Exemple : l'affaire *Popov c. France*[451] concernait la rétention administrative d'une famille pendant deux semaines dans l'attente de leur expulsion vers le Kazakhstan. La CouEDH a conclu à l'existence d'une violation de l'article 3 de la CEDH dans la mesure où les autorités françaises n'avaient pas mesuré les conséquences inévitablement dommageables, pour les deux enfants (âgés de cinq mois et de trois ans), d'un placement dans un centre de rétention dans des conditions qui n'étaient « pas adaptées à la présence d'enfants »[452]. La Cour a également conclu à une violation des articles 5 et 8 à l'égard de la famille entière et fait référence à l'article 37 de la CRC, qui exige que « [t]out enfant privé de liberté soit traité avec humanité et avec le respect dû à la dignité de la personne humaine, et d'une manière tenant compte des besoins des personnes de son âge »[453].

Exemple : de même, dans l'affaire *Kanagaratnam et autres c. Belgique*[454], le placement en détention d'une mère demandeuse d'asile et de ses trois enfants dans un centre fermé pour étrangers en situation irrégulière pendant quatre mois a été jugé constituer une violation des articles 3 et 5 de la CEDH. Malgré le fait que les enfants aient été accompagnés de leur mère, la Cour a considéré qu'en les plaçant dans un centre fermé, les autorités belges les avaient exposés à des sentiments d'angoisse et d'infériorité et

450 CouEDH, *Muskhadzhiyeva et autres c. Belgique*, n° 41442/07, 19 janvier 2010.

451 CouEDH, *Popov c. France*, n° 39472/07 et 39474/07, 19 janvier 2012.

452 *Ibid.*, para. 95.

453 *Ibid.*, para. 90.

454 CouEDH, *Kanagaratnam et autres c. Belgique*, n° 15297/09, 13 décembre 2011.

avaient pris en toute connaissance de cause, le risque de compromettre leur développement.[455]

Dans le droit international, l'article 9, paragraphe 4, de la CRC dispose que lorsqu'un enfant est placé en détention, les autorités nationales doivent donner aux parents les renseignements essentiels quant au lieu où se trouve l'enfant[456].

9.5. Expulsion[457]

Points clés

- La vulnérabilité des enfants migrants face à l'expulsion est étroitement liée au statut de résident de leurs parents dans l'État d'accueil.
- Le principe de l'intérêt supérieur doit orienter toutes les décisions relatives à l'expulsion d'un enfant immigrant et de sa famille/des personnes qui en ont la charge.
- Le droit de l'UE distingue certaines circonstances dans lesquelles les enfants migrants peuvent demeurer dans un État d'accueil quel que soit le statut juridique de leurs parents, notamment pour achever leur éducation ou lorsqu'il serait difficile pour eux de bâtir une vie familiale ailleurs.

Dans le droit de l'UE, comme dans d'autres domaines du droit de l'UE en matière de migration, les règles régissant l'expulsion des enfants varient en fonction de la nationalité de ces derniers, de la nationalité de leurs parents et du contexte de leur migration. Une fois qu'un enfant obtient l'accès à un État membre au titre du droit de l'UE en matière de libre circulation, il peut généralement y demeurer même si le proche avec lequel il avait initialement emménagé perd son droit de résidence ou décide de quitter le pays.

455 Le Comité européen pour la prévention de la torture et des peines ou traitements inhumains ou dégradants a décrit, dans son 19e rapport général, des garanties destinées aux migrants en situation irrégulière privés de liberté, accompagnées de garanties supplémentaires pour les enfants. Pour plus d'informations, voir *20 ans de lutte contre la torture - 19e rapport général du Comité européen pour la prévention de la torture et des peines ou traitements inhumains ou dégradants (CPT), 1er août 2008 - 31 juillet 2009*, CPT/Inf (2009) 27, Strasbourg, 20 octobre 2009.

456 Voir, au sujet des garanties internationales pour les enfants placés en rétention, le *Rapport du Rapporteur spécial sur la torture et autres peines ou traitements cruels, inhumains ou dégradants*, 5 mars 2015, A/HRC/28/68.

457 Également appelée retour, éloignement, rapatriement, extradition en fonction du contexte juridique. Aux fins du présent chapitre, le terme « expulsion » sera utilisé pour définir l'éloignement légal d'un non-ressortissant ou d'une autre personne d'un État. Voir également FRA et CouEDH (2014), section 5.4, sur le maintien de l'unité familiale et la protection contre l'expulsion.

En particulier, au titre de la directive relative à la liberté de circulation, les enfants et les membres de leur famille ont le droit de rester dans l'État d'accueil après le décès du proche citoyen de l'UE avec lequel ils avaient initialement emménagé (article 12, paragraphe 2), pour autant qu'ils aient vécu dans l'État d'accueil pendant au moins 12 mois avant le décès du proche en question. De même, ils peuvent en principe demeurer dans l'État d'accueil après le départ de leur proche. Toutefois, dans les deux cas, si l'enfant/le membre de la famille est un ressortissant de pays tiers, son droit de résidence est subordonné à sa capacité de démontrer qu'il possède suffisamment d'argent pour subvenir à ses besoins. Il doit également posséder une assurance maladie (article 7).

Les règles sont encore plus permissives pour les enfants inscrits dans un établissement d'enseignement de l'État d'accueil. Ces enfants, ainsi que le parent ayant leur garde ou leur pourvoyeur primaire de soins, ont le droit de demeurer dans l'État d'accueil après le décès ou le départ du citoyen migrant de l'UE qu'ils ont initialement rejoint, quel que soit leur nationalité (article 12, paragraphe 3). Si, initialement, cette concession liée à l'éducation semblait ne s'appliquer qu'aux enfants de familles ayant suffisamment de moyens pour subvenir à leurs propres besoins[458], la jurisprudence a ensuite confirmé qu'elle s'appliquait également aux enfants placés dans le système éducatif susceptibles de dépendre de l'aide sociale[459].

Par ailleurs, les membres d'une famille et, plus particulièrement, les proches ressortissants de pays tiers ont également le droit de demeurer dans l'État d'accueil après le divorce du partenaire citoyen de l'UE s'ils ont la garde principale des enfants du couple ou s'ils ont obtenu un droit de visite des enfants devant être exercé dans l'État d'accueil (article 13, paragraphe 2, points b) et d)).

La CJUE s'est basée sur le statut de citoyen de l'UE d'un enfant au titre de l'article 20 du TFUE pour octroyer à ses parents ressortissants de pays tiers un permis de travail et de séjour dans l'État membre dont l'enfant possède la citoyenneté. Ainsi, l'enfant, qui aurait sinon dû quitter l'UE pour accompagner ses parents, peut jouir des droits liés à son statut de citoyen de l'UE[460]. Toutefois, la jurisprudence

458 CJUE, C-413/99, *Baumbast et R c. Secretary of State for the Home Department*, 17 septembre 2002.

459 CJUE, C-480/08, *Maria Teixeira c. London Borough of Lambeth et Secretary of State for the Home Department*, 23 février 2010 ; CJUE, C-310/08, *London Borough of Harrow c. Nimco Hassan Ibrahim et Secretary of State for the Home Department* [GC], 23 février 2010. L'éducation des enfants migrants sera également abordée à la section 8.2.

460 CJUE, C-34/09, *Gerardo Ruiz Zambrano c. Office national de l'emploi (ONEm)*, 8 mars 2011.

postérieure de la CJUE indique que « le seul fait qu'il pourrait paraître souhaitable à un ressortissant d'un État membre, pour des raisons d'ordre économique ou afin de maintenir l'unité familiale sur le territoire de l'Union, que des membres de sa famille, qui ne disposent pas de la nationalité d'un État membre, puissent séjourner avec lui sur le territoire de l'Union, ne suffit pas en soi pour considérer que le citoyen de l'Union serait contraint de quitter le territoire de l'Union si un tel droit n'est pas accordé »[461].

La directive sur la liberté de circulation dispose explicitement que toute expulsion exceptionnelle d'un enfant doit respecter les dispositions de la CRC (considérant 24). Par ailleurs, l'article 28, paragraphe 3, point b), confirme qu'un enfant ne peut être expulsé à moins que son retour ne soit considéré comme étant dans son intérêt supérieur et ne soit conforme aux dispositions de la Convention.

S'agissant des enfants demandeurs d'asile dont la demande a été rejetée, la directive « retour » précise que l'intérêt supérieur de l'enfant doit orienter les décisions relatives au retour des enfants non accompagnés (article 10). Par ailleurs, avant d'éloigner du territoire d'un État membre un enfant non accompagné, les autorités de cet État membre doivent s'assurer qu'il sera remis à un membre de sa famille, à un tuteur désigné ou à des structures d'accueil adéquates dans l'État de retour (article 10, paragraphe 2).

Lorsqu'un enfant demandeur d'asile est renvoyé dans un autre État membre pour y faire étudier sa demande d'asile, le règlement de Dublin dispose que le principe de l'intérêt supérieur doit orienter l'application de la décision (article 6). Le règlement inclut par ailleurs une liste des facteurs à prendre en considération, afin d'aider les autorités à déterminer l'intérêt supérieur de l'enfant. Parmi ces facteurs figurent la prise en considération des possibilités de regroupement familial, le bien-être et le développement social de l'enfant, les aspects relatifs à la sûreté et à la sécurité, en particulier lorsque l'enfant risque d'être victime de la traite des êtres humains, ainsi que le point de vue de l'enfant, en fonction de son âge et de sa maturité.

Exemple : dans l'affaire *The Queen, à la demande de MA et autres c. Secretary of State for the Home Department*[462], la CJUE a dû déterminer quel État était responsable dans le cas d'un enfant non accompagné qui avait a introduit des demandes d'asile dans plusieurs États membres de l'UE et ne possède aucune famille ou proches dans d'autres États membres de l'UE. La Cour a précisé qu'en l'absence de membres de la famille se trouvant légalement dans un État membre, l'État dans lequel l'enfant est physiquement présent est responsable de l'examen de la demande. Elle s'est appuyée pour cette conclusion sur l'article 24, paragraphe 2 de la Charte des droits fondamentaux de l'UE, aux termes duquel l'intérêt supérieur de l'enfant doit être privilégié dans toutes les actions qui concerne ce dernier.

Dans le droit du CdE, les États disposent théoriquement du droit d'ingérence dans l'exercice du droit au respect de la vie familiale conformément à l'article 8, paragraphe 2, de la CEDH.

Exemple : l'affaire *Gül c. Suisse*[463] concerne un requérant vivant en Suisse avec son épouse et sa fille, tous trois ayant obtenu un permis de séjour pour des motifs humanitaires. Le requérant souhaitait également faire venir en Suisse son fils mineur, resté en Turquie. Toutefois, les autorités suisses ont rejeté sa demande, essentiellement au motif qu'il n'avait pas les moyens de subvenir aux besoins de sa famille. La CouEDH a considéré qu'en quittant la Turquie, le requérant avait été à l'origine de la séparation avec son fils. Ses récentes visites en Turquie tendaient à montrer que ses raisons initiales de demander l'asile en Suisse n'étaient plus d'actualité. Aucun obstacle n'empêchait la famille de se réinstaller dans son pays d'origine, où le fils mineur avait toujours vécu. Tout en reconnaissant que la situation de la famille était très difficile d'un point de vue humain, la Cour n'a trouvé aucune violation de l'article 8 de la CEDH.

Exemple : Dans l'affaire *Üner c. Pays-Bas*[464], la Cour a confirmé la nécessité de tenir compte de l'incidence d'une expulsion sur les enfants d'une famille pour déterminer si cette expulsion constitue une réponse

462 CJUE, C-648/11, *The Queen, à la demande de MA et autres c. Secretary of State for the Home Department*, 6 juin 2013.

463 CouEDH, *Gül c. Suisse*, n° 23218/94, 19 février 1996.

464 CouEDH, *Üner c. Pays-Bas* [GC], n° 46410/99, 18 octobre 2006, paras. 57-58. Voir également *Boultif c. Suisse*, n° 54273/00, 2 août 2001.

proportionnée. Il importe notamment de prendre en considération « l'intérêt et le bien-être des enfants, en particulier la gravité des difficultés que les enfants [...] sont susceptibles de rencontrer dans le pays vers lequel l'intéressé doit être expulsé ; et la solidité des liens sociaux, culturels et familiaux avec le pays hôte et avec le pays de destination ».

Exemple : l'affaire *Tarakhel c. Suisse*[465] porte sur le refus des autorités suisses d'examiner la demande d'asile d'un couple afghan et de leurs six enfants et leur décision de les renvoyer en Italie. La CouEDH a considéré qu'au vu de la situation actuelle du système d'accueil italien et en l'absence d'informations détaillées et fiables quant à la structure précise de destination, les autorités suisses ne disposaient pas d'éléments suffisants pour être assurées qu'en cas de renvoi vers l'Italie, les requérants seraient pris en charge d'une manière adaptée à l'âge des enfants. La Cour a par conséquent estimé que les autorités suisses commettraient une violation de l'article 3 de la CEDH en renvoyant les requérants vers l'Italie sans avoir tout d'abord obtenu auprès des autorités italiennes l'assurance qu'ils seraient accueillis dans des conditions adaptées à l'âge des enfants et que l'unité de la cellule familiale sera préservée.

Dans le droit international, un État doit fournir, sur demande d'un enfant, des parents ou de l'un d'eux, les informations essentielles sur le lieu où se trouve le membre ou les membres de la famille, placés en rétention, emprisonnés, en exil, déportés ou décédés, à moins que la divulgation de ces renseignements ne soit préjudiciable au bien-être de l'enfant (article 9, paragraphe 4, de la CRC).

9.6. Accès à la justice[466]

Point clé

- Les enfants migrants ont le droit à un recours effectif.

Dans le droit de l'UE, le droit de l'enfant d'accéder à la justice dans un contexte d'immigration est défini par divers instruments. Premièrement, le droit à un

465 CouEDH, *Tarakhel c. Suisse*, n° 29217/12, 4 novembre 2014.

466 Voir également FRA et CouEDH (2014), section 4.5, sur l'assistance judiciaire dans les procédures d'asile ou de retour.

recours effectif et à un procès équitable est consacré à l'article 47 de la Charte des droits fondamentaux de l'UE. Cet article prévoit notamment le droit de toute personne à ce que sa cause soit entendue équitablement, publiquement et dans un délai raisonnable par un tribunal indépendant et impartial, en ayant la possibilité de bénéficier de conseils, d'une défense et d'une représentation juridique adéquate conformément à l'article 48. Pour les enfants migrants, ces droits sont renforcés par une série de dispositions de droit dérivé. En particulier, le règlement de Dublin oblige les États membres à veiller à ce que les enfants non accompagnés soient représentés par un professionnel dûment qualifié ayant accès à toutes les informations pertinentes contenues dans le dossier de l'enfant (article 6). On retrouve des dispositions parallèles dans la directive « qualification » (article 31) ainsi que dans la directive sur les procédures d'asile (article 25). Le droit de l'enfant à une représentation juridique est également appuyé par le droit d'accéder aux services d'aide aux victimes et aux services d'aide spécialisés confidentiels au titre de l'article 7 de la directive 2012/29/UE établissant des normes minimales concernant les droits, le soutien et la protection des victimes de la criminalité (directive relative aux droits des victimes)[467].

Toutefois, les droits associés à l'accès à la justice ne sont pas dénués de restrictions et peuvent être soumis à certaines conditions relatives à l'âge. Par exemple, la directive sur les procédures d'asile permet aux États membres de « s'abstenir de désigner un représentant [légal] lorsque le mineur non accompagné atteindra selon toute vraisemblance l'âge de dix-huit ans avant qu'une décision ne soit prise en première instance » (article 25, paragraphe 2).

Dans le droit du CdE, la CouEDH a exclu l'applicabilité de l'article 5 (droit à un procès équitable) dans les cas relatifs à des décisions d'entrée, de séjour et d'expulsion d'étrangers[468]. Toutefois, l'article 13 de la CEDH (droit à un recours effectif) peut être invoqué dans certaines circonstances.

> Exemple : l'affaire *Rahimi c. Grèce*[469] traite des conditions dans lesquels un enfant migrant issu d'Afghanistan, qui était entré illégalement en Grèce, a été détenu dans un centre de rétention puis libéré en vue de son ex-

467 Directive 2012/29/UE du Parlement européen et du Conseil du 25 octobre 2012 établissant des normes minimales concernant les droits, le soutien et la protection des victimes de la criminalité, JO 2012 L 315, p. 55.

468 CouEDH, *Maaouia c. France* [GC], n° 39652/98, 5 octobre 2000.

469 CouEDH, *Rahimi c. Grèce*, n° 8687/08, 5 avril 2011.

pulsion. En concluant à une violation de l'article 13 de la CEDH, la CouEDH a observé que la brochure d'information fournie au requérant n'indiquait pas la procédure à suivre pour introduire une plainte auprès du chef de la police. Par ailleurs, le requérant n'a pas été informé dans une langue qu'il comprenait des recours qui étaient à sa disposition pour se plaindre des conditions de son placement en rétention. En se basant sur les rapports du Comité européen pour la prévention de la torture et des peines ou traitements inhumains ou dégradants (CPT), la Cour a noté l'absence, en Grèce, d'une autorité indépendante chargée d'inspecter les locaux de détention des forces de l'ordre. Elle a également souligné l'absence d'autorité impartiale nécessaire à l'efficacité du recours. La Cour a donc conclu à une violation de l'article 3, de l'article 5, paragraphes 1 et 4, et de l'article 13 de la CEDH.

La CSE exige des États qu'ils promeuvent la protection juridique (ainsi que sociale et économique) de la famille (article 16). Par ailleurs, l'article 19, paragraphe 1, dispose que les États doivent maintenir des « services gratuits appropriés » et veiller à ce que les travailleurs migrants et leur famille reçoivent des informations exactes sur l'émigration et l'immigration. Une exigence « d'information » similaire (au sujet de l'accès des migrants à la justice) figure à l'article 6 de la Convention européenne relative au statut juridique du travailleur migrant, mais les dispositions plus vastes régissant le « recours aux autorités judiciaires et administratives de l'État d'accueil » (article 26) ciblent exclusivement les travailleurs migrants et non les membres de leur famille[470].

Il convient de noter par ailleurs que le CdE a élaboré des lignes directrices très complètes au sujet de la justice adaptée aux enfants, spécifiant la manière dont toutes les procédures judiciaires et administratives, y compris celles en matière d'immigration, doivent être adaptées pour répondre aux besoins des enfants[471].

Dans le droit international, l'article 37 de la CRC est particulièrement pertinent pour les enfants migrants privés de liberté, puisqu'il leur garantit le droit à un accès rapide à une assistance juridique et à toute autre assistance appropriée, ainsi que le droit de contester la légalité de leur privation de liberté devant un tribunal ou une autre autorité compétente, indépendante et impartiale, dont la prise de décision doit également être rapide.

Russie*, n° 1585/09, 2013 (divulgation de dossiers médicaux) Convention pour la protection des personnes à l'égard du traitement automatisé des données à caractère personnel

Le présent chapitre traite du droit et de la jurisprudence au niveau européen dans le domaine de la protection des consommateurs et des données à caractère personnel. Il existe une abondance de dispositions législatives et de jurisprudence au niveau de l'UE, le TFUE établissant expressément la compétence de l'UE dans ces matières. La contribution du CdE dans ce domaine est plus limitée. Au niveau des traités, il existe deux grandes conventions relatives aux médias et à la protection des données. La CouEDH a également jugé un certain nombre d'affaires relatives à la protection des données de personnes.

Les sections suivantes traiteront de certains aspects particuliers du droit de la consommation relatifs aux enfants (section 10.1) et à la protection des données (section 10.2). Pour chacun de ces thèmes, le cadre juridique général et son applicabilité pour les enfants sera analysé, de même que les normes spéciales destinées à la protection des enfants, le cas échéant.

10.1. Protection des enfants en tant que consommateurs

Points clés

- Selon la CJUE, l'intérêt supérieur des enfants consommateurs et la protection de leurs droits prévalent sur les exigences d'intérêt général et justifient donc les restrictions à la libre circulation des marchandises, des personnes, des services et des capitaux.
- Les enfants consommateurs devraient recevoir les informations nécessaires pour pouvoir prendre en considération tous les faits pertinents et faire un choix en toute connaissance de cause.
- Les pratiques commerciales déloyales sont celles qui ne respectent pas le principe de diligence professionnelle et sont susceptibles d'influencer les décisions commerciales des enfants et adultes consommateurs.
- Les enfants ne peuvent participer à des essais cliniques que lorsqu'on peut espérer que l'administration du médicament procurerait au patient un bénéfice direct plus grand que les risques.
- Le droit de l'UE et du Conseil de l'Europe limitent la quantité de marketing auquel peuvent être exposés les enfants, sans l'interdire à proprement parler.
- Les enfants ont droit à une protection spécifique, notamment contre toute publicité ainsi que contre les programmes de télé-achat susceptibles de leur nuire moralement ou physiquement.
- Le placement de produits dans les programmes pour enfants est interdit.

10.1.1. Droits des consommateurs

Dans le droit de l'UE, les principaux piliers de la protection des consommateurs sont établis à l'article 169, paragraphe 1, du TFUE, ainsi qu'à l'article 38 de la Charte des droits fondamentaux de l'UE. La CJUE a reconnu que l'intérêt supérieur de l'enfant prévaut sur les exigences d'intérêt général et justifie dès lors les limites aux libertés du marché commun.

Exemple : l'affaire *Dynamic Medien*[472] traite de la vente en ligne de DVD de dessins animés japonais en Allemagne. Les dessins animés avaient été approuvés pour les enfants âgés de plus de 15 ans au Royaume-Uni, mais n'avaient pas été jugés appropriés par l'autorité compétente allemande. La CJUE devait par conséquent déterminer si l'interdiction en Allemagne était contraire au principe de liberté de circulation. Elle a conclu que la finalité de la règlementation allemande était de protéger les enfants des informations qui pourraient nuire à leur bien-être. Selon elle, la limitation de la liberté de circulation des marchandises n'est pas disproportionnée tant qu'elle ne va pas au-delà de ce qui est nécessaire pour atteindre l'objectif de protection des enfants poursuivi par l'État membre concerné.

Exemple : l'affaire *Omega*[473] porte sur l'exploitation d'un « laserdrome » en Allemagne. Le jeu pratiqué dans ce « laserdrome » consistait notamment à tirer sur des cibles sensorielles placées sur la veste des joueurs. L'équipement nécessaire à ce jeu avait été fourni par une société britannique et le jeu comme l'équipement avaient été commercialisés légitimement au Royaume-Uni. Le jeu a été interdit en Allemagne au motif qu'il était contraire à certaines valeurs fondamentales telles que la dignité humaine. La CJUE a jugé que la restriction imposée par les autorités allemandes n'était pas contraire au droit de l'Union, puisqu'elle avait été dûment justifiée par des raisons d'ordre public.

Le dernier processus de révision du droit de la consommation de l'UE a débouché sur l'adoption de la directive 2011/83/UE relative aux droits des consommateurs, qui vise à harmoniser pleinement les législations nationales relatives à la vente à distance et aux contrats hors établissement, ainsi qu'à d'autres types de contrats conclus avec les consommateurs[474]. Le but est de parvenir à un équilibre entre un niveau élevé de protection des consommateurs et la compétitivité des entreprises. Conformément à l'article 3, paragraphe 3, point a), la directive n'est pas applicable aux contrats portant sur les services sociaux, y compris le logement social, l'aide à l'enfance et l'aide aux familles et aux personnes se trouvant de

472 CJUE, C-244/06, *Dynamic Medien Vertriebs GmbH c. Avides Media AG*, 14 février 2008.

473 CJUE, C-36/02, *Omega Spielhallen- und Automatenaufstellungs-GmbH c. Oberbürgermeisterin der Bundesstadt Bonn*, 14 octobre 2004.

474 Directive 2011/83/UE du Parlement européen et du Conseil du 25 octobre 2011 relative aux droits des consommateurs, modifiant la directive 93/13/CEE du Conseil et la directive 1999/44/CE du Parlement européen et du Conseil et abrogeant la directive 85/577/CEE du Conseil et la directive 97/7/CE du Parlement européen et du Conseil, JO L 304/64 (cette directive devrait avoir été mise en œuvre au 13 décembre 2013).

manière permanente ou temporaire dans une situation de besoin, y compris les soins de longue durée. Les services sociaux englobent les services aux enfants et à la jeunesse, les services d'aide aux familles, aux parents isolés et aux personnes âgées et les services aux migrants. La directive accorde une attention particulière aux informations précontractuelles. Elle base ses « exigences en matière d'information » sur l'hypothèse que si les consommateurs, y compris les enfants, reçoivent les informations appropriées, ils pourront prendre en considération tous les faits pertinents et opérer un choix en connaissance de cause.

10.1.2. Pratiques commerciales déloyales concernant des enfants

Dans le droit de l'UE, la directive 2005/29/CE relative aux pratiques commerciales déloyales des entreprises vis-à-vis des consommateurs dans le marché intérieur[475] s'applique à l'ensemble des transactions entre entreprises et consommateurs (« B2C »), effectuées en ligne ou non, et portant indifféremment sur les biens ou les services. La directive inclut les enfants dans la catégorie des « consommateurs vulnérables » (article 5, paragraphe 3). Aucune décision commerciale ne peut être prise comme suite à un harcèlement, une contrainte, une influence injustifiée ou des informations trompeuses, et les enfants consommateurs ont le droit de prendre ces décisions librement. Elle interdit les activités de marketing et de publicité de produits créant une confusion avec un autre produit ou avec la marque d'un concurrent et dispose que le consommateur doit recevoir toutes les informations nécessaires de façon claire et compréhensible, au moment approprié pour lui permettre de prendre une décision commerciale (articles 6 et 7).

10.1.3. Sécurité des produits

Dans le droit de l'UE, il existe un cadre global visant à garantir que seuls des produits sûrs et conformes à d'autres égards soient mis sur le marché. En particulier, la directive 2001/95/CE relative à la sécurité générale des produits accorde une attention particulière à la sécurité des enfants en les incluant dans la catégorie des consommateurs pouvant être particulièrement vulnérables aux risques que présentent les produits considérés (considérant 8 de la directive).

475 Directive 2005/29/CE du Parlement européen et du Conseil du 11 mai 2005 relative aux pratiques commerciales déloyales des entreprises vis-à-vis des consommateurs dans le marché intérieur et modifiant la directive 84/450/CEE du Conseil et les directives 97/7/CE, 98/27/CE et 2002/65/CE du Parlement européen et du Conseil et le règlement (CE) n° 2006/2004 du Parlement européen et du Conseil, JO 2005 L 149/22.

Dès lors, la sécurité des produits doit être évaluée en tenant compte de tous les aspects pertinents, en particulier les catégories de consommateurs auxquelles le produit est destiné.

La directive 87/357/CEE du Conseil est une directive spécifique sur la sécurité des produits concernant le rapprochement des législations des États membres relatives aux produits qui, n'ayant pas l'apparence de ce qu'ils sont, compromettent la santé ou la sécurité des consommateurs[476]. Elle interdit la commercialisation, l'importation et la fabrication des produits qui ressemblent à des denrées alimentaires, mais qui ne sont pas comestibles. Les États membres doivent effectuer des contrôles afin de s'assurer qu'aucun produit de ce type ne soit commercialisé. Si un État membre interdit un produit au titre de cette directive, il doit en informer la Commission et fournir des détails afin d'informer les autres États membres. La question particulière de la sécurité des jouets est abordée plus en détail à la section 10.1.6.

10.1.4. Essais cliniques sur les enfants

Dans le droit de l'UE, la directive 2001/20/CE[477] concernant le rapprochement des dispositions des États membres relatives à l'application de bonnes pratiques cliniques dans la conduite d'essais cliniques de médicaments à usage humain inclut les enfants parmi les personnes vulnérables qui ne sont pas en mesure de donner leur consentement légal pour participer à des essais cliniques (considérant 3). Un enfant ne peut participer à un essai clinique que lorsque l'administration du médicament lui procurera un bénéfice direct plus grand que les risques (considérant 3). Les essais cliniques doivent être réalisés en protégeant les sujets de manière optimale (article 4).

De même, le règlement (UE) n° 536/2014 relatif aux essais cliniques de médicaments à usage humain inclut des dispositions spécifiques pour les enfants relevant de la catégorie de la population vulnérable. Ce règlement entend

476 Directive 87/357/CEE du Conseil du 25 juin 1987 concernant le rapprochement des législations des États membres relatives aux produits qui, n'ayant pas l'apparence de ce qu'ils sont, compromettent la santé ou la sécurité des consommateurs, JO 1987 L 192, p. 49.

477 Directive 2001/20/CE du Parlement européen et du Conseil du 4 avril 2001 concernant le rapprochement des dispositions législatives, réglementaires et administratives des États membres relatives à l'application de bonnes pratiques cliniques dans la conduite d'essais cliniques de médicaments à usage humain, JO 2001 L 121, p. 34.

remplacer progressivement la directive 2001/20/CE[478]. Il exige que les demandes d'autorisation d'essais cliniques impliquant des enfants soient attentivement évaluées. Le représentant légal de l'enfant doit donner son accord pour la réalisation d'un essai clinique, de même que l'enfant, s'il est capable de se former une opinion (article 29, paragraphes 1 et 8). Le règlement établit des conditions spéciales pour la réalisation d'essais cliniques en toute sécurité sur les enfants ainsi que pour s'assurer de leur consentement éclairé (article 32). Ces conditions sont les suivantes : aucun encouragement n'est accordé aux participants hormis une compensation pour les frais et pertes de revenus directement liés à la participation à l'essai clinique ; l'essai clinique est destiné à étudier des traitements pour une condition médicale qui ne touche que les enfants ; enfin, il y a des raisons scientifiques de s'attendre à ce que la participation à l'essai clinique entraîne : un bénéfice direct pour le mineur concerné supérieur aux risques et aux contraintes en jeu ; ou certains bénéfices pour la population représentée par le mineur concerné, et un tel essai clinique comportera un risque minimal pour le mineur concerné et imposera une contrainte minimale à ce dernier par rapport au traitement standard de la condition dont il est atteint. Des essais cliniques ne peuvent être réalisés sur des enfants sans avoir auparavant obtenu leur consentement ou celui de leurs représentants légaux que dans des situations d'urgence (article 35, paragraphe 1).

10.1.5. Aliments destinés aux nourrissons et aux enfants en bas âge

Dans le droit de l'UE, la directive 2009/39/CE relative aux denrées alimentaires destinées à une alimentation particulière[479] s'attache expressément à la composition nutritionnelle et à la sécurité des aliments spécifiquement fabriqués pour les nourrissons et les jeunes enfants âgés de moins de 12 mois. Ses dispositions portent sur les préparations pour nourrissons et préparations de suite, les denrées alimentaires à base de céréales et les aliments pour bébés et additifs destinés aux nourrissons et aux enfants en bas âge. La directive a pour objectif de garantir la sécurité des produits et de fournir aux consommateurs des produits adéquats et des informations appropriées. Elle dispose notamment qu'une

478 Règlement (UE) n° 536/2014 du Parlement européen et du Conseil du 16 avril 2014 relatif aux essais cliniques de médicaments à usage humain et abrogeant la directive 2001/20/CE, JO 2014 L 158, p. 1.

479 Directive 2009/39/CE du Parlement européen et du Conseil du 6 mai 2009 relative aux denrées alimentaires destinées à une alimentation particulière, JO 2009 L 124, p. 21.

alimentation particulière doit répondre aux besoins nutritionnels particuliers de certaines catégories de personnes, y compris ceux des nourrissons ou des enfants en bas âge en bonne santé (article 1, paragraphe 3, point c).

10.1.6. Sécurité des jouets

Dans le droit de l'UE, l'article 2 de la directive 2009/48/CE relative à la sécurité des jouets[480] définit les jouets comme étant des « produits conçus ou destinés, exclusivement ou non, à être utilisés à des fins de jeu par des enfants de moins de 14 ans »[481]. L'annexe I contient une liste non-exhaustive d'articles qui ne sont pas considérés comme des jouets, mais qui peuvent prêter à confusion. L'article 2, paragraphe 2, dresse également une liste de jouets exclus du champ d'action de la directive. La directive renforce également les normes de santé et de sécurité en limitant les quantités de certaines substances chimiques pouvant se retrouver dans les matériaux utilisés pour fabriquer les jouets (article 10)[482].

10.1.7. Les enfants et la publicité

Dans le droit de l'UE, la directive 2010/13/UE sur les services de médias audiovisuels (directive « Services de médias audiovisuels »)[483] a élargi le champ de la réglementation juridique établie par la directive 89/552/CEE visant à la coordination de certaines dispositions législatives, réglementaires et administratives des États membres relatives à l'exercice d'activités de radiodiffusion télévisuelle (directive « Télévision sans frontières »). La directive « Services de médias audiovisuels »traite de la limitation de la quantité, de la qualité et du contenu du marketing auquel peuvent être exposés les enfants, en réglementant la durée de la publicité (articles 20, 24 et 27). Elle interdit le placement de produits dans les programmes pour enfants (article 11) et autorise les États membres à interdire la diffusion de logos de parrainage au cours des programmes pour enfants

480 Directive 2009/48/CE du Parlement européen et du Conseil du 18 juin 2009 relative à la sécurité des jouets, JO 2009 L 170.

481 *Ibid.*, art. 2, para. 1.

482 La Commission européenne a par ailleurs conclu des « accords volontaires » avec les industries/commerçants de jouets européens afin d'améliorer la sécurité des jouets. Pour plus d'informations, voir : http://ec.europa.eu/growth/sectors/toys/safety/index_en.htm.

483 Directive 2010/13/UE du Parlement européen et du Conseil du 10 mars 2010 visant à la coordination de certaines dispositions législatives, réglementaires et administratives des États membres relatives à la fourniture de services de médias audiovisuels (directive « Services de médias audiovisuels »), JO 2010 L 95, p. 1.

(article 10, paragraphe 4)[484]. Elle assure l'équilibre entre la protection des enfants et d'autres valeurs démocratiques importantes, telles que la liberté d'expression, en soutenant l'idée qu'une telle protection est possible grâce à l'implication essentielle de la responsabilité parentale (considérants 48 et 59).

La mise en œuvre effective de la directive « Services de médias audiovisuels » est complétée par les recommandations de 1998[485] et 2006[486] relatives à la protection des enfants et de la dignité humaine.

Dans le droit du CdE, la Convention européenne sur la télévision transfrontière[487] a été le premier traité international à établir un cadre juridique pour la libre circulation des programmes de télévision transfrontière en Europe. Cette convention protège spécifiquement les enfants et les jeunes (article 7, paragraphe 2), par exemple en interdisant la diffusion de matériel pornographique et violent ainsi que de programmes incitant à la haine raciale. Elle définit des normes en matière de publicité et réglemente le temps publicitaire et les coupures de publicité.

484 Pour un aperçu plus global du fonctionnement de la directive « Services de médias audiovisuels », voir : Rapport de la Commission au Parlement européen, au Conseil, au Comité économique et social européen et au Comité des régions relatif à l'application de la directive 2010/13/UE (directive « Services de médias audiovisuels »), COM(2012) 203 final, Bruxelles, 4 mai 2012 ; ainsi que Document de travail des services de la Commission joint au premier rapport de la Commission au Parlement européen, au Conseil, au Comité économique et social européen et au Comité des régions relatif à l'application de la directive 2010/13/UE (directive « Services de médias audiovisuels ») accompagnant le document, SWD(2012)125 final, Bruxelles, 4 mai 2012.

485 Recommandation 98/560/CE du Conseil du 24 septembre 1998 concernant le développement de la compétitivité de l'industrie européenne des services audiovisuels et d'information par la promotion de cadres nationaux visant à assurer un niveau comparable et efficace de protection des mineurs et de la dignité humaine, JO 1998 L 270.

486 Recommandation 2006/952/CE du Parlement européen et du Conseil du 20 décembre 2006 sur la protection des mineurs et de la dignité humaine et sur le droit de réponse en liaison avec la compétitivité de l'industrie européenne des services audiovisuels et d'information en ligne, JO 2006 L 378.

10.2. Enfants et protection des données

Points clés

- Dans le droit de l'UE et du CdE, la protection des données à caractère personnel est reconnue comme étant un droit fondamental.
- Le droit au respect de la vie privée et familiale, du domicile et de la correspondance (article 8 de la CEDH) inclut le droit à la protection des données à caractère personnel.
- Les enfants ont, parmi d'autres droits relatifs à leurs données à caractère personnel, le droit de s'opposer au traitement des données les concernant, sauf raisons impérieuses et légitimes.

10.2.1. Droit européen en matière de protection des données

Dans le droit de l'UE, l'Union est habilitée à légiférer sur les questions relatives à la protection des données (article 16 du TFUE).[488] L'article 8, paragraphe 2, de la Charte des droits fondamentaux de contient des principes clés en matière de protection des données à caractère personnel (traitement loyal, consentement ou but légitime prescrit par la loi, droit d'accès et de rectification), tandis que l'article 8, paragraphe 3, dispose que le respect des règles en matière de protection des données est soumis au contrôle d'une autorité indépendante. Le droit à la protection des données à caractère personnel consacré à l'article 8 peut être limité par la loi, en vue du respect des principes d'une société démocratique tels que les libertés et droits d'autrui (article 52 de la Charte)[489].

La protection des données à caractère personnel est devenue l'un des grands domaines du droit européen relatif à la protection de la vie privée. Directive 95/46/CE relative à la protection des personnes physiques à l'égard du traitement des données à caractère personnel et à la libre circulation de ces données

488 Pour un aperçu général de la législation européenne en matière de protection des données, voir FRA, CouEDH et Conseil de l'Europe (2014).

489 CJUE, affaires jointes C-468/10 et C-469/10, *Asociación Nacional de Establecimientos Financieros de Crédito (ASNEF) et Federación de Comercio Electrónico y Marketing Directo (FECEMD) c. Administración del Estado*, 24 novembre 2011, point 48 ; CJUE, C-275/06, *Productores de Música de España (Promusicae) c. Telefónica de España SAU* [GC], 29 janvier 2008, point 68.

(directive relative à la protection des données)[490] est le principal instrument existant dans ce domaine.

Étant donné que le traitement des données est effectué dans des espaces clos non ouverts au public, les enfants, ainsi que les autres personnes concernées, ne sont généralement pas au courant du traitement de leurs propres données à caractère personnel. Pour compenser la vulnérabilité des personnes dont les données sont traitées, le droit européen garantit aux enfants (et aux autres personnes concernées) des droits individuels spécifiques, tels que le droit d'être informé de la collecte de leurs données, le droit d'accéder aux données stockées et de connaître les détails du traitement, le droit de s'opposer au traitement lorsque celui-ci est illégal et les droits de rectification, d'effacement et de verrouillage des données.

Les responsables du traitement des données doivent fournir des informations adéquates sur le traitement qu'ils effectuent (articles 10 et 11 de la directive relative à la protection des données). L'interprétation d'une manière qui convient à l'âge des enfants implique d'adapter le langage et la forme des informations au niveau de maturité et de compréhension des enfants. Les informations doivent inclure au minimum l'objet du traitement ainsi que l'identité et les coordonnées du responsable du traitement (article 10, points a) et b) de la directive relative à la protection des données).

La directive relative à la protection des données exige le consentement des personnes concernées, quel que soit le caractère sensible des données traitées (articles 7, 8 et 14). Une procédure de consentement adaptée aux enfants suppose de tenir compte des capacités de développement de l'enfant, en l'impliquant progressivement. La première étape consiste à ce que le représentant légal de l'enfant consulte celui-ci pour qu'il donne son consentement, avant de passer à un consentement parallèle de l'enfant et de son représentant légal, puis au consentement de l'adolescent seul.

Les personnes concernées disposent du droit à l'effacement de leurs données, ce qui suppose la possibilité de demander le retrait ou l'effacement de leurs données à caractère personnel, ainsi que le droit de s'opposer au traitement de leurs

490 Directive 95/46/CE du Parlement européen et du Conseil, du 24 octobre 1995, relative à la protection des personnes physiques à l'égard du traitement des données à caractère personnel et à la libre circulation de ces données (directive relative à la protection des données), JO 1995 L 281.

données à caractère personnel. Ce droit a pris énormément d'importance en ce qui concerne les enfants, en raison de la quantité massive de données à caractère personnel relatives à des enfants qui circulent et sont disponibles sur les réseaux sociaux. Si la CJUE n'a pas encore entendu d'affaires concernant des enfants, elle a jugé dans une récente affaire traitant d'un requérant adulte que le droit d'opposition s'appliquait aux données et aux informations « notamment [...] lorsqu'elles apparaissent inadéquates, qu'elles ne sont pas ou plus pertinentes ou sont excessives au regard de ces finalités et du temps qui s'est écoulé »[491]. La CJUE a également considéré que l'applicabilité du droit d'opposition devait être mise en balance avec les autres droits fondamentaux.

Dans le droit du CdE, la CouEDH a considéré que l'article 8 de la CEDH incluait le droit à la protection des données à caractère personnel. La Cour examine les situations dans lesquelles la question de la protection des données se pose, notamment l'interception des communications[492], diverses formes de surveillance[493] et la protection contre le stockage des données à caractère personnel par les autorités publiques[494]. La Cour a par ailleurs considéré que le droit national devait élaborer des mesures appropriées garantissant un recours juridictionnel en cas de violation des droits relatifs à la protection des données.

Exemple : dans l'affaire *K.U. c. Finlande*[495], le requérant était un enfant qui se plaignait qu'une publicité à caractère sexuel a été publiée en son nom sur un site de rencontres en ligne. Le fournisseur de services refusait de divulguer l'identité de la personne ayant publié les informations, au motif d'obligations de confidentialité établies par le droit finlandais. Le requérant affirmait que le droit national n'apportait pas suffisamment de protection contre les actions d'un particulier publiant des données compromettantes au sujet du requérant sur internet. La CouEDH a indiqué que les États avaient des obligations positives qui impliquaient notamment l'adoption de mesures visant au respect de la vie privée jusque dans les relations des

492 Voir par exemple : CouEDH, *Malone c. Royaume-Uni*, n° 8691/79, 2 août 1984 ; CouEDH, *Copland c. Royaume-Uni*, n° 62617/00, 3 avril 2007.

493 Voir par exemple : CouEDH, *Klass et autres c. Allemagne*, n° 5029/71, 6 septembre 1978 ; CouEDH, *Uzun c. Allemagne*, n° 35623/05, 2 septembre 2010.

494 Voir par exemple : CouEDH, *Leander c. Suède*, n° 9248/81, 26 mars 1987 ; CouEDH, *S. et Marper c. Royaume-Uni* [GC], n° 30562/04 et 30566/04, 4 décembre 2008.

495 CouEDH, *K.U. c. Finlande*, n° 2872/02, 2 décembre 2008. Voir également le chapitre 4.

individus entre eux. Dans le cas du requérant, sa protection pratique et effective nécessitait que des mesures effectives soient prises pour identifier et poursuivre l'auteur. Or, l'État ne proposait pas une telle protection et la CouEDH a conclu à une violation de l'article 8 de la CEDH[496].

Exemple : l'affaire *Avilkina et autres c. Russie*[497] porte sur la communication du dossier médical d'une fillette de deux ans au procureur, celui-ci ayant demandé de lui signaler tous les refus de transfusions sanguines émanant de témoins de Jéhovah. Si la Cour a admis que les intérêts d'une enquête pénale pouvaient parfois l'emporter sur l'intérêt d'un patient et de la collectivité dans son ensemble à voir protéger la confidentialité d'informations médicales, elle a toutefois noté que la requérante n'était ni mise en cause en tant que suspecte, ni accusée dans le cadre d'une procédure pénale. En outre, Par ailleurs, les professionnels de la santé qui ont pris en charge la requérante auraient pu demander une autorisation judiciaire pour effectuer une transfusion sanguine, s'ils avaient craint pour la vie de celle-ci. En l'absence de tout besoin social impérieux de demander la communication de données médicales confidentielles concernant la requérante, la CouEDH a conclu à une violation de l'article 8 de la CEDH.

Exemple : dans l'affaire *S. et Marper c. Royaume-Uni*[498], les empreintes digitales et des échantillons d'ADN d'un enfant de onze ans prélevées dans le cadre d'une suspicion de tentative de vol ont été conservées sans limite de temps, bien que l'enfant ait finalement été acquitté. Compte tenu de la nature et de la quantité d'informations personnelles contenues dans les échantillons cellulaires et les profils ADN, leur conservation constituait en elle-même une atteinte au droit du premier requérant au respect de sa vie privée. Les principes clés des instruments pertinents du Conseil de l'Europe, du droit et de la pratique dans les autres États contractants, exigent que la conservation de données soit proportionnée à l'objet de la collecte et limitée dans le temps, notamment dans le secteur de la police. La protection offerte par l'article 8 de la CEDH serait affaiblie de manière inacceptable si l'utilisation de techniques scientifiques modernes dans le système de justice pénale était autorisée à n'importe quel prix et sans une mise en balance attentive des avantages pouvant résulter d'un large recours à ces

496 FRA, CouEDH et CdE (2014), p. 122.

497 CouEDH, *Avilkina et autres c. Russie*, n° 1585/09, 6 juin 2013.

498 CouEDH, *S. and Marper c. Royaume-Uni*, n° 30562/04 et 30566/04, 4 décembre 2008.

techniques, et des intérêts essentiels s'attachant à la protection de la vie privée. À cet égard, le caractère général et indifférencié du pouvoir de conservation en vigueur en Angleterre et au pays de Galles était particulièrement frappant, puisqu'il permettait de que les données puissent être conservées quels que soient la nature et la gravité de l'infraction et l'âge du suspect. La conservation de telles données peut être particulièrement préjudiciable dans le cas de mineurs, en raison de leur situation spéciale et de l'importance que revêt leur développement et leur intégration dans la société. En conclusion, la conservation des données constituait une atteinte disproportionnée au droit du requérant au respect de la vie privée.

La Convention du Conseil de l'Europe pour la protection des personnes à l'égard du traitement automatisé des données à caractère personnel[499] (Convention 108) s'applique à toutes les opérations de traitement de données effectuées dans le secteur public ou privé et protège les individus, y compris les enfants, contre les abus pouvant accompagner le traitement de données à caractère personnel. La Convention 108 comporte un Protocole additionnel réglementant l'institution d'autorités de contrôle et les flux transfrontières de données à caractère personnel vers des États non parties[500].

Les principes énoncés dans la Convention 108 au sujet du traitement des données à caractère personnel portent sur le caractère licite et loyal de la collecte et du traitement automatisé des données, enregistrées à des fins déterminées et légitimes, et non incompatibles avec ces dernières, ni conservées au-delà du temps nécessaire. Ils traitent également de la qualité des données. En l'absence de garanties juridiques convenables, le traitement de données « à caractère sensible », relatives, par exemple, à l'origine raciale, aux opinions politiques, à la santé, aux convictions religieuses, à la vie sexuelle ou aux condamnations pénales d'une personne, est interdit. La Convention consacre également le droit de tous, y compris les enfants, d'être informés de la conservation d'informations les concernant et, si nécessaire, de les faire rectifier. Les limitations des droits établis dans la Convention ne sont autorisées que lorsque des intérêts supérieurs, tels que la sécurité de l'État ou la sûreté publique, sont en jeu.

499 CdE, Convention pour la protection des personnes à l'égard du traitement automatisé des données à caractère personnel, STCE n° 108, 1981.

500 CdE, Protocole additionnel à la Convention pour la protection des personnes à l'égard du traitement automatisé des données à caractère personnel, concernant les autorités de contrôle et les flux transfrontières de données, STCE n° 181, 2001.

Dans le droit international, le droit à la protection des données fait partie du droit au respect de la vie privée de l'enfant inclus à l'article 16 de la CRC. Cet article dispose qu'aucun enfant ne peut être soumis à des immixtions arbitraires ou illégales dans sa vie privée, sa famille, son domicile ou sa correspondance, ni à des atteintes illégales à son honneur et à sa réputation. Ce droit doit être respecté par tous, y compris par le représentant légal de l'enfant.

Les droits de l'enfant dans le cadre de procédures judiciaires visant des mineurs concernent les enfants accusés, poursuivis ou condamnés pour une infraction pénale, ainsi que les enfants impliqués dans des procédures judiciaires ou afférentes en tant que victimes et/ou témoins. La position des enfants dans le contexte de la justice des mineurs est réglementée par des dispositions générales en matière de droits de l'homme applicables tant aux adultes qu'aux enfants.

Ce chapitre propose un aperçu des normes européennes pertinentes pour les enfants impliqués dans des procédures judiciaires ou autres. Il aborde les garanties relatives à un procès équitable, y compris la participation effective et l'accès à un avocat, les droits des jeunes délinquants détenus, y compris la détention provisoire (garanties procédurales et de fond), les conditions de détention et la protection contre les mauvais traitements, et la protection des enfants témoins et victimes. Les aspects relatifs à la protection sont particulièrement importants dans les solutions de remplacement aux procédures judiciaires non contentieuses, qui devraient être encouragées dès lors qu'elles peuvent servir au mieux l'intérêt supérieur de l'enfant[501]. Lorsqu'il est question d'enfants, les objectifs de la justice pénale tels que l'intégration sociale, l'éducation et la prévention de la récidive sont d'importants principes fondamentaux[502].

501 CdE, Comité des Ministres (2010), *Lignes directrices sur une justice adaptée aux enfants*, 17 novembre 2010, para. 24.

502 Voir également CdE, Comité des Ministres (2008), Recommandation CM/Rec(2008)11 du Comité des Ministres aux États membres sur les règles européennes pour les délinquants mineurs faisant l'objet de sanctions ou de mesures, 5 novembre 2008, partie I.A.2.

11.1. Garanties liées au droit à un procès équitable

Points clés

- Les enfants impliqués dans une procédure pénale ont le droit d'être traités avec équité et d'une manière adaptée à leur âge.
- Les procédures judiciaires doivent être adaptées aux besoins des enfants afin d'assurer leur participation effective.
- Les enfants ont le droit d'accéder à un avocat dès les premières étapes de la procédure pénale et dès le premier interrogatoire de police.

Tout en décrivant brièvement les exigences générales d'un procès équitable établies au niveau de l'UE comme au niveau du Conseil de l'Europe, la présente section s'intéresse particulièrement aux garanties en matière de procès équitable accordées spécifiquement aux enfants.

Le droit à un procès équitable constitue l'un des piliers fondamentaux d'une société démocratique. Les enfants soupçonnés ou accusés d'une infraction ont le droit à un procès équitable et bénéficient des mêmes garanties que toute autre personne en conflit avec la loi. Les garanties liées au droit à un procès équitable s'appliquent dès le premier interrogatoire de l'enfant et restent valables pendant le procès. Toutefois, les enfants en conflit avec la loi sont particulièrement vulnérables et peuvent dès lors avoir besoin d'une protection supplémentaire. Les instances européennes se sont dotées d'exigences particulières afin de veiller à ce que les besoins de ces enfants soient dûment pris en compte.

Dans le droit de l'UE, plusieurs dispositions de la Charte des droits fondamentaux de l'UE énoncent les droits fondamentaux d'accès à la justice prévoyant des garanties en matière de procès équitable tant pour les adultes que pour les enfants. L'article 47 traite en particulier du droit à un recours effectif et à un procès équitable, en établissant des dispositions particulièrement pertinentes pour les enfants, telles que le droit de toute personne à ce que sa cause soit entendue équitablement, publiquement et dans un délai raisonnable et le droit d'être défendu, représenté et conseillé et de bénéficier d'une aide juridictionnelle. De même, les principes de légalité et de proportionnalité des délits et des peines définis à l'article 49 présentent un intérêt particulier pour les enfants. En outre,

plusieurs directives de l'UE établissent des garanties spéciales en matière de procès équitable dans les procédures pénales : la directive relative au droit à l'interprétation et à la traduction[503], la directive relative au droit à l'information[504] et la directive relative au droit d'accès à un avocat[505]. Les deux premières directives n'incluent pas de garanties spécifiques aux enfants, bien que la directive relative au droit à l'information contienne des dispositions relatives à la situation des suspects vulnérables ou des personnes accusées de manière plus générale. Les dispositions de la directive relative au droit d'accès à un avocat concernant les enfants sont présentées plus en détail à la section 11.2.2.

Même en l'absence de dispositions spécifiques pour les enfants, les États membres doivent observer la Charte des droits fondamentaux de l'UE au moment de mettre en œuvre les dispositions des directives susmentionnées. Dès lors, les principes tels que l'intérêt supérieur de l'enfant, consacré à l'article 24, doivent être pris dûment en considération dans les affaires où un enfant est soumis à l'une des dispositions des directives. À ce jour, aucune affaire n'a été portée devant la CJUE concernant l'interprétation de l'article 24 de la Charte en combinaison avec l'une des directives mentionnées[506].

Un instrument particulièrement important est la proposition de directive de la Commission européenne relative aux garanties procédurales accordées aux enfants soupçonnés ou poursuivis dans le cadre de procédures pénales,[507] qui a pour but de garantir aux enfants un accès obligatoire à un avocat à tous les stades d'une procédure pénale. Cette proposition dispose également que les enfants devraient être rapidement informés de leurs droits, être assistés de leurs parents (ou d'un autre adulte approprié) et être interrogés à huis clos. En outre, les enfants privés de liberté devraient recevoir une éducation appropriée, une

503 Directive 2010/64/CE du Parlement européen et du Conseil du 20 octobre 2010 relative au droit à l'interprétation et à la traduction dans les procédures pénales, JO 2010 L 280, p. 1.

504 Directive 2012/13/UE du Parlement européen et du Conseil du mardi 22 mai 2012 relative au droit à l'information dans le cadre des procédures pénales, JO 2012 L 142, p. 1.

505 Directive 2013/48/UE du Parlement européen et du Conseil du 22 octobre 2013 relative au droit d'accès à un avocat dans le cadre des procédures pénales et des procédures relatives au mandat d'arrêt européen, au droit d'informer un tiers dès la privation de liberté et au droit des personnes privées de liberté de communiquer avec des tiers et avec les autorités consulaires, JO 2013 L 294, p. 1.

506 La CJUE a traité de l'interprétation de l'article 24 dans des procédures relatives à des affaires internationales d'enlèvement d'enfants (voir la section 5.4).

507 Commission européenne (2013), proposition de directive du Parlement européen et du Conseil relative aux garanties procédurales accordées aux enfants soupçonnés ou poursuivis dans le cadre de procédures pénales, COM(2013) 822 final, Bruxelles, 27 novembre 2013.

orientation et une formation, ainsi qu'une assistance médicale et devraient être séparés des adultes[508].

Dans le droit du CdE, les garanties de la CEDH en matière de procès équitable sont établies à l'article 6, qui génère le plus de jurisprudence de la Cour. L'article 6, paragraphe 1, de la CEDH inclut certaines garanties expresses en matière de procès équitable : le droit à un procès équitable et public et à un prononcé public du jugement (sauf lorsque cela est contraire à l'intérêt, notamment, des mineurs) ; le droit à un procès dans un délai raisonnable ; le droit d'être jugé par un tribunal indépendant et impartial ;[509] le droit d'être jugé par un tribunal établi par la loi. La CouEDH a défini des garanties inhérentes au concept de procès équitable : égalité des armes et procédure contradictoire ; droit de garder le silence ; accès à un avocat ; participation effective ; présence à l'audience ; et décision motivée. En outre, tout accusé est présumé innocent jusqu'à ce que sa culpabilité ait été légalement établie (article 6, paragraphe 2, de la CEDH).

Toute personne accusée d'une infraction dispose des droits minimaux suivants : le droit d'être informé, dans le plus court délai, dans une langue qu'elle comprend, de l'accusation portée contre elle (article 6, paragraphe 3, point a), de la CEDH) ; le droit de disposer du temps et des facilités nécessaires à la préparation de sa défense (article 6, paragraphe 3, point b), de la CEDH) ; le droit d'avoir l'assistance d'un défenseur de son choix (article 6, paragraphe 3, point d), de la CEDH) ; le droit d'interroger ou faire interroger les témoins (article 6, paragraphe 3, point d), de la CEDH) ; et le droit de se faire assister gratuitement d'un interprète (article 6, paragraphe 3, point e), de la CEDH). Ces garanties s'appliquent aux adultes comme aux enfants. Toutefois, les aspects qui revêtent une importance particulière pour les enfants et qui ont donné lieu à une jurisprudence spécifique aux enfants incluent le droit à une participation effective ainsi que le droit d'accès à un avocat. Ces deux garanties spécifiques en matière de procès équitable sont donc analysées plus en détail dans le présent chapitre.

508 Voir également la section 11.2. Un autre document pouvant être pertinent en matière de protection des enfants est celui de la Commission européenne (2013), Proposition de directive du Parlement européen et du Conseil concernant l'aide juridictionnelle provisoire pour les suspects et les personnes poursuivies privés de liberté, ainsi que l'aide juridictionnelle dans le cadre des procédures relatives au mandat d'arrêt européen, COM(2013) 824 final, Bruxelles, 27 novembre 2013.

509 CouEDH, *Nortier c. Pays-Bas*, n° 13924/88, 24 août 1993 ; CouEDH, *Adamkiewicz c. Pologne*, n° 54729/00, 2 mars 2010.

Les Lignes directrices du Conseil de l'Europe sur une justice adaptée aux enfants présentent une importance particulière pour les enfants suspectés ou accusés d'infractions[510]. Même si elles ne sont pas juridiquement contraignantes, elles représentent une étape intermédiaire permettant de faire en sorte que les procédures judiciaires, y compris celles qui relèvent du système de justice pénale, prennent en compte les besoins spéciaux des enfants. Ces lignes directrices s'appuient sur la jurisprudence existante de la CouEDH, ainsi que sur des normes juridiques internationales telles que la Convention des Nations Unies sur les droits de l'enfant. Elles constituent un outil utile pour les professionnels qui travaillent avec des enfants. Selon la section I(1), les lignes directrices s'appliquent aux enfants impliqués dans une procédure judiciaire (pénale ou non) ou dans des dispositifs alternatifs à ces procédures. Pour les enfants impliqués dans procédure pénale, les droits d'une importante particulière sont le droit à ce que les informations relatives aux accusations soient données à la fois à l'enfant et aux parents de sorte qu'ils comprennent l'accusation exacte (section IV.A.1.5) ; le droit de n'être interrogé qu'en présence d'un avocat, d'un des parents ou d'une personne de confiance (section IV.C(30)) ; le droit à une procédure rapide (section IV.D(4)) et le droit à des entretiens et à des auditions tenant compte des spécificités de l'enfant (section IV.D(5)).

En juin 2014, l'Assemblée parlementaire du Conseil de l'Europe (APCE) a adopté une résolution relative à une justice pénale des mineurs adaptée aux enfants, dans laquelle elle souligne la nécessité de traiter les enfants en conflit avec la loi selon une approche fondée sur les droits et adaptée aux enfants[511]. L'APCE invite les États membres à mettre en œuvre les normes internationales en matière de droits de l'homme régissant la justice pour mineurs, y compris les Lignes directrices du Conseil de l'Europe sur une justice adaptée aux enfants, et à mettre les lois et pratiques nationales en conformité avec ces normes. L'APCE suggère de n'avoir recours à la privation de liberté qu'à titre de mesure de dernier ressort et d'une une durée aussi brève que possible, en fixant l'âge minimum de la responsabilité pénale à 14 ans, sans accepter de dérogations en cas d'infractions graves et en instaurant un système spécialisé de justice pour mineurs comprenant des mécanismes de déjudiciarisation, des mesures non privatives de liberté et des professionnels spécialisés.

510 CdE, Comité des Ministres (2010), *Lignes directrices sur une justice adaptée aux enfants*, 17 novembre 2010.

511 APCE (2014), « Une justice pénale des mineurs adaptée aux enfants: de la rhétorique à la réalité », Résolution 2010 (2014) .

Dans le droit international, l'article 40 de la CRC reconnaît à tout enfant soupçonné, accusé ou convaincu d'infraction pénale le droit d'être traité équitablement et d'une manière adaptée à son âge. L'objectif premier de la justice des mineurs, aux termes de l'article 40 de la CRC, est de réintégrer les enfants dans la société, là où ils pourront jouer un rôle constructif. L'article 40, paragraphe 2, de la CRC reconnaît le droit de l'enfant à un procès équitable et souligne que l'enfant doit bénéficier de certains droits supplémentaires tels que le droit d'être en présence de ses parents, le droit de faire appel et le droit à la protection totale de leur vie privée à tous les stades de la procédure.

Par ailleurs, d'autres instruments ont développé les principes de procès équitable et de droit à un traitement adapté aux enfants énoncés dans la CRC, notamment le recours à la privation de liberté uniquement à titre de mesure de dernier ressort et d'une durée aussi brève que possible (voir l'article 37, point b), de la CRC). Les plus importants d'entre eux sont l'Ensemble de règles minima des Nations Unies concernant l'administration de la justice pour mineurs (« Règles de Beijing »)[512], les Principes directeurs des Nations Unies pour la prévention de la délinquance juvénile (« Principes directeurs de Riyad »)[513] et les Règles des Nations Unies pour la protection des mineurs privés de liberté (également appelées « Règles de La Havane »)[514]. Les Règles de Beijing fournissent des orientations détaillées sur l'application des exigences en matière de procès équitable et de traitement adapté aux enfants figurant à l'article 40 de la Convention relative aux droits de l'enfant, y compris les objectifs de la justice pour mineurs, la protection de la vie privée, l'instruction et les poursuites, la détention préventive, le jugement et le règlement des affaires et le traitement en milieu ouvert ou en institution. Les Règles de la Havane portent sur le traitement des mineurs privés de liberté. Elles incluent notamment des règles sur la définition de la privation de liberté, de la garde à vue et de la détention provisoire, les conditions de vie dans les institutions pour mineurs, les procédures disciplinaires, les méthodes de classement et le recours à la force ou à la contrainte, les procédures de réclamation, les mécanismes d'inspection et de contrôle et le retour des mineurs dans leur communauté. Enfin, les Principes directeurs de Riyad fournissent des orientations détaillées sur les politiques visant à prévenir la délinquance juvénile.

512 ONU, Assemblée générale (1985), *Ensemble de règles minima des Nations Unies concernant l'administration de la justice pour mineurs*, GA Res. 40/33, 19 novembre 1985.

513 ONU, Assemblée générale (1990), *Principes directeurs des Nations Unies pour la prévention de la délinquance juvénile*, GA Res. 45/112, 14 décembre 1990.

514 ONU, Assemblée générale (1990), *Règles des Nations Unies pour la protection des mineurs privés de liberté*, GA Res. 45/113, 14 décembre 1990.

Le Comité des droits de l'enfant des Nations Unies a publié une observation générale (n° 10)[515] sur les enfants et la justice des mineurs, proposant des orientations détaillées sur la manière d'interpréter et de mettre en œuvre la CRC en ce qui concerne la justice des mineurs. Cette observation aborde des principes importants de la justice des mineurs, tels que le droit à une participation effective, dans le cadre du droit à un procès équitable (voir également la section 11.1.1), le recours à la privation de liberté uniquement à titre de mesure de dernier ressort et d'une durée aussi brève que possible, le recours à la déjudiciarisation et à la prévention de la délinquance juvénile, la prise en compte du principe de l'intérêt supérieur de l'enfant et du principe de non-discrimination dans le système de justice pour mineurs et les limites d'âge. Le Comité des droits de l'enfant des Nations Unies recommande de fixer l'âge minimum de la responsabilité pénale à 12 ans, ou, de préférence, à un âge plus élevé. Il recommande également d'accorder à tous les enfants le droit d'être jugés dans le cadre de la justice des mineurs et interdit le transfert de jeunes de 16 et 17 ans vers le cadre de la justice pour adultes en cas d'infraction grave. D'autres observations générales, traitant par exemple du droit d'être entendu (en rapport avec le droit de participer activement aux procédures pénales) ou de la protection contre toute forme de violence, présentent également un intérêt au regard de la justice des mineurs[516].

11.1.1. Participation effective

Dans le droit de l'UE, l'article 47 de la Charte des droits fondamentaux établit des garanties similaires à celles de l'article 6 de la CEDH, y compris le droit de toute personne à ce que sa cause soit entendue équitablement, publiquement et dans un délai raisonnable par un tribunal indépendant et impartial, le droit à une représentation légale et le droit à un recours effectif. La proposition de directive relative aux garanties procédurales accordées aux enfants soupçonnés ou poursuivis dans le cadre de procédures pénales inclut le droit à une participation effective, ainsi que le droit à une représentation légale[517].

515 ONU, Comité des droits de l'enfant (2007), *Observation générale n° 10 (2007), Les droits de l'enfant dans le système de justice pour mineurs*, CRC/C/GC/07.

516 ONU, Comité des droits de l'enfant (2009), *Observation générale n° 12 (2009), Le droit de l'enfant d'être entendu*, CRC/C/GC/12 ; ONU, Comité des droits de l'enfant (2011), *Observation générale n° 13 (2011), Le droit de l'enfant d'être protégé contre toutes les formes de violence*, CRC/C/GC/13.

517 Commission européenne (2013), Proposition de directive du Parlement européen et du Conseil relative aux garanties procédurales accordées aux enfants soupçonnés ou poursuivis dans le cadre de procédures pénales, COM(2013) 822 final, Bruxelles, 27 novembre 2013.

Dans le droit du CdE, l'article 6 de la CEDH formule des exigences spécifiques visant à garantir la participation effective des enfants aux procédures pénales. En règle générale, il convient de veiller, lors des procédures, à ce que l'âge de l'enfant, son niveau de maturité et ses capacités affectives soient pris en considération[518]. Des exemples concrets d'exigences de « participation effective » sont notamment la présence de l'enfant pendant les audiences, l'organisation d'audiences à huis clos, la publicité limitée, les mesures visant à faire en sorte que l'enfant puisse comprendre les enjeux du procès et la formalité limitée des audiences. À ce jour, la Cour n'a jamais considéré que l'adoption d'un seuil d'âge trop bas pour la responsabilité pénale constituait en soit une violation de l'article 6 de la CEDH. Lorsqu'elle doit déterminer si un enfant est apte à participer effectivement à une procédure nationale, la Cour examine les circonstances concrètes de l'espèce.

Exemple : l'affaire *T. c. Royaume-Uni*[519] porte sur le meurtre d'un enfant de deux ans par deux enfants de dix ans. Ces derniers ont fait l'objet d'un procès public très médiatisé. La procédure en justice a été en partie modifiée dans la mesure où les audiences étaient plus courtes, où les parents du requérant étaient placés à proximité de lui, où un espace de jeu était disponible pendant les pauses, etc. Le requérant, et l'autre enfant mis en examen, ont toutefois été jugés dans un tribunal pour adultes et la plupart des rigueurs d'un procès pénal ont été maintenues. La CouEDH a considéré que le requérant n'avait pas pu participer effectivement à la procédure en raison de la publicité des audiences, associée au niveau élevé d'attention médiatique et de sa capacité limitée à donner des instructions à ses avocats et à fournir des témoignages adéquats. Ses droits au titre de l'article 6 de la CEDH ont donc été violés.

La reconnaissance du droit à une participation effective est également au cœur des Lignes directives du Conseil de l'Europe sur une justice adaptée aux enfants. La justice destinée aux enfants, y compris la justice des mineurs, doit être « accessible, convenant à l'âge de l'enfant, rapide, diligente, adaptée aux besoins et aux droits de l'enfant, et axée sur ceux-ci, et respectueuse des droits de l'enfant, notamment du droit à des garanties procédurales, du droit de participer à la procédure et de la comprendre, du droit au respect de la vie privée et

518 CouEDH, *T c. Royaume-Uni*, n° 24724/94, 16 décembre 1999, para. 61.

519 CouEDH, *T c. Royaume-Uni*, n° 24724/94, 16 décembre 1999.

familiale, ainsi que du droit à l'intégrité et à la dignité »[520]. Les lignes directrices fournissent des orientations spécifiques sur la manière dont les enfants doivent être traités lors de procédures de justice pour mineurs ou d'autres procédures judiciaires. Les enfants devraient disposer du droit d'accès aux tribunaux et aux procédures judiciaires et leurs droits d'être représenté par un avocat, d'être entendus et d'exprimer leur point de vue devraient être garantis ; les retards injustifiés devraient être évités, les procédures devraient être organisées d'une manière adaptée aux enfants (notamment au niveau de l'environnement et du langage) et des garanties spéciales devraient être prises pour enregistrer et donner suite aux preuves/déclarations fournies par les enfants[521].

11.1.2. Accès à un avocat

Dans le droit de l'UE, la directive 2013/48/UE relative au droit d'accès à un avocat[522], devant être mise en œuvre pour le 27 novembre 2016, inclut des références directes aux enfants aux considérants 52 et 55 de son préambule ainsi qu'à son article 5, paragraphes 2 à 4. En vertu du considérant 55 et de l'article 5, paragraphe 2, lorsqu'un enfant est privé de liberté, le titulaire de la responsabilité parentale doit en être averti et être informé des motifs de cette décision, à moins que ce ne soit contraire à l'intérêt supérieur de l'enfant, auquel cas un autre adulte approprié doit être informé. Aux termes de l'article 2, la directive s'applique dès le moment où les personnes sont informées qu'elles sont soupçonnées d'avoir commis une infraction pénale ou qu'elles sont poursuivies à ce titre et jusqu'au terme de la procédure et au prononcé final de leur culpabilité ou de leur innocence. Par ailleurs, l'article 3, paragraphe 3, dispose que l'accès à un avocat inclut le droit pour les suspects ou les personnes poursuivies de rencontrer en privé l'avocat qui les représente et de communiquer avec lui, y compris avant qu'ils ne soient interrogés pour la première fois, le droit à la présence de l'avocat et à la participation effective de celui-ci à l'interrogatoire et le droit à la présence de l'avocat lors de certaines mesures d'enquête ou mesures de collecte de preuves.

520 CdE, Comité des Ministres (2010), *Lignes directrices sur une justice adaptée aux enfants*, 17 novembre 2010, point II. C.

521 *Ibid.*, section D.

522 Directive 2013/48/UE du Parlement européen et du Conseil du 22 octobre 2013 relative au droit d'accès à un avocat dans le cadre des procédures pénales et des procédures relatives au mandat d'arrêt européen, au droit d'informer un tiers dès la privation de liberté et au droit des personnes privées de liberté de communiquer avec des tiers et avec les autorités consulaires, JO 2013 L 294, p. 1.

Dans le droit du CdE, la CouEDH considère l'accès à un avocat comme étant l'un des éléments fondamentaux du droit à un procès équitable[523]. Les personnes soupçonnées d'infraction pénale ont le droit d'accéder à un avocat dès les premières étapes de l'enquête de police. Ce droit peut être limité dans des circonstances exceptionnelles, pour autant que la restriction ne porte pas indûment préjudice aux droits de la personne soupçonnée. D'après la Cour, ce cas peut se produire lorsque les dépositions effectuées sans accès préalable à un avocat sont utilisées à charge de la personne[524]. La Cour contrôle plus strictement l'accès effectif du requérant à un avocat dans les cas impliquant des enfants[525].

Exemple : l'affaire *Panovits c. Chypre*[526] traite d'un jeune de 17 ans inculpé pour meurtre et cambriolage. Il a été amené au commissariat de police accompagné par son père, puis arrêté et emmené dans une pièce séparée pour y être interrogé, sans son père et sans avocat. Pendant l'interrogatoire du requérant, son père a été informé du droit de son fils à contacter un avocat. Quelques minutes plus tard, le père a appris que son fils avait entretemps avoué être l'auteur du crime. La Cour a estimé qu'étant donné l'âge du requérant, il était impossible de supposer qu'il était informé de son droit à une représentation légale avant d'effectuer une déposition. Il était également improbable qu'il ait pu raisonnablement apprécier les conséquences d'un interrogatoire sans l'assistance d'un avocat dans une procédure pénale relative à un meurtre. Bien que les autorités ne semblent à aucun moment avoir été opposées à la possibilité de permettre au requérant d'être assisté par un avocat s'il en faisait la demande, elles ne l'ont pas averti de son droit à pouvoir être assisté d'un avocat gratuitement si nécessaire. Rien ne prouve que le requérant ou son père auraient renoncé expressément et de manière non équivoque à leur droit à une assistance juridique. La Cour a donc conclu à l'existence d'une violation de l'article 6, paragraphe 3, point c), lu en combinaison avec l'article 6, paragraphe 1, de la CEDH.

524 *Ibid.*, para. 62.

525 *Ibid.*, para. 60.

526 CouEDH, *Panovits c. Chypre*, n° 4268/04, 11 décembre 2008.

11.2. Les droits des délinquants juvéniles en matière de détention

Points clés

- Un enfant ne peut être privé de sa liberté qu'en dernier ressort et pour la période appropriée la plus brève possible.
- En cas de détention, les enfants doivent être traités en tenant compte de leur âge et dans le respect de leur dignité.
- Les enfants ne doivent pas être détenus avec des adultes.

Toute personne a droit à la liberté. La privation de liberté constitue dès lors une exception ; elle inclut toute forme de placement, sur ordre d'une autorité judiciaire ou administrative, dans une institution que le mineur n'est pas autorisé à quitter à sa guise[527]. Compte tenu de l'importance de garantir les droits de l'enfant, y compris son intérêt supérieur, les situations de privation de liberté doivent être considérées sous cet angle particulier dès lors qu'elles concernent des enfants.

Si la détention peut être décidée dans différentes circonstances, la présente section s'intéresse particulièrement aux enfants en contact avec les systèmes de justice pénale.

Les instruments internationaux affirment tous sans exception que la détention doit constituer une mesure de dernier ressort. Par conséquent, à chaque fois que se pose la question de placer ou non un enfant en détention, les autorités nationales doivent en premier lieu étudier les solutions alternatives qui répondraient à l'intérêt supérieur de l'enfant tout en favorisant sa réinsertion (article 40, paragraphe 1, de la Convention relative aux droits de l'enfant). Parmi ces autres solutions figurent par exemple « des dispositions relatives [...] aux soins, à l'orientation et à la supervision, aux conseils, à la probation, au placement familial, aux programmes d'éducation généralisée et professionnelle » (article 40, paragraphe 4), de la Convention relative aux droits de l'enfant). La détention d'un enfant ne doit être envisagée que lorsqu'aucune autre solution

527 CdE, Comité des Ministres, Recommandation CM/Rec(2008)11 sur les règles européennes pour les délinquants mineurs faisant l'objet de sanctions ou de mesures, 5 novembre 2008, Règle 21.5.

n'est envisageable. Par ailleurs, la détention doit être ordonnée pour une durée la plus brève possible et dans le cadre des garanties de fond et de procédure adéquates. Compte tenu de leur âge et de leur vulnérabilité, les enfants placés en détention jouissent de droits et de garanties spéciaux.

11.2.1. Formes de détention (garanties de fond et de procédure)

Dans le droit de l'UE, le cadre juridique actuel pour les procédures judiciaires pénales n'inclut pas d'instrument contraignant au sujet de la rétention des enfants.

Dans le droit du CdE, l'article 5 de la CEDH dispose que toute personne a droit à la liberté. La détention constitue une exception qui doit être établie par la législation nationale et ne doit pas être arbitraire. En outre, elle doit être justifiée par l'une des six situations définies de manière exhaustive à l'article 5, paragraphe 1, points a) à f). La détention d'enfants en contact avec le système de justice pénale peut être justifiée par les points a) détention après condamnation par un tribunal compétent, c) détention provisoire ou d) détention aux fins, notamment, d'un encadrement éducatif. Les deux derniers points seront examinés, puisqu'ils ont donné naissance à des obligations spéciales incombant aux autorités nationales.

Détention provisoire

La « détention provisoire » fait référence aux situations dans lesquelles des personnes sont placées en garde à vue parce que soupçonnées d'avoir commis une infraction pénale ou placées en détention provisoire. Cette détention commence le jour où l'accusé est incarcéré et se termine par un jugement quant au fond par un tribunal de première instance[528]. Si les enfants bénéficient des mêmes garanties que les adultes, la CouEDH a établi plusieurs principes supplémentaires visant à renforcer la position des enfants dans les procédures pénales nationales.

La CouEDH interprète généralement l'article 5, paragraphe 1, point c), et paragraphe 3, en ce sens qu'une personne ne peut être placée en détention provisoire qu'en présence de raisons plausibles de le soupçonner d'avoir commis une infraction pénale. En outre, la détention provisoire ne peut excéder un délai raisonnable et doit être réexaminée à des intervalles raisonnables. Plus la période de détention est longue, plus les raisons avancées par les autorités pour

528 CouEDH, *Idalov c. Russie* [GC], n° 5826/03, 22 mai 2012, para. 112.

la justifier doivent être solides. Selon la jurisprudence de la CouEDH, toute personne inculpée d'une infraction doit être libérée jusqu'à son procès, à moins que l'État ne prouve qu'il existe des motifs « pertinents et suffisants » de justifier une détention prolongée[529].

La CouEDH a défini quatre raisons acceptables de refuser la libération sous caution à un détenu en cas de détention provisoire : le risque de fuite, le risque de préjudice à l'administration de la justice, le risque de nouvelle infraction ou le risque de trouble de l'ordre public. En outre, la prolongation d'une détention provisoire doit être limitée au strict nécessaire et l'État doit examiner tous les faits plaidant pour ou contre l'existence d'une véritable exigence d'intérêt public justifiant le maintien de la privation de liberté[530].

Lorsque des enfants sont impliqués, la CouEDH exige des autorités nationales qu'elles accordent une attention particulière à leur âge au moment de pondérer les arguments en faveur ou en défaveur de la détention provisoire ; cette dernière ne doit être utilisée qu'en dernier ressort et sa durée doit être la plus brève possible[531]. Pour ce faire, les autorités doivent examiner les solutions autres que la détention provisoire[532]. Par ailleurs, les autorités nationales doivent faire preuve d'une diligence particulière afin que les procès concernant des enfants aient lieu dans des délais raisonnables[533].

Exemple : dans l'affaire *Nart c. Turquie*[534], le requérant de 17 ans avait été arrêté pour suspicion de cambriolage d'une épicerie. Il avait été placé en détention provisoire, dans une prison pour adultes, pendant 48 jours. En soulignant particulièrement le fait que le requérant était un enfant, la CouEDH a indiqué que la détention provisoire des mineurs doit être utilisée en dernier recours et être aussi brève que possible. Lorsqu'elle est inévitable, les mineurs doivent être détenus séparément des adultes[535]. Dans

529 CouEDH, *Smirnova c. Russie*, n° 46133/99 et 48183/99, 24 juillet 2003, para. 58.

530 *Ibid.*, CouEDH, *Ladent c. Pologne*, n° 11036/03, 18 mars 2008, para. 55.

531 CouEDH, *Korneykova c. Ukraine*, n° 39884/05, 19 janvier 2012, paras. 43-44. Voir également CouEDH, *Selçuk c. Turquie*, n° 21768/02, 10 janvier 2006, paras. 35 et 36 ; CouEDH, *J.M. c. Danemark*, n° 34421/09, 13 novembre 2012, para. 63.

532 CouEDH, *Dinç et Çakır c. Turquie*, n° 66066/09, 9 juillet 2013, para. 63 ; CouEDH, *Güveç c. Turquie*, n° 70337/01, 20 janvier 2009, para. 108.

533 CouEDH, *Kuptsov et Kuptsova c. Russie*, n° 6110/03, 3 mars 2011, para. 91.

534 CouEDH, *Nart c. Turquie*, n° 20817/04, 6 mai 2008.

535 *Ibid.*, para. 31.

ce cas particulier, les autorités avaient tenté de justifier la détention provisoire sur la base des éléments de preuve actuellement disponibles, mais la Cour a considéré que cette raison ne saurait justifier à elle seule la durée de la détention du requérant. La CouEDH a donc conclu à l'existence d'une violation de l'article 5, paragraphe 3, de la CEDH.

Placement en détention en vue d'un encadrement éducatif

Cette forme de détention a été ordonnée dans des situations dans lesquelles l'enfant présentait un besoin particulier d'encadrement éducatif en raison d'une personnalité dérangée et d'un comportement violent. L'article 5, paragraphe 1, point d), de la CEDH cible essentiellement les formes de détention sortant du cadre du système de justice des mineurs.

Exemple : l'affaire *Bouamar c. Belgique*[536] traite du placement d'un enfant en maison d'arrêt à neuf reprises pendant des périodes d'environ 15 jours. Le requérant était un adolescent jugé posséder une personnalité perturbée et un comportement violent. Le gouvernement belge avait expliqué qu'il avait été placé en maison d'arrêt pour suivre une éducation spécialisée. La CouEDH a noté que l'internement d'un mineur en maison d'arrêt n'enfreint pas forcément l'article 5, paragraphe 1, point d), pour autant que les autorités poursuivent l'objectif de placer le mineur sous éducation surveillée. Toutefois, la Cour a considéré que dans le cas d'espèce, les autorités n'avaient pas démontré leur intention ni la possibilité de le placer dans une institution où il pourrait bénéficier d'une éducation spécialisée. La CouEDH a donc conclu à l'existence d'une violation de l'article 5, paragraphe 1, point d), de la CEDH.

Exemple : l'affaire *D.G. c. Irlande*[537] porte sur le placement d'un enfant violent dans un centre de détention. La CouEDH a estimé que les termes d'« éducation surveillée » ne doivent pas être assimilés systématiquement à la notion d'enseignement en salle de classe. L'éducation surveillée suppose que l'autorité locale prenne en charge de nombreux aspects de l'exercice des droits parentaux au bénéfice et pour la protection de l'intéressé. D'après la Cour, les autorités nationales ont le droit de placer des mineurs dans des centres de détention de manière provisoire jusqu'à ce qu'un lo-

536 CouEDH, *Bouamar c. Belgique*, n° 9106/80, 29 février 1988.

537 CouEDH, *D.G. c. Irlande*, n° 39474/98, 16 mai 2002.

gement adéquat soit trouvé, pour autant que la situation soit rapidement réglée. Dans le cas du requérant, cette exigence de rapidité n'a pas été respectée, puisqu'il n'a été placé dans un logement adéquat que plus de six mois après sa sortie de détention. La CouEDH a donc conclu à l'existence d'une violation de l'article 5, paragraphe 1, point d), de la CEDH.

Recours contre une décision de détention, rapidité de l'examen et accès à un avocat

La CouEDH exige des autorités nationales qu'elles fassent preuve d'une diligence particulière dans les cas impliquant des enfants placés en détention. En plus des garanties mentionnées ci-dessus, les autorités nationales doivent veiller à ce que les enfants aient le droit de contester la légalité de leur détention à intervalles raisonnables et à ce qu'ils aient accès à un avocat pendant la procédure statuant sur la légalité de leur détention. Ces recours juridiques doivent par ailleurs être tranchés rapidement par les juridictions nationales. La CouEDH tire ces garanties procédurales du contenu de l'article 5, paragraphe 4, de la CEDH.

Exemple : dans l'affaire *Bouamar c. Belgique*[538], la CouEDH a conclu à une violation de l'article 5, paragraphe 4, pour les raisons suivantes : les audiences relatives à la fixation de la détention du requérant se sont déroulées en l'absence de ses avocats ; la décision n'a pas été prise à bref délai ; il n'y a eu aucune véritable décision au sujet de la légalité de la détention, puisque les tribunaux nationaux ont rejeté les recours du requérant comme sans objet.

11.2.2. Conditions du placement en détention

Dans le droit de l'UE, l'article 4 de la Charte des droits fondamentaux de l'UE interdit la torture et les traitements inhumains ou dégradants. Toutefois, la Charte ne s'appliquant que dans le cadre du droit de l'Union, cette disposition ne peut devenir contraignante pour les États membres qu'en étant rattachée à un autre instrument juridique de l'UE. À ce jour, la CJUE n'a entendu aucune affaire relevant de l'article 4 de la Charte.

538 CouEDH, *Bouamar c. Belgique*, n° 9106/80, 29 février 1988.

Dans le droit du CdE, la CouEDH a jugé que la détention d'enfants avec des adultes pouvait entraîner une violation de l'article 3 [539] ou de l'article 5 de la CEDH[540]. Le manque de soins médicaux appropriés en détention peut également soulever des questions au titre de l'article 3 [541], comme d'autres aspects tels que la dimension des cellules, l'éclairage et les activités récréatives[542]. Au moment d'évaluer la compatibilité des conditions de détention avec les normes de l'article 3 de la CEDH, la Cour s'appuie souvent sur l'ensemble de normes élaborées par le Comité européen pour la prévention de la torture et des peines ou traitements inhumains ou dégradants (CPT), qui surveille les conditions carcérales sous l'égide de la Convention européenne pour la prévention de la torture et des peines ou traitements inhumains ou dégradants en effectuant des visites sur place dans les États membres du Conseil de l'Europe[543].

Exemple : dans l'affaire *Güveç c. Turquie*[544], un garçon de 15 ans a été arrêté au motif d'être soupçonné d'appartenir au Parti des travailleurs du Kurdistan (PKK). Il a été détenu par le tribunal de la sûreté de l'État dans une prison pour adultes pendant cinq ans. La CouEDH a fait remarquer que sa détention était contraire aux réglementations et obligations de la Turquie au titre des traités internationaux, notamment l'article 37, point c), de la CRC, exigeant que les enfants soient détenus séparément des adultes. La Cour a également noté que le requérant avait commencé à souffrir de problèmes psychologiques en prison, à la suite desquels il a tenté de se suicider à de nombreuses reprises. En outre, les autorités n'ont pas fourni au requérant les soins médicaux dont il avait besoin. Par conséquent, compte tenu de l'âge du requérant, de la durée de sa détention en prison avec des adultes, du fait que les autorités ne lui ont pas fourni l'aide médicale nécessaire pour ses problèmes psychologiques et du fait qu'elles n'ont pris aucune mesure pour empêcher ses nombreuses tentatives de suicide, la Cour n'a aucun doute sur le fait que le requérant a subi un traitement inhumain et dégradant. Il y a donc eu violation de l'article 3 de la CEDH.

539 CouEDH, *Güveç c. Turquie,* n° 70337/01, 20 janvier 2009.

540 CouEDH, *Nart c. Turquie*, n° 20817/04, 6 mai 2008.

541 CouEDH, *Güveç c. Turquie,* n° 70337/01, 20 janvier 2009 ; CouEDH, *Blokhin c. Russie*, n° 47152/06, 14 novembre 2013 (renvoyée vers la Grande Chambre le 24 mars 2014).

542 CouEDH, *Kuptsov et Kuptsova c. Russie*, n° 6110/03, 3 mars 2011, para. 70.

543 Voir par exemple la CouEDH, *Güveç c. Turquie*, n° 70337/01, 20 janvier 2009.

544 *Ibid*.

Le CEDS a toujours interprété l'article 17 de la CSE en ce sens que les enfants détenus ou emprisonnés doivent être séparés des adultes.

Les règles européennes du CdE pour les délinquants mineurs faisant l'objet de sanctions ou de mesures fournissent des orientations détaillées sur les conditions de détention. Elles disposent également que les mineurs ne doivent pas être détenus dans des institutions pour adultes, mais dans des institutions qui ont été spécialement conçues pour eux[545].

Dans le droit international, la Convention relative aux droits de l'enfant contient une disposition distincte relative à la privation de liberté des enfants, indiquant que les enfants doivent être séparés des adultes, à moins que ce ne soit pas dans leur intérêt supérieur (article 37, point c), de la CRC). Cet article dispose également que les enfants ont en principe le droit de maintenir le contact avec leur famille par le biais de visites ou d'échanges de correspondance.

11.2.3. Protection contre les abus et les mauvais traitements

Dans le droit du CdE, la CouEDH a considéré à plusieurs reprises que les autorités nationales étaient responsables de la protection des personnes en détention contre le décès, les abus ou les mauvais traitements infligés par d'autres détenus ou par les autorités elles-mêmes. Les obligations des États à cet égard sont particulièrement strictes, vu que les détenus sont placés sous l'autorité et le contrôle de l'État. [546] En plus de prendre des mesures raisonnables en vue de protéger les détenus, les autorités nationales doivent également enquêter efficacement sur les allégations crédibles de mauvais traitements ou de décès.

Exemple : l'affaire *Çoşelav c. Turquie*[547] portait sur le suicide en prison d'un adolescent qui avait déjà tenté à plusieurs reprises de mettre fin à ses jours. Comme suite à ces tentatives de suicide, les autorités l'avaient transféré d'une aile pour mineurs vers un centre de détention pour adultes.

545 CdE, Comité des Ministres, Recommandation CM/Rec(2008)11 sur les règles européennes pour les délinquants mineurs faisant l'objet de sanctions ou de mesures, 5 novembre 2008, règle 59.1.

546 CouEDH, *Anguelova c. Bulgarie*, n° 38361/97, 13 juin 2002 ; CouEDH, *H.Y. et Hü.Y. c. Turquie*, n° 40262/98, 6 octobre 2005.

547 CouEDH, *Çoşelav c. Turquie*, n° 1413/07, 9 octobre 2012.

Après avoir établi que les autorités étaient conscientes (ou auraient dû l'être) de l'existence d'un risque réel et immédiat pour la vie du fils du requérant, la Cour a ensuite noté que les autorités n'avaient pas pris de mesures raisonnables pour empêcher le drame. La Cour a fortement insisté sur l'âge du défunt et sur le fait qu'il ait été détenu avec des adultes. La CouEDH a donc conclu à une violation du volet matériel de l'article 2 de la CEDH. La Cour a également conclu à une violation de la branche procédurale de l'article 2, tirée de l'absence d'enquête effective sur le décès du fils du requérant par les autorités. Les motifs à l'appui de ces conclusions sont les suivants : les autorités n'ont pas averti rapidement les requérants du décès de leur fils ; le parquet n'a pas examiné l'absence présumée de mesures prises pour éviter le suicide ; et la durée de la procédure administrative ultérieure était excessive.

11.3. Protection des enfants victimes et des témoins

Point clé

- Les enfants victimes et témoins ont le droit à une protection pour éviter toute nouvelle victimisation, à la réadaptation et à la réintégration et à la participation effective aux procédures pénales et autres procédures.

Dans le droit de l'UE comme dans le droit du CdE, la position des enfants victimes et témoins a été reconnue.

Dans le droit de l'UE, la directive 2012/29/UE relative aux droits des victimes[548] reconnaît explicitement la position des enfants victimes. Elle dispose que lorsque la victime est un enfant, son intérêt supérieur doit être une considération primordiale, évaluée au cas-par-cas. En outre, une approche axée sur les spécificités de l'enfant, tenant dûment compte de son âge, de sa maturité, de son opinion, de ses besoins et de ses préoccupations, doit être privilégiée. La directive vise par ailleurs à garantir que l'enfant et le titulaire de l'autorité parentale (ou tout autre

548 Directive 2012/29/UE du Parlement européen et du Conseil du 25 octobre 2012 établissant des normes minimales concernant les droits, le soutien et la protection des victimes de la criminalité, JO 2012 L 315, p. 55.

représentant légal) seront informés de toute mesure ou de tout droit concernant spécifiquement l'enfant (article 1, paragraphe 2). Les enfants victimes ont également le droit d'être entendus pendant les procédures pénales et les États membres doivent veiller à ce qu'ils puissent également apporter des preuves. L'âge et la maturité de l'enfant doivent être dûment pris en considération (article 10, paragraphe 1). Par ailleurs, la directive a pour objectif de protéger la vie privée et l'identité des enfants victimes pendant les procédures pénales afin notamment d'éviter la victimisation secondaire (article 21, paragraphe 1 ; voir également l'article 26). La directive contient également une disposition spéciale relative au droit des enfants victimes à une protection au cours de la procédure pénale (article 24), qui traite de l'enregistrement audiovisuel des auditions des enfants victimes et de leur utilisation en tant qu'éléments de preuve pendant la procédure pénale, de la désignation de représentants spéciaux et du droit à une représentation juridique en son nom propre en cas de conflit d'intérêts entre l'enfant victime et les titulaires de l'autorité parentale. La directive inclut également plusieurs dispositions relatives à la protection des victimes en général, telles que l'accès aux services d'aide aux victimes. Lorsque des enfants ou d'autres groupes vulnérables sont concernés, il convient de mettre à leur disposition des services d'aide spécialisés (voir la section 38 de la résolution accompagnant la directive)[549].

Avant d'être remplacée par la directive relative aux droits des victimes, la décision-cadre 2001/220/JAI relative au statut des victimes dans le cadre des procédures pénales couvrait notamment la participation des victimes, leurs droits et leur traitement équitable. Elle reconnaissait la position spéciale des victimes vulnérables, sans toutefois faire explicitement référence aux enfants. Sur la base de cette décision-cadre, la CJUE a jugé que les enfants pouvaient être qualifiés de vulnérables lorsque l'on tient compte de leur âge et des infractions dont ils estiment avoir été victimes. Ce statut leur donne alors droit à des mesures de protection spéciales, comme l'audition en dehors de l'audience publique et avant la tenue de celle-ci[550]. La CJUE a également jugé que toutes les mesures prises pour protéger les victimes devaient être conçues de manière à ce que l'accusé fasse tout de même l'objet d'un procès équitable. En d'autres termes, la protection des victimes et des témoins ne peut compromettre le droit de la personne accusée à un procès équitable (voir également les exemples de la jurisprudence de la CouEDH)[551].

549 Voir également FRA (2014b), p. 36.

550 CJUE, C-105/03, *Procédure pénale contre Maria Pupino* [GC], 16 juin 2005, point 53.

551 CJUE, C-105/03, *Procédure pénale contre Maria Pupino* [GC], 16 juin 2005. Voir également CJUE, C-507/10, *Procédure pénale contre X.*, 21 décembre 2011.

Exemple : dans l'affaire *Pupino*,[552] une enseignante italienne avait été poursuivie pour mauvais traitements sur un élève. En vertu du code de procédure pénale italien, les témoins doivent, en règle générale, témoigner devant le tribunal pendant le procès. Toutefois, dans certaines circonstances, ce témoignage peut s'effectuer devant un juge avant le procès, dans le cadre d'une procédure spéciale (*incidente probatorio*). Dans le cas d'espèce, le ministère public a demandé à la juridiction nationale d'accepter comme preuves les témoignages qu'ont effectué les jeunes enfants à l'avance, mais celle-ci a refusé. Pour la première fois, la CJUE a donné son interprétation de certaines dispositions relatives à l'apparition des enfants en tant que victimes et témoins devant les tribunaux. Elle a souligné que la décision-cadre 2001/220/JAI exigeait des États membres qu'ils assurent la protection spécifique des victimes vulnérables, ce qui suppose que la juridiction nationale doit pouvoir autoriser les victimes vulnérables à témoigner d'une manière qui garantit leur protection, par exemple en dehors de l'audience publique et avant la tenue de celle-ci. La CJUE a indiqué ce qui suit : « [t]outefois, indépendamment de la question de savoir si la circonstance que la victime d'une infraction pénale est un mineur suffit, en règle générale, pour qualifier une telle victime de particulièrement vulnérable au sens de la décision-cadre, il ne saurait être contesté que lorsque, comme dans l'affaire au principal, des enfants en bas âge prétendent avoir subi des mauvais traitements, de surcroît de la part d'une enseignante, ces enfants sont susceptibles de faire l'objet d'une telle qualification eu égard notamment à leur âge, ainsi qu'à la nature et aux conséquences des infractions dont ils estiment avoir été victimes »[553]. La CJUE a estimé par ailleurs que toutes les mesures relatives à la protection et à la prévention de la victimisation secondaire doivent être élaborées de telle manière que le défendeur bénéficie toujours d'un procès équitable[554].

Dans le droit du CdE, la CouEDH a jugé que l'État avait l'obligation de protéger les intérêts des victimes, également lorsque celles-ci participent en tant que témoins à une procédure pénale. Leurs intérêts au titre des dispositions de la CEDH, telles que les articles 2 et 8, doivent être mis en balance avec ceux de la défense.[555] La CouEDH a rendu un certain nombre d'arrêts relatifs à des affaires

552 CJUE, C-105/03, *Procédure pénale contre Maria Pupino* [GC], 16 juin 2005.

553 *Ibid.*, point 53.

554 *Ibid.*, point 59.

555 CouEDH, *Doorson c. Pays-Bas*, n° 20524/92, 26 mars 1996.

de délits sexuels dans lesquelles des enfants avaient témoigné contre les auteurs présumés. Cette jurisprudence montre que la Cour a admis qu'une procédure pénale portant sur une infraction à caractère sexuel « est souvent vécu[e] comme une épreuve par la victime, en particulier lorsque celle-ci est confrontée contre son gré à l'accusé », a fortiori lorsque la victime est un enfant.[556] La Cour admet donc que dans ce cas de figure, certaines mesures devraient être prises afin de protéger les enfants victimes. Elle a néanmoins aussi noté que ces mesures ne devraient pas compromettre l'exercice adéquat et effectif des droits de la défense et que les autorités judiciaires peuvent être appelées à prendre des mesures qui compensent les obstacles auxquels se heurte la défense.[557]

Exemple : dans l'affaire *Kovač c. Croatie*[558], une fillette de 12 ans a témoigné devant un juge d'instruction en confirmant que le requérant avait commis des actes indécents sur elle. Le requérant n'avait pas assisté à cette déposition et ne s'y était pas fait représenter. Il n'a pas non plus eu la possibilité de contester la déclaration de la victime. La CouEDH a rappelé qu'en règle générale, tous les éléments de preuve doivent être produits en présence de l'accusé lors d'une audience publique en en vue d'un débat contradictoire. L'utilisation en tant que preuves de déclarations faites au stade de l'enquête de police ou de l'instruction n'est pas en soi contraire à l'article 6 de la CEDH pour autant que le défendeur dispose d'une opportunité adéquate et véritable de poser des questions à la victime présumée, ou de remettre en cause sa déposition, au moment des dépositions ou à un stade ultérieur de la procédure. Dans le cas du requérant, les déclarations de la victime étaient les seules preuves directes des faits qui lui étaient reprochés et ces preuves ont joué un rôle décisif dans le verdict de culpabilité rendu par le tribunal. Toutefois, le requérant n'avait pas eu la possibilité de contester ces preuves ou d'obtenir une réponse des tribunaux nationaux concernant sa plainte à cet égard. En outre, la véritable déposition de la victime n'a jamais été lue devant le tribunal : le juge s'est contenté d'indiquer que la victime confirmait la déclaration qu'elle avait fait devant le juge d'instruction. La Cour a donc conclu que le requérant n'avait pas bénéficié d'un procès

558 CouEDH, *Kovač c. Croatie*, n° 503/05, 12 juillet 2007.

équitable, en violation de l'article 6, paragraphe 1, lu conjointement avec l'article 6, paragraphe 3, point d), de la CEDH.

Exemple : dans l'affaire *S.N. c. Suède*[559], un garçon de 10 ans a déclaré à la police qu'il avait été abusé sexuellement par le requérant. Le garçon a été interrogé à deux reprises par un inspecteur de police possédant une vaste expérience des cas d'abus d'enfants. Le premier interrogatoire a été filmé et le second a fait l'objet d'un enregistrement audio. L'avocat du requérant n'a pas assisté au deuxième interrogatoire, mais a convenu avec l'inspecteur de police des questions qui devaient être abordées. Pendant le procès, le tribunal de district a diffusé les enregistrements des interrogatoires de l'enfant, mais ne l'a pas interrogé en personne. Le tribunal condamna le requérant en se basant presque exclusivement sur les témoignages de l'enfant. La cour d'appel a confirmé la condamnation. Elle a considéré que les interrogatoires de police fournissaient suffisamment de preuves de la culpabilité du requérant, tout en reconnaissant qu'aucune preuve technique ne permettait d'étayer les allégations de l'enfant, parfois imprécises. La CouEDH a reconnu que dans les affaires concernant des infractions à caractère sexuel, le contre-interrogatoire des témoins n'est pas toujours possible et que leurs témoignages doivent par conséquent être traités avec une extrême prudence. Si les déclarations de l'enfant étaient pratiquement les seules preuves à charge de l'accusé, la procédure a été globalement équitable. L'enregistrement vidéo a été diffusé au cours des audiences de première instance et d'appel et la transcription écrite du second interrogatoire a été lue à haute voix devant le tribunal de district ; la cour d'appel a également écouté l'enregistrement audio. Le requérant a dès lors eu suffisamment d'occasions de mettre en cause les déclarations et la crédibilité de l'enfant au cours de la procédure pénale. La Cour a donc conclu à l'absence de violation de l'article 6, paragraphe 3, point d), de la CEDH.

La jurisprudence de la CouEDH n'exige pas seulement de maintenir un équilibre entre la protection des enfants victimes et le droit du défendeur à un procès équitable, mais aussi que le droit à la vie des témoins et de leur famille, y compris des enfants, consacré par l'article 2 de la CEDH soit protégé, comme le montre l'exemple suivant.

559 CouEDH, *S.N. c. Suède*, n° 34209/96, 2 juillet 2002.

Exemple : l'affaire *R.R. et autres c. Hongrie*[560] porte sur un homme incarcérée qui a témoigné en audience publique au sujet de ses activités de trafic de drogue et qui est entré dans le programme officiel de protection des témoins, avec son épouse et ses deux enfants, afin de les protéger contre les risques de représailles. Lorsque les autorités virent à soupçonner que le prisonnier était toujours en contact avec le milieu criminel, elles l'ont exclu du programme, ainsi que sa famille, pour en avoir enfreint les conditions. Au titre de l'article 2 de la CEDH, les membres de la famille ont fait valoir que leur exclusion du programme de protection des témoins les a exposés à des risques de représailles de la part de la mafia et a ainsi mis leur vie en danger. La Cour a reconnu que l'entrée des requérants dans le programme de protection des témoins et la collaboration du père avec les autorités signifiaient que leur vie était en danger au moment où la mesure a été prise. L'arrêt de leur protection par le programme n'ayant pas été motivé par une réduction de ce risque, mais par une violation des conditions du programme, la Cour n'était pas convaincue que les autorités avaient démontré que les risques avaient cessé d'exister. Par ailleurs, il n'est pas déraisonnable de supposer que, à la suite du retrait des fausses identités des membres de la famille, quiconque aurait souhaité leur nuire pouvait découvrir leurs véritables identités et l'endroit où ils se trouvaient. Ainsi, les autorités ont potentiellement exposé la famille à un danger mortel, en violation de l'article 2 de la CEDH.

L'article 31 de la Convention de Lanzarote indique les mesures générales de protection que les États membres doivent prendre pour protéger les droits et les intérêts des victimes, y compris leurs besoins spécifiques en tant que témoins, à tous les stades des enquêtes et des procédures judiciaires (article 31, paragraphe 1). Ils doivent notamment tenir les victimes informées de leurs droits, des services à leur disposition et du déroulement général de l'enquête ou de la procédure, assurer la protection de leur vie privée et de leur sécurité (y compris en les informant de toute remise en liberté, temporaire ou définitive, de la personne, poursuivie ou condamnée) et en veillant à ce que les victimes et les auteurs d'infractions ne se trouvent en contact direct dans les locaux des services d'enquête et les locaux judiciaires. L'article 31 dispose par ailleurs que les victimes doivent avoir accès à une aide juridique (article 31, paragraphe 3). Les informations fournies aux enfants doivent l'être d'une manière adaptée à leur

560 CouEDH, *R.R. et autres c. Hongrie*, n° 19400/11, 4 décembre 2012.

âge et à leur degré de maturité et dans une langue qu'ils peuvent comprendre (article 31, paragraphe 6).

Les Lignes directrices du CdE sur une justice adaptée aux enfants[561] prêtent également attention à la position de l'enfant victime et témoin, en particulier lorsque celui-ci témoigne dans une procédure judiciaire. Les lignes directrices invitent les États membres à tout mettre en œuvre « pour permettre aux enfants de témoigner dans les environnements les plus favorables et les conditions les meilleures, eu égard à leur âge, leur maturité et leur niveau de compréhension, et en tenant compte de leurs éventuelles difficultés de communication ».[562] Il convient pour cela de faire appel à des professionnels formés. En outre, les déclarations audiovisuelles sont encouragées. Les enfants devraient également, dans les affaires pénales, avoir la possibilité de témoigner en dehors de la présence de l'auteur présumé de l'infraction. Les lignes directrices reconnaissent également que cette approche adaptée aux enfants doit respecter le droit des autres parties à contester le contenu des déclarations de l'enfant. Elles disposent par ailleurs que la vie privée et familiale des enfants témoins doit être protégée (section IV, point a) (9)) et que les procédures doivent se tenir de préférence à huis clos.

Dans le droit international, la position des enfants victimes est expressément reconnue par l'article 39 de la Convention relative aux droits de l'enfant. Aux termes de cette disposition, les États parties doivent prendre toutes les mesures appropriées pour faciliter la réadaptation physique et psychologique et la réinsertion sociale de tout enfant victime d'abus. La réadaptation et la réintégration doivent avoir lieu dans un environnement propice à la santé, au respect de soi-même et à la dignité de l'enfant.

Il est également à noter que les Nations Unies ont adopté des Lignes directrices en matière de justice dans les affaires impliquant les enfants victimes et témoins d'actes criminels.[563] Celles-ci invitent à traiter les enfants victimes et témoins d'une « manière adaptée à l'enfant », une expression qui « dénote une approche équilibrée du droit à la protection et veut dire que l'on prend en compte les be-

soins et points de vue individuels de l'enfant »[564]. Les lignes directrices fournissent des orientations très détaillées sur la manière de mettre en œuvre ces aspects. Le Comité des droits de l'enfant des Nations unies a également souligné, dans son observation générale n° 12, la pertinence de ces lignes directrices des Nations Unies au regard de l'article 12 de la CRC (droit d'être entendu)[565]. Selon le Comité, les enfants victimes et les enfants témoins d'un crime doivent avoir la possibilité d'exercer leur droit d'exprimer librement leurs opinions, ce qui signifie en particulier que « tout doit être fait pour que l'enfant victime et/ou témoin soit consulté sur les questions pertinentes en ce qui concerne son implication dans l'affaire à l'examen, et pour qu'il ait la possibilité d'exprimer librement, à sa manière, ses vues et ses préoccupations en ce qui concerne son implication dans le processus judiciaire » (paragraphe 63 de l'observation générale). Le Comité affirme par ailleurs que « [l]e droit de l'enfant victime ou témoin d'être entendu est [...] lié au droit d'être informé sur des questions comme la possibilité de bénéficier de services de santé, d'assistance psychologique et d'aide sociale, le rôle d'un enfant victime et/ou témoin, le déroulement de «l'interrogatoire», les mécanismes de soutien dont bénéficient les enfants qui soumettent une plainte ou participent à une enquête et à une procédure judiciaire, le lieu et l'heure des audiences, l'existence de mesures de protection, la possibilité de recevoir réparation, et les possibilités d'appel » (paragraphe 64).

Royaume-Uni, Upper Tribunal, *R (on the application of MK) c. Wolverhampton City Council* [2013] UKUT 00177 (IAC), 26 mars 2013 174

Comment consulter la jurisprudence des cours européennes ?

Cour européenne des droits de l'homme : base de données de jurisprudence HUDOC

La **base de données HUDOC** donne accès gratuitement à la jurisprudence de la CouEDH, via l'adresse suivante : http://HUDOC.echr.coe.int.

Cette base de données est disponible en anglais et en français et met à disposition un moteur de recherche convivial permettant de retrouver facilement la jurisprudence recherchée.

Des tutoriels vidéo et des manuels d'utilisation sont disponibles sur la page d'**aide** d'HUDOC. Pour des détails et exemples sur l'utilisation des filtres et des champs de recherche, l'utilisateur peut placer sa souris sur les icônes ? placées à droite de chaque outil de recherche dans HUDOC.

Les références à la jurisprudence comprises dans ce manuel donnent au lecteur des informations exhaustives lui permettant de retrouver facilement le texte complet des arrêts et décisions cités.

Avant d'entamer une recherche, veuillez noter que l'affichage par défaut reprend les arrêts de Grande chambre et de chambre dans l'ordre chronologique inverse de leur publication. Pour étendre la recherche à d'autres catégories de documents, tels que les décisions, l'utilisateur doit cocher la case correspondante dans le menu « ***catégories de documents*** » en haut, à gauche de l'écran.

La manière la plus simple d'accéder à des affaires est d'entrer le numéro de requête dans le champ « *numéro de requête* » de l'option « ***recherche avancée*** », en haut, à droite de l'écran, puis en cliquant sur « *rechercher* ».

Pour accéder à une jurisprudence plus large relative à d'autres sujets, par exemple les questions liées à l'asile, l'utilisateur peut utiliser le **champ de recherche** arborant une loupe, à droite dans le bandeau supérieur de l'écran. Dans ce champ, l'utilisateur peut lancer une recherche dans les textes à partir :

- d'un mot (enfant, par exemple) ;
- d'une expression (« *enfants migrants* », par exemple) ;
- du titre d'une affaire ;
- de l'État ; ou
- d'une chaîne booléenne (enfants SOUS protection de remplacement, par exemple).

Pour aider l'utilisateur à réaliser une recherche texte, la **recherche booléenne simple** est mise à disposition en cliquant sur la flèche apparaissant dans le **champ de recherche**. Cet outil offre six possibilités de recherche : « *ce mot ou cette expression exact(e)* » ; « *tous les mots suivants* » ; « *l'un des mots suivants* » ; « *aucun des mots suivants* » ; « *proche de ces mots* » et « *recherche booléenne* ».

Une fois sur la page de résultats, l'utilisateur peut restreindre facilement ces derniers à l'aide des filtres proposés dans le menu « ***filtres*** » à gauche de l'écran, en fonction des langues ou de l'État, par exemple. Les filtres peuvent être utilisés seuls ou combinés, pour des résultats encore plus ciblés. Le filtre « *mots-clés* » peut être utile, car il propose souvent des termes issus du texte de la CEDH et est souvent lié directement au raisonnement et aux conclusions de la Cour.

Exemple : pour consulter la jurisprudence de la Cour relative aux expulsions de demandeurs d'asile exposant ces derniers à un risque de torture ou de peine ou traitement inhumain ou dégradant au sens de l'article 3 de la CEDH :

1) l'utilisateur entre l'expression « *demandeurs d'asile* » dans le champ de recherche et clique sur le bouton bleu « *rechercher* » ;

2) sur la page de résultats, il sélectionne ensuite « *3* » dans le filtre « *violation* » du menu « ***filtres*** » pour ne plus afficher que les résultats en lien avec une violation de l'article 3 ; et

3) enfin, il peut sélectionner des mots-clés pertinents sous le filtre « *mots-clés* » pour n'afficher plus que les résultats pertinents concernant l'article 3, en utilisant par exemple la chaîne de mots-clés « *(Art. 3) Interdiction de la torture* ».

Pour les affaires plus importantes, un résumé juridique est disponible dans HUDOC. Ce résumé comprend un chapeau descriptif, ainsi qu'un bref exposé des faits et du droit, s'attardant particulièrement sur les points représentant un intérêt juridique. Si un résumé existe, un lien « Résumés juridiques » apparaîtra dans les résultats, avec le lien vers le texte de l'arrêt ou de la décision. L'utilisateur peut également rechercher exclusivement les résumés juridiques en cochant la case « *résumés juridiques* » dans le menu « ***catégories de documents*** ».

Si des traductions non officielles d'une affaire existent, un lien « Versions linguistiques » apparaîtra dans les résultats, avec le lien vers le texte de l'arrêt ou de la décision. HUDOC propose également des liens vers des sites web extérieurs hébergeant d'autres traductions de la jurisprudence de la CouEDH. Pour plus d'informations, le lecteur est prié de se référer à la page d'aide d'HUDOC, sous l'intitulé « *versions linguistiques* ».

Cour de justice de l'Union européenne : base de données de jurisprudence CURIA

La **base de données de jurisprudence CURIA** donne accès gratuitement à la jurisprudence de la CJCE/CJUE, via l'adresse suivante : http://curia.europa.eu.

Le moteur de recherche est disponible dans toutes les langues officielles de l'UE[566]. La langue peut être sélectionnée en haut et à droite de l'écran. Le moteur de recherche permet de rechercher des informations dans tous les documents liés aux anciennes affaires et aux affaires en instance de la Cour, du Tribunal et du Tribunal de la fonction publique.

566 Langues disponibles depuis le 30 avril 2004 : allemand, anglais, danois, espagnol, finnois, français, grec, italien, néerlandais, portugais et suédois ; depuis le 1er mai 2004 : estonien, hongrois letton, lituanien, polonais, slovaque, slovène et tchèque ; depuis le 1er janvier 2007 : bulgare et roumain ; depuis le 30 avril 2007 : maltais ; et depuis le 31 décembre 2011 : irlandais. Les règlements n° 920/2005 et n° 1257/2010 fixent des dérogations temporaires. Le droit dérivé en vigueur à la date de l'accession de la Croatie est en cours de traduction vers le croate et sera publié progressivement dans l'édition spéciale du Journal officiel de l'Union européenne.

Un document d'**aide** est disponible à l'adresse suivante : http://curia.europa.eu/common/juris/fr/aideGlobale.pdf. Chaque champ de recherche possède également une page d'aide accessible en cliquant sur le point d'interrogation situé devant le champ. Ces pages comprennent des informations utiles pour permettre à l'utilisateur d'utiliser au mieux l'outil.

La manière la plus simple de consulter une affaire donnée est d'entrer le numéro complet de l'affaire dans le champ « ***numéro d'affaire*** », puis de cliquer sur le bouton vert « *rechercher* ». Il est également possible de retrouver une affaire à partir d'une partie seulement de son numéro. En entrant par exemple « *122* » dans le champ « *numéro d'affaire* », l'utilisateur aura accès à toutes les affaires n° 122 de toutes les années devant la Cour, le Tribunal et/ou le Tribunal de la fonction publique.

S'il le désire, l'utilisateur peut également rechercher une affaire à partir de son nom courant en utilisant le champ « ***nom des parties*** ». Les noms des affaires se composent généralement de la forme simplifiée des noms des parties.

Il existe au total 16 champs de recherche multifonctionnels permettant de restreindre les résultats des recherches. Les différents champs de recherche sont faciles d'utilisation et peuvent être combinés de différentes manières. Ils proposent souvent des listes de recherche accessibles en cliquant sur l'icône et en sélectionnant les termes de recherche disponibles.

Pour des recherches plus générales, le champ « ***texte*** » permet de lancer une recherche à partir de mots-clés dans tous les documents publiés dans les recueils (Rec.) de la Cour depuis 1954 et dans les recueils de la jurisprudence « *Fonction publique* » (Rec. FP) depuis 1994.

Pour des recherches plus ciblées en fonction de domaines particuliers, l'utilisateur peut employer le champ « ***matières*** ». Pour cela, il doit cliquer sur l'icône située à droite du champ et sélectionner dans la liste la ou les matière(s) qui l'intéressent. Les résultats de recherche seront alors présentés sous la forme d'une liste alphabétique d'une sélection de documents liés aux questions juridiques abordées dans les décisions de la Cour, du Tribunal et du Tribunal de la fonction publique et dans les conclusions de l'avocat général.

Le site web CURIA propose également les autres outils ci-dessous aux fins de consultation de la jurisprudence.

« ***Accès numérique*** » : cette section permet de retrouver une information pour chacune des affaires introduites devant la Cour, le Tribunal ou le Tribunal de la fonction publique. Les affaires sont présentées en ordre numérique, en fonction de leur dépôt aux greffes respectifs. Elles peuvent être consultées en cliquant sur leurs numéros respectifs. La section « *accès numérique* » est disponible à l'adresse suivante : http://curia.europa.eu/jcms/jcms/Jo2_7045/.

« ***Répertoire de jurisprudence*** » : cette section regroupe, de manière systématique, les sommaires de la jurisprudence reprenant les points de droit essentiels soulevés dans les décisions. Ces résumés se basent le plus fidèlement possible sur le texte même des décisions. La section « *répertoire* » est disponible à l'adresse suivante : http://curia.europa.eu/jcms/jcms/Jo2_7046/.

« ***Notes de doctrine aux arrêts*** » : cette rubrique contient les références aux notes de doctrine relatives aux arrêts de la Cour de justice, du Tribunal et du Tribunal de la fonction publique depuis leur création. Les arrêts sont classés, pour chaque juridiction, par ordre de numéro d'affaire, tandis que les références aux notes sont classées par ordre chronologique de parution. Les références sont données dans leur langue originale. La section « *notes de doctrine aux arrêts* » est disponible à l'adresse suivante : http://curia.europa.eu/jcms/jcms/Jo2_7083/.

« ***Base de données de jurisprudence nationale*** » : cette base de données extérieure est accessible à partir du site web CURIA. Elle donne accès aux jurisprudences nationales pertinentes concernant le droit de l'UE. Elle se base sur une collection de jurisprudence des juridictions des États membres de l'UE sur la base d'un dépouillement sélectif de revues juridiques et de contacts directs avec de nombreuses juridictions nationales. La « *base de données de jurisprudence nationale* » est disponible en anglais et en français, à l'adresse suivante : http://curia.europa.eu/jcms/jcms/Jo2_7062/.

	Titre
Non-Discrimination	
Directive sur l'égalité raciale (2000/43/CE)	Directive 2000/43/CE du Conseil du 29 juin 2000 relative à la mise en œuvre du principe de l'égalité de traitement entre les personnes sans distinction de race ou d'origine ethnique, JO L 180, 19.7.2000, p. 22-26.
Directive relative à l'égalité en matière d'emploi (2000/78/CE)	Directive 2000/78/CE du Conseil du 27 novembre 2000 portant création d'un cadre général en faveur de l'égalité de traitement en matière d'emploi et de travail, JO L 303, 2.12.2000, p. 16-22.
Directive sur l'égalité d'accès aux biens et services (2004/113/CE)	Directive 2004/113/CE du Conseil du 13 décembre 2004 mettant en œuvre le principe de l'égalité de traitement entre les femmes et les hommes dans l'accès des biens et services et la fourniture de biens et services, JO L 373, 21.12.2004, p. 37-43.

Vie familiale et protection parentale	
Règlement Bruxelles II bis (CE) n° 2201/2003	Règlement (CE) n° 2201/2003 du Conseil du 27 novembre 2003 relatif à la compétence, la reconnaissance et l'exécution des décisions en matière matrimoniale et en matière de responsabilité parentale abrogeant le règlement (CE) n° 1347/2000, JO L 338, 23.12.2003, p. 1-29.
Règlement (CE) en matière d'obligations alimentaires n° 4/2009	Règlement (CE) n° 4/2009 du Conseil du 18 décembre 2008 relatif à la compétence, la loi applicable, la reconnaissance et l'exécution des décisions et la coopération en matière d'obligations alimentaires, JO L 7, 10.1.2009, p. 1-79.
Directive sur la médiation (2008/52/CE)	Directive 2008/52/CE du Parlement européen et du Conseil du 21 mai 2008 sur certains aspects de la médiation en matière civile et commerciale, JO L 136, 24.5.2008, p. 3-8.
Directive sur l'accès à la justice (2002/8/CE)	Directive 2002/8/CE du Conseil du 27 janvier 2003 visant à améliorer l'accès à la justice dans les affaires transfrontalières par l'établissement de règles minimales communes relatives à l'aide judiciaire accordée dans le cadre de telles affaires, JO L 26, 31.1.2003, p. 41-47.
Protection des enfants contre la violence et l'exploitation	
Directive « Jeunes travailleurs » (94/33/CE)	Directive 94/33/CE du Conseil, du 22 juin 1994, relative à la protection des jeunes au travail, JO L 216, 20.8.1994, p. 12-20.
Directive relative à la prévention de la traite des êtres humains (2011/36/UE)	Directive 2011/36/UE du Parlement européen et du Conseil du 5 avril 2011 concernant la prévention de la traite des êtres humains et la lutte contre ce phénomène ainsi que la protection des victimes et remplaçant la décision-cadre 2002/629/JAI du Conseil, JO L 101, 15.4.2011, p. 1-11.
Directive à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie (2011/93/UE)	Directive 2011/93/UE du Parlement européen et du Conseil du 13 décembre 2011 relative à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie et remplaçant la décision-cadre 2004/68/JAI du Conseil, JO L 335, 17.12.2011, p. 1-14.
Directive relative aux droits des victimes (2012/29/UE)	Directive 2012/29/UE du Parlement européen et du Conseil du 25 octobre 2012 établissant des normes minimales concernant les droits, le soutien et la protection des victimes de la criminalité et remplaçant la décision-cadre 2001/220/JAI du Conseil, JO L 315, 14.11.2012, p. 57-73.

Directive relative au titre de séjour délivré aux victimes de la traite des êtres humains (2004/81/CE)	Directive 2004/81/CE du Conseil du 29 avril 2004 relative au titre de séjour délivré aux ressortissants de pays tiers qui sont victimes de la traite des êtres humains ou ont fait l'objet d'une aide à l'immigration clandestine et qui coopèrent avec les autorités compétentes, JO L 261, 6.8.2004, p. 19-23.
Décision de la Commission 2007/698/CE	2007/698/CE : Décision de la Commission du 29 octobre 2007 modifiant la décision 2007/116/CE en ce qui concerne l'introduction de numéros réservés supplémentaires commençant par 116 [notifiée sous le numéro C(2007) 5139] (Texte présentant de l'intérêt pour l'EEE), JO L 284, 30.10.2007, p. 31-32.
Migration et asile, y compris les droits sociaux des enfants migrants	
Directive sur les procédures d'asile (2013/32/UE)	Directive 2013/32/UE du Parlement européen et du Conseil du 26 juin 2013 relative à des procédures communes pour l'octroi et le retrait de la protection internationale, JO L 180, 29.6.2013, p. 60-95.
Règlement de Dublin (UE) n° 604/2013	Règlement (UE) n° 604/2013 du Parlement européen et du Conseil du 26 juin 2013 établissant les critères et mécanismes de détermination de l'État membre responsable de l'examen d'une demande de protection internationale introduite dans l'un des États membres par un ressortissant de pays tiers ou un apatride, JO L 180, 29.6.2013, p. 31-59.
Directive « qualification » (2011/95/UE)	Directive 2011/95/UE du Parlement européen et du Conseil du 13 décembre 2011 concernant les normes relatives aux conditions que doivent remplir les ressortissants des pays tiers ou les apatrides pour pouvoir bénéficier d'une protection internationale, à un statut uniforme pour les réfugiés ou les personnes pouvant bénéficier de la protection subsidiaire, et au contenu de cette protection, JO L 337, 20.12.2011, p. 9-26.
Règlement (UE) n° 492/2011	Règlement (UE) n° 492/2011 du Parlement européen et du Conseil du 5 avril 2011 relatif à la libre circulation des travailleurs à l'intérieur de l'Union Texte présentant de l'intérêt pour l'EEE, JO L 141, 27.5.2011, p. 1-12.
Directive relative à la liberté de circulation (2004/38/CE)	Directive 2004/38/CE du Parlement européen et du Conseil du 29 avril 2004 relative au droit des citoyens de l'Union et des membres de leurs familles de circuler et de séjourner librement sur le territoire des États membres, modifiant le règlement (CEE) n° 1612/68 et abrogeant les directives 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE et 93/96/CEE (Texte présentant de l'intérêt pour l'EEE), JO L 158, 30.4.2004, p. 77-123.

Directive du Conseil visant à la scolarisation des enfants des travailleurs migrants (77/486/CEE)	Directive 77/486/CEE du Conseil, du 25 juillet 1977, visant à la scolarisation des enfants des travailleurs migrants, JO L 199, 6.8.1977, p. 32-33.
Directive relative au regroupement familial (2003/86/CE)	Directive 2003/86/CE du Conseil du 22 septembre 2003 relative au droit au regroupement familial, JO L 251, 3.10.2003, p. 12-18.
Directive relative à la protection temporaire (2001/55/CE)	Directive 2001/55/CE du Conseil du 20 juillet 2001 relative à des normes minimales pour l'octroi d'une protection temporaire en cas d'afflux massif de personnes déplacées et à des mesures tendant à assurer un équilibre entre les efforts consentis par les États membres pour accueillir ces personnes et supporter les conséquences de cet accueil, JO L 212, 7.8.2001, p. 12-23.
Directive sur les conditions d'accueil (2013/33/UE)	Directive 2013/33/UE du Parlement européen et du Conseil du 26 juin 2013 établissant des normes pour l'accueil des personnes demandant la protection internationale, JO L 180, 29.6.2013, p. 96-116.
Directive « retour » (2008/115/CE)	Directive 2008/115/CE du Parlement européen et du Conseil du 16 décembre 2008 relative aux normes et procédures communes applicables dans les États membres au retour des ressortissants de pays tiers en séjour irrégulier, JO L 348, 24.12.2008, p. 98-107.
Directive relative aux résidents de longue durée (2003/109/CE)	Directive 2003/109/CE du Conseil du 25 novembre 2003 relative au statut des ressortissants de pays tiers résidents de longue durée, JO L 16, 23.1.2004, p. 44-53.
Règlement (CE) n° 562/2006 (Code frontières Schengen)	Règlement (CE) no° 562/2006 du Parlement européen et du Conseil du 15 mars 2006 établissant un code communautaire relatif au régime de franchissement des frontières par les personnes (code frontières Schengen), JO L 105, 13.4.2006, p. 1-32.
Protection des données et des consommateurs	
Directive relative aux droits des consommateurs (2011/83/UE)	Directive 2011/83/UE du Parlement européen et du Conseil du 25 octobre 2011 relative aux droits des consommateurs, modifiant la directive 93/13/CEE du Conseil et la directive 1999/44/CE du Parlement européen et du Conseil et abrogeant la directive 85/577/CEE du Conseil et la directive 97/7/CE du Parlement européen et du Conseil Texte présentant de l'intérêt pour l'EEE, JO L 304, 22.11.2011, p. 64-88.

Directive relative aux produits qui, n'ayant pas l'apparence de ce qu'ils sont, compromettent la santé ou la sécurité des consommateurs (87/357/CEE)	Directive 87/357/CEE du Conseil du 25 juin 1987 concernant le rapprochement des législations des États membres relatives aux produits qui, n'ayant pas l'apparence de ce qu'ils sont, compromettent la santé ou la sécurité des consommateurs, JO L 192, 11.7.87, p. 49-50.
Directive sur les contrats à distance (97/7/CE)	Directive 97/7/CE du Parlement européen et du Conseil du 20 mai 1997 concernant la protection des consommateurs en matière de contrats à distance - Déclaration du Conseil et du Parlement européen sur l'article 6 paragraphe 1 - Déclaration de la Commission sur l'article 3 paragraphe 1 premier tiret, JO L 144, 4.6.1997, p. 19-27.
Directive relative à la sécurité générale des produits (2001/95/CE)	Directive 2001/95/CE du Parlement européen et du Conseil du 3 décembre 2001 relative à la sécurité générale des produits (Texte présentant de l'intérêt pour l'EEE), JO L 11, 15.1.2002, p. 4-17.
Directive relative aux denrées alimentaires destinées à une alimentation particulière (2009/39/CE)	Directive 2009/39/CE du Parlement Européen et du Conseil du 6 mai 2009 relative aux denrées alimentaires destinées à une alimentation particulière (refonte) (Texte présentant de l'intérêt pour l'EEE), JO L 124, 20.5.2009, p. 21-29.
Directive relative à la sécurité des jouets (2009/48/CE)	Directive 2009/48/CE du Parlement européen et du Conseil du 18 juin 2009 relative à la sécurité des jouets (Texte présentant de l'intérêt pour l'EEE), JO L 170, 30.6.2009, p. 1-37.
Directive « Télévision sans frontières » (89/552/CEE)	Directive 89/552/CEE du Conseil, du 3 octobre 1989, visant à la coordination de certaines dispositions législatives, réglementaires et administratives des États membres relatives à l'exercice d'activités de radiodiffusion télévisuelle, JO L 298, 17.10.1989, p. 23-30.
Directive « Services de médias audiovisuels » (2010/13/UE)	Directive 2010/13/UE du Parlement européen et du Conseil du 10 mars 2010 visant à la coordination de certaines dispositions législatives, réglementaires et administratives des États membres relatives à la fourniture de services de médias audiovisuels (directive Services de médias audiovisuels) (Texte présentant de l'intérêt pour l'EEE), JO L 95, 15.4.2010, p. 1-24.
Directive relative à la protection des données à caractère personnel (95/46/CE)	Directive 95/46/CE du Parlement européen et du Conseil, du 24 octobre 1995, relative à la protection des personnes physiques à l'égard du traitement des données à caractère personnel et à la libre circulation de ces données, JO L 281, 23.11.95, p. 31-50.

Directive vie privée et communications électroniques (2002/58/CE)	Directive 2002/58/CE du Parlement européen et du Conseil du 12 juillet 2002 concernant le traitement des données à caractère personnel et la protection de la vie privée dans le secteur des communications électroniques (directive vie privée et communications électroniques), JO L 201, 31.7.2002, p. 37-47.
Directive relative aux pratiques commerciales déloyales (2005/29/CE)	Directive 2005/29/CE du Parlement européen et du Conseil du 11 mai 2005 relative aux pratiques commerciales déloyales des entreprises vis-à-vis des consommateurs dans le marché intérieur et modifiant la directive 84/450/CEE du Conseil et les directives 97/7/CE, 98/27/CE et 2002/65/CE du Parlement européen et du Conseil et le règlement (CE) n° 2006/2004 du Parlement européen et du Conseil («directive sur les pratiques commerciales déloyales») (Texte présentant de l'intérêt pour l'EEE), JO L 149, 11.6.2005, p. 22-39.
Directive sur les essais cliniques (2001/20/CE)	Directive 2001/20/CE du Parlement européen et du Conseil du 4 avril 2001 concernant le rapprochement des dispositions législatives, réglementaires et administratives des États membres relatives à l'application de bonnes pratiques cliniques dans la conduite d'essais cliniques de médicaments à usage humain, JO L 121, 1.5.2001, p. 34-44.
Règlement n° 536/2014 relatif aux essais cliniques de médicaments à usage humain	Règlement (UE) n° 536/2014 du Parlement européen et du Conseil du 16 avril 2014 relatif aux essais cliniques de médicaments à usage humain et abrogeant la directive 2001/20/CE Texte présentant de l'intérêt pour l'EEE, JO L 158, 27.5.2014, p. 1-76.
Procédures judiciaires et dispositifs alternatifs	
Directive relative au droit à l'interprétation et à la traduction (2010/64/UE)	Directive 2010/64/UE du Parlement européen et du Conseil du 20 octobre 2010 relative au droit à l'interprétation et à la traduction dans le cadre des procédures pénales, JO L 280, 26.10.2010, p. 1-7.
Directive relative au droit à l'information (2012/13/UE)	Directive 2012/13/UE du Parlement européen et du Conseil du 22 mai 2012 relative au droit à l'information dans le cadre des procédures pénales, JO L 142, 1.6.2012, p. 1-10.
Directive relative au droit d'accès à un avocat (2013/48/UE)	Directive 2013/48/UE du Parlement européen et du Conseil du 22 octobre 2013 relative au droit d'accès à un avocat dans le cadre des procédures pénales et des procédures relatives au mandat d'arrêt européen, au droit d'informer un tiers dès la privation de liberté et au droit des personnes privées de liberté de communiquer avec des tiers et avec les autorités consulaires, JO L 294, 6.11.2013, p. 1-12.

Charte des droits fondamentaux	Charte des droits fondamentaux de l'Union européenne, JO C 326, 26.10.2012, p. 391-407.
Enfants handicapés	
Décision du Conseil 2010/48/CE	Décision du Conseil du 26 novembre 2009 concernant la conclusion, par la Communauté européenne, de la convention des Nations unies relative aux droits des personnes handicapées, JO L 23, 27.1.2010, p. 35-61.

De nombreuses informations sur l'Agence des droits fondamentaux de l'Union européenne sont disponibles sur le site internet de la FRA (fra.europa.eu).

D'autres informations sur la jurisprudence de la Cour européenne des droits de l'homme sont disponibles sur le site internet de la Cour : echr.coe.int. Le portail de recherche HUDOC donne accès aux arrêts et décisions en anglais et/ou en français, à des traductions dans d'autres langues, aux avis consultatifs et résumés juridiques, aux communiqués de presse et autres informations sur le travail de la Cour.

Comment vous procurer les publications de l'Union Européenne?

Publications gratuites:

- un seul exemplaire:
  sur le site EU Bookshop (http://bookshop.europa.eu);
- exemplaires multiples/posters/cartes:
  auprès des représentations de l'Union européenne (http://ec.europa.eu/represent_fr.htm),
  des délégations dans les pays hors UE (http://eeas.europa.eu/delegations/index_fr.htm), en
  contactant le réseau Europe Direct (http://europa.eu/europedirect/index_fr.htm)
  ou le numéro 00 800 6 7 8 9 10 11 (gratuit dans toute l'UE) (*).

(*) Les informations sont fournies à titre gracieux et les appels sont généralement gratuits (sauf certains opérateurs, hôtels ou cabines téléphoniques).

Publications payantes:

- sur le site EU Bookshop (http://bookshop.europa.eu).

Comment obtenir des publications du Conseil de l'Europe

Les Éditions du Conseil de l'Europe publient sur tous les domaines de référence de l'Organisation, notamment les droits de l'homme, les sciences juridiques, la santé, l'éthique, les questions sociales, l'environnement, l'éducation, la culture, le sport, la jeunesse, le patrimoine architectural. Chaque livre ou produit électronique peut être commandé directement en ligne à partir du site web : http://book.coe.int/.

Une salle de lecture vous permet, comme dans une bibliothèque virtuelle, de consulter gratuitement des extraits des principaux ouvrages qui viennent de paraître ou l'intégralité de certains documents officiels.

Le texte intégral des Conventions du Conseil de l'Europe et diverses informations sur celles-ci sont disponibles à partir du site officiel des Traités du Conseil de l'Europe : http://conventions.coe.int/.

FRA
EUROPEAN UNION AGENCY FOR FUNDAMENTAL RIGHTS

EUROPEAN COURT OF HUMAN RIGHTS
COUR EUROPÉENNE DES DROITS DE L'HOMME

COUNCIL OF EUROPE
CONSEIL DE L'EUROPE

doi:10.2811/411659 TK-05-16-084-FR-N

Les enfants sont des titulaires de droits à part entière. Ils sont bénéficiaires de tous les droits fondamentaux et de l'homme, et sont sujets de réglementations particulières compte tenu de leurs caractéristiques spécifiques. Ce manuel a pour but de montrer comment le droit et la jurisprudence européens s'adaptent aux intérêts et besoins particuliers des enfants. Il illustre également l'importance des parents et des tuteurs ou d'autres représentants légaux et fait référence, le cas échéant, aux principaux droits et responsabilités conférés aux personnes ayant la charge des enfants. Ce manuel entend sensibiliser le lecteur et approfondir ses connaissances des normes juridiques qui protègent et promeuvent les droits de l'enfant en Europe. Il constitue un ouvrage de référence sur le droit de l'Union européenne (UE) et du Conseil de l'Europe (CdE) relatif à ces domaines. Il explique comment chaque question est réglementée par le droit de l'UE, y compris la Charte des droits fondamentaux de l'Union européenne, ainsi que par la Convention européenne des droits de l'homme (CEDH), la Charte sociale européenne et d'autres instruments du Conseil de l'Europe. Ce manuel est destiné aux juristes non spécialisés, aux juges, aux procureurs, aux autorités chargées de la protection de l'enfance, ainsi qu'à d'autres praticiens et organisations chargés d'assurer la protection juridique des droits de l'enfant. Il explique la jurisprudence essentielle et résume les principaux arrêts de la Cour de justice de l'Union européenne (CJUE) et de la Cour européenne des droits de l'homme (CouEDH).

carepath

Empowering public authorities and professionals towards trauma-informed leaving care support

La parole de l'enfant traumatisé dans les procédures civiles et pénales

Co-funded by the European Union's Rights, Equality and Citizenship Programme (2014-2020)

03 Unité

Objectifs d'apprentissage

Décrire les capacités participatives de l'enfant traumatisé dans les procédures civiles et pénales le concernant et les mesures visant à garantir sa sécurité et son bien-être psycho-physique

Principales sources internationales et européennes

- Convention relatives aux droits de l'enfant (CDE)

COUNCIL OF EUROPE
CONSEIL DE L'EUROPE

- Convention européenne sur l'exercice de droits de l'enfant(convention de Strasbourg) Con.)
- Convention de Lanzarote
- Convention européenne des droits del'homme (ECHR)

- Charte des droits fondamentaux de l'Union européenne
- Directive 2011/36/EU sur la traite des êtres humains
- Directive 2012/29/EU sur les droits des victimes de la criminalité
- Directive 2011/93/EU sur la lutte contre les abus sexuels et l'exploitation sexuelle des enfants et contre la pedopornographie

Procédures dans lesquelles l'enfant peut être impliqué

1. Procédures pénales

L'obligation de l'État de prévenir et de punir la violence et la maltraitance des mineurs (première victimisation) *Art. 3-7 CDE; Art. 3 CEDH; Art. 18 Lanzarote; Art. 2-10 Directive 36; Art. 3-17 Directive 93*

Prévention

Introduction d'infractions pénales liées à la violence et aux abus contre les enfants

Sanction

Sanction des auteurs de violences et d'abus envers les mineurs

2. Procédures civiles

Lorsque l'un ou les deux parents sont les auteurs directs de l'abus, ou l'ont autorisé d'une autre manière

Pour garantir un environnement familial sûr et paisible

Art. 9 CDE; Art. 8 CEDH

Restrictions pour les parents

- Video Baldelli
- Video Ceccarelli
- Video Cibinel

Garde de l'enfant confiée à une autre famille

Placement dans un établissement pour enfants traumatisés

Adoption du mineur

- Video Cibinel
- Video Baldelli

Relations entre les procédures pénales et civiles

carepath

Procédures pénales

Objectif → identifier et punir l'auteur d'un comportement contre le mineur, si ce comportement est un crime

Procédures civiles

Objectif → vérifier le caractère approprié de la famille de l'enfant et prévenir tout nouveau dommage.

Ces procédures sont distinctes et indépendantes → un comportement qui n'est pas un crime peut compromettre l'environnement de la famille, justifiant l'intervention du juge

3. Procédures extrajudiciaires

Lorsque la relation entre l'auteur de l'abus et le mineur semble être récupérable

Art. 13 Strasbourg Conv.; Art. 12 Directive 29

L'objectif est d'éviter les procédures intrusives, qui pourraient compromettre définitivement le rétablissement de la relation

- Médiation
- Tentative de Conciliation
- Mesures supplémentaires de rapprochement

carepath

L'intérêt supérieur de l'enfant

Ce principe s'applique à toute procédure et exige que le bien-être psycho-physique de l'enfant soit placé avant tout autre intérêt digne de protection

Art. 3 CDH; Art. 6 Strasbourg Conv.

Le juge doit rassembler toutes les informations nécessaires à une bonne compréhension de l'environnement familial de l'enfant

La décision du juge doit toujours viser la protection des intérêts du mineur

- Video Ceccarelli
- Video Long

Le droit de l'enfant à être consulté

L'opinion de l'enfant doit être connue par le juge et pris en compte dans la décision

Art. 12 CDE; Art. 3 Conv. Strasbourg

Garanties participatives pour l'enfant

BUT

Mesures de protection pour éviter la "victimisation secondaire'

Garanties de participation de l'enfant

carepath

Le droit à être informé`

Art. 31 Lanzarote; Art. 3 Strasbourg Conv.; Art. 3-4 Directive 29

Seul un enfant ayant des connaissances suffisantes peut participer avec profit au processus de décision

A quel propos?

- signification de la procédure
- faits en cause
- droits et protections
- le rôle de l'enfant
- les conséquences possibles de ses opinions

Qui?

- autorité judiciaire
- avocat
- représentant
- expert

Comment?

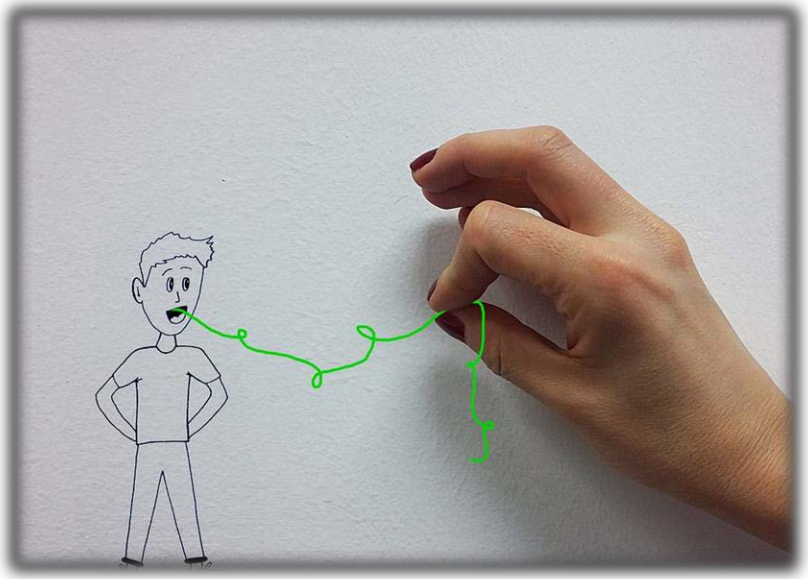
utilisation d'un langage et de concepts adaptés à l'âge et à la compréhension de l'enfant

2. Droit d'être entendu sur les faits en cause

Le mineur peut être invité à témoigner sur les faits pertinents pour la décision

Procédures pénales

L'enfant comme témoin de la violence et des abus subis, afin d'établir la culpabilité de l'accusé



Procédures civiles

L'enfant comme témoin de la violence et des abus subis, afin d'évaluer le caractère adéquat de la famille

Risque élevé de victimisation secondaire

- Video Ceccarelli
- Video Cibinel
- Video Long

3. Droit d'être consulté avant la décision du juge

Avant la décision, l'enfant a le droit d'exprimer son avis sur les questions abordées dans la procédure

Art. 12 CDE; Art. 3 Strasbourg Conv.

Procédures pénales

- début de la procédure
- mesures de précaution
- probation et autres procédures spéciales
- évaluation des preuves

Procédures civiles

- le retrait de la famille
- l'éloignement d'un des parents
- la garde des enfants
- adoption

Souvent, l'opinion est remplacée par la garantie plus forte du consentement

Procédures extrajudiciaires

Consentement à une tentative de médiation ou de conciliation

Le poids de l'opinion dépend du niveau de compréhension de l'enfant

Outils de protection dans le cadre de la procédure

Soutien par une personne
Art. 12 CDE; Art. 31 Lanzarote; Art. 9-10 Strasbourg Conv.; Art. 24 Directive 29

Représentant (si les parents ne sont pas disponibles, ou en cas de conflit d'intérêts)

Il identifie et protège les intérêts de l'enfant

Avocat

Il adopte la stratégie juridique la plus appropriée pour obtenir une décision conforme à l'intérêt de l'enfant

Les professionnels du secteur social ou de la santé
(psychologues, psychiatres, travailleurs sociaux)

- la protection contre la victimisation secondaire
- le soutien au juge, aux parents et aux avocats, pour comprendre les besoins et la fragilité de l'enfant

- Aide pour surmonter le traumatisme dû à la violence vécue

Ces personnes peuvent être désignées par le juge

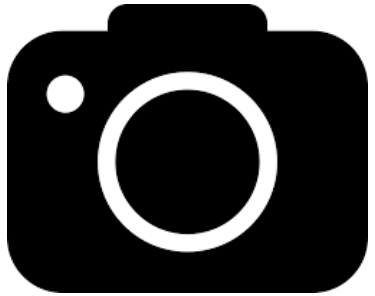
2. Droit à la vie privée

Art. 16 CDE; Art. 8 CEDH; Art. 21 Directive 29

carepath

Audience à huis clos, sans présence du public

Limites à la diffusion d'images et d'informations



Limites aux questions sur la vie privée pouvant être adressées à l'enfant pendant l'audition

3. Durée raisonnable des procédures

La victimisation secondaire est également liée à la durée de la procédure *Art. 7 Strasbourg Conv.*

conflit entre différentes valeurs

La décision doit être prise le plus vite possible pour éviter de prolonger le stress

les autres intérêts du mineur et des autres personnes impliquées dans la décision ne peuvent être complètement sacrifiés

Equilibre nécessaire

4. Mesures de Protection au cours de l'audition (partie I)

Lorsque l'enfant témoigne de la maltraitance, de ses relations avec l'auteur du crime, de sa famille *Art. 31 Lanzarote; Art. 18 Directive 29; CEDH, 2.7.2002, S.N. c. Sweden*

⇩

Mesures visant à éviter le risque de victimisation secondaire

Lieu de l'audition

l'audition peut avoir lieu en dehors de la salle d'audience

⇩

Maison du mineur, bureau du juge, cabinet de l'avocat, pièce spéciale

Qui pose les questions?

les questions peuvent ne pas être posées directement par les avocats des parties, mais par le juge, ou par un expert

⇩

Les avocats peuvent être agressifs, ou plus simplement ne pas avoir l'expérience requise pour examiner des mineurs

4. Mesures de protection au cours de l'audition (partie II)

carepath

Il est nécessaire de procéder le plus vite possible à l'audition et d'éviter les répétitions

L'attente de l'audition et les répétitions augmentent le stress

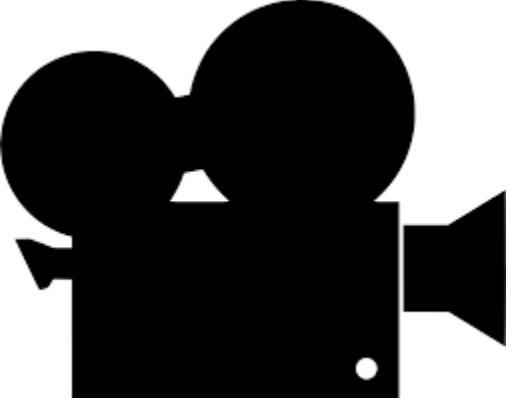
L'audition de l'enfant doit avoir lieu au début de la procédure, puis elle ne doit plus être répétée

Aucun contact avec l'accusé, les parents en conflit d'intérêts et leurs avocats

Le contact visuel peut stresser et intimider l'enfant

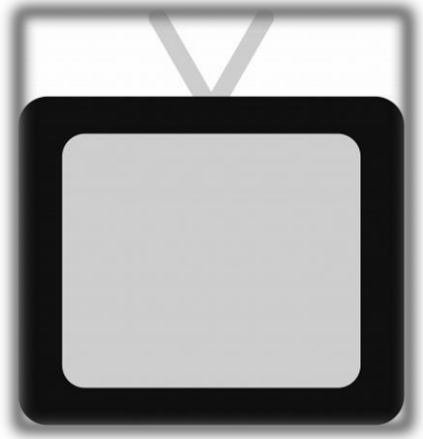
- système d'interphone avec verre réfléchissant
- vidéoconférence
- les questions préparées par les avocats mais adressées par le juge ou par un expert dans une salle spéciale

nécessité de trouver un équilibre entre les intérêts de l'enfant et les droits de la défense



carepath

Videos de l'audition d'un enfant



Exemple d'une salle spéciale en Italie

Préparation de l'enfant avant son témoignage

(video 1 et video 2)

le témoignage d'un enfant à propos de l'assassinat de sa soeur

5. Mesures de protection pour permettre l'expression de l'opinion et du consentement de l'enfant

Art. 6 Strasbourg Conv.

La libre expression des opinions ou du consentement peut être affectée par la présence d'autres personnes telles que les parents, les accusés et les avocats

Le juge peut entendre ce que l'enfant veut dire en dehors de la salle d'audience, ou éviter la présence de ces personnes

- Video Ceccarelli
- Video Long

- Video Baldelli
- Video Cibinel

6. Protection du bien-être

Art. 20-21 CDE; Art. 31 Lanzarote; Art. 18 Directive 29

carepath

Avant que la décision finale ne soit prise, des mesures conservatoires provisoires peuvent être adoptées afin de protéger l'enfant

Mesures à l'encontre de l'auteur

- la détention préventive/l'assignation à résidence
- restrictions à l'encontre des parents
- retrait du domicile familial
- interdiction d'approcher l'enfant

Mesures pour le mineur

- la garde provisoire dans une autre famille
- l'éloignement du domicile familial

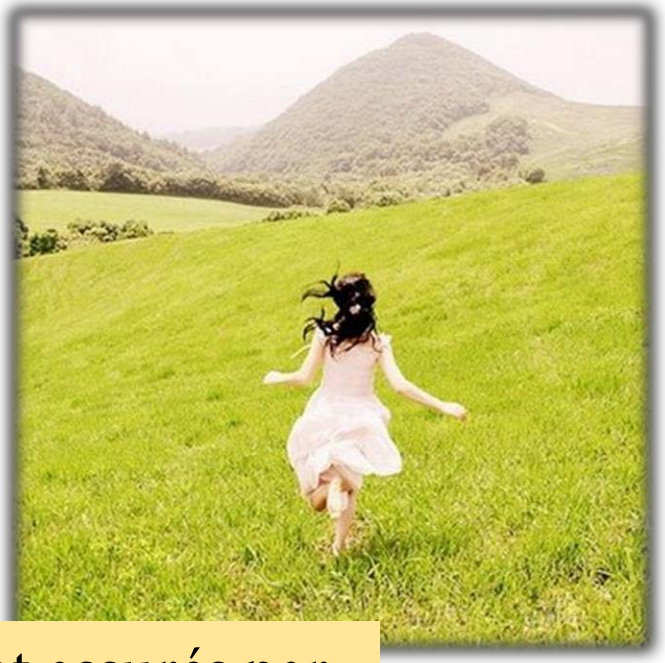
7. Assistance en dehors des procédures

Art. 39 CDE; Art. 31 Lanzarote; Art. 8-9 Directive 29

Video Cibinel

Soutien psychologique et émotionnel en dehors de la procédure

Il faut combattre la victimisation secondaire également avant et après l'audition



La punition des coupables et le rétablissement de la sérénité familiale ne suffisent pas

il est nécessaire d'aider l'enfant à surmonter le traumatisme résultant des abus subis (victimisation primaire)

Ces besoins sont souvent assurés par les services sociaux

Résumé du rôle des professionnels du secteur social ou de la santé

carepath

Au cours des procédures

- Évaluation individuelle des besoins de protection spécifiques
- assistance pendant la participation de l'enfant aux activités procédurales
- évaluation de la fiabilité de l'enfant
- participation aux tentatives de conciliation
- évaluation du niveau de compréhension
- évaluation des conditions familiales

objectif principal → prévenir la victimisation secondaire et fournir au juge des connaissances utiles pour sa décision

en dehors des procédures

- soutien psychologique et émotionnel pour l'enfant
- vérification des conditions de la nouvelle famille

objectif principal → surmonter le traumatisme causé par la violence et les abus subis et restaurer la sérénité familiale

carepath

Empowering public authorities and professionals towards trauma-informed leaving care support

L'impact d'une approche fondée sur les droits de l'enfant sur les politiques sociales et les politiques de santé

Co-funded by the European Union's Rights, Equality and Citizenship Programme (2014-2020)

04

Unité

ssage

Comprendre les effets qu'a sur le fonctionnement des politiques sociales et des politiques de la santé une approche centrée sur les droits fondamentaux des enfants et, en particulier, sur leurs droits à la participation.

Cadres juridiques vs politiques

carepath

Les **politiques** sont un élément essentiel dans la lutte contre la violence à l'égard des enfants : la présence d'une législation adéquate interdisant cette violence n'est PAS suffisante !

"Trop souvent, nous constatons que la législation existe, mais que de nombreux enfants restent en marge de la société (...), d'autant plus vulnérables à la violence et aux maltraitances
(Rima Salah, Directrice exécutive adjointe, UNICEF. cit., dans "United Nations Secretary-General's Study on Violence against Children)"

Les politiques sociales, les politiques de la santé et les droits à la participation

carepath

Les enfants contribuent aux politiques :

- ✓ en participant activement au processus de prise de décisions dans **leur cas particulier** (p. ex. au moyen d'entrevues ou de lettres adressées au travailleur social ou au juge en charge de leur cas, par leur participation directe aux réunions lors desquelles des décisions sont prises au sujet de leur cas, par la présence d'un représentant spécial),

- ✓ en participant, en qualité de groupe, à la définition des priorités et des actions de lutte contre la violence à l'égard des enfants (p. ex. Par la création de conseils consultatifs

pour les enfants, la participation des jeunes à la formation des professionnels de l'enfance, la participation des enfants aux études et recherches sur le fonctionnement des services d'accueil des enfants)

Au sein de la famille

« Une famille où les enfants peuvent librement exprimer leurs opinions et être pris au sérieux dès le plus jeune âge.... **joue un rôle préventif contre toutes les formes de violence à la maison et dans la famille** »

Programmes d'éducation des parents portant sur :
- la relation de respect mutuel entre parents et enfants ;
- la participation des enfants à la prise de décisions ;

- les moyens de régler les divergences de vues au sein de la famille

Source: Observation générale No. 12 (2009) *Le droit de l'enfant d'être entendu*

EXEMPLE N° 1

Au niveau mondial et européen, il existe de multiples initiatives de sensibilisation, dont plusieurs visent spécifiquement les parents, pour affirmer l'illégitimité de tout châtiment corporel infligé aux enfants.

Dans la protection de remplacement

« Il convient de mettre en place des mécanismes pour veiller à ce que les enfants bénéficiant d'une protection de remplacement quelle qu'elle soit, notamment en institution, soient en mesure d'exprimer leurs opinions, celles-ci étant dûment prises en considération, en ce qui concerne leur placement, la réglementation relative aux conditions d'accueil dans les familles d'accueil ou les foyers et leur vie quotidienne" (Observation générale No. 12 (2009) *Le droit de l'enfant d'être entendu*)

Par exemple, ils doivent être entendus pour toute décision concernant :

- le choix du moment et de l'endroit de leur placement en protection de remplacement ;
- les membres de la famille avec lesquels maintenir le contact pendant la protection de remplacement, la fréquence et les méthodes de ces contacts ;
- leurs projets d'avenir ;
- des examens périodiques de leur situation ;

(Voir SOS, Children's Villages International/ISS, Les lignes directrices relatives à la protection de remplacement pour les enfants : un cadre pour les NU, Genève, 2009)

Exemples de mécanismes généraux :

- une **institution de contrôle** (comme un *médiateur* des enfants), avec un libre accès aux établissements de séjour, pour pouvoir entendre directement les opinions et les préoccupations de l'enfant ;
- un **conseil représentatif** des enfants en établissement de séjour, chargé de participer à l'élaboration et à la mise en oeuvre de la politique et des règles de l'institution ;
- une **formation spécifique des professionnels**, associant des enfants comme formateurs.

Source: *Observation générale No. 12 (2009) Le droit de l'enfant d'être entendu*

Exemple No. 2

Dans plusieurs pays européens, des **réseaux informels de personnes quittant ou ayant quitté les structures de prise en charge** placées en institutions ou dans des familles d'accueil encouragent la participation et une citoyenneté active :

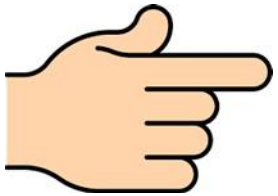
- en suscitant des instants de rencontre, de discussion et d'enrichissement mutuel entre les participants,
- en contribuant à l'amélioration des politiques sociales relatives à la protection de remplacement et au soutien nécessaire des jeunes quittant les structures de prise en charge de l'Etat.

Un réseau "European Care Leavers" est en cours de création.

Source: *http://www.agevolando.org/leavecare-livelife/*

Ce dont les enfants bénéficiant d'une protection de remplacement se soucient le plus est **leur avenir une fois l'âge adulte atteint**, lorsque cesse l'obligation spécifique de l'État de prendre soin d'eux.

Visionnez une action concrète du Réseau italien des enfants quittant les structures de prise en charge pour sensibiliser aux difficultés de l'autonomie une fois la majorité atteinte "18 anni e (non) sentirli"



Visionnez l'action concrète d'un médiateur irlandais "Young person in residential care makes complaint to Ombudsman for Children"

Soins de santé

Les enfants devraient toujours être associés aux discussions et décisions relatives à leur santé

(Unicef- Save The Children, *Every child's right to be heard* , 2009)

Ils ont le « droit d'être **informés** d'une manière adaptée à leur âge et à la capacité de compréhension » (art. 4 EACH –

European Association for Children in Hospital

=

Charter)

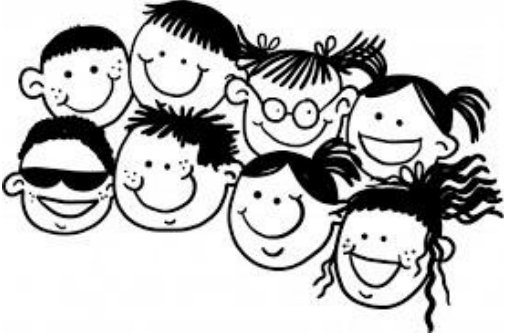
carepath

"Lorsque, selon la loi, un mineur n'a pas la capacité de consentir à une intervention, celle-ci ne peut être effectuée sans l'**autorisation de son représentant**, d'une autorité ou d'une personne ou instance désignée par la loi.
L'**avis du mineur** est pris en considération comme un facteur de plus en plus déterminant, en fonction de son âge et de son degré de maturité."

(art. 6 par. 2 La Convention pour la protection des Droits de l'Homme et de la dignité de l'être humain à l'égard des applications de la biologie et de la médecine)

Lorsqu'ils sont victimes de violence ou d'abus chez eux, les enfants peuvent avoir besoin d'accéder, « sans le consentement de leurs parents, à **des conseils et avis médicaux confidentiels**, sans considération de l'âge de l'enfant ».

Observation générale No. 12 (2009) Le droit de l'enfant d'être entendu



La participation de l'enfant aux décisions concernant sa santé non seulement favorise son bien-être personnel, mais améliore également les politiques de santé et les pratiques en matière de santé et de sécurité.

Parmi les mécanismes possibles :

- systèmes de retour pour tous les usagers des services
- processus de recherche et de consultation avec des enfants comme personnes interrogées et /ou comme chercheurs
- participation des conseils des enfants dans l'élaboration des normes et indicateurs destinés aux services de la santé, respectueux des droits des enfants
- participation des enfants dans les inspections et le suivi

[Unicef- Save The Children, *Every child's right to be heard* , 2009, p.98]

Dans les situations de violence

Les Etats son encouragés à :

- consulter les enfants, y compris les groupes d'enfants marginalisés et défavorisés, dans l'élaboration et la mise en œuvre de mesures législatives, politiques, éducatives et autres visant à combattre toutes les formes de violence. (*Observation générale No. 12 (2009) Le droit de l'enfant d'être entendu*)
  - Faciliter l'accès des personnes ou organisations auxquelles ils peuvent se confier en toute confidentialité et en toute sécurité (*Observation générale No. 12 (2009) Le droit de l'enfant d'être entendu*)
- mettre en place des autorités indépendantes pour garantir les droits de tous les mineurs et, plus particulièrement, des victimes de violence (Observation générale No. 13 (2011) Le droit de l'enfant d'être protégé contre toutes les formes de violence)

EXEMPLE NO. 3

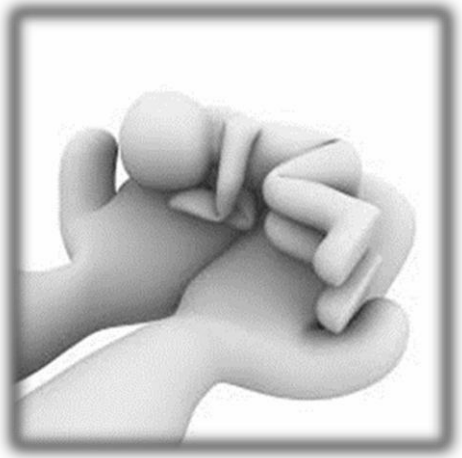
La vidéo du Conseil de l'Europe « Parle à quelqu'un de confiance » traite des abus sexuels en utilisant un langage et des méthodes adaptés aux enfants, **les encourageant à signaler les violences qu'ils ont subies.**

EXEMPLE N° 4

L'Italianaire est une bande dessinée vidéo réalisée avec la participation de cinq jeunes adultes vivant en Italie et originaires d'Égypte, rendue possible grâce à Save the Children, dont l'objectif est d'informer et de sensibiliser les enfants égyptiens vivant dans des zones à fort taux d'émigration enfantine sur les **conditions de vie réelles** en Italie pour les enfants migrants égyptiens.

