domestic violence). Still others may deny their history because they are tired of being interviewed or asked to fill out forms and may believe it doesn't matter anyway.

A client may not report past trauma for many reasons, including:

- Concern for safety (e.g., fearing more abuse by a perpetrator for revealing the trauma).
- Fear of being judged by service providers.
- Shame about victimization.
- Reticence about talking with others in response to trauma.
- Not recalling past trauma through dissociation, denial, or repression (although genuine blockage of all trauma memory is rare among trauma survivors; McNally, 2003).
- Lack of trust in others, including behavioral health service providers.
- Not seeing a significant event as traumatic.

Regarding the second major barrier, counselors and other behavioral health service providers may lack awareness that trauma can significantly affect clients' presentations in treatment and functioning across major life areas, such as relationships and work. In addition, some counselors may believe that their role is to treat only the presenting psychological and/or substance abuse symptoms, and thus they may not be as sensitive to histories and effects of trauma. Other providers may believe that a client should abstain from alcohol and drugs for an extended period before exploring trauma symptoms. Perhaps you fear that addressing a clients' trauma history will only exacerbate symptoms and complicate treatment. Behavioral health service providers who hold biases may assume that a client doesn't have a history of trauma and thus fail to ask the "right" questions, or they may be uncomfortable with emotions that arise from listening to client experiences and, as a result, redirect the screening or counseling focus.

Challenges

Awareness of acculturation and language

Acculturation levels can affect screening and assessment results. Therefore, indepth discussions may be a more appropriate way to gain an understanding of trauma from the client's point of view. During the intake, prior to trauma screening, determine the client's history of

Common Assessment Myths

Several common myths contribute to underassessment of trauma-related disorders (Najavits, 2004):

- ***Myth #1: Substance abuse itself is a trauma.*** However devastating substance abuse is, it does not meet the *Diagnostic and Statistical Manual of Mental Disorders*, Fifth Edition (DSM-5; American Psychiatric Association [APA], 2013a), criteria for trauma per se. Nevertheless, high-risk behaviors that are more likely to occur during addiction, such as interpersonal violence and self-harm, significantly increase the potential for traumatic injury.
- ***Myth #2: Assessment of trauma is enough.*** Thorough assessment is the best way to identify the existence and extent of trauma-related problems. However, simply identifying trauma-related symptoms and disorders is just the first step. Also needed are individualized treatment protocols and action to implement these protocols.
- ***Myth #3: It is best to wait until the client has ended substance use and withdrawal to assess for PTSD.*** Research does not provide a clear answer to the controversial question of when to assess for PTSD; however, Najavits (2004) and others note that underdiagnosis of trauma and PTSD has been more significant in the substance abuse field than overdiagnosis. Clinical experience shows that the PTSD diagnosis is rather stable during substance use or withdrawal, but symptoms can become more or less intense; memory impairment from alcohol or drugs can also cloud the symptom picture. Thus, it is advisable to establish a tentative diagnosis and then reassess after a period of abstinence, if possible.

migration, if applicable, and primary language. Questions about the client's country of birth, length of time in this country, events or reasons for migration, and ethnic self-identification are also appropriate at intake. Also be aware that even individuals who speak English well might have trouble understanding the subtleties of questions on standard screening and assessment tools. It is not adequate to translate items simply from English into another language; words, idioms, and examples often don't translate directly into other languages and therefore need to be adapted. Screening and assessment should be conducted in the client's preferred language by trained staff members who speak the language or by professional translators familiar with treatment jargon.

Awareness of co-occurring diagnoses

A trauma-informed assessor looks for psychological symptoms that are associated with trauma or simply occur alongside it. Symptom screening involves questions about past or present mental disorder symptoms that may indicate the need for a full mental health assessment. A variety of screening tools are available, including symptom checklists. However, you should only use symptom checklists when you need information about how your client is currently feeling; don't use them to screen for specific disorders. Responses will likely change from one administration of the checklist to the next.

Basic mental health screening tools are available. For example, the Mental Health Screening Form-III screens for present or past symptoms of most mental disorders (Carroll & McGinley, 2001); it is available at no charge from Project Return Foundation, Inc. and is also reproduced in TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c). Other screening tools, such as the Beck Depression Inventory II and the Beck Anxiety Inventory (Beck, Wright, Newman, & Liese, 1993), also screen broadly for mental and substance use disorders, as well as for specific disorders often associated with trauma. For further screening information and resources on depression and suicide, see TIP 48, *Managing Depressive Symptoms in Substance Abuse Clients During Early Recovery* (CSAT, 2008), and TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment* (CSAT, 2009a).

For screening substance use disorders, see TIP 11, *Simple Screening Instruments for Outreach for Alcohol and Other Drug Abuse and Infectious Diseases* (CSAT, 1994); TIP 24, *A Guide to Substance Abuse Services for Primary Care Clinicians* (CSAT, 1997a); TIP 31, *Screening and Assessing Adolescents for Substance Use Disorders* (CSAT, 1999c); TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (CSAT, 2005c); and TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d).

A common dilemma in the assessment of trauma-related disorders is that certain trauma symptoms are also symptoms of other disorders. Clients with histories of trauma typically present a variety of symptoms; thus, it is important to determine the full scope of symptoms and/or disorders present to help improve treatment planning. Clients with trauma-related and substance use symptoms and disorders are at increased risk for additional Axis I and/or Axis II mental disorders (Brady, Killeen, Saladin, Dansky, & Becker, 1994; Cottler, Nishith, & Compton, 2001). These symptoms need to be distinguished so that other presenting subclinical features or disorders do not go unidentified and untreated. To accomplish this, a comprehensive assessment of the client's mental health is recommended.

Misdiagnosis and underdiagnosis

Many trauma survivors are either misdiagnosed (i.e., given diagnoses that are not accurate) or underdiagnosed (i.e., have one or more diagnoses that have not been identified at all). Such diagnostic errors could result, in part, from the fact that many general instruments to evaluate mental disorders are not sufficiently sensitive to identify posttraumatic symptoms and can misclassify them as other disorders, including personality disorders or psychoses. Intrusive posttraumatic symptoms, for example, can show up on general measures as indicative of hallucinations or obsessions. Dissociative symptoms can be interpreted as indicative of schizophrenia. Trauma-based cognitive symptoms can be scored as evidence for paranoia or other delusional processes (Briere, 1997). Some of the most common misdiagnoses in clients with PTSD and substance abuse are:

- ***Mood and anxiety disorders.*** Overlapping symptoms with such disorders as major depression, generalized anxiety disorder, and bipolar disorder can lead to misdiagnosis.
- ***Borderline personality disorder.*** Historically, this has been more frequently diagnosed than PTSD. Many of the symptoms, including a pattern of intense interpersonal relationships, impulsivity, rapid and unpredictable mood swings, power struggles in the treatment environment, underlying anxiety and depressive symptoms, and transient, stress-related paranoid ideation or severe dissociative symptoms overlap. The effect of this misdiagnosis on treatment can be particularly negative; counselors often view clients with a borderline personality diagnosis as difficult to treat and unresponsive to treatment.
- ***Antisocial personality disorder.*** For men and women who have been traumatized in childhood, "acting out" behaviors, a lack of empathy and conscience, impulsivity, and self-centeredness can be functions of trauma and survival skills rather than true antisocial characteristics.
- ***Attention deficit hyperactivity disorder (ADHD).*** For children and adolescents, impulsive behaviors and concentration problems can be diagnosed as ADHD rather than PTSD.

It is possible, however, for clients to legitimately have any of these disorders in addition to trauma-related disorders. Given the overlap of posttraumatic symptoms with those of other disorders, a wide variety of diagnoses often needs to be considered to avoid misidentifying

other disorders as PTSD and vice versa. A trained and experienced mental health professional will be required to weigh differential diagnoses. TIP 42 (CSAT, 2005c) explores issues related to differential diagnosis.

Cross-Cultural Screening and Assessment

Many trauma-related symptoms and disorders are culture specific, and a client's cultural background must be considered in screening and assessment (for review of assessment and cultural considerations when working with trauma, see Wilson & Tang, 2007). Behavioral health service providers must approach screening and assessment processes with the influences of culture, ethnicity, and race firmly in mind. Cultural factors, such as norms for expressing psychological distress, defining trauma, and seeking help in dealing with trauma, can affect:

- How traumas are experienced.
- The meaning assigned to the event(s).
- How trauma-related symptoms are expressed (e.g., as somatic expressions of distress, level of emotionality, types of avoidant behavior).
- Willingness to express distress or identify trauma with a behavioral health service provider and sense of safety in doing so.
- Whether a specific pattern of behavior, emotional expression, or cognitive process is considered abnormal.
- Willingness to seek treatment inside and outside of one's own culture.
- Response to treatment.
- Treatment outcome.

When selecting assessment instruments, counselors and administrators need to choose,

Culture-Specific Stress Responses

Culture-bound concepts of distress exist that don't necessarily match diagnostic criteria. Culture-specific symptoms and syndromes can involve physical complaints, broad emotional reactions, or specific cognitive features. Many such syndromes are unique to a specific culture but can broaden to cultures that have similar beliefs or characteristics. Culture-bound syndromes are typically treated by traditional medicine and are known throughout the culture. Cultural concepts of distress include:

- ***Ataques de nervios.*** Recognized in Latin America and among individuals of Latino descent, the primary features of this syndrome include intense emotional upset (e.g., shouting, crying, trembling, dissociative or seizure-like episodes). It frequently occurs in response to a traumatic or stressful event in the family.
- ***Nervios.*** This is considered a common idiom of distress among Latinos; it includes a wide range of emotional distress symptoms including headaches, nervousness, tearfulness, stomach discomfort, difficulty sleeping, and dizziness. Symptoms can vary widely in intensity, as can impairment from them. This often occurs in response to stressful or difficult life events.
- ***Susto.*** This term, meaning "fright," refers to a concept found in Latin American cultures, but it is not recognized among Latinos from the Caribbean. *Susto* is attributed to a traumatic or frightening event that causes the soul to leave the body, thus resulting in illness and unhappiness; extreme cases may result in death. Symptoms include appetite or sleep disturbances, sadness, lack of motivation, low self-esteem, and somatic symptoms.
- ***Taijin kyofusho.*** Recognized in Japan and among some American Japanese, this "interpersonal fear" syndrome is characterized by anxiety about and avoidance of interpersonal circumstances. The individual presents worry or a conviction that his or her appearance or social interactions are inadequate or offensive. Other cultures have similar cultural descriptions or syndromes associated with social anxiety.

whenever possible, instruments that are culturally appropriate for the client. Instruments that have been normed for, adapted to, and tested on specific cultural and linguistic groups should be used. Instruments that are not normed for the population are likely to contain cultural biases and produce misleading results. Subsequently, this can lead to misdiagnosis, overdiagnosis, inappropriate treatment plans, and ineffective interventions. Thus, it is important to interpret all test results cautiously and to discuss the limitations of instruments with clients from diverse ethnic populations and cultures. For a review of cross-cultural screening and assessment considerations, refer to the planned TIP, *Improving Cultural Competence* (Substance Abuse and Mental Health Services Administration, planned c).

Choosing Instruments

Numerous instruments screen for trauma history, indicate symptoms, assess trauma-related and other mental disorders, and identify related clinical phenomena, such as dissociation. One instrument is unlikely to meet all screening or assessment needs or to determine the existence and full extent of trauma symptoms and traumatic experiences. The following sections present general considerations in selecting standardized instruments.

Purpose

Define your assessment needs. Do you need a standardized screening or assessment instrument for clinical purposes? Do you need information on a specific aspect of trauma, such as history, PTSD, or dissociation? Do you wish to make a formal diagnosis, such as PTSD? Do you need to determine quickly whether a client has experienced a trauma? Do you want an assessment that requires a clinician to administer it, or can the client complete the instrument himself or herself? Does the instrument match the current and specific diagnostic criteria established in the DSM-5?

Population

Consider the population to be assessed (e.g., women, children, adolescents, refugees, disaster survivors, survivors of physical or sexual violence, survivors of combat-related trauma, people whose native language is not English); some tools are appropriate only for certain populations. Is the assessment process developmentally and culturally appropriate for your client? Exhibit 1.4-2 lists considerations in choosing a screening or assessment instrument for trauma and/or PTSD.

Instrument Quality

An instrument should be psychometrically adequate in terms of sensitivity and specificity or reliability and validity as measured in several ways under varying conditions. Published research offers information on an instrument's psychometric properties as well as its utility in both research and clinical settings. For further information on a number of widely used trauma evaluation tools, see Appendix D and Antony, Orsillo, and Roemer's paper (2001).

The DSM-5 and Updates to Screening and Assessment Instruments

The recent publication of the DSM-5 (APA, 2013a) reflects changes to certain diagnostic criteria, which will affect screening tools and criteria for trauma-related disorders. Criterion A2 (specific to traumatic stress disorders, acute stress, and posttraumatic stress disorders), included in the fourth edition (text revision) of the DSM (DSM-IV-TR; APA, 2000a), has been eliminated; this criterion stated that the individual's response to the trauma needs to involve intense fear, helplessness, or horror. There are now four cluster symptoms, not three: reexperiencing, avoidance, arousal, and persistent negative alterations in cognitions and mood. Changes to the DSM-5 were made to symptoms within each cluster. Thus, screening will need modification to adjust to this change (APA, 2012b).

Exhibit 1.4-2: Key Areas of Trauma Screening and Assessment

Trauma
Key question: Did the client experience a trauma?

Examples of measures: Life Stressor Checklist-Revised (Wolfe & Kimerling, 1997); Trauma History Questionnaire (Green, 1996); Traumatic Life Events Questionnaire (Kubany et al., 2000).

Note: A good trauma measure identifies events a person experienced (e.g., rape, assault, accident) and also evaluates other trauma-related symptoms (e.g., presence of fear, helplessness, or horror).

Acute Stress Disorder (ASD) and PTSD
Key question: Does the client meet criteria for ASD or PTSD?

Examples of measures: Clinician-Administered PTSD Scale (CAPS; Blake et al., 1990); Modified PTSD Symptom Scale (Falsetti, Resnick, Resnick, & Kilpatrick, 1993); PTSD Checklist (Weathers, Litz, Herman, Huska, & Keane, 1993); Stanford Acute Stress Reaction Questionnaire (Cardena, Koopman, Classen, Waelde, & Spiegel, 2000).

Note: A PTSD diagnosis requires the person to meet criteria for having experienced a trauma; some measures include this, but others do not and require use of a separate trauma measure. The CAPS is an interview; the others listed are self-report questionnaires and take less time.

Other Trauma-Related Symptoms
Key question: Does the client have other symptoms related to trauma? These include depressive symptoms, self-harm, dissociation, sexuality problems, and relationship issues, such as distrust.

Examples of measures: Beck Depression Inventory II (Beck, 1993; Beck et al., 1993); Dissociative Experiences Scale (Bernstein & Putnam, 1986; Carlson & Putnam, 1993); Impact of Event Scale (measures intrusion and avoidance due to exposure to traumatic events; Horowitz, Wilner, & Alvarez, 1979; Weiss & Marmar, 1997); Trauma Symptom Inventory (Briere, 1995); Trauma Symptom Checklist for Children (Briere, 1996b); Modified PTSD Symptom Scale (Falsetti et al., 1993).

Note: These measures can be helpful for clinical purposes and for outcome assessment because they gauge *levels* of symptoms. Trauma-related symptoms are broader than diagnostic criteria and thus useful to measure, even if the patient doesn't meet criteria for any specific diagnoses.

Other Trauma-Related Diagnoses
Key question: Does the client have other disorders related to trauma? These include mood disorders, anxiety disorders besides traumatic stress disorders, and dissociative disorders.

Examples of measures: Mental Health Screening Form III (Carroll & McGinley, 2001); The Mini-International Neuropsychiatric Interview (M.I.N.I.) Structured Clinical Interview for DSM-IV-TR, Patient Edition (First, Spitzer, Gibbon, & Williams, revised 2011); Structured Clinical Interview for DSM-IV-TR, Non-Patient Edition (First, Spitzer, Gibbon, & Williams, revised 2011a).

Note: For complex symptoms and diagnoses such as dissociation and dissociative disorders, interviews are recommended. Look for measures that incorporate DSM-5 criteria.

Sources: Antony et al., 2001; Najavits, 2004.

Practical Issues

Is the instrument freely and readily available, or is there a fee? Is costly and extensive training required to administer it? Is the instrument too lengthy to be used in the clinical setting? Is it easily administered and scored with accompanying manuals and/or other training materials? How will results be presented to or used with the client? Is technical support available for difficulties in administration, scoring, or interpretation of results? Is special equipment required such as a microphone, a video camera, or a touch-screen computer with audio?

Trauma-Informed Screening and Assessment

The following sections focus on initial screening. For more information on screening and assessment tools, including structured interviews, see Exhibit 1.4-2. Screening is only as good as the actions taken afterward to address a positive screen (when clients acknowledge that they experience symptoms or have encountered events highlighted within the screening). Once a screening is complete and a positive screen is acquired, the client then needs referral for a more indepth assessment to ensure development of an appropriate treatment plan that matches his or her presenting problems.

Establish a History of Trauma

A person cannot have ASD, PTSD, or any trauma-related symptoms without experiencing trauma; therefore, it is necessary to inquire about painful, difficult, or overwhelming past experiences. Initial information should be gathered in a way that is minimally intrusive yet clear. Brief questionnaires can be less threatening to a client than face-to-face interviews, but interviews should be an integral part of any screening and assessment process. If the client initially denies a history of trauma (or minimizes it), administer the questionnaire later or delay additional trauma-related questions until the client has perhaps developed more trust in the treatment setting and feels safer with the thoughts and emotions that might arise in discussing his or her trauma experiences.

The Stressful Life Experiences (SLE) screen (Exhibit 1.4-3) is a checklist of traumas that also considers the client's view of the impact of those events on life functioning. Using the SLE can foster the client–counselor relationship. By going over the answers with the client, you can gain a deep understanding of your client, and the client receives a demonstration of your sensitivity and concern for what the client has experienced. The National Center for PTSD Web site offers similar instruments (http://www.ptsd.va.gov/professional/pages/assessments/assessment.asp).

In addition to broad screening tools that capture various traumatic experiences and symptoms, other screening tools, such as the Combat Exposure Scale (Keane et al., 1989) and the Intimate Partner Violence Screening Tool (Exhibit 1.4-4), focus on acknowledging a specific type of traumatic event.

Screen for Trauma-Related Symptoms and Disorders in Clients With Histories of Trauma

This step evaluates whether the client's trauma resulted in subclinical or diagnosable disorders. The counselor can ask such questions as, "Have you received any counseling or therapy? Have you ever been diagnosed or treated for a psychological disorder in the past? Have you ever been prescribed medications for your emotions in the past?" Screening is typically conducted by a wide variety of behavioral health service providers with different levels of training and education; however, all

Exhibit 1.4-3: SLE Screening

Please fill in the number that best represents how much the following statements describe your experiences. You will need to use two scales, one for how well the statement describes your experiences and one for how stressful you found this experience. The two scales are below.

Describes your Experience:

0	1	2	3	4	5	6	7	8	9	10
Did not experience this	a little like my experiences				somewhat like my experiences					exactly like my experiences

Stressfulness of Experience:

0	1	2	3	4	5	6	7	8	9	10
Not at all stressful	not very stressful				somewhat stressful					extremely stressful

Describes your Experience	Life Experience	Stressfulness Then		Stressfulness Now
	I have witnessed or experienced a natural disaster; like a hurricane or earthquake.			
	I have witnessed or experienced a human made disaster like a plane crash or industrial disaster.			
	I have witnessed or experienced a serious accident or injury.			
	I have witnessed or experienced chemical or radiation exposure happening to me, a close friend or a family member.			
	I have witnessed or experienced a life threatening illness happening to me, a close friend or a family member.			
	I have witnessed or experienced the death of my spouse or child.			
	I have witnessed or experienced the death of a close friend or family member (other than my spouse or child).			
	I or a close friend or family member has been kidnapped or taken hostage.			
	I or a close friend or family member has been the victim of a terrorist attack or torture.			
	I have been involved in combat or a war or lived in a war affected area.			
	I have seen or handled dead bodies other than at a funeral.			
	I have felt responsible for the serious injury or death of another person.			
	I have witnessed or been attacked with a weapon other than in combat or family setting			
	As a child/teen I was hit, spanked, choked or pushed hard enough to cause injury			
	As an adult, I was hit, choked or pushed hard enough to cause injury.			
	As an adult or child, I have witnessed someone else being choked, hit, spanked, or pushed hard enough to cause injury.			
	As a child/teen I was forced to have unwanted sexual contact.			
	As an adult I was forced to have unwanted sexual contact.			
	As a child or adult I have witnessed someone else being forced to have unwanted sexual contact			
	I have witnessed or experienced an extremely stressful event not already mentioned. Please Explain:_____ _____

individuals who administer screenings, regardless of education level and experience, should be aware of trauma-related symptoms, grounding techniques, ways of creating safety for the client, proper methods for introducing screening tools, and the protocol to follow when a positive screen is obtained. (See Appendix D for information on specific instruments.) Exhibit 1.4-5 is an example of a screening instrument for trauma symptoms, the Primary Care PTSD (PC-PTSD) Screen. Current research (Prins et al., 2004) suggests that the optimal cutoff score for the PC-PTSD is 3. If sensitivity is of greater concern than efficiency, a cutoff score of 2 is recommended.

Exhibit 1.4-5: PC-PTSD Screen

In your life, have you ever had any experience that was so frightening, horrible, or upsetting that, *in the past month*, you…

1. Have had nightmares about it or thought about it when you did not want to?
   YES NO
2. Tried hard not to think about it or went out of your way to avoid situations that reminded you of it?
   YES NO
3. Were constantly on guard, watchful, or easily startled?
   YES NO
4. Felt numb or detached from others, activities, or your surroundings?
   YES NO

Source: Prins et al., 2004. Material used is in the public domain.

Another instrument that can screen for traumatic stress symptoms is the four-item self-report SPAN, summarized in Exhibit 1.4-6, which is derived from the 17-item Davidson Trauma Scale (DTS). SPAN is an acronym for the four items the screening addresses: startle, physiological arousal, anger, and numbness. It was developed using a small, diverse sample of adult patients (N=243; 72 percent women; 17.4 percent African American; average age = 37 years) participating in several clinical studies, including a family study of rape trauma, combat veterans, and Hurricane Andrew survivors, among others.

The SPAN has a high diagnostic accuracy of 0.80 to 0.88, with sensitivity (percentage of true positive instances) of 0.84 and specificity (percentage of true negative instances) of 0.91 (Meltzer-Brody, Churchill, & Davidson, 1999). SPAN scores correlated highly with the full DTS (r = 0.96) and other measures, such as the Impact of Events Scale (r = 0.85) and the Sheehan Disability Scale (r = 0.87).

The PTSD Checklist (Exhibit 1.4-7), developed by the National Center for PTSD, is in the public domain. Originally developed for combat veterans of the Vietnam and Persian

Exhibit 1.4-6: The SPAN

The SPAN instrument is a brief screening tool that asks clients to identify the trauma in their past that is most disturbing to them currently. It then poses four questions that ask clients to rate the frequency and severity with which they have experienced, in the past week, different types of trauma-related symptoms (startle, physiological arousal, anger, and numbness).

To order this screening instrument, use the following contact information:
Multi-Health Systems, Inc.
P.O. Box 950
North Tonawanda, NY
14120-0950
Phone: 800-456-3003

Source: Meltzer-Brody et al., 1999.

Exhibit 1.4-7: The PTSD Checklist

Instructions to Client: Below is a list of problems and complaints that people sometimes have in response to stressful experiences. Please read each one carefully and circle the number that indicates how much you have been bothered by that problem *in the past month*.

1. Repeated, disturbing memories, thoughts, or images of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
2. Repeated, disturbing dreams of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
3. Suddenly acting or feeling as if a stressful experience were happening again (as if you were reliving it)?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
4. Feeling very upset when something reminded you of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
5. Having physical reactions (e.g., heart pounding, trouble breathing, sweating) when something reminded you of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
6. Avoiding thinking about or talking about a stressful experience or avoiding having feelings related to it?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
7. Avoiding activities or situations because they reminded you of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
8. Trouble remembering important parts of a stressful experience?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
9. Loss of interest in activities that you used to enjoy?
   1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
10. Feeling distant or cut off from other people?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
11. Feeling emotionally numb or being unable to have loving feelings for those close to you?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
12. Feeling as if your future will somehow be cut short?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
13. Trouble falling or staying asleep?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
14. Feeling irritable or having angry outbursts?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
15. Having difficulty concentrating?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
16. Being "super-alert" or watchful or on guard?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely
17. Feeling jumpy or easily startled?
    1. Not at all 2. A little bit 3. Moderately 4. Quite a bit 5. Extremely

Source: Weathers et al., 1993. Material used is in the public domain.

Gulf Wars, it has since been validated on a variety of noncombat traumas (Keane, Brief, Pratt, & Miller, 2007). When using the checklist, identify a specific trauma first and then have the client answer questions in relation to that one specific trauma.

Other Screening and Resilience Measures

Along with identifying the presence of trauma-related symptoms that warrant assessment to determine the severity of symptoms as well as whether or not the individual possesses subclinical symptoms or has met criteria for a trauma-related disorder, clients should receive other screenings for symptoms associated with trauma (e.g., depression, suicidality). It is important that screenings address both external and internal resources (e.g., support systems, strengths, coping styles). Knowing the client's strengths can significantly shape the treatment planning process by allowing you to use strategies that have already worked for the client and incorporating strategies to build resilience (Exhibit 1.4-8).

Exhibit 1.4-8: Resilience Scales

A number of scales with good psychometric properties measure resilience:

- Resilience Scale (Wagnild & Young, 1993)
- Resilience Scale for Adults (Friborg, Hjemdal, Rosenvinge, & Martinussen, 2003)
- Connor Davidson Resilience Scale, 25-,10-, and 2-Item (Connor & Davidson, 2003; Campbell-Sills & Stein, 2007; Vaishnavi, Connor, & Davidson, 2007, respectively)
- Dispositional Resilience Scale, 45-,30-, 15-item forms (Bartone, Roland, Picano, &Williams, 2008)

Preliminary research shows improvement of individual resilience through treatment interventions in other populations (Lavretsky, Siddarth, & Irwin, 2010).

Screen for suicidality

All clients—particularly those who have experienced trauma—should be screened for suicidality by asking, "In the past, have you ever had suicidal thoughts, had intention to commit suicide, or made a suicide attempt? Do you have any of those feelings now? Have you had any such feelings recently?" Behavioral health service providers should receive training to screen for suicide. Additionally, clients with substance use disorders and a history of psychological trauma are at heightened risk for suicidal thoughts and behaviors; thus, screening for suicidality is indicated. See TIP 50, *Addressing Suicidal Thoughts and Behaviors in Substance Abuse Treatment* (CSAT, 2009a). For additional descriptions of screening processes for suicidality, see TIP 42 (CSAT, 2005c).

Concluding Note

Screenings are only beneficial if there are follow-up procedures and resources for handling positive screens, such as the ability to review results with and provide feedback to the individual after the screening, sufficient resources to complete a thorough assessment or to make an appropriate referral for an assessment, treatment planning processes that can easily incorporate additional trauma-informed care objectives and goals, and availability and access to trauma-specific services that match the client's needs. Screening is only the first step!

5 Clinical Issues Across Services

IN THIS CHAPTER

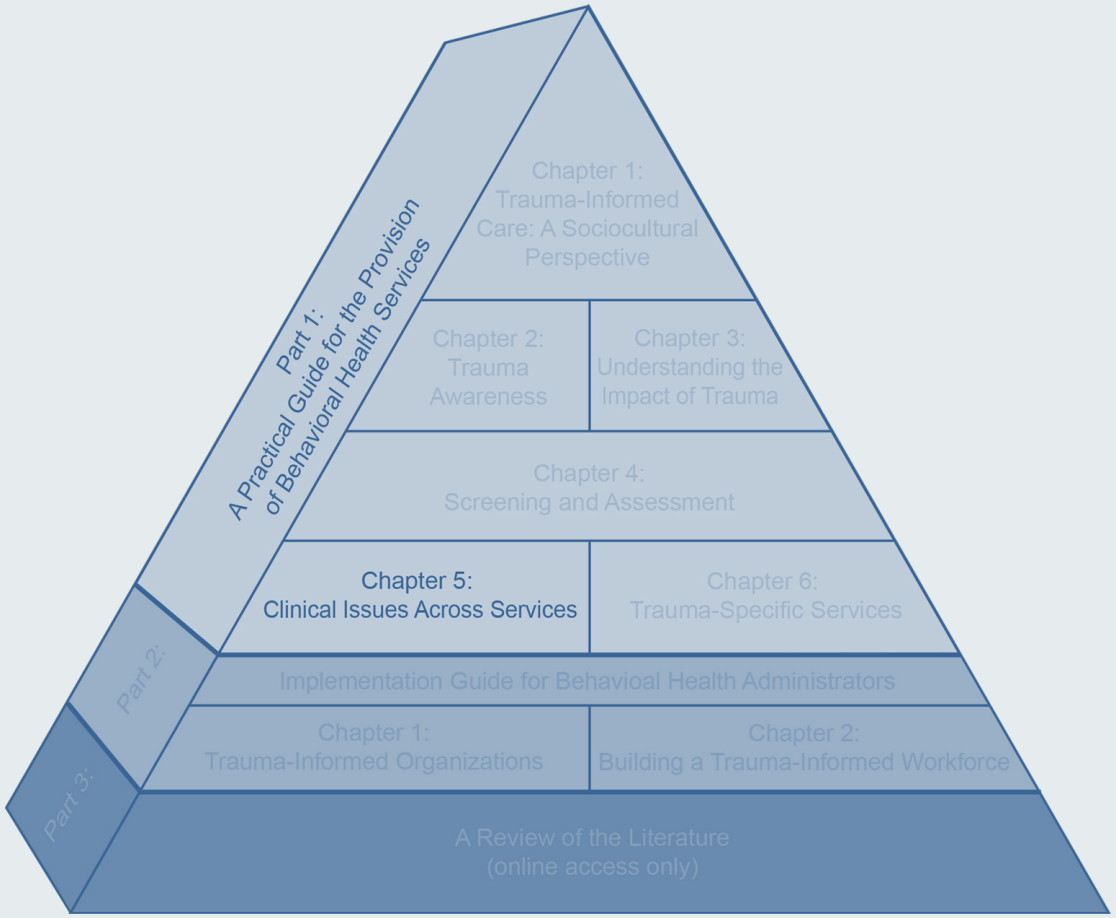
- Trauma Informed Prevention and Treatment Objectives
- Treatment Issues
- Making Referrals to Trauma Specific Services

Many clients in behavioral health treatment may have histories of trauma, so counselors should be prepared to help them address issues that arise from those histories. This chapter begins with a thorough discussion of trauma-informed prevention and treatment objectives along with practical counselor strategies. Specific treatment issues related to working with trauma survivors in a clinical setting are discussed as well, including client engagement, pacing and timing, traumatic memories, and culturally appropriate and gender-responsive services. The chapter ends with guidelines for making referrals to trauma-specific services.

Trauma-Informed Prevention and Treatment Objectives

Trauma-informed care (TIC) not only focuses on identifying individuals who have histories of trauma and traumatic stress symptoms; it also places considerable effort in creating an environment that helps them recognize the impact of trauma and determine the next course of action in a safe place. For some individuals, psychoeducation and development or reinforcement of coping strategies will be the most suitable and effective strategy, whereas others may request or warrant a referral for more trauma-specific interventions (see Part 1, Chapter 6, of this Treatment Improvement Protocol [TIP]). Although research is limited in the area of building resilience to prevent exacerbation of trauma symptoms and traumatic stress disorders, TIC also focuses on prevention strategies to avoid retraumatization in treatment, to promote resilience, and to prevent the development of trauma-related disorders. The following sections highlight key trauma-informed prevention and treatment objectives.

TIC Framework in Behavioral Health Services—Clinical Issues Across Services



Establish Safety

Beyond identifying trauma and trauma-related symptoms, the initial objective of TIC is establishing safety. Borrowing from Herman's (1992) conceptualization of trauma recovery, safety is the first goal of treatment. Establishing safety is especially crucial at the outset of trauma-informed treatment and often becomes a recurrent need when events or therapeutic changes raise safety issues, such as a change in treatment staffing due to vacations.

In the context of TIC, safety has a variety of meanings. Perhaps most importantly, the client has to have some degree of ***safety from trauma symptoms***. Recurring intrusive nightmares; painful memories that burst forth seemingly without provocation; feelings of sadness, anger, shame, or being overwhelmed; or not having control over sudden disconnections from others make moment-to-moment living feel unsafe. Clients might express feeling unsafe through statements such as, "I can't control my feelings," or, "I just space out and disconnect from the world for no reason," or, "I'm afraid to go to sleep because of the nightmares." The intense feelings that accompany trauma can also make clients feel unsafe. They may wake up in the morning feeling fine but become immobilized by depression as the day progresses. Clients with histories of trauma may experience panicky feelings of being trapped or abandoned. An early effort in trauma treatment is thus helping the client

Advice to Counselors: Strategies To Promote Safety

Strategy #1: Teach clients how and when to use grounding exercises when they feel unsafe or overwhelmed.

Strategy #2: Establish some specific routines in individual, group, or family therapy (e.g., have an opening ritual or routine when starting and ending a group session). A structured setting can provide a sense of safety and familiarity for clients with histories of trauma.

Strategy #3: Facilitate a discussion on safe and unsafe behaviors. Have clients identify, on paper, behaviors that promote safety and behaviors that feel unsafe for them today.

Strategy #4: Refer to *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse* (Najavits, 2002a). This menu-based manual covers an array of treatment topics, including the core concept of safety. Each topic consists of several segments, including preparing for the session, session format, session content, handouts, and guidelines.

Strategy #5: Encourage the development of a safety plan. Depending on the type of trauma, personal safety can be an issue; work with the client to develop a plan that will help him or her feel in control and prepared for the unexpected. If the trauma was a natural or human-caused disaster, encourage thinking about how family and friends will respond and connect in the event of another crisis. If sexual abuse or rape was the event, encourage thinking about future steps that could help make the client safer. There is a delicate balance between preparation and the realization that one cannot prepare for all possible traumatic events. Nonetheless, an action plan can help the client regain a sense of environmental balance.

gain more control over trauma symptoms (and be able to label them as such) by learning more about the client and helping him or her develop new coping skills to handle symptoms when they arise and stay more grounded when flooded with feelings or memories.

A second aspect is ***safety in the environment***. Trauma reactions can be triggered by sudden loud sounds (e.g., television at high volume, raised voices), tension between people, certain smells, or casual touches that are perceived as invasions of physical boundaries. The vulnerability of exposing one's history in the treatment setting can manifest in the client as feeling physically vulnerable and unsafe in the treatment environment. Sudden or inadequately explained treatment transitions, such as moving from one level of treatment to another or changing counselors, can also evoke feelings of danger, abandonment, or instability. Early in treatment, trauma survivors generally value routine and predictability. The counselor should recognize these needs and respond appropriately by offering information in advance, providing nonshaming responses to a client's reactions to stimuli in his or her environment, and helping the client build a daily structure that feels safe.

A third aspect of safety is ***preventing a recurrence of trauma***. People with histories of trauma and substance abuse are more likely to engage in high-risk behaviors and to experience subsequent traumas. Early treatment should focus on helping clients stop using unsafe coping mechanisms, such as substance abuse, self-harm, and other self-destructive behaviors, and replacing them with safe and healthy coping strategies. Helping clients learn to protect themselves in reasonable ways is a positive goal of treatment.

Prevent Retraumatization

A key objective in TIC is to prevent retraumatization generated by intervention and treatment practices and policies. Unfortunately, treatment settings and clinicians can

Advice to Counselors: Strategies To Prevent Retraumatization

Strategy #1: Be sensitive to the needs of clients who have experienced trauma regarding behaviors in the treatment setting that might trigger memories of the trauma.

Strategy #2: Do not ignore clients' symptoms and demands when clients with trauma histories act out in response to triggered trauma memories; doing so may replicate the original traumatic experience.

Strategy #3: Be mindful that efforts to control and contain a client's behaviors in treatment can produce an abnormal reaction, particularly for trauma survivors for whom being trapped was part of the trauma experience.

Strategy #4: Listen for specific triggers that seem to be driving the client's reaction. An important step in recovery is helping the client identify these cues and thereby reach a better understanding of reactions and behaviors.

unintentionally create retraumatizing experiences (for a review of traumas that can occur when treating serious mental illness, see Frueh et al., 2005). For instance, compassionate inquiry into a client's history can seem similar to the interest shown by a perpetrator many years before. Direct confrontation by counselors about behaviors related to substance abuse can be seen, by someone who has been repeatedly physically assaulted, as provocation building up to assault. Counselor and program efforts to help clients constrain destructive behaviors can be interpreted as efforts to control and dominate the individual. Intrusive shaming or insensitive behavior demonstrated by another client in the program can threaten a trauma survivor whose boundaries have been disregarded in the past—thus making the experience of treatment feel dangerous rather than safe. Some staff and agency issues that can result in retraumatization include:

- Disrespectfully challenging reports of abuse or other traumatic events.
- Discounting a client's report of a traumatic event.
- Using isolation.
- Using physical restraints.
- Allowing the abusive behavior of one client toward another to continue without intervention.
- Labeling intense rage and other feelings as pathological.
- Minimizing, discrediting, or ignoring client responses.
- Disrupting counselor–client relationships by changing counselors' schedules and assignments.
- Obtaining urine specimens in a nonprivate and/or disrespectful manner.
- Having clients undress in the presence of others.
- Being insensitive to a client's physical or emotional boundaries.
- Inconsistently enforcing rules and allowing chaos in the treatment environment.
- Applying rigid agency policies or rules without an opportunity for clients to question them.
- Accepting agency dysfunction, including a lack of consistent, competent leadership.

Provide Psychoeducation

Trauma-informed education informs clients about traumatic stress and trauma-related symptoms and disorders as well as the related consequences of trauma exposure. It focuses on giving information to clients to help normalize presenting symptoms, to highlight potential short-term and long-term consequences of trauma and various paths to recovery, and to underscore the message that recovery is possible. Education frequently takes place prior to or immediately following an initial screening as a way to prepare clients

Advice to Counselors: Strategies To Implement Psychoeducation

Strategy #1: Remember that this may be the client's first experience with treatment. It's easy to use program or clinical jargon when you're around it every day, but most individuals who seek help are unfamiliar with clinical language, how the program works, and treatment objectives. Psychoeducation begins with understanding the client's expectations and reasons for seeking help, followed by educating the client and other family members about the program. Remember that this is all new for them.

Strategy #2: After obtaining acknowledgment of a trauma history, provide an overview of common symptoms and consequences of traumatic stress, regardless of whether the client affirms having trauma-related symptoms. It is equally important to educate the client on resilience factors associated with recovery from trauma (Wessely et al., 2008). A trauma-informed perspective provides a message that trauma reactions are normal responses to an abnormal situation.

Strategy #3: Develop a resource box that provides an array of printed or multimedia educational materials that address the program, specific symptoms and tools to combat trauma-related symptoms, treatment options and therapy approaches, advantages of peer support, and steps in developing specific coping strategies.

Strategy #4: Develop a rotating educational group that matches services and client schedules to complement treatment. Remember that education can play a pivotal role in enhancing motivation, in normalizing experiences, and in creating a sense of safety as individuals move further into treatment. For some survivors, education can be a powerful intervention or prevention strategy.

for hearing results or to place the screening and subsequent assessment findings in proper context. Education in and of itself, however, does not necessarily constitute a stand-alone treatment; rather, it can be conceptualized as a first step and/or component of more comprehensive treatment. Nonetheless, education may be a prevention and intervention strategy for individuals who have histories of trauma without current consequences or symptoms and/or those who have reported a resolution of past trauma(s). For example, some clients may have significantly delayed onset of traumatic stress symptoms. In this scenario, earlier education can enhance recognition of symptoms and ease the path of seeking treatment.

Some clients do not recognize the link between their current difficulties and their trauma histories; education can help them understand the possible origin of their difficulties. Psychoeducation presents trauma-related symptoms that follow a trauma as normal reactions. By identifying the source of clients' current difficulties and framing them as normal thoughts, emotions, and behaviors in response to trauma, many trauma survivors report a reduction in the intensity of the difficulties or symptoms. Often, a client will express relief that his or her reactions are normal. You may find the U.S. Department of Veterans Affairs (VA) National Center on PTSD's educational handouts on traumatic stress reactions useful.

Psychoeducation goes beyond the identification of traumatic stress symptoms and/or learning about the psychological, cognitive, and physical impacts of trauma. Numerous curricula are available that use psychoeducation as a first-line or complementary approach to trauma-specific therapies to enhance coping strategies in key areas, including safety, emotional regulation, help-seeking, avoidant behavior, and so forth. An example is S.E.L.F., a trauma-informed psychoeducational group curriculum with educational components related to trauma recovery in the following

Case Illustration: Linda

Linda served as an Army nurse in an evacuation hospital in Vietnam. She reported her postdeployment adjustment as difficult and isolating but denied any significant symptoms of traumatic stress throughout her life. Four years ago, Linda sought treatment for alcohol dependence; during the intake, she recalls denying trauma-related symptoms. "I distinctly remember the session," she recounts. "The counselor first took my history but then gave information on typical symptoms and reactions to trauma. I thought, 'Why do I need to hear this? I've survived the worst trauma in my life.' I didn't see the value of this information. Then 3 weeks ago, I began to have recurrent nightmares, the same graphic type I occasionally had when I was in Vietnam. Since then, I've been very anxious, reliving horrible scenes that I'd experienced as a nurse and postponing going to bed in fear of having the dreams again. I didn't understand it. I am 70 years old, and the war happened a long time ago. Then I began putting it together. Recently, the emergency helicopter flight pattern and approach to the area's hospital changed. I began hearing the helicopter periodically in my living room, and it reminded me of Vietnam. I knew then that I needed help; I couldn't stop shaking. I felt as if I was losing control of my emotions. I remembered how the intake counselor took the time to explain common symptoms of trauma. That's why I'm here today."

"This might not sound like a big deal, but for many people relationships have become all about getting: telling your problem story and then getting help with it. There is little, if any, emphasis placed on giving back. That's a big deal!!! Service relationships are like a one way street and both people's roles are clearly defined. But in 'regular' relationships in your community, people give and take all the time. No one is permanently on the taking side or the giving side. This exchange contributes to people feeling ok about being vulnerable (needing help) as well as confident about what they're offering. For many of us, being the role of 'getter' all the time has shaken our confidence, making us feel like we have nothing worthwhile to contribute. Peer support breaks that all down. It gets complicated somewhat when one of us is paid, but modeling this kind of relationship in which both of us learn, offers us the real practice we need to feel like a 'regular' community member as opposed to an 'integrated mental patient'."

(Mead, 2008, p.7)

areas: creating **S**afety, regulating **E**motions, addressing **L**oss, and redefining the **F**uture (Bloom, Foderaro, & Ryan, 2006).

Offer Trauma-Informed Peer Support

Living with a history of trauma can be isolating and consuming. The experience of trauma can reinforce beliefs about being different, alone, and marred by the experience. At times, behavioral health treatment for trauma-related effects can inadvertently reinforce these beliefs. Simply engaging in treatment or receiving specialized services (although warranted) can further strengthen clients' beliefs that there is something wrong with them. Formalized peer support can enhance the treatment experience. Treatment plus peer support can break the cycle of beliefs that reinforce traumatic stress (e.g., believing that one is permanently damaged; that nobody could understand; that no one should or could tolerate one's story). Peer support provides opportunities to form mutual relationships; to learn how one's history shapes perspectives of self, others, and the future; to move beyond trauma; and to mirror and learn alternate coping strategies. Peer support defines recovery as an

Advice to Counselors: Strategies To Enhance Peer Support

Strategy #1: Provide education on what peer support is and is not. Roles and expectations of peer support can be confusing, so providing clarification in the beginning can be quite useful. It is important to provide initial education about peer support and the value of using this resource.

Strategy #2: Use an established peer support curriculum to guide the peer support process. For example, *Intentional Peer Support: An Alternative Approach* (Mead, 2008) is a workbook that highlights four main tasks for peer support: building connections, understanding one's worldview, developing mutuality, and helping each other move toward set desires and goals. This curriculum provides extensive materials for peer support staff members as well as for the individuals seeking peer support.

interactive process, not as a definitive moment wherein someone fixes the "problem."

Normalize Symptoms

Symptoms of trauma can become serious barriers to recovery from substance use and mental disorders, including trauma-related ones. Counselors should be aware of how trauma symptoms can present and how to respond to them when they do appear. A significant step in addressing symptoms is normalizing them. People with traumatic stress symptoms need to know that their symptoms are not unique and that their reactions are common to their experience(s). Often, normalizing symptoms gives considerable relief to clients who may have thought that their symptoms signified some pervasive, untreatable mental disorder.

Advice to Counselors: Strategies To Normalize Symptoms

Strategy #1: Provide psychoeducation on the common symptoms of traumatic stress.

Strategy #2: Research the client's most prevalent symptoms specific to trauma, and then provide education to the client. For example, an individual who was conscious and trapped during or as a result of a traumatic event will more likely be hypervigilant about exits, plan escape routes even in safe environments, and have strong reactions to interpersonal and environmental situations that are perceived as having no options for avoidance or resolution (e.g., feeling stuck in a work environment where the boss is emotionally abusive).

Strategy #3: First, have the client list his or her symptoms. After each symptom, ask the client to list the negative and positive consequences of the symptom. Remember that symptoms serve a purpose, even if they may not appear to work well or work as well as they had in the past. Focus on how the symptoms have served the client in a positive way (see Case Illustration: Hector). This exercise can be difficult, because clients as well as counselors often don't focus on the value of symptoms.

Case Illustration: Hector

Hector was referred to a halfway house specializing in co-occurring disorders after inpatient treatment for methamphetamine dependence and posttraumatic stress disorder (PTSD). In the halfway house, he continued to feel overwhelmed with the frequency and intensity of flashbacks. He often became frustrated, expressing anger and a sense of hopelessness, followed by emotional withdrawal from others in the house. Normalization strategy #3 was introduced in the session. During this exercise, he began to identify many negative aspects of flashbacks. He felt that he couldn't control the occurrence of flashbacks even though he wanted to, and he realized that he often felt shame afterward. In the same exercise, he was also urged to identify positive aspects of flashbacks. Although this was difficult, he realized that flashbacks were clues about content that he needed to address in trauma-specific treatment. "I realized that a flashback, for me, was a billboard advertising what I needed to focus on in therapy."

Identify and Manage Trauma-Related Triggers

Many clients who have traumatic stress are caught off guard with intrusive thoughts, feelings, sensations, or environmental cues of the trauma. This experience can be quite disconcerting, but often, the individual does not draw an immediate connection between the internal or external trigger and his or her reactions. At other times, the trigger is so potent that the individual is unable to discern the present trigger from the past trauma and begins to respond as if the trauma is reoccurring.

Key steps in identifying triggers are to reflect back on the situation, surroundings, or sensations prior to the strong reaction. By doing so, you and your client may be able to determine the connections among these cues, the past trauma(s), and the client's reaction. Once the cue is identified, discuss the ways in which it is connected to past trauma. For some cues, there will be an obvious and immediate connection (e.g., having someone say "I love you" in a significant relationship as an adult and connecting this to an abuser who said the same thing prior to a sexual assault). Other

Advice to Counselors: Strategies To Identify and Manage Trauma-Related Triggers

Strategy #1: Use the Sorting the Past From the Present technique for cognitive realignment (Blackburn, 1995) to help separate the current situation from the past trauma. Identify one trigger at a time, and then discuss the following questions with the client:

- When and where did you begin to notice a reaction?
- How does this situation remind you of your past history or past trauma?
- How are your reactions to the current situation similar to your past reactions to the trauma(s)?
- How was this current situation different from the past trauma?
- How did you react differently to the current situation than to the previous trauma?
- How are you different today (e.g., factors such as age, abilities, strength, level of support)?
- What choices can you make that are different from the past and that can help you address the current situation (trigger)?

After reviewing this exercise several times in counseling, put the questions on a card for the client to carry and use outside of treatment. Clients with substance use disorders can benefit from using the same questions (slightly reworded) to address relapse triggers.

Strategy #2: After the individual identifies the trigger and draws connections between the trigger and past trauma, work with him or her to establish responses and coping strategies to deal with triggers as they occur. Initially, the planned responses will not immediately occur after a trigger, but with practice, the planned responses will move closer to the time of the trigger. Some strategies include an acronym that reflects coping strategies (Exhibit 1.5-1), positive self-talk generated by cognitive–behavioral covert modeling exercises (rehearsal of coping statements), breathing retraining, and use of support systems (e.g., calling someone).

Strategy #3: Self-monitoring is any strategy that asks a client to observe and record the number of times something happens, to note the intensity of specific experiences, or to describe a specific behavioral, emotional, or cognitive phenomenon each time it occurs. For individuals with histories of trauma, triggers and flashbacks can be quite frightening, intense, and powerful. Even if the client has had just one or two triggers or flashbacks, he or she may perceive flashbacks as happening constantly. Often, it takes time to recover from these experiences. Using self-monitoring and asking the client to record each time a trigger occurs, along with describing the trigger and its intensity level (using a scale from 1–10), clients and counselors will gain an understanding of the type of triggers present and the level of distress that each one produces. Moreover, the client may begin to see that the triggers don't actually happen all the time, even though they may seem to occur frequently.

Exhibit 1.5-1: The OBSERVATIONS Coping Strategy

- Take a moment to just ***Observe*** what is happening. Pay attention to your body, your senses, and your environment.
- Focus on your ***Breathing***. Allow your feelings and sensations to wash over you. Breathe.
- Name the ***Situation*** that initiated your response. In what way is this situation familiar to your past? How is it different?
- Remember that ***Emotions*** come and go. They may be intense now, but later they will be less so. Name your feelings.
- ***Recognize*** that this situation does not define you or your future. It does not dictate how things will be, nor is it a sign of things to come. Even if it is familiar, it is only one event.
- ***Validate*** your experience. State, at least internally, what you are feeling, thinking, and experiencing.
- ***Ask*** for help. You don't have to do this alone. Seek support. Other people care for you. Let them!
- ***This*** too shall pass. Remember: There are times that are good and times that are not so good. This hard time will pass.
- ***I*** can handle this. Name your strengths. Your strengths have helped you survive.
- Keep an ***Open*** mind. Look for and try out new solutions.
- ***Name*** strategies that have worked before. Choose one and apply it to this situation.
- Remember you have survived. You are a ***Survivor***!

cues will not be as obvious. With practice, the client can begin to track back through what occurred immediately before an emotional, physical, or behavioral reaction and then examine how that experience reminds him or her of the past.

Draw Connections

Mental health and substance abuse treatment providers have historically underestimated the effects of trauma on their clients for many reasons. Some held a belief that substance

Advice to Counselors: Strategies To Help Clients Draw Connections

Strategy #1: Writing about trauma can help clients gain awareness of their thoughts, feelings, and current experiences and can even improve physical health outcomes (Pennebaker, Kiecolt-Glaser, & Glaser, 1988; Smyth, Hockemeyer, & Tulloch, 2008). Although this tool may help some people draw connections between current experiences and past traumas, it should be used with caution; others may find that it brings up too much intense trauma material (especially among vulnerable trauma survivors with co-occuring substance abuse, psychosis, and current domestic violence). Journal writing is safest when you ask clients to write about present-day specific targets, such as logging their use of coping strategies or identifying strengths with examples. Writing about trauma can also be done via key questions or a workbook that provides questions centered upon trauma experiences and recovery.

Strategy #2: Encourage clients to explore the links among traumatic experiences and mental and substance use disorders. Recognition that a mental disorder or symptom developed after the trauma occurred can provide relief and hope that the symptoms may abate if the trauma is addressed. Ways to help clients connect substance use with trauma histories include (Najavits, 2002b; Najavits, Weiss, & Shaw, 1997):

- Identifying how substances have helped "solve" trauma or PTSD symptoms in the short term (e.g., drinking to get to sleep).
- Teaching clients how trauma, mental, and substance use disorders commonly co-occur so that they will not feel so alone and ashamed about these issues.
- Discussing how substance abuse has impeded healing from trauma (e.g., by blocking feelings and memories).
- Helping clients recognize trauma symptoms as triggers for relapse to substance use and mental distress.
- Working on new coping skills to recover from trauma and substance abuse at the same time.
- Recognizing how both trauma and substance abuse often occur in families through multiple generations.

abuse should be addressed before attending to any co-occurring conditions. Others did not have the knowledge and training to evaluate trauma issues or were uncomfortable or reluctant to discuss these sensitive issues with clients (Ouimette & Brown, 2003). Similarly, in other behavioral health settings, clinicians sometimes address trauma-related symptoms but do not have experience or training in the treatment of substance abuse.

So too, people who have histories of trauma will often be unaware of the connection between the traumas they've experienced and their traumatic stress reactions. They may notice depression, anger, or anxiety, or they may describe themselves as "going crazy" without being able to pinpoint a specific experience that produced the trauma symptoms. Even if clients recognize the events that precipitated their trauma symptoms, they may not understand how others with similar experiences can have different reactions. Thus, a treatment goal for trauma survivors is helping them gain awareness of the connections between their histories of trauma and subsequent consequences. Seeing the connections can improve clients' ability to work on recovery in an integrated fashion.

Teach Balance

You and your clients need to walk a thin line when addressing trauma. Too much work focused on highly distressing content can turn a desensitization process into a session whereby the client dissociates, shuts down, or becomes emotionally overwhelmed. On the other hand, too little focus by the client or counselor can easily reinforce avoidance and confirm the client's internal belief that it is too dangerous to deal with the aftermath of the trauma. Several trauma-specific theories offer guidelines on acceptable levels of distress associated with the traumatic content that the therapy addresses. For example, some traditional desensitization processes start at a very low level of subjective distress, gradually working up through a hierarchy of trauma memories and experiences until those experiences produce minimal reactions when paired with some coping strategy, such as relaxation training. Other desensitization processes start at a higher level of intensity to provide more rapid extinction of traumatic associations and to decrease the risk of avoidance—a behavior that reinforces traumatic stress.

> The Subjective Units of Distress Scale (SUDS) uses a 0 10 rating scale, with 0 representing content that causes no or minimal distress and 10 representing content that is exceptionally distressing and overwhelming.
>
> (Wolpe & Abrams, 1991)

Working with trauma is a delicate balancing act between the development and/or use of coping strategies and the need to process the traumatic experiences. Individuals will choose different paths to recovery; it's a myth that every traumatic experience needs to be expressed and every story told. For some individuals, the use of coping skills, support, and spirituality are enough to recover. Regardless of theoretical beliefs, counselors must teach

Advice to Counselors: Strategy To Teach Balance

Strategy #1: Teach and use the SUDS in counseling. This scale can be useful from the outset as a barometer for the client and counselor to measure the level of distress during and outside of sessions. It provides a common language for the client and counselor, and it can also be used to guide the intensity of sessions. SUDS can tangibly show a client's progress in managing experiences. Without a scale, it is more difficult to grasp that a distressing symptom or circumstance is becoming less and less severe without some repeated measure.

coping strategies as soon as possible. Retraumatization is a risk whenever clients are exposed to their traumatic histories without sufficient tools, supports, and safety to manage emotional, behavioral, and physical reactions.

Build Resilience

Survivors are resilient! Often, counselors and clients who are trauma survivors focus on the negative consequences of trauma while failing to recognize the perseverance and attributes that have helped them survive. It is natural to focus on what's not working rather than what has worked. To promote growth after trauma and establish a strengths-based approach, focus on building on clients' resilience. Current resilience theories claim that building or reinforcing resilience prevents further development of trauma-related symptoms and disorders. The following *Advice to Counselors* box is adapted from the American Psychological Association's 2003 statement on resilience.

Advice to Counselors: Strategies To Build Resilience

Strategy #1: Help clients reestablish personal and social connections. Access community and cultural resources; reconnect the person to healing resources such as mutual-help groups and spiritual supports in the community.

Strategy #2: Encourage the client to take action. Recovery requires activity. Actively taking care of one's own needs early in treatment can evolve into assisting others later on, such as by volunteering at a community organization or helping military families.

Strategy #3: Encourage stability and predictability in the daily routine. Traumatic stress reactions can be debilitating. Keeping a daily routine of sleep, eating, work, errands, household chores, and hobbies can help the client see that life continues. Like exercise, daily living skills take time to take hold as the client learns to live through symptoms.

Strategy #4: Nurture a positive view of personal, social, and cultural resources. Help clients recall ways in which they successfully handled hardships in the past, such as the loss of a loved one, a divorce, or a major illness. Revisit how those crises were addressed.

Strategy #5: Help clients gain perspective. All things pass, even when facing very painful events. Foster a long-term outlook; help clients consider stress and suffering in a spiritual context.

Strategy #6: Help maintain a hopeful outlook. An optimistic outlook enables visions of good things in life and can keep people going even in the hardest times. There are positive aspects to everyone's life. Taking time to identify and appreciate these enhances the client's outlook and helps him or her persevere.

Strategy #7: Encourage participation in peer support, 12-Step, and other mutual-help programs.

Source: American Psychological Association, 2003.

Address Sleep Disturbances

Sleep disturbances are one of the most enduring symptoms of traumatic stress and are a particularly common outcome of severe and prolonged trauma. Sleep disturbances increase one's risk of developing traumatic stress; they significantly alter physical and psychological processes, thus causing problems in daytime functioning (e.g., fatigue, cognitive difficulty, excessive daytime sleepiness). People with sleep disturbances have worse general health and quality of life. The cardiovascular and immune systems, among others, may be affected as well. Sleep disturbances can worsen traumatic stress symptoms and interfere with healing by impeding the brain's ability to process and consolidate traumatic memories (Caldwell & Redeker, 2005).

Sleep disturbances vary among trauma survivors and can include decreased ability to stay asleep, frequent awakenings, early morning unintentional awakening, trouble falling asleep, poor quality of sleep, and disordered

Advice to Counselors: Strategies To Conduct a Sleep Intervention

Strategy #1: Conduct a sleep history assessment focused first on the client's perception of his or her sleep patterns. Assess whether there is difficulty initiating or staying asleep, a history of frequent or early morning awakenings, physically restless sleep, sleepwalking, bedtime aversion, and/or disruptive physical and emotional states upon awakening (e.g., confusion, agitation, feeling unrested). Also determine total sleep time, pattern of nightmares, and use of medications, alcohol, and/or caffeine (see Moul, Hall, Pikonis, & Buysse, 2004, for a review of self-report measures).

Strategy #2: Use a sleep hygiene measure to determine the presence of habits that typically interfere with sleep (e.g., falling asleep while watching television). The National Sleep Foundation Web site (http://www.sleepfoundation.org) provides simple steps for promoting good sleep hygiene.

Strategy #3: Provide education on sleep hygiene practices. Introduce clients to the idea that practicing good sleep hygiene is one step toward gaining control over their sleep disturbances.

Strategy #4: Reassess sleep patterns and history during the course of treatment. Sleep patterns often reflect current client status. For example, clients who are struggling are more likely to have disturbed sleep patterns; sleep disturbances significantly influence clients' mental health status.

Strategy #5: Use interventions such as nightmare rehearsals to target recurrent nightmares. There are numerous examples of imagery-based nightmare rehearsals. Clients may be instructed to rehearse repetitively the recurrent nightmare a few hours before bedtime. In this instruction, the client either rehearses the entire nightmare with someone or visualizes the nightmare several times to gain control over the material and become desensitized to the content. Other strategies involve imagining a change in the outcome of the nightmare (e.g., asking the client to picture getting assistance from others, even though his or her original nightmare reflects dealing with the experience alone).

breathing during sleep (Caldwell & Redeker, 2005). Most traumatic stress literature focuses on nightmares, insomnia, and frequent awakenings. These disturbances are connected to two main symptoms of traumatic stress: hyperarousal (which causes difficulty in falling and remaining asleep) and reexperiencing the trauma (e.g., through recurrent nightmares). Other sleep disturbances trauma survivors report include sleep avoidance or resistance to sleep (see Case Illustration: Selena), panic awakenings, and restless or unwanted body movements (e.g., hitting your spouse unintentionally in bed while asleep; Habukawa, Maeda, & Uchimura, 2010).

Case Illustration: Selena

Selena initially sought treatment for ongoing depression (dysthymia). During treatment, she identified being sexually assaulted while attending a party at college. At times, she blames herself for the incident because she didn't insist that she and her girlfriends stay together during the party and on the way back to their dorm afterward. Selena reported that she only had two drinks that night: "I could never manage more than two drinks before I wanted to just sleep, so I never drank much socially." She was assaulted by someone she barely knew but considered a "big brother" in the brother fraternity of her sorority. "I needed a ride home. During that ride, it happened," she said. For years thereafter, Selena reported mild bouts of depression that began lasting longer and increasing in number. She also reported nightmares and chronic difficulty in falling asleep. In therapy, she noted avoiding her bed until she's exhausted, saying, "I don't like going to sleep; I know what's going to happen." She describes fear of sleeping due to nightmares. "It's become a habit at night. I get very involved in playing computer games to lose track of time. I also leave the television on through the night because then I don't sleep as soundly and have fewer nightmares. But I'm always exhausted."

Build Trust

Some traumatic experiences result from trusting others (e.g., interpersonal trauma). In other cases, trust was violated during or after the traumatic experience, as in cases when help was late to arrive on the scene of a natural disaster. This lack of trust can leave individuals alienated, socially isolated, and terrified of developing relationships. Some feel that the trauma makes them different from others who haven't had similar experiences. Sometimes, a client's trust issues arise from a lack of trust in self—for instance, a lack of trust in one's perceptions, judgment, or memories. People who have also experienced severe mental or substance use disorders may have difficulty trusting others because, during the course of their illness, they felt alienated or discriminated against for behaviors and emotions generated by or associated with the disorders.

Some client groups (e.g., gay, lesbian, and bisexual clients; people from diverse cultures; those with serious mental illness) evidence significant mistrust because their trust has been repeatedly violated in the past. Traumatic experiences then compound this mistrust. Mistrust can come from various sources, is usually unstated, and, if left unaddressed, can impede treatment. For example, some clients leave treatment early or do not engage in potentially beneficial treatments. Others avoid issues of trust and commitment by leaving treatment when those issues begin to arise.

Establishing a safe, trusting relationship is paramount to healing—yet this takes time in the counseling process. Counselors and other behavioral health professionals need to be consistent throughout the course of treatment; this includes maintaining consistency in the parameters set for availability, attendance, and level of empathy. Trust is built on behavior shown inside and outside of treatment; you should immediately address any behavior that may even slightly injure the relationship (e.g., being 5 minutes late for an appointment, not responding to a phone message in a timely manner, being distracted in a session).

Advice to Counselors: Strategies To Build Trust

Strategy #1: Clients can benefit from a support or counseling group composed of other trauma survivors. By comparing themselves with others in the group, they can be inspired by those who are further along in the recovery process and helpful to those who are not faring as well as they are. These groups also motivate clients to trust others by experiencing acceptance and empathy.

Strategy #2: Use conflicts that arise in the program as opportunities. Successful negotiation of a conflict between the client and the counselor is a major milestone (van der Kolk, McFarlane, & Van der Hart, 1996). Helping clients understand that conflicts are healthy and inevitable in relationships (and that they can be resolved while retaining the dignity and respect of all involved) is a key lesson for those whose relationship conflicts have been beset by violence, bitterness, and humiliation.

Strategy #3: Prepare clients for staff changes, vacations, or other separations. Some clients may feel rejected or abandoned if a counselor goes on vacation or is absent due to illness, especially during a period of vulnerability or intense work. A phone call to the client during an unexpected absence can reinforce the importance of the relationship and the client's trust. You can use these opportunities in treatment to help the client understand that separation is part of relationships; work with the client to view separation in a new light.

Strategy #4: Honor the client–counselor relationship, and treat it as significant and mutual. You can support the development of trust by establishing clear boundaries, being dependable, working with the client to define explicit treatment goals and methods, and demonstrating respect for the client's difficulty in trusting you and the therapeutic setting.

Support Empowerment

Strong feelings of powerlessness can arise in trauma survivors seeking to regain some control of their lives. Whether a person has survived a single trauma or chronic trauma, the survivor can feel crushed by the weight of powerlessness. Mental illness and substance abuse, too, can be disempowering; clients may feel that they've lost control over their daily lives, over a behavior such as drug use, or over powerful emotions such as fear, sadness, or anger. Empowerment means helping clients feel greater power and control over their lives, as long as such control is within safe and healthy bounds. A key facet of empowerment is to help clients build on their strengths. Empowerment is more than helping clients discover what they "should" do; it is also helping them take the steps they feel ready to take.

Case Illustration: Abby

Abby, a 30-year-old, nervous-looking woman, is brought by her parents to a community mental health clinic near their home in rural Indiana. During the intake process, the counselor learns that Abby is an Army Reservist who returned from 12 months of combat duty 3 years ago. The war experience changed her in many ways. Her deployment pulled her away from veterinary school as well as the strong emotional support of family, friends, and fellow classmates. She got along with her unit in Iraq and had no disciplinary problems. While there, she served as a truck driver in the Sunni Triangle. Her convoy was attacked often by small arms fire and was once struck by an improvised explosive device. Although Abby sustained only minor injuries, two of her close friends were killed. With each successive convoy, her level of fear and foreboding grew, but she continued performing as a driver.

Since returning to the United States, she has mostly stayed at home and has not returned to school, although she is helping out on the farm with various chores. Abby has isolated herself from both family members and lifelong friends, saying she doesn't think others can understand what she went through and that she prefers being alone. She reports to her parents and the counselor that she is vaguely afraid to be in cars and feels most comfortable in her room or working alone, doing routine tasks, at home. Abby also says that she now understands how fragile life can be.

She has admitted to her parents that she drinks alcohol on a regular basis, something she did not do before her deployment, and that on occasion, she has experienced blackouts. Abby feels she needs a drink before talking with strangers or joining in groups of friends or family. She confided to her father that she isolates herself so that she can drink without having to explain her drinking to others.

The counselor recognizes Abby's general sense of lacking internal control and feeling powerless over what will happen to her in the future. He adopts a motivational interviewing style to establish rapport and a working alliance with Abby. During sessions, the counselor asks Abby to elaborate on her strengths; he reinforces strengths that involve taking action in life, positive self-statements, and comments that deal with future plans. He also introduces Abby to an Iraq War veteran who came home quite discouraged about putting his life together but has done well getting reintegrated. The counselor urges Abby go to the local VA center so that she can meet and bond with other recently returned veterans. He also encourages Abby to attend Alcoholics Anonymous meetings, emphasizing that she won't be pressured to talk or interact with others more than she chooses to.

The counselor continues to see Abby every week and begins using cognitive–behavioral techniques to help her examine some of her irrational fears about not being able to direct her life. He asks Abby to keep a daily diary of activities related to achieving her goals of getting back to school and reestablishing a social network. In each session, Abby reviews her progress using the diary as a memory aid, and the counselor reinforces these positive efforts. After 4 months of treatment, Abby reenrolls in college and is feeling optimistic about her ability to achieve her career plans.

Advice to Counselors: Strategies To Support Empowerment

Strategy #1: Offer clients information about treatment; help them make informed choices. Placing appropriate control for treatment choices in the hands of clients improves their chances of success.

Strategy #2: Give clients the chance to collaborate in the development of their initial treatment plan, in the evaluation of treatment progress, and in treatment plan updates. Incorporate client input into treatment case consultations and subsequent feedback.

Strategy #3: Encourage clients to assume an active role in how the delivery of treatment services occurs. An essential avenue is regularly scheduled and structured client feedback on program and clinical services (e.g., feedback surveys). Some of the most effective initiatives to reinforce client empowerment are the development of peer support services and the involvement of former clients in parts of the organizational structure, such as the advisory board or other board roles.

Strategy #4: Establish a sense of self-efficacy in clients; their belief in their own ability to carry out a specific task successfully—is key. You can help clients come to believe in the possibility of change and in the hope of alternative approaches to achieving change. Supporting clients in accepting increasing responsibility for choosing and carrying out personal change can facilitate their return to empowerment (Miller & Rollnick, 2002).

Acknowledge Grief and Bereavement

The experience of loss is common after traumas, whether the loss is psychological (e.g., no longer feeling safe) or physical (e.g., death of a loved one, destruction of community, physical impairment). Loss can cause public displays of grief, but it is more often a private experience. Grieving processes can be emotionally overwhelming and can lead to increased substance use and other impulsive behaviors as a way to manage grief and other feelings associated with the loss. Even for people who experienced trauma years prior to treatment, grief is still a common psychological issue. Delayed or absent reactions of acute grief can cause exhaustion, lack of strength, gastrointestinal symptoms, and avoidance of emotions.

Risk factors of chronic bereavement (grief lasting more than 6 months) can include:

- Perceived lack of social support.
- Concurrent crises or stressors (including reactivation of PTSD symptoms).
- High levels of ambivalence about the loss.
- An extremely dependent relationship prior to the loss.
- Loved one's death resulting from disaster: unexpected, untimely, sudden, and shocking (New South Wales Institute of Psychiatry & Centre for Mental Health, 2000).

Advice to Counselors: Strategies To Acknowledge and Address Grief

Strategy #1: Help the client grieve by being present, by normalizing the grief, and by assessing social supports and resources.

Strategy #2: When the client begins to discuss or express grief, focus on having him or her voice the losses he or she experienced due to trauma. Remember to clarify that losses include internal experiences, not just physical losses.

Strategy #3: For a client who has difficulty connecting feelings to experiences, assign a feelings journal in which he or she can log and name each feeling he or she experiences, rate the feeling's intensity numerically, and describe the situation during which the feeling occurred. The client may choose to share the journal in an individual or group session.

Strategy #4: Note that some clients benefit from developing a ritual or ceremony to honor their losses, whereas others prefer offering time or resources to an association that represents the loss.

Monitor and Facilitate Stability

Stability refers to an ongoing psychological and physical state whereby one is not overwhelmed by disruptive internal or external stimuli (Briere & Scott, 2006b). It's common for individuals to have an increase in symptoms, distress, or impairment when dealing with the impact of their trauma or talking about specific aspects of their trauma. There is a thin line that the client and counselor need to negotiate and then walk when addressing trauma. Too much work focused on highly distressing content can turn a desensitization process into a session that causes the client to dissociate, shut down, or become emotionally overwhelmed. On the other hand, too little focus by the client or counselor can easily reinforce avoidance and confirm the client's internal belief that it is too dangerous to deal with the aftermath of the trauma.

Advice to Counselors: Strategies To Monitor and Facilitate Stability

Strategy #1: If destabilization occurs during the intake process or treatment, stop exploring the material that triggered the reaction, offer emotional support, and demonstrate ways for the client to self-soothe.

Strategy #2: Seek consultation from supervisors and/or colleagues (e.g., to explore whether a new case conceptualization is needed at this point).

Strategy #3: Refer the client for a further assessment to determine whether a referral is necessary for trauma-specific therapy or a higher level of care, or use of multiple levels of care (e.g., intensive outpatient care, partial hospitalization, residential treatment).

Strategy #4: Focus on coping skills and encourage participation in a peer support program.

Strategy #5: When a client becomes agitated and distressed, carefully explore with the client what is causing this state. When such feelings arise because of current threats in the client's life or environment, it is dangerous to halt or soothe away responses that act as warning signals (Pope & Brown, 1996). When a client is in a situation involving domestic violence, lives in a dangerous neighborhood, or has run out of money for food, he or she requires direct and concrete assistance rather than simple emotional support.

Source: Briere & Scott, 2006b.

Managing Destabilization

When a client becomes destabilized during a session, you can respond in the following manner: "Let's slow down and focus on helping you be and feel safe. What can we do to allow you to take care of yourself at this moment? Then, when you feel ready, we can decide what to focus on next."

Clients should have some psychological stability to engage in trauma-related work. An important distinction can be made between a normative increase in symptoms (e.g., the typical up-and-down course of traumatic stress reactions or substance abuse) and destabilization (dangerous, significant decrease in functioning). Signs of destabilization include (Green Cross Academy of Traumatology, 2007; Najavits, 2002b):

- Increased substance use or other unsafe behavior (e.g., self-harm).
- Increased psychiatric symptoms (e.g., depression, agitation, anxiety, withdrawal, anger).
- Increased symptoms of trauma (e.g., severe dissociation).
- Helplessness or hopelessness expressed verbally or behaviorally.
- Difficulty following through on commitments (e.g., commitment to attend treatment sessions).
- Isolation.
- Notable decline in daily activities (e.g., self-care, hygiene, care of children or pets, going to work).

Treatment Issues

The treatment environment itself can significantly affect how clients experience traumatic stress and how the client responds to treatment. Some specific issues related to working with trauma survivors in a clinical setting are discussed in the following sections.

Client Engagement

A lack of engagement in treatment is the client's inability to make progress toward treatment goals, deal with important topics in treatment, or complete treatment. Clients who have histories of trauma will express ambivalence about treatment similarly to others, except that clients who have traumatic stress can feel more "stuck" and perceive themselves as having fewer options. In addition, clients may be avoiding engagement in treatment because it is one step closer to addressing their trauma. You should attend to the client's motivation to change, implement strategies that address ambivalence toward treatment, and use approaches that help clients overcome avoidant behavior.

Advice to Counselors: Strategies To Foster Engagement

Strategy #1: According to Mahalik (2001), the standard method of handling clients' lack of engagement is exploring it with them, clarifying the situation through discussion with them, reinterpreting (e.g., from "can't" to "won't" to "willing"), and working through the situation toward progress.

Strategy #2: To improve engagement into treatment, try motivational interviewing and enhancement techniques. For additional information on such techniques, see TIP 35, *Enhancing Motivation for Change in Substance Abuse Treatment* (Center for Substance Abuse Treatment [CSAT], 1999b).

Pacing and Timing

Although your training or role as a counselor may prohibit you from providing trauma-specific services, you must still be prepared for the fact that clients are not as focused on when or where it is most appropriate to address trauma—they want relief, and most lay and professional people have been taught that the only path to recovery is disclosure. Some clients are reluctant to talk about anything associated with their histories of trauma. Other clients immediately want to delve into the memories of their trauma without developing a safe environment. The need to gain any relief for the traumatic stress pushes some individuals to disclose too quickly, without having the necessary support and coping skills to manage the intensity of their memories. Clients who enter treatment and immediately disclose past trauma often don't return because the initial encounter was so intense or because they experienced considerable emotional distress for several days afterward and/or in anticipation of the next session.

Proper pacing of sessions, disclosure, and intensity is paramount. Clients who immediately disclose without proper safety nets are actually retraumatizing themselves by reliving the experience without adequate support—often placing themselves in the same circumstances that occurred during the actual traumas they experienced. Although you should not adamantly direct clients not to talk about what happened, it is important to discuss with the clients, even if you have to interrupt them empathically and respectfully, the potential consequences of disclosing too soon and too fast. Ask whether they have done this before, and then inquire about the outcome. Reinforce with clients that trauma heals when there are support, trust, and skills in place to manage the memories of the traumatic experiences. Ideally, disclosure begins after these elements are secured, but realistically, it is a

Advice to Counselors: Strategies To Establish Appropriate Pacing and Timing

Strategy #1: Frequently discuss and request feedback from clients about pacing and timing. Moving too quickly into discussion of the trauma can increase the risk of dissociation, overactivation of memories, and feeling overwhelmed.

Strategy #2: Use the SUDS as a barometer of intensity to determine the level of work.

Strategy #3: Slowly increase the speed of interventions and continually adjust the intensity of interventions; move in and out of very intense work, or use strategies that decrease the intensity when necessary. One approach that typically decreases the intensity of traumatic memories is to ask the individual to imagine that he or she is seeing the scene through a window or on a television screen. This helps decrease intensity and the risk of dissociation. It provides an opportunity for the client to view the trauma from a different perspective and a strategy to use outside of treatment to shift from reliving the trauma to observing it from a neutral position.

Strategy #4: Monitor clients to ensure that treatment does not overwhelm their internal capacities, retraumatize them, or result in excessive avoidance; make sure therapy occurs in the "therapeutic window" (Briere & Scott, 2006b).

Strategy #5: Be alert to signs that discussions of trauma, including screening, assessment, and intake processes, are going too fast. Mild to moderate signs are:
- Missing counseling appointments after discussions of important material.
- Periods of silence.
- Dissociation.
- Misunderstanding what are usually understandable concepts.
- Redirecting the focus of the discussion when certain issues arise.

Strategy #6: Observe the client's emotional state. Slow down; seek consultation if the client exhibits:
- Persistent resistance to addressing trauma symptoms.
- Repetitive flashbacks.
- Increase in dissociation.
- Regression.
- Difficulty in daily functioning (e.g., trouble maintaining everyday self-care tasks).
- Substance use relapses.
- Self-harm or suicidal thoughts/behaviors (e.g., talking about suicide).

Strategy #7: Use caution and avoid (Briere, 1996b, p. 115):
- Encouraging clients to describe traumatic material in detail before they can deal with the consequences of disclosure.
- Using overly stressful interventions (e.g., intensive role-plays, group confrontation, guided imagery).
- Confrontations or interpretations that are too challenging given the client's current functioning.
- Demanding that the client work harder and stop resisting.

balancing act for both the counselor and client as to when and how much should be addressed in any given session. Remember not to inadvertently give a message that it is too dangerous to talk about trauma; instead, reinforce the importance of addressing trauma without further retraumatization.

Length of Treatment

Many factors influence decisions regarding the length of treatment for a given client. Severity of addiction, type of substance abused, type of trauma, age at which the trauma occurred, level of social support, and the existence of

mental disorders all influence length of treatment. External factors, such as transportation and childcare, caps on insurance coverage, and limitations in professional resources, can also affect length of treatment. In general, longer treatment experiences should be expected for clients who have histories of multiple or early traumas, meet diagnostic criteria for multiple Axis I or Axis II diagnoses, and/or require intensive case management. Most of the empirically studied and/or manual-based models described in the next chapter are short-term models (e.g., lasting several months); however, ongoing care is indicated for clients with more complex co-occurring trauma disorders.

Traumatic Memories

One of the most controversial issues in the trauma field is the phenomenon of "recovered memories" or "traumatic amnesia" (Brewin, 2007). Practitioners working with traumatized individuals are particularly concerned about the possibility of new memories of the traumatic event emerging during the course of therapy and the possibility of these memories being induced by the clinician. Scientific reviews indicate that people can experience amnesia and delayed recall for some memories of a wide variety of traumas, including military combat and prisoner of war experiences, natural disasters and accidents, childhood sexual abuse, and political torture (Bowman & Mertz, 1996; Brewin, 2007; Karon & Widener, 1997; McNally, 2005). In some cases, the survivor will not remember some of what happened, and the counselor may need to help the client face the prospect of never knowing all there is to know about the past and accept moving on with what is known.

Legal Issues

Legal issues can emerge during treatment. A client, for instance, could seek to prosecute a perpetrator of trauma (e.g., for domestic violence) or to sue for damages sustained in an accident or natural disaster. The counselor's role is not to provide legal advice, but rather, to offer support during the process and, if needed, refer the client to appropriate legal help (see Advice to Counselors box on p. 131). A legal matter can dominate the treatment atmosphere for its duration. Some clients have difficulty making progress in treatment until most or all legal matters are resolved and no longer act as ongoing stressors.

Memories of Trauma

Points for counselors to remember are:

- Some people are not able to completely remember past events, particularly events that occurred during high-stress and destabilizing moments.
- In addition to exploring the memories themselves, it can be beneficial to explore how a memory of an event helps the client understand his or her feeling, thinking, and behaving in the present.
- Persistently trying to recall all the details of a traumatic event can impair focus on the present.

Forgiveness

Clients may have all sorts of reactions to what has happened to them. They may feel grateful for the help they received, joy at having survived, and dedication to their recovery. At the other extreme, they may have fantasies of revenge, a loss of belief that the world is a good place, and feelings of rage at what has happened. They may hold a wide variety of beliefs associated with these feelings.

One issue that comes up frequently among counselors is whether to encourage clients to forgive. The issue of forgiveness is a very delicate one. It is key to allow survivors their feelings, even if they conflict with the counselor's own responses. Some may choose to forgive the perpetrator, whereas others may remain angry or seek justice through the courts and other legal means. Early in recovery from

Advice to Counselors: Strategies To Manage Traumatic Memories

Strategy #1: Most people who were sexually abused as children remember all or part of what happened to them, although they do not necessarily fully understand or disclose it. Do not assume that the role of the clinician is to investigate, corroborate, or substantiate allegations or memories of abuse (American Psychiatric Association [APA], 2000b).

Strategy #2: Be aware that forgotten memories of childhood abuse can be remembered years later. Clinicians should maintain an empathic, nonjudgmental, neutral stance toward reported memories of sexual abuse or other trauma. Avoid prejudging the cause of the client's difficulties or the veracity of the client's reports. A counselor's prior belief that physical or sexual abuse, or other factors, are or are not the cause of the client's problems can interfere with appropriate assessment and treatment (APA, 2000b).

Strategy #3: Focus on assisting clients in coming to their own conclusions about the accuracy of their memories or in adapting to uncertainty regarding what actually occurred. The therapeutic goal is to help clients understand the impact of the memories or abuse experiences on their lives and to reduce their detrimental consequences in the present and future (APA, 2000b).

Strategy #4: Some clients have concerns about whether or not a certain traumatic event did or did not happen. In such circumstances, educate clients about traumatic memories, including the fact that memories aren't always exact representations of past events; subsequent events and emotions can have the effect of altering the original memory. Inform clients that it is not always possible to determine whether an event occurred but that treatment can still be effective in alleviating distress.

Strategy #5: There is evidence that suggestibility can be enhanced and pseudomemories can develop in some individuals when hypnosis is used as a memory enhancement or retrieval strategy. Hypnosis and guided imagery techniques can enhance relaxation and teach self-soothing strategies with some clients; however, use of these techniques is not recommended in the active exploration of memories of abuse (Academy of Traumatology, 2007).

Strategy #6: When clients are highly distressed by intrusive flashbacks of delayed memories, help them move through the distress. Teach coping strategies and techniques on how to tolerate strong affect and distress (e.g., mindfulness practices).

trauma, it is best to direct clients toward focusing on stabilization and a return to normal functioning; suggest that, if possible, they delay major decisions about forgiveness until they have a clearer mind for making decisions (Herman, 1997). Even in later stages of recovery, it's not essential for the client to forgive in order to recover. Forgiveness is a personal choice independent of recovery. Respect clients' personal beliefs and meanings; don't push clients to forgive or impose your own beliefs about forgiveness onto clients.

In the long-term healing process, typically months or years after the trauma(s), forgiveness may become part of the discussion for some people and some communities. For example, in South Africa, years after the bitter and bloody apartheid conflicts, a Truth and Reconciliation Commission was established by the Government. Public hearings created dialog and aired what had been experienced as a means, ultimately, to promote forgiveness and community healing. By addressing very difficult topics in public, all could potentially benefit from the discourse. Similarly, a parental survivor of the Oklahoma City bombing was, at first, bitter about his daughter's early, unfair, and untimely death. Today, he gives talks around the world about the abolition of the death penalty. He sat with convicted

Advice to Counselors: Strategies To Manage Legal Proceedings

Strategy #1: If you're aware of legal proceedings, you can play a key role in helping your client prepare emotionally for their impact, such as what it might be like to describe the trauma to a judge or jury, or how to cope with seeing the perpetrator in court. When helping a client prepare, however, be careful not to provide legal advice.

Strategy #2: Help clients separate a successful legal outcome from a successful treatment outcome. If clients connect these two outcomes, difficulties can arise. For example, a client may discontinue treatment after his or her assailant is sentenced to serve prison time, believing that the symptoms will abate without intervention.

Strategy #3: If clients express interest in initiating a civil or criminal suit, encourage them to consider the ways in which they are and are not prepared for this, including their own mental states, capacity for resilience, and inevitable loss of confidentiality (Pope & Brown, 1996). Inform clients coping with legal issues that involvement in the legal process can be retraumatizing.

Strategy #4: Emphasize, for trauma survivors who are involved in legal proceedings against an assailant, that "not guilty" is a legal finding—it is based on the degree of available evidence and is not a claim that certain events in question did not occur. They should also receive, from an attorney or other qualified individual, information on:

- The nature of the legal process as it pertains to the clients' specific cases.
- The estimated duration and cost of legal services, if applicable.
- What to expect during police investigations.
- Court procedures.
- Full information on all possible outcomes.
- What to expect during cross-examination.

Strategy #5: Counselors can be called on to assist with a legal case involving trauma. The court may require you to provide treatment records, to write a letter summarizing your client's progress, or to testify at a trial. Always seek supervisory and legal advice in such situations and discuss with the client the possible repercussions that this might have for the therapeutic relationship. As a general rule, it is best practice to avoid dual roles or relationships.

bomber Timothy McVeigh's father while the man's son was executed in Indiana at a Federal prison several years after the bombing. For this man, forgiveness and acceptance helped him attain personal peace. Other trauma survivors may choose never to forgive what happened, and this, too, is a legitimate response.

Culturally and Gender Responsive Services

Culture is the lens through which reality is interpreted. Without an understanding of culture, it is difficult to gauge how individuals organize, interpret, and resolve their traumas. The challenge is to define how culture affects individuals who have been traumatized.

Increased knowledge of PTSD (Wilson & Tang, 2007), mental illness, and substance use disorders and recovery (Westermeyer, 2004) requires behavioral health practitioners to consider the complicated interactions between culture, personality, mental illness, and substance abuse in adapting treatment protocols. This section offers some general guidelines for working with members of cultures other than one's own. Treatment for traumatic stress, mental illness, substance use disorders, and co-occurring trauma-related symptoms is more effective if it is culturally responsive.

The U.S. Department of Health and Human Services (2003) has defined the term "cultural competence" as follows:

> Cultural competence is a set of values, behaviors, attitudes, and practices within a system, organization, program, or among individuals that enables people to work effectively across cultures. It refers to the ability to honor and respect the beliefs, language, interpersonal styles, and behaviors of individuals and families receiving services, as well as staff who are providing such services. Cultural competence is a dynamic, ongoing, developmental process that requires a long-term commitment and is achieved over time (p. 12).

Cultural competence is a process that begins with an awareness of one's own culture and beliefs and includes an understanding of how those beliefs affect one's attitudes toward people of other cultures. It is rooted in respect, validation, and openness toward someone whose social and cultural background is different from one's own. For a thorough review of cultural competence, see the planned TIP, *Improving Cultural Competence* (Substance Abuse and Mental Health Services Administration [SAMHSA], planned c).

Cultural Competence

Cultural competence includes a counselor's knowledge of:

- Whether the client is a survivor of cultural trauma (e.g., genocide, war, government oppression, torture, terrorism).
- How to use cultural brokers (i.e., authorities within the culture who can help interpret cultural patterns and serve as liaisons to those outside the culture).
- How trauma is viewed by an individual's sociocultural support network.
- How to differentiate PTSD, trauma-related symptoms, and other mental disorders in the culture.

For more specific information on cultural competence in trauma therapy, see Brown (2008).

In some cultures, an individual's needs take precedence over group needs (Hui & Triandis, 1986), and problems are seen as deriving from the self. In other cultures, however, complex family, kin, and community systems take precedence over individual needs. Considerable heterogeneity exists within and across most ethnic subcultures and across lines of gender, class, age, and political groups (CSAT, 1999b). Subcultures abound in every culture, such as gangs; populations that are homeless or use substances; orphaned or disenfranchised people; religious, ethnic, and sexual minorities; indigenous people; and refugee and immigrant populations. Some subcultures have more in common with similar subcultures in other countries than with their own cultures (e.g., nonheterosexual populations).

Trauma and substance abuse can themselves be a basis for affiliation with a subculture. De Girolamo (1993) reports that "disaster subcultures" exist within many cultures. These cultures of victimization, like all subcultures, have unique worldviews, codes of conduct, and perceptions of the larger society. In a disaster subculture, people are, to some extent, inured to disaster and heedless of warnings of impending disaster. For example, riverbank erosion in Bangladesh displaces thousands of people each year, yet few believe that it is a serious problem or that the displacement will be permanent (Hutton, 2000). Israelis who have lived with unpredictable violence for many years behave differently in public areas and have adapted to different norms than people who don't commonly experience violence (Young, 2001).

Many people identify with more than one subculture. Some identify with a particular culture or subculture, but not with all of its values. Individual identities are typically a mosaic of factors, including developmental achievements, life experiences, behavioral health histories, traumatic experiences, and

alcohol and illicit drug use; levels of acculturation and/or assimilation vary from one individual to the next as well.

Importance of the trauma aftermath

Counselors working in the immediate aftermath of trauma—whether individual, group, or community in nature—face many challenges. For example, survivors may be forced to adjust without access to other health services, employment, support, or insurance. In these instances, counselors must often work with individuals and communities coping with the trauma while struggling daily to meet basic needs. Research suggests that reestablishing ties to family, community, culture, and spiritual systems can not only be vital to the individual, but can also influence the impact of the trauma upon future generations. For example, Baker and Gippenreiter (1998) studied the descendants of people victimized by Joseph Stalin's purge. They found that families who were able to maintain a sense of connection and continuity with grandparents affected by the purge experienced fewer negative effects than did those who were emotionally or physically severed from their grandparents. The researchers also found that whether the grandparents survived was less important than the connection the grandchildren managed to keep to their past. Ties to family and community can also have an adverse effect, especially if the family or community downplays the trauma or blames the victim. Counselors need to have a full understanding of available support before advocating a particular approach.

Treatment strategies

Many traditional healing ways have been damaged, forgotten, or lost—yet much wisdom remains. Drawing on the best traditional and contemporary approaches to human distress and defining culturally competent curricula regarding identity and healing (Huriwai, 2002; Wilson & Tang, 2007) both require respect and appreciation for the many ways in which various people characterize and resolve trauma and how they use addictive substances to bear the burdens of human distress.

Community-Based Treatment for Native American Historical Trauma

Key beliefs in community healing:

- Clients carry childhood pain that has led to adult dysfunction.
- Childhood pain must be confronted, confessed, and addressed, if relief is to be obtained.
- Cathartic expression is the initial step in the healing journey toward a lifelong pursuit of introspection and self-improvement.
- The healing journey entails reclamation of indigenous heritage, identity, spirituality, and practices to remedy the pathogenic effects of colonization and other sources of historical trauma.

Source: Gone, 2009.

It is not yet known how well existing PTSD treatments work for individuals who identify primarily with cultures other than mainstream American culture. It is possible that such treatments do work for clients of other cultures, though some cultural adaptation and translation may be required. For example, some PTSD treatments that have been used with subculture groups without adaptation other than language translation and that appear to be effective across cultures include eye movement desensitization and reprocessing (Bleich, Gelkopf, & Solomon, 2003) and Seeking Safety (Daouest et al., 2012).

Gender

Gender differences exist in traumatic stress, mental disorders, and substance use disorders. For example, women have higher rates of PTSD, whereas men have higher rates of substance abuse (Kessler, Chiu, Demler, Merikangas, & Walters, 2005; Stewart, Ouimette, & Brown, 2002; Tolin & Foa, 2006).

