish and Dutch. TARGET is a resilience-building and recovery program not limited to individual or group psychotherapy; it is also designed to provide an educational curriculum and milieu intervention that affects all areas of practice in school, therapeutic, or correctional programs. TARGET is listed in SAMHSA's NREPP (http://www.nrepp.samhsa.gov).

Trauma Recovery and Empowerment Model

The trauma recovery and empowerment model (TREM) of therapy (Fallot & Harris, 2002; Harris & Community Connections Trauma Work Group, 1998) is a manualized group intervention designed for female trauma survivors with severe mental disorders. TREM addresses the complexity of long-term adaptation to trauma and attends to a range of difficulties common among survivors of sexual and physical abuse. TREM focuses mainly on developing specific recovery skills and current functioning and uses techniques that are effective in trauma recovery services. The model's content and structure, which cover 33 topics, are informed by the role of gender in women's experience of and coping with trauma.

TREM can be adapted for shorter-term residential settings and outpatient substance abuse treatment settings, among others. Adaptations of the model for men and adolescents are available. The model was used in SAMHSA's Women, Co-Occurring Disorders and Violence Study for three of the nine study sites and in SAMHSA's Homeless Families program, and it is listed in SAMHSA's NREPP. This model has been used with clients in substance abuse treatment; research by Toussaint, VanDeMark, Bornemann, and Graeber (2007) shows that women in a residential substance abuse treatment program showed significantly better trauma treatment outcomes using TREM than they did in treatment as usual, but no difference in substance use.

TREM Program Format

Each session includes an experiential exercise to promote group cohesiveness. The 33 sessions are divided into the following general topic areas:

- **Part I–empowerment** introduces gender identity concepts, interpersonal boundaries, and self-esteem.
- **Part II–trauma recovery** concentrates on sexual, physical, and emotional abuse and their relationship to psychiatric symptoms, substance abuse, and relational patterns and issues.
- **Part III–advanced trauma recovery issues** addresses additional trauma issues, such as blame and the role of forgiveness.
- **Part IV–closing rituals** allows participants to assess their progress and encourages them to plan for their continued healing, either on their own or as part of a community of other survivors.
- **Part V–modifications or supplements for special populations** provides modifications for subgroups such as women with serious mental illness, incarcerated women, women who are parents, women who abuse substances, and male survivors.

Source: Mental Health America Centers for Technical Assistance, 2012.

Triad Women's Project

The Triad Project was developed as a part of SAMHSA's Women, Co-Occurring Disorders and Violence Study. It is a comprehensive, trauma-informed, consumer-responsive integrated model designed for female trauma survivors with co-occurring substance use and mental disorders who live in semirural areas. Triad integrates motivational enhancement for substance use disorders, DBT, and intensive case management techniques for co-occurring mental disorders. This program is a 16-week group intervention for women that uses integrated case management services, a curriculum-based treatment group, and a peer support group (Clark & Fearday, 2003).

Emerging Interventions

New interventions are emerging to address traumatic stress symptoms and disorders. The following sections summarize a few interventions not highlighted in prior chapters; this is not an exhaustive list. In addition to specific interventions, technology is beginning to shape the delivery of care and to increase accessibility to tools that complement trauma-specific treatments. Numerous applications are available and evolving. For more information on the role of technology in the delivery of care, see the planned TIP, *Using Technology-Based Therapeutic Tools in Behavioral Health Services* (SAMHSA, planned g).

Couple and Family Therapy

Trauma and traumatic stress affects significant relationships, including the survivor's family. Although minimal research has targeted the effectiveness of family therapy with trauma survivors, it is important to consider the needs of the individual in the context of their relationships. Family and couples therapy may be key to recovery. Family members may experience secondary traumatization silently, lack understanding of traumatic stress symptoms or treatment, and/or have their own histories of trauma that influence their willingness to support the client in the family or to talk about anything related to trauma and its effects. Family members can engage in similar patterns of avoidance and have their own triggers related to the trauma being addressed at the time. A range of couple and family therapies have addressed traumatic stress and PTSD, but few studies exist that support or refute their value. Current couple or family therapies that have some science-based evidence include behavioral family therapy, behavioral marital therapy, cognitive–behavioral couples treatment, and lifestyle management courses (Riggs, Monson, Glynn, & Canterino, 2009).

Mindfulness Interventions

Mindfulness is a process of learning to be present in the moment and observing internal experience (e.g., thoughts, bodily sensations) and external experience (e.g., interactions with others) in a nonjudgmental way. Mindfulness challenges limiting beliefs that arise from trauma, quells anxiety about future events, and simply helps one stay grounded in the present. It plays a significant role in helping individuals who have been traumatized observe their experiences, increase awareness, and tolerate uncomfortable emotions and cognitions.

To date, mindfulness-based interventions appear to be valuable as an adjunct to trauma-specific interventions and in decreasing arousal (Baer, 2003). It may also help individuals tolerate discomfort during exposure-oriented and trauma processing interventions. Overall, mindfulness practices can help clients in managing traumatic stress, coping, and resilience. In a study of firefighters, mindfulness was associated with fewer PTSD symptoms, depressive symptoms, physical symptoms, and alcohol problems when controlling for other variables (Smith et al., 2011).

Becoming an Observer and Learning To Tolerate Discomfort: The Leaf and Stream Metaphor

The following exercise, "leaves floating on a stream," is a classic. Many clinicians and authors provide renditions of this mindfulness practice. The main objectives are to stand back and observe thoughts rather than get caught up in them. Simply stated, thoughts are just thoughts. Thoughts come and go like water flowing down a stream. We don't need to react to the thoughts; instead, we can just notice them.

Conduct the mindfulness exercise for about 10 minutes, then process afterward. Take time to allow participants to visualize each sense as they imagine themselves sitting next to the stream. For example, what does it look like? What do they hear as they sit next to the stream? Don't rush the exercise. As you slowly make the statements detailed in the following two paragraphs, take time in between each statement for participants to be in the exercise without interruption; simply offer gentle guidance.

Begin to sit quietly, bringing your attention to your breath. If you feel comfortable, close your eyes. As you focus on breathing in and out, imagine that you are sitting next to a stream. In your imagination, you may clearly see and hear the stream, or you may have difficulty visualizing the stream. Follow along with the guided exercise; either way, it will work just as well.

Now begin to notice the thoughts that come into your mind. Some thoughts rush by, while others linger. Just allow yourself to notice your thoughts. As you begin to notice each thought, imagine putting those words onto a leaf as it floats by on the stream. Just let the thoughts come, watching them drift by on the leaves. If your thoughts briefly stop, continue to watch the water flow down the stream. Eventually, your thoughts will come again. Just let them come, and as they do, place them onto a leaf. Your attention may wander. Painful feelings may arise. You may feel uncomfortable or start to think that the exercise is "stupid." You may hook onto a thought—rehashing it repeatedly. That's okay; it's what our minds do. As soon as you notice your mind wandering or getting stuck, just gently bring your focus back to your thoughts, and place them onto the leaves. Now, bring your attention back to your breath for a moment, then open your eyes and become more aware of your environment.

Facilitated Questions:

- What was it like for you to observe your thoughts?
- Did you get distracted? Stuck?
- Were you able to bring yourself back to the exercise after getting distracted?
- In what ways was the exercise uncomfortable?
- In what ways was the exercise comforting?

For clients and practitioners who want to develop a greater capacity for mindfulness, see Kabat-Zinn's books *Wherever You Go, There You Are: Mindfulness Meditation In Everyday Life* (1994) and *Full Catastrophe Living: Using the Wisdom of Your Body and Mind to Face Stress, Pain, and Illness* (1990). For clinical applications of mindfulness, see *Mindfulness-Based Cognitive Therapy for Depression: A New Approach to Preventing Relapse* (Segal et al., 2002) and *Relapse Prevention: Maintenance Strategies in the Treatment of Addictive Behaviors* (Marlatt & Donovan, 2005).

Pharmacological Therapy

Pharmacotherapy for people with mental, substance use, and traumatic stress disorders needs to be carefully managed by physicians who are well versed in the treatment of each condition. Medications can help manage and control symptoms; however, they are only a part of a comprehensive treatment plan. There

are no specific "antitrauma" drugs; rather, certain drugs target specific trauma symptoms. Clients receiving pharmacotherapy need careful assessment. Some clients with preexisting mental disorders may need further adjustment in medications due to the physiological effects of traumatic stress. In addition, sudden withdrawal from a pattern of self-administered substances can not only lead to dangerous levels of physical distress, but also exacerbate the emergence of more severe PTSD symptoms. Distress after trauma often lessens over time, which can sometimes make the use of medications unnecessary for some individuals. Some trauma survivors do not develop long-term psychological problems from their experiences that require medication; others may simply refuse the initiation of pharmacotherapy or the use of additional medications.

Concluding Note

Behavioral health counselors can best serve clients who have experienced trauma by providing integrated treatment that combines therapeutic models to target presenting symptoms and disorders. Doing so acknowledges that the disorders interact with each other. Some models have integrated curricula; others that address trauma alone can be combined with behavioral health techniques with which the counselor is already familiar.

In part, the choice of a treatment model or general approach will depend on the level of evidence for the model, the counselor's training, identified problems, the potential for prevention, and the client's goals and readiness for treatment. Are improved relationships with family members a goal? Will the client be satisfied if sleep problems decrease, or is the goal resolution of broader issues? Are there substance use or substance-related disorders? Is the goal abstinence? Collaborating with clients to decide on goals, eliciting what they would like from treatment, and determining what they expect to happen can provide some clues as to what treatment models or techniques might be successful in keeping clients engaged in recovery.

Part 2: An Implementation Guide for Behavioral Health Program Administrators

1 Trauma-Informed Organizations

IN THIS CHAPTER

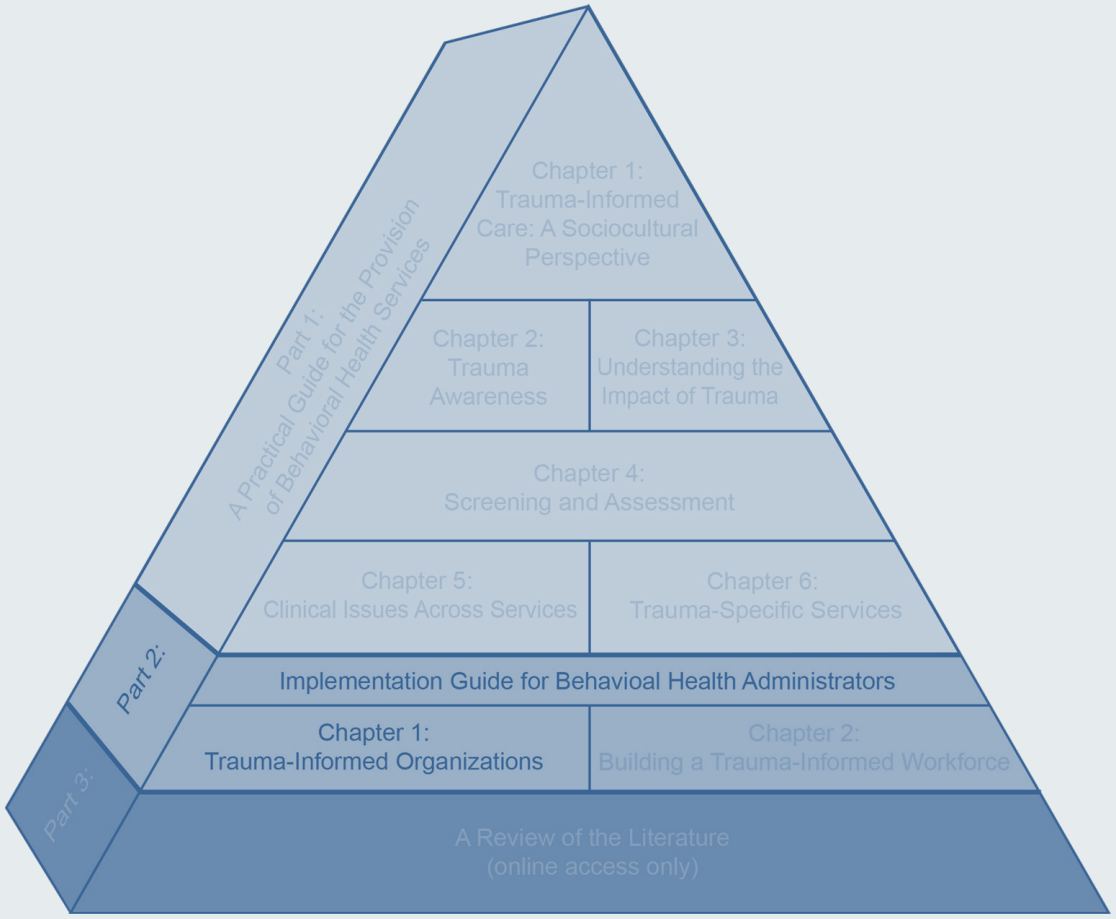
- Show Organizational and Administrative Commitment to TIC
- Use Trauma Informed Principles in Strategic Planning
- Review and Update Vision, Mission, and Value Statements
- Assign a Key Staff Member To Facilitate Change
- Create a Trauma Informed Oversight Committee
- Conduct an Organizational Self Assessment of Trauma Informed Services
- Develop an Implementation Plan
- Develop Policies and Procedures To Ensure Trauma Informed Practices and To Prevent Retraumatization
- Develop a Disaster Plan
- Incorporate Universal Routine Screenings
- Apply Culturally Responsive Principles
- Use Science Based Knowledge
- Create a Peer Support Environment
- Obtain Ongoing Feedback and Evaluations
- Change the Environment To Increase Safety
- Develop Trauma Informed Collaborations

Part 2 provides a broad overview of how to create and implement an institutional framework for trauma-informed services in program delivery and staff development, policies and procedures, administrative practices, and organizational infrastructure in behavioral health services. Chapter 1, "Trauma-Informed Organizations," focuses on specific organizational strategies that will help develop a trauma-informed culture in behavioral health settings. Numerous strategies are presented, including organizational commitment to trauma-informed care (TIC), trauma-informed organizational assessment, implementation of universal screening for trauma, and creation of a peer support environment.

Chapter 2, "Building a Trauma-Informed Workforce," focuses on organizational activities that foster the development of a trauma-informed workforce, including recruiting, hiring, and retaining trauma-informed staff; providing training on evidence-based and emerging trauma-informed best practices; developing competencies specific to TIC; addressing ethical considerations; providing trauma-informed supervision; and preventing and treating secondary trauma in behavioral health service providers.

The strategies described in the following sections can help supervisors and other administrative staff members create a trauma-informed behavioral health environment. As a starting point, the administration should identify key personnel and consumers to guide the organizational change process and the organizational assessment. Administrators and supervisors need to plan for and demonstrate an ongoing commitment to these strategies, or staff may perceive development activities as comprising yet another idea or demand from the agency that is short-lived beyond the initial thrust of training.

TIC Framework in Behavioral Health Services—Trauma-Informed Organizations



Creating a trauma-informed organization is a fluid, ongoing process; it has no completion date. Consumer demographics change across time, exposure to specific types of trauma may become more prevalent, and knowledge of best and evidence-based practices (EBPs) will continue to advance. A trauma-informed organization continues to demonstrate a commitment to compassionate and effective practices and organizational reassessments, and it changes to meet the needs of consumers with histories of trauma. It is encouraging that recent Substance Abuse and Mental Health Services Administration (SAMHSA) data indicates that the majority of over 10,000 programs they surveyed state that they provide trauma-related care (Capezza & Najavits, 2012). However, there remains a major need to make TIC consistently high-quality, routine, and pervasive across treatment systems.

The following stages form the basis of creating a trauma-informed organization:

1. Commit to creating a trauma-informed agency.
2. Create an initial infrastructure to initiate, support, and guide changes.
3. Involve key stakeholders, including consumers who have histories of trauma.
4. Assess whether and to what extent the organization's current policies, procedures, and operations either support TIC or interfere with the development of a trauma-informed approach.
5. Develop an organizational plan to implement and support the delivery of TIC within the agency.

Trauma-Informed Services and Service Systems

"A trauma-informed service system and/or organization is one in which all components of the system have been reconsidered and evaluated in the light of a basic understanding of the role that violence and trauma play in the lives of people seeking mental health and addiction services. A 'trauma-informed' organizational environment is capable of supporting and sustaining 'trauma-specific' services as they develop. A trauma-informed system recognizes that trauma results in multiple vulnerabilities and affects many aspects of a survivor's life over the lifespan, and therefore coordinates and integrates trauma-related activities and training with other systems of care serving trauma survivors. A basic understanding of trauma and trauma dynamics…should be held by all staff and should be used to design systems of services in a manner that accommodates the vulnerabilities of trauma survivors and allows services to be delivered in a way that will avoid retraumatization and facilitate consumer participation in treatment. A trauma-informed service system is knowledgeable and competent to recognize and respond effectively to adults and children traumatically impacted by any of a range of overwhelming adverse experiences, both interpersonal in nature and caused by natural events and disasters. There should be written plans and procedures to develop a trauma-informed service system and/or trauma-informed organizations and facilities with methods to identify and monitor progress. Training programs for this purpose should be implemented."

Source: Jennings, 2009, pp. 111–112.

6. Create collaborations between providers and consumers and among service providers and various community agencies.
7. Put the organizational plan into action.
8. Reassess the implementation of the plan and its ability to meet the needs of consumers and to provide consistent TIC on an ongoing basis.
9. Implement quality improvement measures as needs and problem areas are identified.
10. Institute practices that support sustainability, such as ongoing training, clinical supervision, consumer participation and feedback, and resource allocation.

Strategy #1: Show Organizational and Administrative Commitment to TIC

Foremost, administrators need to understand the impact that trauma can have on people's lives. The consistent delivery of TIC is only as effective as the organization's commitment, which must extend to administrative practices with staff members, program policies and procedures, program design, staffing patterns, use of peer support, staff and peer training and supervision, organizational assessment and consumer feedback, and resources to uphold trauma-informed principles and practices. Even short-term change is not sustainable without the agency's continual commitment.

Typically, desirable organizational change doesn't occur by accident. It comes from steadfast leadership, a convincing message that change is necessary and beneficial for staff and consumers, and resources that support change. Many people naturally resist change; thus, an organization's commitment includes a willingness to discuss with staff members the impact and role of trauma in their service setting, patience in planning and implementation, and

Seminal Resource for Administrators

As you investigate how best to implement or improve trauma informed services within your organization or across systems, review the influential work, *Using Trauma Theory to Design Service Systems: New Directions for Mental Health Services.*

(Harris & Fallot, 2001c)

Advice to Administrators: Managing Staff Reactions to Implementation of New Processes or Ideas

A common hurdle for administrators after introducing a new process or idea is the staff assumption that it will require more work. Frontline staff members are often inundated with many responsibilities beyond face-to-face time with clients. In addition, a common misperception is that if you begin to address trauma, you will have difficulty containing it.

In addition to administrative buy-in, administrators must promote rather than simply announce the implementation of trauma-informed services. Promotion includes educating staff about the rationale for trauma-informed services, offering opportunities for discussion and input from staff and consumers, providing training focused on trauma-informed skills, and so forth. For example, the San Diego Trauma-Informed Guide Team (2012) created a promotional brochure on how TIC can make staff jobs easier:

- Focuses on root problem
- Is preventative
- Increases support system
- Facilitates collaboration
- Shares workload
- Empowers client
- Provides consistency in agencies/systems
- Uses evidence-based best practices

TIC may be cost-effective, lead to less intensive services and less use of services, prevent undue stress for staff members and clients, and prevent client crises caused by old policies that could retraumatize trauma survivors.

the ability to tolerate the uncertainty that naturally accompanies transitions.

Strategy #2: Use Trauma-Informed Principles in Strategic Planning

Strategic planning provides an opportunity to explore and develop short- and long-term goals. The planning process often begins with reevaluating the organizations' values, mission, and vision, yet agencies cannot adequately develop a trauma-informed strategic plan without obtaining specific information about internal (staff, resources, processes) and external environmental (referral constellation, changes in health care, funding sources, State and Federal standards, community needs, consumer demographics, etc.) factors and influences. Data gathered through staff, consumer, organizational, and community assessments shapes the direction of the plan, including projected demands, challenges, obstacles, strengths, weaknesses, and resources. At the conclusion of this planning process, the organization will have specific goals, objectives, and tasks to meet the needs of their stakeholders and to address any anticipated challenges. Ideally, strategic planning should define key steps in developing or refining trauma-informed services within the organization.

Strategy #3: Review and Update Vision, Mission, and Value Statements

Vision, mission, and value statements provide a conceptual framework for TIC development and delivery. They should not be created in isolation; they should reflect voices from the community, populations, and other stakeholders that the organization serves. These statements develop through input, discussion, and assessment. They are not static; they evolve as needs, populations, or environments change.

Statement Example

As behavioral health service providers, we strive to be trauma aware—to understand the dynamics and impact of trauma on the lives of individuals, families, and communities. We strive to create a trauma-sensitive culture by demonstrating, through consumer empowerment, program design, and direct care, an understanding of the relationships among trauma, substance abuse, and mental illness.

Advice to Administrators: How To Create Vision, Value, and Mission Statements

Define the organization's vision, values, and mission to be compatible with TIC. Emphasize the organizational culture needed to provide TIC. An outgrowth of that cultural shift may include an enhanced working environment for employees and consumers that is noncoercive and reduces conflicts, restraint, and seclusion. Even if the current mission statement is appropriate, change it anyway to symbolize intended change within the organization. To define or redefine the vision, values, and mission:

- Involve consumers, all levels of staff, and leadership, including the director/CEO.
- Review:
  - Organizational priorities to identify and manage conflicting priorities.
  - Resources to assess whether reallocation is necessary for change (e.g., to hire peer support specialists, to furnish comfort rooms).
- Operationalize the vision, values, and mission at the level of individual departments
- Evaluate progress at regular staff meetings to ensure that changing the culture of care stays on the agenda.

Source: New Logic Organizational Learning, 2011.

Strategy #4: Assign a Key Staff Member To Facilitate Change

Prior to the development of an oversight committee, a senior staff member with the authority to initiate and implement changes should be assigned to oversee the developmental process. By assigning a trauma-aware senior staff member who is committed to trauma-informed services, it is more likely that the organization's and committee's goals, objectives, and plans will remain in focus. This senior staff member is responsible for ongoing development and facilitation of the oversight committee; management of the initial organizational assessment, reassessments, and other evaluative and feedback processes; and facilitation and oversight of the implementation plan and subsequent changes, including policies and procedures to ensure delivery of TIC.

Strategy #5: Create a Trauma-Informed Oversight Committee

The role of the oversight committee includes providing ongoing input and direction in the initial organizational assessment, strategic plan, plan implementation, reevaluation and development of trauma-informed policies and procedures, and future reassessments. The committee monitors progress and uses real-time data to forge a clear pathway to new processes that support TIC. The committee should involve stakeholders from the community, consumers, specialists, staff members, and administrators. Leadership involvement is necessary. Stakeholders may be alumni, family members, community-based organizations, and other institutions that interact with the agency or would benefit from trauma-informed services.

Initially, the agency must educate the committee on the organization's mission, values, and vision as well as the task at hand—developing trauma-informed services. To ease potential conflicts or confusion about the organization's structure, the guidelines, expectations, and roles of the committee need to be communicated directly to committee members as well as the organization as a whole, including board members, support and professional staff, supervisors, and so forth. The committee also needs to know the extent of their power and the necessary lines of communication before, during, and after evaluating and implementing changes in the organization.

Including consumers and/or those who have lived through trauma is vital. They have unique knowledge, experiences, and perspectives on the impact of treatment design, delivery, policies, and procedures. They offer firsthand information on practices that can potentially retraumatize clients in behavioral health settings and can suggest preventive, alternative practices and solutions. Consumer committee members keep staff and administrators aware of the goal of achieving TIC.

Strategy #6: Conduct an Organizational Self-Assessment of Trauma-Informed Services

An organizational self-assessment evaluates the presence and/or the effectiveness of current trauma-informed practices across each service and level of the organization. This assessment allows an organization to see how it functions within the context of trauma-informed principles and provides feedback to inform the development or revision of the implementation plan for TIC. In essence, this assessment process can serve as a blueprint for change and as a benchmark of compliance with and progress in implementing trauma-informed practices across time. Overall, it is a process of identifying organizational strengths, weaknesses, opportunities, and threats related to the implementation and maintenance of TIC. Refer to Appendix F for sample organizational assessment tools for the organization and the consumer.

The self-assessment should obtain feedback from key stakeholders, particularly consumers, family members, referral sources, community organizations, and all levels of the organization's staff, including nonclinical and clinical staff, supervisors, and administrative personnel. Similar to the universal screening process, an organizational self-assessment is only as effective as the steps taken after data are gathered and analyzed. From this assessment, an implementation plan should be established that highlights the goals, objectives, steps, timeframe, and personnel responsible in overseeing the specific objective. Assessment shouldn't be a once-and-done project. Timely and regularly scheduled organizational assessments should follow to assist in quality improvement. For an explanation of more detailed steps to take in conducting an organizational self-assessment, see Chapter 4 of the planned Treatment Improvement Protocol (TIP), *Improving Cultural Competence* (SAMHSA, planned c).

Advice to Administrators: Ten Steps to Quality Improvement

1. Identify new goals or problems.
2. Gather input from each level of the organization, including consumers and other key stakeholders.
3. Analyze the feedback.
4. Explore improvement options and the potential barriers associated with each.
5. Select the overall approach and specific strategies to address barriers (anticipate barriers, and try to address them before they occur).
6. Develop an implementation plan, and then present the plan to staff members and other key stakeholders not directly involved in the quality improvement process.
7. Implement the plan.
8. Reassess the new plan.
9. Evaluate the results and determine if new goals or additional problems or issues need to be addressed.
10. Repeat the first nine steps.

Strategy #7: Develop an Implementation Plan

Implementation plans should evolve from consumer participation, demographic profiles

Advice to Administrators: Implementation Plan Content

1. **Introduction and overview:** This includes the organization's history, the demographics that characterize its client base, the rationale for the implementation plan, and the incorporation of TIC. Focus on identification of strengths, weaknesses, opportunities, and threats. Provide an overview of goals and objectives.
2. **Specific goals and objectives:** Goals and objectives should address:
   - Workforce development strategies for recruiting, hiring, retaining, training, supervising, and promoting wellness of clinical and nonclinical staff members to support TIC.
   - Consumer participation and peer support development and implementation strategies.
   - Policies, procedures, and practices to support TIC and culturally responsive services, to promote safety, and to prevent retraumatization.
   - Specific evidence-based or best practice adoptions to support TIC.
   - Strategies to amend facility design or environment (plant) operations to reinforce safety.
   - Fiscal planning to ensure sustainability of the steps initiated in the organization.
3. **Guidelines for implementation:** Guidelines should highlight the specific steps, roles, responsibilities, and timeframes for each activity to meet TIC objectives.

of populations served, data from organizational self-assessment, and research on promising and evidence-based trauma-informed practices. Using the framework proposed in this TIP, the oversight committee is responsible for designing a plan that outlines the purpose, goals, objectives, timeframes, and personnel responsible for each objective (Exhibit 2.1-1).

Exhibit 2.1-1: TIC Planning Guidelines

The following publications provide samples of organizational guidelines for implementing TIC.

- Fallot, R. D. & Harris, M. (2009). *Creating cultures of trauma-informed care (CCTIC): A self-assessment and planning protocol.* Washington, DC: Community Connections, 2009.
- Guarino, K., Soares, P., Konnath, K., Clervil, R., & Bassuk, E. (2009). *Trauma-informed organizational toolkit.* Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration; the Daniels Fund; the National Child Traumatic Stress Network; and the W. K. Kellogg Foundation.
- Huckshorn, K. (2009). Transforming cultures of care toward recovery oriented services: Guidelines toward creating a trauma informed system of care. In *Trauma informed care (TIC) planning guidelines for use in developing an organizational action plan.* Alexandria, VA: National Association of State Mental Health Program Directors.
- Jennings, A. (2009). *Criteria for building a trauma-informed mental health service system.* Retrieved on May 21, 2013, from http://www.theannainstitute.org/CBTIMHSS.pdf
- Ohio Legal Rights Service (2007). *Trauma-informed treatment in behavioral health settings.* Columbus, OH: Ohio Legal Rights Service.
- Prescott, L., Soares, P., Konnath, K., & Bassuk, E. (2008). *A long journey home: A guide for creating trauma-informed services for mothers and children experiencing homelessness* [draft]. Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration; the Daniels Fund; the National Child Traumatic Stress Network; and the W.K. Kellogg Foundation.

The following resource is a systemwide set of guidelines for implementing TIC.

- U.S. Department of Health and Human Services, Health Resources and Services Administration (2006). *Model trauma system: Planning and evaluation.* Rockville, MD: Health Resources and Services Administration.

Strategy #8: Develop Policies and Procedures To Ensure Trauma-Informed Practices and To Prevent Retraumatization

In the early stage of evaluating current services and planning for TIC, the committee needs to assess practices, procedures, and policies that may have been or could be retraumatizing to any individual, at any level of the organization, from consumers to administrators. Programs that are not trauma informed are as likely to be unaware of the impact of trauma on staff as they are to be unaware of its influence on consumers. In the initial review, careful scrutiny should be used to eliminate any practice that is potentially harmful, including seclusion and restraint practices, therapeutic activities that are shaming, treatment planning without collaboration, any medical inquiry without privacy, and so forth.

Policies and procedures are the building blocks of each agency. They guide the service process and, if followed, they provide an opportunity for the agency to deliver consistent responses and care. Policies and procedures must incorporate trauma-informed practices across all domains and standards, such as admissions, plant/environmental standards, screening and assessment processes, referrals (to other services, including hospitalization, or for further evaluations), treatment planning, confidentiality, discharge, and more. They also need to be updated periodically to incorporate new science and to meet the changing needs of consumers. By regularly reviewing and adapting administrative and clinical policies and procedures in response to ever-changing needs and evidence, the agency can provide staff members with good guidelines for providing trauma-informed services that are consistent yet flexible.

Program Curriculum: Roadmap to Seclusion-Free and Restraint-Free Mental Health Services

This curriculum, written from consumer perspectives, provides behavioral health staff with education, strategies, and hands-on tools to prevent and ultimately eliminate the use of seclusion and restraint. It includes many handouts for participants and consumers. This training package, available online (http://store.samhsa.gov/product/Roadmap-to-Seclusion-and-Restraint-Free-Mental-Health-Services-CD-/SMA06-4055), is divided into seven modules plus a resources section:

- Module 1: The Personal Experience of Seclusion and Restraint
- Module 2: Understanding the Impact of Trauma
- Module 3: Creating Cultural Change
- Module 4: Understanding Resilience and Recovery from the Consumer Perspective
- Module 5: Strategies to Prevent Seclusion and Restraint
- Module 6: Sustaining Change Through Consumer and Staff Involvement
- Module 7: Review and Action Plan
- Resource Section

Source: Center for Mental Health Services (CMHS), SAMHSA, 2005.

Strategy #9: Develop a Disaster Plan

Facilities are often required to develop disaster plans, but specific requirements vary from State to State. From the outset, developing a disaster plan in behavioral health services is essential. Many clients in behavioral health services have lived with trauma, so proactive steps that reduce the impact of a new trauma may prevent worsening of symptoms and decrease the risk for more pervasive effects. (See also Technical Assistance Publication 34, *Disaster Planning Handbook for Behavioral Health Treatment Programs* [SAMHSA, 2013].)

Most disaster events cannot be accurately anticipated. Even so, behavioral health organizations can take steps to reduce the impact of a disaster event on program functioning and on the lives of clients. Each service or program should develop a disaster response committee that meets regularly to develop, maintain, and adapt policies and procedures to respond to disasters affecting the program. Committee planning efforts may include:

1. Creating a disaster response team of program staff members tasked with coordinating program administration and services in a disaster event.
2. Establishing a communication process for informing staff and clients of the status of program functioning and for coordinating staff assignments during and shortly after the disaster event.
3. Outlining a process to inform clients and their families of available services, their location, and contact information for accessing services to meet clients' critical needs.
4. Developing plans for service provision during a disaster event and service implementation after the event.
5. Creating special plans for high-risk or special needs clients who need services during and shortly after the disaster. Examples of this are clients who are homeless, in detoxification services or methadone programs, on prescribed psychopharmaceuticals, or at risk for suicide.
6. Making plans for maintaining the security of client records, program records, and facilities during and shortly after the event.
7. Coordinating ahead with other community resources and services to ensure that clients at high risk or with special needs get the services they require as soon as possible.
8. Prioritizing how services will start back up after a disaster event.
9. Providing special services after the event to clients at high risk for trauma reactions and symptoms.
10. Establishing a postdisaster debriefing process to review disaster responses, services, and outcomes.

Some specific disaster events, such as hurricanes, may sometimes offer opportunities for planning and preparation in advance of the disaster event. This preparation time is usually just a few days, but it allows programs to make advance preparations and take advance action to establish lines of communication, stockpile resources, prepare for evacuation of clients, and protect client and program records.

Strategy #10: Incorporate Universal Routine Screenings

A key element of trauma-informed services is the institution of universal routine screening across all services, regardless of the individual's path in accessing services (e.g., primary care, hospitalization, outpatient). Considering the prevalence of trauma among individuals who seek services for mental and substance use disorders, the implementation of screening is paramount. Without screening, clients are not identified as trauma survivors. Subsequently, they miss recovery opportunities and treatment services that would be more likely to meet their needs, while also running a higher risk of being retraumatized by unexamined organizational policies, procedures, and practices. For more information on the rationale, processes, and instruments of universal screening for trauma, refer to Part 1, Chapter 4.

Strategy #11: Apply Culturally Responsive Principles

Providers must be culturally competent when incorporating evidence-based and best practices as well as trauma-informed treatment

models within the organization. Clients' views of behavioral health differ according to race, ethnicity, and culture (refer to the planned Treatment Improvement Protocol [TIP], *Improving Cultural Competence* [SAMHSA, planned c]). Likewise, cultures attach different meanings to trauma, and responses to trauma will vary considerable across cultures (see Part 3, the online literature review, for more information). For example, trauma survivors who come from a collective society or culture, in which the goals of the group take precedence over the goals of the individual, may be more focused on the well-being of their family or the family's response to the trauma survivors' experience. Often, this view runs in opposition to the individualistic perspective of many behavioral health services. Subsequently, treatment providers who are not culturally competent may interpret collective values as a sign of resistance or avoidance in dealing with traumatic stress. CMHS (2003) outlines principles of cultural competence in disaster work applicable across all forms of trauma:

1. ***Recognize the importance of culture and respect diversity.*** Those who value culture and diversity understand their own cultures, attitudes, values, and beliefs, and they work to understand the cultures of others. This includes being able to communicate effectively with those from other cultures, respecting others' feelings about personal space, knowing about others' social organization, understanding how time is viewed, and being aware of others' beliefs about the effects of their behaviors.
2. ***Maintain a current profile of the cultural composition of the community.*** This includes describing the community's population in terms of race and ethnicity, age, gender, religion, refugee and immigrant status, housing status, income levels, rural/urban balance, unemployment, languages spoken, literacy, schools, and businesses.
3. ***Recruit workers who are representative of the community or service area.*** If the workers who are available do not match the community, they should have the personal attributes, knowledge, and skills to develop cultural competence.
4. ***Provide ongoing cultural competence training to staff.*** Topics should include cultural values and traditions, family values, linguistics and literacy, immigration experiences and status, help-seeking behaviors, techniques and strategies for cross-cultural outreach, and the avoidance of stereotypes and labels (DeWolfe & Nordboe, 2000b).
5. ***Ensure that services are accessible, appropriate, and equitable.*** In planning disaster work or TIC, community associations and organizations are invaluable. Gaining their acceptance requires time and energy.
6. ***Recognize the role of help-seeking behaviors, traditions, and natural support networks.*** Culture includes traditions that dictate whom, or which groups, to seek in times of need; how to handle suffering and loss; and how healing takes place. These customs and traditions are respected by a culturally responsive disaster relief program.
7. ***Involve community leaders and organizations representing diverse cultural groups as "cultural brokers."*** Collaborating with community leaders is an effective means of learning about the community, establishing program credibility, and ensuring that services are culturally responsive.
8. ***Ensure that services and information are culturally and linguistically responsive.*** Communication with individuals who do not speak English, who are illiterate in all languages or have limited literacy, and who are deaf or hard of hearing is essential to service provision. Local radio stations, television outlets, and newspapers that are multicultural are an excellent venue for educational information after a disaster.

Using survivors' friends or relatives as interpreters is not recommended, as survivors may be uncomfortable discussing personal matters with family members or friends. Asking children to interpret can place too heavy a responsibility on them and reverses parents' and children's roles.

9. ***Assess and evaluate the program's level of cultural responsiveness.*** Self-assessment and process evaluation can help keep a program on track. A variety of strategies can be used for collecting data and communicating findings to stakeholders.

Strategy #12: Use Science-Based Knowledge

Along with culturally responsive services, trauma-informed organizations must use science-based knowledge to guide program development and the implementation of services, policies, procedures, and practices. This includes the adoption of EBPs (see Part 1, Chapter 6, and Part 3, Section 1, to review definition, treatments, and resources for EBPs). TIC research is quite new; interpret these limited studies and information cautiously. Chambless and Hollon's (1998) criteria, which are still the benchmark for EBPs, are valuable resources for administrators. Look closely at who was included—and excluded—from treatment studies. Often, the types of severe, chronic, and unstable cases seen in community settings are excluded from treatment studies. Evidence-based interventions should be a primary consideration in selecting appropriate treatment models for people with mental illness, substance use disorders, and co-occurring psychological trauma. Nonetheless, other variables must also be contemplated before adopting EBPs in an organization, including the cultural appropriateness of the practice; the strength of its clinical focus on strengths-based strategies; training and competence of clinical staff; the cost of training, materials, and implementation; and the ease of maintaining EBP fidelity amidst staff turnover.

For more detailed information on EBPs, visit the National Registry of Evidence Based Programs and Practices (NREPP) Web site (http://nrepp.samhsa.gov). For more specific research oriented information on trauma and trauma specific treatments, refer to the literature review in Part 3 of this TIP, available online.

Strategy #13: Create a Peer-Support Environment

The main purpose of peer support services is to provide consumer mentoring, support, and care coordination for clients with histories of mental illness or substance abuse. The goals are to help others deal with personal and environmental barriers that impede recovery and achieve wellness. Peer support accomplishes this through many activities, including advocacy, support during crises and recovery activities, modeling, education, and assistance in accessing available resources. Peer support programs send a powerful message to staff members, consumers, and the community—that recovery is possible through support, collaboration, and empowerment. These programs reinforce the trauma-informed premise that organizations need to reflect the populations that they serve and involve consumers in planning, implementing, monitoring, and delivering recovery services.

For an introduction to peer support services, see *What Are Peer Recovery Support Services?* (Center for Substance Abuse Treatment, 2009e).

Notably, peer support services have the potential to be considerably flexible to meet client needs at each stage of recovery. Specifically, peer support services can be incorporated

across the continuum of care, starting with outreach services and extending into long-term recovery services. Peer support specialists can enhance consumer motivation to change, to initiate services, and/or to engage in recovery activities. They can play powerful liaison roles by supporting clients entering treatment and explaining what to expect from services. They can ease the transition into treatment, from one service to the next, from one modality to another (e.g., inpatient group to outpatient group), and beyond formal treatment. Moreover, peer support services create an atmosphere focused on mutuality rather than pathology. They provide living models of resilience and promote hope—that recovery is possible and attainable.

Administrators should familiarize themselves with how other organizations have implemented peer support programs, current curricula, certifications and training processes, competencies and ethics, and peer support service State standards or recommendations, if applicable. The Carter Center's Summit in 2009, The Pillars of Peer Support Services, supported in part by SAMHSA and CMHS, highlighted the numerous elements necessary to develop a strong, vital peer workforce (Daniels et al., 2010). These elements include:

- Clear job and service descriptions.
- Job-related competencies and competence-based testing processes.
- Peer support certifications.
- Ongoing continuing education.
- Media and technology access for peer specialists.
- Sustainable funding.
- Research and evaluation components.
- Code of ethics and conduct.
- Competence-based training for supervisors.
- Multilevel support and program support teams.

> "Peer recovery support services are evidence based and have been demonstrated to promote positive health outcomes and control the cost of healthcare. These services are offered by a trained individual with lived experience and recovery from a mental illness, substance use and/or chronic health conditions. Peer recovery support services minimally include chronic illness self management, whole health and wellness promotion and engagement, relapse prevention, life skill coaching, and insurance and health systems navigation."
>
> (Daniels et al., 2012, p. 22)

Advice to Administrators: Sample Peer Support Staff Tasks

- Use active listening skills help peers identify areas of dissatisfaction and benefits of changing beliefs, thoughts, and behavior.
- Use problem-solving skills to help peers identify barriers to recovery and develop plans to meet peer-determined goals.
- Facilitate recovery support groups.
- Link clients with community resources.
- Work with the treatment team to advocate for clients and to remove recovery barriers.
- Participate in consumer panels to educate staff about the consumer perspective and about peer support.
- Participate in hospital-wide committees and workgroups

Source: New Logic Organizational Learning, 2011.

Strategy #14: Obtain Ongoing Feedback and Evaluations

Obtain feedback on and evaluations of organizational performance on a regular basis. Give consumers a clear avenue for offering feedback at any time, and make evaluations assessing the organization's progress toward providing trauma-informed services standard practice. Without feedback and further evaluation, organizations cannot assess whether they are

meeting trauma-informed objectives. A routine monitoring process for TIC implementation gives the organization additional information necessary to combat new obstacles and threats and to understand what works. Regular monitoring equips organizations with the ability to formulate different strategies to meet objectives as well as to respond to the changing needs of the population. Ongoing evaluation and consumer feedback are essential in improving the quality of services.

Strategy #15: Change the Environment To Increase Safety

Practices that generate emotional and physical safety are necessary. Another aspect of creating safety is reevaluating the physical facilities and environment to enhance safety and to circumvent preventable retraumatization. Think how traumatizing it would be if you were a female rape survivor and a night counselor was conducting a room check at 2:00 a.m., or a male security guard was walking the women's residential wing. What would it be like if you were sitting with your back to the door in a small office during an intake interview, if your history included a physical assault and robbery? For most, it would at least increase anxiety; for others it would be retraumatizing. Trauma-informed providers must carefully assess environmental safety. Although you are likely to identify some facility issues that could erode safety for trauma survivors, a safe environment will only be established if regular feedback is obtained from consumers about their experiences with the program.

Strategy #16: Develop Trauma-Informed Collaborations

TIC is about collaboration with consumers, staff members, key stakeholders, and other agencies. Collaborative relationships provide opportunities for consumers to access the most appropriate services as needs arise. Rather than waiting for a crisis or a dire need for a service to investigate available resources, it is far more efficient and compassionate to establish relationships within the agency and with other community resources before these needs arise. No agency can meet the needs of every client; referral agreements and/or collaborative arrangements that integrate the delivery of TIC, including support services (e.g., housing, legal, medical), are important.

Creating Sanctuary

The sanctuary model is a trauma-based therapeutic approach that has been used in inpatient, residential, therapeutic community, and outpatient settings with children, adolescents, and adults. It provides a template for changing social service delivery systems so that they are better equipped to respond to the complex needs of trauma survivors. Sanctuary is informed by four knowledge areas: "the psychobiology of trauma, the active creation of nonviolent environments, principles of social learning, and an understanding of the ways in which complex adaptive systems grow, change, and alter their course" (Bloom et al., 2003, p. 174).

The sanctuary model describes a stage-based approach to healing that is referred to as SAGE: safety, affect modulation, grieving, and emancipation. This model is nonlinear; an individual does not necessarily move from one stage to another in a straight path, but progress in one area does affect progress in other areas (Bloom, 1997; Bloom et al., 2003). SAGE is a cognitive–behavioral translation of the sanctuary model (Bills, 2003). Early in treatment, the focuses are typically on safety and affect management. Safety encompasses four domains: physical, psychological, social, and moral (Bloom, 1997; see http://www.sanctuaryweb.com for further details and a curriculum).

2 Building a Trauma-Informed Workforce

IN THIS CHAPTER

- Introduction
- Workforce Recruitment, Hiring, and Retention
- Training in TIC
- Trauma Informed Counselor Competencies
- Counselor Responsibilities and Ethics
- Clinical Supervision and Consultation
- Secondary Traumatization
- Counselor Self Care

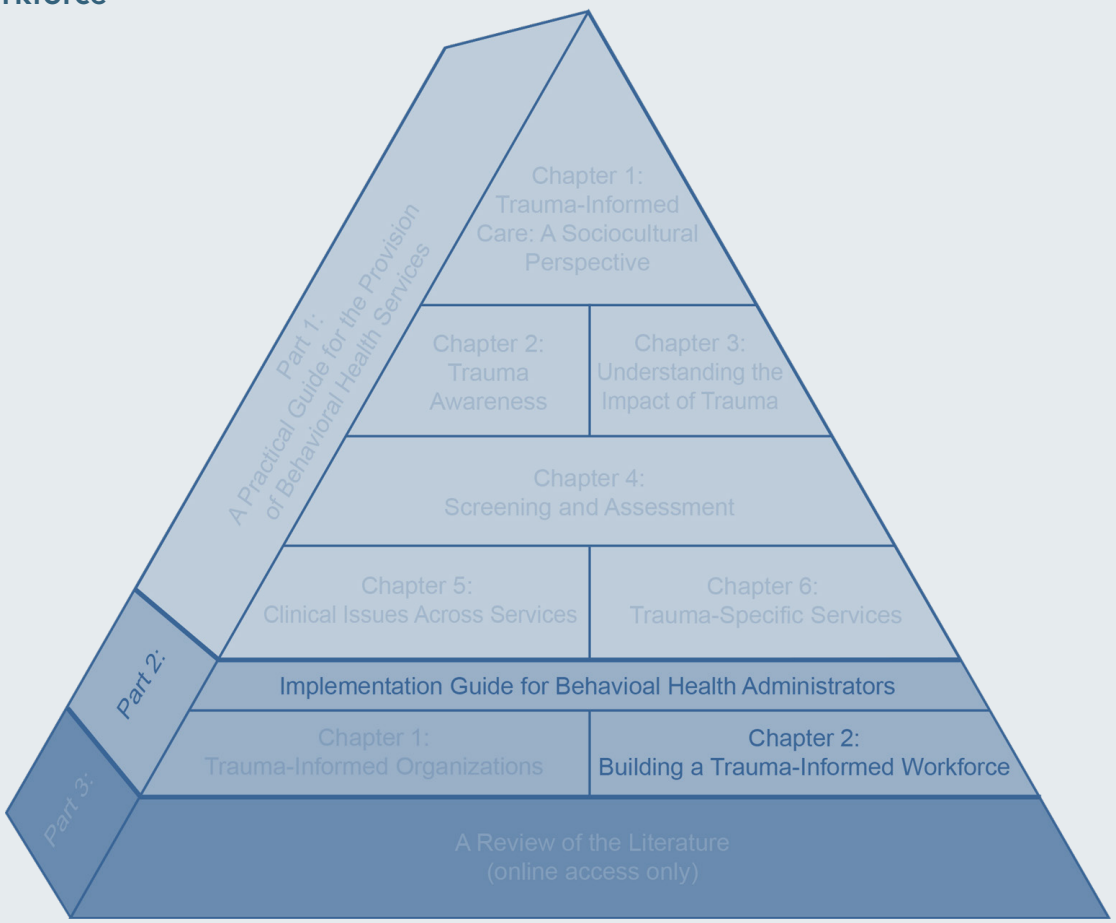
Introduction

For an organization to embrace a trauma-informed care (TIC) model fully, it must adopt a trauma-informed organizational mission and commit resources to support it. This entails implementing an agency-wide strategy for workforce development that is in alignment with the values and principles of TIC and the organization's mission statement. Without a fully trained staff, an organization will not be able to implement the TIC model. However, simply training behavioral health professionals in TIC is not enough. Counselors will not be able to sustain the kind of focus required to adopt and implement a trauma-informed philosophy and services without the ongoing support of administrators and clinical supervisors.

An organizational environment of care for the health, well-being, and safety of, as well as respect for, its staff will enhance the ability of counselors to provide the best possible trauma-informed behavioral health services to clients. This culture of care must permeate the organization from top to bottom. Behavioral health program administrators should aim to strengthen their workforce; doing so "requires creating environments that support the health and well-being, not only of persons with mental and substance use conditions, but of the workforce as well" (Hoge, 2007, p. 58). An organizational culture of care, safety, and respect demands activities that foster the development of trauma-informed counselors. This chapter focuses on key workforce development activities, such as:

- Recruiting, hiring, and retaining trauma-informed staff.
- Training behavioral health service providers on the principles of, and evidence-based and emerging best practices relevant to, TIC.
- Developing and promoting a set of counselor competencies specific to TIC.

TIC Framework in Behavioral Health Services—Building a Trauma-Informed Workforce



- Delineating the responsibilities of counselors and addressing ethical considerations specifically relevant to promoting TIC.
- Providing trauma-informed clinical supervision.
- Committing to prevention and treatment of secondary trauma of behavioral health professionals within the organization.

Addressing each of these areas is essential to building a trauma-informed workforce and an organizational culture that supports TIC.

Workforce Recruitment, Hiring, and Retention

An Action Plan for Behavioral Health Workforce Development (Hoge et al., 2007) emphasizes the importance of organization-wide support and active involvement in workforce recruitment, hiring, and retention in behavioral health systems. One of the key findings of this report is that the work environment itself in many behavioral health settings can be toxic to the workforce and may hinder the delivery of individualized, respectful, collaborative, and client-centered care to service recipients. Factors such as the downward pressure on organizations for higher productivity of counselors increase caseloads and decrease wages of behavioral health staff members and may create a high-stress environment that contributes to low morale and worker dissatisfaction. Other factors that often contribute to low retention of qualified counselors in behavioral health settings include the lack of professional career

ladders, fragile job security, the lack of clinical supervision, and an inability to influence the organization in which they are working (Hoge et al., 2007).

Added to this mix is the intensity of working with people with the co-occurring conditions of trauma-related mental and substance use disorders and the risk of secondary traumatization of counselors. In creating and sustaining a trauma-informed workforce, organizations need to foster a work environment that parallels the treatment philosophy of a trauma-informed system of care. Doing so allows counselors to count on a work environment that values safety, endorses collaboration in the making of decisions at all levels, and promotes counselor well-being.

Recruitment and Hiring in a Trauma-Informed System of Care

In a 2007 technical report (Jennings, 2007b), the National Center for Trauma-Informed Care identified several priorities for organizations with regard to recruitment and hiring trauma-informed staff, including:

- Active recruitment of and outreach to prospective employees who are trauma-informed or have formal education in providing trauma-informed or trauma-specific services in settings such as universities, professional organizations, professional training and conference sites, peer support groups, and consumer advocacy groups.
- Hiring counselors and peer support staff members with educational backgrounds and training in trauma-informed and/or trauma-specific services and/or lived experience of trauma and recovery.
- Providing incentives, bonuses, and promotions for staff members during recruitment and hiring that take into consideration prospective employees' trauma-related education, training, and job responsibilities.

In addition to hiring behavioral health professionals with formal professional education and training, organizations should also "routinely survey the demographics and other characteristics of the population served and recruit a workforce of similar composition" (Hoge et al., 2007, p. 297). Essentially, this means actively engaging in outreach to consumer advocacy groups, recovery-oriented programs, community and faith-based organizations, and former clients/consumers with the intention of recruiting potential employees whose knowledge and expertise comes from their lived experience of trauma, resilience, and recovery. Support staff members, peer support workers, counselors in training, and apprentices can be recruited from this population and offered incentives, such as tuition reimbursement, training stipends, and professional mentoring with the goal of developing a trauma-informed workforce from within the demographic served. Jennings (2007b) calls these staff members "trauma champions" who can provide needed expertise in a trauma-informed organization to promote trauma-informed policies, staff development, and trauma-based services consistent with the mission of the organization (p. 135).

Who Is a Trauma Champion?

"A champion understands the impact of violence and victimization on the lives of people seeking mental health or addiction services and is a front-line worker who thinks 'trauma first.' When trying to understand a person's behavior, the champion will ask, 'is this related to abuse and violence?' A champion will also think about whether his or her own behavior is hurtful or insensitive to the needs of a trauma survivor. The champion is there to do an identified job—he is a case manager or a counselor or a residential specialist—but in addition to his or her job, a champion is there to shine the spotlight on trauma issues."

Source: Harris & Fallot, 2001a, p. 8.

As with hiring behavioral health professionals who are in recovery from substance use disorders, the organization should be transparent and explicit in its recruitment and hiring practices of trauma survivors in recovery. The organization can be transparent by advertising the mission statement of the organization as part of the recruitment process and inviting applicants who are in recovery from trauma to apply. The needs of behavioral health staff members who are in recovery from both substance use and trauma-related conditions and working in a trauma-informed system of care should be addressed in the organization's ongoing training, clinical supervision, and staff development policies and practices.

Workforce Retention

Staff turnover is rampant in behavioral health settings. It is costly to the organization, and as a result, it is costly to clients. A strong therapeutic relationship with a counselor is one of the largest factors in an individual's ability to recover from the overwhelming effects of trauma. When behavioral health professionals leave an organization prematurely or in crisis as a result of chronic levels of high stress or secondary traumatization, clients must deal with disruptions in their relationships with counselors. Some of the organizational factors that contribute to chronic levels of high stress and often lead to high staff turnover include expecting counselors to maintain high caseloads of clients who have experienced trauma; not providing trauma-informed clinical supervision and training to counselors; and failing to provide adequate vacation, health insurance, and other reasonable benefits that support counselors' well-being. Other factors that may have a more profound impact on staff retention include failing to acknowledge the reality of secondary traumatization, promoting the view that counselors' stress reactions are a personal failure instead of a normal response to engaging with clients' traumatic material, and not supporting personal psychotherapy for counselors (Saakvitne, Pearlman, & Traumatic Stress Institute/Center for Adult & Adolescent Psychotherapy, 1996).

Research on promoting counselor retention in behavioral health settings demonstrates that

Advice to Administrators: Preventing Turnover and Increasing Workforce Retention

To prevent behavioral health staff turnover and increase retention of qualified, satisfied, and highly committed trauma-informed counselors, consider:

- Offering competitive wages, benefits, and performance incentives that take into account education, training, and levels of responsibility in providing trauma-informed or trauma-specific services.
- Creating a safe working environment that includes both the physical plant and policies and procedures to prevent harassment, stalking, and/or violence in the workplace and to promote respectful interactions amongst staff at all levels of the organization.
- Establishing an organizational policy that normalizes secondary trauma as an accepted part of working in behavioral health settings and views the problem as systemic—not the result of individual pathology or a deficit on the part of the counselor.
- Instituting reasonable, manageable caseloads that mix clients with and without trauma-related concerns.
- Letting staff offer input into clinical and administrative policies that directly affect their work experience.
- Providing vacation, health insurance (which includes coverage for psychotherapy/personal counseling), and other benefits that promote the well-being of the staff.
- Implementing regular, consistent clinical supervision for all clinical staff members.
- Providing ongoing training in trauma-informed services offered by the organization.

behavioral health staff members are interested in the same kind of work environment and benefits as employees in many other fields. They include a "living wage with healthcare benefits; opportunities to grow and advance; clarity in a job role; some autonomy and input into decisions; manageable workloads; administrative support without crushing administrative burden; basic orientation and training for assigned responsibilities; a decent and safe physical work environment; a competent and cohesive team of coworkers; the support of a supervisor; and rewards for exceptional performance" (Hoge et al., 2007, p. 18).

When an organization's administration values its staff by providing competitive salaries and benefits, a safe working environment, a reasonable and manageable workload, input into the making of clinical and administrative policy decisions, and performance incentives, it helps behavioral health workers feel connected to the mission of the organization and become dedicated to its sustainability and growth. This type of work environment demonstrates both a level of respect for counselors (similar to the level of respect a trauma-informed organization displays toward clients) and an appreciation for the complexity of their job responsibilities and the stress they face when working with people who have experienced trauma in their lives. To retain behavioral health professionals working in a trauma-informed setting, wages and performance incentives should be tied not only to education, training, and work experience, but also to levels of responsibility in working with clients who have experienced trauma.

Training in TIC

Training for all staff members is essential in creating a trauma-informed organization. It may seem that training should simply focus on new counselors or on enhancing the skill level of those who have no prior experience in working with trauma, but training should, in fact, be more systematic across the organization to develop fully sustainable trauma-informed services. All employees, including administrative staff members, should receive an orientation and basic education about the prevalence of trauma and its impact on the organization's clients. To ensure safety and reduction of harm, training should cover dynamics of retraumatization and how practice can mimic original sexual and physical abuse experiences, trigger trauma responses, and cause further harm to the person. Training for all employees must also educate them "about the impacts of culture, race, ethnicity, gender, age, sexual orientation, disability, and socioeconomic status on individuals' experiences of trauma" (Jennings, 2007a, p. 5).

All clinical and direct service staff members, regardless of level of experience, should receive more indepth training in screening and assessment of substance use and trauma-related disorders; the relationships among trauma, substance use disorders, and mental disorders; how to understand difficult client behaviors through a trauma-informed lens; how to avoid retraumatizing clients in a clinical setting; the development of personal and professional boundaries unique to clinical work with traumatized clients; how to identify the signs of secondary traumatization in themselves; and how to develop a comprehensive personal and professional self-care plan to prevent and/or ameliorate the effects of secondary traumatization in the workplace. All clinical staff members who work with traumatized clients should receive additional training in evidence-based and promising practices for the treatment of trauma (for information on locating training, see Appendix B.) This might include training done within the agency by experts in the field or training received by attending advanced trauma trainings. Administrators

should provide the time and financial resources to clinical staff members for this professional development activity. Jennings (2007a) suggests that, whenever possible, "trainings should be multi-system, inclusive of staff in mental health and substance abuse, health care, educational, criminal justice, social services systems and agencies, and promoting systems integration and coordination" (p. 5).

Moreover, criminal justice settings, schools, military/veteran programs, and other places in which behavioral health services are provided may benefit from approaches that are sensitive to the special circumstances and cultures of these environments. For example, in exploring trauma-informed correctional care, Miller and Najavits (2012, p. 1) observe:

> Prisons are challenging settings for trauma-informed care. Prisons are designed to house perpetrators, not victims. Inmates arrive shackled and are crammed into overcrowded housing units; lights are on all night, loud speakers blare without warning and privacy is severely limited. Security staff is focused on maintaining order and must assume each inmate is potentially violent. The correctional environment is full of unavoidable triggers, such as pat downs and strip searches, frequent discipline from authority figures, and restricted movement….This is likely to increase trauma-related behaviors and symptoms that can be difficult for prison staff to manage….Yet, if trauma-informed principles are introduced, all staff can play a major role in minimizing triggers, stabilizing offenders, reducing critical incidents, deescalating situations, and avoiding restraint, seclusion or other measures that may repeat aspects of past abuse.

The Need for Training

Behavioral health service providers working with clients who have mental, substance use, and trauma-related disorders need to have the best knowledge, skills, and abilities. Substance abuse counselors, in particular, require additional training and skill development to be able to extend trauma-informed services (within the

Case Illustration: Larry

Larry is a 28-year-old clinical social worker who just finished his master's program in social work and is working in a trauma-informed outpatient program for people with substance use disorders. He is recovering from alcohol use disorder and previously worked in a residential rehabilitation program as a recovery support counselor. There, his primary responsibilities were to take residents to Alcoholics Anonymous (AA) meetings, monitor their participation, and confront them about their substance use issues and noncompliance with the program's requirement of attendance at 12-Step meetings.

In Larry's new position as a counselor, he confronts a client in his group regarding her discomfort with attending AA meetings. The client reports that she feels uncomfortable with the idea that she has to admit that she is powerless over alcohol to be accepted by the group of mostly men. She was sexually abused by her stepfather when she was a child and began drinking heavily and smoking pot when she was 11 years old. The client reacts angrily to Larry's intervention.

In supervision, Larry discusses his concerns regarding the client's resistance to AA and the feedback that he provided to her in group. Beyond focusing supervision on Larry's new role as a counselor in a trauma-informed program, the clinical supervisor recommends that Larry take an interactive, multisession, computer-assisted training on the 12-Step facilitation (TSF) model. The TSF model introduces clients to and assists them with engaging in 12-Step recovery support groups. The agency has the computer-based training available in the office, and Larry agrees to use follow-up coaching sessions with his supervisor to work on implementation of the approach. The supervisor recognizes that Larry is falling back on his own recovery experience and the strategies he relied on in his previous counseling role. He will benefit from further training and coaching in an evidence-based practice that provides a nonaggressive, focused, and structured way to facilitate participation in recovery support groups with clients who have trauma histories.

limits of their professional licensure and scope of practice) to clients who have co-occurring substance use, trauma-related, or mental disorders. Many clinical practice issues in traditional substance abuse treatment are inconsistent with trauma-informed practice, which needs to be addressed with further training. Similarly, mental health clinicians often need training in substance abuse treatment, as they typically do not have backgrounds or experience in that domain. Moreover, several surveys indicate that clinicians consistently perceive the combination of trauma and substance abuse as harder to treat than either one alone (Najavits, Norman, Kivlahan, & Kosten, 2010). It is thus key to emphasize cross-training as part of TIC. Exhibit 2.2-1 addresses these issues and offers suggestions for additional training.

Exhibit 2.2-1: Clinical Practice Issues Relevant to Counselor Training in Trauma-Informed Treatment Settings

- Some substance abuse counseling strategies commonly used to work through clients' denial and minimization of their substance use issues may be inappropriate when working with trauma survivors (e.g., highly confrontational models can remind trauma survivors of emotional abuse).

  Training: The Stages of Change model of addiction treatment can help counselors shift from the traditional confrontation of denial to conceptualizing clients' ambivalence about changing substance use patterns as a normal part of the precontemplation stage of change. This method is a respectful cognitive–behavioral approach that helps counselors match counseling strategies to their assessment of where each client is in each stage of change, with the ultimate goal of helping clients make changes to health risk behaviors. (Connors, Donovan, & DiClemente, 2001).

- The 12-Step concept of powerlessness (Step 1) may seem unhelpful to trauma survivors for whom the emotional reaction to powerlessness is a major part of their trauma (particularly for victims of repetitive trauma, such as child abuse or intimate partner violence). It can be confusing and counterproductive to dwell on this concept of powerlessness regarding trauma when the therapeutic objective for trauma-informed counseling methods should be to help clients empower themselves. For people in recovery, powerlessness is a paradox, sometimes misunderstood by both counselors and clients, in that the acknowledgment of powerlessness often creates a sense of empowerment. Most clients, with support and respectful guidance from a counselor, will come to understand that powerlessness (as used in 12-Step programs) is not an inability to stand up for oneself or express a need, and it does not mean for one to be powerless in the face of abuse. With this understanding, clients may become more open to participating in 12-Step groups as a resource for their recovery from substance use disorders. When clients continue to struggle with this concept and decline to participate in 12-Step recovery efforts, they may benefit from referral to other forms of mutual-help programs or recovery support groups in which the concept of powerlessness over the substance of abuse is not such a significant issue.

  Training: The TSF model can help counselors develop a more supportive and understanding approach to facilitating clients' involvement in 12-Step recovery groups (if this is a client-generated recovery goal). "Although based on standard counseling models, TSF differs from them in several ways. These differences include TSF's strong emphasis on therapist support, discouragement of aggressive 'confrontation of denial' and therapist self-disclosure, and highly focused and structured format" (Sholomskas & Carroll, 2006, p. 939).

  Another well-intentioned, but often misguided, approach by counselors who have not had formal or extensive training is "digging" for trauma memories without a clear therapeutic rationale or understanding of client readiness. In doing so, the counselor may unintentionally retraumatize the client or produce other harmful effects. In early intervention, it is sufficient simply to acknowledge and validate the pain and suffering of the client without uncovering or exploring specific trauma memories. The counselor who is insufficiently trained in trauma-informed clinical

(Continued on the next page.)

Exhibit 2.2-1: Clinical Practice Issues Relevant to Counselor Training in Trauma-Informed Treatment Settings (continued)

practice may also press agendas that are ultimately unhelpful, such as insisting that the client forgive an abuser, pursue a legal case against a perpetrator, or engage in trauma treatment, even when the client may not be ready for such steps. These efforts are particularly inappropriate for clients in early recovery from substance use disorders. The first goal in treatment is stabilization

Training: The Seeking Safety model of treating substance abuse and posttraumatic stress disorder (PTSD) can help counselors focus on the primary goal of stabilization and safety in TIC. This model emphasizes safety as the target goal, humanistic themes such as honesty and compassion, and making cognitive–behavioral therapy accessible and interesting to clients who may otherwise be difficult to engage (Najavits, 2002a).

- Treatment should be client-centered; it should acknowledge the client's right to refuse counseling for trauma-related issues. It is important to discuss the advantages and disadvantages of exploring trauma-related concerns, and then, following an open discussion, to allow clients the right to choose their path. This discussion should be part of the informed consent process at the start of treatment. Clients also have the right to change their minds.

  Training: Motivational interviewing, a client-centered, nonpathologizing counseling method, can aid clients in resolving ambivalence about and committing to changing health risk behaviors including substance use, eating disorders, self-injury, avoidant and aggressive behaviors associated with PTSD, suicidality, and medication compliance (Arkowitz, Miller, Westra, & Rollnick, 2008; Kress & Hoffman, 2008). Training in MI can help counselors remain focused on the client's agenda for change, discuss the pros and cons of treatment options, and emphasize the personal choice and autonomy of clients.

In addition to the training needs of substance abuse counselors, all direct care workers in mental health settings, community-based programs, crisis intervention settings, and criminal justice environments should receive training in TIC. Guidelines for training in assisting trauma-exposed populations are presented in Exhibit 2.2-2.

Continuing Education

Research on the effectiveness of single-session didactic and/or skill-building workshops

Exhibit 2.2-2: Guidelines for Training in Mental Health Interventions for Trauma-Exposed Populations

After a year of collaboration in 2002, the Task Force on International Trauma Training of the International Society for Traumatic Stress Studies published a consensus-based set of recommendations for training. Core curricular elements of the recommended training include:

- Competence in listening.
- Recognition of psychosocial and mental problems to promote appropriate assessment.
- Familiarity with established interventions in the client population.
- Full understanding of the local context, including help-seeking expectations, duration of treatment, attitudes toward intervention, cost-effectiveness of intervention, and family attitudes and involvement.
- Strategies for solving problems on the individual, family, and community levels.
- Treatment approaches for medically unexplained somatic pain.
- Collaboration with existing local resources and change agents (e.g., clergy, traditional healers, informal leaders).
- Self-care components.

Source: Weine et al., 2002.

Advice to Administrators: Trauma-Informed Staff Training

- Establish training standards for the evidence-based and promising trauma-informed practice models (such as Seeking Safety) adopted by your organization.
- Bring expert trainers with well-developed curricula in TIC and trauma-specific practices into your organization.
- Select a core group of clinical supervisors and senior counselors to attend multisession training or certification programs. These clinicians can then train the rest of the staff.
- Use sequenced, longitudinal training experiences instead of single-session seminars or workshops.
- Emphasize interactive and experiential learning activities over purely didactic training.
- Provide ongoing mentoring/coaching to behavioral health professionals in addition to regular clinical supervision to enhance compliance with the principles and practices of TIC and to foster counselor mastery of trauma-specific practice models.
- Build organization-wide support for the ongoing integration of new attitudes and counselor skills to sustain constructive, TIC-consistent changes in practice patterns.
- Provide adequate and ongoing training for clinical supervisors in the theory and practice of clinical supervision and the principles and practices of TIC.
- Include information and interactive exercises on how counselors can identify, prevent, and ameliorate secondary traumatic stress (STS) reactions in staff trainings.
- Offer cross-training opportunities to enhance knowledge of trauma-informed processes throughout the system.

demonstrates that immediate gains in counselor knowledge and skills diminish quickly after the training event (Martino, Canning-Ball, Carroll, & Rounsaville, 2011). Consequently, organizations may be spending their scarce financial resources on sending counselors to this kind of training but may not be reaping adequate returns with regard to long-lasting changes in counselor skills and the development of trauma-informed and trauma-specific counselor competencies. Hoge et al. (2007) suggest the implementation of training strategies for behavioral health professionals that have proven to be effective in improving counselor skills, attitudes, and practice approaches. These strategies include: "interactive approaches; sequenced, longitudinal learning experiences; outreach visits, known as academic detailing; auditing of practice with feedback to the learner; reminders; the use of opinion leaders to influence practice; and patient-mediated interventions, such as providing information on treatment options to persons in recovery, which in turn influences the practice patterns of their providers" (p. 124).

Trauma-Informed Counselor Competencies

Hoge et al. (2007) identified a number of counselor competencies in behavioral health practices that are consistent with the skills needed to be effective in a trauma-informed system of care. They include person-centered planning, culturally competent care, development of therapeutic alliances, shared responsibility for decisions, collaboratively developed recovery plans, evidence-based practices, recovery- and resilience-oriented care, interdisciplinary- and team-based practice, and consumer/client advocacy. In addition, counselor competencies critical to the effective delivery of services to clients with trauma-related disorders include:

- Screening for and assessment of trauma history and trauma-related disorders, such as mood and anxiety disorders.
- Awareness of differences between trauma-informed and trauma-specific services.

- Understanding the bidirectional relationships among substance use and mental disorders and trauma.
- Engagement in person-centered counseling.
- Competence in delivering trauma-informed and trauma-specific evidence-based interventions that lessen the symptoms associated with trauma and improve quality of life for clients.
- Awareness of and commitment to counselor self-care practices that prevent or lessen the impact of secondary traumatization on behavioral health workers.

Exhibit 2.2-3 provides a checklist of competencies for counselors working in trauma-informed behavioral health settings. Administrators and clinical supervisors can use this checklist to assess behavioral health professionals' understanding of trauma awareness and counseling skills and determine the need for additional training and clinical supervision.

Counselor Responsibilities and Ethics

Treating all clients in an ethical manner is an expectation of all healthcare providers. It is of special importance when working with clients who have trauma-related disorders, as their trust in others may have been severely shaken. Counselors who work with traumatized individuals on a regular basis have special responsibilities to their clients because of the nature of this work. Administrators and clinical supervisors in trauma-informed organizations should develop policies that clearly define the counselors' job and should provide education about the role of counselors in the organization and their responsibilities to clients.

General Principles Regarding Counselor Responsibilities

The following are some general principles governing the responsibilities of counselors who provide behavioral health services for clients with histories of trauma:

- Counselors are responsible for routinely screening clients for traumatic experiences and trauma-related symptoms (Ouimette & Brown, 2003; see also Treatment Improvement Protocol [TIP] 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders*, Center for Substance Abuse Treatment [CSAT], 2005c).
- Counselors should offer clients with substance use and trauma-related disorders continuing mental health services if it is within their professional license and scope of practice to do so.
- Counselors are responsible for referring clients with substance use disorders and co-occurring trauma-related disorders to treatment that addresses both disorders when the treatment falls outside of the counselor's professional license and scope of practice (Ouimette & Brown, 2003).
- Counselors should refer clients with substance use disorders and co-occurring trauma-related disorders to concurrent participation in mutual-help groups if appropriate (Ouimette & Brown, 2003).
- Counselors have a responsibility to practice the principles of confidentiality in all interactions with clients and to respect clients' wishes not to give up their right to privileged communication.
- Counselors are responsible for educating clients about the limits of confidentiality and what happens to protected health information, along with the client's privilege, when the client signs a release of information or agrees to assign insurance benefits to the provider.
- Counselors must inform clients that treatment for trauma-related disorders is always voluntary.
- Counselors are responsible for being aware of their own secondary trauma and

Exhibit 2.2-3: Trauma-Informed Counselor Competencies Checklist

Trauma Awareness

___ Understands the difference between trauma-informed and trauma-specific services

___ Understands the differences among various kinds of abuse and trauma, including: physical, emotional, and sexual abuse; domestic violence; experiences of war for both combat veterans and survivors of war; natural disasters; and community violence

___ Understands the different effects that various kinds of trauma have on human development and the development of psychological and substance use issues

___ Understands how protective factors, such as strong emotional connections to safe and nonjudgmental people and individual resilience, can prevent and ameliorate the negative impact trauma has on both human development and the development of psychological and substance use issues

___ Understands the importance of ensuring the physical and emotional safety of clients

___ Understands the importance of not engaging in behaviors, such as confrontation of substance use or other seemingly unhealthy client behaviors, that might activate trauma symptoms or acute stress reactions

___ Demonstrates knowledge of how trauma affects diverse people throughout their lifespans and with different mental health problems, cognitive and physical disabilities, and substance use issues

___ Demonstrates knowledge of the impact of trauma on diverse cultures with regard to the meanings various cultures attach to trauma and the attitudes they have regarding behavioral health treatment

___ Demonstrates knowledge of the variety of ways clients express stress reactions both behaviorally (e.g., avoidance, aggression, passivity) and psychologically/emotionally (e.g., hyperarousal, avoidance, intrusive memories)

Counseling Skills

___ Expedites client-directed choice and demonstrates a willingness to work within a mutually empowering (as opposed to a hierarchical) power structure in the therapeutic relationship

___ Maintains clarity of roles and boundaries in the therapeutic relationship

___ Demonstrates competence in screening and assessment of trauma history (within the bounds of his or her licensing and scope of practice), including knowledge of and practice with specific screening tools

___ Shows competence in screening and assessment of substance use disorders (within the bounds of his or her licensing and scope of practice), including knowledge of and practice with specific screening tools

___ Demonstrates an ability to identify clients' strengths, coping resources, and resilience

___ Facilitates collaborative treatment and recovery planning with an emphasis on personal choice and a focus on clients' goals and knowledge of what has previously worked for them

___ Respects clients' ways of managing stress reactions while supporting and facilitating taking risks to acquire different coping skills that are consistent with clients' values and preferred identity and way of being in the world

___ Demonstrates knowledge and skill in general trauma-informed counseling strategies, including, but not limited to, grounding techniques that manage dissociative experiences, cognitive–behavioral tools that focus on both anxiety reduction and distress tolerance, and stress management and relaxation tools that reduce hyperarousal

(Continued on the next page.)

Exhibit 2.2-3: Trauma-Informed Counselor Competencies Checklist (continued)

___ Identifies signs of STS reactions and takes steps to engage in appropriate self-care activities that lessen the impact of these reactions on clinical work with clients

___ Recognizes when the needs of clients are beyond his or her scope of practice and/or when clients' trauma material activates persistent secondary trauma or countertransference reactions that cannot be resolved in clinical supervision; makes appropriate referrals to other behavioral health professionals

Source: Abrahams et al., 2010.

countertransference reactions and seeking appropriate help in responding to these reactions so that they do not interfere with the best possible treatment for clients.

TIC organizations have responsibilities to clients in their care, including:

- Protecting client confidentiality, particularly in relation to clients' trauma histories. Organizations should comply with the State and Federal laws that protect the confidentiality of clients being treated for mental and substance use disorders.
- Providing clients with an easy-to-read statement of their rights as consumers of mental health and substance abuse services, including the right to confidentiality (Exhibit 2.2-4).
- Providing quality clinical supervision to all counselors and direct-service workers, with an emphasis on TIC. Organizations should, at minimum, comply with State licensing requirements for the provision of clinical supervision to behavioral health workers.
- Establishing and maintaining appropriate guidelines and boundaries for client and counselor behavior in the program setting.
- Creating and maintaining a trauma-informed treatment environment that respects the clients' right to self-determination and need to be treated with dignity and respect.
- Maintaining a work environment that reinforces and supports counselor self-care.

All behavioral health professionals are responsible for abiding by professional standards of care that protect the client. Breaches of confidentiality, inappropriate conduct, and other violations of trust can do further harm to clients who already have histories of trauma. Many treatment facilities have a Client Bill of Rights (or a similar document) that describes the rights and responsibilities of both the counselors and the participants; it often is part of the orientation and informed consent process when a client enters treatment. However, simply reading and acknowledging the receipt of a piece of paper is not a substitute for the dialog that needs to happen in a collaborative therapeutic partnership. Administrators are responsible for providing clients with easy-to-read information describing counselor responsibilities and client rights. Clinical supervisors are responsible for helping counselors engage in a respectful dialog with clients about those rights and responsibilities as part of a comprehensive informed consent process.

Exhibit 2.2-4 is an excerpt from a Client Bill of Rights that outlines clients' right to confidentiality in plain language that is readable and easily understood.

Exhibit 2.2-4: Sample Statement of the Client's Right to Confidentiality From a Client Bill of Rights

Tri-County Mental Health Services is a trauma-informed mental health and substance abuse treatment agency in Maine. Below is a statement regarding clients' right to confidentiality and staff responsibility to protect that privilege; this statement is provided in a brochure outlining consumer rights that is easily accessible to service recipients at the agency and online.

Confidentiality

We will not give out information about you to anyone without your knowledge and permission. This includes written information from your record and verbal information from your providers. Additionally, we will not request any information about you without your knowledge and permission. A Release of Information Form allows you to say what information can be shared and with whom. You determine the length of time this is valid, up to one year.

Tri-County policies prevent any employee of the agency who does not have a direct need to know from having access to any information about you. The penalty for violation can include immediate dismissal.

Exceptions to this rule of confidentiality include times when a client is at immediate risk of harm to self or others, or when ordered by the court. We will make every effort to notify you in these instances.

Source: Tri-County Mental Health Services, 2008, pp. 6-7.

Ethics in Treating Traumatized Clients

All behavioral health professionals must conform to the ethical guidelines established by their profession's State licensing boards and/or certifying organizations. State licensing boards for substance abuse counseling, psychiatry, social work, psychology, professional counseling, and other behavioral health professions provide regulatory standards for ethical practice in these professions. These boards also have specific procedures for responding to complaints regarding the actions of professional caregivers. Additionally, national professional societies have standards for ethical practices. Members of these organizations are expected to practice within the boundaries and scope of these standards. Some of these standards are quite explicit, whereas others are more general; most approach professional ethics not as a rigid set of rules, but rather, as a process of making ethical decisions.

Clinical supervisors are responsible for informing counselors of their ethical responsibilities with regard to their own organization's policies and procedures, monitoring supervisees' reading and understanding the codes of ethics of professional organizations and State licensing boards, and promoting counselor understanding of ethics and how to make decisions ethically as a regular part of clinical supervision, team meetings, and counselor training. Administrators can support high ethical standards by creating an organization-wide ethics task group consisting of counselors, supervisors, and administrators who meet regularly to review and revise clinical policies in line with State and Federal law and professional codes of ethics. Administrators may also act as a support mechanism for counselors who need additional consultation regarding potential ethical dilemmas with clients. The Green Cross Academy of Traumatology provides ethical guidelines for the treatment of clients who have experienced trauma; these guidelines are adapted in Exhibit 2.2-5.

Exhibit 2.2-5: Green Cross Academy of Traumatology Ethical Guidelines for the Treatment of Clients Who Have Been Traumatized

Respect for the dignity of clients

- Recognize and value the personal, social, spiritual, and cultural diversity present in society, without judgment. As a primary ethical commitment, make every effort to provide interventions with respect for the dignity of those served.

Responsible caring

- Take the utmost care to ensure that interventions do no harm.
- Have a commitment to the care of those served until the need for care ends or the responsibility for care is accepted by another qualified service provider.
- Support colleagues in their work and respond promptly to their requests for help.
- Recognize that service to survivors of trauma can exact a toll in stress on providers. Maintain vigilance for signs in self and colleagues of such stress effects, and accept that dedication to the service of others imposes an obligation to sufficient self-care to prevent impaired functioning.
- Engage in continuing education in the appropriate areas of trauma response. Remain current in the field and ensure that interventions meet current standards of care.

Integrity in relationships

- Clearly and accurately represent your training, competence, and credentials. Limit your practice to methods and problems for which you are appropriately trained and qualified. Readily refer to or consult with colleagues who have appropriate expertise; support requests for such referrals or consultations from clients.
- Maintain a commitment to confidentiality, ensuring that the rights of confidentiality and privacy are maintained for all clients.
- Do not provide professional services to people with whom you already have either emotional ties or extraneous relationships of responsibility. The one exception is in the event of an emergency in which no other qualified person is available.
- Refrain from entering other relationships with present or former clients, especially sexual relationships or relationships that normally entail accountability.
- Within agencies, ensure that confidentiality is consistent with organizational policies; explicitly inform individuals of the legal limits of confidentiality.

Responsibility to society

- Be committed to responding to the needs generated by traumatic events, not only at the individual level, but also at the level of community and community organizations in ways that are consistent with your qualifications, training, and competence.
- Recognize that professions exist by virtue of societal charters in expectation of their functioning as socially valuable resources. Seek to educate government agencies and consumer groups about your expertise, services, and standards; support efforts by these agencies and groups to ensure social benefit and consumer protection.
- If you become aware of activities of colleagues that may indicate ethical violations or impairment of functioning, seek first to resolve the matter through direct expression of concern and offers of help to those colleagues. Failing a satisfactory resolution in this manner, bring the matter to the attention of the officers of professional societies and of governments with jurisdiction over professional misconduct.

Clients' universal rights

All clients have the right to:

- Not be judged for any behaviors they used to cope, either at the time of the trauma or after the trauma.
- Be treated at all times with respect, dignity, and concern for their well-being.
- Refuse treatment, unless failure to receive treatment places them at risk of harm to self or others.

(Continued on the next page.)

Exhibit 2.2-5: Academy of Traumatology Ethical Guidelines for the Treatment of Clients Who Have Been Traumatized (continued)

- Be regarded as collaborators in their own treatment plans.
- Provide their informed consent before receiving any treatment.
- Not be discriminated against based on race, culture, sex, religion, sexual orientation, socioeconomic status, disability, or age.
- Have promises kept, particularly regarding issues related to the treatment contract, role of counselor, and program rules and expectations.

Procedures for introducing clients to treatment

Obtain informed consent, providing clients with information on what they can expect while receiving professional services. In addition to general information provided to all new clients, clients presenting for treatment who have histories of trauma should also receive information on:

- The possible short-term and long-term effects of trauma treatment on the client and the client's relationships with others.
- The amount of distress typically experienced with any particular trauma treatment.
- Possible negative effects of a particular trauma treatment.
- The possibility of lapses and relapses when doing trauma work, and the fact that these are a normal and expected part of healing.

Reaching counseling goals through consensus

Collaborate with clients in the design of a clearly defined contract that articulates a specific goal in a specific time period or a contract that allows for a more open-ended process with periodic evaluations of progress and goals.

Informing clients about the healing process

- Clearly explain to clients the nature of the healing process, making sure clients understand.
- Encourage clients to ask questions about any and all aspects of treatment and the therapeutic relationship. Provide clients with answers in a manner they can understand.
- Encourage clients to inform you if the material discussed becomes overwhelming or intolerable.
- Inform clients of the necessity of contacting you or emergency services if they feel suicidal or homicidal, are at risk of self-injury, or have a sense of being out of touch with reality.
- Give clients written contact information about available crisis or emergency services.
- Inform clients about what constitutes growth and recovery and about the fact that some trauma symptoms may not be fully treatable.
- Address unrealistic expectations clients may have about counseling and/or the recovery process.

Level of functioning

- Inform clients that they may not be able to function at the highest level of their ability—or even at their usual level—when working with traumatic material.
- Prepare clients to experience trauma-related symptoms, such as intrusive memories, dissociative reactions, reexperiencing, avoidance behaviors, hypervigilance, or unusual emotional reactivity.

Boundaries in therapeutic relationships

Maintaining appropriate therapeutic boundaries is a primary ethical concern for behavioral health professionals. Counselors working with clients who have substance use, trauma-related, and other mental disorders may feel challenged at times to maintain boundaries that create a safe therapeutic container. Some clients, especially those with longstanding disorders, bring a history of client–counselor relationships to counseling. Clients who have been traumatized may need help understanding the roles and responsibilities of both the counselor and the client. Clients with trauma-related conditions may also have special needs

Advice to Clinical Supervisors: Recognizing Boundary Confusion

Clinical supervisors should be aware of the following counselor behaviors that can indicate boundary confusion with clients:

- The counselor feels reluctant or embarrassed to discuss specific interactions with a client or details of the client's treatment in supervision or team meetings.
- The counselor feels possessive of the client, advocates with unusual and excessive vehemence for the client, or expresses an unreasonable sense of overresponsibility for the client.
- The counselor becomes defensive and closed to hearing ideas from the supervisor or the treatment team members about approaches to working with a client and/or exploring his or her own emotional reactions to a client.
- The clinician begins or increases personal self-disclosure to the client and is not able to identify legitimate clinical reasons for the self-disclosure.

in establishing appropriate boundaries in the counseling setting; they may be particularly vulnerable and not understand or appreciate the need for professional boundaries, including not engaging in dual relationships. For example, some clients might experience a counselor's boundary around not giving the client his or her personal phone number for emergency calls as a rejection or abandonment. Cultural considerations also influence therapeutic boundaries.

Administrators, in collaboration with clinical supervisors, are responsible for creating policies regarding counselor and client boundaries for various issues (e.g., giving and receiving gifts, counselor personal disclosure, and counselor roles and responsibilities when attending the same 12-Step meetings as clients); policies should be specific to their organization and conform to State and Federal law and behavioral health professional codes of ethics. Clinical supervisors are responsible for training counselors in the informed consent process and effective ways to discuss boundaries with clients when they enter treatment.

Guidelines for establishing and maintaining boundaries in therapeutic relationships, adapted from the Green Cross Academy of Traumatology, are given in Exhibit 2.2-6.

Clients with trauma histories may be especially vulnerable to counselor behaviors that are inconsistent or that are experienced by the client as boundary violations. Examples of such behavior include: being late for appointments, ending counseling sessions early, repeatedly and excessively extending the session time, canceling or "forgetting" appointments multiple times, spending time in the session talking about their own needs and life experiences, exploring opportunities for contact outside the therapeutic relationship (including making arrangements to meet at AA or other 12-Step recovery group meetings), and enforcing rules differently for one client than for another.

Due to the complex dynamics that can arise in the treatment of clients with trauma histories, regularly scheduled clinical supervision, where issues of ethics and boundaries can be discussed, is recommended for counselors. For more information on how clinical supervision can be effectively used, see TIP 52, *Clinical Supervision and the Professional Development of the Substance Abuse Counselor* (CSAT, 2009b).

Boundary crossing and boundary violation

Although guidelines and codes of ethics are useful tools in helping clinical supervisors and counselors understand the boundaries between counselors and clients, they are open to interpretation and are context-bound. Given these limitations, it is crucial to educate counselors

Exhibit 2.2-6: Boundaries in Therapeutic Relationships

Procedures for Establishing Safety

Roles and boundaries
Counselor roles and boundaries should be established at the start of the counseling relationship and reinforced periodically, particularly at times when the client is experiencing high stress.

Ongoing Relationships and the Issue of Boundaries

Dual relationships
Dual relationships and inappropriate interactions with clients are to be avoided. It is important to tell clients at the beginning of counseling that contact between the counselor and the client can only occur within the boundaries of the professional relationship. This information is part of the informed consent process. Relationships outside these boundaries include sexual or romantic relationships, a counselor also serving as a client's sponsor in 12-Step programs, and any kind of relationship in which the counselor exploits the client for financial gain.

Sexual contact
- Never engage in any form of sexual contact with clients.
- Do not reward sexualized behaviors with attention or reactivity.
- Directly clarify the boundaries of the therapeutic relationship, and address the underlying motivations of persisting sexualized behavior.
- Set limits on a client's inappropriate behaviors while maintaining an ethos of care. Maintain respect for the dignity and worth of the client at all times.
- Understand that a client's attempt to sexualize a therapeutic relationship may reflect an early history of abuse, difficulty understanding social norms, or a variety of psychological problems.
- Readdress the absolute inappropriateness of sexual and/or romantic behavior in a nonlecturing, nonpunitive manner.
- If sexual behavior between clients occurs in a treatment program, counselors should consult with a clinical supervisor. Document the nature of the contact and how the issue is addressed.
- If a counselor has sexual contact with a client, he or she should take responsibility by ceasing counseling practice, referring clients to other treatment providers, and notifying legal and professional authorities. If a counselor is at risk for engaging with a client sexually but has not acted on it, the counselor should immediately consult with a supervisor, colleague, or psychotherapist.

Boundaries
Counselors should use care with self-disclosure or any behaviors that may be experienced as intrusive by the client, including:
- Personal disclosures made for the counselor's own gratification.
- Sexualized behavior with the client.
- Excessively intrusive questions or statements.
- Interrupting the client frequently.
- Violating the client's personal space.
- Interpersonal touch, which might activate intrusive memories or dissociative reactions or be experienced as a boundary violation by the client.
- Being consistently late for appointments or allowing outside influences (such as telephone calls) to interrupt the client's time in a counseling session.

Source: Green Cross Academy of Traumatology, 2007. Adapted with permission.

in TIC settings regarding the boundary issues that may arise for clients who have been traumatized and to give counselors a conceptual framework for understanding the contextual nature of boundaries. For example, it would be useful for clinical supervisors to discuss with

counselors the distinction between boundary crossings and boundary violations in clinical practice. Gutheil and Brodsky (2008) define boundary crossing as a departure from the customary norms of counseling practice in relation to psychological, physical, or social space "that are harmless, are nonexploitative, and may even support or advance the therapy" (p. 20). Examples of boundary crossings include taking phone calls from a client between sessions if the client is in crisis or telling a client a story about the counselor's recovery from trauma (without offering specific personal information or graphic/detailed description of the trauma) with the intention of offering hope that it is possible to recover.

Gutheil and Brodsky (2008) define boundary violations as boundary crossings that are unwanted and dangerous and which exploit the client, stating that "some boundary crossings are inadvisable because of their intent (i.e., they are not done in the service of the patient's well-being and growth, involve extra therapeutic gratification for the therapist) and/or their effect (i.e., they are not likely to benefit the patient and entail a significant risk of harming the patient)" (pp. 20–21). An example of a boundary violation would be when a counselor invites a client to attend the same AA meetings the counselor attends or shares drinking and drugging "war stories" for the counselor's own gratification. Two key elements in understanding when a boundary crossing becomes a boundary violation are the intent of the counselor and the damaging effect on the client. Maintaining a standard of practice of nonexploitation of the client is the primary focus for clinical supervisors and counselors in determining when boundary crossings become boundary violations.

Context is also an important consideration in determining the acceptability of boundary crossings. For example, it may be acceptable for a counselor in a partial hospitalization program for serious mental illness to have a cup of coffee at the kitchen table with a resident, whereas for a counselor in an outpatient mental health program, having a cup of coffee with a client at the local coffee shop would be a much more questionable boundary crossing.

Case Illustration: Denise

Denise is a 40-year-old licensed professional counselor working in an inpatient eating disorder program. She has had extensive training in trauma and eating disorder counseling approaches and has been working as a clinician in mental health settings for 15 years. Denise is usually open to suggestions from her supervisor and other treatment team members about specific strategies to use with clients who have trauma histories and eating disorders. However, in the past week, her supervisor has noticed that she has become defensive in team meetings and individual supervision when discussing a recently admitted young adult who was beaten and raped by her boyfriend; subsequently, the client was diagnosed with PTSD and anorexia. When the clinical supervisor makes note of the change in Denise's attitude and behavior in team meetings since this young woman was admitted, initially Denise becomes defensive, saying that the team just doesn't understand this young woman and that the client has repeatedly told Denise, "You're the only counselor I trust."

The clinical supervisor recognizes that Denise may be experiencing secondary traumatization and boundary confusion due to working with this young woman and to the recent increase in the number of clients with co-occurring trauma-related disorders on her caseload. After further exploration, Denise reveals that her own daughter was raped at the same age as the young woman and that hearing her story has activated an STS reaction in Denise. Her way of coping has been to become overly responsible for and overprotective of the young woman. With the nonjudgmental support of her supervisor, Denise is able to gain perspective, recognize that this young woman is not her daughter, and reestablish boundaries with her that are appropriate to the inpatient treatment setting.

Clinical Supervision and Consultation

Organizational change toward a TIC model doesn't happen in isolation. Ongoing support, supervision, and consultation are key ingredients that reinforce behavioral health professionals' training in trauma-informed and trauma-specific counseling methods and ensure compliance with practice standards and consistency over time. Often, considerable energy and resources are spent on the transition to new clinical and programmatic approaches, but without long-range planning to support those changes over time. The new treatment approach fades quickly, making it hard to recognize and lessening its reliability.

Advice to Clinical Supervisors and Administrators: Adopting an Evidence-Based Model of Clinical Supervision and Training

Just as adopting evidence-based clinical practices in a trauma-informed organization is important in providing cost-effective and outcome-relevant services to clients, adopting an evidence-based model of clinical supervision and training clinical supervisors in that model can enhance the quality and effectiveness of clinical supervision for counselors. This will ultimately enhance client care.

One of the most commonly used and researched integrative models of supervision is the discrimination model, originally published by Janine Bernard in 1979 and since updated (Bernard & Goodyear, 2009). This model is considered a competence-based and social role model of supervision; it includes three areas of focus on counselor competencies (intervention, conceptualization, and personalization) and three possible supervisor roles (teacher, counselor, and consultant).

Counselor competencies:

- Intervention: The supervisor focuses on the supervisee's intervention skills and counseling strategies used with a particular client in a given session.
- Conceptualization: The supervisor focuses on how the supervisee understands what is happening in a session with the client.
- Personalization: The supervisor focuses on the personal style of the counselor and countertransference responses (i.e., personal reactions) of the counselor to the client.

Supervisor roles:

- Teacher: The supervisor teaches the supervisee specific counseling theory and skills and guides the supervisee in the use of specific counseling strategies in sessions with clients. The supervisor as teacher is generally task-oriented. The supervisor is more likely to act as a teacher with beginning counselors.
- Counselor: The supervisor does not act as the counselor's therapist, but helps the counselor reflect on his or her counseling style and personal reactions to specific clients. The supervisor as counselor is interpersonally sensitive and focuses on the process and relational aspects of counseling.
- Consultant: The supervisor is more of a guide, offering the supervisee advice on specific clinical situations. The supervisor as consultant invites the counselor to identify topics and set the agenda for the supervision. The supervisor is more likely to act as a consultant with more advanced counselors.

This model of supervision may be particularly useful in working with counselors in TIC settings, because the supervisor's response to the supervisee is flexible and specific to the supervisee's needs. In essence, it is a counselor-centered model of supervision in which the supervisor can meet the most relevant needs of the supervisee in any given moment.

For a review of other theories and methods of clinical supervision, refer to TIP 52, *Clinical Supervision and Professional Development of the Substance Abuse Counselor* (CSAT, 2009b).

Ongoing supervision and consultation supports the organizational message that TIC is the standard of practice. It normalizes secondary traumatization as a systemic issue (not the individual pathology of the counselor) and reinforces the need for counselor self-care to prevent and lessen the impact of secondary traumatization. Quality clinical supervision for direct care staff demonstrates the organization's commitment to implementing a fully integrated, trauma-informed system of care.

Supervision and Consultation

Historically, there was an administrative belief that counselors who had extensive clinical experience and training would naturally be the best clinical supervisors. However, research does not support this idea (Falender & Shafranske, 2004). Although a competent clinical supervisor needs to have an extensive clinical background in the treatment of substance use, trauma-related, and other mental disorders, it is also essential for any counselor moving into a supervisory role to have extensive training in the theory and practice of clinical supervision before taking on this role. In particular, clinical supervisors in trauma-informed behavioral health settings should be educated in how to perform clinical supervision (not just administrative supervision) of direct service staff and in the importance of providing continuous clinical supervision and support for staff members working with individuals affected by trauma. Clinical

Case Illustration: Arlene

Arlene is a 50-year-old licensed substance abuse counselor who has a personal history of trauma, and she is actively engaged in her own recovery from trauma. She is an experienced counselor who has several years of training in trauma-informed and trauma-specific counseling practices. Her clinical supervisor, acting in the role of consultant, begins the supervision session by inviting her to set the agenda. Arlene brings up a clinical situation in which she feels stuck with a client who is acting out in her Seeking Safety group (for more information on Seeking Safety, see Najavits, 2002a).

Arlene reports that her client gets up suddenly and storms out of the group room two or three times during the session. The supervisor, acting in the role of the counselor and focusing on personalization, asks Arlene to reflect on the client's behavior and what feelings are activated in her in response to the client's anger. Arlene is able to identify her own experience of hyperarousal and then paralysis as a stress reaction related to her prior experience of domestic violence in her first marriage. The supervisor, acting in the role of teacher and focusing on conceptualization, reminds Arlene that her client is experiencing a "fight-or-flight" response to some experience in the group that reminds her of her own trauma experience. The supervisor then suggests to Arlene that her own reactions are normal responses to her previous history of trauma, and that when her client is angry, Arlene is not reexperiencing her own trauma but is being activated by the client's traumatic stress reaction to being in group. In this way, the supervisor highlights the parallel process of the client–counselor's stress reactions to a perceived threat based on prior trauma experiences.

The supervisor, acting again as a consultant and focusing on personalization this time, invites Arlene to reflect on the internal and external resources she might be able to bring to this situation that will help remind her to ground herself so she can lessen the impact of her stress reactions on her counseling strategy with this client. Arlene states that she can create a list of safe people in her life and place this list in her pocket before group. She can use this list as a touchstone to remind her that she is safe and has learned many recovery skills that can help her stay grounded, maintain her boundaries, and deal with her client's behavior. The clinical supervisor, acting as a consultant and now focusing on intervention, asks Arlene if she has some specific ideas about how she can address the client's behavior in group. Arlene and the clinical supervisor spend the remainder of the session discussing different options for addressing the client's behavior and helping her feel safer in group.

supervision in a TIC organization should focus on the following priorities:

- General case consultation
- Specialized consultation in specific and unusual cases
- Opportunities to process clients' traumatic material
- Boundaries in the therapeutic and supervisory relationship
- Assessment of secondary traumatization
- Counselor self-care and stress management
- Personal growth and professional development of the counselor

Supervision of counselors working with traumatized clients should be regularly scheduled, with identified goals and with a supervisor who is trained and experienced in working with trauma survivors. The styles and types of supervision and consultation may vary according to the kind of trauma work and its context. For instance, trauma counseling in a major natural disaster would require a different approach to supervision and consultation than would counseling adults who experienced childhood developmental trauma or counseling clients in an intensive early recovery treatment program using a manualized trauma-specific counseling protocol.

Competence-based clinical supervision is recommended for trauma-informed organizations. Competence-based clinical supervision models identify the knowledge and clinical skills each counselor needs to master, and they use targeted learning strategies and evaluation procedures, such as direct observation of counselor sessions with clients, individualized coaching, and performance-based feedback. Studies on competence-based supervision approaches have demonstrated that these models improve counselor treatment skills and proficiency (Martino et al., 2011).

Whichever model of clinical supervision an organization adopts, the key to successful trauma-informed clinical supervision is the recognition that interactions between the supervisor and the counselor may parallel those between the counselor and the client. Clinical supervisors need to recognize counselors' trauma reactions (whether they are primary or secondary to the work with survivors of trauma) and understand that a confrontational or punitive approach will be ineffective and likely retraumatize counselors.

Clinical supervisors should adopt a respectful and collaborative working relationship with counselors in which role expectations are clearly defined in an informed consent process similar to that used in the beginning of the counselor–client relationship and in which exploring the nature of boundaries in both client–counselor and counselor–supervisor relationships is standard practice. Clear role boundaries, performance expectations, open dialog, and supervisor transparency can go a long way toward creating a safe and respectful relationship container for the supervisor and supervisee and set the stage for a mutually enhancing, collaborative relationship. This respectful, collaborative supervisory relationship is the main source of training and professional growth for the counselor and for the provision of quality care to people with behavioral health disorders.

Secondary Traumatization

The demands of caregiving exact a price from behavioral health professionals that cannot be ignored; otherwise, they may become ineffective in their jobs or, worse, emotionally or psychologically impaired. In a study of Master's level licensed social workers, 15.2 percent of respondents to a survey reported STS as a result of indirect exposure to trauma material at a level that meets the diagnostic criteria for PTSD. This rate is almost twice the rate of PTSD in the general population. The author

STS is a trauma related stress reaction and set of symptoms resulting from exposure to another individual's traumatic experiences rather than from exposure directly to a traumatic event.

concluded that behavioral health professionals' experience of STS is a contributing factor in staff turnover and one reason why many behavioral health service professionals leave the field (Bride, 2007). Secondary traumatization of behavioral health workers is a significant organizational issue for clinical supervisors and administrators in substance abuse and mental health treatment programs to address.

To prevent or lessen the impact of secondary traumatization on behavioral health professionals, clinical supervisors and administrators need to understand secondary trauma from the ecological perspective described in Part 1, Chapter 1 of this TIP. The organization itself creates a social context with risk factors that can increase the likelihood of counselors experiencing STS reactions, but it also contains protective factors that can lessen the risk and impact of STS reactions on staff members. Organizations can lessen the impact of the risk factors associated with working in trauma-informed organizations by mixing caseloads to contain clients both with and without trauma-related issues, supporting ongoing counselor training, providing regular clinical supervision, recognizing counselors' efforts, and offering an empowering work environment in which counselors share in the responsibility of making decisions and can offer input into clinical and program policies that affect their work lives.

When organizations support their counselors in their work with clients who are traumatized, counselors can be more effective, more productive, and feel greater personal and professional satisfaction. In addition, counselors develop a sense of allegiance toward the organization, thus decreasing staff turnover. If organizations do not provide this support, counselors can become demoralized and have fewer emotional and psychological resources to manage the impact of clients' traumatic material and outward behavioral expressions of trauma on their own well-being. Providing counselors with the resources to help them build resilience and prevent feeling overwhelmed should be a high priority for administrators and clinical supervisors in TIC organizations.

Risk and Protective Factors Associated With Secondary Traumatization

Clinical and research literature on trauma describes a number of factors related to the development of secondary trauma reactions and psychological distress in behavioral health professionals across a wide range of practice settings, as well as individual and organizational factors that can prevent or lessen the impact of STS on staff. The risk and protective factors model of understanding secondary trauma is based on the ecological perspective

Advice to Clinical Supervisors: Recognizing Secondary Traumatization

Some counselor behaviors that demonstrate inconsistency to clients may be outward manifestations of secondary traumatization, and they should be discussed with counselors through a trauma-informed lens. It is imperative that clinical supervisors provide a nonjudgmental, safe context in which counselors can discuss these behaviors without fear of reprisal or reprimand. Clinical supervisors should work collaboratively with supervisees to help them understand their behavior and engage in self-care activities that lessen the stress that may be contributing to these behaviors.

outlined in Part 1, Chapter 1 of this TIP. The terms "compassion fatigue," "vicarious traumatization," "secondary traumatization," and "burnout" are used in the literature, sometimes interchangeably and sometimes as distinct constructs. As stated in the terminology portion of the "How This TIP Is Organized" section that precedes Part 1, Chapter 1, of this TIP, the term "secondary traumatization" refers to traumatic stress reactions and psychological distress from exposure to another individual's traumatic experiences; this term will be used throughout this section, although the studies cited may use other terms.

Risk factors

Individual risk factors that may contribute to the development of STS in behavioral health professionals include preexisting anxiety or mood disorders; a prior history of personal trauma; high caseloads of clients with trauma-related disorders; being younger in age and new to the field with little clinical experience or training in treating trauma-related conditions; unhealthy coping styles, including distancing and detachment from clients and co-workers; and a lack of tolerance for strong emotions (Newall & MacNeil, 2010). Other negative coping strategies include substance abuse, other addictive behaviors, a lack of recreational activities not related to work, and a lack of engagement with social support. A recent study of trauma nurses found that low use of support systems, use of substances, and a lack of hobbies were among the coping strategies that differed between nurses with and without STS (Von Rueden et al., 2010). Other researchers found that clinicians who engaged in negative coping strategies, such as alcohol and illicit drug use, were more likely to experience intrusive trauma symptoms (Way, Van Deusen, Martin, Applegate, & Janle, 2004).

Numerous organizational factors can contribute to the development of STS in counselors who work with clients with trauma-related disorders. These risk factors include organizational constraints, such as lack of resources for clients, lack of clinical supervision for counselors, lack of support from colleagues, and lack of acknowledgment by the organizational culture that secondary traumatization exists and is a normal reaction of counselors to client trauma (Newall & MacNeil, 2010). In a study of 259 individuals providing mental health counseling services, counselors who spent more time in session with clients with trauma-related disorders reported higher levels of traumatic stress symptoms (Bober & Regehr, 2006). Counselors may be more at risk for developing secondary traumatization if the organization does not allow for balancing the distribution of trauma and nontrauma cases amongst staff members.

Protective factors

Much of the clinical and research literature focuses on individual factors that may lessen the impact of STS on behavioral health professionals, including male gender, being older, having more years of professional experience,

Advice to Clinical Supervisors: Recognizing STS in Counselors Who Are In Recovery

For counselors who are in recovery from a substance use or mental disorder, the development of STS may be a potential relapse concern. As Burke, Carruth, and Prichard (2006) point out, "a return to drinking or illicit drug use as a strategy for dealing with secondary trauma reactions would have a profoundly detrimental effect on the recovering counselor" (p. 292). So too, secondary trauma may ignite the reappearance of depressive or anxiety symptoms associated with a previous mental disorder. Clinical supervisors can address these risk factors with counselors and support them in engaging with their own recovery support network (which might include a peer support group or an individual counselor) to develop a relapse prevention plan.

having specialized training in trauma-informed and trauma-specific counseling practices, lacking a personal trauma history, exhibiting personal autonomy in the workplace, using positive personal coping styles, and possessing resilience or the ability to find meaning in stressful life events and to rebound from adversity (Sprang, Clark, & Whitt-Woosley, 2007). Some of these factors, like positive personal coping styles and the ability to find meaning in adversity, can be developed and enhanced through personal growth work, psychotherapy, engagement with spiritual practices and involvement in the spiritual community, and stress reduction strategies like mindfulness meditation. A recent multimethod study of an 8-week workplace mindfulness training group for social workers and other social service workers found that mindfulness meditation increased coping strategies, reduced stress, and enhanced self-care of the participants; findings suggested that workers were more likely to practice stress management techniques like mindfulness at their place of work than at home (McGarrigle & Walsh, 2011). Organizations can support counselors' individual efforts to enhance positive personal coping styles, find meaning in adversity, and reduce stress by providing time for workers during the workday for personal self-care activities, like mindfulness meditation and other stress reduction practices.

One of the organizational protective factors identified in the literature that may lessen the negative impact of secondary traumatization on behavioral health professionals is providing adequate training in trauma-specific counseling strategies, which increases providers' sense of efficacy in helping clients with trauma-related disorders and reduces the sense of hopelessness that is often a part of the work (Bober & Regehr 2006). One study found that specialized trauma training enhanced job satisfaction and reduced levels of compassion fatigue, suggesting that "knowledge and training might provide some protection against the deleterious effects of trauma exposure" (Sprang et al., 2007, p. 272). Another protective factor that may lessen the chances of developing secondary traumatization is having a diverse caseload of clients. Organizations "must determine ways of distributing workload in order to limit the traumatic exposure of any one worker. This may not only serve to reduce the impact of immediate symptoms but may also address the potential longitudinal effects" (Bober & Regehr, 2006, p. 8).

Emotional support from professional colleagues can be a protective factor. A study of substance abuse counselors working with clients who were HIV positive found that workplace support from colleagues and supervisors most effectively prevented burnout (Shoptaw, Stein, & Rawson, 2000). This support was associated with less emotional fatigue and depersonalization, along with a sense of greater personal accomplishment. In a study of domestic violence advocates, workers who received more support from professional peers were less likely to experience secondary traumatization (Slattery & Goodman, 2009).

In addition, counselor engagement in relationally based clinical supervision with a trauma-informed supervisor acts as a protective agent. Slattery and Goodman (2009) note that "for the trauma worker, good supervision can normalize the feelings and experiences, provide support and information about the nature and course of the traumatic reaction, help in the identification of transference and countertransference issues, and reveal feelings or symptoms associated with the trauma" (p. 1362). Workers who reported "engaging, authentic, and empowering relationships with their supervisors" were less likely to experience STS (p. 1369). Thus, it is not simply the frequency and regularity of clinical supervision,

but also the quality of the supervision and the quality of the supervisor–counselor relationship that can lessen the impact of STS on behavioral health professionals.

Engagement with a personal practice of spirituality that provides a sense of connection to a larger perspective and meaning in life is another protective factor that can lessen the impact of STS on counselors (Trippany, Kress, & Wilcoxon, 2004). Although recovering counselors may look to support groups for connection to a spiritual community, other behavioral health professionals might find support for enhancing spiritual meaning and connection in church, a meditation group, creative endeavors, or even volunteer work. The key is for counselors to develop their own unique resources and practices to enhance a sense of meaningful spirituality in their lives. Clinical supervisors should be aware of spiritual engagement as a protective factor in preventing and lessening the impact of STS and should support clinicians in including it in their self-care plans, but they should take care not to promote or reject any particular religious belief system or spiritual practice.

Another protective factor that may lessen the impact of workers' STS is a culture of empowerment in the organization that offers counselors a sense of autonomy, a greater ability to participate in making decisions about clinical and organizational policies, and obtaining support and resources that further their professional development. Slattery & Goodman (2009) surveyed 148 domestic violence advocates working in a range of settings. The authors found that those workers "who reported a high level of shared power were less likely to report posttraumatic stress symptoms, despite their own personal abuse history or degree of exposure to trauma" (p. 1370). To the degree that organizations can provide a cultural context within which behavioral health professionals have autonomy and feel empowered, they will be able to lessen the impact of STS on their professional and personal lives. Self-efficacy and empowerment are antidotes to the experience of powerlessness that often accompanies trauma.

Strategies for Preventing Secondary Traumatization

The key to prevention of secondary traumatization for behavioral health professionals in a trauma-informed organization is to reduce risk and enhance protective factors. Organizational strategies to prevent secondary traumatization include:

- Normalize STS throughout all levels of the organization as a way to help counselors feel safe and respected, enhancing the likelihood that they will talk openly about their experiences in team meetings, peer supervision, and clinical supervision.
- Implement clinical workload policies and practices that maintain reasonable standards for direct-care hours and emphasize balancing trauma-related and nontrauma-related counselor caseloads.
- Increase the availability of opportunities for supportive professional relationships by promoting activities such as team meetings, peer supervision groups, staff retreats, and counselor training that focuses on understanding secondary traumatization and self-care. Administrators and clinical supervisors should provide time at work for counselors to engage in these activities.
- Provide regular trauma-informed clinical supervision that is relationally based. Supervisors should be experienced and trained in trauma-informed and trauma-specific practices and provide a competence-based model of clinical supervision that promotes counselors' professional and personal development. Supervision limited to case consultation or case management is insufficient to

reduce the risk for secondary traumatization and promote counselor resilience.

- Provide opportunities for behavioral health professionals to enhance their sense of autonomy and feel empowered within the organization. Some of these activities include soliciting input from counselors on clinical and administrative policies that affect their work lives, including how to best balance caseloads of clients with and without histories of trauma; inviting representatives of the counseling staff to attend selected agency board of directors and/or management team meetings to offer input on workforce development; and inviting counselors to participate in organizational task forces that develop trauma-informed services, plan staff retreats, or create mechanisms to discuss self-care in team meetings. Administrators and clinical supervisors should assess the organization's unique culture and develop avenues for counselor participation in activities that will enhance their sense of empowerment and efficacy within the organization.

Exhibit 2.2-7 highlights some specific strategies that individual counselors can engage in to prevent secondary traumatization.

Assessment of Secondary Traumatization

Counselors with unacknowledged STS can harm clients, self, and family and friends by becoming unable to focus on and attend to their needs or those of others. They may feel helpless or cynical and withdraw from support systems. Exhibit 2.2-8 describes some emotional, cognitive, and behavioral signs that may indicate that a counselor is experiencing secondary traumatization. Clinical supervisors should be familiar with the manifestations of STS in their counselors and should address signs of STS immediately.

Stamm (2009–2012) has developed and revised a self-assessment tool, the Professional Quality of Life Scale (ProQOL), that measures indicators of counselor compassion fatigue and compassion satisfaction. Compassion fatigue "is best defined as a syndrome consisting of a combination of the symptoms

Exhibit 2.2-7: Counselor Strategies To Prevent Secondary Traumatization

Strategies that counselors can use (with the support and encouragement of supervisors and administrators) to prevent secondary traumatization include:

- ***Peer support*:** Maintaining adequate social support, both personally and professionally, helps prevent isolation and helps counselors share the emotional distress of working with traumatized individuals.
- ***Supervision and consultation*:** Professional consultation will help counselors understand secondary traumatization, their own personal risks, the protective factors that can help them prevent or lessen its impact, and their countertransference reactions to specific clients.
- ***Training*:** Ongoing professional training can improve counselors' understanding of trauma and enhance a sense of mastery and self-efficacy in their work.
- ***Personal psychotherapy or counseling*:** Being in counseling can help counselors become more self-aware and assist them in managing the psychological and emotional distress that often accompanies working with clients who have trauma histories in a number of behavioral health settings.
- ***Maintaining balance in one's life*:** Balancing work and personal life, developing positive coping styles, and maintaining a healthy lifestyle can enhance resilience and the ability to manage stress.
- ***Engaging in spiritual activities that provide meaning and perspective*:** Connection to a spiritual community and spiritual practices (such as meditation) can help counselors gain a larger perspective on trauma and enhance resilience.

Exhibit 2.2-8: Secondary Traumatization Signs

The following are some indicators that counselors may be experiencing secondary traumatization.

Psychological distress
- Distressing emotions: grief, depression, anxiety, dread, fear, rage, shame
- Intrusive imagery of client's traumatic material: nightmares, flooding, flashbacks of client disclosures
- Numbing or avoidance: avoidance of working with client's traumatic material
- Somatic issues: sleep disturbances, headaches, gastrointestinal distress, heart palpitations, chronic physiological arousal
- Addictive/compulsive behaviors: substance abuse, compulsive eating, compulsive working
- Impaired functioning: missed or canceled appointments, decreased use of supervision, decreased ability to engage in self-care, isolation and alienation

Cognitive shifts
- Chronic suspicion about others
- Heightened sense of vulnerability
- Extreme sense of helplessness or exaggerated sense of control over others or situations
- Loss of personal control or freedom
- Bitterness or cynicism
- Blaming the victim or seeing everyone as a victim
- Witness or clinician guilt if client reexperiences trauma or reenacts trauma in counseling
- Feeling victimized by client

Relational disturbances
- Decreased intimacy and trust in personal/professional relationships
- Distancing or detachment from client, which may include labeling clients, pathologizing them, judging them, canceling appointments, or avoiding exploring traumatic material
- Overidentification with the client, which may include a sense of being paralyzed by one's own responses to the client's traumatic material or becoming overly responsible for the client's life

Frame of reference
- Disconnection from one's sense of identity
- Dramatic change in fundamental beliefs about the world
- Loss or distortion of values or principles
- A previous sense of spirituality as comfort or resource decreases or becomes nonexistent
- Loss of faith in something greater
- Existential despair and loneliness

Sources: Figley, 1995; Newall & MacNeil, 2010; Saakvitne et al., 1996.

of secondary traumatic stress and professional burnout" (Newall & MacNeil, 2010, p. 61). Although secondary traumatization as a reaction to exposure to clients' trauma material is similar to PTSD, burnout is a more general type of psychological distress related to the pressures of working in high-stress environments over time. Burnout may be a result of secondary traumatization and/or a contributing factor in the development of secondary traumatization. The ProQOL includes STS and burnout scales that have been validated in research studies (Adams, Figley, & Boscarino, 2008; Newall & MacNeil, 2010).

This tool can be used in individual and group clinical supervision, trainings on self-care, and team meetings as a way for counselors to check in with themselves on their levels of stress and potential signs of secondary traumatization.

Case Illustration: Gui

Gui is a 48-year-old licensed substance abuse counselor who has worked in a methadone maintenance clinic for 12 years. He originally decided to get his degree and become a counselor because he wanted to help people and make a difference in the world. Over the past 6 months, he has felt fatigued a great deal, gets annoyed easily with both clients and coworkers, and has developed a cynical attitude about the world and the people who come to the clinic for help. During this time, the clinic has been forced to lay off a number of counselors due to funding cutbacks. As a result, Gui and the remaining counselors have had a 20 percent increase in the number of weekly client contact hours required as part of their job duties. In addition, the level and severity of clients' trauma-related and other co-occurring disorders, poverty, joblessness, and homelessness has increased.

Gui is a valued employee, and when Gui discusses his thoughts that he might want to leave the clinic with his clinical supervisor, the supervisor listens to Gui's concerns and explores the possibility of having him fill out the ProQOL to get a pulse on his stress level. Gui agrees and is willing to discuss the results with his supervisor. He is not surprised to see that he scores above average on the burnout scale of the instrument but is very surprised to see that he scores below average on the secondary traumatic stress scale and above average on the compassion satisfaction scale. He begins to feel more hopeful that he still finds satisfaction in his job and sees that he is resilient in many ways that he did not acknowledge before.

Gui and the clinical supervisor discuss ways that the supervisor and the organization can lessen the impact of the stress of the work environment on Gui and support the development of a self-care plan that emphasizes his own ability to rebound from adversity and take charge of his self-care.

The compassion satisfaction scale allows counselors to reflect on their resilience and reminds them of why they choose to work with people with substance use and trauma-related disorders, despite the fact that this work can lead to secondary traumatization. The compassion satisfaction subscale reminds counselors that they are compassionate, that one of the reasons they are in a helping profession is that they value service to others, and that helping brings meaning and fulfillment to their lives. Exhibits 2.2-9 through 2.2-11 present the most recent version of the ProQOL.

Addressing Secondary Traumatization

If a counselor is experiencing STS, the organization should address it immediately. Clinical supervisors can collaborate with counselors to devise an individualized plan that is accessible, acceptable, and appropriate for each counselor and that addresses the secondary stress reactions the counselor is experiencing, providing specific self-care strategies to counteract the stress. Decisions about strategies for addressing secondary traumatization should be based on the personal preferences of the counselor, the opportunity for an immediate intervention following a critical incident, and the counselor's level of awareness regarding his or her experience of STS. Counselors may need to talk about what they are experiencing, feeling, and thinking. These experiences can be processed in teams, in consultations with colleagues, and in debriefing meetings to integrate them effectively (Myers & Wee, 2002).

If a critical incident evokes secondary traumatization among staff—such as a client suicide, a violent assault in the treatment program, or another serious event—crisis intervention should be available for workers who would like to participate. Any intervention should be voluntary and tailored to each worker's individual needs (e.g., peer, group, or individual sessions); if possible, these services should be offered continuously instead of just one time.

Exhibit 2.2-9: PRoQOL Scale

COMPASSION SATISFACTION AND COMPASSION FATIGUE (PRoQOL) VERSION 5 (2009)

When you *[help]* people you have direct contact with their lives. As you may have found, your compassion for those you *[help]* can affect you in positive and negative ways. Below are some questions about your experiences, both positive and negative, as a *[helper]*. Consider each of the following questions about you and your current work situation. Select the number that honestly reflects how frequently you experienced these things in the *past 30 days*.

1=Never 2=Rarely 3=Sometimes 4=Often 5=Very Often

___ 1. I am happy.
___ 2. I am preoccupied with more than one person I *[help]*.
___ 3. I get satisfaction from being able to *[help]* people.
___ 4. I feel connected to others.
___ 5. I jump or am startled by unexpected sounds.
___ 6. I feel invigorated after working with those I *[help]*.
___ 7. I find it difficult to separate my personal life from my life as a *[helper]*.
___ 8. I am not as productive at work because I am losing sleep over traumatic experiences of a person I *[help]*.
___ 9. I think that I might have been affected by the traumatic stress of those I *[help]*.
___ 10. I feel trapped by my job as a *[helper]*.
___ 11. Because of my *[helping]*, I have felt "on edge" about various things.
___ 12. I like my work as a *[helper]*.
___ 13. I feel depressed because of the traumatic experiences of the people I *[help]*.
___ 14. I feel as though I am experiencing the trauma of someone I have *[helped]*.
___ 15. I have beliefs that sustain me.
___ 16. I am pleased with how I am able to keep up with *[helping]* techniques and protocols.
___ 17. I am the person I always wanted to be.
___ 18. My work makes me feel satisfied.
___ 19. I feel worn out because of my work as a *[helper]*.
___ 20. I have happy thoughts and feelings about those I *[help]* and how I could help them.
___ 21. I feel overwhelmed because my case [work] load seems endless.
___ 22. I believe I can make a difference through my work.
___ 23. I avoid certain activities or situations because they remind me of frightening experiences of the people I *[help]*.
___ 24. I am proud of what I can do to *[help]*.
___ 25. As a result of my *[helping]*, I have intrusive, frightening thoughts.
___ 26. I feel "bogged down" by the system.
___ 27. I have thoughts that I am a "success" as a *[helper]*.
___ 28. I can't recall important parts of my work with trauma victims.
___ 29. I am a very caring person.
___ 30. I am happy that I chose to do this work.

Exhibit 2.2-10: Your Scores on the ProQOL: Professional Quality of Life Screening

Based on your responses, place your personal scores below. If you have any concerns, you should discuss them with a physical or mental healthcare professional.

Compassion Satisfaction _____
Compassion satisfaction is about the pleasure you derive from being able to do your work well. For example, you may feel like it is a pleasure to help others through your work. You may feel positively about your colleagues or your ability to contribute to the work setting or even the greater good of society. Higher scores on this scale represent a greater satisfaction related to your ability to be an effective caregiver in your job.

The average score is 50 (SD 10; alpha scale reliability .88). About 25% of people score higher than 57 and about 25% of people score below 43. If you are in the higher range, you probably derive a good deal of professional satisfaction from your position. If your scores are below 40, you may either find problems with your job, or there may be some other reason—for example, you might derive your satisfaction from activities other than your job.

Burnout_____
Most people have an intuitive idea of what burnout is. From the research perspective, burnout is one of the elements of Compassion Fatigue (CF). It is associated with feelings of hopelessness and difficulties in dealing with work or in doing your job effectively. These negative feelings usually have a gradual onset. They can reflect the feeling that your efforts make no difference, or they can be associated with a very high workload or a non-supportive work environment. Higher scores on this scale mean that you are at higher risk for burnout.

The average score on the burnout scale is 50 (SD 10; alpha scale reliability .75). About 25% of people score above 57 and about 25% of people score below 43. If your score is below 43, this probably reflects positive feelings about your ability to be effective in your work. If you score above 57 you may wish to think about what at work makes you feel like you are not effective in your position. Your score may reflect your mood; perhaps you were having a "bad day" or are in need of some time off. If the high score persists or if it is reflective of other worries, it may be a cause for concern.

Secondary Traumatic Stress_____
The second component of Compassion Fatigue (CF) is secondary traumatic stress (STS). It is about your work related, secondary exposure to extremely or traumatically stressful events. Developing problems due to exposure to other's trauma is somewhat rare but does happen to many people who care for those who have experienced extremely or traumatically stressful events. For example, you may repeatedly hear stories about the traumatic things that happen to other people, commonly called Vicarious Traumatization. If your work puts you directly in the path of danger, for example, field work in a war or area of civil violence, this is not secondary exposure; your exposure is primary. However, if you are exposed to others' traumatic events as a result of your work, for example, as a therapist or an emergency worker, this is secondary exposure. The symptoms of STS are usually rapid in onset and associated with a particular event. They may include being afraid, having difficulty sleeping, having images of the upsetting event pop into your mind, or avoiding things that remind you of the event.

The average score on this scale is 50 (SD 10; alpha scale reliability .81). About 25% of people score below 43 and about 25% of people score above 57. If your score is above 57, you may want to take some time to think about what at work may be frightening to you or if there is some other reason for the elevated score. While higher scores do not mean that you do have a problem, they are an indication that you may want to examine how you feel about your work and your work environment. You may wish to discuss this with your supervisor, a colleague, or a healthcare professional.

42 or more	57 or more	High

Burnout Scale

On the burnout scale you will need to take an extra step. Starred items are "reverse scored." If you scored the item 1, write a 5 beside it. The reason we ask you to reverse the scores is because scientifically the measure works better when these questions are asked in a positive way though they can tell us more about their negative form. For example, question 1. "I am happy" tells us more about the effects of helping when you are *not* happy so you reverse the score.

The objective of debriefing a critical incident that evokes STS reactions in counselors is to help them dissipate the hyperarousal associated with traumatic stress and prevent long-term aftereffects that might eventually lead to counselor impairment. Because clinical supervisors may also be experiencing secondary traumatization, it is advisable for administrators to invite an outside trauma consultant into the organization to provide a safe space for all staff members (including clinical supervisors) to address and process the critical stress incident. For noncrisis situations, secondary traumatization should be addressed in clinical supervision. Clinical supervisors and counselors should work collaboratively to incorporate regular screening and self-assessment of STS into supervision sessions.

Advice to Clinical Supervisors: Advantages and Disadvantages of Using Psychometric Measures

Using a psychometric measure such as the ProQOL has advantages and disadvantages. It is important to understand that all tests measure averages and ranges but do not account for individual circumstances.

If you use the ProQOL in clinical supervision, present it as a self-assessment tool. Let counselors opt out of sharing their specific results with you and/or your team if it is administered in a group. If counselors choose to share scores on specific items or scales with you, work collaboratively and respectfully with them to explore their own understanding of and meanings attached to their scores. If this tool is not presented to supervisees in a nonjudgmental, mindful way, counselors may feel as if they have failed if their scores on the secondary traumatization scale are above average or if their scores on the compassion satisfaction scale are below average. High scores on the compassion fatigue and burnout scales do not mean that counselors don't care about their clients or that they aren't competent clinicians. The scores are simply one way for you and your supervisees to get a sense of whether they might be at risk for secondary traumatization, what they can do to prevent it, how to address it, and how you can support them.

The potential benefits of using a self-assessment tool like the ProQOL in clinical supervision are that it can help counselors:

- Reflect on their emotional reactions and behaviors and identify possible triggers for secondary traumatization.
- Assess their risk levels.
- Examine alternative coping strategies that may prevent secondary traumatization.
- Understand their own perceptions of themselves and their job satisfaction, affirming what they already know about their risk of secondary traumatization and their compassion satisfaction.
- Reflect on different factors that might contribute to unexpected low or high scores, such as the day of the week, the intensity of the workload, whether they have just come back from the weekend or a vacation, and so forth.
- Increase self-awareness and self-knowledge, because scores on specific items or scales bring to consciousness what is often outside of awareness.
- Realize how resilient they are emotionally, mentally, physically, and spiritually.
- Become aware of and open up conversations about self-care and self-care activities and resources, such as supportive coworkers, team members, and social networks outside of work.

If used regularly, self-assessment tools can help counselors and clinical supervisors monitor STS levels, indicate significant positive and negative changes, and suggest action toward self-care in specific areas. Clinical supervisors should fill out the ProQOL and review results with their own supervisors, a peer supervisor, or a colleague before administering it to supervisees. Doing so enables supervisors to gauge their own reactions to the self-assessment and anticipate potential reactions from supervisees.

Advice to Clinical Supervisors: Is it Supervision or Psychotherapy?

Although there are some aspects of clinical supervision that can be therapeutic and parallel the therapeutic and emotional support that occurs between the counselor and the client, clinical supervision is not therapy. As a result, it is important for clinical supervisors to maintain appropriate boundaries with supervisees when addressing their STS reactions at work.

When does the process in supervision cross over into the realm of practicing therapy with a supervisee? One clear indicator is if the supervisor begins to explore the personal history of the counselor and reflects directly on that history instead of bringing it back to how the counselor's history influences his or her work with a particular client or with clients with trauma histories in general. Clinical supervisors should focus only on counselor issues that may be directly affecting their clinical functioning with clients. If personal issues arise in clinical supervision, counselors should be encouraged to address them in their own counseling or psychotherapy.

Exhibit 2.2-12: Clinical Supervisor Guidelines for Addressing Secondary Traumatization

1. Engage counselors in regular screening/self-assessment of counselors' experience of STS.
2. Address signs of STS with counselors in clinical supervision.
3. Work collaboratively with counselors to develop a comprehensive self-care plan and evaluate its effectiveness on a regular basis.
4. Provide counselors a safe and nonjudgmental environment within which to process STS in individual and group supervision or team meetings.
5. Provide counselors with a safe and nonjudgmental place within which to debrief critical stress incidents at work; bring in an outside consultant if needed.
6. Support and encourage counselors to engage in individual counseling or psychotherapy, when needed, to explore personal issues that may be contributing to secondary traumatization at work.

When STS issues arise, the clinical supervisor should work with counselors to review and revise their self-care plans to determine what strategies are working and whether additional support, like individual psychotherapy or counseling, may be warranted.

Exhibit 2.2-12 outlines some guidelines for clinical supervisors in addressing secondary trauma in behavioral health professionals working with clients who have substance use, mental, and trauma-related disorders.

Counselor Self-Care

In light of the intensity of therapeutic work with clients with co-occurring substance use, mental, and trauma-related disorders and the vulnerability of counselors to secondary traumatization, a comprehensive, individualized self-care plan is highly recommended. Balance is the key to the development of a self-care plan—a balance between home and work, a balance between focusing on self and others, and a balance between rest and activity (Saakvitne, Perlman, & Traumatic Stress Institute/ Center for Adult & Adolescent Psychotherapy 1996). Counselor self-care is also about balancing vulnerability, which allows counselors to be present and available when clients address intensely painful content, with reasonable efforts to preserve their sense of integrity in situations that may threaten the counselors' faith or worldview (Burke et al., 2006). A comprehensive self-care plan should include activities that nourish the physical, psychological/mental, emotional/relational, and spiritual aspects of counselors' lives.

The literature on counselor self-care advocates for individual, team, and organizational strategies that support behavioral health professionals working with clients who have

Case Illustration: Carla

Carla is a 38-year-old case manager working in an integrated mental health and substance abuse agency. She provides in-home case management services to home-bound clients with chronic health and/or severe mental health and substance abuse problems. Many of her clients have PTSD and chronic, debilitating pain.

Both her parents had alcohol use disorders, and as a result, Carla became the caretaker in her family. She loves her job; however, she often works 50 to 60 hours per week and has difficulty leaving her work at work. She often dreams about her clients and wakes up early, feeling anxious. She sometimes has traumatic nightmares, even though she was never physically or sexually abused, and she has never experienced the trauma of violence or a natural disaster. She drinks five cups of coffee and three to four diet sodas every day and grabs burgers and sweets for snacks while she drives from one client to the next. She has gained 20 pounds in the past year and has few friends outside of her coworkers. She has not taken a vacation in more than 2 years. She belongs to the Catholic church down the street, but she has stopped going because she says she is too busy and exhausted by the time Sunday rolls around.

The agency brings in a trainer who meets with the case management department and guides the staff through a self-assessment of their current self-care practices and the development of a comprehensive self-care plan. During the training, Carla acknowledges that she has let her work take over the rest of her life and needs to make some changes to bring her back into balance. She writes out her self-care plan, which includes cutting back on the caffeine, calling a friend she knows from church to go to a movie, going to Mass on Sunday, dusting off her treadmill, and planning a short vacation to the beach. She also decides that she will discuss her plan with her supervisor and begin to ask around for a counselor for herself to talk about her anxiety and her nightmares. In the next supervision session, Carla's supervisor reviews her self-care plan with her and helps Carla evaluate the effectiveness of her self-care strategies. Her supervisor also begins to make plans for how to cover Carla's cases when she takes her vacation.

substance use and trauma-related disorders. Counselors are responsible for developing comprehensive self-care plans and committing to their plans, but clinical supervisors and administrators are responsible for promoting counselor self-care, supporting implementation of counselor self-care plans, and modeling self-care. Counselor self-care is an ethical imperative; just as the entire trauma-informed organization must commit to other ethical issues with regard to the delivery of services to clients with substance use, mental, and trauma-related disorders, it must also commit to the self-care of staff members who are at risk for secondary traumatization as an ethical concern. Saakvitne and colleagues (1996) suggest that when administrators support counselor-self-care, it is not only cost-effective in that it reduces the negative effects of secondary traumatization on counselors (and their clients), but also promotes "hope-sustaining behaviors" in counselors, making them more motivated and open to learning, and thereby improving job performance and client care.

A Comprehensive Self-Care Plan

A self-care plan should include a self-assessment of current coping skills and strategies and the development of a holistic, comprehensive self-care plan that addresses the following four domains:

1. Physical self-care
2. Psychological self-care (includes cognitive/mental aspects)
3. Emotional self-care (includes relational aspects)
4. Spiritual self-care

Activities that may help behavioral health workers find balance and cope with the stress

Advice to Clinical Supervisors: Spirituality

The word "spiritual" in this context is used broadly to denote finding a sense of meaning and purpose in life and/or a connection to something greater than the self. Spiritual meanings and faith experiences are highly individual and can be found within and outside of specific religious contexts.

Engaging in spiritual practices, creative endeavors, and group/community activities can foster a sense of meaning and connection that can counteract the harmful effects of loss of meaning, loss of faith in life, and cognitive shifts in worldview that can be part of secondary traumatization. Counselors whose clients have trauma-related disorders experience fewer disturbances in cognitive schemas regarding worldview and less hopelessness when they engage in spiritually oriented activities, such as meditation, mindfulness practices, being in nature, journaling, volunteer work, attending church, and finding a spiritual community (Burke et al., 2006). Clinical supervisors can encourage counselors to explore their own spirituality and spiritual resources by staying open and attuned to the multidimensional nature of spiritual meaning of supervisees and refraining from imposing any particular set of religious or spiritual beliefs on them. A strong sense of spiritual connection can enhance counselors' resilience and ability to cope with the sometimes overwhelming effects of clients' trauma material and trauma-related behavior (including suicidality) on counselors' faith in life and sense of meaning and purpose.

Modeling Self-Care

"Implementing interventions was not always easy, and one of the more difficult coping strategies to apply had to do with staff working long hours. Many of the staff working at the support center also had full-time jobs working for the Army. In addition, many staff chose to volunteer at the Family Assistance Center and worked 16- to 18-hour days. When we spoke with them about the importance of their own self-care, many barriers emerged: guilt over not working, worries about others being disappointed in them, fear of failure with respect to being unable to provide what the families might need, and a 'strong need to be there.' Talking with people about taking a break or time off proved problematic in that many of them insisted that time off was not needed, despite signs of fatigue, difficulty concentrating, and decreased productivity. Additionally, time off was not modeled. Management, not wanting to fail the families, continued to work long hours, despite our requests to do otherwise. Generally, individuals could see and understand the reasoning behind such endeavors. Actually making the commitment to do so, however, appeared to be an entirely different matter. In fact, our own team, although we kept reasonable hours (8 to 10 per day), did not take a day off in 27 days. Requiring time off as part of membership of a Disaster Response Team might be one way to solve this problem."

of working with clients with trauma-related disorders include talking with colleagues about difficult clinical situations, attending workshops, participating in social activities with family and friends, exercising, limiting client sessions, balancing caseloads to include clients with and without trauma histories, making sure to take vacations, taking breaks during the workday, listening to music, walking in nature, and seeking emotional support in both their personal and professional lives (Saakvitne et al., 1996). In addition, regular clinical supervision and personal psychotherapy or counseling can be positive coping strategies for lessening the impact of STS on counselors. Still, each counselor is unique, and a self-care approach that is helpful to one counselor may not be helpful to another. Exhibits 2.2-13 and 2.2-14 offer tools for self-reflection to help counselors discover which specific self-care activities might best suit them. The worksheet can be used privately by counselors or by clinical supervisors as an exercise in individual supervision, group supervision, team meetings, or trainings on counselor self-care.

Review the questions in Exhibit 2.2-14, and then write down specific self-care strategies in the form (given in Exhibit 2.2-13) that you're confident you will practice in both personal and professional realms.

The *Comprehensive Self-Care Worksheet* is a tool to help counselors (and clinical supervisors) develop awareness of their current coping strategies and where in the four domains they need to increase their engagement in self-care activities. Once completed, clinical supervisors should periodically review the plan with their supervisees for effectiveness in preventing and/or ameliorating secondary traumatization and then make adjustments as needed.

Essential Components of Self-Care

Saakvitne and colleagues (1996) describe three essential components, the "ABCs," of self-care that effectively address the negative impact of secondary traumatization on counselors:

1. **Awareness** of one's needs, limits, feelings, and internal/external resources. Awareness involves mindful/nonjudgmental attention to one's physical, psychological, emotional, and spiritual needs. Such attention requires quiet time and space that supports self-reflection.
2. **Balance** of activities at work, between work and play, between activity and rest, and between focusing on self and focusing on others. Balance provides stability and helps counselors be more grounded when stress levels are high.
3. **Connection** to oneself, to others, and to something greater than the self. Connection decreases isolation, increases hope, diffuses stress, and helps counselors share the burden of responsibility for client care. It provides an anchor that enhances counselors' ability to witness tremendous suffering without getting caught up in it.

Exhibit 2.2-14: Comprehensive Self-Care Plan Worksheet Instructions

Use the following questions to help you engage in a self-reflective process and develop your comprehensive self-care plan. Be specific and include strategies that are accessible, acceptable, and appropriate to your unique circumstances. Remember to evaluate and revise your plan regularly.

Physical
What are non-chemical things that help my body relax?
What supports my body to be healthy?

Psychological/Mental
What helps my mind relax?
What helps me see a bigger perspective?
What helps me break down big tasks into smaller steps?
What helps me counteract negative self-talk?
What helps me challenge negative beliefs?
What helps me build my theoretical understanding of trauma and addictions?
What helps me enhance my counseling/helping skills in working with traumatized clients?
What helps me become more self-reflective?

Emotional/Relational
What helps me feel grounded and able to tolerate strong feelings?
What helps me express my feelings in a healthy way?
Who helps me cope in positive ways and how do they help?
What helps me feel connected to others?
Who are at least three people I feel safe talking with about my reactions/feelings about clients?
How can I connect with those people on a regular basis?

Spiritual
What helps me find meaning in life?
What helps me feel hopeful?
What sustains me during difficult times?
What connects me to something greater?

Clinical supervisors can help counselors review their self-care plans through the ABCs by reflecting on these questions:

1. Has the counselor accurately identified his or her needs, limits, feelings, and internal and external resources in the four domains (physical, psychological/mental, emotional/relational, spiritual)?
2. Has the counselor described self-care activities that provide a balance between work and leisure, activity and rest, and a focus on self and others?
3. Has the counselor identified self-care activities that enhance connection to self, others, and something greater than self (or a larger perspective on life)?

Supervisors should make their own self-care plans and review them periodically with their clinical supervisors, a peer supervisor, or a colleague.

Commitment to Self-Care

One of the major obstacles to self-care is giving in to the endless demands of others, both at work and at home. It is therefore essential for counselors with the support of clinical supervisors to become "guardians of [their] boundaries and limits" (Saakvitne et al., 1996, p 136). Creating a daily schedule that includes breaks for rest, exercise, connection with coworkers, and other self-care activities can support counselors in recognizing that they are valuable individuals who are worthy of taking the time to nourish and nurture themselves, thus increasing commitment to self-care. Another way to support counselors in committing to self-care is for supervisors and administrators to model self-care in their own professional and personal lives.

Understanding that counselor self-care is not simply a luxury or a selfish activity, but rather, an ethical imperative (Exhibit 2.2-15) can foster counselors' sense of connection to their own values and accountability to the people they serve as competent and compassionate caregivers. Clinical supervisors and administrators can reinforce this sense of accountability while supporting counselors by providing a caring, trauma-informed work environment

Exhibit 2.2-15: The Ethics of Self-Care

The Green Cross Academy of Traumatology was originally established to serve a need in Oklahoma City following the April 19, 1995, bombing of the Alfred P. Murrah Federal Building. Below are adapted examples of the Academy's code of ethics with regard to worker self-care.

Ethical Principles of Self-Care in Practice
These principles declare that it is unethical not to attend to your self-care as a practitioner, because sufficient self-care prevents harming those we serve.

Standards of self-care guidelines:
- Respect for the dignity and worth of self: A violation lowers your integrity and trust.
- Responsibility of self-care: Ultimately it is your responsibility to take care of yourself—and no situation or person can justify neglecting this duty.
- Self-care and duty to perform: There must be a recognition that the duty to perform as a helper cannot be fulfilled if there is not, at the same time, a duty to self-care.

Standards of humane practice of self-care:
- Universal right to wellness: Every helper, regardless of her or his role or employer, has a right to wellness associated with self-care.
- Physical rest and nourishment: Every helper deserves restful sleep and physical separation from work that sustains them in their work role.
- Emotional rest and nourishment: Every helper deserves emotional and spiritual renewal both in and outside the work context.
- Sustenance modulation: Every helper must utilize self-restraint with regard to what and how much they consume (e.g., food, drink, drugs, stimulation) since improper consumption can compromise their competence as a helper.

Commitment to self-care:
- Make a formal, tangible commitment: Written, public, specific, measurable promises of self-care.
- Set deadlines and goals: The self-care plan should set deadlines and goals connected to specific activities of self-care.
- Generate strategies that work and follow them: Such a plan must be attainable and followed with great commitment and monitored by advocates of your self-care.

that acknowledges and normalizes secondary traumatization and by offering reasonable resources that make it possible for counselors to do their work and take care of themselves at the same time. Preventing secondary traumatization and lessening its impact on counselors once it occurs is not only cost-effective with regard to decreasing staff turnover and potential discontinuity of services to clients; it is also the ethical responsibility of a trauma-informed organization.

Appendix B—Trauma Resource List

Introduction

As it would be difficult to include every organization focused on trauma, the list of resources in this appendix is not exhaustive; consequently, this list does not include books or other materials concerning the vast nature of this topic, but rather, it concentrates solely on online resources accessible to the public for free or as part of an organization membership. The inclusion of selected resources does not necessarily signify endorsement by the Substance Abuse and Mental Health Services Administration (SAMHSA), U.S. Department of Health and Human Services (HHS). Following these resources for adults is a list of resources focused on children and adolescents and a list of training opportunities.

Technology and Trauma: Using the Web To Treat PTSD

The role of the Internet in helping those who are experiencing posttraumatic stress disorder (PTSD) has expanded rapidly; there are numerous Web sites with toolkits and research publications for clinicians who treat clients with PTSD, as well as Web sites aimed at providing information and support for these individuals. The U.S. military has contributed to the field in developing these avenues—specifically, with interactive Web applications for use on home computers and smartphones.

- PTSD Coach is a smartphone application from the U.S. Department of Veterans Affairs (VA) to help people experiencing PTSD learn about and manage their symptoms (http://www.ptsd.va.gov/public/pages/ptsdcoach.asp).
- Afterdeployment.org is a Web site developed by the Defense Centers of Excellence project led by the National Center for Telehealth & Technology, with interactive workshops about PTSD, traumatic brain injury (TBI), anxiety, and depression, aimed at returning veterans (http://www.afterdeployment.org).
- T2 Virtual PTSD Experience, also developed by the National Center for Telehealth & Technology, is an application to be used within the popular online game Second Life as an interactive way of simulating how PTSD can be acquired within a combat environment, how PTSD may present itself to the person experiencing it, and how to seek effective treatment (http://www.t2health.org/vwproj).

Resources for Adults

Academy of Cognitive Therapy

http://www.academyofct.org
260 South Broad Street
18th Floor
Philadelphia, PA 19102
Phone: 267-350-7683
Email: info@academyofct.org

The Academy of Cognitive Therapy, a nonprofit organization, supports continuing education and research in cognitive therapy, provides a valuable resource in cognitive therapy for professionals and the public at large,

and actively works toward the identification and certification of clinicians skilled in cognitive therapy. Certification is awarded to those individuals who, based on an objective evaluation, have demonstrated an advanced level of expertise in cognitive therapy. The Academy includes physicians, psychologists, social workers, and other mental health professionals from around the world. The Academy formed a Trauma Task Force after September 11, 2001, to disseminate information (available on their Web site) to help people around the world receive the best help possible following trauma.

Addiction Technology Transfer Center Network

http://www.attcnetwork.org/index.asp
5100 Rockhill Road
Kansas City, MO 64110
Phone: 816-235-6888
Email: networkoffice@attcnetwork.org

The Addiction Technology Transfer Center (ATTC) Network serves as a resource for students and professionals to identify international distance education opportunities for the substance abuse treatment field and as a free marketing venue for ATTC-approved sponsors of distance education courses. The ATTC Web site provides trauma-related resources that include case studies, information on working with returning veterans who have been exposed to trauma, and links to various publications on PTSD and secondary traumatic stress.

Agency for Healthcare Research and Quality

http://www.innovations.ahrq.gov/index.aspx
540 Gaither Road
Suite 2000
Rockville, MD 20850
Phone: 301-427-1104

The Agency for Healthcare Research and Quality (AHRQ) is the research arm of HHS, specializing in patient safety and quality improvement, outcomes and effectiveness of care, clinical practice and technology assessment, and healthcare organization and delivery systems. AHRQ also provides funding and technical assistance to health research and research training programs at many universities and institutions. AHRQ's Web site provides links to research publications on PTSD and to other government publications and toolkits dealing with trauma-informed care.

The American Academy of Experts in Traumatic Stress

http://www.aaets.org
203 Deer Road
Ronkonkoma, NY 11779
Phone: 631-543-2217
Email: info@aaets.org

The American Academy of Experts in Traumatic Stress is a multidisciplinary network of professionals who are committed to the advancement of intervention for survivors of trauma. The Academy aims to identify expertise among professionals and across disciplines and to provide meaningful standards for those who work regularly with survivors. The Academy is committed to fostering a greater appreciation of the effects of common traumatic experiences (e.g., chronic illness, accidents, domestic violence, loss) in addition to large-scale disasters and catastrophes. The group's aim is to help all victims to become survivors and, ultimately, to thrive.

American Red Cross Disaster Services

http://www.redcross.org/what-we-do/disaster-relief
American Red Cross National Headquarters
2025 E Street, NW

Washington, DC 20006
Phone: 202-303-4498

Red Cross disaster relief focuses on meeting people's immediate emergency disaster-caused needs. When a disaster threatens or strikes, the Red Cross provides shelter, food, and health and mental health services to address basic human needs. In addition to these services, the core of Red Cross disaster relief is the assistance given to individuals and families affected by disaster to enable them to resume their normal daily activities independently. Training opportunities are also provided.

Anxiety and Depression Association of America

http://www.adaa.org
8701 Georgia Avenue #412
Silver Spring, MD 20910
Phone: 240-485-1001

The Anxiety and Depression Association of America (ADAA) is the only national, nonprofit membership organization dedicated to informing the public, healthcare professionals, and legislators that anxiety disorders are real, serious, and treatable. ADAA promotes the early diagnosis, treatment, and cure of anxiety disorders and is committed to improving the lives of the people who have them. The ADAA Web site provides information about the symptoms of PTSD and how it can be treated, in addition to offering a PTSD self-screening tool.

Association for Behavioral and Cognitive Therapies

http://www.abct.org
305 7th Avenue
16th Floor
New York, NY 10001
Phone: 212-647-1890
Fax: 212-647-1865

The Association for Behavioral and Cognitive Therapies is a professional, interdisciplinary organization concerned with the application of behavioral and cognitive science to understanding human behavior, developing interventions to enhance the human condition, and promoting the appropriate use of these interventions. The association's Web site includes resources for the public and for professionals on trauma and disaster-related problems, a clinical referral directory, and other resources and training opportunities in behavioral therapy.

Association of Traumatic Stress Specialists

http://www.atss.info
88 Pompton Avenue
Verona, NJ 07044
Phone: 973-559-9200
Email: Admin@atss.info

The Association of Traumatic Stress Specialists is an international membership organization that offers three distinct board certifications to qualified individuals who provide services, intervention, response, and/or treatment in the field of traumatic stress. The Association is dedicated to improving the quality of life of all individuals throughout the world who have been affected by traumatic events. Membership represents those who serve survivors of natural disasters, terrorist attacks, injuries and deaths related to serving in the line of duty or to school and workplace violence; veterans; refugees; victims of crime; Holocaust survivors; those affected and exploited by political persecution; and others who have experienced traumatic stress injuries.

Center for Anxiety and Related Disorders

http://www.bu.edu/card
648 Beacon Street
6th Floor

Boston, MA 02215
Phone: 617-353-9610

The Center for Anxiety and Related Disorders (CARD) at Boston University is a clinical and research center dedicated to advancing knowledge and providing care for anxiety, mood, eating, sleep, and related disorders. CARD's Web site offers information regarding PTSD and research publications on trauma and anxiety, in addition to linking to toolkits from the National Child Traumatic Stress Network's Adolescent Traumatic Stress and Substance Abuse Program.

Center for the Study of Traumatic Stress

http://www.cstsonline.org
Uniformed Services University of the Health Sciences
Department of Psychiatry
4301 Jones Bridge Road
Bethesda, MD 20814-4799
Phone: 301-295-2470
Fax: 301-319-6965

The Center for the Study of Traumatic Stress (CSTS) is a federally funded organization established by the Military Health System in 1987 to address Department of Defense concerns regarding health risks and concerns resulting from the traumatic impact of the use of weapons of mass destruction in combat, acts of terrorism and hostage events, combat and peacekeeping operations, natural disasters, and assaults or accidents occurring in both uniformed and civilian communities. CSTS primarily serves members of the armed forces, along with their children and families.

Center for Culture, Trauma and Mental Health Disparities

http://www.semel.ucla.edu/cctmhd
UCLA Semel Institute of Neuroscience & Biobehavioral Sciences
760 Westwood Plaza
Los Angeles, CA 90024
Phone: 310-794-9929

The Collaborative Center for Trauma and Mental Health Disparities at the University of California Los Angeles is a multiethnic and multidisciplinary group that focuses on conducting research and providing training that pertains to trauma in minority populations.

Council of State Governments Justice Center—Mental Health

http://csgjusticecenter.org/jc/category/mental-health
100 Wall Street
20th Floor
New York, NY 10005
Phone: 212-482-2320
Fax: 212-482-2344
Email: consensusproject@csg.org

The Consensus Project is part of the Council of State Governments Justice Center and partners with other organizations, such as SAMHSA's GAINS Center, working to improve outcomes for people, including juveniles, with mental illnesses involved with the criminal justice system. The Consensus Project offers a webinar on trauma services in the criminal justice system and on child trauma and juvenile justice, as well as a local programs database.

Dart Center for Journalism and Trauma

http://www.dartcenter.org
Columbia University
Graduate School of Journalism
2950 Broadway
New York, NY 10027
Phone: 212-854-8056

The Dart Center is dedicated to improving media coverage of trauma, conflict, and

tragedy. The Center also addresses the consequences of such coverage for those working in journalism and provides training and education via seminars, newsroom briefings and consultation on trauma issues, in addition to training for journalism educators and other trainers. The Dart Center Web site offers fact sheets, publications, and DVDs on request for use by journalists, educators, and clinicians.

David Baldwin's Trauma Information Pages

http://www.trauma-pages.com
Phone: 541-686-2598
Email: dvb@trauma-pages.com

This Web site focuses primarily on emotional trauma and traumatic stress, including PTSD and dissociation, whether following individual traumatic experience(s) or a large-scale disaster. The site's purpose is to provide information for clinicians and researchers in the traumatic stress field. Specifically, the focus is on both clinical and research aspects of trauma responses and their resolution.

Disaster Technical Assistance Center

http://www.samhsa.gov/dtac
9300 Lee Highway
Fairfax, VA 22031
Phone: 800-308-3515
Fax: 703-225-2338

SAMHSA has created the Disaster Technical Assistance Center (DTAC) to help States prepare for and respond to a wide range of potential catastrophes—both natural and human-caused disasters. DTAC primarily serves individuals and communities who are recovering from natural and human-caused disasters. It works in conjunction with the Federal Emergency Management Agency (FEMA) and SAMHSA's Emergency Mental Health and Traumatic Stress Services Branch, using strengths-based, outreach-oriented principles conducted in nontraditional settings, as a supplement to programs already in place on a local level.

EMDR Institute, Inc.

http://www.emdr.com
P.O. Box 750
Watsonville, CA 9507
Phone: 831-761-1040
Fax: 831-761-1204
Email: inst@emdr.com

Eye Movement Desensitization and Reprocessing (EMDR) is an information-processing therapy that uses an eight-phase approach. (See the description in Part 1, Chapter 6.) The Web site presents background and descriptive information about this approach to treatment and lists training opportunities, references, and networking groups.

The Federal Emergency Management Agency

http://www.fema.gov
500 C Street SW
Washington, DC 20472
Phone: 202-646-2500

The Federal Emergency Management Agency, a formerly independent agency that became part of the Department of Homeland Security in March 2003, is tasked with responding to, planning for, recovering from, and mitigating against disasters. FEMA can trace its beginnings to the Congressional Act of 1803. This Act, generally considered the first piece of disaster legislation, provided assistance to a New Hampshire town following an extensive fire. In the century that followed, ad hoc legislation was passed more than 100 times in response to hurricanes, earthquakes, floods, and other natural disasters.

The International Critical Incident Stress Foundation, Inc.

http://www.icisf.org
3290 Pine Orchard Lane
Suite 106
Ellicott City, MD 21042
Phone: 410-750-9600
Fax: 410-750-9601
Email: info@icisf.org

The International Critical Incident Stress Foundation, Inc., is a nonprofit, open-membership foundation dedicated to the prevention and mitigation of disabling stress through the provision of education, training, and support services for all emergency services professions; continuing education and training in emergency mental health services for psychologists, psychiatrists, social workers, and licensed professional counselors; and consultation in the establishment of crisis and disaster response programs for varied organizations and communities worldwide.

International Society for the Study of Trauma and Dissociation

http://www.issd.org
8400 Westpark Drive
Second Floor
McLean, VA 22102
Phone: 703-610-9037
Fax: 703-610-0234
Email: info@isst-d.org

The Society is a nonprofit professional association organized for the purposes of information sharing and international networking of clinicians and researchers; providing professional and public education; promoting research and theory about dissociation; and promoting research and training in the identification, treatment, and prevention of dissociative disorders. The Society offers courses in its Dissociative Disorders Psychotherapy Training Program.

The International Society for Traumatic Stress Studies

http://www.istss.org
111 Deer Lake Road
Suite 100
Deerfield, IL 60015
Phone: 847-480-9028
Fax: 847-480-9282

The International Society for Traumatic Stress Studies (ISTSS) was founded in 1985 for professionals to share information about the effects of trauma. ISTSS is dedicated to the discovery and dissemination of knowledge about policy, program, and service initiatives that seek to reduce traumatic stressors and their immediate and long-term consequences. ISTSS provides a forum for the sharing of research, clinical strategies, public policy concerns, and theoretical formulations on trauma in the United States and around the world.

National Alliance on Mental Illness

http://www.nami.org
3803 N. Fairfax Dr.
Suite 100
Arlington, VA 22203
Phone: 703-524-7600
Fax: 703-524-9094

The National Alliance on Mental Illness (NAMI) is a nonprofit advocacy group founded in 1979 to raise awareness and provide essential and free education, advocacy, and support group programs for people living with mental illness and their loved ones. NAMI operates at the local, State, and national levels, with each level of the organizations providing education, information, support, and advocacy for those with mental illness and their support system. NAMI has developed a Trauma Toolkit and includes a series of lectures for mental health professionals about trauma.

National Association of State Alcohol and Drug Abuse Directors, Inc.

http://www.nasadad.org
1025 Connecticut Ave NW
Suite 605
Washington, DC 20036
Phone: 202-293-0090
Fax: 202-293-1250
Email: dcoffice@nasadad.org

The National Association of State Alcohol and Drug Abuse Directors, Inc. (NASADAD) is a private, not-for-profit educational, scientific, and informational organization. NASADAD's basic purpose is to foster and support the development of effective alcohol and drug abuse prevention and treatment programs throughout every State. NASADAD offers a policy brief with regards to trauma and substance use/abuse in the wake of natural or human-made disasters.

National Association of State Mental Health Program Directors

http://www.nasmhpd.org
66 Canal Center Plaza
Suite 302
Alexandria, VA 22314
Phone: 703-739-9333
Fax: 703-548-9517

The National Association of State Mental Health Program Directors (NASMHPD; pronounced "NASH-pid") is a nonprofit organization dedicated to serving the needs of the Nation's public mental health system through policy development, information dissemination, and technical assistance. NASMHPD represents the $23 billion public mental health service delivery system. As a private, not-for-profit 501(c)(3) membership organization, NASMHPD helps set the agenda and determine the direction of State mental health agency interests across the country, historically including State mental health planning, service delivery, and evaluation. The principal programs operated, funded, and/or regulated by NASMHPD members serve people who have serious mental illnesses, developmental disabilities, and/or substance use disorders. NASMPHD has launched a Technical Assistance Coordinating Center in response to the Alternatives to Restraint and Seclusion State Infrastructure Grant Project, an initiative of SAMHSA's Center for Mental Health Services, designed to promote the implementation and evaluation of best practice approaches to preventing and reducing the use of seclusion and restraint in mental health settings.

National Center for Injury Prevention and Control

http://www.cdc.gov/injury
1600 Clifton Road
Atlanta, GA 30333
Phone: 800-232-4636
Email: cdcinfo@cdc.gov

The National Center for Injury Prevention and Control (NCIPC) was established by the Centers for Disease Control and Prevention in 1992. Through research, surveillance, implementation of evidence-based strategies, capacity building, and communication activities, NCIPC works to reduce morbidity, disability, mortality, and costs associated with injuries and violence. NCIPC is the lead U.S. Federal agency for nonoccupational injury prevention.

National Center for PTSD

http://www.ptsd.va.gov
810 Vermont Avenue NW
Washington, DC 20420
Phone: 802-296-6300
Email: ncptsd@va.gov

The National Center for PTSD (NCPTSD) was created within the Department of

Veterans Affairs in 1989 in response to a Congressional mandate to address the needs of veterans with military-related PTSD. Its mission is to advance the clinical care and social welfare of America's veterans through research, education, and training in the science, diagnosis, and treatment of PTSD and stress-related disorders. Its Web site is provided as an educational resource concerning PTSD and other enduring consequences of traumatic stress. The NCPTSD Web site has information about instruments to measure trauma exposure, risk and resilience factors for PTSD, self-report instruments, and interview schedules. Training opportunities are listed at http://www.ptsd.va.gov/about/training/training-programs.asp.

National Center for Telehealth and Technology

http://www.t2health.org
9933C West Hayes Street
Joint Base Lewis-McChord, WA 98431
Phone: 253-968-1914
Fax: 253-968-4192
Email: AskUs@t2health.org

The National Center for Telehealth and Technology is a Federal agency founded by the Department of Defense as part of the Military Health System. It primarily serves veterans and active-duty military personnel who are experiencing adverse health effects due to TBI and PTSD, as well as military children who are coping with their parents' deployment, through the use of technology (e.g., mobile phone applications, deployable telehealth centers).

National Center for Trauma-Informed Care

http://www.samhsa.gov/nctic
66 Canal Center Plaza
Suite 302
Alexandria, VA 22314
Phone: 866-254-4819
Fax: 703-548-9517
Email: NCTIC@NASMHPD.org

The National Center for Trauma-Informed Care (NCTIC) is a Federal center established by SAMHSA in 2005 to offer consultation, technical assistance, education, outreach, and resources to support trauma-informed care in publicly-funded systems and programs. NCTIC primarily serves those who are already receiving services from the behavioral health system and is focused on helping behavioral health services and programs to become more aware of the impact of trauma among consumers, to adapt services to incorporate trauma-informed practices, and to help raise awareness of practices or processes that are more likely to retraumatize consumers.

National Center for Victims of Crime

http://www.victimsofcrime.org
2000 M Street NW
Suite 480
Washington, DC 20036
Phone: 202-467-8700
Fax: 202-467-8701
Email: webmaster@ncvc.org

The National Center for Victims of Crime (NCVC) is a nonprofit organization funded partially by Federal grants from the Department of Justice. It was founded in 1985 and originally known as the Sunny Von Bulow National Victim Advocacy Center. NCVC is a resource center for those affected by violent crimes and also provides training and education for behavioral health service providers.

National Center on Domestic Violence, Trauma & Mental Health

http://www.nationalcenterdvtraumamh.org/
Phone: 312-726-7020
Fax: 312-726-7022

The National Center on Domestic Violence, Trauma & Mental Health was established in 2005 through a grant from the Family Violence Prevention and Services Program, HHS. The Center's mission is to promote accessible, culturally relevant, and trauma-informed responses to domestic violence and other lifetime trauma so that survivors and their children can access the resources that are essential to their safety and well-being; this is achieved by providing training and online resources to mental health and substance abuse treatment providers and developing policies to improve system responses to domestic violence survivors and their children.

National Center on Elder Abuse

http://www.ncea.aoa.gov
University of California–Irvine
Program in Geriatric Medicine
101 The City Drive South, 200 Building
Orange, CA 92868
Phone: 855-500-3537
Email: ncea-info@aoa.hhs.gov

The National Center on Elder Abuse (NCEA), part of the U.S. Administration on Aging, serves as a national resource center dedicated to the prevention of elder mistreatment. NCEA provides information to both mental health professionals and the general public and also provides technical assistance and training to States and community-based organizations.

National Center on Family Homelessness

http://www.familyhomelessness.org
200 Reservoir Street
Suite 200
Needham, MA 02494
Phone: 617-964-3834
Fax: 617-244-1758
Email: info@familyhomelessness.org

The National Center on Family Homelessness (NCFH) was founded in 1988 and is a nonprofit organization that conducts research and creates public awareness about the special needs of families experiencing homelessness. NCFH primarily serves veterans who are homeless and their families and young mothers who are homeless with their children. NCFH has developed a Trauma-Informed Organizational Toolkit for Homeless Services.

National Coalition Against Domestic Violence

http://www.ncadv.org
1 Broadway
Suite B210
Denver, CO 80203
Phone: 303-839-1852
Fax: 303-831-9251
Email: mainoffice@ncadv.org

The National Coalition Against Domestic Violence (NCADV) is an advocacy group founded in 1978 and acts as a national information and referral center for the general public, media, survivors of domestic violence and their children, and allied and member agencies and organizations. NCADV also works to influence legislation that would provide protection for survivors of domestic violence and their families and provide funding to shelters, healthcare centers, and other organizations.

National Council for Behavioral Health

http://www.thenationalcouncil.org
1701 K Street NW
Suite 400
Washington, DC 20006
Phone: 202-684-7457
Email: communications@thenationalcouncil.org

The National Council for Behavioral Health is a national community behavioral health

advocacy organization, formed in 1970, to conduct Federal advocacy activities, representing the industry on Capitol Hill and before Federal agencies. It also offers a national consulting service program, various publications, and an annual training conference. The National Council Magazine, 2011, Issue 2, focuses on trauma-informed behavioral health services. The National Council has offered a Learning Community for Adoption of Trauma-Informed Practices, funded by SAMHSA.

National Institute on Drug Abuse

http://drugabuse.gov
National Institute on Drug Abuse
National Institutes of Health
6001 Executive Boulevard
Room 5213, MSC 9561
Bethesda, MD 20892-9561
Phone: 301-443-1124
Email: information@nida.nih.gov

The National Institute on Drug Abuse's (NIDA) mission is to lead the Nation in bringing the power of science to bear on drug abuse and addiction. NIDA's goal is to ensure that science, not ideology or anecdote, forms the foundation for all of the Nation's drug abuse reduction efforts. NIDA was established in 1974, and in October 1992 it became part of the National Institutes of Health (NIH), HHS. The Institute is organized into divisions and offices, each of which plays an important role in programs of drug abuse research. NIDA has an ongoing research program on women's health and sex/gender differences, including the gathering of information on trauma and substance abuse.

National Institute of Mental Health

http://www.nimh.nih.gov
National Institute of Mental Health
Science Writing, Press, and Dissemination Branch
6001 Executive Boulevard
Room 8184, MSC 9663
Bethesda, MD 20892-9663
Phone: 301-443-4513
Fax: 301-443-4279
Email: nimhinfo@mail.nih.gov

The National Institute of Mental Health (NIMH) is one of the 27 component institutes of NIH, the Federal Government's principal biomedical and behavioral research agency that is part of HHS. NIMH's mission is to reduce the burden of mental illness and behavioral disorders through research on mind, brain, and behavior. This public health mandate demands that NIMH use science to achieve better understanding, treatment, and eventually, prevention of these disabling conditions that affect millions of Americans. NIMH offers publications and podcasts related to traumatic events and PTSD.

National Registry for Evidence-Based Programs and Practices

http://www.nrepp.samhsa.gov
Phone: 866-436-7377
Email: nrepp@samhsa.hhs.gov

SAMHSA's National Registry for Evidence-Based Programs and Practices (NREPP) is a searchable online registry of more than 300 interventions supporting mental health promotion, substance abuse prevention, and mental health and substance abuse treatment. NREPP offers several interventions that address trauma and PTSD.

National Sexual Violence Resource Center

http://www.nsvrc.org
123 North Enola Drive
Enola, PA 17025
Phone: 717-909-0710
Fax: 717-909-0714

The National Sexual Violence Resource Center (NSVRC) was founded by the Pennsylvania Coalition Against Rape in 2000 and is partially federally funded by grants from the Centers for Disease Control and Prevention. NSVRC advocates for changes in Federal and State legislation to further the goal of ending sexual violence in all communities, in addition to collecting and disseminating a wide range of resources on sexual violence, including statistics, research, position statements, statutes, training curricula, prevention initiatives and program information. NSVRC does not provide direct services to survivors of sexual violence but acts as a resource to support these services.

National Trauma Consortium

http://www.nationaltraumaconsortium.org
520 Ralph Street
Sarasota, FL 34242
Phone: 941-312-9795

The National Trauma Consortium (NTC) is a clearinghouse for information about trauma and emerging best practices in trauma treatment and services and, in addition, offers training and consultation services. NTC also provides resources in the form of downloadable publications and links to other organizations related to mental health and trauma.

National Voluntary Organizations Active in Disasters

http://www.nvoad.org
1501 Lee Highway
Suite 170
Arlington, VA 22209-1109
Phone: 703-778-5088
Fax: 703-778-5091
Email: info@nvoad.org

National Voluntary Organizations Active in Disasters (NVOAD) coordinates planning efforts by many voluntary organizations responding to disaster. Member organizations provide more effective service and less duplication by getting together before disasters strike. Once disasters occur, NVOAD or an affiliated State VOAD encourages members and other voluntary agencies to convene on site. This cooperative effort has proven to be the most effective way for a wide variety of volunteers and organizations to work together in a crisis. NVOAD's principles are cooperation, coordination, communication, education, mitigation, convening mechanisms, and outreach.

Office for Victims of Crime Training and Technical Assistance Center

https://www.ovcttac.gov/
9300 Lee Highway
Fairfax, VA 22031-6050
Phone: 866-682-8822
TTY: 866-682-8880
Fax: 703-279-4673
Email: TTAC@ovcttac.org

The Office for Victims of Crime Training and Technical Assistance Center provides comprehensive, quality technical assistance and training resources to victims' service providers and allied professionals. Its mission is to support the development of the field by increasing the Nation's capacity to provide crime victims with skilled, capable, and sensitive assistance. Its core functions are needs assessment, capacity building, evaluation, and reporting.

Rape, Abuse & Incest National Network

http://www.rainn.org
1220 L Street NW
Suite 505
Washington, DC 20005
Phone: 202-544-1034
Email: info@rainn.org

The Rape, Abuse & Incest National Network (RAINN) is a nonprofit organization, founded in 1994, that is partially funded by a grant from the Office for Victims of Crime, Office of Justice Programs, U.S. Department of Justice. RAINN provides support for survivors of sexual assault via a telephone hotline and an online hotline and works with the Department of Defense (DoD) to provide a hotline for members of the DoD community who have experienced sexual assault.

SAMHSA's Tribal Training and Technical Assistance Center

http://beta.samhsa.gov/tribal-ttac
201 Corporate Drive
Suite 800
Landover, MD 20785
Phone: 240-650-0257
Email: TA-Request@tribaltechllc.com

SAMHSA's Tribal Training and Technical Assistance Center (Tribal TTAC) is committed to providing comprehensive broad, focused, and/or intensive training and technical assistance to federally recognized Tribes and other American Indian and Alaska Native communities seeking to address and prevent mental and substance use disorders and suicide while promoting mental health. The goal of the Tribal TTAC is to use a culturally relevant, evidence-based, holistic approach to support Native communities in their self-determination efforts through infrastructure development, capacity building, and program planning and implementation.

Sanctuary Model

http://www.sanctuaryweb.com
Phone: 888-538-3124

The goals of the Sanctuary Model include increasing the perceived sense of community/cohesiveness; the degree of social immunity to the spread of violence; the capacity for social learning; the making of decisions democratically and the sharing of responsibility in solving problems and resolving conflicts; the ability to deal with complexity; opportunities for all clients and staff members to experience a truly safe and connected community; opportunities for troubled clients to have corrective emotional, relational, and environmental experiences; and recovery, healing, and growth.

Seeking Safety

http://www.seekingsafety.org
Treatment Innovations
28 Westbourne Road
Newton Centre, MA 02459
Phone: 617-299-1610
Fax: 617-701-1295
Email: info@seekingsafety.org

This Web site provides information about Seeking Safety, a psychotherapeutic intervention for treating trauma, PTSD, and substance abuse. Seeking Safety is a present-focused therapy to help people attain safety from both PTSD and substance abuse. The treatment is also available as a book, which provides both client handouts and guidance for clinicians. The site includes topics included in the treatment program, sample materials, relevant empirical studies, and supplementary articles.

Sidran Institute

http://www.sidran.org
P.O. Box 436
Brooklandville, MD 21022-0436
Phone: 410-825-8888
Fax: 410-560-0134
Email: info@sidran.org

The Sidran Institute is a nationally focused nonprofit organization devoted to helping people who have experienced traumatic life events through education and advocacy. The Institute's education and advocacy focuses on:

- The early recognition and treatment of trauma-related stress in children.
- The understanding of trauma and its long-term effect on adults.
- The strategies in engaging in mutual-help recovery for trauma survivors.
- The clinical methods and practices leading in aiding trauma victims.
- The development of public policy initiatives responsive to the needs of adult and child survivors of traumatic events.

Substance Abuse and Mental Health Services Administration

http://www.samhsa.gov
1 Choke Cherry Lane
Rockville, MD 20857
Phone: 877-726-4727
Fax: 240-221-4292
Email: SAMHSAInfo@samhsa.hhs.gov

SAMHSA is the Federal agency within HHS charged with improving the quality and availability of prevention, treatment, and rehabilitative services to reduce illness, death, disability, and cost to society resulting from substance abuse and mental illness. The Emergency Mental Health and Traumatic Stress Services Branch, a branch of SAMHSA's Center for Mental Health Services, works with FEMA to provide crisis counseling training and technical assistance to State and local mental health professionals. SAMHSA offers several publications regarding trauma and PTSD, as well as a publication focusing on creating a seclusion-free and restraint-free environment.

Traumatic Stress Institute

http://www.traumaticstressinstitute.org
Klingberg Family Centers
370 Linwood Street
New Britain, CT 06052
Phone: 860-224-9113

The Traumatic Stress Institute (TSI) works to increase understanding of the psychological impact of trauma and to help victims of violence restore meaning and wholeness to their lives. In meeting these goals, TSI is involved in clinical service, professional training, community education, and research. TSI offers forensic assessment and expert testimony, professional education, training opportunities, and publications. TSI developed the "Risking Connections" trauma treatment program and provides training in the use of this model.

Tulane University Traumatology Institute

http://sites.google.com/site/charlesfigley/Home/traumatologyinstitute
Tulane School of Social Work
6823 St. Charles Ave., Building 9
New Orleans, LA 70118
Phone: 800-631-8234
Email: figley@tulane.edu

The Traumatology Institute, founded in 1996, brings together health and mental health professionals from a wide array of disciplines from throughout the United States and around the world to develop cutting-edge research, treatment approaches, and training programs in the field of traumatology. The Institute facilitates the development of knowledge about the traumatization experience of victims, survivors, and the professionals who serve them. The Traumatology Institute conducts research, education, and service activities toward reducing the deleterious effects of trauma on individuals, families, communities, and entire societies.

Veterans Affairs PTSD Support Services

http://www.ptsdsupport.net/va.html
P.O. Box 5574
Woodland Park, CO 80866
Email: russ@ptsdsupport.net

The Department of Veterans Affairs Medical Centers provide a network of more than 100 specialized programs for veterans with PTSD, working closely in conjunction with the Veterans Web Site (http://www.vetcenter.va.gov) operated by VA's Readjustment Counseling Service. Each specialized PTSD program offers veterans education, evaluation, and treatment conducted by mental health professionals from a variety of disciplines (such as psychiatry, psychology, social work, counseling, and nursing). See also: National Center for PTSD.

White Bison Wellbriety Training Institute

http://www.whitebison.org
701 N. 20th Street
Colorado Springs, CO 80904
Phone: 877-871-1495
Email: info@whitebison.org

White Bison is an American Indian nonprofit charitable organization that focuses on offering sobriety, recovery, addictions prevention, and wellness/Wellbriety learning resources to the Native American community nationwide. White Bison's Wellbriety Training Institute provides training, tools, and resources for historical and intergenerational trauma to trainers and mental health professionals.

Resources for Children and Adolescents

The following section provides resources that address the needs of children and adolescents who are affected by traumatic stress.

American Academy of Child & Adolescent Psychiatry

http://www.aacap.org
3615 Wisconsin Avenue NW
Washington, DC 20016-3007
Phone: 202-966-7300
Fax: 202-966-2891

The American Academy of Child & Adolescent Psychiatry (AACAP) is a national professional medical association dedicated to treating and improving the quality of life for children, adolescents, and families affected by mental, behavioral, and developmental disorders. AACAP distributes information to promote an understanding of mental illnesses and remove the shame associated with them, to advance efforts in prevention of mental illnesses, and to ensure proper treatment and access to services for children and adolescents.

American Professional Society on the Abuse of Children

http://www.apsac.org
350 Poplar Avenue
Elmhurst, IL 60126
Phone: 630-941-1235
Fax: 630-359-4274
E-mail: apsac@apsac.org

The mission of the American Professional Society on the Abuse of Children (APSAC) is to enhance the ability of professionals to respond to children and families affected by abuse and violence. Among other initiatives, APSAC provides education and other sources of information to professionals who work in the child maltreatment and related fields.

Anna Institute

http://www.theannainstitute.org
21 Ocean Street
Rockland, ME 04841
Email: afj@gwi.net

The Anna Institute was founded in memory of artist Anna Caroline Jennings; it focuses on educating both the public and mental health professionals about the effects of sexual abuse and trauma on children. The Anna Institute's Web site provides articles on incorporating

trauma-informed care into existing behavioral health models, presentations on childhood trauma and retraumatization, and handouts for teachers at primary and secondary schools.

Caring for Every Child's Mental Health Campaign

http://www.samhsa.gov/children
P.O. Box 2345
Rockville, MD 20847-2345
Email: nmhic-info@samhsa.hhs.gov

SAMHSA's Caring for Every Child's Mental Health communications campaign is a national public information and education operation. Its goals are to increase public awareness about the importance of protecting the mental health of young people; foster the recognition that many children have mental health problems; and encourage caregivers to seek early, appropriate treatment and services. It also strives to reduce discrimination associated with mental health problems. The campaign is a technical assistance program that is part of the Comprehensive Community Mental Health Services Program for Children and Their Families.

Child Study Center

http://www.aboutourkids.org
One Park Avenue
7th Floor
New York, NY 10016
Phone: 212-263-6622
Email: webmaster@aboutourkids.org

The New York University Child Study Center Web site offers information to parents of children and adolescents with learning, behavioral, and emotional disorders, including PTSD and substance use disorders. An online newsletter is available. Its research initiatives advance understanding of the causes and treatments of child mental disorders, and these findings are integrated into clinical care to provide state-of-the-art service.

Child Trauma Academy

http://www.childtrauma.org
5161 San Felipe
Suite 320
Houston, TX 77056
Phone: 866-943-9779
Email: cta@childtrauma.org

The mission of the Child Trauma Academy is to help improve the lives of traumatized and maltreated children. Through education, service delivery, and program consultation, the academy seeks to advance systems that educate, nurture, protect, and enrich these children.

Child Trauma Institute

http://www.childtrauma.com
P.O. Box 544
Greenfield, MA 01302-0544
Phone: 413-774-2340
Email: cti@childtrauma.com

The Child Trauma Institute provides training, consultation, information, and resources for those who work with trauma-exposed children, adolescents, and adults. The Web site has information for parents, publications for parents and professionals, and links to other child trauma Web sites.

Child Welfare Information Gateway

http://www.childwelfare.gov
Children's Bureau/ACYF
1250 Maryland Avenue SW
Eighth Floor
Washington, DC 20024
Phone: 800-394-3366
Email: info@childwelfare.gov

The Child Welfare Information Gateway (CWIG) is a service of the Children's Bureau in the Administration for Children and Families, part of HHS, which provides information

to child welfare and mental health professionals about programs, research, laws and policies, training approaches, and statistics regarding child welfare, child abuse and neglect, and adoption. CWIG offers educators' toolkits for preventing and responding to child abuse and neglect, a function to search State statutes about child abuse and neglect, and logic model builder toolkits for program administrators.

Child Welfare League of America

http://www.cwla.org
1726 M Street NW
Suite 500
Washington DC, 20036
Phone: 202-688-4200
Fax: 202-833-1689

Through its member child welfare agencies, the Child Welfare League of America develops and disseminates practice standards as benchmarks for high-quality services that protect children and youth; promotes high-quality services through training, consultation, conferences, and publications; formulates and promotes public policies that contribute to the well-being of children and youth; ensures that all child welfare services are provided in a manner that demonstrates respect for cultural and ethnic diversity; and promotes open exchange of data, resources, and ideas within and across systems that serve children, youth, and families.

Eunice Kennedy Shriver National Institute of Child Health and Human Development

http://www.nichd.nih.gov/Pages/index.aspx
31 Center Drive
Building 31, Room 2A32
Bethesda, MD 20892-2425
Phone: 800-370-2943

Established in 1962, NIH's National Institute of Child Health and Human Development (NICHD) focuses on human development processes from conception to later years. The Institute implements, conducts, and supports laboratory research, clinical trials, epidemiological research, and other studies that explore health processes and the impact of disabilities, diseases, and variations on the lives of individuals. NICHD sponsors training for scientists and healthcare providers to promote the goals of the Institute.

National Center for Children Exposed to Violence

http://www.nccev.org
Yale Child Study Center
230 South Frontage Road
P.O. Box 207900
New Haven, CT 06520-7900
Phone: 877-496-2238
Email: colleen.vadala@yale.edu

The National Center for Children Exposed to Violence (NCCEV) seeks to increase the capacity of individuals and communities to reduce the incidence and impact of violence on children and families; to train and support the professionals who provide intervention and treatment; and to increase professional and public awareness of the effects of violence on children, families, communities, and society. The Center's Web site is a rich source of information. NCCEV is supported by grants from the Office of Juvenile Justice and Delinquency Prevention, the Department of Justice, SAMHSA, and the Department of Education.

National Center on Substance Abuse and Child Welfare

http://www.ncsacw.samhsa.gov
P.O. Box 2345
Rockville, MD 20847-2345
Phone: 866-493-2758
Email: ncsacw@cffutures.org

The National Center on Substance Abuse and Child Welfare (NCSACW) is an initiative of HHS and is jointly funded by SAMHSA's Center for Substance Abuse Treatment and the Administration on Children, Youth and Families, Children's Bureau's Office on Child Abuse and Neglect. NCSACW seeks to develop and implement a comprehensive program of information gathering and dissemination, to provide technical assistance, and to develop knowledge that promotes effective practical, organizational, and systemic changes at the local, State, and national levels. Its Web site includes PowerPoint presentations, online tutorials and training, technical assistance presentations, and additional print resources.

National Child Traumatic Stress Network

http://www.nctsnet.org
NCTSN—University of California, Los Angeles
11150 W. Olympic Boulevard
Suite 650
Los Angeles, CA 90064
Phone: 310-235-2633
Fax: 310-235-2612

The National Child Traumatic Stress Network (NCTSN), currently comprising 54 treatment centers nationwide, is funded by SAMHSA's Center for Mental Health Services through the Donald J. Cohen National Child Traumatic Stress Initiative and coordinated by Duke University and the University of California, Los Angeles. The purpose of this congressionally mandated initiative is to improve the quality, effectiveness, provision, and availability of therapeutic services delivered to all children and adolescents experiencing traumatic events. NCTSN works with SAMHSA to raise public awareness of the effects of traumatic stress on children and families, and with other systems of care (including the health, mental health, education, law enforcement, child welfare, juvenile justice, and military family service systems) to ensure that there is a comprehensive trauma-informed continuum of accessible care. Additionally, NCTSN offers a list of evidence-based and promising practices.

National Institute for Trauma and Loss in Children

http://www.starrtraining.org/trauma-and-children
42855 Garfield Road
Suite 111
Clinton Township, MI 48038
Phone: 877-306-5256
Fax: 586-263-4915
Email: TLC@starrtraining.org

The National Institute for Trauma and Loss in Children provides school professionals, crisis intervention teams, medical and mental health professionals, child care professionals, and clinicians with trauma education, training, consultation, referral services, and trauma-specific intervention programs and resource materials needed to help those traumatized by violent or nonviolent trauma-inducing incidents.

National Native Children's Trauma Center

http://iers.umt.edu/National_Native_Childrens_Trauma_Center
Institute for Educational Research and Service
McGill Hall 026
The University of Montana
Missoula, MT 59812-6376
Phone: 406-243-5344
Fax: 406-243-2197
Email: iers@mso.umt.edu

The National Native Children's Trauma Center (NNCTC) is a federally funded organization created by SAMHSA and affiliated with the National Child Traumatic Stress Network. It

is run by the University of Montana. NNCTC offers trauma interventions and trainings to address trauma in American Indian/Alaska Native children, primarily through clinicians, Tribal programs, school systems, and community agencies.

Training Opportunities

The following resources highlight various training and credentialing opportunities for behavioral health professionals interested in gaining more education in treating and providing services to those affected by trauma. It is not an exhaustive list, but provides a starting place for service providers looking for further training.

The Web site of the ISTSS has posted a directory of trauma-related academic and training opportunities (http://www.istss.org/LearningAboutTrauma.htm). It includes links to the institutions providing the programs. The Association for Traumatic Stress Specialists (http://www.atss.info) offers three levels of recognition for education and experience:

- Certified Trauma Specialist (CTS)—designed for counselors, clinicians, and treatment specialists who provide intervention services or individual, group, and/or family counseling. This certification requires 240 hours of education and training in trauma treatment, plus 2,000 hours of trauma counseling and intervention experience.
- Certified Trauma Responder (CTR)—designed for those who provide immediate trauma interventions. It requires a minimum of 40 hours of experience on a crisis or critical incident response team, an associate degree or a high school diploma with successful completion of disaster or critical incident stress debriefing training, and 72 hours of crisis response training.
- Certified Trauma Services Specialist (CTSS)—designed for those who provide immediate trauma intervention, crisis support, advocacy, or victim assistance. It requires 1 year of experience in a trauma-related field, plus specific training.

Some colleges and universities, such as the International Trauma Studies Program at New York University and the Center for Anxiety and Related Disorders at Boston University, provide specialty trauma training for mental health practitioners. The University of Missouri at St. Louis offers specialized training in trauma therapy or research at its Center for Trauma Recovery to students in its Clinical Psychology graduate program. The Center for the Treatment and Study of Anxiety at the University of Pennsylvania provides training for health professionals. The Department of Counseling at the University of Nevada, Las Vegas offers a graduate and undergraduate course on Trauma and Addiction; graduate students can receive training in trauma and addictions as part of the Advanced Graduate Certificate in Addiction Studies. The Medical University of South Carolina offers Web-based courses in trauma-focused cognitive–behavioral therapy (TF-CBT) and in using TF-CBT for childhood traumatic grief. Many universities have faculty members with expertise in trauma and trauma-related subjects, so that training can be accessed through many graduate programs.

The Addiction Technology Transfer Center (ATTC) Network, a resource established in 1993 by the SAMHSA's Center for Substance Abuse Treatment, is a network of 14 independent regional centers with a national office. One of its programs provides long-distance education for clinicians on various topics. Among hundreds of self-paced, self-directed, and supervised courses available online (http://www.attcnetwork.org/learn/education/

dasp.asp) are Substance Abuse Treatment for Trauma Survivors, Substance Abuse Treatment for Persons with Child Abuse and Neglect Issues, Chemical Dependency and Posttraumatic Stress Disorder, Clinical Self-Care for Addiction Counselors and Clinical Supervisors, Eye Movement Desensitization and Reprocessing, Battered Women and Addictions, and Posttraumatic Stress Disorder. ATTC training and educational opportunities are based on empirical research and are intended to bring science to service. Undoubtedly, more distance-learning courses in this specialized area of interest will be developed as professional attention to co-occurring disorders increases.

SAMHSA's Center for Mental Health Services provides training for FEMA-approved crisis counseling programs using Stafford Act funding. These funding resources are available to select agencies designated to provide crisis counseling in the wake of a Presidential Disaster Declaration. Other funding for trauma training may be found through special programs of funding for target groups, such as those who provide mental health services and case management for victims of crime (e.g., Office for Victims of Crime in the U.S. Department of Justice; see p. 257).

The American Red Cross provides limited disaster mental health training. The focus of this training is to orient licensed mental health professionals to the Red Cross Disaster services system and their roles as volunteers.

The National Center for Post-Traumatic Stress Disorder was originally created in 1989 within the U.S. Department of Veterans Affairs (VA) to address the needs of veterans with military-connected PTSD. Its focus has since broadened to include trauma in general. The Center provides a variety of training opportunities for both VA and non-VA mental health personnel, including a PTSD 101 course developed specifically for clinicians who provide services to clients who have experienced trauma (see http://www.ptsd.va.gov/professional/index.asp).

Seeking Safety offers training in trauma, PTSD, and co-occurring disorders to mental health professionals on all levels, from counselors to nurses to administrators. The EMDR International Association (EMDRIA) provides training to clinicians for certification in EMDR via a curriculum including instruction, supervised practicum, and consultation; EMDRIA additionally provides basic training in the field, separate from the certification process. EMDR training is also provided by the EMDR Humanitarian Assistance Program, a nonprofit organization with a training-focused model to assist clinicians in treating trauma.

ISTSS was founded in 1985 to bring attention to the study, assessment, and treatment of traumatized people (http://www.istss.org). ISTSS is a professional society and provides face-to-face training during its annual meeting, especially through the preconference institutes. The ISTSS Web site offers numerous video and audio trainings for continuing education credits. ISTSS and the Figley Institute (http://www.figleyinstitute.com) have established best practice standards. The American Academy of Experts in Traumatic Stress provides training and certification in several different areas (http://www.aaets.org). Similarly, the International Society for the Study of Dissociation (http://www.issd.org) specializes in promoting therapies for dissociative disorders. In 2002, the Green Cross Academy of Traumatology (http://www.greencross.org) established a Commission on Accreditation of Traumatology Education Programs to increase and maintain the high standards in the education and training of traumatologists.

Appendix C—Historical Account of Trauma

Historically, symptoms of traumatic stress have been recorded in both military and civilian populations (Lasiuk & Hegadoren, 2006). Early accounts described the effect of battle conditions on soldiers; "soldier's heart" and "nostalgia" were the terms for traumatic stress reactions used during the American Civil War. As warfare techniques and strategies changed, so did the depiction of soldiers' traumatic stress reactions. The advent of heavy explosives in World War I led to the attribution of symptoms to "shell shock," giving a more physiological description of the effects from explosions (Benedek & Ursano, 2009). On the civilian side, the industrial revolution gave rise to larger and more dramatic catastrophes, including industrial and railway accidents. These, as well as other disasters, are noted in occupational health histories, newspapers, and contemporary literature.

Even with a more physical explanation of traumatic stress (i.e., shell shock), a prevailing attitude remained that the traumatic stress response was due to a character flaw. For instance, a soldier's pain at that time was often seen as a symptom of homesickness. In spite of the efforts of Charcot, Janet, and Freud, who described the psychogenic origin of symptoms as a response to psychological trauma (Lasiuk & Hegadoren, 2006), World War II military recruits were screened in attempt to identify those "who were afflicted with moral weakness," which would prevent them from entering military service.

At the same time, there were new treatment innovations for war-related trauma during World War II. One approach treated soldiers in the field for what was then called "battle fatigue" by allowing some time for rest before returning to battle. During the Korean and Vietnam wars, approaches began to focus more on the use of talk therapy. It was not until the post-Vietnam era that interest in developing treatment alternatives started to take hold. During this time, the U.S. Department of Veterans Affairs (then called the Veterans Administration) developed group therapy for posttraumatic stress disorder (PTSD). Beyond being cost-effective, the technique was well suited to the symptoms of the veterans and fostered socialization and reintegration (Greene et al., 2004).

The publication of the American Psychiatric Association's (APA's) *Diagnostic and Statistical Manual of Mental Disorders,* Third Edition (DSM-III), in 1980 marked the introduction of PTSD as a diagnosis, inspired by symptoms presented by veterans of the Vietnam War (Benedek & Ursano, 2009). The diagnosis in this iteration required the identification of a specific stressor—a catastrophic stressor that was outside the range of usual human experience (APA, 1980)—and classified PTSD as

Historical Approaches to Trauma Healing and Recovery

First Generation of Approaches to Trauma Healing and Recovery
The first generation approaches to trauma healing and recovery focused on individual and clinical interventions to address the symptoms of PTSD and moved toward integration of trauma effects into ongoing life activities. The rapidly developing recognition of additional groups with violence and trauma histories—beyond those with war and captivity experiences (e.g., survivors of natural disasters and terrorism, refugees and immigrants fleeing homeland violence and persecution)—presented issues and needs that incited a second generation of approaches to trauma healing and recovery.

Second Generation of Approaches to Trauma Healing and Recovery
The second generation approaches focused on psychosocial education and empowerment models designed to tap into self-healing forces to energize personal and social movement. These approaches often are based on group and peer support models, and provide both support and education on the management of trauma and its affects. These approaches are not designed to replace clinical or alternative therapies; rather, they provide a social context for care.

Concurrent to the development of psychosocial educational empowerment approaches, we also learned that if the approaches are not implemented in organizations or programs that are trauma-informed, they will not take root and may lose effectiveness.

Trauma-Informed Care: A New Paradigm for Public Health Services
Trauma-informed care is a new paradigm for organizing public mental health and human services. Trauma-informed care changes the opening question for those seeking services from "What is wrong with you?" (patient or consumer) to "What has happened to you?" (survivor). Trauma-informed care is initiated by assumption that every person seeking services is a trauma survivor who designs his or her own path to healing, facilitated by support and mentoring from the service provider.

In a trauma-informed environment, survivors are empowered to proactively set goals and to manage progress toward those goals. For most existing organizations or programs, that requires movement from a traditional "top down" hierarchical clinical model to a psychosocial empowerment partnership that embraces all possible tools and paths to healing. In a pluralistic public health system with many levels and types of services and treatment, this is coming to be accepted as a "sine qua non," or "without which not," for humane, dignified, cost-effective, genuinely person-centered support and assistance in moving forward.

Source: Salasin, 2011, p. 18.

an anxiety disorder (Lasiuk & Hegadoren, 2006). Beginning with this definition, the body of research grew, and the scope of application began to broaden, but not without considerable debate on what constituted a trauma.