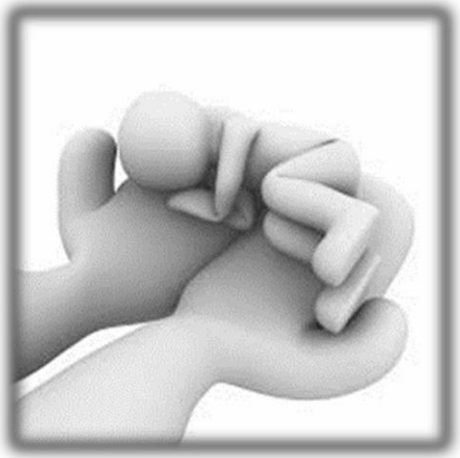
EXEMPLE N° 5

La vidéo du Conseil de l'Europe "Halte au Harcèlement" montre les effets du harcèlement en utilisant des contenus et un langage adaptés aux enfants. Elle encourage les enfants à jouer un rôle moteur dans la lutte contre le harcèlement.



"Le droit des enfants et des jeunes à être entendus peut également jouer un rôle préventif contre toutes les formes de violence à la maison, au sein de la famille, dans les écoles et les institutions."

(European Network of Ombudspersons for Children (ENOC), *Prise de position sur la Violence à l'encontre des enfants*, 2015)



carepath

Les adultes devraient garantir la participation des enfants aux processus décisionnels et prendre toutes les précautions voulues pour réduire au minimum le risque pour un enfant d'être, du fait de sa participation, exposé à la violence, à l'exploitation ou à toute autre conséquence négative.

(Observation générale, N°12 (2009) *Le droit de l'enfant d'être entendu*)

Conclusions

Une **approche intégrée** s'impose et devrait prévoir :

✓ non seulement de combattre, mais également de **prévenir** toute violence à l'encontre des enfants ;
✓ de promouvoir une **culture de respect** des droits de l'enfant ;
✓ d'organiser une **formation spécifique,** destinée aux professionnels travaillant en contact avec les enfants, aux concepts de protection et droits de participation ;
✓ de créer et de gérer des services pour l'enfance adaptés aux besoins des enfants ;
✓ de mettre en place des **services d'aide et d'assistance téléphonique** facilement accessibles aux enfants victimes de violence.

ENOC
European Network of Ombudspersons for Children

European Network of Ombudspersons for Children (ENOC)

Position Statement on 'Violence against Children"

Adopted at the 19th ENOC General Assembly, 24 September 2015, The Hague

"No violence against children is justifiable;
all violence against children is preventable" [1]

We, members of the European Network of Ombudspersons for Children (ENOC), call upon our governments, the European Commission and the Council of Europe to take a stand against violence towards children and to undertake all appropriate action.

ENOC adopts the following definition of violence: "Child abuse or maltreatment constitutes all forms of physical and/or emotional ill-treatment, sexual abuse, neglect or negligent treatment or commercial or other exploitation, resulting in actual or potential harm to the child's health, survival, development or dignity in the context of a relationship of responsibility, trust or power."[2]

Having considered the international binding and non-binding legal instruments, and in particular:

- The UN Convention on the Rights of the Child (1989)
- The Optional Protocol to the Convention on the Rights of the Child on the sale of children, child prostitution and child pornography (2002)
- General Comment no. 8 of the UN Committee on the Rights of the Child (2006)
- The UN Study on Violence against Children (2006)
- The Council of Europe Guidelines on integrated national strategies for the protection of children from violence (2009)
- The Lanzarote Convention (2010)
- The Council of Europe Guidelines on Child-friendly Justice (2010)
- General Comment no. 13 of the UN Committee on the Rights of the Child (2011)
- The European Union Agenda on the Rights of the Child (2011)

Following and in line with ENOC Statements titled "Violence in a children's rights context" (2005) and "Implementation of the UN Study on Violence against Children recommendations" (2007),

Recognizing the important international momentum around tackling violence against children, especially the imminent adoption by the UN General Assembly of the Sustainable Development Goals and the forthcoming 10th anniversary of the Secretary-General's Study on Violence against Children,

Having consulted with the children and young persons who participated in activities of the European Network of Young Advisors (ENYA) run by ENOC, who expressed the following views:

1. Pinheiro, Paulo Sergio. Rights of the child. Report of the independent expert for the United Nations study on violence against children. 2006.
2. World Health Organization. Child maltreatment ("child abuse"). 2014. Retrieved 18 August 2015 from http://www.who.int/violence_injury_prevention/violence/child/en/

e-mail secretariat@ombudsnet.org

> Actions to tackle violence against children should consider the hazards of child poverty often generated by our consumer-based economy. Violence is also produced by state policies or institutions and the result of so-called differences between people: race, religion, disability or gender that they seem to believe our governments fail to address properly. Mass media operate and often contribute to the acceptance and reinforcement of violence against children, by presenting children too often as a threat for our society. Parents and all professionals working with children should be trained how to listen to children, to understand them and take action in order to protect them and avoid further violations of their rights.

ENOC expresses the opinion that, despite all relevant measures adopted by European institutions and states during recent years, violence against children remains one of the greatest direct violation of children's rights in Europe, with an enormous scope and far reaching consequences for its victims. The UN Convention on the Rights of the Child (CRC) states very clearly that every child has the right to grow up without violence and to be protected from it (article 19). Yet a childhood without violence is not the reality for millions of children in Europe[3].

Violence against children can be identified in many aspects of social life. In high income countries, up to 80% of violence against children takes place at home, perpetrated by caregivers[4]. It also may take place in schools, in institutions, in the streets and in the (social) media. Violence is perpetuated both by adults and by peers. Extreme poverty, poor living conditions, social exclusion and racism have been shown to contribute to violence in the home, if families are not properly supported.

ENOC believes all violence against children should be eliminated. No degree of violence against children can be excused; child maltreatment is utterly unacceptable. All our governments have ratified the Convention on the Rights of the Child, and together with all the other binding and non-binding international documents, there is sufficient legal basis for all European countries to take measures to tackle all violence against children. The problem lies in the implementation of the measures we have already agreed upon.

ENOC greatly respects the endeavours of the Council of Europe, United Nations, European Parliament and European Commission. Their efforts have resulted in increased awareness of the issue of violence against children. We are also thankful for all measures introduced by the European Commission to tackle public health issues in a number of policy areas. We are impressed by the results of stringent measures that various European governments have taken to reduce child maltreatment in their countries. Now it is time to ensure that measures that are known to tackle violence against children are rigorously implemented, all over Europe.

Major issues and recommendations

Research has demonstrated that thorough implementation of the following recommended measures to combat five major issues will likely result in a decrease of the number of child victims of no less than 25% within a period of ten years[5]. This is an important milestone on the road towards

e-mail secretariat@ombudsnet.org

absolute eradication. We therefore strongly urge all governments from European countries, as well as the European Commission and European Parliament, to readily implement these measures.

1. Full ban on corporal punishment

The UN Committee on the Rights of the Child stressed in General Comment no. 8 that no form of corporal punishment can be anything other than degrading. However, in Europe many children still grow up in settings where violent upbringing is the norm and where violence is an accepted way of disciplining of and communicating with children. Almost one third of all EU countries do not have a full ban on corporal punishment. A further third of the countries have a ban, but it is not fully implemented, rendering it ineffective. Research evidence demonstrates that it is possible to reduce the share of parents using corporal punishment to less than 5% within a decade when a full ban is implemented and accompanied by thorough public campaigns.

Recommendation No. 1

Implement a full ban on corporal punishment without delay. The ban needs to cover all types of violent punishment, not only at home, but also in other settings, such as day care centres, schools, sports clubs, support services and institutions.

2. Identification and reporting

All states are (already) obliged to take measures to protect children from violence (article 19 CRC). According to the Committee, these measures should include an identification and reporting mechanism (General Comment no. 8). Nonetheless, most child maltreatment still goes undetected and unreported by professionals that are in contact with children or their parents. In many European countries, reliable data on the extent of violence against children is lacking. Furthermore, many countries lack child-friendly procedures and special places for children to disclose violence. Upon disclosing their experiences, children are often not believed. Children with disabilities, those belonging to minority groups and children on the move are often faced with additional obstacles to report their maltreatment. This is a violation of children's right to be heard that often leads to their re-victimization. Data shows that the introduction of high quality identification and reporting procedures can lead to a threefold increase of the screening and reporting rates by education and medical professionals within five years[6].

Recommendation No. 2

Regularly conduct research and collect data on the occurrence of all forms of violence against children, including corporal punishment, in all European countries.

Recommendation No. 3

Provide all professionals whom children and their caregivers regularly come into contact with, such as their teachers and medical professionals, with high quality identification and reporting procedures.

3. Mandatory training and education

Training professionals in the identification and reporting of child maltreatment is crucial to both increasing screening and reporting rates and to enable them to communicate with victims in a trauma sensitive approach. Most of the literature on child maltreatment refers to the need for better training of professionals. Educating children about violence, promoting the principle of equality and encouraging children to think critically about different types of violence in a safe environment have also proven to reduce the occurrence of child maltreatment.

6. De Kinderombudsman & Augeo Foundation. Tackling violence against children in Europe. Ten recommendations and eight targets for the EU member states and the European Commission. The Hague, 2015.

ENOC Secretariat
Council of Europe "Agora" building
Office B5.07.V

Tel +33 3 90 21 54 88
e-mail secretariat@ombudsnet.org

Recommendation No. 4
Implement national legislation that mandates all professionals who come in contact with children to be trained and empowered to listen to them using a trauma sensitive approach, to identify abusive situations and act according to a country's reporting procedures.

Recommendation No. 5
Implement legislation that mandates schools, social services and child protection services to have age-appropriate education programmes in place that teach children about children's rights, violence and the prevention of violence and provide these institutions with the means to run such programmes.

4. Insufficient protection for known victims
For too many children, violence is a chronic condition as it is not stopped, even when reported and substantiated. Furthermore, in most European countries there is a lack of data on the protection of victims and the outcome of implemented protection measures on the safety and wellbeing of maltreated children. This is unacceptable.

Recommendation No. 6
Structurally collect data on the impact of the protection measures and services that are provided for the safety and wellbeing of the victims, to promote the prevention of recurrence of violence in the lives of maltreated children.

5. Re-victimization
For many children, even if they have the courage to break the silence, it is not the end of their traumatisation. Lack of coordination between professionals, insufficient levels of support services provided (for example by social workers and psychologists) as well as the prosecution process (among other things, multiple interviews by police, prosecutors and judges not specifically trained to interview children, delays in court proceedings, non-child friendly environments) cause continuous re-victimization of the child and prevent the healing process.

Recommendation no. 7
Put in place stable, well-co-ordinated networks of adequately trained professionals who can promptly begin the intervention process (support and treatment of victims and families) as well as the investigation process (prosecution/court proceeding) in a child-friendly manner.

6. Integrated child protection services
States have to fulfil their responsibilities outlined in article 39 of the CRC, stating that all children who are victims of violence have the right to receive adequate support in order to recover. Still, too many unassisted victims suffer from the psychological, social and emotional consequences resulting from the violence they experienced. Studies have also consistently shown that maltreated children have lower educational achievement than their peers. These impairments could have been prevented and can be dealt with, by integrated child protection services, where there is joint responsible for both the assessment and provision of care aimed at the victims.

Recommendation No. 8
Strengthen the child protection welfare system and guarantee systematic support of child victims of violence to recover in the most suitable environment, responding to their best interests, needs and fundamental rights. Extra attention is needed for vulnerable children, including minority, disabled children, LGBT children, children in armed conflict and children on the move (article 2, 20, 22, 23, 30, 37 and 40 CRC).

Council of Europe "Agora" building
Office B5.07.V
67075 Strasbourg Cedex
Tel +33 3 90 21 54 88
e-mail secretariat@ombudsnet.org

7. Right to be heard

Children's views must be sought and given due weight as a mandatory step at every point in a child protection system (article 12 CRC, GC no. 12 and 13). We feel this has particular relevance in situations of violence. Children and young people's right to be heard can also play a preventive role against all forms of violence in the home, family, schools and institutions. The ENYA young people stressed that they are not being heard and that there are barriers to participation, particularly for marginalized and/or discriminated groups, for example disabled children, minorities and children on the move.

Recommendation No. 9

Ensure that children's views are sought and given due weight as a mandatory step at every point in a child protection system. Professionals have to be trained in communicating with children.

8. Comprehensive national strategy

In order to fully benefit from the suggested measures, it is crucial to implement them as part of a comprehensive national strategy or agenda. Installing such a strategy is crucial to ensuring a coherent approach to preventing, monitoring and addressing violence against children.

Recommendation No. 10

Implement all recommended measures to combat violence against children, as part of a national commitment and strategy to combat violence against children.

ENOC calls upon national governments, the European Commission and the European Parliament to embrace these recommendations and do everything in their power to ensure thorough implementation. While national governments are the designated bodies to safeguard the wellbeing of children within their territories, the European Commission and European Parliament have an important role in supporting, facilitating and accelerating developments in EU countries. ENOC urges the European Parliament and the European Commission, in particular, to assume responsibility for more extensive data collection, research and training of professionals to narrow the knowledge gap. When these measures have been comprehensively executed, Europe will have made significant advances towards the undisputed mission to safeguard all children in Europe from violence.

Preface

This Third Edition of the Practice Guidelines replaces the second edition published in 2009. Legislation, practice and technology have moved on since then and these changes are captured in the new guidance.

This edition of the guidelines was produced through the British Psychological Society's Professional Practice Board by a working group drawn from the range of Member Networks across The Society whose members are engaged in professional practice, as well as representatives from relevant expert reference groups of The Society, in particular areas of practice. Further information is available in ***Appendix 3: How this document has been developed.***

These Practice Guidelines aim to define good practice for all psychologists whether registered, chartered or in training and offer guidance for decision making. The Guidelines have been designed for broad application across the full range of applied psychology.

The first part of the guidance (sections 1–3) set out considerations for psychologists on different contexts of practice. The second part of the guidance (sections 4–8) sets out guidance for psychologists on how to manage work with clients.

It is recognised that in addition psychologists may require more detailed guidance for some particular roles and responsibilities or for particular situations in which they work. Further information is available in the ***Appendices***.

The Society expects that the guidelines will be used to form a basis for consideration, with the principles being taken into account in the process of decision-making, together with the needs of others and the specific circumstances. No guidance can replace the need for psychologists to use their own professional judgement. Effective practice means exercising this professional judgement in a defensible way that does not put clients or the public at risk, or undermine, or call into question the reputation of the profession as a whole.

The Guidelines will be reviewed in accordance with Society policy within a maximum period of five years in order to reflect current legislation, evidence and practice contexts. Psychologists using the Practice Guidelines should do so in conjunction with the ***BPS Code of Ethics and Conduct*** and the ***BPS Code of Human Research Ethics***, as necessary.

Glossary of terms

Client

The Society's *Code of Ethics and Conduct* uses the term person or people throughout, this is in recognition of the fact that the document is generic and may be used by all psychologists; academics, researchers, students and practitioners alike.

Throughout this Practice Guidelines document the term 'client' is used and refers to any person or persons with whom a psychologist interacts on a professional basis.

For example, the 'client' may be a couple, a family group, an educational institution, a community organisation or group or a private or public organisation including a court, an individual (sometimes referred to as, for example, athlete, child/young person, patient, prisoner, coachee, service user, stakeholder, leader, or student), who are in receipt of the services of the psychologist.

Psychologist

Throughout this Practice Guidelines document the term 'psychologist' is used and refers to all psychologists whether registered, chartered or in training who provide psychological services across the full range of applied psychology, in any context of practice.

1. How psychologists work

1.1 Legal and professional obligations of psychologists

Psychologists' professional practice is impacted upon and governed by a range of legislation and regulation. Particular psychological disciplines may also need to consider additional legislation, regulation and guidelines. It is the psychologist's responsibility to ensure they are aware of the legislation and guidelines that govern their particular area of practice as well as the terms of their employment or terms contracted with a commissioner of their services.

Psychologists are also advised to consider membership of a union or similar body to ensure they have access to appropriate representation, support and legal advice should they be subject to a complaint or disciplinary action, or require support for example with an employment grievance, which may be related to concerns over quality and standards of psychological service provision.

Further information is available in the ***Appendices***. Important examples to note are:

Health and Care Professions Council (HCPC) Registration

It is a statutory requirement for all psychologists wishing to practice using one of the titles protected by the HCPC to register with the HCPC. Unregistered psychologists offering services to the public in any of the domains regulated by the HCPC may commit an offence by doing so, even if they refrain from using protected titles, provided intent to deceive can be proved. The Society's position is that it is in the interests of both the public and the profession for all psychologists providing services in a regulated domain to be registered with the HCPC.

Professional competence

Psychologists should value the continuing development and maintenance of high standards of competence in their practice and the importance of working within the recognised limits of their knowledge, skill, training, education, and experience. Psychologists should consider advances in the evidence base, the need to maintain technical and practical skills and knowledge and the limits of their competence. This is stipulated in both the ***BPS Code of Ethics and Conduct*** and the ***HCPC Standards of Proficiency***.

Professional indemnity insurance

The UK Government has introduced legislation (The Health Care and Associated Professions (Indemnity Arrangements) Order 2014) which now makes it mandatory for health professionals to have a professional indemnity arrangement in place. The HCPC has made having such an arrangement in place a condition of registration.

This may be achieved either through the employer or through a privately arranged policy. An employer's insurance may provide cover only for a negligence claim but not for the costs of a disciplinary hearing. It is the psychologist's responsibility to check carefully that

they have cover in place that meets their personal/professional needs. Further information is available in the ***Society document: Career Support and Development***

Disclosure and Barring Service (DBS) Checks

Psychologists working in certain fields, for example with children or in healthcare, will need to demonstrate they have had a satisfactory criminal records check at the appropriate level for the nature of the work undertaken.

Applicants will be provided with a certificate to demonstrate this. Applicants cannot request a check personally, this can be requested by a psychologist's employer. For psychologists practising independently the Society offers this as a service to members. Further information is available on the ***Society Website: https://beta.bps.org.uk/Practice-Guidelines***

Equality Act 2010

This Act protects people against unfair treatment, promotes equality and prevents discrimination against any of nine protected characteristics: age, disability, gender reassignment, marriage and civil partnership, pregnancy and maternity, race, religion and belief, sex, and sexual orientation. Respect is a core ethical value for psychologists and a commitment to equality of opportunity is embedded in all aspects of psychological practice. Psychologists, where they operate in an organisational context, must also seek to encourage and influence others in ensuring that equality of opportunity is embedded in all thinking and all practice relating to access to services for client groups and recruitment and employment practices.

Providers of service to the public must also make reasonable adjustments for people who have a disability under the Act. This requirement is anticipatory so requires consideration, and adjustment where reasonable, of any barriers which may prevent a person with a disability from using a service.

Data Protection Act 1998

The Data Protection Act defines personal and sensitive personal data, and data must be processed in accordance with eight principles. It gives individuals the right to know what information is held about them and provides a framework to ensure that personal information is handled properly.

Good information governance is at the heart of safe practice. It encompasses physical data security, access controls and acceptable use, data quality, and records management, among other things. Psychologists must have appropriate security to prevent any personal data held from being accidentally or deliberately compromised. In most circumstances, independent practitioners will also need to register as a data controller with the Information Commissioner's Office.

Further information is available in ***Section 7.1: Information governance, Appendix 1: Relevant legislation*** and ***Society Document: Data Protection Act 1998 – Guidelines for Psychologists.***

Freedom of Information Act 2000

The Freedom of Information Act 2000 provides public access to information held by public authorities. Public authorities include government departments, local authorities, the NHS, State schools and police forces.

It does this in two ways:

- public authorities are obliged to publish certain information about their activities; and
- members of the public are entitled to request information from public authorities.

The Act covers any recorded information that is held by a public authority in England, Wales and Northern Ireland, and by UK-wide public authorities based in Scotland. Information held by Scottish public authorities is covered by Scotland's own Freedom of Information (Scotland) Act 2002.

This legislation permits information to be withheld from disclosure in certain prescribed circumstances, for example information provided in confidence, related to law enforcement or where it relates to personal matters.

Health and Safety at Work Act 1974

This Act places a duty on all employers 'to ensure, so far as is reasonably practicable, the health, safety and welfare at work' (Part 1, Section 2.1) of all their employees. Employees themselves also have obligations under the legislation.

Working together to safeguard children guidance

The Government website provides statutory guidance on inter-agency working to safeguard and promote the welfare of children. Statutory guidance is issued by law; it must be followed unless there is a good reason not to. All organisations, including charities, are expected to comply with this government inter-agency statutory guidance. Psychologists have a duty of care to both their clients and the public. Any allegations of abuse, either ongoing or historic, must be taken seriously and consideration must be given about breaking confidentiality especially in cases where other vulnerable people may be at risk. Further information is available in ***Section 4: Safeguarding***.

Mental Capacity Act 2005

The Mental Capacity Act (2005) provides a clear and comprehensive framework with regard to capacity and consent for all individuals aged 16 years and above in England and Wales.

There are five key principles set out in the Act which underpin practice (quoted from legislative source):

(i) A person must be assumed to have capacity unless it is established that he lacks capacity.

(ii) A person is not to be treated as unable to make a decision unless all practicable steps to help him to do so have been taken without success.

(iii) A person is not to be treated as unable to make a decision merely because he makes an unwise decision.

(iv) An act done, or decision made, under this Act for or on behalf of a person who lacks capacity must be done, or made, in his best interests.
(v) Before the act is done, or the decision is made, regard must be had to whether the purpose for which it is needed can be as effectively achieved in a way that is less restrictive of the person's rights and freedom of action.

In Scotland the Adults with Incapacity (Scotland) Act 2000 applies and in Northern Ireland the Mental Capacity Act (Northern Ireland) 2016 is used.

Mental Health Act 1983 as amended 2007

The main purpose of the Mental Health Act 1983 as amended 2007 (MHA) is to allow compulsory action to be taken, where necessary, to ensure that people with mental disorders receive the care and treatment they require for their own health or safety, or for the protection of other people.

The Act sets out the criteria that must be met before compulsory measures can be taken, along with protections and safeguards for patients. The Code of Practice[1] provides statutory guidance for mental health professionals on how they should carry out their responsibilities in practice under the MHA. Although the Act allows for people to be compulsorily detained and treated without their consent if required, empowerment and involvement of patients as far as is possible is required by the Code of Practice.

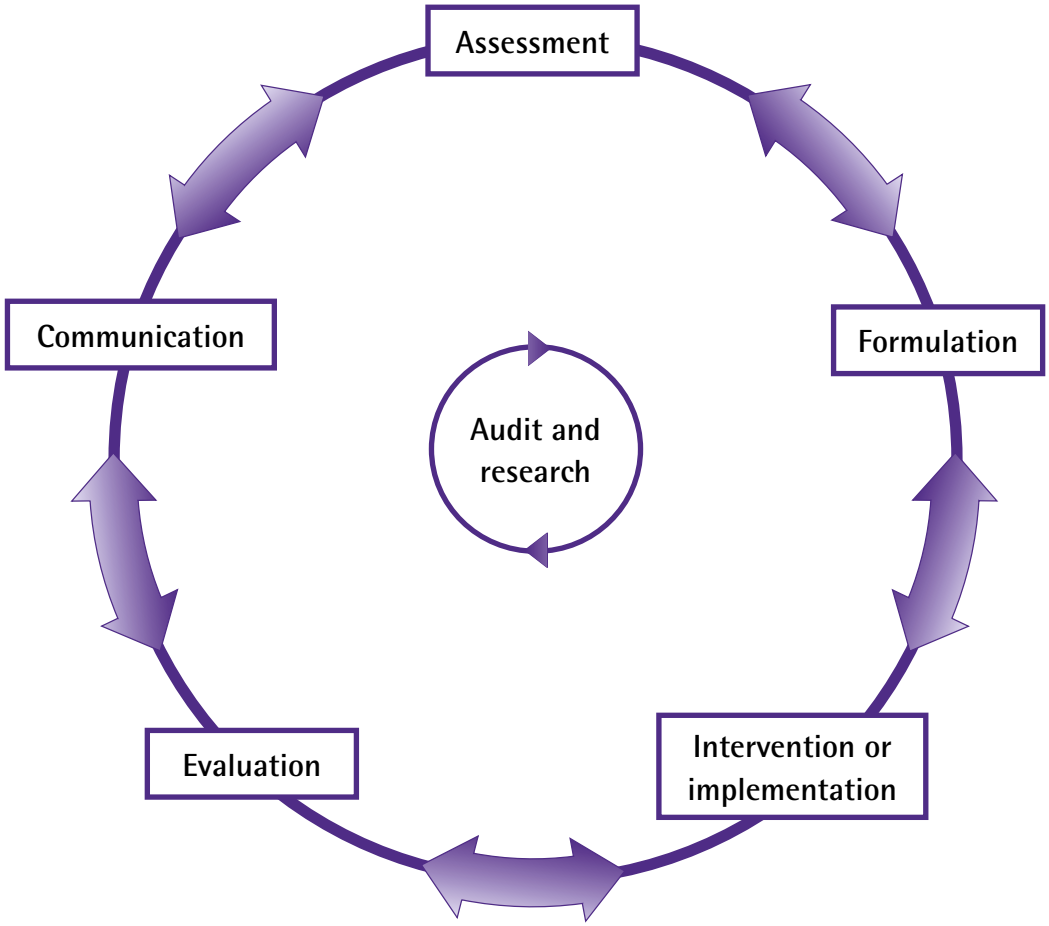
Those involved in working with people subject to provisions of the MHA, including psychologists, must understand and give consideration to the five key principles set out in the Code:
(i) least restrictive option and maximising independence;
(ii) empowerment and involvement;
(iii) respect and dignity;
(iv) purpose and effectiveness; and
(v) efficiency and equity.

1.2 Cycle of professional practice

The professional practice of psychologists is underpinned by four key ethical values – Respect, Competence, Responsibility and Integrity – and five core skills:

- **assessment** and establishment of agreements with the client;
- **formulation** of client needs and problems;
- **intervention or implementation** of solutions;
- **evaluation** of outcomes; and
- **communication** through reporting and reflecting on outcomes.

These core competencies flow and inform each other as illustrated below.



Assessment and establishment of agreements with the client

Assessment of psychological processes and behaviour is derived from the theory and practice of both academic and applied psychology. It includes both assessing change and stability, and comparison with others. Assessment procedures used will depend heavily on the practice context and may include:

- the development and use of psychometric tests following best practice;
- the application of systematic observation and measurement of behaviour in a range of contexts and settings;
- devising structured assessment strategies for individual clients, teams and organisations; and
- the use of a range of interview processes with clients, carers, other stakeholders and other professionals.

Results of these assessments are integrated within the context of the historical, dynamic and developmental processes that will have shaped the client as well as future aspirations or needs. Psychologists have the ability to assess the suitability of different measurement procedures, depending on the purpose for which the assessment is needed, as well as being competent to devise and use context-specific procedures.

Formulation of client needs and problems

Formulation is the summation and integration of the knowledge that is acquired by the assessment process. This will draw on psychological theory and research to provide a framework for describing a client's needs. Because of their particular training in the relationship of theory to practice, psychologists will be able to draw on a number of models to meet needs or support decision-making. This process provides the foundation from which actions derive. What makes this activity unique to psychologists is the knowledge base, experience and information on which they draw. The ability to access, review, critically evaluate, analyse and synthesise data and knowledge from a psychological perspective is one that is distinct to psychologists, both academic and applied.

Intervention or implementation of solutions

This will be the stage where the client's needs, as described by formulation, begin to be met. This may involve the use of psychological models or approaches to, for example, facilitate change, solve a problem or improve the quality of a relationship. All these interventions, or implementation of solutions, are tests of the provisional hypotheses contained in the formulation, and are subject to repeated modification in the light of experience and new data.

Evaluation of and reflecting on outcomes

Evaluation is used to measure the effectiveness of activities and interventions both during and after their implementation. The results of any evaluation and reflection will impact the next steps taken by a psychologist.

Although employers and others may demand certainty about outcomes, psychologists should always be careful to make it clear that they are able to provide only interpretations of behaviour, and advice and guidance, rather than necessarily predicting future behaviours.

Communication through reporting

Communication skills are integral to all aspects of a psychologist's role. Effective communication skills are essential in relation to all aspects of work with others. Communication skills include communication with clients, all forms of electronic and verbal communication, professional letters and reports, and the dissemination of research findings.

Audit and research

Audit and research underpin the cycle, as they help to inform all stages of professional practice.

Audit aims to evaluate how close assessment, formulation, intervention and implementation are against a set of previously given standards of practice. Audit also evaluates how protocols and procedures, for example related to consent or recording of activity, have been followed.

Research provides the evidence base for the practice of psychology. Research methods in psychology vary from qualitative observation to quantitative scientific method, so it is important to distinguish the nature and quality of the evidence underpinning any knowledge or techniques being applied. In general, basic research develops theories, models and data to describe and explain psychological processes and structures, while primary research develops and evaluates ways of using psychological knowledge to intervene with people, organisations, processes or technologies to achieve desired effects. Secondary research consolidates other research to identify higher order trends and directions.

1.3 Reflective practice

One of the key processes that should be encouraged for psychologists is having a complex understanding of self in the context of others. The HCPC requires reflection in the record of continued professional development in order to retain continued registration.

Psychologists will need to make decisions about clients which may have a profound impact on their lives. Decision-making is often subject to various competing biases. Psychologists should be aware of the possibility that they may be influenced by considerations which are not driven by professional knowledge, skills or experience. Maintaining awareness of these biases is important when trying to think through dilemmas.

Sources of influence and bias may include:

- **Cognitive Biases –** Over 150 have been described[2,3,4] including salience (how readily something comes to mind), confirmation bias (the human tendency to look for evidence that confirms their belief and to ignore other evidence), loss aversion (risky behaviour to avoid loss), beliefs about disclosure (tendency to be more honest when they believe their actions will be known by others), and dissonance reduction (justifying actions if consequences are considered worth it).
- **Personal Experience –** the experience of the psychologist may affect how they view or treat a client or situation. This may include current or historical trauma, or the kind of organisation and culture with which they are most familiar. Interventions which may be appropriate in one context may be ineffective and cause distress in another.
- **Motivation –** the original reasons for undertaking the profession may change or be challenged due to fatigue or experience within the profession which may affect the psychologist's viewpoint.
- **Health –** psychologists should be mindful of the potential effect of health conditions or medications which they may be taking, on their practice.
- **Control over the psychologist's own practice –** this refers to clarity and openness in the management of the psychologist's business and maintaining the professional's autonomy in their interactions with clients.
- **Pro bono public work –** psychologists are encouraged, and personally motivated to

engage with such work, while being mindful of impact on the value that is placed on the profession as a whole.

- **An unethical environment –** maintaining self-recognition of what the appropriate ethical standard should be, irrespective of the prevailing situation.
- **Environment –** political realities may lead the psychologist to make compromises; while there is nothing wrong with compromises, their constant use may mean a decline in overall standards.

The literature is generally pessimistic about the ability of practitioners to overcome some of these biases, considering them to be inherent in human thinking patterns. By being aware of and acknowledging them, it can be possible to manage their influence. For example, biases can be levelled out by presenting information in different ways, by engaging the perspectives of people with different experiences and expectations, or by priming thinking with different examples.

A key factor in developing and maintaining these skills is the use of consultation or supervision and having a space where it is possible to open up thinking to the mind of another with a view to extending knowledge about the self.

It is important that psychologists from all disciplines look after their own wellbeing. This is not only important for them as individuals, but also for the quality of the care they give their clients. In their practice and, for example, within their CPD plans and supervision psychologists should consider self-care and how they can maintain their own wellbeing.

It is also important for psychologists to evaluate effectiveness of practice, by welcoming feedback from clients. This can be difficult due to fears of criticism but reflective practitioners are eager to improve and welcome any feedback that will support this process.

1.4 Continuing professional development

Continuing professional development (CPD) is the professional and work-related aspect of lifelong learning. It is an integral part of the process of adapting to change, and essential for maintaining and enhancing professionalism and competence. The Society provides an online facility to record CPD, further information is available on the ***Society website: http://beta.bps.org.uk/Practice-Guidelines***.

- CPD is both a professional expectation and an individual responsibility to taking a structured and self-managed approach to further learning through:
  - actively engaging in a range of CPD
  - maintaining a record of CPD
  - applying learning from CPD to professional practice.
- There is a range of formal and informal learning activities that may be used for CPD and it is recommended that psychologists engage in a mix of CPD activities.
- Professional development is not purely about inputs (i.e. undertaking CPD activities); it also requires a reflective, outcomes-based approach which focuses on the learning gained from CPD and its application to current or future practice, together with the associated benefits for clients and the services provided.

- All members who are registered with the HCPC are required to comply with their CPD requirements as a condition of continued professional registration. Further information is available in ***Appendix 2: Websites and further information***

Mentoring

Psychologists may seek a mentoring relationship with colleagues in order to focus their attention on skills to add to their competencies. Psychologists taking on the role of mentor often support the psychologist with their career path. Early career psychologists may find it beneficial to be mentored by a more experienced psychologist.

1.5 Consultation/supervision

Consultation or supervision is considered an essential part of good practice as a psychologist. There is no legal requirement for supervision, although it is considered an ethical and professional expectation to engage in appropriate consultation in order to support effective practice. Provision of this is therefore an important underpinning to good quality service delivery. The Society's position is, for safe and effective practice in clinical and mental health settings, or with other vulnerable groups, supervision is a requirement of practice.

The objectives of consultation/supervision are:

- to provide practitioners with consultation on their work with clients;
- to enhance the quality and competence of practice offered to all clients;
- to offer psychologists intellectual challenge enabling reflection, transformational learning and psychological support to maximise their responsibility for appropriate self-care; and
- to contribute to the CPD of both psychologist and supervisor by developing competence in the use and practise of supervision.

All aspects of practice are appropriate for discussion in supervision, including research activity, administrative and managerial work, service developments, team working, teaching and the process of supervising others. Supervision is not personal therapy and nor is it a form of, or substitute for, line management or appropriate training.

For psychologists working in a wide range of settings such as therapeutic and organisational settings, supervision is a core component of the psychologist's CPD. For some areas of practice, the nature of supervision changes over time. This may be unique to each psychologist and the context of their application. Expectations should be agreed from the outset and reviewed at appropriate intervals.

Forms of consultation/supervision

Supervision may take the form of clinical supervision, mentoring, coaching, supervision on placement/work setting, tutorials and peer support. Psychologists may engage in one to one supervision; group supervision (facilitated or non-facilitated) or peer supervision and any of these may be face to face or virtual. Whilst it should not be a substitute for line management, a psychologist's supervisor may also be their line manager.

Those working in independent practice, or in the absence of service-based supervision, should seek supervision from appropriately qualified and experienced personnel as appropriate. Peer supervision (individual or group) may be an appropriate way to find collegial support.

Psychologists may select different supervisors, depending on their preferred supervisory style, nature, orientation and their needs at the time. Particularly for experienced psychologists, this may be from an experienced colleague from outside their profession, professional specialty or organisation. Psychologists could also invite supervision from experts by experience for whom they provide services, where appropriate to the context of practice.

The Society maintains the Register of Applied Psychology Practice Supervisors (RAPPS), which recognises psychologists with special expertise in supervision and supervisory practice. Further information is available on the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines***.

Amount of supervision

While there is a specified number of supervision sessions for trainees (e.g. for their Chartered status) which varies across different sub-disciplines of psychology, no definitive amount of supervision is specified as part of CPD. To determine both the quantity and nature of the supervision, the psychologist may consider their need for supervision from various perspectives: their own assessment of need, the competencies required for their practice; the context of their work; organisational requirements; and the support available. For psychologists in employment the arrangements for consultation/supervision should be agreed after considering these factors in consultation with the employer.

Roles and responsibilities of the supervisor

Psychologists undertaking supervision should ensure that they are sufficiently experienced, competent and appropriately trained to provide supervision. Psychologists are often called upon to supervise non-psychologists, in which case these guidelines would also apply.

In supervision, the psychologist as supervisor needs be aware of their own competence in relation to the work of the psychologist and, where necessary, recommend additional supervisors who may have the appropriate level of expertise. Psychologists may offer consultancy supervision to professional colleagues, organisations and stakeholders in line with their competencies.

Psychologists should avoid personal relationships between the supervisor and psychologist which could adversely affect integrity and objectivity.

Psychologists providing consultation/supervision should do so in line with the guidance in other relevant sections of these Practice Guidelines.

Issues of power and control

The nature of supervision itself creates a power imbalance, even between peers. Both the person providing supervision and the person receiving it need to be aware of this.

The supervisory leadership relationship should be both informative and reflective. Psychologists in leadership roles as supervisors should provide regular, informative feedback to the psychologist as well as motivating them to reflect on their own practice, continue to self-assess and improve self-awareness.

1.6 Leadership

Psychologists at any stage of their career are likely to find themselves in a position where they are required to demonstrate or model leadership. This may be an integral part of their practitioner work or may arise through being a leader of a team, including leading in Society work. Leadership is widely quoted and described in the context of leading change as, *'accepting responsibility to create conditions that enable others to achieve shared purpose in the face of uncertainty'*[5]. Furthermore, leaders 'can create conditions interpersonally, structurally, and/or procedurally'[6]. These descriptors highlight the often complex process of psychological change through clinical intervention and also through leading others.

Contemporary leadership styles are generally more aligned to working *within* a team or a system rather than being directive. Leading as a psychologist is likely to include dealing with highly complex information and systems whatever the context. Leading in this way demands high levels of skill in developing, managing and maintaining professional relationships. This may include communicating complex and sensitive information, and reflexivity to enable individuals and teams to co-formulate around difficulty and challenge.

2. Where psychologists work

2.1 Working environment

When undertaking work with clients, psychologists need to give consideration to providing an environment which is welcoming, accessible, safe, and offers privacy. Although choice of workspace is not always available, it is important wherever work takes place with clients that psychologists consider:

- whether lighting, acoustics, heating and seating are comfortable;
- whether confidential conversations may be audible to others;
- whether there are arrangements to ensure client and practitioner safety, for example through easy access to another member of staff if a difficulty arises;
- whether access and exits are safe, well-lit and in areas which are likely to be overseen;
- that reasonable adjustments can be made to support effects of special needs and/or disability;
- whether the setting is culturally acceptable to clients; and
- whether there are facilities and equipment suitable for the clients, for example lavatories, play materials for children.

Where context of practice allows, psychologists could seek the assistance of relevant workplace representatives, for example their trade union representative or human resources staff, in situations where appropriate workplace conditions are not being provided. However, it is acknowledged that sometimes the ideal workspace may not be available or that psychologists may not have access to these workplace representatives due to their context of practice and psychologists should, within the limits of safe practice, be able to adapt to situations within local constraints in order to provide the best service for clients.

Sometimes, it is important to work with clients in representative environments in order to understand behavioural drivers. This will apply if the psychologist's task is to understand behaviours in such environments and provide support, for example through the use of technology, design of procedures, training or team design. Psychologists should consider carefully how to create representative conditions without causing harm. Equally it may sometimes be necessary for psychologists to work in a client's own context as that is where any intervention may be formulated or put in place. Psychologists should ensure they follow the relevant health and safety guidelines in place at their working location even if that location is not their usual place of work.

There may be a temptation to make assumptions about what sort of environment is most suitable, comfortable and culturally appropriate for clients, however it is helpful to ask them and endeavour to make appropriate adjustments to meet their needs.

Lone working

Many psychologists practise in a lone worker workplace and on occasion visit clients in their own homes. When working at home, it is necessary to ensure the proper insurance

and protocols for this type of work, as well as manage boundaries between personal and private space. When working alone, the Suzy Lamplugh Trust recommends always ensuring that someone else has access to schedules and contact details for clients. Psychologists may also want to put in place a 'code word call', where should they fail to answer or speak the correct code word, the police are alerted. This is just an example of an additional safety practice, and there may be different ideas for ensuring personal safety when lone working. However, the important point is to think about keeping safe, have a plan and stick to it. Further information is available in ***Appendix 2: Websites and further information.***

Harassment and bullying

Bullying is behaviour that may take the form of actions or comments that are offensive, which are intended to humiliate, undermine, demean or injure the recipient. It may target an individual or group of individuals and is a form or abuse that may be explicit and therefore obvious, or it may be insidious, an experience recognised only by the recipient and harder to notice by others. Bullying may be vertical (i.e. between managers/supervisors and staff) or horizontal (i.e. between colleagues). Clients may also experience bullying by professionals. While bullying may involve a misuse of power and be committed in the workplace by a manager, supervisor or senior colleagues (sometimes known as downwards bullying), it should be borne in mind that it is not uncommon for senior staff to be bullied by those whose work they oversee.[7] What can be legitimately classified as bullying may take into account the particular personal sensitivities and characteristics of the person suffering the alleged bullying.

Harassment can be defined as actions or comments that are unwanted and which may be related to age, disability, gender reassignment, race, sex, sexual orientation, religion or belief or any other personal characteristic of the recipient. Harassment occurs when someone engages in unwanted conduct in relation to the aforementioned characteristics and that conduct has the purpose or effect of violating the other person's dignity or creating an intimidating, hostile, degrading, humiliating or offensive environment for the other person.

The Society is a charity and bound by its objects which do not include providing direct assistance to individual psychologists in these situations by offering advice. Psychologists with concerns over the above behaviour should seek the support of their supervisor, line manager or other appropriate senior staff member, accredited trade union workplace representative or human resources department. Further information is available in ***Appendix 2: Websites and further information.***

Whistleblowing

Whistleblowing is the disclosure of wrong doing (beyond normal managerial channels) and is important as it is a critical way not only of seeking justice for the individual or individuals affected, but also of developing inside information within organisations about incorrect or unfair practices,[8] thereby increasing the evidence required for corrective action to take place.

A whistle-blower is protected by law (the Public Interest (Disclosure) Act 1998) if:

1. They are a worker (this includes trainees and can include self-employed personnel servicing an organisation in certain circumstances).
2. They are acting in the public interest.
3. The disclosure relates to past, present or likely future wrongdoing which involves one or more of the following:
    - criminal offences (which may include fraudulent actions);
    - a person has failed, is failing or is likely to fail to comply with any legal obligation to which he is subject;
    - a miscarriage of justice has occurred, is occurring or is likely to occur;
    - the health or safety of any individual has been, is being or is likely to be endangered;
    - the environment has been, is being or is likely to be damaged; or
    - information tending to show any matter falling within any one of the preceding paragraphs has been, is being or is likely to be deliberately concealed.

If the individual has been victimised or if they have lost their job due to whistleblowing, the legislation provides them with the right to take a case to an employment tribunal. Whistleblowing is a complex legal area and it is important that anyone considering it considers appropriate advice, for example from an accredited trade union workplace representative or helpline. The relevant human resources department which will have a policy relating to this, or it may be appropriate to seek formal legal advice. Some organisations such as NHS Trusts have a nominated Director responsible for dealing with disclosure issues who may be contacted directly. The Society is a charity and bound by its objects which do not include providing direct assistance to individual psychologists in these situations by offering advice. Further information is available in ***Appendix 2: Websites and further information.***

Psychologists can inform on all aspects of the establishment of workplace cultural norms that promote positive managerial and leadership behaviour and can help facilitate the development of cultures that support the disclosure of inappropriate practices. Psychologists are also appropriately qualified to support workers who have been subject to bullying or harassment or who are contemplating or indeed have already 'blown the whistle'. Whistleblowing, and even the prospect of such, can create traumatic responses in workers[9] and can lead to retaliation as a consequence. Empirical evidence highlights the link between whistleblowing and the devastating effects on health that may follow, such as depression, anxiety and symptoms relating to post-traumatic stress[10]. Psychologists are able to work with affected employees and in a consultative capacity with organisations to manage work-related stress disorders caused by these incidents of bullying, harassment and whistleblowing to lessen the risk of absenteeism and to facilitate a return to work following a period of absence. Further information is available in ***Section 8: How to respond when things go wrong.***

2.2 Working in the digital age

Digital media continues to advance in terms of choice and functionality. It is becoming increasingly common for psychologists in particular when working with clients to make use of the internet and/audio-visual technology. These technologies require the psychologist to ensure that the network used is as secure as reasonably possible and, as far as is feasible, assures privacy to their clients.

There can be no guarantee of security when using the internet, and voice over internet protocol (VOIP) services such as 'Skype' or 'FaceTime' are no different, as they use the same data infrastructure as the rest of the internet.

Most, if not all, VOIP systems encrypt the voice into waveforms during digital transit across the internet, and it would be impossible to eavesdrop on these data packets in real time. However, the information is potentially vulnerable to eavesdropping/compromise before encryption by the speaker's system, and after decryption by the listener's system. This will depend upon the security measures in place for the end user's (speaker and listener) own networking infrastructures, be that a company, institution or home user. If an end user's computer has been compromised by any form of malware, then there will be a risk of eavesdropping, data theft and/or denial of service.

The risk for eavesdropping on VOIP systems is no more or less than that of traditional analogue phone systems, and both would require specialist knowledge, equipment and software to be achieved. However, it is recommended that only fit-for-purpose VOIP systems are used, and that public networks, such as Social Media sites, are avoided for VOIP communications. Further information is available on the ***Society website: http://beta.bps.org.uk/Practice-Guidelines***.

Some employers may have their own rules about which media are acceptable to use. The USA has the Health Insurance Portability and Accountability Act (HIPAA) which sets standards for security for electronic data. There is no such provision in the UK to date, and so psychologists must satisfy themselves that any media used to communicate personal data is secure. This is a rapidly changing area and so technology-specific guidance has not been provided in this document. Further information is available in ***Section 7.1: Information governance*** and ***Appendix 2: Websites and further information.***

The use of online 'Apps', computer assisted decision-making and artificial intelligence in psychological practice and research is evolving rapidly. When recommending or using computerised systems psychologists should pay due regard to peoples' health, wellbeing and safety being mindful of Clinical Safety Evaluations, Medical Device Evaluations and other relevant guidance such as NICE.

Use of social media

Many psychologists are using social media, networking sites or blogs to communicate with friends, family, professionals, colleagues and clients. This specific guidance therefore addresses the use of social media by psychologists, and provides practical advice for using them responsibly. Further information is available in ***Appendix 2: Websites and further information.***

Psychologists should:

- Remember that social networking sites are generally public and permanent. Once something is posted online, it remains traceable even if it is later deleted.
- Keep their professional and personal life as separate as possible. This may be best achieved by having separate accounts for work-related communications to those for friends/family.
- Consider whether, in their context of practice, it is appropriate to accept 'friend' requests from current or past clients, if necessary, decline the request via more formal means of communication. It is highly unlikely to be appropriate to accept in a clinical or forensic context.
- Be minded to act responsibly at all times and uphold the reputation of the profession, whether identified as a psychologist or not on the social media platform.
- Be aware that social networking sites may update their services and that privacy settings can be reset to a default that deletes personalised settings.
- Remember that images posted online by family or friends may be accessible, as they may not have set privacy settings as tightly.
- Be minded that social networking sites can make it easier to engage (intentionally or unintentionally) in professional misconduct.
- Report the misconduct of other psychologists on such social networking sites to any relevant parties (such as the employer or the HCPC).
- Be aware of their employer's social media policy.

Psychologists should not:

- Establish inappropriate relationships with clients online.
- Discuss work-related or confidential issues online in any non-secure medium.
- Publish pictures of clients online, where they are classified as clinical records.
- Use social networking sites for whistle-blowing or raising concerns.
- Post defamatory comments about individuals or institutions. Defamation law can apply to any comments posted on the web, irrespective of whether they are made in a personal or professional capacity.

2.3 Working for the court

Psychologists may be asked to act as professional or expert witnesses in court. The main difference between an expert witness and an ordinary witness (i.e. a witness to fact), is that the former are able to give an opinion, whereas ordinary witnesses can give only factual evidence. A professional witnesses' remit can cross the boundary of both fact and opinion.

Psychologists are responsible for ensuring they are sufficiently competent and expert in offering an opinion. It is not appropriate for trainee or assistant psychologists to act as expert witnesses. Indications of competence in respect of the knowledge required by the court, and expertise within a specialised field, may include:

- qualifications and/or degree(s) in the areas(s) in question;
- a number of years of post-doctoral/post-qualification experience;
- academic, professional and scientific publications in relevant areas;
- demonstrations of professional practice, competence, specialist knowledge and expertise with a bearing upon the issues in the case; and

- current experience in applying psychology in the area of claimed expertise.

It follows that a psychologist with trainee or assistant status is unlikely to have the necessary experience and qualifications to be retained as an expert witness by a legal firm. However, trainees or assistants who have written reports on individuals in the course of their employment may be required to give evidence (for example, at a tribunal). If so, they should bear in mind that only qualified psychologists should give evidence of opinion, and that their supervisor is responsible for the professional quality of their work in this situation as in all others.

Psychologists instructed as experts need to ensure that they can provide an independent and impartial opinion, and that their independence is clear to all. Any potential conflicts of interest should be made explicit and should be reported as soon as they arise. This can extend to being asked to provide an expert report on someone the psychologist is providing with therapy as an 'Applicant', 'Claimant' or 'Complainer'. This dual relationship is an unacceptable conflict.

When lawyers seek to introduce expert psychological evidence, it is the judge in the case who decides whether an individual has the requisite expertise to give evidence with the potential to be relevant to the case. The judge also decides whether what the expert asserts is relevant and, therefore, admissible in law.

Expert evidence in civil court proceedings is governed by Part 35 of the Civil Procedure Rules 1998, and its associated practice direction. This rule makes clear that an expert's overriding duty is to help the court on matters within their expertise and that this duty overrides the expert's duty to the person from whom they are receiving instructions. Any report must be written in accordance with the criteria in Practice Direction 35.

Further information is available in ***Society documents: Psychologists as Expert Witnesses: Guidelines and Procedure*** and ***Psychologists as Expert Witnesses in the Family courts in England and Wales.***

2.4 Working for defence and security organisations

Psychologists may work with defence and security interests in many different capacities. This may include supporting military or security personnel to perform their roles through the development of skills and behaviours, supporting the mental health and wellbeing of people affected by threats, activities and events in this context, and offering advice and consultancy. It is also UK Defence practice to enlist uniformed psychologists for roles associated with psychology. However, in general, psychologists in defence will be in a civilian role and therefore not under military command.

While there is a strong sense of common culture within the defence and security sectors, there are also important variations. For example, each of the armed forces has its own organisational culture resulting in different attitudes and behaviours. There are also differences within different sectors of each organisation. All these differences are very important to the individuals concerned, forming a large part of their sense of identity.

Psychologists working with these populations should ensure they investigate and acknowledge cultural differences, particularly when working with other national cultures. They should also take careful account of the environments in which people are living and working. Psychologists can be working with civilians and/or members of the armed forces who are operating in life threatening environments and are required to make decisions under extraordinary pressure. It is usually invalid to extrapolate from behaviour in benign conditions to behaviour under threat, hardship and stress.

3. Who psychologists work with

3.1 Working with Experts by Experience

In relevant services it is best practice for psychologists to work collaboratively with clients and Experts by Experience in developing and delivering all aspects of psychological services. In mental health, the Government is committed to shared decision-making and the principle 'no decision about me without me'[11]. This applies from work with an individual client through to changes in government policy relevant to the services provided by psychologists. Psychologists should develop services, policies and guidelines in collaboration with the people who use their services.

In professional practice it is important and helpful to work collaboratively with clients and, where relevant, others in order to ensure that the application of psychological research and theory is understood by and adapted appropriately to the client group and context, which may differ from the populations on which the research was based.

3.2 Working with assistants/interns

Many graduate psychologists take up assistant psychologist positions on either a paid or an unpaid basis.

The following (non-exhaustive) list provides examples of activities which can be carried out by assistant psychologists/interns. This list can guide those who are working as assistant psychologists/interns to request or refuse a task or assignment, as well as assist those who are practising and supervising to observe boundaries and limitations:

- research, audit and service evaluation;
- literature searches, developing and maintaining training packs, information leaflets, libraries of equipment, and other tasks necessary to the efficient running of the service;
- assessment of individuals and groups, for example, direct observations, formal psychometric testing, semi-structured interviews, and writing appropriate reports;
- delivery of interventions with individuals, groups and organisations;
- undertaking supportive work with carers, family members, employers, human resources professionals, team members, health staff and other professionals;
- delivering training for other professionals (if and when competent to do so); or
- promoting applied psychology services by providing relevant information to referrers, commissioners and others.

An assistant psychologist/intern should not be employed to:

- substitute for qualified applied psychologists; or
- undertake solely administrative or clerical duties for which a clerical assistant should be employed.

In occupational settings, the issue of appropriate supervision and guidance is of particular importance when the needs of individuals and organisational demands need to be balanced. Appropriate mechanisms need to be in place to ensure that no assistant psychologist/intern is, for instance, put in a position where they have to design or decide on any materials or processes which could have a potential harmful impact on individuals or groups or to an organisation (such as potential loss of profit or revenue).

In clinical and forensic settings, there are some additional limitations, related to the clear delineation between qualified and assistant psychologist/intern, as follows:

- An assistant psychologist should carry out only prescribed interventions with individuals or in groups, and should write reports only when under close supervision of the primary, qualified psychologist. Any report should be signed as having been written 'under the supervision of' followed by the name, registration status and job title of the qualified psychologist.
- When an assistant psychologist is called to give evidence in a legal setting, such as a tribunal, the qualified psychologist remains responsible for the professional quality of the assistant's work. This means the qualified psychologist should attend the hearing also, as there may be questions which an assistant cannot answer. Both should bear in mind that an assistant is not qualified to give evidence of opinion.
- An assistant psychologist should not undertake tasks in areas where there is not a competent supervisor.
- An assistant psychologist should not carry out the duties of a care assistant.

The managing or supervising psychologist has a responsibility to ensure that assistant psychologists are not given work to do that is over and above their level of competence. Further information is available in ***Society Document: Applied practitioner psychologist internship programmes and unpaid voluntary assistant psychologist posts.***

3.3 Working with trainee psychologists

The Society's standards related to working with trainees across the domains of applied psychology are set out in the Standards for accreditation of training programmes. These set out: the required core competencies that trainees need to develop, the curriculum and assessment requirements that programme providers need to deliver against, and the requirements of supervised practice; expectations around trainees' understanding of and ability to work ethically and legally; selection and recruitment of trainees; personal and professional development of trainees whilst in training; academic staffing and leadership for accredited programmes; and expectations in relation to quality management. Psychologists working with trainees as practice educators should familiarise themselves with these standards and adhere to them in their work with trainees. Further information is available on the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines.***

3.4 Working with multiple clients

Psychologists will sometimes be in situations where their client will not be one clear individual or group, for example, a psychologist may be employed by an organisation to

provide assessment or psychological support for employees. Psychologists need to consider and be mindful of the demands that this might place on their ethical practice and how this might lead to conflicts of interest.

Identification of the following client hierarchy may be considered[12],[13]:

- Primary client – the person or persons with whom the psychologist is interacting directly: the recipient of a psychological service.
- Commissioning stakeholders – the organisation or overall commissioning body that has sought the psychologist.
- Others affected by the primary client's actions – the customers of the organisation or service, or the personal acquaintances, friends and family of the primary client. In some circumstances, this will be the general public or larger groups interested in the outcomes of the intervention.

The psychologist's role will be mainly to the primary client and then the commissioning stakeholder. It is paramount that issues around boundaries and sharing of information are made explicit and addressed appropriately through a clear contracting agreement. Further information is available in ***Section 3.5: Working with other professionals***, ***Section 5: Making and maintaining agreements*** and ***Section 7: Managing data and confidentiality.***

Within each of the levels of the hierarchy, varying allegiances to associates (friends, family, acquaintances, colleagues) will need to be attended to, as will consideration of the impact of professional activity on the reputation of the profession and all those concerned.

3.5 Working with other professionals (including in multi-agency settings)

In order to meet the complex needs of clients fully, psychologists will often be required to work collaboratively with other professionals from their own or other agencies.

Such collaborative working will be for the benefit of clients and/or the promotion of the safety and protection of the public or the benefit of the organisation, and is required by national policy and legislation in a number of areas in which psychologists work. Engaging in partnerships drawing on a wide range of services and agencies enables psychologists to address identified community issues with the optimum use of resources.

Where appropriate to their context of practice, and consistent with the requirements of psychological practice, psychologists should:

- Work together with colleagues to develop a shared view of the aims and objectives of work at all levels. They should respect the professional standing and views of other colleagues and commit themselves to joint working.
- Make it clear to other professional colleagues what can be expected of them in collaborative work, the work that will be done, and the point at which the work will be terminated.
- Ensure that there are explicit agreements about information-sharing and confidentiality and its limits, and that these are adhered to.

- Practise and encourage in others full and open communication with colleagues/ agencies to support effective collaboration within the boundaries of the agreed limits on information-sharing and confidentiality,
- Demonstrate their commitment to involving clients in multi-agency work, finding ways to engage them and retaining the central principle of better outcomes for clients as the rationale for multi-professional and multi-agency work, as long as this is consistent with public safety.
- Be sensitive to the effects of clients receiving contradictory advice from different professionals or agencies and should work towards a co-ordinated view wherever possible.

3.6 Boundaries in professional relationships

Psychologists seek to establish good relationships and trust with their clients, other professionals, organisations and the community. They are aware of the complexity of professional relationships and the need to observe their boundaries. Multiple relationships occur when a psychologist is in a professional role with a client or colleague and at the same time is in another role with the same person or group e.g. as a supervisor, sports club member or co-author in a publication or where a psychologist is asked to work at a school where their child is a pupil.

Psychologists should:

- Ensure that the relationship reflects the appropriate context within which the practice is taking place.
- Be aware of the issues of multiple relationships and professional boundaries which may lead to (real or perceived) conflicts of interest or ethical considerations.
- Clarify for clients and other relevant stakeholders when these issues might arise.

When acting as leaders in practitioner or managerial roles, psychologists should maintain an awareness of the importance of respect for boundary and power issues within leadership relationships. In particular, an awareness of the possible abuse of these relationships should be maintained at all times. It is important that psychologists explicitly define the boundary of the relationship and negotiate and respect the responsibility that each holds in relation to it. Where psychologists are in a position of power/leadership with individuals, it is particularly important that they exercise caution and consider the possible issues which may arise from developing a personal relationship with these individuals. It may be necessary to seek further supervision where appropriate, with additional peers as necessary.

Psychologists have a duty of care towards their clients, who may be vulnerable, and should maintain a professional emotional distance from clients, services users or relatives and should not enter into an intimate or sexual relationship with any clients, service users or relatives they come into contact with as part of practice. Psychologists should also be aware that their duty of care can continue after a client practitioner relationship has ended.

As far as is reasonably practical, psychologists should not enter into a professional relationship with someone with whom they already have, or have had, a close personal

relationship. This includes family members and friends. Where there is no reasonable alternative, such as a lack of availability of other professionals, and it is acceptable in the particular context of practice, the psychologist should make every effort to remain professional and objective while working with the individual they know or have known. In such circumstances, at the earliest possible opportunity, this should be disclosed and discussed with a manager, where there is one, and supervisor and a note should be made in client records.

A range of psychologists work with people who initially have accessed the services in a dependent position, and have then transitioned to becoming partners and colleagues in service and policy development and design. The nature of the work becomes more collegiate and the psychologist holds multiple roles including facilitating participation, adapting communication and advocacy.

3.7 Working with children and young people

When seeking to work with children and young people, psychologists should consider how they can develop ways of communicating with the child or young person that will be most effective in ensuring they can express their views and feelings.

In most instances psychologists will use their specialist professional training and experience working with children, young people and families in order to understand the developmental needs of the child or young person in question; where a psychologist does not have specialist training that has included children and young people then there would be an expectation that advice or supervision should be sought before working with a child, young person, or their family. Similarly, work with children, young people and their families should take account of wider systemic factors outside of the child or young person; this will usually involve the child's family and may also include their school, and other settings.

As with adult clients, there can be misunderstandings and confusions about the role of a psychologist, the nature of the work being undertaken, and the possible outcomes of the work. It is essential to ask the children and young people about their understanding of what is happening on a regular basis (this may be appropriate at each session) and address any confusion that has arisen.

When working with children and young people, psychologists are advised to ensure that they have ascertained who has parental responsibility and that those with parental responsibility are aware of their planned involvement, if this is appropriate. Psychologists working with children, young people and families need to be aware that young people who are deemed to be competent to make their own decisions: 'Gillick competent'[14] can give their own consent to involvement with a psychologist, and that if a young person gives consent under these circumstances, then parental consent is not required. Similarly, a young person who is 'Gillick competent' can give consent even if parents have declined to give consent; such young people can also ask that parents are not informed of any involvement, and this should be respected by the psychologist; an example here would be in a school setting where a young person may give their own consent to see a psychologist

and may ask for parents not to be informed. Psychologists also need to be aware that where separated or divorced parents share parental responsibility, one parent can give consent.

3.8 Working with people with intellectual disabilities and impaired cognitive abilities

Psychologists are likely to work at some point with a range of people whose cognitive abilities are either temporarily or permanently altered, either by organic or developmental changes. Appropriate assessment of the abilities and skills is required, so that adaptions can be made to further interventions, treatments or management. The implications of the cognitive abilities on the person, their family and the reason for psychology involvement, will need to be considered.

Psychologists working with people with intellectual (learning) disabilities will need to consider adaptations to their approach to ensure the service they are offering is clearly understood, and is adapted to the individual's preferences, strengths and needs. This can include considering adaptations to oral or written communication, psychological assessment, intervention, and outcome evaluation.

Psychologists will need to be flexible and to make reasonable adjustments to their usual practice to ensure an appropriate service is offered. Psychologists should ensure their work is person-centred and respectful of the individual's needs, whether that work involves working with the individual with intellectual disabilities directly, or whether it also includes, or even may predominantly involve, working indirectly with family, carer or professional systems around the individual.

Psychologists will need to be mindful of the range of complex factors that often affect people with intellectual disabilities (e.g. communication needs, poorer mental and physical health outcomes and healthcare service experiences, unemployment, disempowerment, social isolation and exclusion, including experiences of bullying, abuse and hate crime, being overrepresented in the prison population, among others) and, therefore, the specific policy and practice guidance that applies. Further information is available in ***Section 4.2: Safeguarding adults at risk of harm*** and ***Section 6.3: Informed consent with people who may lack capacity.***

3.9 Working with detained people

Where clients are detained involuntarily there will always be a legal framework within which professionals must practise, and they should be aware of how their work fits into that framework. Involuntary detention is not only covered by professional rules and national legislation, but also by international agreements.

Psychologists should be aware that having the approval of one's employer is not necessarily a guarantee that practice is either ethical or legal, as described for example in the Hoffman report[15]. Where practitioners have doubts about the legal or ethical acceptability of employer demands, they should seek advice from an accredited workplace trade union representative, a human resources department, or appropriate helpline. They should

follow their organisation's guidelines on raising concerns at work. Seeking advice outside the immediate setting is helpful as colleagues within the workplace may be subject to the same pressures as they are.

Under the headings below, the role of the practitioner can be seen to be key to the way that detained persons are understood, and this can have a great impact on the way that their cases are handled by the detaining authority. The practitioner therefore has considerable power, whereas the client has very little. This power imbalance should always be borne in mind by practitioners dealing with detained persons. They should also bear in mind that the imbalance can be implicit as well as explicit.

Prisoners

Putting psychological pressure on detained persons to obtain a confession to an offence is illegal under the UN Convention on Torture[16]. In this context, 'psychological pressure' could well include such things as telling indeterminate-sentence prisoners who maintain innocence that they are unlikely to be released unless they engage with an intervention that relies on acknowledgement of guilt. Decisions about release are not the role of the practitioner, unless they are directly involved with, or are a member of the release authority, with a delegated role in the formal decision-making process. An approach to engagement such as this would not be considered beneficial to the client. However, those instructed by any party to the formal Parole Board decision-making process may properly be asked to give an opinion on suitability for release.

Practitioners dealing with detained offenders who have committed violent or sexual offences should guard against being morally judgemental. It is routine for practitioners in this field to encounter offenders who have committed very unpleasant acts with whose victims they can readily identify. Psychologists should be mindful that their own views about a client do not impact on their work.

Care should be taken when working with detained persons whose literacy is poor or whose first language is not English, and who cannot read a report which has been written about them. Even clients who are literate in English will probably not be familiar with psychological terminology, and may need considerable time to read and fully digest a report. People who are detained can also have cognitive challenges or intellectual disabilities which might make this process more difficult.

Persons detained under immigration legislation

Detained people may be afraid of raising a particular topic in case it is misunderstood, or too embarrassed because of cultural standards. For example, in some cultures it is difficult or unacceptable to discuss sexual matters, but sexual violence has been suffered by many asylum seekers in conflict zones, and some discussion of it may be essential in assessing their case. Even within the same culture there can be considerable generational differences.

Psychologists should guard against unwarranted interpretations of psychological evidence by commissioners or authority figures. For example, reporting that someone's story shows inconsistencies may give the impression that they are lying. This may be the case, but inconsistencies alone are insufficient proof of this. It is commonplace for evidence to be

inconsistently reported when people have been through traumatising experiences in areas of conflict, as is often the case with persons detained under immigration legislation.

Practitioners should take particular care in dealing with detained persons whose first language is not English. The opportunities for misunderstanding in both directions should be obvious, and in many cases the correct procedure will be to interview with the help of an interpreter. Failing to use interpreters when it was clearly appropriate to do so could inappropriately compromise the quality of the psychologist's work.

Mental Health Detentions

Mental Health Act 1983 as amended 2007 (England and Wales)
Under the Mental Health Act (MHA) a person can only be detained for treatment if that person is suffering from a mental disorder of a nature of degree that makes it appropriate for them to receive medical treatment in hospital. In the Act 'mental disorder' is defined as 'any disorder or disability of mind'. This definition is very broad but the *Code of Practice* provides guidance on clinically recognised conditions that fall within its meaning. Major categories of mental illness (e.g. affective disorders, schizophrenia and organic mental disorders) are included along with personality disorders, autistic spectrum disorders and learning disabilities (the latter only if accompanied by abnormally aggressive or seriously irresponsible behaviour). Dependence on alcohol or drugs is not considered a mental disorder under the MHA.

In the Act, all 'medical treatment' including psychological interventions is for the purpose of alleviating, or preventing a worsening of a mental disorder or one or more of its symptoms or manifestations. The medical treatment must be required for the health and safety of the client or for the protection of others. This means that the primary purpose of psychological interventions offered and provided to detained persons has to be to reduce the risks that their mental disorder presents to the detained person or others; as once those risks are reduced or minimised the client will no longer require detention and can progress to a less restrictive environment. This requirement points to the importance of an individualised formulation of a client's treatment needs that includes a careful assessment of the risks to self and others (see section on Risk Assessment, p.32).

Under the MHA appropriate medical treatment must be available. This is described as the 'appropriate medical treatment test' in the *Code of Practice*. Such treatment must have the *purpose* of alleviating or preventing a worsening of the disorder or its symptoms or manifestations, even if it cannot be shown in advance that the treatment is likely to have an effect for a particular patient. Thus, appropriate medical treatment need not be likely to achieve those purposes. That is, purpose is not the same as likelihood. The nature and degree of the patient's mental disorder and all the patient's particular circumstances are all relevant to whether the treatment is appropriate.

The appropriate medical treatment test is designed to ensure that patients are not detained for treatment unless they are actually to be offered appropriate treatment for their mental disorder. Thus, the MHA requires only that appropriate treatment is available to a detained patient. The patient's refusal to accept treatment is not an obstacle to detention, so long as appropriate treatment is available.

This has particular relevance for psychological therapies. The Code at chapter 23.20 states:

> *In particular, psychological therapies and other forms of medical treatments which, to be effective, require the patient's cooperation are not automatically inappropriate simply because a patient does not currently wish to engage with them. Such treatments can potentially remain appropriate and available as long as it continues to be clinically suitable to offer them and they would be provided if the patient agreed to engage.*

Whilst the availability test of appropriate medical treatment applies to psychological interventions in the same way as for other forms of treatment, it is important for psychologists to avoid placing pressure on clients to participate in such treatment. In order for there to be an effective therapeutic alliance there needs to be trust and this only develops in the absence of coercion. Psychological therapy works when the client decides they are ready for therapy and freely consents to it. There is an inevitable power differential in favour of the clinician. Thus, every attempt should be made to emphasise patient involvement and choice and to avoid coercion in a manner consistent with the *Code of Practice* empowerment and involvement and respect and dignity principles. Further information is available in ***Section 6: Obtaining informed consent.***

The Mental Health Act 2007, which amended the MHA 1983, introduced approved clinicians (AC) who may be drawn from a defined group of professions, including practitioner psychologists listed in the register maintained by the Health and Care Professions Council. ACs are approved by the appropriate national authority to act as an approved clinician for the purposes of the MHA 1983. Responsible clinicians (RC) are ACs who have overall responsibility for an allocated patient's case. The Code of Practice at chapter 36.3 says that a patient's RC should be the available AC with the most appropriate expertise to meet the patient's main assessment and treatment needs. At chapter 36.5 the Code says that where psychological therapies are central to a patient's treatment then it may be appropriate for a professional with particular expertise in this area to act as the RC.

Chapter 39 of the *Code of Practice* provides guidance on the circumstances in which potential conflicts of interest may prevent designated professionals from making an application for or recommendations supporting a patient's detention or guardianship. The potential conflicts of interest dealt with in the Code involve financial, business, professional and personal issues.

The Mental Health (Scotland) Act 2015.

This act, together with the Mental Health (Care and Treatment) (Scotland) Act 2003 sets out the law for detaining patients and restricting patients. For patients to be detained, this has to be considered by the Mental Health Tribunal for Scotland. This applies, for example, to those detained in the NHS who are not subject to a court (forensic) decision.

Restricted patients are 'detained in hospital under a compulsion order with a restriction order'. They have usually committed an offence punishable by imprisonment but as a result of mental disorder are not imprisoned but ordered to be detained in hospital for treatment, without limit of time. They are dealt with through a programme of treatment and rehabilitation – the aim being to prevent recurrence of offending by dealing with the mental disorder'.

Risk assessment

When dealing with detained people seeking release, such as parole applicants or patients seeking release from a mental health tribunal, risk assessment (usually for violence risk) will be a prime consideration. Psychologists should bear in mind that risk assessment is not prediction. Risk assessment instruments are rarely more than about 70 per cent accurate when predicting reconviction and many items on commonly used risk-assessment schedules are of poor predictive value.[17] Psychologists should also bear in mind that risk-assessment instruments are better at identifying low-risk than high-risk individuals[18],[19]. A statement of risk is not a prediction about an individual, but a statement based on the behaviour of a criterion group with which that individual is being compared. Risk is statistical by its very nature, and the value of such comparisons depends upon the individual's similarity to the criterion group upon which the risk assessment instrument was developed. Accuracy may be greatly reduced if the similarity is low[20]. It may be better to think of risk assessment as a process of identifying those risk factors which need to be monitored and controlled if supervision of the individual is to be reduced or withdrawn.

3.10 Working with people who are, or would like to be employed

Psychologists are sometimes commissioned to deliver psychological assessment or training with employees and potential employees. Psychologists should take particular care over the advice provided in follow-up reports, as employers are not trained professionals and may misinterpret advice or psychometric testing results. For example, citing a reading ability level using age is misleading, and could be interpreted as incompetent for the role, when in reality the role does not require a high reading level or a reasonable adjustment could be provided.

Similarly, psychologists should ensure that the tools they are using to assess competence or suitability are appropriate for the role, and have good reliability and validity. Any tools devised by the psychologist are likely to be interpreted by the employer as professional and authoritative, where there is ambiguity or multiple interpretations, this must be made clear, so that decisions about peoples' employment are not made in error.

There are people who work or who would like to work, who may experience cognitive difficulties caused by a range of factors, for example intellectual disabilities, dementia, acquired brain injury. Sometimes this information is known and needs to be considered when assessing and advising. At other times, this possibility of a cognitive or intellectual impairment needs to be considered. The impact of this can be far reaching, in terms of ongoing or future employment, access to benefits and of course associated psychological adjustments for the person and the people around them. Further information is available in ***Section 7: Managing data and confidentiality*** and ***Society Document: Psychological Assessment of Adults with Specific Performance Difficulties at Work.***

3.11 Working with cultural difference

It is expected that all psychologists will have the necessary skills and abilities to work with all sections of the community.

Psychologists need to be aware of stereotypical beliefs and assumptions which manifest in thinking about culture and ethnic groups. Psychologists should bear in mind the history of racism and the early development of Western psychology[21] and culturally biased testing in favour of white, middle-class children. Psychologists need to recognise that multi-ethnic groups are not homogenous groups and there are wide regional and local differences among these groups which can be split by language, dialect and regional variations. Each ethnic community has a distinct identity and religious focus may also vary within and across communities.

Race is not a biologically meaningful concept to apply to people, and even the artificial divisions between the so-called racial groups are nebulous and unstable, biologically, socially and physically.[22]

Psychologists need to understand the discrimination suffered by people from diverse and/or minority ethnic and religious backgrounds as a result of:

- the interchangeable use of the terms race, culture and ethnicity leading either to the perception of black and minority culture, race and ethnicity as unitary or an assumption that knowing about these cultures solves the problem of equality, fairness and availability of services;
- the maintenance of the colour-blind approach in service where 'one size fits all', resulting in a lack of formal recognition of the varied diverse needs as well as these needs being ignored, unacknowledged or assumed to be the same;
- the lack of appropriate culturally relevant psychological therapy available to certain Black and Minority Ethnic (BME) communities;
- being discriminated against on grounds of 'special' needs, effectively considered as 'cultural pathology'; and
- experiencing instances of indirect, subtle, or unintentional discrimination often called 'micro-aggressions'.

It would be expected that all practising psychologists should develop a productive working relationship with culturally and linguistically diverse groups of people by:

- avoiding different types of biases and find new ways (verbally and non-verbally) to build rapport and respect;
- using and working with trained interpreters in assessment, formulation and intervention work as well as research work;
- being aware of the impact of culture, ethnicity and religion in assessment, formulation and intervention processes and the use of norm-referenced tests which do not include minority ethnic groups as part of their standardisation;
- pre-assessing and pre-incorporating ethnic identity (including its fine gradations, region, class and generation) which can have impacts on processes and outcomes of psychological work;
- acknowledging their own ethnocentricity and possible underlying socially conditioned prejudice to people who are 'different'; psychologists need to acknowledge that people can change, irrespective of their differences and psychological distress;
- relooking at current models of mental health which traditionally reflect Western

constructions, and incorporating other world views of psychological wellbeing; and
- understanding and respecting the different concepts of health and illness that exist within different ethnicities, including newly arrived people from Europe and refugees from Syria, Turkey, Somalia etc.

Psychologists need to: address the different life situations and life circumstances experienced by users who wish to use mental health services; hear their voices based on their personal experiences; and act and respond accordingly in a human way.

3.12 Working with people of faith, religion and spirituality

In working with clients who hold a variety of values and religious and spiritual beliefs which may be different from their own, psychologists should consider the following:

- Psychologists should respect clients' values and spiritual beliefs and need to be mindful that their personal beliefs should not be an impediment to engaging with the client.
- Spiritual beliefs are very often beneficial to the client's wellbeing and may be helpful to be incorporated into any intervention to achieve a positive impact where appropriate.
- In some circumstances the client's faith belief may be harmful or detrimental to themselves or others.

3.13 Working with sexual and gender minorities

Psychologists are committed to the fair treatment and inclusion of people who are intersex, people who do not identify as heterosexual and/or people who do not identify with their natally-assigned sex. This section provides guidance to address specific issues in support of these heterogeneous populations. In these guidelines we use the term 'sexual minority(ies)' to refer to individuals whose romantic attraction or sexual attraction is other than heterosexual (different from the majority in the surrounding society), and the term 'gender minorities' to refer to transgender, genderqueer and intersex individuals.

When working with gender and sexual minorities, psychologists are encouraged to:

- remember that sexual and gender minority identities are not indicative of mental health disorders;
- understand that attitudes towards sex, sexuality and gender are located in a changing social, cultural, and political context, and to reflect on their own understanding of these concepts and how it may impact their practice;
- reflect on the limits of their practice when working with certain sexual and gender minority clients, and to consider appropriate referral and training when necessary;
- understand how social stigmatisation (e.g. prejudice, discrimination and violence) poses risks to gender and sexual minority clients;
- consider engaging with the wider socio-political context regarding sexual and gender minorities in order to reduce social stigma;
- be knowledgeable about the diversity of sexual and gender minority identities and practices;

- use the preferred language of the sexual and gender minority individuals;
- understand the unique and particular circumstances and challenges facing clients with diverse gender and sexual identities and practices;
- understand the diversity of forms of relationships and families in gender and sexual minority clients;
- be aware of the potential challenges facing sexual and gender minority clients in their relationships and families;
- be mindful of the intersections between sexual and gender minority and socio-cultural/economic status;
- recognise the particular challenges experienced by gender and sexual minorities with physical and/or mental health difficulties;
- recognise the diversity of developmental pathways for sexual and gender minority children and adults;
- recognise the needs and issues of young people from gender and sexual minorities, and their particular vulnerabilities;
- support the self-determination of their clients in the development of their identities and practices; and
- avoid attempting to change gender or sexual minorities on the basis that they can be 'cured' or because of stigmatising theory, personal, religious and/or socio-cultural beliefs.

Working with racially and ethnically diverse Lesbian, Bisexual, Gay, Trans*, Queer (LGBTQ) populations

Black and minority ethnic (BME) LGBTQ people have to negotiate between the values and beliefs of the mainstream and minority ethnic cultures. Cultural differences in norms, beliefs, and values can be a source of psychological stress[23],[24],[25]. There may be no particular sexual and ethnic minority group to which a BME LGBTQ person can anchor their identity and obtain acceptance and support. This may be a particular issue for BME LGBTQ youth who are exploring their sexuality and sexual identity.

When offering psychological services to racially and ethnically diverse LGBTQ populations, it is not sufficient for a psychologist simply to identify the racial and ethnic identity and background of the client. Ethnic minority status can complicate and exacerbate the issues, challenges and difficulties the client experiences. The client can be affected by the way their ethno-culture community view and understand sex, sexuality and gender. The issue of racism within the LGBTQ community is also an important issue to consider[26],[27],[28],[29]. Sensitivity to the complex dynamics associated with factors such as cultural values about gender roles, religious and procreative beliefs, degree of individual and family acculturation, and the personal and cultural history of discrimination or oppression is also important. All of these factors may have a significant impact on identity integration and psychological and social functioning[30],[31],[32],[33],[34].

Further information is available in ***Society Document: Guidelines and Literature Review for Psychologists Working Therapeutically with Sexual and Gender Minority Clients.***

3.14 Working with people who may be socially excluded

Social exclusion refers to the extent to which individuals are denied access to the prevailing social system and the right to participate in key areas of social, economic and cultural life. This exclusion occurs due to constraints and restrictions rather than as a matter of choice. Exclusion is typically a result of poverty and/or belonging to a social minority group. The impact of social exclusion has been well documented and leads to the perpetuation of cycles of inequality for individuals and groups. These cycles of inequality are perpetuated in terms of income, health, opportunity, relationships and life-span. Further information is available in ***Society Document: Socially inclusive practice.***

Social inclusion is the process where the needs of all members of communities and the groups which constitute them are recognised, prioritised and met, resulting in these individuals feeling valued and respected. Promoting social inclusion is a broader task than promoting equality and tackling discrimination and stigma. It requires psychology professionals to address wider structural issues in society which maintain excluding processes and power differentials.

The range of individuals and groups who may experience disadvantage and exclusion is not limited to the protected characteristics outlined in the Equality Act. For example, people may also experience exclusion because of their age, they are a carer or are in care, they have a low income or low educational achievement, or their cognitive ability is compromised.

When working towards social inclusion psychologists are encouraged to:

- acknowledge, understand and respect the diversity of the communities in which they practise;
- make adjustments where possible and needed, to enable people to fully participate, e.g. to communication, access to services, adaptation to materials and psychological assessment and interventions;
- recognise that they have a professional duty actively to promote equality and opportunity;
- recognise the shame and distress caused by discrimination, and the impact of discrimination on wellbeing;
- acknowledge and respond to the trauma and distress caused by exclusion;
- move beyond the level of the individual and recognise that social exclusion is a structural issue, and that inclusion will be achieved only by structural changes in society and broad policy initiatives;
- acknowledge that there is a responsibility to highlight the links between structural societal factors and mental health problems;
- make employers, policy-makers, clients and the general public aware of situations where policies, practice and the distribution of resources are oppressive, unfair, harmful or illegal;
- challenge social conditions, both as individuals and collectively, that contribute to social exclusion and stigmatisation;
- make services accessible in terms of time, space, familiarity and comfort; make reasonable adjustments to services to meet individuals' needs; people need to be able

to get to places, get into places, feel welcomed to places and feel that they belong in places;

- recognise that inclusive services reflect the communities they serve in terms of the identities and diversity of the staff team;
- recognise the range of interventions that can improve clinical and social outcomes and use influence to ensure these services are commissioned;
- emphasise social outcomes and participation alongside clinical outcomes;
- maintain an emphasis on empowering clients to achieve their social goals; and
- identify natural sources of support and reciprocal relationships for individuals within their communities, and seek out opportunities to help individuals transition out of formal mental health services.

4. Safeguarding

Safeguarding means protecting people's health, wellbeing and human rights, and enabling them to live free from harm, abuse and neglect[35]. This guidance addresses safeguarding of both children and adults.

Abuse takes many forms and cuts through various domains of life. The categories below are often referred to in investigation/legislation context and are not mutually exclusive with e.g. emotional abuse featuring in the other domains of abuse. Abuse can be found across all sections of society, irrelevant of gender, age, ability, religion, race, ethnicity, personal circumstances, financial background or sexual orientation.

- Physical abuse – is the use of physical force or mistreatment of one person by another which may or may not result in actual physical injury. This could include hitting, poisoning, deprivation of food, water or liberty, rough handling or exposure to heat or cold, amongst other things.
- Sexual violence and abuse – sexual abuse is any behaviour perceived to be of a sexual nature which is unwanted or takes place without consent or understanding. Sexual violence and abuse can take many forms and may include non-contact sexual activities such as: indecent exposure, stalking, grooming or being made to look at, or be involved in the production of sexually abusive material, or being made to watch sexual activities.
- Psychological/emotional abuse is behaviour that is psychologically harmful or inflicts mental distress by threat, humiliation or other verbal/non-verbal conduct. This may include threats, blaming, controlling, intimidation or coercion amongst other things.
- Financial abuse is actual or attempted theft, fraud or burglary. It is the misappropriation or misuse of money, property, benefits, material goods or other asset transactions which the person did not, or could not, consent to, or which were invalidated by intimidation, coercion or deception. This may include exploitation, embezzlement, withholding pension or benefits or pressure exerted around wills, property of inheritance.
- Institutional abuse is the mistreatment or neglect by a regime or individuals, in settings which people who may be at risk reside in or use. Institutional abuse may occur when routines, systems and regimes result in poor standards of care, poor practice and behaviours, inflexible regimes and rigid routines which violate the dignity and human rights of the adults and place them at risk of harm. It may occur within a culture that denies, restricts or curtails privacy, dignity, choice and independence. It involves the collective failure of a service provider or an organisation to provide safe and appropriate services and includes a failure to ensure the necessary preventative and/or protective measures are in place.
- Neglect is the persistent failure to meet basic physical and/or psychological needs. It may involve a parent or carer failing to provide adequate food, clothing and shelter, failing to provide or unresponsiveness to, basic emotional needs or failing to protect from physical harm.

Psychologists are in a particularly relevant position to identify interactions or circumstances that affect health and development. This applies not only to psychologists who undertake direct work with children and vulnerable adults in a variety of settings; but also to those who work with clients, seen for instance in clinics, hospitals or prisons, who may make historical disclosures of abuse or raise concerns about child protection or the welfare of people within their families or communities. Safeguarding is thus the responsibility of all psychologists whatever their role.

4.1 Safeguarding children

The Society endorses *Working Together to Safeguard Children* – A guide to inter-agency working to safeguard and promote the welfare of children[36]. Safeguarding children is the responsibility of everyone.

The guidance defines safeguarding children as protecting children from maltreatment and preventing impairment of children's physical or mental health or development (physical, intellectual, emotional, social and behavioural). Promotion of welfare is defined as ensuring that children grow up in circumstances consistent with the provision of safe and effective care, and taking action to enable all children to have the best life chances.

Child protection within safeguarding refers to the activity that is undertaken to protect specific children who are suffering or likely to suffer significant harm. For the purposes of child protection legislation children are those who have not yet reached their 18th birthday. The child's needs are paramount, and the needs and wishes of each child be they a baby or infant or an older child, should be put first, so every child receives the support they need before a problem escalates.

The policy of Working Together is underpinned by two key principles: (a) safeguarding is everyone's responsibility and for services to be effective each professional and organisation should play their full part; and (b) safeguarding requires a child-centred approach based on a clear understanding of the needs and views of children.

Where there are concerns that a child is at risk of harm, such concerns should normally be communicated following the psychologist's work-place safeguarding protocol. Where this is not applicable, concerns about a child's welfare can be made directly to the local authority children's social care team.

Psychologists should:

- be alert to the heightened vulnerability/possible need for early intervention support for a child who: has a disability, has additional needs (including special educational needs), is a young carer, is showing signs of engaging in anti-social or criminal behaviour, has returned home from care and/or is showing early signs of abuse and/or neglect.
- be alert to heightened vulnerability where a child is in a family circumstance presenting challenges for the child, such as substance abuse, adult mental health problems and domestic violence.
- consider the potential impacts of parental/carer ill-health on the family and whether this creates any significant negative impacts or risks for children within that family;

- be aware that if an adult has responsibilities for children outside the home setting, such as working with children, their mental ill-health and/or their health more generally upon the adult's capacity to work safely;
- be aware that children within the same family can be treated differently (one child may be singled out for abuse);
- be aware/seek to understand how children can come to abuse other children;
- recognise that some professionals use their position to abuse children and vulnerable people; and
- challenge institutional abuse in its many forms.

Psychologists should be aware of situations of risk which require additional consideration, notably:

- sexual exploitation, which involves exploitative situations, contexts and relationships without the child recognising the harm on account of their age/understanding, social/economic and/or emotional vulnerability;
- internet abuse, which can involve cyber bullying, exposure to pornography or violence and exploitation of young people;
- domestic violence which may expose a child to violence directly or indirectly;
- shame-based abuse where children or young people may be physically assaulted or murdered because of bringing perceived 'shame' to their families or breaking cultural expectations of 'honour'; and
- Trafficking, any child transported for exploitative reasons is considered to be a trafficking victim, whether or not they have been forced or deceived. This is partly because it is not considered possible for children to give informed consent. Even when a child understands what has happened they may still appear to submit willingly to what they believe to be the will of their parents or accompanying adults.

Psychologists should have a knowledge and understanding of services for children in need and how to access them. Psychologists confronted with child abuse in any form should contribute to whatever actions are needed to safeguard children and promote their welfare. The needs/interests of adults should not be allowed to take precedence ahead of the needs of the child. Psychologists should work co-operatively with parents/carers unless this is inconsistent with ensuring the child's safety and ensure that the child's view is sought, heard and communicated. Psychologists should share appropriate information in a timely way, discuss any concerns and help analyse information so that an assessment can be made of the child's needs and circumstances. Psychologists should contact the children's services or social services department at the appropriate local authority (in some cases this role has been delegated to a multi-agency safeguarding hub) if they are concerned about a child or a vulnerable adult.

Managing cases of alleged historical abuse

There is a growing recognition that a disclosure of non-recent abuse may reveal current risks to others from an alleged perpetrator. Psychologists have a duty of care to their clients, and in the safeguarding of others. This may place psychologists in complex positions when trying to negotiate and balance their duties and responsibilities.

Psychologists who work with adult clients who disclose non-recent sexual abuse, should recognise that there may be current and ongoing risks posed by the alleged perpetrator to others. Not sharing concerns beyond the consulting room could mean that other children and young people could be at risk.

A client's allegations should be taken seriously, regardless of their presenting problems or mental health diagnosis.

Lack of access to children identified through familial relationships, work or volunteering roles should not eliminate concerns about risk, given opportunities for abuse to occur within communities.

It is crucial that psychologists seek advice from colleagues, particularly colleagues in safeguarding services, within the organisation and also from other agencies tasked with leading on safeguarding (i.e. social services). Psychologists working with clients without a referral and where no stakeholder agency is involved should seek advice from senior experienced colleagues on how to proceed. Psychologists need to be alert to the possibility that abuse may be organised, severe and complex.

There may be times when, in the interests of supporting a client's psychological readiness for disclosure, consultation may continue without requiring identifying details to be provided to the psychologist. It is important that a clients' lack of readiness to disclose does not become an obstacle to receiving psychological help. Further information is available in ***Society Document: Guidance document on the management of disclosures of non-recent (historic) child sexual abuse.***

Where the disclosure is made by the perpetrator of the abuse, risk assessment should be made regarding the context of the setting of the disclosure but there may be a professional obligation to disclose the criminal offence in order to safeguard other potential victims as above.

4.2 Safeguarding adults at risk of harm

The Care Act 2014 brought in new legislation regarding the safeguarding of all vulnerable adults. In some regions there is a move away from the term 'vulnerable adult' towards the concept of an adult at risk of harm.

An adult at risk of harm is a person aged 18 or over with need for care or support, who is experiencing, or is at risk of, abuse or neglect, and as a result of their needs is unable to protect himself or herself against the abuse or neglect or the risk of it. The needs referred to here may cover a variety of personal or life circumstances including (but not limited to) cognitive impairment, age, disability, illness, injury or mental health condition.

The legal context

There is no set piece of legislation for adult safeguarding. It is a mix of criminal law, case law and welfare law. The Care Act 2014, updated in 2016, brought in the first legal framework for safeguarding adults in a single act. It contains a range of regulations and statutory guidance, which form the base upon how social care will develop in the future.

It enshrines the new statutory principle of wellbeing and it makes it the responsibility of local authorities to promote wellbeing when carrying out any of their care and support functions. The act specifies the rights of those who need care and support, their carers, and the funding system for care and support. It recognises that this cannot be achieved by any single agency. Every organisation and person who comes into contact with a child or adult has a responsibility and a role to play to help to keep children and adults safe. Further information is available in ***Appendix 1: Relevant legislation.***

Modern slavery

An important area of concern is modern slavery. The Government website provides details about the government's work to end modern slavery, including details about how to refer victims into the national referral mechanism (NRM). Modern slavery is a serious crime. It encompasses slavery, servitude, and forced or compulsory labour and human trafficking. Modern slavery victims can often face more than one type of abuse and slavery, for example if they are sold to another trafficker and then forced into another form of exploitation.

A person is trafficked if they are brought to (or moved around) a country by others who threaten, frighten, hurt and force them to do work or other things they don't want to do.

A victim of slavery is entitled to help and protection from the UK Government (this is called the National Referral Mechanism), all support is provided on a confidential basis, and support to talk to the police. The National Referral Mechanism has been put in place to identify victims of trafficking and refer them to organisations that will offer help and support. Further information is available in ***Appendix 2: Websites and further information.***

Responding to concerns

Safeguarding adults means:

- Protecting the rights of adults to live in safety, free from abuse and neglect.
- People and organisations working together to prevent and stop both the risks and experience of abuse or neglect.
- People and organisations making sure that the adult's wellbeing is promoted including, where appropriate, taking fully into account their views, feelings and beliefs in deciding on any action.
- Recognising that adults sometimes have complex interpersonal relationships and may be ambivalent, unclear or unrealistic about their personal circumstances and therefore potential risks to their safety and wellbeing.

Providers' safeguarding arrangements should always promote the adult's wellbeing. Being safe is only one of many things that adults want for themselves and there can be challenges in balancing safety and freedom in a way which protects and fulfils human rights. Providers, and other professionals where relevant, should work with the adult to establish what being safe means to them and how that can be best achieved.

Care and support means different things in every case. The fundamental standard on safeguarding is that children and adults using services must be protected from abuse and improper treatment. Providers should establish and operate systems and processes

effectively to ensure this protection and to investigate allegations of abuse as soon as they are aware of them.

The standard states that care or treatment must not:

- Discriminate on the grounds of any of the protected characteristics of the Equality Act 2010;
- Include acts intended to control or restrain an adult or a child that are not necessary to prevent, or not a proportionate response to, a risk of harm to them or another person if the adult or child was not subject to control or restraint;
- Be degrading to the adult or the child;
- Significantly disregard the needs of the adult or the child for care or treatment.

The standard goes on to state that no adult or child must be deprived of their liberty for the purposes of receiving care or treatment without lawful authority.

Safeguarding Adults Boards were established to help and safeguard adults with care and support needs The Safeguarding Adult Board must lead adult safeguarding arrangements across its locality and oversee and coordinate the effectiveness of the safeguarding work of its member and partner agencies, according to the values of 'Making Safeguarding Personal' Guide 2014[37]. Making safeguarding personal is not just for people with capacity, it is just as important for people who lack capacity. The Guide specifies outcomes that people might want including to be and to feel safe, to maintain or get friends, to know that this won't happen to anyone else or to be able to protect self in the future.

The following are not outcomes:

- Harm or abuse is substantiated/unsubstantiated.
- The person is receiving increased monitoring or care.

The role of the Care Quality Commission[38] is to monitor, inspect and regulate services to make sure that they meet the fundamental standards of quality and care. The Commission works alongside Safeguarding Adults Boards and Safeguarding Children Boards to share information and intelligence where appropriate to help them identify risks. This includes providing appropriate advice and support to people at risk of radicalisation in sectors such as healthcare and education.

4.3 Terrorism and extremism

Section 26 of the Counter-Terrorism and Security Act 2015 (the Act) places a duty on certain bodies ('specified authorities' listed in Schedule 6 to the Act), in the exercise of their functions, to have 'due regard to the need to prevent people from being drawn into terrorism'. Depending on where the psychologist works, these duties may have relevance in the course of their employment. The term 'due regard' as used in the Act means that the authorities should place an appropriate amount of weight on the need to prevent people being drawn into terrorism when they consider all the other factors relevant to how they carry out their usual functions.

The current UK definition of 'terrorism' is given in the Terrorism Act 2000. In summary, this defines terrorism as an action that endangers or causes serious violence to a person/ people; causes serious damage to property; or seriously interferes or disrupts an electronic system. The use or threat must be designed to influence the government or to intimidate the public and is made for the purpose of advancing a political, religious or ideological cause. People suspected of being involved in such activity must be referred to the police.

'Extremism' is defined in the Prevent Strategy[39] as vocal or active opposition to fundamental British values, including democracy, the rule of law, individual liberty, and mutual respect and tolerance of different faiths and beliefs. Definitions of extremism can also include calls for the death of members of our armed forces, whether in this country or overseas.

While it is recognised there is no single profile associated with extremism, identity is considered to be central, and risk screening is based on assessment in relation to two general pathways into extremism – criminal and non-criminal. Disengagement follows a similar process. This is a contentious area of practice. Psychologists should ensure they focus on their core role, working in a non-stigmatising way, and avoiding profiling based on characteristics such as race, religion, ethnicity or any other aspect. The psychologist should carefully weigh relevant professional obligations and seek and follow appropriate local and employer guidance. Further information is available in ***Appendix 2: Websites and further information.***

5. Making and maintaining agreements

Both client and psychologist benefit by having arrangements for the work clearly set out from the start. Psychologists should be aware that all professional engagements are ultimately governed by the law of contract. A legally enforceable contract can arise as a result of the parties' entering into a written agreement, but can also arise as a result of a verbal agreement between the contracting parties.

A contract arises if the following are present:

- one of the parties (the offeror) had made an offer to the other party (the offeree);
- the offeree accepts the offeror's offer;
- there is consideration (i.e. something of value) passing from each party to the other, e.g. the offeror provide services to the offeree; the offeree pays the offeror;
- the parties intended to create a legal binding arrangement; and
- the terms of the contract are sufficiently certain.

While this does not mean that all client engagements are made subject to an agreed contract document, it does mean that in the worst-case scenario of a complaint against a psychologist being made, it will be very helpful for the psychologist to be able to demonstrate that they have met their professional obligations to their client. This will be best done by demonstrating that an agreement was made by both parties who knew what they were agreeing to, that the parties had the legal capacity to make such an agreement and that what they were agreeing to is permitted under the law. Where the client does not have the capacity, best interest decisions need to be made in accordance with the Mental Capacity Act. Further information is available in ***Section 6: Obtaining informed consent***.

Psychologists may wish to include the following when making agreements:

- the role and function of the psychologist;
- the psychologist's relevant qualifications, areas of expertise and ways of working;
- relevant limitations of the psychologist's practice, e.g. assessments not accepted or types of activity not undertaken;
- where the psychologist is appointed to work with a third party, the psychologist should make clear their obligations to each of the clients concerned and each client's obligations under the agreement and ensure that there are no conflicts or ambiguities;
- the extent of the psychologist's power and responsibilities when acting on behalf of other agencies;
- obligations in relation to duty of care and safeguarding, and related limitations to confidentiality;
- how confidentiality of client information and data is assured and any limitations to that confidentiality;
- how conflicts of interest will be managed if applicable;
- the client's, or other party's, rights of access to stored information;
- the use of any one-way viewing screens or video or audio recording and the security of any recorded material;

- the nature of psychological activities involved, the reasons for undertaking them and information about the likely outcomes;
- the availability of the psychologist to the client;
- details of fees, together with application of VAT if non-clinical services, or expenses to be billed in connection with the work undertaken;
- what is expected from the client as their contribution to the engagement with the psychologist, expectations for payment and consequences of non-payment;
- ownership of intellectual property rights;
- what might cause a breach of the agreement;
- the rights of each party to withdraw from the agreement and the consequences to any financial agreement;
- recourse to dispute resolution or law;
- the equality and justice aspects of social policies and their possible impact;
- external ethical scrutiny and approval of the engagement, where appropriate; and
- arrangements to terminate the retainer.

In advance of any psychological assessment, the client should be made aware of the availability of services, and the existence of any waiting lists for intervention.

For some approaches, intervention follows an evolving path, unique to each client and his or her life circumstances, which cannot be precisely predicted in advance. Clients should be made aware of this uncertainty, and predictions should be made on the best judgments. It is recognised that it is sometimes unrealistic and undesirable to provide detailed information on all aspects of psychological intervention, and consent should be obtained to a general strategy rather than specific procedures. Further information is available in this document or the ***Society Website: http://beta.bps.org.uk/Practice-Guidelines.***

5.1 The practitioner's right to withdraw their service

There are circumstances in which a psychologist may decide to terminate the agreement for provision of psychological services. The circumstances may be personal or professional.

The personal circumstances may include but will not be restricted to leaving employment in a psychological service, incidences of illness or family commitments.

The professional issues may relate to service structural changes, safety, or provision of most appropriate service.

In these circumstances, psychologists will, as far as possible, work to ease the transition of service provision and give as much notice as is practical in the particular situation.

5.2 Referrals

Where a psychologist finds themselves unable to come to an agreement with a client, the psychologist may refer the client to a suitably qualified colleague. Psychologists will both make and receive referrals when working in services with other professionals.

In making referrals, psychologists should consider the needs of the client and to the best of their knowledge refer to another professional with the appropriate skills and experience.

In receiving referrals, the psychologist should consider whether the referral is appropriate for psychology, establish the client's understanding of the purpose of the referral, and consider as far as possible prior to meeting the client whether the referral falls appropriately within their own areas of practice.

5.3 Representation of the qualifications and status of the psychologist

HCPC registration and BPS Chartered Status

Psychologists are encouraged to state their registration with the HCPC and protected title(s). This will provide assurance that the psychologist meets national standards of training and professional skills.

Use of the 'consultant' title

The term 'consultant' generally does not have a formal definition. Within the medical field it is used by doctors who have considerable experience and proven expertise demonstrated through examination within their respective Royal Colleges.

While there is no clear comparable grading structure for psychologists outside the NHS (within the NHS, the consultant title is used by psychologists who are employed in Band 8C, 8D and 9 positions), the use of this title would be seen to reflect both seniority and specialist expertise.

There is a difference between a 'consultant' psychologist and a psychologist who provides consultations in their context of practice. The Society expects that psychologists should be honest and accurate in representing their professional affiliations and qualifications, including such matters as knowledge, skill, training, education and experience.

The Society's position is that this would be applicable in any situation where expert knowledge or skills is being marketed or promoted, whether or not this is for financial gain. Further information is available in ***Society Document: Guidance on the use of the title 'Consultant Psychologist'.***

6. Obtaining informed consent

Psychologists should always ensure that they have sought and received the consent of those they work with, given of their own free will, without undue influence.

The concept of informed consent relates to the client's right to choose whether to receive psychological services, and to make this choice on the basis of the best information available presented in the most appropriate way. The principles apply, whether the psychologist works in the public, private or voluntary sector or in independent practice.

Psychologists should obtain the informed consent of the client in an appropriate manner prior to undertaking any assessment, intervention or research activities. In all circumstances, common sense and ethical practice should apply when considering the approach to gaining informed consent from those with whom the psychologist is working.

This section refers, in the main, to consent with adults with capacity. Further information on informed consent with discrete communities where further consideration may be needed is available in ***Sections 6.1 to 6.4***.

Obtaining informed consent involves a process which is dynamic and is relevant to the specific assessment, intervention or decision being made at that time. When there are substantive changes in the intervention or when the psychologist has reason to consider the client may no longer consent, consent should be reviewed. Psychologists should ensure that their clients are enabled to play an active role in this process. Clients should be encouraged to ask questions whenever they are in doubt.

Psychologists should be aware that a client's desire for help, and the immediate impact of the psychologist's supportive listening, may affect the client's ability to make informed choices about the help they wish to receive. They should also be aware that their own desires to help a client may bias their presentation of information, such as the probability of successful outcomes.

Psychologists should be aware of the complexities of obtaining informed consent to treatment due to the perceived power, status and authority of the professional psychologist. It may not be clear if the consent given is freely given by the client or, for example, is part of a pattern of compliance towards authority figures. Equally, a client may say that they understand the explanation given by the psychologist, and accept a plan for intervention, in order to avoid the discomfort of being seen not to understand the psychologist's complex language and ideas.

Obtaining informed consent is particularly difficult when the client is obliged to undertake the psychological intervention as part of an employment process or performance measure where they may have obligations under their employment contract; or when detained.

There should ideally be an ongoing dialogue between client and psychologist, as part of the process of joint decision-making. At any point, the client should feel free to ask questions about the impact of the treatment and withdraw consent to continue.

Psychologists should attempt to intervene against the express wish of a client only after careful consideration and in line with relevant legislation, policies and professional practice.

Provision of information for informed consent

In order to ensure that the client has all the information necessary to make an informed decision about whether to take part or not in a psychological activity, they must be provided with relevant information, such as that listed below, in a format that is designed to meet their specific needs.

The psychologist should consider providing information about the following:

- what the psychological activity involves, as far as this is consistent with the model of interaction, e.g. there will be limits in the use of some non-directive therapies and psychometric assessments;
- the benefits of the activity, either directly to the client in the case of assessment or intervention, or indirectly in the case of systemic intervention, or to potential theoretical advances or service improvement;
- any alternative assessment or treatment options and their known availability;
- foreseeable risks and how minor or serious they may be, for example the potential to feel worse at stages during therapeutic interventions;
- what might be the benefits and potential costs and risks to them of engaging or not engaging in the proposed psychological activity; and
- the client's right to withdraw their consent from assessment, treatment or intervention at any stage, along with information about any likely consequences of such withdrawal.

Consent to involvement of others

Psychologists have an obligation to ensure that prospective clients are informed of the extent and limitations of confidentiality with respect to anticipated services, the purposes of any assessment, the nature of the procedures to be employed or the intended uses of any product such as notes or recordings, before the assessment or intervention starts. Further information is available in ***Section 7: Managing data and confidentiality.***

The psychologist should ask the prospective client: whom they would wish to be informed of their assessment or treatment, if anyone; and the information they are willing to share where communication is essential, for example to the referring agent or organisation, management or court. Wherever appropriate, including in the law, the client should have copies of reports or letters or be given feedback so that they are kept fully informed.

If it is deemed necessary to move from individual contact to include others this should where possible be done with the client's prior consent.

Psychologists may be asked to provide consultancy or advice to colleagues about an identified client, without that person's knowledge or when the client has indicated that they do not want to have direct contact with the psychologist. In these circumstances, the psychologist will need to consider their potential involvement and the need for consent.

A psychologist who draws upon the work of other professionals in preparing a report, should seek their consent, where possible and if not already in disclosed records, to include that material and should acknowledge its source in the report.

If a report is requested which draws upon previous or concurrent investigations of a client in other contexts, for example NHS records in the preparation of a report for the court, the client's consent or relevant authority's consent for that information to be used should be sought.

If psychologists wish to use reports on clients which have been compiled by other professionals, they should do so only with the consent of those professionals and use the reports only in the context for which the report was specifically provided.

Information on and consent to record-keeping

Express consent must be sought in advance for the use of video, audio recording or one-way screens, with a clear explanation of the purpose of these. Further information is available in ***Section 7.1: Information governance***

6.1 Informed consent for court

When a psychologist is instructed to give evidence in court, it is the court that should be informed and whose authority should be sought for the work undertaken. When serving as a witness in the legal arena, the psychologist is responsible to the court, rather than to either party.

6.2 Informed consent with children and young people

All children and young people, whatever their age or status, have a right to express their views freely and be involved in any decision-making that affects their lives, which includes judicial and administrative proceedings[40]. Therefore, psychologists who seek to work with children or young people must gain their informed consent. This applies whether the child or young person or another agent with legitimate responsibility for the child or young person has made the request for involvement. Any direction or guidance provided by parents or other caregivers must be 'in accordance with the child's evolving capabilities' and support the 'exercise by the child of his or her rights'[41]. The onus is then on the adults to provide appropriate support to enable the child or young person to express their views and contribute to decision-making.

Every psychologist should consider how they can:

- provide an accessible explanation to the child or young person about their work as a psychologist;
- offer a clear reason for their possible involvement;
- provide an opportunity for the child or young person to talk about what working with the psychologist might involve.
- discuss and agree how information is recorded and possibly shared with others with an awareness that young people who are 'Gillick competent' can consent to information not being shared with parents;

- discuss how the child or young person will be kept safe;
- ensure that the child or young person has understood the psychologist's role and has given their informed consent;
- ensure the child or young person understands they can withdraw their consent at any point;
- ensure their practice acknowledges and respects the culture, community and context of the child or young person.

Occasionally, a disagreement over consent may arise between parent/carer and child or young person and/or between parents/carers. The psychologist would make every effort to resolve the difference of views, perhaps seeking, with agreement, involvement of an appropriate family member and/or a colleague, although as discussed above, a young person who is 'Gillick competent' can legitimately request that family members (including parents) are not involved or informed of any involvement. If the disagreement is not resolved, the psychologist should draw on their professional experience to act in the best interest of the child or young person seeking consultation and support through appropriate channels, including safeguarding and legal departments, and consultation with appropriate colleagues including other professionals.

6.3 Informed consent with people who may lack capacity

It is likely that psychologists at some stage within their careers will be working with people who lack capacity to consent to assessment or treatment. This could be because of a wide range of difficulties such as intellectual disability, brain injury, dementia, severe mental health difficulties, and neurological conditions. As a result, it will often be necessary to make a judgment about a client's ability to give informed consent. This should include whether the person is able to:

- understand the information relevant to the decision (e.g. psychological treatment);
- retain that information;
- use or weigh that information as part of the process of making the decision; and
- communicate their decision (whether by talking, using sign language or any other means.)

The Mental Capacity Act 2005 contains 5 key principles which it is important to understand:

1. A presumption of capacity;
2. Individuals being supported to make their own decisions;
3. Individuals have the right to make 'unwise' decisions;
4. Anything done on behalf of a person with a mental capacity issue should be in their best interests; and
5. An intervention should be on the basis of the 'less restrictive option' weighed up in the particular circumstances of the case.

The Mental Capacity Act Code of Practice[42] expands upon these points (and indeed all aspects of the Act), highlighting the need to assist a client in making a decision for

themselves (with the use, for example, of memory aids, simplified resources, etc.). It should also be noted that the fact that a person is able to retain the information relevant to a decision for a short period does not prevent them from being regarded as able to make the decision.

The Mental Capacity Act (2005) provides a clear framework for what to do if a person lacks capacity to make a range of decisions, including consenting to treatment. The principle of 'best interest' must be followed, and the Act states clearly who needs to be consulted in relation to making such a decision and ensuring that the individual's wishes are considered.

It is good practice to give full information (possibly using adapted resources) to clients even when they are not deemed able to give informed consent. The psychologist must, so far as reasonably practicable, permit and encourage the client to participate, or to improve their clients' ability to participate, as fully as possible in any act done for the client and in any decision affecting them.

In some circumstances, it is possible that there may be others who have been given legal authority for decision-making on behalf of others, such as Power of Attorney for Health and Welfare or Deputyships for Health and Welfare. It is important to note that patients might also have created Property and Affairs Lasting Powers of Attorney. Those acting under a Property and Affairs power alone will not have authority to make decisions in relation to a patient's treatment. If someone is a Health and Welfare Attorney or Deputy, those persons will be able to make those decisions on behalf of others. It is also necessary to ensure that the client has not made an Advance Decision to refuse treatment prior to the loss of capacity, although this is unusual in relation to psychological treatment.

In some clinical contexts, particularly relating to brain injury, intellectual disabilities and dementia, issues related to capacity and best interest are particularly prevalent. Psychologists practising in these areas need to ensure sufficient knowledge and expertise. Further information is available in ***Society Document: Guidance on determining the best interests of adults who lack the capacity to make a decision for themselves.***

6.4 Informed consent with people as employees

Tripartite arrangements where an employer commissions and pays for an assessment or intervention, such as diagnostic assessments for neurodiversity and cognitive functioning return to work assessments, or coaching, potentially give the employer access to data that they will struggle to interpret, or may misinterpret, for example test scores and details of personal life. It is important that the psychologist protects the employee by giving the employer only what they need to know and can reasonably require for the purpose of employment.

The Psychologist should consider whether they will be gathering information that is not usually held by an employer, or is not held routinely for all employees, for example IQ scores and childhood experiences. If so, the psychologist should consider abridging documentation so that the employer receives only the information they 'need to know',

and the employee can if necessary hold a full copy for future reference. This prevents discrimination against employees who are subject to in depth assessment for reasons related to illness, neurodiversity or disability from being unfairly compared to their peers. It also prevents complex psychological information from being held by those who are not qualified to interpret it.

Agreements should be made explicitly about the information which can be shared with the commissioning organisation. In order to aid transparency, information should normally be sent to the client prior to being shared with the organisation.

6.5 Informed consent with detained persons

Prisoners

Informed consent may be harder to obtain when a client is detained. Psychologists working with detained persons should be aware that, as well as UK law, the UK is signatory to a number of conventions on the treatment of detained persons. These conventions not only outlaw physical ill-treatment, but also certain kinds of psychological pressure. For example, it is contrary to the UN Convention on Torture to apply psychological pressure to elicit a confession, or compliance with a regime. In this context, 'psychological pressure' could include making progression contingent on compliance with a particular aspect of the regime. Practitioners should be particularly mindful of the power imbalance in forensic contexts, which is far more acute than is generally found in non-justice system based settings. Only offenders detained in secure hospitals can be required to comply with assessments or treatments under involuntary detention sections of the Mental Health Act.

Mental Health Detentions

For psychologists there can be potential conflicts of interest or what could be better termed 'competing duties of care' between the roles of Responsible Clinician (RC) (for further information on this role see Section 3.5) (including the duty to detain or otherwise compel participation in treatment) and that of psychologist (including, principally, the duty to establish freely-given consent wherever possible to enhance the efficacy of the therapeutic intervention). The MHA Code at chapter 24.34 (medical treatment) states that permission given by a patient to a particular treatment 'under any unfair or undue pressure' is not consent (p.257).

Good outcomes for psychological therapies are associated with positive therapeutic alliances and good working relationships between therapists and patients. The potential for even perceived abuse of power and the inherent power differential between an RC and a detained patient subject to the MHA runs a risk of rupturing this relationship or it becoming coercive. Psychologist RCs must therefore remain aware of and give full consideration to any potential competing duties of care between the RC and psychological therapist roles when providing psychological treatments to patients over whom they have compulsory powers.

The main issues to be considered by psychologist RCs when addressing potential competing duties of care in this context include the following:

1. Psychological treatments (with the possible exception of indirect interventions delivered by proxies such as paid staff and carers) are more likely to be effective when informed consent is obtained. As such, RCs acting as psychological therapists should utilise all reasonable and ethical attempts to obtain consent from patients before proceeding with psychological treatment. The *Code* at chapter 24.34–24.39 (p.257) provides guidance on obtaining consent.
2. The Act permits psychological treatment to be given without consent and the Code provides guidance on how to proceed with treatment in these circumstances (chapter 24.40–24.44, pp.257–258). There may be circumstances, especially when significant risks to others or self have been identified, when it is considered to be necessary for a psychologist RC to proceed with providing psychological treatment without consent. In such circumstances then there should be, where practicable, prior discussion with the MDT involved in the patient's treatment and care about the risks involved. Careful consideration should be given to the availability and merits of another suitably qualified member of the team providing the psychological treatment required with the RC remaining in overall charge of the client's care.
3. There may be situations where it is judged that informed consent cannot be clearly obtained, or where it would appear another available practitioner would be more likely to achieve a more effective outcome (perhaps due to the power differential between patient and RC). In such situations the psychologist RC is advised to refer on to other members of the treatment team who are able to provide the psychological treatment needed, while the RC remains in charge of overall care.

7. Managing data and confidentiality

7.1 Information governance

Psychologists should follow local and national guidance and statutory responsibilities regarding management of data. Psychologists should make, keep and disclose information in records only in accordance with national policy and legislation, and the policies and procedures of the organisation(s) they are employed by/working in collaboration with. Further information is available in ***Section 1.1: Legal and professional obligations of psychologists, Appendix 1: Relevant legislation*** and ***Appendix 2: Websites and further information.***

Psychologists must bear in mind the potential impact of the information in their records on all who may have access to such records, for example, the client, other professionals, managers, authorised carers, etc. Where possible, distinction should be made between fact, observation and opinion, and judgemental comments should be avoided. Psychologists are responsible for holding their records securely to ensure the confidentiality of the information contained within them and to control access to them. Further information is available in ***Society Guidance: Guidelines on the use of Electronic Health Records.***

This guidance applies to all record-keeping on clients, their relatives, carers and/or associates, and their organisations, regardless of the media in which information is held, e.g. written notes and reports, audio- and video-recordings, paper and electronic records, etc.

Records made, kept or accessed by psychologists should be:

- systematic and appropriately detailed;
- in clear language/format;
- accurate;
- up to date; and
- relevant to professional work and to the purpose for which they were collected.

Clients have a legal right to access records concerning them, and this right is enshrined in legislation. Additionally, it is good practice for clients to be given feedback on their content. Sharing records with clients supports the collaborative approach of psychologists and enables clients to have full and effective involvement. Client access to records will be restricted to information about themselves and not third parties. Restrictions will also apply when disclosure would place the clients or others at risk of serious harm.

In tripartite arrangements involving an employer access to information should be governed by agreements made explicitly about the information which can be shared with the commissioning organisation.

Shared records

In some organisations in which psychologists work single, multi-professional, client-based records are held. Such records are designed as shared documents (paper or electronic),

the function of which is primarily to facilitate inter-professional communication to ensure the safe and effective delivery of high quality services. Such records may be shared among organisations/agencies to facilitate care and/or exceptionally, to safeguard the client or others, including the general public. In some contexts, clients have the right to object to their data being disclosed to a third party even someone who might provide essential healthcare. Psychologists should be aware of local codes and policies. Further information is available in ***Section 3.5: Working with other professionals***, ***Section 7: Managing data and confidentiality*** and ***Appendix 2: Websites and further information.***

Psychologists should include in the shared record all information about their work with clients and related others which is required to ensure appropriate multi-professional care and to safeguard the client and relevant others, including the general public.

Third-party and sensitive material should be clearly marked. There should be clarity/clear communication within the multi-professional team about what is and is not shared with the client if there are safeguarding concerns. A system needs to be established about how suspicions and causes of concern are recorded and/or shared.

Where shared records are held, other professionals involved with the clients will have access to such records. This should be explained to the clients at the onset of engagement with them.

The use of sealed envelopes is no longer considered good practice following the findings from serious untoward incident investigations where the existence of sealed envelopes compromised care.

Assessment materials

Psychologists should be mindful at all times of the confidential nature of assessment materials. Many assessment measures are invalidated by prior knowledge of their specific content and objectives. Psychologists who use these materials are required to respect their confidentiality and to avoid their release into the public domain (unless this is explicitly allowed in the nature of the instrument and by the test publisher). Psychologists should, therefore, take reasonable steps to prevent misuse of test data and materials by others. Further information is available from ***Appendix 2: Websites and further information.***

In many organisations, there is only one shared records system. In these cases, it is necessary for psychologists to be able to use the shared records system to hold raw data from psychometric assessment. The results of psychometric assessment will be incorporated into reports which explain their context and appropriate interpretation, and which are included in the shared institutional record. In relation to the visibility of the psychometric instrument and the raw data to other members of the multidisciplinary team who are not psychologists, the onus is on the other professionals not to interpret information where they are unqualified to do so, just as the psychologist would not interpret, for example, physical healthcare test results they are unqualified to interpret. Psychologists may consider whether it is appropriate to mark assessment materials so their nature is clear.

Additional data

Psychologists may wish to keep separate notes to aid their work but which are not intended for sharing with others or to be part of the permanent client record. These notes, often called process notes, which are written for the purposes of reflection on practice, should be anonymised with no other identifying links e.g. initials, appointment time, so that these notes therefore are clearly not part of the client record. Process notes may, for example, be used for reflection and supervision. If process notes are made to assist in compilation of a report, the material should be incorporated, as relevant, into the final report and the process notes then destroyed.

Long-term illness, incapacity or death of a psychologist

Most organisations will have procedures in place in the event of illness, incapacity or death of a psychologist. Psychologists in independent practice are advised to make a professional will and to appoint a professional executor, probably an experienced colleague, whose role it would be to take charge of client records, to inform the clients involved and, where appropriate and practicable, to make provision for continuity of the service provided.

Retention and destruction of records

Psychologists' records should be held securely for as long as they are required for the purpose of psychological work. Psychologists must follow legal requirements, national and local policy frameworks and procedures regarding the retention or disposal of records after the psychologist's work is concluded. Psychologists should ensure that they keep up to date with requirements.

For independent practitioners general guidance is that many independent psychologists keep records relating to contact with adults for 7 years, and follow NHS guidance in relation to children. Where the records derive from work undertaken within an organisation, the maintenance of these records is determined by the organisation's policies and legal requirements.

Retention and destruction of health records, both paper and electronic, is covered in the NHS code of practice for records management. Generally speaking, retention is until age 26 for people seen as children; 20 years after the last contact for adults, and 8 years after death if the death occurred while the person was in the care of the NHS. There are specific requirements for mental health services depending on the nature of the contact.

In education settings, Local authorities generally retain Education Health and Care Plans for 35 years after the case has been closed. Other records are retained until the child is 25.

All records must be destroyed under confidential conditions following organisational procedures or for independent practitioners using a destruction service or process which meets industry standards for document management and can provide the appropriate certification.

7.2 Confidentiality

Clients are entitled to expect that the information they give to psychologists about themselves and others will remain confidential. Psychologists have a duty not to disclose

such information except as discussed below and to bring their confidentiality practice to the attention of their clients, employers, managers and any other professionals involved.

Psychologists have a duty to inform involved parties of their confidentiality standards and practice at the point of first contact. Clients should be informed of the limits of confidentiality where information about them may be shared and confidentiality breached, for example for reasons of safeguarding, requirements of the law, and public protection.

Psychologists have a duty to be aware of the content of any other relevant guidelines and of any other policy guidelines which set out local expectations.

Use of client data for audit must follow the Caldicott principles, which, designed for the NHS, provide helpful guidance for any setting in terms of when it is appropriate to use with client-identifiable data and when anonymised data should be used[43]. Generally under data protection legislation, it is necessary to obtain specific informed consent for the use of client data for particular purposes, and to inform clients of the purposes for which their data is being collected and how it will be used. Further information is available in ***Appendix 2: Websites and further information.***

Disclosure of information

If disclosure of information is deemed necessary, psychologists should obtain specific informed consent from their clients, making the consequences of disclosure as clear and unbiased as possible. There are a number of circumstances where this might not be possible or may not apply: for example where the health, safety, security or welfare of the client or someone else may otherwise be put at risk; and if there are legal or safeguarding responsibilities, such as the need to avoid 'tipping off'. If confidentiality is broken without consent, the client should be told what has been said and to whom, unless such disclosure may expose the client or others to serious harm or is contrary to legal or safeguarding obligations.

Psychologists who are faced with the difficult decision as to whether to disclose information without a client's consent must weigh carefully the arguments for and against disclosure. The responsibility for this decision lies with the individual psychologist although they may seek advice and guidance from appropriate sources such as their employing organisation's Information Governance or Data Protection Lead, Clinical Governance Lead, Caldicott Guardian, Safeguarding named and designated professionals, or legal departments. These other professionals can be the most helpful sources of advice in difficult disclosure situations. Independent practitioners may wish to consult the legal helpline of their professional indemnity insurer.

Circumstances may emerge where clients may present a risk to others or to themselves, or be at risk from others whom they wish to protect. It is then necessary to discuss the importance of disclosure and to encourage it, for example to partners of HIV positive clients, and to employers if a client's mental health status presents a risk to others via driving, handling machinery or interaction in a working situation, for example, flight deck crew. Disclosure without consent, or against the client's expressed wish may be necessary in situations in which failure to disclose appropriate information would expose the client, or

someone else, to a risk of serious harm (including physical or sexual abuse) or death.

The psychologist must weigh up the needs and interests of their own client against the wider welfare, protection and safeguarding of the public.

Disclosure to clients' employers, insurance companies and others

Psychologists have a duty to ensure, at first contact, that clients understand the purpose of any assessment undertaken at the request of employers, the DVLA or insurance companies, and of the psychologist's obligation to disclose the results of that assessment. In the case of assessment for fitness to work or to drive, they should obtain the client's written consent.

Psychologists should consider what each party involved needs to know, gaining understanding and agreement on which aspects will be fed back, in advance. For example, the full detailed and raw scores obtained by a psychologist in recruitment assessment processes may be unsuitable for an employer to receive in full. The commissioning body should be made aware of the decision-making data that they originally requested, in the case of an employer this could include strengths and weaknesses, and recommendations for employer actions, for example.

Primary clients should be advised about and able to preview, with opportunity to ask questions first, any data that will be sent to an employer about them. Bear in mind that the informed consent difficulties still stand and that an employee or potential employee can withdraw consent for the employer to be informed of any part of their results.

This can be very difficult to manage in practice, and requires psychologists to make these agreements with their commissioners before they start the work, so that all are informed of the risks in the service delivery. Further information is available in ***Section 3.4: Working with multiple clients.***

Disclosure after a client's death

After a client's death, relatives or other authorities may seek access to the psychologist's records. In the first instance, the psychologist is advised to follow organisational procedures where they exist which usually deal with the administrative proofs required such as proof of death, proof of kinship and right to access the material requested.

A psychologist's duty of confidentiality continues after a client has died. The psychologist will need to weigh up the circumstances around the request for disclosure and what personal information is being sought. If there has been a specific request by the client for their information to remain confidential, their wishes should usually be respected. If the psychologist is unaware of any instructions from the client, when considering requests for information the following should be taken into account:

- the purpose of the disclosure;
- whether the disclosure of information is likely to cause distress to, or be of benefit to, the client's partner or families;
- the permission of a surviving relative or next of kin is not required, and does not authorise disclosure of confidential information, although the views of those who were close to the client may help the psychologist decide if disclosure is appropriate;

- whether the disclosure will also disclose information about the client's family or anyone else; and
- whether the information is already public knowledge or can be anonymised or coded.

There may be circumstances where the disclosure of information is required, for example:
- to support an inquest or fatal accident inquiry;
- where the disclosure is required by law, is authorised under section 251 of the NHS Act 2006, or is justified in the public interest, such as for education or research;
- in the case of national confidential inquiries or for local clinical audit; and
- when a person has a right of access to records under the Access to Health Records Act 1990 or Access to Health Records (Northern Ireland) Order 1993.

7.3 Confidentiality when safeguarding

In exceptional circumstances it may be necessary to breach the client's confidentiality with or without their immediate knowledge or consent. This would be the case where there are significant risks to the client's psychological wellbeing; where the alleged perpetrator may be a current risk to others or where there is risk of jeopardising a potential investigation. Any decision to breach confidentiality cannot be taken lightly, but can be justified and accounted for if made in good faith because of safeguarding concerns. This is supported by professional guidance. The focus of any intervention including any breach of confidentiality must be on promoting a proportionate, measured approach to balancing the risk of harm with respecting the client's capacity to consent, their choices and preferred outcome for their own life circumstances.

Specified authorities may need to share personal information to ensure, for example, that a person at risk of radicalisation is given appropriate support. When considering sharing personal information, the specified authority should take account of the following:
- necessity and proportionality: personal information should be shared only where it is strictly necessary to the intended outcome and proportionate to it. Key to determining the necessity and proportionality of sharing information will be the professional judgement of the risks to an individual or the public;
- consent: wherever possible the consent of the person concerned should be obtained before sharing any information about them;
- power to share: the sharing of data by public sector bodies requires the existence of the power to do so, in addition to satisfying the requirements of the Data Protection Act 1998 and the Human Rights Act 1998; and
- Data Protection Act and the Common Law Duty of Confidentiality: in engaging with non-public bodies, the specified authority should ensure that they are aware of their own responsibilities under the Data Protection Act and any confidentiality obligations that exist.

In relation to health sector staff, government guidance states it is important that staff understand how to balance client confidentiality with the duty to report. They should also be made aware of the information-sharing agreements in place for sharing information with other sectors, and get advice and support on confidentiality issues when responding

to potential evidence that someone is being drawn into terrorism, either during informal contact or consultation and treatment.

7.4 Confidentiality for the court

Psychologists acting as expert or professional witnesses have a duty to disclose all of the evidence used to reach their opinion where directed by the court to do so.

This could include:

- the details of any tests and assessments administered with professional colleagues;
- notes made during report writing; and
- referenced academic articles or studies.

No information relating to an assessment or report should be disclosed outside the relevant proceedings without agreement. Psychologists should normally seek permission from the instructing party to disclose any information to another health care professional.

Where instructed directly by the court, the Crown Prosecution Service, Procurator Fiscal or a solicitor, the psychologist is required to report or comment on any or all aspects of the case that appear to the psychologist, as an expert in the field, to be relevant or pertinent. In such circumstances, the psychologist is not in a position to offer confidentiality to any person, and should make this position clear to any party with whom they have contact during psychological investigations or assessment.

In these circumstances, it will be important that the psychologist makes sure they are up to date with the legislation and policy guidance regarding public and media access to information available to whichever court or tribunal their instruction arises from. The psychologist will need this awareness so that they can explain to the adult or child concerned what the limits of privacy are in these legal circumstances. They will need to make clear to the client which information needs to be made accessible, by whom and under what circumstances. Only when the client understands this, can they give informed consent.

There are different levels of access to sensitive information in different legal contexts; this will include testimony, documents and professional and expert reports. Many proceedings typically take place in open court, to which the public has access. In these cases, there is a presumption in favour of providing information and documents to third parties which were relied upon by the court in reaching its decision, though not the entire court file.

Where court papers and other materials are received in electronic format, psychologists should ensure that these are stored in a secure, password-protected format. This may require the addition of additional security for documents that arrive in an unsecured form. Where psychologists submit reports in an electronic format they should ensure that these are in a secure, password-protected format.

Psychologists working with clients who are the subject of court proceedings may need to be careful to ensure that they keep all records which may be of relevance to the court process until it is clear that the court has reached a final conclusion, including any appeal that may have been heard.

With few exceptions, applications in the family court are heard in private, with only those immediately involved being allowed to attend and access information. It is possible, however, for duly accredited members of the media to attend hearings in the family court, subject to the power to exclude them on specified grounds.

In most family court proceedings, media representatives have no entitlement to receive or peruse court documents referred to in the course of evidence, submissions or judgment. If media representatives wish to see documents referred to in the family court they may apply to the judge for disclosure but they are subject to strict guidance in terms of what information they can divulge into the public domain.

7.5 Confidentiality with children and young people

When beginning direct work with a child or young person, the psychologist should discuss and agree who will have access to the information arising from the work, with direct reference to principles of 'Gillick competence'. In undertaking this discussion it is helpful to acknowledge that there may be those adults (e.g. parents/carers, other relevant professionals such as teachers, social workers, counsellors) who may have a supportive interest in the work and may wish to have appropriate access to information but the wishes of a 'Gillick competent' young person should take precedence unless there are safeguarding concerns.

Parents or those with legal responsibility may be made aware of this agreement if appropriate, although a young person deemed to be Gillick competent is able to agree to work with a psychologist independently. Those with parental responsibility do not have an automatic right of access to the psychologist's records by making a subject access request under data protection legislation.

The nature and purposes of any work will vary and this will determine how and to whom information will be shared, however the child or young person should always be made aware of who will have access to what and for what purpose and due consideration given to the wishes of a 'Gillick competent' young person about who can have access to information about any involvement with a psychologist. The child or young person should be fully aware of the content of any shared information, including as appropriate, copies of the documents. Whatever is agreed about information sharing including work where information is confidential, the psychologist must ensure the child or young person knows and understands that if there is a risk of harm the psychologist must follow safeguarding procedures.

7.6 Confidentiality with detained persons

When detained persons give informed consent to the collection of information, they do so for a specific purpose and for use by specific people. The use of such information for a different purpose or for use by different people would require separate consent. Thus, although a psychologist may interview and write a report on a detained person, consent for that purpose cannot be taken as allowing a third party access to the psychologist's records on that person, such as notes on (or recordings of) the interview. If psychologists are

put under pressure to reveal such information, they should seek the advice of colleagues including for example those responsible for governance or data protection. They should bear in mind that they have a legal duty to be aware of and comply with data protection legislation and professional confidentiality rules.

7.7 Confidentiality obligations during training

During training, no academic/training documents should identify clients to whom they relate (even by means for example of initials, service name or date of appointment) as any such potential identifiers could be used to trace the client and therefore make the document a part of the clinical record and subject to the relevant provisions of data protection legislation. This includes published reports, case studies prepared for trainee assessments and any articles or publications. Tutors and supervisors should communicate this to their trainees. Trainees should be clearly instructed to both make and keep separately those records which are part of the provision of psychological service and which belong to the service organisation and are subject to its policies and procedures; and papers which are anonymised and are part of the trainee's academic learning, and belong to the trainee and are subject to the training provider's policies and procedures.

Express consent should be obtained by trainees before audio- or video-recording their interactions with clients. If the client is unable to give informed consent, it is unlikely to be appropriate for the recording to be made. Careful consideration should be given before any material is recorded if the client is party to any legal proceedings or family or employment disputes. If material is to be used for purposes other than client care (including teaching and research), the client should be informed of the purposes of the recording. It should be made clear to clients how the material will be used and to whom it will be disclosed, for example, trainee students, other researchers, and supervisors.

The trainee and the client should come to an agreement about how long recorded material should be kept. The general principle is that recordings will be kept for as long as needed to fulfil the purpose for which the client has given consent and no longer. The security of the material must be maintained, and it must be destroyed at the agreed time limit if no longer required.

Informed consent is required before client material in an identifiable format may be published in case studies, presentations or other research reports. It is becoming common practice for clinical material in professional doctorate portfolios to be stripped out before the thesis is placed in online institutional repositories.

8. How to respond when things go wrong

8.1 Managing conflict with a client

Conflict with a client suggests that someone's expectations are not being met. The first objective should be to restore agreement or agree to make changes. The well prepared psychologist will have a client agreement in place and will be able to review the experience against the agreement with the client to address this question. Further information is available in ***Section 5: Making and maintaining agreements***. Even in the absence of an agreement, the psychologist would be advised to enquire with the client where their expectations are unmet or raise their own unmet expectations with the client. This can be an opportunity to put a belated agreement in place.

It may be that the parties agree to set aside the agreement and bring it to an early close. Agreeing to disagree may be a better outcome for psychologist and client who cannot restore agreement. Take account of any need for onward referral either within the service or elsewhere or back to the original referrer, and depending on the nature of the work setting, any financial obligations in closing the work.

The psychologist may find it helpful to consult with appropriate colleagues in preparation for the conversations with the client, such as line or service managers, those with other relevant organisational responsibilities, and supervisors. There may be more general lessons to be drawn as part of reflective practice in relation to the quality of the client agreement for future use.

8.2 Transparency and duty of candour

The Health and Social Care Act 2008 (Regulated Activities) Regulations 2014 duty of candour (regulation 20) requires all health and adult social care providers registered with the Care Quality Commission to be open with people when things go wrong. Psychologists need to be aware of the terminology relating to this regulation including:

- openness – enabling concerns and complaints to be raised freely without fear and questions asked to be answered;
- transparency – allowing information about the truth about performance and outcomes to be shared with staff, patients, the public and regulators; and
- candour – any patient harmed by the provision of a healthcare service is informed of the fact and an appropriate remedy offered, regardless of whether a complaint has been made or a question asked about it.

Psychologists also have a responsibility to ensure that they engage in open and transparent communications with people who use services and other 'relevant persons' (people acting lawfully on their behalf) in relation to care and treatment. Guidance from the Care Quality Commission on duty of candour outlines the specific requirements that providers must follow when things go wrong with care and treatment, including informing people about

the incident, providing reasonable support, providing truthful information, and making an apology. Psychologists are instrumental in supporting organisations to promote a culture that encourages candour, openness and honesty at all levels. Further information is available in ***Appendix 2: Websites and further information.***

8.3 Managing conflict in team settings

Dealing with breakdowns in working relationships, professional disagreements and fitness to practise concerns

As far as possible, psychologists should seek to resolve any conflict with or between other professional colleagues (including relating to consultation/supervision or line management) by clear communication, relevant evidence and collaboratively working through the issues in reasoned argument within the context of respectful relationships.

The psychologist should first approach the colleague in confidence, if it is appropriate, with relevant information, in a manner that is collegiate and helpful. If misgivings continue, the psychologist should consult with an appropriate colleague to share concerns and to seek advice. Where appropriate they should keep a written record of the meetings and steps taken to resolve any difficulties.

Where there is serious or continual disagreement, both parties need to take whatever action is appropriate in their professional context, consulting other experienced professionals as necessary.

Supervisors and line managers have professional obligations concerning professional standards, ethical practice and 'fitness to practise' issues. If line managers or supervisors have any concerns regarding performance in these areas, they have a duty to discuss these with the psychologist and, if necessary, address the matters by in the first instance following appropriate employment policies and procedures, or in the case of an independent practitioner, making a report to the HCPC.

Working in multi-professional or multi-agency contexts

Psychologists may find themselves in conflict with the approaches to work taken by other individual colleagues or by the multi-professional team or agency.

Psychologists should bring to the awareness of the multi-professional team or agency any difficulty in the group working together which may impact on the psychologist's ability to function effectively and ethically in their role. Such issues are best addressed when guided by national and local policy and current legislation before proceeding with multi-professional/multi-agency collaboration. Further information is available in ***Appendix 1: Relevant legislation.***

The psychologist may also have cause for concern about the ability of the team to provide for the needs of the client owing to interpersonal difficulties between members of the multi-agency or multidisciplinary team that might have an indirect impact on the client. As far as possible, psychologists should seek to resolve any conflict with or between other professional colleagues by clear communication, relevant evidence and collaboratively

working through the issues in reasoned argument within the context of respectful relationships.

If the situation remains unresolved for any reason, for example because it is judged not to be an issue for active management, the psychologist must make a judgement about whether their involvement in the team is helpful to the client or the working of the team. If not, the psychologist should consult with an appropriate colleague about whether they should disengage from that team.

A psychologist may also experience concerns about the competence or ethical practice of individual colleagues involved in joint working. These concerns may relate to the competence of the colleague to carry out a particular intervention, the appropriateness of an intervention for a particular client or problem, the nature of the relationship between a colleague and his or her client (e.g. potential abuses of power).

The psychologist should first approach the colleague in confidence, if it is appropriate, with relevant information, in a manner that is collegiate and helpful. If misgivings continue, the psychologist should consult with an appropriate colleague to share concerns and to seek advice. Where appropriate they should keep a written record of the meetings and steps taken to resolve any difficulties.

If they conclude that misconduct has occurred, psychologists should bring the matter to the attention of those charged with the responsibility to investigate such concerns, generally in the first instance an employer or in the case of an independent practitioner, the HCPC. Further information is available in ***Section 2.1: Working environment.***

8.4 Supporting a colleague when a complaint has been made

The receipt of a complaint or allegation can be distressing for all concerned, not least for the person who is the subject of the complaint or allegation. It is important that they receive advice and support from appropriate persons. Any potential conflicts of interest should be considered. It may be that a psychologist is not best placed to offer support and guidance as they may be called as a witness in the complaints process. Encourage colleagues to seek advice from an experienced colleague or supervisor where appropriate.

The psychologist should also be encouraged to seek the support of an accredited workplace trade-union representative who is skilled at supporting people in these situations and can access legal advice if necessary. Legal advice can also be obtained from the professional indemnity insurance broker, and sometimes from household insurance policies where the householder has taken out the legal advice additional option.

Complaints are an increasingly normal occurrence and must be handled in a professional manner. The complaint investigator or professional body will need the psychologist's version of events and any evidence before any conclusions are reached. Psychologists should support colleagues to respond promptly, objectively, factually and honestly to the complaint. The content of the complaint should always be held in confidence.

8.5 If the client remains unhappy

If any conflict or issue as referred to in this section cannot be resolved, it may be appropriate to advise a client or other individual that that they have a right to raise any concerns about a psychologist with the Health and Care Professions Council, further details of which can be found at www.hcpc-uk.org

Acknowledgements

These guidelines were updated by a working group of the Professional Practice Board of the British Psychological Society. The working group was constituted to include all of the member networks of the Society whose members engage in practice, including the HCPC registered practitioners. It included representatives of the Society's national branches in Scotland, Wales and Northern Ireland, in order to ensure applicability to the different national contexts. It also included representation from the expert working groups of the Society's Professional Practice Board and others on specialist topics of practice. Thanks are due to the members of the working group, and to the founder authors of the first and second editions of the guidelines whose work is the core and the foundation stone of the current edition.

Appendix 1 – Relevant legislation

Unless otherwise stated, Acts can be found on the government website http://www.legislation.gov.uk/

United Kingdom and England

Care Act 2014

An Act to make provision to reform the law relating to care and support for adults and the law relating to support for carers; to make provision about safeguarding adults from abuse or neglect; to make provision about care standards; to establish and make provision about Health Education England; to establish and make provision about the Health Research Authority; to make provision about integrating care and support with health services; and for connected purposes.

Care Standards Act 2000

An Act to establish a National Care Standards Commission; to make provision for the registration and regulation of children's homes, independent hospitals, independent clinics, care homes, residential family centres, independent medical agencies, domiciliary care agencies, fostering agencies, nurses agencies and voluntary adoption agencies; to make provision for the regulation and inspection of local authority fostering and adoption services; to make provision for the registration, regulation and training of those providing child minding or day care' to make provision for the protection of children and vulnerable adults; to amend the law about children looked after in schools and colleges.

Children Act 1989

An Act to reform the law relating to children; to provide for local authority services for children in need and others; to amend the law with respect to children's homes, community homes, voluntary homes and voluntary organisations; to make provision with respect to fostering, child minding and day care for young children and adoption; and for connected purposes.

Children and Families Act 2014

An Act to make provision about children, families, and people with special educational needs or disabilities; to make provision about the right to request flexible working; and for connected purposes.

Data Protection Act 1998

An Act to make new provision for the regulation of the processing of information relating to individuals, including the obtaining, holding, use or disclosure of such information. The Act states that anyone who processes personal information must comply with eight principles, which make sure that personal information is:

- fairly and lawfully processed;

- processed for limited purposes;
- adequate, relevant and not excessive;
- accurate and up to date;
- not kept for longer than is necessary;
- processed in line with your rights;
- secure; and
- not transferred to other countries without adequate protection.

Equality Act 2010

An Act to make provision to require Ministers of the Crown and others when making strategic decisions about the exercise of their functions to have regard to the desirability of reducing socio-economic inequalities; to reform and harmonise equality law and restate the greater part of the enactments relating to discrimination and harassment related to certain personal characteristics; to enable certain employers to be required to publish information about the differences in pay between male and female employees; to prohibit victimisation in certain circumstances; to require the exercise of certain functions to be with regard to the need to eliminate discrimination and other prohibited conduct; to enable duties to be imposed in relation to the exercise of public procurement functions; to increase equality of opportunity; to amend the law relating to rights and responsibilities in family relationships; and for connected purposes.

Health and Social Care Act 2012

An Act to establish and make provision about a National Health Service Commissioning Board and clinical commissioning groups and to make other provision about the National Health Service in England; to make provision about public health in the United Kingdom; to make provision about regulating health and adult social care services; to make provision about regulating health and social care workers; to make provision about public involvement in health and social care matters, scrutiny of health matters by local authorities and co-operation of health care services; to make other provision about information relating to health or social care to make other provision about health care; and for connected purposes.

Mental Capacity Act 2005

An Act to make new provision relating to persons who lack capacity; to establish a superior court of record called the Court of Protection in place of the office of the Supreme Court called by that name; to make provision in connection with the Convention on the International Protection of Adults signed at the Hague on 13th January 2000; and for connected purposes.

Mental Health Act 1983 as amended 2007

An Act to consolidate the law relating to mentally disordered persons. The main purpose of the Mental Health Act 1983 as amended 2007 (MHA) is to allow compulsory action to be taken, where necessary, to ensure that people with mental disorders receive the care and treatment they require for their own health or safety, or for the protection of other people.

Offender Rehabilitation Act 2014

An Act to make provision about the release, and supervision after release, of offenders; to make provision about the extension period for extended sentence prisoners; to make provision about community orders and suspended sentence orders; and for connected purposes.

Official Secrets Act 1989

An Act to replace section 2 of the Official Secrets Act 1911 by provisions protecting more limited classes of official information.

Regulation of Investigatory Powers Act (RIPA) 2000/Investigatory Powers Act 2016

An Act to make provision for and about the interception of communications, the acquisitions and disclosure of data relating to communications, the carrying out of surveillance, the use of human intelligence sources and acquisitions of the means by which electronic data protected by encryption or passwords may be decrypted or accessed; equipment interference, bulk personal datasets and other information; to make provision about the treatment of material held as a result of such interception, equipment interference or acquisition or retention; to establish the Investigatory Powers Commissioner and other Judicial Commissioners and make provision about them and other oversight arrangements; to make further provision about investigatory powers and national security; to amend sections 3 and 5 of the Intelligence Services Act 1994.

Safeguarding Vulnerable Groups Act 2006

An Act to make provision in connection with the protection of children and vulnerable adults. Safeguarding means protecting people's health, wellbeing and human rights, and enabling them to live free from harm, abuse and neglect.

Northern Ireland

Children Act 1989 – NI has a Criminal Justice Children's Order 1998

An Act to reform the law relating to children; to provide for local authority services for children in need and others; to amend the law with respect to children's homes, community homes, voluntary homes and voluntary organisations; to make provision with respect to fostering, child minding and day care for young children and adoption; and for connected purposes.

Criminal Justice (Northern Ireland) Act 2013

An Act to amend the law relating to sex offender notification, sexual offences prevention orders and human trafficking; to provide for the destruction, retention, use and other regulation of certain fingerprints and DNA samples and profiles; to provide for the release on license of persons detained under Article 45(2) of the Criminal Justice (Children) (Northern Ireland) Order 1998.

Criminal Justice (Northern Ireland) Order 2008 and Public Protection Arrangements in Northern Ireland (PPANI)

The Criminal Justice (NI) Order 2008 introduced a new sentencing framework, including extended and indeterminate sentences for public protection to reduce the risk of dangerous sexual and violent offenders being released into the community until the risk they pose is considered by the parole commissioners to be at a manageable level. The Public Protection Arrangements in Northern Ireland (PPANI) contained within the Criminal Justice (NI) Order 2008, place a duty on a number of agencies, within the criminal justice sector and elsewhere, to cooperate in the interest of better assessment and management of risk posed by serious sexual and violent offenders.

Justice Act (Northern Ireland) 2015

An Act to provide for a single jurisdiction for county courts and magistrates' courts; to amend the law on committal for trial; to provide for prosecutorial fines; to make provision in relation to victims and witnesses in criminal proceedings and investigations; to amend the law on criminal records and live links; to provide for violent offences prevention orders; to make other amendments relating to the administration of civil and criminal justice; and for connected purposes.

Mental Capacity Act (Northern Ireland) 2016

This Act fused mental health and mental capacity law into a single piece of legislation. The Act provides a framework for broader decision-making which includes: a statutory presumption of capacity, a requirement to support decision-making, mechanisms to allow individuals to plan for times that they do not have capacity, and safeguards to protect the rights of individuals when compulsory interventions or substitute decisions are required. It will remove the ability for someone to be treated for a mental health condition against his or her wishes if he or she retains the capacity to refuse such treatment, thus putting it on a par with the rights that individuals currently enjoy to make decisions regarding physical health treatment.

The Parole Commissioners' Rules (Northern Ireland) 2009

The Parole Commissioners for Northern Ireland are an independent body responsible for making decisions on the release and recall of prisoners sentenced to life, indeterminate custodial sentences, and extended custodial sentences, as well as the recall of prisoners serving determinate sentences.

The Sexual Offences (Northern Ireland) Order 2008

The Sexual Offences (Northern Ireland) Order 2008 lowered the age of sexual consent from 17 to 16 and incorporated significant changes to the law in relation to sexual offences in Northern Ireland; better protection for young people and people with a mental disorder from sexual abuse and exploitation; and sought to clarify issues surrounding consent in sexual assault cases and rape.

Scotland

Adoption and Children (Scotland) Act 2007

An Act of the Scottish Parliament to restate and amend the law relating to adoption; to make other provision in relation to the care of children; to enable provision to be made in relation to allowances in respect of certain children; and for connected purposes.

Adults with Incapacity (Scotland) Act 2000

An Act of the Scottish Parliament to make provision as to the property, financial affairs and personal welfare of adults who are incapable by reason of mental disorder or inability to communicate; and for connected purposes.

Adult Support and Protection (Scotland) Act 2007

An Act of the Scottish Parliament to make provision for the purposes of protecting adults from harm; to require the establishment of committees with functions relating to the safeguarding of adults who are at risk of harm; to amend the law relating to incapable adults; to allow the Public Guardian to intervene in court proceedings; to amend the law relating to mentally disordered persons; and for connected purposes

Children (Scotland) Act 1995

An Act to reform the law of Scotland relating to children, to the adoption of children and to young persons who as children have been looked after by a local authority; to make new provision as respects the relationship between parent and child and guardian and child in the law of Scotland; to make provision as respects residential establishments for children and certain other residential establishments; and for connected purposes.

Children and Young People (Scotland) Act 2014

An Act of the Scottish Parliament to make provision about the rights of children and young people; to make provision about investigations by the Commissioner for Children and Young People in Scotland; to make provision for and about the provision of services and support for or in relation to children and young people; to make provision for an adoption register; to make provision about children's hearings, detention in secure accommodation and consultation on certain proposals in relation to schools; and for connected purposes.

Mental Health (Scotland) Act 2015

An Act of the Scottish Parliament to amend the Mental Health (Care and Treatment) (Scotland) Act 2003 in various respects; to make provision about mental health disposals in criminal cases; to make provision as to the rights of victims of crime committed by mentally-disordered persons; and for connected purposes.

Mental Health (Care and Treatment) (Scotland) Act 2003

An Act of the Scottish Parliament to restate and amend the law relating to mentally disordered persons; and for connected purposes.

Protection from Abuse (Scotland) Act 2001

An Act of the Scottish Parliament to enable a power of arrest to be attached to interdicts

granted to protect individuals from abuse; to regulate the consequences of such attachment; and for connected purposes.

Protection of Children and Prevention of Sexual Offences (Scotland) Act 2005

An Act of the Scottish Parliament to make it an offence to meet a child following certain preliminary contact and to make other provision for the purposes of protecting children from harm of a sexual nature, including provision for implementing in part Council Framework Decision 2004/68/JHA; and to make further provision about the prevention of sexual offences.

Protection of Vulnerable Groups (Scotland) Act 2007

An Act of the Scottish Parliament to bar certain individuals from working with children or certain adults; to require the Scottish Ministers to keep lists of those individuals; to make further provision in relation to those lists; to establish a scheme under which information about individuals working or seeking to work with children or certain adults is collated and disclosed; to amend Part 5 of the Police Act 1997; to amend the meaning of school care accommodation service in the Regulation of Care (Scotland) Act 2001; and for connected purposes

Public Bodies (Joint Working) (Scotland) Act 2014

An Act of the Scottish Parliament to make provision in relation to the carrying out of functions of local authorities and Health Boards; to make further provision about certain functions of public bodies; to make further provision in relation to certain functions under the National Health Service (Scotland) Act 1978; and for connected purposes.

Regulation of Care (Scotland) Act 2001

An Act of the Scottish Parliament to establish the Scottish Commission for the Regulation of Care and the Scottish Social Services Council; to make provision for the registration and regulation of care services and for the registration, regulation and training of social service workers; to enable local authorities to provide and maintain residential accommodation in which nursing is provided; to make further provision as respects persons who have been looked after by local authorities; to amend the definition of 'place of safety' in the Children (Scotland) Act 1995.

Smoking, Health and Social Care (Scotland) Act 2005

To amend the Regulation of Care (Scotland) Act 2001 as respects what constitutes an independent health care service, the implementation of certain decisions by the Scottish Commission for the Regulation of Care or the Scottish Social Services Council, the provision of information to the Council and the minimum frequency of inspection of care services by the Commission to amend the Adults with Incapacity (Scotland) Act 2000 as respects authorisation of medical treatment; to amend the Public Health (Scotland) Act 1897 to introduce a right of appeal in certain cases under that Act; to enable the Scottish Ministers to form, participate in and provide assistance to companies for the purpose of providing facilities or services for persons exercising functions under the National Health Service (Scotland) Act 1978 or of making money available to the health service in Scotland

Social Care (Self-directed Support) (Scotland) Act 2013

An Act of the Scottish Parliament to enable local authorities to provide support to certain carers; to make provision about the way in which certain social care services are provided by local authorities; and for connected purposes.

Vulnerable Witnesses (Scotland) Act 2004

An Act of the Scottish Parliament to make provision for the use of special measures for the purpose of taking the evidence of children and other vulnerable witnesses in criminal or civil proceedings; to make provision about the admissibility of expert psychological or psychiatric evidence as to subsequent behaviour of the complainer in criminal proceedings in respect of certain offences to make provision about the admissibility of certain evidence bearing on the character, conduct or condition of witnesses in proceedings before a sheriff relating to the establishment of grounds of referral to children's hearings; to abolish the competence test for witnesses in criminal and civil proceedings; and for connected purposes.

Wales

The Mental Health (Wales) Measure 2010

This measure places new legal duties on local health boards and local authorities in Wales in relation to the assessment and treatment of mental health problems. The Measure became law in December 2010 and there are 4 parts to it which are as follows:

- Part 1 ensures that there are more mental health services are available within primary care.
- Part 2 makes sure all patients in secondary services have a Care and Treatment plan.
- Part 3 enables all adults discharged from secondary services to refer themselves back to those services.
- Part 4 supports every in-patient to have help from an independent mental health advocate if wanted.

Social Services and Well-being (Wales) Act 2014

An Act of the National Assembly for Wales to reform social services law; to make provision about improving the wellbeing outcomes for people who need care and support and carers who need support; to make provision about co-operation and partnership by public authorities with a view to improving the wellbeing of people; to make provision about complaints relating to social care and palliative care; and for connected purposes.

Violence against women, Domestic Abuse and Sexual Violence (Wales) Act 2015

An Act of the National Assembly for Wales to improve arrangements for the prevention of gender-based violence, domestic abuse and sexual violence; to improve arrangements for the protection of victims of such abuse and violence; to improve support for people affected by such abuse and violence; and to require the appointment of a National Adviser on gender-based violence, domestic abuse and sexual violence.

Well-being of Future Generations (Wales) Act 2015

An Act of the National Assembly for Wales to make provision requiring public bodies to do things in pursuit of the economic, social, environmental and cultural wellbeing of Wales in

a way that accords with the sustainable development principle; to require public bodies to report on such action; to establish a Commissioner for Future Generations to advise and assist public bodies in doing things in accordance with this Act; to establish public services boards in local authority areas; to make provision requiring those boards to plan and take action in pursuit of economic, social, environmental and cultural wellbeing in their area; and for connected purposes.

Appendix 2 – Websites and further information

British Psychological Society – www.bps.org.uk

The Society website has guidance, advice and further information on many topics not covered in these guidelines as well as those mentioned.

Psychologists working in clinical fields will also need to take account of Clinical Guidelines produced by NICE in England and Wales https://www.nice.org.uk/ or SIGN in Scotland http://www.sign.ac.uk/

1.1 Legal and professional obligations of psychologists

HCPC – http://hcpc-uk.org
The Health and Care Professions Council website has lots of information about professional registration including the standards of proficiency for the seven protected titles and information about indemnity insurance

Information Commissioner's Office – https://ico.org.uk/
The ICO website contains lots of useful information for organisations, private practitioners and the public regarding the rights and responsibilities under the data protection and Freedom of Information Acts.

DBS Checks – https://www.gov.uk/disclosure-barring-service-check
The government website provides helpful information for employers regarding these checks.

1.2 Continuing professional development

The HCPC has provided guidance regarding CPD for registrants. http://www.hcpc-uk.org/cpd

2.1 Working environment

Lone Working

Suzy Lamplugh Trust – http://www.suzylamplugh.org/

The Suzy Lamplugh Trust campaigns for personal safety and has lots of advice for people working alone to help to keep safe. They have some good advices and resources available.

Harassment and Bullying

ACAS – http://www.acas.org.uk/
The Advisory, Conciliation and Arbitration Service (ACAS) is a statutory organisation providing help and advice for employers and employees. They have produced guidance on several topics including harassment and bullying aimed separately at employers and employees.

Whistleblowing

Whistleblowing for employees – https://www.gov.uk/whistleblowing

The government has produced some guidance for employees surrounding whistleblowing including what to do and what to expect.

2.2 Working in the digital age

Health Insurance Portability and Accountability Act of 1996 (HIPAA) – http://www.hhs.gov/hipaa/

This American act makes provisions for health information privacy. The government website provides information for professionals regarding this act.

N.B This Act is ONLY law for practice in America.

Social Media

The HCPC has provided guidance regarding the use of social media by professional psychologists.

http://www.hcpc-uk.org/Assets/documents/100035B7Social_media_guidance.pdf

3. Safeguarding

Statutory guidance Working together to safeguard children – https://www.gov.uk/government/publications/working-together-to-safeguard-children–2
Statutory guidance on inter-agency working to safeguard and promote the welfare of children.

Getting it Right for Every Child (GIRFEC) and the Early Years Framework – http://www.maternal-and-early-years.org.uk/getting-it-right-for-every-child-principles-and-values
This is an NHS Scotland approach which establishes the principle of giving all children and young people the best possible start in life as a priority for all services.

UK Government Guidance – https://www.gov.uk/government/publications/no-secrets-guidance-on-protecting-vulnerable-adults-in-care
No Secrets sets out a code of practice for the protection of vulnerable adults.

It explains how commissioners and providers of health and social care services should work together to produce and implement local policies and procedures. They should collaborate with the public, voluntary and private sectors and they should also consult clients, their carers and representative groups. Local authority social services departments should co-ordinate the development of policies and procedures.

Protection of vulnerable adults scheme (POVA) – http://www.scie.org.uk/publications/guides/guide03/law/adults.asp
Individuals should be referred to, and included on, the POVA list if they have abused, neglected or otherwise harmed vulnerable adults in their care or placed vulnerable adults

in their care at risk of harm. By making statutory checks against the list, providers of care must ensure they do not offer such individuals employment in care positions. POVA checks are requested as part of disclosures from the Criminal Records Bureau.

Prevention and Protection in Partnership 2015 – https://www.health-ni.gov.uk/sites/default/files/publications/dhssps/adult-safeguarding-policy.pdf

This policy from Northern Ireland is for all organisations working with, or providing services to, adults across the statutory, voluntary, community, independent and faith sectors. It sets clear and proportionate safeguarding expectations across the range of organisations.

Modern Slavery and the national referral mechanism (NRM) – https://www.gov.uk/government/collections/modern-slavery
These pages provide details about the government's work to end modern slavery, including details about how to refer victims into the NRM.

Let's talk about it – http://www.ltai.info/about/
Let's Talk About It is an initiative designed to provide practical help and guidance to the public in order to stop people becoming terrorists or supporting terrorism.

4. Managing data and confidentiality

Information Commissioners Office – https://ico.org.uk/
The Information Commissioners Office produces guidance with regards to data sharing and the Data protection and Freedom of information Acts.

HCPC guidance on confidentiality – http://www.hcpc-uk.co.uk/assets/documents/100023F1GuidanceonconfidentialityFINAL.pdf
The HCPC has provided guidance on confidentiality for registrants.

NHS – https://digital.nhs.uk/article/402/Information-Governance
The NHS has produced guidance regarding Information Governance and security for NHS and partner organisations. The NHS has codes of practice for Records management and Confidentiality.

Caldicott Report – https://www.gov.uk/government/publications/the-information-governance-review
A review was commissioned in 1997 by the Chief Medical Officer of England owing to increasing concern about the ways in which patient information is being used in the NHS in England and Wales and the need to ensure that confidentiality is not undermined. Such concern was largely due to the development of information technology in the service, and its capacity to disseminate information about patients rapidly and extensively. A committee was established under the chairmanship of Dame Fiona Caldicott. The Caldicott Report highlighted six key principles, and made 16 specific recommendations. In 2012 Dame Caldicott produced a follow up report which made 26 further recommendations including the addition of a seventh principle.

Psychological Testing Centre – http://ptc.bps.org.uk/ptc/guidelines-and-information

The PTC website contains lots of guidance about psychometric testing and the management of data generated from those tests.

5. Transparency and duty of candour

Care Quality Commission – http://www.cqc.org.uk/sites/default/files/20150327_duty_of_candour_guidance_final.pdf
The CQC has produced Information for all providers: NHS bodies, adult social care, primary medical and dental care, and independent healthcare with regards to duty of candour.

Appendix 3 – How this document has been developed

In developing these guidelines, the overall aim and scope of the guidelines was considered at length, and the decision arrived at that they should be applicable to all psychologists irrespective of registration status or practice context. The guidelines have therefore been written in a way which it is hoped is inclusive of the various contexts of practice. Drawing on a broad stakeholder group for the development work, the guidelines aim to cover all the important considerations for practice. It is however recognised they cannot cover every circumstance and also that new issues arise which will require careful consideration by the individual psychologist.

The Practice Guidelines development Working Group was constituted to include all of the member networks of the Society whose members engage in practice, including the HCPC registered practitioners. It included representatives of the Society's national branches in Scotland, Wales and Northern Ireland, in order to ensure applicability to the different national contexts. It also included representation from the expert working groups of the Society's Professional Practice Board and others on specialist topics of practice.