Working With Clients From Diverse Cultures: Trauma and Substance Abuse

- In socially appropriate ways, educate clients, their loved ones, and possibly members of their extended community about the relationship between substance abuse and PTSD, how substance abuse is often used to cope with trauma, and what treatment entails.
- Make serious efforts to connect clients to supportive and understanding people (preferably within culturally identified groups).
- Help clients understand that many who have not experienced trauma or do not have substance use disorders will not understand the psychological, spiritual, and interpersonal insights that they have gained during their recovery processes.

The types of interpersonal trauma experienced by men and by women are often different. A number of studies (Kimerling, Ouimette, & Weitlauf, 2007) indicate that men experience more combat and crime victimization and women experience more physical and/or sexual assault—implying that men's traumas often occur in public, whereas the traumatization of women is more likely to take place in a private setting, such as a home. Men's abusers are more often strangers. Those who abuse women, on the other hand, are more often in a relationship with them. Women (and girls) often are told, "I love you," during the same time period when the abuse occurs. However, women now serve in the military and thus are increasingly subject to some of the same traumas as men and also to military sexual trauma, which is much more common for women to experience. Similarly, men can be subject to domestic violence or sexual abuse.

In treatment, gender considerations are relevant in a variety of ways, including, but not limited to, the role and impact of societal gender stereotypes upon assessment processes, treatment initiation, and engagement of services (e.g., peer support systems); the selection and implementation of gender-specific and gender-responsive approaches for both men and women at each level of intervention; and the best selection of trauma-related interventions that account for gender-specific differences related to traumatic stress. For an extensive review and discussion of gender-specific and gender-responsive care for traumatic stress and substance use, see the TIP 51, *Substance Abuse Treatment: Addressing the Specific Needs of Women* (CSAT, 2009d), and TIP 56, *Addressing the Specific Behavioral Health Needs of Men* (SAMHSA, 2013a).

Beyond the complexities of gender considerations, one must also consider whether clients should be given the choice of working with a male or a female counselor. Some clients who have been traumatized have no preference, particularly if their trauma wasn't associated with gender (e.g., a natural disaster, act of terrorism, fire, serious accident). If gender did play a role in trauma (e.g., childhood sexual abuse), clients can have strong fears of working with a counselor who is the same gender as the perpetrator. Many women who experienced sexual abuse (whose perpetrators are typically men) feel uncomfortable being treated by men because of the intense emotions that can be evoked (e.g., anger, fear). Men who experienced sexual abuse (whose perpetrators are also typically men) can feel uncomfortable for the same reasons, or they may feel shame when talking to men due to feelings evoked about masculinity, homosexuality, and so forth. However, not all clients with trauma histories prefer female therapists.

Discuss with clients the possible risks (e.g., initial emotional discomfort) and benefits of being treated by a woman or man (e.g., developing a therapeutic relationship with a man might challenge a client's belief that all men are dangerous), and, if possible, let them then choose the gender of their counselor. Tell

them that if they experience initial emotional discomfort, and the discomfort does not decrease, they can switch to a counselor of the opposite gender. For group therapy that focuses on trauma, similar considerations apply. Generally, gender-specific groups are recommended when possible, but mixed-gender groups also work. Gender also comes into play in substance abuse treatment. Research and clinical observation indicate that significant gender differences occur in many facets of substance abuse and its treatment. For example, men and women experience different physical repercussions of substance use (e.g., women have more health problems), different trajectories (e.g., women become addicted more quickly), and different treatment considerations (e.g., traditional substance abuse treatment was designed for men).

Sexual orientation

Lesbian, gay, bisexual, and transgender (LGBT) clients face specific issues in behavioral health treatment settings, including histories of abuse and discrimination relating to sexual orientation, homophobia in treatment on the part of counselors or other clients, potential difficulty addressing traumatic experiences related to their sexuality or sexual orientation, and often, a significant lack of trust toward others. LGBT people sometimes think that others can't understand them and their specific needs and thus are reluctant to engage in treatment programs in which the clientele is predominantly heterosexual. Some clients react with judgment, anger, or embarrassment when an LGBT client attempts to describe sexual trauma relating to homosexual behavior, making it even harder for LGBT clients to describe their experiences.

Often, individual counseling can address issues the LGBT client isn't comfortable discussing in group treatment. "Providing one-on-one services may decrease the difficulty of mixing heterosexual and LGBT clients in treatment groups and decrease the likelihood that heterosexism or homophobia will become an issue" (CSAT, 2001, p. 56). For more on treating LGBT individuals, see *A Provider's Introduction to Substance Abuse Treatment for Lesbian, Gay, Bisexual, and Transgender Individuals* (CSAT, 2001).

Making Referrals to Trauma-Specific Services

Many people who experience trauma do not exhibit persistent traumatic stress symptoms. In fact, people do recover on their own. So how do you determine who is at higher risk for developing more persistent symptoms of traumatic stress, trauma-related disorders, and traumatic stress disorders? One main factor is the severity of symptoms at the time of screening and assessment. Other factors, beyond trauma characteristics and pretrauma individual characteristics, to consider in making referrals include (Ehlers & Clark, 2003):

- Cognitive appraisals that are excessively negative regarding trauma sequelae, including consequences, changes after the event(s), responses of other people to the trauma, and symptoms.
- Acknowledgment of intrusive memories.
- Engagement in behaviors that reinforce or prevent resolution of trauma, including avoidance, dissociation, and substance use.
- History of physical consequences of trauma (e.g., chronic pain, disfigurement, health problems).
- Experiences of more traumas or stressful life events after the prior trauma.
- Identification of co-occurring mood disorders or serious mental illness.

The next chapter provides an overview of trauma-specific services to complement this chapter and to provide trauma-informed counselors with a general knowledge of trauma-specific treatment approaches.

6 Trauma-Specific Services

IN THIS CHAPTER

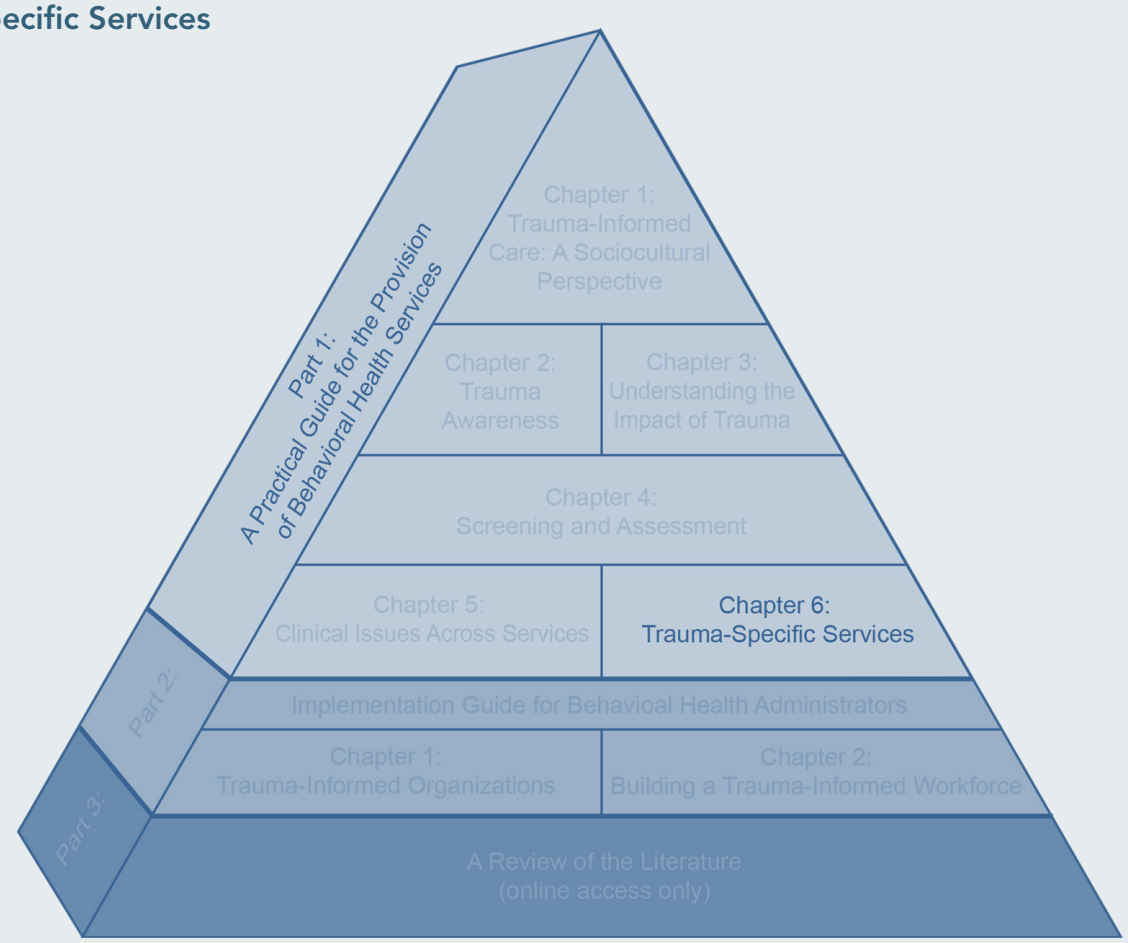
- Introduction
- Trauma Specific Treatment Models
- Integrated Models for Trauma
- Emerging Interventions
- Concluding Note

This chapter covers various treatment approaches designed specifically to treat trauma-related symptoms, trauma-related disorders, and specific disorders of traumatic stress. The models presented do not comprise an exhaustive list, but rather, serve as examples. These models require training and supervised experience to be conducted safely and effectively. The chapter begins with a section on trauma-specific treatment models, providing a brief overview of interventions that can be delivered immediately after a trauma, as well as trauma-specific interventions for use beyond the immediate crisis. The second segment focuses on integrated care that targets trauma-specific treatment for mental, substance use, and co-occurring disorders. Even though entry-level, trauma-informed behavioral health service providers are unlikely to be in a position to use these interventions, having some knowledge of them is nevertheless important. Currently, more research is needed to tease out the most important ingredients of early interventions and their role in the prevention of more pervasive traumatic stress symptoms. More science-based evidence is available for trauma-specific treatments that occur and extend well beyond the immediate reactions to trauma. The last part of the chapter provides a brief review of selected emerging interventions that have not been covered elsewhere in this Treatment Improvement Protocol (TIP).

Introduction

Trauma-specific therapies vary in their approaches and objectives. Some are present focused, some are past focused, and some are combinations (Najavits, 2007a). Present-focused approaches primarily address current coping skills, psychoeducation, and managing symptoms for better functioning. Past-focused approaches primarily focus on telling the trauma story to understand the impact of the trauma on how the person functions today, experiencing emotions that were too overwhelming to experience in the past, and helping clients more effectively cope in the present with their

Trauma-Informed Care Framework in Behavioral Health Services—Trauma-Specific Services



traumatic experiences. Clients participating in present-focused approaches may reveal some of their stories; past-focused approaches emphasize how understanding the past influences current behavior, emotion, and thinking, thereby helping clients cope more effectively with traumatic experiences in the present.

The distinction between these approaches lies in the primary emphasis of the approach. Depending on the nature of the trauma and the specific needs of the client, one approach may be more suitable than the other. For instance, in short-term treatment for clients in early recovery from mental illness and/or substance abuse, present-focused, cognitive–behavioral, or psychoeducational approaches are generally more appropriate. For clients who are stable in their recovery and have histories of developmental trauma where much of the trauma has been repressed, a past-focused orientation may be helpful. Some clients may benefit from both types, either concurrently or sequentially.

This chapter discusses a number of treatment models, general approaches, and techniques. A treatment model is a set of practices designed to alleviate symptoms, promote psychological well-being, or restore mental health. Treatment techniques are specific procedures that can be used as part of a variety of models. Some models and techniques described in this chapter can be used with groups, some with individuals, and some with both. This chapter is selective rather than comprehensive; additional models are described in the literature. See, for example, the PILOTS database on the Web site of the National Center for PTSD

(NCPTSD; http://www.ptsd.va.gov) for treatment literature related to trauma and posttraumatic stress disorder (PTSD). For an overview of models for use with both adult and child populations, refer to *Models for Developing Trauma-Informed Behavioral Health Systems and Trauma-Specific Services* (Center for Mental Health Services, 2008).

Some treatments discussed in this chapter are described as evidence based. Because research on integrated treatment models is so new, many have only been examined in a few studies. Given these circumstances and the fact that an outcome study provides only limited evidence of efficacy, the term "evidence based" should be interpreted cautiously. Additional scientific study is needed to determine whether some treatments discussed herein are, in fact, evidence based. A good resource for evaluating evidence-based, trauma-specific treatment models is *Effective Treatments for PTSD* (Foa, Keane, Friedman, & Cohen, 2009). Although evidence-based interventions should be a primary consideration in selecting appropriate treatment models for people with symptoms of trauma that co-occur with mental and substance use disorders (see Allen, 2001, for an indepth discussion of trauma and serious mental illness), other factors must also be weighed, including the specific treatment needs of the client; his or her history of trauma, psychosocial and cultural background, and experiences in prior trauma treatment; the overall treatment plan for the client; and the competencies of the program's clinical staff. Although behavioral health counselors can prepare to help their clients address some of the issues discussed in Chapter 5, specialized training is necessary to provide treatment for co-occurring substance use and mental disorders related to trauma.

The Substance Abuse and Mental Health Services Administration (SAMHSA) has created the National Registry of Evidence-Based Programs and Practices (NREPP) as a resource for reviewing and identifying effective treatment programs. Programs can be nominated for consideration as co-occurring disorders programs or substance abuse prevention or treatment programs, and their quality of evidence, readiness for dissemination, and training considerations are then reviewed. For more detailed information, including details about several evidence-based co-occurring trauma treatment programs, visit the NREPP Web site (http://www.nrepp.samhsa.gov). Program models for specialized groups, such as adolescents, can also be found on the NREPP Web site. For specific research-oriented information on trauma-specific treatments, refer to Part 3 of this TIP, which provides a literature review and links to select abstracts (available online).

Federal Agencies

Both the American Red Cross and the Federal Emergency Management Agency (FEMA) respond to disasters. Behavioral health service providers should understand the basics about these major emergency response agencies. For example, the Red Cross can respond rapidly with funding for food, shelter, and immediate needs, whereas FEMA assistance requires a period of gearing up but provides for longer-term needs. SAMHSA, along with other Federal agencies, assists FEMA in a number of areas of emergency response planning activities. See also SAMHSA's Disaster Technical Assistance Center Web site (http://www.samhsa.gov/dtac) and Technical Assistance Publication 34, *Disaster Planning Handbook for Behavioral Health Treatment Programs* (SAMHSA, 2013).

Trauma-Specific Treatment Models

Immediate Interventions

Intervention in the first 48 hours

The acute intervention period comprises the first 48 hours after a traumatic event. In a

"One day I was called out of bed at 5:00 a.m. to go to a town approximately 30 miles away because a levee had broken…. By 6:00 a.m., my colleagues and I were there with many of the townspeople, with helicopters flying overhead, with trucks going in and out by the main road trying to empty the factories. When we got there, as far as you could see was farmland. By 11 a.m., you could see a 'lake' in the distance. By 2 p.m., the water was on the edge of the town. Being there, at that town, before, during, and after the water came was probably the most valuable function we performed. We were able to share in the grief of the hundreds of people as we stayed with them while their fields, houses, and workplaces were flooded. We witnessed the death of a town, and the people reacted with disbelief, anger, sadness, and numbness. Each person had a different story, but all grieved, and we provided many an opportunity to express it. People cried as the water started rising into their houses. Some had to watch. Some had to leave. At times it was utterly silent as we all waited. There was a woman whose parents sent her away during the floods of '43 and she had been angry for 50 years about it. She was determined that her children and grandchildren would see everything. I spent 12 hours that day just giving support, listening, giving information, and sometimes shedding a tear or two myself."

—Rosemary Schwartzbard, Ph.D., responder to floods along the Mississippi River in 1993

Source: Schwartzbard, 1997.

disaster, rescue operations usually begin with local agencies prior to other organizations arriving on the scene. Law enforcement is likely to take a primary role on site. Whether it is a disaster, group trauma, or individual trauma (including a trauma that affects an entire family, such as a house fire), a hierarchy of needs should be established: survival, safety, security, food, shelter, health (physical and mental), orientation of survivors to immediate local services, and communication with family, friends, and community (National Institute of Mental Health, 2002). In this crucial time, appropriate interventions include educating survivors about resources; educating other providers, such as faith-based organizations and social service groups, to screen for increased psychological effects including use of substances; and use of a trauma response team that assists clients with their immediate needs. No formal interventions should be attempted at this time, but a professionally trained, empathic listener can offer solace and support (Litz & Gray, 2002).

Basic needs

Basic necessities, such as shelter, food, and water, are key to survival and a sense of safety. It is important to focus on meeting these basic needs and on providing a supportive environment. Clients' access to prescribed medications may be interrupted after a trauma, particularly a disaster, so providers should identify clients' medication needs for preexisting physical and mental disorders, including methadone or other pharmacological treatment for substance use. For example, after September 11, 2001, substance abuse treatment program administrators in New York had to seek alternative methadone administration options (Frank, Dewart, Schmeidler, & Demirjian, 2006).

Psychological first aid

The psychological first aid provided in the first 48 hours after a disaster is designed to ensure safety, provide an emotionally supportive environment and activities, identify those with high-risk reactions, and facilitate communication, including strong, reassuring leadership immediately after the event. The primary helping response of psychological first aid is to provide a calm, caring, and supportive environment to set the scene for psychological recovery. It is also essential that all those first responding to a trauma—rescue workers, medical professionals, behavioral health workers (including substance abuse counselors), journalists, and volunteers—be familiar with relevant aspects of traumatic stress. Approaching

Advice to Counselors: Core Actions in Preparing To Deliver Psychological First Aid

- Contact and engagement

survivors with genuine respect, concern, and knowledge increases the likelihood that the caregiver can (NCPTSD, 2002):

- Answer questions about what survivors may be experiencing.
- Normalize their distress by affirming that what they are experiencing is normal.
- Help them learn to use effective coping strategies.
- Help them be aware of possible symptoms that may require additional assistance.
- Provide a positive experience that will increase their chances of seeking help if they need it in the future.

Clinical experience suggests that care be taken to respect a survivor's individual method of coping; some may want information, for example, whereas others do not. Similarly, some may want to talk about the event, but others won't. An excellent guide to providing psychological first aid is available online from the Terrorism and Disaster Branch of the National Child Traumatic Stress Network (http://www.nctsn.org/content/psychological-first-aid).

Critical incident stress debriefing

Initially developed for work with first responders and emergency personnel, critical incident stress debriefing (CISD; Mitchell & Everly, 2001) is now widely used and encompasses various group protocols used in a variety of settings. This facilitator-led group intervention is for use soon after a traumatic event with exposed people. The goal is to provide psychological closure by encouraging participants to talk about their experiences and then giving a didactic presentation on common stress reactions and management.

The widespread use of CISD has occurred despite the publication of conflicting results regarding its efficacy. Claims that single-session psychological debriefing can prevent development of chronic negative psychological sequelae are not empirically supported (van Emmerik, Kamphuis, Hulsbosch, & Emmelkamp, 2002). Some controlled studies suggest that it may impede natural recovery from trauma (McNally, Bryant, & Ehlers, 2003). Other research suggests emphasizing screening to determine the need for early interventions. Mitchell and Everly (2001) point out that many of the studies showing negative

Advice to Counselors: Evidence Related to Immediate Interventions

Evidence related to immediate interventions suggests that:

- Early, brief, focused psychotherapeutic intervention provided in an individual or group format can reduce distress in bereaved spouses, parents, and children.
- Selected cognitive–behavioral approaches may help reduce the incidence, duration, and severity of acute stress disorder (ASD), PTSD, and depression in trauma survivors.
- A one-session individual recital of events and expression of emotions evoked by a traumatic event does not consistently reduce risk of later developing PTSD. In fact, it may increase the risk for adverse outcomes. Perhaps CISD hinders the natural recovery mechanisms that restore pretrauma functioning (Bonanno, 2004).
- The focus initially should be upon screening with follow-up as indicated.

results were not conducted with first responders; that is, CISD may be appropriate for some, but not all, groups. A recent study of 952 U.S. peacekeepers and CISD by the U.S. Army Research Unit–Europe (Adler et al., 2008) found mixed results.

Interventions Beyond the Initial Response to Trauma

In the interest of increasing your overall familiarity with relevant approaches, the following sections review several traumatic stress treatment approaches that counselors will most likely encounter when collaborating with clinicians or agencies that specialize in trauma-specific services and treating traumatic stress.

Cognitive–behavioral therapies

Most PTSD models involve cognitive–behavioral therapy (CBT) that integrates cognitive and behavioral theories by incorporating two ideas: first, that cognitions (or thoughts) mediate between situational demands and one's attempts to respond to them effectively, and second, that behavioral change influences acceptance of altered cognitions about oneself or a situation and establishment of newly learned cognitive–behavioral interaction patterns. In practice, CBT uses a wide range of coping strategies.

There are many different varieties of CBT. CBT originated in the 1970s (Beck, Rush, Shaw & Emery, 1979; Ellis & Harper, 1975) and has expanded since then to address various populations, including people who use substances, people who experience anxiety, people with PTSD or personality disorders, children and adolescents, individuals involved in the criminal justice system, and many others. CBT has also been expanded to include various techniques, coping skills, and approaches, such as dialectical behavior therapy (DBT; Linehan, 1993), Seeking Safety (Najavits, 2002a), and mindfulness (Segal, Williams, & Teasdale, 2002). Traditional CBT emphasizes symptom reduction or resolution, but recent CBT approaches have also emphasized the therapeutic relationship, a particularly important dynamic in trauma treatment (Jackson, Nissenson, & Cloitre, 2009).

A widely accepted framework in treating trauma, substance use disorders, and mental illness categorizes therapies as single (treatment of only one disorder), sequential (treatment of one disorder first, then the other), or parallel (concurrent treatment of multiple disorders delivered by separate clinicians or in separate programs that do not necessarily address the interactions between symptoms and disorders).

CBT has been applied to the treatment of trauma and has also been widely and effectively used in the treatment of substance use. A review of efficacy research on CBT for PTSD is provided by Rothbaum, Meadows, Resick, and Foy (2000). Najavits and colleagues (2009) and O'Donnell and Cook (2006) offer an overview of CBT therapies for treating PTSD and substance abuse. In addition, a free online training resource incorporating CBT for traumatized children within the community, Trauma-Focused CBT, is available from the Medical University of South Carolina (http://tfcbt.musc.edu/).

Cognitive processing therapy

Cognitive processing therapy (CPT) is a manualized 12-session treatment approach that can be administered in a group or individual setting (Resick & Schnicke, 1992, 1993). CPT was developed for rape survivors and combines elements of existing treatments for PTSD, specifically exposure therapy (see the "Exposure Therapy" section later in this chapter) and cognitive therapy. The exposure therapy component of treatment consists of

Advice to Counselors: Relaxation Training, Biofeedback, and Breathing Retraining Strategies

Relaxation training, biofeedback, and breathing retraining strategies may help some clients cope with anxiety, a core symptom of traumatic stress. However, no evidence supports the use of relaxation and biofeedback as effective standalone PTSD treatment techniques (Cahill, Rothbaum, Resick, & Follete, 2009). Both are sometimes used as complementary strategies to manage anxiety symptoms elicited by trauma-related stimuli. Breathing retraining uses focused or controlled breathing to reduce arousal. Breathing retraining and relaxation, along with other interventions when necessary, can help clients with ASD. An important caution in the use of breath work with trauma clients is that it can sometimes act as a trigger—for example, given its focus on the body and its potential to remind them of heavy breathing that occurred during assault. Biofeedback, which requires specialized equipment, combines stress reduction strategies (e.g., progressive muscle relaxation, guided imagery) with feedback from biological system measures (e.g., heart rate, hand temperature) that gauge levels of stress or anxiety reduction. Relaxation training, which requires no specialized equipment, encourages clients to reduce anxiety responses (including physiological responses) to trauma-related stimuli; it is often part of more comprehensive PTSD treatments (e.g., prolonged exposure and stress inoculation training [SIT]).

clients writing a detailed account of their trauma, including thoughts, sensations, and emotions that were experienced during the event. The client then reads the narrative aloud during a session and at home. The cognitive therapy aspect of CPT uses six key PTSD themes identified by McCann and Pearlman (1990): safety, trust, power, control, esteem, and intimacy. The client is guided to identify cognitive distortions in these areas, such as maladaptive beliefs.

Results from randomized, placebo-controlled trials for the treatment of PTSD related to interpersonal violence (Resick, 2001; Resick, Nishith, Weaver, Astin, & Feuer, 2002) support the use of CPT. CPT and prolonged exposure therapy models are equally and highly positive in treating PTSD and depression in rape survivors; CPT is superior in reducing guilt (Nishith, Resick, & Griffin, 2002; Resick et al., 2002; Resick, Nishith, & Griffin, 2003). CPT has shown positive outcomes with refugees when administered in the refugees' native language (Schulz, Marovic-Johnson, & Huber, 2006) and with veterans (Monson et al., 2006). However, CPT has not been studied with high-complexity populations such as individuals with substance dependence, homelessness, current domestic violence, serious and persistent mental illness, or suicidality. CPT requires a 3-day training plus consultation (Karlin et al., 2010). Resick and Schicke (1996) published a CPT treatment manual, *Cognitive Processing Therapy for Rape Victims: A Treatment Manual*.

Exposure therapy

Exposure therapy for PTSD asks clients to directly describe and explore trauma-related memories, objects, emotions, or places. Intense emotions are evoked (e.g., sadness, anxiety) but eventually decrease, desensitizing clients through repeated encounters with traumatic material. Careful monitoring of the pace and appropriateness of exposure-based interventions is necessary to prevent retraumatization (clients can become conditioned to fear the trauma-related material even more). Clients must have ample time to process their memories and integrate cognition and affect, so some sessions can last for 1.5 hours or more. For simple cases, exposure can work in as few as 9 sessions; more complex cases may require 20 or more sessions (Foa, Hembree, & Rothbaum, 2007). Various techniques can

Advice to Counselors: Steps for Introducing a Breathing Exercise

Use the following statements to lead clients through a breathing exercise:

- Place your hands on your stomach. As you inhale, breathe deeply but slowly so that your hands rise with your stomach. As you exhale slowly, practice breathing so that your hands drop with your stomach.
- Inhale slowly through your nose with your mouth closed; don't rush or force in the air.
- Exhale slowly through your mouth with your lips in the whistling position.
- Breathe out for twice as long as you breathe in.

expose the client to traumatic material. Two of the more common methods are exposure through imagery and in vivo ("real life") exposure.

The effectiveness of exposure therapy has been firmly established (Rothbaum et al., 2000); however, adverse reactions to exposure therapy have also been noted. Some individuals who have experienced trauma exhibit an exacerbation of symptoms during or following exposure treatments. Even so, the exacerbation may depend on counselor variables during administration. Practitioners of exposure therapy need comprehensive training to master its techniques (Karlin et al., 2010); a counselor unskilled in the methods of this treatment model can not only fail to help his or her clients, but also cause symptoms to worsen.

Exposure therapy is recommended as a first-line treatment option when the prominent trauma symptoms are intrusive thoughts, flashbacks, or trauma-related fears, panic, and avoidance. However, counselors should exercise caution when using exposure with clients who have not maintained stability in managing mental illness symptoms or abstinence from substance use disorders. Studies and routine use of exposure have consistently excluded high-complexity clients such as those with substance dependence, homelessness, current domestic violence, serious and persistent mental illness, or suicidality. The only trial of exposure therapy with a substance dependence sample found that it did not outperform standard substance abuse treatment on most variables (Mills et al., 2012).

Prolonged exposure therapy for PTSD is listed in SAMHSA's NREPP. For reviews of exposure therapy, also see Najavits (2007a) and Institute of Medicine (2008). In addition to prolonged exposure therapy, other therapies incorporate exposure and desensitization techniques, including eye movement desensitization and reprocessing (EMDR; Shapiro, 2001), cognitive processing, and systematic desensitization therapies (Wolpe, 1958).

Eye movement desensitization and reprocessing

EMDR (Shapiro, 2001) is one of the most widely used therapies for trauma and PTSD. The treatment protocols of EMDR have evolved into sophisticated paradigms requiring training and, preferably, clinical supervision. EMDR draws on a variety of theoretical

A Brief Description of EMDR Therapy

Treatment involves three main concentrations (past memories, present disturbances, future actions) and eight phases. Counselors may work with several phases in one session. Each phase is meant to be revisited either in every session or when appropriate (e.g., the closure process is meant to be conducted at the end of every session, in preparation for the next).

- Phase 1: History and Treatment Planning (1-2 sessions)
- Phase 2: Preparation
- Phase 3: Assessment and Reprocessing
- Phase 4: Desensitization
- Phase 5: Installation
- Phase 6: Body Scan
- Phase 7: Closure
- Phase 8: Reevaluation

Source: EMDR Network, 2012.

frameworks, including psychoneurology, CBT, information processing, and nonverbal representation of traumatic memories. The goal of this therapy is to process the experiences that are causing problems and distress. It is an effective treatment for PTSD (Seidler & Wagner, 2006) and is accepted as an evidence-based practice by the U.S. Department of Veterans Affairs (VA), the Royal College of Psychiatrists, and the International Society for Traumatic Stress Studies (Najavits, 2007a); numerous reviews support its effectiveness (e.g., Mills et al., 2012). EMDR values the development of "resource installation" (calming procedures) and engages in exposure work to desensitize clients to traumatic material, using external tracking techniques across the visual field to assist in processing distressing material. Training in EMDR, available through the EMDR Institute, is required before counselors use this treatment. It is listed in SAMHSA's NREPP (EMDR Network, 2012). Thus far, there is no study examining the use of EMDR with clients in substance abuse treatment. See Part 3 of this TIP, available online, to review empirical work on EMDR.

Narrative therapy

Narrative therapy is an emerging approach to understanding human growth and change; it is founded on the premise that individuals are the experts on their own lives and can access their existing intrapsychic and interpersonal resources to reduce the impact of problems in their lives. Developed for the treatment of PTSD resulting from political or community violence, narrative therapy is based on CBT principles, particularly exposure therapy (Neuner, Schauer, Elbert, & Roth, 2002; Neuner, Schauer, Klaschik, Karunakara, & Elbert, 2004). This approach views psychotherapy not as a scientific practice, but as a natural extension of healing practices that have been present throughout human history. For a trauma survivor, the narrative, as it is told and retold, expresses the traumatic experience, puts the trauma in the context of the survivor's life, and defines the options he or she has for change. Narrative structure helps clients connect events in their lives, reveals strings of events, explores alternative expressions of trauma, evokes explanations for clients' behaviors, and identifies their knowledge and skills. The use of stories in therapy, with the client as the storyteller, generally helps lessen suffering (McLeod, 1997; White, 2004).

In the substance abuse treatment field, many clients will see a connection between narrative therapy and the process of telling their stories in 12 Step programs, in which reframing life stories of feeling trapped, despairing, and hopeless leads to stories of strength, joy, and hope. Key storytelling points at a 12 Step speaker meeting include describing what an experience was like, what happened, and what it is like now.

Skills training in affective and interpersonal regulation

Skills training in affective and interpersonal regulation (STAIR) is a two-phase cognitive–behavioral model that adapts therapies developed by others into a new package (Cloitre, Koenen, Cohen, & Han, 2002). Phase 1 consists of eight weekly sessions of skills training in affect and interpersonal regulation derived from general CBT and DBT (Linehan, 1993) and adapted to address trauma involving childhood abuse. Session topics are labeling and identifying feelings, emotion management, distress tolerance, acceptance of feelings, identifying trauma-based interpersonal schemas, identifying conflict between trauma-generated feelings and current interpersonal goals, role-plays on issues of power and control, and role-plays on developing flexibility in interpersonal situations. Phase 2 features eight

STAIR Steps

Phase 1, tailored to individual clients, is called Skills Training in Affect Regulation and consists of the following components:

- Psychoeducation: Describe the symptoms of PTSD and explain the treatment rationale.
- Training in experiencing and identifying feelings, triggers, and thoughts, as well as training in mood regulation strategies.
- Learning history: Ask the client the following questions—How did the client deal with traumas past and present? How did the client's family deal with feelings? How did the client's family life affect his or her present difficulty experiencing and identifying feeling?
- Emotion regulation skills: Identify the cognitive, behavioral, and social support modalities for coping. Use data gathered with self-monitoring forms to identify strengths and weaknesses in each coping modality. Teach skills such as breathing retraining, self-statements to reduce fear, and social skill training to improve social support.
- Acceptance and tolerance of negative affect: Motivate clients to face distressing situations related to the trauma that are important to them. Review negative repercussions of avoidance. Discuss tolerating negative affect as a step toward achieving specific goals.
- Schema therapy for improved relationships: Identify relevant schemas learned in childhood. Suggest alternative ways of viewing self and others in current relationships. Use role-playing to teach assertiveness, emphasizing response flexibility based on relative power in each relationship.

Once Phase 1 of STAIR is well learned, clients move to Phase 2, which involves exposure therapy.

Source: Mollick & Spett, 2002.

sessions of modified prolonged exposure using a narrative approach.

Cloitre and colleagues (2002) assigned women with PTSD related to childhood abuse randomly to STAIR or a minimal attention waitlist, excluding clients with current substance dependence as well as other complexities. STAIR participants showed significantly greater gains in affect regulation, interpersonal skills, and PTSD symptoms than the control participants. These gains were maintained through follow-up at 3 and 9 months. However, it is not clear from this study whether DBT and exposure were both needed. Phase 1 therapeutic alliance and negative mood regulation skills predicted Phase 2 exposure success in reducing PTSD, suggesting the importance of establishing a strong therapeutic relationship and emotion regulation skills before conducting exposure work with people who have chronic PTSD.

Stress inoculation training

SIT was originally developed to manage anxiety (Meichenbaum, 1994; Meichenbaum & Deffenbacher, 1988). Kilpatrick, Veronen, and Resick (1982) modified SIT to treat rape survivors based on the idea that the anxiety and fear that rape survivors experience during their trauma generalizes to other objectively safe situations. SIT treatment components include education, skills training (muscle relaxation training, breathing retraining, role-playing, guided self-talk, assertiveness training, and thought stopping [i.e., actively and forcefully ending negative thoughts by thinking

SIT has been used to help individuals cope with the aftermath of exposure to stressful events and on a preventative basis to "inoculate" individuals to future and ongoing stressors (Meichenbaum, 1996). This practice as a preventive strategy is similar to promoting disease resistance through immunizations.

Advice to Counselors: SIT Phases

SIT is a prevention and treatment approach that has three overlapping phases. It is often seen as a complementary approach to other interventions for traumatic stress.

Phase 1: Conceptualization and education. This phase has two main objectives. The initial goal is to develop a collaborative relationship that supports and encourages the client to confront stressors and learn new coping strategies. The next objective is to increase the client's understanding of the nature and impact of his or her stress and awareness of alternative coping skills. Many cognitive strategies are used to meet these objectives, including self-monitoring activities, Socratic questioning, identifying strengths and evidence of resilience, and modeling of coping strategies.

Phase 2: Skill acquisition and rehearsal. This phase focuses on developing coping skills and using coping skills that the individual already possesses. This process includes practice across settings, so that the individual begins to generalize the use of his or her skills across situations through rehearsal, rehearsal, and more rehearsal.

Phase 3: Implementation and following through. The main objective is to create more challenging circumstances that elicit higher stress levels for the client. By gradually increasing the challenge, the client can practice coping strategies that mimic more realistic circumstances. Through successful negotiation, the client builds a greater sense of self-efficacy. Common strategies in this phase include imagery and behavioral rehearsal, modeling, role-playing, and graded in vivo exposure.

Source: Meichenbaum, 2007.

"STOP" and then redirecting thoughts in a more positive direction]), and skills application. The goal is to help clients learn to manage their anxiety and to decrease avoidant behavior by using effective coping strategies. Randomized controlled clinical trials have indicated that SIT reduces the severity of PTSD compared with waitlist controls and shows comparable efficacy to exposure therapy. At follow-up (up to 12 months after treatment), gains were maintained (Foa et al., 1999; Foa, Rothbaum, Riggs, & Murdock, 1991).

Other therapies

Numerous interventions introduced in the past 20 years focus on traumatic stress. For some interventions, the evidence is limited, and for other others, it is evolving. One example is the traumatic incident reduction (TIR) approach. This brief memory-oriented intervention is designed for children, adolescents, and adults who have experienced traumatic stress (Valentine & Smith, 2001). Listed in SAMHSA's NREPP, the intervention is designed to process specific traumatic incidents or problematic themes related to the trauma, including specific feelings, emotions, sensations, attitudes, or pain. It involves having clients talk through the traumatic incident repeatedly with the anticipation that changes in affect will occur throughout the repetitions. TIR is a client-centered approach.

Integrated Models for Trauma

This section covers models specifically designed to treat trauma-related symptoms along with either mental or substance use disorders at the same time. Integrated treatments help clients work on several presenting problems simultaneously throughout the treatment, a promising and recommended strategy (Dass-Brailsford & Myrick, 2010; Najavits, 2002b; Nixon & Nearmy, 2011). Thus far, research is limited, but what is available suggests that integrated treatment models effectively reduce

substance abuse, PTSD symptoms, and other mental disorder symptoms. TIP 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders* (Center for Substance Abuse Treatment, 2005c), offers a detailed description of integrated treatment. In contrast with integrated models, other model types include single (treatment of only one disorder), sequential (treatment of one disorder first, then the other), or parallel (concurrent treatment of multiple disorders delivered by separate clinicians or in separate programs that do not necessarily address the interactions between symptoms and disorders).

Similar to single models, integrated treatment models are designed for use in a variety of settings (e.g., outpatient, day treatment, and/or residential substance abuse and mental health clinics/programs). Most models listed are manual-based treatments that address trauma-related symptoms, mental disorders, and substance use disorders at the same time. Additional approaches and further details on the selected approaches can be found at NREPP (http://www.nrepp.samhsa.gov).

Addiction and Trauma Recovery Integration Model

The Addiction and Trauma Recovery Integrated Model (ATRIUM; Miller & Guidry, 2001) integrates CBT and relational treatment through an emphasis on mental, physical, and spiritual health. This 12-week model for individuals and groups blends psychoeducational, process, and expressive activities, as well as information on the body's responses to addiction and traumatic stress and the impact of trauma and addiction on the mind and spirit. It helps clients explore anxiety, sexuality, self-harm, depression, anger, physical complaints and ailments, sleep difficulties, relationship challenges, and spiritual disconnection. It was designed primarily for women and focuses on developmental (childhood) trauma and interpersonal violence, but it recognizes that other types of traumatic events occur.

The ATRIUM model consists of three phases of treatment. The first stage, or "outer circle," consists of the counselor collecting data from the client about his or her trauma history, offering psychoeducation on the nature of trauma, and helping the client assess personal strengths. ATRIUM actively discourages the evocation of memories of abuse or other trauma events in this phase. The second stage, or "middle circle," allows clients and counselors to address trauma symptoms more directly and specifically encourages clients to reach out to and engage with support resources in the community. The middle circle also emphasizes learning new information about trauma and developing additional coping skills. The third stage of the program, the "inner circle," focuses on challenging old beliefs that arose as a result of the trauma. For instance, the concept of "nonprotecting bystander" is used to represent the lack of support that the traumatized person experienced at the time of the trauma. This representation is replaced with the "protective presence" of supportive others today.

ATRIUM was used in one of the nine study sites of SAMHSA's Women, Co-Occurring Disorders and Violence Study. Across all sites, trauma-specific models achieved more favorable outcomes than control sites that did not use trauma-specific models (Morrissey et al., 2005). There has not yet been a study of ATRIUM per se, however. A manual describing the theory behind this model in greater depth, as well as how to implement it, is published under the title *Addictions and Trauma Recovery: Healing the Body, Mind, and Spirit* (Miller & Guidry, 2001).

Beyond Trauma: A Healing Journey for Women

Beyond Trauma (Covington, 2003) is a curriculum for women's services based on theory, research, and clinical experience. It was developed for use in residential, outpatient, and correctional settings; domestic violence programs; and mental health clinics. It uses behavioral techniques and expressive arts and is based on relational therapy. Although the materials are designed for trauma treatment, the connection between trauma and substance abuse in women's lives is a theme throughout. Beyond Trauma has a psychoeducational component that defines trauma by way of its process as well as its impact on the inner self (thoughts, feelings, beliefs, values) and the outer self (behavior and relationships, including parenting). Coping skills are emphasized; specific exercises develop emotional wellness.

Concurrent Treatment of PTSD and Cocaine Dependence

Concurrent Treatment of PTSD and Cocaine Dependence (CTPCD) is a 16-session, twice-weekly individual outpatient psychotherapy model designed to treat women and men with co-occurring PTSD and cocaine dependence (Coffey, Schumacher, Brimo, & Brady, 2005). CTPCD combines imagery and in vivo exposure therapy (in which the client becomes desensitized to anxiety-producing stimuli through repeated exposure to them) for the treatment of PTSD with elements of CBT for substance dependence. To balance the dual needs of abstinence skill building and prompt trauma treatment, the first five sessions focus on coping skills for cocaine dependence. Session six transitions into exposure therapy, which begins in earnest in session seven and is combined with CBT for the treatment of substance abuse.

CTPCD helps reduce substance use and PTSD symptoms. The use of any illicit drug, as measured by urine screens, was quite low during the 16-week treatment trial and didn't escalate during the second half of treatment—when most exposure sessions occurred. PTSD symptoms dropped significantly over the course of treatment, as did self-reported depressive symptoms; however, the dropout rate was high (Coffey, Dansky, & Brady, 2003). CTPCD was reformulated into Concurrent Prolonged Exposure (COPE; Mills et al., 2012), which was compared with treatment as usual in a high-complexity clinical sample of individuals who had PTSD and substance dependence. Both treatment conditions resulted in improvements in PTSD with no difference at 3 months (though COPE showed significantly greater improvement at 9 months); moreover, the two conditions did not differ in impact on substance use outcomes, depression, or anxiety.

Integrated CBT

Integrated CBT is a 14-session individual therapy model designed for PTSD and substance use. It incorporates elements such as psychoeducation, cognitive restructuring, and breathing retraining (McGovern, Lamber-Harris, Alterman, Xie, & Meier, 2011). A randomized controlled trial showed that both integrated CBT and individual addiction treatment achieved improvements in substance use and other measures of psychiatric symptom severity with no difference between the treatments.

Seeking Safety

Seeking Safety is an empirically validated, present-focused treatment model that helps clients attain safety from trauma and substance abuse (Najavits, 2002a). The Seeking Safety manual (Najavits, 2002b) offers clinician guidelines and client handouts and is available in

several languages. Training videos and other implementation materials are available online (http://www.seekingsafety.org). Seeking Safety is flexible; it can be used for groups and individuals, with women and men, in all settings and levels of care, by all clinicians, for all types of trauma and substance abuse.

Seeking Safety covers 25 topics that address cognitive, behavioral, interpersonal, and case management domains. The topics can be conducted in any order, using as few or as many as are possible within a client's course of treatment. Each topic represents a coping skill relevant to both trauma and substance abuse, such as compassion, taking good care of yourself, healing from anger, coping with triggers, and asking for help. This treatment model builds hope through an emphasis on ideals and simple, emotionally evocative language and quotations. It attends to clinician processes and offers concrete strategies that are thought to be essential for clients dealing with concurrent substance use disorders and histories of trauma.

More than 20 published studies (which include pilot studies, randomized controlled trials, and multisite trials representing various investigators and populations) provide the evidence base for this treatment model. For more information, see SAMHSA's NREPP Web site (http://www.nrepp.samhsa.gov) as well as the "Outcomes" section of the Seeking Safety Web site (http://www.seekingsafety.org/3-03-06/studies.html). Study samples included people with chronic, severe trauma symptoms and substance dependence who were diverse in ethnicity and were treated in a range of settings (e.g., criminal justice, VA centers, adolescent treatment, homelessness services, public sector). Seeking Safety has shown positive outcomes on trauma symptoms, substance abuse, and other domains (e.g., suicidality, HIV risk, social functioning, problem-solving, sense of meaning); consistently outperformed treatment as usual; and achieved high satisfaction ratings from both clients and clinicians. It has been translated into seven languages, and a version for blind and/or dyslexic individuals is available.

The five key elements of Seeking Safety are:

1. Safety as the overarching goal (helping clients attain safety in their relationships, thinking, behavior, and emotions).
2. Integrated treatment (working on trauma and substance abuse at the same time).
3. A focus on ideals to counteract the loss of ideals in both trauma and substance abuse.
4. Four content areas: cognitive, behavioral, interpersonal, and case management.
5. Attention to clinician processes (addressing countertransference, self-care, and other issues).

Substance Dependence PTSD Therapy

Substance Dependence PTSD Therapy (Triffleman, 2000) was designed to help clients of both sexes cope with a broad range of traumas. It combines existing treatments for PTSD and substance abuse into a structured, 40-session (5-month, twice-weekly) individual therapy that occurs in two phases. Phase I is "Trauma-Informed, Addictions-Focused Treatment" and focuses on coping skills and cognitive interventions as well as creating a safe environment. Phase I draws on CBT models, anger management, relaxation training, HIV risk reduction, and motivational enhancement techniques. Phase II, "Trauma-Focused, Addictions-Informed Treatment," begins with psychoeducation about PTSD followed by "Anti-Avoidance I," in which a modified version of stress inoculation training is taught in two to four sessions. Following this is "Anti-Avoidance II," lasting 6 to 10 sessions, in which in vivo exposure is used.

Trauma Affect Regulation: Guide for Education and Therapy

Trauma Affect Regulation: Guide for Education and Therapy (TARGET; Ford & Russo, 2006; Frisman, Ford, Lin, Mallon, & Chang, 2008) uses emotion and information processing in a present-focused, strengths-based approach to education and skills training for trauma survivors with severe mental, substance use, and co-occurring disorders across diverse populations. TARGET helps trauma survivors understand how trauma changes the brain's

TARGET: The Seven-Step FREEDOM Approach

Focus: Being focused helps a person pay attention and think about what's happening right now instead of just reacting based on alarm signals tied to past trauma. This step teaches participants to use the SOS skill (Slow down, Orient, Self-check) to pay attention to body signals and the immediate environment and to use a simple scale to measure stress and control levels.

Recognize triggers: Recognizing trauma triggers enables a person to anticipate and reset alarm signals as he or she learns to distinguish between a real threat and a reminder. This step helps participants identify personal triggers, take control, and short-circuit their alarm reactions.

Emotion self-check: The goal of this skill is to identify two types of emotions. The first are "alarm" or reactive emotions such as terror, rage, shame, hopelessness, and guilt. Because these emotions are the most noticeable after trauma, they are the alarm system's way of keeping a person primed and ready to fend off further danger. The second type of emotion, "main" emotions, include positive feelings (e.g., happiness, love, comfort, compassion) and feelings that represent positive strivings (e.g., hope, interest, confidence). By balancing both kinds of emotions, a person can reflect and draw on his or her own values and hopes even when the alarm is activated.

Evaluate thoughts: When the brain is in alarm mode, thinking tends to be rigid, global, and catastrophic. Evaluating thoughts, as with identifying emotions, is about achieving a healthier balance of positive as well as negative thinking. Through a two-part process, participants learn to evaluate the situation and their options with a focus on how they choose to act—moving from reactive thoughts to "main" thoughts. This is a fundamental change from the PTSD pattern, which causes problems by taking a person straight from alarm signals to automatic survival reactions.

Define goals: Reactive goals tend to be limited to just making it through the immediate situation or away from the source of danger. These reactive goals are necessary in true emergencies but don't reflect a person's "main" goals of doing worthwhile things and ultimately achieving a good and meaningful life. This step teaches one how to create "main" goals that reflect his or her deeper hopes and values.

Options: The only options that are available when the brain's alarm is turned on and won't turn off are automatic "flight/fight" or "freeze/submit" reactive behaviors that are necessary in emergencies but often unhelpful in ordinary living. This step helps identify positive intentions often hidden by the more extreme reactive options generated by the alarm system. This opens the possibility for a greater range of options that take into consideration one's own needs and goals as well as those of others.

Make a contribution: When the brain's alarm is turned on and reacting to ordinary stressors as if they were emergencies, it is very difficult for a person to come away from experiences with a feeling that they have made a positive difference. This can lead to feelings of alienation, worthlessness, or spiritual distress. The ultimate goal of TARGET is to empower adults and young people to think clearly enough to feel in control of their alarm reactions and, as a result, to be able to recognize the contribution they are making not only to their own lives, but to others' lives as well.

Source: Advanced Trauma Solutions, 2012.

normal stress response into an extreme survival-based alarm response that can lead to PTSD, and it teaches them a seven-step approach to making the PTSD alarm response less distressing and more adaptive (summarized by the acronym FREEDOM: Focus, Recognize triggers, Emotion self-check, Evaluate thoughts, Define goals, Options, and Make a contribution).

TARGET can be presented in individual therapy or gender-specific psychoeducational groups, and it has been adapted for individuals who are deaf; it has also been translated into Spanish and Dutch. TARGET is a resilience-building and recovery program not limited to individual or group psychotherapy; it is also designed to provide an educational curriculum and milieu intervention that affects all areas of practice in school, therapeutic, or correctional programs. TARGET is listed in SAMHSA's NREPP (http://www.nrepp.samhsa.gov).

Trauma Recovery and Empowerment Model

The trauma recovery and empowerment model (TREM) of therapy (Fallot & Harris, 2002; Harris & Community Connections Trauma Work Group, 1998) is a manualized group intervention designed for female trauma survivors with severe mental disorders. TREM addresses the complexity of long-term adaptation to trauma and attends to a range of difficulties common among survivors of sexual and physical abuse. TREM focuses mainly on developing specific recovery skills and current functioning and uses techniques that are effective in trauma recovery services. The model's content and structure, which cover 33 topics, are informed by the role of gender in women's experience of and coping with trauma.

TREM can be adapted for shorter-term residential settings and outpatient substance abuse treatment settings, among others. Adaptations of the model for men and adolescents are available. The model was used in SAMHSA's Women, Co-Occurring Disorders and Violence Study for three of the nine study sites and in SAMHSA's Homeless Families program, and it is listed in SAMHSA's NREPP. This model has been used with clients in substance abuse treatment; research by Toussaint, VanDeMark, Bornemann, and Graeber (2007) shows that women in a residential substance abuse treatment program showed significantly better trauma treatment outcomes using TREM than they did in treatment as usual, but no difference in substance use.

TREM Program Format

Each session includes an experiential exercise to promote group cohesiveness. The 33 sessions are divided into the following general topic areas:

- **Part I–empowerment** introduces gender identity concepts, interpersonal boundaries, and self-esteem.
- **Part II–trauma recovery** concentrates on sexual, physical, and emotional abuse and their relationship to psychiatric symptoms, substance abuse, and relational patterns and issues.
- **Part III–advanced trauma recovery issues** addresses additional trauma issues, such as blame and the role of forgiveness.
- **Part IV–closing rituals** allows participants to assess their progress and encourages them to plan for their continued healing, either on their own or as part of a community of other survivors.
- **Part V–modifications or supplements for special populations** provides modifications for subgroups such as women with serious mental illness, incarcerated women, women who are parents, women who abuse substances, and male survivors.

Triad Women's Project

The Triad Project was developed as a part of SAMHSA's Women, Co-Occurring Disorders and Violence Study. It is a comprehensive, trauma-informed, consumer-responsive integrated model designed for female trauma survivors with co-occurring substance use and mental disorders who live in semirural areas. Triad integrates motivational enhancement for substance use disorders, DBT, and intensive case management techniques for co-occurring mental disorders. This program is a 16-week group intervention for women that uses integrated case management services, a curriculum-based treatment group, and a peer support group (Clark & Fearday, 2003).

Emerging Interventions

New interventions are emerging to address traumatic stress symptoms and disorders. The following sections summarize a few interventions not highlighted in prior chapters; this is not an exhaustive list. In addition to specific interventions, technology is beginning to shape the delivery of care and to increase accessibility to tools that complement trauma-specific treatments. Numerous applications are available and evolving. For more information on the role of technology in the delivery of care, see the planned TIP, *Using Technology-Based Therapeutic Tools in Behavioral Health Services* (SAMHSA, planned g).

Couple and Family Therapy

Trauma and traumatic stress affects significant relationships, including the survivor's family. Although minimal research has targeted the effectiveness of family therapy with trauma survivors, it is important to consider the needs of the individual in the context of their relationships. Family and couples therapy may be key to recovery. Family members may experience secondary traumatization silently, lack understanding of traumatic stress symptoms or treatment, and/or have their own histories of trauma that influence their willingness to support the client in the family or to talk about anything related to trauma and its effects. Family members can engage in similar patterns of avoidance and have their own triggers related to the trauma being addressed at the time. A range of couple and family therapies have addressed traumatic stress and PTSD, but few studies exist that support or refute their value. Current couple or family therapies that have some science-based evidence include behavioral family therapy, behavioral marital therapy, cognitive–behavioral couples treatment, and lifestyle management courses (Riggs, Monson, Glynn, & Canterino, 2009).

Mindfulness Interventions

Mindfulness is a process of learning to be present in the moment and observing internal experience (e.g., thoughts, bodily sensations) and external experience (e.g., interactions with others) in a nonjudgmental way. Mindfulness challenges limiting beliefs that arise from trauma, quells anxiety about future events, and simply helps one stay grounded in the present. It plays a significant role in helping individuals who have been traumatized observe their experiences, increase awareness, and tolerate uncomfortable emotions and cognitions.

To date, mindfulness-based interventions appear to be valuable as an adjunct to trauma-specific interventions and in decreasing arousal (Baer, 2003). It may also help individuals tolerate discomfort during exposure-oriented and trauma processing interventions. Overall, mindfulness practices can help clients in managing traumatic stress, coping, and resilience. In a study of firefighters, mindfulness was associated with fewer PTSD symptoms, depressive symptoms, physical symptoms, and alcohol problems when controlling for other variables (Smith et al., 2011).

Becoming an Observer and Learning To Tolerate Discomfort: The Leaf and Stream Metaphor

The following exercise, "leaves floating on a stream," is a classic. Many clinicians and authors provide renditions of this mindfulness practice. The main objectives are to stand back and observe thoughts rather than get caught up in them. Simply stated, thoughts are just thoughts. Thoughts come and go like water flowing down a stream. We don't need to react to the thoughts; instead, we can just notice them.

Conduct the mindfulness exercise for about 10 minutes, then process afterward. Take time to allow participants to visualize each sense as they imagine themselves sitting next to the stream. For example, what does it look like? What do they hear as they sit next to the stream? Don't rush the exercise. As you slowly make the statements detailed in the following two paragraphs, take time in between each statement for participants to be in the exercise without interruption; simply offer gentle guidance.

Begin to sit quietly, bringing your attention to your breath. If you feel comfortable, close your eyes. As you focus on breathing in and out, imagine that you are sitting next to a stream. In your imagination, you may clearly see and hear the stream, or you may have difficulty visualizing the stream. Follow along with the guided exercise; either way, it will work just as well.

Now begin to notice the thoughts that come into your mind. Some thoughts rush by, while others linger. Just allow yourself to notice your thoughts. As you begin to notice each thought, imagine putting those words onto a leaf as it floats by on the stream. Just let the thoughts come, watching them drift by on the leaves. If your thoughts briefly stop, continue to watch the water flow down the stream. Eventually, your thoughts will come again. Just let them come, and as they do, place them onto a leaf. Your attention may wander. Painful feelings may arise. You may feel uncomfortable or start to think that the exercise is "stupid." You may hook onto a thought—rehashing it repeatedly. That's okay; it's what our minds do. As soon as you notice your mind wandering or getting stuck, just gently bring your focus back to your thoughts, and place them onto the leaves. Now, bring your attention back to your breath for a moment, then open your eyes and become more aware of your environment.

Facilitated Questions:

- What was it like for you to observe your thoughts?
- Did you get distracted? Stuck?
- Were you able to bring yourself back to the exercise after getting distracted?
- In what ways was the exercise uncomfortable?
- In what ways was the exercise comforting?

For clients and practitioners who want to develop a greater capacity for mindfulness, see Kabat-Zinn's books *Wherever You Go, There You Are: Mindfulness Meditation In Everyday Life* (1994) and *Full Catastrophe Living: Using the Wisdom of Your Body and Mind to Face Stress, Pain, and Illness* (1990). For clinical applications of mindfulness, see *Mindfulness-Based Cognitive Therapy for Depression: A New Approach to Preventing Relapse* (Segal et al., 2002) and *Relapse Prevention: Maintenance Strategies in the Treatment of Addictive Behaviors* (Marlatt & Donovan, 2005).

Pharmacological Therapy

Pharmacotherapy for people with mental, substance use, and traumatic stress disorders needs to be carefully managed by physicians who are well versed in the treatment of each condition. Medications can help manage and control symptoms; however, they are only a part of a comprehensive treatment plan. There

are no specific "antitrauma" drugs; rather, certain drugs target specific trauma symptoms. Clients receiving pharmacotherapy need careful assessment. Some clients with preexisting mental disorders may need further adjustment in medications due to the physiological effects of traumatic stress. In addition, sudden withdrawal from a pattern of self-administered substances can not only lead to dangerous levels of physical distress, but also exacerbate the emergence of more severe PTSD symptoms. Distress after trauma often lessens over time, which can sometimes make the use of medications unnecessary for some individuals. Some trauma survivors do not develop long-term psychological problems from their experiences that require medication; others may simply refuse the initiation of pharmacotherapy or the use of additional medications.

Concluding Note

Behavioral health counselors can best serve clients who have experienced trauma by providing integrated treatment that combines therapeutic models to target presenting symptoms and disorders. Doing so acknowledges that the disorders interact with each other. Some models have integrated curricula; others that address trauma alone can be combined with behavioral health techniques with which the counselor is already familiar.

In part, the choice of a treatment model or general approach will depend on the level of evidence for the model, the counselor's training, identified problems, the potential for prevention, and the client's goals and readiness for treatment. Are improved relationships with family members a goal? Will the client be satisfied if sleep problems decrease, or is the goal resolution of broader issues? Are there substance use or substance-related disorders? Is the goal abstinence? Collaborating with clients to decide on goals, eliciting what they would like from treatment, and determining what they expect to happen can provide some clues as to what treatment models or techniques might be successful in keeping clients engaged in recovery.

Part 2: An Implementation Guide for Behavioral Health Program Administrators

1 Trauma-Informed Organizations

IN THIS CHAPTER

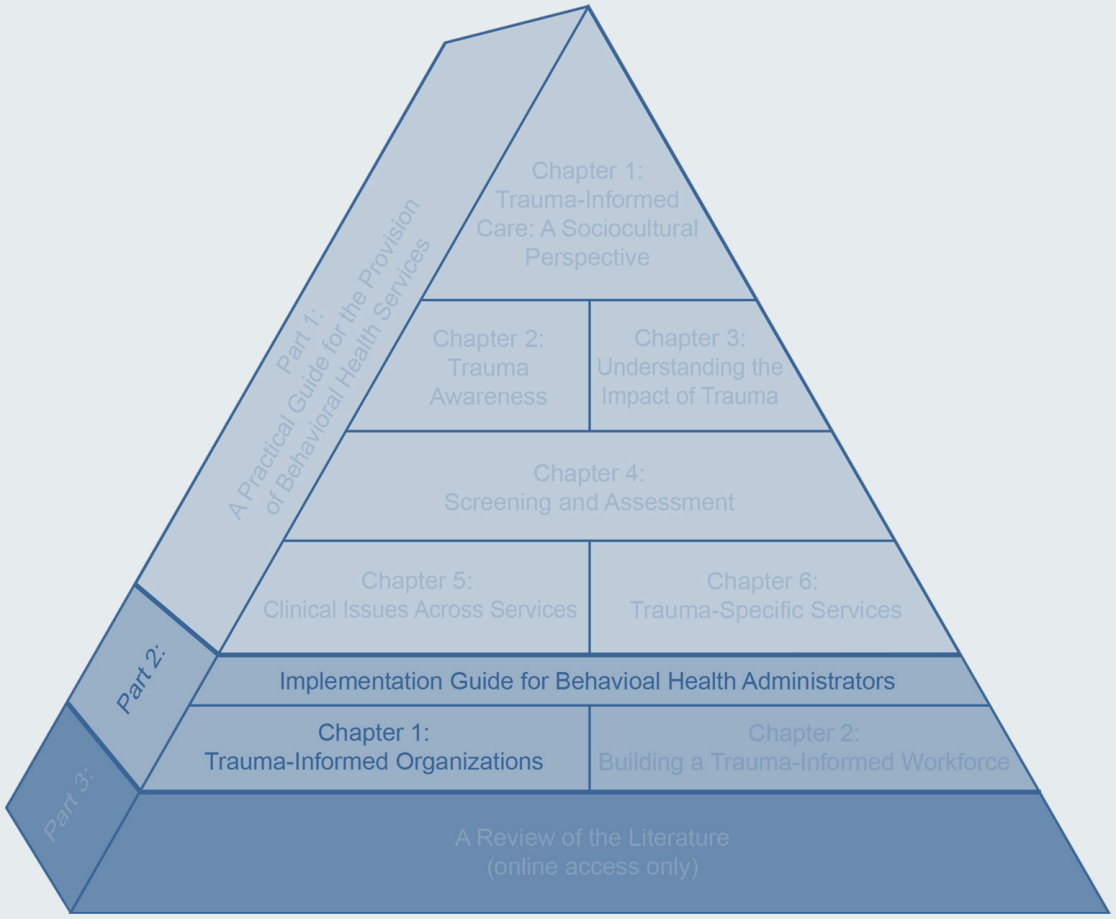
- Show Organizational and Administrative Commitment to TIC
- Use Trauma Informed Principles in Strategic Planning
- Review and Update Vision, Mission, and Value Statements
- Assign a Key Staff Member To Facilitate Change
- Create a Trauma Informed Oversight Committee
- Conduct an Organizational Self Assessment of Trauma Informed Services
- Develop an Implementation Plan
- Develop Policies and Procedures To Ensure Trauma Informed Practices and To Prevent Retraumatization
- Develop a Disaster Plan
- Incorporate Universal Routine Screenings
- Apply Culturally Responsive Principles
- Use Science Based Knowledge
- Create a Peer Support Environment
- Obtain Ongoing Feedback and Evaluations
- Change the Environment To Increase Safety
- Develop Trauma Informed Collaborations

Part 2 provides a broad overview of how to create and implement an institutional framework for trauma-informed services in program delivery and staff development, policies and procedures, administrative practices, and organizational infrastructure in behavioral health services. Chapter 1, "Trauma-Informed Organizations," focuses on specific organizational strategies that will help develop a trauma-informed culture in behavioral health settings. Numerous strategies are presented, including organizational commitment to trauma-informed care (TIC), trauma-informed organizational assessment, implementation of universal screening for trauma, and creation of a peer support environment.

Chapter 2, "Building a Trauma-Informed Workforce," focuses on organizational activities that foster the development of a trauma-informed workforce, including recruiting, hiring, and retaining trauma-informed staff; providing training on evidence-based and emerging trauma-informed best practices; developing competencies specific to TIC; addressing ethical considerations; providing trauma-informed supervision; and preventing and treating secondary trauma in behavioral health service providers.

The strategies described in the following sections can help supervisors and other administrative staff members create a trauma-informed behavioral health environment. As a starting point, the administration should identify key personnel and consumers to guide the organizational change process and the organizational assessment. Administrators and supervisors need to plan for and demonstrate an ongoing commitment to these strategies, or staff may perceive development activities as comprising yet another idea or demand from the agency that is short-lived beyond the initial thrust of training.

TIC Framework in Behavioral Health Services—Trauma-Informed Organizations



Creating a trauma-informed organization is a fluid, ongoing process; it has no completion date. Consumer demographics change across time, exposure to specific types of trauma may become more prevalent, and knowledge of best and evidence-based practices (EBPs) will continue to advance. A trauma-informed organization continues to demonstrate a commitment to compassionate and effective practices and organizational reassessments, and it changes to meet the needs of consumers with histories of trauma. It is encouraging that recent Substance Abuse and Mental Health Services Administration (SAMHSA) data indicates that the majority of over 10,000 programs they surveyed state that they provide trauma-related care (Capezza & Najavits, 2012). However, there remains a major need to make TIC consistently high-quality, routine, and pervasive across treatment systems.

The following stages form the basis of creating a trauma-informed organization:

1. Commit to creating a trauma-informed agency.
2. Create an initial infrastructure to initiate, support, and guide changes.
3. Involve key stakeholders, including consumers who have histories of trauma.
4. Assess whether and to what extent the organization's current policies, procedures, and operations either support TIC or interfere with the development of a trauma-informed approach.
5. Develop an organizational plan to implement and support the delivery of TIC within the agency.

Trauma-Informed Services and Service Systems

"A trauma-informed service system and/or organization is one in which all components of the system have been reconsidered and evaluated in the light of a basic understanding of the role that violence and trauma play in the lives of people seeking mental health and addiction services. A 'trauma-informed' organizational environment is capable of supporting and sustaining 'trauma-specific' services as they develop. A trauma-informed system recognizes that trauma results in multiple vulnerabilities and affects many aspects of a survivor's life over the lifespan, and therefore coordinates and integrates trauma-related activities and training with other systems of care serving trauma survivors. A basic understanding of trauma and trauma dynamics…should be held by all staff and should be used to design systems of services in a manner that accommodates the vulnerabilities of trauma survivors and allows services to be delivered in a way that will avoid retraumatization and facilitate consumer participation in treatment. A trauma-informed service system is knowledgeable and competent to recognize and respond effectively to adults and children traumatically impacted by any of a range of overwhelming adverse experiences, both interpersonal in nature and caused by natural events and disasters. There should be written plans and procedures to develop a trauma-informed service system and/or trauma-informed organizations and facilities with methods to identify and monitor progress. Training programs for this purpose should be implemented."

Source: Jennings, 2009, pp. 111–112.

6. Create collaborations between providers and consumers and among service providers and various community agencies.
7. Put the organizational plan into action.
8. Reassess the implementation of the plan and its ability to meet the needs of consumers and to provide consistent TIC on an ongoing basis.
9. Implement quality improvement measures as needs and problem areas are identified.
10. Institute practices that support sustainability, such as ongoing training, clinical supervision, consumer participation and feedback, and resource allocation.

Strategy #1: Show Organizational and Administrative Commitment to TIC

Foremost, administrators need to understand the impact that trauma can have on people's lives. The consistent delivery of TIC is only as effective as the organization's commitment, which must extend to administrative practices with staff members, program policies and procedures, program design, staffing patterns, use of peer support, staff and peer training and supervision, organizational assessment and consumer feedback, and resources to uphold trauma-informed principles and practices. Even short-term change is not sustainable without the agency's continual commitment.

Typically, desirable organizational change doesn't occur by accident. It comes from steadfast leadership, a convincing message that change is necessary and beneficial for staff and consumers, and resources that support change. Many people naturally resist change; thus, an organization's commitment includes a willingness to discuss with staff members the impact and role of trauma in their service setting, patience in planning and implementation, and

Seminal Resource for Administrators

As you investigate how best to implement or improve trauma informed services within your organization or across systems, review the influential work, *Using Trauma Theory to Design Service Systems: New Directions for Mental Health Services.*

(Harris & Fallot, 2001c)

Advice to Administrators: Managing Staff Reactions to Implementation of New Processes or Ideas

A common hurdle for administrators after introducing a new process or idea is the staff assumption that it will require more work. Frontline staff members are often inundated with many responsibilities beyond face-to-face time with clients. In addition, a common misperception is that if you begin to address trauma, you will have difficulty containing it.

In addition to administrative buy-in, administrators must promote rather than simply announce the implementation of trauma-informed services. Promotion includes educating staff about the rationale for trauma-informed services, offering opportunities for discussion and input from staff and consumers, providing training focused on trauma-informed skills, and so forth. For example, the San Diego Trauma-Informed Guide Team (2012) created a promotional brochure on how TIC can make staff jobs easier:

- Focuses on root problem
- Is preventative
- Increases support system
- Facilitates collaboration
- Shares workload
- Empowers client
- Provides consistency in agencies/systems
- Uses evidence-based best practices

TIC may be cost-effective, lead to less intensive services and less use of services, prevent undue stress for staff members and clients, and prevent client crises caused by old policies that could retraumatize trauma survivors.

the ability to tolerate the uncertainty that naturally accompanies transitions.

Strategy #2: Use Trauma-Informed Principles in Strategic Planning

Strategic planning provides an opportunity to explore and develop short- and long-term goals. The planning process often begins with reevaluating the organizations' values, mission, and vision, yet agencies cannot adequately develop a trauma-informed strategic plan without obtaining specific information about internal (staff, resources, processes) and external environmental (referral constellation, changes in health care, funding sources, State and Federal standards, community needs, consumer demographics, etc.) factors and influences. Data gathered through staff, consumer, organizational, and community assessments shapes the direction of the plan, including projected demands, challenges, obstacles, strengths, weaknesses, and resources. At the conclusion of this planning process, the organization will have specific goals, objectives, and tasks to meet the needs of their stakeholders and to address any anticipated challenges. Ideally, strategic planning should define key steps in developing or refining trauma-informed services within the organization.

Strategy #3: Review and Update Vision, Mission, and Value Statements

Vision, mission, and value statements provide a conceptual framework for TIC development and delivery. They should not be created in isolation; they should reflect voices from the community, populations, and other stakeholders that the organization serves. These statements develop through input, discussion, and assessment. They are not static; they evolve as needs, populations, or environments change.

Statement Example

As behavioral health service providers, we strive to be trauma aware—to understand the dynamics and impact of trauma on the lives of individuals, families, and communities. We strive to create a trauma-sensitive culture by demonstrating, through consumer empowerment, program design, and direct care, an understanding of the relationships among trauma, substance abuse, and mental illness.

Advice to Administrators: How To Create Vision, Value, and Mission Statements

Define the organization's vision, values, and mission to be compatible with TIC. Emphasize the organizational culture needed to provide TIC. An outgrowth of that cultural shift may include an enhanced working environment for employees and consumers that is noncoercive and reduces conflicts, restraint, and seclusion. Even if the current mission statement is appropriate, change it anyway to symbolize intended change within the organization. To define or redefine the vision, values, and mission:

- Involve consumers, all levels of staff, and leadership, including the director/CEO.
- Review:
  - Organizational priorities to identify and manage conflicting priorities.
  - Resources to assess whether reallocation is necessary for change (e.g., to hire peer support specialists, to furnish comfort rooms).
- Operationalize the vision, values, and mission at the level of individual departments
- Evaluate progress at regular staff meetings to ensure that changing the culture of care stays on the agenda.

Source: New Logic Organizational Learning, 2011.

Strategy #4: Assign a Key Staff Member To Facilitate Change

Prior to the development of an oversight committee, a senior staff member with the authority to initiate and implement changes should be assigned to oversee the developmental process. By assigning a trauma-aware senior staff member who is committed to trauma-informed services, it is more likely that the organization's and committee's goals, objectives, and plans will remain in focus. This senior staff member is responsible for ongoing development and facilitation of the oversight committee; management of the initial organizational assessment, reassessments, and other evaluative and feedback processes; and facilitation and oversight of the implementation plan and subsequent changes, including policies and procedures to ensure delivery of TIC.

Strategy #5: Create a Trauma-Informed Oversight Committee

The role of the oversight committee includes providing ongoing input and direction in the initial organizational assessment, strategic plan, plan implementation, reevaluation and development of trauma-informed policies and procedures, and future reassessments. The committee monitors progress and uses real-time data to forge a clear pathway to new processes that support TIC. The committee should involve stakeholders from the community, consumers, specialists, staff members, and administrators. Leadership involvement is necessary. Stakeholders may be alumni, family members, community-based organizations, and other institutions that interact with the agency or would benefit from trauma-informed services.

Initially, the agency must educate the committee on the organization's mission, values, and vision as well as the task at hand—developing trauma-informed services. To ease potential conflicts or confusion about the organization's structure, the guidelines, expectations, and roles of the committee need to be communicated directly to committee members as well as the organization as a whole, including board members, support and professional staff, supervisors, and so forth. The committee also needs to know the extent of their power and the necessary lines of communication before, during, and after evaluating and implementing changes in the organization.

Including consumers and/or those who have lived through trauma is vital. They have unique knowledge, experiences, and perspectives on the impact of treatment design, delivery, policies, and procedures. They offer firsthand information on practices that can potentially retraumatize clients in behavioral health settings and can suggest preventive, alternative practices and solutions. Consumer committee members keep staff and administrators aware of the goal of achieving TIC.

Strategy #6: Conduct an Organizational Self-Assessment of Trauma-Informed Services

An organizational self-assessment evaluates the presence and/or the effectiveness of current trauma-informed practices across each service and level of the organization. This assessment allows an organization to see how it functions within the context of trauma-informed principles and provides feedback to inform the development or revision of the implementation plan for TIC. In essence, this assessment process can serve as a blueprint for change and as a benchmark of compliance with and progress in implementing trauma-informed practices across time. Overall, it is a process of identifying organizational strengths, weaknesses, opportunities, and threats related to the implementation and maintenance of TIC. Refer to Appendix F for sample organizational assessment tools for the organization and the consumer.

The self-assessment should obtain feedback from key stakeholders, particularly consumers, family members, referral sources, community organizations, and all levels of the organization's staff, including nonclinical and clinical staff, supervisors, and administrative personnel. Similar to the universal screening process, an organizational self-assessment is only as effective as the steps taken after data are gathered and analyzed. From this assessment, an implementation plan should be established that highlights the goals, objectives, steps, timeframe, and personnel responsible in overseeing the specific objective. Assessment shouldn't be a once-and-done project. Timely and regularly scheduled organizational assessments should follow to assist in quality improvement. For an explanation of more detailed steps to take in conducting an organizational self-assessment, see Chapter 4 of the planned Treatment Improvement Protocol (TIP), *Improving Cultural Competence* (SAMHSA, planned c).

Advice to Administrators: Ten Steps to Quality Improvement

1. Identify new goals or problems.
2. Gather input from each level of the organization, including consumers and other key stakeholders.
3. Analyze the feedback.
4. Explore improvement options and the potential barriers associated with each.
5. Select the overall approach and specific strategies to address barriers (anticipate barriers, and try to address them before they occur).
6. Develop an implementation plan, and then present the plan to staff members and other key stakeholders not directly involved in the quality improvement process.
7. Implement the plan.
8. Reassess the new plan.
9. Evaluate the results and determine if new goals or additional problems or issues need to be addressed.
10. Repeat the first nine steps.

Strategy #7: Develop an Implementation Plan

Implementation plans should evolve from consumer participation, demographic profiles

Advice to Administrators: Implementation Plan Content

1. **Introduction and overview:** This includes the organization's history, the demographics that characterize its client base, the rationale for the implementation plan, and the incorporation of TIC. Focus on identification of strengths, weaknesses, opportunities, and threats. Provide an overview of goals and objectives.
2. **Specific goals and objectives:** Goals and objectives should address:
   - Workforce development strategies for recruiting, hiring, retaining, training, supervising, and promoting wellness of clinical and nonclinical staff members to support TIC.
   - Consumer participation and peer support development and implementation strategies.
   - Policies, procedures, and practices to support TIC and culturally responsive services, to promote safety, and to prevent retraumatization.
   - Specific evidence-based or best practice adoptions to support TIC.
   - Strategies to amend facility design or environment (plant) operations to reinforce safety.
   - Fiscal planning to ensure sustainability of the steps initiated in the organization.
3. **Guidelines for implementation:** Guidelines should highlight the specific steps, roles, responsibilities, and timeframes for each activity to meet TIC objectives.

of populations served, data from organizational self-assessment, and research on promising and evidence-based trauma-informed practices. Using the framework proposed in this TIP, the oversight committee is responsible for designing a plan that outlines the purpose, goals, objectives, timeframes, and personnel responsible for each objective (Exhibit 2.1-1).

Exhibit 2.1-1: TIC Planning Guidelines

The following publications provide samples of organizational guidelines for implementing TIC.

- Fallot, R. D. & Harris, M. (2009). *Creating cultures of trauma-informed care (CCTIC): A self-assessment and planning protocol.* Washington, DC: Community Connections, 2009.
- Guarino, K., Soares, P., Konnath, K., Clervil, R., & Bassuk, E. (2009). *Trauma-informed organizational toolkit.* Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration; the Daniels Fund; the National Child Traumatic Stress Network; and the W. K. Kellogg Foundation.
- Huckshorn, K. (2009). Transforming cultures of care toward recovery oriented services: Guidelines toward creating a trauma informed system of care. In *Trauma informed care (TIC) planning guidelines for use in developing an organizational action plan.* Alexandria, VA: National Association of State Mental Health Program Directors.
- Jennings, A. (2009). *Criteria for building a trauma-informed mental health service system.* Retrieved on May 21, 2013, from http://www.theannainstitute.org/CBTIMHSS.pdf
- Ohio Legal Rights Service (2007). *Trauma-informed treatment in behavioral health settings.* Columbus, OH: Ohio Legal Rights Service.
- Prescott, L., Soares, P., Konnath, K., & Bassuk, E. (2008). *A long journey home: A guide for creating trauma-informed services for mothers and children experiencing homelessness* [draft]. Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration; the Daniels Fund; the National Child Traumatic Stress Network; and the W.K. Kellogg Foundation.

The following resource is a systemwide set of guidelines for implementing TIC.

- U.S. Department of Health and Human Services, Health Resources and Services Administration (2006). *Model trauma system: Planning and evaluation.* Rockville, MD: Health Resources and Services Administration.

Strategy #8: Develop Policies and Procedures To Ensure Trauma-Informed Practices and To Prevent Retraumatization

In the early stage of evaluating current services and planning for TIC, the committee needs to assess practices, procedures, and policies that may have been or could be retraumatizing to any individual, at any level of the organization, from consumers to administrators. Programs that are not trauma informed are as likely to be unaware of the impact of trauma on staff as they are to be unaware of its influence on consumers. In the initial review, careful scrutiny should be used to eliminate any practice that is potentially harmful, including seclusion and restraint practices, therapeutic activities that are shaming, treatment planning without collaboration, any medical inquiry without privacy, and so forth.

Policies and procedures are the building blocks of each agency. They guide the service process and, if followed, they provide an opportunity for the agency to deliver consistent responses and care. Policies and procedures must incorporate trauma-informed practices across all domains and standards, such as admissions, plant/environmental standards, screening and assessment processes, referrals (to other services, including hospitalization, or for further evaluations), treatment planning, confidentiality, discharge, and more. They also need to be updated periodically to incorporate new science and to meet the changing needs of consumers. By regularly reviewing and adapting administrative and clinical policies and procedures in response to ever-changing needs and evidence, the agency can provide staff members with good guidelines for providing trauma-informed services that are consistent yet flexible.

Program Curriculum: Roadmap to Seclusion-Free and Restraint-Free Mental Health Services

This curriculum, written from consumer perspectives, provides behavioral health staff with education, strategies, and hands-on tools to prevent and ultimately eliminate the use of seclusion and restraint. It includes many handouts for participants and consumers. This training package, available online (http://store.samhsa.gov/product/Roadmap-to-Seclusion-and-Restraint-Free-Mental-Health-Services-CD-/SMA06-4055), is divided into seven modules plus a resources section:

- Module 1: The Personal Experience of Seclusion and Restraint
- Module 2: Understanding the Impact of Trauma
- Module 3: Creating Cultural Change
- Module 4: Understanding Resilience and Recovery from the Consumer Perspective
- Module 5: Strategies to Prevent Seclusion and Restraint
- Module 6: Sustaining Change Through Consumer and Staff Involvement
- Module 7: Review and Action Plan
- Resource Section

Strategy #9: Develop a Disaster Plan

Facilities are often required to develop disaster plans, but specific requirements vary from State to State. From the outset, developing a disaster plan in behavioral health services is essential. Many clients in behavioral health services have lived with trauma, so proactive steps that reduce the impact of a new trauma may prevent worsening of symptoms and decrease the risk for more pervasive effects. (See also Technical Assistance Publication 34, *Disaster Planning Handbook for Behavioral Health Treatment Programs* [SAMHSA, 2013].)

Most disaster events cannot be accurately anticipated. Even so, behavioral health organizations can take steps to reduce the impact of a disaster event on program functioning and on the lives of clients. Each service or program should develop a disaster response committee that meets regularly to develop, maintain, and adapt policies and procedures to respond to disasters affecting the program. Committee planning efforts may include:

1. Creating a disaster response team of program staff members tasked with coordinating program administration and services in a disaster event.
2. Establishing a communication process for informing staff and clients of the status of program functioning and for coordinating staff assignments during and shortly after the disaster event.
3. Outlining a process to inform clients and their families of available services, their location, and contact information for accessing services to meet clients' critical needs.
4. Developing plans for service provision during a disaster event and service implementation after the event.
5. Creating special plans for high-risk or special needs clients who need services during and shortly after the disaster. Examples of this are clients who are homeless, in detoxification services or methadone programs, on prescribed psychopharmaceuticals, or at risk for suicide.
6. Making plans for maintaining the security of client records, program records, and facilities during and shortly after the event.
7. Coordinating ahead with other community resources and services to ensure that clients at high risk or with special needs get the services they require as soon as possible.
8. Prioritizing how services will start back up after a disaster event.
9. Providing special services after the event to clients at high risk for trauma reactions and symptoms.
10. Establishing a postdisaster debriefing process to review disaster responses, services, and outcomes.

Some specific disaster events, such as hurricanes, may sometimes offer opportunities for planning and preparation in advance of the disaster event. This preparation time is usually just a few days, but it allows programs to make advance preparations and take advance action to establish lines of communication, stockpile resources, prepare for evacuation of clients, and protect client and program records.

Strategy #10: Incorporate Universal Routine Screenings

A key element of trauma-informed services is the institution of universal routine screening across all services, regardless of the individual's path in accessing services (e.g., primary care, hospitalization, outpatient). Considering the prevalence of trauma among individuals who seek services for mental and substance use disorders, the implementation of screening is paramount. Without screening, clients are not identified as trauma survivors. Subsequently, they miss recovery opportunities and treatment services that would be more likely to meet their needs, while also running a higher risk of being retraumatized by unexamined organizational policies, procedures, and practices. For more information on the rationale, processes, and instruments of universal screening for trauma, refer to Part 1, Chapter 4.

Strategy #11: Apply Culturally Responsive Principles

Providers must be culturally competent when incorporating evidence-based and best practices as well as trauma-informed treatment

models within the organization. Clients' views of behavioral health differ according to race, ethnicity, and culture (refer to the planned Treatment Improvement Protocol [TIP], *Improving Cultural Competence* [SAMHSA, planned c]). Likewise, cultures attach different meanings to trauma, and responses to trauma will vary considerable across cultures (see Part 3, the online literature review, for more information). For example, trauma survivors who come from a collective society or culture, in which the goals of the group take precedence over the goals of the individual, may be more focused on the well-being of their family or the family's response to the trauma survivors' experience. Often, this view runs in opposition to the individualistic perspective of many behavioral health services. Subsequently, treatment providers who are not culturally competent may interpret collective values as a sign of resistance or avoidance in dealing with traumatic stress. CMHS (2003) outlines principles of cultural competence in disaster work applicable across all forms of trauma:

1. ***Recognize the importance of culture and respect diversity.*** Those who value culture and diversity understand their own cultures, attitudes, values, and beliefs, and they work to understand the cultures of others. This includes being able to communicate effectively with those from other cultures, respecting others' feelings about personal space, knowing about others' social organization, understanding how time is viewed, and being aware of others' beliefs about the effects of their behaviors.
2. ***Maintain a current profile of the cultural composition of the community.*** This includes describing the community's population in terms of race and ethnicity, age, gender, religion, refugee and immigrant status, housing status, income levels, rural/urban balance, unemployment, languages spoken, literacy, schools, and businesses.
3. ***Recruit workers who are representative of the community or service area.*** If the workers who are available do not match the community, they should have the personal attributes, knowledge, and skills to develop cultural competence.
4. ***Provide ongoing cultural competence training to staff.*** Topics should include cultural values and traditions, family values, linguistics and literacy, immigration experiences and status, help-seeking behaviors, techniques and strategies for cross-cultural outreach, and the avoidance of stereotypes and labels (DeWolfe & Nordboe, 2000b).
5. ***Ensure that services are accessible, appropriate, and equitable.*** In planning disaster work or TIC, community associations and organizations are invaluable. Gaining their acceptance requires time and energy.
6. ***Recognize the role of help-seeking behaviors, traditions, and natural support networks.*** Culture includes traditions that dictate whom, or which groups, to seek in times of need; how to handle suffering and loss; and how healing takes place. These customs and traditions are respected by a culturally responsive disaster relief program.
7. ***Involve community leaders and organizations representing diverse cultural groups as "cultural brokers."*** Collaborating with community leaders is an effective means of learning about the community, establishing program credibility, and ensuring that services are culturally responsive.
8. ***Ensure that services and information are culturally and linguistically responsive.*** Communication with individuals who do not speak English, who are illiterate in all languages or have limited literacy, and who are deaf or hard of hearing is essential to service provision. Local radio stations, television outlets, and newspapers that are multicultural are an excellent venue for educational information after a disaster.

Using survivors' friends or relatives as interpreters is not recommended, as survivors may be uncomfortable discussing personal matters with family members or friends. Asking children to interpret can place too heavy a responsibility on them and reverses parents' and children's roles.

9. ***Assess and evaluate the program's level of cultural responsiveness.*** Self-assessment and process evaluation can help keep a program on track. A variety of strategies can be used for collecting data and communicating findings to stakeholders.

Strategy #12: Use Science-Based Knowledge

Along with culturally responsive services, trauma-informed organizations must use science-based knowledge to guide program development and the implementation of services, policies, procedures, and practices. This includes the adoption of EBPs (see Part 1, Chapter 6, and Part 3, Section 1, to review definition, treatments, and resources for EBPs). TIC research is quite new; interpret these limited studies and information cautiously. Chambless and Hollon's (1998) criteria, which are still the benchmark for EBPs, are valuable resources for administrators. Look closely at who was included—and excluded—from treatment studies. Often, the types of severe, chronic, and unstable cases seen in community settings are excluded from treatment studies. Evidence-based interventions should be a primary consideration in selecting appropriate treatment models for people with mental illness, substance use disorders, and co-occurring psychological trauma. Nonetheless, other variables must also be contemplated before adopting EBPs in an organization, including the cultural appropriateness of the practice; the strength of its clinical focus on strengths-based strategies; training and competence of clinical staff; the cost of training, materials, and implementation; and the ease of maintaining EBP fidelity amidst staff turnover.

For more detailed information on EBPs, visit the National Registry of Evidence Based Programs and Practices (NREPP) Web site (http://nrepp.samhsa.gov). For more specific research oriented information on trauma and trauma specific treatments, refer to the literature review in Part 3 of this TIP, available online.

Strategy #13: Create a Peer-Support Environment

The main purpose of peer support services is to provide consumer mentoring, support, and care coordination for clients with histories of mental illness or substance abuse. The goals are to help others deal with personal and environmental barriers that impede recovery and achieve wellness. Peer support accomplishes this through many activities, including advocacy, support during crises and recovery activities, modeling, education, and assistance in accessing available resources. Peer support programs send a powerful message to staff members, consumers, and the community—that recovery is possible through support, collaboration, and empowerment. These programs reinforce the trauma-informed premise that organizations need to reflect the populations that they serve and involve consumers in planning, implementing, monitoring, and delivering recovery services.

For an introduction to peer support services, see *What Are Peer Recovery Support Services?* (Center for Substance Abuse Treatment, 2009e).

Notably, peer support services have the potential to be considerably flexible to meet client needs at each stage of recovery. Specifically, peer support services can be incorporated

across the continuum of care, starting with outreach services and extending into long-term recovery services. Peer support specialists can enhance consumer motivation to change, to initiate services, and/or to engage in recovery activities. They can play powerful liaison roles by supporting clients entering treatment and explaining what to expect from services. They can ease the transition into treatment, from one service to the next, from one modality to another (e.g., inpatient group to outpatient group), and beyond formal treatment. Moreover, peer support services create an atmosphere focused on mutuality rather than pathology. They provide living models of resilience and promote hope—that recovery is possible and attainable.

Administrators should familiarize themselves with how other organizations have implemented peer support programs, current curricula, certifications and training processes, competencies and ethics, and peer support service State standards or recommendations, if applicable. The Carter Center's Summit in 2009, The Pillars of Peer Support Services, supported in part by SAMHSA and CMHS, highlighted the numerous elements necessary to develop a strong, vital peer workforce (Daniels et al., 2010). These elements include:

- Clear job and service descriptions.
- Job-related competencies and competence-based testing processes.
- Peer support certifications.
- Ongoing continuing education.
- Media and technology access for peer specialists.
- Sustainable funding.
- Research and evaluation components.
- Code of ethics and conduct.
- Competence-based training for supervisors.
- Multilevel support and program support teams.

> "Peer recovery support services are evidence based and have been demonstrated to promote positive health outcomes and control the cost of healthcare. These services are offered by a trained individual with lived experience and recovery from a mental illness, substance use and/or chronic health conditions. Peer recovery support services minimally include chronic illness self management, whole health and wellness promotion and engagement, relapse prevention, life skill coaching, and insurance and health systems navigation."
>
> (Daniels et al., 2012, p. 22)

Advice to Administrators: Sample Peer Support Staff Tasks

- Use active listening skills help peers identify areas of dissatisfaction and benefits of changing beliefs, thoughts, and behavior.
- Use problem-solving skills to help peers identify barriers to recovery and develop plans to meet peer-determined goals.
- Facilitate recovery support groups.
- Link clients with community resources.
- Work with the treatment team to advocate for clients and to remove recovery barriers.
- Participate in consumer panels to educate staff about the consumer perspective and about peer support.
- Participate in hospital-wide committees and workgroups

Source: New Logic Organizational Learning, 2011.

Strategy #14: Obtain Ongoing Feedback and Evaluations

Obtain feedback on and evaluations of organizational performance on a regular basis. Give consumers a clear avenue for offering feedback at any time, and make evaluations assessing the organization's progress toward providing trauma-informed services standard practice. Without feedback and further evaluation, organizations cannot assess whether they are

meeting trauma-informed objectives. A routine monitoring process for TIC implementation gives the organization additional information necessary to combat new obstacles and threats and to understand what works. Regular monitoring equips organizations with the ability to formulate different strategies to meet objectives as well as to respond to the changing needs of the population. Ongoing evaluation and consumer feedback are essential in improving the quality of services.

Strategy #15: Change the Environment To Increase Safety

Practices that generate emotional and physical safety are necessary. Another aspect of creating safety is reevaluating the physical facilities and environment to enhance safety and to circumvent preventable retraumatization. Think how traumatizing it would be if you were a female rape survivor and a night counselor was conducting a room check at 2:00 a.m., or a male security guard was walking the women's residential wing. What would it be like if you were sitting with your back to the door in a small office during an intake interview, if your history included a physical assault and robbery? For most, it would at least increase anxiety; for others it would be retraumatizing. Trauma-informed providers must carefully assess environmental safety. Although you are likely to identify some facility issues that could erode safety for trauma survivors, a safe environment will only be established if regular feedback is obtained from consumers about their experiences with the program.