The social revolution that began in the 1960s, combined with the women's movement and the call for more attention to diverse and disenfranchised groups, set the stage for an increase in the acknowledgement and treatment of victims of interpersonal violence and crime-related trauma (Figley, 2002). The introduction of rape trauma syndrome as a condition highlighted the psychological consequences of sexual assault and the subsequent lack of support from society and the social services system (Kramer & Green, 1997). Subsequently, research began to focus more on interpersonal violence, thus leading to the identification of risk factors and treatment approaches unique to this form of violence and trauma (Olff, Langeland, Drajer, & Gersons, 2007).

With input from international and national mental health organizations and research, the DSM-IV further modified the definition of trauma to include a broader interpretation of the identified stressor (Andreasen, 2010). DSM-5 has maintained the modified definition of trauma, but the criterion requires being explicit as to whether qualifying traumatic events were experienced directly, witnessed, or experienced indirectly (APA, 2013b).

Paralleling the change in DSM criteria, cognitive–behavioral therapy for traumatic stress was developed along with other skills-based approaches (Greene et al., 2004).

Researchers, such as Foa, Resick, D'Zurilla, and Michenbaum, added to the body of knowledge and gave clinicians a variety of tools; these approaches continue to develop and show efficacy even today. There was also renewed interest in the long- and short-term effects of childhood sexual abuse and domestic violence. Interest in documenting the effects of trauma expanded further, including traumatic brain injury, significant orthopedic injuries, and multiple traumas (Starr et al., 2004). So too, the consumer movement in health care began. Consumers insisted on patient rights, humane treatment, and involvement in the treatment process; as a result, the paternalistic approach to health care began to change. As consumers set the initial stage and Federal agencies (e.g., the Substance Abuse and Mental Health Services Administration and its centers) and national organizations promoted the need for trauma-informed policies and care, national studies began to demonstrate the prevalence of traumatic experiences. Research including the Adverse Childhood Experiences and the Women, Co-Occurring, and Violence studies clearly demonstrated the pervasive long-term impact of trauma, reinforcing the call for trauma-informed policies and care. (For more information on the development of trauma-informed care, see Harris and Fallot, 2001b, as well as Jennings, 2004.)

Appendix D—Screening and Assessment Instruments

This appendix provides a selected sample of available tools for screening and assessment of traumatic events and trauma-related symptoms. This is not an exhaustive list, nor does this list focus on screening instruments that capture a broader range of symptoms related to trauma (such as sleep hygiene and dissociation) or other features important in providing trauma-informed care (e.g., resilience level, coping skill style, resource availability). For more information on a broad range of available instruments, refer back to Part 1, Chapter 4. Many of the instruments listed below use criteria found in the *Diagnostic and Statistical Manual of Mental Disorders*, Fourth Edition, Text Revision (DSM-IV-TR; APA, 2000), but with the release of the DSM-5 (APA, 2013a), instruments will evolve, and new versions will be available under the same contact information.

Screening and Assessment Measures

- Clinician Administered PTSD Scale (CAPS)
- Davidson Trauma Scale (DTS)
- Distressing Event Questionnaire (DEQ)
- Evaluation of Lifetime Stressors (ELS)
- Impacts of Event Scale Revised (IES-R)
- Mississippi Scale for Combat-Related PTSD (M-PTSD)
- Penn Inventory for Posttraumatic Stress Disorder
- Posttraumatic Diagnostic Scale (PDS)
- PTSD Symptom Scale-Interview (PSS-I)
- PTSD Symptom Scale: Self-Report Version (MPSS-SR)
- Screen for Posttraumatic Stress Symptoms (SPTSS)
- Structured Interview for PTSD (SI-PTSD)
- Trauma Assessment for Adults (TAA)
- Trauma Assessment for Adults (TAA)–Self Report
- Trauma History Questionnaire (THQ)
- Trauma Symptom Inventory (TSI)
- Traumatic Stress Schedule

Screening and Assessment Measures

Clinician Administered PTSD Scale (CAPS)

Domains:	Posttraumatic stress disorder (PTSD), acute stress disorder (ASD)
Timeframe:	CAPS-Sx: Lifetime and current (past week) CAPS-Dx: Current (past month)
Response format:	Other
Format of administration:	Structured
Number of items:	30
Completion time:	30–60 minutes
Qualifications to administer:	Administered by clinicians and clinical researchers who have a working knowledge of PTSD and by appropriately trained paraprofessionals
How to obtain scale:	Contact Danny G. Kaloupek, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: veterans, car accident survivors Reliability: alpha = .94, test-retest = .90–.98 Validity: sensitivity = .85, specificity = .95 (compared with Structured Clinical Interview for DSM Disorders [SCID]), r = .91 (with MS Scale for Combat-related PTSD) kappa = .77 against the SCID diagnosis; item-total correlations = .49–.82; internal consistency = .94
Author(s):	Dudley David Blake, Frank W. Weathers, Linda M. Nagy, Danny G. Kaloupe, Dennis S. Charney, and Terence M. Keane
Contact:	Danny G. Kaloupek, Ph.D. National Center for PTSD Boston VA Medical Center, 11B 150 South Huntington Avenue Boston, MA 02130
Relevant citations:	Blake, D. D. (1994). Rationale and development of the clinician-administered PTSD scales. *PTSD Research Quarterly, 5,* 1–2. Blake, D. D., Weathers, F. W., Nagy, L. M., Kaloupek, D. G., Gusman, F. D., Charney, D. S., & Keane, T. M. (1995). The development of a clinician-administered PTSD scale. *Journal of Traumatic Stress, 8*, 75–90.

Weathers, F. W., Keane, T. M., & Davidson, J. R. (2001). Clinician-Administered PTSD Scale: A review of the first ten years of research. *Depression and Anxiety, 13*, 132–156.

Davidson Trauma Scale (DTS)

Domains:	PTSD symptoms
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and course work in the use of assessment instruments or special training in the use of this instrument. Education/training requirements may be waived for those granted the right to administer tests at this level (B) in their jurisdiction.
How to obtain scale:	Contact Mental Health Systems, Inc.
Cost or public domain:	Cost: $15.00
Psychometrics:	Populations sampled: rape victims, veterans, hurricane victims, miscellaneous traumas Reliability: alpha = .99, test-retest = .86
Author(s):	Jonathan R.T. Davidson
Contact:	Mental Health Systems, Inc. 908 Niagara Falls Boulevard North Tonawanda, NY, 14120-2060 800-456-3003
Relevant citations:	Davidson, J. R. T., Book, S. W., Colket, J. T., Tupler, L. A., Roth, S., David, D., Hertzberg, M., Mellman, T., Beckham, J.C., Smith, R., Davison, R. M., Katz, R., & Feldman, M. (1997). Assessment of a new self-rating scale for posttraumatic stress disorder. *Psychological Medicine, 27,* 153–160. Davidson, J. R., Tharwani, H. M., & Connor, K. M. (2002). Davidson Trauma Scale (DTS): Normative scores in the general population and effect sizes in placebo-controlled SSRI trials. *Depression and Anxiety, 15*, 75–78.

Distressing Event Questionnaire (DEQ)

Domains:	Posttraumatic Stress Disorder (PTSD) for multiple events
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured
Number of items:	35
Completion time:	10–15 minutes
Qualifications to administer:	Contact Edward Kubany, Ph.D.
How to obtain scale:	Contact Edward Kubany, Ph.D.
Cost or public domain:	Contact Edward Kubany, Ph.D.
Psychometrics:	Population sampled: veterans, battered women Reliability: inter-item r = .93, test-retest = .95; validity: Pearson's r reliability coefficient = .83 (with Penn Inventory, Pearson's r reliability coefficient = .76 (with Beck Depression Inventory)
Author(s):	Edward Kubany, Mary Beth Leisen, Aaron S. Kaplan, Martin P. Kelly
Contact:	Edward Kubany, Ph.D. National Center for PTSD Pacific Islands Division Department of VA Suite 307 Honolulu, HI 96813 Kubany.Edward@honolulu.va.gov
Relevant citations:	Kubany, E. S., Leisen, M. B., Kaplan, A. S., & Kelly, M. P. (2000). Validation of a brief measure of posttraumatic stress disorder: The distressing event questionnaire (DEQ). *Psychological Assessment, 12*, 197–209.

Evaluation of Lifetime Stressors (ELS)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Other
Format of administration:	Structured
Number of items:	56
Completion time:	10–20 minutes for screening, 1–3 hours for complete interview
Qualifications to administer:	Should be administered by trained clinicians only

How to obtain scale:	Contact Karen Krinsley, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: male veterans, female sexual abuse survivors Reliability: r = .4–1.0
Author(s):	Karen Krinsley, Frank W. Weathers, Elana Newman, Edward A. Walker, Danny G. Kaloupek, Rachel Kimerling
Relevant citations:	Corcoran, C. B., Green, B. L., Goodman, L. A., & Krinsley, K. E. (2000). Conceptual and methodological issues in trauma history assessment. In A. Y. Shalev, R. Yehuda, & A. C. McFarlane (Eds.), *International handbook of human response to trauma* (pp. 22–232). Dordrecht, Netherlands: Kluwer Academic Publishers. Krinsley, K. (1996). Psychometric review of the Evaluation of Lifetime Stressors (ELS) Questionnaire and Interview. In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation (*pp. 160–162). Lutherville, MD: Sidran Press.

Impact of Event Scale Revised (IES-R)

Domains:	PTSD for a single event
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	22
Completion time:	5–10 minutes for screening
Qualifications to administer:	None
How to obtain scale:	http://consultgerirn.org/uploads/File/trythis/try_this_19.pdf
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: earthquake survivors, emergency disaster workers, Vietnam veterans, violence and sexual assault victims Reliability: alpha = .79–.92, test-retest = .89–.94, Pearson's r reliability coefficient = .74–.87
Author(s):	Daniel Weiss and Charles R. Marmar
Relevant citations:	Sundin, E. C. & Horowitz, M. J. (2002). Impact of Event Scale: Psychometric properties. *British Journal of Psychiatry, 180,* 205–209. Weiss, D. S. & Marmar, C. R. (1996).The Impact of Event Scale-Revised. In J. Wilson & T. M. Keane (Eds.), *Assessing psychological trauma and PTSD* (pp. 399–411). New York: Guilford Press. (Includes measure in its entirety.)

Mississippi Scale for Combat-Related PTSD (M-PTSD)

Domains:	PTSD for multiple events
Timeframe:	Contact National Center for PTSD at ncptsd@ncptsd.org
Response format:	Self-administered
Format of administration:	Structured
Number of items:	35
Completion time:	10–15 minutes
Qualifications to administer:	Contact National Center for PTSD at ncptsd@va.gov
How to obtain scale:	To order the scale contact the National Center for PTSD
Cost or public domain:	Free (ncptsd@va.gov)
Psychometrics:	Population sampled: veterans Reliability: inter-item r = .94, test-retest = .97 Validity: sensitivity = .93, specificity = .89
Author(s):	Terence M. Keane
Contact:	National Center for PTSD (116D) VA Medical Center 215 N. Main St. White River Junction, VT 05009 http://www.ptsd.va.gov/
Relevant citations:	Engdahl, B. & Eberly, R. (1994). Assessing PTSD among veterans exposed to war trauma 40–50 years ago. *NCP Clinical Quarterly, 4,* 13–14. Keane, T. M., Caddell, J. M., & Taylor, K. L. (1988). Mississippi Scale for Combat-Related Posttraumatic Stress Disorder: Three studies in reliability and validity. *Journal of Consulting and Clinical Psychology, 56,* 85–90.

Penn Inventory for Posttraumatic Stress Disorder

Domains:	PTSD for multiple events
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	26
Completion time:	5–15 minutes

Qualifications to administer:	Contact Melvyn Hammarberg, Ph.D.
How to obtain scale:	Contact Melvyn Hammarberg, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: veterans, oil-rig disaster survivors Reliability: alpha = .94, test-retest = .96
Author(s):	Melvyn Hammarberg
Contact:	Melvyn Hammarberg, Ph.D. Department of Anthropology University of Pennsylvania 325 University Museum 33rd and Spruce Street Philadelphia, PA 19104-6398
Relevant citations:	Hammarberg, M. (1996). Psychometric review of the Penn Interview for Post Traumatic Stress Disorder. In B. C., Stillman, J., & Pape, H. C. (2011). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

Posttraumatic Diagnostic Scale (PDS)

Domains:	DSM-IV PTSD symptom clusters
Timeframe:	Current (past month)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	49
Completion time:	10–15 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and course work in the use of assessment instruments or special training in the use of this instrument.
How to obtain scale:	Contact National Computer Systems (NCS)
Cost or public domain:	Cost: $15.00
Psychometrics:	Population sampled: accident/fire, disaster, assault, sexual assault, sexual abuse, major illness Reliability: alpha = .92, test-retest = .83 Validity: sensitivity = .89, specificity = .75

Author(s):	Edna B. Foa, Ph.D.
Contact:	National Computer Systems (NCS) 5605 Green Circle Drive Minnetonka, MN 55343
Relevant citations:	Foa, E. (1996). *Post-traumatic Diagnostic Scale manual*. Minneapolis, MN: National Computer Systems. Foa, E., Cashman, L., Jaycox, L., & Perry, K. (1997). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

PTSD Symptom Scale-Interview (PSS-I)

Domains:	PTSD single event
Timeframe:	Current (past 2 weeks)
Response format:	Other
Format of administration:	Structured
Number of items:	17
Completion time:	20 minutes
Qualifications to administer:	Can be administered by a master's level interviewer after a few hours of training.
How to obtain scale:	Contact Edna B. Foa, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: female sexual assault victims, female assault victims Reliability: alpha = .85, test-retest = .80; validity: sensitivity = .88, specificity = .96 (compared with SCID); Pearson's r reliability coefficient = .48–.80 (with Impact of Events intrusion and avoidance, State portion of State-Trait Anxiety Inventory, and MPSS-SR)
Author(s):	Edna B. Foa and Gregory A. Leskin
Contact:	Edna B. Foa, Ph.D. Medical College of Pennsylvania Department of Psychiatry 3200 Henry Avenue Philadelphia, PA 19129-1137

Relevant citations:	Foa, E. B., Riggs, D. S., Dancu, C. V., & Rothbaum, B. O. (1993). PTSD Symptom Scale: Self-Report Version (MPSS-SR)

Domains:	PTSD for multiple or unknown events
Timeframe:	Current (past 2 weeks)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	Contact Sherry Falsetti, Ph.D.
How to obtain scale:	Contact Sherry Falsetti, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Reliability: alpha = .96–.97 Validity: sensitivity = .89, specificity = .65
Author(s):	Sherry Falsetti, Patricia A. Resick, Heidi S. Resnick, Dean G. Kilpatrick
Contact:	Sherry Falsetti, Ph.D. University of Illinois College of Medicine Department of Family and Community Medicine 1601 Parkview Avenue Rockford, IL 61107-1897
Relevant citations:	Bonin, M. F., Norton, G. R., Asmundson, G. J., Dicurzio, S., & Pidlubney, S. (2000). Screen for Posttraumatic Stress Symptoms (SPTSS)

Domains:	PTSD for multiple or unknown events
Timeframe:	Current (past 2 weeks)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	5 minutes
Qualifications to administer:	Contact Eve Carlson, Ph.D.
How to obtain scale:	Contact Eve Carlson, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: psychiatric inpatients Reliability: split half reliability = .91, test-retest = .82
Author(s):	Eve Carlson, Ph.D.
Contact:	Eve Carlson, Ph.D. National Center for PTSD (352-117-MP) Palo Alto Health Care System 795 Willow Road Menlo Park, CA 94025
Relevant citations:	Carlson, E. (2001). Psychometric study of a brief screen for PTSD: Assessing the impact of multiple traumatic events. *Assessment*, *8*, 431–441.

Structured Interview for PTSD (SI-PTSD)

Domains:	PTSD single event
Timeframe:	Current (past 4 weeks)
Response format:	Other
Format of administration:	Structured
Number of items:	17

Completion time:	20–30 minutes
Qualifications to administer:	Can be administered by mental health professionals or by paraprofessionals after some training.
How to obtain scale:	Contact Jonathan Davidson, M.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: veterans Reliability: alpha = .94, test-retest = .71, intraclass r = .97 Validity: sensitivity = .96, specificity = .80 (compared with SCID), Pearson's r reliability coefficient = .61 (with IES), Pearson's r reliability coefficient = .51 (with Hamilton Anxiety Scale)
Author(s):	Jonathan Davidson
Contact:	Jonathan Davidson, M.D. Department of Psychiatry Box 3812 Duke University Medical Center Durham, NC 27710-3812
Relevant citations:	Davidson, J. R. T., Kudler, H. S., & Smith, R. D. (1990). Assessment and pharmacotherapy of posttraumatic stress disorder. In J. E. L. L., Dunlavy, A. C., Stillman, J., & Pape, H. C. (2011). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

Trauma Assessment for Adults (TAA)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Other
Format of administration:	Structured
Number of items:	13
Completion time:	10–15 minutes
Qualifications to administer:	None specified
How to obtain scale:	Contact Heidi Resnick, Ph.D.
Cost or public domain:	Public domain

Psychometrics:	Populations sampled: adult mental health center clients; face validity established; feasible; validity established via archival records
Author(s):	Connie L. Best, John R. Freedy, Sherry A. Falsetti, Dean G. Kilpatrick, Heidi S. Resnick
Relevant citations:	Cusack, K. J., Frueh, B. C., & Brady, K. T. (2004). Trauma history screening in a community mental health center. *Psychiatric Services, 55,* 157–162. Resnick, H. S. (1996). Psychometric review of Trauma Assessment for Adults (TAA). In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation* (pp. 362–365). Lutherville, MD: Sidran Press.

Trauma Assessment for Adults (TAA)–Self Report

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	None specified
How to obtain scale:	Contact Heidi Resnick, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	None to date
Author(s):	Connie L. Best, John R. Freedy, Sherry A. Falsetti, Dean G. Kilpatrick, Heidi S. Resnick
Relevant citations:	Resnick, H. S., Falsetti, S. A., Kilpatrick, D. G., & Freedy, J. R. (1996). Miller (Ed.), *Stressful life events* (pp. 231–266). Madison, WI: International Universities Press.

Trauma History Questionnaire (THQ)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured

Number of items:	24
Completion time:	5–15 minutes
Qualifications to administer:	Contact Bonnie L. Green, Ph.D.
How to obtain scale:	Contact Bonnie L. Green, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: psychiatric outpatients, college students, women with breast cancer Reliability: r = 0.7–0.9, intraclass = .76
Author(s):	Bonnie L. Green
Relevant citations:	Hooper, L., Stockton, P., Krupnick, J., & Green, B., (2011). Development, use, and psychometric properties of the Trauma History Questionnaire. *Journal of Loss and Trauma, 16*, 258–283. Muesser, K. T., Salyers, M. P., Rosenberg, S. D., Ford, J. Martin (Eds.), *Assessing psychological trauma and PTSD* (pp. 63–102). New York: Guilford Press.

Trauma Symptom Inventory (TSI)

Domains:	Trauma-related symptoms
Timeframe:	Current (last 6 months)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	100
Completion time:	20 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and courses in the use of assessment instruments or special training in the use of this instrument.
How to obtain scale:	Contact Psychological Assessment Resources
Cost or public domain:	Cost: $15.00
Psychometrics:	Population sampled: general population Reliability: alpha = .84–.87

Author(s):	John Briere
Contact:	Psychological Assessment Resources Box 998 Odessa, FL 33556
Relevant citations:	Briere, J. (1996). Psychometric review of Trauma Symptom Inventory (TSI). In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation* (pp. 381–383). New York: KluwerAcademic/Plenum.

Traumatic Stress Schedule

Domains:	Trauma history
Timeframe:	Current (but author suggests any period)
Response format:	Other
Format of administration:	Semi-structured
Number of items:	10 (with 12 probes)
Completion time:	5–30 minutes
Qualifications to administer:	Can be administered by lay interviewer with training
How to obtain scale:	Contact Fran Norris, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Reliability: test-retest = .88, frequency of events equal to National Women's Study PTSD Module
Author(s):	Fran Norris
Relevant citations:	Norris, F. H. (1990). Screening for traumatic stress: A scale of use in the general population. *Journal of Applied Social Psychology*, *20*, 1704–1718. (Includes measure in its entirety.) Norris, F. H. & Hamblen, J. L. (2004). Standardized self-report measures of civilian trauma and PTSD. In J. P. Wilson, T. M. Keane & T. Martin (Eds.), *Assessing psychological trauma and PTSD* (pp. 63–102). New York: Guilford Press.

Appendix E—Consumer Materials

The following are samples of available consumer materials relating to trauma-informed care and traumatic stress. There is a plethora of consumer information available to meet the immediate and long-term needs of consumers of behavioral health services affected by trauma. In order to not waste effort creating new materials for your client's concerns, it is advisable to explore current science-informed resources. In most cases, consumer materials are already available and easily accessible for free.

AfterDeployment.org (2010). *Just the Facts: Resilience*. Available: http://afterdeployment.org/sites/default/files/pdfs/client-handouts/resilience-understanding.pdf

This Web site provides resources to address symptoms related to traumatic stress in addition to other postdeployment adjustment issues. This site provides information and handouts on resilience, triggers, and other trauma-related topics. It is appropriate for service members as well as civilians.

Blanch, A., Filson, B., & Penny, D. (2012). *Engaging Women in Trauma-Informed Peer Support: A Guidebook*. Available: http://www.nasmhpd.org/publications/engagingwomen.aspx

This draft technical assistance guide was created by the National Center for Trauma-Informed Care (NCTIC) and developed under contract with the National Association of State Mental Health Program Directors. This publication is designed to help make trauma-informed peer support available to women who are trauma survivors and who receive or have received behavioral health services. It is a resource for peers providing support in these or other settings who want to learn how to use trauma-informed principles in supporting women or in the peer support groups. It has been a resource used in the delivery of technical assistance through NCTIC.

Brymer, M., Jacobs, A., Layne, C., Pynoos, R., Ruzek, J., Steinberg, A., et al. (2006). Appendix E: Handouts. *Psychological First Aid: Field Operations Guide.* Available: http://www.ptsd.va.gov/professional/manuals/manual-pdf/pfa/PFA_Appx_E_handouts.pdf

Developed jointly with the National Child Traumatic Stress Network and the National Center for PTSD, this curriculum provides a science-informed approach to psychological first aid for response workers. The goals of this module are to assist survivors in the immediate aftermath of disaster and/or terrorism, reduce initial distress, and foster short- and long-term adaptive functioning. This link provides specific survivor-oriented material, such as strategies in seeking and giving support, education on common immediate reactions, and parental tips for children across developmental stages.

Center for Mental Health Services (2002). *Dealing with the Effects of Trauma-A Self-Help Guide.* Available: http://store.samhsa.gov/shin/content//SMA-3717/SMA-3717.pdf

This self-help guide gives practical information and tools to address and manage symptoms and other consequences of traumatic stress. It provides education on a variety of topics, including trauma-related symptoms, advice on the key ingredients of quality care, barriers to recovery, and practical strategies to enhance recovery and manage difficult emotions.

Center for Mental Health Services, Substance Abuse and Mental Health Services Administration (2005). *Roadmap to Seclusion and Restraint Free Mental Health Services*. Available: http://store.samhsa.gov/product/Roadmap-to-Seclusion-and-Restraint-Free-Mental-Health-Services-CD-/SMA06-4055

This curriculum concerns the elimination of seclusion and restraint. It provides numerous handouts for consumers as well as staff. Several consumer handouts include common reactions to trauma, a trauma screening tool, and strategies to de-escalate agitation and distress.

Mead, S. (2008). *Intentional Peer Support: An Alternative Approach*. Sherry Mead Consulting. Available: http://www.intentionalpeersupport.org/apps/webstore/products/show/3408520

This interactive workbook is designed for individuals who are in peer support roles and those who use peer support services. It provides goals, tasks, competencies, and skills associated with peer support relationships and guidelines for first interviews.

Najavits, L. M. (2002). *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse*. New York: Guilford Press.

This evidence-based practice for individuals who have a history of trauma and a substance use disorder provides not only guidelines for clinicians but handouts for individuals. The consumer materials include information on PTSD and substance abuse and their interrelationship, key principles of the Seeking Safety program, coping skills to support safety, and grounding exercises. For additional information and resources, go to http://www.seekingsafety.org.

National Center for PTSD, U.S. Department of Veterans Affairs (2010). *Understanding PTSD*. Available: http://www.ptsd.va.gov/public/understanding_ptsd/booklet.pdf

This booklet provides consumer information on posttraumatic stress, common traumatic stress symptoms, effective treatments, and resources. The National Center for PTSD also provides additional professional and public resources specific to trauma for veterans and civilians.

Sidran Institute (2012). *Healing Self-Injury*. Available: http://healingselfinjury.org/about.html

This Web site provides numerous resources for consumers and professionals to understand self-inflicted violence. It offers publication links, archived newsletters, and a current blog focused on self-harm.

Appendix F—Organizational Assessment for Trauma-Informed Care

The following two resources are organizational assessments, which represent a key strategy in developing or re-evaluating trauma-informed services. The first assessment, presented by the University of South Florida, College of Behavioral and Community Sciences (2012), is designed for staff or key stakeholders. The second assessment comes from the *Trauma-Informed Organizational Toolkit for Homeless Services* (Guarino, Soares, Konnath, Clervil & Bassuk, 2009) and is a consumer version. There are several other assessment tools available, including Fallot and Harris's *Creating Cultures of Trauma-Informed Care (CCTIC): A Self Assessment and Planning Protocol* (2009).

Staff or Key Stakeholder Organizational Assessment Tool
University of South Florida, College of Behavioral and Community Sciences (2012). *Creating Trauma-Informed Care Environments: An Organizational Self-Assessment*. Available: http://www.cfbhn.org/assets/TIC/youthresidentialself%20assess%20Fillable%20FORM%20%282%29.pdf

Consumer Version: Organizational Assessment Tool
Guarino, K., Soares, P., Konnath, K., Clervil, R., & Bassuk, E. (2009). *Trauma-Informed Organizational Toolkit for Homeless Services*. Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration, and the Daniels Fund, the National Child Traumatic Stress Network, and the W.K. Kellogg Foundation. See: pp. 82–93. Available: http://www.familyhomelessness.org/media/90.pdf

Coalition for a Drug-Free Hawaii
Kaneohe, HI
Asian and Pacific Islanders Workgroup and Aging Workgroup

Appendix J: Acknowledgments

Numerous people contributed to the development of this Treatment Improvement Protocol (TIP), including the TIP Consensus Panel (p. vii), the Knowledge Application Program (KAP) Expert Panel and Federal Government Participants (p. ix), SAMHSA Resource Panel (see Appendix G), TIP Field Reviewers (Appendix H), and the KAP Cultural Competency and Diversity Network participants (Appendix I).

This publication was produced under KAP, a Joint Venture of The CDM Group, Inc. (CDM), and JBS International, Inc. (JBS), under contract numbers 270-99-7072, 270-04-7049, and 270-09-0307 for the Substance Abuse and Mental Health Services Administration, Center for Substance Abuse Treatment.

CDM KAP personnel included Rose M. Urban, M.S.W., J.D., LCSW, LCAS, KAP Executive Deputy Project Director; Jessica L. Culotta, M.A., KAP Managing Project Co-Director; Susan Kimner, former Managing Project Co-Director; Elizabeth Marsh, former KAP Deputy Project Director; Claudia Blackburn, M.S., Psy.D., Expert Content Director; Sheldon Weinberg, KAP Senior Researcher/Applied Psychologist; Bruce Carruth, Ph.D., Expert Content Director; Raquel Witkin, M.S., former Deputy Project Manager; Janet G. Humphrey, M.A., former Editor/Writer; Virgie D. Paul, M.L.S., Librarian; Angela T. Fiastro, KAP Junior Editor; Sonja Easley and Elizabeth Plevyak, former Editorial Assistants; and Elizabeth Pratt, Ph.D., Carol Schober, Psy.D., M.S.N., and Patricia A. Burke, M.S.W., LCSW, BCD, C-CATODSW, CCS, contributing authors. Special thanks to Stephanie Perry, M.D., for providing a content review of the TIP, and to John P. Allen, Ph.D., for writing draft material and contributing information on combat stress.

SAMHSA TIPs and Publications Based on TIPs

What Is a TIP?

Treatment Improvement Protocols (TIPs) are the products of a systematic and innovative process that brings together clinicians, researchers, program managers, policymakers, and other Federal and non-Federal experts to reach consensus on state-of-the-art treatment practices. TIPs are developed under the Substance Abuse and Mental Health Services Administration's Knowledge Application Program (KAP) to improve the treatment capabilities of the Nation's alcohol and drug abuse treatment service system.

What Is a Quick Guide?

A Quick Guide clearly and concisely presents the primary information from a TIP in a pocket-sized booklet. Each Quick Guide is divided into sections to help readers quickly locate relevant material. Some contain glossaries of terms or lists of resources. Page numbers from the original TIP are referenced so providers can refer back to the source document for more information.

What Are KAP Keys?

Also based on TIPs, KAP Keys are handy, durable tools. Keys may include assessment or screening instruments, checklists, and summaries of treatment phases. Printed on coated paper, each KAP Keys set is fastened together with a key ring and can be kept within a treatment provider's reach and consulted frequently. The Keys allow you, the busy clinician or program administrator, to locate information easily and to use this information to enhance treatment services.

Ordering Information

Publications may be ordered or downloaded for free at http://store.samhsa.gov. To order over the phone, please call 1-877-SAMHSA-7 (1-877-726-4727) (English and Español).

Implementing a Trauma-Informed Approach for Youth across Service Sectors

This brief is based on a webinar, ***Implementing a Trauma-Informed Approach for Youth Across Service Sectors***, held Tuesday, May 21, 2013, 2:00 p.m. to 3:30 p.m. EDT. The webinar was sponsored by the Interagency Working Group on Youth Programs (IWGYP), a collaboration of 18 Federal departments and agencies that support programs and services focusing on youth and promote the goal of positive, healthy outcomes for youth. The webinar was planned jointly by the IWGYP and the Substance Abuse and Mental Health Services Administration (SAMHSA). The webinar slides are housed on the IWGYP website, FindYouthInfo.gov, under the Mental Health Youth Topic. The webinar featured three content experts nationally known in their field: Eugene Griffin, J.D., Ph.D., Northwestern University, Feinberg School of Medicine; Julian Ford, Ph.D., University of Connecticut, School of Medicine; and Charles Wilson, MSSW, Chadwick Center for Children and Families Rady Children's Hospital - San Diego, California; all of whom have been supported by SAMHSA trauma-focused grants. Additionally, the webinar included two youth presenters, NC and LS, who spoke about their own lived experience and the importance of trauma-informed care. Both youth are referred to only by initials to protect their privacy. NC is a peer specialist and LS is a law student.

Introduction

Trauma affects youth in all communities, and responses to those experiences by child-serving systems are critical. It is important for providers serving youth to understand how best to respond and support healing.

Service providers and policymakers in the youth-serving field are continually learning more from research[i] about trauma, traumatic experiences, and the various responses to traumatic events. It is important for youth serving systems to develop a greater understanding of the association between trauma and mental health and substance use disorders, and how it can derail the healthy development of youth. The field recognizes the importance of addressing trauma and using a trauma-informed approach in prevention, treatment, and recovery efforts.

This brief discusses the concept and prevalence of trauma; techniques for coping with, and recovering from trauma at an individual and systems level; the core principles for building a framework for understanding trauma; and implementation of elements essential for a trauma-informed system as presented by the featured experts.

Recognizing the effects of trauma and understanding how to address trauma are fundamental to the Trauma and Justice Strategic Initiative at the Substance Abuse and Mental Health Services Administration (SAMHSA), a division of the U.S. Department of Health and Human Services (HHS). The focus of SAMHSA's Trauma and Justice Strategic Initiative is on integrating a trauma-informed approach throughout health, behavioral health, and related systems to reduce the harmful effects of trauma and violence on individuals, families, and communities and using innovative strategies to reduce the involvement of individuals with trauma and behavioral health issues in the criminal and juvenile justice systems.

As part of this Initiative, with the help of experts, SAMHSA will be releasing a concept paper outlining a framework for trauma and guidance for developing and implementing a trauma-informed approach.

What Do We Mean by Trauma?

After an introduction by Dr. Larke Huang from the Substance Abuse and Mental Health Services Administration (SAMHSA), Dr. Eugene Griffin provided a framework for understanding trauma.

Trauma is a complex experience that affects youth and the systems that serve them in a variety of ways. The experience of trauma can be described through some common elements: event, experience, and effects, also known as "Three E's."[ii] These elements address the uniqueness of an individual's response to an event and how an event affects one's future behavior and well-being.

An **Event** is objective and measurable. Traumatic events include abuse (physical, emotional, sexual); domestic or community violence; an accident or natural disaster; and war or terrorism.

1. An **Experience** is subjective and difficult to measure because it relates to how someone reacts to an event. It is often thought to be life threatening or physically or emotionally overwhelming, and intensity can vary among people and over time. The way one person experiences an event might differ from the way another person does; culture, gender, and age all influence one's experience of the event. Additionally, people experience events in different ways. Resilience, risk and protective factors, and supports may contribute to this experience.
2. **Effects** are the reactions a person has to an event and the ways an experience changes or alters that person's ongoing and future behavior. Classic symptoms include experiencing hyperarousal, such as overreacting or being hypervigilant; re-experiencing an event as nightmares or flashbacks; and avoiding a situation by having a fight, flight, or freeze reaction. The effects of a traumatic event can have a long-term impact on neurobiological development and contribute to negative physical, hormonal, and chemical changes due to stress responses.

Building on this "Three E's" concept of trauma, SAMHSA frames its concept of trauma as: an event, series of events, or set of circumstances that is experienced by an individual as physically or emotionally harmful or life threatening and that has lasting adverse effects on the individual's functioning and mental, physical, social, emotional, or spiritual well-being.[iii] Researchers[iv] report that traumatic stress occurs when an extreme experience overwhelms and alters an individual's stress-related physiological systems and compromises the functioning of stress-response systems (e.g., neuroimmune, neuroendocrine, autonomic, and central nervous system networks).

"What I found worked best is when I was surrounded by people who really got it, who really understood trauma." — LS

Prevalence of Trauma

Many youth are exposed to traumatic events, including those in the juvenile justice and child welfare systems, as well as those who experience homelessness. Building on the three E's concept, we know that the experience of trauma is complex and particular to each individual's life circumstances, which can make quantifying the extent difficult. Some people experience multiple traumas; for example, a youth who has been separated from his or her family and then experiences assault or abuse in a foster home. As many as half of all children that have been involved with the mental health, child welfare, and juvenile justice systems have experienced multiple traumas.[v] LS and NC, two young people formerly involved with the foster care system, comment in the box above on their experiences with multiple traumas.

"When I was seven years old…my brothers and I were placed in foster care…We were immediately separated, and so I felt like that was probably the first traumatic event that I experienced." — LS

"While I was at my foster home, I had gotten into altercations with my foster brother and before he hit me, I felt scared…" — NC

Coping with and Reactions to Trauma

Dr. Julian Ford provided an overview of strategies for youth, families, and communities to recover from trauma. Recovery from the adverse effects of trauma begins with the recognition that the experience of survival threat caused by traumatic events has caused some major changes in the way a person now copes with stress. These ways of coping are necessary and effective in emergencies such as traumatic events, but they interfere with ordinary day-to-day life. Youth who have experienced trauma may develop coping strategies to help them survive.

Chronic Survival Coping

Trauma affects a youth's relationships, sense of survival, and sense of trust and security with people. The reaction to terrible shock, stressors, challenges, and loss is chronic survival coping. An individual trying to cope or recover from serious challenges and stressors will learn techniques to survive, such as staying on edge; being vigilant, watchful, or even distrustful (hypervigilance); or using indifference to mask hopelessness.

Posttraumatic Survival Coping

Physically, posttraumatic survival coping reflects a change in the body, not just a mental and psychological change. It changes how a person's brain works. The brain helps a person learn, explore, try activities, and experience different ways of living. However, a person cannot experience life freely when trying to survive trauma. Instead, that person must put everything else aside and concentrate only on basic survival needs. Some common survival modes or hypervigilance practices are scanning the environment and being on guard for danger; attempting to block out or not think about upsetting things; being ready to fight or flee; experiencing elevated heart rate and adrenalin rush; and being unable to regulate aggression or use anger management techniques.

"I wish that the people who I was working with in my school were more trauma informed and that they were focused - instead of on the disruptive behavior - on what was causing the disruptive behavior." — LS

Hypervigilance can make it difficult to set and accomplish goals even for the most persistent and high achieving person; all goals are trumped by the larger objective of staying safe. This type of coping can lead to difficulties trusting, including parents, caregivers, friends, teachers, and other adults.

Neurobiological Brain Research

Neuroscience indicates that a person's response to stress and use of coping techniques have three components. Dr. Ford provided a metaphor for understanding these complex brain processes:

- The ***"alarm"*** in the brain tells a person to wake up and pay attention. It also tells the body when there is a crisis and to be ready to react and survive.
- The ***"librarian"*** and ***"search engine"*** file and retrieve memories. When the alarm goes off, the memory filing center pulls information from all parts of the brain to figure out what is going on.
- The ***"computer hard drive"*** is the thinking center where all the information is put together and decisions are made.

If the three above components are working well, the thinking center is activated and a person can handle the stressful situation, not worry about survival, and come up with good ideas and plans for handling the situation, thus the alarm is turned off. However, if the alarm is so strong because of extreme stress (e.g., a threat to survival), it can crash the memory filing center and the hard drive in the brain. At that point, survival coping tactics take over. These activities take place in the part of the brain that helps a person survive and be safe. Operating in survival mode is not the ideal way to live because it leads to difficulty relaxing, trusting, focusing, and handling things appropriately.

Recovery from Trauma

A trauma-informed approach is a framework for providing services that should be integrated into everything that a program and system does. Dr. Ford noted that the goal of recovery from trauma is to tap into an existing strength to reset the brain's alarm to not be in persistent survival mode. Resetting the alarm requires strategies to resume thinking clearly. Evidence-based trauma-informed and trauma-specific therapy programs provide youth and their caregivers with strategies to focus their minds and deal with not feeling safe. Learning the strategies for regulating emotions and controlling anxiety is vital to everyday functioning in society. A trauma-informed approach includes youth and caretakers

in future planning. Trauma takes away control of a person's body or life. Reintroducing some control can tap into resiliency, and planning for the future provides hope.[vi]

Strategies for recovery from trauma include recognizing one's own and others' alarm reactions, sweeping one's mind clear before judging and acting, focusing on what is most important and positive, and being aware of stress and personal control levels. These strategies activate the thinking center and reset the alarm.

Many Paths to Recovery: Evidence-Based Models

- Cognitive-behavioral therapies
- Emotion regulation therapies
- Relational-interpersonal therapies
- Psychotherapies for dissociation
- Parent-child and family system therapies
- Social/helping network therapies
- Peer-to-peer support programs

The webinar presenters acknowledged that there are many paths to recovery and recommended common therapeutic approaches implemented by mental health professionals that can assist individuals who have experienced trauma. It is important to understand that trauma-informed care principles can be implemented by people who are not mental health professionals and work in various systems that provide services for individuals who have experienced trauma.

Trauma at the Systems Level

Mr. Charles Wilson provided a discussion of the child welfare system, and its role in addressing youth and families who have experienced trauma. The experience of trauma is complex and personal, and youth and families who have experienced trauma receive services within a variety of community systems. Providers and systems have the ability to help or potentially re-traumatize. A trauma-informed system aligns interactions among youth-serving agencies, such as the child protection systems, lawyers, juvenile judges, law enforcement, schools, and mental health providers so that they better understand how youth, families, and adults respond to trauma.

A trauma-informed system is not just about raising awareness, but changing behavior, actions, and responses. The approach requires doing things differently so as not to re-traumatize or introduce additional trauma. Systems need to support the natural resiliency of children and youth and assist them in identifying their unique strengths.

In a trauma-informed system, caregivers play a central role in recovery, help promote youth's natural resiliency, and give youth tools for managing stress. A strengths-based approach considers and includes the assistance given to caregivers within the system. This approach considers how the system helps caregivers deal with both current and past traumatic stress. The trauma-informed system assists caregivers understand the significant trauma histories of the children and youth that are in their care. Child welfare workers, mental health therapists, foster parents, juvenile judges, and all those working with children who have experienced significant traumatic events are influenced and touched by the trauma and can experience secondary or vicarious traumatic reactions. Therefore, the trauma-informed system responds to the varying impacts of traumatic stress on children, caregivers, and all those who are in contact with the system. Practitioners take this thinking and awareness about trauma and use it in everyday practice.

"The aftercare team also took a lot of time to do safety planning and future planning with me, and that is important because a lot of young people who experience trauma, they express feelings of hopelessness and they are in a constant state of anxiety, and so their ability to project into the future and plan for the future can be seriously impaired." — LS

Core Principles of a Trauma-Informed Approach

Given the presence of trauma in the lives of many youth and the need for systems and providers to support healing, a trauma-informed approach to providing services is critical. According to SAMHSA's concept of trauma[vii], a program, an organization, or a system that is trauma informed is based on four key assumptions:

- ***Realizes*** the widespread impact of trauma and understands potential paths for recovery.
- ***Recognizes*** the signs and symptoms of trauma in clients, families, staff, and others involved with the system.
- ***Responds*** by fully integrating knowledge about trauma into policies, procedures, practices, and settings.
- ***Resists re-traumatization*** of clients as well as staff***.***

The Chadwick Trauma-Informed Systems Project (CTISP)[viii] National Advisory Committee says that in a trauma-informed child welfare system, all parties recognize and respond to the varying impact of traumatic stress on children, caregivers, and those who have contact with the system. Programs and organizations within the system infuse this knowledge, awareness, and skill into their organizational cultures, policies, and practices. They act in collaboration, using the best available science, to facilitate and support resiliency and recovery.

"I was 13 years old in my first foster home, and I must admit I did not want to be there at first because I was at home with people who I was unfamiliar with…" — NC

SAMHSA's six principles[ix] support a framework for understanding trauma and developing a trauma-informed approach:

- ***Safety:*** Throughout the organization, the staff and the people they serve feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety.
- ***Trustworthiness and transparency:*** Organizational operations and decisions are conducted with transparency and with the goal of building and maintaining trust among clients, family members, staff, and others involved with the organization.
- ***Collaboration and mutuality:*** There is true partnering and leveling of power differences between staff and clients and among organizational staff, from direct care staff to administrators; they recognize that healing happens in relationships and in the meaningful sharing of power and decision making.
- ***Empowerment:*** Throughout the organization and among the clients served, individuals' strengths are recognized, built on, and validated and new skills are developed as needed.
- ***Voice and choice:*** The organization aims to strengthen the experience of choice for clients, family members, and staff and recognizes that every person's experience is unique and requires an individualized approach.
- ***Culture, historical and gender issues:*** The organization incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; are gender-responsive; and incorporate a focus on historical trauma.

These principles underlie the values, beliefs, and attitudes of individuals and organizations offering a trauma-informed approach. Using this approach, organizations foster a belief in resilience and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. Trauma-informed organizations build on strengths and assets of clients, staff, and communities instead of responding only to their perceived deficits. They recognize that everyone has a role to play. They address cultural, historical, and gender issues; actively move past cultural stereotypes and biases; offer gender-responsive services; promote the value of cultural connections; and recognize and address historical trauma. In the words of Dr. Ford, "A person does not have to be a therapist to be therapeutic."

Implementation

In his presentation, Mr. Charles Wilson shared the following central elements of providing trauma-informed care within programs, policies, services, and systems as outlined by the child welfare committee of the National Child Traumatic Stress Network. Sources with additional information are provided in the resources section of this brief.

Element 1: Maximize Physical and Psychological Safety for Children and Families

- Safety is a priority. Children and families who have experienced trauma may still feel unsafe even when they are no longer in danger. In addition to ensuring physical safety, it is important to help children and families feel psychologically safe.
- Sometimes even a noise or smell can trigger the feeling of being unsafe and elicit a reaction that a caretaker might not expect or understand. Being aware of and understanding these triggers and changing something seemingly small or insignificant in a daily routine can change behavior from negative to positive.

Element 2: Identify the Trauma-Related Needs of Children

- One of the first steps in helping trauma-exposed children and families is to understand how they have been impacted by trauma.
- Trauma-related needs can be identified through trauma screening and assessment.
- It is important to consider the type(s) of trauma children have experienced when making service referrals and developing service plans. All children need individualized services that are based on their unique circumstances, strengths, and challenges.

"I had reported a child abuse and neglect incident with social services and they did not come and take us out of our home. It was a form of betrayal of trust because you are expecting someone to help you and when that help does not come, then your relationship with the institutions that you need to rely on in order to get out of a bad situation, the relationship is broken." — LS

Element 3: Enhance Child Well-Being and Resilience

- Many children are naturally resilient.
- Systems must recognize and build on children's existing strengths.
- Both individual caseworkers and overall agency policies should support the continuity of children's relationships.
- Staff and agencies should also ensure that children who have been traumatized have access to evidence-based treatments and services.

Element 4: Enhance Family Well-Being and Resilience

- Families are a critical part of both protecting children from harm and enhancing their natural resilience.
- Providing trauma-informed education and services to parents and other caregivers enhances protective capacities.
- Agencies should recognize and assist caregivers to understand the significant trauma histories of the children and youth that are in their care.
- Agencies should assist caregivers to understand their own trauma histories.

"We need to do some self-esteem building and work with young people to acknowledge their strengths. I think when you have experienced trauma, you have a lot of thoughts, beliefs, or feelings of being unworthy or ashamed and you feel a lot of guilt and sometimes that leads to hopelessness. You are not going to work hard to achieve goals if you do not believe you can achieve them, if you do not believe you are worthy of achieving them…" — LS

Element 5: Enhance the Well-Being and Resilience of Those Working in the System

- Staff play important roles in supporting children, but working with people who have experienced abuse, neglect, violence, and other trauma can cause staff to develop secondary traumatic stress reactions.
- Agencies should collect information about trauma and secondary trauma experienced by staff, implement strategies and practices that build resilience and help staff manage stress, and address the impact of secondary traumatic stress on both individuals and on the system as a whole.

> **"The aftercare team was most useful because they worked across the systems…I did not have to do the work that a lot of young people are burdened with, which is finding a way to get our systems to work with one another." — LS**

Element 6: Partner with Youth and Families

- Youth and families should have choices and an active voice in decision making on individual, agency, and systemic levels.
- Youth and family members who have been in the system have a unique perspective and can provide valuable feedback.
- Partnerships with youth and families should occur at all levels.

Element 7: Partner with Agencies and Systems That Interact with Children and Families

- Agencies need to establish strong partnerships with other child- and family-serving systems.
- Service providers should develop common protocols and frameworks.
- Cross-system collaboration enables all helping professionals to see the child as a whole person, thus preventing potentially competing priorities and messages.
- Collaboration between systems promotes cohesive care and better outcomes.

Conclusion

This brief provides an overview of the webinar content as presented by experts in the field regarding the concepts and prevalence of trauma, principles for understanding trauma, and practices for addressing trauma and working with youth who have experienced trauma.

LS and NC, two young people formerly involved with the foster care system, provided much insight on their experiences with multiple traumas. Their shared comments provide important information and practice-based evidence and strategies that child and youth serving systems could incorporate into their work with children and youth who have experienced trauma. Some of the practical applications they described as beneficial to them include:

- Staff working in schools need to be aware of, educated and informed on the effects of trauma for children and youth, and trained in the causes of disruptive behaviors and ways to address these behaviors that do not re-traumatize children and youth;
- Aftercare teams need to provide consistent and ongoing planning with youth to address the after effects of trauma, (e.g., anxiety, sadness, depressions, feelings of hopelessness, anger, shame, guilt) and to build upon their strengths to instill good self-esteem and a belief that they are worthy of and can achieve goals in their life;

- Aftercare teams need to provide ongoing assistance for children and youth to learn skills for daily life, safety planning to address potential re-traumatization, and development of goals for the "here and now" and in their future;
- Aftercare teams need to provide quick response for children and youth who have been traumatized when reports or incidents of child abuse and/or neglect occur. Teams need to remember that these children and youth have been placed in unfamiliar surroundings and they do not feel safe or trust the people or environment immediately. They must rely on the aftercare teams to provide a trusting relationship with staff that will provide safety, protection and security in their lives;
- Aftercare teams need to work across systems to advocate for children and youth who have experienced trauma, and to assist them with the work needed for their daily care and consistent planning for life transitions.

Many strategies for coping with trauma have been noted in this brief, as well as the experiences of LS and NC which can inform child and youth serving systems on the successful practices and strategies that could improve the experience of children and youth who are coping with and healing from trauma. The resources noted below offer a starting point for deeper understanding of trauma and trauma-informed approaches.

Introduction

Trauma is a widespread, harmful and costly public health problem. It occurs as a result of violence, abuse, neglect, loss, disaster, war and other emotionally harmful experiences. Trauma has no boundaries with regard to age, gender, socioeconomic status, race, ethnicity, geography or sexual orientation. It is an almost universal experience of people with mental and substance use disorders. The need to address trauma is increasingly viewed as an important component of effective behavioral health service delivery. Additionally, it has become evident that addressing trauma requires a multi-pronged, multi-agency public health approach inclusive of public education and awareness, prevention and early identification, and effective trauma-specific assessment and treatment. ***In order to maximize the impact of these efforts, they need to be provided in an organizational or community context that is trauma-informed, that is, based on the knowledge and understanding of trauma and its far-reaching implications.***

The need to address trauma is increasingly viewed as an important component of effective behavioral health service delivery.

The effects of traumatic events place a heavy burden on individuals, families and communities and create challenges for public institutions and service systems. Although many people who experience a traumatic event will go on with their lives without lasting negative effects, others will have more difficulty and experience traumatic stress reactions. Emerging research has documented the relationships among exposure to traumatic events, impaired neurodevelopmental and immune systems responses and subsequent health risk behaviors resulting in chronic physical or behavioral health disorders.[1,2,3,4,5] Research has also indicated that with appropriate supports and intervention, people can overcome traumatic experiences.[6,7,8,9] However, most people go without these services and supports. Unaddressed trauma significantly increases the risk of mental and substance use disorders and chronic physical diseases.[1,10,11]

With appropriate supports and intervention, people can overcome traumatic experiences.

Individuals with experiences of trauma are found in multiple service sectors, not just in behavioral health. Studies of people in the juvenile and criminal justice system reveal high rates of mental and substance use disorders and personal histories of trauma.[12,13] Children and families in the child welfare system similarly experience high rates of trauma and associated behavioral health problems.[5,14] Young people bring their experiences of trauma into the school systems, often interfering with their school success. And many patients in primary care similarly have significant trauma histories which has an impact on their health and their responsiveness to health interventions.[15,16,17]

In addition, the public institutions and service systems that are intended to provide services and supports to individuals are often themselves trauma-inducing. The use of coercive practices, such as seclusion and restraints, in the behavioral health system; the abrupt removal of a child from an abusing family in the child welfare system; the use of invasive procedures in the medical system; the harsh disciplinary practices in educational/school systems; or intimidating practices in the criminal justice system can be re-traumatizing for individuals who already enter these systems with significant histories of trauma. These program or system practices and policies often interfere with achieving the desired outcomes in these systems.

Thus, the pervasive and harmful impact of traumatic events on individuals, families and communities and the unintended but similarly widespread re-traumatizing of individuals within our public institutions and service systems, makes it necessary to rethink doing "business as usual." In public institutions and service systems, there is increasing recognition that many of the individuals have extensive histories of trauma that, left unaddressed, can get in the way of achieving good health and well-being. For example, a child who suffers from maltreatment or neglect in the home may not be able to concentrate on school work and be successful in school; a women victimized by domestic violence may have trouble performing in the work setting; a jail inmate repeatedly exposed to violence on the street may have difficulty refraining from retaliatory violence and re-offending; a sexually abused homeless youth may engage in self-injury and high risk behaviors to cope with the effects of sexual abuse; and, a veteran may use substances to mask the traumatic memories of combat. The experiences of these individuals are compelling and, unfortunately, all too common. Yet, until recently, gaining a better understanding of how to address the trauma experienced by these individuals and how to mitigate the re-traumatizing effect of many of our public institutions and service settings was not an integral part of the work of these systems. Now, however, there is an increasing focus on the impact of trauma and how service systems may help to resolve or exacerbate trauma-related issues. These systems are beginning to revisit how they conduct their "business" under the framework of a trauma-informed approach.

There is an increasing focus on the impact of trauma and how service systems may help to resolve or exacerbate trauma-related issues. These systems are beginning to revisit how they conduct their business under the framework of a trauma-informed approach.

Purpose and Approach: Developing a Framework for Trauma and a Trauma-Informed Approach

PURPOSE

The purpose of this paper is to develop a working concept of trauma and a trauma-informed approach and to develop a shared understanding of these concepts that would be acceptable and appropriate across an array of service systems and stakeholder groups. SAMHSA puts forth a framework for the behavioral health specialty sectors, that can be adapted to other sectors such as child welfare, education, criminal and juvenile justice, primary health care, the military and other settings that have the potential to ease or exacerbate an individual's capacity to cope with traumatic experiences. In fact, many people with behavioral health problems receive treatment and services in these non-specialty behavioral health systems. SAMHSA intends this framework be relevant to its federal partners and their state and local system counterparts and to practitioners, researchers, and trauma survivors, families and communities. The desired goal is to build a framework that helps systems "talk" to each other, to understand better the connections between trauma and behavioral health issues, and to guide systems to become trauma-informed.

APPROACH

SAMHSA approached this task by integrating three significant threads of work: trauma focused research work; practice-generated knowledge about trauma interventions; and the lessons articulated by survivors

of traumatic experiences who have had involvement in multiple service sectors. It was expected that this blending of the research, practice and survivor knowledge would generate a framework for improving the capacity of our service systems and public institutions to better address the trauma-related issues of their constituents.

To begin this work, SAMHSA conducted an environmental scan of trauma definitions and models of trauma informed care. SAMHSA convened a group of national experts who had done extensive work in this area. This included trauma survivors who had been recipients of care in multiple service system; practitioners from an array of fields, who had experience in trauma treatment; researchers whose work focused on trauma and the development of trauma-specific interventions; and policymakers in the field of behavioral health.

From this meeting, SAMHSA developed a working document summarizing the discussions among these experts. The document was then vetted among federal agencies that conduct work in the field of trauma. Simultaneously, it was placed on a SAMHSA website for public comment. Federal agency experts provided rich comments and suggestions; the public comment site drew just over 2,000 respondents and 20,000 comments or endorsements of others' comments. SAMHSA reviewed all of these comments, made revisions to the document and developed the framework and guidance presented in this paper.

The key questions addressed in this paper are:

- **What do we mean by trauma?**
- **What do we mean by a trauma-informed approach?**
- **What are the key principles of a trauma-informed approach?**
- **What is the suggested guidance for implementing a trauma-informed approach?**
- **How do we understand trauma in the context of community?**

SAMHSA's approach to this task has been an attempt to integrate knowledge developed through research and clinical practice with the voices of trauma survivors. This also included experts funded through SAMHSA's trauma-focused grants and initiatives, such as SAMHSA's National Child Traumatic Stress Initiative, SAMHSA's National Center for Trauma Informed Care, and data and lessons learned from other grant programs that did not have a primary focus on trauma but included significant attention to trauma, such as SAMHSA's: Jail Diversion Trauma Recovery grant program; Children's Mental Health Initiative; Women, Children and Family Substance Abuse Treatment Program; and Offender Reentry and Adult Treatment Drug Court Programs.

Background: Trauma — Where We Are and How We Got Here

The concept of traumatic stress emerged in the field of mental health at least four decades ago. Over the last 20 years, SAMHSA has been a leader in recognizing the need to address trauma as a fundamental obligation for public mental health and substance abuse service delivery and has supported the development and promulgation of trauma-informed systems of care. In 1994, SAMHSA convened the Dare to Vision Conference, an event designed to bring trauma to the foreground and the first national conference in which women trauma survivors talked about their experiences and ways in which standard practices in hospitals re-traumatized and often, triggered memories of previous abuse. In 1998, SAMHSA funded the Women, Co-Occurring Disorders and Violence Study to generate knowledge on the development and evaluation of integrated services approaches for women with co-occurring mental and substance use disorders who also had histories of physical and or sexual abuse. In 2001, SAMHSA funded the National Child Traumatic Stress Initiative to increase understanding of child trauma and develop effective interventions for children exposed to different types of traumatic events.

The American Psychiatric Association (APA) played an important role in defining trauma. Diagnostic criteria for traumatic stress disorders have been debated through several iterations of the Diagnostic and Statistical Manual of Mental Disorders (DSM) with a new category of Trauma- and Stressor-Related Disorders, across the life-span, included in the recently released DSM-V (APA, 2013). Measures and inventories of trauma exposure, with both clinical and research applications, have proliferated since the 1970's.[18,19,20,21] National trauma research and practice centers have conducted significant work in the past few decades, further refining the concept of trauma, and developing effective trauma assessments and treatments.[22,23,24,25] With the advances in neuroscience, a biopsychosocial approach to traumatic experiences has begun to delineate the mechanisms in which neurobiology, psychological processes, and social attachment interact and contribute to mental and substance use disorders across the life-span.[3,25]

Simultaneously, an emerging trauma survivors movement has provided another perspective on the understanding of traumatic experiences. Trauma survivors, that is, people with lived experience of trauma, have powerfully and systematically documented their paths to recovery.[26] Traumatic experiences complicate a child's or an adult's capacity to make sense of their lives and to create meaningful consistent relationships in their families and communities.

Trauma survivors have powerfully and systematically documented their paths to recovery.

The convergence of the trauma survivor's perspective with research and clinical work has underscored the central role of traumatic experiences in the lives of people with mental and substance use conditions. The connection between trauma and these conditions offers a potential explanatory model for what has happened to individuals, both children and adults, who come to the attention of the behavioral health and other service systems.[25,27]

People with traumatic experiences, however, do not show up only in behavioral health systems. Responses to these experiences often manifest in behaviors or conditions that result in involvement with the child welfare and the criminal and juvenile justice system or in difficulties in the education, employment or primary care system. Recently, there has also been a focus on individuals in the military and increasing rates of posttraumatic stress disorders.[28,29,30,31]

With the growing understanding of the pervasiveness of traumatic experience and responses, a growing number of clinical interventions for trauma responses have been developed. Federal research agencies, academic institutions and practice-research partnerships have generated empirically-supported interventions. In SAMHSA's National Registry of Evidence-based Programs and Practices (NREPP) alone there are over 15 interventions focusing on the treatment or screening for trauma.

These interventions have been integrated into the behavioral health treatment care delivery system; however, from the voice of trauma survivors, it has become clear that these clinical interventions are not enough. Building on lessons learned from SAMHSA's Women, Co-Occurring Disorders and Violence Study; SAMHSA's National Child Traumatic Stress Network; and SAMHSA's National Center for Trauma-Informed Care and Alternatives to Seclusion and Restraints, among other developments in the field, it became clear that the organizational climate and conditions in which services are provided played a significant role in maximizing the outcomes of interventions and contributing to the healing and recovery of the people being served. SAMHSA's National Center for Trauma-Informed Care has continued to advance this effort, starting first in the behavioral health sector, but increasingly responding to technical assistance requests for organizational change in the criminal justice, education, and primary care sectors.

FEDERAL, STATE AND LOCAL LEVEL TRAUMA-FOCUSED ACTIVITIES

The increased understanding of the pervasiveness of trauma and its connections to physical and behavioral health and well-being, have propelled a growing number of organizations and service systems to explore ways to make their services more responsive to people who have experienced trauma. This has been happening in state and local systems and federal agencies.

States are elevating a focus on trauma. For example, Oregon Health Authority is looking at different types of trauma across the age span and different population groups. Maine's "Thrive Initiative" incorporates a trauma-informed care focus in their children's systems of care. New York is introducing a trauma-informed initiative in the juvenile justice system. Missouri is exploring a trauma-informed approach for their adult mental health system. In Massachusetts, the Child Trauma Project is focused on taking trauma-informed care statewide in child welfare practice. In Connecticut the Child Health and Development Institute with the state Department of Children and Families is building a trauma-informed system of care throughout the state through policy and workforce development. SAMHSA has supported the further development of trauma-informed approaches through its Mental Health Transformation Grant program directed to State and local governments.

Increasing examples of local level efforts are being documented. For example, the City of Tarpon Springs in Florida has taken significant steps in becoming a trauma-informed community. The city made it its mission to promote a widespread awareness of the costly effects of personal adversity upon the wellbeing of the community. The Family Policy Council in Washington State convened groups to focus on the impact of adverse childhood experiences on the health and well-being of its local communities and tribal communities. Philadelphia held a summit to further its understanding of the impact of trauma and violence on the psychological and physical health of its communities.

SAMHSA continues its support of grant programs that specifically address trauma.

At the federal level, SAMHSA continues its support of grant programs that specifically address trauma and technical assistance centers that focus on prevention, treatment and recovery from trauma.

Other federal agencies have increased their focus on trauma. The Administration on Children Youth and Families (ACYF) has focused on the complex trauma of children in the child welfare system and how screening and assessing for severity of trauma and linkage with trauma treatments can contribute to improved well-being for these youth. In a joint effort among ACYF, SAMHSA and the Centers for Medicare and Medicaid Services (CMS), the three agencies developed and issued through the CMS State Directors' mechanism, a letter to all State Child Welfare Administrators, Mental Health Commissioners, Single State Agency Directors for Substance Abuse and State Medicaid Directors discussing trauma, its impact on children, screening, assessment and treatment interventions and strategies for paying for such care. The Office of Juvenile Justice and Delinquency Prevention has specific recommendations to address trauma in their Children Exposed to Violence Initiative. The Office of Women's Health has developed a curriculum to train providers in primary care on how to address trauma issues in health care for women. The Department of Labor is examining trauma and the workplace through a federal interagency workgroup. The Department of Defense is honing in on prevention of sexual violence and trauma in the military.

As multiple federal agencies representing varied sectors have recognized the impact of traumatic experiences on the children, adults, and families they serve, they have requested collaboration with SAMHSA in addressing these issues. The widespread recognition of the impact of trauma and the burgeoning interest in developing capacity to respond through trauma-informed approaches compelled SAMHSA to revisit its conceptual framework and approach to trauma, as well as its applicability not only to behavioral health but also to other related fields.

SAMHSA's Concept of Trauma

Decades of work in the field of trauma have generated multiple definitions of trauma. Combing through this work, SAMHSA developed an inventory of trauma definitions and recognized that there were subtle nuances and differences in these definitions.

Desiring a concept that could be shared among its constituencies — practitioners, researchers, and trauma survivors, SAMHSA turned to its expert panel to help craft a concept that would be relevant to public health agencies and service systems. SAMHSA aims to provide a viable framework that can be used to support people receiving services, communities, and stakeholders in the work they do. A review of the existing definitions and discussions of the expert panel generated the following concept:

> ***Individual trauma results from an* event*, series of events, or set of circumstances that is* experienced *by an individual as physically or emotionally harmful or life threatening and that has lasting adverse* effects *on the individual's functioning and mental, physical, social, emotional, or spiritual well-being.***

THE THREE "E'S" OF TRAUMA: EVENT(S), EXPERIENCE OF EVENT(S), AND EFFECT

Events and circumstances may include the actual or extreme threat of physical or psychological harm (i.e. natural disasters, violence, etc.) or severe, life-threatening neglect for a child that imperils healthy development. These events and circumstances may occur as a single occurrence or repeatedly over time. This element of SAMHSA's concept of trauma is represented in the fifth version of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), which requires all conditions classified as "trauma and stressor-related disorders" to include exposure to a traumatic or stressful event as a diagnostic criterion.

The individual's **experience** of these events or circumstances helps to determine whether it is a traumatic event. A particular event may be experienced as traumatic for one individual and not for another (e.g., a child removed from an abusive home experiences this differently than their sibling; one refugee may experience fleeing one's country differently from another refugee; one military veteran may experience deployment to a war zone as traumatic while another veteran is not similarly affected). How the individual labels, assigns meaning to, and is disrupted physically and psychologically by an event will contribute to whether or not it is experienced as traumatic. Traumatic events by their very nature set up a power differential where one entity (whether an individual, an event, or a force of nature) has power over another. They elicit a profound question of "why me?" The individual's experience of these events or circumstances is shaped in the context of this powerlessness and questioning. Feelings of humiliation, guilt, shame, betrayal, or silencing often shape the experience of the event. When a person experiences physical or sexual abuse, it is often accompanied by a sense of humiliation, which can lead the person to feel as though they are bad or dirty, leading to a sense of self blame, shame and guilt. In cases of war or natural disasters, those who survived the traumatic event may blame themselves for surviving when others did not. Abuse by a trusted caregiver frequently gives rise to feelings of betrayal, shattering a person's trust and leaving them feeling alone. Often, abuse of children and domestic violence are accompanied by threats that lead to silencing and fear of reaching out for help.

How the event is experienced may be linked to a range of factors including the individual's cultural beliefs (e.g., the subjugation of women and the experience of domestic violence), availability of social supports (e.g., whether isolated or embedded in a supportive family or community structure), or to the developmental stage of the individual (i.e., an individual may understand and experience events differently at age five, fifteen, or fifty).[1]

The long-lasting adverse **effects** of the event are a critical component of trauma. These adverse effects may occur immediately or may have a delayed onset. The duration of the effects can be short to long term. In some situations, the individual may not recognize the connection between the traumatic events and the effects. Examples of adverse effects include an individual's inability to cope with the normal stresses and strains of daily living; to trust and benefit from relationships; to manage cognitive processes, such as memory, attention, thinking; to regulate behavior; or to control the expression of emotions. In addition to these more visible effects, there may be an altering of one's neurobiological make-up and ongoing health and well-being. Advances in neuroscience and an increased understanding of the interaction of neurobiological and environmental factors have documented the effects of such threatening events.[1,3] Traumatic effects, which may range from hyper-vigilance or a constant state of arousal, to numbing or avoidance, can eventually wear a person down, physically, mentally, and emotionally. Survivors of trauma have also highlighted the impact of these events on spiritual beliefs and the capacity to make meaning of these experiences.

SAMHSA's Trauma-Informed Approach: Key Assumptions and Principles

Trauma researchers, practitioners and survivors have recognized that the understanding of trauma and trauma-specific interventions is not sufficient to optimize outcomes for trauma survivors nor to influence how service systems conduct their business.

The context in which trauma is addressed or treatments deployed contributes to the outcomes for the trauma survivors, the people receiving services, and the individuals staffing the systems. Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.[22,32,33] SAMHSA's concept of a trauma-informed approach is grounded in a set of four assumptions and six key principles.

A program, organization, or system that is trauma-informed* realizes *the widespread impact of trauma and understands potential paths for recovery;* recognizes *the signs and symptoms of trauma in clients, families, staff, and others involved with the system; and* responds *by fully integrating knowledge about trauma into policies, procedures, and practices, and seeks to actively* resist re-traumatization*.

A trauma informed approach is distinct from trauma-specific services or trauma systems. A trauma informed approach is inclusive of trauma-specific interventions, whether assessment, treatment or recovery supports, yet it also incorporates key trauma principles into the organizational culture.

Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.

THE FOUR "R'S: KEY ASSUMPTIONS IN A TRAUMA-INFORMED APPROACH

In a trauma-informed approach, all people at all levels of the organization or system have a basic **realization** about trauma and understand how trauma can affect families, groups, organizations, and communities as well as individuals. People's experience and behavior are understood in the context of coping strategies designed to survive adversity and overwhelming circumstances, whether these occurred in the past (i.e., a client dealing with prior child abuse), whether they are currently manifesting (i.e., a staff member living with domestic violence in the home), or whether they are related to the emotional distress that results in hearing about the firsthand experiences of another (i.e., secondary traumatic stress experienced by a direct care professional).There is an understanding that trauma plays a role in mental and substance use disorders and should be systematically addressed in prevention, treatment, and recovery settings. Similarly, there is a realization that trauma is not confined to the behavioral health specialty service sector, but is integral to other systems (e.g., child welfare, criminal justice, primary health care, peer–run and community organizations) and is often a barrier to effective outcomes in those systems as well.

People in the organization or system are also able to **recognize** the signs of trauma. These signs may be gender, age, or setting-specific and may be manifest by individuals seeking or providing services in these settings. Trauma screening and assessment assist in the recognition of trauma, as do workforce development, employee assistance, and supervision practices.

The program, organization, or system **responds** by applying the principles of a trauma-informed approach to all areas of functioning. The program, organization, or system integrates an understanding that the experience of traumatic events impacts all people involved, whether directly or indirectly. Staff in every part of the organization, from the person who greets clients at the door to the executives and the governance board, have changed their language, behaviors and policies to take into consideration the experiences of trauma among children and adult users of the services and among staff providing the services. This is accomplished through staff training, a budget that supports this ongoing training, and leadership that realizes the role of trauma in the lives of their staff and the people they serve. The organization has practitioners trained in evidence-based trauma practices. Policies of the organization, such as mission statements, staff handbooks and manuals promote a culture based on beliefs about resilience, recovery, and healing from trauma. For instance, the agency's mission may include an intentional statement on the organization's commitment to promote trauma recovery; agency policies demonstrate a commitment to incorporating perspectives of people served through the establishment of client advisory boards or inclusion of people who have received services on the agency's board of directors; or agency training includes resources for mentoring supervisors on helping staff address secondary traumatic stress. The organization is committed to providing a physically and psychologically safe environment. Leadership ensures that staff work in an environment that promotes trust, fairness and transparency. The program's, organization's, or system's response involves a universal precautions approach in which one expects the presence of trauma in lives of individuals being served, ensuring not to replicate it.

A trauma-informed approach seeks to **resist re-traumatization** of clients as well as staff. Organizations often inadvertently create stressful or toxic environments that interfere with the recovery of clients, the well-being of staff and the fulfillment of the organizational mission.[27] Staff who work within a trauma-informed environment are taught to recognize how organizational practices may trigger painful memories and re-traumatize clients with trauma histories. For example, they recognize that using restraints on a person who has been sexually abused or placing a child who has been neglected and abandoned in a seclusion room may be re-traumatizing and interfere with healing and recovery.

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

A trauma-informed approach reflects adherence to six key principles rather than a prescribed set of practices or procedures. These principles may be generalizable across multiple types of settings, although terminology and application may be setting- or sector-specific.

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

1. **Safety**
2. **Trustworthiness and Transparency**
3. **Peer Support**
4. **Collaboration and Mutuality**
5. **Empowerment, Voice and Choice**
6. **Cultural, Historical, and Gender Issues**

From SAMHSA's perspective, it is critical to promote the linkage to recovery and resilience for those individuals and families impacted by trauma. Consistent with SAMHSA's definition of recovery, services and supports that are trauma-informed build on the best evidence available and consumer and family engagement, empowerment, and collaboration.

The six key principles fundamental to a trauma-informed approach include:[24,36]

1. **Safety:** Throughout the organization, staff and the people they serve, whether children or adults, feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety. Understanding safety as defined by those served is a high priority.

2. **Trustworthiness and Transparency:** Organizational operations and decisions are conducted with transparency with the goal of building and maintaining trust with clients and family members, among staff, and others involved in the organization.

3. **Peer Support:** Peer support and mutual self-help are key vehicles for establishing safety and hope, building trust, enhancing collaboration, and utilizing their stories and lived experience to promote recovery and healing. The term "Peers" refers to individuals with lived experiences of trauma, or in the case of children this may be family members of children who have experienced traumatic events and are key caregivers in their recovery. Peers have also been referred to as "trauma survivors."

4. **Collaboration and Mutuality:** Importance is placed on partnering and the leveling of power differences between staff and clients and among organizational staff from clerical and housekeeping personnel, to professional staff to administrators, demonstrating that healing happens in relationships and in the meaningful sharing of power and decision-making. The organization recognizes that everyone has a role to play in a trauma-informed approach. As one expert stated: "one does not have to be a therapist to be therapeutic."[12]

5. **Empowerment, Voice and Choice:** Throughout the organization and among the clients served, individuals' strengths and experiences are recognized and built upon. The organization fosters a belief in the primacy of the people served, in resilience, and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. The organization understands that the experience of trauma may be a unifying aspect in the lives of those who run the organization, who provide the services, and/or who come to the organization for assistance and support. As such, operations, workforce development and services are organized to foster empowerment for staff and clients alike. Organizations understand the importance of power differentials and ways in which clients, historically, have been diminished in voice and choice and are often recipients of coercive treatment. Clients are supported in shared decision-making, choice, and goal setting to determine the plan of action they need to heal and move forward. They are supported in cultivating self-advocacy skills. Staff are facilitators of recovery rather than controllers of recovery.[34] Staff are empowered to do their work as well as possible by adequate organizational support. This is a parallel process as staff need to feel safe, as much as people receiving services.

6. **Cultural, Historical, and Gender Issues:** The organization actively moves past cultural stereotypes and biases (e.g. based on race, ethnicity, sexual orientation, age, religion, gender-identity, geography, etc.); offers, access to gender responsive services; leverages the healing value of traditional cultural connections; incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; and recognizes and addresses historical trauma.

Guidance for Implementing a Trauma-Informed Approach

Developing a trauma-informed approach requires change at multiples levels of an organization and systematic alignment with the six key principles described above. The guidance provided here builds upon the work of Harris and Fallot and in conjunction with the key principles, provides a starting point for developing an organizational trauma-informed approach.[20] While it is recognized that not all public institutions and service sectors attend to trauma as an aspect of how they conduct business, understanding the role of trauma and a trauma-informed approach may help them meet their goals and objectives. Organizations, across service-sectors and systems, are encouraged to examine how a trauma-informed approach will benefit all stakeholders; to conduct a trauma-informed organizational assessment and change process; and to involve clients and staff at all levels in the organizational development process.

The guidance for implementing a trauma-informed approach is presented in the ten domains described below. This is not provided as a "checklist" or a prescriptive step-by-step process. These are the domains of organizational change that have appeared both in the organizational change management literature and among models for establishing trauma-informed care.[35,36,37,38] What makes it unique to establishing a trauma-informed organizational approach is the cross-walk with the key principles and trauma-specific content.

TEN IMPLEMENTATION DOMAINS

1. **Governance and Leadership**
2. **Policy**
3. **Physical Environment**
4. **Engagement and Involvement**
5. **Cross Sector Collaboration**
6. **Screening, Assessment, Treatment Services**
7. **Training and Workforce Development**
8. **Progress Monitoring and Quality Assurance**
9. **Financing**
10. **Evaluation**

GOVERNANCE AND LEADERSHIP: The leadership and governance of the organization support and invest in implementing and sustaining a trauma-informed approach; there is an identified point of responsibility within the organization to lead and oversee this work; and there is inclusion of the peer voice. A champion of this approach is often needed to initiate a system change process.

POLICY: There are written policies and protocols establishing a trauma-informed approach as an essential part of the organizational mission. Organizational procedures and cross agency protocols, including working with community-based agencies, reflect trauma-informed principles. This approach must be "hard-wired" into practices and procedures of the organization, not solely relying on training workshops or a well-intentioned leader.

PHYSICAL ENVIRONMENT OF THE ORGANIZATION: The organization ensures that the physical environment promotes a sense of safety and collaboration. Staff working in the organization and individuals being served must experience the setting as safe, inviting, and not a risk to their physical or psychological safety. The physical setting also supports the collaborative aspect of a trauma informed approach through openness, transparency, and shared spaces.

ENGAGEMENT AND INVOLVEMENT OF PEOPLE IN RECOVERY, TRAUMA SURVIVORS, PEOPLE RECEIVING SERVICES, AND FAMILY MEMBERS RECEIVING SERVICES: These groups have significant involvement, voice, and meaningful choice at all levels and in all areas of organizational functioning (e.g., program design, implementation, service delivery, quality assurance, cultural competence, access to trauma-informed peer support, workforce development, and evaluation.) This is a key value and aspect of a trauma-informed approach that differentiates it from the usual approaches to services and care.

CROSS SECTOR COLLABORATION: Collaboration across sectors is built on a shared understanding of trauma and principles of a trauma-informed approach. While a trauma focus may not be the stated mission of various service sectors, understanding how awareness of trauma can help or hinder achievement of an organization's mission is a critical aspect of building collaborations. People with significant trauma histories often present with a complexity of needs, crossing various service sectors. Even if a mental health clinician is trauma-informed, a referral to a trauma-insensitive program could then undermine the progress of the individual.

SCREENING, ASSESSMENT, AND TREATMENT SERVICES: Practitioners use and are trained in interventions based on the best available empirical evidence and science, are culturally appropriate, and reflect principles of a trauma-informed approach. Trauma screening and assessment are an essential part of the work. Trauma-specific interventions are acceptable, effective, and available for individuals and families seeking services. When trauma-specific services are not available within the organization, there is a trusted, effective referral system in place that facilitates connecting individuals with appropriate trauma treatment.

TRAINING AND WORKFORCE DEVELOPMENT: On-going training on trauma and peer-support are essential. The organization's human resource system incorporates trauma-informed principles in hiring, supervision, staff evaluation; procedures are in place to support staff with trauma histories and/or those experiencing significant secondary traumatic stress or vicarious trauma, resulting from exposure to and working with individuals with complex trauma.

PROGRESS MONITORING AND QUALITY ASSURANCE: There is ongoing assessment, tracking, and monitoring of trauma-informed principles and effective use of evidence-based trauma specific screening, assessments and treatment.

FINANCING: Financing structures are designed to support a trauma-informed approach which includes resources for: staff training on trauma, key principles of a trauma-informed approach; development of appropriate and safe facilities; establishment of peer-support; provision of evidence-supported trauma screening, assessment, treatment, and recovery supports; and development of trauma-informed cross-agency collaborations.

EVALUATION: Measures and evaluation designs used to evaluate service or program implementation and effectiveness reflect an understanding of trauma and appropriate trauma-oriented research instruments.

To further guide implementation, the chart on the next page provides sample questions in each of the ten domains to stimulate change-focused discussion. The questions address examples of the work to be done in any particular domain yet also reflect the six key principles of a trauma-informed approach. Many of these questions and concepts were adapted from the work of Fallot and Harris, Henry, Black-Pond, Richardson, & Vandervort, Hummer and Dollard, and Penney and Cave.[39, 40, 41,42]

While the language in the chart may seem more familiar to behavioral health settings, organizations across systems are encouraged to adapt the sample questions to best fit the needs of the agency, staff, and individuals being served. For example, a juvenile justice agency may want to ask how it would incorporate the principle of safety when examining its physical environment. A primary care setting may explore how it can use empowerment, voice, and choice when developing policies and procedures to provide trauma-informed services (e.g. explaining step by step a potentially invasive procedure to a patient at an OBGYN office).

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH

KEY PRINCIPLES					
Safety	**Trustworthiness and Transparency**	**Peer Support**	**Collaboration and Mutuality**	**Empowerment, Voice, and Choice**	**Cultural, Historical, and Gender Issues**
10 IMPLEMENTATION DOMAINS					
Governance and Leadership	• How does agency leadership communicate its support and guidance for implementing a trauma-informed approach? • How do the agency's mission statement and/or written policies and procedures include a commitment to providing trauma-informed services and supports? • How do leadership and governance structures demonstrate support for the voice and participation of people using their services who have trauma histories?				
Policy	• How do the agency's written policies and procedures include a focus on trauma and issues of safety and confidentiality? • How do the agency's written policies and procedures recognize the pervasiveness of trauma in the lives of people using services, and express a commitment to reducing re-traumatization and promoting well-being and recovery? • How do the agency's staffing policies demonstrate a commitment to staff training on providing services and supports that are culturally relevant and trauma-informed as part of staff orientation and in-service training? • How do human resources policies attend to the impact of working with people who have experienced trauma? • What policies and procedures are in place for including trauma survivors/people receiving services and peer supports in meaningful and significant roles in agency planning, governance, policy-making, services, and evaluation?				

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH *(continued)*

10 IMPLEMENTATION DOMAINS *continued*	
Physical Environment	• How does the physical environment promote a sense of safety, calming, and de-escalation for clients and staff? • In what ways do staff members recognize and address aspects of the physical environment that may be re-traumatizing, and work with people on developing strategies to deal with this? • How has the agency provided space that both staff and people receiving services can use to practice self-care? • How has the agency developed mechanisms to address gender-related physical and emotional safety concerns (e.g., gender-specific spaces and activities).
Engagement and Involvement	• How do people with lived experience have the opportunity to provide feedback to the organization on quality improvement processes for better engagement and services? • How do staff members keep people fully informed of rules, procedures, activities, and schedules, while being mindful that people who are frightened or overwhelmed may have a difficulty processing information? • How is transparency and trust among staff and clients promoted? • What strategies are used to reduce the sense of power differentials among staff and clients? • How do staff members help people to identify strategies that contribute to feeling comforted and empowered?
Cross Sector Collaboration	• Is there a system of communication in place with other partner agencies working with the individual receiving services for making trauma-informed decisions? • Are collaborative partners trauma-informed? • How does the organization identify community providers and referral agencies that have experience delivering evidence-based trauma services? • What mechanisms are in place to promote cross-sector training on trauma and trauma-informed approaches?
Screening, Assessment, Treatment Services	• Is an individual's own definition of emotional safety included in treatment plans? • Is timely trauma-informed screening and assessment available and accessible to individuals receiving services? • Does the organization have the capacity to provide trauma-specific treatment or refer to appropriate trauma-specific services? • How are peer supports integrated into the service delivery approach? • How does the agency address gender-based needs in the context of trauma screening, assessment, and treatment? For instance, are gender-specific trauma services and supports available for both men and women? • Do staff members talk with people about the range of trauma reactions and work to minimize feelings of fear or shame and to increase self-understanding? • How are these trauma-specific practices incorporated into the organization's ongoing operations?

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH *(continued)*

10 IMPLEMENTATION DOMAINS *continued*	
Training and Workforce Development	• How does the agency address the emotional stress that can arise when working with individuals who have had traumatic experiences? • How does the agency support training and workforce development for staff to understand and increase their trauma knowledge and interventions? • How does the organization ensure that all staff (direct care, supervisors, front desk and reception, support staff, housekeeping and maintenance) receive basic training on trauma, its impact, and strategies for trauma-informed approaches across the agency and across personnel functions? • How does workforce development/staff training address the ways identity, culture, community, and oppression can affect a person's experience of trauma, access to supports and resources, and opportunities for safety? • How does on-going workforce development/staff training provide staff supports in developing the knowledge and skills to work sensitively and effectively with trauma survivors. • What types of training and resources are provided to staff and supervisors on incorporating trauma-informed practice and supervision in their work? • What workforce development strategies are in place to assist staff in working with peer supports and recognizing the value of peer support as integral to the organization's workforce?
Progress Monitoring and Quality Assurance	• Is there a system in place that monitors the agency's progress in being trauma-informed? • Does the agency solicit feedback from both staff and individuals receiving services? • What strategies and processes does the agency use to evaluate whether staff members feel safe and valued at the agency? • How does the agency incorporate attention to culture and trauma in agency operations and quality improvement processes? • What mechanisms are in place for information collected to be incorporated into the agency's quality assurance processes and how well do those mechanisms address creating accessible, culturally relevant, trauma-informed services and supports?
Financing	• How does the agency's budget include funding support for ongoing training on trauma and trauma-informed approaches for leadership and staff development? • What funding exists for cross-sector training on trauma and trauma-informed approaches? • What funding exists for peer specialists? • How does the budget support provision of a safe physical environment?
Evaluation	• How does the agency conduct a trauma-informed organizational assessment or have measures or indicators that show their level of trauma-informed approach? • How does the perspective of people who have experienced trauma inform the agency performance beyond consumer satisfaction survey? • What processes are in place to solicit feedback from people who use services and ensure anonymity and confidentiality? • What measures or indicators are used to assess the organizational progress in becoming trauma-informed?

Next Steps: Trauma in the Context of Community

Delving into the work on community trauma is beyond the scope of this document and will be done in the next phase of this work. However, recognizing that many individuals cope with their trauma in the safe or not-so safe space of their communities, it is important to know how communities can support or impede the healing process.

Trauma does not occur in a vacuum. Individual trauma occurs in a context of community, whether the community is defined geographically as in neighborhoods; virtually as in a shared identity, ethnicity, or experience; or organizationally, as in a place of work, learning, or worship. How a community responds to individual trauma sets the foundation for the impact of the traumatic event, experience, and effect. Communities that provide a context of understanding and self-determination may facilitate the healing and recovery process for the individual. Alternatively, communities that avoid, overlook, or misunderstand the impact of trauma may often be re-traumatizing and interfere with the healing process. Individuals can be re-traumatized by the very people whose intent is to be helpful. This is one way to understand trauma in the context of a community.

A second and equally important perspective on trauma and communities is the understanding that communities as a whole can also experience trauma. Just as with the trauma of an individual or family, a community may be subjected to a community-threatening event, have a shared experience of the event, and have an adverse, prolonged effect. Whether the result of a natural disaster (e.g., a flood, a hurricane or an earthquake) or an event or circumstances inflicted by one group on another (e.g., usurping homelands, forced relocation, servitude, or mass incarceration, ongoing exposure to violence in the community), the resulting trauma is often transmitted from one generation to the next in a pattern often referred to as historical, community, or intergenerational trauma.

Communities can collectively react to trauma in ways that are very similar to the ways in which individuals respond. They can become hyper-vigilant, fearful, or they can be re-traumatized, triggered by circumstances resembling earlier trauma. Trauma can be built into cultural norms and passed from generation to generation. Communities are often profoundly shaped by their trauma histories. Making sense of the trauma experience and telling the story of what happened using the language and framework of the community is an important step toward healing community trauma.

Many people who experience trauma readily overcome it and continue on with their lives; some become stronger and more resilient; for others, the trauma is overwhelming and their lives get derailed. Some may get help in formal support systems; however, the vast majority will not. The manner in which individuals and families can mobilize the resources and support of their communities and the degree to which the community has the capacity, knowledge, and skills to understand and respond to the adverse effects of trauma has significant implications for the well-being of the people in their community.

Conclusion

As the concept of a trauma-informed approach has become a central focus in multiple service sectors, SAMHSA desires to promote a shared understanding of this concept. The working definitions, key principles, and guidance presented in this document represent a beginning step toward clarifying the meaning of this concept. This document builds upon the extensive work of researchers, practitioners, policymakers, and people with lived experience in the field. A standard, unified working concept will serve to advance the understanding of trauma and a trauma-informed approach for public institutions and service sectors.

CFCA PAPER NO. 37 2016

Trauma-informed care in child/family welfare services

Liz Wall, Daryl Higgins and Cathryn Hunter

CHILD FAMILY COMMUNITY AUSTRALIA | INFORMATION EXCHANGE

This paper aims to define and clarify what trauma-informed service delivery means in the context of delivering child/family welfare services in Australia. Exposure to traumatic life events such as child abuse, neglect and domestic violence is a driver of service need. Policies and service providers must respond appropriately to people who are dealing with trauma and its effects in order to ensure best outcomes for individuals and families using these services. In addition to evidence-based programs or clinical interventions that are specific to addressing trauma symptoms, such as trauma-focused cognitive behaviour therapy, there is a need for broader organisational- or service-level systems of care that respond to the needs of clients with a lived experience of trauma that go beyond a clinical response. Some of the challenges identified in implementing and embedding trauma-informed care across services and systems are discussed.

KEY MESSAGES

- Traumatic experiences are common, with people often having multiple adverse experiences across their life. There are many serious and deleterious outcomes associated with exposure to them.
- Clients often present to child/family welfare services with a complex range of symptoms and behaviours related to prior and/or past trauma, which neither they nor those working with them have linked to this previous trauma exposure. As a result they may face an uninformed and fragmented response that is potentially re-traumatising.
- There are a small number of trauma-specific interventions that have been evaluated using a rigorous scientific standard and been shown to be effective—however, the research is often based on populations who have experienced a single traumatic event rather than complex trauma.
- Trauma-informed care is a framework for human service delivery that is based on knowledge and understanding of how trauma affects people's lives, their service needs and service usage.
- With the lack of an overarching framework in Australia, there is a danger of inconsistent or piecemeal development of trauma-informed models and practices that do not share a consistent language or framework for implementing trauma-informed systems of care in child/family services.
- As trauma affects a large proportion of the population, survivors are clients in a broad range of human services, and organisations across all settings should consider how a trauma-informed approach could benefit stakeholders, regardless of whether or not the organisation also provides evidence-based trauma-specific interventions.
- Challenges to implementing a trauma-informed approach to care include: a lack of clearly articulated definitions (e.g. of trauma-specific interventions vs the concept and principles of trauma-informed care); translating trauma-informed care to specific practice and service settings; consistency across service settings and systems; care-coordination; a lack of guidance for facilitating complex system change; and a lack of evaluation of models of trauma-informed care.
- Research is needed to explore whether different trauma-informed approaches are required for different population groups, including children, adolescents and adults, or for males and females.

Understanding the experiences of adversity in childhood such as sexual or other abuse as trauma is now recognised to be an important concept for human service delivery sectors. The USA has led efforts to incorporate trauma theory into mental health and other service delivery, largely driven by the Substance Abuse and Mental Health Services Administration (SAMHSA). SAMHSA funds two major trauma-related resources, the National Center for Trauma-Informed Care (NCTIC) and the National Child Traumatic Stress Initiative (NCTSI), to provide a focus for developing a shared language and evidence base around trauma and trauma-informed approaches to service. Emerging

efforts in Australia are now contributing to our knowledge of effective practice for children, young people and adults who have experienced trauma from events such as child maltreatment, sexual assault, military service, forced adoption and past family separation practices.

This paper aims to define and clarify what trauma-informed service delivery means in an Australian context. Australia is not as far down the track as the USA in terms of implementing a trauma-informed approach to human service provision in systems such as mental health and child and family services. There is, however, a recognition that exposure to traumatic life events is a driver of service need and that policies and service providers must address and respond to trauma appropriately to ensure best outcomes for individuals and families using these services.

Trauma terminology

There has been extensive debate around the classification and terminology for describing the effects of trauma, as well as the relationship to specific diagnostic terms such as post-traumatic stress disorder (Van der Kolk, Roth, Pelcovitz, Sunday, & Spinazzola, 2005; Wall & Quadara, 2014). The latest iteration of the *Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association, 2013), an international classification system for mental health disorders, has taken a broad approach to the terminology with a category of "Trauma and Stressor Related Disorders" rather than specifically including complex trauma as a diagnostic term.

Any discussion of trauma-informed service delivery requires consideration of the vast array of definitions and terminology that arises around trauma. This section explains some of the different terms, phrases and concepts that are used in the literature to describe trauma and trauma-related service provision.

Recently, there have been attempts to provide consistency in definitions and a shared language around trauma and a trauma-informed approach to care. SAMHSA's (2014) *Concept of Trauma and Guidance for a Trauma-Informed Approach* puts forward definitions and a working concept of trauma and a trauma-informed approach in order to develop a shared understanding of these concepts for service systems and stakeholders. SAMHSA is a key resource for trauma-informed approaches to care and these definitions are likely to be widely adopted.

What is trauma?

Traumatic events have been described as those that "overwhelm the ordinary human adaptations to life [and] … generally involve threats to life or bodily integrity, or a close personal encounter with violence and death" (Herman, 1992, p. 33). SAMHSA's concept of trauma provides a comprehensive definition that encompasses trauma related to one-off events as well as ongoing adversity:

> Individual trauma results from an event, series of events or set of circumstances that is experienced by an individual as physically or emotionally harmful or life threatening and that has lasting adverse effects on the individual's functioning and mental, physical, social, emotional or spiritual wellbeing. (SAMHSA, 2014, p. 7)

Although not diagnostic terms, *complex trauma* and *complex post-traumatic stress disorder* are often used to describe trauma that is the result of stressors that are interpersonal—usually severe, sustained and perpetrated by one human being on another—and where clients may not meet all of the specific diagnostic criteria for post-traumatic stress disorder (PTSD) or where the primary clinical presentation is the associated features due to the global effects of trauma on the person's functioning (Connor & Higgins, 2008a, 2008b). Trauma is particularly damaging when it occurs in childhood. Complex, interpersonally generated trauma is severely disruptive of a person's capacity to manage internal states (Kezelman & Stavropoulos, 2012). Complex trauma symptoms include problems with mood regulation, impulse control, self-perception, attention, memory and somatic disorders (Briere & Jordan, 2004; Burstow, 2003; van der Kolk et al., 2005).

Trauma-informed interventions occur at two levels: trauma-specific interventions and trauma-informed models of care. Organisational responses to trauma tend to occur on a continuum from basic trauma awareness, to trauma sensitivity, trauma responsivity and through to trauma-informed and/or trauma-specific interventions. We argue here that it is helpful for organisations providing services in the child/family welfare domain, and human services more broadly, to think about their organisational responses to trauma based on their particular service and client needs.

Trauma-specific interventions

Trauma-specific interventions refer to clinical services or programs designed to treat and ameliorate the actual symptoms and presentations of trauma. While it is possible for individual practitioners to deliver trauma-specific interventions (such as trauma-focused cognitive behaviour therapy [CBT]) within the context of a service delivery model or agency that is not trauma-informed at a system level, this is far from ideal. Elements of a service may not be consistent with a trauma-informed approach—such as the waiting room design and operation, interactions with administrative staff or the absence of adjunct services to address other presenting issues for which the trauma-specific intervention might not be effective. Trauma-specific services are best delivered as part of a trauma-informed system of care operating within a trauma-aware organisational context (Elliot, Bjelajac, Fallor, Markoff, & Reed, 2005; Kezelman & Stavropoulos, 2012).

Funded by the Department of Veterans' Affairs, Phoenix Australia (previously known at the Australian Centre for Posttraumatic Mental Health) has developed a database that summarises the evidence for effective trauma-specific interventions related to military and veteran families and communities (see *What Emerging Interventions are Effective for the Treatment of Adults with PTSD?* <www.evidencecompass.dva.gov.au/home/question/10>). Regarding adults suffering from PTSD, they found a paucity of evidence in relation to the efficacy of emerging therapies.[1] Phoenix Australia have also published a variety of resources for practitioners working with people affected by trauma, including fact sheets, clinical guidelines, booklets for clients and a smartphone app for clients with post-traumatic stress symptoms <phoenixaustralia.org/for-practitioners/practitioner-resources>.

Trauma-focused cognitive behaviour therapy (TF-CBT) is an evidence-based treatment approach for children who have experienced sexual abuse, exposure to domestic violence or similar traumas.[2] TF-CBT features on a range of databases of evidence-based practices, including the California Evidence-Based Clearinghouse for Child Welfare (CEBC) Program Registry: <www.cebc4cw.org>. Training in TF-CBT is available online from the Medical University of South Carolina website: <tfcbt.musc.edu>. However, a full discussion of evidence-based trauma-specific interventions is beyond the scope of this paper.[3]

Similarly, in relation to adults affected by childhood trauma, Connor and Higgins (2008a, 2008b) outlined a model of trauma-specific intervention for clients who experience complex trauma (who may not meet the criteria for PTSD). Evaluating the model, they found qualitative and quantitative evidence from a small-scale pilot study of the effectiveness of their combined individual and group therapy approach focused on the following elements (using the mnemonic "HEALTH"):

- having a supportive therapist;
- ensuring personal safety;
- assisting with daily functioning;
- learning to manage core PTSD symptoms (self-regulation);
- treating complex PTSD symptoms; and
- having patience and persistence to enable "ego strengthening".

1 The emerging interventions included in their review were: mindfulness, acceptance and commitment therapy, meditation, transcendental meditation, acupuncture, power therapies, and experiential psychotherapies including adventure therapy, art therapy, music therapy, and canine- and equine-assisted psychotherapy. See: <evidencecompass.dva.gov.au/home/question/10>.

2 See: *Trauma-Focused Cognitive Behavioral Therapy for Children Affected by Sexual Abuse or Trauma* (Child Welfare Information Gateway, 2012) <www.childwelfare.gov/pubpdfs/trauma.pdf>.

3 See *Approaches Targeting Outcomes for Children Exposed to Trauma Arising From Abuse and Neglect: Evidence, Practice and Implications* (Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2014) for a discussion of the evidence of the effectiveness of trauma-specific and trauma-informed practices pertaining specifically to children who have experienced abuse and neglect.

However, there have been criticisms made of trauma-specific interventions. For example:

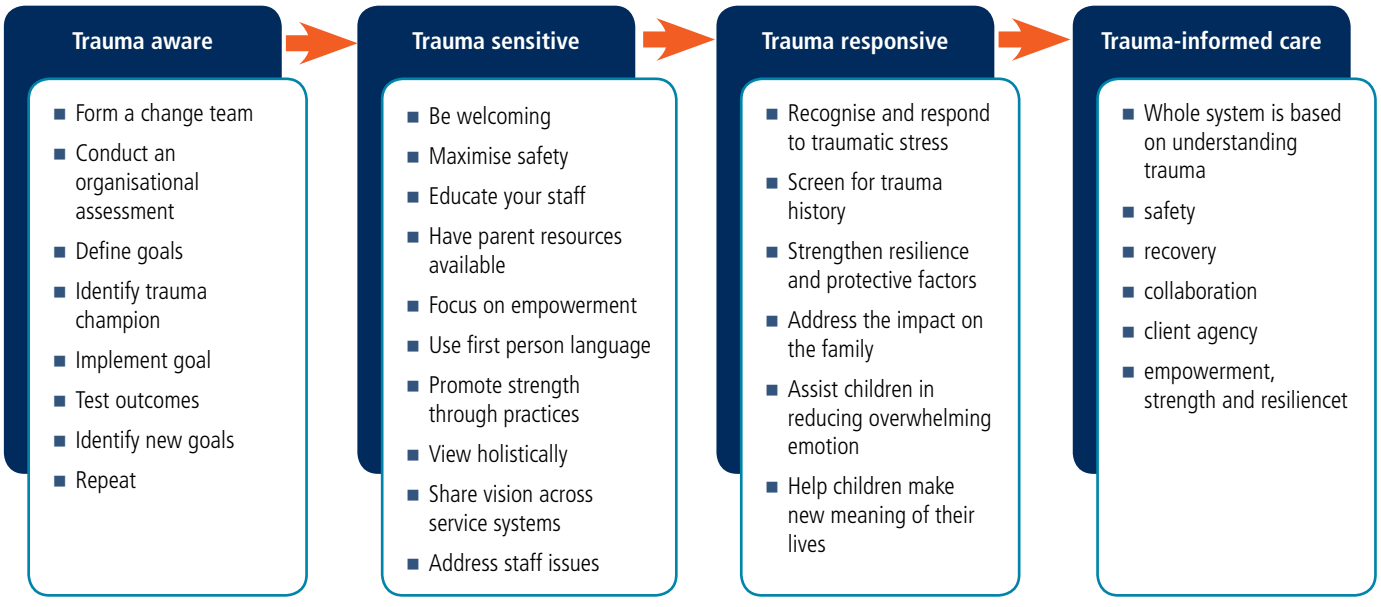
- complex trauma is often inter-relational in nature, so the degree to which research on the treatment of combat-related PSTD applies in these circumstances has been questioned (e.g. for those exposed to prolonged child sexual abuse, particularly if it has resulted in personality or dissociative disorders and is associated with disturbances to affect regulation, self-concept and interpersonal relationships);
- treatment sessions may need to be more frequent and over a longer duration than typical structured programs;
- evaluations of cognitive-based interventions often focus on statistically significant effect sizes rather than clinically meaningful symptom reduction; and
- the value of non-cognitively based interventions, which have been poorly evaluated or not evaluated, are easily overlooked (see: van der Kolk, 2014).

The primary purpose of the paper is not to review the effectiveness—or limitations—of trauma-specific interventions, or even to look specifically at complex trauma and complex PTSD (see: Wall & Quadara, 2014); but rather to explore the broader issue of the value and role of trauma-informed care in child and family welfare service provision.

Trauma-informed model of care

The available literature suggests that there is a continuum from being *trauma aware* (seeking information out about trauma and its implications for organisations) to being *trauma-informed* (a cultural shift at the systemic level). One useful resource sets out the progression in four stages (see Figure 1):

- *trauma aware*: seek information out about trauma;[4]
- *trauma sensitive*: operationalise concepts of trauma within the organisation's work practice;
- *trauma responsive*: respond differently, making changes in behaviour;
- *trauma informed*: entire culture has shifted to reflect a trauma approach in all work practices and settings.



Source: Adapted by Antonia Quadara from Mieseler & Myers (2013)

Figure 1: Practical steps to get from trauma aware to trauma informed

4 At its most basic level, organisations that are trauma aware incorporate trauma awareness into their work. Staff have an understanding of trauma and how symptoms and behavioural presentations in individuals may be responses to traumatic experiences so that behaviours that appear self-destructive or self-defeating can be acknowledged as being adaptive behaviours to trauma that have become maladaptive over time (Hopper, Bassuk, & Olivet, 2010; Markoff, Fallot, Reed, & Elliot, 2005). This applies particularly to broader human service delivery agencies (beyond child/family welfare), particularly if they are not primarily focused on delivering trauma-specific interventions and/or trauma-informed models of care.

SAMHSA's definition of a trauma-informed approach to service is:

> A program, organisation or system that is trauma-informed realises the widespread impact of trauma and understands potential paths for recovery; recognises the signs and symptoms of trauma in clients, families, staff and others involved with the system and responds by fully integrating knowledge about trauma into policies, procedures and practices and seeks to actively resist retraumatisation (SAMHSA, 2014, p. 9)

The main aim of this paper is to explore trauma-informed approaches to care and service delivery specifically in the child and family welfare sectors. While the focus is on how child/family welfare services can be trauma informed, the need extends to other service delivery areas. The trauma literature indicates that trauma survivors are clients in a very broad range of human services such as:

- homelessness (Hopper et al., 2010; Morrison 2009);
- mental health (Kezelman & Stavropoulos, 2012; Muskett, 2014);
- substance abuse treatment; and
- correctional systems (Stathopoulos, 2012).

These types of services have a clear connection to the impacts of trauma, particularly trauma arising from interpersonal victimisation, which has been identified as a driver of human service use (Huntington, Moses, & Veysey, 2005). The term "complex needs" is sometimes used to describe the span of need for an array of services required over a lifetime (Wall & Quadara, 2014). These agencies and services would benefit from being—at a minimum—"trauma aware".

What is the evidence that a trauma-informed approach is needed?

Research suggests that exposure to adverse, potentially traumatic events in childhood is not uncommon (Anda et al., 2006). For example, the Adverse Childhood Experiences (ACE) study in the USA showed that of 17,337 respondents, 64% had experienced at least one adverse experience[5] and approximately 12% had experienced four or more in the first 18 years of life (Anda et al., 2006). Further to this, a recent report suggested that childhood trauma affects an estimated five million Australian adults (Kezelman, Hossack, Stavropoulos, & Burley, 2015). There is also a great deal of evidence associating traumatic experiences with a broad range of deleterious outcomes in childhood, adolescence and adulthood (e.g. Anda et al., 2006; CFCA, 2014a, 2014b; Dube et al., 2001; Hahn Fox, Perez, Cass, Baglivio, & Epps, 2015; Johnson-Reid, Kohl, & Drake, 2012; Nurius, Green, Logan-Greene, & Borja, 2015).

Individual responses to traumatic experiences vary widely, with not all exposure leading to negative outcomes. It is the individual response to the experience that determines whether it is considered traumatic or not (SAMHSA, 2014). If effects occur they can be short- or long-term and may occur immediately following exposure to adversity or have a delayed onset (SAMHSA, 2014).

Multiple studies have reported negative effects associated with experiencing trauma across all facets of life. Mental ill-health, physical illness, social and relational difficulties, and poor academic and employment outcomes have all been linked to previous traumatic experiences. Anda and colleagues (2006) found a strong relationship between increased numbers of adverse childhood experiences and increased prevalence and risk of:

- affective disturbances (e.g. panic attacks, anxiety, hallucinations);
- somatic disturbances (e.g. sleep disturbance, severe obesity);
- smoking, illicit drug use, injected drug use, alcoholism (for people with four or more adverse childhood experiences);
- early intercourse, promiscuity and sexual dissatisfaction;
- impaired memory of childhood; and

5 The adverse childhood experiences measured were three types of childhood abuse: emotional abuse, physical abuse, and contact sexual abuse; and five measures of household dysfunction during childhood: exposure to alcohol or other substance abuse, mental illness, violent treatment of mother or step-mother, criminal behaviour in the household, and parental separation or divorce (Anda et al., 2006, p. 176).

- high perceived stress, difficulty controlling anger and risk of perpetrating intimate partner violence (for people with four or more adverse childhood experiences).

Further to this, the study found that as the number of adverse childhood experiences increased so too did the average number of co-occurring negative outcomes (Anda et al., 2006). There is strong evidence to indicate that certain types of trauma rarely occur in isolation. Research suggests, for example, that the different child maltreatment types are interrelated: sexual abuse, physical abuse, psychological maltreatment, neglect and exposure to domestic and family violence typically occur in combination with each other. A large proportion of children and young people who experience childhood abuse or neglect are exposed to more than one type of abuse (known as "multi-type maltreatment"; Price-Robertson, Higgins, & Vasallo, 2013). Further to this, other forms of victimisation such as bullying or assault by a peer have often been found to co-occur with child maltreatment (known as "poly-victimisation"; see Finkelhor, Ormrod, & Turner, 2007).

Multiple victimisation experiences across different domains are consistently associated with poorer outcomes than a single adverse or maltreatment experience. Those who experience multi-type maltreatment or poly-victimisation are more likely to experience high levels of trauma symptoms and worse outcomes than those who are exposed to no maltreatment or only one type (Finkelhor et al., 2007; Higgins & McCabe, 2001). Supporting these findings, a recent large scale US study of children in the Illinois child welfare system found that children who experienced both violent interpersonal *and* attachment-based ("non-violent") traumas within the caregiver system experienced greater difficulties across several areas of impairment (including attention/behavioural dysregulation and self/relational dysregulation) and were significantly more likely to exhibit PTSD-like symptoms compared to children who had experienced neither type of trauma, violent trauma only or non-violent trauma only (Kisiel et al., 2014).

Co-occurring mental health issues and disorders such as conduct disorder and oppositional defiant disorder (in children), PTSD, depression and other affective disorders, borderline personality disorder, somatoform disorders, psychotic and dissociative disorders have commonly been associated with traumatic experiences (Bateman, Henderson, & Kezelman, 2013; Breslaue, 2009; CFCA, 2014a, 2014b; Nurius et al., 2015; van der Kolk et al., 2005). Self-harm and suicide attempts have also been linked with previous traumatic experiences (Bateman et al., 2013; Cozolino, 2010; Dube et al., 2001; Herman, 1992; Johnson-Reid et al., 2012). In one study, Dube and colleagues (2001) reported that any adverse childhood experience increased the risk of attempted suicide by 2–5 fold with the relationship being partially mediated by illicit drug use, depressed affect and self-reported alcoholism.

Those who have had previous traumatic experiences also commonly report physical health issues. For example, in summarising research on the potential effects of trauma exposure, Bateman and colleagues (2013) found that "survivors of child maltreatment were at increased risk of hepatitis, diabetes, heart disease, cancer, a stroke, are more likely to have surgery and are at increased risk of having one or more chronic pain symptoms" (p. 19). The same authors also noted a range of conditions that child sexual abuse survivors were at increased risk of, including irritable bowel syndrome, asthma, arthritis and digestive problems.

In addition, childhood trauma exposure has been linked to involvement with the criminal justice system. A large study exploring adverse childhood experiences of serious, chronic and violent juvenile offenders and juveniles referred to the justice system for single non-violent offences found that every additional adverse childhood event experienced increased the risk of becoming a serious, chronic and violent juvenile offender by more than 35%, even when other known risk factors for violent behaviour were accounted for (Hahn Fox et al., 2015).

Lastly, difficulties in interpersonal relationships are often reported as a result of experiencing trauma (Bateman et al., 2013; Briere & Spinazzola, 2005; Evans & Coccoma, 2014; van der Kolk, 2005).

Although individual responses to traumatic experiences may vary widely, research has found a strong relationship between the degree of risk of experiencing multiple and complex negative outcomes following traumatic experiences and factors such as the age at which the experience/s occurred, the nature of the experience/s (with negative effects being particularly associated with

trauma of an interpersonal nature such as child abuse and neglect), and the severity and chronicity of the experiences (Cozolino, 2010; Herman, 1992; Kisiel et al., 2014; National Scientific Council on the Developing Child, 2014 [NSCDC]; Resick et al., 2012; van der Kolk et al., 2005). As noted by Cozolino (2010):

> The impact of trauma depends on a complex interaction of the physical and psychological stages of development during which it occurs, the length and degree of the trauma, and the presence of vulnerabilities or past traumas. The impact of chronic trauma becomes woven into the structure of personality and is hidden behind other symptoms, making it difficult to identify, diagnose and treat. (p. 266)

Traumatic events experienced early in life can be extremely damaging to the developing brain. Neural development relies on the interplay of genes and environmental inputs (particularly interaction with primary carers) and early adversity or disrupted attachment relationships that lead to chronic high levels of stress can interfere with key neurobiological development (NSCDC, 2014). Pamela Alexander (2013) suggested that "affective synchronization between mother and child" (p. 45) in carer–infant interactions is crucial for brain development, social development and stress regulation. Early onset, sustained trauma that interferes with this can lead to deficits in multiple domains: dysfunction in fear extinction; affect or emotional regulation; behaviour regulation; learning, cognition and attention; and self and relational dysregulation (Cook et al., 2005; Courtois & Ford, 2009; Evans & Coccoma, 2014; Kisiel et al., 2014; NSCDC, 2014; van der Kolk et al., 2005).

Research has also highlighted that experiencing traumatic events tends to increase the chances of experiencing further traumatic events across the life course. Cozolino (2010) argued that:

> Enduring personality traits and coping strategies that emerge in these situations [experiencing early onset, sustained trauma] tend to decrease positive adaptation and increase an individual's vulnerability to future trauma. This can manifest through engagement in abusive relationships, poor judgement, or a lack of self-protection. (pp. 268–9)

Finally, in examining the need for a trauma-informed approach to care it is pertinent to note that in many cases, due to the co-occurrence of problems resulting from experiencing trauma, individuals may find themselves in multiple systems, cycling in and out of specific services over many years to access, for example, treatment for drug and alcohol addictions, support for employment opportunities and therapeutic services for mental illness.

Historically, the underlying factor often linking a constellation of needs together—the history of abuse and its impacts—has not been adequately acknowledged or integrated into these service systems' service responses to individuals (Harris & Fallot, 2001). Further, populations with complex needs are at high risk of falling through the gaps of service delivery systems due to a lack of service co-ordination and the related barriers to service integration (Whiteford & McKeon, 2012). This can mean that clients: are deemed ineligible for services (e.g. cannot engage in mental health treatment until they have "dealt with" their substance abuse issue or vice versa); are expected to separate out their trauma experiences from their service or treatment needs ("we don't deal with trauma in this parenting class"); and experience services systems' responses as re-traumatising.

The SAMHSA-funded *Women With Co-Occurring Disorders and Violence Study* was a comprehensive 5-year project (1998–2003) across multiple sites, which provided evidence that integrating different services, such as mental health and substance abuse services where there was client need for both, was effective. This study showed that trauma-informed approaches could enhance the effectiveness of mental health and substance abuse services for women with co-occurring mental health and substance abuse disorders (Huntington et al., 2005; Morrisey et al., 2005). A trauma committee for this study also developed an understanding of trauma-informed principles and ways in which mental health and substance abuse service providers could use the approach (Elliot et al., 2005). In the years since the study, further development, debate and discussion has resulted in an expanded evidence base about the effects of trauma and appropriate approaches for services.

What is trauma-informed care?

Trauma-informed care could be described as a framework for human service delivery that is based on knowledge and understanding of how trauma affects people's lives and their service needs (Harris & Fallot, 2001). This requires consideration of a person's environment beyond the immediate service being provided and of how their symptoms and presentations may be seen as adaptations to trauma rather than as pathologies (Herman, 1992). At the broadest level, trauma-informed care means that services have an awareness and sensitivity to the way in which clients' presentation and service needs can be understood in the context of their trauma history (Knight, 2015). Kezelman and Stavropoulos (2012) noted that trauma-informed health and welfare settings and systems contrast dramatically with traditional settings and systems as they require different ways of operating, and without this understanding, risk re-traumatising service users. Trauma-informed approaches to care could be described as a strengths-based framework that is responsive to the effects of trauma (Bateman et al., 2013).

Principles of trauma-informed care

Principles of trauma-informed care have been articulated in a range of academic literature and guidance publications (Elliot et al., 2005; Hopper et al., 2010; Jennings, 2004; Kezelman & Stavropoulos, 2012; SAMHSA, 2014). These principles vary in length and number depending on the publication but essentially have the same underlying philosophies, that trauma-informed care means services are trauma aware, safe, strengths-based and integrated.

At the very minimum, trauma-informed services aim to do no further harm through re-traumatising individuals by acknowledging that usual operations may be an inadvertent trigger for exacerbating trauma symptoms. SAMHSA's (2014) approach to trauma-informed care makes four key assumptions that must be present as a basis of implementation for trauma-informed care, with a further six key principles to then be applied.

The key assumptions that SAMHSA has identified as needing to be inherent in any trauma-informed approach are based on four "R"s:

- *Realisation* at all levels of an organisation or system about trauma and its impacts on individuals, families and communities;
- *Recognition* of the signs of trauma;
- *Response*—program, organisation or system responds by applying the principles of a trauma-informed approach; and
- *Resist* re-traumatisation—of clients as well as staff.

In addition to these assumptions, SAMHSA (2014) then described six key principles of a trauma-informed approach:

- *Safety*—Staff and the people they serve feel physically and psychologically safe.
- *Trustworthiness and transparency*—Organisational operations and decisions are transparent and trust is built.
- *Peer support*—Peers is the terminology SAMHSA use for individuals with lived experience of trauma or their caregivers. Peers are also known as "trauma survivors".
- *Collaboration and mutuality*—This principle is about levelling power differentials between staff and clients and amongst organisational staff to ensure a collaborative approach to healing.
- *Empowerment, voice and choice*—This principle emphasises the strengths-based nature of trauma-informed care. The organisation—and ideally the whole service delivery system—fosters recovery and healing.
- *Cultural, historical and gender issues*—A trauma-informed approach incorporates processes that move past cultural stereotypes and biases, and incorporates policies, protocols and processes that are responsive to the cultural needs of clients.

For an example of an Australian model of trauma-informed care, see Tucci and Mitchell's (2015) outline of the basic understanding of trauma that informs appropriate care underpinning the services and training provided by the Australian Childhood Foundation: *9 Plain English Principles of Trauma Informed Care* <www.childhood.org.au/blog/home/2015/april/trauma-informed-care>.

The Berry Street Childhood Institute also provides a number of resources and training on trauma-informed care for children: <www.childhoodinstitute.org.au/Resources>.

Achieving trauma-informed services: Reflection questions for service managers

- What is the likelihood of clients who have experienced trauma accessing our service?
- Do we provide access to trauma-specific evidence-based treatments for current psychological difficulties that result from that trauma (e.g. Trauma-focused cognitive-behaviour therapy)?
  - See *Trauma-Focused Cognitive Behavioral Therapy for Children Affected by Sexual Abuse or Trauma* <www.childwelfare.gov/pubpdfs/trauma.pdf>
- Do we provide access to effective treatments for complex trauma and complex PTSD (for which trauma-specific treatments may not be as effective)?
  - (See: Connor & Higgins, 2008a, 2008b; Kezelman & Stavropoulos, 2012).
- Are these trauma-specific interventions provided inhouse, in collaboration with other agencies, or via referral to an external agency (and if so, do we provide active/warm referral)? See:
  - *Interagency collaboration: Part A. What is it, what does it look like, when is it needed and what supports it?* <aifs.gov.au/cfca/publications/interagency-collaboration-part-what-it-what-does-it>
  - *Interagency collaboration: Part B. Does collaboration benefit children and families? Exploring the evidence.* <aifs.gov.au/cfca/publications/interagency-collaboration-part-b-does-collaboration-benefi>
  - *Effective practices for service delivery coordination in Indigenous communities*. <www.aihw.gov.au/uploadedFiles/ClosingTheGap/Content/Publications/2011/ctgc-rs-08.pdf>
- How do we incorporate restorative justice principles?
  - According to Higgins et al. (2014), restorative justice activities might include:
    - addressing trauma and other mental health consequences through evidence-based therapeutic interventions;
    - repairing the injuries caused to relationships, especially between sons/daughters and parents;
    - providing opportunities for truth-telling, storytelling and acknowledgement; and
    - overcoming shame and recognising past actions through public activities and community awareness campaigns.
  - See: Higgins et al., 2014, pp. 41–46: *Forced Adoption Support Services Scoping Study* <www.dss.gov.au/our-responsibilities/families-and-children/publications-articles/forced-adoption-support-services-scoping-study>
- Who in the organisation is likely to come into contact with individuals who have experienced trauma, or be providing information to, or receiving communications from clients experiencing trauma? Thinking from a "client journey" perspective, this might include:
  - phone/intake staff;
  - web/staff with online monitoring;
  - reception;
  - office manager;
  - media and communications staff;
  - other staff or contractors on the premises (e.g. catering, cleaning, security); and
  - project/service delivery professionals and support staff.

- Who is less likely to be interacting with trauma survivors but who need to understand, and who need to support "front-line" workers and other support staff who do?
  - executive staff (who create the authorising environment);
  - managers and team leaders; and
  - mentors and supervisors.

This suggests the value of whole-of-organisation approaches to trauma-informed service delivery, directed at every level to ensure a focus on what helps clients feel safe.

- What should training encompass? Training should include:
  - skills in de-escalation or "holding" clients who are experiencing an acute episode of trauma or re-traumatisation;
  - debriefing and staff protocols for responding to difficult situations and clients presenting with complex circumstances and trauma histories;
  - information on staff care and preventing/responding to secondary or vicarious trauma—the psychological term for changes that can occur to people when they are repeatedly exposed to traumatic material (see <aifs.gov.au/publications/feeling-heavy>);
  - organisational supports to prevent or address vicarious trauma for staff including: clinician self-care skills and reflective practice, caseload management, supervision, debriefing, staff and peer support, workplace safety, comfort and supportive work culture that acknowledges the reality of vicarious trauma (Morrison, 2007);
  - types of events/circumstances in clients' lives that may be traumatising;
  - typical modes of reacting—events/triggers for re-traumatisation; and
  - understanding the impacts of trauma (such as behavioural symptoms typical of PTSD, as well as the developmental impacts of victimisation and trauma on an individual's beliefs—about the self, the world, and the future—e.g. see: Janoff-Bulman & Frieze, 1983).

Further to this, SAMHSA also provide a range of sample questions to consider when implementing a trauma-informed approach <store.samhsa.gov/shin/content//SMA14–4884/SMA14–4884.pdf> (p.14–16).

Which services should be delivering trauma-informed care?

Most of the US literature about trauma-informed care is directed at change in behavioural health services. In Australia there appears to be an emphasis on driving change in the mental health sector. This has the potential to cause confusion about the pathway to providing trauma-informed care in the child, family and community sectors and about what being trauma-informed actually means. One aspect of clarifying these questions is to understand which services should be adopting a trauma-informed approach to human service delivery.

In addition, there are communities and populations for whom violence and intergenerational trauma are a constant reality. Some Indigenous communities, for example, experience the phenomenon of trans-generational trauma whereby trauma is transmitted across a number of generations (Atkinson, 2002). The historical impacts of colonisation on Aboriginal people in Australia have played out in a history of disadvantage and discrimination as traditional Aboriginal life was gradually disrupted and dismantled (Atkinson, 2002; Keel, 2004). The effectiveness of the full range of health and human services in such communities could be enhanced by a trauma-informed approach (Atkinson, 2013).

As outlined in the earlier discussion on principles of trauma-informed care, it is important for services to be culturally attuned and relevant (Atkinson, 2013). This is described by SAMHSA as the principle that the trauma-informed organisation actively moves past cultural and gendered stereotypes and incorporates policies and processes that are responsive to the cultural needs of individuals served, including addressing historical trauma (SAMHSA, 2014) or collective trauma (Atkinson, 2013).

Building on the work of Harris and Fallot, SAMHSA's (2014) *Concept of Trauma and Guidance for a Trauma-Informed Approach* outlined ten implementation domains:

- governance and leadership;
- policy;
- physical environment;
- engagement and involvement;
- cross-sector collaboration;
- screening, assessment, treatment services;
- training and workforce development;
- progress monitoring and quality assurance;
- financing; and
- evaluation (p. 12).

This guidance information is designed to provide a starting point for an organisational approach to implementing trauma-informed care. It also indicates that organisations across *all* settings should consider how trauma-informed approaches could benefit stakeholders regardless of whether they deal with trauma in their day-to-day business. The reality of the prevalence of traumatic experiences in the general population indicates that trauma is not confined to prevention, treatment and recovery settings but is integral in other systems as well (SAMHSA, 2014).

It is important to note that many practices that service providers currently use are likely to already be consistent with a trauma-informed approach, such as conveying empathy and validating the client's experiences (Knight, 2015). What is different about identifying as a trauma-informed service is that there is a paradigm shift in service delivery culture to acknowledge and clearly articulate the importance of trauma in understanding and responding to client presentation.

With the lack of an overarching framework in Australia, there is a danger of developing trauma-informed models and practices that are not sharing a consistent language about what being trauma-informed entails. This issue is discussed in more depth in the section about challenges to implementation later in this paper.

The need for a systems approach to trauma-informed care

Following the lead of the USA, Australian health agencies are moving towards a trauma-informed paradigm for considering health and human service delivery systems (Kezelman & Stavropoulos, 2012) in preference to a medical model of individual illness (DeCanandia, Guarino, & Clervil, 2014).

The effects of traumatic experience often manifest in behaviours that result in people being involved in human service systems that go beyond mental health, such as the criminal justice system (SAMHSA, 2014). A systems approach to trauma-informed care means that implementation goes beyond individual practitioner and service organisation change to extend to whole systems that people who have experienced trauma are likely to interact with. A system, for example, could include the justice, homelessness or child welfare systems. These systems may not include treatment settings but can still affect the people who experience them. In the USA, a range of systems are in the process of adopting a cross-sectoral approach to implementing trauma-informed care and trauma-specific services to support service users (DeCanandia et al., 2014). For example, the behavioural health and health care, veterans' administration, homelessness and education sectors are just a few of the systems that are shifting to a trauma-informed approach (DeCanandia et al., 2014).

The differences between trauma-informed services and trauma-specific services are described in the definitions outlined earlier. It is important to distinguish between them but acknowledge the intersection of the two types. Trauma-specific services are designed to treat the symptoms or manifestations of the effect of a trauma on an individual but these interventions must be delivered in a trauma-informed context. This emphasises an overall philosophy of trauma as a central concept in understanding the presentation of clients within a range of health and welfare settings (Kezelman & Stavropoulos, 2012).

Challenges in implementing a trauma-informed approach to care

As noted previously, implementing trauma-informed care requires a paradigm shift in service delivery (Hopper et al., 2010; Jennings, 2004). The literature around trauma-informed care indicates that there are still some challenges to implementing this approach for systems and services, as well as the need for research to evaluate the approach's effect on client wellbeing and other service delivery outcomes (Ashmore, 2013; Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2013; Hopper et al., 2010; Muskett, 2014). These challenges are discussed in the following sections.

Inconsistent understandings of what it means to be trauma-informed

The most identifiable challenges across the literature are in the need to create shared understandings, and current inconsistencies in education regarding trauma-informed care (Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2013; Hopper et al., 2010). It is difficult to align organisational change to a specific practice without a shared understanding or vision of what trauma-informed care actually is. In a comparative study of trauma-informed care in acute mental health inpatient units, Ashmore (2013) identified this as an issue in the implementation of trauma-informed care in an acute patient environment. A lack of definition and of a shared framework, as well as a lack of information specific to an acute mental health inpatient setting, were associated with challenges and inconsistency in implementation.

In their review of the literature, the Parenting Research Centre and the Australian Centre for Post-traumatic Health (2013, now Phoenix Australia) found that although participants within the child and family services sector who worked with children exposed to trauma were familiar with terminology such as "trauma-informed care", they argued that:

- the field still lacked clear definitions or understandings of concepts;
- there were assumptions that children's social and behavioural difficulties were necessarily trauma-related without clear assessment; and
- there was a lack of guidelines for assessment and treatment of trauma.

SAMHSA's (2014) recent guidance document is clearly aimed at addressing this lack of consistency in definitions and the 2012 document by Adults Surviving Child Abuse provides some practice guidelines (Kezelman & Stavropoulos, 2012). However, an aspect of trauma-informed care is that it must be culturally relevant to the populations it serves (Elliot et al., 2005; Jennings, 2004) and any broad level articulation of policy approaches or frameworks must be applicable in a range of systems and settings and for a variety of cohorts.

Translating trauma-informed care to specific practice and service settings

In addition to the array of terminology and concepts that are sometimes used interchangeably and inconsistently, there is a lack of evidence-based guidance for specific settings and systems to assist with coordinating how trauma-informed practice should be provided for particular service settings and specific populations of service users. This issue was identified by Muskett (2013) and Ashmore (2013) in relation to mental health nursing, where the need to remove the use of seclusion and restraint is emphasised but, beyond this, little has been articulated to support the use of specific practices for service settings to adopt to improve service delivery consistent with principles of trauma-informed care. Dealing with survivors of trauma, particularly in a mental health or child protection setting, may require individuals to use their prior experience to respond to specific situations. In such stressful and potentially dangerous settings, crisis management could lead to a de-prioritisation of trauma-informed responses (Conners-Burrow et al., 2013). Training and guidance for staff on how to respond to acute situations appropriately and feel confident that they are acting in accordance with the principles of trauma-informed care is recommended (Knight, 2015; Muskett, 2014).

Facilitating complex system change

As noted by the American Institute for Research, in order to build a trauma-informed system, commitment at all system levels is required. This includes a commitment to ongoing training and service transformation (DeCanandia et al., 2014). Australia is behind the USA and Canada in developing models and systemwide responses to children and other service users impacted by trauma (Bateman et al., 2013). For example, the USA has the National Child Traumatic Stress Network, funded by SAMHSA, which brings a singular and comprehensive focus to responding to childhood trauma. Australia is arguably still at the stage of requiring policy change to articulate a clear direction for moving towards systems of trauma-informed care in a range of different service delivery areas relating to child/family wellbeing (Bateman et al., 2013).

Systemic change is important because it enables people to receive services that are sensitive to the impact of trauma regardless of whether they enter through any particular service setting or intervention.

Large-scale systems change is also logistically difficult and time-consuming and requires commitment and resources (Hopper et al., 2010). Philosophical differences between sectors that need to work together to integrate care can also impede systemic change (Hopper et al., 2010). Ashmore (2013) identified particular features of systems change for systems such as mental health that are challenging. These challenges include that hierarchical systems such as health may encounter resistance and that there is an inherent power inequality between service users and professionals in such environments.

Creating change at a systemic level is more than providing practitioners and organisations with tools. It requires changes to funding models to support outcomes rather than outputs, and changes to education for mental health practitioners, social workers and other specialists. Essentially, this is about a move towards a more holistic understanding of the inter-related biological, psychological and social dimensions of trauma.

Evaluating a trauma-informed approach to care

Studies from the USA, particularly following the Women With Co-Occurring Disorders Study, have found that trauma-informed, integrated services are judged to be cost-effective when compared with treatment as usual in the comparison sites of that particular study (Domino, Morrisey, Chung, Huntington, & Larson, 2005). Although this study is regularly cited in the literature as evidence of the cost-effectiveness of trauma-informed care (DeCanandia et al., 2014, Hopper et al., 2010; Kezelman & Stavropoulos, 2012); in reality, there is a lack of evaluation about cost-effectiveness and other aspects of trauma-informed care approaches, including its effectiveness in improving outcomes for service users (Quadara, 2015). There is also a lack of evaluation tools to measure the extent to which an organisation is trauma-informed, and the lack of consistent definitions further translates into difficulties in identifying a clear method to indicate the degree to which a service or program is trauma-informed (Hopper et al., 2010).

Other challenges identified in evaluating trauma-informed care, highlighted by Hopper et al. (2010), include the difficulty in measuring cultural change and sustainability of change and whether changes in outcome are attributable to trauma-informed environments or trauma-specific interventions. In addition, the need for cross-system collaboration and assessing human service interactions to establish the extent of trauma-informed care practice implementation further complicates evaluation in this area (Kramer et al., 2015).

Applying trauma-informed care principles

To illustrate how trauma-informed care principles can be applied to respond to different trauma issues, we briefly look at service delivery in the context of people affected by the policies that created the Stolen Generation, past adoption practices and humanitarian migration.

The Stolen Generation

In their program logic, the Aboriginal and Torres Strait Islander Healing Foundation (2014, p. 25) explain how a collective healing process for members of the Stolen Generation and their descendants can occur, and the mechanisms that underlie this process. Central to this model is an understanding of an Aboriginal world view and the pervasive trauma of colonisation, and the need for specific strategies to address ongoing, collective trauma. A common element of collective healing projects is that they are based on a trauma-informed or recovery framework. According to the Healing Foundation (2014):

> Trauma-informed practice is a strengths-based approach to healing that: is based on an understanding of, and responsiveness to, the impact of trauma; emphasises physical, psychological, and emotional safety for people seeking help and for the helpers; and creates opportunities for people affected by trauma to rebuild a sense of control and empowerment. It recognises the prevalence of trauma and is sensitive to and informed by the impacts of trauma on the wellbeing of individuals and communities. (p. 47)

Forced adoption and past family removal practices

An example of an issue that has only recently received public acknowledgement of its role in traumatising a large number of Australians is the former practice of forced adoption, or separation from family due to past family removal practices. In their exploration of good practice principles for services addressing the needs of people affected by forced adoption and past family removal practices, Kenny, Higgins, and Morley (2015) noted:

> There is increasing recognition of the potential for trauma for individuals who have been subjected to forced adoption policies and practices, and the value of a "trauma-informed" or "trauma-aware" approach to service delivery. Good practice suggests that service providers should approach all clients with a forced adoption experience as if they might be trauma survivors (p. 8).

In their overview of good practice principles, Kenny et al. (2015, p. 8) outlined the key elements of trauma-informed service delivery. Being a trauma-informed service ensures the provision of:

- a safe and supportive environment that protects against physical harm and re-traumatisation;
- an understanding of clients and their symptoms in relation to their overall life background, experiences and culture;
- continued collaboration between service provider and client throughout all stages of service delivery and treatment;
- an emphasis on skill building rather than managing symptoms;
- an understanding of the symptoms and survival responses required to cope;
- a view of trauma as a fundamental experience that influences an individual's identity rather than a single discrete event; and
- a focus on what has happened to a person rather than what is wrong with a person.[6]

Humanitarian migrants surviving torture and trauma

The NSW Service for the Treatment and Rehabilitation of Torture and Trauma Survivors (STARTTS) outline the program logic for their service model as systemic and based on an ecological model of factors that influence and support healing for survivors (see *How We Work* <www.startts.org.au/about-us/how-we-work>).

They aim to provide a range of services that reflect the bio-psycho-social model, such as:

- complementary therapies or neurofeedback to address biological impacts;
- counselling to address psychological impacts; and
- community development projects to support social changes.

6 See Forced Adoptions Community of Practice <aifs.gov.au/projects/forced-adoptions-community-practice>.

"There is nothing more practical than a good theory": The theoretical basis of trauma-informed models of care

(a) Attachment—developing a secure base

Attachment theory (Bowlby, 1988) has been used by developmental psychologists to explain positive, secure relationships between infants and caregivers, and how this forms the template for secure adult interpersonal relationships. Disruption to the relationship or insecure attachment is seen as a fundamental mechanism by which childhood trauma affects adult self-concept, wellbeing and interpersonal relationships. Trauma-informed care systems provide a safe environment to expose disruption to the attachment relationship, and build new internal models and "scripts" of the self and relationships.

(b) Self-regulation and control

Social cognitive theories of self-regulation help explain how individuals respond to threatening events. Key components of many trauma-specific treatments are to help individuals to improve self-regulation, safety, security, sense of control and mastery of their environment, and modulate their emotional reactions to traumatic stimuli. Trauma-informed systems of care are aware of the ways in which programs and organisations can trigger traumatic reactions—or even inadvertently replicate the dynamics of the traumatic events/relationships—and seek to minimise them, and promote environments that facilitate positive affect regulation or "modulation".

(c) Fundamental attribution error—overestimating the personal characteristics, underestimating situational factors

Theories of social psychology have identified that humans often make what is termed the "fundamental attribution error", whereby we over-emphasise a person's personality, or internal characteristics, in explaining their behaviour, and underestimate the environmental, or situational factors, that are external influences on their behaviours (e.g. see: Jones & Harris, 1967). For clients who have experienced trauma—particularly complex trauma involving multiple injuries in the interpersonal domain—it is likely that those around them, including their families, their work colleagues and even their health/mental health professionals, are likely to attribute their interpersonal difficulties and deficits in functioning and wellbeing to an inherent personality flaw, rather than having been shaped by their environment (i.e. the external traumatic events they have endured). Creating new environments of support, and opportunities for "reprograming" life scripts are important. But practitioners need to be open to seeing the external influences and specifically target intervention strategies to remediate the long-standing negative consequences.

Source: The title is a quote from Lewin (1952, p. 169)

Moving forward

Much of the literature identified that the paradigm shift towards implementation of a trauma-informed approach to care needed to include commitment from political leadership at all levels (Ashmore, 2013; Bateman et al., 2013; Kramer et al., 2015).

In Australia, the Mental Health Coordinating Council (Bateman et al., 2013) has articulated the requirement for a policy statement from national and state leaders endorsing the concept of trauma as a priority mental health issue and supporting the transition to a trauma-informed service system. This would ensure that there is an identifiable commitment from governments to support the need for trauma-informed service systems.

The broad dissemination of information about trauma-informed, evidence-based best practice has been identified as an important feature of developing the evidence base around trauma (Kramer et al., 2015). Development of a nationally based resource, such as SAMHSA's National Center for Trauma-Informed Care and the National Child Traumatic Stress Network, would provide an Australian-based network of information to support policy development and service delivery and to enable the use of what is currently known about trauma-informed services in different health and human service sectors. Having central resources such as these, is instrumental in shifting human service systems towards a trauma-informed approach to service delivery.[7] Australia does not yet have a body with such a specific focus but extensive work has been undertaken by organisations such as the Mental Health Coordinating Council and Adults Surviving Child Abuse, among others, to help shape behavioural health policy towards incorporating an understanding of the damaging effects of trauma into policy and service delivery approaches.

Although there are some resources and tools now available to support guidance towards trauma-informed systems of care in Australia (Bateman et. al., 2013), there does not appear to be an overarching trauma framework to support a shift in a consistent way. As noted earlier, organisations in Australia have recognised the need for trauma-informed services and

7 See National Center for Trauma-Informed Care and Alternatives to Seclusion and Restraint <www.samhsa.gov/nctic>

interventions but the current array of methods, models and interventions on offer and in use do not support a coordinated and common approach that would ensure trauma-informed has a consistent meaning and interpretation in service delivery.

Conclusion

There is growing awareness of the need, and a strong rationale for the value, of implementing a trauma-informed approach to human service delivery. Such an approach has been adopted and implemented extensively in the USA. In Australia, there is a strong push towards trauma-informed approaches to care, and recognition of the impacts of child abuse and other traumas as a driver of service need. However, there is confusion with the array of terminology used and a lack of reference to specific trauma-informed frameworks to guide the introduction of trauma-informed care in a systemic way. Despite the need, and the conceptual/theoretical rationale, it is important to acknowledge that there is limited empirical evidence to show that working systemically to be trauma aware and providing trauma-informed systems of care leads to reductions in trauma symptoms or other positive outcomes for clients.

Currently, there is no overarching policy to mandate trauma-informed care and no framework to guide evidence-based practice to transition in a systematic way to trauma-informed care in Australia. In addition, improvements to collection of research data and adoption of standardised outcome measures for evaluation would support a more systemic approach to evaluating the implementation of trauma-informed care.

There is value in capturing practice-based evidence; however, this is beyond the scope of the current paper, and would be best carried out via a systematic and rigorous approach to gathering and synthesising information from practitioners working with traumatised clients in a variety of fields—as well as the views of those in service delivery systems that are not yet trauma-informed to examine the barriers and enablers of system change. Similarly, there is a need to articulate findings from the emerging field of trauma-informed practice into concrete policy statements or frameworks that can be applied to different client groups within and across a range of service systems and settings.

Executive Summary

In 2013, the Administration for Children, Youth and Families, Family and Youth Services Bureau, US Department of Health and Human Services, awarded a grant to the GLBTQ Domestic Violence Project in Boston, Massachusetts to help improve trauma-informed work with lesbian, gay, bisexual, queer and transgender (LGBQT*) survivors of intimate partner violence (IPV). The following document is a literature review that sets the context for thinking about trauma-informed practice (TIP) for these communities. We developed this review over the course of 2015, supported along the way by an Advisory Board comprised of the NorthEast Two-Spirit Society, Queer Muslims of Boston, Fenway Community Health, the Hispanic Black Gay Coalition, the Massachusetts Alliance of Portuguese Speakers, HarborCOV, and Massachusetts Asian & Pacific Islanders for Health.

This document helps inform a set of practice-based observations that are included in the Appendix (page 40) and are also available as a separate document. At present, there are few, if any, documented LGBQT*-specific models of trauma-informed practice. This literature review and the accompanying practice observations make a clear case for the need for such models, and for the implementation of culturally competent LGBQT* trauma-informed services.

Key takeaways from the literature review include:

- IPV occurs in LGBQT* relationships at rates equal to or higher than rates in heterosexual relationships. Different subgroups within the community may experience different rates or types of IPV, with bisexual and transgender individuals at particularly high risk.

- Although LGBQT* IPV shares many underlying dynamics with IPV in heterosexual couples, it also has unique characteristics, including the types of abusive tactics used and the context of discrimination and social stigma faced by LGBQT* individuals. Within LGBQT* subgroups, there may be additional complexities.

- LGBQT* survivors who are also part of other oppressed groups often face homophobia within their own cultural communities as well as racism, ableism, xenophobia, and colonialism in mainstream communities. Moreover, LGBQT* IPV often occurs in a landscape that includes other forms of abuse and trauma, including family violence, sexual violence, hate crimes, and police brutality. Such overlapping forms of trauma are often interrelated, rendering some members of the LGBQT* communities subject to abuse by more than one person at a time and at more than one point in their lifespans. In the face of these overlapping forms of oppression, LGBQT* survivors are forced to make particularly constrained choices about safety, often trading one kind of safety for another.

- Mental health difficulties are major concerns among LGBQT* people in general. LGBQT* individuals experience higher rates of traumatic events, and may be at greater risk for developing symptoms of PTSD, depression, and anxiety as well as experiencing suicidality and isolation. These concerns are amplified for LGBQT* survivors of IPV, especially transgender individuals and survivors of color. Nonetheless, LGBQT* survivors find strength and resilience through identity affirmation and social support.

- LGBQT* survivors exhibit unique help-seeking behaviors. Overall, they are less likely to seek services from law enforcement and mainstream providers and more likely to rely on informal social support and LGBQT*-focused programs. There also are differences in help-seeking *within* LGBQT* subgroups. For instance, trans individuals may have an especially difficult time accessing culturally competent and non-traumatizing services. For LGBQT* people of color, stigma, economic constraints, and the absence of community outreach are barriers to services.

- Service provision that is not rooted in an expansive understanding of the intersecting oppressions that LGBQT* survivors face may do more harm than good. The kind of harm done by those in a social service system designed to help has been referred to as *sanctuary harm*, which is antithetical to trauma-informed practice.

- Despite growing awareness of the impact of sanctuary harm on clients who experience multiple forms of oppression and of the unique needs of LGBQT* survivors, trauma-informed approaches tailored to LGBQT* communities have been slow to develop. To our knowledge, there are none in the academic literature. It was our Advisory Board that pointed to an alternative model of trauma-informed practice – transformative justice.[1] While the roots of trauma-informed practice grew out of mental health and substance abuse services, transformative justice emerged from activist communities and seeks to uproot the conditions that created traumatic experiences, ending oppression even (if not especially) within helping systems.

We hope that this document will facilitate thinking about how the core principles of trauma-informed practice can be applied to working with LGBQT* survivors and to ameliorating vicarious traumatization among service providers who do their best in difficult circumstances.
Although this document is intended primarily for staff in domestic and sexual violence organizations, it has broad applicability. The information provided can be used to enhance the work of practitioners, advocates, and administrators in other anti-abuse disciplines, homelessness services, mental health and healthcare circles, criminal legal systems, youth services, and an array of other human services disciplines and social change initiatives that seek to serve and ensure the inclusion of LGBQT* communities. The practice-based observations in the Appendix provide further framing for this important endeavor.

[1] The authors wish to thank Hales Burton, at the Fenway Violence Recovery Program, for first suggesting this conceptual shift.

Introduction

IPV refers to the physical and/or emotional abuse of an individual by a current or former intimate partner. It includes the full range of tactics used to create and maintain power and control over another person, including financial abuse, verbal abuse and intimidation, and cultural abuse. In this document, the phrases *intimate partner violence* and *domestic violence* are used interchangeably to denote partner violence. However, it is important to note that domestic violence (DV) is sometimes defined more broadly to include violence and abuse perpetrated by relatives. Although many LGBQT* individuals experience abuse and/or rejection from family and relatives, the dynamics of partner violence versus family violence may differ dramatically. When we discuss the latter, we use the term *family violence* to distinguish it from violence by an intimate partner.

Following a note on language, the literature review is organized into five sections. Section One focuses on the prevalence and dynamics of IPV in LGBQT* communities. Section Two focuses on trauma, mental health, and resilience among LGBQT* individuals to contextualize the critical need for trauma-informed practices for these survivors. Section Three focuses on the range of systemic, institutional, and individual-level barriers that thwart LGBQT* peoples' access to informal and formal support services. Finally, the last section reviews the core principles of a trauma-informed approach to practice, with attention to the needs of service providers who work with LGBQT* survivors, and provides examples of community-specific approaches to trauma.

A Note on Language

The authors wish to acknowledge at the outset the deep complexities of language. LGBQT* stands for lesbian, gay, bisexual, queer, and transgender. It is often used interchangeably with GLBTQ, LGBQT-TS, and similar acronyms to broadly refer to sexual and gender minorities. This document honors the current practice of including an asterisk after the "T" to signify the broad diversity of trans communities, including trans women – transgender individuals who identify as women, though assigned male at birth; trans men – transgender individuals who identify as men, though assigned female at birth; those transitioning from female to male (FTM); those transitioning from male to female (MTF); cross dressers; gender non-conforming individuals; and others who might self-identify as being members of trans communities. In this paper, transgender and trans are used interchangeably.

These definitions belie the complexity of the terms, however. The words *lesbian*, *gay*, *bisexual*, *transgender*, and *queer* all carry particular historical, political and cultural meanings. To a great extent, these words have been shaped in white, Western contexts. Words such as lesbian, gay, and bisexual, for example, are uniquely English. There are seldom translations into other languages that carry the same understanding of LGBQT* identity as being an identity rather than a set of behaviors. Literal translations, into Spanish or Haitian Creole as but two examples, carry few if any of the presumptions that are inherent in English. In many parts of the Latin and Spanish-speaking world, men who engage in sex with

same sex partners are only considered "gay" in the English sense of the word if they are the receptive partner. It is not engaging in the acts that is the determinant of identity, so much as the role that an individual plays (traditionally read as *masculine* or *feminine*) in the conduct of that act. Similarly, men who marry women, but engage in same sex acts with other men, are frequently identified as heterosexual. In short, they are defined by their social role, rather than by their private, intimate acts. Hence the conception of *gay*, as defined in U.S. contexts, frequently fails to apply.

Precisely because identifiers such as LGBQT* were defined in white middle class and academic contexts, the limitations of LGBQT* labels and identifiers may be particularly acute in communities of color, Indigenous communities, and immigrant communities, among others. During the course of crafting this literature review, members of our Advisory Board taught us a tremendous amount. The Hispanic Black Gay Coalition (HBGC) suggested use of the term *same gender loving*, a community-specific phrase coined by Cleo Manago to distinguish African Americans, and in particular African American men, who do not self-identify as being part of the predominantly white gay movement in the U.S., but who nonetheless wish to affirm their same sex intimate relationships. Corey Yarbrough, one of the founding Executive Directors of HBGC, suggested that, for some same gender loving people, this language may be a form of racialized resistance to the racism of the mainstream LGBQT* movement in the U.S. In the alternative, Corey stated, some members of African American communities may be on the *down low*, engaging in same sex sexual activity, but rejecting LGBQT* identifiers as a result of internalized homo- and bi-phobia.

The NorthEast Two-Spirit Society (NETSS) in part echoed Corey's thoughts about the racism of the mainstream LGBQT* movement. In addition, Harlan Pruden, one of co-founders of NETSS, spoke about an "internal muddiness" that some Native peoples may experience when seeking to find language for their experience. Speaking of his own Cree inheritance as a registered member of the Saddle Indian Reservation, Harlan said that when he asked something of an elder, he knew to offer them tobacco, but never understood the spiritual dimension of the ceremony. Having been separated from too much of their own history by colonialism, genocide, and forced assimilation, Harlan stated, many Native people may use the words *Two-Spirit* when what they really mean is gay Indian.[2]

Harlan also spoke at length about the contextual nature of Native Two-Spirit identities. As Harlan put it, "When I am out on a Friday night in a gay club, I am a gay man. Yet when I am in rural Oklahoma at a Two-Spirit gathering, I am a proud Two-Spirit man." Alluding to the unique role and cultural responsibilities that Two-Spirit people often held (and may still hold) in the life of Native communities, Harlan pointed out the obvious differences in the spiritual role of Two-Spirit peoples, and

[2] Two-spirit is a contemporary term, adopted from the Northern Algonquin, and meant to signify the embodiment of both masculine and feminine within one person. Now embraced by many Native peoples as a pan-Indigenous umbrella term connoting both diverse gender expressions and sexual orientations, two-spirit (TS) generally speaks to the respect that Native peoples held for diversity, and the unique sacred and ceremonial roles that TS people held (and may still hold) within their own communities. Herein the phrase TS speaks not simply to a third gender, or to same gender attraction, but more broadly to the history of compulsory Christianization that sought to erase two-spirit peoples within their own nations. Notably, there is no single consensus definition of two-spirit, and the term means different things to different Native peoples.

the political and social function of people claiming LGBQT* identities in mainstream communities. Several members of the project's advisory board echoed this point,
speaking about the complex layering of cultural and spiritual value systems that accompanied their choice to self-identify in, with, and outside of their own communities.

These same Advisory Board members also acknowledged the landscape in which such decisions are made, and stated that individuals in their communities may shift how they self identify as a means of preserving their safety. As the rest of this literature review discusses, LGB, transgender, same gender loving, Two-Spirit, and queer-identified peoples make choices about how, when, and if to "out" themselves in a complex social and political landscape that is too often unsafe, if not violent. Hence, how any individual self-identifies may shift depending on who is asking, why, and in what context. As one Advisory Board member stated, "identities have to be fluid in order to be protective."

Finally, the leadership of HarborCOV, an LGBQT*-affirming DV organization in Boston that specializes in serving communities facing cultural or linguistic barriers, has noted that some cultures may not have the variety or depth of language that words such as LGB, transgender, same gender loving, and Two-Spirit convey. Indeed, Kourou Pich, Co-Executive Director of HarborCOV has observed that people from some cultures and communities may have difficulty finding language for themselves in their own communities, and that that invisibility is intentional – a function both of denial of the existence of sexual minorities in those communities, but also perhaps protectiveness of gender queer and same gender attracted people.

Language is power. We authors, therefore, have put a great deal of thought into the words we use to name peoples' experiences. At the same time, we know that we can never be as inclusive or sensitive as we want to be. We have done our best to honor the range of experiences we are writing about in this document.

Intimate Partner Violence in LGBQT* Communities

Prevalence of IPV in LGBQT Communities*

Historically, DV has been seen primarily as a problem of cisgender[3], heterosexual men abusing cisgender, heterosexual women. Because of this limited framework, research on the prevalence of DV and IPV among LGBQT* and non-female-identified individuals has been scarce and often limited by the use of non-probability sampling, cross-sectional data that precludes causal inference, and inconsistent definitions of IPV and sexual orientation (Brown & Herman, 2015; Finneran & Stephenson, 2012). Recently, however, there has been an increase in studies that provide more rigorous estimates of IPV in LGBQT* communities. The majority of these studies suggest that IPV occurs in LGBQT* relationships at rates equal to or higher than heterosexual, cisgender relationships (Balsam, Rothblum, & Beauchaine, 2005; Duke & Davidson, 2009; Langenderfer-Magruder, Whitfield, Walls, Kattari, & Ramos, 2016; Messinger, 2011; Walters, Chen, & Breiding, 2013). Herein, we briefly present prevalence estimates of LGB IPV before turning to the limited research on prevalence among trans individuals. For a more detailed review of IPV prevalence in LGBQT* communities, see Brown and Herman (2015).

Currently, the best prevalence estimates on partner abuse in LGB communities come from the nationally representative 2010 National Intimate Partner and Sexual Violence Survey (NISVS) conducted by the U.S. Center for Disease Control & Prevention (Walters et al., 2013). Findings suggest higher rates of lifetime IPV experiences (defined as physical violence, sexual violence, or stalking) among lesbians (43.8%), bisexual women (61.1%), and bisexual men (37.3%) – but not gay men (26%) – compared to heterosexual women (35.0%) and heterosexual men (29%). In addition, findings from the California Health Interview warrant mention. Based on a probability sample of California residents ages 18 to 70, this study found that lifetime and 1-year IPV prevalence was higher in sexual minorities compared with heterosexuals, but this was significant only for bisexual women and gay men.

Determining IPV prevalence based on gender identity is difficult due to a lack of studies with representative or even large samples. The National Transgender Discrimination Survey is one of the largest studies of transgender individuals' experience of discrimination with 6,456 participants (Grant, Mottet, & Tanis, 2011). This study did not focus on IPV in particular, but did measure related phenomena. The researchers found that 19% of respondents reported experiences of violence at the hands of a family member specifically due to their gender identity. This statistic is likely an underestimate because it excluded DV perpetrated by non-family intimate partners as well as DV unrelated to gender identity. A much higher percentage of participants reported experiencing actions that may or may not be part of abusive behavior: 29% reported an ex-partner limiting their contact with their children, 45% reported having a relationship end when they came out as trans to their partner, and 57% experienced family rejection (Grant et al., 2011). However, these are unreliable proxies for IPV.

[3] Cisgender is a term that refers to individuals for whom the gender they were assigned at birth matches their gender identity. It can be thought of as meaning "not transgender."

Only one study to date has compared IPV among transgender to IPV among cisgender individuals. Analysis of data from One Colorado's anonymous 2011 LGBT Health Survey (n= 1,193) found that 31.1% of trans respondents reported experiencing IPV, compared to 20.4% of cisgender respondents (Langenderfer-Magruder et al., 2016) – findings that suggest transgender individuals experience higher rates of IPV than their cisgender, LGB counterparts. Furthermore, preliminary evidence suggests that different subgroups within transgender communities experience different rates or types of IPV (Chestnut, Jindasurat, & Varathan, 2012; Clements, Katz, & Marx, 1999). Future studies should examine these differences, particularly with regard to differences between trans men and trans women and with attention to intersecting identities for all participants (e.g., race, sexual orientation, disability, socioeconomic status).

Similarities of LGBQT and Heterosexual IPV*

In general, IPV experienced by LGBQT* individuals follows patterns similar to heterosexual and cisgender individuals (Ristock, 2005). Specifically, abuse can take the form of physical or sexual violence as well as emotional, financial, or verbal abuse. Messinger's (2011) analysis of the National Violence Against Women Survey revealed that the prevalence of various types of abuse in GLB communities mirrored prevalence rates among heterosexuals: Both groups reported prevalence rates that went in descending order from verbal abuse to controlling behavior to physical violence to sexual abuse. However, as described next, there are also unique aspects of IPV in LGBQT* communities, and potentially important differences among LGBQT* subgroups.

Unique Characteristics of IPV in LGB communities

IPV occurs in a larger societal and systemic context of homo-, bi-, and transphobia, heterosexism, misogyny, and patriarchy. These factors can influence abuse tactics and relationship dynamics for LGBQT* survivors, making their experiences different from those of heterosexual survivors. For example, sexual minority victims of IPV may be subject to abusive tactics that leverage systemic and cultural discrimination (i.e., identity abuse; Ard & Makadon, 2011; Balsam, 2001; Balsam & Szymanski, 2005; FORGE, 2014; Gay Men's Domestic Violence Project, 2014; National Center on Domestic & Sexual Violence, 2014; West, 2012). Examples of identity abuse include denying or belittling an individual's LGBQT* identity (e.g., refusing to use preferred gender pronouns), restricting access to a supportive LGBQT* community (NCDSV, 2014), or threatening to disclose a survivor's sexual orientation, gender identity, or HIV/AIDS status (Ristock, 2005). People who use violence against their LGBQT* partners may also use threats to authenticity as a method of control, making survivors feel that they are not "queer enough" or do not understand how LGBQT* relationships are supposed to be (Bornstein, Fawcett, Sullivan, Senturia, & Shiu-Thornton, 2006). Controlling behavior, in general, may be a particularly important aspect of DV among LGBQT* couples, and may result in even higher levels of psychological harm than physical abuse alone (Frankland & Brown, 2014).

IPV in LGBQT* survivors can also be minimized in a variety of ways: For example, common portrayals of DV in the media – usually depicting heterosexual relationships, specifically men abusing women – can render invisible even to themselves experiences of underrepresented survivors (Holt, 2011). Pervasive beliefs that LGBQT* relationships are more egalitarian or that gay and lesbian individuals are better able to defend themselves against partners who use violence also serve to render IPV invisible in these communities (Bornstein et al., 2006; Holt, 2011; Walters, 2011).

Finally, although isolation is a commonly used tactic in heterosexual as well as in LGBQT* relationships, it may be more difficult to overcome in tight-knit LGBQT* communities in which relationships and resources are often shared with the abusive partner (Bornstein et al., 2006). The level of isolation is even more pronounced for LGBQT* survivors from rural and immigrant communities (Ristock, 2005).

Unique Characteristics of IPV among Transgender People

There is limited research on the characteristics of IPV in transgender communities. The National Coalition of Anti-Violence Programs 2014 annual survey of its member programs reported that, compared to people who did not identify as transgender, transgender survivors were two times more likely to face threats/intimidation, nearly two times more likely to experience harassment, and over four times more likely to face police violence in response to reporting IPV (National Coalition of Anti-Violence Program, 2015b). Transgender women were at highest risk of experiencing threats/intimidation, harassment, and injury (NCAVP, 2015a), and transgender people of color were the most likely to report experiencing threats of intimidation in their intimate partnerships.

Generally high rates of violence, trauma, and discrimination in the lives of transgender individuals may have a compounding effect, influencing transgender IPV survivors' willingness to identify abuse or seek help. FORGE's safety planning guide remarks that transgender individuals may feel unwanted, or "believe that they are lucky to ever find love, even if that love turns violent" (Guadalupe-Diaz, 2013, p. 3). In a study of transgender relationship violence, some participants could not even conceptualize their trans partner's behavior as abusive because they viewed these partners as being so oppressed themselves (Ristock, 2011).

Multiple Experiences of Violence in LGBQT Communities*

Because of the fragmented nature of research on violence and abuse in the lives of LGBQT* individuals, the prevalence of "polyvictimization"[4] – that is, multiple kinds of violence and abuse committed by different people – in this community is still unknown. However, evidence suggests that LGBQT* individuals are more likely to experience multiple types of violence (e.g. sexual abuse, physical abuse, and exposure to domestic violence during childhood; sexual assault, physical assault, and stalking during adulthood) at the hands of many different types of individuals (family, partners, community members, legal actors, strangers) and at multiple points in their lifetime (Roberts, Austin, Corliss, Vandermorris, & Koenen, 2010; Grant et al., 2011; Stotzer, 2009).

Specific subgroups of LGBQT* survivors are at especially high risk for multiple forms of victimization. One notable example is LGBQT* homeless youth, highly overrepresented among homeless populations (Durso & Gates, 2012; Grant et al., 2011; Hunter, 2008). Evidence indicates that family and partner violence are major drivers of such homelessness (Cochran et al., 2002; Durso & Gates, 2012; Grant et al., 2011; Risser & Shelton, 2002). Homelessness in turn may render LGBQT* peoples increasingly vulnerable to other forms of violence including harassment, hate crimes, police brutality, and sexual exploitation (Amnesty International, 2005; Durso & Gates, 2012; Keuroghlian et al., 2014; Mogul, Ritchie, & Whitlock, 2012; NCAVP, 2015a; NCAVP, 2015b; Reck, 2009). Layered onto these experiences are other types of oppression such as housing, employment, and healthcare, which are themselves traumatogenic and which also act as barriers to help seeking (D'Augelli, 1998; Durso & Gates, 2012; Grant et al., 2011; Tyler, 2008).

Unique Experiences of IPV among Specific Subgroups of LGBQT Survivors*

The experience of IPV for specific subgroups may be quite different than that of White, middle-class LGBQT* survivors (Chavis & Hill, 2009). The intersections of various identities result in unique social contexts shaped by multiple systems of power and oppression (Chavis & Hill, 2009; Feltey, 2001). These systems may shape the way that IPV is enacted and experienced, and the way it is addressed by service providers. Although attention to all intersections would be beyond the scope of this document, here we focus on three subgroups that have received especially scant attention: sexual minorities in Native communities, immigrant and refugee communities, and faith-based communities. Although there is virtually no research on IPV within these subgroups, it is nevertheless instructive to understand this context when considering the experience of IPV for people within these communities. Later sections touch on specific aspects of the help-seeking experience of African-American and Latin@ LGBQT* survivors.

[4] "Polyvictimization" refers to experiences of multiple kinds of violence and abuse, at the hands of multiple people at multiple points in the lifespan. The authors have chosen to put this word in quotes because some have understood it to imply that the victim is somehow responsible for for these experiences. This would obviously be inaccurate and inappropriate. Indeed, there is now a rich literature on the ways that people who use abusive behaviors target individuals with prior trauma histories.

Two-Spirit and LGBT Native Peoples. In general, there is scant research on the experiences of Two-Spirit and LGBT Native individuals. However, the fact that rates of violence and abuse against cisgender, heterosexual Native women are so high suggests that Two-Spirit Native women might be at especially high risk compared to their non-Native sexual minority counterparts (Lehavot, Walters, Simoni, 2009). Consistent with this view, one study showed that 78% of Two-Spirit women reported experiencing physical assault and 85% reported experiencing sexual assault (Lehavot et al. 2009).

These statistics are all the more alarming given that Native women, regardless of Two-Spirit or LBT status, are more likely to experience physical brutality, and therefore injury, during rapes and sexual assaults (Amnesty International, 2007). Further, some Native researchers have noted the disproportionate impact of homo/transphobia that occurs within the Native community given that Two-Spirit survivors may need cultural support from their own people in the face of violence and trauma (Frazer, Somjen, & Pruden, 2010). Not surprisingly then, violence against Two-Spirit and Native LGBQT* individuals also contributes to the development of a range of health and mental health conditions, such as liver disease, substance abuse, PTSD, as well as to behaviors that increase the risk for HIV (Balsam, Huang, Fieland, Simoni, & Walters, 2004; Centers for Disease Control and Prevention, 2001; Evans-Campbell, Lindhorst, Huang, & Walters, 2006; Simoni, Seghal, Walters, 2004). Clearly, more research is needed on IPV in the lives of Two-Spirit and LGBQT* Native peoples.

Immigrants and Refugees. The experiences of LGBQT* immigrant and refugee survivors of IPV are largely invisible in the academic literature. The broader research on DV in heterosexual, cisgender immigrant communities is complex, indicating that they experience lower rates of IPV, but higher rates of IPV homicide compared to non-immigrants (Bohn, 2003; Tjaden & Thoennes, 1998).

Although there is a need for more prevalence research, it is well documented that sexual minority immigrants face challenges resulting from historically homophobic immigration policies (Chung & Lee, 1999). Under the Immigration and Nationality Act of 1917, LGBQT* immigrants were strictly prohibited from entering the United States on the grounds that they were "mentally or physically defective." The Immigration & Naturalization Act of 1952 similarly prevented LGBQT* immigrants from entering the U.S. based on the idea that they were "afflicted with psychopathic personality" (Foss, 1994). Even up to 1990, Public Health Service physicians barred entrance to those immigrants suspected to be LGBQT*, labeling them as "sexual psychopaths." In addition to contending with these oppressive policies, LGBQT* immigrants were also isolated within their own communities and shunned by white, non-immigrant LGBQT* communities because of their immigration status (Cantú, Hurtado, & Anzaldúa, 2012; Moraga & Anzaldúa, 1981). Even today these interpersonal and institutional challenges echo in the lives of sexual minority immigrants and likely create unique challenges for LGBQT* immigrant and refugee survivors of IPV.

Religious or Spiritual LGBQT Survivors*. LGBQT* people have both positive and negative experiences of faith, possibly even simultaneously. Researchers and practitioners highlight the healing value of religious communities and practices for this community (e.g., Queer Muslims of Boston,

FaithTrust Institute; Ryan, Huebner, Diaz, & Sanchez, 2009). Yet, institutionalized religious policies and principles continue to be a major source of social oppression for many LGBQT* people (Clarke, Brown, & Hochstein, 1989; Davidson, 2000; Hilton, 1992; McNeill, 1993; Morrow & Gill, 2003; Spong, 1991; Spong, 1998). For example, many religious practices condemn non-heterosexual behavior (Bouhdiba, 1998; Jaspal & Cinnirella, 2010) and view LGBQT* people as immoral and spiritually corrupt (Morrow & Gill, 2003). For many religious LGBQT* people, family and societal rejection is therefore compounded by the loss of religious communities (Mahaffy, 1996).

Sources of conflict for religious LGBQT* people include anti-gay religious teachings and scriptural interpretations, homo/bi/transphobic church atmospheres, fear of being "outed" in non-affirming religious settings, and microaggressions (i.e., subtle forms of oppression) from people within their religious communities (Brown & Pantalone, 2011; Shuck & Liddle, 2001). Not surprisingly, receiving homophobic messages through a religious medium has been found to be associated with internalized shame among LGBQT* individuals (Herek, 1987; Ream, 2001).

The challenges of participating in a faith community that is not LGBQT*-affirming may be particularly acute for LGBQT* individuals of color and immigrants since the support role of faith-institutions is particularly crucial in these communities due to the lack of other available social supports. For example, Christian religious institutions have served a range of healing functions within African American communities, where faith has been an important source of strength in the face of ongoing racialized violence and oppression (Billingsley, 2003; Cone, 1997; Cone, 2010; Higginbotham, 1994; Lincoln & Mamiya, 1990). Yet, for African American young men, churches are the primary source of anti-gay messages in their communities (Stokes & Peterson, 1998). The loss of access to one's faith community under such circumstances may be particularly wounding. These challenges are real and ongoing, but their effects on LGBQT* survivors of IPV remain unexplored. Most research on the experience of IPV survivors in relation to their faith communities focuses on the spiritual lives of heterosexual, cisgender women. Clearly, more research is needed in this area.

In sum, violence – be it by intimate partners, family and community members, or society at large – is a common occurrence in the lives of many LGBQT* individuals. Because such polyvictimization is rooted in and exacerbated by the larger context of homophobia and transphobia, the experiences of LGBQT* survivors differ in many ways from those of heterosexual, cisgender survivors. Given that experiences differ, so too does the impact of experiencing IPV. We turn next to the research on the mental health consequences of IPV among LGBQT* survivors as well as protective factors that promote resilience.

Trauma and Mental Health in LGBQT* Communities

The emerging literature on how IPV affects the mental health of LGBQT* survivors is mixed, with some studies indicating that the impact is similar for LGBQT* and non-LGBQT* survivors, and others indicating that adverse effects are more common among LGBQT* survivors (Edwards, Sylaska, & Neal, 2015). This section reviews that literature, focusing especially on depression and PTSD – two common mental effects of abuse. As this section will show, emerging research indicates that bisexual and transgender survivors may be at particularly high risk for experiencing adverse mental health effects.

Depression. LGBQT* survivors of IPV, similar to their heterosexual and cisgender counterparts, are particularly at risk of depression. One longitudinal study examining data from a nationally representative survey of adolescents between the ages of 18 and 27 (227 gay and lesbian, 345 bisexual, and 13,490 heterosexual) found that across all three groups, exposure to IPV was significantly related to increased depression – even after controlling for exposure to childhood physical or sexual abuse and homelessness or expulsion from one's home by caregivers (McLaughlin, Hatzenbuehler, Xuan, & Conron, 2012). This is consistent with a more recent meta-analysis examining 19 studies, which found that men who are victims of IPV at the hands of other men are more likely to use substances, suffer from depressive symptoms, have an HIV positive diagnosis, and engage in unprotected sex (Buller, Devries, Howard, & Bacchus, 2014). As a whole, this body of literature suggests that LGBQT* IPV survivors are at greater risk for experiencing depression than LGBQT* individuals without IPV experience.

Looking more closely within the LGBQT* community, there is some evidence indicating that bisexual individuals may have disproportionately high rates of depression as compared to gay and lesbian individuals (Bostwick, Boyd, Hughes, & McCabe, 2010). Interestingly, theoretical work has posited that the relatively high mental health difficulties within the bisexual community may be attributable to the additional stressors of experiencing bi-negative attitudes from both heterosexual and LGTQ communities. The National Epidemiologic Survey on Alcohol and Related Conditions, which compared rates of major depression among lesbian, gay, bisexual and heterosexual adults (*n*=34,653), found that both male and female individuals who reported bisexual behavior had higher lifetime rates of all mood disorders, including depression (Bostwick et al., 2010). By extension, one might expect bisexual survivors of IPV to be at particular risk for depression.

Likewise, there is scant research on depression and other mental health effects of IPV for transgender survivors. There is, however, literature on the relationship between interpersonal violence more generally and symptoms of depression in this community. For example, in one cross-sectional study of over 591 MTF participants from the New York City area, 63% had depression scores in the clinical range. Further, in this same sample, violence that was related to one's gender identity, or gender abuse, was predictive of depression (Nuttbrock et al., 2014). These findings are consistent with another study of 6,436 transgender-identified individuals, in which 19% of respondents had experienced violence at the hands of a family member because of their chosen gender identity. This exposure was associated with over twice the rate of suicidality, with 65% of those who experienced family violence also reporting

having attempted suicide, compared to 32% of those who did not experience family violence (Grant et al., 2011). Overall, though the literature remains inconclusive, it raises questions about whether transgender survivors of IPV could be at increased risk for depression.

PTSD. IPV exposure also increases the risk of PTSD symptoms in the LGBQT* community. According to the CDC's 2010 IPV report described previously (i.e., NISVS) 19.5% of lesbian women, 46.2% of bisexual women and 22.1% of heterosexual women report experiencing at least one symptom of PTSD – defined as having nightmares and intrusive thoughts of the traumatic experience; feeling constantly on guard, watchful or easily startled; and feeling numb or detached in response to an experience of IPV (Walters et al., 2013). Data from bisexual, gay, and heterosexual men were excluded from the analysis due to small sample sizes. Evidence from other research, however, suggests that that the relationship between IPV and PTSD may extend to gay and bisexual male survivors (Pantalone, Hessler, & Simoni, 2010).

Consistent with the findings on IPV and depression, there is initial evidence that bisexual survivors of IPV have higher rates of PTSD than gay and lesbian survivors. According the CDC's NISVS, more than half of bisexual women (57.4%) who experienced physical or sexual violence or stalking reported at least some form of negative impact (e.g., experiencing PTSD symptoms, missing a day of school or work, feeling fearful or concerned for their safety) as compared to a third of lesbian women (33.5%), and a fourth of heterosexual women (28.2%) (Walters et al., 2013). Significantly more bisexual women (46.2%) reported experiencing at least one symptom of PTSD as compared to lesbian (19.5%) and heterosexual women (22.1%) (Walters et al., 2013). These results suggest that bisexual women may be at disproportionately high risk for developing PTSD after experiencing IPV.

Again, literature on the relationship between IPV and PTSD in transgender communities is limited. As noted earlier, transgender individuals are especially likely to experience violence and discrimination in the domains of education, health, family life, and work which may shape their responses to partner violence (Grant et al., 2011). These risks are not equally distributed among trans individuals. Trans women experience higher rates of violence than trans men, probably because they are less able to "pass" (i.e., be perceived as the gender they identify as) (Dean et al., 2000; Mizock & Lewis, 2008). The risks may also be explained by the concept of trans-misogyny: the idea that there is a particular brand of discrimination that combines transphobia with sexism and applies specifically to trans women (Serano, 2007).

In addition, trans people of color are at particularly high risk (Richmond, Burnes, & Carroll, 2012). In a study of MTF youth of color in Chicago, major life stressors included lack of transportation, difficulty finding a job, sex in exchange for resources, being frequently bothered by police, forced sexual activity, difficulty finding a safe place to sleep, difficulty accessing healthcare, and history of incarceration and homelessness (Stieglitz, 2010). Given that multiple experiences of trauma are more likely to result in the development of clinical PTSD (Scott, 2007), it is not surprising that in one study of MTF transgender individuals, 17.8% reported clinically significant symptoms of PTSD (Shipherd, Maguen, Skidmore, &

Abramovitz, 2011). As a whole, the literature on bisexual and transgender communities makes clear the need for researchers to continue to investigate the distinct experiences of subgroups of the LGBQT* community.

The mental health consequences of IPV among LGBQT* survivors must also be understood within the broader context of historical trauma. Historical trauma is a term used to describe repeated communal traumatic events that exist across time, are embedded throughout culture, and can result in an intergenerational cycle of traumatic stress (Sotero, 2007). Oppressed communities subjected to historical trauma are at heightened risk for mental and physical health consequences compared to communities not exposed to such trauma (Danieli, 1998; McMichael, 1999; Sotero, 2007). Not only have LGBQT* people endured such historical trauma as a group, but many such individuals have also experienced intergenerational trauma originating from other identities such as those based on race or religion (DeGruy, 2005; Franklin, Boyd-Franklin, & Kelly, 2006; Jaimes & Halsey, 1992). Studies have shown that cumulative historical traumatic events actually increase survivors' risk for lifetime trauma and interpersonal violence (Chae & Walters, 2009). These forces are critical to understand when considering the mental health impact of violence against various subgroups of the LGBQT* communities.

Resilience in LGBQT Communities*

Research has identified several important factors that contribute to strength and resilience among LGBQT* survivors. In particular, a positive LGBQT* identity, or *identity affirmation,* and social support from friends can profoundly influence survivors' mental health.

Regarding the first of these two factors, LGBQT* identity affirmation has been well documented as critical to positive mental health outcomes. For example, one study investigating 165 lesbian, gay, and bisexual youth found that family support and self-acceptance mediated the relationship between victimization and mental health (Hershberger & D'Augelli. 1995). Another study surveyed 613 lesbian, gay, and bisexual individuals and found that LGB individuals who have positive appraisals of their LGB identity and do not anticipate rejection from others had lower psychological distress (Balsam & Mohr, 2007). In a subsequent study, the same authors found that higher identity acceptance negatively correlated with measures of depression, guilt, fear, hostility, and sadness, and positively correlated with measures of general life satisfaction, self-assurance, and social self-esteem (Mohr & Kendra, 2011). Finally, in a study of trans people of color who were survivors of traumatic events, participants named pride in one's gender and ethnic identity as critical to resilience (Singh & McKleroy, 2011). In short, LGBQT* individuals who feel more positive about being LGBQT* or their ethnicity are able to cope more successfully with the challenges they face.

Social support from friends and family also serves a critical protective role. Moody and Smith (2013), for example, found that perceived support from friends was associated with reduced suicidality among trans individuals. For transgender youth of color, identifying other youth and adults with similar identities helped to validate their experiences of racism within the LGBQT* community (Singh, 2013).

And in one study of MTF youth of color, friends were the most frequently cited source of support, and physicians or case managers were perceived as at least somewhat helpful (Stieglitz, 2010).

Social media has become a critical conduit for accessing social support within the LGBQT* community (Singh, 2013). Online communities have become sites of community organizing, cultural empowerment, and education for LGBQT* people, enhancing both a sense of identity and a sense of social support and community (Mehra, Merkel, & Bishop, 2004). Religion and spirituality may also contribute to resilience, particularly as these become sources of social support (Potter, 2007).

In sum, there is a clear need for supportive mental health and trauma-informed approaches for LGBQT* individuals. Furthermore, these services must recognize the societal factors that contribute to individual mental health concerns. LGB individuals, and transgender individuals in particular, experience high rates of traumatic experiences that stem from social isolation, prejudice, and discrimination. These experiences can have many negative mental health outcomes, and are exacerbated by multiple forms of oppression. Nonetheless, LGBQT* individuals show remarkable resilience by developing strong social support networks, creating and engaging with online and activist LGBQT* communities, and developing a positive LGBQT* identity. Trauma-informed approaches must allow providers to understand the context in which survivors have experienced abuse, identify sources of individual and communal strength and resilience, and support healing. Unfortunately, the current reality for sexual minorities who seek help from informal and formal supports is far different.

Help-Seeking Among LGBQT* Survivors

A range of systemic, institutional, and individual-level barriers uniquely thwart LGBQT* peoples' access to informal and formal support services (Edwards, Sylaska, & Neal, 2015; Helfrich & Simpson, 2006). At the broadest level, pervasive heterosexism renders violence between same sex partners invisible. The myth that IPV occurs only between men and women contributes to the profound difficulty that service professionals have even identifying IPV among LGBQT* couples (Blasko, Winek, & Bieschke, 2007; Brown & Groscup, 2008; Helfrich & Simpson, 2006; Seelau & Seelau, 2005). Brown and Groscup (2008) studied 120 crisis center workers' perceptions of same-sex DV by presenting scenarios in which only the gender of the abuser and survivor were changed, and found that participants ranked same-sex DV as less severe and less likely to get worse than the same scenario among heterosexual pairs. Although service providers may recognize that LGBQT* survivors deserve protection from IPV just as heterosexual survivors do (Sorenson & Thomas, 2009), these kinds of biases may affect their ability even to identify IPV in this community (Basow & Thompson, 2012).

Beyond the invisibility of LGBQT* IPV, a range of factors cause well-meaning social services systems to harm members of marginalized communities, including sexual minorities. Forms of oppression such as racism, colonialism, ableism, heterosexism, sexism, and transphobia that are often implicit in our helping systems can render these systems traumatogenic, especially when these oppressive dynamics are not acknowledged (Buzawa & Buzawa, 2003; Dirks, 2004; Herman, 2003; Walters, Simoni, & Evans-Campbell, 2002). The kind of harm done by institutions designed to provide support has been termed "sanctuary harm" (Bloom 2011; Bloom 2013).

A primary example of a system that causes this kind of sanctuary harm is the healthcare system. Historically, medicine and the health sciences were central to the effort to pathologize same sex relationships and transgenderism. Being gay or lesbian was classified as a mental disorder by the American Psychological Association until 1973, and conceptions of gender dysphoria as a mental health condition did not undergo a similar revolution until 2013 (Bayer, 1987; Drescher & Merlino, 2007).

The continuing impact of this history is evident in the experiences of LGBQT* patients in healthcare settings. Lambda Legal (2010) found that more than half of all sexual minority survey participants had experienced at least one of the following types of discrimination in a healthcare setting: being refused needed care; being blamed for their health status; seeing healthcare professionals refuse to touch them or use excessive precautions; hearing healthcare professionals use harsh or abusive language; or experiencing healthcare professionals being physically rough or abusive. Similarly, Shires and Jaffee (2015) found that over 40 percent of transgender men reported verbal harassment, physical assault, or denial of equal treatment in a doctor's office or hospital. Grant et al. (2011) reported that over one-quarter of respondents in a survey for the National Center for Transgender Equality experienced verbal harassment in medical settings, and that the likelihood of discrimination, abuse, or assault of transgender patients by their provider actually increased with the provider's awareness of their patient's transgender status. Such experiences of discrimination are far more likely to affect

LGBQT* patients of color, financially-oppressed patients, and undocumented patients (Grant et al., 2011; Lambda Legal, 2010).

Other examples of sanctuary harm abound across systems. For example, between 2010 and 2011, LGBQT* survivors reported an increase of incidences in which the police arrested both the abuser and victim when called (28.4% up from 21.9%), an increase in the percentage of LGBQT* survivors seeking shelter who were denied (61.6% up from 44.6%), and a decrease in the percentage of LGBQT* survivors who received requested orders of protection (78.1% down from 83.7%; NCAVP, 2015b). The same study found that transgender IPV survivors were over six times more likely to experience physical violence while interacting with the police than other survivors, and more likely to experience hate violence in shelters than other survivors (notably, trans men were 3.5 times more likely; whereas, trans women 1.3 times more likely) (NCAVP, 2015b). In short, transgender survivors may experience even more re-traumatization and less access to formal support systems than LGB survivors.

Mainstream programs may use heterosexist language in program materials, or have ambiguous or poorly defined policies regarding service provision for LGBQT* survivors (Helfrich & Simpson, 2006). LGBQT* survivors may well anticipate discrimination both from staff members and the heterosexual survivors using these services and may worry that their sexual orientation (and one could assume, gender identity) will be revealed should they actually seek help (Bornstein et al., 2006; McClennen, 2005; Helfrich & Simpson, 2006).

Low-income LGBQT* survivors of color experience another set of barriers: A community needs assessment of Black and Latin@ LGBQT* communities in the greater Boston area (Tod@s, The Hispanic Black Gay Coalition, The Violence Recovery Program at Fenway Health, The Network/La Red, & Renewal House, 2013) found that a lack of outreach to these communities limited their knowledge of IPV resources. In addition, geographic isolation, lack of transportation options, and the cost of making phone calls were major challenges to finding formal help. Similar to Black and Latin@ communities, Two-Spirit individuals identified lack of financial resources, transportation, and geographic inaccessibility as barriers to seeking support (Walters, Horwath, & Simoni, 2001). In addition, the lack of programming specifically aimed at Two-Spirit people and fear of what other Native community members might think were consistently ranked as barriers.

In the context of these institutional barriers, sexual minority survivors describe a range of personal reasons for not seeking support. Many feel that the need to educate a provider about one's identity and experiences would be overwhelming, particularly during a time of crisis (Turrell & Herrmann, 2008). Others worry about further victimization by providers who lack training on LGBQT* issues, and by other clients accessing the same services (Bornstein et al., 2006). Talking about abuse in one's intimate relationship almost always means coming out about one's sexual orientation or possibly one's gender identity. Further, gossip in insular or tight-knit communities raises concerns of confidentiality and retaliation – not just by the abuser but also by the community at large. Gay male survivors may keep silent about abuse and be more reluctant to seek help because they do not see doing so as consistent

with notions of masculinity (Seidler, 2006). According to Spiegel (2003), the abuse thrusts male survivors into "confrontation between two disparate psychosocial processes: the realities of abuse and the mythology of masculinity" (p. 133). Notably, although LGBQT* individuals may be hesitant to contact mainstream domestic violence programs, one survey reported that 86.2% of LGBQT* respondents *would* contact a domestic violence program if it was LGBQT*-specific (Holt, 2011).

Although the majority of LGBQT* survivors do not immediately seek help from the formal service system, they do rely on their informal social support systems; that is, their friends and families (Edwards et al., 2015). And yet, here too, LGBQT* survivors face a range of barriers to support. For example, LGBQT* survivors may be reluctant to seek help from friends and family given their own or their community's gendered beliefs about violence (e.g., women cannot be violent and men cannot be victimized) (Seelau & Seelau, 2005; Walters, 2011). They may be particularly hesitant to seek help from heterosexual friends or family members if they have had previous experiences of heterosexism and cissexism from their peers (Ard & Makadon, 2011). Survivors may have received messages that LGBQT* relationships themselves are "wrong" or "sick." Consequently, they may feel that admitting violence will only confirm these messages, conferring a sense of stigma on the victim, the relationship, and the LGBQT* community in general. Alternately, survivors who feel as though they are representing the LGBQT* community may feel that admitting IPV will harm the LGBQT* community at large (Balsam, 2001). Also, friends and resources may be shared between the survivor and perpetrator to an even greater degree than in heterosexual relationships, further making it difficult to access support (Bornstein et al., 2006).

In sum, a range of factors hinder LGBQT* survivors from seeking formal and informal assistance. Some survivors choose not to seek help from anyone; however, many survivors will make at least an initial attempt, and how they are treated can affect likelihood of seeking help in the future. Formal systems such as DV programs, hospitals, and law enforcement have a responsibility to ensure that they are facilitating help-seeking, not preventing it. To that end, the next section reviews the literature on a trauma-informed approach to practice, with attention to the needs of service providers who work with LGBQT* survivors, and provides examples of community-specific approaches to trauma.

Trauma-Informed Practices

A growing body of literature suggests that incorporating trauma-informed approaches into work with survivors is beneficial for the participant, staff, and overall organization. In this section we review the definition and core principles of a trauma-informed approach. Next, we discuss the need for LGBQT*-specific trauma-informed models and the role of transformative justice in developing such models.[5]

The term trauma-informed services was first used by Maxine Harris and Roger Fallot (2001a) in the context of mental health and addictions treatment programs. They noticed that many individuals seeking these services had experienced high rates of physical and sexual abuse, yet few providers were knowledgeable about trauma and the effects of such violence. As a result, services were not designed with trauma survivors in mind, increasing the possibility of retraumatization by the very services that were supposed to help them.

In response, Harris and Fallot (2001b) proposed creating trauma-informed service systems. This meant recognizing that the majority of people seeking services are likely to have experienced trauma; and that the effects of trauma impact many life domains, including people's experience of services. Thus, they argued, services had to be redesigned to incorporate an understanding of the pervasiveness of trauma and its impact on every aspect of their work. That is, programs and practices needed to be welcoming and appropriate for individuals with a history of trauma; and they needed to minimize retraumatization and promote healing and recovery. This, in turn, required an organizational commitment to trauma-informed practice, and ensuring that the necessary training for staff was in place.

In their initial work, Harris and Fallot (2001a) identified five requirements for creating trauma-informed services: (1) administrative commitment to change; (2) universal screening for trauma history among participants/clients;[6] (3) training and education on trauma for all staff; (4) hiring staff with a deep knowledge of trauma, referred to as "trauma champions;" and (5) reviewing policies and procedures to ensure they do not replicate abusive dynamics.

Although Harris and Fallot's approach was developed in the context of mental health and addictions services, its underlying principles have been adapted and applied to several different service contexts. These contexts include correctional facilities (Hodas, 2006), psychiatric and hospital settings (Jennings, 2004), homelessness services (Guarino, Soares, Konnath, Clervil, & Bassuk, 2009), addiction

[5] While the terms trauma-informed care and a trauma-informed approach are sometimes used interchangeably, the use of these terms has evolved over time. Trauma-informed care while perhaps still applicable in settings that provide health or mental health care, is actually inconsistent with the spirit/principles of a trauma-informed approach which involves service relationships that are fully collaborative rather than one person providing and the other receiving care.

[6] The requirement for universal trauma screening emerged in the context of mental health and addictions treatment services and are not necessarily applicable to other service settings such as DV programs.

services (Covington, 2008), services for children who have experienced abuse (Hodas, 2006; Ko et al., 2008), and DV organizations (Warshaw, Sullivan, & Rivera, 2013; Warshaw 2014; Wilson, Fauci, & Goodman, 2015).

These adaptations have not fundamentally altered the original principles, but have offered more expanded and nuanced interpretations of how they work in practice. In their excellent review, Hopper, Bassuk, and Olivet (2010) identified core principles that cut across different service contexts. These include: trauma awareness (e.g., staff training, consultation, supervision and self-care); safety (e.g., physical and emotional safety for all, awareness of potential triggers, clear roles and boundaries, and cultural diversity); opportunities to rebuild control (e.g., predictable environments, rebuilding efficacy, and personal control over lives); and a strengths-based approach (e.g., focus on future and skills-building).

Furthermore, Elliot, Bjelajac, Fallot, Markoff and Reed (2005) placed trauma-informed principles in the context of the entire service system and environment. For example, in a trauma-informed system, survivors engage with staff as collaborative partners rather than as passive recipients of services, and organizations actively solicit survivor input. In trauma-informed organizations, providers also strive to understand each survivor within the context of their background and life experiences and in terms of what is meaningful to them. Such contextualizing is essential. Because survivors experience trauma and seek support in a social, historical, and political context, healing must also include recognition of this context.

In order to do this difficult work, staff must themselves be supported. A fundamental aspect of a trauma-informed approach, therefore, involves creating an organizational environment that facilitates providers' capacity to do their work well. Clients interact with individual providers, who themselves interact with supervisors and the organization. When providers are subject to stressful organizational dynamics, those stresses interfere with their ability to be effective (Bloom, 2010). One consequence of problematic organizational dynamics is vicarious traumatization (synonymous with secondary traumatic stress or compassion fatigue) among service providers. Vicarious traumatization has been defined by Charles Figley (1995) as "the stress resulting from helping or wanting to help a traumatized or suffering person" (p. 7), and symptoms may mimic those of PTSD. Vicarious traumatization has been linked to burnout in several studies (Bemiller & Williams, 2011; Brown & O'Brien, 1998; Ortlepp & Friedman, 2002; Ullman & Townsend, 2007).

Vicarious traumatization is widespread. Findings from a study of 148 advocates working in a range of types of DV organizations indicate that 47.3% of participants met criteria for clinical levels of PTSD symptoms (Slattery & Goodman, 2009). Organizational factors that may contribute to vicarious traumatization include a lack of involvement or influence on decision making, feeling like one's abilities are not being used, being exposed to danger at work, and too much focus on fixed regulations, procedures, and paperwork (Brown & O'Brien, 1998). Indeed, Slattery and Goodman (2009) found that lack of access to power (i.e., equality, voice, representation, shared leadership, and respect) in the

workplace significantly predicted vicarious traumatization above and beyond individual factors (e.g., personal history of trauma and exposure to traumatized clients). They recommended creating a workplace that emphasizes support, cooperation, effective communication, and conflict resolution skills and asserted that efforts to "flatten the hierarchy" and address power differences at the organization may also help minimize vicarious traumatization.

Creating a trauma-informed service system, then, occurs on three levels. The first is focused on the needs of survivors. The second is focused on changing an organization's culture to support staff and fully integrate trauma-informed practices into its service delivery; and the third level acknowledges the larger societal context in which survivors seek services and organizations operate. This level emphasizes not only engagement with the individual as part of a community, but also with community change itself in order to transform the conditions that produce abuse, violence, and trauma in the first place (Warshaw, 2014; Wilson et al., 2015).

These overarching principles have been applied across trauma-informed service systems. However, the particular language used to describe specific practices that arise from them may vary substantially depending on the service setting. The appendix provides a table of six trauma-informed models that have been identified as having some relevance for this project either because of the communities being served (LGBQT* or IPV survivors), the popularity of the model, or the credibility of the organization. See also Wilson and colleagues' (2015) recent qualitative content analysis of key documents – publications, manuals, and training guides – that describe an emerging consensus on trauma-informed practices in the domestic violence context, as well as points of difference and tension.

It is important to note that trauma-*informed* services are different from, but related to, trauma-*specific* services. Whereas trauma-informed services are designed to be implemented at all levels of an organization and focus on limiting the potential for retraumatization among participants, trauma-specific services are aimed at treating actual trauma symptoms (Harris & Fallot, 2001a). Examples of trauma-specific services include grounding techniques, psychoeducation, mind-body approaches and body-based therapies, cognitive behavioral therapy, and complex trauma treatment (Courtois & Ford, 2009; Courtois & Ford, 2015; Jennings, 2004; Resick, 2003; Warshaw & Brashler, 2009). A number of trauma-specific interventions have been tested in experimental or quasi-experimental research designs. Several studies have also attempted to document the effectiveness of trauma-specific services for female survivors of domestic violence. For a systematic review of evidence-based, trauma-specific services for survivors of domestic violence, see Warshaw et al. (2013). It is important to note, however, that none of these studies focused on LGBQT* survivors.

Trauma-informed service models are inherently more difficult to study because they focus less on specific practices and more on general principles, and they rely on change at the organizational level. Nonetheless, the Women, Co-Occurring Disorders, and Violence Study (WCDVS) attempted to evaluate the impact of this approach. As the only longitudinal study of a trauma-informed approach, the WCVDS indicated that women who received trauma-informed services showed small but significant

improvements on mental health outcomes and trauma symptoms relative to treatment as usual, but no effect for substance abuse (e.g., Morrissey et al., 2005). Since then, researchers have developed several tools to measure the presence of trauma-informed principles and practices as experienced by survivors (see, Accessing Safety and Recovery Initiative & the National Center on Domestic Violence, Trauma, & Mental Health, 2012; Goodman et al., in press;), and are testing new measures of the effects of trauma-informed practices on survivor wellbeing (National Center on Domestic Violence, Trauma, & Mental Health, in development), yielding new possibilities for exploring this important approach.

Trauma-Informed Practices with LGBQT Survivors of IPV*

Despite the high rates of IPV and trauma in LGBQT* communities, trauma-informed approaches tailored to LGBQT* communities have been slow to develop. Some non-IPV trauma-specific interventions have been designed with input from LGBQT* individuals and with concern for LGBQT* cultural competence (e.g., de Arrellano, Ko, Danielson, & Sprague, 2008; Real Life Heroes and Target-A). In addition, the Technical Assistance Partnership for Child and Family Mental Health created a webinar that discusses trauma-informed care for LGBQT* homeless youth. However, there are few well developed trauma-informed approaches for LGBQT* clients in service settings generally, and none in the field of IPV services.

Because of the barriers and difficulties faced by LGBQT* survivors, providers who work with these particular communities may face unique challenges, including lack of resources both within and outside of the service organization, exposure to homo-, bi-, and transphobia through hotline prank callers, experiences of discrimination while attempting to connect survivors with resources, and the possibility of increased vicarious trauma through shared LGBQT* identities.

At the same time, advocates may find strength and resiliency through a shared LGBQT* identity, a strong sense of LGBQT* community, and increased work satisfaction in serving marginalized community members. Advocates who identify as LGBQT* also may be able to draw upon their own experiences of discrimination as a source of resilience in the face of hardship. However, these hypotheses, which are informed by the authors' extensive practice experiences, have not been explored in the literature; considerable research is needed to determine the strengths and job stressors for providers who work with LGBQT* survivors.

Examples of Community-Specific Approaches to Trauma

Although there are no well-developed LGBQT*-specific practices, several community-specific approaches that have been developed by members of culturally-specific communities that have experienced multiple and overlapping forms of oppression may serve as guides.

One example, "Indigenist coping," which was first posited by Walters and colleagues (2002), is a Native-specific model that asks providers to abandon a focus on individual pathology, and instead center the historical trauma, ongoing discrimination, and experiences as a colonized people within a first world nation that are the norm for Native peoples in the U.S. (Walters et al., 2002). The multiple traumas experienced by Native peoples both individually and collectively are the foundation of service provision.

Walters and colleagues interpret the disproportionate rates of substance use, mental health challenges, and HIV risk behaviors among Native people, as conditions that might best be addressed and healed within the context of reconnection to the history and spiritual and healing practices of the Native community. Perhaps the most interesting aspect of the Indigenist coping model is its focus on uprooting internalized colonization and integrating identity along political, ethnic, racial, cultural, and spiritual dimensions. Although this model is not specific to Two-Spirit peoples, it is Two-Spirit-inclusive, and provides a conceptual framework that is responsive to the layered traumas experienced by too many Two-Spirit individuals (Walters, et al., 2002).