The content of the guidelines has been developed from a combination of revision of the previous edition in the light of professional consensus on current expectations of a good standard of practice of psychology; inclusion of key points from other Society guidance on specific topics with reference to further guidance; and in some cases development of new material drawing on the professional experience of our members or outside professionals in the field. The working group has not used systematic methods to search for or assess the evidence for the material included. Recommendations have been included based on working group consensus. Where there are known areas of professional difference of opinion this has been stated.

A draft of the guidelines was circulated for Society wide consultation and one month allowed for comment. This included circulation to Experts by Experience (psychology service user representatives) with whom the Society works in various contexts. The Guidelines were also sent for comment to the Health and Care Professions Council as the statutory regulator for practitioner psychologists. Comments received were considered carefully by the Working Group and changes made to the text of the guidelines where considered necessary. The annotated audit sheet of the comments received and disposal was provided to a meeting of the Society's Professional Practice Board to assist its consideration of the draft guidelines, by way of final peer scrutiny. The guidelines were reviewed by the Society's legal advisers prior to publication. Final approval of the guidelines was given by the Society's Board of Trustees.

The guidelines will be reviewed and updated in accordance with Society policy after five years or sooner if circumstances indicate this is needed.

To ensure clarity and presentation in a user friendly format, the Guidelines have been edited by professional staff within the Society and the format designed by the Society's Preparation for Print specialists. Where considered helpful, links have been made to

additional web based resources, both to assist practitioner development and to provide up to date information in areas where there is frequent change. Organisational providers of psychological services are encouraged to review how these guidelines are used in practice and feed back to the Society any barriers to application.

In ensuring an appropriate level of independence in the production of these Guidelines, the Society has ensured its conflict of interest policy has been complied with and that no member of the working group's input has been compromised by a conflict of interest. No member has received any form of remuneration other than reimbursement of travel and subsistence expenses in accordance with Society policy. The large size of the working group and peer scrutiny and challenge, as well as the robust consultation process, guards against the potential for any one member or small group of members inappropriately to bias the Guidelines.

INF115/08.17

Principles of recovery oriented mental health practice

From the perspective of the individual with mental illness, recovery means gaining and retaining hope, understanding of ones abilities and disabilities, engagement in an active life, personal autonomy, social identity, meaning and purpose in life, and a positive sense of self.

> *It is important to remember that recovery is not synonymous with cure. Recovery refers to both internal conditions experienced by persons who describe themselves as being in recovery—hope, healing, empowerment and connection—and external conditions that facilitate recovery—implementation of human rights, a positive culture of healing, and recovery-oriented services. (Jacobson and Greenley, 2001 p. 482)*

The purpose of principles of recovery oriented mental health practice is to ensure that mental health services are being delivered in a way that supports the recovery of mental health consumers.

1. UNIQUENESS OF THE INDIVIDUAL

Recovery oriented mental health practice:

- recognises that recovery is not necessarily about cure but is about having opportunities for choices and living a meaningful, satisfying and purposeful life, and being a valued member of the community
- accepts that recovery outcomes are personal and unique for each individual and go beyond an exclusive health focus to include an emphasis on social inclusion and quality of life
- empowers individuals so they recognise that they are at the centre of the care they receive.

2. REAL CHOICES

Recovery oriented mental health practice:

- supports and empowers individuals to make their own choices about how they want to lead their lives and acknowledges choices need to be meaningful and creatively explored
- supports individuals to build on their strengths and take as much responsibility for their lives as they can at any given time
- ensures that there is a balance between duty of care and support for individuals to take positive risks and make the most of new opportunities.

3. ATTITUDES AND RIGHTS

Recovery oriented mental health practice:

- involves listening to, learning from and acting upon communications from the individual and their carers about what is important to each individual
- promotes and protects individual's legal, citizenship and human rights
- supports individuals to maintain and develop social, recreational, occupational and vocational activities which are meaningful to the individual
- instils hope in an individual's future and ability to live a meaningful life.

4. DIGNITY AND RESPECT

Recovery oriented mental health practice:

- consists of being courteous, respectful and honest in all interactions
- involves sensitivity and respect for each individual, particularly for their values, beliefs and culture
- challenges discrimination and stigma wherever it exists within our own services or the broader community.

5. PARTNERSHIP AND COMMUNICATION

Recovery oriented mental health practice:

- acknowledges each individual is an expert on their own life and that recovery involves working in partnership with individuals and their carers to provide support in a way that makes sense to them
- values the importance of sharing relevant information and the need to communicate clearly to enable effective engagement
- involves working in positive and realistic ways with individuals and their carers to help them realise their own hopes, goals and aspirations.

6. EVALUATING RECOVERY

Recovery oriented mental health practice:

- ensures and enables continuous evaluation of recovery based practice at several levels
- individuals and their carers can track their own progress
- services demonstrate that they use the individual's experiences of care to inform quality improvement activities
- the mental health system reports on key outcomes that indicate recovery including (but not limited to) housing, employment, education and social and family relationships as well as health and well being measures.

These Recovery Principles have been adapted from the Hertfordshire Partnership NHS Foundation Trust Recovery Principles in the UK.

SPECIAL ARTICLE

How important are the common factors in psychotherapy? An update

Bruce E. Wampold

Department of Counseling Psychology, University of Wisconsin, Madison, WI, USA; Modum Bad Psychiatric Center, Vikersund, Norway

The common factors have a long history in the field of psychotherapy theory, research and practice. To understand the evidence supporting them as important therapeutic elements, the contextual model of psychotherapy is outlined. Then the evidence, primarily from meta-analyses, is presented for particular common factors, including alliance, empathy, expectations, cultural adaptation, and therapist differences. Then the evidence for four factors related to specificity, including treatment differences, specific ingredients, adherence, and competence, is presented. The evidence supports the conclusion that the common factors are important for producing the benefits of psychotherapy.

Key words: Common factors, contextual model, psychotherapy, alliance, empathy, expectations, cultural adaptation, therapist differences, specific ingredients

(World Psychiatry 2015;14:270–277)

The so-called common factors have a long history in psychiatry, originating with a seminal article by S. Rosenzweig in 1936 (1) and popularized by J. Frank in the various editions of his book *Persuasion and Healing* (2-4). During this period, the common factors have been both embraced and dismissed, creating some tension (5-9). The purpose of this paper is not to review or discuss the debate, but to provide an update, summarizing the evidence related to these factors.

To understand the evidence for the common factors, it is important to keep in mind that these factors are more than a set of therapeutic elements that are common to all or most psychotherapies. They collectively shape a theoretical model about the mechanisms of change in psychotherapy.

A particular common factor model, called the contextual model, has been recently proposed (8,10). Although there are other common factor models (e.g., 4,11), based on different theoretical propositions, the predictions made about the importance of various common factors are similar and the choice of the model does not affect conclusions about the impact of these factors. The contextual model is presented below, followed by a review of the evidence for the common factors imbedded in the model.

THE CONTEXTUAL MODEL

The contextual model posits that there are three pathways through which psychotherapy produces benefits. That is, psychotherapy does not have a unitary influence on patients, but rather works through various mechanisms. The mechanisms underlying the three pathways entail evolved characteristics of humans as the ultimate social species; as such, psychotherapy is a special case of a social healing practice.

Thus, the contextual model provides an alternative explanation for the benefits of psychotherapy to ones that emphasize specific ingredients that are purportedly beneficial for particular disorders due to remediation of an identifiable deficit (8).

The three pathways of the contextual model involve: a) the real relationship, b) the creation of expectations through explanation of disorder and the treatment involved, and c) the enactment of health promoting actions. Before these pathways can be activated, an initial therapeutic relationship must be established.

Initial therapeutic relationship

Before the work of therapy can begin, an initial bond between therapist and patient needs to be created. E. Bordin stated in 1979 that "some basic level of trust surely marks all varieties of therapeutic relationships, but when attention is directed toward the more protected recesses of inner experience, deeper bonds of trust and attachment are required and developed" (12, p. 254). The initial meeting of patient and therapist is essentially the meeting of two strangers, with the patient making a determination of whether the therapist is trustworthy, has the necessary expertise, and will take the time and effort to understand both the problem and the context in which the patient and the problem are situated.

The formation of the initial bond is a combination of bottom-up and top-down processing. Humans make very rapid determination (within 100 ms), based on viewing the face of another human, of whether the other person is trustworthy or not (13), suggesting that patients make very rapid judgments about whether they can trust their therapist. More than likely, patients make rapid judgments about the dress of the therapist, the arrangement and decorations of the room (e.g., diplomas on the wall), and other features of the therapeutic setting (14). However, patients come to therapy with expectations about the nature of psychotherapy as

well, due to prior experiences, recommendations of intimate or influential others, cultural beliefs, and so forth. The initial interaction between patient and therapist is critical, it seems, because more patients prematurely terminate from therapy after the first session than at any other point (15).

Pathway 1: The real relationship

The real relationship, defined psychodynamically, is "the personal relationship between therapist and patient marked by the extent to which each is genuine with the other and perceives/experiences the other in ways that befit the other" (16, p. 119). Although the psychotherapeutic relationship is influenced by general social processes, it is an unusual social relationship in that: a) the interaction is confidential, with some statutory limits (e.g., child abuse reporting), and b) disclosure of difficult material (e.g., of infidelity to a spouse, of shameful affect, and so forth) does not disrupt the social bond. Indeed, in psychotherapy, the patient is able to talk about difficult material without the threat that the therapist will terminate the relationship.

The importance of human connection has been discussed for decades, whether is it called attachment (17), belongingness (18), social support (19), or the lack of loneliness (20,21). In fact, perceived loneliness is a significant risk factor for mortality, equal to or exceeding smoking, obesity, not exercising (for those with chronic cardiac disease or for healthy individuals), environmental pollution, or excessive drinking (22-24). Psychotherapy provides the patient a human connection with an empathic and caring individual, which should be health promoting, especially for patients who have impoverished or chaotic social relations.

Pathway 2: Expectations

Research in a number of areas documents that expectations have a strong influence on experience (25). Indeed, the purported price of a bottle of wine influences rating of pleasantness as well as neural representations (26). The burgeoning research on the effects of placebos documents the importance of expectations, as placebos have robustly shown to alter reported experience as well as demonstrating physiological and neural mechanisms (27,28).

Expectations in psychotherapy work in several possible ways. Frank (4) discussed how patients present to psychotherapy demoralized not only because of their distress, but also because they have attempted many times and in many ways to overcome their problems, always unsuccessfully. Participating in psychotherapy appears to be a form of remoralization.

However, therapy has more specific effects on expectations than simple remoralization. According to the contextual model, patients come to therapy with an explanation for their distress, formed from their own psychological beliefs, which is sometimes called "folk psychology" (29-31). These beliefs, which are influenced by cultural conceptualizations of mental disorder but also are idiosyncratic, are typically not adaptive, in the sense that they do not allow for solutions. Psychotherapy provides an explanation for the patient's difficulties that is adaptive, in the sense that it provides a means to overcome or cope with the difficulties. The patient comes to believe that participating in and successfully completing the tasks of therapy, whatever they may be, will be helpful in coping with his or her problems, which then furthers for the patient the expectation that he or she has ability to enact what is needed. The belief that one can do what is necessary to solve his or her problem has been discussed in various ways, including discussions of mastery (4,32), self-efficacy (33), or response expectancies (25).

Critical to the expectation pathway is that patients believe that the explanation provided and the concomitant treatment actions will be remedial for their problems. Consequently, the patient and therapist will need to be in agreement about the goals of therapy as well as the tasks, which are two critical components of the therapeutic alliance (34,35). Hatcher and Barends described the alliance as "the degree to which the therapy dyad is engaged in collaborative, purposive work" (36, p. 293). Creating expectations in psychotherapy depends on a cogent theoretical explanation, which is provided to the patient and which is accepted by the patient, as well as on therapeutic activities that are consistent with the explanation, and that the patient believes will lead to control over his or her problems. A strong alliance indicates that the patient accepts the treatment and is working together with the therapist, creating confidence in the patient that the treatment will be successful.

Pathway 3: Specific ingredients

The contextual model stipulates that there exists a treatment, particularly one that the patient finds acceptable and that he or she thinks will be remedial for his or her problems, creating the necessary expectations that the patient will experience less distress. Every treatment that meets the conditions of the contextual model will have specific ingredients, that is, each cogent treatment contains certain well-specified therapeutic actions.

The question is how the specific ingredients work to produce the benefits of psychotherapy. Advocates of specific treatments argue that these ingredients are needed to remediate a particular psychological deficit. The contextual model posits that the specific ingredients not only create expectations (pathway 2), but universally produce some salubrious actions. That is, the therapist induces the patient to enact some healthy actions, whether that may be thinking about the world in less maladaptive ways and relying less on dysfunctional schemas (cognitive-behavioral treatments), improving interpersonal relations (interpersonal psychotherapy and some dynamic therapies), being more accepting

of one's self (self-compassion therapies, acceptance and commitment therapy), expressing difficult emotions (emotion-focused and dynamic therapies), taking the perspective of others (mentalization therapies), and so forth. The effect of lifestyle variables on mental health has been understated (37). A strong alliance is necessary for the third pathway as well as the second, as without a strong collaborative work, particularly agreement about the tasks of therapy, the patient will not likely enact the healthy actions.

According to the contextual model, if the treatment elicits healthy patient actions, it will be effective, whereas proponents of specific ingredients as remedial for psychological deficits predict that some treatments – those with the most potent specific ingredients – will be more effective than others (8).

EVIDENCE FOR VARIOUS COMMON FACTORS

Now that the contextual model has been briefly presented, attention is turned toward an update of the evidence for the common factors. Each factor reviewed is imbedded in the contextual model, although each of them is more generically considered atheoretically as an important one. As will be apparent, many of the common factors are not theoretically or empirically distinct.

To present the evidence succinctly and with as little bias and error as possible, we rely on meta-analyses of primary studies. Studies that examine the association of levels of a common factor and outcome are typically reported by some type of correlation statistic (such as Pearson's product-moment correlation), whereas studies that experimentally manipulate and compare conditions typically report some standardized mean difference (such as Cohen's d). For comparison purposes, correlational statistics are converted to Cohen's d. All meta-analyses reported aggregate statistics, corrected for bias, based on the effects of individual studies appropriated weighted. To understand the importance of effects, Cohen (38) classified a d of 0.2 as small, 0.5 as medium, and 0.8 as large. The evidence is summarized in Figure 1, where the effects of various common factors are compared to those of various specific factors.

Alliance

The alliance is composed of three components: the bond, the agreement about the goals of therapy, and the agreement about the tasks of therapy (12). As discussed above, alliance is a critical common factor, instrumental in both pathway 2 and pathway 3.

Alliance is the most researched common factor. Typically the alliance is measured early in therapy (at session 3 or 4) and correlated with final outcome. The most recent meta-analysis of the alliance included nearly 200 studies involving over 14,000 patients and found that the aggregate correlation between alliance and outcome was about .27, which is equivalent to a Cohen's d of 0.57 (39), surpassing the threshold for a medium sized effect.

There have been a number of criticisms of the conclusion that alliance is an important factor in psychotherapy (40), most of which have focused on the correlational nature of alliance research. However, each of the criticisms has been considered and has been found not to attenuate the importance of the alliance (see 8).

First, it could well be that early symptom relief causes a strong alliance at the third or fourth session – that is, early responders report better alliances and have better outcomes. To address this threat, early therapy progress must be statistically controlled or longitudinal research is needed to examine the association of alliance and symptoms over the course of therapy. The studies that have examined this question have found evidence to support either interpretation, but the better designed and more sophisticated studies are converging on the conclusion that the alliance predicts future change in symptoms after controlling for already occurring change.

Second, it could be that the correlation between alliance and outcome is due to the patients' contributions to the alliance. According to this line of thinking, some patients may come to therapy well prepared to form a strong alliance and it is these patients who also have a better prognosis, so the alliance-outcome association is due to the characteristics of the patients rather than to something that therapists provide to the patients. Disentangling the patient and therapist contributions involves the use of multilevel modeling. Recently, Baldwin et al (41) performed such an analysis and found that it was the therapist contribution which was important: more effective therapists were able to form a strong alliance across a range of patients. Patients' contribution did not predict outcome: patients who are able to form better alliances, perhaps because they have secure attachment histories, do not have better prognoses. Indeed, patients with poor attachment histories and chaotic interpersonal relationships may well benefit from a therapist who is able to form alliances with difficult patients. These results have been corroborated by meta-analyses (42).

Third, there may be a halo effect if the patient rates both the alliance and the outcome. However, meta-analyses have shown that the alliance-outcome association is robust even when alliance and outcome are rated by different people. It also appears that the alliance is equally strong for cognitive-behavioral therapies as it is for experiential or dynamic treatments, whether a manual is used to guide treatment or not, and whether the outcomes are targeted symptoms or more global measures.

There are other threats to validity of the alliance as a potent therapeutic factor, but the evidence for each of them is nonexistent or weak (8). The research evidence, by and large, supports the importance of the alliance as an important aspect of psychotherapy, as predicted by the contextual model.

As mentioned above, distinctions between certain common factors are difficult to make. A distinction has been

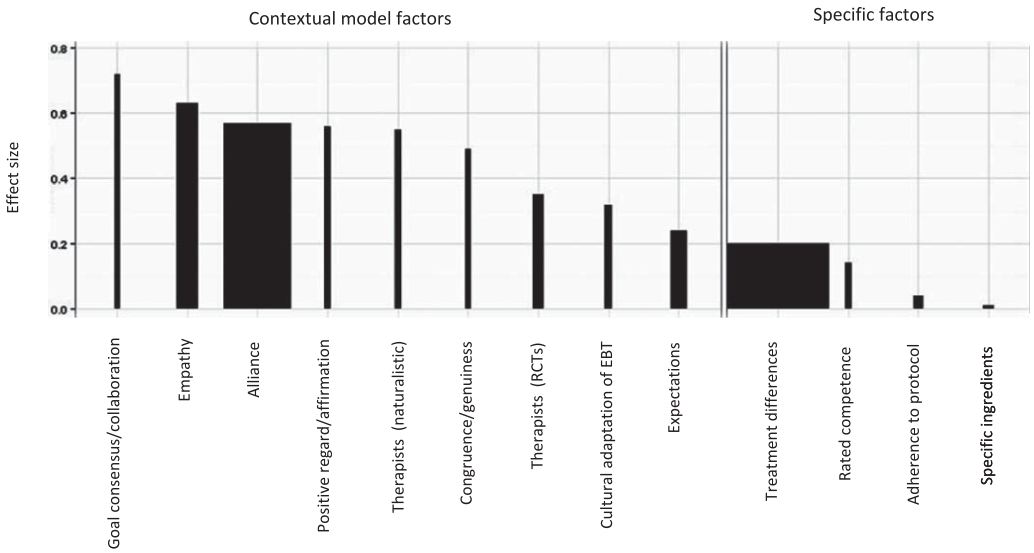

Figure 1 Effect sizes for common factors of the contextual model and specific factors. Width of bars is proportional to number of studies on which effect is based. RCTs – randomized controlled trials, EBT – evidence-based treatments

made between the bond, as defined as a component of the alliance, which is related to purposeful work, and the real relationship, which is focused on the transference-free genuine relationship (8,16). There is some evidence that the real relationship is related to outcome, after controlling for the alliance (16), and, although the evidence is not strong, it does support the first pathway of the contextual model.

A second construct related for the alliance is labeled goal consensus/collaboration. Although related to agreement about the goals and tasks for therapy, goal consensus/collaboration is measured with different instruments. As shown in Figure 1, the effect for goal consensus and collaboration is strong (d=0.72), based on a meta-analysis of 15 studies (43).

Empathy and related constructs

Empathy, a complex process by which an individual can be affected by and share the emotional state of another, assess the reasons for another's state, and identify with the other by adopting his or her perspective, is thought to be necessary for the cooperation, goal sharing, and regulation of social interaction. Such capacities are critical to infant and child rearing, as children, who are unable to care for themselves, signal to the caregiver that care is needed, a process that is then put to use to manage social relations among communities of adult individuals. Therapist expressed empathy is a primary common factor, critical to pathway 1 of the contextual model, but which also augments the effect of expectations.

The power of the empathy in healing was beautifully revealed in a study of placebo acupuncture for patients with irritable bowel syndrome (44). Patients with this syndrome were randomly assigned to a limited interaction condition, an augmented relationship condition, or treatment as usual (waiting list for acupuncture). In the limited interaction condition, the acupuncturist met with the patient briefly, but was not allowed to converse with him or her, and administered the sham acupuncture (a device that gives the sensation of having needles pierce the skin, but they do not). In the augmented relationship condition, the practitioner conversed with the patient about the symptoms, the relevance of lifestyle and relationships to irritable bowel syndrome, as well as the patient's understanding of the cause and meaning of her disorder. All this was done in a warm and friendly manner, using active listening, appropriate silences for reflection, and a communication of confidence and positive expectation. For the four dependent variables (global improvement, adequate relief, symptom severity, and quality of life), the two sham acupuncture conditions were superior to treatment as usual. However, the augmented relationship condition was superior to the limited interaction condition, particularly for quality of life.

The above study is noteworthy because it was an experimental demonstration of the importance of a warm, caring, empathic interaction within a healing setting. Unfortunately, experimental manipulation of empathy in psychotherapy studies is not possible, for design and ethical reasons. Nonetheless, there have been numerous studies (n=59) that have correlated ratings of therapist empathy with outcome, which have been meta-analytically summarized (45), resulting in a relatively large effect (d=0.63; see Figure 1). Constructs related to empathy have also been meta-analyzed and found to be related to outcome, including positive regard/affirmation (d=0.56, n=18; see Figure 1) (46) and congruence/genuineness (d=0.49, n=18; see Figure 1) (47).

It should be recognized that several of the threats to validity for the alliance are also present with regard to empathy. For example, it is clearly easier for a therapist to be warm and

caring toward a motivated, disclosing and cooperative patient than to one who is interpersonally aggressive, and the former types of patients will most likely have better outcomes than the latter, making the empathy/outcome correlation an artifact of patient characteristics rather than therapist action. Unfortunately, studies such as the ones conducted to rule out these threats to validity for the alliance have not been conducted for empathy and related constructs.

Expectations

Examining the role of expectations in psychotherapy is difficult. In medicine, expectations can be induced verbally and then physicochemical agents or procedures can be administered or not, making the two components (creation of expectations and the treatment) independent. In psychotherapy, creating the expectations, through explanation of the patient's disorder, presenting the rationale for the treatment, and participating in the therapeutic actions, is part of therapy. It is difficult to design experimental studies of expectations in psychotherapy (not impossible, but not yet accomplished in any important manner).

The typical way to assess the effect of expectations in psychotherapy is to correlate patient ratings of their expectations with outcomes, but we have seen that such correlational studies produce threats to validity. Furthermore, in many studies, expectations are measured *prior* to when the rationale for the treatment is provided to the patient, when it is the explanation given to the patient that is supposed to create the expectations. Assessing expectations after the explanation has been given (i.e., during the course of treatment) is also problematic, as those patients who have made significant progress in therapy will naturally respond that they think therapy will be helpful.

Despite the difficulties with investigating expectations in psychotherapy, this is a topic of much interest (48-50). Recently, a meta-analysis of expectations showed that there was a relatively small, but statistically significant, relationship between rated expectations and outcome ($d=0.24$, $n=46$; see Figure 1) (49). The best evidence for expectations in the context of healing is derived from studies of the placebo effect, where exquisite care has been taken to experimentally manipulate variables of interest and to control for threats to validity, by using physiological and neurological variables as well as subjective reports. A summary of this literature is beyond the scope of this article, but many excellent reviews are available (8,27,28).

Cultural adaptation of evidence-based treatments

The contextual model emphasizes that the explanation given for the patient's distress and the therapy actions must be acceptable to the patient. Acceptance is partly a function of consistency of the treatment with the patient's beliefs, particularly beliefs about the nature of mental illness and how to cope with the effects of the illness. This suggests that evidence-based treatments that are culturally adapted will be more effective for members of the cultural group for which the adapted treatment is designed. There are many ways to adapt treatments, including those involving language, cultural congruence of therapist and patient, cultural rituals, and explanations adapted to the "myth" of the group.

A recent meta-analysis demonstrated that adapting evidence-based treatments by using an explanation congruent with the cultural group's beliefs (i.e., using the cultural "myth" as the explanation) was more effective than unadapted evidence-based treatments, although the effect was modest ($d=0.32$, $n=21$; see Figure 1) (51).

Therapist effects

Therapist effects are said to exist if some therapists consistently achieve better outcomes with their patients than other therapists, regardless of the nature of the patients or the treatment delivered. Therapist effects have been studied in clinical trials and in naturalistic settings. In both designs, the measure of therapist effects is an intraclass correlation coefficient. Technically, this coefficient indexes the degree to which two patients from the same therapist have similar outcomes relative to two patients from two different therapists. To compare therapist effects to other common factors, the intraclass correlation coefficient is converted to Cohen's d.

The contextual model predicts that there will be differences among therapists *within* a treatment. That is, even though the therapists are delivering the same specific ingredients, some therapists will do so more skillfully and therefore achieve better outcomes than other therapists delivering the same treatment. Evidence for this conjecture is found in clinical trials. A meta-analysis of therapist effects in clinical trials found modest therapist effects ($d=0.35$, $n=29$; see Figure 1) (52). Keep in mind that the therapists in clinical trials generally are included because of their competence and then they are given extra training, supervised, and monitored. Moreover, the patients in such trials are homogeneous, as they have a designated diagnosis and are selected based on various inclusionary/exclusionary criteria. In such designs, patients are randomly assigned to therapists. Consequently, consistent differences among therapists in such trials, although modest, are instructive.

Not surprisingly, therapist effects in naturalistic settings are greater than in clinical trials. In the former settings, therapists are more heterogeneous, patients may not be randomly assigned to therapists, patients are heterogeneous, and so forth. A meta-analysis of therapist effects in such settings found a relatively large effect ($d=0.55$, $n=17$; see Figure 1) (52).

The finding of robust therapist effects raises the question about what are the characteristics or actions of more effective therapists. Recent research has begun to address this

question. Studies have shown that effective therapists (vis-à-vis less effective therapists) are able to form stronger alliances across a range of patients, have a greater level of facilitative interpersonal skills, express more professional self-doubt, and engage in more time outside of the actual therapy practicing various therapy skills (8).

SPECIFIC EFFECTS

Evidence for the common factors is also collected by examining the evidence for specific aspects of psychotherapy. The contextual model makes several predictions about specific effects, which will be discussed as each specific effect is considered.

Treatment differences

When pathway 3 of the contextual model was discussed earlier, it was emphasized that the model contends that all therapies with structure, given by empathic and caring therapists, and which facilitate the patient's engagement in behaviors that are salubrious, will have approximately equal effects. That is, the specific ingredients, discussed in pathway 3, are not critical because they remediate some psychological deficit.

The question of whether some treatments are superior to others has long been debated, with origins at the very beginning of the practice of psychotherapy (think about the disagreements amongst Freud, Adler and Jung, for example). Today, there are claims that some treatments, in general or for specific disorders, are more effective than others. Others, however, claim that there are no differences among psychotherapies, in terms of their outcomes.

The literature addressing this issue is immense and summarizing the results of relative efficacy is not possible. Nevertheless, the various meta-analyses for psychotherapies in general or for specific disorders, if they do find differences among various types of treatment, typically find at most differences of approximately d=0.20, the value shown in Figure 1.

Specific effects from dismantling studies

To many, the dismantling design is the most valid way to identify the effects of specific ingredients. In this design, a specific ingredient is removed from a treatment to determine how much more effective the treatment is in total compared to the treatment without the ingredient that is purportedly remedial for the psychological deficit.

Two meta-analyses have examined dismantling designs and both found minimal differences between the total treatment and the treatment without one or more critical ingredients (d=0.01, n=30, see Figure 1) (53,54). The most recent of these meta-analyses did find that adding an ingredient to an existing treatment increased the effect for targeted variables by a small amount (d=0.28) (53).

Adherence and competence

In clinical trials, it is required that adherence to the protocol and the competence at delivering the treatment are rated. This makes sense: if the goal is to make inferences about a particular treatment, then it is necessary to ensure that the treatment was delivered with the necessary components and not with extraneous components (i.e., with *adherence* to the protocol) and that the treatment components were delivered skillfully (i.e., given *competently*).

It would seem logical theoretically that adherence to the protocol and competence would be related to outcome. That is, for cases where the therapist followed the protocol and did so skillfully, there should be better outcomes. However, this is not the case. In a meta-analysis of adherence and competence (55), effects were small (d=0.04, n=28 for adherence; d=0.14, n=18 for competence; see Figure 1).

The results for adherence and competence demand further explanation. If the specific ingredients of a treatment are critical, then adherence should make a difference – actually delivering those ingredients should be related to outcome. There is evidence that rigid adherence to a protocol can attenuate the alliance and increase resistance to the treatment (i.e., failing to accept the treatment, a contextual model tenet) (8), and that flexibility in adherence is related to better outcomes (56), results consistent with prediction of the contextual model.

The findings for competence are a bit more difficult to understand. Competence in these trials typically is rated by experts in the treatment being given, based on watching therapy sessions. Why can't experts differentiate between "good" therapy and "bad" therapy? If this were indicative of experts' abilities to judge competence, then the notion of psychotherapy supervision would be turned upside down, because what is observed and evaluated would have no relation to outcomes – how could the supervisor then make a case for providing input to the supervisee? But the clue to the resolution of this mystery is found in the definition of competence. Most psychotherapy trials rate the competence *for a specific treatment*. That is, what is rated is the skill in providing the elements of the treatment protocol, rather than common factors, such as empathy, alliance, affirmation, and so forth – aspects of therapy that do predict outcome and seem to differentiate more effective therapists from less effective therapists.

CONCLUSIONS

Although the common factors have been discussed for almost a century, the focus of psychotherapy is typically on the development and dissemination of treatment models. If

not discounted, then the common factors are thought of as perhaps necessary, but clearly not sufficient. The evidence, however, strongly suggests that the common factors must be considered therapeutic and attention must be given to them, in terms of theory, research and practice.

One of the criticisms of the common factors is that they are an atheoretical collection of commonalities. In this paper, the contextual model was presented to convey a theoretical basis for these factors.

Trauma and Public Mental Health: A Focused Review

Rolf J. Kleber[1,2]*

[1] Utrecht University, Utrecht, Netherlands, [2] Arq Psychotrauma Expert Group, Diemen, Netherlands

Psychological trauma has developed into a very common concept in the scientific community, in mental health care, as well as in popular language and mass media. The purpose of this article is to show the relevance of the discipline of traumatic stress studies to the field of public mental health by examining central concepts and findings concerning trauma and its aftermath and examining implications for public mental health. Attention is paid to the diagnosis of posttraumatic stress disorder (PTSD) and the construct of resilience as well as to specific areas of public mental health activities. A public mental health perspective will help to develop preventive approaches to trauma and extend the impact of various forms of interventions. It will also make clear that trauma care will have to consider the community and the society at large.

Keywords: trauma, posttraumatic stress disorder, resilience, public mental health, war, disasters, violence

INTRODUCTION

Psychological trauma has developed into a very popular concept in the scientific community, in the world of mental health care, as well as in common language and mass media. The consequences of various shocking events—violence, disasters, acts of terrorism, accidents, and war—receive frequent and enduring attention. The number of scientific and clinical publications has increased enormously and in many media programs ample attention is paid to victims and others affected by these events. The purpose of this article is to show the relevance of the discipline of traumatic stress studies to the field of public mental health by examining central concepts and findings concerning trauma and its aftermath and examining implications for public mental health.

WHAT IS A TRAUMATIC EVENT?

Traumatic events involve the confrontation with war, violence, disasters, sudden loss, serious illness, and other overwhelming and disturbing events. According to the psychiatric classifications [of the *International Classification of Diseases* of the World Health Organization (ICD-11) and the *Diagnostic and Statistical Manual of Mental Disorders*, fifth edition (DSM-5)], a traumatic event is defined as the exposure to: death, threatened death, actual or threatened serious injury, or actual or threatened sexual violence (1, 2).

Phenomenologically such an event can be characterized by an extreme sense of powerlessness as well as a disruption of beliefs and expectations. The individual has lost control over the situation and is to a large extent a victim of the circumstances and/or other people (i.e. the perpetrator). In "Jenseits des Lustprinzips" (1920), Freud already posed: "the essence of a traumatic situation is an experience of helplessness that is brought about either externally or internally." At the same time, he or she is confronted with a shattering of basic assumptions. The self-evidence of one's life is gone. The sense of invulnerability,

the idea of the benevolence of the world, and the idea that other people can be trusted are devastated. The obvious certainties of life have disappeared. The images one holds of oneself and the environment no longer adequately fit the new situation. In the words of Janoff-Bulman (3), basic assumptions have been shattered.

Exposure to traumatic events is not rare, as has been consistently found in epidemiological studies. The World Mental Health Surveys of adults were carried out among nearly 70,000 participants from 24 countries ranging in economic status from low to high (4). These data showed that at some time in their life 70.4% of the respondents had experienced at least one type of a traumatic event. The specific rates were: 14% had experienced intimate partner or sexual violence, 34.3% accidents or injuries, 22.9% physical violence, 13.1% war-related events, 34.1% the unexpected or traumatic death of a loved one, and 35.7% experienced traumas that happened to loved ones (e.g., serious illness of a child). As Kessler et al. (4) stated, these findings make clear that it is rather normal to be exposed to a very upsetting event in one's lifetime.

RISE AND BLOOM OF THE CONCEPT OF POST-TRAUMATIC STRESS DISORDER

The concept of *posttraumatic stress disorder* (PTSD) is nowadays so much used that it dominates most thinking about the consequences of violence, disaster, and being a refugee. That development is quite unique as the attention for trauma was very meager just 40, 50 years ago. In the 1970s, the United States became increasingly confronted with the psychological and social difficulties of the nearly three million veterans who had fought in Vietnam. They suffered from nightmares, depression, relationship problems, et cetera. However, because of the ambivalent perspective on the Vietnam War, authorities and professionals were rather reluctant to acknowledge these difficulties, but the increasing concern led to the introduction of the term post-traumatic stress disorder in the anxiety disorders section of the *Diagnostic and Statistical Manual of Mental Disorders* (DSM-III) (5).

The diagnosis of PTSD is directly linked to experiencing or witnessing a traumatic event such as a natural disaster, a serious accident, a terrorist act, war/combat, rape, or other violent assault (criterion A). According to DSM-5 (1), PTSD consists of four categories of symptoms. Re-experiencing the traumatic event (criterion B) is manifested in symptoms such as intrusive memories, distressing dreams, flashbacks, or distress or physiological reactions upon exposure to cues of the trauma. The other categories are symptoms of avoidance of the reminders of the trauma (criterion C), alterations in memories or mood associated with the trauma (criterion D), and finally clear alterations in physiological arousal and reactivity [criterion E; see further Ref. (1)].

Recently a relatively different definition of PTSD has been introduced in the new version of the International Classification of Diseases of the World Health Organization (2018). It consists of three categories (reexperiencing, avoidance, hyperarousal) with only two core symptoms in each category. The definition may be more flexible to use (allowing for cultural variation and clinical judgment) but is less detailed and comprehensive. Empirical studies have found that prevalence rates may vary between the two classifications and there is often a lack of overlap (i.e., not the same individuals are classified as PTSD patients by the two classifications). This is a major concern for the field of traumatic stress studies. It is a challenge for future research to unravel the differences and to create order (6), as most research is conducted with the DSM definition while most countries in the world use instead ICD.

Prevalence figures for PTSD vary enormously, according to the nature of the events, various risk factors, the time of measurement, and the instruments used. In general, PTSD occurs more when an aggressor is involved (in the case interpersonal violence), for persistent and extended events (e.g., internment, sexual abuse) and for socially charged events (e.g., rape). Among Dutch veterans who were confronted with war violence during deployment in Iraq, the figures of current prevalence varied between 3 and 4% (7). Nine percent of American Vietnam veterans had current PTSD 20 years after the war (8). Figures on PTSD in studies of disasters (man-made, technological, as well as natural) varied mostly around 5% to 15% (9). The prevalence findings also fluctuated strongly in studies of sexual violence, although the rates are generally higher than after other events: between 3.7% and 65%. The already mentioned World Mental Health Surveys (4, 10) determined that intimate partner or sexual violence (such as rape) was a very frequent cause of PTSD. Nevertheless, the unexpected death of loved ones represented the most frequent cause of event-related psychopathology within the general population because of the high frequency with which people experience such a loss. About this last mentioned finding, it is relevant to remark that there is a close relationship between trauma and loss and consequently between PTSD and complicated grief, but they are not similar (11). The concepts of Persistent Complex Bereavement Disorder (1) and Prolonged Grief Disorder (2) as result of the death of a family member or a close friend are included in DSM-5 and ICD-11, respectively.

In a comprehensive and systematic analysis (12) prevalence rates of PTSD and depression were identified from 181 surveys comprising 81,866 refugees and other conflict-affected persons from 40 countries exposed to humanitarian emergencies. Again, rates of reported PTSD and depression showed large inter-survey variability. The prevalence estimates derived from the methodologically most robust surveys provided rates between 13% and 25% for PTSD, as assessed by Steel et al. (12). The risk of PTSD among refugees was increased by experiencing torture and sexual violence, having a higher age, being a woman, and through a long stay in different asylum seekers centers.

Despite the increased knowledge about PTSD and despite the positive results of therapeutic treatments for PTSD, there are various dilemmas and challenges. First, there is a large comorbidity, as most patients also suffer from depression, substance abuse, or other disorders (6). Furthermore, defining the borderline between normal and abnormal behavior after trauma is difficult. Moreover, although this is matter of heavy debate among researchers and clinicians, PTSD is sometimes an overstretched concept in the sense that normal responses to stressful life events are labelled as disorder. Difficulties of diverse groups—from refugees to veterans—are attributed too much or too easily to traumatic events and their resilience is underestimated (13).

IMPACT ON THE INDIVIDUAL

Regarding a public mental health perspective, it is highly relevant to understand that the majority of people exposed to serious live events does not develop disorders. However, this does not mean that they will not suffer from symptoms and difficulties. Most people will experience responses such as intrusions, nightmares, startle reactions, and numbness (14). Findings from large epidemiological studies of disaster victims have made this clear. In 2000 the Netherlands were confronted with a disastrous explosion of a fireworks container area in the middle of a neighborhood. A comprehensive and longitudinal study was conducted among the inhabitants. In the investigation of post-disaster reactions (15) it was found that most inhabitants suffered from various serious symptoms (especially depression, fears, re-experiences, physical symptoms) in the first 2 to 3 weeks after the explosion. At least 87% of the affected residents were highly affected in those first weeks after the disaster.

These responses can be considered functional and normal, as has been made clear in emotion theories (16). People are afraid that it will happen again. They do not feel safe anymore and are constantly alert for danger. They are angry because of the neglect of the responsible authorities or they feel rage in the direction of the perpetrator. They react easily irritated at remarks of other people. They blame themselves for being there at the moment of the disaster or having not done anything to prevent the situation. They feel despaired because of the death of loved ones and the loss of material goods. They have the impression that other people do not understand their distress and sorrow and feel estranged from others. Nevertheless, the intensity and frequency of these distressing and painful responses do not reach the level of disorder.

Although DSM-5 recognizes the possibility of the occurrence of Acute Stress Disorder (ASS) in the first days after an event, a diagnosis that overlaps with PTSD, this diagnosis is rarely used in clinical practice as well as research. Patients with ASS usually report numbness, problems with memory, sleep and concentration, irritability, fears, or anxiety and have frequent re-experiences of the event. The usefulness of acute stress disorder as a classification is controversial in the literature (17). The difference with normal reactions to a major life event and with PTSS, apart from the time criterion (ASS can only be used for disturbances in the first 4 weeks after the experience), is not yet confirmed adequately.

As mentioned above, the world does not make sense any more after such a traumatic experience. Already in the 1940s the psychiatrist and concentration camp survivor Victor Frankl stated that the search for meaning played a crucial role in adaptation to threatening events (18). Cognitive approaches to trauma (e.g., 19) state that successful processing of the traumatic experience takes place when new information (e.g., the implication of the traumatic experience) is assimilated into existing structures or models. Unsuccessful processing occurs when the trauma-related information is not integrated into existing beliefs concerning self-image and world views (20). In low control situations not amenable to direct repair or problem-solving, such as trauma, loss, and serious illness, meaning-making is often the most adaptive strategy. As Schok et al. (20) have argued, meaning can be created by answering the question why an event occurred and why it happened to the person. It can also be operationalized as considering the ways in which one's life changed because of the event and assessing the extent to which one has "made sense of" the experience. Research findings have indicated that these two processes of finding a cause for the extreme event and finding personal benefits in the traumatic experience play independent roles in adjustment after trauma (21, 22). Therefore, the attempt to find meaning discloses itself twofold: in searching for an answer to the question why it happened as well as in rethinking one's attitudes and priorities to restructure one's life along more satisfying lines (23).

IMPACT ON THE COMMUNITY

Violence, disasters, accidents, and war are also stressful events for the community. Consequently, the impact of traumatic events goes beyond those who are directly exposed to the event and affects close relationships, the social environment, and the society at large. A human being does not live in a vacuum. He or she is surrounded by others. And those others will be confronted with the traumatic event and its aftermath too. This holds true for an event that struck an individual, such as a rape. Others hear about the event, perceive the suffering of the victims, and must cope with the implications. Naturally, it holds also true for events that struck a large group of people. For instance, a disaster undermines the social fabric of a community. It can lead to dissolution of social networks and to forced or voluntary migration. Regarding the health care system, it can lead to a disruption of the provision of social services and an erosion of the health care infrastructure (24, 25).

On the other hand, the social environment can stimulate recovery after trauma. The perception of social support has been found to be an influential factor for the effects of traumatic events on the individual as well as the community. For instance, studies undertaken after disasters have shown that social support had a significant stress-buffering effect for post-traumatic problems. Furthermore, a comprehensive meta-analysis (26) has shown that lack of social support systems and lack of sharing of emotions are significant risk factors for mental health disturbances.

THE OTHER SIDE OF TRAUMA: RESILIENCE

The finding that most people confronted with extreme life events did not develop disturbances like PTSD created interest in the phenomenon of *resilience*. This concept has been widely used in recent years in the scientific and clinical world. Resilience refers to a dynamic process involving positive adaptation to one's circumstances in the face of significant adversity, as defined by Luthar and Cicchetti (27). However, there are various understandings of resilience [see Ref. (28)]. Resilience may be treated as a quality, a personal trait, a process, and an outcome. While, for example, some researchers conceive of resilience

as a multiply determined developmental process that is not fixed, others use measures of trait resilience, which favors the assumption that resilience is a personality attribute [see for the different views Ref. (29)].

Investigation of resilience can lead to useful avenues for intervention. The concept offers a different perspective on risk and protection. Focusing on what makes individuals strong rather that what makes them weak may aid to understand what helps them to maintain their mental health. Sleijpen and colleagues examined strategies of young refugees in dealing with negative experiences (28). Their findings revealed that young refugees living in the Netherlands were affected by memories of traumatic events experienced in their country of origin or during the flight, but that current stressors, especially for young people without a residence permit, played a more significant role in determining their psychological well-being. The participants in this study used the following four strategies to deal with traumatic experiences and current stressors: (1) acting autonomously, (2) performing at school, (3) perceiving support from peers and parents, and (4) participating in the new society. These strategies helped the young refugees to strengthen their sense of power and control, they gave them some distraction, and they supported or sustained their spirit within the family unit and the new society [see Ref. (28)].

PROLONGED AFTERMATH

For public mental health initiatives, it is important to realize on the one hand the significance of the resilience of people affected, but at the other hand also the fact that disturbances can last for a very long period. Difficulties do not always disappear in time. Sometimes they may last for a very long time. 10 years after the Enschede Fireworks disaster still 6.7% of a representative sample of the inhabitants of the neighborhood had an indication of chronic disaster-related PTSD (30). 40 years after the Vietnam War (31), prevalence rates of PTSD were 4.5% (male USA veterans) and 6.1% (female veterans). In the World Mental Health Surveys (4), it was also found that PTSD symptoms typically were quite persistent.

The long-term aftermath of trauma can be illustrated with the following research finding. A large community-based sample of child survivors from World War II was compared with a reference group from the Dutch population as well as with clinical groups (32). These children survived internment in the Japanese camps in the former colony of the Dutch East Indies (now Indonesia) during the period 1942–1945 (and afterwards). Most of them were forced to migrate to the Netherlands in the 1940s and 1950s. Long-term sequelae of the persecution were studied by standardized questionnaires on posttraumatic responses, general health, and dissociation. Compared with control individuals of the same age that lived through the German occupation in the Netherlands during World War II, the child survivors from the former Dutch Indies reported significantly more traumatic experiences and mental health disturbances approximately 50 years after the war. 23 percent of these now adult child survivors in the community sample had an indication of PTSD related to the events in World War II [see Ref. (32)].

These results underline the long-term aftermath of traumatic experiences. This conclusion is also relevant for the many war refugees who migrated to Europe in recent years. In the field of psychotraumatology, there has been a continuing debate about the extent to which diagnostic criteria for PTSD adequately cover the posttraumatic symptomatology experienced by individuals exposed to prolonged, repeated, and interpersonal traumatic events, such as occurring in situations of domestic violence, war, and torture (33). This symptomatology is more complex, more severe, and more invasive than that captured by the classic PTSD diagnosis. This manifestation of psychopathology is referred to as *complex PTSD* (CPTSD). In the 11th version of the ICD (2), this concept is added as a formal diagnosis comorbid to PTSD. It consists of impairments in three domains: difficulties in emotion regulation, negative beliefs about oneself, and difficulties in sustaining relationships. The concept is attractive as it focuses on personal changes due to the confrontation with enduring violence and oppression, but it is as such also rather (too) close to personality disorders while it is not clear whether the addition of this new diagnostic concept is really required beyond PTSD. Research is also still indecisive about these matters. Because of these reasons, a concept such as complex PTSD was not included in DSM-5.

PUBLIC HEALTH STRATEGIES

Public health strategies are aimed at preventing or diminishing mental health problems and addressing the causes of these conditions (see also 10). These strategies are active on multiple levels: individual, family, community, and society. Unfortunately, public health care of trauma is a rather underdeveloped area (see Magruder et al., 2107), especially in contrast to the field of treatment of trauma-related disorders, in particular PTSD. Psychotherapies of PTSD have been found successful, as has been shown by many RCT's (randomized controlled trials) and meta-analyses, in comparison with control groups and placebo treatments [e.g., Ref. (34)]. Most evidence has been found for trauma-focused cognitive behavioral therapy and Eye Movement Desensitization and Reprocessing (EMDR), and to a somewhat lesser extent Narrative Exposure Therapy and Brief Eclectic Psychotherapy for PTSD [e.g., Ref. (35)]. However, here we focus only on public health strategies relevant to trauma care. They are all explicitly aimed at preventing the emergence of health problems or preventing the aggravation of these difficulties.

Preventing adversity. First, although it is a truism, one should bear in mind that stopping or avoiding exposure to events that can be experienced as traumatic is a sensible public health strategy. If disasters, accidents, or wars can be prevented by concrete measures, the chance on traumatic experiences and on their negative consequences is, by definition, taken away.

Creating awareness and recognition. Secondly, creating awareness and acknowledgment concerning the impact of trauma on the population is a strategy by which difficulties can be prevented. Psycho-education with the help of brochures is an obvious example of this. Similarly, so-called silent journeys by a community after a violent crime in their neighborhood

and creating monuments ("lieux de memoire") are just as exemplary regarding recognition and appreciation for the people affected by trauma.

The increase of awareness through public health campaigns has been suggested for combatting child sexual abuse (36). Public health campaigns serve to help the identification of affected children and to facilitate the recognition of their difficulties by adults. Such services imply the awareness of the impact of traumatic experiences in diverse domains (individual, societal), the recognition of signs and symptoms, the integration of knowledge about trauma in public health programs, and the prevention of re-traumatization for their users. In this respect, technology-based interventions (e.g., online platforms, social media, mobile applications) can be advantageous. Such campaigns of awareness and recognition should be accompanied by mental health services with adequate interventions for abused persons looking for care. Nevertheless, despite their positive aims and effects, at the same time, all these campaigns may have a downside: they can lead to complications, such as the risks of promoting an unnecessary victim status and medicalizing complaints of the affected persons, resulting in a reduction of the potential for spontaneous recovery (36, 37).

Strengthening resilience. The third group of strategies is focused on bolstering resilience and stimulating self-efficacy. For example, training programs have been developed in the armies of the USA and several European countries to allow military soldiers to deal with the stress of war and to be more resistant to the intense and overwhelming events they will be confronted with.

Counseling. Fourth, counseling people confronted with traumatic events is a well-known intervention in the field of trauma care. Various forms of secondary preventive interventions providing practical care, support, and information have been designed for employees of organizations confronted with extreme events in the work setting, such as the police and banks, but also for victims of large-scale acts of terrorism. These interventions consist of a couple of protocolled sessions in the first 2 or 3 months after a calamity [see for an overview Ref. (38)]. They are considered as quite helpful, although controlled research is mostly lacking. This intervention should not be confused with so-called psychological debriefing, a typically single session of group counseling directly after a disaster or an act of violence. If this form of support is focused too much on the ventilation of emotions, debriefing has been found to have a negative impact: posttraumatic reactions and depressive feelings are worsened and very early exposure to the trauma material may interfere with natural recovery processes (9, 38).

Reconciliation. A related form of post-trauma care are large-scale programs to reconcile people after large-scale conflicts. For instance, a civil war divides families, communities, and nations, often pitting one neighbor against another. Distrust, resentment, and anger dominate post-war society, just as much as passivity and emotional numbness. That is why programs are designed to reconcile people (perpetrators and victims) and to restore trust, connectedness, and social cohesion.

Such truth and reconciliation efforts were conducted in Sierra Leone (39). Community-level forums in 200 villages were set up in which victims detailed war atrocities and perpetrators confessed to war crimes. Research using a randomized control trial among more than 2,000 individuals showed that reconciliation led to greater forgiveness of perpetrators and strengthened social capital: social networks were larger, and people contributed more to public goods in treated villages. However, there were also negative psychological costs next to the positive societal benefits. The reconciliation intervention also worsened psychological health, increasing depression, anxiety, and PTSD in the same villages. For a subset of villages, outcomes were measured 9 months and 31 months after the intervention. Results showed that both positive and negative effects persisted into the longer time horizon. These findings suggest that policy-makers should be careful with reconciliation processes and must find ways to restrict the emphasis on emotions.

Policy making. Finally, there is the overarching field of policy making, a rather underdeveloped topic in trauma care. As Magruder et al. (40) stated, public policies should be formulated to prevent traumatic events, to understand risk and protective factors, to provide early intervention services for individuals and communities at risk of post-trauma maladjustment, and to shape societal norms to eliminate stigma. Extra priorities for improving mental health include a focus on adequately training researchers and professionals, supporting international collaborations, and encouraging scientists to share their expertise with policymakers. Furthermore, integration of physical and mental health care is especially important, as trauma-exposed individuals often seek help in primary care rather than mental health settings. Consequently, posttraumatic disturbances may go undiagnosed.

FINALLY

A public mental health perspective will help to develop preventive approaches to trauma and extend the impact of various forms of interventions. It will also make clear that trauma care will have to consider the community and the society at large. The concept of trauma is an attractive concept. It refers to both spectacular and shocking events that receive huge attention, such as acts of terrorism and large-scale calamities. Something dramatic happens that could happen to anyone: the cause appears to be clear and the responsibility appears to lay elsewhere. One could argue that traumatic experiences show us the limits of our abilities to master our lives and that they defy our efforts to control the circumstances. However, the concept of trauma is also a dangerous concept. It is often used too easy and too quick. Not every stressful event is a traumatic experience and not every person confronted with war, disaster, or terror is traumatized. Overstretching the concept may create the risk of medicalization of regular difficulties of the afflicted people and ignoring the self-reliance and the adaptive skills of them.

TRAUMA TYPES

ABOUT CHILD TRAUMA

TRAUMA TYPES

- Bullying
- Community Violence
- Complex Trauma
- Disasters
- Early Childhood Trauma
- Intimate Partner Violence
- Medical Trauma
- Physical Abuse
- Refugee Trauma
- Sexual Abuse
- Terrorism and Violence
- Traumatic Grief

POPULATIONS AT RISK

When a child feels intensely threatened by an event he or she is involved in or witnesses, we call that event a trauma. There is a range of traumatic events or trauma types to which children and adolescents can be exposed.

Bullying

Bullying is a deliberate and unsolicited action that occurs with the intent of inflicting social, emotional, physical, and/or psychological harm to someone who often is perceived as being less powerful.

view

Community Violence

Community violence is exposure to intentional acts of interpersonal violence committed in public areas by individuals who are not intimately related to the victim.

view

Complex Trauma

Complex trauma describes both children's exposure to multiple traumatic events—often of an invasive, interpersonal nature—and the wide-ranging, long-term effects of this exposure.

view

Disasters

Natural disasters include hurricanes, earthquakes, tornadoes, wildfires, tsunamis, and floods, as well as extreme weather events such as blizzards, droughts, extreme heat, and wind storms.

view

Early Childhood Trauma

Early childhood trauma generally refers to the traumatic experiences that occur to children aged 0-6.

view

Intimate Partner Violence

Intimate Partner Violence (IPV), also referred to as domestic violence, occurs when an individual purposely causes harm or threatens the risk of harm to any past or current partner or spouse.

view

Medical Trauma

Pediatric medical traumatic stress refers to a set of psychological and physiological responses of children and their families to single or multiple medical events.

view

Physical Abuse

Physical abuse occurs when a parent or caregiver commits an act that results in physical injury to a child or adolescent.

view

Refugee Trauma

Many refugees, especially children, have experienced trauma related to war or persecution that may affect their mental and physical health long after the events have occurred.

view

Sexual Abuse

Child sexual abuse is any interaction between a child and an adult (or another child) in which the child is used for the sexual stimulation of the perpetrator or an observer.

view

Terrorism and Violence

Families and children may be profoundly affected by mass violence, acts of terrorism, or community trauma in the form of shootings, bombings, or other types of attacks.

view

Traumatic Grief

While many children adjust well after a death, other children have ongoing difficulties that interfere with everyday life and make it difficult to recall positive memories of their loved ones.

Traumatic stress: effects on the brain

J. Douglas Bremner, MD

Brain areas implicated in the stress response include the amygdala, hippocampus, and prefrontal cortex. Traumatic stress can be associated with lasting changes in these brain areas. Traumatic stress is associated with increased cortisol and norepinephrine responses to subsequent stressors. Antidepressants have effects on the hippocampus that counteract the effects of stress. Findings from animal studies have been extended to patients with post-traumatic stress disorder (PTSD) showing smaller hippocampal and anterior cingulate volumes, increased amygdala function, and decreased medial prefrontal/anterior cingulate function. In addition, patients with PTSD show increased cortisol and norepinephrine responses to stress. Treatments that are efficacious for PTSD show a promotion of neurogenesis in animal studies, as well as promotion of memory and increased hippocampal volume in PTSD.

Effects of traumatic stress

Traumatic stressors such as early trauma can lead to post-traumatic stress disorder (PTSD), which affects about 8% of Americans at some time in their lives,[1] as well as depression,[2,3] substance abuse,[1,4] dissociation,[5] personality disorders,[6,7] and health problems.[8] For many trauma victims, PTSD can be a lifelong problem.[9] The President's New Freedom Commission Report highlights the importance of providing services for mental disorders related to early trauma.[10-12] However, the development of effective treatments is limited by gaps in knowledge about the underlying neurobiological mechanisms that mediate symptoms of trauma-related disorders like PTSD. This paper reviews preclinical and clinical studies on the effects of traumatic stress on the brain.

Normal development of the brain across the lifespan

To understand how traumatic stress occurring at different stages of the life cycle interacts with the developing brain, it is useful to review normal brain development. The normal human brain undergoes changes in structure and function across the lifespan from early childhood to late life. Understanding these normal developmental changes is critical for determining the difference between normal development and pathology, and how normal development and pathology interact.

Although the bulk of brain development occurs in utero, the brain continues to develop after birth. In the first 5 years of life there is an overall expansion of brain volume related to development of both gray matter and white

matter structures; however, from 7 to 17 years of age there is a progressive increase in white matter (felt to be related to ongoing myelination) and decrease in gray matter (felt to be related to neuronal pruning) while overall brain size stays the same.[13-16] Gray matter areas that undergo the greatest increases throughout this latter developmental epoch include frontal cortex and parietal cortex.[17,18] Basal ganglia decrease in size, while corpus callosum,[19,20] hippocampus, and amygdala[21-23] appear to increase in size during childhood, although there may be developmental sex-laterality effects for some of these structures.[24] Overall brain size is 10% larger in boys than girls during childhood.[24]

During the middle part of life (from age 20 to 70) there is a gradual decrease in caudate,[25] diencephalon,[25] and gray matter,[25,26] which is most pronounced in the temporal[27] and frontal cortex,[26] with enlargement of the ventricles[26,27] and no change in white matter.[25,26] Studies have not been able to document changes in hippocampal volume in normal populations during this period.[27] After menopause in women at about the age of 50, however, there are changes in reproductive hormones, such as decreased levels of estrogen. Since estrogen promotes neuronal branching in brain areas such as the hippocampus,[28] a loss of estrogen may lead to changes in neuronal structure. Although the effects of menopause on the brain have not been well studied, it is known that sex hormones also affect brain function and circuitry[29]; therefore, the changes in sex hormones with menopause will presumably affect brain function, as well as possibly structure. There is some evidence in super-elderly individuals (age >70) for modest reductions in hippocampal volume with late stages of aging.[27,30] More robust findings have included increased ventricular volume and reduction in gray matter, temporal lobe, and cerebellum volumes with normal aging, that begins before the age of 70.[25,27,31-33]

Therefore, trauma at different stages in life will presumably have different effects on brain development. The few studies that have looked at this issue do suggest that there are differences in the effects of trauma on neurobiology, depending on the stage of development at which the trauma occurs. Studies in this area, however, have been limited.

Neurobiology of PTSD

PTSD is characterized by specific symptoms, including intrusive thoughts, hyperarousal, flashbacks, nightmares, and sleep disturbances, changes in memory and concentration, and startle responses. Symptoms of PTSD are hypothesized to represent the behavioral manifestation of stress-induced changes in brain structure and function. Stress results in acute and chronic changes in neurochemical systems and specific brain regions, which result in long-term changes in brain "circuits," involved in the stress response.[34-37] Brain regions that are felt to play an important role in PTSD include hippocampus, amygdala, and medial prefrontal cortex. Cortisol and norepinephrine are two neurochemical systems that are critical in the stress response *(Figure 1)*.

The corticotropin-releasing factor (CRF)/hypothalamic-pituitary-adrenal (HPA) axis system plays an important role in the stress response. CRF is released from the hypothalamus, with stimulation of adrenocorticotropic hormone (ACTH) release from the pituitary, resulting in glucocorticoid (cortisol in man) release from the adrenal, which in turn has a negative feedback effect on the axis at the level of the pituitary, as well as central brain sites including hypothalamus and hippocampus. Cortisol has a number of effects which facilitate survival. In addition to its role in triggering the HPA axis, CRF acts centrally to mediate fear-related behaviors,[38] and triggers other neurochemical responses to stress, such as the noradrenergic system via the brain stem locus coeruleus.[39] Noradrenergic neurons release transmitter throughout the brain; this is associated with an increase in alerting and vigilance behaviors, critical for coping with acute threat.[40-42]

Studies in animals showed that early stress has lasting effects on the HPA axis and norepinephrine. A variety of early stressors resulted in increased glucocorticoid

response to subsequent stressors.[43-45] Maternally deprived rats had decreased numbers of glucocorticoid receptors in the hippocampus, hypothalamus, and frontal cortex.[46] Stressed animals demonstrated an inability to terminate the glucocorticoid response to stress,[47,48] as well as deficits in fast-feedback of glucocorticoids on the HPA axis, which could be related to decreased glucocorticoid receptor binding in the hippocampus.[49] Early postnatal adverse experiences increase hypothalamic CRF messenger ribonucleic acid (mRNA), median eminence CRF content, and stress-induced glucocorticoid[50] and ACTH release.[46] These effects could be mediated by an increase in synthesis of CRH mRNA following stress.[51] In nonhuman primates, adverse early experiences resulted in long-term effects on behaviors, as well as elevated levels of CRF in the cerebrospinal fluid.[52] Exposure to chronic stress results in potentiation of noradrenergic responsiveness to subsequent stressors and increased release of norepinephrine in the hippocampus and other brain regions.[42]

Preclinical and clinical studies have shown alterations in memory function following traumatic stress,[53] as well as changes in a circuit of brain areas, including hippocampus, amygdala, and medial prefrontal cortex, that mediate alterations in memory.[54] The hippocampus, a brain area involved in verbal declarative memory, is very sensitive to the effects of stress. Stress in animals is associated with damage to neurons in the CA3 region of the hippocampus (which may be mediated by hypercortisolemia, decreased brain-derived neurotrophic factor (BDNF), and/or elevated glutamate levels) and inhibition of neurogenesis.[55-60] High levels of glucocorticoids seen with stress were also associated with deficits in new learning.[61,62]

Antidepressant treatments have been shown to block the effects of stress and/or promote neurogenesis.[58,63-66] Animal studies have demonstrated several agents with

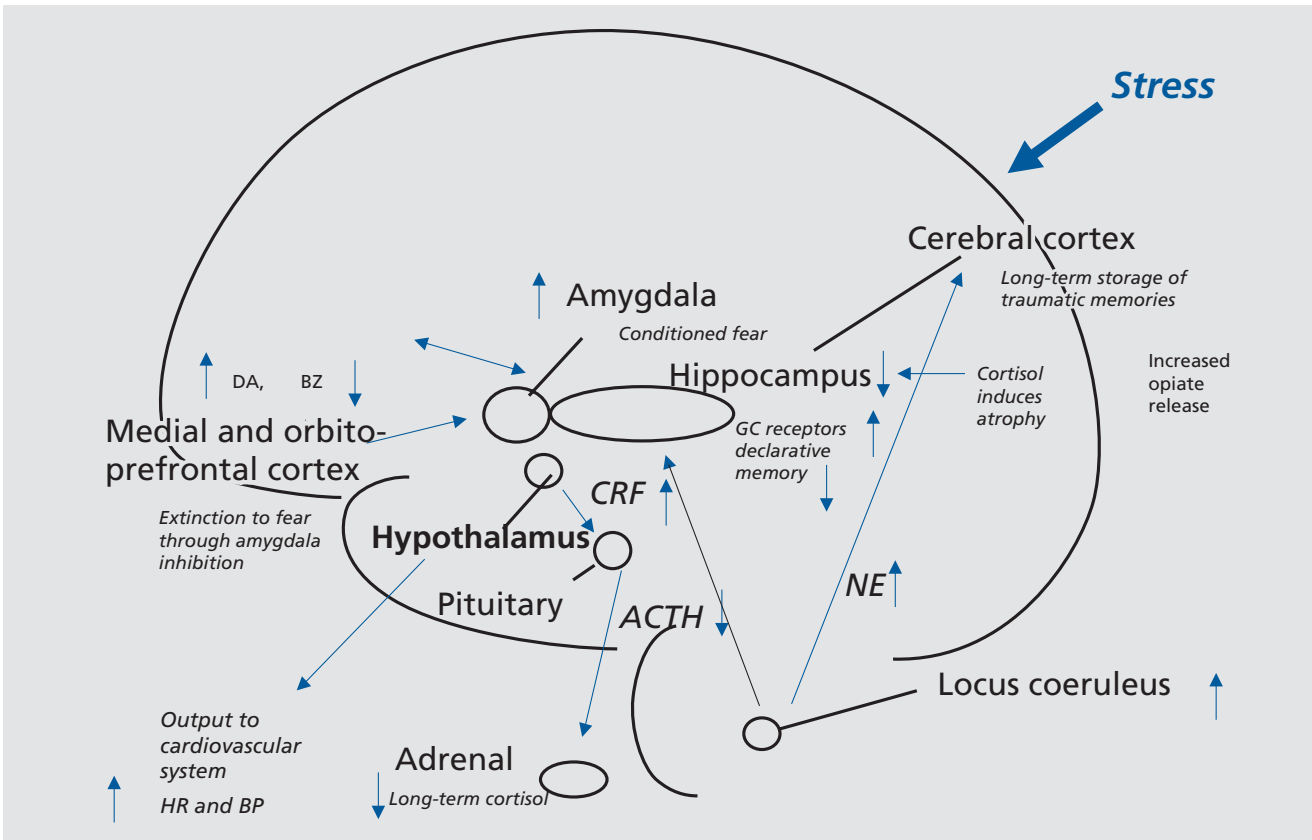

Figure 1. Lasting effects of trauma on the brain, showing long-term dysregulation of norepinephrine and cortisol systems, and vulnerable areas of hippocampus, amygdala, and medial prefrontal cortex that are affected by trauma. potentially beneficial effects on stress-induced hippocampal damage. It has been found that phenytoin blocks the effects of stress on the hippocampus, probably through modulation of excitatory amino acid-induced neurotoxicity.[67] Other agents, including tianeptine, dihydroepiandosterone (DHEA), and fluoxetine have similar effects.[63,64,66,68-73] These medications may share a common mechanism of action through upregulation of cyclic adenosine monophosphate (cAMP) response element binding protein (CREB) that may lead to regulation of expression of specific target genes involved in structural modeling of the hippocampus. Such treatment effects on BDNF and trkB messenger ribonucleic acid (mRNA), can have long-term effects on brain structure and function. There is new evidence that neurogenesis is necessary for the behavioral effects of antidepressants,[74,75] although this continues to be a source of debate.[72,76]

The hippocampus demonstrates an unusual capacity for neuronal plasticity and regeneration. In addition to findings noted above related to the negative effects of stress on neurogenesis, it has recently been demonstrated that changes in the environment, eg, social enrichment or learning, can modulate neurogenesis in the dentate gyrus of the hippocampus, and slow the normal age-related decline in neurogenesis.[77,78] Rat pups that are handled frequently within the first few weeks of life (picking them up and then returning them to their mother) had increased type II glucocorticoid receptor binding which persisted throughout life, with increased feedback sensitivity to glucocorticoids, and reduced glucocorticoid-mediated hippocampal damage in later life.[79] These effects appear to be due to a type of "stress inoculation" from the mothers' repeated licking of the handled pups.[80] Considered together, these findings suggest that early in the postnatal period there is a naturally occurring brain plasticity in key neural systems that may "program" an organism's biological response to stressful stimuli. These findings may have implications for victims of childhood abuse.

Long-term dysregulation of the HPA axis is associated with PTSD, with low levels of cortisol found in chronic PTSD in many studies[81-86] and elevations in CRF.[82,87] Not all studies, however, have found lower cortisol levels in PTSD.[88-91] Exposure to a traumatic reminder appears to be associated with a potentiated release of cortisol in PTSD.[92]

The few studies of the effects of early stress on neurobiology conducted in clinical populations of traumatized children have generally been consistent with findings from animal studies. Research in traumatized children has been complicated by issues related to psychiatric diagnosis and assessment of trauma.[93] Some studies have not specifically examined psychiatric diagnosis, while others have focused on children with trauma and depression, and others on children with trauma and PTSD. Sexually abused girls (in which effects of specific psychiatric diagnosis were not examined) had normal baseline cortisol and blunted ACTH response to CRF,[94] while women with childhood abuse-related PTSD had hypercortisolemia.[95] Another study of traumatized children in which the diagnosis of PTSD was established showed increased levels of cortisol measured in 24-hour urines.[96] Emotionally neglected children from a Romanian orphanage had elevated cortisol levels over a diurnal period compared with controls.[97] Maltreated school-aged children with clinical-level internalizing problems had elevated cortisol compared with controls.[98] Depressed preschool children showed increased cortisol response to separation stress.[99] Adult women with a history of childhood abuse showed increased suppression of cortisol with low-dose (0.5 mg) dexamethasone.[100] Women with PTSD related to early childhood sexual abuse showed decreased baseline cortisol based on 24-hour diurnal assessments of plasma, and exaggerated cortisol response to stressors (traumatic stressors[101] more than neutral cognitive stressors).[102] We also found that patients with PTSD had less of an inhibition of memory function with synthetic cortisol (dexamethasone) than normal subjects.[103] Adult women with depression and a history of early childhood abuse had an increased cortisol response to a stressful cognitive challenge relative to controls,[104] and a blunted ACTH response to CRF challenge.[105] These findings show long-term changes in stress responsive systems. Early in development, stress is associated with increased cortisol and norepinephrine responsiveness, whereas with adulthood, resting cortisol may be normal or low, but there continues to be increased cortisol and norepinephrine responsiveness to stressors. In addition, early stress is associated with alterations in hippocampal morphology which may not manifest until adulthood, as well as increased amygdala function and decreased medial prefrontal function.

Cognitive function and brain structure in PTSD

Studies in PTSD are consistent with changes in cognition and brain structure. Multiple studies have demonstrated verbal declarative memory deficits in PTSD.[53,106-108]

Patients with PTSD secondary to combat[109-113] and childhood abuse[114,115] were found to have deficits in verbal declarative memory function based on neuropsychological testing. Studies, using a variety of measures (including the Wechsler Memory Scale, the visual and verbal components of the Selective Reminding Test, the Auditory Verbal Learning Test, Paired Associate Recall, the California Verbal New Learning Test, and the Rivermead Behavioral Memory Test), found specific deficits in verbal declarative memory function, with a relative sparing of visual memory and IQ.[109-113,115-124] These studies have been conducted in both patients with PTSD related to Vietnam combat,[109-113,116,119-121,123] rape,[117] the Holocaust,[124-126] adults with early childhood abuse,[115] and traumatized children.[118] One study in adult rape survivors showed that verbal declarative memory deficits are specifically associated with PTSD, and are not a nonspecific effect of trauma exposure.[117] Another study of women with early childhood sexual abuse in which some, but not all, of the patients had PTSD, showed no difference between abused and nonabused women,[127] while another study was not able to show a difference between Vietnam veterans with and without PTSD.[128] Other types of memory disturbances studied in PTSD include gaps in memory for everyday events (dissociative amnesia),[129] deficits in autobiographical memory,[130] an attentional bias for trauma-related material,[131-140] and frontal lobe-related impairments.[141] These studies suggest that traumas such as early abuse with associated PTSD result in deficits in verbal declarative memory. It is not clear if cognitive deficits in early abuse survivors are specific to PTSD and are not related to the nonspecific effects of abuse.

These effects were specific to verbal (not visual) memory, and were significant after controlling for IQ. Some of these studies used neuropsychological tests of declarative memory, such as the Wechsler Memory Scale (WMS) and Selective Reminding Test (SRT), that have been validated as sensitive to loss of neurons in the CA3 region of the hippocampus in epileptics who underwent hippocampal resection.[142,143] Vietnam veterans with PTSD were originally shown by us to have 8% smaller right hippocampal volume based on magnetic resonance imaging (MRI) relative to controls matched for a variety of factors such as alcohol abuse and education ($P<0.05$); smaller volume was correlated with deficits in verbal declarative memory function as measured with the Wechsler Memory Scale.[144] A second study from our group showed a 12% reduction in left hippocampal volume in 17 patients with childhood abuse-related PTSD compared with 17 case-matched controls, that was significant after controlling for confounding factors.[145] Smaller hippocampal volume was shown to be specific to PTSD within the anxiety disorders, and was not seen in panic disorder.[146] Gurvits et al[147] showed bilateral hippocampal volume reductions in combat-related PTSD compared with combat veterans without PTSD and normal controls. Combat severity was correlated with volume reduction. Stein et al[148] found a 5% reduction in left hippocampal volume. Other studies in PTSD have found smaller hippocampal volume and/or reductions in *N*-acetyl aspartate (NAA), a marker of neuronal integrity.[149-153] Studies in childhood[154-156] and new-onset[157,158] PTSD did not find hippocampal volume reduction, although reduced NAA (indicating loss of neuronal integrity) was found in medial prefrontal cortex in childhood PTSD.[159] In a recent meta-analysis we pooled data from all of the published studies and found smaller hippocampal volume for both the left and the right sides, equally in adult men and women with chronic PTSD, and no change in children.[160] More recent studies of holocaust survivors with PTSD did not find a reduction in hippocampal volume, although PTSD patients who developed PTSD in response to an initial trauma had smaller hippocampal volume compared with those who developed PTSD after repeated trauma, suggesting a possible vulnerability of smaller hippocampal volume.[161] Two independent studies have shown that PTSD patients have deficits in hippocampal activation while performing a verbal declarative memory task,[149,162] although it is unclear if this is a deficit in activation or higher hippocampal blood flow at baseline. Both hippocampal atrophy and hippocampal-based memory deficits reversed with treatment with the selective serotonin reuptake inhibitor (SSRI) paroxetine, which has been shown to promote neurogenesis (the growth of neurons) in the hippocampus in preclinical studies.[163] In addition, treatment with the anticonvulsant phenytoin led to an improvement in PTSD symptoms[164] and an increase in right hippocampal and right cerebral volume.[165] We hypothesize that stress-induced hippocampal dysfunction may mediate many of the symptoms of PTSD which are related to memory dysregulation, including both explicit memory deficits as well as fragmentation of memory in abuse survivors. It is unclear at the current time whether these changes are specific to PTSD, whether certain common environmental events (eg, stress) in different disorders lead to similar brain changes, or whether common genetic traits lead to similar outcomes.

The meaning of findings related to deficits in memory and the hippocampus in PTSD, and questions related to the relative contribution of genetic and environmental factors, has become an important topic in the field of PTSD and stress research. There are three possible models, taking into account genetic or environmental factors, which have been proposed to explain smaller hippocampal volume in PTSD: Model A (Environment), Model B (Environment and Genetic), and Model C (Genetic).[166-169] In Model C (Genetic), smaller hippocampal volume represents a premorbid risk factor for PTSD. In support of this model Pitman and colleagues[170] have demonstrated that lower premilitary IQ is associated with combat-related PTSD, as well as finding a correlation between PTSD symptoms and hippocampal volume in twin brothers.[151] Model A (Environment) states that stress leads to damage or inhibition of neurogenesis via hypercortisolemia, decreased BDNF, or increased glutamate. Model B (Environment/Genetic) states that a combination of environmental and genetic factors leads to deficits in hippocampal function and structure. Showing that an intervention like medication changes hippocampal volume and cognition would provide support for at least a partial contribution of the environment to the outcomes of interest.

In addition to the hippocampus, other brain structures have been implicated in a neural circuitry of stress, including the amygdala and prefrontal cortex. The amygdala is involved in memory for the emotional valence of events, and plays a critical role in the acquisition of fear responses. The medial prefrontal cortex includes the anterior cingulate gyrus (Brodmann's area [BA] 32) and subcallosal gyrus (area 25) as well as orbitofrontal cortex. Lesion studies demonstrated that the medial prefrontal cortex modulates emotional responsiveness through inhibition of amygdala function. Conditioned fear responses are extinguished following repeated exposure to the conditioned stimulus in the absence of the unconditioned (aversive, eg, electric shock) stimulus. This inhibition appears to be mediated by medial prefrontal cortical inhibition of amygdala responsiveness.

Animal studies also show that early stress is associated with a decrease in branching of neurons in the medial prefrontal cortex.[171] Rauch and colleagues found smaller volume of the anterior cingulate based on MRI measurements in PTSD[172]; we have replicated these findings in women with abuse and PTSD.[160] An important question is whether these effects are reversible with treatment.

Neural circuits in PTSD

Brain imaging studies have shown alterations in a circuit including medial prefrontal cortex (including anterior cingulate), hippocampus, and amygdala in PTSD. Many of these studies have used different methods to trigger PTSD symptoms (eg, using traumatic cues) and then look at brain function. Stimulation of the noradrenergic system with yohimbine resulted in a failure of activation in dorsolateral prefrontal, temporal, parietal, and orbitofrontal cortex, and decreased function in the hippocampus.[173] Exposure to traumatic reminders in the form of traumatic slides and/or sounds or traumatic scripts was associated with an increase in PTSD symptoms, decreased blood flow, and/or failure of activation in the medial prefrontal cortex/anterior cingulate, including Brodmann's area 25, or subcallosal gyrus, area 32 and 24, as measured with positron emission tomography (PET) or functional MRI (fMRI).[174-183] Other findings in studies of traumatic reminder exposure include decreased function in hippocampus,[176] visual association cortex,[176,180] parietal cortex,[176,179,180,184] and inferior frontal gyrus,[176,179,180,184] and increased function in amygdala,[181,184] posterior cingulate,[174,176,177,180] and parahippocampal gyrus.[174,176,178] Shin and colleagues found a correlation between increased amygdala function and decreased medial prefrontal function with traumatic reminders,[181] indicating a failure of inhibition of the amygdala by the medial prefrontal cortex that could account for increased PTSD symptoms with traumatic reminders. Other studies found increased amygdala and parahippocampal function and decreased medial prefrontal function during performance of an attention task,[182] increased posterior cingulate and parahippocampal gyrus and decreased medial prefrontal and dorsolateral prefrontal function during an emotional Stroop paradigm,[185] and increased amygdala function with exposure to masked fearful faces.[186] Retrieval of emotionally valenced words[187] (eg "rape-mutilate") in women with PTSD from early abuse resulted in decreases in blood flow in an extensive area which included orbitofrontal cortex, anterior cingulate, and medial prefrontal cortex (BA 25, 32, and 9), left hippocampus, and fusiform gyrus/inferior temporal gyrus, with increased activation in posterior cingulate, left inferior parietal cortex, left middle frontal gyrus, and visual association and motor cortex.[188] Another study found a failure of medial prefrontal cortical/anterior cingulate activation, and decreased visual association and parietal

cortex function, in women with abuse and PTSD relative to women with abuse without PTSD, during performance of the emotional Stroop task (ie, naming the color of a word such as "rape").[189] We recently found increased amygdala activation with classical fear conditioning (pairing a shock and a visual stimulus), and decreased medial prefrontal cortex function with extinction, in abuse-related PTSD.[190] The findings described above point to a network of related regions mediating symptoms of PTSD, including medial prefrontal cortex, anterior cingulate, hippocampus, amygdala, posterior cingulate, parietal, visual association, and dorsolateral prefrontal cortex.[191]

Fewer brain imaging studies have been performed in children with PTSD. Several studies have shown alterations in electroencephalogram (EEG) measures of brain activity in children with a variety of traumas who were not selected for diagnosis compared with healthy children. About half of the children in these studies had a psychiatric diagnosis. Abnormalities were located in the anterior frontal cortex and temporal lobe and were localized to the left hemisphere.[192,193] Two studies have found reductions in brain volume in children with trauma and PTSD symptoms.[154,155] One group did not find reductions in hippocampal volume, either at baseline or over a longitudinal period,[154,156] while another group found an 8.5% reduction in hippocampal volume that was not significant after controlling for smaller brain volumes in the PTSD group.[155] One study used single-voxel proton magnetic resonance spectroscopy (proton MRS) to measure relative concentration of NAA and creatinine (a marker of neuronal viability) in the anterior cingulate of 11 children with maltreatment-related PTSD and 11 controls. The authors found a reduction in the ratio of NAA to creatinine in PTSD relative to controls.[159] Studies have also found smaller size of the corpus callosum in children with abuse and PTSD relative to controls.[154] as well as larger volume of the superior temporal gyrus.[194] In a study of abused children in whom diagnosis was not specified, there was an increase in T2 relaxation time in the cerebellar vermis, suggesting dysfunction in this brain region.[195] The reason for differences in findings between adults and children are not clear; however, factors such as chronicity of illness or interaction between trauma and development may explain findings to date.

In summary, dysfunction of a circuit involving the medial prefrontal cortex, dorsolateral prefrontal cortex, and possibly hippocampus and amygdala during exposure to traumatic reminders may underlie symptoms of PTSD. These studies have primarily assessed neural correlates of traumatic remembrance, while little has been done in the way of utilizing cognitive tasks as probes of specific regions, such as memory tasks as probes of hippocampal function.

MRI assessment of brain abnormalities in PTSD and trauma spectrum disorders

Findings of smaller hippocampal volume appear to be associated with a range of trauma related psychiatric disorders, as long as there is the presence of psychological trauma. We have used MRI to show smaller hippocampal volume in PTSD,[144,145,149,196] depression,[197] depression with early abuse,[198] borderline personality disorder (BPD) with early abuse,[199] and Dissociative Identity Disorder (DID) with early abuse.[200] The greatest magnitude of difference was seen in the DID patients, who had unusually severe early childhood sexual abuse histories. We did not find changes in hippocampal volume in patients with panic disorder without a history of abuse (suggesting that findings are not generalized to other anxiety disorders).[201] We found smaller amygdala volume in BPD with early abuse[199] and increased amygdala volume in depression.[197,202] Patients with depression had smaller orbitofrontal cortex volume with no changes in anterior cingulate (BA 32) or medial prefrontal cortex (BA 25).[203] More recently, we found smaller anterior cingulate volume in women with abuse and PTSD relative to controls.[204]

Neural circuits in women with abuse and PTSD

We have used PET to study neural circuits of trauma-related disorders in women with early abuse and a variety of trauma spectrum mental disorders. Initially we studied women with abuse and PTSD.[54,205-208] We initially measured brain activation with a paragraph-encoding task in conjunction with PET O-15 water measurement of brain blood flow. Women with abuse and PTSD showed a failure of hippocampal activation during the memory task relative to controls.[149] Women with abuse and PTSD in this study also had smaller hippocampal volume measured with MRI relative to both women with abuse without PTSD and nonabused non-PTSD women. The failure of hippocampal activation was significant

after controlling differences in hippocampal volume as well as accuracy of encoding. In another study we measured neural correlates of exposure to a personalized script of childhood sexual abuse. Women with abuse and PTSD showed a failure of medial prefrontal and hippocampal activation relative to abused women without PTSD.[176] Women with abuse and PTSD also showed a failure of medial prefrontal and hippocampal function during recall of paired word associates with traumatic-emotional content (eg, "rape-mutilate"),[188] and decreased medial prefrontal function during an emotional Stroop task with trauma-content words.[209] Other studies showed a failure of medial prefrontal activation in women with BPD and early abuse during an abandonment script.[210] Women with BPD and abuse had increased psychophysiological responses to abandonment scripts relative to trauma scripts, while women with PTSD and abuse had the opposite pattern,[211] indicating differential responding in those two disorders in spite of the common exposure to early abuse.

In another project we studied 19 physically healthy women including women with a history of severe childhood sexual abuse and the diagnosis of current PTSD (N=8) and women without childhood abuse or PTSD (N=11).[212] All subjects underwent PET measurement of cerebral blood flow and psychophysiology measurement of heart rate and skin conductance during habituation, acquisition, and extinction conditions, on a single day, with scanning during a control condition on another day separated by 1 week from the active condition. Subjects were randomly assigned to undergo either the active condition or the control condition first (ie, active-control or control-active). Subjects were told at the beginning of the study that they would be exposed to electric shocks and viewing images on a screen during collection of PET and psychophysiology data. During habituation subjects were exposed to a blue square on a screen (conditioned stimulus [CS]), 4 seconds in duration, followed by 6 seconds of a blank screen. CS exposure was repeated eight times at regular intervals over 80 seconds in two separate blocks separated by 8 minutes. One PET image of brain blood flow was obtained starting from the beginning of each of the blocks. During active fear acquisition exposure to the blue square (CS) was paired with an electric shock to the forearm (unconditioned stimulus [UCS]). Subjects had 8 paired CS-UCS presentations at 10-second intervals for each of two blocks. With extinction subjects were again exposed to the blue squares (CS) without shock ("active" extinction). On a second day subjects went through the same procedure with electric shocks delivered randomly when the blue square was not present (unpaired CS-UCS) (an equal number as on day 1) during scans 3 and 4, which served as a control for active fear acquisition.

PTSD subjects had increased symptoms of anxiety, fear, dissociation, distress, substance use disorders (SUDs), and PTSD at all time points during both study days relative to non-PTSD. Acquisition of fear was associated with increased skin conductance (SC) responses to CS exposure during the active versus the control conditions in all subjects. There was increased SC for PTSD during the first CS-UCS presentation. Extinction of fear was associated with increased skin conductance (SC) responses to CS exposure during the active versus the control conditions in all subjects. When PTSD and non-PTSD subjects were examined separately, SC levels were significantly elevated in non-PTSD subjects undergoing extinction following the active compared with the control condition during session one.

PTSD subjects showed activation of the bilateral amygdala during fear acquisition compared with the control condition. Non-PTSD subjects showed an area of activation in the region of the left amygdala. When PTSD subjects and control subjects were directly compared, PTSD subjects showed greater activation of the left amygdala during the fear conditioning condition (pairing of US and CS) relative to the random shock control than healthy women. Other areas that showed increased activation with fear acquisition in PTSD included bilateral superior temporal gyrus (BA 22), cerebellum, bilateral inferior frontal gyrus (BA 44, 45), and posterior cingulate (BA 24). Fear acquisition was associated with decreased function in medial prefrontal cortex, visual association cortex, and medial temporal cortex, inferior parietal lobule function, and other areas. Extinction of fear responses was associated with decreased function in the orbitofrontal and medial prefrontal cortex (including subcallosal gyrus, BA 25, and anterior cingulate BA 32), visual association cortex, and other areas, in the PTSD subjects, but not in the controls. Amygdala blood flow with fear acquisition was negatively correlated with medial prefrontal blood flow with fear extinction (increased blood flow in amygdala correlated with decreased blood flow in medial prefrontal cortex) in all subjects (r=-0.48; P<0.05). Increased amygdala blood flow with fear acquisition was positively correlated with PTSD (r=0.45), anxiety (r=0.44) and disso-

ciative (r=0.80) symptom levels in PTSD (but not non-PTSD) subjects. There was a negative correlation between medial prefrontal blood flow during extinction and anxiety as measured with the Panic Attack Symptom Scale (PASS) during extinction in the PTSD group only, which was significant after correction for multiple comparisons (r=-0.90; P=0.006).[190] This study was consistent with increased amygdala function with fear acquisition, and decreased medial prefrontal (anterior cingulate) function during extinction in PTSD. This is consistent with the model of an overactive amygdala and a failure of medial prefrontal cortex to extinguish, or shut off, the amygdala, when the acute threat is no longer present.

Treatment of PTSD

Intervening soon after the trauma is critical for long-term outcomes, since with time traumatic memories become indelible and resistant to treatment.[213] Early treatments are not necessarily effective. For instance, studies have shown that Critical Incident Stress Debriefing (CISD) can be associated with a worsening of outcome relative to no treatment at all.[214] Pharmacological treatment of chronic PTSD has shown efficacy originally for imipramine,[215] amitriptyline,[216] and phenalzine,[215] and later for brofaramine,[217] paroxetine,[218,219] and sertraline.[220] Selective serotonin reuptake inhibitors (SSRIs) and tianeptine are now recommended as first-line treatment for PTSD.[221-226]

The utility of early treatment is also demonstrated by animal studies showing that pretreatment before stress with antidepressants reduces chronic behavioral deficits related to stress.[227,228] Antidepressants, including both norepinephrine and serotonin reuptake inhibitors, as well as gabapentine and phenytoin, promote nerve growth (neurogenesis) in the hippocampus, while stress inhibits neurogenesis.[63,64,66,69,71,75,229] This is important because hippocampal neurogenesis has been shown to be required for antidepressant response.[74]

Few studies have examined the effects of pharmacological treatment on brain structure and function in patients with trauma-related mental disorders. We studied a group of patients with depression and found no effect of fluoxetine on hippocampal volume, although there were increases in memory function[230] and hippocampal activation measured with PET during a memory encoding task. Depressed patients with a history of childhood trauma were excluded, and we subsequently have found hippocampal volume reductions at baseline in women with early abuse and depression but not in women with depression without early abuse;[198] this suggests that the study design of excluding patients with early trauma may account for the negative result. Other studies in depression showed that smaller hippocampal volume was a predictor of resistance to antidepressant treatment.[231] Smaller orbitofrontal cortex volume is associated with depression; one study in geriatric depression found smaller orbitofrontal cortex volume, while length of antidepressant exposure was correlated with larger orbitofrontal volume.[232]

Several studies have looked at functional brain imaging response to antidepressants in depression. Single photon-emission computed tomography (SPECT) blood flow studies in depression showed that antidepressants increased anterior cingulate, right putamen, and right thalamus function.[233] SPECT Xenon-133 studies showed reduced prefrontal function at baseline in depression, with treatment responders showing reduced perfusion in prefrontal cortex compared with nonresponders after treatment.[234] In a fluorodeoxyglucose (FDG) PET study of brain function patients with depression treated with fluoxetine who had a positive response to treatment had limbic and striatal decreases (subgenual cingulate, hippocampus, insula, and pallidum) and brain stem and dorsal cortical increases (prefrontal, parietal, anterior, and posterior cingulate) in function. Failed response was associated with a persistent 1-week pattern and absence of either subgenual cingulate or prefrontal changes.[235] Sertraline resulted in an increase in middle frontal gyrus activity in depression measured with PET FDG, as well as increased function in right parietal lobe and visual association cortex.[236] Successful paroxetine therapy of depression was associated with increased glucose metabolism measured with PET in dorsolateral, ventrolateral, and medial aspects of the prefrontal cortex, parietal cortex, and dorsal anterior cingulate. Areas of decreased metabolism were noted in both anterior and posterior insular regions (left) as well as right hippocampal and parahippocampal regions.[237] In another PET FDG study, at baseline, subjects with depression had higher normalized metabolism than controls in the prefrontal cortex (and caudate and thalamus), and lower metabolism in the temporal lobe. With treatment with paroxetine, subjects with depression had metabolic changes in the direction of normalization in these regions.[238] A PET FDG study of patients with depression and controls showed that at baseline, the mean metabolism was increased in the left and right lateral orbital cortex/ventrolateral prefrontal cortex (PFC), left amygdala,

and posterior cingulate cortex, and decreased in the subgenual anterior cingulate cortex (ACC) and dorsal medial/dorsal anterolateral PFC in depressives relative to controls. Following treatment with antidepressants, metabolism significantly decreased in the left amygdala and left subgenual ACC. The metabolic reduction in the amygdala and right subgenual ACC appeared largely limited to those subjects who both responded to treatment and remained well at 6 months' follow-up.[239] Another study showed that antidepressant treatment of depression resulted in a decrease in amygdala activation with emotional faces as measured with fMRI.[240] In summary, studies show changes in limbic and prefrontal cortical regions with successful antidepressant treatment of depression.

Fewer studies have looked at the effects of pharmacological treatment on the brain in anxiety disorders. One PET FDG study showed that caudate function decreased with treatment of obsessive compulsive disorder with antidepressants.[241] Paroxetine resulted in a decrease in glutamate/glutamine measured with magnetic resonance spectroscopy (MRS) in children with obsessive-compulsive disorder (OCD).[242] Patients with PTSD were shown to have an increase in hippocampal volume and memory function with paroxetine,[163] and increased right hippocampal and right cerebral volume with phenytoin.[165] No published studies have looked at the effects of pharmacological treatment on brain function in PTSD, or on sensitive markers of brain chemistry like NAA.

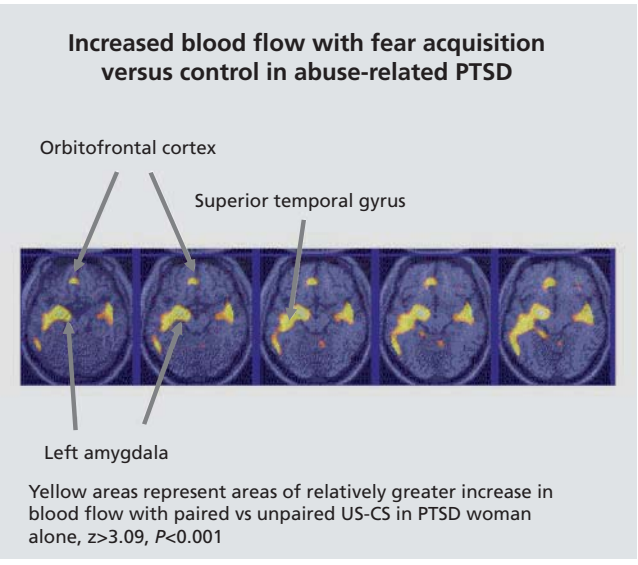

Figure 2. Neural correlates of fear conditioning in women with abuse and PTSD. There was increased amygdala activation with fear acquisition using a classical conditioning paradigm relative to non-PTSD abused women. PTSD, post-traumatic stress disorder

Brain biomarkers like NAA represent an objective marker of neural plasticity. To date psychiatry has relied on subjective reports as the gold standard. However, this is limited by self-reporting and the subjective interpretations of symptoms and response to treatment. Brain markers of antidepressant response may provide a complementary approach to assessing response to treatment, as well as providing insight into the mechanisms of treatment response. Our group is trying to look at mechanisms in the brain underlying treatment response in PTSD.

Effects of pharmacotherapy on brain function and structure in PTSD

We have begun to assess the effects of pharmacotherapy on brain structure and function in PTSD.[243] We recently assessed the effects of phenytoin on brain structure and function. Studies in animals show that phenytoin, which is used in the treatment of epilepsy and is known to modulate glutamatergic function, blocks the effects of stress on the hippocampus.[67] We studied nine patients with PTSD in an open-label function before and after treatment with phenytoin. Phenytoin resulted in a significant improvement in PTSD symptoms.[164] Phenytoin also resulted in increases in both right hippocampal volume and right hemisphere volume.[165] These findings indicate that phenytoin has an effects on PTSD symptoms as well as brain structure in PTSD patients.

We have assessed the effects of open-label paroxetine on memory and the hippocampus in PTSD. Male and female patients with symptoms of PTSD were medication-free for at least 4 weeks before participation in the study. Twenty-eight patients were found to be eligible and started the medication phase. Of the total patient sample five patients did not finish due to noncompliance; 23 patients completed the study.

Before patients started the medication phase, neuropsychological tests were administered, including the *Wechsler Adult Intelligence Scale – Revised*, WAIS-R (arithmetic, vocabulary, picture arrangement, and block design test), two subtests of the *Wechsler Memory Scale-Revised*, WMS-R, including logical memory (free recall of two story narratives, which represents verbal memory) and figural memory (which represents visual memory and involved reproduction of designs after a 6-second presentation); and the verbal and visual components of

the *Selective Reminding Test*, SRT.

Paroxetine was prescribed in the first visit after the pre-treatment assessments. All patients started open-label with a dose of 10 mg daily and were titrated up to 20 mg in 4 days.

Paroxetine treatment resulted in a mean 54% reduction in PTSD symptoms as measured with mean changes from baseline on the CAPS total score ($P<0.005$) among study completers. Improvement was equally strong on all symptom cluster scores (Re-experiencing, Avoidance/Numbing, Hyperarousal). Treatment also resulted in significant improvements in verbal declarative memory as measured with the WMS-R paragraph recall for delayed recall ($P<0.005$) and percent retention (80.2 to 91.1; $P=0.003$), but not immediate recall. Improvements were significant on all subscales of the Verbal Component of the SRT; including long-term recall and delayed recall.

Repeated measures ANOVA with side as the repeated measure showed a main effect for treatment related to a 4.6% increase in mean hippocampal volume (1857.3 mm^3 [SD 225.6] to 1906.2 mm^3, [SD 243.2]) with treatment (F=8.775 df=1. 36; $P=0.005$). Increased hippocampal volume was seen for both left (5.6%) (1807.6 mm^3 [SD 255.5] to 1909.3 mm^3 [SD 236.9]) and right (3.7%) (1906.9 mm^3 [SD 195.8] to 1976.7 mm^3 (SD 249.6]) hippocampus. There was no change in whole brain volume with treatment. Increase in hippocampal volume was significant after adding whole brain volume before and after treatment to the model.

Discussion

Traumatic stress has a broad range of effects on brain function and structure, as well as on neuropsychological components of memory. Brain areas implicated in the stress response include the amygdala, hippocampus, and prefrontal cortex. Neurochemical systems, including cortisol and norepinephrine, play a critical role in the stress response. These brain areas play an important role in the stress response. They also play a critical role in memory, highlighting the important interplay between memory and the traumatic stress response. Preclinical studies show that stress affects these brain areas. Furthermore, antidepressants have effects on the hippocampus that counteract the effects of stress. In fact, promotion of nerve growth (neurogenesis) in the hippocampus may be central to the efficacy of the antidepressants. Studies in patients with PTSD show alterations in brain areas implicated in animal studies, including the amygdala, hippocampus, and prefrontal cortex, as well as in neurochemical stress response systems, including cortisol and norepinephrine. Treatments that are efficacious for PTSD show a promotion of neurogenesis in animal studies, as well as promotion of memory and increased hippocampal volume in PTSD. Future studies are needed to assess neural mechanisms in treatment response in PTSD. ❑

Estrés traumático: efectos en la cerebro

El estrés traumático surte efectos muy diversos sobre la función y la estructura cerebrales. Las regiones cerebrales implicadas en la respuesta al estrés son la amígdala (núcleo amigdalino), el hipocampo y la corteza prefrontal. Los sistemas neuroquímicos, como el cortisol y la noradrenalina, desempeñan una misión crítica en la respuesta al estrés. Estas regiones cerebrales influyen sobre la respuesta al estrés y sobre la memoria, lo que subraya la interrelación entre la memoria y la respuesta al estrés traumático. Los antidepresivos actúan sobre el hipocampo y contrarrestan el efecto del estrés. Los estudios sobre pacientes con trastorno por estrés postraumático (TEPT) revelan alteraciones en las regiones cerebrales implicadas en los estudios con animales como la amígdala, el hipocampo y la corteza prefrontal, así como en los sistemas neuroquímicos de respuesta al estrés, entre ellos el cortisol y la noradrenalina. Los tratamientos con eficacia frente al TEPT promueven la neurogénesis en los estudios con animales y también aumentan la memoria, y el volumen hipocámpico en el TEPT. Se requieren nuevos estudios para evaluar los mecanismos neurales de la respuesta terapéutica en el TEPT.

Effets du stress traumatique sur le cerveau

Le stress traumatique exerce une grande variété d'effets sur la fonction et la structure cérébrales. Les aires cérébrales impliquées dans la réponse au stress comprennent l'amygdale, l'hippocampe et le cortex préfrontal. Les systèmes neurochimiques, incluant le cortisol et la norépinéphrine, jouent un rôle critique dans la réponse au stress. Ces aires cérébrales influent sur la mémoire et sur la réponse au stress traumatique, soulignant ainsi les interactions existant entre les deux. Les effets des antidépresseurs sur l'hippocampe compensent les effets du stress. Les études chez les patients atteints de trouble stress post-traumatique (ESPT) montrent des modifications des aires cérébrales impliquées au cours des études animales, telles l'amygdale, l'hippocampe et le cortex préfrontal, ainsi que des modifications des systèmes neurochimiques de réponse au stress comme le cortisol et la noradrénaline. Les traitements efficaces dans l'ESPT entraînent une activation de la neurogenèse chez l'animal de même qu'une amélioration de la mémoire et une augmentation du volume de l'hippocampe dans l'ESPT. Il faudra d'autres études pour évaluer les mécanismes neuronaux dans la réponse thérapeutique au cours de l'ESPT.

Child abuse and neglect

CHILD ABUSE AND NEGLECT

In Western Australia, under the *Children and Community Services Act 2004,* a child is a person under the age of 18 years.

There are generally five types of child abuse and neglect, which may co-exist:

- physical abuse
- sexual abuse
- emotional abuse
- psychological abuse
- child neglect.

Publication: How do I recognise when a child is at risk of abuse or neglect?

Child development and trauma guide

The *Child development and trauma guide* has been developed to assist practitioners to understand typical developmental pathways of children and recognise indicators of trauma at different ages and stages.

Importantly, the resource offers practical, age appropriate advice as to the needs of children, parents and carers when trauma has occurred, and ways in which children and families can be assisted in healing and recovery.

The *Child development and trauma guide* covers the following age groups:

- 0 to 12 months
- 12 months to 3 years
- 3 to 5 years
- 7 to 9 years
- 9 to 12 years
- 12 to 18 years.

What Is a TIP?

Treatment Improvement Protocols (TIPs) are developed by the Substance Abuse and Mental Health Services Administration (SAMHSA) within the U.S. Department of Health and Human Services (HHS). Each TIP involves the development of topic-specific best practice guidelines for the prevention and treatment of substance use and mental disorders. TIPs draw on the experience and knowledge of clinical, research, and administrative experts of various forms of treatment and prevention. TIPs are distributed to facilities and individuals across the country. Published TIPs can be accessed via the Internet at http://store.samhsa.gov.

Although each consensus-based TIP strives to include an evidence base for the practices it recommends, SAMHSA recognizes that behavioral health is continually evolving, and research frequently lags behind the innovations pioneered in the field. A major goal of each TIP is to convey "front-line" information quickly but responsibly. If research supports a particular approach, citations are provided.

Foreword

The Substance Abuse and Mental Health Services Administration (SAMHSA) is the agency within the U.S. Department of Health and Human Services that leads public health efforts to advance the behavioral health of the nation. SAMHSA's mission is to reduce the impact of substance abuse and mental illness on America's communities.

The Treatment Improvement Protocol (TIP) series fulfills SAMHSA's mission to improve prevention and treatment of substance use and mental disorders by providing best practices guidance to clinicians, program administrators, and payers. TIPs are the result of careful consideration of all relevant clinical and health services research findings, demonstration experience, and implementation requirements. A panel of non-Federal clinical researchers, clinicians, program administrators, and patient advocates debates and discusses their particular area of expertise until they reach a consensus on best practices. This panel's work is then reviewed and critiqued by field reviewers.

The talent, dedication, and hard work that TIP panelists and reviewers bring to this highly participatory process have helped bridge the gap between the promise of research and the needs of practicing clinicians and administrators to serve, in the most scientifically sound and effective ways, people in need of behavioral health services. We are grateful to all who have joined with us to contribute to advances in the behavioral health field.

How This TIP Is Organized

This Treatment Improvement Protocol (TIP) is divided into three parts:

- Part 1: *A Practical Guide for the Provision of Behavioral Health Services*
- Part 2: *An Implementation Guide for Behavioral Health Program Administrators*
- Part 3: *A Review of the Literature*

Part 1 is for behavioral health service providers and consists of six chapters. Recurring themes include the variety of ways that substance abuse, mental health, and trauma interact; the importance of context and culture in a person's response to trauma; trauma-informed screening and assessment tools, techniques, strategies, and approaches that help behavioral health professionals assist clients in recovery from mental and substance use disorders who have also been affected by acute or chronic traumas; and the significance of adhering to a strengths-based perspective that acknowledges the resilience within individual clients, providers, and communities.

Chapter 1 lays the groundwork and rationale for the implementation and provision of trauma-informed services. It provides an overview of specific trauma-informed intervention and treatment principles that guide clinicians, other behavioral health workers, and administrators in becoming trauma informed and in creating a trauma-informed organization and workforce. Chapter 2 provides an overview of traumatic experiences. It covers types of trauma; distinguishes among traumas that affect individuals, groups, and communities; describes trauma characteristics; and addresses the socioecological and cultural factors that influence the impact of trauma. Chapter 3 broadly focuses on understanding the impact of trauma, trauma-related stress reactions and associated symptoms, and common mental health and substance use disorders associated with trauma. Chapter 4 provides an introduction to screening and assessment as they relate to trauma and is devoted to screening and assessment processes and tools that are useful in evaluating trauma exposure, its effects, and client intervention and treatment needs. Chapter 5 covers clinical issues that counselors and other behavioral health professionals may need to know and address when treating clients who have histories of trauma. Chapter 6 presents information on specific treatment models for trauma, distinguishing integrated models (which address substance use disorders, mental disorders, and trauma simultaneously) from those that treat trauma alone.

Advice to Counselors and/or Administrators boxes in Part 1 provide practical information for providers. Case illustrations, exhibits, and text boxes further illustrate information in the text by offering practical examples.

Part 2 provides an overview of programmatic and administrative practices that will help behavioral health program administrators increase the capacity of their organizations to deliver

trauma-informed services. Chapter 1 examines the essential ingredients, challenges, and processes in creating and implementing trauma-informed services within an organization. Chapter 2 focuses on key development activities that support staff members, including trauma-informed training and supervision, ethics, and boundaries pertinent to responding to traumatic stress, secondary trauma, and counselor self-care.

Advice to Administrators and/or Supervisors boxes in Part 2 highlight more detailed information that supports the organizational implementation of trauma-informed care (TIC). In addition, case illustrations, organizational activities, and text boxes reinforce the material presented within this section.

Part 3 is a literature review on TIC and behavioral health services and is intended for use by clinical supervisors, interested providers, and administrators. Part 3 has three sections: an analysis of the literature, links to select abstracts of the references most central to the topic, and a general bibliography of the available literature. To facilitate ongoing updates (performed periodically for up to 3 years from first publication), the literature review is only available online at the Substance Abuse and Mental Health Services Administration (SAMHSA) Publications Ordering Web page (http://store.samhsa.gov).

Terminology

Behavioral health: Throughout the TIP, the term "behavioral health" is used. Behavioral health refers to a state of mental/emotional being and/or choices and actions that affect wellness. Behavioral health problems include substance abuse or misuse, alcohol and drug addiction, serious psychological distress, suicide, and mental and substance use disorders. This includes a range of problems from unhealthy stress to diagnosable and treatable diseases like serious mental illness and substance use disorders, which are often chronic in nature but from which people can and do recover. The term is also used in this TIP to describe the service systems encompassing the promotion of emotional health, the prevention of mental and substance use disorders, substance use and related problems, treatments and services for mental and substance use disorders, and recovery support. Because behavioral health conditions, taken together, are the leading causes of disability burden in North America, efforts to improve their prevention and treatment will benefit society as a whole. Efforts to reduce the impact of mental and substance use disorders on America's communities, such as those described in this TIP, will help achieve nationwide improvements in health.

Client/consumer: In this TIP, the term "client" means anyone who seeks or receives mental health or substance abuse services. The term "consumer" stands in place of "client" in content areas that address consumer participation and determination. It is not the intent of this document to ignore the relevance and historical origin of the term "consumer" among individuals who have received, been subject to, or are seeking mental health services. Instead, we choose the word "client," given that this terminology is also commonly used in substance abuse treatment services. Note: This TIP also uses the term "participant(s)" instead of "client(s)" for individuals, families, or communities seeking or receiving prevention services.

Complex trauma: This manual adopts the National Child Traumatic Stress Network (NCTSN) definition of complex trauma. The term refers to the pervasive impact, including developmental

consequences, of exposure to multiple or prolonged traumatic events. According to the NCTSN Web site (http://www.nctsn.org/trauma-types), complex trauma typically involves exposure to sequential or simultaneous occurrences of maltreatment, "including psychological maltreatment, neglect, physical and sexual abuse, and domestic violence…. Exposure to these initial traumatic experiences—and the resulting emotional dysregulation and the loss of safety, direction, and the ability to detect or respond to danger cues—often sets off a chain of events leading to subsequent or repeated trauma exposure in adolescence and adulthood" (NCTSN, 2013).

Co-occurring disorders: When an individual has one or more mental disorders as well as one or more substance use disorders (including substance abuse), the term "co-occurring" applies. Although people may have a number of health conditions that co-occur, including physical problems, the term "co-occurring disorders," in this TIP, refers to substance use and mental disorders.

Cultural responsiveness and cultural competence: This TIP uses these terms interchangeably, with "responsiveness" applied to services and systems and "competence" applied to people, to refer to "a set of behaviors, attitudes, and policies that…enable a system, agency, or group of professionals to work effectively in cross-cultural situations" (Cross, Bazron, Dennis, & Isaacs, 1989, p. 13). Culturally responsive behavioral health services and culturally competent providers "honor and respect the beliefs, languages, interpersonal styles, and behaviors of individuals and families receiving services…. [C]ultural competence is a dynamic, ongoing developmental process that requires a long-term commitment and is achieved over time" (U.S. Department of Health and Human Services, 2003, p. 12).

Evidence-based practices: There are many different uses of the term "evidence-based practices." One of the most widely accepted is that of Chambless and Hollon (1998), who say that for a treatment to be considered evidence based, it must show evidence of positive outcomes based on peer-reviewed randomized controlled trials or other equivalent strong methodology. A treatment is labeled "strong" if criteria are met for what Chambless and Hollon term "well-established" treatments. To attain this level, rigorous treatment outcome studies conducted by independent investigators (not just the treatment developer) are necessary. Research support is labeled "modest" when treatments attain criteria for what Chambless and Hollon call "probably efficacious treatments." To meet this standard, one well-designed study or two or more adequately designed studies must support a treatment's efficacy. In addition, it is possible to meet the "strong" and "modest" thresholds through a series of carefully controlled single-case studies. An evidence-based practice derived from sound, science-based theories incorporates detailed and empirically supported procedures and implementation guidelines, including parameters of applications (such as for populations), inclusionary and exclusionary criteria for participation, and target interventions.

Promising practices: Even though current clinical wisdom, theories, and professional and expert consensus may support certain practices, these practices may lack support from studies that are scientifically rigorous in research design and statistical analysis; available studies may be limited in number or sample size, or they may not be applicable to the current setting or population. This TIP refers to such practices as "promising."

Recovery: This term denotes a process of change through which individuals improve their health and wellness, live a self-directed life, and strive to reach their full potential. Major dimensions that support a life in recovery, as defined by SAMHSA, include:

- ***Health:*** overcoming or managing one's disease(s) as well as living in a physically and emotionally healthy way.
- ***Home:*** a stable and safe place to live.
- ***Purpose:*** meaningful daily activities, such as a job, school, volunteerism, family caretaking, or creative endeavors, and the independence, income, and resources to participate in society.
- ***Community:*** relationships and social networks that provide support, friendship, love, and hope.

Resilience: This term refers to the ability to bounce back or rise above adversity as an individual, family, community, or provider. Well beyond individual characteristics of hardiness, resilience includes the process of using available resources to negotiate hardship and/or the consequences of adverse events. This TIP applies the term "resilience" and its processes to individuals across the life span.

Retraumatization: In its more literal translation, "retraumatization" means the occurrence of traumatic stress reactions and symptoms after exposure to multiple events (Duckworth & Follette, 2011). This is a significant issue for trauma survivors, both because they are at increased risk for higher rates of retraumatization, and because people who are traumatized multiple times often have more serious and chronic trauma-related symptoms than those with single traumas. In this manual, the term not only refers to the effect of being exposed to multiple events, but also implies the process of reexperiencing traumatic stress as a result of a current situation that mirrors or replicates in some way the prior traumatic experiences (e.g., specific smells or other sensory input; interactions with others; responses to one's surroundings or interpersonal context, such as feeling emotionally or physically trapped).

Secondary trauma: Literature often uses the terms "secondary trauma," "compassion fatigue," and "vicarious traumatization" interchangeably. Although compassion fatigue and secondary trauma refer to similar physical, psychological, and cognitive changes and symptoms that behavioral health workers may encounter when they work specifically with clients who have histories of trauma, vicarious trauma usually refers more explicitly to specific cognitive changes, such as in worldview and sense of self (Newell & MacNeil, 2010). This publication uses "secondary trauma" to describe trauma-related stress reactions and symptoms resulting from exposure to another individual's traumatic experiences, rather than from exposure directly to a traumatic event. Secondary trauma can occur among behavioral health service providers across all behavioral health settings and among all professionals who provide services to those who have experienced trauma (e.g., healthcare providers, peer counselors, first responders, clergy, intake workers).

Substance abuse: Throughout the TIP, the term "substance abuse" has been used to refer to both substance abuse and substance dependence. This term was chosen partly because behavioral health professionals commonly use the term substance abuse to describe any excessive use of addictive substances. In this TIP, the term refers to the use of alcohol as well as other substances of abuse. Readers should attend to the context in which the term occurs to determine what possible range of meanings it covers; in most cases, it will refer to all varieties of substance-related

disorders as found in *Diagnostic and Statistical Manual of Mental Disorders,* Fifth Edition (American Psychiatric Association, 2013a).

Trauma: In this text, the term "trauma" refers to experiences that cause intense physical and psychological stress reactions. It can refer to "a single event, multiple events, or a set of circumstances that is experienced by an individual as physically and emotionally harmful or threatening and that has lasting adverse effects on the individual's physical, social, emotional, or spiritual well-being" (SAMHSA, 2012, p. 2). Although many individuals report a single specific traumatic event, others, especially those seeking mental health or substance abuse services, have been exposed to multiple or chronic traumatic events. See the "What Is Trauma" section in Part 1, Chapter 1, for a more indepth definition and discussion of trauma.

Trauma-informed: A trauma-informed approach to the delivery of behavioral health services includes an understanding of trauma and an awareness of the impact it can have across settings, services, and populations. It involves viewing trauma through an ecological and cultural lens and recognizing that context plays a significant role in how individuals perceive and process traumatic events, whether acute or chronic. In May 2012, SAMHSA convened a group of national experts who identified three key elements of a trauma-informed approach: "(1) realizing the prevalence of trauma; (2) recognizing how trauma affects all individuals involved with the program, organization, or system, including its own workforce; and (3) responding by putting this knowledge into practice" (SAMHSA, 2012, p 4).

Trauma-informed care: TIC is a strengths-based service delivery approach "that is grounded in an understanding of and responsiveness to the impact of trauma, that emphasizes physical, psychological, and emotional safety for both providers and survivors, and that creates opportunities for survivors to rebuild a sense of control and empowerment" (Hopper, Bassuk, & Olivet, 2010, p. 82). It also involves vigilance in anticipating and avoiding institutional processes and individual practices that are likely to retraumatize individuals who already have histories of trauma, and it upholds the importance of consumer participation in the development, delivery, and evaluation of services.

Trauma-specific treatment services: These services are evidence-based and promising practices that facilitate recovery from trauma. The term "trauma-specific services" refers to prevention, intervention, or treatment services that address traumatic stress as well as any co-occurring disorders (including substance use and mental disorders) that developed during or after trauma.

Trauma survivor: This phrase can refer to anyone who has experienced trauma or has had a traumatic stress reaction. Knowing that the use of language and words can set the tone for recovery or contribute to further retraumatization, it is the intent of this manual to put forth a message of hope by avoiding the term "victim" and instead using the term "survivor" when appropriate.

Part 1: A Practical Guide for the Provision of Behavioral Health Services

1 Trauma-Informed Care: A Sociocultural Perspective

IN THIS CHAPTER

- Scope of the TIP
- Intended Audience
- Before You Begin
- Structure of the TIP
- What Is Trauma?
- Trauma Matters in Behavioral Health Services
- Trauma Informed Intervention and Treatment Principles
- As You Proceed

Many individuals who seek treatment in behavioral health settings have histories of trauma, but they often don't recognize the significant effects of trauma in their lives; either they don't draw connections between their trauma histories and their presenting problems, or they avoid the topic altogether. Likewise, treatment providers may not ask questions that elicit a client's history of trauma, may feel unprepared to address trauma-related issues proactively, or may struggle to address traumatic stress effectively within the constraints of their treatment program, the program's clinical orientation, or their agency's directives.

By recognizing that traumatic experiences and their sequelae tie closely into behavioral health problems, front-line professionals and community-based programs can begin to build a trauma-informed environment across the continuum of care. Key steps include meeting client needs in a safe, collaborative, and compassionate manner; preventing treatment practices that retraumatize people with histories of trauma who are seeking help or receiving services; building on the strengths and resilience of clients in the context of their environments and communities; and endorsing trauma-informed principles in agencies through support, consultation, and supervision of staff.

This Treatment Improvement Protocol (TIP) begins by introducing the scope, purpose, and organization of the topic and describing its intended audience. Along with defining trauma and trauma-informed care (TIC), the first chapter discusses the rationale for addressing trauma in behavioral health services and reviews trauma-informed intervention and treatment principles. These principles serve as the TIP's conceptual framework.

Scope of the TIP

Many individuals experience trauma during their lifetimes. Although many people exposed to trauma demonstrate few or no lingering symptoms, those individuals who have experienced repeated, chronic, or multiple traumas are more likely to exhibit pronounced symptoms and consequences, including substance abuse, mental illness, and health problems. Subsequently, trauma can significantly affect how an individual engages in major life areas as well as treatment.

This TIP provides evidence-based and best practice information for behavioral health service providers and administrators who want to work more effectively with people who have been exposed to acute and chronic traumas and/or are at risk of developing traumatic stress reactions. Using key trauma-informed principles, this TIP addresses trauma-related prevention, intervention, and treatment issues and strategies in behavioral health services. The content is adaptable across behavioral health settings that service individuals, families, and communities—placing emphasis on the importance of coordinating as well as integrating services.

Intended Audience

This TIP is for behavioral health service providers, prevention specialists, and program administrators—the professionals directly responsible for providing care to trauma survivors across behavioral health settings, including substance abuse and mental health services. This TIP also targets primary care professionals, including physicians; teams working with clients and communities who have experienced trauma; service providers in the criminal justice system; and researchers with an interest in this topic.

Before You Begin

This TIP endorses a trauma-informed model of care; this model emphasizes the need for behavioral health practitioners and organizations to recognize the prevalence and pervasive impact of trauma on the lives of the people they serve and develop trauma-sensitive or trauma-responsive services. This TIP provides key information to help behavioral health practitioners and program administrators become trauma aware and informed, improve screening and assessment processes, and implement science-informed intervention strategies across settings and modalities in behavioral health services. Whether provided by an agency or an individual provider, trauma-informed services may or may not include trauma-specific services or trauma specialists (individuals who have advanced training and education to provide specific treatment interventions to address traumatic stress reactions). Nonetheless, TIC anticipates the role that trauma can play across the continuum of care—establishing integrated and/or collaborative processes to address the needs of traumatized individuals and communities proactively.

Individuals who have experienced trauma are at an elevated risk for substance use disorders, including abuse and dependence; mental health problems (e.g., depression and anxiety symptoms or disorders, impairment in relational/social and other major life areas, other distressing symptoms); and physical disorders and conditions, such as sleep disorders. This TIP focuses on specific types of prevention (Institute of Medicine et al., 2009): selective prevention, which targets people who are at risk for developing social, psychological, or other conditions as a result of trauma or who are at greater risk for experiencing trauma due to behavioral health disorders or conditions; and indicated prevention, which targets people who display early signs of trauma-related

symptoms. This TIP identifies interventions, including trauma-informed and trauma-specific strategies, and perceives treatment as a means of prevention—building on resilience, developing safety and skills to negotiate the impact of trauma, and addressing mental and substance use disorders to enhance recovery.

This TIP's target population is adults. Beyond the context of family, this publication does not examine or address youth and adolescent responses to trauma, youth-tailored trauma-informed strategies, or trauma-specific interventions for youth or adolescents, because the developmental and contextual issues of these populations require specialized interventions. Providers who work with young clients who have experienced trauma should refer to the resource list in Appendix B. This TIP covers TIC, trauma characteristics, the impact of traumatic experiences, assessment, and interventions for persons who have had traumatic experiences. Considering the vast knowledge base and specificity of individual, repeated, and chronic forms of trauma, this TIP does not provide a comprehensive overview of the unique characteristics of each type of trauma (e.g., sexual abuse, torture, war-related trauma, murder). Instead, this TIP provides an overview supported by examples. For more information on several specific types of trauma, please refer to TIP 36, *Substance Abuse Treatment for Persons With Child Abuse and Neglect Issues* (Center for Substance Abuse Treatment [CSAT], 2000b), TIP 25, *Substance Abuse Treatment and Domestic Violence* (CSAT, 1997b), TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d), and the planned TIP, *Reintegration-Related Behavioral Health Issues in Veterans and Military Families* (Substance Abuse and Mental Health Services Administration [SAMHSA], planned f).

This TIP, *Trauma-Informed Care in Behavioral Health Services*, is guided by SAMHSA's Strategic Initiatives described in *Leading Change: A Plan for SAMHSA's Roles and Actions 2011–2014* (SAMHSA, 2011b). Specific to Strategic Initiative #2, Trauma and Justice, this TIP addresses several goals, objectives, and actions outlined in this initiative by providing behavioral health practitioners, supervisors, and administrators with an introduction to culturally responsive TIC.

Specifically, the TIP presents fundamental concepts that behavioral health service providers can use to:

- Become trauma aware and knowledgeable about the impact and consequences of traumatic experiences for individuals, families, and communities.
- Evaluate and initiate use of appropriate trauma-related screening and assessment tools.
- Implement interventions from a collaborative, strengths-based approach, appreciating the resilience of trauma survivors.
- Learn the core principles and practices that reflect TIC.
- Anticipate the need for specific trauma-informed treatment planning strategies that support the individual's recovery.
- Decrease the inadvertent retraumatization that can occur from implementing standard organizational policies, procedures, and interventions with individuals, including clients and staff, who have experienced trauma or are exposed to secondary trauma.
- Evaluate and build a trauma-informed organization and workforce.

The consensus panelists, as well as other contributors to this TIP, have all had experience as substance abuse and mental health counselors, prevention and peer specialists, supervisors, clinical directors, researchers, or administrators working with individuals, families, and

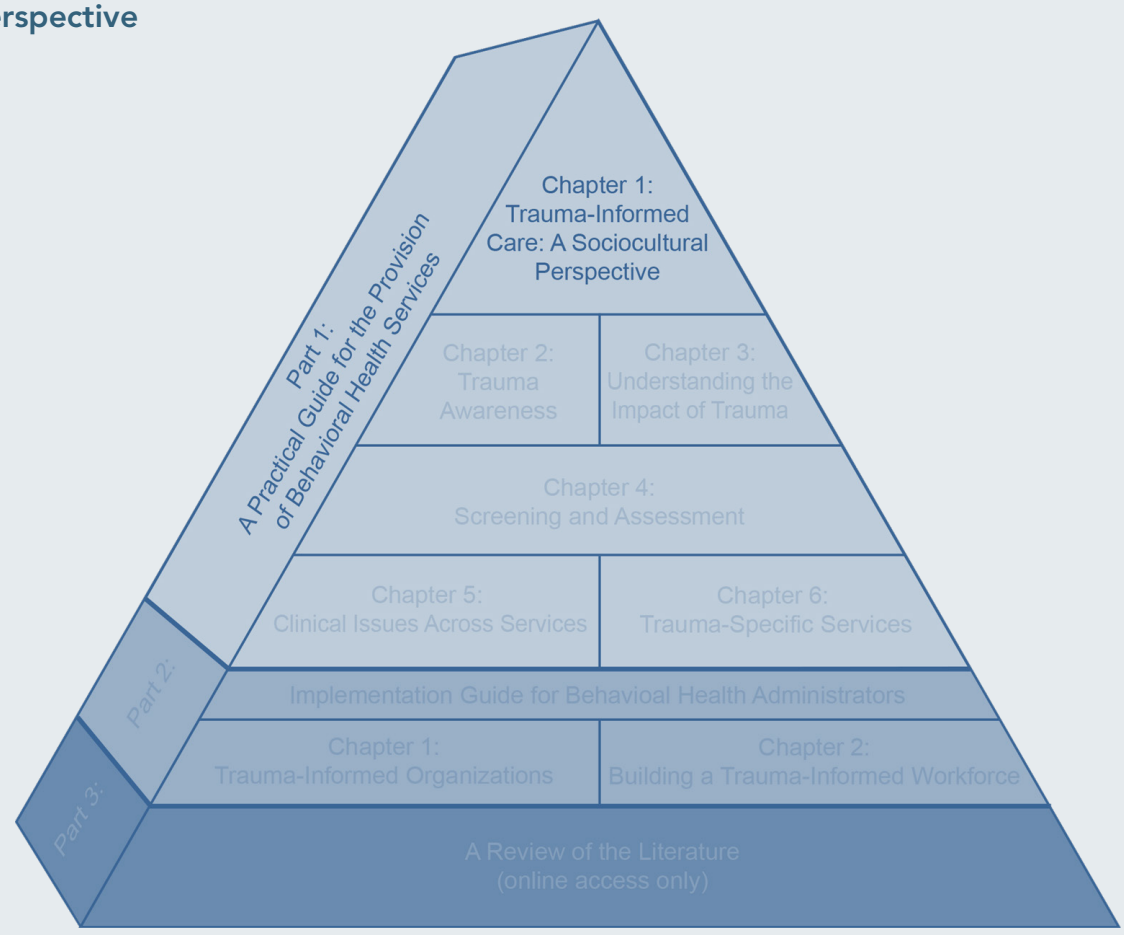
communities who have experienced trauma. The material presented in this TIP uses the wealth of their experience in addition to the available published resources and research relevant to this topic. Throughout the consensus process, the panel members were mindful of the strengths and resilience inherent in individuals, families, and communities affected by trauma and the challenges providers face in addressing trauma and implementing TIC.

Structure of the TIP

Using a TIC framework (Exhibit 1.1-1), this TIP provides information on key aspects of trauma, including what it is; its consequences; screening and assessment; effective prevention, intervention, and treatment approaches; trauma recovery; the impact of trauma on service providers; programmatic and administrative practices; and trauma resources.

Note: To produce a user-friendly but informed document, the first two parts of the TIP include minimal citations. If you are interested in the citations associated with topics covered in Parts 1 and 2, please consult the review of the literature provided in Part 3 (available online at http://store.samhsa.gov). Parts 1 and 2 are easily read and digested on their own, but it is highly recommended that you read the literature review as well.

Exhibit 1.1-1: TIC Framework in Behavioral Health Services—Sociocultural Perspective



What Is Trauma?

According to SAMHSA's Trauma and Justice Strategic Initiative, "trauma results from an event, series of events, or set of circumstances that is experienced by an individual as physically or emotionally harmful or threatening and that has lasting adverse effects on the individual's functioning and physical, social, emotional, or spiritual well-being" (SAMHSA, 2012, p. 2). Trauma can affect people of every race, ethnicity, age, sexual orientation, gender, psychosocial background, and geographic region. A traumatic experience can be a single event, a series of events, and/or a chronic condition (e.g., childhood neglect, domestic violence). Traumas can affect individuals, families, groups, communities, specific cultures, and generations. It generally overwhelms an individual's or community's resources to cope, and it often ignites the "fight, flight, or freeze" reaction at the time of the event(s). It frequently produces a sense of fear, vulnerability, and helplessness.

See Appendix C to read about the history of trauma and trauma interventions.

Often, traumatic events are unexpected. Individuals may experience the traumatic event directly, witness an event, feel threatened, or hear about an event that affects someone they know. Events may be human-made, such as a mechanical error that causes a disaster, war, terrorism, sexual abuse, or violence, or they can be the products of nature (e.g., flooding, hurricanes, tornadoes). Trauma can occur at any age or developmental stage, and often, events that occur outside expected life stages are perceived as traumatic (e.g., a child dying before a parent, cancer as a teen, personal illness, job loss before retirement).

It is not just the event itself that determines whether something is traumatic, but also the individual's experience of the event. Two people may be exposed to the same event or series of events but experience and interpret these events in vastly different ways. Various biopsychosocial and cultural factors influence an individual's immediate response and long-term reactions to trauma. For most, regardless of the severity of the trauma, the immediate or enduring effects of trauma are met with resilience—the ability to rise above the circumstances or to meet the challenges with fortitude.

For some people, reactions to a traumatic event are temporary, whereas others have prolonged reactions that move from acute symptoms to more severe, prolonged, or enduring mental health consequences (e.g., posttraumatic stress and other anxiety disorders, substance use and mood disorders) and medical problems (e.g., arthritis, headaches, chronic pain). Others do not meet established criteria for posttraumatic stress or other mental disorders but encounter significant trauma-related symptoms or culturally expressed symptoms of trauma (e.g., somatization, in which psychological stress is expressed through physical concerns). For that reason, even if an individual does not meet diagnostic criteria for trauma-related disorders, it is important to recognize that trauma may still affect his or her life in significant ways. For more information on traumatic events, trauma characteristics, traumatic stress reactions, and factors that heighten or decrease the impact of trauma, see Part 1, Chapter 2, "Trauma Awareness," and Part 1, Chapter 3, "Understanding the Impact of Trauma."

Trauma Matters in Behavioral Health Services

The past decade has seen an increased focus on the ways in which trauma, psychological distress, quality of life, health, mental illness,

and substance abuse are linked. With the attacks of September 11, 2001, and other acts of terror, the wars in Iraq and Afghanistan, disastrous hurricanes on the Gulf Coast, and sexual abuse scandals, trauma has moved to the forefront of national consciousness.

Trauma was once considered an abnormal experience. However, the first National Comorbidity Study established how prevalent traumas were in the lives of the general population of the United States. In the study, 61 percent of men and 51 percent of women reported experiencing at least one trauma in their lifetime, with witnessing a trauma, being involved in a natural disaster, and/or experiencing a life-threatening accident ranking as the most common events (Kessler et al., 1999). In Wave 2 of the National Epidemiologic Survey on Alcohol and Related Conditions, 71.6 percent of the sample reported witnessing trauma, 30.7 percent experienced a trauma that resulted in injury, and 17.3 percent experienced psychological trauma (El-Gabalawy, 2012). For a thorough review of the impact of trauma on quality of life and health and among individuals with mental and substance use disorders, refer to Part 3 of this TIP, the online literature review.

Rationale for TIC

Integrating TIC into behavioral health services provides many benefits not only for clients, but also for their families and communities, for behavioral health service organizations, and for staff. Trauma-informed services bring to the forefront the belief that trauma can pervasively affect an individual's well-being, including physical and mental health. For behavioral health service providers, trauma-informed practice offers many opportunities. It reinforces the importance of acquiring trauma-specific knowledge and skills to meet the specific needs of clients; of recognizing that individuals may be affected by trauma regardless of its acknowledgment; of understanding that trauma likely affects many clients who are seeking behavioral health services; and of acknowledging that organizations and providers can retraumatize clients through standard or unexamined policies and practices. TIC stresses the importance of addressing the client individually rather than applying general treatment approaches.

TIC provides clients more opportunities to engage in services that reflect a compassionate perspective of their presenting problems. TIC can potentially provide a greater sense of safety for clients who have histories of trauma and a platform for preventing more serious consequences of traumatic stress (Fallot & Harris, 2001). Although many individuals may not identify the need to connect with their histories, trauma-informed services offer clients a chance to explore the impact of trauma, their strengths and creative adaptations in managing traumatic histories, their resilience, and the relationships among trauma, substance use, and psychological symptoms.

Two Influential Studies That Set the Stage for the Development of TIC

The Adverse Childhood Experiences Study (Centers for Disease Control and Prevention, 2013) was a large epidemiological study involving more than 17,000 individuals from United States; it analyzed the long-term effects of childhood and adolescent traumatic experiences on adult health risks, mental health, healthcare costs, and life expectancy.

The Women, Co-Occurring Disorders and Violence Study (SAMHSA, 2007) was a large multisite study focused on the role of interpersonal and other traumatic stressors among women; the interrelatedness of trauma, violence, and co-occurring substance use and mental disorders; and the incorporation of trauma-informed and trauma-specific principles, models, and services.

Implementing trauma-informed services can improve screening and assessment processes, treatment planning, and placement while also decreasing the risk for retraumatization. The implementation may enhance communication between the client and treatment provider, thus decreasing risks associated with misunderstanding the client's reactions and presenting problems or underestimating the need for appropriate referrals for evaluation or trauma-specific treatment. Organizational investment in developing or improving trauma-informed services may also translate to cost effectiveness, in that services are more appropriately matched to clients from the outset. TIC is an essential ingredient in organizational risk management; it ensures the implementation of decisions that will optimize therapeutic outcomes and minimize adverse effects on the client and, ultimately, the organization. A key principle is the engagement of community, clients, and staff. Clients and staff are more apt to be empowered, invested, and satisfied if they are involved in the ongoing development and delivery of trauma-informed services.

An organization also benefits from work development practices through planning for, attracting, and retaining a diverse workforce of individuals who are knowledgeable about trauma and its impact. Developing a trauma-informed organization involves hiring and promotional practices that attract and retain individuals who are educated and trained in trauma-informed practices on all levels of the organization, including board as well as peer support appointments. Trauma-informed organizations are invested in their staff and adopt similar trauma-informed principles, including establishing and providing ongoing support to promote TIC in practice and in addressing secondary trauma and implementing processes that reinforce the safety of the staff. Even though investing in a trauma-informed workforce does not necessarily guarantee trauma-informed practices, it is more likely that services will evolve more proficiently to meet client, staff, and community needs.

Advice to Counselors: The Importance of TIC

The history of trauma raises various clinical issues. Many counselors do not have extensive training in treating trauma or offering trauma-informed services and may be uncertain of how to respond to clients' trauma-related reactions or symptoms. Some counselors have experienced traumas themselves that may be triggered by clients' reports of trauma. Others are interested in helping clients with trauma but may unwittingly cause harm by moving too deeply or quickly into trauma material or by discounting or disregarding a client's report of trauma. Counselors must be aware of trauma-related symptoms and disorders and how they affect clients in behavioral health treatment.

Counselors with primary treatment responsibilities should also have an understanding of how to recognize trauma-related reactions, how to incorporate treatment interventions for trauma-related symptoms into clients' treatment plans, how to help clients build a safety net to prevent further trauma, how to conduct psychoeducational interventions, and when to make treatment referrals for further evaluations or trauma-specific treatment services. All treatment staff should recognize that traumatic stress symptoms or trauma-related disorders should not preclude an individual from mental health or substance abuse treatment and that all co-occurring disorders need to be addressed on some level in the treatment plan and setting. For example, helping a client in substance abuse treatment gain control over trauma-related symptoms can greatly improve the client's chances of substance abuse recovery and lower the possibility of relapse (Farley, Golding, Young, Mulligan, & Minkoff, 2004; Ouimette, Ahrens, Moos, & Finney, 1998). In addition, assisting a client in achieving abstinence builds a platform upon which recovery from traumatic stress can proceed.

Trauma and Substance Use Disorders

Many people who have substance use disorders have experienced trauma as children or adults (Koenen, Stellman, Sommer, & Stellman, 2008; Ompad et al., 2005). Substance abuse is known to predispose people to higher rates of traumas, such as dangerous situations and accidents, while under the influence (Stewart & Conrod, 2003; Zinzow, Resnick, Amstadter, McCauley, Ruggiero, & Kilpatrick, 2010) and as a result of the lifestyle associated with substance abuse (Reynolds et al., 2005). In addition, people who abuse substances and have experienced trauma have worse treatment outcomes than those without histories of trauma (Driessen et al., 2008; Najavits et al., 2007). Thus, the process of recovery is more difficult, and the counselor's role is more challenging, when clients have histories of trauma. A person presenting with both trauma and substance abuse issues can have a variety of other difficult life problems that commonly accompany these disorders, such as other psychological symptoms or mental disorders, poverty, homelessness, increased risk of HIV and other infections, and lack of social support (Mills, Teesson, Ross, & Peters, 2006; Najavits, Weiss, & Shaw, 1997). Many individuals who seek treatment for substance use disorders have histories of one or more traumas. More than half of women seeking substance abuse treatment report one or more lifetime traumas (Farley, Golding, Young, Mulligan, & Minkoff, 2004; Najavits et al., 1997), and a significant number of clients in inpatient treatment also have subclinical traumatic stress symptoms or posttraumatic stress disorder (PTSD; Falck, Wang, Siegal, & Carlson, 2004; Grant et al., 2004; Reynolds et al., 2005).

Trauma and Mental Disorders

People who are receiving treatment for severe mental disorders are more likely to have histories of trauma, including childhood physical and sexual abuse, serious accidents, homelessness, involuntary psychiatric hospitalizations, drug overdoses, interpersonal violence, and other forms of violence. Many clients with severe mental disorders meet criteria for PTSD; others with serious mental illness who have histories of trauma present with psychological symptoms or mental disorders that are commonly associated with a history of trauma, including anxiety symptoms and disorders, mood disorders (e.g., major depression, dysthymia, bipolar disorder; Mueser et al., 2004), impulse control disorders, and substance use disorders (Kessler, Chiu, Demler, & Walters, 2005).

Traumatic stress increases the risk for mental illness, and findings suggest that traumatic stress increases the symptom severity of mental illness (Spitzer, Vogel, Barnow, Freyberger & Grabe, 2007). These findings propose that traumatic stress plays a significant role in perpetuating and exacerbating mental illness and suggest that trauma often precedes the development of mental disorders. As with trauma and substance use disorders, there is a bidirectional relationship; mental illness increases the risk of experiencing trauma, and trauma increases the risk of developing psychological symptoms and mental disorders. For a more comprehensive review of the interactions among traumatic stress, mental illness, and substance use disorders, refer to Part 3 of this TIP, the online literature review.

Trauma-Informed Intervention and Treatment Principles

TIC is an intervention and organizational approach that focuses on how trauma may affect an individual's life and his or her response to behavioral health services from prevention through treatment. There are many definitions of TIC and various models for incorporating it across organizations, but a "trauma-informed approach incorporates three key elements: (1) *realizing* the prevalence of trauma; (2) *recognizing* how trauma affects all individuals involved with the program, organization, or system, including its own workforce; and (3) *responding* by putting this knowledge into practice" (SAMHSA, 2012, p. 4).

TIC begins with the first contact a person has with an agency; it requires all staff members (e.g., receptionists, intake personnel, direct care staff, supervisors, administrators, peer supports, board members) to recognize that the individual's experience of trauma can greatly influence his or her receptivity to and engagement with services, interactions with staff and clients, and responsiveness to program guidelines, practices, and interventions. TIC includes program policies, procedures, and practices to protect the vulnerabilities of those who have experienced trauma and those who provide trauma-related services. TIC is created through a supportive environment and by redesigning organizational practices, with consumer participation, to prevent practices that could be retraumatizing (Harris & Fallot, 2001c; Hopper et al., 2010). The ethical principle, "first, do no harm," resonates strongly in the application of TIC.

> "A program, organization, or system that is trauma informed realizes the widespread impact of trauma and under stands poten tial paths for healing; recognizes the signs and symptoms of trauma in staff, clients, and others involved with the system; and responds by fully integrating knowledge about trauma into policies, procedures, practices, and settings."
>
> (SAMHSA, 2012, p. 4)

TIC involves a commitment to building competence among staff and establishing programmatic standards and clinical guidelines that support the delivery of trauma-sensitive services. It encompasses recruiting, hiring, and retaining competent staff; involving consumers, trauma survivors, and peer support specialists in the planning, implementation, and evaluation of trauma-informed services; developing collaborations across service systems to streamline referral processes, thereby securing trauma-specific services when appropriate; and building a continuity of TIC as consumers move from one system or service to the next. TIC involves reevaluating each service delivery component through a trauma-aware lens.

The principles described in the following subsections serve as the TIP's conceptual

Advice to Counselors: Implementing Trauma-Informed Services

Recognizing that trauma affects a majority of clients served within public health systems, the National Center for Trauma-Informed Care (NCTIC) has sought to establish a comprehensive framework to guide systems of care in the development of trauma-informed services. If a system or program is to support the needs of trauma survivors, it must take a systematic approach that offers trauma-specific diagnostic and treatment services, as well as a trauma-informed environment that is able to sustain such services, while fostering positive outcomes for the clients it serves. NCTIC also offers technical assistance in the implementation of trauma-informed services. For specific administrative information on TIC implementation, refer to Part 2, Chapters 1 and 2, of this TIP.

framework. These principles comprise a compilation of resources, including research, theoretical papers, commentaries, and lessons learned from treatment facilities. Key elements are outlined for each principle in providing services to clients affected by trauma and to populations most likely to incur trauma. Although these principles are useful across all prevention and intervention services, settings, and populations, they are of the utmost importance in working with people who have had traumatic experiences.

Promote Trauma Awareness and Understanding

Foremost, a behavioral health service provider must recognize the prevalence of trauma and its possible role in an individual's emotional, behavioral, cognitive, spiritual, and/or physical development, presentation, and well-being. Being vigilant about the prevalence and potential consequences of traumatic events among clients allows counselors to tailor their presentation styles, theoretical approaches, and intervention strategies from the outset to plan for and be responsive to clients' specific needs. Although not every client has a history of trauma, those who have substance use and mental disorders are more likely to have experienced trauma. Being trauma aware does not mean that you must assume everyone has a history of trauma, but rather that you anticipate the possibility from your initial contact and interactions, intake processes, and screening and assessment procedures.

Even the most standard behavioral health practices can retraumatize an individual exposed to prior traumatic experiences if the provider implements them without recognizing or considering that they may do harm. For example, a counselor might develop a treatment plan recommending that a female client—who has been court mandated to substance abuse treatment and was raped as an adult—attend group therapy, but without considering the implications, for her, of the fact that the only available group at the facility is all male and has had a low historical rate of female participation. Trauma awareness is an essential strategy for preventing this type of retraumatization; it reinforces the need for providers to reevaluate their usual practices.

> "Trauma informed care embraces a perspective that highlights adaptation over symptoms and resilience over pathology."
>
> (Elliot, Bjelajac, Fallot, Markoff, & Reed, 2005, p. 467)

Becoming trauma aware does not stop with the recognition that trauma can affect clients; instead, it encompasses a broader awareness that traumatic experiences as well as the impact of an individual's trauma can extend to significant others, family members, first responders and other medical professionals, behavioral health workers, broader social networks, and even entire communities. Family members frequently experience the traumatic stress reactions of the individual family member who was traumatized (e.g., angry outbursts, nightmares, avoidant behavior, other symptoms of anxiety, overreactions or underreactions to stressful events). These repetitive experiences can increase the risk of secondary trauma and symptoms of mental illness among the family, heighten the risk for externalizing and internalizing behavior among children (e.g., bullying others, problems in social relationships, health-damaging behaviors), increase children's risk for developing posttraumatic stress later in life, and lead to a greater propensity for traumatic stress reactions across generations of the family. Hence, prevention and intervention services can provide education and age-appropriate programming tailored to develop coping skills and support systems.

So too, behavioral health service providers can be influenced by exposure to trauma-related affect and content when working with clients. A trauma-aware workplace supports supervision and program practices that educate all direct service staff members on secondary trauma, encourages the processing of trauma-related content through participation in peer-supported activities and clinical supervision, and provides them with professional development opportunities to learn about and engage in effective coping strategies that help prevent secondary trauma or trauma-related symptoms. It is important to generate trauma awareness in agencies through education across services and among all staff members who have any direct or indirect contact with clients (including receptionists or intake and admission personnel who engage clients for the first time within the agency). Agencies can maintain a trauma-aware environment through ongoing staff training, continued supervisory and administrative support, collaborative (i.e., involving consumer participation) trauma-responsive program design and implementation, and organizational policies and practices that reflect accommodation and flexibility in attending to the needs of clients affected by trauma.

Recognize That Trauma-Related Symptoms and Behaviors Originate From Adapting to Traumatic Experiences

A trauma-informed perspective views trauma-related symptoms and behaviors as an individual's best and most resilient attempt to manage, cope with, and rise above his or her experience of trauma. Some individuals' means of adapting and coping have produced little difficulty; the coping and adaptive strategies of others have worked in the past but are not working as well now. Some people have difficulties in one area of life but have effectively negotiated and functioned in other areas.

Individuals who have survived trauma vary widely in how they experience and express traumatic stress reactions. Traumatic stress reactions vary in severity; they are often measured by the level of impairment or distress that clients report and are determined by the multiple factors that characterize the trauma itself, individual history and characteristics, developmental factors, sociocultural attributes, and available resources. The characteristics of the trauma and the subsequent traumatic stress reactions can dramatically influence how individuals respond to the environment, relationships, interventions, and treatment services, and those same characteristics can also shape the assumptions that clients/consumers make about their world (e.g., their view of others, sense of safety), their future (e.g., hopefulness, fear of a foreshortened future), and themselves (e.g., feeling resilient, feeling incompetent in regulating emotions). The breadth of these effects may be observable or subtle.

Once you become aware of the significance of traumatic experiences in clients' lives and begin to view their presentation as adaptive, your identification and classification of their presenting symptoms and behaviors can shift from a "pathology" mindset (i.e., defining clients strictly from a diagnostic label, implying that something is wrong with them) to one of resilience—a mindset that views clients' presenting difficulties, behaviors, and emotions as responses to surviving trauma. In essence, you will come to view traumatic stress reactions as *normal* reactions to *abnormal* situations. In embracing the belief that trauma-related reactions are adaptive, you can begin relationships with clients from a hopeful, strengths-based stance that builds upon the belief that their responses to traumatic experiences reflect creativity, self-preservation, and determination.

This will help build mutual and collaborative therapeutic relationships, help clients identify what has worked and has not worked in their attempts to deal with the aftermath of trauma from a nonjudgmental stance, and develop intervention and coping strategies that are more likely to fit their strengths and resources. This view of trauma prevents further retraumatization by not defining traumatic stress reactions as pathological or as symptoms of pathology.

View Trauma in the Context of Individuals' Environments

Many factors contribute to a person's response to trauma, whether it is an individual, group, or community-based trauma. Individual attributes, developmental factors (including protective and risk factors), life history, type of trauma, specific characteristics of the trauma, amount and length of trauma exposure, cultural meaning of traumatic events, number of losses associated with the trauma, available resources (internal and external, such as coping skills and family support), and community reactions are a few of the determinants that influence a person's responses to trauma across time. Refer to the "View Trauma Through a Sociocultural Lens" section later in this chapter for more specific information highlighting the importance of culture in understanding and treating the effects of trauma.

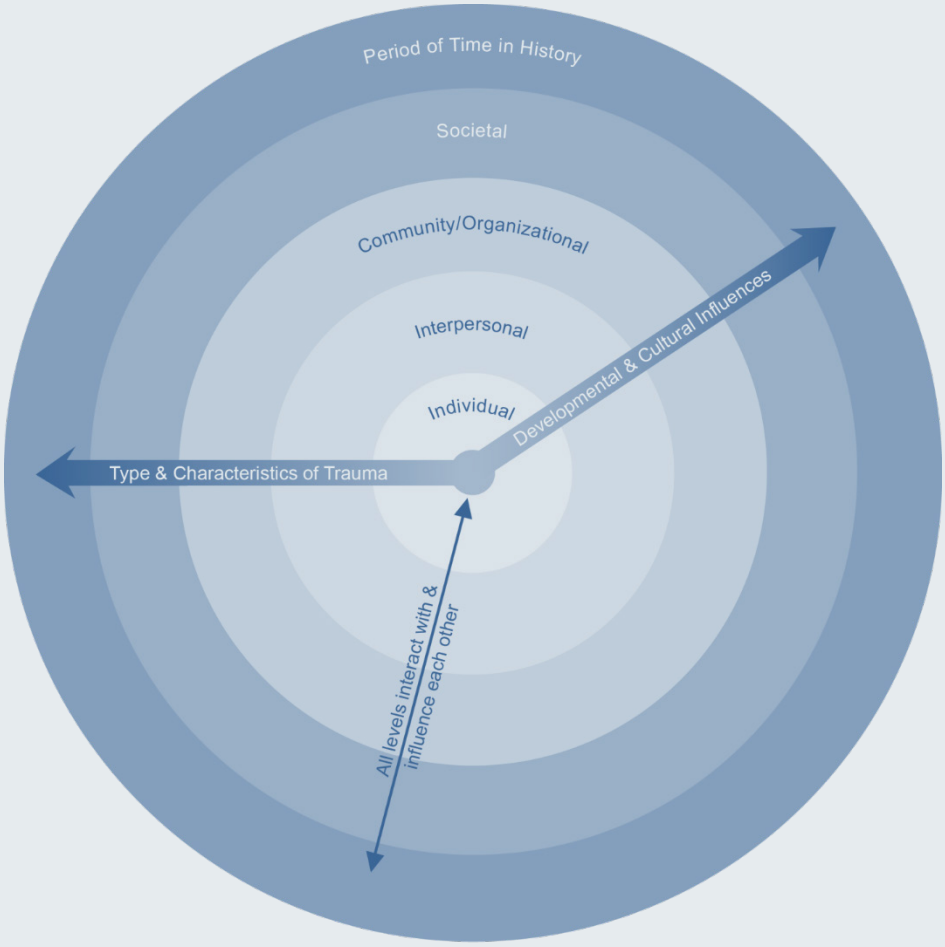
Trauma cannot be viewed narrowly; instead, it needs to be seen through a broader lens—a contextual lens integrating biopsychosocial, interpersonal, community, and societal (the degree of individualistic or collective cultural values) characteristics that are evident preceding and during the trauma, in the immediate and sustained response to the event(s), and in the short- and long-term effects of the traumatic event(s), which may include housing availability, community response, adherence to or maintenance of family routines and structure, and level of family support.

To more adequately understand trauma, you must also consider the contexts in which it occurred. Understanding trauma from this angle helps expand the focus beyond individual characteristics and effects to a broader systemic perspective that acknowledges the influences of social interactions, communities, governments, cultures, and so forth, while also examining the possible interactions among those various influences. Bronfenbrenner's (1979) and Bronfenbrenner and Ceci's (1994) work on ecological models sparked the development of other contextual models. In recent years, the social-ecological framework has been adopted in understanding trauma, in implementing health promotion and other prevention strategies, and in developing treatment interventions (Centers for Disease Control and Prevention, 2009). Here are the three main beliefs of a social-ecological approach (Stokols, 1996):

- Environmental factors greatly influence emotional, physical, and social well-being.
- A fundamental determinant of health versus illness is the degree of fit between individuals' biological, behavioral, and sociocultural needs and the resources available to them.
- Prevention, intervention, and treatment approaches integrate a combination of strategies targeting individual, interpersonal, and community systems.

This TIP uses a social-ecological model to explore trauma and its effects (Exhibit 1.1-2). The focus of this model is not only on negative attributes (risk factors) across each level, but also on positive ingredients (protective factors) that protect against or lessen the impact of trauma. This model also guides the inclusion of certain targeted interventions in this text, including selective and indicated

Exhibit 1.1-2: A Social-Ecological Model for Understanding Trauma and Its Effects



prevention activities. In addition, culture, developmental processes (including the developmental stage or characteristics of the individual and/or community), and the specific era when the trauma(s) occurred can significantly influence how a trauma is perceived and processed, how an individual or community engages in help-seeking, and the degree of accessibility, acceptability, and availability of individual and community resources.

Depending on the developmental stage and/or processes in play, children, adolescents, and adults will perceive, interpret, and cope with traumatic experiences differently. For example, a child may view a news story depicting a traumatic event on television and believe that the trauma is recurring every time they see the scene replayed. Similarly, the era in which one lives and the timing of the trauma can greatly influence an individual or community response. Take, for example, a pregnant woman who is abusing drugs and is wary of receiving medical treatment after being beaten in a domestic dispute. She may fear losing her children or being arrested for child neglect. Even though a number of States have adopted policies focused on the importance of treatment for pregnant women who are abusing drugs and of the accessibility of prenatal care, other States have approached this issue from a criminality standpoint (e.g., with child welfare and criminal laws) in the past few decades. Thus, the traumatic event's timing is a significant

component in understanding the context of trauma and trauma-related responses.

The social-ecological model depicted in Exhibit 1.1-2 provides a systemic framework for looking at individuals, families, and communities affected by trauma in general; it highlights the bidirectional influence that multiple contexts can have on the provision of behavioral health services to people who have experienced trauma (see thin arrow). Each ring represents a different system (refer to Exhibit 1.1-3 for examples of specific factors within each system). The innermost ring represents the individual and his or her biopsychosocial characteristics. The "Interpersonal" circle embodies all immediate relationships including family, friends, peers, and others. The "Community/Organizational" band represents social support networks, workplaces, neighborhoods, and institutions that directly influence the individual and his/her relationships. The "Societal" circle signifies the largest system—State and Federal policies and laws, such as economic and healthcare policies, social norms, governmental systems, and political ideologies. The outermost ring, "Period of Time in History," reflects the significance of the period of time during which the event occurred; it influences each other level represented in the circle. For example, making a comparison of society's attitudes and responses to veterans' homecomings across different wars and conflicts through time shows that homecoming environments can have either a protective or a negative effect on healing from the psychological and physical wounds of war, depending on the era in question. The thicker arrows in the figure represent the key influences of culture, developmental characteristics, and the type and characteristics of the trauma. All told, the context of traumatic events can significantly influence both initial and sustained responses to trauma; treatment needs; selection of prevention, intervention, and other treatment

Exhibit 1.1-3: Understanding the Levels Within the Social-Ecological Model of Trauma and Its Effects

Individual Factors	Interpersonal Factors	Community and Organizational Factors	Societal Factors	Cultural and Developmental Factors	Period of Time in History
Age, biophysical state, mental health status, temperament and other personality traits, education, gender, coping styles, socioeconomic status	Family, peer, and significant other interaction patterns, parent/family mental health, parents' history of trauma, social network	Neighborhood quality, school system and/or work environment, behavioral health system quality and accessibility, faith-based settings, transportation availability, community socioeconomic status, community employment rates	Laws, State and Federal economic and social policies, media, societal norms, judicial system	Collective or individualistic cultural norms, ethnicity, cultural subsystem norms, cognitive and maturational development	Societal attitudes related to military service members' homecomings, changes in diagnostic understanding between DSM-III-R* and DSM-5**

***Diagnostic and Statistical Manual of Mental Disorders,* Fifth Edition (APA, 2013a)

Case Illustration: Marisol

Marisol is a 28-year-old Latina woman working as a barista at a local coffee shop. One evening, she was driving home in the rain when a drunk driver crossed into her lane and hit her head on. Marisol remained conscious as she waited to be freed from the car and was then transported to the hospital. She sustained fractures to both legs. Her recovery involved two surgeries and nearly 6 months of rehabilitation, including initial hospitalization and outpatient physical therapy.

She described her friends and family as very supportive, saying that they often foresaw what she needed before she had to ask. She added that she had an incredible sense of gratitude for her employer and coworkers, who had taken turns visiting and driving her to appointments. Although she was able to return to work after 9 months, Marisol continued experiencing considerable distress about her inability to sleep well, which started just after the accident. Marisol describes repetitive dreams and memories of waiting to be transported to the hospital after the crash. The other driver was charged with driving under the influence (DUI), and it was reported that he had been convicted two other times for a DUI misdemeanor.

Answering the following questions will help you see how the different levels of influence affect the impact and outcome of the traumatic event Marisol experienced, as well as her responses to that event:

1. Based on the limited information provided in this illustration, how might Marisol's personality affect the responses of her family and friends, her coworkers, and the larger community?
2. In what ways could Marisol's ethnic and cultural background influence her recovery?
3. What societal factors could play a role in the car crash itself and the outcomes for Marisol and the other driver?

Explore the influence of the period of time in history during which the scenario occurs—compare the possible outcomes for both Marisol and the other driver if the crash occurred 40 years ago versus in the present day.

strategies; and ways of providing hope and promoting recovery.

Minimize the Risk of Retraumatization or Replicating Prior Trauma Dynamics

Trauma-informed treatment providers acknowledge that clients who have histories of trauma may be more likely to experience particular treatment procedures and practices as negative, reminiscent of specific characteristics of past trauma or abuse, or retraumatizing—feeling as if the past trauma is reoccurring or as if the treatment experience is as dangerous and unsafe as past traumas. For instance, clients may express feelings of powerlessness or being trapped if they are not actively involved in treatment decisions; if treatment processes or providers mirror specific behavior from the clients' past experiences with trauma, they may voice distress or respond in the same way as they did to the original trauma. Among the potentially retraumatizing elements of treatment are seclusion or "time-out" practices that isolate individuals, mislabeling client symptoms as personality or other mental disorders rather than as traumatic stress reactions, interactions that command authority, treatment assignments that could humiliate clients (such as asking a client to wear a sign in group that reflects one of their treatment issues, even if the assignment centers on positive attributes of the client), confronting clients as resistant, or presenting treatment as conditional upon conformity to the provider's beliefs and definitions of issues.

Clients' experiences are unique to the specific traumas they have faced and the surrounding

circumstances before, during, and after that trauma, so remember that even seemingly safe and standard treatment policies and procedures, including physical plant operations (e.g., maintenance, grounds, fire and safety procedures), may feel quite the contrary for a client if one or more of those elements is reminiscent of his or her experience of trauma in some way. Examples include having limited privacy or personal space, being interviewed in a room that feels too isolating or confining, undergoing physical examination by a medical professional of the same sex as the client's previous perpetrator of abuse, attending a group session in which another client expresses anger appropriately in a role play, or being directed not to talk about distressing experiences as a means of deescalating traumatic stress reactions.

Although some treatment policies or procedures are more obviously likely to solicit distress than others, *all* standard practices should be evaluated for their potential to retraumatize a client; this cannot be done without knowing the specific features of the individual's history of trauma. Consider, for instance, a treatment program that serves meals including entrees that combine more than one food group. Your client enters this program and refuses to eat most of the time; he expresses anger toward dietary staff and claims that food choices are limited. You may initially perceive your client's refusal to eat or to avoid certain foods as an eating disorder or a behavioral problem. However, a trauma-aware perspective might change your assumptions; consider that this client experienced neglect and abuse surrounding food throughout childhood (his mother forced him to eat meals prepared by combining anything in the refrigerator and cooking them together).

Advice to Counselors and Administrators: Sending the Right Message About Trauma

How often have you heard "We aren't equipped to handle trauma" or "We don't have time to deal with reactions that surface if traumatic experiences are discussed in treatment" from counselors and administrators in behavioral health services? For agencies, staff members, and clients, these statements present many difficulties and unwanted outcomes. For a client, such comments may replicate his or her earlier encounters with others (including family, friends, and previous behavioral health professionals) who had difficulty acknowledging or talking about traumatic experiences with him or her. A hands-off approach to trauma can also reinforce the client's own desire to avoid such discussions. Even when agencies and staff are motivated in these sentiments by a good intention—to contain clients' feelings of being overwhelmed—such a perspective sends strong messages to clients that their experiences are not important, that they are not capable of handling their trauma-associated feelings, and that dealing with traumatic experiences is simply too dangerous. Statements like these imply that recovery is not possible and provide no structured outlet to address memories of trauma or traumatic stress reactions.

Nevertheless, determining how and when to address traumatic stress in behavioral health services can be a real dilemma, especially if there are no trauma-specific philosophical, programmatic, or procedural processes in place. For example, it is difficult to provide an appropriate forum for a client to address past traumas if no forethought has been given to developing interagency and intra-agency collaborations for trauma-specific services. By anticipating the need for trauma-informed services and planning ahead to provide appropriate services to people who are affected by trauma, behavioral health service providers and program administrators can begin to develop informed intervention strategies that send a powerful, positive message:

- Both clients and providers can competently manage traumatic experiences and reactions.
- Providers are interested in hearing clients' stories and attending to their experiences.
- Recovery is possible.

As a treatment provider, you cannot consistently predict what may or may not be upsetting or retraumatizing to clients. Therefore, it is important to maintain vigilance and an attitude of curiosity with clients, inquiring about the concerns that they express and/or present in treatment. Remember that certain behaviors or emotional expressions can reflect what has happened to them in the past.

Foremost, a trauma-informed approach begins with taking practical steps to reexamine treatment strategies, program procedures, and organizational polices that could solicit distress or mirror common characteristics of traumatic experiences (loss of control, being trapped, or feeling disempowered). To better anticipate the interplay between various treatment elements and the more idiosyncratic aspects of a particular client's trauma history, you can:

- Work with the client to learn the cues he or she associates with past trauma.
- Obtain a good history.
- Maintain a supportive, empathetic, and collaborative relationship.
- Encourage ongoing dialog.
- Provide a clear message of availability and accessibility throughout treatment.

In sum, trauma-informed providers anticipate and respond to potential practices that may be perceived or experienced as retraumatizing to clients; they are able to forge new ways to respond to specific situations that trigger a trauma-related response, and they can provide clients with alternative ways of engaging in a particularly problematic element of treatment.

Create a Safe Environment

The need to create a safe environment is not new to providers; it involves an agency-wide effort supported by effective policies and procedures. However, creating safety within a trauma-informed framework far exceeds the standard expectations of physical plant safety (e.g., facility, environmental, and space-related concerns), security (of staff members, clients, and personal property), policies and procedures (including those specific to seclusion and restraint), emergency management and disaster planning, and adherence to client rights. Providers must be responsive and adapt the environment to establish and support clients' sense of physical and emotional safety.