Strategy #16: Develop Trauma-Informed Collaborations

TIC is about collaboration with consumers, staff members, key stakeholders, and other agencies. Collaborative relationships provide opportunities for consumers to access the most appropriate services as needs arise. Rather than waiting for a crisis or a dire need for a service to investigate available resources, it is far more efficient and compassionate to establish relationships within the agency and with other community resources before these needs arise. No agency can meet the needs of every client; referral agreements and/or collaborative arrangements that integrate the delivery of TIC, including support services (e.g., housing, legal, medical), are important.

Creating Sanctuary

The sanctuary model is a trauma-based therapeutic approach that has been used in inpatient, residential, therapeutic community, and outpatient settings with children, adolescents, and adults. It provides a template for changing social service delivery systems so that they are better equipped to respond to the complex needs of trauma survivors. Sanctuary is informed by four knowledge areas: "the psychobiology of trauma, the active creation of nonviolent environments, principles of social learning, and an understanding of the ways in which complex adaptive systems grow, change, and alter their course" (Bloom et al., 2003, p. 174).

The sanctuary model describes a stage-based approach to healing that is referred to as SAGE: safety, affect modulation, grieving, and emancipation. This model is nonlinear; an individual does not necessarily move from one stage to another in a straight path, but progress in one area does affect progress in other areas (Bloom, 1997; Bloom et al., 2003). SAGE is a cognitive–behavioral translation of the sanctuary model (Bills, 2003). Early in treatment, the focuses are typically on safety and affect management. Safety encompasses four domains: physical, psychological, social, and moral (Bloom, 1997; see http://www.sanctuaryweb.com for further details and a curriculum).

2 Building a Trauma-Informed Workforce

IN THIS CHAPTER

- Introduction
- Workforce Recruitment, Hiring, and Retention
- Training in TIC
- Trauma Informed Counselor Competencies
- Counselor Responsibilities and Ethics
- Clinical Supervision and Consultation
- Secondary Traumatization
- Counselor Self Care

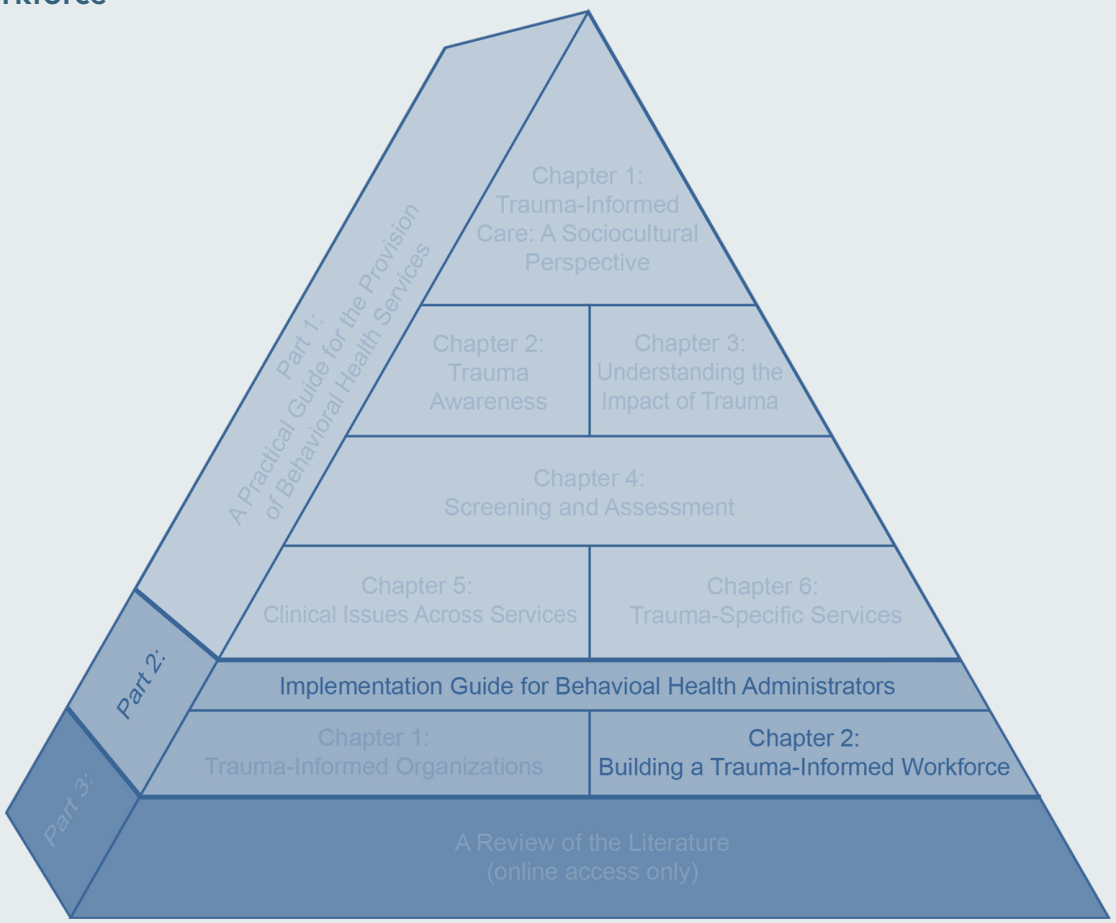
Introduction

For an organization to embrace a trauma-informed care (TIC) model fully, it must adopt a trauma-informed organizational mission and commit resources to support it. This entails implementing an agency-wide strategy for workforce development that is in alignment with the values and principles of TIC and the organization's mission statement. Without a fully trained staff, an organization will not be able to implement the TIC model. However, simply training behavioral health professionals in TIC is not enough. Counselors will not be able to sustain the kind of focus required to adopt and implement a trauma-informed philosophy and services without the ongoing support of administrators and clinical supervisors.

An organizational environment of care for the health, well-being, and safety of, as well as respect for, its staff will enhance the ability of counselors to provide the best possible trauma-informed behavioral health services to clients. This culture of care must permeate the organization from top to bottom. Behavioral health program administrators should aim to strengthen their workforce; doing so "requires creating environments that support the health and well-being, not only of persons with mental and substance use conditions, but of the workforce as well" (Hoge, 2007, p. 58). An organizational culture of care, safety, and respect demands activities that foster the development of trauma-informed counselors. This chapter focuses on key workforce development activities, such as:

- Recruiting, hiring, and retaining trauma-informed staff.
- Training behavioral health service providers on the principles of, and evidence-based and emerging best practices relevant to, TIC.
- Developing and promoting a set of counselor competencies specific to TIC.

TIC Framework in Behavioral Health Services—Building a Trauma-Informed Workforce



- Delineating the responsibilities of counselors and addressing ethical considerations specifically relevant to promoting TIC.
- Providing trauma-informed clinical supervision.
- Committing to prevention and treatment of secondary trauma of behavioral health professionals within the organization.

Addressing each of these areas is essential to building a trauma-informed workforce and an organizational culture that supports TIC.

Workforce Recruitment, Hiring, and Retention

An Action Plan for Behavioral Health Workforce Development (Hoge et al., 2007) emphasizes the importance of organization-wide support and active involvement in workforce recruitment, hiring, and retention in behavioral health systems. One of the key findings of this report is that the work environment itself in many behavioral health settings can be toxic to the workforce and may hinder the delivery of individualized, respectful, collaborative, and client-centered care to service recipients. Factors such as the downward pressure on organizations for higher productivity of counselors increase caseloads and decrease wages of behavioral health staff members and may create a high-stress environment that contributes to low morale and worker dissatisfaction. Other factors that often contribute to low retention of qualified counselors in behavioral health settings include the lack of professional career

ladders, fragile job security, the lack of clinical supervision, and an inability to influence the organization in which they are working (Hoge et al., 2007).

Added to this mix is the intensity of working with people with the co-occurring conditions of trauma-related mental and substance use disorders and the risk of secondary traumatization of counselors. In creating and sustaining a trauma-informed workforce, organizations need to foster a work environment that parallels the treatment philosophy of a trauma-informed system of care. Doing so allows counselors to count on a work environment that values safety, endorses collaboration in the making of decisions at all levels, and promotes counselor well-being.

Recruitment and Hiring in a Trauma-Informed System of Care

In a 2007 technical report (Jennings, 2007b), the National Center for Trauma-Informed Care identified several priorities for organizations with regard to recruitment and hiring trauma-informed staff, including:

- Active recruitment of and outreach to prospective employees who are trauma-informed or have formal education in providing trauma-informed or trauma-specific services in settings such as universities, professional organizations, professional training and conference sites, peer support groups, and consumer advocacy groups.
- Hiring counselors and peer support staff members with educational backgrounds and training in trauma-informed and/or trauma-specific services and/or lived experience of trauma and recovery.
- Providing incentives, bonuses, and promotions for staff members during recruitment and hiring that take into consideration prospective employees' trauma-related education, training, and job responsibilities.

In addition to hiring behavioral health professionals with formal professional education and training, organizations should also "routinely survey the demographics and other characteristics of the population served and recruit a workforce of similar composition" (Hoge et al., 2007, p. 297). Essentially, this means actively engaging in outreach to consumer advocacy groups, recovery-oriented programs, community and faith-based organizations, and former clients/consumers with the intention of recruiting potential employees whose knowledge and expertise comes from their lived experience of trauma, resilience, and recovery. Support staff members, peer support workers, counselors in training, and apprentices can be recruited from this population and offered incentives, such as tuition reimbursement, training stipends, and professional mentoring with the goal of developing a trauma-informed workforce from within the demographic served. Jennings (2007b) calls these staff members "trauma champions" who can provide needed expertise in a trauma-informed organization to promote trauma-informed policies, staff development, and trauma-based services consistent with the mission of the organization (p. 135).

Who Is a Trauma Champion?

"A champion understands the impact of violence and victimization on the lives of people seeking mental health or addiction services and is a front-line worker who thinks 'trauma first.' When trying to understand a person's behavior, the champion will ask, 'is this related to abuse and violence?' A champion will also think about whether his or her own behavior is hurtful or insensitive to the needs of a trauma survivor. The champion is there to do an identified job—he is a case manager or a counselor or a residential specialist—but in addition to his or her job, a champion is there to shine the spotlight on trauma issues."

Source: Harris & Fallot, 2001a, p. 8.

As with hiring behavioral health professionals who are in recovery from substance use disorders, the organization should be transparent and explicit in its recruitment and hiring practices of trauma survivors in recovery. The organization can be transparent by advertising the mission statement of the organization as part of the recruitment process and inviting applicants who are in recovery from trauma to apply. The needs of behavioral health staff members who are in recovery from both substance use and trauma-related conditions and working in a trauma-informed system of care should be addressed in the organization's ongoing training, clinical supervision, and staff development policies and practices.

Workforce Retention

Staff turnover is rampant in behavioral health settings. It is costly to the organization, and as a result, it is costly to clients. A strong therapeutic relationship with a counselor is one of the largest factors in an individual's ability to recover from the overwhelming effects of trauma. When behavioral health professionals leave an organization prematurely or in crisis as a result of chronic levels of high stress or secondary traumatization, clients must deal with disruptions in their relationships with counselors. Some of the organizational factors that contribute to chronic levels of high stress and often lead to high staff turnover include expecting counselors to maintain high caseloads of clients who have experienced trauma; not providing trauma-informed clinical supervision and training to counselors; and failing to provide adequate vacation, health insurance, and other reasonable benefits that support counselors' well-being. Other factors that may have a more profound impact on staff retention include failing to acknowledge the reality of secondary traumatization, promoting the view that counselors' stress reactions are a personal failure instead of a normal response to engaging with clients' traumatic material, and not supporting personal psychotherapy for counselors (Saakvitne, Pearlman, & Traumatic Stress Institute/Center for Adult & Adolescent Psychotherapy, 1996).

Research on promoting counselor retention in behavioral health settings demonstrates that

Advice to Administrators: Preventing Turnover and Increasing Workforce Retention

To prevent behavioral health staff turnover and increase retention of qualified, satisfied, and highly committed trauma-informed counselors, consider:

- Offering competitive wages, benefits, and performance incentives that take into account education, training, and levels of responsibility in providing trauma-informed or trauma-specific services.
- Creating a safe working environment that includes both the physical plant and policies and procedures to prevent harassment, stalking, and/or violence in the workplace and to promote respectful interactions amongst staff at all levels of the organization.
- Establishing an organizational policy that normalizes secondary trauma as an accepted part of working in behavioral health settings and views the problem as systemic—not the result of individual pathology or a deficit on the part of the counselor.
- Instituting reasonable, manageable caseloads that mix clients with and without trauma-related concerns.
- Letting staff offer input into clinical and administrative policies that directly affect their work experience.
- Providing vacation, health insurance (which includes coverage for psychotherapy/personal counseling), and other benefits that promote the well-being of the staff.
- Implementing regular, consistent clinical supervision for all clinical staff members.
- Providing ongoing training in trauma-informed services offered by the organization.

behavioral health staff members are interested in the same kind of work environment and benefits as employees in many other fields. They include a "living wage with healthcare benefits; opportunities to grow and advance; clarity in a job role; some autonomy and input into decisions; manageable workloads; administrative support without crushing administrative burden; basic orientation and training for assigned responsibilities; a decent and safe physical work environment; a competent and cohesive team of coworkers; the support of a supervisor; and rewards for exceptional performance" (Hoge et al., 2007, p. 18).

When an organization's administration values its staff by providing competitive salaries and benefits, a safe working environment, a reasonable and manageable workload, input into the making of clinical and administrative policy decisions, and performance incentives, it helps behavioral health workers feel connected to the mission of the organization and become dedicated to its sustainability and growth. This type of work environment demonstrates both a level of respect for counselors (similar to the level of respect a trauma-informed organization displays toward clients) and an appreciation for the complexity of their job responsibilities and the stress they face when working with people who have experienced trauma in their lives. To retain behavioral health professionals working in a trauma-informed setting, wages and performance incentives should be tied not only to education, training, and work experience, but also to levels of responsibility in working with clients who have experienced trauma.

Training in TIC

Training for all staff members is essential in creating a trauma-informed organization. It may seem that training should simply focus on new counselors or on enhancing the skill level of those who have no prior experience in working with trauma, but training should, in fact, be more systematic across the organization to develop fully sustainable trauma-informed services. All employees, including administrative staff members, should receive an orientation and basic education about the prevalence of trauma and its impact on the organization's clients. To ensure safety and reduction of harm, training should cover dynamics of retraumatization and how practice can mimic original sexual and physical abuse experiences, trigger trauma responses, and cause further harm to the person. Training for all employees must also educate them "about the impacts of culture, race, ethnicity, gender, age, sexual orientation, disability, and socioeconomic status on individuals' experiences of trauma" (Jennings, 2007a, p. 5).

All clinical and direct service staff members, regardless of level of experience, should receive more indepth training in screening and assessment of substance use and trauma-related disorders; the relationships among trauma, substance use disorders, and mental disorders; how to understand difficult client behaviors through a trauma-informed lens; how to avoid retraumatizing clients in a clinical setting; the development of personal and professional boundaries unique to clinical work with traumatized clients; how to identify the signs of secondary traumatization in themselves; and how to develop a comprehensive personal and professional self-care plan to prevent and/or ameliorate the effects of secondary traumatization in the workplace. All clinical staff members who work with traumatized clients should receive additional training in evidence-based and promising practices for the treatment of trauma (for information on locating training, see Appendix B.) This might include training done within the agency by experts in the field or training received by attending advanced trauma trainings. Administrators

should provide the time and financial resources to clinical staff members for this professional development activity. Jennings (2007a) suggests that, whenever possible, "trainings should be multi-system, inclusive of staff in mental health and substance abuse, health care, educational, criminal justice, social services systems and agencies, and promoting systems integration and coordination" (p. 5).

Moreover, criminal justice settings, schools, military/veteran programs, and other places in which behavioral health services are provided may benefit from approaches that are sensitive to the special circumstances and cultures of these environments. For example, in exploring trauma-informed correctional care, Miller and Najavits (2012, p. 1) observe:

> Prisons are challenging settings for trauma-informed care. Prisons are designed to house perpetrators, not victims. Inmates arrive shackled and are crammed into overcrowded housing units; lights are on all night, loud speakers blare without warning and privacy is severely limited. Security staff is focused on maintaining order and must assume each inmate is potentially violent. The correctional environment is full of unavoidable triggers, such as pat downs and strip searches, frequent discipline from authority figures, and restricted movement….This is likely to increase trauma-related behaviors and symptoms that can be difficult for prison staff to manage….Yet, if trauma-informed principles are introduced, all staff can play a major role in minimizing triggers, stabilizing offenders, reducing critical incidents, deescalating situations, and avoiding restraint, seclusion or other measures that may repeat aspects of past abuse.

The Need for Training

Behavioral health service providers working with clients who have mental, substance use, and trauma-related disorders need to have the best knowledge, skills, and abilities. Substance abuse counselors, in particular, require additional training and skill development to be able to extend trauma-informed services (within the

Case Illustration: Larry

Larry is a 28-year-old clinical social worker who just finished his master's program in social work and is working in a trauma-informed outpatient program for people with substance use disorders. He is recovering from alcohol use disorder and previously worked in a residential rehabilitation program as a recovery support counselor. There, his primary responsibilities were to take residents to Alcoholics Anonymous (AA) meetings, monitor their participation, and confront them about their substance use issues and noncompliance with the program's requirement of attendance at 12-Step meetings.

In Larry's new position as a counselor, he confronts a client in his group regarding her discomfort with attending AA meetings. The client reports that she feels uncomfortable with the idea that she has to admit that she is powerless over alcohol to be accepted by the group of mostly men. She was sexually abused by her stepfather when she was a child and began drinking heavily and smoking pot when she was 11 years old. The client reacts angrily to Larry's intervention.

In supervision, Larry discusses his concerns regarding the client's resistance to AA and the feedback that he provided to her in group. Beyond focusing supervision on Larry's new role as a counselor in a trauma-informed program, the clinical supervisor recommends that Larry take an interactive, multisession, computer-assisted training on the 12-Step facilitation (TSF) model. The TSF model introduces clients to and assists them with engaging in 12-Step recovery support groups. The agency has the computer-based training available in the office, and Larry agrees to use follow-up coaching sessions with his supervisor to work on implementation of the approach. The supervisor recognizes that Larry is falling back on his own recovery experience and the strategies he relied on in his previous counseling role. He will benefit from further training and coaching in an evidence-based practice that provides a nonaggressive, focused, and structured way to facilitate participation in recovery support groups with clients who have trauma histories.

limits of their professional licensure and scope of practice) to clients who have co-occurring substance use, trauma-related, or mental disorders. Many clinical practice issues in traditional substance abuse treatment are inconsistent with trauma-informed practice, which needs to be addressed with further training. Similarly, mental health clinicians often need training in substance abuse treatment, as they typically do not have backgrounds or experience in that domain. Moreover, several surveys indicate that clinicians consistently perceive the combination of trauma and substance abuse as harder to treat than either one alone (Najavits, Norman, Kivlahan, & Kosten, 2010). It is thus key to emphasize cross-training as part of TIC. Exhibit 2.2-1 addresses these issues and offers suggestions for additional training.

Exhibit 2.2-1: Clinical Practice Issues Relevant to Counselor Training in Trauma-Informed Treatment Settings

- Some substance abuse counseling strategies commonly used to work through clients' denial and minimization of their substance use issues may be inappropriate when working with trauma survivors (e.g., highly confrontational models can remind trauma survivors of emotional abuse).

  Training: The Stages of Change model of addiction treatment can help counselors shift from the traditional confrontation of denial to conceptualizing clients' ambivalence about changing substance use patterns as a normal part of the precontemplation stage of change. This method is a respectful cognitive–behavioral approach that helps counselors match counseling strategies to their assessment of where each client is in each stage of change, with the ultimate goal of helping clients make changes to health risk behaviors. (Connors, Donovan, & DiClemente, 2001).

- The 12-Step concept of powerlessness (Step 1) may seem unhelpful to trauma survivors for whom the emotional reaction to powerlessness is a major part of their trauma (particularly for victims of repetitive trauma, such as child abuse or intimate partner violence). It can be confusing and counterproductive to dwell on this concept of powerlessness regarding trauma when the therapeutic objective for trauma-informed counseling methods should be to help clients empower themselves. For people in recovery, powerlessness is a paradox, sometimes misunderstood by both counselors and clients, in that the acknowledgment of powerlessness often creates a sense of empowerment. Most clients, with support and respectful guidance from a counselor, will come to understand that powerlessness (as used in 12-Step programs) is not an inability to stand up for oneself or express a need, and it does not mean for one to be powerless in the face of abuse. With this understanding, clients may become more open to participating in 12-Step groups as a resource for their recovery from substance use disorders. When clients continue to struggle with this concept and decline to participate in 12-Step recovery efforts, they may benefit from referral to other forms of mutual-help programs or recovery support groups in which the concept of powerlessness over the substance of abuse is not such a significant issue.

  Training: The TSF model can help counselors develop a more supportive and understanding approach to facilitating clients' involvement in 12-Step recovery groups (if this is a client-generated recovery goal). "Although based on standard counseling models, TSF differs from them in several ways. These differences include TSF's strong emphasis on therapist support, discouragement of aggressive 'confrontation of denial' and therapist self-disclosure, and highly focused and structured format" (Sholomskas & Carroll, 2006, p. 939).

  Another well-intentioned, but often misguided, approach by counselors who have not had formal or extensive training is "digging" for trauma memories without a clear therapeutic rationale or understanding of client readiness. In doing so, the counselor may unintentionally retraumatize the client or produce other harmful effects. In early intervention, it is sufficient simply to acknowledge and validate the pain and suffering of the client without uncovering or exploring specific trauma memories. The counselor who is insufficiently trained in trauma-informed clinical

(Continued on the next page.)

Exhibit 2.2-1: Clinical Practice Issues Relevant to Counselor Training in Trauma-Informed Treatment Settings (continued)

practice may also press agendas that are ultimately unhelpful, such as insisting that the client forgive an abuser, pursue a legal case against a perpetrator, or engage in trauma treatment, even when the client may not be ready for such steps. These efforts are particularly inappropriate for clients in early recovery from substance use disorders. The first goal in treatment is stabilization

Training: The Seeking Safety model of treating substance abuse and posttraumatic stress disorder (PTSD) can help counselors focus on the primary goal of stabilization and safety in TIC. This model emphasizes safety as the target goal, humanistic themes such as honesty and compassion, and making cognitive–behavioral therapy accessible and interesting to clients who may otherwise be difficult to engage (Najavits, 2002a).

- Treatment should be client-centered; it should acknowledge the client's right to refuse counseling for trauma-related issues. It is important to discuss the advantages and disadvantages of exploring trauma-related concerns, and then, following an open discussion, to allow clients the right to choose their path. This discussion should be part of the informed consent process at the start of treatment. Clients also have the right to change their minds.

  Training: Motivational interviewing, a client-centered, nonpathologizing counseling method, can aid clients in resolving ambivalence about and committing to changing health risk behaviors including substance use, eating disorders, self-injury, avoidant and aggressive behaviors associated with PTSD, suicidality, and medication compliance (Arkowitz, Miller, Westra, & Rollnick, 2008; Kress & Hoffman, 2008). Training in MI can help counselors remain focused on the client's agenda for change, discuss the pros and cons of treatment options, and emphasize the personal choice and autonomy of clients.

In addition to the training needs of substance abuse counselors, all direct care workers in mental health settings, community-based programs, crisis intervention settings, and criminal justice environments should receive training in TIC. Guidelines for training in assisting trauma-exposed populations are presented in Exhibit 2.2-2.

Continuing Education

Research on the effectiveness of single-session didactic and/or skill-building workshops

Exhibit 2.2-2: Guidelines for Training in Mental Health Interventions for Trauma-Exposed Populations

After a year of collaboration in 2002, the Task Force on International Trauma Training of the International Society for Traumatic Stress Studies published a consensus-based set of recommendations for training. Core curricular elements of the recommended training include:

- Competence in listening.
- Recognition of psychosocial and mental problems to promote appropriate assessment.
- Familiarity with established interventions in the client population.
- Full understanding of the local context, including help-seeking expectations, duration of treatment, attitudes toward intervention, cost-effectiveness of intervention, and family attitudes and involvement.
- Strategies for solving problems on the individual, family, and community levels.
- Treatment approaches for medically unexplained somatic pain.
- Collaboration with existing local resources and change agents (e.g., clergy, traditional healers, informal leaders).
- Self-care components.

Source: Weine et al., 2002.

Advice to Administrators: Trauma-Informed Staff Training

- Establish training standards for the evidence-based and promising trauma-informed practice models (such as Seeking Safety) adopted by your organization.
- Bring expert trainers with well-developed curricula in TIC and trauma-specific practices into your organization.
- Select a core group of clinical supervisors and senior counselors to attend multisession training or certification programs. These clinicians can then train the rest of the staff.
- Use sequenced, longitudinal training experiences instead of single-session seminars or workshops.
- Emphasize interactive and experiential learning activities over purely didactic training.
- Provide ongoing mentoring/coaching to behavioral health professionals in addition to regular clinical supervision to enhance compliance with the principles and practices of TIC and to foster counselor mastery of trauma-specific practice models.
- Build organization-wide support for the ongoing integration of new attitudes and counselor skills to sustain constructive, TIC-consistent changes in practice patterns.
- Provide adequate and ongoing training for clinical supervisors in the theory and practice of clinical supervision and the principles and practices of TIC.
- Include information and interactive exercises on how counselors can identify, prevent, and ameliorate secondary traumatic stress (STS) reactions in staff trainings.
- Offer cross-training opportunities to enhance knowledge of trauma-informed processes throughout the system.

demonstrates that immediate gains in counselor knowledge and skills diminish quickly after the training event (Martino, Canning-Ball, Carroll, & Rounsaville, 2011). Consequently, organizations may be spending their scarce financial resources on sending counselors to this kind of training but may not be reaping adequate returns with regard to long-lasting changes in counselor skills and the development of trauma-informed and trauma-specific counselor competencies. Hoge et al. (2007) suggest the implementation of training strategies for behavioral health professionals that have proven to be effective in improving counselor skills, attitudes, and practice approaches. These strategies include: "interactive approaches; sequenced, longitudinal learning experiences; outreach visits, known as academic detailing; auditing of practice with feedback to the learner; reminders; the use of opinion leaders to influence practice; and patient-mediated interventions, such as providing information on treatment options to persons in recovery, which in turn influences the practice patterns of their providers" (p. 124).

Trauma-Informed Counselor Competencies

Hoge et al. (2007) identified a number of counselor competencies in behavioral health practices that are consistent with the skills needed to be effective in a trauma-informed system of care. They include person-centered planning, culturally competent care, development of therapeutic alliances, shared responsibility for decisions, collaboratively developed recovery plans, evidence-based practices, recovery- and resilience-oriented care, interdisciplinary- and team-based practice, and consumer/client advocacy. In addition, counselor competencies critical to the effective delivery of services to clients with trauma-related disorders include:

- Screening for and assessment of trauma history and trauma-related disorders, such as mood and anxiety disorders.
- Awareness of differences between trauma-informed and trauma-specific services.

- Understanding the bidirectional relationships among substance use and mental disorders and trauma.
- Engagement in person-centered counseling.
- Competence in delivering trauma-informed and trauma-specific evidence-based interventions that lessen the symptoms associated with trauma and improve quality of life for clients.
- Awareness of and commitment to counselor self-care practices that prevent or lessen the impact of secondary traumatization on behavioral health workers.

Exhibit 2.2-3 provides a checklist of competencies for counselors working in trauma-informed behavioral health settings. Administrators and clinical supervisors can use this checklist to assess behavioral health professionals' understanding of trauma awareness and counseling skills and determine the need for additional training and clinical supervision.

Counselor Responsibilities and Ethics

Treating all clients in an ethical manner is an expectation of all healthcare providers. It is of special importance when working with clients who have trauma-related disorders, as their trust in others may have been severely shaken. Counselors who work with traumatized individuals on a regular basis have special responsibilities to their clients because of the nature of this work. Administrators and clinical supervisors in trauma-informed organizations should develop policies that clearly define the counselors' job and should provide education about the role of counselors in the organization and their responsibilities to clients.

General Principles Regarding Counselor Responsibilities

The following are some general principles governing the responsibilities of counselors who provide behavioral health services for clients with histories of trauma:

- Counselors are responsible for routinely screening clients for traumatic experiences and trauma-related symptoms (Ouimette & Brown, 2003; see also Treatment Improvement Protocol [TIP] 42, *Substance Abuse Treatment for Persons With Co-Occurring Disorders*, Center for Substance Abuse Treatment [CSAT], 2005c).
- Counselors should offer clients with substance use and trauma-related disorders continuing mental health services if it is within their professional license and scope of practice to do so.
- Counselors are responsible for referring clients with substance use disorders and co-occurring trauma-related disorders to treatment that addresses both disorders when the treatment falls outside of the counselor's professional license and scope of practice (Ouimette & Brown, 2003).
- Counselors should refer clients with substance use disorders and co-occurring trauma-related disorders to concurrent participation in mutual-help groups if appropriate (Ouimette & Brown, 2003).
- Counselors have a responsibility to practice the principles of confidentiality in all interactions with clients and to respect clients' wishes not to give up their right to privileged communication.
- Counselors are responsible for educating clients about the limits of confidentiality and what happens to protected health information, along with the client's privilege, when the client signs a release of information or agrees to assign insurance benefits to the provider.
- Counselors must inform clients that treatment for trauma-related disorders is always voluntary.
- Counselors are responsible for being aware of their own secondary trauma and

Exhibit 2.2-3: Trauma-Informed Counselor Competencies Checklist

Trauma Awareness

___ Understands the difference between trauma-informed and trauma-specific services

___ Understands the differences among various kinds of abuse and trauma, including: physical, emotional, and sexual abuse; domestic violence; experiences of war for both combat veterans and survivors of war; natural disasters; and community violence

___ Understands the different effects that various kinds of trauma have on human development and the development of psychological and substance use issues

___ Understands how protective factors, such as strong emotional connections to safe and nonjudgmental people and individual resilience, can prevent and ameliorate the negative impact trauma has on both human development and the development of psychological and substance use issues

___ Understands the importance of ensuring the physical and emotional safety of clients

___ Understands the importance of not engaging in behaviors, such as confrontation of substance use or other seemingly unhealthy client behaviors, that might activate trauma symptoms or acute stress reactions

___ Demonstrates knowledge of how trauma affects diverse people throughout their lifespans and with different mental health problems, cognitive and physical disabilities, and substance use issues

___ Demonstrates knowledge of the impact of trauma on diverse cultures with regard to the meanings various cultures attach to trauma and the attitudes they have regarding behavioral health treatment

___ Demonstrates knowledge of the variety of ways clients express stress reactions both behaviorally (e.g., avoidance, aggression, passivity) and psychologically/emotionally (e.g., hyperarousal, avoidance, intrusive memories)

Counseling Skills

___ Expedites client-directed choice and demonstrates a willingness to work within a mutually empowering (as opposed to a hierarchical) power structure in the therapeutic relationship

___ Maintains clarity of roles and boundaries in the therapeutic relationship

___ Demonstrates competence in screening and assessment of trauma history (within the bounds of his or her licensing and scope of practice), including knowledge of and practice with specific screening tools

___ Shows competence in screening and assessment of substance use disorders (within the bounds of his or her licensing and scope of practice), including knowledge of and practice with specific screening tools

___ Demonstrates an ability to identify clients' strengths, coping resources, and resilience

___ Facilitates collaborative treatment and recovery planning with an emphasis on personal choice and a focus on clients' goals and knowledge of what has previously worked for them

___ Respects clients' ways of managing stress reactions while supporting and facilitating taking risks to acquire different coping skills that are consistent with clients' values and preferred identity and way of being in the world

___ Demonstrates knowledge and skill in general trauma-informed counseling strategies, including, but not limited to, grounding techniques that manage dissociative experiences, cognitive–behavioral tools that focus on both anxiety reduction and distress tolerance, and stress management and relaxation tools that reduce hyperarousal

(Continued on the next page.)

Exhibit 2.2-3: Trauma-Informed Counselor Competencies Checklist (continued)

___ Identifies signs of STS reactions and takes steps to engage in appropriate self-care activities that lessen the impact of these reactions on clinical work with clients

___ Recognizes when the needs of clients are beyond his or her scope of practice and/or when clients' trauma material activates persistent secondary trauma or countertransference reactions that cannot be resolved in clinical supervision; makes appropriate referrals to other behavioral health professionals

Source: Abrahams et al., 2010.

countertransference reactions and seeking appropriate help in responding to these reactions so that they do not interfere with the best possible treatment for clients.

TIC organizations have responsibilities to clients in their care, including:

- Protecting client confidentiality, particularly in relation to clients' trauma histories. Organizations should comply with the State and Federal laws that protect the confidentiality of clients being treated for mental and substance use disorders.
- Providing clients with an easy-to-read statement of their rights as consumers of mental health and substance abuse services, including the right to confidentiality (Exhibit 2.2-4).
- Providing quality clinical supervision to all counselors and direct-service workers, with an emphasis on TIC. Organizations should, at minimum, comply with State licensing requirements for the provision of clinical supervision to behavioral health workers.
- Establishing and maintaining appropriate guidelines and boundaries for client and counselor behavior in the program setting.
- Creating and maintaining a trauma-informed treatment environment that respects the clients' right to self-determination and need to be treated with dignity and respect.
- Maintaining a work environment that reinforces and supports counselor self-care.

All behavioral health professionals are responsible for abiding by professional standards of care that protect the client. Breaches of confidentiality, inappropriate conduct, and other violations of trust can do further harm to clients who already have histories of trauma. Many treatment facilities have a Client Bill of Rights (or a similar document) that describes the rights and responsibilities of both the counselors and the participants; it often is part of the orientation and informed consent process when a client enters treatment. However, simply reading and acknowledging the receipt of a piece of paper is not a substitute for the dialog that needs to happen in a collaborative therapeutic partnership. Administrators are responsible for providing clients with easy-to-read information describing counselor responsibilities and client rights. Clinical supervisors are responsible for helping counselors engage in a respectful dialog with clients about those rights and responsibilities as part of a comprehensive informed consent process.

Exhibit 2.2-4 is an excerpt from a Client Bill of Rights that outlines clients' right to confidentiality in plain language that is readable and easily understood.

Exhibit 2.2-4: Sample Statement of the Client's Right to Confidentiality From a Client Bill of Rights

Tri-County Mental Health Services is a trauma-informed mental health and substance abuse treatment agency in Maine. Below is a statement regarding clients' right to confidentiality and staff responsibility to protect that privilege; this statement is provided in a brochure outlining consumer rights that is easily accessible to service recipients at the agency and online.

Confidentiality

We will not give out information about you to anyone without your knowledge and permission. This includes written information from your record and verbal information from your providers. Additionally, we will not request any information about you without your knowledge and permission. A Release of Information Form allows you to say what information can be shared and with whom. You determine the length of time this is valid, up to one year.

Tri-County policies prevent any employee of the agency who does not have a direct need to know from having access to any information about you. The penalty for violation can include immediate dismissal.

Exceptions to this rule of confidentiality include times when a client is at immediate risk of harm to self or others, or when ordered by the court. We will make every effort to notify you in these instances.

Source: Tri-County Mental Health Services, 2008, pp. 6-7.

Ethics in Treating Traumatized Clients

All behavioral health professionals must conform to the ethical guidelines established by their profession's State licensing boards and/or certifying organizations. State licensing boards for substance abuse counseling, psychiatry, social work, psychology, professional counseling, and other behavioral health professions provide regulatory standards for ethical practice in these professions. These boards also have specific procedures for responding to complaints regarding the actions of professional caregivers. Additionally, national professional societies have standards for ethical practices. Members of these organizations are expected to practice within the boundaries and scope of these standards. Some of these standards are quite explicit, whereas others are more general; most approach professional ethics not as a rigid set of rules, but rather, as a process of making ethical decisions.

Clinical supervisors are responsible for informing counselors of their ethical responsibilities with regard to their own organization's policies and procedures, monitoring supervisees' reading and understanding the codes of ethics of professional organizations and State licensing boards, and promoting counselor understanding of ethics and how to make decisions ethically as a regular part of clinical supervision, team meetings, and counselor training. Administrators can support high ethical standards by creating an organization-wide ethics task group consisting of counselors, supervisors, and administrators who meet regularly to review and revise clinical policies in line with State and Federal law and professional codes of ethics. Administrators may also act as a support mechanism for counselors who need additional consultation regarding potential ethical dilemmas with clients. The Green Cross Academy of Traumatology provides ethical guidelines for the treatment of clients who have experienced trauma; these guidelines are adapted in Exhibit 2.2-5.

Exhibit 2.2-5: Green Cross Academy of Traumatology Ethical Guidelines for the Treatment of Clients Who Have Been Traumatized

Respect for the dignity of clients

- Recognize and value the personal, social, spiritual, and cultural diversity present in society, without judgment. As a primary ethical commitment, make every effort to provide interventions with respect for the dignity of those served.

Responsible caring

- Take the utmost care to ensure that interventions do no harm.
- Have a commitment to the care of those served until the need for care ends or the responsibility for care is accepted by another qualified service provider.
- Support colleagues in their work and respond promptly to their requests for help.
- Recognize that service to survivors of trauma can exact a toll in stress on providers. Maintain vigilance for signs in self and colleagues of such stress effects, and accept that dedication to the service of others imposes an obligation to sufficient self-care to prevent impaired functioning.
- Engage in continuing education in the appropriate areas of trauma response. Remain current in the field and ensure that interventions meet current standards of care.

Integrity in relationships

- Clearly and accurately represent your training, competence, and credentials. Limit your practice to methods and problems for which you are appropriately trained and qualified. Readily refer to or consult with colleagues who have appropriate expertise; support requests for such referrals or consultations from clients.
- Maintain a commitment to confidentiality, ensuring that the rights of confidentiality and privacy are maintained for all clients.
- Do not provide professional services to people with whom you already have either emotional ties or extraneous relationships of responsibility. The one exception is in the event of an emergency in which no other qualified person is available.
- Refrain from entering other relationships with present or former clients, especially sexual relationships or relationships that normally entail accountability.
- Within agencies, ensure that confidentiality is consistent with organizational policies; explicitly inform individuals of the legal limits of confidentiality.

Responsibility to society

- Be committed to responding to the needs generated by traumatic events, not only at the individual level, but also at the level of community and community organizations in ways that are consistent with your qualifications, training, and competence.
- Recognize that professions exist by virtue of societal charters in expectation of their functioning as socially valuable resources. Seek to educate government agencies and consumer groups about your expertise, services, and standards; support efforts by these agencies and groups to ensure social benefit and consumer protection.
- If you become aware of activities of colleagues that may indicate ethical violations or impairment of functioning, seek first to resolve the matter through direct expression of concern and offers of help to those colleagues. Failing a satisfactory resolution in this manner, bring the matter to the attention of the officers of professional societies and of governments with jurisdiction over professional misconduct.

Clients' universal rights

All clients have the right to:

- Not be judged for any behaviors they used to cope, either at the time of the trauma or after the trauma.
- Be treated at all times with respect, dignity, and concern for their well-being.
- Refuse treatment, unless failure to receive treatment places them at risk of harm to self or others.

(Continued on the next page.)

Exhibit 2.2-5: Academy of Traumatology Ethical Guidelines for the Treatment of Clients Who Have Been Traumatized (continued)

- Be regarded as collaborators in their own treatment plans.
- Provide their informed consent before receiving any treatment.
- Not be discriminated against based on race, culture, sex, religion, sexual orientation, socioeconomic status, disability, or age.
- Have promises kept, particularly regarding issues related to the treatment contract, role of counselor, and program rules and expectations.

Procedures for introducing clients to treatment

Obtain informed consent, providing clients with information on what they can expect while receiving professional services. In addition to general information provided to all new clients, clients presenting for treatment who have histories of trauma should also receive information on:

- The possible short-term and long-term effects of trauma treatment on the client and the client's relationships with others.
- The amount of distress typically experienced with any particular trauma treatment.
- Possible negative effects of a particular trauma treatment.
- The possibility of lapses and relapses when doing trauma work, and the fact that these are a normal and expected part of healing.

Reaching counseling goals through consensus

Collaborate with clients in the design of a clearly defined contract that articulates a specific goal in a specific time period or a contract that allows for a more open-ended process with periodic evaluations of progress and goals.

Informing clients about the healing process

- Clearly explain to clients the nature of the healing process, making sure clients understand.
- Encourage clients to ask questions about any and all aspects of treatment and the therapeutic relationship. Provide clients with answers in a manner they can understand.
- Encourage clients to inform you if the material discussed becomes overwhelming or intolerable.
- Inform clients of the necessity of contacting you or emergency services if they feel suicidal or homicidal, are at risk of self-injury, or have a sense of being out of touch with reality.
- Give clients written contact information about available crisis or emergency services.
- Inform clients about what constitutes growth and recovery and about the fact that some trauma symptoms may not be fully treatable.
- Address unrealistic expectations clients may have about counseling and/or the recovery process.

Level of functioning

- Inform clients that they may not be able to function at the highest level of their ability—or even at their usual level—when working with traumatic material.
- Prepare clients to experience trauma-related symptoms, such as intrusive memories, dissociative reactions, reexperiencing, avoidance behaviors, hypervigilance, or unusual emotional reactivity.

Boundaries in therapeutic relationships

Maintaining appropriate therapeutic boundaries is a primary ethical concern for behavioral health professionals. Counselors working with clients who have substance use, trauma-related, and other mental disorders may feel challenged at times to maintain boundaries that create a safe therapeutic container. Some clients, especially those with longstanding disorders, bring a history of client–counselor relationships to counseling. Clients who have been traumatized may need help understanding the roles and responsibilities of both the counselor and the client. Clients with trauma-related conditions may also have special needs

Advice to Clinical Supervisors: Recognizing Boundary Confusion

Clinical supervisors should be aware of the following counselor behaviors that can indicate boundary confusion with clients:

- The counselor feels reluctant or embarrassed to discuss specific interactions with a client or details of the client's treatment in supervision or team meetings.
- The counselor feels possessive of the client, advocates with unusual and excessive vehemence for the client, or expresses an unreasonable sense of overresponsibility for the client.
- The counselor becomes defensive and closed to hearing ideas from the supervisor or the treatment team members about approaches to working with a client and/or exploring his or her own emotional reactions to a client.
- The clinician begins or increases personal self-disclosure to the client and is not able to identify legitimate clinical reasons for the self-disclosure.

in establishing appropriate boundaries in the counseling setting; they may be particularly vulnerable and not understand or appreciate the need for professional boundaries, including not engaging in dual relationships. For example, some clients might experience a counselor's boundary around not giving the client his or her personal phone number for emergency calls as a rejection or abandonment. Cultural considerations also influence therapeutic boundaries.

Administrators, in collaboration with clinical supervisors, are responsible for creating policies regarding counselor and client boundaries for various issues (e.g., giving and receiving gifts, counselor personal disclosure, and counselor roles and responsibilities when attending the same 12-Step meetings as clients); policies should be specific to their organization and conform to State and Federal law and behavioral health professional codes of ethics. Clinical supervisors are responsible for training counselors in the informed consent process and effective ways to discuss boundaries with clients when they enter treatment.

Guidelines for establishing and maintaining boundaries in therapeutic relationships, adapted from the Green Cross Academy of Traumatology, are given in Exhibit 2.2-6.

Clients with trauma histories may be especially vulnerable to counselor behaviors that are inconsistent or that are experienced by the client as boundary violations. Examples of such behavior include: being late for appointments, ending counseling sessions early, repeatedly and excessively extending the session time, canceling or "forgetting" appointments multiple times, spending time in the session talking about their own needs and life experiences, exploring opportunities for contact outside the therapeutic relationship (including making arrangements to meet at AA or other 12-Step recovery group meetings), and enforcing rules differently for one client than for another.

Due to the complex dynamics that can arise in the treatment of clients with trauma histories, regularly scheduled clinical supervision, where issues of ethics and boundaries can be discussed, is recommended for counselors. For more information on how clinical supervision can be effectively used, see TIP 52, *Clinical Supervision and the Professional Development of the Substance Abuse Counselor* (CSAT, 2009b).

Boundary crossing and boundary violation

Although guidelines and codes of ethics are useful tools in helping clinical supervisors and counselors understand the boundaries between counselors and clients, they are open to interpretation and are context-bound. Given these limitations, it is crucial to educate counselors

Exhibit 2.2-6: Boundaries in Therapeutic Relationships

Procedures for Establishing Safety

Roles and boundaries
Counselor roles and boundaries should be established at the start of the counseling relationship and reinforced periodically, particularly at times when the client is experiencing high stress.

Ongoing Relationships and the Issue of Boundaries

Dual relationships
Dual relationships and inappropriate interactions with clients are to be avoided. It is important to tell clients at the beginning of counseling that contact between the counselor and the client can only occur within the boundaries of the professional relationship. This information is part of the informed consent process. Relationships outside these boundaries include sexual or romantic relationships, a counselor also serving as a client's sponsor in 12-Step programs, and any kind of relationship in which the counselor exploits the client for financial gain.

Sexual contact
- Never engage in any form of sexual contact with clients.
- Do not reward sexualized behaviors with attention or reactivity.
- Directly clarify the boundaries of the therapeutic relationship, and address the underlying motivations of persisting sexualized behavior.
- Set limits on a client's inappropriate behaviors while maintaining an ethos of care. Maintain respect for the dignity and worth of the client at all times.
- Understand that a client's attempt to sexualize a therapeutic relationship may reflect an early history of abuse, difficulty understanding social norms, or a variety of psychological problems.
- Readdress the absolute inappropriateness of sexual and/or romantic behavior in a nonlecturing, nonpunitive manner.
- If sexual behavior between clients occurs in a treatment program, counselors should consult with a clinical supervisor. Document the nature of the contact and how the issue is addressed.
- If a counselor has sexual contact with a client, he or she should take responsibility by ceasing counseling practice, referring clients to other treatment providers, and notifying legal and professional authorities. If a counselor is at risk for engaging with a client sexually but has not acted on it, the counselor should immediately consult with a supervisor, colleague, or psychotherapist.

Boundaries
Counselors should use care with self-disclosure or any behaviors that may be experienced as intrusive by the client, including:
- Personal disclosures made for the counselor's own gratification.
- Sexualized behavior with the client.
- Excessively intrusive questions or statements.
- Interrupting the client frequently.
- Violating the client's personal space.
- Interpersonal touch, which might activate intrusive memories or dissociative reactions or be experienced as a boundary violation by the client.
- Being consistently late for appointments or allowing outside influences (such as telephone calls) to interrupt the client's time in a counseling session.

Source: Green Cross Academy of Traumatology, 2007. Adapted with permission.

in TIC settings regarding the boundary issues that may arise for clients who have been traumatized and to give counselors a conceptual framework for understanding the contextual nature of boundaries. For example, it would be useful for clinical supervisors to discuss with

counselors the distinction between boundary crossings and boundary violations in clinical practice. Gutheil and Brodsky (2008) define boundary crossing as a departure from the customary norms of counseling practice in relation to psychological, physical, or social space "that are harmless, are nonexploitative, and may even support or advance the therapy" (p. 20). Examples of boundary crossings include taking phone calls from a client between sessions if the client is in crisis or telling a client a story about the counselor's recovery from trauma (without offering specific personal information or graphic/detailed description of the trauma) with the intention of offering hope that it is possible to recover.

Gutheil and Brodsky (2008) define boundary violations as boundary crossings that are unwanted and dangerous and which exploit the client, stating that "some boundary crossings are inadvisable because of their intent (i.e., they are not done in the service of the patient's well-being and growth, involve extra therapeutic gratification for the therapist) and/or their effect (i.e., they are not likely to benefit the patient and entail a significant risk of harming the patient)" (pp. 20–21). An example of a boundary violation would be when a counselor invites a client to attend the same AA meetings the counselor attends or shares drinking and drugging "war stories" for the counselor's own gratification. Two key elements in understanding when a boundary crossing becomes a boundary violation are the intent of the counselor and the damaging effect on the client. Maintaining a standard of practice of nonexploitation of the client is the primary focus for clinical supervisors and counselors in determining when boundary crossings become boundary violations.

Context is also an important consideration in determining the acceptability of boundary crossings. For example, it may be acceptable for a counselor in a partial hospitalization program for serious mental illness to have a cup of coffee at the kitchen table with a resident, whereas for a counselor in an outpatient mental health program, having a cup of coffee with a client at the local coffee shop would be a much more questionable boundary crossing.

Case Illustration: Denise

Denise is a 40-year-old licensed professional counselor working in an inpatient eating disorder program. She has had extensive training in trauma and eating disorder counseling approaches and has been working as a clinician in mental health settings for 15 years. Denise is usually open to suggestions from her supervisor and other treatment team members about specific strategies to use with clients who have trauma histories and eating disorders. However, in the past week, her supervisor has noticed that she has become defensive in team meetings and individual supervision when discussing a recently admitted young adult who was beaten and raped by her boyfriend; subsequently, the client was diagnosed with PTSD and anorexia. When the clinical supervisor makes note of the change in Denise's attitude and behavior in team meetings since this young woman was admitted, initially Denise becomes defensive, saying that the team just doesn't understand this young woman and that the client has repeatedly told Denise, "You're the only counselor I trust."

The clinical supervisor recognizes that Denise may be experiencing secondary traumatization and boundary confusion due to working with this young woman and to the recent increase in the number of clients with co-occurring trauma-related disorders on her caseload. After further exploration, Denise reveals that her own daughter was raped at the same age as the young woman and that hearing her story has activated an STS reaction in Denise. Her way of coping has been to become overly responsible for and overprotective of the young woman. With the nonjudgmental support of her supervisor, Denise is able to gain perspective, recognize that this young woman is not her daughter, and reestablish boundaries with her that are appropriate to the inpatient treatment setting.

Clinical Supervision and Consultation

Organizational change toward a TIC model doesn't happen in isolation. Ongoing support, supervision, and consultation are key ingredients that reinforce behavioral health professionals' training in trauma-informed and trauma-specific counseling methods and ensure compliance with practice standards and consistency over time. Often, considerable energy and resources are spent on the transition to new clinical and programmatic approaches, but without long-range planning to support those changes over time. The new treatment approach fades quickly, making it hard to recognize and lessening its reliability.

Advice to Clinical Supervisors and Administrators: Adopting an Evidence-Based Model of Clinical Supervision and Training

Just as adopting evidence-based clinical practices in a trauma-informed organization is important in providing cost-effective and outcome-relevant services to clients, adopting an evidence-based model of clinical supervision and training clinical supervisors in that model can enhance the quality and effectiveness of clinical supervision for counselors. This will ultimately enhance client care.

One of the most commonly used and researched integrative models of supervision is the discrimination model, originally published by Janine Bernard in 1979 and since updated (Bernard & Goodyear, 2009). This model is considered a competence-based and social role model of supervision; it includes three areas of focus on counselor competencies (intervention, conceptualization, and personalization) and three possible supervisor roles (teacher, counselor, and consultant).

Counselor competencies:

- Intervention: The supervisor focuses on the supervisee's intervention skills and counseling strategies used with a particular client in a given session.
- Conceptualization: The supervisor focuses on how the supervisee understands what is happening in a session with the client.
- Personalization: The supervisor focuses on the personal style of the counselor and countertransference responses (i.e., personal reactions) of the counselor to the client.

Supervisor roles:

- Teacher: The supervisor teaches the supervisee specific counseling theory and skills and guides the supervisee in the use of specific counseling strategies in sessions with clients. The supervisor as teacher is generally task-oriented. The supervisor is more likely to act as a teacher with beginning counselors.
- Counselor: The supervisor does not act as the counselor's therapist, but helps the counselor reflect on his or her counseling style and personal reactions to specific clients. The supervisor as counselor is interpersonally sensitive and focuses on the process and relational aspects of counseling.
- Consultant: The supervisor is more of a guide, offering the supervisee advice on specific clinical situations. The supervisor as consultant invites the counselor to identify topics and set the agenda for the supervision. The supervisor is more likely to act as a consultant with more advanced counselors.

This model of supervision may be particularly useful in working with counselors in TIC settings, because the supervisor's response to the supervisee is flexible and specific to the supervisee's needs. In essence, it is a counselor-centered model of supervision in which the supervisor can meet the most relevant needs of the supervisee in any given moment.

For a review of other theories and methods of clinical supervision, refer to TIP 52, *Clinical Supervision and Professional Development of the Substance Abuse Counselor* (CSAT, 2009b).

Ongoing supervision and consultation supports the organizational message that TIC is the standard of practice. It normalizes secondary traumatization as a systemic issue (not the individual pathology of the counselor) and reinforces the need for counselor self-care to prevent and lessen the impact of secondary traumatization. Quality clinical supervision for direct care staff demonstrates the organization's commitment to implementing a fully integrated, trauma-informed system of care.

Supervision and Consultation

Historically, there was an administrative belief that counselors who had extensive clinical experience and training would naturally be the best clinical supervisors. However, research does not support this idea (Falender & Shafranske, 2004). Although a competent clinical supervisor needs to have an extensive clinical background in the treatment of substance use, trauma-related, and other mental disorders, it is also essential for any counselor moving into a supervisory role to have extensive training in the theory and practice of clinical supervision before taking on this role. In particular, clinical supervisors in trauma-informed behavioral health settings should be educated in how to perform clinical supervision (not just administrative supervision) of direct service staff and in the importance of providing continuous clinical supervision and support for staff members working with individuals affected by trauma. Clinical

Case Illustration: Arlene

Arlene is a 50-year-old licensed substance abuse counselor who has a personal history of trauma, and she is actively engaged in her own recovery from trauma. She is an experienced counselor who has several years of training in trauma-informed and trauma-specific counseling practices. Her clinical supervisor, acting in the role of consultant, begins the supervision session by inviting her to set the agenda. Arlene brings up a clinical situation in which she feels stuck with a client who is acting out in her Seeking Safety group (for more information on Seeking Safety, see Najavits, 2002a).

Arlene reports that her client gets up suddenly and storms out of the group room two or three times during the session. The supervisor, acting in the role of the counselor and focusing on personalization, asks Arlene to reflect on the client's behavior and what feelings are activated in her in response to the client's anger. Arlene is able to identify her own experience of hyperarousal and then paralysis as a stress reaction related to her prior experience of domestic violence in her first marriage. The supervisor, acting in the role of teacher and focusing on conceptualization, reminds Arlene that her client is experiencing a "fight-or-flight" response to some experience in the group that reminds her of her own trauma experience. The supervisor then suggests to Arlene that her own reactions are normal responses to her previous history of trauma, and that when her client is angry, Arlene is not reexperiencing her own trauma but is being activated by the client's traumatic stress reaction to being in group. In this way, the supervisor highlights the parallel process of the client–counselor's stress reactions to a perceived threat based on prior trauma experiences.

The supervisor, acting again as a consultant and focusing on personalization this time, invites Arlene to reflect on the internal and external resources she might be able to bring to this situation that will help remind her to ground herself so she can lessen the impact of her stress reactions on her counseling strategy with this client. Arlene states that she can create a list of safe people in her life and place this list in her pocket before group. She can use this list as a touchstone to remind her that she is safe and has learned many recovery skills that can help her stay grounded, maintain her boundaries, and deal with her client's behavior. The clinical supervisor, acting as a consultant and now focusing on intervention, asks Arlene if she has some specific ideas about how she can address the client's behavior in group. Arlene and the clinical supervisor spend the remainder of the session discussing different options for addressing the client's behavior and helping her feel safer in group.

supervision in a TIC organization should focus on the following priorities:

- General case consultation
- Specialized consultation in specific and unusual cases
- Opportunities to process clients' traumatic material
- Boundaries in the therapeutic and supervisory relationship
- Assessment of secondary traumatization
- Counselor self-care and stress management
- Personal growth and professional development of the counselor

Supervision of counselors working with traumatized clients should be regularly scheduled, with identified goals and with a supervisor who is trained and experienced in working with trauma survivors. The styles and types of supervision and consultation may vary according to the kind of trauma work and its context. For instance, trauma counseling in a major natural disaster would require a different approach to supervision and consultation than would counseling adults who experienced childhood developmental trauma or counseling clients in an intensive early recovery treatment program using a manualized trauma-specific counseling protocol.

Competence-based clinical supervision is recommended for trauma-informed organizations. Competence-based clinical supervision models identify the knowledge and clinical skills each counselor needs to master, and they use targeted learning strategies and evaluation procedures, such as direct observation of counselor sessions with clients, individualized coaching, and performance-based feedback. Studies on competence-based supervision approaches have demonstrated that these models improve counselor treatment skills and proficiency (Martino et al., 2011).

Whichever model of clinical supervision an organization adopts, the key to successful trauma-informed clinical supervision is the recognition that interactions between the supervisor and the counselor may parallel those between the counselor and the client. Clinical supervisors need to recognize counselors' trauma reactions (whether they are primary or secondary to the work with survivors of trauma) and understand that a confrontational or punitive approach will be ineffective and likely retraumatize counselors.

Clinical supervisors should adopt a respectful and collaborative working relationship with counselors in which role expectations are clearly defined in an informed consent process similar to that used in the beginning of the counselor–client relationship and in which exploring the nature of boundaries in both client–counselor and counselor–supervisor relationships is standard practice. Clear role boundaries, performance expectations, open dialog, and supervisor transparency can go a long way toward creating a safe and respectful relationship container for the supervisor and supervisee and set the stage for a mutually enhancing, collaborative relationship. This respectful, collaborative supervisory relationship is the main source of training and professional growth for the counselor and for the provision of quality care to people with behavioral health disorders.

Secondary Traumatization

The demands of caregiving exact a price from behavioral health professionals that cannot be ignored; otherwise, they may become ineffective in their jobs or, worse, emotionally or psychologically impaired. In a study of Master's level licensed social workers, 15.2 percent of respondents to a survey reported STS as a result of indirect exposure to trauma material at a level that meets the diagnostic criteria for PTSD. This rate is almost twice the rate of PTSD in the general population. The author

STS is a trauma related stress reaction and set of symptoms resulting from exposure to another individual's traumatic experiences rather than from exposure directly to a traumatic event.

concluded that behavioral health professionals' experience of STS is a contributing factor in staff turnover and one reason why many behavioral health service professionals leave the field (Bride, 2007). Secondary traumatization of behavioral health workers is a significant organizational issue for clinical supervisors and administrators in substance abuse and mental health treatment programs to address.

To prevent or lessen the impact of secondary traumatization on behavioral health professionals, clinical supervisors and administrators need to understand secondary trauma from the ecological perspective described in Part 1, Chapter 1 of this TIP. The organization itself creates a social context with risk factors that can increase the likelihood of counselors experiencing STS reactions, but it also contains protective factors that can lessen the risk and impact of STS reactions on staff members. Organizations can lessen the impact of the risk factors associated with working in trauma-informed organizations by mixing caseloads to contain clients both with and without trauma-related issues, supporting ongoing counselor training, providing regular clinical supervision, recognizing counselors' efforts, and offering an empowering work environment in which counselors share in the responsibility of making decisions and can offer input into clinical and program policies that affect their work lives.

When organizations support their counselors in their work with clients who are traumatized, counselors can be more effective, more productive, and feel greater personal and professional satisfaction. In addition, counselors develop a sense of allegiance toward the organization, thus decreasing staff turnover. If organizations do not provide this support, counselors can become demoralized and have fewer emotional and psychological resources to manage the impact of clients' traumatic material and outward behavioral expressions of trauma on their own well-being. Providing counselors with the resources to help them build resilience and prevent feeling overwhelmed should be a high priority for administrators and clinical supervisors in TIC organizations.

Risk and Protective Factors Associated With Secondary Traumatization

Clinical and research literature on trauma describes a number of factors related to the development of secondary trauma reactions and psychological distress in behavioral health professionals across a wide range of practice settings, as well as individual and organizational factors that can prevent or lessen the impact of STS on staff. The risk and protective factors model of understanding secondary trauma is based on the ecological perspective

Advice to Clinical Supervisors: Recognizing Secondary Traumatization

Some counselor behaviors that demonstrate inconsistency to clients may be outward manifestations of secondary traumatization, and they should be discussed with counselors through a trauma-informed lens. It is imperative that clinical supervisors provide a nonjudgmental, safe context in which counselors can discuss these behaviors without fear of reprisal or reprimand. Clinical supervisors should work collaboratively with supervisees to help them understand their behavior and engage in self-care activities that lessen the stress that may be contributing to these behaviors.

outlined in Part 1, Chapter 1 of this TIP. The terms "compassion fatigue," "vicarious traumatization," "secondary traumatization," and "burnout" are used in the literature, sometimes interchangeably and sometimes as distinct constructs. As stated in the terminology portion of the "How This TIP Is Organized" section that precedes Part 1, Chapter 1, of this TIP, the term "secondary traumatization" refers to traumatic stress reactions and psychological distress from exposure to another individual's traumatic experiences; this term will be used throughout this section, although the studies cited may use other terms.

Risk factors

Individual risk factors that may contribute to the development of STS in behavioral health professionals include preexisting anxiety or mood disorders; a prior history of personal trauma; high caseloads of clients with trauma-related disorders; being younger in age and new to the field with little clinical experience or training in treating trauma-related conditions; unhealthy coping styles, including distancing and detachment from clients and co-workers; and a lack of tolerance for strong emotions (Newall & MacNeil, 2010). Other negative coping strategies include substance abuse, other addictive behaviors, a lack of recreational activities not related to work, and a lack of engagement with social support. A recent study of trauma nurses found that low use of support systems, use of substances, and a lack of hobbies were among the coping strategies that differed between nurses with and without STS (Von Rueden et al., 2010). Other researchers found that clinicians who engaged in negative coping strategies, such as alcohol and illicit drug use, were more likely to experience intrusive trauma symptoms (Way, Van Deusen, Martin, Applegate, & Janle, 2004).

Numerous organizational factors can contribute to the development of STS in counselors who work with clients with trauma-related disorders. These risk factors include organizational constraints, such as lack of resources for clients, lack of clinical supervision for counselors, lack of support from colleagues, and lack of acknowledgment by the organizational culture that secondary traumatization exists and is a normal reaction of counselors to client trauma (Newall & MacNeil, 2010). In a study of 259 individuals providing mental health counseling services, counselors who spent more time in session with clients with trauma-related disorders reported higher levels of traumatic stress symptoms (Bober & Regehr, 2006). Counselors may be more at risk for developing secondary traumatization if the organization does not allow for balancing the distribution of trauma and nontrauma cases amongst staff members.

Protective factors

Much of the clinical and research literature focuses on individual factors that may lessen the impact of STS on behavioral health professionals, including male gender, being older, having more years of professional experience,

Advice to Clinical Supervisors: Recognizing STS in Counselors Who Are In Recovery

For counselors who are in recovery from a substance use or mental disorder, the development of STS may be a potential relapse concern. As Burke, Carruth, and Prichard (2006) point out, "a return to drinking or illicit drug use as a strategy for dealing with secondary trauma reactions would have a profoundly detrimental effect on the recovering counselor" (p. 292). So too, secondary trauma may ignite the reappearance of depressive or anxiety symptoms associated with a previous mental disorder. Clinical supervisors can address these risk factors with counselors and support them in engaging with their own recovery support network (which might include a peer support group or an individual counselor) to develop a relapse prevention plan.

having specialized training in trauma-informed and trauma-specific counseling practices, lacking a personal trauma history, exhibiting personal autonomy in the workplace, using positive personal coping styles, and possessing resilience or the ability to find meaning in stressful life events and to rebound from adversity (Sprang, Clark, & Whitt-Woosley, 2007). Some of these factors, like positive personal coping styles and the ability to find meaning in adversity, can be developed and enhanced through personal growth work, psychotherapy, engagement with spiritual practices and involvement in the spiritual community, and stress reduction strategies like mindfulness meditation. A recent multimethod study of an 8-week workplace mindfulness training group for social workers and other social service workers found that mindfulness meditation increased coping strategies, reduced stress, and enhanced self-care of the participants; findings suggested that workers were more likely to practice stress management techniques like mindfulness at their place of work than at home (McGarrigle & Walsh, 2011). Organizations can support counselors' individual efforts to enhance positive personal coping styles, find meaning in adversity, and reduce stress by providing time for workers during the workday for personal self-care activities, like mindfulness meditation and other stress reduction practices.

One of the organizational protective factors identified in the literature that may lessen the negative impact of secondary traumatization on behavioral health professionals is providing adequate training in trauma-specific counseling strategies, which increases providers' sense of efficacy in helping clients with trauma-related disorders and reduces the sense of hopelessness that is often a part of the work (Bober & Regehr 2006). One study found that specialized trauma training enhanced job satisfaction and reduced levels of compassion fatigue, suggesting that "knowledge and training might provide some protection against the deleterious effects of trauma exposure" (Sprang et al., 2007, p. 272). Another protective factor that may lessen the chances of developing secondary traumatization is having a diverse caseload of clients. Organizations "must determine ways of distributing workload in order to limit the traumatic exposure of any one worker. This may not only serve to reduce the impact of immediate symptoms but may also address the potential longitudinal effects" (Bober & Regehr, 2006, p. 8).

Emotional support from professional colleagues can be a protective factor. A study of substance abuse counselors working with clients who were HIV positive found that workplace support from colleagues and supervisors most effectively prevented burnout (Shoptaw, Stein, & Rawson, 2000). This support was associated with less emotional fatigue and depersonalization, along with a sense of greater personal accomplishment. In a study of domestic violence advocates, workers who received more support from professional peers were less likely to experience secondary traumatization (Slattery & Goodman, 2009).

In addition, counselor engagement in relationally based clinical supervision with a trauma-informed supervisor acts as a protective agent. Slattery and Goodman (2009) note that "for the trauma worker, good supervision can normalize the feelings and experiences, provide support and information about the nature and course of the traumatic reaction, help in the identification of transference and countertransference issues, and reveal feelings or symptoms associated with the trauma" (p. 1362). Workers who reported "engaging, authentic, and empowering relationships with their supervisors" were less likely to experience STS (p. 1369). Thus, it is not simply the frequency and regularity of clinical supervision,

but also the quality of the supervision and the quality of the supervisor–counselor relationship that can lessen the impact of STS on behavioral health professionals.

Engagement with a personal practice of spirituality that provides a sense of connection to a larger perspective and meaning in life is another protective factor that can lessen the impact of STS on counselors (Trippany, Kress, & Wilcoxon, 2004). Although recovering counselors may look to support groups for connection to a spiritual community, other behavioral health professionals might find support for enhancing spiritual meaning and connection in church, a meditation group, creative endeavors, or even volunteer work. The key is for counselors to develop their own unique resources and practices to enhance a sense of meaningful spirituality in their lives. Clinical supervisors should be aware of spiritual engagement as a protective factor in preventing and lessening the impact of STS and should support clinicians in including it in their self-care plans, but they should take care not to promote or reject any particular religious belief system or spiritual practice.

Another protective factor that may lessen the impact of workers' STS is a culture of empowerment in the organization that offers counselors a sense of autonomy, a greater ability to participate in making decisions about clinical and organizational policies, and obtaining support and resources that further their professional development. Slattery & Goodman (2009) surveyed 148 domestic violence advocates working in a range of settings. The authors found that those workers "who reported a high level of shared power were less likely to report posttraumatic stress symptoms, despite their own personal abuse history or degree of exposure to trauma" (p. 1370). To the degree that organizations can provide a cultural context within which behavioral health professionals have autonomy and feel empowered, they will be able to lessen the impact of STS on their professional and personal lives. Self-efficacy and empowerment are antidotes to the experience of powerlessness that often accompanies trauma.

Strategies for Preventing Secondary Traumatization

The key to prevention of secondary traumatization for behavioral health professionals in a trauma-informed organization is to reduce risk and enhance protective factors. Organizational strategies to prevent secondary traumatization include:

- Normalize STS throughout all levels of the organization as a way to help counselors feel safe and respected, enhancing the likelihood that they will talk openly about their experiences in team meetings, peer supervision, and clinical supervision.
- Implement clinical workload policies and practices that maintain reasonable standards for direct-care hours and emphasize balancing trauma-related and nontrauma-related counselor caseloads.
- Increase the availability of opportunities for supportive professional relationships by promoting activities such as team meetings, peer supervision groups, staff retreats, and counselor training that focuses on understanding secondary traumatization and self-care. Administrators and clinical supervisors should provide time at work for counselors to engage in these activities.
- Provide regular trauma-informed clinical supervision that is relationally based. Supervisors should be experienced and trained in trauma-informed and trauma-specific practices and provide a competence-based model of clinical supervision that promotes counselors' professional and personal development. Supervision limited to case consultation or case management is insufficient to

reduce the risk for secondary traumatization and promote counselor resilience.

- Provide opportunities for behavioral health professionals to enhance their sense of autonomy and feel empowered within the organization. Some of these activities include soliciting input from counselors on clinical and administrative policies that affect their work lives, including how to best balance caseloads of clients with and without histories of trauma; inviting representatives of the counseling staff to attend selected agency board of directors and/or management team meetings to offer input on workforce development; and inviting counselors to participate in organizational task forces that develop trauma-informed services, plan staff retreats, or create mechanisms to discuss self-care in team meetings. Administrators and clinical supervisors should assess the organization's unique culture and develop avenues for counselor participation in activities that will enhance their sense of empowerment and efficacy within the organization.

Exhibit 2.2-7 highlights some specific strategies that individual counselors can engage in to prevent secondary traumatization.

Assessment of Secondary Traumatization

Counselors with unacknowledged STS can harm clients, self, and family and friends by becoming unable to focus on and attend to their needs or those of others. They may feel helpless or cynical and withdraw from support systems. Exhibit 2.2-8 describes some emotional, cognitive, and behavioral signs that may indicate that a counselor is experiencing secondary traumatization. Clinical supervisors should be familiar with the manifestations of STS in their counselors and should address signs of STS immediately.

Stamm (2009–2012) has developed and revised a self-assessment tool, the Professional Quality of Life Scale (ProQOL), that measures indicators of counselor compassion fatigue and compassion satisfaction. Compassion fatigue "is best defined as a syndrome consisting of a combination of the symptoms

Exhibit 2.2-7: Counselor Strategies To Prevent Secondary Traumatization

Strategies that counselors can use (with the support and encouragement of supervisors and administrators) to prevent secondary traumatization include:

- ***Peer support*:** Maintaining adequate social support, both personally and professionally, helps prevent isolation and helps counselors share the emotional distress of working with traumatized individuals.
- ***Supervision and consultation*:** Professional consultation will help counselors understand secondary traumatization, their own personal risks, the protective factors that can help them prevent or lessen its impact, and their countertransference reactions to specific clients.
- ***Training*:** Ongoing professional training can improve counselors' understanding of trauma and enhance a sense of mastery and self-efficacy in their work.
- ***Personal psychotherapy or counseling*:** Being in counseling can help counselors become more self-aware and assist them in managing the psychological and emotional distress that often accompanies working with clients who have trauma histories in a number of behavioral health settings.
- ***Maintaining balance in one's life*:** Balancing work and personal life, developing positive coping styles, and maintaining a healthy lifestyle can enhance resilience and the ability to manage stress.
- ***Engaging in spiritual activities that provide meaning and perspective*:** Connection to a spiritual community and spiritual practices (such as meditation) can help counselors gain a larger perspective on trauma and enhance resilience.

Exhibit 2.2-8: Secondary Traumatization Signs

The following are some indicators that counselors may be experiencing secondary traumatization.

Psychological distress
- Distressing emotions: grief, depression, anxiety, dread, fear, rage, shame
- Intrusive imagery of client's traumatic material: nightmares, flooding, flashbacks of client disclosures
- Numbing or avoidance: avoidance of working with client's traumatic material
- Somatic issues: sleep disturbances, headaches, gastrointestinal distress, heart palpitations, chronic physiological arousal
- Addictive/compulsive behaviors: substance abuse, compulsive eating, compulsive working
- Impaired functioning: missed or canceled appointments, decreased use of supervision, decreased ability to engage in self-care, isolation and alienation

Cognitive shifts
- Chronic suspicion about others
- Heightened sense of vulnerability
- Extreme sense of helplessness or exaggerated sense of control over others or situations
- Loss of personal control or freedom
- Bitterness or cynicism
- Blaming the victim or seeing everyone as a victim
- Witness or clinician guilt if client reexperiences trauma or reenacts trauma in counseling
- Feeling victimized by client

Relational disturbances
- Decreased intimacy and trust in personal/professional relationships
- Distancing or detachment from client, which may include labeling clients, pathologizing them, judging them, canceling appointments, or avoiding exploring traumatic material
- Overidentification with the client, which may include a sense of being paralyzed by one's own responses to the client's traumatic material or becoming overly responsible for the client's life

Frame of reference
- Disconnection from one's sense of identity
- Dramatic change in fundamental beliefs about the world
- Loss or distortion of values or principles
- A previous sense of spirituality as comfort or resource decreases or becomes nonexistent
- Loss of faith in something greater
- Existential despair and loneliness

Sources: Figley, 1995; Newall & MacNeil, 2010; Saakvitne et al., 1996.

of secondary traumatic stress and professional burnout" (Newall & MacNeil, 2010, p. 61). Although secondary traumatization as a reaction to exposure to clients' trauma material is similar to PTSD, burnout is a more general type of psychological distress related to the pressures of working in high-stress environments over time. Burnout may be a result of secondary traumatization and/or a contributing factor in the development of secondary traumatization. The ProQOL includes STS and burnout scales that have been validated in research studies (Adams, Figley, & Boscarino, 2008; Newall & MacNeil, 2010).

This tool can be used in individual and group clinical supervision, trainings on self-care, and team meetings as a way for counselors to check in with themselves on their levels of stress and potential signs of secondary traumatization.

Case Illustration: Gui

Gui is a 48-year-old licensed substance abuse counselor who has worked in a methadone maintenance clinic for 12 years. He originally decided to get his degree and become a counselor because he wanted to help people and make a difference in the world. Over the past 6 months, he has felt fatigued a great deal, gets annoyed easily with both clients and coworkers, and has developed a cynical attitude about the world and the people who come to the clinic for help. During this time, the clinic has been forced to lay off a number of counselors due to funding cutbacks. As a result, Gui and the remaining counselors have had a 20 percent increase in the number of weekly client contact hours required as part of their job duties. In addition, the level and severity of clients' trauma-related and other co-occurring disorders, poverty, joblessness, and homelessness has increased.

Gui is a valued employee, and when Gui discusses his thoughts that he might want to leave the clinic with his clinical supervisor, the supervisor listens to Gui's concerns and explores the possibility of having him fill out the ProQOL to get a pulse on his stress level. Gui agrees and is willing to discuss the results with his supervisor. He is not surprised to see that he scores above average on the burnout scale of the instrument but is very surprised to see that he scores below average on the secondary traumatic stress scale and above average on the compassion satisfaction scale. He begins to feel more hopeful that he still finds satisfaction in his job and sees that he is resilient in many ways that he did not acknowledge before.

Gui and the clinical supervisor discuss ways that the supervisor and the organization can lessen the impact of the stress of the work environment on Gui and support the development of a self-care plan that emphasizes his own ability to rebound from adversity and take charge of his self-care.

The compassion satisfaction scale allows counselors to reflect on their resilience and reminds them of why they choose to work with people with substance use and trauma-related disorders, despite the fact that this work can lead to secondary traumatization. The compassion satisfaction subscale reminds counselors that they are compassionate, that one of the reasons they are in a helping profession is that they value service to others, and that helping brings meaning and fulfillment to their lives. Exhibits 2.2-9 through 2.2-11 present the most recent version of the ProQOL.

Addressing Secondary Traumatization

If a counselor is experiencing STS, the organization should address it immediately. Clinical supervisors can collaborate with counselors to devise an individualized plan that is accessible, acceptable, and appropriate for each counselor and that addresses the secondary stress reactions the counselor is experiencing, providing specific self-care strategies to counteract the stress. Decisions about strategies for addressing secondary traumatization should be based on the personal preferences of the counselor, the opportunity for an immediate intervention following a critical incident, and the counselor's level of awareness regarding his or her experience of STS. Counselors may need to talk about what they are experiencing, feeling, and thinking. These experiences can be processed in teams, in consultations with colleagues, and in debriefing meetings to integrate them effectively (Myers & Wee, 2002).

If a critical incident evokes secondary traumatization among staff—such as a client suicide, a violent assault in the treatment program, or another serious event—crisis intervention should be available for workers who would like to participate. Any intervention should be voluntary and tailored to each worker's individual needs (e.g., peer, group, or individual sessions); if possible, these services should be offered continuously instead of just one time.

Exhibit 2.2-9: PRoQOL Scale

COMPASSION SATISFACTION AND COMPASSION FATIGUE (PRoQOL) VERSION 5 (2009)

When you *[help]* people you have direct contact with their lives. As you may have found, your compassion for those you *[help]* can affect you in positive and negative ways. Below are some questions about your experiences, both positive and negative, as a *[helper]*. Consider each of the following questions about you and your current work situation. Select the number that honestly reflects how frequently you experienced these things in the *past 30 days*.

1=Never 2=Rarely 3=Sometimes 4=Often 5=Very Often

___ 1. I am happy.
___ 2. I am preoccupied with more than one person I *[help]*.
___ 3. I get satisfaction from being able to *[help]* people.
___ 4. I feel connected to others.
___ 5. I jump or am startled by unexpected sounds.
___ 6. I feel invigorated after working with those I *[help]*.
___ 7. I find it difficult to separate my personal life from my life as a *[helper]*.
___ 8. I am not as productive at work because I am losing sleep over traumatic experiences of a person I *[help]*.
___ 9. I think that I might have been affected by the traumatic stress of those I *[help]*.
___ 10. I feel trapped by my job as a *[helper]*.
___ 11. Because of my *[helping]*, I have felt "on edge" about various things.
___ 12. I like my work as a *[helper]*.
___ 13. I feel depressed because of the traumatic experiences of the people I *[help]*.
___ 14. I feel as though I am experiencing the trauma of someone I have *[helped]*.
___ 15. I have beliefs that sustain me.
___ 16. I am pleased with how I am able to keep up with *[helping]* techniques and protocols.
___ 17. I am the person I always wanted to be.
___ 18. My work makes me feel satisfied.
___ 19. I feel worn out because of my work as a *[helper]*.
___ 20. I have happy thoughts and feelings about those I *[help]* and how I could help them.
___ 21. I feel overwhelmed because my case [work] load seems endless.
___ 22. I believe I can make a difference through my work.
___ 23. I avoid certain activities or situations because they remind me of frightening experiences of the people I *[help]*.
___ 24. I am proud of what I can do to *[help]*.
___ 25. As a result of my *[helping]*, I have intrusive, frightening thoughts.
___ 26. I feel "bogged down" by the system.
___ 27. I have thoughts that I am a "success" as a *[helper]*.
___ 28. I can't recall important parts of my work with trauma victims.
___ 29. I am a very caring person.
___ 30. I am happy that I chose to do this work.

Exhibit 2.2-10: Your Scores on the ProQOL: Professional Quality of Life Screening

Based on your responses, place your personal scores below. If you have any concerns, you should discuss them with a physical or mental healthcare professional.

Compassion Satisfaction _____
Compassion satisfaction is about the pleasure you derive from being able to do your work well. For example, you may feel like it is a pleasure to help others through your work. You may feel positively about your colleagues or your ability to contribute to the work setting or even the greater good of society. Higher scores on this scale represent a greater satisfaction related to your ability to be an effective caregiver in your job.

The average score is 50 (SD 10; alpha scale reliability .88). About 25% of people score higher than 57 and about 25% of people score below 43. If you are in the higher range, you probably derive a good deal of professional satisfaction from your position. If your scores are below 40, you may either find problems with your job, or there may be some other reason—for example, you might derive your satisfaction from activities other than your job.

Burnout_____
Most people have an intuitive idea of what burnout is. From the research perspective, burnout is one of the elements of Compassion Fatigue (CF). It is associated with feelings of hopelessness and difficulties in dealing with work or in doing your job effectively. These negative feelings usually have a gradual onset. They can reflect the feeling that your efforts make no difference, or they can be associated with a very high workload or a non-supportive work environment. Higher scores on this scale mean that you are at higher risk for burnout.

The average score on the burnout scale is 50 (SD 10; alpha scale reliability .75). About 25% of people score above 57 and about 25% of people score below 43. If your score is below 43, this probably reflects positive feelings about your ability to be effective in your work. If you score above 57 you may wish to think about what at work makes you feel like you are not effective in your position. Your score may reflect your mood; perhaps you were having a "bad day" or are in need of some time off. If the high score persists or if it is reflective of other worries, it may be a cause for concern.

Secondary Traumatic Stress_____
The second component of Compassion Fatigue (CF) is secondary traumatic stress (STS). It is about your work related, secondary exposure to extremely or traumatically stressful events. Developing problems due to exposure to other's trauma is somewhat rare but does happen to many people who care for those who have experienced extremely or traumatically stressful events. For example, you may repeatedly hear stories about the traumatic things that happen to other people, commonly called Vicarious Traumatization. If your work puts you directly in the path of danger, for example, field work in a war or area of civil violence, this is not secondary exposure; your exposure is primary. However, if you are exposed to others' traumatic events as a result of your work, for example, as a therapist or an emergency worker, this is secondary exposure. The symptoms of STS are usually rapid in onset and associated with a particular event. They may include being afraid, having difficulty sleeping, having images of the upsetting event pop into your mind, or avoiding things that remind you of the event.

The average score on this scale is 50 (SD 10; alpha scale reliability .81). About 25% of people score below 43 and about 25% of people score above 57. If your score is above 57, you may want to take some time to think about what at work may be frightening to you or if there is some other reason for the elevated score. While higher scores do not mean that you do have a problem, they are an indication that you may want to examine how you feel about your work and your work environment. You may wish to discuss this with your supervisor, a colleague, or a healthcare professional.

The sum of my Compassion Satisfaction questions is	So my score equals	And my Compassion Satisfaction level is
22 or less	43 or less	Low
Between 23 and 41	Around 50	Average
42 or more	57 or more	High

Burnout Scale

On the burnout scale you will need to take an extra step. Starred items are "reverse scored." If you scored the item 1, write a 5 beside it. The reason we ask you to reverse the scores is because scientifically the measure works better when these questions are asked in a positive way though they can tell us more about their negative form. For example, question 1. "I am happy" tells us more about the effects of helping when you are *not* happy so you reverse the score.

The objective of debriefing a critical incident that evokes STS reactions in counselors is to help them dissipate the hyperarousal associated with traumatic stress and prevent long-term aftereffects that might eventually lead to counselor impairment. Because clinical supervisors may also be experiencing secondary traumatization, it is advisable for administrators to invite an outside trauma consultant into the organization to provide a safe space for all staff members (including clinical supervisors) to address and process the critical stress incident. For noncrisis situations, secondary traumatization should be addressed in clinical supervision. Clinical supervisors and counselors should work collaboratively to incorporate regular screening and self-assessment of STS into supervision sessions.

Advice to Clinical Supervisors: Advantages and Disadvantages of Using Psychometric Measures

Using a psychometric measure such as the ProQOL has advantages and disadvantages. It is important to understand that all tests measure averages and ranges but do not account for individual circumstances.

If you use the ProQOL in clinical supervision, present it as a self-assessment tool. Let counselors opt out of sharing their specific results with you and/or your team if it is administered in a group. If counselors choose to share scores on specific items or scales with you, work collaboratively and respectfully with them to explore their own understanding of and meanings attached to their scores. If this tool is not presented to supervisees in a nonjudgmental, mindful way, counselors may feel as if they have failed if their scores on the secondary traumatization scale are above average or if their scores on the compassion satisfaction scale are below average. High scores on the compassion fatigue and burnout scales do not mean that counselors don't care about their clients or that they aren't competent clinicians. The scores are simply one way for you and your supervisees to get a sense of whether they might be at risk for secondary traumatization, what they can do to prevent it, how to address it, and how you can support them.

The potential benefits of using a self-assessment tool like the ProQOL in clinical supervision are that it can help counselors:

- Reflect on their emotional reactions and behaviors and identify possible triggers for secondary traumatization.
- Assess their risk levels.
- Examine alternative coping strategies that may prevent secondary traumatization.
- Understand their own perceptions of themselves and their job satisfaction, affirming what they already know about their risk of secondary traumatization and their compassion satisfaction.
- Reflect on different factors that might contribute to unexpected low or high scores, such as the day of the week, the intensity of the workload, whether they have just come back from the weekend or a vacation, and so forth.
- Increase self-awareness and self-knowledge, because scores on specific items or scales bring to consciousness what is often outside of awareness.
- Realize how resilient they are emotionally, mentally, physically, and spiritually.
- Become aware of and open up conversations about self-care and self-care activities and resources, such as supportive coworkers, team members, and social networks outside of work.

If used regularly, self-assessment tools can help counselors and clinical supervisors monitor STS levels, indicate significant positive and negative changes, and suggest action toward self-care in specific areas. Clinical supervisors should fill out the ProQOL and review results with their own supervisors, a peer supervisor, or a colleague before administering it to supervisees. Doing so enables supervisors to gauge their own reactions to the self-assessment and anticipate potential reactions from supervisees.

Advice to Clinical Supervisors: Is it Supervision or Psychotherapy?

Although there are some aspects of clinical supervision that can be therapeutic and parallel the therapeutic and emotional support that occurs between the counselor and the client, clinical supervision is not therapy. As a result, it is important for clinical supervisors to maintain appropriate boundaries with supervisees when addressing their STS reactions at work.

When does the process in supervision cross over into the realm of practicing therapy with a supervisee? One clear indicator is if the supervisor begins to explore the personal history of the counselor and reflects directly on that history instead of bringing it back to how the counselor's history influences his or her work with a particular client or with clients with trauma histories in general. Clinical supervisors should focus only on counselor issues that may be directly affecting their clinical functioning with clients. If personal issues arise in clinical supervision, counselors should be encouraged to address them in their own counseling or psychotherapy.

Exhibit 2.2-12: Clinical Supervisor Guidelines for Addressing Secondary Traumatization

1. Engage counselors in regular screening/self-assessment of counselors' experience of STS.
2. Address signs of STS with counselors in clinical supervision.
3. Work collaboratively with counselors to develop a comprehensive self-care plan and evaluate its effectiveness on a regular basis.
4. Provide counselors a safe and nonjudgmental environment within which to process STS in individual and group supervision or team meetings.
5. Provide counselors with a safe and nonjudgmental place within which to debrief critical stress incidents at work; bring in an outside consultant if needed.
6. Support and encourage counselors to engage in individual counseling or psychotherapy, when needed, to explore personal issues that may be contributing to secondary traumatization at work.

When STS issues arise, the clinical supervisor should work with counselors to review and revise their self-care plans to determine what strategies are working and whether additional support, like individual psychotherapy or counseling, may be warranted.

Exhibit 2.2-12 outlines some guidelines for clinical supervisors in addressing secondary trauma in behavioral health professionals working with clients who have substance use, mental, and trauma-related disorders.

Counselor Self-Care

In light of the intensity of therapeutic work with clients with co-occurring substance use, mental, and trauma-related disorders and the vulnerability of counselors to secondary traumatization, a comprehensive, individualized self-care plan is highly recommended. Balance is the key to the development of a self-care plan—a balance between home and work, a balance between focusing on self and others, and a balance between rest and activity (Saakvitne, Perlman, & Traumatic Stress Institute/ Center for Adult & Adolescent Psychotherapy 1996). Counselor self-care is also about balancing vulnerability, which allows counselors to be present and available when clients address intensely painful content, with reasonable efforts to preserve their sense of integrity in situations that may threaten the counselors' faith or worldview (Burke et al., 2006). A comprehensive self-care plan should include activities that nourish the physical, psychological/mental, emotional/relational, and spiritual aspects of counselors' lives.

The literature on counselor self-care advocates for individual, team, and organizational strategies that support behavioral health professionals working with clients who have

Case Illustration: Carla

Carla is a 38-year-old case manager working in an integrated mental health and substance abuse agency. She provides in-home case management services to home-bound clients with chronic health and/or severe mental health and substance abuse problems. Many of her clients have PTSD and chronic, debilitating pain.

Both her parents had alcohol use disorders, and as a result, Carla became the caretaker in her family. She loves her job; however, she often works 50 to 60 hours per week and has difficulty leaving her work at work. She often dreams about her clients and wakes up early, feeling anxious. She sometimes has traumatic nightmares, even though she was never physically or sexually abused, and she has never experienced the trauma of violence or a natural disaster. She drinks five cups of coffee and three to four diet sodas every day and grabs burgers and sweets for snacks while she drives from one client to the next. She has gained 20 pounds in the past year and has few friends outside of her coworkers. She has not taken a vacation in more than 2 years. She belongs to the Catholic church down the street, but she has stopped going because she says she is too busy and exhausted by the time Sunday rolls around.

The agency brings in a trainer who meets with the case management department and guides the staff through a self-assessment of their current self-care practices and the development of a comprehensive self-care plan. During the training, Carla acknowledges that she has let her work take over the rest of her life and needs to make some changes to bring her back into balance. She writes out her self-care plan, which includes cutting back on the caffeine, calling a friend she knows from church to go to a movie, going to Mass on Sunday, dusting off her treadmill, and planning a short vacation to the beach. She also decides that she will discuss her plan with her supervisor and begin to ask around for a counselor for herself to talk about her anxiety and her nightmares. In the next supervision session, Carla's supervisor reviews her self-care plan with her and helps Carla evaluate the effectiveness of her self-care strategies. Her supervisor also begins to make plans for how to cover Carla's cases when she takes her vacation.

substance use and trauma-related disorders. Counselors are responsible for developing comprehensive self-care plans and committing to their plans, but clinical supervisors and administrators are responsible for promoting counselor self-care, supporting implementation of counselor self-care plans, and modeling self-care. Counselor self-care is an ethical imperative; just as the entire trauma-informed organization must commit to other ethical issues with regard to the delivery of services to clients with substance use, mental, and trauma-related disorders, it must also commit to the self-care of staff members who are at risk for secondary traumatization as an ethical concern. Saakvitne and colleagues (1996) suggest that when administrators support counselor-self-care, it is not only cost-effective in that it reduces the negative effects of secondary traumatization on counselors (and their clients), but also promotes "hope-sustaining behaviors" in counselors, making them more motivated and open to learning, and thereby improving job performance and client care.

A Comprehensive Self-Care Plan

A self-care plan should include a self-assessment of current coping skills and strategies and the development of a holistic, comprehensive self-care plan that addresses the following four domains:

1. Physical self-care
2. Psychological self-care (includes cognitive/mental aspects)
3. Emotional self-care (includes relational aspects)
4. Spiritual self-care

Activities that may help behavioral health workers find balance and cope with the stress

Advice to Clinical Supervisors: Spirituality

The word "spiritual" in this context is used broadly to denote finding a sense of meaning and purpose in life and/or a connection to something greater than the self. Spiritual meanings and faith experiences are highly individual and can be found within and outside of specific religious contexts.