Similarly, the National Latin@ Network for Healthy Families and Communities has long used human rights and social justice frameworks to interpret trauma. Specifically, they view trauma through an understanding of multiple kinds of historical & collective trauma, the traumatogenic impact of "non-traditional" traumas such as racism, nativism, poverty, and discrimination and unjust denial of services from helping systems currently and historically experienced by Latin peoples. The National Latin@ Network correspondingly looks to identity cultural traditions and collective knowledge and wisdom, as sources of resilience and post-traumatic growth, both for individuals and for entire communities. Much like the Indigenist coping model (Walters et al., 2002), the approach of the National Latin@ Network looks to the community for both healing and leadership (Serrata, 2012).

Transformative Justice as a Trauma-Informed Practice

Transformative justice analyses recognize systemic oppression as contributing to and exacerbating the impact of interpersonal and community violence and seeks justice at every level (Hairston & Oliver, 2006; Generation Five, 2007). Whereas trauma-informed practice was conceptualized in clinical and academic contexts, transformative justice grew out of a community-based intervention model. It moves away from criminalizing and pathologizing those who use violence and toward transforming organizations, conditions, and systems that perpetuate violence. It is critical that trauma-informed practices include transformative justice as an additional lens in service delivery and system reform.

Generation Five (2007), an advocacy-based project working to end childhood sexual abuse, has helped shape a practice-oriented understanding of transformative justice by offering several goals and principles needed to build greater capacity of communities to challenge traumatogenic systems. According to Generation Five, there are four specific goals of transformative justice: safety, healing, and agency for survivors; accountability and transformation for people who use violence; community action,

healing, and accountability among those in positions of power; and, transformation of the social conditions that perpetuate violence. Notably, these goals build on a set of core principles: 1) liberation, 2) shifting power, 3) safety, 4) accountability, 5) collective action, 6) honoring diversity and 7) sustainability. Here, we explain these principles by providing possible ways in which they could be applied to work with LGBQT* survivors.

Liberation refers to ending long-standing intergenerational cycles of systemic and family violence, which can be partly achieved by shifting power away from those whose power has been achieved through domination, oppression, and violence. In the case of LGBQT* survivors, shifting power includes listening and responding to survivors' articulation of their stories and needs in order to promote self-determination. Liberation and shifting power also applies to LGBQT* individuals who use violence: To end intergenerational cycles of violence, it is important to understand their violent behaviors within the context of institutions and norms that perpetuate violence against them. For example, DV organizations can adopt more fluid and nuanced definitions of "victim" and "perpetrator"; that is, definitions that allow for someone to be (or have been) both a victim of violence and someone who used violence. Doing so invites people's full trauma history into the conversation for consideration and healing.

Safety is conceptualized on three intersecting levels. First, on an individual level, LGBQT* survivors must be protected from immediate and future acts of violence via intervention and prevention efforts. Second, within individual communities, action must be taken to foster norms and practices that condemn violence and support conditions for healing. Finally, at the macro level, communities must be accountable to one other in order to challenge institutional power. Part of that accountability includes acknowledging the prevalence and impact of interpersonal and historical trauma on individuals and communities as well as committing to survivor empowerment and healing. For example, mainstream DV programs can develop relationships with LGBQT* community members and programs to work toward long-term accountability of culturally sensitive service provision. They also can engage in ongoing program evaluation, including open discussion of policies, procedures, and staff profiles, in an effort to transform trauma-inducing organizational norms. Futures Without Violence (n.d.) has developed a series of "Program Personnel Policy Questions" for DV organizations to assess their readiness to work with children and teens; many of these questions can be amended to assess readiness to work with LGBQT* survivors. The National Center on Domestic Violence, Trauma & Mental Health's Accessible, Culturally Relevant, DV & Trauma-Informed (ACDVTI) Agency Self-Assessment Tool also provides guidance on organizational readiness and LGBTQ* inclusiveness.

Collective action highlights the need to address cycles of isolation and shame resulting from traumatic experiences by building alliances with communities to transform structures that perpetuate abuse. Additionally, honoring diversity includes creating and implementing interventions that respond to the unique needs of each community. Finally, sustainability refers to building internal capacity of intimate and community networks to support and maintain survivor-centered safety and healing. These last three principles highlight how social service organizations must incorporate advocacy efforts into

their work and cannot operate in isolation. Instead, they must learn from and collaborate with other organizations, specifically culturally specific organizations. Such collaboration includes not only LGBQT* organizations but also organizations that reflect the range of identities that LGBQT* survivors possess. Incorporating a diversity of expertise and perspective into programs and policies is critical for providing a more trauma-informed approach.

Conclusion

This literature review documents the need for LGBQT*-specific trauma-informed practices with survivors of IPV. IPV is at least as common among LGBQT* individuals as heterosexuals, and may be highest in bisexual and transgender communities. Furthermore, although LGBQT* IPV shares many underlying dynamics with IPV in heterosexual couples, it also has unique characteristics, including the types of abusive tactics used and the context of discrimination and social stigma faced by LGBQT* individuals. Moreover, there are additional complexities within LGBQT* subgroups.

LGBQT* survivors also face unique barriers to help-seeking. Overall, LGBQT* individuals are less likely to seek services from law enforcement and mainstream providers and more likely to rely on informal social support and LGBQT*-focused programs. There are also differences in help-seeking *within* LGBQT* subgroups. For instance, trans individuals may have an especially difficult time accessing culturally competent and non-traumatizing services. For LGBQT* people of color, stigma, economic constraints, and the absence of community outreach are barriers to accessing services.

Trauma and mental health are major concerns in LGBQT* communities in general, and for LGBQT* survivors specifically. LGBQT* individuals experience higher rates of traumatic events, and may be more susceptible to developing symptoms of PTSD, depression, isolation, suicidality, and anxiety. These concerns, which must be viewed in the context of historical trauma, are amplified for LGBQT* people of color and transgender individuals. Nonetheless, LGBQT* individuals find strength and resilience through identity affirmation and social support. More research focused on the strengths and sources of resilience of LGBQT* people is needed to complement and inform existing research on pathology and barriers.

Despite the high rates of IPV and trauma that LGBQT* communities experience, trauma-informed approaches tailored to LGBQT* survivors have been slow to develop. We hope that this document will facilitate thinking about how the core principles of trauma-informed practice can be applied to working with this community and to ameliorating vicarious traumatization among service-providers who do their best in difficult circumstances. The practice-based observations in the Appendix provide further framing for this important endeavor.

Appendix A: Existing Trauma-Informed Approaches

Trauma-informed Approach	Trauma-informed Care with LGBQT* Homeless Youth
Community	LGBQT* Homeless Youth

Principles	Examples of Practices
• Recovery is possible • Healing happens in relationships • Sharing power and governance • Understanding trauma and its impact • Promoting safety • Supporting client control, choice, autonomy • Focus on strengths • Integrating cultural awareness	• Organizational commitment to nondiscrimination and cultural competence • Involve LGBQT* youth in decisions about services • Provide positive LGBQT* role models • Coordinate with LGBQT* service and advocacy organizations • Collaborate with other organizations • Outreach to change public awareness • Include LGBQT* youth in outreach • Assess staff for knowledge, attitudes, skills

Poirier, J., Murphy, C., Shelton, J., & Costello, S. (2013). Ending LGBT youth homelessness: A call to action. Retrieved from http://tapartnership.org/events/webinars/webinarArchives/presentationSlides/20130710_LGBThomelessness_FINAL.pdf

Trauma-informed Approach	Trauma-Informed or Trauma-Denied
Community	Female Survivors of Trauma

Principles	Examples of Practices
• Recognize the impact of violence and victimization on development and coping • Identify recovery from trauma as primary goal • Employ an empowerment model • Strive to maximize women's choice and control over recovery • Services are based in relational collaboration • Create an atmosphere respectful of survivors' need for safety, respect and acceptance • Emphasize women's strengths, adaptations and resiliency • Minimize retraumatization • Services are culturally competent and understand each woman in context • Solicit participant input and involve participants in designing and evaluating services	• Outreach and Engagement: prioritize safety, ask permission, follow client's lead • Screening and Assessment: screen all clients for trauma history, understand survivor's unwillingness to answer certain questions, only ask for necessary information, balance usefulness of information against client needs, clearly communicate reason for asking questions • Resource Coordination and Advocacy: focus on empowering clients, identify strengths, emphasize skill-building • Crisis Intervention: plan for crises in advance, avoid using restraints or forced hospitalizations, make sure clients know their options • Trauma-Specific Services: offered in trauma-informed environment by individuals trained in trauma and its treatment • Parenting Services: build on parents' strengths • Mental Health and Substance Abuse: treat trauma and substance abuse in integrated way, emphasize physical and emotional safety, collaborate on treatment • Healthcare: prepare clients for medical appointments that might be triggering, debrief and review information provided during exam

Elliot, D. E., Bjelajac, P., Fallot, R. D., Markoff, L. S., & Reed, B. G. (2005). Trauma-informed or trauma-denied: Principles and implementation of trauma-informed services for women. *Journal of Community Psychology, 33*(4), 461-477.

Trauma-informed Approach	The Sanctuary Model
Community	Originally for adults who experienced abuse as children, adapted to domestic violence settings

Principles	Examples of Practices
• Core Concepts: nonviolence, viewing organization as whole entity, parallel processes • 7 Commitments: • Nonviolence: physical and psychological nonviolence at all organizational levels • Emotional Intelligence: staff must cultivate awareness of emotional responses and be able to manage and talk about them • Social Learning: organization must be dynamic and constantly identify and respond to changing needs of communities being served • Open Communication: organization should espouse transparency, nonviolent language, and effectively manage conflicts • Democracy: everyone at the agency, clients and staff, should have a voice that is heard • Social Responsibility: create a just and safe organization • Growth and Change: focus should be on the future, with goal of changing and growing over time	

The Sanctuary Model. Accessed 7/2014, from http://www.sanctuaryweb.com/

Trauma-informed Approach	National Center for Domestic Violence, Trauma & Mental Health's Accessible, Culturally Relevant, Domestic Violence-and Trauma-Informed (ACDVTI) Agency Self-Assessment Tool
Community	Domestic violence survivors and programs

Principles	Examples of Practices
• ACDVTI Approach • Be sensitive to the pervasiveness of trauma and its impact on survivors, staff and organizations including historical trauma and ongoing experiences of discrimination and oppression • Recognize the role of coercive control and DV-related safety and confidentiality concerns • Ensure services are welcoming, inclusive, accessible and culturally responsive • Work to minimize retraumatization • Support resilience, healing and well-being • Employ a collaborative strength-based approach • Attend to the quality of interactions for people using services and staff • Involve people using services and communities being served in shaping and evaluating services • Maintain a commitment to changing the conditions that contribute to abuse, violence, discrimination & oppression • Key tenets include recognizing the importance of • Physical and emotional safety • Relationship & connection • Respect, empowerment, transparency, collaboration & choice • Hope & resilience • A survivor-defined approach	The ACDVTI tool provides guidance on engaging in a reflective organization-wide self-assessment process. It is structured to walk agencies through a process of considering what an ACDVTI approach would look like in each of the following 7 domains. • Organizational Commitment and Infrastructure • Staff Support • Physical, Sensory and Relational Environment • Intake Process • Programs and Services • Community Partnership • Evaluation and Feedback It also includes a section on organizational readiness.

Introduction and Project Overview

This document contains a set of preliminary practice observations from the field, which are intended to inform the development of a trauma-informed transformative justice approach specific to lesbian, gay, bisexual, queer, and transgender (LGBQT*) survivors of intimate partner violence (IPV). These observations are the result of a research project that was led by the GLBTQ Domestic Violence Project (GLBTQ-DVP) and funded by the Administration for Children, Youth and Families, Family and Youth Services Bureau, US Department of Health and Human Services.

The goal of the project was to help develop a culturally-specific, trauma-informed approach to working with LGBQT* survivors with support and input from a range of stakeholders. To meet this goal, the following activities[1] were conducted over the course of two years (2013-2015):

- A substantive literature review on intimate partner violence in the LGBQT* communities (page 1), which is intended to be read in tandem with the observations
- Input from an advisory committee that included Queer Muslims of Boston, the Hispanic Black Gay Coalition, the Northeast Two Spirit Society, the Massachusetts Alliance of Portuguese Speakers, HarborCOV, Massachusetts Asian & Pacific Islanders for Health, and Fenway Health
- Two focus groups with survivors participating in one GLBTQ DVP program, the goal of which was to explore their experiences seeking help
- Three separate focus groups and multiple individual conversations with staff of one GLBTQ DVP program to assess their perceptions, experiences, and ideas about trauma-informed organizations and providing trauma-informed services
- Surveys of the program's staff as well as LGBQT* practitioners nationally to assess knowledge and experience of trauma-informed practices
- Informal conversations with staff and leadership of LGBQT* culturally-specific organizations across the country
- The authors' own collective experience working with LGBQT* organizations and communities over the past 30 years
- Considerable guidance from the National Center on Domestic Violence, Trauma, & Mental Health

From these multiple sources of data, a set of six observations emerged, which then were simplified and distilled in the hopes that they will be broadly applicable. They are listed here and explained in detail in the subsequent pages.

- Observation 1: The majority of LGBQT* survivors have experienced multiple forms of violence and abuse in their lives. Experiences of historical trauma and ongoing discrimination can compound these multiple experiences of victimization.

[1] The Simmons College Institutional Review Board approved the research activities involving human subjects (i.e., interviews and focus groups with practitioners and program participants).

- Observation 2: Organizations that work with LGBQT* survivors must operate from a place of understanding that perceived "challenges" may actually be creative strengths.

- Observation 3: Organizations that work with LGBQT* survivors must operate from the premise that if LGBQT* communities, staff, board members, organizations, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their family of choice, not merely as a service provider or colleague.

- Observation 4: If practitioners are to truly be of service, a social justice and anti-oppression framework must become the cornerstone of their individual work, their organization's work, and their organization's interactions with the community.

- Observation 5: Staff self-care (and organizational support for self-care) is critical.

- Observation 6: There is a profound need for transformative justice[2] approaches to working with LGBQT* and other multiply oppressed communities.

It is important to note that the authors view these observations as dynamic and evolving, and we are hopeful that LGBQT*organizations, practitioners, activists, and researchers will expand upon them as part of their own trauma-informed, anti-oppression, transformative justice work. Some sections of this addendum tie directly to the literature review (e.g., observations 1 and 5), and others do not. Also, although these observations grew in tandem with the literature review – and should be read together – some of the ideas are not yet supported by a body of literature. Rather, they reflect the practice wisdom and lived experience of LGBQT* practitioners and LGBQT* survivors who contributed to this project.

The practice observations and companion literature review are intended primarily for staff in domestic and sexual violence organizations; however, they are applicable to practitioners in other anti-abuse disciplines, homelessness services, mental health and healthcare circles, criminal legal systems, youth services, and an array of other human services disciplines and social change endeavors that seek to serve and ensure the inclusion of LGBQT* communities.

[2] The authors wish to thank Hales Burton at the Fenway Violence Recovery Program for first suggesting this conceptual shift.

A Note on Language[3]

Before describing the observations, the authors wish to acknowledge the deep complexities of language. In this document, IPV refers to the physical and/or emotional abuse of an individual by a current or former intimate partner. It includes the full range of tactics used to create and maintain power and control over another person, including financial abuse, verbal abuse and intimidation, and cultural abuse. In this document, the phrases *intimate partner violence* and *domestic violence* are used interchangeably to denote partner violence. However, it is important to note that domestic violence (DV) is sometimes defined more broadly to include violence and abuse perpetrated by relatives. Although many LGBQT* individuals experience abuse and/or rejection from family and relatives, the dynamics of partner violence versus family violence may differ dramatically. When we discuss the latter, we use the phrase *family violence* to distinguish it from violence by an intimate partner.

LGBQT* stands for lesbian, gay, bisexual, queer, and transgender. It is often used interchangeably with GLBTQ, LGBQT-TS, and similar acronyms to broadly refer to sexual and gender minorities. This document honors the current practice of including an asterisk after the "T" to signify the broad diversity of trans communities, including trans women – transgender individuals who identify as women, though assigned male at birth; trans men – transgender individuals who identify as men, though assigned female at birth; those transitioning from female to male (FTM); those transitioning from male to female (MTF); cross dressers; gender non-conforming individuals; and others who might self-identify as being members of trans communities. In this paper, transgender and trans are used interchangeably.

These definitions belie the complexity of the terms, however. The words *lesbian*, *gay*, *bisexual*, *transgender*, and *queer* all carry particular historical, political and cultural meanings. To a great extent, these words have been shaped in white, Western contexts. Words such as lesbian, gay, and bisexual, for example, are uniquely English. There are seldom translations into other languages that carry the same understanding of LGBQT* identity as being an identity rather than a set of behaviors. Literal translations, into Spanish or Haitian Creole as but two examples, carry few if any of the presumptions that are inherent in English. In many parts of the Latin and Spanish-speaking world, men who engage in sex with same sex partners are only considered "gay" in the English sense of the word if they are the receptive partner. It is not engaging in the acts that is the determinant of identity, so much as the role that an individual plays (traditionally read as *masculine* or *feminine*) in the conduct of that act. Similarly, men who marry women, but engage in same sex acts with other men, are frequently identified as heterosexual. In short, they are defined by their social role, rather than by their private, intimate acts. Hence the conception of *gay*, as defined in U.S. contexts, frequently fails to apply.

Precisely because identifiers such as LGBQT* were defined in white middle class and academic contexts, the limitations of LGBQT* labels and identifiers may be particularly acute in communities of

[3] For those of you who are reading the literature and practice observations in tandem, please note that this "note on language" section is identical to the "note on language" section in the literature review.

color, Indigenous communities, and immigrant communities, among others. During the course of crafting this literature review, members of our Advisory Board taught us a tremendous amount. The Hispanic Black Gay Coalition (HBGC) suggested use of the term *same gender loving*, a community-specific phrase coined by Cleo Manago to distinguish African Americans, and in particular African American men, who do not self-identify as being part of the predominantly white gay movement in the U.S., but who nonetheless wish to affirm their same sex intimate relationships. Corey Yarbrough, one of the founding Executive Directors of HBGC, suggested that for some same gender loving people this language may be a form of racialized resistance to the racism of the mainstream LGBQT* movement in the U.S. In the alternative, Corey stated, some members of African American communities may be on the *down low*, engaging in same sex sexual activity, but rejecting LGBQT* identifiers as a result of internalized homo and biphobia.

The NorthEast Two-Spirit Society (NETSS) in part echoed Corey's thoughts about the racism of the mainstream LGBQT* movement. In addition, Harlan Pruden, one of co-founders of NETSS, spoke about an "internal muddiness" that some Native peoples may experience when seeking to find language for their experience. Speaking of his own Cree inheritance as a registered member of the Saddle Indian Reservation, Harlan said that when he asked something of an elder, he knew to offer them tobacco, but never understood the spiritual dimension of the ceremony. Having been separated from too much of their own history by colonialism, genocide and forced assimilation, Harlan stated, many Native people may use the words *Two-Spirit* when what they really mean is gay Indian.[4]

Harlan also spoke at length about the contextual nature of Native Two-Spirit identities. As Harlan put it, "When I am out on a Friday night in a gay club, I am a gay man. Yet when I am in rural Oklahoma at a Two-Spirit gathering, I am a proud Two-Spirit man." Alluding to the unique role and cultural responsibilities that Two-Spirit people often held (and may still hold) in the life of Native communities, Harlan pointed out the obvious differences in the spiritual role of Two-Spirit peoples, and the political and social function of people claiming LGBQT* identities in mainstream communities. Several members of the project's advisory board echoed this point,
speaking about the complex layering of cultural and spiritual value systems that accompanied their choice to self-identify in, with, and outside of their own communities.

These same Advisory Board members also acknowledged the landscape in which such decisions are made, and stated that individuals in their communities may shift how they self identify as a means of preserving their safety. As the rest of this literature review discusses, LGB, transgender, same gender loving, Two-Spirit, and queer-identified peoples make choices about how, when, and if to "out" themselves in a complex social and political landscape that is too often unsafe, if not violent. Hence how

[4] Two-Spirit is a contemporary term, adopted from the Northern Algonquin, and meant to signify the embodiment of both masculine and feminine within one person. Now embraced by many Native peoples as a pan-Indigenous umbrella term connoting both diverse gender expressions and sexual orientations, Two-Spirit generally speaks to the respect that Native peoples held for diversity, and the unique sacred and ceremonial roles that Two-Spirit people held (and may still hold) within their own communities. Herein the phrase Two Spirit speaks not simply to a third gender, or to same gender attraction, but more broadly to the history of compulsory Christianization that sought to erase Two-Spirit peoples within their own nations. Notably, there is no single consensus definition of Two-Spirit, and the term means different things to different Native peoples.

any individual self-identifies may shift depending on who is asking, why, and in what context. As one Advisory Board member stated, "identities have to be fluid in order to be protective."

Finally, the leadership of HarborCOV, an LGBQT*-affirming DV organization in Boston that specializes in serving communities facing cultural or linguistic barriers, has noted that some cultures may not have the variety or depth of language that words such as LGB, transgender, same gender loving, and Two-Spirit convey. Indeed, Kourou Pich, Co-Executive Director of HarborCOV has observed that people from some cultures and communities may have difficulty finding language for themselves in their own communities, and that that invisibility is intentional – a function both of denial of the existence of sexual minorities in those communities, but also perhaps protectiveness of gender queer and same gender attracted people.

Language is power. We authors, therefore, have put a great deal of thought into the words we use to name peoples' experiences. At the same time, we know that we can never be as inclusive or sensitive as we want to be. We have done our best to honor the range of experiences we are writing about in this document.

Notes from the Field: A Set of Practice-Base Observations

Observation 1: The majority of LGBQT survivors have experienced multiple forms of violence and abuse in their lives. Experiences of historical trauma and ongoing discrimination can compound these multiple experiences of victimization.*

A trauma-informed approach, at its core, asks that practitioners assume that everyone they serve has experienced some form of violence, abuse, or other trauma in their lives and to see these experiences as the norm, rather than the exception (Felitti et al., 1998; Harris & Fallot, 2001).

Given the prevalence and overlapping nature of violence and abuse in the lives of LGBQT* peoples, it might be more prudent to suggest that practitioners build practices and systems that presume *multiple* forms of victimization among the people they serve. It is not unusual for LGBQT* peoples to be targets of many different forms of violence and abuse at the hands of multiple individuals, at numerous points throughout the lifespan (Roberts, Austin, Corliss, Vandermorris, & Koenen, 2010; Grant, Mottet, & Tanis, 2011; Stotzer, 2009).[5] Indeed, traumatic experiences such as intimate partner

[5] To date, the fragmented nature of the research into violence and abuse in the lives of LGBQT* individuals means that, although there is a broad practice consensus about the prevalence of "polyvictimization" in the lives of LGBQT* peoples, there is little peer-reviewed research examining the phenomenon. However, there is abundant evidence that LGBQT* people, and in particular LGBQT* people of color, are more likely to be targeted for multiple forms of violence and abuse, in multiple contexts (family, partnerships, community) over the course of their lifetime. For example, LGBQT* peoples are disproportionately subject to childhood sexual abuse, bullying by peers, sexual violence in adolescence and adulthood, intimate partner violence, hate crimes, and police brutality (Roberts et al., 2010; Grant et al., 2011; Stotzer, 2009). Again, the authors wish to encourage individuals to read these observations in tandem with the literature review to learn more about these siloed areas of research.

violence, family violence, and other types of trauma that occur over the course of the lifespan, including childhood sexual assault, bullying, hate crimes, or police brutality, may intersect and compound each other in the lives of LGBQT* survivors in ways that create unique challenges for survivors themselves, and unique opportunities for control by future perpetrators.

These interpersonal traumas are often further compounded by experiences of oppression and historical trauma in LGBQT* communities. LGBQT* peoples have historically experienced discrimination at the hands of helping professionals in a range of systems (e.g., healthcare, mental health, criminal-legal, child protection, public assistance, and sexual and domestic violence organizations) – if LGBQT* peoples have been visible in those systems at all.[6] In addition, many of these systems (in particular mental health and criminal-legal systems) have not only pathologized, labeled, isolated, and detained LGBQT* individuals, but also intentionally fractured LGBQT* partnerships, families, and communities. Such treatment is especially the case for multiply marginalized LGBQT* communities, such as communities of color, immigrants and refugees, Two Spirit communities, and people with disabilities.

It is important to understand, however, that these forms of oppression are not merely historical artifact in the lives of LGBQT* survivors, but ongoing and continuing realities, especially for those who are multiply marginalized. This ongoing oppression then exacerbates experiences of current and historical trauma.

A trauma-informed approach encourages practitioners, and indeed entire systems, to minimize the possibilities for retraumatization by creating an atmosphere that prioritizes survivor's need for safety, respect, and acceptance (Elliot, Bjelajac, Fallot, Markoff, & Reed, 2005; Guarino, Soares, Konnath, Clervil, & Bassuk, 2009; Jennings, 2004; Substance Abuse and Mental Health Services Administration, 2014; Warshaw, 2014; Wilson, Fauci & Goodman, 2015). In short, a trauma-informed approach asks first and foremost that practitioners – as well as the systems in which they work – do no harm.

However, for LGBQT* survivors in particular, the mandate to do no harm requires that practitioners understand the concept of *sanctuary harm* – the idea that institutions and institutional gatekeepers can inflict enormous damage on the very people whose healing, empowerment, and safety they are supposed to nurture and protect (Bloom & Farragher, 2011; Smith & Freyd, 2014). Survivors who participated in the focus groups for this project spoke of blatant discrimination, noting, for example, institutions and practitioners who had at times openly refused services to male and LGBQT* survivors. And, in the staff focus groups, participants spoke about the challenges of advocating with organizations that had a funder mandate to be LGBQT* inclusive, but who were still actively resistant to accepting some members of this diverse community.

[6] The authors are mindful that historical trauma means different things in different communities. Many members of First Nation communities frame historical trauma in terms of colonization, genocide, and boarding-school trauma. Members of Jewish communities may frame historical trauma in terms of the intergenerational impact of the Holocaust. And members of the African Diaspora may think of the Middle Passage and the enslavement of African peoples when referencing historical traumas. The specific nature of the historical influences the way it continues to affect the lives of individuals and entire communities.

Conversations with LGBQT* practitioners across the country, especially those from mainstream organizations, surfaced deep ethical tensions over their own roles as institutional actors in organizations and agencies that they believed too often inflicted sanctuary harm. Consciousness of the harm they were doing – and the good they were prevented from doing – was a significant source of mental, emotional, and ethical distress for many practitioners, especially when contrasted with their larger awareness of the needs of the communities and people they were serving.

Observation 2: Organizations that work with LGBQT survivors must operate from a place of understanding that perceived "challenges" may actually be creative strengths.*

Recognizing the potentially significant impact of violence and abuse on development and coping strategies, a trauma-informed approach aims to contextualize coping strategies such as substance use, cutting, eating disorders, "promiscuous" sex, and dissociation as adaptive responses to otherwise intolerable situations (Elliot et al, 2005; Guarino et al., 2009; Jennings, 2004; SAMHSA, 2014, Warshaw 2014). Because it is rooted in clinical frameworks, trauma-informed practice approaches often frame such strategies as necessary within the context of abuse, but no longer adaptive once relative safety had been achieved. Following the examples of Kate Bornstein and Sylvia Rivera, the LGBQT*-specific practitioners who participated in the survey and informal conversations spoke about celebrating survivors' coping strategies as not merely adaptive, but indeed creative, even when such strategies are not on the surface immediately conducive to health or perceived well-being. Given the multiple forms of victimization, ongoing discrimination, and historical trauma that shape the LGBQT* experience, it may be that there is no safety anywhere. In that context, any strategy that allows people to survive – internally or externally – is to be celebrated. As one practitioner put it, "It isn't about coping, it is about surviving. We celebrate survival, because it is so uncertain." Such a response should not preclude practitioners from expressing concern or helping survivors to develop alternative survival strategies in parallel; however, it does require that practitioners fully embrace survivors and honor and respect their own strategies.

Observation 3: Organizations that work with LGBQT survivors must operate from the premise that if LGBQT* communities, staff, board members, organizations, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their family of choice, not merely as a service provider or colleague.*

A trauma-informed approach asks that practitioners base everything they do in relational collaboration. In fact, one of the core principles of a trauma-informed approach is to ensure that goals and strategies are collaboratively defined, and that the partnership between survivor and practitioner is itself a place of healing (Elliot, et al, 2005; SAMHSA, 2014; Warshaw, 2014; Davies & Lyon, 2014; Wilson et al., 2015).

Just as with other historically oppressed communities, the complexities of the LGBQT* experience may be such that a traditional relationship between service provider and client is not sufficient to fully support the person's healing. Instead, a different and more porous set of boundaries may be required – or at least expected. As several LGBQT* practitioners put it, when LGBQT* communities, staff, co-workers, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their "family of choice," not merely as a service provider. Program participants supported this sentiment, describing how one of the most important and helpful aspects of the services they received was the staff's willingness to go "above and beyond their job descriptions." Providing the sort of attention that a friend might provide (e.g., calling to check in or going along to doctor's appointments) was important because, as one survivor expressed, "I had never been treated that way in my life, not even by my family." Although this can raise complex ethical issues for both survivors and practitioners in navigating this important but complicated terrain, recognizing it is critical in working with LGBQT* survivors and working within LGBQT* communities.

Observation 4: If practitioners are to truly be of service, a social justice and anti-oppression framework must become the cornerstone of their individual work, their organization's work, and their organization's interactions with the community.

Another principle of trauma-informed practice is to respond to all people in ways that are sensitive to their individual social locations and contexts (Wilson et al., 2015; see also Elliot, et al, 2005; Jennings, 2004; Guarino et al., 2009; SAMHSA, 2014; National Center on Domestic Violence, Trauma & Mental Health, in press). At a minimum, this principle sets forth an expectation of cultural sensitivity across multiple aspects of identity. Given the chronic and cascading traumas, ongoing oppression and historical trauma referenced above, cultural sensitivity is essential but not sufficient for responding to the experiences of LGBQT* survivors. Instead, attention to individual social locations and contexts must be situated within a broader anti-oppression framework.

LGBQT* practitioners from across the country observed that the broader movements against sexual and domestic violence sometimes minimized the ways in which violence and abuse intersect with other forms of oppression. They took note not simply of the ways in which this lack of proactive attention shaped direct services, but also how it shaped their organization's hiring practices, the tokenization of staff members from historically marginalized communities, the narrow makeup of their organization's governing board, the focus on quantity over holistic quality of services, and the lack of input particularly from transgender community members and community members of color in strategic planning and other organizational activities.

By contrast, they called on practitioners to build organizations that are integrated into and learn from the historically marginalized communities they serve (or should be serving) and that center the knowledge and experiences of those communities. Historically oppressed communities, including LGBQT* communities, are at the leading edge of anti-violence work, not a set of "minority communities" requiring special logistics or uniquely special care. What organizations learn from historically oppressed communities should serve as the foundation of their organizational philosophy, practices, and policies.

Observation 5: Staff self-care (and organizational support for self-care) is critical.

Empathic engagement and bearing witness to other people's pain can affect us deeply. To be effective, it is important for service providers and activists serving people in pain and crisis to be mindful of how they have been affected by their own experiences of trauma *and* how they are affected when they open themselves up to other people's experiences (Saakvitne, Gamble, Pearlman, & Lev, 2000; Hopper, Bassuk, & Olivet, 2010; Bloom & Farragher, 2013; SAMHSA, 2014). Hence, an understanding of vicarious trauma and encouragement to develop strong habits of self-care have become foundational principles in trauma-informed practice (Bloom & Farragher, 2011; Bloom & Farragher, 2013). Thus, to be truly trauma-informed, organizations need to institute programmatic supports for self-care at all levels of the organization (Bloom & Farragher, 2011; Bloom & Farragher, 2013, Warshaw 2014).

Conversations with LGBQT* practitioners across the country led to an additional observation: There is a particular weight that accompanies serving LGBQT* people experiencing violence, abuse, and discrimination while simultaneously identifying with those same communities. Trauma, vicarious trauma, organizational trauma, and historical trauma compounded one another in the lives of the LGBQT* practitioners who contributed to this project, just as they do for the survivors who participate in their programs. Moreover, the impact of compounding trauma was one each group articulated virtually unanimously. Their experiences underscore the need for self-care at the individual level. They also point to need for organizational policies that enable self-care, provide LGBQT*-affirming workspaces, and facilitate connection with the larger community of providers and activists that support and depend upon the work and health of that organization. Essentially, caring for each other individually and as a collective is a critical element of any trauma-informed approach.

Observation 6: There is a profound need for transformative justice[7] approaches to working with LGBQT and other multiply oppressed communities.*

Because the companion literature review focused largely on peer-reviewed, published literature, it did not consider the enormous array of activist literature and art that historically oppressed communities have often used to express their communal strategies for survival and resistance. The work of Incite!, Creative Interventions, Black & Pink, and Break Out, along with broader bodies of art, music, dance, autobiography, fiction, and oral history attest to this creative communal drive.

One innovation that has emerged from this kind of activist energy is the concept of *transformative justice* (Generation Five, 2007; Creative Interventions, 2012). Transformative justice recognizes the profound harm and trauma that mainstream approaches have inflicted on LGBQT* peoples, particularly those who face multiple forms of oppression. Its practitioners argue for an approach that understands these historical harms and seeks to create new and innovative responses that avoid replicating them. Rather than work within the framework of social services, it aims for the liberation of oppressed people as communities not just as individuals, under the fundamental

[7] The authors wish to thank Hales Burton at the Fenway Violence Recovery Program for first suggesting this conceptual shift.

assumption that “individual justice and collective liberation are equally important, mutually supportive, and fundamentally intertwined” (Generation Five, 2007, p.1). In other words, transformative justice seeks to transform the political and cultural conditions that allow violence, abuse and oppression to exist in the first place. It is critical that trauma-informed practices include transformative justice as an additional lens in service delivery and system reform.

Conclusion

In summary, these six observations underscore the ways in which individual, interpersonal, and structural factors coalesce in the lives of LGBQT* survivors of domestic violence, creating a unique context, that affects their experiences and needs. Future trauma-informed approaches for LGBQT* survivors of domestic violence should consider the multi-layered context that surrounds LGBQT* survivors and use that knowledge to inform not only client-level practices, but also organizational-level policies.

ABSTRACT

The European countries have a long history of exposure to large-scale trauma. In the early 1990s the increasing awareness of the consequences of trauma within the mental health community led to the foundation of local societies for psychotraumatology across Europe and the European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary in 2018. The focus of this article is to describe the current state of care for survivors of trauma in the 15 European countries where ESTSS member societies have been established. Brief descriptions on the historical burden of trauma in each country are followed by an overview of the care system for trauma survivors in the countries, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in the future. The reports from the different countries demonstrate how important steps towards a better provision of care for survivors of trauma have been made in Europe. Given the cultural and economic diversity of the continent, there are also differences between the European countries, for instance with regard to the use of evidence-based treatments. Strategies to overcome these differences, like the new ESTSS training curricula for care-providers across Europe, are briefly discussed.

Trauma y Atenciones de Trauma en Europa

Los países Europeos tienen una larga historia de exposición a traumas de larga escala. A principios de la década de 1990, la creciente conciencia de las consecuencias del trauma dentro de la comunidad de salud mental condujo a la fundación de las sociedades locales para la psicotraumatología en Europa y la Sociedad Europea de Estudios de Estrés Traumático (ESTSS), la cual celebra en el 2018 su 25° aniversario. El enfoque de este artículo es describir el estado actual de la atención de los sobrevivientes de traumas en los 15 países Europeos, donde las sociedades miembros de la ESTSS se han establecido. Las descripciones breves sobre la carga histórica de trauma en cada país son seguidas por una descripción general del sistema de atención para sobrevivientes de trauma en el país, el estado de la técnica de las intervenciones, los desafíos actuales en el cuidado de sobrevivientes y los temas que necesitan ser abordados con mayor urgencia en el futuro. Los reportes de los diferentes países demuestran los pasos importantes que se han dado en Europa en la entrega de atención para los sobrevivientes de trauma. Dada la diversidad cultural y económica del continente, hay también diferencias entre los países Europeos, por ejemplo en relación al uso de tratamientos basados en la evidencia. Las estrategias para

HIGHLIGHTS

- Important steps towards a better provision of care for victims of trauma were made in the European countries.
- In 2018, ESTSS celebrates its 25th anniversary.
- Strategies to promote a better practice include new ESTSS curricula for professionals across Europe.

resolver estas diferencias, como el nuevo curriculum de entrenamiento de la ESTSS para los proveedores de atención a lo largo de Europa son discutidas brevemente.

欧洲的创伤和创伤护理

欧洲国家有遭受大规模创伤的久远历史。在20世纪90年代早期，精神卫生界内越来越意识到创伤的后果，导致了在欧洲各个地区性创伤心理学会和欧洲创伤应激研究学会（European Society of Traumatic Stress Studies；ESTSS）的成立，该学会将于2018年庆祝其成立25周年。本文旨在描述在已建立ESTSS子协会的15个欧洲国家中创伤幸存者护理的当前状况。首先是对每个国家创伤的历史负担的简要描述，之后概述了各国创伤幸存者的护理系统的概述，干预措施的最新技术，护理幸存者面临的的当前挑战以及将来最迫切需要解决的问题。来自不同国家的报告展示了，在欧洲是如何实现为创伤幸存者提供更好的护理。鉴于大陆的文化和经济多样性，欧洲国家之间也存在差异，例如在循证治疗的使用上。我们简要讨论了克服这些差异的策略，例如为跨欧洲的护理服务提供者的新ESTSS培训课程。

1. Introduction

Exposure to trauma is common (Kessler et al., 2017) and its consequences on the individuals and communities affected can hardly be overestimated. In Europe, as in other regions of the world, a high burden of trauma is related to human-made events. In the twentieth century, military conflict took place during every single year in the European region and many of them affected numerous countries (see Table 1). Mass traumatization was also related to military conflicts associated with European colonialism, or conflicts in other continents where European military forces were involved in conflicts (see Table 2). Another massive burden of trauma across Europe resulted from the Holocaust and, throughout most of the twentieth century, from the political oppression by the Soviet communism. Trauma has occurred and still occurs in many societal contexts. For example, these include the familial and institutional abuse of children, different forms of gender-based violence in the European societies, various forms of institutional violence (i.e. in detention facilities of some countries) and also large-scale disasters and terror attacks that struck individual countries. Finally, over the last decades, an increasing number of migrants have reached the European countries, due to war and violence in their homeland (Hall & Olff, 2016; Kartal & Kiropoulos, 2016; Knaevelsrud, Stammel, & Olff, 2017; Munz & Melcop, 2018).

In the last two decades of the twentieth century, the increasing awareness of the consequences of trauma in the mental health community led to the foundation of local working groups and societies for psychotraumatology in several European countries. The European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary this year, was founded in 1993. Over two decades, ESTSS was an organization that included both member societies and individual members, which in the first years mainly came from western European countries. Recently, ESTSS has developed into an umbrella organization of the European societies for traumatic stress. This change is the result of a strategic plan that has been pursued over a longer period of time (Gersons, 2013). The ESTSS board consists of representatives from all member societies, which facilitates the work towards common strategic aims, such as promoting a standard curriculum for training in psychotrauma across Europe. In 2018, ESTSS com-

Table 1. Examples of military conflicts in Europe.

Year	Military conflict	Countries affected
1914–1918	First World War	Paneuropean
1917–1922	Soviet revolution	Former Soviet countries
1936–1939	Spanish civil war	Spain
1939–1945	Second World War	Paneuropean
1944–1953	Lithuanian partisan war against Soviet occupation	Lithuania
1968–1998	The Northern Ireland Troubles	UK, Republic of Ireland
1991–2000	Wars following the dissolution of former Yugoslavia	Slovenia, Croatia, Bosnia and Herzegovina Serbia, Montenegro, Kosovo
Since 1990	Military conflicts/wars in the South and North Caucasus	Georgia, Armenia, Azerbaijan and Russia (including North Caucasian region of Russia)
2008	Russian-Georgian war	Georgia, Russia
Since 2014	Conflict in East Ukraine	Ukraine, Russia

The list of military conflicts and countries involved is not all inclusive.

Table 2. Examples of military conflicts outside of Europe.

Year	Military conflict	European countries affected
1945–1949	War in the former Dutch East Indies	The Netherlands
1946–1954	Vietnam war	France
1954–1962	Algeria war	France
1950–1953	Korean war	Belgium, France, Greece, Luxembourg, Netherlands, UK
1961–1974	Portuguese Colonial War in Africa	Portugal
1979–1987	Afghanistan war	Former Soviet countries, UK
1990–1991	Gulf war	Belgium, Denmark, France, Germany, Greece, Hungary, Italy, Netherlands, Norway, Poland, Portugal, Romania, Spain, Sweden, UK
2001–2014	Afghanistan war	Albania, Belgium, Croatia, Czech Republic, Denmark, France, Georgia, Germany, Italy, Lithuania, Norway, Poland, Portugal, Romania, Russia, Spain, Sweden, UK, etc.

The list of military conflicts and countries involved is not all inclusive.

prised of 13 member societies that included 15 European countries and regions. These included Austria, Belgium, Croatia, Georgia, Germany, Lithuania, Italy, The Netherlands, Poland, Portugal, Sweden, the German-speaking and the French-speaking part of Switzerland, Ukraine and the UK (www.estss.org). Moreover, ESTSS had 12 additional affiliated societies and institutions in 2018. The society is constantly working towards the inclusion of further European societies and actively supports the formation of new societies in countries where they do not exist yet, as currently happened in Finland where the Finish Society for Psychotraumatology was launched in 2018.

While a series of articles at the occasion of ESTSS' twentieth anniversary focused on the inspiring and often also entertaining recollections of former presidents on the development of ESTSS (Lueger-Schuster, 2013b), the focus of this article is on the current member societies of ESTSS and on the development of trauma care in the respective countries. After some reflections on the historical burden of trauma in each country, representatives from all the national societies describe the structure of care organizations for trauma survivors, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in their countries in the future.

2. Psychotraumatology in Belgium

Five to eight million deaths, perhaps even 10: this was the devastating toll of the conquest and colonial exploitation of the Belgian Congo with King Leopold II, between the 1880s and the First World War (Hochshild, 1998). All traces of this Genocide remained secret until the early 1980s. Concerning the historical burden of the two World Wars (Manfred, 2015), it is the First World War more than the Second World War which, in the collective memory, constitutes a great trauma because of the looting of the country and the massacre of more than six thousand civilians. Recent events that stay more broadly in the mind of the Belgian people include the Heysel Drama in 1985 and the Dutroux affair with the sexual abuse, sequestration and death of young children and adolescents in 1996. In March 2016, the terrorist attacks at the national airport and in the metro of Brussels caused the death of 35 persons (Deschepper et al., 2018). Psychosocial structures vary across the country and have little or no coordination between them. One of the reasons is a difference between the functioning of French- and Flemish-speaking communities. Some structures can be found in both the French- and the Flemish-speaking communities. For instance, Public Welfare Centres and police victim services can be found in both of them. The integration of a psychosocial dimension into emergency and intervention plans was formalized in 2006. For the last 20 years, psychotherapists and other clinicians working in private practices started to specialize in trauma care for survivors. More and more specifically trained psychologists are working in hospitals and mental health centres. Recently, the development of outpatient trauma treatment centres linked to hospitals is evident. Some centres for the provision of trauma care for refugees were established in Brussels and cover the Dutch- as well as the French-speaking part of the country. In 2017, the High Council on Health received a Ministerial request for an opinion on the psychological care and support of persons following terrorist incidents or related disasters.

Until recently, there were no trauma-focused intervention methods in use in Belgium. The main therapeutic currents, for instance cognitive behavioural therapy (CBT) and psychodynamic therapies, were putting their own accents on working with trauma. In 2006, the BIP (Belgian Institute for Psychotraumatology) started the first psychotraumatology course. More trauma centres were created in the following years in principle cities, mainly Antwerp and Brussels. The course is organized in collaboration with two Universities. BIP organizes conferences in collaboration with other institutes or centres in Belgium. An independent Belgian trauma society needs to be created in the near future.

Current challenges in caring for trauma survivors concern the coordination of different support services. The political system in Belgium involves varying responsibilities at several levels, which makes decision-making complex. More visibility through studies on the positive impact and benefits of qualified trauma-focused care will be important. Finally, a well-structured national accreditation system should be put in place in order to continue provision of quality care for trauma survivors.

Among the topics to be most urgently addressed in the future is accessibility of services which is limited due to long waiting lists before survivors get access to psychological care in the Belgium mental health care system. Moreover, new ways of thinking about specialized trauma-care structures are needed.

3. Psychotraumatology in Croatia

The still living burden of the Second World War psychotrauma in Croatia has merged with the trauma of the Homeland War (1991–1995). Throughout the whole post-World War period there was no awareness of the consequences of trauma exposure, the issue was present neither in the health nor in public discourse. Consequently, no specific care was developed and provided. In contrast, the war in the 1990s brought about a high level of awareness of trauma and posttraumatic stress disorder (PTSD). Decades later the war-affected population reports 18% prevalence of PTSD (Priebe et al., 2010). This may be

partly due to lack of effective early trauma interventions and a number of hindering social factors, such as the prolonged economic crisis that affected more the vulnerable populations. The spin-off effect of massive trauma at the social level is a new understanding of the impact of traumatic events on physical and psychological health, as well as on communities (Corkalo Biruski, Ajdukovic, & Löw Stanic, 2014; Lončar & Henigsberg, 2007), which in turn facilitates access to specialized services by people exposed to trauma in everyday life.

Trauma survivors have access to psychiatric services in major hospitals, while veterans receive help within the three specialized regional centres and the National Centre for Psychotrauma. The cost of services are covered by universal national health insurance. Several non-governmental organizations with qualified staff provide supportive therapy to survivors of sexual assault, traffic accidents and other life threatening incidents, as well as domestic violence. The Polyclinic for the Protection of Children based in Zagreb specializes in working with traumatized children. Other facilities focus on prevention and support in the immediate aftermath of traumatic incidents, such as the Crisis Response Network maintained by the Society for Psychological Assistance (SPA).

The psychiatrists' first treatment choice is psychopharmacology. The prevalent therapeutic approach in psychiatric services for veterans is group therapy. Some veterans have been attending such groups for over 25 years. Low use of evidence-based trauma-focused therapies reflects (Schnyder et al., 2015) the prevailing traditional approach in Croatian psychiatry. Hence, traumatized populations still have poor access to effective, evidence-based trauma treatments. Training in trauma-focused CBT and EMDR is offered to practitioners, but this is not fully integrated into the helping system. With the existing high level of competencies in dynamic psychotherapy and psychopharmacology (Britvić et al., 2012), the challenge remains to develop a more stepwise approach to trauma-informed services, increase public awareness of risk and resilience factors, and to expand treatment choices to include evidence-based trauma-focused therapies and make them more available to the general populations in need. The Croatian Society for Traumatic Stress (CSTS) has been working on this challenge since it was founded in 2011 by organizing training workshops. It is currently promoting the ESTSS certified training in psychotrauma for mental health providers. One of the ambitions is to further integrate such training into university curricula so that future generations of mental health professionals are able to provide state-of-the-art care to traumatized people. Similarly, basic and intermediate levels of trauma-related knowledge and skills will be made more available to first responders and other health professionals.

4. Psychotraumatology in France

According to the World Mental Health survey, 72.7% of the French population has been exposed to traumatic events in their lifetime (Husky, Lépine, Gasquet, & Kovess-Masfety, 2015). Intimate partner violence, serious illness of a child and rape were the events associated with highest risk of PTSD. While rape is underreported in France, each year nearly 100,000 individuals claim to be survivors of rape or attempted rape and 500,000 claim to be survivors of intimate partner violence. A fifth of the French population was exposed to war-related events (mainly the Second World War). The twenty-first century was scarred by numerous Islamism extremist attacks, of which the November 2015 Paris attacks have been the bloodiest to date, resulting in more than 264 dead and 914 injured individuals. Traffic fatalities decreased in the past decades, reaching 5.1 per 100,000 inhabitants per year.

Since 1995, medico-psychological emergency units (CUMP for 'Cellules d'Urgence Médico-Psychologiques') are deployed in the case of mass casualty situations and provide immediate psychological support and care. These units were very effective after terror attacks in Paris and Nice, supporting thousands of survivors over many weeks (Hirsch et al., 2015). Psychological assistance aims at providing survivors with an entry point to psychological health care and giving them a first sense of relief, even though they do not provide psychological follow-up care (Vandentorren et al., 2018). In order to ensure long-term high-quality trauma care to all survivors in need across the country, President Emmanuel Macron in November 2017 announced the creation of about 10 ambulatory services specialized in trauma care. These services are aimed at providing medical and psychological care to survivors (minors or adults) that have experienced violence or any traumatic event during their lifetime.

The traditional psychodynamic approach is gradually but slowly replaced by structured trauma-focused psychotherapies, such as CBT or EMDR, and also new technologies (e-PTSD) are being introduced (Bourla, Mouchabac, El Hage, & Ferreri, 2018). However, the provision and access to treatment remain limited by the fact that there is a limited number of experienced trained trauma therapists and that care centres are not always clearly identified or equitably distributed across the country.

The challenges in caring for survivors are to achieve universal access to prevention, improve access to trauma-focused psychotherapies and ensure coordination of specialized care and support. One major challenge is to expand public funding of structured psychotherapies by trained psychologists. It is advisable to ease access to structured trauma-focused

therapies as part of mental health care programmes in compliance with international guidelines. In the end, patients should benefit from personalized treatment strategies for their trauma-related disorders, based on objective information.

The future ambulatory care services specialized in trauma will have to structure the organization of care, to establish a single French umbrella society (involving the national trauma centre and psychotrauma societies such as AFORCUMP-SFP, ALFEST and ABC des Psychotraumas), to be involved in qualifying training curricula, and to set up a French certification committee connected to the ESTSS accreditation committee, in order to meet modern European and international standards.

5. Psychotraumatology in Georgia

Georgia is a post-Soviet country, with a population of approximately 3.3 million. Since becoming independent in the early 1990s, it went through a prolonged series of civil war and ethnic-political conflicts followed by a war with Russia in 2008 and loss of control over more than 20% of the country's territory. Ongoing social, political and economic crises create pressure on the population, 20.6% of whom live under the poverty level and 7.3% of whom are internally displaced. Among the conflict-affected population, 23.3% suffer from PTSD symptoms, 14.0% from depression, 10.4% from anxiety and 12.4% have more than one mental health condition (Makhashvili et al., 2014). In addition, the population still suffers from the inter-generational effects of trauma related to the Soviet invasion and totalitarian past (Javakhishvili, 2014, 2018).

The large proportion of conflict-affected population led to the build-up of trauma care capacities and corresponding institutional developments, i.e. trauma-focused torture victim rehabilitation centres (GCRT), functional since 2000, with the head office in the capital city Tbilisi and branches in eastern and western Georgia. The multidisciplinary teams provide free of charge care for their clients that include forced migrants, ex-prisoners and others. There are a number of non-governmental organizations providing trauma-informed psychosocial services to socially disadvantaged groups, including forced migrants, domestic violence survivors and other target groups.

The Georgian Society of Psychotrauma (GSP) was founded in 2007 with the support of ESTSS. GSP builds capacity within the local professional community and has introduced such evidence-based treatment methods as Trauma-Focused CBT, Brief Eclectic Psychotherapy for PTSD (BEPP) and EMDR, as well as other relevant psychosocial interventions. Since 2008, GSP regularly conducts an annual international multidisciplinary conference 'Trauma and Society'. To assure capacity building and good quality care, an innovative Master Program in Mental Health was founded in 2012 at Ilia State University in Tbilisi, under the lead and with a main perspective on psychotraumatology.

The mental health treatment gap is about 90% in the country. There is a predominant focus on hospital care; community-based services are under-developed. Common mental disorders are under-recognized and under-treated by the state services. There is a need to develop a trauma-informed primary health care system, enlarge the trauma care infrastructure and establish corresponding referral pathways. Another challenge is low awareness of one's own mental health condition. According to a recent study, of those who suffered from mental health symptoms, only 24.8% sought care, 19.6% acknowledge mental health problems but did not seek care, and 54% did not acknowledge mental health problems (Chikovani et al., 2015).

Since most trauma survivors belong to socially disadvantaged groups who are often exposed to multiple traumatization as well as a series of everyday life stressors, we rarely find among these patients simple PTSD. The most widespread trauma-related condition are complex posttraumatic disorders. Therefore, the most urgent need is to evaluate effective methods of addressing complex trauma conditions. From 2016 to 2018, within the framework of an Erasmus Plus cooperation, the Trauma-Focused Cognitive-Behavioural Therapy Train of Trainers (ToT) module was developed, piloted and adapted to the Georgian cultural context in cooperation with Cardiff University. It has proved its effectiveness in the treatment of not only simple but also complex trauma-related disorders. There is a need to collect strong evidence to further prove the effectiveness of these approaches.

6. Psychotraumatology in the German-speaking countries

As in many European countries, the largest historical burden of trauma in Austria, Germany and Switzerland comes from the two twentieth century World Wars and the Holocaust. Over the decades, the different roles of the three countries in these catastrophic events had an influence on the perception of their traumatic impact. In contrast to Switzerland, discourses in Germany and Austria had been more focused on their role as perpetrators and their responsibility for these events. In general, Switzerland has been much less concerned by the two twentieth century World Wars than Germany and Austria. It took a longer time before the trans-generational consequences of war and displacement on parts of the German and Austrian population were also discussed (e.g. Glück, Tran, & Lueger-Schuster, 2012,

Kuwert, Brähler, Glaesmer, Freyberger, & Decker, 2009). Another population that requires expertise on psychotraumatology in the three countries is that of the refugees (e.g. Knaevelsrud et al., 2017; Spiller et al., 2017).

Services for trauma survivors are organized in a similar way in the three German-speaking countries. Non-governmental organizations play an important role in the psychosocial response to disaster and other mass incidents. Some of them also provide care for survivors of individual trauma in the form of local 'crisis intervention units' that closely collaborate with other emergency services. Specialized counselling agencies, usually funded by the local municipal authorities, offer low-threshold services for survivors of childhood abuse, sexual assault and domestic violence. In all three countries, there are also growing networks of clinical outpatient services for survivors of interpersonal violence that are frequently located at psychiatric hospitals. Psychotherapists in private practice play an important role for the treatment of posttraumatic disorders in both children and adults. Moreover, in each of the three German-speaking countries, a larger number of hospitals offer specialized inpatient care for patients with posttraumatic disorders.

The German-speaking Society for Psychotraumatology (DeGPT), the common trauma society of the three German-speaking countries (Germany, Austria and Switzerland), has developed curricula for the training of professionals in different settings (e.g. staff in counselling services, psychotherapists for children and adults) in trauma-related practices. The curricula for psychotherapists have been recognized by important national bodies, like the national chambers of physicians and psychotherapists in Germany. At present, about 50 training institutes in Germany, Austria and Switzerland offer the curricula. The society also coordinates the national German guideline for the treatment of PTSD. Such activities have contributed to the dissemination of evidence-based practices in different settings. However, as in other European countries (Kazlauskas et al., 2016), many psychotherapists still do not feel competent to deal with traumatized populations. As a result, patients can face substantial problems to find adequate help, for instance in the form of trauma-focussed interventions for individuals with PTSD.

The prevention of trauma in different settings remains a challenge. Recently, initiatives in all three German-speaking countries addressed the problem of institutional violence, e.g. in foster care settings, but more efforts are needed to sustainably implement preventive efforts and bodies like the independent commissioner into childhood sexual abuse in Germany (Bergmann, 2011). The dissemination of trauma-informed practices in all parts of the health care system and the social sector is another urgent issue. Finally, the provision of adequate care for the considerable number of migrants from contexts of war and persecution in the German-speaking countries is a challenge for the years to come.

7. Psychotraumatology in Italy

Trauma permeates the history of Italy: war, terrorism, major mass disasters, abuse and maltreatment deeply affected the Italian society across time and generations. During the Second World War, many Italians experienced the effects of torture and deportation leaving a scattered society (Favaro, Rodella, Colombo, & Santonastaso, 1999). In the 1970s, the Italian society faced the 'dark period' of *Brigate Rosse*, a terroristic group who caused many deaths and created a deep sense of fear in the population. Domestic violence is the most common crime against children; indeed, child abuse and maltreatment is a major public health problem. A recent report (Autorità Garante per l'Infanzia, CISMAI and Terre des Hommes, 2016) revealed that each year 950 children are exposed to sexual abuse. In the past year, the percentage of maltreatment and abuse increased by 6%. Italy has also experienced a significant number of natural disasters, like floods and earthquakes, that potentially increased the prevalence of post-traumatic syndromes in the communities. There are no robust data about the actual burden of such traumatic experiences and their effects on the society today.

Italian health and social care systems have not yet fully embraced a trauma-informed approach. This led to fragmented responses to the needs of survivors, especially in terms of preventive initiatives. There is some resistance to implement routine screening and assessment tools for the early detection and prevention of post-traumatic syndromes. For this reason, the system responds late and mainly to traumatization that became complex as a result of missed accurate diagnoses. It is a challenge to acquire a systemic vision of care for traumatized populations, with shared policies and protocols.

Exposure-based therapies are rarely used; EMDR is the only widely implemented intervention in the social care system at all levels. Other trauma-focused therapies (Ehring et al., 2014) – such as trauma-focused CBT or Narrative Exposure Therapy (NET; Schauer, Neuner, & Elbert, 2011) – struggle to be disseminated. Clinicians are asked to integrate different treatment approaches with a good understanding of assessment and psychoeducation techniques. Training of health and social care professionals is a key issue. In Italy, trauma is still seen as a 'psychologist/psychotherapist business', undermining the importance of multidisciplinarity. Furthermore, a synergy between clinical work and research should be

promoted to investigate the outcomes of treatment and to adapt service models accordingly.

There are a few important strategic points the Italian Society of Traumatic Stress Studies (SISST) should consider for the future. Highly traumatized migrants and refugees are one of the priorities requiring a long-term preventive plan to fight longer-term consequences for the society. The second point is the promotion of a more articulated reasoning about the implementation of evidence-based therapies. Furthermore, epidemiological studies are warranted to determine the actual prevalence and incidence of traumatic events in Italian society. Finally, another crucial issue is a comprehensive training in psychotraumatology. The new ESTSS certification represents a good opportunity for trauma-informed capacity building initiatives in the near future.

8. Psychotraumatology in Lithuania

The burden of trauma in Lithuania was largely influenced by the political situation in Europe in the twentieth century. Large-scale traumas associated with the two World Wars, the Holocaust and the prolonged Soviet occupation had a significant impact on the Lithuanian population, marked with suffering and oppression for several generations. Interest in trauma and trauma research in Lithuania was started soon after the collapse of the Soviet Union in the 1990s and several studies explored posttraumatic effects of political violence in the country (Kazlauskas & Zelviene, 2016).

Survivors of traumatic events can seek treatment for mental disorders in the public mental health care system, which includes about 100 primary mental health centres spread across the country, and in more severe cases in psychiatric hospitals. Several non-governmental organizations and crisis centres in the biggest cities in Lithuania are providing help for survivors of interpersonal violence, including psychosocial support and psychotherapy. Additionally, psychotherapists in private practice are also available for trauma survivors. Despite these positive developments, care organizations for trauma survivors are not developed in Lithuania and evidence-based trauma-focused treatments for trauma survivors are not available in the public mental health care system.

Mental health professionals are increasingly aware of the negative effects of trauma on individuals and are interested in learning new ways to help trauma survivors. There is significant progress regarding the implementation of evidence-based trauma-focused treatments, such as EMDR and BEPP, in Lithuania recently. The numbers of therapists trained in trauma-focused treatments are growing, but these treatments are not offered in the public health care system and are available predominantly in private practice which is expensive and not covered by national health care insurance.

Despite the high prevalence of traumatic experiences in Lithuania (Kazlauskas & Zelviene, 2016), it was reported that PTSD is not identified in the Lithuanian national health care system (Kazlauskas, Zelviene, & Eimontas, 2017). The lack of acknowledgment of trauma and PTSD in Lithuania is a major barrier for the development of treatments for trauma survivors in the country.

Future directions of the trauma field in Lithuania include ensuring access to evidence-based treatments for trauma survivors. There is a need of trainings for practitioners to update their knowledge about the impact of trauma, with a particular focus on how to diagnose stress-related disorders and how to provide trauma-focused treatments. Finally, health care and social policy changes on the national level are needed to acknowledge trauma survivors and include evidence-based treatments in the health care of survivors exposed to various traumas, particularly children and adolescents. The Lithuanian trauma society is taking an active role in raising awareness about the effects of trauma to facilitate the further development of care for trauma survivors.

9. Psychotraumatology in the Netherlands

The Second World War marks the largest historical burden and the starting point for psychotrauma care in the Netherlands. Occupation by German and Japanese (in the former Dutch East Indies) armed forces and subsequent post-colonial wars led to over 250,000 military and civilian lives lost. Public awareness for the psychological effects of wartime and other traumatic experiences started around 1975, with the awareness of the Holocaust. In response, Foundation Center ’45 was funded, first focusing on Second World War concentration camp survivors, but soon extending their services to other traumatized populations. The focus on post-war reconstruction, tensions between interest groups and an emphasis on heroics and the resistance, together with a poorly developed mental health care, contributed to this late societal response (Vermetten & Olff, 2013). Subsequent national and international disasters, such as the 1992 Bijlmermeer airplane disaster and the 2000 Enschede fire explosion, further increased professional and public awareness of psychotrauma, and fuelled the establishment of the Dutch Society of Psychotraumatology in 2006.

Mental health care for trauma-related disorders is covered by health insurance at little or no additional personal costs. Facilities for trauma care have been integrated at many levels of health care. Routinely, the first step for individuals with trauma-related symptoms is to consult their general practitioner for referral to secondary health care organizations.

A national standard of care for trauma- and stressor-related disorders is currently underway (Kwaliteitsontwikkeling GGZ, 2018).

Trauma-focused treatment is increasingly offered next to interventions directed at emotion regulation, day-night structure and social support (Vermetten & Olff, 2013). Examples are EMDR, CBT, NET, BEPP and Imagery Rescripting. There is a growing role for E-health interventions (e.g. Olff, 2015). Some institutions use treatment intensification (EMDR or CBT), with preliminary positive effects (Van Woudenberg et al., 2018; Zepeda Méndez, Nijdam, Ter Heide, van der Aa, & Olff, 2018). Although not yet implemented, other treatment innovations include hormonal enhancers (D-cycloserin, cortisol, oxytocin; e.g. Thomaes et al., 2016).

Effective treatment for PTSD due to events in adulthood in fairly well functioning patients seems available, as well as special services and care for the military and the police. One of the greatest practical challenges are the long waiting lists in secondary mental health care, limiting accessibility to care for vulnerable patient groups, such as individuals with multiple (childhood) traumatization, patients with severe physical, neurocognitive and/or psychiatric comorbidities or severe psychosocial problems, and (asylum seeking) refugees. The latter in particular experience difficulties accessing evidence-based care due to stigma, requirement of referral by general practitioners, and language and cultural barriers. Moreover, research on the (cost-)effectiveness of treatments for these target groups is relatively lacking (e.g. Sijbrandij et al., 2017), as well as on improving symptom recovery and treatment adherence of current PTSD treatments.

Topics which should be urgently addressed in the future include improving treatment outcome for specific target groups, i.e. patients with childhood trauma; implementing treatment for target groups that are currently excluded from regular PTSD treatments; family- or system-oriented interventions to prevent inter-generational consequences of trauma and enhance opportunities for social support; evaluation of e-mental health interventions for PTSD and comorbid disorders, including blended treatment options administered within routine clinical practice; increased use of transdiagnostic treatment options for trauma-exposed patients targeting a variety of psychopathology limiting psychosocial functioning; and the use of low-intensity interventions, carried out by non-professional helpers to increase coverage of mental health interventions.

10. Psychotraumatology in Poland

The recognition of the socio-psychological consequences of the Second World War in Poland is an extremely important issue. Poland belongs to the part of Europe which Snyder (2010) called the 'Bloodlands'. The number of ethnic Poles and Polish Jews who died or were murdered in connection to the Second World War amounted to about six million. Poland lost about 17% of its pre-war population (Materski & Szarota, 2009). Moreover, the Soviet invasion and the subsequent imposition of a communist regime led to large groups of people being persecuted. Many survivors of the war (e.g. resistance movement members, people deported to Siberia) were not even recognized as survivors, and speaking about many aspects of war experiences could lead to prosecution. Very little attention has been paid to Second World War issues in medicine and psychology, in comparison to the volume of analogous research in western countries (Lis-Turlejska, Szumiał, & Drapała, 2018). Psychological help for survivors of the war was practically absent, and the need is still not recognized today. Since the collapse of communism, neither war nor other traumas have been recognized on a broader scale. Research has been conducted on the consequences of the great flood of 1997 (Strelau & Zawadzki, 2005), however, other traumatic events, including the death of the president and other governmental officials in the Smolensk plane crash in 2010, have not yet been the subject of psychological research.

There is no coherent care system in Poland for survivors of various traumatic events. A number of crisis intervention centres provide help for 'families in crisis' – mainly for survivors of domestic violence (www.spoleczenstwoobywatelskie.gov.pl). There are non-governmental organizations working with survivors of trauma (e.g. battered women, abused children, survivors of crime). However, they are all underfunded and their capacity is limited. Access to psychotherapy under national health insurance is also limited. Despite the fact that there are many psychotherapists working privately, mainly in larger cities, there are still very few professionals who are specialized in psychotraumatology.

Crisis intervention is probably the most widely offered help to trauma survivors. Practitioners have the opportunity to be trained in different approaches in psychotherapy, including CBT, prolonged exposure therapy and EMDR. However, there is no clear emphasis on evidence-based treatments and they are not widely used in practice. There is also a lack of research on the effectiveness of trauma therapy. The issue of prevention is neglected in general, except training for professional groups (e.g. flight crews, emergency services).

Currently, the most important challenge is to increase access to professional care, specifically increasing access to therapists who offer evidence-based interventions. However, education of the general population about the importance of help seeking and potential benefits out of it is also crucial. It is necessary to further develop research on the

psychosocial consequences of both the Second World War and other large-scale traumatic events. It is also important to encourage the teaching of contemporary curricula on abnormal psychology, including content specific to trauma. This seems to be the most urgent task, alongside further development of the trauma care system and promotion of good practices in psychological care and psychotherapies for trauma survivors.

11. Psychotraumatology in Portugal

A colonial war of 13 years has left to Portugal an individual and collective traumatic heritage (Maia, McIntyre, Pereira, & Ribeiro, 2011). The consequences remain to this day through the intergenerational transmission of trauma (Dias, Sales, Cardoso, & Kleber, 2014). Throughout the years, clinicians, academics and other professionals discussed the psychosocial consequences and reactions to this trauma. Later, the coordinated response to two major accidents promoted a national approach to survivors of crisis and disaster. In 2009, the Centre for Social Studies of the University of Coimbra created the Centre of Trauma (CT), a society that brings together the country's leading organizations who directly deal with potentially traumatic events. Since 2010, CT is a full member of ESTSS.

In Portugal, the National Authority for Civil Protection provides central technical guidance to the organizations who deliver services to survivors of disasters or catastrophes. It is a governmental entity which coordinates the interventions developed and implemented by the different professional groups and organizations (fire fighters, medical emergency services, etc.). Clinical care to trauma survivals is provided by the National Health Service in the first place, but in cooperation with organizations (both non-governmental and governmental) who are specialized in trauma therapies and relevant psychosocial interventions. There is a core team of trained and certificated psychotherapists within CT whose service is accessible to people in need.

The most widespread therapy methods in Portugal are CBT, EMDR, Psychodrama and brief supportive psychotherapeutic strategies. Psychopharmacotherapy is also frequently used alone or in combination with psychological interventions. Treatment takes place in public and private health institutions. A number of governmental and non-governmental organizations currently invests in building the capacity of their staff in trauma care and designing and implementation of preventive interventions. CT is responsible for regular organization of conferences, seminars and the delivery of a biannual psychotrauma course. The course equips professionals from different fields with relevant knowledge and skills.

Professional and organizational preparation and knowledge to treat trauma consequences at the individual, family and social level needs to be optimized and updated. Minorities and refugees at risk may benefit from more integrated assistance. The ability to effectively respond to disasters and catastrophes through the provision of acute trauma care and coordination among the different organizations that are involved in disaster management has to be improved. There is room for improvement regarding the identification of populations at risk, screening for trauma related disorders and responding to the needs of the health care system. Family doctors and nurses, firemen and other professional groups have to be trained to assure their trauma-informed professional performance.

The topics to be addressed in the near future include creating a national plan for PTSD prevention and psychosocial interventions in case of crisis and disaster, as well as founding a network for specific treatment responses to trauma-related disorders, namely PTSD. Good practices have to be disseminated and young researchers and clinicians need to be motivated to work in the field of psychotraumatology. Finally, more effective and organized strategies to address potentially traumatic contexts such as unemployment, marital violence, cyber bulling and road accidents need to be developed, and the cooperative and coordinated work with national and European entities needs to be further increased.

12. Psychotraumatology in Sweden

The Swedish population has enjoyed peace for over 200 years. For a long time, the country did not experience the same increase in attention to psychotraumatology as other European countries with afflicted veteran soldiers from the nineteenth century wars. The impetus for trauma-informed services has instead come from disasters, large accidents and the increased attention to interpersonal abuse. A harrowing bus crash involving 12-year-olds on a school trip in 1988 (Arnberg et al., 2011) became the initiating event for the public organization of crisis support after large-scale events. Events such as the 1994 Estonia ferry disaster in the Baltic sea (e.g. Arnberg, Hultman, Michel, & Lundin, 2013) and the 2004 Southeast Asia tsunami (e.g. Michélsen, Therup-Svedenlöf, Backheden, & Schulman, 2017), both leading to hundreds of Swedish casualties, as well as the recent deployment of Swedish peacekeeping forces around the world, have highlighted the psychosocial consequences of trauma. More recently, the refugee crisis has set off many activities related to culturally informed trauma services.

In Sweden, every municipality has a psychosocial crisis team and there are psychosocial disaster contingency teams at the larger hospitals. A major step forward was the legislation passed in 2000 that

mandates employers to ensure that they have adequate knowledge of and plans for crisis support for their employees. Beyond the acute crisis support, however, access to qualified treatment of chronic traumatization varies across the country. In some regions there are dedicated trauma clinics; in others, there are trauma teams within the psychiatric services. Some regions lack both dedicated trauma clinics and teams.

The acute crisis interventions that are available in Sweden include Psychological First Aid, various forms of unstructured crisis support and a variety of debriefing methods including psychological debriefing (Witteveen et al., 2012). As for the treatment of PTSD, the Swedish National Board of Health and Welfare issues guidelines for public health care. In their latest guidelines from 2017 (The Swedish National Board of Health and Welfare, 2017), trauma-focused psychological treatments were given the highest priority; selective serotonin reuptake inhibitors (SSRIs) were prioritized as a potential but not necessary option for adults with PTSD, although they probably are the most widely used treatment in the country.

Several challenges lie ahead. The use of ineffective preventative interventions remains and the provision of psychosocial support beyond the acute phase is very limited, partly due to compartmentalized organizations. Further development of acute interventions in health care would benefit from robust evidence for early interventions. Trauma-related problems in patients too often go undetected in health care assessments (Al-Saffar, Borgå, & Hällström, 2002). In addition, access to prioritized treatments is underdeveloped in many parts of Sweden: the concentration of relevant competence in metropolitan areas is a salient issue in this country due to its large rural areas.

Another challenge related to the treatment of PTSD is that a large proportion of therapists are due for retirement in the next five years. It will become important for the field to continue to attract younger professionals. It is hoped that a stronger professional community, aided by the Swedish Society for Psychotrauma, can prevent fragmentation of the many regional initiatives, particularly in light of the many refugees across the country, and serve as a force for increasing the quality of and access to trauma treatments.

13. Psychotraumatology in Ukraine

The historical burden of trauma in Ukraine mainly consists of man-made catastrophes. They include the famines in the years 1933 and 1947, the Second World War, the explosion of the Chernobyl nuclear power station, and the current military conflict with Russia, which is officially called 'Anti Terrorist Operation (ATO)'. All events that happened during the Soviet times were hushed up and psychological support has never been provided to the people in need. It was not until the Maidan revolution and the beginning of the current war that psychological services in Ukraine were organized for victims of mass violence.

In Ukraine, care organizations for trauma survivors are currently under development. It presupposes an effective coordination of governmental and non-governmental organizations and professional institutions. The non-governmental organization Ukrainian Society for Overcoming the Consequences of Traumatic Events (USOCTE) was created to reach that aim. This professional organization aims at the development of crisis intervention services as well as capacity for provision of trauma-focused psychological therapies in Ukraine, in accordance with the international standards. Currently, USOCTE provides psychological help to wounded ATO soldiers and veterans, as well as other people who suffer from consequences of the ATO: those living in the ATO zone, internally displaced persons, families of killed soldiers and participants of the Maidan revolution. USOCTE is also engaged in developing training programmes for psychologists and psychoeducational materials for the general population. The methods used in trauma care are EMDR, CBT and the SEE FAR CBT treatment protocol of the Israeli coalition of trauma.

These treatments are offered in a strictly structured way. All clients sign an agreement, which determines the focus of the therapy. According to that agreement, a client has a right to attend 12 free-of-charge sessions. The first sessions are devoted to a detailed diagnostic interview, psycho-education on the signs and nature of posttraumatic disorders and providing information on therapeutic approaches. The following stabilization phase is intended to create a sense of safety by means of different techniques. It is followed by the trauma-focused interventions mentioned above. The final phase of treatment has the aim to integrate the experiences into daily life, assess the results and adapt to the achieved changes.

Challenges in this work are the very high level of psychological disturbance among the people living close to the conflict zone, and their reluctance to acknowledge this and to ask for psychological support (Roberts et al., 2017). It should also be mentioned that women are especially vulnerable on the front-line territory, and suffer multiple problems including high levels of psychological violence. These problems are often not recognized and the population has a tendency to believe that the end of military activities will solve all problems.

To overcome the consequences of the current military conflict in Ukraine, USOCTE is confronted with a number of tasks. They include building up a multilevel system of psychological assistance with the support of governmental and non-governmental organizations as well as monitoring and evaluating the activities of specialists in the psychological field on a regular basis. Moreover, the local communities need to be involved in supporting the aggrieved. Finally, there is a need for a more intensive cooperation and sharing of experiences with international organizations.

14. Psychotraumatology in the UK and Northern Ireland

The 2014 Adult Psychiatric Morbidity Study (APMS) provides the most comprehensive estimates of PTSD within the UK, although the sample is of English residents only (Fear, Bridges, Hatch, Hawkins, & Wessely, 2014). APMS found a PTSD prevalence of 4.4%, with similar rates observed between men and women. PTSD rates in women declined with increasing age; 12.5% of 16–24-year-old women had PTSD. In contrast, in men PTSD remained roughly consistent until declining from age 65. Northern Ireland (NI) has historically experienced a sustained period of political conflict known as the Troubles. The NI Study of Health and Stress identified that NI has one of the highest global rates of PTSD with lifetime and 12 month prevalence rates of 8.8 and 5.1%, respectively (Bunting et al. 2013). Lifetime prevalence in NI females (11%) was substantially higher than the rates in NI men (6.4%). Although there is no specific information on prevalence rates in Scotland and Wales, it is anticipated they are similar to English rates.

The UK's mental health services are provided by the National Health Service (NHS). Although regional variations exist, the first point of access is via family doctors. Community services, often available via self-referral, typically treat survivors of single incident traumas where a diagnosis of PTSD is present without co-morbid problems (e.g. substance misuse). Treatment of more complex cases (e.g. survivors of child abuse, refugees, etc.) is via specialist mental health teams. NHS treatment complies with best practice guidelines compiled by the National Institute for Health Care and Excellence. A range of other non-governmental organizations exist that are staffed by qualified health professionals and offer support to sub-populations of trauma survivors (e.g. survivors of domestic abuse, veterans, etc.). In NI, a Regional Trauma Service is under development to address the mental health legacy of the Troubles.

Interventions to treat PTSD in the UK are typically trauma-focused psychological therapies such as, but not limited to, trauma-focused CBT, EMDR and prolonged exposure (NICE, 2005). In addition, psychopharmacology support is given to manage co-morbid mental health presentations. Increasingly, e-technologies are being developed to help provide cost-effect support that also promote accessibility. For example, an online guided self-help tool for PTSD has been developed and internet-based video technologies have been successfully used to deliver PTSD treatments with much reduced therapist time required. Some providers also utilize compressed therapy where 16–-20 hours of TF-CBT are delivered over a week.

Currently, whilst there is often some delay in accessing specialist mental health assessment services, the biggest bottleneck is in the provision of specialist services for more complex cases of PTSD. Also, whilst APMS has shown that help-seeking for PTSD is improving, the majority of people with PTSD in the UK still do not seek any help.

Whilst, the UK has made considerable efforts to improve the public understanding of mental health, more needs to be done. Additionally, organizations which routinely expose staff to trauma (such as the emergency services, military and child social workers) need to address the issue of PTSD as a result of chronic trauma exposure as there has been limited work done on this topic.

15. Conclusion

The perspectives above show that important steps towards a better provision of care for survivors of trauma have been taken in the European countries. Given the cultural and economic diversity of the continent, there are still some differences between the countries, for instance with regard to the use of evidence-based treatments. Effective treatments have many elements in common (Schnyder et al., 2015) and the treatment of choice is often based on culture and history. The dissemination of evidence-based knowledge and skills has always been a priority of ESTSS (Ajdukovic, 2013, Bisson, 2013, Olff, 2013) and further strategic steps towards this aim have been made recently. In 2018, the first of a series of new ESTSS curricula, the 'Advanced Training in Treating Posttraumatic Disorders in Adults', was approved by the board. The curriculum comprises 120 hours of training and 20 hours of case supervision. It has a strong focus on evidence-based approaches and provides knowledge and skills for the treatment of acute stress disorder, non-complex PTSD and complex posttraumatic disorders (for more detail see www.estss.org). The curriculum has already been adopted by several member societies who are building up local structures to offer the trainings or adopt their national curricula to meet the requirements of the ESTSS curriculum. Other

curricula, for instance for the treatment of trauma-related disorders in children and adolescents, and more basic curricula to promote the idea of trauma-informed care among different groups of professionals, are currently being developed.

The country reports presented in this paper show that many countries share similar challenges and have topics in common that need to be addressed. These topics include, among others, the prevention of trauma, the promotion of trauma-informed practices in the whole health care system and standards of care for groups with special needs, including refugees and internally displaced people. Of increasing importance in the field of mental health is the involvement of trauma survivors in mental health care teams (Van der Schrieck-De Loos, 2013). It was beyond the scope of this paper to describe the large amount of research in the field of psychotraumatology in the European countries, which represents a significant proportion of the global research activities in this field (Olff, 2018). However, similar to the differences with regard to the use of evidence-based treatments, these activities are not evenly distributed between the different European countries. It is part of ESTSS's mission to stimulate and promote research Europe wide.

The current structure of ESTSS allows for a more direct exchange between the member societies and thereby provides the opportunity to effectively address such common issues. It has always been the aim of the society to provide a platform for all professionals in Europe in the field of psychotraumatology to connect, to develop together training and research, guidelines and actions where needed. ESTSS is constantly working towards this aim, for instance by identifying successful models in individual countries or regions and disseminating these experiences among all others. A recent example of this exchange is a series of movies providing information on the consequences of trauma and effective treatments tailored to the needs of the public, professionals from the health care system and trauma survivors that can be downloaded from the ESTSS website. They were developed by a national society (DeGPT) and translated into 10 European languages with the help of other member societies.

ESTSS can look back on 25 years of advocacy for the field of psychotraumatology in Europe. The first European Conference on Traumatic Stress, which can be considered one of the roots of ESTSS, was held three decades ago (Ørner, 2013). During these years, ESTSS has developed a unique profile as a truly international professional society that integrates the diversity of the European countries and greatly benefits from their cultural richness (Lueger-Schuster, 2013a; Olff, 2013). An important part of the society's success story are the ESTSS conferences that attract delegates from all parts of the world. Other important activities included projects like the European Network of Traumatic Stress (TENTS; Bisson, 2013) and the *European Journal of Psychotraumatology* (EJPT). EJPT has become an important platform for the dissemination of knowledge related to psychological trauma and, thanks to the relentless efforts of its founding editor Miranda Olff, has become one of the journals with the highest impact in the field (Olff, 2018).

Over the years, ESTSS had fruitful collaborations with large societies from other regions of the world. There is also a strong involvement of ESTSS in the global collaboration of trauma societies, an initiative that had initially been proposed by the International Society for Traumatic Stress Studies (ISTSS; Schnyder et al., 2017) and developed to a collaboration of all large trauma societies on an equal basis. It already has the function of a global umbrella for defined projects and holds promise to become a more formal global structure.

Only about half of the more than 40 countries on the European continent have established local trauma societies so far, most of which are members of ESTSS. In the coming decades, it will remain one of the most important aims of ESTSS to support the formation of new societies in countries where they do not exist yet, and to provide a common platform and a professional home for trauma specialists from the whole European region.

In their articles at the occasion of the twentieth anniversary of ESTSS, several former presidents described what some of them called the 'infancy and adolescence' of the society (Schnyder, 2013, Turner, 2013). At the age of 25 years, ESTSS has become a young adult. The society has 'grown up' and, with the latest change of its structure, has completed a developmental process that made it stronger and prepared it for the tasks ahead. This would not have been possible without the enthusiasm of a large number of dedicated colleagues from all over Europe. They invested their time and energy over the last 25 years to make the society what it is today. We congratulate ESTSS on its 25th birthday and strongly believe that it will successfully continue its 'adult life' for the good of psychotraumatology in Europe.

Acknowledgments

We wish to thank the Elfriede Dietrich Foundation, Freiburg, Germany, for supporting the production of the movie series 'Through memories – the road to trauma therapy' and the translations to a range of different European languages.

About the CDC-Kaiser ACE Study

The CDC-Kaiser Permanente Adverse Childhood Experiences (ACE) Study is one of the largest investigations of childhood abuse and neglect and household challenges and later-life health and well-being.

The original ACE Study was conducted at Kaiser Permanente from 1995 to 1997 with two waves of data collection. Over 17,000 Health Maintenance Organization members from Southern California receiving physical exams completed confidential surveys regarding their childhood experiences and current health status and behaviors.

More detailed information about the study can be found in the links below or in the article, "Relationship of Childhood Abuse and Household Dysfunction to Many of the Leading Causes of Death in Adults ,".

SECONDARY TRAUMATIC STRESS

Children's reactions to trauma can interfere considerably with learning and behavior at school. Schools serve as a critical system of support for children who have experienced trauma. Administrators, teachers, and staff can help reduce the effects of trauma on children by recognizing trauma responses, accommodating and responding to traumatized students within the classroom, and referring children to outside professionals when necessary. The National Child Traumatic Stress Network has developed tools and materials to help educators, school staff, and administrators understand and respond to the specific needs of traumatized children.

Essential Elements

The primary mission of schools is to support students in educational achievement. To reach this goal, children must feel safe, supported, and ready to learn.

Salve,

sono Alberto Zucconi,

psicologo psicoterapeuta

e presidente dell'Istituto Centrato sulla Persona

che ha curato

i primi due moduli di questo corso

al quale volevo darvi il benvenuto.

Prima di tutto vorrei dire due parole

come Alberto Zucconi,

cittadino,

e sono parole di gratitudine.

Un grazie sincero ad ognuno di voi che lavora a supporto e tutela

di minori

traumatizzati.

Il vostro è un lavoro importantissimo,

sensibile, delicato, ma alcune volte anche

molto pesante.

Sappiamo bene

che

lavorare con persone che soffrono

a volte fa anche

soffrire e può anche portarci al burn-out.

Quindi

un grazie sincero perchè il vostro

lavoro è a tutela

di

una realtà preziosa per una nazione e per una comunità: il capitale umano.

Le persone traumatizzate hanno tutto il bisogno di tutte le cure possibili

per essere aiutate a rientrare, a pieno titolo, ad essere

membri attivi della comunità

ed

essere costruttivi per sé stessi e gli altri membri della comunità.

Vorrei aggiungere un'altra cosa, forse ovvia, ma che è meglio sottolineare:

questo corso

è indirizzato a tutti voi che siete diversa provenienza, professionalità e competenze

e che - cosa risaputa -siete tenuti dalle leggi vigenti, dagli ordinamenti deontologici

delle varie professioni

e dalle regole interne delle varie organizzazioni di cui fate parte,

a fare tutto quello che sapete fare ed a cui siete è preposti a fare e di non valicare

i confini e i limiti, perché questo non sarebbe certo a favore dei vostri assistiti.

Aggiungo ancora un’altra cosa ovvia,

per complicare le cose le leggi non sono le stesse

in tutte le nazioni europee e questo è un corso

indirizzato a varie nazioni e in varie lingue,

quindi -

ovviamente - l'aspettativa è quella di erogare un corso a persone consapevoli

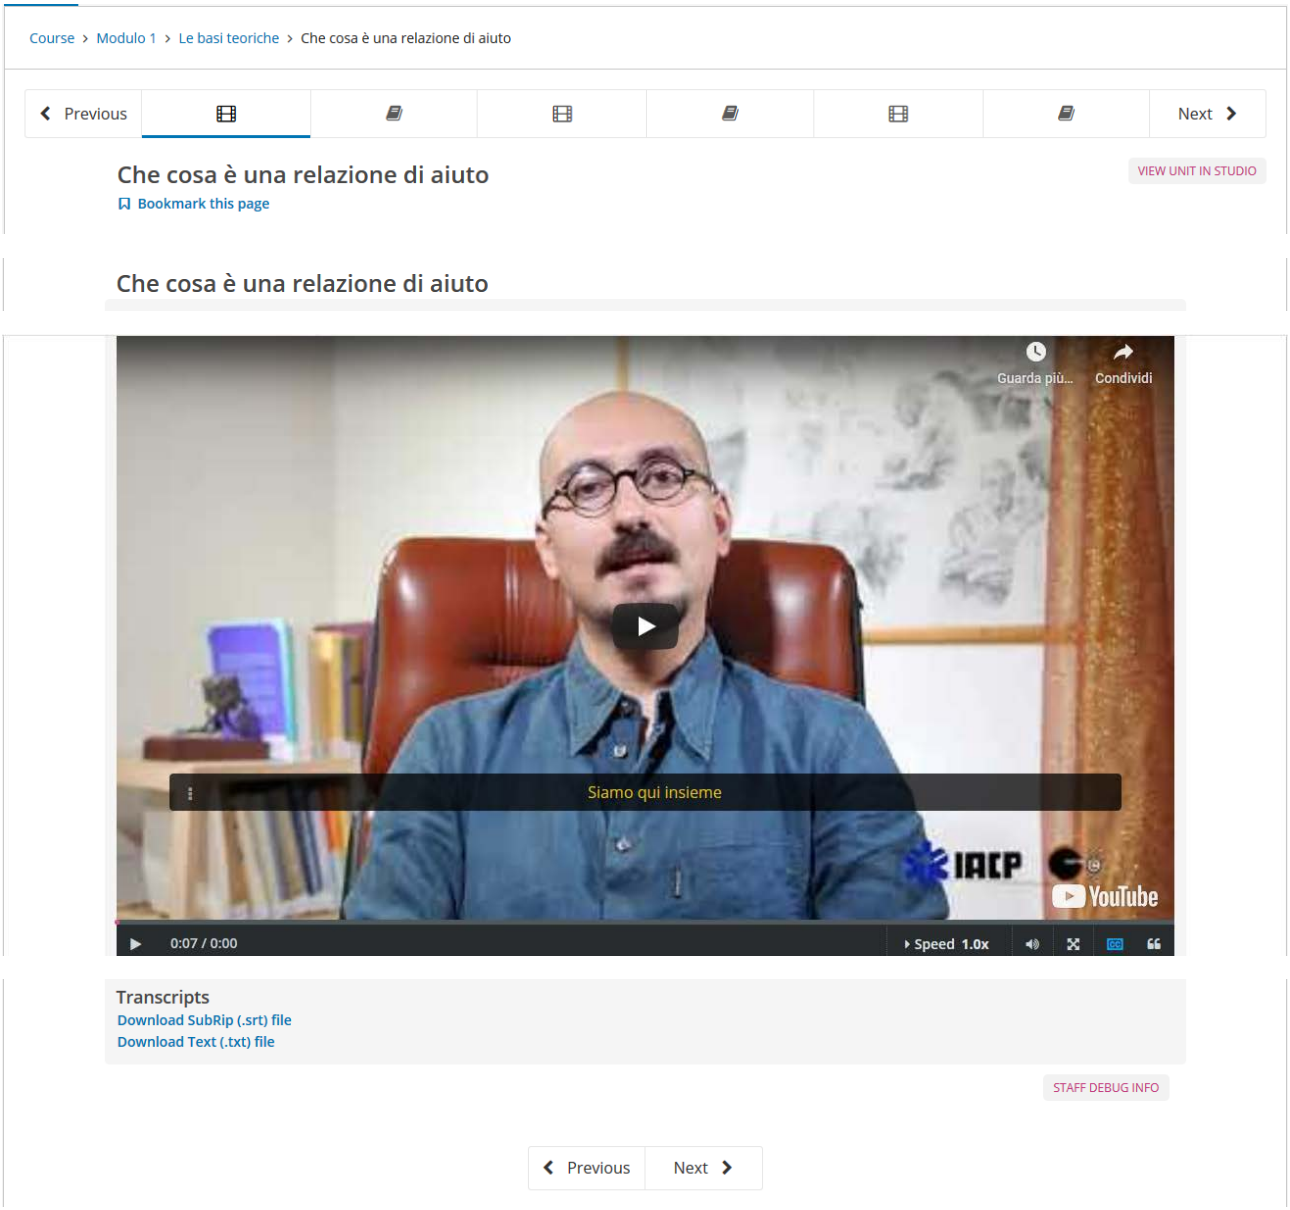
del fatto che anche

rispettare i limiti significa lavorare efficacemente

ed efficientemente.

Ancora grazie per essere saliti a bordo di questa avventura e grazie per il lavoro quotidiano

che svolgete con passione.



Transcript

Siamo qui insieme

oggi proprio per parlare di relazione di aiuto,

soprattutto per andare a definire

che cosa sia una relazione d'aiuto;

per fare questo è necessario partire dal

paradigma di riferimento.

Sappiamo e abbiamo visto che il paradigma

si è modificato.

All'inizio del '900 c'è stato un grosso cambiamento e si è passati da un paradigma

meccanicistico riduzionista ad uno olistico e sistemico.

Anche il modo di intendere una relazione di aiuto è cambiata, infatti nel paradigma meccanicistico riduzionista
la relazione d'aiuto era caratterizzata da un'asimmetria: il professionista era l'agente significante
che imponeva al proprio paziente la visione della realtà, la sua visione della realtà,
in qualche modo agiva creando degli effetti nel proprio paziente
e quindi questiera passivo presso il professionista.
Con l'adozione del nuovo paradigma molte cose si sono modificate
perchè sappiamo che
il centro è divenuto la relazione: l'importanza non è sulle parti, ma sulla relazione
in cui sono queste parti
e che vanno
con essa ad essere qualificate.
La relazione d'aiuto alla luce di questo nuovo paradigma
quale può essere?
Per aiutarci a definirla leggiamo le parole scritte da Carl Rogers già nel 1951, autore
che occupa un posto di primo piano nell'intendere la relazione di aiuto proprio in questa ottica.
Carl Rogers ci dice: "la relazione d'aiuto è una relazione in cui almeno uno dei due
protagonisti ha lo scopo di promuovere nell'altro la crescita, lo sviluppo,
la maturità e il
raggiungimento di un modo di agire più adeguato ed integrato;
'altro in questo senso può
essere un individuo o un gruppo.
In altre parole la relazione di aiuto potrebbe essere definita come una situazione in cui
uno dei partecipanti cerca di favorire, in una o in ambedue le parti, una maggiore realizzazione
delle risorse personali del soggetto e una maggiore possibilità di espressione".
Si evince qui le parole che meglio risaltano sono valorizzazione, promozione, risorse
e quindi
questa nuova ottica in cui vedere la relazione di aiuto
è un'ottica che pone
i due protagonisti
della relazione in una parità,
così il professionista non sarà

l’esperto agente significante,
ma sarà colui che andrà a promuovere tutte quelle
risorse che sono intrinseche all’altra persona.
Così facendo potrà innescare un processo di co-costruzione della realtà
più funzionale per il cliente
andando così ad accompagnarlo in un processo, stando però li dove è lui.
Allora quale caratteristiche deve avere il professionista delle relazioni di aiuto oggi?
Sicuramente deve poter farsi forza attraverso un sapere, deve cioè avere un corpus di nozioni
teoriche a cui appoggiarsi,
deve
oltretutto saperle applicare e quindi queste teorie vanno
anche rese concrete, vanno applicate e sapute applicare nella relazione.
Oltre al saper fare, dato che il focus della relazione è proprio la qualità della relazione
stessa, sarà necessario saper essere, sapere cioè mettere in campo tutte quelle condizioni
e qualità che facilitano e rendono una relazione di aiuto efficace.
Tra queste sappiamo sicuramente che l’autenticità è una, che il saper vedere il mondo con gli
occhi dell’altro è la seconda e che la terza è il non giudicare
il cliente, ma riuscire ad accoglierlo.
Se questo è possibile, se queste tre condizioni saranno attuate dal professionista,
tutto si avvierà verso un processo di cambiamento
e di miglioramento.

Il potere è sempre presente nelle interazioni umane.

Dove due o più persone interagiscono c'è sempre

un potere che può essere oscurato o messo in evidenza.

In genere la storia ci insegna che coloro i quali hanno molto potere non amano molto

discutere su questo argomento perché temono di avere meno potere se c'è trasparenza

sui differenziali di potere.

I differenziali di potere

esistono ovviamente sempre anche nelle relazioni di aiuto.

Il professionista, l'esperto,

colui o colei il quale offre un servizio ha più potere

dell'utente, cliente, paziente che si voglia definire. Perchè?

Perchè sa qualcosa di cui l'utente non conoscere esattamente gli elementi,

in più può offrire al cliente qualcosa di cui il cliente ha bisogno,

inoltre disegna le regole

del setting (cioè della fruizione del servizio) e può addirittura sospendere l'erogazione

del servizio stesso.

Insomma

c'è sempre un differenziale di potere tra chi eroga un servizio e chi lo riceve.

In passato, con il paradigma meccanicistico-riduzionista, nelle relazioni di aiuto il differenziale

di potere era molto elevato.

Si è visto, alla luce anche del nuovo paradigma della Carta di Ottawa e del paradigma biopsicosociale,

che questo non era auspicabile perché un differenziale di potere eccessivamente alto

può portare al fruitore del servizio ad assumere una connotazione passiva che non aiuta a raggiungere

gli obiettivi del servizio stesso.

Oggi quindi si tende a centrarsi sugli utenti, sulle persone dei clienti, ed incoraggiare

il cambiamento attraverso azioni di empowerment che responsabilizzano il cliente a sviluppare

le proprie capacità, la propria creatività e la propria resilienza.

Questo, le ricerche lo evidenziando in molto chiaro, è veramente utile in quanto in tutti

i campi delle relazioni di aiuto si ottengono migliori risultati in minor tempo e si abbassano

- per esempio nel campo della salute e del benessere - effetti secondari e ricadute;

quindi il mondo si sta sempre più orientando all'evidenza che tutti guadagnano se il

potere è condiviso e se tutte le persone contribuiscono a raggiungere gli obiettivi.

Tutto ciò anche a livello della società e quindi una cittadinanza attiva, consapevole

contribuisce molto di più ad una ecologia sociale e alla costruzione comune della policy:

per relazioni sostenibili una policy sostenibile.

Ciò è vero anche quando si erogano servizi ai bambini che sono piccole persone, non sono

bambini che non capiscono e che non sono responsabili, questa costruzione sociale dei bambini come

delle "piccole cose" è senz'altro obsoleta.

A cosa servono

le relazioni di aiuto

per coloro che se ne avvalgono?

Abbiamo sottolineato in precedenza, quando abbiamo evidenziato l'obiettivo della carta di Ottawa del paradigma biopsicosociale, è quello non solo di curare le malattie, ma di sviluppare il potenziale di salute e benessere, la capacità di apprendimento attivo e di sviluppare la propria creatività e resilienza.

Un'altro modo di appellare questa capacità innata negli organismi umani è quella di coping: termine inglese che in italiano significa saper gestire le proprie evenienze di vita; in altre parole di saper gestire al meglio le capacità di relazione con me stesso,

con gli altri e con il mondo che mi circonda.

Sappiamo che nelle relazioni di aiuto,

per quanto riguarda le qualità che il professionista

efficace a prescindere dall'approccio che usa, questi per essere efficace deve sapersi

relazionare con il suo utente con alte qualità di rispetto profondo e non pregiudizio,

di comprensione empatica non solo di quello che dice l'utente, ma quello che sente, i suoi

significati, e rapportarsi a lui con onestà, autenticità, trasparenza.

E necessario però anche da parte dell'utente, cliente, paziente delle capacità perché

questo funzioni, poiché si tratta di un gioco di squadra.

Nelle relazioni di aiuto gli utenti che si potrebbero definire "efficaci", sono utenti

che sono sinceri e si sentono motivati al cambiamento, magari perchè non stanno bene

e vogliono cessare di soffrire in qualche maniera, inoltre hanno la capacità di entrare

in contatto psicologico con il professionista che lavora con loro e di percepire le qualità

relazionali che il professionista mette nella relazione.

Queste capacità fanno sviluppare, insieme anche alla capacità di perseveranza, all'essere

disponibile ad imparare dagli errori, con il coraggio che serve per di ammettere che

si ha sbagliato, per far diventare l'errore un saggio maestro.

Questo sottolinea quanto il coping sia una situazione ottimale di funzionamento e il

risultato di un gioco di squadra del professionista e del suo cliente per il raggiungimento di

obiettivi di maggiore qualità di vita e maggiore realizzazione delle intrinseche

potenzialità

che ognuno di noi è nato proprio e sono descritte nel suo codice genetico e poi sviluppate ulteriormente,

più o meno con le condizioni ambientali che noi troviamo, ma anche con l'attitudine

che abbiamo e come ci poniamo di fronte alla vita.

Centrarsi sulla malattia o sulla salute?

Le ricerche ci mostrano che è molto meglio

centrarsi sulla salute

perché si ottengono maggiori successi

e si abbassano i costi.

Perché ciò avviene?

Perchè nel precedente paradigma meccanicistico riduzionista

la persona che aveva bisogno di aiuto era in una condizione di passivizzazione, infatti l'appellativo

paziente

può diventare in un certo senso troppo paziente, cioè troppo passivo; indicare

l’assunzione di una passività acquisita. Questo è un rischio molto meno evidente nel nuovo paradigma perché si incoraggia la persona all’uso del proprio potere ad essere ed entrare in una partnership, dove anche al il potere decisionale è condiviso tra professionista e il suo utente.

Inoltre le ricerche ci mostrano che con un approccio di promozione alla salute e del benessere si ottengono, per le stesse categorie di utenti, risultati migliori.

Per esempio un rapporto proattivo dei pazienti con una buona relazione con lo staff ospedaliero, nel caso in cui si tratti di ricevere un intervento chirurgico, attraverso il nuovo modello la durata dei giorni di degenza è inferiore e minori sono le conseguenze negative post operatorie, maggiore è lo sviluppo delle difese immunitarie e maggiore è la compliance, cioè la collaborazione con il medico e gli infermieri per rispettare le istruzioni di manutenzioni che possono essere di non fare o fare delle cose, prendere regolarmente dei farmaci.

Il nuovo modello mostra anche molto minore litigiosità da parte degli utenti nei confronti delle strutture sanitarie e risulta anche molto meno frequente il cambio medico curante.

Quello che era forzato, quindi, era la capacità di collaborazione dell’utente e questo nuovo paradigma non solo favorisce i risultati per l’utente e per i suoi familiari, ma per la società tutta, perché una società dove le persone sviluppano più il loro potenziale si ammalano di meno, hanno vite più longeve e meno contrastate da malattie; è una società più prospera. Insomma promuovere la salute e il benessere è una opzione win-win dove tutti risultano vincenti e i risultati parlano da soli.

Vorrei dire alcune parole su le relazioni psicoterapeutiche efficaci.

La psicoterapia è una delle tante relazioni di aiuto,

ma regolata dalle leggi in maniera

specifica: per esempio qui in Italia soltanto medici psicologi possono - se hanno fatto

una scuola di specializzazione di almeno quattro anni - erogare servizi di psicoterapia;

gli altri non possono, sarebbe un reato perché tutto quello che impatta un organismo

- e quindi fa bene - può, se non saputo promuovere nella maniera giusta, ovviamente fare male.

Ebbene

le riceve mostrano che l'efficacia nel campo della psicoterapia non deriva dallo

specifico approccio teorico, deriva molto di più dalle qualità relazionali degli psicoterapeuti

appartenenti ai vari approcci psicoterapici e, come nelle relazioni di aiuto, anche nelle relazioni psicoterapeutiche le stesse variabili, gli stessi fattori, sono operanti.

Un psicoterapeuta efficace non lo è perché applica un certo modello teorico, lo è perchè ha la capacità di relazionarsi con il suo utente con ampie dosi di capacità di accoglienza, non giudizio, rispetto profondo

e perchè ha

la capacità

non solo di ascoltare quello che il suo utente/paziente/cliente gli dice,

ma che cosa significa per la persona dell'utente.

È poi capace di relazionarsi al cliente in maniera genuina, spontanea, trasparente,

ma non basta perchè la relazione psicoterapica come ogni relazione di aiuto è un gioco di squadra, una co-costruzione e quindi il cliente, l'utente, il paziente ci mette del suo,

altrimenti non funziona.

E cosa?

La motivazione che spesso viene fornita dalla sensazione di disagio - e quindi la motivazione al cambiamento -

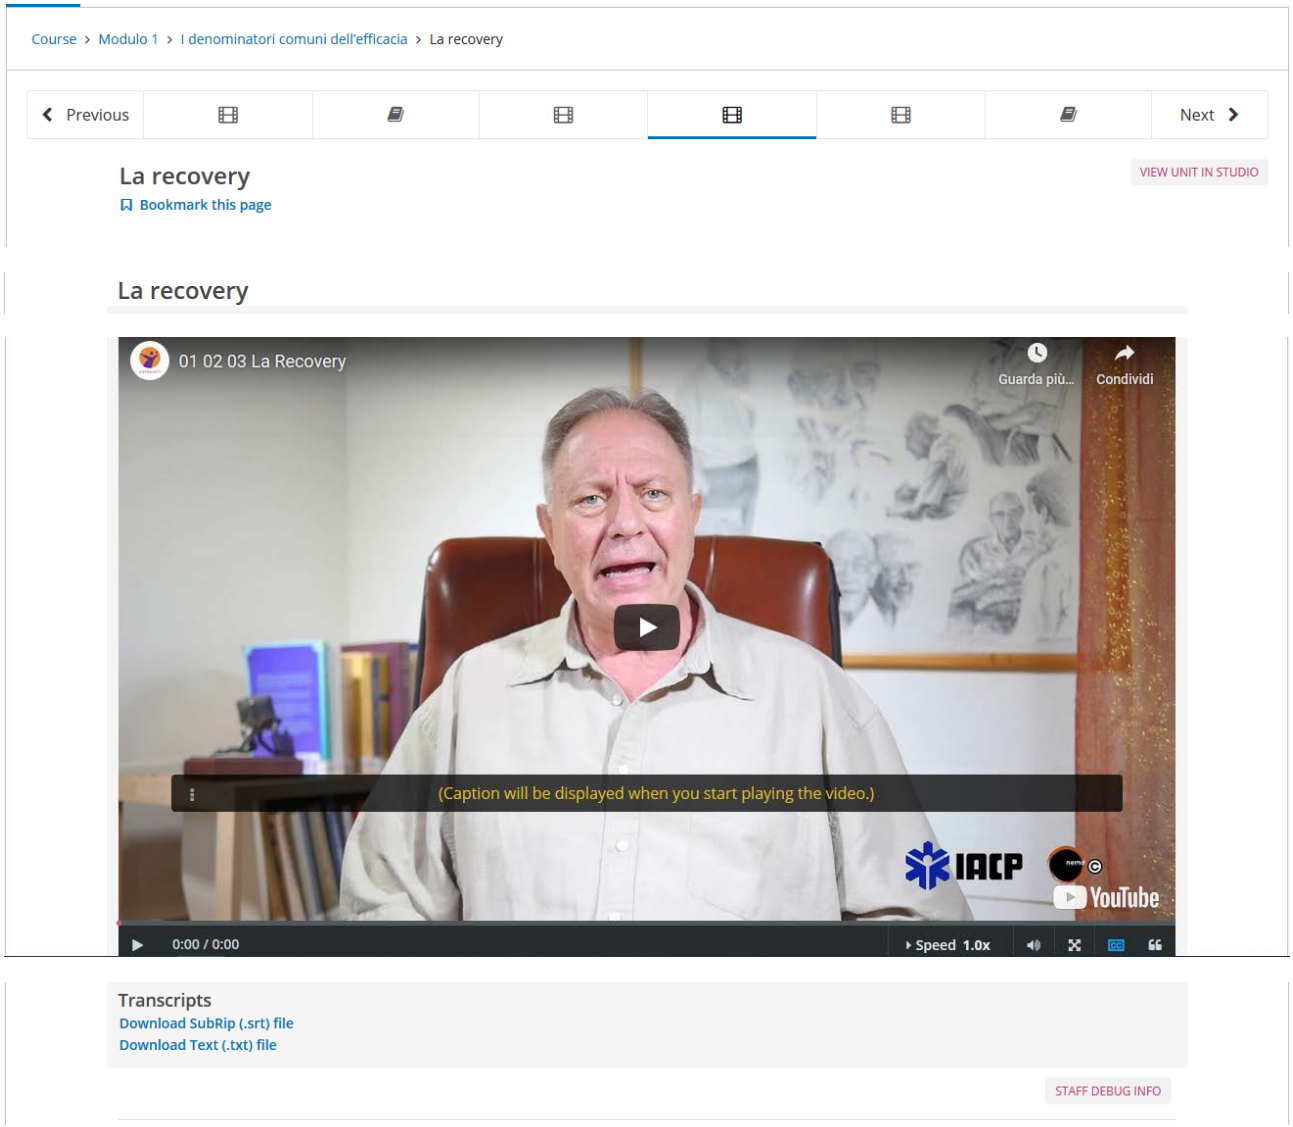
e poi la capacità di contatto psicologico con quello psicoterapeuta

e, inoltre,

la terza condizione: essere capace di percepire la qualità delle relazioni e quelle qualità che sono fondamentali, cioè: il rispetto profondo, l'ascolto empatico e l'autenticità del suo psicoterapeuta.

In questo modo la diade potrà funzionare con risultati molto positivi e più efficaci se la persona per lo stesso disagio ricevesse solo un trattamento farmacologico, o ovviamente nessun trattamento.

Insomma anche nel settore psicoterapico la relazione efficace è buona medicina.



Transcript

L'organizzazione Mondiale della Sanità

ed anche le ricerche nel campo delle relazioni di aiuto,

suggeriscono

che

per avere maggiore efficacia e efficienza dei trattamenti

è raccomandabile

centrarsi, focalizzarsi,

sulla persona dell'individuo

di quel cliente che

abbiamo preso in carico.

Insomma, è importante personalizzare i trattamenti, non come fossero giusto un barattolo di vernice bianco e allora dipingiamo di bianco a prescindere da chi sono gli utenti.

Come la psicoterapia va personalizzata, anche le relazioni di aiuto vanno personalizzate,
perché così si aiuta meglio Gino, Maira, Joseph, Mary, etc.
Perchè
dobbiamo
stabilire al massimo un lavoro di squadra e impegnarci seriamente in un percorso
che vede l'altro come protagonista di questa avventura di cambiamento.
La Task Force 29, che abbiamo già menzionato, dell'American Psychological Association,
mostra l'importanza di centrare sulle persone i trattamenti
e
raccomanda, inoltre, anche un'altro aspetto importante:
che i trattamenti, la loro filosofia, deve essere impostata a
concetti di recovery
invece
che come si faceva precedentemente, ad una facile
e pessimistica
visione di cronicità.
Che cos'è la recovery?
La ricovery negli ultimi decenni ha sviluppato una capacità, con le stesse problematiche
di essere maggiormente d'aiuto,
e ha sfatato alcuni miti,
come quello
che
la schizofrenica
è un'affezione, una patologia, cronica.
Prima si pensava così,
ma il il fatto di pensare in questo modo costitutiva anche
una
profezia autoavverante
e questo, se ci pensiamo bene, è un po' una ovvietà.
Tanto è vero
che, sempre usando l'esempio della schizofrenia, noi sappiamo che esiste
in ogni paese, tuttavia nessuna cultura la tratta ugualmente.

In alcune società e culture lo schizofrenico, lo psicotico, viene considerato come una persona
toccata dagli dei
e perciò la comunità lo vive con rispetto, benevolenza e gli offre
cibo, riparo quando ne ha bisogno;
in altre società
invece è un reietto che viene bandito
dalla comunità e incatenato ad un albero nella foresta.
Nella nostra cultura,
in epoche diverse, abbiamo trattato
queste persone
in maniera molto diversa,
a volte anche crudelmente,
ma ovviamente lo facevamo per il loro bene, come quando credevamo
che fosse un fenomeno derivante da una possessione diabolica e allora torturavamo questi poveretti
con ferri roventi così, se il corpo posseduto da un diavoletto diventava per questo scomodo
si sperava che il diavolo ne uscisse;
oppure
abbiamo trattato le persone con tanti altri
mezzi, ma sempre facendo la profezia della cronicità
e puntualmente queste profezie
si avverano.
Con la visione della recovery, che dice “no, qualsiasi sia la tua
situazione, anche disperata,
come nella schizofrenia, puoi recuperare funzionalità”, ebbene si realizza una profezia positiva che,
come tutte le profezie, in certa misura si avvera.
Per cui oggi vediamo che chi viene visto con maggiore ottimismo soddisfa queste profezie.
Abbiamo quindi persone che ancora vedono cose che gli altri non vedono, sentono voci che
altri non sentono, ma sono consulenti pagati in un'ASL impiegati per consigliare come trattare
persone con le stesse affezioni in maniera più umana e ottimistica, e poter realizzare
- invece di profezie negative - delle profezie positive che sono ugualmente
autoavveranti.
La profezia, infatti, bisogna stare attenti dove ci conduce.

Oggi

disponiamo di

una vasta messe di ricerche

ci illustrano

in cosa consiste l'efficacia

professionale per un professionista

che eroga

dei servizi nell'ambito delle relazioni

di aiuto.

La ricerca

parte da

delle ipotesi genialmente formulate dai Carl Rogers,

colui che sarà
il fondatore dell'approccio centrato sulla persona
e uno dei padri della psicologia umanistica.
Nel lontano 1942 Rogers formulò scientificamente
delle ipotesi
e passò alla sua verifica empirica
su quello che costituiva in un professionista le condizioni necessarie e sufficienti per
promuovere il cambiamento.
Queste
erano e sono state confermate fino ad oggi dalle ricerche: la capacità di stabilire
una relazione con l'utente, il cliente, ricca
di un'attitudine di non giudizio,
un'accoglienza
profonda nel suo rispetto della persona dell'utente,
una capacità
sensibile e accurata di ascolto empatico - cioè capire non solo quello che il cliente dice,
ma anche quello che significa per lui
- e anche un'attitudine di autenticità, schiettezza
ed onestà nella relazione.
Queste ipotesi che furono subito confermate
sono state via a via confermate e operanti
in tutte le relazioni di aiuto,
nessuna esclusa,
quindi in questo
Rogers dette un grande contributo
ad un passo avanti delle relazioni di aiuto basate non su convenzioni, ma propriamente
sulle delle basi empiriche e quindi scientifiche.
Credo ancora più eloquente sarà ascoltare direttamente da Carl Rogers in persona
che illustra queste tre condizioni necessarie e sufficienti in un suo famoso filmato:
"From my own years of therapeutic experience I have come to feel that
If I can create the proper
climate, the proper relationship, the proper conditions,

the process of therapeutic movement will almost inevitably occur in my client.

You might ask, what is this climate?

What are these conditions?

Will they exist in the interview with the women I'm about to talk with whom I have

never seen before?

Well let me try to describe very briefly what these conditions are as I see them.

First of all, one question is,

can I be real in the relationship?

This has come to have an increasing amount of importance to me

over the years.

I feel that

the genuineness is another way of describing the quality I would like to have.

I like the term congruence, by which I mean, what I'm experiencing inside is present

in my awareness and comes out through in my communication.

In a sense,

when I have this quality,

I'm all in one piece in the relationship.

There's another word that describes it for me,

I feel that in the relationship

I would like to have a transparency, I would be quite willing for my client that sees all the way through me,

that there would be nothing hidden.

When I'm real in this fashion that I'm trying to describe then,

I know that my own feelings

will often bubble up into awareness and be expressed, but be expressed in ways

that won't impose themselves on my client.

Then the

second question I would have is, will I find myself praising this person,

caring for this person.

I certainly don't want to pretend a caring that I don't feel.

In fact, if I dislike my client persistently, I feel it's better that I should express it.

But I know that the

process of therapy is much more likely to occur,

and constructive

change is much more likely,

if I feel a real spontaneous prising of this individual with whom I am working.

A prising of this person as a separate individual.

You can call it acceptance, you can call it caring,

you can call it a non-possessive love if you wish.

I think any of those terms tend to describe it.

I know that the relationship will prove more constructive if it's present.

And in the third quality, will I be able to understand the inner world of this individual,

from the inside,

will I be able to see it through her eyes,

will I be

sufficiently sensitive

to

move around inside the world of her feelings,

so that I know what it feels like to be her.

So that I can

sense not only the surface meanings but some of the meanings that lie

somewhat underneath the surface.

I know that If I can

let myself sensitively and accurately enter into her world of experience

than change and therapeutic change are much more likely.

Il trauma che cos'è? Come possiamo definirlo?

Il trauma è, in realtà, un'esperienza, un fenomeno

stressante - spesso

improvviso

- che

oltrepassa le possibilità della persona/soggetto

di

reagire e di difendersi dal trauma stesso.

In realtà il trauma è qualcosa che soverchia le forze

di opposizione di una persona che ne è esposta.

Il trauma è stato studiato

in vari modi,

esistono traumi acuti - per esempio dovuti

a catastrofi naturali o tecnologiche - esistono situazioni traumatiche di tipo cronico/ripetuto
- come ad esempio quello a cui sono spesso esposti i bambini
- ma
quello che si può
dire è che la storia del trauma, da un punto di vista clinico, inizia proprio con lo studio
delle nevrosi post-traumatiche, le quali sono state studiate anche da Freud - e quindi nel
contesto della psicanalisi - e sono state riprese poi da altri autori.
Perchè nevrosi post-traumatica? perché dopo le grandi guerre - in particolare in seguito
alla prima guerra mondiale e alle guerre successive - si sono notati molti disturbi da esposizione
a traumi bellici che hanno poi comportato delle conseguenze psicologiche e che in seguito
sono state riprese dai sistemi di classificazione psichiatrica, quindi della psicopatologia,
come disturbo post-traumatico da stress. Questo disturbo post-traumatico da stress
è l'unico disturbo in psichiatria che è certamente e sicuramente dovuto da un fattore esterno;
questo fattore è appunto il trauma.
Non è quindi necessario ad una persona che
si espone, per esempio, ad un terremoto o ad una inondazione, di essere portatore di
una sua debolezza, fragilità o vulnerabilità, perché il trauma è talmente importante e
soverchiante delle forze dell'individuo che di per sé è in grado di indurre delle
conseguenze a livello psicologico e a livello anche fisico. A livello fisico in quanto tra i
sintomi più importanti di quello che oggi si chiama disturbo post-traumatico da stress
ci sono, per l'appunto, i sintomi di tipo neurovegetativo:
sintomi di allerta, di aumentato
arousal, ovvero di aumento della vigilanza e della reattività agli stimoli esterni.
Questo quindi significa che una persona porta dentro di sé anche dei segni oggettivi, e
non soltanto dei sintomi soggettivi, dell'impatto che il trauma ha avuto su di lei.
Il trauma è stato studiato anche dal punto di vista dei meccanismi psicologici,
i quali sono molto importanti:
quello che
ha studiato la psicoanalisi, fin dalle origini,
è stato il fatto che un trauma
- in particolare se precoce, ad esempio nell'infanzia
- è soggetto ad un processo di rimozione;

questa rimozione non significa però che il trauma viene dimenticato,

negato o sepolto, il trauma può ricomparire, essere riattivato, in un momento successivo

- ad esempio nella vita adulta

- magari

per effetto di un altro trauma che per certi versi

richiama il trauma precedente. Questo è un meccanismo in due tempi che Freud aveva studiato

accuratamente secondo cui c'è un primo trauma che, in un certo senso, sensibilizza

ed un secondo trauma che

ripropone al soggetto la condizione di essere vittima, di impotenza

e fragilità in cui si era trovato,

riproponendo così di fatto la situazione riconducendo

a nuovi

sintomi

ed ad una situazione clinica che il soggetto sperimenta come se fosse la prima volta.

Detto questo il trauma del disturbo post-

traumatico da stress si verifica invece in un modo

puntuale e che mette a repentaglio la vita del soggetto.

Può essere causato da motivi bellici, di tortura, per motivi

tecnologici o ambientali,

ma questo trauma è di tipo puntuale e ben riconoscibile nella

vita del soggetto.

Analizziamo il tipo di trauma che può comportare il disturbo alimentare.

Il trauma classico, quello che colpisce una volta, che è un evento particolarmente grave,

in realtà costituisce forse il caso meno frequente anche se è particolarmente importante

per gli effetti devastanti che può produrre su una persona.

Si tratta di eventi gravi

che hanno un aspetto negativo, che può incidere

sulla vita di

una persona tanto da produrre un danno psichico o fisico, oppure di entrambe le nature,

e che può durare

per diversi anni nella vita di una persona.

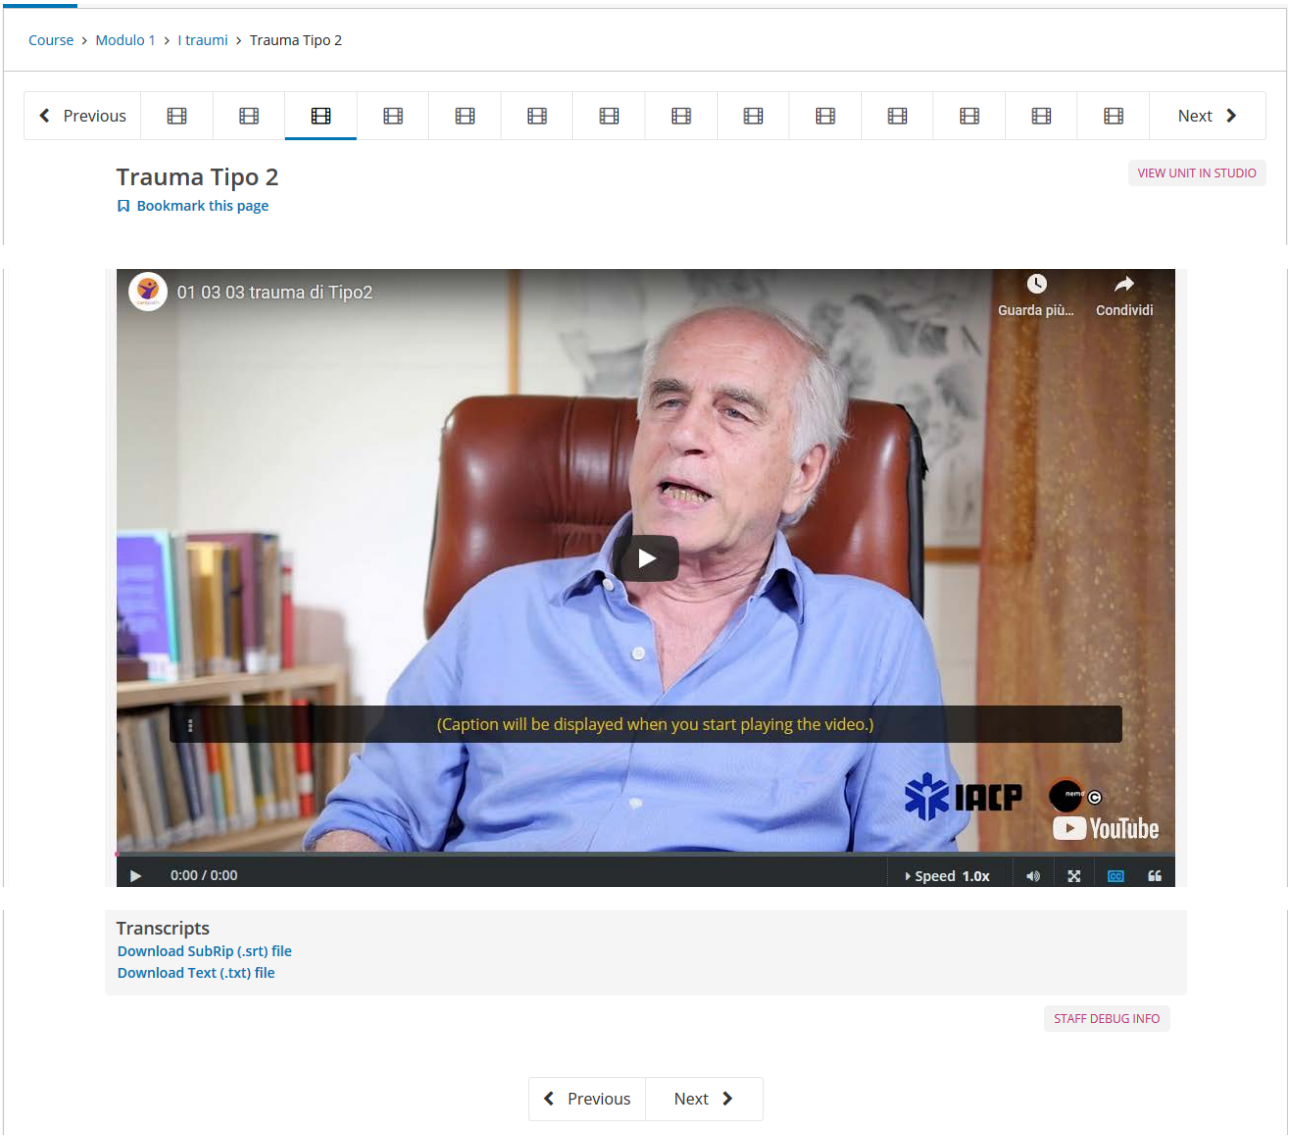
Abitualmente ritroviamo questo trauma in quella che si chiama disturbo post-traumatico da stress,

ma è molto frequente nel disturbo alimentare, in particolare in alcune forme
di disturbo alimentare.
Questo si può suddividere in due parti: - Il trauma fisico, che è quello soprattutto
che può capitare nella vita in momenti o particolarmente drammatici quali lo stupro,
la rapina, la violenza fisica, il combattimento in guerra,
un disastro naturale (come uno
tsunami o un terremoto), un incidente in auto molto grave,
un incidente ferroviario
- Il trauma soprattutto di tipo psichico: quando la vita di una persona viene messa
in pericolo fortemente dalla minaccia di qualcuno, di qualche situazione particolare in cui la
persona può trovarsi,
in cui non derivano
fatti con lesioni fisiche, ma semplicemente
una minaccia così estrema e forte che difficilmente la persona riesce a cancellarla dalla sua
mente nel suo prossimo futuro.
Per le persone soggette al trauma di tipo I, detto anche “trauma focale”,
il trauma è detto “single blow”,
colpisce cioè una volta,
ma
lascia tracce pesanti
e sulla sintomatologia
di tipo alimentare
ha un effetto molto simile a quello del disturbo post-traumatico.
Un trauma di questo genere può avere una serie di conseguenze, tra cui il disturbo alimentare
è uno dei più comuni,
e poi una serie di sintomatologie
piuttosto estese
che
può comportare
una serie di tratti
che, straordinariamente e particolarmente, si trovano tutti presenti
nel disturbo del comportamento alimentare.

Vale a dire il comportamento da disturbo alimentare non è solo un comportamento alimentare,
ma questi sintomi possono accompagnare,
frequentemente
ed in quasi i tutti i casi si ha questa sintomatologia,
tutti i singoli disturbi dell'alimentazione e sono in particolare:
un'autostima bassa, una tendenza molto forte alla depressione,
una immagine del proprio corpo e della sessualità
particolarità distorti,
un alto rischio suicidario, disturbi d'ansia, uso di sostanze alcoliche,
disturbi del sonno, disturbi dissociativi, perdita di memoria, aggressività e disturbi della personalità.
É un corteo sintomatologico che non ci stupisce mai di trovare
nei disturbi alimentari i quali da sintomi
di questo genere o da vere e proprie patologie
che completano il quadro del disturbo i alimentare
e
raramente sono assenti.
Abbiamo, in particolare,
il trauma che lascia una traccia - come
questo trauma di tipo I
- il quale si verifica soprattutto producendo alexithymia, che è un disturbo delle emozioni
che impedisce ad una persona di esprimere aperta le proprie emozioni
con le parole.
La tendenza in questo caso, dopo un trauma di tipo I, è di esprimere emozioni soprattutto
a livello non verbale,
con il proprio corpo,
e queste sensazioni
possono essere
molto gravi
e possono comportare
una disregolazione emotiva, anche notevole, fino al punto in cui la persona
mostra una impulsi
di un certo livello,

e
sappiamo - perché
questo è uno dei riscontri
più frequenti che troviamo
- che esistono delle forme di bulimia nervosa in cui il trauma
di questo tipo (ad esempio l'abuso)
sono
di tale gravità ed entità da produrre
delle sintomatologie
che possono portare ad una perdita di controllo notevole e diffusa a
diversi livelli.
In particolare, soprattutto quanto avviene in una fase precoce dello sviluppo,
quando il trauma è drammatico,
quando le variabili familiari
sono gravi da sostenere e da supportare,
in questi casi
si corre il rischio di bulimia multicomplusiva:
una forma di bulimia
molto grave e pericolosa
in cui insieme ai comportamenti bulimici
si manifestano alterazioni della
personalità del comportamento alimentare e soprattutto impulsività
impulsività che può riguardare
la sessualità,
la
tendenza
ad assumere cibo in maniera incontrollata e senza sentirne il sapore,
ma che ad esempio può comportare-
comportamento tipico di quelle persone attuano
furti nei supermercati, che consumano il cibo nel supermercato e non possono aspettare di
tornare a casa per mangiare anche se avrebbero la possibilità di acquistare cibo.
Una

disinibizione dei propri impulsi che abbiamo visto può riguardare anche la sessualità,
ma soprattutto, più importante e più pericolosa, l'impulsività autolesiva per la quale abbiamo
comportamenti autolesivi quali tagliarsi o tentare il suicidio.
Questo tipo di bulimia, quella multi compulsiva è la più pericolosa conosciuta, in particolare
per l'elevato tasso di suicidi.
Concludendo un trauma di tipo I ha come conseguenza, in particolare se l'ambiente non è supportivo,
questa forma di bulimia che è sicuramente la forma più pericolosa conosciuta in particolare
per il rischio suicidario molto elevato.



Transcript

Affianco del trauma di tipo tradizionale, quello single blow,

che

conosciamo come il grande trauma

che cambia la vita di una persona,

esiste un'altro tipo di trauma che si chiama trauma di tipo II,

ma è soprattutto il trauma

di minore gravità ma che si ripete nel tempo,

con una frequenza tale che le persone iniziano a prevederlo,

ma non possono prevedere esattamente

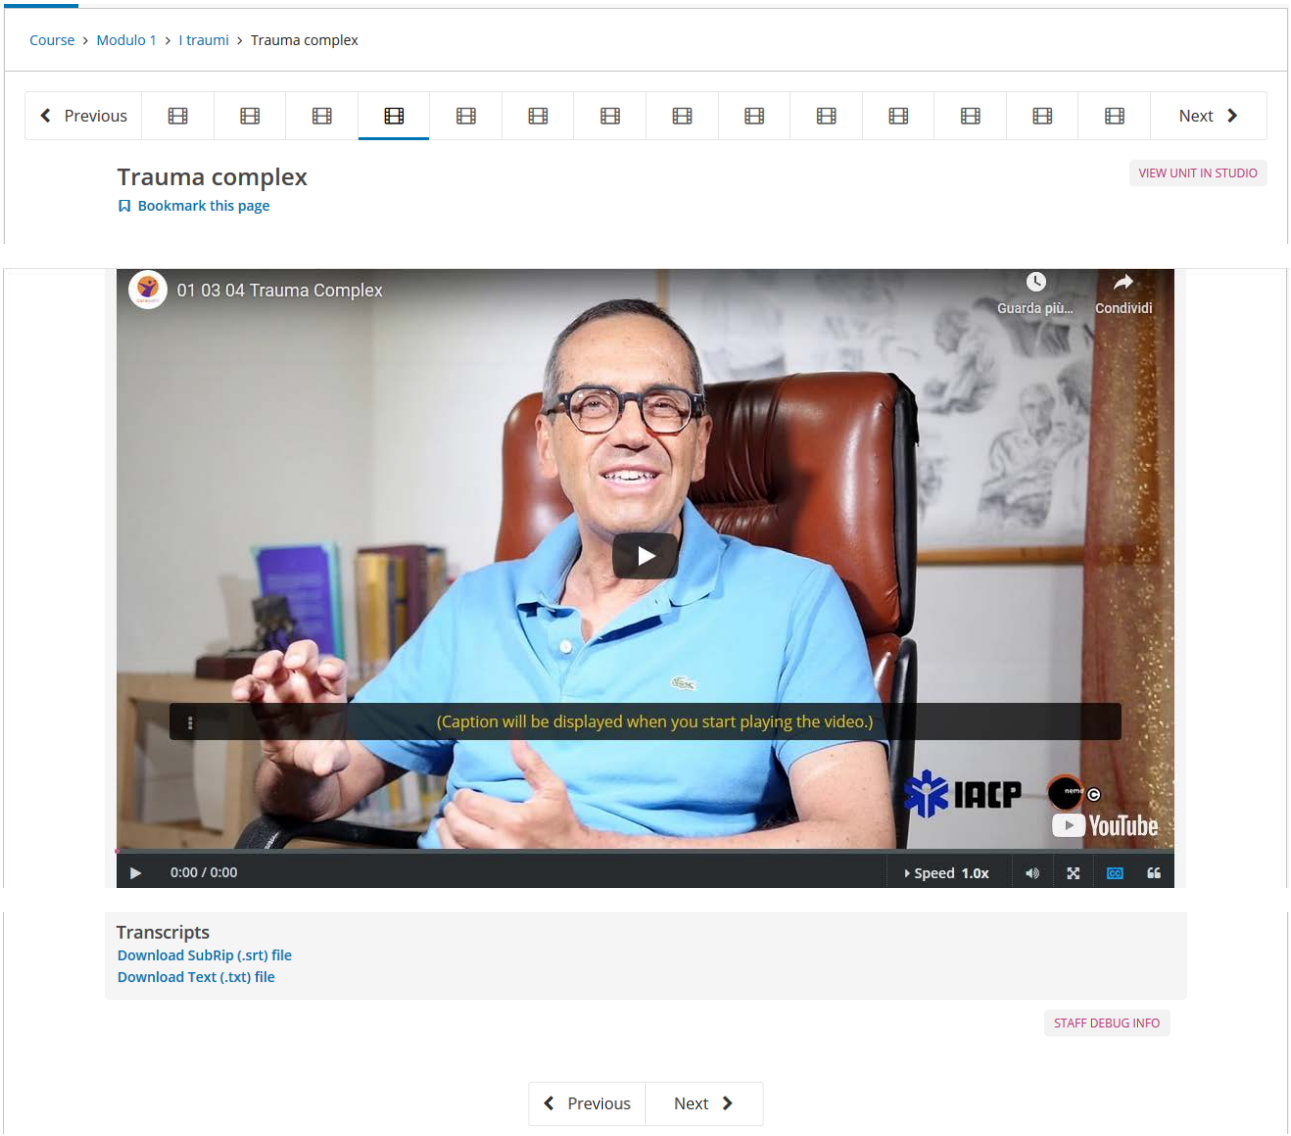
quando avverrà e questa attesa ed aspettativa ha un effetto logorante: produce nel soggetto

una sensazione di impotenza estremamente forte

che da a questi la sensazione di non essere
padrone di se stesso.
In questo tipo di trauma si riscontra frequentemente disturbi alimentari,
può esserci una storia
di conflitti molto violenti nell'ambiente domestico
a cui
il ragazzo, l'adolescente,
a volte il bambino, hanno assistito per lunga parte della loro vita senza conoscerne il
termine; può essere infatti che questo conflitto violento possa sfociare in un vero e proprio
comportamento violento che può produrre
anche danni gravi o addirittura delle perdite.
Questo tipo di trauma che si ripete
crea una situazione di attesa
molto drammatica per la persona, si aspetta
che ci possa essere opposizione
anche se non è detto che avvenga,
tuttavia la traumatizzazione è dovuta all'attesa estremamente forte
e si ripete con tale frequenza
che la vita successiva della persona
può arrivare allo stesso tipo di timore
anchequalora queste esperienze di tipo traumatico sono cessate.
In certi casi si manifesta una tendenza nelle persone a ripetere il tipo di trauma,
per esempio: in una
giovane donna
che ha assistito per tutta la vita alle liti tra padre e madre
a causa dei tradimenti dell'uno verso l'altro,
in tutte le realtà di vita successiva ha
saputo soltanto scegliere
partner che manifestavano comportamenti infedeli, quali tradimenti che
aumentavano in lei il bisogno di scoprire il tradimento vi era o meno; questo tipo di
atteggiamento
in un certo qual modo diventa una ripetizione della previsione dell'evento dannoso

con la paura che si possa verificarsi da un momento all'altro, come se il momento
dell'infanzia non fosse mai passato.
Il trauma di tipo II produce, fra l'altro,
una tendenza al diniego massivo, l'intorpidimento affettivo -
come se la persona tendesse ad eliminare le sensazioni di tipo emotivo
- quindi si tratta di soggetti che si comportano come se fossero "raffreddate", come se non
avessero altre sensazioni
in certi momenti della loro vita;
questo è chiamato numbing che si manifesta come forma di intorpidimento
che è uno degli elementi di base
del cosiddetto disturbo dissociativo: un disturbo in cui la persona perde la capacità
di avvertire
le sensazioni normali,
come se perdesse
delle capacità sensoriali significative,
se si assentasse o non facesse
parte della vita reale di tutti i giorni in alcuni momenti
della sua esistenza.
A questo si accompagna,
soprattutto nei disturbi alimentari
e ancora più
nei disturbi alimentari
in cui si manifesta perdita di controllo quindi anoressia non restrittiva o anoressia
con condotte bulimiche o vere e proprie bulimie,
in questi comportamenti
si nasconde sempre una profonda rabbia:
il soggetto è passivo,
sembra non reagire, ma
quando compie un atto
si percepisce in lui o in lei
una forte rabbia, quali
manifestazioni di aggressività verso l'esterno

sono molto contenute,
ma quando il soggetto prova forti emozioni può esplicitare
la sua forte rabbia fino ad arrivare a veri e propri agiti i quali hanno come conseguenza
anche comportamenti violenti nei confronti di se stessi o degli altri.
Il soggetto manifesta una tristezza incessante, non di tipo intermittente, che è stabile
nella persona
come se
ci fosse stato un trauma infantile che produce una pausa costante la
quale a sua volta produce un senso di disperazione
che comporta una tristezza che si estende
a tutta la vita.
Si tratta, come si è detto, di traumi piccoli
che si accumulano, ma sono stati chiamati
anche traumi complessi o traumi relazionali poiché dipendono
da una serie di relazioni continue che si hanno nei confronti degli altri,
quindi nella vita di una persona può
accadere che chi ha subito questi traumi abbia vissuto nell'ambiente di casa, soprattutto
quello familiare,
momenti traumatici molto forti.
Sono, quindi, traumi costanti che si ripetono e che producono sintomi dissociativi di cui
abbiamo parlato o di regolazioni emotive.



Transcript

La storia del trauma è una storia complessa, fatta di corsi e di ricorsi storici.

Di fatto, negli ultimi venti anni fino ad oggi,

con l'ultima edizione del sistema

di classificazione americano e universalmente noto in psichiatria come DSM5

si è considerato come

possibile disturbo conseguente ad un trauma il disturbo post-traumatico da stress.

In realtà

l'attenzione di ricercatori,

in primis Van der Kolk che ha inaugurato la

questione del trauma complesso,

l'attenzione dei ricercatori si è rivolta ai traumi infantili,

quelli che si sono verificati in un’età del soggetto
in cui
questi si trovava in una
posizione di debolezza, di inferiorità, come per l'appunto normalmente i bambini sono.
Questo tipo di
situazione traumatica, di eventi ai quali può essere esposto il bambino
possono essere riconosciuti, anche dal punto di vista neurobiologico e non soltanto da un punto
di vista psicopatologico, come possibili cause predisponenti allo sviluppo di disturbi psichiatri
che vanno ben oltre il confine del disturbo post-traumatico da stress.
Questi
fenomeni
di
traumi infantili
sono di diverso tipo: possono essere di tipo acuto,
possono essere protratti e ripetuti nel corso dell’infanzia
e vanno sotto il
nome, perl’appunto, di
abusi quando sono dei fenomeni traumatici di tipo positivo - ovvero quando
qualcosa viene commesso sul bambino, come per esempio gli abusi infantili, le violenze
sessuali o fisiche, oppure le violenze psicologiche
- oppure possono essere di tipo
omissivo,
cioè possono essere dovuti a un tipo di neglect, una trascuratezza sia nelle cure psicologiche
che nelle cure fisiche
del bambino portando a dei veri e propri
eventi
e situazioni di maltrattamento.
Il maltrattamento e l’abuso, quindi, sono i fenomeni di cui noi adesso ci occupiamo
quando parliamo di trauma complesso.
Il trauma complesso, complex trauma o trauma evolutivo primario come qualcuno lo chiama,
dovuto spesso al fallimento
delle

figure
di accudimento primario, quindi quelle genitoriali
per esempio
e trauma anche cumulativo - lo psicanalista Masud Khan si è occupato proprio
di questo aspetto del trauma - ovvero tanti piccoli eventi o situazioni traumatiche
o di tipo omissivo o di tipo commissivo che si sono ripetuti durante l'infanzia e che,
cumulativamente, hanno dato luogo ad un clima o dimensione traumatica
della quale il soggetto risentirà
durante la sua età adulta nel momento in cui incontrerà una difficoltà,
un problema o un'altro trauma che richiama il trauma precedente.
Tuttavia questo trauma precedente è un trauma complesso, cioè articolato, che si può estendere
per un periodo temporale molto
importante e lungo, addirittura lungo l'intera infanzia.
Pensiamo a situazioni in cui ci sono famiglie
nelle quali viene vissuto e sperimentato un
clima di paura o di violenza prolungato causato da disturbi o problemi a carico dei dei genitori
- dell'uno o dell'altro
- e che quindi non garantiscono quella serenità, quel senso
di sicurezza e protezione che sono invece molto importanti perché un bambino sviluppi
quella che
si chiama basic trust, che servirà poi ad andare incontro alla vita e alle relazioni
con gli altri in modo tranquillo, aperto e fiducioso.
Il soggetto può non accorgersi di questo, perchè tutte queste situazioni possono più
o meno andare in contro a fenomeni di rimozione, di dimenticanza
e possono
quindi
semplicemente
lavorare dall'interno, in modo sotterraneo,
fino a che poi non si "presenteranno i conti" al soggetto,
perché questa situazione viene a galla, in modo
talvolta anche esplosivo,
ma per effetto di qualche cosa nell'ambiente del soggetto che in età adulta contribuisce

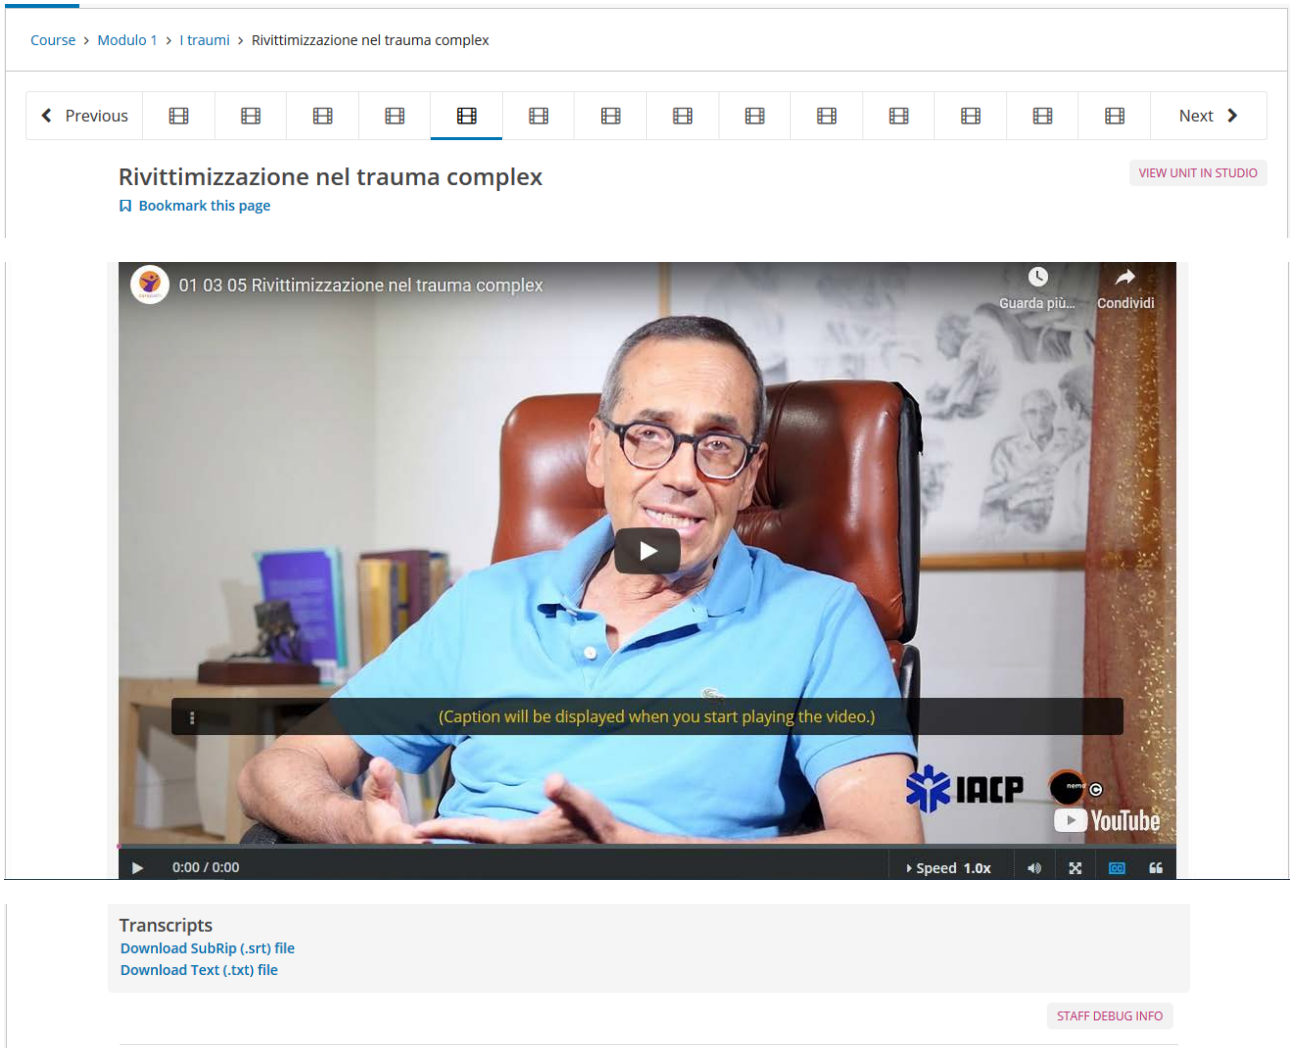
a destrutturarne il clima emotivo

e contribuendo al malessere del soggetto riaprendo così

lo scenario del trauma passato.

Questo perché, come si diceva precedentemente, il trauma attuale può attrarre a sé e richiamare

il trauma passato, come una sorta di attrazione fatale.



Transcript

Quali sono le manifestazioni cliniche del trauma complesso? Si è visto che il trauma complesso porta ad una serie di conseguenze

psicopatologiche che vanno ben oltre il semplice,

per modo di dire, disturbo post traumatico da stress.

Si tratta di conseguenze evolutive che maturano nel tempo e, proprio perchè hanno questa lunga gestazione diversamente dal disturbo postraumatico da stress, si aprono in un arco

di possibilità

patologiche molto più ampio.

A cominciare dai disturbi

della regolazione affettiva,

della emotività,

del comportamento.

Questo significa che spesso queste persone,

che sono state soggette ad un trauma complesso,
sviluppano una impulsività che non è soltanto
di carattere, ma da disturbo, un disturbo che controlla gli impulsi. Si può verificare
e si può
attualizzare in comportamenti di tipo violento, verso gli altri e verso se stessi,
in comportamenti di uso di sostanze
in modo impulsivo e quindi di tipo tossicomanico
o alcolismo.
Un altro ambito molto importante
è quello della regolazione affettiva nel senso
dell'autostima, della possibilità che una persona stabilisca
una fiducia di base
in sé stessa
e quindi anche i possibili sensi di colpa che, in modo
più o meno latente, una persona si porta dietro fin dall'infanzia. Teniamo presente
che un bambino sottoposto ad un abuso, ad esempio sessuale, spesso si sente in colpa
per aver fatto qualche cosa di sporco e non riuscirà, quindi, ad attribuire in modo corretto
la responsabilità di quanto accaduto all'adulto, che invece perpetra l'abuso.
Questi sensi di colpa si possono sviluppare, portare avanti e dare
origine ad una vulnerabilità
di tipo depressivo. La depressione maggiore può essere in età adulta uno degli esiti
di un trauma complesso.
Altri esiti molto importanti sono i disturbi
psicosomatici, infatti le conseguenza di un trauma possono esserci anche sul piano fisico,
ad esempio sulla reattività fisiologica, la iper reattività fisiologica, sul piano
del sistema cardiovascolare (ad esempio fenomeni di tipo cardiotonico, ipertensivo), problemi
della regolazione del dolore e della sua soglia (ad esempio dolori
diffusi in varie parti del corpo),
ipersensibilità agli stimoli dolorosi
e poi ancora i vari disturbi sessuali
che,
dal punto di vista psicosomatico, si vanno poi a collegare a disturbi del controllo

degli impulsi dando così origine a delle vere e proprie forme di perversione e quindi
problemi di discontrollo degli impulsi sessuali.
In ultimo si segnalano i disturbi dissociativi,
per esempio la depersonalizzazione, la derealizzazione i quali sono fenomeni che oggi si riconoscono
con una certa difficoltà intuitiva, ma che si manifestano con un senso di estraneità
che il soggetto prova di fronte alla realtà
e a se stesso.
Questi sono meccanismi di difesa
nei confronti di una realtà che il soggetto sente come, in qualche modo, intollerabile,
che non può sentirsi rivivere addosso
e quindi la dissociazione significa prendere le distanze dalla realtà.
Freud aveva messo in evidenza
questo meccanismo
fondamentale della coazione a ripetere per la quale un soggetto cerca di reincontrare il trauma
non tanto per
subirne ancora
gli effetti negativi, ma quanto per cercare di superarlo.
Questo cercare di superare il trauma significa che alcuni comportamenti
del soggetto
lo possono riportare a rivivere delle situazioni: la situazione classica è quella del bambino,
della vittima rispetto ad un carnefice, che può essere riproposta in età adulta
a ruoli
uguali oppure a ruoli opposti.
L'adulto può cercare di
rivittimizzarsi, cioè creare
delle situazioni in cui si troverà a vivere come vittima
le conseguenze
delle azioni di
altre persone, oppure potrà metter in atto dei comportamenti per i quali egli stesso
si pone come carnefice nei confronti di una vittima.
Questo potrebbe accadere, ad esempio,
in situazioni di violenza sessuale subita da bambino e che magari può diventare in

età più avanzata - in adolescenza o in età adulta -

una situazione che si ripropone,

ad esempio in uno stupro,

una violenza sessuale

nei confronti di una donna

che può essere

vissuta in prima persona come carnefice oppure riproporsi come vittima,

creando una situazione

in cui in ogni - in ruoli anche contrapposti - il trauma viene rivissuto per cercare di

superarlo in quello che Freud ha chiamato coazione a ripetere.

La

re-traumatizzazione

è un evento infausto

che vede una persona che già ha sofferto un trauma

avere una ricaduta,

questo principalmente per due motivi.

Uno perchè

per cause naturali

la persona in precedenza

traumatizzata

si trova esposta

a immagini o accadimenti

dove altre persone sono vittime di trauma e questo

fa rivivere al soggetto

il trauma precedentemente esperito.

L'altro

è

invece

un tipo di re-traumatizzazione

che

ha

origine iatrogene

e cioè

sono le cure

che vengono erogate in maniera

disfunzionale,

magari

non per cattiva intenzione degli operatori

ma per semplice ignoranza,

che la persona traumatizzata

invece di essere aiutata dalle

attenzioni e cure che riceve

ne viene

ulteriormente

traumatizzata.

Insomma,

sarebbe come

una

persona

che

arriva ad un pronto soccorso

con una gamba rotta

e i medici la gestiscono malamente per cui

fanno cadere dalla

barella il paziente che si ritrova con due gambe rotte, raddoppiando così il danno;

una vera propria tragedia.
La storia e la sociologia
dei trattamenti
del trauma
ci rivelano che, purtroppo,
non è stato affatto infrequente nel passato -
ovviamente per cattiva volontà, ma per ignoranza -
commettere
tali danni,
con risultati iatrogeni.
Tutto il mondo delle cure,
perché impattano un sistema complessa e delicato come un essere umano,
rischia non solo di impattarlo a fin di bene, ma - anche non volendo - danneggiando
ulteriormente; è vero per i farmaci, è vero per gli interventi chirurgici, è vero per
qualsiasi tipo di relazione di aiuto, se non
erogata in maniera efficace,
diventa
controproducente.
Nella specificità del trauma questo è particolarmente grave perché una persona traumatizzata
è particolarmente
sensibile e
può essere notevolmente danneggiata con una seconda traumatizzazione,
per questo noi oggi
abbiamo appreso dagli errori, le ricerche sono diventate più numerose
e abbiamo
una
vasta conoscenza - che ovviamente progredirà sempre anche in futuro - grazie
alla quale sono state elaborate delle precauzioni per non far correre il rischio alle persone
già traumatizzate di essere traumatizzate nuovamente.
Queste precauzioni sono dette procedure
trauma inform,
centrate sulla persona dell'utente traumatizzato

e che

hanno l’attenzione provocare altri danni.

Puoi non fare questo esercizio se non lavori nel campo dell’offerta di servizi a minori affetti da trauma.

L'adolescenza è un periodo del nostro ciclo vitale che, per le sue caratteristiche evolutive, rappresenta un periodo di aumentata vulnerabilità in quanto espone ogni individuo ad importanti esperienze di cambiamento bio-psico-sociali che possono essere vissute con disagio, sofferenza e tutti i malesseri che possono accentuarsi se l'individuo è esposto ad esperienze traumatiche perpetuate soprattutto dalle figure criterio.

Se infatti, come illustrato da Rogers, il bambino cresce in un ambiente facilitato, questo gli permetterà di non replicare il proprio sentire, ne di bloccarlo o congelare le esperienze drammatiche, ma di muoversi nella realtà soddisfando i propri bisogni e valutando le esperienze come piacevoli o spiacevoli a seconda che siano favorevoli o sfavorevoli al proprio sviluppo, avendo innata in sé quella tendenza, che Rogers chiama tendenza attualizzante, che è la capacità di autocomprendersi, autoregolarsi e autorealizzarsi.

Se invece il bambino vive in un ambiente in cui sente che l'apprezzamento dei captive dipende solamente da quanto è egli in grado di aderire alle aspettative, questo gli può comportare di amputare per forza una parte del proprio sé e di quindi di rapportarsi alla realtà costruendosi dei costrutti rigidi, costrutti che saranno ancora più rigidi se costruiti su un senso costante di ambiguità, minacce e paura, se il bambino cresce in un ambiente pulsante.

É proprio in questo nucleo profondo di straniamento tra il proprio percepire, esperire, simbolizzare ed agire che si crea e rafforza quel senso di estraniamento da sè che poi è alla base dell'eziopatogenesi.

Vediamo quindi che il nostro adolescente, che è cresciuto e si è nutrito nel suo contesto relazione, si trova poi esposto ai cambiamenti evolutivi a cui si accennava prima e tutti questi cambiamenti gli determinanti richiedono una sorta di rimodernizzazione interna, di risintonizzazione che coinvolge l'individuo stesso e le sue relazioni più importanti e che gli richiedono di ritrovare un equilibrio che sia sia flessibile, che dinamico rispetto alle esperienze che si vive, ma anche costante rispetto al senso di identità che si è costruito fino a quel momento e tutto questo richiede, quindi, una ridefinizione del proprio concetto di sé.

Vediamo quali sono questi cambiamenti a cui va incontro l'adolescente.

Il primo tra tutti riguardano sicuramente il corpo: il corpo dell'adolescente è un corpo in evoluzione, con la crescita ponderale, la comparsa degli organi sessuali secondari, degli organi riproduttivi e quindi un corpo che richiede una nuova qualità della relazione con esso, un corpo che l'adolescente utilizza come veicolo primario e intermediario per comunicare all'esterno i propri vissuti.

Un corpo, quindi, che sceglie di curare, di abbellire, ma anche di scalfire, di tagliare, di dimenticare; un corpo che sceglie per far parlare di sé.

Allo stesso tempo è un corpo che viene visto dall'esterno, che cattura lo sguardo degli altri, con desiderio o derisione e quindi espone l'adolescente a nuove esperienze, nuove opportunità, ma anche a nuovi rischi.

Ci sono poi dei cambiamenti a livello interpersonale.

In famiglia gli viene richiesto il passaggio dalla dipendenza - fase di accudimento e attaccamento - all'autonomia e alla ricerca di equilibrio tra queste due spinte evolutive apparentemente opposte che hanno una ripercussione sul piano sociale, infatti nell'ambiente esterno cambia il ruolo che il ragazzo ha nel gruppo dei pari con altre figure significative.

Inoltre ci sono dei cambiamenti al livello del cervello, come hanno dimostrato tutte le ultime ricerche.

Il cervello a incontro ad una nuova modificazione, sia strutturale, che funzionale, soprattutto in quelle aree corticali che sono adibite ai processi decisionali.

Tutto questo determina una grande vulnerabilità che, come detto prima, viene ancora di più minata se il soggetto vive delle esperienze traumatiche che vanno a ledere o compromettere quel senso di sicurezza interna, la base sicura di Bolby, che il luogo nostro affettivo di sicurezze in cui i bisogni possono essere sentiti, nominati, appagati, a cui non possiamo fare sempre ritorno e che quindi ci permette di fare quella preziosissima esperienza di crescente autonomia senza però perdere l'amore, ma anzi arricchendosi dagli incontri che facciamo con le altre persone.

La persona che, invece, ha subito un trauma ha bassa capacità di mentalizzazione e non è in grado di autoregolare i propri stati affettivi, non può far altro - come ci dice Bromberg - di isolare quella che è l'esperienza traumatica, tutti i vissuti e contenuti ad essa associati, dissociandosi; la dissociazione patologica - come illustra Caretti- porta ad un impoverimento del soggetto e delle sue risorse perché gli impedisce di ricostruire quelle esperienza traumatiche in una narrazione coerente con la propria storia di vita.

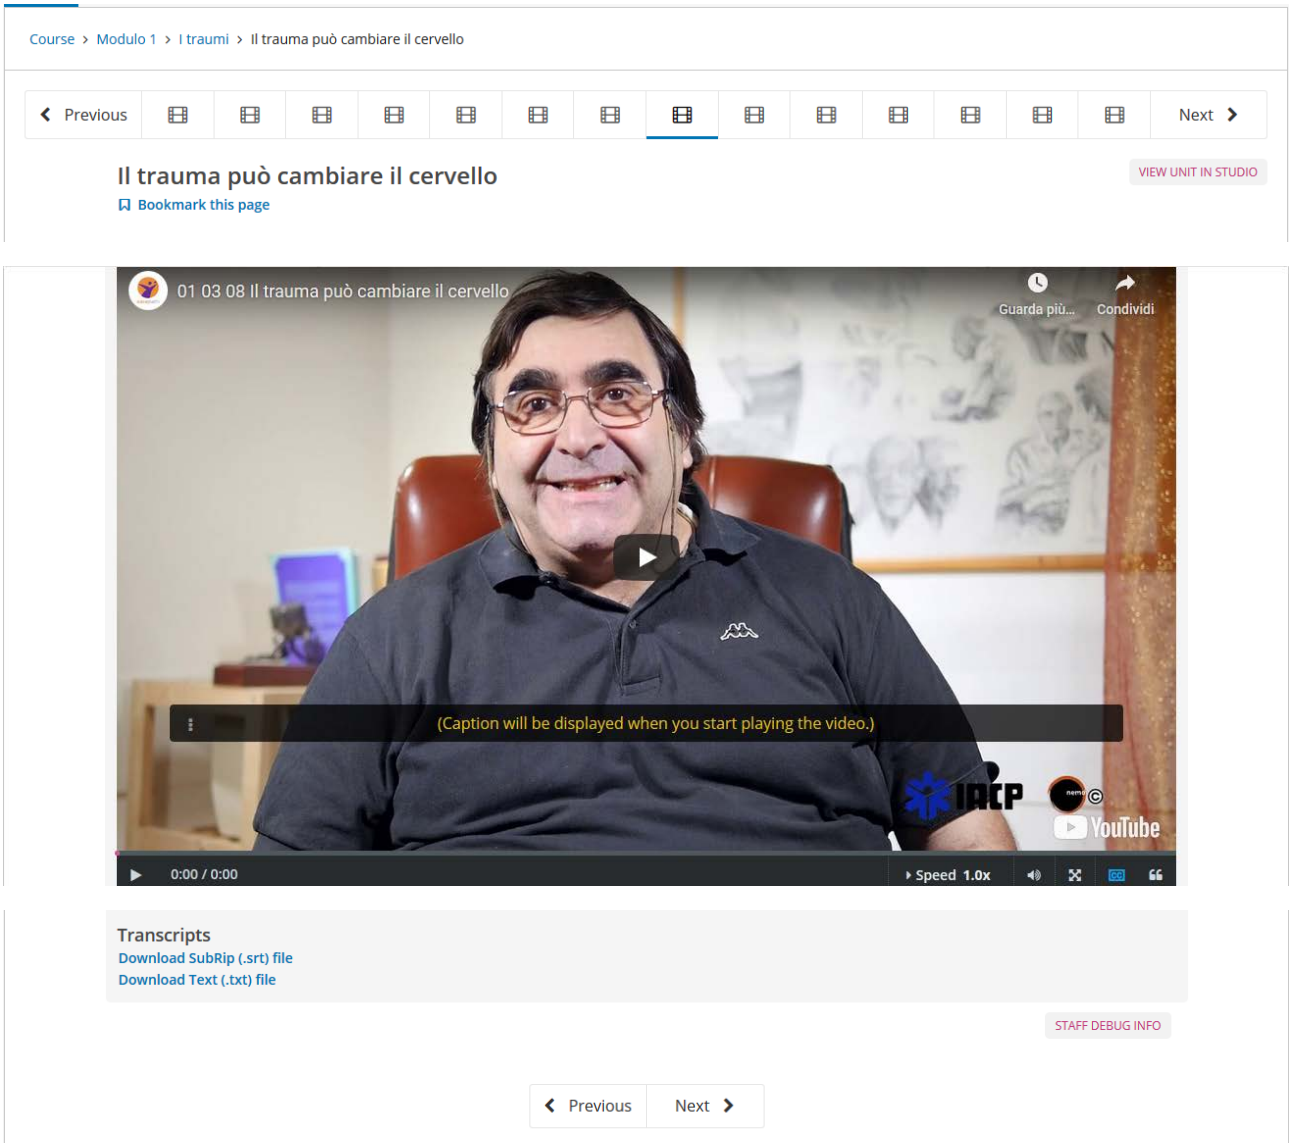
Proprio per questo che

se lavoriamo ad un contatto con ragazzi adolescenti che hanno

un falso di stress emotivo quello che possiamo offrire è lavorare con loro ad una profondità relazionale importante, offrendo loro delle relazioni che siano profonde, basate sull'ascolto, sull'ascolto empatico, sul rispetto profondo di chi sono i ragazzi, sul cercare di capire le esperienze da loro punto di vista cercando di cogliere i significati che loro danno a ciò che vivono e, quindi, offrire dei contesti relazionali in cui il ragazzo può, piano piano, può ricontattare quelle parti di sé, quei bisogni fino a quel momento negati non solo permettendogli di risentirli, ma anche di risintonizzare delle parti di sé, delle esperienze esterne che lui vive fino a quel momento come eccessivamente dissonanti.

Questo è possibile offrendo loro anche dei contesti relazionali nei quali abbiamo verso

di loro uno sguardo diverso, non solo uno sguardo che ci porta ad etichettarli come ragazzi in perenne rivoluzione e lotta col mondo esterno, o come figure apatiche risvegliate solamente dal mondo dei social network, ma di vederli come dei ragazzi con delle caratteristiche, degli strumenti tipici delle loro fasi evolutive, che si muovono curiosi nel mondo, si fanno domande, si danno risposte, esplorano, cercano di dare un senso soggettivo alle loro esperienze, così come poi noi continuiamo a fare da adulti per tutto il resto della nostra vita e quindi avere sempre verso di loro uno sguardo che fa il tifo per loro.



Transcript

Verranno trattati i cambiamenti neurologici che avvengono quando si verifica un trauma,

in qualsiasi persona, ma principalmente negli adolescenti e negli adulti;

negli adolescenti

sono chiaramente più evidenti che rispetto agli adulti.

Lo studio è ripreso da situazioni neurologiche, da ricerche internazionali neurologiche

e

dal lavoro fatto dal Dott.

Petrini e dalla Dott.ssa Mandese della tecnica-processo psicoanalitico mutativo:

una tecnica che ha

una parte psicanalitica e una parte neurologica, completamente in

accordo

con quelle che sono
le ricerche neurologiche internazionali e il rapporto tra neurologia e psicanalisi.
É risaputo che ogni individuo in una situazione di benessere
sviluppa quotidianamente 1400 nuovi neuroni
dalle cellule staminali estrocitaria
sia a livello dell'ippocampo
che al livello olfattivo.
Questo è un aspetto molto importante perchè l'ippocampo è la parte centrale della memoria
del nostro organismo
che viene rievocata in situazioni simili, quindi in situazioni di trauma;
mentre a livello
olfattivo
osserviamo i nostri lobi cerebrali
non sono altro che
un'estroflessione del nostro lobo olfattivo.
Gli animali funzionano con l'olfatto,
noi funzioniamo col pensiero,
quindi il pensiero, nell'uomo,
non è altro che l'olfatto
che si è allargato si è sviluppato in queste
cellule cerebrali.
Pensiamo che l'essere umano ha circa 30.000 geni, troppo pochi per definire tutte le situazioni,
quindi entrano in gioco situazioni familiari, sentimentali, relazionali, culturali e religiose.
afferma che solamente il 70% dei geni è determinato geneticamente
e solo il 30% viene gestito da quelli che sono i fattori esterni.
La differenza di geni
tra un'uomo meschina e un bonobo maschio è del 5%,
tuttavia questa
percentuale è molto rilevante, mettere sullo stesso livello un'uomo e un bonobo non è
equiparabile, a tutti i livelli, da quello sentimentale a quello lavorativo.
Ne risulta che la cultura, la religione, tutte le situazioni esterne, la famiglia, la comunità
in cui si vive sono molto importanti per la formazione di un individuo.

Cosa succede
quando avviene uno stress?
Una situazione stressante, o neglettante (il neglect come si è visto è come uno stress)
non fa altro che bloccare l'attività delle cellule staminali al livello dell'ippocampo
e quindi diviene impossibile sostituire neuroni che normalmente si perdono;
quindi
c'è una perdita neuroni le
nel punto più importante e profondo del cervello che è l'ippocampo.
La regolazione emotivo-cognitiva che accompagna e sostiene queste modifiche
cerebrali
è caratterizzata
da ansie e depressioni
legate
all'amigdala:
un corpicino di piccole dimensioni all'interno del cervello
che sostiene tutte le nostre situazioni emotivo-affettive,
dall'amore, alla sessualità, al mangiare,
a tutto ciò che è importante dal punto di vista affettivo.
Avviene un'alterazione nelle cortecce prefrontali, le quali sono quelle indirizzano i nostri obiettivi:
se decido di andare a teatro a vedere un attore è la corteccia prefrontale
che mi spinge a compiere tale azione, poi la frontale la realizza, ma la corteccia prefrontale
è anche quella degli impulsi, ad esempio quando ho l'impulso di andarmene o di rimanere
in una luogo lo devo alla corteccia prefrontale che la frontale poi reagisce e che comunica
la necessità di rimanere, ad esempio, a causa di un impegno.
Il terzo punto che viene danneggiato è, naturalmente,
l'ippocampo nelle memoria (come abbiamo
già detto la sede della memoria è l'ippocampo).
Studi
longitudinali hanno evidenziato che i traumi non si esprimono attraverso un disturbo
del DSM -5 o del ICD - 10 che si chiama post traumatico da stress,
ma si trasmette
- con i sintomi di ansia e depressione,

a volte situazioni di allucinazione, ma si evidenzia
attraverso modificazioni del senso del sé delle relazioni interpersonali.
Una persona che ha subito un trauma
ha delle limitazioni comportamentali e limitazioni mentali,
cioè la persona sembra non in grado
di esprimersi
nel mondo del lavoro,
degli affetti,
delle relazioni, delle attività,
è come se fosse caduta ad un livello di funzionamento
più basso.
Questo è dovuto al sistema HPA il sistema ippocampale ipofisario e adrenocorticale.
Al livello del cervello si trova una ghiandola che si chiama
ipofisi
dalla quale si irradiano
tutti gli ormoni del nostro organismo.
Il collegamento tra la parte endocrinologica-ormonale
e la parte nervosa
è dato dall'asse
ipotalamo-
ipofisi,
tutto ciò che arriva all'ipotalamo - una zona di centrale importanza, quasi un cervello
più piccolo rispetto la corteccia cerebrale
- viene trasmessa all'ipofisi e da luogo
a delle sensazioni ormai, cioè il segnale nervoso viene trasmesso con sostanze ormonali.
Queste sostanze ormonali
si diramano in tutto l'organismo,
dall'ipofisi,
e controllano
la tiroide,
la sessualità per mezzo delle ghiandole genitali, la sessualità maschile
e femminile con l'ormone maschile (che comunque determina anche la sessualità femminile)

e poi, specialmente,

il rilascio di corticotropina: l'ormone dello stress, o meglio il pre-ormone

dello stress in quanto il vero ormone dello stress è l'ACTH, il cortisolo,

motivo per il quale si somministra cortisone per aiutare l'organismo a reagire quando ci sono malfunzionamenti

fisici, il cortisolo infatti ha gli stessi elementi del cortine.

Anche nel caso di battaglie e guerre l'organismo umano è preparato, infatti il cortisolo - l'ACTH

per la precisione - non fa sentire il dolore,

da luogo a meccanismi di aggressività (come avviene nell'animale)

e questa situazione è una situazione chiaramente di aggressività.

Quando questo meccanismo di attività

viene ripetuto

diventa cronico e si presentano stati di ansia e angoscia

protratti

che dipendono dall'amigdala prima citata.

L'amigdala

è il "comò"

della nostra memoria emotiva, nel senso che conserva tutte

le nostre memorie emotive, come fosse una macchina fotografica della realtà emotiva,

quindi, per esempio, il primo bacio, il primo lavoro, la prima sensazione di benessere,

la prima vittoria in uno sport, sono tutte fotografate nell'amigdala e riemergono quando

si presentano situazioni analoghe; nel momento in cui l'ippocampo

inizia

a secernere cortisolo,

questo si lega con tutti i recettori dell'ippocampo, dell'amigdala e della zona prefrontale

e quando è arrivato ad un livello sufficiente, se la situazione non è cronica,

abbassa il livello ACTH e di CRF (-).

In questo modo l'ippocampo regola le risposte

allo stress.

Quando

invece noi stiamo bene la serotonina gestisce l'area, la serotonina è l'ormone

della felicità, vero è infatti che quando un soggetto è in un momento di depressione

vengono prescritti farmaci serotoninergici.

La serotonina

inibisce comportamenti aggressivi e promuove la socializzazione.

Viene prodotta a partire del triptofano e viene introdotta nella dieta.

La serotonina, insieme all'ossitocina che è l'ormone del legame, è l'ormone più positivo

e utile per l'organismo, nel senso che mentre la serotonina stimola socialità

e relazione con gli altri,

l'ossitocina - liberata dopo 5 secondi di abbraccio con un'altra persona

- è l'ormone

che stimola il legame.

La ricerca sta mettendo in evidenza che attività amate,

pensieri e sentimenti importanti hanno

profondi effetti terapeutici sul nostro corpo,

quindi

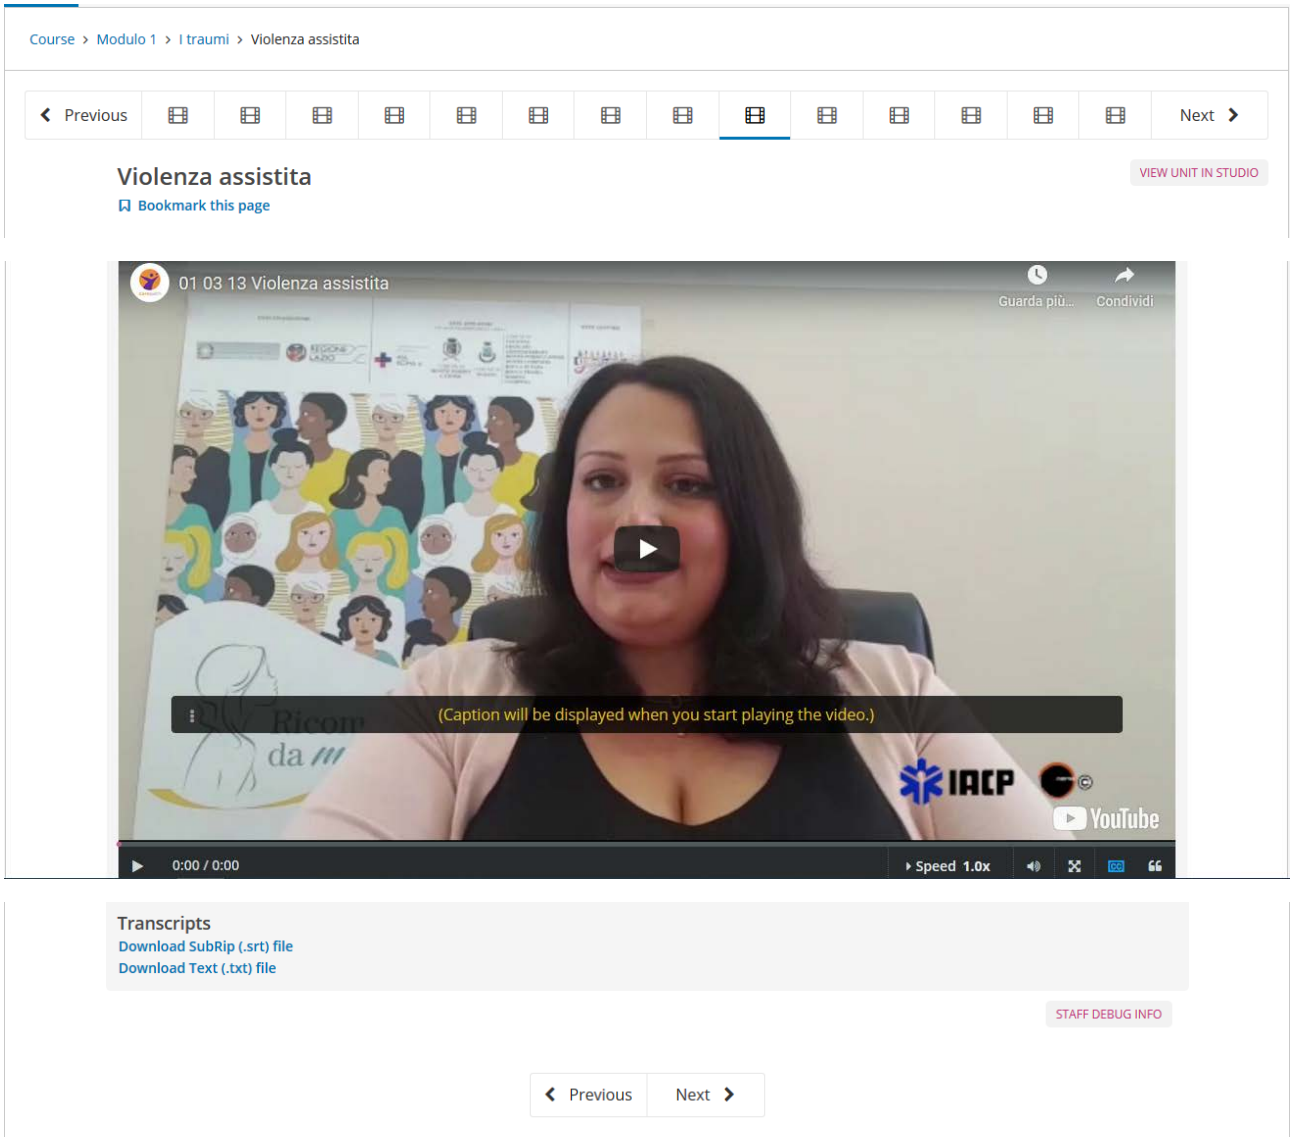
indubbiamente esiste,

nel nostro modo

di essere, una serie di reazioni che vanno a modificare il cervello e che spingono a

modificare il corpo, in qualsiasi situazione sono presenti ormoni legati ai neurormoni

e legati agli stimoli nervosi.



Transcript

Per parlare di minori

vittime di violenza assistente occorre definire cos'è la violenza

assistita nell'ambito familiare.

Ci si riferisce a violenza assistita quando un minore fa esperienza di qualsiasi forma

di maltrattamento

compiuta attraverso atti di violenza fisica, verbale, psicologica,

sessuale ed economica su figure di riferimento o su altre figure affettivamente significative,

adulte o minori.

SI includono in questo tipo di violenze anche quelle messe in atto da minori su altri minori,

ma anche da parte di altri membri della famiglia ad esempio su animali domestici; sono

esperienze altamente traumatizzanti per i minori.

Le caratteristiche di queste esperienze possono essere diverse.
La violenza può essere indiretta: la violenza è percepita all'interno del proprio campo percettivo,
quindi non si tratta solo di vedere la violenza, ma anche solamente sentirla.
È opportuno sottolineare ciò perchè molte donne vittime di violenza riportano che i bambini,
quando venivano picchiate, erano in un'altra stanza; in realtà anche in questi
casi si tratta di una forma di violenza diretta nel caso in cui il bambino sentisse.
L'esperienza può essere indiretta
quando il minore è a conoscenza che la violenza
è avvenuta o che sta per avvenire; in questo senso i bambini hanno come delle "antenne":
capiscono quando c'è una tensione in casa tipica
che precede l'episodio di violenza in se.
L'esperienza può altre volte essere non percepita in modo diretto o indiretto,
ma il minore ne può percepire gli effetti;
ad esempio vedere la madre con dei lividi,
o stare a sentire questa aria di violenza nella casa, ebbene in questi casi si tratta di violenza assistita.
Ci sono alcune false credenze sulla violenza assistita.
Il bambino
non è impermeabile rispetto alla violenza che intercorre all'interno della propria famiglia,
anche se l'atto violento non è agito in sua presenza può coglierne l'attuazione,
questo perchè il bambino non è mai spettatore passivo e inconsapevole.
La violenza assistita aumenta il rischio di violenza diretta sui minori; semplicemente
il minore che cerca di difenderà la madre, mettendosi in mezzo, può essere colpito
daparte del padre: in questo caso
la dott.sa Annibali utilizza un'ottica di genere per
parlare di violenza assistita, in quanto nella maggioranza dei casi la violenza è attuata
da parte dell'uomo verso della donna;
non si esclude che la violenza possa essere perpetrata
da parte della madre nei confronti del padre, o comunque da una persona femminile rispetto
ad una maschile, ma statisticamente è un dato meno significativo.
I bambini esposti alla violenza sono cinque a volte più a rischio, rispetto ai bambini
non testimoni di violenza, di diventare violenti in età adulta.
Gli effetti della violenza assistita sono:

un sentimento di paura, ansia, consunzione, tristezza,
vera e propria depressione, sensi di rabbia, colpa, inadeguatezza e vergogna.
I bambini perdono fiducia in sé stessi e negli altri,
possono avere disturbi psicosomatici,
del controllo degli impulsi, difficoltà scolastiche, disturbi dell'apprendimento,
del linguaggio,
del controllo degli sfinteri, difficoltà relazionale e possono sviluppare anche un
disturbo post-traumatico da stress complesso in quanto tale esperienza traumatica si è
sviluppata all'interno di una relazione di fiducia, come quella familiare.
Al livello bio-psico-sociale
gli effetti della violenza assistita si ripercuotono nel comportamento,
nelle emozioni, nella cognizione, nell'area fisica del bambino, ma anche nelle relazioni.
Ciò che si trova a vivere il bambino è un mondo in completo subbuglio,
la violenza diviene la normalità
e per conseguenza la normalità la violenza;
è questo quello che il bambino nella propria normalità:
riconoscerà come normale e fisiologico un comportamento violenti
o, sminuendo in tal senso la propria esperienza drammatica e, probabilmente, reiterando questi
comportamenti.
Occorre sempre di più focalizzarsi sulla violenza assistita e come questa abbia degli
effetti sui minori e sugli adulti che questi minori diventeranno.

Il neglect è una forma di trauma

infantile e adolescenziale

che è comune ma molto poco considerata. L'attenzione

verso questo tipo di problematica traumatica molto significativa

è stata rivolta

soltanto in tempi molto recenti; si parla infatti di neglect del neglect: la trascuratezza

della trascuratezza.

Per molto tempo

questo aspetto non è stato considerato un vero proprio trauma,

al massimo una piccola parte dei traumi esistenti.

In realtà oggi si pensa a questo trauma come il più diffuso, il più comunque e quello

che da conseguenze peggiori in termini di durata nel tempo.
Da questo punto di vista il neglect indica il perpetrarsi di comportamenti di omissione
da parte di colori che dovrebbero dare cure
e queste omissioni indicano che manca un imminente
rischio grave di danno, ma una serie
di mancanze che si protraggono per un lungo periodo di tempo.
Si tratta di mancanze che possono, ad esempio, accompagnare la presenza di un trauma di tipo I,
un abuso
potrebbe essere
ben tollerato, o in maniera sufficientemente adeguata,
tuttavia
lo è molto di meno se accanto a sé non si ha un genitore capace
di comprendere
e di aiutare, sostenere e proteggere
il figlio che ha subito questo tipo di trauma.
Il neglect quindi può essere complementare al trauma di tipo I,
di per sé comunque produce dei danni.
Possiamo avere diversi tipi di neglect che possono riguardare
l'assistenza sanitaria,
l'istruzione, la supervisione del ragazzo,
la tutela rispetto ai rischi ambientali,
ai bisogni fisici, al sostegno emotivo
che viene dato soprattutto dalla famiglia o comunque
da chi si prende cura del bambino.
Questo tipo di trascuratezza
può sembrare di scarsa importanza,
ma in realtà da la
sensazione alla persona di non avere nessuna protezione da parte degli altri
e quindi di vivere un ambiente ostile non in grado di garantirgli alcun tipo di sicurezza.
Ovviamente
se si parla di diversi tipi
neglect, che sia di tipo emotivo o di tipo fisico,

ritroviamo due aspetti di completamente diversi.
In alcune situazioni l'emotività viene trascurata in quanto ci si trova di fronte
a caregivers freddi,
distaccati e poco partecipi;
il neglect fisico può riguardare invece l'aspetto
strettamente materiale,
i bisogni di base
e può essere esteso anche ai bisogni educativi
del ragazzo che può non ricevere dai genitori
quelle informazioni necessarie
per vivere in un contesto relazionale.
Esiste inoltre un medical neglect,
ovvero quando c'è un bisogno di curare le proprie patologie,
ma chi dovrebbe prendersi cura del ragazzo o del bambino
non lo fanno e per conseguenza
le patologie possono incrementarsi
e diventare particolarmente pericolose o dannose.
Il moral neglect, ovvero la mancanza di istruzioni per gli aspetti etici e morali
del comportamento etico di una persona.
Le conseguenze di questi tipi di neglect sono dei danni sulla salute pubblica che per lungo
tempo sono stati sottovalutati.
Oggi sappiamo
che l'esposizione
per lungo tempo
a neglect può comportare
non solo le patologie di cui si è già parlato, come il disturbo alimentare,
ma anche addirittura una riduzione della materia grigia della corteccia
e quindi una capacità cognitiva molto diminuita
rispetto a soggetti normali.
Questi dati ci hanno così conti o di quanto sia importante di occuparsi del neglect
e
cercare di ristabilire nel contesto familiare, e individuale,

quel tipo di cure e attenzioni

che danno sicurezza all'individuo

e danno la sensazione di essere protetto e capito.

A conclusione della panoramica sulle patologie trattate, dai disturbi alimentari al neglect,

si segnala che quest'ultimo è particolarmente diffuso in persone che svilupperanno un alimentazione incontrollata

fino alla forma avanzata di perdita completa del controllo.

È necessario pensare ad un rapporto terapeutico in cui si presti particolare attenzione

alla persona e si dimostri di avere interesse verso di lei,

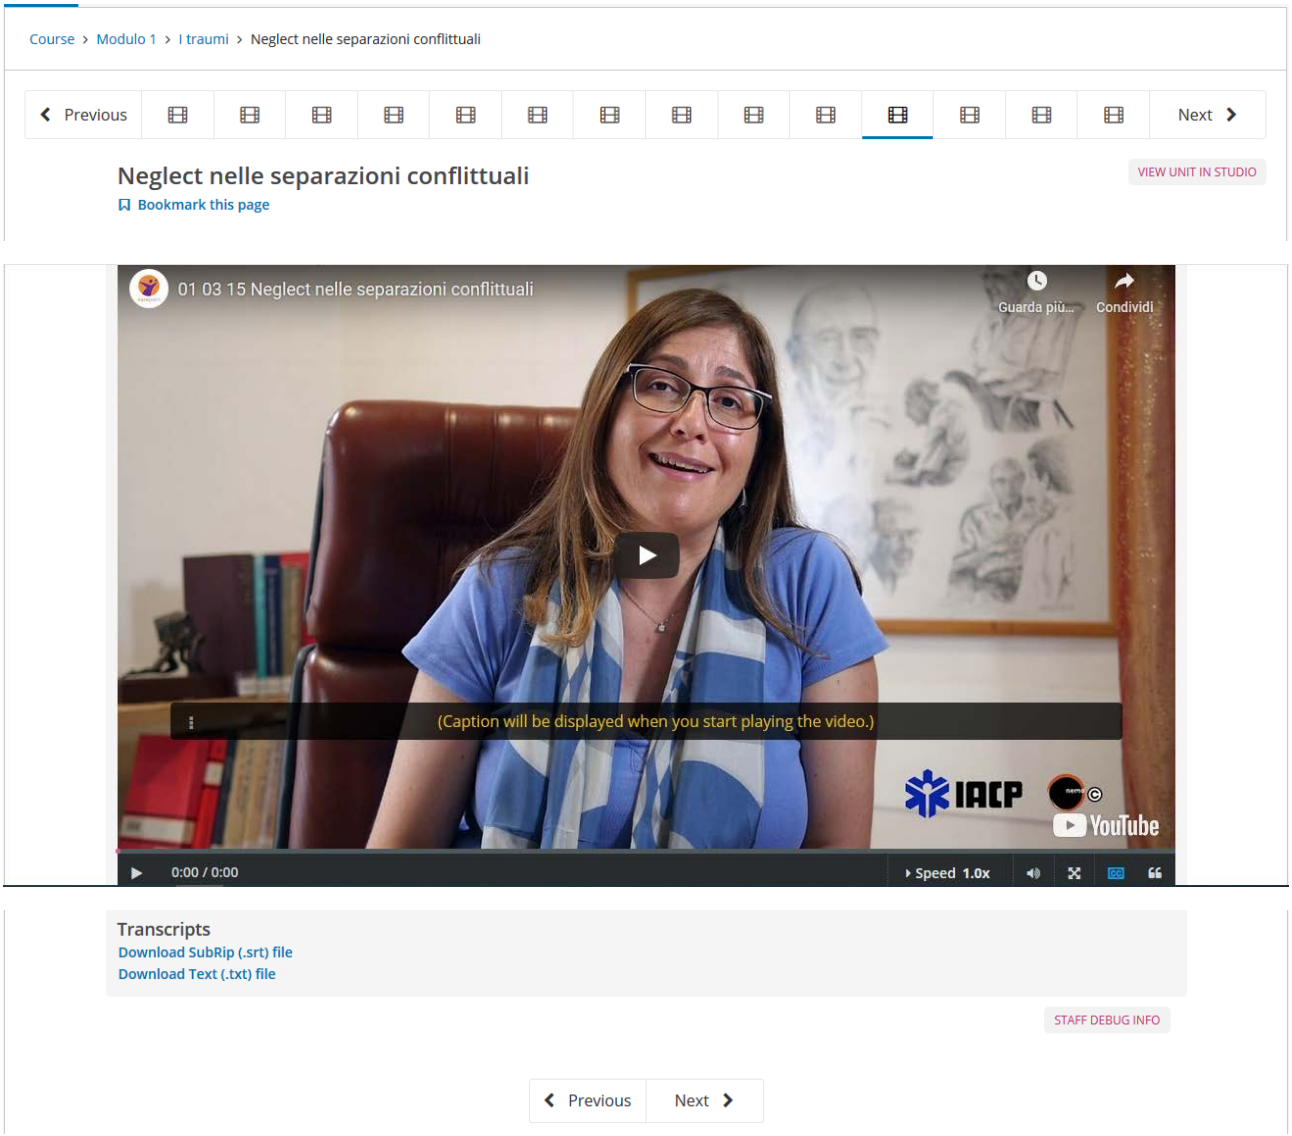
vale a dire un atteggiamento empatico,

di comprensione,

è uno degli elementi più importanti per superare questo trauma,

da poco riconosciuto, ma particolarmente insidioso e non di minore importanza rispetto altri

traumi maggiori.



Transcript

Nelle separazioni conflittuali

i genitori

spesso si “fanno la guerra”

investendo molte energie

nel combattimento dell’altro genitore, visto come un nemico;

in questi contesti la cosa più importante

è vincere.

In queste guerre in realtà

veicolano dei sentimenti di forte rabbia

che ci indicano in realtà di quanto sia complesso,per queste persone,

entrare in contatto

con i sentimenti vissuti e legati al processo separativo;

sentimenti di delusione,

dolore per l'abbandono, per la mancanza, percezione di vuoto, solitudine

e senso di fallimento.

Queste persone in realtà comunicano quanto sia complesso per loro elaborare

quello che si chiama divorzio psichico.

In questo contesto

emerge la figura del minore

che, in quanto tale, andrebbe tutelata;

questo purtroppo non sempre accade in quanto in realtà

il minore diventa il fulcro del conflitto,

ne diventa l'elemento centrale

e quindi

i genitori iniziano a comunica attraverso il minore,

il figlio diventa

il ponte tra i genitori,

il motivo di discussione in quanto ogni genitore litiga

per

cercare

di dichiarare quale sia il bene

del loro figlio.