Beyond anticipating that various environmental stimuli within a program may generate strong emotions and reactions in a trauma survivor (e.g., triggers such as lighting, access to exits, seating arrangements, emotionality within a group, or visual or auditory stimuli) and implementing strategies to help clients cope with triggers that evoke their experiences with trauma, other key elements in establishing a safe environment include consistency in client interactions and treatment processes, following through with what has been reviewed or agreed upon in sessions or meetings, and dependability. Mike's case illustration depicts ways in which the absence of these key elements could erode a client's sense of safety during the treatment process.

Neither providers nor service processes are always perfect. Sometimes, providers

Case Illustration: Mike

From the first time you provide outpatient counseling to Mike, you explain that he can call an agency number that will put him in direct contact with someone who can provide further assistance or support if he has emotional difficulty after the session or after agency hours. However, when he attempts to call one night, no one is available despite what you've described. Instead, Mike is directed by an operator to either use his local emergency room if he perceives his situation to be a crisis or to wait for someone on call to contact him. The inconsistency between what you told him in the session and what actually happens when he calls makes Mike feel unsafe and vulnerable.

unintentionally relay information inaccurately or inconsistently to clients or other staff members; other times, clients mishear something, or extenuating circumstances prevent providers from responding as promised. Creating safety is not about getting it right all the time; it's about how consistently and forthrightly you handle situations with a client when circumstances provoke feelings of being vulnerable or unsafe. Honest and compassionate communication that conveys a sense of handling the situation together generates safety. It is equally important that safety extends beyond the client. Counselors and other behavioral health staff members, including peer support specialists, need to be able to count on the agency to be responsive to and maintain their safety within the environment as well. By incorporating an organizational ethos that recognizes the importance of practices that promote physical safety and emotional well-being, behavioral health staff members may be more likely to seek support and supervision when needed and to comply with clinical and programmatic practices that minimize risks for themselves and their clients.

Beyond an attitudinal promotion of safety, organizational leaders need to consider and create avenues of professional development and assistance that will give their staff the means to seek support and process distressing circumstances or events that occur within the agency or among their clientele, such as case consultation and supervision, formal or informal processes to debrief service providers about difficult clinical issues, and referral processes for client psychological evaluations and employee assistance for staff. Organizational practices are only effective if supported by unswerving trauma awareness, training, and education among staff. Jane's case illustration shows the impact of a minor but necessary postponement in staff orientation for a new hire—not an unusual circumstance in behavioral health programs that have heavy caseloads and high staff turnover.

Identify Recovery From Trauma as a Primary Goal

Often, people who initiate or are receiving mental health or substance abuse services don't identify their experiences with trauma as a significant factor in their current challenges or problems. In part, this is because people who have been exposed to trauma, whether once or repeatedly, are generally reluctant to revisit it. They may already feel stuck in repetitive memories or experiences, which may add to their existing belief that any intervention will make matters worse or, at least, no better. For some clients, any introduction to their trauma-related memories or minor cues reminiscent of the trauma will cause them to experience strong, quick-to-surface emotions, supporting their belief that addressing trauma is dangerous and that they won't be able to handle the

Case Illustration: Jane

Jane, a newly hired female counselor, had a nephew who took his own life. The program that hired her was short of workers at the time; therefore, Jane did not have an opportunity to engage sufficiently in orientation outside of reviewing the policies and procedure manual. In an attempt to present well to her new employer and supervisor, she readily accepted client assignments without considering her recent loss. By not immersing herself in the program's perspective and policies on staff well-being, ethical and clinical considerations in client assignments, and how and when to seek supervision, Jane failed to engage in the practices, heavily supported by the agency, that promoted safety for herself and her clients. Subsequently, she felt emotionally overwhelmed at work and would often abruptly request psychiatric evaluation for clients who expressed any feelings of hopelessness out of sheer panic that they would attempt suicide.

emotions or thoughts that result from attempting to do so. Others readily view their experiences of trauma as being in the past; as a result, they engage in distraction, dissociation, and/or avoidance (as well as adaptation) due to a belief that trauma has little impact on their current lives and presenting problems. Even individuals who are quite aware of the impact that trauma has had on their lives may still struggle to translate or connect how these events continue to shape their choices, behaviors, and emotions. Many survivors draw no connection between trauma and their mental health or substance abuse problems, which makes it more difficult for them to see the value of trauma-informed or trauma-specific interventions, such as creating safety, engaging in psychoeducation, enhancing coping skills, and so forth.

As a trauma-informed provider, it is important that you help clients bridge the gap between their mental health and substance-related issues and the traumatic experiences they may have had. All too often, trauma occurs before substance use and mental disorders develop; then, such disorders and their associated symptoms and consequences create opportunities for additional traumatic events to occur. If individuals engage in mental health and substance abuse treatment without addressing the role that trauma has played in their lives, they are less likely to experience recovery in the long run. For example, a person with a history of trauma is more likely to have anxiety and depressive symptoms, use substances to self-medicate, and/or relapse after exposure to trauma-related cues. Thus, collaboration within and between behavioral health agencies is necessary to make integrated, timely, trauma-specific interventions available from the beginning to clients/consumers who engage in substance abuse and mental health services.

Support Control, Choice, and Autonomy

Not every client who has experienced trauma and is engaged in behavioral health services wants, or sees the need for, trauma-informed or trauma-specific treatment. Clients may think that they've already dealt with their trauma adequately, or they may believe that the effects of past trauma cause minimal distress for them. Other clients may voice the same sentiments, but without conviction—instead using avoidant behavior to deter distressing symptoms or reactions. Still others may struggle to see the role of trauma in their presenting challenges, not connecting their past traumatic experiences with other, more current difficulties (e.g., using substances to self-medicate strong emotions). Simply the idea of acknowledging trauma-related experiences and/or stress reactions may be too frightening or overwhelming for some clients, and others may fear that their reactions will be dismissed. On the other hand, some individuals want so much to dispense with their traumatic experiences and reactions that they hurriedly and repeatedly disclose their experiences before establishing a sufficiently safe environment or learning effective coping strategies to offset distress and other effects of retraumatization.

As these examples show, not everyone affected by trauma will approach trauma-informed services or recognize the impact of trauma in their lives in the same manner. This can be challenging to behavioral health service providers who are knowledgeable about the impact of trauma and who perceive the importance of addressing trauma and its effects with clients. As with knowing that different clients may be at different levels of awareness or stages of change in substance abuse treatment services, you should acknowledge that people affected by trauma

present an array of reactions, various levels of trauma awareness, and different degrees of urgency in their need to address trauma.

Appreciating clients' perception of their presenting problems and viewing their responses to the impact of trauma as adaptive—even when you believe their methods of dealing with trauma to be detrimental—are equally important elements of TIC. By taking the time to engage with clients and understand the ways they have perceived, adjusted to, and responded to traumatic experiences, providers are more likely to project the message that clients possess valuable personal expertise and knowledge about their own presenting problems. This shifts the viewpoint from "Providers know best" to the more collaborative "Together, we can find solutions."

How often have you heard from clients that they don't believe they can handle symptoms that emerge from reexperiencing traumatic cues or memories? Have you ever heard clients state that they can't trust themselves or their reactions, or that they never know when they are going to be triggered or how they are going to react? How confident would you feel about yourself if, at any time, a loud noise could initiate an immediate attempt to hide, duck, or dive behind something? Traumatic experiences have traditionally been described as exposure to events that cause intense fear, helplessness, horror, or feelings of loss of control. Participation in behavioral health services should not mirror these aspects of traumatic experience. Working collaboratively to facilitate clients' sense of control and to maximize clients' autonomy and choices throughout the treatment process, including treatment planning, is crucial in trauma-informed services.

For some individuals, gaining a sense of control and empowerment, along with understanding traumatic stress reactions, may be pivotal ingredients for recovery. By creating opportunities for empowerment, counselors and other behavioral health service providers help reinforce, clients' sense of competence, which is often eroded by trauma and prolonged traumatic stress reactions. Keep in mind that treatment strategies and procedures that prioritize client choice and control need not focus solely on major life decisions or treatment planning; you can apply such approaches to common tasks and everyday interactions between staff and consumers. Try asking your clients some of the following questions (which are only a sample of the types of questions that could be useful):

- What information would be helpful for us to know about what happened to you?
- Where/when would you like us to call you?
- How would you like to be addressed?
- Of the services I've described, which seem to match your present concerns and needs?
- From your experience, what responses from others appear to work best when you feel overwhelmed by your emotions?

Likewise, organizations need to reinforce the importance of staff autonomy, choice, and sense of control. What resources can staff members access, and what choices are available to them, in processing emotionally charged content or events in treatment? How often do administrators and supervisors seek out feedback on how to handle problematic situations (e.g., staff rotations for vacations, case consultations, changes in scheduling)? Think about the parallel between administration and staff members versus staff members and clients; often, the same philosophy, attitudes, and behaviors conveyed to staff members by administrative practices are mirrored in staff–client interactions. Simply stated, if staff members do not feel empowered, it will be a challenge for them to value the need for client empowerment. (For more information on administrative and workforce development issues, refer to Part 2, Chapters 1 and 2.)

Case Illustration: Mina

Mina initially sought counseling after her husband was admitted to an intensive outpatient drug and alcohol program. She was self-referred for low-grade depression, resentment toward her spouse, and codependency. When asked to define "codependency" and how the term applied to her, she responded that she always felt guilty and responsible for everyone in her family and for events that occurred even when she had little or no control over them.

After the intake and screening process, she expressed interest in attending group sessions that focused primarily on family issues and substance abuse, wherein her presenting concerns could be explored. In addition to describing dynamics and issues relating to substance abuse and its impact on her marriage, she referred to her low mood as frozen grief. During treatment, she reluctantly began to talk about an event that she described as life changing: the loss of her father. The story began to unfold in group; her father, who had been 62 years old, was driving her to visit a cousin. During the ride, he had a heart attack and drove off the road. As the car came to stop in a field, she remembered calling 911 and beginning cardiopulmonary resuscitation while waiting for the ambulance. She rode with the paramedics to the hospital, watching them work to save her father's life; however, he was pronounced dead soon after arrival.

She always felt that she never really said goodbye to her father. In group, she was asked what she would need to do or say to feel as if she had revisited that opportunity. She responded in quite a unique way, saying, "I can't really answer this question; the lighting isn't right for me to talk about my dad." The counselor encouraged her to adjust the lighting so that it felt "right" to her. Being invited to do so turned out to be pivotal in her ability to address her loss and to say goodbye to her father on her terms. She spent nearly 10 minutes moving the dimmer switch for the lighting as others in the group patiently waited for her to return to her chair. She then began to talk about what happened during the evening of her father's death, their relationship, the events leading up to that evening, what she had wanted to say to him at the hospital, and the things that she had been wanting to share with him since his death.

Weeks later, as the group was coming to a close, each member spoke about the most important experiences, tools, and insights that he or she had taken from participating. Mina disclosed that the group helped her establish boundaries and coping strategies within her marriage, but said that the event that made the most difference for her had been having the ability to adjust the lighting in the room. She explained that this had allowed her to control something over which she had been powerless during her father's death. To her, the lighting had seemed to stand out more than other details at the scene of the accident, during the ambulance ride, and at the hospital. She felt that the personal experience of losing her father and needing to be with him in the emergency room was marred by the obtrusiveness of staff, procedures, machines, and especially, the harsh lighting. She reflected that she now saw the lighting as a representation of this tragic event and the lack of privacy she had experienced when trying to say goodbye to her father. Mina stated that this moment in group had been the greatest gift: "…to be able to say my goodbyes the way I wanted… I was given an opportunity to have some control over a tragic event where I couldn't control the outcome no matter how hard I tried."

Create Collaborative Relationships and Participation Opportunities

This trauma-informed principle encompasses three main tenets. First, **ensure that the provider–client relationship is collaborative**, regardless of setting or service. Agency staff members cannot make decisions pertaining to interventions or involvement in community services autocratically; instead, they should develop trauma-informed, individualized care plans and/or treatment plans collaboratively with the client and, when appropriate, with family and caregivers. The nonauthoritarian approach that characterizes TIC views clients

as the experts in their own lives and current struggles, thereby emphasizing that clients and providers can learn from each other.

The second tenet is to **build collaboration beyond the provider–client relationship**. Building ongoing relationships across the service system, provider networks, and the local community enhances TIC continuity as clients move from one level of service to the next or when they are involved in multiple services at one time. It also allows you to learn about resources available to your clients in the service system or community and to connect with providers who have more advanced training in trauma-specific interventions and services.

The third tenet emphasizes the need to **ensure client/consumer representation and participation in behavioral health program development, planning, and evaluation as well as in the professional development of behavioral health workers**. To achieve trauma-informed competence in an organization or across systems, clients need to play an active role; this starts with providing program feedback. However, consumer involvement should not end there; rather, it should be encouraged throughout the implementation of trauma-informed services. So too, clients, potential clients, their families, and the community should be invited to participate in forming any behavioral health organization's plans to improve trauma-informed competence, provide TIC, and design relevant treatment services and organizational policies and procedures.

Trauma-informed principles and practices generated without the input of people affected by trauma are difficult to apply effectively. Likewise, staff trainings and presentations should include individuals who have felt the impact of trauma. Their participation reaches past the purely cognitive aspects of such education to offer a personal perspective on the strengths and resilience of people who have experienced trauma. The involvement of trauma survivors in behavioral health education lends a human face to subject matter that is all too easily made cerebral by some staff members in an attempt to avoid the emotionality of the topic.

Consumer participation also means giving clients/consumers the chance to obtain State training and certification, as well as employment in behavioral health settings as peer specialists. Programs that incorporate peer support services reinforce a powerful message—that provider–consumer partnership is important, and that consumers are valued. Peer support specialists are self-identified individuals who have progressed in their own recovery from alcohol dependence, drug addiction, and/or a mental disorder and work within behavioral health programs or at peer support centers to assist others with similar disorders and/or life experiences. Tasks and responsibilities may include leading a peer support group; modeling effective coping, help-seeking, and self-care strategies; helping clients practice new skills or monitor progress; promoting positive self-image to combat clients' potentially negative feelings about themselves and the discrimination they may perceive in the program or community; handling case management tasks; advocating for program changes; and representing a voice of hope that views recovery as possible.

Familiarize the Client With Trauma-Informed Services

Without thinking too much about it, you probably know the purpose of an intake process, the correct way to complete a screening device, the meaning of a lot of the jargon specific to behavioral health, and your program's expectations for client participation; in fact, maybe you're already involved in facilitating these processes in behavioral health services every day, and they've become almost

automatic for you. This can make it easy to forget that nearly everything clients and their families encounter in seeking behavioral health assistance is new to them. Thus, introducing clients to program services, activities, and interventions in a manner that *expects* them to be unfamiliar with these processes is essential, regardless of their clinical and treatment history. Beyond addressing the unfamiliarity of services, educating clients about each process—from first contact all the way through recovery services—gives them a chance to participate actively and make informed decisions across the continuum of care.

Familiarizing clients with trauma-informed services extends beyond explaining program services or treatment processes; it involves explaining the value and type of trauma-related questions that may be asked during an intake process, educating clients about trauma to help normalize traumatic stress reactions, and discussing trauma-specific interventions and other available services (including explanations of treatment methodologies and of the rationale behind specific interventions). Developmentally appropriate psychoeducation about trauma-informed services allows clients to be informed participants.

Incorporate Universal Routine Screenings for Trauma

Screening universally for client histories, experiences, and symptoms of trauma at intake can benefit clients and providers. Most providers know that clients can be affected by trauma, but universal screening provides a steady reminder to be watchful for past traumatic experiences and their potential influence upon a client's interactions and engagement with services across the continuum of care. Screening should guide treatment planning; it alerts the staff to potential issues and serves as a valuable tool to increase clients' awareness of the possible impact of trauma and the importance of addressing related issues during treatment.

Nonetheless, screenings are only as useful as the guidelines and processes established to address positive screens (which occur when clients respond to screening questions in a way that signifies possible trauma-related symptoms or histories). Staff should be trained to use screening tools consistently so that all clients are screened in the same way. Staff members also need to know how to score screenings and when specific variables (e.g., race/ethnicity, native language, gender, culture) may influence screening results. For example, a woman who has been sexually assaulted by a man may be wary of responding to questions if a male staff member or interpreter administers the screening or provides translation services. Likewise, a person in a current abusive or violent relationship may not acknowledge the interpersonal violence in fear of retaliation or as a result of disconnection or denial of his or her experience, and he or she may have difficulty in processing and then living between two worlds—what is acknowledged in treatment versus what is experienced at home.

In addition, staff training on using trauma-related screening tools needs to center on how and when to gather relevant information after the screening is complete. Organizational policies and procedures should guide staff members on how to respond to a positive screening, such as by making a referral for an indepth assessment of traumatic stress, providing the client with an introductory psychoeducational session on the typical biopsychosocial effects of trauma, and/or coordinating care so that the client gains access to trauma-specific services that meet his or her needs. Screening tool selection is an important ingredient in incorporating routine, universal screening practices into behavioral health services. Many screening tools are available, yet they differ in format

and in how they present questions. Select tools based not just on sound test properties, but also according to whether they encompass a broad range of experiences typically considered traumatic and are flexible enough to allow for an individual's own interpretation of traumatic events. For more information on screening and assessment of trauma and trauma-related symptoms and effects, see Chapter 4, "Screening and Assessment," in this TIP.

View Trauma Through a Sociocultural Lens

To understand how trauma affects an individual, family, or community, you must first understand life experiences and cultural background as key contextual elements for that trauma. As demonstrated in Exhibit 1.1-2, many factors shape traumatic experiences and individual and community responses to it; one of the most significant factors is culture. It influences the interpretation and meaning of traumatic events, individual beliefs regarding personal responsibility for the trauma and subsequent responses, and the meaning and acceptability of symptoms, support, and help-seeking behaviors. As this TIP proceeds to describe the differences among cultures pertaining to trauma, remember that there are numerous cross-cutting factors that can directly or indirectly influence the attitudes, beliefs, behaviors, resources, and opportunities within a given culture, subculture, or racial and/or ethnic group (Exhibit 1.1-4). For an indepth

Exhibit 1.1-4: Cross-Cutting Factors of Culture

Culture and Trauma

- Some populations and cultures are more likely than others to experience a traumatic event or a specific type of trauma.
- Rates of traumatic stress are high across all diverse populations and cultures that face military action and political violence.
- Culture influences not only whether certain events are perceived as traumatic, but also how an individual interprets and assigns meaning to the trauma.
- Some traumas may have greater impact on a given culture because those traumas represent something significant for that culture or disrupt cultural practices or ways of life.
- Culture determines acceptable responses to trauma and shapes the expression of distress. It significantly influences how people convey traumatic stress through behavior, emotions, and thinking immediately following a trauma and well after the traumatic experience has ceased.
- Traumatic stress symptoms vary according to the type of trauma within the culture.
- Culture affects what qualifies as a legitimate health concern and which symptoms warrant help.
- In addition to shaping beliefs about acceptable forms of help-seeking behavior and healing practices, culture can provide a source of strength, unique coping strategies, and specific resources.

exploration of these cross-cutting cultural factors, refer to the planned TIP, *Improving Cultural Competence* (SAMHSA, planned c).

When establishing TIC, it is vital that behavioral health systems, service providers, licensing agencies, and accrediting bodies build culturally responsive practices into their curricula, standards, policies and procedures, and credentialing processes. The implementation of culturally responsive practices will further guide the treatment planning process so that trauma-informed services are more appropriate and likely to succeed.

Use a Strengths-Focused Perspective: Promote Resilience

Fostering individual strengths is a key step in prevention when working with people who have been exposed to trauma. It is also an essential intervention strategy—one that builds on the individual's existing resources and views him or her as a resourceful, resilient survivor. Individuals who have experienced trauma develop many strategies and/or behaviors to adapt to its emotional, cognitive, spiritual, and physical consequences. Some behaviors may be effective across time, whereas others may eventually produce difficulties and disrupt the healing process. Traditionally, behavioral health services have tended to focus on presenting problems, risk factors, and symptoms in an attempt to prevent negative outcomes, provide relief, increase clients' level of functioning, and facilitate healing. However, focusing too much on these areas can undermine clients' sense of competence and hope. Targeting only presenting problems and symptoms does not provide individuals with an opportunity to see their own resourcefulness in managing very stressful and difficult experiences. It is important for providers to engage in interventions using a balanced approach that targets the strengths clients have

> "Trauma informed care recognizes symptoms as originating from adaptations to the traumatic event(s) or context. Validating resilience is important even when past coping behaviors are now causing problems. Understanding a symptom as an adaptation reduces a survivor's guilt and shame, increases their self esteem and provides a guideline for developing new skills and resources to allow new and better adaptation to the current situation."
>
> (Elliot et al., 2005, p. 467)

Advice to Counselors and Administrators: Using Strengths-Oriented Questions

Knowing a client's strengths can help you understand, redefine, and reframe the client's presenting problems and challenges. By focusing and building on an individual's strengths, counselors and other behavioral health professionals can shift the focus from "What is wrong with you?" to "What has worked for you?" It moves attention away from trauma-related problems and toward a perspective that honors and uses adaptive behaviors and strengths to move clients along in recovery.

Potential strengths-oriented questions include:

- The history that you provided suggests that you've accomplished a great deal since the trauma. What are some of the accomplishments that give you the most pride?
- What would you say are your strengths?
- How do you manage your stress today?
- What behaviors have helped you survive your traumatic experiences (during and afterward)?
- What are some of the creative ways that you deal with painful feelings?
- You have survived trauma. What characteristics have helped you manage these experiences and the challenges that they have created in your life?
- If we were to ask someone in your life, who knew your history and experience with trauma, to name two positive characteristics that help you survive, what would they be?
- What coping tools have you learned from your _____ (fill in: cultural history, spiritual practices, athletic pursuits, etc.)?
- Imagine for a moment that a group of people are standing behind you showing you support in some way. Who would be standing there? It doesn't matter how briefly or when they showed up in your life, or whether or not they are currently in your life or alive.
- How do you gain support today? (Possible answers include family, friends, activities, coaches, counselors, other supports, etc.)
- What does recovery look like for you?

developed to survive their experiences and to thrive in recovery. A strengths-based, resilience-minded approach lets trauma survivors begin to acknowledge and appreciate their fortitude and the behaviors that help them survive.

Foster Trauma-Resistant Skills

Trauma-informed services build a foundation on which individuals can begin to explore the role of trauma in their lives; such services can also help determine how best to address and tailor interventions to meet their needs. Prevention, mental health, and substance abuse treatment services should include teaching clients about how trauma can affect their lives; these services should also focus on developing self-care skills, coping strategies, supportive networks, and a sense of competence. Building trauma-resistant skills begins with normalizing the symptoms of traumatic stress and helping clients who have experienced trauma connect the dots between current problems and past trauma when appropriate.

Nevertheless, TIC and trauma-specific interventions that focus on skill-building should not do so at the expense of acknowledging individual strengths, creativity in adapting to trauma, and inherent attributes and tools clients possesses to combat the effects of trauma. Some theoretical models that use skill-building strategies base the value of this approach on a deficit perspective; they assume that some individuals lack the necessary tools to manage specific situations and, because of this deficiency, they encounter problems that others with effective skills would not experience. This type of perspective further assumes that, to recover, these individuals must learn new coping skills and behavior. TIC, on the other hand, makes the assumption that clients

Advice to Administrators: Self-Assessment for Trauma-Informed Systems

NCTIC has developed a self-assessment package for trauma-informed systems to help administrators structurally incorporate trauma into programs and services. The self-assessment can be used by systems of care to guide quality improvement with the goal of establishing fully trauma-informed treatment and recovery efforts (NCTIC, Center for Mental Health Services, 2007). Behavioral health treatment program administrators can use these materials and NCTIC as resources for improvement in delivering TIC.

are the experts in their own lives and have learned to adapt and acquire skills to survive. The TIC approach honors each individual's adaptations and acquired skills, and it helps clients explore how these may not be working as well as they had in the past and how their current repertoire of responses may not be as effective as other strategies.

Demonstrate Organizational and Administrative Commitment to TIC

Becoming a trauma-informed organization requires administrative guidance and support across all levels of an agency. Behavioral health staff will not likely sustain TIC practices without the organization's ongoing commitment to support professional development and to allocate resources that promote these practices. An agency that wishes to commit to TIC will benefit from an organizational assessment of how staff members identify and manage trauma and trauma-related reactions in their clients. Are they trauma aware—do they recognize that trauma can significantly affect a client's ability to function in one or more areas of his or her life? Do the staff members understand that traumatic experiences and trauma-related reactions can greatly influence clients' engagement, participation, and response to services?

Agencies need to embrace specific strategies across each level of the organization to create trauma-informed services; this begins with staff education on the impact of trauma among clients. Other agency strategies that reflect a trauma-informed infrastructure include, but are not limited to:

- Universal screening and assessment procedures for trauma.
- Interagency and intra-agency collaboration to secure trauma-specific services.
- Referral agreements and networks to match clients' needs.
- Mission and value statements endorsing the importance of trauma recognition.
- Consumer- and community-supported committees and trauma response teams.
- Workforce development strategies, including hiring practices.
- Professional development plans, including staff training/supervision focused on TIC.
- Program policies and procedures that ensure trauma recognition and secure trauma-informed practices, trauma-specific services, and prevention of retraumatization.

TIC requires organizational commitment, and often, cultural change. For more information on implementing TIC in organizations, see Part 2, Chapter 1 of this TIP.

Develop Strategies To Address Secondary Trauma and Promote Self-Care

Secondary trauma is a normal occupational hazard for mental health and substance abuse professionals, particularly those who serve populations that are likely to include survivors of trauma (Figley, 1995; Klinic Community Health Centre, 2008). Behavioral health staff members who experience secondary trauma present a range of traumatic stress reactions

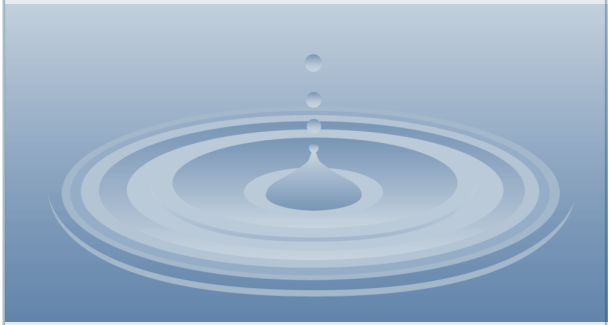
and effects from providing services focused on trauma or listening to clients recount traumatic experiences. So too, when a counselor has a history of personal trauma, working with trauma survivors may evoke memories of the counselor's own trauma history, which may increase the potential for secondary traumatization.

The range of reactions that manifest with secondary trauma can be, but are not necessarily, similar to the reactions presented by clients who have experienced primary trauma. Symptoms of secondary trauma can produce varying levels of difficulty, impairment, or distress in daily functioning; these may or may not meet diagnostic thresholds for acute stress, posttraumatic stress, or adjustment, anxiety, or mood disorders (Bober & Regehr, 2006). Symptoms may include physical or psychological reactions to traumatic memories clients have shared; avoidance behaviors during client interactions or when recalling emotional content in supervision; numbness, limited emotional expression, or diminished affect; somatic complaints; heightened arousal, including insomnia; negative thinking or depressed mood; and detachment from family, friends, and other supports (Maschi & Brown, 2010).

Working daily with individuals who have been traumatized can be a burden for counselors and other behavioral health service providers, but all too often, they blame the symptoms resulting from that burden on other stressors at work or at home. Only in the past 2 decades have literature and trainings begun paying attention to secondary trauma or compassion fatigue; even so, agencies often do not translate this knowledge into routine prevention practices. Counselors and other staff members may find it difficult to engage in activities that could ward off secondary trauma due to time constraints, workload, lack of agency resources, and/or an organizational culture that disapproves of help-seeking or provides inadequate staff support. The demands of providing care to trauma survivors cannot be ignored, lest the provider become increasingly impaired and less effective. Counselors with unacknowledged secondary trauma can cause harm to clients via poorly enforced boundaries, missed appointments, or even abandonment of clients and their needs (Pearlman & Saakvitne, 1995).

Essential components of TIC include organizational and personal strategies to address

The Impact of Trauma



Trauma is similar to a rock hitting the water's surface. The impact first creates the largest wave, which is followed by ever-expanding, but less intense, ripples. Likewise, the influence of a given trauma can be broad, but generally, its effects are less intense for individuals further removed from the trauma; eventually, its impact dissipates all around. For trauma survivors, the impact of trauma can be far-reaching and can affect life areas and relationships long after the trauma occurred. This analogy can also broadly describe the recovery process for individuals who have experienced trauma and for those who have the privilege of hearing their stories. As survivors reveal their trauma-related experiences and struggles to a counselor or another caregiver, the trauma becomes a shared experience, although it is not likely to be as intense for the caregiver as it was for the individual who experienced the trauma. The caregiver may hold onto the trauma's known and unknown effects or may consciously decide to engage in behaviors that provide support to further dissipate the impact of this trauma and the risk of secondary trauma.

Advice to Counselors: Decreasing the Risk of Secondary Trauma and Promoting Self-Care

- **Peer support.** Maintaining adequate social support will help prevent isolation and depression.
- **Supervision and consultation.** Seeking professional support will enable you to understand your own responses to clients and to work with them more effectively.
- **Training.** Ongoing professional training can improve your belief in your abilities to assist clients in their recoveries.
- **Personal therapy.** Obtaining treatment can help you manage specific problems and become better able to provide good treatment to your clients.
- **Maintaining balance.** A healthy, balanced lifestyle can make you more resilient in managing any difficult circumstances you may face.
- **Setting clear limits and boundaries with clients.** Clearly separating your personal and work life allows time to rejuvenate from stresses inherent in being a professional caregiver.

secondary trauma and its physical, cognitive, emotional, and spiritual consequences. In agencies and among individual providers, it is key for the culture to promote acceptability, accessibility, and accountability in seeking help, accessing support and supervision, and engaging in self-care behaviors in and outside of the agency or office. Agencies should involve staff members who work with trauma in developing informal and formal agency practices and procedures to prevent or address secondary trauma. Even though a number of community-based agencies face fiscal constraints, prevention strategies for secondary trauma can be intertwined with the current infrastructure (e.g., staff meetings, education, case consultations and group case discussions, group support, debriefing sessions as appropriate, supervision). For more information on strategies to address and prevent secondary trauma, see Part 2, Chapter 2 of this TIP.

Provide Hope—Recovery Is Possible

What defines recovery from trauma-related symptoms and traumatic stress disorders? Is it the total absence of symptoms or consequences? Does it mean that clients stop having nightmares or being reminded, by cues, of past trauma? When clients who have experienced trauma enter into a helping relationship to address trauma specifically, they are often looking for a cure, a remission of symptoms, or relief from the pain as quickly as possible. However, they often possess a history of unpredictable symptoms and symptom intensity that reinforces an underlying belief that recovery is not possible. On one hand, clients are looking for a message that they can be cured, while on the other hand, they have serious doubts about the likely success of any intervention.

Clients often express ambivalence about dealing with trauma even if they are fully aware of trauma's effects on their lives. The idea of living with more discomfort as they address the past or as they experiment with alternative ways of dealing with trauma-related symptoms or consequences is not an appealing prospect, and it typically elicits fear. Clients may interpret the uncomfortable feelings as dangerous or unsafe even in an environment and relationship that is safe and supportive.

How do you promote hope and relay a message that recovery is possible? First, maintain consistency in delivering services, promoting and providing safety for clients, and showing respect and compassion within the client–provider relationship. Along with clients' commitment to learning how to create safety for themselves, counselors and agencies need

to be aware of, and circumvent, practices that could retraumatize clients. Projecting hope and reinforcing the belief that recovery is possible extends well beyond the practice of establishing safety; it also encompasses discussing what recovery means and how it looks to clients, as well as identifying how they will know that they've entered into recovery in earnest.

Providing hope involves projecting an attitude that recovery is possible. This attitude also involves viewing clients as competent to make changes that will allow them to deal with trauma-related challenges, providing opportunities for them to practice dealing with difficult situations, and normalizing discomfort or difficult emotions and framing these as manageable rather than dangerous. If you convey this attitude consistently to your clients, they will begin to understand that discomfort is not a signal to avoid, but a sign to engage—and that behavioral, cognitive, and emotional responses to cues associated with previous traumas are a normal part of the recovery process. It's not the absence of responses to such triggers that mark recovery, but rather, how clients experience and manage those responses. Clients can also benefit from interacting with others who are further along in their recovery from trauma. Time spent with peer support staff or sharing stories with other trauma survivors who are well on their way to recovery is invaluable—it sends a powerful message that recovery is achievable, that there is no shame in being a trauma survivor, and that there is a future beyond the trauma.

As You Proceed

This chapter has established the foundation and rationale of this TIP, reviewed trauma-informed concepts and terminology, and provided an overview of TIC principles and a guiding framework for this text. As you proceed, be aware of the wide-ranging responses to trauma that occur not only across racially and ethnically diverse groups but also within specific communities, families, and individuals. Counselors, prevention specialists, other behavioral health workers, supervisors, and organizations all need to develop skills to create an environment that is responsive to the unique attributes and experiences of each client. As you read this TIP, remember that many cross-cutting factors influence the experiences, help-seeking behaviors, intervention responses, and outcomes of individuals, families, and populations who have survived trauma. Single, multiple, or chronic exposures to traumatic events, as well as the emotional, cognitive, behavioral, and spiritual responses to trauma, need to be understood within a social-ecological framework that recognizes the many ingredients prior to, during, and after traumatic experiences that set the stage for recovery.

2 Trauma Awareness

IN THIS CHAPTER

- Types of Trauma
- Characteristics of Trauma
- Individual and Sociocultural Features

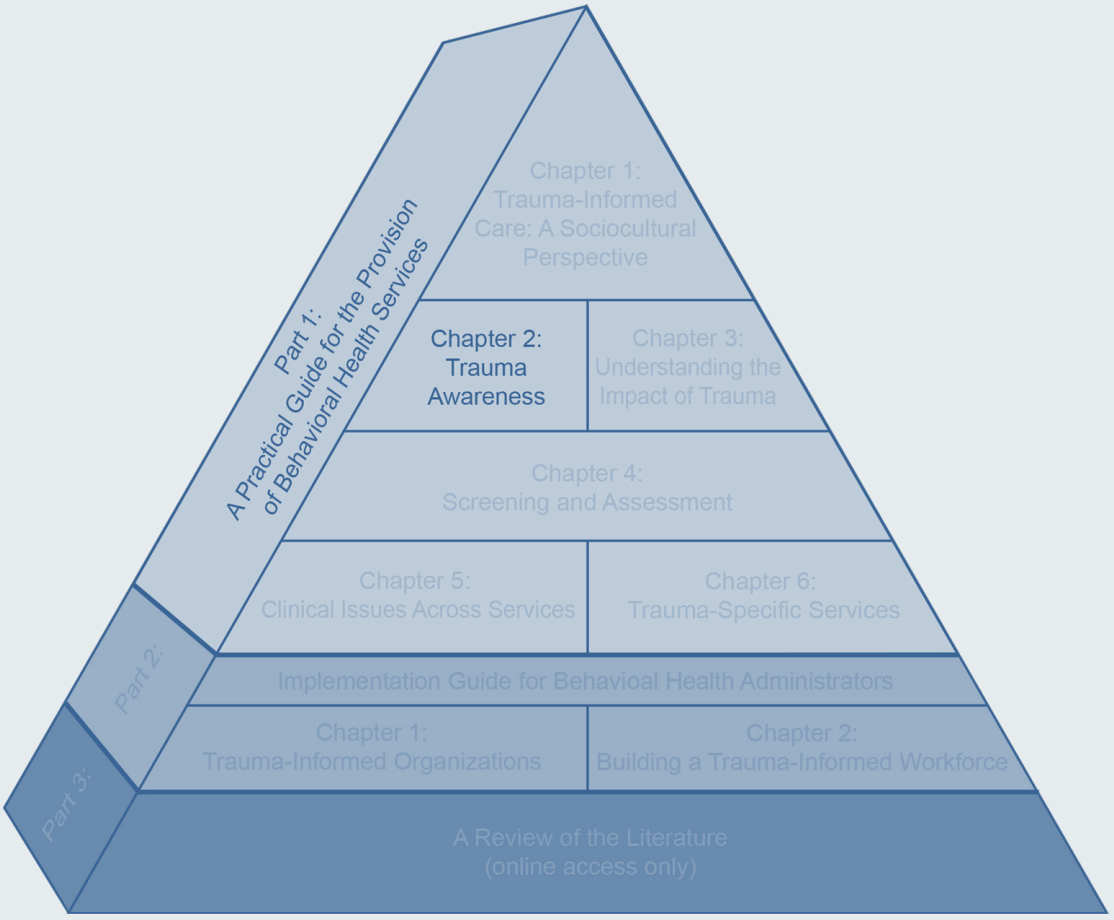
Traumatic experiences typically do not result in long-term impairment for most individuals. It is normal to experience such events across the lifespan; often, individuals, families, and communities respond to them with resilience. This chapter explores several main elements that influence why people respond differently to trauma. Using the social-ecological model outlined in Part 1, Chapter 1, this chapter explores some of the contextual and systemic dynamics that influence individual and community perceptions of trauma and its impact. The three main foci are: types of trauma, objective and subjective characteristics of trauma, and individual and sociocultural features that serve as risk or protective factors.

This chapter's main objective is to highlight the key characteristics of traumatic experiences. Trauma-informed behavioral health service providers understand that many influences shape the effects of trauma among individuals and communities—it is not just the event that determines the outcome, but also the event's context and the resultant interactions across systems.

Types of Trauma

The following section reviews various forms and types of trauma. It does not cover every conceivable trauma that an individual, group, or community may encounter. Specific traumas are reviewed only once, even when they could fit in multiple categories of trauma. Additionally, the order of appearance does not denote a specific trauma's importance or prevalence, and there is no lack of relevance implied if a given trauma is not specifically addressed in this Treatment Improvement Protocol (TIP). The intent is to give a broad perspective of the various categories and types of trauma to behavioral health workers who wish to be trauma informed.

TIC Framework in Behavioral Health Services—Trauma Awareness



Natural or Human-Caused Traumas

The classification of a trauma as natural or caused by humans can have a significant impact on the ways people react to it and on the types of assistance mobilized in its aftermath (see Exhibit 1.2-1 for trauma examples). Natural traumatic experiences can directly affect a small number of people, such as a tree falling on a car during a rainstorm, or many people and communities, as with a hurricane. Natural events, often referred to as "acts of God," are typically unavoidable. Human-caused traumas are caused by human failure (e.g., technological catastrophes, accidents, malevolence) or by human design (e.g., war). Although multiple factors contribute to the severity of a natural or human-caused trauma, traumas perceived as intentionally harmful often make the event more traumatic for people and communities.

For information on resources to prepare States, Territories, and local entities to deliver effective mental health and substance abuse responses during disasters, contact the Substance Abuse and Mental Health Services Administration's (SAMHSA's) Disaster Technical Assistance Center:

Fax: 1 800 311 7691
Email: DTAC@samhsa.hhs.gov

Exhibit 1.2-1: Trauma Examples

Caused Naturally	Caused by People	
	Accidents, Technological Catastrophes	Intentional Acts
Tornado	Train derailment	Arson
Lightning strike	Roofing fall	Terrorism
Wildfire	Structural collapse	Sexual assault and abuse
Avalanche	Mountaineering accident	Homicides or suicides
Physical ailment or disease	Aircraft crash	Mob violence or rioting
Fallen tree	Car accident due to malfunction	Physical abuse and neglect
Earthquake	Mine collapse or fire	Stabbing or shooting
Dust storm	Radiation leak	Warfare
Volcanic eruption	Crane collapse	Domestic violence
Blizzard	Gas explosion	Poisoned water supply
Hurricane	Electrocution	Human trafficking
Cyclone	Machinery-related accident	School violence
Typhoon	Oil spill	Torture
Meteorite	Maritime accident	Home invasion
Flood	Accidental gun shooting	Bank robbery
Tsunami	Sports-related death	Genocide
Epidemic		Medical or food tampering
Famine		
Landslide or fallen boulder		

How survivors of natural trauma respond to the experience often depends on the degree of devastation, the extent of individual and community losses, and the amount of time it takes to reestablish daily routines, activities, and services (e.g., returning to school or work, being able to do laundry, having products to buy in a local store). The amount, accessibility, and duration of relief services can significantly influence the duration of traumatic stress reactions as well as the recovery process.

Alongside the disruption of daily routines, the presence of community members or outsiders in affected areas may add significant stress or create traumatic experiences in and of themselves. Examples include the threat of others stealing what remains of personal property, restrictions on travel or access to property or living quarters, disruption of privacy within shelters, media attention, and subsequent exposure to repetitive images reflecting the devastation. Therefore, it isn't just the natural disaster or event that can challenge an individual or community; often, the consequences of the event and behavioral responses from others within and outside the community play a role in pushing survivors away from effective coping or toward resilience and recovery.

Human-caused traumas are fundamentally different from natural disasters. They are either intentional, such as a convenience store robbery at gunpoint, or unintentional, such as the technological accident of a bridge collapse (as occurred in Minneapolis, Minnesota, in 2007; U.S. Fire Administration, 2007). The subsequent reactions to these traumas often depend on their intentionality. However, a person or group of people is typically the target of the survivors' anger and blame. Survivors of an unintentionally human-caused traumatic event may feel angry and frustrated because of the lack of protection or care offered by the responsible party or government, particularly if there has been a perceived act of omission. After intentional human-caused acts, survivors often struggle to understand the

Case Illustrations: Quecreek Mine Flood and Greensburg's Tornado

Quecreek Mine Flood

The year following the rescue of nine miners from the Quecreek mine in western Pennsylvania in 2002 was a difficult one for residents of Somerset County. The dazzle of publicity surrounding a handful of workers from a small town, tension between miners and rescuers, and animosity over money for movie and book deals, in addition to the trauma itself, resulted in a rescuer's suicide, a number of miners having trauma-related symptoms, and several rescuers needing to seek treatment for posttraumatic stress disorder (PTSD; Goodell, 2003).

Greensburg's Tornado

Greensburg, a small town in southern Kansas, was hit by a large tornado in 2007 that killed 11 residents and leveled 95 percent of the town while causing severe damage to the remaining 5 percent. Families and community members experienced significant grief and traumatic stress after the disaster. Yet today, Greensburg is rebuilding with a focus on being "green"—that is, environmentally responsible—from design to construction and all the way through demolition. This town has the highest number of Leadership in Energy and Environmental Design–certified buildings in the world. A reality television show about the town's reinvention ran for three seasons, demonstrating the town's residents and business owners working with local government and various corporations to make their home an even better place than it was before the tornado.

motives for performing the act, the calculated or random nature of the act, and the psychological makeup of the perpetrator(s).

Individual, Group, Community, and Mass Traumas

In recognizing the role of trauma and understanding responses to it, consider whether the trauma primarily affected an individual and perhaps his or her family (e.g., automobile accident, sexual or physical assault, severe illness); occurred within the context of a group (e.g., trauma experienced by first responders or those who have seen military combat) or community (e.g., gang-related shootings); transpired within a certain culture; or was a large-scale disaster (e.g., hurricane, terrorist attack). This context can have significant implications for whether (and how) people experience shame as a result of the trauma, the kinds of support and compassion they receive, whether their experiences are normalized or diminished by others, and even the kinds of services they are offered to help them recover and cope.

Individual trauma

An individual trauma refers to an event that only occurs to one person. It can be a single event (e.g., mugging, rape, physical attack, work-related physical injury) or multiple or prolonged events (e.g., a life-threatening illness, multiple sexual assaults). Although the trauma directly affects just one individual, others who know the person and/or are aware of the trauma will likely experience emotional repercussions from the event(s) as well, such as recounting what they said to the person before the event, reacting in disbelief, or thinking that it could just as easily have happened to them, too.

Survivors of individual trauma may not receive the environmental support and concern that members of collectively traumatized groups and communities receive. They are less likely to reveal their traumas or to receive validation of their experiences. Often, shame distorts their perception of responsibility for the trauma. Some survivors of individual traumas, especially those who have kept the trauma secret, may not receive needed comfort and

Advice to Counselors: Working With Clients Who Have Experienced Individual Traumas

In working with clients who have histories of individual trauma, counselors should consider that:

- Empathy, or putting oneself in the shoes of another, is more potent than sympathy (expressing a feeling of sorrow for another person).
- Some clients need to briefly describe the trauma(s) they have experienced, particularly in the early stages of recovery. Strategies that focus on reexperiencing the trauma, retrieving feelings related to the trauma, and bringing past experiences to the forefront should only be implemented if trauma-specific treatment planning and services are available.
- Understanding the trauma, especially in early recovery, should begin with educating the client about and normalizing trauma-related symptoms, creating a sense of safety within the treatment environment, and addressing how trauma symptoms may interfere with the client's life in the present.
- It is helpful to examine how the trauma affects opportunities to receive substance abuse and/or mental health treatment as well as treatment for and recovery from the trauma itself (e.g., by limiting one's willingness to share in or participate in group counseling).
- Identifying and exploring strengths in the client's history can help the client apply those strengths to his or her ability to function in the present.

acceptance from others; they are also are more likely to struggle with issues of causation (e.g., a young woman may feel unduly responsible for a sexual assault), to feel isolated by the trauma, and to experience repeated trauma that makes them feel victimized.

Physical injuries

Physical injuries are among the most prevalent individual traumas. Millions of emergency room (ER) visits each year relate directly to physical injuries. Most trauma patients are relatively young; about 70 percent of injury-related ER cases are people younger than 45 years old (McCaig & Burt, 2005). Dedicated ER hospital units, known as "trauma centers," specialize in physical traumas such as gunshot wounds, stabbings, and other immediate physical injuries. The term "trauma" in relation to ERs does not refer to psychological trauma, which is the focus of this TIP, yet physical injuries can be associated with psychological trauma. Sudden, unexpected, adverse health-related events can lead to extensive psychological trauma for patients and their families.

Excessive alcohol use is the leading risk factor for physical injuries; it's also the most promising target for injury prevention. Studies consistently connect injuries and substance use (Gentilello, Ebel, Wickizer, Salkever, & Rivara, 2005); nearly 50 percent of patients admitted to trauma centers have injuries attributable to alcohol abuse and dependence (Gentilello et al., 1999). One study found that two thirds of ambulatory assault victims presenting to an ER had positive substance use urinalysis results; more than half of all victims had PTSD 3 months later (Roy-Byrne et al.,

Acute stress disorder (ASD) prevalence among patients at medical trauma centers is very high, making trauma related disorders some of the most common complications seen in physically injured patients. Clients who have sustained serious injuries in car crashes, fires, stabbings, shootings, falls, and other events have an increased likelihood of developing trauma related mental disorders. Research suggests that PTSD and/or problem drinking is evident in nearly 50 percent of patients 1 year after discharge from trauma surgical units.

(Zatzick, Jurkovich, Gentilello, Wisner, & Rivara, 2002)

2004). Nearly 28 percent of patients whose drinking was identified as problematic during an ER visit for a physical injury will have a new injury within 1 year (Gentilello et al., 2005). For further information, see TIP 16, *Alcohol and Other Drug Screening of Hospitalized Trauma Patients* (Center for Substance Abuse Treatment [CSAT], 1995a).

Group trauma

The term "group trauma" refers to traumatic experiences that affect a particular group of people. This TIP intentionally distinguishes group trauma from mass trauma to highlight the unique experiences and characteristics of trauma-related reactions among small groups. These groups often share a common identity and history, as well as similar activities and concerns. They include vocational groups who specialize in managing traumas or who routinely place themselves in harm's way—for example, first responders, a group including police and emergency medical personnel. Some examples of group trauma include crews and their families who lose members from a commercial fishing accident, a gang whose members experience multiple deaths and injuries, teams of firefighters who lose members in a roof collapse, responders who attempt to save flood victims, and military service members in a specific theater of operation.

Survivors of group trauma can have different experiences and responses than survivors of individual or mass traumas. Survivors of group trauma, such as military service members and first responders, are likely to experience repeated trauma. They tend to keep the trauma experiences within the group, feeling that others outside the group will not understand; group outsiders are generally viewed as intruders. Members may encourage others in the group to shut down emotionally and repress their traumatic experiences—and there are some occupational roles that necessitate the repression of reactions to complete a mission or to be attentive to the needs at hand. Group members may not want to seek help and may discourage others from doing so out of fear that it may shame the entire group. In this environment, members may see it as a violation of group confidentiality when a member seeks assistance outside the group, such as by going to a counselor.

Group members who have had traumatic experiences in the past may not actively support traumatized colleagues for fear that acknowledging the trauma will increase the risk of repressed trauma-related emotions surfacing. However, groups with adequate resources for helping group members can develop a stronger and more supportive environment for handling subsequent traumas. These main group features influence the course of short- and long-term adjustments, including the development of traumatic stress symptoms associated with mental and substance use disorders.

Certain occupational groups are at greater risk of experiencing trauma—particularly multiple traumas. This TIP briefly reviews two main groups as examples in the following sections: first responders and military service members. For more detailed information on the impact of trauma and deployment, refer to the planned TIP, *Reintegration-Related Behavioral Health Issues in Veterans and Military Families* (SAMHSA, planned f).

First responders

First responders are usually emergency medical technicians, disaster management personnel, police officers, rescue workers, medical and behavioral health professionals, journalists, and volunteers from various backgrounds. They also include lifeguards, military personnel, and clergy. Stressors associated with the kinds of traumatic events and/or disasters first responders are likely to experience include

exposure to toxic agents, feeling responsible for the lives of others, witnessing catastrophic devastation, potential exposure to gruesome images, observing human and animal suffering and/or death, working beyond physical exhaustion, and the external and internal pressure of working against the clock.

Military service members

Military personnel are likely to experience numerous stressors associated with trauma. Service members who have repeatedly deployed to a war zone are at a greater risk for traumatic stress reactions (also known as combat stress reaction or traumatic stress injury), other military personnel who provide support services are also at risk for traumatic stress and secondary trauma (refer to the glossary portion of the "How This TIP Is Organized" section that precedes Part 1, Chapter 1, of this TIP). So too, service members who anticipate deployment or redeployment may exhibit psychological symptoms associated with traumatic stress. Some stressors that military service members may encounter include working while physically exhausted, exposure to gunfire, seeing or knowing someone who has been injured or killed, traveling in areas known for roadside bombs and rockets, extended hypervigilance, fear of being struck by an improvised explosive device, and so forth.

Trauma affecting communities and cultures

Trauma that affects communities and cultures covers a broad range of violence and atrocities that erode the sense of safety within a given community, including neighborhoods, schools, towns, and reservations. It may involve violence in the form of physical or sexual assaults, hate crimes, robberies, workplace or gang-related violence, threats, shootings, or stabbings—for example, the school shooting at Virginia Polytechnic Institute and State University in 2007. It also includes actions that attempt to dismantle systemic cultural practices, resources, and identities, such as making boarding school attendance mandatory for Native American children or placing them in non-Native foster homes. Cultural and/or community-based trauma can also occur via indifference or limited responsiveness to specific communities or cultures that are facing a potential catastrophe. Cultural traumas are events that, whether intentionally or not, erode the heritage of a culture—as with prejudice, disenfranchisement, and health inequities (e.g., late prenatal care, inability to afford medications, limited access to culturally appropriate health education, vicinity and quality of affordable medical services), among other examples.

"The excitement of the season had just begun, and then, we heard the news, oil in the water, lots of oil killing lots of water. It is too shocking to understand. Never in the millennium of our tradition have we thought it possible for the water to die, but it is true."

—Chief Walter Meganack, Port Graham, 1989

Of all the groups negatively affected by the Exxon Valdez oil spill, in many ways Alaska Natives were the most devastated. The oil spill destroyed more than economic resources; it shook the core cultural foundation of Native life. Alaska Native subsistence culture is based on an intimate relationship with the environment. Not only does the environment have sacred qualities for Alaska Natives; their survival also depends on the well-being of the ecosystem and the maintenance of cultural norms of subsistence. The spill directly threatened the well-being of the environment, disrupted subsistence behavior, and severely disturbed the sociocultural milieu of Alaska Natives.

Source: Gill & Picou, 1997, pp. 167–168.

Historical trauma

Historical trauma, known also as generational trauma, refers to events that are so widespread as to affect an entire culture; such events also have effects intense enough to influence generations of the culture beyond those who experienced them directly. The enslavement, torture, and lynching of African Americans; the forced assimilation and relocation of American Indians onto reservations; the extermination of millions of Jews and others in Europe during World War II; and the genocidal policies of the Hutus in Rwanda and the Khmer Rouge in Cambodia are examples of historical trauma.

In the past 50 years, research has explored the generational effects of the Holocaust upon survivors and their families. More recent literature has extended the concept of historical or generational trauma to the traumatic experiences of Native Americans. Reduced population, forced relocation, and acculturation are some examples of traumatic experiences that Native people have endured across centuries, beginning with the first European presence in the Americas. These tragic experiences have led to significant loss of cultural identity across generations and have had a significant impact on the well-being of Native communities (Whitbeck, Chen, Hoyt, & Adams, 2004). Data are limited on the association of mental and substance use disorders with historical trauma among Native people, but literature suggests that historical trauma has repercussions across generations, such as depression, grief, traumatic stress, domestic violence, and substance abuse, as well as significant loss of cultural knowledge, language, and identity (Gone, 2009). Historical trauma can increase the vulnerability of multiple generations to the effects of traumas that occur in their own lifetimes.

Mass trauma

Mass traumas or disasters affect large numbers of people either directly or indirectly. It is beyond the scope of this TIP to cover any specific disaster in detail; note, however, that mass traumas include large-scale natural and human-caused disasters (including intentional acts and accidents alike). Mass traumas may involve significant loss of property and lives as well as the widespread disruption of normal routines and services. Responding to such traumas often requires immediate and extensive resources that typically exceed the capacity of the affected communities, States, or countries in which they occur. Recent examples of such large-scale catastrophes include:

- In January 2010, a massive earthquake hit Haiti, killing hundreds of thousands of people and leaving over a million homeless.
- A nuclear reactor meltdown in the Ukraine in 1986 resulted in a technological and environmental disaster that affected tens of millions of people.
- The tsunami in the Indian Ocean in 2005 left hundreds of thousands dead in nine countries.

One factor that influences an individual's response to trauma is his or her ability to process one trauma before another trauma occurs. In mass traumas, the initial event causes considerable destruction, the consequences of which may spawn additional traumas and other stressful events that lead to more difficulties and greater need for adjustments among survivors, first responders, and disaster relief agencies. Often, a chain reaction occurs. Take, for example, Hurricane Katrina and its impact on the people of Louisiana and other coastal States. After the initial flooding, people struggled to obtain basic needs, including food, drinking water, safe shelter, clothing, medicines, personal hygiene items, and so forth, all as concern mounted about the safety of children and

other relatives, friends, and neighbors. In this and similar cases, the destruction from the initial flooding led to mass displacement of families and communities; many people had to relocate far from New Orleans and other badly affected areas, while also needing to gain financial assistance, reinitiate work to generate income, and obtain stable housing. People could not assimilate one stressor before another appeared.

Nevertheless, mass traumas can create an immediate sense of commonality—many people are "in the same boat," thus removing much of the isolation that can occur with other types of trauma. People can acknowledge their difficulties and receive support, even from strangers. It is easier to ask for help because blame is often externalized; large-scale disasters are often referred to as "acts of God" or, in cases of terrorism and other intentional events, as acts of "evil." Even so, survivors of mass trauma often encounter an initial rally of support followed by quickly diminishing services and dwindling care. When the disaster fades from the headlines, public attention and concern are likely to decrease, leaving survivors struggling to reestablish or reinvent their lives without much outside acknowledgment.

The experience of mass trauma can lead to the development of psychological symptoms and substance use at either a subclinical or a diagnostic level (refer to Part 3 of this TIP, available online, for more information highlighting the relationship between trauma and behavioral health problems). Likewise, one of the greatest risks for traumatic stress reactions after a mass tragedy is the presence of preexisting mental and co-occurring disorders, and individuals who are in early recovery from substance use disorders are at greater risk for such reactions as well. Nonetheless, people are amazingly resilient, and most will not develop long-term mental or substance use disorders after an event; in fact, most trauma-related symptoms will resolve in a matter of months (Keane & Piwowarczyk, 2006).

Interpersonal Traumas

Interpersonal traumas are events that occur (and typically continue to reoccur) between people who often know each other, such as spouses or parents and their children. Examples include physical and sexual abuse, sexual assault, domestic violence, and elder abuse.

Intimate partner violence

Intimate partner violence (IPV), often referred to as domestic violence, is a pattern of actual or threatened physical, sexual, and/or emotional abuse. It differs from simple assault in that multiple episodes often occur and the perpetrator is an intimate partner of the victim. Trauma associated with IPV is normally ongoing. Incidents of this form of violence are rarely isolated, and the client may still be in contact with and encountering abuse from the perpetrator while engaged in treatment.

Intimate partners include current and former spouses, boyfriends, and girlfriends. The majority of all nonfatal acts of violence and intimate partner homicides are committed against women; IPV accounts for over 20 percent of nonfatal violence against women but only 3.6 percent of that committed against men (Catalano, 2012). Children are the hidden casualties of IPV. They often witness the assaults or threats directly, within earshot, or by being exposed to the aftermath of the violence (e.g., seeing bruises and destruction of property, hearing the pleas for it to stop or the promises that it will never happen again).

Substance abuse, particularly involving alcohol, is frequently associated with IPV. It is the presence of alcohol-related problems in either partner, rather than the level of alcohol consumption itself, that is the important factor.

Drinking may or may not be the cause of the violence; that said, couples with alcohol-related disorders could have more tension and disagreement within the relationship in general, which leads to aggression and violence. The consumption of alcohol during a dispute is likely to decrease inhibitions and increase impulsivity, thus creating an opportunity for an argument to escalate into a physical altercation. More information on domestic violence and its effects on partners and families, as well as its connection with substance use and trauma-related disorders, is available in TIP 25, *Substance Abuse Treatment and Domestic Violence* (CSAT, 1997b), and from the National Online Resource Center on Violence Against Women (http://www.vawnet.org/).

Developmental Traumas

Developmental traumas include specific events or experiences that occur within a given developmental stage and influence later development, adjustment, and physical and mental health. Often, these traumas are related to adverse childhood experiences (ACEs), but they can also result from tragedies that occur outside an expected developmental or life stage (e.g., a child dying before a parent, being diagnosed with a life-threatening illness as a young adult) or from events at any point in the life cycle that create significant loss and have life-altering consequences (e.g., the death of a significant other in the later years that leads to displacement of the surviving partner).

Adverse childhood experiences

Some people experience trauma at a young age through sexual, physical, or emotional abuse and neglect. The Adverse Childhood Experiences Study (Felitti et al., 1998) examined the effects of several categories of ACEs on adult health, including physical and emotional abuse; sexual abuse; a substance-dependent parent; an incarcerated, mentally ill, or suicidal household member; spousal abuse between parents; and divorce or separation that meant one parent was absent during childhood. The National Comorbidity Studies examined the prevalence of trauma and defined childhood adversities as parental death, parental divorce/separation, life-threatening illness, or extreme economic hardship in addition to the childhood experiences included in the Adverse Childhood Experiences Study (Green et al., 2010).

ACEs can negatively affect a person's well-being into adulthood. Whether or not these experiences occur simultaneously, are time-limited, or recur, they set the stage for increased vulnerability to physical, mental, and substance use disorders and enhance the risk

Child Neglect

Child neglect occurs when a parent or caregiver does not give a child the care he or she needs according to his or her age, even though that adult can afford to give that care or is offered help to give that care. Neglect can mean not providing adequate nutrition, clothing, and/or shelter. It can mean that a parent or caregiver is not providing a child with medical or mental health treatment or is not giving prescribed medicines the child needs. Neglect can also mean neglecting the child's education. Keeping a child from school or from special education can be neglect. Neglect also includes exposing a child to dangerous environments (e.g., exposure to domestic violence). It can mean poor supervision for a child, including putting the child in the care of someone incapable of caring for children. It can mean abandoning a child or expelling him or her from home. Lack of psychological care, including emotional support, attention, or love, is also considered neglect—and it is the most common form of abuse reported to child welfare authorities.

Source: dePanfilis, 2006.

for repeated trauma exposure across the life span. Childhood abuse is highly associated with major depression, suicidal thoughts, PTSD, and dissociative symptoms. So too, ACEs are associated with a greater risk of adult alcohol use. When a person experiences several adverse events in childhood, the risk of his or her heavy drinking, self-reported alcohol dependence, and marrying a person who is alcohol dependent is two to four times greater than that of a person with no ACEs (Dube, Anda, Felitti, Edwards, & Croft, 2002).

A detailed examination of the issues involved in providing substance abuse treatment to survivors of child abuse and neglect is the subject of TIP 36, *Substance Abuse Treatment for Persons With Child Abuse and Neglect Issues* (CSAT, 2000b).

Political Terror and War

Political terror and war are likely to have lasting consequences for survivors. In essence, anything that threatens the existence, beliefs, well-being, or livelihood of a community is likely to be experienced as traumatic by community members. Whether counselors are working with an immigrant or refugee enclave in the United States or in another country, they should be aware of local events, local history, and the possibility that clients have endured trauma. (For international information about the clinical, historical, and theoretical aspects of trauma and terrorism, see Danieli, Brom, & Sills, 2005.) Terrorism is a unique subtype of human-caused disasters. The overall goal of terrorist attacks is to maximize the uncertainty, anxiety, and fear of a large community, so the responses are often epidemic and affect large numbers of people who have had direct or indirect exposure to an event (Silver et al., 2004; Suvak, Maguen, Litz, Silver, & Holman, 2008). Terrorism has a variety of results not common to other disasters, such as reminders of the unpredictability of terrorist acts; increases in security measures for the general population; intensified suspicion about a particular population, ethnicity, or culture; and heightened awareness and/or arousal.

Refugees

According to the World Refugee Survey, there are an estimated 12 million refugees and asylum seekers, 21 million internally displaced people, and nearly 35 million uprooted people (U.S. Committee for Refugees and Immigrants, 2006). Many of these people have survived horrendous ordeals with profound and lasting effects for individuals and whole populations. In addition to witnessing deaths by execution, starvation, or beatings, many survivors have experienced horrific torture.

Refugees are people who flee their homes because they have experienced or have a reasonable fear of experiencing persecution. They

Torture and Captivity

Torture traumatizes by taking away an individual's personhood. To survive, victims have to give up their sense of self and will. They become the person the torturer designs or a nonperson, simply existing. Inevitably, the shame of the victim is enormous, because the focus of torture is to humiliate and degrade. As a result, victims often seek to hide their trauma and significant parts of their selfhood long after torture has ended and freedom has been obtained. According to Judith Herman, "the methods of establishing control over another person are based upon the systematic, repetitive infliction of psychological trauma. They are organized techniques of disempowerment and disconnection. Methods of psychological control are designed to instill terror and helplessness and to destroy the victim's sense of self in relation to others."

Source: Herman, 1997, p. 77.

differ from immigrants who willingly leave their homes or homeland to seek better opportunities. Although immigrants may experience trauma before migrating to or after reaching their new destination, refugees will often have greater exposure to trauma before migration. Refugees typically come from war-torn countries and may have been persecuted or tortured. Consequently, greater exposure to trauma, such as torture, before migrating often leads to more adjustment-related difficulties and psychological symptoms after relocation (Steel et al., 2009).

Refugees typically face substantial difficulties in assimilating into new countries and cultures. Moreover, the environment can create a new set of challenges that may include additional exposure to trauma and social isolation (Miller et al., 2002). These as well as additional factors influence adjustment, the development of mental illness (including PTSD), and the occurrence of substance use disorders. Additional factors that influence outcomes after relocation include receptivity of the local community, along with opportunities for social support and culturally responsive services.

Among refugee populations in the United States, little research is available on rates of mental illness and co-occurring substance use disorders and traumatic stress among refugee populations. Substance use patterns vary based on cultural factors as well as assimilation, yet research suggests that trauma increases the risk for substance use among refugees after war-related experiences (Kozarić-Kovačić, Ljubin, & Grappe, 2000). Therefore, providers should expect to see trauma-related disorders among refugees who are seeking treatment for a substance use disorder and greater prevalence of substance use disorders among refugees who seek behavioral health services.

Vietnamese Refugees

"Wars always have consequences, both immediate and remote, and the consequences are often tragic. One tragic circumstance often caused by war is the forceful, disorganized, and uncontrollable mass movement of both civilians and soldiers trying to escape the horrors of the wars or of an oppressive regime.…

"Vietnamese communists, by taking power in the North in 1954 and then in the South in 1975, caused two major upheavals in the Land of the Small Dragon, as Vietnam was once called. The first Vietnam War led to the 1954 exodus during which 1 million people fled from the North to the South. The second Vietnam War resulted in the dispersion, from 1975-1992, of approximately 2 million Vietnamese all over the world. These significant, unplanned, and uncoordinated mass movements around the world not only dislocated millions of people, but also caused thousands upon thousands of deaths at sea.…

"The second and third wave of refugees from 1976 onward went through a more difficult time. They had to buy their way out and to hide from soldiers and the police who hunted them down. After catching them, the police either asked for brides or threw the escapees into jails. Those who evaded police still had to face engine failures, sea storms, pirates…They then had to survive overcrowded boats for days or weeks, during which food and water could not be replenished and living conditions were terrible… Many people died from exhaustion, dehydration, and hunger. Others suffered at the hands of terrifying pirates… After the sea ordeal came the overcrowded camps where living conditions were most often substandard and where security was painfully lacking.…

"In the United States, within less than 3 decades, the Vietnamese population grew from a minority of perhaps 1,000 persons to the second largest refugee group behind Cubans."

Source: Vo, 2006, pp. 1–4.

System-Oriented Traumas: Retraumatization

Retraumatization occurs when clients experience something that makes them feel as though they are undergoing another trauma. Unfortunately, treatment settings and clinicians can create retraumatizing experiences, often without being aware of it, and sometimes clients themselves are not consciously aware that a clinical situation has actually triggered a traumatic stress reaction. Agencies that anticipate the risk for retraumatization and actively work on adjusting program policies and procedures to remain sensitive to the histories and needs of individuals who have undergone past trauma are likely to have more success in providing care, retaining clients, and achieving positive outcomes.

Staff and agency issues that can cause retraumatization include:

- Being unaware that the client's traumatic history significantly affects his or her life.
- Failing to screen for trauma history prior to treatment planning.
- Challenging or discounting reports of abuse or other traumatic events.
- Using isolation or physical restraints.
- Using experiential exercises that humiliate the individual.
- Endorsing a confrontational approach in counseling.
- Allowing the abusive behavior of one client toward another to continue without intervention.
- Labeling behavior/feelings as pathological.
- Failing to provide adequate security and safety within the program.
- Limiting participation of the client in treatment decisions and planning processes.
- Minimizing, discrediting, or ignoring client responses.
- Disrupting counselor–client relationships by changing counselors' schedules and assignments.
- Obtaining urine specimens in a nonprivate setting.

Advice to Counselors: Addressing Retraumatization

- Anticipate and be sensitive to the needs of clients who have experienced trauma regarding program policies and procedures in the treatment setting that might trigger memories of trauma, such as lack of privacy, feeling pushed to take psychotropic medications, perceiving that they have limited choices within the program or in the selection of the program, and so forth.
- Attend to clients' experiences. Ignoring clients' behavioral and emotional reactions to having their traumatic memories triggered is more likely to increase these responses than decrease them.
- Develop an individual coping plan in anticipation of triggers that the individual is likely to experience in treatment based on his or her history.
- Rehearse routinely the coping strategies highlighted in the coping plan. If the client does not practice strategies prior to being triggered, the likelihood of being able to use them effectively upon triggering is lessened. For example, it is far easier to practice grounding exercises in the absence of severe fear than to wait for that moment when the client is reexperiencing an aspect of a traumatic event. (For more information on grounding exercises, refer to *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse*; Najavits, 2002a, pp. 125–131.)
- Recognize that clinical and programmatic efforts to control or contain behavior in treatment can cause traumatic stress reactions, particularly for trauma survivors for whom being trapped was part of the trauma experience.
- Listen for the specific trigger that seems to be driving the client's reaction. It will typically help both the counselor and client understand the behavior and normalize the traumatic stress reactions.
- Make sure that staff and other clients do not shame the trauma survivor for his or her behavior, such as through teasing or joking about the situation.
- Respond with consistency. The client should not get conflicting information or responses from different staff members; this includes information and responses given by administrators.

- Having clients undress in the presence of others.
- Inconsistently enforcing rules and allowing chaos in the treatment environment.
- Imposing agency policies or rules without exceptions or an opportunity for clients to question them.
- Enforcing new restrictions within the program without staff–client communication.
- Limiting access to services for ethnically diverse populations.
- Accepting agency dysfunction, including lack of consistent, competent leadership.

Characteristics of Trauma

The following section highlights several selected characteristics of traumatic experiences that influence the effects of traumatic stress. Objective characteristics are those elements of a traumatic event that are tangible or factual; subjective characteristics include internal processes, such as perceptions of traumatic experiences and meanings assigned to them.

Objective Characteristics

Was it a single, repeated, or sustained trauma?

Trauma can involve a single event, numerous or repeated events, or sustained/chronic experiences. A *single trauma* is limited to a single point in time. A rape, an automobile accident, the sudden death of a loved one—all are examples of a single trauma. Some people who experience a single trauma recover without any specific intervention. But for others—especially those with histories of previous trauma or mental or substance use disorders, or those for whom the trauma experience is particularly horrific or overwhelming—a single trauma can result in traumatic stress symptoms and trauma- and stress-related disorders. Single traumas do not necessarily have a lesser psychological impact than repeated traumas. After the terrorist attacks on September 11, 2001—a significant single trauma—many Manhattan residents experienced intrusive memories and sleep disruption whether they were at the site of the attacks or watched television coverage of it (Ford & Fournier, 2007; Galea et al., 2002).

A series of traumas happening to the same person over time is known as *repeated trauma*. This can include repeated sexual or physical assaults, exposure to frequent injuries of others, or seemingly unrelated traumas. Military personnel, journalists covering stories of mass tragedies or prolonged conflicts, and first responders who handle hundreds of cases each year typify repeated trauma survivors. Repetitive exposure to traumas can have a cumulative effect over one's lifetime. A person who was assaulted during adolescence, diagnosed with a life-threatening illness in his or her thirties, and involved in a serious car accident later in life has experienced repeated trauma.

Some repeated traumas are sustained or chronic. Sustained trauma experiences tend to wear down resilience and the ability to adapt. Some examples include children who endure ongoing sexual abuse, physical neglect, or emotional abuse; people who are in violent relationships; and people who live in chronic poverty. Individuals in chronically stressful, traumatizing environments are particularly susceptible to traumatic stress reactions, substance use, and mental disorders.

Bidirectional relationships exist between trauma and substance use as well as trauma and mental illness. For example, abuse of alcohol and drugs increases the risk of a traumatic experience and creates greater vulnerability to the effects of trauma; substance abuse reduces a person's ability to take corrective and remedial actions that might reduce the impact of the trauma. Likewise, traumatic stress leads to a greater likelihood of

Case Illustration: Yourself

Think of a time that was particularly stressful (but not traumatic) in your life. Revisit this period as an observer watching the events unfold and then ask yourself, "What made this time particularly stressful?" It is likely that a part of your answer will include the difficulty of managing one situation before another circumstance came along demanding your time. Stressful times denote being bombarded with many things at one time, perceived or actual, without sufficient time or ability to address them emotionally, cognitively, spiritually, and/or physically. The same goes for trauma—rapid exposure to numerous traumas one after another lessens one's ability to process the event before the next onslaught. This creates a cumulative effect, making it more difficult to heal from any one trauma.

substance abuse that, in turn, increases the risk for additional exposure to trauma. Paralleling this bidirectional relationship, mental illness increases vulnerability to the effects of trauma and raises the risk for substance use disorders and for encountering additional traumatic events. So too, early exposure to ACEs is associated with traumatic stress reactions and subsequent exposure to trauma in adult years.

People who have encountered multiple and longer doses of trauma are at the greatest risk for developing traumatic stress. For example, military reservists and other military service members who have had multiple long tours of duty are at greater risk for traumatic stress reactions (see the planned TIP, *Reintegration-Related Behavioral Health Issues in Veterans and Military Families;* SAMHSA, planned f). In addition, people are more likely to encounter greater impairment and distress from trauma if that trauma occurs with significant intensity and continues sporadically or unceasingly for extended periods.

Was there enough time to process the experience?

A particularly severe pattern of ongoing trauma, sometimes referred to as "cascading trauma," occurs when multiple traumas happen in a pattern that does not allow an individual to heal from one traumatic event before another occurs. Take, for example, California residents—they repeatedly face consecutive and/or simultaneous natural disasters including fires, landslides, floods, droughts, and earthquakes. In other cases, there is ample time to process an event, but processing is limited because people don't have supportive relationships or environments that model preventive practices. This can lead to greater vulnerability to traumas that occur later in life.

How many losses has the trauma caused?

Trauma itself can create significant distress, but often, the losses associated with a trauma have more far-reaching effects. For instance, a child may be forced to assume adult responsibilities, such as serving as a confidant for a parent who is sexually abusing him or her, and lose the opportunity of a childhood free from adult worries. In another scenario, a couple may initially feel grateful to have escaped a house fire, but they may nevertheless face significant community and financial losses months afterward. In evaluating the impact of trauma, it is helpful to access and discuss the losses associated with the initial trauma. The number of losses greatly influences an individual's ability to bounce back from the tragedy.

In the case illustration on the next page, Rasheed's losses cause him to disconnect from his wife, who loves and supports him. Successful confrontation of losses can be difficult if the losses compound each other, as with Rasheed's loss of his friend, his disability, his employment struggles, and the threats to his marriage and liberty. People can cite a specific

Case Illustration: Rasheed

Rasheed was referred to an employee assistance program by his employer. He considered quitting his job, but his wife insisted he talk to a counselor. He is a 41-year-old auto mechanic who, 4 years ago, caused a head-on collision while attempting to pass another vehicle. A close friend, riding in the passenger's seat, was killed, and two young people in the other vehicle were seriously injured and permanently disabled. Rasheed survived with a significant back injury and has only been able to work sporadically. He was convicted of negligent homicide and placed on probation because of his physical disability. He is on probation for another 4 years, and if he is convicted of another felony during that time, he will have to serve prison time for his prior offense.

While still in the hospital, Rasheed complained of feeling unreal, numb, and disinterested in the care he received. He did not remember the crash but remembers waking up in the hospital 2 days later. He had difficulty sleeping in the hospital and was aware of feelings of impending doom, although he was unaware of the legal charges he would later face. He was diagnosed with ASD.

He was discharged from the hospital with a variety of medications, including pain pills and a sleep aid. He rapidly became dependent on these medications, feeling he could not face the day without the pain medication and being unable to sleep without sleep medicine in larger doses than had been prescribed. Within 3 months of the accident, he was "doctor shopping" for pain pills and even had a friend obtain a prescription for the sleeping medication from that friend's doctor. In the 4 intervening years, Rasheed's drug use escalated, and his blunted emotions and detachment from friends became more profound. He became adept at obtaining pain pills from a variety of sources, most of them illegal. He fears that if he seeks treatment for the drug problem, he will have to admit to felony offenses and will probably be imprisoned. He also does not believe he can manage his life without the pain pills.

In the past 2 years, he has had recurring dreams of driving a car on the wrong side of the road and into the headlights of an oncoming vehicle. In the dream, he cannot control the car and wakes up just before the vehicles crash. At unusual times—for instance, when he is just awakening in the morning, taking a shower, or walking alone—he will feel profound guilt over the death of his friend in the accident. He becomes very anxious when driving in traffic or when he feels he is driving faster than he should. His marriage of 18 years has been marked by increasing emotional distance, and his wife has talked about separating if he does not do something about his problem. He has been unable to work consistently because of back pain and depression. He was laid off from one job because he could not concentrate and was making too many mistakes.

The counselor in the employee assistance program elicited information on Rasheed's drug use, although she suspected Rasheed was minimizing its extent and effects. Knowledgeable about psychological trauma, the counselor helped Rasheed feel safe enough to talk about the accident and how it had affected his life. She was struck by how little Rasheed connected his present difficulties to the accident and its aftermath. The counselor later commented that Rasheed talked about the accident as if it had happened to someone else. Rasheed agreed to continue seeing the counselor for five additional visits, during which time a plan would be made for Rasheed to begin treatment for drug dependence and PTSD.

event as precipitating their trauma, or, in other cases, the specific trauma can symbolize a series of disabling events in which the person felt his or her life was threatened or in which he or she felt emotionally overwhelmed, psychologically disorganized, or significantly disconnected from his or her surroundings. It will be important for Rasheed to understand how his losses played a part in his abuse of prescription medications to cope with symptoms associated with traumatic stress and loss, (e.g., guilt, depression, fear). If not addressed, his trauma could increase his risk for relapse.

Was the trauma expected or unexpected?

When talking about a trauma, people sometimes say they didn't see it coming. Being unprepared, unaware, and vulnerable often increases the risk of psychological injury, but these are common components of most traumas, given that most traumatic events do occur without warning (e.g., car crashes, terrorist attacks, sexual assaults). People with substance use disorders, mental illness, and/or cognitive disabilities may be especially vulnerable in that they may attend less or have competing concerns that diminish attention to what is going on around them, even in high-risk environments. However, most individuals attempt to gain some control over the tragedy by replaying the moments leading up to the event and processing how they could have anticipated it. Some people perseverate on these thoughts for months or years after the event.

Sometimes, a trauma is anticipated but has unexpected or unanticipated consequences, as in the case of Hurricane Katrina. Learning about what is likely to happen can reduce traumatization. For instance, training military personnel in advance of going to combat overseas prepares them to handle traumas and can reduce the impact of trauma.

Were the trauma's effects on the person's life isolated or pervasive?

When a trauma is isolated from the larger context of life, a person's response to it is more likely to be contained and limited. For instance, military personnel in combat situations can be significantly traumatized by what they experience. On return to civilian life or noncombat service, some are able to isolate the traumatic experience so that it does not invade ordinary, day-to-day living. This does not mean that the combat experience was not disturbing or that it will not resurface if the individual encounters an experience that triggers memories of the trauma; it just means that the person can more easily leave the trauma in the past and attend to the present.

Conversely, people who remain in the vicinity of the trauma may encounter greater challenges in recovery. The traumatic event intertwines with various aspects of the person's daily activities and interactions, thus increasing the possibility of being triggered by surrounding cues and experiencing subsequent psychological distress. However, another way to view this potential dilemma for the client is to reframe it as an opportunity—the repetitive exposure to trauma-related cues may provide vital guidance as to when and which treatment and coping techniques to use in the delivery of trauma-informed and trauma-specific behavioral health services.

Who was responsible for the trauma and was the act intentional?

If the severity of a trauma is judged solely by whether the act was intentional or not, events that reflect an intention to harm would be a primary indicator in predicting subsequent difficulties among individuals exposed to this form of trauma. For most survivors, there is an initial disbelief that someone would conceivably intend to harm others, followed by considerable emotional and, at times, behavioral investment in somehow making things right again or in making sense of a senseless, malicious act. For instance, in the wake of the World Trade Center attacks in New York City, people responded via renewed patriotism, impromptu candlelight vigils, attacks on people of Arab and Muslim descent, and unprecedented donations and willingness to wait in long lines to donate blood to the Red Cross. Each example is a response that in some way attempts to right the perceived wrong or attach new meaning to the event and subsequent consequences.

When terrible things happen, it is human nature to assign blame. Trauma survivors can become heavily invested in assigning blame or finding out who was at fault, regardless of the type of trauma. Often, this occurs as an attempt to make sense of, give meaning to, and reestablish a sense of predictability, control, and safety after an irrational or random act. It is far easier to accept that someone, including oneself, is at fault or could have done something different than it is to accept the fact that one was simply in the wrong place at the wrong time.

For some trauma survivors, needing to find out why a trauma occurred or who is at fault can become a significant block to growth when the individual would be better served by asking, "What do I need to do to heal?" Behavioral health professionals can help clients translate what they have learned about responsibility in recovery to other aspects of their lives. For instance, someone in treatment for co-occurring disorders who has internalized that becoming depressed or addicted was not his or her fault, but that recovery *is* a personal responsibility, can then apply the same principle to the experience of childhood abuse and thereby overcome negative judgments of self (e.g., thinking oneself to be a bad person who deserves abuse). The individual can then begin to reassign responsibility by attaching the blame to the perpetrator(s) while at the same time assuming responsibility for recovery.

Was the trauma experienced directly or indirectly?

Trauma that happens to someone directly seems to be more damaging than witnessing trauma that befalls others. For example, it is usually more traumatic to be robbed at gunpoint than to witness someone else being robbed or hearing someone tell a story about being robbed. Yet, sometimes, experiencing another's pain can be equally traumatic. For instance, parents often internalize the pain and suffering of their children when the children are undergoing traumatic circumstances (e.g., treatments for childhood cancer).

There are two ways to experience the trauma of others. An individual may witness the event, such as seeing someone killed or seriously injured in a car accident, or may learn of an event that happened to someone, such as a violent personal assault, suicide, serious accident, injury, or sudden or unexpected death. For many people, the impact of the trauma will depend on a host of variables, including their proximity to the event as eyewitnesses, the witnesses' response in the situation, their relationship to the victims, the degree of helplessness surrounding the experience, their exposure to subsequent consequences, and so on.

Case Illustration: Frank

Frank entered substance abuse treatment with diagnoses of co-occurring PTSD and substance use disorder. While on a whitewater kayak trip with his wife, her kayak became pinned on a rock, and Frank could only watch helplessly as she drowned. His drinking had increased markedly after the accident. He acknowledged a vicious cycle of sleep disturbance with intrusive nightmares followed by vivid memories and feelings of terror and helplessness after he awoke. He drank heavily at night to quiet the nightmares and memories, but heavy alcohol consumption perpetuated his trouble sleeping. He withdrew from contact with many of his old "couple friends" and his wife's family, with whom he had been close. At treatment entry, he described his life as "going to work and coming home." The trauma occurred 3 years before he sought treatment, but Frank continued to feel numb and disconnected from the world. His only emotion was anger, which he tried to keep in check. Integrated treatment for PTSD and substance abuse helped him sleep and taught him coping skills to use when the memories arose; it fostered his engagement and retention in long-term care for both disorders.

The effects of traumas such as genocide and internment in concentration camps can be felt across generations—stories, coping behaviors, and stress reactions can be passed across generational lines far removed from the actual events or firsthand accounts. Known as historical trauma, this type of trauma can affect the functioning of families, communities, and cultures for multiple generations.

What happened since the trauma?

In reviewing traumatic events, it is important to assess the degree of disruption after the initial trauma has passed, such as the loss of employment, assets, community events, behavioral health services, local stores, and recreational areas. There is typically an initial rally of services and support following a trauma, particularly if it is on a mass scale. However, the reality of the trauma's effects and their disruptiveness may have a more lasting impact. The deterioration of normalcy, including the disruption of day-to-day activities and the damage of structures that house these routines, will likely erode the common threads that provide a sense of safety in individual lives and communities. Hence, the degree of disruption in resuming normal daily activities is a significant risk factor for substance use disorders, subclinical psychological symptoms, and mental disorders. For example, adults displaced from their homes because of Hurricanes Katrina or Rita had significantly higher rates of past-month cigarette use, illicit drug use, and binge drinking than those who were not displaced (Office of Applied Studies, 2008).

Subjective Characteristics

Psychological meaning of trauma

An important clinical issue in understanding the impact of trauma is the meaning that the survivor has attached to the traumatic experience. Survivors' unique cognitive interpretations of an event—that is, their beliefs and assumptions—contribute to how they process, react to, cope with, and recover from the trauma. Does the event represent retribution for past deeds committed by the individual or his or her family? How does the individual attach meaning to his or her survival? Does he or she believe that it is a sign of a greater purpose not yet revealed? People who attempt to share their interpretation and meaning of the event can feel misunderstood and sometimes alienated (Paulson & Krippner, 2007; Schein, Spitz, Burlingame, & Muskin, 2006).

> It is important to remember that what happened is not nearly as important as what the trauma means to the individual.

People interpret traumatic events in vastly different ways, and many variables shape how an individual assigns meaning to the experience (framing the meaning through culture, family beliefs, prior life experiences and learning, personality and other psychological features, etc.). Even in an event that happens in a household, each family member may interpret the experience differently. Likewise, the same type of event can occur at two different times in a person's life, but his or her interpretation of the events may differ considerably because of developmental differences acquired between events, current cognitive and emotional processing skills, availability of and access to environmental resources, and so forth.

Disruption of core assumptions and beliefs

Trauma often engenders a crisis of faith (Frankl, 1992) that leads clients to question basic assumptions about life. Were the individual's core or life-organizing assumptions (e.g., about safety, perception of others, fairness, purpose of life, future dreams) challenged or disrupted during or after the traumatic event? (See the seminal work,

Resilience: Connection and Continuity

Research suggests that reestablishing ties to family, community, culture, and spiritual systems is not only vital to the individual, but it also influences the impact of the trauma upon future generations. For example, Baker and Gippenreiter (1998) studied the descendants of survivors of Joseph Stalin's purge. They found that families who were able to maintain a sense of connection and continuity with grandparents directly affected by the purge experienced fewer negative effects than those who were emotionally or physically severed from their grandparents. Whether the grandparents survived was less important than the connection the grandchildren felt to their pasts.

Shattered Assumptions, by Janoff-Bulman, 1992.) For example, some trauma survivors see themselves as irreparably wounded or beyond the possibility of healing. The following case illustration (Sonja) explores not only the importance of meaning, but also the role that trauma plays in altering an individual's core assumptions—the very assumptions that provide meaning and a means to organize our lives and our interactions with the world and others.

Cultural meaning of trauma

Counselors should strive to appreciate the cultural meaning of a trauma. How do cultural interpretations, cultural support, and cultural responses affect the experience of trauma? It is critical that counselors do not presume to understand the meaning of a traumatic experience without considering the client's cultural context. Culture strongly influences the perceptions of trauma. For instance, a trauma involving shame can be more profound for a person from an Asian culture than for someone from a European culture. Likewise, an Alaska Native individual or community, depending upon their Tribal ancestry, may believe that the traumatic experience serves as a form of retribution. Similarly, the sudden death of a family member or loved one can be less traumatic in a culture that has a strong belief in a positive afterlife. It is important for counselors to recognize that their perceptions of a specific trauma could be very different from their clients' perceptions. Be careful not to judge a client's beliefs in light of your own value system. For more information on culture and how to achieve cultural competence in providing behavioral health services, see SAMHSA's planned TIP, *Improving Cultural Competence* (SAMHSA, planned c).

Individual and Sociocultural Features

A wide variety of social, demographic, environmental, and psychological factors influence a person's experience of trauma, the severity of traumatic stress reactions following the event, and his or her resilience in dealing with the short- and long-term environmental, physical, sociocultural, and emotional consequences. This section addresses a few known factors that influence the risk of trauma along with the development of subclinical and diagnostic traumatic stress symptoms, such as mood and anxiety symptoms and disorders. It is not meant to be an exhaustive exploration of these factors, but rather, a brief presentation to make counselors and other behavioral health professionals aware that various factors influence risk for and protection against traumatic stress and subsequent reactions. (For a broader perspective on such factors, refer to Part 1, Chapter 1.)

Individual Factors

Several factors influence one's ability to deal with trauma effectively and increase one's risk for traumatic stress reactions. Individual factors pertain to the individual's genetic, biological, and psychological makeup and history as they influence the person's experience and

Case Illustration: Sonja

Sonja began to talk about how her life was different after being physically assaulted and robbed in a parking lot at a local strip mall a year ago. She recounts that even though there were people in the parking lot, no one came to her aid until the assailant ran off with her purse. She sustained a cheekbone fracture and developed visual difficulties due to the inflammation from the fracture. She recently sought treatment for depressive symptoms and reported that she had lost interest in activities that typically gave her joy. She reported isolating herself from others and said that her perception of others had changed dramatically since the attack.

Sonja had received a diagnosis of major depression with psychotic features 10 years earlier and received group therapy at a local community mental health center for 3 years until her depression went into remission. She recently became afraid that her depression was becoming more pronounced, and she wanted to prevent another severe depressive episode as well as the use of psychotropic medications, which she felt made her lethargic. Thus, she sought out behavioral health counseling.

As the sessions progressed, and after a psychological evaluation, it was clear that Sonja had some depressive symptoms, but they were subclinical. She denied suicidal thoughts or intent, and her thought process was organized with no evidence of hallucinations or delusions. She described her isolation as a reluctance to shop at area stores. On one hand, Sonja was self-compassionate about her reasons for avoidance, but on the other hand, she was concerned that the traumatic event had altered how she saw life and others. "I don't see people as very caring or kind, like I used to prior to the event. I don't trust them, and I feel people are too self-absorbed. I don't feel safe, and this bothers me. I worry that I'm becoming paranoid again. I guess I know better, but I just want to have the freedom to do what I want and go where I want."

Two months after Sonja initiated counseling, she came to the office exclaiming that things can indeed change. "You won't believe it. I had to go to the grocery store, so I forced myself to go the shopping center that had a grocery store attached to a strip mall. I was walking by a coffee shop, quickly browsing the items in the front window, when a man comes out of the shop talking at me. He says, 'You look like you need a cup of coffee.' What he said didn't register immediately. I looked at him blankly, and he said it again. 'You look like you need a cup of coffee. I'm the owner of the shop, and I noticed you looking in the window, and we have plenty of brewed coffee left before we close the shop. Come on in, it's on the house.' So I did! From that moment on, I began to see people differently. He set it right for me—I feel as if I have myself back again, as if the assault was a sign that I shouldn't trust people, and now I see that there is some goodness in the world. As small as this kindness was, it gave me the hope that I had lost."

For Sonja, the assault changed her assumptions about safety and her view of others. She also attached meaning to the event. She believed that the event was a sign that she shouldn't trust people and that people are uncaring. Yet these beliefs bothered her and contradicted how she saw herself in the world, and she was afraid that her depressive symptoms were returning.

For an inexperienced professional, her presentation may have ignited suspicions that she was beginning to present with psychotic features. However, it is common for trauma survivors to experience changes in core assumptions immediately after the event and to attach meaning to the trauma. Often, a key ingredient in the recovery process is first identifying the meaning of the event and the beliefs that changed following the traumatic experience. So when you hear a client say "I will never see life the same," this expression should trigger further exploration into how life is different, what meaning has been assigned to the trauma, and how the individual has changed his or her perception of self, others, and the future.

(Continued on the next page.)

Case Illustration: Sonja (continued)

Sometimes, reworking the altered beliefs and assumptions occurs with no formal intervention, as with Sonja. In her situation, a random stranger provided a moment that challenged an assumption generated from the trauma. For others, counseling may be helpful in identifying how beliefs and thoughts about self, others, and the world have changed since the event and how to rework them to move beyond the trauma. It is important to understand that the meaning that an individual attaches to the event(s) can either undermine the healing process (e.g., believing that you should not have survived, feeling shame about the trauma, continuing to engage in high-risk activities) or pave the road to recovery (e.g., volunteering to protect victim rights after being sexually assaulted). The following questions can help behavioral health staff members introduce topics surrounding assumptions, beliefs, interpretations, and meanings related to trauma:

- In what ways has your life been different since the trauma?
- How do you understand your survival? (This is an important question for clients who have been exposed to ACEs or cumulative trauma and those who survived a tragedy when others did not.)
- Do you believe that there are reasons that this event happened to you? What are they?
- What meaning does this experience have for you?
- Do you feel that you are the same person as before the trauma? In what ways are you the same? In what ways do you feel different?
- How did this experience change you as a person? Would you like to return to the person you once were? What would you need to do, or what would need to happen, for this to occur?
- Did the traumatic experience change you in a way that you don't like? In what ways?
- How do you view others and your future differently since the trauma?
- What would you like to believe now about the experience?

interpretation of, as well as his or her reactions to, trauma. However, many factors influence individual responses to trauma; it is not just individual characteristics. Failing to recognize that multiple factors aside from individual attributes and history influence experiences during and after trauma can lead to blaming the victim for having traumatic stress.

History of prior psychological trauma

People with histories of prior psychological trauma appear to be the most susceptible to severe traumatic responses (Nishith, Mechanic, & Resick, 2000; Vogt, Bruce, Street, & Stafford, 2007), particularly if they have avoided addressing past traumas. Because minimization, dissociation, and avoidance are common defenses for many trauma survivors, prior traumas are not always consciously available, and when they are, memories can be distorted to avoid painful affects. Some survivors who have repressed their experiences deny a history of trauma or are unable to explain their strong reactions to present situations.

Remember that the effects of trauma are cumulative; therefore, a later trauma that outwardly appears less severe may have more impact upon an individual than a trauma that occurred years earlier. Conversely, individuals who have experienced earlier traumas may have developed effective coping strategies or report positive outcomes as they have learned to adjust to the consequences of the trauma(s). This outcome is often referred to as posttraumatic growth or psychological growth.

Clients in behavioral health treatment who have histories of trauma can respond negatively to or seem disinterested in treatment efforts. They may become uncomfortable in groups that emphasize personal sharing; likewise, an individual who experiences brief bouts of dissociation (a reaction of some trauma survivors) may be misunderstood by others in treatment and seen as uninterested. Providers need to

attend to histories, adjust treatment to avoid retraumatization, and steer clear of labeling clients' behavior as pathological.

History of resilience

Resilience—the ability to thrive despite negative life experiences and heal from traumatic events—is related to the internal strengths and environmental supports of an individual. Most individuals are resilient despite experiencing traumatic stress. The ability to thrive beyond the trauma is associated with individual factors as well as situational and contextual factors. There are not only one or two primary factors that make an individual resilient; many factors contribute to the development of resilience. There is little research to indicate that there are specific traits predictive of resilience; instead, it appears that more general characteristics influence resilience, including neurobiology (Feder, Charney, & Collins, 2011), flexibility in adapting to change, beliefs prior to trauma, sense of self-efficacy, and ability to experience positive emotions (Bonanno & Mancini, 2011).

History of mental disorders

The correlations among traumatic stress, substance use disorders, and co-occurring mental disorders are well known. According to the *Diagnostic and Statistical Manual of Mental Disorders*, Fifth Edition (American Psychiatric Association, 2013a), traumatic stress reactions are linked to higher rates of mood, substance-related, anxiety, trauma, stress-related, and other mental disorders, each of which can precede, follow, or emerge concurrently with trauma itself. A co-occurring mental disorder is a significant determinant of whether an individual can successfully address and resolve trauma as it emerges from the past or occurs in the present. Koenen, Stellman, Stellman, and Sommer (2003) found that the risk of developing PTSD following combat trauma was higher for individuals with preexisting conduct disorder, panic disorder, generalized anxiety disorder, and/or major depression than for those without preexisting mental disorders. For additional information on comorbidity of trauma and other mental disorders, see TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c).

Sociodemographic Factors

Demographic variables are not good predictors of who will experience trauma and subsequent traumatic stress reactions. Gender, age, race and ethnicity, sexual orientation, marital status, occupation, income, and education can all have some influence, but not enough to determine who should or should not receive screening for trauma and traumatic stress symptoms. The following sections cover a few selected variables. (For more information, please refer to Part 3 of this TIP, the online literature review.)

Gender

In the United States, men are at greater risk than women for being exposed to stressful events. Despite the higher prevalence among men, lifetime PTSD occurs at about twice the rate among women as it does in men. Less is known about gender differences with subclinical traumatic stress reactions. There are also other gender differences, such as the types of trauma experienced by men and women. Women are more likely to experience physical and sexual assault, whereas men are most likely to experience combat and crime victimization and to witness killings and serious injuries (Breslau, 2002; Kimerling, Ouimette, & Weitlauf, 2007; Tolin & Foa, 2006). Women in military service are subject to the same risks as men and are also at a greater risk for military sexual trauma. Men's traumas often occur in public; women's are more likely to take place in private settings. Perpetrators of traumas against men are often strangers, but women are more likely to know the perpetrator.

Age

In general, the older one becomes, the higher the risk of trauma—but the increase is not dramatic. Age is not particularly important in predicting exposure to trauma, yet at no age is one immune to the risk. However, trauma that occurs in the earlier and midlife years appears to have greater impact on people for different reasons. For younger individuals, the trauma can affect developmental processes, attachment, emotional regulation, life assumptions, cognitive interpretations of later experiences, and so forth (for additional resources, visit the National Child Traumatic Stress Network; http://www.nctsn.org/). For adults in midlife, trauma may have a greater impact due to the enhanced stress or burden of care that often characterizes this stage of life—caring for their children and their parents at the same time. Older adults are as likely as younger adults to recover quickly from trauma, yet they may have greater vulnerabilities, including their ability to survive without injury and their ability to address the current trauma without psychological interference from earlier stressful or traumatic events. Older people are naturally more likely to have had a history of trauma because they have lived longer, thus creating greater vulnerability to the effects of cumulative trauma.

Race, ethnicity, and culture

The potential for trauma exists in all major racial and ethnic groups in American society, yet few studies analyze the relationship of race and ethnicity to trauma exposure and/or traumatic stress reactions. Some studies show that certain racial and ethnic groups are at greater risk for specific traumas. For example, African Americans experienced higher rates of overall violence, aggravated assault, and robbery than Whites but were as likely to be victims of rape or sexual assault (Catalano, 2004). Literature reflects that diverse ethnic, racial, and cultural groups are more likely to experience adverse effects from various traumas and to meet criteria for posttraumatic stress (Bell, 2011).

Sexual orientation and gender identity

Lesbian, gay, bisexual, and transgender individuals are likely to experience various forms of trauma associated with their sexual orientation, including harsh consequences from families and faith traditions, higher risk of assault from casual sexual partners, hate crimes, lack of legal protection, and laws of exclusion (Brown, 2008). Gay and bisexual men as well as transgender people are more likely to experience victimization than lesbians and bisexual women. Dillon (2001) reported a trauma exposure rate of 94 percent among lesbian, gay,

Resilience: Cultural, Racial, and Ethnic Characteristics

The following list highlights characteristics that often nurture resilience among individuals from diverse cultural, racial, and ethnic groups:

- Strong kinship bonds
- Respect for elders and the importance of extended family
- Spirituality and religious practices (e.g., shrine visitations or the use of traditional healers)
- Value in friendships and warm personal relationships
- Expression of humor and creativity
- Instilling a sense of history, heritage, and historical traditions
- Community orientation, activities, and socialization
- Strong work ethic
- Philosophies and beliefs about life, suffering, and perseverance

"Fortune owes its existence to misfortune, and misfortune is hidden in fortune."

–Lao-Tzu teaching, Taoism (Wong & Wong, 2006)

and bisexual individuals; more than 40 percent of respondents experienced harassment due to their sexual orientation. Heterosexual orientation is also a risk for women, as women in relationships with men are at a greater risk of being physically and sexually abused.

People who are homeless

Homelessness is typically defined as the lack of an adequate or regular dwelling, or having a nighttime dwelling that is a publicly or privately supervised institution or a place not intended for use as a dwelling (e.g., a bus station). The U.S. Department of Housing and Urban Development (HUD) estimates that between 660,000 and 730,000 individuals were homeless on any given night in 2005 (HUD, 2007). Two thirds were unaccompanied persons; the other third were people in families. Adults who are homeless and unmarried are more likely to be male than female. About 40 percent of men who are homeless are veterans (National Coalition for the Homeless, 2002); this percentage has grown, including the number of veterans with dependent children (Kuhn & Nakashima, 2011).

Rates of trauma symptoms are high among people who are homeless (76 to 100 percent of women and 67 percent of men; Christensen et al., 2005; Jainchill, Hawke, & Yagelka, 2000), and the diagnosis of PTSD is among the most prevalent non-substance use Axis I disorders (Lester et al., 2007; McNamara, Schumacher, Milby, Wallace, & Usdan, 2001). People who are homeless report high levels of trauma (especially physical and sexual abuse in childhood or as adults) preceding their homeless status; assault, rape, and other traumas frequently happen while they are homeless. Research suggests that many women are homeless because they are fleeing domestic violence (National Coalition for the Homeless, 2002). Other studies suggest that women who are homeless are more likely to have histories of childhood physical and sexual abuse and to have experienced sexual assault as adults. A history of physical and/or sexual abuse is even more common among women who are homeless and have a serious mental illness.

Youth who are homeless, especially those who live without a parent, are likely to have experienced physical and/or sexual abuse. Between 21 and 42 percent of youth runaways report having been sexually abused before leaving their homes; for young women, rates range from 32 to 63 percent (Administration on Children, Youth and Families, 2002). Additionally, data reflect elevated rates of substance abuse for youth who are homeless and have histories of abuse.

More than half of people who are homeless have a lifetime prevalence of mental illness and substance use disorders. Those who are homeless have higher rates of substance abuse (84 percent of men and 58 percent of women), and substance use disorders, including alcohol and drug abuse/dependence, increase with longer lengths of homelessness (North, Eyrich, Pollio, & Spitznagel, 2004).

For more information on providing trauma-informed behavioral health services to clients who are homeless, and for further discussion of the incidence of trauma in this population, see TIP 55-R, *Behavioral Health Services for People Who Are Homeless* (SAMHSA, 2013b).

3 Understanding the Impact of Trauma

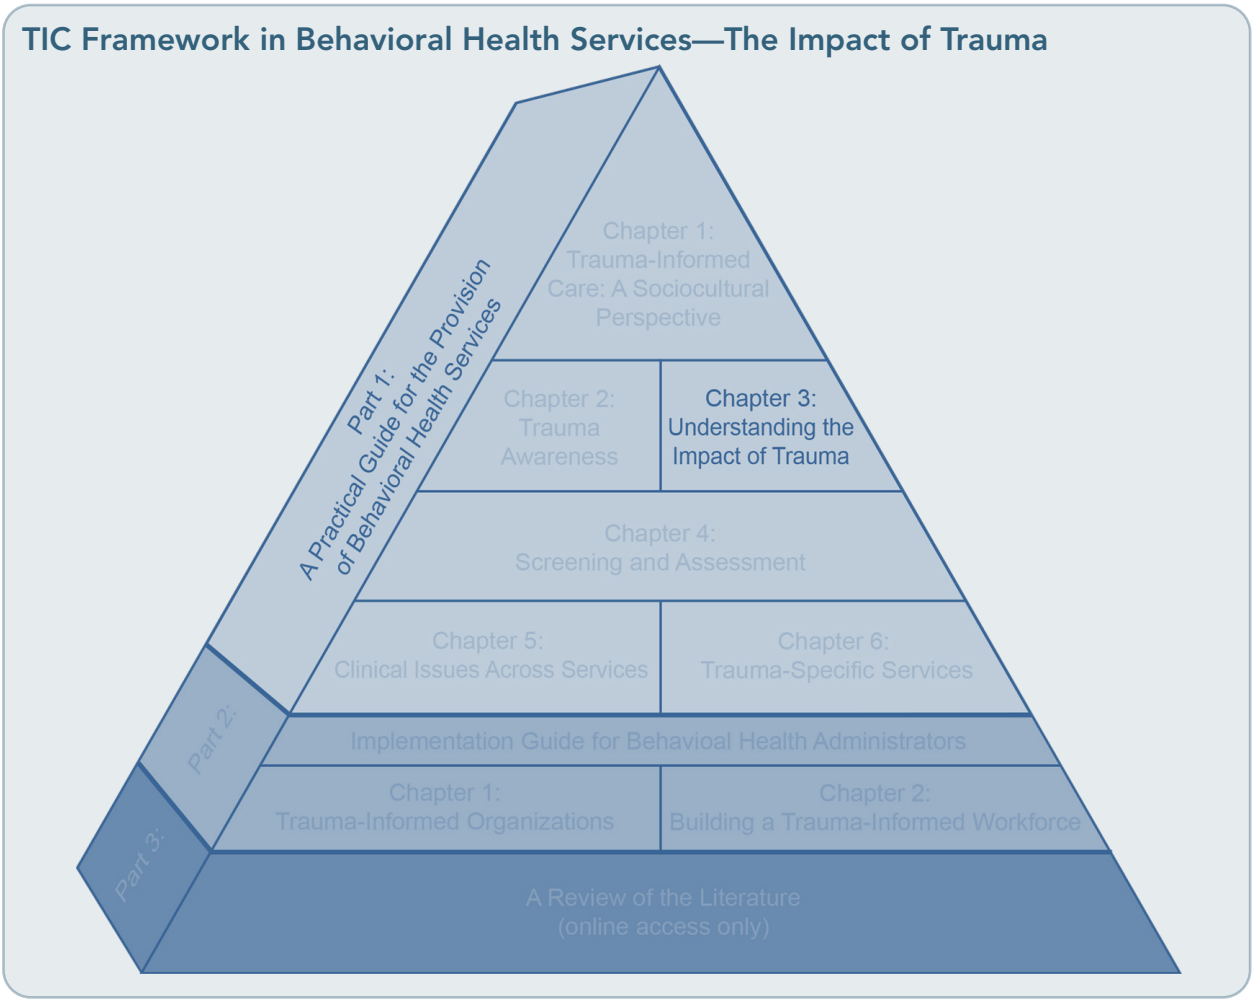
IN THIS CHAPTER

- Sequence of Trauma Reactions
- Common Experiences and Responses to Trauma
- Subthreshold Trauma Related Symptoms
- Specific Trauma Related Psychological Disorders
- Other Trauma Related and Co Occurring Disorders

Trauma-informed care (TIC) involves a broad understanding of traumatic stress reactions and common responses to trauma. Providers need to understand how trauma can affect treatment presentation, engagement, and the outcome of behavioral health services. This chapter examines common experiences survivors may encounter immediately following or long after a traumatic experience.

Trauma, including one-time, multiple, or long-lasting repetitive events, affects everyone differently. Some individuals may clearly display criteria associated with posttraumatic stress disorder (PTSD), but many more individuals will exhibit resilient responses or brief subclinical symptoms or consequences that fall outside of diagnostic criteria. The impact of trauma can be subtle, insidious, or outright destructive. How an event affects an individual depends on many factors, including characteristics of the individual, the type and characteristics of the event(s), developmental processes, the meaning of the trauma, and sociocultural factors.

This chapter begins with an overview of common responses, emphasizing that traumatic stress reactions are normal reactions to abnormal circumstances. It highlights common short- and long-term responses to traumatic experiences in the context of individuals who may seek behavioral health services. This chapter discusses psychological symptoms not represented in the *Diagnostic and Statistical Manual of Mental Disorders,* Fifth Edition (DSM-5; American Psychiatric Association [APA], 2013a), and responses associated with trauma that either fall below the threshold of mental disorders or reflect resilience. It also addresses common disorders associated with traumatic stress. This chapter explores the role of culture in defining mental illness, particularly PTSD, and ends by addressing co-occurring mental and substance-related disorders.



Sequence of Trauma Reactions

Survivors' immediate reactions in the aftermath of trauma are quite complicated and are affected by their own experiences, the accessibility of natural supports and healers, their coping and life skills and those of immediate family, and the responses of the larger community in which they live. Although reactions range in severity, even the most acute responses are natural responses to manage trauma—they are not a sign of psychopathology. Coping styles vary from action oriented to reflective and from emotionally expressive to reticent. Clinically, a response style is less important than the degree to which coping efforts successfully allow one to continue necessary activities, regulate emotions, sustain self-esteem, and maintain and enjoy interpersonal contacts. Indeed, a past error in traumatic stress psychology, particularly regarding group or mass traumas, was the assumption that all survivors need to express emotions associated with trauma and talk about the trauma; more recent research indicates that survivors who choose not to process their trauma are just as psychologically healthy as

Foreshortened future: Trauma can affect one's beliefs about the future via loss of hope, limited expectations about life, fear that life will end abruptly or early, or anticipation that normal life events won't occur (e.g., access to education, ability to have a significant and committed relationship, good opportunities for work).

those who do. The most recent psychological debriefing approaches emphasize respecting the individual's style of coping and not valuing one type over another.

Initial reactions to trauma can include exhaustion, confusion, sadness, anxiety, agitation, numbness, dissociation, confusion, physical arousal, and blunted affect. Most responses are normal in that they affect most survivors and are socially acceptable, psychologically effective, and self-limited. Indicators of more severe responses include continuous distress without periods of relative calm or rest, severe dissociation symptoms, and intense intrusive recollections that continue despite a return to safety. Delayed responses to trauma can include persistent fatigue, sleep disorders, nightmares, fear of recurrence, anxiety focused on flashbacks, depression, and avoidance of emotions, sensations, or activities that are associated with the trauma, even remotely. Exhibit 1.3-1 outlines some common reactions.

Common Experiences and Responses to Trauma

A variety of reactions are often reported and/or observed after trauma. Most survivors exhibit immediate reactions, yet these typically resolve without severe long-term consequences. This is because most trauma survivors are highly resilient and develop appropriate coping strategies, including the use of social supports, to deal with the aftermath and effects of trauma. Most recover with time, show minimal distress, and function effectively across major life areas and developmental stages. Even so, clients who show little impairment may still have subclinical symptoms or symptoms that do not fit diagnostic criteria for acute stress disorder (ASD) or PTSD. Only a small percentage of people with a history of trauma show impairment and symptoms that meet criteria for trauma-related stress disorders, including mood and anxiety disorders.

The following sections focus on some common reactions across domains (emotional, physical, cognitive, behavioral, social, and developmental) associated with singular, multiple, and enduring traumatic events. These reactions are often normal responses to trauma but can still be distressing to experience. Such responses are not signs of mental illness, nor do they indicate a mental disorder. Traumatic stress-related disorders comprise a specific constellation of symptoms and criteria.

Emotional

Emotional reactions to trauma can vary greatly and are significantly influenced by the individual's sociocultural history. Beyond the initial emotional reactions during the event, those most likely to surface include anger, fear, sadness, and shame. However, individuals may encounter difficulty in identifying any of these feelings for various reasons. They might lack experience with or prior exposure to emotional expression in their family or community. They may associate strong feelings with the past trauma, thus believing that emotional expression is too dangerous or will lead to feeling out of control (e.g., a sense of "losing it" or going crazy). Still others might deny that they have any feelings associated with their traumatic experiences and define their reactions as numbness or lack of emotions.

Emotional dysregulation

Some trauma survivors have difficulty regulating emotions such as anger, anxiety, sadness, and shame—this is more so when the trauma occurred at a young age (van der Kolk, Roth, Pelcovitz, & Mandel, 1993). In individuals who are older and functioning well

Exhibit 1.3-1: Immediate and Delayed Reactions to Trauma

Immediate Emotional Reactions	Delayed Emotional Reactions
Numbness and detachment Anxiety or severe fear Guilt (including survivor guilt) Exhilaration as a result of surviving Anger Sadness Helplessness Feeling unreal; depersonalization (e.g., feeling as if you are watching yourself) Disorientation Feeling out of control Denial Constriction of feelings Feeling overwhelmed	Irritability and/or hostility Depression Mood swings, instability Anxiety (e.g., phobia, generalized anxiety) Fear of trauma recurrence Grief reactions Shame Feelings of fragility and/or vulnerability Emotional detachment from anything that requires emotional reactions (e.g., significant and/or family relationships, conversations about self, discussion of traumatic events or reactions to them)
Immediate Physical Reactions	**Delayed Physical Reactions**
Nausea and/or gastrointestinal distress Sweating or shivering Faintness Muscle tremors or uncontrollable shaking Elevated heartbeat, respiration, and blood pressure Extreme fatigue or exhaustion Greater startle responses Depersonalization	Sleep disturbances, nightmares Somatization (e.g., increased focus on and worry about body aches and pains) Appetite and digestive changes Lowered resistance to colds and infection Persistent fatigue Elevated cortisol levels Hyperarousal Long-term health effects including heart, liver, autoimmune, and chronic obstructive pulmonary disease
Immediate Cognitive Reactions	**Delayed Cognitive Reactions**
Difficulty concentrating Rumination or racing thoughts (e.g., replaying the traumatic event over and over again) Distortion of time and space (e.g., traumatic event may be perceived as if it was happening in slow motion, or a few seconds can be perceived as minutes) Memory problems (e.g., not being able to recall important aspects of the trauma) Strong identification with victims	Intrusive memories or flashbacks Reactivation of previous traumatic events Self-blame Preoccupation with event Difficulty making decisions Magical thinking: belief that certain behaviors, including avoidant behavior, will protect against future trauma Belief that feelings or memories are dangerous Generalization of triggers (e.g., a person who experiences a home invasion during the daytime may avoid being alone during the day) Suicidal thinking
Immediate Behavioral Reactions	**Delayed Behavioral Reactions**
Startled reaction Restlessness Sleep and appetite disturbances Difficulty expressing oneself Argumentative behavior Increased use of alcohol, drugs, and tobacco Withdrawal and apathy Avoidant behaviors	Avoidance of event reminders Social relationship disturbances Decreased activity level Engagement in high-risk behaviors Increased use of alcohol and drugs Withdrawal

(Continued on the next page.)

Exhibit 1.3-1: Immediate and Delayed Reactions to Trauma (continued)

Immediate Existential Reactions	Delayed Existential Reactions
Intense use of prayer	Questioning (e.g., "Why me?")
Restoration of faith in the goodness of others (e.g., receiving help from others)	Increased cynicism, disillusionment
Loss of self-efficacy	Increased self-confidence (e.g., "If I can survive this, I can survive anything")
Despair about humanity, particularly if the event was intentional	Loss of purpose
Immediate disruption of life assumptions (e.g., fairness, safety, goodness, predictability of life)	Renewed faith
	Hopelessness
	Reestablishing priorities
	Redefining meaning and importance of life
	Reworking life's assumptions to accommodate the trauma (e.g., taking a self-defense class to reestablish a sense of safety)

Sources: Briere & Scott, 2006b; Foa, Stein, & McFarlane, 2006; Pietrzak, Goldstein, Southwick, & Grant, 2011.

prior to the trauma, such emotional dysregulation is usually short lived and represents an immediate reaction to the trauma, rather than an ongoing pattern. Self-medication—namely, substance abuse—is one of the methods that traumatized people use in an attempt to regain emotional control, although ultimately it causes even further emotional dysregulation (e.g., substance-induced changes in affect during and after use). Other efforts toward emotional regulation can include engagement in high-risk or self-injurious behaviors, disordered eating, compulsive behaviors such as gambling or overworking, and repression or denial of emotions; however, not all behaviors associated with self-regulation are considered negative. In fact, some individuals find creative, healthy, and industrious ways to manage strong affect generated by trauma, such as through renewed commitment to physical activity or by creating an organization to support survivors of a particular trauma.

Traumatic stress tends to evoke two emotional extremes: feeling either too much (overwhelmed) or too little (numb) emotion. Treatment can help the client find the optimal level of emotion and assist him or her with appropriately experiencing and regulating difficult emotions. In treatment, the goal is to help clients learn to regulate their emotions without the use of substances or other unsafe behavior. This will likely require learning new coping skills and how to tolerate distressing emotions; some clients may benefit from mindfulness practices, cognitive restructuring, and trauma-specific desensitization approaches, such as exposure therapy and eye movement desensitization and reprocessing (EMDR; refer to Part 1, Chapter 6, for more information on trauma-specific therapies).

Numbing

Numbing is a biological process whereby emotions are detached from thoughts, behaviors, and memories. In the following case illustration, Sadhanna's numbing is evidenced by her limited range of emotions associated with interpersonal interactions and her inability to associate any emotion with her history of abuse. She also possesses a belief in a foreshortened future. A prospective longitudinal study (Malta, Levitt, Martin, Davis, & Cloitre, 2009) that followed the development of PTSD in disaster workers highlighted the importance of understanding and appreciating numbing as a traumatic stress reaction. Because numbing

Case Illustration: Sadhanna

Sadhanna is a 22-year-old woman mandated to outpatient mental health and substance abuse treatment as the alternative to incarceration. She was arrested and charged with assault after arguing and fighting with another woman on the street. At intake, Sadhanna reported a 7-year history of alcohol abuse and one depressive episode at age 18. She was surprised that she got into a fight but admitted that she was drinking at the time of the incident. She also reported severe physical abuse at the hands of her mother's boyfriend between ages 4 and 15. Of particular note to the intake worker was Sadhanna's matter-of-fact way of presenting the abuse history. During the interview, she clearly indicated that she did not want to attend group therapy and hear other people talk about their feelings, saying, "I learned long ago not to wear emotions on my sleeve."

Sadhanna reported dropping out of 10th grade, saying she never liked school. She didn't expect much from life. In Sadhanna's first weeks in treatment, she reported feeling disconnected from other group members and questioned the purpose of the group. When asked about her own history, she denied that she had any difficulties and did not understand why she was mandated to treatment. She further denied having feelings about her abuse and did not believe that it affected her life now. Group members often commented that she did not show much empathy and maintained a flat affect, even when group discussions were emotionally charged.

symptoms hide what is going on inside emotionally, there can be a tendency for family members, counselors, and other behavioral health staff to assess levels of traumatic stress symptoms and the impact of trauma as less severe than they actually are.

Physical

Diagnostic criteria for PTSD place considerable emphasis on psychological symptoms, but some people who have experienced traumatic stress may present initially with physical symptoms. Thus, primary care may be the first and only door through which these individuals seek assistance for trauma-related symptoms. Moreover, there is a significant connection between trauma, including adverse childhood experiences (ACEs), and chronic health conditions. Common physical disorders and symptoms include somatic complaints; sleep disturbances; gastrointestinal, cardiovascular, neurological, musculoskeletal, respiratory, and dermatological disorders; urological problems; and substance use disorders.

Somatization

Somatization indicates a focus on bodily symptoms or dysfunctions to express emotional distress. Somatic symptoms are more likely to occur with individuals who have traumatic stress reactions, including PTSD. People from certain ethnic and cultural backgrounds may initially or solely present emotional distress via physical ailments or concerns. Many individuals who present with somatization are likely unaware of the connection between their emotions and the physical symptoms that they're experiencing. At times, clients may remain resistant to exploring emotional content and remain focused on bodily complaints as a means of avoidance. Some clients may insist that their primary problems are physical even when medical evaluations and tests fail to confirm ailments. In these situations, somatization may be a sign of a mental illness. However, various cultures approach emotional distress through the physical realm or view emotional and physical symptoms and well-being as one. It is important not to assume that clients with physical complaints are using somatization as a means to express emotional pain; they may have specific conditions or disorders that require medical attention. Foremost, counselors need to refer for medical evaluation.

Advice to Counselors: Using Information About Biology and Trauma

- Educate your clients:
  - Frame reexperiencing the event(s), hyperarousal, sleep disturbances, and other physical symptoms as physiological reactions to extreme stress.
  - Communicate that treatment and other wellness activities can improve both psychological and physiological symptoms (e.g., therapy, meditation, exercise, yoga). You may need to refer certain clients to a psychiatrist who can evaluate them and, if warranted, prescribe psychotropic medication to address severe symptoms.
  - Discuss traumatic stress symptoms and their physiological components.
  - Explain links between traumatic stress symptoms and substance use disorders, if appropriate.
  - Normalize trauma symptoms. For example, explain to clients that their symptoms are not a sign of weakness, a character flaw, being damaged, or going crazy.
- Support your clients and provide a message of hope—that they are not alone, they are not at fault, and recovery is possible and anticipated.

Biology of trauma

Trauma biology is an area of burgeoning research, with the promise of more complex and explanatory findings yet to come. Although a thorough presentation on the biological aspects of trauma is beyond the scope of this publication, what is currently known is that exposure to trauma leads to a cascade of biological changes and stress responses. These biological alterations are highly associated with PTSD, other mental illnesses, and substance use disorders. These include:

- Changes in limbic system functioning.
- Hypothalamic–pituitary–adrenal axis activity changes with variable cortisol levels.
- Neurotransmitter-related dysregulation of arousal and endogenous opioid systems.

As a clear example, early ACEs such as abuse, neglect, and other traumas affect brain development and increase a person's vulnerability to encountering interpersonal violence as an adult and to developing chronic diseases and other physical illnesses, mental illnesses, substance-related disorders, and impairment in other life areas (Centers for Disease Control and Prevention, 2012).

Hyperarousal and sleep disturbances

A common symptom that arises from traumatic experiences is hyperarousal (also called hypervigilance). Hyperarousal is the body's way of remaining prepared. It is characterized by sleep disturbances, muscle tension, and a lower threshold for startle responses and can persist years after trauma occurs. It is also one of the primary diagnostic criteria for PTSD.

Hyperarousal is a consequence of biological changes initiated by trauma. Although it

Case Illustration: Kimi

Kimi is a 35-year-old Native American woman who was group raped at the age of 16 on her walk home from a suburban high school. She recounts how her whole life changed on that day. "I never felt safe being alone after the rape. I used to enjoy walking everywhere. Afterward, I couldn't tolerate the fear that would arise when I walked in the neighborhood. It didn't matter whether I was alone or with friends—every sound that I heard would throw me into a state of fear. I felt like the same thing was going to happen again. It's gotten better with time, but I often feel as if I'm sitting on a tree limb waiting for it to break. I have a hard time relaxing. I can easily get startled if a leaf blows across my path or if my children scream while playing in the yard. The best way I can describe how I experience life is by comparing it to watching a scary, suspenseful movie—anxiously waiting for something to happen, palms sweating, heart pounding, on the edge of your chair."

serves as a means of self-protection after trauma, it can be detrimental. Hyperarousal can interfere with an individual's ability to take the necessary time to assess and appropriately respond to specific input, such as loud noises or sudden movements. Sometimes, hyperarousal can produce overreactions to situations perceived as dangerous when, in fact, the circumstances are safe.

Along with hyperarousal, sleep disturbances are very common in individuals who have experienced trauma. They can come in the form of early awakening, restless sleep, difficulty falling asleep, and nightmares. Sleep disturbances are most persistent among individuals who have trauma-related stress; the disturbances sometimes remain resistant to intervention long after other traumatic stress symptoms have been successfully treated. Numerous strategies are available beyond medication, including good sleep hygiene practices, cognitive rehearsals of nightmares, relaxation strategies, and nutrition.

Cognitive

Traumatic experiences can affect and alter cognitions. From the outset, trauma challenges the just-world or core life assumptions that

Cognitions and Trauma

The following examples reflect some of the types of cognitive or thought-process changes that can occur in response to traumatic stress.

Cognitive errors: Misinterpreting a current situation as dangerous because it resembles, even remotely, a previous trauma (e.g., a client overreacting to an overturned canoe in 8 inches of water, as if she and her paddle companion would drown, due to her previous experience of nearly drowning in a rip current 5 years earlier).

Excessive or inappropriate guilt: Attempting to make sense cognitively and gain control over a traumatic experience by assuming responsibility or possessing survivor's guilt, because others who experienced the same trauma did not survive.

Idealization: Demonstrating inaccurate rationalizations, idealizations, or justifications of the perpetrator's behavior, particularly if the perpetrator is or was a caregiver. Other similar reactions mirror idealization; traumatic bonding is an emotional attachment that develops (in part to secure survival) between perpetrators who engage in interpersonal trauma and their victims, and Stockholm syndrome involves compassion and loyalty toward hostage takers (de Fabrique, Van Hasselt, Vecchi, & Romano, 2007).

Trauma-induced hallucinations or delusions: Experiencing hallucinations and delusions that, although they are biological in origin, contain cognitions that are congruent with trauma content (e.g., a woman believes that a person stepping onto her bus is her father, who had sexually abused her repeatedly as child, because he wore shoes similar to those her father once wore).

Intrusive thoughts and memories: Experiencing, without warning or desire, thoughts and memories associated with the trauma. These intrusive thoughts and memories can easily trigger strong emotional and behavioral reactions, as if the trauma was recurring in the present. The intrusive thoughts and memories can come rapidly, referred to as flooding, and can be disruptive at the time of their occurrence. If an individual experiences a trigger, he or she may have an increase in intrusive thoughts and memories for a while. For instance, individuals who inadvertently are retraumatized due to program or clinical practices may have a surge of intrusive thoughts of past trauma, thus making it difficult for them to discern what is happening now versus what happened then. Whenever counseling focuses on trauma, it is likely that the client will experience some intrusive thoughts and memories. It is important to develop coping strategies before, as much as possible, and during the delivery of trauma-informed and trauma-specific treatment.

help individuals navigate daily life (Janoff-Bulman, 1992). For example, it would be difficult to leave the house in the morning if you believed that the world was not safe, that all people are dangerous, or that life holds no promise. Belief that one's efforts and intentions can protect oneself from bad things makes it less likely for an individual to perceive personal vulnerability. However, traumatic events—particularly if they are unexpected—can challenge such beliefs.

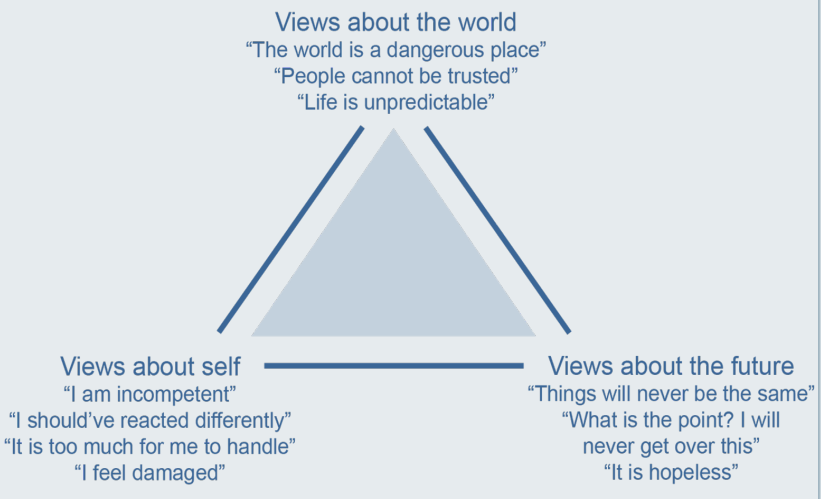
Let's say you always considered your driving time as "your time"—and your car as a safe place to spend that time. Then someone hits you from behind at a highway entrance. Almost immediately, the accident affects how you perceive the world, and from that moment onward, for months following the crash, you feel unsafe in any car. You become hypervigilant about other drivers and perceive that other cars are drifting into your lane or failing to stop at a safe distance behind you. For a time, your perception of safety is eroded, often leading to compensating behaviors (e.g., excessive glancing into the rearview mirror to see whether the vehicles behind you are stopping) until the belief is restored or reworked. Some individuals never return to their previous belief systems after a trauma, nor do they find a way to rework them—thus leading to a worldview that life is unsafe. Still, many other individuals are able to return to organizing core beliefs that support their perception of safety.

Many factors contribute to cognitive patterns prior to, during, and after a trauma. Adopting Beck and colleagues' cognitive triad model (1979), trauma can alter three main cognitive patterns: thoughts about self, the world (others/environment), and the future. To clarify, trauma can lead individuals to see themselves as incompetent or damaged, to see others and the world as unsafe and unpredictable, and to see the future as hopeless—believing that personal suffering will continue, or negative outcomes will preside for the foreseeable future (see Exhibit 1.3-2). Subsequently, this set of cognitions can greatly influence clients' belief in their ability to use internal resources and external support effectively. From a cognitive–behavioral perspective, these cognitions have a bidirectional relationship in sustaining or contributing to the development of depressive and anxiety symptoms after trauma. However, it is possible for cognitive patterns to help protect against debilitating psychological symptoms as well. Many factors contribute to cognitive patterns prior to, during, and after a trauma.

Feeling different

An integral part of experiencing trauma is feeling different from others, whether or not the trauma was an individual or group experience. Traumatic experiences typically feel surreal and challenge the necessity and value of mundane activities of daily life. Survivors

Exhibit 1.3-2: Cognitive Triad of Traumatic Stress



often believe that others will not fully understand their experiences, and they may think that sharing their feelings, thoughts, and reactions related to the trauma will fall short of expectations. However horrid the trauma may be, the *experience* of the trauma is typically profound.

The type of trauma can dictate how an individual feels different or believes that they are different from others. Traumas that generate shame will often lead survivors to feel more alienated from others—believing that they are "damaged goods." When individuals believe that their experiences are unique and incomprehensible, they are more likely to seek support, if they seek support at all, only with others who have experienced a similar trauma.

Triggers and flashbacks

Triggers

A trigger is a stimulus that sets off a memory of a trauma or a specific portion of a traumatic experience. Imagine you were trapped briefly in a car after an accident. Then, several years later, you were unable to unlatch a lock after using a restroom stall; you might have begun to feel a surge of panic reminiscent of the accident, even though there were other avenues of escape from the stall. Some triggers can be identified and anticipated easily, but many are subtle and inconspicuous, often surprising the individual or catching him or her off guard. In treatment, it is important to help clients identify potential triggers, draw a connection between strong emotional reactions and triggers, and develop coping strategies to manage those moments when a trigger occurs. A trigger is any sensory reminder of the traumatic event: a noise, smell, temperature, other physical sensation, or visual scene. Triggers can generalize to any characteristic, no matter how remote, that resembles or represents a previous trauma, such as revisiting the location where the trauma occurred, being alone, having your children reach the same age that you were when you experienced the trauma, seeing the same breed of dog that bit you, or hearing loud voices. Triggers are often associated with the time of day, season, holiday, or anniversary of the event.

Flashbacks

A flashback is reexperiencing a previous traumatic experience as if it were actually happening in that moment. It includes reactions that often resemble the client's reactions during the trauma. Flashback experiences are very brief and typically last only a few seconds, but the emotional aftereffects linger for hours or longer. Flashbacks are commonly initiated by a trigger, but not necessarily. Sometimes, they occur out of the blue. Other times, specific physical states increase a person's vulnerability to reexperiencing a trauma, (e.g., fatigue, high

Advice to Counselors: Helping Clients Manage Flashbacks and Triggers

If a client is triggered in a session or during some aspect of treatment, help the client focus on what is happening in the here and now; that is, use grounding techniques. Behavioral health service providers should be prepared to help the client get regrounded so that they can distinguish between what is happening now versus what had happened in the past (see Covington, 2008, and Najavits, 2002b, 2007b, for more grounding techniques). Offer education about the experience of triggers and flashbacks, and then normalize these events as common traumatic stress reactions. Afterward, some clients need to discuss the experience and understand why the flashback or trigger occurred. It often helps for the client to draw a connection between the trigger and the traumatic event(s). This can be a preventive strategy whereby the client can anticipate that a given situation places him or her at higher risk for retraumatization and requires use of coping strategies, including seeking support.

Source: Green Cross Academy of Traumatology, 2010.

stress levels). Flashbacks can feel like a brief movie scene that intrudes on the client. For example, hearing a car backfire on a hot, sunny day may be enough to cause a veteran to respond as if he or she were back on military patrol. Other ways people reexperience trauma, besides flashbacks, are via nightmares and intrusive thoughts of the trauma.

Dissociation, depersonalization, and derealization

Dissociation is a mental process that severs connections among a person's thoughts, memories, feelings, actions, and/or sense of identity. Most of us have experienced dissociation—losing the ability to recall or track a particular action (e.g., arriving at work but not remembering the last minutes of the drive). Dissociation happens because the person is engaged in an automatic activity and is not paying attention to his or her immediate environment. Dissociation can also occur during severe stress or trauma as a protective element whereby the individual incurs distortion of time, space, or identity. This is a common symptom in traumatic stress reactions.

Dissociation helps distance the experience from the individual. People who have experienced severe or developmental trauma may have learned to separate themselves from distress to survive. At times, dissociation can be very pervasive and symptomatic of a mental disorder, such as dissociative identity disorder (DID; formerly known as multiple personality disorder). According to the DSM-5, "dissociative disorders are characterized by a disruption of and/or discontinuity in the normal integration of consciousness, memory, identity, emotion, perception, body representation, motor control, and behavior" (APA, 2013a, p. 291). Dissociative disorder diagnoses are closely associated with histories of severe childhood trauma or pervasive, human-caused, intentional trauma, such as that experienced by concentration camp survivors or victims of ongoing political imprisonment, torture, or long-term isolation. A mental health professional, preferably with significant training in working with dissociative disorders and with trauma, should be consulted when a dissociative disorder diagnosis is suspected.

Potential Signs of Dissociation

- Fixed or "glazed" eyes
- Sudden flattening of affect
- Long periods of silence
- Monotonous voice
- Stereotyped movements
- Responses not congruent with the present context or situation
- Excessive intellectualization

(Briere, 1996a)

The characteristics of DID can be commonly accepted experiences in other cultures, rather than being viewed as symptomatic of a traumatic experience. For example, in non-Western cultures, a sense of alternate beings within oneself may be interpreted as being inhabited by spirits or ancestors (Kirmayer, 1996). Other experiences associated with dissociation include depersonalization—psychologically "leaving one's body," as if watching oneself from a distance as an observer or through derealization, leading to a sense that what is taking place is unfamiliar or is not real.

If clients exhibit signs of dissociation, behavioral health service providers can use grounding techniques to help them reduce this defense strategy. One major long-term consequence of dissociation is the difficulty it causes in connecting strong emotional or physical reactions with an event. Often, individuals may believe that they are going crazy because they are not in touch with the nature of their reactions. By educating clients on the resilient qualities of dissociation while also emphasizing that it prevents them from addressing or

validating the trauma, individuals can begin to understand the role of dissociation. All in all, it is important when working with trauma survivors that the intensity level is not so great that it triggers a dissociative reaction and prevents the person from engaging in the process.

Behavioral

Traumatic stress reactions vary widely; often, people engage in behaviors to manage the aftereffects, the intensity of emotions, or the distressing aspects of the traumatic experience. Some people reduce tension or stress through avoidant, self-medicating (e.g., alcohol abuse), compulsive (e.g., overeating), impulsive (e.g., high-risk behaviors), and/or self-injurious behaviors. Others may try to gain control over their experiences by being aggressive or subconsciously reenacting aspects of the trauma.

Behavioral reactions are also the consequences of, or learned from, traumatic experiences. For example, some people act like they can't control their current environment, thus failing to take action or make decisions long after the trauma (learned helplessness). Other associate elements of the trauma with current activities, such as by reacting to an intimate moment in a significant relationship as dangerous or unsafe years after a date rape. The following sections discuss behavioral consequences of trauma and traumatic stress reactions.

Reenactments

A hallmark symptom of trauma is reexperiencing the trauma in various ways. Reexperiencing can occur through reenactments (literally, to "redo"), by which trauma survivors repetitively relive and recreate a past trauma in their present lives. This is very apparent in children, who play by mimicking what occurred during the trauma, such as by pretending to crash a toy airplane into a toy building after seeing televised images of the terrorist attacks on the World Trade Center on September 11, 2001. Attempts to understand reenactments are very complicated, as reenactments occur for a variety of reasons. Sometimes, individuals reenact past traumas to master them. Examples of reenactments include a variety of behaviors: self-injurious behaviors, hypersexuality, walking alone in unsafe areas or other high-risk behaviors, driving recklessly, or involvement in repetitive destructive relationships (e.g., repeatedly getting into romantic relationships with people who are abusive or violent), to name a few.

Self-harm and self-destructive behaviors

Self-harm is any type of intentionally self-inflicted harm, regardless of the severity of injury or whether suicide is intended. Often, self-harm is an attempt to cope with emotional or physical distress that seems overwhelming or to cope with a profound sense of dissociation or being trapped, helpless, and "damaged" (Herman, 1997; Santa Mina & Gallop, 1998). Self-harm is associated with past childhood sexual abuse and other forms of trauma as well as substance abuse. Thus,

Resilient Responses to Trauma

Many people find healthy ways to cope with, respond to, and heal from trauma. Often, people automatically reevaluate their values and redefine what is important after a trauma. Such resilient responses include:

- Increased bonding with family and community.
- Redefined or increased sense of purpose and meaning.
- Increased commitment to a personal mission.
- Revised priorities.
- Increased charitable giving and volunteerism.

Case Illustration: Marco

Marco, a 30-year-old man, sought treatment at a local mental health center after a 2-year bout of anxiety symptoms. He was an active member of his church for 12 years, but although he sought help from his pastor about a year ago, he reports that he has had no contact with his pastor or his church since that time. Approximately 3 years ago, his wife took her own life. He describes her as his soulmate and has had a difficult time understanding her actions or how he could have prevented them.

In the initial intake, he mentioned that he was the first person to find his wife after the suicide and reported feelings of betrayal, hurt, anger, and devastation since her death. He claimed that everyone leaves him or dies. He also talked about his difficulty sleeping, having repetitive dreams of his wife, and avoiding relationships. In his first session with the counselor, he initially rejected the counselor before the counselor had an opportunity to begin reviewing and talking about the events and discomfort that led him to treatment.

In this scenario, Marco is likely reenacting his feelings of abandonment by attempting to reject others before he experiences another rejection or abandonment. In this situation, the counselor will need to recognize the reenactment, explore the behavior, and examine how reenactments appear in other situations in Marco's life.

addressing self-harm requires attention to the client's reasons for self-harm. More than likely, the client needs help recognizing and coping with emotional or physical distress in manageable amounts and ways.

Among the self-harm behaviors reported in the literature are cutting, burning skin by heat (e.g., cigarettes) or caustic liquids, punching hard enough to self-bruise, head banging, hair pulling, self-poisoning, inserting foreign objects into bodily orifices, excessive nail biting, excessive scratching, bone breaking, gnawing at flesh, interfering with wound healing, tying off body parts to stop breathing or blood flow, swallowing sharp objects, and suicide. Cutting and burning are among the most common forms of self-harm.

Self-harm tends to occur most in people who have experienced repeated and/or early trauma (e.g., childhood sexual abuse) rather than in those who have undergone a single adult trauma (e.g., a community-wide disaster or a serious car accident). There are strong associations between eating disorders, self-harm, and substance abuse (Claes &Vandereycken, 2007; for discussion, see Harned, Najavits, & Weiss, 2006). Self-mutilation is also associated with (and part of the diagnostic criteria for) a number of personality disorders, including borderline and histrionic, as well as DID, depression, and some forms of schizophrenia; these disorders can co-occur with traumatic stress reactions and disorders.

It is important to distinguish self-harm that is suicidal from self-harm that is not suicidal and to assess and manage both of these very serious dangers carefully. Most people who engage in self-harm are not doing so with the intent to kill themselves (Noll, Horowitz, Bonanno, Trickett, & Putnam, 2003)—although self-harm can be life threatening and can escalate into suicidality if not managed therapeutically. Self-harm can be a way of getting attention or manipulating others, but most often it is not. Self-destructive behaviors such as substance abuse, restrictive or binge eating, reckless automobile driving, or high-risk impulsive behavior are different from self-harming behaviors but are also seen in clients with a history of trauma. Self-destructive behaviors differ from self-harming behaviors in that there may be no immediate negative impact of the behavior on the individual; they differ from suicidal behavior in that there is no intent to cause death in the short term.

Advice to Counselors: Working With Clients Who Are Self-Injurious

Counselors who are unqualified or uncomfortable working with clients who demonstrate self-harming, self-destructive, or suicidal or homicidal ideation, intent, or behavior should work with their agencies and supervisors to refer such clients to other counselors. They should consider seeking specialized supervision on how to manage such clients effectively and safely and how to manage their feelings about these issues. The following suggestions assume that the counselor has had sufficient training and experience to work with clients who are self-injurious. To respond appropriately to a client who engages in self-harm, counselors should:

- Screen the client for self-harm and suicide risk at the initial evaluation and throughout treatment.
- Learn the client's perspective on self-harm and how it "helps."
- Understand that self-harm is often a coping strategy to manage the intensity of emotional and/or physical distress.
- Teach the client coping skills that improve his or her management of emotions without self-harm.
- Help the client obtain the level of care needed to manage genuine risk of suicide or severe self-injury. This might include hospitalization, more intensive programming (e.g., intensive outpatient, partial hospitalization, residential treatment), or more frequent treatment sessions. The goal is to stabilize the client as quickly as possible, and then, if possible, begin to focus treatment on developing coping strategies to manage self-injurious and other harmful impulses.
- Consult with other team members, supervisors, and, if necessary, legal experts to determine whether one's efforts with and conceptualization of the self-harming client fit best practice guidelines. See, for example, Treatment Improvement Protocol (TIP) 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (Center for Substance Abuse Treatment [CSAT], 2005c). Document such consultations and the decisions made as a result of them thoroughly and frequently.
- Help the client identify how substance use affects self-harm. In some cases, it can increase the behavior (e.g., alcohol disinhibits the client, who is then more likely to self-harm). In other cases, it can decrease the behavior (e.g., heroin evokes relaxation and, thus, can lessen the urge to self-harm). In either case, continue to help the client understand how abstinence from substances is necessary so that he or she can learn more adaptive coping.
- Work collaboratively with the client to develop a plan to create a sense of safety. Individuals are affected by trauma in different ways; therefore, safety or a safe environment may mean something entirely different from one person to the next. Allow the client to define what safety means to him or her.

Counselors can also help the client prepare a safety card that the client can carry at all times. The card might include the counselor's contact information, a 24-hour crisis number to call in emergencies, contact information for supportive individuals who can be contacted when needed, and, if appropriate, telephone numbers for emergency medical services. The counselor can discuss with the client the types of signs or crises that might warrant using the numbers on the card. Additionally, the counselor might check with the client from time to time to confirm that the information on the card is current.

TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment* (CSAT, 2009a), has examples of safety agreements specifically for suicidal clients and discusses their uses in more detail. There is no credible evidence that a safety agreement is effective in preventing a suicide attempt or death. Safety agreements for clients with suicidal thoughts and behaviors should only be used as an adjunct support accompanying professional screening, assessment, and treatment for people with suicidal thoughts and behaviors. Keep in mind that safety plans or agreements may be perceived by the trauma survivor as a means of controlling behavior, subsequently replicating or triggering previous traumatic experiences.

All professionals—and in some States, anyone—could have ethical and legal responsibilities to those clients who pose an imminent danger to themselves or others. Clinicians should be aware of the pertinent State laws where they practice and the relevant Federal and professional regulations.

However, as with self-harming behavior, self-destructive behavior needs to be recognized and addressed and may persist—or worsen—without intervention.

Consumption of substances

Substance use often is initiated or increased after trauma. Clients in early recovery—especially those who develop PTSD or have it reactivated—have a higher relapse risk if they experience a trauma. In the first 2 months after September 11, 2001, more than a quarter of New Yorker residents who smoked cigarettes, drank alcohol, or used marijuana (about 265,000 people) increased their consumption. The increases continued 6 months after the attacks (Vlahov, Galea, Ahern, Resnick, & Kilpatrick, 2004). A study by the Substance Abuse and Mental Health Services Administration (SAMHSA, Office of Applied Studies, 2002) used National Survey on Drug Use and Health data to compare the first three quarters of 2001 with the last quarter and reported an increase in the prevalence rate for alcohol use among people 18 or older in the New York metropolitan area during the fourth quarter.

Interviews with New York City residents who were current or former cocaine or heroin users indicated that many who had been clean for 6 months or less relapsed after September 11, 2001. Others, who lost their income and could no longer support their habit, enrolled in methadone programs (Weiss et al., 2002). After the Oklahoma City bombing in 1995, Oklahomans reported double the normal rate of alcohol use, smoking more cigarettes, and a higher incidence of initiating smoking months and even years after the bombing (Smith, Christiansen, Vincent, & Hann, 1999).

Self-medication

Khantzian's self-medication theory (1985) suggests that drugs of abuse are selected for their specific effects. However, no definitive pattern has yet emerged of the use of particular substances in relation to PTSD or trauma symptoms. Use of substances can vary based on a variety of factors, including which trauma symptoms are most prominent for an individual and the individual's access to particular substances. Unresolved traumas sometimes lurk behind the emotions that clients cannot allow themselves to experience. Substance use and abuse in trauma survivors can be a way to self-medicate and thereby avoid or displace difficult emotions associated with traumatic experiences. When the substances are withdrawn, the survivor may use other behaviors to self-soothe, self-medicate, or avoid emotions. As likely, emotions can appear after abstinence in the form of anxiety and depression.

Avoidance

Avoidance often coincides with anxiety and the promotion of anxiety symptoms. Individuals begin to avoid people, places, or situations to alleviate unpleasant emotions, memories, or circumstances. Initially, the avoidance works, but over time, anxiety increases and the perception that the situation is unbearable or dangerous increases as well, leading to a greater need to avoid. Avoidance can be adaptive, but it is also a behavioral pattern that reinforces perceived danger without testing its validity, and it typically leads to greater problems across major life areas (e.g., avoiding emotionally oriented conversations in an intimate relationship). For many individuals who have traumatic stress reactions, avoidance is commonplace. A person may drive 5 miles longer to avoid the road where he or she had an accident. Another individual may avoid crowded places in fear of an assault or to circumvent strong emotional memories about an earlier assault that took place in a crowded area. Avoidance can come in many forms. When people can't tolerate strong affects associated with traumatic memories, they avoid, project,

deny, or distort their trauma-related emotional and cognitive experiences. A key ingredient in trauma recovery is learning to manage triggers, memories, and emotions without avoidance—in essence, becoming desensitized to traumatic memories and associated symptoms.

Social/Interpersonal

A key ingredient in the early stage of TIC is to establish, confirm, or reestablish a support system, including culturally appropriate activities, as soon as possible. Social supports and relationships can be protective factors against traumatic stress. However, trauma typically affects relationships significantly, regardless of whether the trauma is interpersonal or is of some other type. Relationships require emotional exchanges, which means that others who have close relationships or friendships with the individual who survived the trauma(s) are often affected as well—either through secondary traumatization or by directly experiencing the survivor's traumatic stress reactions. In natural disasters, social and community supports can be abruptly eroded and difficult to rebuild after the initial disaster relief efforts have waned.

Survivors may readily rely on family members, friends, or other social supports—or they may avoid support, either because they believe that no one will be understanding or trustworthy or because they perceive their own needs as a burden to others. Survivors who have strong emotional or physical reactions, including outbursts during nightmares, may pull away further in fear of being unable to predict their own reactions or to protect their own safety and that of others. Often, trauma survivors feel ashamed of their stress reactions, which further hampers their ability to use their support systems and resources adequately.

Many survivors of childhood abuse and interpersonal violence have experienced a significant sense of betrayal. They have often encountered trauma at the hands of trusted caregivers and family members or through significant relationships. This history of betrayal can disrupt forming or relying on supportive relationships in recovery, such as peer supports and counseling. Although this fear of trusting others is protective, it can lead to difficulty in connecting with others and greater vigilance in observing the behaviors of others, including behavioral health service providers. It is exceptionally difficult to override the feeling that someone is going to hurt you, take advantage of you, or, minimally, disappoint you. Early betrayal can affect one's ability to develop attachments, yet the formation of supportive relationships is an important antidote in the recovery from traumatic stress.

Developmental

Each age group is vulnerable in unique ways to the stresses of a disaster, with children and the elderly at greatest risk. Young children may display generalized fear, nightmares, heightened arousal and confusion, and physical symptoms, (e.g., stomachaches, headaches). School-age children may exhibit symptoms such as aggressive behavior and anger, regression to behavior seen at younger ages, repetitious traumatic play, loss of ability to concentrate, and worse school performance. Adolescents may display depression and social withdrawal, rebellion, increased risky activities such as sexual acting out, wish for revenge and action-oriented responses to trauma, and sleep and eating disturbances (Hamblen, 2001). Adults may display sleep problems, increased agitation, hypervigilance, isolation or withdrawal, and increased use of alcohol or drugs. Older adults may exhibit increased withdrawal and isolation, reluctance to leave home, worsening of chronic illnesses, confusion, depression, and fear (DeWolfe & Nordboe, 2000b).

Neurobiological Development: Consequences of Early Childhood Trauma

Findings in developmental psychobiology suggest that the consequences of early maltreatment produce enduring negative effects on brain development (DeBellis, 2002; Liu, Diorio, Day, Francis, & Meaney, 2000; Teicher, 2002). Research suggests that the first stage in a cascade of events produced by early trauma and/or maltreatment involves the disruption of chemicals that function as neurotransmitters (e.g., cortisol, norepinephrine, dopamine), causing escalation of the stress response (Heim, Mletzko, Purselle, Musselman, & Nemeroff, 2008; Heim, Newport, Mletzko, Miller, & Nemeroff, 2008; Teicher, 2002). These chemical responses can then negatively affect critical neural growth during specific sensitive periods of childhood development and can even lead to cell death.

Adverse brain development can also result from elevated levels of cortisol and catecholamines by contributing to maturational failures in other brain regions, such as the prefrontal cortex (Meaney, Brake, & Gratton, 2002). Heim, Mletzko et al. (2008) found that the neuropeptide oxytocin—important for social affiliation and support, attachment, trust, and management of stress and anxiety—was markedly decreased in the cerebrospinal fluid of women who had been exposed to childhood maltreatment, particularly those who had experienced emotional abuse. The more childhood traumas a person had experienced, and the longer their duration, the lower that person's current level of oxytocin was likely to be and the higher her rating of current anxiety was likely to be.

Using data from the Adverse Childhood Experiences Study, an analysis by Anda, Felitti, Brown et al. (2006) confirmed that the risk of negative outcomes in affective, somatic, substance abuse, memory, sexual, and aggression-related domains increased as scores on a measure of eight ACEs increased. The researchers concluded that the association of study scores with these outcomes can serve as a theoretical parallel for the effects of cumulative exposure to stress on the developing brain and for the resulting impairment seen in multiple brain structures and functions.

The National Child Traumatic Stress Network (http://www.nctsn.org) offers information about childhood abuse, stress, and physiological responses of children who are traumatized. Materials are available for counselors, educators, parents, and caregivers. There are special sections on the needs of children in military families and on the impact of natural disasters on children's mental health.

Subthreshold Trauma-Related Symptoms

Many trauma survivors experience symptoms that, although they do not meet the diagnostic criteria for ASD or PTSD, nonetheless limit their ability to function normally (e.g., regulate emotional states, maintain steady and rewarding social and family relationships, function competently at a job, maintain a steady pattern of abstinence in recovery). These symptoms can be transient, only arising in a specific context; intermittent, appearing for several weeks or months and then receding; or a part of the individual's regular pattern of functioning (but not to the level of DSM-5 diagnostic criteria). Often, these patterns are termed "subthreshold" trauma symptoms. Like PTSD, the symptoms can be misdiagnosed as depression, anxiety, or another mental illness. Likewise, clients who have experienced trauma may link some of their symptoms to their trauma and diagnose themselves as having PTSD, even though they do not meet all criteria for that disorder.

Combat Stress Reaction

A phenomenon unique to war, and one that counselors need to understand well, is combat stress reaction (CSR). CSR is an acute anxiety reaction occurring during or shortly after participating in military conflicts and wars as well as other operations within the war zone, known as the theater. CSR is not a formal diagnosis, nor is it included in the DSM-5 (APA, 2013a). It is similar to acute stress

Case Illustration: Frank

Frank is a 36-year-old man who was severely beaten in a fight outside a bar. He had multiple injuries, including broken bones, a concussion, and a stab wound in his lower abdomen. He was hospitalized for 3.5 weeks and was unable to return to work, thus losing his job as a warehouse forklift operator. For several years, when faced with situations in which he perceived himself as helpless and overwhelmed, Frank reacted with violent anger that, to others, appeared grossly out of proportion to the situation. He has not had a drink in almost 3 years, but the bouts of anger persist and occur three to five times a year. They leave Frank feeling even more isolated from others and alienated from those who love him. He reports that he cannot watch certain television shows that depict violent anger; he has to stop watching when such scenes occur. He sometimes daydreams about getting revenge on the people who assaulted him.

Psychiatric and neurological evaluations do not reveal a cause for Frank's anger attacks. Other than these symptoms, Frank has progressed well in his abstinence from alcohol. He attends a support group regularly, has acquired friends who are also abstinent, and has reconciled with his family of origin. His marriage is more stable, although the episodes of rage limit his wife's willingness to commit fully to the relationship. In recounting the traumatic event in counseling, Frank acknowledges that he thought he was going to die as a result of the fight, especially when he realized he had been stabbed. As he described his experience, he began to become very anxious, and the counselor observed the rage beginning to appear.

After his initial evaluation, Frank was referred to an outpatient program that provided trauma-specific interventions to address his subthreshold trauma symptoms. With a combination of cognitive–behavioral counseling, EMDR, and anger management techniques, he saw a gradual decrease in symptoms when he recalled the assault. He started having more control of his anger when memories of the trauma emerged. Today, when feeling trapped, helpless, or overwhelmed, Frank has resources for coping and does not allow his anger to interfere with his marriage or other relationships.

reaction, except that the precipitating event or events affect military personnel (and civilians exposed to the events) in an armed conflict situation. The terms "combat stress reaction" and "posttraumatic stress injury" are relatively new, and the intent of using these new terms is to call attention to the unique experiences of combat-related stress as well as to decrease the shame that can be associated with seeking behavioral health services for PTSD (for more information on veterans and combat stress reactions, see the planned TIP, *Reintegration-Related Behavioral Health Issues for Veterans and Military Families*; SAMHSA, planned f).

Although stress mobilizes an individual's physical and psychological resources to perform more effectively in combat, reactions to the stress may persist long after the actual danger has ended. As with other traumas, the nature of the event(s), the reactions of others, and the survivor's psychological history and resources affect the likelihood and severity of CSR. With combat veterans, this translates to the number, intensity, and duration of threat factors; the social support of peers in the veterans' unit; the emotional and cognitive resilience of the service members; and the quality of military leadership. CSR can vary from manageable and mild to debilitating and severe. Common, less severe symptoms of CSR include tension, hypervigilance, sleep problems, anger, and difficulty concentrating. If left untreated, CSR can lead to PTSD.

Common causes of CSR are events such as a direct attack from insurgent small arms fire or a military convoy being hit by an improvised explosive device, but combat stressors encompass a diverse array of traumatizing events, such as seeing grave injuries, watching others

Advice to Counselors: Understanding the Nature of Combat Stress

Several sources of information are available to help counselors deepen their understanding of combat stress and postdeployment adjustment. Friedman (2006) explains how a prolonged combat-ready stance, which is adaptive in a war zone, becomes hypervigilance and overprotectiveness at home. He makes the point that the "mutual interdependence, trust, and affection" (p. 587) that are so necessarily a part of a combat unit are different from relationships with family members and colleagues in a civilian workplace. This complicates the transition to civilian life. *Wheels Down: Adjusting to Life After Deployment* (Moore & Kennedy, 2011) provides practical advice for military service members, including inactive or active duty personnel and veterans, in transitioning from the theater to home.

The following are just a few of the many resources and reports focused on combat-related psychological and stress issues:

- *Invisible Wounds of War: Psychological and Cognitive Injuries, Their Consequences, and Services to Assist Recovery* (Tanielian & Jaycox, 2008)
- *On Killing* (Grossman, 1995), an indepth analysis of the psychological dynamics of combat
- *Haunted by Combat* (Paulson & Krippner, 2007), which contains specific chapters on Reserve and National Guard troops and female veterans
- *Treating Young Veterans: Promoting Resilience Through Practice and Advocacy* (Kelly, Howe-Barksdale, & Gitelson, 2011)

die, and making on-the-spot decisions in ambiguous conditions (e.g., having to determine whether a vehicle speeding toward a military checkpoint contains insurgents with explosives or a family traveling to another area). Such circumstances can lead to combat stress. Military personnel also serve in noncombat positions (e.g., healthcare and administrative roles), and personnel filling these supportive roles can be exposed to combat situations by proximity or by witnessing their results.

Specific Trauma-Related Psychological Disorders

Part of the definition of trauma is that the individual responds with intense fear, helplessness, or horror. Beyond that, in both the short term and the long term, trauma comprises a range of reactions from normal (e.g., being unable to concentrate, feeling sad, having trouble sleeping) to warranting a diagnosis of a trauma-related mental disorder. Most people who experience trauma have no long-lasting disabling effects; their coping skills and the support of those around them are sufficient to help them overcome their difficulties, and their ability to function on a daily basis over time is unimpaired. For others, though, the symptoms of trauma are more severe and last longer. The most common diagnoses associated with trauma are PTSD and ASD, but trauma is also associated with the onset of other mental disorders—particularly substance use disorders, mood disorders, various anxiety disorders, and personality disorders. Trauma also typically exacerbates symptoms of preexisting disorders, and, for people who are predisposed to a mental disorder, trauma can precipitate its onset. Mental disorders can occur almost simultaneously with trauma exposure or manifest sometime thereafter.

Acute Stress Disorder

ASD represents a normal response to stress. Symptoms develop within 4 weeks of the trauma and can cause significant levels of distress. Most individuals who have acute stress reactions never develop further impairment or PTSD. Acute stress disorder is highly associated with the experience of one specific trauma rather than the experience of long-term exposure to chronic traumatic stress. Diagnostic criteria are presented in Exhibit 1.3-3.

Exhibit 1.3-3: DSM-5 Diagnostic Criteria for ASD

A. Exposure to actual or threatened death, serious injury, or sexual violation in one (or more) of the following ways:
   1. Directly experiencing the traumatic event(s).
   2. Witnessing, in person, the event(s) as it occurred to others.
   3. Learning that the event(s) occurred to a close family member or close friend. **Note:** In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental.
   4. Experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g., first responders collecting human remains, police officers repeatedly exposed to details of child abuse). **Note:** This does not apply to exposure through electronic media, television, movies, or pictures, unless this exposure is work related.

B. Presence of nine (or more) of the following symptoms from any of the five categories of intrusion, negative mood, dissociation, avoidance, and arousal, beginning or worsening after the traumatic event(s) occurred:

Intrusion Symptoms:
   1. Recurrent, involuntary, and intrusive distressing memories of the traumatic event(s). **Note:** In children, repetitive play may occur in which themes or aspects of the traumatic event(s) are expressed.
   2. Recurrent distressing dreams in which the content and/or affect of the dream are related to the event(s). **Note:** In children, there may be frightening dreams without recognizable content.
   3. Dissociative reactions (e.g., flashbacks), during which the individual feels or acts as if the traumatic event(s) were recurring. Such reactions may occur on a continuum, with the most extreme expression being a complete loss of awareness of present surroundings. **Note:** In children, trauma-specific reenactment may occur in play.
   4. Intense or prolonged psychological distress or marked physiological reactions in response to internal or external cues that symbolize or resemble an aspect of the traumatic event(s).

Negative Mood:
   5. Persistent inability to experience positive emotions (e.g., inability to experience happiness, satisfaction, or loving feelings).

Dissociative Symptoms:
   6. An altered sense of the reality of one's surroundings or oneself (e.g., seeing oneself from another's perspective, being in a daze, time slowing).
   7. Inability to remember an important aspect of the traumatic event(s) (typically due to dissociative amnesia and not to other factors, such as head injury, alcohol, or drugs).

Avoidance Symptoms:
   8. Efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).
   9. Efforts to avoid external reminders (e.g., people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).

Arousal Symptoms:
   10. Sleep disturbance (e.g., difficulty falling or staying asleep, restless sleep).
   11. Irritable behavior and angry outbursts (with little or no provocation), typically expressed as verbal or physical aggression toward people or objects.
   12. Hypervigilance.
   13. Problems with concentration.
   14. Exaggerated startle response.

(Continued on the next page.)

Exhibit 1.3-3: DSM-5 Diagnostic Criteria for ASD (continued)

C. Duration of the disturbance (symptoms in Criterion B) is 3 days to 1 month after trauma exposure. **Note:** Symptoms typically begin immediately after the trauma, but persistence for at least 3 days and up to a month is needed to meet disorder criteria.

D. The disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning.

E. The disturbance is not attributable to the physiological effects of a substance (e.g., medication or alcohol) or another medical condition (e.g., mild traumatic brain injury) and is not better explained by brief psychotic disorder.

Source: APA, 2013a, pp. 280–281.

The primary presentation of an individual with an acute stress reaction is often that of someone who appears overwhelmed by the traumatic experience. The need to talk about the experience can lead the client to seem self-centered and unconcerned about the needs of others. He or she may need to describe, in repetitive detail, what happened, or may seem obsessed with trying to understand what happened in an effort to make sense of the experience. The client is often hypervigilant and avoids circumstances that are reminders of the trauma. For instance, someone who was in a serious car crash in heavy traffic can become anxious and avoid riding in a car or driving in traffic for a finite time afterward. Partial amnesia for the trauma often accompanies ASD, and the individual may repetitively question others to fill in details. People with ASD symptoms sometimes seek assurance from others that the event happened in the way they remember, that they are not "going crazy" or "losing it," and that they could not have prevented the event. The next case illustration demonstrates the time-limited nature of ASD.