Engaging in spiritual practices, creative endeavors, and group/community activities can foster a sense of meaning and connection that can counteract the harmful effects of loss of meaning, loss of faith in life, and cognitive shifts in worldview that can be part of secondary traumatization. Counselors whose clients have trauma-related disorders experience fewer disturbances in cognitive schemas regarding worldview and less hopelessness when they engage in spiritually oriented activities, such as meditation, mindfulness practices, being in nature, journaling, volunteer work, attending church, and finding a spiritual community (Burke et al., 2006). Clinical supervisors can encourage counselors to explore their own spirituality and spiritual resources by staying open and attuned to the multidimensional nature of spiritual meaning of supervisees and refraining from imposing any particular set of religious or spiritual beliefs on them. A strong sense of spiritual connection can enhance counselors' resilience and ability to cope with the sometimes overwhelming effects of clients' trauma material and trauma-related behavior (including suicidality) on counselors' faith in life and sense of meaning and purpose.

Modeling Self-Care

"Implementing interventions was not always easy, and one of the more difficult coping strategies to apply had to do with staff working long hours. Many of the staff working at the support center also had full-time jobs working for the Army. In addition, many staff chose to volunteer at the Family Assistance Center and worked 16- to 18-hour days. When we spoke with them about the importance of their own self-care, many barriers emerged: guilt over not working, worries about others being disappointed in them, fear of failure with respect to being unable to provide what the families might need, and a 'strong need to be there.' Talking with people about taking a break or time off proved problematic in that many of them insisted that time off was not needed, despite signs of fatigue, difficulty concentrating, and decreased productivity. Additionally, time off was not modeled. Management, not wanting to fail the families, continued to work long hours, despite our requests to do otherwise. Generally, individuals could see and understand the reasoning behind such endeavors. Actually making the commitment to do so, however, appeared to be an entirely different matter. In fact, our own team, although we kept reasonable hours (8 to 10 per day), did not take a day off in 27 days. Requiring time off as part of membership of a Disaster Response Team might be one way to solve this problem."

—Member of a Disaster Response Team at the Pentagon after September 11

Source: Walser, 2004, pp. 4–5.

of working with clients with trauma-related disorders include talking with colleagues about difficult clinical situations, attending workshops, participating in social activities with family and friends, exercising, limiting client sessions, balancing caseloads to include clients with and without trauma histories, making sure to take vacations, taking breaks during the workday, listening to music, walking in nature, and seeking emotional support in both their personal and professional lives (Saakvitne et al., 1996). In addition, regular clinical supervision and personal psychotherapy or counseling can be positive coping strategies for lessening the impact of STS on counselors. Still, each counselor is unique, and a self-care approach that is helpful to one counselor may not be helpful to another. Exhibits 2.2-13 and 2.2-14 offer tools for self-reflection to help counselors discover which specific self-care activities might best suit them. The worksheet can be used privately by counselors or by clinical supervisors as an exercise in individual supervision, group supervision, team meetings, or trainings on counselor self-care.

Review the questions in Exhibit 2.2-14, and then write down specific self-care strategies in the form (given in Exhibit 2.2-13) that you're confident you will practice in both personal and professional realms.

The *Comprehensive Self-Care Worksheet* is a tool to help counselors (and clinical supervisors) develop awareness of their current coping strategies and where in the four domains they need to increase their engagement in self-care activities. Once completed, clinical supervisors should periodically review the plan with their supervisees for effectiveness in preventing and/or ameliorating secondary traumatization and then make adjustments as needed.

Essential Components of Self-Care

Saakvitne and colleagues (1996) describe three essential components, the "ABCs," of self-care that effectively address the negative impact of secondary traumatization on counselors:

1. **Awareness** of one's needs, limits, feelings, and internal/external resources. Awareness involves mindful/nonjudgmental attention to one's physical, psychological, emotional, and spiritual needs. Such attention requires quiet time and space that supports self-reflection.
2. **Balance** of activities at work, between work and play, between activity and rest, and between focusing on self and focusing on others. Balance provides stability and helps counselors be more grounded when stress levels are high.
3. **Connection** to oneself, to others, and to something greater than the self. Connection decreases isolation, increases hope, diffuses stress, and helps counselors share the burden of responsibility for client care. It provides an anchor that enhances counselors' ability to witness tremendous suffering without getting caught up in it.

Exhibit 2.2-14: Comprehensive Self-Care Plan Worksheet Instructions

Use the following questions to help you engage in a self-reflective process and develop your comprehensive self-care plan. Be specific and include strategies that are accessible, acceptable, and appropriate to your unique circumstances. Remember to evaluate and revise your plan regularly.

Physical
What are non-chemical things that help my body relax?
What supports my body to be healthy?

Psychological/Mental
What helps my mind relax?
What helps me see a bigger perspective?
What helps me break down big tasks into smaller steps?
What helps me counteract negative self-talk?
What helps me challenge negative beliefs?
What helps me build my theoretical understanding of trauma and addictions?
What helps me enhance my counseling/helping skills in working with traumatized clients?
What helps me become more self-reflective?

Emotional/Relational
What helps me feel grounded and able to tolerate strong feelings?
What helps me express my feelings in a healthy way?
Who helps me cope in positive ways and how do they help?
What helps me feel connected to others?
Who are at least three people I feel safe talking with about my reactions/feelings about clients?
How can I connect with those people on a regular basis?

Spiritual
What helps me find meaning in life?
What helps me feel hopeful?
What sustains me during difficult times?
What connects me to something greater?

Clinical supervisors can help counselors review their self-care plans through the ABCs by reflecting on these questions:

1. Has the counselor accurately identified his or her needs, limits, feelings, and internal and external resources in the four domains (physical, psychological/mental, emotional/relational, spiritual)?
2. Has the counselor described self-care activities that provide a balance between work and leisure, activity and rest, and a focus on self and others?
3. Has the counselor identified self-care activities that enhance connection to self, others, and something greater than self (or a larger perspective on life)?

Supervisors should make their own self-care plans and review them periodically with their clinical supervisors, a peer supervisor, or a colleague.

Commitment to Self-Care

One of the major obstacles to self-care is giving in to the endless demands of others, both at work and at home. It is therefore essential for counselors with the support of clinical supervisors to become "guardians of [their] boundaries and limits" (Saakvitne et al., 1996, p 136). Creating a daily schedule that includes breaks for rest, exercise, connection with coworkers, and other self-care activities can support counselors in recognizing that they are valuable individuals who are worthy of taking the time to nourish and nurture themselves, thus increasing commitment to self-care. Another way to support counselors in committing to self-care is for supervisors and administrators to model self-care in their own professional and personal lives.

Understanding that counselor self-care is not simply a luxury or a selfish activity, but rather, an ethical imperative (Exhibit 2.2-15) can foster counselors' sense of connection to their own values and accountability to the people they serve as competent and compassionate caregivers. Clinical supervisors and administrators can reinforce this sense of accountability while supporting counselors by providing a caring, trauma-informed work environment

Exhibit 2.2-15: The Ethics of Self-Care

The Green Cross Academy of Traumatology was originally established to serve a need in Oklahoma City following the April 19, 1995, bombing of the Alfred P. Murrah Federal Building. Below are adapted examples of the Academy's code of ethics with regard to worker self-care.

Ethical Principles of Self-Care in Practice
These principles declare that it is unethical not to attend to your self-care as a practitioner, because sufficient self-care prevents harming those we serve.

Standards of self-care guidelines:
- Respect for the dignity and worth of self: A violation lowers your integrity and trust.
- Responsibility of self-care: Ultimately it is your responsibility to take care of yourself—and no situation or person can justify neglecting this duty.
- Self-care and duty to perform: There must be a recognition that the duty to perform as a helper cannot be fulfilled if there is not, at the same time, a duty to self-care.

Standards of humane practice of self-care:
- Universal right to wellness: Every helper, regardless of her or his role or employer, has a right to wellness associated with self-care.
- Physical rest and nourishment: Every helper deserves restful sleep and physical separation from work that sustains them in their work role.
- Emotional rest and nourishment: Every helper deserves emotional and spiritual renewal both in and outside the work context.
- Sustenance modulation: Every helper must utilize self-restraint with regard to what and how much they consume (e.g., food, drink, drugs, stimulation) since improper consumption can compromise their competence as a helper.

Commitment to self-care:
- Make a formal, tangible commitment: Written, public, specific, measurable promises of self-care.
- Set deadlines and goals: The self-care plan should set deadlines and goals connected to specific activities of self-care.
- Generate strategies that work and follow them: Such a plan must be attainable and followed with great commitment and monitored by advocates of your self-care.

that acknowledges and normalizes secondary traumatization and by offering reasonable resources that make it possible for counselors to do their work and take care of themselves at the same time. Preventing secondary traumatization and lessening its impact on counselors once it occurs is not only cost-effective with regard to decreasing staff turnover and potential discontinuity of services to clients; it is also the ethical responsibility of a trauma-informed organization.

Appendix B—Trauma Resource List

Introduction

As it would be difficult to include every organization focused on trauma, the list of resources in this appendix is not exhaustive; consequently, this list does not include books or other materials concerning the vast nature of this topic, but rather, it concentrates solely on online resources accessible to the public for free or as part of an organization membership. The inclusion of selected resources does not necessarily signify endorsement by the Substance Abuse and Mental Health Services Administration (SAMHSA), U.S. Department of Health and Human Services (HHS). Following these resources for adults is a list of resources focused on children and adolescents and a list of training opportunities.

Technology and Trauma: Using the Web To Treat PTSD

The role of the Internet in helping those who are experiencing posttraumatic stress disorder (PTSD) has expanded rapidly; there are numerous Web sites with toolkits and research publications for clinicians who treat clients with PTSD, as well as Web sites aimed at providing information and support for these individuals. The U.S. military has contributed to the field in developing these avenues—specifically, with interactive Web applications for use on home computers and smartphones.

- PTSD Coach is a smartphone application from the U.S. Department of Veterans Affairs (VA) to help people experiencing PTSD learn about and manage their symptoms (http://www.ptsd.va.gov/public/pages/ptsdcoach.asp).
- Afterdeployment.org is a Web site developed by the Defense Centers of Excellence project led by the National Center for Telehealth & Technology, with interactive workshops about PTSD, traumatic brain injury (TBI), anxiety, and depression, aimed at returning veterans (http://www.afterdeployment.org).
- T2 Virtual PTSD Experience, also developed by the National Center for Telehealth & Technology, is an application to be used within the popular online game Second Life as an interactive way of simulating how PTSD can be acquired within a combat environment, how PTSD may present itself to the person experiencing it, and how to seek effective treatment (http://www.t2health.org/vwproj).

Resources for Adults

Academy of Cognitive Therapy

http://www.academyofct.org
260 South Broad Street
18th Floor
Philadelphia, PA 19102
Phone: 267-350-7683
Email: info@academyofct.org

The Academy of Cognitive Therapy, a nonprofit organization, supports continuing education and research in cognitive therapy, provides a valuable resource in cognitive therapy for professionals and the public at large,

and actively works toward the identification and certification of clinicians skilled in cognitive therapy. Certification is awarded to those individuals who, based on an objective evaluation, have demonstrated an advanced level of expertise in cognitive therapy. The Academy includes physicians, psychologists, social workers, and other mental health professionals from around the world. The Academy formed a Trauma Task Force after September 11, 2001, to disseminate information (available on their Web site) to help people around the world receive the best help possible following trauma.

Addiction Technology Transfer Center Network

http://www.attcnetwork.org/index.asp
5100 Rockhill Road
Kansas City, MO 64110
Phone: 816-235-6888
Email: networkoffice@attcnetwork.org

The Addiction Technology Transfer Center (ATTC) Network serves as a resource for students and professionals to identify international distance education opportunities for the substance abuse treatment field and as a free marketing venue for ATTC-approved sponsors of distance education courses. The ATTC Web site provides trauma-related resources that include case studies, information on working with returning veterans who have been exposed to trauma, and links to various publications on PTSD and secondary traumatic stress.

Agency for Healthcare Research and Quality

http://www.innovations.ahrq.gov/index.aspx
540 Gaither Road
Suite 2000
Rockville, MD 20850
Phone: 301-427-1104

The Agency for Healthcare Research and Quality (AHRQ) is the research arm of HHS, specializing in patient safety and quality improvement, outcomes and effectiveness of care, clinical practice and technology assessment, and healthcare organization and delivery systems. AHRQ also provides funding and technical assistance to health research and research training programs at many universities and institutions. AHRQ's Web site provides links to research publications on PTSD and to other government publications and toolkits dealing with trauma-informed care.

The American Academy of Experts in Traumatic Stress

http://www.aaets.org
203 Deer Road
Ronkonkoma, NY 11779
Phone: 631-543-2217
Email: info@aaets.org

The American Academy of Experts in Traumatic Stress is a multidisciplinary network of professionals who are committed to the advancement of intervention for survivors of trauma. The Academy aims to identify expertise among professionals and across disciplines and to provide meaningful standards for those who work regularly with survivors. The Academy is committed to fostering a greater appreciation of the effects of common traumatic experiences (e.g., chronic illness, accidents, domestic violence, loss) in addition to large-scale disasters and catastrophes. The group's aim is to help all victims to become survivors and, ultimately, to thrive.

American Red Cross Disaster Services

http://www.redcross.org/what-we-do/disaster-relief
American Red Cross National Headquarters
2025 E Street, NW

Washington, DC 20006
Phone: 202-303-4498

Red Cross disaster relief focuses on meeting people's immediate emergency disaster-caused needs. When a disaster threatens or strikes, the Red Cross provides shelter, food, and health and mental health services to address basic human needs. In addition to these services, the core of Red Cross disaster relief is the assistance given to individuals and families affected by disaster to enable them to resume their normal daily activities independently. Training opportunities are also provided.

Anxiety and Depression Association of America

http://www.adaa.org
8701 Georgia Avenue #412
Silver Spring, MD 20910
Phone: 240-485-1001

The Anxiety and Depression Association of America (ADAA) is the only national, nonprofit membership organization dedicated to informing the public, healthcare professionals, and legislators that anxiety disorders are real, serious, and treatable. ADAA promotes the early diagnosis, treatment, and cure of anxiety disorders and is committed to improving the lives of the people who have them. The ADAA Web site provides information about the symptoms of PTSD and how it can be treated, in addition to offering a PTSD self-screening tool.

Association for Behavioral and Cognitive Therapies

http://www.abct.org
305 7th Avenue
16th Floor
New York, NY 10001
Phone: 212-647-1890
Fax: 212-647-1865

The Association for Behavioral and Cognitive Therapies is a professional, interdisciplinary organization concerned with the application of behavioral and cognitive science to understanding human behavior, developing interventions to enhance the human condition, and promoting the appropriate use of these interventions. The association's Web site includes resources for the public and for professionals on trauma and disaster-related problems, a clinical referral directory, and other resources and training opportunities in behavioral therapy.

Association of Traumatic Stress Specialists

http://www.atss.info
88 Pompton Avenue
Verona, NJ 07044
Phone: 973-559-9200
Email: Admin@atss.info

The Association of Traumatic Stress Specialists is an international membership organization that offers three distinct board certifications to qualified individuals who provide services, intervention, response, and/or treatment in the field of traumatic stress. The Association is dedicated to improving the quality of life of all individuals throughout the world who have been affected by traumatic events. Membership represents those who serve survivors of natural disasters, terrorist attacks, injuries and deaths related to serving in the line of duty or to school and workplace violence; veterans; refugees; victims of crime; Holocaust survivors; those affected and exploited by political persecution; and others who have experienced traumatic stress injuries.

Center for Anxiety and Related Disorders

http://www.bu.edu/card
648 Beacon Street
6th Floor

Boston, MA 02215
Phone: 617-353-9610

The Center for Anxiety and Related Disorders (CARD) at Boston University is a clinical and research center dedicated to advancing knowledge and providing care for anxiety, mood, eating, sleep, and related disorders. CARD's Web site offers information regarding PTSD and research publications on trauma and anxiety, in addition to linking to toolkits from the National Child Traumatic Stress Network's Adolescent Traumatic Stress and Substance Abuse Program.

Center for the Study of Traumatic Stress

http://www.cstsonline.org
Uniformed Services University of the Health Sciences
Department of Psychiatry
4301 Jones Bridge Road
Bethesda, MD 20814-4799
Phone: 301-295-2470
Fax: 301-319-6965

The Center for the Study of Traumatic Stress (CSTS) is a federally funded organization established by the Military Health System in 1987 to address Department of Defense concerns regarding health risks and concerns resulting from the traumatic impact of the use of weapons of mass destruction in combat, acts of terrorism and hostage events, combat and peacekeeping operations, natural disasters, and assaults or accidents occurring in both uniformed and civilian communities. CSTS primarily serves members of the armed forces, along with their children and families.

Center for Culture, Trauma and Mental Health Disparities

http://www.semel.ucla.edu/cctmhd
UCLA Semel Institute of Neuroscience & Biobehavioral Sciences
760 Westwood Plaza
Los Angeles, CA 90024
Phone: 310-794-9929

The Collaborative Center for Trauma and Mental Health Disparities at the University of California Los Angeles is a multiethnic and multidisciplinary group that focuses on conducting research and providing training that pertains to trauma in minority populations.

Council of State Governments Justice Center—Mental Health

http://csgjusticecenter.org/jc/category/mental-health
100 Wall Street
20th Floor
New York, NY 10005
Phone: 212-482-2320
Fax: 212-482-2344
Email: consensusproject@csg.org

The Consensus Project is part of the Council of State Governments Justice Center and partners with other organizations, such as SAMHSA's GAINS Center, working to improve outcomes for people, including juveniles, with mental illnesses involved with the criminal justice system. The Consensus Project offers a webinar on trauma services in the criminal justice system and on child trauma and juvenile justice, as well as a local programs database.

Dart Center for Journalism and Trauma

http://www.dartcenter.org
Columbia University
Graduate School of Journalism
2950 Broadway
New York, NY 10027
Phone: 212-854-8056

The Dart Center is dedicated to improving media coverage of trauma, conflict, and

tragedy. The Center also addresses the consequences of such coverage for those working in journalism and provides training and education via seminars, newsroom briefings and consultation on trauma issues, in addition to training for journalism educators and other trainers. The Dart Center Web site offers fact sheets, publications, and DVDs on request for use by journalists, educators, and clinicians.

David Baldwin's Trauma Information Pages

http://www.trauma-pages.com
Phone: 541-686-2598
Email: dvb@trauma-pages.com

This Web site focuses primarily on emotional trauma and traumatic stress, including PTSD and dissociation, whether following individual traumatic experience(s) or a large-scale disaster. The site's purpose is to provide information for clinicians and researchers in the traumatic stress field. Specifically, the focus is on both clinical and research aspects of trauma responses and their resolution.

Disaster Technical Assistance Center

http://www.samhsa.gov/dtac
9300 Lee Highway
Fairfax, VA 22031
Phone: 800-308-3515
Fax: 703-225-2338

SAMHSA has created the Disaster Technical Assistance Center (DTAC) to help States prepare for and respond to a wide range of potential catastrophes—both natural and human-caused disasters. DTAC primarily serves individuals and communities who are recovering from natural and human-caused disasters. It works in conjunction with the Federal Emergency Management Agency (FEMA) and SAMHSA's Emergency Mental Health and Traumatic Stress Services Branch, using strengths-based, outreach-oriented principles conducted in nontraditional settings, as a supplement to programs already in place on a local level.

EMDR Institute, Inc.

http://www.emdr.com
P.O. Box 750
Watsonville, CA 9507
Phone: 831-761-1040
Fax: 831-761-1204
Email: inst@emdr.com

Eye Movement Desensitization and Reprocessing (EMDR) is an information-processing therapy that uses an eight-phase approach. (See the description in Part 1, Chapter 6.) The Web site presents background and descriptive information about this approach to treatment and lists training opportunities, references, and networking groups.

The Federal Emergency Management Agency

http://www.fema.gov
500 C Street SW
Washington, DC 20472
Phone: 202-646-2500

The Federal Emergency Management Agency, a formerly independent agency that became part of the Department of Homeland Security in March 2003, is tasked with responding to, planning for, recovering from, and mitigating against disasters. FEMA can trace its beginnings to the Congressional Act of 1803. This Act, generally considered the first piece of disaster legislation, provided assistance to a New Hampshire town following an extensive fire. In the century that followed, ad hoc legislation was passed more than 100 times in response to hurricanes, earthquakes, floods, and other natural disasters.

The International Critical Incident Stress Foundation, Inc.

http://www.icisf.org
3290 Pine Orchard Lane
Suite 106
Ellicott City, MD 21042
Phone: 410-750-9600
Fax: 410-750-9601
Email: info@icisf.org

The International Critical Incident Stress Foundation, Inc., is a nonprofit, open-membership foundation dedicated to the prevention and mitigation of disabling stress through the provision of education, training, and support services for all emergency services professions; continuing education and training in emergency mental health services for psychologists, psychiatrists, social workers, and licensed professional counselors; and consultation in the establishment of crisis and disaster response programs for varied organizations and communities worldwide.

International Society for the Study of Trauma and Dissociation

http://www.issd.org
8400 Westpark Drive
Second Floor
McLean, VA 22102
Phone: 703-610-9037
Fax: 703-610-0234
Email: info@isst-d.org

The Society is a nonprofit professional association organized for the purposes of information sharing and international networking of clinicians and researchers; providing professional and public education; promoting research and theory about dissociation; and promoting research and training in the identification, treatment, and prevention of dissociative disorders. The Society offers courses in its Dissociative Disorders Psychotherapy Training Program.

The International Society for Traumatic Stress Studies

http://www.istss.org
111 Deer Lake Road
Suite 100
Deerfield, IL 60015
Phone: 847-480-9028
Fax: 847-480-9282

The International Society for Traumatic Stress Studies (ISTSS) was founded in 1985 for professionals to share information about the effects of trauma. ISTSS is dedicated to the discovery and dissemination of knowledge about policy, program, and service initiatives that seek to reduce traumatic stressors and their immediate and long-term consequences. ISTSS provides a forum for the sharing of research, clinical strategies, public policy concerns, and theoretical formulations on trauma in the United States and around the world.

National Alliance on Mental Illness

http://www.nami.org
3803 N. Fairfax Dr.
Suite 100
Arlington, VA 22203
Phone: 703-524-7600
Fax: 703-524-9094

The National Alliance on Mental Illness (NAMI) is a nonprofit advocacy group founded in 1979 to raise awareness and provide essential and free education, advocacy, and support group programs for people living with mental illness and their loved ones. NAMI operates at the local, State, and national levels, with each level of the organizations providing education, information, support, and advocacy for those with mental illness and their support system. NAMI has developed a Trauma Toolkit and includes a series of lectures for mental health professionals about trauma.

National Association of State Alcohol and Drug Abuse Directors, Inc.

http://www.nasadad.org
1025 Connecticut Ave NW
Suite 605
Washington, DC 20036
Phone: 202-293-0090
Fax: 202-293-1250
Email: dcoffice@nasadad.org

The National Association of State Alcohol and Drug Abuse Directors, Inc. (NASADAD) is a private, not-for-profit educational, scientific, and informational organization. NASADAD's basic purpose is to foster and support the development of effective alcohol and drug abuse prevention and treatment programs throughout every State. NASADAD offers a policy brief with regards to trauma and substance use/abuse in the wake of natural or human-made disasters.

National Association of State Mental Health Program Directors

http://www.nasmhpd.org
66 Canal Center Plaza
Suite 302
Alexandria, VA 22314
Phone: 703-739-9333
Fax: 703-548-9517

The National Association of State Mental Health Program Directors (NASMHPD; pronounced "NASH-pid") is a nonprofit organization dedicated to serving the needs of the Nation's public mental health system through policy development, information dissemination, and technical assistance. NASMHPD represents the $23 billion public mental health service delivery system. As a private, not-for-profit 501(c)(3) membership organization, NASMHPD helps set the agenda and determine the direction of State mental health agency interests across the country, historically including State mental health planning, service delivery, and evaluation. The principal programs operated, funded, and/or regulated by NASMHPD members serve people who have serious mental illnesses, developmental disabilities, and/or substance use disorders. NASMPHD has launched a Technical Assistance Coordinating Center in response to the Alternatives to Restraint and Seclusion State Infrastructure Grant Project, an initiative of SAMHSA's Center for Mental Health Services, designed to promote the implementation and evaluation of best practice approaches to preventing and reducing the use of seclusion and restraint in mental health settings.

National Center for Injury Prevention and Control

http://www.cdc.gov/injury
1600 Clifton Road
Atlanta, GA 30333
Phone: 800-232-4636
Email: cdcinfo@cdc.gov

The National Center for Injury Prevention and Control (NCIPC) was established by the Centers for Disease Control and Prevention in 1992. Through research, surveillance, implementation of evidence-based strategies, capacity building, and communication activities, NCIPC works to reduce morbidity, disability, mortality, and costs associated with injuries and violence. NCIPC is the lead U.S. Federal agency for nonoccupational injury prevention.

National Center for PTSD

http://www.ptsd.va.gov
810 Vermont Avenue NW
Washington, DC 20420
Phone: 802-296-6300
Email: ncptsd@va.gov

The National Center for PTSD (NCPTSD) was created within the Department of

Veterans Affairs in 1989 in response to a Congressional mandate to address the needs of veterans with military-related PTSD. Its mission is to advance the clinical care and social welfare of America's veterans through research, education, and training in the science, diagnosis, and treatment of PTSD and stress-related disorders. Its Web site is provided as an educational resource concerning PTSD and other enduring consequences of traumatic stress. The NCPTSD Web site has information about instruments to measure trauma exposure, risk and resilience factors for PTSD, self-report instruments, and interview schedules. Training opportunities are listed at http://www.ptsd.va.gov/about/training/training-programs.asp.

National Center for Telehealth and Technology

http://www.t2health.org
9933C West Hayes Street
Joint Base Lewis-McChord, WA 98431
Phone: 253-968-1914
Fax: 253-968-4192
Email: AskUs@t2health.org

The National Center for Telehealth and Technology is a Federal agency founded by the Department of Defense as part of the Military Health System. It primarily serves veterans and active-duty military personnel who are experiencing adverse health effects due to TBI and PTSD, as well as military children who are coping with their parents' deployment, through the use of technology (e.g., mobile phone applications, deployable telehealth centers).

National Center for Trauma-Informed Care

http://www.samhsa.gov/nctic
66 Canal Center Plaza
Suite 302
Alexandria, VA 22314
Phone: 866-254-4819
Fax: 703-548-9517
Email: NCTIC@NASMHPD.org

The National Center for Trauma-Informed Care (NCTIC) is a Federal center established by SAMHSA in 2005 to offer consultation, technical assistance, education, outreach, and resources to support trauma-informed care in publicly-funded systems and programs. NCTIC primarily serves those who are already receiving services from the behavioral health system and is focused on helping behavioral health services and programs to become more aware of the impact of trauma among consumers, to adapt services to incorporate trauma-informed practices, and to help raise awareness of practices or processes that are more likely to retraumatize consumers.

National Center for Victims of Crime

http://www.victimsofcrime.org
2000 M Street NW
Suite 480
Washington, DC 20036
Phone: 202-467-8700
Fax: 202-467-8701
Email: webmaster@ncvc.org

The National Center for Victims of Crime (NCVC) is a nonprofit organization funded partially by Federal grants from the Department of Justice. It was founded in 1985 and originally known as the Sunny Von Bulow National Victim Advocacy Center. NCVC is a resource center for those affected by violent crimes and also provides training and education for behavioral health service providers.

National Center on Domestic Violence, Trauma & Mental Health

http://www.nationalcenterdvtraumamh.org/
Phone: 312-726-7020
Fax: 312-726-7022

The National Center on Domestic Violence, Trauma & Mental Health was established in 2005 through a grant from the Family Violence Prevention and Services Program, HHS. The Center's mission is to promote accessible, culturally relevant, and trauma-informed responses to domestic violence and other lifetime trauma so that survivors and their children can access the resources that are essential to their safety and well-being; this is achieved by providing training and online resources to mental health and substance abuse treatment providers and developing policies to improve system responses to domestic violence survivors and their children.

National Center on Elder Abuse

http://www.ncea.aoa.gov
University of California–Irvine
Program in Geriatric Medicine
101 The City Drive South, 200 Building
Orange, CA 92868
Phone: 855-500-3537
Email: ncea-info@aoa.hhs.gov

The National Center on Elder Abuse (NCEA), part of the U.S. Administration on Aging, serves as a national resource center dedicated to the prevention of elder mistreatment. NCEA provides information to both mental health professionals and the general public and also provides technical assistance and training to States and community-based organizations.

National Center on Family Homelessness

http://www.familyhomelessness.org
200 Reservoir Street
Suite 200
Needham, MA 02494
Phone: 617-964-3834
Fax: 617-244-1758
Email: info@familyhomelessness.org

The National Center on Family Homelessness (NCFH) was founded in 1988 and is a nonprofit organization that conducts research and creates public awareness about the special needs of families experiencing homelessness. NCFH primarily serves veterans who are homeless and their families and young mothers who are homeless with their children. NCFH has developed a Trauma-Informed Organizational Toolkit for Homeless Services.

National Coalition Against Domestic Violence

http://www.ncadv.org
1 Broadway
Suite B210
Denver, CO 80203
Phone: 303-839-1852
Fax: 303-831-9251
Email: mainoffice@ncadv.org

The National Coalition Against Domestic Violence (NCADV) is an advocacy group founded in 1978 and acts as a national information and referral center for the general public, media, survivors of domestic violence and their children, and allied and member agencies and organizations. NCADV also works to influence legislation that would provide protection for survivors of domestic violence and their families and provide funding to shelters, healthcare centers, and other organizations.

National Council for Behavioral Health

http://www.thenationalcouncil.org
1701 K Street NW
Suite 400
Washington, DC 20006
Phone: 202-684-7457
Email: communications@thenationalcouncil.org

The National Council for Behavioral Health is a national community behavioral health

advocacy organization, formed in 1970, to conduct Federal advocacy activities, representing the industry on Capitol Hill and before Federal agencies. It also offers a national consulting service program, various publications, and an annual training conference. The National Council Magazine, 2011, Issue 2, focuses on trauma-informed behavioral health services. The National Council has offered a Learning Community for Adoption of Trauma-Informed Practices, funded by SAMHSA.

National Institute on Drug Abuse

http://drugabuse.gov
National Institute on Drug Abuse
National Institutes of Health
6001 Executive Boulevard
Room 5213, MSC 9561
Bethesda, MD 20892-9561
Phone: 301-443-1124
Email: information@nida.nih.gov

The National Institute on Drug Abuse's (NIDA) mission is to lead the Nation in bringing the power of science to bear on drug abuse and addiction. NIDA's goal is to ensure that science, not ideology or anecdote, forms the foundation for all of the Nation's drug abuse reduction efforts. NIDA was established in 1974, and in October 1992 it became part of the National Institutes of Health (NIH), HHS. The Institute is organized into divisions and offices, each of which plays an important role in programs of drug abuse research. NIDA has an ongoing research program on women's health and sex/gender differences, including the gathering of information on trauma and substance abuse.

National Institute of Mental Health

http://www.nimh.nih.gov
National Institute of Mental Health
Science Writing, Press, and Dissemination Branch
6001 Executive Boulevard
Room 8184, MSC 9663
Bethesda, MD 20892-9663
Phone: 301-443-4513
Fax: 301-443-4279
Email: nimhinfo@mail.nih.gov

The National Institute of Mental Health (NIMH) is one of the 27 component institutes of NIH, the Federal Government's principal biomedical and behavioral research agency that is part of HHS. NIMH's mission is to reduce the burden of mental illness and behavioral disorders through research on mind, brain, and behavior. This public health mandate demands that NIMH use science to achieve better understanding, treatment, and eventually, prevention of these disabling conditions that affect millions of Americans. NIMH offers publications and podcasts related to traumatic events and PTSD.

National Registry for Evidence-Based Programs and Practices

http://www.nrepp.samhsa.gov
Phone: 866-436-7377
Email: nrepp@samhsa.hhs.gov

SAMHSA's National Registry for Evidence-Based Programs and Practices (NREPP) is a searchable online registry of more than 300 interventions supporting mental health promotion, substance abuse prevention, and mental health and substance abuse treatment. NREPP offers several interventions that address trauma and PTSD.

National Sexual Violence Resource Center

http://www.nsvrc.org
123 North Enola Drive
Enola, PA 17025
Phone: 717-909-0710
Fax: 717-909-0714

The National Sexual Violence Resource Center (NSVRC) was founded by the Pennsylvania Coalition Against Rape in 2000 and is partially federally funded by grants from the Centers for Disease Control and Prevention. NSVRC advocates for changes in Federal and State legislation to further the goal of ending sexual violence in all communities, in addition to collecting and disseminating a wide range of resources on sexual violence, including statistics, research, position statements, statutes, training curricula, prevention initiatives and program information. NSVRC does not provide direct services to survivors of sexual violence but acts as a resource to support these services.

National Trauma Consortium

http://www.nationaltraumaconsortium.org
520 Ralph Street
Sarasota, FL 34242
Phone: 941-312-9795

The National Trauma Consortium (NTC) is a clearinghouse for information about trauma and emerging best practices in trauma treatment and services and, in addition, offers training and consultation services. NTC also provides resources in the form of downloadable publications and links to other organizations related to mental health and trauma.

National Voluntary Organizations Active in Disasters

http://www.nvoad.org
1501 Lee Highway
Suite 170
Arlington, VA 22209-1109
Phone: 703-778-5088
Fax: 703-778-5091
Email: info@nvoad.org

National Voluntary Organizations Active in Disasters (NVOAD) coordinates planning efforts by many voluntary organizations responding to disaster. Member organizations provide more effective service and less duplication by getting together before disasters strike. Once disasters occur, NVOAD or an affiliated State VOAD encourages members and other voluntary agencies to convene on site. This cooperative effort has proven to be the most effective way for a wide variety of volunteers and organizations to work together in a crisis. NVOAD's principles are cooperation, coordination, communication, education, mitigation, convening mechanisms, and outreach.

Office for Victims of Crime Training and Technical Assistance Center

https://www.ovcttac.gov/
9300 Lee Highway
Fairfax, VA 22031-6050
Phone: 866-682-8822
TTY: 866-682-8880
Fax: 703-279-4673
Email: TTAC@ovcttac.org

The Office for Victims of Crime Training and Technical Assistance Center provides comprehensive, quality technical assistance and training resources to victims' service providers and allied professionals. Its mission is to support the development of the field by increasing the Nation's capacity to provide crime victims with skilled, capable, and sensitive assistance. Its core functions are needs assessment, capacity building, evaluation, and reporting.

Rape, Abuse & Incest National Network

http://www.rainn.org
1220 L Street NW
Suite 505
Washington, DC 20005
Phone: 202-544-1034
Email: info@rainn.org

The Rape, Abuse & Incest National Network (RAINN) is a nonprofit organization, founded in 1994, that is partially funded by a grant from the Office for Victims of Crime, Office of Justice Programs, U.S. Department of Justice. RAINN provides support for survivors of sexual assault via a telephone hotline and an online hotline and works with the Department of Defense (DoD) to provide a hotline for members of the DoD community who have experienced sexual assault.

SAMHSA's Tribal Training and Technical Assistance Center

http://beta.samhsa.gov/tribal-ttac
201 Corporate Drive
Suite 800
Landover, MD 20785
Phone: 240-650-0257
Email: TA-Request@tribaltechllc.com

SAMHSA's Tribal Training and Technical Assistance Center (Tribal TTAC) is committed to providing comprehensive broad, focused, and/or intensive training and technical assistance to federally recognized Tribes and other American Indian and Alaska Native communities seeking to address and prevent mental and substance use disorders and suicide while promoting mental health. The goal of the Tribal TTAC is to use a culturally relevant, evidence-based, holistic approach to support Native communities in their self-determination efforts through infrastructure development, capacity building, and program planning and implementation.

Sanctuary Model

http://www.sanctuaryweb.com
Phone: 888-538-3124

The goals of the Sanctuary Model include increasing the perceived sense of community/cohesiveness; the degree of social immunity to the spread of violence; the capacity for social learning; the making of decisions democratically and the sharing of responsibility in solving problems and resolving conflicts; the ability to deal with complexity; opportunities for all clients and staff members to experience a truly safe and connected community; opportunities for troubled clients to have corrective emotional, relational, and environmental experiences; and recovery, healing, and growth.

Seeking Safety

http://www.seekingsafety.org
Treatment Innovations
28 Westbourne Road
Newton Centre, MA 02459
Phone: 617-299-1610
Fax: 617-701-1295
Email: info@seekingsafety.org

This Web site provides information about Seeking Safety, a psychotherapeutic intervention for treating trauma, PTSD, and substance abuse. Seeking Safety is a present-focused therapy to help people attain safety from both PTSD and substance abuse. The treatment is also available as a book, which provides both client handouts and guidance for clinicians. The site includes topics included in the treatment program, sample materials, relevant empirical studies, and supplementary articles.

Sidran Institute

http://www.sidran.org
P.O. Box 436
Brooklandville, MD 21022-0436
Phone: 410-825-8888
Fax: 410-560-0134
Email: info@sidran.org

The Sidran Institute is a nationally focused nonprofit organization devoted to helping people who have experienced traumatic life events through education and advocacy. The Institute's education and advocacy focuses on:

- The early recognition and treatment of trauma-related stress in children.
- The understanding of trauma and its long-term effect on adults.
- The strategies in engaging in mutual-help recovery for trauma survivors.
- The clinical methods and practices leading in aiding trauma victims.
- The development of public policy initiatives responsive to the needs of adult and child survivors of traumatic events.

Substance Abuse and Mental Health Services Administration

http://www.samhsa.gov
1 Choke Cherry Lane
Rockville, MD 20857
Phone: 877-726-4727
Fax: 240-221-4292
Email: SAMHSAInfo@samhsa.hhs.gov

SAMHSA is the Federal agency within HHS charged with improving the quality and availability of prevention, treatment, and rehabilitative services to reduce illness, death, disability, and cost to society resulting from substance abuse and mental illness. The Emergency Mental Health and Traumatic Stress Services Branch, a branch of SAMHSA's Center for Mental Health Services, works with FEMA to provide crisis counseling training and technical assistance to State and local mental health professionals. SAMHSA offers several publications regarding trauma and PTSD, as well as a publication focusing on creating a seclusion-free and restraint-free environment.

Traumatic Stress Institute

http://www.traumaticstressinstitute.org
Klingberg Family Centers
370 Linwood Street
New Britain, CT 06052
Phone: 860-224-9113

The Traumatic Stress Institute (TSI) works to increase understanding of the psychological impact of trauma and to help victims of violence restore meaning and wholeness to their lives. In meeting these goals, TSI is involved in clinical service, professional training, community education, and research. TSI offers forensic assessment and expert testimony, professional education, training opportunities, and publications. TSI developed the "Risking Connections" trauma treatment program and provides training in the use of this model.

Tulane University Traumatology Institute

http://sites.google.com/site/charlesfigley/Home/traumatologyinstitute
Tulane School of Social Work
6823 St. Charles Ave., Building 9
New Orleans, LA 70118
Phone: 800-631-8234
Email: figley@tulane.edu

The Traumatology Institute, founded in 1996, brings together health and mental health professionals from a wide array of disciplines from throughout the United States and around the world to develop cutting-edge research, treatment approaches, and training programs in the field of traumatology. The Institute facilitates the development of knowledge about the traumatization experience of victims, survivors, and the professionals who serve them. The Traumatology Institute conducts research, education, and service activities toward reducing the deleterious effects of trauma on individuals, families, communities, and entire societies.

Veterans Affairs PTSD Support Services

http://www.ptsdsupport.net/va.html
P.O. Box 5574
Woodland Park, CO 80866
Email: russ@ptsdsupport.net

The Department of Veterans Affairs Medical Centers provide a network of more than 100 specialized programs for veterans with PTSD, working closely in conjunction with the Veterans Web Site (http://www.vetcenter.va.gov) operated by VA's Readjustment Counseling Service. Each specialized PTSD program offers veterans education, evaluation, and treatment conducted by mental health professionals from a variety of disciplines (such as psychiatry, psychology, social work, counseling, and nursing). See also: National Center for PTSD.

White Bison Wellbriety Training Institute

http://www.whitebison.org
701 N. 20th Street
Colorado Springs, CO 80904
Phone: 877-871-1495
Email: info@whitebison.org

White Bison is an American Indian nonprofit charitable organization that focuses on offering sobriety, recovery, addictions prevention, and wellness/Wellbriety learning resources to the Native American community nationwide. White Bison's Wellbriety Training Institute provides training, tools, and resources for historical and intergenerational trauma to trainers and mental health professionals.

Resources for Children and Adolescents

The following section provides resources that address the needs of children and adolescents who are affected by traumatic stress.

American Academy of Child & Adolescent Psychiatry

http://www.aacap.org
3615 Wisconsin Avenue NW
Washington, DC 20016-3007
Phone: 202-966-7300
Fax: 202-966-2891

The American Academy of Child & Adolescent Psychiatry (AACAP) is a national professional medical association dedicated to treating and improving the quality of life for children, adolescents, and families affected by mental, behavioral, and developmental disorders. AACAP distributes information to promote an understanding of mental illnesses and remove the shame associated with them, to advance efforts in prevention of mental illnesses, and to ensure proper treatment and access to services for children and adolescents.

American Professional Society on the Abuse of Children

http://www.apsac.org
350 Poplar Avenue
Elmhurst, IL 60126
Phone: 630-941-1235
Fax: 630-359-4274
E-mail: apsac@apsac.org

The mission of the American Professional Society on the Abuse of Children (APSAC) is to enhance the ability of professionals to respond to children and families affected by abuse and violence. Among other initiatives, APSAC provides education and other sources of information to professionals who work in the child maltreatment and related fields.

Anna Institute

http://www.theannainstitute.org
21 Ocean Street
Rockland, ME 04841
Email: afj@gwi.net

The Anna Institute was founded in memory of artist Anna Caroline Jennings; it focuses on educating both the public and mental health professionals about the effects of sexual abuse and trauma on children. The Anna Institute's Web site provides articles on incorporating

trauma-informed care into existing behavioral health models, presentations on childhood trauma and retraumatization, and handouts for teachers at primary and secondary schools.

Caring for Every Child's Mental Health Campaign

http://www.samhsa.gov/children
P.O. Box 2345
Rockville, MD 20847-2345
Email: nmhic-info@samhsa.hhs.gov

SAMHSA's Caring for Every Child's Mental Health communications campaign is a national public information and education operation. Its goals are to increase public awareness about the importance of protecting the mental health of young people; foster the recognition that many children have mental health problems; and encourage caregivers to seek early, appropriate treatment and services. It also strives to reduce discrimination associated with mental health problems. The campaign is a technical assistance program that is part of the Comprehensive Community Mental Health Services Program for Children and Their Families.

Child Study Center

http://www.aboutourkids.org
One Park Avenue
7th Floor
New York, NY 10016
Phone: 212-263-6622
Email: webmaster@aboutourkids.org

The New York University Child Study Center Web site offers information to parents of children and adolescents with learning, behavioral, and emotional disorders, including PTSD and substance use disorders. An online newsletter is available. Its research initiatives advance understanding of the causes and treatments of child mental disorders, and these findings are integrated into clinical care to provide state-of-the-art service.

Child Trauma Academy

http://www.childtrauma.org
5161 San Felipe
Suite 320
Houston, TX 77056
Phone: 866-943-9779
Email: cta@childtrauma.org

The mission of the Child Trauma Academy is to help improve the lives of traumatized and maltreated children. Through education, service delivery, and program consultation, the academy seeks to advance systems that educate, nurture, protect, and enrich these children.

Child Trauma Institute

http://www.childtrauma.com
P.O. Box 544
Greenfield, MA 01302-0544
Phone: 413-774-2340
Email: cti@childtrauma.com

The Child Trauma Institute provides training, consultation, information, and resources for those who work with trauma-exposed children, adolescents, and adults. The Web site has information for parents, publications for parents and professionals, and links to other child trauma Web sites.

Child Welfare Information Gateway

http://www.childwelfare.gov
Children's Bureau/ACYF
1250 Maryland Avenue SW
Eighth Floor
Washington, DC 20024
Phone: 800-394-3366
Email: info@childwelfare.gov

The Child Welfare Information Gateway (CWIG) is a service of the Children's Bureau in the Administration for Children and Families, part of HHS, which provides information

to child welfare and mental health professionals about programs, research, laws and policies, training approaches, and statistics regarding child welfare, child abuse and neglect, and adoption. CWIG offers educators' toolkits for preventing and responding to child abuse and neglect, a function to search State statutes about child abuse and neglect, and logic model builder toolkits for program administrators.

Child Welfare League of America

http://www.cwla.org
1726 M Street NW
Suite 500
Washington DC, 20036
Phone: 202-688-4200
Fax: 202-833-1689

Through its member child welfare agencies, the Child Welfare League of America develops and disseminates practice standards as benchmarks for high-quality services that protect children and youth; promotes high-quality services through training, consultation, conferences, and publications; formulates and promotes public policies that contribute to the well-being of children and youth; ensures that all child welfare services are provided in a manner that demonstrates respect for cultural and ethnic diversity; and promotes open exchange of data, resources, and ideas within and across systems that serve children, youth, and families.

Eunice Kennedy Shriver National Institute of Child Health and Human Development

http://www.nichd.nih.gov/Pages/index.aspx
31 Center Drive
Building 31, Room 2A32
Bethesda, MD 20892-2425
Phone: 800-370-2943

Established in 1962, NIH's National Institute of Child Health and Human Development (NICHD) focuses on human development processes from conception to later years. The Institute implements, conducts, and supports laboratory research, clinical trials, epidemiological research, and other studies that explore health processes and the impact of disabilities, diseases, and variations on the lives of individuals. NICHD sponsors training for scientists and healthcare providers to promote the goals of the Institute.

National Center for Children Exposed to Violence

http://www.nccev.org
Yale Child Study Center
230 South Frontage Road
P.O. Box 207900
New Haven, CT 06520-7900
Phone: 877-496-2238
Email: colleen.vadala@yale.edu

The National Center for Children Exposed to Violence (NCCEV) seeks to increase the capacity of individuals and communities to reduce the incidence and impact of violence on children and families; to train and support the professionals who provide intervention and treatment; and to increase professional and public awareness of the effects of violence on children, families, communities, and society. The Center's Web site is a rich source of information. NCCEV is supported by grants from the Office of Juvenile Justice and Delinquency Prevention, the Department of Justice, SAMHSA, and the Department of Education.

National Center on Substance Abuse and Child Welfare

http://www.ncsacw.samhsa.gov
P.O. Box 2345
Rockville, MD 20847-2345
Phone: 866-493-2758
Email: ncsacw@cffutures.org

The National Center on Substance Abuse and Child Welfare (NCSACW) is an initiative of HHS and is jointly funded by SAMHSA's Center for Substance Abuse Treatment and the Administration on Children, Youth and Families, Children's Bureau's Office on Child Abuse and Neglect. NCSACW seeks to develop and implement a comprehensive program of information gathering and dissemination, to provide technical assistance, and to develop knowledge that promotes effective practical, organizational, and systemic changes at the local, State, and national levels. Its Web site includes PowerPoint presentations, online tutorials and training, technical assistance presentations, and additional print resources.

National Child Traumatic Stress Network

http://www.nctsnet.org
NCTSN—University of California, Los Angeles
11150 W. Olympic Boulevard
Suite 650
Los Angeles, CA 90064
Phone: 310-235-2633
Fax: 310-235-2612

The National Child Traumatic Stress Network (NCTSN), currently comprising 54 treatment centers nationwide, is funded by SAMHSA's Center for Mental Health Services through the Donald J. Cohen National Child Traumatic Stress Initiative and coordinated by Duke University and the University of California, Los Angeles. The purpose of this congressionally mandated initiative is to improve the quality, effectiveness, provision, and availability of therapeutic services delivered to all children and adolescents experiencing traumatic events. NCTSN works with SAMHSA to raise public awareness of the effects of traumatic stress on children and families, and with other systems of care (including the health, mental health, education, law enforcement, child welfare, juvenile justice, and military family service systems) to ensure that there is a comprehensive trauma-informed continuum of accessible care. Additionally, NCTSN offers a list of evidence-based and promising practices.

National Institute for Trauma and Loss in Children

http://www.starrtraining.org/trauma-and-children
42855 Garfield Road
Suite 111
Clinton Township, MI 48038
Phone: 877-306-5256
Fax: 586-263-4915
Email: TLC@starrtraining.org

The National Institute for Trauma and Loss in Children provides school professionals, crisis intervention teams, medical and mental health professionals, child care professionals, and clinicians with trauma education, training, consultation, referral services, and trauma-specific intervention programs and resource materials needed to help those traumatized by violent or nonviolent trauma-inducing incidents.

National Native Children's Trauma Center

http://iers.umt.edu/National_Native_Childrens_Trauma_Center
Institute for Educational Research and Service
McGill Hall 026
The University of Montana
Missoula, MT 59812-6376
Phone: 406-243-5344
Fax: 406-243-2197
Email: iers@mso.umt.edu

The National Native Children's Trauma Center (NNCTC) is a federally funded organization created by SAMHSA and affiliated with the National Child Traumatic Stress Network. It

is run by the University of Montana. NNCTC offers trauma interventions and trainings to address trauma in American Indian/Alaska Native children, primarily through clinicians, Tribal programs, school systems, and community agencies.

Training Opportunities

The following resources highlight various training and credentialing opportunities for behavioral health professionals interested in gaining more education in treating and providing services to those affected by trauma. It is not an exhaustive list, but provides a starting place for service providers looking for further training.

The Web site of the ISTSS has posted a directory of trauma-related academic and training opportunities (http://www.istss.org/LearningAboutTrauma.htm). It includes links to the institutions providing the programs. The Association for Traumatic Stress Specialists (http://www.atss.info) offers three levels of recognition for education and experience:

- Certified Trauma Specialist (CTS)—designed for counselors, clinicians, and treatment specialists who provide intervention services or individual, group, and/or family counseling. This certification requires 240 hours of education and training in trauma treatment, plus 2,000 hours of trauma counseling and intervention experience.
- Certified Trauma Responder (CTR)—designed for those who provide immediate trauma interventions. It requires a minimum of 40 hours of experience on a crisis or critical incident response team, an associate degree or a high school diploma with successful completion of disaster or critical incident stress debriefing training, and 72 hours of crisis response training.
- Certified Trauma Services Specialist (CTSS)—designed for those who provide immediate trauma intervention, crisis support, advocacy, or victim assistance. It requires 1 year of experience in a trauma-related field, plus specific training.

Some colleges and universities, such as the International Trauma Studies Program at New York University and the Center for Anxiety and Related Disorders at Boston University, provide specialty trauma training for mental health practitioners. The University of Missouri at St. Louis offers specialized training in trauma therapy or research at its Center for Trauma Recovery to students in its Clinical Psychology graduate program. The Center for the Treatment and Study of Anxiety at the University of Pennsylvania provides training for health professionals. The Department of Counseling at the University of Nevada, Las Vegas offers a graduate and undergraduate course on Trauma and Addiction; graduate students can receive training in trauma and addictions as part of the Advanced Graduate Certificate in Addiction Studies. The Medical University of South Carolina offers Web-based courses in trauma-focused cognitive–behavioral therapy (TF-CBT) and in using TF-CBT for childhood traumatic grief. Many universities have faculty members with expertise in trauma and trauma-related subjects, so that training can be accessed through many graduate programs.

The Addiction Technology Transfer Center (ATTC) Network, a resource established in 1993 by the SAMHSA's Center for Substance Abuse Treatment, is a network of 14 independent regional centers with a national office. One of its programs provides long-distance education for clinicians on various topics. Among hundreds of self-paced, self-directed, and supervised courses available online (http://www.attcnetwork.org/learn/education/

dasp.asp) are Substance Abuse Treatment for Trauma Survivors, Substance Abuse Treatment for Persons with Child Abuse and Neglect Issues, Chemical Dependency and Posttraumatic Stress Disorder, Clinical Self-Care for Addiction Counselors and Clinical Supervisors, Eye Movement Desensitization and Reprocessing, Battered Women and Addictions, and Posttraumatic Stress Disorder. ATTC training and educational opportunities are based on empirical research and are intended to bring science to service. Undoubtedly, more distance-learning courses in this specialized area of interest will be developed as professional attention to co-occurring disorders increases.

SAMHSA's Center for Mental Health Services provides training for FEMA-approved crisis counseling programs using Stafford Act funding. These funding resources are available to select agencies designated to provide crisis counseling in the wake of a Presidential Disaster Declaration. Other funding for trauma training may be found through special programs of funding for target groups, such as those who provide mental health services and case management for victims of crime (e.g., Office for Victims of Crime in the U.S. Department of Justice; see p. 257).

The American Red Cross provides limited disaster mental health training. The focus of this training is to orient licensed mental health professionals to the Red Cross Disaster services system and their roles as volunteers.

The National Center for Post-Traumatic Stress Disorder was originally created in 1989 within the U.S. Department of Veterans Affairs (VA) to address the needs of veterans with military-connected PTSD. Its focus has since broadened to include trauma in general. The Center provides a variety of training opportunities for both VA and non-VA mental health personnel, including a PTSD 101 course developed specifically for clinicians who provide services to clients who have experienced trauma (see http://www.ptsd.va.gov/professional/index.asp).

Seeking Safety offers training in trauma, PTSD, and co-occurring disorders to mental health professionals on all levels, from counselors to nurses to administrators. The EMDR International Association (EMDRIA) provides training to clinicians for certification in EMDR via a curriculum including instruction, supervised practicum, and consultation; EMDRIA additionally provides basic training in the field, separate from the certification process. EMDR training is also provided by the EMDR Humanitarian Assistance Program, a nonprofit organization with a training-focused model to assist clinicians in treating trauma.

ISTSS was founded in 1985 to bring attention to the study, assessment, and treatment of traumatized people (http://www.istss.org). ISTSS is a professional society and provides face-to-face training during its annual meeting, especially through the preconference institutes. The ISTSS Web site offers numerous video and audio trainings for continuing education credits. ISTSS and the Figley Institute (http://www.figleyinstitute.com) have established best practice standards. The American Academy of Experts in Traumatic Stress provides training and certification in several different areas (http://www.aaets.org). Similarly, the International Society for the Study of Dissociation (http://www.issd.org) specializes in promoting therapies for dissociative disorders. In 2002, the Green Cross Academy of Traumatology (http://www.greencross.org) established a Commission on Accreditation of Traumatology Education Programs to increase and maintain the high standards in the education and training of traumatologists.

Appendix C—Historical Account of Trauma

Historically, symptoms of traumatic stress have been recorded in both military and civilian populations (Lasiuk & Hegadoren, 2006). Early accounts described the effect of battle conditions on soldiers; "soldier's heart" and "nostalgia" were the terms for traumatic stress reactions used during the American Civil War. As warfare techniques and strategies changed, so did the depiction of soldiers' traumatic stress reactions. The advent of heavy explosives in World War I led to the attribution of symptoms to "shell shock," giving a more physiological description of the effects from explosions (Benedek & Ursano, 2009). On the civilian side, the industrial revolution gave rise to larger and more dramatic catastrophes, including industrial and railway accidents. These, as well as other disasters, are noted in occupational health histories, newspapers, and contemporary literature.

Even with a more physical explanation of traumatic stress (i.e., shell shock), a prevailing attitude remained that the traumatic stress response was due to a character flaw. For instance, a soldier's pain at that time was often seen as a symptom of homesickness. In spite of the efforts of Charcot, Janet, and Freud, who described the psychogenic origin of symptoms as a response to psychological trauma (Lasiuk & Hegadoren, 2006), World War II military recruits were screened in attempt to identify those "who were afflicted with moral weakness," which would prevent them from entering military service.

At the same time, there were new treatment innovations for war-related trauma during World War II. One approach treated soldiers in the field for what was then called "battle fatigue" by allowing some time for rest before returning to battle. During the Korean and Vietnam wars, approaches began to focus more on the use of talk therapy. It was not until the post-Vietnam era that interest in developing treatment alternatives started to take hold. During this time, the U.S. Department of Veterans Affairs (then called the Veterans Administration) developed group therapy for posttraumatic stress disorder (PTSD). Beyond being cost-effective, the technique was well suited to the symptoms of the veterans and fostered socialization and reintegration (Greene et al., 2004).

The publication of the American Psychiatric Association's (APA's) *Diagnostic and Statistical Manual of Mental Disorders,* Third Edition (DSM-III), in 1980 marked the introduction of PTSD as a diagnosis, inspired by symptoms presented by veterans of the Vietnam War (Benedek & Ursano, 2009). The diagnosis in this iteration required the identification of a specific stressor—a catastrophic stressor that was outside the range of usual human experience (APA, 1980)—and classified PTSD as

Historical Approaches to Trauma Healing and Recovery

First Generation of Approaches to Trauma Healing and Recovery
The first generation approaches to trauma healing and recovery focused on individual and clinical interventions to address the symptoms of PTSD and moved toward integration of trauma effects into ongoing life activities. The rapidly developing recognition of additional groups with violence and trauma histories—beyond those with war and captivity experiences (e.g., survivors of natural disasters and terrorism, refugees and immigrants fleeing homeland violence and persecution)—presented issues and needs that incited a second generation of approaches to trauma healing and recovery.

Second Generation of Approaches to Trauma Healing and Recovery
The second generation approaches focused on psychosocial education and empowerment models designed to tap into self-healing forces to energize personal and social movement. These approaches often are based on group and peer support models, and provide both support and education on the management of trauma and its affects. These approaches are not designed to replace clinical or alternative therapies; rather, they provide a social context for care.

Concurrent to the development of psychosocial educational empowerment approaches, we also learned that if the approaches are not implemented in organizations or programs that are trauma-informed, they will not take root and may lose effectiveness.

Trauma-Informed Care: A New Paradigm for Public Health Services
Trauma-informed care is a new paradigm for organizing public mental health and human services. Trauma-informed care changes the opening question for those seeking services from "What is wrong with you?" (patient or consumer) to "What has happened to you?" (survivor). Trauma-informed care is initiated by assumption that every person seeking services is a trauma survivor who designs his or her own path to healing, facilitated by support and mentoring from the service provider.

In a trauma-informed environment, survivors are empowered to proactively set goals and to manage progress toward those goals. For most existing organizations or programs, that requires movement from a traditional "top down" hierarchical clinical model to a psychosocial empowerment partnership that embraces all possible tools and paths to healing. In a pluralistic public health system with many levels and types of services and treatment, this is coming to be accepted as a "sine qua non," or "without which not," for humane, dignified, cost-effective, genuinely person-centered support and assistance in moving forward.

Source: Salasin, 2011, p. 18.

an anxiety disorder (Lasiuk & Hegadoren, 2006). Beginning with this definition, the body of research grew, and the scope of application began to broaden, but not without considerable debate on what constituted a trauma.

The social revolution that began in the 1960s, combined with the women's movement and the call for more attention to diverse and disenfranchised groups, set the stage for an increase in the acknowledgement and treatment of victims of interpersonal violence and crime-related trauma (Figley, 2002). The introduction of rape trauma syndrome as a condition highlighted the psychological consequences of sexual assault and the subsequent lack of support from society and the social services system (Kramer & Green, 1997). Subsequently, research began to focus more on interpersonal violence, thus leading to the identification of risk factors and treatment approaches unique to this form of violence and trauma (Olff, Langeland, Drajer, & Gersons, 2007).

With input from international and national mental health organizations and research, the DSM-IV further modified the definition of trauma to include a broader interpretation of the identified stressor (Andreasen, 2010). DSM-5 has maintained the modified definition of trauma, but the criterion requires being explicit as to whether qualifying traumatic events were experienced directly, witnessed, or experienced indirectly (APA, 2013b).

Paralleling the change in DSM criteria, cognitive–behavioral therapy for traumatic stress was developed along with other skills-based approaches (Greene et al., 2004).

Researchers, such as Foa, Resick, D'Zurilla, and Michenbaum, added to the body of knowledge and gave clinicians a variety of tools; these approaches continue to develop and show efficacy even today. There was also renewed interest in the long- and short-term effects of childhood sexual abuse and domestic violence. Interest in documenting the effects of trauma expanded further, including traumatic brain injury, significant orthopedic injuries, and multiple traumas (Starr et al., 2004). So too, the consumer movement in health care began. Consumers insisted on patient rights, humane treatment, and involvement in the treatment process; as a result, the paternalistic approach to health care began to change. As consumers set the initial stage and Federal agencies (e.g., the Substance Abuse and Mental Health Services Administration and its centers) and national organizations promoted the need for trauma-informed policies and care, national studies began to demonstrate the prevalence of traumatic experiences. Research including the Adverse Childhood Experiences and the Women, Co-Occurring, and Violence studies clearly demonstrated the pervasive long-term impact of trauma, reinforcing the call for trauma-informed policies and care. (For more information on the development of trauma-informed care, see Harris and Fallot, 2001b, as well as Jennings, 2004.)

Appendix D—Screening and Assessment Instruments

This appendix provides a selected sample of available tools for screening and assessment of traumatic events and trauma-related symptoms. This is not an exhaustive list, nor does this list focus on screening instruments that capture a broader range of symptoms related to trauma (such as sleep hygiene and dissociation) or other features important in providing trauma-informed care (e.g., resilience level, coping skill style, resource availability). For more information on a broad range of available instruments, refer back to Part 1, Chapter 4. Many of the instruments listed below use criteria found in the *Diagnostic and Statistical Manual of Mental Disorders*, Fourth Edition, Text Revision (DSM-IV-TR; APA, 2000), but with the release of the DSM-5 (APA, 2013a), instruments will evolve, and new versions will be available under the same contact information.

Screening and Assessment Measures

- Clinician Administered PTSD Scale (CAPS)
- Davidson Trauma Scale (DTS)
- Distressing Event Questionnaire (DEQ)
- Evaluation of Lifetime Stressors (ELS)
- Impacts of Event Scale Revised (IES-R)
- Mississippi Scale for Combat-Related PTSD (M-PTSD)
- Penn Inventory for Posttraumatic Stress Disorder
- Posttraumatic Diagnostic Scale (PDS)
- PTSD Symptom Scale-Interview (PSS-I)
- PTSD Symptom Scale: Self-Report Version (MPSS-SR)
- Screen for Posttraumatic Stress Symptoms (SPTSS)
- Structured Interview for PTSD (SI-PTSD)
- Trauma Assessment for Adults (TAA)
- Trauma Assessment for Adults (TAA)–Self Report
- Trauma History Questionnaire (THQ)
- Trauma Symptom Inventory (TSI)
- Traumatic Stress Schedule

Screening and Assessment Measures

Clinician Administered PTSD Scale (CAPS)

Domains:	Posttraumatic stress disorder (PTSD), acute stress disorder (ASD)
Timeframe:	CAPS-Sx: Lifetime and current (past week) CAPS-Dx: Current (past month)
Response format:	Other
Format of administration:	Structured
Number of items:	30
Completion time:	30–60 minutes
Qualifications to administer:	Administered by clinicians and clinical researchers who have a working knowledge of PTSD and by appropriately trained paraprofessionals
How to obtain scale:	Contact Danny G. Kaloupek, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: veterans, car accident survivors Reliability: alpha = .94, test-retest = .90–.98 Validity: sensitivity = .85, specificity = .95 (compared with Structured Clinical Interview for DSM Disorders [SCID]), r = .91 (with MS Scale for Combat-related PTSD) kappa = .77 against the SCID diagnosis; item-total correlations = .49–.82; internal consistency = .94
Author(s):	Dudley David Blake, Frank W. Weathers, Linda M. Nagy, Danny G. Kaloupe, Dennis S. Charney, and Terence M. Keane
Contact:	Danny G. Kaloupek, Ph.D. National Center for PTSD Boston VA Medical Center, 11B 150 South Huntington Avenue Boston, MA 02130
Relevant citations:	Blake, D. D. (1994). Rationale and development of the clinician-administered PTSD scales. *PTSD Research Quarterly, 5,* 1–2. Blake, D. D., Weathers, F. W., Nagy, L. Davidson Trauma Scale (DTS)

Domains:	PTSD symptoms
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and course work in the use of assessment instruments or special training in the use of this instrument. Education/training requirements may be waived for those granted the right to administer tests at this level (B) in their jurisdiction.
How to obtain scale:	Contact Mental Health Systems, Inc.
Cost or public domain:	Cost: $15.00
Psychometrics:	Populations sampled: rape victims, veterans, hurricane victims, miscellaneous traumas Reliability: alpha = .99, test-retest = .86
Author(s):	Jonathan R.T. Davidson
Contact:	Mental Health Systems, Inc. 908 Niagara Falls Boulevard North Tonawanda, NY, 14120-2060 800-456-3003
Relevant citations:	Davidson, J. R. T., Book, S. W., Colket, J. T., Tupler, L. A., Roth, S., David, D., Hertzberg, M., Mellman, T., Beckham, J.C., Smith, R., Davison, R. M., Katz, R., & Feldman, M. (1997). Assessment of a new self-rating scale for posttraumatic stress disorder. *Psychological Medicine, 27,* 153–160. Davidson, J. R., Tharwani, H. M., & Connor, K. M. (2002). Davidson Trauma Scale (DTS): Normative scores in the general population and effect sizes in placebo-controlled SSRI trials. *Depression and Anxiety, 15*, 75–78.

Distressing Event Questionnaire (DEQ)

Domains:	Posttraumatic Stress Disorder (PTSD) for multiple events
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured
Number of items:	35
Completion time:	10–15 minutes
Qualifications to administer:	Contact Edward Kubany, Ph.D.
How to obtain scale:	Contact Edward Kubany, Ph.D.
Cost or public domain:	Contact Edward Kubany, Ph.D.
Psychometrics:	Population sampled: veterans, battered women Reliability: inter-item r = .93, test-retest = .95; validity: Pearson's r reliability coefficient = .83 (with Penn Inventory, Pearson's r reliability coefficient = .76 (with Beck Depression Inventory)
Author(s):	Edward Kubany, Mary Beth Leisen, Aaron S. Kaplan, Martin P. Kelly
Contact:	Edward Kubany, Ph.D. National Center for PTSD Pacific Islands Division Department of VA Suite 307 Honolulu, HI 96813 Kubany.Edward@honolulu.va.gov
Relevant citations:	Kubany, E. S., Leisen, M. B., Kaplan, A. S., & Kelly, M. P. (2000). Validation of a brief measure of posttraumatic stress disorder: The distressing event questionnaire (DEQ). *Psychological Assessment, 12*, 197–209.

Evaluation of Lifetime Stressors (ELS)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Other
Format of administration:	Structured
Number of items:	56
Completion time:	10–20 minutes for screening, 1–3 hours for complete interview
Qualifications to administer:	Should be administered by trained clinicians only

How to obtain scale:	Contact Karen Krinsley, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: male veterans, female sexual abuse survivors Reliability: r = .4–1.0
Author(s):	Karen Krinsley, Frank W. Weathers, Elana Newman, Edward A. Walker, Danny G. Kaloupek, Rachel Kimerling
Relevant citations:	Corcoran, C. B., Green, B. L., Goodman, L. A., & Krinsley, K. E. (2000). Conceptual and methodological issues in trauma history assessment. In A. Y. Shalev, R. Yehuda, & A. C. McFarlane (Eds.), *International handbook of human response to trauma* (pp. 22–232). Dordrecht, Netherlands: Kluwer Academic Publishers. Krinsley, K. (1996). Psychometric review of the Evaluation of Lifetime Stressors (ELS) Questionnaire and Interview. In B. H. Stamm (Ed.), *Measurement of stress, trauma, and adaptation (*pp. 160–162). Lutherville, MD: Sidran Press.

Impact of Event Scale Revised (IES-R)

Domains:	PTSD for a single event
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	22
Completion time:	5–10 minutes for screening
Qualifications to administer:	None
How to obtain scale:	http://consultgerirn.org/uploads/File/trythis/try_this_19.pdf
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: earthquake survivors, emergency disaster workers, Vietnam veterans, violence and sexual assault victims Reliability: alpha = .79–.92, test-retest = .89–.94, Pearson's r reliability coefficient = .74–.87
Author(s):	Daniel Weiss and Charles R. Marmar
Relevant citations:	Sundin, E. C. & Horowitz, M. J. (2002). Impact of Event Scale: Psychometric properties. *British Journal of Psychiatry, 180,* 205–209. Weiss, D. S. & Marmar, C. R. (1996).The Impact of Event Scale-Revised. In J. Wilson & T. M. Keane (Eds.), *Assessing psychological trauma and PTSD* (pp. 399–411). New York: Guilford Press. (Includes measure in its entirety.)

Mississippi Scale for Combat-Related PTSD (M-PTSD)

Domains:	PTSD for multiple events
Timeframe:	Contact National Center for PTSD at ncptsd@ncptsd.org
Response format:	Self-administered
Format of administration:	Structured
Number of items:	35
Completion time:	10–15 minutes
Qualifications to administer:	Contact National Center for PTSD at ncptsd@va.gov
How to obtain scale:	To order the scale contact the National Center for PTSD
Cost or public domain:	Free (ncptsd@va.gov)
Psychometrics:	Population sampled: veterans Reliability: inter-item r = .94, test-retest = .97 Validity: sensitivity = .93, specificity = .89
Author(s):	Terence M. Keane
Contact:	National Center for PTSD (116D) VA Medical Center 215 N. Main St. White River Junction, VT 05009 http://www.ptsd.va.gov/

M., & Taylor, K. L. (1988). Mississippi Scale for Combat-Related Posttraumatic Stress Disorder: Three studies in reliability and validity. *Journal of Consulting and Clinical Psychology, 56,* 85–90.

Penn Inventory for Posttraumatic Stress Disorder

Domains:	PTSD for multiple events
Timeframe:	Current (past week)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	26
Completion time:	5–15 minutes

Qualifications to administer:	Contact Melvyn Hammarberg, Ph.D.
How to obtain scale:	Contact Melvyn Hammarberg, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: veterans, oil-rig disaster survivors Reliability: alpha = .94, test-retest = .96
Author(s):	Melvyn Hammarberg
Contact:	Melvyn Hammarberg, Ph.D. Department of Anthropology University of Pennsylvania 325 University Museum 33rd and Spruce Street Philadelphia, PA 19104-6398
Relevant citations:	Hammarberg, M. (1996). Psychometric review of the Penn Interview for Post Traumatic Stress Disorder. In B. C., Stillman, J., & Pape, H. C. (2011). Measuring depression and PTSD after trauma: Common scales and checklists. *Injury, 42,* 288–300.

Posttraumatic Diagnostic Scale (PDS)

Domains:	DSM-IV PTSD symptom clusters
Timeframe:	Current (past month)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	49
Completion time:	10–15 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and course work in the use of assessment instruments or special training in the use of this instrument.
How to obtain scale:	Contact National Computer Systems (NCS)
Cost or public domain:	Cost: $15.00
Psychometrics:	Population sampled: accident/fire, disaster, assault, sexual assault, sexual abuse, major illness Reliability: alpha = .92, test-retest = .83 Validity: sensitivity = .89, specificity = .75

Author(s):	Edna B. Foa, Ph.D.
Contact:	National Computer Systems (NCS) 5605 Green Circle Drive Minnetonka, MN 55343

PTSD Symptom Scale-Interview (PSS-I)

Domains:	PTSD single event
Timeframe:	Current (past 2 weeks)
Response format:	Other
Format of administration:	Structured
Number of items:	17
Completion time:	20 minutes
Qualifications to administer:	Can be administered by a master's level interviewer after a few hours of training.
How to obtain scale:	Contact Edna B. Foa, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: female sexual assault victims, female assault victims Reliability: alpha = .85, test-retest = .80; validity: sensitivity = .88, specificity = .96 (compared with SCID); Pearson's r reliability coefficient = .48–.80 (with Impact of Events intrusion and avoidance, State portion of State-Trait Anxiety Inventory, and MPSS-SR)
Author(s):	Edna B. Foa and Gregory A. Leskin
Contact:	Edna B. Foa, Ph.D. Medical College of Pennsylvania Department of Psychiatry 3200 Henry Avenue Philadelphia, PA 19129-1137

PTSD Symptom Scale: Self-Report Version (MPSS-SR)

Domains:	PTSD for multiple or unknown events
Timeframe:	Current (past 2 weeks)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	10–15 minutes
Qualifications to administer:	Contact Sherry Falsetti, Ph.D.
How to obtain scale:	Contact Sherry Falsetti, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Reliability: alpha = .96–.97 Validity: sensitivity = .89, specificity = .65
Author(s):	Sherry Falsetti, Patricia A. Resick, Heidi S. Resnick, Dean G. Kilpatrick

Screen for Posttraumatic Stress Symptoms (SPTSS)

Domains:	PTSD for multiple or unknown events
Timeframe:	Current (past 2 weeks)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	17
Completion time:	5 minutes
Qualifications to administer:	Contact Eve Carlson, Ph.D.
How to obtain scale:	Contact Eve Carlson, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: psychiatric inpatients Reliability: split half reliability = .91, test-retest = .82
Author(s):	Eve Carlson, Ph.D.
Contact:	Eve Carlson, Ph.D. National Center for PTSD (352-117-MP) Palo Alto Health Care System 795 Willow Road Menlo Park, CA 94025
Relevant citations:	Carlson, E. (2001). Psychometric study of a brief screen for PTSD: Assessing the impact of multiple traumatic events. *Assessment*, *8*, 431–441.

Structured Interview for PTSD (SI-PTSD)

Domains:	PTSD single event
Timeframe:	Current (past 4 weeks)
Response format:	Other
Format of administration:	Structured
Number of items:	17

Completion time:	20–30 minutes
Qualifications to administer:	Can be administered by mental health professionals or by paraprofessionals after some training.
How to obtain scale:	Contact Jonathan Davidson, M.D.
Cost or public domain:	Public domain
Psychometrics:	Population sampled: veterans Reliability: alpha = .94, test-retest = .71, intraclass r = .97 Validity: sensitivity = .96, specificity = .80 (compared with SCID), Pearson's r reliability coefficient = .61 (with IES), Pearson's r reliability coefficient = .51 (with Hamilton Anxiety Scale)

Trauma Assessment for Adults (TAA)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Other
Format of administration:	Structured
Number of items:	13
Completion time:	10–15 minutes
Qualifications to administer:	None specified
How to obtain scale:	Contact Heidi Resnick, Ph.D.
Cost or public domain:	Public domain

Psychometrics:	Populations sampled: adult mental health center clients; face validity established; feasible; validity established via archival records
Author(s):	Connie L. Best, John R. Freedy, Sherry A. Falsetti, Dean G. Kilpatrick, Heidi S. Resnick

Miller (Ed.), *Stressful life events* (pp. 231–266). Madison, WI: International Universities Press.

Trauma History Questionnaire (THQ)

Domains:	Trauma history
Timeframe:	Lifetime
Response format:	Self-administered
Format of administration:	Structured

Number of items:	24
Completion time:	5–15 minutes
Qualifications to administer:	Contact Bonnie L. Green, Ph.D.
How to obtain scale:	Contact Bonnie L. Green, Ph.D.
Cost or public domain:	Public domain
Psychometrics:	Populations sampled: psychiatric outpatients, college students, women with breast cancer Reliability: r = 0.7–0.9, intraclass = .76
Author(s):	Bonnie L. Green
Relevant citations:	Hooper, L., Stockton, P., Krupnick, J., & Green, B., (2011). Martin (Eds.), *Assessing psychological trauma and PTSD* (pp. 63–102). New York: Guilford Press.

Trauma Symptom Inventory (TSI)

Domains:	Trauma-related symptoms
Timeframe:	Current (last 6 months)
Response format:	Self-administered
Format of administration:	Structured
Number of items:	100
Completion time:	20 minutes
Qualifications to administer:	Bachelor's degree in psychology. Must have related field and courses in the use of assessment instruments or special training in the use of this instrument.
How to obtain scale:	Contact Psychological Assessment Resources
Cost or public domain:	Cost: $15.00
Psychometrics:	Population sampled: general population Reliability: alpha = .84–.87

Author(s):	John Briere
Contact:	Psychological Assessment Resources Box 998 Odessa, FL 33556

Martin (Eds.), *Assessing psychological trauma and PTSD* (pp. 63–102). New York: Guilford Press.

Appendix E—Consumer Materials

The following are samples of available consumer materials relating to trauma-informed care and traumatic stress. There is a plethora of consumer information available to meet the immediate and long-term needs of consumers of behavioral health services affected by trauma. In order to not waste effort creating new materials for your client's concerns, it is advisable to explore current science-informed resources. In most cases, consumer materials are already available and easily accessible for free.

AfterDeployment.org (2010). *Just the Facts: Resilience*. Available: http://afterdeployment.org/sites/default/files/pdfs/client-handouts/resilience-understanding.pdf

This Web site provides resources to address symptoms related to traumatic stress in addition to other postdeployment adjustment issues. This site provides information and handouts on resilience, triggers, and other trauma-related topics. It is appropriate for service members as well as civilians.

Blanch, A., Filson, B., & Penny, D. (2012). *Engaging Women in Trauma-Informed Peer Support: A Guidebook*. Available: http://www.nasmhpd.org/publications/engagingwomen.aspx

This draft technical assistance guide was created by the National Center for Trauma-Informed Care (NCTIC) and developed under contract with the National Association of State Mental Health Program Directors. This publication is designed to help make trauma-informed peer support available to women who are trauma survivors and who receive or have received behavioral health services. It is a resource for peers providing support in these or other settings who want to learn how to use trauma-informed principles in supporting women or in the peer support groups. It has been a resource used in the delivery of technical assistance through NCTIC.

Brymer, M., Jacobs, A., Layne, C., Pynoos, R., Ruzek, J., Steinberg, A., et al. (2006). Appendix E: Handouts. *Psychological First Aid: Field Operations Guide.* Available: http://www.ptsd.va.gov/professional/manuals/manual-pdf/pfa/PFA_Appx_E_handouts.pdf

Developed jointly with the National Child Traumatic Stress Network and the National Center for PTSD, this curriculum provides a science-informed approach to psychological first aid for response workers. The goals of this module are to assist survivors in the immediate aftermath of disaster and/or terrorism, reduce initial distress, and foster short- and long-term adaptive functioning. This link provides specific survivor-oriented material, such as strategies in seeking and giving support, education on common immediate reactions, and parental tips for children across developmental stages.

Center for Mental Health Services (2002). *Dealing with the Effects of Trauma-A Self-Help Guide.* Available: http://store.samhsa.gov/shin/content//SMA-3717/SMA-3717.pdf

This self-help guide gives practical information and tools to address and manage symptoms and other consequences of traumatic stress. It provides education on a variety of topics, including trauma-related symptoms, advice on the key ingredients of quality care, barriers to recovery, and practical strategies to enhance recovery and manage difficult emotions.

Center for Mental Health Services, Substance Abuse and Mental Health Services Administration (2005). *Roadmap to Seclusion and Restraint Free Mental Health Services*. Available: http://store.samhsa.gov/product/Roadmap-to-Seclusion-and-Restraint-Free-Mental-Health-Services-CD-/SMA06-4055

This curriculum concerns the elimination of seclusion and restraint. It provides numerous handouts for consumers as well as staff. Several consumer handouts include common reactions to trauma, a trauma screening tool, and strategies to de-escalate agitation and distress.

Mead, S. (2008). *Intentional Peer Support: An Alternative Approach*. Sherry Mead Consulting. Available: http://www.intentionalpeersupport.org/apps/webstore/products/show/3408520

This interactive workbook is designed for individuals who are in peer support roles and those who use peer support services. It provides goals, tasks, competencies, and skills associated with peer support relationships and guidelines for first interviews.

Najavits, L. M. (2002). *Seeking Safety: A Treatment Manual for PTSD and Substance Abuse*. New York: Guilford Press.

This evidence-based practice for individuals who have a history of trauma and a substance use disorder provides not only guidelines for clinicians but handouts for individuals. The consumer materials include information on PTSD and substance abuse and their interrelationship, key principles of the Seeking Safety program, coping skills to support safety, and grounding exercises. For additional information and resources, go to http://www.seekingsafety.org.

National Center for PTSD, U.S. Department of Veterans Affairs (2010). *Understanding PTSD*. Available: http://www.ptsd.va.gov/public/understanding_ptsd/booklet.pdf

This booklet provides consumer information on posttraumatic stress, common traumatic stress symptoms, effective treatments, and resources. The National Center for PTSD also provides additional professional and public resources specific to trauma for veterans and civilians.

Sidran Institute (2012). *Healing Self-Injury*. Available: http://healingselfinjury.org/about.html

This Web site provides numerous resources for consumers and professionals to understand self-inflicted violence. It offers publication links, archived newsletters, and a current blog focused on self-harm.

Appendix F—Organizational Assessment for Trauma-Informed Care

The following two resources are organizational assessments, which represent a key strategy in developing or re-evaluating trauma-informed services. The first assessment, presented by the University of South Florida, College of Behavioral and Community Sciences (2012), is designed for staff or key stakeholders. The second assessment comes from the *Trauma-Informed Organizational Toolkit for Homeless Services* (Guarino, Soares, Konnath, Clervil & Bassuk, 2009) and is a consumer version. There are several other assessment tools available, including Fallot and Harris's *Creating Cultures of Trauma-Informed Care (CCTIC): A Self Assessment and Planning Protocol* (2009).

Staff or Key Stakeholder Organizational Assessment Tool
University of South Florida, College of Behavioral and Community Sciences (2012). *Creating Trauma-Informed Care Environments: An Organizational Self-Assessment*. Available: http://www.cfbhn.org/assets/TIC/youthresidentialself%20assess%20Fillable%20FORM%20%282%29.pdf

Consumer Version: Organizational Assessment Tool
Guarino, K., Soares, P., Konnath, K., Clervil, R., & Bassuk, E. (2009). *Trauma-Informed Organizational Toolkit for Homeless Services*. Rockville, MD: Center for Mental Health Services, Substance Abuse and Mental Health Services Administration, and the Daniels Fund, the National Child Traumatic Stress Network, and the W.K. Kellogg Foundation. See: pp. 82–93. Available: http://www.familyhomelessness.org/media/90.pdf

Appendix J: Acknowledgments

Numerous people contributed to the development of this Treatment Improvement Protocol (TIP), including the TIP Consensus Panel (p. vii), the Knowledge Application Program (KAP) Expert Panel and Federal Government Participants (p. ix), SAMHSA Resource Panel (see Appendix G), TIP Field Reviewers (Appendix H), and the KAP Cultural Competency and Diversity Network participants (Appendix I).

This publication was produced under KAP, a Joint Venture of The CDM Group, Inc. (CDM), and JBS International, Inc. (JBS), under contract numbers 270-99-7072, 270-04-7049, and 270-09-0307 for the Substance Abuse and Mental Health Services Administration, Center for Substance Abuse Treatment.

CDM KAP personnel included Rose M. Urban, M.S.W., J.D., LCSW, LCAS, KAP Executive Deputy Project Director; Jessica L. Culotta, M.A., KAP Managing Project Co-Director; Susan Kimner, former Managing Project Co-Director; Elizabeth Marsh, former KAP Deputy Project Director; Claudia Blackburn, M.S., Psy.D., Expert Content Director; Sheldon Weinberg, KAP Senior Researcher/Applied Psychologist; Bruce Carruth, Ph.D., Expert Content Director; Raquel Witkin, M.S., former Deputy Project Manager; Janet G. Humphrey, M.A., former Editor/Writer; Virgie D. Paul, M.L.S., Librarian; Angela T. Fiastro, KAP Junior Editor; Sonja Easley and Elizabeth Plevyak, former Editorial Assistants; and Elizabeth Pratt, Ph.D., Carol Schober, Psy.D., M.S.N., and Patricia A. Burke, M.S.W., LCSW, BCD, C-CATODSW, CCS, contributing authors. Special thanks to Stephanie Perry, M.D., for providing a content review of the TIP, and to John P. Allen, Ph.D., for writing draft material and contributing information on combat stress.

SAMHSA TIPs and Publications Based on TIPs

What Is a TIP?

Treatment Improvement Protocols (TIPs) are the products of a systematic and innovative process that brings together clinicians, researchers, program managers, policymakers, and other Federal and non-Federal experts to reach consensus on state-of-the-art treatment practices. TIPs are developed under the Substance Abuse and Mental Health Services Administration's Knowledge Application Program (KAP) to improve the treatment capabilities of the Nation's alcohol and drug abuse treatment service system.

What Is a Quick Guide?

A Quick Guide clearly and concisely presents the primary information from a TIP in a pocket-sized booklet. Each Quick Guide is divided into sections to help readers quickly locate relevant material. Some contain glossaries of terms or lists of resources. Page numbers from the original TIP are referenced so providers can refer back to the source document for more information.

What Are KAP Keys?

Also based on TIPs, KAP Keys are handy, durable tools. Keys may include assessment or screening instruments, checklists, and summaries of treatment phases. Printed on coated paper, each KAP Keys set is fastened together with a key ring and can be kept within a treatment provider's reach and consulted frequently. The Keys allow you, the busy clinician or program administrator, to locate information easily and to use this information to enhance treatment services.

Ordering Information

Publications may be ordered or downloaded for free at http://store.samhsa.gov. To order over the phone, please call 1-877-SAMHSA-7 (1-877-726-4727) (English and Español).

TIP 1 **State Methadone Treatment Guidelines**—*Replaced by TIP 43*

TIP 2 **Pregnant, Substance-Using Women**—*Replaced by TIP 51*

TIP 3 **Screening and Assessment of Alcohol- and Other Drug-Abusing Adolescents**—*Replaced by TIP 31*

TIP 4 **Guidelines for the Treatment of Alcohol- and Other Drug-Abusing Adolescents**—*Replaced by TIP 32*

TIP 5 **Improving Treatment for Drug-Exposed Infants**

TIP 6 **Screening for Infectious Diseases Among Substance Abusers**—*Archived*

TIP 7 **Screening and Assessment for Alcohol and Other Drug Abuse Among Adults in the Criminal Justice System**—*Replaced by TIP 44*

TIP 8 **Intensive Outpatient Treatment for Alcohol and Other Drug Abuse**—*Replaced by TIPs 46 and 47*

TIP 9 **Assessment and Treatment of Patients With Coexisting Mental Illness and Alcohol and Other Drug Abuse**—*Replaced by TIP 42*

TIP 10 **Assessment and Treatment of Cocaine-Abusing Methadone-Maintained Patients**—*Replaced by TIP 43*

TIP 11 **Simple Screening Instruments for Outreach for Alcohol and Other Drug Abuse and Infectious Diseases**—*Replaced by TIP 53*

TIP 12 **Combining Substance Abuse Treatment With Intermediate Sanctions for Adults in the Criminal Justice System**—*Replaced by TIP 44*

Implementing a Trauma-Informed Approach for Youth across Service Sectors

This brief is based on a webinar, ***Implementing a Trauma-Informed Approach for Youth Across Service Sectors***, held Tuesday, May 21, 2013, 2:00 p.m. to 3:30 p.m. EDT. The webinar was sponsored by the Interagency Working Group on Youth Programs (IWGYP), a collaboration of 18 Federal departments and agencies that support programs and services focusing on youth and promote the goal of positive, healthy outcomes for youth. The webinar was planned jointly by the IWGYP and the Substance Abuse and Mental Health Services Administration (SAMHSA). The webinar slides are housed on the IWGYP website, FindYouthInfo.gov, under the Mental Health Youth Topic. The webinar featured three content experts nationally known in their field: Eugene Griffin, J.D., Ph.D., Northwestern University, Feinberg School of Medicine; Julian Ford, Ph.D., University of Connecticut, School of Medicine; and Charles Wilson, MSSW, Chadwick Center for Children and Families Rady Children's Hospital - San Diego, California; all of whom have been supported by SAMHSA trauma-focused grants. Additionally, the webinar included two youth presenters, NC and LS, who spoke about their own lived experience and the importance of trauma-informed care. Both youth are referred to only by initials to protect their privacy. NC is a peer specialist and LS is a law student.

Introduction

Trauma affects youth in all communities, and responses to those experiences by child-serving systems are critical. It is important for providers serving youth to understand how best to respond and support healing.

Service providers and policymakers in the youth-serving field are continually learning more from research[i] about trauma, traumatic experiences, and the various responses to traumatic events. It is important for youth serving systems to develop a greater understanding of the association between trauma and mental health and substance use disorders, and how it can derail the healthy development of youth. The field recognizes the importance of addressing trauma and using a trauma-informed approach in prevention, treatment, and recovery efforts.

This brief discusses the concept and prevalence of trauma; techniques for coping with, and recovering from trauma at an individual and systems level; the core principles for building a framework for understanding trauma; and implementation of elements essential for a trauma-informed system as presented by the featured experts.

Recognizing the effects of trauma and understanding how to address trauma are fundamental to the Trauma and Justice Strategic Initiative at the Substance Abuse and Mental Health Services Administration (SAMHSA), a division of the U.S. Department of Health and Human Services (HHS). The focus of SAMHSA's Trauma and Justice Strategic Initiative is on integrating a trauma-informed approach throughout health, behavioral health, and related systems to reduce the harmful effects of trauma and violence on individuals, families, and communities and using innovative strategies to reduce the involvement of individuals with trauma and behavioral health issues in the criminal and juvenile justice systems.

As part of this Initiative, with the help of experts, SAMHSA will be releasing a concept paper outlining a framework for trauma and guidance for developing and implementing a trauma-informed approach.

What Do We Mean by Trauma?

After an introduction by Dr. Larke Huang from the Substance Abuse and Mental Health Services Administration (SAMHSA), Dr. Eugene Griffin provided a framework for understanding trauma.

Trauma is a complex experience that affects youth and the systems that serve them in a variety of ways. The experience of trauma can be described through some common elements: event, experience, and effects, also known as "Three E's."[ii] These elements address the uniqueness of an individual's response to an event and how an event affects one's future behavior and well-being.

An **Event** is objective and measurable. Traumatic events include abuse (physical, emotional, sexual); domestic or community violence; an accident or natural disaster; and war or terrorism.

1. An **Experience** is subjective and difficult to measure because it relates to how someone reacts to an event. It is often thought to be life threatening or physically or emotionally overwhelming, and intensity can vary among people and over time. The way one person experiences an event might differ from the way another person does; culture, gender, and age all influence one's experience of the event. Additionally, people experience events in different ways. Resilience, risk and protective factors, and supports may contribute to this experience.
2. **Effects** are the reactions a person has to an event and the ways an experience changes or alters that person's ongoing and future behavior. Classic symptoms include experiencing hyperarousal, such as overreacting or being hypervigilant; re-experiencing an event as nightmares or flashbacks; and avoiding a situation by having a fight, flight, or freeze reaction. The effects of a traumatic event can have a long-term impact on neurobiological development and contribute to negative physical, hormonal, and chemical changes due to stress responses.

Building on this "Three E's" concept of trauma, SAMHSA frames its concept of trauma as: an event, series of events, or set of circumstances that is experienced by an individual as physically or emotionally harmful or life threatening and that has lasting adverse effects on the individual's functioning and mental, physical, social, emotional, or spiritual well-being.[iii] Researchers[iv] report that traumatic stress occurs when an extreme experience overwhelms and alters an individual's stress-related physiological systems and compromises the functioning of stress-response systems (e.g., neuroimmune, neuroendocrine, autonomic, and central nervous system networks).