In questo caso il benessere del minore diventa una scusa

dietro cui si nascondono disappunti,

gelosie

e fastidi personali;

ciò che viene a mancare

è la protezione del minore che deve essere sempre presente,

ma

è necessaria in contesti

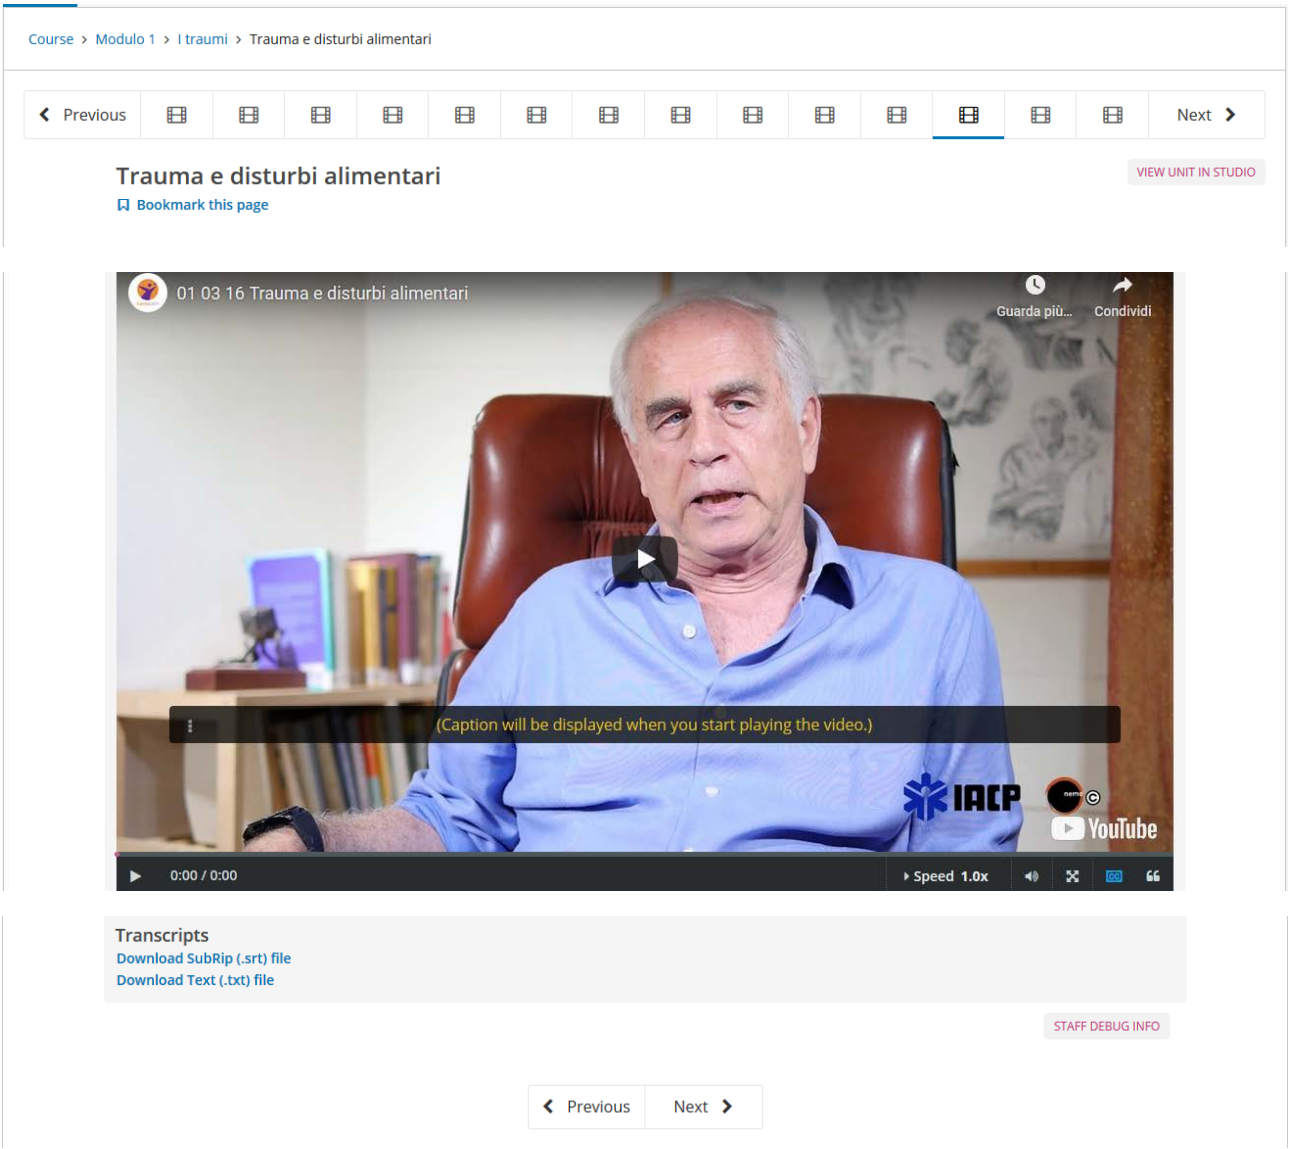
di rottura

come quelli che stiamo vedendo. Quello che potrebbero e dovrebbero fare i genitori

è collaborare e cooperare in tutti gli aspetti legati alla funzione

genitoriale,
nell'ottica di alleggerire il figlio di un peso in quanto i figli, in realtà,
si caricano di un peso in quanto si sentono in colpa per la separazione dei genitori,
si sentono responsabili della loro felicità
in quanto anche sono causa dei loro litigi.
In questo frangente ciò che accade è che il figlio,
in realtà, non viene visto
e qui nasce il trauma del minore:
nel momento di maggiore vulnerabilità
il minore non viene
visto e quindi i suoi bisogni e sentimenti non vengono riconosciuti e per conseguenza accolti.
La separazione è sempre un evento traumatico
in quanto è lesivo,
provoca una spaccatura: una coppia genitoriale che nella mente del
figlio è un nucleo unico che in un certo qual modo
deve spaccarsi,
questa scissione esterna
di padre e madre
produrrà una scissione interna,
tuttavia nella mente del figlio
la coppia genitoriale
non smette di esistere, ma rimane,
solo che perde di forza,
di identità,
di dignità,
di funzione di guida.
Subentrano in questo caso altri fattori
che hanno una carica
molto forte
in senso negativo:
ci sono degli aspetti che ci indicano poi l'entità del trauma,
ad esempio il temperamento del minore

e la sua capacità
di tollerare la frustrazione,
la qualità della relazione e il tipo di attaccamento che i genitori sono
stati capaci di creare
prima dell'evento separativo.
Il fattore che più di tutti ci
dice del trauma e della sua entità è l'età del minore:
più piccolo è il figlio maggiore
sarà l'entità del trauma
e i genitori,
anche inconsapevolmente,
attuano una serie di dinamiche disfunzionali
che intrappolano il minore in un ruolo rigido
dal quale questi non riesce a liberarsi
poiché,
data la sua
giovane età,
non ha ancora quel livello di consapevolezza
e neppure una personalità solida
e capace di liberarsi da solo questo incastro.
Per questo motivo interviene in questi casi un consulente tecnico,
in quanto capace di individuare
il tipo di dinamica che esiste in una famiglia
e di capire quali sono gli interventi da arrivare sulla coppia genitoriale
per liberare il minore.



Transcript

Vediamo ora i disturbi e i comportamenti alimentari di quelli soggetti che hanno

difficoltà ad esprimere le emozioni con le parole le trasmettono soprattutto con il proprio corpo.

Si tratta di una serie di patologie che vanno dall'anoressia all'alimentazione incontrollata che

sono caratterizzate da un interesse esagerato per il proprio corpo

e da un'alimentazione che può essere estremamente limitata

o esageratamente accresciuta.

Questo tipo di pazienti,

in particolare nel caso dell'anoressia, sono soprattutto di

genere femminile.

L'anoressia nervosa è caratterizzata da una grande dimagrimento

che porta le persone ad un peso che può diventare estremamente pericoloso per la vita,

questo dimagrimento è voluto e ricercato dalla persona affetta che considera il suo corpo, invece,
di proporzioni molto maggiori di quello che sono effettivamente.
Nell'anoressia può esserci una restrizione severa,
quindi il cibo che si assume è molto limitato, oppure
il peso viene mantenuto basso attraverso l'assunzione di cibo seguita
da forti condotte di eliminazione che portano
ad eliminare più di quanto si è assunto
e per conseguenza a perdere peso.
Subito dopo viene la
bulimia nervosa.
Una patologia in cui
l'alimentazione è prevalentemente
cospicua,
si presentano episodi di abbuffate,
momenti in cui
il paziente assume una quantità di cibo
ingente
e al tempo stesso, questo paziente però ha la capacità di ridurre
il loro peso corporeo attraverso l'eliminazione
di cibo
e soprattutto
ricorrendo a strumenti o mezzi inappropriati quali il vomito,
l'uso di lassativi o diuretici,
l'uso di sostanze che eliminano l'appetito
o di attività fisica.
In queste persone l'equilibrio del peso si mantiene buono
e fisicamente si mantengono in forma.
L'eccesso opposto si verifica nella
direzione dell'alimentazione incontrollata detta anche.
L'alimentazione incontrollata
è costituita da una modalità di assunzione di cibo
costantemente basata sulle abbuffate,

il ricorso al cibo in maniera continuativa per diverse ore del giorno,
un'alimentazione senza freno,
vengono a mancare le capacità dell'individuo
di ridurre
l'alimentazione
e di ridurre il proprio peso fino ad arrivare a pesi notevoli, dai 150 ai 200 kg,
con un connesso rischio fisico in quanto
il peso eccessivo può causare patologie fisiche
di notevole gravità.
Queste tre patologie si susseguono una dietro l'altra,
hanno
come caratteristica di
passare dall'una all'altra man mano che la capacità
di controllo diminuisce. Nell'anoressia
nervosa il controllo è molto buono
e le persone sono in grado di limitare l'alimentazione
fino a mantenere un peso corporeo estremamente basso.
Quando il controllo diminuisce si passa
alla bulimia nervosa
all'interno della quale,
ragazzi o ragazzi che vivono
questa problematica,
si alimentano - anche molto -
ma mantengono un buon compenso
e hanno una capacità di controllo che emerge successivamente dopo
l'assunzione del cibo, non prima,
e tuttavia permette di mantenere
il peso a livelli accettabili.
Nel terzo tipo, l'alimentazione incontrollata,
la giornata è trascorsa soltanto
alimentandosi,
spesso davanti alla televisione, quasi senza consapevolezza dell'atto ripetitivo e costante nel tempo

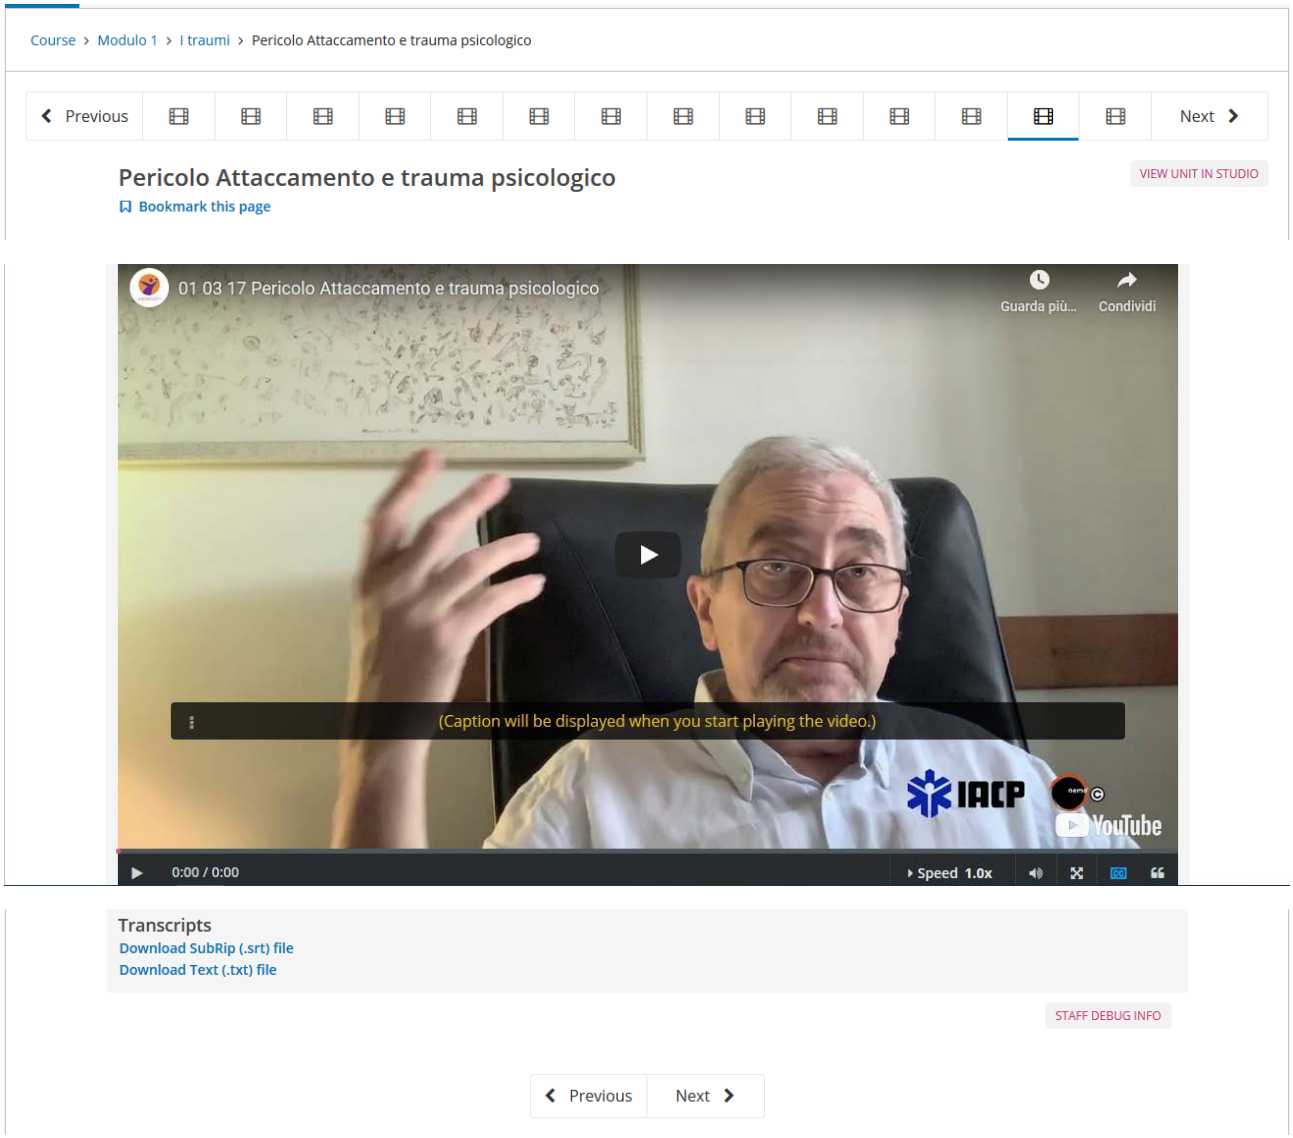
di assunzione di cibo. In comunque, queste tre patologie,

hanno una

serie di aspetti che riguardano tutta l’area emozionale

ed il fatto di esporre a vari tipi

di trauma che possono verificarsi nei disturbi alimentari.



Transcript

L’esposizione a situazioni di pericolo e a minacce

sul piano fisico o psicologico, come malattie, traumi,

condizioni di abbandono,

maltrattamento,

abuso fisico sessuale,

sono esperienze molto comuni,

sia durante l’infanzia che in età adulta.

Queste esperienze

non comportano necessariamente

lo sviluppo di un trauma psicologico,

in quanto

la nostra specie ha delle capacità di adattamento
estremamente
sofisticate,
che permettono di affrontare anche situazioni estreme
senza che queste necessariamente
sviluppino una condizione di trauma psicologico.
Se sono affrontate in modo efficace
queste situazioni pericolose
vengono, in qualche modo,
disarmate nel loro potenziale
disadattivo
permettendo all'individuo di rimanere in una condizione
di salute mentale
e psicologica.
In particolare la nostra specie ha sviluppato, nel corso
del tempo,
delle
capacità di relazione
e dei comportamenti molto sofisticati
che hanno la funzione principale di proteggerci
nei confronti dei pericoli.
Questo
insieme di comportamenti
e di atteggiamenti è definito
con il nome di sistema di attaccamento.
La parola attaccamento
deriva dalla teoria dell'attaccamento
che venne proposta inizialmente negli anni '50
dallo psicoanalista inglese John Bowlby.
La teoria dell'attaccamento sostiene che l'essere umano
ha una predisposizione innata
a sviluppare delle particolari relazioni di attaccamento

con delle figure primarie, spesso i genitori,
che svolgono
la funzione principale
di proteggere nei confronti dei pericoli.
Questa teoria non deriva solo dalle osservazioni psicologiche e psicoanalitiche,
ma da quelle che allora erano
le prime conoscenze che si sviluppavano
nell'ambito dell'etologia,
lo studio del comportamento animale,
della teoria dell'evoluzione
e delle nuove teorie cognitiviste,
sistemiche e cibernetiche.
La teoria dell'attaccamento nasce da un crogiolo di teorie moderne
che negli anni '50 dello scorso secolo iniziavano a diffondersi.
In questa teoria si parla di attaccamento, la cui funzione principale
è quello di proteggere dalle condizioni di pericolo, ma non solo:
la persona che si sente
in una condizione sufficientemente sicura
è sostenuta
ad
esplorare l'ambiente esterno,
conoscendone
le risorse
e imparando anche a prevenire i pericoli che l'ambiente stesso può nascondere.
Queste
funzioni dell'attaccamento sono state studiate sia nei bambini di ogni età
- in particolare in quelli di 1 e 2 anni di vita nel rapporto con la madre
- che nei primati, ed esempio
esistono ricerche degli anni '50 sulle piccole scimmie
resus
che
dimostrano quanto sia importante

anche per i primati
la funzione protettiva
della madre,
più ancora che quella nutritiva.
L'attaccamento viene solitamente suddiviso in: sicuro e insicuro.
Quello sicuro
è caratterizzato da un senso
di sicurezza, fiducia nei confronti dell'ambiente,
di fiducia nelle proprie risorse
e nella possibilità di essere aiutato e protetto in caso di pericolo.
L'attaccamento insicuro
è a sua volta diviso classicamente
in
attaccamento insicuro ambivalente preoccuparti
- nei bambini definito di tipo C -
caratterizzato da una
iperattivazione dell'organismo
con enfasi emotiva,
manifestazioni di rabbia,
paura,
lamentele
rispetto al proprio bisogno di protezione,
difficoltà nella separazione dalla madre;
l'altro tipo di attaccamento insicuro è quello evitante distanziante
- noto anche come tipo A -
al contrario del
precedente, si caratterizza da ipoattivazione, in particolare da una presa di distanza
dalle reazioni emotive
che possono essere
sollecitate da una condizione di pericolo, quindi dalla propria
paura, la rabbia,
il senso di vulnerabilità

che vengono
o inibiti nella loro espressione
(ad esempio con un atteggiamento di apparente indifferenza)
oppure falsificati e trasformati
in espressioni di emozioni opposte (ed esempio sorridere di fronte ad un argomento spaventoso).
QUando
queste modalità di attaccamento sono efficaci
proteggono
dal pericolo
che proviene dall'ambiente
e dalle relazioni nelle quali ci si trova impegnati.
Se
queste strategiesono efficaci
e proteggono sufficientemente
non si verificano condizioni di trauma psicologico
e l'individuo si mantiene in una condizione di relativa sicurezza.
La condizione di trauma psicologico si manifesta quando queste
modalità sono
inefficaci,
ad esempio quando un atteggiamento di inibizione di espressione delle proprie paure, rabbia
o bisogni,
non è sufficiente per protegge l'individuo
dalle minacci ambientali.
Il trauma psicologico è una condizione nella quale tutta l'attività di elaborazione mentale
è influenzata negativamente
da un'esperienza di pericolo passata oppure attuale.
Questo può venire da un evento singolo particolarmente intenso ed improvviso - ad esempio
un trauma fisico
o un abuso -
ma può venire anche da una serie ripetuta di esperienze
che nel loro complesso assumono valore
traumatico:

in questo caso si parla di trauma evolutivo,
è la condizione in cui un bambino,
per esempio, cresce in un gruppo familiare
inadeguato
e trascurante
e nel loro complesso queste esperienze prolungate creano un clima di sviluppo
inadeguato
che può portare ad una condizione comunque di trauma psicologico.
La capacità di adattamento e rielaborazione di una situazione di pericolo potenzialmente traumatica
dipende da alcune caratteristiche.
Dall'individuo, la sua età, maturazione,
personalità
e dalle caratteristiche del suo attaccamento, se sono efficaci o meno a proteggerlo;
la sua forza fisica e condizione di salute
in quanto una persona malata è più fragile
nei confronti dell'elaborazione di una condizione di pericolo.
È molto importante, inoltre,
la disponibilità protettiva delle figure di attaccamento, che una persona che non si
senta sola davanti al pericolo, ma accompagnata da relazioni protettive da parte di persone
disposte a far sentire
protetto
e accompagnato nell'elaborazione
di una esperienza di natura pericolosa.
Un ruolo importante è giocato dal contesto sociale: è fondamentale trovarsi
in un ambiente accogliente, con persone che accolgono e sostengono
con
la loro cultura,
rituali o presenza personale (ad esempio gli amici).
Il processo di adattamento di una condizione di trauma non è immediato ma ha bisogno di tempo,
ad esempio
un lutto significativo - come quello
del coniuge o genitore -

richiede solitamente

uno o due anni per poter essere adeguatamente elaborato,

senza trasformarsi in una condizione

di lutto traumatico.

Quando

un'esperienza potenzialmente traumatica non è elaborata,

solitamente, viene accompagnata da

un'eccessiva iperattivazione

emotiva, con

sogni, incubi,

paure,

senso di minaccia,

reazioni incontrollate

- come nel caso del disturbo post traumatico da stress -

oppure da una situazione di ipoattivazione eccessiva, ovvero una eccessiva presa di distanza

da tutto ciò che riguarda l'esperienza

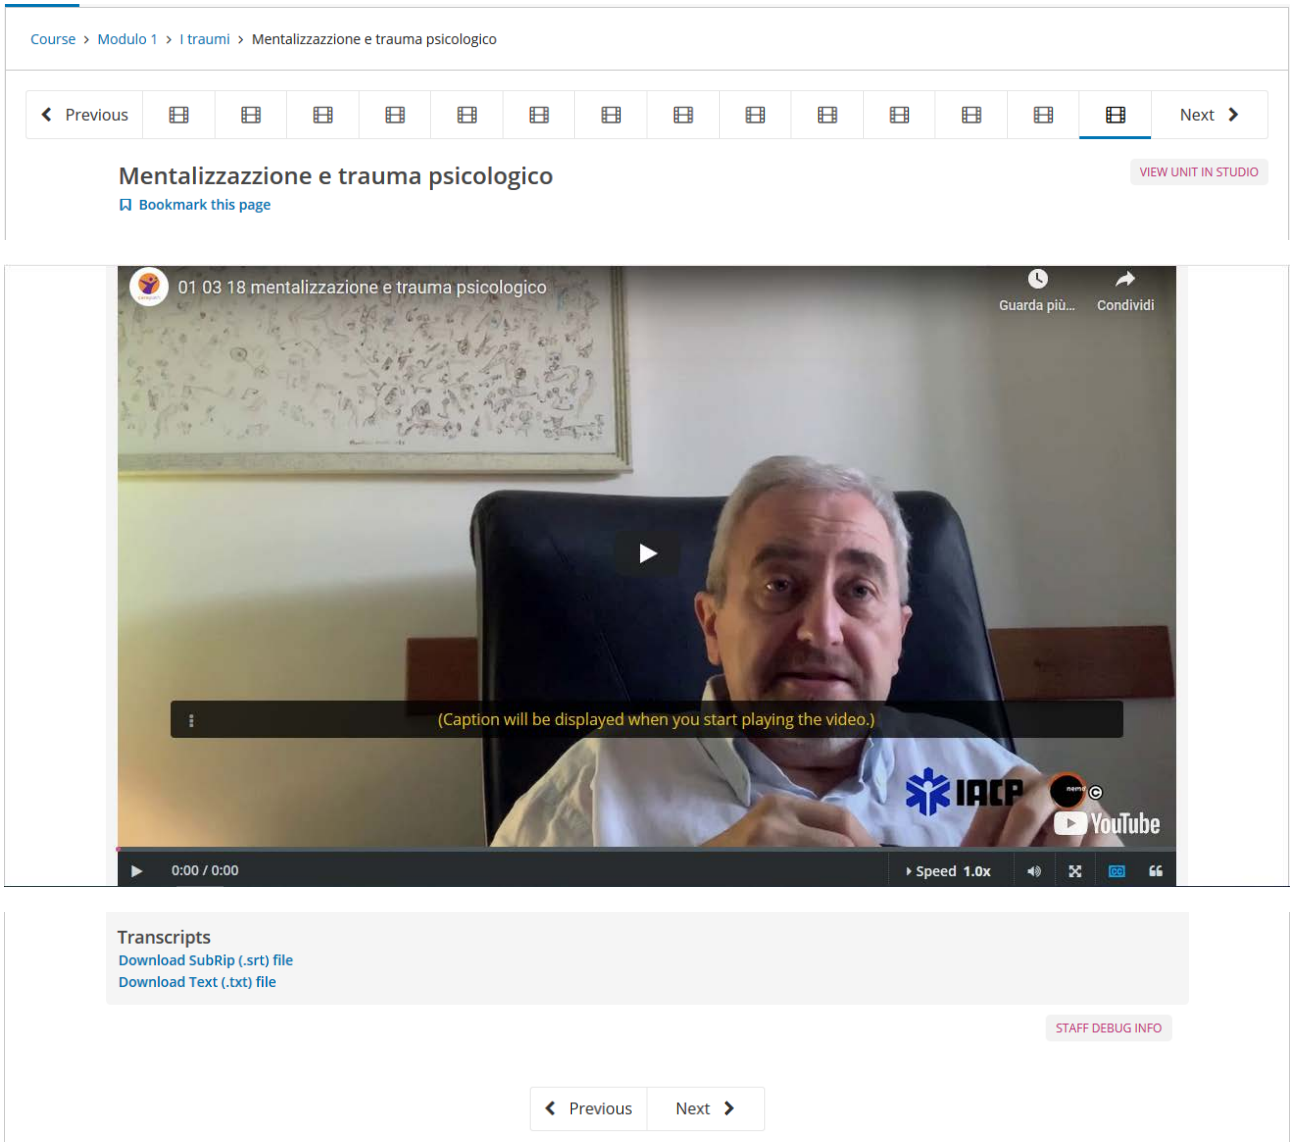
pericolosa,

mancanza di ricordi,

inibizione affettiva,

evitare di parlare o i luoghi che sono legati all'esperienza traumatica.

In presenza di queste due condizioni si può parlare di trauma psicologico.



Transcript

Quando si parla di mentalizzazione si parla di qualche cosa che sembra un scontato,

che viene da molto lontano.

In effetti ogni essere umano,

prima ancora

dello

sviluppo della psicologia,

ad un certo punto della sua vita si pone dei problemi di mentalizzazione;

cioè si pone

il problema di riflettere su se stesso e su gli altri,

considerando che noi e gli altri abbiamo

una mente,

dei pensieri,

sentimenti, bisogni,

aspettative e credenze

che ci influenzano.

Un modo semplice per intendere il concetto di

mentalizzazione

è quello

che corrisponde a considerare

sé stessi e gli altri

in termini di stati mentali.

Queste capacità nella nostra specie

iniziano a configurarsi

attorno ai 4 anni di età,

quando il bambino si rende conte

che

quello che pensa e sente

non è necessariamente capito e condiviso da altre persone,

ad esempio la madre può non conoscere cosa passa nella mente del bambino.

I bambini quando imparano questa

grande novità imparano allo stesso tempo anche

a

utilizzare

una modalità

strategica di adattamento ai problemi

molto utile

e importante; imparano cioè l'importanza della menzogna:

una bugia si può dire se si pensa che la mente degli altri ha una visione

del mondo diversa dalla propria

e gli altri non possono conoscere i pensieri di un individuo.

La mentalizzazione

e i suoi processi sono basati su una serie di

passaggi.

Il primo riguarda il fatto di essere
relativamente
sensibili a percepire
gli stati mentali, ovvero
a rappresentare di noi e degli altri
degli stati mentali (ad esempio capire di essere
allegri, tristi,
di avere aspettative,
pregiudizi)
e
la capacità di interpretare il proprio comportamento e quello degli altri
sulla base
di questi stati mentali
è fondamentale per poter adattarsi
(ad esempio una persona che sta davanti a noi in silenzio:
non pensiamo non abbia
nulla da dire,
pensiamo che la sua mente
sia attraversata
da immagini e pensieri e il suo silenzio non è espressione di vuoto, ma di una serie di stati mentali
che
sono alla base di questo comportamento silenzioso).
Un secondo aspetto importante della mentalizzazione è che
la mentalizzazione di noi stessi
favorisce la regolazione del nostro organismo,
se per esempio ci rendiamo
conto di essere
arrabbiati
e iniziamo a pensare
che qualcosa che si è detto
è relazionato alla rabbia,
il fatto

di rendersene conto,
ricordare,
fare aspettative
e proiezioni sulle conseguenze
di un'azione
apre una strada psicologica per regolare la rabbia che si è attivata in noi.
Il cuore, la respirazione, la produzione di ormoni
legati all'attivazione rabbiosa
cominciano ad essere regolati
da meccanismi di carattere psicologico;
ad esempio potrei sentirmi
in colpa per aver provato rabbia verso qualcuno a cui voglio bene,
questo inibisce l'espressione della rabbia
e regola lo stesso organismo;
si tratta di una funzione fondamentale, tanto è vero
che le persone con scarse capacità
mentalizzazione sono maggiormente esposte
alla disregolazione dell'organismo
(il cuore
batte
più velocemente e in modo irregolare,
le reazioni emotive sono più incontrollate,
e questo può portare a lungo termine
a
malattie
dovute alla disregolazione costante dell'organismo).
Una delle funzioni più importanti del genitore nei confronti dei figli
è quello di essere
mentalizzazione:
pensare
cioè ai figli
anche in relazione a quelli che possono essere

i bisogni, sentimenti,

paure,

calandosi - in un certo senso - nei panni dei figli

e percependo le cose anche dal loro punto di vista.

Ad esempio un bambino di tre anni

vivrà certi argomenti

e interpreterà certe parole o discorsi

con le proprie capacità

di bambino,

da parte dell'adulto è importante

mettersi nei suoi panni.

Questa condizione, che è stata definita mindedness

è una delle condizioni maggiormente

correlata

allo sviluppo sicuro dei figli; è una condizione è basilare

del buon genitore

quello di riuscire

a mettersi nei panni dei figli e percepire i bisogni.

Si osserva giànella madre di un bambino molto piccolo

che, per esempio,

si

mette nei panni del figlio

che piange e si agita, e quindi pensa che possa avere freddo, o fame, dando così voce

ad uno stato del bambino,

come se il figlio a essere in qualche modo pensieri organizzati

e li potesse esprimere.

La capacità di rappresentarsi gli stati mentali dei figli

è una condizione base di fare il genitore.

La mentalizzazione è anche alla base della

capacità di affrontare lo stress e le condizioni potenzialmente pericolose

adattandosi

senza che si sviluppino condizioni di traumi psicologici.

Per esempio:
ad un bambino di fronte ad un
comportamento incoerente del genitore -
che magari ha un gesto di rabbia
o di violenza fisica
o dire cose negative verso il bambino -
la capacità di questo bambino di immaginare lo stato mentale del genitore
agisce come ammortizzatore e permette di considerare
quello che il genitore fa e dice
all'interno di un contesto. (Può pensare
"il babbo
è stanco e quello che dice non corrisponde alla realtà,
il babbo di solito
è affettuoso e mi vuole bene,
ciò che accade ora ha valore
in questo momento ed è legato a stati d'animo particolari ma non è assoluto").
L'atteggiamento appena esposto protegge dagli stati mentali
degli altri
e rende la situazione potenzialmente meno traumatica.
È un fatto che si osserva chiaramente nelle persone adulte con dei bassi
livelli di mentalizzazione,
come il caso
da persone con disturbo borderline della personalità,
sono molto più esposte a continui traumi psicologici,
ciò che avviene a loro non viene
contestualizzato, sottoposto ad un processo di riflessione sufficiente,
per cui tutte diventano
totali, assolute
e
potenzialmente traumatiche.
In alcuni momenti
l'incapacità

dei genitori di porsi nei panni dei figli
può essere particolarmente
pericolosa
e produrre degli atteggiamenti che in un bambino o adolescente
possono
manifestarsi attraverso comportamenti di forte aggressività.
L'aggressività e i comportamenti dettati da questa
possono essere,
in parte,
interpretabili
attraverso il concetto di mentalizzazione.
Se per esempio dei genitori sono costantemente irritati
dai comportamenti di un figlio, se
ad esempio un figlio
pone
un problema
o fa un capriccio
il genitore inizia a rivolgersi
al figlio in modo negativo (magari affermando che sia stupido, malato, non valga nulla),
dal punto di vista del figlio
questo ha di se stesso un'immagine restituita di una persona malata,
disturbata,
incapace,
questo atteggiamento viene tenuto a distanza
da comportamenti aggressivi per cui ogni volta che un adulto si avvicina
ad un bambino in queste condizioni con l'intento di conoscerlo
e di farlo confidare avrà come risposta probabile un atteggiamento
di forte reazione aggressiva,
con la funzione di tenere l'adulto lontano
in quanto potenzialmente traumatico.
Il caso può essere quello di giovani che in classe sono ritenuti incapaci
e vengono più volte punti,

gli insegnanti li ritengono

dei soggetti

negativi

e a casa questi ragazzi hanno genitori che rinforzano

questa idea negativa di se stessi; questi ragazzi

nei confronti degli stessi adulti che cercano

di aiutarli (un educatore, un insegnante) hanno degli atteggiamenti di forte reattività

e rabbia con la funzione di tenere l'altro

lontano

in modo da non ripetere l'esperienza

di sentirsi dipingere come persone sbagliate o negative.

lo sprar il sistema di protezione per

richiedenti asilo rifugiati ha

modificato il nome in cipro imi questo a

causa della entrata in vigore della

legge 113 nel 2018 quindi molto

recentemente

dopo tutta una serie di modifiche anche

normative che il nuovo governo

insediatosi nello scorso maggio in

italia ha apportato tutto il tema

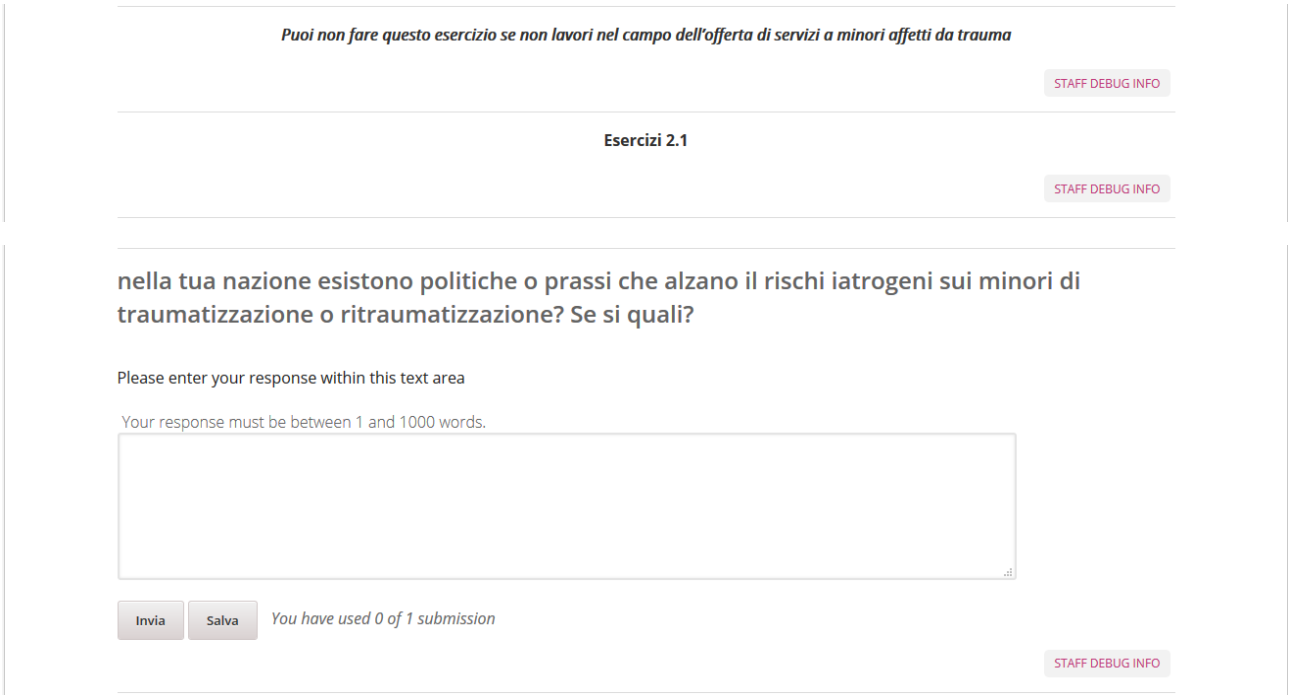
dell'immigrazione del diritto d'asilo e

quindi dell'accoglienza lo sprar è stato
istituito nel 2002 è costituito da una
rete di comuni enti locali che in
collaborazione con le associazioni del
terzo settore e le amg gestiscono su
base volontaria quindi su propria scelta
dei progetti di accoglienza e
integrazione per i richiedenti asilo e
rifugiati
questa rete nel corso degli anni ha
avuto una progressiva e positiva
evoluzione
siamo passati dagli iniziali 1.500 posti
di accoglienza agli attuali 35 mila vi
sono stati diversi passaggi nel corso
della storia dello sprar che ne hanno
determinato alcuni cambiamenti
il primo è stato appunto il momento
della sua istituzionalizzazione
attraverso una legge che lo ha reso
stabile e ordinario come sistema
d'accoglienza centrale in italia laddove
negli anni precedenti non esistevano
altri sistemi di accoglienza strutturati
ma soltanto degli interventi di tipo
emergenziale
un altro momento importante è stato
quando nel 2003 la cosiddetta emergenza
nord africa ha fatto emergere con ancora
più evidenza anche a livello europeo la
efficacia el efficienza del modello
sprar in termini di raggiungimento di

obiettivi di inclusione sociale e
l'integrazione
l'ultimo passaggio è quello appunto più
recente nel quale viene modificata
l'identità dello sprar che non può più
accogliere
a seguito dell'entrata in vigore della
legge di cui parlavo né richiedenti
asilo nei progetti umanitari
anche perché la protezione umanitaria
viene abolita e spa cogliere
esclusivamente minori stranieri non
accompagnati titolari di protezione
internazionale che però costituiscono un
numero residuale rispetto al numero
delle richieste d'asilo e alcuni nuove
alcune nuove tipologie di permesso di
soggiorno ai cosiddetti casi speciali e
quindi lo sprar che adesso appunto si
chiama sipro anni potrà accogliere i
casi speciali per cure mediche
i casi speciali di vittime di tratta
vittime di sfruttamento lavorativo
vittime di violenza domestica vittime di
calamità naturali e persone che si siano
distinte per particolari atti di eroismo
questo sempre riferito agli stranieri
naturalmente non ai cittadini italiani
che hanno altri circuiti di protezione
sociale si può dire quindi che lo strada
assume adesso una identità più di
welfare indirizzato agli stranieri che

non di sistema accogliente e protettivo
nei confronti delle persone qualche modo
afferenti al tema del diritto ad asilo
dunque cambia la propria identità e
potrebbe rappresentare sulla carta anche
un passaggio parzialmente positivo se si
pensa che ci si rivolge comunque alla
protezione di persone con qualche tipo
di fragilità e la difficoltà in questo
momento è costituita dal fatto che il
permesso di soggiorno diventa dirimente
ma non è detto che la persona vittima di
tratta automaticamente possa acquisire
il permesso per caso speciale come
vittima di tratta e lo stesso si può
dire della vittima di sfruttamento
lavorativo e così via
non abbiamo dei criteri quindi precisi
di come dovranno essere queste procedure
e di come far confluire tutte le persone
con questo tipo di vulnerabilità sotto
la definizione anche giuridica di caso
speciale perché solo attraverso la
formalizzazione in un permesso
un giorno per caso speciale quella
persona potrà accedere allo sprar e
quindi usufruire di tutti i servizi di
protezione presa in carico e anche
accompagnamento all'inclusione e
all'integrazione che lo sprar prevede
inoltre non sono stati definiti ancora i
criteri i requisiti in base ai quali una

persona per esempio potrà avere il
permesso per cure mediche per quale
tipologia di disagio mentale fisico di
quale livello di gravità per quale
temporalità questo questa presa in
carico e prevista e dunque ci troviamo
in un momento di transizione molto
critico perché moltissime persone che
fino a pochi mesi fa avevano diritto di
accesso ai progetti sprar cura non
l'hanno più
e viceversa tutti coloro che
apparentemente sulla carta sembrano
poter avere questo accesso in realtà non
sanno o non sappiamo come poter dar loro
diciamo così la pezza d'appoggio con cui
effettivamente usufruire di questo
diritto



Se tu avessi il potere di promuovere il cambiamento nella tua nazione cosa cambieresti per abbassare i rischi iatrogeni di traumatizzazione o ritraumatizzazione nelle politiche in generale e in quelle relative alla salute, assistenza sociale, pari opportunità ecc.?

Il concetto di intersectionality sviluppato in origine da Kimberly Williams Chrenchsud,

docente di legge, nera e femminista,

potrebbe essere compreso più a fondo da un punto di

vista geografico, geopolitico, globale, transnazionale e postcoloniale;

questo secondo coloro che hanno poi studiato e riutilizzato questo concetto.

Alice Ludvig ha sviluppato elaborati schemi

multidimensionali che includano più livelli di differenza,

quali possono essere il genere, la sessualità, la razza, il colore della pelle, l'etnia, lo stato, la classe, la cultura,

e così via e questo ci da la misura degli innumerevoli livelli

di cui dovremmo tenere conto e prestare attenzione quando ci troviamo in una relazione di aiuto con

persone che afferiscono quelle che vengono comunemente considerate popolazioni minoritarie.

Per citare Audre Lorde
potremmo dire che non c'è nessuna lotta che abbia a che fare
con un solo problema, perchè non viviamo vite fatte di una sola dimensione.
L'internazionalità è sempre più spesso un elemento dello sviluppo di politiche di parità,
la possibilità,
anche grazie al lavoro delle Nazioni Unite e dell'Unione Europea.
SI pensi alle direttive per combattere le discriminazioni
e di tutte le iniziative a livello nazionale, regionale, locale
e alle politiche e al management delle diversità
che ormai in tutte le nazioni dell'Occidente, in moltissime
aziende,
vengono adottate.
Questo non azzera, ovviamente, le ambivalenze, le sofferenze e i silenzi
di chi si trova a vivere condizioni di minoritarietà multiple,
magari dopo aver vissuto situazioni traumatiche proprio a causa minoritarietà.
Sul "fatto quotidiano" del 17 maggio 2018
viene riportata una frase di un ragazzo del Camerun:
"un giorno eravamo in cucina e guardavamo in TV un programma sui migranti LGBTQI,
i miei compagni africani hanno cominciato a dire -
l'Italia è un paese di merda pieno di omosessuali
- ancora una volta non mi sono sentito libero";
Allen ha 22 anni ed è scappato da chi lo picchiava e lo chiamava demonio,
si è lasciato alle spalle il Camerun -
riporta il giornale
- dove essere omosessuale è reato,
per chiedere in Italia la protezione internazionale,
ma la paura è rimasta a lungo la stessa
perché l'omofobia lo ha seguito fino a dentro al hub di Via Mattea Bologna dove è stato accolto
insieme ai suoi connazionali.
I migranti LGBTQI, molto spesso, sono molto giovani,
non possono contare
sul sostegno della propria comunità di origine,

con cui si trovano a migrare,

ma che spesso culturalmente connotate da quella omofobia o transfobia da cui si è sfuggiti.

Non possono neppure essere certi di venire a contatto con realtà multiculturali in cui vivere

serenamente il proprio orientamento sessuale o la propria identità.

Come si sottolinea in più occasioni in alcune interviste di Vincenzo Bramato,

presidente del circolo Arcigay di Bologna,

in alcuni paesi europei- come la Germania

- esistono strutture protette per accogliere chi scappa da persecuzioni a causa del proprio orientamento sessuale,

in cui il personale ha ricevuto una formazione specifica

volta proprio a non riproporre atteggiamenti giudicanti o denigratori che rinverdirebbero lo stigma

e il trauma delle persone.

In Italia , al momento, il modello di accoglienza non prevede queste specificità,

ma esistono realtà virtuose come l'esperimento pilota

avviato nel 2017 a Modena con un piccolo appartamento da sei posti

riservato proprio ai richiedenti asilo LGBTQI,

in più uno sportello per migranti LGBTQI di Verona.

Per questi ragazzi

migranti

in una età evolutiva

afferenti alla comunità LGBTQI

essere parte di una minoranza etnica in un paese che li ospita

è solo una parte del problema.

Sono infatti, molto spesso una minoranza silenzio e spaventata,

anche all'interno della propria comunità di riferimento.

Un trauma dell'invisibilità, per dirla con Rogers,

raddoppiato,

un minority stress - se vogliamo fare riferimento a Vittorio Lingiardi

- che ha un'incongruenza - perarrivare fino a Rogers - raddoppiata;

dunque un rischio raddoppiato per la salute psicofisica di queste persone

e quindi una perdita di capitale umane inestimabile.

Formarsi all'accoglienza significa innanzitutto formarsi sui diritti umani

e sulle specificità
che il migrante
LGBTQI porta con sé nella relazione d'aiuto.
La formazione dovrà quindi essere centrata sulla persona
e accogliere queste specificità conoscendole per risultare veramente inclusivi,
inoltre i servizi rivolti ai migranti,
progettati e forniti senza considerare
molto spesso la variabile dell'orientamento sessuale e dell'identità di genere
ne riducono a volte l'efficacia,
sia per quanto concerne la relazione con l'utente
(e quindi questi ragazzi che non
posso ricevere l'accoglienza che invece potrebbero avere),
ma anche relativamente all'utilità di percorsi formativi o preventivi
(pensiamo ad esempio alle malattie sessualmente trasmissibili,
quanto sia
multidimensionale anche una formazione rispetto a questo aspetto
nel momento in cui abbiamo un'adolescente migrante afferente alla comunità LGBTQI).
Dall'altro lato i servizi forniti proprio dalla comunità LGBT
sono fortemente collegati ad un modello culturale di uomo-gay e donna-lesbica occidentali,
e quindi molto spesso questi modelli non considerano
un modello in cui questi ragazzi che vengono da altre culture
possono davvero riconoscersi.
L'esperienza delle realtà sopra citate
ha provato che i servizi di informazione
di supporto e di counseling forniti dalle istituzioni, ma anche dalle associazioni,
possono non essere efficaci per questi ragazzi;
pertanto
lavorare con queste popolazioni di molteplici minoritarietà
implicherà una riflessione interdisciplinare
sulle prassi delle relazioni d'aiuto. Nella relazione con queste persone
la approfondire delle dimensioni relative all'omosessualità, la bisessualità e la transessualità
nella storia della psichiatria e della psicologia,

il concetto di stigma,

di omofobia, di omofobia interiorizzata,

ma anche a costare tutto questo un costante aggiornamento degli operatori

sulle legislazioni

relative a questi temi,

sia nei paesi di accoglienza che nei paesi di provenienza delle persone che si va ad accogliere.

In più andrebbe continuamente

approfondito e conosciuto, perché in continua evoluzione e variazione, tutto quello che

è relativo alla legislazione

legata all'asilo.

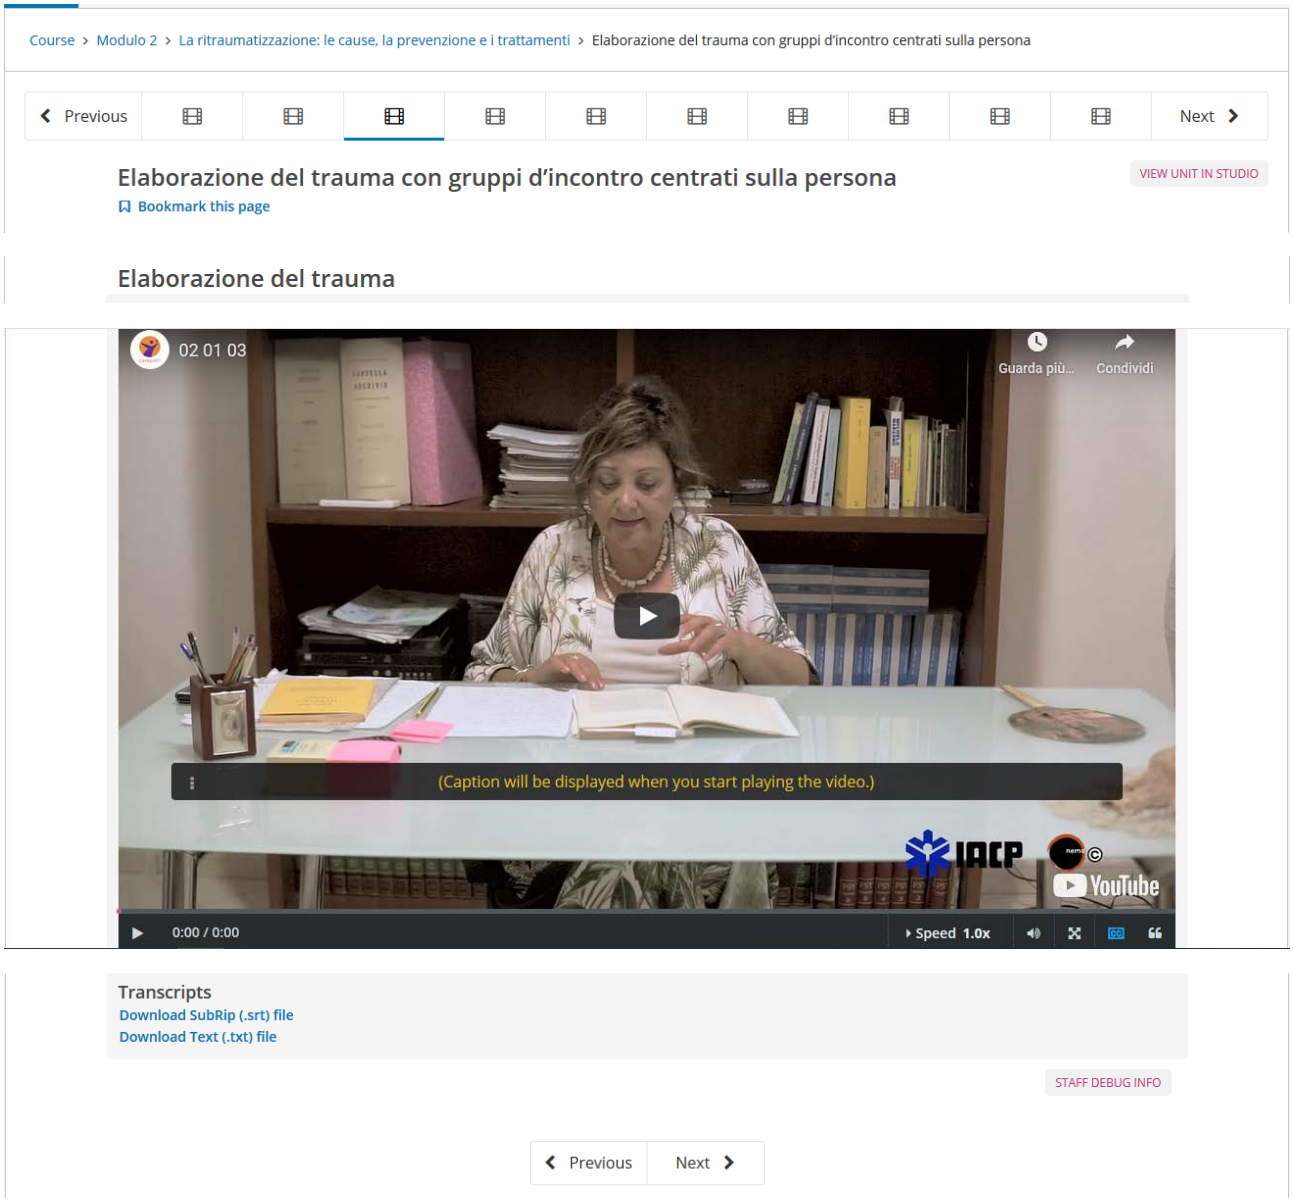
Unitamente alle competenze di ordine più tecnico,

sarà necessario sviluppare e consolidare, dal punto di vista più personale,

un approccio sensibile al genere

e mantenere viva dentro di sé e all'interno del gruppo di lavoro

con cui si accolgono i quesiti ragazzi una riflessione sui diritti umani, come convenzione occidentale.



Transcript

Nella sua attività presso il servizio poliambulatorio di Lampedusa, dal 2001, la dott.ssa Malatino da ormai 25 anni. Lampedusa è sede di sbarchi da parte di uomini e donne che cercano di lasciare la loro terra per trovare un futuro migliore. Nell'affrontare il lavoro con le persone dell'isola si sono presentate occasioni di lavoro anche con i migranti, l'esperienza migratoria è divenuta parte del suo percorso personale e professionale.

Nel 2002 si chiedeva di offrire presso il centro di accoglienza supporto e terapia a persone che, sbarcate sull'isola dopo viaggi molto difficili, lunghi e con notevoli rischi di morte, avessero bisogno di farmaci e il responsabile della struttura chiese di fare una valutazione psichiatrica dei soggetti che sbarcavano sull'isola.

Si mostrò pressoché impossibile valutare la salute psichiatrica di soggetti esposti

e sottoposti ad eventi traumatici così gravi, e che però venivano da cultura diverse non richiedevano l'aiuto o il sostegno di tipo farmacologico, provenendo da contesti questi che non consideravano la medicina occidentale come medicina convenzionale. Ciò che più sosteneva ed aiutava questi soggetti in certi casi era ricorrere a rituali magici e in qualche modo legati al pensiero magico preventivo di cui molti erano portatori.

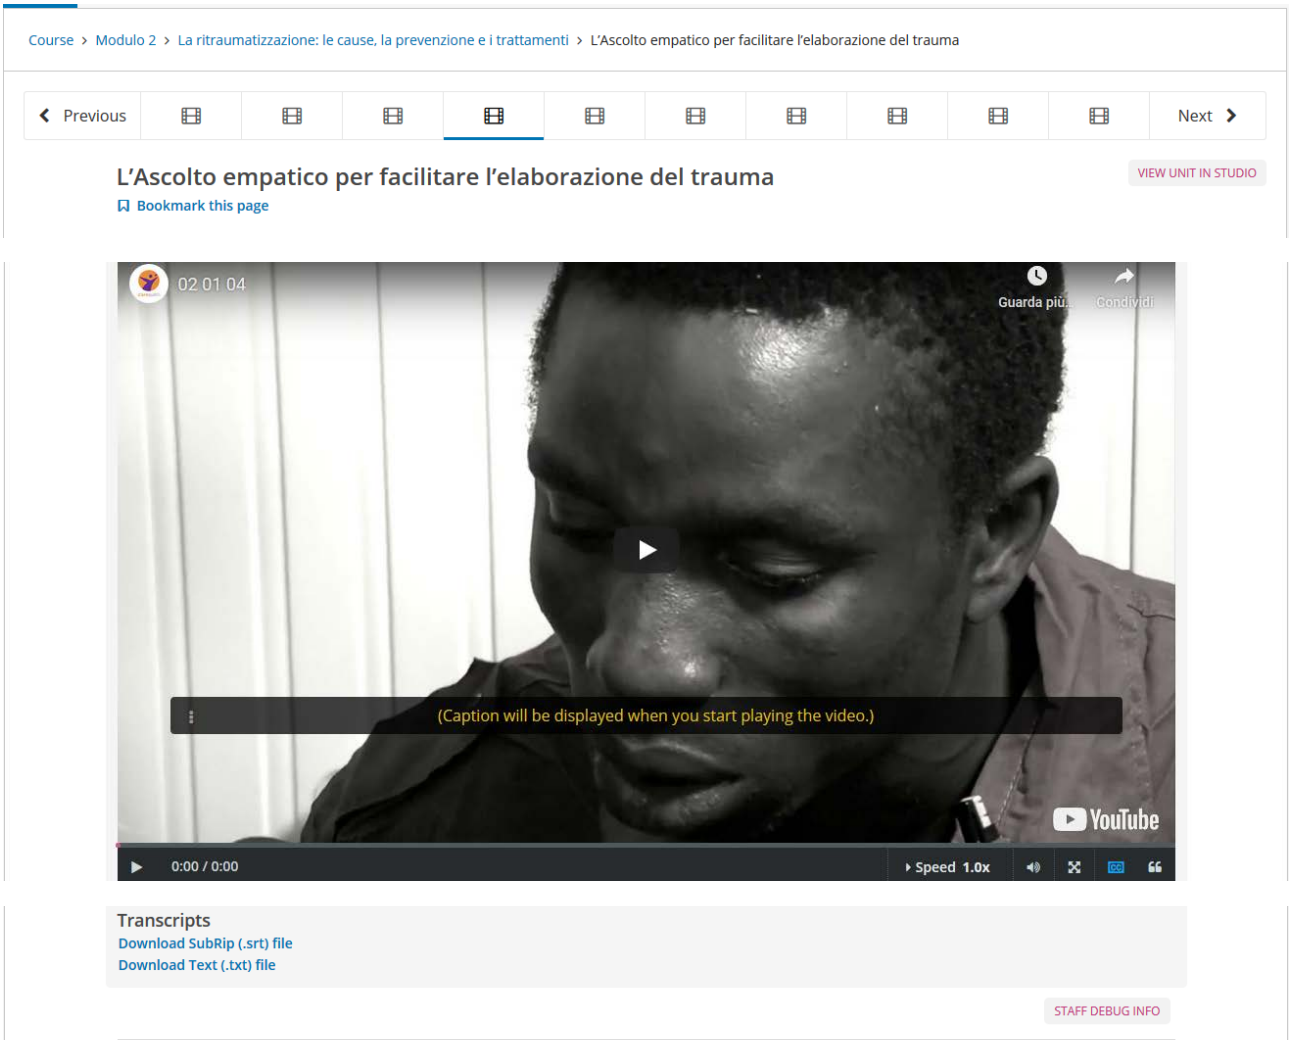
Accogliere tutta questa sofferenza si mostrava particolarmente complesso e allo stesso tempo essere di aiuto e supporto. Fu così che si pensò di organizzare dei gruppi di ascolto.

Questa è stata un'esperienza straordinaria per una psicoterapeuta psichiatra Rogersiana che fino a quel momento aveva condotto gruppi di ascolto legati al modello di Carl Rogers.

In questo tipo di gruppo l'incontro è caratterizzato dal fatto che le persone si siedono in cerchio e si ascoltano reciprocamente, l'elemento fondamentale è l'assenza totale di giudizio e il rispetto assoluto di qualsiasi argomento voglia essere trattato dal gruppo; in questo modo è possibile creare un clima di confidenza che facilita molto la fiducia e aiuta i partecipanti, anche in situazioni emozionali particolarmente problematiche, a rielaborare l'esperienza e contemporaneamente a trovare una forma di solidarietà: rendersi conto del proprio vissuto personale non è necessariamente solo individuale, ma può essere condiviso e compreso da altri soggeti, ciò di per sé favorisce la risoluzione - a volte - della sofferenza, del conflitto o dell'evento doloroso. Questo è quanto è accaduto all'interno di questi gruppi. Un elemento importante e fondamentale è stato trovare l'equilibrio con il mediatore culturale, il traduttore, in quanto il facilitatore non parlava la lingua dei soggetti e le condizioni di base su cui si è trovati ad operare sono state assolutamente proibitive per mancanza di materiali (mancavano sedie) o per situazioni contingenti (alcuni gruppi erano appena scampati dal naufragio e alcuni avevano addosso solo lenzuola di salvataggio).

Nonostante la situazione poco ortodossa, con grande sorpresa, si è constatato che il valore profondo non sta solo nella forma, ma nella sostanza. Di fronte a persone che portavano con sé la loro storia dopo viaggi terribili e lunghi (nel deserto, in Libia, il rischio di annegamento), le esperienze raccontare erano fortemente traumatiche e lo sono state anche per il professionista che ascoltava queste storie, con la difficoltà di uscire anche da questa situazione di sofferenza e di dolore che era diventata anche l'esperienza dello stesso professionista. È stato rievocativo, per il professionista, di un evento - che era stato dimenticato - dell'infanzia di quando una zia era partita e che aveva causato tanto dolore da aver comportato la rimozione

del ricordo. Alla luce di tutto ciò, quando si accoglie
qualcuno che ha vissuto un dramma come questo, la cosa fondamentale è provare a dare sempre l'elemento dell'ascolto, elemento fondamentale della possibilità che qualcuno si apra ed esprima anche i suoi vissuti. Accanto a questo è necessario avere l'accettazione profonda della persona e l'assenza di giudizio perché questo favorisce la fiducia. Inoltre è importante l'empatia, un balsamo per l'anima, il sentire che un'altra persona si mette nei tuoi panni e ascolta profondamente come se sentisse il tuo stesso dolore. Queste sono le tre condizioni fondamentali che detta Carl Rogers per lavorare nei gruppi di incontro e nelle relazioni di aiuto di psicoterapia. A conclusione di questa riflessione sul valore dei gruppi di incontro rogersiani nella rielaborazione del trauma con soggetti migranti è possibile soffermarsi su un aspetto interessante: nessuno ha avuto bisogno di somministrazione di farmaci dopo aver partecipato ai gruppi di ascolto. Quello che ha favorito molto è la naturale dimensione del gruppo che è quello dell'assetto circolare, la circolarità ha riprodotto forse anche un po' parte delle esperienze che i soggetti riescono a vivere nei loro paesi, ad esempio in Eritrea, dove c'è l'usanza che gli anziani e i maschi del villaggio si riuniscono in cerchio intorno ad un grande albero, che viene definito l'albero delle parole. In questo incontro, attraverso le parole, è stato ricostruito il tessuto di una trama strappata.



Transcript

Attraverso lo spezzone di un film, "Orizzonti Mediterranei" di Pina Mandolfo e Maria Grazia Lo Cicero, curato nel 2014 dopo gli eventi dell'ottobre 2013 dove morirono 388 persone nel naufragio dell'isola di Lampedusa.

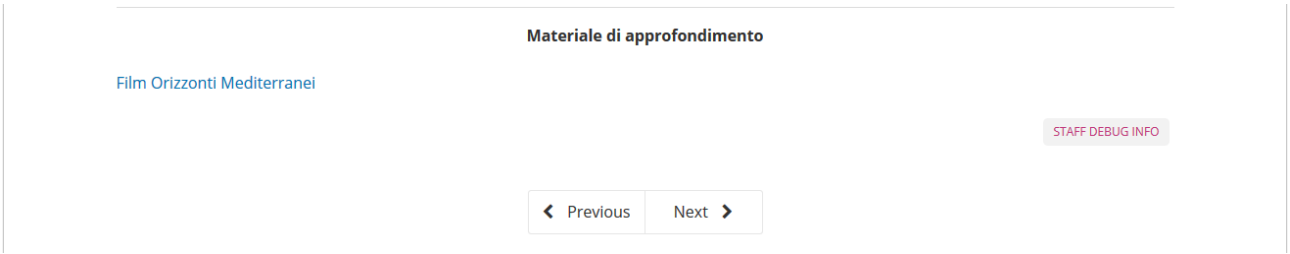
In quel tempo si è pensato di elaborare questo film per dare persone contezza e conoscenza della realtà drammatica dell'esperienza di migrazione.

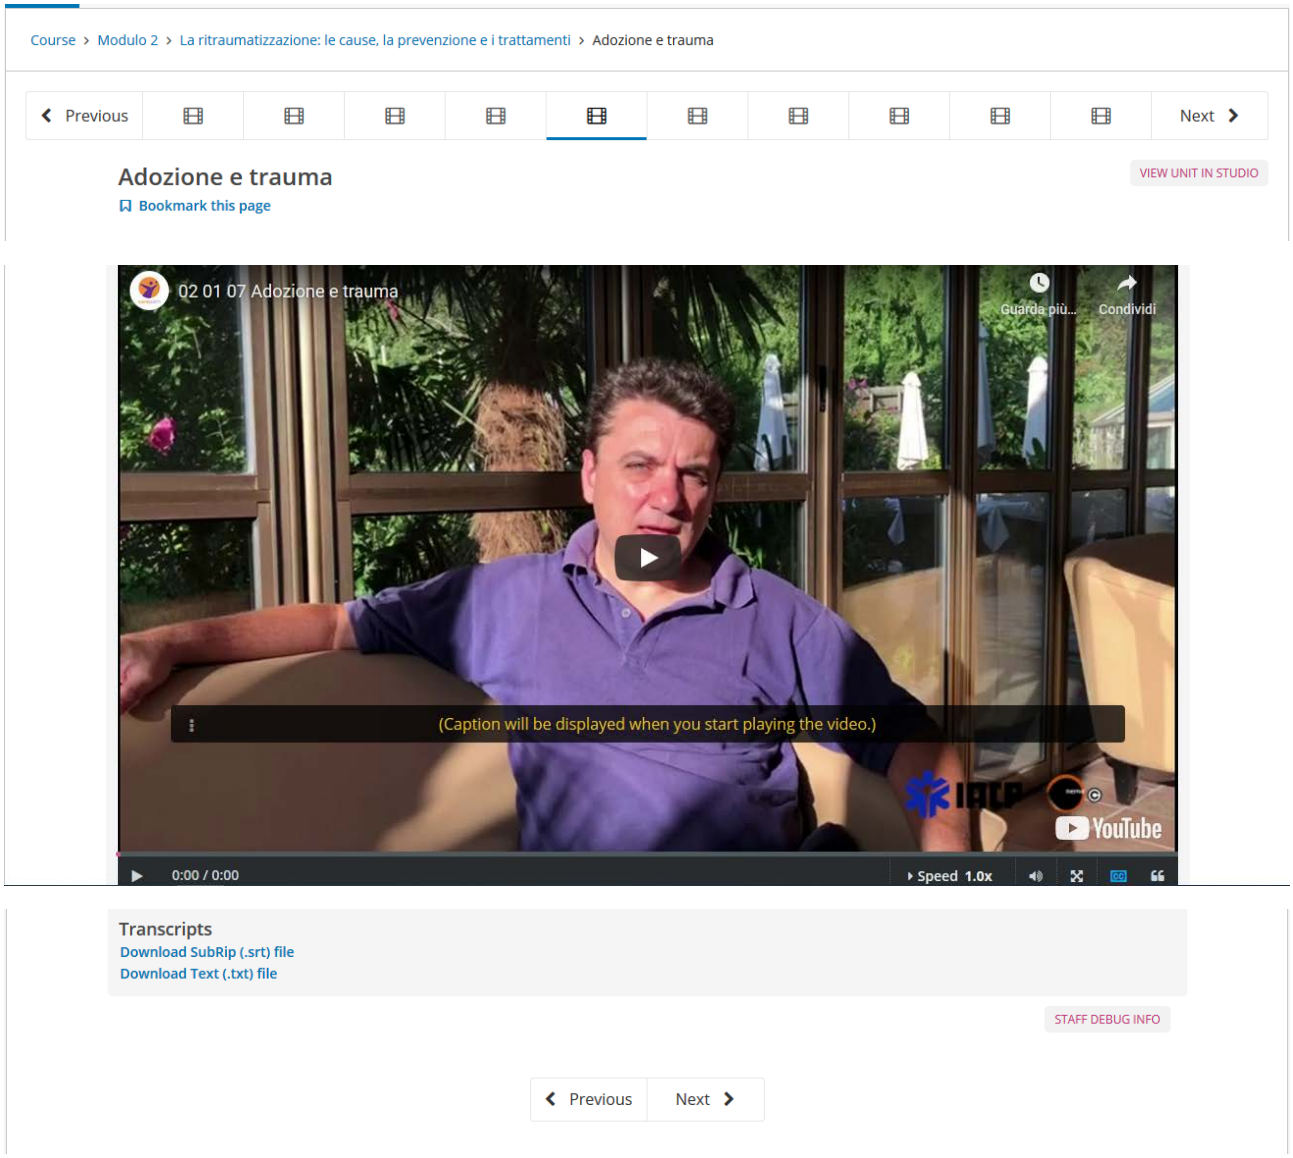
La storia del ragazzo protagonista è una storia che racconta di violenze fisiche e psichiche; la cosa singolare è che questo ragazzo è arrivato accompagnato dalla sorella e questa - anch'essa oggetto di violenza e stupro - non aveva mai parlato con il fratello di questa esperienza, come lui a sua volta era stato violentato e non ne aveva mai parlato con la sorella.

Si è osservato come per lui era fonte di vergogna parlare di questa esperienza, tant'è che aveva chiesto che la sorella non fosse presente, perché lui non voleva che lei lo sapesse, ma un po' - come confessò in seguito - per vergogna di essere un uomo e di essere

stato fatto oggetto di violenze.
Va ricordato che questo ragazzo aveva solamente 16 anni.
Nella testimonianza che il ragazzo rende si ascolta cosa è accaduto nel suo percorso
e come l'unica modalità per lasciare che il suo flusso emozionale non si interrompesse
fosse stata quella di ascoltare senza mai interrompere la narrazione.
Solo in pochi casi, in caso di situazione, qualche cenno del capo o la condivisione di
uno sguardo più profondo, favoriva per lui la possibilità di continuare a parlare della
sua storia.
Si osserva quindi come l'aspetto empatico ha a che fare con la manifestazione di un'empatia
più che verbale situazionale, cioè il contatto visivo, cenni del capo, il corpo che si protendeva
verso di lui.
Questo è stato necessario per aiutarlo a parlare, senza
mai toccarlo; questo perchè per lui il contatto era fonte di vergogna, come fosse un bambino
incapace di esplorare una storia difficile e di sopportarla, lui che era piccolo della
sorella riteneva di dover essere quello che dava sostegno e coraggio alla sorella.
Anche qui si osserva come la delicatezza, il tatto, l'empatia e l'ascolto favoriscono
profondo l'emergenza delle relazioni di condivisione.
Il video ha a che fare con l'esperienza
di ascolto di due storie: quella di una ragazza
o quella di un ragazzo, che sono fratelli.
Questi due fratelli, partiti dall'Eritrea
e approdati a Lampedusa nel 2014, portati al CARA di Mineo
rimanevano presso la struttura per ottenere il permesso di soggiorno,
ma quando si è cercato di intervistarli peravere la possibilità di dare testimonianza
delle loro esperienze e storie ci si è resi conto alla base di questo tipo di racconto
doveva esserci una dimensione di ascolto molto attenta, delicata perché questi due ragazzi
erano stati fatti oggetto di torture e di violenze molti forti e drammatiche.
Ognuno di loro aveva chiesto di parlare in assenza dell'altro.
La storia della ragazza, della sua esperienza di viaggio iniziata per dare possibilità
al fratello di non essere costretto a 16 anni di fare il servizio militare.
Nella sua narrazione si capisce che lei dice una cosa fondamentale: "non posso dimenticare,
non trovo la forza di parlare"; si tratta delle parole chiave e allora l'ascolto è

stato accompagnato con un contatto tra le mani del professionista e quelle della ragazza.
Lavorare con contatto fisico in presenza di queste esperienze è complesso, anzi è preferibile non toccare le persone oggetto di trauma e violenza fisica; in questo specifico ci si è resi conto che la ragazza aveva la necessità di essere profondamente sostenuta per poter raccontare questa storia, così la professionista ha chiesto se poteva prendere le sue mani. Proprio la richiesta, e non l'azione non accettata, ha favorito la possibilità che lei desse il suo assenso.
Con questo contatto si è creato un canale di energia forte e potente, ogni volta che la ragazza doveva parlare di aspetti particolarmente traumatici e dolorosi tendeva a fermarsi e così la professionista stringeva le sue mani provocando così il proseguire del flusso energetico necessario per il prosieguo della storia.
A conclusione di questa esperienza si può affermare che mai il racconto di qualcuno può essere, in presenza di storie di traumi, fatto oggetto di banalizzazione o di esasperazione o di amplificazione, la cosa fondamentale è l'ascolto della storia, come viene raccontata, ascoltando con grande sensibilità e soprattutto empatia e riconoscimento della sofferenza altrui.
Questo è stato l'elemento fondamentale che ha consentito di aver accesso alla espressione emozionale più intensa e profonda di questa profonda nel racconto della sua storia.





Transcript

Adottare un bambino significa vincere sulla natura, in particolare sulla sterilità.

Il gesto di un genitore che adotta un bambino è un gran regalo che il genitore fa, non solo a se stesso in quanto in questo modo finalmente ha un figlio, ma anche al bambino, perché il bambino finalmente trova una famiglia.

Si discute se chiamare il genitore “genitore adottivo” o limitarsi al termine “genitore”.

Chiaramente il genitore adottivo è un genitore a 360° che non ha nulla in meno di un genitore biologico, lo dicono le ricerche, ma soprattutto lo dice la relazione che viene a generarsi tra figlio e genitore.

Avere un figlio adottato ha molte sovrapposizioni con l’avere un figlio biologico.

Per un genitore adottivo sentirsi chiamare babbo è ogni volta una sorpresa, mentre per un genitore biologico è forse scontato.

Questo vuol dire che forse la genitorialità adottiva è persino più intensa di quanto possa essere quella biologica.

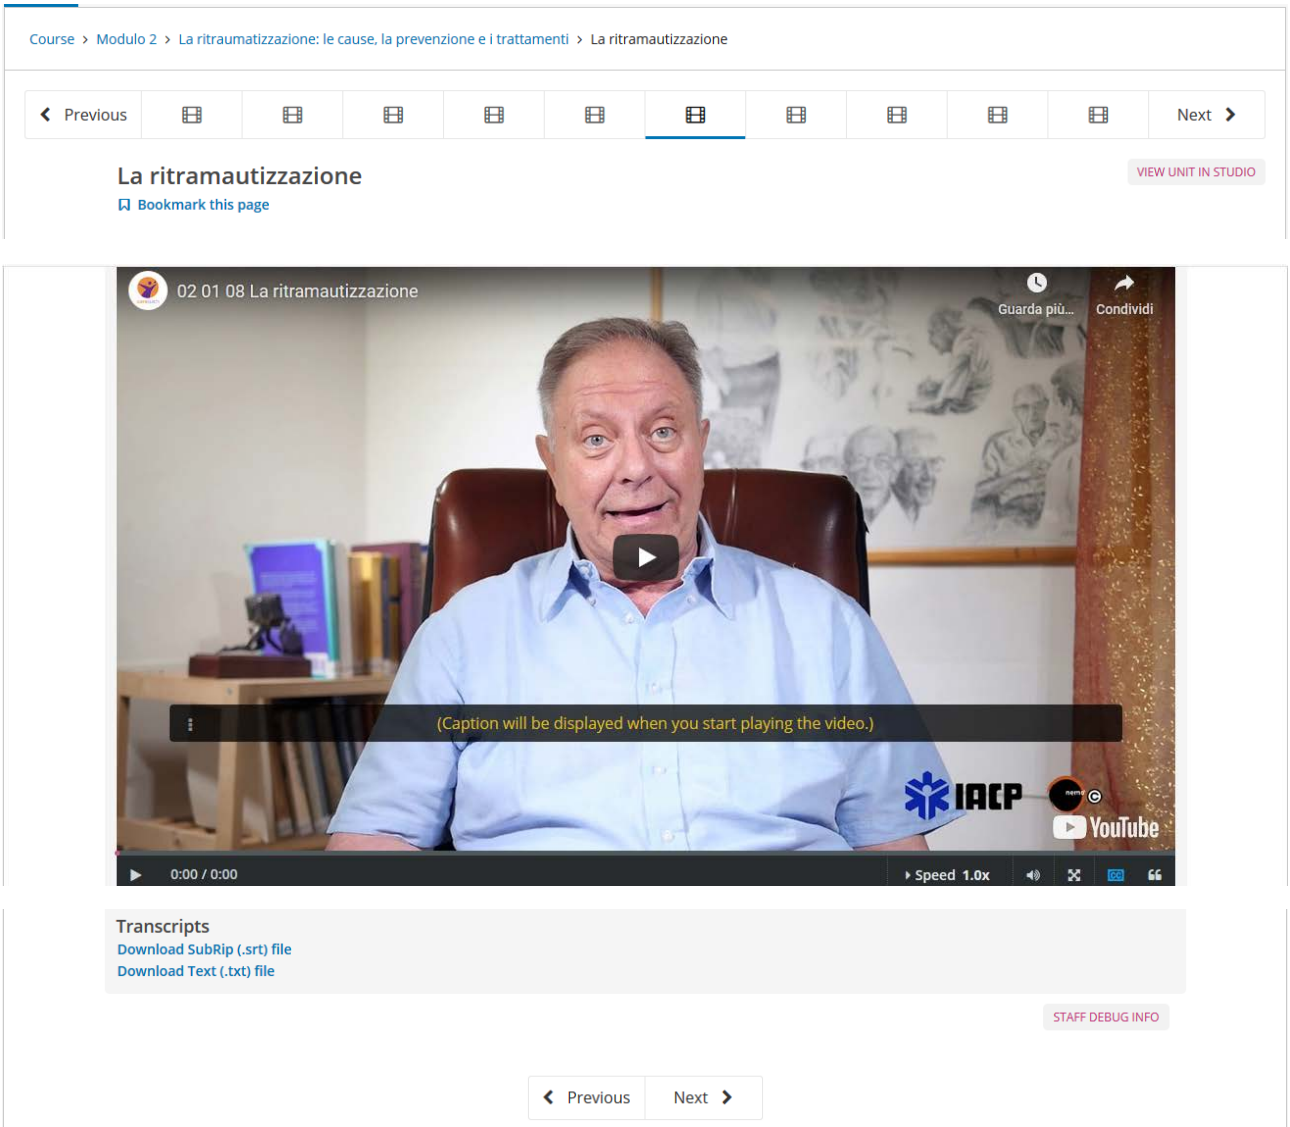
Questo però deve porre comunque delle attenzioni da parte del genitore: il figlio adottato ha il diritto ad essere felice e per essere felice si deve anche considerare quale è stata sua storia, che noi non sempre potremmo conoscere, perchè nessuno ce la racconta e lo stesso figlio non se la ricorda.

Tuttavia si deve prestare attenzione con sensibilità a quelle che sono le problematiche che il bambino può portarsi dietro.

Il bambino, e poi l'adulto, adottato spesso si confronta con temi esistenziali: quali sono state le mie origini?

Perché sono stato abbandonato?

Sono risposte a cui nessuno può dare spiegazioni, ma questo non esclude che la vita è bella e tutti dobbiamo tendere a vivere al meglio



Transcript

I fattori di ritraumatizzazione sono molti, ma principalmente li possiamo dividere in due gruppi.

Quelli che avvengono per cause naturali: come una persona già traumatizzata si trova a rivivere il trauma in quanto esposta a stimoli esterni che sono traumatici (come una catastrofe, o vede persone che vengono traumatizzate, a volte anche vedere un film o un notiziario può essere traumatizzante; quelli in cui il trauma che viene vissuto e sofferto da una persona già traumatizzata, perché gli si offrono dei servizi, delle cura, da parte di persone inesperte o di un'organizzazione non traum oriented, che anche anche non volendo provocano danni ritraumatizzando la persona.

Infatti si chiamano trauma inform tutte quelle cautele e procedure che un operatore, un professionista, una istituzione adottano per prevenire la ritraumatizzare dei propri assistiti.

In passato, purtroppo, abbiamo traumatizzato chi già aveva sofferto un trauma non per

cattiva volontaria, ma per ignoranza.

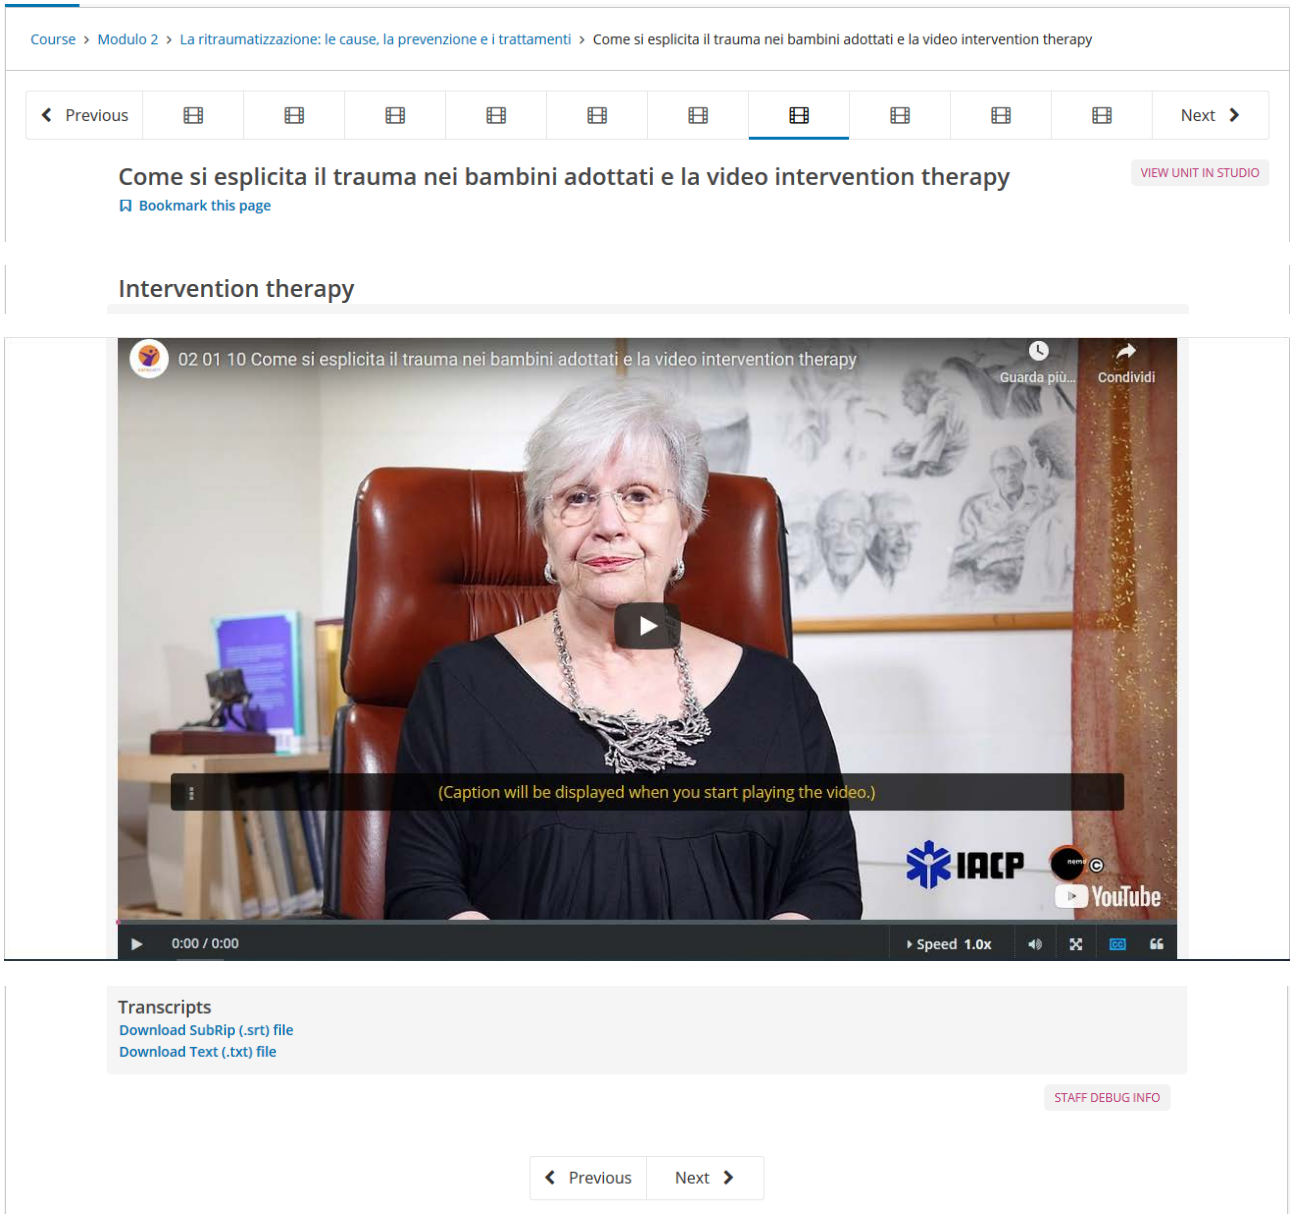
É proprio grazie alle ricerche e alle evidenze cliniche che si è osservato che queste persone, se venivano pressate a fare cose che non volevano fare, se non venivano rispettate nei propri tempi, se venivano forzate a ricordare le loro esperienze traumatiche - ovviamente a fin di bene - pur senza accorgersene si procuravano loro dei danni iatrogeni.

Per cui, con la definizione trauma inform oggi si intende tutte quelle cautele, quella rete di sicurezza sviluppata attraverso le ricerche, che ci han mostrato che è importantissimo, per proteggere le persone già traumatizzate dal pericolo di nuove traumatizzazione, rispettare i loro tempi, centrarsi sull'erogazione di servizi sulla loro persona, sulla loro esigenza e sensibilità, inoltre mai forzare a fare qualcosa che gli utenti non sono disponibili ancora a fare.

Il perchè è molto semplice: abbiamo osservato che persone già traumatizzate hanno bisogno di accoglienza, di benevolenza e dei porti sicuri in cui riprendere le forze e riprendere i loro ritmi di esplorazione che, proprio perché traumatizzati, necessariamente cauta visto la loro pregressa esperienza.

Quindi, fidarsi delle capacità di autoregolazione degli utenti traumatizzati è fondamentale buona cura.

Rispettare le persone - è interessante notare - sembra così semplice è invece spesso difficile nel mondo delle cure.



Transcript

Il sostegno alla genitorialità adottiva nel sostegno post adottivo è importante perché,

nel periodo post adottivo verranno ad evidenziarsi i traumi che i bambini hanno subito durante

il periodo precedente, durante il periodo dell'istituzione, quello in cui sono stati

lasciati dalla propria famiglia o madre, o in istituto o in altre famiglie.

Tutto questo sarà importante per la famiglia che adotterà questi bambini perché di fatto

si ripresenteranno delle difficoltà importanti nella relazione con la nuova famiglia.

Dalla ricerca sappiamo che i traumi hanno la capacità di rompere le relazioni, di renderle

problematiche e difficili, i bambini non fanno eccezione a questo.

Il poter avere consapevolezza della difficoltà che il bambino trova nella nuova famiglia

adottiva può rendere più facile o, perlomeno, più consapevole il genitore del percorso

che si troverà a dover affrontare.
Negli scambi che costituiscono la relazione, negli scambi interattivi, i bambini saranno difficile da gestire, possono dare dei segnali confusi e pochi chiari, sembrare non interessati, assenti.
Tutti questi sono aspetti che andranno analizzati punto per punto e che faranno parte della storia di ogni adottato.
In tal senso noi sappiamo, sempre dalla ricerca, che ogni scambio interattivo è formato da micro eventi che analizzati in dettaglio influenzano la risposta adulto-bambino e bambino-adulto; su questo non fa eccezione il rapporto tra genitore adottante e figlio adottivo.
Per questo sarà estremamente importante l'uso del video, perchè proprio in questa situazione in cui il trauma ha creato dei presupposti di difficoltà alla lettura di aspetti microanalitici interattivi sarà importante poterli filmare, vederli in uno scambio e vedere dove e come si muove il bambino nello scambio interattivo e come può rispondere il genitore.
L'uso del video, quindi, sarà veramente da sottolineare e da raccomandare perché sarà un modo di porre le basi e poter guardare in dettaglio in maniera specifica, momento per momento, tutto quello che accade nello scambio tra bambino e genitore.
La cosa importante da sottolineare è che questo particolare uso del video deve, e dovrà sempre, essere utilizzato e mostrato soltanto da terapeuti specializzati in questo particolare uso; non potrà essere utilizzato da chi non ne ha la specializzazione, data la particolare delicatezza del tema trattato.
Si osserva che, come s'è detto, i bambini adottati hanno una modalità di mandare segnali un po' meno evidente, più breve e confusa, di bambini non adottati.
In questo senso l'uso del video sarà estremamente importante perchè consentirà al genitore, scandendo l'interazione momento per momento, di vedere dove e come il bambino è in grado di agganciarsi relazionalmente a lui.
Questa sarà una pietra miliare nello scambio interattivo e sarà l'inizio della possibile nuova costruzione e di un legame di attaccamento.
Un'altro aspetto molto importante dell'espressione del bambino è l'ipervigilanza.
È molto importante perché ci racconta della sua storia, delle sue paure, dell'incuria e trascuratezza che ha vissuto, ma soprattutto se questo bambino ha subito violenza fisica, forse abuso, o comunque violenza assistita nella migliore delle ipotesi.
L'ipervigilanza è un aspetto per cui il bambino è estremamente focalizzato sull'espressione

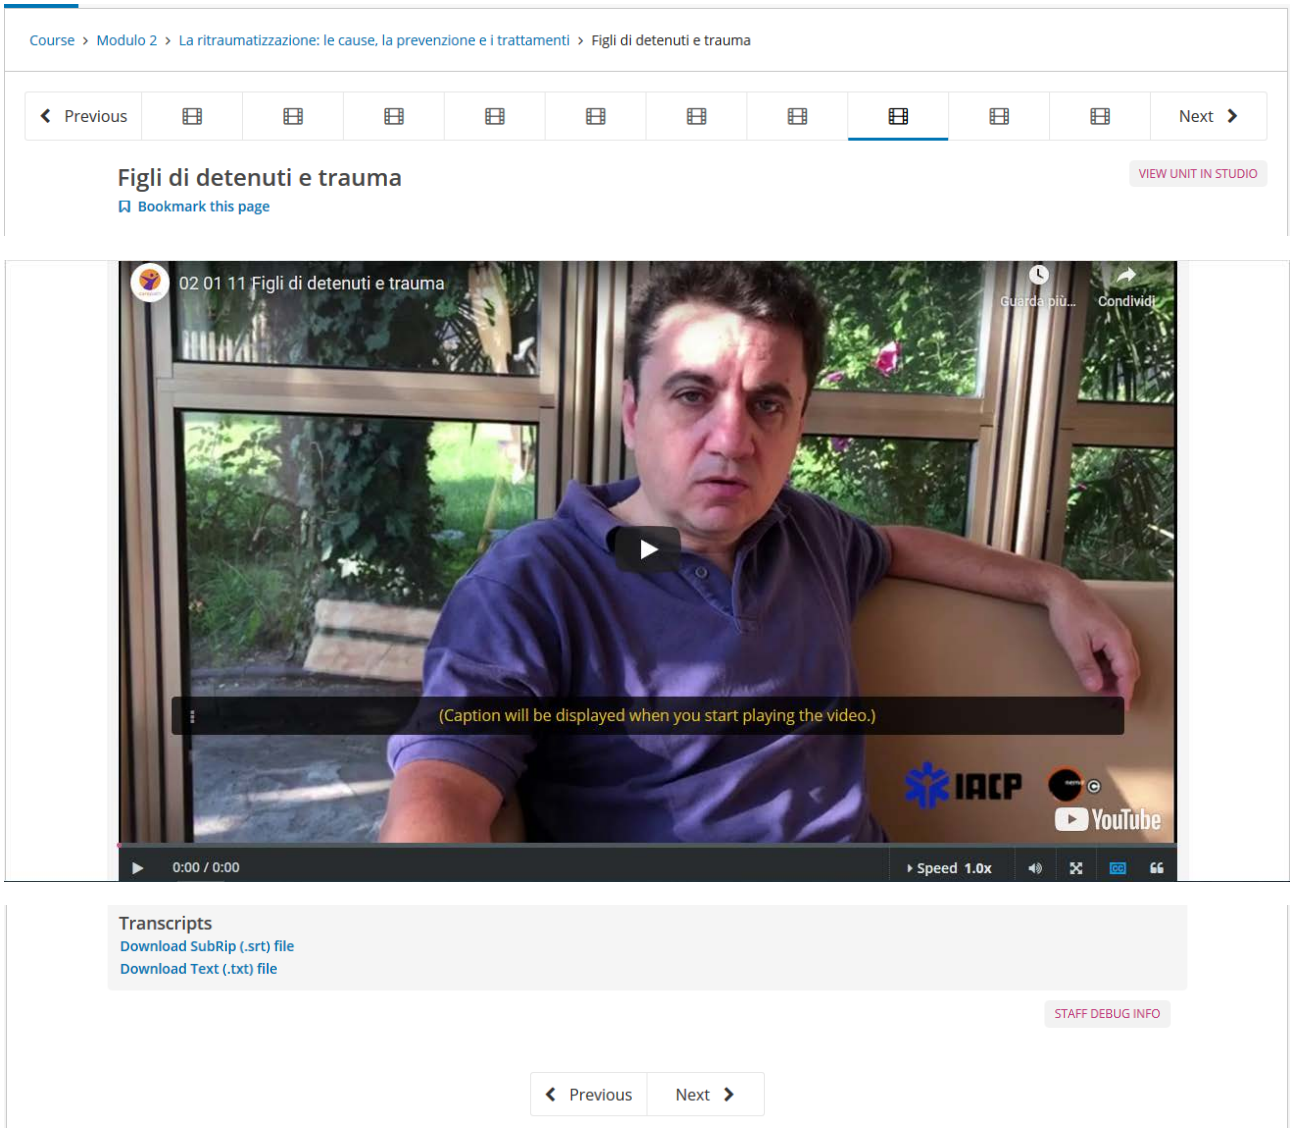
dell’adulto, lo monitora momento per momento per poter leggere attraverso l’espressione dell’adulto se ci sarà qualcosa che potrà essere pericoloso per lui o se quello che sta facendo potrà diventare in qualche modo pericolo o fonte di minaccia.
Indica quindi chiaramente la mancanza di fiducia che il bambino presenta nei confronti dell'adulto, questo tenderà a sparire piano-piano lavorando nella relazione adulto-bambino, ma non sempre in maniera definitiva.
Un’altro aspetto che il bambino presenterà sarà un aspetto di goffaggine affettiva, un aspetto che farà molto soffrire il genitore adottivo perchè sentirà questo bambino mai perfettamente libero nell’esprimere il suo affetto e vicinanza affettiva all’adulto.
Non è responsabilità del bambino, anche questo è un frammento, che si esprime nella relazione, di una storia passata è particolarmente dolorosa.
I bambini sono abituati a non avvicinarsi all’adulto, a far in modo che l’adulto diventi meno pericoloso per sé nella relazione, per cui non sono abituati spesso a toccarlo, abbracciarlo, cosa che nella relazione nuova potrebbe avvenire.
Possiamo quindi assistere a bambini particolarmente vicini, forse troppo, a volte appiccicosi, ma proprio perché non sanno modulare la modalità di avvicinarsi all’adulto, non sanno quando è troppo o troppo poco e sono in un completo disorientamento ed imbarazzo.
Altre volte il bambino si avvicina con un fare estremamente goffo, quasi falso, poco spontaneo, questo è subito monitorato dal genitore che tende ad etichettarlo.
Quello che si raccomanda è vederlo sempre come l’espressione di un momento della storia del bambino, non è mai stato libero di avvicinarsi come avrebbe voluto e come avrebbe sentito ad un adulto, questo rimane ancora in tale modalità poco spontanea e piuttosto goffa.
Un altro aspetto che il genitore troverà sarà la fatica e la difficoltà al sonno e ad avere sempre un sonno estremamente agitato, poco riposante e la difficoltà ad addormentarsi.
Un’ulteriore aspetto si può osservare nella difficoltà di concentrazione, spesso letta come disturbo di apprendimento non meglio identificato:
il bambino non ha disturbo d’apprendimento,
ma la sua modalità ipervigile gli suscita elementi emotivi così difficili, negativi e faticosi che lo distraggono dal compito assegnatogli.
Ancora una volta vedremmo che il bambino è sintonizzato sul volto dell’adulto, la sua espressione, su quello che l’adulto esprime, sulla pericolosità che potrà dimostrare;
tutto ciò renderà difficile al bambino il potersi concentrare.

Tutti questi aspetti però sono estremamente importanti, questi comportamenti sono la narrativa di una storia passata, diranno al genitore adottivo tutto quello che è segnato nella storia del bambino, che forse questo bambino non riesce ad esprimere se non attraverso questi comportamenti;

per cui, forse, è importante pensare che sono informazioni preziose che possono metterci nella condizione di sapere quella parte di passato, assolutamente inconoscibile per noi, ma che ha creato quel cambino così com'è, in quella relazione così com'è con il nuovo genitore adottivo.

Più che situazioni da correggere sono comportamenti da accogliere al massimo, nello pieno delle possibilità di poter leggere cosa ci raccontano di una storia passata che possa diventare, insieme a questo piccolo bambino, oggi una storia insieme.

Come la narrazione del passato possa creare il ponte con la narrativa del presente.



Transcript

Il figlio del detenuto si trova nella condizione di vivere diverse condizioni di difficoltà.

La prima è il fatto di essere deprivato improvvisamente dal proprio genitore e di dover crescere senza di lui.

La seconda è quella di dover vivere in una famiglia che spesso non ha risorse economiche, infatti con l'arresto del genitore viene a mancare, il più delle volte, l'unica fonte di guadagno (per quanto fosse una fonte illecita, ma sufficiente per le necessità quotidiane).

Un'altra tragedia secondaria, ma non meno importante è dovuta al fatto che il bambino si trova immerso in mondo di giudizio:

essere figli di genitori detenuti significa essere figli della colpa;

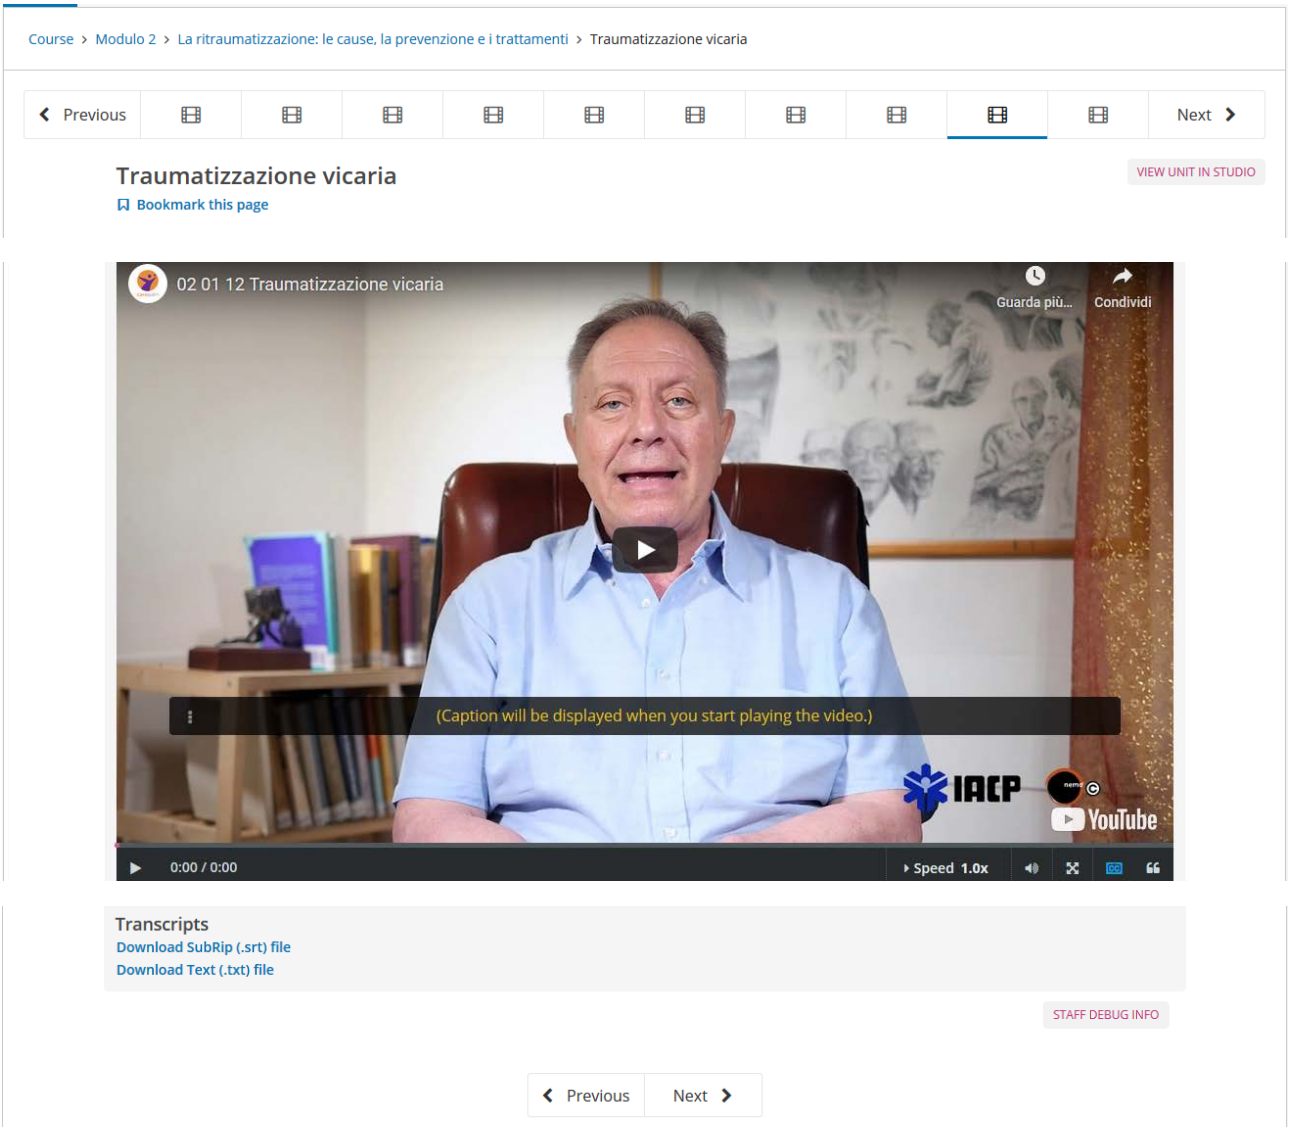
il bambino mano a mano che si relaziona con questo processo sociale

fa suo il giudizio fino a convincersi di essere lui stesso una persona meritevole di punizioni.
Tanto è vero che spesso i figli di genitori detenuti sono bambini agitati, la cui agitazione è dovuta anche al fatto che non ha un genitore - spesso il padre - che lo educa e lo frena nelle sue intemperanze.
È un bambino costretto a vivere da solo, la madre non riesce a far fronte a tutte problematiche che si concentrano sulla sua persone, non potendo più far conto sul contributo del proprio marito.
È una sfida tutta da giocare perchè purtroppo anche gli operatori sociali cadono nella trappola di stigmatizzare il bambino che dovrebbe essere capito ancor di più di bambini, perché vivere da soli con la madre in difficoltà non deve essere assolutamente semplice.
C'è una discussione su come comunicare al bambino che il proprio genitore è stato arrestato.
Tanti genitori, per vergogna o per difficoltà, raccontano al bambino la storia di essere dovuti improvvisamente partire per andare a lavorare.
Chiaramente le bugie hanno le gambe corte e il bambino non è convinto, perché se fino ad allora il padre lavorare tornando a casa ogni giorni non si spiega come mai sia cambiata improvvisamente la mansione lavorativa e sia partito per così tanti giorni, mesi, anni, i natali, i compleanni, così il bambino capisce la bugia.
La cosa migliore da dire ai bambini in questi casi è dire la verità "il babbo ha sbagliato, ha commesso degli errori e purtroppo deve stare in un luogo a rispondere di del suo comportamento, ma sta bene, ci sono tutti i servizi perchè stia bene, stai sereno, lo potrai vedere presto.
Questo è un'altro tema legato ai figli di genitori detenuti: se far vedere o meno il genitore in carcere.
Alcuni operatori sociali sostengono non sia opportuno perchè l'ambiente del carcere non è ambiente tagliato sulle esigenze del bambino.
É vero che entrando in carcere si ha a che fare con poliziotti, ambienti non sempre dignitosi, ma è altrettanto vero che non c'è elemento più importante per un bambino che quello di poter vedere il genitore.
In realtà quindi andrebbero facilitati gli incontri tra detenuti e figli.
Fino a pochi anni fa esistevano ancora dei muri che dividevano i detenuti dai visitatori, oggi molte cose sono cambiate: molti carceri dispongono di una ludoteca o di ambienti più

colorati, con giochi, e gli stessi agenti penitenziari sono molto più preparati nell'accogliere i bambini.

Questo tuttavia non è il tema principale, il tema non è se il bambino va in un ambiente idoneo o meno, ma è quello di facilitare l'incontro tra genitore e figlio.

Tutto ciò viene rivisto ovviamente se il genitore è in carcere per un reato contro il minore.



Transcript

Che cos'è il trauma vicario? È il trauma derivante da assistere persone che sono colpite da traumi; infatti il trauma vicario in genere colpisce coloro che erogano servizi alle persone colpite da traumi naturali (tipo catastrofi) o persone che soffrono di traumi a seguito di violenze perpetrate ai lori danni altri esseri umani,

esempi sono la guerra, gli attentati

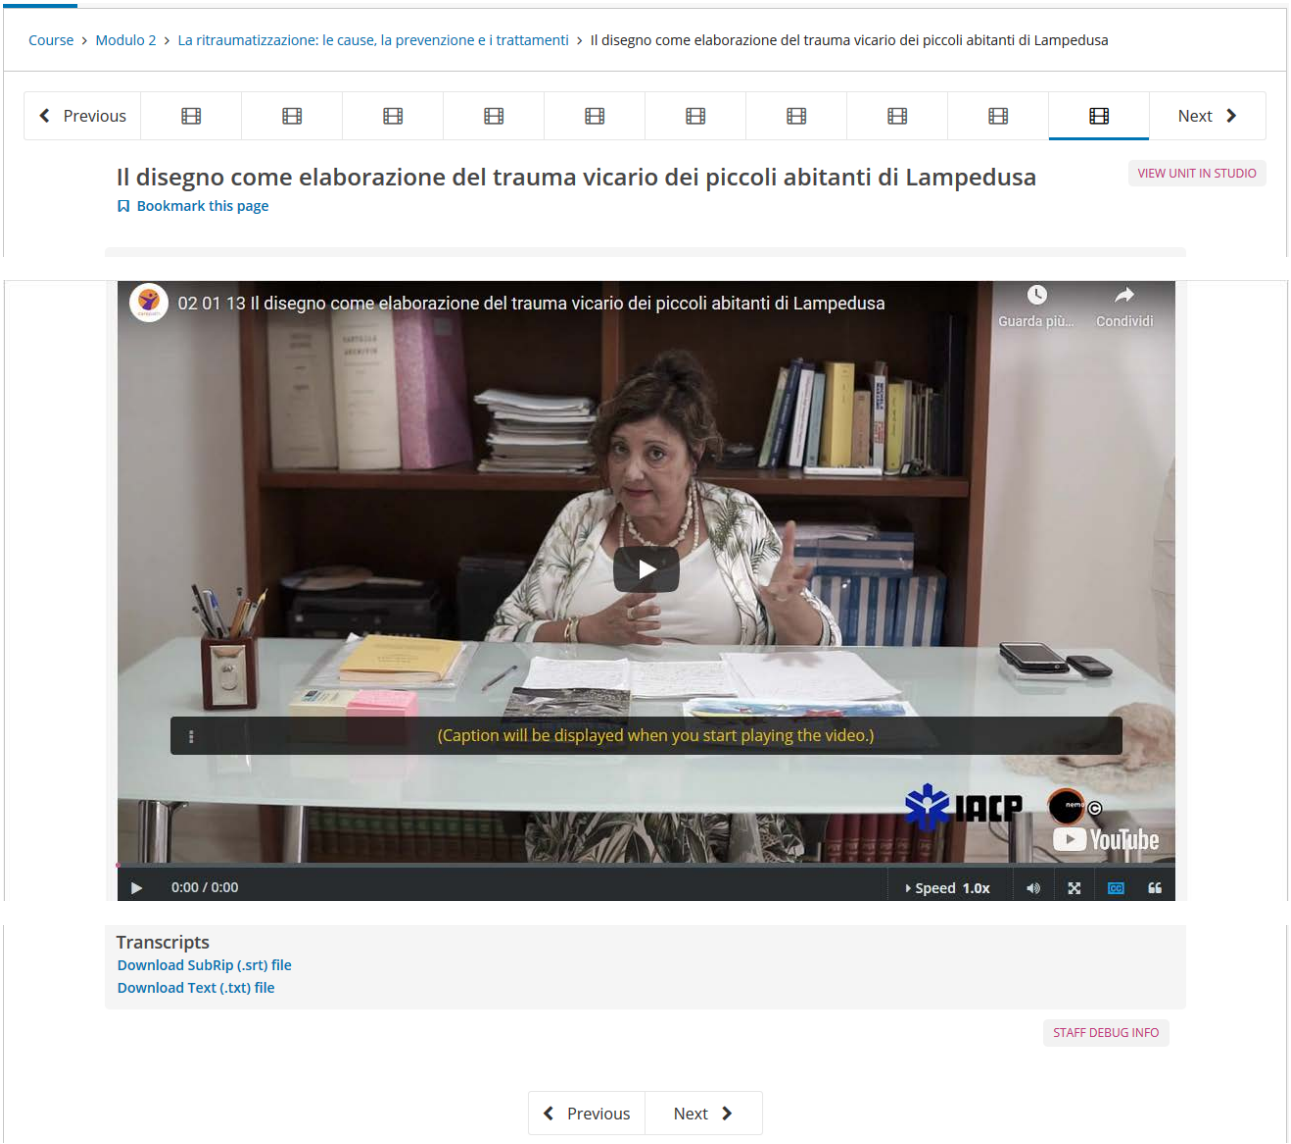
terroristici, ma anche la violenza famigliare o assistere le vittime di violenza sessuale.

Insomma l'operatore con buona volontà si apre e da assistenza, supporto umano e contatto psicologico ad una vittima di trauma, ma questo - giornalmente - nonostante il significato profondo della generosità dell'apertura, anche a livello esistenziale, può incidere

sulla mia salute mentale, le mie forze, il mio metabolismo e diventare fonte di un vero

e proprio trauma con tutte le conseguenze che hanno i traumi.

Per cui è importante per prevenire e diluire l'impatto del trauma vicario che gli operatori
e tutti colori i quali si trovano per il loro lavoro esposti a vittime di traumi o violenze;
i poliziotti ad esempio, o i giornalisti reporter e tutti coloro che a vario motivo sono a contatto
con persone traumatizzate.
È buona regola, quindi, poter prevenire il
trauma vicario, come anche quello più generalmente chiamato burn out che colpisce anch'esso persone
nelle relazioni di aiuto e che colpisce duramente, in particolare, quando non si riesce a ricaricare
le batterie, staccare dal lavoro che è pesante e oneroso oltre che bello, e anche avere un
certo bilancio tra il lavoro - diciamo - umanitario e la propria vita personale, la famiglia,
gli amici e gli svaghi. Insomma è una sfida per tutti coloro che
meritevolmente offrono i loro servizi con passione, generosità, empatia anche estendere
tale rispetto a se stessi,
perchè purtroppo non si può dare agli altri quello che non
si ha, è quindi moralmente doveroso promuovere la propria resilienza, salute e benessere,
perchè se vogliamo dare molto dobbiamo includere con generosità anche la persona che non ci
abbandonerà per ogni ora della nostra vita: noi stessi.



Transcript

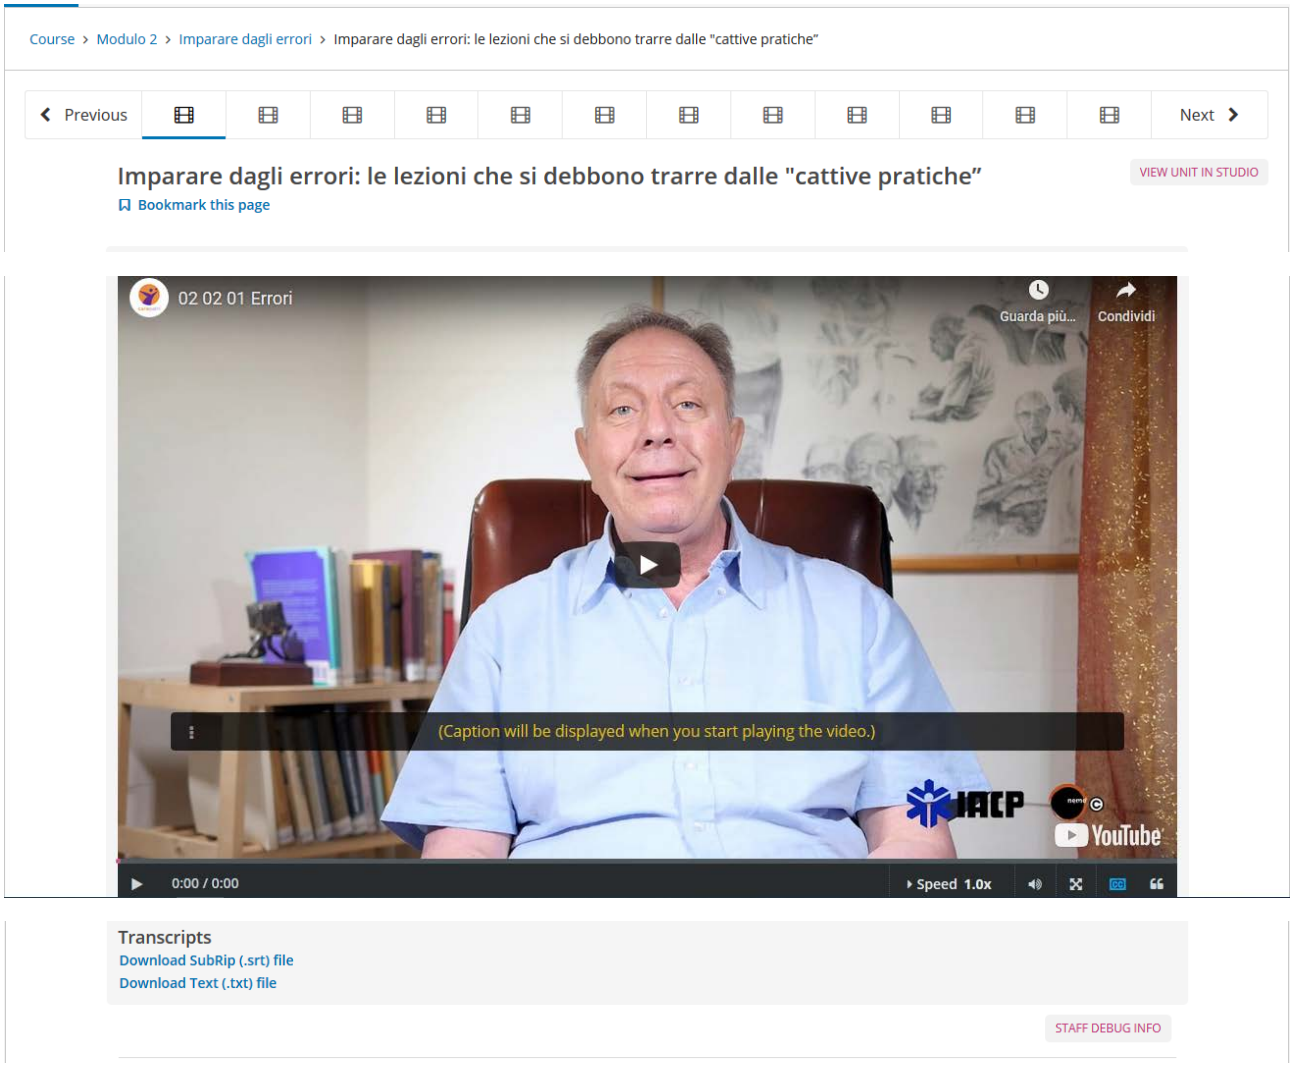
Il 3 ottobre 2013, a Lampedusa, si è verificato un evento di particolare drammaticità.

Un barcone con 500 migranti ha fatto naufragio e 388 di questi hanno perso la vita. Tra questi che hanno perso la vita si riscontrano donne, bambini, molti giovani e per la popolazione di Lampedusa è stato un evento particolarmente traumatico perché tutti gli abitanti si sono ritrovati a prestare soccorso nel mare e a recuperare centinaia di cadaveri e vivere e vedere dimensioni sconvolgenti legate alla tragicità della morte, addirittura è stata ritrovata una mamma che stava partorendo durante il naufragio con il figlio ancora attacato col cordone ombelicale.

Un evento di questo genere inevitabilmente non poteva non produrre l'effetto di un trauma vicario sulla popolazione e quindi si è cercato, in qualche modo, al poliambulatorio di avere quanto più possibilità di ascolto,

visite e supporto alle persone che avevano avuto esperienze di tipo traumatico nel prestare il loro aiuto,
ma una delle situazioni più difficili da gestire è stata quella legata all'esperienza traumatica percepita dai bambini, in particolare delle scuole elementari.
L'immigrazione a Lampedusa è un'esperienza pluriennale e tutti (anche i ragazzi giovani) sanno che spesso viaggi della speranza si risolvono con la perdita della vita, ma i bambini di 6 e 7 anni sono particolarmente sensibili a questo tipo di esperienza e molti di loro hanno iniziato ad avere paure, angoscia, fobie, tutti fenomeni tipici di chi è stato esposto a esperienze traumatiche dove la vita viene messa in pericolo e oggettivamente perduta.
Per questi bambini questo evento era accaduto nel loro mare, un mare che vivono come fonte di gioia, gioco e divertimento; quel mare che rappresentava per loro un elemento di gioia e leggerezza improvvisamente si è trasformato in un mare di morte.
Una delle possibilità che si sono messe in atto per affrontare l'elaborazione di questo trauma vicario dei bambini è stata quella di proporre loro di fare dei disegni, questi disegni adesso mostrano come i bambini rispondo e reagiscono a questo trauma.
Si deve fare una piccola premessa: l'arte è uno strumento potente per rendere tangibili eventi dolori e spaventosi, in sé l'arte produce effetti liberatori e di rielaborazione anche degli eventi traumatici.
Ci si deve chiedere poi cosa sia un evento traumatico dal punto di vista dei bambini.
In questo caso dipende dal tipo di evento, l'evento traumatico ha diverse forme, può essere prodotto dall'uomo (come le guerre e del terrorismo) o determinato dalla natura (uragani e terremoti) e ognuno di questi lascia tracce specifiche e specifiche paure nella mente e nella psiche dei bambini.
Da questo punto di vista è stato necessario nel caso del naufragio di Lampedusa ricomporre la frattura emozionale e interna che i bambini avevano avuto, legata al fatto che questo evento potesse non solo ripresi, ma investire anche le loro famiglie; questo perché un bambino di 6 e 7 anni è difficile comprendere il senso della morte e sappiamo come i bambini riconducono tutto a se stessi.

Questi eventi e storie di morte hanno avuto
l'effetto di produrre in molti bambini la paura di mangiare il pesce (i pesci avevano
mangiato i bambini e le loro mamme) o di andare al mare (nel mare ci potevano essere i cadaveri);
è stato necessario ricostruire questo puzzle della loro dimensione di serenità rispetto
anche all'immaginario che si costruiva nell'isola di Lampedusa.
Questo è stato possibile con il disegno, come si diceva.
Con il disegno è possibile costruire una narrazione di come ogni bambino individualmente
abbia percepito questo evento, perchè l'evento era collettivo ma la percezione era specifica
per ogni bambino.
È stato importante non offrire elementi di consolazione immediata
e risolutivi, ma lasciare che ogni bambini per mezzo dell'elaborazione grafica e verbale
che l'ascolto che ha seguito i disegni, trovasse delle personali soluzioni a quello
che è un elemento fortemente angoscioso come la dimensione della morte e della perdita
che a 6 - 7 anni è l'angoscia più grande per un bambino.



Transcript

Imparare dagli errori, più facile a dirlo che farlo, anche perchè c'è una certa

cultura che ci spinge ad associare alla nozione "ho commesso un errore" un modo di disappunto,

ma anche una certa vergogna: la paura di aver perso la stima dei colleghi - e magari degli

utenti - e quindi una certa inflessione un po' infantilistica che tende a rimuovere

l'errore, a scusarsi dicendo che non è colpa nostra, che è colpa di altri fattori

esterni, insomma con un risultato misero che ci impedisce di vedere del un po' l'ovvio:

che dietro ogni errore noi possiamo trovare un tesoro di saggezza.

Con la giusta attitudine, non difensiva noi possiamo aprirci a imparare dagli errori:

gli errori come maestri che ci aiutano a diventare dei professionisti

che fanno quello che esortano

i loro utenti e clienti a fare, ovvero apprendere dall'esperienza.

È buffa - e tragica - la situazione: noi professionisti della relazione di aiuto ispiriamo

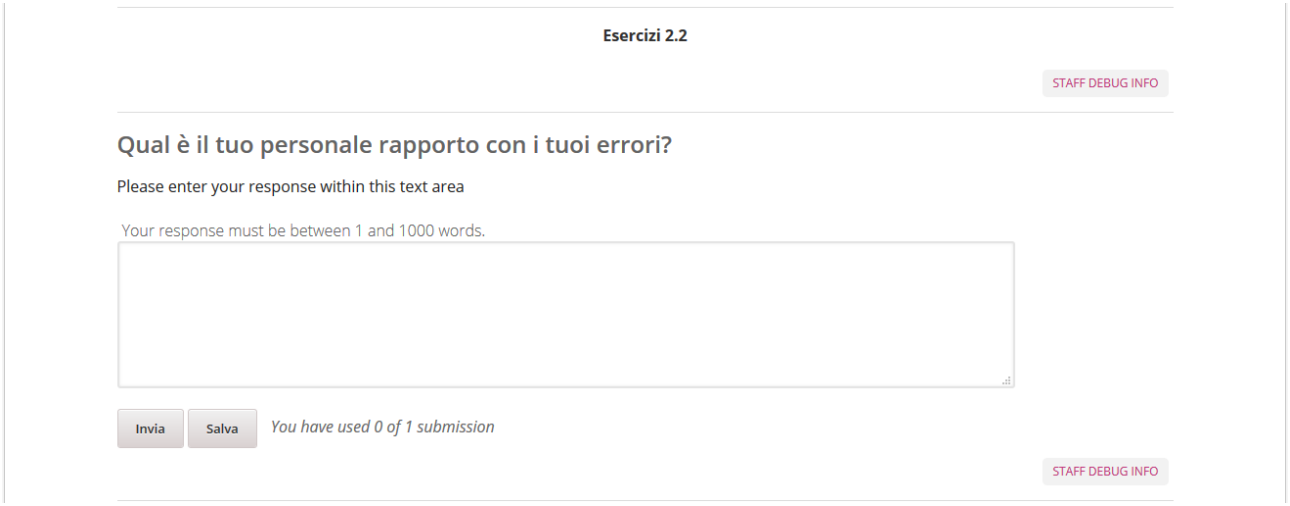
convintamente i nostri clienti d imparare dalle loro esperienze e dai loro errori, ma

questo è valido per i nostri clienti e meno per noi; siamo meno entusiasti noi ad accettare di non difenderci e di ammettere che l'errore è nostro, lo sbaglio è nostro, e così facendo essere aperti all'apprendimento.

Una maniera disfunzionale di costruire l'esperienza dell'errore mi porta a perdere autostima, quando dovrebbe accrescere, come se fosse una cosa un po' pazza che chi prova paura pensa di essere un codardo, ignorando che chi è coraggioso prova paura ma non si fa congelare da questa, e così chi è intelligente e saggio accetta l'errore e impara da esso.

Abbiamo quindi da imparare dai nostri utenti che sono, a volte, più pronti di noi ad accettare con umiltà di imparare dalla loro esperienza e cercare di non commettere sempre gli stessi errori, ma noi siamo condannati ad una vera coazione a ripetere se ci rifiutiamo di ammettere che ridiscendono in io gli errori, perchè così facendo e descrivendoci come vittime ci creiamo una autodefinita situazione di impotenza.

In questo senso diamo il benvenuto agli errori come maestri di saggezza.



Cosa potresti o vorresti fare per aumentare le probabilità che i tuoi errori diventino tuoi maestri e così aiutarci a crescere personalmente e professionalmente?

Notevole è l'impatto negativo sulla salute fisica e mentale delle persone che soffrono una qualsiasi forma di trauma.

L'Organizzazione Mondiale della Sanità afferma che le varie forme di trauma costituiscono una vera e propria emergenza sanitaria.

Noi vediamo che il capitale umano soffre notevolmente al livello fisico-mentale, in relazione al subire un trauma,

e anche la capacità di contribuire efficacemente alla prosperità

della sua comunità viene compromessa in quanto chi è colpito da trauma è bisognoso di cure

e queste richiedono risorse economiche, finanziarie

ed è anche debilitato nel produrre prosperità

per se stesso, la propria famiglia, comunità e nazione.

Osserviamo anche un altro aspetto molto preoccupante per chi è vittima di trauma:

che non solo

la vittima diventa una persona con danni alla propria salute fisica e mentale, ma sovente,

soprattutto per alcuni tipi di traumi (come essere vittime di violenza o violenza sessuale)

c'è un'alta frequenza di diventare perpetratori e quindi traumatizzare altre persone innocenti

e da vittime divenire aguzzini; un cosa terribile è come il trauma sia un virus che si espande

se non contrastato, prevenuto e curato efficacemente nella comunità: una vera e propria pandemia.

Si potrebbe parlare di pandemie, cioè di qualcosa che si trasmette da individuo a individuo

velocemente in tutta la popolazione che ammonta ad una perdita di capitale umano sempre più

importante.

Dobbiamo anche vedere che in un approccio bio-psico-sociale non possiamo lasciare solo

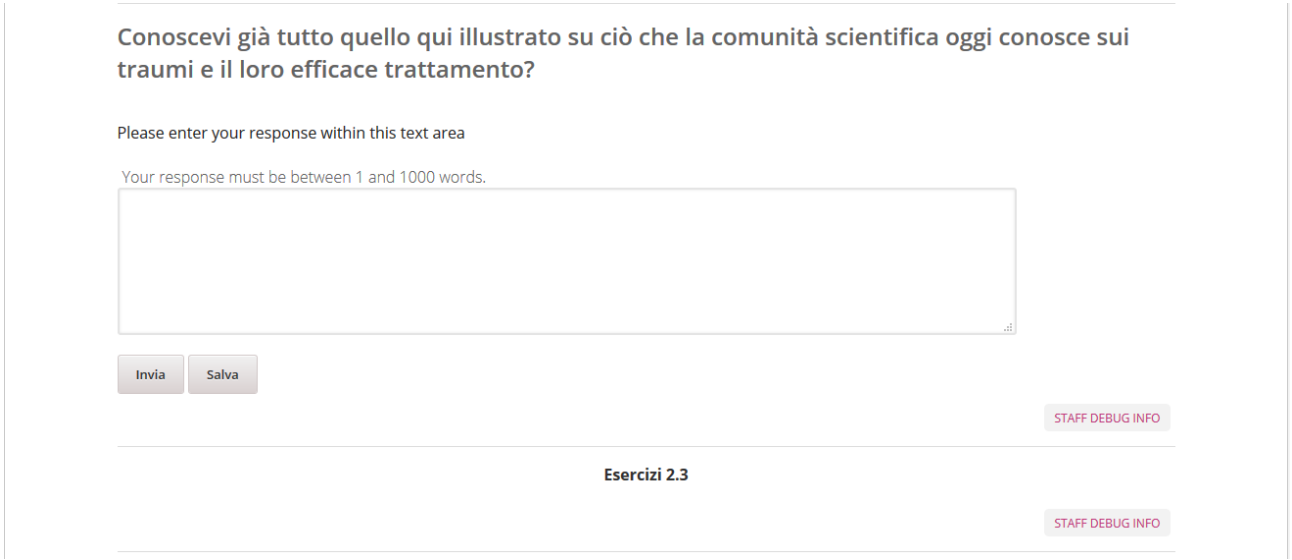
al settore sanitario la prevenzione e cura del trauma, ma è compito della policy e di

quindi tutte le istituzioni - la scuola, il lavoro, le organizzazioni, il mondo della

giustizia minorile - che devono diventare sensibili a queste problematiche e diventare

anche parte di una rete efficace di prevenzione e risoluzione del trauma.

Questo nell'interesse e per il bene di tutti.



Secondo il tuo parere sarebbe auspicabile migliorare questa sezione e aggiungere qualcosa? Se si, Cosa?

Parleremo della pervasività del trauma: si sta scoprendo sempre di più, infatti, che il trauma ha degli effetti importanti sulla comunità e le società.

Un tempo gli studi sul trauma si concentravano più su quegli aspetti dell'acutezza di un trauma e quindi dell'esposizione di un evento di una certa importanza, nel tempo il concetto di trauma si è allargato fino ad includere molti altri aspetti.

Comunque sia il trauma è qualcosa che davvero si mostra in forma pervasiva nelle nostre società: sappiamo che un individuo adulto è stato esposto, o lo sarà in futuro, almeno una volta ad un evento traumatico.

Da alcuni studi, che troverete nell'approfondimento come studi di Benguet, sappiamo che a livello mondiale la percentuale del trauma nelle varie nazioni è molto alta, con variazioni, ma che rimangono comunque percentuali elevate.

È quindi importante oggi andare ad approfondire quali sono gli aspetti che proteggono e quali aumento il rischio di esposizione al trauma.

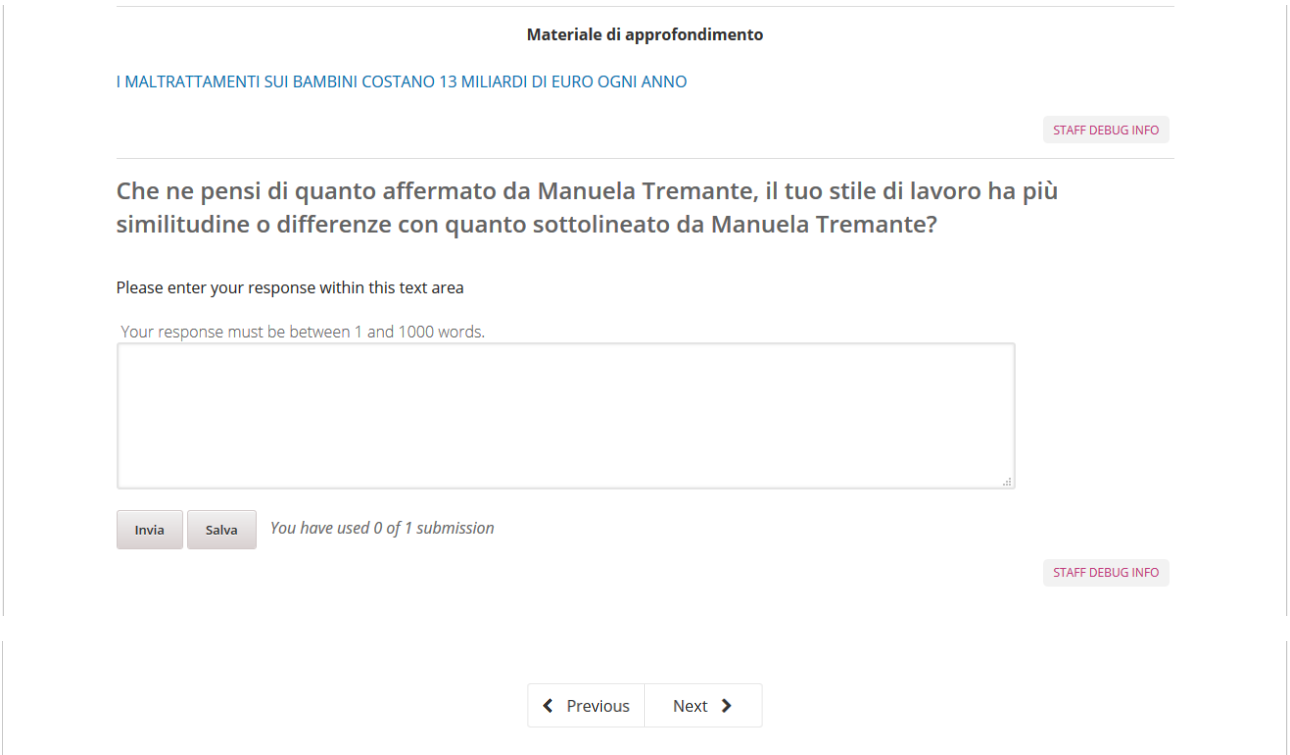
Sappiamo da altri approfondimenti sul tema che il trauma è anche alla base molti dei disturbi cronici che oggi hanno ripercussioni importanti a livello economico e sulla salute pubblica, ma soprattutto vanno anche a inficiare sulle capacità dell'individuo di esprimere le proprie potenzialità e quindi di diventare pienamente un cittadino cosciente ed efficace nella comunità e società in cui vive.

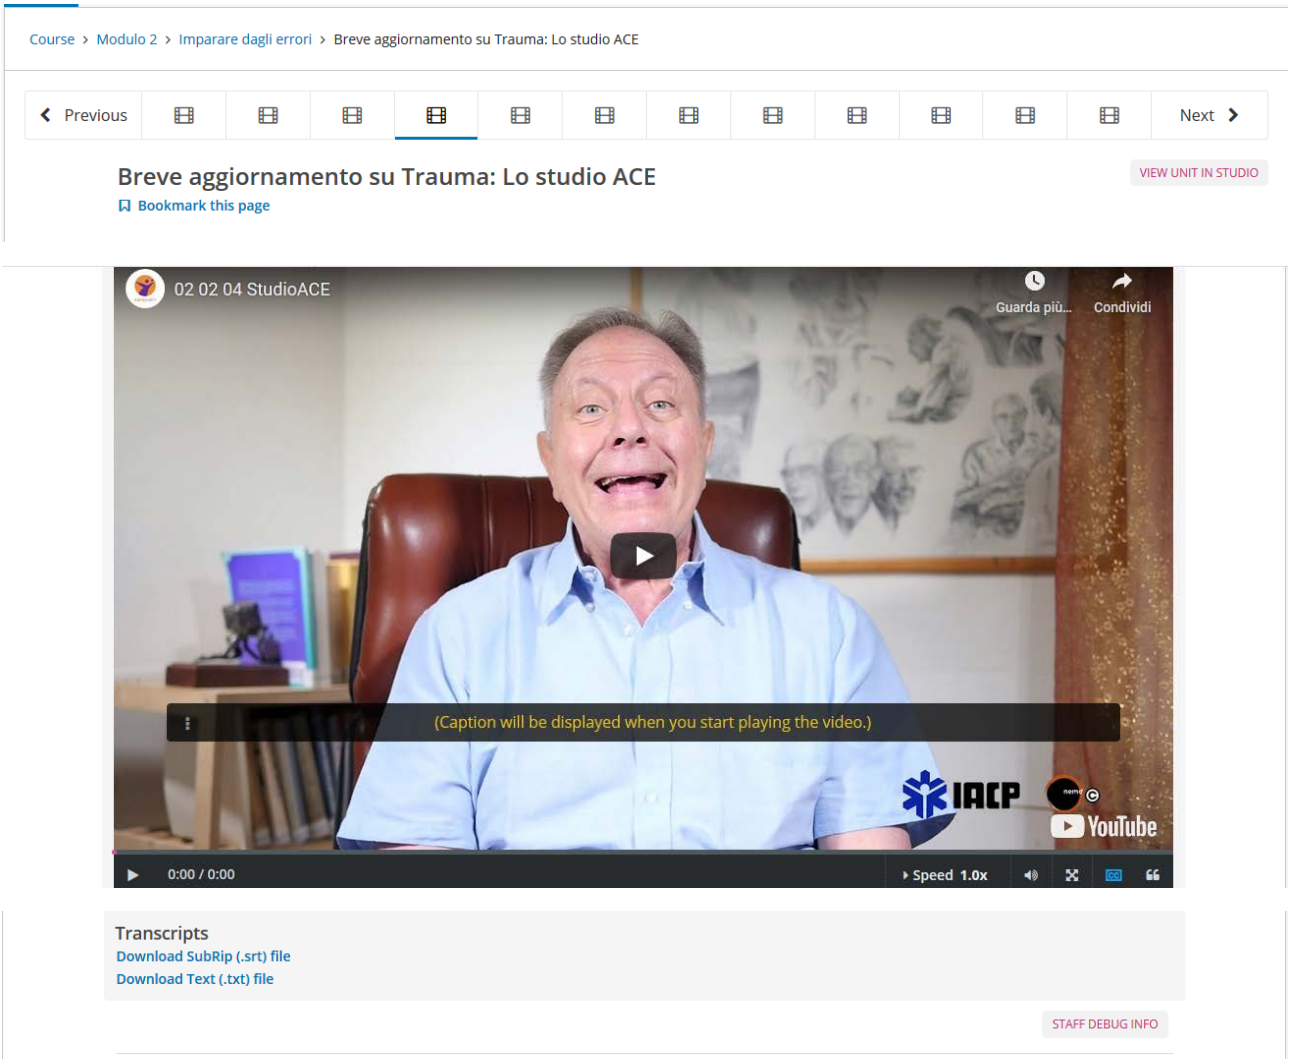
Ancora più importante è il trauma se consideriamo tutti quei traumi che intervengono nel periodo di sviluppo dell'individuo,

infatti è lì, nel momento in cui la persona va a costruire le proprie capacità convinti e, emotive e socio relazionali, che un trauma può andare inficiare potentemente sullo sviluppo di queste capacità,

andando a minare seriamente lo sviluppo futuro dell'individuo.

Sarà quindi fondamentale, e lo è tuttora, approfondire le nostre conoscenze sul trauma, cioè essere informati, proprio come stiamo facendo attraverso questo percorso.





Transcript

Adverse Childhood Experience: su un campione molto vasto della popolazione sono state misurate l'incidenza e i risultati di avere da bambini degli effetti traumatizzanti e le loro conseguenze negative nella vita delle persone, ma andiamo per ordine.

The ACE study, cioè quello che ha studiato le esperienze infantili negativi di una larga fetta della popolazione è stato condotto dalla più grande organizzazione no profit di assicurazioni sanitarie: il Kaiser Permanente un' assicurazione sanitaria privata senza scopo di lucro , in California, ha investito molti milioni di dollari per fare questo studio e che ha beneficiato l'intera comunità scientifica perchè ora sappiamo, e repliche di questo studio e altri simili hanno confermato i dati originali, che mediamente nella popolazione almeno un terzo - quindi ⅓ cittadini - viene colpito nella propria infanzia almeno da un episodio avverso, quindi da un trauma.

Un numero inferiore di cittadini viene colpito da due tipi di traumi,

un numero ancora inferiore ha un numero superiore di traumi.
Più una persona è colpita da traumi multipli e più questa soffre delle conseguenze negative,
come se una coltellata facesse molto male, ma ancora peggio è essere accoltellati più volte.
I traumi sono peggio delle coltellate, perché questi non solo hanno conseguenze
negative - come le coltellate - sull'aspetto fisico e mentale della vittima di tale violenza,
ma sono anche - in qualche maniera - una sorta di virus che porta alcune persone colpite
da traumi
- soprattutto traumi in cui si è vittime di violenza, abuso sessuale etc. -
a divenire in età adulta dei perpetratori.
Inoltre le problematiche di tipo mentale e
di tipo fisico, spesso le due cose sono associate; per spiegare meglio: le persone che sono i
soggette a trauma cercano istintivamente di aggiustarsi al trauma, cioè di fare coping,
gestire l'evento, e alcuni aspetti di questo tipo di gestione dell'evento possono essere
efficaci in un primo momento, ma molto costosi a lungo andare. Ad esempio alcune persone
possono - per gestire gli effetti del trauma - attutire la loro sofferenza con l'ingestione
di alcolici o con l'uso di droghe, che però
creano subito un altro problema, quindi aggravano
la situazione, perchè uno diventa poi alcolizzato o dipendente. Oppure a livello comportamentale
è noto il fatto di evitare il contatto con gli altri, ma isolandosi ci si taglia fuori
dal "rifare le batterie". Oppure praticare promiscuità sessuale, insomma le esperienze
avverse infantili sono una vera piaga sociale e costosissima, perché i costi solo per il
trattamento e le cure sono molto onerosi. Nell'interesse di tutti, tutti debbono impegnarsi
a prevenire e curare efficacemente i traumi che soffriamo da bambini.
Questo non solo
beneficia le vittime, ma tutta la società.

Che vuol dire trauma informed? Semplicemente informato sul trauma. É una approccio teso a prevenire la ritraumatizzazione e a offrire servizi e disegnare strutture che abbassino il pericolo di ritraumatizzazione e massimizzano la possibilità di erogare servizi efficaci.
Siamo giunti a definire delle buone pratiche come pratiche trauma informed grazie anche a un'attitudine di apertura e riconoscimento degli errori commessi in passato. Errori, ovviamente, commessi non intenzionalmente, ma per ignoranza,
proprio perché non sapevamo
che alcuni aspetti dei trattamenti in voga allora erano parte del problema e non della soluzione: ad esempio quello di spingere contro la loro volontà utenti a ricordare traumi passati, riesperienziare momenti traumatici e così via.
Oggi, grazie a quanto imparato dagli errori del passato,
abbiamo una serie di direttive,
di parametri che ci aiutano a prevenire i danni e massimizzare i benefici dell'erogazione

di servizi;

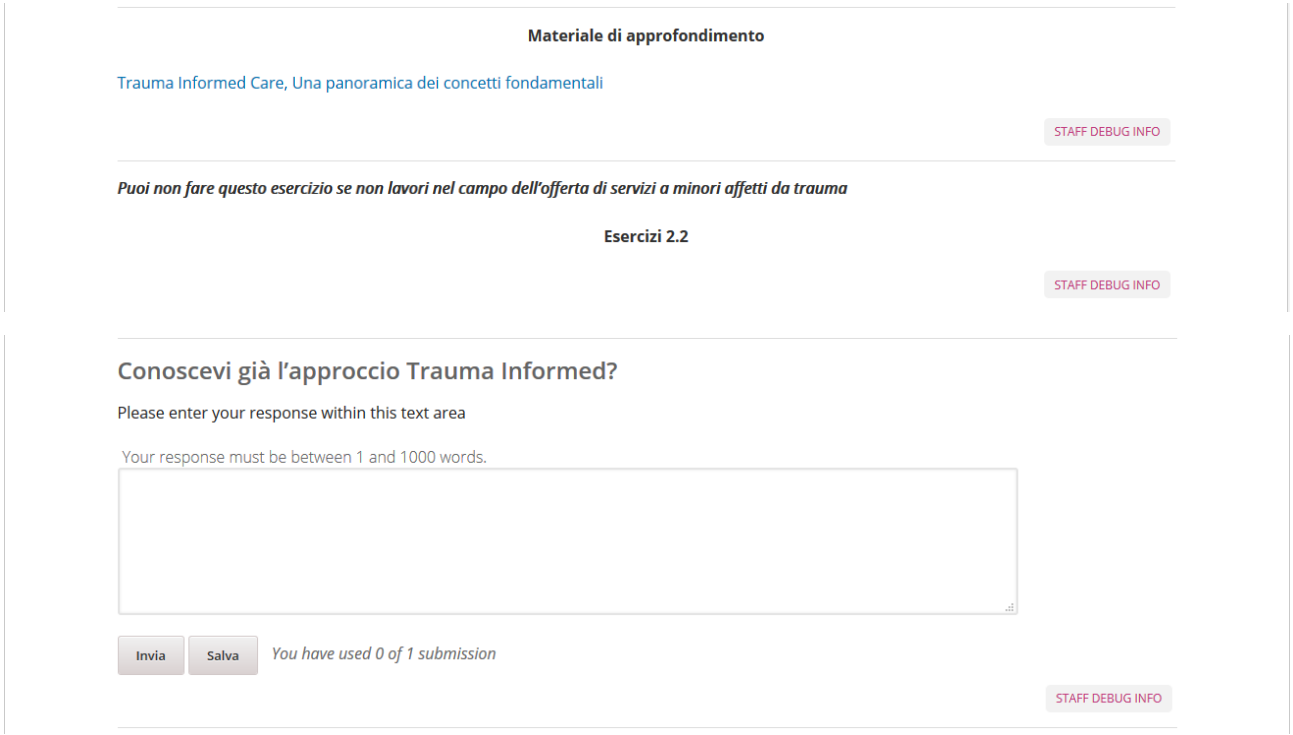
questo non solo in ambito sanitario, della salute mentale,

ma proprio in ogni ambito

i - per esempio la scuola, le organizzazioni, le regolamentazioni della giustizia minorile

o addirittura anche le leggi - insomma Trauma Informed School è una scuola sensibile alla problematica del trauma e quindi anche gli insegnanti sapranno che non sempre uno studente discolo è solo discolo, ma sta esprimendo un disagio dovuto ad un trauma, e quindi sapendo questo avranno strumento di reform, di invio allo psicologo affinché lo studente possa essere aiutato e il problema non diventi più grave di quanto già lo sia.

In fondo avere un approccio trauma informed è non solo doveroso, da un un punto di vista etico, clinico e di salute mentale, ma è anche qualcosa di efficace nel rapporto costi-benefici, perché erogare trattamenti che riducono i danni è nell'interesse non solo delle vittime di traumi ma dell'intera società.



Il tuo luogo di lavoro è trauma informed? Se si da quanti anni?

I comuni denominatori che sono presenti in ogni struttura, non importa quale, che sia trauma informed, cioè che non rischi di ritraumatizzare chi è stato già colpito da trauma e che offre un porto sicuro, non importa se essa sia una struttura territoriale dedicata alla protezione e promozione della salute, o una scuola, o una organizzazione lavorativa o un istituto per trattamenti specializzati, oppure anche una casa di correzione giovanile parte del sistema giudiziario.

Anche una comunità, per essere trauma informed, deve avere questi comuni denominatori che hanno un filo rosso:

i comuni denominatori sono tutti unificati nel voler comunicare

e assicurare all'utente che ha avuto un trauma

una piena sensazione di sicurezza,

fisica e psicologica, essere un porto sicuro.

Il primo principio trauma informed è che le struttura deve fornire una sicurezza fisica ed emozionale e quindi la persona avrà la certezza, perchè è informata a tal riguardo, ma anche l'esperienza che niente di male, nessun attacco, può essere portato a suoi danni, è un luogo sicuro dove non è necessario stare sul chi vive, in continuo allarme, vivere in ansia.

La struttura trauma informed è anche molto accogliente, in tutti gli aspetti di comunicazione e metacomunicazione e quindi l'utente è benvenuto, si dice proprio "benvenuto, o ben tornato" e sono convinti tutti che la persona dell'utente è una persona a cui si da realmente il benvenuto.

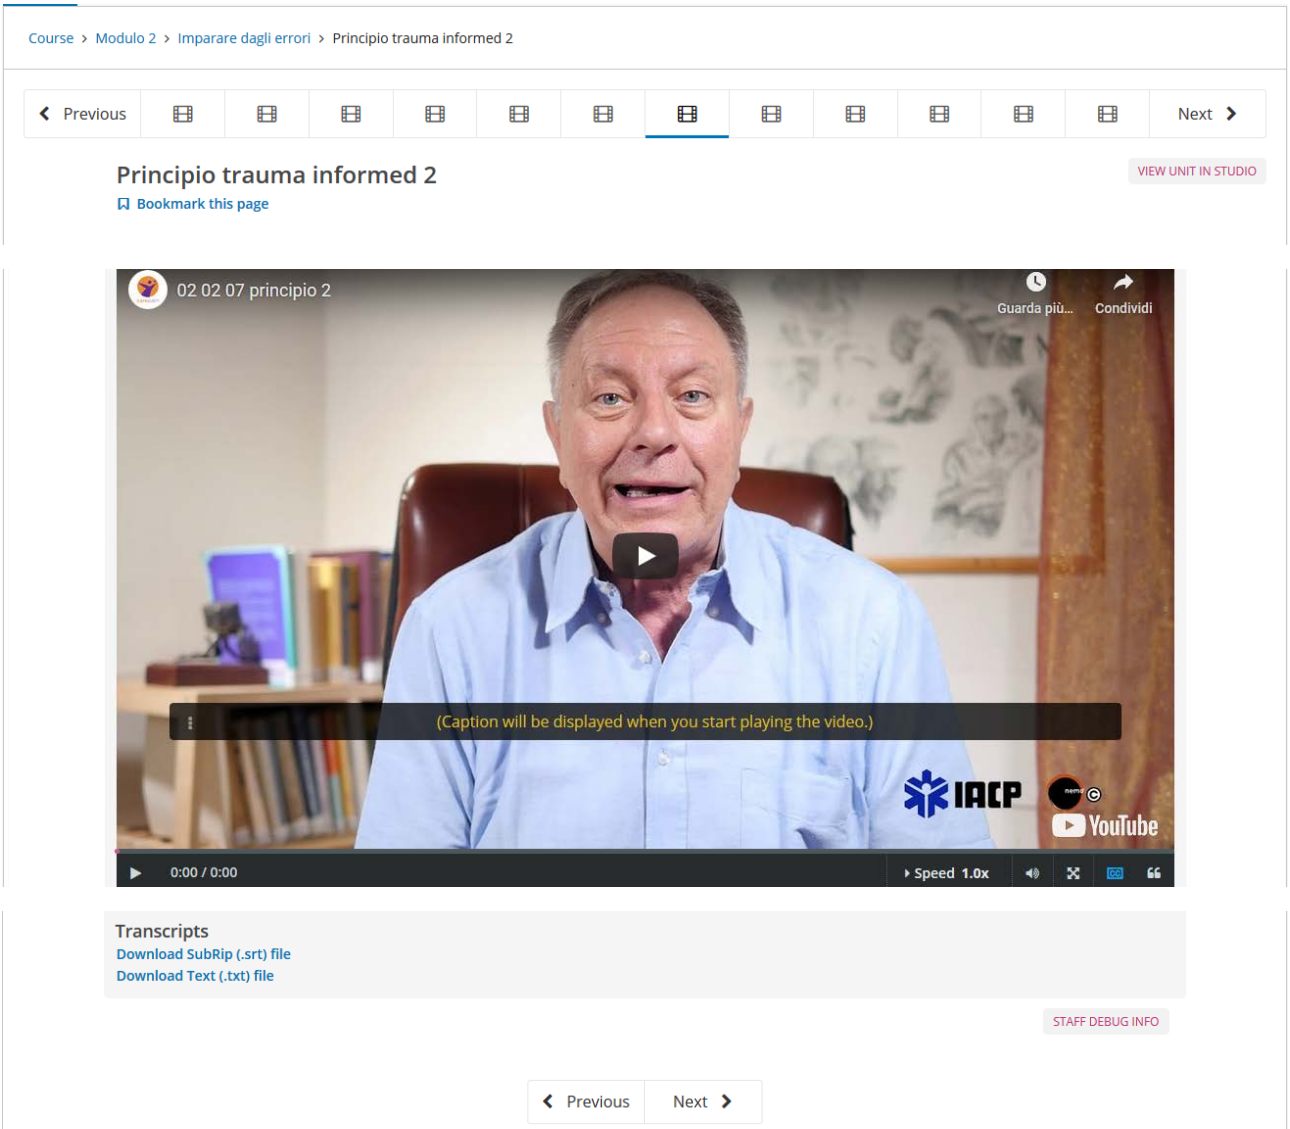
Una struttura per guadagnarsi la fiducia e dare sicurezza agli utenti deve essere coerente, cioè i suoi messaggi a tutti i livelli devono essere congruenti con le proprie azioni e costanti nel tempo.

Solo così la persona dell'utente potrà nutrire e sviluppare reale fiducia e sentire che la struttura è realmente accogliente e un porto sicuro a cui ci si può affidare.

In una struttura trauma informed non ha spazio, non hanno cittadinanza, la violenza, la vergogna e la colpa, aspetti molto problematici che possono acuire o ritraumatizzare chi ha subito già un trauma.

O vivamente una struttura trauma informed assicura anche la confidenzialità e proprio il segreto professionale, la privacy dell'individuo, il quale non verrà esposto a questo tipo di pericoli e di violenze.

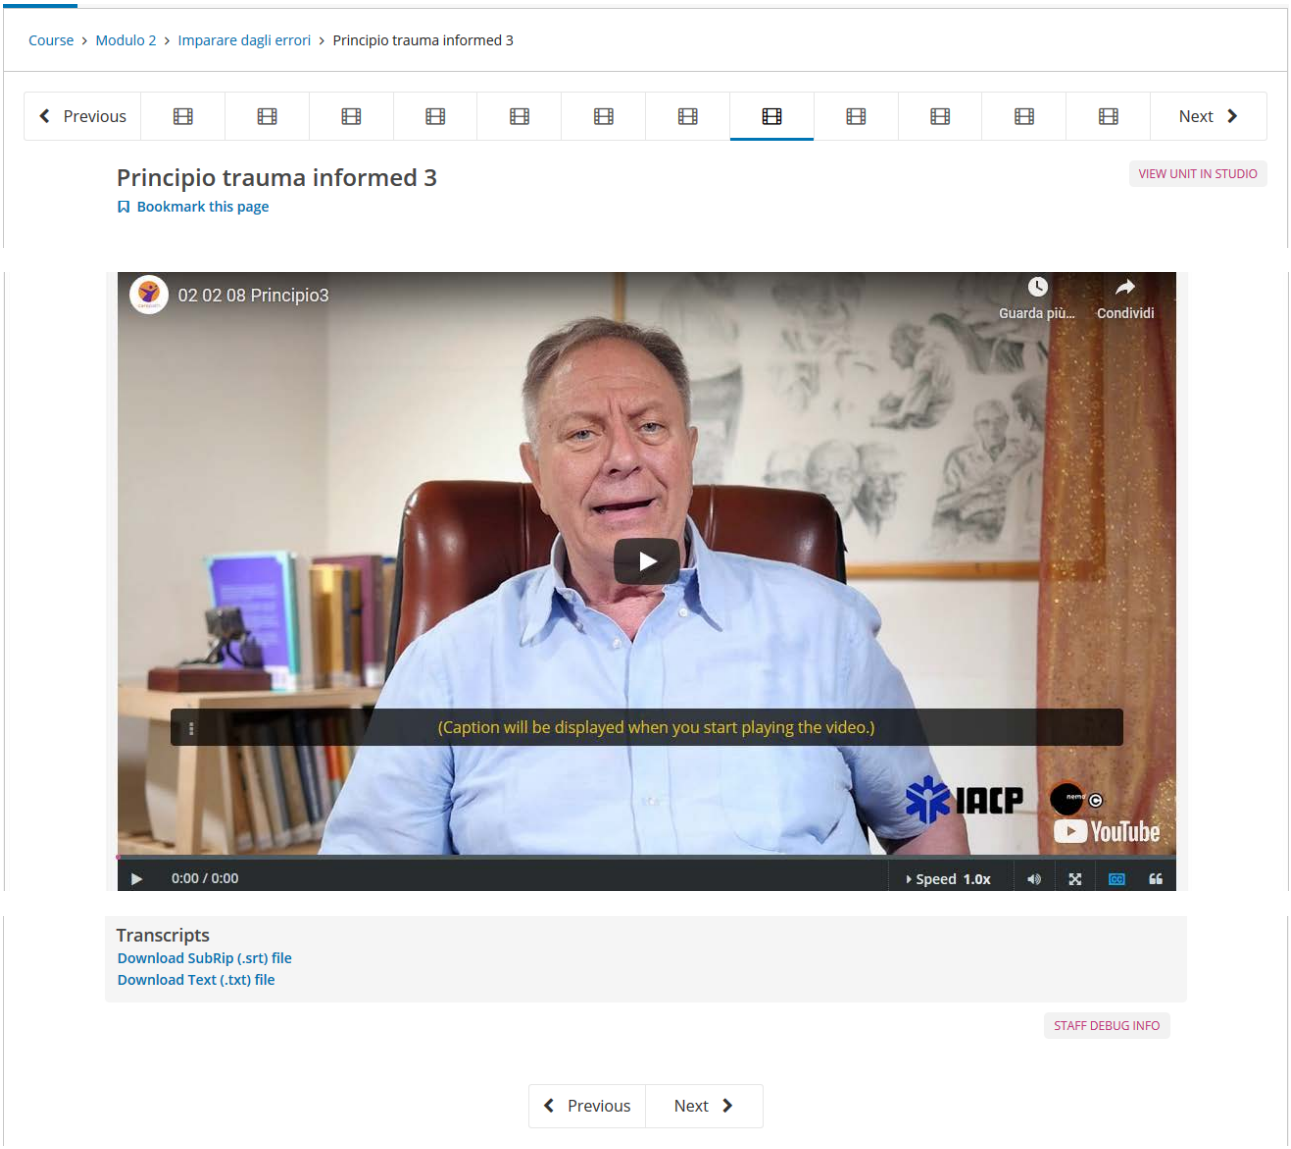
Inoltre il linguaggio di una struttura trauma informed è centrato sulla persona, cioè parlerà un linguaggio chiaro, coerente, che l'utente può comprendere e non dei criptici linguaggi professionali dove occorrono tre lauree per comprendere.



Transcript

Il secondo principio di una organizzazione trauma informed è la collaborazione e la mutualità, per mutualità si intende che l'utente è ingaggiato attivamente alla co creazione dei servizi a lui erogati e quindi il potere personale non è quello tradizionale, come nei modelli meccanicistici-riduzionistici, dove l'utente era il paziente designato; no, qui ha voce in capitolo e il ruolo che assumerà è quello di agenzia attiva nella sua azione di recupero delle sue capacità e potenzialità. Una struttura trauma informed promuoverà il recupero del rispetto per se stessi, un aspetto cruciale per chi è stato vittima di trauma, e anche per la speranza, la recovery,

il recupero del proprio potenziale.
Una struttura come questa metterà sempre in chiaro, soprattutto a se stessa, che il
recupero della salute, della funzionalità di una persona affetta da stress
post traumatico,
da traumi, può avvenire solo attraverso delle relazioni efficaci che i membri del personale
della struttura riescono a stabilire con l'utente.
Insomma un buon gioco di squadra, un'alleanza di lavoro.
Condividere gli aspetti decisionali è un aspetto centrale per assicurare un buon funzionamento
del servizio erogato,
innanzitutto sappiamo bene - lo hanno illustrato le ricerche di
Karasek sullo stress - se io ho degli stimoli stressanti ma ho ampio potere di controllo,
lo stress si abbassa,
se ho poco controllo sulla situazione lo stress si alza; è proprio
questo principio all'opera.
Quindi dare potere decisionale, controllo all'utente significa già parte della cura,
in altre parole, la persona con maggior controllo
è capace di superare meglio le sue condizioni.
Una struttura centrata sul fornire dei servizi trauma informed è una struttura che non incoraggia
eccessive disparità di potere, eccessivi livelli di differenziale di potere tra struttura,
operatori di questa e cliente, ma fa un'attiva azione di empowerment e riconosce alla persona
del cliente il diritto a esercitare un controllo e un potere personale nella co-costruzione
della realtà condivisa.
La struttura trauma informed è sistemica e olistica nel senso
che è ben consapevole
che quello su cui deve operare è proprio la costruzione sociale di una realtà trauma
informed, tutti gli aspetti concorrono a renderla tale
e quindi avrà cura dall'alfa all'omega,
dall'inizio dell'intake, dall'accoglienza
alla persona che ha avuto il trattamento,
come il cliente è accompagnato e aiutato a vivere efficacemente
la fase dell'after care.



Transcript

Il terzo principio è costituito dalla promozione della fiducia e l'offerta sempre presente della trasparenza, elementi importanti per stabilire un buon rapporto, un'alleanza efficace con l'utente. Per raggiungere questo obiettivo è ovviamente di primaria importanza che anche lo staff viva le relazioni interpersonali con gli altri membri dello staff, con il team, con la squadra basate sulla fiducia e la trasparenza

e anche questo nell'ambito delle relazioni

interpersonali vissute dallo staff con gli utenti e con le loro famiglie.

Altro aspetto importante è rispettare i limiti, mantenere i confini, perché innanzitutto proprio avendo dei confini chiari si creano degli spazi chiari, non rispettare i confini significa inquinare i setting e decretarne la loro disfunzione.

La trasparenza è fondamentale e quindi le politiche devono essere chiare, formulate

non in linguaggio burocratese, ma un linguaggio chiaro
e trasparente è un’altro motivo
di chiarezza, cioè tutti devono sapere - soprattutto gli utenti - in che luogo si trovano, quali sono i diritti e quali i doveri, quali sono di ogni aspetto della struttura e del personale che con egli lavora.
Per questo è necessario avere anche molta chiarezza dei ruoli e sapere che i vari professionisti operanti in una struttura hanno competenze varie
e anche erogano diversi aspetti, nessuno
è tuttologo e che quindi, come in un'articolata società, il panettiere fa il pane, lattaio distribuisce il latte, l’ingegnere si ingegna e così via.
Fondamentale per una struttura trauma informed è il rispetto dei diritti e il la promozione attiva dei diritti degli utenti, è quindi fondamentale
ricevere un reale consenso informato
spiegando bene all’utente come si trattano le procedure, l’erogazione dei servizi e facendo di tutto per assicurarsi che la comprensione e il consenso
siano reali e non semplice formalità.

Il quarto principio delle strutture trauma informed è basato su azioni di empowerment,

su dare diritto alla scelta e anche alla Co-creazione delle realtà dedicate agli utenti.

Tutto nella struttura offre messaggi

e meta-messaggi centrati su promuovere i punti di forza, la

resilienza degli utenti, la scelta è di promuovere il cambiamento

centrandosi sui punti di forza

e non sulle debolezza o di disfunzione dell'utente.

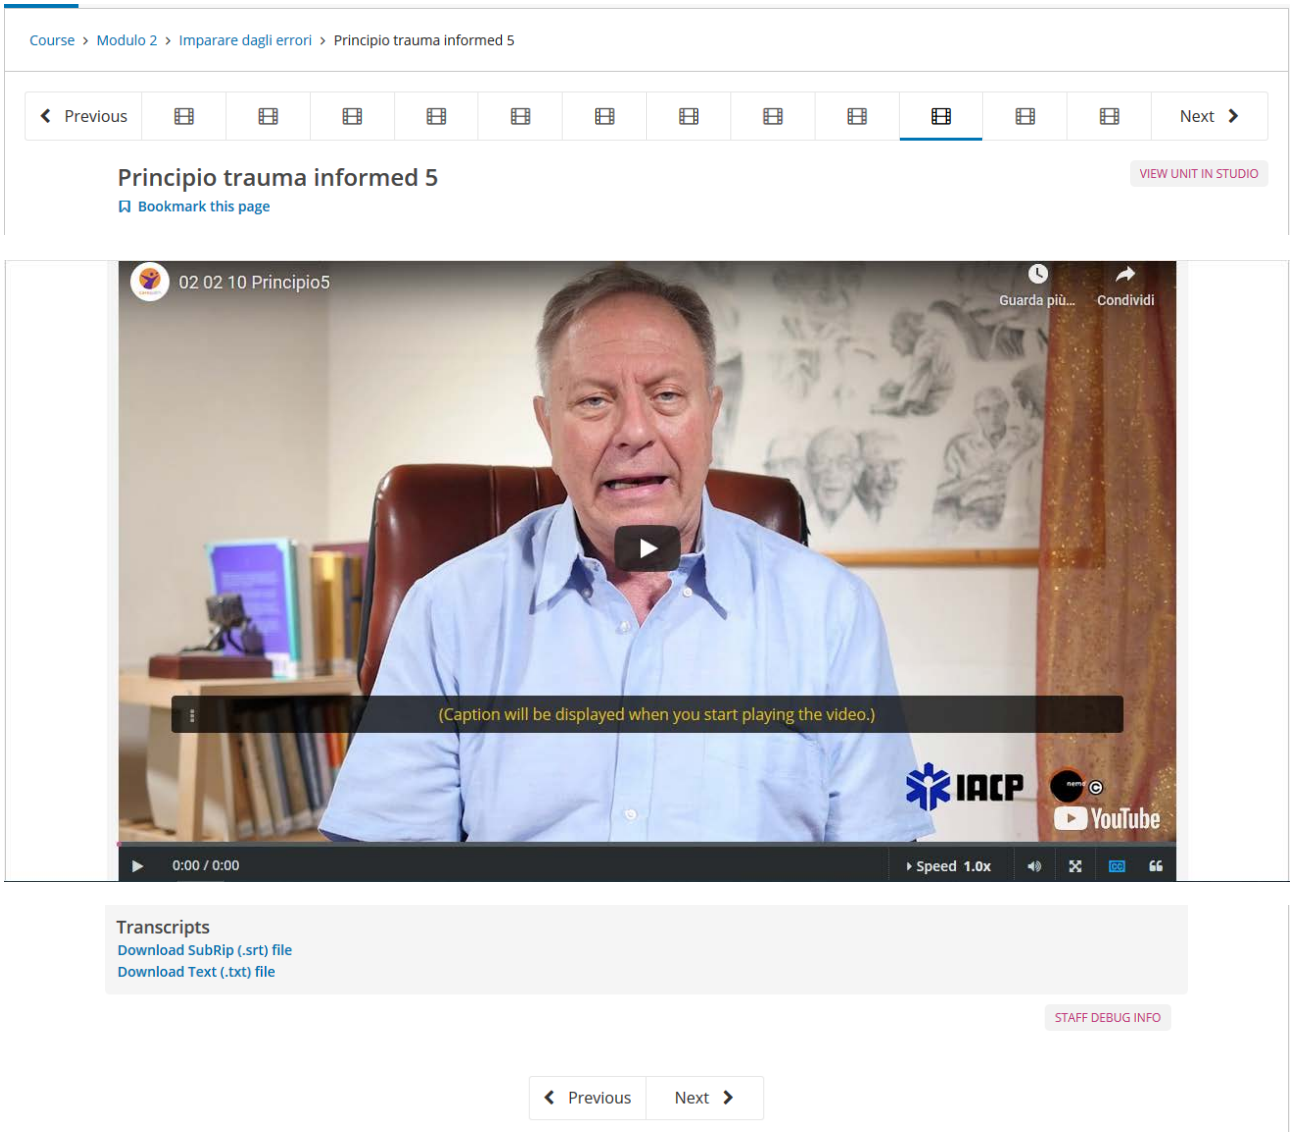
L'enfasi è promuovere la consapevolezza

dell'utente su come in passato ha affrontato,

a volte in modo non efficace, le varie situazioni, insomma il coping.

Si tratta, quindi, di applicare una vera propria filosofia che enfatizza l'utilità di basarsi

sui punti di forza; in altre parole in passato ci si centrava sulle patologie
e la loro riduzione,
ora ci si basa sulla salute, la forza e si cerca di promuovere l'espansione e l'allargamento.
Si valorizza inoltre i ruoli sociali e perchè noi siamo mammiferi sociali e quindi questo
è di vitale importanza per l'identità e lo sviluppo del nostro potenziale.
Obiettivo dichiarato e perseguito coerentemente
è promuovere le capacità di autoregolazione,
di autonomia e autogestione degli utenti, quindi si sottolineerà la possibilità di
crescere anche dalle esperienze traumatiche
non si enfatizza che una persona sia una povera
vittima, ma la sua capacità di resilienza.



Transcript

Il quinto principio è quello del supporto dei pari, quindi un'organizzazione trauma informed farà di tutto per favorire che i propri utenti ricevano il supporto dei loro pari.

Si tratta di una variabile molto importante.

Per stabilire sicurezza e speranza.

Innanzitutto il supporto dei pari aiuta a far sentire

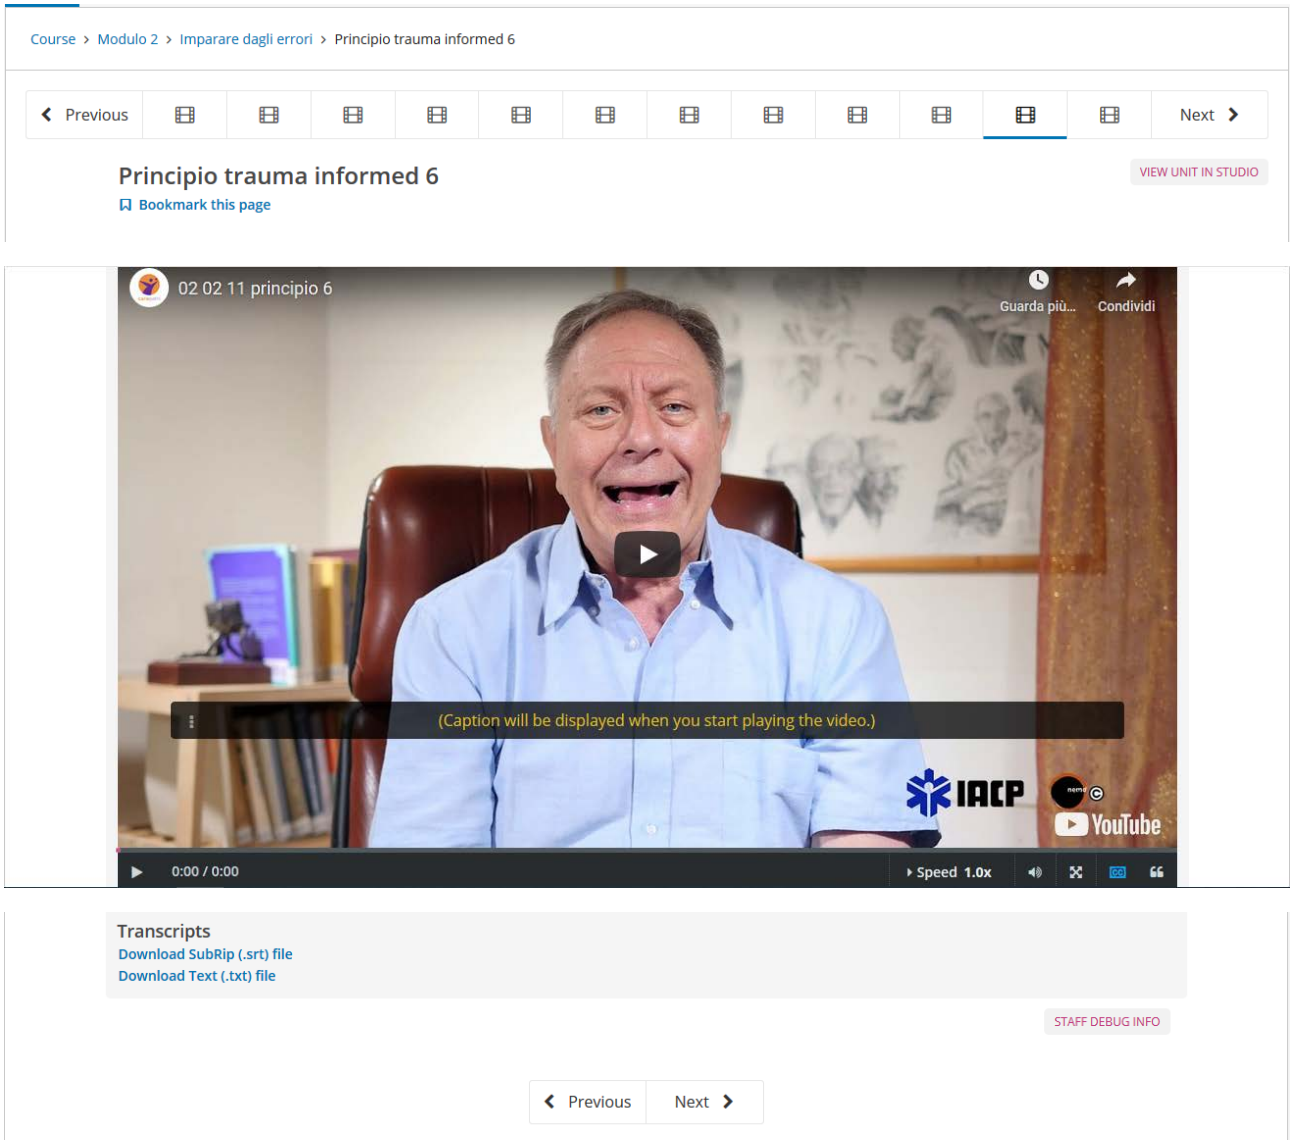
le persone che la ricevono più

sicure e anche a suscitare

la loro speranza, che ci sia la possibilità di stare meglio;

insomma è importante è il supporto dei pari per costruire maggiore fiducia in se stessi e nelle proprie potenzialità, anche autostima.

Il supporto dei pari promuove altresì le possibilità di collaborazione e quindi tutto
ciò che è di positivo nel promuovere il proprio ruolo sociale e sentirsi attivi.
È innegabile che il supporto dei pari porta ad una comunicazione interpersonale che può
veramente avvantaggiarsi della costruzione di narrative
che sono una parte di un puzzle
molto più ricco e che fanno sviluppare
narrative di speranza e di guarigione.



Transcript

Il sesto principio riguarda la sensibilità di una struttura trauma informed a tutti

le tematiche culturali, interculturali

e di genere o quelle che riguardano parte della popolazione

o minoranze per essere

sicura di trattare tutti in maniera accogliente e soprattutto

democratica.

Ovviamente una struttura efficace ed efficiente non avrà costrutti legati al passato di stereotipi

assolutamente ingiusti e distruttivi verso minoranze.

Il servizio erogato sarà, per esempio, molto

sensibile alle diversità di genere e al rispetto

equo delle diversità di genere e poi

una tale sfruttare efficacemente faciliterà l’utilizzo
del background culturale, delle tradizioni,
della cultura e nazione di origine dei suoi utenti.
Costruirà una realtà fedele alla propria filosofia per cui l’organizzazione e le
procedure saranno tutte
non discriminatorie e sensibile alle diversità.
Inoltre saprà riconoscere e affrontare efficiente il trauma storico.
I traumi storici sono costituiti da eventi
di trauma di massa che impattano anche chi
non l’ha vissuto direttamente, facendo un esempio drammatico: l'olocausto, non solo
milioni di poveretti sono stati vittime
del delirio nazista, ma anche i loro figli e nipoti
portino il riverbero di tale bestialità.

Le scuole possono fare molto per la prevenzione e gestione efficace

dei traumi e soprattutto

nel prevenire la ritraumatizzazione.

Le scuole sono un punto nevralgico della comunità

e gli insegnanti in modo particolare poiché

vedono continuamente i loro studenti

e hanno frequenti contatti con le loro famiglie.

Inoltre gli insegnanti godo di un certo prestigio, derivante dal loro ruolo, nella comunità.

Per cui se gli insegnanti e tutto il personale scolastico

sono sensibilizzati su quelli che

sono i parametri una scuola trauma informed, e magari hanno

avuto una consulenza da un

esperto che li aiuta a fare quelle migliorie

che renderanno la scuola da scuola ignorante
della problematica a scuola informed sulle problematiche del trauma, ebbene tale scuola
potrà essere non parte del problema, ma parte della soluzione.
Non solo perché gli insegnanti
sensibilizzati sulle problematiche del trauma potranno essere
ben pronti a cogliere segnali
che se non avessero un occhio addestrato potrebbero interpretare
come meri problemi disciplinari, ma invece - essendo insegnanti trauma informed - potranno
essere sensibili fare da riferimento ai loro
allievi e chiedere accertamenti se un loro
studente ha bisogno di supporto professionale se lo studente è o è stato vittima di un
trauma.
Un'altra influenza significativa gli insegnanti possono esercitarla nei confronti dei genitori,
che piano piano diventano dei genitori trauma informed
e potranno dare un notevole contributo
a questo tipo di problematica.
Insomma una scuola trauma informed
è il completamento della vocazione di una scuola, che è avere
e diffondere efficacemente le conoscenze
per funzionare come cittadini proattivi della polis.
Quindi, una scuola trauma informed
è pienamente pronta a realizzare la propria mission di
scuola nel senso migliore del termine.

Puoi non fare questo esercizio se non lavori nel campo dell'offerta di servizi a minori affetti da trauma

Verranno illustrati alcuni insegnamenti tratti dall'esperienza di 20 anni di lavoro nei servizi rivolti a minori e famiglie e che si occupano di creare dei percorsi di aiuto, sostegno e intervento per i minori esposti a situazioni di violenza, violenza assistita, abuso o ad altre situazioni di vissuti traumatici.

Nel corso del tempo le cose più importanti

focalizzate sono state: la necessità e l'importanza di costruire - al di là di competenze tecnico scientifiche - una relazione adeguata a creare un contesto sicuro per il minore.

Il termine sicuro va declinato nella dimensione di ascolto

delle esigenze e dei bisogni e di rispetto,

fondamentale in particolare nelle situazioni in cui il minore esce da esperienze che hanno violato il senso di sicurezza e di rispetto e di continuità della vita, in queste garantire una situazione di rispetto è fondamentale per riprendere un percorso evolutivo.

Corsa vuol dire una dimensione di rispetto? Significa una vera dimensione di ascolto,

ascolto empatico e non una centratura
su protocolli e sulle esigenze degli operatori, ma una centratura
su quello che è il mondo interno
del minore, i suoi bisogni, i tempi del minore, i quali
vanno rispettati dal momento che spesso ci troviamo davanti a minori che hanno sviluppato
una situazione di difesa e protezione di sé.
È quindi importante che l'operatore che
interviene lo faccia non minacciando di abbattere le difese (volendo sapere, portare, fare domande)
ma rispettando un tempo di esposizione del minore, avendo coscienza che la difesa non
è che il modo migliore trovato dal minore per fare fronte ad una forza che è stata
soverchiando. Quindi piano piano, rendendo inutili e meno indispensabili le difese si
potrà andare a incontrare il nucleo del cuore di quel minore.
L'esperienza ce lo mostra é, quindi, importante essere centrati sui bisogni del minore.
Si illustreranno ora le esperienze accumulate dall'attività di assistente sociale che
per 8 anni ha prestato servizio presso il comune di Roma occupandosi di prevenzione,
tutela e sostegno dei minori e delle loro famiglie.
In accordo con quanto detto sopra in riferimento alla necessità di essere centrati sui bisogni
del minore si può allargare questa riflessione alla necessità di essere centrati sulle caratteristiche
e l'unicità di ogni situazione, quindi anche di tutti i soggetti coinvolti, oltre
il minore sicuramente i suoi genitori. Nella quotidianità del lavoro come assistente sociale
ci si occupa principalmente di lavorare con i genitori, in quanto i minori che subiscono
o hanno subito uno o più traumi
solitamente vengono presi in carico e seguiti da specialisti
opportunamente formati per sostenerli in questo processo.
Per quanto riguarda l'attività dell'assistente sociale questi si occupa di accompagnare le
famiglie nel processo di consapevolezza
delle loro difficoltà, criticità, fragilità,
ma anche degli agiti che hanno recato danni e malessere ai propri figli, per poi costruire
anche delle reti di supporto attraverso le quali sostenerli nell'acquisizione e nell'utilizzo
adeguato di responsabilità genitoriali che garantiscano
al minore il suo diritto a crescere
serenamente nella propria famiglia,

in un contesto quindi di protezione e tutela.

Secondo l'esperienza quali sono gli elementi preponderanti di cui si ha bisogno come operatori per lavorare in questo ambito è con queste persone? Sono sicuramente le competenze tecnico professionali scientifiche, ma sicuramente anche competenze e capacità che riguardano di più la sfera personale, ci si riferisce, quindi, a tutto quello che si può racchiudere con l'accezione di "mondo interiore" dell'operatore: le proprie emozioni, pregiudizi, risonanze, proiezioni che tendiamo a fare e facciamo entrando in relazione con gli altri; oltre ad essere professionisti della relazione d'aiuto si è delle persone che incontrano altre persone.

Cosa accade quando ci si trova a lavorare con genitori abusanti o maltrattanti? Non si nasconde di provare a volte, anche spesso, sentimenti o emozioni di rabbia, sdegno, indignazione e anche talvolta di paura; sicuramente quello che si vuole dire è che non si deve far finta che queste emozioni non esistano, fanno parte di noi ed entrerebbero in ogni caso nella relazione di aiuto. L'importante è invece saperle riconoscere, in modo tale da saperle gestire e fare in modo che non vadano ad inficiare la realtà che si ha difronte, ovvero fare in modo che la soggettività personale non sia il linguaggio attraverso il quale si interpreta quello che si ha di fronte, confondendo i piani di realtà o i ruoli. A volte l'operatore, confuso dall emozioni, tenda a porsi come colui che da le direttive e il genitore diventa semplicemente la vittima delle decisioni dell'operatore; questo sicuramente allontana dal garantire la tutela e la protezione dei minori, perché se non si è assolutamente concentrati sulla realtà della situazione affrontata non è possibile ne capire ne percepire i bisogni dei minori e quindi orientare l'intervento.

Per quanto riguarda invece la relazione diretta con il minore, l'intervento dell'assistente sociale in tal caso è più ridotto, ma anche in questo caso ci sono componenti emotive forti, può capitare di voler rispondere al bisogno personale di dare ai minori l'affettività e le cure non ricevute, altre volte tentando di sostituirsi ai professionisti dell'aiuto che li seguono e li aiutano nell'elaborazione dei propri traumi.

la complessa narrativa che vede gli adolescenti LGBTQI crescere in

contesti familiari e sociali che molto spesso disconoscono, denigrano le

dimensioni fondanti della loro identità quali sono

la sessualità e l'affettività

può esitare in una varietà di disagi

psichici un'ampia letteratura scientifica che evidenzia come in una

popolazione non clinica queste persone soffrono in misura significativamente

maggiore di disturbi d'ansia abuso di sostanze disturbo post traumatico da stress

e che abbiano un aumentato a rischio suicidario

i ricercatori e corre l'anno questa maggiore incidenza dei disagi psichici

alle dimensioni del minority stress e dell'omofobia sociale quindi

l'invisibilità e l'indicibilità emergono al contempo come cause e conseguenze di

vissuti traumatici all'interno dell'esperienza di queste persone a

questa è una drammatica realtà i concetti di trovano cumulativo di tra
una relazionale e le concettualizzazioni relative ai disturbi traumatici
evolutivi complessi
esiste quindi una relazione a circolare
tra pregiudizio sociale aspetti del sé dissociati invisibilità ma anche le si
chiesa in una popolazione che vede negata oltre a questa dimensione anche
quella della cittadinanza dell'appartenenza e dell'inclusione
E necessario quindi che chi è deputato all'accoglienza ed al supporto di questi
ragazzi si interroga su come facilitarli di succo acquistare aiutarli a
conquistare per sé diritto di esistenza dignità e diritto alla.
Le ricerche che si susseguono da oltre 50 anni e continuano i documenti vademecum
le linee guida prodotti a seguito di queste ricerche
fanno riferimento alle
dimensioni che seguono
le omosessualità sono varianti normali e positivi della
sessualità umana e non costituiscono di per sé indicatori di disturbi mentali o
di disturbi dello sviluppo abbiamo stesso ritardi le bisessualità sono
oggetto di stigma sociale e questo può avere svariate conseguenze negative nei
percorsi nei processi evolutivi
e effetti e di comportamenti omosessuali
possono essere presenti in vari orientamenti sessuali.
Le persone lgbt sono condurre vite soddisfacenti e felici instaurare
relazioni di coppia durature e formare famiglie solide quanto quelle
eterosessuali. Non esistono ricerche scientifiche che riconducano
l'omosessualità al trauma o la disfunzionalità delle famiglie di origine.
Non è dimostrato che tutti i tentativi terapeutici che abbiano
l'obiettivo di modificare l'orientamento sessuale siano efficaci voi sentite
rischi linee guida rilasciate dalle pieghe nel 2012 rispetto al pratica
psicologico con persone lgbt linea non l'importanza di prendere in
considerazione gli atteggiamenti del relatore di aiuto verso l'omosessualità
e la bisessualità intesi non soltanto come la conoscenza degli effetti dello
stigma su queste persone ma anche come la consapevolezza di quanto i propri

atteggiamenti impliciti ed espliciti rispetto alle ore di sessualità e quindi
la personale competenza su queste tematiche ma anche la personale
personale sguardo su queste tematiche possano influire in ambito di
valutazione e di intervento
I punti in comune che si possono estrapolare da
tutti i documenti finora prodotti possono essere così sintetizzati.
Offrire accettazione e sostegno
mettendo in atto un ascolto rispettoso non giudicate ed
empatico che aiuta l'utente a ridurre il disagio causato dal minority stress
Adottare opportuni accorgimenti nella fase di conoscenza di queste persone
la valutazione deve essere indirizzata alla conoscenza del ragazzo della
ragazza e in tutta la sua complessità considerando le interazioni e le
interconnessioni tra il minority stress la salute mentale e la dimensione
spirituale interiore nonché la posizione dell'orientamento sessuale occupa nel
funzionamento generale dell'individuo.
Favorire e sostenere modalità attive di
coping sappiamo che per gli adolescenti in generale è molto importante sentirsi
agenti attivi nelle proprie esistenze in particolare quando c'è da far fronte a
degli eventi stressanti il relatore d'aiuto dovrà cercare di
aiutare l'utente a favorire delle strategie che tendano all'elaborazione
cognitivo ed emozionale dello stesso comprendere di nuovo la dimensione
fondante nell'adolescenza
il ruolo svolto dalle amicizie dalle comuni ed
alla comunità lgbt sideranno che il minority stress può comportare che
emarginazione ed isolamento
un obiettivo fondamentale è quello di incrementare la
capacità di avvalersi del supporto sociale.
Esplorare e sviluppare l'identità
e dinamiche identitarie costituiscono un aspetto importantissimo
e fondante adolescenza e nell'adolescenza delle
persone lgbt è importante che queste persone possano esplorare ed integrare
senza necessariamente dover scegliere un'identità a scapito della scapito

dell'altra come nel caso della dicotomia maschio femmina.

Comprendre i conflitti e favorire la loro integrazione

la relazione d'aiuto dovrebbe favorire

il dialogo e l'integrazione fra le parti di se eventualmente in conflitto come

può accadere ad esempio nel caso dell'orientamento sessuale e del credo

religioso comprendere i significati sottostanti alle richieste di modificare

l'orientamento sessuale o di fare una terapia riparativa

in questi casi è necessario uno psicoterapeuta opportunamente formato

mondo con un analisi della domanda appropriata accogliendo significano ed

esplorando tale desiderio e riconducendolo a complesse dinamiche

psicologiche familiari e sociali che potrebbero condurre il ragazzo con la

ragazza a considerare inaccettabile un elemento costitutivo della propria

identità.

Comprerete esplorare il processo di camminato.

Cogliere i livelli di minority stress in relazione alle condizioni di

doppia minoranza in cui l'individuo viene discriminato non soltanto a causa

dell'omosessualità della bisessualità ma anche di altre condizioni oggetto di

stigma sociale

Tenere conto del peso che ha il minority stress

nelle dinamiche di coppia ed è importante ricordare che le coppie gay

e lesbiche non sono riconosciute né dalle principali religioni né

dall'ordinamento giuridico di molti paesi connesso a ciò c'è da considerare

tutto quello che è il relativo al omogenitorialità e alla mancanza alla

scarsa regolamentazione giuridica di questo tipo di formazione familiare

Per growth after trauma si intende un fenomeno

di crescita personale che alcuni individui

traumatizzati esperiscono come conseguenza del trauma stesso.

In altre parole, non solo il trauma provoca danni notevoli, gravi all'organismo e alla

psiche degli individui interessati,

però oltre a tutti i danni esiste anche questo fenomeno

che un numero significativo, anche se non maggioritario, di vittime di traumi

esperienza.

Si vuole sottolineare che questo ci parla ancora una volta dell'incredibile resilienza

della specie umana, o forse parla della resilienza

di tutte le forme di vita che si sono sviluppate

nell'evoluzione della vita sul nostro pianeta.

Comunque sia la tragedia del trauma manda in tilt la persona, la "sbatacchia",

la offende e ferisce
e quindi è un vero e proprio terremoto, le cui scosse impattano sia il
piano psichico che il piano fisico di un individuo.
Tuttavia, in tale sconquasso, come succede sovente,
non tutto il male è unicamente a
senso unico perché quando un soggetto è travolto da un trauma
si deve riaggiustare
alla nuova realtà ed alcuni individui
si riaggiustano, si riassestano, crescendo dall'esperienza.
Quindi a livello esistenziale essi vivono
una esperienza di crescita, in altre parole
sono più aperti, più convinti di valori morali e spirituali che vivono in maniera
più significativa e si relazionano alla vita,
con se stessi, gli altri e il mondo con nuovi
e più profondi significati.
Un esempio personale: ricordo la commozione che ho provato leggendo proprio un libro scritto
da un collega - Victor Frankl - che ha avuto a sorte la tragedia e tutti i traumi relativi
ad essere preso, in quanto ebreo, durante il nazismo
ed internato in un campo di sterminio
nazista; ebbene i campi di sterminio, prima di uccidere le persone nel fisico le angariavano
e cercavano di uccidere nella loro dignità umana, tuttavia un numero - anche esiguo - di
persone non solo sopravviveva a livello fisico, nonostante tutti i traumi anche a livello
psichico, ma diventavano persone migliori e quindi, come ci racconta Frankl nel suo
libro "Uno psicologo nei lager" come lui ed altri compagni di campo facessero in quattro
e si privassero del poco cibo per dare
amoroso supporto a persone più sfortunate addirittura
di loro (malate o deboli), rischiavano di essere mandati alle famose docce alla camere
a gas e quindi sterminati.
Chi di questo gruppo è sopravvissuto ed è stato poi liberato alla fine della follia
nazista era diventato, pur nella debolezza fisica e pur traumatizzati, una persona migliore
e con un rapporto più significativo a livello esistenziale con se stesso, gli altri, il
mondo; un aspetto che ci fa meditare e ci infonde forse un po' di speranza.

Nel lavoro in ambito clinico con bambini traumatizzazione

attraverso un modello di psicoterapia basato

sul gioco denominata play-therapy.

Secondo il modello di Virginia Axline, psicoterapeuta

statunitense allieva di Carl Rogers e che ha trasposto i principi basilari sviluppati

da Rogers nell'ambito della psicoterapia dell'adulto, nel lavoro clinico con i bambini.

Questo lavoro è stato pubblicato nel libro "play therapy" nel 1947.

I postulati evidenziati e delineati da Rogers,

basilari per la comprensione del mondo interno

del bambino, a cui la Axline fa riferimento, parlano di un bambino che ha una tendenza

innata ad attualizzare le potenzialità del suo organismo

e tutti i suoi comportamenti

sono tesi al raggiungimento di questa meta.

Un secondo postulato parla di un bambino in
grado di autoregolarsi perché nessuno meglio di lui conosce ciò che è meglio per se stesso.
Un terzo postulato parla di un bambino che
ricerca attivamente tutte quelle esperienze
che possono esser favorevoli per il suo sviluppo, per l'espressione delle sue o potenziali
e del suo organismo, mentre tenderà a rifiutare tutte quelle esperienze che valuta come sfavorevoli.
In questa ottica la play therapy permette al bambino di
esprimere se stesso nelle migliori
condizioni possibili,
proprio grazie ad un clima calmo, contenitivo e facilitante il
bambino ha la possibilità di esprimere meglio il suo potenziale.
Il clima facilitante che
si realizza nell'ambito della play therapy permette al bambino di rafforzarsi,conoscersi
meglio e di simbolizzare correttamente la sua esperienza
che, in altre parole, vuol
dire dare espressione alle emozioni e ai sentimenti.
L'accesso al mondo interno del bambino è
possibile attraverso dei canali cosiddetti preferenziali che sono: il gioco, il disegno
e la favola. Attraverso questi canali il bambino è in grado di poter esprimere in maniera
più spontanea e libera, in quanto canali che gli appartengono fortemente, ed è cos'è
in grado di esprimere i propri bisogni, vissuti ed emozioni.
Nell'ambito del processo della play therapy il terapeuta starà attento a rimandare e
a riflettere al bambino tutto ciò che emerge attraverso il gioco e quindi sintonizzandosi
con quelle che sono le sue emozioni.
Questo permette al bambino di ampliare la consapevolezza
rispetto al proprio comportamento.
La costruzione del setting nella play therapy
è fondamentale perché è il modo in cui il bambino viene accolto. In questo senso,
per esempio, avere a disposizione molto materiale di gioco permette al bambino di esprimersi
in libertà, di muoversi in libertà dentro
l'ambiente, questa diventa per lui una esperienza
fortemente significativa:

nel momento in cui il bambino si sente libero è maggiormente
facilitato nella autoesplorazione
e, attraverso questa, così avviene il cambiamento, il quale
produce presa di potere personale, l'empowerment.
Ritornando alla costruzione del setting, la
presenza ad esempio di molti materiali, ad esempio fogli di carta, vari colori, plastilina
da modellare, vaschette per la sabbia su cui realizzare scene oppure la presenza di libri,
di favole da poter raccontare o leggere assieme;
insieme alla presenza dei puppets che permettano
al bambino di esprimersi al meglio: come ad esempio l'uso di due pupazzi che il bambino
ed il terapeuta possono indossare, come marionette,
ed indossandoli il bambino li fa diventare
parti di sè e può così interagire col terapeuta, ma facendo parlare il pupazzo come canale
di comunicazione, importante perché così facendo il bambino può aprirsi in modo più
profondo ed efficace.
In questo senso i pupazzi possono interagire
come se fossero entità autonome, è importante che il terapeuta guardi direttamente i pupazzi
e non il bambino, questo lo facilità nel
considerarlo come canale di espressione che
non è se stesso. Il fatto che rappresentino animali è un elemento facilitante perché
per il bambino è più semplice identificarsi con l'animale rispetto che con la figura
umana. Il terapeuta in questo processo con questi
materiali di gioco non farà altro che accompagnare
il bambino in questo percorso e - citando
Axline - durante un percorso di psicoterapia sarà il bambino ad indicare la strada da
seguire e non sarà il terapeuta a dirigerlo. Nel momento in cui infatti il bambino è libero
di esprimersi è possibile l'autoregolazione,
uno dei postulati di Rogers prima citrati.
In questa ottica la play therapy è efficace nel lavoro con bambini che hanno subito esperienze
traumatiche, in quanto la creazione di un clima di sicurezza, contenimento e libertà
permetta al soggetto traumatizzato di esprimere
al meglio se stesso e avviare un processo

di elaborazione della sua esperienza.
L'importanza del gioco è stata ampliamento
rafforzata anche dalle ricerche nell'ambito delle neuroscienze, in particolare significativo
è il contributo di Panksepp, che nel suo libero "l'ecologia della mente" identifica
sette sistemi affettivi di base presenti nei mammiferi.
Tra questi sistemi quello che più
ci interessa è l'identificazione del circuito del gioco, un circuito determinato geneticamente
che media gli effetti positivi nel cervello dei mammiferi.
Panksepp ha riscontrato che
al livello genetico il circuito del gioco è presente in tutti i mammiferi e quindi
li accomuna. Queste ricerche valorizzano l'importanza del gioco per la crescita cognitiva, affettiva,
relazionale del bambino
e si è dimostrato che il gioco facilità le abilità di coping,
ad esempio di cooperazione sociale.
Il fatto che il gioco sia stato confermato
come un'attività spontanea, radicata geneticamente, ci permette di fare delle riflessioni nel
momento in cui abbiamo a che fare con un bambino che non gioca. Un bambino che non gioca è
in qualche modo indicativo di un bambino che
in quel momento esprime un malessere.
La play therapy si configura come un intervento psicoterapeutico altamente efficace con bambini
sofferenti, che portano con sé disagi, ma ancora
di più con bambini che portano con
sé esperienze traumatiche;
in particolar modo la play therapy fa si che il punto di
vista centrale sia quello del bambino,
il quale è considerato come una persona che
può raccontare, condividere ed esprimere tutte le sue emozioni, sentimento, angosce
e paure, però in un contesto protetto, sicuro e rispettoso del bambino stesso e di quelle
che sono le sue peculiarità.
Tutto questo può aiutare il bambino a superare l'esperienza
traumatica e permettergli di crescere in maniera sana.