Differences between ASD and PTSD

It is important to consider the differences between ASD and PTSD when forming a diagnostic impression. The primary difference is the amount of time the symptoms have been present. ASD resolves 2 days to 4 weeks after an event, whereas PTSD continues beyond the 4-week period. The diagnosis of ASD can change to a diagnosis of PTSD if the condition is noted within the first 4 weeks after the event, but the symptoms persist past 4 weeks.

ASD also differs from PTSD in that the ASD diagnosis requires 9 out of 14 symptoms from five categories, including intrusion, negative mood, dissociation, avoidance, and arousal. These symptoms can occur at the time of the trauma or in the following month. Studies indicate that dissociation at the time of trauma is a good predictor of subsequent PTSD, so the inclusion of dissociative symptoms makes it more likely that those who develop ASD will later be diagnosed with PTSD (Bryant & Harvey, 2000). Additionally, ASD is a transient disorder, meaning that it is present in a person's life for a relatively short time and then passes. In contrast, PTSD typically becomes a primary feature of an individual's life. Over a lengthy period, PTSD can have profound effects on clients' perceptions of safety, their sense of hope for the future, their relationships with others, their physical health, the appearance of psychiatric symptoms, and their patterns of substance use and abuse.

There are common symptoms between PTSD and ASD, and untreated ASD is a possible predisposing factor to PTSD, but it is unknown whether most people with ASD are likely to develop PTSD. There is some suggestion that, as with PTSD, ASD is more

Case Illustration: Sheila

Two months ago, Sheila, a 55-year-old married woman, experienced a tornado in her home town. In the previous year, she had addressed a long-time marijuana use problem with the help of a treatment program and had been abstinent for about 6 months. Sheila was proud of her abstinence; it was something she wanted to continue. She regarded it as a mark of personal maturity; it improved her relationship with her husband, and their business had flourished as a result of her abstinence.

During the tornado, an employee reported that Sheila had become very agitated and had grabbed her assistant to drag him under a large table for cover. Sheila repeatedly yelled to her assistant that they were going to die. Following the storm, Sheila could not remember certain details of her behavior during the event. Furthermore, Sheila said that after the storm, she felt numb, as if she was floating out of her body and could watch herself from the outside. She stated that nothing felt real and it was all like a dream.

Following the tornado, Sheila experienced emotional numbness and detachment, even from people close to her, for about 2 weeks. The symptoms slowly decreased in intensity but still disrupted her life. Sheila reported experiencing disjointed or unconnected images and dreams of the storm that made no real sense to her. She was unwilling to return to the building where she had been during the storm, despite having maintained a business at this location for 15 years. In addition, she began smoking marijuana again because it helped her sleep. She had been very irritable and had uncharacteristic angry outbursts toward her husband, children, and other family members.

As a result of her earlier contact with a treatment program, Sheila returned to that program and engaged in psychoeducational, supportive counseling focused on her acute stress reaction. She regained abstinence from marijuana and returned shortly to a normal level of functioning. Her symptoms slowly diminished over a period of 3 weeks. With the help of her counselor, she came to understand the link between the trauma and her relapse, regained support from her spouse, and again felt in control of her life.

prevalent in women than in men (Bryant & Harvey, 2003). However, many people with PTSD do not have a diagnosis or recall a history of acute stress symptoms before seeking treatment for or receiving a diagnosis of PTSD.

Effective interventions for ASD can significantly reduce the possibility of the subsequent development of PTSD. Effective treatment of ASD can also reduce the incidence of other co-occurring problems, such as depression, anxiety, dissociative disorders, and compulsive behaviors (Bryant & Harvey, 2000). Intervention for ASD also helps the individual develop coping skills that can effectively prevent the recurrence of ASD after later traumas.

Although predictive science for ASD and PTSD will continue to evolve, both disorders are associated with increased substance use and mental disorders and increased risk of relapse; therefore, effective screening for ASD and PTSD is important for all clients with these disorders. Individuals in early recovery—lacking well-practiced coping skills, lacking environmental supports, and already operating at high levels of anxiety—are particularly susceptible to ASD. Events that would not normally be disabling can produce symptoms of intense helplessness and fear, numbing and depersonalization, disabling anxiety, and an inability to handle normal life events. Counselors should be able to recognize ASD and treat it rather than attributing the symptoms to a client's lack of motivation to change, being "dry drunk" (for those in substance abuse recovery), or being manipulative.

Posttraumatic Stress Disorder

The trauma-related disorder that receives the greatest attention is PTSD; it is the most

Case Illustration: Michael

Michael is a 62-year-old Vietnam veteran. He is a divorced father of two children and has four grandchildren. Both of his parents were dependent on alcohol. He describes his childhood as isolated. His father physically and psychologically abused him (e.g., he was beaten with a switch until he had welts on his legs, back, and buttocks). By age 10, his parents regarded him as incorrigible and sent him to a reformatory school for 6 months. By age 15, he was using marijuana, hallucinogens, and alcohol and was frequently truant from school.

At age 19, Michael was drafted and sent to Vietnam, where he witnessed the deaths of six American military personnel. In one incident, the soldier he was next to in a bunker was shot. Michael felt helpless as he talked to this soldier, who was still conscious. In Vietnam, Michael increased his use of both alcohol and marijuana. On his return to the United States, Michael continued to drink and use marijuana. He reenlisted in the military for another tour of duty.

His life stabilized in his early 30s, as he had a steady job, supportive friends, and a relatively stable family life. However, he divorced in his late 30s. Shortly thereafter, he married a second time, but that marriage ended in divorce as well. He was chronically anxious and depressed and had insomnia and frequent nightmares. He periodically binged on alcohol. He complained of feeling empty, had suicidal ideation, and frequently stated that he lacked purpose in his life.

In the 1980s, Michael received several years of mental health treatment for dysthymia. He was hospitalized twice and received 1 year of outpatient psychotherapy. In the mid-1990s, he returned to outpatient treatment for similar symptoms and was diagnosed with PTSD and dysthymia. He no longer used marijuana and rarely drank. He reported that he didn't like how alcohol or other substances made him feel anymore—he felt out of control with his emotions when he used them. Michael reported symptoms of hyperarousal, intrusion (intrusive memories, nightmares, and preoccupying thoughts about Vietnam), and avoidance (isolating himself from others and feeling "numb"). He reported that these symptoms seemed to relate to his childhood abuse and his experiences in Vietnam. In treatment, he expressed relief that he now understood the connection between his symptoms and his history.

commonly diagnosed trauma-related disorder, and its symptoms can be quite debilitating over time. Nonetheless, it is important to remember that PTSD symptoms are represented in a number of other mental illnesses, including major depressive disorder (MDD), anxiety disorders, and psychotic disorders (Foa et al., 2006). The DSM-5 (APA, 2013a) identifies four symptom clusters for PTSD: presence of intrusion symptoms, persistent avoidance of stimuli, negative alterations in cognitions and mood, and marked alterations in arousal and reactivity. Individuals must have been exposed to actual or threatened death, serious injury, or sexual violence, and the symptoms must produce significant distress and impairment for more than 4 weeks (Exhibit 1.3-4).

Certain characteristics make people more susceptible to PTSD, including one's unique personal vulnerabilities at the time of the traumatic exposure, the support (or lack of support) received from others at the time of the trauma and at the onset of trauma-related symptoms, and the way others in the person's environment gauge the nature of the traumatic event (Brewin, Andrews, & Valentine, 2000).

People with PTSD often present varying clinical profiles and histories. They can experience symptoms that are activated by environmental triggers and then recede for a period of time. Some people with PTSD who show mostly psychiatric symptoms (particularly depression and anxiety) are misdiagnosed and go untreated for their primary condition. For many people, the trauma experience and diagnosis

Exhibit 1.3-4: DSM-5 Diagnostic Criteria for PTSD

Note: The following criteria apply to adults, adolescents, and children older than 6 years. For children 6 years and younger, see the DSM-5 section titled "Posttraumatic Stress Disorder for Children 6 Years and Younger" (APA, 2013a).

A. Exposure to actual or threatened death, serious injury, or sexual violence in one (or more) of the following ways:
   1. Directly experiencing the traumatic event(s).
   2. Witnessing, in person, the event(s) as it occurred to others.
   3. Learning that the traumatic event(s) occurred to a close family member or close friend. In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental.
   4. Experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g., first responders collecting human remains; police officers repeatedly exposed to details of child abuse). **Note:** Criterion A4 does not apply to exposure through electronic media, television, movies, or pictures, unless this exposure is work related.

B. Presence of one (or more) of the following intrusion symptoms associated with the traumatic event(s), beginning after the traumatic event(s) occurred:
   1. Recurrent, involuntary, and intrusive distressing memories of the traumatic event(s). **Note:** In children older than 6 years, repetitive play may occur in which themes or aspects of the traumatic event(s) are expressed.
   2. Recurrent distressing dreams in which the content and/or affect of the dream are related to the traumatic event(s). **Note:** In children, there may be frightening dreams without recognizable content.
   3. Dissociative reactions (e.g., flashbacks) in which the individual feels or acts as if the traumatic event(s) were recurring. (Such reactions may occur on a continuum, with the most extreme expression being a complete loss of awareness of present surroundings.) **Note:** In children, trauma-specific reenactment may occur in play.
   4. Intense or prolonged psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event(s).
   5. Marked physiological reactions to internal or external cues that symbolize or resemble an aspect of the traumatic event(s).

C. Persistent avoidance of stimuli associated with the traumatic event(s), beginning after the traumatic event(s) occurred, as evidenced by one or both of the following:
   1. Avoidance of or efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).
   2. Avoidance of or efforts to avoid external reminders (people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s).

D. Negative alterations in cognitions and mood associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following:
   1. Inability to remember an important aspect of the traumatic event(s) (typically due to dissociative amnesia, and not to other factors such as head injury, alcohol, or drugs).
   2. Persistent and exaggerated negative beliefs or expectations about oneself, others, or the world (e.g., "I am bad," "No one can be trusted," "The world is completely dangerous," "My whole nervous system is permanently ruined").
   3. Persistent, distorted cognitions about the cause or consequences of the traumatic event(s) that lead the individual to blame himself/herself or others.
   4. Persistent negative emotional state (e.g., fear, horror, anger, guilt, or shame).
   5. Markedly diminished interest or participation in significant activities.
   6. Feelings of detachment or estrangement from others.
   7. Persistent inability to experience positive emotions (e.g., inability to experience happiness, satisfaction, or loving feelings).

(Continued on the next page.)

Exhibit 1.3-4: DSM-5 Diagnostic Criteria for PTSD (continued)

E. Marked alterations in arousal and reactivity associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following:
   1. Irritable behavior and angry outbursts (with little or no provocation), typically expressed as verbal or physical aggression toward people or objects.
   2. Reckless or self-destructive behavior.
   3. Hypervigilance.
   4. Exaggerated startle response.
   5. Problems with concentration.
   6. Sleep disturbance (e.g., difficulty falling or staying asleep or restless sleep).

F. Duration of the disturbance (Criteria B, C, D and E) is more than 1 month.

G. The disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning.

H. The disturbance is not attributable to the physiological effects of a substance (e.g., medication, alcohol) or another medical condition.

Specify whether:

With dissociative symptoms: The individual's symptoms meet the criteria for posttraumatic stress disorder, and in addition, in response to the stressor, the individual experiences persistent or recurrent symptoms of either of the following:

1. **Depersonalization:** Persistent or recurrent experiences of feeling detached from, and as if one were an outside observer of, one's mental processes or body (e.g., feeling as though one were in a dream; feeling a sense of unreality of self or body or of time moving slowly).
2. **Derealization:** Persistent or recurrent experiences of unreality of surroundings (e.g., the world around the individual is experienced as unreal, dreamlike, distant, or distorted). **Note**: To use this subtype, the dissociative symptoms must not be attributable to the physiological effects of a substance (e.g., blackouts, behavior during alcohol intoxication) or another medical condition (e.g., complex partial seizures).

Specify whether:

With delayed expression: If the full diagnostic criteria are not met until at least 6 months after the event (although the onset and expression of some symptoms may be immediate).

Source: APA, 2013a, pp. 271–272.

are obscured by co-occurring substance use disorder symptoms. The important feature of PTSD is that the disorder becomes an orienting feature of the individual's life. How well the person can work, with whom he or she associates, the nature of close and intimate relationships, the ability to have fun and rejuvenate, and the way in which an individual goes about confronting and solving problems in life are all affected by the client's trauma experiences and his or her struggle to recover.

Posttraumatic stress disorder: Timing of symptoms

Although symptoms of PTSD usually begin within 3 months of a trauma in adulthood, there can be a delay of months or even years before symptoms appear for some people. Some people may have minimal symptoms after a trauma but then experience a crisis later in life. Trauma symptoms can appear suddenly, even without conscious memory of the original trauma or without any overt provocation. Survivors of abuse in childhood can have a delayed response triggered by something that happens to them as adults. For example, seeing a movie about child abuse can trigger symptoms related

Advice to Counselors: Helping Clients With Delayed Trauma Responses

Clients who are experiencing a delayed trauma response can benefit if you help them to:

- Create an environment that allows acknowledgment of the traumatic event(s).
- Discuss their initial recall or first suspicion that they were having a traumatic response.
- Become educated on delayed trauma responses.
- Draw a connection between the trauma and presenting trauma-related symptoms.
- Create a safe environment.
- Explore their support systems and fortify them as needed.
- Understand that triggers can precede traumatic stress reactions, including delayed responses to trauma.
- Identify their triggers.
- Develop coping strategies to navigate and manage symptoms.

to the trauma. Other triggers include returning to the scene of the trauma, being reminded of it in some other way, or noting the anniversary of an event. Likewise, combat veterans and survivors of community-wide disasters may seem to be coping well shortly after a trauma, only to have symptoms emerge later when their life situations seem to have stabilized. Some clients in substance abuse recovery only begin to experience trauma symptoms when they maintain abstinence for some time. As individuals decrease tension-reducing or self-medicating behaviors, trauma memories and symptoms can emerge.

Culture and posttraumatic stress

Although research is limited across cultures, PTSD has been observed in Southeast Asian, South American, Middle Eastern, and Native American survivors (Osterman & de Jong, 2007; Wilson & Tang, 2007). As Stamm and Friedman (2000) point out, however, simply observing PTSD does not mean that it is the "best conceptual tool for characterizing posttraumatic distress among non-Western individuals" (p. 73). In fact, many trauma-related symptoms from other cultures do not fit the DSM-5 criteria. These include somatic and psychological symptoms and beliefs about the origins and nature of traumatic events. Moreover, religious and spiritual beliefs can affect how a survivor experiences a traumatic event and whether he or she reports the distress. For example, in societies where attitudes toward karma and the glorification of war veterans are predominant, it is harder for war veterans to come forward and disclose that they are emotionally overwhelmed or struggling. It would be perceived as inappropriate and possibly demoralizing to focus on the emotional distress that he or she still bears. (For a review of cultural competence in treating trauma, refer to Brown, 2008.)

Methods for measuring PTSD are also culturally specific. As part of a project begun in 1972, the World Health Organization (WHO) and the National Institutes of Health (NIH) embarked on a joint study to test the cross-cultural applicability of classification systems for various diagnoses. WHO and NIH identified apparently universal factors of psychological disorders and developed specific instruments to measure them. These instruments, the Composite International Diagnostic Interview and the Schedules for Clinical Assessment in Neuropsychiatry, include certain criteria from the DSM (Fourth Edition, Text Revision; APA, 2000a) as well as criteria from the International Statistical Classification of Diseases and Related Health Problems, 10th revision (ICD-10; Exhibit 1.3-5).

Exhibit 1.3-5: ICD-10 Diagnostic Criteria for PTSD

A. The patient must have been exposed to a stressful event or situation (either brief or long-lasting) of exceptionally threatening or catastrophic nature, which would be likely to cause pervasive distress in almost anyone.

B. There must be persistent remembering or "reliving" of the stressor in intrusive "flashbacks," vivid memories, or recurring dreams, or in experiencing distress when exposed to circumstances resembling or associated with the stressor.

C. The patient must exhibit an actual or preferred avoidance of circumstances resembling or associated with the stressor, which was not present before exposure to the stressor.

D. Either of the following must be present:
   1. Inability to recall, either partially or completely, some important aspects of the period of exposure to the stressor.
   2. Persistent symptoms of increased psychological sensitivity and arousal (not present before exposure to the stressor), shown by any two of the following:
      a. Difficulty in falling or staying asleep.
      b. Irritability or outbursts of anger.
      c. Difficulty in concentrating.
      d. Exaggerated startle response.

E. Criteria B, C, and D must all be met within 6 months of the stressful event or at the end of a period of stress. (For some purposes, onset delayed more than 6 months can be included, but this should be clearly specified.)

Source: WHO, 1992.

Complex trauma and complex traumatic stress

When individuals experience multiple traumas, prolonged and repeated trauma during childhood, or repetitive trauma in the context of significant interpersonal relationships, their reactions to trauma have unique characteristics (Herman, 1992). This unique constellation of reactions, called complex traumatic stress, is not recognized diagnostically in the DSM-5, but theoretical discussions and research have begun to highlight the similarities and differences in symptoms of posttraumatic stress versus complex traumatic stress (Courtois & Ford, 2009). Often, the symptoms generated from complex trauma do not fully match PTSD criteria and exceed the severity of PTSD. Overall, literature reflects that PTSD criteria or subthreshold symptoms do not fully account for the persistent and more impairing clinical presentation of complex trauma. Even though current research in the study of traumatology is prolific, it is still in the early stages of development. The idea that there may be more diagnostic variations or subtypes is forthcoming, and this will likely pave the way for more client-matching interventions to better serve those individuals who have been repeatedly exposed to multiple, early childhood, and/or interpersonal traumas.

Other Trauma-Related and Co-Occurring Disorders

The symptoms of PTSD and other mental disorders overlap considerably; these disorders often coexist and include mood, anxiety,

The term "**co occurring disorders**" refers to cases when a person has one or more mental disorders as well as one or more substance use disorders (including sub stance abuse). Co occurring disorders are common among individuals who have a history of trauma and are seeking help.

Advice to Counselors: Universal Screening and Assessment

Only people specifically trained and licensed in mental health assessment should make diagnoses; trauma can result in complicated cases, and many symptoms can be present, whether or not they meet full diagnostic criteria for a specific disorder. Only a trained assessor can distinguish accurately among various symptoms and in the presence of co-occurring disorders. However, behavioral health professionals without specific assessment training can still serve an important role in screening for possible mental disorders using established screening tools (CSAT, 2005c; see also Chapter 4 of this TIP). In agencies and clinics, it is critical to provide such screenings systematically—for each client—as PTSD and other co-occurring disorders are typically underdiagnosed or misdiagnosed.

substance use, and personality disorders. Thus, it's common for trauma survivors to be underdiagnosed or misdiagnosed. If they have not been identified as trauma survivors, their psychological distress is often not associated with previous trauma, and/or they are diagnosed with a disorder that marginally matches their presenting symptoms and psychological sequelae of trauma. The following sections present a brief overview of some mental disorders that can result from (or be worsened by) traumatic stress. PTSD is not the only diagnosis related to trauma nor its only psychological consequence; trauma can broadly influence mental and physical health in clients who already have behavioral health disorders.

People With Mental Disorders

MDD is the most common co-occurring disorder in people who have experienced trauma and are diagnosed with PTSD. A well-established causal relationship exists between stressful events and depression, and a prior history of MDD is predictive of PTSD after exposure to major trauma (Foa et al., 2006).

Many survivors with severe mental disorders function fairly well following trauma, including disasters, as long as essential services aren't interrupted. For others, additional mental health supports may be necessary. For more information, see *Responding to the Needs of People With Serious and Persistent Mental Illness in Times of Major Disaster* (Center for Mental Health Services, 1996).

Co-occurrence is also linked with greater impairment and more severe symptoms of both disorders, and the person is less likely to experience remission of symptoms within 6 months.

Generalized anxiety, obsessive–compulsive, and other anxiety disorders are also associated with PTSD. PTSD may exacerbate anxiety disorder symptoms, but it is also likely that preexisting anxiety symptoms and anxiety disorders increase vulnerability to PTSD. Preexisting anxiety primes survivors for greater hyperarousal and distress. Other disorders, such as personality and somatization disorders, are also associated with trauma, but the history of trauma is often overlooked as a significant factor or necessary target in treatment.

The relationship between PTSD and other disorders is complex. More research is now examining the multiple potential pathways among PTSD and other disorders and how various sequences affect clinical presentation. TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c), is valuable in understanding the relationship of substance use to other mental disorders.

People With Substance Use Disorders

There is clearly a correlation between trauma (including individual, group, or mass trauma) and substance use as well as the presence of posttraumatic stress (and other trauma-related disorders) and substance use disorders. Alcohol and drug use can be, for some, an effort to

Co-Occurring PTSD and Other Mental Disorders

- Individuals with PTSD often have at least one additional diagnosis of a mental disorder.
- The presence of other disorders typically worsens and prolongs the course of PTSD and complicates clinical assessment, diagnosis, and treatment.
- The most common co-occurring disorders, in addition to substance use disorders, include mood disorders, various anxiety disorders, eating disorders, and personality disorders.
- Exposure to early, severe, and chronic trauma is linked to more complex symptoms, including impulse control deficits, greater difficulty in emotional regulation and establishing stable relationships, and disruptions in consciousness, memory, identity, and/or perception of the environment (Dom, De, Hulstijn, & Sabbe, 2007; Waldrop, Back, Verduin, & Brady, 2007).
- Certain diagnostic groups and at-risk populations (e.g., people with developmental disabilities, people who are homeless or incarcerated) are more susceptible to trauma exposure and to developing PTSD if exposed but less likely to receive appropriate diagnosis and treatment.
- Given the prevalence of traumatic events in clients who present for substance abuse treatment, counselors should assess all clients for possible trauma-related disorders.

manage traumatic stress and specific PTSD symptoms. Likewise, people with substance use disorders are at higher risk of developing PTSD than people who do not abuse substances. Counselors working with trauma survivors or clients who have substance use disorders have to be particularly aware of the possibility of the other disorder arising.

Timeframe: PTSD and the onset of substance use disorders

Knowing whether substance abuse or PTSD came first informs whether a causal relationship exists, but learning this requires thorough assessment of clients and access to complete data on PTSD; substance use, abuse, and dependence; and the onset of each. Much current research focuses solely on the age of onset of substance use (not abuse), so determining causal relationships can be difficult.

The relationship between PTSD and substance use disorders is thought to be bidirectional and cyclical: substance use increases trauma risk, and exposure to trauma escalates substance use to manage trauma-related symptoms. Three other causal pathways described by Chilcoat and Breslau's seminal work (1998) further explain the relationship between PTSD and substance use disorders:

1. The "self-medication" hypothesis suggests that clients with PTSD use substances to manage PTSD symptoms (e.g., intrusive memories, physical arousal). Substances such as alcohol, cocaine, barbiturates, opioids, and amphetamines are frequently abused in attempts to relieve or numb emotional pain or to forget the event.
2. The "high-risk" hypothesis states that drug and alcohol use places people who use substances in high-risk situations that increase their chances of being exposed to events that lead to PTSD.
3. The "susceptibility" hypothesis suggests that people who use substances are more susceptible to developing PTSD after exposure to trauma than people who do not. Increased vulnerability may result from failure to develop effective stress management strategies, changes in brain chemistry, or damage to neurophysiological systems due to extensive substance use.

PTSD and substance abuse treatment

PTSD can limit progress in substance abuse recovery, increase the potential for relapse, and complicate a client's ability to achieve success in various life areas. Each disorder can mask or hide the symptoms of the other, and both need

Case Illustration: Maria

Maria is a 31-year-old woman diagnosed with PTSD and alcohol dependence. From ages 8 to 12, she was sexually abused by an uncle. Maria never told anyone about the abuse for fear that she would not be believed. Her uncle remains close to the family, and Maria still sees him on certain holidays. When she came in for treatment, she described her emotions and thoughts as out of control. Maria often experiences intrusive memories of the abuse, which at times can be vivid and unrelenting. She cannot predict when the thoughts will come; efforts to distract herself from them do not always work. She often drinks in response to these thoughts or his presence, as she has found that alcohol can dull her level of distress. Maria also has difficulty falling asleep and is often awakened by nightmares. She does not usually remember the dreams, but she wakes up feeling frightened and alert and cannot go back to sleep.

Maria tries to avoid family gatherings but often feels pressured to go. Whenever she sees her uncle, she feels intense panic and anger but says she can usually "hold it together" if she avoids him. Afterward, however, she describes being overtaken by these feelings and unable to calm down. She also describes feeling physically ill and shaky. At these times, she often isolates herself, stays in her apartment, and drinks steadily for several days. Maria also reports distress pertaining to her relationship with her boyfriend. In the beginning of their relationship, she found him comforting and enjoyed his affection, but more recently, she has begun to feel anxious and unsettled around him. Maria tries to avoid sex with him, but she sometimes gives in for fear of losing the relationship. She finds it easier to have sex with him when she is drunk, but she often experiences strong feelings of dread and disgust reminiscent of her abuse. Maria feels guilty and confused about these feelings.

to be assessed and treated if the individual is to have a full recovery. There is a risk of misinterpreting trauma-related symptoms in substance abuse treatment settings. For example, avoidance symptoms in an individual with PTSD can be misinterpreted as lack of motivation or unwillingness to engage in substance abuse treatment; a counselor's efforts to address substance abuse–related behaviors in early recovery can likewise provoke an exaggerated response from a trauma survivor who has profound traumatic experiences of being trapped and controlled. Exhibit 1.3-6 lists important facts about PTSD and substance use disorders for counselors.

Sleep, PTSD, and substance use

Many people have trouble getting to sleep and/or staying asleep after a traumatic event; consequently, some have a drink or two to help them fall asleep. Unfortunately, any initially helpful effects are likely not only to wane quickly, but also to incur a negative rebound effect. When someone uses a substance before going to bed, "sleep becomes lighter and more easily disrupted," and rapid eye movement sleep (REM) "increases, with an associated increase in dreams and nightmares," as the effects wear off (Auerbach, 2003, p. 1185).

People with alcohol dependence report multiple types of sleep disturbances over time, and it is not unusual for clients to report that they cannot fall asleep without first having a drink. Both REM and slow wave sleep are reduced in clients with alcohol dependence, which is also associated with an increase in the amount of time it takes before sleep occurs, decreased overall sleep time, more nightmares, and reduced sleep efficiency. Sleep during withdrawal is "frequently marked by severe insomnia and sleep fragmentation…a loss of restful sleep and feelings of daytime fatigue. Nightmares and vivid dreams are not uncommon" (Auerbach, 2003, pp. 1185–1186).

Confounding changes in the biology of sleep that occur in clients with PTSD and substance use disorders often add to the problems of

Exhibit 1.3-6: PTSD and Substance Use Disorders: Important Treatment Facts

Profile Severity

- PTSD is one of the most common co-occurring mental disorders found in clients in substance abuse treatment (CSAT, 2005c).
- People in treatment for PTSD tend to abuse a wide range of substances, including opioids, cocaine, marijuana, alcohol, and prescription medications.
- People in treatment for PTSD and substance abuse have a more severe clinical profile than those with just one of these disorders.
- PTSD, with or without major depression, significantly increases risk for suicidality (CSAT, 2009a).

Gender Differences

- Rates of trauma-related disorders are high in men and women in substance abuse treatment.
- Women with PTSD and a substance use disorder most frequently experienced rape or witnessed a killing or injury; men with both disorders typically witnessed a killing or injury or were the victim of sudden injury or accident (Cottler, Nishith, & Compton, 2001).

Risk of Continued Cycle of Violence

- While under the influence of substances, a person is more vulnerable to traumatic events (e.g., automobile crashes, assaults).
- Perpetrators of violent assault often are under the influence of substances or test positive for substances at the time of arrest.

Treatment Complications

- It is important to recognize and help clients understand that becoming abstinent from substances does not resolve PTSD; in fact, some PTSD symptoms become worse with abstinence for some people. Both disorders must be addressed in treatment.
- Treatment outcomes for clients with PTSD and a substance use disorder are worse than for clients with other co-occurring disorders or who only abuse substances (Brown, Read, & Kahler, 2003).

recovery. Sleep can fail to return to normal for months or even years after abstinence, and the persistence of sleep disruptions appears related to the likelihood of relapse. Of particular clinical importance is the vicious cycle that can also begin during "slips"; relapse initially improves sleep, but continued drinking leads to sleep disruption. This cycle of initial reduction of an unpleasant symptom, which only ends up exacerbating the process as a whole, can take place for clients with PTSD as well as for clients with substance use disorders. There are effective cognitive–behavioral therapies and nonaddictive pharmacological interventions for sleep difficulties.

4 Screening and Assessment

IN THIS CHAPTER

- Screening and Assessment
- Barriers and Challenges to Trauma Informed Screening and Assessment
- Cross Cultural Screening and Assessment
- Choosing Instruments
- Trauma Informed Screening and Assessment
- Concluding Note

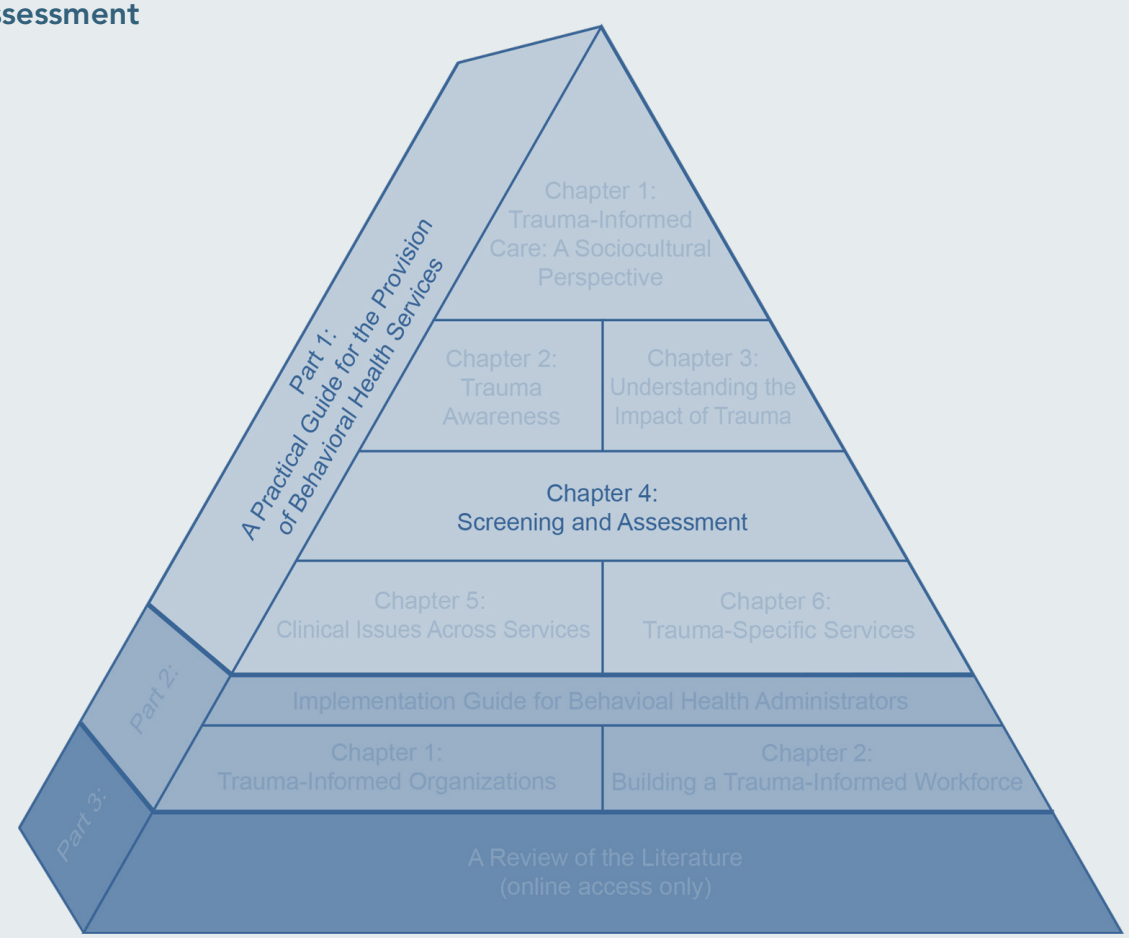
Why screen universally for trauma in behavioral health services? Exposure to trauma is common; in many surveys, more than half of respondents report a history of trauma, and the rates are even higher among clients with mental or substance use disorders. Furthermore, behavioral health problems, including substance use and mental disorders, are more difficult to treat if trauma-related symptoms and disorders aren't detected early and treated effectively (Part 3, Section 1, of this Treatment Improvement Protocol [TIP], available online, summarizes research on the prevalence of trauma and its relationship with other behavioral health problems).

Not addressing traumatic stress symptoms, trauma-specific disorders, and other symptoms/disorders related to trauma can impede successful mental health and substance abuse treatment. Unrecognized, unaddressed trauma symptoms can lead to poor engagement in treatment, premature termination, greater risk for relapse of psychological symptoms or substance use, and worse outcomes. Screening can also prevent misdiagnosis and inappropriate treatment planning. People with histories of trauma often display symptoms that meet criteria for other disorders.

Without screening, clients' trauma histories and related symptoms often go undetected, leading providers to direct services toward symptoms and disorders that may only partially explain client presentations and distress. Universal screening for trauma history and trauma-related symptoms can help behavioral health practitioners identify individuals at risk of developing more pervasive and severe symptoms of traumatic stress. Screening, early identification, and intervention serves as a prevention strategy.

Screening to identify clients who have histories of trauma and experience trauma related symptoms is a prevention strategy.

Trauma-Informed Care Framework in Behavioral Health Services—Screening and Assessment



The chapter begins with a discussion of screening and assessment concepts, with a particular focus on trauma-informed screening. It then highlights specific factors that influence screening and assessment, including timing and environment. Barriers and challenges in providing trauma-informed screening are discussed, along with culturally specific screening and assessment considerations and guidelines. Instrument selection, trauma-informed screening and assessment tools, and trauma-informed screening and assessment processes are reviewed as well. For a more research-oriented perspective on screening and assessment for traumatic stress disorders, please refer to the literature review provided in Part 3 of this TIP, which is available online.

Screening and Assessment

Screening

The first two steps in screening are to determine whether the person has a history of trauma and whether he or she has trauma-related symptoms. Screening mainly obtains answers to "yes" or "no" questions: "Has this client experienced a trauma in the past?" and "Does this client at this time warrant further assessment regarding trauma-related symptoms?" If someone acknowledges a trauma history, then further screening is necessary to determine whether trauma-related symptoms are present. However, the presence of such symptoms does not necessarily say anything about their severity, nor does a positive screen indicate that a disorder actually exists. Positive

Screening is often the first contact between the client and the treatment provider, and the client forms his or her first impression of treatment during this intake process. Thus, how screening is conducted can be as important as the actual information gathered, as it sets the tone of treatment and begins the relationship with the client.

screens only indicate that assessment or further evaluation is warranted, and negative screens do not necessarily mean that an individual doesn't have symptoms that warrant intervention.

Screening procedures should always define the steps to take after a positive or negative screening. That is, the screening process establishes precisely how to score responses to screening tools or questions and clearly defines what constitutes a positive score (called a "cut-off score") for a particular potential problem. The screening procedures detail the actions to take after a client scores in the positive range. Clinical supervision is helpful—and sometimes necessary—in judging how to proceed.

Trauma-informed screening is an essential part of the intake evaluation and the treatment planning process, but it is not an end in itself. Screening processes can be developed that allow staff without advanced degrees or graduate-level training to conduct them, whereas assessments for trauma-related disorders require a mental health professional trained in assessment and evaluation processes. The most important domains to screen among individuals with trauma histories include:

- Trauma-related symptoms.
- Depressive or dissociative symptoms, sleep disturbances, and intrusive experiences.
- Past and present mental disorders, including typically trauma-related disorders (e.g., mood disorders).
- Severity or characteristics of a specific trauma type (e.g., forms of interpersonal violence, adverse childhood events, combat experiences).
- Substance abuse.
- Social support and coping styles.
- Availability of resources.
- Risks for self-harm, suicide, and violence.
- Health screenings.

Assessment

When a client screens positive for substance abuse, trauma-related symptoms, or mental disorders, the agency or counselor should follow up with an assessment. A positive screening calls for more action—an assessment that determines and defines presenting struggles to develop an appropriate treatment plan and to make an informed and collaborative decision about treatment placement. Assessment determines the nature and extent of the client's problems; it might require the client to respond to written questions, or it could involve a clinical interview by a mental health or substance abuse professional qualified to assess the client and arrive at a diagnosis. A clinical assessment delves into a client's past and current experiences, psychosocial and cultural history, and assets and resources.

Assessment protocols can require more than a single session to complete and should also use multiple avenues to obtain the necessary clinical information, including self-assessment tools, past and present clinical and medical records, structured clinical interviews, assessment measures, and collateral information from significant others, other behavioral health professionals, and agencies. Qualifications for conducting assessments and clinical interviews are more rigorous than for screening. Advanced degrees, licensing or certification, and special training in administration, scoring, and interpretation of specific assessment instruments and interviews are often

Advice to Counselors: Screening and Assessing Clients

- Ask all clients about any possible history of trauma; use a checklist to increase proper identification of such a history (see the online Adverse Childhood Experiences Study Score Calculator [http://acestudy.org/ace_score] for specific questions about adverse childhood experiences).
- Use only validated instruments for screening and assessment.
- Early in treatment, screen all clients who have histories of exposure to traumatic events for psychological symptoms and mental disorders related to trauma.
- When clients screen positive, also screen for suicidal thoughts and behaviors (see TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment*; Center for Substance Abuse Treatment [CSAT], 2009a).
- Do not delay screening; do not wait for a period of abstinence or stabilization of symptoms.
- Be aware that some clients will not make the connection between trauma in their histories and their current patterns of behavior (e.g., alcohol and drug use and/or avoidant behavior).
- Do not require clients to describe emotionally overwhelming traumatic events in detail.
- Focus assessment on how trauma symptoms affect clients' current functioning.
- Consider using paper-and-pencil instruments for screening and assessment as well as self-report measures when appropriate; they are less threatening for some clients than a clinical interview.
- Talk about how you will use the findings to plan the client's treatment, and discuss any immediate action necessary, such as arranging for interpersonal support, referrals to community agencies, or moving directly into the active phase of treatment. It is helpful to explore the strategies clients have used in the past that have worked to relieve strong emotions (Fallot & Harris, 2001).
- At the end of the session, make sure the client is grounded and safe before leaving the interview room (Litz, Miller, Ruef, & McTeague, 2002). Readiness to leave can be assessed by checking on the degree to which the client is conscious of the current environment, what the client's plan is for maintaining personal safety, and what the client's plans are for the rest of the day.

required. Counselors must be familiar with (and obtain) the level of training required for any instruments they consider using.

For people with histories of traumatic life events who screen positive for possible trauma-related symptoms and disorders, thorough assessment gathers all relevant information necessary to understand the role of the trauma in their lives; appropriate treatment objectives, goals, planning, and placement; and any ongoing diagnostic and treatment considerations, including reevaluation or follow-up.

Overall, assessment may indicate symptoms that meet diagnostic criteria for a substance use or mental disorder or a milder form of symptomatology that doesn't reach a diagnostic level—or it may reveal that the positive screen was false and that there is no significant cause for concern. Information from an assessment is used to plan the client's treatment. The plan can include such domains as level of care, acute safety needs, diagnosis, disability, strengths and skills, support network, and cultural context. Assessments should reoccur throughout treatment. Ongoing assessment during treatment can provide valuable information by revealing further details of trauma history as clients' trust in staff members grows and by gauging clients' progress.

Timing of Screening and Assessment

As a trauma-informed counselor, you need to offer psychoeducation and support from the outset of service provision; this begins with explaining screening and assessment and with proper pacing of the initial intake and evaluation process. The client should understand the screening process, why the specific questions are important, and that he or she may choose to delay a response or to not answer a question

at all. Discussing the occurrence or consequences of traumatic events can feel as unsafe and dangerous to the client as if the event were reoccurring. It is important not to encourage avoidance of the topic or reinforce the belief that discussing trauma-related material is dangerous, but be sensitive when gathering information in the initial screening. Initial questions about trauma should be general and gradual. Taking the time to prepare and explain the screening and assessment process to the client gives him or her a greater sense of control and safety over the assessment process.

Clients with substance use disorders

No screening or assessment of trauma should occur when the client is under the influence of alcohol or drugs. Clients under the influence are more likely to give inaccurate information. Although it's likely that clients in an active phase of use (albeit not at the assessment itself) or undergoing substance withdrawal can provide consistent information to obtain a valid screening and assessment, there is insufficient data to know for sure. Some theorists state that no final assessment of trauma or posttraumatic stress disorder (PTSD) should occur during these early phases (Read, Bollinger, & Sharkansky, 2003), asserting that symptoms of withdrawal can mimic PTSD and thus result in overdiagnosis of PTSD and other trauma-related disorders. Alcohol or drugs can also cause memory impairment that clouds the client's history of trauma symptoms. However, Najavits (2004) and others note that underdiagnosis, not overdiagnosis, of trauma and PTSD has been a significant issue in the substance abuse field and thus claim that it is essential to obtain an initial assessment early, which can later be modified if needed (e.g., if the client's symptom pattern changes). Indeed, clinical observations suggest that assessments for both trauma and PTSD—even during active use or withdrawal—appear robust (Coffey, Schumacher, Brady, & Dansky, 2003). Although some PTSD symptoms and trauma memories can be dampened or increased to a degree, their overall presence or absence, as assessed early in treatment, appears accurate (Najavits, 2004).

Conduct Assessments Throughout Treatment

Ongoing assessments let counselors:

- Track changes in the presence, frequency, and intensity of symptoms.
- Learn the relationships among the client's trauma, presenting psychological symptoms, and substance abuse.
- Adjust diagnoses and treatment plans as needed.
- Select prevention strategies to avoid more pervasive traumatic stress symptoms.

The Setting for Trauma Screening and Assessment

Advances in the development of simple, brief, and public-domain screening tools mean that at least a basic screening for trauma can be done in almost any setting. Not only can clients be screened and assessed in behavioral health treatment settings; they can also be evaluated in the criminal justice system, educational settings, occupational settings, physicians' offices, hospital medical and trauma units, and emergency rooms. Wherever they occur, trauma-related screenings and subsequent assessments can reduce or eliminate wasted resources, relapses, and, ultimately, treatment failures among clients who have histories of trauma, mental illness, and/or substance use disorders.

Creating an effective screening and assessment environment

You can greatly enhance the success of treatment by paying careful attention to how you approach the screening and assessment process. Take into account the following points:

- ***Clarify for the client what to expect in the screening and assessment process.*** For example, tell the client that the screening and assessment phase focuses on identifying issues that might benefit from treatment. Inform him or her that during the trauma screening and assessment process, uncomfortable thoughts and feelings can arise. Provide reassurance that, if they do, you'll assist in dealing with this distress—but also let them know that, even with your assistance, some psychological and physical reactions to the interview may last for a few hours or perhaps as long as a few days after the interview, and be sure to highlight the fact that such reactions are normal (Read et al., 2003).
- ***Approach the client in a matter-of-fact, yet supportive, manner.*** Such an approach helps create an atmosphere of trust, respect, acceptance, and thoughtfulness (Melnick & Bassuk, 2000). Doing so helps to normalize symptoms and experiences generated by the trauma; consider informing clients that such events are common but can cause continued emotional distress if they are not treated. Clients may also find it helpful for you to explain the purpose of certain difficult questions. For example, you could say, "Many people have experienced troubling events as children, so some of my questions are about whether you experienced any such events while growing up." Demonstrate kindness and directness in equal measure when screening/assessing clients (Najavits, 2004).
- ***Respect the client's personal space.*** Cultural and ethnic factors vary greatly regarding the appropriate physical distance to maintain during the interview. You should respect the client's personal space, sitting neither too far from nor too close to the client; let your observations of the client's comfort level during the screening and assessment process guide the amount of distance. Clients with trauma may have particular sensitivity about their bodies, personal space, and boundaries.
- ***Adjust tone and volume of speech to suit the client's level of engagement and degree of comfort in the interview process.*** Strive to maintain a soothing, quiet demeanor. Be sensitive to how the client might hear what you have to say in response to personal disclosures. Clients who have been traumatized may be more reactive even to benign or well-intended questions.
- ***Provide culturally appropriate symbols of safety in the physical environment.*** These include paintings, posters, pottery, and other room decorations that symbolize the safety of the surroundings to the client population. Avoid culturally inappropriate or insensitive items in the physical environment.
- ***Be aware of one's own emotional responses to hearing clients' trauma histories.*** Hearing about clients' traumas may be very painful and can elicit strong emotions. The client may interpret your reaction to his or her revelations as disinterest, disgust for the client's behavior, or some other inaccurate interpretation. It is important for you to monitor your interactions and to check in with the client as necessary. You may also feel emotionally drained to the point that it interferes with your ability to accurately listen to or assess clients. This effect of exposure to traumatic stories, known as secondary traumatization, can result in symptoms similar to those experienced by the client (e.g., nightmares, emotional numbing); if necessary, refer to a colleague for assessment (Valent, 2002). Secondary traumatization is addressed in greater detail in Part 2, Chapter 2, of this TIP.
- ***Overcome linguistic barriers via an interpreter.*** Deciding when to add an interpreter requires careful judgment. The interpreter should be knowledgeable of behavioral

health terminology, be familiar with the concepts and purposes of the interview and treatment programming, be unknown to the client, and be part of the treatment team. Avoid asking family members or friends of the client to serve as interpreters.

- ***Elicit only the information necessary for determining a history of trauma and the possible existence and extent of traumatic stress symptoms and related disorders.*** There is no need to probe deeply into the details of a client's traumatic experiences at this stage in the treatment process. Given the lack of a therapeutic relationship in which to process the information safely, pursuing details of trauma can cause retraumatization or produce a level of response that neither you nor your client is prepared to handle. Even if a client wants to tell his or her trauma story, it's your job to serve as "gatekeeper" and preserve the client's safety. Your tone of voice when suggesting postponement of a discussion of trauma is very important. Avoid conveying the message, "I really don't want to hear about it." Examples of appropriate statements are:
  - "Your life experiences are very important, but at this early point in our work together, we should start with what's going on in your life currently rather than discussing past experiences in detail. If you feel that certain past experiences are having a big effect on your life now, it would be helpful for us to discuss them as long as we focus on your safety and recovery right now."
  - "Talking about your past at this point could arouse intense feelings—even more than you might be aware of right now. Later, if you choose to, you can talk with your counselor about how to work on exploring your past."
  - "Often, people who have a history of trauma want to move quickly into the details of the trauma to gain relief. I understand this desire, but my concern for you at this moment is to help you establish a sense of safety and support before moving into the traumatic experiences. We want to avoid retraumatization—meaning, we want to establish resources that weren't available to you at the time of the trauma before delving into more content."
- ***Give the client as much personal control as possible during the assessment by:***
  - Presenting a rationale for the interview and its stress-inducing potential, making clear that the client has the right to refuse to answer any and all questions.
  - Giving the client (where staffing permits) the option of being interviewed by someone of the gender with which he or she is most comfortable.
  - Postponing the interview if necessary (Fallot & Harris, 2001).
- ***Use self-administered, written checklists rather than interviews when possible to assess trauma.*** Traumas can evoke shame, guilt, anger, or other intense feelings that can make it difficult for the client to report them aloud to an interviewer. Clients are more likely to report trauma when they use self-administered screening tools; however, these types of screening instruments only guide the next step. Interviews should coincide with self-administered tools to create a sense of safety for the client (someone is present as he or she completes the screening) and to follow up with more indepth data gathering after a self-administered screening is complete. The Trauma History Questionnaire (THQ) is a self-administered tool (Green, 1996). It has been used successfully with clinical and nonclinical populations, including medical patients, women who have experienced domestic violence, and people with serious mental illness (Hooper, Stockton,

Krupnick, & Green, 2011). Screening instruments (including the THQ) are included in Appendix D of this TIP.

- ***Interview the client if he or she has trouble reading or writing or is otherwise unable to complete a checklist.*** Clients who are likely to minimize their trauma when using a checklist (e.g., those who exhibit significant symptoms of dissociation or repression) benefit from a clinical interview. A trained interviewer can elicit information that a self-administered checklist does not capture. Overall, using both a self-administered questionnaire and an interview can help achieve greater clarity and context.
- ***Allow time for the client to become calm and oriented to the present if he or she has very intense emotional responses when recalling or acknowledging a trauma.*** At such times, avoid responding with such exclamations as "I don't know how you survived that!" (Bernstein, 2000). If the client has difficulty self-soothing, guide him or her through grounding techniques (Exhibit 1.4-1), which are particularly useful—perhaps even critical—to achieving a successful

Exhibit 1.4-1: Grounding Techniques

Grounding techniques are important skills for assessors and all other behavioral health service providers who interact with traumatized clients (e.g., nurses, security, administrators, clinicians). Even if you do not directly conduct therapy, knowledge of grounding can help you defuse an escalating situation or calm a client who is triggered by the assessment process. Grounding strategies help a person who is overwhelmed by memories or strong emotions or is dissociating; they help the person become aware of the here and now. A useful metaphor is the experience of walking out of a movie theater. When the person dissociates or has a flashback, it's like watching a mental movie; grounding techniques help him or her step out of the movie theater into the daylight and the present environment. The client's task is not only to hold on to moments from the past, but also to acknowledge that what he or she was experiencing is from the past. Try the following techniques:

1. **Ask the client to state what he or she observes.**
   Guide the client through this exercise by using statements like, "You seem to feel very scared/angry right now. You're probably feeling things related to what happened in the past. Now, you're in a safe situation. Let's try to stay in the present. Take a slow deep breath, relax your shoulders, put your feet on the floor; let's talk about what day and time it is, notice what's on the wall, etc. What else can you do to feel okay in your body right now?"
2. **Help the client decrease the intensity of affect.**
   - "Emotion dial": A client imagines turning down the volume on his or her emotions.
   - Clenching fists can move the energy of an emotion into fists, which the client can then release.
   - Guided imagery can be used to visualize a safe place.
   - Distraction (see #3 below).
   - Use strengths-based questions (e.g., "How did you survive?" or "What strengths did you possess to survive the trauma?").
3. **Distract the client from unbearable emotional states.**
   - Have the client focus on the external environment (e.g., name red objects in the room).
   - Ask the client to focus on recent and future events (e.g., "to do" list for the day).
   - Help the client use self-talk to remind himself or herself of current safety.
   - Use distractions, such as counting, to return the focus to current reality.
   - Somatosensory techniques (toe-wiggling, touching a chair) can remind clients of current reality.
4. **Ask the client to use breathing techniques.**
   - Ask the client to inhale through the nose and exhale through the mouth.
   - Have the client place his or her hands on his or her abdomen and then watch the hands go up and down while the belly expands and contracts.

Source: Melnick & Bassuk, 2000.

interview when a client has dissociated or is experiencing intense feelings in response to screening and/or interview questions.

- ***Avoid phrases that imply judgment about the trauma.*** For example, don't say to a client who survived Hurricane Katrina and lost family members, "It was God's will," or "It was her time to pass," or "It was meant to be." Do not make assumptions about what a person has experienced. Rather, listen supportively without imposing personal views on the client's experience.
- ***Provide feedback about the results of the screening.*** Keep in mind the client's vulnerability, ability to access resources, strengths, and coping strategies. Present results in a synthesized manner, avoiding complicated, overly scientific jargon or explanations. Allow time to process client reactions during the feedback session. Answer client questions and concerns in a direct, honest, and compassionate manner. Failure to deliver feedback in this way can negatively affect clients' psychological status and severely weaken the potential for developing a therapeutic alliance with the client.
- ***Be aware of the possible legal implications of assessment.*** Information you gather during the screening and assessment process can necessitate mandatory reporting to authorities, even when the client does not want such information disclosed (Najavits, 2004). For example, you can be required to report a client's experience of child abuse even if it happened many years ago or the client doesn't want the information reported. Other legal issues can be quite complex, such as confidentiality of records, pursuing a case against a trauma perpetrator and divulging information to third parties while still protecting the legal status of information used in prosecution, and child custody issues (Najavits, 2004). It's essential that you know the laws in your State, have an expert legal consultant available, and access clinical supervision.

Barriers and Challenges to Trauma-Informed Screening and Assessment

Barriers

It is not necessarily easy or obvious to identify an individual who has survived trauma without screening. Moreover, some clients may deny that they have encountered trauma and its effects even after being screened or asked direct questions aimed at identifying the occurrence of traumatic events. The two main barriers to the evaluation of trauma and its related disorders in behavioral health settings are clients not reporting trauma and providers overlooking trauma and its effects.

Concerning the first main barrier, some events will be experienced as traumatic by one person but considered nontraumatic by another. A history of trauma encompasses not only the experience of a potentially traumatic event, but also the person's responses to it and the meanings he or she attaches to the event. Certain situations make it more likely that the client will not be forthcoming about traumatic events or his or her responses to those events. Some clients might not have ever thought of a particular event or their response to it as traumatic and thus might not report or even recall the event. Some clients might feel a reluctance to discuss something that they sense might bring up uncomfortable feelings (especially with a counselor whom they've only recently met). Clients may avoid openly discussing traumatic events or have difficulty recognizing or articulating their experience of trauma for other reasons, such as feelings of shame, guilt, or fear of retribution by others associated with the event (e.g., in cases of interpersonal or

Common Reasons Why Some Providers Avoid Screening Clients for Trauma

Treatment providers may avoid screening for traumatic events and trauma-related symptoms due to:

- A reluctance to inquire about traumatic events and symptoms because these questions are not a part of the counselor's or program's standard intake procedures.
- Underestimation of the impact of trauma on clients' physical and mental health.
- A belief that treatment of substance abuse issues needs to occur first and exclusively, before treating other behavioral health disorders.
- A belief that treatment should focus solely on presenting symptoms rather than exploring the potential origins or aggravators of symptoms.
- A lack of training and/or feelings of incompetence in effectively treating trauma-related problems (Salyers, Evans, Bond, & Meyer, 2004).
- Not knowing how to respond therapeutically to a client's report of trauma.
- Fear that a probing trauma inquiry will be too disturbing to clients.
- Not using common language with clients that will elicit a report of trauma (e.g., asking clients if they were abused as a child without describing what is meant by abuse).
- Concern that if disorders are identified, clients will require treatment that the counselor or program does not feel capable of providing (Fallot & Harris, 2001).
- Insufficient time for assessment to explore trauma histories or symptoms.
- Untreated trauma-related symptoms of the counselor, other staff members, and administrators.

domestic violence). Still others may deny their history because they are tired of being interviewed or asked to fill out forms and may believe it doesn't matter anyway.

A client may not report past trauma for many reasons, including:

- Concern for safety (e.g., fearing more abuse by a perpetrator for revealing the trauma).
- Fear of being judged by service providers.
- Shame about victimization.
- Reticence about talking with others in response to trauma.
- Not recalling past trauma through dissociation, denial, or repression (although genuine blockage of all trauma memory is rare among trauma survivors; McNally, 2003).
- Lack of trust in others, including behavioral health service providers.
- Not seeing a significant event as traumatic.

Regarding the second major barrier, counselors and other behavioral health service providers may lack awareness that trauma can significantly affect clients' presentations in treatment and functioning across major life areas, such as relationships and work. In addition, some counselors may believe that their role is to treat only the presenting psychological and/or substance abuse symptoms, and thus they may not be as sensitive to histories and effects of trauma. Other providers may believe that a client should abstain from alcohol and drugs for an extended period before exploring trauma symptoms. Perhaps you fear that addressing a clients' trauma history will only exacerbate symptoms and complicate treatment. Behavioral health service providers who hold biases may assume that a client doesn't have a history of trauma and thus fail to ask the "right" questions, or they may be uncomfortable with emotions that arise from listening to client experiences and, as a result, redirect the screening or counseling focus.

Challenges

Awareness of acculturation and language

Acculturation levels can affect screening and assessment results. Therefore, indepth discussions may be a more appropriate way to gain an understanding of trauma from the client's point of view. During the intake, prior to trauma screening, determine the client's history of

Common Assessment Myths

Several common myths contribute to underassessment of trauma-related disorders (Najavits, 2004):

- ***Myth #1: Substance abuse itself is a trauma.*** However devastating substance abuse is, it does not meet the *Diagnostic and Statistical Manual of Mental Disorders*, Fifth Edition (DSM-5; American Psychiatric Association [APA], 2013a), criteria for trauma per se. Nevertheless, high-risk behaviors that are more likely to occur during addiction, such as interpersonal violence and self-harm, significantly increase the potential for traumatic injury.
- ***Myth #2: Assessment of trauma is enough.*** Thorough assessment is the best way to identify the existence and extent of trauma-related problems. However, simply identifying trauma-related symptoms and disorders is just the first step. Also needed are individualized treatment protocols and action to implement these protocols.
- ***Myth #3: It is best to wait until the client has ended substance use and withdrawal to assess for PTSD.*** Research does not provide a clear answer to the controversial question of when to assess for PTSD; however, Najavits (2004) and others note that underdiagnosis of trauma and PTSD has been more significant in the substance abuse field than overdiagnosis. Clinical experience shows that the PTSD diagnosis is rather stable during substance use or withdrawal, but symptoms can become more or less intense; memory impairment from alcohol or drugs can also cloud the symptom picture. Thus, it is advisable to establish a tentative diagnosis and then reassess after a period of abstinence, if possible.

migration, if applicable, and primary language. Questions about the client's country of birth, length of time in this country, events or reasons for migration, and ethnic self-identification are also appropriate at intake. Also be aware that even individuals who speak English well might have trouble understanding the subtleties of questions on standard screening and assessment tools. It is not adequate to translate items simply from English into another language; words, idioms, and examples often don't translate directly into other languages and therefore need to be adapted. Screening and assessment should be conducted in the client's preferred language by trained staff members who speak the language or by professional translators familiar with treatment jargon.

Awareness of co-occurring diagnoses

A trauma-informed assessor looks for psychological symptoms that are associated with trauma or simply occur alongside it. Symptom screening involves questions about past or present mental disorder symptoms that may indicate the need for a full mental health assessment. A variety of screening tools are available, including symptom checklists. However, you should only use symptom checklists when you need information about how your client is currently feeling; don't use them to screen for specific disorders. Responses will likely change from one administration of the checklist to the next.

Basic mental health screening tools are available. For example, the Mental Health Screening Form-III screens for present or past symptoms of most mental disorders (Carroll & McGinley, 2001); it is available at no charge from Project Return Foundation, Inc. and is also reproduced in TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c). Other screening tools, such as the Beck Depression Inventory II and the Beck Anxiety Inventory (Beck, Wright, Newman, & Liese, 1993), also screen broadly for mental and substance use disorders, as well as for specific disorders often associated with trauma. For further screening information and resources on depression and suicide, see TIP 48, *Managing Depressive Symptoms in Substance Abuse Clients During Early Recovery* (CSAT, 2008), and TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment* (CSAT, 2009a).

For screening substance use disorders, see TIP 11, *Simple Screening Instruments for Outreach for Alcohol and Other Drug Abuse and Infectious Diseases* (CSAT, 1994); TIP 24, *A Guide to Substance Abuse Services for Primary Care Clinicians* (CSAT, 1997a); TIP 31, *Screening and Assessing Adolescents for Substance Use Disorders* (CSAT, 1999c); TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c); and TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d).

A common dilemma in the assessment of trauma-related disorders is that certain trauma symptoms are also symptoms of other disorders. Clients with histories of trauma typically present a variety of symptoms; thus, it is important to determine the full scope of symptoms and/or disorders present to help improve treatment planning. Clients with trauma-related and substance use symptoms and disorders are at increased risk for additional Axis I and/or Axis II mental disorders (Brady, Killeen, Saladin, Dansky, & Becker, 1994; Cottler, Nishith, & Compton, 2001). These symptoms need to be distinguished so that other presenting subclinical features or disorders do not go unidentified and untreated. To accomplish this, a comprehensive assessment of the client's mental health is recommended.

Misdiagnosis and underdiagnosis

Many trauma survivors are either misdiagnosed (i.e., given diagnoses that are not accurate) or underdiagnosed (i.e., have one or more diagnoses that have not been identified at all). Such diagnostic errors could result, in part, from the fact that many general instruments to evaluate mental disorders are not sufficiently sensitive to identify posttraumatic symptoms and can misclassify them as other disorders, including personality disorders or psychoses. Intrusive posttraumatic symptoms, for example, can show up on general measures as indicative of hallucinations or obsessions. Dissociative symptoms can be interpreted as indicative of schizophrenia. Trauma-based cognitive symptoms can be scored as evidence for paranoia or other delusional processes (Briere, 1997). Some of the most common misdiagnoses in clients with PTSD and substance abuse are:

- ***Mood and anxiety disorders.*** Overlapping symptoms with such disorders as major depression, generalized anxiety disorder, and bipolar disorder can lead to misdiagnosis.
- ***Borderline personality disorder.*** Historically, this has been more frequently diagnosed than PTSD. Many of the symptoms, including a pattern of intense interpersonal relationships, impulsivity, rapid and unpredictable mood swings, power struggles in the treatment environment, underlying anxiety and depressive symptoms, and transient, stress-related paranoid ideation or severe dissociative symptoms overlap. The effect of this misdiagnosis on treatment can be particularly negative; counselors often view clients with a borderline personality diagnosis as difficult to treat and unresponsive to treatment.
- ***Antisocial personality disorder.*** For men and women who have been traumatized in childhood, "acting out" behaviors, a lack of empathy and conscience, impulsivity, and self-centeredness can be functions of trauma and survival skills rather than true antisocial characteristics.
- ***Attention deficit hyperactivity disorder (ADHD).*** For children and adolescents, impulsive behaviors and concentration problems can be diagnosed as ADHD rather than PTSD.

It is possible, however, for clients to legitimately have any of these disorders in addition to trauma-related disorders. Given the overlap of posttraumatic symptoms with those of other disorders, a wide variety of diagnoses often needs to be considered to avoid misidentifying

other disorders as PTSD and vice versa. A trained and experienced mental health professional will be required to weigh differential diagnoses. TIP 42 (CSAT, 2005c) explores issues related to differential diagnosis.

Cross-Cultural Screening and Assessment

Many trauma-related symptoms and disorders are culture specific, and a client's cultural background must be considered in screening and assessment (for review of assessment and cultural considerations when working with trauma, see Wilson & Tang, 2007). Behavioral health service providers must approach screening and assessment processes with the influences of culture, ethnicity, and race firmly in mind. Cultural factors, such as norms for expressing psychological distress, defining trauma, and seeking help in dealing with trauma, can affect:

- How traumas are experienced.
- The meaning assigned to the event(s).
- How trauma-related symptoms are expressed (e.g., as somatic expressions of distress, level of emotionality, types of avoidant behavior).
- Willingness to express distress or identify trauma with a behavioral health service provider and sense of safety in doing so.
- Whether a specific pattern of behavior, emotional expression, or cognitive process is considered abnormal.
- Willingness to seek treatment inside and outside of one's own culture.
- Response to treatment.
- Treatment outcome.

When selecting assessment instruments, counselors and administrators need to choose,

Culture-Specific Stress Responses

Culture-bound concepts of distress exist that don't necessarily match diagnostic criteria. Culture-specific symptoms and syndromes can involve physical complaints, broad emotional reactions, or specific cognitive features. Many such syndromes are unique to a specific culture but can broaden to cultures that have similar beliefs or characteristics. Culture-bound syndromes are typically treated by traditional medicine and are known throughout the culture. Cultural concepts of distress include:

- ***Ataques de nervios.*** Recognized in Latin America and among individuals of Latino descent, the primary features of this syndrome include intense emotional upset (e.g., shouting, crying, trembling, dissociative or seizure-like episodes). It frequently occurs in response to a traumatic or stressful event in the family.
- ***Nervios.*** This is considered a common idiom of distress among Latinos; it includes a wide range of emotional distress symptoms including headaches, nervousness, tearfulness, stomach discomfort, difficulty sleeping, and dizziness. Symptoms can vary widely in intensity, as can impairment from them. This often occurs in response to stressful or difficult life events.
- ***Susto.*** This term, meaning "fright," refers to a concept found in Latin American cultures, but it is not recognized among Latinos from the Caribbean. *Susto* is attributed to a traumatic or frightening event that causes the soul to leave the body, thus resulting in illness and unhappiness; extreme cases may result in death. Symptoms include appetite or sleep disturbances, sadness, lack of motivation, low self-esteem, and somatic symptoms.
- ***Taijin kyofusho.*** Recognized in Japan and among some American Japanese, this "interpersonal fear" syndrome is characterized by anxiety about and avoidance of interpersonal circumstances. The individual presents worry or a conviction that his or her appearance or social interactions are inadequate or offensive. Other cultures have similar cultural descriptions or syndromes associated with social anxiety.

whenever possible, instruments that are culturally appropriate for the client. Instruments that have been normed for, adapted to, and tested on specific cultural and linguistic groups should be used. Instruments that are not normed for the population are likely to contain cultural biases and produce misleading results. Subsequently, this can lead to misdiagnosis, overdiagnosis, inappropriate treatment plans, and ineffective interventions. Thus, it is important to interpret all test results cautiously and to discuss the limitations of instruments with clients from diverse ethnic populations and cultures. For a review of cross-cultural screening and assessment considerations, refer to the planned TIP, *Improving Cultural Competence* (Substance Abuse and Mental Health Services Administration, planned c).

Choosing Instruments

Numerous instruments screen for trauma history, indicate symptoms, assess trauma-related and other mental disorders, and identify related clinical phenomena, such as dissociation. One instrument is unlikely to meet all screening or assessment needs or to determine the existence and full extent of trauma symptoms and traumatic experiences. The following sections present general considerations in selecting standardized instruments.

Purpose

Define your assessment needs. Do you need a standardized screening or assessment instrument for clinical purposes? Do you need information on a specific aspect of trauma, such as history, PTSD, or dissociation? Do you wish to make a formal diagnosis, such as PTSD? Do you need to determine quickly whether a client has experienced a trauma? Do you want an assessment that requires a clinician to administer it, or can the client complete the instrument himself or herself? Does the instrument match the current and specific diagnostic criteria established in the DSM-5?

Population

Consider the population to be assessed (e.g., women, children, adolescents, refugees, disaster survivors, survivors of physical or sexual violence, survivors of combat-related trauma, people whose native language is not English); some tools are appropriate only for certain populations. Is the assessment process developmentally and culturally appropriate for your client? Exhibit 1.4-2 lists considerations in choosing a screening or assessment instrument for trauma and/or PTSD.

Instrument Quality

An instrument should be psychometrically adequate in terms of sensitivity and specificity or reliability and validity as measured in several ways under varying conditions. Published research offers information on an instrument's psychometric properties as well as its utility in both research and clinical settings. For further information on a number of widely used trauma evaluation tools, see Appendix D and Antony, Orsillo, and Roemer's paper (2001).

The DSM-5 and Updates to Screening and Assessment Instruments

The recent publication of the DSM-5 (APA, 2013a) reflects changes to certain diagnostic criteria, which will affect screening tools and criteria for trauma-related disorders. Criterion A2 (specific to traumatic stress disorders, acute stress, and posttraumatic stress disorders), included in the fourth edition (text revision) of the DSM (DSM-IV-TR; APA, 2000a), has been eliminated; this criterion stated that the individual's response to the trauma needs to involve intense fear, helplessness, or horror. There are now four cluster symptoms, not three: reexperiencing, avoidance, arousal, and persistent negative alterations in cognitions and mood. Changes to the DSM-5 were made to symptoms within each cluster. Thus, screening will need modification to adjust to this change (APA, 2012b).

Exhibit 1.4-2: Key Areas of Trauma Screening and Assessment

Trauma
Key question: Did the client experience a trauma?

Examples of measures: Life Stressor Checklist-Revised (Wolfe & Kimerling, 1997); Trauma History Questionnaire (Green, 1996); Traumatic Life Events Questionnaire (Kubany et al., 2000).

Note: A good trauma measure identifies events a person experienced (e.g., rape, assault, accident) and also evaluates other trauma-related symptoms (e.g., presence of fear, helplessness, or horror).

Acute Stress Disorder (ASD) and PTSD
Key question: Does the client meet criteria for ASD or PTSD?

Examples of measures: Clinician-Administered PTSD Scale (CAPS; Blake et al., 1990); Modified PTSD Symptom Scale (Falsetti, Resnick, Resnick, & Kilpatrick, 1993); PTSD Checklist (Weathers, Litz, Herman, Huska, & Keane, 1993); Stanford Acute Stress Reaction Questionnaire (Cardena, Koopman, Classen, Waelde, & Spiegel, 2000).

Note: A PTSD diagnosis requires the person to meet criteria for having experienced a trauma; some measures include this, but others do not and require use of a separate trauma measure. The CAPS is an interview; the others listed are self-report questionnaires and take less time.

Other Trauma-Related Symptoms
Key question: Does the client have other symptoms related to trauma? These include depressive symptoms, self-harm, dissociation, sexuality problems, and relationship issues, such as distrust.

Examples of measures: Beck Depression Inventory II (Beck, 1993; Beck et al., 1993); Dissociative Experiences Scale (Bernstein & Putnam, 1986; Carlson & Putnam, 1993); Impact of Event Scale (measures intrusion and avoidance due to exposure to traumatic events; Horowitz, Wilner, & Alvarez, 1979; Weiss & Marmar, 1997); Trauma Symptom Inventory (Briere, 1995); Trauma Symptom Checklist for Children (Briere, 1996b); Modified PTSD Symptom Scale (Falsetti et al., 1993).

Note: These measures can be helpful for clinical purposes and for outcome assessment because they gauge *levels* of symptoms. Trauma-related symptoms are broader than diagnostic criteria and thus useful to measure, even if the patient doesn't meet criteria for any specific diagnoses.

Other Trauma-Related Diagnoses
Key question: Does the client have other disorders related to trauma? These include mood disorders, anxiety disorders besides traumatic stress disorders, and dissociative disorders.

Examples of measures: Mental Health Screening Form III (Carroll & McGinley, 2001); The Mini-International Neuropsychiatric Interview (M.I.N.I.) Structured Clinical Interview for DSM-IV-TR, Patient Edition (First, Spitzer, Gibbon, & Williams, revised 2011); Structured Clinical Interview for DSM-IV-TR, Non-Patient Edition (First, Spitzer, Gibbon, & Williams, revised 2011a).

Note: For complex symptoms and diagnoses such as dissociation and dissociative disorders, interviews are recommended. Look for measures that incorporate DSM-5 criteria.

Sources: Antony et al., 2001; Najavits, 2004.

Practical Issues

Is the instrument freely and readily available, or is there a fee? Is costly and extensive training required to administer it? Is the instrument too lengthy to be used in the clinical setting? Is it easily administered and scored with accompanying manuals and/or other training materials? How will results be presented to or used with the client? Is technical support available for difficulties in administration, scoring, or interpretation of results? Is special equipment required such as a microphone, a video camera, or a touch-screen computer with audio?

Trauma-Informed Screening and Assessment

The following sections focus on initial screening. For more information on screening and assessment tools, including structured interviews, see Exhibit 1.4-2. Screening is only as good as the actions taken afterward to address a positive screen (when clients acknowledge that they experience symptoms or have encountered events highlighted within the screening). Once a screening is complete and a positive screen is acquired, the client then needs referral for a more indepth assessment to ensure development of an appropriate treatment plan that matches his or her presenting problems.

Establish a History of Trauma

A person cannot have ASD, PTSD, or any trauma-related symptoms without experiencing trauma; therefore, it is necessary to inquire about painful, difficult, or overwhelming past experiences. Initial information should be gathered in a way that is minimally intrusive yet clear. Brief questionnaires can be less threatening to a client than face-to-face interviews, but interviews should be an integral part of any screening and assessment process. If the client initially denies a history of trauma (or minimizes it), administer the questionnaire later or delay additional trauma-related questions until the client has perhaps developed more trust in the treatment setting and feels safer with the thoughts and emotions that might arise in discussing his or her trauma experiences.

The Stressful Life Experiences (SLE) screen (Exhibit 1.4-3) is a checklist of traumas that also considers the client's view of the impact of those events on life functioning. Using the SLE can foster the client–counselor relationship. By going over the answers with the client, you can gain a deep understanding of your client, and the client receives a demonstration of your sensitivity and concern for what the client has experienced. The National Center for PTSD Web site offers similar instruments (http://www.ptsd.va.gov/professional/pages/assessments/assessment.asp).

In addition to broad screening tools that capture various traumatic experiences and symptoms, other screening tools, such as the Combat Exposure Scale (Keane et al., 1989) and the Intimate Partner Violence Screening Tool (Exhibit 1.4-4), focus on acknowledging a specific type of traumatic event.

Screen for Trauma-Related Symptoms and Disorders in Clients With Histories of Trauma

This step evaluates whether the client's trauma resulted in subclinical or diagnosable disorders. The counselor can ask such questions as, "Have you received any counseling or therapy? Have you ever been diagnosed or treated for a psychological disorder in the past? Have you ever been prescribed medications for your emotions in the past?" Screening is typically conducted by a wide variety of behavioral health service providers with different levels of training and education; however, all

Exhibit 1.4-3: SLE Screening

Please fill in the number that best represents how much the following statements describe your experiences. You will need to use two scales, one for how well the statement describes your experiences and one for how stressful you found this experience. The two scales are below.

Describes your Experience:

0	1	2	3	4	5	6	7	8	9	10
Did not experience this	a little like my experiences				somewhat like my experiences					exactly like my experiences

Stressfulness of Experience:

0	1	2	3	4	5	6	7	8	9	10
Not at all stressful	not very stressful				somewhat stressful					extremely stressful

Describes your Experience	Life Experience	Stressfulness Then		Stressfulness Now
	I have witnessed or experienced a natural disaster; like a hurricane or earthquake.			
	I have witnessed or experienced a human made disaster like a plane crash or industrial disaster.			
	I have witnessed or experienced a serious accident or injury.			
	I have witnessed or experienced chemical or radiation exposure happening to me, a close friend or a family member.			
	I have witnessed or experienced a life threatening illness happening to me, a close friend or a family member.			
	I have witnessed or experienced the death of my spouse or child.			
	I have witnessed or experienced the death of a close friend or family member (other than my spouse or child).			
	I or a close friend or family member has been kidnapped or taken hostage.			
	I or a close friend or family member has been the victim of a terrorist attack or torture.			
	I have been involved in combat or a war or lived in a war affected area.			
	I have seen or handled dead bodies other than at a funeral.			
	I have felt responsible for the serious injury or death of another person.			
	I have witnessed or been attacked with a weapon other than in combat or family setting			
	As a child/teen I was hit, spanked, choked or pushed hard enough to cause injury			
	As an adult, I was hit, choked or pushed hard enough to cause injury.			
	As an adult or child, I have witnessed someone else being choked, hit, spanked, or pushed hard enough to cause injury.			
	As a child/teen I was forced to have unwanted sexual contact.			
	As an adult I was forced to have unwanted sexual contact.			
	As a child or adult I have witnessed someone else being forced to have unwanted sexual contact			
	I have witnessed or experienced an extremely stressful event not already mentioned. Please Explain:_____ _____

individuals who administer screenings, regardless of education level and experience, should be aware of trauma-related symptoms, grounding techniques, ways of creating safety for the client, proper methods for introducing screening tools, and the protocol to follow when a positive screen is obtained. (See Appendix D for information on specific instruments.) Exhibit 1.4-5 is an example of a screening instrument for trauma symptoms, the Primary Care PTSD (PC-PTSD) Screen. Current research (Prins et al., 2004) suggests that the optimal cutoff score for the PC-PTSD is 3. If sensitivity is of greater concern than efficiency, a cutoff score of 2 is recommended.

Exhibit 1.4-5: PC-PTSD Screen

In your life, have you ever had any experience that was so frightening, horrible, or upsetting that, *in the past month*, you…

1. Have had nightmares about it or thought about it when you did not want to?
   YES NO
2. Tried hard not to think about it or went out of your way to avoid situations that reminded you of it?
   YES NO
3. Were constantly on guard, watchful, or easily startled?
   YES NO
4. Felt numb or detached from others, activities, or your surroundings?
   YES NO

Another instrument that can screen for traumatic stress symptoms is the four-item self-report SPAN, summarized in Exhibit 1.4-6, which is derived from the 17-item Davidson Trauma Scale (DTS). SPAN is an acronym for the four items the screening addresses: startle, physiological arousal, anger, and numbness. It was developed using a small, diverse sample of adult patients (N=243; 72 percent women; 17.4 percent African American; average age = 37 years) participating in several clinical studies, including a family study of rape trauma, combat veterans, and Hurricane Andrew survivors, among others.

The SPAN has a high diagnostic accuracy of 0.80 to 0.88, with sensitivity (percentage of true positive instances) of 0.84 and specificity (percentage of true negative instances) of 0.91 (Meltzer-Brody, Churchill, & Davidson, 1999). SPAN scores correlated highly with the full DTS (r = 0.96) and other measures, such as the Impact of Events Scale (r = 0.85) and the Sheehan Disability Scale (r = 0.87).

The PTSD Checklist (Exhibit 1.4-7), developed by the National Center for PTSD, is in the public domain. Originally developed for combat veterans of the Vietnam and Persian

Exhibit 1.4-6: The SPAN

The SPAN instrument is a brief screening tool that asks clients to identify the trauma in their past that is most disturbing to them currently. It then poses four questions that ask clients to rate the frequency and severity with which they have experienced, in the past week, different types of trauma-related symptoms (startle, physiological arousal, anger, and numbness).

Exhibit 1.4-7: The PTSD Checklist

Instructions to Client: Below is a list of problems and complaints that people sometimes have in response to stressful experiences. Please read each one carefully and circle the number that indicates how much you have been bothered by that problem *in the past month*.

1. Repeated, disturbing memories, thoughts, or images of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
2. Repeated, disturbing dreams of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
3. Suddenly acting or feeling as if a stressful experience were happening again (as if you were reliving it)?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
4. Feeling very upset when something reminded you of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
5. Having physical reactions (e.g., heart pounding, trouble breathing, sweating) when something reminded you of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
6. Avoiding thinking about or talking about a stressful experience or avoiding having feelings related to it?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
7. Avoiding activities or situations because they reminded you of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
8. Trouble remembering important parts of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
9. Loss of interest in activities that you used to enjoy?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
10. Feeling distant or cut off from other people?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
11. Feeling emotionally numb or being unable to have loving feelings for those close to you?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
12. Feeling as if your future will somehow be cut short?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
13. Trouble falling or staying asleep?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
14. Feeling irritable or having angry outbursts?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
15. Having difficulty concentrating?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
16. Being "super-alert" or watchful or on guard?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
17. Feeling jumpy or easily startled?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely

Source: Weathers et al., 1993. Material used is in the public domain.

Gulf Wars, it has since been validated on a variety of noncombat traumas (Keane, Brief, Pratt, & Miller, 2007). When using the checklist, identify a specific trauma first and then have the client answer questions in relation to that one specific trauma.

Other Screening and Resilience Measures

Along with identifying the presence of trauma-related symptoms that warrant assessment to determine the severity of symptoms as well as whether or not the individual possesses subclinical symptoms or has met criteria for a trauma-related disorder, clients should receive other screenings for symptoms associated with trauma (e.g., depression, suicidality). It is important that screenings address both external and internal resources (e.g., support systems, strengths, coping styles). Knowing the client's strengths can significantly shape the treatment planning process by allowing you to use strategies that have already worked for the client and incorporating strategies to build resilience (Exhibit 1.4-8).

Exhibit 1.4-8: Resilience Scales

A number of scales with good psychometric properties measure resilience:

- Resilience Scale (Wagnild & Young, 1993)
- Resilience Scale for Adults (Friborg, Hjemdal, Rosenvinge, & Martinussen, 2003)
- Connor Davidson Resilience Scale, 25-,10-, and 2-Item (Connor & Davidson, 2003; Campbell-Sills & Stein, 2007; Vaishnavi, Connor, & Davidson, 2007, respectively)
- Dispositional Resilience Scale, 45-,30-, 15-item forms (Bartone, Roland, Picano, &Williams, 2008)

Preliminary research shows improvement of individual resilience through treatment interventions in other populations (Lavretsky, Siddarth, & Irwin, 2010).

Screen for suicidality

All clients—particularly those who have experienced trauma—should be screened for suicidality by asking, "In the past, have you ever had suicidal thoughts, had intention to commit suicide, or made a suicide attempt? Do you have any of those feelings now? Have you had any such feelings recently?" Behavioral health service providers should receive training to screen for suicide. Additionally, clients with substance use disorders and a history of psychological trauma are at heightened risk for suicidal thoughts and behaviors; thus, screening for suicidality is indicated. See TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment* (CSAT, 2009a). For additional descriptions of screening processes for suicidality, see TIP 42 (CSAT, 2005c).

Concluding Note

Screenings are only beneficial if there are follow-up procedures and resources for handling positive screens, such as the ability to review results with and provide feedback to the individual after the screening, sufficient resources to complete a thorough assessment or to make an appropriate referral for an assessment, treatment planning processes that can easily incorporate additional trauma-informed care objectives and goals, and availability and access to trauma-specific services that match the client's needs. Screening is only the first step!

5 Clinical Issues Across Services

IN THIS CHAPTER

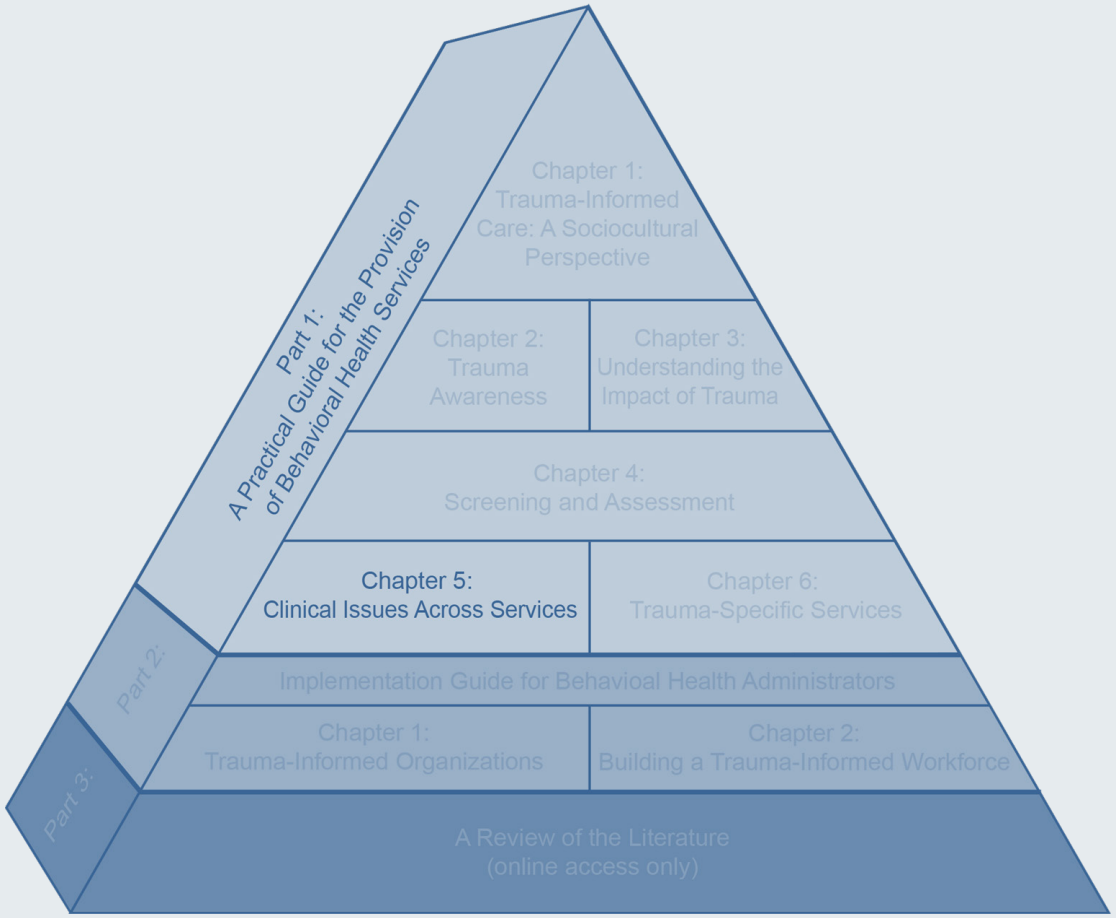
- Trauma Informed Prevention and Treatment Objectives
- Treatment Issues
- Making Referrals to Trauma Specific Services

Many clients in behavioral health treatment may have histories of trauma, so counselors should be prepared to help them address issues that arise from those histories. This chapter begins with a thorough discussion of trauma-informed prevention and treatment objectives along with practical counselor strategies. Specific treatment issues related to working with trauma survivors in a clinical setting are discussed as well, including client engagement, pacing and timing, traumatic memories, and culturally appropriate and gender-responsive services. The chapter ends with guidelines for making referrals to trauma-specific services.

Trauma-Informed Prevention and Treatment Objectives

Trauma-informed care (TIC) not only focuses on identifying individuals who have histories of trauma and traumatic stress symptoms; it also places considerable effort in creating an environment that helps them recognize the impact of trauma and determine the next course of action in a safe place. For some individuals, psychoeducation and development or reinforcement of coping strategies will be the most suitable and effective strategy, whereas others may request or warrant a referral for more trauma-specific interventions (see Part 1, Chapter 6, of this Treatment Improvement Protocol [TIP]). Although research is limited in the area of building resilience to prevent exacerbation of trauma symptoms and traumatic stress disorders, TIC also focuses on prevention strategies to avoid retraumatization in treatment, to promote resilience, and to prevent the development of trauma-related disorders. The following sections highlight key trauma-informed prevention and treatment objectives.

TIC Framework in Behavioral Health Services—Clinical Issues Across Services



Establish Safety

Beyond identifying trauma and trauma-related symptoms, the initial objective of TIC is establishing safety. Borrowing from Herman's (1992) conceptualization of trauma recovery, safety is the first goal of treatment. Establishing safety is especially crucial at the outset of trauma-informed treatment and often becomes a recurrent need when events or therapeutic changes raise safety issues, such as a change in treatment staffing due to vacations.

In the context of TIC, safety has a variety of meanings. Perhaps most importantly, the client has to have some degree of ***safety from trauma symptoms***. Recurring intrusive nightmares; painful memories that burst forth seemingly without provocation; feelings of sadness, anger, shame, or being overwhelmed; or not having control over sudden disconnections from others make moment-to-moment living feel unsafe. Clients might express feeling unsafe through statements such as, "I can't control my feelings," or, "I just space out and disconnect from the world for no reason," or, "I'm afraid to go to sleep because of the nightmares." The intense feelings that accompany trauma can also make clients feel unsafe. They may wake up in the morning feeling fine but become immobilized by depression as the day progresses. Clients with histories of trauma may experience panicky feelings of being trapped or abandoned. An early effort in trauma treatment is thus helping the client

Advice to Counselors: Strategies To Promote Safety

Strategy #1: Teach clients how and when to use grounding exercises when they feel unsafe or overwhelmed.

Strategy #2: Establish some specific routines in individual, group, or family therapy (e.g., have an opening ritual or routine when starting and ending a group session). A structured setting can provide a sense of safety and familiarity for clients with histories of trauma.

Strategy #3: Facilitate a discussion on safe and unsafe behaviors. Have clients identify, on paper, behaviors that promote safety and behaviors that feel unsafe for them today.

Strategy #4: Refer to *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse* (Najavits, 2002a). This menu-based manual covers an array of treatment topics, including the core concept of safety. Each topic consists of several segments, including preparing for the session, session format, session content, handouts, and guidelines.

Strategy #5: Encourage the development of a safety plan. Depending on the type of trauma, personal safety can be an issue; work with the client to develop a plan that will help him or her feel in control and prepared for the unexpected. If the trauma was a natural or human-caused disaster, encourage thinking about how family and friends will respond and connect in the event of another crisis. If sexual abuse or rape was the event, encourage thinking about future steps that could help make the client safer. There is a delicate balance between preparation and the realization that one cannot prepare for all possible traumatic events. Nonetheless, an action plan can help the client regain a sense of environmental balance.

gain more control over trauma symptoms (and be able to label them as such) by learning more about the client and helping him or her develop new coping skills to handle symptoms when they arise and stay more grounded when flooded with feelings or memories.

A second aspect is ***safety in the environment***. Trauma reactions can be triggered by sudden loud sounds (e.g., television at high volume, raised voices), tension between people, certain smells, or casual touches that are perceived as invasions of physical boundaries. The vulnerability of exposing one's history in the treatment setting can manifest in the client as feeling physically vulnerable and unsafe in the treatment environment. Sudden or inadequately explained treatment transitions, such as moving from one level of treatment to another or changing counselors, can also evoke feelings of danger, abandonment, or instability. Early in treatment, trauma survivors generally value routine and predictability. The counselor should recognize these needs and respond appropriately by offering information in advance, providing nonshaming responses to a client's reactions to stimuli in his or her environment, and helping the client build a daily structure that feels safe.

A third aspect of safety is ***preventing a recurrence of trauma***. People with histories of trauma and substance abuse are more likely to engage in high-risk behaviors and to experience subsequent traumas. Early treatment should focus on helping clients stop using unsafe coping mechanisms, such as substance abuse, self-harm, and other self-destructive behaviors, and replacing them with safe and healthy coping strategies. Helping clients learn to protect themselves in reasonable ways is a positive goal of treatment.

Prevent Retraumatization

A key objective in TIC is to prevent retraumatization generated by intervention and treatment practices and policies. Unfortunately, treatment settings and clinicians can

Advice to Counselors: Strategies To Prevent Retraumatization

Strategy #1: Be sensitive to the needs of clients who have experienced trauma regarding behaviors in the treatment setting that might trigger memories of the trauma.

Strategy #2: Do not ignore clients' symptoms and demands when clients with trauma histories act out in response to triggered trauma memories; doing so may replicate the original traumatic experience.

Strategy #3: Be mindful that efforts to control and contain a client's behaviors in treatment can produce an abnormal reaction, particularly for trauma survivors for whom being trapped was part of the trauma experience.

Strategy #4: Listen for specific triggers that seem to be driving the client's reaction. An important step in recovery is helping the client identify these cues and thereby reach a better understanding of reactions and behaviors.

unintentionally create retraumatizing experiences (for a review of traumas that can occur when treating serious mental illness, see Frueh et al., 2005). For instance, compassionate inquiry into a client's history can seem similar to the interest shown by a perpetrator many years before. Direct confrontation by counselors about behaviors related to substance abuse can be seen, by someone who has been repeatedly physically assaulted, as provocation building up to assault. Counselor and program efforts to help clients constrain destructive behaviors can be interpreted as efforts to control and dominate the individual. Intrusive shaming or insensitive behavior demonstrated by another client in the program can threaten a trauma survivor whose boundaries have been disregarded in the past—thus making the experience of treatment feel dangerous rather than safe. Some staff and agency issues that can result in retraumatization include:

- Disrespectfully challenging reports of abuse or other traumatic events.
- Discounting a client's report of a traumatic event.
- Using isolation.
- Using physical restraints.
- Allowing the abusive behavior of one client toward another to continue without intervention.
- Labeling intense rage and other feelings as pathological.
- Minimizing, discrediting, or ignoring client responses.
- Disrupting counselor–client relationships by changing counselors' schedules and assignments.
- Obtaining urine specimens in a nonprivate and/or disrespectful manner.
- Having clients undress in the presence of others.
- Being insensitive to a client's physical or emotional boundaries.
- Inconsistently enforcing rules and allowing chaos in the treatment environment.
- Applying rigid agency policies or rules without an opportunity for clients to question them.
- Accepting agency dysfunction, including a lack of consistent, competent leadership.

Provide Psychoeducation

Trauma-informed education informs clients about traumatic stress and trauma-related symptoms and disorders as well as the related consequences of trauma exposure. It focuses on giving information to clients to help normalize presenting symptoms, to highlight potential short-term and long-term consequences of trauma and various paths to recovery, and to underscore the message that recovery is possible. Education frequently takes place prior to or immediately following an initial screening as a way to prepare clients

Advice to Counselors: Strategies To Implement Psychoeducation

Strategy #1: Remember that this may be the client's first experience with treatment. It's easy to use program or clinical jargon when you're around it every day, but most individuals who seek help are unfamiliar with clinical language, how the program works, and treatment objectives. Psychoeducation begins with understanding the client's expectations and reasons for seeking help, followed by educating the client and other family members about the program. Remember that this is all new for them.

Strategy #2: After obtaining acknowledgment of a trauma history, provide an overview of common symptoms and consequences of traumatic stress, regardless of whether the client affirms having trauma-related symptoms. It is equally important to educate the client on resilience factors associated with recovery from trauma (Wessely et al., 2008). A trauma-informed perspective provides a message that trauma reactions are normal responses to an abnormal situation.

Strategy #3: Develop a resource box that provides an array of printed or multimedia educational materials that address the program, specific symptoms and tools to combat trauma-related symptoms, treatment options and therapy approaches, advantages of peer support, and steps in developing specific coping strategies.

Strategy #4: Develop a rotating educational group that matches services and client schedules to complement treatment. Remember that education can play a pivotal role in enhancing motivation, in normalizing experiences, and in creating a sense of safety as individuals move further into treatment. For some survivors, education can be a powerful intervention or prevention strategy.

for hearing results or to place the screening and subsequent assessment findings in proper context. Education in and of itself, however, does not necessarily constitute a stand-alone treatment; rather, it can be conceptualized as a first step and/or component of more comprehensive treatment. Nonetheless, education may be a prevention and intervention strategy for individuals who have histories of trauma without current consequences or symptoms and/or those who have reported a resolution of past trauma(s). For example, some clients may have significantly delayed onset of traumatic stress symptoms. In this scenario, earlier education can enhance recognition of symptoms and ease the path of seeking treatment.

Some clients do not recognize the link between their current difficulties and their trauma histories; education can help them understand the possible origin of their difficulties. Psychoeducation presents trauma-related symptoms that follow a trauma as normal reactions. By identifying the source of clients' current difficulties and framing them as normal thoughts, emotions, and behaviors in response to trauma, many trauma survivors report a reduction in the intensity of the difficulties or symptoms. Often, a client will express relief that his or her reactions are normal. You may find the U.S. Department of Veterans Affairs (VA) National Center on PTSD's educational handouts on traumatic stress reactions useful.

Psychoeducation goes beyond the identification of traumatic stress symptoms and/or learning about the psychological, cognitive, and physical impacts of trauma. Numerous curricula are available that use psychoeducation as a first-line or complementary approach to trauma-specific therapies to enhance coping strategies in key areas, including safety, emotional regulation, help-seeking, avoidant behavior, and so forth. An example is S.E.L.F., a trauma-informed psychoeducational group curriculum with educational components related to trauma recovery in the following

Case Illustration: Linda

Linda served as an Army nurse in an evacuation hospital in Vietnam. She reported her postdeployment adjustment as difficult and isolating but denied any significant symptoms of traumatic stress throughout her life. Four years ago, Linda sought treatment for alcohol dependence; during the intake, she recalls denying trauma-related symptoms. "I distinctly remember the session," she recounts. "The counselor first took my history but then gave information on typical symptoms and reactions to trauma. I thought, 'Why do I need to hear this? I've survived the worst trauma in my life.' I didn't see the value of this information. Then 3 weeks ago, I began to have recurrent nightmares, the same graphic type I occasionally had when I was in Vietnam. Since then, I've been very anxious, reliving horrible scenes that I'd experienced as a nurse and postponing going to bed in fear of having the dreams again. I didn't understand it. I am 70 years old, and the war happened a long time ago. Then I began putting it together. Recently, the emergency helicopter flight pattern and approach to the area's hospital changed. I began hearing the helicopter periodically in my living room, and it reminded me of Vietnam. I knew then that I needed help; I couldn't stop shaking. I felt as if I was losing control of my emotions. I remembered how the intake counselor took the time to explain common symptoms of trauma. That's why I'm here today."

"This might not sound like a big deal, but for many people relationships have become all about getting: telling your problem story and then getting help with it. There is little, if any, emphasis placed on giving back. That's a big deal!!! Service relationships are like a one way street and both people's roles are clearly defined. But in 'regular' relationships in your community, people give and take all the time. No one is permanently on the taking side or the giving side. This exchange contributes to people feeling ok about being vulnerable (needing help) as well as confident about what they're offering. For many of us, being the role of 'getter' all the time has shaken our confidence, making us feel like we have nothing worthwhile to contribute. Peer support breaks that all down. It gets complicated somewhat when one of us is paid, but modeling this kind of relationship in which both of us learn, offers us the real practice we need to feel like a 'regular' community member as opposed to an 'integrated mental patient'."

(Mead, 2008, p.7)

areas: creating **S**afety, regulating **E**motions, addressing **L**oss, and redefining the **F**uture (Bloom, Foderaro, & Ryan, 2006).

Offer Trauma-Informed Peer Support

Living with a history of trauma can be isolating and consuming. The experience of trauma can reinforce beliefs about being different, alone, and marred by the experience. At times, behavioral health treatment for trauma-related effects can inadvertently reinforce these beliefs. Simply engaging in treatment or receiving specialized services (although warranted) can further strengthen clients' beliefs that there is something wrong with them. Formalized peer support can enhance the treatment experience. Treatment plus peer support can break the cycle of beliefs that reinforce traumatic stress (e.g., believing that one is permanently damaged; that nobody could understand; that no one should or could tolerate one's story). Peer support provides opportunities to form mutual relationships; to learn how one's history shapes perspectives of self, others, and the future; to move beyond trauma; and to mirror and learn alternate coping strategies. Peer support defines recovery as an

Advice to Counselors: Strategies To Enhance Peer Support

Strategy #1: Provide education on what peer support is and is not. Roles and expectations of peer support can be confusing, so providing clarification in the beginning can be quite useful. It is important to provide initial education about peer support and the value of using this resource.

Strategy #2: Use an established peer support curriculum to guide the peer support process. For example, *Intentional Peer Support: An Alternative Approach* (Mead, 2008) is a workbook that highlights four main tasks for peer support: building connections, understanding one's worldview, developing mutuality, and helping each other move toward set desires and goals. This curriculum provides extensive materials for peer support staff members as well as for the individuals seeking peer support.

interactive process, not as a definitive moment wherein someone fixes the "problem."

Normalize Symptoms

Symptoms of trauma can become serious barriers to recovery from substance use and mental disorders, including trauma-related ones. Counselors should be aware of how trauma symptoms can present and how to respond to them when they do appear. A significant step in addressing symptoms is normalizing them. People with traumatic stress symptoms need to know that their symptoms are not unique and that their reactions are common to their experience(s). Often, normalizing symptoms gives considerable relief to clients who may have thought that their symptoms signified some pervasive, untreatable mental disorder.

Advice to Counselors: Strategies To Normalize Symptoms

Strategy #1: Provide psychoeducation on the common symptoms of traumatic stress.

Strategy #2: Research the client's most prevalent symptoms specific to trauma, and then provide education to the client. For example, an individual who was conscious and trapped during or as a result of a traumatic event will more likely be hypervigilant about exits, plan escape routes even in safe environments, and have strong reactions to interpersonal and environmental situations that are perceived as having no options for avoidance or resolution (e.g., feeling stuck in a work environment where the boss is emotionally abusive).

Strategy #3: First, have the client list his or her symptoms. After each symptom, ask the client to list the negative and positive consequences of the symptom. Remember that symptoms serve a purpose, even if they may not appear to work well or work as well as they had in the past. Focus on how the symptoms have served the client in a positive way (see Case Illustration: Hector). This exercise can be difficult, because clients as well as counselors often don't focus on the value of symptoms.

Case Illustration: Hector

Hector was referred to a halfway house specializing in co-occurring disorders after inpatient treatment for methamphetamine dependence and posttraumatic stress disorder (PTSD). In the halfway house, he continued to feel overwhelmed with the frequency and intensity of flashbacks. He often became frustrated, expressing anger and a sense of hopelessness, followed by emotional withdrawal from others in the house. Normalization strategy #3 was introduced in the session. During this exercise, he began to identify many negative aspects of flashbacks. He felt that he couldn't control the occurrence of flashbacks even though he wanted to, and he realized that he often felt shame afterward. In the same exercise, he was also urged to identify positive aspects of flashbacks. Although this was difficult, he realized that flashbacks were clues about content that he needed to address in trauma-specific treatment. "I realized that a flashback, for me, was a billboard advertising what I needed to focus on in therapy."

Identify and Manage Trauma-Related Triggers

Many clients who have traumatic stress are caught off guard with intrusive thoughts, feelings, sensations, or environmental cues of the trauma. This experience can be quite disconcerting, but often, the individual does not draw an immediate connection between the internal or external trigger and his or her reactions. At other times, the trigger is so potent that the individual is unable to discern the present trigger from the past trauma and begins to respond as if the trauma is reoccurring.

Key steps in identifying triggers are to reflect back on the situation, surroundings, or sensations prior to the strong reaction. By doing so, you and your client may be able to determine the connections among these cues, the past trauma(s), and the client's reaction. Once the cue is identified, discuss the ways in which it is connected to past trauma. For some cues, there will be an obvious and immediate connection (e.g., having someone say "I love you" in a significant relationship as an adult and connecting this to an abuser who said the same thing prior to a sexual assault). Other

Advice to Counselors: Strategies To Identify and Manage Trauma-Related Triggers

Strategy #1: Use the Sorting the Past From the Present technique for cognitive realignment (Blackburn, 1995) to help separate the current situation from the past trauma. Identify one trigger at a time, and then discuss the following questions with the client:

- When and where did you begin to notice a reaction?
- How does this situation remind you of your past history or past trauma?
- How are your reactions to the current situation similar to your past reactions to the trauma(s)?
- How was this current situation different from the past trauma?
- How did you react differently to the current situation than to the previous trauma?
- How are you different today (e.g., factors such as age, abilities, strength, level of support)?
- What choices can you make that are different from the past and that can help you address the current situation (trigger)?

After reviewing this exercise several times in counseling, put the questions on a card for the client to carry and use outside of treatment. Clients with substance use disorders can benefit from using the same questions (slightly reworded) to address relapse triggers.

Strategy #2: After the individual identifies the trigger and draws connections between the trigger and past trauma, work with him or her to establish responses and coping strategies to deal with triggers as they occur. Initially, the planned responses will not immediately occur after a trigger, but with practice, the planned responses will move closer to the time of the trigger. Some strategies include an acronym that reflects coping strategies (Exhibit 1.5-1), positive self-talk generated by cognitive–behavioral covert modeling exercises (rehearsal of coping statements), breathing retraining, and use of support systems (e.g., calling someone).

Strategy #3: Self-monitoring is any strategy that asks a client to observe and record the number of times something happens, to note the intensity of specific experiences, or to describe a specific behavioral, emotional, or cognitive phenomenon each time it occurs. For individuals with histories of trauma, triggers and flashbacks can be quite frightening, intense, and powerful. Even if the client has had just one or two triggers or flashbacks, he or she may perceive flashbacks as happening constantly. Often, it takes time to recover from these experiences. Using self-monitoring and asking the client to record each time a trigger occurs, along with describing the trigger and its intensity level (using a scale from 1–10), clients and counselors will gain an understanding of the type of triggers present and the level of distress that each one produces. Moreover, the client may begin to see that the triggers don't actually happen all the time, even though they may seem to occur frequently.

Exhibit 1.5-1: The OBSERVATIONS Coping Strategy

- Take a moment to just ***Observe*** what is happening. Pay attention to your body, your senses, and your environment.
- Focus on your ***Breathing***. Allow your feelings and sensations to wash over you. Breathe.
- Name the ***Situation*** that initiated your response. In what way is this situation familiar to your past? How is it different?
- Remember that ***Emotions*** come and go. They may be intense now, but later they will be less so. Name your feelings.
- ***Recognize*** that this situation does not define you or your future. It does not dictate how things will be, nor is it a sign of things to come. Even if it is familiar, it is only one event.
- ***Validate*** your experience. State, at least internally, what you are feeling, thinking, and experiencing.
- ***Ask*** for help. You don't have to do this alone. Seek support. Other people care for you. Let them!
- ***This*** too shall pass. Remember: There are times that are good and times that are not so good. This hard time will pass.
- ***I*** can handle this. Name your strengths. Your strengths have helped you survive.
- Keep an ***Open*** mind. Look for and try out new solutions.
- ***Name*** strategies that have worked before. Choose one and apply it to this situation.
- Remember you have survived. You are a ***Survivor***!

cues will not be as obvious. With practice, the client can begin to track back through what occurred immediately before an emotional, physical, or behavioral reaction and then examine how that experience reminds him or her of the past.

Draw Connections

Mental health and substance abuse treatment providers have historically underestimated the effects of trauma on their clients for many reasons. Some held a belief that substance

Advice to Counselors: Strategies To Help Clients Draw Connections

Strategy #1: Writing about trauma can help clients gain awareness of their thoughts, feelings, and current experiences and can even improve physical health outcomes (Pennebaker, Kiecolt-Glaser, & Glaser, 1988; Smyth, Hockemeyer, & Tulloch, 2008). Although this tool may help some people draw connections between current experiences and past traumas, it should be used with caution; others may find that it brings up too much intense trauma material (especially among vulnerable trauma survivors with co-occuring substance abuse, psychosis, and current domestic violence). Journal writing is safest when you ask clients to write about present-day specific targets, such as logging their use of coping strategies or identifying strengths with examples. Writing about trauma can also be done via key questions or a workbook that provides questions centered upon trauma experiences and recovery.

Strategy #2: Encourage clients to explore the links among traumatic experiences and mental and substance use disorders. Recognition that a mental disorder or symptom developed after the trauma occurred can provide relief and hope that the symptoms may abate if the trauma is addressed. Ways to help clients connect substance use with trauma histories include (Najavits, 2002b; Najavits, Weiss, & Shaw, 1997):

- Identifying how substances have helped "solve" trauma or PTSD symptoms in the short term (e.g., drinking to get to sleep).
- Teaching clients how trauma, mental, and substance use disorders commonly co-occur so that they will not feel so alone and ashamed about these issues.
- Discussing how substance abuse has impeded healing from trauma (e.g., by blocking feelings and memories).
- Helping clients recognize trauma symptoms as triggers for relapse to substance use and mental distress.
- Working on new coping skills to recover from trauma and substance abuse at the same time.
- Recognizing how both trauma and substance abuse often occur in families through multiple generations.

abuse should be addressed before attending to any co-occurring conditions. Others did not have the knowledge and training to evaluate trauma issues or were uncomfortable or reluctant to discuss these sensitive issues with clients (Ouimette & Brown, 2003). Similarly, in other behavioral health settings, clinicians sometimes address trauma-related symptoms but do not have experience or training in the treatment of substance abuse.

So too, people who have histories of trauma will often be unaware of the connection between the traumas they've experienced and their traumatic stress reactions. They may notice depression, anger, or anxiety, or they may describe themselves as "going crazy" without being able to pinpoint a specific experience that produced the trauma symptoms. Even if clients recognize the events that precipitated their trauma symptoms, they may not understand how others with similar experiences can have different reactions. Thus, a treatment goal for trauma survivors is helping them gain awareness of the connections between their histories of trauma and subsequent consequences. Seeing the connections can improve clients' ability to work on recovery in an integrated fashion.

Teach Balance

You and your clients need to walk a thin line when addressing trauma. Too much work focused on highly distressing content can turn a desensitization process into a session whereby the client dissociates, shuts down, or becomes emotionally overwhelmed. On the other hand, too little focus by the client or counselor can easily reinforce avoidance and confirm the client's internal belief that it is too dangerous to deal with the aftermath of the trauma. Several trauma-specific theories offer guidelines on acceptable levels of distress associated with the traumatic content that the therapy addresses. For example, some traditional desensitization processes start at a very low level of subjective distress, gradually working up through a hierarchy of trauma memories and experiences until those experiences produce minimal reactions when paired with some coping strategy, such as relaxation training. Other desensitization processes start at a higher level of intensity to provide more rapid extinction of traumatic associations and to decrease the risk of avoidance—a behavior that reinforces traumatic stress.

> The Subjective Units of Distress Scale (SUDS) uses a 0 10 rating scale, with 0 representing content that causes no or minimal distress and 10 representing content that is exceptionally distressing and overwhelming.
>
> (Wolpe & Abrams, 1991)

Working with trauma is a delicate balancing act between the development and/or use of coping strategies and the need to process the traumatic experiences. Individuals will choose different paths to recovery; it's a myth that every traumatic experience needs to be expressed and every story told. For some individuals, the use of coping skills, support, and spirituality are enough to recover. Regardless of theoretical beliefs, counselors must teach

Advice to Counselors: Strategy To Teach Balance

Strategy #1: Teach and use the SUDS in counseling. This scale can be useful from the outset as a barometer for the client and counselor to measure the level of distress during and outside of sessions. It provides a common language for the client and counselor, and it can also be used to guide the intensity of sessions. SUDS can tangibly show a client's progress in managing experiences. Without a scale, it is more difficult to grasp that a distressing symptom or circumstance is becoming less and less severe without some repeated measure.

coping strategies as soon as possible. Retraumatization is a risk whenever clients are exposed to their traumatic histories without sufficient tools, supports, and safety to manage emotional, behavioral, and physical reactions.

Build Resilience

Survivors are resilient! Often, counselors and clients who are trauma survivors focus on the negative consequences of trauma while failing to recognize the perseverance and attributes that have helped them survive. It is natural to focus on what's not working rather than what has worked. To promote growth after trauma and establish a strengths-based approach, focus on building on clients' resilience. Current resilience theories claim that building or reinforcing resilience prevents further development of trauma-related symptoms and disorders. The following *Advice to Counselors* box is adapted from the American Psychological Association's 2003 statement on resilience.

Advice to Counselors: Strategies To Build Resilience

Strategy #1: Help clients reestablish personal and social connections. Access community and cultural resources; reconnect the person to healing resources such as mutual-help groups and spiritual supports in the community.

Strategy #2: Encourage the client to take action. Recovery requires activity. Actively taking care of one's own needs early in treatment can evolve into assisting others later on, such as by volunteering at a community organization or helping military families.

Strategy #3: Encourage stability and predictability in the daily routine. Traumatic stress reactions can be debilitating. Keeping a daily routine of sleep, eating, work, errands, household chores, and hobbies can help the client see that life continues. Like exercise, daily living skills take time to take hold as the client learns to live through symptoms.

Strategy #4: Nurture a positive view of personal, social, and cultural resources. Help clients recall ways in which they successfully handled hardships in the past, such as the loss of a loved one, a divorce, or a major illness. Revisit how those crises were addressed.

Strategy #5: Help clients gain perspective. All things pass, even when facing very painful events. Foster a long-term outlook; help clients consider stress and suffering in a spiritual context.

Strategy #6: Help maintain a hopeful outlook. An optimistic outlook enables visions of good things in life and can keep people going even in the hardest times. There are positive aspects to everyone's life. Taking time to identify and appreciate these enhances the client's outlook and helps him or her persevere.

Strategy #7: Encourage participation in peer support, 12-Step, and other mutual-help programs.

Address Sleep Disturbances

Sleep disturbances are one of the most enduring symptoms of traumatic stress and are a particularly common outcome of severe and prolonged trauma. Sleep disturbances increase one's risk of developing traumatic stress; they significantly alter physical and psychological processes, thus causing problems in daytime functioning (e.g., fatigue, cognitive difficulty, excessive daytime sleepiness). People with sleep disturbances have worse general health and quality of life. The cardiovascular and immune systems, among others, may be affected as well. Sleep disturbances can worsen traumatic stress symptoms and interfere with healing by impeding the brain's ability to process and consolidate traumatic memories (Caldwell & Redeker, 2005).

Sleep disturbances vary among trauma survivors and can include decreased ability to stay asleep, frequent awakenings, early morning unintentional awakening, trouble falling asleep, poor quality of sleep, and disordered

Advice to Counselors: Strategies To Conduct a Sleep Intervention

Strategy #1: Conduct a sleep history assessment focused first on the client's perception of his or her sleep patterns. Assess whether there is difficulty initiating or staying asleep, a history of frequent or early morning awakenings, physically restless sleep, sleepwalking, bedtime aversion, and/or disruptive physical and emotional states upon awakening (e.g., confusion, agitation, feeling unrested). Also determine total sleep time, pattern of nightmares, and use of medications, alcohol, and/or caffeine (see Moul, Hall, Pikonis, & Buysse, 2004, for a review of self-report measures).

Strategy #2: Use a sleep hygiene measure to determine the presence of habits that typically interfere with sleep (e.g., falling asleep while watching television). The National Sleep Foundation Web site (http://www.sleepfoundation.org) provides simple steps for promoting good sleep hygiene.

Strategy #3: Provide education on sleep hygiene practices. Introduce clients to the idea that practicing good sleep hygiene is one step toward gaining control over their sleep disturbances.

Strategy #4: Reassess sleep patterns and history during the course of treatment. Sleep patterns often reflect current client status. For example, clients who are struggling are more likely to have disturbed sleep patterns; sleep disturbances significantly influence clients' mental health status.

Strategy #5: Use interventions such as nightmare rehearsals to target recurrent nightmares. There are numerous examples of imagery-based nightmare rehearsals. Clients may be instructed to rehearse repetitively the recurrent nightmare a few hours before bedtime. In this instruction, the client either rehearses the entire nightmare with someone or visualizes the nightmare several times to gain control over the material and become desensitized to the content. Other strategies involve imagining a change in the outcome of the nightmare (e.g., asking the client to picture getting assistance from others, even though his or her original nightmare reflects dealing with the experience alone).

breathing during sleep (Caldwell & Redeker, 2005). Most traumatic stress literature focuses on nightmares, insomnia, and frequent awakenings. These disturbances are connected to two main symptoms of traumatic stress: hyperarousal (which causes difficulty in falling and remaining asleep) and reexperiencing the trauma (e.g., through recurrent nightmares). Other sleep disturbances trauma survivors report include sleep avoidance or resistance to sleep (see Case Illustration: Selena), panic awakenings, and restless or unwanted body movements (e.g., hitting your spouse unintentionally in bed while asleep; Habukawa, Maeda, & Uchimura, 2010).

Case Illustration: Selena

Selena initially sought treatment for ongoing depression (dysthymia). During treatment, she identified being sexually assaulted while attending a party at college. At times, she blames herself for the incident because she didn't insist that she and her girlfriends stay together during the party and on the way back to their dorm afterward. Selena reported that she only had two drinks that night: "I could never manage more than two drinks before I wanted to just sleep, so I never drank much socially." She was assaulted by someone she barely knew but considered a "big brother" in the brother fraternity of her sorority. "I needed a ride home. During that ride, it happened," she said. For years thereafter, Selena reported mild bouts of depression that began lasting longer and increasing in number. She also reported nightmares and chronic difficulty in falling asleep. In therapy, she noted avoiding her bed until she's exhausted, saying, "I don't like going to sleep; I know what's going to happen." She describes fear of sleeping due to nightmares. "It's become a habit at night. I get very involved in playing computer games to lose track of time. I also leave the television on through the night because then I don't sleep as soundly and have fewer nightmares. But I'm always exhausted."

Build Trust

Some traumatic experiences result from trusting others (e.g., interpersonal trauma). In other cases, trust was violated during or after the traumatic experience, as in cases when help was late to arrive on the scene of a natural disaster. This lack of trust can leave individuals alienated, socially isolated, and terrified of developing relationships. Some feel that the trauma makes them different from others who haven't had similar experiences. Sometimes, a client's trust issues arise from a lack of trust in self—for instance, a lack of trust in one's perceptions, judgment, or memories. People who have also experienced severe mental or substance use disorders may have difficulty trusting others because, during the course of their illness, they felt alienated or discriminated against for behaviors and emotions generated by or associated with the disorders.

Some client groups (e.g., gay, lesbian, and bisexual clients; people from diverse cultures; those with serious mental illness) evidence significant mistrust because their trust has been repeatedly violated in the past. Traumatic experiences then compound this mistrust. Mistrust can come from various sources, is usually unstated, and, if left unaddressed, can impede treatment. For example, some clients leave treatment early or do not engage in potentially beneficial treatments. Others avoid issues of trust and commitment by leaving treatment when those issues begin to arise.

Establishing a safe, trusting relationship is paramount to healing—yet this takes time in the counseling process. Counselors and other behavioral health professionals need to be consistent throughout the course of treatment; this includes maintaining consistency in the parameters set for availability, attendance, and level of empathy. Trust is built on behavior shown inside and outside of treatment; you should immediately address any behavior that may even slightly injure the relationship (e.g., being 5 minutes late for an appointment, not responding to a phone message in a timely manner, being distracted in a session).

Advice to Counselors: Strategies To Build Trust

Strategy #1: Clients can benefit from a support or counseling group composed of other trauma survivors. By comparing themselves with others in the group, they can be inspired by those who are further along in the recovery process and helpful to those who are not faring as well as they are. These groups also motivate clients to trust others by experiencing acceptance and empathy.

Strategy #2: Use conflicts that arise in the program as opportunities. Successful negotiation of a conflict between the client and the counselor is a major milestone (van der Kolk, McFarlane, & Van der Hart, 1996). Helping clients understand that conflicts are healthy and inevitable in relationships (and that they can be resolved while retaining the dignity and respect of all involved) is a key lesson for those whose relationship conflicts have been beset by violence, bitterness, and humiliation.

Strategy #3: Prepare clients for staff changes, vacations, or other separations. Some clients may feel rejected or abandoned if a counselor goes on vacation or is absent due to illness, especially during a period of vulnerability or intense work. A phone call to the client during an unexpected absence can reinforce the importance of the relationship and the client's trust. You can use these opportunities in treatment to help the client understand that separation is part of relationships; work with the client to view separation in a new light.

Strategy #4: Honor the client–counselor relationship, and treat it as significant and mutual. You can support the development of trust by establishing clear boundaries, being dependable, working with the client to define explicit treatment goals and methods, and demonstrating respect for the client's difficulty in trusting you and the therapeutic setting.

Support Empowerment

Strong feelings of powerlessness can arise in trauma survivors seeking to regain some control of their lives. Whether a person has survived a single trauma or chronic trauma, the survivor can feel crushed by the weight of powerlessness. Mental illness and substance abuse, too, can be disempowering; clients may feel that they've lost control over their daily lives, over a behavior such as drug use, or over powerful emotions such as fear, sadness, or anger. Empowerment means helping clients feel greater power and control over their lives, as long as such control is within safe and healthy bounds. A key facet of empowerment is to help clients build on their strengths. Empowerment is more than helping clients discover what they "should" do; it is also helping them take the steps they feel ready to take.

Case Illustration: Abby

Abby, a 30-year-old, nervous-looking woman, is brought by her parents to a community mental health clinic near their home in rural Indiana. During the intake process, the counselor learns that Abby is an Army Reservist who returned from 12 months of combat duty 3 years ago. The war experience changed her in many ways. Her deployment pulled her away from veterinary school as well as the strong emotional support of family, friends, and fellow classmates. She got along with her unit in Iraq and had no disciplinary problems. While there, she served as a truck driver in the Sunni Triangle. Her convoy was attacked often by small arms fire and was once struck by an improvised explosive device. Although Abby sustained only minor injuries, two of her close friends were killed. With each successive convoy, her level of fear and foreboding grew, but she continued performing as a driver.

Since returning to the United States, she has mostly stayed at home and has not returned to school, although she is helping out on the farm with various chores. Abby has isolated herself from both family members and lifelong friends, saying she doesn't think others can understand what she went through and that she prefers being alone. She reports to her parents and the counselor that she is vaguely afraid to be in cars and feels most comfortable in her room or working alone, doing routine tasks, at home. Abby also says that she now understands how fragile life can be.

She has admitted to her parents that she drinks alcohol on a regular basis, something she did not do before her deployment, and that on occasion, she has experienced blackouts. Abby feels she needs a drink before talking with strangers or joining in groups of friends or family. She confided to her father that she isolates herself so that she can drink without having to explain her drinking to others.

The counselor recognizes Abby's general sense of lacking internal control and feeling powerless over what will happen to her in the future. He adopts a motivational interviewing style to establish rapport and a working alliance with Abby. During sessions, the counselor asks Abby to elaborate on her strengths; he reinforces strengths that involve taking action in life, positive self-statements, and comments that deal with future plans. He also introduces Abby to an Iraq War veteran who came home quite discouraged about putting his life together but has done well getting reintegrated. The counselor urges Abby go to the local VA center so that she can meet and bond with other recently returned veterans. He also encourages Abby to attend Alcoholics Anonymous meetings, emphasizing that she won't be pressured to talk or interact with others more than she chooses to.

The counselor continues to see Abby every week and begins using cognitive–behavioral techniques to help her examine some of her irrational fears about not being able to direct her life. He asks Abby to keep a daily diary of activities related to achieving her goals of getting back to school and reestablishing a social network. In each session, Abby reviews her progress using the diary as a memory aid, and the counselor reinforces these positive efforts. After 4 months of treatment, Abby reenrolls in college and is feeling optimistic about her ability to achieve her career plans.

Advice to Counselors: Strategies To Support Empowerment

Strategy #1: Offer clients information about treatment; help them make informed choices. Placing appropriate control for treatment choices in the hands of clients improves their chances of success.

Strategy #2: Give clients the chance to collaborate in the development of their initial treatment plan, in the evaluation of treatment progress, and in treatment plan updates. Incorporate client input into treatment case consultations and subsequent feedback.

Strategy #3: Encourage clients to assume an active role in how the delivery of treatment services occurs. An essential avenue is regularly scheduled and structured client feedback on program and clinical services (e.g., feedback surveys). Some of the most effective initiatives to reinforce client empowerment are the development of peer support services and the involvement of former clients in parts of the organizational structure, such as the advisory board or other board roles.

Strategy #4: Establish a sense of self-efficacy in clients; their belief in their own ability to carry out a specific task successfully—is key. You can help clients come to believe in the possibility of change and in the hope of alternative approaches to achieving change. Supporting clients in accepting increasing responsibility for choosing and carrying out personal change can facilitate their return to empowerment (Miller & Rollnick, 2002).

Acknowledge Grief and Bereavement

The experience of loss is common after traumas, whether the loss is psychological (e.g., no longer feeling safe) or physical (e.g., death of a loved one, destruction of community, physical impairment). Loss can cause public displays of grief, but it is more often a private experience. Grieving processes can be emotionally overwhelming and can lead to increased substance use and other impulsive behaviors as a way to manage grief and other feelings associated with the loss. Even for people who experienced trauma years prior to treatment, grief is still a common psychological issue. Delayed or absent reactions of acute grief can cause exhaustion, lack of strength, gastrointestinal symptoms, and avoidance of emotions.

Risk factors of chronic bereavement (grief lasting more than 6 months) can include:

- Perceived lack of social support.
- Concurrent crises or stressors (including reactivation of PTSD symptoms).
- High levels of ambivalence about the loss.
- An extremely dependent relationship prior to the loss.
- Loved one's death resulting from disaster: unexpected, untimely, sudden, and shocking (New South Wales Institute of Psychiatry & Centre for Mental Health, 2000).

Advice to Counselors: Strategies To Acknowledge and Address Grief

Strategy #1: Help the client grieve by being present, by normalizing the grief, and by assessing social supports and resources.

Strategy #2: When the client begins to discuss or express grief, focus on having him or her voice the losses he or she experienced due to trauma. Remember to clarify that losses include internal experiences, not just physical losses.

Strategy #3: For a client who has difficulty connecting feelings to experiences, assign a feelings journal in which he or she can log and name each feeling he or she experiences, rate the feeling's intensity numerically, and describe the situation during which the feeling occurred. The client may choose to share the journal in an individual or group session.

Strategy #4: Note that some clients benefit from developing a ritual or ceremony to honor their losses, whereas others prefer offering time or resources to an association that represents the loss.

Monitor and Facilitate Stability

Stability refers to an ongoing psychological and physical state whereby one is not overwhelmed by disruptive internal or external stimuli (Briere & Scott, 2006b). It's common for individuals to have an increase in symptoms, distress, or impairment when dealing with the impact of their trauma or talking about specific aspects of their trauma. There is a thin line that the client and counselor need to negotiate and then walk when addressing trauma. Too much work focused on highly distressing content can turn a desensitization process into a session that causes the client to dissociate, shut down, or become emotionally overwhelmed. On the other hand, too little focus by the client or counselor can easily reinforce avoidance and confirm the client's internal belief that it is too dangerous to deal with the aftermath of the trauma.

Advice to Counselors: Strategies To Monitor and Facilitate Stability

Strategy #1: If destabilization occurs during the intake process or treatment, stop exploring the material that triggered the reaction, offer emotional support, and demonstrate ways for the client to self-soothe.

Strategy #2: Seek consultation from supervisors and/or colleagues (e.g., to explore whether a new case conceptualization is needed at this point).

Strategy #3: Refer the client for a further assessment to determine whether a referral is necessary for trauma-specific therapy or a higher level of care, or use of multiple levels of care (e.g., intensive outpatient care, partial hospitalization, residential treatment).

Strategy #4: Focus on coping skills and encourage participation in a peer support program.

Strategy #5: When a client becomes agitated and distressed, carefully explore with the client what is causing this state. When such feelings arise because of current threats in the client's life or environment, it is dangerous to halt or soothe away responses that act as warning signals (Pope & Brown, 1996). When a client is in a situation involving domestic violence, lives in a dangerous neighborhood, or has run out of money for food, he or she requires direct and concrete assistance rather than simple emotional support.

Source: Briere & Scott, 2006b.

Managing Destabilization

When a client becomes destabilized during a session, you can respond in the following manner: "Let's slow down and focus on helping you be and feel safe. What can we do to allow you to take care of yourself at this moment? Then, when you feel ready, we can decide what to focus on next."

Clients should have some psychological stability to engage in trauma-related work. An important distinction can be made between a normative increase in symptoms (e.g., the typical up-and-down course of traumatic stress reactions or substance abuse) and destabilization (dangerous, significant decrease in functioning). Signs of destabilization include (Green Cross Academy of Traumatology, 2007; Najavits, 2002b):

- Increased substance use or other unsafe behavior (e.g., self-harm).
- Increased psychiatric symptoms (e.g., depression, agitation, anxiety, withdrawal, anger).
- Increased symptoms of trauma (e.g., severe dissociation).
- Helplessness or hopelessness expressed verbally or behaviorally.
- Difficulty following through on commitments (e.g., commitment to attend treatment sessions).
- Isolation.
- Notable decline in daily activities (e.g., self-care, hygiene, care of children or pets, going to work).

Treatment Issues

The treatment environment itself can significantly affect how clients experience traumatic stress and how the client responds to treatment. Some specific issues related to working with trauma survivors in a clinical setting are discussed in the following sections.

Client Engagement

A lack of engagement in treatment is the client's inability to make progress toward treatment goals, deal with important topics in treatment, or complete treatment. Clients who have histories of trauma will express ambivalence about treatment similarly to others, except that clients who have traumatic stress can feel more "stuck" and perceive themselves as having fewer options. In addition, clients may be avoiding engagement in treatment because it is one step closer to addressing their trauma. You should attend to the client's motivation to change, implement strategies that address ambivalence toward treatment, and use approaches that help clients overcome avoidant behavior.

Advice to Counselors: Strategies To Foster Engagement

Strategy #1: According to Mahalik (2001), the standard method of handling clients' lack of engagement is exploring it with them, clarifying the situation through discussion with them, reinterpreting (e.g., from "can't" to "won't" to "willing"), and working through the situation toward progress.

Strategy #2: To improve engagement into treatment, try motivational interviewing and enhancement techniques. For additional information on such techniques, see TIP 35, *Enhancing Motivation for Change in Substance Abuse Treatment* (Center for Substance Abuse Treatment [CSAT], 1999b).

Pacing and Timing

Although your training or role as a counselor may prohibit you from providing trauma-specific services, you must still be prepared for the fact that clients are not as focused on when or where it is most appropriate to address trauma—they want relief, and most lay and professional people have been taught that the only path to recovery is disclosure. Some clients are reluctant to talk about anything associated with their histories of trauma. Other clients immediately want to delve into the memories of their trauma without developing a safe environment. The need to gain any relief for the traumatic stress pushes some individuals to disclose too quickly, without having the necessary support and coping skills to manage the intensity of their memories. Clients who enter treatment and immediately disclose past trauma often don't return because the initial encounter was so intense or because they experienced considerable emotional distress for several days afterward and/or in anticipation of the next session.

Proper pacing of sessions, disclosure, and intensity is paramount. Clients who immediately disclose without proper safety nets are actually retraumatizing themselves by reliving the experience without adequate support—often placing themselves in the same circumstances that occurred during the actual traumas they experienced. Although you should not adamantly direct clients not to talk about what happened, it is important to discuss with the clients, even if you have to interrupt them empathically and respectfully, the potential consequences of disclosing too soon and too fast. Ask whether they have done this before, and then inquire about the outcome. Reinforce with clients that trauma heals when there are support, trust, and skills in place to manage the memories of the traumatic experiences. Ideally, disclosure begins after these elements are secured, but realistically, it is a

Advice to Counselors: Strategies To Establish Appropriate Pacing and Timing

Strategy #1: Frequently discuss and request feedback from clients about pacing and timing. Moving too quickly into discussion of the trauma can increase the risk of dissociation, overactivation of memories, and feeling overwhelmed.

Strategy #2: Use the SUDS as a barometer of intensity to determine the level of work.

Strategy #3: Slowly increase the speed of interventions and continually adjust the intensity of interventions; move in and out of very intense work, or use strategies that decrease the intensity when necessary. One approach that typically decreases the intensity of traumatic memories is to ask the individual to imagine that he or she is seeing the scene through a window or on a television screen. This helps decrease intensity and the risk of dissociation. It provides an opportunity for the client to view the trauma from a different perspective and a strategy to use outside of treatment to shift from reliving the trauma to observing it from a neutral position.

Strategy #4: Monitor clients to ensure that treatment does not overwhelm their internal capacities, retraumatize them, or result in excessive avoidance; make sure therapy occurs in the "therapeutic window" (Briere & Scott, 2006b).

Strategy #5: Be alert to signs that discussions of trauma, including screening, assessment, and intake processes, are going too fast. Mild to moderate signs are:
- Missing counseling appointments after discussions of important material.
- Periods of silence.
- Dissociation.
- Misunderstanding what are usually understandable concepts.
- Redirecting the focus of the discussion when certain issues arise.

Strategy #6: Observe the client's emotional state. Slow down; seek consultation if the client exhibits:
- Persistent resistance to addressing trauma symptoms.
- Repetitive flashbacks.
- Increase in dissociation.
- Regression.
- Difficulty in daily functioning (e.g., trouble maintaining everyday self-care tasks).
- Substance use relapses.
- Self-harm or suicidal thoughts/behaviors (e.g., talking about suicide).

Strategy #7: Use caution and avoid (Briere, 1996b, p. 115):
- Encouraging clients to describe traumatic material in detail before they can deal with the consequences of disclosure.
- Using overly stressful interventions (e.g., intensive role-plays, group confrontation, guided imagery).
- Confrontations or interpretations that are too challenging given the client's current functioning.
- Demanding that the client work harder and stop resisting.

balancing act for both the counselor and client as to when and how much should be addressed in any given session. Remember not to inadvertently give a message that it is too dangerous to talk about trauma; instead, reinforce the importance of addressing trauma without further retraumatization.

Length of Treatment

Many factors influence decisions regarding the length of treatment for a given client. Severity of addiction, type of substance abused, type of trauma, age at which the trauma occurred, level of social support, and the existence of

mental disorders all influence length of treatment. External factors, such as transportation and childcare, caps on insurance coverage, and limitations in professional resources, can also affect length of treatment. In general, longer treatment experiences should be expected for clients who have histories of multiple or early traumas, meet diagnostic criteria for multiple Axis I or Axis II diagnoses, and/or require intensive case management. Most of the empirically studied and/or manual-based models described in the next chapter are short-term models (e.g., lasting several months); however, ongoing care is indicated for clients with more complex co-occurring trauma disorders.

Traumatic Memories

One of the most controversial issues in the trauma field is the phenomenon of "recovered memories" or "traumatic amnesia" (Brewin, 2007). Practitioners working with traumatized individuals are particularly concerned about the possibility of new memories of the traumatic event emerging during the course of therapy and the possibility of these memories being induced by the clinician. Scientific reviews indicate that people can experience amnesia and delayed recall for some memories of a wide variety of traumas, including military combat and prisoner of war experiences, natural disasters and accidents, childhood sexual abuse, and political torture (Bowman & Mertz, 1996; Brewin, 2007; Karon & Widener, 1997; McNally, 2005). In some cases, the survivor will not remember some of what happened, and the counselor may need to help the client face the prospect of never knowing all there is to know about the past and accept moving on with what is known.

Legal Issues

Legal issues can emerge during treatment. A client, for instance, could seek to prosecute a perpetrator of trauma (e.g., for domestic violence) or to sue for damages sustained in an accident or natural disaster. The counselor's role is not to provide legal advice, but rather, to offer support during the process and, if needed, refer the client to appropriate legal help (see Advice to Counselors box on p. 131). A legal matter can dominate the treatment atmosphere for its duration. Some clients have difficulty making progress in treatment until most or all legal matters are resolved and no longer act as ongoing stressors.

Memories of Trauma

Points for counselors to remember are:

- Some people are not able to completely remember past events, particularly events that occurred during high-stress and destabilizing moments.
- In addition to exploring the memories themselves, it can be beneficial to explore how a memory of an event helps the client understand his or her feeling, thinking, and behaving in the present.
- Persistently trying to recall all the details of a traumatic event can impair focus on the present.

Forgiveness

Clients may have all sorts of reactions to what has happened to them. They may feel grateful for the help they received, joy at having survived, and dedication to their recovery. At the other extreme, they may have fantasies of revenge, a loss of belief that the world is a good place, and feelings of rage at what has happened. They may hold a wide variety of beliefs associated with these feelings.

One issue that comes up frequently among counselors is whether to encourage clients to forgive. The issue of forgiveness is a very delicate one. It is key to allow survivors their feelings, even if they conflict with the counselor's own responses. Some may choose to forgive the perpetrator, whereas others may remain angry or seek justice through the courts and other legal means. Early in recovery from

Advice to Counselors: Strategies To Manage Traumatic Memories

Strategy #1: Most people who were sexually abused as children remember all or part of what happened to them, although they do not necessarily fully understand or disclose it. Do not assume that the role of the clinician is to investigate, corroborate, or substantiate allegations or memories of abuse (American Psychiatric Association [APA], 2000b).

Strategy #2: Be aware that forgotten memories of childhood abuse can be remembered years later. Clinicians should maintain an empathic, nonjudgmental, neutral stance toward reported memories of sexual abuse or other trauma. Avoid prejudging the cause of the client's difficulties or the veracity of the client's reports. A counselor's prior belief that physical or sexual abuse, or other factors, are or are not the cause of the client's problems can interfere with appropriate assessment and treatment (APA, 2000b).

Strategy #3: Focus on assisting clients in coming to their own conclusions about the accuracy of their memories or in adapting to uncertainty regarding what actually occurred. The therapeutic goal is to help clients understand the impact of the memories or abuse experiences on their lives and to reduce their detrimental consequences in the present and future (APA, 2000b).

Strategy #4: Some clients have concerns about whether or not a certain traumatic event did or did not happen. In such circumstances, educate clients about traumatic memories, including the fact that memories aren't always exact representations of past events; subsequent events and emotions can have the effect of altering the original memory. Inform clients that it is not always possible to determine whether an event occurred but that treatment can still be effective in alleviating distress.

Strategy #5: There is evidence that suggestibility can be enhanced and pseudomemories can develop in some individuals when hypnosis is used as a memory enhancement or retrieval strategy. Hypnosis and guided imagery techniques can enhance relaxation and teach self-soothing strategies with some clients; however, use of these techniques is not recommended in the active exploration of memories of abuse (Academy of Traumatology, 2007).

Strategy #6: When clients are highly distressed by intrusive flashbacks of delayed memories, help them move through the distress. Teach coping strategies and techniques on how to tolerate strong affect and distress (e.g., mindfulness practices).

trauma, it is best to direct clients toward focusing on stabilization and a return to normal functioning; suggest that, if possible, they delay major decisions about forgiveness until they have a clearer mind for making decisions (Herman, 1997). Even in later stages of recovery, it's not essential for the client to forgive in order to recover. Forgiveness is a personal choice independent of recovery. Respect clients' personal beliefs and meanings; don't push clients to forgive or impose your own beliefs about forgiveness onto clients.

In the long-term healing process, typically months or years after the trauma(s), forgiveness may become part of the discussion for some people and some communities. For example, in South Africa, years after the bitter and bloody apartheid conflicts, a Truth and Reconciliation Commission was established by the Government. Public hearings created dialog and aired what had been experienced as a means, ultimately, to promote forgiveness and community healing. By addressing very difficult topics in public, all could potentially benefit from the discourse. Similarly, a parental survivor of the Oklahoma City bombing was, at first, bitter about his daughter's early, unfair, and untimely death. Today, he gives talks around the world about the abolition of the death penalty. He sat with convicted

Advice to Counselors: Strategies To Manage Legal Proceedings

Strategy #1: If you're aware of legal proceedings, you can play a key role in helping your client prepare emotionally for their impact, such as what it might be like to describe the trauma to a judge or jury, or how to cope with seeing the perpetrator in court. When helping a client prepare, however, be careful not to provide legal advice.

Strategy #2: Help clients separate a successful legal outcome from a successful treatment outcome. If clients connect these two outcomes, difficulties can arise. For example, a client may discontinue treatment after his or her assailant is sentenced to serve prison time, believing that the symptoms will abate without intervention.

Strategy #3: If clients express interest in initiating a civil or criminal suit, encourage them to consider the ways in which they are and are not prepared for this, including their own mental states, capacity for resilience, and inevitable loss of confidentiality (Pope & Brown, 1996). Inform clients coping with legal issues that involvement in the legal process can be retraumatizing.

Strategy #4: Emphasize, for trauma survivors who are involved in legal proceedings against an assailant, that "not guilty" is a legal finding—it is based on the degree of available evidence and is not a claim that certain events in question did not occur. They should also receive, from an attorney or other qualified individual, information on:

- The nature of the legal process as it pertains to the clients' specific cases.
- The estimated duration and cost of legal services, if applicable.
- What to expect during police investigations.
- Court procedures.
- Full information on all possible outcomes.
- What to expect during cross-examination.

Strategy #5: Counselors can be called on to assist with a legal case involving trauma. The court may require you to provide treatment records, to write a letter summarizing your client's progress, or to testify at a trial. Always seek supervisory and legal advice in such situations and discuss with the client the possible repercussions that this might have for the therapeutic relationship. As a general rule, it is best practice to avoid dual roles or relationships.

bomber Timothy McVeigh's father while the man's son was executed in Indiana at a Federal prison several years after the bombing. For this man, forgiveness and acceptance helped him attain personal peace. Other trauma survivors may choose never to forgive what happened, and this, too, is a legitimate response.

Culturally and Gender Responsive Services

Culture is the lens through which reality is interpreted. Without an understanding of culture, it is difficult to gauge how individuals organize, interpret, and resolve their traumas. The challenge is to define how culture affects individuals who have been traumatized.

Increased knowledge of PTSD (Wilson & Tang, 2007), mental illness, and substance use disorders and recovery (Westermeyer, 2004) requires behavioral health practitioners to consider the complicated interactions between culture, personality, mental illness, and substance abuse in adapting treatment protocols. This section offers some general guidelines for working with members of cultures other than one's own. Treatment for traumatic stress, mental illness, substance use disorders, and co-occurring trauma-related symptoms is more effective if it is culturally responsive.

The U.S. Department of Health and Human Services (2003) has defined the term "cultural competence" as follows:

> Cultural competence is a set of values, behaviors, attitudes, and practices within a system, organization, program, or among individuals that enables people to work effectively across cultures. It refers to the ability to honor and respect the beliefs, language, interpersonal styles, and behaviors of individuals and families receiving services, as well as staff who are providing such services. Cultural competence is a dynamic, ongoing, developmental process that requires a long-term commitment and is achieved over time (p. 12).

Cultural competence is a process that begins with an awareness of one's own culture and beliefs and includes an understanding of how those beliefs affect one's attitudes toward people of other cultures. It is rooted in respect, validation, and openness toward someone whose social and cultural background is different from one's own. For a thorough review of cultural competence, see the planned TIP, *Improving Cultural Competence* (Substance Abuse and Mental Health Services Administration [SAMHSA], planned c).

Cultural Competence

Cultural competence includes a counselor's knowledge of:

- Whether the client is a survivor of cultural trauma (e.g., genocide, war, government oppression, torture, terrorism).
- How to use cultural brokers (i.e., authorities within the culture who can help interpret cultural patterns and serve as liaisons to those outside the culture).
- How trauma is viewed by an individual's sociocultural support network.
- How to differentiate PTSD, trauma-related symptoms, and other mental disorders in the culture.

For more specific information on cultural competence in trauma therapy, see Brown (2008).

In some cultures, an individual's needs take precedence over group needs (Hui & Triandis, 1986), and problems are seen as deriving from the self. In other cultures, however, complex family, kin, and community systems take precedence over individual needs. Considerable heterogeneity exists within and across most ethnic subcultures and across lines of gender, class, age, and political groups (CSAT, 1999b). Subcultures abound in every culture, such as gangs; populations that are homeless or use substances; orphaned or disenfranchised people; religious, ethnic, and sexual minorities; indigenous people; and refugee and immigrant populations. Some subcultures have more in common with similar subcultures in other countries than with their own cultures (e.g., nonheterosexual populations).

Trauma and substance abuse can themselves be a basis for affiliation with a subculture. De Girolamo (1993) reports that "disaster subcultures" exist within many cultures. These cultures of victimization, like all subcultures, have unique worldviews, codes of conduct, and perceptions of the larger society. In a disaster subculture, people are, to some extent, inured to disaster and heedless of warnings of impending disaster. For example, riverbank erosion in Bangladesh displaces thousands of people each year, yet few believe that it is a serious problem or that the displacement will be permanent (Hutton, 2000). Israelis who have lived with unpredictable violence for many years behave differently in public areas and have adapted to different norms than people who don't commonly experience violence (Young, 2001).

Many people identify with more than one subculture. Some identify with a particular culture or subculture, but not with all of its values. Individual identities are typically a mosaic of factors, including developmental achievements, life experiences, behavioral health histories, traumatic experiences, and

alcohol and illicit drug use; levels of acculturation and/or assimilation vary from one individual to the next as well.

Importance of the trauma aftermath

Counselors working in the immediate aftermath of trauma—whether individual, group, or community in nature—face many challenges. For example, survivors may be forced to adjust without access to other health services, employment, support, or insurance. In these instances, counselors must often work with individuals and communities coping with the trauma while struggling daily to meet basic needs. Research suggests that reestablishing ties to family, community, culture, and spiritual systems can not only be vital to the individual, but can also influence the impact of the trauma upon future generations. For example, Baker and Gippenreiter (1998) studied the descendants of people victimized by Joseph Stalin's purge. They found that families who were able to maintain a sense of connection and continuity with grandparents affected by the purge experienced fewer negative effects than did those who were emotionally or physically severed from their grandparents. The researchers also found that whether the grandparents survived was less important than the connection the grandchildren managed to keep to their past. Ties to family and community can also have an adverse effect, especially if the family or community downplays the trauma or blames the victim. Counselors need to have a full understanding of available support before advocating a particular approach.

Treatment strategies

Many traditional healing ways have been damaged, forgotten, or lost—yet much wisdom remains. Drawing on the best traditional and contemporary approaches to human distress and defining culturally competent curricula regarding identity and healing (Huriwai, 2002; Wilson & Tang, 2007) both require respect and appreciation for the many ways in which various people characterize and resolve trauma and how they use addictive substances to bear the burdens of human distress.

Community-Based Treatment for Native American Historical Trauma

Key beliefs in community healing:

- Clients carry childhood pain that has led to adult dysfunction.
- Childhood pain must be confronted, confessed, and addressed, if relief is to be obtained.
- Cathartic expression is the initial step in the healing journey toward a lifelong pursuit of introspection and self-improvement.
- The healing journey entails reclamation of indigenous heritage, identity, spirituality, and practices to remedy the pathogenic effects of colonization and other sources of historical trauma.

Source: Gone, 2009.

It is not yet known how well existing PTSD treatments work for individuals who identify primarily with cultures other than mainstream American culture. It is possible that such treatments do work for clients of other cultures, though some cultural adaptation and translation may be required. For example, some PTSD treatments that have been used with subculture groups without adaptation other than language translation and that appear to be effective across cultures include eye movement desensitization and reprocessing (Bleich, Gelkopf, & Solomon, 2003) and Seeking Safety (Daouest et al., 2012).

Gender

Gender differences exist in traumatic stress, mental disorders, and substance use disorders. For example, women have higher rates of PTSD, whereas men have higher rates of substance abuse (Kessler, Chiu, Demler, Merikangas, & Walters, 2005; Stewart, Ouimette, & Brown, 2002; Tolin & Foa, 2006).

Working With Clients From Diverse Cultures: Trauma and Substance Abuse

- In socially appropriate ways, educate clients, their loved ones, and possibly members of their extended community about the relationship between substance abuse and PTSD, how substance abuse is often used to cope with trauma, and what treatment entails.
- Make serious efforts to connect clients to supportive and understanding people (preferably within culturally identified groups).
- Help clients understand that many who have not experienced trauma or do not have substance use disorders will not understand the psychological, spiritual, and interpersonal insights that they have gained during their recovery processes.

The types of interpersonal trauma experienced by men and by women are often different. A number of studies (Kimerling, Ouimette, & Weitlauf, 2007) indicate that men experience more combat and crime victimization and women experience more physical and/or sexual assault—implying that men's traumas often occur in public, whereas the traumatization of women is more likely to take place in a private setting, such as a home. Men's abusers are more often strangers. Those who abuse women, on the other hand, are more often in a relationship with them. Women (and girls) often are told, "I love you," during the same time period when the abuse occurs. However, women now serve in the military and thus are increasingly subject to some of the same traumas as men and also to military sexual trauma, which is much more common for women to experience. Similarly, men can be subject to domestic violence or sexual abuse.

In treatment, gender considerations are relevant in a variety of ways, including, but not limited to, the role and impact of societal gender stereotypes upon assessment processes, treatment initiation, and engagement of services (e.g., peer support systems); the selection and implementation of gender-specific and gender-responsive approaches for both men and women at each level of intervention; and the best selection of trauma-related interventions that account for gender-specific differences related to traumatic stress. For an extensive review and discussion of gender-specific and gender-responsive care for traumatic stress and substance use, see the TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d), and TIP 56, *Addressing the Specific Behavioral Health Needs of Men* (SAMHSA, 2013a).

Beyond the complexities of gender considerations, one must also consider whether clients should be given the choice of working with a male or a female counselor. Some clients who have been traumatized have no preference, particularly if their trauma wasn't associated with gender (e.g., a natural disaster, act of terrorism, fire, serious accident). If gender did play a role in trauma (e.g., childhood sexual abuse), clients can have strong fears of working with a counselor who is the same gender as the perpetrator. Many women who experienced sexual abuse (whose perpetrators are typically men) feel uncomfortable being treated by men because of the intense emotions that can be evoked (e.g., anger, fear). Men who experienced sexual abuse (whose perpetrators are also typically men) can feel uncomfortable for the same reasons, or they may feel shame when talking to men due to feelings evoked about masculinity, homosexuality, and so forth. However, not all clients with trauma histories prefer female therapists.

Discuss with clients the possible risks (e.g., initial emotional discomfort) and benefits of being treated by a woman or man (e.g., developing a therapeutic relationship with a man might challenge a client's belief that all men are dangerous), and, if possible, let them then choose the gender of their counselor. Tell

them that if they experience initial emotional discomfort, and the discomfort does not decrease, they can switch to a counselor of the opposite gender. For group therapy that focuses on trauma, similar considerations apply. Generally, gender-specific groups are recommended when possible, but mixed-gender groups also work. Gender also comes into play in substance abuse treatment. Research and clinical observation indicate that significant gender differences occur in many facets of substance abuse and its treatment. For example, men and women experience different physical repercussions of substance use (e.g., women have more health problems), different trajectories (e.g., women become addicted more quickly), and different treatment considerations (e.g., traditional substance abuse treatment was designed for men).

Sexual orientation

Lesbian, gay, bisexual, and transgender (LGBT) clients face specific issues in behavioral health treatment settings, including histories of abuse and discrimination relating to sexual orientation, homophobia in treatment on the part of counselors or other clients, potential difficulty addressing traumatic experiences related to their sexuality or sexual orientation, and often, a significant lack of trust toward others. LGBT people sometimes think that others can't understand them and their specific needs and thus are reluctant to engage in treatment programs in which the clientele is predominantly heterosexual. Some clients react with judgment, anger, or embarrassment when an LGBT client attempts to describe sexual trauma relating to homosexual behavior, making it even harder for LGBT clients to describe their experiences.

Often, individual counseling can address issues the LGBT client isn't comfortable discussing in group treatment. "Providing one-on-one services may decrease the difficulty of mixing heterosexual and LGBT clients in treatment groups and decrease the likelihood that heterosexism or homophobia will become an issue" (CSAT, 2001, p. 56). For more on treating LGBT individuals, see *A Provider's Introduction to Substance Abuse Treatment for Lesbian, Gay, Bisexual, and Transgender Individuals* (CSAT, 2001).

Making Referrals to Trauma-Specific Services

Many people who experience trauma do not exhibit persistent traumatic stress symptoms. In fact, people do recover on their own. So how do you determine who is at higher risk for developing more persistent symptoms of traumatic stress, trauma-related disorders, and traumatic stress disorders? One main factor is the severity of symptoms at the time of screening and assessment. Other factors, beyond trauma characteristics and pretrauma individual characteristics, to consider in making referrals include (Ehlers & Clark, 2003):

- Cognitive appraisals that are excessively negative regarding trauma sequelae, including consequences, changes after the event(s), responses of other people to the trauma, and symptoms.
- Acknowledgment of intrusive memories.
- Engagement in behaviors that reinforce or prevent resolution of trauma, including avoidance, dissociation, and substance use.
- History of physical consequences of trauma (e.g., chronic pain, disfigurement, health problems).
- Experiences of more traumas or stressful life events after the prior trauma.
- Identification of co-occurring mood disorders or serious mental illness.

The next chapter provides an overview of trauma-specific services to complement this chapter and to provide trauma-informed counselors with a general knowledge of trauma-specific treatment approaches.

6 Trauma-Specific Services

IN THIS CHAPTER

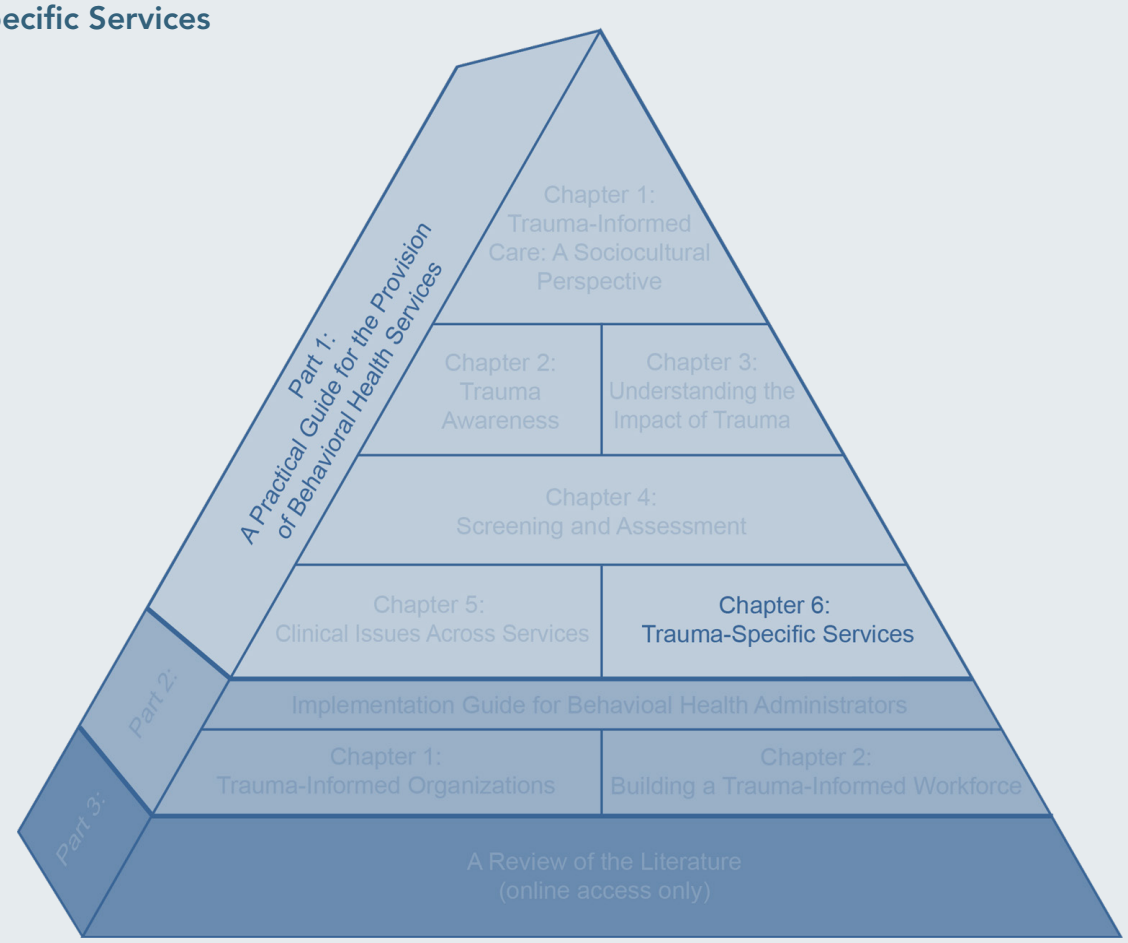
- Introduction
- Trauma Specific Treatment Models
- Integrated Models for Trauma
- Emerging Interventions
- Concluding Note

This chapter covers various treatment approaches designed specifically to treat trauma-related symptoms, trauma-related disorders, and specific disorders of traumatic stress. The models presented do not comprise an exhaustive list, but rather, serve as examples. These models require training and supervised experience to be conducted safely and effectively. The chapter begins with a section on trauma-specific treatment models, providing a brief overview of interventions that can be delivered immediately after a trauma, as well as trauma-specific interventions for use beyond the immediate crisis. The second segment focuses on integrated care that targets trauma-specific treatment for mental, substance use, and co-occurring disorders. Even though entry-level, trauma-informed behavioral health service providers are unlikely to be in a position to use these interventions, having some knowledge of them is nevertheless important. Currently, more research is needed to tease out the most important ingredients of early interventions and their role in the prevention of more pervasive traumatic stress symptoms. More science-based evidence is available for trauma-specific treatments that occur and extend well beyond the immediate reactions to trauma. The last part of the chapter provides a brief review of selected emerging interventions that have not been covered elsewhere in this Treatment Improvement Protocol (TIP).

Introduction

Trauma-specific therapies vary in their approaches and objectives. Some are present focused, some are past focused, and some are combinations (Najavits, 2007a). Present-focused approaches primarily address current coping skills, psychoeducation, and managing symptoms for better functioning. Past-focused approaches primarily focus on telling the trauma story to understand the impact of the trauma on how the person functions today, experiencing emotions that were too overwhelming to experience in the past, and helping clients more effectively cope in the present with their

Trauma-Informed Care Framework in Behavioral Health Services—Trauma-Specific Services



traumatic experiences. Clients participating in present-focused approaches may reveal some of their stories; past-focused approaches emphasize how understanding the past influences current behavior, emotion, and thinking, thereby helping clients cope more effectively with traumatic experiences in the present.

The distinction between these approaches lies in the primary emphasis of the approach. Depending on the nature of the trauma and the specific needs of the client, one approach may be more suitable than the other. For instance, in short-term treatment for clients in early recovery from mental illness and/or substance abuse, present-focused, cognitive–behavioral, or psychoeducational approaches are generally more appropriate. For clients who are stable in their recovery and have histories of developmental trauma where much of the trauma has been repressed, a past-focused orientation may be helpful. Some clients may benefit from both types, either concurrently or sequentially.

This chapter discusses a number of treatment models, general approaches, and techniques. A treatment model is a set of practices designed to alleviate symptoms, promote psychological well-being, or restore mental health. Treatment techniques are specific procedures that can be used as part of a variety of models. Some models and techniques described in this chapter can be used with groups, some with individuals, and some with both. This chapter is selective rather than comprehensive; additional models are described in the literature. See, for example, the PILOTS database on the Web site of the National Center for PTSD

(NCPTSD; http://www.ptsd.va.gov) for treatment literature related to trauma and posttraumatic stress disorder (PTSD). For an overview of models for use with both adult and child populations, refer to *Models for Developing Trauma-Informed Behavioral Health Systems and Trauma-Specific Services* (Center for Mental Health Services, 2008).

Some treatments discussed in this chapter are described as evidence based. Because research on integrated treatment models is so new, many have only been examined in a few studies. Given these circumstances and the fact that an outcome study provides only limited evidence of efficacy, the term "evidence based" should be interpreted cautiously. Additional scientific study is needed to determine whether some treatments discussed herein are, in fact, evidence based. A good resource for evaluating evidence-based, trauma-specific treatment models is *Effective Treatments for PTSD* (Foa, Keane, Friedman, & Cohen, 2009). Although evidence-based interventions should be a primary consideration in selecting appropriate treatment models for people with symptoms of trauma that co-occur with mental and substance use disorders (see Allen, 2001, for an indepth discussion of trauma and serious mental illness), other factors must also be weighed, including the specific treatment needs of the client; his or her history of trauma, psychosocial and cultural background, and experiences in prior trauma treatment; the overall treatment plan for the client; and the competencies of the program's clinical staff. Although behavioral health counselors can prepare to help their clients address some of the issues discussed in Chapter 5, specialized training is necessary to provide treatment for co-occurring substance use and mental disorders related to trauma.

The Substance Abuse and Mental Health Services Administration (SAMHSA) has created the National Registry of Evidence-Based Programs and Practices (NREPP) as a resource for reviewing and identifying effective treatment programs. Programs can be nominated for consideration as co-occurring disorders programs or substance abuse prevention or treatment programs, and their quality of evidence, readiness for dissemination, and training considerations are then reviewed. For more detailed information, including details about several evidence-based co-occurring trauma treatment programs, visit the NREPP Web site (http://www.nrepp.samhsa.gov). Program models for specialized groups, such as adolescents, can also be found on the NREPP Web site. For specific research-oriented information on trauma-specific treatments, refer to Part 3 of this TIP, which provides a literature review and links to select abstracts (available online).

Federal Agencies

Both the American Red Cross and the Federal Emergency Management Agency (FEMA) respond to disasters. Behavioral health service providers should understand the basics about these major emergency response agencies. For example, the Red Cross can respond rapidly with funding for food, shelter, and immediate needs, whereas FEMA assistance requires a period of gearing up but provides for longer-term needs. SAMHSA, along with other Federal agencies, assists FEMA in a number of areas of emergency response planning activities. See also SAMHSA's Disaster Technical Assistance Center Web site (http://www.samhsa.gov/dtac) and Technical Assistance Publication 34, *Disaster Planning Handbook for Behavioral Health Treatment Programs* (SAMHSA, 2013).