"What I found worked best is when I was surrounded by people who really got it, who really understood trauma." — LS

Prevalence of Trauma

Many youth are exposed to traumatic events, including those in the juvenile justice and child welfare systems, as well as those who experience homelessness. Building on the three E's concept, we know that the experience of trauma is complex and particular to each individual's life circumstances, which can make quantifying the extent difficult. Some people experience multiple traumas; for example, a youth who has been separated from his or her family and then experiences assault or abuse in a foster home. As many as half of all children that have been involved with the mental health, child welfare, and juvenile justice systems have experienced multiple traumas.[v] LS and NC, two young people formerly involved with the foster care system, comment in the box above on their experiences with multiple traumas.

"When I was seven years old…my brothers and I were placed in foster care…We were immediately separated, and so I felt like that was probably the first traumatic event that I experienced." — LS

"While I was at my foster home, I had gotten into altercations with my foster brother and before he hit me, I felt scared…" — NC

Coping with and Reactions to Trauma

Dr. Julian Ford provided an overview of strategies for youth, families, and communities to recover from trauma. Recovery from the adverse effects of trauma begins with the recognition that the experience of survival threat caused by traumatic events has caused some major changes in the way a person now copes with stress. These ways of coping are necessary and effective in emergencies such as traumatic events, but they interfere with ordinary day-to-day life. Youth who have experienced trauma may develop coping strategies to help them survive.

Chronic Survival Coping

Trauma affects a youth's relationships, sense of survival, and sense of trust and security with people. The reaction to terrible shock, stressors, challenges, and loss is chronic survival coping. An individual trying to cope or recover from serious challenges and stressors will learn techniques to survive, such as staying on edge; being vigilant, watchful, or even distrustful (hypervigilance); or using indifference to mask hopelessness.

Posttraumatic Survival Coping

Physically, posttraumatic survival coping reflects a change in the body, not just a mental and psychological change. It changes how a person's brain works. The brain helps a person learn, explore, try activities, and experience different ways of living. However, a person cannot experience life freely when trying to survive trauma. Instead, that person must put everything else aside and concentrate only on basic survival needs. Some common survival modes or hypervigilance practices are scanning the environment and being on guard for danger; attempting to block out or not think about upsetting things; being ready to fight or flee; experiencing elevated heart rate and adrenalin rush; and being unable to regulate aggression or use anger management techniques.

"I wish that the people who I was working with in my school were more trauma informed and that they were focused - instead of on the disruptive behavior - on what was causing the disruptive behavior." — LS

Hypervigilance can make it difficult to set and accomplish goals even for the most persistent and high achieving person; all goals are trumped by the larger objective of staying safe. This type of coping can lead to difficulties trusting, including parents, caregivers, friends, teachers, and other adults.

Neurobiological Brain Research

Neuroscience indicates that a person's response to stress and use of coping techniques have three components. Dr. Ford provided a metaphor for understanding these complex brain processes:

- The ***"alarm"*** in the brain tells a person to wake up and pay attention. It also tells the body when there is a crisis and to be ready to react and survive.
- The ***"librarian"*** and ***"search engine"*** file and retrieve memories. When the alarm goes off, the memory filing center pulls information from all parts of the brain to figure out what is going on.
- The ***"computer hard drive"*** is the thinking center where all the information is put together and decisions are made.

If the three above components are working well, the thinking center is activated and a person can handle the stressful situation, not worry about survival, and come up with good ideas and plans for handling the situation, thus the alarm is turned off. However, if the alarm is so strong because of extreme stress (e.g., a threat to survival), it can crash the memory filing center and the hard drive in the brain. At that point, survival coping tactics take over. These activities take place in the part of the brain that helps a person survive and be safe. Operating in survival mode is not the ideal way to live because it leads to difficulty relaxing, trusting, focusing, and handling things appropriately.

Recovery from Trauma

A trauma-informed approach is a framework for providing services that should be integrated into everything that a program and system does. Dr. Ford noted that the goal of recovery from trauma is to tap into an existing strength to reset the brain's alarm to not be in persistent survival mode. Resetting the alarm requires strategies to resume thinking clearly. Evidence-based trauma-informed and trauma-specific therapy programs provide youth and their caregivers with strategies to focus their minds and deal with not feeling safe. Learning the strategies for regulating emotions and controlling anxiety is vital to everyday functioning in society. A trauma-informed approach includes youth and caretakers

in future planning. Trauma takes away control of a person's body or life. Reintroducing some control can tap into resiliency, and planning for the future provides hope.[vi]

Strategies for recovery from trauma include recognizing one's own and others' alarm reactions, sweeping one's mind clear before judging and acting, focusing on what is most important and positive, and being aware of stress and personal control levels. These strategies activate the thinking center and reset the alarm.

Many Paths to Recovery: Evidence-Based Models

- Cognitive-behavioral therapies
- Emotion regulation therapies
- Relational-interpersonal therapies
- Psychotherapies for dissociation
- Parent-child and family system therapies
- Social/helping network therapies
- Peer-to-peer support programs

The webinar presenters acknowledged that there are many paths to recovery and recommended common therapeutic approaches implemented by mental health professionals that can assist individuals who have experienced trauma. It is important to understand that trauma-informed care principles can be implemented by people who are not mental health professionals and work in various systems that provide services for individuals who have experienced trauma.

Trauma at the Systems Level

Mr. Charles Wilson provided a discussion of the child welfare system, and its role in addressing youth and families who have experienced trauma. The experience of trauma is complex and personal, and youth and families who have experienced trauma receive services within a variety of community systems. Providers and systems have the ability to help or potentially re-traumatize. A trauma-informed system aligns interactions among youth-serving agencies, such as the child protection systems, lawyers, juvenile judges, law enforcement, schools, and mental health providers so that they better understand how youth, families, and adults respond to trauma.

A trauma-informed system is not just about raising awareness, but changing behavior, actions, and responses. The approach requires doing things differently so as not to re-traumatize or introduce additional trauma. Systems need to support the natural resiliency of children and youth and assist them in identifying their unique strengths.

In a trauma-informed system, caregivers play a central role in recovery, help promote youth's natural resiliency, and give youth tools for managing stress. A strengths-based approach considers and includes the assistance given to caregivers within the system. This approach considers how the system helps caregivers deal with both current and past traumatic stress. The trauma-informed system assists caregivers understand the significant trauma histories of the children and youth that are in their care. Child welfare workers, mental health therapists, foster parents, juvenile judges, and all those working with children who have experienced significant traumatic events are influenced and touched by the trauma and can experience secondary or vicarious traumatic reactions. Therefore, the trauma-informed system responds to the varying impacts of traumatic stress on children, caregivers, and all those who are in contact with the system. Practitioners take this thinking and awareness about trauma and use it in everyday practice.

"The aftercare team also took a lot of time to do safety planning and future planning with me, and that is important because a lot of young people who experience trauma, they express feelings of hopelessness and they are in a constant state of anxiety, and so their ability to project into the future and plan for the future can be seriously impaired." — LS

Core Principles of a Trauma-Informed Approach

Given the presence of trauma in the lives of many youth and the need for systems and providers to support healing, a trauma-informed approach to providing services is critical. According to SAMHSA's concept of trauma[vii], a program, an organization, or a system that is trauma informed is based on four key assumptions:

- ***Realizes*** the widespread impact of trauma and understands potential paths for recovery.
- ***Recognizes*** the signs and symptoms of trauma in clients, families, staff, and others involved with the system.
- ***Responds*** by fully integrating knowledge about trauma into policies, procedures, practices, and settings.
- ***Resists re-traumatization*** of clients as well as staff***.***

The Chadwick Trauma-Informed Systems Project (CTISP)[viii] National Advisory Committee says that in a trauma-informed child welfare system, all parties recognize and respond to the varying impact of traumatic stress on children, caregivers, and those who have contact with the system. Programs and organizations within the system infuse this knowledge, awareness, and skill into their organizational cultures, policies, and practices. They act in collaboration, using the best available science, to facilitate and support resiliency and recovery.

"I was 13 years old in my first foster home, and I must admit I did not want to be there at first because I was at home with people who I was unfamiliar with…" — NC

SAMHSA's six principles[ix] support a framework for understanding trauma and developing a trauma-informed approach:

- ***Safety:*** Throughout the organization, the staff and the people they serve feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety.
- ***Trustworthiness and transparency:*** Organizational operations and decisions are conducted with transparency and with the goal of building and maintaining trust among clients, family members, staff, and others involved with the organization.
- ***Collaboration and mutuality:*** There is true partnering and leveling of power differences between staff and clients and among organizational staff, from direct care staff to administrators; they recognize that healing happens in relationships and in the meaningful sharing of power and decision making.
- ***Empowerment:*** Throughout the organization and among the clients served, individuals' strengths are recognized, built on, and validated and new skills are developed as needed.
- ***Voice and choice:*** The organization aims to strengthen the experience of choice for clients, family members, and staff and recognizes that every person's experience is unique and requires an individualized approach.
- ***Culture, historical and gender issues:*** The organization incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; are gender-responsive; and incorporate a focus on historical trauma.

These principles underlie the values, beliefs, and attitudes of individuals and organizations offering a trauma-informed approach. Using this approach, organizations foster a belief in resilience and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. Trauma-informed organizations build on strengths and assets of clients, staff, and communities instead of responding only to their perceived deficits. They recognize that everyone has a role to play. They address cultural, historical, and gender issues; actively move past cultural stereotypes and biases; offer gender-responsive services; promote the value of cultural connections; and recognize and address historical trauma. In the words of Dr. Ford, "A person does not have to be a therapist to be therapeutic."

Implementation

In his presentation, Mr. Charles Wilson shared the following central elements of providing trauma-informed care within programs, policies, services, and systems as outlined by the child welfare committee of the National Child Traumatic Stress Network. Sources with additional information are provided in the resources section of this brief.

Element 1: Maximize Physical and Psychological Safety for Children and Families

- Safety is a priority. Children and families who have experienced trauma may still feel unsafe even when they are no longer in danger. In addition to ensuring physical safety, it is important to help children and families feel psychologically safe.
- Sometimes even a noise or smell can trigger the feeling of being unsafe and elicit a reaction that a caretaker might not expect or understand. Being aware of and understanding these triggers and changing something seemingly small or insignificant in a daily routine can change behavior from negative to positive.

Element 2: Identify the Trauma-Related Needs of Children

- One of the first steps in helping trauma-exposed children and families is to understand how they have been impacted by trauma.
- Trauma-related needs can be identified through trauma screening and assessment.
- It is important to consider the type(s) of trauma children have experienced when making service referrals and developing service plans. All children need individualized services that are based on their unique circumstances, strengths, and challenges.

"I had reported a child abuse and neglect incident with social services and they did not come and take us out of our home. It was a form of betrayal of trust because you are expecting someone to help you and when that help does not come, then your relationship with the institutions that you need to rely on in order to get out of a bad situation, the relationship is broken." — LS

Element 3: Enhance Child Well-Being and Resilience

- Many children are naturally resilient.
- Systems must recognize and build on children's existing strengths.
- Both individual caseworkers and overall agency policies should support the continuity of children's relationships.
- Staff and agencies should also ensure that children who have been traumatized have access to evidence-based treatments and services.

Element 4: Enhance Family Well-Being and Resilience

- Families are a critical part of both protecting children from harm and enhancing their natural resilience.
- Providing trauma-informed education and services to parents and other caregivers enhances protective capacities.
- Agencies should recognize and assist caregivers to understand the significant trauma histories of the children and youth that are in their care.
- Agencies should assist caregivers to understand their own trauma histories.

"We need to do some self-esteem building and work with young people to acknowledge their strengths. I think when you have experienced trauma, you have a lot of thoughts, beliefs, or feelings of being unworthy or ashamed and you feel a lot of guilt and sometimes that leads to hopelessness. You are not going to work hard to achieve goals if you do not believe you can achieve them, if you do not believe you are worthy of achieving them…" — LS

Element 5: Enhance the Well-Being and Resilience of Those Working in the System

- Staff play important roles in supporting children, but working with people who have experienced abuse, neglect, violence, and other trauma can cause staff to develop secondary traumatic stress reactions.
- Agencies should collect information about trauma and secondary trauma experienced by staff, implement strategies and practices that build resilience and help staff manage stress, and address the impact of secondary traumatic stress on both individuals and on the system as a whole.

> **"The aftercare team was most useful because they worked across the systems…I did not have to do the work that a lot of young people are burdened with, which is finding a way to get our systems to work with one another." — LS**

Element 6: Partner with Youth and Families

- Youth and families should have choices and an active voice in decision making on individual, agency, and systemic levels.
- Youth and family members who have been in the system have a unique perspective and can provide valuable feedback.
- Partnerships with youth and families should occur at all levels.

Element 7: Partner with Agencies and Systems That Interact with Children and Families

- Agencies need to establish strong partnerships with other child- and family-serving systems.
- Service providers should develop common protocols and frameworks.
- Cross-system collaboration enables all helping professionals to see the child as a whole person, thus preventing potentially competing priorities and messages.
- Collaboration between systems promotes cohesive care and better outcomes.

Conclusion

This brief provides an overview of the webinar content as presented by experts in the field regarding the concepts and prevalence of trauma, principles for understanding trauma, and practices for addressing trauma and working with youth who have experienced trauma.

LS and NC, two young people formerly involved with the foster care system, provided much insight on their experiences with multiple traumas. Their shared comments provide important information and practice-based evidence and strategies that child and youth serving systems could incorporate into their work with children and youth who have experienced trauma. Some of the practical applications they described as beneficial to them include:

- Staff working in schools need to be aware of, educated and informed on the effects of trauma for children and youth, and trained in the causes of disruptive behaviors and ways to address these behaviors that do not re-traumatize children and youth;
- Aftercare teams need to provide consistent and ongoing planning with youth to address the after effects of trauma, (e.g., anxiety, sadness, depressions, feelings of hopelessness, anger, shame, guilt) and to build upon their strengths to instill good self-esteem and a belief that they are worthy of and can achieve goals in their life;

- Aftercare teams need to provide ongoing assistance for children and youth to learn skills for daily life, safety planning to address potential re-traumatization, and development of goals for the "here and now" and in their future;
- Aftercare teams need to provide quick response for children and youth who have been traumatized when reports or incidents of child abuse and/or neglect occur. Teams need to remember that these children and youth have been placed in unfamiliar surroundings and they do not feel safe or trust the people or environment immediately. They must rely on the aftercare teams to provide a trusting relationship with staff that will provide safety, protection and security in their lives;
- Aftercare teams need to work across systems to advocate for children and youth who have experienced trauma, and to assist them with the work needed for their daily care and consistent planning for life transitions.

Many strategies for coping with trauma have been noted in this brief, as well as the experiences of LS and NC which can inform child and youth serving systems on the successful practices and strategies that could improve the experience of children and youth who are coping with and healing from trauma. The resources noted below offer a starting point for deeper understanding of trauma and trauma-informed approaches.

Introduction

Trauma is a widespread, harmful and costly public health problem. It occurs as a result of violence, abuse, neglect, loss, disaster, war and other emotionally harmful experiences. Trauma has no boundaries with regard to age, gender, socioeconomic status, race, ethnicity, geography or sexual orientation. It is an almost universal experience of people with mental and substance use disorders. The need to address trauma is increasingly viewed as an important component of effective behavioral health service delivery. Additionally, it has become evident that addressing trauma requires a multi-pronged, multi-agency public health approach inclusive of public education and awareness, prevention and early identification, and effective trauma-specific assessment and treatment. ***In order to maximize the impact of these efforts, they need to be provided in an organizational or community context that is trauma-informed, that is, based on the knowledge and understanding of trauma and its far-reaching implications.***

The need to address trauma is increasingly viewed as an important component of effective behavioral health service delivery.

The effects of traumatic events place a heavy burden on individuals, families and communities and create challenges for public institutions and service systems. Although many people who experience a traumatic event will go on with their lives without lasting negative effects, others will have more difficulty and experience traumatic stress reactions. Emerging research has documented the relationships among exposure to traumatic events, impaired neurodevelopmental and immune systems responses and subsequent health risk behaviors resulting in chronic physical or behavioral health disorders.[1,2,3,4,5] Research has also indicated that with appropriate supports and intervention, people can overcome traumatic experiences.[6,7,8,9] However, most people go without these services and supports. Unaddressed trauma significantly increases the risk of mental and substance use disorders and chronic physical diseases.[1,10,11]

With appropriate supports and intervention, people can overcome traumatic experiences.

Individuals with experiences of trauma are found in multiple service sectors, not just in behavioral health. Studies of people in the juvenile and criminal justice system reveal high rates of mental and substance use disorders and personal histories of trauma.[12,13] Children and families in the child welfare system similarly experience high rates of trauma and associated behavioral health problems.[5,14] Young people bring their experiences of trauma into the school systems, often interfering with their school success. And many patients in primary care similarly have significant trauma histories which has an impact on their health and their responsiveness to health interventions.[15,16,17]

In addition, the public institutions and service systems that are intended to provide services and supports to individuals are often themselves trauma-inducing. The use of coercive practices, such as seclusion and restraints, in the behavioral health system; the abrupt removal of a child from an abusing family in the child welfare system; the use of invasive procedures in the medical system; the harsh disciplinary practices in educational/school systems; or intimidating practices in the criminal justice system can be re-traumatizing for individuals who already enter these systems with significant histories of trauma. These program or system practices and policies often interfere with achieving the desired outcomes in these systems.

Thus, the pervasive and harmful impact of traumatic events on individuals, families and communities and the unintended but similarly widespread re-traumatizing of individuals within our public institutions and service systems, makes it necessary to rethink doing "business as usual." In public institutions and service systems, there is increasing recognition that many of the individuals have extensive histories of trauma that, left unaddressed, can get in the way of achieving good health and well-being. For example, a child who suffers from maltreatment or neglect in the home may not be able to concentrate on school work and be successful in school; a women victimized by domestic violence may have trouble performing in the work setting; a jail inmate repeatedly exposed to violence on the street may have difficulty refraining from retaliatory violence and re-offending; a sexually abused homeless youth may engage in self-injury and high risk behaviors to cope with the effects of sexual abuse; and, a veteran may use substances to mask the traumatic memories of combat. The experiences of these individuals are compelling and, unfortunately, all too common. Yet, until recently, gaining a better understanding of how to address the trauma experienced by these individuals and how to mitigate the re-traumatizing effect of many of our public institutions and service settings was not an integral part of the work of these systems. Now, however, there is an increasing focus on the impact of trauma and how service systems may help to resolve or exacerbate trauma-related issues. These systems are beginning to revisit how they conduct their "business" under the framework of a trauma-informed approach.

There is an increasing focus on the impact of trauma and how service systems may help to resolve or exacerbate trauma-related issues. These systems are beginning to revisit how they conduct their business under the framework of a trauma-informed approach.

Purpose and Approach: Developing a Framework for Trauma and a Trauma-Informed Approach

PURPOSE

The purpose of this paper is to develop a working concept of trauma and a trauma-informed approach and to develop a shared understanding of these concepts that would be acceptable and appropriate across an array of service systems and stakeholder groups. SAMHSA puts forth a framework for the behavioral health specialty sectors, that can be adapted to other sectors such as child welfare, education, criminal and juvenile justice, primary health care, the military and other settings that have the potential to ease or exacerbate an individual's capacity to cope with traumatic experiences. In fact, many people with behavioral health problems receive treatment and services in these non-specialty behavioral health systems. SAMHSA intends this framework be relevant to its federal partners and their state and local system counterparts and to practitioners, researchers, and trauma survivors, families and communities. The desired goal is to build a framework that helps systems "talk" to each other, to understand better the connections between trauma and behavioral health issues, and to guide systems to become trauma-informed.

APPROACH

SAMHSA approached this task by integrating three significant threads of work: trauma focused research work; practice-generated knowledge about trauma interventions; and the lessons articulated by survivors

of traumatic experiences who have had involvement in multiple service sectors. It was expected that this blending of the research, practice and survivor knowledge would generate a framework for improving the capacity of our service systems and public institutions to better address the trauma-related issues of their constituents.

To begin this work, SAMHSA conducted an environmental scan of trauma definitions and models of trauma informed care. SAMHSA convened a group of national experts who had done extensive work in this area. This included trauma survivors who had been recipients of care in multiple service system; practitioners from an array of fields, who had experience in trauma treatment; researchers whose work focused on trauma and the development of trauma-specific interventions; and policymakers in the field of behavioral health.

From this meeting, SAMHSA developed a working document summarizing the discussions among these experts. The document was then vetted among federal agencies that conduct work in the field of trauma. Simultaneously, it was placed on a SAMHSA website for public comment. Federal agency experts provided rich comments and suggestions; the public comment site drew just over 2,000 respondents and 20,000 comments or endorsements of others' comments. SAMHSA reviewed all of these comments, made revisions to the document and developed the framework and guidance presented in this paper.

The key questions addressed in this paper are:

- **What do we mean by trauma?**
- **What do we mean by a trauma-informed approach?**
- **What are the key principles of a trauma-informed approach?**
- **What is the suggested guidance for implementing a trauma-informed approach?**
- **How do we understand trauma in the context of community?**

SAMHSA's approach to this task has been an attempt to integrate knowledge developed through research and clinical practice with the voices of trauma survivors. This also included experts funded through SAMHSA's trauma-focused grants and initiatives, such as SAMHSA's National Child Traumatic Stress Initiative, SAMHSA's National Center for Trauma Informed Care, and data and lessons learned from other grant programs that did not have a primary focus on trauma but included significant attention to trauma, such as SAMHSA's: Jail Diversion Trauma Recovery grant program; Children's Mental Health Initiative; Women, Children and Family Substance Abuse Treatment Program; and Offender Reentry and Adult Treatment Drug Court Programs.

Background: Trauma — Where We Are and How We Got Here

The concept of traumatic stress emerged in the field of mental health at least four decades ago. Over the last 20 years, SAMHSA has been a leader in recognizing the need to address trauma as a fundamental obligation for public mental health and substance abuse service delivery and has supported the development and promulgation of trauma-informed systems of care. In 1994, SAMHSA convened the Dare to Vision Conference, an event designed to bring trauma to the foreground and the first national conference in which women trauma survivors talked about their experiences and ways in which standard practices in hospitals re-traumatized and often, triggered memories of previous abuse. In 1998, SAMHSA funded the Women, Co-Occurring Disorders and Violence Study to generate knowledge on the development and evaluation of integrated services approaches for women with co-occurring mental and substance use disorders who also had histories of physical and or sexual abuse. In 2001, SAMHSA funded the National Child Traumatic Stress Initiative to increase understanding of child trauma and develop effective interventions for children exposed to different types of traumatic events.

The American Psychiatric Association (APA) played an important role in defining trauma. Diagnostic criteria for traumatic stress disorders have been debated through several iterations of the Diagnostic and Statistical Manual of Mental Disorders (DSM) with a new category of Trauma- and Stressor-Related Disorders, across the life-span, included in the recently released DSM-V (APA, 2013). Measures and inventories of trauma exposure, with both clinical and research applications, have proliferated since the 1970's.[18,19,20,21] National trauma research and practice centers have conducted significant work in the past few decades, further refining the concept of trauma, and developing effective trauma assessments and treatments.[22,23,24,25] With the advances in neuroscience, a biopsychosocial approach to traumatic experiences has begun to delineate the mechanisms in which neurobiology, psychological processes, and social attachment interact and contribute to mental and substance use disorders across the life-span.[3,25]

Simultaneously, an emerging trauma survivors movement has provided another perspective on the understanding of traumatic experiences. Trauma survivors, that is, people with lived experience of trauma, have powerfully and systematically documented their paths to recovery.[26] Traumatic experiences complicate a child's or an adult's capacity to make sense of their lives and to create meaningful consistent relationships in their families and communities.

Trauma survivors have powerfully and systematically documented their paths to recovery.

The convergence of the trauma survivor's perspective with research and clinical work has underscored the central role of traumatic experiences in the lives of people with mental and substance use conditions. The connection between trauma and these conditions offers a potential explanatory model for what has happened to individuals, both children and adults, who come to the attention of the behavioral health and other service systems.[25,27]

People with traumatic experiences, however, do not show up only in behavioral health systems. Responses to these experiences often manifest in behaviors or conditions that result in involvement with the child welfare and the criminal and juvenile justice system or in difficulties in the education, employment or primary care system. Recently, there has also been a focus on individuals in the military and increasing rates of posttraumatic stress disorders.[28,29,30,31]

With the growing understanding of the pervasiveness of traumatic experience and responses, a growing number of clinical interventions for trauma responses have been developed. Federal research agencies, academic institutions and practice-research partnerships have generated empirically-supported interventions. In SAMHSA's National Registry of Evidence-based Programs and Practices (NREPP) alone there are over 15 interventions focusing on the treatment or screening for trauma.

These interventions have been integrated into the behavioral health treatment care delivery system; however, from the voice of trauma survivors, it has become clear that these clinical interventions are not enough. Building on lessons learned from SAMHSA's Women, Co-Occurring Disorders and Violence Study; SAMHSA's National Child Traumatic Stress Network; and SAMHSA's National Center for Trauma-Informed Care and Alternatives to Seclusion and Restraints, among other developments in the field, it became clear that the organizational climate and conditions in which services are provided played a significant role in maximizing the outcomes of interventions and contributing to the healing and recovery of the people being served. SAMHSA's National Center for Trauma-Informed Care has continued to advance this effort, starting first in the behavioral health sector, but increasingly responding to technical assistance requests for organizational change in the criminal justice, education, and primary care sectors.

FEDERAL, STATE AND LOCAL LEVEL TRAUMA-FOCUSED ACTIVITIES

The increased understanding of the pervasiveness of trauma and its connections to physical and behavioral health and well-being, have propelled a growing number of organizations and service systems to explore ways to make their services more responsive to people who have experienced trauma. This has been happening in state and local systems and federal agencies.

States are elevating a focus on trauma. For example, Oregon Health Authority is looking at different types of trauma across the age span and different population groups. Maine's "Thrive Initiative" incorporates a trauma-informed care focus in their children's systems of care. New York is introducing a trauma-informed initiative in the juvenile justice system. Missouri is exploring a trauma-informed approach for their adult mental health system. In Massachusetts, the Child Trauma Project is focused on taking trauma-informed care statewide in child welfare practice. In Connecticut the Child Health and Development Institute with the state Department of Children and Families is building a trauma-informed system of care throughout the state through policy and workforce development. SAMHSA has supported the further development of trauma-informed approaches through its Mental Health Transformation Grant program directed to State and local governments.

Increasing examples of local level efforts are being documented. For example, the City of Tarpon Springs in Florida has taken significant steps in becoming a trauma-informed community. The city made it its mission to promote a widespread awareness of the costly effects of personal adversity upon the wellbeing of the community. The Family Policy Council in Washington State convened groups to focus on the impact of adverse childhood experiences on the health and well-being of its local communities and tribal communities. Philadelphia held a summit to further its understanding of the impact of trauma and violence on the psychological and physical health of its communities.

SAMHSA continues its support of grant programs that specifically address trauma.

At the federal level, SAMHSA continues its support of grant programs that specifically address trauma and technical assistance centers that focus on prevention, treatment and recovery from trauma.

Other federal agencies have increased their focus on trauma. The Administration on Children Youth and Families (ACYF) has focused on the complex trauma of children in the child welfare system and how screening and assessing for severity of trauma and linkage with trauma treatments can contribute to improved well-being for these youth. In a joint effort among ACYF, SAMHSA and the Centers for Medicare and Medicaid Services (CMS), the three agencies developed and issued through the CMS State Directors' mechanism, a letter to all State Child Welfare Administrators, Mental Health Commissioners, Single State Agency Directors for Substance Abuse and State Medicaid Directors discussing trauma, its impact on children, screening, assessment and treatment interventions and strategies for paying for such care. The Office of Juvenile Justice and Delinquency Prevention has specific recommendations to address trauma in their Children Exposed to Violence Initiative. The Office of Women's Health has developed a curriculum to train providers in primary care on how to address trauma issues in health care for women. The Department of Labor is examining trauma and the workplace through a federal interagency workgroup. The Department of Defense is honing in on prevention of sexual violence and trauma in the military.

As multiple federal agencies representing varied sectors have recognized the impact of traumatic experiences on the children, adults, and families they serve, they have requested collaboration with SAMHSA in addressing these issues. The widespread recognition of the impact of trauma and the burgeoning interest in developing capacity to respond through trauma-informed approaches compelled SAMHSA to revisit its conceptual framework and approach to trauma, as well as its applicability not only to behavioral health but also to other related fields.

SAMHSA's Concept of Trauma

Decades of work in the field of trauma have generated multiple definitions of trauma. Combing through this work, SAMHSA developed an inventory of trauma definitions and recognized that there were subtle nuances and differences in these definitions.

Desiring a concept that could be shared among its constituencies — practitioners, researchers, and trauma survivors, SAMHSA turned to its expert panel to help craft a concept that would be relevant to public health agencies and service systems. SAMHSA aims to provide a viable framework that can be used to support people receiving services, communities, and stakeholders in the work they do. A review of the existing definitions and discussions of the expert panel generated the following concept:

> ***Individual trauma results from an* event*, series of events, or set of circumstances that is* experienced *by an individual as physically or emotionally harmful or life threatening and that has lasting adverse* effects *on the individual's functioning and mental, physical, social, emotional, or spiritual well-being.***

THE THREE "E'S" OF TRAUMA: EVENT(S), EXPERIENCE OF EVENT(S), AND EFFECT

Events and circumstances may include the actual or extreme threat of physical or psychological harm (i.e. natural disasters, violence, etc.) or severe, life-threatening neglect for a child that imperils healthy development. These events and circumstances may occur as a single occurrence or repeatedly over time. This element of SAMHSA's concept of trauma is represented in the fifth version of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), which requires all conditions classified as "trauma and stressor-related disorders" to include exposure to a traumatic or stressful event as a diagnostic criterion.

The individual's **experience** of these events or circumstances helps to determine whether it is a traumatic event. A particular event may be experienced as traumatic for one individual and not for another (e.g., a child removed from an abusive home experiences this differently than their sibling; one refugee may experience fleeing one's country differently from another refugee; one military veteran may experience deployment to a war zone as traumatic while another veteran is not similarly affected). How the individual labels, assigns meaning to, and is disrupted physically and psychologically by an event will contribute to whether or not it is experienced as traumatic. Traumatic events by their very nature set up a power differential where one entity (whether an individual, an event, or a force of nature) has power over another. They elicit a profound question of "why me?" The individual's experience of these events or circumstances is shaped in the context of this powerlessness and questioning. Feelings of humiliation, guilt, shame, betrayal, or silencing often shape the experience of the event. When a person experiences physical or sexual abuse, it is often accompanied by a sense of humiliation, which can lead the person to feel as though they are bad or dirty, leading to a sense of self blame, shame and guilt. In cases of war or natural disasters, those who survived the traumatic event may blame themselves for surviving when others did not. Abuse by a trusted caregiver frequently gives rise to feelings of betrayal, shattering a person's trust and leaving them feeling alone. Often, abuse of children and domestic violence are accompanied by threats that lead to silencing and fear of reaching out for help.

How the event is experienced may be linked to a range of factors including the individual's cultural beliefs (e.g., the subjugation of women and the experience of domestic violence), availability of social supports (e.g., whether isolated or embedded in a supportive family or community structure), or to the developmental stage of the individual (i.e., an individual may understand and experience events differently at age five, fifteen, or fifty).[1]

The long-lasting adverse **effects** of the event are a critical component of trauma. These adverse effects may occur immediately or may have a delayed onset. The duration of the effects can be short to long term. In some situations, the individual may not recognize the connection between the traumatic events and the effects. Examples of adverse effects include an individual's inability to cope with the normal stresses and strains of daily living; to trust and benefit from relationships; to manage cognitive processes, such as memory, attention, thinking; to regulate behavior; or to control the expression of emotions. In addition to these more visible effects, there may be an altering of one's neurobiological make-up and ongoing health and well-being. Advances in neuroscience and an increased understanding of the interaction of neurobiological and environmental factors have documented the effects of such threatening events.[1,3] Traumatic effects, which may range from hyper-vigilance or a constant state of arousal, to numbing or avoidance, can eventually wear a person down, physically, mentally, and emotionally. Survivors of trauma have also highlighted the impact of these events on spiritual beliefs and the capacity to make meaning of these experiences.

SAMHSA's Trauma-Informed Approach: Key Assumptions and Principles

Trauma researchers, practitioners and survivors have recognized that the understanding of trauma and trauma-specific interventions is not sufficient to optimize outcomes for trauma survivors nor to influence how service systems conduct their business.

The context in which trauma is addressed or treatments deployed contributes to the outcomes for the trauma survivors, the people receiving services, and the individuals staffing the systems. Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.[22,32,33] SAMHSA's concept of a trauma-informed approach is grounded in a set of four assumptions and six key principles.

A program, organization, or system that is trauma-informed* realizes *the widespread impact of trauma and understands potential paths for recovery;* recognizes *the signs and symptoms of trauma in clients, families, staff, and others involved with the system; and* responds *by fully integrating knowledge about trauma into policies, procedures, and practices, and seeks to actively* resist re-traumatization*.

A trauma informed approach is distinct from trauma-specific services or trauma systems. A trauma informed approach is inclusive of trauma-specific interventions, whether assessment, treatment or recovery supports, yet it also incorporates key trauma principles into the organizational culture.

Referred to variably as "trauma-informed care" or "trauma-informed approach" this framework is regarded as essential to the context of care.

THE FOUR "R'S: KEY ASSUMPTIONS IN A TRAUMA-INFORMED APPROACH

In a trauma-informed approach, all people at all levels of the organization or system have a basic **realization** about trauma and understand how trauma can affect families, groups, organizations, and communities as well as individuals. People's experience and behavior are understood in the context of coping strategies designed to survive adversity and overwhelming circumstances, whether these occurred in the past (i.e., a client dealing with prior child abuse), whether they are currently manifesting (i.e., a staff member living with domestic violence in the home), or whether they are related to the emotional distress that results in hearing about the firsthand experiences of another (i.e., secondary traumatic stress experienced by a direct care professional).There is an understanding that trauma plays a role in mental and substance use disorders and should be systematically addressed in prevention, treatment, and recovery settings. Similarly, there is a realization that trauma is not confined to the behavioral health specialty service sector, but is integral to other systems (e.g., child welfare, criminal justice, primary health care, peer–run and community organizations) and is often a barrier to effective outcomes in those systems as well.

People in the organization or system are also able to **recognize** the signs of trauma. These signs may be gender, age, or setting-specific and may be manifest by individuals seeking or providing services in these settings. Trauma screening and assessment assist in the recognition of trauma, as do workforce development, employee assistance, and supervision practices.

The program, organization, or system **responds** by applying the principles of a trauma-informed approach to all areas of functioning. The program, organization, or system integrates an understanding that the experience of traumatic events impacts all people involved, whether directly or indirectly. Staff in every part of the organization, from the person who greets clients at the door to the executives and the governance board, have changed their language, behaviors and policies to take into consideration the experiences of trauma among children and adult users of the services and among staff providing the services. This is accomplished through staff training, a budget that supports this ongoing training, and leadership that realizes the role of trauma in the lives of their staff and the people they serve. The organization has practitioners trained in evidence-based trauma practices. Policies of the organization, such as mission statements, staff handbooks and manuals promote a culture based on beliefs about resilience, recovery, and healing from trauma. For instance, the agency's mission may include an intentional statement on the organization's commitment to promote trauma recovery; agency policies demonstrate a commitment to incorporating perspectives of people served through the establishment of client advisory boards or inclusion of people who have received services on the agency's board of directors; or agency training includes resources for mentoring supervisors on helping staff address secondary traumatic stress. The organization is committed to providing a physically and psychologically safe environment. Leadership ensures that staff work in an environment that promotes trust, fairness and transparency. The program's, organization's, or system's response involves a universal precautions approach in which one expects the presence of trauma in lives of individuals being served, ensuring not to replicate it.

A trauma-informed approach seeks to **resist re-traumatization** of clients as well as staff. Organizations often inadvertently create stressful or toxic environments that interfere with the recovery of clients, the well-being of staff and the fulfillment of the organizational mission.[27] Staff who work within a trauma-informed environment are taught to recognize how organizational practices may trigger painful memories and re-traumatize clients with trauma histories. For example, they recognize that using restraints on a person who has been sexually abused or placing a child who has been neglected and abandoned in a seclusion room may be re-traumatizing and interfere with healing and recovery.

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

A trauma-informed approach reflects adherence to six key principles rather than a prescribed set of practices or procedures. These principles may be generalizable across multiple types of settings, although terminology and application may be setting- or sector-specific.

SIX KEY PRINCIPLES OF A TRAUMA-INFORMED APPROACH

1. **Safety**
2. **Trustworthiness and Transparency**
3. **Peer Support**
4. **Collaboration and Mutuality**
5. **Empowerment, Voice and Choice**
6. **Cultural, Historical, and Gender Issues**

From SAMHSA's perspective, it is critical to promote the linkage to recovery and resilience for those individuals and families impacted by trauma. Consistent with SAMHSA's definition of recovery, services and supports that are trauma-informed build on the best evidence available and consumer and family engagement, empowerment, and collaboration.

The six key principles fundamental to a trauma-informed approach include:[24,36]

1. **Safety:** Throughout the organization, staff and the people they serve, whether children or adults, feel physically and psychologically safe; the physical setting is safe and interpersonal interactions promote a sense of safety. Understanding safety as defined by those served is a high priority.

2. **Trustworthiness and Transparency:** Organizational operations and decisions are conducted with transparency with the goal of building and maintaining trust with clients and family members, among staff, and others involved in the organization.

3. **Peer Support:** Peer support and mutual self-help are key vehicles for establishing safety and hope, building trust, enhancing collaboration, and utilizing their stories and lived experience to promote recovery and healing. The term "Peers" refers to individuals with lived experiences of trauma, or in the case of children this may be family members of children who have experienced traumatic events and are key caregivers in their recovery. Peers have also been referred to as "trauma survivors."

4. **Collaboration and Mutuality:** Importance is placed on partnering and the leveling of power differences between staff and clients and among organizational staff from clerical and housekeeping personnel, to professional staff to administrators, demonstrating that healing happens in relationships and in the meaningful sharing of power and decision-making. The organization recognizes that everyone has a role to play in a trauma-informed approach. As one expert stated: "one does not have to be a therapist to be therapeutic."[12]

5. **Empowerment, Voice and Choice:** Throughout the organization and among the clients served, individuals' strengths and experiences are recognized and built upon. The organization fosters a belief in the primacy of the people served, in resilience, and in the ability of individuals, organizations, and communities to heal and promote recovery from trauma. The organization understands that the experience of trauma may be a unifying aspect in the lives of those who run the organization, who provide the services, and/or who come to the organization for assistance and support. As such, operations, workforce development and services are organized to foster empowerment for staff and clients alike. Organizations understand the importance of power differentials and ways in which clients, historically, have been diminished in voice and choice and are often recipients of coercive treatment. Clients are supported in shared decision-making, choice, and goal setting to determine the plan of action they need to heal and move forward. They are supported in cultivating self-advocacy skills. Staff are facilitators of recovery rather than controllers of recovery.[34] Staff are empowered to do their work as well as possible by adequate organizational support. This is a parallel process as staff need to feel safe, as much as people receiving services.

6. **Cultural, Historical, and Gender Issues:** The organization actively moves past cultural stereotypes and biases (e.g. based on race, ethnicity, sexual orientation, age, religion, gender-identity, geography, etc.); offers, access to gender responsive services; leverages the healing value of traditional cultural connections; incorporates policies, protocols, and processes that are responsive to the racial, ethnic and cultural needs of individuals served; and recognizes and addresses historical trauma.

Guidance for Implementing a Trauma-Informed Approach

Developing a trauma-informed approach requires change at multiples levels of an organization and systematic alignment with the six key principles described above. The guidance provided here builds upon the work of Harris and Fallot and in conjunction with the key principles, provides a starting point for developing an organizational trauma-informed approach.[20] While it is recognized that not all public institutions and service sectors attend to trauma as an aspect of how they conduct business, understanding the role of trauma and a trauma-informed approach may help them meet their goals and objectives. Organizations, across service-sectors and systems, are encouraged to examine how a trauma-informed approach will benefit all stakeholders; to conduct a trauma-informed organizational assessment and change process; and to involve clients and staff at all levels in the organizational development process.

The guidance for implementing a trauma-informed approach is presented in the ten domains described below. This is not provided as a "checklist" or a prescriptive step-by-step process. These are the domains of organizational change that have appeared both in the organizational change management literature and among models for establishing trauma-informed care.[35,36,37,38] What makes it unique to establishing a trauma-informed organizational approach is the cross-walk with the key principles and trauma-specific content.

TEN IMPLEMENTATION DOMAINS

1. **Governance and Leadership**
2. **Policy**
3. **Physical Environment**
4. **Engagement and Involvement**
5. **Cross Sector Collaboration**
6. **Screening, Assessment, Treatment Services**
7. **Training and Workforce Development**
8. **Progress Monitoring and Quality Assurance**
9. **Financing**
10. **Evaluation**

GOVERNANCE AND LEADERSHIP: The leadership and governance of the organization support and invest in implementing and sustaining a trauma-informed approach; there is an identified point of responsibility within the organization to lead and oversee this work; and there is inclusion of the peer voice. A champion of this approach is often needed to initiate a system change process.

POLICY: There are written policies and protocols establishing a trauma-informed approach as an essential part of the organizational mission. Organizational procedures and cross agency protocols, including working with community-based agencies, reflect trauma-informed principles. This approach must be "hard-wired" into practices and procedures of the organization, not solely relying on training workshops or a well-intentioned leader.

PHYSICAL ENVIRONMENT OF THE ORGANIZATION: The organization ensures that the physical environment promotes a sense of safety and collaboration. Staff working in the organization and individuals being served must experience the setting as safe, inviting, and not a risk to their physical or psychological safety. The physical setting also supports the collaborative aspect of a trauma informed approach through openness, transparency, and shared spaces.

ENGAGEMENT AND INVOLVEMENT OF PEOPLE IN RECOVERY, TRAUMA SURVIVORS, PEOPLE RECEIVING SERVICES, AND FAMILY MEMBERS RECEIVING SERVICES: These groups have significant involvement, voice, and meaningful choice at all levels and in all areas of organizational functioning (e.g., program design, implementation, service delivery, quality assurance, cultural competence, access to trauma-informed peer support, workforce development, and evaluation.) This is a key value and aspect of a trauma-informed approach that differentiates it from the usual approaches to services and care.

CROSS SECTOR COLLABORATION: Collaboration across sectors is built on a shared understanding of trauma and principles of a trauma-informed approach. While a trauma focus may not be the stated mission of various service sectors, understanding how awareness of trauma can help or hinder achievement of an organization's mission is a critical aspect of building collaborations. People with significant trauma histories often present with a complexity of needs, crossing various service sectors. Even if a mental health clinician is trauma-informed, a referral to a trauma-insensitive program could then undermine the progress of the individual.

SCREENING, ASSESSMENT, AND TREATMENT SERVICES: Practitioners use and are trained in interventions based on the best available empirical evidence and science, are culturally appropriate, and reflect principles of a trauma-informed approach. Trauma screening and assessment are an essential part of the work. Trauma-specific interventions are acceptable, effective, and available for individuals and families seeking services. When trauma-specific services are not available within the organization, there is a trusted, effective referral system in place that facilitates connecting individuals with appropriate trauma treatment.

TRAINING AND WORKFORCE DEVELOPMENT: On-going training on trauma and peer-support are essential. The organization's human resource system incorporates trauma-informed principles in hiring, supervision, staff evaluation; procedures are in place to support staff with trauma histories and/or those experiencing significant secondary traumatic stress or vicarious trauma, resulting from exposure to and working with individuals with complex trauma.

PROGRESS MONITORING AND QUALITY ASSURANCE: There is ongoing assessment, tracking, and monitoring of trauma-informed principles and effective use of evidence-based trauma specific screening, assessments and treatment.

FINANCING: Financing structures are designed to support a trauma-informed approach which includes resources for: staff training on trauma, key principles of a trauma-informed approach; development of appropriate and safe facilities; establishment of peer-support; provision of evidence-supported trauma screening, assessment, treatment, and recovery supports; and development of trauma-informed cross-agency collaborations.

EVALUATION: Measures and evaluation designs used to evaluate service or program implementation and effectiveness reflect an understanding of trauma and appropriate trauma-oriented research instruments.

To further guide implementation, the chart on the next page provides sample questions in each of the ten domains to stimulate change-focused discussion. The questions address examples of the work to be done in any particular domain yet also reflect the six key principles of a trauma-informed approach. Many of these questions and concepts were adapted from the work of Fallot and Harris, Henry, Black-Pond, Richardson, & Vandervort, Hummer and Dollard, and Penney and Cave.[39, 40, 41,42]

While the language in the chart may seem more familiar to behavioral health settings, organizations across systems are encouraged to adapt the sample questions to best fit the needs of the agency, staff, and individuals being served. For example, a juvenile justice agency may want to ask how it would incorporate the principle of safety when examining its physical environment. A primary care setting may explore how it can use empowerment, voice, and choice when developing policies and procedures to provide trauma-informed services (e.g. explaining step by step a potentially invasive procedure to a patient at an OBGYN office).

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH

KEY PRINCIPLES					
Safety	**Trustworthiness and Transparency**	**Peer Support**	**Collaboration and Mutuality**	**Empowerment, Voice, and Choice**	**Cultural, Historical, and Gender Issues**
10 IMPLEMENTATION DOMAINS					
Governance and Leadership	• How does agency leadership communicate its support and guidance for implementing a trauma-informed approach? • How do the agency's mission statement and/or written policies and procedures include a commitment to providing trauma-informed services and supports? • How do leadership and governance structures demonstrate support for the voice and participation of people using their services who have trauma histories?				
Policy	• How do the agency's written policies and procedures include a focus on trauma and issues of safety and confidentiality? • How do the agency's written policies and procedures recognize the pervasiveness of trauma in the lives of people using services, and express a commitment to reducing re-traumatization and promoting well-being and recovery? • How do the agency's staffing policies demonstrate a commitment to staff training on providing services and supports that are culturally relevant and trauma-informed as part of staff orientation and in-service training? • How do human resources policies attend to the impact of working with people who have experienced trauma? • What policies and procedures are in place for including trauma survivors/people receiving services and peer supports in meaningful and significant roles in agency planning, governance, policy-making, services, and evaluation?				

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH *(continued)*

10 IMPLEMENTATION DOMAINS *continued*	
Physical Environment	• How does the physical environment promote a sense of safety, calming, and de-escalation for clients and staff? • In what ways do staff members recognize and address aspects of the physical environment that may be re-traumatizing, and work with people on developing strategies to deal with this? • How has the agency provided space that both staff and people receiving services can use to practice self-care? • How has the agency developed mechanisms to address gender-related physical and emotional safety concerns (e.g., gender-specific spaces and activities).
Engagement and Involvement	• How do people with lived experience have the opportunity to provide feedback to the organization on quality improvement processes for better engagement and services? • How do staff members keep people fully informed of rules, procedures, activities, and schedules, while being mindful that people who are frightened or overwhelmed may have a difficulty processing information? • How is transparency and trust among staff and clients promoted? • What strategies are used to reduce the sense of power differentials among staff and clients? • How do staff members help people to identify strategies that contribute to feeling comforted and empowered?
Cross Sector Collaboration	• Is there a system of communication in place with other partner agencies working with the individual receiving services for making trauma-informed decisions? • Are collaborative partners trauma-informed? • How does the organization identify community providers and referral agencies that have experience delivering evidence-based trauma services? • What mechanisms are in place to promote cross-sector training on trauma and trauma-informed approaches?
Screening, Assessment, Treatment Services	• Is an individual's own definition of emotional safety included in treatment plans? • Is timely trauma-informed screening and assessment available and accessible to individuals receiving services? • Does the organization have the capacity to provide trauma-specific treatment or refer to appropriate trauma-specific services? • How are peer supports integrated into the service delivery approach? • How does the agency address gender-based needs in the context of trauma screening, assessment, and treatment? For instance, are gender-specific trauma services and supports available for both men and women? • Do staff members talk with people about the range of trauma reactions and work to minimize feelings of fear or shame and to increase self-understanding? • How are these trauma-specific practices incorporated into the organization's ongoing operations?

SAMPLE QUESTIONS TO CONSIDER WHEN IMPLEMENTING A TRAUMA-INFORMED APPROACH *(continued)*

10 IMPLEMENTATION DOMAINS *continued*	
Training and Workforce Development	• How does the agency address the emotional stress that can arise when working with individuals who have had traumatic experiences? • How does the agency support training and workforce development for staff to understand and increase their trauma knowledge and interventions? • How does the organization ensure that all staff (direct care, supervisors, front desk and reception, support staff, housekeeping and maintenance) receive basic training on trauma, its impact, and strategies for trauma-informed approaches across the agency and across personnel functions? • How does workforce development/staff training address the ways identity, culture, community, and oppression can affect a person's experience of trauma, access to supports and resources, and opportunities for safety? • How does on-going workforce development/staff training provide staff supports in developing the knowledge and skills to work sensitively and effectively with trauma survivors. • What types of training and resources are provided to staff and supervisors on incorporating trauma-informed practice and supervision in their work? • What workforce development strategies are in place to assist staff in working with peer supports and recognizing the value of peer support as integral to the organization's workforce?
Progress Monitoring and Quality Assurance	• Is there a system in place that monitors the agency's progress in being trauma-informed? • Does the agency solicit feedback from both staff and individuals receiving services? • What strategies and processes does the agency use to evaluate whether staff members feel safe and valued at the agency? • How does the agency incorporate attention to culture and trauma in agency operations and quality improvement processes? • What mechanisms are in place for information collected to be incorporated into the agency's quality assurance processes and how well do those mechanisms address creating accessible, culturally relevant, trauma-informed services and supports?
Financing	• How does the agency's budget include funding support for ongoing training on trauma and trauma-informed approaches for leadership and staff development? • What funding exists for cross-sector training on trauma and trauma-informed approaches? • What funding exists for peer specialists? • How does the budget support provision of a safe physical environment?
Evaluation	• How does the agency conduct a trauma-informed organizational assessment or have measures or indicators that show their level of trauma-informed approach? • How does the perspective of people who have experienced trauma inform the agency performance beyond consumer satisfaction survey? • What processes are in place to solicit feedback from people who use services and ensure anonymity and confidentiality? • What measures or indicators are used to assess the organizational progress in becoming trauma-informed?

Next Steps: Trauma in the Context of Community

Delving into the work on community trauma is beyond the scope of this document and will be done in the next phase of this work. However, recognizing that many individuals cope with their trauma in the safe or not-so safe space of their communities, it is important to know how communities can support or impede the healing process.

Trauma does not occur in a vacuum. Individual trauma occurs in a context of community, whether the community is defined geographically as in neighborhoods; virtually as in a shared identity, ethnicity, or experience; or organizationally, as in a place of work, learning, or worship. How a community responds to individual trauma sets the foundation for the impact of the traumatic event, experience, and effect. Communities that provide a context of understanding and self-determination may facilitate the healing and recovery process for the individual. Alternatively, communities that avoid, overlook, or misunderstand the impact of trauma may often be re-traumatizing and interfere with the healing process. Individuals can be re-traumatized by the very people whose intent is to be helpful. This is one way to understand trauma in the context of a community.

A second and equally important perspective on trauma and communities is the understanding that communities as a whole can also experience trauma. Just as with the trauma of an individual or family, a community may be subjected to a community-threatening event, have a shared experience of the event, and have an adverse, prolonged effect. Whether the result of a natural disaster (e.g., a flood, a hurricane or an earthquake) or an event or circumstances inflicted by one group on another (e.g., usurping homelands, forced relocation, servitude, or mass incarceration, ongoing exposure to violence in the community), the resulting trauma is often transmitted from one generation to the next in a pattern often referred to as historical, community, or intergenerational trauma.

Communities can collectively react to trauma in ways that are very similar to the ways in which individuals respond. They can become hyper-vigilant, fearful, or they can be re-traumatized, triggered by circumstances resembling earlier trauma. Trauma can be built into cultural norms and passed from generation to generation. Communities are often profoundly shaped by their trauma histories. Making sense of the trauma experience and telling the story of what happened using the language and framework of the community is an important step toward healing community trauma.

Many people who experience trauma readily overcome it and continue on with their lives; some become stronger and more resilient; for others, the trauma is overwhelming and their lives get derailed. Some may get help in formal support systems; however, the vast majority will not. The manner in which individuals and families can mobilize the resources and support of their communities and the degree to which the community has the capacity, knowledge, and skills to understand and respond to the adverse effects of trauma has significant implications for the well-being of the people in their community.

Conclusion

As the concept of a trauma-informed approach has become a central focus in multiple service sectors, SAMHSA desires to promote a shared understanding of this concept. The working definitions, key principles, and guidance presented in this document represent a beginning step toward clarifying the meaning of this concept. This document builds upon the extensive work of researchers, practitioners, policymakers, and people with lived experience in the field. A standard, unified working concept will serve to advance the understanding of trauma and a trauma-informed approach for public institutions and service sectors.

CFCA PAPER NO. 37 2016

Trauma-informed care in child/family welfare services

Liz Wall, Daryl Higgins and Cathryn Hunter

CHILD FAMILY COMMUNITY AUSTRALIA | INFORMATION EXCHANGE

This paper aims to define and clarify what trauma-informed service delivery means in the context of delivering child/family welfare services in Australia. Exposure to traumatic life events such as child abuse, neglect and domestic violence is a driver of service need. Policies and service providers must respond appropriately to people who are dealing with trauma and its effects in order to ensure best outcomes for individuals and families using these services. In addition to evidence-based programs or clinical interventions that are specific to addressing trauma symptoms, such as trauma-focused cognitive behaviour therapy, there is a need for broader organisational- or service-level systems of care that respond to the needs of clients with a lived experience of trauma that go beyond a clinical response. Some of the challenges identified in implementing and embedding trauma-informed care across services and systems are discussed.

KEY MESSAGES

- Traumatic experiences are common, with people often having multiple adverse experiences across their life. There are many serious and deleterious outcomes associated with exposure to them.
- Clients often present to child/family welfare services with a complex range of symptoms and behaviours related to prior and/or past trauma, which neither they nor those working with them have linked to this previous trauma exposure. As a result they may face an uninformed and fragmented response that is potentially re-traumatising.
- There are a small number of trauma-specific interventions that have been evaluated using a rigorous scientific standard and been shown to be effective—however, the research is often based on populations who have experienced a single traumatic event rather than complex trauma.
- Trauma-informed care is a framework for human service delivery that is based on knowledge and understanding of how trauma affects people's lives, their service needs and service usage.
- With the lack of an overarching framework in Australia, there is a danger of inconsistent or piecemeal development of trauma-informed models and practices that do not share a consistent language or framework for implementing trauma-informed systems of care in child/family services.
- As trauma affects a large proportion of the population, survivors are clients in a broad range of human services, and organisations across all settings should consider how a trauma-informed approach could benefit stakeholders, regardless of whether or not the organisation also provides evidence-based trauma-specific interventions.
- Challenges to implementing a trauma-informed approach to care include: a lack of clearly articulated definitions (e.g. of trauma-specific interventions vs the concept and principles of trauma-informed care); translating trauma-informed care to specific practice and service settings; consistency across service settings and systems; care-coordination; a lack of guidance for facilitating complex system change; and a lack of evaluation of models of trauma-informed care.
- Research is needed to explore whether different trauma-informed approaches are required for different population groups, including children, adolescents and adults, or for males and females.

Understanding the experiences of adversity in childhood such as sexual or other abuse as trauma is now recognised to be an important concept for human service delivery sectors. The USA has led efforts to incorporate trauma theory into mental health and other service delivery, largely driven by the Substance Abuse and Mental Health Services Administration (SAMHSA). SAMHSA funds two major trauma-related resources, the National Center for Trauma-Informed Care (NCTIC) and the National Child Traumatic Stress Initiative (NCTSI), to provide a focus for developing a shared language and evidence base around trauma and trauma-informed approaches to service. Emerging

efforts in Australia are now contributing to our knowledge of effective practice for children, young people and adults who have experienced trauma from events such as child maltreatment, sexual assault, military service, forced adoption and past family separation practices.

This paper aims to define and clarify what trauma-informed service delivery means in an Australian context. Australia is not as far down the track as the USA in terms of implementing a trauma-informed approach to human service provision in systems such as mental health and child and family services. There is, however, a recognition that exposure to traumatic life events is a driver of service need and that policies and service providers must address and respond to trauma appropriately to ensure best outcomes for individuals and families using these services.

Trauma terminology

There has been extensive debate around the classification and terminology for describing the effects of trauma, as well as the relationship to specific diagnostic terms such as post-traumatic stress disorder (Van der Kolk, Roth, Pelcovitz, Sunday, & Spinazzola, 2005; Wall & Quadara, 2014). The latest iteration of the *Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association, 2013), an international classification system for mental health disorders, has taken a broad approach to the terminology with a category of "Trauma and Stressor Related Disorders" rather than specifically including complex trauma as a diagnostic term.

Any discussion of trauma-informed service delivery requires consideration of the vast array of definitions and terminology that arises around trauma. This section explains some of the different terms, phrases and concepts that are used in the literature to describe trauma and trauma-related service provision.

Recently, there have been attempts to provide consistency in definitions and a shared language around trauma and a trauma-informed approach to care. SAMHSA's (2014) *Concept of Trauma and Guidance for a Trauma-Informed Approach* puts forward definitions and a working concept of trauma and a trauma-informed approach in order to develop a shared understanding of these concepts for service systems and stakeholders. SAMHSA is a key resource for trauma-informed approaches to care and these definitions are likely to be widely adopted.

What is trauma?

Traumatic events have been described as those that "overwhelm the ordinary human adaptations to life [and] … generally involve threats to life or bodily integrity, or a close personal encounter with violence and death" (Herman, 1992, p. 33). SAMHSA's concept of trauma provides a comprehensive definition that encompasses trauma related to one-off events as well as ongoing adversity:

> Individual trauma results from an event, series of events or set of circumstances that is experienced by an individual as physically or emotionally harmful or life threatening and that has lasting adverse effects on the individual's functioning and mental, physical, social, emotional or spiritual wellbeing. (SAMHSA, 2014, p. 7)

Although not diagnostic terms, *complex trauma* and *complex post-traumatic stress disorder* are often used to describe trauma that is the result of stressors that are interpersonal—usually severe, sustained and perpetrated by one human being on another—and where clients may not meet all of the specific diagnostic criteria for post-traumatic stress disorder (PTSD) or where the primary clinical presentation is the associated features due to the global effects of trauma on the person's functioning (Connor & Higgins, 2008a, 2008b). Trauma is particularly damaging when it occurs in childhood. Complex, interpersonally generated trauma is severely disruptive of a person's capacity to manage internal states (Kezelman & Stavropoulos, 2012). Complex trauma symptoms include problems with mood regulation, impulse control, self-perception, attention, memory and somatic disorders (Briere & Jordan, 2004; Burstow, 2003; van der Kolk et al., 2005).

Trauma-informed interventions occur at two levels: trauma-specific interventions and trauma-informed models of care. Organisational responses to trauma tend to occur on a continuum from basic trauma awareness, to trauma sensitivity, trauma responsivity and through to trauma-informed and/or trauma-specific interventions. We argue here that it is helpful for organisations providing services in the child/family welfare domain, and human services more broadly, to think about their organisational responses to trauma based on their particular service and client needs.

Trauma-specific interventions

Trauma-specific interventions refer to clinical services or programs designed to treat and ameliorate the actual symptoms and presentations of trauma. While it is possible for individual practitioners to deliver trauma-specific interventions (such as trauma-focused cognitive behaviour therapy [CBT]) within the context of a service delivery model or agency that is not trauma-informed at a system level, this is far from ideal. Elements of a service may not be consistent with a trauma-informed approach—such as the waiting room design and operation, interactions with administrative staff or the absence of adjunct services to address other presenting issues for which the trauma-specific intervention might not be effective. Trauma-specific services are best delivered as part of a trauma-informed system of care operating within a trauma-aware organisational context (Elliot, Bjelajac, Fallor, Markoff, & Reed, 2005; Kezelman & Stavropoulos, 2012).

Funded by the Department of Veterans' Affairs, Phoenix Australia (previously known at the Australian Centre for Posttraumatic Mental Health) has developed a database that summarises the evidence for effective trauma-specific interventions related to military and veteran families and communities (see *What Emerging Interventions are Effective for the Treatment of Adults with PTSD?* <www.evidencecompass.dva.gov.au/home/question/10>). Regarding adults suffering from PTSD, they found a paucity of evidence in relation to the efficacy of emerging therapies.[1] Phoenix Australia have also published a variety of resources for practitioners working with people affected by trauma, including fact sheets, clinical guidelines, booklets for clients and a smartphone app for clients with post-traumatic stress symptoms <phoenixaustralia.org/for-practitioners/practitioner-resources>.

Trauma-focused cognitive behaviour therapy (TF-CBT) is an evidence-based treatment approach for children who have experienced sexual abuse, exposure to domestic violence or similar traumas.[2] TF-CBT features on a range of databases of evidence-based practices, including the California Evidence-Based Clearinghouse for Child Welfare (CEBC) Program Registry: <www.cebc4cw.org>. Training in TF-CBT is available online from the Medical University of South Carolina website: <tfcbt.musc.edu>. However, a full discussion of evidence-based trauma-specific interventions is beyond the scope of this paper.[3]

Similarly, in relation to adults affected by childhood trauma, Connor and Higgins (2008a, 2008b) outlined a model of trauma-specific intervention for clients who experience complex trauma (who may not meet the criteria for PTSD). Evaluating the model, they found qualitative and quantitative evidence from a small-scale pilot study of the effectiveness of their combined individual and group therapy approach focused on the following elements (using the mnemonic "HEALTH"):

- having a supportive therapist;
- ensuring personal safety;
- assisting with daily functioning;
- learning to manage core PTSD symptoms (self-regulation);
- treating complex PTSD symptoms; and
- having patience and persistence to enable "ego strengthening".

1 The emerging interventions included in their review were: mindfulness, acceptance and commitment therapy, meditation, transcendental meditation, acupuncture, power therapies, and experiential psychotherapies including adventure therapy, art therapy, music therapy, and canine- and equine-assisted psychotherapy. See: <evidencecompass.dva.gov.au/home/question/10>.

2 See: *Trauma-Focused Cognitive Behavioral Therapy for Children Affected by Sexual Abuse or Trauma* (Child Welfare Information Gateway, 2012) <www.childwelfare.gov/pubpdfs/trauma.pdf>.

3 See *Approaches Targeting Outcomes for Children Exposed to Trauma Arising From Abuse and Neglect: Evidence, Practice and Implications* (Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2014) for a discussion of the evidence of the effectiveness of trauma-specific and trauma-informed practices pertaining specifically to children who have experienced abuse and neglect.

However, there have been criticisms made of trauma-specific interventions. For example:

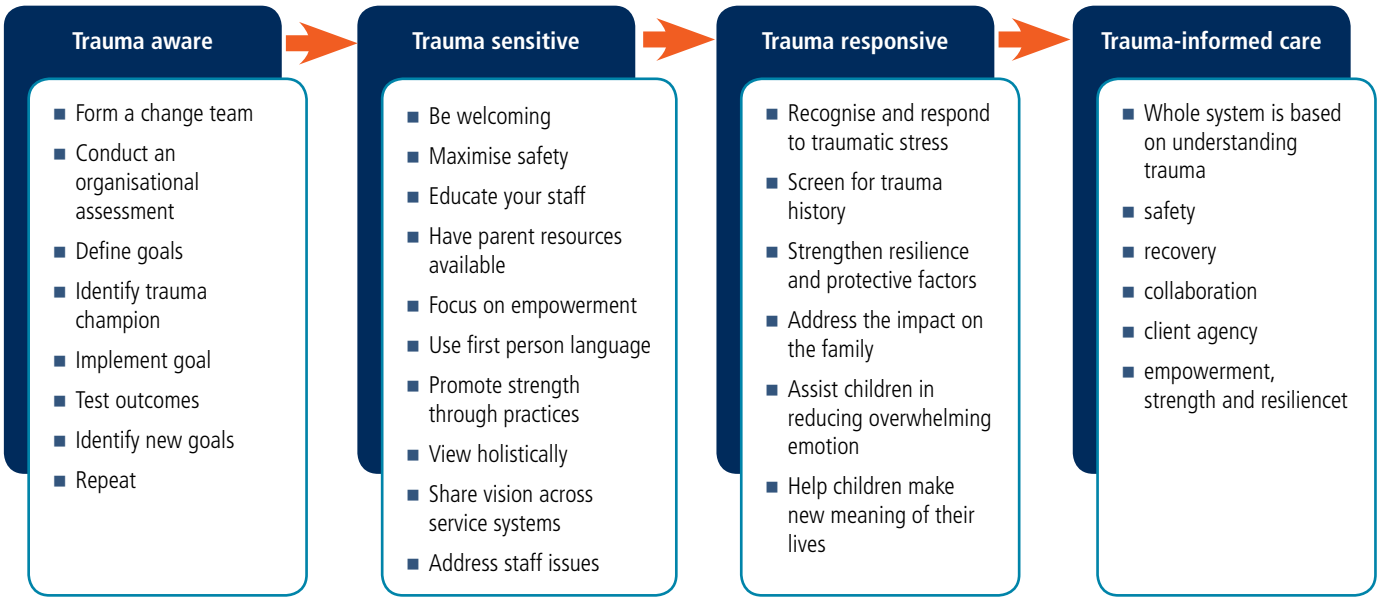
- complex trauma is often inter-relational in nature, so the degree to which research on the treatment of combat-related PSTD applies in these circumstances has been questioned (e.g. for those exposed to prolonged child sexual abuse, particularly if it has resulted in personality or dissociative disorders and is associated with disturbances to affect regulation, self-concept and interpersonal relationships);
- treatment sessions may need to be more frequent and over a longer duration than typical structured programs;
- evaluations of cognitive-based interventions often focus on statistically significant effect sizes rather than clinically meaningful symptom reduction; and
- the value of non-cognitively based interventions, which have been poorly evaluated or not evaluated, are easily overlooked (see: van der Kolk, 2014).

The primary purpose of the paper is not to review the effectiveness—or limitations—of trauma-specific interventions, or even to look specifically at complex trauma and complex PTSD (see: Wall & Quadara, 2014); but rather to explore the broader issue of the value and role of trauma-informed care in child and family welfare service provision.

Trauma-informed model of care

The available literature suggests that there is a continuum from being *trauma aware* (seeking information out about trauma and its implications for organisations) to being *trauma-informed* (a cultural shift at the systemic level). One useful resource sets out the progression in four stages (see Figure 1):

- *trauma aware*: seek information out about trauma;[4]
- *trauma sensitive*: operationalise concepts of trauma within the organisation's work practice;
- *trauma responsive*: respond differently, making changes in behaviour;
- *trauma informed*: entire culture has shifted to reflect a trauma approach in all work practices and settings.



Source: Adapted by Antonia Quadara from Mieseler & Myers (2013)

Figure 1: Practical steps to get from trauma aware to trauma informed

4 At its most basic level, organisations that are trauma aware incorporate trauma awareness into their work. Staff have an understanding of trauma and how symptoms and behavioural presentations in individuals may be responses to traumatic experiences so that behaviours that appear self-destructive or self-defeating can be acknowledged as being adaptive behaviours to trauma that have become maladaptive over time (Hopper, Bassuk, & Olivet, 2010; Markoff, Fallot, Reed, & Elliot, 2005). This applies particularly to broader human service delivery agencies (beyond child/family welfare), particularly if they are not primarily focused on delivering trauma-specific interventions and/or trauma-informed models of care.

SAMHSA's definition of a trauma-informed approach to service is:

> A program, organisation or system that is trauma-informed realises the widespread impact of trauma and understands potential paths for recovery; recognises the signs and symptoms of trauma in clients, families, staff and others involved with the system and responds by fully integrating knowledge about trauma into policies, procedures and practices and seeks to actively resist retraumatisation (SAMHSA, 2014, p. 9)

The main aim of this paper is to explore trauma-informed approaches to care and service delivery specifically in the child and family welfare sectors. While the focus is on how child/family welfare services can be trauma informed, the need extends to other service delivery areas. The trauma literature indicates that trauma survivors are clients in a very broad range of human services such as:

- homelessness (Hopper et al., 2010; Morrison 2009);
- mental health (Kezelman & Stavropoulos, 2012; Muskett, 2014);
- substance abuse treatment; and
- correctional systems (Stathopoulos, 2012).

These types of services have a clear connection to the impacts of trauma, particularly trauma arising from interpersonal victimisation, which has been identified as a driver of human service use (Huntington, Moses, & Veysey, 2005). The term "complex needs" is sometimes used to describe the span of need for an array of services required over a lifetime (Wall & Quadara, 2014). These agencies and services would benefit from being—at a minimum—"trauma aware".

What is the evidence that a trauma-informed approach is needed?

Research suggests that exposure to adverse, potentially traumatic events in childhood is not uncommon (Anda et al., 2006). For example, the Adverse Childhood Experiences (ACE) study in the USA showed that of 17,337 respondents, 64% had experienced at least one adverse experience[5] and approximately 12% had experienced four or more in the first 18 years of life (Anda et al., 2006). Further to this, a recent report suggested that childhood trauma affects an estimated five million Australian adults (Kezelman, Hossack, Stavropoulos, & Burley, 2015). There is also a great deal of evidence associating traumatic experiences with a broad range of deleterious outcomes in childhood, adolescence and adulthood (e.g. Anda et al., 2006; CFCA, 2014a, 2014b; Dube et al., 2001; Hahn Fox, Perez, Cass, Baglivio, & Epps, 2015; Johnson-Reid, Kohl, & Drake, 2012; Nurius, Green, Logan-Greene, & Borja, 2015).

Individual responses to traumatic experiences vary widely, with not all exposure leading to negative outcomes. It is the individual response to the experience that determines whether it is considered traumatic or not (SAMHSA, 2014). If effects occur they can be short- or long-term and may occur immediately following exposure to adversity or have a delayed onset (SAMHSA, 2014).

Multiple studies have reported negative effects associated with experiencing trauma across all facets of life. Mental ill-health, physical illness, social and relational difficulties, and poor academic and employment outcomes have all been linked to previous traumatic experiences. Anda and colleagues (2006) found a strong relationship between increased numbers of adverse childhood experiences and increased prevalence and risk of:

- affective disturbances (e.g. panic attacks, anxiety, hallucinations);
- somatic disturbances (e.g. sleep disturbance, severe obesity);
- smoking, illicit drug use, injected drug use, alcoholism (for people with four or more adverse childhood experiences);
- early intercourse, promiscuity and sexual dissatisfaction;
- impaired memory of childhood; and

5 The adverse childhood experiences measured were three types of childhood abuse: emotional abuse, physical abuse, and contact sexual abuse; and five measures of household dysfunction during childhood: exposure to alcohol or other substance abuse, mental illness, violent treatment of mother or step-mother, criminal behaviour in the household, and parental separation or divorce (Anda et al., 2006, p. 176).

- high perceived stress, difficulty controlling anger and risk of perpetrating intimate partner violence (for people with four or more adverse childhood experiences).

Further to this, the study found that as the number of adverse childhood experiences increased so too did the average number of co-occurring negative outcomes (Anda et al., 2006). There is strong evidence to indicate that certain types of trauma rarely occur in isolation. Research suggests, for example, that the different child maltreatment types are interrelated: sexual abuse, physical abuse, psychological maltreatment, neglect and exposure to domestic and family violence typically occur in combination with each other. A large proportion of children and young people who experience childhood abuse or neglect are exposed to more than one type of abuse (known as "multi-type maltreatment"; Price-Robertson, Higgins, & Vasallo, 2013). Further to this, other forms of victimisation such as bullying or assault by a peer have often been found to co-occur with child maltreatment (known as "poly-victimisation"; see Finkelhor, Ormrod, & Turner, 2007).

Multiple victimisation experiences across different domains are consistently associated with poorer outcomes than a single adverse or maltreatment experience. Those who experience multi-type maltreatment or poly-victimisation are more likely to experience high levels of trauma symptoms and worse outcomes than those who are exposed to no maltreatment or only one type (Finkelhor et al., 2007; Higgins & McCabe, 2001). Supporting these findings, a recent large scale US study of children in the Illinois child welfare system found that children who experienced both violent interpersonal *and* attachment-based ("non-violent") traumas within the caregiver system experienced greater difficulties across several areas of impairment (including attention/behavioural dysregulation and self/relational dysregulation) and were significantly more likely to exhibit PTSD-like symptoms compared to children who had experienced neither type of trauma, violent trauma only or non-violent trauma only (Kisiel et al., 2014).

Co-occurring mental health issues and disorders such as conduct disorder and oppositional defiant disorder (in children), PTSD, depression and other affective disorders, borderline personality disorder, somatoform disorders, psychotic and dissociative disorders have commonly been associated with traumatic experiences (Bateman, Henderson, & Kezelman, 2013; Breslaue, 2009; CFCA, 2014a, 2014b; Nurius et al., 2015; van der Kolk et al., 2005). Self-harm and suicide attempts have also been linked with previous traumatic experiences (Bateman et al., 2013; Cozolino, 2010; Dube et al., 2001; Herman, 1992; Johnson-Reid et al., 2012). In one study, Dube and colleagues (2001) reported that any adverse childhood experience increased the risk of attempted suicide by 2–5 fold with the relationship being partially mediated by illicit drug use, depressed affect and self-reported alcoholism.

Those who have had previous traumatic experiences also commonly report physical health issues. For example, in summarising research on the potential effects of trauma exposure, Bateman and colleagues (2013) found that "survivors of child maltreatment were at increased risk of hepatitis, diabetes, heart disease, cancer, a stroke, are more likely to have surgery and are at increased risk of having one or more chronic pain symptoms" (p. 19). The same authors also noted a range of conditions that child sexual abuse survivors were at increased risk of, including irritable bowel syndrome, asthma, arthritis and digestive problems.

In addition, childhood trauma exposure has been linked to involvement with the criminal justice system. A large study exploring adverse childhood experiences of serious, chronic and violent juvenile offenders and juveniles referred to the justice system for single non-violent offences found that every additional adverse childhood event experienced increased the risk of becoming a serious, chronic and violent juvenile offender by more than 35%, even when other known risk factors for violent behaviour were accounted for (Hahn Fox et al., 2015).

Lastly, difficulties in interpersonal relationships are often reported as a result of experiencing trauma (Bateman et al., 2013; Briere & Spinazzola, 2005; Evans & Coccoma, 2014; van der Kolk, 2005).

Although individual responses to traumatic experiences may vary widely, research has found a strong relationship between the degree of risk of experiencing multiple and complex negative outcomes following traumatic experiences and factors such as the age at which the experience/s occurred, the nature of the experience/s (with negative effects being particularly associated with

trauma of an interpersonal nature such as child abuse and neglect), and the severity and chronicity of the experiences (Cozolino, 2010; Herman, 1992; Kisiel et al., 2014; National Scientific Council on the Developing Child, 2014 [NSCDC]; Resick et al., 2012; van der Kolk et al., 2005). As noted by Cozolino (2010):

> The impact of trauma depends on a complex interaction of the physical and psychological stages of development during which it occurs, the length and degree of the trauma, and the presence of vulnerabilities or past traumas. The impact of chronic trauma becomes woven into the structure of personality and is hidden behind other symptoms, making it difficult to identify, diagnose and treat. (p. 266)

Traumatic events experienced early in life can be extremely damaging to the developing brain. Neural development relies on the interplay of genes and environmental inputs (particularly interaction with primary carers) and early adversity or disrupted attachment relationships that lead to chronic high levels of stress can interfere with key neurobiological development (NSCDC, 2014). Pamela Alexander (2013) suggested that "affective synchronization between mother and child" (p. 45) in carer–infant interactions is crucial for brain development, social development and stress regulation. Early onset, sustained trauma that interferes with this can lead to deficits in multiple domains: dysfunction in fear extinction; affect or emotional regulation; behaviour regulation; learning, cognition and attention; and self and relational dysregulation (Cook et al., 2005; Courtois & Ford, 2009; Evans & Coccoma, 2014; Kisiel et al., 2014; NSCDC, 2014; van der Kolk et al., 2005).

Research has also highlighted that experiencing traumatic events tends to increase the chances of experiencing further traumatic events across the life course. Cozolino (2010) argued that:

> Enduring personality traits and coping strategies that emerge in these situations [experiencing early onset, sustained trauma] tend to decrease positive adaptation and increase an individual's vulnerability to future trauma. This can manifest through engagement in abusive relationships, poor judgement, or a lack of self-protection. (pp. 268–9)

Finally, in examining the need for a trauma-informed approach to care it is pertinent to note that in many cases, due to the co-occurrence of problems resulting from experiencing trauma, individuals may find themselves in multiple systems, cycling in and out of specific services over many years to access, for example, treatment for drug and alcohol addictions, support for employment opportunities and therapeutic services for mental illness.

Historically, the underlying factor often linking a constellation of needs together—the history of abuse and its impacts—has not been adequately acknowledged or integrated into these service systems' service responses to individuals (Harris & Fallot, 2001). Further, populations with complex needs are at high risk of falling through the gaps of service delivery systems due to a lack of service co-ordination and the related barriers to service integration (Whiteford & McKeon, 2012). This can mean that clients: are deemed ineligible for services (e.g. cannot engage in mental health treatment until they have "dealt with" their substance abuse issue or vice versa); are expected to separate out their trauma experiences from their service or treatment needs ("we don't deal with trauma in this parenting class"); and experience services systems' responses as re-traumatising.

The SAMHSA-funded *Women With Co-Occurring Disorders and Violence Study* was a comprehensive 5-year project (1998–2003) across multiple sites, which provided evidence that integrating different services, such as mental health and substance abuse services where there was client need for both, was effective. This study showed that trauma-informed approaches could enhance the effectiveness of mental health and substance abuse services for women with co-occurring mental health and substance abuse disorders (Huntington et al., 2005; Morrisey et al., 2005). A trauma committee for this study also developed an understanding of trauma-informed principles and ways in which mental health and substance abuse service providers could use the approach (Elliot et al., 2005). In the years since the study, further development, debate and discussion has resulted in an expanded evidence base about the effects of trauma and appropriate approaches for services.

What is trauma-informed care?

Trauma-informed care could be described as a framework for human service delivery that is based on knowledge and understanding of how trauma affects people's lives and their service needs (Harris & Fallot, 2001). This requires consideration of a person's environment beyond the immediate service being provided and of how their symptoms and presentations may be seen as adaptations to trauma rather than as pathologies (Herman, 1992). At the broadest level, trauma-informed care means that services have an awareness and sensitivity to the way in which clients' presentation and service needs can be understood in the context of their trauma history (Knight, 2015). Kezelman and Stavropoulos (2012) noted that trauma-informed health and welfare settings and systems contrast dramatically with traditional settings and systems as they require different ways of operating, and without this understanding, risk re-traumatising service users. Trauma-informed approaches to care could be described as a strengths-based framework that is responsive to the effects of trauma (Bateman et al., 2013).

Principles of trauma-informed care

Principles of trauma-informed care have been articulated in a range of academic literature and guidance publications (Elliot et al., 2005; Hopper et al., 2010; Jennings, 2004; Kezelman & Stavropoulos, 2012; SAMHSA, 2014). These principles vary in length and number depending on the publication but essentially have the same underlying philosophies, that trauma-informed care means services are trauma aware, safe, strengths-based and integrated.

At the very minimum, trauma-informed services aim to do no further harm through re-traumatising individuals by acknowledging that usual operations may be an inadvertent trigger for exacerbating trauma symptoms. SAMHSA's (2014) approach to trauma-informed care makes four key assumptions that must be present as a basis of implementation for trauma-informed care, with a further six key principles to then be applied.

The key assumptions that SAMHSA has identified as needing to be inherent in any trauma-informed approach are based on four "R"s:

- *Realisation* at all levels of an organisation or system about trauma and its impacts on individuals, families and communities;
- *Recognition* of the signs of trauma;
- *Response*—program, organisation or system responds by applying the principles of a trauma-informed approach; and
- *Resist* re-traumatisation—of clients as well as staff.

In addition to these assumptions, SAMHSA (2014) then described six key principles of a trauma-informed approach:

- *Safety*—Staff and the people they serve feel physically and psychologically safe.
- *Trustworthiness and transparency*—Organisational operations and decisions are transparent and trust is built.
- *Peer support*—Peers is the terminology SAMHSA use for individuals with lived experience of trauma or their caregivers. Peers are also known as "trauma survivors".
- *Collaboration and mutuality*—This principle is about levelling power differentials between staff and clients and amongst organisational staff to ensure a collaborative approach to healing.
- *Empowerment, voice and choice*—This principle emphasises the strengths-based nature of trauma-informed care. The organisation—and ideally the whole service delivery system—fosters recovery and healing.
- *Cultural, historical and gender issues*—A trauma-informed approach incorporates processes that move past cultural stereotypes and biases, and incorporates policies, protocols and processes that are responsive to the cultural needs of clients.

For an example of an Australian model of trauma-informed care, see Tucci and Mitchell's (2015) outline of the basic understanding of trauma that informs appropriate care underpinning the services and training provided by the Australian Childhood Foundation: *9 Plain English Principles of Trauma Informed Care* <www.childhood.org.au/blog/home/2015/april/trauma-informed-care>.

The Berry Street Childhood Institute also provides a number of resources and training on trauma-informed care for children: <www.childhoodinstitute.org.au/Resources>.

Achieving trauma-informed services: Reflection questions for service managers

- What is the likelihood of clients who have experienced trauma accessing our service?
- Do we provide access to trauma-specific evidence-based treatments for current psychological difficulties that result from that trauma (e.g. Trauma-focused cognitive-behaviour therapy)?
  - See *Trauma-Focused Cognitive Behavioral Therapy for Children Affected by Sexual Abuse or Trauma* <www.childwelfare.gov/pubpdfs/trauma.pdf>
- Do we provide access to effective treatments for complex trauma and complex PTSD (for which trauma-specific treatments may not be as effective)?
  - (See: Connor & Higgins, 2008a, 2008b; Kezelman & Stavropoulos, 2012).
- Are these trauma-specific interventions provided inhouse, in collaboration with other agencies, or via referral to an external agency (and if so, do we provide active/warm referral)? See:
  - *Interagency collaboration: Part A. What is it, what does it look like, when is it needed and what supports it?* <aifs.gov.au/cfca/publications/interagency-collaboration-part-what-it-what-does-it>
  - *Interagency collaboration: Part B. Does collaboration benefit children and families? Exploring the evidence.* <aifs.gov.au/cfca/publications/interagency-collaboration-part-b-does-collaboration-benefi>
  - *Effective practices for service delivery coordination in Indigenous communities*. <www.aihw.gov.au/uploadedFiles/ClosingTheGap/Content/Publications/2011/ctgc-rs-08.pdf>
- How do we incorporate restorative justice principles?
  - According to Higgins et al. (2014), restorative justice activities might include:
    - addressing trauma and other mental health consequences through evidence-based therapeutic interventions;
    - repairing the injuries caused to relationships, especially between sons/daughters and parents;
    - providing opportunities for truth-telling, storytelling and acknowledgement; and
    - overcoming shame and recognising past actions through public activities and community awareness campaigns.
  - See: Higgins et al., 2014, pp. 41–46: *Forced Adoption Support Services Scoping Study* <www.dss.gov.au/our-responsibilities/families-and-children/publications-articles/forced-adoption-support-services-scoping-study>
- Who in the organisation is likely to come into contact with individuals who have experienced trauma, or be providing information to, or receiving communications from clients experiencing trauma? Thinking from a "client journey" perspective, this might include:
  - phone/intake staff;
  - web/staff with online monitoring;
  - reception;
  - office manager;
  - media and communications staff;
  - other staff or contractors on the premises (e.g. catering, cleaning, security); and
  - project/service delivery professionals and support staff.

- Who is less likely to be interacting with trauma survivors but who need to understand, and who need to support "front-line" workers and other support staff who do?
  - executive staff (who create the authorising environment);
  - managers and team leaders; and
  - mentors and supervisors.

This suggests the value of whole-of-organisation approaches to trauma-informed service delivery, directed at every level to ensure a focus on what helps clients feel safe.

- What should training encompass? Training should include:
  - skills in de-escalation or "holding" clients who are experiencing an acute episode of trauma or re-traumatisation;
  - debriefing and staff protocols for responding to difficult situations and clients presenting with complex circumstances and trauma histories;
  - information on staff care and preventing/responding to secondary or vicarious trauma—the psychological term for changes that can occur to people when they are repeatedly exposed to traumatic material (see <aifs.gov.au/publications/feeling-heavy>);
  - organisational supports to prevent or address vicarious trauma for staff including: clinician self-care skills and reflective practice, caseload management, supervision, debriefing, staff and peer support, workplace safety, comfort and supportive work culture that acknowledges the reality of vicarious trauma (Morrison, 2007);
  - types of events/circumstances in clients' lives that may be traumatising;
  - typical modes of reacting—events/triggers for re-traumatisation; and
  - understanding the impacts of trauma (such as behavioural symptoms typical of PTSD, as well as the developmental impacts of victimisation and trauma on an individual's beliefs—about the self, the world, and the future—e.g. see: Janoff-Bulman & Frieze, 1983).

Further to this, SAMHSA also provide a range of sample questions to consider when implementing a trauma-informed approach <store.samhsa.gov/shin/content//SMA14–4884/SMA14–4884.pdf> (p.14–16).

Which services should be delivering trauma-informed care?

Most of the US literature about trauma-informed care is directed at change in behavioural health services. In Australia there appears to be an emphasis on driving change in the mental health sector. This has the potential to cause confusion about the pathway to providing trauma-informed care in the child, family and community sectors and about what being trauma-informed actually means. One aspect of clarifying these questions is to understand which services should be adopting a trauma-informed approach to human service delivery.

In addition, there are communities and populations for whom violence and intergenerational trauma are a constant reality. Some Indigenous communities, for example, experience the phenomenon of trans-generational trauma whereby trauma is transmitted across a number of generations (Atkinson, 2002). The historical impacts of colonisation on Aboriginal people in Australia have played out in a history of disadvantage and discrimination as traditional Aboriginal life was gradually disrupted and dismantled (Atkinson, 2002; Keel, 2004). The effectiveness of the full range of health and human services in such communities could be enhanced by a trauma-informed approach (Atkinson, 2013).

As outlined in the earlier discussion on principles of trauma-informed care, it is important for services to be culturally attuned and relevant (Atkinson, 2013). This is described by SAMHSA as the principle that the trauma-informed organisation actively moves past cultural and gendered stereotypes and incorporates policies and processes that are responsive to the cultural needs of individuals served, including addressing historical trauma (SAMHSA, 2014) or collective trauma (Atkinson, 2013).

Building on the work of Harris and Fallot, SAMHSA's (2014) *Concept of Trauma and Guidance for a Trauma-Informed Approach* outlined ten implementation domains:

- governance and leadership;
- policy;
- physical environment;
- engagement and involvement;
- cross-sector collaboration;
- screening, assessment, treatment services;
- training and workforce development;
- progress monitoring and quality assurance;
- financing; and
- evaluation (p. 12).

This guidance information is designed to provide a starting point for an organisational approach to implementing trauma-informed care. It also indicates that organisations across *all* settings should consider how trauma-informed approaches could benefit stakeholders regardless of whether they deal with trauma in their day-to-day business. The reality of the prevalence of traumatic experiences in the general population indicates that trauma is not confined to prevention, treatment and recovery settings but is integral in other systems as well (SAMHSA, 2014).

It is important to note that many practices that service providers currently use are likely to already be consistent with a trauma-informed approach, such as conveying empathy and validating the client's experiences (Knight, 2015). What is different about identifying as a trauma-informed service is that there is a paradigm shift in service delivery culture to acknowledge and clearly articulate the importance of trauma in understanding and responding to client presentation.

With the lack of an overarching framework in Australia, there is a danger of developing trauma-informed models and practices that are not sharing a consistent language about what being trauma-informed entails. This issue is discussed in more depth in the section about challenges to implementation later in this paper.

The need for a systems approach to trauma-informed care

Following the lead of the USA, Australian health agencies are moving towards a trauma-informed paradigm for considering health and human service delivery systems (Kezelman & Stavropoulos, 2012) in preference to a medical model of individual illness (DeCanandia, Guarino, & Clervil, 2014).

The effects of traumatic experience often manifest in behaviours that result in people being involved in human service systems that go beyond mental health, such as the criminal justice system (SAMHSA, 2014). A systems approach to trauma-informed care means that implementation goes beyond individual practitioner and service organisation change to extend to whole systems that people who have experienced trauma are likely to interact with. A system, for example, could include the justice, homelessness or child welfare systems. These systems may not include treatment settings but can still affect the people who experience them. In the USA, a range of systems are in the process of adopting a cross-sectoral approach to implementing trauma-informed care and trauma-specific services to support service users (DeCanandia et al., 2014). For example, the behavioural health and health care, veterans' administration, homelessness and education sectors are just a few of the systems that are shifting to a trauma-informed approach (DeCanandia et al., 2014).

The differences between trauma-informed services and trauma-specific services are described in the definitions outlined earlier. It is important to distinguish between them but acknowledge the intersection of the two types. Trauma-specific services are designed to treat the symptoms or manifestations of the effect of a trauma on an individual but these interventions must be delivered in a trauma-informed context. This emphasises an overall philosophy of trauma as a central concept in understanding the presentation of clients within a range of health and welfare settings (Kezelman & Stavropoulos, 2012).

Challenges in implementing a trauma-informed approach to care

As noted previously, implementing trauma-informed care requires a paradigm shift in service delivery (Hopper et al., 2010; Jennings, 2004). The literature around trauma-informed care indicates that there are still some challenges to implementing this approach for systems and services, as well as the need for research to evaluate the approach's effect on client wellbeing and other service delivery outcomes (Ashmore, 2013; Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2013; Hopper et al., 2010; Muskett, 2014). These challenges are discussed in the following sections.

Inconsistent understandings of what it means to be trauma-informed

The most identifiable challenges across the literature are in the need to create shared understandings, and current inconsistencies in education regarding trauma-informed care (Australian Centre for Posttraumatic Mental Health & Parenting Research Centre, 2013; Hopper et al., 2010). It is difficult to align organisational change to a specific practice without a shared understanding or vision of what trauma-informed care actually is. In a comparative study of trauma-informed care in acute mental health inpatient units, Ashmore (2013) identified this as an issue in the implementation of trauma-informed care in an acute patient environment. A lack of definition and of a shared framework, as well as a lack of information specific to an acute mental health inpatient setting, were associated with challenges and inconsistency in implementation.

In their review of the literature, the Parenting Research Centre and the Australian Centre for Post-traumatic Health (2013, now Phoenix Australia) found that although participants within the child and family services sector who worked with children exposed to trauma were familiar with terminology such as "trauma-informed care", they argued that:

- the field still lacked clear definitions or understandings of concepts;
- there were assumptions that children's social and behavioural difficulties were necessarily trauma-related without clear assessment; and
- there was a lack of guidelines for assessment and treatment of trauma.

SAMHSA's (2014) recent guidance document is clearly aimed at addressing this lack of consistency in definitions and the 2012 document by Adults Surviving Child Abuse provides some practice guidelines (Kezelman & Stavropoulos, 2012). However, an aspect of trauma-informed care is that it must be culturally relevant to the populations it serves (Elliot et al., 2005; Jennings, 2004) and any broad level articulation of policy approaches or frameworks must be applicable in a range of systems and settings and for a variety of cohorts.