Matreriale di approfondimento

Virginia Axline, psicologa statunitense è stata allieva e poi collega di Carl Rogers, il padre della Psicoterapia Centrata sul Cliente. Ha applicato i principi della Psicoterapia Centrata sul Cliente adattandola alla realtà e alle esigenze dei bambini servendosi del gioco come mezzo di comunicazione più efficace per questo tipo di clienti. Ha scritto Dibs In Search Of Self (1964), pubblicato in Italia da Mondadori, Storia di Dibs (1969) e La Play Theraphy Edizioni La Meridiana, 2015

La notevole capacità della Axline e la sua fiducia palpabile nelle innate capacità di autoregolazione dei bambini a lei affidati sono un esempio eloquente di come si possa incarnare questa fiducia nelle capacità autopoietiche dei bambini e come una relazione improntata alla fiducia divenga una profezia auto-realizzante."

Dalla Prefazione di Alberto Zucconi al libro di Virginia Axline Play Therapy

"Un bambino di sette anni durante una seduta di play therapy spontaneamente disse a gran voce: 'Oh! Tutti i bambini, almeno per una volta nella vita, dovrebbero avere l'opportunità di buttare tutto fuori senza doversi sentire dire: Non ti azzardare a...! Non ti azzardare a...! Non ti azzardare a...!'

Questo fu il suo modo di definire la play therapy.

Nelle esperienze di play therapy, grazie alla relazione con lo psicoterapeuta, si dà al bambino l'opportunità di conoscere se stesso. Lo psicoterapeuta si comporta in modo tale da comunicare al bambino che questa esperienza gli offre la sicurezza e la possibilità di esplorare liberamente, non solo la play-room con i suoi giocattoli, ma anche l'esplorazione di se stesso nell'ambito della relazione terapeutica.

Qui il bambino avrà l'opportunità di misurarsi con se stesso. Il bambino come risultato di questa esperienza di auto-esplorazione di sé in relazione con gli altri, di auto-espansione e auto-espressione imparerà non solo ad accettare e rispettare se stesso ma anche gli altri e a utilizzare la libertà con senso di responsabilità.

C'è franchezza, onestà e vitale autenticità nel modo in cui i bambini si manifestano nelle esperienze di gioco. I loro sentimenti, atteggiamenti e pensieri emergono, si dispiegano, si muovono e le spigolosità si smussano.

I bambini imparano a comprendere un po' meglio se stessi e gli altri e ad offrire più generosamente accoglienza emozionale a tutte le persone."

(dall'introduzione dell'autrice)

Un classico della letteratura internazionale che ha aperto la terapia al gioco come strumento di **auto-esplorazione dei bambini**.

Esistono vari strumenti di valutazione del trauma che, come tutti gli strumenti diagnostici, possono essere somministrati esclusivamente da psicologi.

Tra i vari strumenti che esistono vale la pena citare il Test di Wartegg proiettivo, semi strutturato, basato sul disegno.

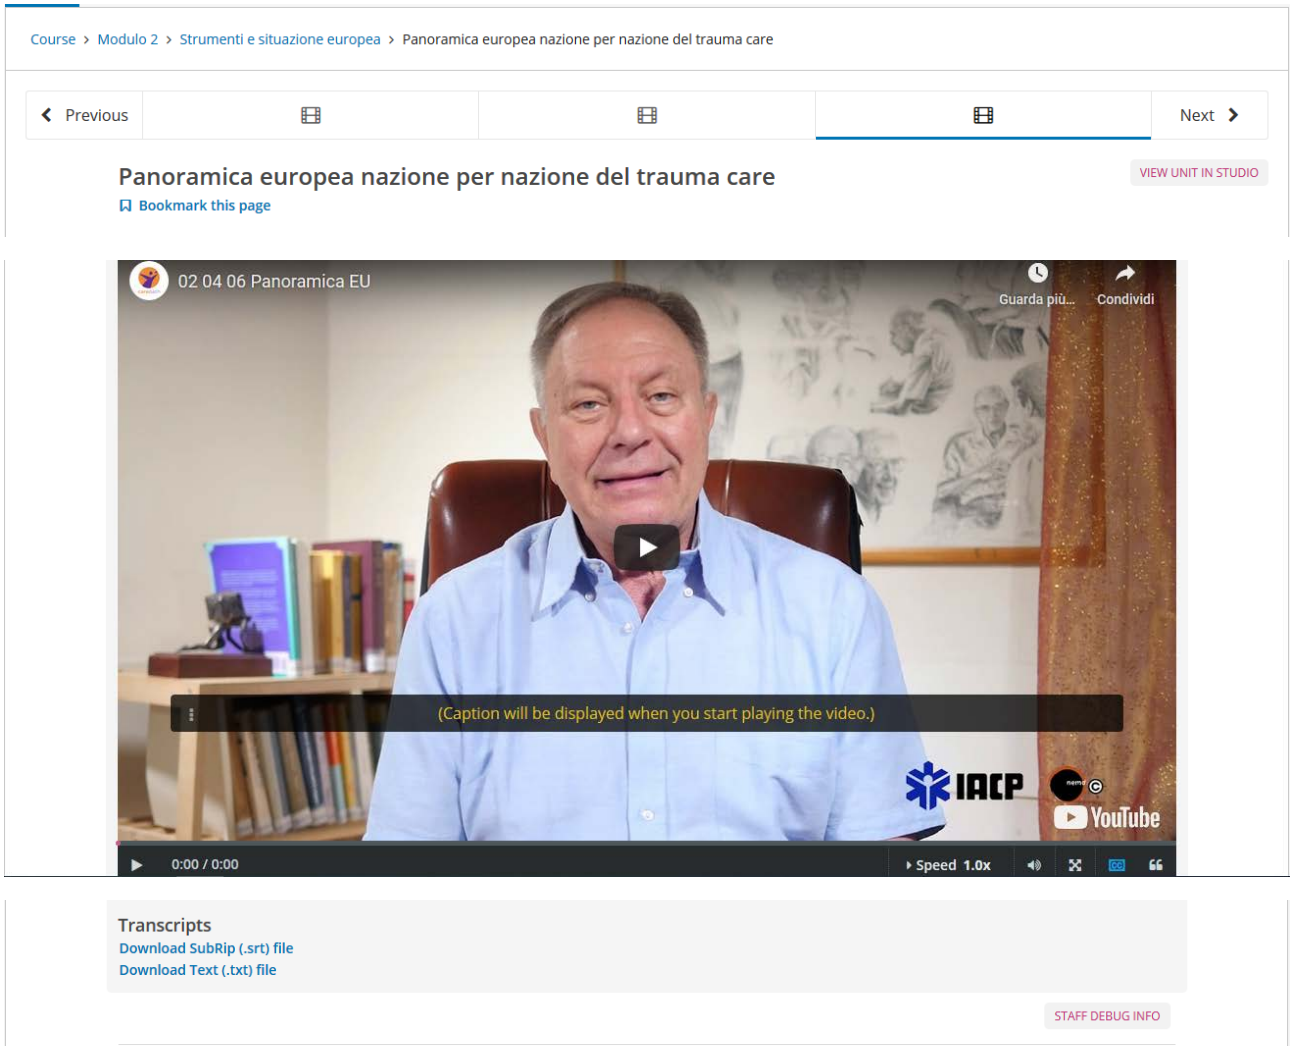
É un test somministrabile dai 4 anni in su, fino all'età adulta.

Si costituisce da un modulo cartaceo sul quale sono rappresentati 8 riquadri delimitati da una cornice nera all'interno dei quali è presente già un piccolo segno stimolo;

la persona che realizza il test dovrà completare un disegno prendendo spunto da quello che è già presente nel riquadro, farlo riquadro per riquadro e fare otto disegni nel complesso.

È uno strumento psicodiagnostico molto semplice da somministrare, anche in termini di tempistica, ed è basato sul disegno, un canale sicuramente preferenziale e facilitante per il bambino,

come accennato in precedenza sulla play therapy.
Essendo un canale preferenziale per il bambino facilità la sua realizzazione.
Il test di Wartegg si basa su un sistema di decodifica ed interpretazione molto accurato.
Nonostante la semplicità di somministrazione il sistema di decodifica è molto articolato
e accurato e fa riferimento a Crisi-Wartegg system: una procedura messa a punto dal professore
Crisi, che, in generale permette di ottenere una descrizione del funzionamento della personalità
dell'individuo a cui è stato somministrato il test.
Rispetto alla specificità del trauma il test consente, attraverso la lettura di determinati
indici, di individuare intanto la presenza di un trauma, in termini di impatto sull'individuo,
e tutto ciò che può scaturire a seguito di aver vissuto un'esperienza traumatica,
questo sia su un piano cognitivo, che relazionale, che affettivo.
Il test di Wartegg non nasce come un test specifico per la valutazione del trauma, però
può dare un contributo significativo in tal senso.
Il report che scaturisce a seguito della decodifica, la quale avviene attraverso una prima fase
in cui i disegni vengono tradotti in sigle, le sigle in indici, e questi letti in configurazione
di indici che delineano e descrivono aspetti di funzionamento della personalità-
La forza di questo test è nella sua semplicità e immediatezza e può dare una descrizione
di quello che è stato l'impatto del trauma sul funzionamento psicologico dell'individuo
stesso.
Accanto al test di Wartegg, che ha natura proiettiva, esistono anche dei questionari
di valutazione del trauma, per citarne alcuni: la Hopkins Symptom Checklist - 2 che è un
questionario messo a punto dall'università di Harvard e che è stato creato per dare
valutare la presenza di sintomi in bambini rifugiati (che hanno quindi vissuto questa
esperienza), un'altro questionario è il Trauma Symptoms Checklist for Young Children
un questionario che viene compilato non direttamente dal soggetto ma dal caregiver, infine il Coping
Responses Inventory
che invece viene somministrato dai 12 anni in su ed è un questionario self report



Transcript

L'Europa è stata teatro di eventi traumatici di massa che hanno impattato negativamente

larghe fasce della popolazione.

Del resto il trauma, in tutte le parti del mondo, è molto diffuso.

I calci sono che circa il 70% della popolazione

subirà nell'arco della propria vita almeno

un evento traumatico,

da questo ne riceverà dann;

è una vera propria pandemia: un'epidemia

diffusissima, e in quanto tale è così grave il danno a livello mentale,

fisico, comportamentale,

sociale, economico che gli effetti dei traumi provocano

che si potrebbe dire sono state

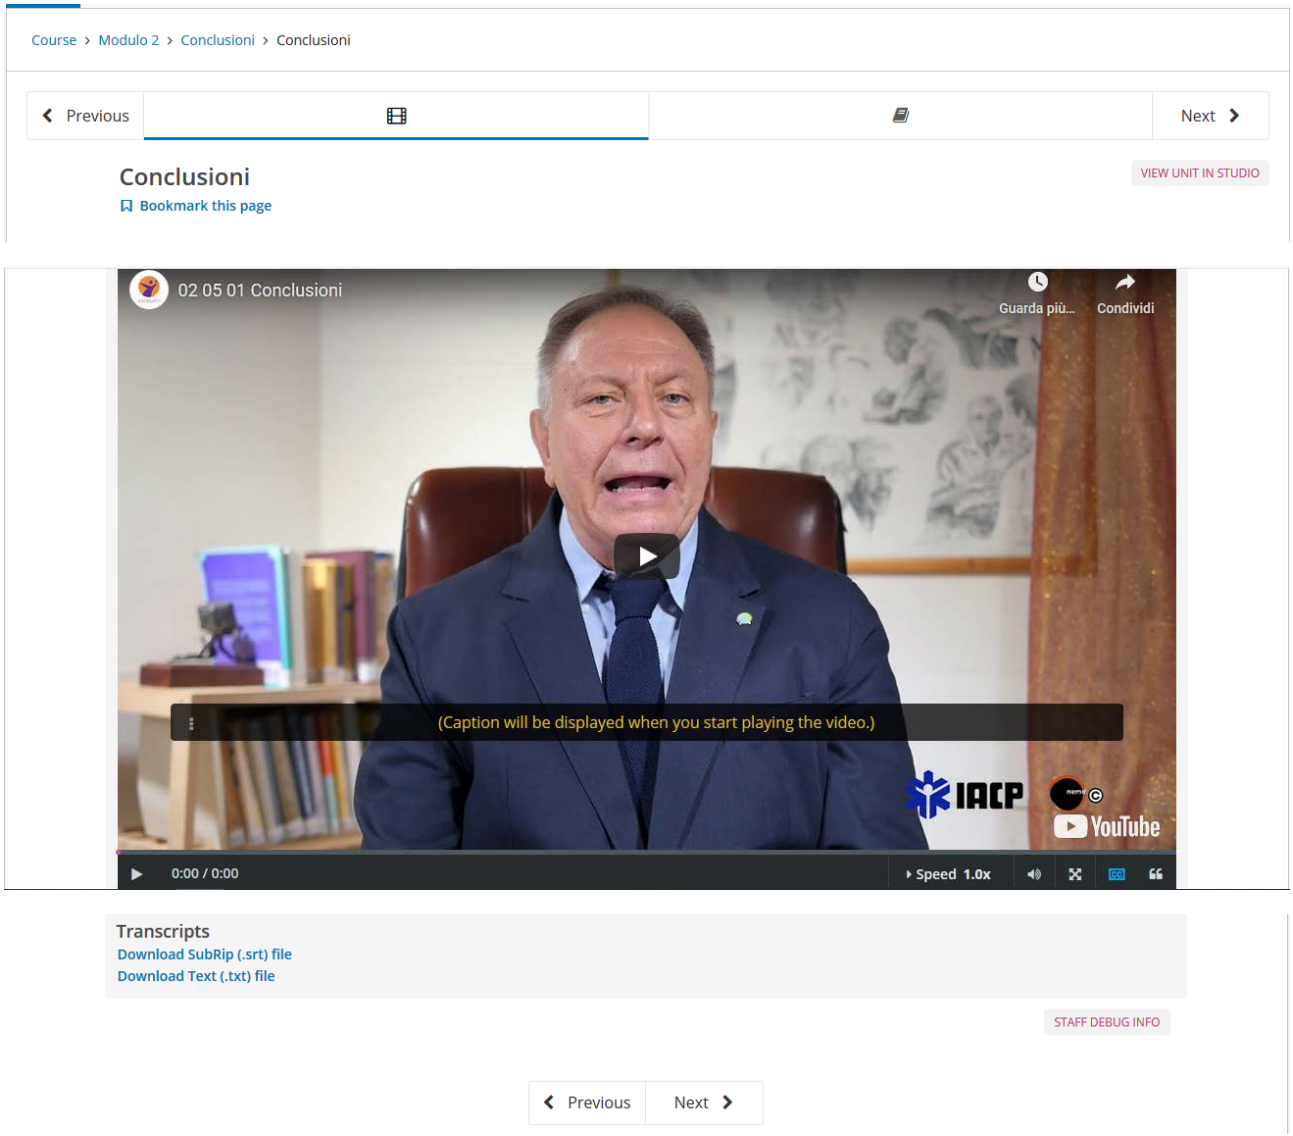
bel allertate le nazioni Europee,

tra le più avanzate al mondo, per investire in ricerche,
know how, finanziamento e sviluppare le skills per gestire efficacemente - come facciamo
per tante altri fenomeni - questa pandemia.
Invece, purtroppo, così non è; incredibile ma vero è quanto poco è stato fatto.
Ci sono delle eccezioni a questa regola, nazioni virtuose - come quelle scandinave - per esempio
in Svezia si sono attrezzati non solo a livello di trattamenti di persone traumatizzate, ma
anche a livello sociale, affrontando con lungimiranza
la problematica per cui in ogni città esiste
una task force dedicata al trauma;
oppure i professionisti - come gli assistenti sociali
- sono ben addestrati durante il loro iter accademico, su come gestire e prevenire queste
tematiche.
Molti altri paesi europei, però, non sono stati altrettanto efficaci.
Basti pensare che il Belgio, dove esiste un ottimo reddito pro capite, un'ottima capacità
di sviluppo, dell'industria, dei servizi, fino a pochi anni fa non possedeva strumenti
per contrastare o aiutare i professionisti a sviluppare le competenze nei loro iter di
costruzione sociale del professionista.
La situazione, quindi, non è oggi assolutamente soddisfacente, con delle variabili - come
l'inghilterra ed in genere le nazioni
di tipo anglosassone - che hanno sviluppato in maniera
lungimirante le possibilità di addestrare e investire risorse nel creare istituzioni
che possano essere di aiuto e trattamento alle persone traumatizzate, ma anche la loro
prevenzione.
Tuttavia in molte nazioni, per esempio in Italia, ancora c'è ancora molto cammino
da compiere prima che sia accettabile
avere una situazione decentemente sotto controllo.
Un lavoro positivo è stato svolto, ovviamente, dalle società di traumatologia che si sono
sviluppate negli ultimi decenni; queste hanno un po'
supplito a quello che sarebbe il
compito degli iter di formazione universitaria delle varie professioni sanitarie a creare
ed offrire training, aggiornamenti
e addirittura delle possibilità di qualificazione dei diplomi

nel trattamento del trauma.

Moltissimo è ancora da fare e questo è un imperativo assolutamente etico, morale, ma soprattutto di salute sociale e di diritti alla salute degli individui.

In Italia l'art. 33 della Costituzione, come tante altre costituzioni europee, dice che la salute è un diritto di ogni cittadino, quindi dobbiamo proteggere e promuovere la salute di tutti: questo è un imperativo.



Transcript

Siamo arrivati alla fine del secondo modulo di questo corso. Vorrei ringraziare sentitamente tutti quelli che hanno contribuito a realizzarlo,

incluso ognuno di voi che ha partecipato e

in molti casi partecipato attivamente. Grazie a tutti coloro che hanno dato un onesto feedback, segnalato la propria situazione locale, suggerito e dato il permesso. Di usare del materiale, delle mappe e delle conoscenze che grazie a voi hanno migliorato questo corso nelle edizioni successive.

Un grazie sincero al team che ha lavorato

veramente con grande generosità e impegno a realizzare quest'opera in cui credevano,

negli scopi e gli obiettivi.

Un grazie a tutti i colleghi esterni all'istituto

che hanno accettato di lavorare gratuitamente e
dare la propria immagine, il proprio contributo
e anche il proprio materiale per essere condividi gratuitamente e di disseminati attraverso
il portale di questo corso.
Grazie a tutto lo staff IACP che generosamente
ha contribuito altrettanto con tutto il loro cuore e la loro mente a condividere le loro
esperienze in questo campo difficile del trattamento dei minori affetti da traumi.
Un grazie anche a tutte le organizzazioni che hanno collaborato con noi e infine un
grazie a tutti i partner del progetto Care Path che ci hanno assistito in ogni modo e
anche con la loro simpatia e affabilità.
L'ultimo grazie, ciliegina sulla torta,
è al project manager e a tutti i colleghi dell'università di Torino, Luca Rollè
è veramente è uno dei migliori project manager che abbiamo incontrato nei vari progetti europei
a cui abbiamo partecipato;
anche ai suoi colleghi dell'università di Torino, Facoltà di
Psicologia, sono meravigliosi e hanno fatto
tutto e di più per facilitare il nostro compito.
Quindi un grazie, grazie a tutti e buon lavoro e buon proseguimento con gli altri moduli.

Q1

16 points possible (graded)

1. Cosa si intende per "relazione d'aiuto?"

- ○ Una relazione affettiva che si basa sull'aiuto di un partner all'altro
- ○ Una relazione che si instaura tra un professionista ed un utente
- ○ Una relazione che soddisfa i bisogni del professionista e dell'utente
- ○ Una relazione tra medico e paziente

2. La teoria generale dei sistemi è stata formulata da:

- ○ Wertheimer
- ○ Maslow
- ○ Rogers
- ○ Von Bertalanffy

3. Cosa è l' OMS?

- ○ Organizzazione Mondiale della Scienza
- ○ Organizzazione Medica Sociale
- ○ Organizzazione Mondiale della Salute
- ○ Organizzazione Mondiale della Sanità

4. L' Approccio centrato sulla Persona è stato fondato da

- ○ C. Rogers
- ○ O. Rank
- ○ J. Bowlby
- ○ A. Maslow

5. Quali tra queste condizioni necessarie all'instaurarsi di una relazione d'aiuto non è stata teorizzata da C.Rogers?

- ○ Empatia
- ○ Accettazione positiva incondizionata
- ○ Resilienza
- ○ Congruenza

6. Alleanza di lavoro

- ○ Riguarda la modalità contrattuale tra professionista e datore di lavoro
- ○ Non riguarda le relazioni d'aiuto del singolo ma solo del gruppo
- ○ E' auspicabile in una relazione d'aiuto
- ○ E' l'insieme di regole poste dal professionista e che l'utente deve rispettare

7. La mancanza di empatia nella relazione d'aiuto

- ○ è indice di professionalità
- ○ serve per capire meglio cosa sta dicendo l'utente
- ○ è un'azione consigliata per prevenire il burn out
- ○ impedisce il realizzarsi di una relazione d'aiuto

8. Cosa si intende per disturbo post-traumatico da stress complesso?

- ○ è una dicitura alternativa del disturbo post traumatico da stress
- ○ è un disturbo derivato da esperienze cronicamente traumatiche
- ○ è una dicitura utilizzata quando i sintomi del disturbo post traumatico da stress perdurano per più di 6 mesi
- ○ è un disturbo derivato da un trauma di gruppo

9. Quali tra le seguenti caratteristiche non sono auspicabili in un sistema di assistenza "Trauma informed Care"?

- ○ Valorizzare il paziente in tutti gli aspetti della cura
- ○ Adottare un linguaggio neutrale e di supporto
- ○ Fare un corretto screening su quale esperienza possa definirsi traumatica
- ○ Formare il personale sul trauma ed i suoi effetti

10. Non si può guarire dal trauma

- ○ Vero
- ○ Falso

11. Quale è il fattore eziopatogenico più comune nello sviluppo del trauma psicologico?

- ○ Esperienza reiterata di incuria fisica e psicologica da parte delle figure di accudimento
- ○ Esperienza in prima persona a catastrofi naturali
- ○ Esperienza in prima persone di morti improvvise
- ○ Esperienza di abuso sessuale infantile

12. Per trauma informed care si intende:

- ○ Un insieme di tecniche che accompagnate all' EMDR facilita la rielaborazione traumatica
- ○ Una tipologia di psicoterapia
- ○ Un' approccio sistemico per l'inquadramento e la presa in carico di persone con vissuto traumatico
- ○ Un reparto ospedaliero specifico per le persone con vissuto traumatico

13. Per violenza assistita si intende:

- ○ Il trauma derivato dall'assistere a eventi catastrofici
- ○ Situazione nella quale un minorenne assiste, direttamente o indirettamente, o percepisce gli effetti di atti di violenza compiuti su figure di riferimento per lui o lei affettivamente significative.
- ○ Tipologia di violenza attuata da un genitore verso l'altro con l'appoggio psicologico e/o materiale (ottenuto attraverso la manipolazione psicologica) di un figlio
- ○ Il trauma derivato dall'assistere a fenomeni di violenza generici

14. Quali sono le azioni di intervento raccomandate in caso di violenza assistita?

- ○ Rilevazione, Protezione, Valutazione, Trattamento
- ○ Osservazione, Valutazione, Trattamento, Mediazione familiare
- ○ Rilevazione, Allontamento dal nucleo familiare, Trattamento,Mediazione familiare, ricollocamento in famiglia
- ○ Allontanamento dal nucleo familiare, Mediazione familiare, ricollocamento in famiglia

15. Secondo il rapporto dell'OMS pubblicato nel 2013 sulla prevenzione del maltrattamento all'infanzia in Europa, quanti sono i minori al di sotto dei 15 anni morti per maltrattamento?

- ○ Tra 800 e 900
- ○ Tra 500 e 600
- ○ Tra 900 e 1000
- ○ Tra i 400 e i 500

16. Il PTSD complex si differenzia dal PTSD per:

- ○ il complex è tipico dell'infanzia
- ○ il complex è presente in casi di violenza all'interno di una relazione di fiducia
- ○ il complex è presente se accanto a sintomi psicologici ci sono sintomi motori
- ○ il complex è presente esclusivamente in donne e minori

Greetings.

I am Shazara Bloomfield and I am the co-founder of Maui Therapy Animals.

At Maui Therapy Animals we utilize animals in a broad range of various activities that provide for motivational, educational and/or recreational benefits to enhance quality of life.

The love of animals is transformational.

At Maui Therapy Animals our mission is to improve social, emotional, and mental functioning with the support of one of our therapy animals.

Animal Assisted Therapy is an effective tool proven to aid children in overcoming emotional trauma.

Animals are incorporated as part of a structured intervention and a child is facilitated to build a safe and trusting relationship.

This method is a goal directed intervention in which a specially trained therapy animal is introduced into the therapy treatment process.

Activities and interactions with animals have been scientifically proven to increase socialization,

elevate mood, release calming endorphins, produce an automatic relaxation response, inspire affection and lift spirits, lessen depression, lower feelings of loneliness and alienation, encourage communication, increase socialization, diminish boredom, and reduce anxiety.

Animal Assisted Therapy and Animal Assisted Activities offer children who have experienced trauma an opportunity to have a meaningful and customized interaction.

Often this approach can reach the inner world of the client where other means do not.

The compassionate approach of one of our trained therapy animals allows for empowerment and meaningful reflection within the client.

Individuals are able to restore a sense of safety and build healthy attachments within relationships.

The human-animal bond has been credited with increasing a sense of self-worth, empathy, psychological well-being and sense of purpose.

Bentrovate e bentrovati. In queste due settimane approfondiremo il tema della ricerca scientifica.
In modo particolare, durante la prima settimana esporremo alcune definizioni di ricerca tentando
di declinarne le tipologie, a seconda delle applicazioni, dei suoi obiettivi e delle sue tecniche.
Osserveremo il processo che ci porta dall'espressione di un problema teorico,
quindi dalla teoria, ai metodi che ci permettono di esplorarlo, producendo dati che in qualche
modo possono essere interpretabili ed utilizzabili. Ecco che allora andremo ad integrare ed approfondire
i principi fondamentali, i limiti ed i benefici di quella che è la Ricerca-Azione, da cui
partiremo ed alcuni colleghi e colleghe ci spiegheranno il senso della Ricerca-Azione,
per arrivare alla ricerca Evidence Based, la ricerca basata sull'evidenza.
Dopodichè, approfondiremo gli aspetti legati ai vantaggi e sfide della integrazione della

Evidence-Based Research (quindi la ricerca basata sull'evidenza) in quella che è la Trauma-Informed Care, proprio del nostro percorso formativo. In particolare, la rilevanza internazionale dell'argomento ci fornisce una prospettiva trasversale su quelli che sono i punti critici ed i punti di forza del trasformare la ricerca in pratica clinica. Qui analizzeremo quelli che sono gli elementi portanti e quelli che sono anche considerati in letteratura aspetti legati alle buone pratiche, di cui alcuni che sono informativi. Ci interrogheremo, e cercheremo di comprendere, quale senso ha, e qual'è il significato di bisogno formativo, e di come questo possa in qualche modo essere avvalorato, preso in considerazione, dall'organizzazione. Non dobbiamo infatti dimenticare che un approccio Trauma-Informed Care ha sicuramente un aspetto, una ricaduta, che è fondamentale in quello che è l'elemento organizzazione e nei singoli membri dell'organizzazione. Di qui, approfitteremo di questo spazio per andare a discutere anche gli aspetti rispetto alla divulgazione scientifica nello sviluppo e nell'implementazione di interventi specifici in Trauma-Informed Care. Arrivando verso la fine del nostro percorso di questa settimana, andremo ad approfondire quelli che sono gli aspetti valutativi nelle organizzazioni, che mettono a punto, o tentano di mettere a punto una procedura o un processo Trauma-Informed Care. Questi infatti possono offrire ai propri dipendenti, ai propri collaboratori, ai propri volontari, elementi formativi e informativi sulla Trauma-Informed Care, come anche offrire quelli che possono essere interventi efficaci rispetto ad elementi legati a quello che è l'evidenza della ricerca in psicoterapia, o meglio in terapia Evidence-Based. Di qui ci accompagneremo e ci porteremo poi sulla seconda settimana che ci permetterà di approfondire ulteriori temi legati alla ricerca.

Non mi resta che augurare a tutte quante voi e a tutti quanti voi una buona settimana di corso e una buona lezione, a nome mio e a nome di tutti i colleghi.

Ma anche divertimento.

Curiosità, innovazione, ricchezza.

La ricerca è la natura dell'essere umano, un uomo che non

ricerca è un uomo che non risolve i problemi, è un uomo che non esiste.

La ricerca è curiosità, è desiderio di conoscere la realtà, e soprattutto per

chi l'ha fatta è la gioia impagabile della scoperta.

Non è semplice delimitare i confini di ciò che è ricerca e ciò che non lo è. Nel corso del tempo sono state date molteplici definizioni, vediamone alcune delle più recenti:

«La ricerca cerca semplicemente la risposta a certe domande a cui non è stata finora data una risposta e le risposte dipendono dagli sforzi umani. [...] In realtà la ricerca è

semplicemente il processo per arrivare a soluzioni affidabili a un problema attraverso la raccolta, l'analisi e l'interpretazione pianificate e sistematiche dei dati.» (Singh, 2006, p.1).

«...è un processo creativo di scoperta che si sviluppa secondo un itinerario prefissato e secondo procedure prestabilite che si sono consolidate all'interno della comunità scientifica» (Corbetta, 2015, p.15).

In generale si sta facendo ricerca "nel momento in cui la curiosità e l'intuizione vengono applicate con un approccio sistematico per rispondere a domande rispetto ai fenomeni che si osservano quotidianamente, facendo tesoro delle esperienze e delle conoscenze già acquisite" (Research Italy, 2013).

Ci sono diversi tipi di ricerca che si distinguono in base alla sua applicazione, agli obiettivi e ai metodi di indagine. La ricerca può infatti essere "applicata" o "pura". La ricerca applicata mira a trovare una soluzione per un problema applicativo che deve essere affrontato, mentre la ricerca pura riguarda principalmente le generalizzazioni e la formulazione di una teoria (Kothary, 2004; Singh & Masuku, 2013). A seconda dei suoi obiettivi, la ricerca può essere di tipo descrittivo, esplorativo, correlazionale o esplicativa. La ricerca descrittiva ha l'obiettivo di descrivere un fenomeno, un problema, una situazione.

La ricerca correlazionale ha l'obiettivo di esplorare una relazione tra due o più variabili.

La ricerca esplicativa ha l'obiettivo di spiegare perché certe cose accadono.

La ricerca esplorativa ha l'obiettivo di esaminare la fattibilità di uno studio o di esplorare un'area tematica poco nota.

L'indagine che si desidera avviare necessita di un piano di lavoro determinato da alcune fasi procedurali che si devono compiere in relazione all'indagine stessa, queste fasi di natura progettuale sono conosciute come "disegno di ricerca".

In base alle tecniche utilizzate, la ricerca si può distinguere in:

- Ricerca quantitativa: utilizza un approccio strutturato, ha l'obiettivo di quantificare la variazione o la diversità di un fenomeno, situazione o atteggiamento attraverso un disegno di ricerca ben strutturato, che fornisce dati di natura quantitativa che possono essere analizzati per verificare ipotesi e testare relazioni tra variabili.
- Ricerca qualitativa: utilizza un approccio non strutturato è esplicativa, descrittiva e di natura induttiva con particolare attenzione al contesto e ha l'obiettivo di identificare e descrivere il maggior numero di variazioni possibili di un fenomeno, una situazione o un atteggiamento, comprendendone le motivazioni sottostanti alle variazioni. Quest'ultima implica un «approccio interpretativo e naturalistico al mondo; significa che i ricercatori qualitativi studiano i fenomeni nei loro contesti naturali, tentando di dargli un senso o interpretarli in termini del significato che le persone portano loro» (Denzin & Lincoln, 2011, p. 3). Lo scopo della ricerca qualitativa è di descrivere e comprendere i fenomeni, piuttosto che predirli e/o controllarli (Streubert & Carpenter, 2005).

L'approccio misto, invece, coniuga sia i metodi di indagine della ricerca quantitativa che quelli della ricerca qualitativa. «La ricerca sociale si basa sulla definizione di variabili, sulla ricerca di associazioni tra loro e sul tentativo di capire se e come la variazione di una cosa causa una variazione in un'altra. Alcune variabili comuni che troverete nella ricerca sociale sono età, sesso, etnia, razza, istruzione, reddito, stato civile e occupazione» (Bernard, 2006, pp. 28-29). In primo luogo quindi si trova il concetto di variabile: qualcosa che può assumere più di un valore. In secondo luogo si trova il concetto di "misurazione": infatti le variabili sono misurate dai loro indicatori che sono definiti dai valori della variabile stessa. La misurazione implica quale valore registrare. Qualsiasi ricerca inoltre deve rispettare i principi di validità e affidabilità. Per validità si intende che la ricerca deve avere strumenti di misurazione, dati e risultati accurati; mentre l'affidabilità fa riferimento al fatto di ottenere i medesimi risultati misurandoli più volte con lo stesso strumento.

Bernard (2006) illustra i quattro punti fondamentali che segue il processo di ricerca:

1. In primo luogo, viene formulato un problema teorico (teoria e letteratura scientifica);

2. Successivamente, vengono selezionati unità di analisi e metodo appropriati;

3. Quindi, i dati vengono raccolti e analizzati;

4. Infine, la proposizione teorica con la quale è stata avviata la ricerca è o contestata o supportata.

(Bernard, 2006, p.69)

L'insegnamento è una abilità. È sia una arte che una scienza. Ed è per questo che i migliori insegnanti sperimentano sempre e fanno un sacco di errori. Ma come si fa a sapere cosa sta effettivamente funzionando?

Bene, una opzione è la ricerca-azione. Qui si può identificare una domanda, provare una strategia, raccogliere dati e determinare se funziona. Il risultato finale è qualcosa di dinamico, innovativo, e legato direttamente alla tua classe.

La ricerca-azione dissolve la barriera tra partecipanti e ricercatori.

In altre parole, l'insegnante partecipa attivamente alla situazione mentre conduce la ricerca. Esistono diversi framework di ricerca-azione,

ma generalmente seguono un processo simile. Si comincia dalla fase 1, la pianificazione della ricerca.

Qui si comincia dalla indagine, dove si definisce una specifica domanda di ricerca.

Deve essere qualcosa che può effettivamente essere testato.

Poi, si conduce una revisione della letteratura per ottenere una comprensione migliore dell'argomento.

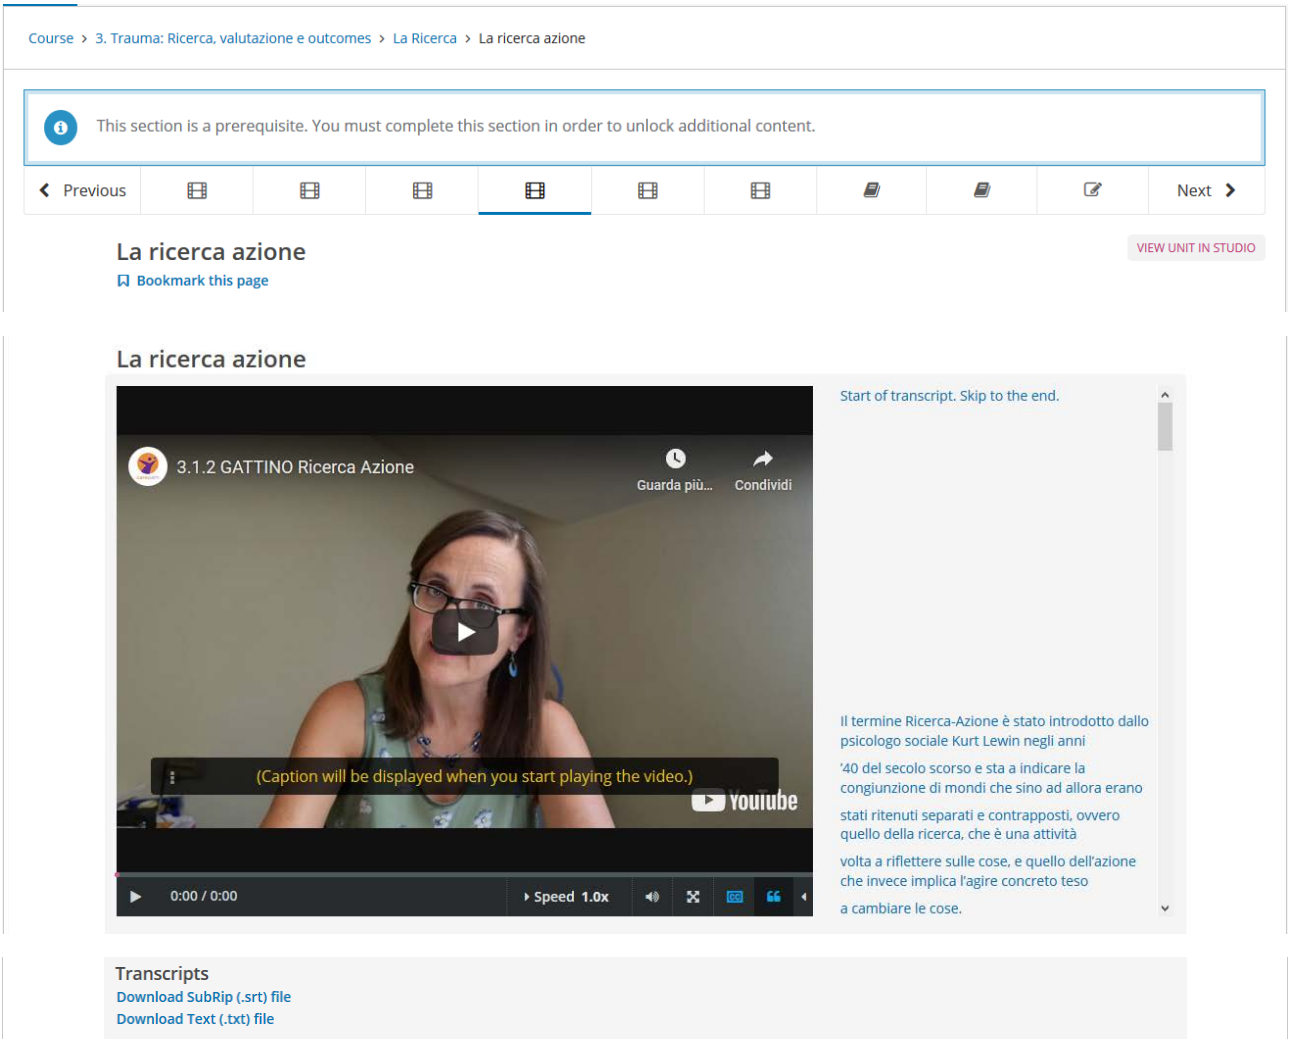
Infine ci si sposta nel processo di disegno, si determinano i metodi di ottenimento dei dati, si considerano i problemi etici, si ottengono i permessi necessari, si creano delle scadenze, e si impostano i sistemi.

Poi ci si sposta nella fase dell'azione. Qui è dove si cominciano numerosi cicli di sperimentazione e raccolta dei dati. La raccolta dei dati potrebbe includere dati qualitativi come osservazioni, artefatti, e interviste, oppure dati quantitativi come sondaggi delle griglie di valutazione, o dati sui risultati. Dopodichè ci si sposta alla analisi. Spesso si comincia organizzando i dati in grafici o classifiche e cercando tendenze specifiche.

Si potrebbe anche discuterne con i pari, scrivere liberamente in un diario o creare una mappa a grappolo prima di scrivere i risultati. Infine si arriva alla conclusione.

Qui è dove si condivide la ricerca con il mondo e si riflette sulla propria pratica.

Questo porterà infine a nuove domande, ed il ciclo continuerà mentre si raffinano le proprie abilità da insegnante migliore e più creativo.



Transcript

Il termine Ricerca-Azione è stato introdotto dallo psicologo sociale Kurt Lewin negli anni ’40 del secolo scorso e sta a indicare la congiunzione di mondi che sino ad allora erano stati ritenuti separati e contrapposti, ovvero quello della ricerca, che è una attività volta a riflettere sulle cose, e quello dell’azione che invece implica l’agire concreto teso a cambiare le cose.

La Ricerca-Azione consente quindi di creare un’alleanza strettissima tra l’aspetto conoscitivo, la Ricerca, e l’aspetto applicativo, l’Azione, ed esprime una trasformazione nel modo di ideare, progettare e fare ricerca nelle scienze umane in cui la complessità dei fenomeni studiati non viene semplificata ma, al contrario, è accolta e tenuta in conto.

La Ricerca-Azione è realizzata da Lewin sempre in gruppo e questo binomio “Ricerca-Azione e gruppo” è dovuto al fatto che il gruppo è quel luogo psicosociale all’interno del quale le persone costruiscono le loro azioni ed è anche uno strumento che può facilitare i processi di cambiamento.

La Ricerca-Azione si può descrivere come una famiglia di metodologie di ricerca il cui obiettivo, come abbiamo detto, è attivare simultaneamente un percorso di azione, ossia di cambiamento, e di ricerca, ovvero di comprensione dei fenomeni.

Questo percorso avviene attraverso un processo flessibile che consiste in una spirale di cicli, ognuno dei quali si struttura in tre momenti successivi: la pianificazione, l'esecuzione e la ricognizione o inchiesta, tesa a valutare i risultati di ogni momento, a preparare una base razionale per il momento successivo e per cambiare, se occorre, il piano di azione originario.

Terminato il primo ciclo di Ricerca-Azione, che cosa accade?

Accade che sono stati analizzati i risultati e anche l'eventuale cambiamento che è stato prodotto rispetto alla situazione iniziale, e fatto tutto ciò il processo ricomincia con un nuovo ciclo, in cui saranno inseriti gli elementi nuovi emersi dall'attività svolta nel ciclo precedente, e così via, fino all'esaurimento della situazione problematica.

La pianificazione, l'esecuzione e la ricognizione sono sorrette da una valutazione critica in cui ci si chiede cosa ha funzionato, cosa non ha funzionato, che cosa si è imparato, e che cosa si può fare in modo diverso rispetto a come si è lavorato in precedenza.

La valutazione critica in ogni ciclo consente di correggere eventuali errori e di riadattare le azioni alle effettive esigenze emerse nel corso della ricerca stessa.

Qual è l'obiettivo che si propone di raggiungere la Ricerca-Azione?

L'obiettivo della Ricerca-Azione è il cambiamento:
cambiamento dei comportamenti, delle consuetudini,
dei contesti e via così.

L'assunzione di base è che lo status quo attuale non consente agli individui di star bene e che soltanto attraverso il cambiamento la situazione può migliorare.

Il cambiamento, quindi, deve essere provocato e poi analizzato e compreso e deve essere duraturo.

Secondo Lewin, affinché il cambiamento sia duraturo deve passare attraverso tre fasi:
la fase di rottura dell'equilibrio (unfreezing) che si ottiene agendo sui fattori di resistenza al cambiamento che spesso sono legati all'adesione alle norme sociali.

Vi è poi una fase di spostamento (moving), ad esempio cambiare e sviluppare nuove credenze, nuovi valori e atteggiamenti sulla base di nuove informazioni, e quindi uno spostamento da una vecchia situazione ad una nuova.

Infine vi è una fase di ricostruzione, di fissazione (re-freezing) in cui la nuova situazione che si è creata si stabilizza intorno a un nuovo equilibrio, ovvero i nuovi valori, atteggiamenti, comportamenti si stabiliscono e si integrano nel resto del sistema.

Un aspetto importante della Ricerca-Azione è il coinvolgimento attivo di coloro ai quali è rivolto l'intervento, che sono contemporaneamente destinatari e attori dell'intervento e devono essere messi nelle condizioni di condividere le finalità della ricerca stessa.

L'assunto di base della Ricerca-Azione è che le persone con cui si lavora siano individui attivi, dotati di capacità e competenze che vadano coinvolti nel processo di ricerca stesso.

Quando si adotta l'approccio della Ricerca-Azione non si può prescindere dal coinvolgere attivamente le persone a cui è rivolto l'intervento e si deve creare una situazione di collaborazione e confronto con i destinatari-attori dell'intervento.

Un altro elemento caratteristica di questa famiglia di metodologie di ricerca che è la Ricerca-Azione è la assenza di un metodo di intervento predefinito da applicare.

Questo infatti viene costruito insieme al gruppo a partire da alcuni principi cruciali e sulla base di quelle che sono le risposte osservate in corso d'opera.

Spesso accade che il modello di partenza venga modificato, dal momento che la scelta della metodologia e delle azioni da attuare sono costruite durante il processo.

Sin qui abbiamo illustrato gli aspetti che definiscono la Ricerca-Azione, vediamo ora quali sono gli elementi che la differenziano dal metodo sperimentale.

Abbiamo detto prima che nella Ricerca-Azione non si ha un intervento prefissato.

Chi adotta questo approccio permette quindi che l'ipotesi emerga nel corso del processo e ne modifica l'andamento attraverso il controllo continuo.

Un altro elemento di differenza è che nella Ricerca-Azione non si cerca di definire rapporti di causalità, di verificare delle ipotesi a partire dalla letteratura e di determinare gli esiti di trattamenti su campioni rappresentativi avendo l'obiettivo di confermare o falsificare teorie generali.

Nella Ricerca-Azione in ogni ciclo il fenomeno su cui si sta intervenendo è messo maggiormente a fuoco.

Non ci si cura della misurabilità delle variabili e l'obiettivo è risolvere i problemi esaminando diverse strade che non si possono anticipare a priori, ma che diventano il risultato e anche lo strumento del gruppo.

Infine, un ulteriore elemento di differenziazione è il modo in cui sono presentati i risultati

finali che, nel caso della Ricerca-Azione, sono illustrati all'intero gruppo, all'intera comunità attraverso forme partecipative, che utilizzano un linguaggio più semplice rispetto a quello tecnico-scientifico che caratterizza i report della ricerca sperimentale.
L'obiettivo che si intende raggiungere attraverso la presentazione dei dati è suscitare nuove valutazioni che consentano di definire eventuali opportunità di miglioramento.
Per chiudere, sulla base di quanto detto sinora possiamo riassumere i principali assunti alla base della Ricerca-Azione, ossia: Il fatto di avere un carattere pratico e contestuale.
La Ricerca-Azione assume infatti come suo oggetto i problemi di un gruppo, di una comunità, e ha quindi una natura contestuale, è cioè una ricerca situata: situata nel contesto;
Un altro aspetto è il fatto che è una ricerca finalizzata al cambiamento e ha una focalizzazione sulla dimensione gruppale più che su quella individuale, sia per quanto riguarda l'analisi dei processi, sia per ciò che concerne la definizione delle soluzioni e dei risultati emersi; Inoltre, la Ricerca-Azione ha una natura multistadiale e ciclica che è data dal disegno della ricerca che si configura come un alternarsi di fasi di conoscenza e azione; Infine, l'altro elemento centrale è quello di porre al centro la partecipazione, in termini di cooperazione, di interdipendenza tra ricercatori e gruppo, tra ricercatori e comunità.

STAFF DEBUG INFO

Tradizionalmente il compito della ricerca è stato quello di estrapolare leggi inscritte nella natura del mondo analizzando i fenomeni in modo oggettivo. Il ricercatore deve mettersi di fronte ai fenomeni che studia in posizione assolutamente neutra. La ricerca è per sua definizione indirizzata alla teoria, tende alla generalità, a costruire modelli il più possibile universalistici. L'azione, invece, nell'esperienza comune è intrisa di motivazioni, di desideri, di emozioni, di saperi spesso poco logici, contraddittori e finalizzati a fare, ottenere, trasformare. L'azione è indirizzata alla pratica, è legata al particolare e al singolare, localistica e situazionale, storicizzata, non sempre prevedibile nella sua origine e nei suoi esiti (Amerio, 2000). La ricerca-azione nasce con l'intento di coniugare queste due dimensioni che tradizionalmente sono state viste come separate e inconciliabili. I due capisaldi della ricerca-azione, che la differenziano dalla ricerca tradizionale, sono la partecipazione e la cooperazione. Elliot la definirebbe così:

«Si potrebbe definire la ricerca-azione come lo studio di una situazione sociale con lo scopo di migliorare la qualità dell'azione al suo interno. In altre parole, essa mira a introdurre una valutazione pratica in situazioni concrete; la validità delle «teorie» o ipotesi che essa genera dipende non tanto da verifiche «scientifiche» della verità, quanto dalla loro utilità nell'aiutare le persone ad agire in modo più intelligente e abile. Nella ricerca azione le «teorie» non sono convalidate indipendentemente e poi applicate alla pratica. Esse sono convalidate attraverso la pratica.» (Elliott, 1994, p.97)

E ancora:

«La situazione-problema deve essere diagnosticata e si deve pianificare e attuare un'azione di rimedio i cui effetti vanno controllati, se si vogliono ottenere dei miglioramenti. Questo processo globale di Analisi-Diagnosi-Pianificazione-Attuazione-Controllo degli effetti è chiamato ricerca-azione [...]» (Elliott, 1994, p.96)

Il modello originario della Ricerca-Azione viene elaborato da Lewin (1946) con lo scopo di comprendere le problematiche esistenti in specifici contesti attraverso la condivisione di saperi tra persone che sono allo stesso tempo sia ricercatori sia soggetti sperimentali. L'azione assume sempre più valore perché diventa un momento in cui si costruisce una conoscenza sul problema. Il processo di cambiamento avviene in tre tappe:

1) Unfreezing (rottura): si rompe l'equilibrio iniziale agendo sui fattori di resistenza legati all'adesione alle norme sociali.

2) Moving (spostamento): gli elementi nuovi e quelli già presenti nel campo si muovono in base alle forze che agiscono all'interno del campo.

3) Refreezing (ricostruzione): la nuova situazione si stabilizza attorno a un nuovo equilibrio.

La ricerca azione è dunque una «raccolta sistematica e analisi dei dati che ha lo scopo di intraprendere azioni e apportare cambiamenti» generando conoscenza pratica condivisibile (Gillis & Jackson, 2002, p.264).

Lo scopo di ogni ricerca azione è di produrre dei cambiamenti sociali attraverso un'azione (o azioni), che è a sua volta obiettivo finale della ricerca (Greenwood & Levin, 1998; Kach & Kralik, 2006; McNiff & Whitehead, 2006; MacDonald, 2012).

I ricercatori che avviano una ricerca-azione lo fanno avendo in mente il presupposto che la realtà viene continuamente creata e ricreata da un processo sociale continuo riconoscendo che, in accordo con Argyris et al (1982), gli elementi cruciali in un approccio di ricerca che funziona all'interno di una specifica situazione sociale sono: collaborazione tra ricercatori e comunità di riferimento; processo di indagine critica; focus sulla pratica sociale; processo di apprendimento riflessivo. Questo necessariamente implica un tipo di ricerca diverso dalla verifica delle ipotesi, che pone maggiore attenzione sulle tematiche della ricerca, necessariamente dichiarate e discusse, per consentire a chiunque sia interessato di sottoporre la ricerca a un esame critico (Checkland & Holwell, 1998).

Transcript

Abbiamo visto prima quali sono gli assunti generali della Ricerca-Azione che abbiamo

detto essere una famiglia di metodologie di ricerca.

Vediamo adesso di zoomare, di focalizzarci su una specifica componente di questa ampia

famiglia della Ricerca-Azione, ovvero sulla Ricerca-Azione partecipata.

L'elemento centrale della Ricerca-Azione partecipata è proprio la focalizzazione sull'idea di

una conoscenza condivisa tra il ricercatore ed i destinatari dell'intervento, che sono

contemporaneamente destinatari e attori dell'intervento, e come dicevo, la focalizzazione della Ricerca-Azione

partecipata è quella di considerare che vi è una conoscenza condivisa che serve a progettare

e restituire il senso dell'agire collettivo.

La Ricerca-Azione partecipata considera importante una Ricerca-Azione che è progettata e condotta

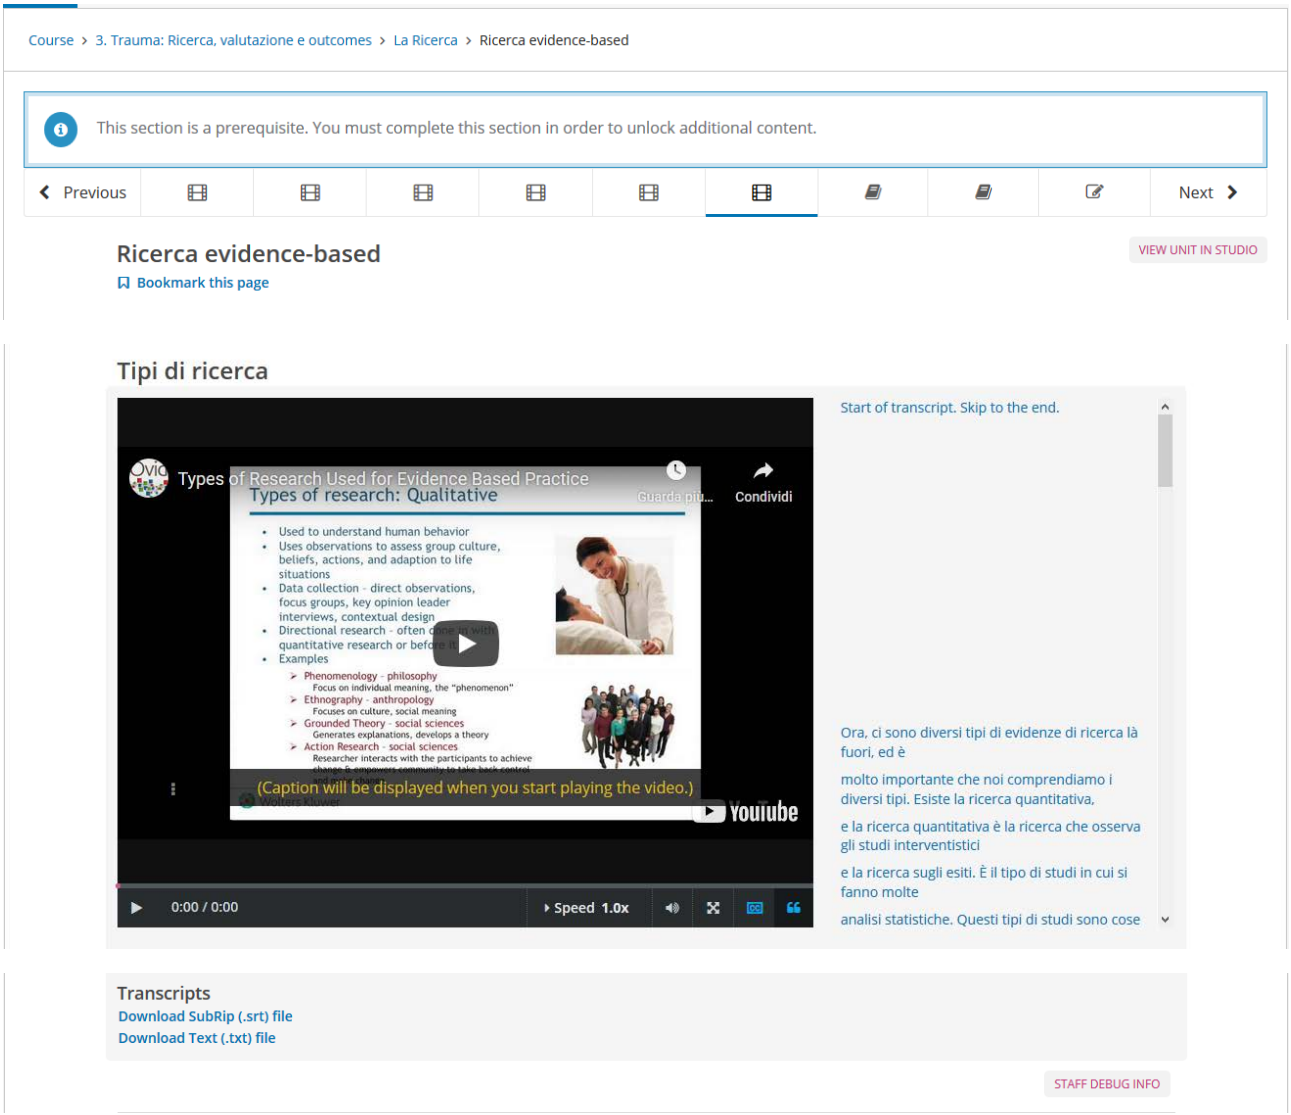
in modo collettivo attraverso la partecipazione di tecnici ma anche di persone che appartengono al contesto in cui si interviene, e che sono in grado di valorizzare saperi locali e saperi esperti facendo emergere la molteplicità dei punti di vista, delle prospettive che sono presenti all'interno di quel contesto specifico.

Alla base degli interventi della Ricerca-Azione partecipata c'è dunque il principio di partecipazione, inteso come strumento e anche obiettivo del cambiamento sociale di intervento.

La Ricerca-Azione partecipata riconosce che il problema nasce da un gruppo che è in difficoltà in uno specifico contesto ed in un momento storico preciso e ben definito.

Il ricercatore quindi constata il problema, non lo suscita, ed il suo ruolo è aiutare il gruppo e la comunità a identificare gli aspetti fondamentali per poter proseguire con l'azione.

Chi adotta l'approccio della Ricerca-Azione partecipata deve quindi creare una situazione di collaborazione e confronto con i cittadini e gli operatori per quanto riguarda sia la definizione dei problemi da indagare e sia lo svolgimento della ricerca e l'impostazione del cambiamento.



Transcript

Ora, ci sono diversi tipi di evidenze di ricerca là fuori, ed è

molto importante che noi comprendiamo i diversi tipi. Esiste la ricerca quantitativa,

e la ricerca quantitativa è la ricerca che osserva gli studi interventistici

e la ricerca sugli esiti. È il tipo di studi in cui si fanno molte

analisi statistiche. Questi tipi di studi sono cose come gli esperimenti clinici (clinical trials),

gli esperimenti randomizzati con gruppo di controllo (randomized control trials, o RCT), gli studi caso-controllo (case-control studies),

ed i livelli più alti sarebbero le meta-analisi e le revisioni sistematiche. Le linee guida per la pratica clinica sono

per la maggior parte basate su analisi quantitative della ricerca. C'è un altro tipo

di ricerca là fuori ed è chiamata ricerca qualitativa, e la ricerca qualitativa

è fatta per comprendere il comportamento umano, come le persone rispondono

alla loro situazione. Quindi, i tipi di ricerca qualitativa che vengono fatti, e vengono spesso fatti nelle scienze infermieristiche e sociali, sono gli studi come la fenomenologia, dove si osserva il fenomeno di star male o di avere una determinata condizione. Significa anche guardare gli studi sui gruppi etnografici, questi sono basati sull'antropologia, quindi guardiamo i gruppi di persone che hanno una determinata condizione. Sappiamo che la ricerca qualitativa è molto molto importante per come eseguiamo le cure, perchè c'è bisogno di assicurarsi che i pazienti stiano avendo una buona esperienza con le cure che stanno ricevendo. Ora, la ricerca secondaria è considerata il livello più alto di ricerca, e questa è la cosa che chiamiamo una revisione sistematica o meta-analisi, e ciò che è diverso di una revisione sistematica e nelle meta-analisi è che portano lo stesso livello di rigore a tutti gli studi di ricerca che sono stati fatti su uno specifico argomento.

Porta lo stesso livello di rigore alla analisi di tutti quegli studi.

Ecco un altro caveat: le revisioni sistematiche sono molto diverse rispetto alle revisioni della letteratura in quanto le revisioni sistematiche e le meta-analisi devono essere revisionate dai pari (peer-reviewed) e questo vuol dire che due o più persone devono valutare tutti gli studi che vengono inclusi in una revisione sistematica o una meta-analisi.

Quando si fa una revisione sistematica c'è anche bisogno di controllare alcune altre cose per esserne sicuri, è importante per come provvediamo a prenderci cura dei nostri pazienti. Bisogna controllare: sono davvero fattibili i risultati della revisione sistematica? Posso davvero implementare questo intervento con una specifica popolazione di pazienti?

Sarà appropriato? È significativo per le popolazioni di pazienti e per la mia pratica come fornitore di assistenza sanitaria? E sarà efficace? Farà davvero la differenza? Sappiamo però che le evidenze di ricerca non vengono create tutte uguali, quindi è davvero importante nel momento in cui i fornitori di assistenza sanitaria esaminano una ricerca, essi hanno il bisogno di determinare che livello di ricerca stanno osservando. Alla base abbiamo tutti gli studi di ricerca originali e questi sono cose come gli studi randomizzati con gruppo di controllo (RCT) e questo tipo di cose. Il livello superiore successivo sarebbero le revisioni sistematiche nelle meta-analisi: di nuovo, le meta-analisi nelle revisioni sistematiche vengono fatte quando

un ricercatore guarda tutte le ricerche originali intorno ad un determinato argomento,

ne fa una valutazione critica ed una sintesi e poi mette tutto insieme

sotto forma di revisione sistematica, quindi questo è considerato il livello più alto di

ricerca nella gerarchia delle evidenze. Ma al livello più alto c'è il supporto alle decisioni

cliniche ("clinical decision support"), ed il supporto alle decisioni cliniche è composto di strumenti che i fornitori di assistenza sanitaria

possono usare, li leggono immediatamente e li mettono in pratica

immediatamente. Ora, perchè questo è importante? Perchè i fornitori di assistenza sanitaria che hanno a che fare

con i pazienti non hanno tempo di leggere cento, duecento, trecento pagine di revisioni

sistematiche o di meta-analisi e poi prendere una decisione su un

paziente: devono leggere le evidenze e metterle in pratica

immediatamente e questo è ciò che fanno gli strumenti di supporto alle decisioni cliniche. Tutti gli

strumenti di supporto alle decisioni cliniche dovrebbero essere basati sulle revisioni sistematiche, sulle meta-analisi,

sui riassunti delle evidenze o sulle evidenze migliori disponibili.

Il termine evidence-based research (EBR) è stato coniato nel 2009 per indicare l'approccio che contrasta la rilevante fonte di spreco nella ricerca biomedica (Robinson, 2009) che era dovuta principalmente agli studi primari effettuati senza una revisione sistematica delle evidenze disponibili. Questo non era considerato né etico né scientifico (Lund, H. et al., 2017). La ricerca evidence-based parte sempre da una revisione sistematica (RS), che prevede quesiti di ricerca predefiniti, criteri di inclusione, metodi di ricerca, procedure di selezione, valutazione di qualità, estrazione dei dati e analisi statistiche (Lund, H. et al., 2017). Le revisioni sistematiche servono a comprendere e a definire le priorità di una ricerca e se essa è necessaria e utile alla comunità o possibile fonte di spreco di risorse in quanto non produce nuove conoscenze scientifiche. Le linee guida suggerite da Evidence, rivista open access della Fondazione GIMBE (Gruppo Italiano per La Medicina Basata sulle Evidenze), per creare un progetto di ricerca evidence-based sono le seguenti:

1) Formulare il quesito di ricerca preliminare e identificare revisioni sistematiche pertinenti;

2) Valutare l'adeguatezza dello scopo, della qualità e dell'aggiornamento della ricerca;

3) Valutare i dettagli relativi a: popolazione, intervento, confronto, outcomes, e range temporali (PICOT);

4) Valutare il metodo utilizzato e i risultati.

In definitiva, i ricercatori dovrebbero utilizzare le revisioni sistematiche per formulare il quesito finale dello studio che vogliono promuovere; giustificare la necessità durante la richiesta di finanziamento e l'approvazione del comitato etico; interpretare i risultati del nuovo studio nel contesto delle evidenze disponibili; formulare raccomandazioni per la ricerca futura. Nel corso del tempo si è assistito ad una crescita esponenziale della ricerca evidence-based, che ha portato alla pubblicazione di circa due milioni di articoli in oltre venti mila riviste. Le motivazioni di questa crescita sono molteplici, da una parte è dovuta alla sua vocazione educazionale (JAMA, 1992) e al cambiamento di paradigma (Pagliaro & Colli, 2014) che ha portato tale pratica, dall'altra si è assistito ai punti di forza che l'evidence-based presenta:

- consentire di produrre conoscenza e guidare la pratica professionale nelle aree dove c'è maggiore incertezza riguardo agli interventi effettuati nella pratica clinica;

- ridurre gli sprechi perché definisce le priorità dei quesiti di ricerca prendendo in considerazione le revisioni sistematiche precedenti;

- consentire di descrivere in modo chiaro i disegni di ricerca (popolazione target, interventi, confronti, outcome);

- produrre aggiornamenti e diffondere revisioni sistematiche;

- integrare le evidenze nella pratica clinica;

- permettere una rivalutazione continua delle proprie conoscenze (GIMBE).

ESEMPI DI RICERCA

- **Ricerca Quantitativa**

Il sito di questo studio era un piccolo college (iscrizione 1.000), religioso, coeducativo, di arti liberali in una città del Midwest con una popolazione di 175.000 persone. [Gli autori hanno identificato il sito di ricerca e la popolazione.]
Il tasso di abbandono dell'anno precedente era del 25%. I tassi di abbandono tendono ad essere più alti tra le matricole e gli studenti del secondo anno, quindi è stato fatto un tentativo di raggiungere il numero più elevato possibile di matricole e studenti del secondo anno attraverso la distribuzione del questionario nelle classi. La ricerca indica che maschi e femmine abbandonano il college per diversi motivi (Bean, 1978; Spady, 1971). Pertanto, solo le donne sono state analizzate in questo studio. Nell'aprile del 1979, 169 donne hanno restituito i questionari. È stato selezionato per questa analisi un campione omogeneo di 135 donne di 25 anni o più giovani, non sposate, a tempo pieno cittadini statunitensi e caucasici (Kerlinger, 1973).
Di queste donne, 71 erano matricole, 55 erano studenti del secondo anno e 9 erano juniores. Tra gli studenti, il 95% aveva un'età compresa tra i 18 e i 21 anni. Questo campione è affetto da bias dovuto alla partecipazione di studenti con maggiore capacità, come indicato dai punteggi del test ACT. [Gli autori hanno presentato informazioni descrittive sul campione.] I dati sono stati raccolti mediante un questionario contenente 116 items. La maggior parte di degli items erano di tipo Likert basati su una scala da "in misura molto limitata" a "in misura molto grande".
Altre domande hanno richiesto informazioni concrete, come punteggi ACT, voti delle scuole superiori e livello di istruzione dei genitori. Tutte le

Q3.1

4 points possible (graded)

1. Una ricerca scientifica...

- ○ Dovrebbe sempre tenere conto della conoscenza precedentemente acquisita
- ○ Inizia con la raccolta dei dati
- ○ Permette sempre una fedele registrazione della realtà
- ○ Utilizza sempre un singolo metodo

2. Nella ricerca-azione...

- ○ Il ricercatore deve essere completamente neutrale rispetto all'oggetto di ricerca
- ○ Si tenta di estrapolare leggi iscritte nella natura attraverso l'analisi oggettiva dei fenomeni
- ○ Non andrebbero prodotti cambiamenti sociali nel contesto di ricerca
- ○ La partecipazione e la cooperazione del ricercatore sono incoraggiate

3. Quale di questi passaggi NON è parte di ogni progetto di ricerca evidence-based?

- ○ La valutazione dei risultati
- ○ La convalida della teoria attraverso la pratica
- ○ La formulazione delle ipotesi di ricerca
- ○ La revisione sistematica della letteratura

4. L'elemento centrale della Ricerca-Azione partecipata è:

- ○ La focalizzazione sull'idea di una conoscenza non condivisa tra il ricercatore ed i destinatari dell'intervento
- ○ La focalizzazione sull'idea di una conoscenza condivisa tra il ricercatore ed i destinatari dell'intervento
- ○ La netta e assoluta separazione tra Azione e Ricerca
- ○ La scelta a priori dei problemi da indagare e degli strumenti da utilizzare

EBR in TIC/TIP e la sua rilevanza a livello internazionale

VIEW UNIT IN STUDIO

Bookmark this page

Uno dei temi fondamentali nell'organizzazione dei servizi che si occupano di minori traumatizzati e una delle richieste maggiori che da questi proviene è quello di garantire un'adeguata ed efficace formazione agli operatori sugli interventi evidence-based (Ruzek & Rosen, 2009). Osservando da una prospettiva generale la situazione dell'applicazione dei trattamenti e delle linee guida evidence-based, si può evincere, nonostante la salienza di questa tematica nel campo della salute pubblica, una difformità di implementazione e un'attenzione limitata alla valutazione sistematica e sul lungo temine degli effetti dei programmi di training (Ruzek & Rosen, 2009). Inoltre, da un punto di vista comparativo, Delaney (2006) ha sottolineato un altro aspetto rilevante: a livello internazionale le linee giuda e la loro declinazione in pratiche cliniche di trattamento elettivo variano considerevolmente su base nazionale e tra le diverse nazioni (anche a livello di regolamenti socio-sanitari). Weiner, Schneider & Lyons (2009) si sono occupati dell'analisi delle metodologie evidence-based per il trattamento del trauma nei minori.

Come indicato dagli autori, alcuni di essi sono stati testati attraverso procedure sperimentali e quasi-sperimentali, ma la maggior parte delle metodologie era stata strutturata per popolazioni adulte sebbene applicata anche a popolazioni minorili e valutata con poca o nulla attenzione alle variabili culturali e alla differenziazione dei sottogruppi in base a fattori incidenti sugli outcomes. Da queste osservazioni deriva, quindi, un'interessante sollecitazione alla validazione cross-culturale dei trattamenti, il che può consentire non solo di approfondirne l'efficacia, ma anche di esplorare con attenzione quali possano essere le barriere nella loro applicazione e le esigenze di flessibile adattamento in relazione a specifici sottogruppi o condizioni applicative. Prima Courtois & Gold nel 2009, poi Layne e colleghi (2014) mettono in luce come sia centrale includere nella formazione degli operatori uno specifico focus sul trauma e le sue conseguenze partendo dalla consapevolezza che esso e i sui effetti impattano su tutte le fasi del trattamento tra cui, nello specifico, quelle del coinvolgimento del paziente, l'assessment e la risposta al trattamento. Inoltre, essi sottolineano che, in questo ambito, un ruolo rilevante è ricoperto dalla creazione di standard internazionali e metodi condivisi di formazione degli operatori nell'ambito della Evidence-Based Practice (EBP; Lyon et al., 2011). L'EBP consente all'operatore di selezionare le migliori opzioni operative validate per e adeguate a quella singola situazione basandosi sui bisogni specifici del cliente, i punti di forza e le circostanze (Layne et al., 2014). Affinchè si possa garantire un'adeguata formazione in tale ambito è, quindi, fondamentale che la comunità scientifica definisca delle core competencies, cioè delle conoscenze di base che coloro che operano con persone con una storia traumatica dovrebbero possedere. In particolare, questa attenzione consente di garantire una buona qualità dei servizi erogati, aumentare la responsabilità degli operatori e diffondere un sapere condiviso e, spesso, manualizzato attraverso protocolli, tra le molteplici discipline impegnate in questo campo (psicologia, psicoterapia, scienze sociali, psichiatria, ecc.).

Il National Child Traumatic Stress Network (NCTSN) è una rete di professionisti, componenti familiari, ricercatori e partner internazionali che si occupa di migliorare gli standard di cura e la possibilità di accesso ai servizi per bambini e famiglie. Il NCTSN ha creato un protocollo formativo denominato CCCT (Core Curriculum on Childhood Trauma) (Layne et al., 2011) che enuclea i principali elementi di intervento includendoli in una matrice integrata fondata sull'evidenza, sui concetti fondamentali nell'ambito del trauma e sulle competenze terapeutiche indispensabili per progettare e implementare un intervento efficace per i bambini affetti da trauma e le loro famiglie. Due elementi risultano fondanti: gli obiettivi degli interventi (obiettivi che si desidera raggiungere attraverso l'intervento) e gli elementi pratici (le procedure concrete che si intende applicare per raggiungere i risultati). Questa attenzione alla formazione degli operatori sulle competenze fondanti passa attraverso la definizione di specifici gold standards relativi al training sull'EBP e sui trattamenti evidence-based (EBTT, Evidence-based Trauma Treatment).

Il CCCT include 5 livelli:

a) la base empirica delle conoscenze (Empirical Evidence Base);

b) i concetti fondamentali sul trauma (12 Core Concepts for Understanding Traumatic Stress Responses in Children and Families) che costituiscono il fondamento teoretico dell'intervento;

c) obiettivi dell'intervento;

d) elementi pratici (azioni osservabili messe in atto per raggiungere gli obiettivi);

e) abilità/capacità terapeutiche (con due sottolivelli: 1) procedurale e process-oriented; 2) valutativo).

Il suddetto modello supporta pratiche e competenze evidence-based tra le quali le prassi di assessment e la raccolta delle informazioni, la teoria della pratica, l'applicazione delle risultanze connesse alla letteratura scientifica alla situazione individuale del paziente, la concettualizzazione del caso, la pianificazione dell'intervento. Una task-force, che sta approfondendo e implementando il modello CCCT, ha previsto una sessione specifica di approfondimento delle competenze di analisi statistica e di strutturazione di protocolli d'indagine utili per la validazione di pratiche cliniche. Quello che viene più sottolineato in merito è l'invito a sviluppare sia gli aspetti teorici, sia i metodi di valutazione (multidimensionali), nonché la base empirica accessibile a valutazione e validazione degli interventi (in particolare degli esiti, dei fattori intervenienti e dell'efficacia di interventi centrati sulla situazione specifica della persona).

Anche Briggs e colleghi (2012) identificano come elemento di prioritaria rilevanza il miglioramento degli standard attraverso "[...] lo sviluppo, l'implementazione e la disseminazione evidence-based" (p. 1). La strutturazione di linee guida per l'intervento - che ne identifichino i target ottimali e le metodologie d'identificazione (quale sia l'intervento migliore date alcune condizioni specifiche) e valutazione degli outcomes - è fondamentale e utile per gli operatori e per coloro che si occupano di strutturazione dei servizi. I disegni di ricerca che potrebbero, quindi, risultare utili potrebbero essere quelli che considerano l'interconnessione tra i fattori di rischio e i differenti esiti ai fini di enucleare quali potrebbero essere gli elementi su cui implementare l'intervento, ma anche per, ricorsivamente, includere nuovi aspetti nella dimensione della comprensione teorica del trauma e complessificare il framework di riferimento scientifico. Particolarmente interessante è, infatti, la considerazione che i trattamenti mirati alla riduzione dei sintomi connessi al PTSD hanno anche efficacia nel ridurre difficoltà funzionali non direttamente oggetto di intervento, il che mette in luce quanto un trattamento focalizzato sul trauma possa generare effetti positivi ad ampio spettro (Layne et al, 2010).

Bisogni formativi nelle organizzazioni che si occupano di tic

VIEW UNIT IN STUDIO

Bookmark this page

Bryson e colleghi (2017) pongono un'interessante premessa che è utile per distinguere due piani di riflessione applicabili all'analisi e alla valutazione delle tematiche oggetto di questo modulo; gli autori distinguono i trattamenti specifici per il trauma (intese come tecniche di intervento volte a ridurre la sintomatologia connessa al trauma) dalla TIC definita come ottica generale che ha come obiettivo la trasformazione del sistema di cura includendo in quest'ultima una comprensione delle risposte di stress connesse alle esperienze traumatiche a tutti i livelli e in tutte le dimensioni implicate nell'organizzazione dei servizi. Nonostante sia diffusa la richiesta di applicazione di principi fondanti la TIC nei servizi e l'interesse per i vantaggi che questa può comportare, i contributi scientifici sull'implementazione della TIC per l'utenza in età minorile è, purtroppo, scarsa (Bryson et al., 2017). Già Ruzek & Rosen, nel 2009, avevano osservato che la diffusione di trattamenti evidence-based aventi come focus la cura della sintomatologia connessa al PTSD era uno degli elementi chiave su cui erano impegnate le organizzazioni sanitarie che operavano nell'ambito dell'aiuto alle persone vittime di trauma e che, di conseguenza, si era assistito a un aumento della letteratura scientifica che si occupava dei fattori organizzativi legati all'implementazione e diffusione di best-practices. Nonostante ciò, da una precedente analisi della letteratura presentata da Delaney (2006), confermata da Ruzek & Rosen (2009) e dagli stessi Bryson e colleghi (2017) era emersa ed emerge tuttora un'alta variabilità nei tassi di utilizzo di pratiche quali la contenzione e l'isolamento. Inoltre, come indicato da Valenkamp e colleghi (2014), nonché da Bryson e colleghi (2017), pochi sono gli studi che hanno testato efficacia di questi interventi in comparazione con modalità di presa in carico alternativa. La variabilità delle modalità di intervento, secondo Ruzek e Rosen (2009), aprirebbe alla necessità di procedere ad analisi comparative delle linee guida e delle best-practices internazionali al fine di renderle maggiormente fondate nel campo delle proposte di cambiamento organizzativo e a livello di politiche che siano evidence-based oriented. Bryson e colleghi (2017) si propongono, attraverso un contributo di revisione sistematica della letteratura scientifica, di mettere in luce quali fattori rendono efficace l'applicazione della TIC, per quale tipo di utenza, in quali circostanze e in quale direzione e perché.

Le strategie che vengono considerate maggiormente condivise all'interno dei contributi scientifici sono:

1) una leadership orientata al cambiamento;

2) l'utilizzo dei dati di ricerca per informare la pratica;

3) lo sviluppo dell'organico;

4) l'uso di strumenti per prevenire azioni di contenzione e isolamento;

5) i ruoli degli utenti nel contesto di degenza;

6) tecniche di debriefing.

In ragione della necessità di analizzare la complessità applicativa di questi elementi connettendola anche alle peculiarità territoriali e alle specificità organizzative, l'invito degli autori ai servizi che si occupano di applicare la TIC è quello di proseguire nel tentativo di dimostrare, attraverso il processo della ricerca scientifica e in una prospettiva longitudinale, l'efficacia sia degli sforzi e dei cambiamenti compiuti nel migliorare la salvaguardia dei pazienti, sia degli esiti a lungo termine dei trattamenti. In coerenza con quest'ottica, inoltre, Lang e colleghi (2016) sottolineano come sia importante che si raggiunga il consenso su cosa costituisca un servizio trauma-informed e come si possano efficacemente misurare i fattori coinvolti. Innanzitutto, questioni centrali riguardano: come si possa pervenire a una procedura ottimale di screening, come operazionalizzare al meglio i principi fondanti della TIC nel lavoro quotidiano con soggetti esposti a eventi potenzialmente o sicuramente traumatici e quali siano i metodi migliori per potenziare i servizi che di questa popolazione si occupano. Attualmente non sembrano così frequenti le ricerche sull'efficacia del cambiamento delle modalità di presa in carico dei pazienti in un'ottica TIC a livello organizzativo e su come/quanto queste trasformazioni siano utili ai fini degli outcomes di salute per l'utenza che afferisce al servizio. Una sfida sottolineata dai ricercatori potrebbe proprio essere quella dell'integrazione fra ricerca sulle EBPs e best-practices nell'ottica di incrementare la qualità dell'implementazione dell'offerta di servizi (considerata anche l'analisi della dimensione dell'impatto economico di queste iniziative) passando attraverso lo sviluppo delle competenze del personale, delle procedure di screening, della capacità di cambiamento delle policies. Un ruolo determinante in questa direzione può essere svolto dalla leadership che dovrebbe supportare un processo di cambiamento, in alcune situazioni radicale, anche a livello di cultura organizzativa (enfasi, ad esempio, sull'importanza della TIC).

Il training sul trauma è una componente essenziale, ma non sufficiente affinché un'organizzazione sia trauma-informed. Inoltre, come specificato da Kramer e colleghi (2013), importante è anche la collaborazione tra le differenti agenzie che si occupano dell'assistenza ai minori e alle loro famiglie, le quali, possibilmente, condividano i principi della TIC. Su quest'ultimo aspetto, gli autori, ad esempio hanno analizzato efficacia di un training orientato all'acquisizione delle specifiche conoscenze con somministrazioni longitudinali di idonei strumenti di rilevazione (pre e post formazione) nonché una rilevazione sotto forma di follow-up per analizzare quanto queste competenze acquisite abbiano comportato modifiche nella modalità di organizzare il servizio di appartenenza. Su questo specifico aspetto, inoltre, un tema interessante è l'analisi delle barriere incontrate dall'intero staff e la strutturazione di ricerche comparative (con gruppi randomizzati) volte ad esaminare l'utilità delle differenti strategie utilizzate e degli ulteriori bisogni formativi anche longitudinalmente.

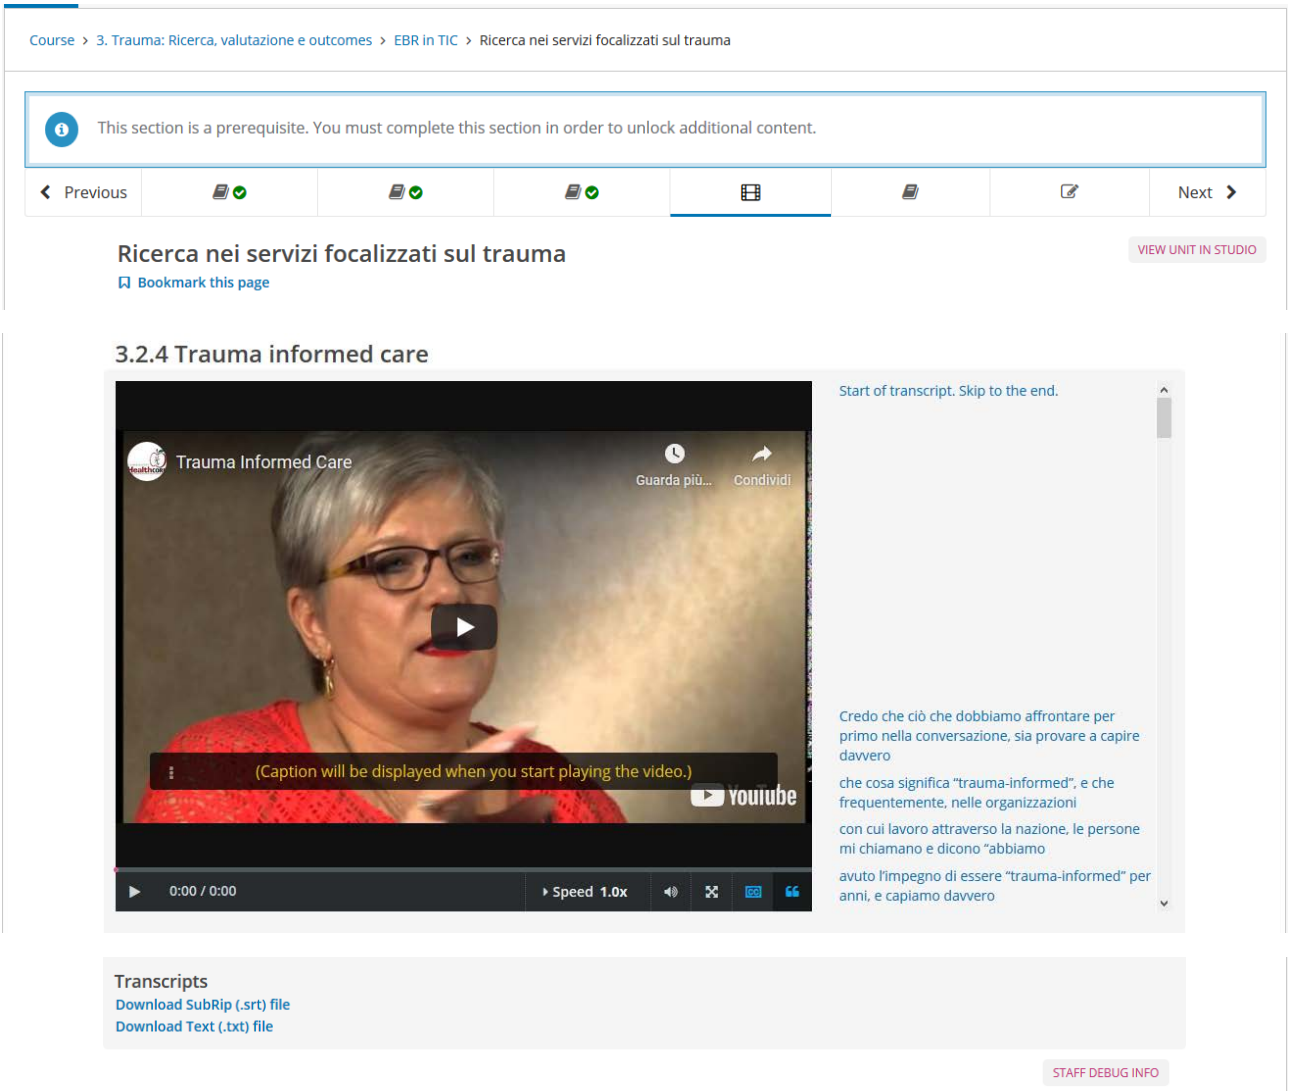
Diffusione della ricerca sul trauma nei settings organizzativi

Ruzek & Rosen (2009), trattando il tema della diffusione della ricerca sul trauma nei settings organizzativi, ne sottolineano la complessità: i modelli che si occupano di disseminazione hanno messo in luce come questa dipenda da molteplici fattori in interazione tra loro a differenti livelli (individuali e organizzativi). Briggs e colleghi (2012) indicano come sia sì riconosciuto il fatto che un cambiamento nell'ambito delle conoscenze rappresenti il primo passaggio verso il cambiamento organizzativo, ma anche che è altrettanto fondamentale la verifica di quanto questo si espliciti attraverso o si traduca in un cambiamento comportamentale. Due aspetti, quindi, risultano importanti: la complessità sistemica e multilivello della disseminazione dei contenuti scientifici nelle organizzazioni e il processo che connette l'ambito delle conoscenze e la messa in pratica di queste attraverso un meccanismo complesso di cambiamento individuale e organizzativo.

Questo processo porta in primo piano una delle resistenze più frequenti all'implementazione di nuove best-practices: il fatto che la scelta della loro applicazione nell'organizzazione è una decisione spesso vissuta come "top-down" e, perciò, come poco partecipata da parte dei clinici (Rohrbach et al, 2006; Ruzek & Rosen, 2009). In questo caso, infatti, il coinvolgimento (commitment) degli operatori nel cambiamento delle loro prassi organizzative è una dimensione nodale. Come suggerito dai contributi degli studiosi, un assetto in cui la concertazione del cambiamento è negoziata dalla leadership con i sottoposti, tenendo conto delle esigenze locali, contribuisce al successo nella loro implementazione (Durlak & DuPre, 2008; Ruzek & Rosen, 2009). Un altro tema centrale è quello per cui le organizzazioni sanitarie spesso non hanno nel loro organico personale specializzato e dedicato alla ricerca di EBPs, allo studio delle best-practices e delle strategie per la loro applicazione e, in particolare, all'analisi e integrazione sistematiche e continue delle risultanze della ricerca scientifica (Berwick, 2003; Ruzek & Rosen, 2009).

A questo proposito, Marvin e Robinson (2018), sottolineano la necessità per le organizzazioni di avere una visione che contempli l'analisi dell'istituzione o del servizio stesso in quanto a capacità di o prontezza nell'accogliere e sostenere gli interventi di cambiamento (quella che in letteratura viene definita "Organizational readiness" e che può essere misurata a livello organizzativo, gruppale e individuale). Occuparsi di questa dimensione nella fase progettuale è sicuramente rilevante per sostenere l'applicazione di nuove pratiche, analizzare le possibili barriere nel processo e sostenere le credenze e gli atteggiamenti positivi verso il cambiamento organizzativo. Una considerazione trasversale a questo tema è quella della centralità che dovrebbe avere la raccomandazione di costruire strategie su misura per il cambiamento in quella specifica organizzazione (Augustsson et al., 2017; Marvin & Robinson, 2018). La ricerca dimostra l'importanza della leadership e della vision manageriale nel co-costruire insieme agli operatori la via del cambiamento e nel condividere una cultura orientata all'applicazione della TIC, attenta, innanzitutto, all'analisi dei bisogni dello staff.



Transcript

Credo che ciò che dobbiamo affrontare per primo nella conversazione, sia provare a capire davvero
che cosa significa "trauma-informed", e che frequentemente, nelle organizzazioni
con cui lavoro attraverso la nazione, le persone mi chiamano e dicono "abbiamo
avuto l'impegno di essere "trauma-informed" per anni, e capiamo davvero
perchè sia così importante, ma davvero non stiamo andando da nessuna parte.
C'è, sai, sappiamo che ci siano dei passi successivi che dobbiamo fare ma
non siamo mai davvero riusciti ad organizzarci e non siamo mai stato capaci
di fare quel passo successivo, e ciò che abbiamo fatto al Consiglio Nazionale, è, abbiamo sviluppato
uno strumento chiamato l'"organizational self-assessment" e con questo strumento abbiamo
preso i pensieri e le idee dai leader del campo, leader del campo come
Roger Fowler e Maxine Harris e Judith Herman e Sandy Blum,
e tentato di sintetizzare il loro lavoro in un modo che esprime le pratiche ed

i principi che esprimono cosa significhi essere trauma-informed, quindi per esempio “prima la sicurezza” o la trasparenza, e, sai, la mutualità e la scelta e la voce ed il controllo e la collaborazione ed il restituire il controllo alle persone nelle loro vite e quindi, quello che abbiamo fatto è creare uno strumento chiamato l’“organizational self-assessment” utilizzando questi pezzi delle pratiche e dei principi per operazionalizzare com’è per una organizzazione spostarsi verso l’essere trauma-informed, e l’OSA è una scala Likert da zero a quattro con un “non applicabile” incluso, abbiamo preso e creato i sette domini della trauma-informed care ed in quei sette domini è dove si catturano questi principi. Sotto ogni dominio esistono diversi standard, e questi standard non sono gli unici ma l’idea dell’OSA è far pensare le organizzazioni in maniera un po’ diversa sul lavoro che fanno. Quindi per esempio, nei sette domini, il primo dominio è “screening e valutazione”, quindi vogliamo avere per le persone una esperienza all’entrata in una agenzia dove viene fatto lo screening, ma vogliamo anche che le persone abbiano l’opportunità di parlare di tutto, di qualsiasi esperienza, in una maniera sensibile e con il tempo. Se sono qualcuno che sta entrando in una organizzazione potrei essere molto molto spaventato o potrei non fidarmi di te se sei il coordinatore degli ingressi ma dove voglio arrivare, quello che vogliamo essere capaci di fare è creare un ambiente in cui le persone si sentono al sicuro nel rispondere ad alcune di queste domande. E le persone devono essere istruite su come porre le domande, devono essere istruite su come stabilire una relazione dalla primissima volta che qualcuno attraversa la porta. Il secondo dominio è “cura e servizi basate sul consumatore” e sono così elettrizzata da Community HealthCore e dal modo in cui stanno pensando al lavoro che fanno ed il numero di pari che stanno venendo istruiti ed utilizzati in modi assolutamente meravigliosi, e non è l’unica parte. I pari possono vedere i servizi sotto una lente molto molto diversa: sappiamo cosa vuol dire passare attraverso un processo di screening e valutazione, sappiamo cosa vuol dire essere incanalati in un gruppo che davvero non sta funzionando per noi, sappiamo cosa vuol dire essere ritraumatizzati dal sistema ed essere capaci di avere quella voce è parte di tutto il lavoro, è un pezzo della cura e dei servizi

basati sul consumatore, ma è guardare le cose da quella prospettiva
veramente orientata al recupero dove è basata sul consumatore, è centrata sulla persona e
che io ho, se sono una persona che sta ricevendo dei servizi ho una opportunità
di dire cosa funziona per me e cosa no. Sto davvero portando quella voce
e mi sto assicurando che i pari, i clienti consumatori, in qualunque modo inquadri
il linguaggio, che le persone abbiano una opportunità di parlare davvero di cosa sta funzionando davvero
nell'organizzazione e cosa non funziona bene. Abbiamo anche parlato di sviluppo della forza lavoro
in una forza lavoro educata e trauma-informed e questo include
l'addestramento clinico, i clinici hanno bisogno di avere un addestramento adeguato per fare il proprio
lavoro ma se sono la receptionist cosa vuol dire per me essere una persona
che lavora in una organizzazione trauma-informed? Ogni
persona fa la differenza, se sono il guidatore del furgoncino, se sono la persona che fa la manutenzione, faccio
la differenza nel creare quella comunità dove le persone sentono di poter
iniziare a guarire. E anche pensare all' "affaticamento da compassione" dello staff, nel
nostro lavoro precedente oggi stavamo parlando del servizio clienti interno, è come
ogni persona nell'organizzazione tratta gli altri. Non puoi avere una organizzazione
trauma-informed se lo staff è così sovraccaricato di lavoro che
sperimentano l'affaticamento da compassione, così, sai, pensando ai bisogni dello staff
ma anche pensando a come questo ha un impatto se non mi sto prendendo cura di me stesso
come faccio ad esserci davvero per un'altra persona? È anche sull'avere una buona supervisione
clinica, stai facendo una supervisione in una maniera trauma-informed invece che fare supervisione
in maniera punitiva? Il dominio 4 è l'evidence-based nelle best practices
emergenti, è il guardare sempre, è il non dire "questa è la cosa che stiamo facendo che è
evidence-based e non guardiamo mai le cose nuove ed emergenti
che si stanno sviluppando". È avere sempre un occhio di riguardo per la roba
buona, e davvero, sai, provvedere l'addestramento per lo staff, usare
best practice eseguite dai pari ed evidence-based, come la "WHAM" Wellness, Whole Health Action
Management, dove i pari stanno davvero aiutando gli altri pari, prendono
il controllo della loro stessa salute fisica. O la "WRAP", Wellness Recovery Action Planning,
è un ottimo strumento trauma-informed da usare che è evidence-based, e poi
creare un ambiente sicuro e riparato. Le persone non possono guarire se non si sentono

al sicuro. Se sei in iper-allerta, se ti senti come se stessi entrando in un
ambiente che non ti accoglie, dove non ti senti al sicuro,
non succederà nulla di buono. Qualcuno mi ha detto, ero in un meeting, e
avevano ridipinto, avevano soltanto ridipinto ed aggiornato l'area della reception, ed uno dei
clienti è venuto e ha detto "Stiamo traslocando?" e la persona ha risposto "No, perchè?" "Beh
abbiamo pensato, se la stavate rendendo così bella era
perchè dovevamo andarcene." e questo è
un indicatore che le persone non si sentivano altamente valorizzate, è stata una grossa lezione per
loro. Le persone devono essere trattate in un posto ed in un modo che dice "ti rispetto,
hai valore", non puoi cominciare a guarire finchè non cominci
a coprire queste cose. E poi il dominio sei è sul costruire un rapporto di partnership con la comunità,
chiunque noi siamo nella comunità, abbiamo bisogno di lavorare per renderla una comunità,
il guarire trauma-informed non avviene in un vuoto quindi se io ricevo ottimi
servizi al tuo programma ma vado, sai, al dipartimento tal dei tali e mi trattano
come se fossi, sai, fango sul fondo della tua scarpa, annulla tutto
il buon lavoro che ho fatto mentre stavo lavorando con te, quindi mettersi per davvero in comunicazione con
la comunità ed aiutare la comunità a capire cosa significhi essere
trauma-informed. E infine, il dominio sette è tutto sul "miglioramento delle performance":
Come sai se ciò che stai facendo fa la differenza?
Se faccio la cosa X funzionerà per me? Questo sta funzionando per le persone che
serviamo? Sto facendo sondaggi sul feedback dei clienti? Sto chiedendo ai clienti il livello di sicurezza
che sentono? Sto sondando il mio staff? E quando ho fatto il sondaggio, faccio
qualcosa riguardo a ciò che ottengo? Ho appena fatto un sondaggio quindi, sai, il modo in cui usiamo l'OSA
è, chiediamo alle organizzazioni, quando iniziano la valutazione, questa è la loro
baseline, e poi chiediamo loro lungo un periodo di tempo di farlo di nuovo, così che loro
possano vedere i progressi che hanno fatto. E poi usiamo una serie di altri strumenti,
uno strumento di monitoraggio delle performance, e una guida di implementazione per aiutare
le organizzazioni ad andare avanti, ma questo è un po' l'OSA in una istantanea, una istantanea
molto veloce, perchè è un processo lungo, l'OSA non è
disegnata perchè le organizzazioni possano dire "okay abbiamo finito ora", non è una
checklist, è un modo di guidare le conversazioni, iniziare a fare

cambiamenti significativi all'interno delle organizzazioni.

La TIC è definibile come un approccio evidence-based per rispondere al trauma che pone il focus sulla capacità (o meno) dei membri dello staff di compartecipare a una visione della presa in carico del paziente traumatizzato come un precursore critico per il successo o il fallimento nell'adottare strategie atte a ridurre il rischio di ri-traumatizzaione dell'utente (Marvin & Volino Robinson, 2018). In questo, fondamentale è l'attenzione ad accogliere la complessità delle storie in cui il trauma può essere generato da esperienze differenti e individuali. Le politiche, le procedure e l'operatività quotidiana possono anche configurarsi come ulteriori esperienze traumatizzanti oppure elicitare risposte connesse al funzionamento individuale della persona traumatizzata, impedendo alla persona di ricevere l'aiuto di cui necessita. Per evitare che queste situazioni si verifichino, generando frustrazione anche nello staff, potrebbe essere utile il ricorso a best-practices appositamente strutturate e riconosciute a livello internazionale (cfr, ad esempio le strategie promosse dalla SAMHSA nel 2014). In sinergia con questo, l'ottica della TIC invita le organizzazioni a considerare quale sia l'impatto per i membri afferenti ai servizi clinici del lavorare con soggetti aventi storie traumatiche (SAMHSA, 2014; Knight, 2015) e come gli operatori possano essere aiutati, attraverso il training e una trauma-informed leadership, a mantenere un buon livello di benessere al lavoro e di efficienza/efficacia dell'intervento (Manderscheid, 2009). Ruzek & Rosen (2009) hanno approfondito i fattori che influenzano il modo in cui i servizi recepiscono le risultanze di ricerca sulle pratiche evidence-based connesse al trattamento del trauma.

Una valutazione attenta delle dimensioni sia della disseminazione di pratiche, sia della ricerca implica l'inclusione nel campo d'analisi di molteplici fattori che possono influenzare l'evoluzione del processo di cura, il rapporto dei pazienti o della potenziale utenza con i servizi, la modalità con la quale i clinici apprendono tecniche di trattamento, i cambiamenti nelle organizzazioni connessi con la trasformazione comportamentale. Sicuramente, secondo la visione degli autori, una sempre più urgente priorità alla base dell'applicazione della ricerca empirica in questo ambito è quella di validare o supportare modalità trattamentali applicabili in un modo economicamente vantaggioso. I ricercatori, in particolare, hanno analizzato il ruolo dei fattori inerenti gli operatori che la ricerca ha messo in luce in connessione agli outcomes. In merito osservano che le valutazioni degli operatori specializzati nello stress legato a eventi traumatici (specificamente coloro che si occupano di PTSD) in merito a una determinata pratica, le loro competenze e caratteristiche (ad esempio il livello di autoefficacia), la loro disponibilità al cambiamento nelle prassi operative (ad esempio nell'adottare una specifica best-practice integrandola nella loro operatività quotidiana) sono fattori incidenti, ma poco studiati a livello empirico. Accessibilità a percorsi di training sulle EBPs e le preoccupazioni sull'applicabilità delle novità nel campo della ricerca alla loro specifica popolazione di riferimento (problema della generalizzabilità dei risultati) risultano essere le variabili maggiormente incidenti sulla loro attitudine verso le pratiche evidence-based indipendentemente dall'orientamento teorico di appartenenza. La modalità di formazione che risulta particolarmente efficace ai fini del cambiamento dei comportamenti di cura sono i percorsi di training intensivo soprattutto quando prevedono la dimostrazione delle competenze necessarie e la possibilità di mettersi alla prova attraverso la partecipazione interattiva alle sessioni (con la disponibilità anche di supervisione su base continuativa e, quindi, al di là del momento formativo in senso stretto ed eventi di training-the-trainers). Per quanto concerne, invece, i fattori d'innovazione gli autori mettono in luce che le percezioni degli operatori e dei pazienti sui trattamenti sono un elemento fondamentale nella loro adozione, in particolare in merito alla loro comprovata efficacia (anche a livello comparativo con altre metodologie).

Tra i fattori sistemici essi osservano come sia particolarmente rilevante, ai fini del successo nell'applicazione di una buona pratica, la disponibilità di approcci multilivello a lungo termine, tra cui la disponibilità di spazi per la supervisione e il supporto a livello amministrativo-organizzativo (Fixsen et al., 2005). Ulteriormente importante è l'osservazione della necessità di supportare empiricamente l'esigenza di creare sistemi di cura trauma-informed (Ko et al., 2008; Ruzek e Rosen, 2009). Inoltre, il monitoraggio dell'implementazione del trattamento è un aspetto risultato centrale per quanto concerne la diffusione, gli effetti, la fedeltà alla procedura di realizzazione delle EBPs (Rosenheck, 2001b; DuFrene, Noell, Gilberton & Duhon, 2005; Durlak & DuPre, 2008; Ruzek e Rosen, 2009). Un aspetto particolarmente interessante è quello analizzato da Rosenheck (2001a) quando sottolinea il processo mutualmente ricorsivo d'interazione tra EBPs (nella loro dimensione generale e prescrittiva) ed esperienze/esigenze locali di applicazione. La finalità del monitoraggio, anche in ragione del suo costo in quanto a risorse economiche e di tempo per i servizi, dovrebbe quindi essere quella di consentire il focalizzarsi prevalentemente sugli elementi cruciali per gli esiti del trattamento e l'efficacia dell'intervento (Ruzek & Rosen, 2009). Una delle domande cruciali potrebbe riguardare quanto le modifiche apportate dal clinico in risposta a esigenze specifiche possa minare, incrementare o lasciare inalterati gli effetti dell'intervento (Ruzek & Rosen, 2009).

Q3.2

3 points possible (graded)

1. Una ricerca di Ruzek e Rosen (2009) ha evidenziato che nel contesto internazionale dei trattamenti legati al trauma:

- ○ I trattamenti erano applicati in maniera uniforme attraverso le varie nazioni, evidenziando l'efficacia degli approcci utilizzati
- ○ Le necessità di specifici sottogruppi erano adeguatamente prese in carico
- ○ Gli stessi trattamenti erano ugualmente efficaci in adulti e minori
- ○ I programmi di training erano implementati in maniera difforme, evidenziando la necessità della definizione di core competencies

2. La Trauma-Informed Care...

- ○ Punta a trasformare il sistema di cura, concentrandosi sulla capacità dello staff di partecipare ad una visione della presa in carico del paziente traumatizzato
- ○ Punta a ridurre esclusivamente i sintomi correlati al trauma, concentrandosi sulle tecniche di intervento
- ○ Implementa tecniche quali contenimento ed isolamento
- ○ È utilizzata esclusivamente con minorenni

3. Uno dei vantaggi della divulgazione scientifica nelle organizzazioni che si occupano di trauma è:

- ○ La possibilità di manifestare esclusivo interesse per le questioni legate ai gruppi di lavoro
- ○ La possibilità di iniziare un percorso di implementazione delle più recenti pratiche evidence-based, mirate al miglioramento del benessere di staff e pazienti
- ○ L'implementazione delle evidenze come decisione top-down da parte della leadership
- ○ Il passaggio a trattamenti generici che funzionano per tutti i pazienti

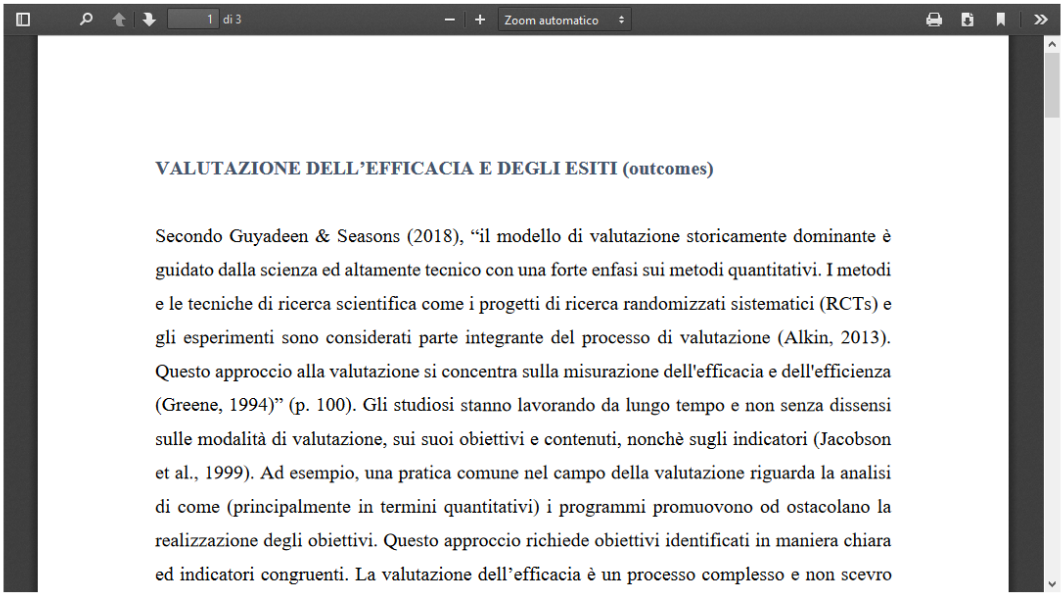
Valutazione dell'efficacia e degli esiti



VALUTAZIONE DELL'EFFICACIA E DEGLI ESITI (outcomes)

Secondo Guyadeen & Seasons (2018), "il modello di valutazione storicamente dominante è guidato dalla scienza ed altamente tecnico con una forte enfasi sui metodi quantitativi. I metodi e le tecniche di ricerca scientifica come i progetti di ricerca randomizzati sistematici (RCTs) e gli esperimenti sono considerati parte integrante del processo di valutazione (Alkin, 2013). Questo approccio alla valutazione si concentra sulla misurazione dell'efficacia e dell'efficienza (Greene, 1994)" (p. 100). Gli studiosi stanno lavorando da lungo tempo e non senza dissensi sulle modalità di valutazione, sui suoi obiettivi e contenuti, nonchè sugli indicatori (Jacobson et al., 1999). Ad esempio, una pratica comune nel campo della valutazione riguarda la analisi di come (principalmente in termini quantitativi) i programmi promuovono od ostacolano la realizzazione degli obiettivi. Questo approccio richiede obiettivi identificati in maniera chiara ed indicatori congruenti. La valutazione dell'efficacia è un processo complesso e non scevro

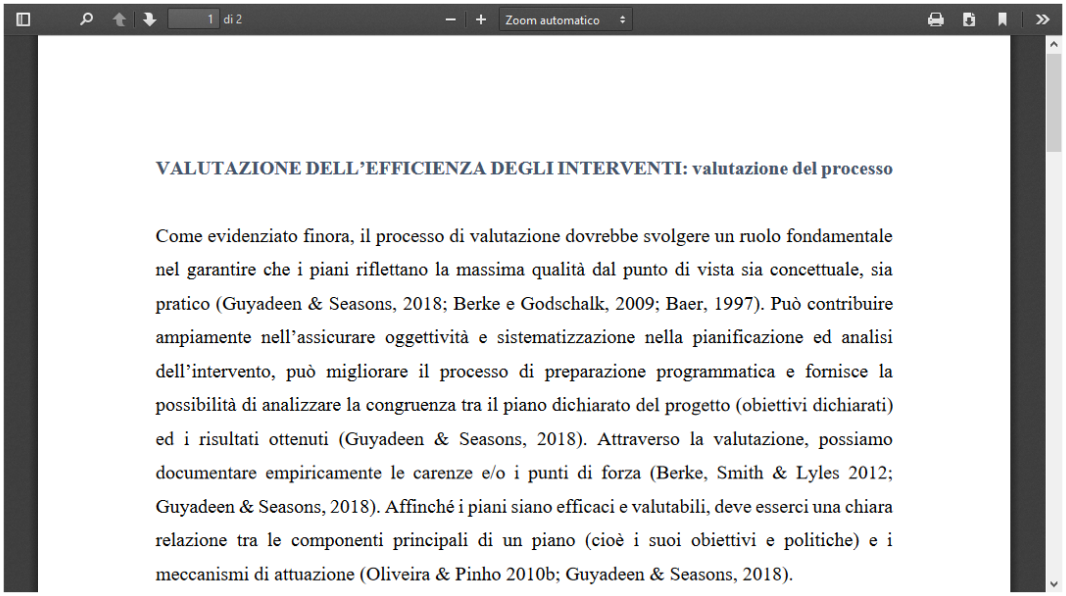
Valutazione dell'efficacia e degli interventi



VALUTAZIONE DELL'EFFICIENZA DEGLI INTERVENTI: valutazione del processo

Come evidenziato finora, il processo di valutazione dovrebbe svolgere un ruolo fondamentale nel garantire che i piani riflettano la massima qualità dal punto di vista sia concettuale, sia pratico (Guyadeen & Seasons, 2018; Berke e Godschalk, 2009; Baer, 1997). Può contribuire ampiamente nell'assicurare oggettività e sistematizzazione nella pianificazione ed analisi dell'intervento, può migliorare il processo di preparazione programmatica e fornisce la possibilità di analizzare la congruenza tra il piano dichiarato del progetto (obiettivi dichiarati) ed i risultati ottenuti (Guyadeen & Seasons, 2018). Attraverso la valutazione, possiamo documentare empiricamente le carenze e/o i punti di forza (Berke, Smith & Lyles 2012; Guyadeen & Seasons, 2018). Affinché i piani siano efficaci e valutabili, deve esserci una chiara relazione tra le componenti principali di un piano (cioè i suoi obiettivi e politiche) e i meccanismi di attuazione (Oliveira & Pinho 2010b; Guyadeen & Seasons, 2018).

Q3.3

3 points possible (graded)

1. Secondo Rychetnik, Frommer, Hawe e Shiell (2002), la valutazione si può definire come:

- ○ Un insieme di cambiamenti e di esiti definibili a priori
- ○ La lettura interpretativa dei dati rilevati attraverso una ricerca formale o indagini specifiche
- ○ Il setting sociale, politico e/o organizzativo entro il quale l'intervento è programmato
- ○ Il processo che consente di determinare la valenza di un intervento attraverso il confronto con standard predeterminati ed espliciti

2. Nel valutare l'efficacia di un intervento, quale di queste NON sembra una dimensione significativa? (Rychetnik et al., 2002)

- ○ La pertinenza degli effetti misurati nel contesto di implementazione
- ○ Il numero di interventi svolti dall'organizzazione
- ○ La grandezza degli effetti misurati
- ○ La forza dell'evidenza, determinata da una combinazione del disegno di studio, della qualità metodologica e della precisione statistica

3. La valutazione...

- ○ Permette di documentare empiricamente le carenze ed i punti di forza dei piani di intervento
- ○ Non richiede una integrazione tra metodi di valutazione e piano da valutare
- ○ Dovrebbe evitare di considerare gli interessi delle persone coinvolte nelle decisioni sugli interventi
- ○ Andrebbe portata avanti solo sugli esiti\outcome

Bentrovate e bentrovati. Eccoci nuovamente ad una nuova settimana, con nuovi aspetti, nuovi approfondimenti. In questa settimana affronteremo gli aspetti legati alle best practice, gli aspetti legati all'osservazione e gli aspetti legati agli indicatori di abuso e maltrattamento infantile. Partiamo dal primo elemento. Indagheremo insieme quelli che sono gli elementi legati all'intervento della ricerca e della pratica con particolare attenzione allo sviluppo delle best practice, o delle buone pratiche. Dopo di che esamineremo quelli che sono gli aspetti metodologici della ricerca in Trauma-Informed Care, che ormai abbiamo imparato a comprendere e a leggere, e avremo modo di comprendere ulteriormente come queste si applichino alla pianificazione di una ricerca, come utilizzare il format Trauma-Informed Care nella ricerca, quindi il canale dalla teoria alla pratica. Tenteremo poi ancora di identificare gli elementi che costituiscono una buona proposta di ricerca

andando a vedere quelli che sono aspetti legati ad esempio ad una buona tecnica che è l'osservazione. L'osservazione come strumento clinico, l'osservazione come strumento che può permettere ad un operatore che a diverso titolo collabora o ha intenzione di lavorare o per mille altre ragioni è intenzionato a conoscere e approfondire il tema del Trauma-Informed Care può utilizzare il metodo, lo strumento osservativo, che può essere a sua volta uno strumento importante per comprendere il contesto, e per comprendere anche la persona calata in quel contesto (ricordiamoci il senso del Trauma-Informed Care). E qui indagheremo quelli che sono i requisiti e le applicazioni possibili con l'osservazione clinica e non solo. Proseguiremo poi su quelli che sono gli esempi e i concetti esposti precedentemente come buone pratiche, osservazione e come questi possono essere applicati all'abuso e maltrattamento infantile andando a individuare anche indicatori, tenendo in considerazione che un indicatore è, come tale, un indicatore, non è certo un elemento fondamentale e certo di abuso e maltrattamento, ma un insieme di indicatori possono essere per noi interessanti come elemento da tenere a mente che lì vi può essere un qualche cosa da indagare. Di qui andiamo quindi a vedere quello che è lo screening sulla valutazione del trauma e cercheremo di capire con colleghi e con colleghe quanto uno screening di un trauma possa essere importante ai fini della conoscenza. Chiuderemo poi quello che sono gli aspetti legati al Trauma-Informed Care e collegamenti con la ricerca, e a come vi possa essere un sistema organizzato di processi che va dalla teoria alla pratica. Se nella prima parte, nelle prime due settimane abbiamo discusso e abbiamo affrontato con i colleghi quello che è forse l'aspetto più teorico del trauma, con noi oggi, con queste due settimane abbiamo discusso quella che è la ricerca in evidence-based o action-research in Trauma-Informed Care, di qui in poi vi avvierete verso un nuovo percorso che avrà sempre come filo rosso il trauma ed il Trauma-Informed Care ma da un aspetto un po' diverso, ossia quello legislativo, per affrontare poi i temi legati alla legislazione, alla ricerca e alle policy. Vi auguriamo, a nome mio e a nome di tutti i colleghi un buon proseguimento di percorso, ormai siete arrivati a metà, forse a più di metà del percorso, e a questo punto vi state avviando verso la chiusura del vostro MOOC. Nuovamente, buona prosecuzione, e ci rivedremo alla fine del MOOC.

Introduzione agli aspetti metodologici di base della ricerca in TIC

VIEW UNIT IN STUDIO

Bookmark this page

Come indicato da Newman & Ridenour (1998), il modo in cui i ricercatori conducono uno studio e quali conclusioni ne traggono sono molto diversi a seconda dell'approccio adottato nei confronti della realtà. Inoltre, l'epistemologia riguarda lo studio di come conosciamo le cose mentre il metodo riguarda la scelta della tecnica attraverso la quale procedere alla conoscenza dei fenomeni (Bernard, 2006)

Come sottolineato da Lastrucci (1963), la scienza è "un metodo oggettivo, logico e sistematico di analisi dei fenomeni, ideato per permettere l'accumulo di conoscenze affidabili" (p. 6). Questo avviene attraverso tre obiettivi che guidano le scelte del ricercatore (Bernard, 2006):

- L'oggettività: questo implica l'essere espliciti riguardo alle misurazioni, l'attenzione alla metodologia e il riferimento alla revisione fra pari nell'ambito della comunità scientifica
- Il metodo scientifico
- L'affidabilità

La dimensione etica è parte del metodo scientifico e, riferendosi alla ricerca nell'ambito delle scienze umane, una questione centrale è quella riguardante come operazionalizzare fenomeni che per loro natura sono complessi; questo tipo di processo si basa sulla definizione di variabili, sulla ricerca di associazioni o relazioni tra loro e sul tentativo di capire se e come la variazione di una cosa causi una variazione in un'altra (Bernard, 2006). In connessione con questi aspetti un elemento fondante è quello della misurazione e dell'identificazione di indicatori validi e affidabili ed è strettamente connesso alla strutturazione di definizioni operative che "consistono in un insieme di istruzioni su come misurare una variabile che è stata definita concettualmente" (p. 38).

La ricerca in TIC

VIEW UNIT IN STUDIO

Bookmark this page

Nell'ambito dalla TIC uno dei concetti fondamentali è quello di utilizzare procedure e concetti scientificamente validati. Da questo punto di vista è fondamentale la promozione di una sinergica interazione tra lavoro clinico e ricerca al fine di indagare gli esiti del trattamento e per valutare i modelli di funzionamento dei servizi in termini di efficacia ed efficienza anche con la formalizzazione di questi aspetti in specifiche linee guida e/o l'attenzione all'adesione dello specifico protocollo agli elementi consolidati nella ricerca internazionale in questo campo (Schäfer et al., 2018).

In questo non è irrilevante il contributo della ricerca scientifica in merito all'analisi delle definizioni della TIC e dei suoi fattori fondanti.

Infatti, a questo proposito, Becker-Blease (2017), Hanson & Lang (2016) e Johnson (2017) evidenziano una serie di aspetti critici relativi alla TIC e di difficoltà applicative, tra cui, ad esempio, l'esistenza di un focus molto presente nella letteratura scientifica sugli aspetti teorici e sui principi fondamentali a discapito di un'attenzione rispetto agli elementi tangibili e alla loro applicabilità nella pratica: "vi è una lacuna su come i professionisti possono trasformare la teoria e i principi nella pratica quotidiana e quindi valutare la loro efficacia "(Becker-Blease, 2017, p.3). l'attenzione alla ricerca è, quindi, utile per la valutazione delle iniziative applicative, dei programmi e dei servizi trauma-informed e se questi siano correlati a risultati positivi rilevanti.

Nel cercare di attuare un proficuo e funzionale interscambio tra gli aspetti concettuali e teorici e quelli applicativi, un rilevante focus dovrebbe essere dedicato all'analisi dell'applicabilità di procedure e indicatori standardizzati sia in capo agli elementi processuali, sia agli esiti ottenuti. La letteratura scientifica sull'argomento sollecita le organizzazioni e le istituzioni a considerare particolarmente rilevante la strutturazione di progetti di ricerca, sia di base sia applicativi, volti ad occuparsi delle modalità di screening (evidence-based screening), all'analisi delle procedure di assessment atte a identificare gli eventi traumatici e le loro peculiarità. Inoltre, a tal fine, risulta importante che vengano implementati studi randomizzati, controllati, su base sperimentale che testino l'efficacia degli interventi trauma-oriented.

Gli elementi di base per strutturare una buona proposta di ricerca

VIEW UNIT IN STUDIO

Bookmark this page

Esistono differenti approcci alla strutturazione di un progetto (Leone & Prezza, 1999) in ambito socio-sanitario: a) sinottico-razionale (che implica massima pre-strutturazione dei contenuti), b) concertativo-partecipativo o della progettualità dialogica (in cui è centrale continua negoziazione degli obiettivi fra esperti e destinatari); c) euristico (che prevede una minima strutturazione a priori degli obiettivi).

Da un punto di vista generale, nel processo di ricerca si dovrebbero seguire i seguenti steps:

1. Viene formulato un problema teorico (derivante dall'analisi della teoria e della letteratura scientifica);

2. Vengono selezionati unità di analisi e metodo appropriati;

3. I dati vengono raccolti e analizzati;

4. La proposizione teorica con la quale è stata avviata la ricerca è o contestata o supportata.

Come indicato da Lanzara (1985): "Ogni attore che si ponga il problema dell'innovazione, o semplicemente dell'intervento in una situazione per modificarla, ha di fronte a sé un problema di progettazione" (p. 336). La progettazione è un processo di sistematizzazione; infatti, la strutturazione di un progetto di ricerca è una fase critica e fondamentale che comporta scelte importanti che ne condizionano gli esiti. Inoltre, Leone & Prezza (1999) sottolineano che: "Articolare un progetto tra diversi soggetti, pensare alla coerenza tra diverse parti (scopi, tempi, operatori disponibili...) significa problematizzare la prassi e fare i conti con il limite, con la parzialità, e questo è proprio ciò che in alcuni contesti tende ad essere rimosso" (p. 23) o considerato troppo complesso da un punto di vista applicativo.

Da un punto di vista trasversale, le autrici indicano le tappe fondamentali nella strutturazione di un progetto in campo sociale:

1) Ideazione: fase in cui si ipotizza di realizzare o proporre un progetto

2) Attivazione: verifica risorse, ruoli, problema e strategie, eventuale analisi della domanda (committenza)

3) Progettazione: elaborazione del progetto e strutturazione delle fasi che lo compongono, si stabiliscono i tempi e si definiscono le scelte metodologiche

4) Realizzazione: avvio delle attività, verifica prime ipotesi, modifiche in itinere

5) Verifica: analisi conclusiva dei risultati

Inoltre, nell'ambito della ricerca scientifica, elementi importanti dal punto di vista applicativo sono:

- Definizione e analisi dell'oggetto di ricerca dal punto di vista della letteratura scientifica, esplicitazione del framework teorico
- Individuazione ed esplicitazione delle finalità generali e degli obiettivi specifici dello studio (domanda di ricerca: esplorativa, valutativa, esplicativa)
- Strutturazione delle ipotesi
- Identificazione della popolazione target, del reclutamento dei partecipanti e delle procedure di campionamento
- Procedure di valutazione, definizione degli indicatori, strumenti e tecniche di analisi dei dati raccolti
- Pianificazione dei tempi (cronoprogramma) e analisi della fattibilità (inclusi criticità e limiti)

Nel fare questo si può ricorrere a impianti metodologici di matrice quantitativa, qualitativa, mista in base alla domanda di ricerca.

Ciascuna fase della progettazione comporta che il ricercatore si ponga interrogativi importanti che tengano conto anche degli elementi critici dal punto di vista concettuale e pratico. Il contesto in cui si svolge la ricerca è uno di questi, così come le risorse.

Stante tale complessità, è di fondamentale rilevanza l'attenzione alla formazione del personale anche su questa dimensione e la costante interazione tra i professionisti impegnati nel lavoro clinico e i ricercatori che si occupano di ricerca nella e sulla clinica.

Inoltre, un settore importante che mostra la sua centralità è quello che riguarda la strutturazione e validazione di strumenti che possono essere utilizzati a partire da obiettivi sia di intervento sia di ricerca. Questi possono avere forme differenti ed essere applicabili a target specifici, ragione per cui è fondamentale che tutti gli attori coinvolti nella progettazione e implementazione di un progetto concertino sinergicamente ogni fase prevista nel piano progettuale, scelte metodologiche comprese.

Q4.1

3 points possible (graded)

1. La definizione operativa:

- ○ È successiva alla definizione concettuale di una variabile
- ○ È precedente alla definizione concettuale di una variabile
- ○ Non è utile al fine di misurare una variabile
- ○ Viene elaborata durante la misurazione di una variabile

2. Nell'ambito della TIC è fondamentale:

- ○ Imporre una metodologia di intervento agli operatori
- ○ Non tenere conto dei contributi della ricerca scientifica
- ○ Non tenere in considerazione gli aspetti critici e le difficoltà applicative
- ○ Promuovere una sinergica interazione tra lavoro clinico e ricerca

3. In ciascuna fase della progettazione:

- ○ Il ricercatore non dovrebbe porsi interrogativi importanti che tengano conto anche degli elementi critici dal punto di vista concettuale e pratico
- ○ Il ricercatore dovrebbe porsi interrogativi importanti che tengano conto anche degli elementi critici dal punto di vista concettuale e pratico
- ○ Bisogna sempre analizzare i dati
- ○ Non è necessario pianificare le tempistiche

Buone pratiche nella TIC

VIEW UNIT IN STUDIO

Bookmark this page

Visti i grandi rischi per la salute fisica e psicologica dovuti all'impatto di eventi traumatici (Adverse Childhood Experiences, ACEs), nel corso degli anni sono stati sviluppati molti interventi volti ad aiutare istituzioni e operatori che assistono persone con storie di trauma al fine di sottolineare il vantaggio dell'adottare un approccio improntato alla TIC (Baker et al., 2016). In particolare, un "approccio TIC guarda una persona in modo olistico, non solo come una lista di problemi che sta vivendo" (Hepburn, 2017, p. 7). Come indicato da molti autori (Bryson et al., 2017; Bridgett, Valentino & Hayden, 2012; Ellis & Boyce, 2011; Perry, 2002; Rothbart, Ziaie, O'Boyle, 1992), un effetto protettivo (effetto tampone) è giocato da una buona cura e relazioni di supporto esercitate da caregivers attenti e proattivi: la sicurezza relazionale riduce gli effetti nocivi del trauma nei bambini. Lo stress traumatico è una condizione comune nel caso dell'ACE e spesso causa manifestazioni cliniche significative (internalizzazione e / o sintomi esternalizzanti) frequentemente riscontrabili in ospedale o nell'ambito delle strutture residenziali dedicate ad adulti e minori (Bryson et al., 2017; Greenwald et al, 2012; Hummer, Dollard, Robst, 2010; Ko et al., 2008). Citando quanto indicato da Elliott e colleghi (2005), i quali hanno affermato che "I servizi informati sul trauma sono quelli in cui l'erogazione del servizio è influenzata dalla comprensione dell'impatto della violenza interpersonale e della vittimizzazione sulla vita e sullo sviluppo di un individuo" (p. 462) e che "Molte procedure e pratiche comuni nelle impostazioni del servizio riattivano le reazioni traumatiche e sono vissute come emozioni non sicure e fonte di debolezza per i sopravvissuti al trauma" (p.446), è possibile ulteriormente sottolineare che le buone pratiche (good practices) dovrebbero essere valutate in base a criteri specifici che sono identificati e dettagliati nella letteratura scientifica e che includono un'attenta valorizzazione dei complessi fattori coinvolti nelle storie traumatiche e nella condizione da esse esitante. Infatti, nelle situazioni in cui il servizio o l'organizzazione si occupi di soggetti che hanno subito traumi, è raccomandata una prospettiva in cui la salute pubblica e l'assistenza sociale siano orientate alla prevenzione e alla riduzione del rischio (Bryson et al., 2017). In questo campo promuovere approcci trauma-informed è una questione centrale: la trauma-informed care (TIC) e la pratica informata sul trauma (TIP) sono paradigmi di trattamento d'elezione perché mirano a trasformare interi sistemi di cura includendo una comprensione dello stress in risposta al trauma in tutti gli aspetti del servizio e concentrandosi sulla priorità della sicurezza e della possibilità di scelta. Inoltre, questa filosofia mira a creare una cultura del trattamento incentrata sulla non violenza, sull'apprendimento e sulla collaborazione in cui l'attenzione è dedicata a tutte le interazioni ambientali e interpersonali (Bryson et al., 2017). Nella revisione sistematica della letteratura, Bryson e colleghi (2017) hanno incluso alcune importanti risultanze:

- "la riduzione della coercizione fisica nelle cure psichiatriche di routine e residenziali" (p. 11) è sottolineata come la riduzione/eliminazione dell'isolamento o delle strategie controllo e coercizione;

- un aspetto fondamentale del TIC è "l'importanza fondamentale dei leader senior che diano priorità alla TIC [...] specialmente quando allo staff è richiesto di adeguarsi a nuovi modi di lavorare" (p. 11)

- i ricercatori sottolineano la necessità di sostenere il personale attraverso una formazione avanzata - in particolare sulle sequele del trauma - la supervisione continua, il coaching e il debriefing

- in questo, è fondamentale ascoltare i pazienti e le famiglie, con particolare attenzione alle loro esperienze, bisogni, priorità per quanto riguarda il processo di trattamento

- l'importanza attribuita all'area di aggiornamento costante dei dati di ricerca e l'analisi degli indicatori di esito sono dimensioni trasversali finalizzate a motivare e informare le prestazioni dei servizi e il miglioramento dell'efficacia

- la letteratura tratta ampiamente "la necessità di allineare la politica e la pratica, formale e informale, con i principi generali della pratica informata sui traumi" (p. 11).

Nonostante la sua sempre più frequente applicazione, la ricerca scientifica sull'efficacia di questo tipo di approccio è ancora carente (Bryson et al., 2017); come sottolineato da Valenkamp, Delaney e Verheij (2014) e da Chandler (2008), si può osservare una mancanza di studi randomizzati e controllati che testino gli interventi ed esplorino i fattori critici implicati nell'attuazione dei trattamenti orientati al TIC. In merito a quanto attualmente indicato a livello internazionale, studi empirici hanno dimostrato quanto sia rilevante la formazione nel fornire al personale un linguaggio comune da utilizzare per quanto riguarda l'esperienza del paziente e particolari interventi da utilizzare con i pazienti affetti da trauma (Bryson et al., 2017). La centralità di questa questione è stata ben evidenziata precedentemente anche da Le Bel, Huckshorn e Caldwell (2008) e da Brown, Baker e Wilcox (2012). Inoltre, una formazione specifica sulle migliori pratiche e la partecipazione dei pazienti alle attività di formazione del personale (ad esempio attraverso il riferire sulle loro esperienze) si sono rivelate utili (Holstead, Lamond, Dalton, Horne & Crick, 2010), così come il coinvolgimento dei minori nel debriefing su aspetti o fasi critici nella fornitura dell'assistenza (Lebel et al., 2008), la condivisione dei dati e il costante monitoraggio delle prestazioni/dei processi (a livello individuale, collettivo e di unità) (Bryson et al., 2017). Un altro punto focale emergente della letteratura scientifica sulle strategie efficaci nell'ambito della TIC è la capacità delle organizzazioni di allineare le politiche e le pratiche ai principi della cura informata sul trauma (Bryson et al., 2017). Secondo questa visione, l'ambiente e la cultura delle organizzazioni sono strumenti terapeutici essi stessi ed entrambi danno un contributo nel costruire una "comunità terapeutica". Di particolare rilevanza sono: 1) l'attenzione a creare uno spazio di trattamento sicuro sia per i pazienti che per il personale e 2) l'inclusione dei principi TIC nelle dichiarazioni di missione e visione. Riassumendo, le principali strategie nel campo della TIC focalizzate da Bryson e colleghi (2017) sono allineate a quelle alla base dell'intervento di riduzione S/R (NASMHPD, National Association of State Mental Health Program Directors) ed entrambe sono presentate nella Tabella 1.

Core strategies in TIC

Bryson e collechi (2017)

- Inclusione nella comunità (Community inclusion)
- Impegno della leadership (Leadership commitment)
- Selezione del modello (Model selection)
- Trasformazione della forza lavoro (Workforce transformation)
- Orientamento al risultato (Outcome orientation)
- Assistenza condivisa (Shared maintenance)

NASMHPD

- Leadership orientata al cambiamento organizzativo (Leadership towards organizational change)
- Utilizzo dei dati per informare la pratica (Use of data to inform practice)
- Riduzione dell'uso di strumenti di segregazione e isolamento (Use of restraint and seclusion reduction tools)
- Sviluppo dello staff di lavoro (Workforce development)
- Migliorare il ruolo dell'utente nel setting ospedaliero (Improve consumer's role in inpatient setting)
- Tecniche di debriefing attive (Vigorous debriefing techniques)

Inoltre, in uno studio di Azeem e colleghi (2011), questi elementi strategici sono stati testati longitudinalmente per analizzare la riduzione dell'uso della contenzione e dell'isolamento. In particolare, gli autori hanno sottolineato che:

✓ la leadership gioca un ruolo fondamentale nel portare il cambiamento della cultura in particolare quando una visione orientata alla TIC è condivisa con tutto lo staff

✓ la raccolta e la condivisione dei dati ha "un ruolo fondamentale nei progetti di miglioramento delle prestazioni" (p. 12) e nei processi di monitoraggio

✓ il training e la formazione continua del personale sui principi dell'assistenza orientata alla recovery, dell'assistenza centrata sulla persona e della TIC con le relative valutazioni delle prestazioni si sono state rivelate aventi effetti rilevanti in senso positivo

✓ un importante focus deve essere dedicato ai principi della prevenzione primaria utilizzando piani di trattamento individuali che includono la storia del trauma e la comunicazione con le strategie del paziente, della famiglia e dello staff

✓ un buon principio per la pratica del TIC è il coinvolgimento del paziente e della famiglia

✓ attività di debriefing di supporto - in particolare per quanto riguarda gli aspetti emotivi e le modifiche necessarie nei piani di trattamento - quali interventi per mitigare l'impatto traumatizzazione e traumatizzazione sono stati implementati efficacemente.

Hanson e Lang (2016) e Johnson (2017), esaminando diversi approcci alla TIC, hanno identificato alcuni temi che potrebbero essere considerati importanti per esplorare gli approcci dei servizi per minori e hanno concluso che è possibile identificare 15 componenti fondamentali della TIC.

I componenti identificati sono stati organizzati in tre livelli (Hanson & Lang, 2016, p. 98):

1. sviluppo della forza lavoro (Workforce Development, WD):

- Formazione richiesta a tutto il personale in consapevolezza e conoscenza dell'impatto dell'abuso o del trauma

- Misurazione della competenza del personale in criteri definiti per dimostrare la conoscenza / pratica sul trauma

- Strategie / procedure per affrontare / ridurre lo stress connesso al trauma secondario tra il personale

- Conoscenze / abilità su come accedere e fare riferimento al le migliori pratiche evidence-based focalizzate sul trauma

2. servizi focalizzati sul trauma (Trauma Focused Services, TFS):

- Uso di misure standardizzate di screening / valutazione evidence-based per identificare la storia e i sintomi o i problemi correlati al trauma

- Inclusione della storia del trauma del bambino nella documentazione / nei file /nel piano di servizio sul caso

- Disponibilità di clinici qualificati per e addestrati in pratiche focalizzate sul trauma evidence-based

3. consegne organizzative (Organizational Delivery,ORG):

- Collaborazione, coordinamento dei servizi e condivisione delle informazioni tra i professionisti all'interno dell'agenzia connessi ai servizi trauma-informed

- Collaborazione, coordinamento dei servizi e condivisione delle informazioni tra i professionisti di altre agenzie legate ai servizi trauma-informed

- Procedure per ridurre il rischio di re-traumatizzazione dell'utente

- Procedure per il coinvolgimento degli utenti e input nella pianificazione del servizio e sviluppo di un sistema trauma-informed

- Fornitura di servizi basati sui punti di forza e promozione di uno sviluppo positivo

- Fornitura di un ambiente fisico positivo e sicuro

- Politiche scritte che includono e supportano esplicitamente i principi trauma-informed

- Presenza di una posizione di leadership definita o di una funzione lavorativa specificamente correlata alla TIC.

Elementi fondamentali delle buone pratiche

VIEW UNIT IN STUDIO

Bookmark this page

Analizzando letteratura e protocolli per la valutazione delle pratiche di TIC è quindi possibile concludere che le buone pratiche (potenzialmente trasferibili in differenti contesti) dovrebbero includere:

1) una formazione permanente di tutti i membri dello staff sul trauma e sui suoi correlati. Questa formazione non dovrebbe essere fornita solo a professionisti che lavorano direttamente a livello clinico con gli utenti, ma a tutti coloro che sono inclusi a vario titolo e con diverse funzioni nell'organizzazione

2) un costante aggiornamento dello staff interno sulle pratiche evidence-based (EBP) nella cura del trauma e un'attenzione sull'atteggiamento dei professionisti nei confronti degli EBP

3) collaborazione con esperti del settore al fine di aumentare la disponibilità di providers clinici addestrati

4) l'inclusione di procedure di screening standardizzate ed evidence-based nella pratica clinica e l'uso di misure / strumenti di valutazione specifici e validati per identificare gli eventi traumatici (ACEs)

5) un'attenzione condivisa dedicata alla storia degli utenti e alla sua associazione con sintomi o difficoltà correlati al trauma

6) in linea con il punto precedente, il riconoscimento della specificità della storia di vita di ciascun utente garantita attraverso un ascolto attivo ed empatico da parte di tutto il personale

7) l'inclusione e un'attenta condivisione della storia del trauma dei bambini nella pianificazione dell'intervento o nella concettualizzazione dei casi

8) una valutazione approfondita e un monitoraggio costante delle competenze dello staff (utilizzo di procedure specificatamente progettate)

9) monitoraggio approfondito per mantenere gli standard stabiliti per un buon servizio TIC e, possibilmente, per migliorare gli elementi deficitari

10) l'implementazione di procedure per ridurre lo stress da traumatizzazione secondaria e aumentare il benessere del personale

11) la costruzione e il mantenimento di una buona rete di collaborazione non solo all'interno dei servizi, ma anche con altre agenzie operanti sul campo

12) l'attenzione alla centralità della dimensione comunicativa: l'obiettivo di più alto livello dovrebbe essere quello di avere professionisti attenti e collaborativi nel perseguire obiettivi e nell'applicare procedure condivise e co-costruite

13) l'attenzione alle procedure per ridurre il rischio di ri-traumatizzazione per gli utenti

14) incoraggiare la partecipazione dei pazienti alla progettazione del piano di trattamento

15) per coinvolgere gli utenti nella pianificazione del servizio: attenzione al loro feedback e suggerimenti per migliorare l'organizzazione e i servizi offerti

16) una particolare attenzione al fornire servizi basati sui punti di forza, volti a promuovere fattori per uno sviluppo positivo (ad esempio, resilienza, empowerment)

17) formazione sulle strategie per organizzare un ambiente positivo per gli utenti e per il personale

18) particolare attenzione alle dimensioni fisiche e strutturali del servizio

19) adesione e promozione dei principi della TIC con politiche specifiche e chiare

20) un ruolo centrale assegnato alla dimensione della leadership e alle sue funzioni nell'organizzazione del servizio.

Elementi critici e sfide

VIEW UNIT IN STUDIO

Bookmark this page

L'uso di pratiche evidence-based - sebbene sia un argomento particolarmente sottolineato nelle raccomandazioni per l'implementazione delle best practices - è ancora oggi un elemento di resistenza da parte di alcuni professionisti, organizzazioni e ricercatori (Gray, Elhai, Schmidt, 2007): questo dovrebbe essere oggetto di analisi, discussione e attenzione da parte delle organizzazioni che si occupano dell'intervento clinico sul trauma, anche ai fini di creare una definizione cooperativa di standard.

Infatti, sebbene l'approccio TIC stia assumendo un ruolo importante nell'organizzazione dei servizi e nella fornitura di assistenza per le persone traumatizzate al momento, ci sono ancora alcuni ostacoli nella sua applicazione e, ancor prima, nella sua concettualizzazione (Baker, 2016). In particolare si riscontrano carenze in merito a:

una definizione operativa chiara

la presenza di strumenti validati psicometricamente per valutare le dimensioni della TIC.

Per colmare questa lacuna, Baker e colleghi (2016), ad esempio, hanno costruito e validato uno strumento –Attitudes Related to Trauma-Informed Care (ARTIC) Scale - per valutare le attitudini relative alla TIC del personale che lavora in diverse aree di intervento o contesti che si occupano di individui con storie traumatiche. Precedentemente, Fallot e Harris (2009) - nella loro pubblicazione Creating cultures of trauma-informed care (CCTIC): a self-assessment and planning protocol - hanno strutturato un protocollo di autovalutazione e pianificazione (Self-Assessment and Planning Protocol) che comprende sei domini che si implicano modifiche sia a livello di servizi, sia a livello amministrativo o di sistema. L'attenzione alla complessità della situazione applicativa della TIC si costituisce sempre più salientemente come obiettivo sfidante – in un'ottica propulsiva - sia per i singoli operatori, sia per i servizi socio-sanitari nella loro quotidiana interazione e nel loro rapporto con la comunità scientifica di riferimento.

Siamo a Roma a intervistare i ragazzi tra i 18 e i 22 anni

Che cos'è la TARI?

Chi è?

Ah, sui risparmi

Un concetto sempre riguardo l'economia

La TARI è una cosa, una parte politica

Sì, regolare

Che è la TARI?

La TARI? È una tassa?

Devi trovare casa: come fai?

Come fai? Come ti muovi?

Con i mezzi

L’ha trovata Giulia

Con l’agenzia immobiliare

Io vivo a casa, con mamma a casa che mi aspetta

tutte le sere

Che tipo di contratto fai?

Cioè, io pago solo, cioè io devo pagare...

Contratti, ok, indeterminati, contratti a

lungo termine

Cioè, ho iniziato adesso Giurisprudenza,

però cioè, ho iniziato adesso! Quindi...

Si fa il 4..?

4 Mesi?

Più 5

Spesi in affitto sono soldi buttati

Tipo l’acqua e la corrente sono compresi nel prezzo

4?

Il conto corrente

Cioè, è più facile un’interrogazione di latino

Mah, non saprei

Dove si depositano i..

Se vuole possiamo parlare di Seneca

Quando hai qualche problema, tu chi chiami?

Giulia

Papà

A Seneca che è morto.. e quindi a mamma e

papà per ora

Ci sono alcune domande a cui è difficile rispondere, però alcuni ragazzi a 18 anni

e un giorno le dovranno affrontare da soli

Care Leavers

Non so cosa sia

I fabbisogni della salute?

Chi sono?

Giocatori del Liverpool

Non so cosa sia, mai sentito

Non ho capito la domanda?

I clerici

Sono dei ragazzi che, arrivati a 18 anni,

che vivono in una Casa Famiglia, devono lasciare la Casa Famiglia e trovare una sistemazione autonoma

Grande!

Che gli possiamo dire a questi ragazzi su?!

Che..un augurio.. che gli vogliamo dire?!

La TIC, in quanto modello che si propone di strutturare l'offerta dei servizi, è implementato in un ampio e variegato range contestuale; Bowen e Murshid (2016) sottolineano come tale paradigma possa essere applicato in egual misura, nei suoi principi fondanti (sicurezza, affidabilità e trasparenza, collaborazione, empowerment, scelta e intersezionalità) alle politiche sociali. Questo, secondo la proposta degli autori, poiché la TIC offre ai professionisti operanti nel campo della salute mentale (specialmente nel settore pubblico) un percorso finalizzato a interrompere le disparità attraverso l'azione clinico-organizzativa che, per la sua dimensione anche etica e deontologica, può assurgere altresì a una più ampia dimensione politica. Già Reeves (2015) aveva messo in luce come l'implementazione diffusa di modelli di cura TIC-oriented possa porre al centro dell'intervento la risposta ai bisogni unici e peculiari dei soggetti presi in carico dai servizi riabilitativi, attenuando le disparità assistenziali sperimentate da questa popolazione in condizione di vulnerabilità.

Recentemente Levy-Carrick e colleghi (2019) hanno sottolineato la disparità di trattamento nell'ambito del trauma come un tema critico nell'organizzazione nazionale dei servizi sanitari a cui l'adozione della TIC può porre – se non totalmente almeno ampiamente - rimedio. Infatti, un punto centrale sottolineato dagli autori è che l'applicazione efficace di questo paradigma sarebbe garantita dalla piena partecipazione delle figure assistenziali alla pianificazione e implementazione delle attività ad ogni step. Infatti, anche De Chesnay e Anderson (2019), nel loro libro "Caring for the vulnerable: Perspectives in nursing theory, practice, and research", hanno evidenziato che la salute mentale ha una precipua natura politica e partecipativa (in particolare da parte dell'utenza). In linea con ciò, l'Organizzazione Mondiale della Sanità ha spesso sollecitato la politica al fine di creare uno spazio collaborativo in cui operatori e gruppi in difesa dei diritti dei fruitori dei servizi di salute mentale (advocacy groups) nonché l'ampia gamma di stakeholders possano impegnarsi nella direzione di una sinergia attenta alle mutue esigenze.

Inoltre, come accade in alcune circostanze, è importante il contributo politico nella decisione di finanziare studi volti ad analizzare e promuovere pratiche evidence-based, nel creare e diffondere standards condivisi e nel definire la razio organizzativa e gli obiettivi comunitari delle organizzazioni e delle istituzioni coinvolte nell'offerta di modelli di cura (Ko et al., 2008; Bateman & Anderson, 2013; Levy-Carrick et al., 2019).

Quanto detto finora riguarda la dimensione generale della politica sanitaria, ma riguarda anche quella locale in risposta a specifiche esigenze territoriali e, ancor più nello specifico, le politiche delle singole organizzazioni o servizi. Infatti, la letteratura che si occupa di TIC suggerisce che, "per attuare l'assistenza informata sul trauma, c'è bisogno di preparazione, valutazione e cambiamento organizzativo (Harris & Fallot, 2001, Rivard, Bloom, McCorkle, & Abramovitz, 2005) [...] L'implementazione di pratiche informate sul trauma è quindi basata sull'utilizzo di dati organizzativi individualizzati per informare la pianificazione e l'implementazione" (Hummer et al., 2010, p. 82). La capacità di supportare le politiche con i dati ricavati da efficaci impianti di ricerca è indubbiamente un elemento strategico prioritario e auspicabile (Levy-Carrick et al., 2019). Ad esempio, a livello di strumenti utili nell'analizzare quanto le policies organizzative siano orientate ai principi della TIC, il protocollo CCTIC elaborato da Fallot and Harris (2009) potrebbe essere particolarmente interessante nella misura in cui enuclea domini e sottodomini coinvolti nella valutazione di servizi e iniziative organizzative nell'ambito della cura del trauma.

In conclusione, quindi, adottare una prospettiva orientata alla TIC implica una sensibilità a quanto sottolineato da Levy-Carrick e colleghi (2019): "Aiutare i nostri pazienti e noi stessi richiederà un cambiamento critico di prospettiva che deve essere introdotto all'inizio della formazione, rafforzato in tutto, modellato dai suoi professionisti più anziani e promosso dalle generazioni future" (p. 107).

Q4.2

3 points possible (graded)

1. L'approccio TIC:

- ○ Considera esclusivamente la dimensione psicologica di una persona
- ○ Considera esclusivamente la dimensione fisica di una persona
- ○ Considera esclusivamente la dimensione sociale di una persona
- ○ Promuove una presa in carico olistica della persona

2. Un intervento, per tenere in considerazione le best practices, dovrebbe:

- ○ Promuovere una valutazione approfondita e un monitoraggio costante delle competenze dello staff (utilizzo di procedure specificatamente progettate)
- ○ Evitare di porre attenzione alla storia degli utenti e alla sua associazione con sintomi o difficoltà correlati al trauma
- ○ Evitare di includere procedure di screening standardizzate ed evidence-based nella pratica clinica
- ○ Assicurarsi che lo staff interno continui sempre a eseguire le procedure su cui è stato formato inizialmente

3. Una buona proposta di ricerca...

- ○ Mantiene i suoi obiettivi più generali possibili
- ○ Formula le ipotesi di ricerca sempre dopo la raccolta dei dati
- ○ Effettua una analisi della fattibilità e definisce una timeline
- ○ Prevede sempre un campione stratificato

Nel 1969, la psicologa americana Mary Ainsworth ha consegnato alla psicologia dello sviluppo una nuova procedura per lo studio dell'attaccamento nei bambini.

L'ha chiamata la "classificazione Strange Situation" e viene chiamata più semplicemente "la Strange Situation". Da adulto, sai quando hai sviluppato un attaccamento verso qualcuno. Sai come ci si sente, E sai come esprimere i tuoi sentimenti in parole. Tuttavia, quando si tratta di neonati e bambini, essi non hanno ancora sviluppato queste abilità, e dunque i ricercatori devono affidarsi a tecniche più sottili.

Come la strange situation, che misura la sicurezza di un attaccamento in bambini da uno a due anni. Una osservazione partecipatoria di 20 minuti durante la quale il ricercatore osserva le risposte comportamentali del bambino ad una serie di scenari.

La Strange Situation di Ainsworth include otto fasi, ognuna della durata di circa tre minuti

All’inizio, la madre, il bambino ed il ricercatore sono tutti insieme nella stanza,

Uno spazio piccolo e dai colori neutri con qualche giocattolo per far giocare il bambino.

Lo sperimentatore esce dopo circa un minuto e la madre ed il bambino rimangono soli per circa

tre minuti. In questa fase

i ricercatori stanno osservando per vedere se il bambino è abbastanza sicuro di sè da esplorare il nuovo ambiente

o se resta vicino alla madre. Uno sconosciuto si unisce al bambino e alla madre all’interno

stanza. I ricercatori registrano la risposta del bambino a questo insolito nuovo arrivato,

che viene lasciato da solo con il bambino quando la madre lascia la stanza.

In questa fase, i ricercatori stanno osservando il comportamento del bambino cercando segni di ansia da separazione.

Tre minuti dopo, la madre ritorna, ed

i ricercatori osservano la risposta di riunione del bambino. Lo sconosciuto lascia la stanza.

Ancora qualche minuto ed anche la madre lascia la stanza - lasciando il bambino da solo

per la prima volta da quando è iniziato l’esperimento. La persona successiva ad entrare nella stanza è lo sconosciuto,

e infine, dopo tre minuti, la madre ritorna e

lo sconosciuto esce, tutto sommato una situazione perfettamente strana per tutti i coinvolti.

Quindi, cosa stavano misurando i ricercatori? Quando la madre era nella stanza con il bambino,

hanno valutato il comportamento del bambino su quattro scale:

"Vicinanza e ricerca del contatto". "Mantenimento del contatto".

"Evitamento della vicinanza e del contatto" e "Resistenza al contatto e alla consolazione".

I comportamenti esploratori del bambino sono anche stati registrati mentre esplorava l’ambiente.

Ainsworth ha riferito che i bambini mostrano uno di tre tipi di attaccamento:

I bambini con attaccamento sicuro mostravano angoscia quando separati dalla loro madre, evitavano

lo sconosciuto quando erano soli, ma erano amichevoli in presenza della madre

ed erano felici quando la madre tornava dall’esterno della stanza.

Il 70% dei bambini studiati rientrava in questa categoria. Il 15% dei bambini mostrava un attaccamento ambivalente

con la loro madre. Questi bambini mostravano una forte angoscia quando

la madre usciva dalla stanza e dimostravano una importante paura dello sconosciuto.

Quando la madre tornava nella stanza, i bambini ambivalenti si avvicinavano alla madre

ma rifiutavano il contatto. Ainsworth ha riferito che un 15% finale

aveva uno stile di attaccamento evitante. Questi bambini non mostrano ansia quando la madre lascia la stanza e giocano felicemente con lo sconosciuto.

Quando la madre torna, i bambini evitanti sembrano a malapena accorgersene.

Nel 1990, Maine e Solomon hanno aggiunto che una percentuale molto piccola di bambini si mostrava inconsistente nel comportamento e hanno definito questo stile di attaccamento come "disorganizzato".

La “ipotesi della sensibilità del caregiver” di Ainsworth suggerisce che le diversità negli stili di attaccamento dipendano dal comportamento della madre verso il bambino durante un periodo critico dello sviluppo.

I clinici e i ricercatori sono costantemente alla ricerca della conoscenza su un particolare fenomeno, in modo più o meno sistematico. Tale desiderio di conoscenza nasce per interesse o per curiosità, da uno sguardo attento, attraverso l'occhio nudo o con l'aiuto di strumenti; utilizzando una sola parola, attraverso l' "osservazione".

Mantovani (1995) infatti definisce l'osservazione come: «[...] una forma di rilevazione finalizzata all'esplorazione di un determinato fenomeno» (p. 84).

L'osservazione è un'attività complessa e impegnativa che richiede:

- tempo;
- libertà intellettuale;
- assenza di pregiudizi e preconcetti,
- consapevolezza di sé;
- capacità di non coinvolgersi;
- capacità di sospendere;
- il giudizio

Nei contesti clinici e di ricerca l'osservazione acquisisce un'importanza rilevante, trasformandosi da metodo semplice e poco scientifico, a metodo flessibile, strutturato e affidabile (Venuti, 2001). Con il progredire degli studi sui bambini, per esempio, si è abbandonato l'utilizzo delle "biografie infantili", per dare spazio all'osservazione sistematica e alla sperimentazione (Bornstein, 2001). Infatti, con il tempo le osservazioni di tipo naturalistico hanno lasciato spazio alle osservazioni standardizzate (Bornstein, 2001).

Si potrebbe affermare, con le parole di Venuti (2001), che l'osservazione "[...] fa da ponte tra un modello esplicativo di riferimento e un successivo processo di analisi e di interpretazione dei dati" (p. 58). Per osservare, quindi, non basta più guardare un gruppo di bambini che interagiscono o videoregistrare i comportamenti tra madre e bambino; in quanto l'osservazione deve fare sempre riferimento ad un modello teorico ed esplicativo, che guiderà il ricercatore a formulare ipotesi e ad analizzare i dati (Venuti, 2001). Cosa osservare, come, dove e quando farlo, dipenderanno dallo scopo della ricerca e dall'approccio teorico di riferimento.

Esistono diversi tipi di osservazione:

- osservazione psicoanalitica, che ha come modello teorico la psicoanalisi;
- osservazione piagetiana, che ha come modello teorico la psicologia dello sviluppo;
- osservazione etologica, che ha come modello teorico l'etologia.

L'osservazione piagetiana è un tipo di osservazione quasi sperimentale, pone le sue basi sugli approcci teorici interazionista, strutturalista, cognitivista e approfondisce lo studio del percorso della vita mentale nel corso dello sviluppo (Vigna, 2002). Non si limita alla registrazione di tutto ciò che il bambino fa, ma è guidata da alcune ipotesi che costituiscono la base della teoria piagetiana. L'osservatore cerca di stabilire un'interazione con l'osservato in un contesto naturale (Petter, 1984; Vigna, 2002). I principi di base di questa osservazione sono due:

1. L'osservatore si adegua allo stadio di sviluppo del bambino e interagendo, modifica le condizioni stesse dell'osservazione;
2. L'osservatore riproduce ripetutamente una stessa situazione di gioco durante un'osservazione per valutare se la reazione del bambino si ripete in presenza di uno stesso stimolo e non è attribuibile a casualità.

I principali contesti applicativi di questo tipo di osservazione sono l'asilo nido e la scuola materna.

L'approccio etologico invece si ispira alla teoria dell'evoluzione di Darwin e al lavoro dell'etologo Lorenz. L'osservazione si definisce etologica quando l'osservatore non influenza in alcun modo il comportamento che è interessato a studiare e annulla il più possibile la propria soggettività. Di norma questa tecnica si applica nell'ambiente naturale in cui un determinato comportamento si manifesta spontaneamente. È possibile, però, utilizzare come ambiente il laboratorio, purché lo si attrezzi in modo da riprodurre un ambiente familiare per il bambino (ad es. una stanza da gioco).

È utile nell'indagine sui primi anni di vita, in cui il linguaggio verbale è ancora assente o

povero, per due ragioni:

1. è più facile definire qual è l'ambiente naturale di vita dei bambini piccoli;
2. i bambini piccoli non sempre si rendono conto di essere osservati e, comunque, non reagiscono modificando il proprio comportamento.

Questo tipo di osservazione mira all'esclusione della soggettività e al raggiungimento dell'obiettività che da sola consente di trarre conclusioni non fuorvianti (Lis & Venuti, 1986). In questo tipo di osservazione sono utilizzate delle procedure che consentono la registrazione e la catalogazione obiettiva e sistematica dei comportamenti, per poterli interpretare successivamente alla luce delle ipotesi iniziali. Tra i punti di forza dell'osservazione etologica emergono:

- un incremento di studi descrittivi del comportamento infantile;
- un'attribuzione di importanza alle ricerche longitudinali, considerate le più idonee a cogliere il processo di cambiamento e il suo significato evolutivo.

Tuttavia, l'enfasi sulla descrizione obiettiva può far dimenticare che quando si osserva è inevitabile operare delle scelte. Inoltre, l'importanza di rilevare micro-comportamenti, descrivibili in modo oggettivo, non può far perdere di vista il significato che un certo comportamento assume in un particolare momento e contesto.

L'osservazione psicoanalitica invece è un tipo di osservazione diretta, cioè di un metodo che non si avvale di alcun strumento al di fuori dell'osservatore stesso. Secondo il modello psicoanalitico non esistono fenomeni previsti in base a una teoria, "l'inatteso" (Bion ,1962) diventa rilevante. L'osservazione in questo caso ha la funzione principale di creare uno spazio dove l'inatteso possa esprimersi. Questo quadro non comporta nessuna intenzionalità da parte dell'osservatore per permettere di cogliere l'intenzionalità conscia e inconscia della persona osservata. Gli ambiti di applicazione sono:

- ricerca psicologica;
- clinica;
- formazione degli psicoterapeuti infantili e degli analisti.

L'osservatore è parte integrante della situazione e osserva sia i comportamenti che le verbalizzazioni, sia gli stati d'animo che le emozioni. Inoltre deve valutare con attenzione i propri stati psicologici come fonte d'informazione sul soggetto osservato, utilizzando la propria somiglianza per differenziare quest'ultimo da sé e accettando la propria presenza.

Infine si può osservare l'intero nucleo familiare attraverso compiti strutturati nel contesto clinico oppure nel proprio ambiente naturale. Questo tipo di osservazione può associarsi al colloquio con la famiglia ed ha l'intento di cogliere come i membri del nucleo interagiscono fra di loro e le comunicazioni a livello verbale e preverbale (forme di intersoggettività implicita).

In definitiva, l'osservazione è uno dei cardini fondanti la professionalità di chi opera in campo educativo e formativo, contribuisce a costituire un "atteggiamento di fondo" che diventa parte integrante del modo di agire professionale, quale elemento basilare della competenza educativa. Non è un semplice strumento, ma un insieme di atteggiamenti, metodologie, strumenti. Questi ultimi possono essere strutturati (videoregistrazione, griglie, checklist ecc.) o non strutturati (ad es. diario di bordo). L'osservatore dovrà quindi formarsi attraverso una fase di training, acquisire competenze e conoscenze specifiche per essere in grado di utilizzare questi strumenti e per rilevare il fenomeno che intende studiare (Venuti, 2001). I dati che si ricavano dall'osservazione possono essere sia qualitativi che quantitativi. Quelli qualitativi hanno una struttura narrativa (Hilliard, 1993), mentre quelli quantitativi si prestano a diverse misurazioni e analisi (per es. misurazione di frequenza e di durata, analisi sequenziali ecc).

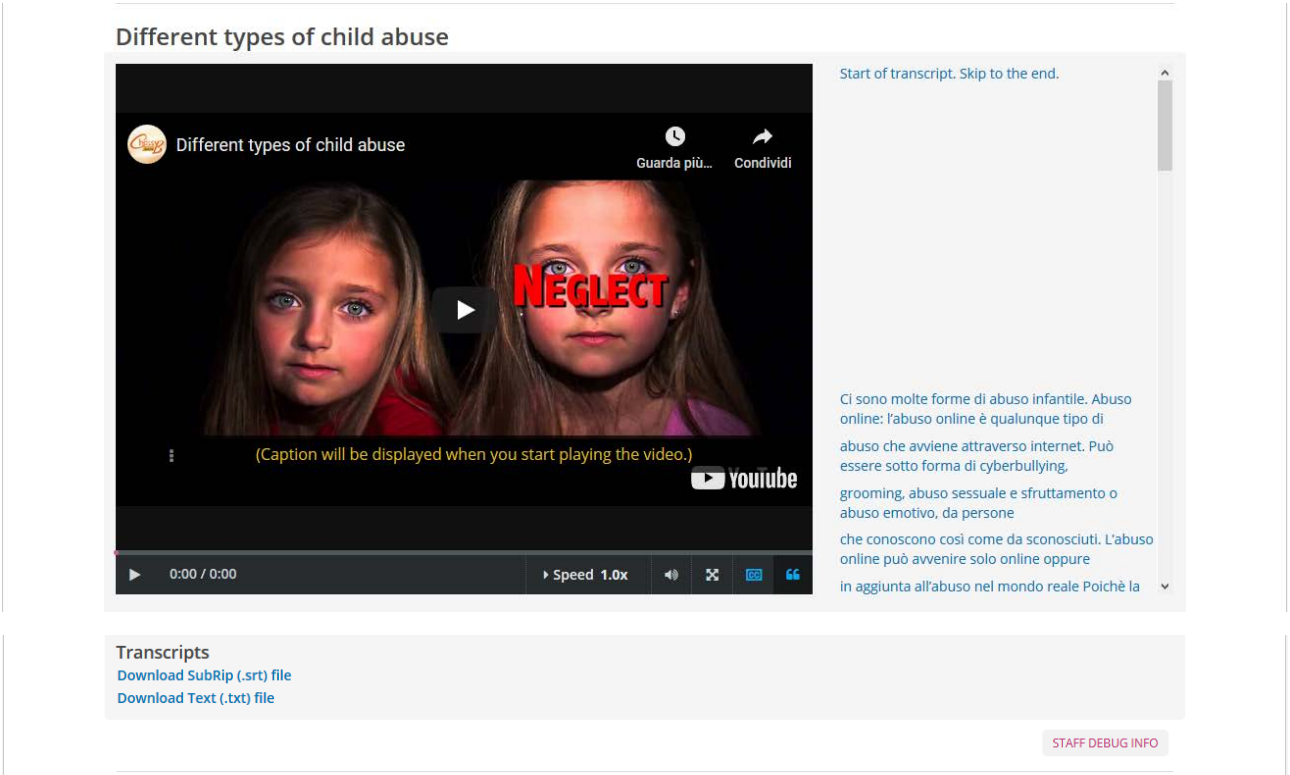
Schimmenti (2018) sottolinea come il trauma costituisca una lacerazione profonda per l'individuo che può impattare sui suoi processi psicologici condizionandone, a molteplici livelli, il funzionamento; in particolare esso comporta conseguenze relativamente al concetto di sé, alle modalità relazionali e al sistema di credenze. Inoltre, l'autore sottolinea che gli studi scientifici hanno messo in luce come spesso gli eventi che possono essere definiti traumatici siano interrelati tra loro e che l'esposizione a molteplici esperienze traumatiche aumenta il rischio di sviluppare una psicopatologia (trauma cumulativo), specialmente nel caso in cui questo sia avvenuto durante l'infanzia e, in particolar modo, nel contesto delle relazioni familiari. Anche Curran e colleghi (2018) mettono in evidenza questo aspetto nella letteratura scientifica, sottolineando come questo comporti:

1. per i soggetti in età infantile che sono stati vittime di molteplici esperienze traumatiche, un incremento nel rischio di esperire depressione e senso di impotenza (Arata et al., 2007) ;
2. a livello longitudinale in età adulta per i soggetti con storie di abuso fisico e psicologico, un decremento dell'autostima e delle capacità di coping rispetto alle emozioni (in particolar modo rabbia e aggressività), aumento di comportamenti sessuali devianti e di difficoltà di adattamento psico-sociale (Sesar et al., 2010);
3. per le vittime di abuso sessuale o fisico un maggiore rischio di avere difficoltà psicosociali e comportamenti asociali o antisociali, sintomi fisici cronici, disturbi ansiosi o depressivi, sintomatologie legate al trauma e alla dissociazione (Higgins e McCabe, 2000).
4. Inoltre, in adolescenza, la ricerca scientifica evidenzia anche un incrementato rischio di sviluppo di comportamenti delinquenziali, di abuso di sostanze e di ricorso a condotte anticonservative, specie nei soggetti con PTSD o storie di poli-vittimizzazione.

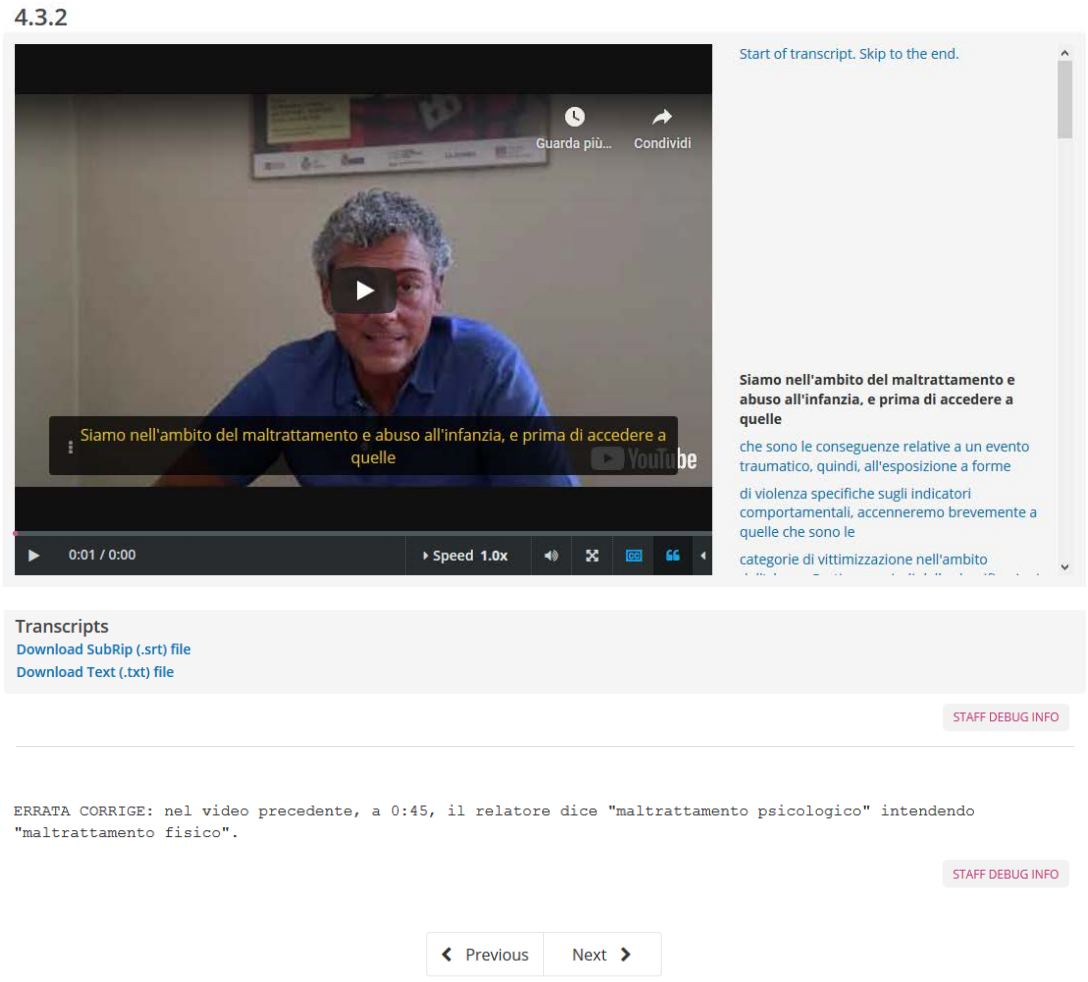
In generale, la ricerca suggerisce, da un punto di vista epidemiologico, la connessione tra trauma e gravità della menomazione; inoltre, se subito durante l'infanzia, esso può comportare gravi e invalidanti conseguenze sullo sviluppo delle capacità sia cognitive, sia emotive, sia sociali (Curran et al., 2018). Un aspetto che sembra particolarmente incidente sullo sviluppo e sugli esiti delle esperienze traumatiche nell'infanzia è la trascuratezza emotiva da parte delle figure di attaccamento – in particolare quelle aventi funzioni genitoriali - per il bambino (emotional neglect) (Schimmenti, 2018). Un'adeguata comprensione dei meccanismi sottostanti alla variabilità individuale nella risposta psicologica al trauma è importante sia per identificare i bambini esposti a rischi di distress a lungo termine, sia per strutturare idonei ed efficaci interventi (Ozer et al., 2003; Alisic et al., 2011). In particolare, è importante sottolineare che i minori reagiscono al trauma con modalità differenti rispetto agli adulti anche in ragione del loro livello di sviluppo e delle loro capacità comprese quelle di gestione dei contenuti mnestici e delle risposte emotive agli accadimenti. Già Lonigan e colleghi (1998) avevano sottolineato l'esigenza che la ricerca scientifica si concentrasse sull'analisi delle reazioni infantili al trauma e dei fattori ad esso associati. Una delle questioni da essi sollevate era la necessità di approfondimento degli indicatori – specificamente validi e affidabili per la popolazione infantile e non semplicemente mutuati dalle condizioni riscontrate in soggetti adulti - in merito alle reazioni normali versus psicopatologiche dei bambini agli eventi avversi. Un'interessante area di indagine è, infatti, quella riguardante la distinzione fra le reazioni tipiche al trauma e quelle condizioni in cui è possibile riscontrare una risposta psicopatologica con un focus particolare a quali sintomi consentano una visione differenziale tra le due condizioni e un miglioramento delle possibilità di efficace assessment da parte dei clinici (Lonigan et al., 1998). La letteratura offre molte informazioni sugli indicatori di maltrattamento e abuso, sottolineando che si tratta di segnali spesso aspecifici che vanno letti con attenzione e prudenza, poiché non sempre indicano esclusivamente la dimensione del maltrattamento. Occorre infatti che gli operatori migliorino sempre di più le loro capacità di cogliere la sofferenza del bambino nei contesti in cui si trovano, offrendogli le adeguate condizioni affinché si possa sentire accolto ed aiutato ad esprimere le sue emozioni e le sue difficoltà. Insieme alle tecniche di osservazione gli operatori possono utilizzare delle griglie di indicatori per approfondire il più possibile il problema. A titolo di esempio si allega il link al documento redatto dal CE.S.P.IM (Centro Servizi per il volontariato Provincia di Imperia) dal titolo "Il Silenzio dei Passerotti. Progetto per il contrasto ed il recupero del maltrattamento e abuso di bambini e bambine", in cui sono visionabili alcuni esempi di indicatori di maltrattamento e abuso



Transcript

Ci sono molte forme di abuso infantile. Abuso online: l'abuso online è qualunque tipo di abuso che avviene attraverso internet. Può essere sotto forma di cyberbullying, grooming, abuso sessuale e sfruttamento o abuso emotivo, da persone che conoscono così come da sconosciuti. L'abuso online può avvenire solo online oppure in aggiunta all'abuso nel mondo reale Poichè la tecnologia è ovunque, i bambini ed i giovani che soffrono per questa forma di abuso potrebbero sentirsi intrappolati e senza un posto in cui scappare, ovunque vadano, come la loro camera da letto, che dovrebbe essere un posto sicuro per loro. Grooming: il grooming è quando un adulto costruisce una connessione con un bambino allo scopo di abusarlo o sfruttarlo sessualmente. Questo può essere fatto online, o nel mondo reale, da uno sconosciuto o qualcuno che conoscono. Abuso sessuale: l'abuso sessuale è quando un bambino viene costretto o persuaso a partecipare in qualunque tipo di atto sessuale, e questo non deve essere necessariamente fisico. A volte il bambino potrebbe non essere cosciente del fatto che ciò che sta succedendo sia abuso o che ciò che sta succedendo è sbagliato. Abuso fisico: l'abuso fisico è fare deliberatamente del male ad un bambino, causando dunque danni come costole rotte, bruciature o tagli. Potrebbe essere calciato, preso a pugni, schiaffeggiato, avvelenato, bruciato, o potrebbero venirgli lanciati degli oggetti. I bambini possono essere scossi, a volte così violentemente che porta alla sua morte.

Neglect\Incuria: L’incuria è un fallimento continuo nel
soddisfare i bisogni più basilari di un bambino. I bambini lasciati affamati, non lavati o non adeguatamente vestiti, non protetti dalle intemperie o non supervisionati sono tutti esempi di bambini trascurati.
L’incuria può anche avvenire sotto forma di un genitore o badante che non protegge
un bambino da altri tipi di abuso. Bullismo:
il bullismo è un comportamento che ferisce qualcun altro, ad esempio gli insulti,
le spinte, la diffusione di pettegolezzi, le minacce o i sabotaggi. Questo può succedere ovunque,
anche nella loro stessa casa, e spesso lungo un periodo di tempo esteso.
L’abuso emotivo, anche conosciuto come abuso psicologico, quando un genitore o un badante
maltratta o trascura emotivamente un bambino in maniera costante, ad esempio
tentando deliberatamente di spaventare o umiliare un bambino oppure isolandolo o
ignorandolo. Comportamento sessuale dannoso: i bambini e le persone giovani che sviluppano un
comportamento sessuale dannoso danneggiano sè stessi e gli altri utilizzando
parole e frasi sessualmente esplicite, contatto inappropriato,
l’utilizzo di violenza sessuale e minacce oppure effettuando sesso penetrativo completo con altri
bambini o adulti. Lo sfruttamento sessuale infantile è un’altra forma di abuso
infantile. I bambini e i giovani che vengono sfruttati sessualmente sono persone vulnerabili
che vengono ingannate o manipolate nel credere di essere in una relazione amorevole, e sicura.
Potrebbe essere offerto loro del denaro o altre ricompense per poi farli finire
in schiavitù. Potrebbero essere stati adescati online e poi essere diventati completamente dipendenti dal
loro abusante, rendendo loro ancora più difficile andarsene.
Anche il traffico di bambini costituisce abuso infantile. I bambini possono essere venduti per manodopera a basso costo,
abuso sessuale, servitù domestica, frode per ottenere indennità e matrimonio forzato.



Transcript

Siamo nell'ambito del maltrattamento e abuso all'infanzia, e prima di accedere a quelle che sono le conseguenze relative a un evento traumatico, quindi, all'esposizione a forme di violenza specifiche sugli indicatori comportamentali, accenneremo brevemente a quelle che sono le categorie di vittimizzazione nell'ambito dell'abuso. Partiamo quindi dalle classificazioni internazionali relative al maltrattamento psicologico, definito anche "Emotional abuse" \ "Psychological abuse", abbiamo poi l'abuso fisico, e infine l'abuso sessuale.

Per maltrattamento psicologico, sono quelle esposizioni a forme di violenza caratterizzate proprio da un danno fisico a cui il bambino va incontro, quindi un evento traumatico molto molto forte perchè ha delle conseguenze sul processo di sviluppo, adesso vedremo a quali faccio riferimento. Per quanto riguarda l'esposizione invece a forme di violenza psicologica facciamo riferimento a insulti, a denigrazioni, a isolamento sociale del bambino, a una certa trascuratezza, e quindi sono quelle forme di violenza meno visibili ma che hanno un impatto psicologico, quindi un evento traumatico, a lungo termine.

Infine per quanto riguarda l'abuso sessuale facciamo riferimento a tutti quegli atti legati alla vittimizzazione, legati ad una esposizione fisica alla violenza, quindi ad un incesto, oppure sfioramenti, toccamenti vari da parte di chi si occupa del bambino in una situazione protetta. Ma vediamo quali sono le conseguenze relative all'abuso che può essere esercitato, delle forme di violenza a carico di un bambino. Vengono definiti in genere indicatori sia comportamentali sia emotivi. Le conseguenze a cui va incontro il bambino durante il suo percorso di sviluppo sono legate ad esempio a disturbi della percezione corporea, quindi della propria immagine corporea, proprio perchè non riesce a comprendere se il suo corpo è bambino o adulto perchè viene erotizzato fin dall'infanzia. Facciamo riferimento a ripetute difficoltà legate al sonno, quindi l'evento traumatico ha un impatto proprio sulla regolazione del ritmo sonno-veglia. Facciamo riferimento anche a disturbi dell'attenzione, e a difficoltà di concentrazione e di attenzione a livello scolastico. Se i bambini sono più piccoli quindi nella fascia 3-5 anni, sono presenti anche disturbi dell'evacuazione. In piena adolescenza facciamo riferimento invece ad altre manifestazioni di disagio che il bambino o il ragazzo esprime come ad esempio disturbi dell'alimentazione, inclusi anoressia e bulimia, atti di aggressività esplicita verso tutti i soggetti che tendono ad esprimere un comportamento di natura attenzionale verso il bambino, quindi il bambino si difende con l'aggressività esplicita. Infine atti di autolesivismo, proprio perchè c'è una sofferenza insita, interna al bambino per l'evento traumatico subito, che quindi reagisce con l'arrecare danno a se stesso oltre che naturalmente ad altri soggetti. Queste alcune delle conseguenze di esposizione ad eventi traumatici nell'infanzia, nella fanciullezza e nella adolescenza, ma sono molteplici quelle indagate dalla letteratura, abbiamo anche difficoltà di apprendimento, isolamento e comportamenti antisociali come uso e abuso di sostanze alcoliche e stupefacenti, comportamenti sessuali promiscui, esposizione a particolari malattie sessualmente trasmissibili. Quindi, questo ci fa comprendere quanto una normale traiettoria di un percorso di sviluppo non va a buon fine perchè chi si occupa del bambino e ha funzione di child care tende ad esprimere quelle forme di maltrattamento fisico accertate in precedenza, quindi legate al picchiare e infliggere volontariamente dolore al bambino, o di natura sessualizzata, quindi, l'erotizzare il corpo del bambino per degli sfoghi personali, o di natura psicologica come l'umiliare, isolare e denigrare il bambino, ha un evento di tipo traumatico sul bambino con le conseguenze che abbiamo appena indicato. Conseguenze che poi sono indicatori di natura

comportamentale ma anche emotiva che altro non esprimono che un disagio che il bambino sta vivendo in quello specifico momento e sul quale è necessario intervenire precocemente prima che le conseguenze diventino sempre più traumatiche ed insite nello sviluppo della personalità del soggetto, con conseguenze di natura, naturalmente, psicopatologica.

Q4.3

4 points possible (graded)

1. L'osservazione viene definita come (Mantovani, 1995):

- ○ Una forma di rilevazione finalizzata all'esplorazione di un determinato fenomeno
- ○ Un momento intermedio tra un fenomeno e la sua interpretazione
- ○ La descrizione di una specie all'interno di un catalogo
- ○ Un modo oggettivo e fedele di registrare la realtà

2. Durante l'osservazione, è importante:

- ○ Evitare a tutti i costi di essere coinvolti nell'interazione con l'oggetto dell'osservazione
- ○ Utilizzare sempre strumenti osservativi strutturati
- ○ La velocità di giudizio
- ○ Evitare di farsi influenzare da pregiudizi e preconcetti

3. In un minore, la presenza di indicatori e segni associati a maltrattamento e abuso...

- ○ Può essere dedotta attraverso l'osservazione di emozioni e comportamenti
- ○ Andrebbe considerata senza tener conto dei comportamenti
- ○ Corrisponde, in ogni caso, a situazioni di maltrattamento e abuso
- ○ Si traduce nella decadenza immediata della responsabilità genitoriale

4. Secondo Schimmenti (2018), le esperienze traumatiche...

- ○ Sono sempre facilmente superabili parlando con amici e familiari dell'evento
- ○ Aumentano la probabilità di sviluppare una psicopatologia, particolarmente quando il soggetto è sottoposto ad una esposizione multipla (trauma cumulativo)
- ○ Non provocano danni se si tratta di un singolo evento, grazie alla neuroplasticità
- ○ Andrebbero represse, cercando di non pensarci

L'obiettivo del modulo giuridico è quello di far comprendere il quadro normativo e i principi giuridici fondamentali, all'interno dei quali si inserisce il Trauma Informed Care.
Al termine del modulo, occorrerà imparare a utilizzare correttamente concetti come abuso, maltrattamento, pregiudizio, stato di abbandono.
Obiettivi formativi specifici di questo corso sono conoscere il processo culturale e giuridico che ha portato, a livello mondiale ed europeo, al riconoscimento che le persone di minore età sono soggetti di diritti e che esiste un obbligo per lo Stato di intervenire prontamente ed efficacemente per la loro protezione in caso di maltrattamenti.
Nel modulo giuridico, imparerete anche a conoscere i diritti e i principi fondamentali posti dal quadro normativo internazionale ed europeo vigente in materia di diritti dell'infanzia

e dell’adolescenza,
un quadro all’interno del quale si inserisce il Trauma Informed Care;
con particolare riguardo al diritto di bambini e ragazzi a essere informati ed
essere ascoltati nelle procedure in cui si decida della loro assistenza, delle loro cure
e del loro futuro, anche dopo la cessazione della presa in carico da parte dello Stato.
Nel modulo giuridico imparerete anche a conoscere e comprendere come funzionano i dispositivi
normativi che garantiscono la partecipazione dei minorenni, che abbiano subito maltrattamenti,
ai procedimenti decisionali, siano essi amministrativi o giudiziari, in cui si decida degli interventi
per la loro protezione;
quindi, il diritto ad esempio del minore, capace di discernimento,
di essere ascoltato e, in alcuni casi, il dovere di ottenere anche il consenso del ragazzo
per poter attivare lo strumento di protezione.
Infine, una parte del modulo sarà dedicata
alle ricadute operative sulle politiche sociali e sanitarie del children’s rights based approach
e questo avverrà sia attraverso una panoramica generale, sia attraverso alcuni
casi di studio; quindi, ad esempio, attraverso l’analisi delle politiche di contrasto attivate
contro le pratiche di mutilazione genitale femminile, o contro l’utilizzo delle punizioni
corporali in famiglia, o, ancora, attraverso l’analisi delle politiche che molti Paesi
hanno adottato per nominare un tutore come assistente o supporto ai minori stranieri
non accompagnati.

Glossario giuridico sul trauma all'infanzia

VIEW UNIT IN STUDIO

Bookmark this page

Il termine "trauma" non viene comunemente utilizzato nel linguaggio giuridico.

La Convenzione internazionale sui diritti dell'infanzia e dell'adolescenza (CRC) per esempio fa riferimento a "ogni forma di violenza, di oltraggio o di brutalità fisiche o mentali, di abbandono o di negligenza, di maltrattamenti o di sfruttamento, compresa la violenza sessuale" (articolo 19)

ABUSO e MALTRATTAMENTI:

Il Consiglio d'Europa definisce come **abuso all'infanzia (child abuse)**: «gli atti e le carenze che turbano gravemente il bambino, attentano alla sua integrità corporea, al suo sviluppo fisico, intellettivo e morale, le cui manifestazioni sono la trascuratezza e/o le lesioni di ordine fisico e/o psichico e/o sessuale da parte di un familiare o di altri che hanno cura del bambino» (IV Seminario Criminologico – Strasburgo, 1978)

L'Organizzazione mondiale della sanità afferma che: "per **abuso all'infanzia e maltrattamento (child abuse, maltreatment)** debbano intendersi tutte le forme di cattiva salute fisica e/o emozionale, abuso sessuale, trascuratezza o negligenza o sfruttamento commerciale o altro che comportano un pregiudizio reale o potenziale per la salute del bambino, per la sua sopravvivenza, per il suo sviluppo o per la sua dignità nell'ambito di una relazione caratterizzata da responsabilità, fiducia o potere " (Organizzazione Mondiale della Sanità, World Report on Violence and Health, 2002).

Sia gli abusi, sia i maltrattamenti possono concretizzarsi in:

- condotte attive (esempio percosse, lesioni, atti sessuali, sfruttamento)
- condotte omissive (esempio incuria, trascuratezza, negligenza).

L'assenza di evidenze traumatiche nel fisico non esclude l'ipotesi di maltrattamento o abusi. Ad esempio può integrare **abuso** la condotta dell'insegnante / genitore che umilia, svaluta, denigra o violenta psicologicamente un minore o una minaccia, quando costituisca una *violenza psicologica che possa causare un danno alla salute psico-fisica del minore e ne leda la dignità.*

Con i termini **VIOLENZA** e **SFRUTTAMENTO** (**violence and exploitation**) si fa usualmente riferimento a condotte commissive realizzate a danno del minore.

Lo **sfruttamento**, in particolare, può essere di natura economica o di natura sessuale

- articolo 32 (CRC): "Gli Stati parti riconoscono il diritto del fanciullo di essere protetto controllo sfruttamento economico e di non essere costretto ad alcun lavoro che comporti rischi o sia suscettibile di porre a repentaglio la sua educazione o di nuocere alla sua salute o al suo sviluppo fisico, mentale, spirituale, morale o sociale."
- articolo 34, comma 1 (CRC): "Gli Stati parti si impegnano a proteggere il fanciullo contro ogni forma di sfruttamento sessuale e di violenza sessuale."

Il Comitato delle Nazioni Unite per i diritti dell'infanzia e dell'adolescenza stabilisce che per "**violenza**" s'intenda "ogni forma di violenza fisica o mentale, lesione o abuso, trattamento negligente o d'abbandono, maltrattamento o sfruttamento, incluso l'abuso sessuale". Nel linguaggio comune il termine violenza è spesso utilizzato per designare solo il danno fisico e/o il danno intenzionale. Tuttavia, il Comitato pone una forte enfasi sul fatto che la scelta del termine violenza nel presente commento generale non deve essere interpretata in nessun modo come volta a minimizzare l'impatto o il bisogno d'affrontare forme di danno non fisiche e/o non intenzionali (come, fra le altre, l'abbandono e il maltrattamento psicologico) (Il diritto del minore alla libertà da ogni forma di violenza General comment n. 13 (2011) CRC/C/GC/13, 18 aprile 2011).

Infine, con l'espressione **STATO DI ABBANDONO** si indica una situazione di grave e permanente inadeguatezza dei genitori a prendersi cura del minore in conseguenza di una **negligenza (neglect or negligent treatment)** o gravi violenze o sfruttamenti.

Buongiorno. Obiettivo di questo video è quello di fornire alcuni elementi di conoscenza sul processo culturale e legale che ha portato, da un lato, al riconoscimento del fatto che le persone di età minore sono anche esse soggetti di diritti, cioè che sono titolari dei diritti usualmente riconosciuti a ogni essere umano in quanto tale nonché dei diritti loro specificamente riconosciuti per il fatto di essere soggetti in formazione; in secondo luogo, il percorso che ha portato il riconoscimento dell'esistenza di un dovere dello Stato di intervenire a protezione e a promozione dei diritti delle persone di età minore che siano vittime di violenza e maltrattamenti. Per inquadrare l'argomento leggo alcune righe tratte da un libro del 2006, intitolato "La vita e le regole", edito da Feltrinelli in Italia. L'autore è Stefano Rodotà, giurista, politico italiano, tra gli autori

della Carta europea dei diritti fondamentali. Scrive Rodotà:

“la regola giuridica non

può essere pensata come ciò che rimuove il dolore dal mondo, ma come uno dei criteri

che segnano la soglia del dolore tollerabile, personalmente e socialmente.

Mi pare che questo testo ci aiuti a inquadrare il tema della reazione dello Stato di fronte

al maltrattamento dell’infanzia perché evidenzia: anzitutto, che il diritto non è

onnipotente. E questo significa che anche se esistono delle norme giuridiche che reprimono

la violenza e i maltrattamenti nei confronti dell’infanzia e che cercano di prevenirli,

non per questo, purtroppo, violenza e maltrattamenti non si verificano nella pratica.

Oltre a ciò occorre ammettere che non sempre, in concreto, quando queste violenze e maltrattamenti si

verificano lo Stato riesce ad attivare un intervento tempestivo ed efficiente.

Oltre a ciò, le brevi righe del testo di Rodotà ci aiutano a riflettere sulla soglia

per l’intervento dello Stato, in generale per la protezione dei soggetti che si trovano

in gravi condizioni di disagio e poi, nello specifico, a sostegno dei minori vittime di

maltrattamenti. Ecco, questa soglia può essere individuata nell’attacco, nella violazione

della dignità umana. Quindi, l’intervento dello Stato deve verificarsi quando la soglia

del dolore è così alta da pregiudicare la dignità stessa dell’essere umano e la ratio

dell’intervento dello Stato in questi casi deve essere individuata nel generale dovere

di solidarietà sociale che porta, una delle funzioni del diritti, tutela delle libertà

individuali e tutela specifica dei soggetti in condizione di vulnerabilità.

Ma veniamo ora alle tappe fondamentali di questo percorso che ha condotto al riconoscimento

del minore come soggetto di diritti e al dovere dello Stato di protezione dei minori vittime

di maltrattamenti.

Una prima data fondamentale può essere individuata

nel 1874. In quell’anno nella città di New York, negli Stati Unti, si tiene il processo

ai danni di una donna, la madre di una bambina di nome Mary Ellen Wilson.

Il caso di Mary Ellen Wilson è un caso giudiziario che suscita molto clamore perché pone il luce l’inesistenza

di un sistema pubblico di protezione dell’infanzia e fu proprio il caso specifico che portò

alla creazione della prima charity specializzata in materia: la New York Society for the prevention

of Cruelty to children. Cos’era successo?

I vicini di casa avevano

segnalato a una missionaria metodista, di nome Etta Wheeler, che una bambina dell’apparente

età di 5 anni (Mary Ellen, appunto, che risulterà poi avere 10 anni) era vittima di maltrattamenti da parte della madre. Etta Wheeler entra nell'abitazione con la scusa di chiedere aiuto per una vicina che aveva una disabilità cronica. Con la scusa di chiedere aiuto per una vicina
Etta Wheeler entra nella casa dei genitori di Mary Ellen e può così verificare in prima persona la situazione della bambina, che trova effettivamente essere vittima di maltrattamenti, sia di natura fisica, perché presentava ustioni, ematomi, dei tagli sul corpo e anche un abbigliamento non adatto alla stagione; ma anche maltrattamenti di carattere psicologico, perché la bambina per esempio, per molte ore al giorno era spesso costretta a stare rinchiusa in un armadio, nonché non poteva uscire in strada, se non nel cortile del palazzo notte tempo.
Etta Wheeler contatta l'ente locale, cerca di ottenere dalle autorità locali l'allontanamento della bambina dalla casa familiare, ma gli enti locali rifiutano in assenza di un quadro giuridico che tale allontanamento consentisse. Etta Wheeler non demorde: chiede e ottiene l'aiuto di un avvocato specializzato in protezione degli animali dalle crudeltà e utilizzando questo quadro normativo riesce ad ottenere l'obiettivo di allontanare la bambina dalla casa e, come dicevo, nel 1874 viene anche celebrato il processo che si concluderà con la condanna della madre a un anno di reclusione per i maltrattamenti subiti da Mary Ellen.
Andando per tappe molto ampie un'altra data significativa nel processo di affermazione dei diritti dell'infanzia è il 1924. Questa volta siamo in Europa, nella città di Ginevra.
La Società delle Nazioni proclama la Carta, la Dichiarazione cosiddetta "di Ginevra", la Dichiarazione dei diritti del fanciullo. È ancora una Carta che è fortemente incentrata sulle necessità materiali e affettive dei minori e i minori sono concepiti essenzialmente come destinatari passivi dei diritti. Per fare un esempio, la Dichiarazione recita:
"Il fanciullo che ha fame deve essere nutrito; il fanciullo malato deve essere curato".
Occorrerà aspettare qualche decennio per arrivare a una nuova Carta, la Dichiarazione universale de diritti del fanciullo, Dichiarazione di New York del 1959, questa volta nell'ambito delle Nazioni Unite, per arrivare a un documento in cui vengono riconosciuti i minori come soggetti di diritto, e quindi si introduce il concetto che anche il minore, al pari di ogni essere umano, può essere direttamente titolare di diritti. Nel principio primo, per esempio, si legge: "il fanciullo deve godere di tutti i diritti enunciati nella presente dichiarazione". E poi, per esempio, il principio terzo: "il fanciullo ha diritto, sin dalla nascita, a un nome e una nazionalità". Questa formulazione in termini di diritti dell'infanzia viene poi ripresa nel documento più noto a livello mondiale sui diritti dell'infanzia

che è la Convenzione delle Nazioni Unite del 1989.