Trauma-Specific Treatment Models

Immediate Interventions

Intervention in the first 48 hours

The acute intervention period comprises the first 48 hours after a traumatic event. In a

"One day I was called out of bed at 5:00 a.m. to go to a town approximately 30 miles away because a levee had broken…. By 6:00 a.m., my colleagues and I were there with many of the townspeople, with helicopters flying overhead, with trucks going in and out by the main road trying to empty the factories. When we got there, as far as you could see was farmland. By 11 a.m., you could see a 'lake' in the distance. By 2 p.m., the water was on the edge of the town. Being there, at that town, before, during, and after the water came was probably the most valuable function we performed. We were able to share in the grief of the hundreds of people as we stayed with them while their fields, houses, and workplaces were flooded. We witnessed the death of a town, and the people reacted with disbelief, anger, sadness, and numbness. Each person had a different story, but all grieved, and we provided many an opportunity to express it. People cried as the water started rising into their houses. Some had to watch. Some had to leave. At times it was utterly silent as we all waited. There was a woman whose parents sent her away during the floods of '43 and she had been angry for 50 years about it. She was determined that her children and grandchildren would see everything. I spent 12 hours that day just giving support, listening, giving information, and sometimes shedding a tear or two myself."

—Rosemary Schwartzbard, Ph.D., responder to floods along the Mississippi River in 1993

Source: Schwartzbard, 1997.

disaster, rescue operations usually begin with local agencies prior to other organizations arriving on the scene. Law enforcement is likely to take a primary role on site. Whether it is a disaster, group trauma, or individual trauma (including a trauma that affects an entire family, such as a house fire), a hierarchy of needs should be established: survival, safety, security, food, shelter, health (physical and mental), orientation of survivors to immediate local services, and communication with family, friends, and community (National Institute of Mental Health, 2002). In this crucial time, appropriate interventions include educating survivors about resources; educating other providers, such as faith-based organizations and social service groups, to screen for increased psychological effects including use of substances; and use of a trauma response team that assists clients with their immediate needs. No formal interventions should be attempted at this time, but a professionally trained, empathic listener can offer solace and support (Litz & Gray, 2002).

Basic needs

Basic necessities, such as shelter, food, and water, are key to survival and a sense of safety. It is important to focus on meeting these basic needs and on providing a supportive environment. Clients' access to prescribed medications may be interrupted after a trauma, particularly a disaster, so providers should identify clients' medication needs for preexisting physical and mental disorders, including methadone or other pharmacological treatment for substance use. For example, after September 11, 2001, substance abuse treatment program administrators in New York had to seek alternative methadone administration options (Frank, Dewart, Schmeidler, & Demirjian, 2006).

Psychological first aid

The psychological first aid provided in the first 48 hours after a disaster is designed to ensure safety, provide an emotionally supportive environment and activities, identify those with high-risk reactions, and facilitate communication, including strong, reassuring leadership immediately after the event. The primary helping response of psychological first aid is to provide a calm, caring, and supportive environment to set the scene for psychological recovery. It is also essential that all those first responding to a trauma—rescue workers, medical professionals, behavioral health workers (including substance abuse counselors), journalists, and volunteers—be familiar with relevant aspects of traumatic stress. Approaching

Advice to Counselors: Core Actions in Preparing To Deliver Psychological First Aid

- Contact and engagement

- Stabilization
- Information gathering: Current needs and concerns
- Practical assistance
- Connection with social supports
- Information on coping
- Linkage with collaborative services

Source: National Child Traumatic Stress Network & NCPTSD, 2012.

survivors with genuine respect, concern, and knowledge increases the likelihood that the caregiver can (NCPTSD, 2002):

- Answer questions about what survivors may be experiencing.
- Normalize their distress by affirming that what they are experiencing is normal.
- Help them learn to use effective coping strategies.
- Help them be aware of possible symptoms that may require additional assistance.
- Provide a positive experience that will increase their chances of seeking help if they need it in the future.

Clinical experience suggests that care be taken to respect a survivor's individual method of coping; some may want information, for example, whereas others do not. Similarly, some may want to talk about the event, but others won't. An excellent guide to providing psychological first aid is available online from the Terrorism and Disaster Branch of the National Child Traumatic Stress Network (http://www.nctsn.org/content/psychological-first-aid).

Critical incident stress debriefing

Initially developed for work with first responders and emergency personnel, critical incident stress debriefing (CISD; Mitchell & Everly, 2001) is now widely used and encompasses various group protocols used in a variety of settings. This facilitator-led group intervention is for use soon after a traumatic event with exposed people. The goal is to provide psychological closure by encouraging participants to talk about their experiences and then giving a didactic presentation on common stress reactions and management.

The widespread use of CISD has occurred despite the publication of conflicting results regarding its efficacy. Claims that single-session psychological debriefing can prevent development of chronic negative psychological sequelae are not empirically supported (van Emmerik, Kamphuis, Hulsbosch, & Emmelkamp, 2002). Some controlled studies suggest that it may impede natural recovery from trauma (McNally, Bryant, & Ehlers, 2003). Other research suggests emphasizing screening to determine the need for early interventions. Mitchell and Everly (2001) point out that many of the studies showing negative

Advice to Counselors: Evidence Related to Immediate Interventions

Evidence related to immediate interventions suggests that:

- Early, brief, focused psychotherapeutic intervention provided in an individual or group format can reduce distress in bereaved spouses, parents, and children.
- Selected cognitive–behavioral approaches may help reduce the incidence, duration, and severity of acute stress disorder (ASD), PTSD, and depression in trauma survivors.
- A one-session individual recital of events and expression of emotions evoked by a traumatic event does not consistently reduce risk of later developing PTSD. In fact, it may increase the risk for adverse outcomes. Perhaps CISD hinders the natural recovery mechanisms that restore pretrauma functioning (Bonanno, 2004).
- The focus initially should be upon screening with follow-up as indicated.

results were not conducted with first responders; that is, CISD may be appropriate for some, but not all, groups. A recent study of 952 U.S. peacekeepers and CISD by the U.S. Army Research Unit–Europe (Adler et al., 2008) found mixed results.

Interventions Beyond the Initial Response to Trauma

In the interest of increasing your overall familiarity with relevant approaches, the following sections review several traumatic stress treatment approaches that counselors will most likely encounter when collaborating with clinicians or agencies that specialize in trauma-specific services and treating traumatic stress.

Cognitive–behavioral therapies

Most PTSD models involve cognitive–behavioral therapy (CBT) that integrates cognitive and behavioral theories by incorporating two ideas: first, that cognitions (or thoughts) mediate between situational demands and one's attempts to respond to them effectively, and second, that behavioral change influences acceptance of altered cognitions about oneself or a situation and establishment of newly learned cognitive–behavioral interaction patterns. In practice, CBT uses a wide range of coping strategies.

There are many different varieties of CBT. CBT originated in the 1970s (Beck, Rush, Shaw & Emery, 1979; Ellis & Harper, 1975) and has expanded since then to address various populations, including people who use substances, people who experience anxiety, people with PTSD or personality disorders, children and adolescents, individuals involved in the criminal justice system, and many others. CBT has also been expanded to include various techniques, coping skills, and approaches, such as dialectical behavior therapy (DBT; Linehan, 1993), Seeking Safety (Najavits, 2002a), and mindfulness (Segal, Williams, & Teasdale, 2002). Traditional CBT emphasizes symptom reduction or resolution, but recent CBT approaches have also emphasized the therapeutic relationship, a particularly important dynamic in trauma treatment (Jackson, Nissenson, & Cloitre, 2009).

A widely accepted framework in treating trauma, substance use disorders, and mental illness categorizes therapies as single (treatment of only one disorder), sequential (treatment of one disorder first, then the other), or parallel (concurrent treatment of multiple disorders delivered by separate clinicians or in separate programs that do not necessarily address the interactions between symptoms and disorders).

CBT has been applied to the treatment of trauma and has also been widely and effectively used in the treatment of substance use. A review of efficacy research on CBT for PTSD is provided by Rothbaum, Meadows, Resick, and Foy (2000). Najavits and colleagues (2009) and O'Donnell and Cook (2006) offer an overview of CBT therapies for treating PTSD and substance abuse. In addition, a free online training resource incorporating CBT for traumatized children within the community, Trauma-Focused CBT, is available from the Medical University of South Carolina (http://tfcbt.musc.edu/).

Cognitive processing therapy

Cognitive processing therapy (CPT) is a manualized 12-session treatment approach that can be administered in a group or individual setting (Resick & Schnicke, 1992, 1993). CPT was developed for rape survivors and combines elements of existing treatments for PTSD, specifically exposure therapy (see the "Exposure Therapy" section later in this chapter) and cognitive therapy. The exposure therapy component of treatment consists of

Advice to Counselors: Relaxation Training, Biofeedback, and Breathing Retraining Strategies

Relaxation training, biofeedback, and breathing retraining strategies may help some clients cope with anxiety, a core symptom of traumatic stress. However, no evidence supports the use of relaxation and biofeedback as effective standalone PTSD treatment techniques (Cahill, Rothbaum, Resick, & Follete, 2009). Both are sometimes used as complementary strategies to manage anxiety symptoms elicited by trauma-related stimuli. Breathing retraining uses focused or controlled breathing to reduce arousal. Breathing retraining and relaxation, along with other interventions when necessary, can help clients with ASD. An important caution in the use of breath work with trauma clients is that it can sometimes act as a trigger—for example, given its focus on the body and its potential to remind them of heavy breathing that occurred during assault. Biofeedback, which requires specialized equipment, combines stress reduction strategies (e.g., progressive muscle relaxation, guided imagery) with feedback from biological system measures (e.g., heart rate, hand temperature) that gauge levels of stress or anxiety reduction. Relaxation training, which requires no specialized equipment, encourages clients to reduce anxiety responses (including physiological responses) to trauma-related stimuli; it is often part of more comprehensive PTSD treatments (e.g., prolonged exposure and stress inoculation training [SIT]).

clients writing a detailed account of their trauma, including thoughts, sensations, and emotions that were experienced during the event. The client then reads the narrative aloud during a session and at home. The cognitive therapy aspect of CPT uses six key PTSD themes identified by McCann and Pearlman (1990): safety, trust, power, control, esteem, and intimacy. The client is guided to identify cognitive distortions in these areas, such as maladaptive beliefs.

Results from randomized, placebo-controlled trials for the treatment of PTSD related to interpersonal violence (Resick, 2001; Resick, Nishith, Weaver, Astin, & Feuer, 2002) support the use of CPT. CPT and prolonged exposure therapy models are equally and highly positive in treating PTSD and depression in rape survivors; CPT is superior in reducing guilt (Nishith, Resick, & Griffin, 2002; Resick et al., 2002; Resick, Nishith, & Griffin, 2003). CPT has shown positive outcomes with refugees when administered in the refugees' native language (Schulz, Marovic-Johnson, & Huber, 2006) and with veterans (Monson et al., 2006). However, CPT has not been studied with high-complexity populations such as individuals with substance dependence, homelessness, current domestic violence, serious and persistent mental illness, or suicidality. CPT requires a 3-day training plus consultation (Karlin et al., 2010). Resick and Schicke (1996) published a CPT treatment manual, *Cognitive Processing Therapy for Rape Victims: A Treatment Manual*.

Exposure therapy

Exposure therapy for PTSD asks clients to directly describe and explore trauma-related memories, objects, emotions, or places. Intense emotions are evoked (e.g., sadness, anxiety) but eventually decrease, desensitizing clients through repeated encounters with traumatic material. Careful monitoring of the pace and appropriateness of exposure-based interventions is necessary to prevent retraumatization (clients can become conditioned to fear the trauma-related material even more). Clients must have ample time to process their memories and integrate cognition and affect, so some sessions can last for 1.5 hours or more. For simple cases, exposure can work in as few as 9 sessions; more complex cases may require 20 or more sessions (Foa, Hembree, & Rothbaum, 2007). Various techniques can

Advice to Counselors: Steps for Introducing a Breathing Exercise

Use the following statements to lead clients through a breathing exercise:

- Place your hands on your stomach. As you inhale, breathe deeply but slowly so that your hands rise with your stomach. As you exhale slowly, practice breathing so that your hands drop with your stomach.
- Inhale slowly through your nose with your mouth closed; don't rush or force in the air.
- Exhale slowly through your mouth with your lips in the whistling position.
- Breathe out for twice as long as you breathe in.

expose the client to traumatic material. Two of the more common methods are exposure through imagery and in vivo ("real life") exposure.

The effectiveness of exposure therapy has been firmly established (Rothbaum et al., 2000); however, adverse reactions to exposure therapy have also been noted. Some individuals who have experienced trauma exhibit an exacerbation of symptoms during or following exposure treatments. Even so, the exacerbation may depend on counselor variables during administration. Practitioners of exposure therapy need comprehensive training to master its techniques (Karlin et al., 2010); a counselor unskilled in the methods of this treatment model can not only fail to help his or her clients, but also cause symptoms to worsen.

Exposure therapy is recommended as a first-line treatment option when the prominent trauma symptoms are intrusive thoughts, flashbacks, or trauma-related fears, panic, and avoidance. However, counselors should exercise caution when using exposure with clients who have not maintained stability in managing mental illness symptoms or abstinence from substance use disorders. Studies and routine use of exposure have consistently excluded high-complexity clients such as those with substance dependence, homelessness, current domestic violence, serious and persistent mental illness, or suicidality. The only trial of exposure therapy with a substance dependence sample found that it did not outperform standard substance abuse treatment on most variables (Mills et al., 2012).

Prolonged exposure therapy for PTSD is listed in SAMHSA's NREPP. For reviews of exposure therapy, also see Najavits (2007a) and Institute of Medicine (2008). In addition to prolonged exposure therapy, other therapies incorporate exposure and desensitization techniques, including eye movement desensitization and reprocessing (EMDR; Shapiro, 2001), cognitive processing, and systematic desensitization therapies (Wolpe, 1958).

Eye movement desensitization and reprocessing

EMDR (Shapiro, 2001) is one of the most widely used therapies for trauma and PTSD. The treatment protocols of EMDR have evolved into sophisticated paradigms requiring training and, preferably, clinical supervision. EMDR draws on a variety of theoretical

A Brief Description of EMDR Therapy

Treatment involves three main concentrations (past memories, present disturbances, future actions) and eight phases. Counselors may work with several phases in one session. Each phase is meant to be revisited either in every session or when appropriate (e.g., the closure process is meant to be conducted at the end of every session, in preparation for the next).

- Phase 1: History and Treatment Planning (1-2 sessions)
- Phase 2: Preparation
- Phase 3: Assessment and Reprocessing
- Phase 4: Desensitization
- Phase 5: Installation
- Phase 6: Body Scan
- Phase 7: Closure
- Phase 8: Reevaluation

Source: EMDR Network, 2012.

frameworks, including psychoneurology, CBT, information processing, and nonverbal representation of traumatic memories. The goal of this therapy is to process the experiences that are causing problems and distress. It is an effective treatment for PTSD (Seidler & Wagner, 2006) and is accepted as an evidence-based practice by the U.S. Department of Veterans Affairs (VA), the Royal College of Psychiatrists, and the International Society for Traumatic Stress Studies (Najavits, 2007a); numerous reviews support its effectiveness (e.g., Mills et al., 2012). EMDR values the development of "resource installation" (calming procedures) and engages in exposure work to desensitize clients to traumatic material, using external tracking techniques across the visual field to assist in processing distressing material. Training in EMDR, available through the EMDR Institute, is required before counselors use this treatment. It is listed in SAMHSA's NREPP (EMDR Network, 2012). Thus far, there is no study examining the use of EMDR with clients in substance abuse treatment. See Part 3 of this TIP, available online, to review empirical work on EMDR.

Narrative therapy

Narrative therapy is an emerging approach to understanding human growth and change; it is founded on the premise that individuals are the experts on their own lives and can access their existing intrapsychic and interpersonal resources to reduce the impact of problems in their lives. Developed for the treatment of PTSD resulting from political or community violence, narrative therapy is based on CBT principles, particularly exposure therapy (Neuner, Schauer, Elbert, & Roth, 2002; Neuner, Schauer, Klaschik, Karunakara, & Elbert, 2004). This approach views psychotherapy not as a scientific practice, but as a natural extension of healing practices that have been present throughout human history. For a trauma survivor, the narrative, as it is told and retold, expresses the traumatic experience, puts the trauma in the context of the survivor's life, and defines the options he or she has for change. Narrative structure helps clients connect events in their lives, reveals strings of events, explores alternative expressions of trauma, evokes explanations for clients' behaviors, and identifies their knowledge and skills. The use of stories in therapy, with the client as the storyteller, generally helps lessen suffering (McLeod, 1997; White, 2004).

In the substance abuse treatment field, many clients will see a connection between narrative therapy and the process of telling their stories in 12 Step programs, in which reframing life stories of feeling trapped, despairing, and hopeless leads to stories of strength, joy, and hope. Key storytelling points at a 12 Step speaker meeting include describing what an experience was like, what happened, and what it is like now.

Skills training in affective and interpersonal regulation

Skills training in affective and interpersonal regulation (STAIR) is a two-phase cognitive–behavioral model that adapts therapies developed by others into a new package (Cloitre, Koenen, Cohen, & Han, 2002). Phase 1 consists of eight weekly sessions of skills training in affect and interpersonal regulation derived from general CBT and DBT (Linehan, 1993) and adapted to address trauma involving childhood abuse. Session topics are labeling and identifying feelings, emotion management, distress tolerance, acceptance of feelings, identifying trauma-based interpersonal schemas, identifying conflict between trauma-generated feelings and current interpersonal goals, role-plays on issues of power and control, and role-plays on developing flexibility in interpersonal situations. Phase 2 features eight

STAIR Steps

Phase 1, tailored to individual clients, is called Skills Training in Affect Regulation and consists of the following components:

- Psychoeducation: Describe the symptoms of PTSD and explain the treatment rationale.
- Training in experiencing and identifying feelings, triggers, and thoughts, as well as training in mood regulation strategies.
- Learning history: Ask the client the following questions—How did the client deal with traumas past and present? How did the client's family deal with feelings? How did the client's family life affect his or her present difficulty experiencing and identifying feeling?
- Emotion regulation skills: Identify the cognitive, behavioral, and social support modalities for coping. Use data gathered with self-monitoring forms to identify strengths and weaknesses in each coping modality. Teach skills such as breathing retraining, self-statements to reduce fear, and social skill training to improve social support.
- Acceptance and tolerance of negative affect: Motivate clients to face distressing situations related to the trauma that are important to them. Review negative repercussions of avoidance. Discuss tolerating negative affect as a step toward achieving specific goals.
- Schema therapy for improved relationships: Identify relevant schemas learned in childhood. Suggest alternative ways of viewing self and others in current relationships. Use role-playing to teach assertiveness, emphasizing response flexibility based on relative power in each relationship.

Once Phase 1 of STAIR is well learned, clients move to Phase 2, which involves exposure therapy.

Source: Mollick & Spett, 2002.

sessions of modified prolonged exposure using a narrative approach.

Cloitre and colleagues (2002) assigned women with PTSD related to childhood abuse randomly to STAIR or a minimal attention waitlist, excluding clients with current substance dependence as well as other complexities. STAIR participants showed significantly greater gains in affect regulation, interpersonal skills, and PTSD symptoms than the control participants. These gains were maintained through follow-up at 3 and 9 months. However, it is not clear from this study whether DBT and exposure were both needed. Phase 1 therapeutic alliance and negative mood regulation skills predicted Phase 2 exposure success in reducing PTSD, suggesting the importance of establishing a strong therapeutic relationship and emotion regulation skills before conducting exposure work with people who have chronic PTSD.

Stress inoculation training

SIT was originally developed to manage anxiety (Meichenbaum, 1994; Meichenbaum & Deffenbacher, 1988). Kilpatrick, Veronen, and Resick (1982) modified SIT to treat rape survivors based on the idea that the anxiety and fear that rape survivors experience during their trauma generalizes to other objectively safe situations. SIT treatment components include education, skills training (muscle relaxation training, breathing retraining, role-playing, guided self-talk, assertiveness training, and thought stopping [i.e., actively and forcefully ending negative thoughts by thinking

SIT has been used to help individuals cope with the aftermath of exposure to stressful events and on a preventative basis to "inoculate" individuals to future and ongoing stressors (Meichenbaum, 1996). This practice as a preventive strategy is similar to promoting disease resistance through immunizations.

Advice to Counselors: SIT Phases

SIT is a prevention and treatment approach that has three overlapping phases. It is often seen as a complementary approach to other interventions for traumatic stress.

Phase 1: Conceptualization and education. This phase has two main objectives. The initial goal is to develop a collaborative relationship that supports and encourages the client to confront stressors and learn new coping strategies. The next objective is to increase the client's understanding of the nature and impact of his or her stress and awareness of alternative coping skills. Many cognitive strategies are used to meet these objectives, including self-monitoring activities, Socratic questioning, identifying strengths and evidence of resilience, and modeling of coping strategies.

Phase 2: Skill acquisition and rehearsal. This phase focuses on developing coping skills and using coping skills that the individual already possesses. This process includes practice across settings, so that the individual begins to generalize the use of his or her skills across situations through rehearsal, rehearsal, and more rehearsal.

Phase 3: Implementation and following through. The main objective is to create more challenging circumstances that elicit higher stress levels for the client. By gradually increasing the challenge, the client can practice coping strategies that mimic more realistic circumstances. Through successful negotiation, the client builds a greater sense of self-efficacy. Common strategies in this phase include imagery and behavioral rehearsal, modeling, role-playing, and graded in vivo exposure.

Source: Meichenbaum, 2007.

"STOP" and then redirecting thoughts in a more positive direction]), and skills application. The goal is to help clients learn to manage their anxiety and to decrease avoidant behavior by using effective coping strategies. Randomized controlled clinical trials have indicated that SIT reduces the severity of PTSD compared with waitlist controls and shows comparable efficacy to exposure therapy. At follow-up (up to 12 months after treatment), gains were maintained (Foa et al., 1999; Foa, Rothbaum, Riggs, & Murdock, 1991).

Other therapies

Numerous interventions introduced in the past 20 years focus on traumatic stress. For some interventions, the evidence is limited, and for other others, it is evolving. One example is the traumatic incident reduction (TIR) approach. This brief memory-oriented intervention is designed for children, adolescents, and adults who have experienced traumatic stress (Valentine & Smith, 2001). Listed in SAMHSA's NREPP, the intervention is designed to process specific traumatic incidents or problematic themes related to the trauma, including specific feelings, emotions, sensations, attitudes, or pain. It involves having clients talk through the traumatic incident repeatedly with the anticipation that changes in affect will occur throughout the repetitions. TIR is a client-centered approach.

Integrated Models for Trauma

This section covers models specifically designed to treat trauma-related symptoms along with either mental or substance use disorders at the same time. Integrated treatments help clients work on several presenting problems simultaneously throughout the treatment, a promising and recommended strategy (Dass-Brailsford & Myrick, 2010; Najavits, 2002b; Nixon & Nearmy, 2011). Thus far, research is limited, but what is available suggests that integrated treatment models effectively reduce

substance abuse, PTSD symptoms, and other mental disorder symptoms. TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (Center for Substance Abuse Treatment, 2005c), offers a detailed description of integrated treatment. In contrast with integrated models, other model types include single (treatment of only one disorder), sequential (treatment of one disorder first, then the other), or parallel (concurrent treatment of multiple disorders delivered by separate clinicians or in separate programs that do not necessarily address the interactions between symptoms and disorders).

Similar to single models, integrated treatment models are designed for use in a variety of settings (e.g., outpatient, day treatment, and/or residential substance abuse and mental health clinics/programs). Most models listed are manual-based treatments that address trauma-related symptoms, mental disorders, and substance use disorders at the same time. Additional approaches and further details on the selected approaches can be found at NREPP (http://www.nrepp.samhsa.gov).

Addiction and Trauma Recovery Integration Model

The Addiction and Trauma Recovery Integrated Model (ATRIUM; Miller & Guidry, 2001) integrates CBT and relational treatment through an emphasis on mental, physical, and spiritual health. This 12-week model for individuals and groups blends psychoeducational, process, and expressive activities, as well as information on the body's responses to addiction and traumatic stress and the impact of trauma and addiction on the mind and spirit. It helps clients explore anxiety, sexuality, self-harm, depression, anger, physical complaints and ailments, sleep difficulties, relationship challenges, and spiritual disconnection. It was designed primarily for women and focuses on developmental (childhood) trauma and interpersonal violence, but it recognizes that other types of traumatic events occur.

The ATRIUM model consists of three phases of treatment. The first stage, or "outer circle," consists of the counselor collecting data from the client about his or her trauma history, offering psychoeducation on the nature of trauma, and helping the client assess personal strengths. ATRIUM actively discourages the evocation of memories of abuse or other trauma events in this phase. The second stage, or "middle circle," allows clients and counselors to address trauma symptoms more directly and specifically encourages clients to reach out to and engage with support resources in the community. The middle circle also emphasizes learning new information about trauma and developing additional coping skills. The third stage of the program, the "inner circle," focuses on challenging old beliefs that arose as a result of the trauma. For instance, the concept of "nonprotecting bystander" is used to represent the lack of support that the traumatized person experienced at the time of the trauma. This representation is replaced with the "protective presence" of supportive others today.

ATRIUM was used in one of the nine study sites of SAMHSA's Women, Co-Occurring Disorders and Violence Study. Across all sites, trauma-specific models achieved more favorable outcomes than control sites that did not use trauma-specific models (Morrissey et al., 2005). There has not yet been a study of ATRIUM per se, however. A manual describing the theory behind this model in greater depth, as well as how to implement it, is published under the title *Addictions and Trauma Recovery: Healing the Body, Mind, and Spirit* (Miller & Guidry, 2001).

Beyond Trauma: A Healing Journey for Women

Beyond Trauma (Covington, 2003) is a curriculum for women's services based on theory, research, and clinical experience. It was developed for use in residential, outpatient, and correctional settings; domestic violence programs; and mental health clinics. It uses behavioral techniques and expressive arts and is based on relational therapy. Although the materials are designed for trauma treatment, the connection between trauma and substance abuse in women's lives is a theme throughout. Beyond Trauma has a psychoeducational component that defines trauma by way of its process as well as its impact on the inner self (thoughts, feelings, beliefs, values) and the outer self (behavior and relationships, including parenting). Coping skills are emphasized; specific exercises develop emotional wellness.

Concurrent Treatment of PTSD and Cocaine Dependence

Concurrent Treatment of PTSD and Cocaine Dependence (CTPCD) is a 16-session, twice-weekly individual outpatient psychotherapy model designed to treat women and men with co-occurring PTSD and cocaine dependence (Coffey, Schumacher, Brimo, & Brady, 2005). CTPCD combines imagery and in vivo exposure therapy (in which the client becomes desensitized to anxiety-producing stimuli through repeated exposure to them) for the treatment of PTSD with elements of CBT for substance dependence. To balance the dual needs of abstinence skill building and prompt trauma treatment, the first five sessions focus on coping skills for cocaine dependence. Session six transitions into exposure therapy, which begins in earnest in session seven and is combined with CBT for the treatment of substance abuse.

CTPCD helps reduce substance use and PTSD symptoms. The use of any illicit drug, as measured by urine screens, was quite low during the 16-week treatment trial and didn't escalate during the second half of treatment—when most exposure sessions occurred. PTSD symptoms dropped significantly over the course of treatment, as did self-reported depressive symptoms; however, the dropout rate was high (Coffey, Dansky, & Brady, 2003). CTPCD was reformulated into Concurrent Prolonged Exposure (COPE; Mills et al., 2012), which was compared with treatment as usual in a high-complexity clinical sample of individuals who had PTSD and substance dependence. Both treatment conditions resulted in improvements in PTSD with no difference at 3 months (though COPE showed significantly greater improvement at 9 months); moreover, the two conditions did not differ in impact on substance use outcomes, depression, or anxiety.

Integrated CBT

Integrated CBT is a 14-session individual therapy model designed for PTSD and substance use. It incorporates elements such as psychoeducation, cognitive restructuring, and breathing retraining (McGovern, Lamber-Harris, Alterman, Xie, & Meier, 2011). A randomized controlled trial showed that both integrated CBT and individual addiction treatment achieved improvements in substance use and other measures of psychiatric symptom severity with no difference between the treatments.

Seeking Safety

Seeking Safety is an empirically validated, present-focused treatment model that helps clients attain safety from trauma and substance abuse (Najavits, 2002a). The Seeking Safety manual (Najavits, 2002b) offers clinician guidelines and client handouts and is available in

several languages. Training videos and other implementation materials are available online (http://www.seekingsafety.org). Seeking Safety is flexible; it can be used for groups and individuals, with women and men, in all settings and levels of care, by all clinicians, for all types of trauma and substance abuse.

Seeking Safety covers 25 topics that address cognitive, behavioral, interpersonal, and case management domains. The topics can be conducted in any order, using as few or as many as are possible within a client's course of treatment. Each topic represents a coping skill relevant to both trauma and substance abuse, such as compassion, taking good care of yourself, healing from anger, coping with triggers, and asking for help. This treatment model builds hope through an emphasis on ideals and simple, emotionally evocative language and quotations. It attends to clinician processes and offers concrete strategies that are thought to be essential for clients dealing with concurrent substance use disorders and histories of trauma.

More than 20 published studies (which include pilot studies, randomized controlled trials, and multisite trials representing various investigators and populations) provide the evidence base for this treatment model. For more information, see SAMHSA's NREPP Web site (http://www.nrepp.samhsa.gov) as well as the "Outcomes" section of the Seeking Safety Web site (http://www.seekingsafety.org/3-03-06/studies.html). Study samples included people with chronic, severe trauma symptoms and substance dependence who were diverse in ethnicity and were treated in a range of settings (e.g., criminal justice, VA centers, adolescent treatment, homelessness services, public sector). Seeking Safety has shown positive outcomes on trauma symptoms, substance abuse, and other domains (e.g., suicidality, HIV risk, social functioning, problem-solving, sense of meaning); consistently outperformed treatment as usual; and achieved high satisfaction ratings from both clients and clinicians. It has been translated into seven languages, and a version for blind and/or dyslexic individuals is available.

The five key elements of Seeking Safety are:

1. Safety as the overarching goal (helping clients attain safety in their relationships, thinking, behavior, and emotions).
2. Integrated treatment (working on trauma and substance abuse at the same time).
3. A focus on ideals to counteract the loss of ideals in both trauma and substance abuse.
4. Four content areas: cognitive, behavioral, interpersonal, and case management.
5. Attention to clinician processes (addressing countertransference, self-care, and other issues).

Substance Dependence PTSD Therapy

Substance Dependence PTSD Therapy (Triffleman, 2000) was designed to help clients of both sexes cope with a broad range of traumas. It combines existing treatments for PTSD and substance abuse into a structured, 40-session (5-month, twice-weekly) individual therapy that occurs in two phases. Phase I is "Trauma-Informed, Addictions-Focused Treatment" and focuses on coping skills and cognitive interventions as well as creating a safe environment. Phase I draws on CBT models, anger management, relaxation training, HIV risk reduction, and motivational enhancement techniques. Phase II, "Trauma-Focused, Addictions-Informed Treatment," begins with psychoeducation about PTSD followed by "Anti-Avoidance I," in which a modified version of stress inoculation training is taught in two to four sessions. Following this is "Anti-Avoidance II," lasting 6 to 10 sessions, in which in vivo exposure is used.

Trauma Affect Regulation: Guide for Education and Therapy

Trauma Affect Regulation: Guide for Education and Therapy (TARGET; Ford & Russo, 2006; Frisman, Ford, Lin, Mallon, & Chang, 2008) uses emotion and information processing in a present-focused, strengths-based approach to education and skills training for trauma survivors with severe mental, substance use, and co-occurring disorders across diverse populations. TARGET helps trauma survivors understand how trauma changes the brain's

TARGET: The Seven-Step FREEDOM Approach

Focus: Being focused helps a person pay attention and think about what's happening right now instead of just reacting based on alarm signals tied to past trauma. This step teaches participants to use the SOS skill (Slow down, Orient, Self-check) to pay attention to body signals and the immediate environment and to use a simple scale to measure stress and control levels.

Recognize triggers: Recognizing trauma triggers enables a person to anticipate and reset alarm signals as he or she learns to distinguish between a real threat and a reminder. This step helps participants identify personal triggers, take control, and short-circuit their alarm reactions.

Emotion self-check: The goal of this skill is to identify two types of emotions. The first are "alarm" or reactive emotions such as terror, rage, shame, hopelessness, and guilt. Because these emotions are the most noticeable after trauma, they are the alarm system's way of keeping a person primed and ready to fend off further danger. The second type of emotion, "main" emotions, include positive feelings (e.g., happiness, love, comfort, compassion) and feelings that represent positive strivings (e.g., hope, interest, confidence). By balancing both kinds of emotions, a person can reflect and draw on his or her own values and hopes even when the alarm is activated.

Evaluate thoughts: When the brain is in alarm mode, thinking tends to be rigid, global, and catastrophic. Evaluating thoughts, as with identifying emotions, is about achieving a healthier balance of positive as well as negative thinking. Through a two-part process, participants learn to evaluate the situation and their options with a focus on how they choose to act—moving from reactive thoughts to "main" thoughts. This is a fundamental change from the PTSD pattern, which causes problems by taking a person straight from alarm signals to automatic survival reactions.

Define goals: Reactive goals tend to be limited to just making it through the immediate situation or away from the source of danger. These reactive goals are necessary in true emergencies but don't reflect a person's "main" goals of doing worthwhile things and ultimately achieving a good and meaningful life. This step teaches one how to create "main" goals that reflect his or her deeper hopes and values.

Options: The only options that are available when the brain's alarm is turned on and won't turn off are automatic "flight/fight" or "freeze/submit" reactive behaviors that are necessary in emergencies but often unhelpful in ordinary living. This step helps identify positive intentions often hidden by the more extreme reactive options generated by the alarm system. This opens the possibility for a greater range of options that take into consideration one's own needs and goals as well as those of others.

Make a contribution: When the brain's alarm is turned on and reacting to ordinary stressors as if they were emergencies, it is very difficult for a person to come away from experiences with a feeling that they have made a positive difference. This can lead to feelings of alienation, worthlessness, or spiritual distress. The ultimate goal of TARGET is to empower adults and young people to think clearly enough to feel in control of their alarm reactions and, as a result, to be able to recognize the contribution they are making not only to their own lives, but to others' lives as well.

Source: Advanced Trauma Solutions, 2012.

normal stress response into an extreme survival-based alarm response that can lead to PTSD, and it teaches them a seven-step approach to making the PTSD alarm response less distressing and more adaptive (summarized by the acronym FREEDOM: Focus, Recognize triggers, Emotion self-check, Evaluate thoughts, Define goals, Options, and Make a contribution).

TARGET can be presented in individual therapy or gender-specific psychoeducational groups, and it has been adapted for individuals who are deaf; it has also been translated into Spanish and Dutch. TARGET is a resilience-building and recovery program not limited to individual or group psychotherapy; it is also designed to provide an educational curriculum and milieu intervention that affects all areas of practice in school, therapeutic, or correctional programs. TARGET is listed in SAMHSA's NREPP (http://www.nrepp.samhsa.gov).

Trauma Recovery and Empowerment Model

The trauma recovery and empowerment model (TREM) of therapy (Fallot & Harris, 2002; Harris & Community Connections Trauma Work Group, 1998) is a manualized group intervention designed for female trauma survivors with severe mental disorders. TREM addresses the complexity of long-term adaptation to trauma and attends to a range of difficulties common among survivors of sexual and physical abuse. TREM focuses mainly on developing specific recovery skills and current functioning and uses techniques that are effective in trauma recovery services. The model's content and structure, which cover 33 topics, are informed by the role of gender in women's experience of and coping with trauma.

TREM can be adapted for shorter-term residential settings and outpatient substance abuse treatment settings, among others. Adaptations of the model for men and adolescents are available. The model was used in SAMHSA's Women, Co-Occurring Disorders and Violence Study for three of the nine study sites and in SAMHSA's Homeless Families program, and it is listed in SAMHSA's NREPP. This model has been used with clients in substance abuse treatment; research by Toussaint, VanDeMark, Bornemann, and Graeber (2007) shows that women in a residential substance abuse treatment program showed significantly better trauma treatment outcomes using TREM than they did in treatment as usual, but no difference in substance use.

TREM Program Format

Each session includes an experiential exercise to promote group cohesiveness. The 33 sessions are divided into the following general topic areas:

- **Part I–empowerment** introduces gender identity concepts, interpersonal boundaries, and self-esteem.
- **Part II–trauma recovery** concentrates on sexual, physical, and emotional abuse and their relationship to psychiatric symptoms, substance abuse, and relational patterns and issues.
- **Part III–advanced trauma recovery issues** addresses additional trauma issues, such as blame and the role of forgiveness.
- **Part IV–closing rituals** allows participants to assess their progress and encourages them to plan for their continued healing, either on their own or as part of a community of other survivors.
- **Part V–modifications or supplements for special populations** provides modifications for subgroups such as women with serious mental illness, incarcerated women, women who are parents, women who abuse substances, and male survivors.

Triad Women's Project

The Triad Project was developed as a part of SAMHSA's Women, Co-Occurring Disorders and Violence Study. It is a comprehensive, trauma-informed, consumer-responsive integrated model designed for female trauma survivors with co-occurring substance use and mental disorders who live in semirural areas. Triad integrates motivational enhancement for substance use disorders, DBT, and intensive case management techniques for co-occurring mental disorders. This program is a 16-week group intervention for women that uses integrated case management services, a curriculum-based treatment group, and a peer support group (Clark & Fearday, 2003).

Emerging Interventions

New interventions are emerging to address traumatic stress symptoms and disorders. The following sections summarize a few interventions not highlighted in prior chapters; this is not an exhaustive list. In addition to specific interventions, technology is beginning to shape the delivery of care and to increase accessibility to tools that complement trauma-specific treatments. Numerous applications are available and evolving. For more information on the role of technology in the delivery of care, see the planned TIP, *Using Technology-Based Therapeutic Tools in Behavioral Health Services* (SAMHSA, planned g).

Couple and Family Therapy

Trauma and traumatic stress affects significant relationships, including the survivor's family. Although minimal research has targeted the effectiveness of family therapy with trauma survivors, it is important to consider the needs of the individual in the context of their relationships. Family and couples therapy may be key to recovery. Family members may experience secondary traumatization silently, lack understanding of traumatic stress symptoms or treatment, and/or have their own histories of trauma that influence their willingness to support the client in the family or to talk about anything related to trauma and its effects. Family members can engage in similar patterns of avoidance and have their own triggers related to the trauma being addressed at the time. A range of couple and family therapies have addressed traumatic stress and PTSD, but few studies exist that support or refute their value. Current couple or family therapies that have some science-based evidence include behavioral family therapy, behavioral marital therapy, cognitive–behavioral couples treatment, and lifestyle management courses (Riggs, Monson, Glynn, & Canterino, 2009).

Mindfulness Interventions

Mindfulness is a process of learning to be present in the moment and observing internal experience (e.g., thoughts, bodily sensations) and external experience (e.g., interactions with others) in a nonjudgmental way. Mindfulness challenges limiting beliefs that arise from trauma, quells anxiety about future events, and simply helps one stay grounded in the present. It plays a significant role in helping individuals who have been traumatized observe their experiences, increase awareness, and tolerate uncomfortable emotions and cognitions.

To date, mindfulness-based interventions appear to be valuable as an adjunct to trauma-specific interventions and in decreasing arousal (Baer, 2003). It may also help individuals tolerate discomfort during exposure-oriented and trauma processing interventions. Overall, mindfulness practices can help clients in managing traumatic stress, coping, and resilience. In a study of firefighters, mindfulness was associated with fewer PTSD symptoms, depressive symptoms, physical symptoms, and alcohol problems when controlling for other variables (Smith et al., 2011).

Becoming an Observer and Learning To Tolerate Discomfort: The Leaf and Stream Metaphor

The following exercise, "leaves floating on a stream," is a classic. Many clinicians and authors provide renditions of this mindfulness practice. The main objectives are to stand back and observe thoughts rather than get caught up in them. Simply stated, thoughts are just thoughts. Thoughts come and go like water flowing down a stream. We don't need to react to the thoughts; instead, we can just notice them.

Conduct the mindfulness exercise for about 10 minutes, then process afterward. Take time to allow participants to visualize each sense as they imagine themselves sitting next to the stream. For example, what does it look like? What do they hear as they sit next to the stream? Don't rush the exercise. As you slowly make the statements detailed in the following two paragraphs, take time in between each statement for participants to be in the exercise without interruption; simply offer gentle guidance.

Begin to sit quietly, bringing your attention to your breath. If you feel comfortable, close your eyes. As you focus on breathing in and out, imagine that you are sitting next to a stream. In your imagination, you may clearly see and hear the stream, or you may have difficulty visualizing the stream. Follow along with the guided exercise; either way, it will work just as well.

Now begin to notice the thoughts that come into your mind. Some thoughts rush by, while others linger. Just allow yourself to notice your thoughts. As you begin to notice each thought, imagine putting those words onto a leaf as it floats by on the stream. Just let the thoughts come, watching them drift by on the leaves. If your thoughts briefly stop, continue to watch the water flow down the stream. Eventually, your thoughts will come again. Just let them come, and as they do, place them onto a leaf. Your attention may wander. Painful feelings may arise. You may feel uncomfortable or start to think that the exercise is "stupid." You may hook onto a thought—rehashing it repeatedly. That's okay; it's what our minds do. As soon as you notice your mind wandering or getting stuck, just gently bring your focus back to your thoughts, and place them onto the leaves. Now, bring your attention back to your breath for a moment, then open your eyes and become more aware of your environment.

Facilitated Questions:

- What was it like for you to observe your thoughts?
- Did you get distracted? Stuck?
- Were you able to bring yourself back to the exercise after getting distracted?
- In what ways was the exercise uncomfortable?
- In what ways was the exercise comforting?

For clients and practitioners who want to develop a greater capacity for mindfulness, see Kabat-Zinn's books *Wherever You Go, There You Are: Mindfulness Meditation In Everyday Life* (1994) and *Full Catastrophe Living: Using the Wisdom of Your Body and Mind to Face Stress, Pain, and Illness* (1990). For clinical applications of mindfulness, see *Mindfulness-Based Cognitive Therapy for Depression: A New Approach to Preventing Relapse* (Segal et al., 2002) and *Relapse Prevention: Maintenance Strategies in the Treatment of Addictive Behaviors* (Marlatt & Donovan, 2005).

Pharmacological Therapy

Pharmacotherapy for people with mental, substance use, and traumatic stress disorders needs to be carefully managed by physicians who are well versed in the treatment of each condition. Medications can help manage and control symptoms; however, they are only a part of a comprehensive treatment plan. There

are no specific "antitrauma" drugs; rather, certain drugs target specific trauma symptoms. Clients receiving pharmacotherapy need careful assessment. Some clients with preexisting mental disorders may need further adjustment in medications due to the physiological effects of traumatic stress. In addition, sudden withdrawal from a pattern of self-administered substances can not only lead to dangerous levels of physical distress, but also exacerbate the emergence of more severe PTSD symptoms. Distress after trauma often lessens over time, which can sometimes make the use of medications unnecessary for some individuals. Some trauma survivors do not develop long-term psychological problems from their experiences that require medication; others may simply refuse the initiation of pharmacotherapy or the use of additional medications.

Concluding Note

Behavioral health counselors can best serve clients who have experienced trauma by providing integrated treatment that combines therapeutic models to target presenting symptoms and disorders. Doing so acknowledges that the disorders interact with each other. Some models have integrated curricula; others that address trauma alone can be combined with behavioral health techniques with which the counselor is already familiar.

In part, the choice of a treatment model or general approach will depend on the level of evidence for the model, the counselor's training, identified problems, the potential for prevention, and the client's goals and readiness for treatment. Are improved relationships with family members a goal? Will the client be satisfied if sleep problems decrease, or is the goal resolution of broader issues? Are there substance use or substance-related disorders? Is the goal abstinence? Collaborating with clients to decide on goals, eliciting what they would like from treatment, and determining what they expect to happen can provide some clues as to what treatment models or techniques might be successful in keeping clients engaged in recovery.

Part 2: An Implementation Guide for Behavioral Health Program Administrators

1 Trauma-Informed Organizations

IN THIS CHAPTER

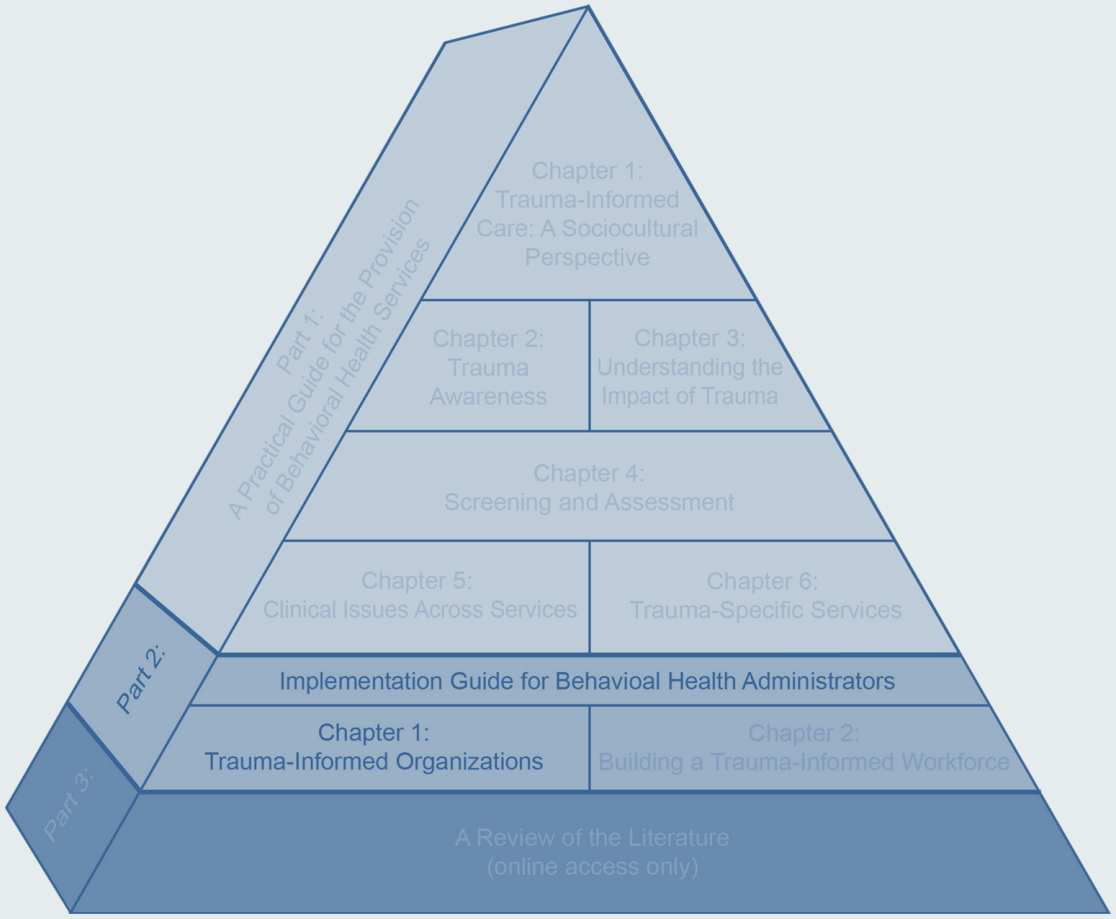
- Show Organizational and Administrative Commitment to TIC
- Use Trauma Informed Principles in Strategic Planning
- Review and Update Vision, Mission, and Value Statements
- Assign a Key Staff Member To Facilitate Change
- Create a Trauma Informed Oversight Committee
- Conduct an Organizational Self Assessment of Trauma Informed Services
- Develop an Implementation Plan
- Develop Policies and Procedures To Ensure Trauma Informed Practices and To Prevent Retraumatization
- Develop a Disaster Plan
- Incorporate Universal Routine Screenings
- Apply Culturally Responsive Principles
- Use Science Based Knowledge
- Create a Peer Support Environment
- Obtain Ongoing Feedback and Evaluations
- Change the Environment To Increase Safety
- Develop Trauma Informed Collaborations

Part 2 provides a broad overview of how to create and implement an institutional framework for trauma-informed services in program delivery and staff development, policies and procedures, administrative practices, and organizational infrastructure in behavioral health services. Chapter 1, "Trauma-Informed Organizations," focuses on specific organizational strategies that will help develop a trauma-informed culture in behavioral health settings. Numerous strategies are presented, including organizational commitment to trauma-informed care (TIC), trauma-informed organizational assessment, implementation of universal screening for trauma, and creation of a peer support environment.

Chapter 2, "Building a Trauma-Informed Workforce," focuses on organizational activities that foster the development of a trauma-informed workforce, including recruiting, hiring, and retaining trauma-informed staff; providing training on evidence-based and emerging trauma-informed best practices; developing competencies specific to TIC; addressing ethical considerations; providing trauma-informed supervision; and preventing and treating secondary trauma in behavioral health service providers.

The strategies described in the following sections can help supervisors and other administrative staff members create a trauma-informed behavioral health environment. As a starting point, the administration should identify key personnel and consumers to guide the organizational change process and the organizational assessment. Administrators and supervisors need to plan for and demonstrate an ongoing commitment to these strategies, or staff may perceive development activities as comprising yet another idea or demand from the agency that is short-lived beyond the initial thrust of training.

TIC Framework in Behavioral Health Services—Trauma-Informed Organizations



Creating a trauma-informed organization is a fluid, ongoing process; it has no completion date. Consumer demographics change across time, exposure to specific types of trauma may become more prevalent, and knowledge of best and evidence-based practices (EBPs) will continue to advance. A trauma-informed organization continues to demonstrate a commitment to compassionate and effective practices and organizational reassessments, and it changes to meet the needs of consumers with histories of trauma. It is encouraging that recent Substance Abuse and Mental Health Services Administration (SAMHSA) data indicates that the majority of over 10,000 programs they surveyed state that they provide trauma-related care (Capezza & Najavits, 2012). However, there remains a major need to make TIC consistently high-quality, routine, and pervasive across treatment systems.

The following stages form the basis of creating a trauma-informed organization:

1. Commit to creating a trauma-informed agency.
2. Create an initial infrastructure to initiate, support, and guide changes.
3. Involve key stakeholders, including consumers who have histories of trauma.
4. Assess whether and to what extent the organization's current policies, procedures, and operations either support TIC or interfere with the development of a trauma-informed approach.
5. Develop an organizational plan to implement and support the delivery of TIC within the agency.

Trauma-Informed Services and Service Systems

"A trauma-informed service system and/or organization is one in which all components of the system have been reconsidered and evaluated in the light of a basic understanding of the role that violence and trauma play in the lives of people seeking mental health and addiction services. A 'trauma-informed' organizational environment is capable of supporting and sustaining 'trauma-specific' services as they develop. A trauma-informed system recognizes that trauma results in multiple vulnerabilities and affects many aspects of a survivor's life over the lifespan, and therefore coordinates and integrates trauma-related activities and training with other systems of care serving trauma survivors. A basic understanding of trauma and trauma dynamics…should be held by all staff and should be used to design systems of services in a manner that accommodates the vulnerabilities of trauma survivors and allows services to be delivered in a way that will avoid retraumatization and facilitate consumer participation in treatment. A trauma-informed service system is knowledgeable and competent to recognize and respond effectively to adults and children traumatically impacted by any of a range of overwhelming adverse experiences, both interpersonal in nature and caused by natural events and disasters. There should be written plans and procedures to develop a trauma-informed service system and/or trauma-informed organizations and facilities with methods to identify and monitor progress. Training programs for this purpose should be implemented."

Source: Jennings, 2009, pp. 111–112.

6. Create collaborations between providers and consumers and among service providers and various community agencies.
7. Put the organizational plan into action.
8. Reassess the implementation of the plan and its ability to meet the needs of consumers and to provide consistent TIC on an ongoing basis.
9. Implement quality improvement measures as needs and problem areas are identified.
10. Institute practices that support sustainability, such as ongoing training, clinical supervision, consumer participation and feedback, and resource allocation.

Strategy #1: Show Organizational and Administrative Commitment to TIC

Foremost, administrators need to understand the impact that trauma can have on people's lives. The consistent delivery of TIC is only as effective as the organization's commitment, which must extend to administrative practices with staff members, program policies and procedures, program design, staffing patterns, use of peer support, staff and peer training and supervision, organizational assessment and consumer feedback, and resources to uphold trauma-informed principles and practices. Even short-term change is not sustainable without the agency's continual commitment.

Typically, desirable organizational change doesn't occur by accident. It comes from steadfast leadership, a convincing message that change is necessary and beneficial for staff and consumers, and resources that support change. Many people naturally resist change; thus, an organization's commitment includes a willingness to discuss with staff members the impact and role of trauma in their service setting, patience in planning and implementation, and

Seminal Resource for Administrators

As you investigate how best to implement or improve trauma informed services within your organization or across systems, review the influential work, *Using Trauma Theory to Design Service Systems: New Directions for Mental Health Services.*

(Harris & Fallot, 2001c)

Advice to Administrators: Managing Staff Reactions to Implementation of New Processes or Ideas

A common hurdle for administrators after introducing a new process or idea is the staff assumption that it will require more work. Frontline staff members are often inundated with many responsibilities beyond face-to-face time with clients. In addition, a common misperception is that if you begin to address trauma, you will have difficulty containing it.

In addition to administrative buy-in, administrators must promote rather than simply announce the implementation of trauma-informed services. Promotion includes educating staff about the rationale for trauma-informed services, offering opportunities for discussion and input from staff and consumers, providing training focused on trauma-informed skills, and so forth. For example, the San Diego Trauma-Informed Guide Team (2012) created a promotional brochure on how TIC can make staff jobs easier:

- Focuses on root problem
- Is preventative
- Increases support system
- Facilitates collaboration
- Shares workload
- Empowers client
- Provides consistency in agencies/systems
- Uses evidence-based best practices

TIC may be cost-effective, lead to less intensive services and less use of services, prevent undue stress for staff members and clients, and prevent client crises caused by old policies that could retraumatize trauma survivors.

the ability to tolerate the uncertainty that naturally accompanies transitions.

Strategy #2: Use Trauma-Informed Principles in Strategic Planning

Strategic planning provides an opportunity to explore and develop short- and long-term goals. The planning process often begins with reevaluating the organizations' values, mission, and vision, yet agencies cannot adequately develop a trauma-informed strategic plan without obtaining specific information about internal (staff, resources, processes) and external environmental (referral constellation, changes in health care, funding sources, State and Federal standards, community needs, consumer demographics, etc.) factors and influences. Data gathered through staff, consumer, organizational, and community assessments shapes the direction of the plan, including projected demands, challenges, obstacles, strengths, weaknesses, and resources. At the conclusion of this planning process, the organization will have specific goals, objectives, and tasks to meet the needs of their stakeholders and to address any anticipated challenges. Ideally, strategic planning should define key steps in developing or refining trauma-informed services within the organization.

Strategy #3: Review and Update Vision, Mission, and Value Statements

Vision, mission, and value statements provide a conceptual framework for TIC development and delivery. They should not be created in isolation; they should reflect voices from the community, populations, and other stakeholders that the organization serves. These statements develop through input, discussion, and assessment. They are not static; they evolve as needs, populations, or environments change.

Statement Example

As behavioral health service providers, we strive to be trauma aware—to understand the dynamics and impact of trauma on the lives of individuals, families, and communities. We strive to create a trauma-sensitive culture by demonstrating, through consumer empowerment, program design, and direct care, an understanding of the relationships among trauma, substance abuse, and mental illness.

Advice to Administrators: How To Create Vision, Value, and Mission Statements

Define the organization's vision, values, and mission to be compatible with TIC. Emphasize the organizational culture needed to provide TIC. An outgrowth of that cultural shift may include an enhanced working environment for employees and consumers that is noncoercive and reduces conflicts, restraint, and seclusion. Even if the current mission statement is appropriate, change it anyway to symbolize intended change within the organization. To define or redefine the vision, values, and mission:

- Involve consumers, all levels of staff, and leadership, including the director/CEO.
- Review:
  - Organizational priorities to identify and manage conflicting priorities.
  - Resources to assess whether reallocation is necessary for change (e.g., to hire peer support specialists, to furnish comfort rooms).
- Operationalize the vision, values, and mission at the level of individual departments
- Evaluate progress at regular staff meetings to ensure that changing the culture of care stays on the agenda.

Source: New Logic Organizational Learning, 2011.

Strategy #4: Assign a Key Staff Member To Facilitate Change

Prior to the development of an oversight committee, a senior staff member with the authority to initiate and implement changes should be assigned to oversee the developmental process. By assigning a trauma-aware senior staff member who is committed to trauma-informed services, it is more likely that the organization's and committee's goals, objectives, and plans will remain in focus. This senior staff member is responsible for ongoing development and facilitation of the oversight committee; management of the initial organizational assessment, reassessments, and other evaluative and feedback processes; and facilitation and oversight of the implementation plan and subsequent changes, including policies and procedures to ensure delivery of TIC.

Strategy #5: Create a Trauma-Informed Oversight Committee

The role of the oversight committee includes providing ongoing input and direction in the initial organizational assessment, strategic plan, plan implementation, reevaluation and development of trauma-informed policies and procedures, and future reassessments. The committee monitors progress and uses real-time data to forge a clear pathway to new processes that support TIC. The committee should involve stakeholders from the community, consumers, specialists, staff members, and administrators. Leadership involvement is necessary. Stakeholders may be alumni, family members, community-based organizations, and other institutions that interact with the agency or would benefit from trauma-informed services.

Initially, the agency must educate the committee on the organization's mission, values, and vision as well as the task at hand—developing trauma-informed services. To ease potential conflicts or confusion about the organization's structure, the guidelines, expectations, and roles of the committee need to be communicated directly to committee members as well as the organization as a whole, including board members, support and professional staff, supervisors, and so forth. The committee also needs to know the extent of their power and the necessary lines of communication before, during, and after evaluating and implementing changes in the organization.

Including consumers and/or those who have lived through trauma is vital. They have unique knowledge, experiences, and perspectives on the impact of treatment design, delivery, policies, and procedures. They offer firsthand information on practices that can potentially retraumatize clients in behavioral health settings and can suggest preventive, alternative practices and solutions. Consumer committee members keep staff and administrators aware of the goal of achieving TIC.

Strategy #6: Conduct an Organizational Self-Assessment of Trauma-Informed Services

An organizational self-assessment evaluates the presence and/or the effectiveness of current trauma-informed practices across each service and level of the organization. This assessment allows an organization to see how it functions within the context of trauma-informed principles and provides feedback to inform the development or revision of the implementation plan for TIC. In essence, this assessment process can serve as a blueprint for change and as a benchmark of compliance with and progress in implementing trauma-informed practices across time. Overall, it is a process of identifying organizational strengths, weaknesses, opportunities, and threats related to the implementation and maintenance of TIC. Refer to Appendix F for sample organizational assessment tools for the organization and the consumer.

The self-assessment should obtain feedback from key stakeholders, particularly consumers, family members, referral sources, community organizations, and all levels of the organization's staff, including nonclinical and clinical staff, supervisors, and administrative personnel. Similar to the universal screening process, an organizational self-assessment is only as effective as the steps taken after data are gathered and analyzed. From this assessment, an implementation plan should be established that highlights the goals, objectives, steps, timeframe, and personnel responsible in overseeing the specific objective. Assessment shouldn't be a once-and-done project. Timely and regularly scheduled organizational assessments should follow to assist in quality improvement. For an explanation of more detailed steps to take in conducting an organizational self-assessment, see Chapter 4 of the planned Treatment Improvement Protocol (TIP), *Improving Cultural Competence* (SAMHSA, planned c).

Advice to Administrators: Ten Steps to Quality Improvement

1. Identify new goals or problems.
2. Gather input from each level of the organization, including consumers and other key stakeholders.
3. Analyze the feedback.
4. Explore improvement options and the potential barriers associated with each.
5. Select the overall approach and specific strategies to address barriers (anticipate barriers, and try to address them before they occur).
6. Develop an implementation plan, and then present the plan to staff members and other key stakeholders not directly involved in the quality improvement process.
7. Implement the plan.
8. Reassess the new plan.
9. Evaluate the results and determine if new goals or additional problems or issues need to be addressed.
10. Repeat the first nine steps.

Strategy #7: Develop an Implementation Plan

Implementation plans should evolve from consumer participation, demographic profiles

Advice to Administrators: Implementation Plan Content

1. **Introduction and overview:** This includes the organization's history, the demographics that characterize its client base, the rationale for the implementation plan, and the incorporation of TIC. Focus on identification of strengths, weaknesses, opportunities, and threats. Provide an overview of goals and objectives.
2. **Specific goals and objectives:** Goals and objectives should address:
   - Workforce development strategies for recruiting, hiring, retaining, training, supervising, and promoting wellness of clinical and nonclinical staff members to support TIC.
   - Consumer participation and peer support development and implementation strategies.
   - Policies, procedures, and practices to support TIC and culturally responsive services, to promote safety, and to prevent retraumatization.
   - Specific evidence-based or best practice adoptions to support TIC.
   - Strategies to amend facility design or environment (plant) operations to reinforce safety.
   - Fiscal planning to ensure sustainability of the steps initiated in the organization.
3. **Guidelines for implementation:** Guidelines should highlight the specific steps, roles, responsibilities, and timeframes for each activity to meet TIC objectives.

of populations served, data from organizational self-assessment, and research on promising and evidence-based trauma-informed practices. Using the framework proposed in this TIP, the oversight committee is responsible for designing a plan that outlines the purpose, goals, objectives, timeframes, and personnel responsible for each objective (Exhibit 2.1-1).

Exhibit 2.1-1: TIC Planning Guidelines

The following publications provide samples of organizational guidelines for implementing TIC.

- Fallot, R. D. & Harris, M. (2009). *Creating cultures of trauma-informed care (CCTIC): A self-assessment and planning protocol.* Washington, DC: Community Connections, 2009.
- Guarino, K., Soares, P., Konnath, K., Clervil, R., & Bassuk, E. (2009). *Trauma-informed organizational toolkit.* Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration; the Daniels Fund; the National Child Traumatic Stress Network; and the W. K. Kellogg Foundation.
- Huckshorn, K. (2009). Transforming cultures of care toward recovery oriented services: Guidelines toward creating a trauma informed system of care. In *Trauma informed care (TIC) planning guidelines for use in developing an organizational action plan.* Alexandria, VA: National Association of State Mental Health Program Directors.
- Jennings, A. (2009). *Criteria for building a trauma-informed mental health service system.* Retrieved on May 21, 2013, from http://www.theannainstitute.org/CBTIMHSS.pdf
- Ohio Legal Rights Service (2007). *Trauma-informed treatment in behavioral health settings.* Columbus, OH: Ohio Legal Rights Service.
- Prescott, L., Soares, P., Konnath, K., & Bassuk, E. (2008). *A long journey home: A guide for creating trauma-informed services for mothers and children experiencing homelessness* [draft]. Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration; the Daniels Fund; the National Child Traumatic Stress Network; and the W.K. Kellogg Foundation.

The following resource is a systemwide set of guidelines for implementing TIC.

- U.S. Department of Health and Human Services, Health Resources and Services Administration (2006). *Model trauma system: Planning and evaluation.* Rockville, MD: Health Resources and Services Administration.

Strategy #8: Develop Policies and Procedures To Ensure Trauma-Informed Practices and To Prevent Retraumatization

In the early stage of evaluating current services and planning for TIC, the committee needs to assess practices, procedures, and policies that may have been or could be retraumatizing to any individual, at any level of the organization, from consumers to administrators. Programs that are not trauma informed are as likely to be unaware of the impact of trauma on staff as they are to be unaware of its influence on consumers. In the initial review, careful scrutiny should be used to eliminate any practice that is potentially harmful, including seclusion and restraint practices, therapeutic activities that are shaming, treatment planning without collaboration, any medical inquiry without privacy, and so forth.

Policies and procedures are the building blocks of each agency. They guide the service process and, if followed, they provide an opportunity for the agency to deliver consistent responses and care. Policies and procedures must incorporate trauma-informed practices across all domains and standards, such as admissions, plant/environmental standards, screening and assessment processes, referrals (to other services, including hospitalization, or for further evaluations), treatment planning, confidentiality, discharge, and more. They also need to be updated periodically to incorporate new science and to meet the changing needs of consumers. By regularly reviewing and adapting administrative and clinical policies and procedures in response to ever-changing needs and evidence, the agency can provide staff members with good guidelines for providing trauma-informed services that are consistent yet flexible.

Program Curriculum: Roadmap to Seclusion-Free and Restraint-Free Mental Health Services

This curriculum, written from consumer perspectives, provides behavioral health staff with education, strategies, and hands-on tools to prevent and ultimately eliminate the use of seclusion and restraint. It includes many handouts for participants and consumers. This training package, available online (http://store.samhsa.gov/product/Roadmap-to-Seclusion-and-Restraint-Free-Mental-Health-Services-CD-/SMA06-4055), is divided into seven modules plus a resources section:

- Module 1: The Personal Experience of Seclusion and Restraint
- Module 2: Understanding the Impact of Trauma
- Module 3: Creating Cultural Change
- Module 4: Understanding Resilience and Recovery from the Consumer Perspective
- Module 5: Strategies to Prevent Seclusion and Restraint
- Module 6: Sustaining Change Through Consumer and Staff Involvement
- Module 7: Review and Action Plan
- Resource Section

Source: Center for Mental Health Services (CMHS), SAMHSA, 2005.

Strategy #9: Develop a Disaster Plan

Facilities are often required to develop disaster plans, but specific requirements vary from State to State. From the outset, developing a disaster plan in behavioral health services is essential. Many clients in behavioral health services have lived with trauma, so proactive steps that reduce the impact of a new trauma may prevent worsening of symptoms and decrease the risk for more pervasive effects. (See also Technical Assistance Publication 34, *Disaster Planning Handbook for Behavioral Health Treatment Programs* [SAMHSA, 2013].)

Most disaster events cannot be accurately anticipated. Even so, behavioral health organizations can take steps to reduce the impact of a disaster event on program functioning and on the lives of clients. Each service or program should develop a disaster response committee that meets regularly to develop, maintain, and adapt policies and procedures to respond to disasters affecting the program. Committee planning efforts may include:

1. Creating a disaster response team of program staff members tasked with coordinating program administration and services in a disaster event.
2. Establishing a communication process for informing staff and clients of the status of program functioning and for coordinating staff assignments during and shortly after the disaster event.
3. Outlining a process to inform clients and their families of available services, their location, and contact information for accessing services to meet clients' critical needs.
4. Developing plans for service provision during a disaster event and service implementation after the event.
5. Creating special plans for high-risk or special needs clients who need services during and shortly after the disaster. Examples of this are clients who are homeless, in detoxification services or methadone programs, on prescribed psychopharmaceuticals, or at risk for suicide.
6. Making plans for maintaining the security of client records, program records, and facilities during and shortly after the event.
7. Coordinating ahead with other community resources and services to ensure that clients at high risk or with special needs get the services they require as soon as possible.
8. Prioritizing how services will start back up after a disaster event.
9. Providing special services after the event to clients at high risk for trauma reactions and symptoms.
10. Establishing a postdisaster debriefing process to review disaster responses, services, and outcomes.

Some specific disaster events, such as hurricanes, may sometimes offer opportunities for planning and preparation in advance of the disaster event. This preparation time is usually just a few days, but it allows programs to make advance preparations and take advance action to establish lines of communication, stockpile resources, prepare for evacuation of clients, and protect client and program records.

Strategy #10: Incorporate Universal Routine Screenings

A key element of trauma-informed services is the institution of universal routine screening across all services, regardless of the individual's path in accessing services (e.g., primary care, hospitalization, outpatient). Considering the prevalence of trauma among individuals who seek services for mental and substance use disorders, the implementation of screening is paramount. Without screening, clients are not identified as trauma survivors. Subsequently, they miss recovery opportunities and treatment services that would be more likely to meet their needs, while also running a higher risk of being retraumatized by unexamined organizational policies, procedures, and practices. For more information on the rationale, processes, and instruments of universal screening for trauma, refer to Part 1, Chapter 4.

Strategy #11: Apply Culturally Responsive Principles

Providers must be culturally competent when incorporating evidence-based and best practices as well as trauma-informed treatment

models within the organization. Clients' views of behavioral health differ according to race, ethnicity, and culture (refer to the planned Treatment Improvement Protocol [TIP], *Improving Cultural Competence* [SAMHSA, planned c]). Likewise, cultures attach different meanings to trauma, and responses to trauma will vary considerable across cultures (see Part 3, the online literature review, for more information). For example, trauma survivors who come from a collective society or culture, in which the goals of the group take precedence over the goals of the individual, may be more focused on the well-being of their family or the family's response to the trauma survivors' experience. Often, this view runs in opposition to the individualistic perspective of many behavioral health services. Subsequently, treatment providers who are not culturally competent may interpret collective values as a sign of resistance or avoidance in dealing with traumatic stress. CMHS (2003) outlines principles of cultural competence in disaster work applicable across all forms of trauma:

1. ***Recognize the importance of culture and respect diversity.*** Those who value culture and diversity understand their own cultures, attitudes, values, and beliefs, and they work to understand the cultures of others. This includes being able to communicate effectively with those from other cultures, respecting others' feelings about personal space, knowing about others' social organization, understanding how time is viewed, and being aware of others' beliefs about the effects of their behaviors.
2. ***Maintain a current profile of the cultural composition of the community.*** This includes describing the community's population in terms of race and ethnicity, age, gender, religion, refugee and immigrant status, housing status, income levels, rural/urban balance, unemployment, languages spoken, literacy, schools, and businesses.
3. ***Recruit workers who are representative of the community or service area.*** If the workers who are available do not match the community, they should have the personal attributes, knowledge, and skills to develop cultural competence.
4. ***Provide ongoing cultural competence training to staff.*** Topics should include cultural values and traditions, family values, linguistics and literacy, immigration experiences and status, help-seeking behaviors, techniques and strategies for cross-cultural outreach, and the avoidance of stereotypes and labels (DeWolfe & Nordboe, 2000b).
5. ***Ensure that services are accessible, appropriate, and equitable.*** In planning disaster work or TIC, community associations and organizations are invaluable. Gaining their acceptance requires time and energy.
6. ***Recognize the role of help-seeking behaviors, traditions, and natural support networks.*** Culture includes traditions that dictate whom, or which groups, to seek in times of need; how to handle suffering and loss; and how healing takes place. These customs and traditions are respected by a culturally responsive disaster relief program.
7. ***Involve community leaders and organizations representing diverse cultural groups as "cultural brokers."*** Collaborating with community leaders is an effective means of learning about the community, establishing program credibility, and ensuring that services are culturally responsive.
8. ***Ensure that services and information are culturally and linguistically responsive.*** Communication with individuals who do not speak English, who are illiterate in all languages or have limited literacy, and who are deaf or hard of hearing is essential to service provision. Local radio stations, television outlets, and newspapers that are multicultural are an excellent venue for educational information after a disaster.

Using survivors' friends or relatives as interpreters is not recommended, as survivors may be uncomfortable discussing personal matters with family members or friends. Asking children to interpret can place too heavy a responsibility on them and reverses parents' and children's roles.

9. ***Assess and evaluate the program's level of cultural responsiveness.*** Self-assessment and process evaluation can help keep a program on track. A variety of strategies can be used for collecting data and communicating findings to stakeholders.

Strategy #12: Use Science-Based Knowledge

Along with culturally responsive services, trauma-informed organizations must use science-based knowledge to guide program development and the implementation of services, policies, procedures, and practices. This includes the adoption of EBPs (see Part 1, Chapter 6, and Part 3, Section 1, to review definition, treatments, and resources for EBPs). TIC research is quite new; interpret these limited studies and information cautiously. Chambless and Hollon's (1998) criteria, which are still the benchmark for EBPs, are valuable resources for administrators. Look closely at who was included—and excluded—from treatment studies. Often, the types of severe, chronic, and unstable cases seen in community settings are excluded from treatment studies. Evidence-based interventions should be a primary consideration in selecting appropriate treatment models for people with mental illness, substance use disorders, and co-occurring psychological trauma. Nonetheless, other variables must also be contemplated before adopting EBPs in an organization, including the cultural appropriateness of the practice; the strength of its clinical focus on strengths-based strategies; training and competence of clinical staff; the cost of training, materials, and implementation; and the ease of maintaining EBP fidelity amidst staff turnover.

For more detailed information on EBPs, visit the National Registry of Evidence Based Programs and Practices (NREPP) Web site (http://nrepp.samhsa.gov). For more specific research oriented information on trauma and trauma specific treatments, refer to the literature review in Part 3 of this TIP, available online.

Strategy #13: Create a Peer-Support Environment

The main purpose of peer support services is to provide consumer mentoring, support, and care coordination for clients with histories of mental illness or substance abuse. The goals are to help others deal with personal and environmental barriers that impede recovery and achieve wellness. Peer support accomplishes this through many activities, including advocacy, support during crises and recovery activities, modeling, education, and assistance in accessing available resources. Peer support programs send a powerful message to staff members, consumers, and the community—that recovery is possible through support, collaboration, and empowerment. These programs reinforce the trauma-informed premise that organizations need to reflect the populations that they serve and involve consumers in planning, implementing, monitoring, and delivering recovery services.

For an introduction to peer support services, see *What Are Peer Recovery Support Services?* (Center for Substance Abuse Treatment, 2009e).

Notably, peer support services have the potential to be considerably flexible to meet client needs at each stage of recovery. Specifically, peer support services can be incorporated

across the continuum of care, starting with outreach services and extending into long-term recovery services. Peer support specialists can enhance consumer motivation to change, to initiate services, and/or to engage in recovery activities. They can play powerful liaison roles by supporting clients entering treatment and explaining what to expect from services. They can ease the transition into treatment, from one service to the next, from one modality to another (e.g., inpatient group to outpatient group), and beyond formal treatment. Moreover, peer support services create an atmosphere focused on mutuality rather than pathology. They provide living models of resilience and promote hope—that recovery is possible and attainable.

Administrators should familiarize themselves with how other organizations have implemented peer support programs, current curricula, certifications and training processes, competencies and ethics, and peer support service State standards or recommendations, if applicable. The Carter Center's Summit in 2009, The Pillars of Peer Support Services, supported in part by SAMHSA and CMHS, highlighted the numerous elements necessary to develop a strong, vital peer workforce (Daniels et al., 2010). These elements include:

- Clear job and service descriptions.
- Job-related competencies and competence-based testing processes.
- Peer support certifications.
- Ongoing continuing education.
- Media and technology access for peer specialists.
- Sustainable funding.
- Research and evaluation components.
- Code of ethics and conduct.
- Competence-based training for supervisors.
- Multilevel support and program support teams.

> "Peer recovery support services are evidence based and have been demonstrated to promote positive health outcomes and control the cost of healthcare. These services are offered by a trained individual with lived experience and recovery from a mental illness, substance use and/or chronic health conditions. Peer recovery support services minimally include chronic illness self management, whole health and wellness promotion and engagement, relapse prevention, life skill coaching, and insurance and health systems navigation."
>
> (Daniels et al., 2012, p. 22)

Advice to Administrators: Sample Peer Support Staff Tasks

- Use active listening skills help peers identify areas of dissatisfaction and benefits of changing beliefs, thoughts, and behavior.
- Use problem-solving skills to help peers identify barriers to recovery and develop plans to meet peer-determined goals.
- Facilitate recovery support groups.
- Link clients with community resources.
- Work with the treatment team to advocate for clients and to remove recovery barriers.
- Participate in consumer panels to educate staff about the consumer perspective and about peer support.
- Participate in hospital-wide committees and workgroups

Source: New Logic Organizational Learning, 2011.

Strategy #14: Obtain Ongoing Feedback and Evaluations

Obtain feedback on and evaluations of organizational performance on a regular basis. Give consumers a clear avenue for offering feedback at any time, and make evaluations assessing the organization's progress toward providing trauma-informed services standard practice. Without feedback and further evaluation, organizations cannot assess whether they are

meeting trauma-informed objectives. A routine monitoring process for TIC implementation gives the organization additional information necessary to combat new obstacles and threats and to understand what works. Regular monitoring equips organizations with the ability to formulate different strategies to meet objectives as well as to respond to the changing needs of the population. Ongoing evaluation and consumer feedback are essential in improving the quality of services.

Strategy #15: Change the Environment To Increase Safety

Practices that generate emotional and physical safety are necessary. Another aspect of creating safety is reevaluating the physical facilities and environment to enhance safety and to circumvent preventable retraumatization. Think how traumatizing it would be if you were a female rape survivor and a night counselor was conducting a room check at 2:00 a.m., or a male security guard was walking the women's residential wing. What would it be like if you were sitting with your back to the door in a small office during an intake interview, if your history included a physical assault and robbery? For most, it would at least increase anxiety; for others it would be retraumatizing. Trauma-informed providers must carefully assess environmental safety. Although you are likely to identify some facility issues that could erode safety for trauma survivors, a safe environment will only be established if regular feedback is obtained from consumers about their experiences with the program.

Strategy #16: Develop Trauma-Informed Collaborations

TIC is about collaboration with consumers, staff members, key stakeholders, and other agencies. Collaborative relationships provide opportunities for consumers to access the most appropriate services as needs arise. Rather than waiting for a crisis or a dire need for a service to investigate available resources, it is far more efficient and compassionate to establish relationships within the agency and with other community resources before these needs arise. No agency can meet the needs of every client; referral agreements and/or collaborative arrangements that integrate the delivery of TIC, including support services (e.g., housing, legal, medical), are important.

Creating Sanctuary

The sanctuary model is a trauma-based therapeutic approach that has been used in inpatient, residential, therapeutic community, and outpatient settings with children, adolescents, and adults. It provides a template for changing social service delivery systems so that they are better equipped to respond to the complex needs of trauma survivors. Sanctuary is informed by four knowledge areas: "the psychobiology of trauma, the active creation of nonviolent environments, principles of social learning, and an understanding of the ways in which complex adaptive systems grow, change, and alter their course" (Bloom et al., 2003, p. 174).

The sanctuary model describes a stage-based approach to healing that is referred to as SAGE: safety, affect modulation, grieving, and emancipation. This model is nonlinear; an individual does not necessarily move from one stage to another in a straight path, but progress in one area does affect progress in other areas (Bloom, 1997; Bloom et al., 2003). SAGE is a cognitive–behavioral translation of the sanctuary model (Bills, 2003). Early in treatment, the focuses are typically on safety and affect management. Safety encompasses four domains: physical, psychological, social, and moral (Bloom, 1997; see http://www.sanctuaryweb.com for further details and a curriculum).

2 Building a Trauma-Informed Workforce

IN THIS CHAPTER

- Introduction
- Workforce Recruitment, Hiring, and Retention
- Training in TIC
- Trauma Informed Counselor Competencies
- Counselor Responsibilities and Ethics
- Clinical Supervision and Consultation
- Secondary Traumatization
- Counselor Self Care

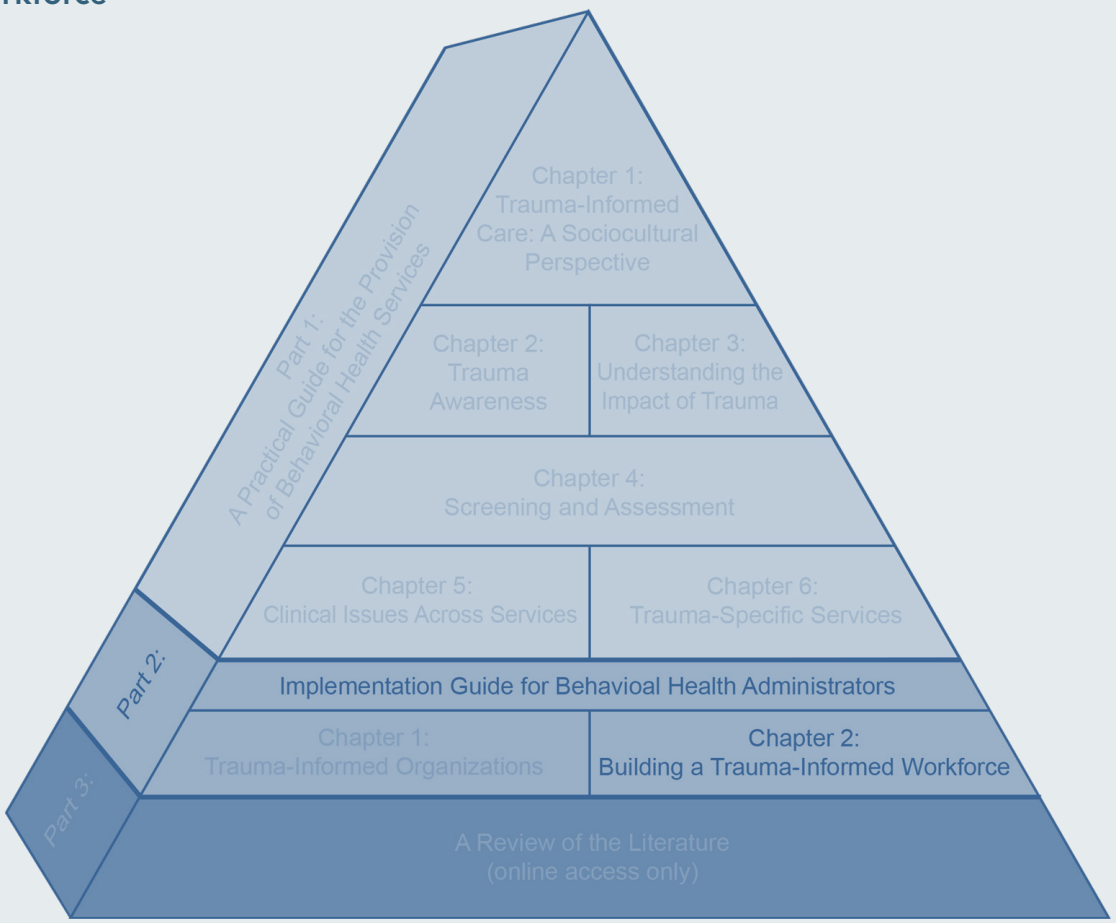
Introduction

For an organization to embrace a trauma-informed care (TIC) model fully, it must adopt a trauma-informed organizational mission and commit resources to support it. This entails implementing an agency-wide strategy for workforce development that is in alignment with the values and principles of TIC and the organization's mission statement. Without a fully trained staff, an organization will not be able to implement the TIC model. However, simply training behavioral health professionals in TIC is not enough. Counselors will not be able to sustain the kind of focus required to adopt and implement a trauma-informed philosophy and services without the ongoing support of administrators and clinical supervisors.

An organizational environment of care for the health, well-being, and safety of, as well as respect for, its staff will enhance the ability of counselors to provide the best possible trauma-informed behavioral health services to clients. This culture of care must permeate the organization from top to bottom. Behavioral health program administrators should aim to strengthen their workforce; doing so "requires creating environments that support the health and well-being, not only of persons with mental and substance use conditions, but of the workforce as well" (Hoge, 2007, p. 58). An organizational culture of care, safety, and respect demands activities that foster the development of trauma-informed counselors. This chapter focuses on key workforce development activities, such as:

- Recruiting, hiring, and retaining trauma-informed staff.
- Training behavioral health service providers on the principles of, and evidence-based and emerging best practices relevant to, TIC.
- Developing and promoting a set of counselor competencies specific to TIC.

TIC Framework in Behavioral Health Services—Building a Trauma-Informed Workforce



- Delineating the responsibilities of counselors and addressing ethical considerations specifically relevant to promoting TIC.
- Providing trauma-informed clinical supervision.
- Committing to prevention and treatment of secondary trauma of behavioral health professionals within the organization.

Addressing each of these areas is essential to building a trauma-informed workforce and an organizational culture that supports TIC.

Workforce Recruitment, Hiring, and Retention

An Action Plan for Behavioral Health Workforce Development (Hoge et al., 2007) emphasizes the importance of organization-wide support and active involvement in workforce recruitment, hiring, and retention in behavioral health systems. One of the key findings of this report is that the work environment itself in many behavioral health settings can be toxic to the workforce and may hinder the delivery of individualized, respectful, collaborative, and client-centered care to service recipients. Factors such as the downward pressure on organizations for higher productivity of counselors increase caseloads and decrease wages of behavioral health staff members and may create a high-stress environment that contributes to low morale and worker dissatisfaction. Other factors that often contribute to low retention of qualified counselors in behavioral health settings include the lack of professional career

ladders, fragile job security, the lack of clinical supervision, and an inability to influence the organization in which they are working (Hoge et al., 2007).

Added to this mix is the intensity of working with people with the co-occurring conditions of trauma-related mental and substance use disorders and the risk of secondary traumatization of counselors. In creating and sustaining a trauma-informed workforce, organizations need to foster a work environment that parallels the treatment philosophy of a trauma-informed system of care. Doing so allows counselors to count on a work environment that values safety, endorses collaboration in the making of decisions at all levels, and promotes counselor well-being.

Recruitment and Hiring in a Trauma-Informed System of Care

In a 2007 technical report (Jennings, 2007b), the National Center for Trauma-Informed Care identified several priorities for organizations with regard to recruitment and hiring trauma-informed staff, including:

- Active recruitment of and outreach to prospective employees who are trauma-informed or have formal education in providing trauma-informed or trauma-specific services in settings such as universities, professional organizations, professional training and conference sites, peer support groups, and consumer advocacy groups.
- Hiring counselors and peer support staff members with educational backgrounds and training in trauma-informed and/or trauma-specific services and/or lived experience of trauma and recovery.
- Providing incentives, bonuses, and promotions for staff members during recruitment and hiring that take into consideration prospective employees' trauma-related education, training, and job responsibilities.

In addition to hiring behavioral health professionals with formal professional education and training, organizations should also "routinely survey the demographics and other characteristics of the population served and recruit a workforce of similar composition" (Hoge et al., 2007, p. 297). Essentially, this means actively engaging in outreach to consumer advocacy groups, recovery-oriented programs, community and faith-based organizations, and former clients/consumers with the intention of recruiting potential employees whose knowledge and expertise comes from their lived experience of trauma, resilience, and recovery. Support staff members, peer support workers, counselors in training, and apprentices can be recruited from this population and offered incentives, such as tuition reimbursement, training stipends, and professional mentoring with the goal of developing a trauma-informed workforce from within the demographic served. Jennings (2007b) calls these staff members "trauma champions" who can provide needed expertise in a trauma-informed organization to promote trauma-informed policies, staff development, and trauma-based services consistent with the mission of the organization (p. 135).

Who Is a Trauma Champion?

"A champion understands the impact of violence and victimization on the lives of people seeking mental health or addiction services and is a front-line worker who thinks 'trauma first.' When trying to understand a person's behavior, the champion will ask, 'is this related to abuse and violence?' A champion will also think about whether his or her own behavior is hurtful or insensitive to the needs of a trauma survivor. The champion is there to do an identified job—he is a case manager or a counselor or a residential specialist—but in addition to his or her job, a champion is there to shine the spotlight on trauma issues."

Source: Harris & Fallot, 2001a, p. 8.

As with hiring behavioral health professionals who are in recovery from substance use disorders, the organization should be transparent and explicit in its recruitment and hiring practices of trauma survivors in recovery. The organization can be transparent by advertising the mission statement of the organization as part of the recruitment process and inviting applicants who are in recovery from trauma to apply. The needs of behavioral health staff members who are in recovery from both substance use and trauma-related conditions and working in a trauma-informed system of care should be addressed in the organization's ongoing training, clinical supervision, and staff development policies and practices.

Workforce Retention

Staff turnover is rampant in behavioral health settings. It is costly to the organization, and as a result, it is costly to clients. A strong therapeutic relationship with a counselor is one of the largest factors in an individual's ability to recover from the overwhelming effects of trauma. When behavioral health professionals leave an organization prematurely or in crisis as a result of chronic levels of high stress or secondary traumatization, clients must deal with disruptions in their relationships with counselors. Some of the organizational factors that contribute to chronic levels of high stress and often lead to high staff turnover include expecting counselors to maintain high caseloads of clients who have experienced trauma; not providing trauma-informed clinical supervision and training to counselors; and failing to provide adequate vacation, health insurance, and other reasonable benefits that support counselors' well-being. Other factors that may have a more profound impact on staff retention include failing to acknowledge the reality of secondary traumatization, promoting the view that counselors' stress reactions are a personal failure instead of a normal response to engaging with clients' traumatic material, and not supporting personal psychotherapy for counselors (Saakvitne, Pearlman, & Traumatic Stress Institute/Center for Adult & Adolescent Psychotherapy, 1996).

Research on promoting counselor retention in behavioral health settings demonstrates that

Advice to Administrators: Preventing Turnover and Increasing Workforce Retention

To prevent behavioral health staff turnover and increase retention of qualified, satisfied, and highly committed trauma-informed counselors, consider:

- Offering competitive wages, benefits, and performance incentives that take into account education, training, and levels of responsibility in providing trauma-informed or trauma-specific services.
- Creating a safe working environment that includes both the physical plant and policies and procedures to prevent harassment, stalking, and/or violence in the workplace and to promote respectful interactions amongst staff at all levels of the organization.
- Establishing an organizational policy that normalizes secondary trauma as an accepted part of working in behavioral health settings and views the problem as systemic—not the result of individual pathology or a deficit on the part of the counselor.
- Instituting reasonable, manageable caseloads that mix clients with and without trauma-related concerns.
- Letting staff offer input into clinical and administrative policies that directly affect their work experience.
- Providing vacation, health insurance (which includes coverage for psychotherapy/personal counseling), and other benefits that promote the well-being of the staff.
- Implementing regular, consistent clinical supervision for all clinical staff members.
- Providing ongoing training in trauma-informed services offered by the organization.

behavioral health staff members are interested in the same kind of work environment and benefits as employees in many other fields. They include a "living wage with healthcare benefits; opportunities to grow and advance; clarity in a job role; some autonomy and input into decisions; manageable workloads; administrative support without crushing administrative burden; basic orientation and training for assigned responsibilities; a decent and safe physical work environment; a competent and cohesive team of coworkers; the support of a supervisor; and rewards for exceptional performance" (Hoge et al., 2007, p. 18).

When an organization's administration values its staff by providing competitive salaries and benefits, a safe working environment, a reasonable and manageable workload, input into the making of clinical and administrative policy decisions, and performance incentives, it helps behavioral health workers feel connected to the mission of the organization and become dedicated to its sustainability and growth. This type of work environment demonstrates both a level of respect for counselors (similar to the level of respect a trauma-informed organization displays toward clients) and an appreciation for the complexity of their job responsibilities and the stress they face when working with people who have experienced trauma in their lives. To retain behavioral health professionals working in a trauma-informed setting, wages and performance incentives should be tied not only to education, training, and work experience, but also to levels of responsibility in working with clients who have experienced trauma.

Training in TIC

Training for all staff members is essential in creating a trauma-informed organization. It may seem that training should simply focus on new counselors or on enhancing the skill level of those who have no prior experience in working with trauma, but training should, in fact, be more systematic across the organization to develop fully sustainable trauma-informed services. All employees, including administrative staff members, should receive an orientation and basic education about the prevalence of trauma and its impact on the organization's clients. To ensure safety and reduction of harm, training should cover dynamics of retraumatization and how practice can mimic original sexual and physical abuse experiences, trigger trauma responses, and cause further harm to the person. Training for all employees must also educate them "about the impacts of culture, race, ethnicity, gender, age, sexual orientation, disability, and socioeconomic status on individuals' experiences of trauma" (Jennings, 2007a, p. 5).

All clinical and direct service staff members, regardless of level of experience, should receive more indepth training in screening and assessment of substance use and trauma-related disorders; the relationships among trauma, substance use disorders, and mental disorders; how to understand difficult client behaviors through a trauma-informed lens; how to avoid retraumatizing clients in a clinical setting; the development of personal and professional boundaries unique to clinical work with traumatized clients; how to identify the signs of secondary traumatization in themselves; and how to develop a comprehensive personal and professional self-care plan to prevent and/or ameliorate the effects of secondary traumatization in the workplace. All clinical staff members who work with traumatized clients should receive additional training in evidence-based and promising practices for the treatment of trauma (for information on locating training, see Appendix B.) This might include training done within the agency by experts in the field or training received by attending advanced trauma trainings. Administrators

should provide the time and financial resources to clinical staff members for this professional development activity. Jennings (2007a) suggests that, whenever possible, "trainings should be multi-system, inclusive of staff in mental health and substance abuse, health care, educational, criminal justice, social services systems and agencies, and promoting systems integration and coordination" (p. 5).

Moreover, criminal justice settings, schools, military/veteran programs, and other places in which behavioral health services are provided may benefit from approaches that are sensitive to the special circumstances and cultures of these environments. For example, in exploring trauma-informed correctional care, Miller and Najavits (2012, p. 1) observe:

> Prisons are challenging settings for trauma-informed care. Prisons are designed to house perpetrators, not victims. Inmates arrive shackled and are crammed into overcrowded housing units; lights are on all night, loud speakers blare without warning and privacy is severely limited. Security staff is focused on maintaining order and must assume each inmate is potentially violent. The correctional environment is full of unavoidable triggers, such as pat downs and strip searches, frequent discipline from authority figures, and restricted movement….This is likely to increase trauma-related behaviors and symptoms that can be difficult for prison staff to manage….Yet, if trauma-informed principles are introduced, all staff can play a major role in minimizing triggers, stabilizing offenders, reducing critical incidents, deescalating situations, and avoiding restraint, seclusion or other measures that may repeat aspects of past abuse.

The Need for Training

Behavioral health service providers working with clients who have mental, substance use, and trauma-related disorders need to have the best knowledge, skills, and abilities. Substance abuse counselors, in particular, require additional training and skill development to be able to extend trauma-informed services (within the

Case Illustration: Larry

Larry is a 28-year-old clinical social worker who just finished his master's program in social work and is working in a trauma-informed outpatient program for people with substance use disorders. He is recovering from alcohol use disorder and previously worked in a residential rehabilitation program as a recovery support counselor. There, his primary responsibilities were to take residents to Alcoholics Anonymous (AA) meetings, monitor their participation, and confront them about their substance use issues and noncompliance with the program's requirement of attendance at 12-Step meetings.

In Larry's new position as a counselor, he confronts a client in his group regarding her discomfort with attending AA meetings. The client reports that she feels uncomfortable with the idea that she has to admit that she is powerless over alcohol to be accepted by the group of mostly men. She was sexually abused by her stepfather when she was a child and began drinking heavily and smoking pot when she was 11 years old. The client reacts angrily to Larry's intervention.

In supervision, Larry discusses his concerns regarding the client's resistance to AA and the feedback that he provided to her in group. Beyond focusing supervision on Larry's new role as a counselor in a trauma-informed program, the clinical supervisor recommends that Larry take an interactive, multisession, computer-assisted training on the 12-Step facilitation (TSF) model. The TSF model introduces clients to and assists them with engaging in 12-Step recovery support groups. The agency has the computer-based training available in the office, and Larry agrees to use follow-up coaching sessions with his supervisor to work on implementation of the approach. The supervisor recognizes that Larry is falling back on his own recovery experience and the strategies he relied on in his previous counseling role. He will benefit from further training and coaching in an evidence-based practice that provides a nonaggressive, focused, and structured way to facilitate participation in recovery support groups with clients who have trauma histories.

limits of their professional licensure and scope of practice) to clients who have co-occurring substance use, trauma-related, or mental disorders. Many clinical practice issues in traditional substance abuse treatment are inconsistent with trauma-informed practice, which needs to be addressed with further training. Similarly, mental health clinicians often need training in substance abuse treatment, as they typically do not have backgrounds or experience in that domain. Moreover, several surveys indicate that clinicians consistently perceive the combination of trauma and substance abuse as harder to treat than either one alone (Najavits, Norman, Kivlahan, & Kosten, 2010). It is thus key to emphasize cross-training as part of TIC. Exhibit 2.2-1 addresses these issues and offers suggestions for additional training.

Exhibit 2.2-1: Clinical Practice Issues Relevant to Counselor Training in Trauma-Informed Treatment Settings

- Some substance abuse counseling strategies commonly used to work through clients' denial and minimization of their substance use issues may be inappropriate when working with trauma survivors (e.g., highly confrontational models can remind trauma survivors of emotional abuse).

  Training: The Stages of Change model of addiction treatment can help counselors shift from the traditional confrontation of denial to conceptualizing clients' ambivalence about changing substance use patterns as a normal part of the precontemplation stage of change. This method is a respectful cognitive–behavioral approach that helps counselors match counseling strategies to their assessment of where each client is in each stage of change, with the ultimate goal of helping clients make changes to health risk behaviors. (Connors, Donovan, & DiClemente, 2001).

- The 12-Step concept of powerlessness (Step 1) may seem unhelpful to trauma survivors for whom the emotional reaction to powerlessness is a major part of their trauma (particularly for victims of repetitive trauma, such as child abuse or intimate partner violence). It can be confusing and counterproductive to dwell on this concept of powerlessness regarding trauma when the therapeutic objective for trauma-informed counseling methods should be to help clients empower themselves. For people in recovery, powerlessness is a paradox, sometimes misunderstood by both counselors and clients, in that the acknowledgment of powerlessness often creates a sense of empowerment. Most clients, with support and respectful guidance from a counselor, will come to understand that powerlessness (as used in 12-Step programs) is not an inability to stand up for oneself or express a need, and it does not mean for one to be powerless in the face of abuse. With this understanding, clients may become more open to participating in 12-Step groups as a resource for their recovery from substance use disorders. When clients continue to struggle with this concept and decline to participate in 12-Step recovery efforts, they may benefit from referral to other forms of mutual-help programs or recovery support groups in which the concept of powerlessness over the substance of abuse is not such a significant issue.

  Training: The TSF model can help counselors develop a more supportive and understanding approach to facilitating clients' involvement in 12-Step recovery groups (if this is a client-generated recovery goal). "Although based on standard counseling models, TSF differs from them in several ways. These differences include TSF's strong emphasis on therapist support, discouragement of aggressive 'confrontation of denial' and therapist self-disclosure, and highly focused and structured format" (Sholomskas & Carroll, 2006, p. 939).

  Another well-intentioned, but often misguided, approach by counselors who have not had formal or extensive training is "digging" for trauma memories without a clear therapeutic rationale or understanding of client readiness. In doing so, the counselor may unintentionally retraumatize the client or produce other harmful effects. In early intervention, it is sufficient simply to acknowledge and validate the pain and suffering of the client without uncovering or exploring specific trauma memories. The counselor who is insufficiently trained in trauma-informed clinical

(Continued on the next page.)

Exhibit 2.2-1: Clinical Practice Issues Relevant to Counselor Training in Trauma-Informed Treatment Settings (continued)

practice may also press agendas that are ultimately unhelpful, such as insisting that the client forgive an abuser, pursue a legal case against a perpetrator, or engage in trauma treatment, even when the client may not be ready for such steps. These efforts are particularly inappropriate for clients in early recovery from substance use disorders. The first goal in treatment is stabilization

Training: The Seeking Safety model of treating substance abuse and posttraumatic stress disorder (PTSD) can help counselors focus on the primary goal of stabilization and safety in TIC. This model emphasizes safety as the target goal, humanistic themes such as honesty and compassion, and making cognitive–behavioral therapy accessible and interesting to clients who may otherwise be difficult to engage (Najavits, 2002a).

- Treatment should be client-centered; it should acknowledge the client's right to refuse counseling for trauma-related issues. It is important to discuss the advantages and disadvantages of exploring trauma-related concerns, and then, following an open discussion, to allow clients the right to choose their path. This discussion should be part of the informed consent process at the start of treatment. Clients also have the right to change their minds.

  Training: Motivational interviewing, a client-centered, nonpathologizing counseling method, can aid clients in resolving ambivalence about and committing to changing health risk behaviors including substance use, eating disorders, self-injury, avoidant and aggressive behaviors associated with PTSD, suicidality, and medication compliance (Arkowitz, Miller, Westra, & Rollnick, 2008; Kress & Hoffman, 2008). Training in MI can help counselors remain focused on the client's agenda for change, discuss the pros and cons of treatment options, and emphasize the personal choice and autonomy of clients.

In addition to the training needs of substance abuse counselors, all direct care workers in mental health settings, community-based programs, crisis intervention settings, and criminal justice environments should receive training in TIC. Guidelines for training in assisting trauma-exposed populations are presented in Exhibit 2.2-2.

Continuing Education

Research on the effectiveness of single-session didactic and/or skill-building workshops

Exhibit 2.2-2: Guidelines for Training in Mental Health Interventions for Trauma-Exposed Populations

After a year of collaboration in 2002, the Task Force on International Trauma Training of the International Society for Traumatic Stress Studies published a consensus-based set of recommendations for training. Core curricular elements of the recommended training include:

- Competence in listening.
- Recognition of psychosocial and mental problems to promote appropriate assessment.
- Familiarity with established interventions in the client population.
- Full understanding of the local context, including help-seeking expectations, duration of treatment, attitudes toward intervention, cost-effectiveness of intervention, and family attitudes and involvement.
- Strategies for solving problems on the individual, family, and community levels.
- Treatment approaches for medically unexplained somatic pain.
- Collaboration with existing local resources and change agents (e.g., clergy, traditional healers, informal leaders).
- Self-care components.

Source: Weine et al., 2002.

Advice to Administrators: Trauma-Informed Staff Training

- Establish training standards for the evidence-based and promising trauma-informed practice models (such as Seeking Safety) adopted by your organization.
- Bring expert trainers with well-developed curricula in TIC and trauma-specific practices into your organization.
- Select a core group of clinical supervisors and senior counselors to attend multisession training or certification programs. These clinicians can then train the rest of the staff.
- Use sequenced, longitudinal training experiences instead of single-session seminars or workshops.
- Emphasize interactive and experiential learning activities over purely didactic training.
- Provide ongoing mentoring/coaching to behavioral health professionals in addition to regular clinical supervision to enhance compliance with the principles and practices of TIC and to foster counselor mastery of trauma-specific practice models.
- Build organization-wide support for the ongoing integration of new attitudes and counselor skills to sustain constructive, TIC-consistent changes in practice patterns.
- Provide adequate and ongoing training for clinical supervisors in the theory and practice of clinical supervision and the principles and practices of TIC.
- Include information and interactive exercises on how counselors can identify, prevent, and ameliorate secondary traumatic stress (STS) reactions in staff trainings.
- Offer cross-training opportunities to enhance knowledge of trauma-informed processes throughout the system.

demonstrates that immediate gains in counselor knowledge and skills diminish quickly after the training event (Martino, Canning-Ball, Carroll, & Rounsaville, 2011). Consequently, organizations may be spending their scarce financial resources on sending counselors to this kind of training but may not be reaping adequate returns with regard to long-lasting changes in counselor skills and the development of trauma-informed and trauma-specific counselor competencies. Hoge et al. (2007) suggest the implementation of training strategies for behavioral health professionals that have proven to be effective in improving counselor skills, attitudes, and practice approaches. These strategies include: "interactive approaches; sequenced, longitudinal learning experiences; outreach visits, known as academic detailing; auditing of practice with feedback to the learner; reminders; the use of opinion leaders to influence practice; and patient-mediated interventions, such as providing information on treatment options to persons in recovery, which in turn influences the practice patterns of their providers" (p. 124).

Trauma-Informed Counselor Competencies

Hoge et al. (2007) identified a number of counselor competencies in behavioral health practices that are consistent with the skills needed to be effective in a trauma-informed system of care. They include person-centered planning, culturally competent care, development of therapeutic alliances, shared responsibility for decisions, collaboratively developed recovery plans, evidence-based practices, recovery- and resilience-oriented care, interdisciplinary- and team-based practice, and consumer/client advocacy. In addition, counselor competencies critical to the effective delivery of services to clients with trauma-related disorders include:

- Screening for and assessment of trauma history and trauma-related disorders, such as mood and anxiety disorders.
- Awareness of differences between trauma-informed and trauma-specific services.

- Understanding the bidirectional relationships among substance use and mental disorders and trauma.
- Engagement in person-centered counseling.
- Competence in delivering trauma-informed and trauma-specific evidence-based interventions that lessen the symptoms associated with trauma and improve quality of life for clients.
- Awareness of and commitment to counselor self-care practices that prevent or lessen the impact of secondary traumatization on behavioral health workers.

Exhibit 2.2-3 provides a checklist of competencies for counselors working in trauma-informed behavioral health settings. Administrators and clinical supervisors can use this checklist to assess behavioral health professionals' understanding of trauma awareness and counseling skills and determine the need for additional training and clinical supervision.

Counselor Responsibilities and Ethics

Treating all clients in an ethical manner is an expectation of all healthcare providers. It is of special importance when working with clients who have trauma-related disorders, as their trust in others may have been severely shaken. Counselors who work with traumatized individuals on a regular basis have special responsibilities to their clients because of the nature of this work. Administrators and clinical supervisors in trauma-informed organizations should develop policies that clearly define the counselors' job and should provide education about the role of counselors in the organization and their responsibilities to clients.

General Principles Regarding Counselor Responsibilities

The following are some general principles governing the responsibilities of counselors who provide behavioral health services for clients with histories of trauma:

- Counselors are responsible for routinely screening clients for traumatic experiences and trauma-related symptoms (Ouimette & Brown, 2003; see also Treatment Improvement Protocol [TIP] 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders*, Center for Substance Abuse Treatment [CSAT], 2005c).
- Counselors should offer clients with substance use and trauma-related disorders continuing mental health services if it is within their professional license and scope of practice to do so.
- Counselors are responsible for referring clients with substance use disorders and co-occurring trauma-related disorders to treatment that addresses both disorders when the treatment falls outside of the counselor's professional license and scope of practice (Ouimette & Brown, 2003).
- Counselors should refer clients with substance use disorders and co-occurring trauma-related disorders to concurrent participation in mutual-help groups if appropriate (Ouimette & Brown, 2003).
- Counselors have a responsibility to practice the principles of confidentiality in all interactions with clients and to respect clients' wishes not to give up their right to privileged communication.
- Counselors are responsible for educating clients about the limits of confidentiality and what happens to protected health information, along with the client's privilege, when the client signs a release of information or agrees to assign insurance benefits to the provider.
- Counselors must inform clients that treatment for trauma-related disorders is always voluntary.
- Counselors are responsible for being aware of their own secondary trauma and

Exhibit 2.2-3: Trauma-Informed Counselor Competencies Checklist

Trauma Awareness

___ Understands the difference between trauma-informed and trauma-specific services

___ Understands the differences among various kinds of abuse and trauma, including: physical, emotional, and sexual abuse; domestic violence; experiences of war for both combat veterans and survivors of war; natural disasters; and community violence

___ Understands the different effects that various kinds of trauma have on human development and the development of psychological and substance use issues

___ Understands how protective factors, such as strong emotional connections to safe and nonjudgmental people and individual resilience, can prevent and ameliorate the negative impact trauma has on both human development and the development of psychological and substance use issues

___ Understands the importance of ensuring the physical and emotional safety of clients

___ Understands the importance of not engaging in behaviors, such as confrontation of substance use or other seemingly unhealthy client behaviors, that might activate trauma symptoms or acute stress reactions

___ Demonstrates knowledge of how trauma affects diverse people throughout their lifespans and with different mental health problems, cognitive and physical disabilities, and substance use issues

___ Demonstrates knowledge of the impact of trauma on diverse cultures with regard to the meanings various cultures attach to trauma and the attitudes they have regarding behavioral health treatment

___ Demonstrates knowledge of the variety of ways clients express stress reactions both behaviorally (e.g., avoidance, aggression, passivity) and psychologically/emotionally (e.g., hyperarousal, avoidance, intrusive memories)

Counseling Skills

___ Expedites client-directed choice and demonstrates a willingness to work within a mutually empowering (as opposed to a hierarchical) power structure in the therapeutic relationship

___ Maintains clarity of roles and boundaries in the therapeutic relationship

___ Demonstrates competence in screening and assessment of trauma history (within the bounds of his or her licensing and scope of practice), including knowledge of and practice with specific screening tools

___ Shows competence in screening and assessment of substance use disorders (within the bounds of his or her licensing and scope of practice), including knowledge of and practice with specific screening tools

___ Demonstrates an ability to identify clients' strengths, coping resources, and resilience

___ Facilitates collaborative treatment and recovery planning with an emphasis on personal choice and a focus on clients' goals and knowledge of what has previously worked for them

___ Respects clients' ways of managing stress reactions while supporting and facilitating taking risks to acquire different coping skills that are consistent with clients' values and preferred identity and way of being in the world

___ Demonstrates knowledge and skill in general trauma-informed counseling strategies, including, but not limited to, grounding techniques that manage dissociative experiences, cognitive–behavioral tools that focus on both anxiety reduction and distress tolerance, and stress management and relaxation tools that reduce hyperarousal

(Continued on the next page.)

Exhibit 2.2-3: Trauma-Informed Counselor Competencies Checklist (continued)

___ Identifies signs of STS reactions and takes steps to engage in appropriate self-care activities that lessen the impact of these reactions on clinical work with clients

___ Recognizes when the needs of clients are beyond his or her scope of practice and/or when clients' trauma material activates persistent secondary trauma or countertransference reactions that cannot be resolved in clinical supervision; makes appropriate referrals to other behavioral health professionals

Source: Abrahams et al., 2010.

countertransference reactions and seeking appropriate help in responding to these reactions so that they do not interfere with the best possible treatment for clients.

TIC organizations have responsibilities to clients in their care, including:

- Protecting client confidentiality, particularly in relation to clients' trauma histories. Organizations should comply with the State and Federal laws that protect the confidentiality of clients being treated for mental and substance use disorders.
- Providing clients with an easy-to-read statement of their rights as consumers of mental health and substance abuse services, including the right to confidentiality (Exhibit 2.2-4).
- Providing quality clinical supervision to all counselors and direct-service workers, with an emphasis on TIC. Organizations should, at minimum, comply with State licensing requirements for the provision of clinical supervision to behavioral health workers.
- Establishing and maintaining appropriate guidelines and boundaries for client and counselor behavior in the program setting.
- Creating and maintaining a trauma-informed treatment environment that respects the clients' right to self-determination and need to be treated with dignity and respect.
- Maintaining a work environment that reinforces and supports counselor self-care.

All behavioral health professionals are responsible for abiding by professional standards of care that protect the client. Breaches of confidentiality, inappropriate conduct, and other violations of trust can do further harm to clients who already have histories of trauma. Many treatment facilities have a Client Bill of Rights (or a similar document) that describes the rights and responsibilities of both the counselors and the participants; it often is part of the orientation and informed consent process when a client enters treatment. However, simply reading and acknowledging the receipt of a piece of paper is not a substitute for the dialog that needs to happen in a collaborative therapeutic partnership. Administrators are responsible for providing clients with easy-to-read information describing counselor responsibilities and client rights. Clinical supervisors are responsible for helping counselors engage in a respectful dialog with clients about those rights and responsibilities as part of a comprehensive informed consent process.

Exhibit 2.2-4 is an excerpt from a Client Bill of Rights that outlines clients' right to confidentiality in plain language that is readable and easily understood.

Exhibit 2.2-4: Sample Statement of the Client's Right to Confidentiality From a Client Bill of Rights

Tri-County Mental Health Services is a trauma-informed mental health and substance abuse treatment agency in Maine. Below is a statement regarding clients' right to confidentiality and staff responsibility to protect that privilege; this statement is provided in a brochure outlining consumer rights that is easily accessible to service recipients at the agency and online.

Confidentiality

We will not give out information about you to anyone without your knowledge and permission. This includes written information from your record and verbal information from your providers. Additionally, we will not request any information about you without your knowledge and permission. A Release of Information Form allows you to say what information can be shared and with whom. You determine the length of time this is valid, up to one year.

Tri-County policies prevent any employee of the agency who does not have a direct need to know from having access to any information about you. The penalty for violation can include immediate dismissal.

Exceptions to this rule of confidentiality include times when a client is at immediate risk of harm to self or others, or when ordered by the court. We will make every effort to notify you in these instances.

Source: Tri-County Mental Health Services, 2008, pp. 6-7.

Ethics in Treating Traumatized Clients

All behavioral health professionals must conform to the ethical guidelines established by their profession's State licensing boards and/or certifying organizations. State licensing boards for substance abuse counseling, psychiatry, social work, psychology, professional counseling, and other behavioral health professions provide regulatory standards for ethical practice in these professions. These boards also have specific procedures for responding to complaints regarding the actions of professional caregivers. Additionally, national professional societies have standards for ethical practices. Members of these organizations are expected to practice within the boundaries and scope of these standards. Some of these standards are quite explicit, whereas others are more general; most approach professional ethics not as a rigid set of rules, but rather, as a process of making ethical decisions.

Clinical supervisors are responsible for informing counselors of their ethical responsibilities with regard to their own organization's policies and procedures, monitoring supervisees' reading and understanding the codes of ethics of professional organizations and State licensing boards, and promoting counselor understanding of ethics and how to make decisions ethically as a regular part of clinical supervision, team meetings, and counselor training. Administrators can support high ethical standards by creating an organization-wide ethics task group consisting of counselors, supervisors, and administrators who meet regularly to review and revise clinical policies in line with State and Federal law and professional codes of ethics. Administrators may also act as a support mechanism for counselors who need additional consultation regarding potential ethical dilemmas with clients. The Green Cross Academy of Traumatology provides ethical guidelines for the treatment of clients who have experienced trauma; these guidelines are adapted in Exhibit 2.2-5.

Exhibit 2.2-5: Green Cross Academy of Traumatology Ethical Guidelines for the Treatment of Clients Who Have Been Traumatized

Respect for the dignity of clients

- Recognize and value the personal, social, spiritual, and cultural diversity present in society, without judgment. As a primary ethical commitment, make every effort to provide interventions with respect for the dignity of those served.

Responsible caring

- Take the utmost care to ensure that interventions do no harm.
- Have a commitment to the care of those served until the need for care ends or the responsibility for care is accepted by another qualified service provider.
- Support colleagues in their work and respond promptly to their requests for help.
- Recognize that service to survivors of trauma can exact a toll in stress on providers. Maintain vigilance for signs in self and colleagues of such stress effects, and accept that dedication to the service of others imposes an obligation to sufficient self-care to prevent impaired functioning.
- Engage in continuing education in the appropriate areas of trauma response. Remain current in the field and ensure that interventions meet current standards of care.

Integrity in relationships

- Clearly and accurately represent your training, competence, and credentials. Limit your practice to methods and problems for which you are appropriately trained and qualified. Readily refer to or consult with colleagues who have appropriate expertise; support requests for such referrals or consultations from clients.
- Maintain a commitment to confidentiality, ensuring that the rights of confidentiality and privacy are maintained for all clients.
- Do not provide professional services to people with whom you already have either emotional ties or extraneous relationships of responsibility. The one exception is in the event of an emergency in which no other qualified person is available.
- Refrain from entering other relationships with present or former clients, especially sexual relationships or relationships that normally entail accountability.
- Within agencies, ensure that confidentiality is consistent with organizational policies; explicitly inform individuals of the legal limits of confidentiality.

Responsibility to society

- Be committed to responding to the needs generated by traumatic events, not only at the individual level, but also at the level of community and community organizations in ways that are consistent with your qualifications, training, and competence.
- Recognize that professions exist by virtue of societal charters in expectation of their functioning as socially valuable resources. Seek to educate government agencies and consumer groups about your expertise, services, and standards; support efforts by these agencies and groups to ensure social benefit and consumer protection.
- If you become aware of activities of colleagues that may indicate ethical violations or impairment of functioning, seek first to resolve the matter through direct expression of concern and offers of help to those colleagues. Failing a satisfactory resolution in this manner, bring the matter to the attention of the officers of professional societies and of governments with jurisdiction over professional misconduct.

Clients' universal rights

All clients have the right to:

- Not be judged for any behaviors they used to cope, either at the time of the trauma or after the trauma.
- Be treated at all times with respect, dignity, and concern for their well-being.
- Refuse treatment, unless failure to receive treatment places them at risk of harm to self or others.

(Continued on the next page.)

Exhibit 2.2-5: Academy of Traumatology Ethical Guidelines for the Treatment of Clients Who Have Been Traumatized (continued)

- Be regarded as collaborators in their own treatment plans.
- Provide their informed consent before receiving any treatment.
- Not be discriminated against based on race, culture, sex, religion, sexual orientation, socioeconomic status, disability, or age.
- Have promises kept, particularly regarding issues related to the treatment contract, role of counselor, and program rules and expectations.

Procedures for introducing clients to treatment

Obtain informed consent, providing clients with information on what they can expect while receiving professional services. In addition to general information provided to all new clients, clients presenting for treatment who have histories of trauma should also receive information on:

- The possible short-term and long-term effects of trauma treatment on the client and the client's relationships with others.
- The amount of distress typically experienced with any particular trauma treatment.
- Possible negative effects of a particular trauma treatment.
- The possibility of lapses and relapses when doing trauma work, and the fact that these are a normal and expected part of healing.

Reaching counseling goals through consensus

Collaborate with clients in the design of a clearly defined contract that articulates a specific goal in a specific time period or a contract that allows for a more open-ended process with periodic evaluations of progress and goals.

Informing clients about the healing process

- Clearly explain to clients the nature of the healing process, making sure clients understand.
- Encourage clients to ask questions about any and all aspects of treatment and the therapeutic relationship. Provide clients with answers in a manner they can understand.
- Encourage clients to inform you if the material discussed becomes overwhelming or intolerable.
- Inform clients of the necessity of contacting you or emergency services if they feel suicidal or homicidal, are at risk of self-injury, or have a sense of being out of touch with reality.
- Give clients written contact information about available crisis or emergency services.
- Inform clients about what constitutes growth and recovery and about the fact that some trauma symptoms may not be fully treatable.
- Address unrealistic expectations clients may have about counseling and/or the recovery process.

Level of functioning

- Inform clients that they may not be able to function at the highest level of their ability—or even at their usual level—when working with traumatic material.
- Prepare clients to experience trauma-related symptoms, such as intrusive memories, dissociative reactions, reexperiencing, avoidance behaviors, hypervigilance, or unusual emotional reactivity.

Boundaries in therapeutic relationships

Maintaining appropriate therapeutic boundaries is a primary ethical concern for behavioral health professionals. Counselors working with clients who have substance use, trauma-related, and other mental disorders may feel challenged at times to maintain boundaries that create a safe therapeutic container. Some clients, especially those with longstanding disorders, bring a history of client–counselor relationships to counseling. Clients who have been traumatized may need help understanding the roles and responsibilities of both the counselor and the client. Clients with trauma-related conditions may also have special needs

Advice to Clinical Supervisors: Recognizing Boundary Confusion

Clinical supervisors should be aware of the following counselor behaviors that can indicate boundary confusion with clients:

- The counselor feels reluctant or embarrassed to discuss specific interactions with a client or details of the client's treatment in supervision or team meetings.
- The counselor feels possessive of the client, advocates with unusual and excessive vehemence for the client, or expresses an unreasonable sense of overresponsibility for the client.
- The counselor becomes defensive and closed to hearing ideas from the supervisor or the treatment team members about approaches to working with a client and/or exploring his or her own emotional reactions to a client.
- The clinician begins or increases personal self-disclosure to the client and is not able to identify legitimate clinical reasons for the self-disclosure.

in establishing appropriate boundaries in the counseling setting; they may be particularly vulnerable and not understand or appreciate the need for professional boundaries, including not engaging in dual relationships. For example, some clients might experience a counselor's boundary around not giving the client his or her personal phone number for emergency calls as a rejection or abandonment. Cultural considerations also influence therapeutic boundaries.

Administrators, in collaboration with clinical supervisors, are responsible for creating policies regarding counselor and client boundaries for various issues (e.g., giving and receiving gifts, counselor personal disclosure, and counselor roles and responsibilities when attending the same 12-Step meetings as clients); policies should be specific to their organization and conform to State and Federal law and behavioral health professional codes of ethics. Clinical supervisors are responsible for training counselors in the informed consent process and effective ways to discuss boundaries with clients when they enter treatment.

Guidelines for establishing and maintaining boundaries in therapeutic relationships, adapted from the Green Cross Academy of Traumatology, are given in Exhibit 2.2-6.

Clients with trauma histories may be especially vulnerable to counselor behaviors that are inconsistent or that are experienced by the client as boundary violations. Examples of such behavior include: being late for appointments, ending counseling sessions early, repeatedly and excessively extending the session time, canceling or "forgetting" appointments multiple times, spending time in the session talking about their own needs and life experiences, exploring opportunities for contact outside the therapeutic relationship (including making arrangements to meet at AA or other 12-Step recovery group meetings), and enforcing rules differently for one client than for another.

Due to the complex dynamics that can arise in the treatment of clients with trauma histories, regularly scheduled clinical supervision, where issues of ethics and boundaries can be discussed, is recommended for counselors. For more information on how clinical supervision can be effectively used, see TIP 52, *Clinical Supervision and the Professional Development of the Substance Abuse Counselor* (CSAT, 2009b).

Boundary crossing and boundary violation

Although guidelines and codes of ethics are useful tools in helping clinical supervisors and counselors understand the boundaries between counselors and clients, they are open to interpretation and are context-bound. Given these limitations, it is crucial to educate counselors

Exhibit 2.2-6: Boundaries in Therapeutic Relationships

Procedures for Establishing Safety

Roles and boundaries
Counselor roles and boundaries should be established at the start of the counseling relationship and reinforced periodically, particularly at times when the client is experiencing high stress.

Ongoing Relationships and the Issue of Boundaries

Dual relationships
Dual relationships and inappropriate interactions with clients are to be avoided. It is important to tell clients at the beginning of counseling that contact between the counselor and the client can only occur within the boundaries of the professional relationship. This information is part of the informed consent process. Relationships outside these boundaries include sexual or romantic relationships, a counselor also serving as a client's sponsor in 12-Step programs, and any kind of relationship in which the counselor exploits the client for financial gain.

Sexual contact
- Never engage in any form of sexual contact with clients.
- Do not reward sexualized behaviors with attention or reactivity.
- Directly clarify the boundaries of the therapeutic relationship, and address the underlying motivations of persisting sexualized behavior.
- Set limits on a client's inappropriate behaviors while maintaining an ethos of care. Maintain respect for the dignity and worth of the client at all times.
- Understand that a client's attempt to sexualize a therapeutic relationship may reflect an early history of abuse, difficulty understanding social norms, or a variety of psychological problems.
- Readdress the absolute inappropriateness of sexual and/or romantic behavior in a nonlecturing, nonpunitive manner.
- If sexual behavior between clients occurs in a treatment program, counselors should consult with a clinical supervisor. Document the nature of the contact and how the issue is addressed.
- If a counselor has sexual contact with a client, he or she should take responsibility by ceasing counseling practice, referring clients to other treatment providers, and notifying legal and professional authorities. If a counselor is at risk for engaging with a client sexually but has not acted on it, the counselor should immediately consult with a supervisor, colleague, or psychotherapist.

Boundaries
Counselors should use care with self-disclosure or any behaviors that may be experienced as intrusive by the client, including:
- Personal disclosures made for the counselor's own gratification.
- Sexualized behavior with the client.
- Excessively intrusive questions or statements.
- Interrupting the client frequently.
- Violating the client's personal space.
- Interpersonal touch, which might activate intrusive memories or dissociative reactions or be experienced as a boundary violation by the client.
- Being consistently late for appointments or allowing outside influences (such as telephone calls) to interrupt the client's time in a counseling session.

Source: Green Cross Academy of Traumatology, 2007. Adapted with permission.

in TIC settings regarding the boundary issues that may arise for clients who have been traumatized and to give counselors a conceptual framework for understanding the contextual nature of boundaries. For example, it would be useful for clinical supervisors to discuss with

counselors the distinction between boundary crossings and boundary violations in clinical practice. Gutheil and Brodsky (2008) define boundary crossing as a departure from the customary norms of counseling practice in relation to psychological, physical, or social space "that are harmless, are nonexploitative, and may even support or advance the therapy" (p. 20). Examples of boundary crossings include taking phone calls from a client between sessions if the client is in crisis or telling a client a story about the counselor's recovery from trauma (without offering specific personal information or graphic/detailed description of the trauma) with the intention of offering hope that it is possible to recover.

Gutheil and Brodsky (2008) define boundary violations as boundary crossings that are unwanted and dangerous and which exploit the client, stating that "some boundary crossings are inadvisable because of their intent (i.e., they are not done in the service of the patient's well-being and growth, involve extra therapeutic gratification for the therapist) and/or their effect (i.e., they are not likely to benefit the patient and entail a significant risk of harming the patient)" (pp. 20–21). An example of a boundary violation would be when a counselor invites a client to attend the same AA meetings the counselor attends or shares drinking and drugging "war stories" for the counselor's own gratification. Two key elements in understanding when a boundary crossing becomes a boundary violation are the intent of the counselor and the damaging effect on the client. Maintaining a standard of practice of nonexploitation of the client is the primary focus for clinical supervisors and counselors in determining when boundary crossings become boundary violations.

Context is also an important consideration in determining the acceptability of boundary crossings. For example, it may be acceptable for a counselor in a partial hospitalization program for serious mental illness to have a cup of coffee at the kitchen table with a resident, whereas for a counselor in an outpatient mental health program, having a cup of coffee with a client at the local coffee shop would be a much more questionable boundary crossing.

Case Illustration: Denise

Denise is a 40-year-old licensed professional counselor working in an inpatient eating disorder program. She has had extensive training in trauma and eating disorder counseling approaches and has been working as a clinician in mental health settings for 15 years. Denise is usually open to suggestions from her supervisor and other treatment team members about specific strategies to use with clients who have trauma histories and eating disorders. However, in the past week, her supervisor has noticed that she has become defensive in team meetings and individual supervision when discussing a recently admitted young adult who was beaten and raped by her boyfriend; subsequently, the client was diagnosed with PTSD and anorexia. When the clinical supervisor makes note of the change in Denise's attitude and behavior in team meetings since this young woman was admitted, initially Denise becomes defensive, saying that the team just doesn't understand this young woman and that the client has repeatedly told Denise, "You're the only counselor I trust."

The clinical supervisor recognizes that Denise may be experiencing secondary traumatization and boundary confusion due to working with this young woman and to the recent increase in the number of clients with co-occurring trauma-related disorders on her caseload. After further exploration, Denise reveals that her own daughter was raped at the same age as the young woman and that hearing her story has activated an STS reaction in Denise. Her way of coping has been to become overly responsible for and overprotective of the young woman. With the nonjudgmental support of her supervisor, Denise is able to gain perspective, recognize that this young woman is not her daughter, and reestablish boundaries with her that are appropriate to the inpatient treatment setting.

Clinical Supervision and Consultation

Organizational change toward a TIC model doesn't happen in isolation. Ongoing support, supervision, and consultation are key ingredients that reinforce behavioral health professionals' training in trauma-informed and trauma-specific counseling methods and ensure compliance with practice standards and consistency over time. Often, considerable energy and resources are spent on the transition to new clinical and programmatic approaches, but without long-range planning to support those changes over time. The new treatment approach fades quickly, making it hard to recognize and lessening its reliability.

Advice to Clinical Supervisors and Administrators: Adopting an Evidence-Based Model of Clinical Supervision and Training

Just as adopting evidence-based clinical practices in a trauma-informed organization is important in providing cost-effective and outcome-relevant services to clients, adopting an evidence-based model of clinical supervision and training clinical supervisors in that model can enhance the quality and effectiveness of clinical supervision for counselors. This will ultimately enhance client care.

One of the most commonly used and researched integrative models of supervision is the discrimination model, originally published by Janine Bernard in 1979 and since updated (Bernard & Goodyear, 2009). This model is considered a competence-based and social role model of supervision; it includes three areas of focus on counselor competencies (intervention, conceptualization, and personalization) and three possible supervisor roles (teacher, counselor, and consultant).

Counselor competencies:

- Intervention: The supervisor focuses on the supervisee's intervention skills and counseling strategies used with a particular client in a given session.
- Conceptualization: The supervisor focuses on how the supervisee understands what is happening in a session with the client.
- Personalization: The supervisor focuses on the personal style of the counselor and countertransference responses (i.e., personal reactions) of the counselor to the client.

Supervisor roles:

- Teacher: The supervisor teaches the supervisee specific counseling theory and skills and guides the supervisee in the use of specific counseling strategies in sessions with clients. The supervisor as teacher is generally task-oriented. The supervisor is more likely to act as a teacher with beginning counselors.
- Counselor: The supervisor does not act as the counselor's therapist, but helps the counselor reflect on his or her counseling style and personal reactions to specific clients. The supervisor as counselor is interpersonally sensitive and focuses on the process and relational aspects of counseling.
- Consultant: The supervisor is more of a guide, offering the supervisee advice on specific clinical situations. The supervisor as consultant invites the counselor to identify topics and set the agenda for the supervision. The supervisor is more likely to act as a consultant with more advanced counselors.

This model of supervision may be particularly useful in working with counselors in TIC settings, because the supervisor's response to the supervisee is flexible and specific to the supervisee's needs. In essence, it is a counselor-centered model of supervision in which the supervisor can meet the most relevant needs of the supervisee in any given moment.

For a review of other theories and methods of clinical supervision, refer to TIP 52, *Clinical Supervision and Professional Development of the Substance Abuse Counselor* (CSAT, 2009b).

Ongoing supervision and consultation supports the organizational message that TIC is the standard of practice. It normalizes secondary traumatization as a systemic issue (not the individual pathology of the counselor) and reinforces the need for counselor self-care to prevent and lessen the impact of secondary traumatization. Quality clinical supervision for direct care staff demonstrates the organization's commitment to implementing a fully integrated, trauma-informed system of care.

Supervision and Consultation

Historically, there was an administrative belief that counselors who had extensive clinical experience and training would naturally be the best clinical supervisors. However, research does not support this idea (Falender & Shafranske, 2004). Although a competent clinical supervisor needs to have an extensive clinical background in the treatment of substance use, trauma-related, and other mental disorders, it is also essential for any counselor moving into a supervisory role to have extensive training in the theory and practice of clinical supervision before taking on this role. In particular, clinical supervisors in trauma-informed behavioral health settings should be educated in how to perform clinical supervision (not just administrative supervision) of direct service staff and in the importance of providing continuous clinical supervision and support for staff members working with individuals affected by trauma. Clinical

Case Illustration: Arlene

Arlene is a 50-year-old licensed substance abuse counselor who has a personal history of trauma, and she is actively engaged in her own recovery from trauma. She is an experienced counselor who has several years of training in trauma-informed and trauma-specific counseling practices. Her clinical supervisor, acting in the role of consultant, begins the supervision session by inviting her to set the agenda. Arlene brings up a clinical situation in which she feels stuck with a client who is acting out in her Seeking Safety group (for more information on Seeking Safety, see Najavits, 2002a).

Arlene reports that her client gets up suddenly and storms out of the group room two or three times during the session. The supervisor, acting in the role of the counselor and focusing on personalization, asks Arlene to reflect on the client's behavior and what feelings are activated in her in response to the client's anger. Arlene is able to identify her own experience of hyperarousal and then paralysis as a stress reaction related to her prior experience of domestic violence in her first marriage. The supervisor, acting in the role of teacher and focusing on conceptualization, reminds Arlene that her client is experiencing a "fight-or-flight" response to some experience in the group that reminds her of her own trauma experience. The supervisor then suggests to Arlene that her own reactions are normal responses to her previous history of trauma, and that when her client is angry, Arlene is not reexperiencing her own trauma but is being activated by the client's traumatic stress reaction to being in group. In this way, the supervisor highlights the parallel process of the client–counselor's stress reactions to a perceived threat based on prior trauma experiences.

The supervisor, acting again as a consultant and focusing on personalization this time, invites Arlene to reflect on the internal and external resources she might be able to bring to this situation that will help remind her to ground herself so she can lessen the impact of her stress reactions on her counseling strategy with this client. Arlene states that she can create a list of safe people in her life and place this list in her pocket before group. She can use this list as a touchstone to remind her that she is safe and has learned many recovery skills that can help her stay grounded, maintain her boundaries, and deal with her client's behavior. The clinical supervisor, acting as a consultant and now focusing on intervention, asks Arlene if she has some specific ideas about how she can address the client's behavior in group. Arlene and the clinical supervisor spend the remainder of the session discussing different options for addressing the client's behavior and helping her feel safer in group.

supervision in a TIC organization should focus on the following priorities:

- General case consultation
- Specialized consultation in specific and unusual cases
- Opportunities to process clients' traumatic material
- Boundaries in the therapeutic and supervisory relationship
- Assessment of secondary traumatization
- Counselor self-care and stress management
- Personal growth and professional development of the counselor

Supervision of counselors working with traumatized clients should be regularly scheduled, with identified goals and with a supervisor who is trained and experienced in working with trauma survivors. The styles and types of supervision and consultation may vary according to the kind of trauma work and its context. For instance, trauma counseling in a major natural disaster would require a different approach to supervision and consultation than would counseling adults who experienced childhood developmental trauma or counseling clients in an intensive early recovery treatment program using a manualized trauma-specific counseling protocol.

Competence-based clinical supervision is recommended for trauma-informed organizations. Competence-based clinical supervision models identify the knowledge and clinical skills each counselor needs to master, and they use targeted learning strategies and evaluation procedures, such as direct observation of counselor sessions with clients, individualized coaching, and performance-based feedback. Studies on competence-based supervision approaches have demonstrated that these models improve counselor treatment skills and proficiency (Martino et al., 2011).

Whichever model of clinical supervision an organization adopts, the key to successful trauma-informed clinical supervision is the recognition that interactions between the supervisor and the counselor may parallel those between the counselor and the client. Clinical supervisors need to recognize counselors' trauma reactions (whether they are primary or secondary to the work with survivors of trauma) and understand that a confrontational or punitive approach will be ineffective and likely retraumatize counselors.

Clinical supervisors should adopt a respectful and collaborative working relationship with counselors in which role expectations are clearly defined in an informed consent process similar to that used in the beginning of the counselor–client relationship and in which exploring the nature of boundaries in both client–counselor and counselor–supervisor relationships is standard practice. Clear role boundaries, performance expectations, open dialog, and supervisor transparency can go a long way toward creating a safe and respectful relationship container for the supervisor and supervisee and set the stage for a mutually enhancing, collaborative relationship. This respectful, collaborative supervisory relationship is the main source of training and professional growth for the counselor and for the provision of quality care to people with behavioral health disorders.

Secondary Traumatization

The demands of caregiving exact a price from behavioral health professionals that cannot be ignored; otherwise, they may become ineffective in their jobs or, worse, emotionally or psychologically impaired. In a study of Master's level licensed social workers, 15.2 percent of respondents to a survey reported STS as a result of indirect exposure to trauma material at a level that meets the diagnostic criteria for PTSD. This rate is almost twice the rate of PTSD in the general population. The author

STS is a trauma related stress reaction and set of symptoms resulting from exposure to another individual's traumatic experiences rather than from exposure directly to a traumatic event.

concluded that behavioral health professionals' experience of STS is a contributing factor in staff turnover and one reason why many behavioral health service professionals leave the field (Bride, 2007). Secondary traumatization of behavioral health workers is a significant organizational issue for clinical supervisors and administrators in substance abuse and mental health treatment programs to address.

To prevent or lessen the impact of secondary traumatization on behavioral health professionals, clinical supervisors and administrators need to understand secondary trauma from the ecological perspective described in Part 1, Chapter 1 of this TIP. The organization itself creates a social context with risk factors that can increase the likelihood of counselors experiencing STS reactions, but it also contains protective factors that can lessen the risk and impact of STS reactions on staff members. Organizations can lessen the impact of the risk factors associated with working in trauma-informed organizations by mixing caseloads to contain clients both with and without trauma-related issues, supporting ongoing counselor training, providing regular clinical supervision, recognizing counselors' efforts, and offering an empowering work environment in which counselors share in the responsibility of making decisions and can offer input into clinical and program policies that affect their work lives.

When organizations support their counselors in their work with clients who are traumatized, counselors can be more effective, more productive, and feel greater personal and professional satisfaction. In addition, counselors develop a sense of allegiance toward the organization, thus decreasing staff turnover. If organizations do not provide this support, counselors can become demoralized and have fewer emotional and psychological resources to manage the impact of clients' traumatic material and outward behavioral expressions of trauma on their own well-being. Providing counselors with the resources to help them build resilience and prevent feeling overwhelmed should be a high priority for administrators and clinical supervisors in TIC organizations.

Risk and Protective Factors Associated With Secondary Traumatization

Clinical and research literature on trauma describes a number of factors related to the development of secondary trauma reactions and psychological distress in behavioral health professionals across a wide range of practice settings, as well as individual and organizational factors that can prevent or lessen the impact of STS on staff. The risk and protective factors model of understanding secondary trauma is based on the ecological perspective

Advice to Clinical Supervisors: Recognizing Secondary Traumatization

Some counselor behaviors that demonstrate inconsistency to clients may be outward manifestations of secondary traumatization, and they should be discussed with counselors through a trauma-informed lens. It is imperative that clinical supervisors provide a nonjudgmental, safe context in which counselors can discuss these behaviors without fear of reprisal or reprimand. Clinical supervisors should work collaboratively with supervisees to help them understand their behavior and engage in self-care activities that lessen the stress that may be contributing to these behaviors.

outlined in Part 1, Chapter 1 of this TIP. The terms "compassion fatigue," "vicarious traumatization," "secondary traumatization," and "burnout" are used in the literature, sometimes interchangeably and sometimes as distinct constructs. As stated in the terminology portion of the "How This TIP Is Organized" section that precedes Part 1, Chapter 1, of this TIP, the term "secondary traumatization" refers to traumatic stress reactions and psychological distress from exposure to another individual's traumatic experiences; this term will be used throughout this section, although the studies cited may use other terms.

Risk factors

Individual risk factors that may contribute to the development of STS in behavioral health professionals include preexisting anxiety or mood disorders; a prior history of personal trauma; high caseloads of clients with trauma-related disorders; being younger in age and new to the field with little clinical experience or training in treating trauma-related conditions; unhealthy coping styles, including distancing and detachment from clients and co-workers; and a lack of tolerance for strong emotions (Newall & MacNeil, 2010). Other negative coping strategies include substance abuse, other addictive behaviors, a lack of recreational activities not related to work, and a lack of engagement with social support. A recent study of trauma nurses found that low use of support systems, use of substances, and a lack of hobbies were among the coping strategies that differed between nurses with and without STS (Von Rueden et al., 2010). Other researchers found that clinicians who engaged in negative coping strategies, such as alcohol and illicit drug use, were more likely to experience intrusive trauma symptoms (Way, Van Deusen, Martin, Applegate, & Janle, 2004).

Numerous organizational factors can contribute to the development of STS in counselors who work with clients with trauma-related disorders. These risk factors include organizational constraints, such as lack of resources for clients, lack of clinical supervision for counselors, lack of support from colleagues, and lack of acknowledgment by the organizational culture that secondary traumatization exists and is a normal reaction of counselors to client trauma (Newall & MacNeil, 2010). In a study of 259 individuals providing mental health counseling services, counselors who spent more time in session with clients with trauma-related disorders reported higher levels of traumatic stress symptoms (Bober & Regehr, 2006). Counselors may be more at risk for developing secondary traumatization if the organization does not allow for balancing the distribution of trauma and nontrauma cases amongst staff members.

Protective factors

Much of the clinical and research literature focuses on individual factors that may lessen the impact of STS on behavioral health professionals, including male gender, being older, having more years of professional experience,

Advice to Clinical Supervisors: Recognizing STS in Counselors Who Are In Recovery

For counselors who are in recovery from a substance use or mental disorder, the development of STS may be a potential relapse concern. As Burke, Carruth, and Prichard (2006) point out, "a return to drinking or illicit drug use as a strategy for dealing with secondary trauma reactions would have a profoundly detrimental effect on the recovering counselor" (p. 292). So too, secondary trauma may ignite the reappearance of depressive or anxiety symptoms associated with a previous mental disorder. Clinical supervisors can address these risk factors with counselors and support them in engaging with their own recovery support network (which might include a peer support group or an individual counselor) to develop a relapse prevention plan.

having specialized training in trauma-informed and trauma-specific counseling practices, lacking a personal trauma history, exhibiting personal autonomy in the workplace, using positive personal coping styles, and possessing resilience or the ability to find meaning in stressful life events and to rebound from adversity (Sprang, Clark, & Whitt-Woosley, 2007). Some of these factors, like positive personal coping styles and the ability to find meaning in adversity, can be developed and enhanced through personal growth work, psychotherapy, engagement with spiritual practices and involvement in the spiritual community, and stress reduction strategies like mindfulness meditation. A recent multimethod study of an 8-week workplace mindfulness training group for social workers and other social service workers found that mindfulness meditation increased coping strategies, reduced stress, and enhanced self-care of the participants; findings suggested that workers were more likely to practice stress management techniques like mindfulness at their place of work than at home (McGarrigle & Walsh, 2011). Organizations can support counselors' individual efforts to enhance positive personal coping styles, find meaning in adversity, and reduce stress by providing time for workers during the workday for personal self-care activities, like mindfulness meditation and other stress reduction practices.

One of the organizational protective factors identified in the literature that may lessen the negative impact of secondary traumatization on behavioral health professionals is providing adequate training in trauma-specific counseling strategies, which increases providers' sense of efficacy in helping clients with trauma-related disorders and reduces the sense of hopelessness that is often a part of the work (Bober & Regehr 2006). One study found that specialized trauma training enhanced job satisfaction and reduced levels of compassion fatigue, suggesting that "knowledge and training might provide some protection against the deleterious effects of trauma exposure" (Sprang et al., 2007, p. 272). Another protective factor that may lessen the chances of developing secondary traumatization is having a diverse caseload of clients. Organizations "must determine ways of distributing workload in order to limit the traumatic exposure of any one worker. This may not only serve to reduce the impact of immediate symptoms but may also address the potential longitudinal effects" (Bober & Regehr, 2006, p. 8).

Emotional support from professional colleagues can be a protective factor. A study of substance abuse counselors working with clients who were HIV positive found that workplace support from colleagues and supervisors most effectively prevented burnout (Shoptaw, Stein, & Rawson, 2000). This support was associated with less emotional fatigue and depersonalization, along with a sense of greater personal accomplishment. In a study of domestic violence advocates, workers who received more support from professional peers were less likely to experience secondary traumatization (Slattery & Goodman, 2009).

In addition, counselor engagement in relationally based clinical supervision with a trauma-informed supervisor acts as a protective agent. Slattery and Goodman (2009) note that "for the trauma worker, good supervision can normalize the feelings and experiences, provide support and information about the nature and course of the traumatic reaction, help in the identification of transference and countertransference issues, and reveal feelings or symptoms associated with the trauma" (p. 1362). Workers who reported "engaging, authentic, and empowering relationships with their supervisors" were less likely to experience STS (p. 1369). Thus, it is not simply the frequency and regularity of clinical supervision,

but also the quality of the supervision and the quality of the supervisor–counselor relationship that can lessen the impact of STS on behavioral health professionals.

Engagement with a personal practice of spirituality that provides a sense of connection to a larger perspective and meaning in life is another protective factor that can lessen the impact of STS on counselors (Trippany, Kress, & Wilcoxon, 2004). Although recovering counselors may look to support groups for connection to a spiritual community, other behavioral health professionals might find support for enhancing spiritual meaning and connection in church, a meditation group, creative endeavors, or even volunteer work. The key is for counselors to develop their own unique resources and practices to enhance a sense of meaningful spirituality in their lives. Clinical supervisors should be aware of spiritual engagement as a protective factor in preventing and lessening the impact of STS and should support clinicians in including it in their self-care plans, but they should take care not to promote or reject any particular religious belief system or spiritual practice.

Another protective factor that may lessen the impact of workers' STS is a culture of empowerment in the organization that offers counselors a sense of autonomy, a greater ability to participate in making decisions about clinical and organizational policies, and obtaining support and resources that further their professional development. Slattery & Goodman (2009) surveyed 148 domestic violence advocates working in a range of settings. The authors found that those workers "who reported a high level of shared power were less likely to report posttraumatic stress symptoms, despite their own personal abuse history or degree of exposure to trauma" (p. 1370). To the degree that organizations can provide a cultural context within which behavioral health professionals have autonomy and feel empowered, they will be able to lessen the impact of STS on their professional and personal lives. Self-efficacy and empowerment are antidotes to the experience of powerlessness that often accompanies trauma.

Strategies for Preventing Secondary Traumatization

The key to prevention of secondary traumatization for behavioral health professionals in a trauma-informed organization is to reduce risk and enhance protective factors. Organizational strategies to prevent secondary traumatization include:

- Normalize STS throughout all levels of the organization as a way to help counselors feel safe and respected, enhancing the likelihood that they will talk openly about their experiences in team meetings, peer supervision, and clinical supervision.
- Implement clinical workload policies and practices that maintain reasonable standards for direct-care hours and emphasize balancing trauma-related and nontrauma-related counselor caseloads.
- Increase the availability of opportunities for supportive professional relationships by promoting activities such as team meetings, peer supervision groups, staff retreats, and counselor training that focuses on understanding secondary traumatization and self-care. Administrators and clinical supervisors should provide time at work for counselors to engage in these activities.
- Provide regular trauma-informed clinical supervision that is relationally based. Supervisors should be experienced and trained in trauma-informed and trauma-specific practices and provide a competence-based model of clinical supervision that promotes counselors' professional and personal development. Supervision limited to case consultation or case management is insufficient to

reduce the risk for secondary traumatization and promote counselor resilience.

- Provide opportunities for behavioral health professionals to enhance their sense of autonomy and feel empowered within the organization. Some of these activities include soliciting input from counselors on clinical and administrative policies that affect their work lives, including how to best balance caseloads of clients with and without histories of trauma; inviting representatives of the counseling staff to attend selected agency board of directors and/or management team meetings to offer input on workforce development; and inviting counselors to participate in organizational task forces that develop trauma-informed services, plan staff retreats, or create mechanisms to discuss self-care in team meetings. Administrators and clinical supervisors should assess the organization's unique culture and develop avenues for counselor participation in activities that will enhance their sense of empowerment and efficacy within the organization.

Exhibit 2.2-7 highlights some specific strategies that individual counselors can engage in to prevent secondary traumatization.

Assessment of Secondary Traumatization

Counselors with unacknowledged STS can harm clients, self, and family and friends by becoming unable to focus on and attend to their needs or those of others. They may feel helpless or cynical and withdraw from support systems. Exhibit 2.2-8 describes some emotional, cognitive, and behavioral signs that may indicate that a counselor is experiencing secondary traumatization. Clinical supervisors should be familiar with the manifestations of STS in their counselors and should address signs of STS immediately.

Stamm (2009–2012) has developed and revised a self-assessment tool, the Professional Quality of Life Scale (ProQOL), that measures indicators of counselor compassion fatigue and compassion satisfaction. Compassion fatigue "is best defined as a syndrome consisting of a combination of the symptoms

Exhibit 2.2-7: Counselor Strategies To Prevent Secondary Traumatization

Strategies that counselors can use (with the support and encouragement of supervisors and administrators) to prevent secondary traumatization include:

- ***Peer support*:** Maintaining adequate social support, both personally and professionally, helps prevent isolation and helps counselors share the emotional distress of working with traumatized individuals.
- ***Supervision and consultation*:** Professional consultation will help counselors understand secondary traumatization, their own personal risks, the protective factors that can help them prevent or lessen its impact, and their countertransference reactions to specific clients.
- ***Training*:** Ongoing professional training can improve counselors' understanding of trauma and enhance a sense of mastery and self-efficacy in their work.
- ***Personal psychotherapy or counseling*:** Being in counseling can help counselors become more self-aware and assist them in managing the psychological and emotional distress that often accompanies working with clients who have trauma histories in a number of behavioral health settings.
- ***Maintaining balance in one's life*:** Balancing work and personal life, developing positive coping styles, and maintaining a healthy lifestyle can enhance resilience and the ability to manage stress.
- ***Engaging in spiritual activities that provide meaning and perspective*:** Connection to a spiritual community and spiritual practices (such as meditation) can help counselors gain a larger perspective on trauma and enhance resilience.

Exhibit 2.2-8: Secondary Traumatization Signs

The following are some indicators that counselors may be experiencing secondary traumatization.

Psychological distress
- Distressing emotions: grief, depression, anxiety, dread, fear, rage, shame
- Intrusive imagery of client's traumatic material: nightmares, flooding, flashbacks of client disclosures
- Numbing or avoidance: avoidance of working with client's traumatic material
- Somatic issues: sleep disturbances, headaches, gastrointestinal distress, heart palpitations, chronic physiological arousal
- Addictive/compulsive behaviors: substance abuse, compulsive eating, compulsive working
- Impaired functioning: missed or canceled appointments, decreased use of supervision, decreased ability to engage in self-care, isolation and alienation

Cognitive shifts
- Chronic suspicion about others
- Heightened sense of vulnerability
- Extreme sense of helplessness or exaggerated sense of control over others or situations
- Loss of personal control or freedom
- Bitterness or cynicism
- Blaming the victim or seeing everyone as a victim
- Witness or clinician guilt if client reexperiences trauma or reenacts trauma in counseling
- Feeling victimized by client

Relational disturbances
- Decreased intimacy and trust in personal/professional relationships
- Distancing or detachment from client, which may include labeling clients, pathologizing them, judging them, canceling appointments, or avoiding exploring traumatic material
- Overidentification with the client, which may include a sense of being paralyzed by one's own responses to the client's traumatic material or becoming overly responsible for the client's life

Frame of reference
- Disconnection from one's sense of identity
- Dramatic change in fundamental beliefs about the world
- Loss or distortion of values or principles
- A previous sense of spirituality as comfort or resource decreases or becomes nonexistent
- Loss of faith in something greater
- Existential despair and loneliness

Sources: Figley, 1995; Newall & MacNeil, 2010; Saakvitne et al., 1996.

of secondary traumatic stress and professional burnout" (Newall & MacNeil, 2010, p. 61). Although secondary traumatization as a reaction to exposure to clients' trauma material is similar to PTSD, burnout is a more general type of psychological distress related to the pressures of working in high-stress environments over time. Burnout may be a result of secondary traumatization and/or a contributing factor in the development of secondary traumatization. The ProQOL includes STS and burnout scales that have been validated in research studies (Adams, Figley, & Boscarino, 2008; Newall & MacNeil, 2010).

This tool can be used in individual and group clinical supervision, trainings on self-care, and team meetings as a way for counselors to check in with themselves on their levels of stress and potential signs of secondary traumatization.

Case Illustration: Gui

Gui is a 48-year-old licensed substance abuse counselor who has worked in a methadone maintenance clinic for 12 years. He originally decided to get his degree and become a counselor because he wanted to help people and make a difference in the world. Over the past 6 months, he has felt fatigued a great deal, gets annoyed easily with both clients and coworkers, and has developed a cynical attitude about the world and the people who come to the clinic for help. During this time, the clinic has been forced to lay off a number of counselors due to funding cutbacks. As a result, Gui and the remaining counselors have had a 20 percent increase in the number of weekly client contact hours required as part of their job duties. In addition, the level and severity of clients' trauma-related and other co-occurring disorders, poverty, joblessness, and homelessness has increased.

Gui is a valued employee, and when Gui discusses his thoughts that he might want to leave the clinic with his clinical supervisor, the supervisor listens to Gui's concerns and explores the possibility of having him fill out the ProQOL to get a pulse on his stress level. Gui agrees and is willing to discuss the results with his supervisor. He is not surprised to see that he scores above average on the burnout scale of the instrument but is very surprised to see that he scores below average on the secondary traumatic stress scale and above average on the compassion satisfaction scale. He begins to feel more hopeful that he still finds satisfaction in his job and sees that he is resilient in many ways that he did not acknowledge before.

Gui and the clinical supervisor discuss ways that the supervisor and the organization can lessen the impact of the stress of the work environment on Gui and support the development of a self-care plan that emphasizes his own ability to rebound from adversity and take charge of his self-care.

The compassion satisfaction scale allows counselors to reflect on their resilience and reminds them of why they choose to work with people with substance use and trauma-related disorders, despite the fact that this work can lead to secondary traumatization. The compassion satisfaction subscale reminds counselors that they are compassionate, that one of the reasons they are in a helping profession is that they value service to others, and that helping brings meaning and fulfillment to their lives. Exhibits 2.2-9 through 2.2-11 present the most recent version of the ProQOL.

Addressing Secondary Traumatization

If a counselor is experiencing STS, the organization should address it immediately. Clinical supervisors can collaborate with counselors to devise an individualized plan that is accessible, acceptable, and appropriate for each counselor and that addresses the secondary stress reactions the counselor is experiencing, providing specific self-care strategies to counteract the stress. Decisions about strategies for addressing secondary traumatization should be based on the personal preferences of the counselor, the opportunity for an immediate intervention following a critical incident, and the counselor's level of awareness regarding his or her experience of STS. Counselors may need to talk about what they are experiencing, feeling, and thinking. These experiences can be processed in teams, in consultations with colleagues, and in debriefing meetings to integrate them effectively (Myers & Wee, 2002).

If a critical incident evokes secondary traumatization among staff—such as a client suicide, a violent assault in the treatment program, or another serious event—crisis intervention should be available for workers who would like to participate. Any intervention should be voluntary and tailored to each worker's individual needs (e.g., peer, group, or individual sessions); if possible, these services should be offered continuously instead of just one time.

Exhibit 2.2-9: PRoQOL Scale

COMPASSION SATISFACTION AND COMPASSION FATIGUE (PRoQOL) VERSION 5 (2009)

When you *[help]* people you have direct contact with their lives. As you may have found, your compassion for those you *[help]* can affect you in positive and negative ways. Below are some questions about your experiences, both positive and negative, as a *[helper]*. Consider each of the following questions about you and your current work situation. Select the number that honestly reflects how frequently you experienced these things in the *past 30 days*.

1=Never 2=Rarely 3=Sometimes 4=Often 5=Very Often

___ 1. I am happy.
___ 2. I am preoccupied with more than one person I *[help]*.
___ 3. I get satisfaction from being able to *[help]* people.
___ 4. I feel connected to others.
___ 5. I jump or am startled by unexpected sounds.
___ 6. I feel invigorated after working with those I *[help]*.
___ 7. I find it difficult to separate my personal life from my life as a *[helper]*.
___ 8. I am not as productive at work because I am losing sleep over traumatic experiences of a person I *[help]*.
___ 9. I think that I might have been affected by the traumatic stress of those I *[help]*.
___ 10. I feel trapped by my job as a *[helper]*.
___ 11. Because of my *[helping]*, I have felt "on edge" about various things.
___ 12. I like my work as a *[helper]*.
___ 13. I feel depressed because of the traumatic experiences of the people I *[help]*.
___ 14. I feel as though I am experiencing the trauma of someone I have *[helped]*.
___ 15. I have beliefs that sustain me.
___ 16. I am pleased with how I am able to keep up with *[helping]* techniques and protocols.
___ 17. I am the person I always wanted to be.
___ 18. My work makes me feel satisfied.
___ 19. I feel worn out because of my work as a *[helper]*.
___ 20. I have happy thoughts and feelings about those I *[help]* and how I could help them.
___ 21. I feel overwhelmed because my case [work] load seems endless.
___ 22. I believe I can make a difference through my work.
___ 23. I avoid certain activities or situations because they remind me of frightening experiences of the people I *[help]*.
___ 24. I am proud of what I can do to *[help]*.
___ 25. As a result of my *[helping]*, I have intrusive, frightening thoughts.
___ 26. I feel "bogged down" by the system.
___ 27. I have thoughts that I am a "success" as a *[helper]*.
___ 28. I can't recall important parts of my work with trauma victims.
___ 29. I am a very caring person.
___ 30. I am happy that I chose to do this work.

Exhibit 2.2-10: Your Scores on the ProQOL: Professional Quality of Life Screening

Based on your responses, place your personal scores below. If you have any concerns, you should discuss them with a physical or mental healthcare professional.

Compassion Satisfaction _____
Compassion satisfaction is about the pleasure you derive from being able to do your work well. For example, you may feel like it is a pleasure to help others through your work. You may feel positively about your colleagues or your ability to contribute to the work setting or even the greater good of society. Higher scores on this scale represent a greater satisfaction related to your ability to be an effective caregiver in your job.

The average score is 50 (SD 10; alpha scale reliability .88). About 25% of people score higher than 57 and about 25% of people score below 43. If you are in the higher range, you probably derive a good deal of professional satisfaction from your position. If your scores are below 40, you may either find problems with your job, or there may be some other reason—for example, you might derive your satisfaction from activities other than your job.

Burnout_____
Most people have an intuitive idea of what burnout is. From the research perspective, burnout is one of the elements of Compassion Fatigue (CF). It is associated with feelings of hopelessness and difficulties in dealing with work or in doing your job effectively. These negative feelings usually have a gradual onset. They can reflect the feeling that your efforts make no difference, or they can be associated with a very high workload or a non-supportive work environment. Higher scores on this scale mean that you are at higher risk for burnout.

The average score on the burnout scale is 50 (SD 10; alpha scale reliability .75). About 25% of people score above 57 and about 25% of people score below 43. If your score is below 43, this probably reflects positive feelings about your ability to be effective in your work. If you score above 57 you may wish to think about what at work makes you feel like you are not effective in your position. Your score may reflect your mood; perhaps you were having a "bad day" or are in need of some time off. If the high score persists or if it is reflective of other worries, it may be a cause for concern.

Secondary Traumatic Stress_____
The second component of Compassion Fatigue (CF) is secondary traumatic stress (STS). It is about your work related, secondary exposure to extremely or traumatically stressful events. Developing problems due to exposure to other's trauma is somewhat rare but does happen to many people who care for those who have experienced extremely or traumatically stressful events. For example, you may repeatedly hear stories about the traumatic things that happen to other people, commonly called Vicarious Traumatization. If your work puts you directly in the path of danger, for example, field work in a war or area of civil violence, this is not secondary exposure; your exposure is primary. However, if you are exposed to others' traumatic events as a result of your work, for example, as a therapist or an emergency worker, this is secondary exposure. The symptoms of STS are usually rapid in onset and associated with a particular event. They may include being afraid, having difficulty sleeping, having images of the upsetting event pop into your mind, or avoiding things that remind you of the event.

The average score on this scale is 50 (SD 10; alpha scale reliability .81). About 25% of people score below 43 and about 25% of people score above 57. If your score is above 57, you may want to take some time to think about what at work may be frightening to you or if there is some other reason for the elevated score. While higher scores do not mean that you do have a problem, they are an indication that you may want to examine how you feel about your work and your work environment. You may wish to discuss this with your supervisor, a colleague, or a healthcare professional.

Between 23 and 41	Around 50	Average
42 or more	57 or more	High

Burnout Scale

On the burnout scale you will need to take an extra step. Starred items are "reverse scored." If you scored the item 1, write a 5 beside it. The reason we ask you to reverse the scores is because scientifically the measure works better when these questions are asked in a positive way though they can tell us more about their negative form. For example, question 1. "I am happy" tells us more about the effects of helping when you are *not* happy so you reverse the score.

The objective of debriefing a critical incident that evokes STS reactions in counselors is to help them dissipate the hyperarousal associated with traumatic stress and prevent long-term aftereffects that might eventually lead to counselor impairment. Because clinical supervisors may also be experiencing secondary traumatization, it is advisable for administrators to invite an outside trauma consultant into the organization to provide a safe space for all staff members (including clinical supervisors) to address and process the critical stress incident. For noncrisis situations, secondary traumatization should be addressed in clinical supervision. Clinical supervisors and counselors should work collaboratively to incorporate regular screening and self-assessment of STS into supervision sessions.

Advice to Clinical Supervisors: Advantages and Disadvantages of Using Psychometric Measures

Using a psychometric measure such as the ProQOL has advantages and disadvantages. It is important to understand that all tests measure averages and ranges but do not account for individual circumstances.

If you use the ProQOL in clinical supervision, present it as a self-assessment tool. Let counselors opt out of sharing their specific results with you and/or your team if it is administered in a group. If counselors choose to share scores on specific items or scales with you, work collaboratively and respectfully with them to explore their own understanding of and meanings attached to their scores. If this tool is not presented to supervisees in a nonjudgmental, mindful way, counselors may feel as if they have failed if their scores on the secondary traumatization scale are above average or if their scores on the compassion satisfaction scale are below average. High scores on the compassion fatigue and burnout scales do not mean that counselors don't care about their clients or that they aren't competent clinicians. The scores are simply one way for you and your supervisees to get a sense of whether they might be at risk for secondary traumatization, what they can do to prevent it, how to address it, and how you can support them.