Translating trauma-informed care to specific practice and service settings

In addition to the array of terminology and concepts that are sometimes used interchangeably and inconsistently, there is a lack of evidence-based guidance for specific settings and systems to assist with coordinating how trauma-informed practice should be provided for particular service settings and specific populations of service users. This issue was identified by Muskett (2013) and Ashmore (2013) in relation to mental health nursing, where the need to remove the use of seclusion and restraint is emphasised but, beyond this, little has been articulated to support the use of specific practices for service settings to adopt to improve service delivery consistent with principles of trauma-informed care. Dealing with survivors of trauma, particularly in a mental health or child protection setting, may require individuals to use their prior experience to respond to specific situations. In such stressful and potentially dangerous settings, crisis management could lead to a de-prioritisation of trauma-informed responses (Conners-Burrow et al., 2013). Training and guidance for staff on how to respond to acute situations appropriately and feel confident that they are acting in accordance with the principles of trauma-informed care is recommended (Knight, 2015; Muskett, 2014).

Facilitating complex system change

As noted by the American Institute for Research, in order to build a trauma-informed system, commitment at all system levels is required. This includes a commitment to ongoing training and service transformation (DeCanandia et al., 2014). Australia is behind the USA and Canada in developing models and systemwide responses to children and other service users impacted by trauma (Bateman et al., 2013). For example, the USA has the National Child Traumatic Stress Network, funded by SAMHSA, which brings a singular and comprehensive focus to responding to childhood trauma. Australia is arguably still at the stage of requiring policy change to articulate a clear direction for moving towards systems of trauma-informed care in a range of different service delivery areas relating to child/family wellbeing (Bateman et al., 2013).

Systemic change is important because it enables people to receive services that are sensitive to the impact of trauma regardless of whether they enter through any particular service setting or intervention.

Large-scale systems change is also logistically difficult and time-consuming and requires commitment and resources (Hopper et al., 2010). Philosophical differences between sectors that need to work together to integrate care can also impede systemic change (Hopper et al., 2010). Ashmore (2013) identified particular features of systems change for systems such as mental health that are challenging. These challenges include that hierarchical systems such as health may encounter resistance and that there is an inherent power inequality between service users and professionals in such environments.

Creating change at a systemic level is more than providing practitioners and organisations with tools. It requires changes to funding models to support outcomes rather than outputs, and changes to education for mental health practitioners, social workers and other specialists. Essentially, this is about a move towards a more holistic understanding of the inter-related biological, psychological and social dimensions of trauma.

Evaluating a trauma-informed approach to care

Studies from the USA, particularly following the Women With Co-Occurring Disorders Study, have found that trauma-informed, integrated services are judged to be cost-effective when compared with treatment as usual in the comparison sites of that particular study (Domino, Morrisey, Chung, Huntington, & Larson, 2005). Although this study is regularly cited in the literature as evidence of the cost-effectiveness of trauma-informed care (DeCanandia et al., 2014, Hopper et al., 2010; Kezelman & Stavropoulos, 2012); in reality, there is a lack of evaluation about cost-effectiveness and other aspects of trauma-informed care approaches, including its effectiveness in improving outcomes for service users (Quadara, 2015). There is also a lack of evaluation tools to measure the extent to which an organisation is trauma-informed, and the lack of consistent definitions further translates into difficulties in identifying a clear method to indicate the degree to which a service or program is trauma-informed (Hopper et al., 2010).

Other challenges identified in evaluating trauma-informed care, highlighted by Hopper et al. (2010), include the difficulty in measuring cultural change and sustainability of change and whether changes in outcome are attributable to trauma-informed environments or trauma-specific interventions. In addition, the need for cross-system collaboration and assessing human service interactions to establish the extent of trauma-informed care practice implementation further complicates evaluation in this area (Kramer et al., 2015).

Applying trauma-informed care principles

To illustrate how trauma-informed care principles can be applied to respond to different trauma issues, we briefly look at service delivery in the context of people affected by the policies that created the Stolen Generation, past adoption practices and humanitarian migration.

The Stolen Generation

In their program logic, the Aboriginal and Torres Strait Islander Healing Foundation (2014, p. 25) explain how a collective healing process for members of the Stolen Generation and their descendants can occur, and the mechanisms that underlie this process. Central to this model is an understanding of an Aboriginal world view and the pervasive trauma of colonisation, and the need for specific strategies to address ongoing, collective trauma. A common element of collective healing projects is that they are based on a trauma-informed or recovery framework. According to the Healing Foundation (2014):

> Trauma-informed practice is a strengths-based approach to healing that: is based on an understanding of, and responsiveness to, the impact of trauma; emphasises physical, psychological, and emotional safety for people seeking help and for the helpers; and creates opportunities for people affected by trauma to rebuild a sense of control and empowerment. It recognises the prevalence of trauma and is sensitive to and informed by the impacts of trauma on the wellbeing of individuals and communities. (p. 47)

Forced adoption and past family removal practices

An example of an issue that has only recently received public acknowledgement of its role in traumatising a large number of Australians is the former practice of forced adoption, or separation from family due to past family removal practices. In their exploration of good practice principles for services addressing the needs of people affected by forced adoption and past family removal practices, Kenny, Higgins, and Morley (2015) noted:

> There is increasing recognition of the potential for trauma for individuals who have been subjected to forced adoption policies and practices, and the value of a "trauma-informed" or "trauma-aware" approach to service delivery. Good practice suggests that service providers should approach all clients with a forced adoption experience as if they might be trauma survivors (p. 8).

In their overview of good practice principles, Kenny et al. (2015, p. 8) outlined the key elements of trauma-informed service delivery. Being a trauma-informed service ensures the provision of:

- a safe and supportive environment that protects against physical harm and re-traumatisation;
- an understanding of clients and their symptoms in relation to their overall life background, experiences and culture;
- continued collaboration between service provider and client throughout all stages of service delivery and treatment;
- an emphasis on skill building rather than managing symptoms;
- an understanding of the symptoms and survival responses required to cope;
- a view of trauma as a fundamental experience that influences an individual's identity rather than a single discrete event; and
- a focus on what has happened to a person rather than what is wrong with a person.[6]

Humanitarian migrants surviving torture and trauma

The NSW Service for the Treatment and Rehabilitation of Torture and Trauma Survivors (STARTTS) outline the program logic for their service model as systemic and based on an ecological model of factors that influence and support healing for survivors (see *How We Work* <www.startts.org.au/about-us/how-we-work>).

They aim to provide a range of services that reflect the bio-psycho-social model, such as:

- complementary therapies or neurofeedback to address biological impacts;
- counselling to address psychological impacts; and
- community development projects to support social changes.

"There is nothing more practical than a good theory": The theoretical basis of trauma-informed models of care

(a) Attachment—developing a secure base

Attachment theory (Bowlby, 1988) has been used by developmental psychologists to explain positive, secure relationships between infants and caregivers, and how this forms the template for secure adult interpersonal relationships. Disruption to the relationship or insecure attachment is seen as a fundamental mechanism by which childhood trauma affects adult self-concept, wellbeing and interpersonal relationships. Trauma-informed care systems provide a safe environment to expose disruption to the attachment relationship, and build new internal models and "scripts" of the self and relationships.

(b) Self-regulation and control

Social cognitive theories of self-regulation help explain how individuals respond to threatening events. Key components of many trauma-specific treatments are to help individuals to improve self-regulation, safety, security, sense of control and mastery of their environment, and modulate their emotional reactions to traumatic stimuli. Trauma-informed systems of care are aware of the ways in which programs and organisations can trigger traumatic reactions—or even inadvertently replicate the dynamics of the traumatic events/relationships—and seek to minimise them, and promote environments that facilitate positive affect regulation or "modulation".

(c) Fundamental attribution error—overestimating the personal characteristics, underestimating situational factors

Theories of social psychology have identified that humans often make what is termed the "fundamental attribution error", whereby we over-emphasise a person's personality, or internal characteristics, in explaining their behaviour, and underestimate the environmental, or situational factors, that are external influences on their behaviours (e.g. see: Jones & Harris, 1967). For clients who have experienced trauma—particularly complex trauma involving multiple injuries in the interpersonal domain—it is likely that those around them, including their families, their work colleagues and even their health/mental health professionals, are likely to attribute their interpersonal difficulties and deficits in functioning and wellbeing to an inherent personality flaw, rather than having been shaped by their environment (i.e. the external traumatic events they have endured). Creating new environments of support, and opportunities for "reprograming" life scripts are important. But practitioners need to be open to seeing the external influences and specifically target intervention strategies to remediate the long-standing negative consequences.

Source: The title is a quote from Lewin (1952, p. 169)

Moving forward

Much of the literature identified that the paradigm shift towards implementation of a trauma-informed approach to care needed to include commitment from political leadership at all levels (Ashmore, 2013; Bateman et al., 2013; Kramer et al., 2015).

In Australia, the Mental Health Coordinating Council (Bateman et al., 2013) has articulated the requirement for a policy statement from national and state leaders endorsing the concept of trauma as a priority mental health issue and supporting the transition to a trauma-informed service system. This would ensure that there is an identifiable commitment from governments to support the need for trauma-informed service systems.

The broad dissemination of information about trauma-informed, evidence-based best practice has been identified as an important feature of developing the evidence base around trauma (Kramer et al., 2015). Development of a nationally based resource, such as SAMHSA's National Center for Trauma-Informed Care and the National Child Traumatic Stress Network, would provide an Australian-based network of information to support policy development and service delivery and to enable the use of what is currently known about trauma-informed services in different health and human service sectors. Having central resources such as these, is instrumental in shifting human service systems towards a trauma-informed approach to service delivery.[7] Australia does not yet have a body with such a specific focus but extensive work has been undertaken by organisations such as the Mental Health Coordinating Council and Adults Surviving Child Abuse, among others, to help shape behavioural health policy towards incorporating an understanding of the damaging effects of trauma into policy and service delivery approaches.

Although there are some resources and tools now available to support guidance towards trauma-informed systems of care in Australia (Bateman et. al., 2013), there does not appear to be an overarching trauma framework to support a shift in a consistent way. As noted earlier, organisations in Australia have recognised the need for trauma-informed services and

7 See National Center for Trauma-Informed Care and Alternatives to Seclusion and Restraint <www.samhsa.gov/nctic>

interventions but the current array of methods, models and interventions on offer and in use do not support a coordinated and common approach that would ensure trauma-informed has a consistent meaning and interpretation in service delivery.

Conclusion

There is growing awareness of the need, and a strong rationale for the value, of implementing a trauma-informed approach to human service delivery. Such an approach has been adopted and implemented extensively in the USA. In Australia, there is a strong push towards trauma-informed approaches to care, and recognition of the impacts of child abuse and other traumas as a driver of service need. However, there is confusion with the array of terminology used and a lack of reference to specific trauma-informed frameworks to guide the introduction of trauma-informed care in a systemic way. Despite the need, and the conceptual/theoretical rationale, it is important to acknowledge that there is limited empirical evidence to show that working systemically to be trauma aware and providing trauma-informed systems of care leads to reductions in trauma symptoms or other positive outcomes for clients.

Currently, there is no overarching policy to mandate trauma-informed care and no framework to guide evidence-based practice to transition in a systematic way to trauma-informed care in Australia. In addition, improvements to collection of research data and adoption of standardised outcome measures for evaluation would support a more systemic approach to evaluating the implementation of trauma-informed care.

There is value in capturing practice-based evidence; however, this is beyond the scope of the current paper, and would be best carried out via a systematic and rigorous approach to gathering and synthesising information from practitioners working with traumatised clients in a variety of fields—as well as the views of those in service delivery systems that are not yet trauma-informed to examine the barriers and enablers of system change. Similarly, there is a need to articulate findings from the emerging field of trauma-informed practice into concrete policy statements or frameworks that can be applied to different client groups within and across a range of service systems and settings.

Executive Summary

In 2013, the Administration for Children, Youth and Families, Family and Youth Services Bureau, US Department of Health and Human Services, awarded a grant to the GLBTQ Domestic Violence Project in Boston, Massachusetts to help improve trauma-informed work with lesbian, gay, bisexual, queer and transgender (LGBQT*) survivors of intimate partner violence (IPV). The following document is a literature review that sets the context for thinking about trauma-informed practice (TIP) for these communities. We developed this review over the course of 2015, supported along the way by an Advisory Board comprised of the NorthEast Two-Spirit Society, Queer Muslims of Boston, Fenway Community Health, the Hispanic Black Gay Coalition, the Massachusetts Alliance of Portuguese Speakers, HarborCOV, and Massachusetts Asian & Pacific Islanders for Health.

This document helps inform a set of practice-based observations that are included in the Appendix (page 40) and are also available as a separate document. At present, there are few, if any, documented LGBQT*-specific models of trauma-informed practice. This literature review and the accompanying practice observations make a clear case for the need for such models, and for the implementation of culturally competent LGBQT* trauma-informed services.

Key takeaways from the literature review include:

- IPV occurs in LGBQT* relationships at rates equal to or higher than rates in heterosexual relationships. Different subgroups within the community may experience different rates or types of IPV, with bisexual and transgender individuals at particularly high risk.

- Although LGBQT* IPV shares many underlying dynamics with IPV in heterosexual couples, it also has unique characteristics, including the types of abusive tactics used and the context of discrimination and social stigma faced by LGBQT* individuals. Within LGBQT* subgroups, there may be additional complexities.

- LGBQT* survivors who are also part of other oppressed groups often face homophobia within their own cultural communities as well as racism, ableism, xenophobia, and colonialism in mainstream communities. Moreover, LGBQT* IPV often occurs in a landscape that includes other forms of abuse and trauma, including family violence, sexual violence, hate crimes, and police brutality. Such overlapping forms of trauma are often interrelated, rendering some members of the LGBQT* communities subject to abuse by more than one person at a time and at more than one point in their lifespans. In the face of these overlapping forms of oppression, LGBQT* survivors are forced to make particularly constrained choices about safety, often trading one kind of safety for another.

- Mental health difficulties are major concerns among LGBQT* people in general. LGBQT* individuals experience higher rates of traumatic events, and may be at greater risk for developing symptoms of PTSD, depression, and anxiety as well as experiencing suicidality and isolation. These concerns are amplified for LGBQT* survivors of IPV, especially transgender individuals and survivors of color. Nonetheless, LGBQT* survivors find strength and resilience through identity affirmation and social support.

- LGBQT* survivors exhibit unique help-seeking behaviors. Overall, they are less likely to seek services from law enforcement and mainstream providers and more likely to rely on informal social support and LGBQT*-focused programs. There also are differences in help-seeking *within* LGBQT* subgroups. For instance, trans individuals may have an especially difficult time accessing culturally competent and non-traumatizing services. For LGBQT* people of color, stigma, economic constraints, and the absence of community outreach are barriers to services.

- Service provision that is not rooted in an expansive understanding of the intersecting oppressions that LGBQT* survivors face may do more harm than good. The kind of harm done by those in a social service system designed to help has been referred to as *sanctuary harm*, which is antithetical to trauma-informed practice.

- Despite growing awareness of the impact of sanctuary harm on clients who experience multiple forms of oppression and of the unique needs of LGBQT* survivors, trauma-informed approaches tailored to LGBQT* communities have been slow to develop. To our knowledge, there are none in the academic literature. It was our Advisory Board that pointed to an alternative model of trauma-informed practice – transformative justice.[1] While the roots of trauma-informed practice grew out of mental health and substance abuse services, transformative justice emerged from activist communities and seeks to uproot the conditions that created traumatic experiences, ending oppression even (if not especially) within helping systems.

We hope that this document will facilitate thinking about how the core principles of trauma-informed practice can be applied to working with LGBQT* survivors and to ameliorating vicarious traumatization among service providers who do their best in difficult circumstances.
Although this document is intended primarily for staff in domestic and sexual violence organizations, it has broad applicability. The information provided can be used to enhance the work of practitioners, advocates, and administrators in other anti-abuse disciplines, homelessness services, mental health and healthcare circles, criminal legal systems, youth services, and an array of other human services disciplines and social change initiatives that seek to serve and ensure the inclusion of LGBQT* communities. The practice-based observations in the Appendix provide further framing for this important endeavor.

[1] The authors wish to thank Hales Burton, at the Fenway Violence Recovery Program, for first suggesting this conceptual shift.

Introduction

IPV refers to the physical and/or emotional abuse of an individual by a current or former intimate partner. It includes the full range of tactics used to create and maintain power and control over another person, including financial abuse, verbal abuse and intimidation, and cultural abuse. In this document, the phrases *intimate partner violence* and *domestic violence* are used interchangeably to denote partner violence. However, it is important to note that domestic violence (DV) is sometimes defined more broadly to include violence and abuse perpetrated by relatives. Although many LGBQT* individuals experience abuse and/or rejection from family and relatives, the dynamics of partner violence versus family violence may differ dramatically. When we discuss the latter, we use the term *family violence* to distinguish it from violence by an intimate partner.

Following a note on language, the literature review is organized into five sections. Section One focuses on the prevalence and dynamics of IPV in LGBQT* communities. Section Two focuses on trauma, mental health, and resilience among LGBQT* individuals to contextualize the critical need for trauma-informed practices for these survivors. Section Three focuses on the range of systemic, institutional, and individual-level barriers that thwart LGBQT* peoples' access to informal and formal support services. Finally, the last section reviews the core principles of a trauma-informed approach to practice, with attention to the needs of service providers who work with LGBQT* survivors, and provides examples of community-specific approaches to trauma.

A Note on Language

The authors wish to acknowledge at the outset the deep complexities of language. LGBQT* stands for lesbian, gay, bisexual, queer, and transgender. It is often used interchangeably with GLBTQ, LGBQT-TS, and similar acronyms to broadly refer to sexual and gender minorities. This document honors the current practice of including an asterisk after the "T" to signify the broad diversity of trans communities, including trans women – transgender individuals who identify as women, though assigned male at birth; trans men – transgender individuals who identify as men, though assigned female at birth; those transitioning from female to male (FTM); those transitioning from male to female (MTF); cross dressers; gender non-conforming individuals; and others who might self-identify as being members of trans communities. In this paper, transgender and trans are used interchangeably.

These definitions belie the complexity of the terms, however. The words *lesbian*, *gay*, *bisexual*, *transgender*, and *queer* all carry particular historical, political and cultural meanings. To a great extent, these words have been shaped in white, Western contexts. Words such as lesbian, gay, and bisexual, for example, are uniquely English. There are seldom translations into other languages that carry the same understanding of LGBQT* identity as being an identity rather than a set of behaviors. Literal translations, into Spanish or Haitian Creole as but two examples, carry few if any of the presumptions that are inherent in English. In many parts of the Latin and Spanish-speaking world, men who engage in sex with

same sex partners are only considered "gay" in the English sense of the word if they are the receptive partner. It is not engaging in the acts that is the determinant of identity, so much as the role that an individual plays (traditionally read as *masculine* or *feminine*) in the conduct of that act. Similarly, men who marry women, but engage in same sex acts with other men, are frequently identified as heterosexual. In short, they are defined by their social role, rather than by their private, intimate acts. Hence the conception of *gay*, as defined in U.S. contexts, frequently fails to apply.

Precisely because identifiers such as LGBQT* were defined in white middle class and academic contexts, the limitations of LGBQT* labels and identifiers may be particularly acute in communities of color, Indigenous communities, and immigrant communities, among others. During the course of crafting this literature review, members of our Advisory Board taught us a tremendous amount. The Hispanic Black Gay Coalition (HBGC) suggested use of the term *same gender loving*, a community-specific phrase coined by Cleo Manago to distinguish African Americans, and in particular African American men, who do not self-identify as being part of the predominantly white gay movement in the U.S., but who nonetheless wish to affirm their same sex intimate relationships. Corey Yarbrough, one of the founding Executive Directors of HBGC, suggested that, for some same gender loving people, this language may be a form of racialized resistance to the racism of the mainstream LGBQT* movement in the U.S. In the alternative, Corey stated, some members of African American communities may be on the *down low*, engaging in same sex sexual activity, but rejecting LGBQT* identifiers as a result of internalized homo- and bi-phobia.

The NorthEast Two-Spirit Society (NETSS) in part echoed Corey's thoughts about the racism of the mainstream LGBQT* movement. In addition, Harlan Pruden, one of co-founders of NETSS, spoke about an "internal muddiness" that some Native peoples may experience when seeking to find language for their experience. Speaking of his own Cree inheritance as a registered member of the Saddle Indian Reservation, Harlan said that when he asked something of an elder, he knew to offer them tobacco, but never understood the spiritual dimension of the ceremony. Having been separated from too much of their own history by colonialism, genocide, and forced assimilation, Harlan stated, many Native people may use the words *Two-Spirit* when what they really mean is gay Indian.[2]

Harlan also spoke at length about the contextual nature of Native Two-Spirit identities. As Harlan put it, "When I am out on a Friday night in a gay club, I am a gay man. Yet when I am in rural Oklahoma at a Two-Spirit gathering, I am a proud Two-Spirit man." Alluding to the unique role and cultural responsibilities that Two-Spirit people often held (and may still hold) in the life of Native communities, Harlan pointed out the obvious differences in the spiritual role of Two-Spirit peoples, and

[2] Two-spirit is a contemporary term, adopted from the Northern Algonquin, and meant to signify the embodiment of both masculine and feminine within one person. Now embraced by many Native peoples as a pan-Indigenous umbrella term connoting both diverse gender expressions and sexual orientations, two-spirit (TS) generally speaks to the respect that Native peoples held for diversity, and the unique sacred and ceremonial roles that TS people held (and may still hold) within their own communities. Herein the phrase TS speaks not simply to a third gender, or to same gender attraction, but more broadly to the history of compulsory Christianization that sought to erase two-spirit peoples within their own nations. Notably, there is no single consensus definition of two-spirit, and the term means different things to different Native peoples.

the political and social function of people claiming LGBQT* identities in mainstream communities. Several members of the project's advisory board echoed this point,
speaking about the complex layering of cultural and spiritual value systems that accompanied their choice to self-identify in, with, and outside of their own communities.

These same Advisory Board members also acknowledged the landscape in which such decisions are made, and stated that individuals in their communities may shift how they self identify as a means of preserving their safety. As the rest of this literature review discusses, LGB, transgender, same gender loving, Two-Spirit, and queer-identified peoples make choices about how, when, and if to "out" themselves in a complex social and political landscape that is too often unsafe, if not violent. Hence, how any individual self-identifies may shift depending on who is asking, why, and in what context. As one Advisory Board member stated, "identities have to be fluid in order to be protective."

Finally, the leadership of HarborCOV, an LGBQT*-affirming DV organization in Boston that specializes in serving communities facing cultural or linguistic barriers, has noted that some cultures may not have the variety or depth of language that words such as LGB, transgender, same gender loving, and Two-Spirit convey. Indeed, Kourou Pich, Co-Executive Director of HarborCOV has observed that people from some cultures and communities may have difficulty finding language for themselves in their own communities, and that that invisibility is intentional – a function both of denial of the existence of sexual minorities in those communities, but also perhaps protectiveness of gender queer and same gender attracted people.

Language is power. We authors, therefore, have put a great deal of thought into the words we use to name peoples' experiences. At the same time, we know that we can never be as inclusive or sensitive as we want to be. We have done our best to honor the range of experiences we are writing about in this document.

Intimate Partner Violence in LGBQT* Communities

Prevalence of IPV in LGBQT Communities*

Historically, DV has been seen primarily as a problem of cisgender[3], heterosexual men abusing cisgender, heterosexual women. Because of this limited framework, research on the prevalence of DV and IPV among LGBQT* and non-female-identified individuals has been scarce and often limited by the use of non-probability sampling, cross-sectional data that precludes causal inference, and inconsistent definitions of IPV and sexual orientation (Brown & Herman, 2015; Finneran & Stephenson, 2012). Recently, however, there has been an increase in studies that provide more rigorous estimates of IPV in LGBQT* communities. The majority of these studies suggest that IPV occurs in LGBQT* relationships at rates equal to or higher than heterosexual, cisgender relationships (Balsam, Rothblum, & Beauchaine, 2005; Duke & Davidson, 2009; Langenderfer-Magruder, Whitfield, Walls, Kattari, & Ramos, 2016; Messinger, 2011; Walters, Chen, & Breiding, 2013). Herein, we briefly present prevalence estimates of LGB IPV before turning to the limited research on prevalence among trans individuals. For a more detailed review of IPV prevalence in LGBQT* communities, see Brown and Herman (2015).

Currently, the best prevalence estimates on partner abuse in LGB communities come from the nationally representative 2010 National Intimate Partner and Sexual Violence Survey (NISVS) conducted by the U.S. Center for Disease Control & Prevention (Walters et al., 2013). Findings suggest higher rates of lifetime IPV experiences (defined as physical violence, sexual violence, or stalking) among lesbians (43.8%), bisexual women (61.1%), and bisexual men (37.3%) – but not gay men (26%) – compared to heterosexual women (35.0%) and heterosexual men (29%). In addition, findings from the California Health Interview warrant mention. Based on a probability sample of California residents ages 18 to 70, this study found that lifetime and 1-year IPV prevalence was higher in sexual minorities compared with heterosexuals, but this was significant only for bisexual women and gay men.

Determining IPV prevalence based on gender identity is difficult due to a lack of studies with representative or even large samples. The National Transgender Discrimination Survey is one of the largest studies of transgender individuals' experience of discrimination with 6,456 participants (Grant, Mottet, & Tanis, 2011). This study did not focus on IPV in particular, but did measure related phenomena. The researchers found that 19% of respondents reported experiences of violence at the hands of a family member specifically due to their gender identity. This statistic is likely an underestimate because it excluded DV perpetrated by non-family intimate partners as well as DV unrelated to gender identity. A much higher percentage of participants reported experiencing actions that may or may not be part of abusive behavior: 29% reported an ex-partner limiting their contact with their children, 45% reported having a relationship end when they came out as trans to their partner, and 57% experienced family rejection (Grant et al., 2011). However, these are unreliable proxies for IPV.

[3] Cisgender is a term that refers to individuals for whom the gender they were assigned at birth matches their gender identity. It can be thought of as meaning "not transgender."

Only one study to date has compared IPV among transgender to IPV among cisgender individuals. Analysis of data from One Colorado's anonymous 2011 LGBT Health Survey (n= 1,193) found that 31.1% of trans respondents reported experiencing IPV, compared to 20.4% of cisgender respondents (Langenderfer-Magruder et al., 2016) – findings that suggest transgender individuals experience higher rates of IPV than their cisgender, LGB counterparts. Furthermore, preliminary evidence suggests that different subgroups within transgender communities experience different rates or types of IPV (Chestnut, Jindasurat, & Varathan, 2012; Clements, Katz, & Marx, 1999). Future studies should examine these differences, particularly with regard to differences between trans men and trans women and with attention to intersecting identities for all participants (e.g., race, sexual orientation, disability, socioeconomic status).

Similarities of LGBQT and Heterosexual IPV*

In general, IPV experienced by LGBQT* individuals follows patterns similar to heterosexual and cisgender individuals (Ristock, 2005). Specifically, abuse can take the form of physical or sexual violence as well as emotional, financial, or verbal abuse. Messinger's (2011) analysis of the National Violence Against Women Survey revealed that the prevalence of various types of abuse in GLB communities mirrored prevalence rates among heterosexuals: Both groups reported prevalence rates that went in descending order from verbal abuse to controlling behavior to physical violence to sexual abuse. However, as described next, there are also unique aspects of IPV in LGBQT* communities, and potentially important differences among LGBQT* subgroups.

Unique Characteristics of IPV in LGB communities

IPV occurs in a larger societal and systemic context of homo-, bi-, and transphobia, heterosexism, misogyny, and patriarchy. These factors can influence abuse tactics and relationship dynamics for LGBQT* survivors, making their experiences different from those of heterosexual survivors. For example, sexual minority victims of IPV may be subject to abusive tactics that leverage systemic and cultural discrimination (i.e., identity abuse; Ard & Makadon, 2011; Balsam, 2001; Balsam & Szymanski, 2005; FORGE, 2014; Gay Men's Domestic Violence Project, 2014; National Center on Domestic & Sexual Violence, 2014; West, 2012). Examples of identity abuse include denying or belittling an individual's LGBQT* identity (e.g., refusing to use preferred gender pronouns), restricting access to a supportive LGBQT* community (NCDSV, 2014), or threatening to disclose a survivor's sexual orientation, gender identity, or HIV/AIDS status (Ristock, 2005). People who use violence against their LGBQT* partners may also use threats to authenticity as a method of control, making survivors feel that they are not "queer enough" or do not understand how LGBQT* relationships are supposed to be (Bornstein, Fawcett, Sullivan, Senturia, & Shiu-Thornton, 2006). Controlling behavior, in general, may be a particularly important aspect of DV among LGBQT* couples, and may result in even higher levels of psychological harm than physical abuse alone (Frankland & Brown, 2014).

IPV in LGBQT* survivors can also be minimized in a variety of ways: For example, common portrayals of DV in the media – usually depicting heterosexual relationships, specifically men abusing women – can render invisible even to themselves experiences of underrepresented survivors (Holt, 2011). Pervasive beliefs that LGBQT* relationships are more egalitarian or that gay and lesbian individuals are better able to defend themselves against partners who use violence also serve to render IPV invisible in these communities (Bornstein et al., 2006; Holt, 2011; Walters, 2011).

Finally, although isolation is a commonly used tactic in heterosexual as well as in LGBQT* relationships, it may be more difficult to overcome in tight-knit LGBQT* communities in which relationships and resources are often shared with the abusive partner (Bornstein et al., 2006). The level of isolation is even more pronounced for LGBQT* survivors from rural and immigrant communities (Ristock, 2005).

Unique Characteristics of IPV among Transgender People

There is limited research on the characteristics of IPV in transgender communities. The National Coalition of Anti-Violence Programs 2014 annual survey of its member programs reported that, compared to people who did not identify as transgender, transgender survivors were two times more likely to face threats/intimidation, nearly two times more likely to experience harassment, and over four times more likely to face police violence in response to reporting IPV (National Coalition of Anti-Violence Program, 2015b). Transgender women were at highest risk of experiencing threats/intimidation, harassment, and injury (NCAVP, 2015a), and transgender people of color were the most likely to report experiencing threats of intimidation in their intimate partnerships.

Generally high rates of violence, trauma, and discrimination in the lives of transgender individuals may have a compounding effect, influencing transgender IPV survivors' willingness to identify abuse or seek help. FORGE's safety planning guide remarks that transgender individuals may feel unwanted, or "believe that they are lucky to ever find love, even if that love turns violent" (Guadalupe-Diaz, 2013, p. 3). In a study of transgender relationship violence, some participants could not even conceptualize their trans partner's behavior as abusive because they viewed these partners as being so oppressed themselves (Ristock, 2011).

Multiple Experiences of Violence in LGBQT Communities*

Because of the fragmented nature of research on violence and abuse in the lives of LGBQT* individuals, the prevalence of "polyvictimization"[4] – that is, multiple kinds of violence and abuse committed by different people – in this community is still unknown. However, evidence suggests that LGBQT* individuals are more likely to experience multiple types of violence (e.g. sexual abuse, physical abuse, and exposure to domestic violence during childhood; sexual assault, physical assault, and stalking during adulthood) at the hands of many different types of individuals (family, partners, community members, legal actors, strangers) and at multiple points in their lifetime (Roberts, Austin, Corliss, Vandermorris, & Koenen, 2010; Grant et al., 2011; Stotzer, 2009).

Specific subgroups of LGBQT* survivors are at especially high risk for multiple forms of victimization. One notable example is LGBQT* homeless youth, highly overrepresented among homeless populations (Durso & Gates, 2012; Grant et al., 2011; Hunter, 2008). Evidence indicates that family and partner violence are major drivers of such homelessness (Cochran et al., 2002; Durso & Gates, 2012; Grant et al., 2011; Risser & Shelton, 2002). Homelessness in turn may render LGBQT* peoples increasingly vulnerable to other forms of violence including harassment, hate crimes, police brutality, and sexual exploitation (Amnesty International, 2005; Durso & Gates, 2012; Keuroghlian et al., 2014; Mogul, Ritchie, & Whitlock, 2012; NCAVP, 2015a; NCAVP, 2015b; Reck, 2009). Layered onto these experiences are other types of oppression such as housing, employment, and healthcare, which are themselves traumatogenic and which also act as barriers to help seeking (D'Augelli, 1998; Durso & Gates, 2012; Grant et al., 2011; Tyler, 2008).

Unique Experiences of IPV among Specific Subgroups of LGBQT Survivors*

The experience of IPV for specific subgroups may be quite different than that of White, middle-class LGBQT* survivors (Chavis & Hill, 2009). The intersections of various identities result in unique social contexts shaped by multiple systems of power and oppression (Chavis & Hill, 2009; Feltey, 2001). These systems may shape the way that IPV is enacted and experienced, and the way it is addressed by service providers. Although attention to all intersections would be beyond the scope of this document, here we focus on three subgroups that have received especially scant attention: sexual minorities in Native communities, immigrant and refugee communities, and faith-based communities. Although there is virtually no research on IPV within these subgroups, it is nevertheless instructive to understand this context when considering the experience of IPV for people within these communities. Later sections touch on specific aspects of the help-seeking experience of African-American and Latin@ LGBQT* survivors.

[4] "Polyvictimization" refers to experiences of multiple kinds of violence and abuse, at the hands of multiple people at multiple points in the lifespan. The authors have chosen to put this word in quotes because some have understood it to imply that the victim is somehow responsible for for these experiences. This would obviously be inaccurate and inappropriate. Indeed, there is now a rich literature on the ways that people who use abusive behaviors target individuals with prior trauma histories.

Two-Spirit and LGBT Native Peoples. In general, there is scant research on the experiences of Two-Spirit and LGBT Native individuals. However, the fact that rates of violence and abuse against cisgender, heterosexual Native women are so high suggests that Two-Spirit Native women might be at especially high risk compared to their non-Native sexual minority counterparts (Lehavot, Walters, Simoni, 2009). Consistent with this view, one study showed that 78% of Two-Spirit women reported experiencing physical assault and 85% reported experiencing sexual assault (Lehavot et al. 2009).

These statistics are all the more alarming given that Native women, regardless of Two-Spirit or LBT status, are more likely to experience physical brutality, and therefore injury, during rapes and sexual assaults (Amnesty International, 2007). Further, some Native researchers have noted the disproportionate impact of homo/transphobia that occurs within the Native community given that Two-Spirit survivors may need cultural support from their own people in the face of violence and trauma (Frazer, Somjen, & Pruden, 2010). Not surprisingly then, violence against Two-Spirit and Native LGBQT* individuals also contributes to the development of a range of health and mental health conditions, such as liver disease, substance abuse, PTSD, as well as to behaviors that increase the risk for HIV (Balsam, Huang, Fieland, Simoni, & Walters, 2004; Centers for Disease Control and Prevention, 2001; Evans-Campbell, Lindhorst, Huang, & Walters, 2006; Simoni, Seghal, Walters, 2004). Clearly, more research is needed on IPV in the lives of Two-Spirit and LGBQT* Native peoples.

Immigrants and Refugees. The experiences of LGBQT* immigrant and refugee survivors of IPV are largely invisible in the academic literature. The broader research on DV in heterosexual, cisgender immigrant communities is complex, indicating that they experience lower rates of IPV, but higher rates of IPV homicide compared to non-immigrants (Bohn, 2003; Tjaden & Thoennes, 1998).

Although there is a need for more prevalence research, it is well documented that sexual minority immigrants face challenges resulting from historically homophobic immigration policies (Chung & Lee, 1999). Under the Immigration and Nationality Act of 1917, LGBQT* immigrants were strictly prohibited from entering the United States on the grounds that they were "mentally or physically defective." The Immigration & Naturalization Act of 1952 similarly prevented LGBQT* immigrants from entering the U.S. based on the idea that they were "afflicted with psychopathic personality" (Foss, 1994). Even up to 1990, Public Health Service physicians barred entrance to those immigrants suspected to be LGBQT*, labeling them as "sexual psychopaths." In addition to contending with these oppressive policies, LGBQT* immigrants were also isolated within their own communities and shunned by white, non-immigrant LGBQT* communities because of their immigration status (Cantú, Hurtado, & Anzaldúa, 2012; Moraga & Anzaldúa, 1981). Even today these interpersonal and institutional challenges echo in the lives of sexual minority immigrants and likely create unique challenges for LGBQT* immigrant and refugee survivors of IPV.

Religious or Spiritual LGBQT Survivors*. LGBQT* people have both positive and negative experiences of faith, possibly even simultaneously. Researchers and practitioners highlight the healing value of religious communities and practices for this community (e.g., Queer Muslims of Boston,

FaithTrust Institute; Ryan, Huebner, Diaz, & Sanchez, 2009). Yet, institutionalized religious policies and principles continue to be a major source of social oppression for many LGBQT* people (Clarke, Brown, & Hochstein, 1989; Davidson, 2000; Hilton, 1992; McNeill, 1993; Morrow & Gill, 2003; Spong, 1991; Spong, 1998). For example, many religious practices condemn non-heterosexual behavior (Bouhdiba, 1998; Jaspal & Cinnirella, 2010) and view LGBQT* people as immoral and spiritually corrupt (Morrow & Gill, 2003). For many religious LGBQT* people, family and societal rejection is therefore compounded by the loss of religious communities (Mahaffy, 1996).

Sources of conflict for religious LGBQT* people include anti-gay religious teachings and scriptural interpretations, homo/bi/transphobic church atmospheres, fear of being "outed" in non-affirming religious settings, and microaggressions (i.e., subtle forms of oppression) from people within their religious communities (Brown & Pantalone, 2011; Shuck & Liddle, 2001). Not surprisingly, receiving homophobic messages through a religious medium has been found to be associated with internalized shame among LGBQT* individuals (Herek, 1987; Ream, 2001).

The challenges of participating in a faith community that is not LGBQT*-affirming may be particularly acute for LGBQT* individuals of color and immigrants since the support role of faith-institutions is particularly crucial in these communities due to the lack of other available social supports. For example, Christian religious institutions have served a range of healing functions within African American communities, where faith has been an important source of strength in the face of ongoing racialized violence and oppression (Billingsley, 2003; Cone, 1997; Cone, 2010; Higginbotham, 1994; Lincoln & Mamiya, 1990). Yet, for African American young men, churches are the primary source of anti-gay messages in their communities (Stokes & Peterson, 1998). The loss of access to one's faith community under such circumstances may be particularly wounding. These challenges are real and ongoing, but their effects on LGBQT* survivors of IPV remain unexplored. Most research on the experience of IPV survivors in relation to their faith communities focuses on the spiritual lives of heterosexual, cisgender women. Clearly, more research is needed in this area.

In sum, violence – be it by intimate partners, family and community members, or society at large – is a common occurrence in the lives of many LGBQT* individuals. Because such polyvictimization is rooted in and exacerbated by the larger context of homophobia and transphobia, the experiences of LGBQT* survivors differ in many ways from those of heterosexual, cisgender survivors. Given that experiences differ, so too does the impact of experiencing IPV. We turn next to the research on the mental health consequences of IPV among LGBQT* survivors as well as protective factors that promote resilience.

Trauma and Mental Health in LGBQT* Communities

The emerging literature on how IPV affects the mental health of LGBQT* survivors is mixed, with some studies indicating that the impact is similar for LGBQT* and non-LGBQT* survivors, and others indicating that adverse effects are more common among LGBQT* survivors (Edwards, Sylaska, & Neal, 2015). This section reviews that literature, focusing especially on depression and PTSD – two common mental effects of abuse. As this section will show, emerging research indicates that bisexual and transgender survivors may be at particularly high risk for experiencing adverse mental health effects.

Depression. LGBQT* survivors of IPV, similar to their heterosexual and cisgender counterparts, are particularly at risk of depression. One longitudinal study examining data from a nationally representative survey of adolescents between the ages of 18 and 27 (227 gay and lesbian, 345 bisexual, and 13,490 heterosexual) found that across all three groups, exposure to IPV was significantly related to increased depression – even after controlling for exposure to childhood physical or sexual abuse and homelessness or expulsion from one's home by caregivers (McLaughlin, Hatzenbuehler, Xuan, & Conron, 2012). This is consistent with a more recent meta-analysis examining 19 studies, which found that men who are victims of IPV at the hands of other men are more likely to use substances, suffer from depressive symptoms, have an HIV positive diagnosis, and engage in unprotected sex (Buller, Devries, Howard, & Bacchus, 2014). As a whole, this body of literature suggests that LGBQT* IPV survivors are at greater risk for experiencing depression than LGBQT* individuals without IPV experience.

Looking more closely within the LGBQT* community, there is some evidence indicating that bisexual individuals may have disproportionately high rates of depression as compared to gay and lesbian individuals (Bostwick, Boyd, Hughes, & McCabe, 2010). Interestingly, theoretical work has posited that the relatively high mental health difficulties within the bisexual community may be attributable to the additional stressors of experiencing bi-negative attitudes from both heterosexual and LGTQ communities. The National Epidemiologic Survey on Alcohol and Related Conditions, which compared rates of major depression among lesbian, gay, bisexual and heterosexual adults (*n*=34,653), found that both male and female individuals who reported bisexual behavior had higher lifetime rates of all mood disorders, including depression (Bostwick et al., 2010). By extension, one might expect bisexual survivors of IPV to be at particular risk for depression.

Likewise, there is scant research on depression and other mental health effects of IPV for transgender survivors. There is, however, literature on the relationship between interpersonal violence more generally and symptoms of depression in this community. For example, in one cross-sectional study of over 591 MTF participants from the New York City area, 63% had depression scores in the clinical range. Further, in this same sample, violence that was related to one's gender identity, or gender abuse, was predictive of depression (Nuttbrock et al., 2014). These findings are consistent with another study of 6,436 transgender-identified individuals, in which 19% of respondents had experienced violence at the hands of a family member because of their chosen gender identity. This exposure was associated with over twice the rate of suicidality, with 65% of those who experienced family violence also reporting

having attempted suicide, compared to 32% of those who did not experience family violence (Grant et al., 2011). Overall, though the literature remains inconclusive, it raises questions about whether transgender survivors of IPV could be at increased risk for depression.

PTSD. IPV exposure also increases the risk of PTSD symptoms in the LGBQT* community. According to the CDC's 2010 IPV report described previously (i.e., NISVS) 19.5% of lesbian women, 46.2% of bisexual women and 22.1% of heterosexual women report experiencing at least one symptom of PTSD – defined as having nightmares and intrusive thoughts of the traumatic experience; feeling constantly on guard, watchful or easily startled; and feeling numb or detached in response to an experience of IPV (Walters et al., 2013). Data from bisexual, gay, and heterosexual men were excluded from the analysis due to small sample sizes. Evidence from other research, however, suggests that that the relationship between IPV and PTSD may extend to gay and bisexual male survivors (Pantalone, Hessler, & Simoni, 2010).

Consistent with the findings on IPV and depression, there is initial evidence that bisexual survivors of IPV have higher rates of PTSD than gay and lesbian survivors. According the CDC's NISVS, more than half of bisexual women (57.4%) who experienced physical or sexual violence or stalking reported at least some form of negative impact (e.g., experiencing PTSD symptoms, missing a day of school or work, feeling fearful or concerned for their safety) as compared to a third of lesbian women (33.5%), and a fourth of heterosexual women (28.2%) (Walters et al., 2013). Significantly more bisexual women (46.2%) reported experiencing at least one symptom of PTSD as compared to lesbian (19.5%) and heterosexual women (22.1%) (Walters et al., 2013). These results suggest that bisexual women may be at disproportionately high risk for developing PTSD after experiencing IPV.

Again, literature on the relationship between IPV and PTSD in transgender communities is limited. As noted earlier, transgender individuals are especially likely to experience violence and discrimination in the domains of education, health, family life, and work which may shape their responses to partner violence (Grant et al., 2011). These risks are not equally distributed among trans individuals. Trans women experience higher rates of violence than trans men, probably because they are less able to "pass" (i.e., be perceived as the gender they identify as) (Dean et al., 2000; Mizock & Lewis, 2008). The risks may also be explained by the concept of trans-misogyny: the idea that there is a particular brand of discrimination that combines transphobia with sexism and applies specifically to trans women (Serano, 2007).

In addition, trans people of color are at particularly high risk (Richmond, Burnes, & Carroll, 2012). In a study of MTF youth of color in Chicago, major life stressors included lack of transportation, difficulty finding a job, sex in exchange for resources, being frequently bothered by police, forced sexual activity, difficulty finding a safe place to sleep, difficulty accessing healthcare, and history of incarceration and homelessness (Stieglitz, 2010). Given that multiple experiences of trauma are more likely to result in the development of clinical PTSD (Scott, 2007), it is not surprising that in one study of MTF transgender individuals, 17.8% reported clinically significant symptoms of PTSD (Shipherd, Maguen, Skidmore, &

Abramovitz, 2011). As a whole, the literature on bisexual and transgender communities makes clear the need for researchers to continue to investigate the distinct experiences of subgroups of the LGBQT* community.

The mental health consequences of IPV among LGBQT* survivors must also be understood within the broader context of historical trauma. Historical trauma is a term used to describe repeated communal traumatic events that exist across time, are embedded throughout culture, and can result in an intergenerational cycle of traumatic stress (Sotero, 2007). Oppressed communities subjected to historical trauma are at heightened risk for mental and physical health consequences compared to communities not exposed to such trauma (Danieli, 1998; McMichael, 1999; Sotero, 2007). Not only have LGBQT* people endured such historical trauma as a group, but many such individuals have also experienced intergenerational trauma originating from other identities such as those based on race or religion (DeGruy, 2005; Franklin, Boyd-Franklin, & Kelly, 2006; Jaimes & Halsey, 1992). Studies have shown that cumulative historical traumatic events actually increase survivors' risk for lifetime trauma and interpersonal violence (Chae & Walters, 2009). These forces are critical to understand when considering the mental health impact of violence against various subgroups of the LGBQT* communities.

Resilience in LGBQT Communities*

Research has identified several important factors that contribute to strength and resilience among LGBQT* survivors. In particular, a positive LGBQT* identity, or *identity affirmation,* and social support from friends can profoundly influence survivors' mental health.

Regarding the first of these two factors, LGBQT* identity affirmation has been well documented as critical to positive mental health outcomes. For example, one study investigating 165 lesbian, gay, and bisexual youth found that family support and self-acceptance mediated the relationship between victimization and mental health (Hershberger & D'Augelli. 1995). Another study surveyed 613 lesbian, gay, and bisexual individuals and found that LGB individuals who have positive appraisals of their LGB identity and do not anticipate rejection from others had lower psychological distress (Balsam & Mohr, 2007). In a subsequent study, the same authors found that higher identity acceptance negatively correlated with measures of depression, guilt, fear, hostility, and sadness, and positively correlated with measures of general life satisfaction, self-assurance, and social self-esteem (Mohr & Kendra, 2011). Finally, in a study of trans people of color who were survivors of traumatic events, participants named pride in one's gender and ethnic identity as critical to resilience (Singh & McKleroy, 2011). In short, LGBQT* individuals who feel more positive about being LGBQT* or their ethnicity are able to cope more successfully with the challenges they face.

Social support from friends and family also serves a critical protective role. Moody and Smith (2013), for example, found that perceived support from friends was associated with reduced suicidality among trans individuals. For transgender youth of color, identifying other youth and adults with similar identities helped to validate their experiences of racism within the LGBQT* community (Singh, 2013).

And in one study of MTF youth of color, friends were the most frequently cited source of support, and physicians or case managers were perceived as at least somewhat helpful (Stieglitz, 2010).

Social media has become a critical conduit for accessing social support within the LGBQT* community (Singh, 2013). Online communities have become sites of community organizing, cultural empowerment, and education for LGBQT* people, enhancing both a sense of identity and a sense of social support and community (Mehra, Merkel, & Bishop, 2004). Religion and spirituality may also contribute to resilience, particularly as these become sources of social support (Potter, 2007).

In sum, there is a clear need for supportive mental health and trauma-informed approaches for LGBQT* individuals. Furthermore, these services must recognize the societal factors that contribute to individual mental health concerns. LGB individuals, and transgender individuals in particular, experience high rates of traumatic experiences that stem from social isolation, prejudice, and discrimination. These experiences can have many negative mental health outcomes, and are exacerbated by multiple forms of oppression. Nonetheless, LGBQT* individuals show remarkable resilience by developing strong social support networks, creating and engaging with online and activist LGBQT* communities, and developing a positive LGBQT* identity. Trauma-informed approaches must allow providers to understand the context in which survivors have experienced abuse, identify sources of individual and communal strength and resilience, and support healing. Unfortunately, the current reality for sexual minorities who seek help from informal and formal supports is far different.

Help-Seeking Among LGBQT* Survivors

A range of systemic, institutional, and individual-level barriers uniquely thwart LGBQT* peoples' access to informal and formal support services (Edwards, Sylaska, & Neal, 2015; Helfrich & Simpson, 2006). At the broadest level, pervasive heterosexism renders violence between same sex partners invisible. The myth that IPV occurs only between men and women contributes to the profound difficulty that service professionals have even identifying IPV among LGBQT* couples (Blasko, Winek, & Bieschke, 2007; Brown & Groscup, 2008; Helfrich & Simpson, 2006; Seelau & Seelau, 2005). Brown and Groscup (2008) studied 120 crisis center workers' perceptions of same-sex DV by presenting scenarios in which only the gender of the abuser and survivor were changed, and found that participants ranked same-sex DV as less severe and less likely to get worse than the same scenario among heterosexual pairs. Although service providers may recognize that LGBQT* survivors deserve protection from IPV just as heterosexual survivors do (Sorenson & Thomas, 2009), these kinds of biases may affect their ability even to identify IPV in this community (Basow & Thompson, 2012).

Beyond the invisibility of LGBQT* IPV, a range of factors cause well-meaning social services systems to harm members of marginalized communities, including sexual minorities. Forms of oppression such as racism, colonialism, ableism, heterosexism, sexism, and transphobia that are often implicit in our helping systems can render these systems traumatogenic, especially when these oppressive dynamics are not acknowledged (Buzawa & Buzawa, 2003; Dirks, 2004; Herman, 2003; Walters, Simoni, & Evans-Campbell, 2002). The kind of harm done by institutions designed to provide support has been termed "sanctuary harm" (Bloom 2011; Bloom 2013).

A primary example of a system that causes this kind of sanctuary harm is the healthcare system. Historically, medicine and the health sciences were central to the effort to pathologize same sex relationships and transgenderism. Being gay or lesbian was classified as a mental disorder by the American Psychological Association until 1973, and conceptions of gender dysphoria as a mental health condition did not undergo a similar revolution until 2013 (Bayer, 1987; Drescher & Merlino, 2007).

The continuing impact of this history is evident in the experiences of LGBQT* patients in healthcare settings. Lambda Legal (2010) found that more than half of all sexual minority survey participants had experienced at least one of the following types of discrimination in a healthcare setting: being refused needed care; being blamed for their health status; seeing healthcare professionals refuse to touch them or use excessive precautions; hearing healthcare professionals use harsh or abusive language; or experiencing healthcare professionals being physically rough or abusive. Similarly, Shires and Jaffee (2015) found that over 40 percent of transgender men reported verbal harassment, physical assault, or denial of equal treatment in a doctor's office or hospital. Grant et al. (2011) reported that over one-quarter of respondents in a survey for the National Center for Transgender Equality experienced verbal harassment in medical settings, and that the likelihood of discrimination, abuse, or assault of transgender patients by their provider actually increased with the provider's awareness of their patient's transgender status. Such experiences of discrimination are far more likely to affect

LGBQT* patients of color, financially-oppressed patients, and undocumented patients (Grant et al., 2011; Lambda Legal, 2010).

Other examples of sanctuary harm abound across systems. For example, between 2010 and 2011, LGBQT* survivors reported an increase of incidences in which the police arrested both the abuser and victim when called (28.4% up from 21.9%), an increase in the percentage of LGBQT* survivors seeking shelter who were denied (61.6% up from 44.6%), and a decrease in the percentage of LGBQT* survivors who received requested orders of protection (78.1% down from 83.7%; NCAVP, 2015b). The same study found that transgender IPV survivors were over six times more likely to experience physical violence while interacting with the police than other survivors, and more likely to experience hate violence in shelters than other survivors (notably, trans men were 3.5 times more likely; whereas, trans women 1.3 times more likely) (NCAVP, 2015b). In short, transgender survivors may experience even more re-traumatization and less access to formal support systems than LGB survivors.

Mainstream programs may use heterosexist language in program materials, or have ambiguous or poorly defined policies regarding service provision for LGBQT* survivors (Helfrich & Simpson, 2006). LGBQT* survivors may well anticipate discrimination both from staff members and the heterosexual survivors using these services and may worry that their sexual orientation (and one could assume, gender identity) will be revealed should they actually seek help (Bornstein et al., 2006; McClennen, 2005; Helfrich & Simpson, 2006).

Low-income LGBQT* survivors of color experience another set of barriers: A community needs assessment of Black and Latin@ LGBQT* communities in the greater Boston area (Tod@s, The Hispanic Black Gay Coalition, The Violence Recovery Program at Fenway Health, The Network/La Red, & Renewal House, 2013) found that a lack of outreach to these communities limited their knowledge of IPV resources. In addition, geographic isolation, lack of transportation options, and the cost of making phone calls were major challenges to finding formal help. Similar to Black and Latin@ communities, Two-Spirit individuals identified lack of financial resources, transportation, and geographic inaccessibility as barriers to seeking support (Walters, Horwath, & Simoni, 2001). In addition, the lack of programming specifically aimed at Two-Spirit people and fear of what other Native community members might think were consistently ranked as barriers.

In the context of these institutional barriers, sexual minority survivors describe a range of personal reasons for not seeking support. Many feel that the need to educate a provider about one's identity and experiences would be overwhelming, particularly during a time of crisis (Turrell & Herrmann, 2008). Others worry about further victimization by providers who lack training on LGBQT* issues, and by other clients accessing the same services (Bornstein et al., 2006). Talking about abuse in one's intimate relationship almost always means coming out about one's sexual orientation or possibly one's gender identity. Further, gossip in insular or tight-knit communities raises concerns of confidentiality and retaliation – not just by the abuser but also by the community at large. Gay male survivors may keep silent about abuse and be more reluctant to seek help because they do not see doing so as consistent

with notions of masculinity (Seidler, 2006). According to Spiegel (2003), the abuse thrusts male survivors into "confrontation between two disparate psychosocial processes: the realities of abuse and the mythology of masculinity" (p. 133). Notably, although LGBQT* individuals may be hesitant to contact mainstream domestic violence programs, one survey reported that 86.2% of LGBQT* respondents *would* contact a domestic violence program if it was LGBQT*-specific (Holt, 2011).

Although the majority of LGBQT* survivors do not immediately seek help from the formal service system, they do rely on their informal social support systems; that is, their friends and families (Edwards et al., 2015). And yet, here too, LGBQT* survivors face a range of barriers to support. For example, LGBQT* survivors may be reluctant to seek help from friends and family given their own or their community's gendered beliefs about violence (e.g., women cannot be violent and men cannot be victimized) (Seelau & Seelau, 2005; Walters, 2011). They may be particularly hesitant to seek help from heterosexual friends or family members if they have had previous experiences of heterosexism and cissexism from their peers (Ard & Makadon, 2011). Survivors may have received messages that LGBQT* relationships themselves are "wrong" or "sick." Consequently, they may feel that admitting violence will only confirm these messages, conferring a sense of stigma on the victim, the relationship, and the LGBQT* community in general. Alternately, survivors who feel as though they are representing the LGBQT* community may feel that admitting IPV will harm the LGBQT* community at large (Balsam, 2001). Also, friends and resources may be shared between the survivor and perpetrator to an even greater degree than in heterosexual relationships, further making it difficult to access support (Bornstein et al., 2006).

In sum, a range of factors hinder LGBQT* survivors from seeking formal and informal assistance. Some survivors choose not to seek help from anyone; however, many survivors will make at least an initial attempt, and how they are treated can affect likelihood of seeking help in the future. Formal systems such as DV programs, hospitals, and law enforcement have a responsibility to ensure that they are facilitating help-seeking, not preventing it. To that end, the next section reviews the literature on a trauma-informed approach to practice, with attention to the needs of service providers who work with LGBQT* survivors, and provides examples of community-specific approaches to trauma.

Trauma-Informed Practices

A growing body of literature suggests that incorporating trauma-informed approaches into work with survivors is beneficial for the participant, staff, and overall organization. In this section we review the definition and core principles of a trauma-informed approach. Next, we discuss the need for LGBQT*-specific trauma-informed models and the role of transformative justice in developing such models.[5]

The term trauma-informed services was first used by Maxine Harris and Roger Fallot (2001a) in the context of mental health and addictions treatment programs. They noticed that many individuals seeking these services had experienced high rates of physical and sexual abuse, yet few providers were knowledgeable about trauma and the effects of such violence. As a result, services were not designed with trauma survivors in mind, increasing the possibility of retraumatization by the very services that were supposed to help them.

In response, Harris and Fallot (2001b) proposed creating trauma-informed service systems. This meant recognizing that the majority of people seeking services are likely to have experienced trauma; and that the effects of trauma impact many life domains, including people's experience of services. Thus, they argued, services had to be redesigned to incorporate an understanding of the pervasiveness of trauma and its impact on every aspect of their work. That is, programs and practices needed to be welcoming and appropriate for individuals with a history of trauma; and they needed to minimize retraumatization and promote healing and recovery. This, in turn, required an organizational commitment to trauma-informed practice, and ensuring that the necessary training for staff was in place.

In their initial work, Harris and Fallot (2001a) identified five requirements for creating trauma-informed services: (1) administrative commitment to change; (2) universal screening for trauma history among participants/clients;[6] (3) training and education on trauma for all staff; (4) hiring staff with a deep knowledge of trauma, referred to as "trauma champions;" and (5) reviewing policies and procedures to ensure they do not replicate abusive dynamics.

Although Harris and Fallot's approach was developed in the context of mental health and addictions services, its underlying principles have been adapted and applied to several different service contexts. These contexts include correctional facilities (Hodas, 2006), psychiatric and hospital settings (Jennings, 2004), homelessness services (Guarino, Soares, Konnath, Clervil, & Bassuk, 2009), addiction

[5] While the terms trauma-informed care and a trauma-informed approach are sometimes used interchangeably, the use of these terms has evolved over time. Trauma-informed care while perhaps still applicable in settings that provide health or mental health care, is actually inconsistent with the spirit/principles of a trauma-informed approach which involves service relationships that are fully collaborative rather than one person providing and the other receiving care.

[6] The requirement for universal trauma screening emerged in the context of mental health and addictions treatment services and are not necessarily applicable to other service settings such as DV programs.

services (Covington, 2008), services for children who have experienced abuse (Hodas, 2006; Ko et al., 2008), and DV organizations (Warshaw, Sullivan, & Rivera, 2013; Warshaw 2014; Wilson, Fauci, & Goodman, 2015).

These adaptations have not fundamentally altered the original principles, but have offered more expanded and nuanced interpretations of how they work in practice. In their excellent review, Hopper, Bassuk, and Olivet (2010) identified core principles that cut across different service contexts. These include: trauma awareness (e.g., staff training, consultation, supervision and self-care); safety (e.g., physical and emotional safety for all, awareness of potential triggers, clear roles and boundaries, and cultural diversity); opportunities to rebuild control (e.g., predictable environments, rebuilding efficacy, and personal control over lives); and a strengths-based approach (e.g., focus on future and skills-building).

Furthermore, Elliot, Bjelajac, Fallot, Markoff and Reed (2005) placed trauma-informed principles in the context of the entire service system and environment. For example, in a trauma-informed system, survivors engage with staff as collaborative partners rather than as passive recipients of services, and organizations actively solicit survivor input. In trauma-informed organizations, providers also strive to understand each survivor within the context of their background and life experiences and in terms of what is meaningful to them. Such contextualizing is essential. Because survivors experience trauma and seek support in a social, historical, and political context, healing must also include recognition of this context.

In order to do this difficult work, staff must themselves be supported. A fundamental aspect of a trauma-informed approach, therefore, involves creating an organizational environment that facilitates providers' capacity to do their work well. Clients interact with individual providers, who themselves interact with supervisors and the organization. When providers are subject to stressful organizational dynamics, those stresses interfere with their ability to be effective (Bloom, 2010). One consequence of problematic organizational dynamics is vicarious traumatization (synonymous with secondary traumatic stress or compassion fatigue) among service providers. Vicarious traumatization has been defined by Charles Figley (1995) as "the stress resulting from helping or wanting to help a traumatized or suffering person" (p. 7), and symptoms may mimic those of PTSD. Vicarious traumatization has been linked to burnout in several studies (Bemiller & Williams, 2011; Brown & O'Brien, 1998; Ortlepp & Friedman, 2002; Ullman & Townsend, 2007).

Vicarious traumatization is widespread. Findings from a study of 148 advocates working in a range of types of DV organizations indicate that 47.3% of participants met criteria for clinical levels of PTSD symptoms (Slattery & Goodman, 2009). Organizational factors that may contribute to vicarious traumatization include a lack of involvement or influence on decision making, feeling like one's abilities are not being used, being exposed to danger at work, and too much focus on fixed regulations, procedures, and paperwork (Brown & O'Brien, 1998). Indeed, Slattery and Goodman (2009) found that lack of access to power (i.e., equality, voice, representation, shared leadership, and respect) in the

workplace significantly predicted vicarious traumatization above and beyond individual factors (e.g., personal history of trauma and exposure to traumatized clients). They recommended creating a workplace that emphasizes support, cooperation, effective communication, and conflict resolution skills and asserted that efforts to "flatten the hierarchy" and address power differences at the organization may also help minimize vicarious traumatization.

Creating a trauma-informed service system, then, occurs on three levels. The first is focused on the needs of survivors. The second is focused on changing an organization's culture to support staff and fully integrate trauma-informed practices into its service delivery; and the third level acknowledges the larger societal context in which survivors seek services and organizations operate. This level emphasizes not only engagement with the individual as part of a community, but also with community change itself in order to transform the conditions that produce abuse, violence, and trauma in the first place (Warshaw, 2014; Wilson et al., 2015).

These overarching principles have been applied across trauma-informed service systems. However, the particular language used to describe specific practices that arise from them may vary substantially depending on the service setting. The appendix provides a table of six trauma-informed models that have been identified as having some relevance for this project either because of the communities being served (LGBQT* or IPV survivors), the popularity of the model, or the credibility of the organization. See also Wilson and colleagues' (2015) recent qualitative content analysis of key documents – publications, manuals, and training guides – that describe an emerging consensus on trauma-informed practices in the domestic violence context, as well as points of difference and tension.

It is important to note that trauma-*informed* services are different from, but related to, trauma-*specific* services. Whereas trauma-informed services are designed to be implemented at all levels of an organization and focus on limiting the potential for retraumatization among participants, trauma-specific services are aimed at treating actual trauma symptoms (Harris & Fallot, 2001a). Examples of trauma-specific services include grounding techniques, psychoeducation, mind-body approaches and body-based therapies, cognitive behavioral therapy, and complex trauma treatment (Courtois & Ford, 2009; Courtois & Ford, 2015; Jennings, 2004; Resick, 2003; Warshaw & Brashler, 2009). A number of trauma-specific interventions have been tested in experimental or quasi-experimental research designs. Several studies have also attempted to document the effectiveness of trauma-specific services for female survivors of domestic violence. For a systematic review of evidence-based, trauma-specific services for survivors of domestic violence, see Warshaw et al. (2013). It is important to note, however, that none of these studies focused on LGBQT* survivors.

Trauma-informed service models are inherently more difficult to study because they focus less on specific practices and more on general principles, and they rely on change at the organizational level. Nonetheless, the Women, Co-Occurring Disorders, and Violence Study (WCDVS) attempted to evaluate the impact of this approach. As the only longitudinal study of a trauma-informed approach, the WCVDS indicated that women who received trauma-informed services showed small but significant

improvements on mental health outcomes and trauma symptoms relative to treatment as usual, but no effect for substance abuse (e.g., Morrissey et al., 2005). Since then, researchers have developed several tools to measure the presence of trauma-informed principles and practices as experienced by survivors (see, Accessing Safety and Recovery Initiative & the National Center on Domestic Violence, Trauma, & Mental Health, 2012; Goodman et al., in press;), and are testing new measures of the effects of trauma-informed practices on survivor wellbeing (National Center on Domestic Violence, Trauma, & Mental Health, in development), yielding new possibilities for exploring this important approach.

Trauma-Informed Practices with LGBQT Survivors of IPV*

Despite the high rates of IPV and trauma in LGBQT* communities, trauma-informed approaches tailored to LGBQT* communities have been slow to develop. Some non-IPV trauma-specific interventions have been designed with input from LGBQT* individuals and with concern for LGBQT* cultural competence (e.g., de Arrellano, Ko, Danielson, & Sprague, 2008; Real Life Heroes and Target-A). In addition, the Technical Assistance Partnership for Child and Family Mental Health created a webinar that discusses trauma-informed care for LGBQT* homeless youth. However, there are few well developed trauma-informed approaches for LGBQT* clients in service settings generally, and none in the field of IPV services.

Because of the barriers and difficulties faced by LGBQT* survivors, providers who work with these particular communities may face unique challenges, including lack of resources both within and outside of the service organization, exposure to homo-, bi-, and transphobia through hotline prank callers, experiences of discrimination while attempting to connect survivors with resources, and the possibility of increased vicarious trauma through shared LGBQT* identities.

At the same time, advocates may find strength and resiliency through a shared LGBQT* identity, a strong sense of LGBQT* community, and increased work satisfaction in serving marginalized community members. Advocates who identify as LGBQT* also may be able to draw upon their own experiences of discrimination as a source of resilience in the face of hardship. However, these hypotheses, which are informed by the authors' extensive practice experiences, have not been explored in the literature; considerable research is needed to determine the strengths and job stressors for providers who work with LGBQT* survivors.

Examples of Community-Specific Approaches to Trauma

Although there are no well-developed LGBQT*-specific practices, several community-specific approaches that have been developed by members of culturally-specific communities that have experienced multiple and overlapping forms of oppression may serve as guides.

One example, "Indigenist coping," which was first posited by Walters and colleagues (2002), is a Native-specific model that asks providers to abandon a focus on individual pathology, and instead center the historical trauma, ongoing discrimination, and experiences as a colonized people within a first world nation that are the norm for Native peoples in the U.S. (Walters et al., 2002). The multiple traumas experienced by Native peoples both individually and collectively are the foundation of service provision.

Walters and colleagues interpret the disproportionate rates of substance use, mental health challenges, and HIV risk behaviors among Native people, as conditions that might best be addressed and healed within the context of reconnection to the history and spiritual and healing practices of the Native community. Perhaps the most interesting aspect of the Indigenist coping model is its focus on uprooting internalized colonization and integrating identity along political, ethnic, racial, cultural, and spiritual dimensions. Although this model is not specific to Two-Spirit peoples, it is Two-Spirit-inclusive, and provides a conceptual framework that is responsive to the layered traumas experienced by too many Two-Spirit individuals (Walters, et al., 2002).

Similarly, the National Latin@ Network for Healthy Families and Communities has long used human rights and social justice frameworks to interpret trauma. Specifically, they view trauma through an understanding of multiple kinds of historical & collective trauma, the traumatogenic impact of "non-traditional" traumas such as racism, nativism, poverty, and discrimination and unjust denial of services from helping systems currently and historically experienced by Latin peoples. The National Latin@ Network correspondingly looks to identity cultural traditions and collective knowledge and wisdom, as sources of resilience and post-traumatic growth, both for individuals and for entire communities. Much like the Indigenist coping model (Walters et al., 2002), the approach of the National Latin@ Network looks to the community for both healing and leadership (Serrata, 2012).

Transformative Justice as a Trauma-Informed Practice

Transformative justice analyses recognize systemic oppression as contributing to and exacerbating the impact of interpersonal and community violence and seeks justice at every level (Hairston & Oliver, 2006; Generation Five, 2007). Whereas trauma-informed practice was conceptualized in clinical and academic contexts, transformative justice grew out of a community-based intervention model. It moves away from criminalizing and pathologizing those who use violence and toward transforming organizations, conditions, and systems that perpetuate violence. It is critical that trauma-informed practices include transformative justice as an additional lens in service delivery and system reform.

Generation Five (2007), an advocacy-based project working to end childhood sexual abuse, has helped shape a practice-oriented understanding of transformative justice by offering several goals and principles needed to build greater capacity of communities to challenge traumatogenic systems. According to Generation Five, there are four specific goals of transformative justice: safety, healing, and agency for survivors; accountability and transformation for people who use violence; community action,

healing, and accountability among those in positions of power; and, transformation of the social conditions that perpetuate violence. Notably, these goals build on a set of core principles: 1) liberation, 2) shifting power, 3) safety, 4) accountability, 5) collective action, 6) honoring diversity and 7) sustainability. Here, we explain these principles by providing possible ways in which they could be applied to work with LGBQT* survivors.

Liberation refers to ending long-standing intergenerational cycles of systemic and family violence, which can be partly achieved by shifting power away from those whose power has been achieved through domination, oppression, and violence. In the case of LGBQT* survivors, shifting power includes listening and responding to survivors' articulation of their stories and needs in order to promote self-determination. Liberation and shifting power also applies to LGBQT* individuals who use violence: To end intergenerational cycles of violence, it is important to understand their violent behaviors within the context of institutions and norms that perpetuate violence against them. For example, DV organizations can adopt more fluid and nuanced definitions of "victim" and "perpetrator"; that is, definitions that allow for someone to be (or have been) both a victim of violence and someone who used violence. Doing so invites people's full trauma history into the conversation for consideration and healing.

Safety is conceptualized on three intersecting levels. First, on an individual level, LGBQT* survivors must be protected from immediate and future acts of violence via intervention and prevention efforts. Second, within individual communities, action must be taken to foster norms and practices that condemn violence and support conditions for healing. Finally, at the macro level, communities must be accountable to one other in order to challenge institutional power. Part of that accountability includes acknowledging the prevalence and impact of interpersonal and historical trauma on individuals and communities as well as committing to survivor empowerment and healing. For example, mainstream DV programs can develop relationships with LGBQT* community members and programs to work toward long-term accountability of culturally sensitive service provision. They also can engage in ongoing program evaluation, including open discussion of policies, procedures, and staff profiles, in an effort to transform trauma-inducing organizational norms. Futures Without Violence (n.d.) has developed a series of "Program Personnel Policy Questions" for DV organizations to assess their readiness to work with children and teens; many of these questions can be amended to assess readiness to work with LGBQT* survivors. The National Center on Domestic Violence, Trauma & Mental Health's Accessible, Culturally Relevant, DV & Trauma-Informed (ACDVTI) Agency Self-Assessment Tool also provides guidance on organizational readiness and LGBTQ* inclusiveness.

Collective action highlights the need to address cycles of isolation and shame resulting from traumatic experiences by building alliances with communities to transform structures that perpetuate abuse. Additionally, honoring diversity includes creating and implementing interventions that respond to the unique needs of each community. Finally, sustainability refers to building internal capacity of intimate and community networks to support and maintain survivor-centered safety and healing. These last three principles highlight how social service organizations must incorporate advocacy efforts into

their work and cannot operate in isolation. Instead, they must learn from and collaborate with other organizations, specifically culturally specific organizations. Such collaboration includes not only LGBQT* organizations but also organizations that reflect the range of identities that LGBQT* survivors possess. Incorporating a diversity of expertise and perspective into programs and policies is critical for providing a more trauma-informed approach.

Conclusion

This literature review documents the need for LGBQT*-specific trauma-informed practices with survivors of IPV. IPV is at least as common among LGBQT* individuals as heterosexuals, and may be highest in bisexual and transgender communities. Furthermore, although LGBQT* IPV shares many underlying dynamics with IPV in heterosexual couples, it also has unique characteristics, including the types of abusive tactics used and the context of discrimination and social stigma faced by LGBQT* individuals. Moreover, there are additional complexities within LGBQT* subgroups.

LGBQT* survivors also face unique barriers to help-seeking. Overall, LGBQT* individuals are less likely to seek services from law enforcement and mainstream providers and more likely to rely on informal social support and LGBQT*-focused programs. There are also differences in help-seeking *within* LGBQT* subgroups. For instance, trans individuals may have an especially difficult time accessing culturally competent and non-traumatizing services. For LGBQT* people of color, stigma, economic constraints, and the absence of community outreach are barriers to accessing services.

Trauma and mental health are major concerns in LGBQT* communities in general, and for LGBQT* survivors specifically. LGBQT* individuals experience higher rates of traumatic events, and may be more susceptible to developing symptoms of PTSD, depression, isolation, suicidality, and anxiety. These concerns, which must be viewed in the context of historical trauma, are amplified for LGBQT* people of color and transgender individuals. Nonetheless, LGBQT* individuals find strength and resilience through identity affirmation and social support. More research focused on the strengths and sources of resilience of LGBQT* people is needed to complement and inform existing research on pathology and barriers.

Despite the high rates of IPV and trauma that LGBQT* communities experience, trauma-informed approaches tailored to LGBQT* survivors have been slow to develop. We hope that this document will facilitate thinking about how the core principles of trauma-informed practice can be applied to working with this community and to ameliorating vicarious traumatization among service-providers who do their best in difficult circumstances. The practice-based observations in the Appendix provide further framing for this important endeavor.

Appendix A: Existing Trauma-Informed Approaches

Trauma-informed Approach	Trauma-informed Care with LGBQT* Homeless Youth
Community	LGBQT* Homeless Youth

Principles	Examples of Practices
• Recovery is possible • Healing happens in relationships • Sharing power and governance • Understanding trauma and its impact • Promoting safety • Supporting client control, choice, autonomy • Focus on strengths • Integrating cultural awareness	• Organizational commitment to nondiscrimination and cultural competence • Involve LGBQT* youth in decisions about services • Provide positive LGBQT* role models • Coordinate with LGBQT* service and advocacy organizations • Collaborate with other organizations • Outreach to change public awareness • Include LGBQT* youth in outreach • Assess staff for knowledge, attitudes, skills

Poirier, J., Murphy, C., Shelton, J., & Costello, S. (2013). Ending LGBT youth homelessness: A call to action. Retrieved from http://tapartnership.org/events/webinars/webinarArchives/presentationSlides/20130710_LGBThomelessness_FINAL.pdf

Trauma-informed Approach	Trauma-Informed or Trauma-Denied
Community	Female Survivors of Trauma

Principles	Examples of Practices
• Recognize the impact of violence and victimization on development and coping • Identify recovery from trauma as primary goal • Employ an empowerment model • Strive to maximize women's choice and control over recovery • Services are based in relational collaboration • Create an atmosphere respectful of survivors' need for safety, respect and acceptance • Emphasize women's strengths, adaptations and resiliency • Minimize retraumatization • Services are culturally competent and understand each woman in context • Solicit participant input and involve participants in designing and evaluating services	• Outreach and Engagement: prioritize safety, ask permission, follow client's lead • Screening and Assessment: screen all clients for trauma history, understand survivor's unwillingness to answer certain questions, only ask for necessary information, balance usefulness of information against client needs, clearly communicate reason for asking questions • Resource Coordination and Advocacy: focus on empowering clients, identify strengths, emphasize skill-building • Crisis Intervention: plan for crises in advance, avoid using restraints or forced hospitalizations, make sure clients know their options • Trauma-Specific Services: offered in trauma-informed environment by individuals trained in trauma and its treatment • Parenting Services: build on parents' strengths • Mental Health and Substance Abuse: treat trauma and substance abuse in integrated way, emphasize physical and emotional safety, collaborate on treatment • Healthcare: prepare clients for medical appointments that might be triggering, debrief and review information provided during exam

Elliot, D. E., Bjelajac, P., Fallot, R. D., Markoff, L. S., & Reed, B. G. (2005). Trauma-informed or trauma-denied: Principles and implementation of trauma-informed services for women. *Journal of Community Psychology, 33*(4), 461-477.

Trauma-informed Approach	The Sanctuary Model
Community	Originally for adults who experienced abuse as children, adapted to domestic violence settings

Principles	Examples of Practices
• Core Concepts: nonviolence, viewing organization as whole entity, parallel processes • 7 Commitments: • Nonviolence: physical and psychological nonviolence at all organizational levels • Emotional Intelligence: staff must cultivate awareness of emotional responses and be able to manage and talk about them • Social Learning: organization must be dynamic and constantly identify and respond to changing needs of communities being served • Open Communication: organization should espouse transparency, nonviolent language, and effectively manage conflicts • Democracy: everyone at the agency, clients and staff, should have a voice that is heard • Social Responsibility: create a just and safe organization • Growth and Change: focus should be on the future, with goal of changing and growing over time	

The Sanctuary Model. Accessed 7/2014, from http://www.sanctuaryweb.com/

Trauma-informed Approach	National Center for Domestic Violence, Trauma & Mental Health's Accessible, Culturally Relevant, Domestic Violence-and Trauma-Informed (ACDVTI) Agency Self-Assessment Tool
Community	Domestic violence survivors and programs

Principles	Examples of Practices
• ACDVTI Approach • Be sensitive to the pervasiveness of trauma and its impact on survivors, staff and organizations including historical trauma and ongoing experiences of discrimination and oppression • Recognize the role of coercive control and DV-related safety and confidentiality concerns • Ensure services are welcoming, inclusive, accessible and culturally responsive • Work to minimize retraumatization • Support resilience, healing and well-being • Employ a collaborative strength-based approach • Attend to the quality of interactions for people using services and staff • Involve people using services and communities being served in shaping and evaluating services • Maintain a commitment to changing the conditions that contribute to abuse, violence, discrimination & oppression • Key tenets include recognizing the importance of • Physical and emotional safety • Relationship & connection • Respect, empowerment, transparency, collaboration & choice • Hope & resilience • A survivor-defined approach	The ACDVTI tool provides guidance on engaging in a reflective organization-wide self-assessment process. It is structured to walk agencies through a process of considering what an ACDVTI approach would look like in each of the following 7 domains. • Organizational Commitment and Infrastructure • Staff Support • Physical, Sensory and Relational Environment • Intake Process • Programs and Services • Community Partnership • Evaluation and Feedback It also includes a section on organizational readiness.

Introduction and Project Overview

This document contains a set of preliminary practice observations from the field, which are intended to inform the development of a trauma-informed transformative justice approach specific to lesbian, gay, bisexual, queer, and transgender (LGBQT*) survivors of intimate partner violence (IPV). These observations are the result of a research project that was led by the GLBTQ Domestic Violence Project (GLBTQ-DVP) and funded by the Administration for Children, Youth and Families, Family and Youth Services Bureau, US Department of Health and Human Services.

The goal of the project was to help develop a culturally-specific, trauma-informed approach to working with LGBQT* survivors with support and input from a range of stakeholders. To meet this goal, the following activities[1] were conducted over the course of two years (2013-2015):

- A substantive literature review on intimate partner violence in the LGBQT* communities (page 1), which is intended to be read in tandem with the observations
- Input from an advisory committee that included Queer Muslims of Boston, the Hispanic Black Gay Coalition, the Northeast Two Spirit Society, the Massachusetts Alliance of Portuguese Speakers, HarborCOV, Massachusetts Asian & Pacific Islanders for Health, and Fenway Health
- Two focus groups with survivors participating in one GLBTQ DVP program, the goal of which was to explore their experiences seeking help
- Three separate focus groups and multiple individual conversations with staff of one GLBTQ DVP program to assess their perceptions, experiences, and ideas about trauma-informed organizations and providing trauma-informed services
- Surveys of the program's staff as well as LGBQT* practitioners nationally to assess knowledge and experience of trauma-informed practices
- Informal conversations with staff and leadership of LGBQT* culturally-specific organizations across the country
- The authors' own collective experience working with LGBQT* organizations and communities over the past 30 years
- Considerable guidance from the National Center on Domestic Violence, Trauma, & Mental Health

From these multiple sources of data, a set of six observations emerged, which then were simplified and distilled in the hopes that they will be broadly applicable. They are listed here and explained in detail in the subsequent pages.

- Observation 1: The majority of LGBQT* survivors have experienced multiple forms of violence and abuse in their lives. Experiences of historical trauma and ongoing discrimination can compound these multiple experiences of victimization.

[1] The Simmons College Institutional Review Board approved the research activities involving human subjects (i.e., interviews and focus groups with practitioners and program participants).

- Observation 2: Organizations that work with LGBQT* survivors must operate from a place of understanding that perceived "challenges" may actually be creative strengths.

- Observation 3: Organizations that work with LGBQT* survivors must operate from the premise that if LGBQT* communities, staff, board members, organizations, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their family of choice, not merely as a service provider or colleague.

- Observation 4: If practitioners are to truly be of service, a social justice and anti-oppression framework must become the cornerstone of their individual work, their organization's work, and their organization's interactions with the community.

- Observation 5: Staff self-care (and organizational support for self-care) is critical.

- Observation 6: There is a profound need for transformative justice[2] approaches to working with LGBQT* and other multiply oppressed communities.

It is important to note that the authors view these observations as dynamic and evolving, and we are hopeful that LGBQT*organizations, practitioners, activists, and researchers will expand upon them as part of their own trauma-informed, anti-oppression, transformative justice work. Some sections of this addendum tie directly to the literature review (e.g., observations 1 and 5), and others do not. Also, although these observations grew in tandem with the literature review – and should be read together – some of the ideas are not yet supported by a body of literature. Rather, they reflect the practice wisdom and lived experience of LGBQT* practitioners and LGBQT* survivors who contributed to this project.

The practice observations and companion literature review are intended primarily for staff in domestic and sexual violence organizations; however, they are applicable to practitioners in other anti-abuse disciplines, homelessness services, mental health and healthcare circles, criminal legal systems, youth services, and an array of other human services disciplines and social change endeavors that seek to serve and ensure the inclusion of LGBQT* communities.

[2] The authors wish to thank Hales Burton at the Fenway Violence Recovery Program for first suggesting this conceptual shift.

A Note on Language[3]

Before describing the observations, the authors wish to acknowledge the deep complexities of language. In this document, IPV refers to the physical and/or emotional abuse of an individual by a current or former intimate partner. It includes the full range of tactics used to create and maintain power and control over another person, including financial abuse, verbal abuse and intimidation, and cultural abuse. In this document, the phrases *intimate partner violence* and *domestic violence* are used interchangeably to denote partner violence. However, it is important to note that domestic violence (DV) is sometimes defined more broadly to include violence and abuse perpetrated by relatives. Although many LGBQT* individuals experience abuse and/or rejection from family and relatives, the dynamics of partner violence versus family violence may differ dramatically. When we discuss the latter, we use the phrase *family violence* to distinguish it from violence by an intimate partner.

LGBQT* stands for lesbian, gay, bisexual, queer, and transgender. It is often used interchangeably with GLBTQ, LGBQT-TS, and similar acronyms to broadly refer to sexual and gender minorities. This document honors the current practice of including an asterisk after the "T" to signify the broad diversity of trans communities, including trans women – transgender individuals who identify as women, though assigned male at birth; trans men – transgender individuals who identify as men, though assigned female at birth; those transitioning from female to male (FTM); those transitioning from male to female (MTF); cross dressers; gender non-conforming individuals; and others who might self-identify as being members of trans communities. In this paper, transgender and trans are used interchangeably.

These definitions belie the complexity of the terms, however. The words *lesbian*, *gay*, *bisexual*, *transgender*, and *queer* all carry particular historical, political and cultural meanings. To a great extent, these words have been shaped in white, Western contexts. Words such as lesbian, gay, and bisexual, for example, are uniquely English. There are seldom translations into other languages that carry the same understanding of LGBQT* identity as being an identity rather than a set of behaviors. Literal translations, into Spanish or Haitian Creole as but two examples, carry few if any of the presumptions that are inherent in English. In many parts of the Latin and Spanish-speaking world, men who engage in sex with same sex partners are only considered "gay" in the English sense of the word if they are the receptive partner. It is not engaging in the acts that is the determinant of identity, so much as the role that an individual plays (traditionally read as *masculine* or *feminine*) in the conduct of that act. Similarly, men who marry women, but engage in same sex acts with other men, are frequently identified as heterosexual. In short, they are defined by their social role, rather than by their private, intimate acts. Hence the conception of *gay*, as defined in U.S. contexts, frequently fails to apply.

Precisely because identifiers such as LGBQT* were defined in white middle class and academic contexts, the limitations of LGBQT* labels and identifiers may be particularly acute in communities of

[3] For those of you who are reading the literature and practice observations in tandem, please note that this "note on language" section is identical to the "note on language" section in the literature review.

color, Indigenous communities, and immigrant communities, among others. During the course of crafting this literature review, members of our Advisory Board taught us a tremendous amount. The Hispanic Black Gay Coalition (HBGC) suggested use of the term *same gender loving*, a community-specific phrase coined by Cleo Manago to distinguish African Americans, and in particular African American men, who do not self-identify as being part of the predominantly white gay movement in the U.S., but who nonetheless wish to affirm their same sex intimate relationships. Corey Yarbrough, one of the founding Executive Directors of HBGC, suggested that for some same gender loving people this language may be a form of racialized resistance to the racism of the mainstream LGBQT* movement in the U.S. In the alternative, Corey stated, some members of African American communities may be on the *down low*, engaging in same sex sexual activity, but rejecting LGBQT* identifiers as a result of internalized homo and biphobia.

The NorthEast Two-Spirit Society (NETSS) in part echoed Corey's thoughts about the racism of the mainstream LGBQT* movement. In addition, Harlan Pruden, one of co-founders of NETSS, spoke about an "internal muddiness" that some Native peoples may experience when seeking to find language for their experience. Speaking of his own Cree inheritance as a registered member of the Saddle Indian Reservation, Harlan said that when he asked something of an elder, he knew to offer them tobacco, but never understood the spiritual dimension of the ceremony. Having been separated from too much of their own history by colonialism, genocide and forced assimilation, Harlan stated, many Native people may use the words *Two-Spirit* when what they really mean is gay Indian.[4]

Harlan also spoke at length about the contextual nature of Native Two-Spirit identities. As Harlan put it, "When I am out on a Friday night in a gay club, I am a gay man. Yet when I am in rural Oklahoma at a Two-Spirit gathering, I am a proud Two-Spirit man." Alluding to the unique role and cultural responsibilities that Two-Spirit people often held (and may still hold) in the life of Native communities, Harlan pointed out the obvious differences in the spiritual role of Two-Spirit peoples, and the political and social function of people claiming LGBQT* identities in mainstream communities. Several members of the project's advisory board echoed this point,
speaking about the complex layering of cultural and spiritual value systems that accompanied their choice to self-identify in, with, and outside of their own communities.

These same Advisory Board members also acknowledged the landscape in which such decisions are made, and stated that individuals in their communities may shift how they self identify as a means of preserving their safety. As the rest of this literature review discusses, LGB, transgender, same gender loving, Two-Spirit, and queer-identified peoples make choices about how, when, and if to "out" themselves in a complex social and political landscape that is too often unsafe, if not violent. Hence how

[4] Two-Spirit is a contemporary term, adopted from the Northern Algonquin, and meant to signify the embodiment of both masculine and feminine within one person. Now embraced by many Native peoples as a pan-Indigenous umbrella term connoting both diverse gender expressions and sexual orientations, Two-Spirit generally speaks to the respect that Native peoples held for diversity, and the unique sacred and ceremonial roles that Two-Spirit people held (and may still hold) within their own communities. Herein the phrase Two Spirit speaks not simply to a third gender, or to same gender attraction, but more broadly to the history of compulsory Christianization that sought to erase Two-Spirit peoples within their own nations. Notably, there is no single consensus definition of Two-Spirit, and the term means different things to different Native peoples.

any individual self-identifies may shift depending on who is asking, why, and in what context. As one Advisory Board member stated, "identities have to be fluid in order to be protective."

Finally, the leadership of HarborCOV, an LGBQT*-affirming DV organization in Boston that specializes in serving communities facing cultural or linguistic barriers, has noted that some cultures may not have the variety or depth of language that words such as LGB, transgender, same gender loving, and Two-Spirit convey. Indeed, Kourou Pich, Co-Executive Director of HarborCOV has observed that people from some cultures and communities may have difficulty finding language for themselves in their own communities, and that that invisibility is intentional – a function both of denial of the existence of sexual minorities in those communities, but also perhaps protectiveness of gender queer and same gender attracted people.

Language is power. We authors, therefore, have put a great deal of thought into the words we use to name peoples' experiences. At the same time, we know that we can never be as inclusive or sensitive as we want to be. We have done our best to honor the range of experiences we are writing about in this document.

Notes from the Field: A Set of Practice-Base Observations

Observation 1: The majority of LGBQT survivors have experienced multiple forms of violence and abuse in their lives. Experiences of historical trauma and ongoing discrimination can compound these multiple experiences of victimization.*

A trauma-informed approach, at its core, asks that practitioners assume that everyone they serve has experienced some form of violence, abuse, or other trauma in their lives and to see these experiences as the norm, rather than the exception (Felitti et al., 1998; Harris & Fallot, 2001).

Given the prevalence and overlapping nature of violence and abuse in the lives of LGBQT* peoples, it might be more prudent to suggest that practitioners build practices and systems that presume *multiple* forms of victimization among the people they serve. It is not unusual for LGBQT* peoples to be targets of many different forms of violence and abuse at the hands of multiple individuals, at numerous points throughout the lifespan (Roberts, Austin, Corliss, Vandermorris, & Koenen, 2010; Grant, Mottet, & Tanis, 2011; Stotzer, 2009).[5] Indeed, traumatic experiences such as intimate partner

[5] To date, the fragmented nature of the research into violence and abuse in the lives of LGBQT* individuals means that, although there is a broad practice consensus about the prevalence of "polyvictimization" in the lives of LGBQT* peoples, there is little peer-reviewed research examining the phenomenon. However, there is abundant evidence that LGBQT* people, and in particular LGBQT* people of color, are more likely to be targeted for multiple forms of violence and abuse, in multiple contexts (family, partnerships, community) over the course of their lifetime. For example, LGBQT* peoples are disproportionately subject to childhood sexual abuse, bullying by peers, sexual violence in adolescence and adulthood, intimate partner violence, hate crimes, and police brutality (Roberts et al., 2010; Grant et al., 2011; Stotzer, 2009). Again, the authors wish to encourage individuals to read these observations in tandem with the literature review to learn more about these siloed areas of research.

violence, family violence, and other types of trauma that occur over the course of the lifespan, including childhood sexual assault, bullying, hate crimes, or police brutality, may intersect and compound each other in the lives of LGBQT* survivors in ways that create unique challenges for survivors themselves, and unique opportunities for control by future perpetrators.

These interpersonal traumas are often further compounded by experiences of oppression and historical trauma in LGBQT* communities. LGBQT* peoples have historically experienced discrimination at the hands of helping professionals in a range of systems (e.g., healthcare, mental health, criminal-legal, child protection, public assistance, and sexual and domestic violence organizations) – if LGBQT* peoples have been visible in those systems at all.[6] In addition, many of these systems (in particular mental health and criminal-legal systems) have not only pathologized, labeled, isolated, and detained LGBQT* individuals, but also intentionally fractured LGBQT* partnerships, families, and communities. Such treatment is especially the case for multiply marginalized LGBQT* communities, such as communities of color, immigrants and refugees, Two Spirit communities, and people with disabilities.