Ho sottolineato il termine “convenzione”

perché questa rappresenta una prima importante novità rispetto ai documenti del 1924 e del 1959. La Convenzione del 1989 è un documento che è vincolante per gli Stati che l’hanno ratificata, diversamente invece dalla Dichiarazione che è un atto dotato di un’efficacia meramente programmatica e, dunque, persuasiva per gli Stati che ne erano i destinatari.

La Convenzione del 1989 si segnala anche per l’istituzione di un meccanismo di monitoraggio e di controllo che è incentrato sul Comitato dei diritti dei fanciulli che ha sede a Ginevra e che esamina i rapporti periodici che vengono presentati dagli Stati membri sull’implementazione della Convenzione all’interno degli ordinamenti nazionali. Per quanto concerne l’articolato vengono al minore riconosciuti tutti i diritti riconosciuti in generale dalle Carte internazionali agli esseri umani, più alcuni specifici diritti che spettano ai minori in quanto soggetti in formazione. In tema di maltrattamento all’infanzia segnalo, in particolare, l’articolo 19 che tutela “il fanciullo contro ogni forma di violenza” in ambito familiare;

poi l’articolo 34, “protezione contro sfruttamento e violenza sessuale”; il 35 “protezione del minore contro rapimento, vendita e tratta”; il 37 “protezione contro tortura, pene o trattamenti inumani e crudeli”; e poi l’articolo 39,

assai rilevante perché stabilisce che: “Gli Stati parti adottano ogni adeguato provvedimento per agevolare il recupero fisico e psicologico e il reinserimento sociale di ogni fanciullo vittima di maltrattamenti”.

CAUSA Z E ALTRI contro REGNO UNITO

sentenza10 maggio 2001

IL FATTO

La causa trae origine da una domanda contro il Regno Unito presentata dai ricorrenti il 9 ottobre 1995.

I ricorrenti, Z, A, B e C, erano quattro fratelli di età compresa tra i sette e i tredici anni che lamentavano la violazione degli articoli 3, 6, 8 e 13 della Convenzione europea dei diritti dell'uomo in ragione del fatto che l'autorità locale non aveva adottato misure adeguate per proteggerli dalla negligenza e dagli abusi di cui erano stati vittime.

La famiglia veniva segnalata per la prima volta ai servizi sociali nell'ottobre 1987 dal loro assistente sanitario, preoccupato per le condizioni dei bambini e i problemi tra i coniugi.

La famiglia veniva riesaminata in un ulteriore incontro nel marzo 1988 e, poiché sembrava che le preoccupazioni fossero diminuite, il fascicolo veniva chiuso.

Successivamente, veniva riferito da un vicino che i bambini rimanevano chiusi fuori casa per gran parte della giornata. A ciò si aggiungeva la circostanza, riferita dalla polizia e confermata dal medico di famiglia, secondo cui le camere dei bambini erano sporche e, secondo il medico, le porte delle camere dei bambini erano spesso chiuse a chiave.

In una riunione di professionisti del 4 ottobre 1989, alla quale avevano partecipato i servizi sociali, il dirigente scolastico, i medici dei richiedenti e il personale sanitario, veniva deciso che nessun assistente sociale sarebbe stato incaricato di seguire la famiglia; si stabiliva che la scuola dovesse monitorare il peso dei bambini più grandi e l'assistente sanitario dovesse continuare a visitare regolarmente la famiglia.

Il 13 dicembre 1989, l'assistente sanitario chiedeva che i quattro bambini fossero iscritti nel Registro di protezione del bambino - elenco confidenziale di bambini che sono a rischio continuo di abuso fisico, emotivo o sessuale o negligenza - poiché riteneva che la madre non potesse offrire loro cure adeguate. Questo suggerimento veniva respinto; alla famiglia veniva assegnata un'assistente sociale, la signora M.

In un'ulteriore riunione dei professionisti, il 3 ottobre 1990, l'assistente sociale, M., dichiarava di essere preoccupata per la sporcizia dei ricorrenti e per la mancanza di interesse della madre: i bambini defecavano nella loro camera da letto e spalmavano escrementi sulle loro finestre.

A causa della preoccupazione per i bambini, in una riunione di professionisti del 5 dicembre 1990 veniva presa la decisione di organizzare una conferenza per il caso nel gennaio 1991.

Alla successiva riunione tenutasi il 28 gennaio 1991, la sig.ra M. dichiarava che la camera dei ragazzi non aveva luce, tappeti o giocattoli e che la loro biancheria da letto era bagnata, puzzolente e macchiata di terra. Il loro dirigente scolastico affermava che Z spesso piangeva, A saccheggiava i bidoni della spazzatura della scuola ed era spesso sporco, e B appariva desiderosa di attenzione e affamata.

All'esito di queste dichiarazioni si concludeva tuttavia che, nonostante le numerose preoccupazioni in merito alle capacità accuditive dei genitori dei ricorrenti e alle condizioni della casa, si riteneva che i genitori non trascurassero volontariamente i loro figli e che, data la loro scarsa educazione, stessero facendo ciò che potevano ma che fosse necessario un sostegno continuo per cercare di migliorare la situazione. Veniva comunque deciso di non iscrivere i bambini nel Registro di protezione del bambino.

Il 10 giugno 1992 la madre dei ricorrenti chiedeva aiuto per l'assistenza dei figli, dichiarando che se i bambini non fossero stati allontanati li avrebbe picchiati.

I ricorrenti venivano posti in affidamento di emergenza ed iscritti al Registro di Protezione del bambino sotto le categorie di abbandono e abuso emotivo dopo una riunione di protezione dei bambini del 22 giugno 1992.

L'8 ottobre 1992 l'autorità locale decideva di chiedere l'allontanamento dei bambini. Le ordinanze cautelari venivano emesse il 7 dicembre 1992.

Tutti i ricorrenti venivano visitati dalla dott.ssa Black, una consulente psichiatra infantile, nel gennaio 1993. La consulente dichiarava che i tre bambini più grandi mostravano tutti segni di disturbo psicologico. Z esibiva segni di grave malattia depressiva e si era assunta la responsabilità della sua famiglia e della rottura della stessa. La madre aveva tenuto nei suoi confronti un comportamento descritto come crudele ed emotivamente offensivo. A e B erano stati entrambi identificati come affetti da disturbo da stress post-traumatico. La consulente evidenziava che tutti i bambini erano stati privati di affetto e cure fisiche e qualificava la vicenda come il peggiore caso di negligenza di cui si fosse occupata nella sua carriera professionale.

Nel giugno 1993 i ricorrenti, assistiti da un avvocato, iniziavano un'azione legale contro l'autorità locale. L'avvocato domandava il risarcimento dei danni subiti per negligenza e/o violazione dei doveri legali sostenendo che l'autorità, contrariamente a quanto previsto dalla legge, non aveva tenuto in considerazione il benessere dei fratelli: le autorità locali avrebbero dovuto agire in modo più rapido e l'omesso intervento delle istituzioni aveva fatto sì che i ricorrenti riportassero gravi danni psicologici.

La richiesta veniva respinta sia dal Giudice di primo grado, sia dalla Corte di appello.

I ricorrenti presentavano allora ricorso alla House of Lords.

Il 29 giugno 1995 la House of Lords respingeva il ricorso, ritenendo che non fosse possibile alcuna azione nei confronti dell'autorità locale per negligenza o violazione degli obblighi statutari relativi allo svolgimento di compiti volti al benessere dei bambini ai sensi della legge sui minori del 1989.

LA DECISIONE DELLA CORTE

La Corte afferma all'unanimità che sussiste una violazione dell'articolo 3 della Convenzione; che nessuna questione separata sorge a norma dell'articolo 8 della Convenzione; con dodici voti contro cinque stabilisce che non vi è stata violazione dell'articolo 6 della Convenzione; infine, con quindici voti contro due, decide che sussiste una violazione anche dell'articolo 13 della Convenzione.

IL PERCORSO ARGOMENTATIVO DELLA CORTE

SULLA VIOLAZIONE DELL'ARTICOLO 3 DELLA CONVENZIONE ("nessuno può essere sottoposto a tortura o a trattamenti o punizioni disumane o degradanti")

I ricorrenti affermavano che l'autorità locale non era riuscita a proteggerli da trattamenti inumani e degradanti vietati dall'art. 3 della Convenzione.

La Corte ricorda che l'articolo 3 della Convenzione sancisce uno dei valori fondamentali delle società democratiche e vieta in termini assoluti la tortura e le pene o trattamenti inumani o degradanti. Gli Stati che hanno ratificato la Convenzione europea dei diritti dell'uomo hanno l'obbligo di adottare misure per impedire che le persone sotto la loro giurisdizione siano sottoposte a tortura o a pene o trattamenti inumani o degradanti. Queste disposizioni devono fornire una protezione efficace per i bambini e altre persone vulnerabili e includere misure ragionevoli per prevenire maltrattamenti di cui le autorità sapevano o avrebbero dovuto essere a conoscenza.

Nel caso in esame non vi è alcun dubbio che la negligenza e l'abuso subiti dai quattro figli richiedenti siano tali da poter essere qualificati come trattamenti inumani e degradanti.

Tali trattamenti erano stati portati all'attenzione dell'autorità locale già nell'ottobre 1987.

L'autorità aveva l'obbligo di proteggere i bambini e disponeva di una serie di mezzi a tal fine, tra cui il potere di allontanare i bambini dalla loro casa. I richiedenti, invece, furono allontanati d'urgenza dalla casa familiare, su insistenza della madre, solamente il 30 aprile 1992.

Durante il periodo intermedio di quattro anni e mezzo, i bambini erano stati vittime di una terribile negligenza che aveva determinato lesioni fisiche e psicologiche.

La Corte riconosce che i servizi sociali devono affrontare decisioni difficili e sensibili e riconosce altresì l'importanza del principio secondo cui la vita familiare dovrebbe essere rispettata e preservata.

In questo caso, tuttavia, non vi è dubbio che il sistema non sia riuscito a proteggere i bambini richiedenti da negligenza e gravi abusi per un lungo periodo di tempo.

Pertanto, la Corte riconosce l'esistenza di una violazione dell'articolo 3 della Convenzione.

SULLA VIOLAZIONE DELL'ARTICOLO 13 DELLA CONVENZIONE (Diritto a un ricorso effettivo)

I ricorrenti hanno sostenuto di non aver ricevuto alcun rimedio per il danno da loro subito a causa della mancata tutela da parte dell'autorità locale, facendo leva sull'articolo 13 della Convenzione.

Sul punto la Corte constata che in questo caso i ricorrenti non avevano avuto a disposizione mezzi per ottenere accoglimento delle loro affermazioni secondo cui l'autorità locale avrebbe omesso di proteggerli da trattamenti inumani e degradanti con la possibilità di ottenere un titolo esecutivo per il risarcimento del danno subito.

Conseguentemente, non essendo stato loro offerto un rimedio effettivo in relazione alla violazione dell'articolo 3, sussiste una violazione dell'articolo 13 della Convenzione.

Per contro, avendo constatato la violazione dell'articolo 3, la Corte ritiene che nessuna questione separata sorga in relazione alla VIOLAZIONE DELL'ARTICOLO 8 DELLA CONVENZIONE (Diritto al rispetto della vita privata e familiare).

Parimenti, la Corte ritiene che non vi sia stata alcuna VIOLAZIONE DELL'ARTICOLO 6 DELLA CONVENZIONE (Diritto a un equo processo), posto che ai ricorrenti non è stato impedito in alcun modo pratico di presentare le loro richieste dinanzi ai tribunali nazionali, tanto che il caso è stato contestato fino alla House of Lords e i ricorrenti sono state giuridicamente assistiti a tale scopo.

Multiple Choice with Hints and Feedback

5 points possible (graded)

1) Nel linguaggio giuridico è "trauma" all'infanzia:

- ○ ogni forma di violenza fisica e non fisica, anche se non agita con intenzione di procurarla
- ○ solo la violenza fisica e agita con intenzione di procurarla
- ○ solo la violenza fisica, anche se non agita con intenzione di procurarla
- ○ ogni forma di violenza fisica o non fisica, se agita con intenzione di procurarla

2) Nel caso di Mary Ellen Wilson la bambina vittima di maltrattamenti riceve protezione in applicazione del:

- ○ divieto di trattamenti inumani e degradanti
- ○ divieto di punizioni corporali
- ○ divieto di crudeltà sugli animali
- ○ divieto di abusi sui minori

3) Quale tra le seguenti affermazioni è vera?

- ○ Le persone di età minore non sono soggetti di diritti
- ○ Le persone di età minore sono titolari dei soli diritti riconosciuti ad ogni essere umano in quanto tale
- ○ Le persone di età minore sono soggetti di diritti se hanno la capacità di discernimento
- ○ Le persone di età minore sono titolari di specifici diritti loro riconosciuti in quanto persone in formazione

4) Quale fra i seguenti rappresenta uno strumento specifico elaborato nell'ambito del Consiglio d'Europa per la protezione del minore?

- ○ CEDU
- ○ Convenzione di Lanzarote
- ○ Carta sociale europea
- ○ Carta di Nizza

5) Nella sentenza della Corte EDU Z. E ALTRI contro REGNO UNITO, viene riconosciuta la violazione:

- ○ dell'articolo 5 Cedu (Diritto alla libertà e alla sicurezza)
- ○ dell'articolo 3 Cedu (Proibizione della tortura)
- ○ dell'articolo 6 Cedu (Diritto a un equo processo)
- ○ dell'articolo 8 Cedu (Diritto al rispetto della vita privata e familiare)

Glossario Organizzazioni e trattati internazionali e dell'UE

VIEW UNIT IN STUDIO

Bookmark this page

Organizzazione delle Nazioni Unite (ONU) = organizzazione internazionale fondata nel 1945, con l'obiettivo di mantenere la pace e la sicurezza internazionali, sviluppare relazioni amichevoli fra le nazioni, cooperare nella risoluzione dei problemi internazionali e nella promozione del rispetto per i diritti umani, rappresentare un centro per l'armonizzazione delle diverse iniziative nazionali. I Membri dell'ONU sono degli Stati Sovrani; le Nazioni Unite non sono un governo mondiale e non legiferano.

L'ONU, tuttavia, fornisce i mezzi per aiutare a risolvere i conflitti internazionali e formula politiche appropriate su questioni di interesse comune.

Convenzione internazionale sui diritti dell'infanzia (CRC) = trattato internazionale approvato dall'Assemblea Generale delle Nazioni Unite nel 1989 che esprime un consenso su quali sono gli obblighi degli Stati e della comunità internazionale nei confronti dell'infanzia e riconosce per la prima volta che anche i bambini godono di diritti civili, sociali, politici, culturali ed economici.

Comitato ONU sui Diritti dell'Infanzia = istituito dalla Convenzione ONU sui diritti dell'Infanzia allo scopo di esaminare i progressi compiuti dagli Stati parti nell'esecuzione degli obblighi derivanti dal trattato, si compone di 18 esperti di alta moralità e in possesso di una competenza riconosciuta nel settore oggetto della Convenzione. Il compito del Comitato è analizzare i rapporti periodici sull'attuazione della Convenzione che gli Stati parti sono impegnati a presentare in base a quanto previsto dall'art. 44 della Convenzione.

Convenzione europea dei diritti dell'uomo (CEDU) = trattato internazionale mediante il quale gli stati membri del Consiglio d'Europa garantiscono i diritti fondamentali civili e politici non solo ai propri cittadini ma anche a chiunque si trovi sotto la loro giurisdizione. Firmata a Roma il 4 novembre 1950, la Convenzione è entrata in vigore nel 1953.

Corte europea dei diritti dell'uomo (Corte di Strasburgo) = Corte internazionale istituita nel 1959 con sede a Strasburgo. Si pronuncia sui ricorsi individuali o statali inerenti presunte violazioni dei diritti civili e politici stabiliti dalla Convenzione Europea dei Diritti dell'Uomo. Dal 1998, la Corte è Organo permanente e può essere adita direttamente dagli individui.

Consiglio d'Europa = organizzazione internazionale il cui scopo è promuovere la democrazia, i diritti umani, l'identità culturale europea e la ricerca di soluzioni ai problemi sociali in Europa. Fondato il 5 maggio 1949 con il Trattato di Londra ha sede a Strasburgo e include 47 Stati membri, tra cui i 28 membri dell'Unione europea.

Attenzione! Il Consiglio d'Europa è estraneo all'Unione europea e non va confuso con organi di quest'ultima.

Convenzione del Consiglio d'Europa per la protezione dei bambini contro lo sfruttamento e gli abusi sessuali (Convenzione di Lanzarote) = trattato con cui gli Stati membri si accordano per criminalizzare alcune forme di abuso sessuale nei confronti dei bambini. È il primo trattato internazionale che affronta gli abusi sessuali nei confronti dei bambini che avvengono all'interno della famiglia.

Convenzione del Consiglio d'Europa sulla prevenzione e la lotta contro la violenza nei confronti delle donne e la violenza domestica (Convenzione di Istanbul) = trattato internazionale che si propone di prevenire la violenza, favorire la protezione delle vittime ed impedire l'impunità dei colpevoli. È il primo strumento internazionale giuridicamente vincolante a creare un quadro giuridico completo per proteggere le donne contro qualsiasi forma di violenza.

Unione europea = organizzazione economica e politica tra 28 paesi del continente europeo, creata dopo la Seconda guerra mondiale con l'obiettivo di promuovere una maggiore cooperazione economica tra gli Stati membri, è diventata col tempo un'organizzazione volta ad istituire le basi di un'Unione tra i popoli europei, salvaguardare la pace e ricercare l'unità politica e garantire, attraverso un'azione comune, progressi economici e sociali, quali sono la creazione di un mercato unico europeo e il rafforzamento della coesione sociale.

Carta dei Diritti Fondamentali dell'Unione europea (Cosiddetta Carta di Nizza) = proclamata nel corso del Consiglio Europeo di Nizza del 20 dicembre 2000, raccoglie tutti i diritti civili, politici, economici e sociali validi all'interno dell'Unione europea e sancisce il carattere fondamentale e la portata dei diritti umani per i cittadini dell'Unione. Nonostante sia divenuta giuridicamente vincolante solo a seguito dell'entrata in vigore del Trattato di Lisbona, ha ispirato, fin dalla sua origine, l'attività del Parlamento europeo. Con l'entrata in vigore del Trattato di Lisbona, la Carta di Nizza ha il medesimo valore giuridico dei trattati e si pone dunque come pienamente vincolante per le istituzioni europee e gli Stati membri.

Corte di giustizia dell'Unione europea (CGUE – Corte di Lussemburgo) = istituita nel 1952 ha sede a Lussemburgo ed interpreta il diritto dell'UE per garantire che sia applicato allo stesso modo in tutti gli Stati membri e dirime le controversie giuridiche tra governi nazionali e istituzioni dell'UE.

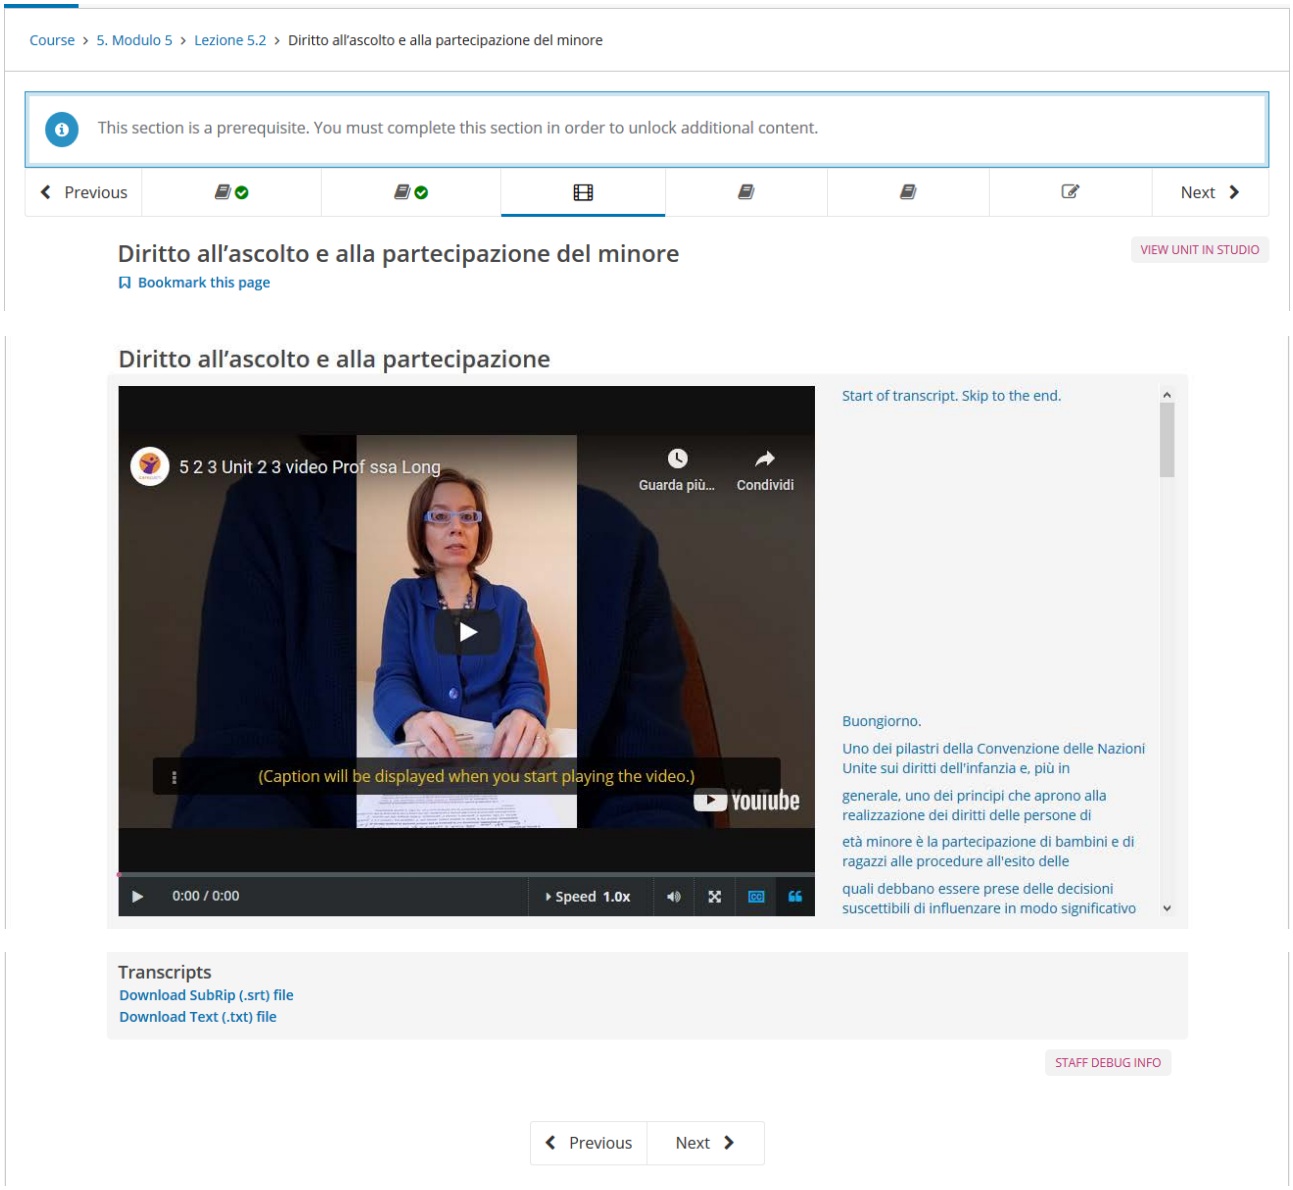
I DIRITTI DEL MINORE NEL DIRITTO INTERNAZIONALE E DELL'UNIONE EUROPEA

Download the PDF

STAFF DEBUG INFO



Transcript

Buongiorno.

Uno dei pilastri della Convenzione delle Nazioni Unite sui diritti dell'infanzia e, più in generale, uno dei principi che aprono alla realizzazione dei diritti delle persone di età minore è la partecipazione di bambini e di ragazzi alle procedure all'esito delle quali debbano essere prese delle decisioni suscettibili di influenzare in modo significativo la loro vita.

La Convenzione ONU sui diritti dell'infanzia riconosce il diritto del minore, in quanto essere umano, alla libertà di espressione nell'articolo 12, comma 1; e, nel comma successivo, il comma 2, individua uno degli strumenti che garantiscono la partecipazione del minore alle procedure, in particolare il diritto all'ascolto, da parte del giudice o da parte delle altre autorità amministrative che prenderanno decisioni nell'interesse del minore.

Ma l'ascolto non è l'unico strumento che garantisce la partecipazione del minore alle decisioni che lo riguardino.

La Convenzione europea sull'esercizio dei diritti dei minori, che riguarda specificamente le procedure giudiziarie, all'articolo 3 riconosce il diritto del minore di "ricevere ogni informazione pertinente" e, all'articolo 4 riconosce il diritto del minore di "richiedere [...] la designazione di un rappresentante speciale" qualora tra gli esercenti la responsabilità genitoriale e il minore ci sia un conflitto di interessi, un rappresentante che operi, appunto nelle procedure giudiziarie.

Ma cosa significa in concreto ricondurre l'ascolto del minore alla sua libertà di espressione?

Significa che, se anche è vero che il decisore durante l'ascolto del minore potrà ottenere delle informazioni che gli saranno utili per arrivare alla decisione finale, questa finalità istruttoria dell'ascolto è subordinata rispetto alla valenza principale dell'ascolto che è quella di garantire all'ascoltato la possibilità di esprimersi su un tema così importante per la sua vita.

Da qui alcune conseguenze pratiche che riguardano, per esempio, le modalità di ascolto: questo significa che l'ascolto non potrà essere condotto come un interrogatorio o come un'audizione di un testimone.

Significa però anche, per esempio, che il minore potrà rifiutarsi di essere ascoltato dal giudice.

Essendo l'ascolto un diritto il titolare del diritto può scegliere di non esercitarlo.

O, ancora, per quanto concerne le ragioni per le quali si potrà non procedere all'ascolto: non si potrà motivare il fatto di non aver ascoltato un minore dicendo che tale ascolto risultava nel caso specifico superfluo.

L'unica ragione per la quale l'ascolto potrà essere escluso è ritenere che quell'ascolto sarebbe stato contrario all'interesse della persona di età minore.

Un altro dei pilastri della Convenzione ONU dei diritti dell'infanzia è infatti proprio la protezione del minore e il pilastro della protezione va bilanciato con i diritti del minore alla partecipazione nelle procedure che lo riguardano.

E questa esigenza di bilanciamento si vede anche con riferimento al ruolo che la volontà manifestata dal minore durante l'ascolto svolge nella decisione finale presa dall'autorità.

L'autorità, infatti, non può ritenersi vincolata dalla volontà espressa dal minore.

Può, infatti, avvenire che l'autorità ritenga che la volontà espressa dal minore sia in

realtà contraria al suo interesse.

Pensiamo, per esempio, a una persona di età minore che nel quadro di una procedura civile che riguardi i maltrattamenti in famiglia insista per rivedere il genitore o più in generale l'adulto maltrattante.

In questo caso l'autorità ben potrà negare le visite, continuare a mantenere la sospensione delle visite anche qualora ciò sia contrario alla volontà manifestata dal minore.

È diverso, dunque, rispetto a quanto avviene per il soggetto maggiorenne.

Il soggetto maggiorenne, addirittura, ha il diritto di rifiutare un trattamento sanitario anche qualora da tale rifiuto derivi una morte certa.

Non così per la persona di età minore perché appunto, come dicevo, il diritto di partecipazione e in generale il diritto all'autodeterminazione deve essere bilanciato con il principio del superiore interesse del minore.

L'esigenza di bilanciamento impone, però, all'autorità giudiziaria e in generale alle autorità che prendono decisioni sulla vita del minore, di informare il minore della decisione presa e anche di motivare specificamente sulle ragioni per le quali non è stato possibile aderire alla volontà espressa dal minore stesso durante l'ascolto.

INTRODUZIONE AL FILM "THE CHILDREN ACT"

Protagonisti del film sono Adam, un diciassettenne che d'accordo con i genitori rifiuta per ragioni religiose la trasfusione di sangue necessaria a salvargli la vita, e Fiona Maye, giudice inglese della famiglia e dei minori, chiamata a decidere se autorizzare i sanitari a procedere comunque alla trasfusione sul ragazzo.

Il film consente di riflettere su due tratti caratterizzanti della disciplina del diritto del minorenne all'ascolto contenuta nell'art. 12 della Convenzione delle Nazioni Unite sui diritti dell'infanzia (CRC).

1) **L'ascolto costituisce lo strumento attraverso cui la persona di età minore esercita la propria libertà di espressione.** Fiona infatti incontra Adam perché vuole "conoscerlo" e non lo "ascolta" con le modalità proprie di un interrogatorio o di un'audizione di un testimone. Non si limita inoltre ad approfondire le ragioni della decisione di rifiutare le trasfusioni, ma chiacchera con lui toccando temi diversi, quali la musica e la poesia.

2) Inoltre, **l'ascolto non vincola il giudice alla volontà del minore**. Nel film infatti Fiona decide in modo opposto alla volontà espressa da Adam durante l'ascolto. Diversamente dalla persona maggiorenne - che ha il diritto di decidere sulla propria vita anche qualora la sua decisione possa determinarne la morte (es. tipico il rifiuto di una trasfusione di sangue salva vita per ragioni religiose) – la persona minore d'età non è titolare di questo diritto in termini assoluti: l'art. 12 della Convenzione delle Nazioni Unite sui diritti dell'infanzia (CRC) stabilisce che chi decide debba tenere conto dell'opinione del minore in modo crescente in funzione dell'età e del grado di maturità del minorenne, ma questo non significa che ne sia vincolato. Se infatti il giudice, o in generale chi è chiamato a prendere una decisione che riguardi un minore, ritiene che la volontà espressa dal minore durante l'ascolto non sia conforme al suo interesse, non solo può ma DEVE decidere in senso contrario.

Q5.2

5 points possible (graded)

1. Sono punizioni corporali a danno del minore:

- ○ esclusivamente le punizioni fisiche intese a causare dolore al minore
- ○ esclusivamente le punizioni fisiche intese a causare dolore o disagio al minore
- ○ anche azioni non fisiche, come le minacce, volte all'umiliazione del minore
- ○ azioni fisiche o non fisiche, ad eccezione di quelle realizzate per educare i minori

2. Quale tra le seguenti affermazioni è falsa?

- ○ Sono vietati i trattamenti ingiustificatamente differenziati in base all'età
- ○ Sono vietati tutti i trattamenti differenziati in base all'età
- ○ Le persone di età minore hanno il diritto in quanto tali a un trattamento differenziato sulla base dell'età
- ○ Il trattamento dei minori di età deve ispirarsi al principio del superiore interesse del minore

3. Quale fra le seguenti affermazioni sull'ascolto del minore è vera?

- ○ deve essere garantito solo nelle procedure giudiziarie e amministrative che lo riguardano
- ○ può essere condotto come l'audizione di un testimone, ma non come un interrogatorio
- ○ può essere escluso quando l'opinione del minore è superflua
- ○ deve essere garantito solo nelle procedure giudiziarie e non amministrative che lo riguardano

4. In caso di ascolto, l'opinione del minore è vincolante per chi decide?

- ○ Sì
- ○ No, e il decisore può anche non tenerne conto
- ○ Sì se il minore presenta un elevato grado di maturità
- ○ No, ma il decisore deve tenerne conto

5. Quale tra i seguenti rappresenta uno strumento specifico elaborato nell'ambito del Consiglio d'Europa in tema di violenza domestica e violenza assistita?

- ○ Convenzione di Lanzarote
- ○ Convenzione di Istanbul
- ○ Convenzione internazionale sui diritti dell'infanzia e dell'adolescenza (CRC)
- ○ Convenzione sulle relazioni personali riguardanti i minori

Glossario giuridico sulla partecipazione dei minori ai procedimenti decisionali

VIEW UNIT IN STUDIO

Bookmark this page

Vittimizzazione primaria = condotta di abuso, violenza o maltrattamento, che cagiona al minore sofferenze e lesioni fisiche e/o psicologiche.

Vittimizzazione secondaria = sofferenza ulteriore provocata dallo stress del processo in sé, dalla necessità di rievocare, in tale sede, i maltrattamenti, nonché dall'eventuale contatto con l'autore della condotta subita.

Procedimento penale = procedura giurisdizionale tramite cui viene ricercato e penalmente sanzionato l'autore dei maltrattamenti ai danni del minore, qualora costituiscano reato.

Procedimento civile = procedura giurisdizionale in cui, a seguito del maltrattamento, viene valutata l'adeguatezza dell'ambiente famigliare del minore e adottati gli eventuali provvedimenti necessari.

Ascolto del minore = attività del procedimento (civile o penale) per mezzo della quale vengono acquisite le dichiarazioni del minore sui fatti rilevanti per la decisione da prendere.

Consultazione del minore = attività del procedimento (specialmente civile) con cui il minore ha la possibilità di esprimere la propria opinione e il proprio pensiero, prima che il giudice prenda una decisione.

Consenso del minore = garanzia ulteriore rispetto al diritto di esprimere la propria opinione, che consiste nell'obbligo, per il giudice, di ottenere il previo parere favorevole del minore per poter prendere una determinata decisione (ad esempio, affidamento o adozione).

Rappresentante = colui il quale, in caso di assenza, indisponibilità, o situazione di conflitto d'interesse dei genitori, individua gli interessi e le necessità del minore e li tutela all'interno del procedimento.

Difensore = avvocato designato per cercare di ottenere un provvedimento giudiziale il più possibile conforme agli interessi del minore.

Professionisti sociali e sanitari = soggetti esperti in psicologia, psichiatria e sociologia, che assistono il minore maltratto durante i procedimenti che lo riguardano e aiutano il giudice e le parti a valutarne lo stato psico-fisico, nonché le eventuali necessità di protezione.

Provvedimenti cautelari = misure provvisorie, adottate dal giudice, per proteggere l'integrità psico-fisica del minore, in attesa del termine del procedimento e della conseguente decisione definitiva.

Transcript

L'intervento del tribunale per i minorenni a tutela dei minori vittime di maltrattamenti si svolge in questo modo sostanzialmente: è necessario che ci sia una richiesta del pubblico ministero presso il tribunale, perché il tribunale d'ufficio non assume alcuna iniziativa, una richiesta del pubblico ministero minorile che a sua volta nasce da una segnalazione ricevuta da altri soggetti di una situazione di maltrattamento di cui il minore sia vittima nell'ambito familiare.

Questi altri soggetti, che a loro volta hanno segnalato al pubblico ministero minorile la situazione di maltrattamento, sono i servizi sociali prevalentemente, ma possono anche essere le strutture scolastiche dove il minore si trova, o anche le autorità di polizia giudiziaria che intervengono in situazioni di reato.

C'è poi anche un intervento, ovviamente, dell'autorità giudiziaria penale ma, molto spesso, quando ci sono delle ipotesi di reato, gli interventi sono simultanei: il tribunale per i minorenni interviene per le misure di protezione, l'autorità giudiziaria penale interviene per l'accertamento dei reati.

L'intervento del tribunale è condizionato dal tipo di richiesta che il pubblico ministero ha fatto al tribunale.

Ci sono delle situazioni in cui il pubblico ministero, situazioni molto gravi in cui il pubblico ministero può chiedere un intervento immediato e urgente di allontanamento del minore e il tribunale può disporlo questo intervento; oppure situazioni in cui in partenza lo stesso pubblico ministero chiede al tribunale di fare degli accertamenti per verificare la gravità della situazione denunciata, la veridicità della situazione denunciata e la gravità, e individuare gli interventi ritenuti più opportuni per tutelare il minore.

Nel corso di questi accertamenti,

o subito dopo il provvedimento anche di allontanamento,

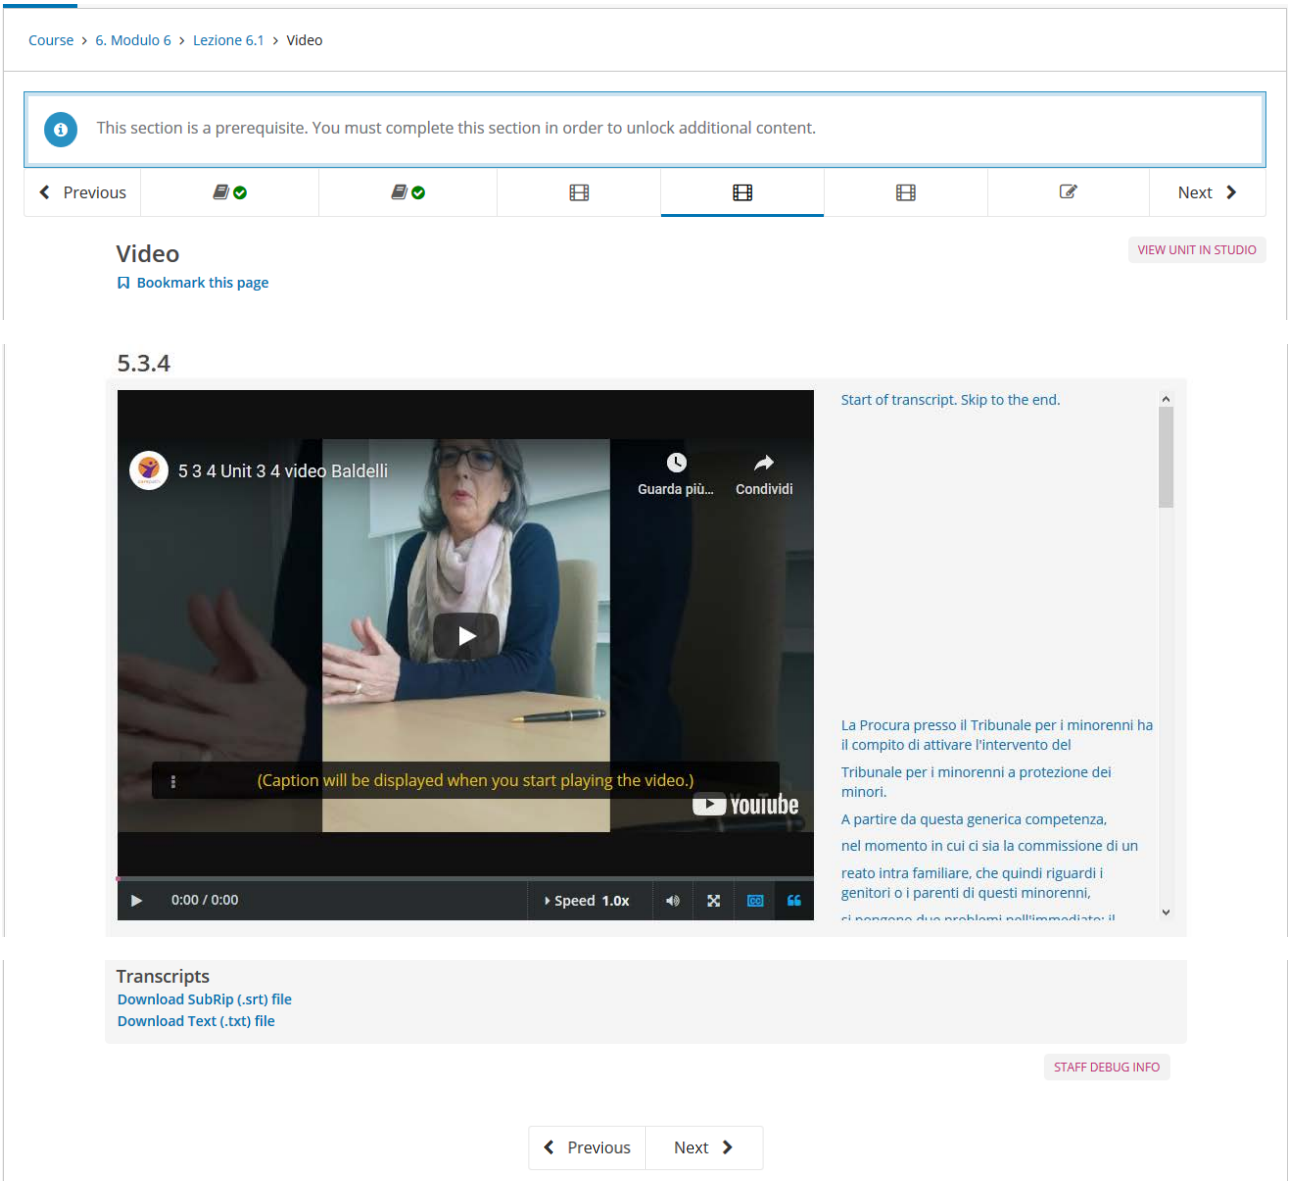
quando è stato necessario adottarlo, quando il tribunale ha ritenuto indispensabile adottare un provvedimento di allontanamento, dicevo nel corso di questo accertamento intervengono i servizi segnalanti, ma intervengono anche altri servizi: intervengono i servizi specializzati di psicologia, intervengono gli stessi genitori necessariamente anche se, ovviamente, il loro intervento è un intervento particolare, ma nell'ambito della procedura la legge prevede che debbano essere sentiti prima che il tribunale adotti dei provvedimenti definitivi a protezione dei minori che sarebbero degli interventi di limitazione della responsabilità dei genitori, o addirittura degli interventi "ablativi" si dice, cioè di decadenza dei genitori dalla responsabilità, sempre che il pubblico ministero abbia fatto richiesta anche di questo tipo di decisione.

Viene sentito anche il minore nell'ambito di questi procedimenti se ha compiuto i 12 anni, dice la legge, oppure non ha ancora compiuto i 12 anni ma viene ritenuto dal giudice in grado di esprimere, di essere, diciamo, sentito e di esprimere una sua valutazione sulla situazione.

Ovviamente è una valutazione che il giudice a sua volta valuterà liberamente per comprendere soprattutto i desideri, sì, ma anche la reale situazione psicologica del minore.

Ripeto, però: si tratta di una reale situazione psicologica del minore che innanzitutto viene stabilita e valutata attraverso l'intervento dei servizi specializzati i quali a loro volta

sentono il minore e riferiscono al giudice quello che il minore è stato in grado, anche a seconda dell'età,
di dire.
Questa è una forma di ascolto, diciamo, del minore "mediata", svolta da altri soggetti, con competenze professionali specifiche, di cui il giudice si avvale per prendere la decisione.



Transcript

La Procura presso il Tribunale per i minorenni ha il compito di attivare l'intervento del Tribunale per i minorenni a protezione dei minori.

A partire da questa generica competenza,

nel momento in cui ci sia la commissione di un

reato intra familiare, che quindi riguardi i genitori o i parenti di questi minorenni,

si pongono due problemi nell'immediato: il primo è quello di coordinarsi con i Procuratori ordinari, che hanno la titolarità del procedimento penale, per evitare delle interferenze che possano danneggiare l'indagine penale,

e il secondo di raccogliere gli elementi, non soltanto

di conoscenza della situazione di pregiudizio grave,

ma anche elementi di conoscenza sulle

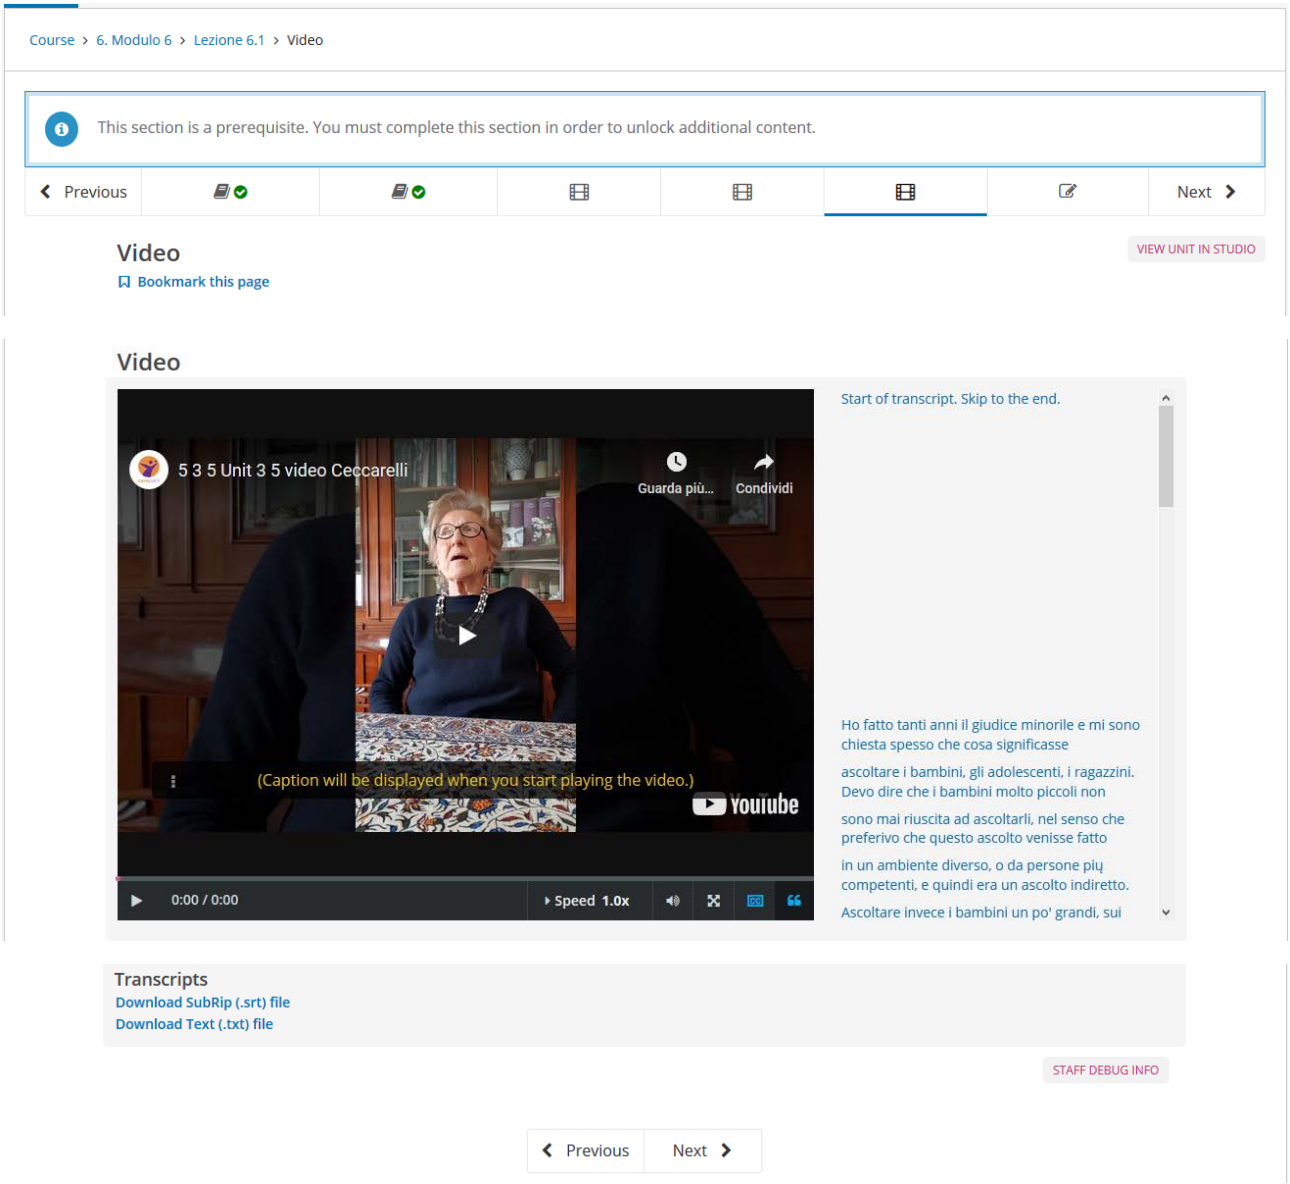
risorse personali e famigliari, eventualmente di altri famigliari o sociali, che siano intorno a questo minorenne; per poi costruire un ricorso al Tribunale per i minorenni, che abbia delle prospettive di intervento adeguate.

La difficoltà principale è quella di contenere i tempi, perché il processo di tutela ha dei tempi suoi, ma anche il processo penale ha dei tempi che non sempre sono governabili. Quello che noi abbiamo cercato di fare è stato di chiedere alle forze di polizia di segnalare, contestualmente, sia alla Procura ordinaria, che è titolare del procedimento penale nei confronti dell'autore di reato, sia alla Procura dei minorenni, che è titolare del potere di protezione della vittima del reato, in modo tale da mettere questi uffici nella condizione di coordinarsi in modo assolutamente tempestivo e immediato, cioè sin dalle prime battute dell'indagine.

Questa modalità, anche supportata da convenzioni che si sono fatte con le diverse Procure, ha consentito di definire chi fa che cosa, quando e come, salvando, appunto, come dicevo prima, le esigenze di percorso penale corretto, ma anche le esigenze di tutela nei confronti del minorenne.

Qualche volta può succedere, soprattutto quando i bambini vengono ricoverati in ospedale e non ci sia un dissenso dei genitori a questo ricovero, qualche volta è possibile che si ritardi l'intervento di protezione e quindi si ritardi l'intervento del Tribunale per i minorenni, potendo però garantire al minorenne una tutela di fatto, attraverso appunto il ricovero in ospedale, permettendo così al pubblico ministero ordinario, titolare del procedimento penale nei confronti dell'autore di reato, di svolgere i propri accertamenti in modo segreto e in modo quindi efficace.

Una volta che poi sia in qualche modo evidente la non rinviabilità di un provvedimento a tutela, può essere addirittura il collega della Procura ordinaria, titolare del procedimento penale, a emettere un provvedimento amministrativo di tutela attraverso la sua polizia giudiziaria, ai sensi dell'articolo 403 del codice civile, cioè mettere in protezione il minorenne, in attesa che poi, con un nostro ricorso, il Tribunale per in minorenni possa ratificare questo strumento di tutela provvisorio.



Transcript

Ho fatto tanti anni il giudice minorile e mi sono chiesta spesso che cosa significasse
ascoltare i bambini, gli adolescenti, i ragazzini. Devo dire che i bambini molto piccoli non
sono mai riuscita ad ascoltarli, nel senso che preferivo che questo ascolto venisse fatto
in un ambiente diverso, o da persone più competenti, e quindi era un ascolto indiretto.
Ascoltare invece i bambini un po' grandi, sui sette, otte, dieci anni, undici, ne ho
avuti parecchi casi.
Erano soprattutto bambini in situazioni familiari estremamente conflittuali, con genitori che
non si decidevano a separarsi, separati, ma in realtà sempre uniti da conflitto, da rivendicazioni,
che si riflettevano pesantemente sui figli.
La cosa che io cercavo di comunicare ai bambini,
in queste situazioni di ascolto, era anzitutto che c'era una persona

che li stava ad ascoltare,
una persona che aveva un compito preciso, che era quello di decidere nel modo migliore per loro,
che necessariamente questo decidere
poteva anche diverso da quello che i bambini
desideravano, da quello che esprimevano.
E, tuttavia, cercavo appunto di comunicare questo.
La decisione dipende dal Tribunale, dipende dal giudice. Il giudice, per mestiere, deve decidere
e quindi tengo conto di tutto quello che tu mi racconti,
cercherò di essere il
più possibile attenta a fare quello che va bene per te
e, però, non sempre la decisione
coinciderà con il tuo desiderio. Questa č una cosa che succede sempre nella vita e quindi
anche rispetto a questo devi abituarti a vivere.
Rispetto ai genitori, io cercavo sempre di salvaguardare l'aspetto positivo del rapporto
loro con i genitori, cioè cercavo di spiegare che il papà - in generale erano i papà che
erano molti prepotenti nei rapporti con i bambini
e quindi li costringevano a fare delle
cose pensando che fossero utili nel loro rapporto conflittuale con l'ex compagna -
cercavo di
dire: guarda il papà non ha nulla contro di te ed è giusto che tu voglia bene al papà;
però sappiamo che ha dei problemi, che non accetta questa situazione.
E quindi dobbiamo essere capaci anche di preservare questa figura del papà.
Quindi, come dire, mai aderire ad atteggiamenti conflittuali del bambino contro;
però anche
cercare di salvaguardare,
come dire, anche la possibilità che il bambino possa dire
di no, non ce la faccio più a stare con questo papà; non ce la faccio più, perché lui
non capisce e quindi, se non capisce alla fine.
Ho in mente la situazione di una bambina che aveva una decina di anni con due genitori,
il padre assolutamente molto molto patologico, e a questo punto il provvedimento č stato:
va bene aspettiamo che il papà cambi, se riuscirà a cambiare, e se non riuscirà a
cambiare, non sarà certamente la bambina che dovrà sopportare tutto questo peso.

Q6.1

5 points possible (graded)

1) La "vittimizzazione secondaria" è causata:

- ○ dai maltrattamenti che hanno reso necessario l'intervento dell'autorità giudiziaria
- ○ dallo stress derivante dalla partecipazione del minore alle attività procedimentali
- ○ dallo stress derivante dall'ingresso del minore in un nuovo nucleo famigliare
- ○ dalla reiterazione dei maltrattamenti originariamente subiti

2) Il principio del superiore interesse del minore:

- ○ vale solo nel procedimento penale
- ○ vale solo nel procedimento civile
- ○ obbliga gli Stati a evitare la partecipazione del minore ai procedimenti successivi ai maltrattamenti subiti
- ○ impone al giudice di tenere sempre in considerazione, sopra ogni altro interesse meritevole di tutela, il benessere psico-fisico del minore

3) L'ascolto del minore come testimone:

- ○ deve sempre essere compiuto dal giudice
- ○ è preferibile che sia svolto come ultimo atto del procedimento
- ○ è preferibile che sia svolto fra i primi atti del procedimento
- ○ per saggiare l'attendibilità del dichiarante, è meglio se viene ripetuto almeno due volte

4) L'opinione espressa dal minore nel corso del procedimento

- ○ non è vincolante, ma il giudice deve tenerne conto per decidere
- ○ è sempre vincolante per il giudice
- ○ è vincolante per il giudice, ma solo se il minore ha almeno 14 anni
- ○ è vincolante per il giudice, ma solo se il minore ha una capacità di discernimento adeguata

5) I procedimenti penali e civili instaurati in seguito al maltrattamento del minore:

- ○ sono separati, ma quello civile può cominciare solo dopo quello penale
- ○ affrontano temi diversi e hanno scopi diversi
- ○ sono separati, ma quello civile può cominciare solo se, nel processo penale, il genitore è stato condannato
- ○ hanno lo stesso fine e lo stesso oggetto

Servizi sociali = gamma di servizi, forniti da enti pubblici o privati, che rispondono a bisogni collettivi e personali. Mentre con il termine "servizi" si intendono servizi standardizzati, universalmente forniti alle persone in quanto membri di una categoria, i "servizi sociali" rispondono a "bisogni specifici" dei beneficiari.

Servizi sociali per bambini e famiglie = serie di misure e di attività che soddisfano bisogni generali o individuali di un minore e/o della sua famiglia. Questo tipo di servizi sono finalizzati a soddisfare i diversi bisogni dei bambini e delle famiglie, come i servizi specializzati e intensivi.

Servizi sociali a misura di bambino = servizi sociali che rispettano, proteggono e realizzano i diritti di ogni bambino, compreso il diritto di accesso alle prestazioni, la partecipazione e la protezione e il principio del superiore interesse del bambino.

Giustizia a misura di minore = sistemi giudiziari che garantiscono il rispetto e l'effettiva attuazione di tutti i diritti dei minori al più alto livello possibile, tenendo in considerazione il grado di maturità e di comprensione del minore. Si tratta di una giustizia accessibile, adeguata all'età, rapida, diligente, adatta alle esigenze del minore e su di esse incentrata, nel rispetto dei diritti del minore, tra cui il diritto al giusto processo, alla partecipazione e alla comprensione del procedimento, al rispetto della vita privata e familiare, all'integrità e alla dignità.

Educazione e cura della prima infanzia (ECEC- Early Childhood Education and Care) = servizio offerto ai bambini dalla nascita all'istruzione primaria soggetto a un quadro di regolamentazione nazionale e al rispetto di una serie di regole di standard minimi e/o di procedure per l'accreditamento. Il servizio comprende i servizi privati, pubblici e del volontariato. I paesi europei presentano soluzioni diverse per garantire l'educazione e la cura dei bambini al di sotto dell'età della scuola dell'obbligo. Tuttavia, L'ECEC sta diventando sempre più parte integrante dei sistemi di istruzione in Europa

Spazio Europeo dell'Istruzione Superiore (European Higher Education Area - EHEA) = progetto che si propone di realizzare un processo di convergenza e di rafforzamento degli studi superiori o universitari in Europa. Questo processo è in linea con le strategie che la Commissione Europea assieme agli Stati Membri dell'Unione ha varato in questi anni per costruire una vera Europa della conoscenza ed ha lo scopo principale di promuovere la mobilità e l'impiego occupazionale degli studenti, migliorare la qualità e rendere i sistemi educativi più competitivi, attrarre studenti (e docenti) dall'Europa e da altre parti del mondo. I mezzi per raggiungere tale obiettivo sono il sostegno a una maggiore comparabilità e compatibilità tra i diversi sistemi e le diverse istituzioni di Istruzione Superiore in Europa, e l'innalzamento della loro qualità.

Assistenza sanitaria a misura di bambino = politiche e pratiche di assistenza sanitaria incentrate sui diritti, i bisogni, le caratteristiche, le risorse e le capacità in evoluzione dei bambini, tenendo conto della loro opinione.

Approccio di assistenza sanitaria a misura di bambino = quadro concettuale e operativo integrato che rispetta appieno i diritti e i bisogni dei bambini in ambito sanitario.

Ruolo e funzioni del Garante per l'infanzia

VIEW UNIT IN STUDIO

Bookmark this page

I GARANTI PER L'INFANZIA E L'ADOLESCENZA

Le competenze attribuite dalle diverse leggi istitutive alle Autorità garanti per l'infanzia e l'adolescenza sono riconducibili a diverse azioni: ascolto e partecipazione, promozione e sensibilizzazione, collaborazione, elaborazione di proposte, pareri e raccomandazioni.

L'attività dei Garanti dell'infanzia e dell'adolescenza (Ombudsman for Children) assume oggi un ruolo di primo piano nelle politiche volte a garantire la conoscenza e il rispetto dei diritti dei minori, e consente di dare voce a persone (i minori) che spesso rischiano di essere invisibili: https://www.youtube.com/watch?v=jWiE2jHX5yE.

Le Autorità Garanti, in sintesi:

- vigilano sull'applicazione della Convenzione sui diritti dell'infanzia e dell'adolescenza nel territorio e contribuire a diffondere la conoscenza e la cultura dei diritti dell'infanzia e dell'adolescenza;
- segnalano alle autorità competenti eventuali violazioni di tali diritti;
- verificano che le persone di minore età abbiano pieno accesso ai loro diritti;
- esprimono pareri sulle proposte normative riguardanti i minori di età e sulla tutela dei diritti e lo sviluppo dei soggetti in età evolutiva.

Più nel dettaglio, le funzioni e i poteri delle Autorità garanti (Ombudsman for Children) si possono suddividere in due principali aree.

1) La prima è di carattere generale e riconducibile a interventi di promozione dei diritti delle persone di minore età. I Garanti, per esempio, promuovono la conoscenza e l'affermazione dei diritti individuali, sociali e politici dell'infanzia e dell'adolescenza assumendo ogni iniziativa finalizzata alla loro concreta realizzazione; vigilano sull'applicazione nel territorio della Convenzione sui diritti del fanciullo; esprimono, su richiesta dei competenti organi locali, pareri, proposte e rilievi su progetti di legge, di regolamento e di atti amministrativi in ordine al possibile ed eventuale impatto su bambini e ragazzi.

2) La seconda area di intervento è specifica e riguarda le risposte a segnalazioni di situazioni di singoli minori in difficoltà. I Garanti, infatti, accolgono le segnalazioni provenienti da persone anche di minore età (per un esempio vd. qui), dalle famiglie, dalle scuole, da associazioni ed enti, in ordine a casi di violazione dei diritti; segnalano alle amministrazioni pubbliche competenti i casi di violazione di diritti, conseguenti a atti o fatti ritardati, omessi o comunque irregolarmente compiuti, di cui abbia avuto conoscenza da soggetti pubblici e privati, o da parte di persone singole, anche di minore età.

Quanto al modus operandi , ai Garanti non sono conferiti poteri diretti e incisivi di indagine, di prescrizione e di sanzione. L'azione dei Garanti si estrinseca infatti essenzialmente nella cosiddetta moral suasion, cioè nella persuasione esercitata nei confronti di soggetti pubblici (decisori politici, amministrazioni locali, servizi socio-assistenziali territoriali, autorità giudiziarie) e privati (genitori in conflitto, enti del terzo settore) basandosi sull'autorevolezza del proprio status di autorità di garanzia. Così, per esempio, il Garante può raccomandare alle amministrazioni competenti l'adozione di interventi di aiuto e sostegno, nonché l'adozione, in caso di loro condotte omissive, di specifici provvedimenti; promuovere, presso le amministrazioni competenti, la modifica o la riforma di provvedimenti ritenuti pregiudizievoli per bambini e ragazzi; richiamare le amministrazioni competenti a prendere in considerazione come preminente il superiore interesse del fanciullo.

Le Autorità garanti possono esistere tanto a livello nazionale quanto a livello locale.

In ambito europeo è attiva la Rete europea dei Garanti dell'infanzia e dell'adolescenza (European Network of Ombudsman for Children – sito web: *https://enoc.eu/?page_id=174*) che si riunisce almeno una volta l'anno per discutere temi di interesse comune a livello europeo e individuare linee di intervento condivise.

Le Autorità garanti nazionali collaborano costantemente con la rete internazionale dei garanti delle persone di minore età, con le organizzazioni e gli istituti internazionali di tutela e di promozione dei diritti dei minorenni e le organizzazioni no profit.

Lo scambio con soggetti diversi permette alle Autorità di sviluppare proposte al passo con i tempi e le necessità dei ragazzi.

Uno degli ambiti di intervento dei Garanti concerne i fenomeni di violenza e maltrattamento a danno di persone di età minore (maltrattamento psicologico, maltrattamento fisico, violenza sessuale, trascuratezza, violenza assistita). Sul punto si veda il contributo ENOC. Position Statement on 'Violence against Children", *http://enoc.eu/wp-content/uploads/2014/12/ENOC-position-statement-on-Violence-against-children-2015-FV.pdf*.

L'esperienza di un tutore volontario di un minore straniero non accompagnato

VIEW UNIT IN STUDIO

Il tutore volontario come "voce" del minore straniero non accompagnato

Sono molti i minorenni che sono costretti a lasciare il loro Paese per trascorrere la loro infanzia e adolescenza lontano da casa, separati dalle loro famiglie e senza adulti di riferimento che possano assicurarsi che vengano tutelati i loro interessi. La grande maggioranza di loro ha vissuti traumatici legati al percorso migratorio, alla vita prima della migrazione o comunque all'abbandono della o dalla famiglia di origine.

Nel Diritto dell'Unione europea, la Direttiva 2011/95/UE del Parlamento Europeo e del Consiglio definisce il minore straniero non accompagnato (MSNA): "il minore di 18 anni, non appartenente a una nazione dell'Unione Europea o apolide, che giunga nel territorio dello Stato membro senza essere accompagnato da un adulto che ne sia responsabile in base alla normativa o alla prassi dello Stato membro interessato, e fino a quando non sia effettivamente affidato a un tale adulto; il termine include il minore che venga abbandonato dopo essere entrato nel territorio degli Stati membri".

In numerosi ordinamenti europei si sta diffondendo la figura del tutore volontario, un privato cittadino, altamente qualificato, chiamato ad esercitare la rappresentanza legale dei minori arrivati nello Stato da soli e ad assicurare che i loro interessi vengano tutelati, i loro bisogni ascoltati e le loro potenzialità coltivate. L'istituto del tutore volontario rappresenta, in altre parole, un esempio di cittadinanza attiva e dunque uno strumento di politica sociale in favore di persone di età minore.

Carlo Infuso, avvocato torinese, racconta così la sua esperienza di tutore volontario.

"Ho conosciuto V., il mio tutelato, in un'occasione assolutamente ordinaria: mi è stato presentato dalla Comunità che lo ospitava. Mi sono trovato davanti questo ragazzo e devo dire che dopo la presentazione di rito non sapevamo tanto né io né lui che cosa dire. L'ho caricato sul motorino, siamo andati a fare un giro, abbiamo un po' parlato, e pian piano abbiamo cominciato a costruire questo rapporto che oggi direi essere evoluto veramente in un rapporto piacevole, pieno, di fiducia e di piacere reciproco.

V. sta finalmente cominciando la sua vita qui in Italia. Gode della protezione umanitaria, avrà quindi un permesso di soggiorno fino a quando diventa maggiorenne e anche oltre perché gli è stato dato per due anni. Chiederemo appunto che possa proseguire e portare a termine gli studi.

Sta finalmente iniziando a capire l'importanza di imparare l'italiano, cosa che non gli serviva e non aveva assolutamente colto nei suoi aspetti, per sé stesso, per le relazioni con gli altri, per le sue relazioni con me, per le relazioni con i miei amici, per le persone che frequenta attraverso me, che sta cominciando a conoscere e a scoprire. Sta capendo l'importanza di studiare anche da cameriere, dava per scontato che fare il cameriere significasse semplicemente portare a tavola i cibi e invece sta imparando a fare il cappuccino, il cappuccino con il disegno, servire con le doppie posate dal piatto di portata, a destra, a sinistra, i bicchieri per l'acqua, per il vino, come disporre il tovagliolo, eccetera... Sta scoprendo un poco il piacere dell'imparare le cose per imparare le cose proprio per sé stesse.

È molto divertente. È un giovane, un adolescente: pensa tantissimo alla musica, ha l'orecchino, il taglio di capelli... come tutti i ragazzi.

Mi ha stupito, devo dire, una cosa nel mio ruolo di tutore, che è un po' fuori dal ruolo di tutore. Quando si trattava di prendere una decisione iniziale sul dove studiare, sul che cosa studiare, quando V. mi ha detto: "io non ho genitori, tu sei il mio papà italiano, decidi tu per me, perché so che quello che tu decidi per me è sicuramente fatto bene ".

Oggi, a distanza di alcuni mesi, sono contento che V. riesca a dire: "sono contento che abbiamo deciso insieme di fare questo studio, perché è uno scuola che mi piace molto".

Anche il fatto di essere riuscito, forse con piccole cose, con le cose di ogni giorno, un poco a innescare in lui un meccanismo di fiducia negli altri, ha permesso di avere, di costruire, un po' di fiducia in sé stesso e oggi V. probabilmente è in grado di fare piccole scelte che una volta non era in grado di fare, con molta più coscienza, con molta più leggerezza, con molto più impegno rispetto a prima.

È un rapporto tra persone quello che si crea ed è un rapporto che può andare bene o può andare male, nel nostro caso è andato bene, ci ha permesso di costruire.

Posso dire con piacere V. è ospite questo fine settimana a casa mia, stasera preparerà probabilmente lui da mangiare una delle sue cose e ne siamo tutti molto contenti".

Q6.2

5 points possible (graded)

1) Nelle situazioni di violenza domestica o in caso di conflitto con i genitori, bambini e ragazzi:

- ○ devono avere accesso a consulenze e consigli medici confidenziali senza il consenso dei genitori, se di età superiore ai 14 anni
- ○ devono avere accesso a consulenze e consigli medici confidenziali senza il consenso dei genitori, indipendentemente dalla loro età
- ○ devono avere accesso a consulenze e consigli medici confidenziali previo consenso dei genitori, indipendentemente dalla loro età
- ○ devono avere accesso a consulenze e consigli medici confidenziali previo consenso dei genitori, se dotati di un elevato grado di maturità

2) La dichiarazione di Bucarest dei bambini dell'Unione Europea è uno strumento volto a mobilitare le istituzioni europee e gli Stati membri a stabilire strutture e meccanismi formali che promuovano il diritto dei bambini e dei giovani:

- ○ ad essere ascoltati in ogni procedura giudiziaria o amministrativa che li concerne
- ○ ricevere o comunicare informazioni o idee senza che vi possa essere ingerenza da parte delle autorità pubbliche e senza limiti di frontiera
- ○ a beneficiare di una protezione particolare e quindi a un trattamento differenziato sulla base dell'età
- ○ a partecipare alle decisioni dell'Unione Europea

3) Quando, secondo la legge, un minore non ha la capacità di dare consenso a un intervento sanitario, questo:

- ○ non può essere effettuato senza l'autorizzazione del suo rappresentante, di un'autorità o di una persona o di un organo designato dalla legge
- ○ non può essere effettuato
- ○ può essere effettuato anche senza l'autorizzazione del suo rappresentante, di un'autorità o di una persona o di un organo designato dalla legge
- ○ può essere effettuato anche senza l'autorizzazione del suo rappresentante, di un'autorità o di una persona o di un organo designato dalla legge se è possibile ricostruire la volontà del minore

4) Il video del Consiglio d'Europa "Tell someone you trust" affronta con modalità adatte ai bambini il tema:

- ○ dell'abuso sessuale
- ○ del bullismo
- ○ della violenza assistita
- ○ delle punizioni corporali

5) Le Autorità garanti per l'infanzia e l'adolescenza esercitano:

- ○ poteri incisivi di indagine
- ○ poteri di prescrizione e di sanzione
- ○ poteri normativi
- ○ poteri di moral suasion

Transcript

Siete ormai giunti al termine di queste due settimane di formazione,

nelle quali abbiamo cercato di individuare

e di descrivere gli strumenti giuridici e sociali, che l'ordinamento

pone a fondamento della tutela dei minori che abbiano subito un trauma.

Così, in questo breve video conclusivo, vorrei cercare di tirare le fila del nostro percorso,

identificando le principali chiavi di lettura delle varie questioni che abbiamo trattato.

In primo luogo, è importante ricordare che la consacrazione dei diritti del minore

è stata una conquista travagliata e per nulla scontata.

Una chiara testimonianza di quanto detto è sicuramente il caso di Mary Ellen Wilson,

che si è concluso positivamente solo grazie alla tenacia di una missionaria metodista

e dell'intuizione di un avvocato:

in quel caso, infatti, per allontanare una minore

da un contesto familiare a dir poco inadeguato, ci si era addirittura dovuti rivolgere alle

leggi in materia di maltrattamento degli animali.

Il che è certamente qualche cosa che può meravigliare.

Ma anche maggiore meraviglia può aver destato

in voi la vicenda a cui fa riferimento la decisione Z. c. Regno Unito della Corte europea

dei diritti dell'uomo,

non fosse altro perché si è verificata oltre cento anni dopo.

Dunque possiamo dire

che, ancora nei primi anni Novanta, l'idea di un obbligo, in capo allo Stato,

di porre rimedio a situazioni familiari problematiche per il benessere di un minore faceva

una certa fatica a radicarsi.

I giudici della Corte europea, in quel caso, hanno dovuto ricavare

un tale dovere dalla Convenzione europea dei diritti dell'uomo, riconoscendolo in sostanza

come un corollario del divieto di trattamenti inumani e degradanti di cui all'art. 3 della Convenzione europea.

Poi c'è un secondo punto importante da ricordare:

è che un decisivo impulso verso il superamento

di lacune giuridiche, che in ogni Stato

sono presenti, è certamente venuto dal diritto

internazionale e dal diritto sovranazionale.

Sicuramente va ricordata la Convenzione di New York,

seguita poi, per quel che ci riguarda più vicino, da molte iniziative del Consiglio

d'Europa, nonché, piụ di recente, anche dell'Unione europea.

Solo attraverso questi strumenti, potremmo dire, la consapevolezza che il minore sia

un autonomo soggetto di diritti, titolare di posizioni giuridiche proprie e indipendenti

rispetto a quelle dei genitori, ha potuto progressivamente affermarsi;

così che oggi

possiamo davvero definirlo un patrimonio comune in ogni ordinamento.

Allo stesso modo, è anche

pacifico che esista un vero e proprio dovere delle autoritā statali di prevenire

e punire oggi eventuali maltrattamenti nei confronti dei minori, come è pacifico che
vi sia un dovere di accompagnare efficacemente chi ha subito un maltrattamento verso un pieno
e totale recupero del proprio benessere psico-fisico.
C'è anche una terza chiave di lettura molto importante.
Il minore è un individuo che presenta
spiccate peculiarità:
la sua personalità è ancora in formazione e,
proporzionalmente all'età, necessita sicuramente di attenzioni che l'adulto di solito non richiede;
a maggior ragione queste
attenzioni speciali sono necessarie quando il minore è stato vittima di abusi e violenze,
magari, ancor di più, in ambito familiare.
In altre parole, potremmo dire
che, per quanto riguarda i minori, i diritti che sono generalmente riconosciuti a ogni
individuo hanno richiesto un'autonoma elaborazione, che tenesse conto delle loro particolari e
delicate condizioni.
Per fare qualche esempio, è vero che il minore
ha diritto di essere ascoltato e di esprimere la propria opinione su ogni questione che lo riguarda;
ma è anche vero che, se necessario per realizzare il suo superiore interesse,
allora la decisione, che alla fine l'ordinamento prende in una procedura che lo riguarda, potrebbe
anche essere diversa da quella che lui ha manifestato come preferibile; e può essere
anche completamente differente dalla volontà che il minorenne ha manifestato.
Poi c'è anche un quarto punto importante da ricordare.
Il cammino verso
la reintegrazione del benessere del minore traumatizzato
può essere un cammino doloroso quasi quanto le
violenze e gli abusi che il minorenne ha subito.
In questo senso, instaurare un procedimento
penale, un procedimento civile, in seguito al maltrattamento, è certamente una condizione
essenziale per il raggiungimento di numerosi e importanti obiettivi: punire chi ha commesso
il fatto, se costituisce reato;
impedire che le condotte di abuso vengano reiterate;
risarcireil danno subito;

quando sia necessario, anche ristabilire un adeguato contesto famigliare.
Ma non va dimenticato che esiste anche un rovescio di questa medaglia,
che è dato dai
sacrifici - spesso altrettanto numerosi - che sono richiesti al minore per affrontare tutti
i passaggi di un procedimento.
Spesso è cruciale ad esempio la sua partecipazione
al procedimento che lo coinvolge;
e questa partecipazione, oltre a essere diritto del
minorenne, è anche importante, addirittura fondamentale, per l'accertamento dei fatti:
esprimendo la sua opinione e raccontando la sua esperienza, la vittima può sempre offrire
al giudice degli elementi importanti per la decisione finale.
Però, come abbiamo visto,
esistono anche dei rischi importanti di vittimizzazione secondaria,
perché,
nel corso di un procedimento,
il minore deve probabilmente ricordare i fatti e quindi i traumi subiti;
deve probabilmente
subire l'esposizione pubblica legata alla sua vicenda processuale;
deve probabilmente,
nel corso del processo, venire anche a contatto diretto con l'autore dell'abuso.
E sono tutti rischi assolutamente importanti e rilevanti.
Poi quando si riveli necessario disporre l'adozione
o anche solo l'affidamento di un minorenne, non va certo dimenticato quanto possa essere
difficile l'inserimento in nucleo famigliare nuovo.
Paradossalmente, potremmo dire, il superamento di un primo trauma,
che è dato dall'abuso,
richiede poi di imboccare un nuovo percorso, che però a sua volta è costellato dal pericolo
di molti altri piccoli traumi.
E poi c'è forse la considerazione più importante.
Spesso accade che nuovi diritti e nuove tutele
richiedano molto tempo e molte energie per affermarsi;
e questo, come abbiamo visto, è accaduto anche per il minore.

Ora che,
però, queste garanzie esistono va probabilmente
compiuto un passo ulteriore:
bisogna acquisire consapevolezza che il diritto, da solo, non basta.
Che le Convenzioni internazionali, sovranazionali, che le direttive europee,
le leggi dei singoli Stati, da sole, non bastano.
Sono il punto di partenza,
sono la base su
cui tutto il resto dev'essere poi costruito.
Ciò che più conta - in questo ambito probabilmente
più che in altri - è come le garanzie, che sono sancite sulla carta, vengono poi attuate,
realizzate, tramite efficienti politiche sociali.
In questo, le amministrazioni centrali e locali
devono certamente farsi carico di promuovere, con iniziative concrete, una cultura del rispetto
dei diritti dei minori;
allo stesso tempo, devono costruire, monitorare, investire,
su servizi specifici per l'infanzia e l'adolescenza;
servizi come gli sportelli di aiuto, i gruppi di sostegno,
autorità di vigilanza e di controllo.
E, in questo, non dimentichiamolo, un ruolo
importante hanno sempre anche il volontariato e le associazioni che promuovono e tutelano
i diritti dei minori,
perché queste associazioni sono sicuramente un tassello fondamentale,
per attuare politiche sociali efficaci ed efficienti.
Anche per limitare poi il rischio di quella vittimizzazione secondaria, di cui abbiamo
parlato, le amministrazioni pubbliche devono avere una adeguata sensibilitā e devono agire
con opportuni investimenti.
Giusto per fare qualche esempio, devono sicuramente allestire
delle aule in tribunale per l'ascolto protetto;
devono sensibilizzare adeguatamente i giudici e gli avvocati;
devono assicurare delle condizioni adeguate per lo svolgimento delle audizioni del minorenne;
devono sicuramente garantire una assistenza psicologica continuativa per

tutto il corso del procedimento.

E naturalmente il contributo dei primi fruitori

di questo corso, cioč i professionisti, sociali e sanitari, che sono deputati a interagire

con il minore, è fondamentale.

Perché questi operatori sono,

siete,

i custodi dei minorenni fuori dai processi,

per il superamento del trauma che č causato dalla vittimizzazione

primaria; ma siete anche i custodi del minorenne dentro i processi,

perché potete rendere

più sopportabile qualcosa

che non potrà mai essere vissuto come ordinario;

e poi siete i custodi dei minorenni anche dopo i processi,

perché dovete fare in modo che il cammino

faticoso verso il recupero della serenità non s'interrompa proprio nel momento in cui dovrebbe

maggiormente accelerare e dare poi i suoi frutti.

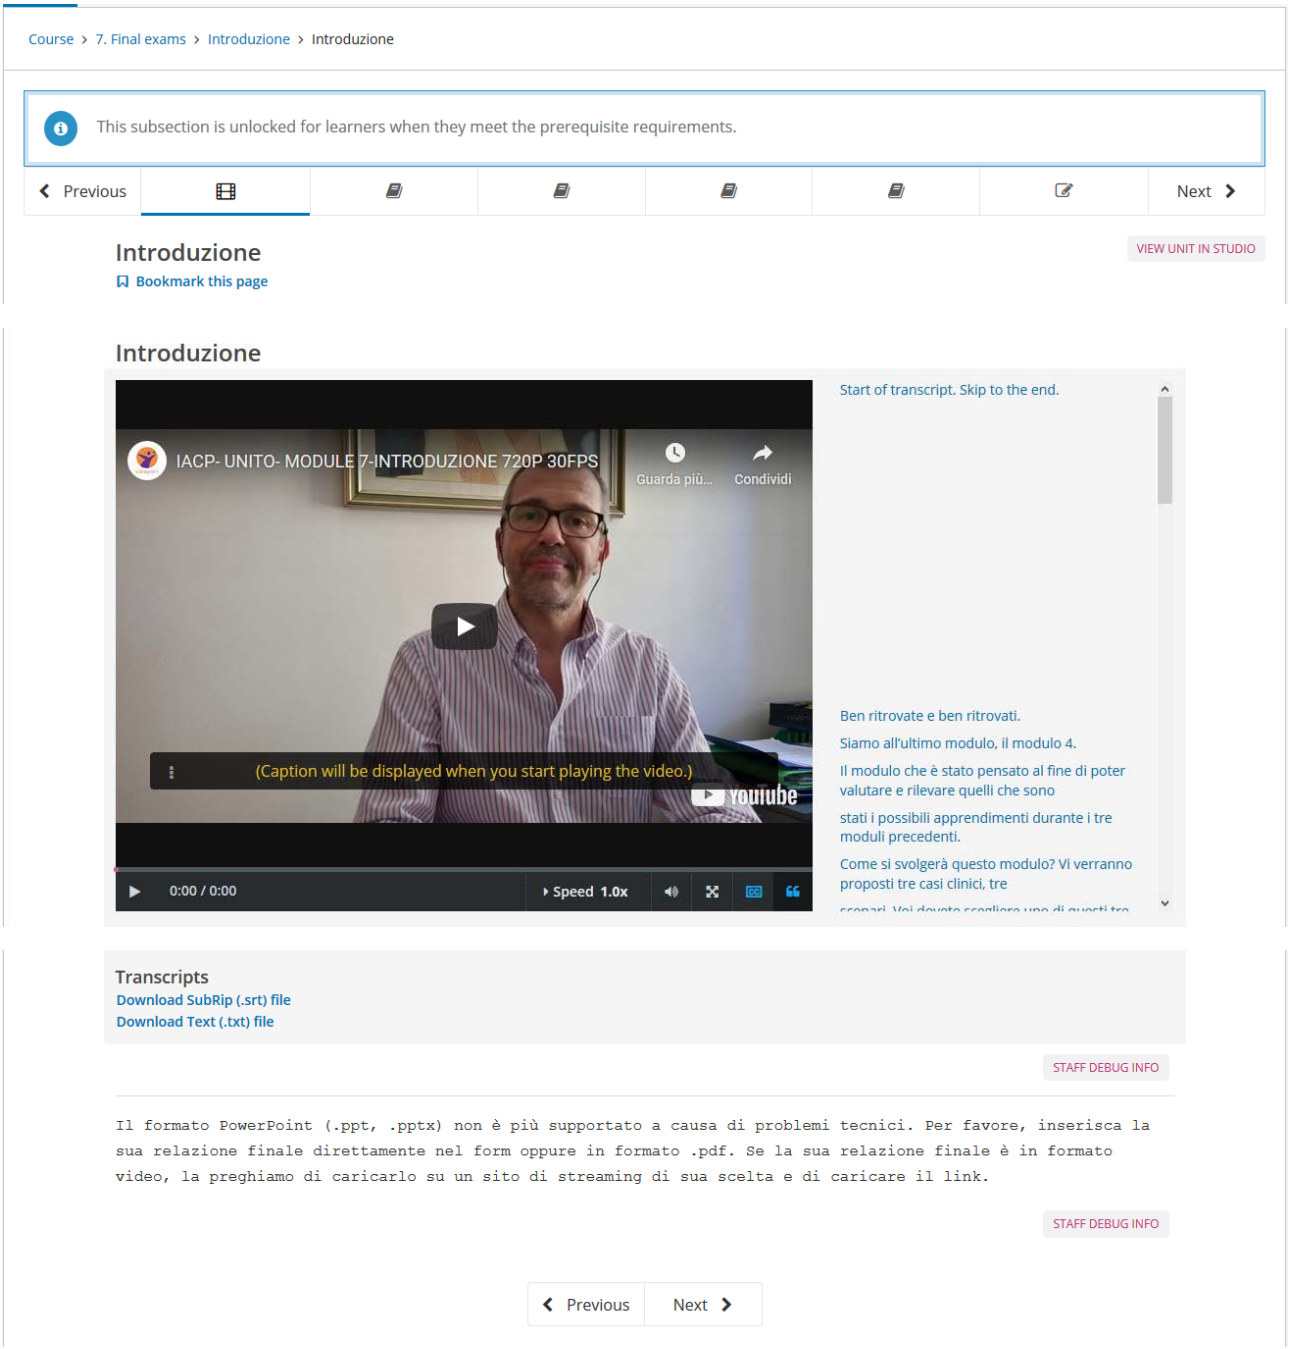
In definitiva, sono moltissime le difficoltà che attendono il bambino o l'adolescente vittima

di maltrattamenti;

ma, come abbiamo cercato di evidenziare fino a questo momento, esistono

anche molti strumenti per aiutarlo ad affrontare queste sfide e a vincerle.

Quindi buon lavoro a tutte e a tutti.



Transcript

Ben ritrovate e ben ritrovati.

Siamo all'ultimo modulo, il modulo 4.

Il modulo che è stato pensato al fine di poter valutare e rilevare quelli che sono

stati i possibili apprendimenti durante i tre moduli precedenti.

Come si svolgerà questo modulo? Vi verranno proposti tre casi clinici, tre

scenari. Voi dovete scegliere uno di questi tre scenari e dopo di che dovrete provare

a rispondere mettendo insieme e integrando le competenze apprese nel modulo uno: la teoria,

nel modulo due: la ricerca, e nel modulo tre la parte legislativa; quelli che sono gli

aspetti rilevanti il TIC, il Trauma Informed Care, e come questo possa essere applicato
ai tre scenari.
Come dovrete produrre questo breve report,
questa breve relazione? Avrete più opzioni. Potrete produrre un file
in PowerPoint, quindi una presentazione; potrete registrare un breve video, quindi utilizzare
questo format o potrete produrre un documento Word oppure un file PDF o ancora potrete utilizzare
altre modalità che vi vengono in mente.
La particolarità, la peculiarità di questo
ultimo modulo è che ci sarà una peer review, ossia valuterete il progetto di un altro partecipante
al corso e il vostro progetto al contempo sarà valutato da un altro partecipante.
Vi sarà una revisione fra pari. L'ultima valutazione però verrà sempre a carico e sarà sempre
a carico di un tutor anziano, di uno dei responsabile del progetto.
Questo possiamo dire che è veramente l'ultimo step che vi richiediamo per poter ottenere
quello che sarà il certificato di partecipazione a questo percorso formativo online.
Una volta che avrete terminato la documentazione e avrete terminato il vostro report, video
o presentazione in Power Point, potrete sottometterlo, vi sarà un abbinamento casuale e anonimo
con un altro studente, dopodiché sarete chiamati anche voi a valutare un documento, un report o un video
Vi sarà poi la submission finale del vostro lavoro e arriverà a quel punto
un senior che provvederà a un ulteriore valutazione e a autorizzare o meno la chiusura del vostro percorso formativo
Speriamo che sia stato un percorso piacevole,
che abbiate potuto apprendere un qualche cosa o comunque confermare e avvalorare un sapere
in più rispetto al Trauma Informed Care. Se avrete piacere potrete anche lasciare dei
brevi video alla fine del vostro percorso, con il vostro nome e cognome, brevi documenti
dove andremo a certificare che voi sarete stati su questo percorso formativo.
A nome mio, Luca Rollè, e di tutto il gruppo di lavoro del progetto Care Path, vi diamo
ancora una volta un grande ringraziamento per essere stati con noi e speriamo di rivedervi
ad una futura edizione.

Durante questa attività le verrà richiesto di analizzare un caso (scegliendo lo scenario che preferisce) da un punto di vista legale, psicologico e/o di ricerca scientifica. Il suo contributo dovrebbe contenere le sue riflessioni alla luce dei principi fondamentali della Trauma Informed Care.

1. Può preparare il suo contributo in

- testo (inserisca semplicemente la risposta nell'area corrispondente) OPPURE
- può effettuare l'upload di un file contenente il suo contributo. **Nota importante - il file dovrebbe essere in formato PDF ed avere una dimensione massima di 5MB.**

Se ha preparato un video può semplicemente inserire il link del video che ha pubblicato per renderlo disponibile alla valutazione.
2. Dopo l'invio del suo contributo, ogni partecipante dovrà valutare almeno un contributo preparato da un altro partecipante. Questo è un passaggio obbligatorio per terminare l'attività.
Nota importante - se c'è bisogno di valutare una risposta contenuta in un file, è necessario scaricare il file ed aprirlo nel proprio dispositivo. Bisogna inoltre assicurarsi che abbia l'estensione .pdf. Se questo non è il caso, bisogna rinominare il file aggiungendo il suffisso .pdf alla fine.
3. La valutazione finale del contributo sarà in ogni caso presa in carico dai coordinatori del progetto. Una volta completata questa fase, il voto finale sarà visualizzabile.

Scenario 1

La minore C.F. di anni 15, viene conosciuta da un servizio territoriale su invio dell'Ospedale.

Frequenta la scuola superiore con discontinuità e scarso rendimento ed è stata accompagnata al Pronto Soccorso a causa dell'ingestione di un quantitativo eccessivo di psicofarmaci.

Dopo l'intervento del Pronto Soccorso, viene reinviata a casa con l'obbligo per tutta la famiglie di seguire un percorso di aiuto e sostegno.

La minore si presenta con un atteggiamento in parte rabbioso, non vuole essere al colloquio né parlare delle sue cose e non capisce il perché di questo invio. Lei dichiara di aver fatto una stronzata insieme alla sua amica ma di sicuro non la ripeterà.

Riconosciuta la immaginabile paura con la quale ha vissuto la "stronzata" cui fa riferimento, e chiariti i termini del colloquio, la ragazza si apre e, dando voce alla fragilità della sua storia, racconta di sé:

i genitori sono separati, anche se non ufficialmente, da alcuni mesi e la mamma è fuori casa. C. trova questo positivo per se, ha un rapporto molto difficile con la madre ed il fatto che sia fuori casa la fa sentire più tranquilla da una parte, anche se le ha fatto perdere una persone che la aiutava a fare dellecose. A lungo, nel corso delle scuole elementari e parte delle medie, questa mamma è stata rabbiosa e l'ha picchiata ed insultata quando si trovava davanti a degli errori o delle cose che lei doveva fare diversamente. Le correzioni di azioni venivano agite con botte, insulti "sei una stronza" "stupida" per arrivare nell'ultimo periodo a squalifiche più significative "sei una puttanella". Però, nell'ultimo anno di vita C. ha iniziato "finalmente" a non subire più le cose ma a rispondere a sua madre e a volte sono arrivate a picchiarsi, cosa che lei ha trovato un buon modo per affrontare i litigi. Il padre è via tutto il giorno per lavoro e C. dice che è una brava persona, che tuttavia tornava a casa la sera e non sembrava interessato alle cose di casa, probabilmente per la stanchezza della giornata. Tra i genitori le cose sembrano un po' fredde e non ci sono momenti nella vita familiare in cui le persone si ritrovano insieme a fare cose. Anche le domeniche vengono trascorse a casa o con la zia (sorella del padre) che per C. è un punto di riferimento.

Quando ha 13 anni C. a scuola inizia a fumare ed insieme alla sua amica conoscono marijuana e fumo. Le piace la sensazione di rilassamento e divertimento che prova quando fuma e ben presto inizia a frequentare un gruppo di persone che condividono lo stesso "interesse" per il fumo.

Dopo qualche mese di continue difficoltà in casa, sua mamma inizia ad essere meno presente e nel pomeriggio esce tutti i giorni e questo permette a C. di essere libera di portare a casa chi vuole e di avere il suo spazio per stare come vuole. Inizialmente lei è contenta di questo e non si informa su questo cambiamento e sulle ragioni che lo hanno determinato, anzi trova che questo sia proprio un vantaggio per la sua vita. Scopre poi un giorno, girando con un'amica, che sua mamma sta frequentando un altro uomo perché li trova seduti in un bar fuori zona in atteggiamenti amorosi.

A questo punto, lei dice, trova finalmente il modo per riuscire ad ottenere tutto ciò che vuole, poiché entra in un gioco di richieste con la madre alle quali la donna non può sottrarsi: C. vuole portare a casa il suo fidanzatino e restare sola e chiede alla madre di lasciarla sola. Inizialmente la donna non vuole ma quando C. le dice che deve per evitare che poi lei spifferi tutto al padre la donna cede e così via, aumentano le richieste di C. e le concessioni della madre: C. porta a casa chi vuole, fuma in casa, le viene concesso l'acquisto di birra e soldi per quello che chiede. Paga tutto questo con la rabbia e gli insulti della donna, che cede ad ogni richiesta seppur facendole sentire tutto il suo disprezzo.

Il padre è all'oscuro di tutto questo. Mentre parla di questo C. ha un atteggiamento di triste trionfo e di grande rabbia.

Ciò va avanti fino al mese di settembre (un anno circa), quando il padre, scoperto il tradimento della moglie, la allontana da casa. A quel punto C. è ancora più libera e resta sola fino al ritorno del padre, inizia a far tardi a scuola o a non andare affatto, fino a quando stando a casa dell'amica e trovando un farmaco che la mamma della sua amica prende, decidono di provarlo insieme. Esattamente a seguito di questo episodio, il papà viene chiamato dalla madre dell'amica che trova le ragazza addormentate sul letto ed in un ostato confusionale e "purtroppo" vengono portate al Pronto Soccorso.

Scenario 2

B. 15 anni, studentessa, figlia maggiore di due; madre imprenditrice, padre disoccupato; vivono nella periferia di una grande città.

Arriva in consultazione a causa di forti ed invalidanti dolori fisici, a carico della metà inferiore del corpo (gambe e addome) non spiegati da alcuna patologia organica (i genitori hanno provveduto a far effettuare tutti i controlli medici).

Questi dolori impediscono a B. di condurre una vita adeguata e soddisfacente per la sua età: andare a scuola con continuità è impossibile e, infatti, rischia di perdere l'anno scolastico; inoltre uscire, praticare uno sport o frequentare i coetanei è molto complicato perché ogni programma potrebbe essere mandato in frantumi da questi improvvisi e lancinanti dolori.

Al primo colloquio la ragazza si presenta molto poco curata, piuttosto schiva (non condivide lo sguardo, parla poco e a bassa voce) e ritirata (resta per tutto il tempo rannicchiata sulla poltrona). Riferisce di aver deciso di chiedere aiuto perché consapevole della necessità di occuparsi di una problematica che la sta "chiudendo in casa".

Mostra una cultura piuttosto vasta, una grande curiosità ed un'intelligenza molto vivace, che sembrano fare da contraltare alla staticità e al ripiegamento del corpo.

Dichiara di non avere idea rispetto a cosa possa aver dato l'avvio a questa sintomatologia, che è comparsa indicativamente con l'arrivo del menarca.

Racconta di avere ottimi rapporti con i membri della propria famiglia, pochissimi amici e di fare molta fatica a stare in gruppo, sia fra pari che in presenza di adulti. Ama molto leggere ed ascoltare musica, studia diverse lingue da autodidatta.

Nel corso del primo anno di psicoterapia, lavorando sul senso invalidante del sintomo e puntando all'empowerment, i dolori fisici vengono circoscritti e mitigati: si presentano soltanto a ridosso del ciclo mestruale e le fanno perdere al massimo uno o due giorni di scuola. Accanto a ciò, però, non vi è ancora contezza dell'origine del sintomo, inoltre compaiono attacchi di panico piuttosto frequenti.

Accanto al lavoro individuale con B., periodicamente, incontro tutto il nucleo familiare che, sebbene esprima preoccupazione per la sofferenza espressa dalla ragazza, le riconosce grandi cambiamenti e grandi risorse messe in campo per tornare a vivere la propria vita in modo soddisfacente.

Dopo circa due anni di lavoro, ormai B. è in grado di gestire gli attacchi di panico, che sono ormai rarissimi e di utilizzare varie strategie (training autogeno, yoga, fantasie guidate, respirazione) per fare fronte ai dolori fisici. Durante la visione di un film, però, come mi riporterà alla seduta successiva, mentre le immagini mostrano una scena di violenza sessuale, la ragazza ha un'improvvisa sensazione di angoscia che racconterà "come un black out interiore". Iniziamo ad esplorare questo suo sentire, cominciando ad avvicinarci a quelli che inizialmente sembrano alla ragazza "frammenti di sogni", poi divengono nebulose immagini che non sa se siano fantasie o ricordi di film o libri.

Lavorando, con tempi e modalità rispettosi della ragazza, delle sue difese e delle sue comprensibili paure, ma anche continuando a supportare e rinforzare le sue risorse, lentamente B. recupera il ricordo dell'abuso subito da una persona cui era affidata, in assenza dei genitori, tra i 3 e i 7 anni. Il recupero del ricordo permette a B. sia di dare l'avvio all'iter per la denuncia e per mettersi in sicurezza (l'abusante frequentava ancora, seppur sporadicamente, la famiglia) sia di iniziare a dare senso alle proprie sofferenze psichiche, fino a quel momento gestite, ma non significate.

Scenario 3

Il minore R. di anni 13, viene conosciuto da un servizio territoriale su invio del Tribunale.

Frequenta la scuola elementare ed è inserito all'interno di una casa famiglia da quando ha 9 anni .

All'incontro è accompagnato dall'educatrice della casa famiglia ed è aperto ed interessato a conoscere le persone con le quali ha un colloquio finalizzato ad una presa in carico. Inizialmente socievole, risponde alle domande, interagisce con le persone, scherza ed è simpatico, quando si parla un po' del motivo del colloquio da voce a tutta la sua confusione: non capisce perché sta lì, cosa dovrebbe fare, cosa si vuole da lui e chiede risposte a queste domande dando voce al disorientamento e a diversi timori (di essere allontanato ancora di più dai genitori, di far loro del male, che qualcuno decida che non potrà frequentarli , etc....).

Dopo un periodo di separazione i genitori oggi vivono insieme, esattamente come quando R. è stato allontanato. Il ragazzo ricorda diversi litigi tra i due, non sono andati molto d'accordo, e diverse volte la mamma, originaria di un paese diverso da quello di residenza, ha cercato di ritornare nella sua famiglia di origine. R. quando la mamma se ne andava era dispiaciuto, ma anche contento perché i litigi per un periodo si interrompevano. Vuole bene ai suoi genitori ed anche ora gli fa piacere passare il tempo con loro.

Li sente tutti i giorni e li vede 1 volta a settimana, quando lo vanno a trovare nella sede della casa famiglia.

Sta lì da un paio d'anni e si trova bene, anche se vorrebbe tornare a vivere a casa, ma non sa se è possibile.

Non ricorda bene il giorno in cui è entrato in casa famiglia, ma sa che fu il padre ad accompagnarlo. La mamma restò a casa a piangere e lui si sentì molto dispiaciuto per lei. Papà è stato più forte, perché lo ha accompagnato, e come sempre lo ha riempito di parole ma non ha pianto.

R. era spaventato quando è entrato in casa famiglia, ma ha trovato delle persone divertenti e simpatiche che lo hanno fatto sentire meno impaurito ed anche con gli altri è stato facile fare amicizia.

R. entra in casa famiglia dopo che un amico dei suoi genitori fa delle avances di natura sessuale, violandolo. Non è lui a dirlo a nessuno, ma ad un certo punto la cosa viene fuori (R. ancora non sa perché) e finisce anche in Tribunale. Quest'uomo era un amico dei genitori e frequentava la casa abbastanza spesso, e lui gli era affezionato e sentiva che anche per questo amico lui era importante: la sera gli raccontava delle storie e a volte il papà gli chiedeva di metterlo a letto.

Quando sono successe delle cose brutte e si sono venute a sapere, il padre ha accompagnato R. in casa famiglia, volendolo proteggere da questo uomo.

R. non sa bene cosa prova per tutto ciò, forse – dice - solo tanta confusione.

In casa famiglia sta bene, a volte si sente però un po' costretto a stare dentro certe regole dure e allora si arrabbia moltissimo e finisce per fare danni, agli oggetti e non alle persone. Non sopporta in particolare che gli vengano messe delle regole che non capisce per sentire i suoi genitori o per vederli, ma per il resto dentro la casa famiglia fa delle cose interessanti (addirittura sport) e sta bene con gli altri. Gli piace avere amici intorno anche se certe volte desidera stare da solo e vorrebbe essere lasciato in pace.

Ha un'educatrice con la quale ha stabilito un rapporto speciale, che si occupa molto di lui e questo gli piace molto.

Ha molte paure su quello che succederà quando uscirà dalla casa famiglia, non perché debba uscire, ma perché* sa che ad un certo punto succederà ma non vuole che queste paure le sappiano i suoi genitori, perché ha paura si dispiacciano e pensino che lui non gli vuole bene.

FINAL EXAMS

This assignment has several steps. In the first step, you'll provide a response to the prompt. The other steps appear below the **Your Response** field.

IN PROGRESS

1 Your Response

Enter your response to the prompt. You can save your progress and return to complete your response at any time. **After you submit your response, you cannot edit it.**

The prompt for this section

> Analizzare il caso (Scelga lo Scenario che preferisce) da un punto di vista legale, psicologico e/o della ricerca scientifica.
>
> Realizzare un contributo (che può assumere diverse forme quali, ad esempio: testo, video, presentazione .ppt) che contenga le riflessioni del partecipante alla luce dei principi fondamentali della Trauma Informed Care, in merito allo scenario prescelto.

Your response (optional)

Enter your response to the prompt above.

carepath

Empowering public authorities and professionals towards trauma-informed leaving care support

Training and assessment material
ANNEX 1
–
Italian Version

Co-funded by the European Union's Rights, Equality and Citizenship Programme (2014-2020)

ESEMPI DI RICERCA

- Ricerca Quantitativa

Il sito di questo studio era un piccolo college (iscrizione 1.000), religioso, coeducativo, di arti liberali in una città del Midwest con una popolazione di 175.000 persone. [Gli autori hanno identificato il sito di ricerca e la popolazione.]
Il tasso di abbandono dell'anno precedente era del 25%. I tassi di abbandono tendono ad essere più alti tra le matricole e gli studenti del secondo anno, quindi è stato fatto un tentativo di raggiungere il numero più elevato possibile di matricole e studenti del secondo anno attraverso la distribuzione del questionario nelle classi. La ricerca indica che maschi e femmine abbandonano il college per diversi motivi (Bean, 1978; Spady, 1971). Pertanto, solo le donne sono state analizzate in questo studio. Nell'aprile del 1979, 169 donne hanno restituito i questionari. È stato selezionato per questa analisi un campione omogeneo di 135 donne di 25 anni o più giovani, non sposate, a tempo pieno cittadini statunitensi e caucasici (Kerlinger, 1973).
Di queste donne, 71 erano matricole, 55 erano studenti del secondo anno e 9 erano juniores. Tra gli studenti, il 95% aveva un'età compresa tra i 18 e i 21 anni. Questo campione è affetto da bias dovuto alla partecipazione di studenti con maggiore capacità, come indicato dai punteggi del test ACT. [Gli autori hanno presentato informazioni descrittive sul campione.] I dati sono stati raccolti mediante un questionario contenente 116 items. La maggior parte di degli items erano di tipo Likert basati su una scala da "in misura molto limitata" a "in misura molto grande".
Altre domande hanno richiesto informazioni concrete, come punteggi ACT, voti delle scuole superiori e livello di istruzione dei genitori. Tutte le informazioni utilizzate in questa analisi sono state ricavate dai dati del questionario. Questo questionario era stato sviluppato e testato in altre tre istituzioni prima del suo uso in questo college. [Gli autori hanno discusso lo strumento.]...
Per analizzare i dati sono stati utilizzati regressione multipla e path analysis (Heise, 1969; Kerlinger & Pedhazur, 1973).

(Bean & Creswell, 1980, pp. 321-322)

Ricerca Qualitativa

Lo scopo della ricerca era quello di studiare l'iniziazione al tabagismo di pre-adolescenti (Frohlich, Potvin, Chabot, Corin 2002). Dopo aver ricostruito la prevalenza del tabagismo fra pre-adolescenti in 32 territori del Quebec e aver acquisito informazioni pertinenti sui vincoli e sulle risorse «strutturali» che ora ostacolo, ora autorizzano l'abitudine al fumo di questa popolazione – la presenza di rivendite di sigarette, quella di luoghi pubblici nei quali non è consentito fumare, la presenza di soggetti che controllano il rispetto delle regole che governano la vendita delle sigarette ad adolescenti e il fumo nei luoghi pubblici – le autrici puntano l'attenzione su otto territori nei quali conducono dei focus group. In ciascun territorio i partecipanti vengono reclutati con la mediazione degli insegnanti della scuola di quartiere, mettendo con ciò capo a gruppi di ragazzi e ragazze che – con ogni probabilità – si conoscevano e frequentavano prima del focus group. In questo studio, la reciproca conoscenza dei partecipanti diventa una risorsa e non già un limite, offrendo alle ricercatrici la possibilità di accedere a discorsi che, magari meno «addomesticati», prendevano forma nel contesto di vita dei partecipanti. Questi ultimi, inoltre, forte del sostegno reciproco hanno avuto modo di affrontare con maggiore serenità un tema – l'abitudine al fumo – difficile da discutere di fronte a un interlocutore adulto. La conoscenza del «contesto etnografico» (Cicourel, 1974), dei codici linguistici delle pratiche sociali diffuse nei territori cui i focus group furono ancorati è quanto consentì alle autrici di fronteggiare le difficoltà comunemente associate alla realizzazione di un focus group con un gruppo naturale: il richiamo a esperienze condivise non pienamente esplicitate nel discorso, l'uso di espressioni gergali, il ricorso ad espressioni indicali.

(Cardano, Ortalda, 2017, pp. 242- 243)

DEFINIZIONI E PREMESSE

Guyadeen & Seasons (2018) evidenziano come, in modo simile a molte altre discipline, “il campo della pianificazione ha un proprio stile di valutazione” (p. 98) che può essere classificato secondo due filoni: “valutazione del piano e valutazione della pianificazione. Tradizionalmente, la valutazione nella pianificazione era considerata indipendente dalla valutazione del programma e comportava l'uso di approcci di valutazione specifici. La disciplina di pianificazione attualmente sostiene che vi sia un vantaggio nel costruire legami più forti tra la valutazione del programma e la valutazione nella pianificazione” (p. 98). Nel sistema sanitario pubblico, in particolare, la valutazione svolge un ruolo importante nei processi di elaborazione delle politiche e dei piani programmatici. “Entrambi i processi seguono una fase di identificazione e definizione del problema” (p. 99), a cui seguono le fasi di formulazione, implementazione e, infine, di valutazione. L’ultima fase è mirata alla determinazione del successo dell'intervento e all'identificazione delle aree di miglioramento (Pal, 2014; Guyadeen & Seasons, 2018). Come specificato da Guyadeen & Seasons (2018): “È un processo strutturato che mira a creare e sintetizzare informazioni sugli interventi al fine di formulare giudizi sui cambiamenti risultanti, sulla desiderabilità di un intervento e sul grado di adattamento tra risultati intenzionali e non intenzionali (McDavid & Hawthorn, 2006)” (p. 99) . Il processo di valutazione può concentrarsi anche sull'efficacia dei costi di programmi e piani, e può essere considerato particolarmente importante nelle organizzazioni afferenti al settore pubblico: per motivi di responsabilità politica o legislativa, è richiesto ai pianificatori di dimostrare i benefici delle loro azioni al pubblico e alla comunità (Vedung, 2010; Guyadeen & Seasons, 2018).

Craig e colleghi (2008) mettono in luce “come interventi complessi siano ampiamente usati nel servizio sanitario, nelle pratiche della salute pubblica e in aree di politica sociale che hanno importanti conseguenze sulla salute” (p. 1). Tali iniziative presentano sfide per gli operatori che si occupano di valutazione, che vanno oltre le difficoltà pratiche e metodologiche che ogni valutazione del successo di un’iniziativa deve affrontare. Infatti, “gli interventi complessi sono solitamente descritti come interventi che contengono diversi componenti interagenti” e che hanno molteplici “caratteristiche che i valutatori dovrebbero tenere in considerazione” (Craig et al., 2008, p. 1). In questo, ad esempio, domande chiave nella valutazione di interventi complessi riguardano: tali interventi sono efficaci nella pratica quotidiana? Gli effetti variano

a seconda dei destinatari o dei contesti? Come funziona l'intervento? Quali sono gli elementi chiave e come esercitano i loro effetti?

In via generale, dal punto di vista procedurale e processuale, la *best-practice* consiste nello sviluppare sistematicamente gli interventi. Questo vuol dire che: "la *best-practice* è lo sviluppare interventi sistematicamente, utilizzando le migliori evidenze disponibili e la teoria appropriata, quindi testarli utilizzando un approccio graduale, partendo da una serie di studi pilota mirati a dipanare i principali elementi di incertezza nel disegno progettuale e passando a una valutazione esplorativa e, in seguito, ad una definitiva. I risultati dovrebbero essere divulgati nel modo più ampio e dettagliato possibile, con ulteriori ricerche per monitorare il processo di attuazione" (Craig et al., 2008, p. 2).

Per iniziare a chiarire gli elementi coinvolti in questo complesso processo, Rychetnik, Frommer, Hawe & Shiell (2002) ci forniscono le seguenti definizioni:

- INTERVENTO: può essere definito come un insieme di azioni finalizzate a un obiettivo che comporta un cambiamento o produce esiti (*outcomes*) identificabili. Promuovere un maggior benessere o proteggere lo stato di salute sono gli obiettivi principali degli interventi pubblici di salute, che si distinguono da quelli clinici che sono generalmente rivolti alla prevenzione o al trattamento del disagio negli individui.
- CONTESTO: fa riferimento al setting sociale, politico e/o organizzativo entro il quale l'intervento è programmato/progettato e in cui è implementato e valutato. Le caratteristiche contestuali che vengono considerate rilevanti ai fini di un intervento variano in base al tipo di intervento. Per gli interventi di carattere pubblico nell'ambito della salute risultano importanti i fattori politici e organizzativi, socioeconomici e demografici, nonché ambientali.
- VALUTAZIONE: è il processo che consente di determinare il valore di un intervento attraverso il confronto con standard predeterminati ed espliciti.
- EVIDENZA: l'evidenza implica la lettura interpretativa dei dati rilevati attraverso una ricerca formale o indagini specifiche implementate secondo gli standard propri del metodo scientifico. La Evidence-based practice, infatti, mette in luce e si occupa delle conseguenze desiderate di un intervento e considera centrale l'efficacia (anche in termini di costo) considerando i dati sull'implementazione e gli esiti dell'intervento.

Inoltre, i PROGRAMMI sono composti da insiemi di attività volte a raggiungere un risultato specifico correlato o un insieme di obiettivi (McDavid & Hawthorn, 2006; Pal, 2014; Guyadeen & Seasons, 2018). I programmi sono generalmente pensati come mezzi-fini in cui le risorse vengono trasformate in attività per produrre un risultato desiderato (McDavid & Hawthorn,

2006; Guyadeen & Seasons, 2018). I PIANI, che possono assumere le caratteristiche di una guida, una sorta di visione programmatica e di pianificazione, hanno un ruolo predominante nell'organizzazione di interventi o iniziative per una comunità (Baer 1997; Ryan, 2011; Guyadeen & Seasons, 2018). Possono avere obiettivi complessivi in quanto offrono una visione orientata agli sviluppi futuri: incorporano fatti, obiettivi e politiche che possono essere tradotti in un modello di sviluppo fisico e affrontano molteplici problemi della comunità (Berke et al., 2006). I programmi possono essere parte delle strategie di implementazione di un piano (Guyadeen & Seasons, 2018). Come descritto da Guyadeen & Seasons (2018): "È importante notare che i piani sono strumenti in evoluzione che devono essere sottoposti a revisioni e aggiornamenti continui per rimanere pertinenti ai bisogni, alle conoscenze e alle esperienze in evoluzione (Brody, 2003). A tale riguardo, la valutazione dovrebbe svolgere un ruolo fondamentale nel garantire l'applicabilità e la pertinenza di piani e programmi" (p. 99).

In primo luogo, la valutazione può essere considerata "una disciplina empiricamente orientata che genera informazioni sui programmi" (Guyadeen & Seasons, 2018, p. 99) con lo scopo di migliorarli e/o guidare le decisioni future. In secondo luogo, vi è un'enfasi sia sul funzionamento del programma sia sui risultati. Ovvero, la valutazione non riguarda solo l'efficacia del programma, ma anche il processo. Infatti, è concentrata sul modo in cui i programmi vengono messi in pratica; include una analisi dei metodi organizzativi utilizzati per somministrare il programma, gli input utilizzati (ad es. Risorse), i risultati (ad es. le misure tangibili di un programma), e la sua economicità (Howlett, Ramesh & Perl 2009; Guyadeen & Seasons, 2018). Infine, la valutazione del programma viene utilizzata per tentare di rendere i programmi più efficienti ed efficaci (Weiss, 1998; Guyadeen & Seasons, 2018), e come mezzo per assicurare responsabilità e garanzia della qualità (Cousins et al., 2014; Pal, 2014; Guyadeen & Seasons, 2018).

Per queste ragioni, le decisioni relative agli interventi nel campo della sanità pubblica dovrebbero essere basate su una profonda valutazione dei punti di forza delle innovazioni proposte, ma anche delle debolezze e delle lacune nelle evidenze che ne sostengono la applicazione (Rychetnik et al., 2002). Le guide critiche nel campo della valutazione degli interventi, che identificano e valutano molteplici dimensioni delle evidenze, consentono di dare un adeguato spazio di considerazione per questioni quali la rilevanza e la trasferibilità, fornendo raccomandazioni specifiche e giustificate per la pratica (Rychetnik et al., 2002). Tuttavia, è altrettanto importante bilanciare una valutazione rigorosa e gli scopi complessivi per distinguere tra una valutazione sistematica e rigorosa delle prove disponibili e il complesso

processo sociopolitico che determina le decisioni politiche e pratiche (Rychetnik, Frommer, Hawe & Shiell, 2002).

Inoltre, Rychetnik, Frommer, Hawe & Shiell (2002) sottolineano "la distinzione tra la valutazione delle evidenze e il processo del prendere decisioni politiche od operative sull'attuazione degli interventi. Le evidenze basate sulla ricerca sono solo uno dei numerosi fattori presi in considerazione in queste decisioni" (p. 119). Infatti, gli autori specificano ulteriormente: "gli interventi di sanità pubblica tendono ad essere complessi, programmatici e dipendenti dal contesto. Le prove per la loro efficacia devono essere sufficientemente complete da comprendere tale complessità. La valutazione delle prove deve distinguere tra la fedeltà del processo di valutazione nel rilevare il successo o il fallimento di un intervento e il relativo successo o fallimento dell'intervento stesso. Inoltre, se un intervento non ha successo, l'evidenza dovrebbe aiutare a determinare se l'intervento fosse intrinsecamente difettoso (ovvero, il fallimento del concetto o della teoria dell'intervento), o la mancata consegna (mancata attuazione). Inoltre, una corretta interpretazione delle evidenze dipende dalla disponibilità di adeguate informazioni descrittive sull'intervento e sul suo contesto, in modo tale da poter determinare la trasferibilità delle evidenze" (p. 119).

Come indicato da Craig e colleghi (2008), nella pratica, la valutazione si realizza attraverso una vasta gamma di approcci che limitano la scelta degli interventi da parte dei ricercatori e la loro scelta dei metodi di valutazione. Inoltre, nel campo degli interventi complessi, varie fonti (ad es. la accettabilità politica) possono influenzare notevolmente i ricercatori ed influenzare la modalità di attuazione o adozione di un progetto di valutazione ideale Ancora, i metodi sperimentali sono sempre più ampiamente accettati come metodologie per valutare le *policies*, ma obiezioni politiche o etiche potrebbero limitare il loro utilizzo. La valutazione dovrebbe giocare un ruolo centrale nell'approccio critico agli interventi. Se i pianificatori decidono di utilizzare metodi non sperimentali, dovrebbero essere consapevoli dei loro limiti, interpretare e presentare i risultati con la dovuta cautela. I ricercatori "dovrebbero essere pronti a spiegare ai responsabili delle decisioni politiche o organizzative la necessità di un adeguato lavoro di sviluppo, i pro e i contro degli approcci sperimentali e non sperimentali e i compromessi coinvolti nell'individuazione dei metodi più deboli. Dovrebbero essere pronti a sfidare i decisori istituzionali quando vengono attuati interventi di incerta efficacia in un modo che renderebbe difficile il rafforzamento delle evidenze attraverso una rigorosa valutazione, o quando una modifica della strategia di attuazione aprirebbe la possibilità di una valutazione molto più informativa" (Craig et al., 2008, p. 2).

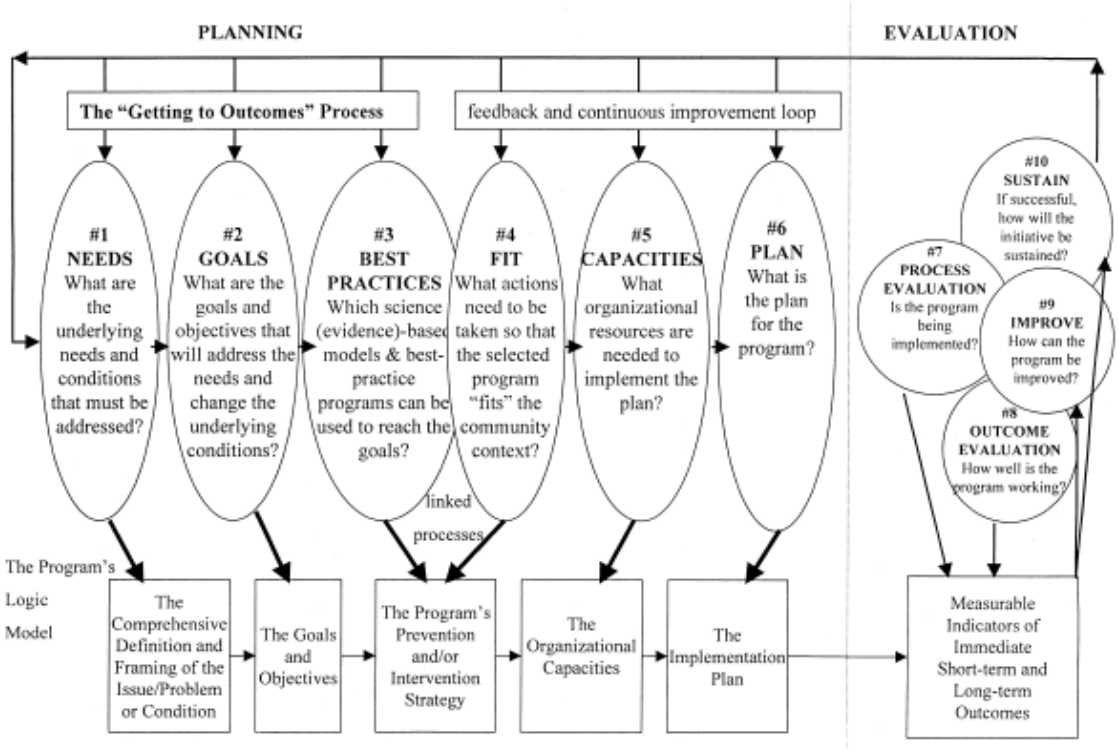
Più specificamente, i ricercatori (Craig et al., 2008) sottolineano che, ai fini di sviluppare un intervento complesso, il processo valutativo dovrebbe seguire una serie di passaggi:

1. Identificazione delle evidenze esistenti in merito: ciò che è già pubblicato o divulgato nella comunità scientifica su interventi simili (revisione sistematica e di alta qualità delle evidenze rilevanti, inclusi i metodi utilizzati per valutare il processo ed i risultati);
2. Identificazione e sviluppo della teoria: la logica dei programmi complessi di intervento, gli esiti previsti ed il modo in cui il cambiamento deve essere raggiunto potrebbero non essere completamente chiari fin dall'inizio. Uno dei primi compiti chiave è "sviluppare una comprensione teorica del probabile processo di cambiamento attingendo a modelli e teorie esistenti, integrate se necessario da nuove ricerche primarie. Questo dovrebbe essere fatto se il ricercatore sta sviluppando l'intervento o valutando uno che è già stato sviluppato" (p. 2);
3. Processo di modellizzazione: la modellizzazione di un intervento complesso prima di una valutazione completa permette ai pianificatori di includere e raccogliere informazioni importanti sulla progettazione sia dell'intervento che della valutazione. Potrebbe essere necessaria una serie di studi per perfezionare progressivamente il progetto prima di intraprendere una valutazione completa. Un altro approccio utile nella fase preliminare del design è una valutazione economica, che può aiutare i proponenti del progetto ad identificare debolezze e portare a perfezionamenti.

Infine, ci sono molti progetti di studio tra cui scegliere e diversi disegni si adattano a domande e circostanze differenti. I ricercatori dovrebbero fare attenzione alle affermazioni generali su quali modelli siano adatti al tipo di intervento e scegliere sulla base delle caratteristiche specifiche dello studio, come la dimensione dell'effetto attesa e la probabilità di selezione o di bias di allocazione. "La consapevolezza dell'intera gamma di approcci sperimentali e non sperimentali dovrebbe portare a compiere scelte metodologiche più appropriate" (Craig et al., 2008, p. 3).

Esistono generalmente due tipi principali di valutazione di un programma: formativo e riepilogativo/globale (*summative evaluation*). Le valutazioni che si concentrano sul miglioramento delle prestazioni di un programma sono conosciute come formative. Una valutazione formativa fornisce feedback al fine di migliorare i risultati dei programmi o aumentarne l'efficienza (McDavid & Hawthorn, 2006; Posavac & Carey, 2007; Guyadeen & Seasons, 2018). Le valutazioni formative generano informazioni per influenzare decisioni immediate su un programma, come il miglioramento delle parti componenti e dei processi (Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018). Le valutazioni che si

concentrano sui risultati, che vengono messe in atto quando un programma è stato finalizzato o è quasi completato, forniscono informazioni su se un programma ha raggiunto o meno i propri obiettivi dichiarati e/o se valga la pena continuare nel processo (McDavid & Hawthorn, 2006; Posavac & Carey 2007; Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018).
Riepilogando, come indicato da Wandersman e colleghi nel 2000, il processo di valutazione è complesso e articolato (Figura 1).



The "Getting to Outcomes" questions contribute to the delineation of the program's logic model structure

Fig. 1. The getting to outcomes framework.

VALUTAZIONE DELL'EFFICACIA E DEGLI ESITI (outcomes)

Secondo Guyadeen & Seasons (2018), "il modello di valutazione storicamente dominante è guidato dalla scienza ed altamente tecnico con una forte enfasi sui metodi quantitativi. I metodi e le tecniche di ricerca scientifica come i progetti di ricerca randomizzati sistematici (RCTs) e gli esperimenti sono considerati parte integrante del processo di valutazione (Alkin, 2013). Questo approccio alla valutazione si concentra sulla misurazione dell'efficacia e dell'efficienza (Greene, 1994)" (p. 100). Gli studiosi stanno lavorando da lungo tempo e non senza dissensi sulle modalità di valutazione, sui suoi obiettivi e contenuti, nonchè sugli indicatori (Jacobson et al., 1999). Ad esempio, una pratica comune nel campo della valutazione riguarda la analisi di come (principalmente in termini quantitativi) i programmi promuovono od ostacolano la realizzazione degli obiettivi. Questo approccio richiede obiettivi identificati in maniera chiara ed indicatori congruenti. La valutazione dell'efficacia è un processo complesso e non scevro dalla responsabilità di compiere rilevanti decisioni: come sottolineano Craig e colleghi (2008), nella valutazione dell'efficacia di un intervento, la randomizzazione deve essere sempre considerata come metodo d'elezione (ad es., per prevenire errori di selezione). Se un trial randomizzato fra gruppi paralleli convenzionale non è appropriato, dovrebbero essere considerati altri progetti randomizzati, o, se un approccio sperimentale non è fattibile, si può prendere in considerazione un progetto quasi sperimentale oppure osservativo.

In merito all'analisi degli esiti dell'intervento, qualora il piano della ricerca sia effettuato conformemente al metodo scientifico, essa ha l'obiettivo di confermare o disconfermare la sussistenza di una relazione causale tra intervento e i suoi effetti e comprendere le ragioni (perché) per cui esso è efficace o meno. Il disegno dello studio definisce inoltre il livello dell'evidenza che ne discende. La revisione sistematica degli studi randomizzati e controllati (*randomised controlled trials* o RCTs) è uno dei metodi che viene maggiormente utilizzato e riconosciuto per fornire il livello migliore di evidenza in merito agli effetti degli interventi di prevenzione e/o trattamento (Rychetnik, Frommer, Hawe & Shiell, 2002). Può essere necessario un follow-up a lungo termine per determinare se i risultati previsti da misure provvisorie o surrogate si verificano o se persistono cambiamenti a breve termine: "sebbene non comuni, tali studi possono essere altamente informativi" (Craig et al., 2008, p. 3).

A proposito dei livelli di evidenza nella valutazione degli interventi di salute pubblica, questi sono oggetto di approfondimento della letteratura scientifica a causa della loro dipendenza dai criteri stabiliti per valutarne la credibilità. In merito, continuano a essere presenti controversie

nel campo dei RCTs applicati all'analisi degli interventi di salute pubblica; esse riguardano prevelentemente la difficoltà nel condurre questi studi a causa della complessità programmatica degli interventi e dell'analisi delle risultanze e del sottostimare il contributo degli studi osservazionali. In particolare, molti interventi pubblici richiedono, per loro natura, strategie di analisi multiple e flessibili a cui difficilmente gli studi basati su modelli RCT "classici" – secondo gli autori - si adattano (specie perche prevedono una standardizzazione troppo rigida dell'intervento e l'assunzione della randomizzazione sulla base di unità individuali). Un punto importante dell'analisi dei ricercatori è quello in cui viene sottolineato che applicare metodologie non-randomizzate ove queste sarebbero, invece possibili, può comportare una rilevante e non sostenibile perdita di rilevanza; ma, seguendo le parole di Rychetnik e colleghi (2002): *"la progettazione dello studio da sola non può essere sufficiente come criterio principale per la credibilità delle prove sugli interventi di sanità pubblica"* (p. 121).

Interpretazione dei risultati

Il processo di valutazione è un elemento rilevante indipendentemente dal fatto che i risultati siano negativi o positivi. Infatti, le prove di un'attuazione adeguata delle procedure previste dal programma di intervento e l'utilizzo di indicatori efficaci nel monitorare il processo di valutazione sono riconosciuti come centrali nella letteratura scientifica (Rychetnik et al., 2002). Le teorie alla base degli interventi, le loro specificazioni (spiegazione e plausibilità) in relazione alle assunzioni sottostanti (le ipotesi), relative alla efficacia e alla funzionalità delle misure dei risultati e degli impatti, sono criteri chiave per la valutazione e l'interpretazione della sua qualità in termini di salute pubblica (Rychetnik et al., 2002).

Seguendo l'analisi di Rychetnik e colleghi (2002), in letteratura sono disponibili approcci multidimensionali per valutare la ricerca sui risultati. Nella valutazione delle prove sull'efficacia dell'intervento tre dimensioni risultano importanti:

1) "la forza dell'evidenza, determinata da una combinazione del disegno dello studio (livello), della qualità metodologica e della precisione statistica" (p. 122);
2) "la grandezza degli effetti misurati" (p. 122);
3) "la pertinenza degli effetti misurati (come osservato nella valutazione) nel contesto di implementazione" (p. 122).

Le valutazioni della qualità su base empirica sono importanti nella misura in cui influenzano le decisioni in merito alla politica o alle pratiche di sanità pubblica. È necessario assicurarsi che l'utilizzo di protocolli di valutazione inadeguati non si traduca in richieste non realistiche o eccessivamente costose. I criteri di valutazione dovrebbero supportare il processo di *decision-*

making ed aiutare a determinare se i risultati misurati comprendono (a) gli interessi delle persone che potrebbero essere coinvolte nel decidere o proporre l'intervento e i destinatari; (b) effetti imprevisti e previsti dell'intervento, benefici o meno; e (c) l'efficienza dell'intervento, nonché la sua efficacia. Sulla prima dimensione è fondamentale il contributo di tutti gli stakeholders, considerata la natura sociale e politica nel campo della salute pubblica. Per questi motivi, figure importanti nel processo di valutazione includono i *decision-maker* e i gruppi bersaglio.

Come sottolineato da Guyadeen & Seasons (2018) esistono modelli di valutazione che pongono una forte enfasi sul pluralismo e sulla comprensione delle diverse parti interessate coinvolte in una valutazione (Greene, 1994); infatti, potrebbero essere considerati critici in quanto direttamente coinvolti (ad es., soldi o interessi personali) nella valutazione. I metodi qualitativi sono spesso usati per migliorare la comprensione dei programmi dalle prospettive degli stakeholder direttamente coinvolti nel programma (Greene, 1994). Le parti interessate sono considerate critiche in quanto sono considerate come aventi una partecipazione diretta (ad esempio, denaro e interessi personali) nella valutazione.

La valutazione partecipatoria (Cousins, 2004), la valutazione dell'empowerment (Fetterman, 2004), la valutazione collaborativa (Rodriguez-Campos, 2012), e più recentemente, la valutazione dello sviluppo (Patton, 2011) potrebbero essere considerati buoni esempi di metodi efficaci in questo campo (Guyadeen & Seasons, 2018).

VALUTAZIONE DELL'EFFICIENZA DEGLI INTERVENTI: valutazione del processo

Come evidenziato finora, il processo di valutazione dovrebbe svolgere un ruolo fondamentale nel garantire che i piani riflettano la massima qualità dal punto di vista sia concettuale, sia pratico (Guyadeen & Seasons, 2018; Berke e Godschalk, 2009; Baer, 1997). Può contribuire ampiamente nell'assicurare oggettività e sistematizzazione nella pianificazione ed analisi dell'intervento, può migliorare il processo di preparazione programmatica e fornisce la possibilità di analizzare la congruenza tra il piano dichiarato del progetto (obiettivi dichiarati) ed i risultati ottenuti (Guyadeen & Seasons, 2018). Attraverso la valutazione, possiamo documentare empiricamente le carenze e/o i punti di forza (Berke, Smith & Lyles 2012; Guyadeen & Seasons, 2018). Affinché i piani siano efficaci e valutabili, deve esserci una chiara relazione tra le componenti principali di un piano (cioè i suoi obiettivi e politiche) e i meccanismi di attuazione (Oliveira & Pinho 2010b; Guyadeen & Seasons, 2018).

Complessivamente, esistono due forme generali di valutazione nella pianificazione: (a) valutazione del piano (ad esempio, valutazione della qualità del piano, valutazione dell'implementazione del piano e valutazione dei risultati del piano) e b) valutazione della pianificazione (ad esempio, la valutazione dei processi di pianificazione e della pratica di pianificazione) (Guyadeen & Seasons, 2018). Mentre la valutazione della pianificazione implica la determinazione dell'efficacia del processo di pianificazione, la valutazione del piano dell'intervento e dei relativi risultati implica la valutazione della qualità del piano, il successo della sua attuazione e il raggiungimento dei suoi obiettivi (Morckel, 2010; Guyadeen & Seasons, 2018). Queste forme di valutazione sono simili alla valutazione del programma perché cercano di migliorare il processo decisionale, ma differiscono a causa della loro enfasi sul piano, su come è stato creato e sui risultati generati dal piano (Guyadeen & Seasons, 2018). Inoltre, esistono generalmente tre tipi di valutazione nella pianificazione: ex ante (o a priori), in corso e ex post (Guyadeen & Seasons, 2018). Secondo Oliveira & Pinho (2010), questi tipi di valutazione corrispondono alle diverse fasi della pianificazione, che comprendono la preparazione del piano, l'implementazione e la revisione (cioè, una volta implementato).

L'assistenza sanitaria evidence-based è volta a tenere conto dell'efficienza e dell'efficacia, anche se fino ad oggi le questioni di efficienza non sono state enfatizzate nella medicina basata sull'evidenza. La valutazione delle evidenze sugli interventi di sanità pubblica deve

inevitabilmente determinare se l'efficienza è stata valutata e, in caso affermativo, quanto bene (Rychetnik, Frommer, Hawe & Shiell, 2002). Inoltre, “le decisioni evidence-based sul valore e sull'applicabilità di un intervento si basano sulla conoscenza dell'efficacia di un intervento identico, simile o analogo, solitamente condotto e valutato in un contesto diverso in un momento differente. Per valutare la trasferibilità delle evidenze su un intervento sono necessarie informazioni su (a) l'intervento stesso (b) il contesto di valutazione, e (c) interazioni tra l'intervento e il contesto” (Rychetnik, Frommer, Hawe & Shiell, 2002, p. 123). La fedeltà non è semplice in relazione a interventi complessi. Un elemento che aggiunge complessità è il fatto che la standardizzazione rigorosa delle procedure talvolta danneggia la specificità dell’intervento quando questo è motivato da bisogni locali (Craig et al., 2008). Un punto chiave che deve essere reso chiaro è quanto cambiamento o adattamento sia permesso ed il bisogno di registrare variazioni nell'implementazione in modo che la fedeltà possa essere valutata in relazione al grado di standardizzazione richiesto dal protocollo dello studio. La variabilità nell'implementazione - pianificata o meno – rende ancora più importante che entrambe le valutazioni dei processi e degli esiti siano riportate completamente e che sia fornita una descrizione chiara dell'intervento per consentirne la replicazione (Craig et al., 2008).

La Convenzione sui diritti dell'infanzia e dell'adolescenza è composta in tutto da 54 articoli, ma la maggior parte dei restanti articoli riguarda il modo in cui gli adulti e i governi dovrebbero collaborare per assicurarsi che vengano rispettati tutti i diritti di tutti i bambini e i ragazzi. Se vuoi, puoi leggere tu stesso la Convenzione. Discutine con i tuoi amici, i tuoi genitori, i tuoi insegnanti. Se parli dei diritti dei bambini, aiuti anche altri bambini. Più la gente capisce che i bambini e i ragazzi hanno dei diritti, più sarà disposta ad aiutarli ad avere tutto ciò che serve loro per crescere sani, sicuri e liberi.

ARTICOLO 42

Tutti gli adulti e tutte le bambine e i bambini devono sapere che esiste questa Convenzione. Hai il diritto di sapere quali sono i tuoi diritti, e anche gli adulti devono conoscerli.

Dalla prima edizione de *I diritti dei bambini in parole semplici* sono trascorsi alcuni anni, durante i quali abbiamo sperimentato l'efficacia di comunicare anche ai più piccoli i principi sanciti dalla **Convenzione sui diritti dell'infanzia e dell'adolescenza**, attraverso parole semplici e disegni divertenti.

A quasi vent'anni dalla sua approvazione, la Convenzione ci ricorda quali sono i diritti inviolabili dei bambini e i doveri degli adulti nei loro confronti. Per l'UNICEF è importante ribadire questi principi, perché sappiamo che nessun diritto è acquisito per sempre e che ci sono luoghi nel mondo dove non ci sono istituzioni forti, comunità, società e famiglie in grado di difendere i diritti dei più piccoli.

E non è meno importante, evidentemente, ricordare anche in Italia la centralità dei diritti dell'infanzia, rivolgendo a tutti i bambini l'invito a conoscerli e a parlarne. È quanto ci proponiamo con questo libro che, nella sua terza edizione, si è arricchito dei suggerimenti di tanti piccoli lettori che lo hanno letto e apprezzato in tutti questi anni.

Sfogliando le pagine vi accorgerete che il "mondo intorno" è rappresentato attraverso gli occhi dei più piccoli, è visto dal loro particolare punto di osservazione. È questa l'azione che dobbiamo cercare di promuovere sempre: costruire un mondo a misura di bambino.

Le parole, i disegni, i colori, la carta di questa pubblicazione sono pensati per comunicare con i bambini. Noi adulti dobbiamo impegnarci a promuovere i loro diritti, per un'infanzia che sia ovunque sana, protetta e libera.

Presidente
Comitato Italiano per l'UNICEF

ARTICOLO 38

Hai il diritto di essere protetto in tempi di guerra. Se hai meno di quindici anni non devi far parte di un esercito, né partecipare a battaglie.

ARTICOLO 39

Se sei stato ferito o trascurato in qualsiasi maniera, per esempio in guerra, hai diritto a un trattamento speciale e ad attenzioni speciali.

ARTICOLO 40

Hai il diritto di difenderti se sei stato accusato di aver commesso un crimine. La polizia, gli avvocati e i giudici in aula devono trattarti con rispetto e assicurarsi che tu capisca tutto quello che sta succedendo.

ARTICOLO 37

Anche se fai qualcosa di sbagliato, a nessuno è permesso punirti in una maniera che ti umili o ti ferisca gravemente. Non devi mai essere rinchiuso in prigione, se non come rimedio estremo; e se vieni messo in prigione hai diritto ad attenzioni speciali e a visite regolari dalla tua famiglia.

Questa è la traduzione di un opuscolo pubblicato dall'UNICEF nel Regno Unito. È il frutto del lavoro di un gruppo di bambini che hanno riscritto con parole loro alcuni articoli della Convenzione sui diritti dell'infanzia e dell'adolescenza del 1989, quelli più attinenti alla realtà che li riguarda, per spiegarli ai coetanei di tutto il mondo.

Sapevi di avere dei diritti?
Sapevi che esiste una Convenzione sui diritti dell'infanzia e dell'adolescenza?

I tuoi diritti stabiliscono quello che ti è permesso fare, e quello che deve fare chi si occupa di te per assicurarti felicità, salute e sicurezza. Certo, anche tu hai delle responsabilità nei confronti degli altri bambini e degli adulti, per assicurare il rispetto dei loro diritti.

Una Convenzione è un accordo fra nazioni che vogliono obbedire alle stesse leggi. Si dice che il governo di una nazione ratifica una convenzione quando accetta di obbedire alla legge scritta nella convenzione stessa.

Lo Stato italiano ha ratificato la Convenzione sui diritti dell'infanzia e dell'adolescenza il 27 maggio 1991. Ciò significa che il nostro governo deve assicurarsi che ogni bambino abbia tutti i diritti elencati nella Convenzione.

Ciascun articolo della Convenzione spiega uno dei tuoi diritti.
La Convenzione sui diritti dell'infanzia e dell'adolescenza è stata scritta per gli avvocati, perciò nemmeno per gli adulti è facile e comprensibile.
Abbiamo deciso di scegliere i diritti che ci sembravano più importanti e spiegarli con parole nostre.

Hai il diritto di sapere quali sono i tuoi diritti: lo dice l'articolo 42!

ARTICOLO 34

Hai il diritto di essere protetto dagli abusi sessuali. Ciò significa che nessuno può fare nulla al tuo corpo contro la tua volontà; per esempio, nessuno può toccarti o scattarti foto o farti dire cose che non vuoi dire.

ARTICOLO 35

A nessuno è permesso rapirti o venderti.

ARTICOLO 32

Hai il diritto di essere protetto dal lavorare in luoghi o in condizioni che possano danneggiare la tua salute o impedire la tua istruzione. Se il tuo lavoro produce un guadagno, devi essere pagato in modo adeguato.

Hai il diritto di essere protetto dalle droghe illegali e dalle attività volte a produrre e spacciare droghe.

ARTICOLO 33

ARTICOLO 1

Chi ha meno di 18 anni ha tutti i diritti elencati nella Convenzione.

ARTICOLO 2

Ogni bambino ha i diritti elencati nella Convenzione; non ha importanza chi è, né chi sono i suoi genitori, non ha importanza il colore della pelle, né il sesso, né la religione, non ha importanza che lingua parla, né se è un disabile, né se è ricco o povero.

ARTICOLO 3

Quando un adulto ha a che fare con te, deve fare quel che è meglio per te.

Tutti devono riconoscere che hai il diritto di vivere.

Articolo 6

ARTICOLO 30

Se appartieni a una minoranza hai il diritto di mantenere la tua cultura, professare la tua religione e parlare la tua lingua.

Hai il diritto di giocare.

ARTICOLO 31

ARTICOLO 28

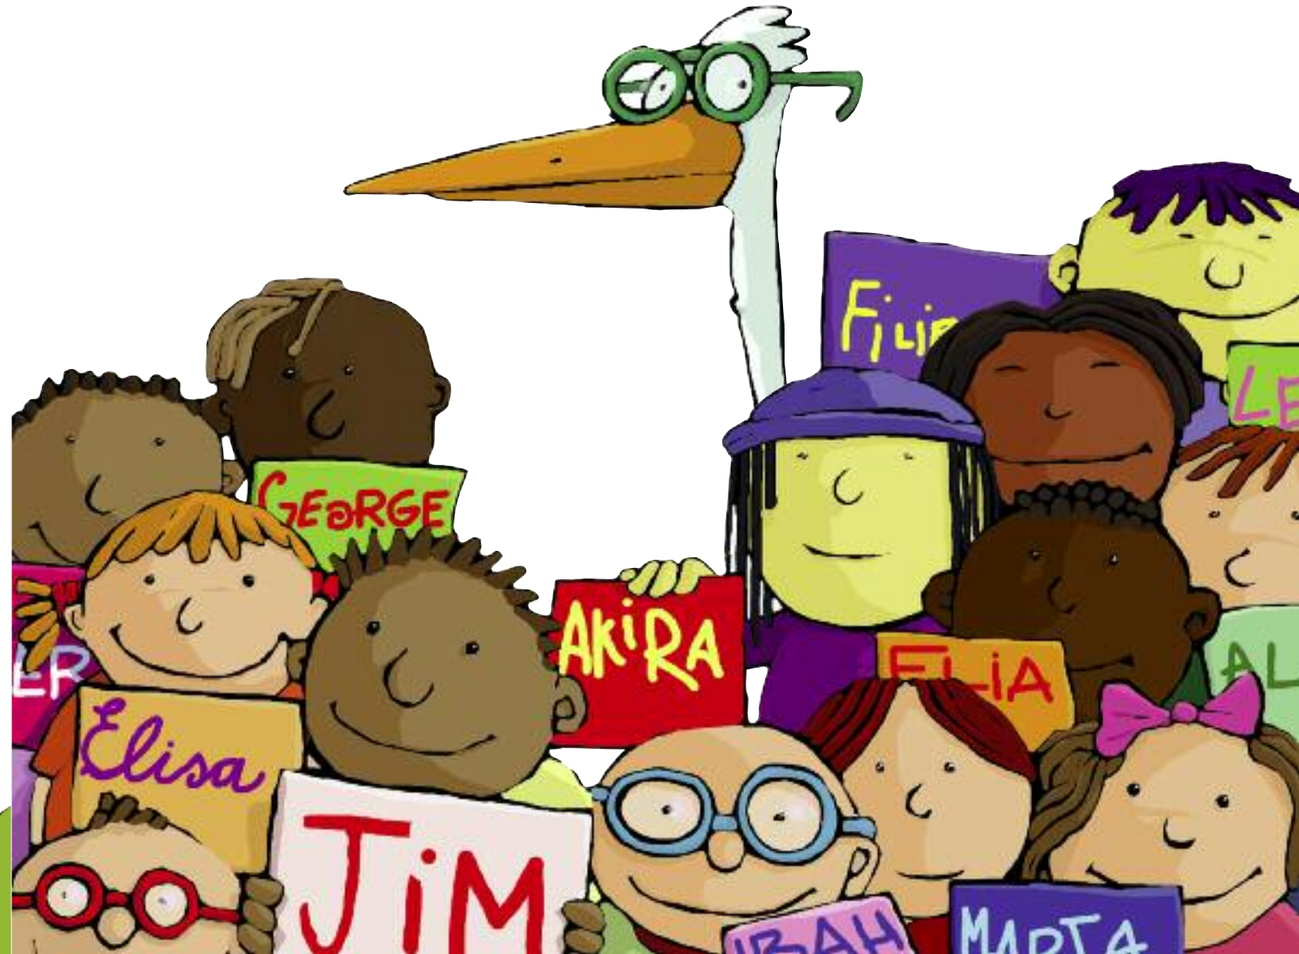
Hai il diritto di ricevere un'istruzione. Devi ricevere un'istruzione primaria, che dev'essere gratuita. Devi anche poter andare alla scuola secondaria.

ARTICOLO 29

Lo scopo della tua istruzione è di sviluppare al meglio la tua personalità, i tuoi talenti e le tue capacità mentali e fisiche. L'istruzione deve anche prepararti a vivere in maniera responsabile e pacifica, in una società libera, nel rispetto dei diritti degli altri e nel rispetto dell'ambiente.

ARTICOLO 7

Hai il diritto di avere un nome, e al momento della tua nascita il tuo nome, il nome dei tuoi genitori e la data devono venire scritti. Hai il diritto di avere una nazionalità e il diritto di conoscere i tuoi genitori e di venire accudito da loro.



Articolo 9

Non devi venire separato dai tuoi genitori, a meno che non sia per il tuo bene. Per esempio, i tuoi genitori potrebbero farti del male o non prendersi cura di te.
Inoltre, se i tuoi genitori decidono di vivere separati, dovrai vivere con uno solo di essi, ma hai il diritto di poter contattare facilmente l'altro.

Articolo 24

Hai il diritto di godere di una buona salute. Ciò significa che devi ricevere cure mediche e farmaci quando sei malato.
Gli adulti devono fare di tutto per evitare che i bambini si ammalino, in primo luogo nutrendoli e prendendosi cura di loro.

Articolo 27

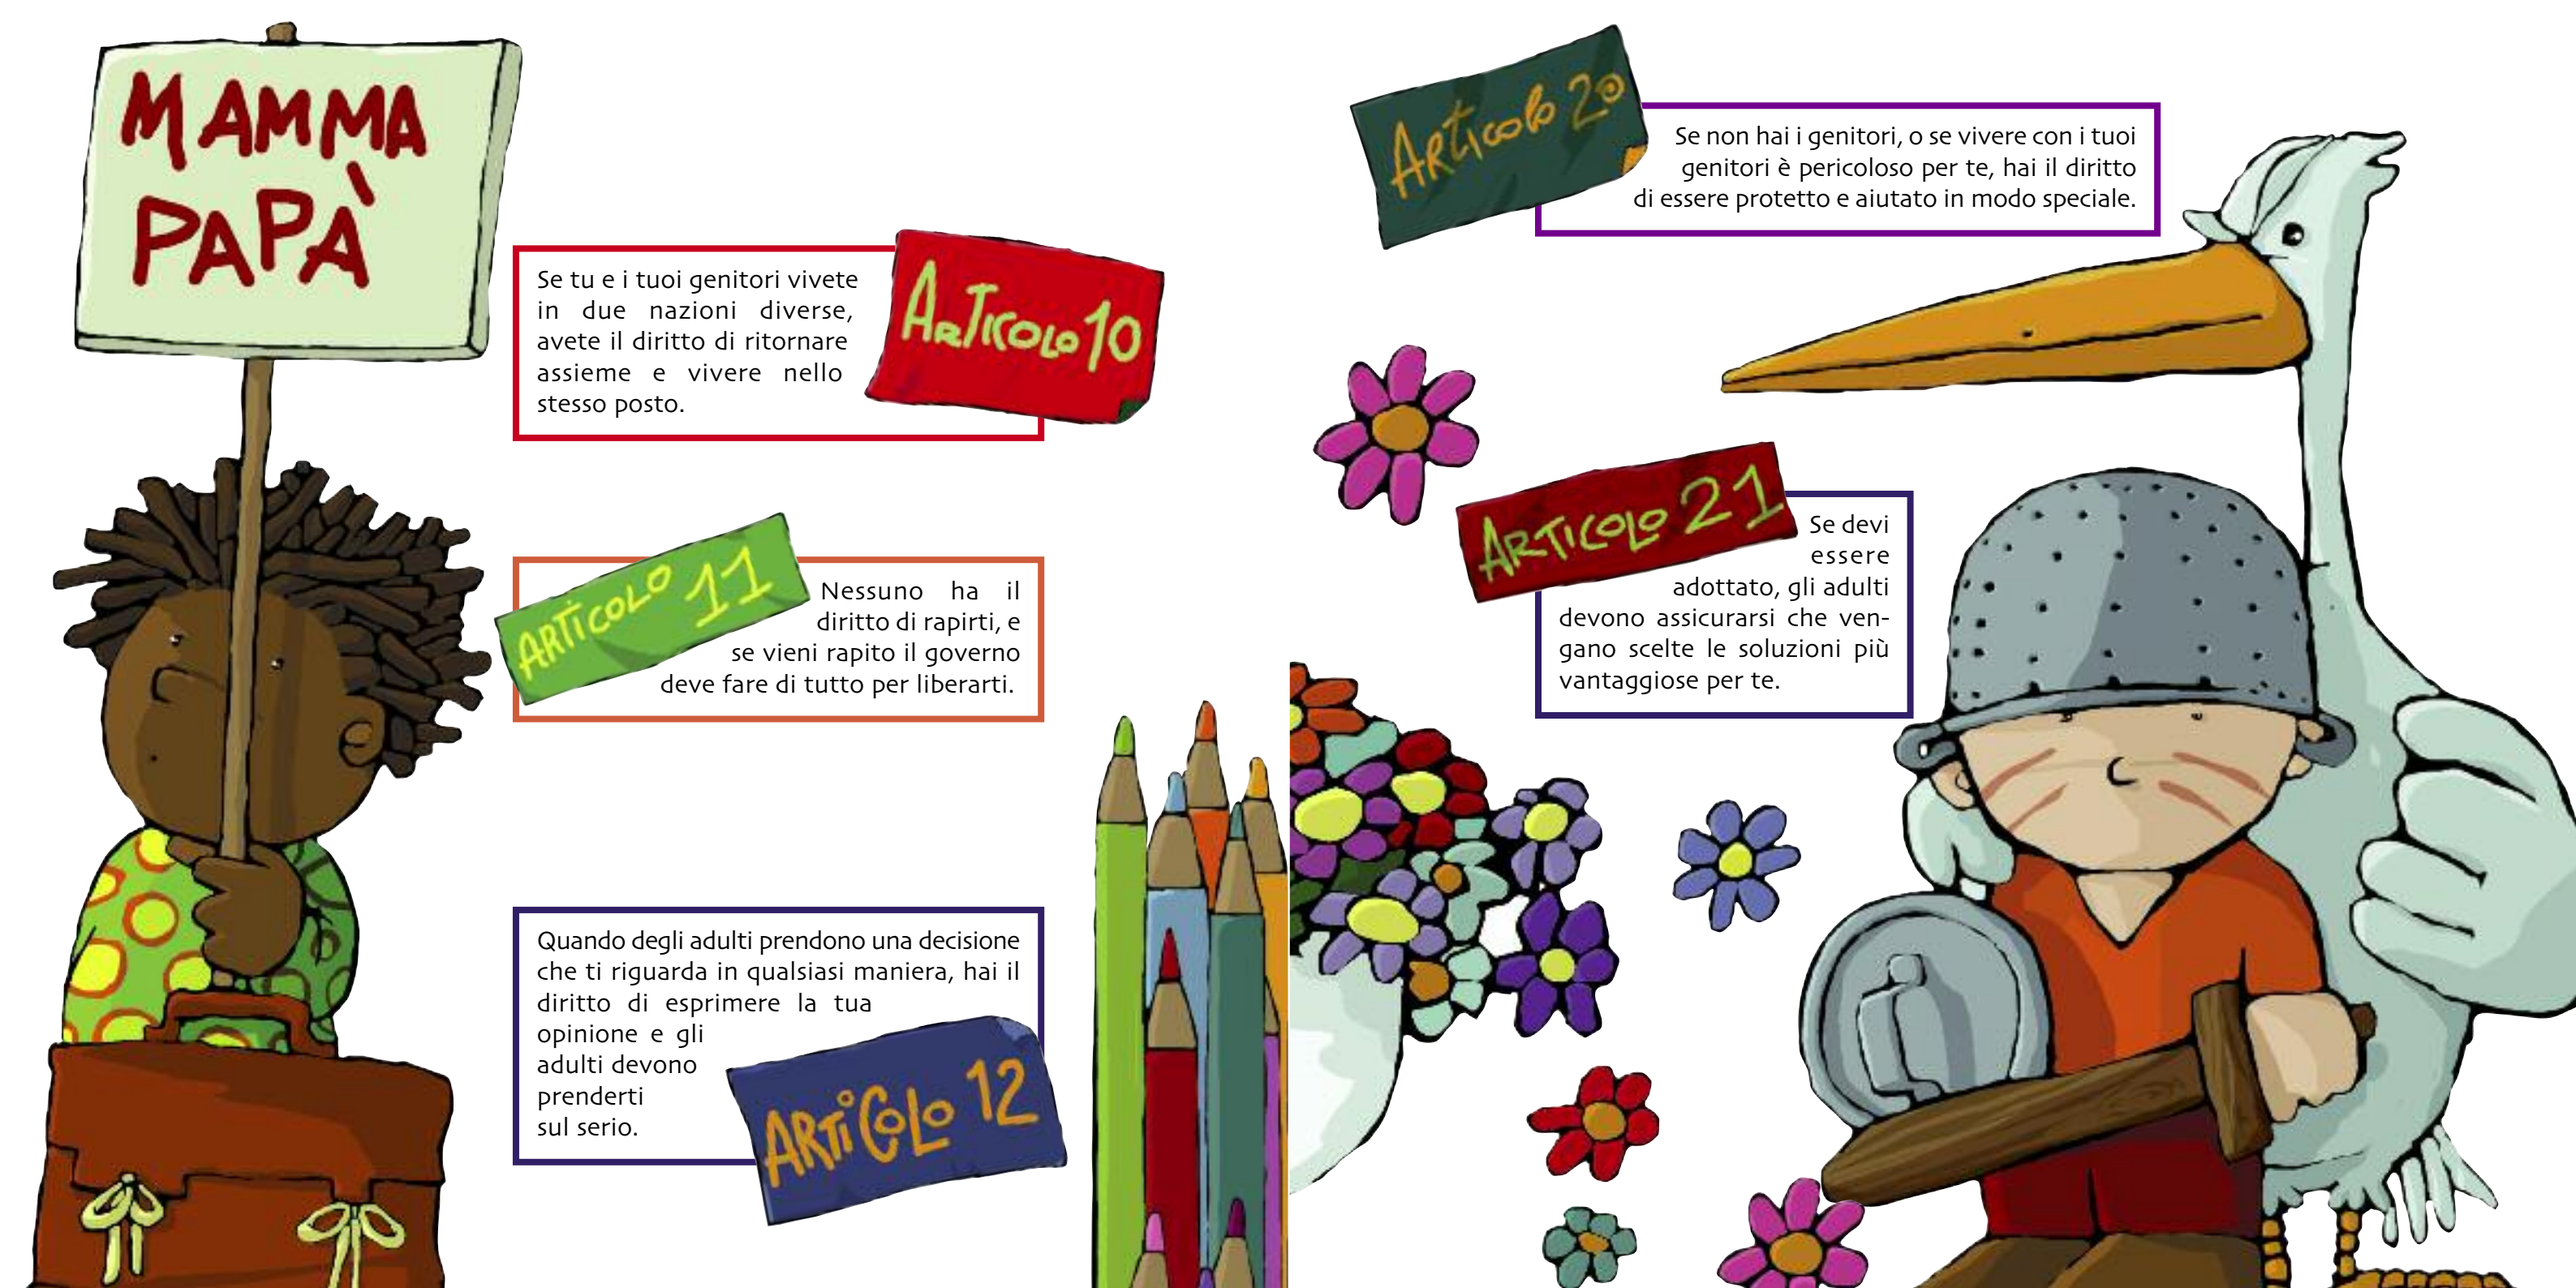
Hai diritto a uno standard di vita sufficientemente buono. Ciò significa che i tuoi genitori hanno l'obbligo di assicurarti cibo, vestiti, un alloggio, ecc.
Se i tuoi genitori non possono permettersi queste cose, il governo deve aiutarli.

ARTICOLO 22

Se sei un rifugiato (cioè se devi lasciare la tua nazione perché viverci sarebbe pericoloso per te) hai il diritto di essere protetto e aiutato in modo speciale.

ARTICOLO 23

Se sei un disabile, fisico o psichico, hai diritto a cure speciali e a un'istruzione speciale, che ti permettano di crescere come gli altri bambini.



ARTICOLO 10

Se tu e i tuoi genitori vivete in due nazioni diverse, avete il diritto di ritornare assieme e vivere nello stesso posto.

ARTICOLO 11

Nessuno ha il diritto di rapirti, e se vieni rapito il governo deve fare di tutto per liberarti.

ARTICOLO 12

Quando degli adulti prendono una decisione che ti riguarda in qualsiasi maniera, hai il diritto di esprimere la tua opinione e gli adulti devono prenderti sul serio.

ARTICOLO 20

Se non hai i genitori, o se vivere con i tuoi genitori è pericoloso per te, hai il diritto di essere protetto e aiutato in modo speciale.

ARTICOLO 21

Se devi essere adottato, gli adulti devono assicurarsi che vengano scelte le soluzioni più vantaggiose per te.

ARTICOLO 18

I tuoi genitori devono collaborare per allevarti e devono fare quel che è meglio per te.

ARTICOLO 19

Nessuno deve farti del male in nessun modo. Gli adulti devono assicurarsi che tu sia protetto da abusi, violenze o negligenze. Nemmeno i tuoi genitori hanno il diritto di farti del male.

ARTICOLO 13

Hai il diritto di imparare e di esprimerti per mezzo delle parole, della scrittura, dell'arte e così via, a meno che queste attività non danneggino i diritti degli altri.

ARTICOLO 14

Hai il diritto di pensare quello che vuoi e di appartenere alla religione che preferisci. I tuoi genitori devono aiutarti a distinguere fra ciò che è giusto e ciò che è sbagliato.

ARTICOLO 15

Hai il diritto di incontrare altre persone, fare amicizia con loro e fondare delle associazioni, a meno che ciò non danneggi i diritti degli altri.

Hai il diritto di avere una vita privata. Per esempio, puoi tenere un diario che gli altri non hanno il diritto di leggere.

ARTICOLO 16

articolo 17

Hai il diritto di raccogliere informazioni dalle radio, dai giornali, dalle televisioni, dai libri di tutto il mondo.
Gli adulti devono assicurarsi che tu riceva delle informazioni che puoi capire.

Convention on the Rights of the Child

Adopted and opened for signature, ratification and accession by General Assembly resolution 44/25 of 20 November 1989

entry into force 2 September 1990, in accordance with article 49

Preamble

The States Parties to the present Convention,

Considering that, in accordance with the principles proclaimed in the Charter of the United Nations, recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world,

Bearing in mind that the peoples of the United Nations have, in the Charter, reaffirmed their faith in fundamental human rights and in the dignity and worth of the human person, and have determined to promote social progress and better standards of life in larger freedom,

Recognizing that the United Nations has, in the Universal Declaration of Human Rights and in the International Covenants on Human Rights, proclaimed and agreed that everyone is entitled to all the rights and freedoms set forth therein, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status,

Recalling that, in the Universal Declaration of Human Rights, the United Nations has proclaimed that childhood is entitled to special care and assistance,

Convinced that the family, as the fundamental group of society and the natural environment for the growth and well-being of all its members and particularly children, should be afforded the necessary protection and assistance so that it can fully assume its responsibilities within the community,

Recognizing that the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding,

Considering that the child should be fully prepared to live an individual life in society, and brought up in the spirit of the ideals proclaimed in the Charter of the United Nations, and in particular in the spirit of peace, dignity, tolerance, freedom, equality and solidarity,

Bearing in mind that the need to extend particular care to the child has been stated in the Geneva Declaration of the Rights of the Child of 1924 and in the Declaration of the Rights of the Child adopted by the General Assembly on 20 November 1959 and recognized in the Universal Declaration of Human Rights, in the International Covenant on Civil and Political Rights (in particular in articles 23 and 24), in the International Covenant on Economic, Social and Cultural Rights (in particular in article 10) and in the statutes and relevant instruments of specialized agencies and international organizations concerned with the welfare of children,

Bearing in mind that, as indicated in the Declaration of the Rights of the Child, "the child, by reason of his physical and mental immaturity, needs special safeguards and care, including appropriate legal protection, before as well as after birth",

Recalling the provisions of the Declaration on Social and Legal Principles relating to the Protection and Welfare of Children, with Special Reference to Foster Placement and Adoption Nationally and Internationally; the United Nations Standard Minimum Rules for the Administration of Juvenile Justice (The Beijing Rules) ; and the Declaration on the Protection of Women and Children in Emergency and Armed Conflict, Recognizing that, in all countries in the world, there are children living in exceptionally difficult conditions, and that such children need special consideration,

Taking due account of the importance of the traditions and cultural values of each people for the protection and harmonious development of the child, Recognizing the importance of international co-operation for improving the living conditions of children in every country, in particular in the developing countries,

Have agreed as follows:

PART I

Article 1

For the purposes of the present Convention, a child means every human being below the age of eighteen years unless under the law applicable to the child, majority is attained earlier.

Article 2

1. States Parties shall respect and ensure the rights set forth in the present Convention to each child within their jurisdiction without discrimination of any kind, irrespective of the child's or his or her parent's or legal guardian's race, colour, sex, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status.

2. States Parties shall take all appropriate measures to ensure that the child is protected against all forms of discrimination or punishment on the basis of the status, activities, expressed opinions, or beliefs of the child's parents, legal guardians, or family members.

Article 3

1. In all actions concerning children, whether undertaken by public or private social welfare institutions, courts of law, administrative authorities or legislative bodies, the best interests of the child shall be a primary consideration.

2. States Parties undertake to ensure the child such protection and care as is necessary for his or her well-being, taking into account the rights and duties of his or her parents, legal guardians, or other individuals legally responsible for him or her, and, to this end, shall take all appropriate legislative and administrative measures.

3. States Parties shall ensure that the institutions, services and facilities responsible for the care or protection of children shall conform with the standards established by competent authorities, particularly in the areas of safety, health, in the number and suitability of their staff, as well as competent supervision.

Article 4

States Parties shall undertake all appropriate legislative, administrative, and other measures for the implementation of the rights recognized in the present Convention. With regard to economic, social and cultural rights, States Parties shall undertake such measures to the maximum extent of their available resources and, where needed, within the framework of international co-operation.

Article 5

States Parties shall respect the responsibilities, rights and duties of parents or, where applicable, the members of the extended family or community as provided for by local custom, legal guardians or other persons legally responsible for the child, to provide, in a manner consistent with the evolving capacities of the child, appropriate direction and guidance in the exercise by the child of the rights recognized in the present Convention.

Article 6

1. States Parties recognize that every child has the inherent right to life. 2. States Parties shall ensure to the maximum extent possible the survival and development of the child.

Article 7

1. The child shall be registered immediately after birth and shall have the right from birth to a name, the right to acquire a nationality and. as far as possible, the right to know and be cared for by his or her parents.

2. States Parties shall ensure the implementation of these rights in accordance with their national law and their obligations under the relevant international instruments in this field, in particular where the child would otherwise be stateless.

Article 8

1. States Parties undertake to respect the right of the child to preserve his or her identity, including nationality, name and family relations as recognized by law without unlawful interference.

2. Where a child is illegally deprived of some or all of the elements of his or her identity, States Parties shall provide appropriate assistance and protection, with a view to re-establishing speedily his or her identity.

Article 9

1. States Parties shall ensure that a child shall not be separated from his or her parents against their will, except when competent authorities subject to judicial review determine, in accordance with applicable law and procedures, that such separation is necessary for the best interests of the child. Such determination may be necessary in a particular case such as one involving abuse or neglect of the child by the parents, or one where the parents are living separately and a decision must be made as to the child's place of residence.

2. In any proceedings pursuant to paragraph 1 of the present article, all interested parties shall be given an opportunity to participate in the proceedings and make their views known.

3. States Parties shall respect the right of the child who is separated from one or both parents to maintain personal relations and direct contact with both parents on a regular basis, except if it is contrary to the child's best interests.

4. Where such separation results from any action initiated by a State Party, such as the detention, imprisonment, exile, deportation or death (including death arising from any cause while the person is in the custody of the State) of one or both parents or of the child, that State Party shall, upon request, provide the parents, the child or, if appropriate, another member of the family with the essential information concerning the whereabouts of the absent member(s) of the family unless the provision of the information would be detrimental to the well-being of the child. States Parties shall further ensure that the submission of such a request shall of itself entail no adverse consequences for the person(s) concerned.

Article 10

1. In accordance with the obligation of States Parties under article 9, paragraph 1, applications by a child or his or her parents to enter or leave a State Party for the purpose of family reunification shall be dealt with by States Parties in a positive, humane and expeditious manner. States Parties shall further ensure that the submission of such a request shall entail no adverse consequences for the applicants and for the members of their family.

2. A child whose parents reside in different States shall have the right to maintain on a regular basis, save in exceptional circumstances personal relations and direct contacts with both parents. Towards that end and in accordance with the obligation of States Parties under article 9, paragraph 1, States Parties shall respect the right of the child and his or her parents to leave any country, including their

own, and to enter their own country. The right to leave any country shall be subject only to such restrictions as are prescribed by law and which are necessary to protect the national security, public order (ordre public), public health or morals or the rights and freedoms of others and are consistent with the other rights recognized in the present Convention.

Article 11

1. States Parties shall take measures to combat the illicit transfer and non-return of children abroad.

2. To this end, States Parties shall promote the conclusion of bilateral or multilateral agreements or accession to existing agreements.

Article 12

1. States Parties shall assure to the child who is capable of forming his or her own views the right to express those views freely in all matters affecting the child, the views of the child being given due weight in accordance with the age and maturity of the child.

2. For this purpose, the child shall in particular be provided the opportunity to be heard in any judicial and administrative proceedings affecting the child, either directly, or through a representative or an appropriate body, in a manner consistent with the procedural rules of national law.

Article 13

1. The child shall have the right to freedom of expression; this right shall include freedom to seek, receive and impart information and ideas of all kinds, regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media of the child's choice.

2. The exercise of this right may be subject to certain restrictions, but these shall only be such as are provided by law and are necessary:

(a) For respect of the rights or reputations of others; or

(b) For the protection of national security or of public order (ordre public), or of public health or morals.

Article 14

1. States Parties shall respect the right of the child to freedom of thought, conscience and religion.

2. States Parties shall respect the rights and duties of the parents and, when applicable, legal guardians, to provide direction to the child in the exercise of his or her right in a manner consistent with the evolving capacities of the child.

3. Freedom to manifest one's religion or beliefs may be subject only to such limitations as are prescribed by law and are necessary to protect public safety, order, health or morals, or the fundamental rights and freedoms of others.

Article 15

1. States Parties recognize the rights of the child to freedom of association and to freedom of peaceful assembly.

2. No restrictions may be placed on the exercise of these rights other than those imposed in conformity with the law and which are necessary in a democratic society in the interests of national security or public safety, public order (ordre public), the protection of public health or morals or the protection of the rights and freedoms of others.

Article 16

1. No child shall be subjected to arbitrary or unlawful interference with his or her privacy, family, home or correspondence, nor to unlawful attacks on his or her honour and reputation.

2. The child has the right to the protection of the law against such interference or attacks.

Article 17

States Parties recognize the important function performed by the mass media and shall ensure that the child has access to information and material from a diversity of national and international sources, especially those aimed at the promotion of his or her social, spiritual and moral well-being and physical and mental health.

To this end, States Parties shall:

(a) Encourage the mass media to disseminate information and material of social and cultural benefit to the child and in accordance with the spirit of article 29;

(b) Encourage international co-operation in the production, exchange and dissemination of such information and material from a diversity of cultural, national and international sources;

(c) Encourage the production and dissemination of children's books;

(d) Encourage the mass media to have particular regard to the linguistic needs of the child who belongs to a minority group or who is indigenous;

(e) Encourage the development of appropriate guidelines for the protection of the child from information and material injurious to his or her well-being, bearing in mind the provisions of articles 13 and 18.

Article 18

1. States Parties shall use their best efforts to ensure recognition of the principle that both parents have common responsibilities for the upbringing and development of the child. Parents or, as the case may be, legal guardians, have the primary responsibility for the upbringing and development of the child. The best interests of the child will be their basic concern.

2. For the purpose of guaranteeing and promoting the rights set forth in the present Convention, States Parties shall render appropriate assistance to parents and legal guardians in the performance of their child-rearing responsibilities and shall ensure the development of institutions, facilities and services for the care of children.

3. States Parties shall take all appropriate measures to ensure that children of working parents have the right to benefit from child-care services and facilities for which they are eligible.

Article 19

1. States Parties shall take all appropriate legislative, administrative, social and educational measures to protect the child from all forms of physical or mental violence, injury or abuse, neglect or negligent treatment, maltreatment or exploitation, including sexual abuse, while in the care of parent(s), legal guardian(s) or any other person who has the care of the child.

2. Such protective measures should, as appropriate, include effective procedures for the establishment of social programmes to provide necessary support for the child and for those who have the care of the child, as well as for other forms of prevention and for identification, reporting, referral, investigation, treatment and follow-up of instances of child maltreatment described heretofore, and, as appropriate, for judicial involvement.

Article 20

1. A child temporarily or permanently deprived of his or her family environment, or in whose own best interests cannot be allowed to remain in that environment, shall be entitled to special protection and assistance provided by the State.

2. States Parties shall in accordance with their national laws ensure alternative care for such a child.

3. Such care could include, inter alia, foster placement, kafalah of Islamic law, adoption or if necessary placement in suitable institutions for the care of children. When considering solutions, due regard shall be paid to the desirability of continuity in a child's upbringing and to the child's ethnic, religious, cultural and linguistic background.

Article 21

States Parties that recognize and/or permit the system of adoption shall ensure that the best interests of the child shall be the paramount consideration and they shall:

(a) Ensure that the adoption of a child is authorized only by competent authorities who determine, in accordance with applicable law and procedures and on the basis of all pertinent and reliable information, that the adoption is permissible in view of the child's status concerning parents, relatives and legal guardians and that, if required, the persons concerned have given their informed consent to the adoption on the basis of such counselling as may be necessary;

(b) Recognize that inter-country adoption may be considered as an alternative means of child's care, if the child cannot be placed in a foster or an adoptive family or cannot in any suitable manner be cared for in the child's country of origin;

(c) Ensure that the child concerned by inter-country adoption enjoys safeguards and standards equivalent to those existing in the case of national adoption;

(d) Take all appropriate measures to ensure that, in inter-country adoption, the placement does not result in improper financial gain for those involved in it;

(e) Promote, where appropriate, the objectives of the present article by concluding bilateral or multilateral arrangements or agreements, and endeavour, within this framework, to ensure that the placement of the child in another country is carried out by competent authorities or organs.

Article 22

1. States Parties shall take appropriate measures to ensure that a child who is seeking refugee status or who is considered a refugee in accordance with applicable international or domestic law and procedures shall, whether unaccompanied or accompanied by his or her parents or by any other person, receive appropriate protection and humanitarian assistance in the enjoyment of applicable rights set forth in the present Convention and in other international human rights or humanitarian instruments to which the said States are Parties.

2. For this purpose, States Parties shall provide, as they consider appropriate, co-operation in any efforts by the United Nations and other competent intergovernmental organizations or non-governmental organizations co-operating with the United Nations to protect and assist such a child and to trace the parents or other members of the family of any refugee child in order to obtain information necessary for reunification with his or her family. In cases where no parents or other members of the family can be found, the child shall be accorded the same protection as any other child permanently or temporarily deprived of his or her family environment for any reason , as set forth in the present Convention.

Article 23

1. States Parties recognize that a mentally or physically disabled child should enjoy a full and decent life, in conditions which ensure dignity, promote self-reliance and facilitate the child's active participation in the community.

2. States Parties recognize the right of the disabled child to special care and shall encourage and ensure the extension, subject to available resources, to the eligible child and those responsible for his or her care, of assistance for which application is made and which is appropriate to the child's condition and to the circumstances of the parents or others caring for the child.

3. Recognizing the special needs of a disabled child, assistance extended in accordance with paragraph 2 of the present article shall be provided free of charge, whenever possible, taking into account the financial resources of the parents or others caring for the child, and shall be designed to ensure that the disabled child has effective access to and receives education, training, health care services, rehabilitation services, preparation for employment and recreation opportunities in a manner conducive to the child's achieving the fullest possible social integration and individual development, including his or her cultural and spiritual development

4. States Parties shall promote, in the spirit of international cooperation, the exchange of appropriate information in the field of preventive health care and of medical, psychological and functional treatment of disabled children, including dissemination of and access to information concerning methods of rehabilitation, education and vocational services, with the aim of enabling States Parties to improve their capabilities and skills and to widen their experience in these areas. In this regard, particular account shall be taken of the needs of developing countries.

Article 24

1. States Parties recognize the right of the child to the enjoyment of the highest attainable standard of health and to facilities for the treatment of illness and rehabilitation of health. States Parties shall strive to ensure that no child is deprived of his or her right of access to such health care services.

2. States Parties shall pursue full implementation of this right and, in particular, shall take appropriate measures:

(a) To diminish infant and child mortality;

(b) To ensure the provision of necessary medical assistance and health care to all children with emphasis on the development of primary health care;

(c) To combat disease and malnutrition, including within the framework of primary health care, through, inter alia, the application of readily available technology and through the provision of adequate nutritious foods and clean drinking-water, taking into consideration the dangers and risks of environmental pollution;

(d) To ensure appropriate pre-natal and post-natal health care for mothers;

(e) To ensure that all segments of society, in particular parents and children, are informed, have access to education and are supported in the use of basic knowledge of child health and nutrition, the advantages of breastfeeding, hygiene and environmental sanitation and the prevention of accidents;

(f) To develop preventive health care, guidance for parents and family planning education and services.

3. States Parties shall take all effective and appropriate measures with a view to abolishing traditional practices prejudicial to the health of children.

4. States Parties undertake to promote and encourage international co-operation with a view to achieving progressively the full realization of the right recognized in the present article. In this regard, particular account shall be taken of the needs of developing countries.

Article 25

States Parties recognize the right of a child who has been placed by the competent authorities for the purposes of care, protection or treatment of his or her physical or mental health, to a periodic review of the treatment provided to the child and all other circumstances relevant to his or her placement.

Article 26

1. States Parties shall recognize for every child the right to benefit from social security, including social insurance, and shall take the necessary measures to achieve the full realization of this right in accordance with their national law.

2. The benefits should, where appropriate, be granted, taking into account the resources and the circumstances of the child and persons having responsibility for the maintenance of the child, as well as any other consideration relevant to an application for benefits made by or on behalf of the child.

Article 27

1. States Parties recognize the right of every child to a standard of living adequate for the child's physical, mental, spiritual, moral and social development.

2. The parent(s) or others responsible for the child have the primary responsibility to secure, within their abilities and financial capacities, the conditions of living necessary for the child's development.

3. States Parties, in accordance with national conditions and within their means, shall take appropriate measures to assist parents and others responsible for the child to implement this right and shall in case of need provide material assistance and support programmes, particularly with regard to nutrition, clothing and housing.

4. States Parties shall take all appropriate measures to secure the recovery of maintenance for the child from the parents or other persons having financial responsibility for the child, both within the State Party and from abroad. In particular, where the person having financial responsibility for the child lives in a State different from that of the child, States Parties shall promote the accession to international agreements or the conclusion of such agreements, as well as the making of other appropriate arrangements.

Article 28

1. States Parties recognize the right of the child to education, and with a view to achieving this right progressively and on the basis of equal opportunity, they shall, in particular:

(a) Make primary education compulsory and available free to all;

(b) Encourage the development of different forms of secondary education, including general and vocational education, make them available and accessible to every child, and take appropriate measures such as the introduction of free education and offering financial assistance in case of need;

(c) Make higher education accessible to all on the basis of capacity by every appropriate means;

(d) Make educational and vocational information and guidance available and accessible to all children;

(e) Take measures to encourage regular attendance at schools and the reduction of drop-out rates.

2. States Parties shall take all appropriate measures to ensure that school discipline is administered in a manner consistent with the child's human dignity and in conformity with the present Convention.

3. States Parties shall promote and encourage international cooperation in matters relating to education, in particular with a view to contributing to the elimination of ignorance and illiteracy

throughout the world and facilitating access to scientific and technical knowledge and modern teaching methods. In this regard, particular account shall be taken of the needs of developing countries.

Article 29

1. States Parties agree that the education of the child shall be directed to:

(a) The development of the child's personality, talents and mental and physical abilities to their fullest potential;

(b) The development of respect for human rights and fundamental freedoms, and for the principles enshrined in the Charter of the United Nations;

(c) The development of respect for the child's parents, his or her own cultural identity, language and values, for the national values of the country in which the child is living, the country from which he or she may originate, and for civilizations different from his or her own;

(d) The preparation of the child for responsible life in a free society, in the spirit of understanding, peace, tolerance, equality of sexes, and friendship among all peoples, ethnic, national and religious groups and persons of indigenous origin;

(e) The development of respect for the natural environment.

2. No part of the present article or article 28 shall be construed so as to interfere with the liberty of individuals and bodies to establish and direct educational institutions, subject always to the observance of the principle set forth in paragraph 1 of the present article and to the requirements that the education given in such institutions shall conform to such minimum standards as may be laid down by the State.

Article 30

In those States in which ethnic, religious or linguistic minorities or persons of indigenous origin exist, a child belonging to such a minority or who is indigenous shall not be denied the right, in community with other members of his or her group, to enjoy his or her own culture, to profess and practise his or her own religion, or to use his or her own language.

Article 31

1. States Parties recognize the right of the child to rest and leisure, to engage in play and recreational activities appropriate to the age of the child and to participate freely in cultural life and the arts.

2. States Parties shall respect and promote the right of the child to participate fully in cultural and artistic life and shall encourage the provision of appropriate and equal opportunities for cultural, artistic, recreational and leisure activity.

Article 32

1. States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development.

2. States Parties shall take legislative, administrative, social and educational measures to ensure the implementation of the present article. To this end, and having regard to the relevant provisions of other international instruments, States Parties shall in particular:

(a) Provide for a minimum age or minimum ages for admission to employment;

(b) Provide for appropriate regulation of the hours and conditions of employment;

(c) Provide for appropriate penalties or other sanctions to ensure the effective enforcement of the present article.

Article 33

States Parties shall take all appropriate measures, including legislative, administrative, social and educational measures, to protect children from the illicit use of narcotic drugs and psychotropic substances as defined in the relevant international treaties, and to prevent the use of children in the illicit production and trafficking of such substances.

Article 34

States Parties undertake to protect the child from all forms of sexual exploitation and sexual abuse. For these purposes, States Parties shall in particular take all appropriate national, bilateral and multilateral measures to prevent:

(a) The inducement or coercion of a child to engage in any unlawful sexual activity;

(b) The exploitative use of children in prostitution or other unlawful sexual practices;

(c) The exploitative use of children in pornographic performances and materials.

Article 35

States Parties shall take all appropriate national, bilateral and multilateral measures to prevent the abduction of, the sale of or traffic in children for any purpose or in any form.

Article 36

States Parties shall protect the child against all other forms of exploitation prejudicial to any aspects of the child's welfare.

Article 37

States Parties shall ensure that:

(a) No child shall be subjected to torture or other cruel, inhuman or degrading treatment or punishment. Neither capital punishment nor life imprisonment without possibility of release shall be imposed for offences committed by persons below eighteen years of age;

(b) No child shall be deprived of his or her liberty unlawfully or arbitrarily. The arrest, detention or imprisonment of a child shall be in conformity with the law and shall be used only as a measure of last resort and for the shortest appropriate period of time;

(c) Every child deprived of liberty shall be treated with humanity and respect for the inherent dignity of the human person, and in a manner which takes into account the needs of persons of his or her age. In particular, every child deprived of liberty shall be separated from adults unless it is considered in the child's best interest not to do so and shall have the right to maintain contact with his or her family through correspondence and visits, save in exceptional circumstances;

(d) Every child deprived of his or her liberty shall have the right to prompt access to legal and other appropriate assistance, as well as the right to challenge the legality of the deprivation of his or her liberty before a court or other competent, independent and impartial authority, and to a prompt decision on any such action.

Article 38

1. States Parties undertake to respect and to ensure respect for rules of international humanitarian law applicable to them in armed conflicts which are relevant to the child.

2. States Parties shall take all feasible measures to ensure that persons who have not attained the age of fifteen years do not take a direct part in hostilities.

3. States Parties shall refrain from recruiting any person who has not attained the age of fifteen years into their armed forces. In recruiting among those persons who have attained the age of fifteen years but who have not attained the age of eighteen years, States Parties shall endeavour to give priority to those who are oldest.

4. In accordance with their obligations under international humanitarian law to protect the civilian population in armed conflicts, States Parties shall take all feasible measures to ensure protection and care of children who are affected by an armed conflict.

Article 39

States Parties shall take all appropriate measures to promote physical and psychological recovery and social reintegration of a child victim of: any form of neglect, exploitation, or abuse; torture or any other form of cruel, inhuman or degrading treatment or punishment; or armed conflicts. Such recovery and reintegration shall take place in an environment which fosters the health, self-respect and dignity of the child.

Article 40

1. States Parties recognize the right of every child alleged as, accused of, or recognized as having infringed the penal law to be treated in a manner consistent with the promotion of the child's sense of dignity and worth, which reinforces the child's respect for the human rights and fundamental freedoms of others and which takes into account the child's age and the desirability of promoting the child's reintegration and the child's assuming a constructive role in society.

2. To this end, and having regard to the relevant provisions of international instruments, States Parties shall, in particular, ensure that:

(a) No child shall be alleged as, be accused of, or recognized as having infringed the penal law by reason of acts or omissions that were not prohibited by national or international law at the time they were committed;

(b) Every child alleged as or accused of having infringed the penal law has at least the following guarantees:

(i) To be presumed innocent until proven guilty according to law;

(ii) To be informed promptly and directly of the charges against him or her, and, if appropriate, through his or her parents or legal guardians, and to have legal or other appropriate assistance in the preparation and presentation of his or her defence;

(iii) To have the matter determined without delay by a competent, independent and impartial authority or judicial body in a fair hearing according to law, in the presence of legal or other appropriate assistance and, unless it is considered not to be in the best interest of the child, in particular, taking into account his or her age or situation, his or her parents or legal guardians;

(iv) Not to be compelled to give testimony or to confess guilt; to examine or have examined adverse witnesses and to obtain the participation and examination of witnesses on his or her behalf under conditions of equality;

(v) If considered to have infringed the penal law, to have this decision and any measures imposed in consequence thereof reviewed by a higher competent, independent and impartial authority or judicial body according to law;

(vi) To have the free assistance of an interpreter if the child cannot understand or speak the language used;

(vii) To have his or her privacy fully respected at all stages of the proceedings.

3. States Parties shall seek to promote the establishment of laws, procedures, authorities and institutions specifically applicable to children alleged as, accused of, or recognized as having infringed the penal law, and, in particular:

(a) The establishment of a minimum age below which children shall be presumed not to have the capacity to infringe the penal law;

(b) Whenever appropriate and desirable, measures for dealing with such children without resorting to judicial proceedings, providing that human rights and legal safeguards are fully respected. 4. A variety of dispositions, such as care, guidance and supervision orders; counselling; probation; foster care; education and vocational training programmes and other alternatives to institutional care shall be available to ensure that children are dealt with in a manner appropriate to their well-being and proportionate both to their circumstances and the offence.

Article 41

Nothing in the present Convention shall affect any provisions which are more conducive to the realization of the rights of the child and which may be contained in:

(a) The law of a State party; or

(b) International law in force for that State.

PART II

Article 42

States Parties undertake to make the principles and provisions of the Convention widely known, by appropriate and active means, to adults and children alike.

Article 43

1. For the purpose of examining the progress made by States Parties in achieving the realization of the obligations undertaken in the present Convention, there shall be established a Committee on the Rights of the Child, which shall carry out the functions hereinafter provided.

2. The Committee shall consist of ten experts of high moral standing and recognized competence in the field covered by this Convention. The members of the Committee shall be elected by States Parties from among their nationals and shall serve in their personal capacity, consideration being given to equitable geographical distribution, as well as to the principal legal systems.

3. The members of the Committee shall be elected by secret ballot from a list of persons nominated by States Parties. Each State Party may nominate one person from among its own nationals.

4. The initial election to the Committee shall be held no later than six months after the date of the entry into force of the present Convention and thereafter every second year. At least four months before the date of each election, the Secretary-General of the United Nations shall address a letter to States Parties inviting them to submit their nominations within two months. The Secretary-General shall subsequently prepare a list in alphabetical order of all persons thus nominated, indicating States Parties which have nominated them, and shall submit it to the States Parties to the present Convention.

5. The elections shall be held at meetings of States Parties convened by the Secretary-General at United Nations Headquarters. At those meetings, for which two thirds of States Parties shall constitute

a quorum, the persons elected to the Committee shall be those who obtain the largest number of votes and an absolute majority of the votes of the representatives of States Parties present and voting.

6. The members of the Committee shall be elected for a term of four years. They shall be eligible for re-election if renominated. The term of five of the members elected at the first election shall expire at the end of two years; immediately after the first election, the names of these five members shall be chosen by lot by the Chairman of the meeting.

7. If a member of the Committee dies or resigns or declares that for any other cause he or she can no longer perform the duties of the Committee, the State Party which nominated the member shall appoint another expert from among its nationals to serve for the remainder of the term, subject to the approval of the Committee.

8. The Committee shall establish its own rules of procedure.

9. The Committee shall elect its officers for a period of two years.

10. The meetings of the Committee shall normally be held at United Nations Headquarters or at any other convenient place as determined by the Committee. The Committee shall normally meet annually. The duration of the meetings of the Committee shall be determined, and reviewed, if necessary, by a meeting of the States Parties to the present Convention, subject to the approval of the General Assembly.

11. The Secretary-General of the United Nations shall provide the necessary staff and facilities for the effective performance of the functions of the Committee under the present Convention.

12. With the approval of the General Assembly, the members of the Committee established under the present Convention shall receive emoluments from United Nations resources on such terms and conditions as the Assembly may decide.

Article 44

1. States Parties undertake to submit to the Committee, through the Secretary-General of the United Nations, reports on the measures they have adopted which give effect to the rights recognized herein and on the progress made on the enjoyment of those rights

(a) Within two years of the entry into force of the Convention for the State Party concerned;

(b) Thereafter every five years.

2. Reports made under the present article shall indicate factors and difficulties, if any, affecting the degree of fulfilment of the obligations under the present Convention. Reports shall also contain sufficient information to provide the Committee with a comprehensive understanding of the implementation of the Convention in the country concerned.

3. A State Party which has submitted a comprehensive initial report to the Committee need not, in its subsequent reports submitted in accordance with paragraph 1 (b) of the present article, repeat basic information previously provided.

4. The Committee may request from States Parties further information relevant to the implementation of the Convention.

5. The Committee shall submit to the General Assembly, through the Economic and Social Council, every two years, reports on its activities.

6. States Parties shall make their reports widely available to the public in their own countries.

Article 45

In order to foster the effective implementation of the Convention and to encourage international co-operation in the field covered by the Convention:

(a) The specialized agencies, the United Nations Children's Fund, and other United Nations organs shall be entitled to be represented at the consideration of the implementation of such provisions of the present Convention as fall within the scope of their mandate. The Committee may invite the specialized agencies, the United Nations Children's Fund and other competent bodies as it may consider appropriate to provide expert advice on the implementation of the Convention in areas falling within the scope of their respective mandates. The Committee may invite the specialized agencies, the United Nations Children's Fund, and other United Nations organs to submit reports on the implementation of the Convention in areas falling within the scope of their activities;

(b) The Committee shall transmit, as it may consider appropriate, to the specialized agencies, the United Nations Children's Fund and other competent bodies, any reports from States Parties that contain a request, or indicate a need, for technical advice or assistance, along with the Committee's observations and suggestions, if any, on these requests or indications;

(c) The Committee may recommend to the General Assembly to request the Secretary-General to undertake on its behalf studies on specific issues relating to the rights of the child;

(d) The Committee may make suggestions and general recommendations based on information received pursuant to articles 44 and 45 of the present Convention. Such suggestions and general recommendations shall be transmitted to any State Party concerned and reported to the General Assembly, together with comments, if any, from States Parties.

PART III

Article 46

The present Convention shall be open for signature by all States.

Article 47

The present Convention is subject to ratification. Instruments of ratification shall be deposited with the Secretary-General of the United Nations.

Article 48

The present Convention shall remain open for accession by any State. The instruments of accession shall be deposited with the Secretary-General of the United Nations.

Article 49

1. The present Convention shall enter into force on the thirtieth day following the date of deposit with the Secretary-General of the United Nations of the twentieth instrument of ratification or accession.

2. For each State ratifying or acceding to the Convention after the deposit of the twentieth instrument of ratification or accession, the Convention shall enter into force on the thirtieth day after the deposit by such State of its instrument of ratification or accession.

Article 50

1. Any State Party may propose an amendment and file it with the Secretary-General of the United Nations. The Secretary-General shall thereupon communicate the proposed amendment to States Parties, with a request that they indicate whether they favour a conference of States Parties for the purpose of considering and voting upon the proposals. In the event that, within four months from the date of such communication, at least one third of the States Parties favour such a conference, the Secretary-General shall convene the conference under the auspices of the United Nations. Any

amendment adopted by a majority of States Parties present and voting at the conference shall be submitted to the General Assembly for approval.

2. An amendment adopted in accordance with paragraph 1 of the present article shall enter into force when it has been approved by the General Assembly of the United Nations and accepted by a two-thirds majority of States Parties.

3. When an amendment enters into force, it shall be binding on those States Parties which have accepted it, other States Parties still being bound by the provisions of the present Convention and any earlier amendments which they have accepted.

Article 51

1. The Secretary-General of the United Nations shall receive and circulate to all States the text of reservations made by States at the time of ratification or accession.

2. A reservation incompatible with the object and purpose of the present Convention shall not be permitted.

3. Reservations may be withdrawn at any time by notification to that effect addressed to the Secretary-General of the United Nations, who shall then inform all States. Such notification shall take effect on the date on which it is received by the Secretary-General

Article 52

A State Party may denounce the present Convention by written notification to the Secretary-General of the United Nations. Denunciation becomes effective one year after the date of receipt of the notification by the Secretary-General.

Article 53

The Secretary-General of the United Nations is designated as the depositary of the present Convention.

Article 54

The original of the present Convention, of which the Arabic, Chinese, English, French, Russian and Spanish texts are equally authentic, shall be deposited with the Secretary-General of the United Nations. IN WITNESS THEREOF the undersigned plenipotentiaries, being duly authorized thereto by their respective governments, have signed the present Convention.

Conoscere i diritti e i principi fondamentali posti dal quadro normativo internazionale e dell'Unione europea, con particolare riguardo al diritto di bambini e ragazzi a essere informati e a partecipare alle procedure che li riguardino

Chi è il minore?

carepath

La Convenzione internazionale sui diritti dell'infanzia (CRC) stabilisce che "si intende per fanciullo ogni essere umano avente un'età inferiore a diciott'anni" (art. 1).

Anche il diritto del Consiglio d'Europa, per la maggior parte degli strumenti riguardanti i minori, adotta la definizione di minore della CRC.

Nell'ambito dell'Unione Europea non esiste una definizione di "minore" e quindi si ricorre alla definizione posta dalla CRC.