The potential benefits of using a self-assessment tool like the ProQOL in clinical supervision are that it can help counselors:

- Reflect on their emotional reactions and behaviors and identify possible triggers for secondary traumatization.
- Assess their risk levels.
- Examine alternative coping strategies that may prevent secondary traumatization.
- Understand their own perceptions of themselves and their job satisfaction, affirming what they already know about their risk of secondary traumatization and their compassion satisfaction.
- Reflect on different factors that might contribute to unexpected low or high scores, such as the day of the week, the intensity of the workload, whether they have just come back from the weekend or a vacation, and so forth.
- Increase self-awareness and self-knowledge, because scores on specific items or scales bring to consciousness what is often outside of awareness.
- Realize how resilient they are emotionally, mentally, physically, and spiritually.
- Become aware of and open up conversations about self-care and self-care activities and resources, such as supportive coworkers, team members, and social networks outside of work.

If used regularly, self-assessment tools can help counselors and clinical supervisors monitor STS levels, indicate significant positive and negative changes, and suggest action toward self-care in specific areas. Clinical supervisors should fill out the ProQOL and review results with their own supervisors, a peer supervisor, or a colleague before administering it to supervisees. Doing so enables supervisors to gauge their own reactions to the self-assessment and anticipate potential reactions from supervisees.

Advice to Clinical Supervisors: Is it Supervision or Psychotherapy?

Although there are some aspects of clinical supervision that can be therapeutic and parallel the therapeutic and emotional support that occurs between the counselor and the client, clinical supervision is not therapy. As a result, it is important for clinical supervisors to maintain appropriate boundaries with supervisees when addressing their STS reactions at work.

When does the process in supervision cross over into the realm of practicing therapy with a supervisee? One clear indicator is if the supervisor begins to explore the personal history of the counselor and reflects directly on that history instead of bringing it back to how the counselor's history influences his or her work with a particular client or with clients with trauma histories in general. Clinical supervisors should focus only on counselor issues that may be directly affecting their clinical functioning with clients. If personal issues arise in clinical supervision, counselors should be encouraged to address them in their own counseling or psychotherapy.

Exhibit 2.2-12: Clinical Supervisor Guidelines for Addressing Secondary Traumatization

1. Engage counselors in regular screening/self-assessment of counselors' experience of STS.
2. Address signs of STS with counselors in clinical supervision.
3. Work collaboratively with counselors to develop a comprehensive self-care plan and evaluate its effectiveness on a regular basis.
4. Provide counselors a safe and nonjudgmental environment within which to process STS in individual and group supervision or team meetings.
5. Provide counselors with a safe and nonjudgmental place within which to debrief critical stress incidents at work; bring in an outside consultant if needed.
6. Support and encourage counselors to engage in individual counseling or psychotherapy, when needed, to explore personal issues that may be contributing to secondary traumatization at work.

When STS issues arise, the clinical supervisor should work with counselors to review and revise their self-care plans to determine what strategies are working and whether additional support, like individual psychotherapy or counseling, may be warranted.

Exhibit 2.2-12 outlines some guidelines for clinical supervisors in addressing secondary trauma in behavioral health professionals working with clients who have substance use, mental, and trauma-related disorders.

Counselor Self-Care

In light of the intensity of therapeutic work with clients with co-occurring substance use, mental, and trauma-related disorders and the vulnerability of counselors to secondary traumatization, a comprehensive, individualized self-care plan is highly recommended. Balance is the key to the development of a self-care plan—a balance between home and work, a balance between focusing on self and others, and a balance between rest and activity (Saakvitne, Perlman, & Traumatic Stress Institute/ Center for Adult & Adolescent Psychotherapy 1996). Counselor self-care is also about balancing vulnerability, which allows counselors to be present and available when clients address intensely painful content, with reasonable efforts to preserve their sense of integrity in situations that may threaten the counselors' faith or worldview (Burke et al., 2006). A comprehensive self-care plan should include activities that nourish the physical, psychological/mental, emotional/relational, and spiritual aspects of counselors' lives.

The literature on counselor self-care advocates for individual, team, and organizational strategies that support behavioral health professionals working with clients who have

Case Illustration: Carla

Carla is a 38-year-old case manager working in an integrated mental health and substance abuse agency. She provides in-home case management services to home-bound clients with chronic health and/or severe mental health and substance abuse problems. Many of her clients have PTSD and chronic, debilitating pain.

Both her parents had alcohol use disorders, and as a result, Carla became the caretaker in her family. She loves her job; however, she often works 50 to 60 hours per week and has difficulty leaving her work at work. She often dreams about her clients and wakes up early, feeling anxious. She sometimes has traumatic nightmares, even though she was never physically or sexually abused, and she has never experienced the trauma of violence or a natural disaster. She drinks five cups of coffee and three to four diet sodas every day and grabs burgers and sweets for snacks while she drives from one client to the next. She has gained 20 pounds in the past year and has few friends outside of her coworkers. She has not taken a vacation in more than 2 years. She belongs to the Catholic church down the street, but she has stopped going because she says she is too busy and exhausted by the time Sunday rolls around.

The agency brings in a trainer who meets with the case management department and guides the staff through a self-assessment of their current self-care practices and the development of a comprehensive self-care plan. During the training, Carla acknowledges that she has let her work take over the rest of her life and needs to make some changes to bring her back into balance. She writes out her self-care plan, which includes cutting back on the caffeine, calling a friend she knows from church to go to a movie, going to Mass on Sunday, dusting off her treadmill, and planning a short vacation to the beach. She also decides that she will discuss her plan with her supervisor and begin to ask around for a counselor for herself to talk about her anxiety and her nightmares. In the next supervision session, Carla's supervisor reviews her self-care plan with her and helps Carla evaluate the effectiveness of her self-care strategies. Her supervisor also begins to make plans for how to cover Carla's cases when she takes her vacation.

substance use and trauma-related disorders. Counselors are responsible for developing comprehensive self-care plans and committing to their plans, but clinical supervisors and administrators are responsible for promoting counselor self-care, supporting implementation of counselor self-care plans, and modeling self-care. Counselor self-care is an ethical imperative; just as the entire trauma-informed organization must commit to other ethical issues with regard to the delivery of services to clients with substance use, mental, and trauma-related disorders, it must also commit to the self-care of staff members who are at risk for secondary traumatization as an ethical concern. Saakvitne and colleagues (1996) suggest that when administrators support counselor-self-care, it is not only cost-effective in that it reduces the negative effects of secondary traumatization on counselors (and their clients), but also promotes "hope-sustaining behaviors" in counselors, making them more motivated and open to learning, and thereby improving job performance and client care.

A Comprehensive Self-Care Plan

A self-care plan should include a self-assessment of current coping skills and strategies and the development of a holistic, comprehensive self-care plan that addresses the following four domains:

1. Physical self-care
2. Psychological self-care (includes cognitive/mental aspects)
3. Emotional self-care (includes relational aspects)
4. Spiritual self-care

Activities that may help behavioral health workers find balance and cope with the stress

Advice to Clinical Supervisors: Spirituality

The word "spiritual" in this context is used broadly to denote finding a sense of meaning and purpose in life and/or a connection to something greater than the self. Spiritual meanings and faith experiences are highly individual and can be found within and outside of specific religious contexts.

Engaging in spiritual practices, creative endeavors, and group/community activities can foster a sense of meaning and connection that can counteract the harmful effects of loss of meaning, loss of faith in life, and cognitive shifts in worldview that can be part of secondary traumatization. Counselors whose clients have trauma-related disorders experience fewer disturbances in cognitive schemas regarding worldview and less hopelessness when they engage in spiritually oriented activities, such as meditation, mindfulness practices, being in nature, journaling, volunteer work, attending church, and finding a spiritual community (Burke et al., 2006). Clinical supervisors can encourage counselors to explore their own spirituality and spiritual resources by staying open and attuned to the multidimensional nature of spiritual meaning of supervisees and refraining from imposing any particular set of religious or spiritual beliefs on them. A strong sense of spiritual connection can enhance counselors' resilience and ability to cope with the sometimes overwhelming effects of clients' trauma material and trauma-related behavior (including suicidality) on counselors' faith in life and sense of meaning and purpose.

Modeling Self-Care

"Implementing interventions was not always easy, and one of the more difficult coping strategies to apply had to do with staff working long hours. Many of the staff working at the support center also had full-time jobs working for the Army. In addition, many staff chose to volunteer at the Family Assistance Center and worked 16- to 18-hour days. When we spoke with them about the importance of their own self-care, many barriers emerged: guilt over not working, worries about others being disappointed in them, fear of failure with respect to being unable to provide what the families might need, and a 'strong need to be there.' Talking with people about taking a break or time off proved problematic in that many of them insisted that time off was not needed, despite signs of fatigue, difficulty concentrating, and decreased productivity. Additionally, time off was not modeled. Management, not wanting to fail the families, continued to work long hours, despite our requests to do otherwise. Generally, individuals could see and understand the reasoning behind such endeavors. Actually making the commitment to do so, however, appeared to be an entirely different matter. In fact, our own team, although we kept reasonable hours (8 to 10 per day), did not take a day off in 27 days. Requiring time off as part of membership of a Disaster Response Team might be one way to solve this problem."

of working with clients with trauma-related disorders include talking with colleagues about difficult clinical situations, attending workshops, participating in social activities with family and friends, exercising, limiting client sessions, balancing caseloads to include clients with and without trauma histories, making sure to take vacations, taking breaks during the workday, listening to music, walking in nature, and seeking emotional support in both their personal and professional lives (Saakvitne et al., 1996). In addition, regular clinical supervision and personal psychotherapy or counseling can be positive coping strategies for lessening the impact of STS on counselors. Still, each counselor is unique, and a self-care approach that is helpful to one counselor may not be helpful to another. Exhibits 2.2-13 and 2.2-14 offer tools for self-reflection to help counselors discover which specific self-care activities might best suit them. The worksheet can be used privately by counselors or by clinical supervisors as an exercise in individual supervision, group supervision, team meetings, or trainings on counselor self-care.

Review the questions in Exhibit 2.2-14, and then write down specific self-care strategies in the form (given in Exhibit 2.2-13) that you're confident you will practice in both personal and professional realms.

The *Comprehensive Self-Care Worksheet* is a tool to help counselors (and clinical supervisors) develop awareness of their current coping strategies and where in the four domains they need to increase their engagement in self-care activities. Once completed, clinical supervisors should periodically review the plan with their supervisees for effectiveness in preventing and/or ameliorating secondary traumatization and then make adjustments as needed.

Essential Components of Self-Care

Saakvitne and colleagues (1996) describe three essential components, the "ABCs," of self-care that effectively address the negative impact of secondary traumatization on counselors:

1. **Awareness** of one's needs, limits, feelings, and internal/external resources. Awareness involves mindful/nonjudgmental attention to one's physical, psychological, emotional, and spiritual needs. Such attention requires quiet time and space that supports self-reflection.
2. **Balance** of activities at work, between work and play, between activity and rest, and between focusing on self and focusing on others. Balance provides stability and helps counselors be more grounded when stress levels are high.
3. **Connection** to oneself, to others, and to something greater than the self. Connection decreases isolation, increases hope, diffuses stress, and helps counselors share the burden of responsibility for client care. It provides an anchor that enhances counselors' ability to witness tremendous suffering without getting caught up in it.

Exhibit 2.2-14: Comprehensive Self-Care Plan Worksheet Instructions

Use the following questions to help you engage in a self-reflective process and develop your comprehensive self-care plan. Be specific and include strategies that are accessible, acceptable, and appropriate to your unique circumstances. Remember to evaluate and revise your plan regularly.

Physical
What are non-chemical things that help my body relax?
What supports my body to be healthy?

Psychological/Mental
What helps my mind relax?
What helps me see a bigger perspective?
What helps me break down big tasks into smaller steps?
What helps me counteract negative self-talk?
What helps me challenge negative beliefs?
What helps me build my theoretical understanding of trauma and addictions?
What helps me enhance my counseling/helping skills in working with traumatized clients?
What helps me become more self-reflective?

Emotional/Relational
What helps me feel grounded and able to tolerate strong feelings?
What helps me express my feelings in a healthy way?
Who helps me cope in positive ways and how do they help?
What helps me feel connected to others?
Who are at least three people I feel safe talking with about my reactions/feelings about clients?
How can I connect with those people on a regular basis?

Spiritual
What helps me find meaning in life?
What helps me feel hopeful?
What sustains me during difficult times?
What connects me to something greater?

Clinical supervisors can help counselors review their self-care plans through the ABCs by reflecting on these questions:

1. Has the counselor accurately identified his or her needs, limits, feelings, and internal and external resources in the four domains (physical, psychological/mental, emotional/relational, spiritual)?
2. Has the counselor described self-care activities that provide a balance between work and leisure, activity and rest, and a focus on self and others?
3. Has the counselor identified self-care activities that enhance connection to self, others, and something greater than self (or a larger perspective on life)?

Supervisors should make their own self-care plans and review them periodically with their clinical supervisors, a peer supervisor, or a colleague.

Commitment to Self-Care

One of the major obstacles to self-care is giving in to the endless demands of others, both at work and at home. It is therefore essential for counselors with the support of clinical supervisors to become "guardians of [their] boundaries and limits" (Saakvitne et al., 1996, p 136). Creating a daily schedule that includes breaks for rest, exercise, connection with coworkers, and other self-care activities can support counselors in recognizing that they are valuable individuals who are worthy of taking the time to nourish and nurture themselves, thus increasing commitment to self-care. Another way to support counselors in committing to self-care is for supervisors and administrators to model self-care in their own professional and personal lives.

Understanding that counselor self-care is not simply a luxury or a selfish activity, but rather, an ethical imperative (Exhibit 2.2-15) can foster counselors' sense of connection to their own values and accountability to the people they serve as competent and compassionate caregivers. Clinical supervisors and administrators can reinforce this sense of accountability while supporting counselors by providing a caring, trauma-informed work environment

Exhibit 2.2-15: The Ethics of Self-Care

The Green Cross Academy of Traumatology was originally established to serve a need in Oklahoma City following the April 19, 1995, bombing of the Alfred P. Murrah Federal Building. Below are adapted examples of the Academy's code of ethics with regard to worker self-care.

Ethical Principles of Self-Care in Practice
These principles declare that it is unethical not to attend to your self-care as a practitioner, because sufficient self-care prevents harming those we serve.

Standards of self-care guidelines:
- Respect for the dignity and worth of self: A violation lowers your integrity and trust.
- Responsibility of self-care: Ultimately it is your responsibility to take care of yourself—and no situation or person can justify neglecting this duty.
- Self-care and duty to perform: There must be a recognition that the duty to perform as a helper cannot be fulfilled if there is not, at the same time, a duty to self-care.

Standards of humane practice of self-care:
- Universal right to wellness: Every helper, regardless of her or his role or employer, has a right to wellness associated with self-care.
- Physical rest and nourishment: Every helper deserves restful sleep and physical separation from work that sustains them in their work role.
- Emotional rest and nourishment: Every helper deserves emotional and spiritual renewal both in and outside the work context.
- Sustenance modulation: Every helper must utilize self-restraint with regard to what and how much they consume (e.g., food, drink, drugs, stimulation) since improper consumption can compromise their competence as a helper.

Commitment to self-care:
- Make a formal, tangible commitment: Written, public, specific, measurable promises of self-care.
- Set deadlines and goals: The self-care plan should set deadlines and goals connected to specific activities of self-care.
- Generate strategies that work and follow them: Such a plan must be attainable and followed with great commitment and monitored by advocates of your self-care.

that acknowledges and normalizes secondary traumatization and by offering reasonable resources that make it possible for counselors to do their work and take care of themselves at the same time. Preventing secondary traumatization and lessening its impact on counselors once it occurs is not only cost-effective with regard to decreasing staff turnover and potential discontinuity of services to clients; it is also the ethical responsibility of a trauma-informed organization.

Appendix B—Trauma Resource List

Introduction

As it would be difficult to include every organization focused on trauma, the list of resources in this appendix is not exhaustive; consequently, this list does not include books or other materials concerning the vast nature of this topic, but rather, it concentrates solely on online resources accessible to the public for free or as part of an organization membership. The inclusion of selected resources does not necessarily signify endorsement by the Substance Abuse and Mental Health Services Administration (SAMHSA), U.S. Department of Health and Human Services (HHS). Following these resources for adults is a list of resources focused on children and adolescents and a list of training opportunities.

Technology and Trauma: Using the Web To Treat PTSD

The role of the Internet in helping those who are experiencing posttraumatic stress disorder (PTSD) has expanded rapidly; there are numerous Web sites with toolkits and research publications for clinicians who treat clients with PTSD, as well as Web sites aimed at providing information and support for these individuals. The U.S. military has contributed to the field in developing these avenues—specifically, with interactive Web applications for use on home computers and smartphones.

- PTSD Coach is a smartphone application from the U.S. Department of Veterans Affairs (VA) to help people experiencing PTSD learn about and manage their symptoms (http://www.ptsd.va.gov/public/pages/ptsdcoach.asp).
- Afterdeployment.org is a Web site developed by the Defense Centers of Excellence project led by the National Center for Telehealth & Technology, with interactive workshops about PTSD, traumatic brain injury (TBI), anxiety, and depression, aimed at returning veterans (http://www.afterdeployment.org).
- T2 Virtual PTSD Experience, also developed by the National Center for Telehealth & Technology, is an application to be used within the popular online game Second Life as an interactive way of simulating how PTSD can be acquired within a combat environment, how PTSD may present itself to the person experiencing it, and how to seek effective treatment (http://www.t2health.org/vwproj).

Resources for Adults

Academy of Cognitive Therapy

http://www.academyofct.org
260 South Broad Street
18th Floor
Philadelphia, PA 19102
Phone: 267-350-7683
Email: info@academyofct.org

The Academy of Cognitive Therapy, a nonprofit organization, supports continuing education and research in cognitive therapy, provides a valuable resource in cognitive therapy for professionals and the public at large,

and actively works toward the identification and certification of clinicians skilled in cognitive therapy. Certification is awarded to those individuals who, based on an objective evaluation, have demonstrated an advanced level of expertise in cognitive therapy. The Academy includes physicians, psychologists, social workers, and other mental health professionals from around the world. The Academy formed a Trauma Task Force after September 11, 2001, to disseminate information (available on their Web site) to help people around the world receive the best help possible following trauma.

Addiction Technology Transfer Center Network

http://www.attcnetwork.org/index.asp
5100 Rockhill Road
Kansas City, MO 64110
Phone: 816-235-6888
Email: networkoffice@attcnetwork.org

The Addiction Technology Transfer Center (ATTC) Network serves as a resource for students and professionals to identify international distance education opportunities for the substance abuse treatment field and as a free marketing venue for ATTC-approved sponsors of distance education courses. The ATTC Web site provides trauma-related resources that include case studies, information on working with returning veterans who have been exposed to trauma, and links to various publications on PTSD and secondary traumatic stress.

Agency for Healthcare Research and Quality

http://www.innovations.ahrq.gov/index.aspx
540 Gaither Road
Suite 2000
Rockville, MD 20850
Phone: 301-427-1104

The Agency for Healthcare Research and Quality (AHRQ) is the research arm of HHS, specializing in patient safety and quality improvement, outcomes and effectiveness of care, clinical practice and technology assessment, and healthcare organization and delivery systems. AHRQ also provides funding and technical assistance to health research and research training programs at many universities and institutions. AHRQ's Web site provides links to research publications on PTSD and to other government publications and toolkits dealing with trauma-informed care.

The American Academy of Experts in Traumatic Stress

http://www.aaets.org
203 Deer Road
Ronkonkoma, NY 11779
Phone: 631-543-2217
Email: info@aaets.org

The American Academy of Experts in Traumatic Stress is a multidisciplinary network of professionals who are committed to the advancement of intervention for survivors of trauma. The Academy aims to identify expertise among professionals and across disciplines and to provide meaningful standards for those who work regularly with survivors. The Academy is committed to fostering a greater appreciation of the effects of common traumatic experiences (e.g., chronic illness, accidents, domestic violence, loss) in addition to large-scale disasters and catastrophes. The group's aim is to help all victims to become survivors and, ultimately, to thrive.

American Red Cross Disaster Services

http://www.redcross.org/what-we-do/disaster-relief
American Red Cross National Headquarters
2025 E Street, NW

Washington, DC 20006
Phone: 202-303-4498

Red Cross disaster relief focuses on meeting people's immediate emergency disaster-caused needs. When a disaster threatens or strikes, the Red Cross provides shelter, food, and health and mental health services to address basic human needs. In addition to these services, the core of Red Cross disaster relief is the assistance given to individuals and families affected by disaster to enable them to resume their normal daily activities independently. Training opportunities are also provided.

Anxiety and Depression Association of America

http://www.adaa.org
8701 Georgia Avenue #412
Silver Spring, MD 20910
Phone: 240-485-1001

The Anxiety and Depression Association of America (ADAA) is the only national, nonprofit membership organization dedicated to informing the public, healthcare professionals, and legislators that anxiety disorders are real, serious, and treatable. ADAA promotes the early diagnosis, treatment, and cure of anxiety disorders and is committed to improving the lives of the people who have them. The ADAA Web site provides information about the symptoms of PTSD and how it can be treated, in addition to offering a PTSD self-screening tool.

Association for Behavioral and Cognitive Therapies

http://www.abct.org
305 7th Avenue
16th Floor
New York, NY 10001
Phone: 212-647-1890
Fax: 212-647-1865

The Association for Behavioral and Cognitive Therapies is a professional, interdisciplinary organization concerned with the application of behavioral and cognitive science to understanding human behavior, developing interventions to enhance the human condition, and promoting the appropriate use of these interventions. The association's Web site includes resources for the public and for professionals on trauma and disaster-related problems, a clinical referral directory, and other resources and training opportunities in behavioral therapy.

Association of Traumatic Stress Specialists

http://www.atss.info
88 Pompton Avenue
Verona, NJ 07044
Phone: 973-559-9200
Email: Admin@atss.info

The Association of Traumatic Stress Specialists is an international membership organization that offers three distinct board certifications to qualified individuals who provide services, intervention, response, and/or treatment in the field of traumatic stress. The Association is dedicated to improving the quality of life of all individuals throughout the world who have been affected by traumatic events. Membership represents those who serve survivors of natural disasters, terrorist attacks, injuries and deaths related to serving in the line of duty or to school and workplace violence; veterans; refugees; victims of crime; Holocaust survivors; those affected and exploited by political persecution; and others who have experienced traumatic stress injuries.

Center for Anxiety and Related Disorders

http://www.bu.edu/card
648 Beacon Street
6th Floor

Boston, MA 02215
Phone: 617-353-9610

The Center for Anxiety and Related Disorders (CARD) at Boston University is a clinical and research center dedicated to advancing knowledge and providing care for anxiety, mood, eating, sleep, and related disorders. CARD's Web site offers information regarding PTSD and research publications on trauma and anxiety, in addition to linking to toolkits from the National Child Traumatic Stress Network's Adolescent Traumatic Stress and Substance Abuse Program.

Center for the Study of Traumatic Stress

http://www.cstsonline.org
Uniformed Services University of the Health Sciences
Department of Psychiatry
4301 Jones Bridge Road
Bethesda, MD 20814-4799
Phone: 301-295-2470
Fax: 301-319-6965

The Center for the Study of Traumatic Stress (CSTS) is a federally funded organization established by the Military Health System in 1987 to address Department of Defense concerns regarding health risks and concerns resulting from the traumatic impact of the use of weapons of mass destruction in combat, acts of terrorism and hostage events, combat and peacekeeping operations, natural disasters, and assaults or accidents occurring in both uniformed and civilian communities. CSTS primarily serves members of the armed forces, along with their children and families.

Center for Culture, Trauma and Mental Health Disparities

http://www.semel.ucla.edu/cctmhd
UCLA Semel Institute of Neuroscience & Biobehavioral Sciences
760 Westwood Plaza
Los Angeles, CA 90024
Phone: 310-794-9929

The Collaborative Center for Trauma and Mental Health Disparities at the University of California Los Angeles is a multiethnic and multidisciplinary group that focuses on conducting research and providing training that pertains to trauma in minority populations.

Council of State Governments Justice Center—Mental Health

http://csgjusticecenter.org/jc/category/mental-health
100 Wall Street
20th Floor
New York, NY 10005
Phone: 212-482-2320
Fax: 212-482-2344
Email: consensusproject@csg.org

The Consensus Project is part of the Council of State Governments Justice Center and partners with other organizations, such as SAMHSA's GAINS Center, working to improve outcomes for people, including juveniles, with mental illnesses involved with the criminal justice system. The Consensus Project offers a webinar on trauma services in the criminal justice system and on child trauma and juvenile justice, as well as a local programs database.

Dart Center for Journalism and Trauma

http://www.dartcenter.org
Columbia University
Graduate School of Journalism
2950 Broadway
New York, NY 10027
Phone: 212-854-8056

The Dart Center is dedicated to improving media coverage of trauma, conflict, and

tragedy. The Center also addresses the consequences of such coverage for those working in journalism and provides training and education via seminars, newsroom briefings and consultation on trauma issues, in addition to training for journalism educators and other trainers. The Dart Center Web site offers fact sheets, publications, and DVDs on request for use by journalists, educators, and clinicians.

David Baldwin's Trauma Information Pages

http://www.trauma-pages.com
Phone: 541-686-2598
Email: dvb@trauma-pages.com

This Web site focuses primarily on emotional trauma and traumatic stress, including PTSD and dissociation, whether following individual traumatic experience(s) or a large-scale disaster. The site's purpose is to provide information for clinicians and researchers in the traumatic stress field. Specifically, the focus is on both clinical and research aspects of trauma responses and their resolution.

Disaster Technical Assistance Center

http://www.samhsa.gov/dtac
9300 Lee Highway
Fairfax, VA 22031
Phone: 800-308-3515
Fax: 703-225-2338

SAMHSA has created the Disaster Technical Assistance Center (DTAC) to help States prepare for and respond to a wide range of potential catastrophes—both natural and human-caused disasters. DTAC primarily serves individuals and communities who are recovering from natural and human-caused disasters. It works in conjunction with the Federal Emergency Management Agency (FEMA) and SAMHSA's Emergency Mental Health and Traumatic Stress Services Branch, using strengths-based, outreach-oriented principles conducted in nontraditional settings, as a supplement to programs already in place on a local level.

EMDR Institute, Inc.

http://www.emdr.com
P.O. Box 750
Watsonville, CA 9507
Phone: 831-761-1040
Fax: 831-761-1204
Email: inst@emdr.com

Eye Movement Desensitization and Reprocessing (EMDR) is an information-processing therapy that uses an eight-phase approach. (See the description in Part 1, Chapter 6.) The Web site presents background and descriptive information about this approach to treatment and lists training opportunities, references, and networking groups.

The Federal Emergency Management Agency

http://www.fema.gov
500 C Street SW
Washington, DC 20472
Phone: 202-646-2500

The Federal Emergency Management Agency, a formerly independent agency that became part of the Department of Homeland Security in March 2003, is tasked with responding to, planning for, recovering from, and mitigating against disasters. FEMA can trace its beginnings to the Congressional Act of 1803. This Act, generally considered the first piece of disaster legislation, provided assistance to a New Hampshire town following an extensive fire. In the century that followed, ad hoc legislation was passed more than 100 times in response to hurricanes, earthquakes, floods, and other natural disasters.

The International Critical Incident Stress Foundation, Inc.

http://www.icisf.org
3290 Pine Orchard Lane
Suite 106
Ellicott City, MD 21042
Phone: 410-750-9600
Fax: 410-750-9601
Email: info@icisf.org

The International Critical Incident Stress Foundation, Inc., is a nonprofit, open-membership foundation dedicated to the prevention and mitigation of disabling stress through the provision of education, training, and support services for all emergency services professions; continuing education and training in emergency mental health services for psychologists, psychiatrists, social workers, and licensed professional counselors; and consultation in the establishment of crisis and disaster response programs for varied organizations and communities worldwide.

International Society for the Study of Trauma and Dissociation

http://www.issd.org
8400 Westpark Drive
Second Floor
McLean, VA 22102
Phone: 703-610-9037
Fax: 703-610-0234
Email: info@isst-d.org

The Society is a nonprofit professional association organized for the purposes of information sharing and international networking of clinicians and researchers; providing professional and public education; promoting research and theory about dissociation; and promoting research and training in the identification, treatment, and prevention of dissociative disorders. The Society offers courses in its Dissociative Disorders Psychotherapy Training Program.

The International Society for Traumatic Stress Studies

http://www.istss.org
111 Deer Lake Road
Suite 100
Deerfield, IL 60015
Phone: 847-480-9028
Fax: 847-480-9282

The International Society for Traumatic Stress Studies (ISTSS) was founded in 1985 for professionals to share information about the effects of trauma. ISTSS is dedicated to the discovery and dissemination of knowledge about policy, program, and service initiatives that seek to reduce traumatic stressors and their immediate and long-term consequences. ISTSS provides a forum for the sharing of research, clinical strategies, public policy concerns, and theoretical formulations on trauma in the United States and around the world.

National Alliance on Mental Illness

http://www.nami.org
3803 N. Fairfax Dr.
Suite 100
Arlington, VA 22203
Phone: 703-524-7600
Fax: 703-524-9094

The National Alliance on Mental Illness (NAMI) is a nonprofit advocacy group founded in 1979 to raise awareness and provide essential and free education, advocacy, and support group programs for people living with mental illness and their loved ones. NAMI operates at the local, State, and national levels, with each level of the organizations providing education, information, support, and advocacy for those with mental illness and their support system. NAMI has developed a Trauma Toolkit and includes a series of lectures for mental health professionals about trauma.

National Association of State Alcohol and Drug Abuse Directors, Inc.

http://www.nasadad.org
1025 Connecticut Ave NW
Suite 605
Washington, DC 20036
Phone: 202-293-0090
Fax: 202-293-1250
Email: dcoffice@nasadad.org

The National Association of State Alcohol and Drug Abuse Directors, Inc. (NASADAD) is a private, not-for-profit educational, scientific, and informational organization. NASADAD's basic purpose is to foster and support the development of effective alcohol and drug abuse prevention and treatment programs throughout every State. NASADAD offers a policy brief with regards to trauma and substance use/abuse in the wake of natural or human-made disasters.

National Association of State Mental Health Program Directors

http://www.nasmhpd.org
66 Canal Center Plaza
Suite 302
Alexandria, VA 22314
Phone: 703-739-9333
Fax: 703-548-9517

The National Association of State Mental Health Program Directors (NASMHPD; pronounced "NASH-pid") is a nonprofit organization dedicated to serving the needs of the Nation's public mental health system through policy development, information dissemination, and technical assistance. NASMHPD represents the $23 billion public mental health service delivery system. As a private, not-for-profit 501(c)(3) membership organization, NASMHPD helps set the agenda and determine the direction of State mental health agency interests across the country, historically including State mental health planning, service delivery, and evaluation. The principal programs operated, funded, and/or regulated by NASMHPD members serve people who have serious mental illnesses, developmental disabilities, and/or substance use disorders. NASMPHD has launched a Technical Assistance Coordinating Center in response to the Alternatives to Restraint and Seclusion State Infrastructure Grant Project, an initiative of SAMHSA's Center for Mental Health Services, designed to promote the implementation and evaluation of best practice approaches to preventing and reducing the use of seclusion and restraint in mental health settings.

National Center for Injury Prevention and Control

http://www.cdc.gov/injury
1600 Clifton Road
Atlanta, GA 30333
Phone: 800-232-4636
Email: cdcinfo@cdc.gov

The National Center for Injury Prevention and Control (NCIPC) was established by the Centers for Disease Control and Prevention in 1992. Through research, surveillance, implementation of evidence-based strategies, capacity building, and communication activities, NCIPC works to reduce morbidity, disability, mortality, and costs associated with injuries and violence. NCIPC is the lead U.S. Federal agency for nonoccupational injury prevention.

National Center for PTSD

http://www.ptsd.va.gov
810 Vermont Avenue NW
Washington, DC 20420
Phone: 802-296-6300
Email: ncptsd@va.gov

The National Center for PTSD (NCPTSD) was created within the Department of

Veterans Affairs in 1989 in response to a Congressional mandate to address the needs of veterans with military-related PTSD. Its mission is to advance the clinical care and social welfare of America's veterans through research, education, and training in the science, diagnosis, and treatment of PTSD and stress-related disorders. Its Web site is provided as an educational resource concerning PTSD and other enduring consequences of traumatic stress. The NCPTSD Web site has information about instruments to measure trauma exposure, risk and resilience factors for PTSD, self-report instruments, and interview schedules. Training opportunities are listed at http://www.ptsd.va.gov/about/training/training-programs.asp.

National Center for Telehealth and Technology

http://www.t2health.org
9933C West Hayes Street
Joint Base Lewis-McChord, WA 98431
Phone: 253-968-1914
Fax: 253-968-4192
Email: AskUs@t2health.org

The National Center for Telehealth and Technology is a Federal agency founded by the Department of Defense as part of the Military Health System. It primarily serves veterans and active-duty military personnel who are experiencing adverse health effects due to TBI and PTSD, as well as military children who are coping with their parents' deployment, through the use of technology (e.g., mobile phone applications, deployable telehealth centers).

National Center for Trauma-Informed Care

http://www.samhsa.gov/nctic
66 Canal Center Plaza
Suite 302
Alexandria, VA 22314
Phone: 866-254-4819
Fax: 703-548-9517
Email: NCTIC@NASMHPD.org

The National Center for Trauma-Informed Care (NCTIC) is a Federal center established by SAMHSA in 2005 to offer consultation, technical assistance, education, outreach, and resources to support trauma-informed care in publicly-funded systems and programs. NCTIC primarily serves those who are already receiving services from the behavioral health system and is focused on helping behavioral health services and programs to become more aware of the impact of trauma among consumers, to adapt services to incorporate trauma-informed practices, and to help raise awareness of practices or processes that are more likely to retraumatize consumers.

National Center for Victims of Crime

http://www.victimsofcrime.org
2000 M Street NW
Suite 480
Washington, DC 20036
Phone: 202-467-8700
Fax: 202-467-8701
Email: webmaster@ncvc.org

The National Center for Victims of Crime (NCVC) is a nonprofit organization funded partially by Federal grants from the Department of Justice. It was founded in 1985 and originally known as the Sunny Von Bulow National Victim Advocacy Center. NCVC is a resource center for those affected by violent crimes and also provides training and education for behavioral health service providers.

National Center on Domestic Violence, Trauma & Mental Health

http://www.nationalcenterdvtraumamh.org/
Phone: 312-726-7020
Fax: 312-726-7022

The National Center on Domestic Violence, Trauma & Mental Health was established in 2005 through a grant from the Family Violence Prevention and Services Program, HHS. The Center's mission is to promote accessible, culturally relevant, and trauma-informed responses to domestic violence and other lifetime trauma so that survivors and their children can access the resources that are essential to their safety and well-being; this is achieved by providing training and online resources to mental health and substance abuse treatment providers and developing policies to improve system responses to domestic violence survivors and their children.

National Center on Elder Abuse

http://www.ncea.aoa.gov
University of California–Irvine
Program in Geriatric Medicine
101 The City Drive South, 200 Building
Orange, CA 92868
Phone: 855-500-3537
Email: ncea-info@aoa.hhs.gov

The National Center on Elder Abuse (NCEA), part of the U.S. Administration on Aging, serves as a national resource center dedicated to the prevention of elder mistreatment. NCEA provides information to both mental health professionals and the general public and also provides technical assistance and training to States and community-based organizations.

National Center on Family Homelessness

http://www.familyhomelessness.org
200 Reservoir Street
Suite 200
Needham, MA 02494
Phone: 617-964-3834
Fax: 617-244-1758
Email: info@familyhomelessness.org

The National Center on Family Homelessness (NCFH) was founded in 1988 and is a nonprofit organization that conducts research and creates public awareness about the special needs of families experiencing homelessness. NCFH primarily serves veterans who are homeless and their families and young mothers who are homeless with their children. NCFH has developed a Trauma-Informed Organizational Toolkit for Homeless Services.

National Coalition Against Domestic Violence

http://www.ncadv.org
1 Broadway
Suite B210
Denver, CO 80203
Phone: 303-839-1852
Fax: 303-831-9251
Email: mainoffice@ncadv.org

The National Coalition Against Domestic Violence (NCADV) is an advocacy group founded in 1978 and acts as a national information and referral center for the general public, media, survivors of domestic violence and their children, and allied and member agencies and organizations. NCADV also works to influence legislation that would provide protection for survivors of domestic violence and their families and provide funding to shelters, healthcare centers, and other organizations.

National Council for Behavioral Health

http://www.thenationalcouncil.org
1701 K Street NW
Suite 400
Washington, DC 20006
Phone: 202-684-7457
Email: communications@thenationalcouncil.org

The National Council for Behavioral Health is a national community behavioral health

advocacy organization, formed in 1970, to conduct Federal advocacy activities, representing the industry on Capitol Hill and before Federal agencies. It also offers a national consulting service program, various publications, and an annual training conference. The National Council Magazine, 2011, Issue 2, focuses on trauma-informed behavioral health services. The National Council has offered a Learning Community for Adoption of Trauma-Informed Practices, funded by SAMHSA.

National Institute on Drug Abuse

http://drugabuse.gov
National Institute on Drug Abuse
National Institutes of Health
6001 Executive Boulevard
Room 5213, MSC 9561
Bethesda, MD 20892-9561
Phone: 301-443-1124
Email: information@nida.nih.gov

The National Institute on Drug Abuse's (NIDA) mission is to lead the Nation in bringing the power of science to bear on drug abuse and addiction. NIDA's goal is to ensure that science, not ideology or anecdote, forms the foundation for all of the Nation's drug abuse reduction efforts. NIDA was established in 1974, and in October 1992 it became part of the National Institutes of Health (NIH), HHS. The Institute is organized into divisions and offices, each of which plays an important role in programs of drug abuse research. NIDA has an ongoing research program on women's health and sex/gender differences, including the gathering of information on trauma and substance abuse.

National Institute of Mental Health

http://www.nimh.nih.gov
National Institute of Mental Health
Science Writing, Press, and Dissemination Branch
6001 Executive Boulevard
Room 8184, MSC 9663
Bethesda, MD 20892-9663
Phone: 301-443-4513
Fax: 301-443-4279
Email: nimhinfo@mail.nih.gov

The National Institute of Mental Health (NIMH) is one of the 27 component institutes of NIH, the Federal Government's principal biomedical and behavioral research agency that is part of HHS. NIMH's mission is to reduce the burden of mental illness and behavioral disorders through research on mind, brain, and behavior. This public health mandate demands that NIMH use science to achieve better understanding, treatment, and eventually, prevention of these disabling conditions that affect millions of Americans. NIMH offers publications and podcasts related to traumatic events and PTSD.

National Registry for Evidence-Based Programs and Practices

http://www.nrepp.samhsa.gov
Phone: 866-436-7377
Email: nrepp@samhsa.hhs.gov

SAMHSA's National Registry for Evidence-Based Programs and Practices (NREPP) is a searchable online registry of more than 300 interventions supporting mental health promotion, substance abuse prevention, and mental health and substance abuse treatment. NREPP offers several interventions that address trauma and PTSD.

National Sexual Violence Resource Center

http://www.nsvrc.org
123 North Enola Drive
Enola, PA 17025
Phone: 717-909-0710
Fax: 717-909-0714

The National Sexual Violence Resource Center (NSVRC) was founded by the Pennsylvania Coalition Against Rape in 2000 and is partially federally funded by grants from the Centers for Disease Control and Prevention. NSVRC advocates for changes in Federal and State legislation to further the goal of ending sexual violence in all communities, in addition to collecting and disseminating a wide range of resources on sexual violence, including statistics, research, position statements, statutes, training curricula, prevention initiatives and program information. NSVRC does not provide direct services to survivors of sexual violence but acts as a resource to support these services.

National Trauma Consortium

http://www.nationaltraumaconsortium.org
520 Ralph Street
Sarasota, FL 34242
Phone: 941-312-9795

The National Trauma Consortium (NTC) is a clearinghouse for information about trauma and emerging best practices in trauma treatment and services and, in addition, offers training and consultation services. NTC also provides resources in the form of downloadable publications and links to other organizations related to mental health and trauma.

National Voluntary Organizations Active in Disasters

http://www.nvoad.org
1501 Lee Highway
Suite 170
Arlington, VA 22209-1109
Phone: 703-778-5088
Fax: 703-778-5091
Email: info@nvoad.org

National Voluntary Organizations Active in Disasters (NVOAD) coordinates planning efforts by many voluntary organizations responding to disaster. Member organizations provide more effective service and less duplication by getting together before disasters strike. Once disasters occur, NVOAD or an affiliated State VOAD encourages members and other voluntary agencies to convene on site. This cooperative effort has proven to be the most effective way for a wide variety of volunteers and organizations to work together in a crisis. NVOAD's principles are cooperation, coordination, communication, education, mitigation, convening mechanisms, and outreach.

Office for Victims of Crime Training and Technical Assistance Center

https://www.ovcttac.gov/
9300 Lee Highway
Fairfax, VA 22031-6050
Phone: 866-682-8822
TTY: 866-682-8880
Fax: 703-279-4673
Email: TTAC@ovcttac.org

The Office for Victims of Crime Training and Technical Assistance Center provides comprehensive, quality technical assistance and training resources to victims' service providers and allied professionals. Its mission is to support the development of the field by increasing the Nation's capacity to provide crime victims with skilled, capable, and sensitive assistance. Its core functions are needs assessment, capacity building, evaluation, and reporting.

Rape, Abuse & Incest National Network

http://www.rainn.org
1220 L Street NW
Suite 505
Washington, DC 20005
Phone: 202-544-1034
Email: info@rainn.org

The Rape, Abuse & Incest National Network (RAINN) is a nonprofit organization, founded in 1994, that is partially funded by a grant from the Office for Victims of Crime, Office of Justice Programs, U.S. Department of Justice. RAINN provides support for survivors of sexual assault via a telephone hotline and an online hotline and works with the Department of Defense (DoD) to provide a hotline for members of the DoD community who have experienced sexual assault.

SAMHSA's Tribal Training and Technical Assistance Center

http://beta.samhsa.gov/tribal-ttac
201 Corporate Drive
Suite 800
Landover, MD 20785
Phone: 240-650-0257
Email: TA-Request@tribaltechllc.com

SAMHSA's Tribal Training and Technical Assistance Center (Tribal TTAC) is committed to providing comprehensive broad, focused, and/or intensive training and technical assistance to federally recognized Tribes and other American Indian and Alaska Native communities seeking to address and prevent mental and substance use disorders and suicide while promoting mental health. The goal of the Tribal TTAC is to use a culturally relevant, evidence-based, holistic approach to support Native communities in their self-determination efforts through infrastructure development, capacity building, and program planning and implementation.

Sanctuary Model

http://www.sanctuaryweb.com
Phone: 888-538-3124

The goals of the Sanctuary Model include increasing the perceived sense of community/cohesiveness; the degree of social immunity to the spread of violence; the capacity for social learning; the making of decisions democratically and the sharing of responsibility in solving problems and resolving conflicts; the ability to deal with complexity; opportunities for all clients and staff members to experience a truly safe and connected community; opportunities for troubled clients to have corrective emotional, relational, and environmental experiences; and recovery, healing, and growth.

Seeking Safety

http://www.seekingsafety.org
Treatment Innovations
28 Westbourne Road
Newton Centre, MA 02459
Phone: 617-299-1610
Fax: 617-701-1295
Email: info@seekingsafety.org

This Web site provides information about Seeking Safety, a psychotherapeutic intervention for treating trauma, PTSD, and substance abuse. Seeking Safety is a present-focused therapy to help people attain safety from both PTSD and substance abuse. The treatment is also available as a book, which provides both client handouts and guidance for clinicians. The site includes topics included in the treatment program, sample materials, relevant empirical studies, and supplementary articles.

Sidran Institute

http://www.sidran.org
P.O. Box 436
Brooklandville, MD 21022-0436
Phone: 410-825-8888
Fax: 410-560-0134
Email: info@sidran.org

The Sidran Institute is a nationally focused nonprofit organization devoted to helping people who have experienced traumatic life events through education and advocacy. The Institute's education and advocacy focuses on:

- The early recognition and treatment of trauma-related stress in children.
- The understanding of trauma and its long-term effect on adults.
- The strategies in engaging in mutual-help recovery for trauma survivors.
- The clinical methods and practices leading in aiding trauma victims.
- The development of public policy initiatives responsive to the needs of adult and child survivors of traumatic events.

Substance Abuse and Mental Health Services Administration

http://www.samhsa.gov
1 Choke Cherry Lane
Rockville, MD 20857
Phone: 877-726-4727
Fax: 240-221-4292
Email: SAMHSAInfo@samhsa.hhs.gov

SAMHSA is the Federal agency within HHS charged with improving the quality and availability of prevention, treatment, and rehabilitative services to reduce illness, death, disability, and cost to society resulting from substance abuse and mental illness. The Emergency Mental Health and Traumatic Stress Services Branch, a branch of SAMHSA's Center for Mental Health Services, works with FEMA to provide crisis counseling training and technical assistance to State and local mental health professionals. SAMHSA offers several publications regarding trauma and PTSD, as well as a publication focusing on creating a seclusion-free and restraint-free environment.

Traumatic Stress Institute

http://www.traumaticstressinstitute.org
Klingberg Family Centers
370 Linwood Street
New Britain, CT 06052
Phone: 860-224-9113

The Traumatic Stress Institute (TSI) works to increase understanding of the psychological impact of trauma and to help victims of violence restore meaning and wholeness to their lives. In meeting these goals, TSI is involved in clinical service, professional training, community education, and research. TSI offers forensic assessment and expert testimony, professional education, training opportunities, and publications. TSI developed the "Risking Connections" trauma treatment program and provides training in the use of this model.

Tulane University Traumatology Institute

http://sites.google.com/site/charlesfigley/Home/traumatologyinstitute
Tulane School of Social Work
6823 St. Charles Ave., Building 9
New Orleans, LA 70118
Phone: 800-631-8234
Email: figley@tulane.edu

The Traumatology Institute, founded in 1996, brings together health and mental health professionals from a wide array of disciplines from throughout the United States and around the world to develop cutting-edge research, treatment approaches, and training programs in the field of traumatology. The Institute facilitates the development of knowledge about the traumatization experience of victims, survivors, and the professionals who serve them. The Traumatology Institute conducts research, education, and service activities toward reducing the deleterious effects of trauma on individuals, families, communities, and entire societies.

Veterans Affairs PTSD Support Services

http://www.ptsdsupport.net/va.html
P.O. Box 5574
Woodland Park, CO 80866
Email: russ@ptsdsupport.net

The Department of Veterans Affairs Medical Centers provide a network of more than 100 specialized programs for veterans with PTSD, working closely in conjunction with the Veterans Web Site (http://www.vetcenter.va.gov) operated by VA's Readjustment Counseling Service. Each specialized PTSD program offers veterans education, evaluation, and treatment conducted by mental health professionals from a variety of disciplines (such as psychiatry, psychology, social work, counseling, and nursing). See also: National Center for PTSD.

White Bison Wellbriety Training Institute

http://www.whitebison.org
701 N. 20th Street
Colorado Springs, CO 80904
Phone: 877-871-1495
Email: info@whitebison.org

White Bison is an American Indian nonprofit charitable organization that focuses on offering sobriety, recovery, addictions prevention, and wellness/Wellbriety learning resources to the Native American community nationwide. White Bison's Wellbriety Training Institute provides training, tools, and resources for historical and intergenerational trauma to trainers and mental health professionals.

Resources for Children and Adolescents

The following section provides resources that address the needs of children and adolescents who are affected by traumatic stress.

American Academy of Child & Adolescent Psychiatry

http://www.aacap.org
3615 Wisconsin Avenue NW
Washington, DC 20016-3007
Phone: 202-966-7300
Fax: 202-966-2891

The American Academy of Child & Adolescent Psychiatry (AACAP) is a national professional medical association dedicated to treating and improving the quality of life for children, adolescents, and families affected by mental, behavioral, and developmental disorders. AACAP distributes information to promote an understanding of mental illnesses and remove the shame associated with them, to advance efforts in prevention of mental illnesses, and to ensure proper treatment and access to services for children and adolescents.

American Professional Society on the Abuse of Children

http://www.apsac.org
350 Poplar Avenue
Elmhurst, IL 60126
Phone: 630-941-1235
Fax: 630-359-4274
E-mail: apsac@apsac.org

The mission of the American Professional Society on the Abuse of Children (APSAC) is to enhance the ability of professionals to respond to children and families affected by abuse and violence. Among other initiatives, APSAC provides education and other sources of information to professionals who work in the child maltreatment and related fields.

Anna Institute

http://www.theannainstitute.org
21 Ocean Street
Rockland, ME 04841
Email: afj@gwi.net

The Anna Institute was founded in memory of artist Anna Caroline Jennings; it focuses on educating both the public and mental health professionals about the effects of sexual abuse and trauma on children. The Anna Institute's Web site provides articles on incorporating

trauma-informed care into existing behavioral health models, presentations on childhood trauma and retraumatization, and handouts for teachers at primary and secondary schools.

Caring for Every Child's Mental Health Campaign

http://www.samhsa.gov/children
P.O. Box 2345
Rockville, MD 20847-2345
Email: nmhic-info@samhsa.hhs.gov

SAMHSA's Caring for Every Child's Mental Health communications campaign is a national public information and education operation. Its goals are to increase public awareness about the importance of protecting the mental health of young people; foster the recognition that many children have mental health problems; and encourage caregivers to seek early, appropriate treatment and services. It also strives to reduce discrimination associated with mental health problems. The campaign is a technical assistance program that is part of the Comprehensive Community Mental Health Services Program for Children and Their Families.

Child Study Center

http://www.aboutourkids.org
One Park Avenue
7th Floor
New York, NY 10016
Phone: 212-263-6622
Email: webmaster@aboutourkids.org

The New York University Child Study Center Web site offers information to parents of children and adolescents with learning, behavioral, and emotional disorders, including PTSD and substance use disorders. An online newsletter is available. Its research initiatives advance understanding of the causes and treatments of child mental disorders, and these findings are integrated into clinical care to provide state-of-the-art service.

Child Trauma Academy

http://www.childtrauma.org
5161 San Felipe
Suite 320
Houston, TX 77056
Phone: 866-943-9779
Email: cta@childtrauma.org

The mission of the Child Trauma Academy is to help improve the lives of traumatized and maltreated children. Through education, service delivery, and program consultation, the academy seeks to advance systems that educate, nurture, protect, and enrich these children.

Child Trauma Institute

http://www.childtrauma.com
P.O. Box 544
Greenfield, MA 01302-0544
Phone: 413-774-2340
Email: cti@childtrauma.com

The Child Trauma Institute provides training, consultation, information, and resources for those who work with trauma-exposed children, adolescents, and adults. The Web site has information for parents, publications for parents and professionals, and links to other child trauma Web sites.

Child Welfare Information Gateway

http://www.childwelfare.gov
Children's Bureau/ACYF
1250 Maryland Avenue SW
Eighth Floor
Washington, DC 20024
Phone: 800-394-3366
Email: info@childwelfare.gov

The Child Welfare Information Gateway (CWIG) is a service of the Children's Bureau in the Administration for Children and Families, part of HHS, which provides information

to child welfare and mental health professionals about programs, research, laws and policies, training approaches, and statistics regarding child welfare, child abuse and neglect, and adoption. CWIG offers educators' toolkits for preventing and responding to child abuse and neglect, a function to search State statutes about child abuse and neglect, and logic model builder toolkits for program administrators.

Child Welfare League of America

http://www.cwla.org
1726 M Street NW
Suite 500
Washington DC, 20036
Phone: 202-688-4200
Fax: 202-833-1689

Through its member child welfare agencies, the Child Welfare League of America develops and disseminates practice standards as benchmarks for high-quality services that protect children and youth; promotes high-quality services through training, consultation, conferences, and publications; formulates and promotes public policies that contribute to the well-being of children and youth; ensures that all child welfare services are provided in a manner that demonstrates respect for cultural and ethnic diversity; and promotes open exchange of data, resources, and ideas within and across systems that serve children, youth, and families.

Eunice Kennedy Shriver National Institute of Child Health and Human Development

http://www.nichd.nih.gov/Pages/index.aspx
31 Center Drive
Building 31, Room 2A32
Bethesda, MD 20892-2425
Phone: 800-370-2943

Established in 1962, NIH's National Institute of Child Health and Human Development (NICHD) focuses on human development processes from conception to later years. The Institute implements, conducts, and supports laboratory research, clinical trials, epidemiological research, and other studies that explore health processes and the impact of disabilities, diseases, and variations on the lives of individuals. NICHD sponsors training for scientists and healthcare providers to promote the goals of the Institute.

National Center for Children Exposed to Violence

http://www.nccev.org
Yale Child Study Center
230 South Frontage Road
P.O. Box 207900
New Haven, CT 06520-7900
Phone: 877-496-2238
Email: colleen.vadala@yale.edu

The National Center for Children Exposed to Violence (NCCEV) seeks to increase the capacity of individuals and communities to reduce the incidence and impact of violence on children and families; to train and support the professionals who provide intervention and treatment; and to increase professional and public awareness of the effects of violence on children, families, communities, and society. The Center's Web site is a rich source of information. NCCEV is supported by grants from the Office of Juvenile Justice and Delinquency Prevention, the Department of Justice, SAMHSA, and the Department of Education.

National Center on Substance Abuse and Child Welfare

http://www.ncsacw.samhsa.gov
P.O. Box 2345
Rockville, MD 20847-2345
Phone: 866-493-2758
Email: ncsacw@cffutures.org

The National Center on Substance Abuse and Child Welfare (NCSACW) is an initiative of HHS and is jointly funded by SAMHSA's Center for Substance Abuse Treatment and the Administration on Children, Youth and Families, Children's Bureau's Office on Child Abuse and Neglect. NCSACW seeks to develop and implement a comprehensive program of information gathering and dissemination, to provide technical assistance, and to develop knowledge that promotes effective practical, organizational, and systemic changes at the local, State, and national levels. Its Web site includes PowerPoint presentations, online tutorials and training, technical assistance presentations, and additional print resources.

National Child Traumatic Stress Network

http://www.nctsnet.org
NCTSN—University of California, Los Angeles
11150 W. Olympic Boulevard
Suite 650
Los Angeles, CA 90064
Phone: 310-235-2633
Fax: 310-235-2612

The National Child Traumatic Stress Network (NCTSN), currently comprising 54 treatment centers nationwide, is funded by SAMHSA's Center for Mental Health Services through the Donald J. Cohen National Child Traumatic Stress Initiative and coordinated by Duke University and the University of California, Los Angeles. The purpose of this congressionally mandated initiative is to improve the quality, effectiveness, provision, and availability of therapeutic services delivered to all children and adolescents experiencing traumatic events. NCTSN works with SAMHSA to raise public awareness of the effects of traumatic stress on children and families, and with other systems of care (including the health, mental health, education, law enforcement, child welfare, juvenile justice, and military family service systems) to ensure that there is a comprehensive trauma-informed continuum of accessible care. Additionally, NCTSN offers a list of evidence-based and promising practices.

National Institute for Trauma and Loss in Children

http://www.starrtraining.org/trauma-and-children
42855 Garfield Road
Suite 111
Clinton Township, MI 48038
Phone: 877-306-5256
Fax: 586-263-4915
Email: TLC@starrtraining.org

The National Institute for Trauma and Loss in Children provides school professionals, crisis intervention teams, medical and mental health professionals, child care professionals, and clinicians with trauma education, training, consultation, referral services, and trauma-specific intervention programs and resource materials needed to help those traumatized by violent or nonviolent trauma-inducing incidents.

National Native Children's Trauma Center

http://iers.umt.edu/National_Native_Childrens_Trauma_Center
Institute for Educational Research and Service
McGill Hall 026
The University of Montana
Missoula, MT 59812-6376
Phone: 406-243-5344
Fax: 406-243-2197
Email: iers@mso.umt.edu

The National Native Children's Trauma Center (NNCTC) is a federally funded organization created by SAMHSA and affiliated with the National Child Traumatic Stress Network. It

is run by the University of Montana. NNCTC offers trauma interventions and trainings to address trauma in American Indian/Alaska Native children, primarily through clinicians, Tribal programs, school systems, and community agencies.

Training Opportunities

The following resources highlight various training and credentialing opportunities for behavioral health professionals interested in gaining more education in treating and providing services to those affected by trauma. It is not an exhaustive list, but provides a starting place for service providers looking for further training.

The Web site of the ISTSS has posted a directory of trauma-related academic and training opportunities (http://www.istss.org/LearningAboutTrauma.htm). It includes links to the institutions providing the programs. The Association for Traumatic Stress Specialists (http://www.atss.info) offers three levels of recognition for education and experience:

- Certified Trauma Specialist (CTS)—designed for counselors, clinicians, and treatment specialists who provide intervention services or individual, group, and/or family counseling. This certification requires 240 hours of education and training in trauma treatment, plus 2,000 hours of trauma counseling and intervention experience.
- Certified Trauma Responder (CTR)—designed for those who provide immediate trauma interventions. It requires a minimum of 40 hours of experience on a crisis or critical incident response team, an associate degree or a high school diploma with successful completion of disaster or critical incident stress debriefing training, and 72 hours of crisis response training.
- Certified Trauma Services Specialist (CTSS)—designed for those who provide immediate trauma intervention, crisis support, advocacy, or victim assistance. It requires 1 year of experience in a trauma-related field, plus specific training.

Some colleges and universities, such as the International Trauma Studies Program at New York University and the Center for Anxiety and Related Disorders at Boston University, provide specialty trauma training for mental health practitioners. The University of Missouri at St. Louis offers specialized training in trauma therapy or research at its Center for Trauma Recovery to students in its Clinical Psychology graduate program. The Center for the Treatment and Study of Anxiety at the University of Pennsylvania provides training for health professionals. The Department of Counseling at the University of Nevada, Las Vegas offers a graduate and undergraduate course on Trauma and Addiction; graduate students can receive training in trauma and addictions as part of the Advanced Graduate Certificate in Addiction Studies. The Medical University of South Carolina offers Web-based courses in trauma-focused cognitive–behavioral therapy (TF-CBT) and in using TF-CBT for childhood traumatic grief. Many universities have faculty members with expertise in trauma and trauma-related subjects, so that training can be accessed through many graduate programs.

The Addiction Technology Transfer Center (ATTC) Network, a resource established in 1993 by the SAMHSA's Center for Substance Abuse Treatment, is a network of 14 independent regional centers with a national office. One of its programs provides long-distance education for clinicians on various topics. Among hundreds of self-paced, self-directed, and supervised courses available online (http://www.attcnetwork.org/learn/education/

dasp.asp) are Substance Abuse Treatment for Trauma Survivors, Substance Abuse Treatment for Persons with Child Abuse and Neglect Issues, Chemical Dependency and Posttraumatic Stress Disorder, Clinical Self-Care for Addiction Counselors and Clinical Supervisors, Eye Movement Desensitization and Reprocessing, Battered Women and Addictions, and Posttraumatic Stress Disorder. ATTC training and educational opportunities are based on empirical research and are intended to bring science to service. Undoubtedly, more distance-learning courses in this specialized area of interest will be developed as professional attention to co-occurring disorders increases.

SAMHSA's Center for Mental Health Services provides training for FEMA-approved crisis counseling programs using Stafford Act funding. These funding resources are available to select agencies designated to provide crisis counseling in the wake of a Presidential Disaster Declaration. Other funding for trauma training may be found through special programs of funding for target groups, such as those who provide mental health services and case management for victims of crime (e.g., Office for Victims of Crime in the U.S. Department of Justice; see p. 257).

The American Red Cross provides limited disaster mental health training. The focus of this training is to orient licensed mental health professionals to the Red Cross Disaster services system and their roles as volunteers.

The National Center for Post-Traumatic Stress Disorder was originally created in 1989 within the U.S. Department of Veterans Affairs (VA) to address the needs of veterans with military-connected PTSD. Its focus has since broadened to include trauma in general. The Center provides a variety of training opportunities for both VA and non-VA mental health personnel, including a PTSD 101 course developed specifically for clinicians who provide services to clients who have experienced trauma (see http://www.ptsd.va.gov/professional/index.asp).

Seeking Safety offers training in trauma, PTSD, and co-occurring disorders to mental health professionals on all levels, from counselors to nurses to administrators. The EMDR International Association (EMDRIA) provides training to clinicians for certification in EMDR via a curriculum including instruction, supervised practicum, and consultation; EMDRIA additionally provides basic training in the field, separate from the certification process. EMDR training is also provided by the EMDR Humanitarian Assistance Program, a nonprofit organization with a training-focused model to assist clinicians in treating trauma.

ISTSS was founded in 1985 to bring attention to the study, assessment, and treatment of traumatized people (http://www.istss.org). ISTSS is a professional society and provides face-to-face training during its annual meeting, especially through the preconference institutes. The ISTSS Web site offers numerous video and audio trainings for continuing education credits. ISTSS and the Figley Institute (http://www.figleyinstitute.com) have established best practice standards. The American Academy of Experts in Traumatic Stress provides training and certification in several different areas (http://www.aaets.org). Similarly, the International Society for the Study of Dissociation (http://www.issd.org) specializes in promoting therapies for dissociative disorders. In 2002, the Green Cross Academy of Traumatology (http://www.greencross.org) established a Commission on Accreditation of Traumatology Education Programs to increase and maintain the high standards in the education and training of traumatologists.

Appendix C—Historical Account of Trauma

Historically, symptoms of traumatic stress have been recorded in both military and civilian populations (Lasiuk & Hegadoren, 2006). Early accounts described the effect of battle conditions on soldiers; "soldier's heart" and "nostalgia" were the terms for traumatic stress reactions used during the American Civil War. As warfare techniques and strategies changed, so did the depiction of soldiers' traumatic stress reactions. The advent of heavy explosives in World War I led to the attribution of symptoms to "shell shock," giving a more physiological description of the effects from explosions (Benedek & Ursano, 2009). On the civilian side, the industrial revolution gave rise to larger and more dramatic catastrophes, including industrial and railway accidents. These, as well as other disasters, are noted in occupational health histories, newspapers, and contemporary literature.

Even with a more physical explanation of traumatic stress (i.e., shell shock), a prevailing attitude remained that the traumatic stress response was due to a character flaw. For instance, a soldier's pain at that time was often seen as a symptom of homesickness. In spite of the efforts of Charcot, Janet, and Freud, who described the psychogenic origin of symptoms as a response to psychological trauma (Lasiuk & Hegadoren, 2006), World War II military recruits were screened in attempt to identify those "who were afflicted with moral weakness," which would prevent them from entering military service.

At the same time, there were new treatment innovations for war-related trauma during World War II. One approach treated soldiers in the field for what was then called "battle fatigue" by allowing some time for rest before returning to battle. During the Korean and Vietnam wars, approaches began to focus more on the use of talk therapy. It was not until the post-Vietnam era that interest in developing treatment alternatives started to take hold. During this time, the U.S. Department of Veterans Affairs (then called the Veterans Administration) developed group therapy for posttraumatic stress disorder (PTSD). Beyond being cost-effective, the technique was well suited to the symptoms of the veterans and fostered socialization and reintegration (Greene et al., 2004).

The publication of the American Psychiatric Association's (APA's) *Diagnostic and Statistical Manual of Mental Disorders,* Third Edition (DSM-III), in 1980 marked the introduction of PTSD as a diagnosis, inspired by symptoms presented by veterans of the Vietnam War (Benedek & Ursano, 2009). The diagnosis in this iteration required the identification of a specific stressor—a catastrophic stressor that was outside the range of usual human experience (APA, 1980)—and classified PTSD as

Historical Approaches to Trauma Healing and Recovery

First Generation of Approaches to Trauma Healing and Recovery
The first generation approaches to trauma healing and recovery focused on individual and clinical interventions to address the symptoms of PTSD and moved toward integration of trauma effects into ongoing life activities. The rapidly developing recognition of additional groups with violence and trauma histories—beyond those with war and captivity experiences (e.g., survivors of natural disasters and terrorism, refugees and immigrants fleeing homeland violence and persecution)—presented issues and needs that incited a second generation of approaches to trauma healing and recovery.

Second Generation of Approaches to Trauma Healing and Recovery
The second generation approaches focused on psychosocial education and empowerment models designed to tap into self-healing forces to energize personal and social movement. These approaches often are based on group and peer support models, and provide both support and education on the management of trauma and its affects. These approaches are not designed to replace clinical or alternative therapies; rather, they provide a social context for care.

Concurrent to the development of psychosocial educational empowerment approaches, we also learned that if the approaches are not implemented in organizations or programs that are trauma-informed, they will not take root and may lose effectiveness.

Trauma-Informed Care: A New Paradigm for Public Health Services
Trauma-informed care is a new paradigm for organizing public mental health and human services. Trauma-informed care changes the opening question for those seeking services from "What is wrong with you?" (patient or consumer) to "What has happened to you?" (survivor). Trauma-informed care is initiated by assumption that every person seeking services is a trauma survivor who designs his or her own path to healing, facilitated by support and mentoring from the service provider.

In a trauma-informed environment, survivors are empowered to proactively set goals and to manage progress toward those goals. For most existing organizations or programs, that requires movement from a traditional "top down" hierarchical clinical model to a psychosocial empowerment partnership that embraces all possible tools and paths to healing. In a pluralistic public health system with many levels and types of services and treatment, this is coming to be accepted as a "sine qua non," or "without which not," for humane, dignified, cost-effective, genuinely person-centered support and assistance in moving forward.

Source: Salasin, 2011, p. 18.

an anxiety disorder (Lasiuk & Hegadoren, 2006). Beginning with this definition, the body of research grew, and the scope of application began to broaden, but not without considerable debate on what constituted a trauma.

The social revolution that began in the 1960s, combined with the women's movement and the call for more attention to diverse and disenfranchised groups, set the stage for an increase in the acknowledgement and treatment of victims of interpersonal violence and crime-related trauma (Figley, 2002). The introduction of rape trauma syndrome as a condition highlighted the psychological consequences of sexual assault and the subsequent lack of support from society and the social services system (Kramer & Green, 1997). Subsequently, research began to focus more on interpersonal violence, thus leading to the identification of risk factors and treatment approaches unique to this form of violence and trauma (Olff, Langeland, Drajer, & Gersons, 2007).

With input from international and national mental health organizations and research, the DSM-IV further modified the definition of trauma to include a broader interpretation of the identified stressor (Andreasen, 2010). DSM-5 has maintained the modified definition of trauma, but the criterion requires being explicit as to whether qualifying traumatic events were experienced directly, witnessed, or experienced indirectly (APA, 2013b).

Paralleling the change in DSM criteria, cognitive–behavioral therapy for traumatic stress was developed along with other skills-based approaches (Greene et al., 2004).

Researchers, such as Foa, Resick, D'Zurilla, and Michenbaum, added to the body of knowledge and gave clinicians a variety of tools; these approaches continue to develop and show efficacy even today. There was also renewed interest in the long- and short-term effects of childhood sexual abuse and domestic violence. Interest in documenting the effects of trauma expanded further, including traumatic brain injury, significant orthopedic injuries, and multiple traumas (Starr et al., 2004). So too, the consumer movement in health care began. Consumers insisted on patient rights, humane treatment, and involvement in the treatment process; as a result, the paternalistic approach to health care began to change. As consumers set the initial stage and Federal agencies (e.g., the Substance Abuse and Mental Health Services Administration and its centers) and national organizations promoted the need for trauma-informed policies and care, national studies began to demonstrate the prevalence of traumatic experiences. Research including the Adverse Childhood Experiences and the Women, Co-Occurring, and Violence studies clearly demonstrated the pervasive long-term impact of trauma, reinforcing the call for trauma-informed policies and care. (For more information on the development of trauma-informed care, see Harris and Fallot, 2001b, as well as Jennings, 2004.)

Appendix D—Screening and Assessment Instruments

This appendix provides a selected sample of available tools for screening and assessment of traumatic events and trauma-related symptoms. This is not an exhaustive list, nor does this list focus on screening instruments that capture a broader range of symptoms related to trauma (such as sleep hygiene and dissociation) or other features important in providing trauma-informed care (e.g., resilience level, coping skill style, resource availability). For more information on a broad range of available instruments, refer back to Part 1, Chapter 4. Many of the instruments listed below use criteria found in the *Diagnostic and Statistical Manual of Mental Disorders*, Fourth Edition, Text Revision (DSM-IV-TR; APA, 2000), but with the release of the DSM-5 (APA, 2013a), instruments will evolve, and new versions will be available under the same contact information.

Screening and Assessment Measures

- Clinician Administered PTSD Scale (CAPS)
- Davidson Trauma Scale (DTS)
- Distressing Event Questionnaire (DEQ)
- Evaluation of Lifetime Stressors (ELS)
- Impacts of Event Scale Revised (IES-R)
- Mississippi Scale for Combat-Related PTSD (M-PTSD)
- Penn Inventory for Posttraumatic Stress Disorder
- Posttraumatic Diagnostic Scale (PDS)
- PTSD Symptom Scale-Interview (PSS-I)
- PTSD Symptom Scale: Self-Report Version (MPSS-SR)
- Screen for Posttraumatic Stress Symptoms (SPTSS)
- Structured Interview for PTSD (SI-PTSD)
- Trauma Assessment for Adults (TAA)
- Trauma Assessment for Adults (TAA)–Self Report
- Trauma History Questionnaire (THQ)
- Trauma Symptom Inventory (TSI)
- Traumatic Stress Schedule

Screening and Assessment Measures

Clinician Administered PTSD Scale (CAPS)

Domains:	Posttraumatic stress disorder (PTSD), acute stress disorder (ASD)
Timeframe:	CAPS-Sx: Lifetime and current (past week) CAPS-Dx: Current (past month)
Response format:	Other
Format of administration:	Structured
Number of items:	30
Completion time:	30–60 minutes
Qualifications to administer:	Administered by clinicians and clinical researchers who have a working knowledge of PTSD and by appropriately trained paraprofessionals
How to obtain scale:	Contact Danny G. Kaloupek, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: veterans, car accident survivors Reliability: alpha = .94, test-retest = .90–.98 Validity: sensitivity = .85, specificity = .95 (compared with Structured Clinical Interview for DSM Disorders [SCID]), r = .91 (with MS Scale for Combat-related PTSD) kappa = .77 against the SCID diagnosis; item-total correlations = .49–.82; internal consistency = .94
Author(s):	Dudley David Blake, Frank W. Weathers, Linda M. Nagy, Danny G. Kaloupe, Dennis S. Charney, and Terence M. Keane
Contact:	Danny G. Kaloupek, Ph.D. National Center for PTSD Boston VA Medical Center, 11B 150 South Huntington Avenue Boston, MA 02130
Relevant citations:	Blake, D. D. (1994). Rationale and development of the clinician-administered PTSD scales. *PTSD Research Quarterly, 5,* 1–2. Blake, D. D., Weathers, F. W., Nagy, L. M., Kaloupek, D. G., Gusman, F. D., Charney, D. S., & Keane, T. M. (1995). The development of a clinician-administered PTSD scale. *Journal of Traumatic Stress, 8*, 75–90.

Weathers, F. W., Keane, T. M., & Davidson, J. R. (2001). Clinician-Administered PTSD Scale: A review of the first ten years of research. *Depression and Anxiety, 13*, 132–156.

Davidson Trauma Scale (DTS)

Domains:	PTSD symptoms
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and course work in the use of assessment instruments or special training in the use of this instrument. Education/training requirements may be waived for those granted the right to administer tests at this level (B) in their jurisdiction.
How to obtain scale:	Contact Mental Health Systems, Inc.
Cost or public domain:	Cost: $15.00
Psychometrics:	Populations sampled: rape victims, veterans, hurricane victims, miscellaneous traumas Reliability: alpha = .99, test-retest = .86
Author(s):	Jonathan R.T. Davidson
Contact:	Mental Health Systems, Inc. 908 Niagara Falls Boulevard North Tonawanda, NY, 14120-2060 800-456-3003
Relevant citations:	Davidson, J. R. T., Book, S. W., Colket, J. T., Tupler, L. A., Roth, S., David, D., Hertzberg, M., Mellman, T., Beckham, J.C., Smith, R., Davison, R. M., Katz, R., & Feldman, M. (1997). Assessment of a new self-rating scale for posttraumatic stress disorder. *Psychological Medicine, 27,* 153–160. Davidson, J. R., Tharwani, H. M., & Connor, K. M. (2002). Davidson Trauma Scale (DTS): Normative scores in the general population and effect sizes in placebo-controlled SSRI trials. *Depression and Anxiety, 15*, 75–78.

Distressing Event Questionnaire (DEQ)

Domains:	Posttraumatic Stress Disorder (PTSD) for multiple events
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured
Number of items:	35
Completion time:	10–15 minutes
Qualifications to administer:	Contact Edward Kubany, Ph.D.
How to obtain scale:	Contact Edward Kubany, Ph.D.
Cost or public domain:	Contact Edward Kubany, Ph.D.
Psychometrics:	Population sampled: veterans, battered women Reliability: inter-item r = .93, test-retest = .95; validity: Pearson's r reliability coefficient = .83 (with Penn Inventory, Pearson's r reliability coefficient = .76 (with Beck Depression Inventory)
Author(s):	Edward Kubany, Mary Beth Leisen, Aaron S. Kaplan, Martin P. Kelly
Contact:	Edward Kubany, Ph.D. National Center for PTSD Pacific Islands Division Department of VA Suite 307 Honolulu, HI 96813 Kubany.Edward@honolulu.va.gov
Relevant citations:	Kubany, E. S., Leisen, M. B., Kaplan, A. S., & Kelly, M. P. (2000). Validation of a brief measure of posttraumatic stress disorder: The distressing event questionnaire (DEQ). *Psychological Assessment, 12*, 197–209.

Evaluation of Lifetime Stressors (ELS)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Other
Format of administration:	Structured
Number of items:	56
Completion time:	10–20 minutes for screening, 1–3 hours for complete interview
Qualifications to administer:	Should be administered by trained clinicians only

How to obtain scale:	Contact Karen Krinsley, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: male veterans, female sexual abuse survivors Reliability: r = .4–1.0
Author(s):	Karen Krinsley, Frank W. Weathers, Elana Newman, Edward A. Walker, Danny G. Kaloupek, Rachel Kimerling
Relevant citations:	Corcoran, C. B., Green, B. L., Goodman, L. A., & Krinsley, K. E. (2000). Conceptual and methodological issues in trauma history assessment. In A. Y. Shalev, R. Yehuda, & A. C. McFarlane (Eds.), *International handbook of human response to trauma* (pp. 22–232). Dordrecht, Netherlands: Kluwer Academic Publishers. Krinsley, K. (1996). Psychometric review of the Evaluation of Lifetime Stressors (ELS) Questionnaire and Interview. In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation (*pp. 160–162). Lutherville, MD: Sidran Press.

Impact of Event Scale Revised (IES-R)

Domains:	PTSD for a single event
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	22
Completion time:	5–10 minutes for screening
Qualifications to administer:	None
How to obtain scale:	http://consultgerirn.org/uploads/File/trythis/try_this_19.pdf
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: earthquake survivors, emergency disaster workers, Vietnam veterans, violence and sexual assault victims Reliability: alpha = .79–.92, test-retest = .89–.94, Pearson's r reliability coefficient = .74–.87
Author(s):	Daniel Weiss and Charles R. Marmar
Relevant citations:	Sundin, E. C. & Horowitz, M. J. (2002). Impact of Event Scale: Psychometric properties. *British Journal of Psychiatry, 180,* 205–209. Weiss, D. S. & Marmar, C. R. (1996).The Impact of Event Scale-Revised. In J. Wilson & T. M. Keane (Eds.), *Assessing psychological trauma and PTSD* (pp. 399–411). New York: Guilford Press. (Includes measure in its entirety.)

Mississippi Scale for Combat-Related PTSD (M-PTSD)

Domains:	PTSD for multiple events
Timeframe:	Contact National Center for PTSD at ncptsd@ncptsd.org
Response format:	Self-administered
Format of administration:	Structured
Number of items:	35
Completion time:	10–15 minutes
Qualifications to administer:	Contact National Center for PTSD at ncptsd@va.gov
How to obtain scale:	To order the scale contact the National Center for PTSD
Cost or public domain:	Free (ncptsd@va.gov)
Psychometrics:	Population sampled: veterans Reliability: inter-item r = .94, test-retest = .97 Validity: sensitivity = .93, specificity = .89
Author(s):	Terence M. Keane
Contact:	National Center for PTSD (116D) VA Medical Center 215 N. Main St. White River Junction, VT 05009 http://www.ptsd.va.gov/
Relevant citations:	Engdahl, B. & Eberly, R. (1994). Assessing PTSD among veterans exposed to war trauma 40–50 years ago. *NCP Clinical Quarterly, 4,* 13–14. Keane, T. M., Caddell, J. M., & Taylor, K. L. (1988). Mississippi Scale for Combat-Related Posttraumatic Stress Disorder: Three studies in reliability and validity. *Journal of Consulting and Clinical Psychology, 56,* 85–90.

Penn Inventory for Posttraumatic Stress Disorder

Domains:	PTSD for multiple events
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	26
Completion time:	5–15 minutes

Qualifications to administer:	Contact Melvyn Hammarberg, Ph.D.
How to obtain scale:	Contact Melvyn Hammarberg, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: veterans, oil-rig disaster survivors Reliability: alpha = .94, test-retest = .96
Author(s):	Melvyn Hammarberg
Contact:	Melvyn Hammarberg, Ph.D. Department of Anthropology University of Pennsylvania 325 University Museum 33rd and Spruce Street Philadelphia, PA 19104-6398
Relevant citations:	Hammarberg, M. (1996). Psychometric review of the Penn Interview for Post Traumatic Stress Disorder. In B. C., Stillman, J., & Pape, H. C. (2011). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

Posttraumatic Diagnostic Scale (PDS)

Domains:	DSM-IV PTSD symptom clusters
Timeframe:	Current (past month)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	49
Completion time:	10–15 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and course work in the use of assessment instruments or special training in the use of this instrument.
How to obtain scale:	Contact National Computer Systems (NCS)
Cost or public domain:	Cost: $15.00
Psychometrics:	Population sampled: accident/fire, disaster, assault, sexual assault, sexual abuse, major illness Reliability: alpha = .92, test-retest = .83 Validity: sensitivity = .89, specificity = .75

Author(s):	Edna B. Foa, Ph.D.
Contact:	National Computer Systems (NCS) 5605 Green Circle Drive Minnetonka, MN 55343
Relevant citations:	Foa, E. (1996). *Post-traumatic Diagnostic Scale manual*. Minneapolis, MN: National Computer Systems. Foa, E., Cashman, L., Jaycox, L., & Perry, K. (1997). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

PTSD Symptom Scale-Interview (PSS-I)

Domains:	PTSD single event
Timeframe:	Current (past 2 weeks)
Response format:	Other
Format of administration:	Structured
Number of items:	17
Completion time:	20 minutes
Qualifications to administer:	Can be administered by a master's level interviewer after a few hours of training.
How to obtain scale:	Contact Edna B. Foa, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: female sexual assault victims, female assault victims Reliability: alpha = .85, test-retest = .80; validity: sensitivity = .88, specificity = .96 (compared with SCID); Pearson's r reliability coefficient = .48–.80 (with Impact of Events intrusion and avoidance, State portion of State-Trait Anxiety Inventory, and MPSS-SR)
Author(s):	Edna B. Foa and Gregory A. Leskin
Contact:	Edna B. Foa, Ph.D. Medical College of Pennsylvania Department of Psychiatry 3200 Henry Avenue Philadelphia, PA 19129-1137

Relevant citations:	Foa, E. B., Riggs, D. S., Dancu, C. V., & Rothbaum, B. O. (1993). PTSD Symptom Scale: Self-Report Version (MPSS-SR)

Domains:	PTSD for multiple or unknown events
Timeframe:	Current (past 2 weeks)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	Contact Sherry Falsetti, Ph.D.
How to obtain scale:	Contact Sherry Falsetti, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Reliability: alpha = .96–.97 Validity: sensitivity = .89, specificity = .65
Author(s):	Sherry Falsetti, Patricia A. Resick, Heidi S. Resnick, Dean G. Kilpatrick
Contact:	Sherry Falsetti, Ph.D. University of Illinois College of Medicine Department of Family and Community Medicine 1601 Parkview Avenue Rockford, IL 61107-1897
Relevant citations:	Bonin, M. F., Norton, G. R., Asmundson, G. J., Dicurzio, S., & Pidlubney, S. (2000). Screen for Posttraumatic Stress Symptoms (SPTSS)

Domains:	PTSD for multiple or unknown events
Timeframe:	Current (past 2 weeks)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	5 minutes
Qualifications to administer:	Contact Eve Carlson, Ph.D.
How to obtain scale:	Contact Eve Carlson, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: psychiatric inpatients Reliability: split half reliability = .91, test-retest = .82
Author(s):	Eve Carlson, Ph.D.
Contact:	Eve Carlson, Ph.D. National Center for PTSD (352-117-MP) Palo Alto Health Care System 795 Willow Road Menlo Park, CA 94025
Relevant citations:	Carlson, E. (2001). Psychometric study of a brief screen for PTSD: Assessing the impact of multiple traumatic events. *Assessment*, *8*, 431–441.

Structured Interview for PTSD (SI-PTSD)

Domains:	PTSD single event
Timeframe:	Current (past 4 weeks)
Response format:	Other
Format of administration:	Structured
Number of items:	17

Completion time:	20–30 minutes
Qualifications to administer:	Can be administered by mental health professionals or by paraprofessionals after some training.
How to obtain scale:	Contact Jonathan Davidson, M.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: veterans Reliability: alpha = .94, test-retest = .71, intraclass r = .97 Validity: sensitivity = .96, specificity = .80 (compared with SCID), Pearson's r reliability coefficient = .61 (with IES), Pearson's r reliability coefficient = .51 (with Hamilton Anxiety Scale)
Author(s):	Jonathan Davidson
Contact:	Jonathan Davidson, M.D. Department of Psychiatry Box 3812 Duke University Medical Center Durham, NC 27710-3812

L., Dunlavy, A. C., Stillman, J., & Pape, H. C. (2011). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

Trauma Assessment for Adults (TAA)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Other
Format of administration:	Structured
Number of items:	13
Completion time:	10–15 minutes
Qualifications to administer:	None specified
How to obtain scale:	Contact Heidi Resnick, Ph.D.
Cost or public domain:	Public domain

Psychometrics:	Populations sampled: adult mental health center clients; face validity established; feasible; validity established via archival records
Author(s):	Connie L. Best, John R. Freedy, Sherry A. Falsetti, Dean G. Kilpatrick, Heidi S. Resnick
Relevant citations:	Cusack, K. J., Frueh, B. C., & Brady, K. T. (2004). Trauma history screening in a community mental health center. *Psychiatric Services, 55,* 157–162. Resnick, H. S. (1996). Psychometric review of Trauma Assessment for Adults (TAA). In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation* (pp. 362–365). Lutherville, MD: Sidran Press.

Trauma Assessment for Adults (TAA)–Self Report

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	None specified
How to obtain scale:	Contact Heidi Resnick, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	None to date
Author(s):	Connie L. Best, John R. Freedy, Sherry A. Falsetti, Dean G. Kilpatrick, Heidi S. Resnick
Relevant citations:	Resnick, H. S., Falsetti, S. A., Kilpatrick, D. G., & Freedy, J. R. (1996). Miller (Ed.), *Stressful life events* (pp. 231–266). Madison, WI: International Universities Press.

Trauma History Questionnaire (THQ)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured

Number of items:	24
Completion time:	5–15 minutes
Qualifications to administer:	Contact Bonnie L. Green, Ph.D.
How to obtain scale:	Contact Bonnie L. Green, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: psychiatric outpatients, college students, women with breast cancer Reliability: r = 0.7–0.9, intraclass = .76
Author(s):	Bonnie L. Green
Relevant citations:	Hooper, L., Stockton, P., Krupnick, J., & Green, B., (2011). Development, use, and psychometric properties of the Trauma History Questionnaire. *Journal of Loss and Trauma, 16*, 258–283. Muesser, K. T., Salyers, M. P., Rosenberg, S. D., Ford, J. Martin (Eds.), *Assessing psychological trauma and PTSD* (pp. 63–102). New York: Guilford Press.

Trauma Symptom Inventory (TSI)

Domains:	Trauma-related symptoms
Timeframe:	Current (last 6 months)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	100
Completion time:	20 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and courses in the use of assessment instruments or special training in the use of this instrument.
How to obtain scale:	Contact Psychological Assessment Resources
Cost or public domain:	Cost: $15.00
Psychometrics:	Population sampled: general population Reliability: alpha = .84–.87

Author(s):	John Briere
Contact:	Psychological Assessment Resources Box 998 Odessa, FL 33556
Relevant citations:	Briere, J. (1996). Psychometric review of Trauma Symptom Inventory (TSI). In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation* (pp. 381–383). New York: KluwerAcademic/Plenum.

Traumatic Stress Schedule

Domains:	Trauma history
Timeframe:	Current (but author suggests any period)
Response format:	Other
Format of administration:	Semi-structured
Number of items:	10 (with 12 probes)
Completion time:	5–30 minutes
Qualifications to administer:	Can be administered by lay interviewer with training
How to obtain scale:	Contact Fran Norris, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Reliability: test-retest = .88, frequency of events equal to National Women's Study PTSD Module
Author(s):	Fran Norris
Relevant citations:	Norris, F. H. (1990). Screening for traumatic stress: A scale of use in the general population. *Journal of Applied Social Psychology*, *20*, 1704–1718. (Includes measure in its entirety.) Norris, F. H. & Hamblen, J. L. (2004). Standardized self-report measures of civilian trauma and PTSD. In J. P. Wilson, T. M. Keane & T. Martin (Eds.), *Assessing psychological trauma and PTSD* (pp. 63–102). New York: Guilford Press.

Appendix E—Consumer Materials

The following are samples of available consumer materials relating to trauma-informed care and traumatic stress. There is a plethora of consumer information available to meet the immediate and long-term needs of consumers of behavioral health services affected by trauma. In order to not waste effort creating new materials for your client's concerns, it is advisable to explore current science-informed resources. In most cases, consumer materials are already available and easily accessible for free.

AfterDeployment.org (2010). *Just the Facts: Resilience*. Available: http://afterdeployment.org/sites/default/files/pdfs/client-handouts/resilience-understanding.pdf

This Web site provides resources to address symptoms related to traumatic stress in addition to other postdeployment adjustment issues. This site provides information and handouts on resilience, triggers, and other trauma-related topics. It is appropriate for service members as well as civilians.

Blanch, A., Filson, B., & Penny, D. (2012). *Engaging Women in Trauma-Informed Peer Support: A Guidebook*. Available: http://www.nasmhpd.org/publications/engagingwomen.aspx

This draft technical assistance guide was created by the National Center for Trauma-Informed Care (NCTIC) and developed under contract with the National Association of State Mental Health Program Directors. This publication is designed to help make trauma-informed peer support available to women who are trauma survivors and who receive or have received behavioral health services. It is a resource for peers providing support in these or other settings who want to learn how to use trauma-informed principles in supporting women or in the peer support groups. It has been a resource used in the delivery of technical assistance through NCTIC.

Brymer, M., Jacobs, A., Layne, C., Pynoos, R., Ruzek, J., Steinberg, A., et al. (2006). Appendix E: Handouts. *Psychological First Aid: Field Operations Guide.* Available: http://www.ptsd.va.gov/professional/manuals/manual-pdf/pfa/PFA_Appx_E_handouts.pdf

Developed jointly with the National Child Traumatic Stress Network and the National Center for PTSD, this curriculum provides a science-informed approach to psychological first aid for response workers. The goals of this module are to assist survivors in the immediate aftermath of disaster and/or terrorism, reduce initial distress, and foster short- and long-term adaptive functioning. This link provides specific survivor-oriented material, such as strategies in seeking and giving support, education on common immediate reactions, and parental tips for children across developmental stages.

Center for Mental Health Services (2002). *Dealing with the Effects of Trauma-A Self-Help Guide.* Available: http://store.samhsa.gov/shin/content//SMA-3717/SMA-3717.pdf

This self-help guide gives practical information and tools to address and manage symptoms and other consequences of traumatic stress. It provides education on a variety of topics, including trauma-related symptoms, advice on the key ingredients of quality care, barriers to recovery, and practical strategies to enhance recovery and manage difficult emotions.

Center for Mental Health Services, Substance Abuse and Mental Health Services Administration (2005). *Roadmap to Seclusion and Restraint Free Mental Health Services*. Available: http://store.samhsa.gov/product/Roadmap-to-Seclusion-and-Restraint-Free-Mental-Health-Services-CD-/SMA06-4055

This curriculum concerns the elimination of seclusion and restraint. It provides numerous handouts for consumers as well as staff. Several consumer handouts include common reactions to trauma, a trauma screening tool, and strategies to de-escalate agitation and distress.

Mead, S. (2008). *Intentional Peer Support: An Alternative Approach*. Sherry Mead Consulting. Available: http://www.intentionalpeersupport.org/apps/webstore/products/show/3408520

This interactive workbook is designed for individuals who are in peer support roles and those who use peer support services. It provides goals, tasks, competencies, and skills associated with peer support relationships and guidelines for first interviews.

Najavits, L. M. (2002). *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse*. New York: Guilford Press.

This evidence-based practice for individuals who have a history of trauma and a substance use disorder provides not only guidelines for clinicians but handouts for individuals. The consumer materials include information on PTSD and substance abuse and their interrelationship, key principles of the Seeking Safety program, coping skills to support safety, and grounding exercises. For additional information and resources, go to http://www.seekingsafety.org.

National Center for PTSD, U.S. Department of Veterans Affairs (2010). *Understanding PTSD*. Available: http://www.ptsd.va.gov/public/understanding_ptsd/booklet.pdf

This booklet provides consumer information on posttraumatic stress, common traumatic stress symptoms, effective treatments, and resources. The National Center for PTSD also provides additional professional and public resources specific to trauma for veterans and civilians.

Sidran Institute (2012). *Healing Self-Injury*. Available: http://healingselfinjury.org/about.html

This Web site provides numerous resources for consumers and professionals to understand self-inflicted violence. It offers publication links, archived newsletters, and a current blog focused on self-harm.

Appendix F—Organizational Assessment for Trauma-Informed Care

The following two resources are organizational assessments, which represent a key strategy in developing or re-evaluating trauma-informed services. The first assessment, presented by the University of South Florida, College of Behavioral and Community Sciences (2012), is designed for staff or key stakeholders. The second assessment comes from the *Trauma-Informed Organizational Toolkit for Homeless Services* (Guarino, Soares, Konnath, Clervil & Bassuk, 2009) and is a consumer version. There are several other assessment tools available, including Fallot and Harris's *Creating Cultures of Trauma-Informed Care (CCTIC): A Self Assessment and Planning Protocol* (2009).

Staff or Key Stakeholder Organizational Assessment Tool
University of South Florida, College of Behavioral and Community Sciences (2012). *Creating Trauma-Informed Care Environments: An Organizational Self-Assessment*. Available: http://www.cfbhn.org/assets/TIC/youthresidentialself%20assess%20Fillable%20FORM%20%282%29.pdf

Consumer Version: Organizational Assessment Tool
Guarino, K., Soares, P., Konnath, K., Clervil, R., & Bassuk, E. (2009). *Trauma-Informed Organizational Toolkit for Homeless Services*. Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration, and the Daniels Fund, the National Child Traumatic Stress Network, and the W.K. Kellogg Foundation. See: pp. 82–93. Available: http://www.familyhomelessness.org/media/90.pdf

Associate Chief for Addictive Disorders and Psychiatric Rehabilitation
Mental Health and Behavioral Sciences Services
Department of Veterans Affairs
Washington, DC

Beth A. Weinman, M.A.
Coordinator
National Drug Abuse Programs
Correctional Programs Division-Services Branch
U.S. Department of Justice
Washington, DC

Penelope P. Ziegler, M.D.
Head, Treatment Section
American Academy of Addiction Psychiatry
Williamsburg, VA

Appendix H—Field Reviewers

Carol Ackley
Owner/Director
River Ridge Treatment Center
Burnsville, MN

Rosie Anderson-Harper, M.A.
Mental Health Manager
Division of Alcohol and Drug Abuse
Missouri Department of Mental Health
Jefferson City, MO

Reba Architzel
Director
Federal Relations and Policy Analysis
New York State Office of Alcoholism and Substance Abuse Services
Albany, NY

Larry L. Ashley, Ed.S., M.A.
Addictions Specialist
Department of Counseling
University of Nevada, Las Vegas
Las Vegas, NV

G.T. (Gigi) Belanger
Public Health Advisor
Homeless Programs Branch
Center for Mental Health Services
Substance Abuse and Mental Health Services Administration
Rockville, MD

Charles H. Bombardier, Ph.D.
Associate Professor
Department of Rehabilitation Medicine
Harborview Medical Center
University of Washington School of Medicine
Seattle, WA

Patricia T. Bowman
Probation Counselor
Fairfax Alcohol Safety Action Program
Fairfax, VA

Patricia Allen Bradford, LISW, LMFT, CTS
Program Manager
Health Care for Homeless Veterans
Columbia, SC

Kathy Brock
Director
Polytechnic University Counseling Center
Brooklyn, NY

Vivian B. Brown, Ph.D.
Chief Executive Officer
Mental Health and Social Services Centers for Innovation in Health
PROTOTYPES
Culver City, CA

Wilma J. Calvert, R.N., Ph.D.
Post-Doctoral Fellow
Department of Psychiatry
Washington University School of Medicine
St. Louis, MO

Jerome F.X. Carroll, Ph.D.
Consultant in private practice
Chair, Columbia University's Drugs & Society Seminar
Brooklyn, NY

Steven J. Chen, Ph.D.
Associate Director
Division of Substance Abuse and Mental Health
Utah Department of Human Services
Salt Lake City, UT

Colleen Clark, M.A., Ph.D.
Research Assistant Professor
Licensed Clinical Psychologist
Triad Women's Project
University of South Florida
Tampa, FL

R.T. Codd, III., Ed.S.
Certified Member of the Academy of Cognitive Therapy
Director/Owner
Cognitive–Behavioral Therapy Center of Western North Carolina
Asheville, NC

Carol Coley, M.S.
Senior Program Management Advisor
Division of State and Community Assistance
Center for Substance Abuse Treatment
Substance Abuse and Mental Health Services Administration
Rockville, MD

Carol J. Colleran, CAP, ICADC
Director of Primary Programs
Center of Recovery for Older Adults
Hanley-Hazelden Center
West Palm Beach, FL

Rockville, MD

Appendix I: Cultural Competency and Diversity Network Participants

Charles H. Bombardier, Ph.D.
Associate Professor
Department of Rehabilitation Medicine
Harborview Medical Center
University of Washington School of Medicine
Seattle, WA
Disability Workgroup

Carol S. D'Agostino, CSW, CASAC
Director
Geriatric Addictions Program
LIFESPAN of Greater Rochester, Inc.
Rochester, NY
Aging Workgroup

Thomas L. Geraty, M.S.W., Ph.D., LICSW
Private Practice
Jamaica Plain, MA
LGBT Workgroup

Wayne Lee Mitchell, M.D.
Indian Health Service
Phoenix, AZ
Aging Workgroup

Ann S. Yabusaki, M.Ed., M.A., Ph.D.
Substance Abuse Director
Psychologist
Substance Abuse Programs and Training
Coalition for a Drug-Free Hawaii
Kaneohe, HI
Asian and Pacific Islanders Workgroup and Aging Workgroup

Appendix J: Acknowledgments

Numerous people contributed to the development of this Treatment Improvement Protocol (TIP), including the TIP Consensus Panel (p. vii), the Knowledge Application Program (KAP) Expert Panel and Federal Government Participants (p. ix), SAMHSA Resource Panel (see Appendix G), TIP Field Reviewers (Appendix H), and the KAP Cultural Competency and Diversity Network participants (Appendix I).

This publication was produced under KAP, a Joint Venture of The CDM Group, Inc. (CDM), and JBS International, Inc. (JBS), under contract numbers 270-99-7072, 270-04-7049, and 270-09-0307 for the Substance Abuse and Mental Health Services Administration, Center for Substance Abuse Treatment.

CDM KAP personnel included Rose M. Urban, M.S.W., J.D., LCSW, LCAS, KAP Executive Deputy Project Director; Jessica L. Culotta, M.A., KAP Managing Project Co-Director; Susan Kimner, former Managing Project Co-Director; Elizabeth Marsh, former KAP Deputy Project Director; Claudia Blackburn, M.S., Psy.D., Expert Content Director; Sheldon Weinberg, KAP Senior Researcher/Applied Psychologist; Bruce Carruth, Ph.D., Expert Content Director; Raquel Witkin, M.S., former Deputy Project Manager; Janet G. Humphrey, M.A., former Editor/Writer; Virgie D. Paul, M.L.S., Librarian; Angela T. Fiastro, KAP Junior Editor; Sonja Easley and Elizabeth Plevyak, former Editorial Assistants; and Elizabeth Pratt, Ph.D., Carol Schober, Psy.D., M.S.N., and Patricia A. Burke, M.S.W., LCSW, BCD, C-CATODSW, CCS, contributing authors. Special thanks to Stephanie Perry, M.D., for providing a content review of the TIP, and to John P. Allen, Ph.D., for writing draft material and contributing information on combat stress.

SAMHSA TIPs and Publications Based on TIPs

What Is a TIP?

Treatment Improvement Protocols (TIPs) are the products of a systematic and innovative process that brings together clinicians, researchers, program managers, policymakers, and other Federal and non-Federal experts to reach consensus on state-of-the-art treatment practices. TIPs are developed under the Substance Abuse and Mental Health Services Administration's Knowledge Application Program (KAP) to improve the treatment capabilities of the Nation's alcohol and drug abuse treatment service system.

What Is a Quick Guide?

A Quick Guide clearly and concisely presents the primary information from a TIP in a pocket-sized booklet. Each Quick Guide is divided into sections to help readers quickly locate relevant material. Some contain glossaries of terms or lists of resources. Page numbers from the original TIP are referenced so providers can refer back to the source document for more information.

What Are KAP Keys?

Also based on TIPs, KAP Keys are handy, durable tools. Keys may include assessment or screening instruments, checklists, and summaries of treatment phases. Printed on coated paper, each KAP Keys set is fastened together with a key ring and can be kept within a treatment provider's reach and consulted frequently. The Keys allow you, the busy clinician or program administrator, to locate information easily and to use this information to enhance treatment services.

Ordering Information

Publications may be ordered or downloaded for free at http://store.samhsa.gov. To order over the phone, please call 1-877-SAMHSA-7 (1-877-726-4727) (English and Español).

About the CDC-Kaiser ACE Study

The CDC-Kaiser Permanente Adverse Childhood Experiences (ACE) Study is one of the largest investigations of childhood abuse and neglect and household challenges and later-life health and well-being.

The original ACE Study was conducted at Kaiser Permanente from 1995 to 1997 with two waves of data collection. Over 17,000 Health Maintenance Organization members from Southern California receiving physical exams completed confidential surveys regarding their childhood experiences and current health status and behaviors.

More detailed information about the study can be found in the links below or in the article, "Relationship of Childhood Abuse and Household Dysfunction to Many of the Leading Causes of Death in Adults ,".

Implementing a Trauma-Informed Approach for Youth across Service Sectors

This brief is based on a webinar, ***Implementing a Trauma-Informed Approach for Youth Across Service Sectors***, held Tuesday, May 21, 2013, 2:00 p.m. to 3:30 p.m. EDT. The webinar was sponsored by the Interagency Working Group on Youth Programs (IWGYP), a collaboration of 18 Federal departments and agencies that support programs and services focusing on youth and promote the goal of positive, healthy outcomes for youth. The webinar was planned jointly by the IWGYP and the Substance Abuse and Mental Health Services Administration (SAMHSA). The webinar slides are housed on the IWGYP website, FindYouthInfo.gov, under the Mental Health Youth Topic. The webinar featured three content experts nationally known in their field: Eugene Griffin, J.D., Ph.D., Northwestern University, Feinberg School of Medicine; Julian Ford, Ph.D., University of Connecticut, School of Medicine; and Charles Wilson, MSSW, Chadwick Center for Children and Families Rady Children's Hospital - San Diego, California; all of whom have been supported by SAMHSA trauma-focused grants. Additionally, the webinar included two youth presenters, NC and LS, who spoke about their own lived experience and the importance of trauma-informed care. Both youth are referred to only by initials to protect their privacy. NC is a peer specialist and LS is a law student.

Introduction

Trauma affects youth in all communities, and responses to those experiences by child-serving systems are critical. It is important for providers serving youth to understand how best to respond and support healing.

Service providers and policymakers in the youth-serving field are continually learning more from research[i] about trauma, traumatic experiences, and the various responses to traumatic events. It is important for youth serving systems to develop a greater understanding of the association between trauma and mental health and substance use disorders, and how it can derail the healthy development of youth. The field recognizes the importance of addressing trauma and using a trauma-informed approach in prevention, treatment, and recovery efforts.

This brief discusses the concept and prevalence of trauma; techniques for coping with, and recovering from trauma at an individual and systems level; the core principles for building a framework for understanding trauma; and implementation of elements essential for a trauma-informed system as presented by the featured experts.

Recognizing the effects of trauma and understanding how to address trauma are fundamental to the Trauma and Justice Strategic Initiative at the Substance Abuse and Mental Health Services Administration (SAMHSA), a division of the U.S. Department of Health and Human Services (HHS). The focus of SAMHSA's Trauma and Justice Strategic Initiative is on integrating a trauma-informed approach throughout health, behavioral health, and related systems to reduce the harmful effects of trauma and violence on individuals, families, and communities and using innovative strategies to reduce the involvement of individuals with trauma and behavioral health issues in the criminal and juvenile justice systems.

As part of this Initiative, with the help of experts, SAMHSA will be releasing a concept paper outlining a framework for trauma and guidance for developing and implementing a trauma-informed approach.

What Do We Mean by Trauma?

After an introduction by Dr. Larke Huang from the Substance Abuse and Mental Health Services Administration (SAMHSA), Dr. Eugene Griffin provided a framework for understanding trauma.

Trauma is a complex experience that affects youth and the systems that serve them in a variety of ways. The experience of trauma can be described through some common elements: event, experience, and effects, also known as "Three E's."[ii] These elements address the uniqueness of an individual's response to an event and how an event affects one's future behavior and well-being.

An **Event** is objective and measurable. Traumatic events include abuse (physical, emotional, sexual); domestic or community violence; an accident or natural disaster; and war or terrorism.

1. An **Experience** is subjective and difficult to measure because it relates to how someone reacts to an event. It is often thought to be life threatening or physically or emotionally overwhelming, and intensity can vary among people and over time. The way one person experiences an event might differ from the way another person does; culture, gender, and age all influence one's experience of the event. Additionally, people experience events in different ways. Resilience, risk and protective factors, and supports may contribute to this experience.
2. **Effects** are the reactions a person has to an event and the ways an experience changes or alters that person's ongoing and future behavior. Classic symptoms include experiencing hyperarousal, such as overreacting or being hypervigilant; re-experiencing an event as nightmares or flashbacks; and avoiding a situation by having a fight, flight, or freeze reaction. The effects of a traumatic event can have a long-term impact on neurobiological development and contribute to negative physical, hormonal, and chemical changes due to stress responses.

Building on this "Three E's" concept of trauma, SAMHSA frames its concept of trauma as: an event, series of events, or set of circumstances that is experienced by an individual as physically or emotionally harmful or life threatening and that has lasting adverse effects on the individual's functioning and mental, physical, social, emotional, or spiritual well-being.[iii] Researchers[iv] report that traumatic stress occurs when an extreme experience overwhelms and alters an individual's stress-related physiological systems and compromises the functioning of stress-response systems (e.g., neuroimmune, neuroendocrine, autonomic, and central nervous system networks).

"What I found worked best is when I was surrounded by people who really got it, who really understood trauma." — LS

Prevalence of Trauma

Many youth are exposed to traumatic events, including those in the juvenile justice and child welfare systems, as well as those who experience homelessness. Building on the three E's concept, we know that the experience of trauma is complex and particular to each individual's life circumstances, which can make quantifying the extent difficult. Some people experience multiple traumas; for example, a youth who has been separated from his or her family and then experiences assault or abuse in a foster home. As many as half of all children that have been involved with the mental health, child welfare, and juvenile justice systems have experienced multiple traumas.[v] LS and NC, two young people formerly involved with the foster care system, comment in the box above on their experiences with multiple traumas.

"When I was seven years old…my brothers and I were placed in foster care…We were immediately separated, and so I felt like that was probably the first traumatic event that I experienced." — LS

"While I was at my foster home, I had gotten into altercations with my foster brother and before he hit me, I felt scared…" — NC

Coping with and Reactions to Trauma

Dr. Julian Ford provided an overview of strategies for youth, families, and communities to recover from trauma. Recovery from the adverse effects of trauma begins with the recognition that the experience of survival threat caused by traumatic events has caused some major changes in the way a person now copes with stress. These ways of coping are necessary and effective in emergencies such as traumatic events, but they interfere with ordinary day-to-day life. Youth who have experienced trauma may develop coping strategies to help them survive.

Chronic Survival Coping

Trauma affects a youth's relationships, sense of survival, and sense of trust and security with people. The reaction to terrible shock, stressors, challenges, and loss is chronic survival coping. An individual trying to cope or recover from serious challenges and stressors will learn techniques to survive, such as staying on edge; being vigilant, watchful, or even distrustful (hypervigilance); or using indifference to mask hopelessness.

Posttraumatic Survival Coping

Physically, posttraumatic survival coping reflects a change in the body, not just a mental and psychological change. It changes how a person's brain works. The brain helps a person learn, explore, try activities, and experience different ways of living. However, a person cannot experience life freely when trying to survive trauma. Instead, that person must put everything else aside and concentrate only on basic survival needs. Some common survival modes or hypervigilance practices are scanning the environment and being on guard for danger; attempting to block out or not think about upsetting things; being ready to fight or flee; experiencing elevated heart rate and adrenalin rush; and being unable to regulate aggression or use anger management techniques.

"I wish that the people who I was working with in my school were more trauma informed and that they were focused - instead of on the disruptive behavior - on what was causing the disruptive behavior." — LS

Hypervigilance can make it difficult to set and accomplish goals even for the most persistent and high achieving person; all goals are trumped by the larger objective of staying safe. This type of coping can lead to difficulties trusting, including parents, caregivers, friends, teachers, and other adults.

Neurobiological Brain Research

Neuroscience indicates that a person's response to stress and use of coping techniques have three components. Dr. Ford provided a metaphor for understanding these complex brain processes:

- The ***"alarm"*** in the brain tells a person to wake up and pay attention. It also tells the body when there is a crisis and to be ready to react and survive.
- The ***"librarian"*** and ***"search engine"*** file and retrieve memories. When the alarm goes off, the memory filing center pulls information from all parts of the brain to figure out what is going on.
- The ***"computer hard drive"*** is the thinking center where all the information is put together and decisions are made.

If the three above components are working well, the thinking center is activated and a person can handle the stressful situation, not worry about survival, and come up with good ideas and plans for handling the situation, thus the alarm is turned off. However, if the alarm is so strong because of extreme stress (e.g., a threat to survival), it can crash the memory filing center and the hard drive in the brain. At that point, survival coping tactics take over. These activities take place in the part of the brain that helps a person survive and be safe. Operating in survival mode is not the ideal way to live because it leads to difficulty relaxing, trusting, focusing, and handling things appropriately.

Recovery from Trauma

A trauma-informed approach is a framework for providing services that should be integrated into everything that a program and system does. Dr. Ford noted that the goal of recovery from trauma is to tap into an existing strength to reset the brain's alarm to not be in persistent survival mode. Resetting the alarm requires strategies to resume thinking clearly. Evidence-based trauma-informed and trauma-specific therapy programs provide youth and their caregivers with strategies to focus their minds and deal with not feeling safe. Learning the strategies for regulating emotions and controlling anxiety is vital to everyday functioning in society. A trauma-informed approach includes youth and caretakers

in future planning. Trauma takes away control of a person's body or life. Reintroducing some control can tap into resiliency, and planning for the future provides hope.[vi]

Strategies for recovery from trauma include recognizing one's own and others' alarm reactions, sweeping one's mind clear before judging and acting, focusing on what is most important and positive, and being aware of stress and personal control levels. These strategies activate the thinking center and reset the alarm.

Many Paths to Recovery: Evidence-Based Models

- Cognitive-behavioral therapies
- Emotion regulation therapies
- Relational-interpersonal therapies
- Psychotherapies for dissociation
- Parent-child and family system therapies
- Social/helping network therapies
- Peer-to-peer support programs

The webinar presenters acknowledged that there are many paths to recovery and recommended common therapeutic approaches implemented by mental health professionals that can assist individuals who have experienced trauma. It is important to understand that trauma-informed care principles can be implemented by people who are not mental health professionals and work in various systems that provide services for individuals who have experienced trauma.

Trauma at the Systems Level

Mr. Charles Wilson provided a discussion of the child welfare system, and its role in addressing youth and families who have experienced trauma. The experience of trauma is complex and personal, and youth and families who have experienced trauma receive services within a variety of community systems. Providers and systems have the ability to help or potentially re-traumatize. A trauma-informed system aligns interactions among youth-serving agencies, such as the child protection systems, lawyers, juvenile judges, law enforcement, schools, and mental health providers so that they better understand how youth, families, and adults respond to trauma.

A trauma-informed system is not just about raising awareness, but changing behavior, actions, and responses. The approach requires doing things differently so as not to re-traumatize or introduce additional trauma. Systems need to support the natural resiliency of children and youth and assist them in identifying their unique strengths.

In a trauma-informed system, caregivers play a central role in recovery, help promote youth's natural resiliency, and give youth tools for managing stress. A strengths-based approach considers and includes the assistance given to caregivers within the system. This approach considers how the system helps caregivers deal with both current and past traumatic stress. The trauma-informed system assists caregivers understand the significant trauma histories of the children and youth that are in their care. Child welfare workers, mental health therapists, foster parents, juvenile judges, and all those working with children who have experienced significant traumatic events are influenced and touched by the trauma and can experience secondary or vicarious traumatic reactions. Therefore, the trauma-informed system responds to the varying impacts of traumatic stress on children, caregivers, and all those who are in contact with the system. Practitioners take this thinking and awareness about trauma and use it in everyday practice.

"The aftercare team also took a lot of time to do safety planning and future planning with me, and that is important because a lot of young people who experience trauma, they express feelings of hopelessness and they are in a constant state of anxiety, and so their ability to project into the future and plan for the future can be seriously impaired." — LS

Core Principles of a Trauma-Informed Approach

Given the presence of trauma in the lives of many youth and the need for systems and providers to support healing, a trauma-informed approach to providing services is critical. According to SAMHSA's concept of trauma[vii], a program, an organization, or a system that is trauma informed is based on four key assumptions:

- ***Realizes*** the widespread impact of trauma and understands potential paths for recovery.
- ***Recognizes*** the signs and symptoms of trauma in clients, families, staff, and others involved with the system.
- ***Responds*** by fully integrating knowledge about trauma into policies, procedures, practices, and settings.
- ***Resists re-traumatization*** of clients as well as staff***.***

The Chadwick Trauma-Informed Systems Project (CTISP)[viii] National Advisory Committee says that in a trauma-informed child welfare system, all parties recognize and respond to the varying impact of traumatic stress on children, caregivers, and those who have contact with the system. Programs and organizations within the system infuse this knowledge, awareness, and skill into their organizational cultures, policies, and practices. They act in collaboration, using the best available science, to facilitate and support resiliency and recovery.

"I was 13 years old in my first foster home, and I must admit I did not want to be there at first because I was at home with people who I was unfamiliar with…" — NC

SAMHSA's six principles[ix] support a framework for understanding trauma and developing a trauma-informed approach:

- ***Safety:*** Throughout the organization, the staff and the people they serve feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety.
- ***Trustworthiness and transparency:*** Organizational operations and decisions are conducted with transparency and with the goal of building and maintaining trust among clients, family members, staff, and others involved with the organization.
- ***Collaboration and mutuality:*** There is true partnering and leveling of power differences between staff and clients and among organizational staff, from direct care staff to administrators; they recognize that healing happens in relationships and in the meaningful sharing of power and decision making.
- ***Empowerment:*** Throughout the organization and among the clients served, individuals' strengths are recognized, built on, and validated and new skills are developed as needed.
- ***Voice and choice:*** The organization aims to strengthen the experience of choice for clients, family members, and staff and recognizes that every person's experience is unique and requires an individualized approach.
- ***Culture, historical and gender issues:*** The organization incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; are gender-responsive; and incorporate a focus on historical trauma.

These principles underlie the values, beliefs, and attitudes of individuals and organizations offering a trauma-informed approach. Using this approach, organizations foster a belief in resilience and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. Trauma-informed organizations build on strengths and assets of clients, staff, and communities instead of responding only to their perceived deficits. They recognize that everyone has a role to play. They address cultural, historical, and gender issues; actively move past cultural stereotypes and biases; offer gender-responsive services; promote the value of cultural connections; and recognize and address historical trauma. In the words of Dr. Ford, "A person does not have to be a therapist to be therapeutic."

Implementation

In his presentation, Mr. Charles Wilson shared the following central elements of providing trauma-informed care within programs, policies, services, and systems as outlined by the child welfare committee of the National Child Traumatic Stress Network. Sources with additional information are provided in the resources section of this brief.

Element 1: Maximize Physical and Psychological Safety for Children and Families

- Safety is a priority. Children and families who have experienced trauma may still feel unsafe even when they are no longer in danger. In addition to ensuring physical safety, it is important to help children and families feel psychologically safe.
- Sometimes even a noise or smell can trigger the feeling of being unsafe and elicit a reaction that a caretaker might not expect or understand. Being aware of and understanding these triggers and changing something seemingly small or insignificant in a daily routine can change behavior from negative to positive.

Element 2: Identify the Trauma-Related Needs of Children

- One of the first steps in helping trauma-exposed children and families is to understand how they have been impacted by trauma.
- Trauma-related needs can be identified through trauma screening and assessment.
- It is important to consider the type(s) of trauma children have experienced when making service referrals and developing service plans. All children need individualized services that are based on their unique circumstances, strengths, and challenges.

"I had reported a child abuse and neglect incident with social services and they did not come and take us out of our home. It was a form of betrayal of trust because you are expecting someone to help you and when that help does not come, then your relationship with the institutions that you need to rely on in order to get out of a bad situation, the relationship is broken." — LS

Element 3: Enhance Child Well-Being and Resilience

- Many children are naturally resilient.
- Systems must recognize and build on children's existing strengths.
- Both individual caseworkers and overall agency policies should support the continuity of children's relationships.
- Staff and agencies should also ensure that children who have been traumatized have access to evidence-based treatments and services.

Element 4: Enhance Family Well-Being and Resilience

- Families are a critical part of both protecting children from harm and enhancing their natural resilience.
- Providing trauma-informed education and services to parents and other caregivers enhances protective capacities.
- Agencies should recognize and assist caregivers to understand the significant trauma histories of the children and youth that are in their care.
- Agencies should assist caregivers to understand their own trauma histories.

"We need to do some self-esteem building and work with young people to acknowledge their strengths. I think when you have experienced trauma, you have a lot of thoughts, beliefs, or feelings of being unworthy or ashamed and you feel a lot of guilt and sometimes that leads to hopelessness. You are not going to work hard to achieve goals if you do not believe you can achieve them, if you do not believe you are worthy of achieving them…" — LS

Element 5: Enhance the Well-Being and Resilience of Those Working in the System

- Staff play important roles in supporting children, but working with people who have experienced abuse, neglect, violence, and other trauma can cause staff to develop secondary traumatic stress reactions.
- Agencies should collect information about trauma and secondary trauma experienced by staff, implement strategies and practices that build resilience and help staff manage stress, and address the impact of secondary traumatic stress on both individuals and on the system as a whole.

> **"The aftercare team was most useful because they worked across the systems…I did not have to do the work that a lot of young people are burdened with, which is finding a way to get our systems to work with one another." — LS**

Element 6: Partner with Youth and Families

- Youth and families should have choices and an active voice in decision making on individual, agency, and systemic levels.
- Youth and family members who have been in the system have a unique perspective and can provide valuable feedback.
- Partnerships with youth and families should occur at all levels.

Element 7: Partner with Agencies and Systems That Interact with Children and Families

- Agencies need to establish strong partnerships with other child- and family-serving systems.
- Service providers should develop common protocols and frameworks.
- Cross-system collaboration enables all helping professionals to see the child as a whole person, thus preventing potentially competing priorities and messages.
- Collaboration between systems promotes cohesive care and better outcomes.

Conclusion

This brief provides an overview of the webinar content as presented by experts in the field regarding the concepts and prevalence of trauma, principles for understanding trauma, and practices for addressing trauma and working with youth who have experienced trauma.

LS and NC, two young people formerly involved with the foster care system, provided much insight on their experiences with multiple traumas. Their shared comments provide important information and practice-based evidence and strategies that child and youth serving systems could incorporate into their work with children and youth who have experienced trauma. Some of the practical applications they described as beneficial to them include:

- Staff working in schools need to be aware of, educated and informed on the effects of trauma for children and youth, and trained in the causes of disruptive behaviors and ways to address these behaviors that do not re-traumatize children and youth;
- Aftercare teams need to provide consistent and ongoing planning with youth to address the after effects of trauma, (e.g., anxiety, sadness, depressions, feelings of hopelessness, anger, shame, guilt) and to build upon their strengths to instill good self-esteem and a belief that they are worthy of and can achieve goals in their life;

- Aftercare teams need to provide ongoing assistance for children and youth to learn skills for daily life, safety planning to address potential re-traumatization, and development of goals for the "here and now" and in their future;
- Aftercare teams need to provide quick response for children and youth who have been traumatized when reports or incidents of child abuse and/or neglect occur. Teams need to remember that these children and youth have been placed in unfamiliar surroundings and they do not feel safe or trust the people or environment immediately. They must rely on the aftercare teams to provide a trusting relationship with staff that will provide safety, protection and security in their lives;
- Aftercare teams need to work across systems to advocate for children and youth who have experienced trauma, and to assist them with the work needed for their daily care and consistent planning for life transitions.

Many strategies for coping with trauma have been noted in this brief, as well as the experiences of LS and NC which can inform child and youth serving systems on the successful practices and strategies that could improve the experience of children and youth who are coping with and healing from trauma. The resources noted below offer a starting point for deeper understanding of trauma and trauma-informed approaches.

Introduction

Trauma is a widespread, harmful and costly public health problem. It occurs as a result of violence, abuse, neglect, loss, disaster, war and other emotionally harmful experiences. Trauma has no boundaries with regard to age, gender, socioeconomic status, race, ethnicity, geography or sexual orientation. It is an almost universal experience of people with mental and substance use disorders. The need to address trauma is increasingly viewed as an important component of effective behavioral health service delivery. Additionally, it has become evident that addressing trauma requires a multi-pronged, multi-agency public health approach inclusive of public education and awareness, prevention and early identification, and effective trauma-specific assessment and treatment. ***In order to maximize the impact of these efforts, they need to be provided in an organizational or community context that is trauma-informed, that is, based on the knowledge and understanding of trauma and its far-reaching implications.***

The need to address trauma is increasingly viewed as an important component of effective behavioral health service delivery.

The effects of traumatic events place a heavy burden on individuals, families and communities and create challenges for public institutions and service systems. Although many people who experience a traumatic event will go on with their lives without lasting negative effects, others will have more difficulty and experience traumatic stress reactions. Emerging research has documented the relationships among exposure to traumatic events, impaired neurodevelopmental and immune systems responses and subsequent health risk behaviors resulting in chronic physical or behavioral health disorders.[1,2,3,4,5] Research has also indicated that with appropriate supports and intervention, people can overcome traumatic experiences.[6,7,8,9] However, most people go without these services and supports. Unaddressed trauma significantly increases the risk of mental and substance use disorders and chronic physical diseases.[1,10,11]

With appropriate supports and intervention, people can overcome traumatic experiences.

Individuals with experiences of trauma are found in multiple service sectors, not just in behavioral health. Studies of people in the juvenile and criminal justice system reveal high rates of mental and substance use disorders and personal histories of trauma.[12,13] Children and families in the child welfare system similarly experience high rates of trauma and associated behavioral health problems.[5,14] Young people bring their experiences of trauma into the school systems, often interfering with their school success. And many patients in primary care similarly have significant trauma histories which has an impact on their health and their responsiveness to health interventions.[15,16,17]

In addition, the public institutions and service systems that are intended to provide services and supports to individuals are often themselves trauma-inducing. The use of coercive practices, such as seclusion and restraints, in the behavioral health system; the abrupt removal of a child from an abusing family in the child welfare system; the use of invasive procedures in the medical system; the harsh disciplinary practices in educational/school systems; or intimidating practices in the criminal justice system can be re-traumatizing for individuals who already enter these systems with significant histories of trauma. These program or system practices and policies often interfere with achieving the desired outcomes in these systems.

Thus, the pervasive and harmful impact of traumatic events on individuals, families and communities and the unintended but similarly widespread re-traumatizing of individuals within our public institutions and service systems, makes it necessary to rethink doing "business as usual." In public institutions and service systems, there is increasing recognition that many of the individuals have extensive histories of trauma that, left unaddressed, can get in the way of achieving good health and well-being. For example, a child who suffers from maltreatment or neglect in the home may not be able to concentrate on school work and be successful in school; a women victimized by domestic violence may have trouble performing in the work setting; a jail inmate repeatedly exposed to violence on the street may have difficulty refraining from retaliatory violence and re-offending; a sexually abused homeless youth may engage in self-injury and high risk behaviors to cope with the effects of sexual abuse; and, a veteran may use substances to mask the traumatic memories of combat. The experiences of these individuals are compelling and, unfortunately, all too common. Yet, until recently, gaining a better understanding of how to address the trauma experienced by these individuals and how to mitigate the re-traumatizing effect of many of our public institutions and service settings was not an integral part of the work of these systems. Now, however, there is an increasing focus on the impact of trauma and how service systems may help to resolve or exacerbate trauma-related issues. These systems are beginning to revisit how they conduct their "business" under the framework of a trauma-informed approach.

There is an increasing focus on the impact of trauma and how service systems may help to resolve or exacerbate trauma-related issues. These systems are beginning to revisit how they conduct their business under the framework of a trauma-informed approach.

Purpose and Approach: Developing a Framework for Trauma and a Trauma-Informed Approach

PURPOSE

The purpose of this paper is to develop a working concept of trauma and a trauma-informed approach and to develop a shared understanding of these concepts that would be acceptable and appropriate across an array of service systems and stakeholder groups. SAMHSA puts forth a framework for the behavioral health specialty sectors, that can be adapted to other sectors such as child welfare, education, criminal and juvenile justice, primary health care, the military and other settings that have the potential to ease or exacerbate an individual's capacity to cope with traumatic experiences. In fact, many people with behavioral health problems receive treatment and services in these non-specialty behavioral health systems. SAMHSA intends this framework be relevant to its federal partners and their state and local system counterparts and to practitioners, researchers, and trauma survivors, families and communities. The desired goal is to build a framework that helps systems "talk" to each other, to understand better the connections between trauma and behavioral health issues, and to guide systems to become trauma-informed.

APPROACH

SAMHSA approached this task by integrating three significant threads of work: trauma focused research work; practice-generated knowledge about trauma interventions; and the lessons articulated by survivors

of traumatic experiences who have had involvement in multiple service sectors. It was expected that this blending of the research, practice and survivor knowledge would generate a framework for improving the capacity of our service systems and public institutions to better address the trauma-related issues of their constituents.

To begin this work, SAMHSA conducted an environmental scan of trauma definitions and models of trauma informed care. SAMHSA convened a group of national experts who had done extensive work in this area. This included trauma survivors who had been recipients of care in multiple service system; practitioners from an array of fields, who had experience in trauma treatment; researchers whose work focused on trauma and the development of trauma-specific interventions; and policymakers in the field of behavioral health.

From this meeting, SAMHSA developed a working document summarizing the discussions among these experts. The document was then vetted among federal agencies that conduct work in the field of trauma. Simultaneously, it was placed on a SAMHSA website for public comment. Federal agency experts provided rich comments and suggestions; the public comment site drew just over 2,000 respondents and 20,000 comments or endorsements of others' comments. SAMHSA reviewed all of these comments, made revisions to the document and developed the framework and guidance presented in this paper.

The key questions addressed in this paper are:

- **What do we mean by trauma?**
- **What do we mean by a trauma-informed approach?**
- **What are the key principles of a trauma-informed approach?**
- **What is the suggested guidance for implementing a trauma-informed approach?**
- **How do we understand trauma in the context of community?**

SAMHSA's approach to this task has been an attempt to integrate knowledge developed through research and clinical practice with the voices of trauma survivors. This also included experts funded through SAMHSA's trauma-focused grants and initiatives, such as SAMHSA's National Child Traumatic Stress Initiative, SAMHSA's National Center for Trauma Informed Care, and data and lessons learned from other grant programs that did not have a primary focus on trauma but included significant attention to trauma, such as SAMHSA's: Jail Diversion Trauma Recovery grant program; Children's Mental Health Initiative; Women, Children and Family Substance Abuse Treatment Program; and Offender Reentry and Adult Treatment Drug Court Programs.

Background: Trauma — Where We Are and How We Got Here

The concept of traumatic stress emerged in the field of mental health at least four decades ago. Over the last 20 years, SAMHSA has been a leader in recognizing the need to address trauma as a fundamental obligation for public mental health and substance abuse service delivery and has supported the development and promulgation of trauma-informed systems of care. In 1994, SAMHSA convened the Dare to Vision Conference, an event designed to bring trauma to the foreground and the first national conference in which women trauma survivors talked about their experiences and ways in which standard practices in hospitals re-traumatized and often, triggered memories of previous abuse. In 1998, SAMHSA funded the Women, Co-Occurring Disorders and Violence Study to generate knowledge on the development and evaluation of integrated services approaches for women with co-occurring mental and substance use disorders who also had histories of physical and or sexual abuse. In 2001, SAMHSA funded the National Child Traumatic Stress Initiative to increase understanding of child trauma and develop effective interventions for children exposed to different types of traumatic events.

The American Psychiatric Association (APA) played an important role in defining trauma. Diagnostic criteria for traumatic stress disorders have been debated through several iterations of the Diagnostic and Statistical Manual of Mental Disorders (DSM) with a new category of Trauma- and Stressor-Related Disorders, across the life-span, included in the recently released DSM-V (APA, 2013). Measures and inventories of trauma exposure, with both clinical and research applications, have proliferated since the 1970's.[18,19,20,21] National trauma research and practice centers have conducted significant work in the past few decades, further refining the concept of trauma, and developing effective trauma assessments and treatments.[22,23,24,25] With the advances in neuroscience, a biopsychosocial approach to traumatic experiences has begun to delineate the mechanisms in which neurobiology, psychological processes, and social attachment interact and contribute to mental and substance use disorders across the life-span.[3,25]

Simultaneously, an emerging trauma survivors movement has provided another perspective on the understanding of traumatic experiences. Trauma survivors, that is, people with lived experience of trauma, have powerfully and systematically documented their paths to recovery.[26] Traumatic experiences complicate a child's or an adult's capacity to make sense of their lives and to create meaningful consistent relationships in their families and communities.

Trauma survivors have powerfully and systematically documented their paths to recovery.

The convergence of the trauma survivor's perspective with research and clinical work has underscored the central role of traumatic experiences in the lives of people with mental and substance use conditions. The connection between trauma and these conditions offers a potential explanatory model for what has happened to individuals, both children and adults, who come to the attention of the behavioral health and other service systems.[25,27]

People with traumatic experiences, however, do not show up only in behavioral health systems. Responses to these experiences often manifest in behaviors or conditions that result in involvement with the child welfare and the criminal and juvenile justice system or in difficulties in the education, employment or primary care system. Recently, there has also been a focus on individuals in the military and increasing rates of posttraumatic stress disorders.[28,29,30,31]

With the growing understanding of the pervasiveness of traumatic experience and responses, a growing number of clinical interventions for trauma responses have been developed. Federal research agencies, academic institutions and practice-research partnerships have generated empirically-supported interventions. In SAMHSA's National Registry of Evidence-based Programs and Practices (NREPP) alone there are over 15 interventions focusing on the treatment or screening for trauma.

These interventions have been integrated into the behavioral health treatment care delivery system; however, from the voice of trauma survivors, it has become clear that these clinical interventions are not enough. Building on lessons learned from SAMHSA's Women, Co-Occurring Disorders and Violence Study; SAMHSA's National Child Traumatic Stress Network; and SAMHSA's National Center for Trauma-Informed Care and Alternatives to Seclusion and Restraints, among other developments in the field, it became clear that the organizational climate and conditions in which services are provided played a significant role in maximizing the outcomes of interventions and contributing to the healing and recovery of the people being served. SAMHSA's National Center for Trauma-Informed Care has continued to advance this effort, starting first in the behavioral health sector, but increasingly responding to technical assistance requests for organizational change in the criminal justice, education, and primary care sectors.

FEDERAL, STATE AND LOCAL LEVEL TRAUMA-FOCUSED ACTIVITIES

The increased understanding of the pervasiveness of trauma and its connections to physical and behavioral health and well-being, have propelled a growing number of organizations and service systems to explore ways to make their services more responsive to people who have experienced trauma. This has been happening in state and local systems and federal agencies.

States are elevating a focus on trauma. For example, Oregon Health Authority is looking at different types of trauma across the age span and different population groups. Maine's "Thrive Initiative" incorporates a trauma-informed care focus in their children's systems of care. New York is introducing a trauma-informed initiative in the juvenile justice system. Missouri is exploring a trauma-informed approach for their adult mental health system. In Massachusetts, the Child Trauma Project is focused on taking trauma-informed care statewide in child welfare practice. In Connecticut the Child Health and Development Institute with the state Department of Children and Families is building a trauma-informed system of care throughout the state through policy and workforce development. SAMHSA has supported the further development of trauma-informed approaches through its Mental Health Transformation Grant program directed to State and local governments.

Increasing examples of local level efforts are being documented. For example, the City of Tarpon Springs in Florida has taken significant steps in becoming a trauma-informed community. The city made it its mission to promote a widespread awareness of the costly effects of personal adversity upon the wellbeing of the community. The Family Policy Council in Washington State convened groups to focus on the impact of adverse childhood experiences on the health and well-being of its local communities and tribal communities. Philadelphia held a summit to further its understanding of the impact of trauma and violence on the psychological and physical health of its communities.

SAMHSA continues its support of grant programs that specifically address trauma.

At the federal level, SAMHSA continues its support of grant programs that specifically address trauma and technical assistance centers that focus on prevention, treatment and recovery from trauma.

Other federal agencies have increased their focus on trauma. The Administration on Children Youth and Families (ACYF) has focused on the complex trauma of children in the child welfare system and how screening and assessing for severity of trauma and linkage with trauma treatments can contribute to improved well-being for these youth. In a joint effort among ACYF, SAMHSA and the Centers for Medicare and Medicaid Services (CMS), the three agencies developed and issued through the CMS State Directors' mechanism, a letter to all State Child Welfare Administrators, Mental Health Commissioners, Single State Agency Directors for Substance Abuse and State Medicaid Directors discussing trauma, its impact on children, screening, assessment and treatment interventions and strategies for paying for such care. The Office of Juvenile Justice and Delinquency Prevention has specific recommendations to address trauma in their Children Exposed to Violence Initiative. The Office of Women's Health has developed a curriculum to train providers in primary care on how to address trauma issues in health care for women. The Department of Labor is examining trauma and the workplace through a federal interagency workgroup. The Department of Defense is honing in on prevention of sexual violence and trauma in the military.

As multiple federal agencies representing varied sectors have recognized the impact of traumatic experiences on the children, adults, and families they serve, they have requested collaboration with SAMHSA in addressing these issues. The widespread recognition of the impact of trauma and the burgeoning interest in developing capacity to respond through trauma-informed approaches compelled SAMHSA to revisit its conceptual framework and approach to trauma, as well as its applicability not only to behavioral health but also to other related fields.

SAMHSA's Concept of Trauma

Decades of work in the field of trauma have generated multiple definitions of trauma. Combing through this work, SAMHSA developed an inventory of trauma definitions and recognized that there were subtle nuances and differences in these definitions.

Desiring a concept that could be shared among its constituencies — practitioners, researchers, and trauma survivors, SAMHSA turned to its expert panel to help craft a concept that would be relevant to public health agencies and service systems. SAMHSA aims to provide a viable framework that can be used to support people receiving services, communities, and stakeholders in the work they do. A review of the existing definitions and discussions of the expert panel generated the following concept:

> ***Individual trauma results from an* event*, series of events, or set of circumstances that is* experienced *by an individual as physically or emotionally harmful or life threatening and that has lasting adverse* effects *on the individual's functioning and mental, physical, social, emotional, or spiritual well-being.***

THE THREE "E'S" OF TRAUMA: EVENT(S), EXPERIENCE OF EVENT(S), AND EFFECT

Events and circumstances may include the actual or extreme threat of physical or psychological harm (i.e. natural disasters, violence, etc.) or severe, life-threatening neglect for a child that imperils healthy development. These events and circumstances may occur as a single occurrence or repeatedly over time. This element of SAMHSA's concept of trauma is represented in the fifth version of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), which requires all conditions classified as "trauma and stressor-related disorders" to include exposure to a traumatic or stressful event as a diagnostic criterion.

The individual's **experience** of these events or circumstances helps to determine whether it is a traumatic event. A particular event may be experienced as traumatic for one individual and not for another (e.g., a child removed from an abusive home experiences this differently than their sibling; one refugee may experience fleeing one's country differently from another refugee; one military veteran may experience deployment to a war zone as traumatic while another veteran is not similarly affected). How the individual labels, assigns meaning to, and is disrupted physically and psychologically by an event will contribute to whether or not it is experienced as traumatic. Traumatic events by their very nature set up a power differential where one entity (whether an individual, an event, or a force of nature) has power over another. They elicit a profound question of "why me?" The individual's experience of these events or circumstances is shaped in the context of this powerlessness and questioning. Feelings of humiliation, guilt, shame, betrayal, or silencing often shape the experience of the event. When a person experiences physical or sexual abuse, it is often accompanied by a sense of humiliation, which can lead the person to feel as though they are bad or dirty, leading to a sense of self blame, shame and guilt. In cases of war or natural disasters, those who survived the traumatic event may blame themselves for surviving when others did not. Abuse by a trusted caregiver frequently gives rise to feelings of betrayal, shattering a person's trust and leaving them feeling alone. Often, abuse of children and domestic violence are accompanied by threats that lead to silencing and fear of reaching out for help.

How the event is experienced may be linked to a range of factors including the individual's cultural beliefs (e.g., the subjugation of women and the experience of domestic violence), availability of social supports (e.g., whether isolated or embedded in a supportive family or community structure), or to the developmental stage of the individual (i.e., an individual may understand and experience events differently at age five, fifteen, or fifty).[1]

The long-lasting adverse **effects** of the event are a critical component of trauma. These adverse effects may occur immediately or may have a delayed onset. The duration of the effects can be short to long term. In some situations, the individual may not recognize the connection between the traumatic events and the effects. Examples of adverse effects include an individual's inability to cope with the normal stresses and strains of daily living; to trust and benefit from relationships; to manage cognitive processes, such as memory, attention, thinking; to regulate behavior; or to control the expression of emotions. In addition to these more visible effects, there may be an altering of one's neurobiological make-up and ongoing health and well-being. Advances in neuroscience and an increased understanding of the interaction of neurobiological and environmental factors have documented the effects of such threatening events.[1,3] Traumatic effects, which may range from hyper-vigilance or a constant state of arousal, to numbing or avoidance, can eventually wear a person down, physically, mentally, and emotionally. Survivors of trauma have also highlighted the impact of these events on spiritual beliefs and the capacity to make meaning of these experiences.

SAMHSA's Trauma-Informed Approach: Key Assumptions and Principles

Trauma researchers, practitioners and survivors have recognized that the understanding of trauma and trauma-specific interventions is not sufficient to optimize outcomes for trauma survivors nor to influence how service systems conduct their business.

The context in which trauma is addressed or treatments deployed contributes to the outcomes for the trauma survivors, the people receiving services, and the individuals staffing the systems. Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.[22,32,33] SAMHSA's concept of a trauma-informed approach is grounded in a set of four assumptions and six key principles.

A program, organization, or system that is trauma-informed* realizes *the widespread impact of trauma and understands potential paths for recovery;* recognizes *the signs and symptoms of trauma in clients, families, staff, and others involved with the system; and* responds *by fully integrating knowledge about trauma into policies, procedures, and practices, and seeks to actively* resist re-traumatization*.

A trauma informed approach is distinct from trauma-specific services or trauma systems. A trauma informed approach is inclusive of trauma-specific interventions, whether assessment, treatment or recovery supports, yet it also incorporates key trauma principles into the organizational culture.

Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.

THE FOUR "R'S: KEY ASSUMPTIONS IN A TRAUMA-INFORMED APPROACH

In a trauma-informed approach, all people at all levels of the organization or system have a basic **realization** about trauma and understand how trauma can affect families, groups, organizations, and communities as well as individuals. People's experience and behavior are understood in the context of coping strategies designed to survive adversity and overwhelming circumstances, whether these occurred in the past (i.e., a client dealing with prior child abuse), whether they are currently manifesting (i.e., a staff member living with domestic violence in the home), or whether they are related to the emotional distress that results in hearing about the firsthand experiences of another (i.e., secondary traumatic stress experienced by a direct care professional).There is an understanding that trauma plays a role in mental and substance use disorders and should be systematically addressed in prevention, treatment, and recovery settings. Similarly, there is a realization that trauma is not confined to the behavioral health specialty service sector, but is integral to other systems (e.g., child welfare, criminal justice, primary health care, peer–run and community organizations) and is often a barrier to effective outcomes in those systems as well.

People in the organization or system are also able to **recognize** the signs of trauma. These signs may be gender, age, or setting-specific and may be manifest by individuals seeking or providing services in these settings. Trauma screening and assessment assist in the recognition of trauma, as do workforce development, employee assistance, and supervision practices.

The program, organization, or system **responds** by applying the principles of a trauma-informed approach to all areas of functioning. The program, organization, or system integrates an understanding that the experience of traumatic events impacts all people involved, whether directly or indirectly. Staff in every part of the organization, from the person who greets clients at the door to the executives and the governance board, have changed their language, behaviors and policies to take into consideration the experiences of trauma among children and adult users of the services and among staff providing the services. This is accomplished through staff training, a budget that supports this ongoing training, and leadership that realizes the role of trauma in the lives of their staff and the people they serve. The organization has practitioners trained in evidence-based trauma practices. Policies of the organization, such as mission statements, staff handbooks and manuals promote a culture based on beliefs about resilience, recovery, and healing from trauma. For instance, the agency's mission may include an intentional statement on the organization's commitment to promote trauma recovery; agency policies demonstrate a commitment to incorporating perspectives of people served through the establishment of client advisory boards or inclusion of people who have received services on the agency's board of directors; or agency training includes resources for mentoring supervisors on helping staff address secondary traumatic stress. The organization is committed to providing a physically and psychologically safe environment. Leadership ensures that staff work in an environment that promotes trust, fairness and transparency. The program's, organization's, or system's response involves a universal precautions approach in which one expects the presence of trauma in lives of individuals being served, ensuring not to replicate it.

A trauma-informed approach seeks to **resist re-traumatization** of clients as well as staff. Organizations often inadvertently create stressful or toxic environments that interfere with the recovery of clients, the well-being of staff and the fulfillment of the organizational mission.[27] Staff who work within a trauma-informed environment are taught to recognize how organizational practices may trigger painful memories and re-traumatize clients with trauma histories. For example, they recognize that using restraints on a person who has been sexually abused or placing a child who has been neglected and abandoned in a seclusion room may be re-traumatizing and interfere with healing and recovery.

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

A trauma-informed approach reflects adherence to six key principles rather than a prescribed set of practices or procedures. These principles may be generalizable across multiple types of settings, although terminology and application may be setting- or sector-specific.

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

1. **Safety**
2. **Trustworthiness and Transparency**
3. **Peer Support**
4. **Collaboration and Mutuality**
5. **Empowerment, Voice and Choice**
6. **Cultural, Historical, and Gender Issues**

From SAMHSA's perspective, it is critical to promote the linkage to recovery and resilience for those individuals and families impacted by trauma. Consistent with SAMHSA's definition of recovery, services and supports that are trauma-informed build on the best evidence available and consumer and family engagement, empowerment, and collaboration.

The six key principles fundamental to a trauma-informed approach include:[24,36]

1. **Safety:** Throughout the organization, staff and the people they serve, whether children or adults, feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety. Understanding safety as defined by those served is a high priority.

2. **Trustworthiness and Transparency:** Organizational operations and decisions are conducted with transparency with the goal of building and maintaining trust with clients and family members, among staff, and others involved in the organization.

3. **Peer Support:** Peer support and mutual self-help are key vehicles for establishing safety and hope, building trust, enhancing collaboration, and utilizing their stories and lived experience to promote recovery and healing. The term "Peers" refers to individuals with lived experiences of trauma, or in the case of children this may be family members of children who have experienced traumatic events and are key caregivers in their recovery. Peers have also been referred to as "trauma survivors."

4. **Collaboration and Mutuality:** Importance is placed on partnering and the leveling of power differences between staff and clients and among organizational staff from clerical and housekeeping personnel, to professional staff to administrators, demonstrating that healing happens in relationships and in the meaningful sharing of power and decision-making. The organization recognizes that everyone has a role to play in a trauma-informed approach. As one expert stated: "one does not have to be a therapist to be therapeutic."[12]

5. **Empowerment, Voice and Choice:** Throughout the organization and among the clients served, individuals' strengths and experiences are recognized and built upon. The organization fosters a belief in the primacy of the people served, in resilience, and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. The organization understands that the experience of trauma may be a unifying aspect in the lives of those who run the organization, who provide the services, and/or who come to the organization for assistance and support. As such, operations, workforce development and services are organized to foster empowerment for staff and clients alike. Organizations understand the importance of power differentials and ways in which clients, historically, have been diminished in voice and choice and are often recipients of coercive treatment. Clients are supported in shared decision-making, choice, and goal setting to determine the plan of action they need to heal and move forward. They are supported in cultivating self-advocacy skills. Staff are facilitators of recovery rather than controllers of recovery.[34] Staff are empowered to do their work as well as possible by adequate organizational support. This is a parallel process as staff need to feel safe, as much as people receiving services.

6. **Cultural, Historical, and Gender Issues:** The organization actively moves past cultural stereotypes and biases (e.g. based on race, ethnicity, sexual orientation, age, religion, gender-identity, geography, etc.); offers, access to gender responsive services; leverages the healing value of traditional cultural connections; incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; and recognizes and addresses historical trauma.

Guidance for Implementing a Trauma-Informed Approach

Developing a trauma-informed approach requires change at multiples levels of an organization and systematic alignment with the six key principles described above. The guidance provided here builds upon the work of Harris and Fallot and in conjunction with the key principles, provides a starting point for developing an organizational trauma-informed approach.[20] While it is recognized that not all public institutions and service sectors attend to trauma as an aspect of how they conduct business, understanding the role of trauma and a trauma-informed approach may help them meet their goals and objectives. Organizations, across service-sectors and systems, are encouraged to examine how a trauma-informed approach will benefit all stakeholders; to conduct a trauma-informed organizational assessment and change process; and to involve clients and staff at all levels in the organizational development process.

The guidance for implementing a trauma-informed approach is presented in the ten domains described below. This is not provided as a "checklist" or a prescriptive step-by-step process. These are the domains of organizational change that have appeared both in the organizational change management literature and among models for establishing trauma-informed care.[35,36,37,38] What makes it unique to establishing a trauma-informed organizational approach is the cross-walk with the key principles and trauma-specific content.

TEN IMPLEMENTATION DOMAINS

1. **Governance and Leadership**
2. **Policy**
3. **Physical Environment**
4. **Engagement and Involvement**
5. **Cross Sector Collaboration**
6. **Screening, Assessment, Treatment Services**
7. **Training and Workforce Development**
8. **Progress Monitoring and Quality Assurance**
9. **Financing**
10. **Evaluation**

GOVERNANCE AND LEADERSHIP: The leadership and governance of the organization support and invest in implementing and sustaining a trauma-informed approach; there is an identified point of responsibility within the organization to lead and oversee this work; and there is inclusion of the peer voice. A champion of this approach is often needed to initiate a system change process.

POLICY: There are written policies and protocols establishing a trauma-informed approach as an essential part of the organizational mission. Organizational procedures and cross agency protocols, including working with community-based agencies, reflect trauma-informed principles. This approach must be "hard-wired" into practices and procedures of the organization, not solely relying on training workshops or a well-intentioned leader.

PHYSICAL ENVIRONMENT OF THE ORGANIZATION: The organization ensures that the physical environment promotes a sense of safety and collaboration. Staff working in the organization and individuals being served must experience the setting as safe, inviting, and not a risk to their physical or psychological safety. The physical setting also supports the collaborative aspect of a trauma informed approach through openness, transparency, and shared spaces.

ENGAGEMENT AND INVOLVEMENT OF PEOPLE IN RECOVERY, TRAUMA SURVIVORS, PEOPLE RECEIVING SERVICES, AND FAMILY MEMBERS RECEIVING SERVICES: These groups have significant involvement, voice, and meaningful choice at all levels and in all areas of organizational functioning (e.g., program design, implementation, service delivery, quality assurance, cultural competence, access to trauma-informed peer support, workforce development, and evaluation.) This is a key value and aspect of a trauma-informed approach that differentiates it from the usual approaches to services and care.

CROSS SECTOR COLLABORATION: Collaboration across sectors is built on a shared understanding of trauma and principles of a trauma-informed approach. While a trauma focus may not be the stated mission of various service sectors, understanding how awareness of trauma can help or hinder achievement of an organization's mission is a critical aspect of building collaborations. People with significant trauma histories often present with a complexity of needs, crossing various service sectors. Even if a mental health clinician is trauma-informed, a referral to a trauma-insensitive program could then undermine the progress of the individual.

SCREENING, ASSESSMENT, AND TREATMENT SERVICES: Practitioners use and are trained in interventions based on the best available empirical evidence and science, are culturally appropriate, and reflect principles of a trauma-informed approach. Trauma screening and assessment are an essential part of the work. Trauma-specific interventions are acceptable, effective, and available for individuals and families seeking services. When trauma-specific services are not available within the organization, there is a trusted, effective referral system in place that facilitates connecting individuals with appropriate trauma treatment.

TRAINING AND WORKFORCE DEVELOPMENT: On-going training on trauma and peer-support are essential. The organization's human resource system incorporates trauma-informed principles in hiring, supervision, staff evaluation; procedures are in place to support staff with trauma histories and/or those experiencing significant secondary traumatic stress or vicarious trauma, resulting from exposure to and working with individuals with complex trauma.

PROGRESS MONITORING AND QUALITY ASSURANCE: There is ongoing assessment, tracking, and monitoring of trauma-informed principles and effective use of evidence-based trauma specific screening, assessments and treatment.

FINANCING: Financing structures are designed to support a trauma-informed approach which includes resources for: staff training on trauma, key principles of a trauma-informed approach; development of appropriate and safe facilities; establishment of peer-support; provision of evidence-supported trauma screening, assessment, treatment, and recovery supports; and development of trauma-informed cross-agency collaborations.

EVALUATION: Measures and evaluation designs used to evaluate service or program implementation and effectiveness reflect an understanding of trauma and appropriate trauma-oriented research instruments.

To further guide implementation, the chart on the next page provides sample questions in each of the ten domains to stimulate change-focused discussion. The questions address examples of the work to be done in any particular domain yet also reflect the six key principles of a trauma-informed approach. Many of these questions and concepts were adapted from the work of Fallot and Harris, Henry, Black-Pond, Richardson, & Vandervort, Hummer and Dollard, and Penney and Cave.[39, 40, 41,42]

While the language in the chart may seem more familiar to behavioral health settings, organizations across systems are encouraged to adapt the sample questions to best fit the needs of the agency, staff, and individuals being served. For example, a juvenile justice agency may want to ask how it would incorporate the principle of safety when examining its physical environment. A primary care setting may explore how it can use empowerment, voice, and choice when developing policies and procedures to provide trauma-informed services (e.g. explaining step by step a potentially invasive procedure to a patient at an OBGYN office).

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH

KEY PRINCIPLES					
Safety	**Trustworthiness and Transparency**	**Peer Support**	**Collaboration and Mutuality**	**Empowerment, Voice, and Choice**	**Cultural, Historical, and Gender Issues**
10 IMPLEMENTATION DOMAINS					
Governance and Leadership	• How does agency leadership communicate its support and guidance for implementing a trauma-informed approach? • How do the agency's mission statement and/or written policies and procedures include a commitment to providing trauma-informed services and supports? • How do leadership and governance structures demonstrate support for the voice and participation of people using their services who have trauma histories?				
Policy	• How do the agency's written policies and procedures include a focus on trauma and issues of safety and confidentiality? • How do the agency's written policies and procedures recognize the pervasiveness of trauma in the lives of people using services, and express a commitment to reducing re-traumatization and promoting well-being and recovery? • How do the agency's staffing policies demonstrate a commitment to staff training on providing services and supports that are culturally relevant and trauma-informed as part of staff orientation and in-service training? • How do human resources policies attend to the impact of working with people who have experienced trauma? • What policies and procedures are in place for including trauma survivors/people receiving services and peer supports in meaningful and significant roles in agency planning, governance, policy-making, services, and evaluation?				

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH *(continued)*

10 IMPLEMENTATION DOMAINS *continued*	
Physical Environment	• How does the physical environment promote a sense of safety, calming, and de-escalation for clients and staff? • In what ways do staff members recognize and address aspects of the physical environment that may be re-traumatizing, and work with people on developing strategies to deal with this? • How has the agency provided space that both staff and people receiving services can use to practice self-care? • How has the agency developed mechanisms to address gender-related physical and emotional safety concerns (e.g., gender-specific spaces and activities).
Engagement and Involvement	• How do people with lived experience have the opportunity to provide feedback to the organization on quality improvement processes for better engagement and services? • How do staff members keep people fully informed of rules, procedures, activities, and schedules, while being mindful that people who are frightened or overwhelmed may have a difficulty processing information? • How is transparency and trust among staff and clients promoted? • What strategies are used to reduce the sense of power differentials among staff and clients? • How do staff members help people to identify strategies that contribute to feeling comforted and empowered?
Cross Sector Collaboration	• Is there a system of communication in place with other partner agencies working with the individual receiving services for making trauma-informed decisions? • Are collaborative partners trauma-informed? • How does the organization identify community providers and referral agencies that have experience delivering evidence-based trauma services? • What mechanisms are in place to promote cross-sector training on trauma and trauma-informed approaches?
Screening, Assessment, Treatment Services	• Is an individual's own definition of emotional safety included in treatment plans? • Is timely trauma-informed screening and assessment available and accessible to individuals receiving services? • Does the organization have the capacity to provide trauma-specific treatment or refer to appropriate trauma-specific services? • How are peer supports integrated into the service delivery approach? • How does the agency address gender-based needs in the context of trauma screening, assessment, and treatment? For instance, are gender-specific trauma services and supports available for both men and women? • Do staff members talk with people about the range of trauma reactions and work to minimize feelings of fear or shame and to increase self-understanding? • How are these trauma-specific practices incorporated into the organization's ongoing operations?

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH *(continued)*

10 IMPLEMENTATION DOMAINS *continued*	
Training and Workforce Development	• How does the agency address the emotional stress that can arise when working with individuals who have had traumatic experiences? • How does the agency support training and workforce development for staff to understand and increase their trauma knowledge and interventions? • How does the organization ensure that all staff (direct care, supervisors, front desk and reception, support staff, housekeeping and maintenance) receive basic training on trauma, its impact, and strategies for trauma-informed approaches across the agency and across personnel functions? • How does workforce development/staff training address the ways identity, culture, community, and oppression can affect a person's experience of trauma, access to supports and resources, and opportunities for safety? • How does on-going workforce development/staff training provide staff supports in developing the knowledge and skills to work sensitively and effectively with trauma survivors. • What types of training and resources are provided to staff and supervisors on incorporating trauma-informed practice and supervision in their work? • What workforce development strategies are in place to assist staff in working with peer supports and recognizing the value of peer support as integral to the organization's workforce?
Progress Monitoring and Quality Assurance	• Is there a system in place that monitors the agency's progress in being trauma-informed? • Does the agency solicit feedback from both staff and individuals receiving services? • What strategies and processes does the agency use to evaluate whether staff members feel safe and valued at the agency? • How does the agency incorporate attention to culture and trauma in agency operations and quality improvement processes? • What mechanisms are in place for information collected to be incorporated into the agency's quality assurance processes and how well do those mechanisms address creating accessible, culturally relevant, trauma-informed services and supports?
Financing	• How does the agency's budget include funding support for ongoing training on trauma and trauma-informed approaches for leadership and staff development? • What funding exists for cross-sector training on trauma and trauma-informed approaches? • What funding exists for peer specialists? • How does the budget support provision of a safe physical environment?
Evaluation	• How does the agency conduct a trauma-informed organizational assessment or have measures or indicators that show their level of trauma-informed approach? • How does the perspective of people who have experienced trauma inform the agency performance beyond consumer satisfaction survey? • What processes are in place to solicit feedback from people who use services and ensure anonymity and confidentiality? • What measures or indicators are used to assess the organizational progress in becoming trauma-informed?

Next Steps: Trauma in the Context of Community

Delving into the work on community trauma is beyond the scope of this document and will be done in the next phase of this work. However, recognizing that many individuals cope with their trauma in the safe or not-so safe space of their communities, it is important to know how communities can support or impede the healing process.

Trauma does not occur in a vacuum. Individual trauma occurs in a context of community, whether the community is defined geographically as in neighborhoods; virtually as in a shared identity, ethnicity, or experience; or organizationally, as in a place of work, learning, or worship. How a community responds to individual trauma sets the foundation for the impact of the traumatic event, experience, and effect. Communities that provide a context of understanding and self-determination may facilitate the healing and recovery process for the individual. Alternatively, communities that avoid, overlook, or misunderstand the impact of trauma may often be re-traumatizing and interfere with the healing process. Individuals can be re-traumatized by the very people whose intent is to be helpful. This is one way to understand trauma in the context of a community.

A second and equally important perspective on trauma and communities is the understanding that communities as a whole can also experience trauma. Just as with the trauma of an individual or family, a community may be subjected to a community-threatening event, have a shared experience of the event, and have an adverse, prolonged effect. Whether the result of a natural disaster (e.g., a flood, a hurricane or an earthquake) or an event or circumstances inflicted by one group on another (e.g., usurping homelands, forced relocation, servitude, or mass incarceration, ongoing exposure to violence in the community), the resulting trauma is often transmitted from one generation to the next in a pattern often referred to as historical, community, or intergenerational trauma.

Communities can collectively react to trauma in ways that are very similar to the ways in which individuals respond. They can become hyper-vigilant, fearful, or they can be re-traumatized, triggered by circumstances resembling earlier trauma. Trauma can be built into cultural norms and passed from generation to generation. Communities are often profoundly shaped by their trauma histories. Making sense of the trauma experience and telling the story of what happened using the language and framework of the community is an important step toward healing community trauma.

Many people who experience trauma readily overcome it and continue on with their lives; some become stronger and more resilient; for others, the trauma is overwhelming and their lives get derailed. Some may get help in formal support systems; however, the vast majority will not. The manner in which individuals and families can mobilize the resources and support of their communities and the degree to which the community has the capacity, knowledge, and skills to understand and respond to the adverse effects of trauma has significant implications for the well-being of the people in their community.

Conclusion

As the concept of a trauma-informed approach has become a central focus in multiple service sectors, SAMHSA desires to promote a shared understanding of this concept. The working definitions, key principles, and guidance presented in this document represent a beginning step toward clarifying the meaning of this concept. This document builds upon the extensive work of researchers, practitioners, policymakers, and people with lived experience in the field. A standard, unified working concept will serve to advance the understanding of trauma and a trauma-informed approach for public institutions and service sectors.

CFCA PAPER NO. 37 2016

Trauma-informed care in child/family welfare services

Liz Wall, Daryl Higgins and Cathryn Hunter

CHILD FAMILY COMMUNITY AUSTRALIA | INFORMATION EXCHANGE

This paper aims to define and clarify what trauma-informed service delivery means in the context of delivering child/family welfare services in Australia. Exposure to traumatic life events such as child abuse, neglect and domestic violence is a driver of service need. Policies and service providers must respond appropriately to people who are dealing with trauma and its effects in order to ensure best outcomes for individuals and families using these services. In addition to evidence-based programs or clinical interventions that are specific to addressing trauma symptoms, such as trauma-focused cognitive behaviour therapy, there is a need for broader organisational- or service-level systems of care that respond to the needs of clients with a lived experience of trauma that go beyond a clinical response. Some of the challenges identified in implementing and embedding trauma-informed care across services and systems are discussed.

KEY MESSAGES

- Traumatic experiences are common, with people often having multiple adverse experiences across their life. There are many serious and deleterious outcomes associated with exposure to them.
- Clients often present to child/family welfare services with a complex range of symptoms and behaviours related to prior and/or past trauma, which neither they nor those working with them have linked to this previous trauma exposure. As a result they may face an uninformed and fragmented response that is potentially re-traumatising.
- There are a small number of trauma-specific interventions that have been evaluated using a rigorous scientific standard and been shown to be effective—however, the research is often based on populations who have experienced a single traumatic event rather than complex trauma.
- Trauma-informed care is a framework for human service delivery that is based on knowledge and understanding of how trauma affects people's lives, their service needs and service usage.
- With the lack of an overarching framework in Australia, there is a danger of inconsistent or piecemeal development of trauma-informed models and practices that do not share a consistent language or framework for implementing trauma-informed systems of care in child/family services.
- As trauma affects a large proportion of the population, survivors are clients in a broad range of human services, and organisations across all settings should consider how a trauma-informed approach could benefit stakeholders, regardless of whether or not the organisation also provides evidence-based trauma-specific interventions.
- Challenges to implementing a trauma-informed approach to care include: a lack of clearly articulated definitions (e.g. of trauma-specific interventions vs the concept and principles of trauma-informed care); translating trauma-informed care to specific practice and service settings; consistency across service settings and systems; care-coordination; a lack of guidance for facilitating complex system change; and a lack of evaluation of models of trauma-informed care.
- Research is needed to explore whether different trauma-informed approaches are required for different population groups, including children, adolescents and adults, or for males and females.

Understanding the experiences of adversity in childhood such as sexual or other abuse as trauma is now recognised to be an important concept for human service delivery sectors. The USA has led efforts to incorporate trauma theory into mental health and other service delivery, largely driven by the Substance Abuse and Mental Health Services Administration (SAMHSA). SAMHSA funds two major trauma-related resources, the National Center for Trauma-Informed Care (NCTIC) and the National Child Traumatic Stress Initiative (NCTSI), to provide a focus for developing a shared language and evidence base around trauma and trauma-informed approaches to service. Emerging

efforts in Australia are now contributing to our knowledge of effective practice for children, young people and adults who have experienced trauma from events such as child maltreatment, sexual assault, military service, forced adoption and past family separation practices.

This paper aims to define and clarify what trauma-informed service delivery means in an Australian context. Australia is not as far down the track as the USA in terms of implementing a trauma-informed approach to human service provision in systems such as mental health and child and family services. There is, however, a recognition that exposure to traumatic life events is a driver of service need and that policies and service providers must address and respond to trauma appropriately to ensure best outcomes for individuals and families using these services.