It is important to understand, however, that these forms of oppression are not merely historical artifact in the lives of LGBQT* survivors, but ongoing and continuing realities, especially for those who are multiply marginalized. This ongoing oppression then exacerbates experiences of current and historical trauma.

A trauma-informed approach encourages practitioners, and indeed entire systems, to minimize the possibilities for retraumatization by creating an atmosphere that prioritizes survivor's need for safety, respect, and acceptance (Elliot, Bjelajac, Fallot, Markoff, & Reed, 2005; Guarino, Soares, Konnath, Clervil, & Bassuk, 2009; Jennings, 2004; Substance Abuse and Mental Health Services Administration, 2014; Warshaw, 2014; Wilson, Fauci & Goodman, 2015). In short, a trauma-informed approach asks first and foremost that practitioners – as well as the systems in which they work – do no harm.

However, for LGBQT* survivors in particular, the mandate to do no harm requires that practitioners understand the concept of *sanctuary harm* – the idea that institutions and institutional gatekeepers can inflict enormous damage on the very people whose healing, empowerment, and safety they are supposed to nurture and protect (Bloom & Farragher, 2011; Smith & Freyd, 2014). Survivors who participated in the focus groups for this project spoke of blatant discrimination, noting, for example, institutions and practitioners who had at times openly refused services to male and LGBQT* survivors. And, in the staff focus groups, participants spoke about the challenges of advocating with organizations that had a funder mandate to be LGBQT* inclusive, but who were still actively resistant to accepting some members of this diverse community.

[6] The authors are mindful that historical trauma means different things in different communities. Many members of First Nation communities frame historical trauma in terms of colonization, genocide, and boarding-school trauma. Members of Jewish communities may frame historical trauma in terms of the intergenerational impact of the Holocaust. And members of the African Diaspora may think of the Middle Passage and the enslavement of African peoples when referencing historical traumas. The specific nature of the historical influences the way it continues to affect the lives of individuals and entire communities.

Conversations with LGBQT* practitioners across the country, especially those from mainstream organizations, surfaced deep ethical tensions over their own roles as institutional actors in organizations and agencies that they believed too often inflicted sanctuary harm. Consciousness of the harm they were doing – and the good they were prevented from doing – was a significant source of mental, emotional, and ethical distress for many practitioners, especially when contrasted with their larger awareness of the needs of the communities and people they were serving.

Observation 2: Organizations that work with LGBQT survivors must operate from a place of understanding that perceived "challenges" may actually be creative strengths.*

Recognizing the potentially significant impact of violence and abuse on development and coping strategies, a trauma-informed approach aims to contextualize coping strategies such as substance use, cutting, eating disorders, "promiscuous" sex, and dissociation as adaptive responses to otherwise intolerable situations (Elliot et al, 2005; Guarino et al., 2009; Jennings, 2004; SAMHSA, 2014, Warshaw 2014). Because it is rooted in clinical frameworks, trauma-informed practice approaches often frame such strategies as necessary within the context of abuse, but no longer adaptive once relative safety had been achieved. Following the examples of Kate Bornstein and Sylvia Rivera, the LGBQT*-specific practitioners who participated in the survey and informal conversations spoke about celebrating survivors' coping strategies as not merely adaptive, but indeed creative, even when such strategies are not on the surface immediately conducive to health or perceived well-being. Given the multiple forms of victimization, ongoing discrimination, and historical trauma that shape the LGBQT* experience, it may be that there is no safety anywhere. In that context, any strategy that allows people to survive – internally or externally – is to be celebrated. As one practitioner put it, "It isn't about coping, it is about surviving. We celebrate survival, because it is so uncertain." Such a response should not preclude practitioners from expressing concern or helping survivors to develop alternative survival strategies in parallel; however, it does require that practitioners fully embrace survivors and honor and respect their own strategies.

Observation 3: Organizations that work with LGBQT survivors must operate from the premise that if LGBQT* communities, staff, board members, organizations, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their family of choice, not merely as a service provider or colleague.*

A trauma-informed approach asks that practitioners base everything they do in relational collaboration. In fact, one of the core principles of a trauma-informed approach is to ensure that goals and strategies are collaboratively defined, and that the partnership between survivor and practitioner is itself a place of healing (Elliot, et al, 2005; SAMHSA, 2014; Warshaw, 2014; Davies & Lyon, 2014; Wilson et al., 2015).

Just as with other historically oppressed communities, the complexities of the LGBQT* experience may be such that a traditional relationship between service provider and client is not sufficient to fully support the person's healing. Instead, a different and more porous set of boundaries may be required – or at least expected. As several LGBQT* practitioners put it, when LGBQT* communities, staff, co-workers, and individual survivors lend you their trust, they are often accepting you as a community member, and possibly even as their "family of choice," not merely as a service provider. Program participants supported this sentiment, describing how one of the most important and helpful aspects of the services they received was the staff's willingness to go "above and beyond their job descriptions." Providing the sort of attention that a friend might provide (e.g., calling to check in or going along to doctor's appointments) was important because, as one survivor expressed, "I had never been treated that way in my life, not even by my family." Although this can raise complex ethical issues for both survivors and practitioners in navigating this important but complicated terrain, recognizing it is critical in working with LGBQT* survivors and working within LGBQT* communities.

Observation 4: If practitioners are to truly be of service, a social justice and anti-oppression framework must become the cornerstone of their individual work, their organization's work, and their organization's interactions with the community.

Another principle of trauma-informed practice is to respond to all people in ways that are sensitive to their individual social locations and contexts (Wilson et al., 2015; see also Elliot, et al, 2005; Jennings, 2004; Guarino et al., 2009; SAMHSA, 2014; National Center on Domestic Violence, Trauma & Mental Health, in press). At a minimum, this principle sets forth an expectation of cultural sensitivity across multiple aspects of identity. Given the chronic and cascading traumas, ongoing oppression and historical trauma referenced above, cultural sensitivity is essential but not sufficient for responding to the experiences of LGBQT* survivors. Instead, attention to individual social locations and contexts must be situated within a broader anti-oppression framework.

LGBQT* practitioners from across the country observed that the broader movements against sexual and domestic violence sometimes minimized the ways in which violence and abuse intersect with other forms of oppression. They took note not simply of the ways in which this lack of proactive attention shaped direct services, but also how it shaped their organization's hiring practices, the tokenization of staff members from historically marginalized communities, the narrow makeup of their organization's governing board, the focus on quantity over holistic quality of services, and the lack of input particularly from transgender community members and community members of color in strategic planning and other organizational activities.

By contrast, they called on practitioners to build organizations that are integrated into and learn from the historically marginalized communities they serve (or should be serving) and that center the knowledge and experiences of those communities. Historically oppressed communities, including LGBQT* communities, are at the leading edge of anti-violence work, not a set of "minority communities" requiring special logistics or uniquely special care. What organizations learn from historically oppressed communities should serve as the foundation of their organizational philosophy, practices, and policies.

Observation 5: Staff self-care (and organizational support for self-care) is critical.

Empathic engagement and bearing witness to other people's pain can affect us deeply. To be effective, it is important for service providers and activists serving people in pain and crisis to be mindful of how they have been affected by their own experiences of trauma *and* how they are affected when they open themselves up to other people's experiences (Saakvitne, Gamble, Pearlman, & Lev, 2000; Hopper, Bassuk, & Olivet, 2010; Bloom & Farragher, 2013; SAMHSA, 2014). Hence, an understanding of vicarious trauma and encouragement to develop strong habits of self-care have become foundational principles in trauma-informed practice (Bloom & Farragher, 2011; Bloom & Farragher, 2013). Thus, to be truly trauma-informed, organizations need to institute programmatic supports for self-care at all levels of the organization (Bloom & Farragher, 2011; Bloom & Farragher, 2013, Warshaw 2014).

Conversations with LGBQT* practitioners across the country led to an additional observation: There is a particular weight that accompanies serving LGBQT* people experiencing violence, abuse, and discrimination while simultaneously identifying with those same communities. Trauma, vicarious trauma, organizational trauma, and historical trauma compounded one another in the lives of the LGBQT* practitioners who contributed to this project, just as they do for the survivors who participate in their programs. Moreover, the impact of compounding trauma was one each group articulated virtually unanimously. Their experiences underscore the need for self-care at the individual level. They also point to need for organizational policies that enable self-care, provide LGBQT*-affirming workspaces, and facilitate connection with the larger community of providers and activists that support and depend upon the work and health of that organization. Essentially, caring for each other individually and as a collective is a critical element of any trauma-informed approach.

Observation 6: There is a profound need for transformative justice[7] approaches to working with LGBQT and other multiply oppressed communities.*

Because the companion literature review focused largely on peer-reviewed, published literature, it did not consider the enormous array of activist literature and art that historically oppressed communities have often used to express their communal strategies for survival and resistance. The work of Incite!, Creative Interventions, Black & Pink, and Break Out, along with broader bodies of art, music, dance, autobiography, fiction, and oral history attest to this creative communal drive.

One innovation that has emerged from this kind of activist energy is the concept of *transformative justice* (Generation Five, 2007; Creative Interventions, 2012). Transformative justice recognizes the profound harm and trauma that mainstream approaches have inflicted on LGBQT* peoples, particularly those who face multiple forms of oppression. Its practitioners argue for an approach that understands these historical harms and seeks to create new and innovative responses that avoid replicating them. Rather than work within the framework of social services, it aims for the liberation of oppressed people as communities not just as individuals, under the fundamental

[7] The authors wish to thank Hales Burton at the Fenway Violence Recovery Program for first suggesting this conceptual shift.

assumption that “individual justice and collective liberation are equally important, mutually supportive, and fundamentally intertwined” (Generation Five, 2007, p.1). In other words, transformative justice seeks to transform the political and cultural conditions that allow violence, abuse and oppression to exist in the first place. It is critical that trauma-informed practices include transformative justice as an additional lens in service delivery and system reform.

Conclusion

In summary, these six observations underscore the ways in which individual, interpersonal, and structural factors coalesce in the lives of LGBQT* survivors of domestic violence, creating a unique context, that affects their experiences and needs. Future trauma-informed approaches for LGBQT* survivors of domestic violence should consider the multi-layered context that surrounds LGBQT* survivors and use that knowledge to inform not only client-level practices, but also organizational-level policies.

ABSTRACT

The European countries have a long history of exposure to large-scale trauma. In the early 1990s the increasing awareness of the consequences of trauma within the mental health community led to the foundation of local societies for psychotraumatology across Europe and the European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary in 2018. The focus of this article is to describe the current state of care for survivors of trauma in the 15 European countries where ESTSS member societies have been established. Brief descriptions on the historical burden of trauma in each country are followed by an overview of the care system for trauma survivors in the countries, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in the future. The reports from the different countries demonstrate how important steps towards a better provision of care for survivors of trauma have been made in Europe. Given the cultural and economic diversity of the continent, there are also differences between the European countries, for instance with regard to the use of evidence-based treatments. Strategies to overcome these differences, like the new ESTSS training curricula for care-providers across Europe, are briefly discussed.

Trauma y Atenciones de Trauma en Europa

Los países Europeos tienen una larga historia de exposición a traumas de larga escala. A principios de la década de 1990, la creciente conciencia de las consecuencias del trauma dentro de la comunidad de salud mental condujo a la fundación de las sociedades locales para la psicotraumatología en Europa y la Sociedad Europea de Estudios de Estrés Traumático (ESTSS), la cual celebra en el 2018 su 25° aniversario. El enfoque de este artículo es describir el estado actual de la atención de los sobrevivientes de traumas en los 15 países Europeos, donde las sociedades miembros de la ESTSS se han establecido. Las descripciones breves sobre la carga histórica de trauma en cada país son seguidas por una descripción general del sistema de atención para sobrevivientes de trauma en el país, el estado de la técnica de las intervenciones, los desafíos actuales en el cuidado de sobrevivientes y los temas que necesitan ser abordados con mayor urgencia en el futuro. Los reportes de los diferentes países demuestran los pasos importantes que se han dado en Europa en la entrega de atención para los sobrevivientes de trauma. Dada la diversidad cultural y económica del continente, hay también diferencias entre los países Europeos, por ejemplo en relación al uso de tratamientos basados en la evidencia. Las estrategias para

HIGHLIGHTS

- Important steps towards a better provision of care for victims of trauma were made in the European countries.
- In 2018, ESTSS celebrates its 25th anniversary.
- Strategies to promote a better practice include new ESTSS curricula for professionals across Europe.

resolver estas diferencias, como el nuevo curriculum de entrenamiento de la ESTSS para los proveedores de atención a lo largo de Europa son discutidas brevemente.

欧洲的创伤和创伤护理

欧洲国家有遭受大规模创伤的久远历史。在20世纪90年代早期，精神卫生界内越来越意识到创伤的后果，导致了在欧洲各个地区性创伤心理学会和欧洲创伤应激研究学会（European Society of Traumatic Stress Studies；ESTSS）的成立，该学会将于2018年庆祝其成立25周年。本文旨在描述在已建立ESTSS子协会的15个欧洲国家中创伤幸存者护理的当前状况。首先是对每个国家创伤的历史负担的简要描述，之后概述了各国创伤幸存者的护理系统的概述，干预措施的最新技术，护理幸存者面临的的当前挑战以及将来最迫切需要解决的问题。来自不同国家的报告展示了，在欧洲是如何实现为创伤幸存者提供更好的护理。鉴于大陆的文化和经济多样性，欧洲国家之间也存在差异，例如在循证治疗的使用上。我们简要讨论了克服这些差异的策略，例如为跨欧洲的护理服务提供者的新ESTSS培训课程。

1. Introduction

Exposure to trauma is common (Kessler et al., 2017) and its consequences on the individuals and communities affected can hardly be overestimated. In Europe, as in other regions of the world, a high burden of trauma is related to human-made events. In the twentieth century, military conflict took place during every single year in the European region and many of them affected numerous countries (see Table 1). Mass traumatization was also related to military conflicts associated with European colonialism, or conflicts in other continents where European military forces were involved in conflicts (see Table 2). Another massive burden of trauma across Europe resulted from the Holocaust and, throughout most of the twentieth century, from the political oppression by the Soviet communism. Trauma has occurred and still occurs in many societal contexts. For example, these include the familial and institutional abuse of children, different forms of gender-based violence in the European societies, various forms of institutional violence (i.e. in detention facilities of some countries) and also large-scale disasters and terror attacks that struck individual countries. Finally, over the last decades, an increasing number of migrants have reached the European countries, due to war and violence in their homeland (Hall & Olff, 2016; Kartal & Kiropoulos, 2016; Knaevelsrud, Stammel, & Olff, 2017; Munz & Melcop, 2018).

In the last two decades of the twentieth century, the increasing awareness of the consequences of trauma in the mental health community led to the foundation of local working groups and societies for psychotraumatology in several European countries. The European Society of Traumatic Stress Studies (ESTSS), which celebrated its 25th anniversary this year, was founded in 1993. Over two decades, ESTSS was an organization that included both member societies and individual members, which in the first years mainly came from western European countries. Recently, ESTSS has developed into an umbrella organization of the European societies for traumatic stress. This change is the result of a strategic plan that has been pursued over a longer period of time (Gersons, 2013). The ESTSS board consists of representatives from all member societies, which facilitates the work towards common strategic aims, such as promoting a standard curriculum for training in psychotrauma across Europe. In 2018, ESTSS com-

Table 1. Examples of military conflicts in Europe.

Year	Military conflict	Countries affected
1914–1918	First World War	Paneuropean
1917–1922	Soviet revolution	Former Soviet countries
1936–1939	Spanish civil war	Spain
1939–1945	Second World War	Paneuropean
1944–1953	Lithuanian partisan war against Soviet occupation	Lithuania
1968–1998	The Northern Ireland Troubles	UK, Republic of Ireland
1991–2000	Wars following the dissolution of former Yugoslavia	Slovenia, Croatia, Bosnia and Herzegovina Serbia, Montenegro, Kosovo
Since 1990	Military conflicts/wars in the South and North Caucasus	Georgia, Armenia, Azerbaijan and Russia (including North Caucasian region of Russia)
2008	Russian-Georgian war	Georgia, Russia
Since 2014	Conflict in East Ukraine	Ukraine, Russia

The list of military conflicts and countries involved is not all inclusive.

Table 2. Examples of military conflicts outside of Europe.

Year	Military conflict	European countries affected
1945–1949	War in the former Dutch East Indies	The Netherlands
1946–1954	Vietnam war	France
1954–1962	Algeria war	France
1950–1953	Korean war	Belgium, France, Greece, Luxembourg, Netherlands, UK
1961–1974	Portuguese Colonial War in Africa	Portugal
1979–1987	Afghanistan war	Former Soviet countries, UK
1990–1991	Gulf war	Belgium, Denmark, France, Germany, Greece, Hungary, Italy, Netherlands, Norway, Poland, Portugal, Romania, Spain, Sweden, UK
2001–2014	Afghanistan war	Albania, Belgium, Croatia, Czech Republic, Denmark, France, Georgia, Germany, Italy, Lithuania, Norway, Poland, Portugal, Romania, Russia, Spain, Sweden, UK, etc.

The list of military conflicts and countries involved is not all inclusive.

prised of 13 member societies that included 15 European countries and regions. These included Austria, Belgium, Croatia, Georgia, Germany, Lithuania, Italy, The Netherlands, Poland, Portugal, Sweden, the German-speaking and the French-speaking part of Switzerland, Ukraine and the UK (www.estss.org). Moreover, ESTSS had 12 additional affiliated societies and institutions in 2018. The society is constantly working towards the inclusion of further European societies and actively supports the formation of new societies in countries where they do not exist yet, as currently happened in Finland where the Finish Society for Psychotraumatology was launched in 2018.

While a series of articles at the occasion of ESTSS' twentieth anniversary focused on the inspiring and often also entertaining recollections of former presidents on the development of ESTSS (Lueger-Schuster, 2013b), the focus of this article is on the current member societies of ESTSS and on the development of trauma care in the respective countries. After some reflections on the historical burden of trauma in each country, representatives from all the national societies describe the structure of care organizations for trauma survivors, the state-of-the-art of interventions, current challenges in caring for survivors and the topics that need to be most urgently addressed in their countries in the future.

2. Psychotraumatology in Belgium

Five to eight million deaths, perhaps even 10: this was the devastating toll of the conquest and colonial exploitation of the Belgian Congo with King Leopold II, between the 1880s and the First World War (Hochshild, 1998). All traces of this Genocide remained secret until the early 1980s. Concerning the historical burden of the two World Wars (Manfred, 2015), it is the First World War more than the Second World War which, in the collective memory, constitutes a great trauma because of the looting of the country and the massacre of more than six thousand civilians. Recent events that stay more broadly in the mind of the Belgian people include the Heysel Drama in 1985 and the Dutroux affair with the sexual abuse, sequestration and death of young children and adolescents in 1996. In March 2016, the terrorist attacks at the national airport and in the metro of Brussels caused the death of 35 persons (Deschepper et al., 2018). Psychosocial structures vary across the country and have little or no coordination between them. One of the reasons is a difference between the functioning of French- and Flemish-speaking communities. Some structures can be found in both the French- and the Flemish-speaking communities. For instance, Public Welfare Centres and police victim services can be found in both of them. The integration of a psychosocial dimension into emergency and intervention plans was formalized in 2006. For the last 20 years, psychotherapists and other clinicians working in private practices started to specialize in trauma care for survivors. More and more specifically trained psychologists are working in hospitals and mental health centres. Recently, the development of outpatient trauma treatment centres linked to hospitals is evident. Some centres for the provision of trauma care for refugees were established in Brussels and cover the Dutch- as well as the French-speaking part of the country. In 2017, the High Council on Health received a Ministerial request for an opinion on the psychological care and support of persons following terrorist incidents or related disasters.

Until recently, there were no trauma-focused intervention methods in use in Belgium. The main therapeutic currents, for instance cognitive behavioural therapy (CBT) and psychodynamic therapies, were putting their own accents on working with trauma. In 2006, the BIP (Belgian Institute for Psychotraumatology) started the first psychotraumatology course. More trauma centres were created in the following years in principle cities, mainly Antwerp and Brussels. The course is organized in collaboration with two Universities. BIP organizes conferences in collaboration with other institutes or centres in Belgium. An independent Belgian trauma society needs to be created in the near future.

Current challenges in caring for trauma survivors concern the coordination of different support services. The political system in Belgium involves varying responsibilities at several levels, which makes decision-making complex. More visibility through studies on the positive impact and benefits of qualified trauma-focused care will be important. Finally, a well-structured national accreditation system should be put in place in order to continue provision of quality care for trauma survivors.

Among the topics to be most urgently addressed in the future is accessibility of services which is limited due to long waiting lists before survivors get access to psychological care in the Belgium mental health care system. Moreover, new ways of thinking about specialized trauma-care structures are needed.

3. Psychotraumatology in Croatia

The still living burden of the Second World War psychotrauma in Croatia has merged with the trauma of the Homeland War (1991–1995). Throughout the whole post-World War period there was no awareness of the consequences of trauma exposure, the issue was present neither in the health nor in public discourse. Consequently, no specific care was developed and provided. In contrast, the war in the 1990s brought about a high level of awareness of trauma and posttraumatic stress disorder (PTSD). Decades later the war-affected population reports 18% prevalence of PTSD (Priebe et al., 2010). This may be

partly due to lack of effective early trauma interventions and a number of hindering social factors, such as the prolonged economic crisis that affected more the vulnerable populations. The spin-off effect of massive trauma at the social level is a new understanding of the impact of traumatic events on physical and psychological health, as well as on communities (Corkalo Biruski, Ajdukovic, & Löw Stanic, 2014; Lončar & Henigsberg, 2007), which in turn facilitates access to specialized services by people exposed to trauma in everyday life.

Trauma survivors have access to psychiatric services in major hospitals, while veterans receive help within the three specialized regional centres and the National Centre for Psychotrauma. The cost of services are covered by universal national health insurance. Several non-governmental organizations with qualified staff provide supportive therapy to survivors of sexual assault, traffic accidents and other life threatening incidents, as well as domestic violence. The Polyclinic for the Protection of Children based in Zagreb specializes in working with traumatized children. Other facilities focus on prevention and support in the immediate aftermath of traumatic incidents, such as the Crisis Response Network maintained by the Society for Psychological Assistance (SPA).

The psychiatrists' first treatment choice is psychopharmacology. The prevalent therapeutic approach in psychiatric services for veterans is group therapy. Some veterans have been attending such groups for over 25 years. Low use of evidence-based trauma-focused therapies reflects (Schnyder et al., 2015) the prevailing traditional approach in Croatian psychiatry. Hence, traumatized populations still have poor access to effective, evidence-based trauma treatments. Training in trauma-focused CBT and EMDR is offered to practitioners, but this is not fully integrated into the helping system. With the existing high level of competencies in dynamic psychotherapy and psychopharmacology (Britvić et al., 2012), the challenge remains to develop a more stepwise approach to trauma-informed services, increase public awareness of risk and resilience factors, and to expand treatment choices to include evidence-based trauma-focused therapies and make them more available to the general populations in need. The Croatian Society for Traumatic Stress (CSTS) has been working on this challenge since it was founded in 2011 by organizing training workshops. It is currently promoting the ESTSS certified training in psychotrauma for mental health providers. One of the ambitions is to further integrate such training into university curricula so that future generations of mental health professionals are able to provide state-of-the-art care to traumatized people. Similarly, basic and intermediate levels of trauma-related knowledge and skills will be made more available to first responders and other health professionals.

4. Psychotraumatology in France

According to the World Mental Health survey, 72.7% of the French population has been exposed to traumatic events in their lifetime (Husky, Lépine, Gasquet, & Kovess-Masfety, 2015). Intimate partner violence, serious illness of a child and rape were the events associated with highest risk of PTSD. While rape is underreported in France, each year nearly 100,000 individuals claim to be survivors of rape or attempted rape and 500,000 claim to be survivors of intimate partner violence. A fifth of the French population was exposed to war-related events (mainly the Second World War). The twenty-first century was scarred by numerous Islamism extremist attacks, of which the November 2015 Paris attacks have been the bloodiest to date, resulting in more than 264 dead and 914 injured individuals. Traffic fatalities decreased in the past decades, reaching 5.1 per 100,000 inhabitants per year.

Since 1995, medico-psychological emergency units (CUMP for 'Cellules d'Urgence Médico-Psychologiques') are deployed in the case of mass casualty situations and provide immediate psychological support and care. These units were very effective after terror attacks in Paris and Nice, supporting thousands of survivors over many weeks (Hirsch et al., 2015). Psychological assistance aims at providing survivors with an entry point to psychological health care and giving them a first sense of relief, even though they do not provide psychological follow-up care (Vandentorren et al., 2018). In order to ensure long-term high-quality trauma care to all survivors in need across the country, President Emmanuel Macron in November 2017 announced the creation of about 10 ambulatory services specialized in trauma care. These services are aimed at providing medical and psychological care to survivors (minors or adults) that have experienced violence or any traumatic event during their lifetime.

The traditional psychodynamic approach is gradually but slowly replaced by structured trauma-focused psychotherapies, such as CBT or EMDR, and also new technologies (e-PTSD) are being introduced (Bourla, Mouchabac, El Hage, & Ferreri, 2018). However, the provision and access to treatment remain limited by the fact that there is a limited number of experienced trained trauma therapists and that care centres are not always clearly identified or equitably distributed across the country.

The challenges in caring for survivors are to achieve universal access to prevention, improve access to trauma-focused psychotherapies and ensure coordination of specialized care and support. One major challenge is to expand public funding of structured psychotherapies by trained psychologists. It is advisable to ease access to structured trauma-focused

therapies as part of mental health care programmes in compliance with international guidelines. In the end, patients should benefit from personalized treatment strategies for their trauma-related disorders, based on objective information.

The future ambulatory care services specialized in trauma will have to structure the organization of care, to establish a single French umbrella society (involving the national trauma centre and psychotrauma societies such as AFORCUMP-SFP, ALFEST and ABC des Psychotraumas), to be involved in qualifying training curricula, and to set up a French certification committee connected to the ESTSS accreditation committee, in order to meet modern European and international standards.

5. Psychotraumatology in Georgia

Georgia is a post-Soviet country, with a population of approximately 3.3 million. Since becoming independent in the early 1990s, it went through a prolonged series of civil war and ethnic-political conflicts followed by a war with Russia in 2008 and loss of control over more than 20% of the country's territory. Ongoing social, political and economic crises create pressure on the population, 20.6% of whom live under the poverty level and 7.3% of whom are internally displaced. Among the conflict-affected population, 23.3% suffer from PTSD symptoms, 14.0% from depression, 10.4% from anxiety and 12.4% have more than one mental health condition (Makhashvili et al., 2014). In addition, the population still suffers from the inter-generational effects of trauma related to the Soviet invasion and totalitarian past (Javakhishvili, 2014, 2018).

The large proportion of conflict-affected population led to the build-up of trauma care capacities and corresponding institutional developments, i.e. trauma-focused torture victim rehabilitation centres (GCRT), functional since 2000, with the head office in the capital city Tbilisi and branches in eastern and western Georgia. The multidisciplinary teams provide free of charge care for their clients that include forced migrants, ex-prisoners and others. There are a number of non-governmental organizations providing trauma-informed psychosocial services to socially disadvantaged groups, including forced migrants, domestic violence survivors and other target groups.

The Georgian Society of Psychotrauma (GSP) was founded in 2007 with the support of ESTSS. GSP builds capacity within the local professional community and has introduced such evidence-based treatment methods as Trauma-Focused CBT, Brief Eclectic Psychotherapy for PTSD (BEPP) and EMDR, as well as other relevant psychosocial interventions. Since 2008, GSP regularly conducts an annual international multidisciplinary conference 'Trauma and Society'. To assure capacity building and good quality care, an innovative Master Program in Mental Health was founded in 2012 at Ilia State University in Tbilisi, under the lead and with a main perspective on psychotraumatology.

The mental health treatment gap is about 90% in the country. There is a predominant focus on hospital care; community-based services are under-developed. Common mental disorders are under-recognized and under-treated by the state services. There is a need to develop a trauma-informed primary health care system, enlarge the trauma care infrastructure and establish corresponding referral pathways. Another challenge is low awareness of one's own mental health condition. According to a recent study, of those who suffered from mental health symptoms, only 24.8% sought care, 19.6% acknowledge mental health problems but did not seek care, and 54% did not acknowledge mental health problems (Chikovani et al., 2015).

Since most trauma survivors belong to socially disadvantaged groups who are often exposed to multiple traumatization as well as a series of everyday life stressors, we rarely find among these patients simple PTSD. The most widespread trauma-related condition are complex posttraumatic disorders. Therefore, the most urgent need is to evaluate effective methods of addressing complex trauma conditions. From 2016 to 2018, within the framework of an Erasmus Plus cooperation, the Trauma-Focused Cognitive-Behavioural Therapy Train of Trainers (ToT) module was developed, piloted and adapted to the Georgian cultural context in cooperation with Cardiff University. It has proved its effectiveness in the treatment of not only simple but also complex trauma-related disorders. There is a need to collect strong evidence to further prove the effectiveness of these approaches.

6. Psychotraumatology in the German-speaking countries

As in many European countries, the largest historical burden of trauma in Austria, Germany and Switzerland comes from the two twentieth century World Wars and the Holocaust. Over the decades, the different roles of the three countries in these catastrophic events had an influence on the perception of their traumatic impact. In contrast to Switzerland, discourses in Germany and Austria had been more focused on their role as perpetrators and their responsibility for these events. In general, Switzerland has been much less concerned by the two twentieth century World Wars than Germany and Austria. It took a longer time before the trans-generational consequences of war and displacement on parts of the German and Austrian population were also discussed (e.g. Glück, Tran, & Lueger-Schuster, 2012,

Kuwert, Brähler, Glaesmer, Freyberger, & Decker, 2009). Another population that requires expertise on psychotraumatology in the three countries is that of the refugees (e.g. Knaevelsrud et al., 2017; Spiller et al., 2017).

Services for trauma survivors are organized in a similar way in the three German-speaking countries. Non-governmental organizations play an important role in the psychosocial response to disaster and other mass incidents. Some of them also provide care for survivors of individual trauma in the form of local 'crisis intervention units' that closely collaborate with other emergency services. Specialized counselling agencies, usually funded by the local municipal authorities, offer low-threshold services for survivors of childhood abuse, sexual assault and domestic violence. In all three countries, there are also growing networks of clinical outpatient services for survivors of interpersonal violence that are frequently located at psychiatric hospitals. Psychotherapists in private practice play an important role for the treatment of posttraumatic disorders in both children and adults. Moreover, in each of the three German-speaking countries, a larger number of hospitals offer specialized inpatient care for patients with posttraumatic disorders.

The German-speaking Society for Psychotraumatology (DeGPT), the common trauma society of the three German-speaking countries (Germany, Austria and Switzerland), has developed curricula for the training of professionals in different settings (e.g. staff in counselling services, psychotherapists for children and adults) in trauma-related practices. The curricula for psychotherapists have been recognized by important national bodies, like the national chambers of physicians and psychotherapists in Germany. At present, about 50 training institutes in Germany, Austria and Switzerland offer the curricula. The society also coordinates the national German guideline for the treatment of PTSD. Such activities have contributed to the dissemination of evidence-based practices in different settings. However, as in other European countries (Kazlauskas et al., 2016), many psychotherapists still do not feel competent to deal with traumatized populations. As a result, patients can face substantial problems to find adequate help, for instance in the form of trauma-focussed interventions for individuals with PTSD.

The prevention of trauma in different settings remains a challenge. Recently, initiatives in all three German-speaking countries addressed the problem of institutional violence, e.g. in foster care settings, but more efforts are needed to sustainably implement preventive efforts and bodies like the independent commissioner into childhood sexual abuse in Germany (Bergmann, 2011). The dissemination of trauma-informed practices in all parts of the health care system and the social sector is another urgent issue. Finally, the provision of adequate care for the considerable number of migrants from contexts of war and persecution in the German-speaking countries is a challenge for the years to come.

7. Psychotraumatology in Italy

Trauma permeates the history of Italy: war, terrorism, major mass disasters, abuse and maltreatment deeply affected the Italian society across time and generations. During the Second World War, many Italians experienced the effects of torture and deportation leaving a scattered society (Favaro, Rodella, Colombo, & Santonastaso, 1999). In the 1970s, the Italian society faced the 'dark period' of *Brigate Rosse*, a terroristic group who caused many deaths and created a deep sense of fear in the population. Domestic violence is the most common crime against children; indeed, child abuse and maltreatment is a major public health problem. A recent report (Autorità Garante per l'Infanzia, CISMAI and Terre des Hommes, 2016) revealed that each year 950 children are exposed to sexual abuse. In the past year, the percentage of maltreatment and abuse increased by 6%. Italy has also experienced a significant number of natural disasters, like floods and earthquakes, that potentially increased the prevalence of post-traumatic syndromes in the communities. There are no robust data about the actual burden of such traumatic experiences and their effects on the society today.

Italian health and social care systems have not yet fully embraced a trauma-informed approach. This led to fragmented responses to the needs of survivors, especially in terms of preventive initiatives. There is some resistance to implement routine screening and assessment tools for the early detection and prevention of post-traumatic syndromes. For this reason, the system responds late and mainly to traumatization that became complex as a result of missed accurate diagnoses. It is a challenge to acquire a systemic vision of care for traumatized populations, with shared policies and protocols.

Exposure-based therapies are rarely used; EMDR is the only widely implemented intervention in the social care system at all levels. Other trauma-focused therapies (Ehring et al., 2014) – such as trauma-focused CBT or Narrative Exposure Therapy (NET; Schauer, Neuner, & Elbert, 2011) – struggle to be disseminated. Clinicians are asked to integrate different treatment approaches with a good understanding of assessment and psychoeducation techniques. Training of health and social care professionals is a key issue. In Italy, trauma is still seen as a 'psychologist/psychotherapist business', undermining the importance of multidisciplinarity. Furthermore, a synergy between clinical work and research should be

promoted to investigate the outcomes of treatment and to adapt service models accordingly.

There are a few important strategic points the Italian Society of Traumatic Stress Studies (SISST) should consider for the future. Highly traumatized migrants and refugees are one of the priorities requiring a long-term preventive plan to fight longer-term consequences for the society. The second point is the promotion of a more articulated reasoning about the implementation of evidence-based therapies. Furthermore, epidemiological studies are warranted to determine the actual prevalence and incidence of traumatic events in Italian society. Finally, another crucial issue is a comprehensive training in psychotraumatology. The new ESTSS certification represents a good opportunity for trauma-informed capacity building initiatives in the near future.

8. Psychotraumatology in Lithuania

The burden of trauma in Lithuania was largely influenced by the political situation in Europe in the twentieth century. Large-scale traumas associated with the two World Wars, the Holocaust and the prolonged Soviet occupation had a significant impact on the Lithuanian population, marked with suffering and oppression for several generations. Interest in trauma and trauma research in Lithuania was started soon after the collapse of the Soviet Union in the 1990s and several studies explored posttraumatic effects of political violence in the country (Kazlauskas & Zelviene, 2016).

Survivors of traumatic events can seek treatment for mental disorders in the public mental health care system, which includes about 100 primary mental health centres spread across the country, and in more severe cases in psychiatric hospitals. Several non-governmental organizations and crisis centres in the biggest cities in Lithuania are providing help for survivors of interpersonal violence, including psychosocial support and psychotherapy. Additionally, psychotherapists in private practice are also available for trauma survivors. Despite these positive developments, care organizations for trauma survivors are not developed in Lithuania and evidence-based trauma-focused treatments for trauma survivors are not available in the public mental health care system.

Mental health professionals are increasingly aware of the negative effects of trauma on individuals and are interested in learning new ways to help trauma survivors. There is significant progress regarding the implementation of evidence-based trauma-focused treatments, such as EMDR and BEPP, in Lithuania recently. The numbers of therapists trained in trauma-focused treatments are growing, but these treatments are not offered in the public health care system and are available predominantly in private practice which is expensive and not covered by national health care insurance.

Despite the high prevalence of traumatic experiences in Lithuania (Kazlauskas & Zelviene, 2016), it was reported that PTSD is not identified in the Lithuanian national health care system (Kazlauskas, Zelviene, & Eimontas, 2017). The lack of acknowledgment of trauma and PTSD in Lithuania is a major barrier for the development of treatments for trauma survivors in the country.

Future directions of the trauma field in Lithuania include ensuring access to evidence-based treatments for trauma survivors. There is a need of trainings for practitioners to update their knowledge about the impact of trauma, with a particular focus on how to diagnose stress-related disorders and how to provide trauma-focused treatments. Finally, health care and social policy changes on the national level are needed to acknowledge trauma survivors and include evidence-based treatments in the health care of survivors exposed to various traumas, particularly children and adolescents. The Lithuanian trauma society is taking an active role in raising awareness about the effects of trauma to facilitate the further development of care for trauma survivors.

9. Psychotraumatology in the Netherlands

The Second World War marks the largest historical burden and the starting point for psychotrauma care in the Netherlands. Occupation by German and Japanese (in the former Dutch East Indies) armed forces and subsequent post-colonial wars led to over 250,000 military and civilian lives lost. Public awareness for the psychological effects of wartime and other traumatic experiences started around 1975, with the awareness of the Holocaust. In response, Foundation Center ’45 was funded, first focusing on Second World War concentration camp survivors, but soon extending their services to other traumatized populations. The focus on post-war reconstruction, tensions between interest groups and an emphasis on heroics and the resistance, together with a poorly developed mental health care, contributed to this late societal response (Vermetten & Olff, 2013). Subsequent national and international disasters, such as the 1992 Bijlmermeer airplane disaster and the 2000 Enschede fire explosion, further increased professional and public awareness of psychotrauma, and fuelled the establishment of the Dutch Society of Psychotraumatology in 2006.

Mental health care for trauma-related disorders is covered by health insurance at little or no additional personal costs. Facilities for trauma care have been integrated at many levels of health care. Routinely, the first step for individuals with trauma-related symptoms is to consult their general practitioner for referral to secondary health care organizations.

A national standard of care for trauma- and stressor-related disorders is currently underway (Kwaliteitsontwikkeling GGZ, 2018).

Trauma-focused treatment is increasingly offered next to interventions directed at emotion regulation, day-night structure and social support (Vermetten & Olff, 2013). Examples are EMDR, CBT, NET, BEPP and Imagery Rescripting. There is a growing role for E-health interventions (e.g. Olff, 2015). Some institutions use treatment intensification (EMDR or CBT), with preliminary positive effects (Van Woudenberg et al., 2018; Zepeda Méndez, Nijdam, Ter Heide, van der Aa, & Olff, 2018). Although not yet implemented, other treatment innovations include hormonal enhancers (D-cycloserin, cortisol, oxytocin; e.g. Thomaes et al., 2016).

Effective treatment for PTSD due to events in adulthood in fairly well functioning patients seems available, as well as special services and care for the military and the police. One of the greatest practical challenges are the long waiting lists in secondary mental health care, limiting accessibility to care for vulnerable patient groups, such as individuals with multiple (childhood) traumatization, patients with severe physical, neurocognitive and/or psychiatric comorbidities or severe psychosocial problems, and (asylum seeking) refugees. The latter in particular experience difficulties accessing evidence-based care due to stigma, requirement of referral by general practitioners, and language and cultural barriers. Moreover, research on the (cost-)effectiveness of treatments for these target groups is relatively lacking (e.g. Sijbrandij et al., 2017), as well as on improving symptom recovery and treatment adherence of current PTSD treatments.

Topics which should be urgently addressed in the future include improving treatment outcome for specific target groups, i.e. patients with childhood trauma; implementing treatment for target groups that are currently excluded from regular PTSD treatments; family- or system-oriented interventions to prevent inter-generational consequences of trauma and enhance opportunities for social support; evaluation of e-mental health interventions for PTSD and comorbid disorders, including blended treatment options administered within routine clinical practice; increased use of transdiagnostic treatment options for trauma-exposed patients targeting a variety of psychopathology limiting psychosocial functioning; and the use of low-intensity interventions, carried out by non-professional helpers to increase coverage of mental health interventions.

10. Psychotraumatology in Poland

The recognition of the socio-psychological consequences of the Second World War in Poland is an extremely important issue. Poland belongs to the part of Europe which Snyder (2010) called the 'Bloodlands'. The number of ethnic Poles and Polish Jews who died or were murdered in connection to the Second World War amounted to about six million. Poland lost about 17% of its pre-war population (Materski & Szarota, 2009). Moreover, the Soviet invasion and the subsequent imposition of a communist regime led to large groups of people being persecuted. Many survivors of the war (e.g. resistance movement members, people deported to Siberia) were not even recognized as survivors, and speaking about many aspects of war experiences could lead to prosecution. Very little attention has been paid to Second World War issues in medicine and psychology, in comparison to the volume of analogous research in western countries (Lis-Turlejska, Szumiał, & Drapała, 2018). Psychological help for survivors of the war was practically absent, and the need is still not recognized today. Since the collapse of communism, neither war nor other traumas have been recognized on a broader scale. Research has been conducted on the consequences of the great flood of 1997 (Strelau & Zawadzki, 2005), however, other traumatic events, including the death of the president and other governmental officials in the Smolensk plane crash in 2010, have not yet been the subject of psychological research.

There is no coherent care system in Poland for survivors of various traumatic events. A number of crisis intervention centres provide help for 'families in crisis' – mainly for survivors of domestic violence (www.spoleczenstwoobywatelskie.gov.pl). There are non-governmental organizations working with survivors of trauma (e.g. battered women, abused children, survivors of crime). However, they are all underfunded and their capacity is limited. Access to psychotherapy under national health insurance is also limited. Despite the fact that there are many psychotherapists working privately, mainly in larger cities, there are still very few professionals who are specialized in psychotraumatology.

Crisis intervention is probably the most widely offered help to trauma survivors. Practitioners have the opportunity to be trained in different approaches in psychotherapy, including CBT, prolonged exposure therapy and EMDR. However, there is no clear emphasis on evidence-based treatments and they are not widely used in practice. There is also a lack of research on the effectiveness of trauma therapy. The issue of prevention is neglected in general, except training for professional groups (e.g. flight crews, emergency services).

Currently, the most important challenge is to increase access to professional care, specifically increasing access to therapists who offer evidence-based interventions. However, education of the general population about the importance of help seeking and potential benefits out of it is also crucial. It is necessary to further develop research on the

psychosocial consequences of both the Second World War and other large-scale traumatic events. It is also important to encourage the teaching of contemporary curricula on abnormal psychology, including content specific to trauma. This seems to be the most urgent task, alongside further development of the trauma care system and promotion of good practices in psychological care and psychotherapies for trauma survivors.

11. Psychotraumatology in Portugal

A colonial war of 13 years has left to Portugal an individual and collective traumatic heritage (Maia, McIntyre, Pereira, & Ribeiro, 2011). The consequences remain to this day through the intergenerational transmission of trauma (Dias, Sales, Cardoso, & Kleber, 2014). Throughout the years, clinicians, academics and other professionals discussed the psychosocial consequences and reactions to this trauma. Later, the coordinated response to two major accidents promoted a national approach to survivors of crisis and disaster. In 2009, the Centre for Social Studies of the University of Coimbra created the Centre of Trauma (CT), a society that brings together the country's leading organizations who directly deal with potentially traumatic events. Since 2010, CT is a full member of ESTSS.

In Portugal, the National Authority for Civil Protection provides central technical guidance to the organizations who deliver services to survivors of disasters or catastrophes. It is a governmental entity which coordinates the interventions developed and implemented by the different professional groups and organizations (fire fighters, medical emergency services, etc.). Clinical care to trauma survivals is provided by the National Health Service in the first place, but in cooperation with organizations (both non-governmental and governmental) who are specialized in trauma therapies and relevant psychosocial interventions. There is a core team of trained and certificated psychotherapists within CT whose service is accessible to people in need.

The most widespread therapy methods in Portugal are CBT, EMDR, Psychodrama and brief supportive psychotherapeutic strategies. Psychopharmacotherapy is also frequently used alone or in combination with psychological interventions. Treatment takes place in public and private health institutions. A number of governmental and non-governmental organizations currently invests in building the capacity of their staff in trauma care and designing and implementation of preventive interventions. CT is responsible for regular organization of conferences, seminars and the delivery of a biannual psychotrauma course. The course equips professionals from different fields with relevant knowledge and skills.

Professional and organizational preparation and knowledge to treat trauma consequences at the individual, family and social level needs to be optimized and updated. Minorities and refugees at risk may benefit from more integrated assistance. The ability to effectively respond to disasters and catastrophes through the provision of acute trauma care and coordination among the different organizations that are involved in disaster management has to be improved. There is room for improvement regarding the identification of populations at risk, screening for trauma related disorders and responding to the needs of the health care system. Family doctors and nurses, firemen and other professional groups have to be trained to assure their trauma-informed professional performance.

The topics to be addressed in the near future include creating a national plan for PTSD prevention and psychosocial interventions in case of crisis and disaster, as well as founding a network for specific treatment responses to trauma-related disorders, namely PTSD. Good practices have to be disseminated and young researchers and clinicians need to be motivated to work in the field of psychotraumatology. Finally, more effective and organized strategies to address potentially traumatic contexts such as unemployment, marital violence, cyber bulling and road accidents need to be developed, and the cooperative and coordinated work with national and European entities needs to be further increased.

12. Psychotraumatology in Sweden

The Swedish population has enjoyed peace for over 200 years. For a long time, the country did not experience the same increase in attention to psychotraumatology as other European countries with afflicted veteran soldiers from the nineteenth century wars. The impetus for trauma-informed services has instead come from disasters, large accidents and the increased attention to interpersonal abuse. A harrowing bus crash involving 12-year-olds on a school trip in 1988 (Arnberg et al., 2011) became the initiating event for the public organization of crisis support after large-scale events. Events such as the 1994 Estonia ferry disaster in the Baltic sea (e.g. Arnberg, Hultman, Michel, & Lundin, 2013) and the 2004 Southeast Asia tsunami (e.g. Michélsen, Therup-Svedenlöf, Backheden, & Schulman, 2017), both leading to hundreds of Swedish casualties, as well as the recent deployment of Swedish peacekeeping forces around the world, have highlighted the psychosocial consequences of trauma. More recently, the refugee crisis has set off many activities related to culturally informed trauma services.

In Sweden, every municipality has a psychosocial crisis team and there are psychosocial disaster contingency teams at the larger hospitals. A major step forward was the legislation passed in 2000 that

mandates employers to ensure that they have adequate knowledge of and plans for crisis support for their employees. Beyond the acute crisis support, however, access to qualified treatment of chronic traumatization varies across the country. In some regions there are dedicated trauma clinics; in others, there are trauma teams within the psychiatric services. Some regions lack both dedicated trauma clinics and teams.

The acute crisis interventions that are available in Sweden include Psychological First Aid, various forms of unstructured crisis support and a variety of debriefing methods including psychological debriefing (Witteveen et al., 2012). As for the treatment of PTSD, the Swedish National Board of Health and Welfare issues guidelines for public health care. In their latest guidelines from 2017 (The Swedish National Board of Health and Welfare, 2017), trauma-focused psychological treatments were given the highest priority; selective serotonin reuptake inhibitors (SSRIs) were prioritized as a potential but not necessary option for adults with PTSD, although they probably are the most widely used treatment in the country.

Several challenges lie ahead. The use of ineffective preventative interventions remains and the provision of psychosocial support beyond the acute phase is very limited, partly due to compartmentalized organizations. Further development of acute interventions in health care would benefit from robust evidence for early interventions. Trauma-related problems in patients too often go undetected in health care assessments (Al-Saffar, Borgå, & Hällström, 2002). In addition, access to prioritized treatments is underdeveloped in many parts of Sweden: the concentration of relevant competence in metropolitan areas is a salient issue in this country due to its large rural areas.

Another challenge related to the treatment of PTSD is that a large proportion of therapists are due for retirement in the next five years. It will become important for the field to continue to attract younger professionals. It is hoped that a stronger professional community, aided by the Swedish Society for Psychotrauma, can prevent fragmentation of the many regional initiatives, particularly in light of the many refugees across the country, and serve as a force for increasing the quality of and access to trauma treatments.

13. Psychotraumatology in Ukraine

The historical burden of trauma in Ukraine mainly consists of man-made catastrophes. They include the famines in the years 1933 and 1947, the Second World War, the explosion of the Chernobyl nuclear power station, and the current military conflict with Russia, which is officially called 'Anti Terrorist Operation (ATO)'. All events that happened during the Soviet times were hushed up and psychological support has never been provided to the people in need. It was not until the Maidan revolution and the beginning of the current war that psychological services in Ukraine were organized for victims of mass violence.

In Ukraine, care organizations for trauma survivors are currently under development. It presupposes an effective coordination of governmental and non-governmental organizations and professional institutions. The non-governmental organization Ukrainian Society for Overcoming the Consequences of Traumatic Events (USOCTE) was created to reach that aim. This professional organization aims at the development of crisis intervention services as well as capacity for provision of trauma-focused psychological therapies in Ukraine, in accordance with the international standards. Currently, USOCTE provides psychological help to wounded ATO soldiers and veterans, as well as other people who suffer from consequences of the ATO: those living in the ATO zone, internally displaced persons, families of killed soldiers and participants of the Maidan revolution. USOCTE is also engaged in developing training programmes for psychologists and psychoeducational materials for the general population. The methods used in trauma care are EMDR, CBT and the SEE FAR CBT treatment protocol of the Israeli coalition of trauma.

These treatments are offered in a strictly structured way. All clients sign an agreement, which determines the focus of the therapy. According to that agreement, a client has a right to attend 12 free-of-charge sessions. The first sessions are devoted to a detailed diagnostic interview, psycho-education on the signs and nature of posttraumatic disorders and providing information on therapeutic approaches. The following stabilization phase is intended to create a sense of safety by means of different techniques. It is followed by the trauma-focused interventions mentioned above. The final phase of treatment has the aim to integrate the experiences into daily life, assess the results and adapt to the achieved changes.

Challenges in this work are the very high level of psychological disturbance among the people living close to the conflict zone, and their reluctance to acknowledge this and to ask for psychological support (Roberts et al., 2017). It should also be mentioned that women are especially vulnerable on the front-line territory, and suffer multiple problems including high levels of psychological violence. These problems are often not recognized and the population has a tendency to believe that the end of military activities will solve all problems.

To overcome the consequences of the current military conflict in Ukraine, USOCTE is confronted with a number of tasks. They include building up a multilevel system of psychological assistance with the support of governmental and non-governmental organizations as well as monitoring and evaluating the activities of specialists in the psychological field on a regular basis. Moreover, the local communities need to be involved in supporting the aggrieved. Finally, there is a need for a more intensive cooperation and sharing of experiences with international organizations.

14. Psychotraumatology in the UK and Northern Ireland

The 2014 Adult Psychiatric Morbidity Study (APMS) provides the most comprehensive estimates of PTSD within the UK, although the sample is of English residents only (Fear, Bridges, Hatch, Hawkins, & Wessely, 2014). APMS found a PTSD prevalence of 4.4%, with similar rates observed between men and women. PTSD rates in women declined with increasing age; 12.5% of 16–24-year-old women had PTSD. In contrast, in men PTSD remained roughly consistent until declining from age 65. Northern Ireland (NI) has historically experienced a sustained period of political conflict known as the Troubles. The NI Study of Health and Stress identified that NI has one of the highest global rates of PTSD with lifetime and 12 month prevalence rates of 8.8 and 5.1%, respectively (Bunting et al. 2013). Lifetime prevalence in NI females (11%) was substantially higher than the rates in NI men (6.4%). Although there is no specific information on prevalence rates in Scotland and Wales, it is anticipated they are similar to English rates.

The UK's mental health services are provided by the National Health Service (NHS). Although regional variations exist, the first point of access is via family doctors. Community services, often available via self-referral, typically treat survivors of single incident traumas where a diagnosis of PTSD is present without co-morbid problems (e.g. substance misuse). Treatment of more complex cases (e.g. survivors of child abuse, refugees, etc.) is via specialist mental health teams. NHS treatment complies with best practice guidelines compiled by the National Institute for Health Care and Excellence. A range of other non-governmental organizations exist that are staffed by qualified health professionals and offer support to sub-populations of trauma survivors (e.g. survivors of domestic abuse, veterans, etc.). In NI, a Regional Trauma Service is under development to address the mental health legacy of the Troubles.

Interventions to treat PTSD in the UK are typically trauma-focused psychological therapies such as, but not limited to, trauma-focused CBT, EMDR and prolonged exposure (NICE, 2005). In addition, psychopharmacology support is given to manage co-morbid mental health presentations. Increasingly, e-technologies are being developed to help provide cost-effect support that also promote accessibility. For example, an online guided self-help tool for PTSD has been developed and internet-based video technologies have been successfully used to deliver PTSD treatments with much reduced therapist time required. Some providers also utilize compressed therapy where 16–-20 hours of TF-CBT are delivered over a week.

Currently, whilst there is often some delay in accessing specialist mental health assessment services, the biggest bottleneck is in the provision of specialist services for more complex cases of PTSD. Also, whilst APMS has shown that help-seeking for PTSD is improving, the majority of people with PTSD in the UK still do not seek any help.

Whilst, the UK has made considerable efforts to improve the public understanding of mental health, more needs to be done. Additionally, organizations which routinely expose staff to trauma (such as the emergency services, military and child social workers) need to address the issue of PTSD as a result of chronic trauma exposure as there has been limited work done on this topic.

15. Conclusion

The perspectives above show that important steps towards a better provision of care for survivors of trauma have been taken in the European countries. Given the cultural and economic diversity of the continent, there are still some differences between the countries, for instance with regard to the use of evidence-based treatments. Effective treatments have many elements in common (Schnyder et al., 2015) and the treatment of choice is often based on culture and history. The dissemination of evidence-based knowledge and skills has always been a priority of ESTSS (Ajdukovic, 2013, Bisson, 2013, Olff, 2013) and further strategic steps towards this aim have been made recently. In 2018, the first of a series of new ESTSS curricula, the 'Advanced Training in Treating Posttraumatic Disorders in Adults', was approved by the board. The curriculum comprises 120 hours of training and 20 hours of case supervision. It has a strong focus on evidence-based approaches and provides knowledge and skills for the treatment of acute stress disorder, non-complex PTSD and complex posttraumatic disorders (for more detail see www.estss.org). The curriculum has already been adopted by several member societies who are building up local structures to offer the trainings or adopt their national curricula to meet the requirements of the ESTSS curriculum. Other

curricula, for instance for the treatment of trauma-related disorders in children and adolescents, and more basic curricula to promote the idea of trauma-informed care among different groups of professionals, are currently being developed.

The country reports presented in this paper show that many countries share similar challenges and have topics in common that need to be addressed. These topics include, among others, the prevention of trauma, the promotion of trauma-informed practices in the whole health care system and standards of care for groups with special needs, including refugees and internally displaced people. Of increasing importance in the field of mental health is the involvement of trauma survivors in mental health care teams (Van der Schrieck-De Loos, 2013). It was beyond the scope of this paper to describe the large amount of research in the field of psychotraumatology in the European countries, which represents a significant proportion of the global research activities in this field (Olff, 2018). However, similar to the differences with regard to the use of evidence-based treatments, these activities are not evenly distributed between the different European countries. It is part of ESTSS's mission to stimulate and promote research Europe wide.

The current structure of ESTSS allows for a more direct exchange between the member societies and thereby provides the opportunity to effectively address such common issues. It has always been the aim of the society to provide a platform for all professionals in Europe in the field of psychotraumatology to connect, to develop together training and research, guidelines and actions where needed. ESTSS is constantly working towards this aim, for instance by identifying successful models in individual countries or regions and disseminating these experiences among all others. A recent example of this exchange is a series of movies providing information on the consequences of trauma and effective treatments tailored to the needs of the public, professionals from the health care system and trauma survivors that can be downloaded from the ESTSS website. They were developed by a national society (DeGPT) and translated into 10 European languages with the help of other member societies.

ESTSS can look back on 25 years of advocacy for the field of psychotraumatology in Europe. The first European Conference on Traumatic Stress, which can be considered one of the roots of ESTSS, was held three decades ago (Ørner, 2013). During these years, ESTSS has developed a unique profile as a truly international professional society that integrates the diversity of the European countries and greatly benefits from their cultural richness (Lueger-Schuster, 2013a; Olff, 2013). An important part of the society's success story are the ESTSS conferences that attract delegates from all parts of the world. Other important activities included projects like the European Network of Traumatic Stress (TENTS; Bisson, 2013) and the *European Journal of Psychotraumatology* (EJPT). EJPT has become an important platform for the dissemination of knowledge related to psychological trauma and, thanks to the relentless efforts of its founding editor Miranda Olff, has become one of the journals with the highest impact in the field (Olff, 2018).

Over the years, ESTSS had fruitful collaborations with large societies from other regions of the world. There is also a strong involvement of ESTSS in the global collaboration of trauma societies, an initiative that had initially been proposed by the International Society for Traumatic Stress Studies (ISTSS; Schnyder et al., 2017) and developed to a collaboration of all large trauma societies on an equal basis. It already has the function of a global umbrella for defined projects and holds promise to become a more formal global structure.

Only about half of the more than 40 countries on the European continent have established local trauma societies so far, most of which are members of ESTSS. In the coming decades, it will remain one of the most important aims of ESTSS to support the formation of new societies in countries where they do not exist yet, and to provide a common platform and a professional home for trauma specialists from the whole European region.

In their articles at the occasion of the twentieth anniversary of ESTSS, several former presidents described what some of them called the 'infancy and adolescence' of the society (Schnyder, 2013, Turner, 2013). At the age of 25 years, ESTSS has become a young adult. The society has 'grown up' and, with the latest change of its structure, has completed a developmental process that made it stronger and prepared it for the tasks ahead. This would not have been possible without the enthusiasm of a large number of dedicated colleagues from all over Europe. They invested their time and energy over the last 25 years to make the society what it is today. We congratulate ESTSS on its 25th birthday and strongly believe that it will successfully continue its 'adult life' for the good of psychotraumatology in Europe.

Acknowledgments

We wish to thank the Elfriede Dietrich Foundation, Freiburg, Germany, for supporting the production of the movie series 'Through memories – the road to trauma therapy' and the translations to a range of different European languages.

About the CDC-Kaiser ACE Study

The CDC-Kaiser Permanente Adverse Childhood Experiences (ACE) Study is one of the largest investigations of childhood abuse and neglect and household challenges and later-life health and well-being.

The original ACE Study was conducted at Kaiser Permanente from 1995 to 1997 with two waves of data collection. Over 17,000 Health Maintenance Organization members from Southern California receiving physical exams completed confidential surveys regarding their childhood experiences and current health status and behaviors.

More detailed information about the study can be found in the links below or in the article, "Relationship of Childhood Abuse and Household Dysfunction to Many of the Leading Causes of Death in Adults ,".

Child abuse and neglect

CHILD ABUSE AND NEGLECT

In Western Australia, under the *Children and Community Services Act 2004,* a child is a person under the age of 18 years.

There are generally five types of child abuse and neglect, which may co-exist:

- physical abuse
- sexual abuse
- emotional abuse
- psychological abuse
- child neglect.

Publication: How do I recognise when a child is at risk of abuse or neglect?

Child development and trauma guide

The *Child development and trauma guide* has been developed to assist practitioners to understand typical developmental pathways of children and recognise indicators of trauma at different ages and stages.

Importantly, the resource offers practical, age appropriate advice as to the needs of children, parents and carers when trauma has occurred, and ways in which children and families can be assisted in healing and recovery.

The *Child development and trauma guide* covers the following age groups:

- 0 to 12 months
- 12 months to 3 years
- 3 to 5 years
- 7 to 9 years
- 9 to 12 years
- 12 to 18 years.

Growth after trauma

Why are some people more resilient than others—and can it be taught?

By Lorna Collier
November 2016, Vol 47, No. 10
Print version: page 48

As Kay Wilson struggled to make her way through a Jerusalem forest after being repeatedly stabbed by a Palestinian terrorist, she distracted herself from her agony by playing the song "Somewhere Over the Rainbow" in her mind, composing a new piano arrangement while she fought for breath and forced herself to put one bare foot in front of the other.

Wilson, then 46, had been working as a tour guide when, on Dec. 18, 2010, she and a friend were ambushed by terrorists. Wilson witnessed her friend's murder and was herself viciously stabbed with a machete, ultimately playing dead as her attacker plunged his knife into her chest a final time.

She eventually recovered from her severe physical wounds and is healing from her psychological trauma. She now speaks to global audiences about her survival, hoping to "dispel hatred, whether toward Arabs or Jews."

The work "helps me make meaning out of something so senseless," says Wilson, who is also writing a book about her experiences.

After the attack, Wilson had flashbacks and deep survivor's guilt. But like many people who have survived trauma, she has found positive change as well—a new appreciation for life, a newfound sense of personal strength and a new focus on helping others.

Post-traumatic growth (PTG) is a theory that explains this kind of transformation following trauma. It was developed by psychologists Richard Tedeschi, PhD, and Lawrence Calhoun, PhD, in the mid-1990s, and holds that people who endure psychological struggle following adversity can often see positive growth afterward.

"People develop new understandings of themselves, the world they live in, how to relate to other people, the kind of future they might have and a better understanding of how to live life," says Tedeschi.

How can clinicians use PTG theory to help patients? How has new research helped refine understanding of it? Here's a look at developments in the field.

Signs of post-traumatic growth

PTG can be confused with resilience, but the two are different constructs (see "The post-traumatic growth inventory" below).

"PTG is sometimes considered synonymous with resilience because becoming more resilient as a result of struggle with trauma can be an example of PTG—but PTG is different from resilience, says Kanako Taku, PhD, associate professor of psychology at Oakland University, who has both researched PTG and experienced it as a survivor of the 1995 Kobe earthquake in Japan.

"Resiliency is the personal attribute or ability to bounce back," says Taku. PTG, on the other hand, refers to what can happen when someone who has difficulty bouncing back experiences a traumatic event that challenges his or her core beliefs, endures psychological struggle (even a mental illness such as post-traumatic stress disorder), and then ultimately finds a sense of personal growth. It's a process that "takes a lot of time, energy and struggle," Taku says.

Someone who is already resilient when trauma occurs won't experience PTG because a resilient person isn't rocked to the core by an event and doesn't have to seek a new belief system, explains Tedeschi. Less resilient people, on the other hand, may go through distress and confusion as they try to understand why this terrible thing happened to them and what it means for their world view.

To evaluate whether and to what extent someone has achieved growth after a trauma, psychologists use a variety of self-report scales. One that was developed by Tedeschi and Calhoun is the Post-Traumatic Growth Inventory (PTGI) (*Journal of Traumatic Stress*

, 1996). It looks for positive responses in five areas:

- Appreciation of life.
- Relationships with others.
- New possibilities in life.
- Personal strength.
- Spiritual change.

The scale is being revised to add new items that will expand the "spiritual change" domain, says Tedeschi. This is being done "to incorporate more existential themes that should resonate with those who are more secular" as well as reflect cross-cultural differences in perceptions of spirituality.

A predisposition for growth?

How many people experience PTG? Tedeschi prefers not to put a hard number on it.

"It all depends on the trauma, the circumstances, the timing of the measurement ... [and] on how you define growth using the PTGI, looking at total score, means, factors or individual items," he says. However, he estimates that about one-half to two-thirds of people show PTG.

Some PTG researchers have tried to corroborate self-reported growth by questioning friends and family members about whether growth "sticks."

"We are getting more studies that show that PTG is generally stable over time, with a few people showing increases and a few showing decreases," Tedeschi says. "It is now up to us to learn what is going on with those who change over time, but the evidence is for stability in general, and also corroboration by others."

There appear to be two traits that make some more likely to experience PTG, says Tedeschi: openness to experience and extraversion. That's because people who are more open are more likely to reconsider their belief systems, says Tedeschi, and extroverts are more likely to be more active in response to trauma and seek out connections with others.

Women also tend to report more growth than men, says Tedeschi, but the difference is relatively small.

Age also can be a factor, with children under 8 less likely to have the cognitive capacity to experience PTG, while those in late adolescence and early adulthood—who may already be trying to determine their world view—are more open to the type of change that such growth reflects, says Tedeschi.

There also may be genetic underpinnings for PTG, but researchers are just beginning to tease this out. In a 2014 study in the *Journal of Affective Disorders*, for example, Harvard social and psychiatric epidemiologist Erin Dunn, ScD, and a team of researchers examined data previously collected from over 200 Hurricane Katrina survivors and found that variants in the gene RGS2 significantly interacted with levels of exposure to the hurricane to predict PTG. RGS2 is linked to fear-related disorders, such as post-traumatic stress disorder, panic disorder and anxiety.

Dunn calls the results "very interesting" but notes that "we have to be somewhat cautious in interpreting it because we were unable to find a similar sample to replicate that finding."

Sarah Lowe, PhD, of Montclair State University, who worked with Dunn on the research, says one difficulty with gene studies for PTG is the concept's complexity. "If you look at what predicts PTG, it is often psychological stress and dysfunction—but also more positive personality traits like optimism and future orientation, which you'd expect would have a very different genetic basis," she says.

Theory into practice

Is it possible to prepare people for PTG, to pave the way should tragedy or trauma strike? Yes, says Tedeschi, noting that psychologists can "allow people to understand that this may be a possibility for themselves" and is a "fairly normal process" if and when trauma occurs.

More often, though, therapists will become involved not before adversity has occurred, but afterward. In this context, they can introduce PTG concepts but need to take care doing so.

H'Sien Hayward, PhD, cautions that therapists should not "jump right into the possibility of growth," which she says can "often be construed as minimizing someone's pain and suffering and minimizing the impact of the loss."

Hayward, who works with veterans at VA Long Beach Medical Center in Long Beach, California, knows about such growth firsthand: She was paralyzed in a car accident when she was 16, ending a competitive athletic career. She overcame that trauma through the help of supportive family and friends, went on to study social psychology at Harvard and has traveled to more than 42 countries, often on humanitarian missions providing counseling and other support to trauma victims. Today, she credits the accident for increasing her strength of character "exponentially" by forcing her to overcome challenges. She also appreciates life and relationships with others—including the near-daily support in the small tasks of daily living that she gets from friends and strangers alike: "those interactions warm my heart."

Yet Hayward is careful not to preach the potential for upside to her patients before they are ready. Instead, she waits for them to express "some positive reaction to the event."

She also helps patients discover what's meaningful in their lives and then helps them schedule activities involving these interests, such as spending more time with family members or doing volunteer work.

Tedeschi says sometimes traditional therapy for trauma patients gives people short-fix solutions to help them resume daily functions, such as sleep or work, but may not provide them with a way of living "beyond just getting by ... We've got to attend to their experience of life and how meaningful, satisfied and fulfilling it is."

One veterans' care facility that takes a nontraditional, PTG approach to trauma treatment is Boulder Crest Retreat in Bluemont, Virginia. The private, donor-supported institute provides free, weeklong nonclinical exercises and activities for vets seeking recovery from combat stress. The treatment is led primarily by veterans who have themselves gone through trauma and achieved growth. Vets are encouraged to deal with past traumas while also discovering their underlying strengths, as well as forging connections with others and ultimately finding ways to give back.

After the intensive program, vets are followed for 18 months with regular Skype check-ins.

Kevin Sakaki, a former Marine and intelligence/special operations veteran, entered Boulder Crest's Warrior program last September and found it transformative. He's noticed such changes in himself as better communication with his family, less anger ("Things don't get to me as much"), a deeper appreciation of "the little things," more generosity and a stronger connection to other people.

Tedeschi is among the psychologists studying the Boulder Crest program's efficacy as part of a research grant funded by the Marcus Foundation.

He hopes that as vets go through the process at Boulder Crest, they "develop new principles for living that involve altruistic behavior, having a mission in life and purpose that goes beyond oneself, so that trauma is transformed into something that's useful not only for oneself but for others."

The post-traumatic growth inventory

To evaluate whether and to what extent someone has achieved growth after a trauma, psychologists look for positive responses in five areas.

1: Appreciation of life

2: Relationships with others

3: New possibilities in life

4: Personal strength

5: Spiritual change

TRAUMA TYPES

ABOUT CHILD TRAUMA

TRAUMA TYPES

- Bullying
- Community Violence
- Complex Trauma
- Disasters
- Early Childhood Trauma
- Intimate Partner Violence
- Medical Trauma
- Physical Abuse
- Refugee Trauma
- Sexual Abuse
- Terrorism and Violence
- Traumatic Grief

POPULATIONS AT RISK

When a child feels intensely threatened by an event he or she is involved in or witnesses, we call that event a trauma. There is a range of traumatic events or trauma types to which children and adolescents can be exposed.

Bullying

Bullying is a deliberate and unsolicited action that occurs with the intent of inflicting social, emotional, physical, and/or psychological harm to someone who often is perceived as being less powerful.

view

Community Violence

Community violence is exposure to intentional acts of interpersonal violence committed in public areas by individuals who are not intimately related to the victim.

view

Complex Trauma

Complex trauma describes both children's exposure to multiple traumatic events—often of an invasive, interpersonal nature—and the wide-ranging, long-term effects of this exposure.

view

Disasters

Natural disasters include hurricanes, earthquakes, tornadoes, wildfires, tsunamis, and floods, as well as extreme weather events such as blizzards, droughts, extreme heat, and wind storms.

view

Early Childhood Trauma

Early childhood trauma generally refers to the traumatic experiences that occur to children aged 0-6.

view

Intimate Partner Violence

Intimate Partner Violence (IPV), also referred to as domestic violence, occurs when an individual purposely causes harm or threatens the risk of harm to any past or current partner or spouse.

view

Medical Trauma

Pediatric medical traumatic stress refers to a set of psychological and physiological responses of children and their families to single or multiple medical events.

view

Physical Abuse

Physical abuse occurs when a parent or caregiver commits an act that results in physical injury to a child or adolescent.

view

Refugee Trauma

Many refugees, especially children, have experienced trauma related to war or persecution that may affect their mental and physical health long after the events have occurred.

view

Sexual Abuse

Child sexual abuse is any interaction between a child and an adult (or another child) in which the child is used for the sexual stimulation of the perpetrator or an observer.

view

Terrorism and Violence

Families and children may be profoundly affected by mass violence, acts of terrorism, or community trauma in the form of shootings, bombings, or other types of attacks.

view

Traumatic Grief

While many children adjust well after a death, other children have ongoing difficulties that interfere with everyday life and make it difficult to recall positive memories of their loved ones.

SECONDARY TRAUMATIC STRESS

Children's reactions to trauma can interfere considerably with learning and behavior at school. Schools serve as a critical system of support for children who have experienced trauma. Administrators, teachers, and staff can help reduce the effects of trauma on children by recognizing trauma responses, accommodating and responding to traumatized students within the classroom, and referring children to outside professionals when necessary. The National Child Traumatic Stress Network has developed tools and materials to help educators, school staff, and administrators understand and respond to the specific needs of traumatized children.

Essential Elements

The primary mission of schools is to support students in educational achievement. To reach this goal, children must feel safe, supported, and ready to learn.

Bonjour,

je suis Alberto Zucconi,

psychologue-psychothérapeute

et président de l'Institut de l'approche centrée sur la personne (IACP),

qui a été chargé d'élaborer

les deux premiers modules de ce cours.

Je vous souhaite la bienvenue.

Tout d'abord, je voudrais dire deux mots

en tant qu'Alberto Zucconi,

le citoyen.

Et ce sont des mots de gratitude.

Un sincère merci à chacun d'entre vous qui faites tant et tant d'efforts pour soutenir et protéger

les mineurs

victimes de traumatisme.

Votre travail est très important,

sensible, délicat, mais il peut

s'avérer extrêmement lourd.

Nous savons

que

s'occuper de personnes qui souffrent

risque de causer

de la douleur et de mener à l'épuisement.

Donc,

un sincère merci à vous tous et vous toutes,

dont le travail oeuvre à protéger

une réalité précieuse pour toute nation et pour toute communauté : le capital humain.

Chaque personne traumatisée doit recevoir tous les soins possibles

pour qu'elle puisse se réinsérer, exercer tous ses droits,

redevenir un membre actif de la communauté

et

contribuer tant à son propre développement qu'à celui de la communauté.

J'aimerais ajouter une autre chose, qui peut paraître évidente, mais mérite d'être soulignée:

ce cours

s'adresse à vous tous et vous toutes, qui venez d'horizons, de professions et de compétences divers

et qui - comme vous le savez – êtes tenus, par les lois existantes, les codes éthiques/déontologiques

des différentes professions

et les règles internes des différentes organisations auxquelles vous appartenez,

d'utiliser toutes vos connaissances et compétences pour ceux et celles dont vous avez la responsabilité, sans jamais franchir

les limites, car cela serait certainement en défaveur de vos clients.

Je voudrais ajouter une remaque évidente.

Pour compliquer les choses, les lois ne sont pas les mêmes

dans toutes les nations européennes et c'est un cours

adressé à différentes nations et dans des langues diverses

par conséquent

De toute evidence, l’objectif de cela est d’offrir un cours aux personnes conscientes

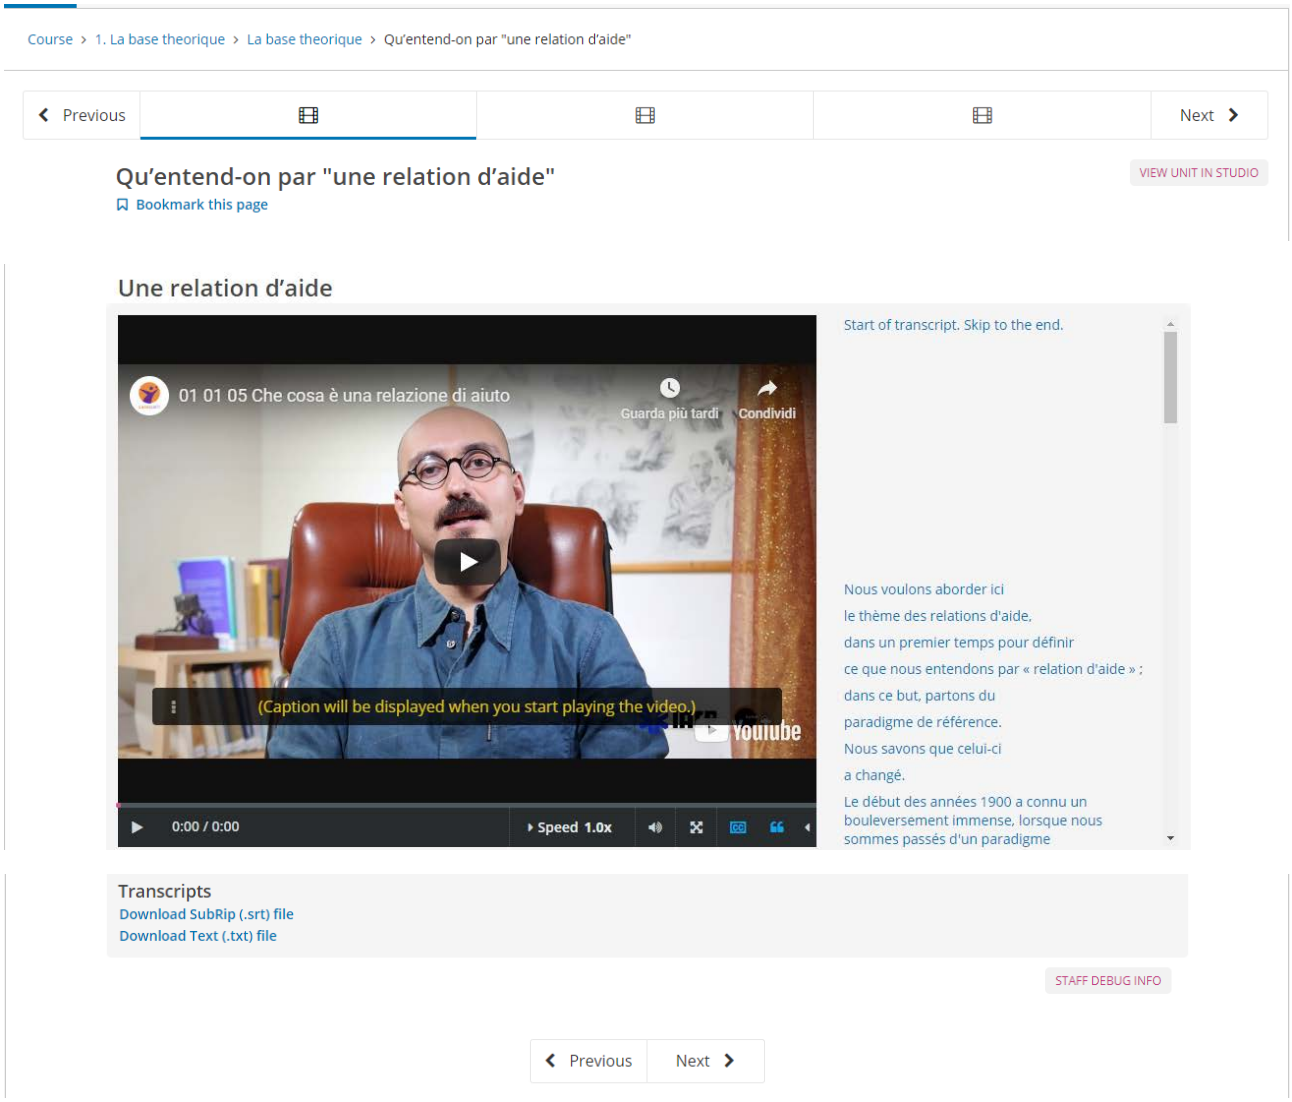
du fait que également

le respect les limites signifie travailler de manière effective

et efficace.

Merci encore de vous être embarqués dans cette aventure et merci pour le travail

que vous accomplissez tous les jours avec passion.



Transcript

Nous voulons aborder ici

le thème des relations d'aide,

dans un premier temps pour définir

ce que nous entendons par « relation d'aide » ;

dans ce but, partons du

paradigme de référence.

Nous savons que celui-ci

a changé.

Le début des années 1900 a connu un bouleversement immense, lorsque nous sommes passés d'un paradigme

mécaniste réductionniste à un paradigme holistique et systémique.

La façon de comprendre la relation d'aide a également changé ; dans le paradigme mécaniste

réductionniste,

elle se caractérisait par son asymétrie : le professionnel était l'agent de sens

imposant une réalité à son patient, sa propre vision de la réalité,

rendant en quelque sorte son patient passif.

L'adoption du nouveau paradigme a modifié la donne ;

nous plaçons maintenant

les relations au centre de l'approche : la priorité n'est plus donnée aux composantes individuelles, mais aux relations

qui font de ces composantes

un tout.

With it to be qualified

Alors, qu'est-ce qu'une relation d'aide à la lumière du nouveau paradigme ?

Pour nous aider à la définir, relisons les écrits de Carl Rogers de 1951, un auteur

qui occupe une place centrale pour tout qui veut comprendre la nouvelle vision de la relation d'aide.

Carl Rogers écrit : « Une relation d'aide est une relation dans laquelle au moins un des deux

protagonistes a pour but de promouvoir la croissance, le développement,

la maturité et l'adoption

d'un comportement plus adéquat et intégré chez l'autre personne.

Dans ce sens,

l'autre peut être un individu ou un groupe.

En d'autres termes, une relation d'aide pourrait être définie comme une situation dans laquelle

l'un des participants essaie de favoriser, chez l'un ou l'autre, un plus grand épanouissement

des ressources personnelles et une plus grande possibilité d'expression de soi ».

Les mots qui ressortent ici sont valorisation, promotion, ressources ;

cette

nouvelle vision des relations d'aide

place donc

les deux protagonistes

dans une relation de parité ;

ainsi, le professionnel ne sera pas

l'expert, l'agent de sens,

mais plutôt celui qui favorise l'épanouissement de toutes les

ressources propres à l'autre.

Ce faisant, il pourra faciliter un processus plus fonctionnel de co-construction de la réalité

pour le patient,

l'accompagnant ainsi dans un processus, en acceptant et en respectant l'endroit où se trouve le patient.

Aujourd'hui, quelles sont les caractéristiques que doit avoir un professionnel de la relation d'aide ?

Il ou elle doit certainement posséder des connaissances, c'est-à-dire un corpus

de savoirs théoriques

sur

lesquelles s'appuyer ;

il ou elle doit, en outre, savoir comment appliquer ces connaissances (les théories doivent être concrétisées, appliquées)

et savoir comment les appliquer dans la relation. Mais savoir comment appliquer ne suffit pas. L'accent de la relation étant mis sur sa propre qualité,

le professionnel devra également savoir comment être, comment mettre en pratique toutes les conditions

et qualités qui facilitent et rendent efficace une relation d'aide.

Parmi celles-ci, nous savons que l'authenticité est sûrement la première qualité, que voir le monde à travers les

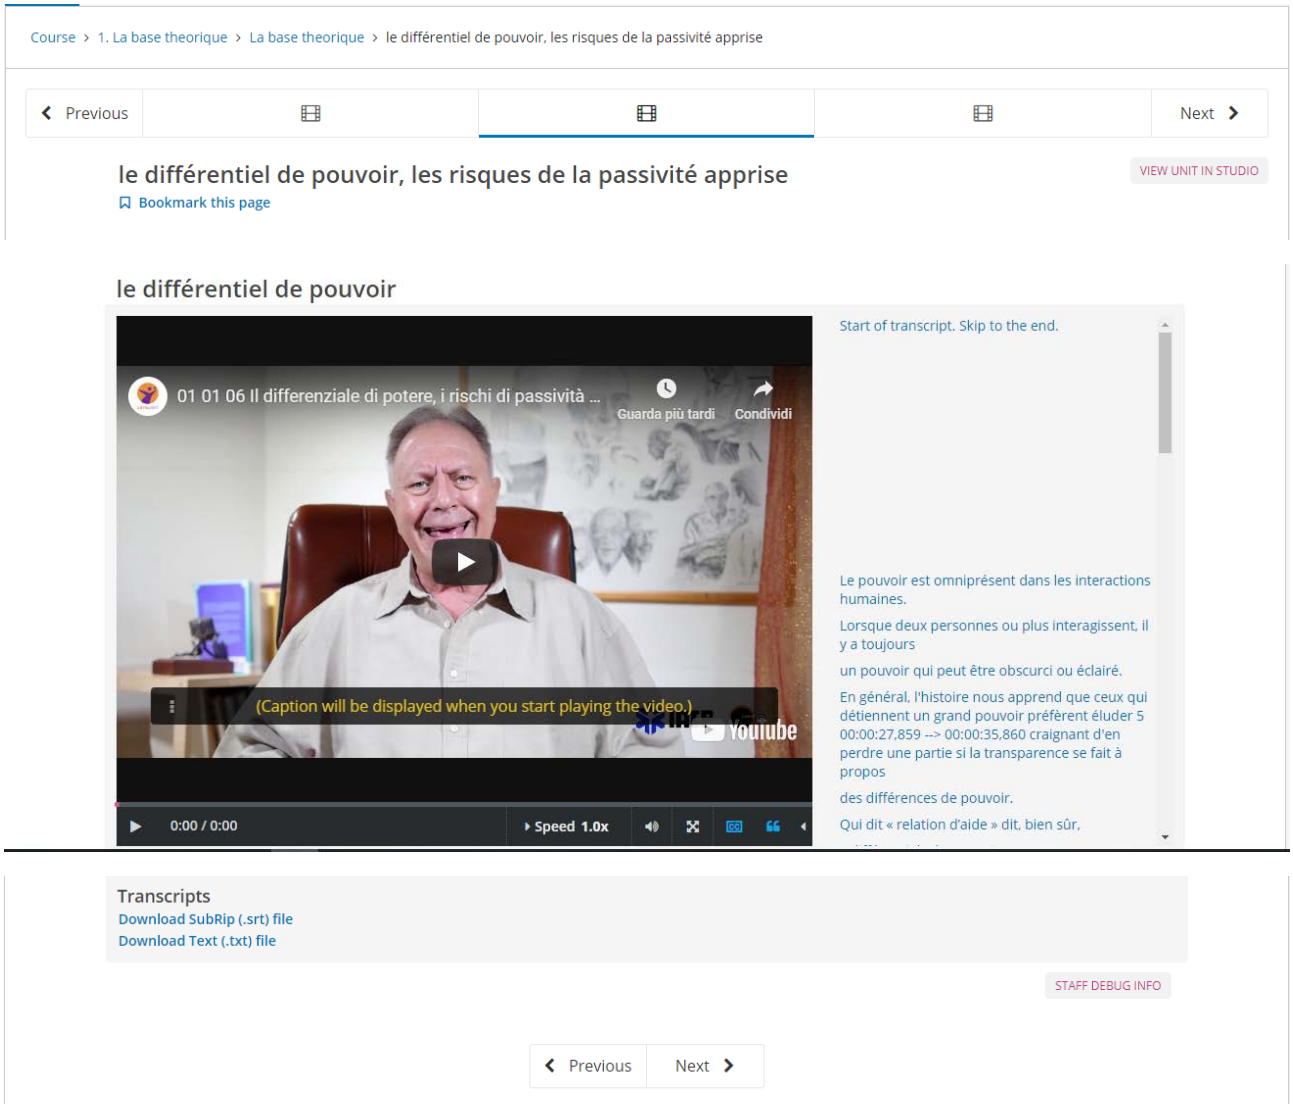
yeux de l'autre est la deuxième, et la troisième est de ne pas juger

le patient, mais de pouvoir le respecter et l'accueillir tel qu'il est.

Si cela est possible, si ces trois conditions sont remplies par le professionnel,

un processus de changement

et d'auto-épanouissement chez le patient s’en trouvera facilité.



Transcript

Le pouvoir est omniprésent dans les interactions humaines.

Lorsque deux personnes ou plus interagissent, il y a toujours

un pouvoir qui peut être obscurci ou éclairé.

En général, l'histoire nous apprend que ceux qui détiennent un grand pouvoir préfèrent éluder 5 00:00:27,859 --> 00:00:35,860 craignant d'en perdre une partie si la transparence se fait à propos

des différences de pouvoir.

Qui dit « relation d'aide » dit, bien sûr,

« différentiels de pouvoir ».

Le professionnel, l'expert,

celui ou celle qui offre un service aura plus de pouvoir

que l'utilisateur du service, le client, le patient, quel que soit la façon dont vous voulez définir cette personne. Pourquoi ?

Parce que le professionnel sait quelque chose que le patient ignore en partie,

et parce que le professionnel offre au patient quelque chose dont il a besoin.

C’est également lui ou elle qui conçoit les règles

du cadre (c'est-à-dire les règles qui régissent la conception et la gestion du cadre)

et qui a le pouvoir de suspendre la prestation du service.

En bref,

il y a toujours une différence de pouvoir entre ceux qui fournissent un service et ceux qui le reçoivent.

Lorsque s’appliquait le paradigme réductionniste-mécaniste,

les différentiels de pouvoir dans les relations d'aide étaient très élevées.

Nous avons constaté, à la lumière du nouveau paradigme de la Charte d'Ottawa et du paradigme bio-psychosocial,

que ces différentiels de pouvoir sont à éviter,

que, s’il sont excessifs, ils peuvent amener les usagers du service à assumer un rôle passif contreproductif.

Nous constatons aujourd'hui une tendance à se concentrer sur les utilisateurs, sur la personne du patient, et à encourager

le changement par des actions d'empowerment (de mise en capacité)

qui permettent aux patients de développer leurs propres compétences, leur créativité et leur résilience.

Ceci, comme la recherche le souligne très clairement, s’avère très utile,

la relation d'aide offrant de meilleurs résultats dans un délai plus court ;

par exemple dans le domaine de la santé et du bien-être, nous remarquons une diminution des effets secondaires et des rechutes.

On en conclut donc que tout le monde est gagnant lorsque le pouvoir est partagé et lorsque chacun

contribue à la poursuite des objectifs.

Cette vérité s’applique également au niveau sociétal, les citoyens actifs et conscients

contribuant davantage à leur écologie sociale et à la construction communautaire de la réalité :

une réalité durable pour des relations durables.

La remarque s’applique également à la prestation de services pour enfants, who are small people, compris comme individus petits et non pas comme enfants incapables

de comprendre ni de répondre. La construction sociale des enfants en tant que

« charmantes petites choses » n’est plus d’actualité.

Comment ceux

qui les pratiquent comprennent-ils les relations d'aide ?

Nous avons déjà souligné, lorsque

nous avons mis en évidence l'objectif du

paradigme bio-psychosocial, que l'objectif n'est pas uniquement de guérir les maladies, mais

de protéger et de promouvoir le potentiel de santé

et de bien-être, la capacité d'apprentissage actif et le développement de la créativité et de la résilience.

Un autre terme décrivant cette capacité innée des organismes humains est

« coping ». Un terme anglais qui, en français, peut se traduire par « savoir gérer les circonstances de la vie » :

savoir mieux gérer son propre rapport avec soi-même,

avec les autres et avec le monde qui nous entoure.

Nous savons que, dans les relations d'aide,

les qualités recherchées chez un professionnel efficace,

quelle que soit son approche, concernent son comportement

avec ses patients, un profond respect et l'absence de préjugés,

une compréhension empathique non seulement de ce que dit le patient, mais également de ce qu'il ressent, de ses

significations, une attitude honnête, authentique et transparente.

Par ailleurs, il est également nécessaire, si l'on veut que ce processus fonctionne, que l'utilisateur, le client ou le patient

s'implique activement, puisqu'il s'agit ici d'un jeu d'équipe co-construit.

Dans les relations d'aide, les patients que l'on peut définir comme « efficaces »

sont sincères et motivés à changer, fut-ce parce qu'ils ne se sentent pas bien

et veulent arrêter de souffrir. Ils doivent également avoir la capacité d'entrer

en contact psychologique avec le professionnel qui travaille avec eux et de percevoir les qualités

que le professionnel met dans la relation.

Ces capacités évoluent, tout comme la capacité de persévérer, d'être prêt à apprendre de ses erreurs,

avec le courage qu'il faut pour admettre ses propres erreurs,

pour transformer les erreurs en enseignants de sagesse.