Quadro di riferimento

carepath

CONTESTO INERNAZIONALE

- Organizzazione delle Nazioni Unite - ONU
  - Convenzione internazionale sui diritti dell'infanzia- CRC

CONTESTO EUROPEO

- Unione europea
  - Carta dei diritti fondamentali dell'Unione europea (Carta di Nizza)
  - Corte di giustizia dell'Unione europea (CGUE – Corte di Lussemburgo)
- Consiglio d'Europa
  - Convenzione di Lanzarote
  - Convenzione di Istanbul
  - Convenzione europea dei diritti dell'uomo (CEDU)
    - Corte europea dei diritti dell'uomo (CEDU -Corte di Strasburgo)

DIRITTI E LIBERTA' DEL MINORENNE

Tutti gli individui, e dunque anche i minorenni, godono delle libertà e dei diritti civili riconosciuti dagli strumenti (convenzioni, trattati, dichiarazioni) sui diritti umani, in particolare la Carta dei diritti fondamentali dell'UE (Carta di Nizza) e la Convenzione europea dei diritti dell'uomo (CEDU).

LIBERTÀ E DIRITTI FONDAMENTALI

carepath

- LIBERTÀ E DIRITTI CIVILI FONDAMENTALI
- DIRITTI ECONOMICI, SOCIALI E CULTURALI

LIBERTÀ E DIRITTI CIVILI FONDAMENTALI

- Sono detti «di prima generazione» e si considerano **fondamentali** poiché la loro violazione danneggia profondamente la vita di una persona.
- Impongono agli Stati da un lato di non interferire nella sfera privata dell'individuo, dall'altro di attivarsi per garantire il rispetto della persona umana: per esempio il diritto al rispetto della vita familiare (articolo 8 CEDU) obbliga gli Stati a non separare i figli dai genitori tranne il caso in cui ciò sia strettamente necessario per la protezione dei minori stessi, ma anche ad attivarsi per promuovere lo sviluppo delle relazioni tra genitori e figli

Diritto al rispetto della vita familiare

Ogni individuo ha diritto al rispetto delle relazioni familiari

così come vissute nelle pratica

(il minore ha, per esempio, il diritto ad crescere in famiglia e di mantenere contatti con entrambi i genitori dopo la separazione tra loro)

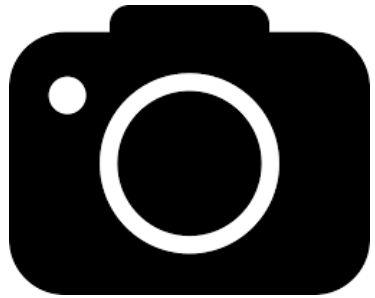
Norme di riferimento:

- Articolo 7 (diritto al rispetto della vita familiare) Carta dei diritti fondamentali dell'UE (Carta di Nizza)
- Articolo 8 (diritto al rispetto della vita familiare) CEDU
- Articoli 8 e 9 Convenzione internazionale sui diritti dell'Infanzia (CRC)

Diritto al rispetto della vita privata

La nozione di «**vita privata**» elaborata dalla giurisprudenza della Corte di Strasburgo è una nozione ampia che include numerosi aspetti dell'identità di un individuo

(per esempio l'integrità fisica e morale della persona, il nome, l'immagine, la riservatezza e la protezione dei dati personali)

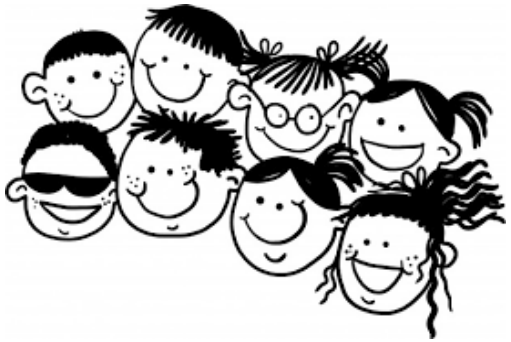


Norme di riferimento:

- Articolo 7 (diritto al rispetto della vita privata) Carta dei diritti fondamentali dell'UE (Carta di Nizza)
- Articolo 8 (diritto al rispetto della vita privata) CEDU
- Articolo 16 Convenzione internazionale sui diritti dell'Infanzia (CRC)

Non discriminazione

Sono vietati i trattamenti **ingiustificatamente differenziati** in base al sesso, alla razza, al colore della pelle, all'origine etnica o sociale, alle caratteristiche genetiche, alla lingua, alle convinzioni o alla religione, alle opinioni politiche o di altro genere, all'appartenenza a una minoranza nazionale, alla situazione finanziaria, alla nascita, alla disabilità, all'età o all'orientamento sessuale.



Norme di riferimento:

- Articolo 7 (diritto al rispetto della vita privata) Carta dei diritti fondamentali dell'UE (Carta di Nizza) Articoli 20 (uguaglianza davanti alla legge) e 21 (non discriminazione) Carta dei diritti fondamentali dell'UE (Carta di Nizza)
- Articolo 14 CEDU; articolo 1 del Protocollo n. 12 della CEDU (non discriminazione)
- Articolo E (non discriminazione) Carta sociale europea (CSE)
- Articolo 8 (diritto al rispetto della vita privata) CEDU
- Articolo 2 Convenzione internazionale sui diritti dell'Infanzia (CRC)

Principio del superiore interesse del minore

carepath

… MA ATTENZIONE!!!

Bambini e ragazzi hanno diritto in quanto minori a beneficiare di una protezione particolare e quindi a un trattamento differenziato sulla base dell'età

Norme di riferimento:

Articolo 3 Convenzione internazionale sui diritti dell'Infanzia (CRC)

ESEMPIO N. 1

Il giudice che debba decidere l'affidamento dei figli minorenni dopo la separazione/divorzio dei genitori dovrà decidere sulla base di ciò che è meglio nell'esclusivo interesse del minore e non dei genitori

Libertà di espressione

Ad ogni individuo deve essere riconosciuta la libertà di opinione e la libertà di ricevere o comunicare informazioni o idee senza che vi possa essere ingerenza da parte delle autorità pubbliche e senza limiti di frontiera (Articolo 10, comma 1 CEDU)

Norme di riferimento:

- Articolo 11 Carta dei diritti fondamentali dell'UE (Carta di Nizza)
- Articolo 10 CEDU
- Articolo 24 comma 1 Carta dei diritti fondamentali dell'UE (Carta di Nizza)
- Articolo 12, comma 1 Convenzione internazionale sui diritti dell'Infanzia (CRC)

Diritto del minorenne di essere ascoltato

«Il minorenne ha diritto di essere ascoltato in ogni procedura giudiziaria o amministrativa che lo concerne, sia direttamente, sia tramite un rappresentante o un organo appropriato, in maniera compatibile con le regole di procedura della legislazione nazionale.» (Articolo 12 Convenzione internazionale sui diritti dell'infanzia e dell'adolescenza - CRC)

Per approfondimenti sul diritto all'ascolto del minore si veda il contributo
Unit_2_3_video_Prof.ssa_Long

Norme di riferimento:

- Articolo 12 Convenzione internazionale sui diritti dell'Infanzia
- Articoli 3 e 6 Convenzione europea sull'esercizio dei diritti dei minori

Diritto del minore alla protezione contro la violenza e lo sfruttamento

«Il minore ha diritto ad contro ogni forma di violenza, di oltraggio o di brutalità fisiche o mentali, di abbandono o di negligenza, di maltrattamenti o di sfruttamento, compresa la violenza sessuale» (articolo 19, comma 1 Convenzione internazionale sui diritti dell'Infanzia - CRC)

sentenza Corte EDU, Z. e altri contro Regno Unito

Norme di riferimento:

- Articoli 2 (diritto alla vita), 3 (trattamenti inumani o degradanti) e 8 (integrità fisica) CEDU; Protocollo n. 1 alla CEDU, articolo 2 (diritto all'istruzione)
- Articoli 7 (diritto a una speciale protezione contro i pericoli fisici e morali) e 17 (diritto a una tutela) Carta sociale europea (CSE)
- Convenzione sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale (Convenzione di Lanzarote).
- Convenzione sulla prevenzione e la lotta contro la violenza nei confronti delle donne e la violenza domestica (Convenzione di Istanbul)
- Direttiva relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile (2011/93/UE)

ESEMPIO N. 2: violenza assistita

La violenza non produce danni soltanto quando viene agita, ma anche quando i bambini ne diventano testimoni.

Guardare, ascoltare, vivere l'angoscia, esserne investiti, contagiati e sovrastati senza poter far nulla. Significa esporre un bambino a qualsiasi forma di maltrattamento, compiuto attraverso atti di violenza fisica, verbale, psicologica, sessuale ed economica, su figure di riferimento o su altre figure affettivamente significative all'interno di ambienti domestici e familiari. Questa è violenza assistita.

Un fenomeno ancora sommerso, quasi "invisibile", contraddistinto da segnali plurimi, i cui effetti possono essere devastanti sullo sviluppo fisico, cognitivo e comportamentale dei bambini

(Save the Children, https://www.savethechildren.it/campagne/abbattiamo-il-muro-del-silenzio)

I bambini che assistono ad un atto di violenza lo subiscono

Articolo 17 Carta sociale europea (CSE)

The story of a child witness
https://www.youtube.com/watch?v=hYX8cRkiklE

ESEMPIO N. 3: Punizioni corporali

È punizione corporale

- qualsiasi punizione per la quale viene utilizzata la forza fisica, allo scopo di infliggere un certo livello di dolore o di afflizione, non importa quanto lieve
- forme di punizioni non fisiche ugualmente crudeli e degradanti, per esempio, le punizioni che mirano a denigrare il bambino, umiliarlo, sminuirlo, disprezzarlo, farlo diventare un capro espiatorio, minacciarlo, spaventarlo o schernirlo (Comitato ONU sui diritti dell'infanzia, Commento Generale n.8 del 2006)

Raise your hand against smacking!

Norme di riferimento:

Articolo 3 CEDU.

Articoli 19, 28, paragrafo 2, e 37 Convenzione internazionale sui diritti dell'Infanzia (CRC)

ESEMPIO N. 4: abuso sessuale

È abuso sessuale a danno di un minorenne il coinvolgimento in attività sessuali, fisiche o psicologiche realizzato:

- facendo uso di coercizione, forza o minaccia
- approfittando di una posizione riconosciuta di fiducia, autorità o influenza sul minore, anche in ambito familiare
- Approfittando di una situazione di particolare vulnerabilità del minore, in particolare in ragione di una disabilità fisica o mentale o di una situazione di dipendenza

(Articolo 18, paragrafo 1, Convenzione del Consiglio d'Europa sulla protezione dei minori dallo sfruttamento e dagli abusi sessuali – cosiddetta Convenzione di Lanzarote)

Qui non si tocca!

Norme di riferimento:

- Articoli 32 e 34 Convenzione internazionale sui diritti dell'Infanzia (CRC)
- Convenzione di Lanzarote

DIRITTI ECONOMICI, SOCIALI E CULTURALI E CONDIZIONI DI VITA ADEGUATE

carepath

Rappresentano diritti di cosiddetta «seconda generazione» che ogni Stato è chiamato a soddisfare per ovviare alle diseguaglianze sociali, agli squilibri economici, agli svantaggi causati dalla natura, dall'età ecc.

La loro realizzazione concreta (purtroppo!) avviene gradualmente e compatibilmente con i problemi economico-strutturali cui ogni Stato deve far fronte.

Diritto alla salute

«La salute è uno stato di completo benessere fisico, mentale e sociale e non semplicemente un'assenza di malattia o infermità»

(Organizzazione Mondiale della Sanità, 1948)

Norme di riferimento:

- Articolo 35 (accesso all'assistenza sanitaria) Carta dei diritti fondamentali dell'UE (Carta di Nizza)
- Articolo 25 Dichiarazione Universale dei Diritti dell'Uomo
- Articoli 24, 25 e 26 Convenzione internazionale sui diritti dell'infanzia e dell'adolescenza (CRC
- Articolo 2 (diritto alla vita) e articolo 3 (diritto all'integrità fisica) CEDU
- Articolo 11 (diritto alla protezione della salute) e articolo 13 (diritto all'assistenza sociale e medica) Carta sociale europea (CSE)
- Articolo 6 Convenzione europea per la protezione dei diritti dell'uomo e la dignità dell'essere umano riguardo alle applicazioni della biologia e della medicina, cosiddetta «Convenzione di Oviedo»

Diritto all'istruzione

«istruzione deve essere gratuita almeno per quanto riguarda le classi elementari e fondamentali. L'istruzione elementare deve essere obbligatoria. L'istruzione tecnica e professionale deve essere messa alla portata di tutti e l'istruzione superiore deve essere egualmente accessibile a tutti sulla base del merito.»

(articolo 26 Dichiarazione Universale dei Diritti Umani)

Il diritto all'istruzione non si riferisce solo all'apprendimento delle materie scolastiche fondamentali ma deve essere concepito in un senso più ampio. L'istruzione deve cercare di favorire lo sviluppo della personalità del bambino, delle sue qualità e delle sue attitudini mentali e fisiche.

(Convenzione internazionale sui diritti dell'infanzia e dell'adolescenza)

Norme di riferimento:

Articolo 14 Carta dei diritti fondamentali dell'UE (Carta di Nizza)

Articoli 28 e 29 Convenzione internazionale sui diritti dell'infanzia e dell'adolescenza (CRC)

Articolo 17 CEDU

Articolo 2 del Protocollo n. 1 CEDU

Manuale di diritto europeo in materia di diritti dell'infanzia e dell'adolescenza

Prefazione

Il presente manuale sul diritto europeo in materia di diritti dell'infanzia e dell'adolescenza nasce da una redazione congiunta dell'Agenzia dell'Unione europea per i diritti fondamentali (FRA) e del Consiglio d'Europa con la cancelleria della Corte europea dei diritti dell'uomo. Si tratta del quarto di una serie di manuali sul diritto europeo elaborati di concerto dalle nostre organizzazioni. I precedenti manuali erano dedicati al diritto europeo in materia di non discriminazione, asilo, frontiere e immigrazione, e protezione dei dati.

Ci siamo imbarcati in questo nuovo progetto congiunto in occasione delle celebrazioni del 25° anniversario della Convenzione delle Nazioni Unite sui diritti del fanciullo, che è stata ratificata da tutti gli Stati europei, per gettare luce sul ruolo che la normativa europea ricopre nel garantire ai minori il godimento dei loro diritti universali.

I minori sono titolari di diritti a pieno titolo. Il presente manuale pertanto mira a sensibilizzare e migliorare le conoscenze delle norme di legge che proteggono e promuovono questi diritti in Europa. Il Trattato sull'Unione europea (TUE) impone all'Unione l'obbligo di promuovere la protezione dei diritti del minore. La Carta dei diritti fondamentali dell'Unione europea (UE), i regolamenti e le direttive dell'UE oltre che la giurisprudenza della Corte di giustizia dell'UE (CGUE) hanno contribuito a definire ulteriormente la protezione dei diritti dei minori. Nell'ambito del Consiglio d'Europa un nutrito *corpus* di convenzioni affronta specifici aspetti della protezione dei diritti del minore, che vanno dai diritti e dalla sicurezza dei minori nel cyberspazio all'adozione. Queste convenzioni contribuiscono ad arricchire la tutela offerta ai minori nell'ambito della Convenzione europea dei diritti dell'uomo e della Carta sociale europea, comprese la giurisprudenza della Corte europea dei diritti dell'uomo (Corte EDU) e le decisioni del Comitato europeo dei diritti sociali (CEDS).

Il presente manuale è destinato a professionisti legali non specializzati, giudici, magistrati e autorità responsabili della protezione dei minori, nonché ad altre figure professionali e organizzazioni impegnate nell'offrire la tutela legale dei diritti del minore.

Desideriamo ringraziare il prof. Ton Liefaard, LL.M., Simona Florescu, JD., Margaret Fine, il prof. Karl Hanson, la prof.ssa Ursula Kilkelly, la dott.ssa Roberta Ruggiero, la prof.ssa Helen Stalford e il prof. Wouter Vandenhole per il contributo offerto alla stesura del presente manuale. La nostra gratitudine va anche a tutti coloro che hanno fornito assistenza e suggerimenti per tutto il corso della sua preparazione.

PREFAZIONE 3

ACRONIMI 11

COME USARE IL MANUALE 13

1 INTRODUZIONE AL DIRITTO EUROPEO IN MATERIA DI DIRITTI DEI MINORI: CONTESTO E PRINCIPI CHIAVE 15

1.1. Concetti essenziali 17

Punto saliente 17

1.1.1. Campo di applicazione della legislazione europea sui diritti dei minori 17

1.1.2. Il "minore" come titolare dei diritti 18

1.2. Contesto della legislazione europea sui diritti dei minori 20

1.2.1. Unione europea: sviluppo della legislazione sui diritti dei minori e aree di protezione contemplate 20

1.2.2. Consiglio d'Europa: sviluppo della legislazione sui diritti dei minori e aree di protezione contemplate 23

1.3. La legislazione europea sui diritti dei minori e la Convenzione delle Nazioni Unite sui diritti del fanciullo 27

Punto saliente 27

1.4. Interpretazione e applicazione della legislazione europea sui diritti dei minori: il ruolo delle Corti europee 29

1.4.1. Corte di giustizia dell'Unione europea 29

1.4.2. La Corte europea dei diritti dell'uomo 31

1.5. Comitato europeo dei diritti sociali 32

2 LIBERTÀ E DIRITTI CIVILI FONDAMENTALI 35

2.1. Libertà di pensiero, di coscienza e di religione 37

Punti salienti 37

2.1.1. Il diritto del minore alla libertà di religione 37

2.2. I diritti dei genitori e la libertà di religione dei loro figli 39

2.3. Libertà di espressione e d'informazione 41

Punti salienti 41

2.4. Diritto di essere ascoltato 44

Punti salienti 44

2.5. Diritto alla libertà di riunione e di associazione 47
Punti salienti 47

3 UGUAGLIANZA E NON DISCRIMINAZIONE 49
3.1. Diritto europeo in materia di non discriminazione 51
Punti salienti 51
3.2. Divieto di discriminazione sulla base della razza o dell'origine etnica 53
Punti salienti 53
3.3. Divieto di discriminazione sulla base della nazionalità e dello status di immigrazione 56
Punti salienti 56
3.4. Divieto di discriminazione sulla base dell'età 59
Punto saliente 59
3.5. Divieto di discriminazione sulla base di altri motivi oggetto di protezione 60
Punto saliente 60

4 QUESTIONI RIGUARDANTI L'IDENTITÀ PERSONALE 63
4.1. Registrazione della nascita e diritto al nome 65
Punto saliente 65
4.2. Diritto all'identità personale 67
Punti salienti 67
4.2.1. Accertamento della paternità 68
4.2.2. Accertamento della maternità: parto anonimo 71
4.3. Accertamento delle proprie origini: adozione 71
4.4. Furto d'identità 72
Punto saliente 72
4.5. Diritto alla cittadinanza 73
Punti salienti 73
4.6. Identità di minori appartenenti a minoranze nazionali 75
Punto saliente 75

5 VITA FAMILIARE 77
5.1. Diritto al rispetto della vita familiare 79
Punti salienti 79
5.2. Diritto del minore a essere cresciuto dai suoi genitori 80
Punti salienti 80

5.3. Diritto di intrattenere contatti con entrambi i genitori 83
Punti salienti 83
5.4. Trasferimento transfrontaliero illegittimo di minori – sottrazione di minori 91
Punti salienti 91

6 ACCOGLIENZA ETEROFAMILIARE E ADOZIONE 99
6.1. Accoglienza alternativa: principi generali 101
Punti salienti 101
6.2. Collocamento dei minori in accoglienza eterofamiliare 105
Punti salienti 105
6.3. Adozione 111
Punti salienti 111

7 PROTEZIONE DEI MINORI CONTRO LA VIOLENZA E LO SFRUTTAMENTO 119
7.1. Violenza a casa, nelle scuole o in altri contesti 122
Punti salienti 122
7.1.1. Portata della responsabilità statale 122
7.1.2. Punizioni corporali 126
7.1.3. Abusi sessuali 128
7.1.4. Violenza domestica e incuria nei confronti di minori 130
7.2. Sfruttamento dei minori, pornografia minorile e adescamento di minori 133
Punto saliente 133
7.2.1. Lavoro forzato 133
7.2.2. Tratta di minori 136
7.2.3. Pornografia minorile e adescamento di minori 139
7.3. Gruppi ad alto rischio 141
Punto saliente 141
7.3.1. Minori appartenenti a una minoranza 141
7.3.2. Minori con disabilità 142
7.4. Minori scomparsi 144

8 DIRITTI ECONOMICI, SOCIALI E CULTURALI E CONDIZIONI DI VITA ADEGUATE 147
8.1. Approcci ai diritti economici, sociali e culturali 149
Punti salienti 149
8.2. Diritto all'istruzione 151

Punti salienti 151
8.2.1. Diritto all'istruzione dei figli di migranti 154
8.3. Diritto alla salute 160
Punti salienti 160
8.4. Diritto all'abitazione 166
Punti salienti 166
8.5. Diritto a uno standard di vita adeguato e diritto alla sicurezza sociale 169
Punti salienti 169

9 IMMIGRAZIONE E ASILO 173
9.1. Ingresso e soggiorno 176
Punti salienti 176
9.2. Accertamento dell'età 179
Punti salienti 179
9.3. Ricongiungimento familiare e minori separati 181
Punti salienti 181
9.4. Trattenimento 185
Punti salienti 185
9.5. Espulsione 188
Punti salienti 188
9.6. Accesso alla giustizia 192
Punto saliente 192

10 TUTELA DEI CONSUMATORI E PROTEZIONE DEI DATI PERSONALI 195
10.1. Protezione dei minori come consumatori 197
Punti salienti 197
10.1.1. Diritti dei consumatori 197
10.1.2. Pratiche commerciali illecite nei confronti di minori 199
10.1.3. Sicurezza del prodotto 199
10.1.4. Sperimentazioni cliniche su minori 200
10.1.5. Cibo destinato a lattanti e bambini piccoli 201
10.1.6. Sicurezza dei giocattoli 202
10.1.7. Minori e pubblicità 202
10.2. Minori e protezione dei dati personali 204
Punti salienti 204
10.2.1. Diritto dell'Unione europea in materia di protezione dei dati 204

11 DIRITTI DEI MINORI NELLA SFERA DELLA GIUSTIZIA PENALE E DEI PROCEDIMENTI ALTERNATIVI (STRAGIUDIZIALI) 211
11.1. Garanzie relative a un equo processo 213
Punti salienti 213
11.1.1. Partecipazione efficace 218
11.1.2. Accesso alla giustizia 220
11.2. Diritti dei rei minori in relazione alla detenzione 222

Acronimi

APCE	Assemblea parlamentare del Consiglio d'Europa
CdE	Consiglio d'Europa
CEDS	Comitato europeo dei diritti sociali
CEDU	Convenzione per la salvaguardia dei diritti dell'uomo e delle libertà fondamentali (più comunemente nota come Convenzione europea sui diritti dell'uomo, CEDU)
CEE	Comunità economica europea
CGUE	Corte di giustizia dell'Unione europea (denominata Corte di giustizia europea (GC) fino a dicembre 2009)
Corte EDU	Corte europea dei diritti dell'uomo
CPT	Comitato europeo per la prevenzione della tortura e delle pene o trattamenti inumani o degradanti
CRC	Convenzione delle Nazioni Unite sui diritti del fanciullo
CRD	Direttiva sui diritti dei consumatori
CRPD	Convenzione delle Nazioni Unite sui diritti delle persone con disabilità
CSE	Carta sociale europea
ECOSOC	Consiglio economico e sociale delle Nazioni Unite
ECPT	Convenzione europea per la prevenzione della tortura e delle pene o trattamenti inumani o degradanti
FCNM	Convenzione quadro del Consiglio d'Europa per la protezione delle minoranze nazionali
FRA	Agenzia dell'Unione europea per i diritti fondamentali
GC	Grande Camera (della Corte europea dei diritti dell'uomo)
GPSD	Direttiva sulla sicurezza generale dei prodotti
GRETA	Gruppo di esperti sulla lotta contro la tratta di esseri umani

ICCPR	Patto internazionale delle Nazioni Unite relativo ai diritti civili e politici
ICERD	Convenzione internazionale sull'eliminazione di tutte le forme di discriminazione razziale
ICESCR	Patto internazionale relativo ai diritti economici, sociali e culturali
OIL	Organizzazione internazionale del lavoro
ONU	Nazioni Unite
SEE	Spazio economico europeo
TCN	Cittadini di un paese terzo
TFUE	Trattato sul funzionamento dell'Unione europea
TSD	Direttiva sulla sicurezza dei giocattoli
TUE	Trattato sull'Unione europea
UCPD	Direttiva relativa alle pratiche commerciali sleali tra imprese e consumatori nel mercato interno
UE	Unione europea
UNHCR	Alto Commissario delle Nazioni Unite per i rifugiati

Come usare il manuale

Il presente manuale offre una panoramica dei diritti fondamentali dei minori negli Stati membri dell'Unione europea (UE) e del Consiglio d'Europa (CdE). Esso ha una portata ampia, poiché riconosce che i minori sono beneficiari di tutti i diritti umani/fondamentali nonché oggetto di regolamenti speciali, in virtù delle loro caratteristiche specifiche. Quella dei diritti dell'infanzia e dell'adolescenza è una sfera trasversale del diritto. Il manuale si sofferma sugli aspetti del diritto che sono d'importanza specifica per i minori.

È' volto ad assistere i professionisti legali che non sono specializzati nel campo del diritto dei minori; è destinato ad avvocati, giudici, pubblici ministeri, assistenti sociali e altre figure professionali che collaborano con le autorità nazionali oltre che a organizzazioni non governative (ONG) e altri organismi che potrebbero dover affrontare problematiche legali relative a questi soggetti per la prima volta. Esso rappresenta un punto di riferimento per quanto concerne sia il diritto dell'UE sia il diritto del Consiglio d'Europa in materia e illustra come ciascun tema sia disciplinato dal diritto dell'UE, dalla Convenzione europea sui diritti dell'uomo (CEDU), dalla Carta sociale europea (CSE) e da altri strumenti del Consiglio d'Europa. Ogni capitolo è introdotto da una tabella delle disposizioni legali applicabili secondo i due distinti sistemi giuridici europei. Il diritto di ciascun sistema è quindi presentato in successione, in relazione ai vari temi trattati. In questo modo il lettore può cogliere le convergenze e le divergenze dei due sistemi giuridici. Dove necessario, si fa riferimento alla Convenzione delle Nazioni Unite sui diritti del fanciullo (CRC) e ad altri strumenti internazionali.

I professionisti appartenenti ai paesi terzi che fanno parte del Consiglio d'Europa e sono pertanto membri della CEDU possono accedere alle informazioni riguardanti il proprio paese visitando direttamente le sezioni del Consiglio d'Europa. I professionisti degli Stati membri dell'UE devono invece consultare tutte e due le sezioni, in quanto questi Stati sono vincolati a entrambi gli ordinamenti giuridici. I lettori che necessitano di maggiori informazioni su un particolare argomento possono reperire una bibliografia più specialistica nella sezione del manuale riservata agli "Approfondimenti".

Il diritto della CEDU è riportato tramite brevi riferimenti a determinati casi esaminati dalla Corte europea dei diritti dell'uomo (Corte EDU) riguardanti le tematiche trattate dal manuale. I casi sono stati selezionati tra le sentenze e le decisioni della Corte EDU concernenti i diritti dei minori.

Il diritto dell'UE è illustrato attraverso il riferimento alle misure legislative adottate, alle disposizioni pertinenti dei trattati, in particolare alla Carta dei diritti fondamentali dell'Unione europea, come interpretate nella giurisprudenza della Corte di giustizia dell'Unione europea (CGUE, denominata Corte di giustizia o CG fino a dicembre 2009).

La giurisprudenza presentata o citata nel presente manuale offre esempi tratti da un ampio *corpus* giurisprudenziale della Corte EDU e della CGUE. Il manuale comprende, per quanto possibile, considerato il suo ambito di applicazione limitato e la sua natura di documento introduttivo, gli sviluppi registrati in ambito legale fino al 1°gennaio 2015, benché siano stati inclusi, nei limiti del possibile, anche argomenti più recenti.

Il manuale è composto da un'introduzione, che spiega brevemente il ruolo dei due sistemi giuridici come stabilito dalla CEDU e dal diritto dell'UE, e da 10 capitoli che riguardano le seguenti tematiche:

- libertà e diritti civili;
- uguaglianza;
- questioni riguardanti l'identità personale;
- vita familiare;
- accoglienza eterofamiliare e adozione;
- protezione dei minori contro la violenza e lo sfruttamento;
- diritti economici, sociali e culturali;
- immigrazione e asilo;
- tutela dei consumatori e dei dati;
- diritti dei minori nella sfera della giustizia penale e dei procedimenti alternativi.

Ogni capitolo tratta un argomento distinto, mentre riferimenti incrociati ad altre questioni e capitoli permettono di meglio comprendere il quadro giuridico applicabile. I punti salienti sono sintetizzati all' inizio di ogni capitolo.

Questo capitolo introduttivo spiega in che modo si è sviluppato il diritto in materia di diritti dei minori, quali sono i principi chiave che ne guidano l'applicazione e quali aspetti preponderanti dei diritti dei minori sono trattati nel diritto dell'UE. Esso getta le basi per un'analisi più approfondita per argomenti riportata nei seguenti capitoli.

1.1. Concetti essenziali

Punto saliente

- La legislazione europea sui diritti dei minori si basa sulle misure esistenti a livello nazionale e internazionale.

1.1.1. Campo di applicazione della legislazione europea sui diritti dei minori

Quando si cita la "legislazione europea sui diritti dei minori", si fa essenzialmente riferimento alle fonti primarie del diritto (trattati, convenzioni, diritto derivato e giurisprudenza) introdotte dal Consiglio d'Europa e dall'Unione europea (UE). Ove opportuno, si fa riferimento ad altre fonti europee che influenzano lo sviluppo della legislazione europea sui diritti dei minori, tra cui documenti strategici, linee guida o altri strumenti non vincolanti di importanza fondamentale.

I minori sono titolari di diritti, piuttosto che solo soggetti da tutelare. Sono beneficiari di tutti i diritti umani/fondamentali nonché oggetto di regolamenti speciali, in virtù delle loro caratteristiche specifiche. Buona parte della giurisprudenza europea deriva da controversie avviate da genitori o altri rappresentanti legali di minori, in considerazione della limitata capacità giuridica di questi ultimi. Pur avendo l'obiettivo di illustrare il modo in cui la legislazione si adatta alle esigenze e agli interessi specifici dei minori, il presente manuale evidenzia altresì l'importanza dei genitori/tutori o di altri rappresentanti legali e fa riferimento, ove opportuno, alle situazioni in cui diritti e responsabilità sono conferiti prevalentemente alle persone che si prendono cura dei minori. In tali casi si adotta l'approccio della Convenzione delle Nazioni Unite sui diritti del fanciullo (CRC)[1],

1 Nazioni Unite (ONU), Assemblea generale (1989), Convenzione sui diritti del fanciullo, 20 novembre 1989.

secondo cui le responsabilità genitoriali devono essere esercitate considerando preminente l'interesse superiore del minore e in maniera corrispondente allo sviluppo delle sue capacità.

1.1.2. Il "minore" come titolare dei diritti

Nell'ambito del diritto internazionale, l'articolo 1 della CRC stabilisce che "si intende per fanciullo ogni essere umano avente un'età inferiore a diciott'anni". Questo è il parametro giuridico utilizzato attualmente, anche in Europa, per definire un minore.

Nell'ambito del diritto dell'UE, non esiste una singola definizione formale di "minore" in alcuno dei trattati, nel diritto da esso derivato o nella giurisprudenza. La definizione di minore può variare considerevolmente ai sensi del diritto dell'UE, a seconda del contesto normativo. Per esempio, la direttiva dell'UE che disciplina i diritti dei cittadini dell'Unione e dei loro familiari di circolare liberamente nel territorio degli Stati membri definisce i "minori" come "i discendenti diretti di età inferiore a 21 anni o a carico"[2], avallando essenzialmente un concetto biologico ed economico anziché una nozione di minoranza.

Alcune normative dell'UE attribuiscono ai minori diritti differenti a seconda dell'età. La direttiva 94/33/CE relativa alla protezione dei giovani sul lavoro (la "direttiva sui giovani lavoratori")[3], per esempio, che disciplina l'accesso dei minori all'occupazione formale negli Stati membri dell'UE e le sue condizioni, distingue tra "giovani" (un termine generale per indicare tutte le persone di età inferiore a 18 anni), "adolescenti" (ogni giovane di almeno 15 anni che non ha ancora compiuto 18 anni, e che non ha più obblighi scolastici a tempo pieno) e "bambini" (ovvero tutti i giovani che non hanno ancora compiuto 15 anni, ai quali è ampiamente fatto divieto di intraprendere un'occupazione formale).

Altri settori del diritto dell'Unione, in particolare quelli in cui l'attività dell'UE integra l'azione degli Stati membri (quali la previdenza sociale, l'immigrazione

2 Direttiva 2004/38/CE del Parlamento europeo e del Consiglio, del 29 aprile 2004, relativa al diritto dei cittadini dell'Unione e dei loro familiari di circolare e di soggiornare liberamente sul territorio degli Stati membri, che modifica il regolamento (CEE) n. 1612/68 e abroga le direttive 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE e 93/96/CEE, GU L 158 del 30 aprile 2004 e GU L 158 del 29 aprile 2004, articolo 2, paragrafo 2, lettera c).

3 Direttiva 94/33/CE del 20 agosto 1994 relativa alla protezione dei giovani sul lavoro, GU L 216 del 20.8.1994, articolo 3.

e l'istruzione), demandano all'ordinamento giuridico nazionale la responsabilità di stabilire chi sia un minore. In genere, in tali contesti si adotta la definizione della CRC.

Nell'ambito del diritto del Consiglio d'Europa, la maggior parte degli strumenti riguardanti i minori adotta la definizione di minore della CRC. Tra gli esempi figurano l'articolo 4, lettera d), della Convenzione del Consiglio d'Europa sulla lotta contro la tratta di esseri umani[4] o l'articolo 3, lettera a), della Convenzione del Consiglio d'Europa sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale (Convenzione di Lanzarote).[5]

La Convenzione europea dei diritti dell'uomo (CEDU) non fornisce una definizione di minore, ma il suo articolo 1 obbliga gli Stati a riconoscere i diritti della Convenzione a "ogni persona" sottoposta alla loro giurisdizione. L'articolo 14 della CEDU assicura il godimento dei diritti riconosciuti nella Convenzione "senza nessuna discriminazione", comprese quelle fondate sull'età.[6] La Corte europea dei diritti dell'uomo (Corte EDU) ha accolto ricorsi da parte e a nome di minori indipendentemente dalla loro età.[7] Nella sua giurisprudenza ha accettato la definizione di minore fornita dalla CRC,[8] avallando il concetto di "ogni essere umano avente un'età inferiore a diciott'anni".

Lo stesso vale per la Carta sociale europea (CSE) e la sua interpretazione da parte del Comitato europeo dei diritti sociali (CEDS).[9]

1.2. Contesto della legislazione europea sui diritti dei minori

Finora la maggior parte della legislazione europea sui diritti dei minori è stata sviluppata dall'UE e dal Consiglio d'Europa. Oltre all'ONU, anche altre istituzioni internazionali quali la Conferenza dell'Aia sul diritto internazionale privato hanno adottato strumenti importanti che continuano a informare lo sviluppo del diritto europeo. Benché abbiano operato separatamente l'uno dall'altro, questi quadri internazionali sono sempre più interconnessi.[10] La cooperazione interistituzionale tra il Consiglio d'Europa e l'UE è particolarmente forte.

1.2.1. Unione europea: sviluppo della legislazione sui diritti dei minori e aree di protezione contemplate

In passato la legislazione sui diritti dei minori nell'UE si è sviluppata in maniera frammentaria. Storicamente, la legislazione europea sui minori era in ampia misura finalizzata ad affrontare aspetti specifici riguardanti i minori di iniziative economiche e politiche di più ampia portata, per esempio nell'ambito della tutela dei consumatori [11] e della libera circolazione delle persone.[12] Tuttavia, più di recente, i diritti dei minori sono stati trattati all'interno di un programma più coordinato dell'UE, sulla base di tre importanti pietre miliari:

- l'introduzione della Carta dei diritti fondamentali dell'Unione europea;
- l'entrata in vigore del trattato di Lisbona nel dicembre 2009;
- l'adozione della comunicazione della Commissione europea "Riservare ai minori un posto speciale nella politica esterna dell'UE" e degli orientamenti del Consiglio dell'UE in materia di promozione e tutela dei diritti del bambino.

10 Cfr., per esempio, il capitolo 5, che illustra il modo in cui il diritto di famiglia dell'UE che disciplina la sottrazione transfrontaliera di minori opera con la Convenzione dell'Aia del 25 ottobre 1980 sugli aspetti civili della sottrazione internazionale di minori (Convenzione dell'Aia sulla sottrazione di minori).

11 Per esempio, la direttiva 2009/48/CE del Parlamento europeo e del Consiglio, del 18 giugno 2009, sulla sicurezza dei giocattoli (GU L 170 del 30.6.2009), che stabilisce misure di sicurezza per i giocattoli destinati ai bambini.

12 Per esempio, la direttiva 2004/38/CE.

La prima pietra miliare è stata l'introduzione della Carta dei diritti fondamentali dell'UE nel 2000.[13] Il 1° dicembre 2009, con l'entrata in vigore del trattato di Lisbona, è stato conferito alla Carta lo stesso valore giuridico vincolante dei trattati dell'UE (articolo 6 del trattato sull'Unione europea, TUE). La Carta obbliga l'Unione e i suoi Stati membri a tutelare i diritti da essa sanciti nell'attuazione del diritto dell'UE. La Carta dei diritti fondamentali dell'UE contiene i primi riferimenti dettagliati ai diritti dei minori a livello costituzionale dell'UE, anche attraverso il riconoscimento del diritto dei minori di accedere gratuitamente all'istruzione obbligatoria (articolo 14, paragrafo 2), il divieto di qualsiasi forma di discriminazione fondata sull'età (articolo 21) nonché il divieto di sfruttamento del lavoro minorile (articolo 32). Degno di nota è il fatto che la Carta contenga una disposizione dedicata ai diritti del minore (articolo 24), che sancisce tre principi fondamentali dei diritti dei minori: il diritto di esprimere liberamente la propria opinione in funzione della loro età e della loro maturità (articolo 24, paragrafo 1), il diritto a che il loro interesse superiore sia considerato preminente in tutti gli atti relativi ai minori (articolo 24, paragrafo 2) e il diritto di intrattenere regolarmente relazioni personali e contatti diretti con i due genitori (articolo 24, paragrafo 3).

La seconda pietra miliare è rappresentata dal trattato di Lisbona, che, come precedentemente indicato, è entrato in vigore il 1° dicembre 2009.[14] Questo strumento ha introdotto importanti cambiamenti istituzionali, procedurali e costituzionali nell'UE modificando il TUE e il precedente trattato che istituisce la Comunità europea (ora "trattato sul funzionamento dell'Unione europea", TFUE).[15] Tali modifiche hanno rafforzato il potenziale dell'UE di compiere progressi riguardo ai diritti dei minori, non da ultimo individuando la "tutela dei diritti del minore" come un obiettivo generale dichiarato dell'UE (articolo 3, paragrafo 3, del TUE) e come un aspetto importante della politica di relazioni esterne dell'UE (articolo 3, paragrafo 5, del TUE). Anche il TFUE contiene riferimenti più specifici ai minori, che permettono all'UE di adottare misure legislative volte a combattere lo sfruttamento sessuale e la tratta di esseri umani (articolo 79, paragrafo 2, lettera d), e articolo 83, paragrafo 1)).

13 UE (2012), Carta dei diritti fondamentali dell'Unione europea (GU C 326 del 26.10.2012).

14 UE (2007), Trattato di Lisbona che modifica il trattato sull'Unione europea e il trattato che istituisce la Comunità europea, firmato a Lisbona (GU C 306 del 17.12.2007, pagg. 1–271).

15 Cfr. le versioni consolidate delle Comunità europee (2012), trattato sull'Unione europea (TUE) e trattato sul funzionamento dell'Unione europea (TFUE), GU 2012 C 326 del 26.10.2012.

È stato così possibile adottare sia la direttiva relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile,[16] sia la direttiva concernente la prevenzione e la repressione della tratta di esseri umani e la protezione delle vittime,[17] contenente a sua volta disposizioni volte ad affrontare le esigenze specifiche dei minori vittime di tratta. Analogamente, la più recente direttiva che istituisce norme minime in materia di diritti, assistenza e protezione delle vittime di reato dedica molte delle sue disposizioni ai minori.[18]

La terza importante pietra miliare è stata posta a un livello politico più strategico, inizialmente nell'ambito del programma dell'UE sulla cooperazione esterna e in seguito in relazione a questioni interne. Nello specifico, il Consiglio dell'UE e la Commissione europea hanno rispettivamente adottato gli "Orientamenti dell'UE in materia di promozione e tutela dei diritti del bambino"[19] e la comunicazione "Riservare ai minori un posto speciale nella politica esterna dell'UE"[20], al fine di integrare i diritti dei minori in tutte le attività svolte dall'UE con i paesi terzi. Analogamente, nel 2011 la Commissione ha adottato il programma UE per i diritti dei minori, che delinea le principali priorità per lo sviluppo della legislazione e della politica sui diritti dei minori negli Stati membri dell'UE.[21] Nell'ambito del programma avrebbero dovuto essere presi in considerazione anche i processi legislativi pertinenti ai fini della tutela dei minori, quali la suddetta adozione della direttiva sui diritti delle vittime.

Più recentemente, questa iniziativa è stata integrata dall'adozione, da parte della Commissione, di una strategia globale volta ad aiutare gli Stati membri a impegnarsi nella lotta contro la povertà e l'esclusione sociale attraverso l'attuazione di una serie di interventi sin dalla prima infanzia (destinati ai bambini in età prescolare e della scuola primaria).[22] Né questa specifica iniziativa, né il programma

17 Direttiva 2011/36/UE (GU L 101 del 15.4.2011, pag. 1).

18 Direttiva 2012/29/UE (GU L 315 del 15.4.2012, pag. 57).

19 Consiglio dell'Unione europea (2007), *Orientamenti dell'UE in materia di promozione e tutela dei diritti del bambino*, Bruxelles, 10 dicembre 2007.

20 Commissione europea (2008), *Riservare ai minori un posto speciale nella politica esterna dell'UE: Comunicazione della Commissione al Consiglio, al Parlamento europeo, al Comitato economico e sociale europeo e al Comitato delle regioni*, COM (2008) 55 final, Bruxelles, 5 febbraio 2008.

21 Commissione europea (2011), *Programma UE per i diritti dei* minori*: Comunicazione della Commissione al Parlamento europeo, al Consiglio, al Comitato economico e sociale europeo e al Comitato delle regioni*, COM (2011) 0060 final, Bruxelles, 15 febbraio 2011.

22 Commissione europea (2013), *Investire nell'infanzia per spezzare il circolo vizioso dello svantaggio*, raccomandazione 2013/112/UE, Bruxelles.

sono giuridicamente vincolanti; tuttavia, sono entrambi significativi nella misura in cui definiscono il modello per la normativa e l'approccio metodologico dell'UE nei confronti della legislazione sui diritti dei minori, un modello che, oltre a essere fermamente associato alla CRC, si colloca nell'ambito di un'etica di tutela, partecipazione e non discriminazione dei minori.

L'UE può legiferare solo qualora gliene sia stata attribuita la competenza dai trattati (articoli da 2 a 4 del TFUE). Poiché i diritti dei minori sono un ambito intersettoriale, la competenza dell'UE deve essere determinata caso per caso. Finora, gli ambiti attinenti ai diritti dei minori in cui l'UE ha ampiamente legiferato sono i seguenti:

- tutela dei dati e protezione dei consumatori;
- asilo e migrazione;
- cooperazione in materia civile e penale.

L'articolo 6, paragrafo 1, del TUE e l'articolo 51, paragrafo 2, della Carta dei diritti fondamentali dell'UE stabiliscono che la Carta non estende le competenze dell'UE né modifica o introduce competenze nuove o compiti nuovi per l'UE. Le disposizioni della Carta si applicano alle istituzioni e agli Stati membri dell'UE esclusivamente nell'attuazione del diritto dell'Unione. Sebbene per l'UE siano sempre vincolanti, le disposizioni della Carta diventano giuridicamente vincolanti per gli Stati membri solo quando essi agiscono nel campo di applicazione del diritto dell'Unione.

Ciascuno dei capitoli riportati di seguito contiene una breve panoramica delle competenze dell'UE negli ambiti trattati nel rispettivo capitolo.

1.2.2. Consiglio d'Europa: sviluppo della legislazione sui diritti dei minori e aree di protezione contemplate

Diversamente dall'UE, fin dalla sua istituzione, il Consiglio d'Europa ha il chiaro mandato di proteggere e promuovere i diritti umani. Il principale trattato sui diritti umani del Consiglio d'Europa, ratificato da tutti i suoi Stati membri, è la Convenzione per la salvaguardia dei diritti dell'uomo e delle libertà fondamentali (o Convenzione europea dei diritti dell'uomo, CEDU), che contiene specifici

riferimenti ai minori. I principali sono i seguenti: l'articolo 5, paragrafo 1, lettera d), prevede la detenzione regolare di un minore decisa allo scopo di sorvegliare la sua educazione; l'articolo 6, paragrafo 1, limita il diritto a che la causa di una persona sia esaminata equamente e pubblicamente quando lo esigono gli interessi dei minori; l'articolo 2 del Protocollo n. 1 prevede il diritto all'istruzione e stabilisce che gli Stati rispettino le convinzioni religiose e filosofiche dei genitori nell'istruzione dei figli. Inoltre, tutte le altre disposizioni generali della CEDU sono applicabili a chiunque, minori compresi. Alcune di esse si sono rivelate particolarmente pertinenti per i minori, nella fattispecie l'articolo 8, che garantisce il diritto al rispetto della vita privata e familiare, e l'articolo 3, che vieta la tortura nonché pene e trattamenti inumani e degradanti. Avvalendosi di approcci interpretativi che si concentrano sugli obblighi positivi insiti nelle disposizioni della CEDU, la Corte EDU ha sviluppato un ampio *corpus* giurisprudenziale in materia di diritti dei minori, che contiene frequenti riferimenti alla CRC. Detto questo, la Corte EDU esamina i ricorsi caso per caso e, di conseguenza, non offre una panoramica esaustiva dei diritti dei minori nell'ambito della CEDU.

L'altro importante trattato sui diritti umani del Consiglio d'Europa, la Carta sociale europea (CSE[23], riveduta nel 1996[24]), sancisce la tutela dei diritti sociali, prevedendo disposizioni specifiche per i diritti dei minori. Nella fattispecie, contiene due disposizioni particolarmente importanti per i diritti dei minori. L'articolo 7 stabilisce l'obbligo di proteggere i minori dallo sfruttamento economico. L'articolo 17 impone agli Stati di prendere tutte le misure necessarie e appropriate per garantire ai bambini le cure, l'assistenza, l'istruzione e la formazione di cui necessitano (compreso l'insegnamento primario e secondario gratuito), a proteggere i bambini e gli adolescenti dalla negligenza, dalla violenza o dallo sfruttamento e ad assicurare protezione dei bambini privati del loro sostegno familiare. Il comitato europeo dei diritti sociali (CEDS), composto da esperti indipendenti che valutano la conformità del diritto e della prassi nazionale alla CSE attraverso una procedura di reclami collettivi o nell'ambito di una procedura nazionale di presentazione di relazioni, è incaricato di controllare l'applicazione della Carta.

23 Consiglio d'Europa, Carta sociale europea, STCE n. 35, 18 ottobre 1961.

24 Consiglio d'Europa, Carta sociale europea (riveduta), STCE n. 163, 3 maggio 1996.

Inoltre il Consiglio d'Europa ha adottato molti trattati che si occupano di una serie di questioni specifiche attinenti ai diritti dei minori. Tra questi figurano:

- la Convenzione europea sullo statuto giuridico dei figli nati fuori matrimonio;[25]
- la Convenzione sull'adozione dei minori, riveduta nel 2008;[26]
- la Convenzione sulle relazioni personali riguardanti i minori;[27]
- la Convenzione sull'esercizio dei diritti dei minori;[28]
- la Convenzione del Consiglio d'Europa sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale (convenzione di Lanzarote).[29]

Infine, a livello politico è importante rilevare che nel 2006 il Consiglio d'Europa ha avviato il suo programma "Costruire un'Europa per e con i bambini e le bambine", un piano d'azione trasversale volto ad affrontare questioni riguardanti i diritti dell'infanzia, tra cui l'adozione di strumenti per la definizione di norme in vari settori.[30] Le priorità attuali si concentrano su quattro aree strategiche[31]:

- promuovere servizi e sistemi a misura di bambino;
- eliminare tutte le forme di violenza contro i minori;
- garantire i diritti dei minori in situazioni di vulnerabilità;
- promuovere la partecipazione del minore.

L'obiettivo principale del programma del Consiglio d'Europa sui diritti del bambino è sostenere l'attuazione, da parte di tutti i suoi Stati membri, di norme internazionali nel settore dei diritti dei minori, e in particolare promuovere l'attuazione

25 Consiglio d'Europa, Convenzione europea sullo statuto giuridico dei figli nati fuori matrimonio, STCE n. 85, 15 ottobre 1975.

26 Consiglio d'Europa, Convenzione sull'adozione dei minori (riveduta), STCE n. 202, 27 novembre 2008.

27 Consiglio d'Europa, Convenzione sulle relazioni personali riguardanti i minori, STCE n. 192, 15 maggio 2003.

28 Consiglio d'Europa, Convenzione europea sull'esercizio dei diritti dei minori, STCE n. 160, 25 gennaio 1996.

29 Consiglio d'Europa, Convenzione sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale, STCE n. 201, 25 ottobre 2007.

30 Per maggiori informazioni, cfr. http://www.coe.int/t/dg3/children/.

31 Consiglio d'Europa, Comitato dei ministri (2011), Strategia del Consiglio d'Europa sui diritti del bambino (2012-2015), CM (2011)171 final, 15 febbraio 2012.

della CRC, evidenziandone i principi essenziali: la non discriminazione, il diritto alla vita e allo sviluppo, l'interesse superiore del minore come considerazione preminente dei responsabili decisionali e il diritto del minore a essere ascoltato.[32]

Nell'ambito del programma sono stati adottati alcuni strumenti sui diritti dei minori che integrano con orientamenti pratici le misure giuridiche europee vincolanti, tra cui:

- le Linee guida per una giustizia a misura di minore;[33]
- le Linee guida per un'assistenza sanitaria a misura di bambino;[34]
- la raccomandazione sulle strategie nazionali integrate per la protezione dei minori dalla violenza;[35]
- la raccomandazione sui diritti dei bambini e i servizi sociali adatti ai bambini e alle loro famiglie;[36]
- la raccomandazione sulla partecipazione dei bambini e dei giovani di età inferiore ai 18 anni.[37]

In tal modo, il programma ha assicurato la centralità dell'Europa nella definizione di norme sui diritti dell'infanzia e ha inoltre spianato la strada, con vari mezzi, al fine di garantire che la voce dei minori rivesta un ruolo fondamentale per il suddetto processo. Il programma intende altresì sostenere l'attuazione della CEDU e della CSE nonché promuovere gli altri strumenti giuridici di cui il Consiglio d'Europa dispone attualmente in relazione all'infanzia (partecipazione, protezione e diritti), ai giovani e alla famiglia.[38]

1.3. La legislazione europea sui diritti dei minori e la Convenzione delle Nazioni Unite sui diritti del fanciullo

Punto saliente

- La legislazione europea sui diritti dei minori si basa in ampia misura sulla Convenzione delle Nazioni Unite sui diritti del fanciullo (CRC).

Il fatto che tutti gli Stati membri dell'UE e del Consiglio d'Europa siano firmatari della Convenzione delle Nazioni Unite sui diritti del fanciullo indica l'importanza attribuita alla CRC a livello europeo. La convenzione impone effettivamente obblighi giuridici comuni agli Stati europei con un effetto a catena sul modo in cui le istituzioni europee sviluppano e applicano i diritti dei minori.

La CRC è così diventata il termine di paragone per lo sviluppo della legislazione europea sui diritti dei minori, con il risultato che il Consiglio d'Europa e l'UE fanno sempre più spesso riferimento alla sua influenza. In particolare, l'integrazione dei principi e delle disposizioni della CRC nella giurisprudenza e in strumenti vincolanti a livello europeo conferisce una forza maggiore alla Convenzione, schiudendo canali di applicazione più efficaci per chi cerca di invocare i diritti dei minori in Europa, come si evince dagli esempi specifici forniti in tal senso nel presente manuale.

L'Unione europea non è e non può diventare una firmataria della CRC poiché la Convenzione non è dotata di meccanismi giuridici che permettano a organismi diversi dagli Stati di aderirvi. Tuttavia, l'Unione attinge ai "principi generali del diritto dell'UE" (principi scritti e non scritti derivanti dalle tradizioni costituzionali comuni degli Stati membri) per integrare e orientare le interpretazioni dei suoi trattati (articolo 6, paragrafo 3, del TUE). Le sentenze della Corte di giustizia dell'Unione europea (CGUE) hanno confermato che non deve esistere un conflitto tra gli obblighi derivanti dall'adesione all'UE e gli obblighi che gli Stati membri sono tenuti a rispettare in virtù delle loro costituzioni nazionali e degli impegni internazionali assunti in materia di diritti umani.[39] Poiché tutti gli Stati membri

39 Cfr., per esempio, Corte di giustizia dell'Unione europea (CGUE), sentenza 14 maggio 1974, causa C-4/73, *J. Nold, Kohlen- und Baustoffgroßhandlung c. Commissione delle Comunità europee*.

hanno ratificato la CRC, l'UE è tenuta a rispettare i principi e le disposizioni da essa sanciti, almeno in relazione alle questioni rientranti nel suo ambito di competenza (quale definito dai trattati dell'UE).

Questo obbligo è rafforzato da altri trattati dell'UE e, in particolare, dalla Carta dei diritti fondamentali dell'Unione europea. L'articolo 24 della Carta è ispirato direttamente dalle disposizioni della CRC, tra cui alcune che sono assurte al rango di "principi della CRC", segnatamente il principio dell'interesse superiore del minore (articolo 3 della CRC), il principio della partecipazione del minore (articolo 12 della CRC) e il diritto del minore di vivere e/o di intrattenere rapporti con i suoi genitori (articolo 9 della CRC).

L'importanza della CRC nell'orientare lo sviluppo dei diritti dei minori nell'UE è riconosciuta nel programma per i diritti dei minori della Commissione, in cui si legge che "le norme e i principi ivi contenuti devono continuare a guidare le politiche e le azioni dell'Unione che possono incidere sui diritti dei minori".[40] In tale ottica, gli strumenti legislativi riguardanti i minori sono accompagnati, quasi senza eccezioni, o da un riferimento esplicito alla CRC o da un riferimento più implicito ai principi sui diritti dei minori, quali "l'interesse superiore", il diritto del minore a partecipare a decisioni che lo riguardano o il diritto alla protezione dalla discriminazione.

Il Consiglio d'Europa, al pari dell'UE, non è un'organizzazione giuridicamente obbligata ad attenersi alla CRC, sebbene tutti i suoi Stati membri siano parti individuali firmatarie della convenzione. Tuttavia, la CEDU non può essere interpretata isolatamente, bensì in armonia con i principi generali del diritto internazionale. Devono essere prese in considerazione tutte le pertinenti norme del diritto internazionale applicabili nelle relazioni tra gli Stati contraenti della CEDU, in particolare quelle riguardanti la protezione universale dei diritti umani. Gli obblighi che gli Stati contraenti della CEDU sono tenuti a rispettare nell'ambito dei diritti dei minori devono più specificamente essere interpretati alla luce della CRC.[41] Anche il CEDS, nelle sue decisioni, ha fatto espressamente riferimento alla CRC.[42] Inoltre, le attività di definizione di norme e di elaborazione dei trattati del Consiglio

40 Commissione europea (2011), *Programma UE per i diritti dei minori*, COM (2011) 0060 final, Bruxelles.

41 Corte EDU, sentenza 4 ottobre 2012, *Harroudj c. Francia* (n. 43631/09), punto 42.

42 CEDS, sentenza 7 dicembre 2004, *World Organisation against Torture (OMCT) c. Irlanda*, (ricorso n. 18/2003), punti 61-63; CEDS, sentenza 20 ottobre 2009, *Defence for Children International (DCI) c. Paesi Bassi*, (ricorso n. 47/2008), punto 25.

d'Europa sono influenzate dai principi e dalle disposizioni della CRC. Per esempio, le *Linee guida per una giustizia a misura di minore*[43] sono direttamente informate da una serie di disposizioni della CRC, al pari dei commenti generali del Comitato delle Nazioni Unite sui diritti dell'infanzia di cui sono corredate.[44]

1.4. Interpretazione e applicazione della legislazione europea sui diritti dei minori: il ruolo delle Corti europee

1.4.1. Corte di giustizia dell'Unione europea

La CGUE emette sentenze riguardo molti tipi di azioni giuridiche. Nelle cause riguardanti i diritti dei minori, finora la CGUE si è pronunciata principalmente in via pregiudiziale (articolo 267 del TFUE).[45] Si tratta di procedure nel cui ambito una corte o un tribunale nazionale chiedono alla CGUE di fornire un'interpretazione del diritto primario dell'UE (ad esempio i trattati) o del diritto derivato dell'UE (ad esempio decisioni, normative) che è pertinente per una causa nazionale pendente dinanzi alla corte o al tribunale nazionale in questione.

Fino a qualche anno fa, la CGUE si era pronunciata solo su alcune cause riguardanti i diritti dei minori. Tuttavia, con l'adozione di misure legislative più esplicite sui diritti dei minori e di un programma più rilevante per i diritti dei minori, è probabile che in futuro i diritti dei minori figurino più regolarmente negli elenchi delle sentenze della CGUE.

La CGUE ha pronunciato la maggior parte delle sue sentenze sui diritti dei minori nel contesto della libera circolazione e della cittadinanza dell'UE, settori in cui l'Unione vanta una lunga competenza. In quest'ambito la CGUE ha espressamente

43 Consiglio d'Europa, Comitato dei ministri (2010), *Linee guida per una giustizia a misura di minore*, 17 novembre 2010.

44 Cfr. Nazioni Unite (ONU), Comitato sui diritti dell'infanzia (2007), *Commento generale n. 10 (2007): I diritti dell'infanzia e dell'adolescenza in materia di giustizia minorile*, 25 aprile 2007; ONU, Comitato sui diritti dell'infanzia (2009), *Commento generale n. 12 (2009): Il diritto del minore di essere ascoltato*, CRC/C/GC/12, 1° luglio 2009; e ONU, Comitato sui diritti dell'infanzia (2013), *Commento generale n. 14 (2013) sul diritto del minore a che il suo interesse superiore sia tenuto in primaria considerazione:* (articolo 3, paragrafo 1), CRC/C/GC/14, 29 maggio 2013.

45 L'unica eccezione è costituita da un ricorso d'annullamento: CGUE, sentenza 27 giugno 2006, causa C-540/03, *Parlamento europeo c. Consiglio dell'Unione europea* [GS].

riconosciuto che i minori godono a titolo individuale dei benefici associati alla cittadinanza dell'UE, estendendo loro, in tal modo, il permesso di soggiorno autonomo nonché i diritti sociali e all'istruzione sulla base della nazionalità dell'UE.[46]

La CGUE è ricorsa direttamente alla CRC per stabilire come dovesse essere interpretato il diritto dell'UE in relazione ai minori solo una volta, ovvero nella causa *Dynamic Medien GmbH c. Avides Media AG*. Questa causa riguarda la legalità delle restrizioni tedesche in materia di etichettatura su videocassette e DVD importati, che erano già stati sottoposti a controlli analoghi nel Regno Unito. La CGUE ha concluso che i controlli dei contrassegni effettuati dalla Germania costituivano una restrizione legittima delle disposizioni dell'UE sulla libera circolazione delle merci (che altrimenti precludono processi normativi doppi di questa natura), poiché erano volti a tutelare il benessere dei minori. La CGUE ha sostenuto la sua decisione facendo riferimento all'articolo 17 della CRC, che incoraggia gli Stati firmatari a elaborare principi direttivi adatti a proteggere il minore dalle informazioni e dai materiali mediatici che nuocciono al suo benessere.[47] Si applicano tuttavia requisiti di proporzionalità riguardo alle procedure di controllo istituite per proteggere i minori, che devono essere facilmente accessibili e devono potersi concludere entro termini ragionevoli.[48]

In altri casi, in particolare nel contesto delle cause riguardanti la sottrazione transfrontaliera di minori, per fondare le sue decisioni, la CGUE ha alluso ai principi generali sui diritti dei minori, contenuti anche nelle disposizioni della CRC (quali l'interesse superiore del minore e il suo diritto a essere ascoltato).[49]

A prescindere da ciò, l'UE è sempre stata cauta nell'attribuire una forza decisiva alla CRC, in particolare in settori politicamente più sensibili quali il controllo

46 Cfr. CGUE, sentenza 17 settembre 2002, causa C-413/99, *Baumbast e R c. Secretary of State for the Home Department*; CGUE, sentenza 19 ottobre 2004, causa C-200/02, *Kunqian Catherine Zhu e Man Lavette Chen c. Nimco Hassan Ibrahim e Secretary of State for the Home Department* [GS], CGUE, sentenza 23 febbraio 2010, causa C-480/08, *Maria Teixera c. London Borough of Lambeth e Secretary of State for the Home Department*. Si tornerà nuovamente su queste cause ai capitoli 8 e 9.

47 CGUE, sentenza 14 febbraio 2008, causa C-244/06, *Dynamic Medien Vertriebs GmbH c. Avides Media AG*, punti 42 e 52.

48 *Ibid.*, punti 49 e 50.

49 CGUE, sentenza 22 dicembre 2010, causa C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz*. Cfr., più avanti, il capitolo 5.

dell'immigrazione,[50] benché nella recente giurisprudenza si stia assistendo a un cambiamento in tal senso, come discusso nei capitoli successivi. Dall'adozione della Carta dei diritti fondamentali dell'UE, i riferimenti della CGUE ai suoi articoli sui diritti dei minori spesso sono ricchi di riferimenti alla CRC, in virtù della somiglianzatra le disposizioni.

1.4.2. La Corte europea dei diritti dell'uomo

La Corte EDU si pronuncia essenzialmente su ricorsi individuali presentati in conformità degli articoli 34 e 35 della CEDU. La competenza della Corte si estende a tutte le questioni concernenti l'interpretazione e l'applicazione della Convenzione e dei suoi protocolli (articolo 32 della CEDU).

Diversamente dalla CGUE, la Corte EDU ha una vasta giurisprudenza sui diritti dei minori. Benché molti casi rientranti nell'ambito dell'articolo 8 della CEDU sul diritto al rispetto della vita privata e familiare siano esaminati dalla prospettiva dei diritti dei genitori anziché di quelli dei minori, i casi contemplati da altre disposizioni sostanziali non coinvolgono necessariamente i genitori e si concentrano più chiaramente sui diritti dei minori interessati, come il diritto alla protezione da trattamenti inumani o degradanti (articolo 3 della CEDU) o al diritto ad un equo processo (articolo 6 della CEDU).

Sebbene faccia spesso riferimento alla CRC quando esamina i ricorsi presentati da o a nome di minori, la Corte EDU non attribuisce sistematicamente un'importanza decisiva alla Convenzione. In alcuni casi, i principi sui diritti dei minori enunciati dalla CRC hanno influenzato profondamente il ragionamento della Corte EDU, in particolare per quanto riguarda l'interpretazione dell'articolo 6 della CEDU (diritto a un equo processo) in relazione al trattamento dei minori in conflitto con la legge (cfr. il capitolo 11). In altri ambiti, l'approccio della Corte EDU può discostarsi leggermente da quello della CRC, per esempio per quanto riguarda il diritto dei minori di essere ascoltati in giudizio (cfr. il capitolo 2). In alcuni casi, invece, la Corte EDU si è espressamente basata sulla CRC.

50 CGUE, sentenza 27 giugno 2006, causa C-540/03, *Parlamento europeo c. Consiglio dell'Unione europea* [GS].

Esempio: il caso *Maslov c. Austria*[51] riguarda l'espulsione del ricorrente, che era stato condannato per una serie di reati penali commessi quando era minorenne. Per quanto riguarda le misure di espulsione nei confronti di un minore autore di reati, la Corte EDU ha stabilito che nell'obbligo di tenere conto dell'interesse superiore del minore figura anche l'obbligo di agevolarne il reinserimento, in linea con l'articolo 40 della CRC. La Corte EDU ha ritenuto che non sarebbe stato possibile reinserire il minore rescindendo i suoi legami familiari e sociali attraverso l'espulsione.[52] La CRC è stata dunque uno dei motivi utilizzati per considerare l'espulsione come una sproporzionata ingerenza nei diritti del ricorrente ai sensi dell'articolo 8 della CEDU (rispetto della vita privata e familiare).

1.5. Comitato europeo dei diritti sociali

Il CEDS è composto da 15 esperti indipendenti e imparziali che valutano la conformità del diritto e della prassi nazionale alla CSE attraverso la procedura dei reclami collettivi o nell'ambito della procedura nazionale di presentazione di relazioni.[53] Le organizzazioni nazionali e internazionali designate possono presentare ricorsi collettivi nei confronti degli Stati contraenti che hanno accolto la procedura dei reclami. Finora i ricorsi hanno riguardato l'eventuale violazione, da parte degli Stati, dei diritti dei minori ai sensi della CSE su questioni quali lo sfruttamento economico dei minori,[54] l'integrità fisica dei minori,[55] i diritti dei minori migranti in materia di salute[56] e l'accesso all'istruzione da parte di minori disabili.[57]

51 Corte EDU, sentenza 23 giugno 2008, *Maslov c. Austria* [GC] (n. 1638/0323).

52 *Ibid.*, punto 83.

53 Per maggiori informazioni consultare il sito web del CEDS: www.coe.int/t/dghl/monitoring/socialcharter/ECSR/ECSRdefault_en.asp.

54 CEDS, sentenza 9 settembre 1999, *International Commission of Jurists (ICJ) c. Portogallo*, (ricorso n. 1/1998).

55 CEDS, sentenza 7 dicembre 2004, *World Organisation Against Torture (OMCT) c. Grecia*, (ricorso n. 17/2003).

56 CEDS, sentenza 23 ottobre 2012, *Defence for Children International (DCI) c. Belgio* (ricorso n. 69/2011).

57 CEDS, sentenza 3 giugno 2008, *Mental Disability Advocacy Center (MDAC) c. Bulgaria* (ricorso n. 41/2007), punto 35.

Esempio: nel caso *International Commission of Jurists (ICJ) c. Portogallo*[58], si era sostenuto che, sebbene rispettasse l'età minima di 15 anni per l'ammissione al lavoro fissata dall'articolo 7, paragrafo 1, della CSE, la normativa portoghese non era adeguatamente applicata. Il CEDS ha dichiarato che la CSE ha l'obiettivo e la finalità di proteggere i diritti non solo in teoria, ma anche in pratica, e che pertanto la suddetta normativa deve essere applicata efficacemente. Avendo constatato che in Portogallo un numero considerevole di minori aveva un'occupazione irregolare, il CEDS ha ritenuto che tale situazione costituisse una violazione dell'articolo 7, paragrafo 1, della CSE.

58 CEDS, sentenza 9 settembre 1999, *International Commission of Jurists (ICJ) c. Portogallo*, (ricorso n. 1/1998).

2 Libertà e diritti civili fondamentali

UE	Argomenti trattati	Consiglio d'Europa
Carta dei diritti fondamentali dell'UE, articolo 24 (diritti del bambino) CGUE, sentenza C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz*, 2010 (diritto di essere ascoltato, sottrazione internazionale di minori)	**Diritto di essere ascoltato**	CEDU, articolo 6 (equo processo) Convenzione europea sull'esercizio dei diritti dei minori, articoli 3, 4, 6 e 7 Corte EDU, *Sahin c. Germania* [GC], n. 30943/96, 2003 (diritto del minore di essere ascoltato in giudizio nei procedimenti relativi al diritto di visita)
Carta dei diritti fondamentali, articolo 12 (libertà di riunione e di associazione)	**Diritto alla libertà di riunione e di associazione**	CEDU, articolo 11 (libertà di riunione pacifica e libertà d'associazione) Corte EDU, *Christian Democratic People's Party c. Moldova*, n. 28793/02, 2006 (partecipazione a una riunione in un luogo pubblico)

Tutti godono delle libertà e dei diritti civili sanciti in vari strumenti, in particolare la Carta dei diritti fondamentali dell'UE e la Convenzione europea dei diritti dell'uomo (CEDU), quali interpretate dalla Corte europea dei diritti dell'uomo (Corte EDU). Al di là della Carta, nessun altro strumento giuridico dell'UE prende espressamente in considerazione i diritti civili discussi nel presente capitolo, poiché si applicano ai minori. Tuttavia, per quanto riguarda il Consiglio d'Europa, nel corso degli anni si è assistito a un ampio sviluppo dell'ambito di applicazione e dell'interpretazione di questi diritti civili, in particolare attraverso la giurisprudenza della Corte EDU.

Il presente capitolo fornisce una panoramica delle libertà elencate al titolo II della Carta dei diritti fondamentali dell'UE nella misura in cui incidono sui diritti dei minori. Inoltre, analizza il diritto del minore alla libertà di pensiero, di coscienza e di religione (paragrafo 2.1), alla libertà di espressione e d'informazione (paragrafo 2.3), al diritto del minore di essere ascoltato (paragrafo 2.4) e al diritto alla libertà di riunione e di associazione (paragrafo 2.5).

2.1. Libertà di pensiero, di coscienza e di religione

Punti salienti

- La libertà di pensiero, di coscienza e di religione, garantita dalla Carta dei diritti fondamentali dell'UE e dalla CEDU, include il diritto di cambiare religione o convinzione, così come la libertà di manifestare la propria religione o la propria convinzione mediante il culto, l'insegnamento, le pratiche e l'osservanza dei riti.
- I genitori hanno il diritto di provvedere all'educazione e all'istruzione dei loro figli secondo le loro convinzioni religiose, filosofiche e pedagogiche.
- I genitori hanno il diritto e il dovere di guidare il minore nell'esercizio del suo diritto alla libertà di pensiero, di coscienza e di religione in maniera che corrisponda allo sviluppo delle sue capacità.

2.1.1. Il diritto del minore alla libertà di religione

Nell'ambito del diritto dell'UE, l'articolo 10 della Carta dei diritti fondamentali dell'UE garantisce a ogni persona il diritto alla libertà di pensiero, di coscienza e di religione. Tale diritto include la libertà di cambiare religione o convinzione, così come la libertà di manifestare la propria religione o la propria convinzione individualmente o collettivamente, in pubblico o in privato, mediante il culto, l'insegnamento, le pratiche e l'osservanza dei riti. Il diritto all'obiezione di coscienza è riconosciuto secondo le leggi nazionali che ne disciplinano l'esercizio (articolo 10, paragrafo 2 della Carta dei diritti fondamentali dell'UE).

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 9 della CEDU garantisce a ogni persona il diritto alla libertà di pensiero, di coscienza e di religione. Dalla giurisprudenza della Corte EDU sono state ricavate tre dimensioni del diritto alla libertà di religione: la dimensione interna, la libertà di cambiare religione o convinzione e la libertà di manifestare la propria religione o la propria convinzione. Le prime due dimensioni sono assolute e gli Stati non possono limitarle in alcun modo.[59] La libertà di manifestare la propria religione o la propria convinzione può essere limitata se tali restrizioni sono stabilite dalla legge, perseguono un

59 Corte EDU, sentenza 23 ottobre 1990, *Darby c. Svezia* (n. 11581/85).

obiettivo legittimo e costituiscono misure necessarie in una società democratica (articolo 9, paragrafo 2, della CEDU).

Nella sua giurisprudenza, la Corte EDU si è occupata della libertà di pensiero, di coscienza e di religione dei minori principalmente in relazione al diritto all'istruzione e al sistema scolastico statale. Un argomento che è stato oggetto di un ampio dibattito pubblico nei paesi europei è la religione nelle scuole.

Esempio: i casi di *Dogru c. Francia* e *Kervanci c. Francia*[60] riguardano l'espulsione dal primo anno di una scuola secondaria statale francese di due ragazze, di 11 e 12 anni di età, in seguito al loro rifiuto di togliere il velo durante le lezioni di educazione fisica. La Corte EDU ha osservato che la limitazione del diritto delle ricorrenti a manifestare le loro convinzioni religiose aveva la finalità di preservare gli imperativi della laicità nelle scuole pubbliche. A parere delle autorità nazionali, indossare un velo, in particolare il velo islamico, non era compatibile con la pratica dello sport per ragioni di sicurezza e di igiene. La Corte EDU ha ritenuto la suddetta conclusione ragionevole, poiché la scuola aveva soppesato le convinzioni religiose delle ricorrenti e gli imperativi della protezione dei diritti e delle libertà altrui e dell'ordine pubblico. Ha pertanto stabilito che l'ingerenza nella libertà delle studentesse di manifestare la loro religione era giustificata e proporzionata all'obiettivo perseguito. La Corte non ha dunque riscontrato alcuna violazione dell'articolo 9 della CEDU.

Esempio: il caso *Grzelak c. Polonia*[61] riguarda l'impossibilità di uno studente dispensato dall'istruzione religiosa di frequentare un corso di etica e di ricevere la relativa valutazione. Durante il suo intero percorso d'istruzione primaria e secondaria (ovvero tra i sette e i 18 anni), il ricorrente non aveva ricevuto alcuna istruzione religiosa, conformemente alla volontà dei suoi genitori, che erano agnostici dichiarati. A causa dello scarso numero di studenti interessati, non era mai stato organizzato alcun corso di etica eil ricorrente aveva ricevuto pagelle e certificati scolastici in cui alla rubrica "religione/etica" al posto di un voto figurava una barra. La Corte EDU ha ritenuto che l'assenza di un voto di "religione/etica" sulle pagelle scolastiche del ragazzo rientrasse nell'ambito dell'aspetto negativo della libertà di

60 Corte EDU, sentenza 4 dicembre 2008, *Dogru c. Francia* (n. 27058/05); Corte EDU, sentenza 4 dicembre 2008, *Kervanci c. Francia* (n. 31645/04) (consultabile in francese).

61 Corte EDU, sentenza 15 giugno 2010, *Grzelak c. Polonia* (n. 7710/02).

pensiero, di coscienza e di religione, in quanto le pagelle avrebbero potuto indicare la sua mancata affiliazione religiosa. Si trattava pertanto di una forma di stigmatizzazione immotivata. La disparità di trattamento tra non credenti interessati a frequentare un corso di etica e studenti che seguivano le lezioni di religione non era dunque oggettivamente e ragionevolmente giustificata, né sussisteva un nesso ragionevole di proporzionalità tra i mezzi impiegati e lo scopo perseguito. Lo Stato aveva oltrepassato il proprio margine di apprezzamento in materia poiché era stata violata l'essenza stessa del diritto del ricorrente di non manifestare la sua religione o le sue convinzioni, in violazione dell'articolo 14 della CEDU in combinato disposto con l'articolo 9 della CEDU.

2.2. I diritti dei genitori e la libertà di religione dei loro figli

La legislazione europea tratta i diritti dei genitori nel contesto della libertà di religione dei loro figli in maniera diversa dalla CRC.

Nell'ambito della legislazione dell'UE, deve essere accordato il dovuto rispetto al diritto dei genitori di provvedere all'educazione e all'istruzione dei figli secondo le loro convinzioni religiose, filosofiche e pedagogiche, in particolare per quanto riguarda la libertà di creare istituti di insegnamento (articolo 14, paragrafo 3, della Carta).

Nell'ambito del diritto del Consiglio d'Europa, in particolare l'articolo 2 del Protocollo n. 1 della CEDU, gli Stati devono tenere conto delle convinzioni (religiose) dei genitori nell'esercizio delle funzioni che assumono nel campo dell'educazione e dell'insegnamento. Secondo la giurisprudenza della Corte EDU, questo dovere ha un'ampia portata, poiché si applica non solo al contenuto e all'attuazione dei programmi scolastici, ma anche allo svolgimento di tutte le funzioni assunte da uno Stato[62]. Comprende l'organizzazione e il finanziamento dell'istruzione pubblica, la definizione e la pianificazione del programma di studio, la diffusione in maniera obiettiva, critica e pluralista delle informazioni o delle conoscenze che

62 Cfr. la pertinente giurisprudenza della Corte EDU: Corte EDU, sentenza 7 dicembre 1976, *Kjeldsen, Busk Madsen e Pedersen c. Danimarca* (nn. 5095/71, 5920/72 e 5926/72); Corte EDU, sentenza 18 dicembre 1996, *Valsamis c. Grecia* (n. 21787/93); Corte EDU, sentenza 29 giugno 2007, *Folgerø e altri c. Norvegia* [GC] (n. 15472/02); Corte EDU, sentenza 9 ottobre 2007, *Hasan e Eylem Zengin c. Turchia* (n. 1448/04); Corte EDU, sentenza 18 marzo 2011, *Lautsi e altri c. Italia* [GC] (n. 30814/06).

figurano nel programma (vietando in tal modo allo Stato di perseguire uno scopo di indottrinamento che potrebbe essere considerato irrispettoso delle convinzioni religiose e filosofiche dei genitori) nonché l'organizzazione dell'ambiente scolastico, compresa la presenza di crocifissi nelle aule delle scuole pubbliche.

Esempio: il caso *Lautsi e altri c. Italia*[63] riguarda l'esposizione di crocifissi nelle aule delle scuole pubbliche. Una mamma aveva contestato la presenza di crocifissi nelle aule della scuola pubblica frequentata dai suoi figli perché a suo parere violava il principio di laicità conformemente al quale intendeva educarli. La Grande Camera della Corte EDU ha ritenuto che la decisione relativa alla presenza di crocifissi nelle aule delle scuole pubbliche rientrasse tra le funzioni assunte dallo Stato nell'ambito dell'educazione e dell'insegnamento e ricadesse nella sfera di applicazione della seconda frase dell'articolo 2 del Protocollo n. 1 della CEDU. La Corte ha sostenuto che questa decisione rientrava in linea di principio nel margine di valutazione dello Stato convenuto e che non esiste un consenso europeo sulla presenza dei simboli religiosi nelle scuole pubbliche. È vero che la presenza dei crocifissi nelle aule delle scuole pubbliche (un simbolo che rinvia indubbiamente al cristianesimo) conferisce alla religione maggioritaria del paese una visibilità preponderante nell'ambiente scolastico. Tuttavia, ciò non è di per sé sufficiente a denotare un processo di indottrinamento da parte dello Stato convenuto. A parere della Corte EDU, un crocifisso appeso al muro è un simbolo essenzialmente passivo al quale non può essere attribuita un'influenza sugli allievi paragonabile a quella che può avere un discorso o la partecipazione ad attività religiose. Di conseguenza, la Grande Camera ha concluso che, nel decidere di mantenere i crocifissi nelle aule della scuola pubblica frequentata dai figli della ricorrente, le autorità avevano agito entro i limiti del loro potere discrezionale e pertanto avevano rispettato il diritto dei genitori ad assicurare l'educazione e l'insegnamento conformemente alle loro convinzioni religiose e filosofiche.

Nell'ambito del diritto internazionale, l'articolo 14, paragrafo 2, della CRC prevede che gli Stati contraenti rispettino il diritto e il dovere dei genitori di guidare il minore nell'esercizio del suo diritto alla libertà di pensiero, di coscienza e di religione in maniera che corrisponda allo sviluppo delle sue capacità. Pertanto, diversamente dall'articolo 14, paragrafo 3, della Carta dei diritti fondamentali dell'UE, la CRC tutela l'esercizio della libertà del minore stesso. Nell'ambito della

63 Corte EDU, sentenza 18 marzo 2011, *Lautsi e altri c. Italia* [GC] (n. 30814/06).

CRC i genitori hanno il diritto di fornire consigli e orientamento non conformemente alle loro convinzioni, bensì a quelle dei figli. La formulazione dell'articolo 14, paragrafo 2, della CRC è in linea con il concetto generale di responsabilità genitoriali della Convenzione: le responsabilità genitoriali devono essere esercitate in maniera corrispondente allo sviluppo delle capacità del minore (articolo 5 della CRC) e considerando preminente il suo interesse superiore (articolo 18, paragrafo 1, della CRC).

2.3. Libertà di espressione e d'informazione

Punti salienti

- Sia la Carta dei diritti fondamentali dell'UE sia la CEDU garantiscono il diritto alla libertà di espressione, che include la libertà di opinione e la libertà di ricevere o di comunicare informazioni o idee senza che vi possa essere ingerenza da parte delle autorità pubbliche.
- Il diritto alla libertà d'informazione non include il diritto di accesso a fascicoli riguardanti il collocamento extrafamiliare di minori.
- Subordinare l'accesso a fascicoli riguardanti il collocamento extrafamiliare di minori al consenso dell'informatore potrebbe essere compatibile con l'articolo 8 (diritto al rispetto della vita privata e familiare) della CEDU qualora un organo indipendente fosse incaricato di adottare la decisione definitiva sull'accesso.

Nell'ambito del diritto dell'UE, il diritto alla libertà di espressione include la libertà di opinione e la libertà di ricevere o di comunicare informazioni o idee senza che vi possa essere ingerenza da parte delle autorità pubbliche e senza limiti di frontiera (articolo 11 della Carta dei diritti fondamentali dell'UE).

Nell'ambito del diritto del Consiglio d'Europa, la libertà di espressione è garantita dall'articolo 10 della CEDU e può essere limitata solo se la restrizione è prevista dalla legge, persegue uno degli obiettivi legittimi elencati all'articolo 10, paragrafo 2, ed è necessaria in una società democratica.

Nella sua giurisprudenza la Corte EDU ha sottolineato che "[l]a libertà di espressione costituisce uno dei fondamenti essenziali di una società [democratica], una delle condizioni basilari per il progresso di tale società e per il pieno sviluppo di ogni singola persona [...] si estende non solo alle "informazioni" o alle "idee"

accolte con favore o considerate come inoffensive o indifferenti, ma anche a tutte quelle informazioni o idee che disturbino, sconvolgano o inquietino lo Stato o una parte della popolazione."[64]

Esempio: nel caso *Handyside c. Regno Unito,*[65] la Corte EDU aveva ritenuto che il divieto di divulgazione del libro intitolato "*Little Red School Book*" imposto dalle autorità fosse conforme all'eccezione prevista dall'articolo 10, paragrafo 2, della CEDU sulla protezione della morale. Il caso riguarda il diritto di ricevere informazioni adeguate all'età e alla maturità di un bambino, aspetto del diritto alla libertà di espressione che è particolarmente pertinente per i minori. Il libro, che era stato tradotto dal danese, era stato scritto per bambini in età scolare e metteva in discussione una serie di norme sociali, riguardanti ad esempio la sessualità e gli stupefacenti. Alcuni passaggi del libro potrebbero essere interpretati dai giovani, in una fase critica del loro sviluppo, come un incoraggiamento a indulgere in attività precoci per loro dannose o addirittura indurli a commettere taluni reati penali. Pertanto, secondo la Corte EDU, i giudici inglesi competenti "erano autorizzati, nell'esercizio del loro margine discrezionale, a pensare che all'epoca il libro avrebbe avuto effetti nocivi sulla morale di molti dei bambini e adolescenti che lo avessero letto."[66]

Altri casi relativi ai minori che rinviano all'articolo 10 della CEDU riguardano il diritto di accesso alle informazioni di minori collocati fuori dalla famiglia.

Esempio: il caso *Gaskin c. Regno Unito*[67] riguarda una persona che aveva trascorso al di fuori della famiglia la maggior parte dell'infanzia, periodo durante il quale l'autorità locale aveva costituito un fascicolo riservato su di essa. Tra le informazioni contenute nel suddetto fascicolo figuravano relazioni redatte da medici, insegnanti, agenti di polizia, funzionari addetti alla sorveglianza di individui affidati in prova al servizio sociale e/o in regime di semi-libertà, operatori sociali, assistenti sanitari, genitori affidatari e personale scolastico. Quando il ricorrente aveva chiesto di accedere a tale fascicolo al fine di avviare un'azione giudiziaria per danni personali

64 Cfr., per esempio, Corte EDU, sentenza 7 dicembre 1976, *Handyside c. Regno Unito* (n. 5493/72), punto 49.

65 *Ibid.*

66 *Ibid.*, punto 52.

67 Corte EDU, sentenza 7 luglio 1989, *Gaskin c. Regno Unito* (n. 10454/83).

nei confronti dell'autorità locale, la sua richiesta era stata respinta. La riservatezza di tali informazioni era stata garantita nel pubblico interesse al fine di assicurare il corretto funzionamento del servizio di collocamento dei minori, che sarebbe stato altrimenti compromesso se in futuro gli informatori fossero stati riluttanti a esprimersi con franchezza nelle loro relazioni. La Corte EDU ha riconosciuto l'interesse primario delle persone affidate alla pubblica assistenza in giovane età "a ricevere le informazioni necessarie a conoscere e comprendere la loro infanzia e gli anni della loro formazione."[68] Benché sia necessario garantire la riservatezza dei fascicoli pubblici, un sistema che ne subordini l'accesso al consenso dell'informatore, come nel Regno Unito, potrebbe in linea di principio essere compatibile con l'articolo 8 della CEDU laddove gli interessi di chiunque cerchi di consultare documenti relativi alla sua vita privata siano salvaguardati nel caso in cui un informatore non sia disponibile o rifiuti abusivamente il consenso. In tal caso, un organo indipendente deve essere incaricato di adottare la decisione definitiva sull'accesso. Nella fattispecie, il ricorrente non aveva la possibilità di avvalersi di tale procedura e la Corte ha riscontrato una violazione dei diritti del ricorrente ai sensi dell'articolo 8 della CEDU. La Corte EDU non ha tuttavia riscontrato una violazione dell'articolo 10 della CEDU, ribadendo che il diritto di ricevere informazioni implica che uno Stato non possa impedire a una persona di ricevere informazioni che altri desiderano o potrebbero desiderare comunicarle, ma non obbliga uno Stato a comunicare tali informazioni alla persona in questione.

68 *Ibid.*, punto 49.

2.4. Diritto di essere ascoltato

Punti salienti

- Nell'ambito della legislazione dell'UE, i minori hanno il diritto di esprimere liberamente la propria opinione. Questa viene presa in considerazione sulle questioni che li riguardano in funzione della loro età e della loro maturità.
- La CEDU non prescrive l'obbligo assoluto di ascoltare un minore in giudizio. Per stabilire l'opportunità di procedere in tal senso si devono valutare le circostanze specifiche di ogni caso, tenendo conto dell'età e del grado di maturità del minore.
- Nell'ambito del diritto delle Nazioni Unite, il diritto dei minori di esprimere liberamente la loro opinione su ogni questione che li interessa è stato riconosciuto come uno dei principi generali della Convenzione sui diritti del fanciullo.

Ai sensi della legislazione dell'Unione, l'articolo 24, paragrafo 1, della Carta dei diritti fondamentali dell'UE stabilisce che i minori possono esprimere liberamente la propria opinione e che questa viene presa in considerazione sulle questioni che li riguardano in funzione della loro età e della loro maturità. Questa è una disposizione di applicabilità generale e non è limitata a procedimenti specifici. La CGUE ha interpretato il significato di questa disposizione in combinato disposto con il regolamento Bruxelles II *bis*.

Esempio: la causa *Joseba Andoni Aguirre Zarraga c. Simone Pelz*[69] riguarda il trasferimento di una minore dalla Spagna alla Germania in violazione di sentenze di affidamento. La CGUE era stata chiamata a stabilire se i giudici tedeschi (ossia i giudici del paese in cui la minore era stata trasferita) potevano opporsi all'esecuzione di una decisione del giudice spagnolo (il paese d'origine) a motivo del fatto che la minore non era stata ascoltata e pertanto erano stati violati l'articolo 42, paragrafo 2, lettera a), del regolamento (CE) n. 2201/2003 (Bruxelles II *bis*) e l'articolo 24 della Carta dei diritti fondamentali dell'UE. La minore si era opposta al ritorno quando aveva espresso il proprio parere nell'ambito del procedimento dinanzi al giudice tedesco. La CGUE ha dichiarato che, sebbene ascoltare un minore in giudizio non sia un diritto assoluto, qualora reputi necessario agire

69 CGUE, sentenza 22 dicembre 2010, causa C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz.*; cfr. anche il paragrafo 5.4, che esamina più approfonditamente questa sentenza nonché il funzionamento del regolamento Bruxelles II bis.

in tal senso, un giudice deve offrire al minore una possibilità concreta ed effettiva di esprimersi. Ha altresì stabilito che il diritto di un minore di essere ascoltato, sancito sia dalla Carta che dal regolamento Bruxelles II *bis*, richiede che siano messe a disposizione di tale minore le procedure e condizioni legali che gli consentano di esprimere liberamente la sua opinione e che quest'ultima sia raccolta dal giudice. Il giudice deve inoltre adottare, in funzione dell'interesse superiore del minore e alla luce delle circostanze di ogni caso di specie, tutte le misure appropriate ai fini di una siffatta udienza. Tuttavia, conformemente alla sentenza della CGUE, le autorità del paese in cui la minore era stata trasferita (la Germania) non potevano opporsi al ritorno della minore sulla base di una violazione del suo diritto di essere ascoltata nel paese d'origine (la Spagna).

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU non ritiene che il diritto al rispetto della vita privata e familiare (articolo 8 della CEDU) contempli sempre l'obbligo di ascoltare il minore in giudizio. Di norma, spetta ai giudici nazionali valutare gli elementi di prova ottenuti, compresi i mezzi utilizzati per accertare i fatti pertinenti. I giudici nazionali non sono sempre tenuti ad ascoltare un minore in giudizio sulla questione della visita a un genitore che non ha diritti di affidamento. La questione deve essere valutata alla luce delle circostanze specifiche di ogni caso, nel rispetto dell'età e del grado di maturità del minore interessato. Inoltre, nell'ambito dell'elemento procedurale dell'articolo 8, la Corte EDU si farà spesso carico di garantire che le autorità abbiano adottato le misure adeguate affinché le loro decisioni siano corredate delle necessarie garanzie.

Esempio: nel caso *Sahin c. Germania,*[70] la madre aveva vietato qualsiasi tipo di contatto tra il ricorrente e la figlia di quattro anni. Il tribunale regionale tedesco aveva stabilito che permettere al padre di vedere la figlia sarebbe stato dannoso per quest'ultima a causa della situazione altamente conflittuale esistente tra i genitori. Il giudice aveva preso questa decisione senza sentire se la bambina volesse continuare a vedere suo padre. Quanto al diritto di un minore di essere ascoltato in giudizio, la Corte EDU aveva rinviato alla perizia presentata dinanzi al tribunale regionale tedesco. Dopo alcuni incontri con la bambina, la madre e il ricorrente, l'esperta

70 Corte EDU, sentenza 8 luglio 2003, *Sahin c. Germania* (n. 30943/96), punto 73. Per quanto riguarda l'aspetto specifico dei giudizi nazionali che sono tenuti a valutare gli elementi di prova ottenuti, nonché la pertinenza degli elementi di prova che gli imputati cercano di addurre, cfr. anche Corte EDU, sentenza 22 aprile 1992, *Vidal c. Belgio* (n. 12351/86), punto 33.

aveva ritenuto che un eventuale interrogatorio avrebbe potuto esporre la minore a un rischio, che non avrebbe potuto essere evitato attraverso l'adozione di misure speciali in tribunale. La Corte EDU ha constatato che, nel caso di specie, i requisiti procedurali impliciti all'articolo 8 della CEDU, che sanciscono il diritto di un minore a essere ascoltato in giudizio, non comportavano l'obbligo di sottoporre la minore a un interrogatorio diretto sul suo rapporto con il padre.

Esempio: nel caso *Sommerfeld c. Germania,*[71] la figlia tredicenne del ricorrente aveva espresso chiaramente il desiderio di non vedere il padre e si era comportata di conseguenza per alcuni anni. I giudici nazionali erano del parere che obbligarla a vedere il ricorrente avrebbe seriamente turbato il suo equilibrio emotivo e psicologico. La Corte EDU ha convenuto che il processo decisionale aveva garantito la necessaria protezione degli interessi del ricorrente.[72]

Il diritto dei minori di esprimere liberamente la loro opinione è previsto anche dalla Convenzione europea sull'esercizio dei diritti dei minori.[73] Obiettivo della suddetta convenzione è promuovere i diritti dei minori riconoscendo loro diritti procedurali specifici nei procedimenti in materia di famiglia dinanzi a un'autorità giudiziaria, in particolare nei procedimenti aventi per oggetto l'esercizio delle responsabilità genitoriali, quali la residenza e il diritto di visita nei confronti dei figli. Tra i diritti procedurali che riconosce ai minori, l'articolo 3 della convenzione garantisce loro il diritto di essere informati e di esprimere la propria opinione nei procedimenti. L'articolo 4 riconosce al minore il diritto di richiedere la designazione di un rappresentante speciale nei procedimenti che lo riguardano dinanzi a un'autorità giudiziaria. In linea con l'articolo 6, le autorità devono assicurarsi che il minore abbia ricevuto tutte le informazioni pertinenti, consultare il minore personalmente, nei casi che lo richiedono, e permettere al minore di esprimere la propria opinione.

Nell'ambito del diritto internazionale, l'articolo 12, paragrafo 1, della CRC afferma che un minore capace di discernimento ha il diritto di esprimere liberamente la sua opinione su ogni questione che lo interessa. Le opinioni del minore devono essere prese debitamente in considerazione tenendo conto della sua età e del

71 Corte EDU, sentenza 8 luglio 2003, *Sommerfeld c. Germania* [GC] (n. 31871/96).

72 *Ibid.*, punti 72 e 88.

73 Consiglio d'Europa, Convenzione europea sull'esercizio dei diritti dei minori, STE N. 160, 1996.

suo grado di maturità. L'articolo 12, paragrafo 2, della CRC prescrive inoltre che al minore sia data la possibilità di essere ascoltato in ogni procedimento giudiziario o amministrativo che lo concerne, sia direttamente, sia tramite un rappresentante o un organo appropriato, in maniera compatibile con le regole di procedura della legislazione nazionale.

Il Comitato sui diritti dell'infanzia dell'ONU ha sottolineato che gli Stati contraenti devono garantire direttamente questo diritto oppure adottare nuove normative o rivedere le leggi esistenti affinché il minore possa beneficiare appieno di tale diritto.[74] Devono inoltre fare in modo che il minore riceva tutte le informazioni e gli orientamenti necessari a prendere una decisione a favore del suo interesse superiore. Il Comitato rileva altresì che il minore ha la facoltà di non esercitare tale diritto; può scegliere di esprimere il proprio parere, ma non è obbligato a farlo.

2.5. Diritto alla libertà di riunione e di associazione

Punti salienti

- Sia la Carta dei diritti fondamentali dell'UE sia la CEDU garantiscono la libertà di riunione pacifica e la libertà d'associazione.
- Questo diritto protegge le persone e permette loro di promuovere le loro cause insieme ad altri.

Nell'ambito del diritto dell'UE, l'articolo 12 della Carta dei diritti fondamentali dell'Unione stabilisce che ogni persona ha diritto alla libertà di riunione pacifica e alla libertà di associazione a tutti i livelli, segnatamente in campo politico, sindacale e civico, il che implica il diritto di ogni persona di fondare sindacati insieme con altri e di aderirvi per la difesa dei propri interessi.

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 11, paragrafo 1, della CEDU garantisce il diritto alla libertà di riunione e di associazione fatte salve le restrizioni di cui all'articolo 11, paragrafo 2.

74 ONU, Comitato sui diritti dell'infanzia, *Commento generale n. 14 (2013) sul diritto del minore a che il suo interesse superiore sia tenuto in primaria considerazione* (articolo 3, paragrafo 1), CRC/C/GC/14, 29 maggio 2013.

La Corte EDU ha espressamente riconosciuto il diritto dei minori di partecipare a riunioni in un luogo pubblico. Come ha rilevato la Corte nel caso *Christian Democratic People's Party c. Moldova*, vietare a genitori e figli di partecipare a eventi, in particolare di contestare la politica statale in materia di insegnamento, equivale a violare la loro libertà di riunione.

Nell'ambito del diritto internazionale, sia i singoli minori sia le organizzazioni per l'infanzia possono avvalersi della protezione offerta dall'articolo 15 della CRC, che sancisce il diritto alla libertà di associazione e alla libertà di riunirsi pacificamente. Ai sensi della suddetta disposizione, è stata garantita la protezione internazionale di un'ampia varietà di forme associative in cui sono coinvolti minori.

3 Uguaglianza e non discriminazione

Il diritto di non subire discriminazioni è uno dei principi fondamentali di una società democratica. Sia l'UE sia il Consiglio d'Europa hanno svolto un ruolo determinante ai fini dell'interpretazione di questo principio. Le istituzioni dell'UE hanno adottato una serie di direttive che sono estremamente importanti per le questioni riguardanti i minori. La Corte EDU ha sviluppato un ampio *corpus* giurisprudenziale sul diritto di non subire discriminazioni a norma dell'articolo 14 CEDU sul divieto di discriminazione, in combinato disposto con altri articoli della Convenzione.

Il comitato europeo dei diritti sociali (CEDS) ritiene che la funzione dell'articolo E della Carta sociale europea (CSE) sulla non discriminazione sia simile a quella dell'articolo 14 CEDU: non ha un'esistenza indipendente e deve essere combinato con una delle disposizioni sostanziali della CSE.[75]

Il presente capitolo tratta i principi dell'uguaglianza e della non discriminazione, prestando particolare attenzione ai motivi di discriminazione per i quali è stata elaborata una specifica giurisprudenza sui minori. Innanzitutto fornisce informazioni di carattere generale sul diritto europeo in materia di non discriminazione (paragrafo 3.1); successivamente illustra la questione dell'uguaglianza e della discriminazione dei minori sulla base dell'origine etnica (paragrafo 3.2), della nazionalità e dello status d'immigrazione (paragrafo 3.3), dell'età (paragrafo 3.4) e di altri motivi oggetto di protezione, tra cui il genere, la lingua e l'identità personale (paragrafo 3.5).

75 CEDS, sentenza 15 giugno 2005, *Syndicat des Agrégés de l'Enseignement Supérieur (SAGES) c. Francia*, (ricorso n. 26/2004), punto 34.

3.1. Diritto europeo in materia di non discriminazione

Punti salienti

- Il diritto dell'UE e del Consiglio d'Europa proibiscono la discriminazione in base al sesso, alla razza, al colore della pelle, all'origine etnica o sociale, alle caratteristiche genetiche, alla lingua, alle convinzioni o alla religione, alle opinioni politiche o di altro genere, all'appartenenza a una minoranza nazionale, alla situazione finanziaria, alla nascita, alla disabilità, all'età o all'orientamento sessuale.[76]
- Se rileverà una disparità nel trattamento riservato a persone che si trovano in situazioni significativamente simili, la Corte EDU verificherà l'esistenza di una giustificazione oggettiva e ragionevole. Qualora non riscontri tale giustificazione, la Corte EDU riterrà discriminatorio il trattamento, in violazione dell'articolo 14 CEDU sul divieto di discriminazione.

Nell'ambito del diritto dell'UE, il divieto di discriminazione sancito dall'articolo 21 della Carta dei diritti fondamentali dell'UE è un principio autonomo valido anche in situazioni in cui non si applica nessun'altra disposizione della Carta. Tra i motivi elencati nella presente disposizione in base alla quale la discriminazione è proibita si annoverano il sesso, la razza, il colore della pelle, l'origine etnica o sociale, le caratteristiche genetiche, la lingua, le convinzioni o la religione, le opinioni politiche o di altro genere, l'appartenenza a una minoranza nazionale, la situazione finanziaria, la nascita, la disabilità, l'età o l'orientamento sessuale. I motivi contemplati dall'articolo 19 del TFUE, invece, sono solo il sesso, la razza o l'origine etnica, la religione o le convinzioni personali, la disabilità, l'età e l'orientamento sessuale.

Alcune direttive dell'UE vietano la discriminazione nei settori dell'occupazione, del sistema di previdenza sociale e dei beni e servizi, che sono tutti potenzialmente pertinenti per i minori. La direttiva 2000/78/CE del Consiglio, che stabilisce un quadro generale per la parità di trattamento in materia di occupazione e di condizioni di lavoro (direttiva sulla parità di trattamento in materia di

76 Per una panoramica del diritto europeo in materia di non discriminazione, costituito dalle direttive dell'UE contro la discriminazione nonché dall'articolo 14 e dal Protocollo n. 12 della CEDU, cfr. FRA e Corte EDU (2011) e l'aggiornamento della giurisprudenza luglio 2010–dicembre 2011.

occupazione),[77] vieta le discriminazioni fondate sulla religione o le convinzioni personali, gli handicap, l'età o le tendenze sessuali. La direttiva 2000/43/CE del Consiglio, che attua il principio della parità di trattamento fra le persone indipendentemente dalla razza e dall'origine etnica (direttiva sull'uguaglianza razziale), vieta la discriminazione sulla base della razza o dell'origine etnica non solo nel contesto dell'occupazione e dell'accesso ai beni e ai servizi, ma anche in relazione al sistema di previdenza sociale (compresa la protezione sociale, la sicurezza sociale e l'assistenza sanitaria) e all'istruzione.[78] Altre direttive applicano il principio della parità di trattamento fra uomini e donne sia in materia di occupazione e impiego (direttiva sulla parità di trattamento fra uomini e donne),[79] sia per quanto riguarda l'accesso a beni e servizi e la loro fornitura (direttiva sulla parità di trattamento tra uomini e donne in materia di accesso ai beni e ai servizi).[80]

Nell'ambito del diritto del Consiglio d'Europa, il divieto di discriminazione si applica nell'esercizio di qualsivoglia diritto e libertà fondamentale di cui alla CEDU (articolo 14), nonché nell'esercizio di qualsivoglia diritto garantito dalla legislazione nazionale o in qualsiasi atto promulgato da un'autorità pubblica (articolo 1 del Protocollo n. 12 della CEDU). Il Protocollo n. 12, tuttavia, ha un'applicabilità limitata; infatti è stato ratificato solo da un esiguo numero di Paesi e sulla sua base non sono ancora state adottate decisioni riguardanti i minori. Le disposizioni enunciate in entrambi gli strumenti comprendono un elenco non esaustivo di motivi di discriminazione vietati: il sesso, la razza, il colore, la lingua, la religione, le opinioni politiche o quelle di altro genere, l'origine nazionale o sociale, l'appartenenza a una minoranza nazionale, la ricchezza, la nascita o ogni altra condizione. Dove rileverà una disparità di trattamento tra persone che si trovano in situazioni significativamente simili, la Corte EDU verificherà se tale disparità possa essere oggettivamente e ragionevolmente giustificata.[81]

L'articolo E della CSE fornisce a sua volta un elenco non esaustivo di motivi di discriminazione vietati: la razza, il colore della pelle, il sesso, la lingua, la religione, le

77 Direttiva 2000/78/CE del Consiglio (GU L 303 del 2.12.2000). Tutti gli strumenti giuridici dell'UE sono disponibili sul portale online EUR-Lex, che permette di accedere al diritto dell'Unione europea: http://eur-lex.europa.eu/homepage.html.

78 Direttiva 2000/43/CE del Consiglio, del 29 giugno 2000, che attua il principio della parità di trattamento fra le persone indipendentemente dalla razza e dall'origine etnica (GU L 180 del 19.7.2000).

79 Direttiva 2004/113/CE del Consiglio (GU L 373 del 21.12.2004, pag. 37).

80 Direttiva 2006/54/CE (rifusione) (GU L 204 del 26.7.2006).

81 Per una panoramica della giurisprudenza della Corte EDU, cfr. FRA e Corte EDU (2011) nonché l'aggiornamento della giurisprudenza luglio 2010–dicembre 2011.

opinioni politiche o ogni altra opinione, l'ascendenza nazionale o l'origine sociale, la salute, l'appartenenza ad una minoranza nazionale o la nascita. L'appendice al suddetto articolo chiarisce che la differenza di trattamento fondata su un motivo oggettivo e ragionevole comprende il requisito di una certa età o una determinata capacità di accedere a talune forme d'istruzione[82] e pertanto non è considerata discriminatoria.

Ai sensi dell' articolo 4 della Convenzione quadro per la protezione delle minoranze nazionali[83] (FCNM), le parti garantiscono ad ogni persona appartenente ad una minoranza nazionale il diritto all'eguaglianza di fronte alla legge e ad una eguale protezione da parte della legge; è inoltre vietata ogni discriminazione basata sull'appartenenza ad una minoranza nazionale. Le parti s'impegnano altresì ad adottare, se necessario, misure adeguate in vista di promuovere, in tutti i settori della vita economica, sociale, politica e culturale, un'eguaglianza piena ed effettiva tra le persone appartenenti ad una minoranza nazionale e quelle appartenenti alla maggioranza.

I paragrafi riportati di seguito analizzano motivi di discriminazione specifici che assumono particolare rilievo per i minori.

3.2. Divieto di discriminazione sulla base della razza o dell'origine etnica

Punti salienti

- La razza e l'origine etnica sono motivi di discriminazione vietati.
- Sia l'UE che il Consiglio d'Europa si occupano della discriminazione dei rom nei settori dell'istruzione, dell'occupazione, dell'assistenza sanitaria e dell'alloggio.
- La sovrarappresentazione o la segregazione di bambini appartenenti a un gruppo etnico specifico in scuole o classi speciali possono essere oggettivamente giustificate solo se si predispongono adeguate garanzie per indirizzare i bambini in tali scuole o classi.

82 Consiglio d'Europa, Carta sociale europea (riveduta) (1996), Rapporto esplicativo, paragrafo 136.

83 Consiglio d'Europa, Convenzione-quadro per la protezione delle minoranze nazionali (FCNM), STE n. 157, 1995.

Nell'ambito del diritto dell'UE, la direttiva sull'uguaglianza razziale vieta la discriminazione sulla base della razza o dell'origine etnica non solo nel contesto dell'occupazione e dei beni e servizi, ma anche in relazione all'accesso al sistema di previdenza sociale, all'istruzione e alla sicurezza sociale. I rom, come gruppo etnico particolarmente numeroso e vulnerabile, rientrano pienamente nell'ambito di applicazione della direttiva. Un contributo fondamentale all'offensiva contro la discriminazione nei confronti dei rom a livello di Unione europea è venuto dall'adozione del quadro dell'UE per le strategie nazionali di integrazione dei rom fino al 2020[84], cui ha fatto seguito il monitoraggio annuale delle strategie nazionali degli Stati membri dell'UE svolto dalla Commissione. La direttiva sull'uguaglianza razziale copre almeno quattro settori fondamentali che sono importanti per i bambini rom: istruzione, occupazione, assistenza sanitaria e alloggio. Per conseguire la piena parità nella pratica, in alcune circostanze può essere necessaria un'azione positiva a favore dei rom, in particolare in questi quattro settori fondamentali.[85]

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha emesso alcune sentenze epocali sulla disparità di trattamento riservata ai bambini rom nel sistema d'istruzione. I casi in questione sono stati analizzati ai sensi dell'articolo 14 in combinato disposto con l'articolo 2 del Protocollo n. 1 della CEDU. La Corte EDU ha ritenuto che la sovrarappresentazione o la segregazione di bambini rom in scuole o classi speciali potrebbe essere oggettivamente giustificata solo predisponendo adeguate garanzie per indirizzare i bambini in tali scuole o classi, quali ad esempio test appositamente concepiti per gli alunni rom e idonei alle loro esigenze, una valutazione e un monitoraggio appropriati dei progressi compiuti grazie a cui sia possibile procedere alla loro integrazione nelle classi normali non appena sarà stato posto rimedio alle difficoltà di apprendimento e misure positive volte a contrastare le difficoltà di apprendimento. In assenza di misure efficaci contro la segregazione, potrebbe pertanto non essere giustificato prolungare la segregazione educativa degli alunni rom da una scuola ordinaria con un programma regolare.[86]

84 Commissione europea (2011), *Quadro dell'UE per le strategie nazionali di integrazione dei Rom fino al 2020: Comunicazione della Commissione al Parlamento europeo, al Consiglio, al Comitato economico e sociale europeo e al Comitato delle regioni*, COM (2011) 173 final, Bruxelles, 5 aprile 2011.

85 Commissione europea (2014), *Relazione congiunta sull'applicazione della direttiva 2000/43/CE del Consiglio, del 29 giugno 2000, che attua il principio della parità di trattamento fra le persone indipendentemente dalla razza e dall'origine etnica e della direttiva 2000/78/CE del Consiglio, del 27 novembre 2000, che stabilisce un quadro generale per la parità di trattamento in materia di occupazione e di condizioni di lavoro*, Relazione della Commissione al Parlamento europeo e al Consiglio, COM(2014) 2 definitivo, Bruxelles, 17 gennaio 2014.

86 Corte EDU, sentenza 30 maggio 2013, *Lavida e altri c. Grecia* (n. 7973/10) (consultabile in francese).

Esempio: nel caso *D.H. e altri c. Repubblica ceca*[87], la Corte EDU ha constatato che un numero sproporzionato di alunni rom era stato collocato, senza alcuna giustificazione, in scuole speciali destinate a minori con difficoltà di apprendimento. La Corte aveva espresso preoccupazione riguardo sia al programma più basilare offerto in tali scuole sia alla segregazione causata da questo sistema. Gli alunni rom avevano quindi ricevuto un'istruzione che aggravava le loro difficoltà e comprometteva il loro successivo sviluppo personale, anziché aiutarli a integrarsi nel sistema scolastico tradizionale e a sviluppare le capacità che avrebbero facilitato la loro vita tra la popolazione maggioritaria. La Corte EDU ha riscontrato una violazione dell'articolo 14 della Convenzione in combinato disposto con l'articolo 1 del Protocollo n. 1.

Esempio: nel caso *Oršuš e altri c. Croazia*[88], la Corte EDU ha esaminato l'esistenza di classi separate per bambini rom all'interno delle scuole primarie ordinarie. In linea di principio, la prassi di collocare temporaneamente gli alunni in una classe separata in funzione dell'insufficiente padronanza della lingua d'istruzione non è di per sé discriminatoria. Si può ritenere che l'adozione di tale prassi sia finalizzata ad adeguare il sistema d'istruzione alle esigenze speciali di studenti con difficoltà linguistiche. Tuttavia, laddove tale collocazione riguardi in misura sproporzionata o esclusiva i membri di uno specifico gruppo etnico, devono essere predisposte adeguate garanzie. Per quanto riguarda la collocazione iniziale in classi separate, la Corte EDU ha rilevato che tale collocazione non rientrava in una prassi generale volta ad affrontare i problemi degli studenti con un'insufficiente padronanza linguistica e che i bambini non erano stati sottoposti a test specifici per verificare la loro conoscenza della lingua. Quanto al programma offerto loro, ad alcuni alunni non erano stati riservati programmi specifici (quali lezioni di lingua speciali) che consentissero loro di acquisire le competenze linguistiche necessarie nel più breve tempo possibile. Analogamente, non esisteva una procedura di trasferimento o monitoraggio volta a garantire il trasferimento immediato e automatico nelle classi miste degli alunni rom non appena questi avessero raggiunto una sufficiente padronanza linguistica. La Corte EDU ha pertanto riscontrato una violazione dell'articolo 14 della CEDU in combinato disposto con l'articolo 2 del Protocollo n. 1.

87 Corte EDU, sentenza 13 novembre 2007, *D.H. e altri c. Repubblica ceca* [GC] (n. 57325/00), punti 206–210.

88 Corte EDU, sentenza 16 marzo 2010, *Oršuš e altri c. Croazia* [GC] (n. 15766/03), punto 157.

Il CEDS ritiene che, sebbene le politiche scolastiche a favore dei bambini rom possano essere affiancate da strutture flessibili per rispecchiare l'eterogeneità del gruppo e possano tenere conto del fatto che alcuni gruppi conducono uno stile di vita itinerante o semi-itinerante, non devono esistere scuole separate per gli alunni rom.[89]

Ai sensi dell'articolo 4, paragrafi 2 e 3, della Convenzione quadro per la protezione delle minoranze nazionali, le misure speciali adottate per promuovere l'eguaglianza effettiva delle persone appartenenti a minoranze nazionali non sono considerate discriminatorie. Conformemente all'articolo 12, paragrafo 3 della suddetta convenzione, le parti s'impegnano inoltre espressamente a promuovere l'uguaglianza delle opportunità nell'accesso all'educazione a tutti i livelli per le persone appartenenti a minoranze nazionali. Il comitato consultivo della Convenzione quadro per la protezione delle minoranze nazionali esamina periodicamente la parità di accesso all'istruzione dei bambini rom in linea con detta disposizione.[90]

3.3. Divieto di discriminazione sulla base della nazionalità e dello status di immigrazione

Punti salienti

- La portata della protezione contro la discriminazione sulla base della nazionalità è più limitata nell'ambito del diritto dell'UE che in quello del Consiglio d'Europa.
- Nell'ambito del diritto dell'UE, la protezione contro la discriminazione sulla base della nazionalità è accordata solo ai cittadini degli Stati membri dell'UE, conformemente a quanto stabilito dall'articolo 45 (libertà di circolazione e di soggiorno) della Carta dei diritti fondamentali dell'Unione europea.
- La CEDU garantisce il godimento dei diritti a ogni persona sottoposta alla giurisdizione di uno Stato membro.

89 CEDS, Carta sociale europea (riveduta) – Conclusioni 2003 (Bulgaria), articolo 17, paragrafo 2, pag. 53.

90 Cfr. Consiglio d'Europa, comitato consultivo della Convenzione-quadro per la protezione delle minoranze nazionali, *Commentary on Education under the Framework Convention for the Protection of National Minorities* (2006) (Commento sull'istruzione ai sensi della Convenzione quadro per la protezione delle minoranze nazionali), ACFC/25DOC(2006)002.

Nell'ambito del diritto dell'UE, la protezione contro la discriminazione sulla base della nazionalità è particolarmente rilevante nel contesto della libera circolazione delle persone. I cittadini di paesi terzi (ovvero coloro che sono cittadini di uno Stato che non è membro dell'UE) godono del diritto alla parità di trattamento a grandi linee negli stessi ambiti previsti dalle direttive contro la discriminazione allorché ottengono lo status di "soggiornante di lungo periodo". La direttiva sui cittadini dei paesi terzi prevede, tra gli altri requisiti, che l'ottenimento di tale status sia subordinato a un periodo di soggiorno legale di cinque anni).[91] Inoltre, a talune condizioni, la direttiva 2003/86/CE relativa al diritto al ricongiungimento familiare (direttiva sul ricongiungimento familiare)[92] permette ai cittadini di paesi terzi che soggiornano legalmente in uno Stato membro di farsi raggiungere dai familiari (cfr. anche il paragrafo 9.5).

Esempio: la causa *Chen*[93] doveva stabilire se la figlia di una cittadina di un paese terzo avesse il diritto di soggiornare sul territorio di uno Stato membro dell'UE essendo nata in un altro Stato membro e avendone ottenuto la cittadinanza. La madre, dalla quale dipendeva, era una cittadina di un paese terzo. La CGUE ha ritenuto che, se uno Stato membro subordina l'ottenimento della cittadinanza al rispetto di determinate condizioni e queste sono soddisfatte, un altro Stato membro non può successivamente mettere in discussione tale diritto qualora la madre e la figlia presentino domanda di soggiorno. La CGUE ha confermato che uno Stato membro non può negare il diritto di soggiorno al genitore che ha la custodia di un figlio che è un cittadino dell'UE poiché tale rifiuto priverebbe di qualsiasi effetto utile il diritto di soggiorno di quest'ultimo.

Nell'ambito del diritto del Consiglio d'Europa, la CEDU garantisce il godimento dei diritti a tutti coloro che sono sottoposti alla giurisdizione di uno Stato membro, indipendentemente dal fatto che ne siano o meno cittadini, anche alle persone che vivono al di fuori del territorio nazionale, nelle zone soggette al controllo effettivo dello Stato. Per quanto riguarda l'istruzione, la Corte EDU ritiene pertanto che la disparità di trattamento fondata sulla nazionalità e sullo status di immigrazione potrebbe costituire una discriminazione.

91 Direttiva 2003/109/CE del Consiglio, del 25 novembre 2003, relativa allo status dei cittadini di paesi terzi che siano soggiornanti di lungo periodo (GU L 16 del 23.1.2004, pag. 44).

92 Direttiva 2003/86/CE del Consiglio, del 22 settembre 2003, relativa al diritto al ricongiungimento familiare (GU L 251 del 3 ottobre 2003, pag. 12).

93 CGUE, sentenza 19 ottobre 2004, causa C-200/02, *Kunqian Catherine Zhu e Man Lavette Chen c. Secretary of State for the Home Department*.

Esempio: il caso *Ponomaryovi c. Bulgaria*[94] riguarda la questione di cittadini stranieri privi di permessi di soggiorno permanenti costretti a pagare tasse per l'iscrizione alla scuola secondaria. In linea di principio, era necessario circostanziare l'ampio margine di apprezzamento di cui godono di norma gli Stati quando adottano misure generali in materia economica o sociale per due ragioni:

- il diritto all'istruzione è espressamente sancito dalla CEDU;
- l'istruzione è un tipo di servizio pubblico molto particolare, che svolge funzioni sociali di vasta portata.

A parere della Corte EDU, il margine di apprezzamento aumenta con il livello di istruzione in maniera inversamente proporzionale rispetto all'importanza di detta istruzione per gli interessati e per la società in generale. Pertanto, se l'obbligo per i cittadini stranieri di versare tasse (più elevate) per l'istruzione primaria è difficile da giustificare, a livello universitario tale requisito potrebbe essere pienamente giustificato. Considerata l'importanza dell'istruzione secondaria per lo sviluppo personale e l'integrazione sociale e professionale, è opportuno esaminare con maggiore attenzione la proporzionalità della disparità di trattamento per quel livello d'istruzione. La Corte ha precisato di non avere stabilito se uno Stato è autorizzato o meno a privare tutti i migranti irregolari dei benefici in termini di istruzione che fornisce ai suoi cittadini e a talune categorie limitate di stranieri. Nel valutare le circostanze del caso di specie, la Corte ha rilevato che non trovava applicazione alcuna considerazione riguardo alla necessità di arrestare o invertire il flusso dell'immigrazione illegale. I ricorrenti non avevano cercato di abusare del sistema d'istruzione bulgaro: erano arrivati nel paese in giovane età, in seguito al matrimonio della loro madre con un cittadino bulgaro, e pertanto non avevano avuto altra scelta che frequentare la scuola in Bulgaria. Era stato pertanto violato l'articolo 14 della CEDU in combinato disposto con l'articolo 2 del Protocollo n. 1 della CEDU.

94 Corte EDU, sentenza 21 giugno 2011, *Ponomaryovi c. Bulgaria* (n. 5335/05), punto 60.

3.4. Divieto di discriminazione sulla base dell'età

Punto saliente

- La discriminazione in base all'età è vietata sia dal diritto dell'UE sia della CEDU.

Nell'ambito del diritto dell'UE, l'articolo 21 della Carta dei diritti fondamentali dell'UE cita espressamente "l'età" tra i motivi di discriminazione vietati. L'articolo 24 annovera i diritti del minore tra i diritti fondamentali tutelati. Nell'ambito della vigente legislazione dell'UE in materia di non discriminazione, la protezione contro la discriminazione fondata sull'età è più limitata rispetto alla protezione fondata sulla razza e sull'origine etnica o sul sesso. Attualmente l'età è tutelata solo nel contesto dell'accesso all'occupazione, analogamente all'orientamento sessuale, alla disabilità e alla religione o alle convinzioni personali.

La direttiva sulla parità di trattamento in materia di occupazione è applicabile ai minori che sono legalmente autorizzati a lavorare. Sebbene la Convenzione dell'Organizzazione internazionale del lavoro sull'età minima di ammissione al lavoro,[95] ratificata da tutti gli Stati membri dell'UE, fissi un'età minima di 15 anni, tra gli Stati membri dell'UE permangono differenze riguardo alla suddetta età minima.[96] Ai sensi dell'articolo 6 della direttiva sulla parità di trattamento in materia di occupazione, gli Stati membri possono giustificare le disparità di trattamento collegate all'età. Tali disparità non costituiscono discriminazione laddove siano oggettivamente e ragionevolmente giustificate da una finalità legittima e i mezzi per il conseguimento di tale finalità siano appropriati e necessari. Per quanto riguarda i bambini e i giovani, tali disparità di trattamento possono comprendere, ad esempio, la definizione di condizioni speciali di accesso all'occupazione e alla formazione professionale, di occupazione e di lavoro, onde favorire l'inserimento professionale o assicurare la protezione degli stessi.

95 Rete europea di esperti giuridici in materia di non discriminazione, O'Dempsey, D. e Beale, A. (2011), *Age and employment*, Commissione europea, Direzione generale della Giustizia. Lussemburgo, Ufficio delle pubblicazioni.

96 Organizzazione internazionale del lavoro (1973), Convenzione n. 138 sull'età minima di ammissione al lavoro.

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 14 della CEDU e l'articolo 1 del Protocollo n. 12 della CEDU non menzionano espressamente "l'età" nell'elenco di motivi di discriminazione vietati. La Corte EDU ha tuttavia esaminato casi di discriminazione fondata sull'età in relazione a vari diritti tutelati della CEDU e, di conseguenza, ha implicitamente analizzato l'età fra i motivi rientranti in "ogni altra condizione". Nei casi *D.G. c. Irlanda*[97] e *Bouamar c. Belgio,*[98] ad esempio, la Corte EDU ha riscontrato una disparità di trattamento tra adulti e minori in materia di detenzione nei rispettivi sistemi giudiziari nazionali, pertinente ai fini dell'applicazione della Convenzione. Tale disparità di trattamento è scaturita dalla scopo della detenzione, punitivo per gli adulti e preventivo per i minori. La Corte ha pertanto riconosciuto "l'età" tra i possibili motivi di discriminazione.

3.5. Divieto di discriminazione sulla base di altri motivi oggetto di protezione

Punto saliente

- Altri motivi di discriminazione, quali la disabilità o la nascita, sono stati trattati nella giurisprudenza europea riguardante i minori.

Nell'ambito del diritto dell'UE, l'articolo 21 della Carta dei diritti fondamentali dell'UE vieta anche la discriminazione fondata su altri motivi particolarmente rilevanti per i minori, quali il sesso, le caratteristiche genetiche, la lingua, la disabilità o l'orientamento sessuale. Almeno per quanto riguarda la disabilità, la CGUE ha ammesso che l'UE tutela anche dalla cosiddetta "discriminazione per associazione", ossia la discriminazione nei confronti di una persona che è associata a un'altra avente le caratteristiche protette (ad esempio la madre di un minore disabile).

97 Corte EDU, sentenza 29 febbraio 1988, *Bouamar c. Belgio* (n. 9106/80) (cfr. anche il paragrafo 11.2.2).

98 Corte EDU, sentenza 16 maggio 2002, *D.G. c. Irlanda* (n. 39474/98) (cfr. anche il paragrafo 11.2.2).

Esempio: nella causa *S. Coleman c. Attridge Law e Steve Law,*[99] la CGUE ha osservato che la direttiva sulla parità di trattamento in materia di occupazione contiene talune disposizioni volte a tener conto specificamente delle esigenze dei disabili. Tuttavia, tale constatazione non permette di concludere che il principio della parità di trattamento in essa sancito debba essere interpretato in senso restrittivo, vale a dire nel senso che esso vieterebbe soltanto le discriminazioni dirette fondate sulla disabilità e riguarderebbe esclusivamente le persone che siano esse stesse disabili. Secondo la CGUE, la direttiva non si applica a una determinata categoria di persone, ma alla natura stessa della discriminazione. Un'interpretazione che ne limiti l'applicazione alle persone disabili rischierebbe di privare tale direttiva di una parte importante del suo effetto utile e di ridurre la tutela che essa dovrebbe garantire. La CGUE ha concluso che la direttiva deve essere interpretata nel senso che il divieto di discriminazione diretta ivi previsto non è limitato alle persone disabili. Di conseguenza, qualora un datore di lavoro tratti un lavoratore che non sia esso stesso disabile in modo meno favorevole rispetto al modo in cui è trattato un altro lavoratore in una situazione analoga, a causa della disabilità del figlio, al quale presta la parte essenziale delle cure di cui quest'ultimo ha bisogno, un siffatto trattamento viola il divieto di discriminazione diretta enunciato dalla direttiva.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU si è occupata della discriminazione nei confronti dei minori in una serie di situazioni diverse da quelle già indicate, quali la discriminazione fondata sulla lingua[100] o sulla filiazione.[101]

Esempio: nel caso *Fabris c. Francia,*[102] il ricorrente aveva presentato ricorso sostenendo di non aver potuto beneficiare di una legge introdotta nel 2001 che riconosceva a favore dei figli "adulterini" i medesimi diritti successori dei figli legittimi, una legge approvata dopo la sentenza pronunciata dalla Corte EDU nella causa *Mazurek c. Francia* [103] nel 2000. La Corte ha ritenuto che lo scopo legittimo della tutela dei diritti ereditari del fratello e della sorella unilaterali del ricorrente non fosse tale da prevalere sul diritto del ricorrente di

99 CGUE, sentenza 17 luglio 2008, causa C-303/06, *S. Coleman c. Attridge Law e Steve Law* [GS].

100 Corte EDU, sentenza 7 febbraio 2013, *Fabris c. Francia* [GC] (n. 16574/08).

101 Corte EDU, sentenza 23 luglio 1968, *Caso "Relating to certain aspects of the laws on the use of languages in education in Belgium" c. Belgio* (nn. 1474/62, 1677/62, 1691/62, 1769/63, 1994/63 e 2126/64).

102 Corte EDU, sentenza 1° febbraio 2000, *Mazurek c. Francia* (n. 34406/97).

103 *Ibid.*

ottenere una parte della successione materna. Nel caso di specie, la disparità di trattamento è stata discriminatoria in quanto priva di una giustificazione oggettiva e ragionevole. La Corte EDU ha riscontrato una violazione dell'articolo 14 della CEDU in combinato disposto con l'articolo 1 del Protocollo n. 1 della CEDU.[104]

Per quanto riguarda i minori disabili, il comitato europeo dei diritti sociali ritiene che l'applicazione dell'articolo 17, paragrafo 2, della CSE sia accettabile per operare una distinzione tra minori disabili e non disabili. Dovrebbe tuttavia essere la norma a integrare i minori disabili nelle scuole ordinarie, che dovrebbero adottare disposizioni volte a permettere di provvedere alle loro esigenze speciali, mentre le scuole specializzate dovrebbero costituire l'eccezione.[105] Inoltre, occorre impartire un'istruzione e una formazione sufficienti ai minori che frequentano istituti scolastici speciali conformi all'articolo 17, paragrafo 2, della CSE affinché, in proporzione, nelle scuole specializzate completi la propria istruzione un numero di alunni equivalente a quello degli studenti che frequentano scuole ordinarie.[106] Ulteriori approfondimenti sui diritti dei minori in relazione all'istruzione sono contenuti al paragrafo 8.2.

Nell'ambito del diritto delle Nazioni Unite, l'articolo 2 della CRC vieta la discriminazione nei confronti dei minori sulla base di un elenco non esaustivo di motivi, citando espressamente fra questi la "nascita". L'articolo 2 sancisce che:

> *1. Gli Stati parti s'impegnano a rispettare i diritti enunciati nella presente Convenzione e a garantirli a ogni fanciullo che dipende dalla loro giurisdizione, senza distinzione di sorta e a prescindere da ogni considerazione di razza, di colore, di sesso, di lingua, di religione, di opinione politica o altra del fanciullo o dei suoi genitori o rappresentanti legali, dalla loro origine nazionale, etnica o sociale, dalla loro situazione finanziaria, dalla loro incapacità, dalla loro nascita o da ogni altra circostanza.*
>
> *2. Gli Stati parti adottano tutti i provvedimenti appropriati affinché il fanciullo sia effettivamente tutelato contro ogni forma di discriminazione o di sanzione motivate dalla condizione sociale, dalle attività, opinioni professate o convinzioni dei suoi genitori, dei suoi rappresentanti legali o dei suoi familiari.*

	Identità come membri di una minoranza nazionale	Convenzione-quadro per la protezione delle minoranze nazionali, articolo 5, paragrafo 1 (mantenimento degli elementi essenziali dell'identità)

In generale i problemi legati all'identità personale non sono stati affrontati a livello dell'UE alla luce della competenza limitata dell'Unione in quest'ambito. La CGUE si è tuttavia incidentalmente pronunciata sul diritto al nome (in particolare sul diritto a vedere riconosciuto anche in altri paesi il nome che è stato riconosciuto in uno Stato membro dell'UE) dalla prospettiva del principio della libertà di circolazione. La CGUE si è pronunciata in materia di cittadinanza e soggiorno anche alla luce dell'articolo 20 del TFUE. Il Consiglio d'Europa, dal canto suo, ha interpretato e sviluppato l'applicazione di alcuni diritti fondamentali nell'ambito dell'identità personale, in particolare attraverso la giurisprudenza della Corte EDU. Pertanto, ad eccezione di alcuni ambiti in cui i problemi legati all'identità personale sono stati affrontati a livello dell'UE, i paragrafi riportati di seguito riguardano esclusivamente il diritto del Consiglio d'Europa.

Il presente capitolo non fa riferimento a un diritto fondamentale specifico. Fornisce piuttosto uno spaccato delle questioni relative ai diritti fondamentali riguardanti l'identità, quali la registrazione della nascita e il diritto al nome (paragrafo 4.1), il diritto all'identità personale (paragrafo 4.2), il furto d'identità (paragrafo 4.4), il

diritto alla cittadinanza (paragrafo 4.5) e l'identità di minori appartenenti a minoranze nazionali (paragrafo 4.6). Alcune questioni correlate sono trattate in altri capitoli, in particolare quelle riguardanti l'abuso sessuale (capitolo 7.1.3) o la protezione dei dati (capitolo 10). Alcuni di questi diritti, come il diritto al nome, sono stati essenzialmente rivendicati come diritti genitoriali, ma l'approccio potrebbe essere facilmente trasposto ai minori stessi, considerate le implicazioni per i loro propri diritti.

4.1. Registrazione della nascita e diritto al nome

Punto saliente

- Il rifiuto di registrare un bambino con un nome che non è inadeguato e di cui è già stata autorizzata l'attribuzione potrebbe costituire una violazione dell'articolo 8 della CEDU (diritto al rispetto della vita privata e familiare).

Diversamente dai trattati ONU (ad esempio l'articolo 24, paragrafo 2, del Patto internazionale relativo ai diritti civili e politici (ICCPR), l'articolo 7, paragrafo 1, della CRC e l'articolo 18 della Convenzione sui diritti delle persone con disabilità (CRPD)), gli strumenti europei sui diritti fondamentali non sanciscono espressamente il diritto alla registrazione della nascita subito dopo la nascita o il diritto al nome sin dalla nascita.

Nell'ambito del diritto dell'UE, la questione del diritto al nome è stata affrontata dalla prospettiva della libertà di circolazione. La CGUE sostiene che la libertà di circolazione vieta a uno Stato membro dell'UE di rifiutare di riconoscere il cognome di un minore registrato in un altro Stato membro di cui il minore è cittadino o in cui il minore è nato e ha soggiornato.[107]

Nell'ambito del diritto del Consiglio d'Europa, il rifiuto di registrare la nascita di un minore può sollevare un problema ai sensi dell'articolo 8 della CEDU.

107 Cfr. CGUE, sentenza 2 ottobre 2003, causa C-148/02, *Carlos Garcia Avello c. Stato belga*; CGUE, sentenza 14 ottobre 2008, causa C-353/06, *Stefan Grunkin e Dorothee Regina Paul* [GC].

Innanzitutto, la Corte EDU ha ritenuto che il nome, quale strumento per identificare le persone all'interno delle loro famiglie e della comunità, rientri nell'ambito di applicazione del diritto al rispetto della vita privata e familiare sancito dall'articolo 8 della CEDU.[108] La scelta del nome[109] e del cognome del figlio[110] da parte dei genitori rientra nella sfera privata di questi ultimi. La Corte ha ritenuto che il rifiuto delle autorità statali di registrare un determinato nome sulla base del probabile danno o pregiudizio che tale nome potrebbe arrecare al minore non costituisse una violazione dell'articolo 8 della CEDU.[111] Tuttavia, il rifiuto di registrare un bambino con un nome che non è inadeguato e di cui è già stata autorizzata l'attribuzione potrebbe costituire una violazione dell'articolo 8 della CEDU.

Esempio: nel caso *Johansson c. Finlandia,*[112] le autorità finlandesi si erano rifiutate di registrare il nome "Axl Mick" poiché la grafia non rispettava la pratica nazionale in materia di nomi. La Corte EDU ha ammesso che era necessario tenere in debita considerazione l'interesse superiore del minore e che era nel pubblico interesse preservare la pratica nazionale in materia di nomi. Ha tuttavia riscontrato che il nome era stato ufficialmente registrato in altri casi e pertanto non poteva essere ritenuto inadeguato per un bambino. Poiché in Finlandia l'attribuzione del nome era già stata autorizzata e non si era asserito che tale nome avesse avuto conseguenze negative sulla preservazione dell'identità culturale e linguistica del paese, la Corte EDU ha concluso che le considerazioni sul pubblico interesse non prevalevano sull'interesse di registrare il bambino con il nome prescelto. La Corte ha concluso asserendo che vi era stata una violazione dell'articolo 8 della CEDU.

La Corte EDU ha altresì stabilito che la regola secondo la quale il cognome del marito è attribuito ai figli legittimi al momento dell'iscrizione dei neonati nei registri dello stato civile non costituisce di per sé una violazione della CEDU. Tuttavia, l'impossibilità di derogarvi è stata ritenuta eccessivamente rigida e discriminatoria

111 Corte EDU, sentenza 24 ottobre 1993, *Guillot c. Francia* (n. 22500/93), punto 27.

112 Corte EDU, sentenza 6 settembre 2007, *Johansson c. Finlandia* (n. 10163/02).

nei confronti delle donne, e pertanto ha costituito una violazione dell'articolo 14 in combinato disposto con l'articolo 8 della CEDU.[113]

L'articolo 11 della Convenzione quadro per la protezione delle minoranze nazionali stabilisce che ogni persona appartenente a una minoranza nazionale ha il diritto di utilizzare il suo cognome (il suo patronimico) ed i suoi nomi nella lingua minoritaria oltre che il diritto al loro riconoscimento ufficiale, secondo le modalità previste dal sistema giuridico.

L'articolo 11, paragrafo 3, della Convenzione europea sull'adozione dei minori (riveduta) prevede la possibilità per gli Stati contraenti di mantenere il cognome originale del minore adottato (Convenzione sull'adozione).[114] Si tratta di un'eccezione al principio generale secondo cui il rapporto giuridico tra il minore adottato e la sua famiglia d'origine è cessato.

4.2. Diritto all'identità personale

Punti salienti

- Il diritto di conoscere le proprie origini rientra nella sfera della vita privata di un minore.
- Ai fini dell'accertamento della paternità occorre bilanciare attentamente l'interesse del minore a conoscere la propria identità, l'interesse del presunto padre e l'interesse generale.
- I parti anonimi possono essere ammissibili ai sensi dell'articolo 8 della CEDU (diritto al rispetto della vita privata e familiare) a patto che il minore possa almeno ottenere informazioni non identificative su sua madre e che esista la possibilità di chiedere la rinuncia al segreto da parte della madre.
- Un figlio adottivo ha il diritto di accedere a informazioni riguardanti le sue origini. Ai genitori biologici può essere accordato il diritto giuridico di non divulgare la loro identità, ma ciò non si configura come un veto assoluto.

Nell'ambito del diritto del Consiglio d'Europa, a parere della Corte EDU l'articolo 8 della CEDU include il diritto all'identità e allo sviluppo personale. I dettagli

113 Corte EDU, sentenza 7 gennaio 2014, *Cusan e Fazzo c. Italia* (n. 77/07), paragrafo 67.

114 Consiglio d'Europa, Convenzione europea sull'adozione dei minori (riveduta), STCE n. 202, 2008.

sull'identità di una persona e l'interesse a ottenere le informazioni necessarie a scoprire la verità su aspetti importanti della propria identità personale, compresa l'identità dei propri genitori,[115] sono stati ritenuti pertinenti ai fini dello sviluppo personale. La nascita, e in particolare le sue circostanze, attengono alla vita privata del minore. "[L]e informazioni riguardanti aspetti estremamente personali dell'infanzia, dello sviluppo e della storia di un individuo possono costituire una fonte principale di informazioni sul suo passato e sui suoi anni di formazioni"[116] e, di conseguenza, l'impossibilità di accedere a tali informazioni da parte del minore solleva un problema ai sensi dell'articolo 8 della CEDU.

Nell'ambito del diritto internazionale, l'articolo 8 della CRC garantisce un livello di protezione elevato e piuttosto dettagliato del diritto a preservare l'identità del minore. Tutela la preservazione dell'identità del minore da ingerenze illegali, ivi compresa la sua nazionalità, il suo nome e le sue relazioni familiari, così come riconosciute dalla legge. Garantisce inoltre "un'adeguata assistenza e protezione" se il minore è illegalmente privato degli elementi costitutivi della sua identità o di alcuni di essi affinché tale identità sia ristabilita il più rapidamente possibile.

4.2.1. Accertamento della paternità

Nell'ambito del diritto del Consiglio d'Europa, i minori hanno presentato ricorso alla Corte EDU in merito all'impossibilità di accertare l'identità dei loro padri naturali. A parere della Corte EDU, l'accertamento del rapporto giuridico tra un minore e il presunto padre naturale rientrava nella sfera della vita privata (articolo 8 della CEDU). La filiazione è un aspetto fondamentale dell'identità di una persona.[117] L'interesse di un minore ad accertare la paternità deve tuttavia essere bilanciato con gli interessi del presunto padre e con l'interesse generale. Di fatto, l'interesse del minore ad avere certezza giuridica sulla propria filiazione paterna non prevarica l'interesse del padre a respingere la presunzione legale di paternità.

Esempio: nel caso *Mikulić c. Croazia,*[118] la ricorrente era nata da una relazione non matrimoniale e aveva avviato un'azione giudiziaria nei confronti del presunto padre ai fini dell'accertamento della paternità. La parte avversa si era rifiutata in più occasioni di sottoporsi al test del DNA disposto

115 Corte EDU, sentenza 13 febbraio 2003, *Odièvre c. Francia* [GC] (n. 42326/98), punto 29.

116 Corte EDU, sentenza 7 luglio 1989, *Gaskin c. Regno Unito* (n. 10454/83), punto 36.

117 Corte EDU, sentenza 26 giugno 2014, *Mennesson c. Francia* (n. 65192/11), punto 96.

118 Corte EDU, sentenza 7 febbraio 2002, *Mikulić c. Croazia* (n. 53176/99), punto 64–65.

dal giudice e, di conseguenza, l'azione giudiziale per l'accertamento della paternità si era inutilmente protratta per circa cinque anni. La Corte EDU ha stabilito che, se l'ordinamento nazionale non obbliga i presunti padri a sottoporsi a test medici, gli Stati devono prevedere strumenti alternativi che consentano la rapida individuazione dei padri naturali da parte di un'autorità indipendente. Nel caso della ricorrente ha riscontrato una violazione dell'articolo 8 della CEDU.

Esempio: nel caso *Mizzi c. Malta,*[119] il presunto padre non aveva potuto disconoscere la paternità di una bambina partorita dalla moglie poiché il termine di sei mesi stabilito dalla legge per la contestazione della paternità era scaduto. La Corte EDU ha esaminato il caso ai sensi sia dell'articolo 6 (diritto a un equo processo) che dell'articolo 8 (rispetto della vita privata e familiare) della CEDU. Ha osservato che l'introduzione di un limite temporale entro cui un presunto padre deve procedere all'accertamento della paternità per disconoscere un figlio è finalizzata a garantire la certezza del diritto e a tutelare l'interesse del minore a conoscere la sua identità. Ciononostante, tali finalità non prevalgono sul diritto del padre di avere l'opportunità di disconoscere la paternità. In questo caso, l'impossibilità pratica di disconoscere la paternità sin dalla nascita aveva rappresentato un onere eccessivo a carico del presunto padre, in violazione del suo diritto di accesso a un tribunale e a un equo processo sanciti dall'articolo 6 della CEDU. Aveva inoltre costituito un'ingerenza sproporzionata nei suoi diritti ai sensi dell' articolo 8 della CEDU.[120]

Gli interessi di un minore che vuole accertare la paternità e gli interessi del padre biologico possono talvolta coincidere, com'è avvenuto nel caso di un padre che, a causa della sua mancanza di capacità giuridica, non poteva avviare un'azione giudiziaria a livello nazionale per costituire un rapporto di filiazione con il figlio. La Corte EDU ha stabilito che non era nell'interesse superiore di un minore nato fuori dal matrimonio che il suo padre biologico non fosse in grado di avviare un'azione giudiziaria per vedere riconosciuta la sua paternità e che il minore dipendesse dunque completamente dalla discrezionalità delle autorità statali per l'accertamento della sua filiazione.[121]

119 Corte EDU, sentenza 12 gennaio 2006, *Mizzi c. Malta* (n. 26111/02).

120 *Ibid.*, punti 112–114.

121 Corte EDU, sentenza 21 giugno 2011, *Krušković c. Croazia* (n. 46185/08), punti 38–41.

Le autorità possono avere l'obbligo positivo di intervenire nel procedimento per l'accertamento della paternità nell'interesse superiore del minore qualora il rappresentante giuridico (in questo caso la madre) del minore non sia in grado di rappresentare adeguatamente il minore, per esempio a causa di una grave disabilità.[122]

Per quanto riguarda il caso specifico del riconoscimento della filiazione tra genitori committenti e figli nati da maternità surrogata, la Corte ha ammesso in linea di principio che gli Stati hanno un ampio margine di apprezzamento poiché a livello europeo non esiste un consenso in materia di autorizzazione o riconoscimento della filiazione negli accordi di maternità surrogata. Tuttavia, il fatto che la filiazione sia un aspetto fondamentale dell'identità di un minore riduce il margine di apprezzamento.

Esempio: il caso *Mennesson c. Francia*[123] riguarda il rifiuto delle autorità francesi di iscrivere nel registro francese delle nascite i figli nati da maternità surrogata negli Stati Uniti per motivi di ordine pubblico. La Corte EDU non ha riscontrato violazioni del diritto dei ricorrenti al rispetto della vita familiare, concludendo che non era stato in alcun modo loro impedito di godere della vita familiare in Francia e che gli ostacoli amministrativi che avrebbero potuto incontrare non erano stati insormontabili. Quanto al diritto al rispetto della vita privata dei minori, la Corte ha attribuito grande importanza al loro interesse superiore. In particolare ha sottolineato che l'uomo che avrebbe dovuto essere registrato come il padre dei bambini sul certificato era anche il loro padre biologico. Negare il rapporto giuridico di filiazione con il figlio quando è stata accertata la filiazione biologica e quando il genitore interessato rivendica il pieno riconoscimento non può essere ritenuto un atto conforme all'interesse superiore dei minori. La Corte ha pertanto riscontrato una violazione dell'articolo 8 della CEDU in merito al reclamo riguardante il rispetto della "vita privata" dei minori.[124]

122 Corte EDU, sentenza 14 febbraio 2012, *A.M.M. c. Romania* (n. 2151/10), punti 58–65 (consultabile in francese).

123 Corte EDU, 26 giugno 2014, *Mennesson c. Francia* (n. 65192/11).

124 *Ibid.*, punto 100; cfr. anche Corte EDU, sentenza 26 giugno 2014, *Labassee c. Francia* (n. 65941/11), punto 79.

4.2.2. Accertamento della maternità: parto anonimo

Nell'ambito del diritto del Consiglio d'Europa, l'interesse del minore a conoscere le sue origini, e in particolare sua madre, deve essere bilanciato con altri interessi privati e pubblici, quali gli interessi della famiglia o delle famiglie interessate, l'interesse pubblico di evitare aborti clandestini, l'abbandono di minori o la protezione della salute. I casi in cui la madre biologica decide di rimanere anonima, ma il minore può quantomeno ottenere informazioni non identificative sulla madre biologica e ha la possibilità di chiedere la rinuncia al segreto da parte della madre, potrebbero essere conformi all'articolo 8 della CEDU.[125]

> Esempio: nel caso *Godelli c. Italia,*[126] la ricorrente era stata abbandonata alla nascita dalla madre, che non aveva consentito di essere nominata sul certificato di nascita. La ricorrente non poteva accedere a elementi non identificativi riguardanti le sue origini né ottenere la divulgazione dell'identità di sua madre. La Corte EDU ha riscontrato una violazione dell'articolo 8 della CEDU poiché lo Stato non aveva garantito un giusto equilibrio tra gli interessi concorrenti della madre biologica e della figlia.

4.3. Accertamento delle proprie origini: adozione

Al diritto del minore a conoscere le proprie origini è stata attribuita una particolare rilevanza nel contesto dell'adozione. Le garanzie sostanziali connesse all'adozione, al di là del diritto di conoscere le proprie origini, sono trattate al paragrafo 6.3.

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 22, paragrafo 3, della Convenzione europea sull'adozione dei minori (riveduta) è una disposizione piuttosto solida sul diritto del minore adottato di accedere alle informazioni sulle proprie origini in possesso delle autorità. Permette agli Stati contraenti di accordare ai genitori d'origine il diritto giuridico di non divulgare la loro identità purché ciò non equivalga a un veto assoluto. L'autorità competente deve essere in grado di stabilire se tale diritto prevale sul diritto dei genitori d'origine e se sia quindipossibile divulgare informazioni identificative alla luce delle circostanze

125 Corte EDU, sentenza 13 febbraio 2003, *Odièvre c. Francia* [GC], n. 42326/98, paragrafi 48–49.

126 Corte EDU, sentenza 25 settembre 2012, *Godelli c. Italia* (n. 33783/09), paragrafo 58.

e dei rispettivi diritti in gioco. In caso di adozione piena, il minore adottato deve poter almeno ottenere un documento attestante la data e il luogo di nascita.[127]

Nell'ambito del diritto internazionale, la Convenzione dell'Aia sull'adozione internazionale prevede la possibilità per il minore adottato di accedere alle informazioni relative all'identità dei suoi genitori con l'assistenza appropriata, ma conferisce a ogni Stato contraente la facoltà di autorizzare o meno tale accesso.[128]

4.4. Furto d'identità

Punto saliente

- I minori devono essere protetti dal furto d'identità in maniera concreta ed effettiva.

Il furto d'identità riguarda situazioni in cui il nome di un minore è utilizzato a sua insaputa.

Per quanto riguarda il diritto del Consiglio d'Europa, la Corte EDU ha esaminato il furto d'identità ai sensi dell'articolo 8 della CEDU sul rispetto della vita privata e familiare. Ha stabilito che gli Stati sono tenuti a garantire la protezione concreta ed effettiva dei minori dal furto d'identità; gli Stati devono adottare misure efficaci per identificare e perseguire l'autore del reato.[129]

Esempio: nel caso *K.U. c. Finlandia*[130] era stato pubblicato un annuncio su un sito di incontri su Internet a nome di un ragazzino di 12 anni, a sua insaputa. L'annuncio indicava l'età, il numero di telefono e la descrizione fisica del ragazzino e, inoltre, conteneva un link a una pagina web in cui figurava una sua fotografia. L'annuncio, a sfondo sessuale, lasciava intendere che il ragazzino fosse alla ricerca di una relazione intima con un coetaneo o con

128 Conferenza dell'Aia sul diritto internazionale privato, Convenzione sulla protezione dei minori e sulla cooperazione in materia di adozione internazionale, 29 maggio 1993, articolo 30, paragrafo 2.

129 Corte EDU, sentenza 2 dicembre 2008, *K.U. c. Finlandia* (n. 2872/02), punto 49.

130 Corte EDU, sentenza 2 dicembre 2008, *K.U. c. Finlandia* (n. 2872/02).

un adulto, esponendolo in tal modo all'attenzione dei pedofili. L'identità della persona che aveva pubblicato l'annuncio non poteva essere rivelata dal fornitore di servizi a causa degli obblighi imposti dalla legislazione in vigore. A parere della Corte EDU, l'obbligo positivo di cui all'articolo 8 della CEDU, che prevede non solo la criminalizzazione dei reati, ma anche lo svolgimento di efficaci attività di indagine e perseguimento, assume un'importanza ancora maggiore quando a essere minacciato è il benessere fisico e morale di un minore. Nel caso di specie, la Corte ha ritenuto che, esponendolo ad approcci da parte di pedofili su Internet, l'annuncio costituiva una minaccia per il benessere fisico e morale del minore. Era dunque stato violato l'articolo 8 della CEDU.

Gli aspetti connessi al furto d'identità sono strettamente correlati alla pornografia infantile e all'adescamento di minori in rete, questioni affrontate al paragrafo 7.2.3.

4.5. Diritto alla cittadinanza

Punti salienti

- Il diritto di soggiorno nell'Unione di minori che sono cittadini dell'UE non deve essere privato di alcun effetto utile negando diritti di soggiorno al loro genitore o ai loro genitori.
- La CEDU non garantisce il diritto alla cittadinanza, ma un rifiuto arbitrario della cittadinanza potrebbe rientrare nel campo di applicazione dell'articolo 8 della CEDU (diritto al rispetto della vita privata e familiare) a causa del suo impatto sulla vita privata di una persona.

Nell'ambito del diritto dell'UE, l'articolo 20, paragrafo 1, del TFUE conferisce lo status di cittadino dell'UE a chiunque abbia la cittadinanza di uno Stato membro dell'Unione. La CGUE si è pronunciata sull'efficacia del diritto di soggiorno di minori che hanno la cittadinanza dell'UE, ma non la nazionalità dello Stato membro dell'UE in cui soggiornano. La controversia verteva sul rifiuto di riconoscere i diritti di soggiorno nell'Unione a un genitore che aveva la custodia di un figlio che era cittadino dell'UE. La CGUE ha stabilito che il rifiuto di riconoscere i diritti di soggiorno a un genitore che ha effettivamente la custodia di un minore priva di qualsiasi effetto utile il diritto di soggiorno di quest'ultimo. Di conseguenza, il genitore che ha effettivamente la custodia di un minore ha il diritto di soggiornare

con quest'ultimo nello Stato membro ospitante.[131] Questi aspetti sono trattati più dettagliatamente al paragrafo 9.5.

Nell'ambito del diritto del Consiglio d'Europa, la CEDU non garantisce il diritto alla cittadinanza.[132] Tuttavia, un rifiuto arbitrario della cittadinanza potrebbe essere contemplato dall'articolo 8 della CEDU a causa del suo impatto sulla vita privata di una persona, in cui rientrano aspetti dell'identità sociale di un minore,[133] nella fattispecie l'identità di un minore nella società.

> Esempio: nel caso *Genovese c. Malta*, era stata negata la cittadinanza maltese a un minore nato al di fuori del matrimonio in un paese diverso da Malta da madre non maltese e padre maltese legalmente riconosciuto. Il rifiuto della cittadinanza non configurava di per sé una violazione dell'articolo 8 della CEDU. Il diniego arbitrario della cittadinanza motivato dalla nascita al di fuori del matrimonio, tuttavia, sollevava questioni di discriminazione. Una disparità di trattamento arbitraria fondata su questo motivo deve essere giustificata da ragioni molto serie. In assenza di tali ragioni era stata riscontrata una violazione dell'articolo 8 in combinato disposto con l'articolo 14 della CEDU.[134]

Le disposizioni dei trattati sul diritto di acquisizione della cittadinanza accordano un'importanza fondamentale alla prevenzione della condizione di apolide. La Convenzione europea sulla nazionalità contiene disposizioni dettagliate sull'acquisizione giuridica della nazionalità da parte dei minori e limita le possibilità per i minori di perdere la cittadinanza.[135] La Convenzione del Consiglio d'Europa sulla prevenzione della condizione di apolide in relazione alla successione di Stati contiene l'obbligo di evitare l'apolidia alla nascita (articolo 10) e sancisce il diritto di acquisire la nazionalità dello Stato successore in caso di apolidia (articolo 2).[136] Anche l'articolo 12 della Convenzione europea sull'adozione dei minori (riveduta) ribadisce l'importanza di evitare l'apolidia; gli Stati devono agevolare

131 CGUE, sentenza 19 ottobre 2004, causa C-200/02, *Kunqian Catherine Zhu e Man Lavette Chen c. Secretary of State for the Home Department*, punti 45-46.

132 Corte EDU, sentenza 23 gennaio 2002, *Slivenko e altri c. Lettonia* [GC], decisione sull'ammissibilità, (n. 48321/99), punto 77.

133 Corte EDU, sentenza 11 ottobre 2011, *Genovese c. Malta* (n. 53124/09), punto 33.

134 *Ibid.*, paragrafi 43–49.

135 Consiglio d'Europa, Convenzione europea sulla nazionalità, STE n. 166, 1997, articoli 6 e 7.

136 Consiglio d'Europa, Convenzione sulla prevenzione della condizione di apolide in relazione alla successione di Stati, STCE n. 200, 2006.

l'acquisizione della loro nazionalità da parte di un minore adottato da uno dei loro cittadini e la perdita della nazionalità a seguito dell'adozione è subordinata al possesso o all'acquisizione di un'altra nazionalità.

Nell'ambito del diritto internazionale, sia l'articolo 7 della CRC che l'articolo 24, paragrafo 3, dell'ICCPR garantiscono il diritto ad acquisire una nazionalità.

4.6. Identità di minori appartenenti a minoranze nazionali

Punto saliente

- Un minore appartenente a una minoranza nazionale ha il diritto di avere una vita culturale propria, di professare e praticare la propria religione e di usare la propria lingua.[137]

Il diritto dell'UE non dedica una particolare attenzione all'identità dei minori che appartengono a minoranze nazionali dal punto di vista dei diritti fondamentali. Inoltre, nell'UE non esiste una giurisprudenza fondamentale che rafforzi le norme del Consiglio d'Europa.

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 5, paragrafo 1, della Convenzione quadro per la protezione delle minoranze nazionali afferma espressamente che gli Stati contraenti s'impegnano a preservare gli elementi essenziali dell'identità delle persone appartenenti a minoranze nazionali, cioè la loro religione, la loro lingua, le loro tradizioni ed il loro patrimonio culturale. La Convenzione quadro per la protezione delle minoranze nazionali non contiene disposizioni specifiche riguardanti i minori. La questione della lingua nell'istruzione è trattata al paragrafo 8.2.

Nell'ambito del diritto internazionale, l'articolo 30 della CRC garantisce a un fanciullo autoctono o che appartiene a una minoranza nazionale il diritto "di avere una propria vita culturale, di professare e di praticare la propria religione o di far uso della propria lingua" insieme agli altri membri del suo gruppo.

137 Per quanto riguarda altri aspetti dei diritti economici, sociali e culturali, cfr. di seguito il capitolo 8.

Lettonia* [GC], n. 27853/09, 2013 (fondato rischio in caso di rimpatrio di una minore ai sensi della Convenzione dell'Aia)

La legislazione europea, a livello sia di UE che di Consiglio d'Europa, sancisce il diritto al rispetto della vita familiare (articolo 7 della Carta dei diritti fondamentali dell'UE; articolo 8 della CEDU). La competenza dell'UE in materia di vita familiare riguarda le controversie transfrontaliere, tra cui il riconoscimento e l'esecuzione di sentenze negli Stati membri. La CGUE si occupa di questioni quali l'interesse superiore del minore e il diritto alla vita familiare sanciti dalla Carta dei diritti fondamentali dell'UE in relazione al regolamento Bruxelles II *bis*. La giurisprudenza della Corte EDU riguardante la vita familiare riconosce diritti interdipendenti quali il diritto alla vita familiare e il diritto del minore a che il suo interesse superiore sia considerato preminente. Riconosce altresì che talvolta i diritti dei minori sono in conflitto tra loro. Il diritto del minore al rispetto della vita familiare, ad esempio, può essere limitato al fine di tutelare il suo interesse superiore. Inoltre, il Consiglio d'Europa ha adottato vari altri strumenti che disciplinano questioni connesse al contatto, all'affidamento e all'esercizio dei diritti dei minori.

Il presente capitolo esamina il diritto del minore al rispetto della vita familiare e i diritti associati, in particolare il contenuto e la portata di tali diritti nonché gli obblighi giuridici associati e la loro interazione con altri diritti. Tra gli aspetti specifici trattati figurano il diritto al rispetto della vita familiare e le sue limitazioni (paragrafo 5.1), il diritto del minore a essere allevato dai suoi genitori (paragrafo 5.2), il diritto di intrattenere contatti con entrambi i genitori (paragrafo 5.3) e la sottrazione di minori (paragrafo 5.4).

5.1. Diritto al rispetto della vita familiare

Punti salienti

- Gli Stati hanno obblighi positivi di garantire il godimento effettivo da parte dei minori del diritto al rispetto della vita familiare.
- Ai sensi del diritto sia dell'UE che del Consiglio d'Europa, le autorità giudiziarie e amministrative devono tenere conto dell'interesse superiore del minore in qualsiasi decisione riguardante il diritto del minore al rispetto della sua vita familiare.

Il diritto del minore al rispetto della vita familiare comprende una serie di diritti compositi, quali il diritto del minore a essere allevato dai suoi genitori (paragrafo 5.2), il diritto di intrattenere contatti con entrambi i genitori (paragrafo 5.3), il diritto a non essere separato dai genitori, a meno che ciò non sia nel suo interesse superiore (paragrafo 5.4 e capitolo 6) e il diritto al ricongiungimento familiare (capitolo 9).

Ai sensi del diritto sia dell'UE che del Consiglio d'Europa, il diritto al rispetto della vita familiare non è assoluto, ed è soggetto a una serie di limitazioni. Tali limitazioni, come precisano le spiegazioni relative alla Carta dei diritti fondamentali dell'UE[138], sono identiche a quelle previste dalla corrispondente disposizione della CEDU, nella fattispecie l'articolo 8, paragrafo 2, che recita: "[Non può esservi ingerenza di una autorità pubblica nell'esercizio di tale diritto a meno che tale ingerenza] sia prevista dalla legge e costituisca una misura che, in una società democratica, è necessaria alla sicurezza nazionale, alla pubblica sicurezza, al benessere economico del paese, alla difesa dell'ordine e alla prevenzione

138 Parlamento Europeo, Consiglio dell'Unione Europea, Commissione Europea (2007), "Spiegazioni riguardanti la Carta dei Diritti Fondamentali dell'UE", 2007/C 303/02, OJ 2007 C 303, 14 Dicembre 2007, pp. 17–35, vedi spiegazioni relative all'Art. 7.

dei reati, alla protezione della salute o della morale, o alla protezione dei diritti e delle libertà altrui".[139]

La Carta dei diritti fondamentali dell'UE integra espressamente in tale diritto l'obbligo di considerare preminente l'interesse superiore del minore (articolo 24, paragrafo 2).[140] Benché l'obbligo di considerare l'interesse superiore del minore non sia espressamente sancito dalla CEDU, la Corte EDU lo incorpora nella sua giurisprudenza.[141]

5.2. Diritto del minore a essere cresciuto dai suoi genitori

Punti salienti

- Il diritto dell'UE disciplina gli aspetti procedurali del diritto del minore a essere cresciuto dai suoi genitori.
- Ai sensi della CEDU, gli Stati hanno obblighi sia negativi che positivi di rispettare il diritto alla vita familiare dei minori e dei loro genitori.

Il diritto dei minori a conoscere l'identità dei loro genitori e il diritto a esserne cresciuti sono due componenti fondamentali del diritto dei minori al rispetto della vita familiare. In certa misura tali diritti sono interdipendenti: il diritto dei minori a conoscere i loro genitori è garantito attraverso le cure genitoriali. Tuttavia, talvolta tali diritti non sono gli stessi, ad esempio, per i minori che sono stati adottati o che sono nati a seguito della procreazione medicalmente assistita. In questo caso il diritto è più strettamente associato al diritto all'identità del minore, che si esprime attraverso la conoscenza della sua parentela biologica, ed è pertanto esaminato al capitolo 4. Il presente paragrafo si concentra invece sul secondo diritto: il diritto del minore a essere cresciuto dai suoi genitori.

139 Consiglio d'Europa, Convenzione per la salvaguardia dei diritti dell'uomo e delle libertà fondamentali, STE n. 5, 4 novembre 1950, articolo 8.

140 CGUE, sentenza 5 ottobre 2010, causa C-400/10 PPU, *J. McB. c. L. E.*.

141 Cfr., per esempio, Corte EDU, sentenza 25 gennaio 2000, *Ignaccolo-Zenide c. Romania* (n. 31679/96), punto 94.

Il diritto dell'UE non contiene disposizioni riguardanti il campo di applicazione materiale del diritto a essere allevati dai genitori. Gli strumenti dell'UE possono trattare aspetti transfrontalieri, come il riconoscimento e l'esecuzione di sentenze negli Stati membri. Il regolamento (CE) n. 4/2009 relativo alla competenza, alla legge applicabile, al riconoscimento e all'esecuzione delle decisioni e alla cooperazione in materia di obbligazioni alimentari (regolamento in materia di obbligazioni alimentari), ad esempio, si applica alle domande transfrontaliere di alimenti derivanti da rapporti di famiglia.[142] Definisce norme comuni per tutta l'Unione, volte a garantire il recupero dei crediti alimentari anche qualora il debitore o il creditore si trovino in un altro paese.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha sottolineato che l'articolo 8 della CEDU stabilisce essenzialmente l'obbligo di non ingerenza nella vita familiare da parte dello Stato.[143] Tuttavia, gli Stati hanno anche l'obbligo positivo di adottare le misure necessarie sia per sostenere i genitori e le famiglie che per proteggere i minori da potenziali abusi.[144] I minori devono essere separati dai loro genitori solo in casi eccezionali. In tali circostanze, occorre fare tutto il possibile per preservare le relazioni personali e, ove opportuno, "ricostruire" la famiglia. Gli Stati godono di un ampio margine di apprezzamento quando prendono la decisione iniziale di separare i minori dai loro genitori.[145] È però necessario sottoporre a un esame più rigoroso altre eventuali limitazioni, quali le restrizioni ai diritti di visita dei genitori, nonché eventuali salvaguardie giuridiche volte a garantire l'effettiva protezione del diritto dei genitori e dei minori al rispetto della loro vita familiare. Tali ulteriori limitazioni comportano il rischio che i rapporti familiari tra un minore e uno o entrambi i genitori siano di fatto ridotti. Analogamente, quando si tratta di separare le madri dai neonati, le ragioni avanzate dallo Stato devono essere straordinariamente convincenti.[146]

Il margine di apprezzamento diminuisce con la quantità di tempo durante il quale i minori sono separati dai loro genitori e le autorità statali devono presentare

142 Consiglio dell'Unione europea (2008), regolamento (CE) n. 4/2009 del Consiglio, del 18 dicembre 2008, relativo alla competenza, alla legge applicabile, al riconoscimento e all'esecuzione delle decisioni e alla cooperazione in materia di obbligazioni alimentari (GU L 7 del 10.1.2009) (regolamento in materia di obbligazioni alimentari).

143 Corte EDU, sentenza 18 giugno 2013, *R.M.S. c. Spagna* (n. 28775/12), punto 69.

144 *Ibid.*, punto 69 e segg.

145 Corte EDU, sentenza 13 marzo 2012, *Y.C. c. Regno Unito* (n. 4547/10), punto 137.

146 Corte EDU, sentenza 12 luglio 2001, *K. e T. c. Finlandia* [GC] (n. 25702/94), punto 168.

forti validi motivi per sostenere la loro decisione di mantenere la separazione.[147] La Corte EDU valuta l'equità del processo decisionale e stabilisce se è stata data l'opportunità di perorare la propria causa a tutte le parti interessate.

> Esempio: nel caso *R.M.S. c. Spagna,*[148] la ricorrente lamentava di essere stata privata di ogni contatto con la figlia da quando quest'ultima aveva tre anni e 10 mesi a causa della sua situazione socioeconomica. Nel rilevare una violazione dell'articolo 8 della CEDU, la Corte ha sottolineato che le autorità amministrative spagnole avrebbero dovuto prendere in considerazione misure meno drastiche anziché prendere in carico la bambina. LaCorte ha altresì affermato che il compito degli enti di assistenza sociale è proprio quello di aiutare le persone in difficoltà, di fornire loro orientamento e consigli, ad esempio sui differenti tipi di prestazioni sociali disponibili, sulla possibilità di accedere all'edilizia sociale e su altri mezzi con cui superare le loro difficoltà, come la ricorrente aveva inizialmente cercato di fare. La Corte EDU ha pertanto concluso che le autorità spagnole non hanno compiuto sforzi adeguati e sufficienti a garantire il diritto della ricorrente a vivere con sua figlia.[149]

Nell'ambito del diritto internazionale, l'articolo 5 della CRC stabilisce che "Gli Stati parti rispettano la responsabilità, il diritto e il dovere dei genitori, [...] di dare al fanciullo, in maniera corrispondente allo sviluppo delle sue capacità, l'orientamento e i consigli adeguati all'esercizio dei diritti che gli sono riconosciuti dalla presente Convenzione." Inoltre, l'articolo 9 della CRC afferma che il fanciullo deve essere separato dai suoi genitori contro la sua volontà e che tutte le parti interessate devono avere la possibilità di partecipare alle deliberazioni riguardanti tale situazione. Le Linee guida dell'ONU sull'accoglienza eterofamiliare avvalorano ulteriormente i diritti dei minori che si trovano in tali circostanze e i corrispondenti obblighi degli Stati.[150]

5.3. Diritto di intrattenere contatti con entrambi i genitori

Punti salienti

- Il diritto del minore di intrattenere contatti con entrambi i genitori sussiste in tutte le forme di separazione genitoriale, siano esse collegate alla famiglia o sancite dallo Stato.
- Ai fini del processo volto a garantire il diritto del minore a intrattenere contatti con i genitori e ad assicurare il ricongiungimento familiare, occorre considerare preminente l'interesse superiore del minore tenendone debitamente in considerazione le opinioni in funzione della sua età e del suo grado di maturità.

La portata del diritto a intrattenere contatti con i genitori varia a seconda del contesto. Qualora la decisione di separarsi sia presa dai genitori, il campo di applicazione è più ampio e di norma limitato solo dall'interesse superiore del minore. Nel caso di una separazione sancita dallo Stato, derivante ad esempio dall'espulsione o dalla detenzione di un genitore, le autorità statali agiscono per tutelare un interesse protetto e devono garantire un giusto equilibrio tra gli interessi delle parti e l'obbligo di tutelare l'interesse superiore del minore. Il diritto del minore di intrattenere contatti con entrambi i genitori è applicabile in ambedue i casi.

Nell'ambito del diritto dell'UE, l'articolo 24, paragrafo 3, della Carta dei diritti fondamentali dell'UE riconosce espressamente il diritto del minore di intrattenere contatti diretti con *i due* genitori. La formulazione della disposizione precisa il contenuto del diritto, in particolare il significato di "contatti", che devono essere intrattenuti *regolarmente*, permettere lo sviluppo di *relazioni personali* e avvenire sotto forma di *contatti diretti*. L'articolo contiene tuttavia un ammonimento: il diritto del minore a intrattenere contatti con i genitori è espressamente limitato dal suo interesse superiore. Come precisa la nota esplicativa alla Carta, questa disposizione è espressamente informata dall'articolo 9 della CRC.

In linea con le competenze dell'UE (cfr. il capitolo 1), è stata dedicata una particolare attenzione alla cooperazione giudiziaria (con l'obiettivo di creare uno spazio di libertà, sicurezza e giustizia in cui sia garantita la libera circolazione delle persone). Due strumenti dell'UE sono particolarmente rilevanti: il regolamento (CE)

n. 2201/2003[151] del Consiglio (regolamento Bruxelles II bis) e la direttiva del Parlamento europeo e del Consiglio 2008/52/CE (direttiva sulla mediazione).[152] Dalla prospettiva dei diritti, il regolamento Bruxelles II *bis* è un dispositivo importante. In primo luogo, si applica a *tutte* le decisioni in materia di responsabilità genitoriale, indipendentemente dallo stato coniugale. In secondo luogo, le norme sulla competenza (determinate perlopiù dalla residenza abituale del minore) sono espressamente informate dall'interesse superiore del minore e, in terzo luogo, il regolamento presta una particolare attenzione a garantire il rispetto delle opinioni dei minori.[153]

La giurisprudenza della CGUE, nei casi di trasferimento illecito di un minore in seguito a una decisione presa unilateralmente da uno dei genitori, è stata innanzitutto finalizzata a rispettare il diritto fondamentale del minore di intrattenere regolarmente relazioni personali e contatti diretti con i due genitori (articolo 24, paragrafo 3, della Carta), poiché la Corte afferma che tale diritto s'identifica innegabilmente con l'interesse superiore del bambino. A parere della CGUE, una misura che impedisca al minore di intrattenere regolarmente relazioni personali e contatti diretti con i suoi due genitori potrebbe essere giustificata soltanto da un altro interesse del minore di importanza tale da comportarne il prevalere sull'interesse sotteso al citato diritto fondamentale.[154] In quest'ambito rientra l'adozione di provvedimenti provvisori o cautelari ai sensi dell'articolo 20 del regolamento Bruxelles II *bis*. La Corte ha stabilito che una valutazione equilibrata e ragionevole di tutti gli interessi in gioco, da effettuarsi sulla base di considerazioni oggettive riguardanti la persona stessa del minore e il suo ambiente sociale, deve essere compiuta, in linea di principio, nell'ambito di un procedimento in forza delle disposizioni del regolamento Bruxelles II *bis*.[155]

151 Parlamento europeo, Consiglio dell'Unione europea (2008), direttiva 2008/52/CE del Parlamento europeo e del Consiglio, del 21 maggio 2008, relativa a determinati aspetti della mediazione in materia civile e commerciale (GU L 136 del 24.5.2008, pag. 3) (*direttiva sulla mediazione*).

152 Consiglio dell'Unione europea (2003), regolamento (CE) n. 2201/2003 del Consiglio, del 27 novembre 2003, relativo alla competenza, al riconoscimento e all'esecuzione delle decisioni in materia matrimoniale e in materia di responsabilità genitoriale, che abroga il regolamento (CE) n. 1347/2000 (GU L 338 del 23.12.2003) (Bruxelles II *bis*).

153 Cfr. per esempio, il regolamento (CE) n. 2201/2003 del Consiglio, preambolo (considerando 5, 12, 13 e 19 e articolo 8, articolo 41, paragrafo 2, lettera c), e articolo 42, paragrafo 2, lettera a)).

154 CGUE, sentenza 23 dicembre 2009, causa C-403/09 PPU, *Jasna Detiček c. Maurizio Sgueglia*, punto 59.

155 *Ibid.*, punto 60.

Esempio: la causa di *E. c. B.*[156] verte sulla controversia tra E. (il padre) e B. (la madre) in relazione alla competenza dei giudici del Regno Unito per quanto riguarda la determinazione del luogo di residenza abituale del loro figlio S. e il diritto di visita del padre. I genitori avevano sottoscritto un accordo dinanzi a un giudice spagnolo che attribuiva l'affidamento alla madre e riconosceva il diritto di visita al padre. In seguito la madre aveva chiesto una riduzione dei diritti di visita concessi al padre con tale accordo. Il padre aveva presentato un ricorso dinanzi al medesimo giudice ai fini dell'esecuzione dell'accordo spagnolo. La madre aveva riconosciuto di aver prorogato la competenza del giudice spagnolo e aveva cercato di trasferire ai giudici dell'Inghilterra e del Galles la competenza prorogata. Nell'ambito dell'appello presentato dal padre, la Corte d'Appello aveva sottoposto alla CGUE alcune questioni riguardanti l'interpretazione dell'articolo 12, paragrafo 3, del regolamento Bruxelles II *bis*. La CGUE ha stabilito che, quando un'autorità giurisdizionale è adita conformemente all'articolo 12, paragrafo 3, del regolamento Bruxelles II *bis*, l'interesse superiore del minore può essere tutelato solo mediante un esame, caso per caso, della questione se la proroga di competenza considerata sia conforme a tale interesse superiore. Una proroga di competenza è applicabile solo allo specifico procedimento per il quale è adita l'autorità giurisdizionale la cui competenza è prorogata. Con l'archiviazione definitiva del procedimento all'origine della proroga di competenza, tale competenza viene meno, a vantaggio dell'autorità giurisdizionale che gode di una competenza generale ai sensi dell'articolo 8, paragrafo 1, del regolamento Bruxelles II *bis*.

Per quanto riguarda la potestà genitoriale, il regolamento Bruxelles II *bis* coesiste con la Convenzione dell'Aia concernente la competenza, la legge applicabile, il riconoscimento, l'esecuzione e la cooperazione in materia di potestà genitoriale e di misure di protezione dei minori.[157] Conformemente all'articolo 61, il regolamento Bruxelles II *bis* prevale sulla Convenzione dell'Aia: (a) se il minore in questione ha la sua residenza abituale nel territorio di uno Stato membro o (b) per quanto riguarda il riconoscimento e l'esecuzione di una decisione emessa dal giudice competente di uno Stato membro nel territorio di un altro Stato membro,

156 CGUE, sentenza 1° ottobre 2014, causa C-436/13, *E. c. B.* (sintesi adattata da http://cases.iclr.co.uk)

157 Organizzazione mondiale per la cooperazione transfrontaliera in materia civile e commerciale (1996), Conferenza dell'Aia sul diritto internazionale privato, Convenzione dell'Aia concernente la competenza, la legge applicabile, il riconoscimento, l'esecuzione e la cooperazione in materia di potestà genitoriale e di misure di protezione dei minori, 19 ottobre 1996.

anche se il minore risiede abitualmente nel territorio di uno Stato non membro che è parte contraente della Convenzione dell'Aia. Di conseguenza, una questione chiave ai sensi del regolamento Bruxelles II *bis* è la determinazione della residenza abituale del minore.

> Esempio: nella causa *Mercredi c. Chaffe,*[158] la Court of Appeal (England and Wales) aveva adito la CGUE riguardo al trasferimento di una bambina di due mesi dal Regno Unito all'isola francese della Riunione. La CGUE ha stabilito che la nozione di "residenza abituale", ai sensi degli articoli 8 e 10 del regolamento Bruxelles II *bis*, corrisponde al luogo che denota una certa integrazione del minore in un ambiente sociale e familiare. Laddove la situazione riguardi un/a neonato/a che soggiorna con la madre solo da pochi giorni in uno Stato membro – diverso da quello della sua residenza abituale – nel quale è stato/a portato/a, devono essere presi in considerazione, da un lato, la durata, la regolarità, le condizioni e le ragioni del soggiorno nel territorio di tale Stato membro nonché del trasferimento della madre in detto Stato e, d'altro lato, tenuto conto segnatamente dell'età del minore, l'origine geografica e familiare della madre nonché i rapporti familiari e sociali che madre e minore intrattengono in quello stesso Stato membro.

Particolarmente rilevanti per il godimento del diritto a intrattenere contatti con entrambi i genitori nelle controversie transfrontaliere sono anche gli strumenti relativi alla regolamentazione dell'accesso alla giustizia che spiegano come gestire controversie complesse, quali la direttiva 2002/8/CE del Consiglio (direttiva sull'accesso alla giustizia) intesa "a miglior[are] l'accesso alla giustizia nelle controversie transfrontaliere attraverso la definizione di norme minime comuni relative al patrocinio a spese dello Stato in tali controversie".[159] La suddetta direttiva è volta a migliorare l'accesso alla giustizia nei procedimenti civili transfrontalieri attraverso la definizione di norme minime comuni relative al patrocinio a spese dello Stato, a garantire, a talune condizioni, un livello adeguato di patrocinio a spese dello Stato alle persone che sono incapaci di sostenere le spese processuali a causa della loro situazione finanziaria nonché a promuovere

158 CGUE, sentenza 22 dicembre 2010, causa C-497/10 PPU, *Barbara Mercredi c. Richard Chaffe*.

159 Consiglio dell'Unione europea (2003), direttiva 2002/8/CE del Consiglio, del 27 gennaio 2003, intesa a migliorare l'accesso alla giustizia nelle controversie transfrontaliere attraverso la definizione di norme minime comuni relative al patrocinio a spese dello Stato in tali controversie (GU L 26 del 31.1.2003) (direttiva sull'accesso alla giustizia).

la compatibilità delle norme nazionali in materia e a prevedere meccanismi di cooperazione tra le autorità degli Stati membri.

Nell'ambito del diritto del Consiglio d'Europa, il diritto di ogni minore di intrattenere contatti con entrambi i genitori è implicito all'articolo 8 della CEDU. Pur affermando che il godimento da parte del genitore e del figlio della reciproca compagnia costituisce un elemento fondamentale della vita familiare,[160] la Corte EDU sottolinea altresì che tale diritto può essere limitato dall'interesse superiore del minore (cfr. paragrafo 5.4 e capitolo 6). Questo diritto è al centro del processo decisionale giudiziario in materia di affidamento e intrattenimento di contatti tra i minori e i genitori.

La Corte EDU ha espressamente o implicitamente fatto riferimento all'interesse superiore del minore nell'ambito dell'affidamento e dei contatti tra il minore e i genitori in una serie di casi.

Esempio: nel caso *Schneider c. Germania*,[161] il ricorrente aveva avuto una relazione con una donna sposata e sosteneva di essere il padre biologico di suo figlio, il cui padre legalmente riconosciuto era il marito della madre. A parere del ricorrente, la decisione dei giudici nazionali di respingere la sua richiesta di avere contatti con il minore e di essere informato sulla sua crescita in ragione del fatto che non era il padre legittimo del bambino, né aveva una relazione con lui, costituiva una violazione dei suoi diritti ai sensi dell'articolo 8 della CEDU. Nel riscontrare una violazione del suddetto articolo, la Corte EDU si è concentrata sulla mancata considerazione accordata dai giudici nazionali all'eventualità che, nelle circostanze particolari del caso, l'intrattenimento di contatti tra il bambino e il ricorrente fosse nell'interesse superiore del minore.[162] Per quanto riguarda la richiesta del ricorrente di essere informato sullo sviluppo personale del bambino, la Corte ha stabilito che i giudici nazionali non avevano addotto ragioni sufficienti per giustificare la loro ingerenza ai sensi dell'articolo 8, paragrafo 2,[163] e che, pertanto, tale ingerenza non costituiva una misura necessaria "in una società democratica".

160 Corte EDU, sentenza 12 luglio 2001, *K. e T. c. Finlandia* [GC] (n. 25702/94), punto 151.

161 Corte EDU, sentenza 15 settembre 2011, *Schneider c. Germania* (n. 17080/07).

162 Cfr. anche Corte EDU, sentenza 21 dicembre 2010, *Anayo c. Germania* (n. 20578/07), punti 67 e 71.

163 Corte EDU, sentenza 15 settembre 2011, *Schneider c. Germania* (n. 17080/07), punto 104.

Esempio: nel caso *Levin c. Svezia*,[164] la ricorrente, una madre di tre figli in affido eterofamiliare, sosteneva che le restrizioni al suo diritto di intrattenere contatti con i figli violassero il suo diritto al rispetto della vita familiare. La Corte EDU si è concentrata sull'obiettivo delle restrizioni ai contatti, ossia la tutela dell'interesse superiore dei minori. Nel caso di specie, i minori erano trascurati mentre erano affidati alla ricorrente e, quando avevano contatti con la madre, mostravano forti reazioni negative. Nel sostenere che non sussisteva alcuna violazione dell'articolo 8 della CEDU, la Corte ha rilevato che l'ingerenza nei diritti della ricorrente era stata proporzionata allo scopo legittimo perseguito (l'interesse superiore dei minori) e rientrava nel margine di discrezionalità delle autorità nazionali.

Esempio: nel caso *Sommerfeld c. Germania*,[165] il ricorrente aveva presentato ricorso riguardo alle restrizioni al suo diritto di intrattenere contatti con la figlia, che aveva costantemente espresso l'intenzione di non volere rimanere in contatto con lui. In particolare, a parere del ricorrente il mancato ottenimento di una perizia psicologica da parte dei giudici nazionali costituiva un vizio di procedura. Non avendo riscontrato alcuna violazione dell'articolo 8 della CEDU, la Corte EDU ha concluso che il giudice nazionale era nella posizione ideale per valutare le dichiarazioni della figlia del ricorrente e per stabilire se aveva potuto prendere autonomamente una decisione.

Esempio: nel caso *Mustafa e Armağan Akin c. Turchia*,[166] i ricorrenti (un padre e un figlio) sostenevano che le prescrizioni di un provvedimento di affidamento adottato dal giudice nazionale avessero violato i loro diritti ai sensi dell'articolo 8 della CEDU. Tali prescrizioni impedivano al figlio di avere contatti con sua sorella, che era stata affidata alla madre. Inoltre, il padre non poteva avere contatti con entrambi i figli contemporaneamente perché il figlio poteva vedere la madre nello stesso momento in cui lui poteva vedere la figlia. La Corte EDU ha ritenuto che la decisione del tribunale nazionale di separare fratello e sorella costituisse una violazione del diritto dei ricorrenti al rispetto della loro vita familiare, poiché non solo non permetteva ai due fratelli di frequentarsi, ma impediva anche al padre di godere della compagnia di entrambi i figli contemporaneamente.

164 Corte EDU, sentenza giovedì 15 marzo 2012, *S.N. c. Svezia* (n. 35141/06), punti 57 e 69; Corte EDU, sentenza 12 luglio 2001, *K. e T. c. Finlandia* [GC] (n. 25702/94), punto 151.

165 Corte EDU, sentenza 8 luglio 2003, *Sommerfeld c. Germania* [GC] (n. 31871/96), punto 72.

166 Corte EDU, sentenza 6 aprile 2010, *Mustafa e Armağan Akin c. Turchia* (n. 4694/03).

Nell'ambito del processo decisionale riguardante l'affidamento e l'intrattenimento di contatti tra i minori e i genitori, la Corte EDU vieta altresì la discriminazione incompatibile con l'articolo 14 della CEDU.

Esempio: nel caso *Vojnity c. Ungheria,*[167] il ricorrente sosteneva che gli fosse stato negato il diritto di visita al figlio in ragione delle sue convinzioni religiose.[168] Nel rilevare una violazione dell'articolo 14 in combinato disposto con l'articolo 8 della CEDU, la Corte EDU ha osservato l'assenza di elementi attestanti che le convinzioni religiose del ricorrente comportassero pratiche pericolose o esponessero suo figlio a danni fisici o psicologici.[169] Le decisioni dei giudici nazionali di revocare i diritti di visita del ricorrente avevano reso impossibile qualsiasi forma di contatto nonché qualsivoglia proseguimento della vita familiare, benché la totale interruzione dei contatti possa essere giustificata solo in circostanze eccezionali.[170] La Corte EDU ha pertanto stabilito che non vi fosse alcun ragionevole rapporto di proporzionalità tra la revoca totale dei diritti di visita del ricorrente e la finalità perseguita, ossia la tutela dell'interesse superiore del minore.[171]

Esempio: nel caso *Salgueiro da Silva Mouta c. Portogallo,*[172] il ricorso era stato presentato da un padre che rivendicava la potestà genitoriale sulla figlia. Il ricorrente sosteneva che, nel procedimento nazionale, le autorità portoghesi avevano respinto la sua richiesta e affidato la potestà genitoriale alla madre in ragione del suo orientamento sessuale. La Corte EDU ha rilevato che le autorità nazionali avevano di fatto revocato l'affidamento al padre in ragione della sua omosessualità, una decisione priva di una giustificazione oggettiva e ragionevole. La Corte ha concluso che era stato violato l'articolo 8 in combinato disposto con l'articolo 14 della CEDU.

Inoltre, il diritto del minore a intrattenere contatti con entrambi i genitori è espressamente sancito dalla Convenzione del Consiglio d'Europa sulle relazioni personali

167 Corte EDU, sentenza 12 febbraio 2013, *Vojnity c. Ungheria* (n. 29617/07), punto 22.

168 *Ibid.*, punto 38.

169 Corte EDU, sentenza 12 febbraio 2013, *Vojnity c. Ungheria* (n. 29617/07); cfr. anche Corte EDU, sentenza 30 novembre 2010, *P.V. c. Spagna* (n. 35159/09) (consultabile in francese e spagnolo).

170 *Ibid.*, punto 41.

171 *Ibid.*, punto 43.

172 Corte EDU, sentenza 21 dicembre 1999, *Salgueiro da Silva Mouta c. Portogallo* (n. 33290/96).

riguardanti i minori.[173] L'articolo 4, paragrafo 1, della suddetta convenzione afferma che "un minore ed i suoi genitori devono avere il diritto di ottenere e mantenere regolari relazioni personali tra loro". I principi generali da applicare nella giurisprudenza in materia di contatti tra genitori e figli sottolineano il diritto del minore a essere informato, consultato e a esprimere la sua opinione e la necessità di tenere tale opinione nella dovuta considerazione. L'articolo 6 della Convenzione del Consiglio d'Europa sull'esercizio dei diritti dei minori[174] individua inoltre i requisiti che devono contraddistinguere il processo decisionale giudiziario, tra cui figurano i seguenti obblighi giuridici: esaminare se l'autorità giudiziaria dispone di informazioni sufficienti al fine di prendere una decisione nell'interesse superiore del minore; garantire il diritto del minore a ricevere informazioni sul processo e sui suoi esiti; e offrire ai minori interessati uno spazio sicuro in cui possano esprimere liberamente le proprie opinioni in maniera adeguata alla loro età e maturità.

Possono verificarsi situazioni in cui i minori sono separati da un genitore per motivi di altra natura, ad esempio a seguito della carcerazione di un genitore. La Corte EDU si è occupata di una situazione simile nel caso *Horych c. Polonia,*[175] in cui ha affrontato la questione delle condizioni in cui il ricorrente, classificato come detenuto pericoloso, aveva ricevuto visite dalle figlie minori. La Corte ha osservato che le visite dei minori in carcere richiedono misure speciali e potrebbero essere subordinate a condizioni specifiche a seconda della loro età, dei possibili effetti sul loro stato o benessere emotivo e della situazione personale dell'individuo destinatario della visita.[176] La Corte ha aggiunto che gli obblighi positivi dello Stato ai sensi dell'articolo 8 comprendono il dovere di garantire condizioni adeguate e quanto più prive di stress possibile per ricevere visite da parte di minori, in considerazione delle conseguenze pratiche della carcerazione. [177]

Infine, il diritto dei minori privati della libertà di mantenere contatti con i loro genitori è rafforzato da determinate disposizioni delle Linee guida del Consiglio

173 Consiglio d'Europa, Convenzione sulle relazioni personali riguardanti i minori, STE n. 192, 15 maggio 2003. Cfr. anche Organizzazione mondiale per la cooperazione transfrontaliera in materia civile e commerciale (1996), Conferenza dell'Aia sul diritto internazionale privato, Convenzione dell'Aia concernente la competenza, la legge applicabile, il riconoscimento, l'esecuzione e la cooperazione in materia di potestà genitoriale e di misure di protezione dei minori.

174 Consiglio d'Europa, Convenzione europea sull'esercizio dei diritti dei minori, STE N. 160, 25 gennaio 1996.

175 Corte EDU, sentenza 17 aprile 2012, *Horych c. Polonia* (n. 13621/08).

176 *Ibid.*, punto 131.

177 *Ibid.*, punto 131.

d'Europa per una giustizia a misura di minore.[178] Le suddette linee guida affermano espressamente il diritto dei minori privati della libertà di "mantenere contatti regolari e significativi con i genitori [e] la famiglia" (articolo 21, lettera a)) (cfr. anche il capitolo 11).

Nell'ambito del diritto internazionale, il diritto di intrattenere contatti con entrambi i genitori è sancito dall'articolo 9, paragrafo 3, della CRC: "Gli Stati parti rispettano il diritto del fanciullo separato da entrambi i genitori o da uno di essi di intrattenere regolarmente rapporti personali e contatti diretti con entrambi i genitori, a meno che ciò non sia contrario all'interesse preminente del fanciullo."

5.4. Trasferimento transfrontaliero illegittimo di minori – sottrazione di minori

Punti salienti

- Nei casi riguardanti i trasferimenti illegittimi in violazione degli accordi di affidamento, la Corte EDU prevede l'adozione di un approccio basato sui diritti dei minori: l'articolo 8 della CEDU (diritto al rispetto della vita privata e familiare) deve essere interpretato alla luce della Convenzione dell'Aia e della CRC.
- Il diritto dell'UE prevede più espressamente che il minore sia ascoltato nei procedimenti riguardanti il suo ritorno in seguito a un trasferimento illecito o mancato rientro.

Per sottrazione di minore s'intende una situazione in cui un minore è trasferito o trattenuto oltre i confini nazionali in violazione degli accordi di affidamento esistenti (articolo 3 della Convenzione dell'Aia sugli aspetti civili della sottrazione internazionale di minori[179] [Convenzione dell'Aia]). La Convenzione dell'Aia prevede l'immediato rientro nel loro Stato di residenza abituale dei minori illecitamente trasferiti o trattenuti (articolo 11, paragrafo 1). I giudici dello Stato di resi-

178 Consiglio d'Europa, Comitato dei ministri (2010), *Linee guida per una giustizia a misura di minore*.

179 Organizzazione mondiale per la cooperazione transfrontaliera in materia civile e commerciale (1980), Conferenza dell'Aia sul diritto internazionale privato, Convenzione dell'Aia del 25 ottobre 1980 sugli aspetti civili della sottrazione internazionale di minori, 25 ottobre 1980.

denza abituale deliberano sul merito della controversia relativa all'affidamento. I giudici dello Stato da cui il minore è stato trasferito devono ordinarne il ritorno entro un termine di sei settimane dalla data in cui è stata presentata l'istanza di rientro (articolo 11). La Convenzione dell'Aia si fonda sul principio dell'interesse superiore del minore. Nell'ambito di tale convenzione, la presunzione è che il trasferimento illecito di un minore sia di per sé dannoso e che lo *status quo ante* debba essere ripristinato quanto prima per evitare il consolidamento giuridico di situazioni illegali. A pronunciarsi in materia di diritti di affidamento e di visita devono essere i giudici competenti nel luogo di residenza abituale del minore anziché quelli del paese nel quale il minore è stato illecitamente trasferito. Gli articoli 12, 13 e 20 della Convenzione dell'Aia prevedono alcune limitate eccezioni al meccanismo di ritorno. L'articolo 13 contiene le disposizioni da cui è scaturita la maggior parte delle vertenze giudiziarie a livello sia nazionale che internazionale. Tale articolo stabilisce che lo Stato in cui il minore è stato trasferito può opporsi al suo ritorno qualora sussista un fondato rischio, per il minore, di essere esposto, per il fatto del suo ritorno, a pericoli fisici e psichici, o comunque di trovarsi in una situazione intollerabile (articolo 13, lettera b)). Uno Stato può altresì rifiutarsi di ordinare il ritorno del minore qualora accerti che quest'ultimo si oppone al ritorno o che ha raggiunto un grado di maturità tale da consentirgli di esprimere il suo parere (articolo 13, paragrafo 2).