Trauma terminology

There has been extensive debate around the classification and terminology for describing the effects of trauma, as well as the relationship to specific diagnostic terms such as post-traumatic stress disorder (Van der Kolk, Roth, Pelcovitz, Sunday, & Spinazzola, 2005; Wall & Quadara, 2014). The latest iteration of the *Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association, 2013), an international classification system for mental health disorders, has taken a broad approach to the terminology with a category of "Trauma and Stressor Related Disorders" rather than specifically including complex trauma as a diagnostic term.

Any discussion of trauma-informed service delivery requires consideration of the vast array of definitions and terminology that arises around trauma. This section explains some of the different terms, phrases and concepts that are used in the literature to describe trauma and trauma-related service provision.

Recently, there have been attempts to provide consistency in definitions and a shared language around trauma and a trauma-informed approach to care. SAMHSA's (2014) *Concept of Trauma and Guidance for a Trauma-Informed Approach* puts forward definitions and a working concept of trauma and a trauma-informed approach in order to develop a shared understanding of these concepts for service systems and stakeholders. SAMHSA is a key resource for trauma-informed approaches to care and these definitions are likely to be widely adopted.

What is trauma?

Traumatic events have been described as those that "overwhelm the ordinary human adaptations to life [and] … generally involve threats to life or bodily integrity, or a close personal encounter with violence and death" (Herman, 1992, p. 33). SAMHSA's concept of trauma provides a comprehensive definition that encompasses trauma related to one-off events as well as ongoing adversity:

> Individual trauma results from an event, series of events or set of circumstances that is experienced by an individual as physically or emotionally harmful or life threatening and that has lasting adverse effects on the individual's functioning and mental, physical, social, emotional or spiritual wellbeing. (SAMHSA, 2014, p. 7)

Although not diagnostic terms, *complex trauma* and *complex post-traumatic stress disorder* are often used to describe trauma that is the result of stressors that are interpersonal—usually severe, sustained and perpetrated by one human being on another—and where clients may not meet all of the specific diagnostic criteria for post-traumatic stress disorder (PTSD) or where the primary clinical presentation is the associated features due to the global effects of trauma on the person's functioning (Connor & Higgins, 2008a, 2008b). Trauma is particularly damaging when it occurs in childhood. Complex, interpersonally generated trauma is severely disruptive of a person's capacity to manage internal states (Kezelman & Stavropoulos, 2012). Complex trauma symptoms include problems with mood regulation, impulse control, self-perception, attention, memory and somatic disorders (Briere & Jordan, 2004; Burstow, 2003; van der Kolk et al., 2005).

Trauma-informed interventions occur at two levels: trauma-specific interventions and trauma-informed models of care. Organisational responses to trauma tend to occur on a continuum from basic trauma awareness, to trauma sensitivity, trauma responsivity and through to trauma-informed and/or trauma-specific interventions. We argue here that it is helpful for organisations providing services in the child/family welfare domain, and human services more broadly, to think about their organisational responses to trauma based on their particular service and client needs.

Trauma-specific interventions

Trauma-specific interventions refer to clinical services or programs designed to treat and ameliorate the actual symptoms and presentations of trauma. While it is possible for individual practitioners to deliver trauma-specific interventions (such as trauma-focused cognitive behaviour therapy [CBT]) within the context of a service delivery model or agency that is not trauma-informed at a system level, this is far from ideal. Elements of a service may not be consistent with a trauma-informed approach—such as the waiting room design and operation, interactions with administrative staff or the absence of adjunct services to address other presenting issues for which the trauma-specific intervention might not be effective. Trauma-specific services are best delivered as part of a trauma-informed system of care operating within a trauma-aware organisational context (Elliot, Bjelajac, Fallor, Markoff, & Reed, 2005; Kezelman & Stavropoulos, 2012).

Funded by the Department of Veterans' Affairs, Phoenix Australia (previously known at the Australian Centre for Posttraumatic Mental Health) has developed a database that summarises the evidence for effective trauma-specific interventions related to military and veteran families and communities (see *What Emerging Interventions are Effective for the Treatment of Adults with PTSD?* <www.evidencecompass.dva.gov.au/home/question/10>). Regarding adults suffering from PTSD, they found a paucity of evidence in relation to the efficacy of emerging therapies.[1] Phoenix Australia have also published a variety of resources for practitioners working with people affected by trauma, including fact sheets, clinical guidelines, booklets for clients and a smartphone app for clients with post-traumatic stress symptoms <phoenixaustralia.org/for-practitioners/practitioner-resources>.

Trauma-focused cognitive behaviour therapy (TF-CBT) is an evidence-based treatment approach for children who have experienced sexual abuse, exposure to domestic violence or similar traumas.[2] TF-CBT features on a range of databases of evidence-based practices, including the California Evidence-Based Clearinghouse for Child Welfare (CEBC) Program Registry: <www.cebc4cw.org>. Training in TF-CBT is available online from the Medical University of South Carolina website: <tfcbt.musc.edu>. However, a full discussion of evidence-based trauma-specific interventions is beyond the scope of this paper.[3]

Similarly, in relation to adults affected by childhood trauma, Connor and Higgins (2008a, 2008b) outlined a model of trauma-specific intervention for clients who experience complex trauma (who may not meet the criteria for PTSD). Evaluating the model, they found qualitative and quantitative evidence from a small-scale pilot study of the effectiveness of their combined individual and group therapy approach focused on the following elements (using the mnemonic "HEALTH"):

- having a supportive therapist;
- ensuring personal safety;
- assisting with daily functioning;
- learning to manage core PTSD symptoms (self-regulation);
- treating complex PTSD symptoms; and
- having patience and persistence to enable "ego strengthening".

1 The emerging interventions included in their review were: mindfulness, acceptance and commitment therapy, meditation, transcendental meditation, acupuncture, power therapies, and experiential psychotherapies including adventure therapy, art therapy, music therapy, and canine- and equine-assisted psychotherapy. See: <evidencecompass.dva.gov.au/home/question/10>.

2 See: *Trauma-Focused Cognitive Behavioral Therapy for Children Affected by Sexual Abuse or Trauma* (Child Welfare Information Gateway, 2012) <www.childwelfare.gov/pubpdfs/trauma.pdf>.

3 See *Approaches Targeting Outcomes for Children Exposed to Trauma Arising From Abuse and Neglect: Evidence, Practice and Implications* (Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2014) for a discussion of the evidence of the effectiveness of trauma-specific and trauma-informed practices pertaining specifically to children who have experienced abuse and neglect.

However, there have been criticisms made of trauma-specific interventions. For example:

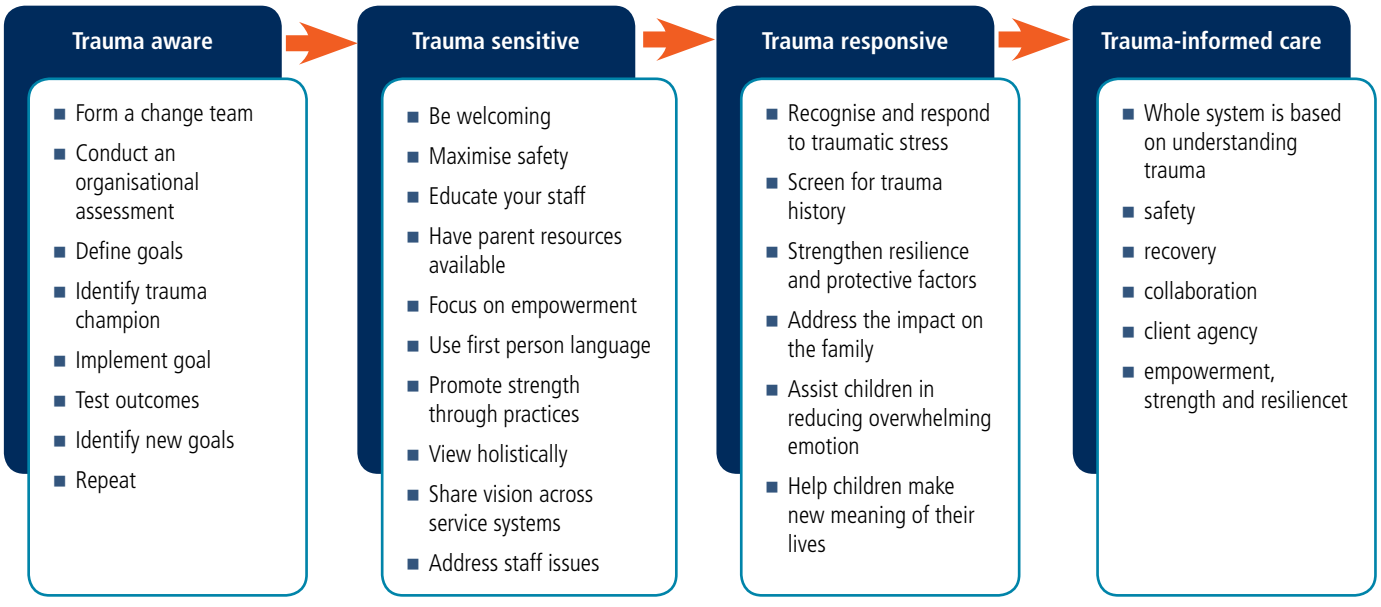
- complex trauma is often inter-relational in nature, so the degree to which research on the treatment of combat-related PSTD applies in these circumstances has been questioned (e.g. for those exposed to prolonged child sexual abuse, particularly if it has resulted in personality or dissociative disorders and is associated with disturbances to affect regulation, self-concept and interpersonal relationships);
- treatment sessions may need to be more frequent and over a longer duration than typical structured programs;
- evaluations of cognitive-based interventions often focus on statistically significant effect sizes rather than clinically meaningful symptom reduction; and
- the value of non-cognitively based interventions, which have been poorly evaluated or not evaluated, are easily overlooked (see: van der Kolk, 2014).

The primary purpose of the paper is not to review the effectiveness—or limitations—of trauma-specific interventions, or even to look specifically at complex trauma and complex PTSD (see: Wall & Quadara, 2014); but rather to explore the broader issue of the value and role of trauma-informed care in child and family welfare service provision.

Trauma-informed model of care

The available literature suggests that there is a continuum from being *trauma aware* (seeking information out about trauma and its implications for organisations) to being *trauma-informed* (a cultural shift at the systemic level). One useful resource sets out the progression in four stages (see Figure 1):

- *trauma aware*: seek information out about trauma;[4]
- *trauma sensitive*: operationalise concepts of trauma within the organisation's work practice;
- *trauma responsive*: respond differently, making changes in behaviour;
- *trauma informed*: entire culture has shifted to reflect a trauma approach in all work practices and settings.



Source: Adapted by Antonia Quadara from Mieseler & Myers (2013)

Figure 1: Practical steps to get from trauma aware to trauma informed

4 At its most basic level, organisations that are trauma aware incorporate trauma awareness into their work. Staff have an understanding of trauma and how symptoms and behavioural presentations in individuals may be responses to traumatic experiences so that behaviours that appear self-destructive or self-defeating can be acknowledged as being adaptive behaviours to trauma that have become maladaptive over time (Hopper, Bassuk, & Olivet, 2010; Markoff, Fallot, Reed, & Elliot, 2005). This applies particularly to broader human service delivery agencies (beyond child/family welfare), particularly if they are not primarily focused on delivering trauma-specific interventions and/or trauma-informed models of care.

SAMHSA's definition of a trauma-informed approach to service is:

> A program, organisation or system that is trauma-informed realises the widespread impact of trauma and understands potential paths for recovery; recognises the signs and symptoms of trauma in clients, families, staff and others involved with the system and responds by fully integrating knowledge about trauma into policies, procedures and practices and seeks to actively resist retraumatisation (SAMHSA, 2014, p. 9)

The main aim of this paper is to explore trauma-informed approaches to care and service delivery specifically in the child and family welfare sectors. While the focus is on how child/family welfare services can be trauma informed, the need extends to other service delivery areas. The trauma literature indicates that trauma survivors are clients in a very broad range of human services such as:

- homelessness (Hopper et al., 2010; Morrison 2009);
- mental health (Kezelman & Stavropoulos, 2012; Muskett, 2014);
- substance abuse treatment; and
- correctional systems (Stathopoulos, 2012).

These types of services have a clear connection to the impacts of trauma, particularly trauma arising from interpersonal victimisation, which has been identified as a driver of human service use (Huntington, Moses, & Veysey, 2005). The term "complex needs" is sometimes used to describe the span of need for an array of services required over a lifetime (Wall & Quadara, 2014). These agencies and services would benefit from being—at a minimum—"trauma aware".

What is the evidence that a trauma-informed approach is needed?

Research suggests that exposure to adverse, potentially traumatic events in childhood is not uncommon (Anda et al., 2006). For example, the Adverse Childhood Experiences (ACE) study in the USA showed that of 17,337 respondents, 64% had experienced at least one adverse experience[5] and approximately 12% had experienced four or more in the first 18 years of life (Anda et al., 2006). Further to this, a recent report suggested that childhood trauma affects an estimated five million Australian adults (Kezelman, Hossack, Stavropoulos, & Burley, 2015). There is also a great deal of evidence associating traumatic experiences with a broad range of deleterious outcomes in childhood, adolescence and adulthood (e.g. Anda et al., 2006; CFCA, 2014a, 2014b; Dube et al., 2001; Hahn Fox, Perez, Cass, Baglivio, & Epps, 2015; Johnson-Reid, Kohl, & Drake, 2012; Nurius, Green, Logan-Greene, & Borja, 2015).

Individual responses to traumatic experiences vary widely, with not all exposure leading to negative outcomes. It is the individual response to the experience that determines whether it is considered traumatic or not (SAMHSA, 2014). If effects occur they can be short- or long-term and may occur immediately following exposure to adversity or have a delayed onset (SAMHSA, 2014).

Multiple studies have reported negative effects associated with experiencing trauma across all facets of life. Mental ill-health, physical illness, social and relational difficulties, and poor academic and employment outcomes have all been linked to previous traumatic experiences. Anda and colleagues (2006) found a strong relationship between increased numbers of adverse childhood experiences and increased prevalence and risk of:

- affective disturbances (e.g. panic attacks, anxiety, hallucinations);
- somatic disturbances (e.g. sleep disturbance, severe obesity);
- smoking, illicit drug use, injected drug use, alcoholism (for people with four or more adverse childhood experiences);
- early intercourse, promiscuity and sexual dissatisfaction;
- impaired memory of childhood; and

5 The adverse childhood experiences measured were three types of childhood abuse: emotional abuse, physical abuse, and contact sexual abuse; and five measures of household dysfunction during childhood: exposure to alcohol or other substance abuse, mental illness, violent treatment of mother or step-mother, criminal behaviour in the household, and parental separation or divorce (Anda et al., 2006, p. 176).

- high perceived stress, difficulty controlling anger and risk of perpetrating intimate partner violence (for people with four or more adverse childhood experiences).

Further to this, the study found that as the number of adverse childhood experiences increased so too did the average number of co-occurring negative outcomes (Anda et al., 2006). There is strong evidence to indicate that certain types of trauma rarely occur in isolation. Research suggests, for example, that the different child maltreatment types are interrelated: sexual abuse, physical abuse, psychological maltreatment, neglect and exposure to domestic and family violence typically occur in combination with each other. A large proportion of children and young people who experience childhood abuse or neglect are exposed to more than one type of abuse (known as "multi-type maltreatment"; Price-Robertson, Higgins, & Vasallo, 2013). Further to this, other forms of victimisation such as bullying or assault by a peer have often been found to co-occur with child maltreatment (known as "poly-victimisation"; see Finkelhor, Ormrod, & Turner, 2007).

Multiple victimisation experiences across different domains are consistently associated with poorer outcomes than a single adverse or maltreatment experience. Those who experience multi-type maltreatment or poly-victimisation are more likely to experience high levels of trauma symptoms and worse outcomes than those who are exposed to no maltreatment or only one type (Finkelhor et al., 2007; Higgins & McCabe, 2001). Supporting these findings, a recent large scale US study of children in the Illinois child welfare system found that children who experienced both violent interpersonal *and* attachment-based ("non-violent") traumas within the caregiver system experienced greater difficulties across several areas of impairment (including attention/behavioural dysregulation and self/relational dysregulation) and were significantly more likely to exhibit PTSD-like symptoms compared to children who had experienced neither type of trauma, violent trauma only or non-violent trauma only (Kisiel et al., 2014).

Co-occurring mental health issues and disorders such as conduct disorder and oppositional defiant disorder (in children), PTSD, depression and other affective disorders, borderline personality disorder, somatoform disorders, psychotic and dissociative disorders have commonly been associated with traumatic experiences (Bateman, Henderson, & Kezelman, 2013; Breslaue, 2009; CFCA, 2014a, 2014b; Nurius et al., 2015; van der Kolk et al., 2005). Self-harm and suicide attempts have also been linked with previous traumatic experiences (Bateman et al., 2013; Cozolino, 2010; Dube et al., 2001; Herman, 1992; Johnson-Reid et al., 2012). In one study, Dube and colleagues (2001) reported that any adverse childhood experience increased the risk of attempted suicide by 2–5 fold with the relationship being partially mediated by illicit drug use, depressed affect and self-reported alcoholism.

Those who have had previous traumatic experiences also commonly report physical health issues. For example, in summarising research on the potential effects of trauma exposure, Bateman and colleagues (2013) found that "survivors of child maltreatment were at increased risk of hepatitis, diabetes, heart disease, cancer, a stroke, are more likely to have surgery and are at increased risk of having one or more chronic pain symptoms" (p. 19). The same authors also noted a range of conditions that child sexual abuse survivors were at increased risk of, including irritable bowel syndrome, asthma, arthritis and digestive problems.

In addition, childhood trauma exposure has been linked to involvement with the criminal justice system. A large study exploring adverse childhood experiences of serious, chronic and violent juvenile offenders and juveniles referred to the justice system for single non-violent offences found that every additional adverse childhood event experienced increased the risk of becoming a serious, chronic and violent juvenile offender by more than 35%, even when other known risk factors for violent behaviour were accounted for (Hahn Fox et al., 2015).

Lastly, difficulties in interpersonal relationships are often reported as a result of experiencing trauma (Bateman et al., 2013; Briere & Spinazzola, 2005; Evans & Coccoma, 2014; van der Kolk, 2005).

Although individual responses to traumatic experiences may vary widely, research has found a strong relationship between the degree of risk of experiencing multiple and complex negative outcomes following traumatic experiences and factors such as the age at which the experience/s occurred, the nature of the experience/s (with negative effects being particularly associated with

trauma of an interpersonal nature such as child abuse and neglect), and the severity and chronicity of the experiences (Cozolino, 2010; Herman, 1992; Kisiel et al., 2014; National Scientific Council on the Developing Child, 2014 [NSCDC]; Resick et al., 2012; van der Kolk et al., 2005). As noted by Cozolino (2010):

> The impact of trauma depends on a complex interaction of the physical and psychological stages of development during which it occurs, the length and degree of the trauma, and the presence of vulnerabilities or past traumas. The impact of chronic trauma becomes woven into the structure of personality and is hidden behind other symptoms, making it difficult to identify, diagnose and treat. (p. 266)

Traumatic events experienced early in life can be extremely damaging to the developing brain. Neural development relies on the interplay of genes and environmental inputs (particularly interaction with primary carers) and early adversity or disrupted attachment relationships that lead to chronic high levels of stress can interfere with key neurobiological development (NSCDC, 2014). Pamela Alexander (2013) suggested that "affective synchronization between mother and child" (p. 45) in carer–infant interactions is crucial for brain development, social development and stress regulation. Early onset, sustained trauma that interferes with this can lead to deficits in multiple domains: dysfunction in fear extinction; affect or emotional regulation; behaviour regulation; learning, cognition and attention; and self and relational dysregulation (Cook et al., 2005; Courtois & Ford, 2009; Evans & Coccoma, 2014; Kisiel et al., 2014; NSCDC, 2014; van der Kolk et al., 2005).

Research has also highlighted that experiencing traumatic events tends to increase the chances of experiencing further traumatic events across the life course. Cozolino (2010) argued that:

> Enduring personality traits and coping strategies that emerge in these situations [experiencing early onset, sustained trauma] tend to decrease positive adaptation and increase an individual's vulnerability to future trauma. This can manifest through engagement in abusive relationships, poor judgement, or a lack of self-protection. (pp. 268–9)

Finally, in examining the need for a trauma-informed approach to care it is pertinent to note that in many cases, due to the co-occurrence of problems resulting from experiencing trauma, individuals may find themselves in multiple systems, cycling in and out of specific services over many years to access, for example, treatment for drug and alcohol addictions, support for employment opportunities and therapeutic services for mental illness.

Historically, the underlying factor often linking a constellation of needs together—the history of abuse and its impacts—has not been adequately acknowledged or integrated into these service systems' service responses to individuals (Harris & Fallot, 2001). Further, populations with complex needs are at high risk of falling through the gaps of service delivery systems due to a lack of service co-ordination and the related barriers to service integration (Whiteford & McKeon, 2012). This can mean that clients: are deemed ineligible for services (e.g. cannot engage in mental health treatment until they have "dealt with" their substance abuse issue or vice versa); are expected to separate out their trauma experiences from their service or treatment needs ("we don't deal with trauma in this parenting class"); and experience services systems' responses as re-traumatising.

The SAMHSA-funded *Women With Co-Occurring Disorders and Violence Study* was a comprehensive 5-year project (1998–2003) across multiple sites, which provided evidence that integrating different services, such as mental health and substance abuse services where there was client need for both, was effective. This study showed that trauma-informed approaches could enhance the effectiveness of mental health and substance abuse services for women with co-occurring mental health and substance abuse disorders (Huntington et al., 2005; Morrisey et al., 2005). A trauma committee for this study also developed an understanding of trauma-informed principles and ways in which mental health and substance abuse service providers could use the approach (Elliot et al., 2005). In the years since the study, further development, debate and discussion has resulted in an expanded evidence base about the effects of trauma and appropriate approaches for services.

What is trauma-informed care?

Trauma-informed care could be described as a framework for human service delivery that is based on knowledge and understanding of how trauma affects people's lives and their service needs (Harris & Fallot, 2001). This requires consideration of a person's environment beyond the immediate service being provided and of how their symptoms and presentations may be seen as adaptations to trauma rather than as pathologies (Herman, 1992). At the broadest level, trauma-informed care means that services have an awareness and sensitivity to the way in which clients' presentation and service needs can be understood in the context of their trauma history (Knight, 2015). Kezelman and Stavropoulos (2012) noted that trauma-informed health and welfare settings and systems contrast dramatically with traditional settings and systems as they require different ways of operating, and without this understanding, risk re-traumatising service users. Trauma-informed approaches to care could be described as a strengths-based framework that is responsive to the effects of trauma (Bateman et al., 2013).

Principles of trauma-informed care

Principles of trauma-informed care have been articulated in a range of academic literature and guidance publications (Elliot et al., 2005; Hopper et al., 2010; Jennings, 2004; Kezelman & Stavropoulos, 2012; SAMHSA, 2014). These principles vary in length and number depending on the publication but essentially have the same underlying philosophies, that trauma-informed care means services are trauma aware, safe, strengths-based and integrated.

At the very minimum, trauma-informed services aim to do no further harm through re-traumatising individuals by acknowledging that usual operations may be an inadvertent trigger for exacerbating trauma symptoms. SAMHSA's (2014) approach to trauma-informed care makes four key assumptions that must be present as a basis of implementation for trauma-informed care, with a further six key principles to then be applied.

The key assumptions that SAMHSA has identified as needing to be inherent in any trauma-informed approach are based on four "R"s:

- *Realisation* at all levels of an organisation or system about trauma and its impacts on individuals, families and communities;
- *Recognition* of the signs of trauma;
- *Response*—program, organisation or system responds by applying the principles of a trauma-informed approach; and
- *Resist* re-traumatisation—of clients as well as staff.

In addition to these assumptions, SAMHSA (2014) then described six key principles of a trauma-informed approach:

- *Safety*—Staff and the people they serve feel physically and psychologically safe.
- *Trustworthiness and transparency*—Organisational operations and decisions are transparent and trust is built.
- *Peer support*—Peers is the terminology SAMHSA use for individuals with lived experience of trauma or their caregivers. Peers are also known as "trauma survivors".
- *Collaboration and mutuality*—This principle is about levelling power differentials between staff and clients and amongst organisational staff to ensure a collaborative approach to healing.
- *Empowerment, voice and choice*—This principle emphasises the strengths-based nature of trauma-informed care. The organisation—and ideally the whole service delivery system—fosters recovery and healing.
- *Cultural, historical and gender issues*—A trauma-informed approach incorporates processes that move past cultural stereotypes and biases, and incorporates policies, protocols and processes that are responsive to the cultural needs of clients.

For an example of an Australian model of trauma-informed care, see Tucci and Mitchell's (2015) outline of the basic understanding of trauma that informs appropriate care underpinning the services and training provided by the Australian Childhood Foundation: *9 Plain English Principles of Trauma Informed Care* <www.childhood.org.au/blog/home/2015/april/trauma-informed-care>.

The Berry Street Childhood Institute also provides a number of resources and training on trauma-informed care for children: <www.childhoodinstitute.org.au/Resources>.

Achieving trauma-informed services: Reflection questions for service managers

- What is the likelihood of clients who have experienced trauma accessing our service?
- Do we provide access to trauma-specific evidence-based treatments for current psychological difficulties that result from that trauma (e.g. Trauma-focused cognitive-behaviour therapy)?
  - See *Trauma-Focused Cognitive Behavioral Therapy for Children Affected by Sexual Abuse or Trauma* <www.childwelfare.gov/pubpdfs/trauma.pdf>
- Do we provide access to effective treatments for complex trauma and complex PTSD (for which trauma-specific treatments may not be as effective)?
  - (See: Connor & Higgins, 2008a, 2008b; Kezelman & Stavropoulos, 2012).
- Are these trauma-specific interventions provided inhouse, in collaboration with other agencies, or via referral to an external agency (and if so, do we provide active/warm referral)? See:
  - *Interagency collaboration: Part A. What is it, what does it look like, when is it needed and what supports it?* <aifs.gov.au/cfca/publications/interagency-collaboration-part-what-it-what-does-it>
  - *Interagency collaboration: Part B. Does collaboration benefit children and families? Exploring the evidence.* <aifs.gov.au/cfca/publications/interagency-collaboration-part-b-does-collaboration-benefi>
  - *Effective practices for service delivery coordination in Indigenous communities*. <www.aihw.gov.au/uploadedFiles/ClosingTheGap/Content/Publications/2011/ctgc-rs-08.pdf>
- How do we incorporate restorative justice principles?
  - According to Higgins et al. (2014), restorative justice activities might include:
    - addressing trauma and other mental health consequences through evidence-based therapeutic interventions;
    - repairing the injuries caused to relationships, especially between sons/daughters and parents;
    - providing opportunities for truth-telling, storytelling and acknowledgement; and
    - overcoming shame and recognising past actions through public activities and community awareness campaigns.
  - See: Higgins et al., 2014, pp. 41–46: *Forced Adoption Support Services Scoping Study* <www.dss.gov.au/our-responsibilities/families-and-children/publications-articles/forced-adoption-support-services-scoping-study>
- Who in the organisation is likely to come into contact with individuals who have experienced trauma, or be providing information to, or receiving communications from clients experiencing trauma? Thinking from a "client journey" perspective, this might include:
  - phone/intake staff;
  - web/staff with online monitoring;
  - reception;
  - office manager;
  - media and communications staff;
  - other staff or contractors on the premises (e.g. catering, cleaning, security); and
  - project/service delivery professionals and support staff.

- Who is less likely to be interacting with trauma survivors but who need to understand, and who need to support "front-line" workers and other support staff who do?
  - executive staff (who create the authorising environment);
  - managers and team leaders; and
  - mentors and supervisors.

This suggests the value of whole-of-organisation approaches to trauma-informed service delivery, directed at every level to ensure a focus on what helps clients feel safe.

- What should training encompass? Training should include:
  - skills in de-escalation or "holding" clients who are experiencing an acute episode of trauma or re-traumatisation;
  - debriefing and staff protocols for responding to difficult situations and clients presenting with complex circumstances and trauma histories;
  - information on staff care and preventing/responding to secondary or vicarious trauma—the psychological term for changes that can occur to people when they are repeatedly exposed to traumatic material (see <aifs.gov.au/publications/feeling-heavy>);
  - organisational supports to prevent or address vicarious trauma for staff including: clinician self-care skills and reflective practice, caseload management, supervision, debriefing, staff and peer support, workplace safety, comfort and supportive work culture that acknowledges the reality of vicarious trauma (Morrison, 2007);
  - types of events/circumstances in clients' lives that may be traumatising;
  - typical modes of reacting—events/triggers for re-traumatisation; and
  - understanding the impacts of trauma (such as behavioural symptoms typical of PTSD, as well as the developmental impacts of victimisation and trauma on an individual's beliefs—about the self, the world, and the future—e.g. see: Janoff-Bulman & Frieze, 1983).

Further to this, SAMHSA also provide a range of sample questions to consider when implementing a trauma-informed approach <store.samhsa.gov/shin/content//SMA14–4884/SMA14–4884.pdf> (p.14–16).

Which services should be delivering trauma-informed care?

Most of the US literature about trauma-informed care is directed at change in behavioural health services. In Australia there appears to be an emphasis on driving change in the mental health sector. This has the potential to cause confusion about the pathway to providing trauma-informed care in the child, family and community sectors and about what being trauma-informed actually means. One aspect of clarifying these questions is to understand which services should be adopting a trauma-informed approach to human service delivery.

In addition, there are communities and populations for whom violence and intergenerational trauma are a constant reality. Some Indigenous communities, for example, experience the phenomenon of trans-generational trauma whereby trauma is transmitted across a number of generations (Atkinson, 2002). The historical impacts of colonisation on Aboriginal people in Australia have played out in a history of disadvantage and discrimination as traditional Aboriginal life was gradually disrupted and dismantled (Atkinson, 2002; Keel, 2004). The effectiveness of the full range of health and human services in such communities could be enhanced by a trauma-informed approach (Atkinson, 2013).

As outlined in the earlier discussion on principles of trauma-informed care, it is important for services to be culturally attuned and relevant (Atkinson, 2013). This is described by SAMHSA as the principle that the trauma-informed organisation actively moves past cultural and gendered stereotypes and incorporates policies and processes that are responsive to the cultural needs of individuals served, including addressing historical trauma (SAMHSA, 2014) or collective trauma (Atkinson, 2013).

Building on the work of Harris and Fallot, SAMHSA's (2014) *Concept of Trauma and Guidance for a Trauma-Informed Approach* outlined ten implementation domains:

- governance and leadership;
- policy;
- physical environment;
- engagement and involvement;
- cross-sector collaboration;
- screening, assessment, treatment services;
- training and workforce development;
- progress monitoring and quality assurance;
- financing; and
- evaluation (p. 12).

This guidance information is designed to provide a starting point for an organisational approach to implementing trauma-informed care. It also indicates that organisations across *all* settings should consider how trauma-informed approaches could benefit stakeholders regardless of whether they deal with trauma in their day-to-day business. The reality of the prevalence of traumatic experiences in the general population indicates that trauma is not confined to prevention, treatment and recovery settings but is integral in other systems as well (SAMHSA, 2014).

It is important to note that many practices that service providers currently use are likely to already be consistent with a trauma-informed approach, such as conveying empathy and validating the client's experiences (Knight, 2015). What is different about identifying as a trauma-informed service is that there is a paradigm shift in service delivery culture to acknowledge and clearly articulate the importance of trauma in understanding and responding to client presentation.

With the lack of an overarching framework in Australia, there is a danger of developing trauma-informed models and practices that are not sharing a consistent language about what being trauma-informed entails. This issue is discussed in more depth in the section about challenges to implementation later in this paper.

The need for a systems approach to trauma-informed care

Following the lead of the USA, Australian health agencies are moving towards a trauma-informed paradigm for considering health and human service delivery systems (Kezelman & Stavropoulos, 2012) in preference to a medical model of individual illness (DeCanandia, Guarino, & Clervil, 2014).

The effects of traumatic experience often manifest in behaviours that result in people being involved in human service systems that go beyond mental health, such as the criminal justice system (SAMHSA, 2014). A systems approach to trauma-informed care means that implementation goes beyond individual practitioner and service organisation change to extend to whole systems that people who have experienced trauma are likely to interact with. A system, for example, could include the justice, homelessness or child welfare systems. These systems may not include treatment settings but can still affect the people who experience them. In the USA, a range of systems are in the process of adopting a cross-sectoral approach to implementing trauma-informed care and trauma-specific services to support service users (DeCanandia et al., 2014). For example, the behavioural health and health care, veterans' administration, homelessness and education sectors are just a few of the systems that are shifting to a trauma-informed approach (DeCanandia et al., 2014).

The differences between trauma-informed services and trauma-specific services are described in the definitions outlined earlier. It is important to distinguish between them but acknowledge the intersection of the two types. Trauma-specific services are designed to treat the symptoms or manifestations of the effect of a trauma on an individual but these interventions must be delivered in a trauma-informed context. This emphasises an overall philosophy of trauma as a central concept in understanding the presentation of clients within a range of health and welfare settings (Kezelman & Stavropoulos, 2012).

Challenges in implementing a trauma-informed approach to care

As noted previously, implementing trauma-informed care requires a paradigm shift in service delivery (Hopper et al., 2010; Jennings, 2004). The literature around trauma-informed care indicates that there are still some challenges to implementing this approach for systems and services, as well as the need for research to evaluate the approach's effect on client wellbeing and other service delivery outcomes (Ashmore, 2013; Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2013; Hopper et al., 2010; Muskett, 2014). These challenges are discussed in the following sections.

Inconsistent understandings of what it means to be trauma-informed

The most identifiable challenges across the literature are in the need to create shared understandings, and current inconsistencies in education regarding trauma-informed care (Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2013; Hopper et al., 2010). It is difficult to align organisational change to a specific practice without a shared understanding or vision of what trauma-informed care actually is. In a comparative study of trauma-informed care in acute mental health inpatient units, Ashmore (2013) identified this as an issue in the implementation of trauma-informed care in an acute patient environment. A lack of definition and of a shared framework, as well as a lack of information specific to an acute mental health inpatient setting, were associated with challenges and inconsistency in implementation.

In their review of the literature, the Parenting Research Centre and the Australian Centre for Post-traumatic Health (2013, now Phoenix Australia) found that although participants within the child and family services sector who worked with children exposed to trauma were familiar with terminology such as "trauma-informed care", they argued that:

- the field still lacked clear definitions or understandings of concepts;
- there were assumptions that children's social and behavioural difficulties were necessarily trauma-related without clear assessment; and
- there was a lack of guidelines for assessment and treatment of trauma.

SAMHSA's (2014) recent guidance document is clearly aimed at addressing this lack of consistency in definitions and the 2012 document by Adults Surviving Child Abuse provides some practice guidelines (Kezelman & Stavropoulos, 2012). However, an aspect of trauma-informed care is that it must be culturally relevant to the populations it serves (Elliot et al., 2005; Jennings, 2004) and any broad level articulation of policy approaches or frameworks must be applicable in a range of systems and settings and for a variety of cohorts.

Translating trauma-informed care to specific practice and service settings

In addition to the array of terminology and concepts that are sometimes used interchangeably and inconsistently, there is a lack of evidence-based guidance for specific settings and systems to assist with coordinating how trauma-informed practice should be provided for particular service settings and specific populations of service users. This issue was identified by Muskett (2013) and Ashmore (2013) in relation to mental health nursing, where the need to remove the use of seclusion and restraint is emphasised but, beyond this, little has been articulated to support the use of specific practices for service settings to adopt to improve service delivery consistent with principles of trauma-informed care. Dealing with survivors of trauma, particularly in a mental health or child protection setting, may require individuals to use their prior experience to respond to specific situations. In such stressful and potentially dangerous settings, crisis management could lead to a de-prioritisation of trauma-informed responses (Conners-Burrow et al., 2013). Training and guidance for staff on how to respond to acute situations appropriately and feel confident that they are acting in accordance with the principles of trauma-informed care is recommended (Knight, 2015; Muskett, 2014).

Facilitating complex system change

As noted by the American Institute for Research, in order to build a trauma-informed system, commitment at all system levels is required. This includes a commitment to ongoing training and service transformation (DeCanandia et al., 2014). Australia is behind the USA and Canada in developing models and systemwide responses to children and other service users impacted by trauma (Bateman et al., 2013). For example, the USA has the National Child Traumatic Stress Network, funded by SAMHSA, which brings a singular and comprehensive focus to responding to childhood trauma. Australia is arguably still at the stage of requiring policy change to articulate a clear direction for moving towards systems of trauma-informed care in a range of different service delivery areas relating to child/family wellbeing (Bateman et al., 2013).

Systemic change is important because it enables people to receive services that are sensitive to the impact of trauma regardless of whether they enter through any particular service setting or intervention.

Large-scale systems change is also logistically difficult and time-consuming and requires commitment and resources (Hopper et al., 2010). Philosophical differences between sectors that need to work together to integrate care can also impede systemic change (Hopper et al., 2010). Ashmore (2013) identified particular features of systems change for systems such as mental health that are challenging. These challenges include that hierarchical systems such as health may encounter resistance and that there is an inherent power inequality between service users and professionals in such environments.

Creating change at a systemic level is more than providing practitioners and organisations with tools. It requires changes to funding models to support outcomes rather than outputs, and changes to education for mental health practitioners, social workers and other specialists. Essentially, this is about a move towards a more holistic understanding of the inter-related biological, psychological and social dimensions of trauma.

Evaluating a trauma-informed approach to care

Studies from the USA, particularly following the Women With Co-Occurring Disorders Study, have found that trauma-informed, integrated services are judged to be cost-effective when compared with treatment as usual in the comparison sites of that particular study (Domino, Morrisey, Chung, Huntington, & Larson, 2005). Although this study is regularly cited in the literature as evidence of the cost-effectiveness of trauma-informed care (DeCanandia et al., 2014, Hopper et al., 2010; Kezelman & Stavropoulos, 2012); in reality, there is a lack of evaluation about cost-effectiveness and other aspects of trauma-informed care approaches, including its effectiveness in improving outcomes for service users (Quadara, 2015). There is also a lack of evaluation tools to measure the extent to which an organisation is trauma-informed, and the lack of consistent definitions further translates into difficulties in identifying a clear method to indicate the degree to which a service or program is trauma-informed (Hopper et al., 2010).

Other challenges identified in evaluating trauma-informed care, highlighted by Hopper et al. (2010), include the difficulty in measuring cultural change and sustainability of change and whether changes in outcome are attributable to trauma-informed environments or trauma-specific interventions. In addition, the need for cross-system collaboration and assessing human service interactions to establish the extent of trauma-informed care practice implementation further complicates evaluation in this area (Kramer et al., 2015).

Applying trauma-informed care principles

To illustrate how trauma-informed care principles can be applied to respond to different trauma issues, we briefly look at service delivery in the context of people affected by the policies that created the Stolen Generation, past adoption practices and humanitarian migration.

The Stolen Generation

In their program logic, the Aboriginal and Torres Strait Islander Healing Foundation (2014, p. 25) explain how a collective healing process for members of the Stolen Generation and their descendants can occur, and the mechanisms that underlie this process. Central to this model is an understanding of an Aboriginal world view and the pervasive trauma of colonisation, and the need for specific strategies to address ongoing, collective trauma. A common element of collective healing projects is that they are based on a trauma-informed or recovery framework. According to the Healing Foundation (2014):

> Trauma-informed practice is a strengths-based approach to healing that: is based on an understanding of, and responsiveness to, the impact of trauma; emphasises physical, psychological, and emotional safety for people seeking help and for the helpers; and creates opportunities for people affected by trauma to rebuild a sense of control and empowerment. It recognises the prevalence of trauma and is sensitive to and informed by the impacts of trauma on the wellbeing of individuals and communities. (p. 47)

Forced adoption and past family removal practices

An example of an issue that has only recently received public acknowledgement of its role in traumatising a large number of Australians is the former practice of forced adoption, or separation from family due to past family removal practices. In their exploration of good practice principles for services addressing the needs of people affected by forced adoption and past family removal practices, Kenny, Higgins, and Morley (2015) noted:

> There is increasing recognition of the potential for trauma for individuals who have been subjected to forced adoption policies and practices, and the value of a "trauma-informed" or "trauma-aware" approach to service delivery. Good practice suggests that service providers should approach all clients with a forced adoption experience as if they might be trauma survivors (p. 8).

In their overview of good practice principles, Kenny et al. (2015, p. 8) outlined the key elements of trauma-informed service delivery. Being a trauma-informed service ensures the provision of:

- a safe and supportive environment that protects against physical harm and re-traumatisation;
- an understanding of clients and their symptoms in relation to their overall life background, experiences and culture;
- continued collaboration between service provider and client throughout all stages of service delivery and treatment;
- an emphasis on skill building rather than managing symptoms;
- an understanding of the symptoms and survival responses required to cope;
- a view of trauma as a fundamental experience that influences an individual's identity rather than a single discrete event; and
- a focus on what has happened to a person rather than what is wrong with a person.[6]

Humanitarian migrants surviving torture and trauma

The NSW Service for the Treatment and Rehabilitation of Torture and Trauma Survivors (STARTTS) outline the program logic for their service model as systemic and based on an ecological model of factors that influence and support healing for survivors (see *How We Work* <www.startts.org.au/about-us/how-we-work>).

They aim to provide a range of services that reflect the bio-psycho-social model, such as:

- complementary therapies or neurofeedback to address biological impacts;
- counselling to address psychological impacts; and
- community development projects to support social changes.

6 See Forced Adoptions Community of Practice <aifs.gov.au/projects/forced-adoptions-community-practice>.

"There is nothing more practical than a good theory": The theoretical basis of trauma-informed models of care

(a) Attachment—developing a secure base

Attachment theory (Bowlby, 1988) has been used by developmental psychologists to explain positive, secure relationships between infants and caregivers, and how this forms the template for secure adult interpersonal relationships. Disruption to the relationship or insecure attachment is seen as a fundamental mechanism by which childhood trauma affects adult self-concept, wellbeing and interpersonal relationships. Trauma-informed care systems provide a safe environment to expose disruption to the attachment relationship, and build new internal models and "scripts" of the self and relationships.

(b) Self-regulation and control

Social cognitive theories of self-regulation help explain how individuals respond to threatening events. Key components of many trauma-specific treatments are to help individuals to improve self-regulation, safety, security, sense of control and mastery of their environment, and modulate their emotional reactions to traumatic stimuli. Trauma-informed systems of care are aware of the ways in which programs and organisations can trigger traumatic reactions—or even inadvertently replicate the dynamics of the traumatic events/relationships—and seek to minimise them, and promote environments that facilitate positive affect regulation or "modulation".

(c) Fundamental attribution error—overestimating the personal characteristics, underestimating situational factors

Theories of social psychology have identified that humans often make what is termed the "fundamental attribution error", whereby we over-emphasise a person's personality, or internal characteristics, in explaining their behaviour, and underestimate the environmental, or situational factors, that are external influences on their behaviours (e.g. see: Jones & Harris, 1967). For clients who have experienced trauma—particularly complex trauma involving multiple injuries in the interpersonal domain—it is likely that those around them, including their families, their work colleagues and even their health/mental health professionals, are likely to attribute their interpersonal difficulties and deficits in functioning and wellbeing to an inherent personality flaw, rather than having been shaped by their environment (i.e. the external traumatic events they have endured). Creating new environments of support, and opportunities for "reprograming" life scripts are important. But practitioners need to be open to seeing the external influences and specifically target intervention strategies to remediate the long-standing negative consequences.

Source: The title is a quote from Lewin (1952, p. 169)

Moving forward

Much of the literature identified that the paradigm shift towards implementation of a trauma-informed approach to care needed to include commitment from political leadership at all levels (Ashmore, 2013; Bateman et al., 2013; Kramer et al., 2015).

In Australia, the Mental Health Coordinating Council (Bateman et al., 2013) has articulated the requirement for a policy statement from national and state leaders endorsing the concept of trauma as a priority mental health issue and supporting the transition to a trauma-informed service system. This would ensure that there is an identifiable commitment from governments to support the need for trauma-informed service systems.

The broad dissemination of information about trauma-informed, evidence-based best practice has been identified as an important feature of developing the evidence base around trauma (Kramer et al., 2015). Development of a nationally based resource, such as SAMHSA's National Center for Trauma-Informed Care and the National Child Traumatic Stress Network, would provide an Australian-based network of information to support policy development and service delivery and to enable the use of what is currently known about trauma-informed services in different health and human service sectors. Having central resources such as these, is instrumental in shifting human service systems towards a trauma-informed approach to service delivery.[7] Australia does not yet have a body with such a specific focus but extensive work has been undertaken by organisations such as the Mental Health Coordinating Council and Adults Surviving Child Abuse, among others, to help shape behavioural health policy towards incorporating an understanding of the damaging effects of trauma into policy and service delivery approaches.

Although there are some resources and tools now available to support guidance towards trauma-informed systems of care in Australia (Bateman et. al., 2013), there does not appear to be an overarching trauma framework to support a shift in a consistent way. As noted earlier, organisations in Australia have recognised the need for trauma-informed services and

7 See National Center for Trauma-Informed Care and Alternatives to Seclusion and Restraint <www.samhsa.gov/nctic>

interventions but the current array of methods, models and interventions on offer and in use do not support a coordinated and common approach that would ensure trauma-informed has a consistent meaning and interpretation in service delivery.

Conclusion

There is growing awareness of the need, and a strong rationale for the value, of implementing a trauma-informed approach to human service delivery. Such an approach has been adopted and implemented extensively in the USA. In Australia, there is a strong push towards trauma-informed approaches to care, and recognition of the impacts of child abuse and other traumas as a driver of service need. However, there is confusion with the array of terminology used and a lack of reference to specific trauma-informed frameworks to guide the introduction of trauma-informed care in a systemic way. Despite the need, and the conceptual/theoretical rationale, it is important to acknowledge that there is limited empirical evidence to show that working systemically to be trauma aware and providing trauma-informed systems of care leads to reductions in trauma symptoms or other positive outcomes for clients.

Currently, there is no overarching policy to mandate trauma-informed care and no framework to guide evidence-based practice to transition in a systematic way to trauma-informed care in Australia. In addition, improvements to collection of research data and adoption of standardised outcome measures for evaluation would support a more systemic approach to evaluating the implementation of trauma-informed care.

There is value in capturing practice-based evidence; however, this is beyond the scope of the current paper, and would be best carried out via a systematic and rigorous approach to gathering and synthesising information from practitioners working with traumatised clients in a variety of fields—as well as the views of those in service delivery systems that are not yet trauma-informed to examine the barriers and enablers of system change. Similarly, there is a need to articulate findings from the emerging field of trauma-informed practice into concrete policy statements or frameworks that can be applied to different client groups within and across a range of service systems and settings.

SECONDARY TRAUMATIC STRESS

Children's reactions to trauma can interfere considerably with learning and behavior at school. Schools serve as a critical system of support for children who have experienced trauma. Administrators, teachers, and staff can help reduce the effects of trauma on children by recognizing trauma responses, accommodating and responding to traumatized students within the classroom, and referring children to outside professionals when necessary. The National Child Traumatic Stress Network has developed tools and materials to help educators, school staff, and administrators understand and respond to the specific needs of traumatized children.

Essential Elements

The primary mission of schools is to support students in educational achievement. To reach this goal, children must feel safe, supported, and ready to learn.

Executive Summary

In 2013, the Administration for Children, Youth and Families, Family and Youth Services Bureau, US Department of Health and Human Services, awarded a grant to the GLBTQ Domestic Violence Project in Boston, Massachusetts to help improve trauma-informed work with lesbian, gay, bisexual, queer and transgender (LGBQT*) survivors of intimate partner violence (IPV). The following document is a literature review that sets the context for thinking about trauma-informed practice (TIP) for these communities. We developed this review over the course of 2015, supported along the way by an Advisory Board comprised of the NorthEast Two-Spirit Society, Queer Muslims of Boston, Fenway Community Health, the Hispanic Black Gay Coalition, the Massachusetts Alliance of Portuguese Speakers, HarborCOV, and Massachusetts Asian & Pacific Islanders for Health.

This document helps inform a set of practice-based observations that are included in the Appendix (page 40) and are also available as a separate document. At present, there are few, if any, documented LGBQT*-specific models of trauma-informed practice. This literature review and the accompanying practice observations make a clear case for the need for such models, and for the implementation of culturally competent LGBQT* trauma-informed services.

Key takeaways from the literature review include:

- IPV occurs in LGBQT* relationships at rates equal to or higher than rates in heterosexual relationships. Different subgroups within the community may experience different rates or types of IPV, with bisexual and transgender individuals at particularly high risk.

- Although LGBQT* IPV shares many underlying dynamics with IPV in heterosexual couples, it also has unique characteristics, including the types of abusive tactics used and the context of discrimination and social stigma faced by LGBQT* individuals. Within LGBQT* subgroups, there may be additional complexities.

- LGBQT* survivors who are also part of other oppressed groups often face homophobia within their own cultural communities as well as racism, ableism, xenophobia, and colonialism in mainstream communities. Moreover, LGBQT* IPV often occurs in a landscape that includes other forms of abuse and trauma, including family violence, sexual violence, hate crimes, and police brutality. Such overlapping forms of trauma are often interrelated, rendering some members of the LGBQT* communities subject to abuse by more than one person at a time and at more than one point in their lifespans. In the face of these overlapping forms of oppression, LGBQT* survivors are forced to make particularly constrained choices about safety, often trading one kind of safety for another.

- Mental health difficulties are major concerns among LGBQT* people in general. LGBQT* individuals experience higher rates of traumatic events, and may be at greater risk for developing symptoms of PTSD, depression, and anxiety as well as experiencing suicidality and isolation. These concerns are amplified for LGBQT* survivors of IPV, especially transgender individuals and survivors of color. Nonetheless, LGBQT* survivors find strength and resilience through identity affirmation and social support.

- LGBQT* survivors exhibit unique help-seeking behaviors. Overall, they are less likely to seek services from law enforcement and mainstream providers and more likely to rely on informal social support and LGBQT*-focused programs. There also are differences in help-seeking *within* LGBQT* subgroups. For instance, trans individuals may have an especially difficult time accessing culturally competent and non-traumatizing services. For LGBQT* people of color, stigma, economic constraints, and the absence of community outreach are barriers to services.

- Service provision that is not rooted in an expansive understanding of the intersecting oppressions that LGBQT* survivors face may do more harm than good. The kind of harm done by those in a social service system designed to help has been referred to as *sanctuary harm*, which is antithetical to trauma-informed practice.

- Despite growing awareness of the impact of sanctuary harm on clients who experience multiple forms of oppression and of the unique needs of LGBQT* survivors, trauma-informed approaches tailored to LGBQT* communities have been slow to develop. To our knowledge, there are none in the academic literature. It was our Advisory Board that pointed to an alternative model of trauma-informed practice – transformative justice.[1] While the roots of trauma-informed practice grew out of mental health and substance abuse services, transformative justice emerged from activist communities and seeks to uproot the conditions that created traumatic experiences, ending oppression even (if not especially) within helping systems.

We hope that this document will facilitate thinking about how the core principles of trauma-informed practice can be applied to working with LGBQT* survivors and to ameliorating vicarious traumatization among service providers who do their best in difficult circumstances.
Although this document is intended primarily for staff in domestic and sexual violence organizations, it has broad applicability. The information provided can be used to enhance the work of practitioners, advocates, and administrators in other anti-abuse disciplines, homelessness services, mental health and healthcare circles, criminal legal systems, youth services, and an array of other human services disciplines and social change initiatives that seek to serve and ensure the inclusion of LGBQT* communities. The practice-based observations in the Appendix provide further framing for this important endeavor.

[1] The authors wish to thank Hales Burton, at the Fenway Violence Recovery Program, for first suggesting this conceptual shift.

Introduction

IPV refers to the physical and/or emotional abuse of an individual by a current or former intimate partner. It includes the full range of tactics used to create and maintain power and control over another person, including financial abuse, verbal abuse and intimidation, and cultural abuse. In this document, the phrases *intimate partner violence* and *domestic violence* are used interchangeably to denote partner violence. However, it is important to note that domestic violence (DV) is sometimes defined more broadly to include violence and abuse perpetrated by relatives. Although many LGBQT* individuals experience abuse and/or rejection from family and relatives, the dynamics of partner violence versus family violence may differ dramatically. When we discuss the latter, we use the term *family violence* to distinguish it from violence by an intimate partner.

Following a note on language, the literature review is organized into five sections. Section One focuses on the prevalence and dynamics of IPV in LGBQT* communities. Section Two focuses on trauma, mental health, and resilience among LGBQT* individuals to contextualize the critical need for trauma-informed practices for these survivors. Section Three focuses on the range of systemic, institutional, and individual-level barriers that thwart LGBQT* peoples' access to informal and formal support services. Finally, the last section reviews the core principles of a trauma-informed approach to practice, with attention to the needs of service providers who work with LGBQT* survivors, and provides examples of community-specific approaches to trauma.

A Note on Language

The authors wish to acknowledge at the outset the deep complexities of language. LGBQT* stands for lesbian, gay, bisexual, queer, and transgender. It is often used interchangeably with GLBTQ, LGBQT-TS, and similar acronyms to broadly refer to sexual and gender minorities. This document honors the current practice of including an asterisk after the "T" to signify the broad diversity of trans communities, including trans women – transgender individuals who identify as women, though assigned male at birth; trans men – transgender individuals who identify as men, though assigned female at birth; those transitioning from female to male (FTM); those transitioning from male to female (MTF); cross dressers; gender non-conforming individuals; and others who might self-identify as being members of trans communities. In this paper, transgender and trans are used interchangeably.

These definitions belie the complexity of the terms, however. The words *lesbian*, *gay*, *bisexual*, *transgender*, and *queer* all carry particular historical, political and cultural meanings. To a great extent, these words have been shaped in white, Western contexts. Words such as lesbian, gay, and bisexual, for example, are uniquely English. There are seldom translations into other languages that carry the same understanding of LGBQT* identity as being an identity rather than a set of behaviors. Literal translations, into Spanish or Haitian Creole as but two examples, carry few if any of the presumptions that are inherent in English. In many parts of the Latin and Spanish-speaking world, men who engage in sex with

same sex partners are only considered "gay" in the English sense of the word if they are the receptive partner. It is not engaging in the acts that is the determinant of identity, so much as the role that an individual plays (traditionally read as *masculine* or *feminine*) in the conduct of that act. Similarly, men who marry women, but engage in same sex acts with other men, are frequently identified as heterosexual. In short, they are defined by their social role, rather than by their private, intimate acts. Hence the conception of *gay*, as defined in U.S. contexts, frequently fails to apply.

Precisely because identifiers such as LGBQT* were defined in white middle class and academic contexts, the limitations of LGBQT* labels and identifiers may be particularly acute in communities of color, Indigenous communities, and immigrant communities, among others. During the course of crafting this literature review, members of our Advisory Board taught us a tremendous amount. The Hispanic Black Gay Coalition (HBGC) suggested use of the term *same gender loving*, a community-specific phrase coined by Cleo Manago to distinguish African Americans, and in particular African American men, who do not self-identify as being part of the predominantly white gay movement in the U.S., but who nonetheless wish to affirm their same sex intimate relationships. Corey Yarbrough, one of the founding Executive Directors of HBGC, suggested that, for some same gender loving people, this language may be a form of racialized resistance to the racism of the mainstream LGBQT* movement in the U.S. In the alternative, Corey stated, some members of African American communities may be on the *down low*, engaging in same sex sexual activity, but rejecting LGBQT* identifiers as a result of internalized homo- and bi-phobia.

The NorthEast Two-Spirit Society (NETSS) in part echoed Corey's thoughts about the racism of the mainstream LGBQT* movement. In addition, Harlan Pruden, one of co-founders of NETSS, spoke about an "internal muddiness" that some Native peoples may experience when seeking to find language for their experience. Speaking of his own Cree inheritance as a registered member of the Saddle Indian Reservation, Harlan said that when he asked something of an elder, he knew to offer them tobacco, but never understood the spiritual dimension of the ceremony. Having been separated from too much of their own history by colonialism, genocide, and forced assimilation, Harlan stated, many Native people may use the words *Two-Spirit* when what they really mean is gay Indian.[2]

Harlan also spoke at length about the contextual nature of Native Two-Spirit identities. As Harlan put it, "When I am out on a Friday night in a gay club, I am a gay man. Yet when I am in rural Oklahoma at a Two-Spirit gathering, I am a proud Two-Spirit man." Alluding to the unique role and cultural responsibilities that Two-Spirit people often held (and may still hold) in the life of Native communities, Harlan pointed out the obvious differences in the spiritual role of Two-Spirit peoples, and

[2] Two-spirit is a contemporary term, adopted from the Northern Algonquin, and meant to signify the embodiment of both masculine and feminine within one person. Now embraced by many Native peoples as a pan-Indigenous umbrella term connoting both diverse gender expressions and sexual orientations, two-spirit (TS) generally speaks to the respect that Native peoples held for diversity, and the unique sacred and ceremonial roles that TS people held (and may still hold) within their own communities. Herein the phrase TS speaks not simply to a third gender, or to same gender attraction, but more broadly to the history of compulsory Christianization that sought to erase two-spirit peoples within their own nations. Notably, there is no single consensus definition of two-spirit, and the term means different things to different Native peoples.

the political and social function of people claiming LGBQT* identities in mainstream communities. Several members of the project's advisory board echoed this point,
speaking about the complex layering of cultural and spiritual value systems that accompanied their choice to self-identify in, with, and outside of their own communities.

These same Advisory Board members also acknowledged the landscape in which such decisions are made, and stated that individuals in their communities may shift how they self identify as a means of preserving their safety. As the rest of this literature review discusses, LGB, transgender, same gender loving, Two-Spirit, and queer-identified peoples make choices about how, when, and if to "out" themselves in a complex social and political landscape that is too often unsafe, if not violent. Hence, how any individual self-identifies may shift depending on who is asking, why, and in what context. As one Advisory Board member stated, "identities have to be fluid in order to be protective."

Finally, the leadership of HarborCOV, an LGBQT*-affirming DV organization in Boston that specializes in serving communities facing cultural or linguistic barriers, has noted that some cultures may not have the variety or depth of language that words such as LGB, transgender, same gender loving, and Two-Spirit convey. Indeed, Kourou Pich, Co-Executive Director of HarborCOV has observed that people from some cultures and communities may have difficulty finding language for themselves in their own communities, and that that invisibility is intentional – a function both of denial of the existence of sexual minorities in those communities, but also perhaps protectiveness of gender queer and same gender attracted people.

Language is power. We authors, therefore, have put a great deal of thought into the words we use to name peoples' experiences. At the same time, we know that we can never be as inclusive or sensitive as we want to be. We have done our best to honor the range of experiences we are writing about in this document.

Intimate Partner Violence in LGBQT* Communities

Prevalence of IPV in LGBQT Communities*

Historically, DV has been seen primarily as a problem of cisgender[3], heterosexual men abusing cisgender, heterosexual women. Because of this limited framework, research on the prevalence of DV and IPV among LGBQT* and non-female-identified individuals has been scarce and often limited by the use of non-probability sampling, cross-sectional data that precludes causal inference, and inconsistent definitions of IPV and sexual orientation (Brown & Herman, 2015; Finneran & Stephenson, 2012). Recently, however, there has been an increase in studies that provide more rigorous estimates of IPV in LGBQT* communities. The majority of these studies suggest that IPV occurs in LGBQT* relationships at rates equal to or higher than heterosexual, cisgender relationships (Balsam, Rothblum, & Beauchaine, 2005; Duke & Davidson, 2009; Langenderfer-Magruder, Whitfield, Walls, Kattari, & Ramos, 2016; Messinger, 2011; Walters, Chen, & Breiding, 2013). Herein, we briefly present prevalence estimates of LGB IPV before turning to the limited research on prevalence among trans individuals. For a more detailed review of IPV prevalence in LGBQT* communities, see Brown and Herman (2015).

Currently, the best prevalence estimates on partner abuse in LGB communities come from the nationally representative 2010 National Intimate Partner and Sexual Violence Survey (NISVS) conducted by the U.S. Center for Disease Control & Prevention (Walters et al., 2013). Findings suggest higher rates of lifetime IPV experiences (defined as physical violence, sexual violence, or stalking) among lesbians (43.8%), bisexual women (61.1%), and bisexual men (37.3%) – but not gay men (26%) – compared to heterosexual women (35.0%) and heterosexual men (29%). In addition, findings from the California Health Interview warrant mention. Based on a probability sample of California residents ages 18 to 70, this study found that lifetime and 1-year IPV prevalence was higher in sexual minorities compared with heterosexuals, but this was significant only for bisexual women and gay men.

Determining IPV prevalence based on gender identity is difficult due to a lack of studies with representative or even large samples. The National Transgender Discrimination Survey is one of the largest studies of transgender individuals' experience of discrimination with 6,456 participants (Grant, Mottet, & Tanis, 2011). This study did not focus on IPV in particular, but did measure related phenomena. The researchers found that 19% of respondents reported experiences of violence at the hands of a family member specifically due to their gender identity. This statistic is likely an underestimate because it excluded DV perpetrated by non-family intimate partners as well as DV unrelated to gender identity. A much higher percentage of participants reported experiencing actions that may or may not be part of abusive behavior: 29% reported an ex-partner limiting their contact with their children, 45% reported having a relationship end when they came out as trans to their partner, and 57% experienced family rejection (Grant et al., 2011). However, these are unreliable proxies for IPV.

[3] Cisgender is a term that refers to individuals for whom the gender they were assigned at birth matches their gender identity. It can be thought of as meaning "not transgender."

Only one study to date has compared IPV among transgender to IPV among cisgender individuals. Analysis of data from One Colorado's anonymous 2011 LGBT Health Survey (n= 1,193) found that 31.1% of trans respondents reported experiencing IPV, compared to 20.4% of cisgender respondents (Langenderfer-Magruder et al., 2016) – findings that suggest transgender individuals experience higher rates of IPV than their cisgender, LGB counterparts. Furthermore, preliminary evidence suggests that different subgroups within transgender communities experience different rates or types of IPV (Chestnut, Jindasurat, & Varathan, 2012; Clements, Katz, & Marx, 1999). Future studies should examine these differences, particularly with regard to differences between trans men and trans women and with attention to intersecting identities for all participants (e.g., race, sexual orientation, disability, socioeconomic status).

Similarities of LGBQT and Heterosexual IPV*

In general, IPV experienced by LGBQT* individuals follows patterns similar to heterosexual and cisgender individuals (Ristock, 2005). Specifically, abuse can take the form of physical or sexual violence as well as emotional, financial, or verbal abuse. Messinger's (2011) analysis of the National Violence Against Women Survey revealed that the prevalence of various types of abuse in GLB communities mirrored prevalence rates among heterosexuals: Both groups reported prevalence rates that went in descending order from verbal abuse to controlling behavior to physical violence to sexual abuse. However, as described next, there are also unique aspects of IPV in LGBQT* communities, and potentially important differences among LGBQT* subgroups.

Unique Characteristics of IPV in LGB communities

IPV occurs in a larger societal and systemic context of homo-, bi-, and transphobia, heterosexism, misogyny, and patriarchy. These factors can influence abuse tactics and relationship dynamics for LGBQT* survivors, making their experiences different from those of heterosexual survivors. For example, sexual minority victims of IPV may be subject to abusive tactics that leverage systemic and cultural discrimination (i.e., identity abuse; Ard & Makadon, 2011; Balsam, 2001; Balsam & Szymanski, 2005; FORGE, 2014; Gay Men's Domestic Violence Project, 2014; National Center on Domestic & Sexual Violence, 2014; West, 2012). Examples of identity abuse include denying or belittling an individual's LGBQT* identity (e.g., refusing to use preferred gender pronouns), restricting access to a supportive LGBQT* community (NCDSV, 2014), or threatening to disclose a survivor's sexual orientation, gender identity, or HIV/AIDS status (Ristock, 2005). People who use violence against their LGBQT* partners may also use threats to authenticity as a method of control, making survivors feel that they are not "queer enough" or do not understand how LGBQT* relationships are supposed to be (Bornstein, Fawcett, Sullivan, Senturia, & Shiu-Thornton, 2006). Controlling behavior, in general, may be a particularly important aspect of DV among LGBQT* couples, and may result in even higher levels of psychological harm than physical abuse alone (Frankland & Brown, 2014).

IPV in LGBQT* survivors can also be minimized in a variety of ways: For example, common portrayals of DV in the media – usually depicting heterosexual relationships, specifically men abusing women – can render invisible even to themselves experiences of underrepresented survivors (Holt, 2011). Pervasive beliefs that LGBQT* relationships are more egalitarian or that gay and lesbian individuals are better able to defend themselves against partners who use violence also serve to render IPV invisible in these communities (Bornstein et al., 2006; Holt, 2011; Walters, 2011).

Finally, although isolation is a commonly used tactic in heterosexual as well as in LGBQT* relationships, it may be more difficult to overcome in tight-knit LGBQT* communities in which relationships and resources are often shared with the abusive partner (Bornstein et al., 2006). The level of isolation is even more pronounced for LGBQT* survivors from rural and immigrant communities (Ristock, 2005).

Unique Characteristics of IPV among Transgender People

There is limited research on the characteristics of IPV in transgender communities. The National Coalition of Anti-Violence Programs 2014 annual survey of its member programs reported that, compared to people who did not identify as transgender, transgender survivors were two times more likely to face threats/intimidation, nearly two times more likely to experience harassment, and over four times more likely to face police violence in response to reporting IPV (National Coalition of Anti-Violence Program, 2015b). Transgender women were at highest risk of experiencing threats/intimidation, harassment, and injury (NCAVP, 2015a), and transgender people of color were the most likely to report experiencing threats of intimidation in their intimate partnerships.

Generally high rates of violence, trauma, and discrimination in the lives of transgender individuals may have a compounding effect, influencing transgender IPV survivors' willingness to identify abuse or seek help. FORGE's safety planning guide remarks that transgender individuals may feel unwanted, or "believe that they are lucky to ever find love, even if that love turns violent" (Guadalupe-Diaz, 2013, p. 3). In a study of transgender relationship violence, some participants could not even conceptualize their trans partner's behavior as abusive because they viewed these partners as being so oppressed themselves (Ristock, 2011).

Multiple Experiences of Violence in LGBQT Communities*

Because of the fragmented nature of research on violence and abuse in the lives of LGBQT* individuals, the prevalence of "polyvictimization"[4] – that is, multiple kinds of violence and abuse committed by different people – in this community is still unknown. However, evidence suggests that LGBQT* individuals are more likely to experience multiple types of violence (e.g. sexual abuse, physical abuse, and exposure to domestic violence during childhood; sexual assault, physical assault, and stalking during adulthood) at the hands of many different types of individuals (family, partners, community members, legal actors, strangers) and at multiple points in their lifetime (Roberts, Austin, Corliss, Vandermorris, & Koenen, 2010; Grant et al., 2011; Stotzer, 2009).

Specific subgroups of LGBQT* survivors are at especially high risk for multiple forms of victimization. One notable example is LGBQT* homeless youth, highly overrepresented among homeless populations (Durso & Gates, 2012; Grant et al., 2011; Hunter, 2008). Evidence indicates that family and partner violence are major drivers of such homelessness (Cochran et al., 2002; Durso & Gates, 2012; Grant et al., 2011; Risser & Shelton, 2002). Homelessness in turn may render LGBQT* peoples increasingly vulnerable to other forms of violence including harassment, hate crimes, police brutality, and sexual exploitation (Amnesty International, 2005; Durso & Gates, 2012; Keuroghlian et al., 2014; Mogul, Ritchie, & Whitlock, 2012; NCAVP, 2015a; NCAVP, 2015b; Reck, 2009). Layered onto these experiences are other types of oppression such as housing, employment, and healthcare, which are themselves traumatogenic and which also act as barriers to help seeking (D'Augelli, 1998; Durso & Gates, 2012; Grant et al., 2011; Tyler, 2008).

Unique Experiences of IPV among Specific Subgroups of LGBQT Survivors*

The experience of IPV for specific subgroups may be quite different than that of White, middle-class LGBQT* survivors (Chavis & Hill, 2009). The intersections of various identities result in unique social contexts shaped by multiple systems of power and oppression (Chavis & Hill, 2009; Feltey, 2001). These systems may shape the way that IPV is enacted and experienced, and the way it is addressed by service providers. Although attention to all intersections would be beyond the scope of this document, here we focus on three subgroups that have received especially scant attention: sexual minorities in Native communities, immigrant and refugee communities, and faith-based communities. Although there is virtually no research on IPV within these subgroups, it is nevertheless instructive to understand this context when considering the experience of IPV for people within these communities. Later sections touch on specific aspects of the help-seeking experience of African-American and Latin@ LGBQT* survivors.

[4] "Polyvictimization" refers to experiences of multiple kinds of violence and abuse, at the hands of multiple people at multiple points in the lifespan. The authors have chosen to put this word in quotes because some have understood it to imply that the victim is somehow responsible for for these experiences. This would obviously be inaccurate and inappropriate. Indeed, there is now a rich literature on the ways that people who use abusive behaviors target individuals with prior trauma histories.

Two-Spirit and LGBT Native Peoples. In general, there is scant research on the experiences of Two-Spirit and LGBT Native individuals. However, the fact that rates of violence and abuse against cisgender, heterosexual Native women are so high suggests that Two-Spirit Native women might be at especially high risk compared to their non-Native sexual minority counterparts (Lehavot, Walters, Simoni, 2009). Consistent with this view, one study showed that 78% of Two-Spirit women reported experiencing physical assault and 85% reported experiencing sexual assault (Lehavot et al. 2009).

These statistics are all the more alarming given that Native women, regardless of Two-Spirit or LBT status, are more likely to experience physical brutality, and therefore injury, during rapes and sexual assaults (Amnesty International, 2007). Further, some Native researchers have noted the disproportionate impact of homo/transphobia that occurs within the Native community given that Two-Spirit survivors may need cultural support from their own people in the face of violence and trauma (Frazer, Somjen, & Pruden, 2010). Not surprisingly then, violence against Two-Spirit and Native LGBQT* individuals also contributes to the development of a range of health and mental health conditions, such as liver disease, substance abuse, PTSD, as well as to behaviors that increase the risk for HIV (Balsam, Huang, Fieland, Simoni, & Walters, 2004; Centers for Disease Control and Prevention, 2001; Evans-Campbell, Lindhorst, Huang, & Walters, 2006; Simoni, Seghal, Walters, 2004). Clearly, more research is needed on IPV in the lives of Two-Spirit and LGBQT* Native peoples.

Immigrants and Refugees. The experiences of LGBQT* immigrant and refugee survivors of IPV are largely invisible in the academic literature. The broader research on DV in heterosexual, cisgender immigrant communities is complex, indicating that they experience lower rates of IPV, but higher rates of IPV homicide compared to non-immigrants (Bohn, 2003; Tjaden & Thoennes, 1998).

Although there is a need for more prevalence research, it is well documented that sexual minority immigrants face challenges resulting from historically homophobic immigration policies (Chung & Lee, 1999). Under the Immigration and Nationality Act of 1917, LGBQT* immigrants were strictly prohibited from entering the United States on the grounds that they were "mentally or physically defective." The Immigration & Naturalization Act of 1952 similarly prevented LGBQT* immigrants from entering the U.S. based on the idea that they were "afflicted with psychopathic personality" (Foss, 1994). Even up to 1990, Public Health Service physicians barred entrance to those immigrants suspected to be LGBQT*, labeling them as "sexual psychopaths." In addition to contending with these oppressive policies, LGBQT* immigrants were also isolated within their own communities and shunned by white, non-immigrant LGBQT* communities because of their immigration status (Cantú, Hurtado, & Anzaldúa, 2012; Moraga & Anzaldúa, 1981). Even today these interpersonal and institutional challenges echo in the lives of sexual minority immigrants and likely create unique challenges for LGBQT* immigrant and refugee survivors of IPV.

Religious or Spiritual LGBQT Survivors*. LGBQT* people have both positive and negative experiences of faith, possibly even simultaneously. Researchers and practitioners highlight the healing value of religious communities and practices for this community (e.g., Queer Muslims of Boston,

FaithTrust Institute; Ryan, Huebner, Diaz, & Sanchez, 2009). Yet, institutionalized religious policies and principles continue to be a major source of social oppression for many LGBQT* people (Clarke, Brown, & Hochstein, 1989; Davidson, 2000; Hilton, 1992; McNeill, 1993; Morrow & Gill, 2003; Spong, 1991; Spong, 1998). For example, many religious practices condemn non-heterosexual behavior (Bouhdiba, 1998; Jaspal & Cinnirella, 2010) and view LGBQT* people as immoral and spiritually corrupt (Morrow & Gill, 2003). For many religious LGBQT* people, family and societal rejection is therefore compounded by the loss of religious communities (Mahaffy, 1996).

Sources of conflict for religious LGBQT* people include anti-gay religious teachings and scriptural interpretations, homo/bi/transphobic church atmospheres, fear of being "outed" in non-affirming religious settings, and microaggressions (i.e., subtle forms of oppression) from people within their religious communities (Brown & Pantalone, 2011; Shuck & Liddle, 2001). Not surprisingly, receiving homophobic messages through a religious medium has been found to be associated with internalized shame among LGBQT* individuals (Herek, 1987; Ream, 2001).

The challenges of participating in a faith community that is not LGBQT*-affirming may be particularly acute for LGBQT* individuals of color and immigrants since the support role of faith-institutions is particularly crucial in these communities due to the lack of other available social supports. For example, Christian religious institutions have served a range of healing functions within African American communities, where faith has been an important source of strength in the face of ongoing racialized violence and oppression (Billingsley, 2003; Cone, 1997; Cone, 2010; Higginbotham, 1994; Lincoln & Mamiya, 1990). Yet, for African American young men, churches are the primary source of anti-gay messages in their communities (Stokes & Peterson, 1998). The loss of access to one's faith community under such circumstances may be particularly wounding. These challenges are real and ongoing, but their effects on LGBQT* survivors of IPV remain unexplored. Most research on the experience of IPV survivors in relation to their faith communities focuses on the spiritual lives of heterosexual, cisgender women. Clearly, more research is needed in this area.

In sum, violence – be it by intimate partners, family and community members, or society at large – is a common occurrence in the lives of many LGBQT* individuals. Because such polyvictimization is rooted in and exacerbated by the larger context of homophobia and transphobia, the experiences of LGBQT* survivors differ in many ways from those of heterosexual, cisgender survivors. Given that experiences differ, so too does the impact of experiencing IPV. We turn next to the research on the mental health consequences of IPV among LGBQT* survivors as well as protective factors that promote resilience.

Trauma and Mental Health in LGBQT* Communities

The emerging literature on how IPV affects the mental health of LGBQT* survivors is mixed, with some studies indicating that the impact is similar for LGBQT* and non-LGBQT* survivors, and others indicating that adverse effects are more common among LGBQT* survivors (Edwards, Sylaska, & Neal, 2015). This section reviews that literature, focusing especially on depression and PTSD – two common mental effects of abuse. As this section will show, emerging research indicates that bisexual and transgender survivors may be at particularly high risk for experiencing adverse mental health effects.

Depression. LGBQT* survivors of IPV, similar to their heterosexual and cisgender counterparts, are particularly at risk of depression. One longitudinal study examining data from a nationally representative survey of adolescents between the ages of 18 and 27 (227 gay and lesbian, 345 bisexual, and 13,490 heterosexual) found that across all three groups, exposure to IPV was significantly related to increased depression – even after controlling for exposure to childhood physical or sexual abuse and homelessness or expulsion from one's home by caregivers (McLaughlin, Hatzenbuehler, Xuan, & Conron, 2012). This is consistent with a more recent meta-analysis examining 19 studies, which found that men who are victims of IPV at the hands of other men are more likely to use substances, suffer from depressive symptoms, have an HIV positive diagnosis, and engage in unprotected sex (Buller, Devries, Howard, & Bacchus, 2014). As a whole, this body of literature suggests that LGBQT* IPV survivors are at greater risk for experiencing depression than LGBQT* individuals without IPV experience.

Looking more closely within the LGBQT* community, there is some evidence indicating that bisexual individuals may have disproportionately high rates of depression as compared to gay and lesbian individuals (Bostwick, Boyd, Hughes, & McCabe, 2010). Interestingly, theoretical work has posited that the relatively high mental health difficulties within the bisexual community may be attributable to the additional stressors of experiencing bi-negative attitudes from both heterosexual and LGTQ communities. The National Epidemiologic Survey on Alcohol and Related Conditions, which compared rates of major depression among lesbian, gay, bisexual and heterosexual adults (*n*=34,653), found that both male and female individuals who reported bisexual behavior had higher lifetime rates of all mood disorders, including depression (Bostwick et al., 2010). By extension, one might expect bisexual survivors of IPV to be at particular risk for depression.

Likewise, there is scant research on depression and other mental health effects of IPV for transgender survivors. There is, however, literature on the relationship between interpersonal violence more generally and symptoms of depression in this community. For example, in one cross-sectional study of over 591 MTF participants from the New York City area, 63% had depression scores in the clinical range. Further, in this same sample, violence that was related to one's gender identity, or gender abuse, was predictive of depression (Nuttbrock et al., 2014). These findings are consistent with another study of 6,436 transgender-identified individuals, in which 19% of respondents had experienced violence at the hands of a family member because of their chosen gender identity. This exposure was associated with over twice the rate of suicidality, with 65% of those who experienced family violence also reporting

having attempted suicide, compared to 32% of those who did not experience family violence (Grant et al., 2011). Overall, though the literature remains inconclusive, it raises questions about whether transgender survivors of IPV could be at increased risk for depression.

PTSD. IPV exposure also increases the risk of PTSD symptoms in the LGBQT* community. According to the CDC's 2010 IPV report described previously (i.e., NISVS) 19.5% of lesbian women, 46.2% of bisexual women and 22.1% of heterosexual women report experiencing at least one symptom of PTSD – defined as having nightmares and intrusive thoughts of the traumatic experience; feeling constantly on guard, watchful or easily startled; and feeling numb or detached in response to an experience of IPV (Walters et al., 2013). Data from bisexual, gay, and heterosexual men were excluded from the analysis due to small sample sizes. Evidence from other research, however, suggests that that the relationship between IPV and PTSD may extend to gay and bisexual male survivors (Pantalone, Hessler, & Simoni, 2010).

Consistent with the findings on IPV and depression, there is initial evidence that bisexual survivors of IPV have higher rates of PTSD than gay and lesbian survivors. According the CDC's NISVS, more than half of bisexual women (57.4%) who experienced physical or sexual violence or stalking reported at least some form of negative impact (e.g., experiencing PTSD symptoms, missing a day of school or work, feeling fearful or concerned for their safety) as compared to a third of lesbian women (33.5%), and a fourth of heterosexual women (28.2%) (Walters et al., 2013). Significantly more bisexual women (46.2%) reported experiencing at least one symptom of PTSD as compared to lesbian (19.5%) and heterosexual women (22.1%) (Walters et al., 2013). These results suggest that bisexual women may be at disproportionately high risk for developing PTSD after experiencing IPV.

Again, literature on the relationship between IPV and PTSD in transgender communities is limited. As noted earlier, transgender individuals are especially likely to experience violence and discrimination in the domains of education, health, family life, and work which may shape their responses to partner violence (Grant et al., 2011). These risks are not equally distributed among trans individuals. Trans women experience higher rates of violence than trans men, probably because they are less able to "pass" (i.e., be perceived as the gender they identify as) (Dean et al., 2000; Mizock & Lewis, 2008). The risks may also be explained by the concept of trans-misogyny: the idea that there is a particular brand of discrimination that combines transphobia with sexism and applies specifically to trans women (Serano, 2007).

In addition, trans people of color are at particularly high risk (Richmond, Burnes, & Carroll, 2012). In a study of MTF youth of color in Chicago, major life stressors included lack of transportation, difficulty finding a job, sex in exchange for resources, being frequently bothered by police, forced sexual activity, difficulty finding a safe place to sleep, difficulty accessing healthcare, and history of incarceration and homelessness (Stieglitz, 2010). Given that multiple experiences of trauma are more likely to result in the development of clinical PTSD (Scott, 2007), it is not surprising that in one study of MTF transgender individuals, 17.8% reported clinically significant symptoms of PTSD (Shipherd, Maguen, Skidmore, &

Abramovitz, 2011). As a whole, the literature on bisexual and transgender communities makes clear the need for researchers to continue to investigate the distinct experiences of subgroups of the LGBQT* community.

The mental health consequences of IPV among LGBQT* survivors must also be understood within the broader context of historical trauma. Historical trauma is a term used to describe repeated communal traumatic events that exist across time, are embedded throughout culture, and can result in an intergenerational cycle of traumatic stress (Sotero, 2007). Oppressed communities subjected to historical trauma are at heightened risk for mental and physical health consequences compared to communities not exposed to such trauma (Danieli, 1998; McMichael, 1999; Sotero, 2007). Not only have LGBQT* people endured such historical trauma as a group, but many such individuals have also experienced intergenerational trauma originating from other identities such as those based on race or religion (DeGruy, 2005; Franklin, Boyd-Franklin, & Kelly, 2006; Jaimes & Halsey, 1992). Studies have shown that cumulative historical traumatic events actually increase survivors' risk for lifetime trauma and interpersonal violence (Chae & Walters, 2009). These forces are critical to understand when considering the mental health impact of violence against various subgroups of the LGBQT* communities.

Resilience in LGBQT Communities*

Research has identified several important factors that contribute to strength and resilience among LGBQT* survivors. In particular, a positive LGBQT* identity, or *identity affirmation,* and social support from friends can profoundly influence survivors' mental health.

Regarding the first of these two factors, LGBQT* identity affirmation has been well documented as critical to positive mental health outcomes. For example, one study investigating 165 lesbian, gay, and bisexual youth found that family support and self-acceptance mediated the relationship between victimization and mental health (Hershberger & D'Augelli. 1995). Another study surveyed 613 lesbian, gay, and bisexual individuals and found that LGB individuals who have positive appraisals of their LGB identity and do not anticipate rejection from others had lower psychological distress (Balsam & Mohr, 2007). In a subsequent study, the same authors found that higher identity acceptance negatively correlated with measures of depression, guilt, fear, hostility, and sadness, and positively correlated with measures of general life satisfaction, self-assurance, and social self-esteem (Mohr & Kendra, 2011). Finally, in a study of trans people of color who were survivors of traumatic events, participants named pride in one's gender and ethnic identity as critical to resilience (Singh & McKleroy, 2011). In short, LGBQT* individuals who feel more positive about being LGBQT* or their ethnicity are able to cope more successfully with the challenges they face.

Social support from friends and family also serves a critical protective role. Moody and Smith (2013), for example, found that perceived support from friends was associated with reduced suicidality among trans individuals. For transgender youth of color, identifying other youth and adults with similar identities helped to validate their experiences of racism within the LGBQT* community (Singh, 2013).

And in one study of MTF youth of color, friends were the most frequently cited source of support, and physicians or case managers were perceived as at least somewhat helpful (Stieglitz, 2010).

Social media has become a critical conduit for accessing social support within the LGBQT* community (Singh, 2013). Online communities have become sites of community organizing, cultural empowerment, and education for LGBQT* people, enhancing both a sense of identity and a sense of social support and community (Mehra, Merkel, & Bishop, 2004). Religion and spirituality may also contribute to resilience, particularly as these become sources of social support (Potter, 2007).

In sum, there is a clear need for supportive mental health and trauma-informed approaches for LGBQT* individuals. Furthermore, these services must recognize the societal factors that contribute to individual mental health concerns. LGB individuals, and transgender individuals in particular, experience high rates of traumatic experiences that stem from social isolation, prejudice, and discrimination. These experiences can have many negative mental health outcomes, and are exacerbated by multiple forms of oppression. Nonetheless, LGBQT* individuals show remarkable resilience by developing strong social support networks, creating and engaging with online and activist LGBQT* communities, and developing a positive LGBQT* identity. Trauma-informed approaches must allow providers to understand the context in which survivors have experienced abuse, identify sources of individual and communal strength and resilience, and support healing. Unfortunately, the current reality for sexual minorities who seek help from informal and formal supports is far different.

Help-Seeking Among LGBQT* Survivors

A range of systemic, institutional, and individual-level barriers uniquely thwart LGBQT* peoples' access to informal and formal support services (Edwards, Sylaska, & Neal, 2015; Helfrich & Simpson, 2006). At the broadest level, pervasive heterosexism renders violence between same sex partners invisible. The myth that IPV occurs only between men and women contributes to the profound difficulty that service professionals have even identifying IPV among LGBQT* couples (Blasko, Winek, & Bieschke, 2007; Brown & Groscup, 2008; Helfrich & Simpson, 2006; Seelau & Seelau, 2005). Brown and Groscup (2008) studied 120 crisis center workers' perceptions of same-sex DV by presenting scenarios in which only the gender of the abuser and survivor were changed, and found that participants ranked same-sex DV as less severe and less likely to get worse than the same scenario among heterosexual pairs. Although service providers may recognize that LGBQT* survivors deserve protection from IPV just as heterosexual survivors do (Sorenson & Thomas, 2009), these kinds of biases may affect their ability even to identify IPV in this community (Basow & Thompson, 2012).

Beyond the invisibility of LGBQT* IPV, a range of factors cause well-meaning social services systems to harm members of marginalized communities, including sexual minorities. Forms of oppression such as racism, colonialism, ableism, heterosexism, sexism, and transphobia that are often implicit in our helping systems can render these systems traumatogenic, especially when these oppressive dynamics are not acknowledged (Buzawa & Buzawa, 2003; Dirks, 2004; Herman, 2003; Walters, Simoni, & Evans-Campbell, 2002). The kind of harm done by institutions designed to provide support has been termed "sanctuary harm" (Bloom 2011; Bloom 2013).

A primary example of a system that causes this kind of sanctuary harm is the healthcare system. Historically, medicine and the health sciences were central to the effort to pathologize same sex relationships and transgenderism. Being gay or lesbian was classified as a mental disorder by the American Psychological Association until 1973, and conceptions of gender dysphoria as a mental health condition did not undergo a similar revolution until 2013 (Bayer, 1987; Drescher & Merlino, 2007).

The continuing impact of this history is evident in the experiences of LGBQT* patients in healthcare settings. Lambda Legal (2010) found that more than half of all sexual minority survey participants had experienced at least one of the following types of discrimination in a healthcare setting: being refused needed care; being blamed for their health status; seeing healthcare professionals refuse to touch them or use excessive precautions; hearing healthcare professionals use harsh or abusive language; or experiencing healthcare professionals being physically rough or abusive. Similarly, Shires and Jaffee (2015) found that over 40 percent of transgender men reported verbal harassment, physical assault, or denial of equal treatment in a doctor's office or hospital. Grant et al. (2011) reported that over one-quarter of respondents in a survey for the National Center for Transgender Equality experienced verbal harassment in medical settings, and that the likelihood of discrimination, abuse, or assault of transgender patients by their provider actually increased with the provider's awareness of their patient's transgender status. Such experiences of discrimination are far more likely to affect

LGBQT* patients of color, financially-oppressed patients, and undocumented patients (Grant et al., 2011; Lambda Legal, 2010).

Other examples of sanctuary harm abound across systems. For example, between 2010 and 2011, LGBQT* survivors reported an increase of incidences in which the police arrested both the abuser and victim when called (28.4% up from 21.9%), an increase in the percentage of LGBQT* survivors seeking shelter who were denied (61.6% up from 44.6%), and a decrease in the percentage of LGBQT* survivors who received requested orders of protection (78.1% down from 83.7%; NCAVP, 2015b). The same study found that transgender IPV survivors were over six times more likely to experience physical violence while interacting with the police than other survivors, and more likely to experience hate violence in shelters than other survivors (notably, trans men were 3.5 times more likely; whereas, trans women 1.3 times more likely) (NCAVP, 2015b). In short, transgender survivors may experience even more re-traumatization and less access to formal support systems than LGB survivors.

Mainstream programs may use heterosexist language in program materials, or have ambiguous or poorly defined policies regarding service provision for LGBQT* survivors (Helfrich & Simpson, 2006). LGBQT* survivors may well anticipate discrimination both from staff members and the heterosexual survivors using these services and may worry that their sexual orientation (and one could assume, gender identity) will be revealed should they actually seek help (Bornstein et al., 2006; McClennen, 2005; Helfrich & Simpson, 2006).

Low-income LGBQT* survivors of color experience another set of barriers: A community needs assessment of Black and Latin@ LGBQT* communities in the greater Boston area (Tod@s, The Hispanic Black Gay Coalition, The Violence Recovery Program at Fenway Health, The Network/La Red, & Renewal House, 2013) found that a lack of outreach to these communities limited their knowledge of IPV resources. In addition, geographic isolation, lack of transportation options, and the cost of making phone calls were major challenges to finding formal help. Similar to Black and Latin@ communities, Two-Spirit individuals identified lack of financial resources, transportation, and geographic inaccessibility as barriers to seeking support (Walters, Horwath, & Simoni, 2001). In addition, the lack of programming specifically aimed at Two-Spirit people and fear of what other Native community members might think were consistently ranked as barriers.

In the context of these institutional barriers, sexual minority survivors describe a range of personal reasons for not seeking support. Many feel that the need to educate a provider about one's identity and experiences would be overwhelming, particularly during a time of crisis (Turrell & Herrmann, 2008). Others worry about further victimization by providers who lack training on LGBQT* issues, and by other clients accessing the same services (Bornstein et al., 2006). Talking about abuse in one's intimate relationship almost always means coming out about one's sexual orientation or possibly one's gender identity. Further, gossip in insular or tight-knit communities raises concerns of confidentiality and retaliation – not just by the abuser but also by the community at large. Gay male survivors may keep silent about abuse and be more reluctant to seek help because they do not see doing so as consistent

with notions of masculinity (Seidler, 2006). According to Spiegel (2003), the abuse thrusts male survivors into "confrontation between two disparate psychosocial processes: the realities of abuse and the mythology of masculinity" (p. 133). Notably, although LGBQT* individuals may be hesitant to contact mainstream domestic violence programs, one survey reported that 86.2% of LGBQT* respondents *would* contact a domestic violence program if it was LGBQT*-specific (Holt, 2011).

Although the majority of LGBQT* survivors do not immediately seek help from the formal service system, they do rely on their informal social support systems; that is, their friends and families (Edwards et al., 2015). And yet, here too, LGBQT* survivors face a range of barriers to support. For example, LGBQT* survivors may be reluctant to seek help from friends and family given their own or their community's gendered beliefs about violence (e.g., women cannot be violent and men cannot be victimized) (Seelau & Seelau, 2005; Walters, 2011). They may be particularly hesitant to seek help from heterosexual friends or family members if they have had previous experiences of heterosexism and cissexism from their peers (Ard & Makadon, 2011). Survivors may have received messages that LGBQT* relationships themselves are "wrong" or "sick." Consequently, they may feel that admitting violence will only confirm these messages, conferring a sense of stigma on the victim, the relationship, and the LGBQT* community in general. Alternately, survivors who feel as though they are representing the LGBQT* community may feel that admitting IPV will harm the LGBQT* community at large (Balsam, 2001). Also, friends and resources may be shared between the survivor and perpetrator to an even greater degree than in heterosexual relationships, further making it difficult to access support (Bornstein et al., 2006).

In sum, a range of factors hinder LGBQT* survivors from seeking formal and informal assistance. Some survivors choose not to seek help from anyone; however, many survivors will make at least an initial attempt, and how they are treated can affect likelihood of seeking help in the future. Formal systems such as DV programs, hospitals, and law enforcement have a responsibility to ensure that they are facilitating help-seeking, not preventing it. To that end, the next section reviews the literature on a trauma-informed approach to practice, with attention to the needs of service providers who work with LGBQT* survivors, and provides examples of community-specific approaches to trauma.

Trauma-Informed Practices

A growing body of literature suggests that incorporating trauma-informed approaches into work with survivors is beneficial for the participant, staff, and overall organization. In this section we review the definition and core principles of a trauma-informed approach. Next, we discuss the need for LGBQT*-specific trauma-informed models and the role of transformative justice in developing such models.[5]

The term trauma-informed services was first used by Maxine Harris and Roger Fallot (2001a) in the context of mental health and addictions treatment programs. They noticed that many individuals seeking these services had experienced high rates of physical and sexual abuse, yet few providers were knowledgeable about trauma and the effects of such violence. As a result, services were not designed with trauma survivors in mind, increasing the possibility of retraumatization by the very services that were supposed to help them.

In response, Harris and Fallot (2001b) proposed creating trauma-informed service systems. This meant recognizing that the majority of people seeking services are likely to have experienced trauma; and that the effects of trauma impact many life domains, including people's experience of services. Thus, they argued, services had to be redesigned to incorporate an understanding of the pervasiveness of trauma and its impact on every aspect of their work. That is, programs and practices needed to be welcoming and appropriate for individuals with a history of trauma; and they needed to minimize retraumatization and promote healing and recovery. This, in turn, required an organizational commitment to trauma-informed practice, and ensuring that the necessary training for staff was in place.

In their initial work, Harris and Fallot (2001a) identified five requirements for creating trauma-informed services: (1) administrative commitment to change; (2) universal screening for trauma history among participants/clients;[6] (3) training and education on trauma for all staff; (4) hiring staff with a deep knowledge of trauma, referred to as "trauma champions;" and (5) reviewing policies and procedures to ensure they do not replicate abusive dynamics.

Although Harris and Fallot's approach was developed in the context of mental health and addictions services, its underlying principles have been adapted and applied to several different service contexts. These contexts include correctional facilities (Hodas, 2006), psychiatric and hospital settings (Jennings, 2004), homelessness services (Guarino, Soares, Konnath, Clervil, & Bassuk, 2009), addiction

[5] While the terms trauma-informed care and a trauma-informed approach are sometimes used interchangeably, the use of these terms has evolved over time. Trauma-informed care while perhaps still applicable in settings that provide health or mental health care, is actually inconsistent with the spirit/principles of a trauma-informed approach which involves service relationships that are fully collaborative rather than one person providing and the other receiving care.

[6] The requirement for universal trauma screening emerged in the context of mental health and addictions treatment services and are not necessarily applicable to other service settings such as DV programs.

services (Covington, 2008), services for children who have experienced abuse (Hodas, 2006; Ko et al., 2008), and DV organizations (Warshaw, Sullivan, & Rivera, 2013; Warshaw 2014; Wilson, Fauci, & Goodman, 2015).

These adaptations have not fundamentally altered the original principles, but have offered more expanded and nuanced interpretations of how they work in practice. In their excellent review, Hopper, Bassuk, and Olivet (2010) identified core principles that cut across different service contexts. These include: trauma awareness (e.g., staff training, consultation, supervision and self-care); safety (e.g., physical and emotional safety for all, awareness of potential triggers, clear roles and boundaries, and cultural diversity); opportunities to rebuild control (e.g., predictable environments, rebuilding efficacy, and personal control over lives); and a strengths-based approach (e.g., focus on future and skills-building).

Furthermore, Elliot, Bjelajac, Fallot, Markoff and Reed (2005) placed trauma-informed principles in the context of the entire service system and environment. For example, in a trauma-informed system, survivors engage with staff as collaborative partners rather than as passive recipients of services, and organizations actively solicit survivor input. In trauma-informed organizations, providers also strive to understand each survivor within the context of their background and life experiences and in terms of what is meaningful to them. Such contextualizing is essential. Because survivors experience trauma and seek support in a social, historical, and political context, healing must also include recognition of this context.

In order to do this difficult work, staff must themselves be supported. A fundamental aspect of a trauma-informed approach, therefore, involves creating an organizational environment that facilitates providers' capacity to do their work well. Clients interact with individual providers, who themselves interact with supervisors and the organization. When providers are subject to stressful organizational dynamics, those stresses interfere with their ability to be effective (Bloom, 2010). One consequence of problematic organizational dynamics is vicarious traumatization (synonymous with secondary traumatic stress or compassion fatigue) among service providers. Vicarious traumatization has been defined by Charles Figley (1995) as "the stress resulting from helping or wanting to help a traumatized or suffering person" (p. 7), and symptoms may mimic those of PTSD. Vicarious traumatization has been linked to burnout in several studies (Bemiller & Williams, 2011; Brown & O'Brien, 1998; Ortlepp & Friedman, 2002; Ullman & Townsend, 2007).

Vicarious traumatization is widespread. Findings from a study of 148 advocates working in a range of types of DV organizations indicate that 47.3% of participants met criteria for clinical levels of PTSD symptoms (Slattery & Goodman, 2009). Organizational factors that may contribute to vicarious traumatization include a lack of involvement or influence on decision making, feeling like one's abilities are not being used, being exposed to danger at work, and too much focus on fixed regulations, procedures, and paperwork (Brown & O'Brien, 1998). Indeed, Slattery and Goodman (2009) found that lack of access to power (i.e., equality, voice, representation, shared leadership, and respect) in the

workplace significantly predicted vicarious traumatization above and beyond individual factors (e.g., personal history of trauma and exposure to traumatized clients). They recommended creating a workplace that emphasizes support, cooperation, effective communication, and conflict resolution skills and asserted that efforts to "flatten the hierarchy" and address power differences at the organization may also help minimize vicarious traumatization.

Creating a trauma-informed service system, then, occurs on three levels. The first is focused on the needs of survivors. The second is focused on changing an organization's culture to support staff and fully integrate trauma-informed practices into its service delivery; and the third level acknowledges the larger societal context in which survivors seek services and organizations operate. This level emphasizes not only engagement with the individual as part of a community, but also with community change itself in order to transform the conditions that produce abuse, violence, and trauma in the first place (Warshaw, 2014; Wilson et al., 2015).

These overarching principles have been applied across trauma-informed service systems. However, the particular language used to describe specific practices that arise from them may vary substantially depending on the service setting. The appendix provides a table of six trauma-informed models that have been identified as having some relevance for this project either because of the communities being served (LGBQT* or IPV survivors), the popularity of the model, or the credibility of the organization. See also Wilson and colleagues' (2015) recent qualitative content analysis of key documents – publications, manuals, and training guides – that describe an emerging consensus on trauma-informed practices in the domestic violence context, as well as points of difference and tension.

It is important to note that trauma-*informed* services are different from, but related to, trauma-*specific* services. Whereas trauma-informed services are designed to be implemented at all levels of an organization and focus on limiting the potential for retraumatization among participants, trauma-specific services are aimed at treating actual trauma symptoms (Harris & Fallot, 2001a). Examples of trauma-specific services include grounding techniques, psychoeducation, mind-body approaches and body-based therapies, cognitive behavioral therapy, and complex trauma treatment (Courtois & Ford, 2009; Courtois & Ford, 2015; Jennings, 2004; Resick, 2003; Warshaw & Brashler, 2009). A number of trauma-specific interventions have been tested in experimental or quasi-experimental research designs. Several studies have also attempted to document the effectiveness of trauma-specific services for female survivors of domestic violence. For a systematic review of evidence-based, trauma-specific services for survivors of domestic violence, see Warshaw et al. (2013). It is important to note, however, that none of these studies focused on LGBQT* survivors.

Trauma-informed service models are inherently more difficult to study because they focus less on specific practices and more on general principles, and they rely on change at the organizational level. Nonetheless, the Women, Co-Occurring Disorders, and Violence Study (WCDVS) attempted to evaluate the impact of this approach. As the only longitudinal study of a trauma-informed approach, the WCVDS indicated that women who received trauma-informed services showed small but significant

improvements on mental health outcomes and trauma symptoms relative to treatment as usual, but no effect for substance abuse (e.g., Morrissey et al., 2005). Since then, researchers have developed several tools to measure the presence of trauma-informed principles and practices as experienced by survivors (see, Accessing Safety and Recovery Initiative & the National Center on Domestic Violence, Trauma, & Mental Health, 2012; Goodman et al., in press;), and are testing new measures of the effects of trauma-informed practices on survivor wellbeing (National Center on Domestic Violence, Trauma, & Mental Health, in development), yielding new possibilities for exploring this important approach.

Trauma-Informed Practices with LGBQT Survivors of IPV*

Despite the high rates of IPV and trauma in LGBQT* communities, trauma-informed approaches tailored to LGBQT* communities have been slow to develop. Some non-IPV trauma-specific interventions have been designed with input from LGBQT* individuals and with concern for LGBQT* cultural competence (e.g., de Arrellano, Ko, Danielson, & Sprague, 2008; Real Life Heroes and Target-A). In addition, the Technical Assistance Partnership for Child and Family Mental Health created a webinar that discusses trauma-informed care for LGBQT* homeless youth. However, there are few well developed trauma-informed approaches for LGBQT* clients in service settings generally, and none in the field of IPV services.

Because of the barriers and difficulties faced by LGBQT* survivors, providers who work with these particular communities may face unique challenges, including lack of resources both within and outside of the service organization, exposure to homo-, bi-, and transphobia through hotline prank callers, experiences of discrimination while attempting to connect survivors with resources, and the possibility of increased vicarious trauma through shared LGBQT* identities.

At the same time, advocates may find strength and resiliency through a shared LGBQT* identity, a strong sense of LGBQT* community, and increased work satisfaction in serving marginalized community members. Advocates who identify as LGBQT* also may be able to draw upon their own experiences of discrimination as a source of resilience in the face of hardship. However, these hypotheses, which are informed by the authors' extensive practice experiences, have not been explored in the literature; considerable research is needed to determine the strengths and job stressors for providers who work with LGBQT* survivors.

Examples of Community-Specific Approaches to Trauma

Although there are no well-developed LGBQT*-specific practices, several community-specific approaches that have been developed by members of culturally-specific communities that have experienced multiple and overlapping forms of oppression may serve as guides.

One example, "Indigenist coping," which was first posited by Walters and colleagues (2002), is a Native-specific model that asks providers to abandon a focus on individual pathology, and instead center the historical trauma, ongoing discrimination, and experiences as a colonized people within a first world nation that are the norm for Native peoples in the U.S. (Walters et al., 2002). The multiple traumas experienced by Native peoples both individually and collectively are the foundation of service provision.

Walters and colleagues interpret the disproportionate rates of substance use, mental health challenges, and HIV risk behaviors among Native people, as conditions that might best be addressed and healed within the context of reconnection to the history and spiritual and healing practices of the Native community. Perhaps the most interesting aspect of the Indigenist coping model is its focus on uprooting internalized colonization and integrating identity along political, ethnic, racial, cultural, and spiritual dimensions. Although this model is not specific to Two-Spirit peoples, it is Two-Spirit-inclusive, and provides a conceptual framework that is responsive to the layered traumas experienced by too many Two-Spirit individuals (Walters, et al., 2002).

Similarly, the National Latin@ Network for Healthy Families and Communities has long used human rights and social justice frameworks to interpret trauma. Specifically, they view trauma through an understanding of multiple kinds of historical & collective trauma, the traumatogenic impact of "non-traditional" traumas such as racism, nativism, poverty, and discrimination and unjust denial of services from helping systems currently and historically experienced by Latin peoples. The National Latin@ Network correspondingly looks to identity cultural traditions and collective knowledge and wisdom, as sources of resilience and post-traumatic growth, both for individuals and for entire communities. Much like the Indigenist coping model (Walters et al., 2002), the approach of the National Latin@ Network looks to the community for both healing and leadership (Serrata, 2012).

Transformative Justice as a Trauma-Informed Practice

Transformative justice analyses recognize systemic oppression as contributing to and exacerbating the impact of interpersonal and community violence and seeks justice at every level (Hairston & Oliver, 2006; Generation Five, 2007). Whereas trauma-informed practice was conceptualized in clinical and academic contexts, transformative justice grew out of a community-based intervention model. It moves away from criminalizing and pathologizing those who use violence and toward transforming organizations, conditions, and systems that perpetuate violence. It is critical that trauma-informed practices include transformative justice as an additional lens in service delivery and system reform.

Generation Five (2007), an advocacy-based project working to end childhood sexual abuse, has helped shape a practice-oriented understanding of transformative justice by offering several goals and principles needed to build greater capacity of communities to challenge traumatogenic systems. According to Generation Five, there are four specific goals of transformative justice: safety, healing, and agency for survivors; accountability and transformation for people who use violence; community action,

healing, and accountability among those in positions of power; and, transformation of the social conditions that perpetuate violence. Notably, these goals build on a set of core principles: 1) liberation, 2) shifting power, 3) safety, 4) accountability, 5) collective action, 6) honoring diversity and 7) sustainability. Here, we explain these principles by providing possible ways in which they could be applied to work with LGBQT* survivors.

Liberation refers to ending long-standing intergenerational cycles of systemic and family violence, which can be partly achieved by shifting power away from those whose power has been achieved through domination, oppression, and violence. In the case of LGBQT* survivors, shifting power includes listening and responding to survivors' articulation of their stories and needs in order to promote self-determination. Liberation and shifting power also applies to LGBQT* individuals who use violence: To end intergenerational cycles of violence, it is important to understand their violent behaviors within the context of institutions and norms that perpetuate violence against them. For example, DV organizations can adopt more fluid and nuanced definitions of "victim" and "perpetrator"; that is, definitions that allow for someone to be (or have been) both a victim of violence and someone who used violence. Doing so invites people's full trauma history into the conversation for consideration and healing.

Safety is conceptualized on three intersecting levels. First, on an individual level, LGBQT* survivors must be protected from immediate and future acts of violence via intervention and prevention efforts. Second, within individual communities, action must be taken to foster norms and practices that condemn violence and support conditions for healing. Finally, at the macro level, communities must be accountable to one other in order to challenge institutional power. Part of that accountability includes acknowledging the prevalence and impact of interpersonal and historical trauma on individuals and communities as well as committing to survivor empowerment and healing. For example, mainstream DV programs can develop relationships with LGBQT* community members and programs to work toward long-term accountability of culturally sensitive service provision. They also can engage in ongoing program evaluation, including open discussion of policies, procedures, and staff profiles, in an effort to transform trauma-inducing organizational norms. Futures Without Violence (n.d.) has developed a series of "Program Personnel Policy Questions" for DV organizations to assess their readiness to work with children and teens; many of these questions can be amended to assess readiness to work with LGBQT* survivors. The National Center on Domestic Violence, Trauma & Mental Health's Accessible, Culturally Relevant, DV & Trauma-Informed (ACDVTI) Agency Self-Assessment Tool also provides guidance on organizational readiness and LGBTQ* inclusiveness.

Collective action highlights the need to address cycles of isolation and shame resulting from traumatic experiences by building alliances with communities to transform structures that perpetuate abuse. Additionally, honoring diversity includes creating and implementing interventions that respond to the unique needs of each community. Finally, sustainability refers to building internal capacity of intimate and community networks to support and maintain survivor-centered safety and healing. These last three principles highlight how social service organizations must incorporate advocacy efforts into

their work and cannot operate in isolation. Instead, they must learn from and collaborate with other organizations, specifically culturally specific organizations. Such collaboration includes not only LGBQT* organizations but also organizations that reflect the range of identities that LGBQT* survivors possess. Incorporating a diversity of expertise and perspective into programs and policies is critical for providing a more trauma-informed approach.

Conclusion

This literature review documents the need for LGBQT*-specific trauma-informed practices with survivors of IPV. IPV is at least as common among LGBQT* individuals as heterosexuals, and may be highest in bisexual and transgender communities. Furthermore, although LGBQT* IPV shares many underlying dynamics with IPV in heterosexual couples, it also has unique characteristics, including the types of abusive tactics used and the context of discrimination and social stigma faced by LGBQT* individuals. Moreover, there are additional complexities within LGBQT* subgroups.

LGBQT* survivors also face unique barriers to help-seeking. Overall, LGBQT* individuals are less likely to seek services from law enforcement and mainstream providers and more likely to rely on informal social support and LGBQT*-focused programs. There are also differences in help-seeking *within* LGBQT* subgroups. For instance, trans individuals may have an especially difficult time accessing culturally competent and non-traumatizing services. For LGBQT* people of color, stigma, economic constraints, and the absence of community outreach are barriers to accessing services.

Trauma and mental health are major concerns in LGBQT* communities in general, and for LGBQT* survivors specifically. LGBQT* individuals experience higher rates of traumatic events, and may be more susceptible to developing symptoms of PTSD, depression, isolation, suicidality, and anxiety. These concerns, which must be viewed in the context of historical trauma, are amplified for LGBQT* people of color and transgender individuals. Nonetheless, LGBQT* individuals find strength and resilience through identity affirmation and social support. More research focused on the strengths and sources of resilience of LGBQT* people is needed to complement and inform existing research on pathology and barriers.

Despite the high rates of IPV and trauma that LGBQT* communities experience, trauma-informed approaches tailored to LGBQT* survivors have been slow to develop. We hope that this document will facilitate thinking about how the core principles of trauma-informed practice can be applied to working with this community and to ameliorating vicarious traumatization among service-providers who do their best in difficult circumstances. The practice-based observations in the Appendix provide further framing for this important endeavor.

Appendix A: Existing Trauma-Informed Approaches

Trauma-informed Approach	Trauma-informed Care with LGBQT* Homeless Youth
Community	LGBQT* Homeless Youth

Principles	Examples of Practices
• Recovery is possible • Healing happens in relationships • Sharing power and governance • Understanding trauma and its impact • Promoting safety • Supporting client control, choice, autonomy • Focus on strengths • Integrating cultural awareness	• Organizational commitment to nondiscrimination and cultural competence • Involve LGBQT* youth in decisions about services • Provide positive LGBQT* role models • Coordinate with LGBQT* service and advocacy organizations • Collaborate with other organizations • Outreach to change public awareness • Include LGBQT* youth in outreach • Assess staff for knowledge, attitudes, skills

Poirier, J., Murphy, C., Shelton, J., & Costello, S. (2013). Ending LGBT youth homelessness: A call to action. Retrieved from http://tapartnership.org/events/webinars/webinarArchives/presentationSlides/20130710_LGBThomelessness_FINAL.pdf

Trauma-informed Approach	Trauma-Informed or Trauma-Denied
Community	Female Survivors of Trauma

Principles	Examples of Practices
• Recognize the impact of violence and victimization on development and coping • Identify recovery from trauma as primary goal • Employ an empowerment model • Strive to maximize women's choice and control over recovery • Services are based in relational collaboration • Create an atmosphere respectful of survivors' need for safety, respect and acceptance • Emphasize women's strengths, adaptations and resiliency • Minimize retraumatization • Services are culturally competent and understand each woman in context • Solicit participant input and involve participants in designing and evaluating services	• Outreach and Engagement: prioritize safety, ask permission, follow client's lead • Screening and Assessment: screen all clients for trauma history, understand survivor's unwillingness to answer certain questions, only ask for necessary information, balance usefulness of information against client needs, clearly communicate reason for asking questions • Resource Coordination and Advocacy: focus on empowering clients, identify strengths, emphasize skill-building • Crisis Intervention: plan for crises in advance, avoid using restraints or forced hospitalizations, make sure clients know their options • Trauma-Specific Services: offered in trauma-informed environment by individuals trained in trauma and its treatment • Parenting Services: build on parents' strengths • Mental Health and Substance Abuse: treat trauma and substance abuse in integrated way, emphasize physical and emotional safety, collaborate on treatment • Healthcare: prepare clients for medical appointments that might be triggering, debrief and review information provided during exam

Elliot, D. E., Bjelajac, P., Fallot, R. D., Markoff, L. S., & Reed, B. G. (2005). Trauma-informed or trauma-denied: Principles and implementation of trauma-informed services for women. *Journal of Community Psychology, 33*(4), 461-477.

Trauma-informed Approach	The Sanctuary Model
Community	Originally for adults who experienced abuse as children, adapted to domestic violence settings

Principles	Examples of Practices
• Core Concepts: nonviolence, viewing organization as whole entity, parallel processes • 7 Commitments: • Nonviolence: physical and psychological nonviolence at all organizational levels • Emotional Intelligence: staff must cultivate awareness of emotional responses and be able to manage and talk about them • Social Learning: organization must be dynamic and constantly identify and respond to changing needs of communities being served • Open Communication: organization should espouse transparency, nonviolent language, and effectively manage conflicts • Democracy: everyone at the agency, clients and staff, should have a voice that is heard • Social Responsibility: create a just and safe organization • Growth and Change: focus should be on the future, with goal of changing and growing over time	

The Sanctuary Model. Accessed 7/2014, from http://www.sanctuaryweb.com/

Trauma-informed Approach	National Center for Domestic Violence, Trauma & Mental Health's Accessible, Culturally Relevant, Domestic Violence-and Trauma-Informed (ACDVTI) Agency Self-Assessment Tool
Community	Domestic violence survivors and programs

Principles	Examples of Practices
• ACDVTI Approach • Be sensitive to the pervasiveness of trauma and its impact on survivors, staff and organizations including historical trauma and ongoing experiences of discrimination and oppression • Recognize the role of coercive control and DV-related safety and confidentiality concerns • Ensure services are welcoming, inclusive, accessible and culturally responsive • Work to minimize retraumatization • Support resilience, healing and well-being • Employ a collaborative strength-based approach • Attend to the quality of interactions for people using services and staff • Involve people using services and communities being served in shaping and evaluating services • Maintain a commitment to changing the conditions that contribute to abuse, violence, discrimination & oppression • Key tenets include recognizing the importance of • Physical and emotional safety • Relationship & connection • Respect, empowerment, transparency, collaboration & choice • Hope & resilience • A survivor-defined approach	The ACDVTI tool provides guidance on engaging in a reflective organization-wide self-assessment process. It is structured to walk agencies through a process of considering what an ACDVTI approach would look like in each of the following 7 domains. • Organizational Commitment and Infrastructure • Staff Support • Physical, Sensory and Relational Environment • Intake Process • Programs and Services • Community Partnership • Evaluation and Feedback It also includes a section on organizational readiness.

Introduction and Project Overview

This document contains a set of preliminary practice observations from the field, which are intended to inform the development of a trauma-informed transformative justice approach specific to lesbian, gay, bisexual, queer, and transgender (LGBQT*) survivors of intimate partner violence (IPV). These observations are the result of a research project that was led by the GLBTQ Domestic Violence Project (GLBTQ-DVP) and funded by the Administration for Children, Youth and Families, Family and Youth Services Bureau, US Department of Health and Human Services.

The goal of the project was to help develop a culturally-specific, trauma-informed approach to working with LGBQT* survivors with support and input from a range of stakeholders. To meet this goal, the following activities[1] were conducted over the course of two years (2013-2015):

- A substantive literature review on intimate partner violence in the LGBQT* communities (page 1), which is intended to be read in tandem with the observations
- Input from an advisory committee that included Queer Muslims of Boston, the Hispanic Black Gay Coalition, the Northeast Two Spirit Society, the Massachusetts Alliance of Portuguese Speakers, HarborCOV, Massachusetts Asian & Pacific Islanders for Health, and Fenway Health
- Two focus groups with survivors participating in one GLBTQ DVP program, the goal of which was to explore their experiences seeking help
- Three separate focus groups and multiple individual conversations with staff of one GLBTQ DVP program to assess their perceptions, experiences, and ideas about trauma-informed organizations and providing trauma-informed services
- Surveys of the program's staff as well as LGBQT* practitioners nationally to assess knowledge and experience of trauma-informed practices
- Informal conversations with staff and leadership of LGBQT* culturally-specific organizations across the country
- The authors' own collective experience working with LGBQT* organizations and communities over the past 30 years
- Considerable guidance from the National Center on Domestic Violence, Trauma, & Mental Health

From these multiple sources of data, a set of six observations emerged, which then were simplified and distilled in the hopes that they will be broadly applicable. They are listed here and explained in detail in the subsequent pages.

- Observation 1: The majority of LGBQT* survivors have experienced multiple forms of violence and abuse in their lives. Experiences of historical trauma and ongoing discrimination can compound these multiple experiences of victimization.

[1] The Simmons College Institutional Review Board approved the research activities involving human subjects (i.e., interviews and focus groups with practitioners and program participants).

- Observation 2: Organizations that work with LGBQT* survivors must operate from a place of understanding that perceived "challenges" may actually be creative strengths.

- Observation 3: Organizations that work with LGBQT* survivors must operate from the premise that if LGBQT* communities, staff, board members, organizations, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their family of choice, not merely as a service provider or colleague.

- Observation 4: If practitioners are to truly be of service, a social justice and anti-oppression framework must become the cornerstone of their individual work, their organization's work, and their organization's interactions with the community.

- Observation 5: Staff self-care (and organizational support for self-care) is critical.

- Observation 6: There is a profound need for transformative justice[2] approaches to working with LGBQT* and other multiply oppressed communities.

It is important to note that the authors view these observations as dynamic and evolving, and we are hopeful that LGBQT*organizations, practitioners, activists, and researchers will expand upon them as part of their own trauma-informed, anti-oppression, transformative justice work. Some sections of this addendum tie directly to the literature review (e.g., observations 1 and 5), and others do not. Also, although these observations grew in tandem with the literature review – and should be read together – some of the ideas are not yet supported by a body of literature. Rather, they reflect the practice wisdom and lived experience of LGBQT* practitioners and LGBQT* survivors who contributed to this project.

The practice observations and companion literature review are intended primarily for staff in domestic and sexual violence organizations; however, they are applicable to practitioners in other anti-abuse disciplines, homelessness services, mental health and healthcare circles, criminal legal systems, youth services, and an array of other human services disciplines and social change endeavors that seek to serve and ensure the inclusion of LGBQT* communities.

[2] The authors wish to thank Hales Burton at the Fenway Violence Recovery Program for first suggesting this conceptual shift.

A Note on Language[3]

Before describing the observations, the authors wish to acknowledge the deep complexities of language. In this document, IPV refers to the physical and/or emotional abuse of an individual by a current or former intimate partner. It includes the full range of tactics used to create and maintain power and control over another person, including financial abuse, verbal abuse and intimidation, and cultural abuse. In this document, the phrases *intimate partner violence* and *domestic violence* are used interchangeably to denote partner violence. However, it is important to note that domestic violence (DV) is sometimes defined more broadly to include violence and abuse perpetrated by relatives. Although many LGBQT* individuals experience abuse and/or rejection from family and relatives, the dynamics of partner violence versus family violence may differ dramatically. When we discuss the latter, we use the phrase *family violence* to distinguish it from violence by an intimate partner.

LGBQT* stands for lesbian, gay, bisexual, queer, and transgender. It is often used interchangeably with GLBTQ, LGBQT-TS, and similar acronyms to broadly refer to sexual and gender minorities. This document honors the current practice of including an asterisk after the "T" to signify the broad diversity of trans communities, including trans women – transgender individuals who identify as women, though assigned male at birth; trans men – transgender individuals who identify as men, though assigned female at birth; those transitioning from female to male (FTM); those transitioning from male to female (MTF); cross dressers; gender non-conforming individuals; and others who might self-identify as being members of trans communities. In this paper, transgender and trans are used interchangeably.

These definitions belie the complexity of the terms, however. The words *lesbian*, *gay*, *bisexual*, *transgender*, and *queer* all carry particular historical, political and cultural meanings. To a great extent, these words have been shaped in white, Western contexts. Words such as lesbian, gay, and bisexual, for example, are uniquely English. There are seldom translations into other languages that carry the same understanding of LGBQT* identity as being an identity rather than a set of behaviors. Literal translations, into Spanish or Haitian Creole as but two examples, carry few if any of the presumptions that are inherent in English. In many parts of the Latin and Spanish-speaking world, men who engage in sex with same sex partners are only considered "gay" in the English sense of the word if they are the receptive partner. It is not engaging in the acts that is the determinant of identity, so much as the role that an individual plays (traditionally read as *masculine* or *feminine*) in the conduct of that act. Similarly, men who marry women, but engage in same sex acts with other men, are frequently identified as heterosexual. In short, they are defined by their social role, rather than by their private, intimate acts. Hence the conception of *gay*, as defined in U.S. contexts, frequently fails to apply.

Precisely because identifiers such as LGBQT* were defined in white middle class and academic contexts, the limitations of LGBQT* labels and identifiers may be particularly acute in communities of

[3] For those of you who are reading the literature and practice observations in tandem, please note that this "note on language" section is identical to the "note on language" section in the literature review.

color, Indigenous communities, and immigrant communities, among others. During the course of crafting this literature review, members of our Advisory Board taught us a tremendous amount. The Hispanic Black Gay Coalition (HBGC) suggested use of the term *same gender loving*, a community-specific phrase coined by Cleo Manago to distinguish African Americans, and in particular African American men, who do not self-identify as being part of the predominantly white gay movement in the U.S., but who nonetheless wish to affirm their same sex intimate relationships. Corey Yarbrough, one of the founding Executive Directors of HBGC, suggested that for some same gender loving people this language may be a form of racialized resistance to the racism of the mainstream LGBQT* movement in the U.S. In the alternative, Corey stated, some members of African American communities may be on the *down low*, engaging in same sex sexual activity, but rejecting LGBQT* identifiers as a result of internalized homo and biphobia.

The NorthEast Two-Spirit Society (NETSS) in part echoed Corey's thoughts about the racism of the mainstream LGBQT* movement. In addition, Harlan Pruden, one of co-founders of NETSS, spoke about an "internal muddiness" that some Native peoples may experience when seeking to find language for their experience. Speaking of his own Cree inheritance as a registered member of the Saddle Indian Reservation, Harlan said that when he asked something of an elder, he knew to offer them tobacco, but never understood the spiritual dimension of the ceremony. Having been separated from too much of their own history by colonialism, genocide and forced assimilation, Harlan stated, many Native people may use the words *Two-Spirit* when what they really mean is gay Indian.[4]

Harlan also spoke at length about the contextual nature of Native Two-Spirit identities. As Harlan put it, "When I am out on a Friday night in a gay club, I am a gay man. Yet when I am in rural Oklahoma at a Two-Spirit gathering, I am a proud Two-Spirit man." Alluding to the unique role and cultural responsibilities that Two-Spirit people often held (and may still hold) in the life of Native communities, Harlan pointed out the obvious differences in the spiritual role of Two-Spirit peoples, and the political and social function of people claiming LGBQT* identities in mainstream communities. Several members of the project's advisory board echoed this point,
speaking about the complex layering of cultural and spiritual value systems that accompanied their choice to self-identify in, with, and outside of their own communities.

These same Advisory Board members also acknowledged the landscape in which such decisions are made, and stated that individuals in their communities may shift how they self identify as a means of preserving their safety. As the rest of this literature review discusses, LGB, transgender, same gender loving, Two-Spirit, and queer-identified peoples make choices about how, when, and if to "out" themselves in a complex social and political landscape that is too often unsafe, if not violent. Hence how

[4] Two-Spirit is a contemporary term, adopted from the Northern Algonquin, and meant to signify the embodiment of both masculine and feminine within one person. Now embraced by many Native peoples as a pan-Indigenous umbrella term connoting both diverse gender expressions and sexual orientations, Two-Spirit generally speaks to the respect that Native peoples held for diversity, and the unique sacred and ceremonial roles that Two-Spirit people held (and may still hold) within their own communities. Herein the phrase Two Spirit speaks not simply to a third gender, or to same gender attraction, but more broadly to the history of compulsory Christianization that sought to erase Two-Spirit peoples within their own nations. Notably, there is no single consensus definition of Two-Spirit, and the term means different things to different Native peoples.

any individual self-identifies may shift depending on who is asking, why, and in what context. As one Advisory Board member stated, "identities have to be fluid in order to be protective."

Finally, the leadership of HarborCOV, an LGBQT*-affirming DV organization in Boston that specializes in serving communities facing cultural or linguistic barriers, has noted that some cultures may not have the variety or depth of language that words such as LGB, transgender, same gender loving, and Two-Spirit convey. Indeed, Kourou Pich, Co-Executive Director of HarborCOV has observed that people from some cultures and communities may have difficulty finding language for themselves in their own communities, and that that invisibility is intentional – a function both of denial of the existence of sexual minorities in those communities, but also perhaps protectiveness of gender queer and same gender attracted people.

Language is power. We authors, therefore, have put a great deal of thought into the words we use to name peoples' experiences. At the same time, we know that we can never be as inclusive or sensitive as we want to be. We have done our best to honor the range of experiences we are writing about in this document.

Notes from the Field: A Set of Practice-Base Observations

Observation 1: The majority of LGBQT survivors have experienced multiple forms of violence and abuse in their lives. Experiences of historical trauma and ongoing discrimination can compound these multiple experiences of victimization.*

A trauma-informed approach, at its core, asks that practitioners assume that everyone they serve has experienced some form of violence, abuse, or other trauma in their lives and to see these experiences as the norm, rather than the exception (Felitti et al., 1998; Harris & Fallot, 2001).

Given the prevalence and overlapping nature of violence and abuse in the lives of LGBQT* peoples, it might be more prudent to suggest that practitioners build practices and systems that presume *multiple* forms of victimization among the people they serve. It is not unusual for LGBQT* peoples to be targets of many different forms of violence and abuse at the hands of multiple individuals, at numerous points throughout the lifespan (Roberts, Austin, Corliss, Vandermorris, & Koenen, 2010; Grant, Mottet, & Tanis, 2011; Stotzer, 2009).[5] Indeed, traumatic experiences such as intimate partner

[5] To date, the fragmented nature of the research into violence and abuse in the lives of LGBQT* individuals means that, although there is a broad practice consensus about the prevalence of "polyvictimization" in the lives of LGBQT* peoples, there is little peer-reviewed research examining the phenomenon. However, there is abundant evidence that LGBQT* people, and in particular LGBQT* people of color, are more likely to be targeted for multiple forms of violence and abuse, in multiple contexts (family, partnerships, community) over the course of their lifetime. For example, LGBQT* peoples are disproportionately subject to childhood sexual abuse, bullying by peers, sexual violence in adolescence and adulthood, intimate partner violence, hate crimes, and police brutality (Roberts et al., 2010; Grant et al., 2011; Stotzer, 2009). Again, the authors wish to encourage individuals to read these observations in tandem with the literature review to learn more about these siloed areas of research.

violence, family violence, and other types of trauma that occur over the course of the lifespan, including childhood sexual assault, bullying, hate crimes, or police brutality, may intersect and compound each other in the lives of LGBQT* survivors in ways that create unique challenges for survivors themselves, and unique opportunities for control by future perpetrators.

These interpersonal traumas are often further compounded by experiences of oppression and historical trauma in LGBQT* communities. LGBQT* peoples have historically experienced discrimination at the hands of helping professionals in a range of systems (e.g., healthcare, mental health, criminal-legal, child protection, public assistance, and sexual and domestic violence organizations) – if LGBQT* peoples have been visible in those systems at all.[6] In addition, many of these systems (in particular mental health and criminal-legal systems) have not only pathologized, labeled, isolated, and detained LGBQT* individuals, but also intentionally fractured LGBQT* partnerships, families, and communities. Such treatment is especially the case for multiply marginalized LGBQT* communities, such as communities of color, immigrants and refugees, Two Spirit communities, and people with disabilities.

It is important to understand, however, that these forms of oppression are not merely historical artifact in the lives of LGBQT* survivors, but ongoing and continuing realities, especially for those who are multiply marginalized. This ongoing oppression then exacerbates experiences of current and historical trauma.

A trauma-informed approach encourages practitioners, and indeed entire systems, to minimize the possibilities for retraumatization by creating an atmosphere that prioritizes survivor's need for safety, respect, and acceptance (Elliot, Bjelajac, Fallot, Markoff, & Reed, 2005; Guarino, Soares, Konnath, Clervil, & Bassuk, 2009; Jennings, 2004; Substance Abuse and Mental Health Services Administration, 2014; Warshaw, 2014; Wilson, Fauci & Goodman, 2015). In short, a trauma-informed approach asks first and foremost that practitioners – as well as the systems in which they work – do no harm.

However, for LGBQT* survivors in particular, the mandate to do no harm requires that practitioners understand the concept of *sanctuary harm* – the idea that institutions and institutional gatekeepers can inflict enormous damage on the very people whose healing, empowerment, and safety they are supposed to nurture and protect (Bloom & Farragher, 2011; Smith & Freyd, 2014). Survivors who participated in the focus groups for this project spoke of blatant discrimination, noting, for example, institutions and practitioners who had at times openly refused services to male and LGBQT* survivors. And, in the staff focus groups, participants spoke about the challenges of advocating with organizations that had a funder mandate to be LGBQT* inclusive, but who were still actively resistant to accepting some members of this diverse community.

[6] The authors are mindful that historical trauma means different things in different communities. Many members of First Nation communities frame historical trauma in terms of colonization, genocide, and boarding-school trauma. Members of Jewish communities may frame historical trauma in terms of the intergenerational impact of the Holocaust. And members of the African Diaspora may think of the Middle Passage and the enslavement of African peoples when referencing historical traumas. The specific nature of the historical influences the way it continues to affect the lives of individuals and entire communities.

Conversations with LGBQT* practitioners across the country, especially those from mainstream organizations, surfaced deep ethical tensions over their own roles as institutional actors in organizations and agencies that they believed too often inflicted sanctuary harm. Consciousness of the harm they were doing – and the good they were prevented from doing – was a significant source of mental, emotional, and ethical distress for many practitioners, especially when contrasted with their larger awareness of the needs of the communities and people they were serving.

Observation 2: Organizations that work with LGBQT survivors must operate from a place of understanding that perceived "challenges" may actually be creative strengths.*

Recognizing the potentially significant impact of violence and abuse on development and coping strategies, a trauma-informed approach aims to contextualize coping strategies such as substance use, cutting, eating disorders, "promiscuous" sex, and dissociation as adaptive responses to otherwise intolerable situations (Elliot et al, 2005; Guarino et al., 2009; Jennings, 2004; SAMHSA, 2014, Warshaw 2014). Because it is rooted in clinical frameworks, trauma-informed practice approaches often frame such strategies as necessary within the context of abuse, but no longer adaptive once relative safety had been achieved. Following the examples of Kate Bornstein and Sylvia Rivera, the LGBQT*-specific practitioners who participated in the survey and informal conversations spoke about celebrating survivors' coping strategies as not merely adaptive, but indeed creative, even when such strategies are not on the surface immediately conducive to health or perceived well-being. Given the multiple forms of victimization, ongoing discrimination, and historical trauma that shape the LGBQT* experience, it may be that there is no safety anywhere. In that context, any strategy that allows people to survive – internally or externally – is to be celebrated. As one practitioner put it, "It isn't about coping, it is about surviving. We celebrate survival, because it is so uncertain." Such a response should not preclude practitioners from expressing concern or helping survivors to develop alternative survival strategies in parallel; however, it does require that practitioners fully embrace survivors and honor and respect their own strategies.

Observation 3: Organizations that work with LGBQT survivors must operate from the premise that if LGBQT* communities, staff, board members, organizations, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their family of choice, not merely as a service provider or colleague.*

A trauma-informed approach asks that practitioners base everything they do in relational collaboration. In fact, one of the core principles of a trauma-informed approach is to ensure that goals and strategies are collaboratively defined, and that the partnership between survivor and practitioner is itself a place of healing (Elliot, et al, 2005; SAMHSA, 2014; Warshaw, 2014; Davies & Lyon, 2014; Wilson et al., 2015).

Just as with other historically oppressed communities, the complexities of the LGBQT* experience may be such that a traditional relationship between service provider and client is not sufficient to fully support the person's healing. Instead, a different and more porous set of boundaries may be required – or at least expected. As several LGBQT* practitioners put it, when LGBQT* communities, staff, co-workers, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their "family of choice," not merely as a service provider. Program participants supported this sentiment, describing how one of the most important and helpful aspects of the services they received was the staff's willingness to go "above and beyond their job descriptions." Providing the sort of attention that a friend might provide (e.g., calling to check in or going along to doctor's appointments) was important because, as one survivor expressed, "I had never been treated that way in my life, not even by my family." Although this can raise complex ethical issues for both survivors and practitioners in navigating this important but complicated terrain, recognizing it is critical in working with LGBQT* survivors and working within LGBQT* communities.

Observation 4: If practitioners are to truly be of service, a social justice and anti-oppression framework must become the cornerstone of their individual work, their organization's work, and their organization's interactions with the community.

Another principle of trauma-informed practice is to respond to all people in ways that are sensitive to their individual social locations and contexts (Wilson et al., 2015; see also Elliot, et al, 2005; Jennings, 2004; Guarino et al., 2009; SAMHSA, 2014; National Center on Domestic Violence, Trauma & Mental Health, in press). At a minimum, this principle sets forth an expectation of cultural sensitivity across multiple aspects of identity. Given the chronic and cascading traumas, ongoing oppression and historical trauma referenced above, cultural sensitivity is essential but not sufficient for responding to the experiences of LGBQT* survivors. Instead, attention to individual social locations and contexts must be situated within a broader anti-oppression framework.

LGBQT* practitioners from across the country observed that the broader movements against sexual and domestic violence sometimes minimized the ways in which violence and abuse intersect with other forms of oppression. They took note not simply of the ways in which this lack of proactive attention shaped direct services, but also how it shaped their organization's hiring practices, the tokenization of staff members from historically marginalized communities, the narrow makeup of their organization's governing board, the focus on quantity over holistic quality of services, and the lack of input particularly from transgender community members and community members of color in strategic planning and other organizational activities.

By contrast, they called on practitioners to build organizations that are integrated into and learn from the historically marginalized communities they serve (or should be serving) and that center the knowledge and experiences of those communities. Historically oppressed communities, including LGBQT* communities, are at the leading edge of anti-violence work, not a set of "minority communities" requiring special logistics or uniquely special care. What organizations learn from historically oppressed communities should serve as the foundation of their organizational philosophy, practices, and policies.

Observation 5: Staff self-care (and organizational support for self-care) is critical.

Empathic engagement and bearing witness to other people's pain can affect us deeply. To be effective, it is important for service providers and activists serving people in pain and crisis to be mindful of how they have been affected by their own experiences of trauma *and* how they are affected when they open themselves up to other people's experiences (Saakvitne, Gamble, Pearlman, & Lev, 2000; Hopper, Bassuk, & Olivet, 2010; Bloom & Farragher, 2013; SAMHSA, 2014). Hence, an understanding of vicarious trauma and encouragement to develop strong habits of self-care have become foundational principles in trauma-informed practice (Bloom & Farragher, 2011; Bloom & Farragher, 2013). Thus, to be truly trauma-informed, organizations need to institute programmatic supports for self-care at all levels of the organization (Bloom & Farragher, 2011; Bloom & Farragher, 2013, Warshaw 2014).

Conversations with LGBQT* practitioners across the country led to an additional observation: There is a particular weight that accompanies serving LGBQT* people experiencing violence, abuse, and discrimination while simultaneously identifying with those same communities. Trauma, vicarious trauma, organizational trauma, and historical trauma compounded one another in the lives of the LGBQT* practitioners who contributed to this project, just as they do for the survivors who participate in their programs. Moreover, the impact of compounding trauma was one each group articulated virtually unanimously. Their experiences underscore the need for self-care at the individual level. They also point to need for organizational policies that enable self-care, provide LGBQT*-affirming workspaces, and facilitate connection with the larger community of providers and activists that support and depend upon the work and health of that organization. Essentially, caring for each other individually and as a collective is a critical element of any trauma-informed approach.

Observation 6: There is a profound need for transformative justice[7] approaches to working with LGBQT and other multiply oppressed communities.*

Because the companion literature review focused largely on peer-reviewed, published literature, it did not consider the enormous array of activist literature and art that historically oppressed communities have often used to express their communal strategies for survival and resistance. The work of Incite!, Creative Interventions, Black & Pink, and Break Out, along with broader bodies of art, music, dance, autobiography, fiction, and oral history attest to this creative communal drive.

One innovation that has emerged from this kind of activist energy is the concept of *transformative justice* (Generation Five, 2007; Creative Interventions, 2012). Transformative justice recognizes the profound harm and trauma that mainstream approaches have inflicted on LGBQT* peoples, particularly those who face multiple forms of oppression. Its practitioners argue for an approach that understands these historical harms and seeks to create new and innovative responses that avoid replicating them. Rather than work within the framework of social services, it aims for the liberation of oppressed people as communities not just as individuals, under the fundamental

[7] The authors wish to thank Hales Burton at the Fenway Violence Recovery Program for first suggesting this conceptual shift.

assumption that “individual justice and collective liberation are equally important, mutually supportive, and fundamentally intertwined” (Generation Five, 2007, p.1). In other words, transformative justice seeks to transform the political and cultural conditions that allow violence, abuse and oppression to exist in the first place. It is critical that trauma-informed practices include transformative justice as an additional lens in service delivery and system reform.

Conclusion

In summary, these six observations underscore the ways in which individual, interpersonal, and structural factors coalesce in the lives of LGBQT* survivors of domestic violence, creating a unique context, that affects their experiences and needs. Future trauma-informed approaches for LGBQT* survivors of domestic violence should consider the multi-layered context that surrounds LGBQT* survivors and use that knowledge to inform not only client-level practices, but also organizational-level policies.

Growth after trauma

Why are some people more resilient than others—and can it be taught?

By Lorna Collier
November 2016, Vol 47, No. 10
Print version: page 48

As Kay Wilson struggled to make her way through a Jerusalem forest after being repeatedly stabbed by a Palestinian terrorist, she distracted herself from her agony by playing the song "Somewhere Over the Rainbow" in her mind, composing a new piano arrangement while she fought for breath and forced herself to put one bare foot in front of the other.

Wilson, then 46, had been working as a tour guide when, on Dec. 18, 2010, she and a friend were ambushed by terrorists. Wilson witnessed her friend's murder and was herself viciously stabbed with a machete, ultimately playing dead as her attacker plunged his knife into her chest a final time.

She eventually recovered from her severe physical wounds and is healing from her psychological trauma. She now speaks to global audiences about her survival, hoping to "dispel hatred, whether toward Arabs or Jews."

The work "helps me make meaning out of something so senseless," says Wilson, who is also writing a book about her experiences.

After the attack, Wilson had flashbacks and deep survivor's guilt. But like many people who have survived trauma, she has found positive change as well—a new appreciation for life, a newfound sense of personal strength and a new focus on helping others.

Post-traumatic growth (PTG) is a theory that explains this kind of transformation following trauma. It was developed by psychologists Richard Tedeschi, PhD, and Lawrence Calhoun, PhD, in the mid-1990s, and holds that people who endure psychological struggle following adversity can often see positive growth afterward.

"People develop new understandings of themselves, the world they live in, how to relate to other people, the kind of future they might have and a better understanding of how to live life," says Tedeschi.

How can clinicians use PTG theory to help patients? How has new research helped refine understanding of it? Here's a look at developments in the field.

Signs of post-traumatic growth

PTG can be confused with resilience, but the two are different constructs (see "The post-traumatic growth inventory" below).

"PTG is sometimes considered synonymous with resilience because becoming more resilient as a result of struggle with trauma can be an example of PTG—but PTG is different from resilience, says Kanako Taku, PhD, associate professor of psychology at Oakland University, who has both researched PTG and experienced it as a survivor of the 1995 Kobe earthquake in Japan.

"Resiliency is the personal attribute or ability to bounce back," says Taku. PTG, on the other hand, refers to what can happen when someone who has difficulty bouncing back experiences a traumatic event that challenges his or her core beliefs, endures psychological struggle (even a mental illness such as post-traumatic stress disorder), and then ultimately finds a sense of personal growth. It's a process that "takes a lot of time, energy and struggle," Taku says.

Someone who is already resilient when trauma occurs won't experience PTG because a resilient person isn't rocked to the core by an event and doesn't have to seek a new belief system, explains Tedeschi. Less resilient people, on the other hand, may go through distress and confusion as they try to understand why this terrible thing happened to them and what it means for their world view.

To evaluate whether and to what extent someone has achieved growth after a trauma, psychologists use a variety of self-report scales. One that was developed by Tedeschi and Calhoun is the Post-Traumatic Growth Inventory (PTGI) (*Journal of Traumatic Stress*, 1996). It looks for positive responses in five areas:

- Appreciation of life.
- Relationships with others.
- New possibilities in life.
- Personal strength.
- Spiritual change.

The scale is being revised to add new items that will expand the "spiritual change" domain, says Tedeschi. This is being done "to incorporate more existential themes that should resonate with those who are more secular" as well as reflect cross-cultural differences in perceptions of spirituality.

A predisposition for growth?

How many people experience PTG? Tedeschi prefers not to put a hard number on it.

"It all depends on the trauma, the circumstances, the timing of the measurement ... [and] on how you define growth using the PTGI, looking at total score, means, factors or individual items," he says. However, he estimates that about one-half to two-thirds of people show PTG.

Some PTG researchers have tried to corroborate self-reported growth by questioning friends and family members about whether growth "sticks."

"We are getting more studies that show that PTG is generally stable over time, with a few people showing increases and a few showing decreases," Tedeschi says. "It is now up to us to learn what is going on with those who change over time, but the evidence is for stability in general, and also corroboration by others."

There appear to be two traits that make some more likely to experience PTG, says Tedeschi: openness to experience and extraversion. That's because people who are more open are more likely to reconsider their belief systems, says Tedeschi, and extroverts are more likely to be more active in response to trauma and seek out connections with others.

Women also tend to report more growth than men, says Tedeschi, but the difference is relatively small.

Age also can be a factor, with children under 8 less likely to have the cognitive capacity to experience PTG, while those in late adolescence and early adulthood—who may already be trying to determine their world view—are more open to the type of change that such growth reflects, says Tedeschi.

There also may be genetic underpinnings for PTG, but researchers are just beginning to tease this out. In a 2014 study in the *Journal of Affective Disorders*, for example, Harvard social and psychiatric epidemiologist Erin Dunn, ScD, and a team of researchers examined data previously collected from over 200 Hurricane Katrina survivors and found that variants in the gene RGS2 significantly interacted with levels of exposure to the hurricane to predict PTG. RGS2 is linked to fear-related disorders, such as post-traumatic stress disorder, panic disorder and anxiety.

Dunn calls the results "very interesting" but notes that "we have to be somewhat cautious in interpreting it because we were unable to find a similar sample to replicate that finding."

Sarah Lowe, PhD, of Montclair State University, who worked with Dunn on the research, says one difficulty with gene studies for PTG is the concept's complexity. "If you look at what predicts PTG, it is often psychological stress and dysfunction—but also more positive personality traits like optimism and future orientation, which you'd expect would have a very different genetic basis," she says.

Theory into practice

Is it possible to prepare people for PTG, to pave the way should tragedy or trauma strike? Yes, says Tedeschi, noting that psychologists can "allow people to understand that this may be a possibility for themselves" and is a "fairly normal process" if and when trauma occurs.

More often, though, therapists will become involved not before adversity has occurred, but afterward. In this context, they can introduce PTG concepts but need to take care doing so.

H'Sien Hayward, PhD, cautions that therapists should not "jump right into the possibility of growth," which she says can "often be construed as minimizing someone's pain and suffering and minimizing the impact of the loss."

Hayward, who works with veterans at VA Long Beach Medical Center in Long Beach, California, knows about such growth firsthand: She was paralyzed in a car accident when she was 16, ending a competitive athletic career. She overcame that trauma through the help of supportive family and friends, went on to study social psychology at Harvard and has traveled to more than 42 countries, often on humanitarian missions providing counseling and other support to trauma victims. Today, she credits the accident for increasing her strength of character "exponentially" by forcing her to overcome challenges. She also appreciates life and relationships with others—including the near-daily support in the small tasks of daily living that she gets from friends and strangers alike: "those interactions warm my heart."

Yet Hayward is careful not to preach the potential for upside to her patients before they are ready. Instead, she waits for them to express "some positive reaction to the event."

She also helps patients discover what's meaningful in their lives and then helps them schedule activities involving these interests, such as spending more time with family members or doing volunteer work.

Tedeschi says sometimes traditional therapy for trauma patients gives people short-fix solutions to help them resume daily functions, such as sleep or work, but may not provide them with a way of living "beyond just getting by .... We've got to attend to their experience of life and how meaningful, satisfied and fulfilling it is."

One veterans' care facility that takes a nontraditional, PTG approach to trauma treatment is Boulder Crest Retreat in Bluemont, Virginia. The private, donor-supported institute provides free, weeklong nonclinical exercises and activities for vets seeking recovery from combat stress. The treatment is led primarily by veterans who have themselves gone through trauma and achieved growth. Vets are encouraged to deal with past traumas while also discovering their underlying strengths, as well as forging connections with others and ultimately finding ways to give back.

After the intensive program, vets are followed for 18 months with regular Skype check-ins.

Kevin Sakaki, a former Marine and intelligence/special operations veteran, entered Boulder Crest's Warrior program last September and found it transformative. He's noticed such changes in himself as better communication with his family, less anger ("Things don't get to me as much"), a deeper appreciation of "the little things," more generosity and a stronger connection to other people.

Tedeschi is among the psychologists studying the Boulder Crest program's efficacy as part of a research grant funded by the Marcus Foundation.

He hopes that as vets go through the process at Boulder Crest, they "develop new principles for living that involve altruistic behavior, having a mission in life and purpose that goes beyond oneself, so that trauma is transformed into something that's useful not only for oneself but for others."

ABSTRACT

The European countries have a long history of exposure to large-scale trauma. In the early 1990s the increasing awareness of the consequences of trauma within the mental health community led to the foundation of local societies for psychotraumatology across Europe and the European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary in 2018. The focus of this article is to describe the current state of care for survivors of trauma in the 15 European countries where ESTSS member societies have been established. Brief descriptions on the historical burden of trauma in each country are followed by an overview of the care system for trauma survivors in the countries, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in the future. The reports from the different countries demonstrate how important steps towards a better provision of care for survivors of trauma have been made in Europe. Given the cultural and economic diversity of the continent, there are also differences between the European countries, for instance with regard to the use of evidence-based treatments. Strategies to overcome these differences, like the new ESTSS training curricula for care-providers across Europe, are briefly discussed.

Trauma y Atenciones de Trauma en Europa

Los países Europeos tienen una larga historia de exposición a traumas de larga escala. A principios de la década de 1990, la creciente conciencia de las consecuencias del trauma dentro de la comunidad de salud mental condujo a la fundación de las sociedades locales para la psicotraumatología en Europa y la Sociedad Europea de Estudios de Estrés Traumático (ESTSS), la cual celebra en el 2018 su 25° aniversario. El enfoque de este artículo es describir el estado actual de la atención de los sobrevivientes de traumas en los 15 países Europeos, donde las sociedades miembros de la ESTSS se han establecido. Las descripciones breves sobre la carga histórica de trauma en cada país son seguidas por una descripción general del sistema de atención para sobrevivientes de trauma en el país, el estado de la técnica de las intervenciones, los desafíos actuales en el cuidado de sobrevivientes y los temas que necesitan ser abordados con mayor urgencia en el futuro. Los reportes de los diferentes países demuestran los pasos importantes que se han dado en Europa en la entrega de atención para los sobrevivientes de trauma. Dada la diversidad cultural y económica del continente, hay también diferencias entre los países Europeos, por ejemplo en relación al uso de tratamientos basados en la evidencia. Las estrategias para

resolver estas diferencias, como el nuevo curriculum de entrenamiento de la ESTSS para los proveedores de atención a lo largo de Europa son discutidas brevemente.

欧洲的创伤和创伤护理

欧洲国家有遭受大规模创伤的久远历史。在20世纪90年代早期，精神卫生界内越来越意识到创伤的后果，导致了在欧洲各个地区性创伤心理学会和欧洲创伤应激研究学会（European Society of Traumatic Stress Studies；ESTSS）的成立，该学会将于2018年庆祝其成立25周年。本文旨在描述在已建立ESTSS子协会的15个欧洲国家中创伤幸存者护理的当前状况。首先是对每个国家创伤的历史负担的简要描述，之后概述了各国创伤幸存者的护理系统的概述，干预措施的最新技术，护理幸存者面临的的当前挑战以及将来最迫切需要解决的问题。来自不同国家的报告展示了，在欧洲是如何实现为创伤幸存者提供更好的护理。鉴于大陆的文化和经济多样性，欧洲国家之间也存在差异，例如在循证治疗的使用上。我们简要讨论了克服这些差异的策略，例如为跨欧洲的护理服务提供者的新ESTSS培训课程。

1. Introduction

Exposure to trauma is common (Kessler et al., 2017) and its consequences on the individuals and communities affected can hardly be overestimated. In Europe, as in other regions of the world, a high burden of trauma is related to human-made events. In the twentieth century, military conflict took place during every single year in the European region and many of them affected numerous countries (see Table 1). Mass traumatization was also related to military conflicts associated with European colonialism, or conflicts in other continents where European military forces were involved in conflicts (see Table 2). Another massive burden of trauma across Europe resulted from the Holocaust and, throughout most of the twentieth century, from the political oppression by the Soviet communism. Trauma has occurred and still occurs in many societal contexts. For example, these include the familial and institutional abuse of children, different forms of gender-based violence in the European societies, various forms of institutional violence (i.e. in detention facilities of some countries) and also large-scale disasters and terror attacks that struck individual countries. Finally, over the last decades, an increasing number of migrants have reached the European countries, due to war and violence in their homeland (Hall & Olff, 2016; Kartal & Kiropoulos, 2016; Knaevelsrud, Stammel, & Olff, 2017; Munz & Melcop, 2018).

In the last two decades of the twentieth century, the increasing awareness of the consequences of trauma in the mental health community led to the foundation of local working groups and societies for psychotraumatology in several European countries. The European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary this year, was founded in 1993. Over two decades, ESTSS was an organization that included both member societies and individual members, which in the first years mainly came from western European countries. Recently, ESTSS has developed into an umbrella organization of the European societies for traumatic stress. This change is the result of a strategic plan that has been pursued over a longer period of time (Gersons, 2013). The ESTSS board consists of representatives from all member societies, which facilitates the work towards common strategic aims, such as promoting a standard curriculum for training in psychotrauma across Europe. In 2018, ESTSS com-

Table 1. Examples of military conflicts in Europe.

Year	Military conflict	Countries affected
1914–1918	First World War	Paneuropean
1917–1922	Soviet revolution	Former Soviet countries
1936–1939	Spanish civil war	Spain
1939–1945	Second World War	Paneuropean
1944–1953	Lithuanian partisan war against Soviet occupation	Lithuania
1968–1998	The Northern Ireland Troubles	UK, Republic of Ireland
1991–2000	Wars following the dissolution of former Yugoslavia	Slovenia, Croatia, Bosnia and Herzegovina Serbia, Montenegro, Kosovo
Since 1990	Military conflicts/wars in the South and North Caucasus	Georgia, Armenia, Azerbaijan and Russia (including North Caucasian region of Russia)
2008	Russian-Georgian war	Georgia, Russia
Since 2014	Conflict in East Ukraine	Ukraine, Russia

The list of military conflicts and countries involved is not all inclusive.

Table 2. Examples of military conflicts outside of Europe.

Year	Military conflict	European countries affected
1945–1949	War in the former Dutch East Indies	The Netherlands
1946–1954	Vietnam war	France
1954–1962	Algeria war	France
1950–1953	Korean war	Belgium, France, Greece, Luxembourg, Netherlands, UK
1961–1974	Portuguese Colonial War in Africa	Portugal
1979–1987	Afghanistan war	Former Soviet countries, UK
1990–1991	Gulf war	Belgium, Denmark, France, Germany, Greece, Hungary, Italy, Netherlands, Norway, Poland, Portugal, Romania, Spain, Sweden, UK
2001–2014	Afghanistan war	Albania, Belgium, Croatia, Czech Republic, Denmark, France, Georgia, Germany, Italy, Lithuania, Norway, Poland, Portugal, Romania, Russia, Spain, Sweden, UK, etc.

The list of military conflicts and countries involved is not all inclusive.

prised of 13 member societies that included 15 European countries and regions. These included Austria, Belgium, Croatia, Georgia, Germany, Lithuania, Italy, The Netherlands, Poland, Portugal, Sweden, the German-speaking and the French-speaking part of Switzerland, Ukraine and the UK (www.estss.org). Moreover, ESTSS had 12 additional affiliated societies and institutions in 2018. The society is constantly working towards the inclusion of further European societies and actively supports the formation of new societies in countries where they do not exist yet, as currently happened in Finland where the Finish Society for Psychotraumatology was launched in 2018.

While a series of articles at the occasion of ESTSS' twentieth anniversary focused on the inspiring and often also entertaining recollections of former presidents on the development of ESTSS (Lueger-Schuster, 2013b), the focus of this article is on the current member societies of ESTSS and on the development of trauma care in the respective countries. After some reflections on the historical burden of trauma in each country, representatives from all the national societies describe the structure of care organizations for trauma survivors, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in their countries in the future.

2. Psychotraumatology in Belgium

Five to eight million deaths, perhaps even 10: this was the devastating toll of the conquest and colonial exploitation of the Belgian Congo with King Leopold II, between the 1880s and the First World War (Hochshild, 1998). All traces of this Genocide remained secret until the early 1980s. Concerning the historical burden of the two World Wars (Manfred, 2015), it is the First World War more than the Second World War which, in the collective memory, constitutes a great trauma because of the looting of the country and the massacre of more than six thousand civilians. Recent events that stay more broadly in the mind of the Belgian people include the Heysel Drama in 1985 and the Dutroux affair with the sexual abuse, sequestration and death of young children and adolescents in 1996. In March 2016, the terrorist attacks at the national airport and in the metro of Brussels caused the death of 35 persons (Deschepper et al., 2018). Psychosocial structures vary across the country and have little or no coordination between them. One of the reasons is a difference between the functioning of French- and Flemish-speaking communities. Some structures can be found in both the French- and the Flemish-speaking communities. For instance, Public Welfare Centres and police victim services can be found in both of them. The integration of a psychosocial dimension into emergency and intervention plans was formalized in 2006. For the last 20 years, psychotherapists and other clinicians working in private practices started to specialize in trauma care for survivors. More and more specifically trained psychologists are working in hospitals and mental health centres. Recently, the development of outpatient trauma treatment centres linked to hospitals is evident. Some centres for the provision of trauma care for refugees were established in Brussels and cover the Dutch- as well as the French-speaking part of the country. In 2017, the High Council on Health received a Ministerial request for an opinion on the psychological care and support of persons following terrorist incidents or related disasters.

Until recently, there were no trauma-focused intervention methods in use in Belgium. The main therapeutic currents, for instance cognitive behavioural therapy (CBT) and psychodynamic therapies, were putting their own accents on working with trauma. In 2006, the BIP (Belgian Institute for Psychotraumatology) started the first psychotraumatology course. More trauma centres were created in the following years in principle cities, mainly Antwerp and Brussels. The course is organized in collaboration with two Universities. BIP organizes conferences in collaboration with other institutes or centres in Belgium. An independent Belgian trauma society needs to be created in the near future.

Current challenges in caring for trauma survivors concern the coordination of different support services. The political system in Belgium involves varying responsibilities at several levels, which makes decision-making complex. More visibility through studies on the positive impact and benefits of qualified trauma-focused care will be important. Finally, a well-structured national accreditation system should be put in place in order to continue provision of quality care for trauma survivors.

Among the topics to be most urgently addressed in the future is accessibility of services which is limited due to long waiting lists before survivors get access to psychological care in the Belgium mental health care system. Moreover, new ways of thinking about specialized trauma-care structures are needed.

3. Psychotraumatology in Croatia

The still living burden of the Second World War psychotrauma in Croatia has merged with the trauma of the Homeland War (1991–1995). Throughout the whole post-World War period there was no awareness of the consequences of trauma exposure, the issue was present neither in the health nor in public discourse. Consequently, no specific care was developed and provided. In contrast, the war in the 1990s brought about a high level of awareness of trauma and posttraumatic stress disorder (PTSD). Decades later the war-affected population reports 18% prevalence of PTSD (Priebe et al., 2010). This may be

partly due to lack of effective early trauma interventions and a number of hindering social factors, such as the prolonged economic crisis that affected more the vulnerable populations. The spin-off effect of massive trauma at the social level is a new understanding of the impact of traumatic events on physical and psychological health, as well as on communities (Corkalo Biruski, Ajdukovic, & Löw Stanic, 2014; Lončar & Henigsberg, 2007), which in turn facilitates access to specialized services by people exposed to trauma in everyday life.

Trauma survivors have access to psychiatric services in major hospitals, while veterans receive help within the three specialized regional centres and the National Centre for Psychotrauma. The cost of services are covered by universal national health insurance. Several non-governmental organizations with qualified staff provide supportive therapy to survivors of sexual assault, traffic accidents and other life threatening incidents, as well as domestic violence. The Polyclinic for the Protection of Children based in Zagreb specializes in working with traumatized children. Other facilities focus on prevention and support in the immediate aftermath of traumatic incidents, such as the Crisis Response Network maintained by the Society for Psychological Assistance (SPA).

The psychiatrists' first treatment choice is psychopharmacology. The prevalent therapeutic approach in psychiatric services for veterans is group therapy. Some veterans have been attending such groups for over 25 years. Low use of evidence-based trauma-focused therapies reflects (Schnyder et al., 2015) the prevailing traditional approach in Croatian psychiatry. Hence, traumatized populations still have poor access to effective, evidence-based trauma treatments. Training in trauma-focused CBT and EMDR is offered to practitioners, but this is not fully integrated into the helping system. With the existing high level of competencies in dynamic psychotherapy and psychopharmacology (Britvić et al., 2012), the challenge remains to develop a more stepwise approach to trauma-informed services, increase public awareness of risk and resilience factors, and to expand treatment choices to include evidence-based trauma-focused therapies and make them more available to the general populations in need. The Croatian Society for Traumatic Stress (CSTS) has been working on this challenge since it was founded in 2011 by organizing training workshops. It is currently promoting the ESTSS certified training in psychotrauma for mental health providers. One of the ambitions is to further integrate such training into university curricula so that future generations of mental health professionals are able to provide state-of-the-art care to traumatized people. Similarly, basic and intermediate levels of trauma-related knowledge and skills will be made more available to first responders and other health professionals.

4. Psychotraumatology in France

According to the World Mental Health survey, 72.7% of the French population has been exposed to traumatic events in their lifetime (Husky, Lépine, Gasquet, & Kovess-Masfety, 2015). Intimate partner violence, serious illness of a child and rape were the events associated with highest risk of PTSD. While rape is underreported in France, each year nearly 100,000 individuals claim to be survivors of rape or attempted rape and 500,000 claim to be survivors of intimate partner violence. A fifth of the French population was exposed to war-related events (mainly the Second World War). The twenty-first century was scarred by numerous Islamism extremist attacks, of which the November 2015 Paris attacks have been the bloodiest to date, resulting in more than 264 dead and 914 injured individuals. Traffic fatalities decreased in the past decades, reaching 5.1 per 100,000 inhabitants per year.

Since 1995, medico-psychological emergency units (CUMP for 'Cellules d'Urgence Médico-Psychologiques') are deployed in the case of mass casualty situations and provide immediate psychological support and care. These units were very effective after terror attacks in Paris and Nice, supporting thousands of survivors over many weeks (Hirsch et al., 2015). Psychological assistance aims at providing survivors with an entry point to psychological health care and giving them a first sense of relief, even though they do not provide psychological follow-up care (Vandentorren et al., 2018). In order to ensure long-term high-quality trauma care to all survivors in need across the country, President Emmanuel Macron in November 2017 announced the creation of about 10 ambulatory services specialized in trauma care. These services are aimed at providing medical and psychological care to survivors (minors or adults) that have experienced violence or any traumatic event during their lifetime.

The traditional psychodynamic approach is gradually but slowly replaced by structured trauma-focused psychotherapies, such as CBT or EMDR, and also new technologies (e-PTSD) are being introduced (Bourla, Mouchabac, El Hage, & Ferreri, 2018). However, the provision and access to treatment remain limited by the fact that there is a limited number of experienced trained trauma therapists and that care centres are not always clearly identified or equitably distributed across the country.

The challenges in caring for survivors are to achieve universal access to prevention, improve access to trauma-focused psychotherapies and ensure coordination of specialized care and support. One major challenge is to expand public funding of structured psychotherapies by trained psychologists. It is advisable to ease access to structured trauma-focused

therapies as part of mental health care programmes in compliance with international guidelines. In the end, patients should benefit from personalized treatment strategies for their trauma-related disorders, based on objective information.