Nell'ambito del diritto dell'UE, lo strumento più importante che disciplina la sottrazione di minori tra gli Stati membri dell'UE è il regolamento Bruxelles II *bis*,[180] che s'ispira in ampia misura alle disposizioni della Convenzione dell'Aia. Detto regolamento integra la Convenzione dell'Aia e prevale su di essa nei casi di sottrazione di minore all'interno dell'UE (considerando 17 e articolo 60, lettera e)). Benché la Convenzione dell'Aia rimanga lo strumento principale in materia di sottrazione di minori, sotto taluni aspetti il regolamento Bruxelles II *bis* ha "rafforzato" le norme di competenza a favore delle autorità giurisdizionali di origine/dello Stato di residenza abituale. Analogamente alla Convenzione dell'Aia, il regolamento Bruxelles II *bis* prevede che l'autorità giurisdizionale dello Stato nel quale il minore aveva la residenza abituale immediatamente prima del trasferimento illecito o del mancato rientro conservino la competenza nei casi di sottrazione di minore. Il regolamento mantiene le stesse eccezioni al meccanismo di ritorno previste dalla Convenzione sulla sottrazione di minori.

180 Consiglio dell'Unione europea (2003), regolamento (CE) n. 2201/2003 del Consiglio, del 27 novembre 2003, relativo alla competenza, al riconoscimento e all'esecuzione delle decisioni in materia matrimoniale e in materia di responsabilità genitoriale, che abroga il regolamento (CE) n. 1347/2000 (GU L 338 del 23.12.2003).

Tuttavia, diversamente dalla Convenzione dell'Aia, il regolamento Bruxelles II *bis* prevede che lo Stato di residenza abituale rimanga competente a pronunciarsi sul merito della controversia relativa all'affidamento anche dopo l'emanazione di un provvedimento contro il ritorno in applicazione dell'articolo 13, lettera b), della Convenzione dell'Aia e dell'articolo 11, paragrafi 6–8, del regolamento Bruxelles II *bis*. Il trasferimento di competenza dello Stato in cui il minore è stato trasferito può avvenire solo in due situazioni, previste dall'articolo 10 del regolamento Bruxelles II *bis*. La prima situazione attribuisce la competenza ai giudici dello Stato di rifugio qualora il minore abbia acquisito la residenza abituale in tale Stato e ciascuna persona titolare del diritto di affidamento abbia accettato il trasferimento o mancato rientro.[181] La seconda situazione si verifica se: il minore ha acquisito la residenza abituale nello Stato in cui è stato trasferito; è trascorso un periodo di un anno da quando il genitore cui è stato sottratto il minore ha avuto conoscenza, o avrebbe dovuto avere conoscenza, del luogo in cui il minore si trovava; il minore si è integrato nel nuovo ambiente; e ricorre almeno una delle quattro ulteriori condizioni elencate all'articolo 10, lettera b), del regolamento Bruxelles II *bis*.[182]

Come per tutti gli altri strumenti giuridici dell'UE, il regolamento Bruxelles II *bis* deve essere interpretato conformemente alle disposizioni della Carta dei diritti fondamentali dell'UE, in particolare all'articolo 24. La CGUE ha avuto l'opportunità di chiarire l'interpretazione dell'articolo 24 della Carta nel contesto delle sottrazioni di minori. Come già discusso al paragrafo 2.4, nella causa *Aguirre Zarraga*, la CGUE ha stabilito che il diritto del minore di essere ascoltato, sancito dall'articolo 24 della Carta, richiede che siano messe a disposizione di tale minore le procedure e condizioni legali che gli consentono di esprimere liberamente la sua opinione e che quest'ultima sia raccolta dal giudice.[183] Secondo la CGUE, tuttavia,

181 Articolo 10, lettera a), del regolamento Bruxelles II *bis*.

182 L'articolo 10, lettera b), del regolamento Bruxelles II *bis* enumera le quattro condizioni alternative elencate di seguito: (i) entro un anno da quando il titolare del diritto di affidamento ha avuto conoscenza, o avrebbe dovuto avere conoscenza, del luogo in cui il minore si trovava non è stata presentata alcuna domanda di ritorno del minore dinanzi alle autorità competenti dello Stato membro nel quale il minore è stato trasferito o dal quale non ha fatto rientro; (ii) una domanda di ritorno presentata dal titolare del diritto di affidamento è stata ritirata e non è stata presentata una nuova domanda entro il termine di cui al punto i); (iii) un procedimento dinanzi all'autorità giurisdizionale dello Stato membro nel quale il minore aveva la residenza abituale immediatamente prima del trasferimento o del mancato rientro è stato definito a norma dell'articolo 11, paragrafo 7; (iv) l'autorità giurisdizionale dello Stato membro nel quale il minore aveva la residenza abituale immediatamente prima dell'illecito trasferimento o del mancato ritorno ha emanato una decisione di affidamento che non prevede il ritorno del minore.

183 CGUE, sentenza 22 dicembre 2010, causa C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz*. Per quanto riguarda gli aspetti relativi alla partecipazione del minore nel caso di specie, cfr. inoltre l'analisi al paragrafo 2.4.

spetta ai soli giudici nazionali dello Stato di residenza abituale del minore esaminare la legittimità delle loro decisioni alla luce della Carta dei diritti fondamentali dell'UE e del regolamento Bruxelles II *bis*. Conformemente al principio della fiducia reciproca, gli ordinamenti giuridici degli Stati membri devono fornire una tutela equivalente ed effettiva dei diritti fondamentali. Di conseguenza, le parti interessate devono sottoporre eventuali questioni riguardanti i diritti umani alle autorità giurisdizionali competenti a pronunciarsi sul merito della controversia relativa all'affidamento in conformità del regolamento. La CGUE ha stabilito che i giudici dello Stato membro in cui il minore era stato trasferito illecitamente non potevano opporsi all'esecuzione di una decisione certificata che prescriveva il ritorno del minore, poiché l'accertamento della sussistenza di una violazione delle suddette disposizioni era di competenza esclusiva dei giudici dello Stato membro d'origine.

Esempio: la causa *Povse c. Alpago*[184] riguarda il trasferimento illecito di una bambina in Austria da parte della madre. I giudici austriaci avevano respinto la domanda presentata dal padre per il ritorno della figlia in Italia, rilevando che sussisteva un grave rischio di danno per la minore. Nel frattempo, su richiesta del padre, il giudice italiano aveva stabilito che avrebbe mantenuto la competenza a pronunciarsi sul merito della controversia relativa all'affidamento e aveva emanato un provvedimento di ritorno della minore in Italia nonché un certificato di esecuzione sulla base dell'articolo 42 del regolamento Bruxelles II *bis*. Il caso era stato deferito alla CGUE da un giudice austriaco in seguito all'appello interposto dalla madre contro la domanda di esecuzione del certificato e il conseguente provvedimento di ritorno della minore in Italia. La CGUE ha stabilito che, una volta emesso il certificato di esecuzione, il paese in cui il minore è stato trasferito (nel caso di specie l'Austria) non può opporsi al ritorno, poiché il certificato è automaticamente dotato di efficacia esecutiva. La CGUE ha inoltre deciso che, nella fattispecie, solo i giudici italiani erano competenti a pronunciarsi sul grave rischio per l'interesse superiore della minore comportato dal ritorno. Supponendo che dovessero considerare tale rischio giustificato, i suddetti giudici hanno mantenuto la competenza esclusiva di sospendere il loro provvedimento di esecuzione.[185]

184 CGUE, sentenza 1°luglio 2010, causa C-211/10, *Doris Povse c. Mauro Alpago*.

185 Un ricorso basato sugli stessi fatti è stato successivamente presentato alla Corte EDU e dichiarato inammissibile. Cfr. Corte EDU, sentenza 18 giugno 2013, *Povse c. Austria* (n. 3890/11), decisione di inammissibilità.

Nell'ambito del diritto del Consiglio d'Europa, la Convenzione europea sul riconoscimento e l'esecuzione delle decisioni in materia di affidamento dei minori e sul ristabilimento dell'affidamento dei minori[186] e la Convenzione sulle relazioni personali riguardanti i minori[187] contengono tutele volte a impedire il trasferimento illegittimo dei minori e ad assicurare la restituzione dei minori.[188]

La Corte EDU si occupa spesso di casi di sottrazione di minore e, in tali occasioni, interpreta l'articolo 8 della CEDU ispirandosi generalmente alle disposizioni della Convenzione dell'Aia. Ciononostante, in tali casi la Corte EDU conduce inevitabilmente un'analisi dell'interesse superiore del minore. Due sentenze fondamentali della Grande Camera riflettono la posizione della Corte in materia.

Esempio: il ricorso *Neulinger e Shuruk c. Svizzera*[189] è stato presentato da una madre che aveva trasferito il figlio da Israele alla Svizzera in violazione degli accordi esistenti in materia di tutela. In seguito al ricorso presentato dal padre ai sensi della Convenzione dell'Aia, le autorità svizzere avevano disposto il ritorno del minore in Israele. A parere degli esperti e dei giudici nazionali, il ritorno del minore in Israele avrebbe potuto essere concepibile solo se il bambino fosse stato accompagnato dalla madre. La misura in questione rientrava nel margine di discrezionalità concesso alle autorità nazionali competenti in materia. Tuttavia, per valutare l'osservanza dell'articolo 8 della CEDU, era altresì necessario tenere conto di tutti gli sviluppi intercorsi dalla sentenza del Tribunale federale che ordinava il ritorno del minore. Nel caso di specie, il minore era un cittadino svizzero e si era integrato bene nel Paese, in cui risiedeva ininterrottamente da circa quattro anni. Benché la sua età gli permettesse di avere ancora una notevole capacità di adattamento, un nuovo trasferimento avrebbe probabilmente avuto gravi conseguenze per lui e doveva essere valutato rispetto ai benefici che il minore avrebbe verosimilmente potuto trarne. Era altresì degno di nota che al diritto di visita del padre fossero state imposte restrizioni

186 Consiglio d'Europa, Convenzione sulle relazioni personali riguardanti i minori, STE n. 192, 15 maggio 2003.

187 *Ibid.*, articolo 10, lettera b), e articolo 16, rispettivamente; Consiglio d'Europa, Convenzione europea sul riconoscimento e l'esecuzione delle decisioni in materia di affidamento dei minori e sul ristabilimento dell'affidamento dei minori, STE n. 105, 20 maggio 1980, articolo 8.

188 Consiglio d'Europa, Convenzione europea sul riconoscimento e l'esecuzione delle decisioni in materia di affidamento dei minori e sul ristabilimento dell'affidamento dei minori, STE n. 105, 20 maggio 1980.

189 Corte EDU, sentenza 6 luglio 2010, *Neulinger e Shuruk c. Svizzera* [GC] (n. 41615/07).

prima del trasferimento del minore. Inoltre, nel frattempo il padre si era risposato due volte e aveva avuto un'altra figlia, a favore della quale non versava però gli alimenti. La Corte EDU dubitava che tali circostanze sarebbero state favorevoli al benessere e allo sviluppo del minore. Quanto alla madre, il suo ritorno in Israele avrebbe potuta esporla al rischio di incorrere in sanzioni penali, quali ad esempio la condanna a una pena detentiva. Era evidente che tale situazione sarebbe stata contraria all'interesse superiore del minore, poiché la madre era probabilmente l'unica persona con cui intratteneva contatti. Il rifiuto della madre di tornare in Israele, pertanto, non era totalmente ingiustificato. Inoltre, il padre non aveva mai vissuto da solo con il figlio e non lo vedeva da quando il bambino era stato trasferito in Svizzera, all'età di due anni. La Corte EDU non era dunque convinta che tornare in Israele sarebbe stato nell'interesse superiore del minore. Per quanto riguarda la madre, un ritorno in Israele avrebbe costituito un'ingerenza sproporzionata nel suo diritto al rispetto della propria vita familiare. Di conseguenza, l'eventuale esecuzione della decisione che dispone il ritorno del secondo ricorrente in Israele costituirebbe una violazione dell'articolo 8 della CEDU.

Esempio: nel caso *X c. Lettonia*,[190] la madre sosteneva che il ritorno della figlia in Australia, da cui era stata illecitamente trasferita, l'avrebbe esposta a un danno grave. Nello stabilire se le decisioni dei giudici nazionali avessero garantito un giusto equilibrio tra gli interessi concorrenti in gioco, nell'ambito del margine di apprezzamento concesso agli Stati in materia occorreva considerare preminente l'interesse superiore della minore. Per giungere a un'interpretazione armoniosa della CEDU e della Convenzione dell'Aia, i fattori in grado di costituire un'eccezione al ritorno immediato della minore ai sensi degli articoli 12, 13 e 20 della Convenzione dell'Aia dovevano essere tenuti effettivamente in considerazione dallo Stato richiesto, che doveva adottare una decisione che fosse sufficientemente ragionata su questo punto, e successivamente valutata alla luce dell'articolo 8 della CEDU. Tale articolo imponeva alle autorità nazionali un obbligo procedurale, conformemente al quale i giudici, nell'ambito dell'esame di una domanda di ritorno di un minore, erano tenuti a valutare le sostenibili affermazioni di un "fondato rischio" al quale sarebbe stata esposta la minore in caso di ritorno e a emettere una decisione specificamente moti-

190 Corte EDU, sentenza 26 novembre 2013, *X c. Lettonia* [GC] (n. 27853/09), punti 101, 106, 107 e 115–119.

vata. Quanto all'esatta natura del "fondato rischio", l'eccezione di cui all'articolo 13, lettera b), della Convenzione dell'Aia riguardava solo le situazioni che vanno oltre ciò che un minore potrebbe ragionevolmente tollerare. Nel caso di specie, la ricorrente aveva presentato alla corte d'appello lettone un certificato rilasciato da uno psicologo attestante che la minore avrebbe potuto subire un trauma qualora fosse stata immediatamente separata dalla madre. Benché spettasse ai giudici nazionali verificare l'esistenza di un "fondato rischio" per la minore e la perizia psicologica fosse direttamente collegata all'interesse superiore della minore, il tribunale regionale si era rifiutato di esaminare le conclusioni di tale perizia alla luce delle disposizioni dell'articolo 13, lettera b), della Convenzione dell'Aia. Al tempo stesso, i giudici nazionali non avevano valutato se per la madre fosse possibile seguire la figlia in Australia e intrattenere contatti con lei. I giudici nazionali non avevano preso effettivamente in considerazione le affermazioni della ricorrente e, di conseguenza, il processo decisionale previsto dalla legge lettone non aveva rispettato i requisiti procedurali prescritti dall'articolo 8 della CEDU e la ricorrente aveva subito un'ingerenza sproporzionata nel suo diritto al rispetto della propria vita familiare.

Ogni minore ha diritto al rispetto della vita familiare, un diritto riconosciuto ai sensi dell' articolo 7 della Carta dei diritti fondamentali dell'UE e dell'articolo 8 della Convenzione europea dei diritti dell'uomo (CEDU) (cfr. il capitolo 5). Sia la legislazione dell'UE sia il diritto del Consiglio d'Europa riflettono l'importanza delle relazioni familiari per il minore, fra cui rientra anche il diritto del minore a non essere privato del contatto con i genitori, a meno che ciò non sia contrario al suo interesse superiore.[191] È difficile trovare il giusto equilibrio tra l'intento di garantire la permanenza del minore presso la famiglia d'origine (in linea con il rispetto della vita familiare) e l'esigenza di tutelare la sua integrità personale. Quando è allontanato dalla sua famiglia, un minore può essere collocato in affidamento o in accoglienza residenziale. La vita familiare non si conclude con questa separazione e richiede il mantenimento dei contatti allo scopo di sostenere il ricongiungimento familiare qualora ciò risponda all'interesse superiore del minore. In talune circostanze si procederà all'allontanamento permanente attraverso l'adozione. Ai fini dell'adozione è necessario rispettare rigorosi requisiti.

Obiettivo del presente capitolo è quello di esaminare il diritto europeo in materia di accoglienza alternativa. Il diritto dell'UE, principalmente attraverso il

191 UE (2012), Carta dei diritti fondamentali dell'Unione europea (GU C 326 del 26.10.2012), articolo 24, paragrafo 3.

regolamento Bruxelles II *bis*, si occupa degli aspetti procedurali transfrontalieri connessi al collocamento dei minori in accoglienza eterofamiliare. Il suddetto regolamento deve essere interpretato conformemente alla Carta dei diritti fondamentali dell'UE, in particolare l'articolo 24. La Corte EDU ha a sua volta sviluppato un ampio *corpus* giurisprudenziale riguardo alle questioni sia sostanziali che procedurali inerenti il collocamento dei minori in accoglienza eterofamiliare.

Il paragrafo 6.1 inizia introducendo alcuni dei principi generali che disciplinano la situazione dei minori privati dell'assistenza familiare, il paragrafo 6.2 illustra la legislazione concernente il collocamento del minore in accoglienza eterofamiliare e il paragrafo 6.3 esamina le norme europee in materia di adozione.

6.1. Accoglienza alternativa: principi generali

Punti salienti

- L'accoglienza eterofamiliare è una misura di protezione temporanea.
- Il diritto internazionale conferma che l'accoglienza su modello familiare deve essere privilegiata rispetto all'accoglienza residenziale.
- I minori hanno diritto ad essere informati e ad esprimere il loro parere riguardo al collocamento in accoglienza eterofamiliare.

Nell'ambito del diritto dell'UE, del Consiglio d'Europa e del diritto internazionale, considerati nel loro complesso, emergono sei ampi principi riguardanti l'accoglienza eterofamiliare.

Innanzitutto, l'accoglienza eterofamiliare è una misura di protezione che garantisce la sicurezza temporanea dei minori e ne agevola il ritorno presso le loro famiglie, ove possibile.[192] Idealmente, quindi, si configura come una soluzione temporanea. Talvolta si tratta invece di una misura di protezione in attesa del

192 ONU, Assemblea generale, *Linee guida dell'ONU sull'accoglienza eterofamiliare*, 24 febbraio 2010, A/RES/64/142, punti 48–51; ONU, Comitato sui diritti dell'infanzia (2013), *Commento generale n. 14 (2014), Il diritto del minore a che il suo interesse superiore sia tenuto in primaria considerazione (articolo 3, paragrafo 1)*, documento ONU CRC/C/GC/14, 29 maggio 2013, paragrafi 58–70.

ricongiungimento familiare, per esempio dei minori migranti separati o non accompagnati dalle loro famiglie.[193] In altri casi è una misura di protezione attuata in attesa di sviluppi nell'ambito della vita familiare, per esempio di miglioramenti della salute di un genitore o di disposizione di sostegno ai genitori.

In secondo luogo, il diritto internazionale conferma che l'accoglienza sul modello familiare (ad esempio, l'affidamento) è la forma ottimale di accoglienza alternativa al fine di garantire la protezione e lo sviluppo dei minori, come affermano le Linee guida dell'ONU sull'accoglienza eterofamiliare e la Convenzione dell'ONU sui diritti delle persone con disabilità (CRPD), di cui l'UE è parte.[194] La convenzione CRPD afferma espressamente che "gli Stati parti s'impegnano, qualora i familiari più stretti non siano in condizioni di prendersi cura di un minore con disabilità, a non tralasciare alcuno sforzo per assicurare una sistemazione alternativa all'interno della famiglia allargata e, ove ciò non sia possibile, all'interno della comunità in un contesto familiare".[195] L'accoglienza eterofamiliare (ad esempio l'accoglienza residenziale) "dovrebbe essere limitata ai casi dove tale opzione risulti appropriata, necessaria e costruttiva per il bambino coinvolto e per i suoi interessi".[196]

In terzo luogo, il diritto del minore ad avere un tutore o un rappresentante è fondamentale al fine di tutelare i suoi diritti più ampi.[197] Benché il diritto dell'Unione non preveda espressamente l'obbligo generale di nominare un tutore per i minori privati dell'assistenza genitoriale, sono almeno sette le direttive dell'UE che impongono la nomina, da parte degli Stati membri, di un tutore per i minori in contesti differenti, alcuni dei quali riguardano direttamente i minori privati dell'assistenza genitoriale.[198] Tale *corpus* giurisprudenziale è peraltro corroborato dalle Linee guida dell'ONU sull'accoglienza eterofamiliare (riguardanti, in ge-

nerale, i minori privati dell'assistenza genitoriale), dalla CRC (specialmente per quel che riguarda i minori non accompagnati) e dalla Convezione del Consiglio d'Europa sulla lotta contro la tratta di esseri umani.[199] Nella maggior parte dei casi il ruolo di un tutore legale è salvaguardare l'interesse superiore del minore, tutelare il suo benessere generale e integrare la sua limitata capacità giuridica (e, talvolta, anche esercitare la rappresentanza legale).[200]

In quarto luogo, l'articolo 24 della Carta dei diritti fondamentali dell'UE comporta implicitamente l'obbligo giuridico di adottare misure positive volte a garantire che il processo decisionale sul collocamento di un minore sia orientato dal principio del suo interesse superiore[201] e dalle sue opinioni.[202] I commenti generali numero 5 e 14 del comitato sui diritti dell'infanzia,[203], al pari delle Linee guida dell'ONU sull'accoglienza eterofamiliare, sottolineano la necessità di garantire sia il diritto del minore di essere informato, riguardo anche ai suoi diritti e alle opzioni a sua disposizione, sia il diritto del bambino "di essere consultato e di vedere la propria volontà presa in considerazione, nel rispetto delle sue capacità".[204]

In quinto luogo, i più ampi diritti dei minori sanciti dalla Carta dei diritti fondamentali dell'UE, dalla CEDU e dalla CRC rimangono applicabili anche ai casi di accoglienza eterofamiliare (affidamento o accoglienza residenziale). In quest'ambito rientrano i loro diritti civili e politici (ovvero i loro diritti al rispetto della vita privata, alla libertà di espressione e alla libertà di religione e alla protezione da tutte

le forme di violenza) nonché i loro diritti socioeconomici (compresi i loro diritti all'istruzione, all'assistenza sanitaria e alla partecipazione alla vita culturale).[205]

Infine, l'articolo 4 della CRC prevede che gli Stati adottino "tutti i provvedimenti legislativi, amministrativi e altri" per attuare la convenzione. Tale prescrizione si applica anche al contesto dell'accoglienza eterofamiliare. Analogamente, l'articolo 17, paragrafo 1, lettera c), della Carta sociale europea (CSE) riveduta prevede che le parti prendano tutte le misure necessarie e appropriate miranti ad assicurare una protezione e un aiuto speciali nei confronti del bambino o dell'adolescente, temporaneamente o definitivamente privato del suo sostegno familiare.

Nell'ambito del diritto dell'UE, la CGUE ha stabilito che il regolamento Bruxelles II *bis* si applica alle decisioni di collocare un minore in accoglienza eterofamiliare. Come osservato al capitolo 5, il regolamento Bruxelles II bis integra nel suo approccio i principi sui diritti dei minori, sottolineando che occorre tenere in considerazione, tra l'altro, la necessità di garantire parità di condizioni a tutti i minori, l'interesse superiore del minore e il suo diritto di essere ascoltato.[206] A tale proposito, i "motivi di non riconoscimento delle decisioni relative alla responsabilità genitoriale", quali enunciati all'articolo 23 del regolamento Bruxelles II *bis*, sono rivelatori. L'articolo 23 stipula che le decisioni non sono riconosciute nei casi seguenti:

> *"(a) se, tenuto conto dell'interesse superiore del minore, il riconoscimento è manifestamente contrario all'ordine pubblico dello Stato membro richiesto; (b) se, salvo i casi d'urgenza, la decisione è stata resa senza che il minore abbia avuto la possibilità di essere ascoltato, in violazione dei principi fondamentali di procedura dello Stato membro richiesto [...]."*

Ai sensi del regolamento, la competenza giurisdizionale è determinata sulla base della residenza abituale del minore, con alcune limitate eccezioni, tra cui l'interesse superiore del minore (articoli 8, 12 e 15 del regolamento Bruxelles II *bis*).

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU afferma che la famiglia è l'ambiente naturale per la crescita e il benessere dei minori. Tuttavia, qualora

205 Carta dei diritti fondamentali dell'Unione europea, articoli 3–4, 7, 10–11, 14 e 24; CEDU, in particolare l'articolo 8; e CRC, articoli 13–14, 16, 19, 28, 29, 24, 31 e 37; ONU, Assemblea generale (2010), *Linee guida dell'ONU sull'accoglienza eterofamiliare*, 24 febbraio 2010, A/RES/64/142, sezione 2.

206 Regolamento Bruxelles II *bis*, preambolo. Cfr. anche il capitolo 5.

la famiglia non possa fornire al minore l'accoglienza e la protezione richieste, potrebbe rendersi necessario affidare il bambino all'accoglienza alternativa. Tale allontanamento del minore dalla famiglia costituisce un'ingerenza nel diritto al rispetto della vita familiare. La Corte EDU ha spiegato che nella maggior parte dei casi il collocamento di un minore in un contesto di assistenza eterofamiliare deve essere inteso come una misura temporanea e che, in ultima analisi, il minore deve ricongiungersi alla sua famiglia in osservanza del diritto al rispetto della vita privata e familiare di cui all'articolo 8 della CEDU.[207]

Benché la CEDU non imponga agli Stati l'obbligo specifico di fornire ai minori accoglienza e protezione, l'articolo 17 della CSE prevede che le parti prendano "tutte le misure necessarie e appropriate miranti ad assicurare una speciale protezione e l'aiuto dello Stato nei confronti del bambino o dell'adolescente, temporaneamente o definitivamente privato del suo sostegno familiare".[208]

6.2. Collocamento dei minori in accoglienza eterofamiliare

Punti salienti

- Nell'ambito del diritto del Consiglio d'Europa, il collocamento di un minore in un contesto di accoglienza eterofamiliare deve essere previsto dalla legge, perseguire un obiettivo legittimo ed essere necessario in una società democratica. L'autorità competente deve addurre motivazioni pertinenti e sufficienti.
- Nell'ambito del diritto del Consiglio d'Europa, il processo decisionale deve attenersi a determinate garanzie procedurali.

Nell'ambito del diritto del Consiglio d'Europa,[209] il collocamento del minore in un contesto di accoglienza eterofamiliare è compatibile con l'articolo 8 della CEDU

207 Corte EDU, sentenza 14 gennaio 2003, *K.A. c. Finlandia* (n. 27751/95). Il comitato dei ministri del Consiglio d'Europa ha avallato tale approccio nella sua raccomandazione in merito ai diritti dei minori che vivono in istituti di custodia, adottata il 16 marzo 2005.

208 Consiglio d'Europa, Carta sociale europea (riveduta), STE n. 163, 1996, articolo 17, paragrafo 1, lettera c).

209 Il collocamento dei minori in contesti di accoglienza eterofamiliare è inoltre oggetto di dibattito politico in seno al Consiglio d'Europa da molti anni. Cfr., ad esempio, la risoluzione (77)33 del comitato dei ministri sull'affidamento dei minori, adottata il 3 novembre 1977.

solo quando è conforme alla legge, persegue un obiettivo legittimo (quale la protezione dell'interesse superiore del minore) ed è considerato necessario in una società democratica. Quest'ultimo aspetto prevede che i giudici forniscano motivazioni sia pertinenti che sufficienti a sostegno dei mezzi utilizzati per il conseguimento dell'obiettivo perseguito.

Esempio: nel caso *Olsson c. Svezia (n. 1)*,[210] i ricorrenti avevano presentato ricorso riguardo alla decisione di collocare i loro tre figli al di fuori della famiglia. Ritenendo che la decisione sull'affidamento rientrasse nell'ambito del margine di apprezzamento dello Stato, la Corte EDU si era concentrata sulle modalità di esecuzione dell'ordinanza di collocamento. A parere della Corte, la decisione sull'affidamento avrebbe dovuto essere considerata una misura temporanea, da sospendere non appena le circostanze lo avessero permesso, giacché l'adozione non era contemplata. Le misure prese avrebbero pertanto dovuto essere coerenti con l'obiettivo ultimo di riunire la famiglia naturale. In tale ottica, la Corte EDU aveva osservato che le autorità nazionali avevano collocato i minori presso famiglie affidatarie separate, a una distanza considerevole gli uni dagli altri e dai genitori. Sebbene le autorità avessero agito in buona fede nell'esecuzione dell'ordinanza di collocamento, la Corte ha ritenuto inaccettabile che il luogo in cui sarebbero stati collocati i minori fosse stato determinato da difficoltà amministrative quali la mancanza di famiglie affidatarie adeguate o di contesti di accoglienza eterofamiliare appropriati. In un ambito così essenziale come il rispetto della vita familiare, tali considerazioni non potevano svolgere che un ruolo secondario. Di conseguenza, nel rilevare una violazione dell'articolo 8 della CEDU, la Corte EDU ha dichiarato che le misure adottate dalle autorità nell'esecuzione dell'ordinanza di collocamento non erano suffragate da motivazioni sufficienti a renderle proporzionate al legittimo scopo perseguito ai sensi dell'articolo 8.

Più di recente, la Corte EDU si è pronunciata sul merito delle decisioni di collocare i minori in contesti di accoglienza eterofamiliare ai sensi dell'articolo 8 della CEDU.

210 Corte EDU, sentenza 24 marzo 1988, *Olsson c. Svezia (n. 1)* (n.10465/83).

Esempio: nel caso *Wallová e Walla c. Repubblica ceca*[211] i ricorrenti avevano presentato ricorso riguardo al collocamento dei loro cinque figli in due diversi centri di accoglienza per minori, determinato dall'inadeguatezza della loro abitazione. I bambini erano stati affidati ai centri di accoglienza nel 2002 sulla base dell'instabilità economica dei genitori e le ordinanze di collocamento erano state revocate quando la loro situazione economica e abitativa era migliorata. La Corte EDU ha rilevato che la decisione di collocare i minori al di fuori della famiglia era stata determinata dalla mancanza di un'abitazione adeguata e che, di conseguenza, avrebbe potuto essere adottata una misura meno drastica per affrontare la loro situazione. Il diritto ceco prevedeva la possibilità di monitorare le condizioni di vita e di igiene della famiglia e di fornirle consigli sul modo di migliorare la situazione, ma questa opzione non era stata utilizzata. Pur essendo pertinenti, le motivazioni addotte per collocare i minori al di fuori della famiglia non erano sufficienti e le autorità non si erano impegnate abbastanza per aiutare i ricorrenti a superare le loro difficoltà con misure alternative. Nel concludere che era stato violato l'articolo 8 della CEDU, la Corte aveva inoltre preso atto delle conclusioni del comitato sui diritti dell'infanzia dell'ONU, il quale aveva osservato che il principio della considerazione preminente dell'interesse superiore del minore non era ancora stato adeguatamente definito e tradotto in tutte le normative, le sentenze e le politiche ceche riguardanti i minori.

Esempio: nel caso *Saviny c. Ucraina*,[212] i figli dei ricorrenti erano stati collocati al di fuori della famiglia a causa della mancanza di mezzi finanziari dei genitori e sulla scorta della conclusione del giudice nazionale, secondo cui le loro caratteristiche personali mettevano in pericolo la vita, la salute e l'educazione morale dei figli. Nell'esaminare il caso, la Corte EDU aveva messo in discussione l'adeguatezza degli elementi di prova sui quali le autorità nazionali avevano basato le loro conclusioni e aveva ritenuto insufficienti le informazioni disponibili sul livello di assistenza sociale offerto. Tali informazioni sarebbero state pertinenti al fine di valutare se le autorità avessero assolto il compito di tenere unita la famiglia e se avessero esaminato a sufficienza l'efficacia di alternative meno drastiche prima di cercare di separare i figli dai loro genitori. Inoltre, i minori non erano stati ascol-

211 Corte EDU, sentenza 26 ottobre 2006, *Wallová e Walla c. Repubblica ceca* (n. 23848/04) (consultabile in francese).

212 Corte EDU, sentenza 18 dicembre 2008, *Saviny c. Ucraina* (n. 39948/06).

tati dai giudici in alcuna fase del procedimento. In sintesi, benché fossero pertinenti, le motivazioni fornite dalle autorità nazionali per giustificare l'allontanamento dei figli dei ricorrenti non erano sufficienti a legittimare tale grave ingerenza nella vita familiare dei ricorrenti. La Corte ha concluso asserendo che vi era stata una violazione dell'articolo 8 della CEDU.

Ai sensi dell'articolo 8 della CEDU, la Corte EDU prevede che il processo decisionale riguardante il rispetto della vita familiare osservi talune garanzie procedurali. Essa afferma che il processo decisionale (procedimenti amministrativi e giudiziari) che comporta l'adozione di misure di ingerenza nella vita familiare deve essere equo e assicurare il dovuto rispetto degli interessi tutelati dall'articolo 8. Ai sensi dell'articolo 8 si esamina se "i genitori siano stati coinvolti nel processo decisionale [...] in misura sufficiente a garantire la necessaria protezione dei loro interessi".[213] Coinvolgere i genitori significa, tra l'altro, aggiornarli periodicamente sugli sviluppi, garantire che possano partecipare alle decisioni che li riguardano[214] e, in talune circostanze, ascoltare i minori interessati.[215]

Esempio: nel caso *B. c. Romania (n. 2)*,[216] la ricorrente era stata più volte sottoposta a trattamenti presso istituti psichiatrici nei quali era stata condotta dalla polizia in seguito alla diagnosi di schizofrenia paranoide. I suoi figli non vivevano più con lei ed erano stati collocati in un centro di accoglienza a causa della malattia della madre. La Corte EDU doveva stabilire se, considerata la serietà delle decisioni da adottare riguardo al collocamento dei minori al di fuori della famiglia, nel complesso il processo decisionale garantisse in misura sufficiente la necessaria protezione degli interessi dei genitori. A tale proposito, la Corte ha osservato che alla ricorrente, che soffriva di un grave disturbo mentale, non erano stati assegnati né un avvocato né un curatore che la rappresentassero durante il procedimento e, di conseguenza, per lei era stato impossibile partecipare al processo decisionale riguardante il collocamento dei figli minorenni. Inoltre, nel corso dei 12 anni precedenti al raggiungimento della maggiore età da parte dei due minori, la situazione della ricorrente e quella dei suoi figli erano state esaminate solo due volte da un giudice e non esistevano prove che

214 Corte EDU, sentenza 19 febbraio 2013, *B. c. Romania (n. 2)* (n. 1285/03); Corte EDU, sentenza 14 marzo 2013, *B.B. e F.B. c. Germania* (nn. 18734/09 e 9424/11).

215 Corte EDU, sentenza 24 febbraio 1995, *McMichael c. Regno Unito* (n. 16424/90).

216 Corte EDU, sentenza 19 febbraio 2013, *B. c. Romania (n. 2)* (n. 1285/03).

fossero intercorsi contatti periodici tra gli assistenti sociali e la ricorrente, che avrebbero altrimenti rappresentato uno strumento atto a illustrarne il parere alle autorità. Alla luce delle suddette constatazioni, la Corte ha concluso che il processo decisionale riguardante il collocamento in accoglienza eterofamiliare dei figli della ricorrente non aveva adeguatamente protetto i suoi interessi e, pertanto, erano stati violati i suoi diritti ai sensi dell'articolo 8 della CEDU.

Esempio: nel caso *B.B. e F.B. c. Germania*,[217] in seguito alle affermazioni della figlia dodicenne dei ricorrenti, secondo cui lei e il fratello di otto anni erano stati ripetutamente picchiati dal padre, la potestà genitoriale sui due figli era stata trasferita al tribunale dei minori e i bambini erano stati collocati in un centro di accoglienza per i minori. Il tribunale distrettuale aveva pronunciato una sentenza piena che trasferiva la potestà genitoriale dai ricorrenti all'Ufficio della gioventù, basando la sua decisione sulle testimonianze dirette dei minori. Circa un anno dopo, in occasione del primo incontro successivo con i genitori, la ragazzina aveva ammesso di avere mentito riguardo alle percosse subite e i figli erano stati infine restituiti ai genitori. Nel valutare la doglianza dei ricorrenti, secondo cui le autorità non avevano esaminato adeguatamente i fatti pertinenti, la Corte EDU ha sottolineato che un'errata valutazione da parte dei professionisti non implicava necessariamente che le misure adottate fossero incompatibili con l'articolo 8 della CEDU. La decisione riguardante il collocamento dei minori poteva essere valutata solo alla luce della situazione illustrata a suo tempo alle autorità nazionali. Nell'ambito della sua valutazione, la Corte EDU ha ritenuto significativo sia che il tribunale distrettuale si fosse basato solo sulle dichiarazioni dei minori, sebbene i ricorrenti avessero presentato perizie mediche dalle quali non emergeva alcun segno di maltrattamento, sia che la Corte d'appello non avesse riascoltato i minori. Poiché all'epoca dell'udienza di merito i minori erano stati collocati al sicuro fuori dalla famiglia, non sussisteva una situazione d'urgenza e i giudici avrebbero potuto avviare un'indagine d'ufficio sui fatti in questione, atto che invece non avevano compiuto. In sintesi, i giudici tedeschi non avevano addotto motivi sufficienti per giustificare la loro decisione di revocare la potestà genitoriale dei ricorrenti, in violazione dell'articolo 8 della CEDU.

217 Corte EDU, sentenza 14 marzo 2013, *B.B. e F.B. c. Germania* (nn. 18734/09 e 9424/11).

Anche quando sono collocati in contesti di accoglienza eterofamiliare, i bambini conservano il diritto di intrattenere contatti con i loro genitori. Tale diritto è stato riconosciuto ai sensi della CEDU.[218] La Corte EDU afferma infatti che i contatti reciproci tra genitori e figli costituiscono un elemento fondamentale della vita familiare ai sensi dell'articolo 8. Poiché il collocamento del minore in un contesto di accoglienza eterofamiliare dovrebbe di norma costituire una misura temporanea, il mantenimento delle relazioni familiari è essenziale al fine di garantire l'effettivo ricongiungimento del minore con la loro famiglia.[219] Ai sensi della CEDU, da tali principi scaturiscono obblighi positivi, quali evidenziati dai casi illustrati di seguito.

Esempio: nel caso *T. c. Repubblica ceca*,[220] la Corte EDU ha esaminato se i diritti di un padre e di una figlia (ricorrenti) fossero stati violati dal collocamento in accoglienza eterofamiliare della minore e si è inoltre pronunciata sul mancato impegno delle autorità a favorire i contatti tra i due. La minore era stata collocata in un istituto specializzato in seguito alla morte della madre e dopo che le domande del padre per ottenerne l'affidamento erano state respinte a causa delle preoccupazioni sulla personalità di quest'ultimo. Successivamente, quando aveva chiesto di trascorrere le vacanze con la figlia, questa possibilità gli era stata negata; inoltre, quando un centro terapeutico aveva concluso che le visite non giovavano alla bambina poiché la figlia aveva paura di lui, era terminato ogni contatto. In seguito i giudici avevano stabilito che i due ricorrenti avrebbero potuto intrattenere contatti solo per iscritto, conformemente al volere della bambina. La Corte EDU ha evidenziato tra l'altro l'interesse del minore a mantenere legami con la famiglia, fuorché in casi particolarmente estremi in cui ciò sia contrario al suo interesse superiore. Nell'esaminare la decisione di collocare la minore in un contesto di accoglienza eterofamiliare, la Corte EDU ha constatato con soddisfazione che le autorità nazionali avevano ponderato attentamente la loro decisione, adottata dopo aver esaminato perizie psicologiche e psichiatriche e avere tenuto conto del volere della bambina. Per quanto riguarda la decisione di collocare in accoglienza eterofamiliare la bambina, non era pertanto stato violato l'articolo 8 della CEDU. La Corte ha aggiunto che l'articolo 8 era però stato violato a seguito delle restrizioni imposte ai contatti tra i ricorrenti, in particolare a causa della scarsa lungimiranza delle decisioni di negare i contatti con il padre da parte dell'istituto

218 Corte EDU, sentenza 24 marzo 1988, *Olsson c. Svezia (n. 1)* (n. 10465/83).

219 Corte EDU, sentenza 22 giugno 1989, *Eriksson c. Svezia* (n. 11373/85).

residenziale presso cui era collocata la bambina, poiché, in ultima analisi, tali decisioni riducevano le possibilità di un ricongiungimento familiare.

Esempio: nel caso *K.A. c. Finlandia*,[221] i figli del ricorrente erano stati affidati all'accoglienza alternativa in seguito al sospetto che fossero stati oggetto di abusi sessuali. Durante il collocamento dei minori al di fuori della famiglia, i contatti intercorsi tra loro e i genitori erano stati scarsi ed erano stati compiuti pochi sforzi per pianificare il loro ricongiungimento. Nell'esaminare il caso, la Corte EDU ha osservato che lo Stato aveva l'obbligo positivo di favorire il ricongiungimento familiare non appena fosse stato ragionevolmente possibile, tenendo conto dell'obbligo di proteggere l'interesse superiore del minore. Secondo la Corte EDU, le rigorose restrizioni al diritto del ricorrente di fare visita ai figli riflettevano l'intenzione dell'ente di assistenza sociale di rafforzare i legami tra i minori e la famiglia affidataria anziché di ricongiungerli alla famiglia d'origine. Tale decisione era stata adottata nonostante fosse stato rilevato un miglioramento nella situazione del padre. La Corte ha riscontrato una violazione dell'articolo 8 CEDU.

6.3. Adozione

Punti salienti

- L'adozione garantisce il collocamento in accoglienza eterofamiliare ai minori che non possono rimanere con le loro famiglie biologiche.
- L'interesse superiore del minore deve essere considerato preminente nell'ambito dell'adozione.
- Né l'UE né il Consiglio d'Europa sanciscono il diritto all'adozione, ma, per rispondere all'interesse superiore del minore, il processo di adozione deve rispettare determinati criteri.[222]

Per quanto riguarda il diritto internazionale, l'interesse superiore del minore deve essere considerato preminente nei casi di adozione. Oltre al principio dell'interesse superiore, anche altri principi generali della CRC ne orientano e informano l'attuazione nel contesto dell'adozione: la non discriminazione, il diritto alla

221 Corte EDU, sentenza 14 gennaio 2003, *K.A. c. Finlandia* (n. 27751/95).

222 In merito all'interesse del minore a conoscere le proprie origini nel contesto dell'adozione, cfr. il capitolo 4.

vita, la sopravvivenza e lo sviluppo nonché il rispetto delle opinioni dei minori.[223] Particolarmente pertinente è il commento generale n. 14 del comitato sui diritti dell'infanzia dell'ONU sul "diritto del minore a che il suo interesse superiore sia tenuto in primaria considerazione".[224]

Analogamente, uno degli obiettivi della Convenzione dell'Aia sulla protezione dei minori e la cooperazione in materia di adozione internazionale è "di stabilire delle garanzie, affinché le adozioni internazionali si facciano nell'interesse superiore del minore e nel rispetto dei diritti fondamentali che gli sono riconosciuti nel diritto internazionale".[225]

Nell'ambito del diritto dell'UE, i diritti e gli obblighi giuridici associati di cui all'articolo 24 della Carta dei diritti fondamentali dell'UE sono applicabili all'adozione nella misura in cui siano contemplati dall'UE.

Nell'ambito del diritto del Consiglio d'Europa, il diritto al rispetto della vita familiare sancito all'articolo 8 della CEDU è applicabile e invocato nei casi di adozione. Sull'argomento esistono anche due convenzioni specifiche del Consiglio d'Europa: la Convenzione europea sull'adozione dei minori[226] e la Convenzione europea sull'adozione dei minori (riveduta).[227] Tali strumenti richiedono un approccio all'adozione basato sui diritti dei minori. La Convenzione europea sull'adozione dei minori (riveduta), per esempio, stipula che "[l]'autorità competente autorizza l'adozione solo qualora sia appurato che l'adozione risponderà all'interesse superiore del minore".[228] Analogamente, la Corte EDU sottolinea che, in talune circostanze, tra cui l'adozione, l'interesse superiore del minore può prevalere su quello del genitore.[229] La Convenzione europea sull'adozione dei minori (rivedu-

ta) prescrive inoltre che l'adozione non sia autorizzata dall'autorità competente senza "il consenso del minore ritenuto dotato di una sufficiente capacità di discernimento secondo le disposizioni del diritto interno".[230] Inoltre, qualora non sia considerato dotato della sufficiente capacitàˆ di discernimento, il minore sarà "per quanto possibile, consultato e saranno presi in considerazione il suo volere e le sue opinioni tenendo conto del suo grado di maturità".[231]

Esempio: nel caso *Pini e altri c. Romania*,[232] due coppie italiane avevano presentato ricorso poiché le autorità rumene non avevano dato esecuzione alla decisione di un giudice rumeno riguardo alla loro adozione di due bambini rumeni. In violazione dei provvedimenti del giudice, l'istituto privato presso cui i bambini risiedevano in Romania si era rifiutato di consegnarli ai ricorrenti. La Corte EDU ha stabilito che la relazione tra i ricorrenti e i loro figli adottivi rientrava nella sfera della vita familiare ai sensi dell'articolo 8 della CEDU anche se non avevano mai vissuto insieme né avevano instaurato legami emotivi. Nell'esaminare il caso, la Corte EDU ha interpretato l'articolo 8 alla luce della CRC e della Convenzione dell'Aia, rilevando che l'obbligo positivo delle autorità di fare in modo che i ricorrenti fossero in grado di instaurare legami familiari con i loro figli adottivi era limitato dall'interesse superiore del minore.[233] A tale proposito, la Corte ha stabilito che, a seconda della sua natura e gravità, l'interesse del minore può prevalere su quello del genitore. Inoltre, nel non riscontrare alcuna violazione dell'articolo 8, la Corte ha sottolineato che, in una relazione basata sull'adozione, è importante che l'interesse superiore del minore prevalga su quello dei genitori, poiché la finalità dell'adozione è donare una famiglia a un bambino, non un bambino a una famiglia.[234]

Esempio: nel caso *Kearns c. Francia*,[235] la Corte EDU ha ritenuto compatibile con la CEDU il fatto che una donna irlandese, che aveva autorizzato l'adozione della figlia in Francia, non potesse revocare il suo consenso formale all'adozione allo scadere di un periodo di due mesi. La Corte EDU ha

233 *Ibid.*, punto 155.

234 *Ibid.*, punto 156.

235 Corte EDU, sentenza 10 gennaio 2008, *Kearns c. Francia* (n. 35991/04).

innanzitutto sottolineato che il rifiuto opposto dalle autorità nazionali alla richiesta di restituzione della bambina perseguiva il legittimo obiettivo di proteggere le libertà e i diritti altrui, nel caso di specie quelli della bambina.[236] Quanto all'imposizione di un limite temporale per la revoca del consenso, la normativa francese era finalizzata a conseguire un giusto equilibrio e a garantire la proporzionalità tra gli interessi concorrenti della madre biologica, della bambina e della famiglia adottiva. In tale processo, doveva essere considerato preminente l'interesse superiore della minore.[237] Dagli elementi di prova presentati alla Corte è emerso che era nell'interesse superiore della minore beneficiare quanto più rapidamente possibile di relazioni stabili all'interno di una nuova famiglia ed erano state adottate tutte le misure necessarie affinché la ricorrente comprendesse le implicazioni esatte del suo gesto. Alla luce delle suddette considerazioni, la Corte ha stabilito che la Francia aveva ottemperato ai suoi obblighi positivi nei confronti della ricorrente ai sensi dell'articolo 8 della CEDU.

La Corte EDU ha inoltre affermato che il processo decisionale in materia di adozione deve essere attuato coerentemente al divieto di discriminazione di cui all'articolo 14 della CEDU. In particolare, la Corte EDU ha esaminato se l'esclusione dei ricorrenti dall'ammissibilità all'adozione sulla base dell'orientamento sessuale o dell'età fosse compatibile con l'articolo 14 in combinato disposto con l'articolo 8. Nell'ambito di tale valutazione ha ribadito che il dovere di adottare misure proporzionate al fine di proteggere l'interesse superiore del minore ha un'importanza fondamentale.

Esempio: nel caso *Schwizgebel c. Svizzera*,[238] alla ricorrente, una donna non coniugata di 47 anni, era stata negata la possibilità di adottare un secondo bambino sulla base della differenza di età tra lei e il minore che intendeva adottare. La ricorrente sosteneva di essere stata discriminata sulla base dell'età. La Corte EDU ha ritenuto che, nel caso della ricorrente, la decisione di non autorizzare l'adozione perseguiva il legittimo obiettivo di proteggere il benessere e i diritti del minore.[239] Considerati la mancanza di un consenso europeo riguardo al diritto di adozione da parte di un genitore non coniugato, i limiti inferiori e superiori d'età degli adottanti e la differenza

236 *Ibid.*, punto 73.

237 *Ibid.*, punto 79.

239 *Ibid.*, punto 86.

d'età tra l'adottante e il minore e il conseguente ampio margine di apprezzamento dello Stato in quest'ambito, nonché la necessità di tutelare l'interesse superiore dei minori, il rifiuto di autorizzare l'adozione di un secondo bambino non violava il principio della proporzionalità.[240] La Corte ha pertanto reputato oggettiva e ragionevole la giustificazione fornita dal governo e ha ritenuto che la disparità di trattamento lamentata dalla ricorrente non fosse stata discriminatoria ai sensi dell'articolo 14 della CEDU.

Esempio: il caso *E.B. c. Francia*[241] riguarda il rifiuto delle autorità nazionali di concedere l'autorizzazione all'adozione alla ricorrente, una donna lesbica convivente con la compagna, intenzionata ad adottare un bambino in qualità di persona non coniugata.[242] La Corte ha ribadito che, di per sé, l'articolo 8 della CEDU non conferiva il diritto né di costituire una famiglia né di adottare. Un ricorso per discriminazione poteva tuttavia rientrare nel più vasto campo di applicazione di un determinato diritto, anche nel caso in cui l'oggetto della questione non riguardasse uno specifico diritto conferito dalla CEDU.[243] Poiché il diritto francese consentiva l'adozione di un minore da parte di un soggetto non sposato, tale diritto non poteva essere negato a una persona per motivi discriminatori. Come stabilito dai giudici nazionali, la ricorrente presentava delle qualità umane ed educative incontestabili, il che serviva sicuramente l'interesse superiore del minore, nozione chiave degli strumenti internazionali rilevanti.[244] A parere della Corte, l'orientamento sessuale della ricorrente aveva svolto un ruolo determinante nel rifiuto delle autorità di concederle l'autorizzazione all'adozione, decisione che aveva comportato un trattamento discriminatorio rispetto ad altre persone non sposate aventi il diritto di adottare ai sensi della normativa nazionale.[245]

Esempio: nel caso *Gas e Dubois c. Francia*[246] la Corte doveva stabilire se le coppie omosessuali avessero lo stesso diritto all'adozione coparentale delle coppie eterosessuali. Le ricorrenti erano una coppia omosessuale che

244 *Ibid.*, punto 95.

245 *Ibid.*, punto 96.

246 Corte EDU, sentenza 15 marzo 2012, *Gas e Dubois c. Francia* (n. 25951/07).

aveva contratto un'unione civile. Insieme avevano cresciuto una figlia, che era stata concepita grazie alla procreazione assistita ed era stata data alla luce da una delle due conviventi nel 2000. La domanda di adozione semplice presentata dall'altra convivente era stata respinta perché l'adozione avrebbe privato la madre biologica della bambina dei suoi diritti genitoriali, eventualità che sarebbe stata contraria sia alle intenzioni della ricorrente che all'interesse superiore del minore. Ai sensi del diritto francese, un'adozione semplice non comporta il trasferimento dei diritti dei genitori biologici al genitore adottivo solo nel caso in cui una persona adotti il/la figlio/a del proprio coniuge. Le ricorrenti sostenevano di avere subito un trattamento discriminatorio rispetto alle coppie eterosessuali sia sposate che non sposate. Nell'esaminare se le ricorrenti fossero state discriminate rispetto a una coppia sposata, la Corte EDU ha concluso che il matrimonio conferisce uno status particolare e comporta conseguenze sociali, personali e giuridiche; pertanto, non si poteva affermare che le ricorrenti si trovassero in una situazione significativamente simile a quella delle coppie sposate. Per quanto riguarda il confronto con le coppie eterosessuali non sposate, la Corte ha concluso che, conformemente alle disposizioni dell'ordinamento francese, sarebbe negata l'autorizzazione all'adozione semplice anche a una coppia eterosessuale che abbia contratto un'unione civile in una situazione comparabile. La Corte EDU non ha dunque ravvisato alcuna disparità di trattamento sulla base dell'orientamento sessuale e, di conseguenza, non ha riscontrato alcuna violazione dei diritti delle ricorrenti sanciti dalla convenzione.

Esempio: il caso *X e altri c. Austria*[247] riguarda un ricorso presentato da una coppia omosessuale che era stata discriminata rispetto alle coppie eterosessuali riguardo all'adozione coparentale. La prima e la terza ricorrente vivevano una relazione stabile e la prima ricorrente voleva adottare il secondo ricorrente, che era il figlio della terza ricorrente. Come nel caso *Gas e Dubois*, la Corte EDU non ha ritenuto che la situazione delle ricorrenti fosse assimilabile a quella di una coppia sposata nella quale uno dei coniugi desideri adottare il figlio dell'altro. La Corte EDU ha tuttavia riconosciuto che la situazione delle ricorrenti era assimilabile a quella di una coppia eterosessuale non sposata. Sebbene la legislazione austriaca permetta l'adozione coparentale alle coppie eterosessuali non sposate, il codice civile austriaco stabilisce che chiunque adotti un minore sostituirà il genitore bio-

247 Corte EDU, sentenza 19 febbraio 2013, *X e altri c. Austria* [GC] (n. 19010/07).

logico dello stesso sesso. Questo significa che per le coppie omosessuali è giuridicamente impossibile accedere all'adozione coparentale. La Corte ha concluso che, in tali condizioni, le ricorrenti erano state vittime di una disparità di trattamento a causa del loro orientamento sessuale e che il governo non aveva fornito motivi sufficientemente solidi e convincenti, in violazione dell'articolo 14 in combinato disposto con l'articolo 8 della CEDU.

Infine, la Corte EDU concentra la sua attenzione anche sul merito di attenersi allo spirito e alla finalità del diritto internazionale per quanto riguarda il processo decisionale in materia di adozione.

Esempio: nel caso *Harroudj c. Francia*[248] le autorità francesi avevano respinto l'istanza in cui la ricorrente chiedeva l'adozione piena di una bambina algerina che era stata abbandonata alla nascita e le era stata affidata mediante lo strumento della *kafala* (tutela dei minori ai sensi del diritto islamico). Tale rifiuto era stato motivato dal fatto che il codice civile francese stabilisce che non può essere adottato un minore il cui paese di origine vieta l'adozione (non ammessa dal diritto algerino) e dal fatto che la *kafala* aveva già conferito alla ricorrente la potestà genitoriale che le permetteva di prendere decisioni nell'interesse superiore della minore. Un successivo ricorso era stato respinto poiché l'ordinamento nazionale era conforme alla Convenzione dell'Aia sulla protezione dei minori e la cooperazione in materia di adozione internazionale e poiché l'articolo 20 della CRC riconosceva che la *kafala* tutelava l'interesse superiore del minore al pari dell'adozione. Nell'esaminare il ricorso della ricorrente, la Corte EDU aveva rammentato il principio secondo il quale, una volta instaurato un legame familiare, lo Stato deve agire in modo da permettere a tale legame di svilupparsi e garantire una protezione giuridica che renda possibile l'integrazione del minore nella famiglia, ricordando altresì la necessità di interpretare la CEDU in armonia con i principi generali del diritto internazionale. Nella sua valutazione la Corte EDU ha evidenziato la volontà dei giudici francesi di rispettare lo spirito e la finalità delle convenzioni internazionali, tra cui la Convenzione dell'ONU sui diritti del fanciullo. La *kafala* era riconosciuta nell'ordinamento francese e la ricorrente poteva esercitare la potestà genitoriale e adottare decisioni nell'interesse della minore. Ad esempio, aveva la possibilità di redigere un testamento a favore della bambina, superando le difficoltà derivanti dalle restrizioni all'adozione. In conclusione, ovviando

248 Corte EDU, sentenza 4 ottobre 2012, *Harroudj c. Francia* (n. 43631/09).

in tal modo gradualmente al divieto di adozione, lo Stato convenuto, che intendeva favorire l'integrazione dei minori di origine straniera senza recidere immediatamente il legame con le leggi del Paese d'origine, ha mostrato rispetto nei confronti del pluralismo culturale, garantendo il giusto equilibrio tra l'interesse pubblico e quello della ricorrente. La Corte EDU non ha dunque ravvisato alcuna violazione dei diritti della ricorrente.

7 Protezione dei minori contro la violenza e lo sfruttamento

La protezione dei minori, in senso lato, riguarda tutte le misure concepite per garantire l'esercizio dei diritti dei minori. In senso stretto, si riferisce ai diritti dei minori di vivere protetti da qualsiasi forma di violenza. Il diritto internazionale impone agli Stati l'obbligo di adottare provvedimenti che garantiscano ai minori il beneficio di godere di una protezione adeguata e di provvedere affinché i loro diritti all'integrità fisica e alla dignità siano effettivamente assicurati. Il dovere di protezione dello Stato può assumere varie forme, a seconda dello specifico rischio di violenza cui è esposto un minore e dell'autore di tali violenze. I doveri dello Stato, pertanto, sono più evidenti allorché i minori si trovano sotto l'autorità e il controllo dello Stato, per esempio quando sono affidati a istituti di assistenza pubblici. Ciò avviene quando il rischio di violenza è elevato. Lo Stato potrebbe avere più difficoltà ad adempiere il proprio dovere di protezione quando i minori sono esposti alla violenza di privati, per esempio i familiari.

La principale competenza dell'Unione Europea in questo settore riguarda i reati che presentano una dimensione transnazionale (articolo 83 del Trattato sul Funzionalmento dell'Unione Europea (TFUE)). Per questo motivo sono state emanate specifiche misure legislative in materia di pornografia minorile e tratta degli esseri umani. L'UE ha inoltre adottato una legislazione che obbliga gli Stati membri a configurare come reati varie forme di abuso sessuale. A livello di Consiglio d'Europa, la Convenzione europea dei diritti dell'uomo (CEDU), principalmente tramite gli articoli 2, 3 e 8, esplicita gli obblighi degli Stati in relazione a un ampio ventaglio di atti che costituiscono una forma di violenza contro i minori. Anche il CEDS è intervenuto in questa sfera, attraverso sia la sua procedura di segnalazione sia il meccanismo dei reclami collettivi. Sono inoltre entrate in vigore specifiche convenzioni del Consiglio d'Europa, in particolare la Convenzione del Consiglio d'Europa sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale (Convenzione di Lanzarote),[249] e sono stati costituiti gli organi di vigilanza incaricati di controllarne la messa in atto.

Il presente capitolo analizza gli aspetti specifici della violenza contro i minori e la risposta elaborata dalla comunità internazionale. Il paragrafo 7.1 prende in esame il fenomeno della violenza a casa, a scuola e in altri contesti, e si sofferma su aspetti specifici quali le punizioni corporali, gli abusi e gli episodi di incuria nei confronti dei minori, e la violenza sessuale. Il paragrafo 7.2 si occupa dei casi di sfruttamento di minori che sono contrassegnati da un'evidente dimensione transnazionale, compresi la tratta di esseri umani (finalizzata al lavoro forzato

249 Consiglio d'Europa, Convenzione sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale, STCE n. 201, 25 ottobre 2007.

o allo sfruttamento sessuale), la pornografia minorile e l'adescamento. Infine, il paragrafo 7.3 riporta esempi di abusi di minori in cui le vittime si trovano in situazioni particolarmente vulnerabili.

7.1. Violenza a casa, nelle scuole o in altri contesti

Punti salienti

- Gli Stati hanno l'obbligo di garantire che i minori siano efficacemente protetti da violenze e pregiudizi in qualsiasi contesto.
- Gli Stati sono obbligati a definire un quadro giuridico adeguato a garantire la protezione dei minori.
- Gli Stati devono condurre indagini efficaci a fronte di segnalazioni di presunti abusi/violenze/pregiudizi nei confronti di minori.

Nell'ambito del diritto dell'UE,[250] il principale strumento giuridico in questa sfera, emanato sulla base degli articoli 82 e 83 del TFUE, è la direttiva 2011/93/UE relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile.[251]

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU e il CEDS hanno sviluppato una nutrita giurisprudenza nella sfera della protezione dei minori contro la violenza in tutti i contesti. Inoltre, specifiche convenzioni del Consiglio d'Europa (come la Convenzione di Lanzarote) forniscono dettagliate garanzie a tutela dei minori contro specifiche forme di violenza.

7.1.1. Portata della responsabilità statale

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha passato in esame le più gravi forme di violenza contro i minori previste da vari articoli della CEDU, in particolare gli articoli 2 e 3. La Corte ha individuato chiari obblighi incombenti

250 Direttiva 2011/93/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile (GU L 335 del 17.12.2011, pag. 1).

251 *Ibid.*

agli Stati membri ogniqualvolta un minore sia affidato a istituzioni poste sotto la loro autorità.[252] Analogamente, se una determinata condotta o situazione raggiunge un grado di severità tale da poter essere qualificata come trattamento inumano o degradante ai sensi dell'articolo 3, lo Stato è obbligato a tutelare il minore da maltrattamenti, compresi i trattamenti somministrati da cittadini privati. Casi di negligenza di lungo termine da parte dei genitori,[253] di abusi sessuali ripetuti ad opera di insegnanti,[254] di stupri[255] o di punizioni corporali[256] sono stati riconosciuti come pertinenti all'ambito di applicazione dell'articolo 3 della CEDU.

In caso di decesso, uno Stato può essere considerato responsabile ai sensi dell'articolo 2 della CEDU anche se la morte è stata inflitta da un privato cittadino e non da un pubblico ufficiale. Gli obblighi positivi degli Stati variano da caso a caso, mentre rimane fondamentale l'obbligo di assicurare una protezione *efficace* dei minori contro la violenza. In caso di gravi forme di maltrattamento, gli obblighi positivi comprendono il diritto ad apprestare disposizioni efficaci in ambito penale, che siano sostenute dal sistema di attuazione della legge.[257] Gli Stati devono inoltre adottare misure e salvaguardie speciali per la tutela dei minori.[258]

In più occasioni la Corte EDU si è trovata a esaminare casi concernenti forme di violenza somministrate ai danni di minori da parte di privati cittadini in istituti di istruzione, abitazioni private o altri luoghi gestiti da attori non statali in cui era sorta la questione se potesse configurarsi una responsabilità dello Stato. Ancora più importante è osservare che la Corte ha stabilito che uno Stato non può esimersi dal dovere di tutelare i minori delegando l'amministrazione di importanti servizi pubblici (come l'istruzione) a privati cittadini[259]. Nei casi concernenti la determinazione della responsabilità statale, la Corte EDU solitamente ha tracciato una distinzione tra l'obbligo di tutela generale dello Stato, laddove il rischio non sia chiaramente identificabile, e uno specifico obbligo di tutela, quando la vittima sia chiaramente identificabile. Nel primo caso, la Corte EDU ha verificato

se l'assenza di un intervento statale non abbia determinato un rischio concreto di violenza per la vittima di minore età.

Esempio: il caso *Kayak c. Turchia*[260] riguarda la morte per accoltellamento di un ragazzino di 15 anni per mano di un altro adolescente in prossimità di una scuola. La Corte EDU ha stabilito che tutte le scuole hanno l'obbligo di proteggere gli alunni iscritti da ogni forma di violenza. Nel caso di specie la Corte ha riconosciuto la Turchia responsabile, in forza dell'articolo 2 della CEDU, della mancata protezione del diritto alla vita del figlio e fratello dei ricorrenti, non avendo posto in essere all'epoca alcun sistema di sorveglianza efficace. In assenza di un siffatto sistema, un adolescente è riuscito a impossessarsi di un coltello, sottraendolo alla cucina della scuola, e a utilizzarlo per colpire la vittima.

Esempio: il caso *O'Keeffe c. Irlanda*[261] riguarda gli abusi sessuali commessi negli anni 1970 in una scuola nazionale irlandese. In Irlanda all'epoca le scuole nazionali erano gestite e amministrate dalla Chiesa, ma riconosciute e finanziate dallo Stato. La ricorrente, che all'epoca era un'alunna della scuola, aveva subito circa 20 episodi di abusi sessuali da parte di uno degli insegnanti, abusi che tuttavia aveva denunciato alle autorità statali soltanto nel 1998, dopo essere venuta al corrente che lo stesso insegnante aveva abusato anche di altri minori. La Corte EDU doveva stabilire se lo Stato potesse essere considerato responsabile degli atti di violenza che all'epoca non erano stati denunciati alle autorità. La Corte ha dapprima constatato che gli abusi cui era stata sottoposta la ricorrente ricadevano nell'ambito di applicazione dell'articolo 3 della CEDU. Successivamente, sulla base di varie relazioni, la Corte EDU ha riscontrato che lo Stato avrebbe dovuto essere a conoscenza dei potenziali rischi di abusi su minori nelle scuole. All'epoca non esistevano procedure adeguate che avrebbero consentito a un minore o a un genitore di rivolgersi direttamente allo Stato per denunciare gli abusi. Non esistevano nemmeno meccanismi di supervisione del trattamento dei minori da parte degli insegnanti. La Corte EDU ha pertanto concluso che l'Irlanda aveva violato gli obblighi positivi discendenti dall'articolo 3 della CEDU, non avendo predisposto un meccanismo efficace di tutela dei minori dagli abusi nelle scuole.

260 Corte EDU, sentenza 10 luglio 2012, *Kayak c. Turchia* (n. 60444/08) (consultabile in francese).
261

Secondo la Corte EDU, gli Stati devono anche condurre efficaci indagini a fronte di denunce di maltrattamenti o decesso, indipendentemente dal fatto che tali atti siano stati perpetrati da agenti statali[262] o da privati cittadini. Un'indagine è efficace se, al ricevimento di una denuncia da parte di una vittima o dei suoi successori, lo Stato mette a punto una procedura in grado di portare all'identificazione e alla punizione dei responsabili degli atti di violenza contrari all'articolo 2 o all'articolo 3 della CEDU.

Nell'ambito della CSE, i diritti dei minori di protezione da abusi e maltrattamenti ricadono prevalentemente nell'ambito di applicazione degli articoli 7 e 17.

Inoltre, ai sensi della convenzione di Lanzarote, gli Stati devono prevedere come reati varie forme di abuso sessuale e sfruttamento sessuale perpetrati nei confronti di minori[263]. La convenzione prevede altresì che gli Stati adottino misure legislative o di altra natura per impedire gli abusi sessuali nei confronti di minori, organizzando campagne di sensibilizzazione, formando esperti, informando i minori dei rischi di abuso e consentendo alle persone a rischio di perpetrare abusi ai danni di minori di accedere alla consulenza di uno specialista. Inoltre, ai sensi degli articoli 4 e 5 della Convenzione del Consiglio d'Europa sulla protezione e la lotta contro la violenza nei confronti delle donne e la violenza domestica (convenzione di Istanbul),[264] gli Stati si impegnano ad adottare speciali misure legislative e a condurre indagini in relazione ad atti di violenza perpetrati nei confronti delle donne. L'articolo 22 della convenzione di Istanbul obbliga gli Stati a fornire servizi di supporto specializzati alle donne vittime di violenza domestica e ai loro bambini.

Nell'ambito del diritto internazionale, la CRC è lo strumento giuridico fondamentale per garantire la tutela dei minori a livello statale. Ai sensi dell'articolo 19 della convenzione, gli Stati parti sono tenuti ad adottare ogni misura legislativa, amministrativa, sociale ed educativa per tutelare il fanciullo contro ogni forma di violenza. Il comitato delle Nazioni Unite sui diritti dell'infanzia ha emanato un importante volume di osservazioni e raccomandazioni generali che interpretano gli obblighi degli Stati discendenti dalla CRC. Per esempio, il commento generale

262 Corte EDU, sentenza 28 ottobre 1998, *Assenov e altri c. Bulgaria* (n. 24760/94).

263 Consiglio d'Europa, Convenzione sulla protezione dei minori contro lo sfruttamento e l'abuso sessuale, STCE n. 201, 25 ottobre 2007.

264 Consiglio d'Europa, Convenzione del Consiglio d'Europa sulla prevenzione e la lotta contro la violenza nei confronti delle donne e la violenza domestica, STCE n. 210, 11 maggio 2011.

n. 13 descrive le misure atte a tutelare i minori contro ogni forma di violenza.[265] Il commento generale n. 5, d'altro canto, si riferisce alle misure volte ad rendere la CRC effettiva negli ordinamenti e nelle politiche nazionali e a supervisionarne l'attuazione.[266]

7.1.2. Punizioni corporali

È definita, in generale, punizione corporale qualsiasi azione di punizione fisica intesa a causare dolore o disagio a qualcuno. L'espressione riguarda prevalentemente le punizioni inflitte a un fanciullo con le mani o con un oggetto, ma può comportare anche azioni non fisiche, come le minacce, che abbiano lo stesso risultato finale, ovvero l'umiliazione del bambino.[267]

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha esaminato denunce di punizioni corporali comminate come forma di misura disciplinare prevalentemente ai sensi dell'articolo 3 della CEDU. La Corte EDU ha accertato una violazione di tale disposizione quando la misura raggiungeva il grado di severità previsto dall'articolo 3.[268] Le misure di punizione corporale che non superano la soglia di gravità stabilita dall'articolo 3 possono comunque ricadere nell'ambito di applicazione dell'articolo 8, che tutela il diritto all'integrità fisica e morale. Tuttavia, la Corte EDU non ha finora riscontrato violazioni dell'articolo 8 nei casi di punizioni corporali. Il ricorso alla punizione corporale nelle scuole statali può anche infrangere i diritti dei genitori di crescere i propri figli secondo le proprie convinzioni filosofiche, previsto dall'articolo 2 del Protocollo n. 1 alla CEDU.[269]

265 ONU, Comitato sui diritti dell'infanzia (2011), *Commento generale n. 13*, CRC/C/GC/13, 18 aprile 2011.

266 ONU, Comitato sui diritti dell'infanzia (2003), *Commento generale n. 5*, CRC/GC/2003/5, 27 novembre 2003.

267 ONU, Comitato sui diritti dell'infanzia, *Commento generale n. 8 (2006), Il diritto del bambino di essere protetto dalle punizioni corporali e da altre forme crudeli o degradanti di punizione* (articolo 19; articolo 28, paragrafo 2; e articolo 37, tra gli altri) (Quarantaduesima sessione, 2006), ONU doc. CRC/C/GC/8, 2 marzo 2007.

268 Corte EDU, sentenza 25 aprile 1978, *Tyrer c. Regno Unito* (n. 5856/72).

269 Corte EDU, sentenza 25 febbraio 1982, *Campbell e Cosans c. Regno Unito* (n. 7511/76 e n. 7743/76), punto 38.

Esempio: i casi *Campbell e Cosans c. Regno Unito*[270] riguardano la sospensione dalla scuola di due ragazzi che si erano rifiutati di accettare punizioni corporali. La Corte EDU non ha riscontrato una violazione dell'articolo 3 della CEDU, perché i ragazzi non erano di fatto stati sottoposti a punizioni corporali. Ha tuttavia accertato una violazione dell'articolo 2 del Protocollo n. 1 della CEDU, per il fatto che, autorizzando le punizioni corporali, lo Stato convenuto non aveva rispettato le convinzioni filosofiche dei genitori. La Corte ha altresì riscontrato la violazione del diritto all'istruzione, sancito dall'articolo 2 del Protocollo n. 1 della CEDU, di uno dei due ragazzi, che era stato sospeso dalla scuola.

La CSE non contempla un divieto esplicito di punizione corporale. Nonostante ciò, il CEDS ha interpretato in tal senso il disposto dell'articolo 17 della CSE.[271] Essendo competente a vigilare sull'osservanza dell'articolo 17 da parte degli Stati, attraverso sia la procedura di presentazione di relazioni, sia la procedura dei reclami collettivi, il CEDS ha riscontrato che alcuni Stati contraenti infrangono tale disposizione poiché non proibiscono tutte le forme di punizione corporale. In tre casi simili presentati dall'associazione "Association for the Protection of All Children (APPROACH) Ltd." rispettivamente contro Belgio,[272] Repubblica ceca[273] e Slovenia[274], il CEDS ha accertato una violazione dell'articolo 17 della CSE, poiché questi Stati erano privi di una legislazione che vietasse in maniera esplicita e generale tutte le forme di punizione corporale dei minori che possono pregiudicarne l'integrità fisica, la dignità, lo sviluppo o il benessere psicologico.[275] Il CEDS ha anche stabilito che le leggi che proibiscono le punizioni corporali dei minori devono essere applicate a talune forme di assistenza alternativa come l'assistenza istituzionale, la presa a carico in famiglie di accoglienza e le scuole materne. Si deve rammentare a tale proposito che nel 2004 l'Assemblea parlamentare del

270 Corte EDU, sentenza 25 febbraio 1982, *Campbell e Cosans c. Regno Unito* (n. 7511/76 e n. 7743/76).

271 Cfr., per esempio, CEDS, sentenza 7 dicembre 2004, *World Organisation against Torture (OMCT) c. Belgio* (ricorso n. 21/2003); CEDS, Conclusioni XVI-2, Polonia, articolo 17, paragrafo 65.

273 CEDS, sentenza 29 maggio 2015, *Association for the Protection of All Children (APPROACH) c. Repubblica ceca* (ricorso n. 96/2013).

274 CEDS, sentenza 27 maggio 2015, *Association for the Protection of All Children (APPROACH) c. Slovenia* (ricorso n. 95/2013).

275 CEDS, 27 maggio 2015, *Association for the Protection of All Children (APPROACH) c. Slovenia* (ricorso n. 95/2013), punto 51.

Consiglio d'Europa ha emanato una raccomandazione con cui invitava tutti gli Stati contraenti a proibire le punizioni corporali.[276]

Nell'ambito del diritto internazionale, le punizioni corporali sono indirettamente considerate una forma di violenza nei confronti dei minori che rientra nel campo di applicazione dell'articolo 19, dell'articolo 28, paragrafo 2, e dell' articolo 37 della CRC. Inoltre, il comitato sui diritti dell'infanzia ha emanato il commento generale n. 8/2006, con cui invitava gli Stati ad adottare misure appropriate contro tutte le forme di punizione corporale.[277]

7.1.3. Abusi sessuali

La tratta degli esseri umani e la pornografia minorile sono esaminati, rispettivamente, nei paragrafi 7.2.2 e 7.2.3.

Gli abusi sessuali nei confronti di minori possono assumere varie forme, comprese le molestie, le strusciate e i toccamenti, l'incesto o lo stupro. Gli abusi ai danni di minori possono aver luogo in vari contesti, compresi gli ambienti domestici, le scuole, gli istituti assistenziali, le chiese, ecc. I minori sono particolarmente vulnerabili agli abusi sessuali, poiché spesso si trovano sotto l'autorità e il controllo degli adulti e hanno meno opportunità di accesso ai meccanismi di denuncia.

Nell'ambito del diritto dell'UE, la direttiva 2011/93/UE, che riprende ampiamente l'approccio della convenzione di Lanzarote, cerca di armonizzare le sanzioni penali minime applicabili a vari reati di abuso sessuale di minori negli Stati membri.[278] Ai sensi dell'articolo 3 di tale direttiva, gli Stati membri devono adottare misure di carattere penale per garantire la punibilità di varie forme di abuso sessuale, tra cui indurre un bambino ad assistere ad atti sessuali e compiere atti sessuali con un minore. La direttiva prevede pene più elevate se gli atti sono commessi da persone che abusano di una posizione di fiducia nei confronti di minori particolarmente vulnerabili e/o fanno uso di coercizione. Inoltre, gli Stati membri devono garantire che l'azione penale contro persone sospettate di abusi su

276 Consiglio d'Europa, Assemblea parlamentare (2004), raccomandazione 1666 (2004), per la messa a bando a livello europeo delle punizioni corporali contro i bambini, 23 giugno 2004.

277 ONU, Comitato sui diritti dell'infanzia (2008), *Commento generale n. 8 (2006): Il diritto del bambino di essere protetto dalle punizioni corporali e da altre forme crudeli o degradanti di punizione (articolo 19; articolo 28, paragrafo 2; e articolo 37, tra gli altri),* CRC/C/GC/8, 2 marzo 2007.

278 Direttiva 2011/93/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile (GU L 335 del 17.12.2011, pag. 1).

minori scatti automaticamente e che le persone condannate per reati di abuso sessuale siano interdette dall'esercizio di attività professionali che comportano contatti diretti o regolari con minori. La direttiva prevede anche disposizioni relative a procedimenti a misura di minore e garantisce la protezione delle vittime minorenni nei tribunali.

La direttiva 2011/93/UE è correlata alla decisione quadro n. 2009/315/GAI[279] relativa all'organizzazione e al contenuto degli scambi fra gli Stati membri di informazioni estratte dal casellario giudiziario. Pur non essendo specificatamente rivolta ai minori, la decisione colma un'importante lacuna nel sistema di protezione, garantendo alle autorità degli Stati membri di avere accesso alle informazioni dei condannati registrate nel casellario giudiziario. È così facilitata l'identificazione di individui condannati per abusi sessuali in cerca di un lavoro presso istituzioni che operano con minori in altri Stati membri.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha esaminato casi di abusi sessuali alla luce degli articoli 3 e 8 della CEDU. Le denunce generalmente riguardano la mancata adozione da parte degli Stati di misure appropriate per proteggere i minori dagli abusi. Per quanto riguarda l'articolo 3, la Corte EDU ha anche valutato se gli Stati avessero condotto indagini efficaci in relazione alle denunce di abuso sessuale. Le denunce di abusi ai danni di minori presentate ai sensi dell'articolo 8 riguardano l'impatto di tali azioni sull'integrità fisica della vittima e sul diritto al rispetto della vita familiare. Talvolta, la distinzione degli obblighi degli Stati previsti dall'articolo 3 e dall'articolo 8 è poco chiara, dal momento che la Corte EDU ricorre a ragionamenti analoghi per individuare violazioni dell'uno e dell'altro articolo. Occorre notare, tuttavia, che i casi rientranti nell'ambito di applicazione dell'articolo 8 sono stati più frequenti in situazioni di allontanamento/presa a carico ingiustificati e dell'impatto delle denunce di abuso di minori sulla famiglia. Queste situazioni sono esaminate nel capitolo 5.

Esempio: nel caso *M.C. c. Bulgaria*[280] la ricorrente era una ragazza di 14 anni che dichiarava di essere stata stuprata da due persone dopo essere uscita di casa una sera. La denuncia della ragazzina era stata archiviata dalle autorità locali, perlopiù per il fatto che non erano stati riscontrati segni di

279 Decisione quadro 2009/315/GAI del Consiglio, del 26 febbraio 2009, relativa all'organizzazione e al contenuto degli scambi fra gli Stati membri di informazioni estratte dal casellario giudiziario (GU L 93 del 7.4.2009, pagg. 23–32).

280 Corte EDU, sentenza 4 dicembre 2003, *M.C. c. Bulgaria* (n. 39272/98).

violenza fisica. La Corte EDU ha osservato che le denunce di stupro rientrano nel campo di applicazione dell'articolo 3 della CEDU e che lo Stato convenuto era tenuto a condurre un'indagine efficace in presenza di una denuncia di questo genere. Per accertare se le autorità bulgare avessero condotto un'indagine inadeguata, la Corte EDU si è fondata su elementi di prova che dimostravano che esse tendevano ad archiviare i casi in cui la vittima non era in grado di dimostrare di essersi fisicamente opposta allo stupro. La Corte ha ritenuto che questo livello di prova fosse in contrasto con le realtà fattuali che riguardano le vittime degli stupri e pertanto fosse tale da compromettere l'efficacia delle indagini delle autorità, in violazione dell'articolo 3 della CEDU.

Inoltre, la convenzione di Lanzarote disciplina in dettaglio il diritto dei minori di essere tutelati dagli abusi sessuali. Questa convenzione, adottata nel quadro del Consiglio d'Europa, è soggetta a ratifica da parte degli Stati non europei. Si tratta di un documento vincolante supportato da una pletora di strumenti non giuridicamente vincolanti, il cui scopo è assicurarsi ulteriormente che gli Stati approntino misure efficaci contro l'abuso di minori.[281]

7.1.4. Violenza domestica e incuria nei confronti di minori

Molti casi di violenza domestica contengono segnalazioni di abuso sessuale. A tale proposito, gli obblighi degli Stati discendenti dal diritto internazionale sono simili a quelli riportati nel precedente paragrafo 7.1.3

Nell'ambito del diritto del Consiglio d'Europa, sono state solitamente le madri a denunciare alla Corte EDU l'incapacità dello Stato di adempiere il proprio obbligo di protezione da pregiudizi sancito dalla CEDU. I casi di violenza domestica sollevavano questioni in relazione agli articoli 2, 3 e 8 della suddetta Convenzione. Gli Stati devono adempiere i propri obblighi positivi che prevedono l'adozione di misure

281 Tra gli esempi figurano: Consiglio d'Europa, Comitato dei ministri (2001), raccomandazione Rec (2001) 16 sulla protezione dei minori contro lo sfruttamento sessuale, 31 ottobre 2001; Consiglio d'Europa, Assemblea parlamentare (1996), risoluzione n. 1099 (1996) sullo sfruttamento sessuale dei minori, 25 settembre 1996; Consiglio d'Europa, Assemblea parlamentare (2000), risoluzione n. 1212 (2000) sullo stupro nei conflitti armati, 3 aprile 2000; Consiglio d'Europa, Assemblea parlamentare (2002), risoluzione n. 1307 (2002) sullo sfruttamento sessuale dei bambini: tolleranza zero, 27 settembre 2002.

efficaci contro la violenza domestica e l'esecuzione di indagini efficaci in caso di verosimili sospetti di violenza domestica o negligenza nei confronti di un minore.

Esempio: nel caso *Kontrová c. Slovacchia*,[282] la richiedente era stata aggredita fisicamente dal marito in più occasioni. Si era pertanto rivolta alla polizia, ma successivamente aveva ritirato la denuncia. In un secondo tempo, il marito aveva intimorito la donna minacciando che avrebbe ucciso i loro figli. Un parente aveva riferito l'episodio alla polizia. Nonostante ciò, a distanza di qualche giorno dall'incidente, il marito della ricorrente aveva ucciso i suoi due figli e si era poi sparato. La Corte EDU ha dichiarato che gli obblighi positivi di uno Stato emergono nella sfera dell'articolo 2 della CEDU ogniqualvolta le autorità sono al corrente o dovrebbero essere al corrente dell'esistenza di un rischio concreto e immediato per la vita di una persona chiaramente identificata. In questo caso, le autorità slovacche avrebbero dovuto essere consapevoli di tale rischio, in virtù delle precedenti comunicazioni tra la ricorrente e la polizia. Gli obblighi positivi della polizia avrebbero dovuto sfociare in una registrazione della denuncia penale della ricorrente, nell'avvio di un'indagine penale e del relativo procedimento penale, nella creazione di un registro adeguato delle chiamate di emergenza e in un intervento atto a verificare la veridicità della rivelazione della ricorrente che il marito deteneva un'arma da fuoco. La polizia, al contrario, non aveva adempiuto i suoi obblighi e la conseguenza diretta di tali mancanze era stata la morte dei figli della ricorrente, in palese violazione dell'articolo 2 della CEDU.

Esempio: il caso *Eremia c. Repubblica di Moldova*[283] riguarda la denuncia di una madre e delle sue due figlie dell'incapacità delle autorità di proteggerle dal comportamento violento e abusivo del relativo marito e padre. La Corte EDU ha stabilito che, nonostante fossero al corrente degli abusi subiti dalla ricorrente, le autorità non avevano adottato misure efficaci per proteggere la donna da nuove violenze domestiche. Ha altresì constatato che, a dispetto dei devastanti effetti psicologici sulle figlie, che erano costrette ad assistere alla violenza del padre contro la ricorrente tra le mura domestiche, poco o nulla era stato fatto per impedire il ripetersi di tali comportamenti. La Corte ha riscontrato che le autorità moldave non avevano adeguatamente ottemperato ai propri obblighi ai sensi dell'articolo 8 CEDU.

282 Corte EDU, sentenza 31 maggio 2007, *Kontrová c Slovacchia* (n. 7510/04).

283 Corte EDU, sentenza 28 maggio 2013, *Eremia c. Repubblica di Moldova* (n. 3564/11).

Sempre in relazione alla CEDU sono stati avviati casi di negligenza nei confronti di minori sia presso le istituzioni statali che in ambiente domestico. Gli obblighi che incombono alle autorità in situazioni di incuria dei genitori nei confronti dei figli minorenni sono analoghi a quelli concernenti i casi illustrati poc'anzi. Da un lato, lo Stato deve approntare meccanismi efficaci di tutela dei minori; dall'altro lato, le autorità statali devono intervenire per proteggere i minori in situazioni segnalate di negligenza nei loro confronti o quando dispongano di elementi sufficienti a dimostrare una situazione di negligenza, sia in ambito domestico, sia in istituti gestiti da privati.[284] I casi di negligenza nelle istituzioni statali pongono in capo alle autorità l'obbligo diretto di tutelare i minori provvedendo affinché ricevano un'adeguata assistenza (medica), e affinché le strutture cui sono affidati siano adeguate e/o il personale sia addestrato a far fronte alle esigenze dei minori.[285]

Anche la convenzione di Istanbul è rilevante.[286] Pur non essendo specificamente diretta ai minori, contiene svariati riferimenti ai soggetti minorenni. In primo luogo, ai sensi dell'articolo 3, lettera f), con il termine "donne" sono da intendersi anche le ragazze di meno di 18 anni, pertanto tutte le disposizioni della convenzione si applicano a loro. In secondo luogo, ai sensi dell'articolo 2, paragrafo 2, le parti contraenti sono incoraggiate ad applicare la convenzione a tutte le vittime di violenza domestica, compresi dunque i minori. Nella maggior parte dei casi, infatti, i bambini sono testimoni delle violenze perpetrate entro le mura domestiche e ne sono gravemente colpiti.[287] Infine, le disposizioni della convenzione riguardanti nello specifico i minori comprendono gli obblighi per lo Stato di adottare misure atte a rispondere ai bisogni delle vittime minorenni, a sensibilizzare i minori e a proteggere i minori testimoni di violenze.

Analogamente, ai sensi dell'articolo 17 della CSE, gli Stati sono tenuti a vietare ogni forma di violenza nei confronti dei minori e ad adottare adeguate disposizioni di diritto civile e penale.

287 FRA (2014c), pagg. 134-135. Cfr. anche UNICEF (2006).

Le questioni della violenza domestica e dell'incuria nei confronti dei minori sono state affrontate in vari strumenti non giuridicamente vincolanti del Consiglio d'Europa.[288]

7.2. Sfruttamento dei minori, pornografia minorile e adescamento di minori

Punto saliente

- Le autorità statali hanno il dovere di collaborare e operare efficacemente insieme, anche nello svolgimento delle indagini, per proteggere i minori dalle violenze.

7.2.1. Lavoro forzato

Nell'ambito del diritto dell'UE sono vietati la schiavitù, la servitù e il lavoro forzato o obbligatorio (articolo 5, paragrafo 2, della Carta dei diritti fondamentali dell'Unione europea). È altresì vietato il lavoro minorile (articolo 32 della Carta). La direttiva 94/33/CE rappresenta il principale strumento giuridico che vieta il lavoro minorile.[289] Solo in casi eccezionali gli Stati sono autorizzati a prevedere un'età minima per l'ammissione al lavoro inferiore all'età in cui termina la scuola dell'obbligo (articolo 4, paragrafo 2). Gli Stati devono garantire che i giovani ammessi al lavoro possano beneficiare di condizioni di lavoro adatte (articoli 6 e 7). Inoltre, i minori possono essere impiegati soltanto per lo svolgimento di talune attività, tra cui servizi domestici poco pesanti o attività di carattere sociale e culturale (articolo 2, paragrafo 2, e articolo 5). La direttiva definisce altresì specifiche misure di protezione da adottare nei casi di lavoro minorile (Sezione III).

288 Tra gli esempi figurano: Consiglio d'Europa, Comitato dei ministri (1985), raccomandazione R (85) 4 sulle vittime delle violenze in ambito familiare, 26 marzo 1985; Consiglio d'Europa, Comitato dei ministri (1990), raccomandazione R (90) 2 sui provvedimenti sociali relativi alla violenza entro le mura domestiche, 15 gennaio 1990; Consiglio d'Europa, assemblea Parlamentare (1998), raccomandazione 1371 (1998) sull'abuso e l'abbandono dei bambini, 23 aprile 1998.

289 Direttiva 94/33/CE del Consiglio, del 22 giugno 1994, relativa alla protezione dei giovani sul lavoro (GU L 216 del 20.8.1994).

È frequente che i casi di lavoro forzato imposto a minori siano collegati alla tratta di minori.[290] La direttiva 2011/36/UE relativa alla prevenzione e la repressione della tratta di esseri umani annovera il lavoro forzato tra le forme di sfruttamento minorile (articolo 2, paragrafo 3).[291] I minori vittime di tratta ai fini dell'impiego nel lavoro forzato sono protetti dalla direttiva alla stregua delle vittime della tratta orientata ad altri scopi (come lo sfruttamento sessuale, cfr. il paragrafo 7.1.3).[292]

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 4 della CEDU vieta in termini perentori ogni forma di schiavitù, servitù, lavoro forzato o obbligatorio. La Corte EDU definisce "lavoro forzato o obbligatorio" un lavoro o servizio che è imposto a chiunque sotto minaccia di punizione, contro la volontà della persona interessata e che la persona interessata non si è offerta spontaneamente di svolgere.[293] La servitù comprende, inoltre, l'obbligo per il "servo" di vivere presso la proprietà di un'altra persona e l'impossibilità di modificare la sua situazione.[294] La servitù rappresenta pertanto una forma aggravata di lavoro forzato.

Nei casi concernenti le denunce di lavoro forzato, la Corte EDU determina dapprima se tali segnalazioni rientrino nell'ambito di applicazione dell'articolo 4 della CEDU.[295] Successivamente, esamina se gli Stati abbiano ottemperato ai propri obblighi positivi di mettere a punto un quadro legislativo e amministrativo che vieti, punisca e persegua efficacemente i casi di lavoro forzato o obbligatorio, servitù e schiavitù.[296] Quanto all'aspetto procedurale dell'articolo 4, la Corte EDU valuta se le autorità nazionali hanno condotto un'indagine efficace in relazione alle segnalazioni di asserito lavoro forzato o servitù.[297]

290 Direttiva 2011/36/UE del Parlamento europeo e del Consiglio, del 15 aprile 2011, concernente la prevenzione e la repressione della tratta di esseri umani e la protezione delle vittime (GU L 101 del 15.4.2011, pag. 1), considerando 11.

291 Direttiva 2011/36/UE del Parlamento europeo e del Consiglio, del 15 aprile 2011, concernente la prevenzione e la repressione della tratta di esseri umani e la protezione delle vittime (GU L 101 del 15.4.2011, pag. 1).

292 Cfr. anche FRA (2015c), pagg. 40–41.

293 Corte EDU, sentenza 26 luglio 2005, *Siliadin c. Francia* (n. 73316/01), punto 116.

294 *Ibid.*, punto 123.

295 Corte EDU, sentenza 11 ottobre 2012, *C.N. e V. c. Francia* (n. 67724/09), punto 70.

296 *Ibid.*, punto 104 e segg.

297 Corte EDU, sentenza 13 novembre 2012, *C.N. c. Regno Unito* (n. 4239/08), punti 70–82.

Esempio: il caso *C.N. e V. c. Francia*[298] riguarda le denunce di lavoro forzato presentate da due sorelle originarie del Burundi. Dopo la morte dei genitori, le ragazze erano state affidate alle cure della zia e della sua famiglia in Francia. Per quattro anni avevano vissuto nel seminterrato della casa della zia, in condizioni presumibilmente pessime. La sorella maggiore non frequentava la scuola e trascorreva tutto il tempo a eseguire i lavori domestici e a prendersi cura del figlio disabile della zia. La sorella minore frequentava la scuola e lavorava per la zia e la sua famiglia nel pomeriggio, dopo la scuola e dopo aver fatto i compiti. Le due sorelle hanno dichiarato dinanzi alla Corte EDU di essere state tenute in servitù e obbligate a svolgere un lavoro forzato. La Corte EDU ha constatato che la prima ricorrente era stata effettivamente sottoposta a lavoro forzato, dal momento che era stata costretta a lavorare sette giorni alla settimana senza percepire una remunerazione né avere diritto a una vacanza. Inoltre, era stata tenuta in servitù perché aveva avuto l'impressione che la sua situazione fosse definitiva, senza possibilità di riscatto. La Corte EDU ha altresì appurato che lo Stato non aveva ottemperato ai suoi obblighi positivi, dacché il quadro giuridico in essere non offriva una protezione effettiva alle vittime del lavoro obbligatorio. Per quanto riguarda l'obbligo procedurale di avviare un'indagine, la Corte EDU ha stabilito che i requisiti dell'articolo 4 CEDU erano stati soddisfatti, poiché le autorità avevano prontamente condotto un'indagine indipendente, che aveva permesso di identificare e punire i responsabili. La Corte EDU ha invece respinto le accuse di lavoro forzato della seconda ricorrente, sottolineando che la ragazza aveva potuto frequentare la scuola e aveva avuto la possibilità di fare i compiti.

La CSE garantisce il diritto dei minori a una protezione contro i pericoli fisici e morali che risultano direttamente e indirettamente dal loro lavoro (articolo 7, paragrafo 10). Il CEDS ha osservato che lo sfruttamento domestico o lavorativo dei minori, compresa la tratta ai fini dello sfruttamento del lavoro, dev'essere proibito a livello nazionale.[299] Gli Stati parti della CSE devono garantire non soltanto di disporre della legislazione necessaria per prevenire lo sfruttamento e proteggere i bambini e gli adolescenti, ma anche che tale legislazione abbia efficacia nella pratica.[300]

298 Corte EDU, sentenza 11 ottobre 2012, *C.N. e V. c. Francia* (n. 67724/09).

299 CEDS, Conclusioni 2004, Bulgaria, pag. 57.

300 CEDS, Conclusioni 2006, Albania, pag. 61; Conclusioni 2006, Bulgaria, pag. 113.

La convenzione di Lanzarote stipula inoltre che gli Stati devono prevedere come reati ogni forma di sfruttamento sessuale perpetrata nei confronti di minori.

7.2.2. Tratta di minori

Nell'ambito del diritto dell'UE, l'articolo 83 del TFUE annovera la tratta degli esseri umani tra le sfere in cui il Parlamento europeo e il Consiglio hanno potere legislativo. L'articolo 5, paragrafo 3, della Carta dei diritti fondamentali dell'Unione europea contiene un'esplicita proibizione della tratta degli esseri umani. Il contributo dell'UE è valutato in questa sede, poiché si tratta di un tema di dimensioni transnazionali.

La direttiva 2011/36/UE concernente la prevenzione e la repressione della tratta di esseri umani e la protezione delle vittime rappresenta il primo strumento adottato dal Parlamento europeo e dal Consiglio sulla base dell'articolo 83 del TFUE.[301] L' articolo 2, paragrafo 1, della suddetta direttiva definisce tratta di esseri umani "il reclutamento, il trasporto, il trasferimento, l'alloggio o l'accoglienza di persone, compreso il passaggio o il trasferimento dell'autorità su queste persone, con la minaccia dell'uso o con l'uso stesso della forza o di altre forme di coercizione, con il rapimento, la frode, l'inganno, l'abuso di potere o della posizione di vulnerabilità o con l'offerta o l'accettazione di somme di denaro o di vantaggi per ottenere il consenso di una persona che ha autorità su un'altra, a fini di sfruttamento". Scopo della direttiva è stabilire norme minime relative alla definizione dei reati e alle sanzioni nell'ambito della tratta di esseri umani (articolo 1). La direttiva nel suo complesso interessa i minori, poiché contiene alcune disposizioni specificamente destinate a questa categoria, relative cioè all'assistenza e al sostegno delle vittime minorenni della tratta di esseri umani e alla tutela dei minori nei procedimenti penali (articoli 13-16).[302] A seguito di una valutazione specialistica di ciascuna vittima devono essere adottate specifiche misure di sostegno (articolo 14, paragrafo 1). Gli Stati nominano un tutore per rappresentare l'interesse superiore del minore (articolo 14, paragrafo 2) e forniscono sostegno alla famiglia del minore (articolo 14, paragrafo 3). Nel corso dei procedimenti penali, i minori hanno diritto ad avere un rappresentante, ad avere accesso alla consulenza legale gratuita, e ad essere ascoltati in audizione in locali adatti e da operatori formati a tale scopo (articolo 15, paragrafi 1-3). Ulteriori misure di

301 Direttiva 2011/36/UE del Parlamento europeo e del Consiglio, del 15 aprile 2011, concernente la prevenzione e la repressione della tratta di esseri umani e la protezione delle vittime (GU L 101 del 15.4.2011, pag. 1).

302 Disposizioni dettagliate sono reperibili in FRA e Corte EDU (2014), pag. 222.

protezione comprendono la possibilità che l'udienza sia condotta a porte chiuse e che il minore sia ascoltato in aula indirettamente, ricorrendo alle tecnologie di comunicazione (articolo 15, paragrafo 5).[303]

Anche la direttiva 2004/81/EC affronta il tema della tratta di minori.[304] Tramite questo strumento, le vittime della tratta possono ottenere titoli di soggiorno da parte degli Stati membri ospitanti, purché collaborino alle indagini penali. La direttiva si applica ai minorenni soltanto nella misura decisa dagli Stati membri.[305]

In termini di applicazione della legge, l'ufficio europeo di polizia (Europol) e l'unità di cooperazione giudiziaria dell'Unione Europea (Eurojust) rivestono un ruolo importante nel garantire la cooperazione tra Stati membri ai fini dell'identificazione e del perseguimento delle reti della criminalità organizzata dedite alla tratta di esseri umani. Le relative disposizioni per la tutela delle vittime minorenni a livello di UE sono esaminate nel paragrafo 11.3 del presente manuale.

Nell'ambito del diritto del Consiglio d'Europa, la CEDU non prevede disposizioni specifiche sulla tratta di esseri umani. Tuttavia, la Corte EDU interpreta l'articolo 4 della CEDU nel senso che esso vieta la tratta di esseri umani.[306] La Corte ha adottato la medesima definizione di tratta di esseri umani contenuta nell'articolo 3, lettera a), del Protocollo addizionale della Convenzione delle Nazioni Unite contro la criminalità transnazionale organizzata per prevenire, reprimere e punire la tratta di persone, in particolare di donne e bambini (Protocollo di Palermo) e nell'articolo 4, lettera a), della Convenzione del Consiglio d'Europa sulla lotta contro la tratta di esseri umani.[307] La Corte EDU valuta dapprima se una situazione particolare implichi un'accusa credibile di tratta di esseri umani e, quindi, se rientri nell'ambito di applicazione dell'articolo 4. In caso affermativo, l'analisi della Corte EDU segue la procedura descritta nel paragrafo 7.2.1: la Corte, cioè,

303 Cfr. FRA (2015b), pag. 79.

304 Direttiva 2004/81/CE del Consiglio, del 29 aprile 2004, riguardante il titolo di soggiorno da rilasciare ai cittadini di paesi terzi vittime della tratta di esseri umani o coinvolti in un'azione di favoreggiamento dell'immigrazione illegale che cooperino con le autorità competenti (GU L 261 del 6.8.2004, pagg. 19–23).

305 *Ibid*, articolo 3.

306 Corte EDU, sentenza 7 gennaio 2010, *Rantsev c. Cipro e Russia*, (n. 25965/04), punto 282.

307 ONU, Protocollo addizionale della Convenzione delle Nazioni Unite contro la criminalità organizzata transnazionale (UNCTOC) per prevenire, reprimere e punire la tratta di persone, in particolare di donne e bambini, New York, 15 novembre 2000; Consiglio d'Europa, Convenzione del Consiglio d'Europa sulla lotta contro la tratta di esseri umani, STCE n. 197, 16 maggio 2005.

esamina se il quadro giuridico dello Stato convenuto offra una protezione efficace contro la tratta di esseri umani, se lo Stato abbia assolto i propri obblighi positivi nelle circostanze particolari del caso e se le autorità abbiano condotto un'indagine efficace a seguito delle segnalazioni di asserita tratta di esseri umani.

Esempio: il caso *Rantsev c. Russia e Cipro*[308] è stato avviato dal padre di una giovane ragazza russa morta in circostanze sospette a Cipro. La ragazza si era recata a Cipro con un visto di artista di cabaret. Dopo quello che è apparso come un tentativo di fuga, la ragazza è deceduta cadendo dal balcone di un appartamento di proprietà di conoscenti del suo datore di lavoro. Il padre della ragazza ha denunciato sia la Russia sia Cipro, dichiarando in sostanza che le autorità non avevano adeguatamente indagato in merito alle circostanze che avevano portato alla morte della figlia. In quest'occasione la Corte EDU ha stabilito per la prima volta che la tratta di esseri umani ricade nell'ambito di applicazione dell'articolo 4 CEDU. Cipro, pur avendo un quadro giuridico adeguato per reprimere la tratta di esseri umani, aveva violato l'articolo 4, poiché le prassi amministrative che impongono a un datore di lavoro di versare garanzie finanziarie per le ballerine di cabaret non offrivano una protezione efficace contro la tratta di esseri umani e lo sfruttamento. Inoltre, nelle specifiche circostanze del caso, le autorità cipriote avrebbero dovuto essere al corrente del fatto che la figlia del ricorrente era a rischio di diventare vittima della tratta. La Corte ha dichiarato che la polizia non aveva adottato misure adeguate per proteggere la sig.ra Rantseva dallo sfruttamento. La Corte ha infine accertato una violazione dell'articolo 4 da parte della Russia, poiché le autorità russe non avevano condotto indagini appropriate a seguito della denuncia di una presunta tratta di esseri umani.

Il CEDS è del parere che la tratta di esseri umani costituisca una grave violazione dei diritti umani e della dignità umana, equiparandola a una nuova forma di schiavitù.[309] Ai sensi dell'articolo 7, paragrafo 10, gli Stati hanno l'obbligo di introdurre una legislazione che configuri la tratta come un reato.[310] La legislazione

308 Corte EDU, sentenza 7 gennaio 2010, *Rantsev c. Cipro e Russia*, (n. 25965/04). Il caso non riguarda la morte di un minore; merita tuttavia una menzione in assenza di casi esaminati dalla Corte EDU in materia di tratta di minori e in considerazione della minaccia specifica posta dalla tratta di minori.

309 CEDS, sentenza 12 settembre 2014, *Federation of Catholic Family Associations in Europe (FAFCE) c. Irlanda* (ricorso n. 89/2013), punto 56.

310 CEDS, Conclusioni XVII-2 (2005), Polonia, pag. 638.

deve essere supportata da un adeguato meccanismo di controllo, da sanzioni, e da un piano d'azione volto a contrastare la tratta e lo sfruttamento sessuale dei minori.[311]

A livello di trattati, la Convenzione del Consiglio d'Europa sulla lotta contro la tratta di esseri umani rappresenta lo strumento fondamentale per contrastare questo fenomeno.[312] Alla luce della più ampia partecipazione al Consiglio d'Europa e del fatto che la Convenzione sulla lotta contro la tratta di esseri umani può essere ratificata anche da Stati non appartenenti al Consiglio d'Europa,[313] essa integra la direttiva 2011/35/UE ed è utile per contrastare questo fenomeno negli Stati firmatari della Convenzione, siano questi Stati membri dell'UE o meno, sulla base di norme e obblighi comuni. L'attuazione della Convenzione è monitorata da un gruppo di esperti indipendenti (il Gruppo di esperti sulla lotta contro la tratta di esseri umani, GRETA), che periodicamente valuta la situazione in ciascun paese e pubblica relazioni. Sulla base di tali relazioni, il comitato delle parti, il pilastro politico del meccanismo di controllo previsto dalla Convenzione, adotta le raccomandazioni destinate agli Stati parti e concernenti le misure da intraprendere per mettere in atto le conclusioni del GRETA e il monitoraggio dei progressi compiuti.

7.2.3. Pornografia minorile e adescamento di minori

Nell'ambito del diritto dell'UE, la direttiva 2011/93/UE rappresenta il principale strumento giuridico che affronta la questione della pornografia minorile.[314]. Nella direttiva si definisce pornografia minorile o materiale pedopornografico come: "i) il materiale che ritrae visivamente un minore in atteggiamenti sessuali espliciti, reali o simulati; ii) la rappresentazione degli organi sessuali di un minore per scopi prevalentemente sessuali; iii) il materiale che ritrae visivamente una persona che sembra un minore in atteggiamenti sessuali espliciti, reali o simulati, oppure la rappresentazione per scopi prevalentemente sessuali degli organi sessuali di una persona che sembra un minore; oppure iv) immagini realistiche di

311 CEDS, sentenza 12 settembre 2014, *Federation of Catholic Family Associations in Europe (FAFCE) c. Irlanda* (ricorso n. 89/2013), punto 57.

312 Consiglio d'Europa, Convenzione sulla lotta contro la tratta di esseri umani, STCE n. 197, 15 maggio 2005.

313 Per esempio, la Bielorussia ha aderito alla Convenzione il 26 novembre 2013.

314 Direttiva 2011/93/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, relativa alla lotta contro l'abuso e lo sfruttamento sessuale dei minori e la pornografia minorile (GU L 335 del 17.12.2011, pagg. 1–14).

un minore in atteggiamenti sessuali espliciti o immagini realistiche degli organi sessuali di un minore, per scopi prevalentemente sessuali."[315] L'articolo 5 della direttiva introduce l'obbligo per gli Stati membri dell'UE di adottare le misure necessarie per garantire che siano puniti la produzione intenzionale, l'acquisto o il possesso, la distribuzione, la diffusione, la trasmissione, l'offerta, la fornitura o la messa a disposizione di materiale pedopornografico, oltre che l'accesso consapevole di questo tipo di contenuti.

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha in più occasioni esaminato casi di pornografia minorile alla luce dell'articolo 8 CEDU.

> Esempio: il caso *Söderman c. Svezia* è stato presentato da una ragazza il cui patrigno aveva tentato di filmarla mentre faceva la doccia.[316] La ragazza sosteneva che la Svezia fosse priva di un quadro giuridico adeguato a tutelare la sua vita privata. La Corte EDU ha stabilito che, conformemente ai suoi obblighi positivi, lo Stato è tenuto a istituire un quadro legislativo adeguato a fornire una tutela ai cittadini vittime di abusi come la ricorrente. Poiché il caso riguardava soltanto un tentativo di filmare la ricorrente, la Corte EDU ha sostenuto che il suddetto quadro legislativo non deve necessariamente prevedere sanzioni penali. È sufficiente che i rimedi a disposizione di una vittima, a livello civile o penale, siano efficaci. In merito ai fatti del caso, la Corte EDU ha dichiarato che la ricorrente non disponeva di efficaci rimedi di diritto penale o civile per tutelarsi dal tentativo del patrigno di filmarla, riscontrando dunque una violazione dell'articolo 8 della CEDU.

L'articolo 9 della Convenzione del Consiglio d'Europa sulla criminalità informatica[317] impone agli Stati parti l'obbligo di definire come reato l'offerta o la messa a disposizione, la distribuzione, la trasmissione, il procurare o il possesso di pornografia infantile o la produzione di questo tipo di materiali attraverso un sistema informatico. Un requisito importante è che questa condotta debba essere intenzionale. Il rapporto esplicativo della Convenzione stabilisce che il termine "materiale pornografico" dipende dalle norme nazionali riguardanti i materiali classificati come osceni, incompatibili con la morale pubblica o comunque

315 *Ibid.*, articolo 2, lettera c).

316 Corte EDU, sentenza 12 novembre 2013, *Söderman c. Svezia* [GC] (n. 5786/08).

317 Consiglio d'Europa, Convenzione sulla criminalità informatica, STE n. 185, 23 novembre 2001.

corrotti.[318] Al di là di questo, l'obbligo di definire come reato tali condotte non riguarda soltanto il materiale che ritrae visivamente un minore, ma anche il materiale che ritrae visivamente una persona che sembra un minore in atteggiamenti sessuali espliciti.[319]

Oltretutto, ai sensi degli articoli 21-23 della convenzione di Lanzarote, gli Stati sono obbligati ad adottare misure legislative per definire varie forme di pornografia minorile. Secondo l'articolo 21, reclutare e costringere un minore a partecipare a spettacoli pornografici e assistere a spettacoli pornografici che comportano la partecipazione di un minore sono condotte che devono essere previste come reati. Conformemente all'articolo 22, deve essere parimenti previsto come reato l'obbligare un minore ad assistere ad abusi sessuali o attività sessuali. Infine, l'articolo 23 impone l'obbligo di applicare la legislazione penale in relazione alla proposta, da parte di un adulto, di un incontro a scopo sessuale con un minore mediante l'utilizzo delle tecnologie dell'informazione e della comunicazione. Il comitato di Lanzarote ha adottato un parere al riguardo, invitando gli Stati parti della convenzione a valutare l'opportunità di estendere il reato di adescamento ai casi in cui l'abuso sessuale non scaturisca da un incontro con la persona adulta ma sia commesso online.[320]

7.3. Gruppi ad alto rischio

Punto saliente

- I minori vittime di scomparsa forzata (nota anche come "sparizione forzata" nel diritto internazionale) hanno il diritto di preservare o ristabilire la propria identità.

7.3.1. Minori appartenenti a una minoranza

Nell'ambito del diritto del Consiglio d'Europa, i casi della Corte EDU vertenti nello specifico su episodi di violenza ai danni di minori appartenenti a una minoranza

318 Rapporto esplicativo al Consiglio d'Europa della Convenzione del Consiglio d'Europa sulla criminalità informatica, paragrafo 99.

319 Consiglio d'Europa, Convenzione sulla criminalità informatica, STE n. 185, 23 novembre 2001, articolo 9, paragrafo 2.

320 Parere del comitato di Lanzarote sull'articolo 23 della Convenzione di Lanzarote e la relativa nota esplicativa, 17 giugno 2015.

(fuori dal contesto della tratta di esseri umani e del lavoro forzato) sono alquanto limitati. Essi riguardano perlopiù la segregazione nelle scuole e la discriminazione, due fenomeni che sono trattati nel paragrafo 3.2.

> Esempio: nel caso *Centre of Legal Resources on behalf of Valentin Câmpeanu c. Romania*, una ONG ha presentato ricorso a nome di un giovane ragazzo rom morto in un istituto statale.[321] Il ragazzo aveva un'infezione da HIV e un grave handicap intellettivo. Le condizioni in cui viveva nell'istituto erano terribili: la struttura era priva di riscaldamento, biancheria da letto o indumenti, il ragazzo non riceveva alcun tipo di assistenza dal personale, ecc. In assenza di parenti stretti della vittima, una ONG ha presentato a suo nome una denuncia di violazione dei diritti stabiliti dagli articoli 2, 3, 5, 8, 13 e 14 della CEDU. La grande camera ha deciso che, nelle circostanze eccezionali del caso (l'estrema vulnerabilità del ragazzo rom e la mancanza di parenti prossimi noti), la ONG era legittimata a rappresentare il ricorrente deceduto. Nel merito, la Corte EDU ha riscontrato una violazione dell'ambito materiale dell'articolo 2. Le autorità nazionali sono state riconosciute responsabili del decesso del sig. Câmpeanu, avendolo assegnato a un istituto dov'era morto di stenti, a causa di un'alimentazione, una sistemazione e un'assistenza medica inadeguate. La Corte EDU ha inoltre accertato una violazione dell'articolo 2, dovuta al fatto che le autorità rumene non avevano condotto un'indagine efficace sulla morte del sig. Câmpeanu.

Per quanto riguarda i minori accolti presso istituti di assistenza, la raccomandazione del Consiglio d'Europa Rec(2005)5 supporta la decisione che l'assegnazione di un minore non deve essere fondata su motivazioni discriminatorie.[322]

7.3.2. Minori con disabilità

Nell'ambito del diritto dell'UE, l'UE ha firmato la Convenzione sui diritti delle persone con disabilità (CRPD), il primo trattato internazionale nella sfera dei diritti umani cui ha aderito l'UE.[323] La CRPD prevede disposizioni specifiche sui mi-

321 Corte EDU, sentenza 17 luglio 2014, *Centre for Legal Resources per conto di Valentin Câmpeanu c. Romania* [GC] (n. 47848/08).

322 Consiglio d'Europa, Comitato dei ministri (2005), raccomandazione Rec (2005)5 sui diritti dei bambini ospiti di istituti, 16 marzo 2005.

323 Consiglio dell'Unione europea (2009), decisione 2010/48/CE del Consiglio, del 26 novembre 2009, relativa alla conclusione, da parte della Comunità europea, della convenzione delle Nazioni Unite sui diritti delle persone con disabilità (GU L 23/35 del 27.1.2010).

nori. Gli Stati membri dell'UE e l'UE stessa si sono impegnati a garantire il pieno godimento dei diritti umani da parte dei minori con disabilità, sulla base dell'uguaglianza con gli altri minori. Ai sensi dell'articolo 16 della CRPD, essi adottano specifiche misure per proteggere i minori con disabilità da ogni forma di abuso e sfruttamento.[324]

Nell'ambito del diritto del Consiglio d'Europa, i casi della Corte EDU riguardanti minori con disabilità hanno sollevato svariate questioni, tra cui il consenso, gli obblighi positivi degli Stati in termini di protezione dal decesso e dai maltrattamenti, e le condizioni di vita nelle strutture a gestione statale.

Esempio: il caso *Nencheva e altri c. Bulgaria*[325] riguarda la morte di 15 bambini e adolescenti in una struttura per persone con disabilità fisiche e mentali. La Corte EDU ha stabilito che i minori erano stati affidati alle cure di un istituto pubblico specializzato posto esclusivamente sotto il controllo dello Stato. Le condizioni di vita dei minori nell'istituto erano terribili, in assenza di cibo, medicinali, indumenti e riscaldamento. Le autorità competenti erano state allertate della situazione in più occasioni e, di conseguenza, erano al corrente o avrebbero dovuto essere al corrente dei rischi di decesso. La Corte EDU ha riscontrato una violazione dell'ambito materiale dell'articolo 2 della CEDU, poiché le autorità non avevano adottato le misure necessarie a proteggere la vita dei minori posti sotto la loro sorveglianza. Inoltre, le autorità bulgare non avevano condotto un'indagine efficace in relazione alla morte dei figli dei ricorrenti. Nelle particolari circostanze del caso, le autorità bulgare avrebbero dovuto avviare un'indagine penale *ex officio*. L'indagine è stata considerata vana per svariate ragioni: era stata avviata a distanza di due anni dalla morte dei minori, si era protratta per un periodo irragionevolmente lungo, non aveva riguardato la morte di tutti i minori e non aveva chiarito tutti gli elementi pertinenti implicati.

324 Cfr. anche il paragrafo 3.5.

325 Corte EDU, sentenza 18 giugno 2013, *Nencheva e altri c. Bulgaria* (n. 48609/06) (consultabile in francese).

7.4. Minori scomparsi

Nell'ambito del diritto dell'UE, la Commissione europea ha istituito un nuovo numero verde (116000) per i bambini scomparsi.[326] Questo servizio raccoglie le segnalazioni di minori scomparsi e le trasferisce alle autorità di polizia, offre orientamento e sostegno alle persone responsabili del minore scomparso, e assiste le autorità nelle indagini.

Nell'ambito del diritto del Consiglio d'Europa, la sparizione forzata di minori è stata esaminata alla luce dell'articolo 8 CEDU.

> Esempio: nel caso *Zorica Jovanović c. Serbia*,[327] un neonato era asseritamente deceduto in ospedale poco dopo la nascita, ma il suo corpo non era mai stato consegnato ai genitori. La madre ha denunciato l'incapacità dello Stato di trasmetterle informazioni sul destino del figlio, tra cui la causa della presunta morte o l'ora e il luogo della sua sepoltura. La Corte EDU ha statuito che la continua mancata trasmissione da parte di uno Stato di informazioni credibili alla madre sul destino del figlio costituiva una violazione del diritto della donna al rispetto della vita familiare.[328]

Nell'ambito del diritto delle Nazioni Unite, l'articolo 25, paragrafo 1, lettera b), della Convenzione internazionale per la protezione di tutte le persone dalla sparizione forzata[329] stipula che gli Stati sono tenuti a prevenire e punire "la falsificazione, l'occultamento o la distruzione di documenti attestanti la vera identità" dei bambini sottoposti a sparizione forzata o i cui genitori sono sottoposti a sparizione forzata. Gli Stati devono altresì prendere le misure necessarie a rintracciare e identificare questi bambini e restituirli alle loro famiglie d'origine. In considerazione della necessità di tutelare il diritto dei minori a mantenere o ristabilire la propria identità, compresa la nazionalità, il nome e i rapporti familiari riconosciuti dalla legge, gli Stati istituiscono procedimenti legali per rivedere e annullare l'adozione o il collocamento dei bambini che hanno all'origine una sparizione forzata (articolo 25, paragrafo 4). La convenzione ribadisce due dei principi generali

326 Decisione della Commissione (2007), decisione 2007/698/CE della Commissione, del 29 ottobre 2007, recante modifica della decisione 2007/116/CE per quanto riguarda l'introduzione di altri numeri riservati che iniziano con "116" (GU L 284 del 30.10.2007, pag. 31).

327 Corte EDU, sentenza 26 marzo 2013, *Zorica Jovanović c. Serbia* (n. 21794/08).

328 *Ibid.*, punto 74.

329 ONU, Convenzione internazionale per la protezione di tutte le persone dalle sparizioni forzate, 20 dicembre 2006.

che soggiaciono ai diritti dei minori: il fatto che l'interesse superiore del bambino debba essere una considerazione prioritaria, e il diritto del bambino di esprimere liberamente le proprie opinioni (articolo 25, paragrafo 5). Nonostante siano relativamente pochi gli Stati europei ad avere ratificato questa convenzione, la sua importanza per il quadro normativo europeo non dovrebbe essere trascurata.[330]

330 Al 19 febbraio 2015 avevano ratificato questa convenzione 9 Stati membri dell'UE su 28 (Austria, Belgio, Spagna, Francia, Germania, Lituania, Paesi Bassi, Portogallo e Slovacchia). Avevano inoltre ratificato la convenzione i seguenti Stati membri del Consiglio d'Europa: Serbia, Montenegro, Bosnia-Erzegovina, Armenia e Albania.

I diritti economici, sociali e culturali (diritti ESC), più spesso riferiti in un contesto europeo come diritti socioeconomici o diritti sociali, comprendono i diritti correlati all'attività lavorativa e il diritto all'istruzione, alla salute, all'abitazione, alla sicurezza sociale e, più in generale, a condizioni di vita adeguate. I diritti culturali sono rimasti poco indagati e trattati nella comunità scientifica e nella giurisprudenza. Alcuni aspetti riguardanti questa sfera dei diritti sono trattati nel paragrafo 4.6, che si occupa dell'identità dei minori appartenenti a una minoranza, e nel paragrafo 8.2, nella parte riguardante il diritto all'istruzione.

Norme esplicite sui diritti ESC nel contesto europeo si possono riscontrare prevalentemente nella Carta sociale europea e nella Carta dei diritti fondamentali dell'UE, benché la CEDU e i suoi protocolli prevedano anch'essi alcune disposizioni fondamentali, come il divieto del lavoro forzato e il diritto all'istruzione. Oltretutto, la Corte EDU ha stabilito che non esiste uno spartiacque che separa la sfera dei diritti sociali ed economici dall'ambito disciplinato dalla Convenzione[331] e ha riconosciuto che i diritti ESC rientrano tra i diritti civili garantiti dalla CEDU. In tal senso, per esempio, l'accesso all'assistenza sanitaria è fatto rientrare nel divieto di tortura e di inflizione di pene o trattamenti inumani o degradanti (articolo 3 della CEDU).[332]

Il capitolo analizza i diritti ESC che riguardano in particolare i minori: il diritto all'istruzione (paragrafo 8.2); il diritto alla salute (paragrafo 8.3); il diritto all'abitazione (paragrafo 8.4) e il diritto a uno standard di vita adeguato e alla sicurezza sociale (paragrafo 8.5).

8.1. Approcci ai diritti economici, sociali e culturali

Punti salienti

- Per assicurare la protezione dei diritti sociali è fondamentale garantire la disponibilità di risorse adeguate.
- Gli elementi essenziali dei diritti sociali sono la disponibilità, l'accessibilità, l'adattabilità e l'accettabilità.

331 Corte EDU, sentenza 9 ottobre 1979, *Airey c. Irlanda* (n. 6289/73), punto 26.

332 Cfr., per esempio, Corte EDU, *Factsheet on Prisoners' health-related rights* (Scheda informativa sui diritti in materia di salute dei carcerati), febbraio 2015, e *Factsheet on Health* (Scheda in materia di salute), aprile 2015.

Nell'ambito del diritto dell'UE, i diritti ESC sono stati inclusi nella Carta dei diritti fondamentali dell'UE sullo stesso piano dei diritti civili e politici. Tuttavia, l'articolo 52 della Carta distingue tra diritti e principi; le disposizioni relative ai principi sono limitate nelle modalità con cui possono essere "invocate dinanzi a un giudice".

Nell'ambito del diritto del Consiglio d'Europa, il CEDS osserva che, quando la realizzazione di un diritto è eccezionalmente complessa e particolarmente costosa da risolvere, tale progressiva realizzazione è valutata sulla base di tre criteri: "l'adozione di provvedimenti per raggiungere gli obiettivi della Carta entro un termine ragionevole, con progressi tangibili e in misura coerente con un massiccio ricorso alle risorse disponibili".[333] Introduce altresì un ordine di priorità, rammentando agli Stati l'impatto che le loro scelte avranno per i gruppi con accresciute vulnerabilità oltre che per altri soggetti interessati.[334]

Il CEDS, sia pur nel contesto specifico del diritto alla sicurezza sociale, ritiene che alcune tappe involutive siano ammissibili se finalizzate a garantire il mantenimento e la sostenibilità del sistema di sicurezza sociale esistente, purché non compromettano il quadro fondamentale di un sistema di sicurezza sociale nazionale o non neghino agli individui l'opportunità di godere della tutela offerta da tale sistema contro gravi rischi sociali ed economici.[335] La Corte EDU ammette anch'essa la possibilità di tappe involutive, ma esamina se il metodo scelto sia ragionevole e adatto al raggiungimento dello scopo legittimo perseguito.[336]

Nel contesto del diritto all'istruzione, il CEDS, in linea con l'approccio del comitato per i diritti economici, sociali e culturali delle Nazioni Unite, ha adottato il quadro analitico di disponibilità, accessibilità, accettabilità e adattabilità.[337] La distinzione tra disponibilità e accessibilità è ripresa anche nella giurisprudenza della Corte EDU. I criteri o gli elementi essenziali della disponibilità, accessibilità,

334 CEDS, sentenza 4 novembre 2003, *International Association Autism Europe (IAAE) c. Francia* (ricorso n. 13/2002), punto 53.

335 CESD, sentenza 23 maggio 2012, *General Federation of Employees of the National Electric Power Corporation (GENOP-DEI) e Confederation of Greek Civil Servants' Trade Unions (ADEDY) c. Grecia* (ricorso n. 66/2011), punto 47.

336 Corte EDU, sentenza 24 giugno 2014, *Markovics e altri c. Ungheria*, decisione di inammissibilità (n. 77575/11, n. 19828/13 e n. 19829/13), punti 37 e 39.

337 CEDS, sentenza 3 giugno 2008, *Mental Disability Advocacy Center (MDAC) c. Bulgaria* (ricorso n. 41/2007), punto 37.

accettabilità e adattabilità guidano l'analisi che segue, nella misura in cui è disponibile una giurisprudenza pertinente.

8.2. Diritto all'istruzione

Punti salienti

- I limiti all'accessibilità dell'istruzione devono essere prevedibili, perseguire uno scopo legittimo ed essere giustificati e non discriminatori.
- L'accettabilità dell'istruzione, che richiede rispetto per le convinzioni religiose e filosofiche dei genitori, non esclude la possibilità di avere un'istruzione religiosa o sessuale nelle scuole.
- L'adattabilità impone l'adozione di misure speciali per minori con disabilità e la possibilità che i bambini e gli adolescenti appartenenti a una minoranza studino e siano istruiti nella loro lingua.
- I bambini hanno diritto all'istruzione, indipendentemente dalla nazionalità o dallo status di migranti.

Nell'ambito del diritto dell'UE, l'articolo 14, paragrafo 2, della Carta dei diritti fondamentali dell'UE garantisce a ogni persona il diritto all'istruzione, compresa la "facoltà di accedere gratuitamente all'istruzione obbligatoria". L'articolo 14, al paragrafo 3, garantisce la libertà di creare istituti di insegnamento così come il diritto dei genitori di provvedere all'educazione e all'istruzione dei loro figli secondo le loro convinzioni religiose, filosofiche e pedagogiche.

Nell'ambito del diritto del Consiglio d'Europa, l'articolo 2 del Protocollo n. 1 alla CEDU garantisce il diritto all'istruzione. La Corte EDU chiarisce che questo articolo non obbliga gli Stati a rendere disponibile l'istruzione, ma sancisce il diritto ad accedere agli istituti di insegnamento esistenti in un determinato momento.[338] Inoltre, il diritto all'istruzione comprende anche la possibilità di trarre profitto dall'istruzione ricevuta, vale a dire il diritto di ottenere, in conformità con le norme in vigore in ciascuno Stato, e nell'una o nell'altra forma, un riconoscimento ufficiale

338 Corte EDU, sentenza 23 luglio 1968, *Caso "Relating to certain aspects of the laws on the use of languages in education in Belgium" c. Belgio* (nn. 1474/62, 1677/62, 1691/62, 1769/63, 1994/63 e 2126/64), punto 4.

degli studi compiuti.[339] Questo diritto tuttavia non è assoluto: i limiti devono essere prevedibili per le persone coinvolte e devono perseguire uno scopo legittimo. Sono consentite misure disciplinari, compresa la sospensione o l'espulsione da un istituto di insegnamento, purché tali provvedimenti soddisfino le condizioni previste per i limiti ammissibili. Per valutare se queste forme di esclusione dall'istruzione comportino la negazione del diritto all'istruzione saranno considerati fattori quali le salvaguardie procedurali, la durata dell'esclusione, i tentativi di reintegrazione, e l'adeguatezza dell'istruzione alternativa proposta.[340]

Esempio: nel caso *Catan e altri c. Repubblica di Moldovia e Russia*,[341] la Corte EDU ha esaminato la politica linguistica introdotta nelle scuole dalle autorità separatiste della Transinstria. L'obiettivo di questa politica linguistica era la russificazione della popolazione. Dopo la chiusura forzata delle scuole di lingua moldava (dove si utilizzava l'alfabeto latino), i genitori erano stati costretti a scegliere se mandare i propri figli nelle scuole dove era previsto l'insegnamento in una combinazione artificiale di lingua moldava e alfabeto cirillico, sulla base di materiali didattici prodotti in epoca sovietica, o se mandarli in scuole meno attrezzate e situate in luoghi disagiati, esposti al rischio di essere soggetti a molestie e intimidazioni lungo il percorso. La chiusura forzata delle scuole e le conseguenti molestie sono state considerate un'interferenza ingiustificata nel diritto dei bambini all'istruzione, di portata tale da configurare una violazione dell'articolo 2 del Protocollo n. 1 alla CEDU.[342]

Nell'ambito del diritto all'istruzione, i genitori hanno il diritto al rispetto delle proprie convinzioni religiose e filosofiche. Tuttavia, secondo la Corte, la definizione e pianificazione del programma di studi rientrano, in linea di principio, nelle competenze dello Stato.[343] È anche possibile che informazioni o conoscenze di tipo religioso o filosofico siano integrate nel programma di studi, a condizione che siano trasmesse in maniera obiettiva, critica e pluralistica.[344] Per salvaguardare il pluralismo, le differenze di carattere quantitativo e qualitativo dell'insegna-

344 *Ibid.*, punto 84.

mento di una determinata religione o filosofia devono essere bilanciate, offrendo ai genitori la possibilità di esentare i propri figli, in parte o in toto, da questo tipo di insegnamento, per esempio con l'esenzione da talune ore di lezione o da un intero corso di religione.[345] Per le modalità con cui la Corte EDU ha gestito la questione da una prospettiva di non discriminazione, cfr. il paragrafo 2.1.[346]

Ai sensi dell'articolo 17, paragrafo 2, della CSE riveduta, gli Stati si impegnano "a prendere [...] tutte le misure necessarie e appropriate miranti [...] ad assicurare ai bambini ed agli adolescenti un insegnamento primario e secondario gratuito, favorendo una regolare frequentazione scolastica".[347] Inoltre, il CEDS ha stabilito che, ai sensi di tale disposizione, gli Stati contraenti dovrebbero provvedere affinché anche i minori illegalmente presenti sul loro territorio abbiano accesso all'istruzione.[348]

Inoltre, gli istituti di insegnamento devono essere accessibili a chiunque, senza discriminazioni.[349] Il CEDS ha dichiarato anche che l'integrazione di minori con disabilità nelle scuole ordinarie dovrebbe essere la norma e l'insegnamento in scuole speciali l'eccezione.[350] Gli Stati non godono di un ampio margine di discrezionalità per quanto riguarda la scelta del tipo di scuola per le persone con disabilità: per questi alunni la scuola di accoglienza deve dunque essere una scuola ordinaria.[351]

Le situazioni riguardanti un trattamento differenziato nell'istruzione sulla base della nazionalità, lo status di immigrante o l'origine etnica sono esaminate nel capitolo 3.

Ai sensi della giurisprudenza del CEDS, l'educazione sessuale e alla salute riproduttiva dev'essere parte integrante del programma di studi ordinario.[352] Gli Stati, pur godendo di un ampio margine di discrezionalità nella determinazio-

352 CEDS, sentenza 30 marzo 2009, *International Centre for the Legal Protection of Human Rights (INTERIGHTS) c. Croazia* (ricorso n. 45/2007), punto 47.

ne dell'adeguatezza culturale dei materiali didattici utilizzati, devono garantire un'educazione sessuale e alla salute riproduttiva non discriminatoria, che non perpetui o rafforzi l'esclusione sociale e non neghi la dignità umana. I materiali didattici non devono rinsaldare stereotipi umilianti, per esempio nei confronti di persone di orientamento non eterosessuale.[353]

Infine, il principio dell'adattabilità dell'istruzione prevede, per esempio, che per i minori con disabilità che sono inseriti in scuole ordinarie, siano adottati "provvedimenti che consentano di rispondere ai loro bisogni speciali"[354] (cfr. anche il paragrafo 3.5).

Inoltre, ai sensi dell'articolo 12, paragrafo 3, della Convenzione quadro per la protezione delle minoranze nazionali, le parti si impegnano a promuovere l'uguaglianza delle opportunità nell'accesso all'educazione a tutti i livelli per le persone appartenenti a minoranze nazionali (cfr. anche il capitolo 3).[355] Nel caso dei minori appartenenti alle minoranze nazionali, l'articolo 14 della convenzione sancisce il diritto di apprendere la lingua minoritaria e di ricevere un insegnamento in questa lingua.[356] La Corte EDU ha confermato che il diritto all'istruzione implica il diritto a ricevere un insegnamento nella lingua nazionale o in una delle lingue nazionali.[357]

8.2.1. Diritto all'istruzione dei figli di migranti

Nell'ambito del diritto dell'UE, il diritto fondamentale all'istruzione dei minori, indipendentemente dallo status di migranti, è riconosciuto praticamente in tutte

357 Corte EDU, sentenza 19 ottobre 2012, *Catan e altri c. Repubblica di Moldavia e Russia* [GC] (n. 43370/04, n. 8252/05 e n. 18454/06), punto 137.

le sfere del diritto in materia di migrazione dell'UE.[358] Detto ciò, l'UE non ha la competenza necessaria per determinare i contenuti o la portata delle disposizioni nazionali in materia di istruzione. L'UE tutela invece il diritto dei figli dei migranti di accedere all'istruzione con lo stesso trattamento o, a seconda dello status, con un trattamento simile ai cittadini nazionali. La direttiva studenti (2004/114/CE) disciplina le condizioni di ammissione dei cittadini di paesi terzi per motivi di studio, scambio di alunni, tirocinio non retribuito o volontariato.[359] L'ammissione comprende l'ingresso e il soggiorno di cittadini di paesi terzi per un periodo superiore a tre mesi. I requisiti generali di ammissione per un minore comprendono la presentazione di un titolo di viaggio valido, l'autorizzazione dei genitori per il soggiorno in questione, un'assicurazione di malattia e, se richiesto dallo Stato, il pagamento delle tasse dovute per l'esame della domanda di ammissione.[360] Gli alunni, per esempio, devono dimostrare di partecipare a un programma di scambio fra scuole messo in atto da un'organizzazione riconosciuta dallo Stato membro.[361]I tirocinanti non retribuiti devono esibire le prove richieste dallo Stato membro per dimostrare che disporrà, durante il soggiorno, di risorse sufficienti per provvedere al suo sostentamento, agli studi e al suo ritorno.[362] L'accesso da parte di studenti di istituti di insegnamento superiori alle attività economiche, inclusa l'occupazione, è soggetto a restrizioni.[363]

I figli di cittadini dell'UE che si trasferiscono in un altro Stato membro dell'UE in virtù della legislazione sulla libera circolazione beneficiano dei diritti più favorevoli in questo ambito. Essi cioè hanno il diritto a essere ammessi a frequentare i corsi d'insegnamento generale, di apprendistato e di formazione professionale

358 Per esempio, articolo 27 della direttiva 2011/95/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, recante norme sull'attribuzione, a cittadini di paesi terzi o apolidi, della qualifica di beneficiario di protezione internazionale, su uno status uniforme per i rifugiati o per le persone aventi titolo a beneficiare della protezione sussidiaria, nonché sul contenuto della protezione riconosciuta (rifusione) (direttiva qualifiche) (GU L 337 del 20.12.2011, pagine 9–268).

359 Direttiva 2004/114/CE del Consiglio relativa alle condizioni di ammissione dei cittadini di paesi terzi per motivi di studio, scambio di alunni, tirocinio non retribuito o volontariato (direttiva studenti).

360 *Ibid.*, articolo 6.

361 *Ibid*, articolo 7.

362 *Ibid*, articolo 10.

363 *Ibid*, articolo 17.

alle stesse condizioni previste per i cittadini di tale Stato,[364] siano essi corsi di natura pubblica e privata, e con riferimento all'istruzione obbligatoria e non obbligatoria. La Corte di giustizia dell'Unione europea ha sempre interpretato questo diritto in senso estensivo, per garantire pari accesso all'istruzione, ma anche a benefici sociali di più ampio respiro correlati all'istruzione, oltre che a qualsiasi altro beneficio mirante a facilitare la frequentazione dell'insegnamento. Per esempio, nella causa *Casagrande*, il figlio di un lavoratore migrante è riuscito ad accedere a un sussidio scolastico soggetto a particolari condizioni di reddito in virtù della normativa sulla libera circolazione nell'UE.[365]

Inoltre, la legislazione introdotta negli anni 1970 obbliga gli Stati membri a fornire corsi di lingua supplementari ai figli dei cittadini migranti dell'UE, sia nella lingua dello Stato ospitante sia nella lingua madre, al fine di favorirne l'inserimento nello Stato ospitante e nel paese d'origine, nel caso in cui dovessero farvi ritorno.[366] Se da un lato la normativa sembra offrire un generoso e prezioso sostegno integrativo ai minori dopo l'ammissione a una scuola nello Stato ospitante, la sua attuazione nei paesi dell'UE è notoriamente lacunosa e sempre meno pratica, alla luce del ventaglio delle diverse lingue implicate.[367]

Esempio: la questione esaminata nella causa *Baumbast e R c. Secretary of State for the Home Department*[368] riguardava il diritto delle due figlie di un lavoratore migrante tedesco, che si era trasferito nel Regno Unito con la moglie colombiana e le due figlie, di continuare a frequentare la scuola in questo paese anche dopo che il padre aveva lasciato il Regno Unito per

364 Regolamento (UE) n. 492/2011/CE del Parlamento europeo e del Consiglio, del 5 aprile 2011, relativo alla libera circolazione dei lavoratori all'interno dell'Unione (GU L 141 del 27.5.2011, pagg. 1–12), articolo 10; e direttiva 2004/38/CE del Parlamento europeo e del Consiglio, del 29 aprile 2004, relativa al diritto dei cittadini dell'Unione e dei loro familiari di circolare e di soggiornare liberamente nel territorio degli Stati membri, che modifica il regolamento (CEE) n. 11612/68 ed abroga le direttive 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE e 93/96/CEE (direttiva sulla libera circolazione) (GU L 158 del 30.4.2004, pagg. 77–123), articolo 24, paragrafo 1.

365 CGUE, sentenza 3 luglio 1974, causa C-9/74, *Donato Casagrande c. Landeshauptstadt München*. Successivamente confermato in cause quali CGUE, sentenza 26 febbraio 1992, causa C-3/90, *M.J.E. Bernini c. Minister van Onderwijs en Wetenschappen*.

366 Direttiva 77/486/CEE del Consiglio, del 25 luglio 1977, relativa alla formazione scolastica dei figli dei lavoratori migranti (GU L 199 del 6.8.1977, pagg. 32–33). Si noti che i figli dei cittadini migranti di paesi terzi sono esclusi da questo ambito di applicazione.

367 La Commissione riferisce in merito all'applicazione della direttiva 77/486/CEE (COM(84) 54 final e COM(88) 787 final).

368 CGUE, sentenza 17 settembre 2002, causa C-413/99, *Baumbast e R c. Secretary of State for the Home Department*.

trasferirsi in un paese terzo, lasciando moglie e figlie. La Corte doveva stabilire se la moglie e le figlie erano autorizzate a rimanere nello Stato ospitante nonostante il sig. Baumbast (da cui erano scaturiti i diritti di soggiorno della famiglia) avesse di fatto rinunciato al proprio status di lavoratore migrante dell'UE. Il fattore decisivo per la Corte era il fatto che le bambine si erano integrate nel sistema scolastico dello Stato ospitante e che sarebbe stato dannoso e sproporzionato sradicarle in questo momento cruciale del loro percorso. La Corte ha confermato che il fatto di garantire la continuità dell'istruzione dei figli è talmente importante da poter effettivamente "ancorare" il soggiorno di una famiglia (che altrimenti non godrebbe del diritto di soggiorno) nello Stato ospitante per tutta la durata degli studi dei figli di un migrante.

La decisione *Baumbast* è stata seguita nelle cause successive[369] ed è stata codificata nell'articolo 12, paragrafo 3, della direttiva 2004/38/CE (Direttiva sulla libera circolazione).[370]

In linea generale, i figli di cittadini di paesi terzi possono accedere all'istruzione *statale* alle stesse condizioni dei cittadini dello Stato ospitante, mentre non hanno diritto di godere dei benefici associati come gli assegni di mantenimento.[371] Alcuni strumenti dell'UE in materia di immigrazione, tuttavia, si spingono oltre la tutela della mera parità di accesso, imponendo agli Stati membri di attivare meccanismi

369 CGUE, sentenza 23 febbraio 2010, causa C-480/08, *Maria Teixeira c. London Borough of Lambeth e Secretary of State for the Home Department*; CGUE, sentenza 23 febbraio 2010, causa C-310/08, *London Borough of Harrow c. Nimco Hassan Ibrahim e Secretary of State for the Home Department* [GC].

370 Direttiva 2004/38/CE del Parlamento europeo e del Consiglio, del 29 aprile 2004, relativa al diritto dei cittadini dell'Unione e dei loro familiari di circolare e di soggiornare liberamente sul territorio degli Stati membri, che modifica il regolamento (CEE) n. 1612/68 e abroga le direttive 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE e 93/96/CEE (GU L 158 del 30.4.2004), articolo 2, paragrafo 2, lettera c) e articolo 12, paragrafo 3.

371 Direttiva sulla qualifica di rifugiato (direttiva 2011/95/UE), articolo 11; direttiva soggiornanti di lungo periodo (direttiva 2003/109/CE), articolo 14; direttiva 2003/86/CE relativa al ricongiungimento familiare, articolo 14; direttiva protezione temporanea (2001/55/CE); direttiva accoglienza (2013/33/UE), articolo 14, lettera c); direttiva rimpatri (2008/115/CE).

per garantire il dovuto riconoscimento e la trasferibilità delle qualifiche straniere, anche in assenza di prove documentali (articolo 28 della direttiva qualifiche).[372]

I diritti all'istruzione dei figli dei richiedenti asilo sono ancora più deboli: questi soggetti hanno diritto ad accedere al sistema d'istruzione dello Stato ospitante a condizioni *simili* ma non necessariamente alle *medesime* condizioni che si applicano per i cittadini di quel paese.[373] In tal senso, l'istruzione potrebbe essere fornita in centri di accoglienza anziché nelle scuole e le autorità possono posticipare il pieno accesso alla scuola dei figli dei richiedenti asilo per un periodo massimo di tre mesi dalla data di deposito della domanda d'asilo. Qualora l'accesso al sistema educativo non sia possibile a causa della situazione specifica del minore, gli Stati membri sono tenuti a offrire altre modalità d'insegnamento (articolo 14, paragrafo 3, della direttiva sulle condizioni di accoglienza).[374]

Ai sensi del diritto del Consiglio d'Europa, l'articolo 2 del Protocollo n. 1 è stato usato in combinato disposto con l'articolo 14 per garantire l'accesso dei figli dei migranti all'istruzione (cfr. anche il paragrafo 3.3).

Esempio: nel caso *Ponomaryovi c. Bulgaria*,[375] la Corte EDU ha esaminato l'obbligo per due studenti russi di una scuola superiore privi di un permesso di soggiorno permanente di versare le tasse scolastiche. La Corte ha concluso che, in questo caso, il requisito del versamento delle tasse per la scuola secondaria era stato discriminatorio e, quindi, in contrasto con l'articolo 14 della CEDU, letto in combinato disposto con l'articolo 2 del Protocollo n. 1 alla CEDU.[376]

372 Direttiva 2011/95/UE del Parlamento europeo e del Consiglio, del 13 dicembre 2011, recante norme sull'attribuzione, a cittadini di paesi terzi o apolidi, della qualifica di beneficiario di protezione internazionale, su uno status uniforme per i rifugiati o per le persone aventi titolo a beneficiare della protezione sussidiaria, nonché sul contenuto della protezione riconosciuta (rifusione) (direttiva qualifiche) (GU L 337 del 20.12.2011, pag. 9).

373 Direttiva sulle condizioni di accoglienza (2013/33/UE). Si rammenta che, ai sensi della direttiva sulla qualifica di rifugiato (2011/95/UE, articolo 27), i minori beneficiari di protezione internazionale (che hanno ottenuto diritti di soggiorno di più lungo termine) possono accedere all'istruzione secondo le stesse modalità previste per i cittadini dello Stato ospitante.

374 Direttiva 2013/33/UE del Parlamento europeo e del Consiglio, del 26 giugno 2013, recante norme relative all'accoglienza dei richiedenti protezione internazionale (rifusione) (direttiva accoglienza) (GU L 180 del 29.6.2013, pagg. 96–116).

375 Corte EDU, sentenza 21 giugno 2011, *Ponomaryovi c. Bulgaria* (n. 5335/05).

376 Cfr. anche il paragrafo 3.3.

La CSE tutela i diritti all'istruzione dei figli dei migranti sia direttamente (articolo 17, paragrafo 2), sia indirettamente, imponendo restrizioni ai diritti all'occupazione dei minori, per consentirgli di godere appieno dei vantaggi dell'istruzione obbligatoria (articolo 7).

Inoltre, la Convenzione europea sullo statuto giuridico dei lavoratori emigranti[377] ribadisce il diritto dei figli dei migranti di accedere all'istruzione generale e alla formazione professionale nello Stato ospitante "sulla stessa base e alle stesse condizioni dei cittadini di questo Stato" (articolo 14, paragrafo 1).

Nell'ambito del diritto internazionale, la parità di accesso all'istruzione dei figli dei migranti è riconosciuta dalla Convenzione sulla protezione dei diritti dei lavoratori migranti e dei membri delle loro famiglie (articolo 30).[378]

L'articolo 28 della CRC stabilisce che tutti i fanciulli hanno diritto all'insegnamento obbligatorio gratuito. Secondo l'articolo 29, paragrafo 1, lettera c), tale diritto va ben oltre la parità di accesso all'istruzione e include disposizioni concernenti lo sviluppo dell'identità culturale del fanciullo, la sua lingua e i valori del suo paese d'origine.

377 Consiglio d'Europa, Convenzione europea sullo statuto giuridico dei lavoratori emigranti, STE n. 93, 1977.

378 Convenzione delle Nazioni Unite sulla protezione dei diritti di tutti i lavoratori emigranti e dei membri delle loro famiglie, 18 dicembre 1990.

8.3. Diritto alla salute

Punti salienti

- Gli Stati hanno l'obbligo positivo di adottare misure contro gravi rischi per la salute, di cui le autorità sono o dovrebbero essere consapevoli.
- In caso di decesso di una persona, le autorità statali devono avviare un'indagine efficace.
- Ai sensi della CSE, i minori che si trovano illegalmente nel paese in questione hanno diritto all'assistenza sanitaria e non limitatamente all'assistenza medica urgente.
- Il principio di accettabilità dell'assistenza sanitaria richiede il consenso informato o un'autorizzazione.
- Conformemente al diritto dell'UE e alla CSE, i figli dei migranti hanno diritto, fatte salve alcune limitazioni, all'assistenza sociale e medica.

Nell'ambito del diritto dell'UE, l'articolo 35 della Carta dei diritti fondamentali dell'UE garantisce il diritto di ottenere cure mediche.

I figli dei cittadini dell'UE migranti possono accedere all'assistenza sociale e sanitaria alla stessa stregua dei cittadini dello Stato membro ospitante, dopo i primi tre mesi di soggiorno nel paese.[379] Diritti analoghi, per quanto limitati alle cosiddette "prestazioni essenziali", sono disponibili per i figli dei cittadini di paesi terzi che hanno acquisito un permesso di soggiorno permanente in uno Stato membro[380]. Per quanto riguarda i figli dei rifugiati e dei richiedenti asilo, gli Stati membri provvedono affinché essi ricevano adeguata assistenza sociale, alla stregua dei cittadini dello Stato membro in questione; anche in questo caso, tuttavia, tale assistenza può essere limitata alle "prestazioni essenziali" (articolo 29 della direttiva qualifiche). La legislazione impone agli Stati membri l'obbligo di fornire ai figli di migranti in condizione di vulnerabilità l'accesso a un'assistenza sanitaria sufficiente. Per esempio, i minori che hanno subito violenze o torture devono ricevere misure di assistenza sufficienti per rispondere alle loro esigenze fisiche e psicologiche (capo IV, articolo 21, articolo 23, paragrafo 4, e articolo 25

379 Direttiva sulla libera circolazione, articolo 24.

380 Direttiva 2003/109/CE del Consiglio, del 25 novembre 2003, relativa allo status dei cittadini di paesi terzi che siano soggiornanti di lungo periodo (GU L 16 del 23.1.2004), articolo 11, paragrafo 4.

della direttiva sull'accoglienza rifusa). La direttiva qualifiche contiene disposizioni simili per i figli dei migranti in condizioni di vulnerabilità.

Nell'ambito del diritto del Consiglio d'Europa, la CEDU non garantisce espressamente un diritto all'assistenza sanitaria o un diritto alla salute. In varie circostanze, tuttavia, la Corte EDU si è occupata di una serie di casi in materia di salute. In primo luogo, la Corte esamina le situazioni che possono mettere in pericolo la vita dei minori. Inoltre la Corte individua l'obbligo positivo per lo Stato di adottare misure preventive nei confronti dei rischi gravi per la salute, di cui è al corrente o dovrebbe essere al corrente.

Esempio: nel caso *Oyal c. Turchia*, lo Stato non aveva preso le misure preventive necessarie ad evitare la diffusione dell'HIV attraverso trasfusioni di sangue. Di conseguenza, un neonato era stato infettato dal virus HIV in seguito a trasfusioni di sangue effettuate in un ospedale statale. Nonostante sia stata offerta una somma a titolo di risarcimento, la Corte ha constatato che, in mancanza di una totale copertura medica per il trattamento e per le cure necessarie per minore interessato durante tutta la sua vita, lo Stato non aveva offerto un risarcimento soddisfacente e, pertanto, aveva violato il diritto alla vita (articolo 2 della CEDU).[381] Ha altresì ordinato allo Stato turco di provvedere a una totale e gratuita copertura medica della vittima durante tutta la sua vita.

Esempio: nel caso *Iliya Petrov c. Bulgaria*,[382] un ragazzino di undici anni ha riportato gravi lesioni dopo essersi introdotto in una centralina di energia elettrica, situata in un parco giochi dove bambini e adolescenti erano soliti incontrarsi. La porta della centralina non era chiusa a chiave. La Corte EDU ha sostenuto che lo sfruttamento della rete elettrica è un'attività che rappresenta un rischio elevato per le persone che si trovano in prossimità delle centraline. Lo Stato è dunque obbligato a introdurre un'adeguata regolamentazione, ivi compreso un sistema per controllare la corretta applicazione delle norme di sicurezza. La Corte ha stabilito che la mancata messa in sicurezza della centralina elettrica da parte dello Stato, che pure

381 Corte EDU, sentenza 23 marzo 2010, *Oyal c. Turchia* (n. 4864/05), punti 71–72.

382 Corte EDU, sentenza 24 aprile 2012, *Iliya Petrov c. Bulgaria* (n. 19202/03) (consultabile in francese).

era consapevole dei problemi di sicurezza, equivaleva a una violazione del diritto alla vita (articolo 2 della CEDU).[383]

Tra gli obblighi positivi degli Stati rientra inoltre l'obbligo di provvedere al trattamento dei minori che si trovano in una situazione vulnerabile e che sono affidati alle autorità statali (cfr. anche il capitolo 6 e la sezione 7.3).

Esempio: il caso *Centre for Legal Resources per conto di Valentin Câmpeanu c. Romania*[384] riguardava un adolescente rom positivo all'HIV e con una grave disabilità mentale, che soffriva anche di tubercolosi, polmonite ed epatite, morto all'età di 18 anni. Il ragazzo aveva vissuto tutta la vita in un istituto di assistenza statale. La Corte EDU ha riscontrato gravi errori nelle decisioni adottate riguardo alle cure e al trattamento del ragazzo, oltre che una continua incapacità del personale medico di fornirgli un'assistenza e cure mediche adeguate. Era stato quindi violato l'articolo 2 della CEDU.[385]

Inoltre, in assenza di un'emergenza, la Corte EDU ha stabilito che un trattamento medico avviato senza il consenso dei genitori rappresenta una violazione dell'articolo 8 della CEDU.

Esempio: nel caso *Glass c. Regno Unito*[386] un ragazzo con una grave disabilità era stato trattato con diamorfina, nonostante le ferme obiezioni della madre. La Corte ha riscontrato che, in assenza dell'autorizzazione di un giudice, la decisione delle autorità ospedaliere di travalicare le obiezioni della madre alla terapia proposta configurava una violazione dell'articolo 8 della CEDU.[387]

Esempio: nel caso *M.A.K. e R.K. c. Regno Unito*,[388] una bambina di nove anni era stata fotografata e sottoposta a prelievi del sangue senza il consenso dei genitori, nonostante le espresse richieste del padre di non ef-

383 *Ibid.*

384 Corte EDU, sentenza 17 luglio 2014, *Centre for Legal Resources per conto di Valentin Câmpeanu c. Romania* [GC] (n. 47848/08). Cfr. anche la descrizione di questa sentenza della Corte EDU nel capitolo 7.

385 Cfr. anche il paragrafo 7.

386 Corte EDU, sentenza 9 marzo 2004, *Glass c. Regno Unito* (n. 61827/00).

387 *Ibid.*, punto 83.

388 Corte EDU, sentenza 23 marzo 2010, *M.A.K. e R.K c. Regno Unito* (n. 45901/05 e n. 40146/06).

fettuare esami medici sulla figlia quando la bambina si trovava da sola in ospedale. In assenza di un'emergenza medica, lo svolgimento di questi interventi medici senza il consenso genitoriale è stato considerato una violazione del diritto della bambina all'integrità fisica ai sensi dell'articolo 8 della CEDU.[389]

In conformità agli articoli 6 e 8 della Convenzione sui diritti dell'uomo e la biomedicina[390], quando un minore non ha la capacità giuridica di dare consenso a un intervento medico, questo non può essere effettuato senza l'autorizzazione del suo rappresentante, fatta eccezione per le situazioni d'urgenza. Se, da un lato, la Convenzione non prevede il consenso del minore nel caso in cui quest'ultimo non abbia la capacità giuridica per concederlo, dall'altro essa stabilisce che il parere del minore sia preso in considerazione "come un fattore determinante, in funzione dell'età e del suo grado di maturità" (articolo 6, paragrafo 2).

Inoltre, ai sensi dell'articolo 11 della CSE, le parti concordano di adottare adeguate misure volte a prevedere consultori e servizi d'istruzione riguardo al miglioramento della salute ed allo sviluppo del senso di responsabilità individuale in materia di salute.[391] L'assistenza medica e sociale è garantita dall'articolo 13 della CSE a coloro che non dispongono di risorse sufficienti e che non sono in grado di procurarsi tali risorse con i propri mezzi o di riceverli da un'altra fonte. Infine, nel 2011 il comitato dei ministri ha adottato orientamenti specifici in materia di minori sull'assistenza sanitaria a misura di bambino.[392]

Come illustrato negli esempi a seguire, il CEDS è del parere che i figli dei migranti che si trovano illegalmente nel territorio di un Paese hanno diritto all'assistenza sanitaria e non limitatamente all'assistenza medica urgente. La CSE fa svariati riferimenti ai diritti dei minori all'assistenza sociale e ai servizi sanitari (articoli 11, 12, 13, 14, 16 e 17), che si applicano indipendentemente dallo status di migrante.

389 *Ibid.*, punto 79.

390 Consiglio d'Europa, Convenzione per la protezione dei diritti dell'uomo e della dignità dell'essere umano nei confronti dell'applicazione della biologia e della medicina: Convenzione sui diritti dell'uomo e la biomedicina, STE n. 164, 4 aprile 1997.

391 Per quanto concerne l'educazione sessuale e alla salute riproduttiva, v. sopra, alla voce "Istruzione" (paragrafo 8.2).

392 Consiglio d'Europa, Comitato dei ministri (2011), *Guidelines on child-friendly health care* (Linee guida per un'assistenza sanitaria a misura di bambino), 21 settembre 2011.

Esempio: la decisione del CEDS nel caso *International Federation of Human Rights Leagues (FIDH) c. Francia*[393] riguardava l'adozione da parte della Francia di una legge che aboliva l'esenzione dal pagamento delle cure mediche concessa agli immigrati in situazione irregolare e con redditi estremamente bassi e che imponeva oneri per l'assistenza sanitaria. Il CEDS ha stabilito che gli individui di minore età, compresi i minori non accompagnati, devono ricevere cure mediche gratuite.

Esempio: nel caso *Defence for Children International (DCI) c. Belgio,*[394] il CEDS ha riscontrato una violazione dell'articolo 17 della CSE per via delle limitazioni all'assistenza medica poste nei confronti di migranti minorenni privi di documenti. Il comitato ha confermato il diritto dei migranti minorenni illegalmente presenti sul territorio di un paese a ricevere un'assistenza sanitaria che vada oltre l'assistenza medica urgente e che comprenda l'assistenza primaria e secondaria, oltre che il sostegno psicologico.[395] Ha altresì dichiarato che la mancanza di strutture di accoglienza per minori stranieri illegalmente presenti sul territorio di un paese ne ostacola l'accesso all'assistenza sanitaria. Ha constatato inoltre che le cause di malattia possono essere eliminate soltanto se i minori ricevono un alloggio o sono affidati alle cure di una famiglia adottiva. Di conseguenza, ha riscontrato una violazione dell'articolo 11, paragrafi 1 e 3, della CSE, dovuta alla mancanza di un alloggio e dell'affido familiare.[396]

Analogamente, la Convenzione europea sullo statuto giuridico dei lavoratori emigranti[397] stabilisce che ai lavoratori migranti che sono legalmente occupati nel territorio di un altro Stato e ai loro familiari sia garantito pari accesso all'assistenza sociale e medica (articolo 19).

Nell'ambito del diritto internazionale, disposizioni più esaustive sul diritto alla salute si trovano nell'articolo 12 della Convenzione internazionale sui diritti economici,

393 CEDS, sentenza 8 settembre 2004, *International Federation of Human Rights Leagues (FIDH) c. Francia* (ricorso n. 14/2003), punti 35–37.

396 *Ibid.*, punti 116–118.

397 Consiglio d'Europa, Convenzione europea sullo statuto giuridico dei lavoratori emigranti, STE n. 93, 1977.

sociali e culturali (ICESCR)[398] e nell'articolo 24 della CRC. Questi strumenti sottolineano l'importanza della prevenzione e delle cure. Il comitato delle Nazioni Unite sui diritti dell'infanzia ribadisce l'importanza di garantire l'accesso al migliore standard possibile in materia di assistenza sanitaria e nutrizione durante la prima infanzia,[399] oltre che l'accesso degli adolescenti all'informazione sessuale e riproduttiva.[400] Chiarisce altresì che il diritto dei minori alla salute comporta il diritto di controllare la propria salute e il proprio corpo, compresa la libertà sessuale e riproduttiva di compiere scelte responsabili.[401] Incoraggia gli Stati a considerare l'opportunità di consentire ai minori di dare il proprio consenso a taluni trattamenti e interventi medici senza il permesso di un genitore, un tutore o un guardiano, quali i test per l'HIV e i servizi di salute sessuale e riproduttiva, compresa l'educazione e l'orientamento in relazione a salute sessuale, contraccezione e aborto sicuro.[402]

402 *Ibid.*, paragrafo 31.

8.4. Diritto all'abitazione

Punti salienti

- Il diritto a un'abitazione di livello sufficiente è garantito dall'articolo 31 della CSE.
- Il CEDS ritiene che debba essere fornito un adeguato riparo ai minori che risiedono irregolarmente in un paese e che le condizioni di vita in queste strutture devono garantire la dignità umana.
- Secondo la Corte EDU, l'esistenza di un'abitazione inadeguata non giustifica l'affidamento a un istituto di assistenza.

Nell'ambito del diritto dell'UE, l'articolo 34, paragrafo 3, della Carta dei diritti fondamentali dell'UE contiene un riferimento all'assistenza abitativa nel contesto della lotta contro l'esclusione sociale e la povertà. La direttiva sull'uguaglianza razziale cita l'alloggio tra i beni e servizi disponibili al pubblico la cui fornitura o l'accesso ai quali deve essere garantito su base non discriminatoria.[403] In materia di benefici abitativi, i soggiornanti di lungo periodo hanno diritto a un trattamento non differenziato. Il diritto dell'UE, tuttavia, cerca di garantire, per esempio in relazione alla riunificazione familiare, che i familiari non costituiscano un onere per i sistemi di assistenza sociale degli Stati membri.[404] La direttiva sul ricongiungimento familiare prevede che il soggiornante titolare di un permesso di soggiorno per un periodo di validità pari o superiore a un anno e con una fondata prospettiva di ottenere il diritto di soggiornare in modo stabile dimostri, al momento della presentazione della domanda di ricongiungimento familiare, di disporre di un alloggio considerato normale per una famiglia analoga nella stessa regione. L'alloggio deve corrispondere alle norme generali di sicurezza e salubrità in vigore nello Stato membro interessato.[405]

Nell'ambito del diritto del Consiglio d'Europa, la CEDU non prevede un diritto all'alloggio ma, se uno Stato decide di offrire un'abitazione, è tenuto a farlo senza discriminazioni.

403 Direttiva 2000/43/CE del Consiglio, del 29 giugno 2000, che attua il principio della parità di trattamento fra le persone indipendentemente dalla razza e dall'origine etnica, articolo 3.

404 Cfr. anche FRA e Corte EDU (2014), pag. 201.

405 Direttiva 2003/86/CE del Consiglio, del 22 settembre 2003, relativa al diritto al ricongiungimento familiare (direttiva sul ricongiungimento familiare), articolo 7, paragrafo 1, lettera a).

Esempio: nel caso *Bah c. Regno Unito*[406] la ricorrente, che risiedeva regolarmente nel Regno Unito, aveva ottenuto l'autorizzazione a ospitare il figlio a condizione che quest'ultimo non richiedesse alcuna assistenza finanziaria alle autorità pubbliche. Poco dopo l'arrivo del figlio, la ricorrente aveva presentato domanda di assegnazione di un alloggio di edilizia residenziale pubblica. Tuttavia, poiché il figlio godeva di un permesso di soggiorno condizionato, le autorità pubbliche avevano rigettato la richiesta di esaminare con priorità la sua condizione di persona involontariamente priva di alloggio con un minore a carico, cui ordinariamente la ricorrente avrebbe avuto diritto. Alla fine le autorità avevano aiutato la donna a trovare un nuovo alloggio e, in un secondo tempo, le avevano offerto un alloggio sociale. La ricorrente ravvisava una discriminazione nel rifiuto delle autorità di garantirle l'accesso a un alloggio in via prioritaria. La Corte EDU, pur riconoscendo la legittimità di fissare criteri per l'assegnazione di risorse limitate come l'edilizia residenziale pubblica, ha stabilito che tali criteri non devono essere arbitrari o discriminatori. Non vi era stata arbitrarietà nel rifiuto delle autorità di esaminare con priorità la domanda della ricorrente, che aveva accolto il figlio nel paese ospitate nella piena consapevolezza della condizione legata al suo permesso di ingresso. Oltretutto, la ricorrente non era mai stata di fatto priva di un alloggio e, nell'eventualità in cui si fosse manifestato il rischio per madre e figlio di rimanere senza un'abitazione, sussistevano altri obblighi di legge che imponevano alle autorità l'obbligo di assistenza. Di conseguenza, non è stata ravvisata alcuna violazione dell'articolo 14 della CEDU in combinato disposto con l'articolo 8 della CEDU.

La Corte EDU esamina altresì i casi di espulsione delle famiglie rom dai campi nomadi.[407] A tale proposito, la Corte ha indirettamente affrontato la questione della qualità dell'alloggio, stabilendo che l'inadeguatezza di un alloggio non giustifica l'affidamento di minori a istituti di assistenza[408] (cfr. anche i paragrafi 5.2. e 6.2.).

Il diritto a un'abitazione di livello sufficiente è garantito dall'articolo 31 della CSE. Il CEDS afferma che per abitazione di livello sufficiente ai sensi dell'articolo 31, paragrafo 1, si intende un alloggio sicuro dal punto di vista igienico e sanitario, ossia dotato di tutti i servizi di base tra cui l'acqua potabile, il riscaldamento,

406 Corte EDU, sentenza 27 settembre 2011, *Bah c. Regno Unito* (n. 56328/07).

407 Corte EDU, sentenza 27 maggio 2004, *Connors c. Regno Unito* (n. 66746/01).

408 Corte EDU, sentenza 26 ottobre 2006, *Wallová e Walla c. Repubblica ceca*, (n. 23848/04), punti 73-74 (consultabile in francese); Corte EDU, sentenza 21 giugno 2007, *Havelka e altri c. Repubblica ceca*, (n. 23499/06), punti 57-59 (consultabile in francese).

i servizi igienici e l'allacciamento alla rete fognaria, e un impianto elettrico; l'alloggio deve essere inoltre strutturalmente sicuro, non sovraffollato e con un contratto certo tutelato dalla legge.[409] Gli sgomberi sono ammessi se giustificati, se effettuati in condizioni che rispettino la dignità umana e se è disponibile un alloggio alternativo.[410] Le condizioni di vita in un alloggio "devono essere tali da garantire un'esistenza compatibile con la dignità umana" "[...] [e] devono rispondere a requisiti di sicurezza, salute e igiene, garantiti tra l'altro dall'esistenza di servizi di base come l'acqua potabile, un'illuminazione sufficiente e il riscaldamento. I requisiti fondamentali di un alloggio temporaneo comprendono anche la sicurezza delle immediate vicinanze."[411]

Per quanto concerne l'alloggio per minori stranieri che si trovano in una situazione di irregolarità, il CEDS è del parere che sia l'incapacità di fornire un alloggio, sia la fornitura di un alloggio di livello non sufficiente in strutture alberghiere equivalgono a una violazione dell'articolo 17, paragrafo 1, della CSE.[412] Inoltre, ai sensi dell'articolo 31, paragrafo 2, della CSE, per prevenire il problema dei senzatetto, gli Stati sono tenuti a fornire un alloggio adeguato ai minori che si trovano in una situazione di irregolarità senza ricorrere alle strutture di accoglienza.[413]

8.5. Diritto a uno standard di vita adeguato e diritto alla sicurezza sociale

Punti salienti

- L'accesso all'assegno familiare e al congedo parentale deve essere di carattere non discriminatorio.
- Nell'ambito del diritto dell'UE, la copertura previdenziale dei giovani lavoratori assunti con contratti di apprendistato non deve essere così modesta da escludere questa categoria di lavoratori dalla gamma di tutele generale.
- Ai sensi della CSE, la sospensione dell'assegno famigliare in caso di assenteismo scolastico rappresenta un limite sproporzionato al diritto del nucleo familiare alla tutela economica, sociale e legale.

Nell'ambito del diritto dell'UE, l'articolo 34, paragrafo 1, della Carta dei diritti fondamentali dell'UE stipula che "[l]'Unione riconosce e rispetta il diritto di accesso alle prestazioni di sicurezza sociale e ai servizi sociali" in casi che rientrano nelle tradizionali sfere della sicurezza sociale quali la maternità, la malattia, gli infortuni sul lavoro, la dipendenza o la vecchiaia, oltre che la perdita del posto di lavoro. Il diritto si estende a chiunque risieda o si sposti legalmente all'interno dell'Unione. Il diritto all'assistenza sociale è riconosciuto per garantire un'esistenza dignitosa a tutti coloro che non dispongano di risorse sufficienti e per lottare contro l'esclusione sociale e la povertà. Tutti questi aspetti sono qualificati dalle "modalità stabilite dal diritto [dell'Unione] e le legislazioni e le prassi nazionali" (articolo 34, paragrafo 1, della Carta).

La Corte di giustizia dell'Unione europea sostiene che, se ai cittadini di uno Stato membro è semplicemente chiesto di risiedere nello Stato membro per poter richiedere l'indennità di educazione per i figli, non si può esigere dai cittadini di altri Stati membri dell'UE di produrre un regolare documento di soggiorno per accedere agli stessi benefici.[414] Rifiutare il congedo parentale a talune categorie di persone, tra cui le madri committenti che abbiano avuto un figlio mediante un

414 CGUE, sentenza 12 maggio 1998, causa C-85/96, *María Martínez Sala c. Freistaat Bayern*, punti 60–65.

contratto di maternità surrogata, è discriminatorio.[415] Lo stesso dicasi per gli uomini dipendenti pubblici cui è rifiutato il congedo parentale, se le loro mogli non lavorano o esercitano una professione, a meno che le stesse, a causa di grave malattia o disabilità, non siano incapaci di provvedere all'educazione di un bambino.[416] Analogamente, gli Stati membri devono istituire un regime di congedo parentale in caso di nascita di gemelli, che assicuri ai genitori di ricevere un trattamento specifico rispondente alle loro esigenze. A tal fine è possibile determinare la durata del congedo parentale in base al numero di figli nati e prevedere altre forme di assistenza quali un sostegno materiale o un aiuto finanziario.[417]

Nell'ambito del diritto del Consiglio d'Europa, la Corte EDU ha esaminato un presunto caso di discriminazione nella concessione di un congedo parentale e degli assegni familiari in Russia.

> Esempio: nel caso *Konstantin Markin c. Russia*,[418] il congedo parentale è stato rifiutato a un militare di carriera dell'esercito russo, pur essendo un istituto concesso alle persone di sesso femminile appartenenti all'arma. A parere della Corte, il rifiuto di concedere ai militari di sesso maschile il congedo parentale non è ragionevole né giustificato. Né il contesto specifico delle forze armate né le affermazioni concernenti l'esistenza di un rischio per l'efficienza operativa dell'arma o le argomentazioni riguardanti il ruolo speciale devoluto alle donne in relazione alla maternità o le concezioni tradizionali prevalenti nel Paese sono stati considerati utili a giustificare la differenza di trattamento. La Corte ha pertanto riscontrato una violazione dell'articolo 14 in combinato disposto con l'articolo 8 della CEDU.

Gli articoli 12-14 della CSE contengono disposizioni più ampie sul diritto alla sicurezza sociale, all'assistenza sociale e medica, e al diritto ad usufruire di servizi sociali. L'articolo 16 della CSE menziona esplicitamente le prestazioni sociali e familiari come strumento per promuovere la tutela economica, giuridica e sociale della vita di famiglia. L'articolo 30 della CSE sancisce il diritto alla protezione contro la povertà e l'emarginazione sociale. Talune rivendicazioni in materia di

418 Corte EDU, sentenza 22 marzo 2012, *Konstantin Markin c. Russia* [GC] (n. 30078/06).

sicurezza sociale ricadono nell'ambito di applicazione dell'articolo 1, Protocollo n. 1 alla CEDU, purché la legislazione nazionale non generi un interesse di natura proprietaria, prevedendo il pagamento, di diritto, della prestazione assistenziale, subordinato o meno al precedente pagamento dei contributi.[419]

L'articolo 12 della CSE impone agli Stati di stabilire o mantenere un regime di sicurezza sociale e di adoperarsi per elevare progressivamente il livello di tale regime.

Ai sensi dell'articolo 16 della CSE gli Stati sono tenuti a garantire la tutela economica, giuridica e sociale della vita di famiglia per mezzo di strumenti appropriati. I mezzi primari dovrebbero essere le prestazioni familiari e le prestazioni per figli a carico, purché rientrino nell'ambito della previdenza sociale e siano disponibili a tutta la popolazione o subordinati a requisiti di reddito. Queste prestazioni devono costituire un'adeguata integrazione del reddito per un numero consistente di famiglie. Il CEDS valuta l'adeguatezza delle prestazioni familiari (parentali) con particolare riguardo per il reddito mediano equivalente (Eurostat).[420] Il CEDS è del parere che l'assenza di un regime generale di prestazioni familiari non sia conforme alla CSE.[421]

Il CEDS ammette, tuttavia, che il pagamento delle prestazioni per figli a carico possa essere subordinato alla residenza dei figli.[422] È del parere che la mera introduzione di una tutela estremamente limitata contro i rischi sociali ed economici nei contratti di apprendistato prevista per gli adolescenti (di età compresa tra 15 e 18 anni, che avevano diritto esclusivamente a prestazioni di malattia in natura e a una copertura assicurativa per gli infortuni sul lavoro al tasso dell'1 %) escluda di fatto una specifica categoria di lavoratori (minorenni) dalla gamma generale di tutele offerta dal regime di previdenza sociale. Essa pertanto viola l'obbligo dello Stato di elevare progressivamente il livello del regime di sicurezza sociale.[423]

La sospensione dell'assegno famigliare in caso di assenteismo scolastico rappresenta inoltre un limite sproporzionato al diritto del nucleo familiare alla tutela economica, sociale e legale.

---

419 Corte EDU, sentenza 7 luglio 2011, *Stummer c. Austria* [GC] (n. 37452/02), punto 82.

420 CEDS, Conclusioni 2006, Estonia, pag. 215.

421 CEDS, Conclusioni 2011, Turchia, articolo 16.

422 CEDS (2007), Conclusioni XVIII-1, Introduzione generale, pag. 11.

423 CESD, sentenza 23 maggio 2012, *General Federation of Employees of the National Electric Power Corporation (GENOP-DEI) e Confederation of Greek Civil Servants' Trade Unions (ADEDY) c. Grecia* (ricorso n. 66/2011), punto 48.

Esempio: in una denuncia contro la Francia, l'EUROCEF (*European Committee for Home-Based Priority Action for the Child and the Family*, il comitato europeo per un'azione prioritaria in favore del fanciullo e della famiglia in ambiente domestico) sosteneva che la sospensione delle prestazioni familiari applicata per contrastare l'assenteismo scolastico rappresentasse una violazione del diritto delle famiglie alla tutela sociale, legale ed economica sancita dall'articolo 16 della CSE. Il comitato, ritenendo il provvedimento sproporzionato rispetto allo scopo perseguito, ha osservato che la misura contestata di sospendere ed eventualmente revocare le prestazioni familiari fa ricadere esclusivamente sui genitori la responsabilità di perseguire l'obiettivo della riduzione dell'assenteismo scolastico e accresce la vulnerabilità economica e sociale delle famiglie interessate.[424]

La Convenzione europea sullo statuto giuridico dei lavoratori emigranti[425] stabilisce che ai lavoratori migranti che sono legalmente occupati nel territorio di un altro Stato e ai loro familiari sia garantito pari accesso all'assistenza sociale (articolo 18) e ad altri "servizi sociali" che favoriscono l'integrazione di questi individui nello Stato ospitante (articolo 10). Analogamente, la Convenzione europea di sicurezza sociale tutela i diritti dei rifugiati e degli apolidi ad accedere alle prestazioni di sicurezza sociale nello Stato ospitante (compresi gli assegni per figli a carico).[426]

Nell'ambito del diritto internazionale, il diritto a uno standard di vita adeguato è sancito dall'articolo 11 dell'ICESCR e dall'articolo 27 della CRC.

Grecia*, n. 8687/08, 2011 (ricorsi effettivi per migliorare le condizioni di detenzione)

L'UE è esplicitamente competente a legiferare nel settore della migrazione e dell'asilo. Le disposizioni per i figli dei migranti disciplinano una gamma di situazioni, tra cui la migrazione di lungo periodo per motivi di lavoro, l'asilo e la protezione sussidiaria, nonché la situazione dei migranti irregolari. Oltre alla tutela cui hanno diritto i figli dei migranti ai sensi dell'articolo 24 della Carta dei diritti fondamentali dell'UE, gli articoli 18 e 19 della stessa sanciscono il diritto all'asilo e alla protezione in caso di allontanamento, di espulsione e di estradizione. L'UE si è occupata altresì delle esigenze specifiche dei minori non accompagnati, anche in relazione ad aspetti giuridici quali la tutela legale e la rappresentanza legale, l'accertamento dell'età, l'identificazione dei familiari e il ricongiungimento con la famiglia, le procedure d'asilo, il trattenimento e l'espulsione, oltre che ad aspetti riguardanti le condizioni di vita dei minori, compresi l'alloggio, l'assistenza sanitaria, l'istruzione e la formazione, la religione, le norme e i valori culturali, lo svago e il divertimento, e l'interazione sociale e le esperienze di razzismo.[427]

Nell'ambito del sistema del Consiglio d'Europa, sono quattro in particolare le convenzioni che sanciscono i diritti dei migranti minorenni in vari contesti: la CEDU, la CSE, la Convenzione europea sullo statuto giuridico dei lavoratori emigranti e la Convenzione europea sulla nazionalità. Questo capitolo si occupa perlopiù dell'attuazione delle disposizioni della CEDU, in particolare l'articolo 3 (protezione da trattamenti inumani o degradanti), l'articolo 5 (privazione della libertà) e l'articolo 8 (diritto al rispetto della vita privata e familiare), da soli o in combinato disposto con l'articolo 14 (non discriminazione). Tali disposizioni sono usate a sostegno del diritto dei migranti, rifugiati e richiedenti asilo minorenni e dei loro familiari al ricongiungimento familiare, all'accesso alla giustizia e a un soggiorno stabile nello Stato ospitante.

A livello internazionale, alcune disposizioni della CRC definiscono i diritti dei minori nel contesto della migrazione e dell'asilo e hanno contribuito allo sviluppo di misure legali a livello europeo. In particolare, l'articolo 7 protegge il diritto dei minori all'iscrizione nei registri dello stato civile, alla cittadinanza e all'assistenza genitoriale; l'articolo 8 tutela il diritto del fanciullo a preservare la propria identità, compresa la sua nazionalità, il suo nome e le sue relazioni familiari; l'articolo 9 garantisce che i fanciulli separati intrattengano contatti diretti con entrambi i genitori, a meno che ciò non sia contrario al loro interesse preminente; l'articolo 22, infine, garantisce ai fanciulli con lo status di rifugiati il diritto a ricevere una protezione e un'assistenza speciali. Infine, la Convenzione delle Nazioni

427 Cfr. anche FRA (2010); FRA (2011a), pagg. 27–38; FRA (2011b), pagg. 26–30.

Unite sullo status di rifugiati,[428] unitamente al suo protocollo del 1967, è universalmente considerata il fulcro della legislazione internazionale in materia di protezione dei rifugiati.

I seguenti paragrafi si riferiscono in particolare all'ingresso e al soggiorno (paragrafo 9.1); all'accertamento dell'età (paragrafo 9.2); al ricongiungimento familiare per i minori separati (paragrafo 9.3); al trattenimento (paragrafo 9.4); all'espulsione (paragrafo 9.5) e all'accesso alla giustizia (paragrafo 9.6).

9.1. Ingresso e soggiorno

Punti salienti

- I cittadini dell'UE hanno diritto alla libera circolazione all'interno dell'UE.
- Le decisioni relative all'ingresso e al soggiorno di un minore devono essere adottate nell'ambito di meccanismi e procedure appropriati e nell'interesse superiore del minore.

Nell'ambito del diritto dell'UE, la natura e l'ambito di applicazione dei diritti dei minori sono estremamente diversi e variano in base alla cittadinanza del minore e ai genitori, e a seconda che il minore si sia trasferito con i genitori o in maniera autonoma.

La migrazione di cittadini dell'UE è disciplinata da vari strumenti giuridici. I diritti garantiti ai cittadini dell'UE sono di ampio respiro e mirano a stimolare una mobilità ottimale attraverso l'Unione. In primo luogo, l'articolo 21 del TFUE stabilisce che i cittadini dell'UE e i loro familiari hanno il diritto di circolare e di soggiornare liberamente nel territorio di un qualsiasi Stato membro dell'UE. Inoltre, una volta raggiunto lo Stato ospitante, essi hanno il diritto di essere trattati alla stregua dei cittadini di quello Stato per quanto concerne l'accesso alle prestazioni lavorative, sociali e assistenziali, alla scuola, all'assistenza sanitaria ecc. e le relative

428 ONU, Assemblea generale, *Convenzione sullo status di rifugiati*, 28 luglio 1951, Nazioni Unite, Serie dei trattati, vol. 189, pag. 137.

condizioni di accesso.[429] L'articolo 45 della Carta dei diritti fondamentali dell'UE garantisce anch'esso il diritto per i cittadini dell'UE di circolare liberamente nel territorio degli Stati membri.

I diritti dei minori di circolare liberamente assieme a genitori/tutori cittadini dell'UE sono altresì disciplinati dalla direttiva sulla libera circolazione,[430] la quale stipula che i familiari hanno il diritto di entrare nel territorio di uno Stato ospitante e di soggiornarvi, indipendentemente dal fatto che viaggino con il cittadino dell'UE migrante o in un momento successivo (articolo 5, paragrafo 1). Ai sensi di tale strumento, si intendono per "familiare" i figli biologici del cittadino dell'UE (o del suo coniuge o partner) di età inferiore a 21 anni o che siano a suo carico (articolo 2, paragrafo 2). Può trattarsi di cittadini sia dell'UE sia di un paese terzo, purché la persona con cui si sono trasferiti sia un cittadino dell'Unione. Nei primi tre mesi successivi al trasferimento, il diritto della famiglia al soggiorno è incondizionato; successivamente, i cittadini dell'UE che desiderano tenere con sé i figli nel paese ospitante devono dimostrare di disporre di risorse economiche sufficienti e di un'assicurazione malattia (articolo 7). I figli e altri familiari del cittadino dell'UE che si trasferisce in un altro Stato membro acquisiscono automaticamente il diritto al soggiorno permanente se hanno soggiornato per cinque anni in via continuativa assieme al cittadino dell'Unione nello Stato membro ospitante (articolo 16, paragrafo 2, e articolo 18). A quel punto non sono più soggetti a condizioni in termini di risorse economiche e di assicurazione malattia.

La libertà di circolazione di cittadini di paesi terzi che non appartengono alla famiglia di un cittadino dell'UE è soggetta a maggiori restrizioni. Questa sfera è disciplinata in parte dal diritto dell'UE e in parte dalla legislazione nazionale in materia di immigrazione.

Nel contesto delle procedure di tutela internazionale, i minori sono considerati "persone vulnerabili" la cui situazione specifica negli Stati membri deve essere

429 Sono state imposte alcune restrizioni sui migranti provenienti dalla Croazia, il paese che per ultimo ha aderito all'UE, per un periodo transitorio che termina nel giugno 2015, con la possibilità per gli Stati membri di estendere al 2020 il periodo di applicazione di tali restrizioni.

430 Si noti che le disposizioni pertinenti della direttiva si applicano anche nel SEE. Cfr. anche l'accordo sullo Spazio economico europeo, 2 maggio 1992, parte III, libera circolazione delle persone, dei servizi e dei capitali, e l'accordo tra la Comunità europea ed i suoi Stati membri, da una parte, e la Confederazione svizzera, dall'altra, sulla libera circolazione delle persone, firmato a Lussemburgo il 21 giugno 1999, entrato in vigore il 1° giugno 2002 (GU L 114 del 30.4.2002, pag. 6).

presa in considerazione nell'applicazione del diritto dell'UE.[431] Ciò impone agli Stati l'obbligo di individuare e attivare le misure specifiche di cui, in particolare, potrebbero aver bisogno i minori richiedenti asilo nel momento in cui entrano nel paese ospitante. L'articolo 24 della Carta dei diritti fondamentali dell'Unione europea, che sancisce i diritti dei bambini, si applica ai requisiti di ingresso e di soggiorno dell'*acquis* dell'UE in materia di asilo. Esso stabilisce che, in tutti gli atti relativi ai minori, siano essi compiuti da autorità pubbliche o da istituzioni private, gli Stati membri si adoperino affinché l'interesse superiore del minore sia considerato preminente. Più in particolare, il principio dell'interesse superiore del minore soggiace all'attuazione della direttiva 2013/32/UE recante procedure comuni ai fini del riconoscimento e della revoca dello status di protezione internazionale (direttiva sulle procedure d'asilo)[432] e del regolamento che stabilisce i criteri e i meccanismi di determinazione dello Stato membro competente per l'esame di una domanda di protezione internazionale presentata in uno degli Stati membri da un cittadino di un paese terzo o da un apolide (regolamento Dublino), laddove essi si riferiscono ai minori.[433] Entrambi i testi contengono inoltre garanzie specifiche per i minori non accompagnati, compresa la rappresentanza legale. Il regolamento (CE) n. 562/2006 sul Codice frontiere Schengen obbliga le guardie di frontiera a verificare la sussistenza della potestà genitoriale nei confronti del minore, soprattutto nel caso in cui il minore sia accompagnato da un adulto soltanto e vi siano seri motivi di ritenere che il minore sia stato illegalmente sottratto alla custodia della persona o delle persone che esercitano legalmente la potestà genitoriale nei suoi confronti. In tal caso, le guardie di frontiera devono svolgere ulteriori indagini, al fine di individuare incoerenze o contraddizioni nelle informazioni fornite. In caso di minori che viaggiano senza accompagnatore, le guardie di frontiera devono assicurarsi, mediante verifiche approfondite dei documenti di viaggio e dei giustificativi, che i minori non lascino il territorio

431 Cfr., in particolare, la direttiva sulle condizioni di accoglienza (2013/33/UE), articolo 21, e la direttiva sui rimpatri (2008/115/CE), articolo 3, paragrafo 9.

432 Direttiva 2013/32/UE del Parlamento europeo e del Consiglio, del 26 giugno 2013, recante procedure comuni ai fini del riconoscimento e della revoca dello status di protezione internazionale (rifusione) (GU L 180 del 29.6.2013, pag. 60), articolo 25, paragrafo 6.

433 Regolamento (UE) n. 604/2013 del Parlamento europeo e del Consiglio, del 26 giugno 2013, che stabilisce i criteri e i meccanismi di determinazione dello Stato membro competente per l'esame di una domanda di protezione internazionale presentata in uno degli Stati membri da un cittadino di un paese terzo o da un apolide (rifusione) (GU L 180 del 29.6.2013, pagg. 31–59), articolo 6.

contro la volontà della persona o delle persone che esercitano la potestà genitoriale nei loro confronti.[434]

Nell'ambito del diritto del Consiglio d'Europa, gli Stati hanno il diritto, in virtù di un consolidato principio di diritto internazionale e fatti salvi gli obblighi derivanti dai trattati (compresa la CEDU), di controllare l'ingresso, il soggiorno e l'espulsione dei non cittadini. Il diritto al rispetto della vita privata e familiare di cui all'articolo 8 della CEDU è spesso invocato come scudo contro l'espulsione in casi concernenti minori che, altrimenti, sarebbero considerati come non bisognosi di protezione internazionale, compresa la protezione sussidiaria. Sono state riscontrate violazioni dell'articolo 8 in casi riguardanti minori, poiché la separazione forzata da parenti stretti può avere un forte impatto sul loro equilibrio e sulla loro identità scolastica, sociale ed emotiva.[435]

9.2. Accertamento dell'età[436]

Punti salienti

- Le procedure di accertamento dell'età devono tener conto dei diritti del minore.
- L'accertamento dell'età si riferisce alle procedure attraverso cui le autorità cercano di determinare l'età legale di un migrante per individuare le procedure e le norme da seguire in materia di immigrazione.

Nell'ambito del diritto dell'UE, l'articolo 25, paragrafo 5, della direttiva sulle procedure d'asilo consente agli Stati membri di effettuare visite mediche, purché siano eseguite "nel pieno rispetto della dignità della persona con l'esame meno invasivo possibile ed effettuato da professionisti nel settore medico qualificati". Tale disposizione prevede altresì che il minore sia informato, in una lingua che capisce, della possibilità che la sua età possa essere determinata attraverso una visita medica e che il minore acconsenta allo svolgimento della visita medica. Il

434 Regolamento (CE) n. 562/2006 del Parlamento europeo e del Consiglio, del 15 marzo 2006, che istituisce un codice comunitario relativo al regime di attraversamento delle frontiere da parte delle persone (codice frontiere Schengen) (GU L 105 del 13.4.2006), allegato VII, paragrafo 6.

rifiuto di sottoporsi alla visita medica finalizzata all'accertamento dell'età non è un motivo sufficiente per respingere la domanda di protezione internazionale.

La natura e l'ambito di applicazione dei metodi di accertamento dell'età utilizzati nell'UE variano di Paese in Paese.[437] Nel Regno Unito, per esempio, la magistratura ha rivisto le procedure nazionali sull'accertamento dell'età e, nel caso *Merton*, ha definito i requisiti procedurali minimi per l'accertamento dell'età quando una persona dichiara di essere un minore senza accompagnamento.[438] Tra i requisiti si annoverano il diritto del richiedente asilo di essere informato in merito ai motivi del rigetto o alle obiezioni della persona incaricata di condurre il colloquio.[439] I giudizi nazionali hanno inoltre menzionato la necessità di applicare il beneficio del dubbio nei casi di accertamento dell'età, benché tale posizione sia stata interpretata da alcuni giudici nazionali come una mera valutazione "indulgente" delle prove anziché un principio formale di "beneficio del dubbio".[440]

Nell'ambito del diritto del Consiglio d'Europa, non vi sono disposizioni specifiche o una giurisprudenza della Corte EDU sui diritti dei minori nell'ambito delle procedure di accertamento dell'età. Tuttavia, il ricorso a prassi particolarmente invasive in tal senso potrebbe sollevare un problema ai sensi degli articoli 3 o 8 della CEDU. L'articolo 3 è stato interpretato in modo da comprendere un'ampia gamma di scenari che potrebbero essere considerati disumani o degradanti, compresi gli esami fisici invasivi sui minori.[441] Ai sensi dell'articolo 8, applicato al contesto dell'immigrazione, le autorità potrebbero legittimamente interferire con il diritto di un minore alla vita privata e condurre accertamenti dell'età, se l'ingerenza è prevista dalla legge e necessaria per tutelare uno degli scopi legittimi di cui all'articolo 8, paragrafo 2, della CEDU.

Nell'ambito del diritto internazionale, l'articolo 8 della CRC obbliga gli Stati a rispettare il diritto del fanciullo a preservare la propria identità. Ciò implica l'obbligo

437 Per una panoramica dei vari metodi applicati in ciascun paese, cfr. le seguenti linee guida "European Asylum Support Office Guidelines on Age Assessment Practice in Europe", Lussemburgo, 2014. Cfr. anche FRA (2010), pagg. 53–55.

di assistere il fanciullo nel ristabilire la sua identità, anche confermando l'età del bambino. Le procedure di accertamento dell'età, tuttavia, dovrebbero rappresentare l'ultima risorsa.

In ogni caso, le procedure nazionali di accertamento dell'età dovrebbero essere guidate dal principio dell'interesse superiore del minore. Il comitato delle Nazioni Unite sui diritti dell'infanzia sostiene che l'accertamento dell'età dovrebbe tener conto dell'aspetto fisico del fanciullo e della sua maturità psicologica. La visita medica deve essere eseguita con metodi scientifici, in piena sicurezza, con modalità giuste e rispettose del bambino e del suo sesso, e, evitando il rischio di violazione dell'integrità fisica del minore e osservando il debito rispetto della dignità umana.[442]

9.3. Ricongiungimento familiare e minori separati[443]

Punti salienti

- Le disposizioni a livello europeo intervengono prevalentemente sul ricongiungimento sicuro dei minori con i genitori, nel paese ospitante o nel paese d'origine.
- Nel determinare quali familiari debbano essere ricongiunti al nucleo familiare sarà data priorità ai genitori del minore e/o ai principali responsabili della sua assistenza.
- I casi di ricongiungimento familiare devono essere ispirati al principio dell'interesse superiore del minore.

Nell'ambito del diritto dell'UE, lo strumento fondamentale è la direttiva sul ricongiungimento familiare, che impone agli Stati membri l'obbligo di autorizzare l'ingresso e il soggiorno dei genitori del minore non accompagnato che siano cittadini di paesi terzi, nelle situazioni in cui il ricongiungimento con i genitori all'estero non rappresenti l'interesse superiore del minore. In assenza di un genitore, gli Stati membri possono autorizzare l'ingresso e il soggiorno del tutore legale

del minore o di altro familiare.[444] La definizione e i diritti correlati alla "famiglia" sono pertanto più generosi nei confronti dei minori non accompagnati rispetto alla maggior parte delle altre categorie di figli di migranti.

Quanto ai minori richiedenti asilo, la direttiva qualifiche sottolinea la necessità di provvedere, per quanto possibile, affinché i minori non accompagnati siano alloggiati presso familiari adulti nello Stato ospitante, che i fratelli siano alloggiati assieme e che i familiari assenti siano rintracciati quanto prima, effettuando le operazioni in sicurezza e in via confidenziale (articolo 31). La direttiva sulle condizioni di accoglienza contiene disposizioni simili per i minori non accompagnati che non hanno ancora acquisito lo status di rifugiato (articolo 24).

La direttiva 2001/55/CE del Consiglio, del 20 luglio 2001, sulle norme minime per la concessione della protezione temporanea in caso di afflusso massiccio di sfollati e sulla promozione dell'equilibrio degli sforzi tra gli Stati membri che ricevono gli sfollati e subiscono le conseguenze dell'accoglienza degli stessi (direttiva sulla protezione temporanea), cerca anche di accelerare il ricongiungimento dei familiari (compresi i minori) che sono stati separati a causa di circostanze connesse all'afflusso massiccio dal loro paese d'origine (articolo 15).[445] Questa direttiva, tuttavia, non è stata ancora resa effettiva; perché possa essere "attivata", è necessaria una decisione del Consiglio e questa decisione deve ancora essere adottata.