Il en ressort que l'adaptation (coping) est un processus de fonctionnement optimal et le

résultat d'un travail d'équipe entre le professionnel et son patient visant à atteindre

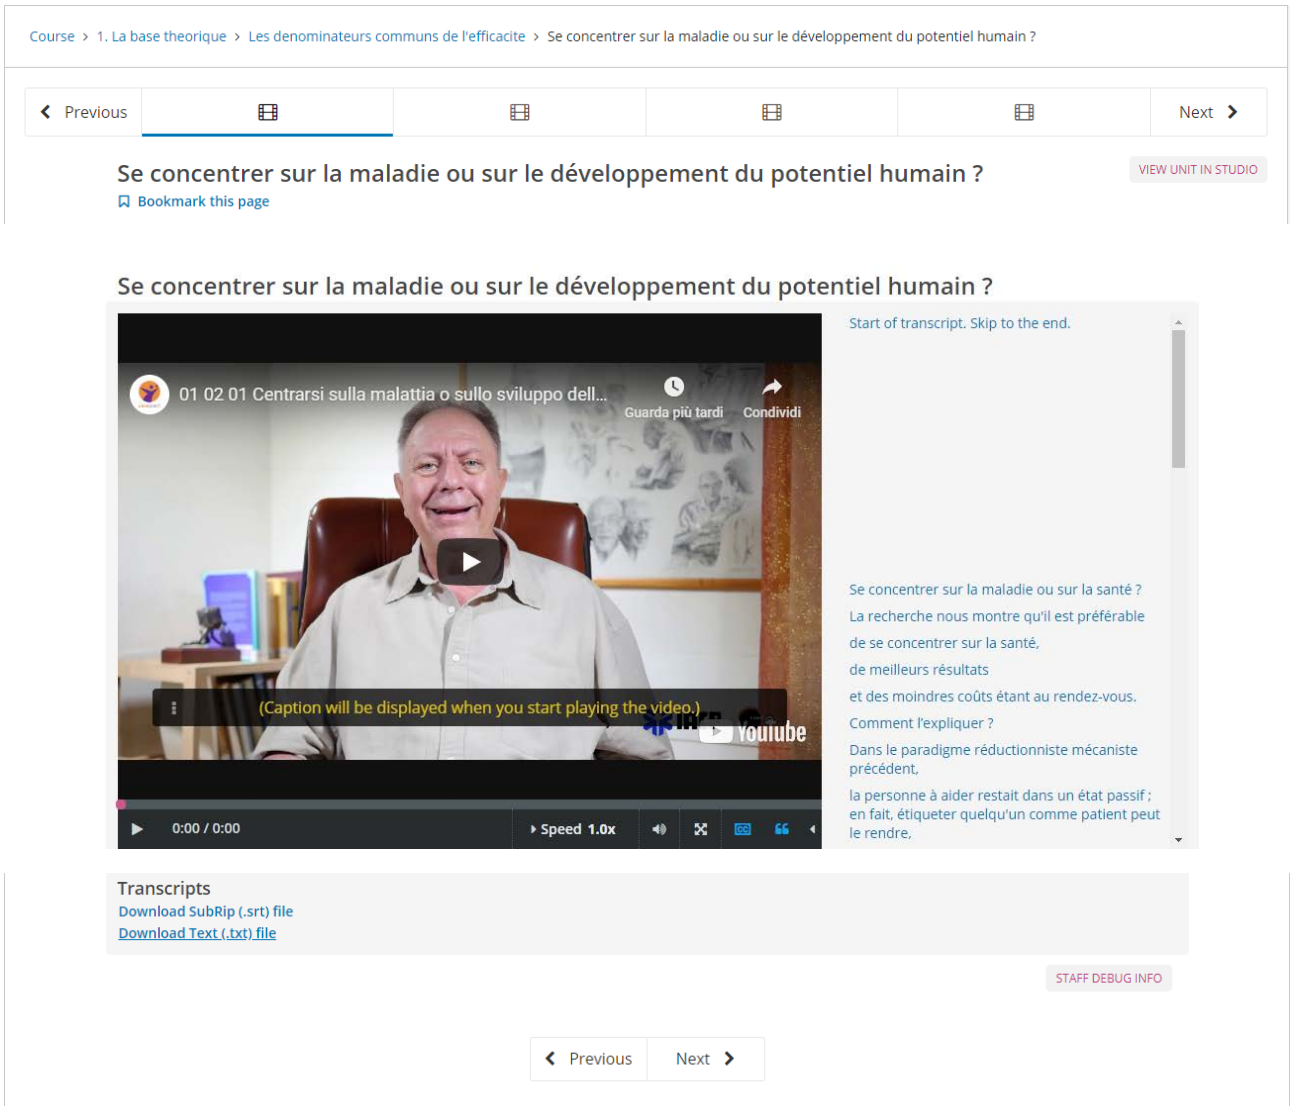
les objectifs d'une meilleure qualité de vie et d'une plus grande réalisation du potentiel

intrinsèque

intrinsèque avec lequel chacun d'entre nous sommes nés et qui est inscrit dans notre code génétique. Ce potentiel

inné s'est ensuite développé avec plus ou moins d'amplitude en fonction des conditions environnementales dans lesquelles nous nous trouvons, mais également des attitudes

que nous avons et de la façon dont nous faisons face à la vie.



Transcript

Se concentrer sur la maladie ou sur la santé ?

La recherche nous montre qu'il est préférable

de se concentrer sur la santé,

de meilleurs résultats

et des moindres coûts étant au rendez-vous.

Comment l'expliquer ?

Dans le paradigme réductionniste mécaniste précédent,

la personne à aider restait dans un état passif ; en fait, étiqueter quelqu'un comme patient peut le rendre,

dans un certain sens, trop patient,

c'est-à-dire trop passif ; porteur

d'une passivité acquise. Le risque est moindre dans le

nouveau paradigme qui encourage la personne à utiliser son propre pouvoir dans le but d'être et

d’entrer dans un partenariat basé sur un partage du pouvoir décisionnel entre le professionnel

et son patient.

De plus, la recherche nous montre qu'une approche de protection et de promotion de la santé

et du bien-être

peut

donner de meilleurs résultats pour les mêmes catégories d'utilisateurs de services.

Citons comme exemple

une

relation proactive des patients avec a good relationship le personnel de l'hôpital,

au cas où ils viendraient à subir une opération chirurgicale. Dans le nouveau modèle,

nous constatons moins de jours d'hospitalisation

et moins de negative conséquences négatives après la chirurgie,

un meilleur développement des défenses immunitaires

et une meilleure conformité

(entendez « une meilleure collaboration du client avec les médecins et les infirmières pour se conformer à leurs prescriptions,

comme de prendre des médicaments régulièrement »).

Le nouveau modèle se caractérise également par moins de plaintes déposées par les usagers

contre les établissements de santé et

un meilleur taux de rétention des médecins.

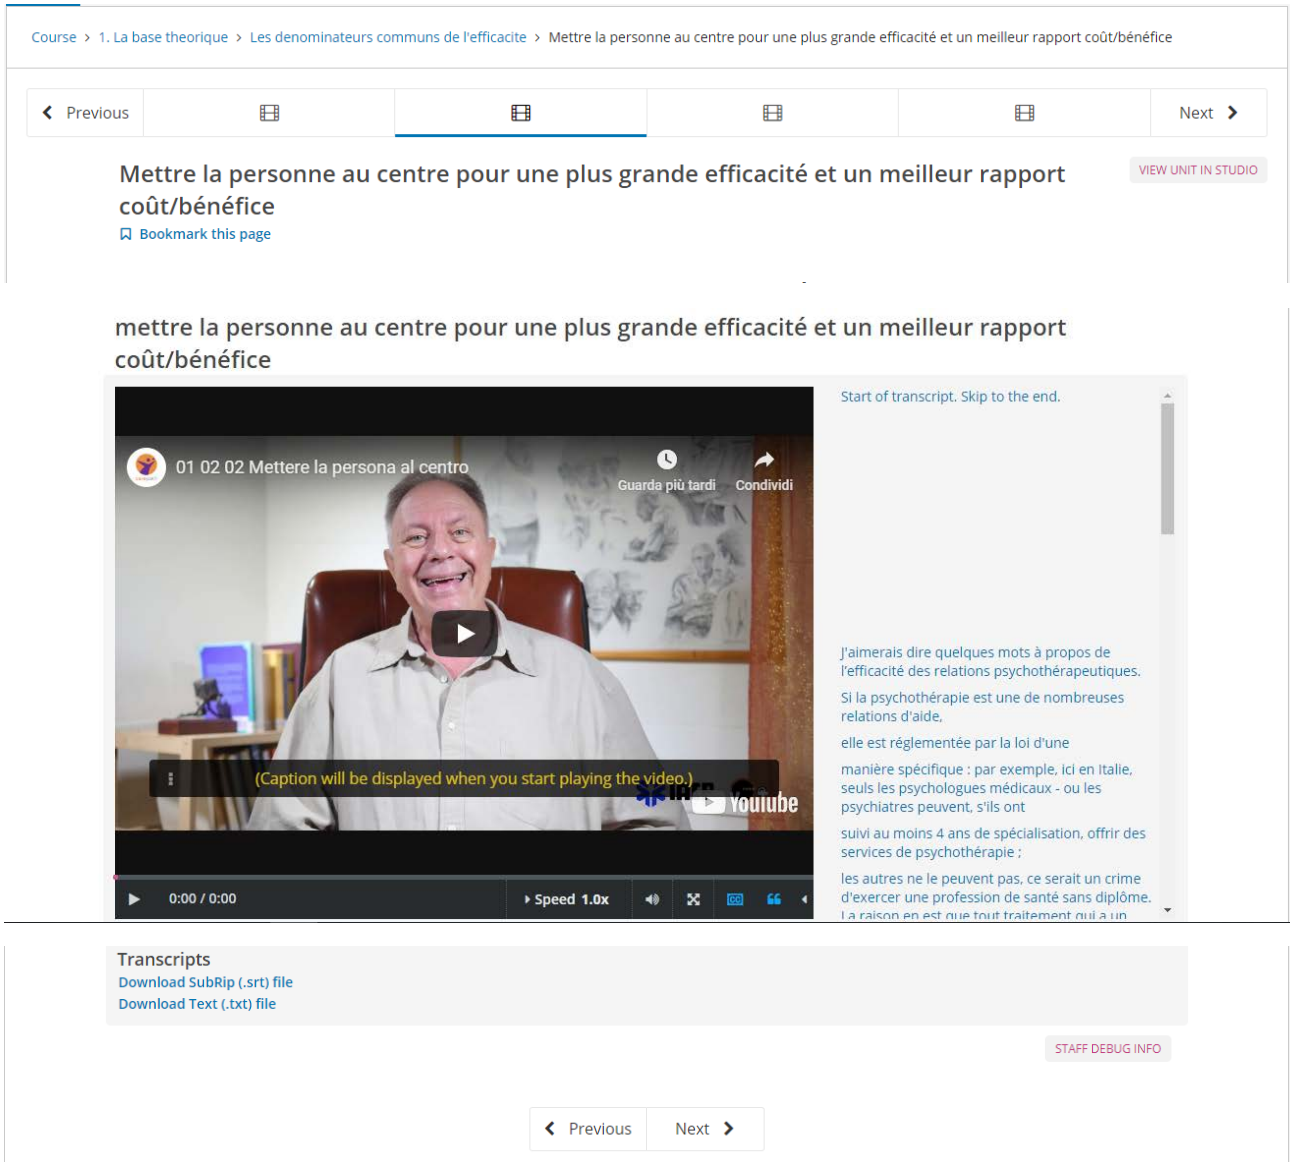
Ce nouveau paradigme favorise les résultats non seulement pour l'utilisateur et sa famille,

mais également pour la société dans son ensemble, car une société où les gens peuvent mieux développer leur potentiel

est une société où ils seront moins malades, où ils vivront plus vieux et seront moins sujets aux maladies ; en résumé, c'est une société plus prospère.

En bref, quand il y a promotion de la santé et du bien-être, il n’y a que des gagnants,

chacun s'en sort mieux et les résultats parlent d'eux-mêmes.



Transcript

J'aimerais dire quelques mots à propos de l’efficacité des relations psychothérapeutiques.

Si la psychothérapie est une de nombreuses relations d'aide,

elle est réglementée par la loi d'une

manière spécifique : par exemple, ici en Italie, seuls les psychologues médicaux - ou les psychiatres peuvent, s'ils ont

suivi au moins 4 ans de spécialisation, offrir des services de psychothérapie ;

les autres ne le peuvent pas, ce serait un crime d'exercer une profession de santé sans diplôme. La raison en est que tout traitement qui a un impact sur la santé d'un organisme

- et donc qui fait du bien - peut, s'il n'est pas bien pratiqué,

faire du mal.

Le vaste corpus de recherches montre que l'efficacité dans la psychothérapie n’est pas le simple résultat d’une

« approche théorique spécifique », mais plutôt des qualités relationnelles des psychothérapeutes,

quelles que soient leurs démarches ; ajoutons que, comme dans toute relation d'aide,

les mêmes variables et les mêmes facteurs interviennent.

Un psychothérapeute sera efficace, non pas parce qu'il appliquera un certain modèle théorique, mais parce

qu'il aura la capacité de se mettre en relation avec le patient, de l'accepter et

de le respecter, sans le juger,

mais avec un profond respect,

et parce qu'il sera en mesure non seulement

d'écouter ce que son usager / patient / client dira, mais également de faire preuve d'empathie,

c'est à dire tout ce qui fera sens pour le patient en tant qu'individu.

Le professionnel est également capable d'établir une relation authentique, spontanée et transparente avec le patient.

Pourtant, tout cela ne suffira pas. En effet la relation psychothérapeutique, comme toute relation d'aide, est un

travail d'équipe, une co-construction à laquelle le client, l'usager, le patient contribuera activement,

au risque qu'elle ne fonctionne pas.

Et donc ?

La motivation, qui vient souvent du sentiment de malaise vécu par le patient - et donc de sa motivation à changer –

est également importante, tout comme la relation psychologique avec le psychothérapeute

et,

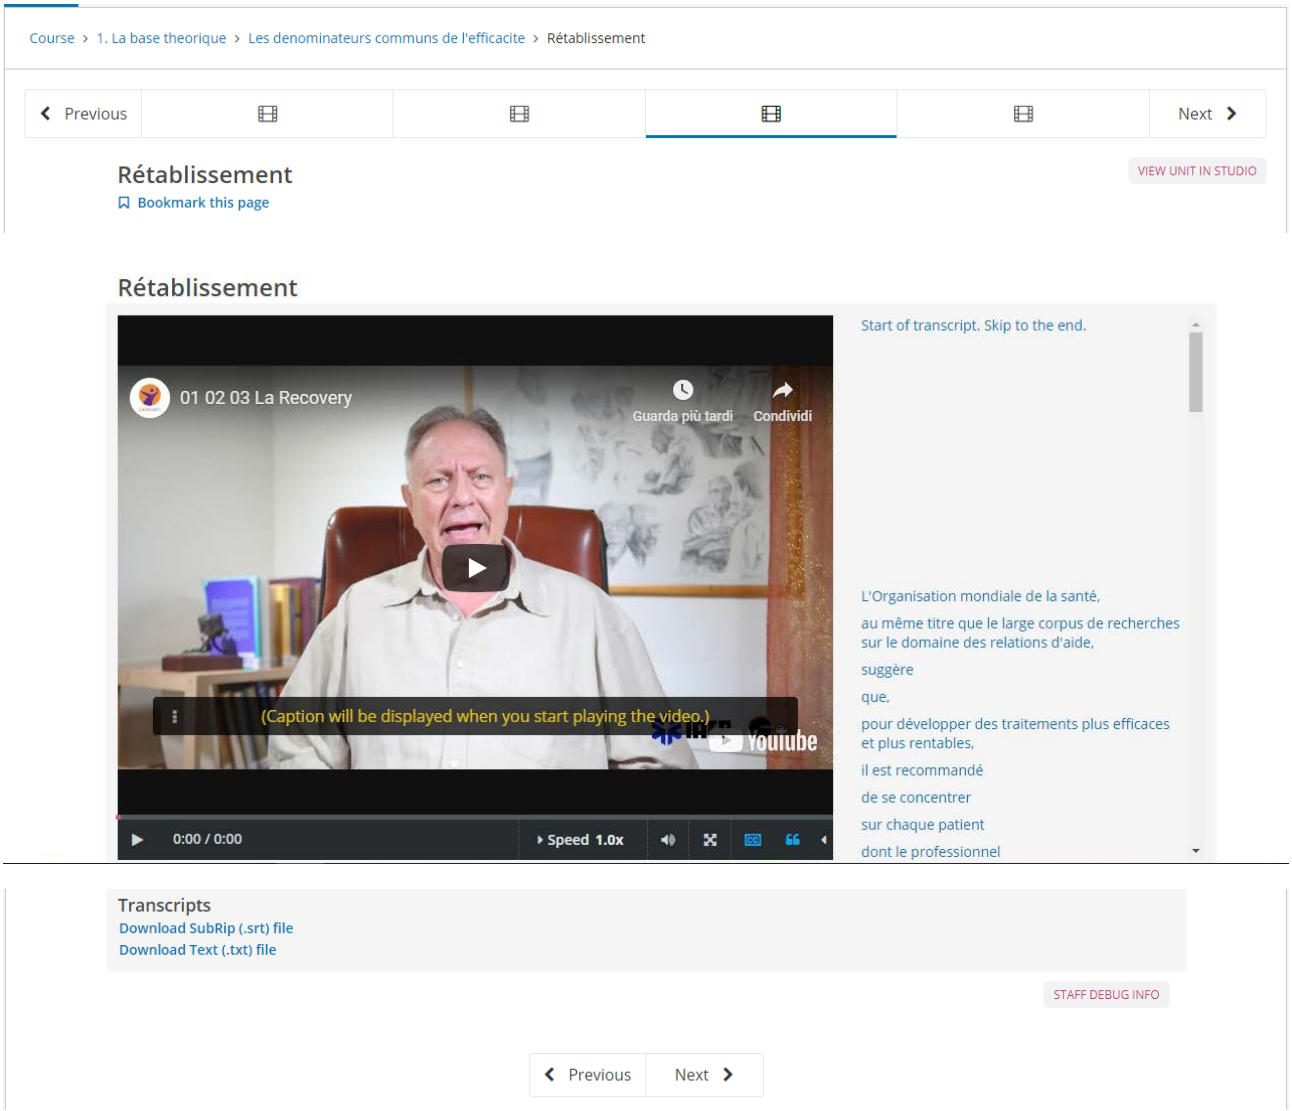
troisième condition, la capacité de percevoir la qualité de relation établie par le professionnel qui possède

les qualités fondamentales de respect profond, d'écoute empathique et d'authenticité.

C'est ainsi que la dyade pourra fonctionner et donner des résultats très positifs,

plus efficaces que si la personne souffrant du malaise ne recevait qu'un traitement médicamenteux ou, pire,

aucun traitement.



Transcript

L'Organisation mondiale de la santé,

au même titre que le large corpus de recherches sur le domaine des relations d'aide,

suggère

que,

pour développer des traitements plus efficaces et plus rentables,

il est recommandé

de se concentrer

sur chaque patient

dont le professionnel

prend soin.

En bref, il est important de personnaliser les traitements, et donc de ne pas utiliser

un pot de peinture blanche qui nous permettrait de peindre en blanc tout le monde, peu importe qui en seraient les utilisateurs.

Tout comme la psychothérapie doit être personnalisée, les relations d'aide doivent également l'être,

car c'est cela qui aidera au mieux Gino, Maria, Joseph, etc.

En effet,

nous devons

nouer des relations de travail solides et nous lancer dans des récits

qui considèrent le client comme un acteur dans l'aventure du changement.

La Task Force 29 de l'American Psychological Association (APA)

montre combien il est important de centrer les traitements sur les personnes,

et

ajoutant:

que les traitements et leur philosophie doivent se baser

sur les concepts de rétablissement

et

de développement du potentiel,

à mille lieues de la vision pessimiste

de la pathologie et de la chronicité qui dominait auparavant.

Qu'entend-on par rétablissement ?

Au cours des dernières décennies, le concept de « rétablissement » a gagné des galons,

une capacité à soutenir des patients et à en accroître l'autonomie,

tout en dissipant certains mythes,

comme celui

selon

lequel la schizophrénie

est une pathologie chronique.

C'est ce que l'on pensait auparavant,

mais le fait même de penser de cette manière devient aussi,

dans une

certaine mesure, une prophétie auto-réalisatrice,

un phénomène de construction sociale qui - si l'on y réfléchit -

est assez évident.

Prenons l'exemple de la schizophrénie, si on sait

qu'elle existe dans tous les pays, aucune culture ne la traite de la même manière.

Dans certaines sociétés et cultures, le schizophrène est considéré comme une personne

touchée par les dieux qui sera,

par conséquent, traitée avec respect et bienveillance par une communauté qui lui offrira

nourriture et abri ;

Dans d'autres sociétés,

par contre, ils seront plutôt traités comme des parias,

bannis de la communauté et enchaînés à un arbre dans la forêt.

Dans notre culture occidentale,

selon les époques, nous

les traitions

différemment,

parfois avec cruauté,

mais toujours « pour leur propre bien »,

in turn that it was a phenomenon caused by a devil's possession and so we tortured these poor people

comme lorsque nous avons cru qu'il s'agissait d'un phénomène causé par une possession diabolique

et que nous avons torturé ces pauvres gens avec des fers chauds, pensant que,si leur corps était possédé par un diable,

il fallait rendre le corps inconfortable par la torture pour que le diable en sorte.

Nous avons essayé d'autres traitements,

mais en faisant toujours en sorte que la prophétie

de la pathologie et de la chronicité

se réalise.

Dans une vision axée sur le rétablissement, qui postule que, indépendamment de votre situation,

fût-elle aussi grave que la schizophrénie,

vous pourrez récupérer vos capacités et reprendre place au sein de la communauté, nous formulons une prophétie positive qui,

comme toutes les prophéties, finit, dans une certaine mesure, par se réaliser.

Ainsi, nous constatons aujourd'hui que, lorsque les gens sont perçus avec un plus grand optimisme, ils réalisent ces prophéties.

Nous rencontrons des gens qui voient des choses que d'autres ne voient pas, entendent des voix que

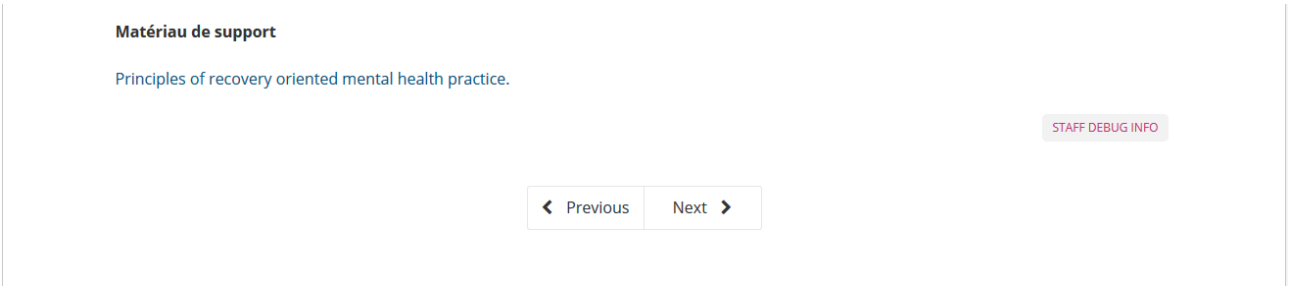
d'autres n'entendent pas, mais qui travaillent néanmoins comme consultants rémunérés dans une Agence de Santé Locale pour conseiller sur la manière

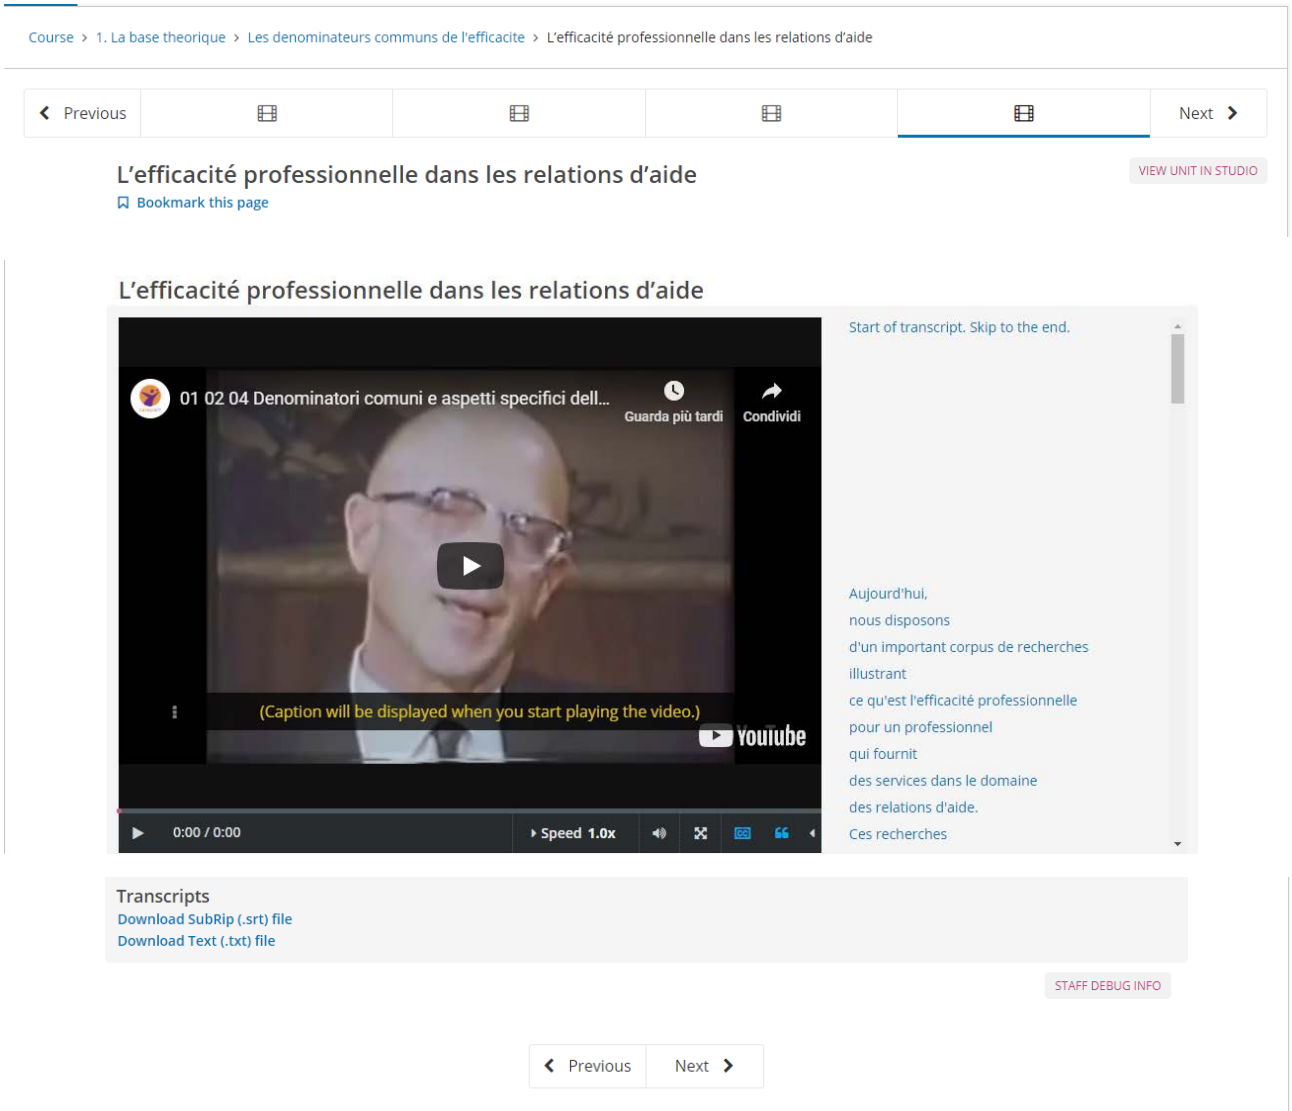
de traiter des afflictions d'une manière plus humaine et positive, afin de réaliser –

non pas des prophéties négatives –

mais des prophéties positives.

Dans le monde des prophéties, nous devons faire attention à laquelle choisir et où elle nous mènera.





Transcript

Aujourd'hui,

nous disposons

d'un important corpus de recherches

illustrant

ce qu'est l'efficacité professionnelle

pour un professionnel

qui fournit

des services dans le domaine

des relations d'aide.

Ces recherches

ont commencé il y a longtemps

partir des hypothèses formulées par Carl Rogers,

à

le fondateur de l'approche centrée sur la personne

et l'un des pères de la psychologie humaniste.

À partir de 1942, Rogers a formulé

une série d'hypothèses scientifiques,

avant de passer à la vérification empirique

de ce qui constituait les conditions nécessaires et suffisantes pour qu'un professionnel

efficace opère un changement.

Ces conditions ont été et sont encore confirmées aujourd'hui par la recherche :

l'établissement

d'une relation de confiance avec l'usager / le patient,

l'absence de jugement dans le chef du professionnel,

une capacité d'acceptation

et de respect profond de la personne du patient,

une écoute

empathique sensible et précise (comprendre non seulement ce que dit le patient,

mais également ce que cela signifie pour lui),

sans oublier une attitude d'authenticité, de franchise

et d'honnêteté dans la relation.

Ces hypothèses, qui ont été validées par des recherches sur la psychothérapie,

ont prouvé leur efficacité

dans toutes les relations d'aide.

Rogers a révolutionné l'approche,

en l'enracinant solidement dans

la science, et non plus dans la métaphysique, et en explicitant les valeurs qui la fondent.

Je pense qu'il est préférable de donner la parole à Carl Rogers en personne,

qui illustre ces trois conditions nécessaires et suffisantes dans un de ses célèbres films :

« De mes années d'expérience thérapeutique, je suis venu à penser que,

si je peux créer le bon

climat, la bonne relation, les bonnes conditions,

un processus de mouvement thérapeutique se produira presque inévitablement chez mon patient.

Vous vous demandez peut-être ce qu'est ce climat ?

Quelles en sont les conditions ?

Existeront-elles dans une entrevue avec des femmes que je n'ai

jamais vues auparavant ?

Laissez-moi essayer de décrire très brièvement ces conditions telles que je les perçois.

Tout d'abord, la question se pose de savoir

si je peux être réel dans la relation.

Cela a pris une importance croissante pour moi

au fil des ans.

Je pense qu'authenticité

est une autre façon de décrire la qualité que j'aimerais posséder.

J'aime le terme de congruence, qui signifie pour moi que ce que je vis à l'intérieur est présent

dans ma conscience et s'exprime par ma communication.

Dans un sens,

quand j'ai cette qualité,

je suis tout entier dans la relation.

Un autre mot décrit cet état :

je sens que

j'aimerais mettre de la transparence dans la relation, je serais tout à fait disposé à ce que mon client voit tout à travers moi,

qu'il n'y ait rien de caché.

Quand j'atteins ce niveau de réalité,

je sais que mes propres sentiments

vont prendre conscience et s'exprimer,

mais pas d'une façon qui s'imposera à mon patient.

Ensuite,

la deuxième question que je me pose est de savoir si je vais me retrouver

à faire l'éloge de cette personne,à prendre soin d'elle.

Je ne veux certainement pas tomber dans une fausse empathie.

En fait, si je n'aime pas mon client de façon persistante, je pense qu'il vaut mieux que je le dise.

Mais je sais que le

processus de thérapie est beaucoup plus susceptible de réussir,

et que le changement constructif

est plus envisageable,

si je ressens une véritable appréciation spontanée de l'individu avec lequel je travaille.

Une appréciation de cette personne comme individu à part entière.

Vous pouvez l'appeler « acceptation », vous pouvez l'appeler « attention »,

vous pouvez l'appeler « amour non possessif » si vous le souhaitez.

Je pense que tous ces termes décrivent bien mon propos.

Je sais que la relation sera plus constructive si tout cela est présent.

Pour ce qui est de la troisième qualité, serai-je capable de comprendre le monde intérieur de cet individu,

de l'intérieur ?

Serai-je capable de le voir à travers ses yeux ?

Serai-je suffisamment

sensible

pour

me transporter dans le monde de ses sentiments,

de sorte que je sache ce que l'on ressent en étant lui ?

Pour que je puisse

sentir non seulement le sens superficiel, mais également certaines

significations cachées sous la surface.

Je sais que si je peux

me laisser entrer avec sensibilité et précision dans le monde de son expérience,

le changement et le changement thérapeutique seront beaucoup plus probables. »

Qu'est-ce qu'un traumatisme ? Comment le définir ?

Le traumatisme, en réalité, est une expérience,

un phénomène stressant

- souvent soudain -

qui

va au-delà de la possibilité pour la personne de réagir

et

de se défendre contre le traumatisme lui-même.

Le traumatisme est une chose qui submerge

les personnes qui y sont exposées.

Les traumatismes ont été étudiés

de diverses manières.

Il y a des traumatismes aigus

pouvant être causés par des catastrophes naturelles ou technologiques, des situations chroniques/répétées de traumatisme

(comme celles auxquelles les enfants sont souvent exposés).

Toutefois,

nous pouvons affirmer

que l'histoire des traumatismes, d'un point de vue clinique, commence

avec l'étude des névroses post-traumatiques, qui ont également été étudiées par Freud (et donc dans le cadre

de la psychanalyse), puis reprises par d'autres.

Le traumatisme a également été étudié du point de vue des mécanismes psychologiques, dont l'importance

est indéniable.

Depuis ses origines, la psychanalyse prétend qu'un traumatisme,

en particulier

s'il se produit dans la petite enfance,

subit un processus de suppression.

Cette suppression ne signifie pas pour autant que le traumatisme est oublié,

nié ou enterré. Il peut réapparaître, être réactivé à un autre moment,

par exemple à l'âge adulte,

parfois

suite à un nouveau traumatisme qui rappelle en quelque sorte

le traumatisme précédent. Il s'agit d'un mécanisme en deux étapes, que Freud a étudié attentivement,

selon lequel se produit un premier traumatisme qui, dans un certain sens, sensibilise,

puis un second traumatisme qui

reproduit chez le sujet la victimisation,

l'impuissance et la fragilité. Ainsi,

la répétition de la situation conduit

à de nouveaux

symptômes et

à un état clinique qui suscite le ressenti comme si c'était la première fois.

Ceci dit, le traumatisme du syndrome

de stress post-traumatique se produit plutôt

de manière ponctuelle et met en danger la vie des sujets.

S’il peut être causé par la guerre, la torture,

des facteurs technologiques ou environnementaux,

il est de type ponctuel et facilement reconnaissable

in the life of the subjectdans la vie du sujet.

Analysons les types de traumatismes pouvant entraîner des troubles alimentaires.

Le traumatisme classique, qui ne frappe qu'une fois, mais avec force,

représente en fait l'un des cas les moins fréquents, même si ses effets sur une personne

peuvent être dévastateurs.

Il s'agit d'événements graves

qui peuvent avoir un aspect négatif,

causer des dégâts

psychologiques et/ou physiques,

et durer

plusieurs années.

Habituellement, si on retrouve ce traumatisme dans ce qu'on appelle le syndrome de stress post-traumatique,

il est également très courant dans les troubles de l'alimentation, en particulier dans certaines formes de troubles de l'alimentation.

On peut les répartir en deux catégories : 1. le traumatisme physique, susceptible de se produire principalement dans des moments particulièrement dramatiques, comme un viol, un vol, un acte de violence physique, des combats en temps de guerre, des catastrophes naturelles (comme un tsunami ou un tremblement de terre), un très grave accident de voiture ou de train ;

2. le traumatisme de type essentiellement psychologique :lorsque la vie d'une personne est mise en danger par quelqu'un d'autre, dans une situation particulière où, même en l'absence de blessures physiques, physical injuries, but simply la menace est à ce point extrême et forte qu'il est difficile pour la personne de l'effacer rapidement de son esprit.

Pour les personnes ayant subi un traumatisme de type I, également appelé « traumatisme focal », il s'agit d'un « coup unique », c'est-à-dire que le traumatisme frappe une fois, mais laisse des traces durables et dans les symptômes liés à l'alimentation, a un effet semblable au trouble de stress post-traumatique.

Un traumatisme du type I peut avoir une série de conséquences, parmi lesquelles les troubles alimentaires sont l'une des plus fréquentes, ainsi que des symptômes assez étendus pouvant se manifester par une série de traits tous présents dans le comportement du trouble alimentaire.

C'est-à-dire que le trouble alimentaire n'est pas seulement un comportement alimentaire,

mais les symptômes peuvent accompagner,

fréquemment

et dans presque tous les cas de cette symptomatologie,

chacun des troubles alimentaires individuels. Quels sont ces traits ?

Une faible estime de soi, une très forte tendance à la dépression,

a distorted image of one's body and sexuality

une image déformée de son propre corps et

de sa sexualité,n risque suicidaire élevé, des troubles anxieux, un abus d'alcool,

des troubles du sommeil, des troubles dissociatifs, des pertes de mémoire, de l'agressivité et des troubles de la personnalité.

C'est un cortège symptomologique qui ne nous surprend jamais :

les troubles alimentaires ne surviennent jamais seuls, mais sont toujours accompagnés de symptômes

de ce genre ou de véritables pathologies

qui complètent le tableau des troubles alimentaires

et

en sont rarement absents.

Nous pouvons citer en exemple

un traumatisme qui laisse une trace - comme dans le cas d'un traumatisme de type I

– et qui se produit principalement

en produisant une alexithymie, soit un trouble émotionnel empêchant

la personne d'exprimer ouvertement ses émotions

avec des mots.

La tendance dans ce cas, après un traumatisme de type I, est d'exprimer ses émotions

de manière non verbale,

avec son propre corps ;

ces sensations peuvent

s'avérer

très graves

et entraîner

une forte dysrégulation émotionnelle, également notable, au point que la personne

montre une impulsion

à un certain niveau,

et

nous savons - parce que c'est

l'une des réactions les

plus fréquentes que nous constatons

- qu'il existe certaines formes de boulimie dans lesquelles ce type de traumatisme

(par exemple la maltraitance) est

d'une gravité

et d'une ampleur telles qu'il produit des

symptômes

pouvant entraîner une perte de contrôle considérable et

généralisée à différents niveaux.

En particulier, ce qui se passe à un stade précoce du développement,

lorsque le traumatisme est dramatique

et qu'il y a des variables sérieuses dans la famille

à soutenir,

dans ces cas,

le risque existe d'une boulimie multi-impulsive :

une forme très grave et

dangereuse de boulimie

qui peut entraîner, en plus des comportements boulimiques,

des altérations du comportement alimentaire,

et surtout de l'impulsivité,

parfois

sexuelle,

the

une tendance

à consommer de la nourriture de manière incontrôlée, sans la goûter,

ce qui peut, par exemple, conduire aux

comportements typiques de ceux qui commettent

des vols dans les supermarchés ou qui y consomment de la nourriture sans pouvoir

attendre de rentrer chez eux pour manger,

même s'ils peuvent payer leur nourriture.

Il s’agit d’une désinhibition des pulsions, constatée dans le champs de la sexualité,

mais également, ce qui est plus important et plus dangereux, d’une auto-mutilation impulsive,

de comportements d'auto-mutilation pouvant aller jusqu’à se couper ou tenter de se suicider.

Ce type de boulimie, multi-compulsive, est la plus dangereuse,

notamment en raison du taux de suicide élevé.

En conclusion, un traumatisme de type I peut entraîner,

of this form of bulimia which is certainly the most dangerous form known in particular surtout si l'environnement n'est pas favorable,

cette forme de boulimie, qui est certainement la plus dangereuse, notamment en raison d’un risque très élevé de suicide.

A côté du traumatisme traditionnel, dit « de coup unique »,

dont

nous savons que la gravité peut

chambouler la vie d'une personne,

il existe un autre type de traumatisme : le traumatisme de type II.

Il s'agit typiquement d'un traumatisme

de moindre gravité, mais qui se répète dans le temps,

avec une fréquence telle que les gens commencent à le prévoir,

même s’ils ne peuvent pas en prédire le moment exact de la survenance.

Cette attente a un effet lassant : elle produit

un sentiment d'impuissance extrêmement fort

in the chez le sujet qui a l'impression de ne

pas pouvoir se maîtriser.
Ce type de traumatisme, qui cause fréquemment des troubles alimentaires,
peut résulter
de conflits violents dans le milieu familial
dont
l'adolescent,
ou parfois l'enfant, a été témoin pendant une longue partie de sa vie sans pouvoir les nommer.
Ces conflits violents peuvent mener à un comportement réellement
violent qui risque de causer de graves dommages
ou même des pertes.
Ce type de traumatisme répétitif crée une situation
d'attente dramatique :
la personne s'attend à rencontrer une opposition
même si ce n'est
pas nécessairement le cas.
Néanmoins, le traumatisme est causé par une répétition si forte
et si fréquente que,
dans la vie ultérieure de la personne,
la peur qu'il suscitait peut réapparaitre
une fois le traumatisme disparu.
Dans certains cas, les gens ont tendance à répéter ce type de traumatisme.
Par exemple, une
jeune femme
qui toute sa vie a été témoin de disputes entre ses parents
causées par des infidélités,
risque de ne choisir, plus tard,
que des partenaires
susceptibles de reproduire les mêmes comportements infidèles.
Les trahisons passées la poussent à chercher une tricherie, qu'elle ait eu lieu ou non.
Ce type de comportement devient,
d'une certaine façon, la répétition d'une prédiction d'un événement négatif,
avec la crainte qu'il puisse se produire d'un moment à l'autre,

comme si le moment de l'enfance n'était jamais passé.

Le traumatisme de type II produit, entre autres,

une tendance au déni massif, un engourdissement affectif,

comme si la personne voulait réprimer ses sentiments émotionnels.

Elle aura tendance à se comporter comme si elle était « refroidie », comme si elle n'éprouvait

que ce seul et unique sentiment

à certains moments de sa vie.

C'est ce qu'on appelle l'engourdissement, qui est considéré comme

l'une des composantes de base

des troubles dissociatifs : un trouble qui fait perdre la capacité

de ressentir

des sensations normales,

comme si on avait perdu

des capacités sensorielles importantes,

ou comme si on était absent ou s'éclipsait

de la vie quotidienne à certains moments

de l'existence.

Cela s'accompagne,

surtout dans le cas de troubles alimentaires

(d'autant plus

s'il y a perte de contrôle,

anorexie restreinte ou anorexie avec comportements boulimiques ou boulimie),

d'une colère

cachée

et profonde.

Le sujet est passif,

semble incapable de réagir,

même si, lorsqu'il accomplit une action,

on perçoit en lui .

une forte colère

Les manifestations d'agression envers le monde extérieur

sont très contenues,

mais lorsque le sujet ressent des émotions fortes,

la colère peut devenir explicite

et se traduire par un comportement violent rs lui-même ou envers les autres.

Le sujet exprime une tristesse incessante - et non intermittente -

qui se stabilise,

comme s'il

avait connu un traumatisme de l'enfance qui s’est mis en pause constante,

nt de produire un sentiment de désespoir qui,

ava lui,

se prolonge toute la vie.

Ce sont, comme on dit, des petits traumatismes

qui s'accumulent. On les définit également

comme des traumatismes complexes ou relationnels, parce qu'ils dépendent

d'une série de relations mutuelles continues.

Il peut donc arriver que la personne qui a vécu ces traumatismes

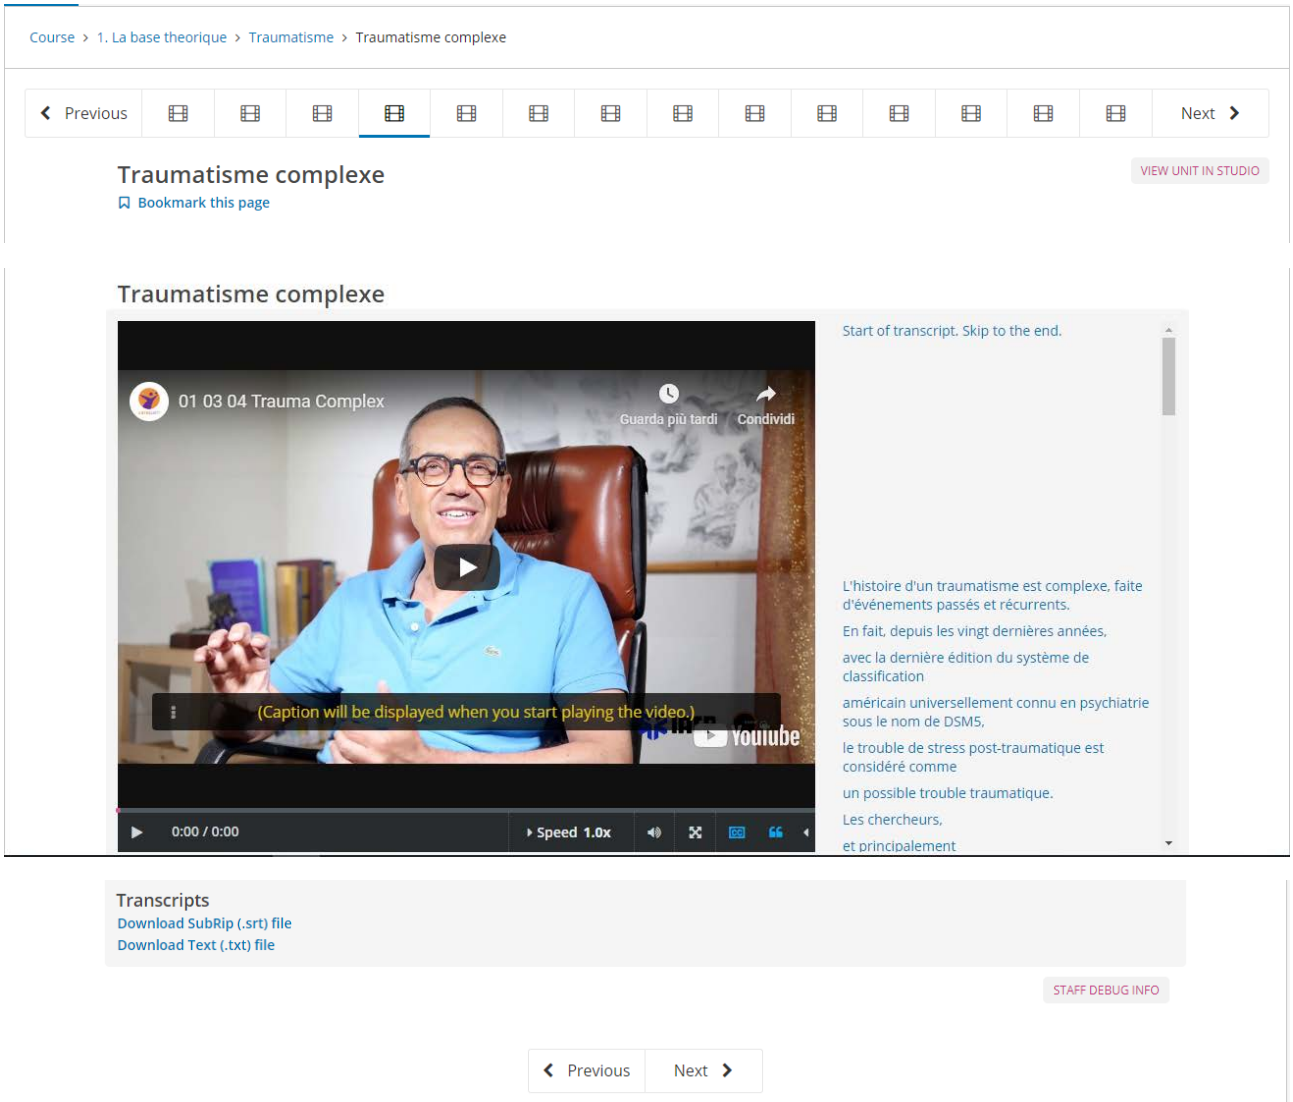
vive des moments fortement traumatisants dans son lieu de vie, et plus précisément

dans son environnement familial.

Il s'agit

donc de traumatismes constants qui réapparaissent et produisent les symptômes dissociatifs

mentionnés précédemment ou, en d’autres termes, une régulation émotionnelle.



Transcript

L'histoire d'un traumatisme est complexe, faite d'événements passés et récurrents.

En fait, depuis les vingt dernières années,

avec la dernière édition du système de classification

américain universellement connu en psychiatrie sous le nom de DSM5,

le trouble de stress post-traumatique est considéré comme

un possible trouble traumatique.

Les chercheurs,

et principalement

Van der Kolk, à la base

du questionnement sur les traumatismes complexes,

se sont tournés vers les traumatismes de l'enfance,

ceux qui se sont produits à un âge où le sujet se trouvait dans une

position de faiblesse,

d'infériorité -

comme le sont normalement les enfants.

Ce type de

situation traumatique, d'événements auxquels les enfants sont exposés,

d'un point de vue non seulement psychopathologique,

mais également neurobiologique, peuvent expliquer une prédisposition au développement de troubles psychiatriques

qui vont bien au-delà du syndrome de stress post-traumatique.

Ces

phénomènes

de

traumatismes de l'enfance

se présentent de diverses manière : ils peuvent être aigus,

prolongés et répétés pendant l'enfance

et assimilés à

des formes

de maltraitance lorsque les phénomènes traumatiques sont positifs.

Par exemple, lorsqu'un acte est commis contre l'enfant, comme des mauvais traitements,

de la violence sexuelle ou physique, ou de la violence psychologique.

Ils peuvent,

par ailleurs,

être omissifs, c'est-à-dire qu'ils peuvent être dus à une forme de négligence,

à une absence des soins tant psychologique se physiques

qu de l'enfant conduisant

à des événements

et des situations réelles de maltraitance.

Ainsi, la maltraitance et l'abus sont les phénomènes auxquels nous nous confrontons aujourd'hui

lorsque nous parlons de traumatismes complexes.

Le traumatisme complexe, ou traumatisme évolutif primaire comme certains l'appellent,

est souvent dû à l'échec

des

soignants primaires,

les parents

par exemple

ainsi qu'à un traumatisme cumulatif. Le psychanalyste Masud Khan s'occupe précisément 48 00:03:12,380 --> 00:03:19,080 de ce type de traumatisme, constitué d'un grand nombre de petits événements

ou de situations traumatiques omissives ou commissives, qui

se sont répétés pendant l'enfance et qui, cumulativement, créent un climat ou une dimension traumatiques

que le sujet ressentira pendant

sa vie adulte chaque fois qu'il rencontrera des difficultés,

des problèmes ou un autre traumatisme qui lui rappellera le traumatisme précédent.

Cependant, ce traumatisme antérieur est complexe et risque de se prolonger

sur une période très longue

et importante, voire sur toute une enfance.

Pensez aux familles qui vivent

dans un climat de

peur ou de violence prolongée en raison de nuisances ou de problèmes affectant les parents

et qui rendent impossible la sérénité,

le sentiment de sécurité

et de protection indispensable pour qu'un enfant puisse développer une confiance de base,

affronter la vie

et les relations

avec les autres de manière calme, ouverte et confiante.

Le phénomène peut passer inaperçu aux yeux du sujet, car presque toutes ces situations peuvent

être réprimées ou oubliées,

et

donc

se développer

de manière intérieure, sous-jacente,

jusqu'à ce que le sujet doive «régler la note ».

La raison en est que ces situations se révèlent subitement,

d'une manière parfois explosive,

sous l'effet d'un événement survenu dans l'environnement du sujet et qui,

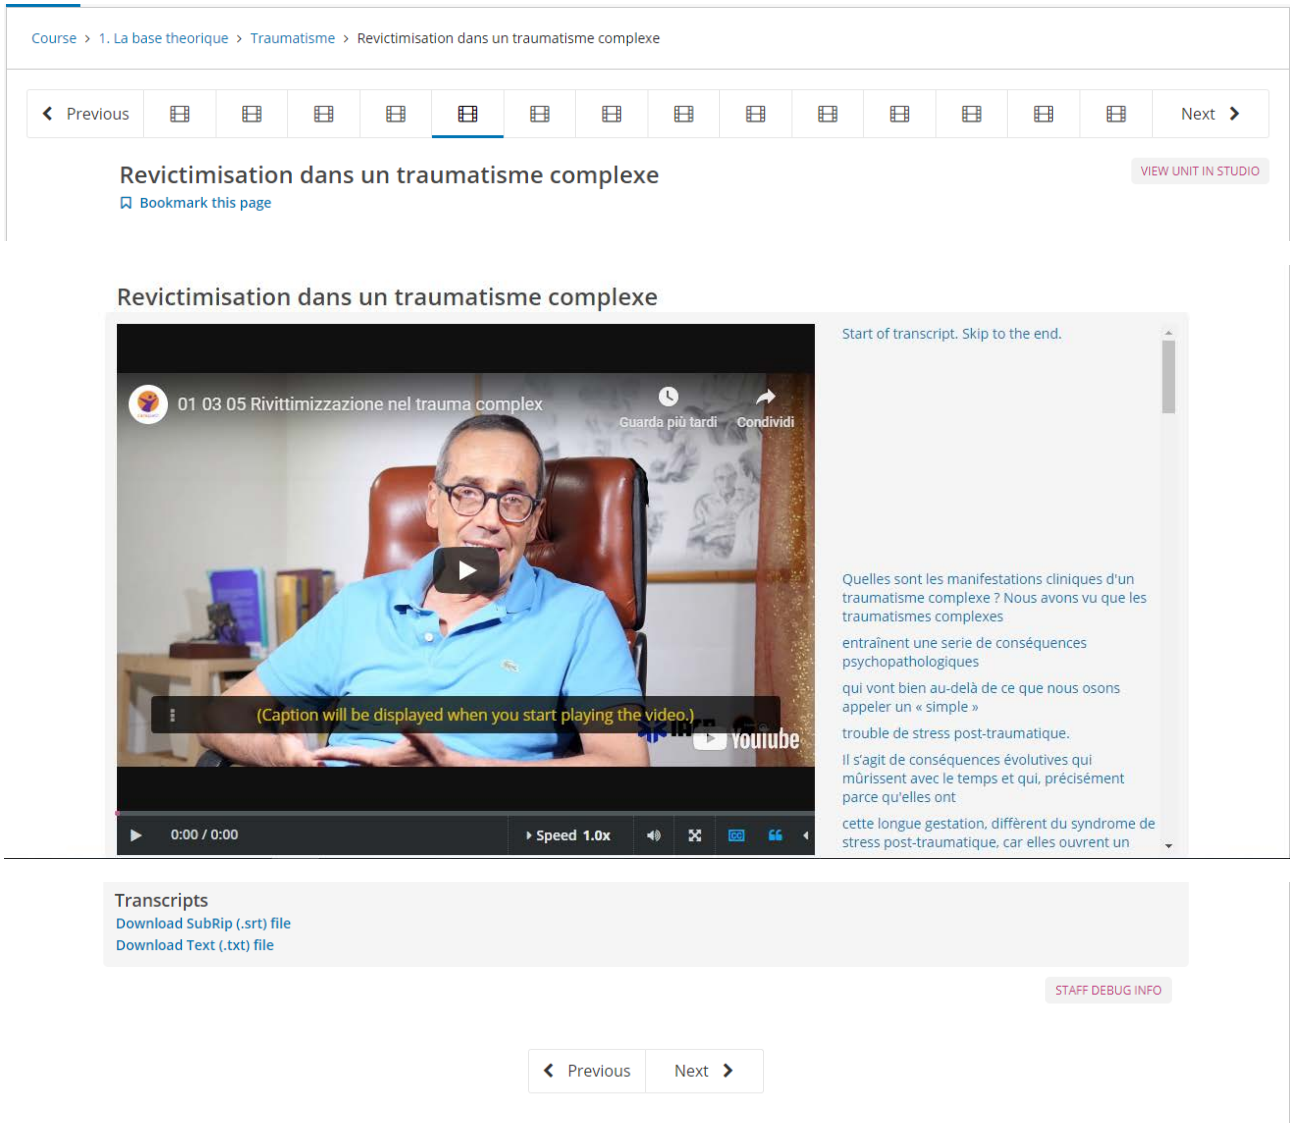
une fois celui-ci arrivé à l'âge adulte,

l’aide à déconstruire son climat émotionnel, contribuant à son

inconfort et rouvrant ainsi le scénario du traumatisme passé.

Il en va de cette manière parce que, comme nous l'avons déjà mentionné,

le traumatisme actuel peut attirer et rappeler le traumatisme passé, dans une sorte d'attraction fatale.



Transcript

Quelles sont les manifestations cliniques d'un traumatisme complexe ? Nous avons vu que les traumatismes complexes

entraînent une serie de conséquences psychopathologiques

qui vont bien au-delà de ce que nous osons appeler un « simple »

trouble de stress post-traumatique.

Il s'agit de conséquences évolutives qui mûrissent avec le temps et qui, précisément parce qu'elles ont

cette longue gestation, diffèrent du syndrome de stress post-traumatique, car elles ouvrent un éventail beaucoup

plus large de pathologies.

Commençons par les troubles

de la régulation affective,

de l'émotion

et

du comportement.

Il arrive donc souvent que les personnes,

quand elles ont été soumises à un traumatisme complexe,

développent une impulsivité qui n'est pas seulement

de caractère, mais d'un trouble, un trouble qui contrôle les impulsions. Elle peut

se manifester et

s'exprimer dans des comportements violents,

envers les autres et envers soi-même,

dans une consommation impulsive de substances

(toxicomanie ou alcoolisme).

Un autre aspect très important

est celui de l'autorégulation émotionnelle dans le sens

de l'estime de soi. Il s'agit de la possibilité pour un sujet d'établir

une confiance de base

en lui-même

et, partant, des éventuels sentiments de culpabilité que,

de façon plus ou moins latente, il porte en lui depuis l'enfance. N'oublions pas

qu'un enfant soumis à des abus, sexuels ou autres, se sent souvent coupable d'avoir fait

quelque chose de sale et ne pourra donc pas attribuer correctement

a responsabilité de ce qui est arrivé à l'adulte, auteur de l'abus.

Ces sentiments de culpabilité peuvent se développer,

se prolonger et déboucher sur une forme dépressive de vulnérabilité.

La dépression peut ainsi être l'une des conséquences

d'un traumatisme complexe à l'âge adulte.

Parmi les autres conséquences,

citons les troubles psychosomatiques ; en effet les conséquences d'un traumatisme peuvent également se manifester sur le plan

physique : réactivité physiologique, hyperréactivité physiologique, conséquences sur le système

cardiovasculaire (phénomènes cardiotoniques, hypertensifs), problèmes

de régulation de la douleur et de son seuil

(diffusion de la douleur dans le corps),

hypersensibilité à des stimuli douloureux
et divers troubles sexuels,
qui
d'un point de vue psychosomatique, sont liés à des troubles du contrôle
des impulsions pouvant déboucher sur des formes de perversion et donc
des pertes de contrôle des impulsions sexuelles.
Enfin, nous constatons des troubles dissociatifs,
par exemple la dépersonnalisation et la déréalisation, des phénomènes aujourd'hui reconnus
ec une certaine difficulté intuitive, qui se manifestent par un sentiment d'extranéit
avé que le sujet ressent face à la réalité et face à lui-même.
Il s'agit
de mécanismes de défense contre
une réalité que le sujet ressent comme intolérable,
qu'il ne peut pas ressentir
comme revivifiée, la dissociation permettant de s'en éloigner.
Freud a mis en évidence
le mécanisme fondamental
de la compulsion de répétition, par lequel un sujet tente de retrouver le traumatisme,
non pas tant pour
en subir
à nouveau les effets négatifs, mais plutôt pour tenter de le surmonter.
Cette tentative de surmonter le traumatisme fait que certains comportements du sujet
le conduisent
à revivre des situations données : le cas classique est celui de l'enfant,
victime d'un agresseur, qui peut répéter l’agression, une fois à l'âge adulte,
tantôt dans le rôle
de l’agresseur, tantôt dans celui de l’agressé.
L'adulte peut tenter de se re-légitimer,
en créant une situation où
il revit en tant que victime l’acte
d’un autre,
ou il peut

adopter un comportement qui fait de lui

l'auteur d'une agression.

Cela pourrait survenir, par exemple,

dans des situations de violence sexuelle subies dans l'enfance et susceptibles

de se reproduire avec une plus grande fréquence à l'âge adulte ou à l'adolescence,

soit une situation qui se reproduit.

Prenons l'exemple d'un viol,

une violence sexuelle

à l'encontre d'une femme

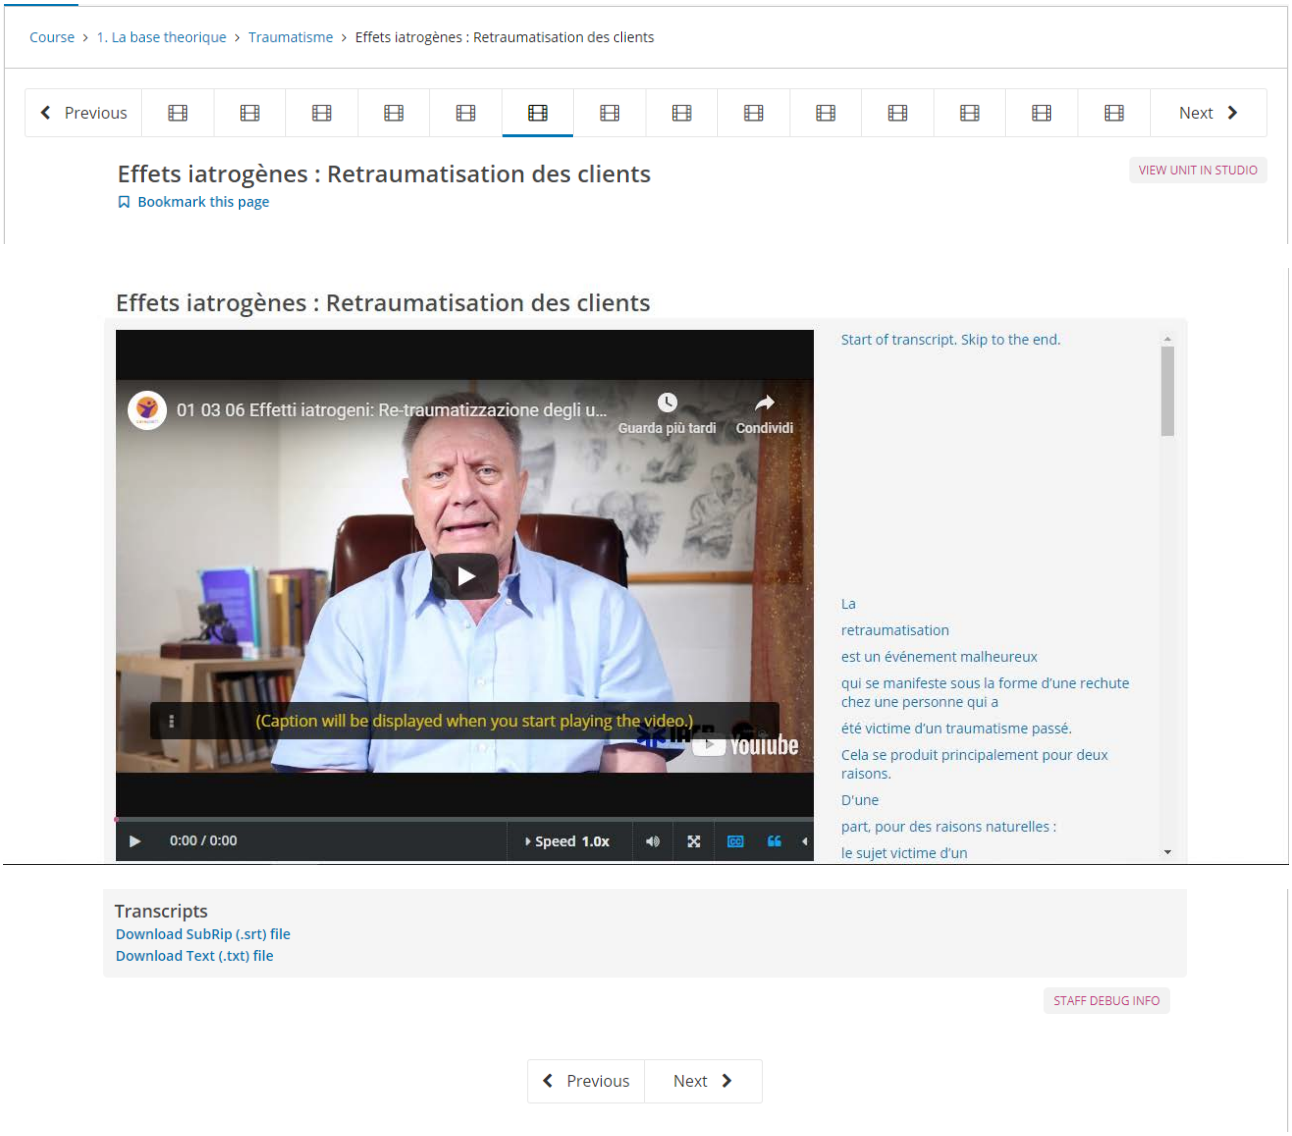
qui peut être vécue

à la première personne (en tant que bourreau)

ou recréée en tant que victime,

soit une situation qui fait revivre le traumatisme,

dans chacun des rôles pour essayer de le surmonter, dans ce que Freud appelle la « compulsion de répétition ».



Transcript

La

retraumatisation

est un événement malheureux

qui se manifeste sous la forme d'une rechute chez une personne qui a

été victime d'un traumatisme passé.

Cela se produit principalement pour deux raisons.

D'une

part, pour des raisons naturelles :

le sujet victime d'un

traumatisme passé

est exposé

à des images ou des événements
qui causent un traumatisme chez d’autres,
et revit le traumatisme vécu.
Autre
raison :
une
forme
de retraumatisation 20 00:00:58,840 --> 00:00:59,340 dont
les
origines sont iatrogènes.
traitements ont
été dispensés
de manière dysfonctionnelle,
pas nécessairement
en raison
des mauvaises intentions des professionnels
ou des administrateurs
de l'établissement de soins,
mais par simple ignorance,
de sorte qu'au lieu de recevoir l’aide souhaitée,
le sujet
traumatisé
subit un
nouveau traumatisme.
En bref,
cela s’assimile
au cas d’une personne
arrivant
aux urgences avec une jambe cassée,
qui tombe de la civière,
par la faute
d’une mauvaise manipulation par les soignants.

Le sujet se retrouve alors avec deux jambes cassées, doublant ainsi les dommages ;

une véritable tragédie.

L'histoire et la sociologie

des traitements

de traumatismes

révèlent que, malheureusement,

il n'était pas rare dans le passé –

non pas en raison d'une mauvaise volonté, mais par ignorance -

de produire

des

résultats iatrogènes.

Puisque les traitements

touchent le système complexe et délicat qu'est l'être humain,

le secteur des soins peut non seulement avoir un impact positif sur les patients, mais également – et sans le vouloir – risque de leur causer des dommages supplémentaires ;

cela est vrai pour les médicaments, pour les interventions chirurgicales

et pour tout type de relation d'aide. Un service, s'il n'est pas fourni de manière

efficace, peut

s'avérer

contre-productif.

Dans le cas spécifique d'un traumatisme, ce risque est particulièrement grave, car la victime d'un traumatisme sera ,

de facto,

plus sensible

et risque donc d'être considérablement « abîmée » par le second traumatisme.

Aujourd'hui, nous avons tiré

les enseignements des erreurs du passé, les recherches

sont non seulement

plus nombreuses,

mais également plus précises, et nous avons développé un corpus suffisant (et non encore épuisé)

de connaissances qui nous permettent de réduire le risque de

« retraumatiser » des personnes déjà traumatisées,

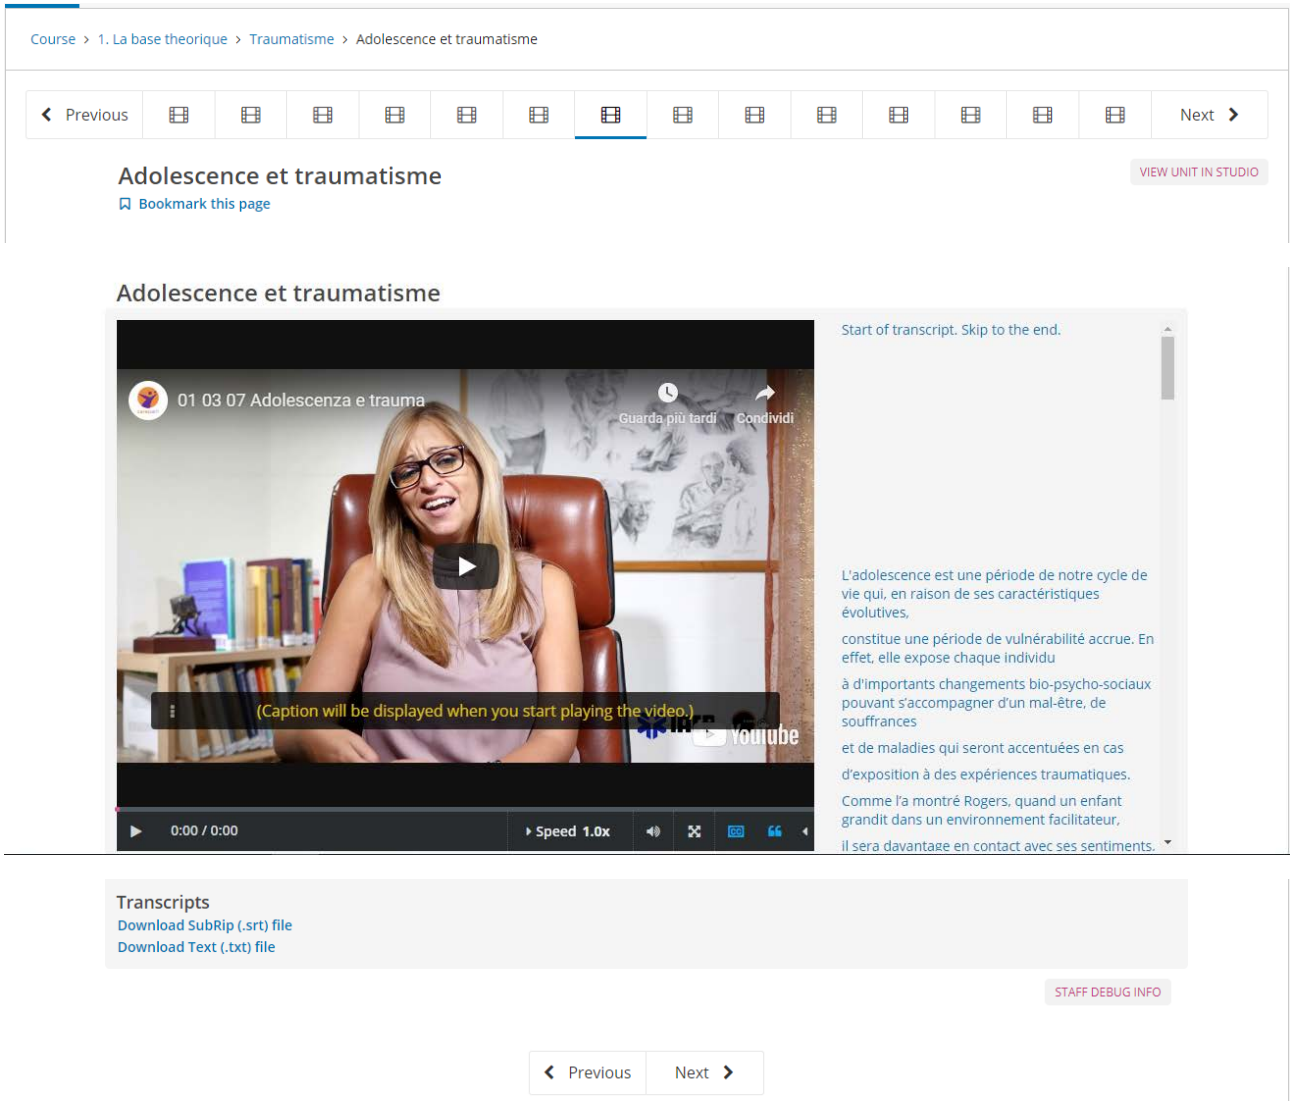
grâce à ce qu’on appelle des

« pratiques sensibles au traumatisme »,

centrées sur la personne de l'usager traumatisé

et

attentive aux causes éventuelles de dommages supplémentaires.



L'adolescence est une période de notre cycle de vie qui, en raison de ses caractéristiques évolutives,

constitue une période de vulnérabilité accrue. En effet, elle expose chaque individu

à d'importants changements bio-psycho-sociaux pouvant s'accompagner d'un mal-être, de souffrances

et de maladies qui seront accentuées en cas

d'exposition à des expériences traumatiques.

Comme l'a montré Rogers, quand un enfant grandit dans un environnement facilitateur,

il sera davantage en contact avec ses sentiments, sans risque de bloquer ni de figer les expériences traumatisantes,

et il pourra avancer dans la vie, en satisfaisant ses besoins et

en évaluant les expériences comme agréables ou désagréables

selon qu'elles seront favorables ou défavorables à son propre développement.

Rogers appelle cette capacité innée d'autorégulation la tendance actualisante, soit la capacité de se comprendre, de s'autoréguler et de s'actualiser.

Si, au contraire, l'enfant vit dans un environnement où il ne sentira accepté par les personnes qui s'occupent de lui uniquement

si lui-même est en mesure de répondre à leurs attentes,

il risque une introjection de ces attentes,

d'amputer de force une partie de son propre soi

et de construire un soi idéal avec des constructions rigides.

Des constructions qui seront encore plus rigides si

elles se construisent sur un sentiment constant d'ambiguïté, de menaces et de peur, si l'enfant grandit dans

un environnement imprévisible.

Nous constatons que notre adolescent, qui grandit et se nourrit dans son contexte relationnel,

est ainsi exposé aux changements évolutifs mentionnés plus haut.

Toutes ces modifications de déterminants imposent une sorte de réorganisation interne,

un réajustement qui implique l'image individuelle de lui-même et de ses relations les plus importantes...

Tout cela exige donc une redéfinition du sens de sa propre identité.

Voyons quels sont les changements auxquels l'adolescent est confronté.

Le premier touche son corps : le corps de l'adolescent est un corps en évolution, avec

une croissance en taille, l'apparition d'organes sexuels secondaires,

d'organes reproducteurs. Il s'agit donc d'un corps qui nécessite un nouveau type de relation avec lui-même.

Le corps devient un véhicule primaire et intermédiaire par

lequel l'adolescent communique ses expériences vers l'extérieur.

Un corps, dès lors, que vous pouvez choisir d'entretenir et d'embellir,

mais également de gratter, de couper ou d'ignorer

; un corps qui veut que l'on parle de lui.

En même temps, c'est un corps qui est vu de l'extérieur, qui capte le regard des autres,

avec désir ou dérision, et qui expose l'adolescent à de nouvelles expériences,

à de nouvelles opportunités, mais également à de nouveaux risques.

Ensuite, viennent des changements au niveau interpersonnel.

Au sein de la famille, on demande à l'adolescent de passer de la dépendance - la phase de soins et d'attachement

- à l'autonomie et à la recherche d'un équilibre entre ces deux axes

évolutifs apparemment opposés, avec les répercussions sociales que cela induit. En effet, dans l'environnement extérieur,

le rôle de l'adolescent au sein de son groupe de pairs et d'autres figures relationnelles significatives, change

Comme l'ont montré les dernières recherches, des changements se produisent également au niveau du cerveau

Celui-ci subit des modifications,

à la fois structurelles et fonctionnelles, notamment

dans les zones corticales qui participent aux processus de décision.

Tout cela entraîne une grande vulnérabilité qui, comme nous l'avons déjà mentionné, est encore plus aigüe

si le sujet subit des traumatismes ou compromet

ce sentiment de sécurité interne, la base de sécurité décrite par Bowlby.

toujours réciproquer, mais qui nous permet donc de vivre cette précieuse expérience

ddu développement de l'autonomie sans perte de l'amour. Au lieu de cela, nous nous enrichissons par les rencontres que 58 00:04:38,190 --> 00:04:39,500 nous entretenons avec d'autres.

Par contre, la victime d'un traumatisme a une faible capacité de mentalisation et n'est pas

capable d'auto-réguler ses états émotionnels ; comme nous le dit Bromberg,

elle ne peut rien faire pour isoler l'expérience traumatique et toutes les expériences et tous les contenus

qui lui sont associés, en la dissociant. La dissociation pathologique - comme l'illustre Caretti - conduit

à l'épuisement du sujet et de ses ressources, car elle l'empêche de reconstruire

ces expériences traumatiques dans un récit qui serait cohérent avec sa propre histoire de vie.

Pour cette raison, si

nous travaillons avec des adolescents en situation

de stress émotionnel, nous pouvons travailler avec eux à une profondeur relationnelle importante,

en leur offrant des relations profondes, basées sur l'écoute,

une écoute empathique, avec un profond respect pour ce qu'ils sont. Essayer de comprendre

les expériences de leur point de vue, essayer de saisir le sens de ce qu'ils vivent et, par conséquent,

offrir des contextes relationnels dans lesquels les adolescents peuvent,

lentement, rétablir le contact avec ces parties d'eux-mêmes - ces besoins qui leur ont été refusés jusqu'alors.

Non seulement en leur permettant de les ressentir à nouveau, mais également en les aidant à reconnecter des parties d'eux-mêmes

aux expériences extérieures qu'ils vivaient auparavant comme excessivement dissonantes.

Nous y parviendrons en proposant aux adolescents un contexte relationnel qui pose

un regard différent sur eux. Pas uniquement un regard qui nous amène à les étiqueter

comme des garçons ou des filles en révolution perpétuelle et en lutte avec le monde extérieur, ou comme des figures apathiques réveillées

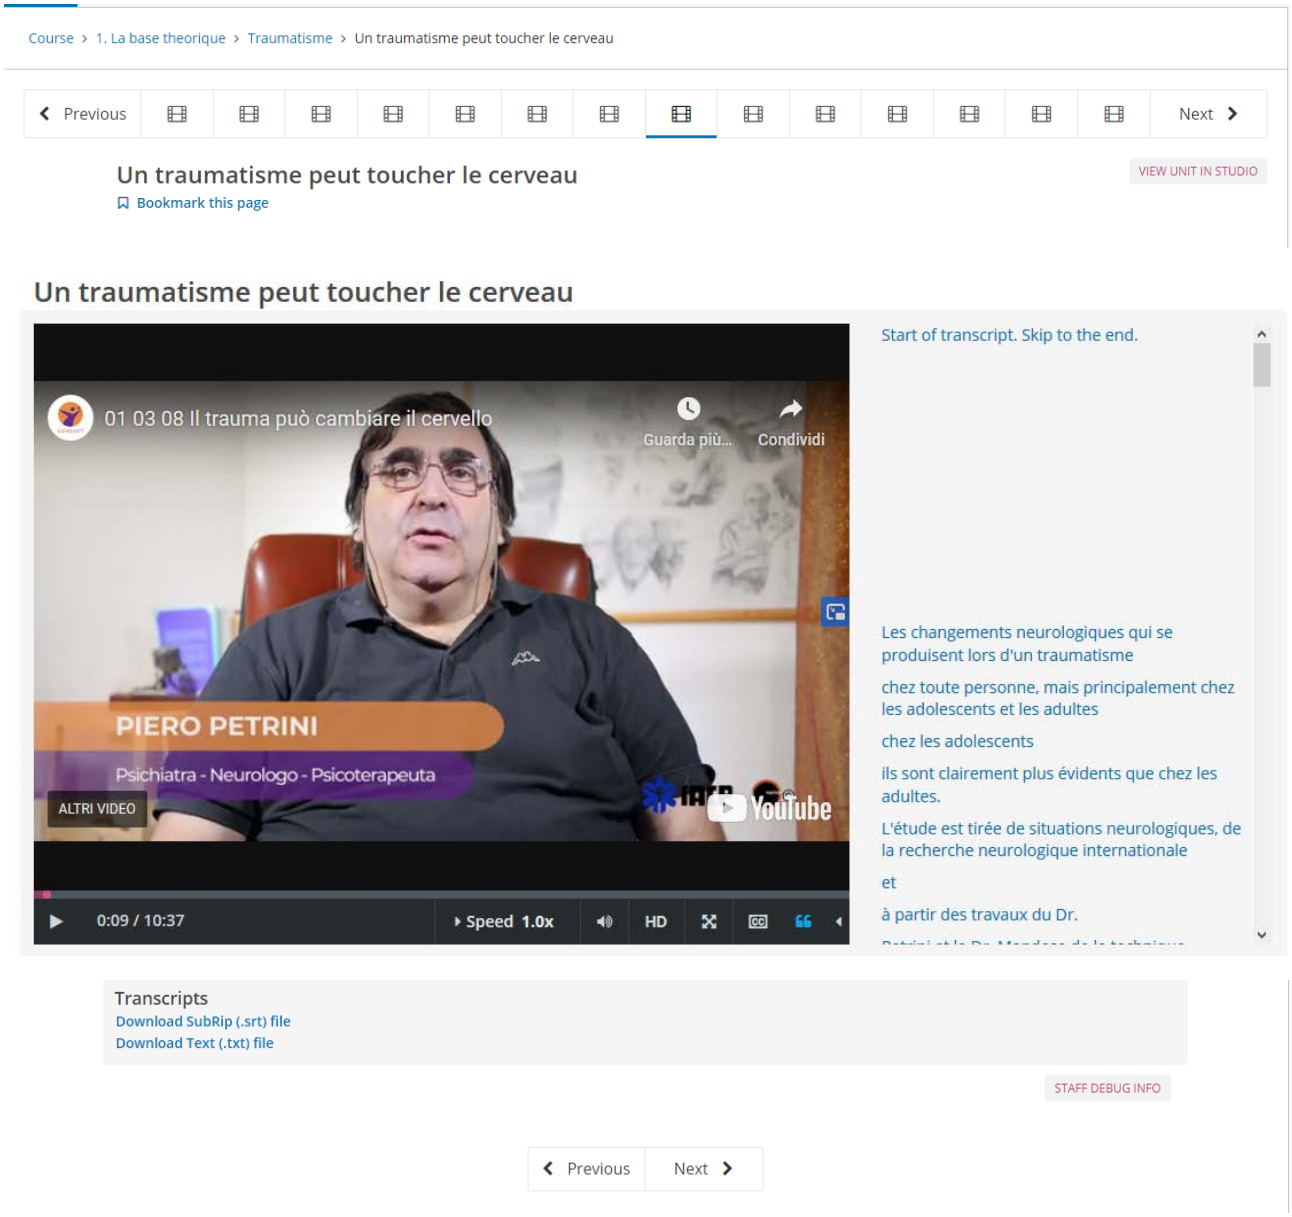
uniquement par l'univers du réseau social, mais plutôt un regard qui les voit comme des enfants dotés de caractéristiques

et d'outils typiques à leurs phases d'évolution, qui se déplacent dans le monde,

posent des questions, apportent des réponses, explorent, essaient de donner un sens personnel à leurs expériences.

A l'image de ce que nous faisons lorsque nous continuons à agir comme des adultes pour le reste de notre vie ;

l'affection que nous leur portons est donc très importante.



Transcript

Les changements neurologiques qui se produisent lors d'un traumatisme

chez toute personne, mais principalement chez les adolescents et les adultes

chez les adolescents

ils sont clairement plus évidents que chez les adultes.

L'étude est tirée de situations neurologiques, de la recherche neurologique internationale

et

à partir des travaux du Dr.

Petrini et le Dr. Mandese de la technique - processus psychanalytique mutatif :

une technique qui a clairement

les parties psychanalytiques et neurologiques, en

accord

avec les conclusions de

la recherche neurologique internationale et la relation entre la neurologie et la psychanalyse.

Il est bien connu que tout individu en bonne santé

l'état développe 1400 nouveaux neurones

à partir de cellules souches oestrogéniques

au quotidien, tant au niveau de l'hippocampe

et au niveau olfactif.

C'est un aspect important car l'hippocampe est la partie centrale de la mémoire,

l'organisme

qui rappelle des situations similaires, donc dans des situations de traumatisme.

Lors de la

niveau olfactif

nous observons nos lobes cérébraux

ne sont rien d'autre que

un exutoire de notre lobe olfactif

les animaux travaillent avec l'odorat

nous travaillons avec la pensée

donc la pensée de l'être humain

rien d'autre que l'olfactif

qui s'est répandu s'est développé dans ces

les cellules du cerveau

Nous pensons que les êtres humains ont environ 30.000 gènes, trop peu pour définir toutes les situations,

pour que les situations familiales, sentimentales, relationnelles, culturelles et religieuses entrent en jeu

La recherche montre que seulement 70% des gènes sont déterminés génétiquement

et seulement 30 % sont touchés par des facteurs externes.

La différence entre les gènes

entre un petit homme et un bonobo masculin est de 5%,

Toutefois, cette

Le pourcentage est très important. Un homme et un bonobo ne sont pas du tout comparables.

comparable, tout au plus. Pour les humains,

la culture, la religion, toutes les situations extérieures, la famille, la communauté

dans lequel nous vivons, sont très importants pour la formation d'un individu.

Ce qui se passe

quand le stress se produit ?

Comme nous l'avons vu, une situation stressante ou négligente est comme un stress

ne fait rien d'autre que de bloquer l'activité des cellules souches au niveau de l'hippocampe

et il devient donc impossible de remplacer les neurones qui sont normalement perdus ;

donc là

est une perte de neurones

dans la partie la plus importante et la plus profonde du cerveau qui est l'hippocampe

La régulation cognitive des émotions qui accompagne et soutient ces

changements dans le cerveau

est caractérisé

par l'anxiété et la dépression

en rapport avec

à l'amygdale :

un petit groupe de noyaux à l'intérieur du cerveau qui supporte

toutes nos situations émotionnelles et affectives,

de l'amour, à la sexualité, à l'alimentation,

qui est important d'un point de vue émotionnel.

Une altération se produit dans le cortex préfrontal, qui sont ceux qui orientent nos objectifs :

si je décide d'aller au théâtre pour voir un acteur, c'est le cortex préfrontal

qui me pousse à faire cette action, puis le cortex frontal la réalise.

Mais le cortex préfrontal donne également des impulsions, par exemple lorsque j'ai l'impulsion de partir ou de rester

à un endroit, je dois au cortex préfrontal le fait que le frontal réagit et communique

la nécessité de rester, par exemple en raison d'un engagement.

La troisième partie qui sera endommagée est

l'hippocampe et la mémoire (comme nous l'avons déjà dit,

l'hippocampe est le siège de la mémoire).

Des études longitudinales

ont montré que les traumatismes ne s'expriment pas à travers un trouble

de DSM -5 ou ICD - 10 qui est appelé trouble de stress post-traumatique,

mais est transmis

par des symptômes d'anxiété et de dépression,

parfois une hallucination, mais elle est mise en évidence

par des changements dans le sens du moi dans les relations interpersonnelles.

Une personne qui a subi un traumatisme

a des limitations comportementales et mentales,

est que la personne semble incapable

pour exprimer

elle-même dans le monde du travail,

d'affections

les relations, - c'est

comme s'il était tombé à un niveau de fonctionnement inférieur

Il s'agit de

Cela est dû à l'axe HPA - axe hypothalamo-hypophyso-surrénalien.

Au niveau du cerveau, il existe une glande appelée

l'hypophyse,

que toutes les hormones

de notre corps rayonnent.

Le lien entre les parties hormonales (endocriniennes)

et la partie nerveuse

est donné par le

hypothalamique -

l'axe pituitaire.

Tout ce qui atteint l'hypothalamus - une zone d'importance centrale, presque

un petit cerveau

est transmise à l'hypophyse et donne lieu

aux sensations, c'est-à-dire que le signal nerveux est transmis avec des substances hormonales.

Ces substances hormonales

se ramifient sur tout le corps,

de la glande pituitaire,

et le contrôle

la thyroïde

la sexualité par les glandes génitales, chez l'homme

et la sexualité féminine avec l'hormone mâle (qui détermine également la sexualité féminine).

Alors, surtout,

la libération de corticotrophine : l'hormone du stress, ou plutôt la pré-hormone du stress car la véritable hormone du stress est l'ACTH

parce que la véritable hormone du stress est l'ACTH, le cortisol,

C'est pourquoi la cortisone est administrée pour aider le corps à réagir en cas de dysfonctionnement physique,

Le cortisol possède en fait les mêmes éléments que la cortine (POMC).

Même dans le cas de batailles et de guerres, l'organisme humain est préparé, en fait le cortisol - ACTH

pour être précis - provoque la douleur

de ne pas être ressentie et donne lieu à des mécanismes d'agression (comme cela se produit chez les animaux).

Une situation d'agression claire

Lorsque ce mécanisme d'activité

est répétée

elle devient des états chroniques et prolongés d'anxiété et d'angoisse

se produire

en fonction de l'amygdale susmentionnée.

L'amygdale

est la commode

de notre mémoire émotionnelle, en ce sens qu'elle préserve tout

nos souvenirs émotionnels, comme s'il s'agissait d'une caméra de la réalité émotionnelle.

Ainsi, par exemple, notre premier baiser, notre premier travail, notre première sensation de bien-être

la première victoire sportive - ils sont tous photographiés dans l'amygdale et réapparaissent lorsque

des situations similaires se présentent ; lorsque l'hippocampe

commence

pour sécréter du cortisol

Ce cortisol se lie aux récepteurs de l'hippocampe, de l'amygdale et de la zone préfrontale

et lorsqu'elle a atteint un niveau suffisant, si la situation n'est pas chronique,

il abaisse le taux d'ACTH et de CRF.

Ainsi, l'hippocampe régule nos réponses

pour souligner

Quand

nous sommes bien la sérotonine gère la zone à la place - la sérotonine est l'hormone

de bonheur, lorsqu'une personne est déprimée,

des médicaments sérotoninergiques sont prescrits.

Sérotonine

inhibe les comportements agressifs et favorise la socialisation.

Il est produit à partir du tryptophane et est introduit dans l'alimentation.

La sérotonine, avec l'ocytocine, qui est l'hormone de liaison, est la plus positive

et hormone utile pour l'organisme, en ce sens que si la sérotonine stimule la socialité

et la relation avec les autres,

Ocytocine - libérée après 5 secondes d'étreinte d'une autre personne

est l'hormone

qui stimule le lien.

La recherche met en évidence que les activités d'amour,

les pensées et les sentiments importants ont

des effets thérapeutiques profonds sur notre corps.

Alors

Il existe sans aucun doute,

dans notre façon d'être

une série de réactions qui changent le cerveau et modifient le corps,

dans toute situation où il existe des hormones liées aux neurohormones

et liés à des stimuli nerveux.

Avant de parler d'enfants

victimes de violence subie, définissons ce

qu'est la violence subie au sein de la famille.

Nous parlons de violence subie quand un enfant subit toute forme

de maltraitance

(actes de violence physique, verbale, psychologique,

sexuelle et financière perpétrés envers un proche, quelqu'un à qui vous êtes attaché affectivement,

que ce soit un adulte ou un mineur).

Ce type de violence englobe la violence infligée par des mineurs à d'autres mineurs,

mais également par des membres de la famille envers des animaux domestiques ; il s'agit

d'expériences très traumatisantes pour les enfants.

Les caractéristiques de ces expériences peuvent varier.

La violence peut être indirecte : elle est ressentie,

ce qui signifie qu'elle peut être vue, mais également entendue.

C'est un aspect important, car de nombreuses femmes victimes de violence signalent que,

lorsque l'acte violent survient, leurs enfants se trouvent parfois dans une autre pièce;

on parle tout de même ici de violence directe, même si l'enfant ne fait qu'entendre l'acte violent, sans le voir.

L'expérience peut être indirecte,

lorsque l'enfant est conscient que l'acte violent

a déjà eu lieu ou est sur le point de se produire ; dans ce cas, on pourrait dire que les enfants possèdent des « antennes » :

ils comprennent lorsque règne dans la maison

la tension caractéristique et précurseur d'un épisode de violence.

Parfois, si l'expérience n'est vécue ni directement ni indirectement,

l'enfant en ressent les effets ; par exemple,

il voit des hématomes

sur la peau de sa mère ou sent un vent de violence dans la maison.

Dans de telles situations, on parle de violence dont l'enfant a été le témoin (witnessed violence).

Des fausses croyances circulent à propos de la violence dont l'enfant est le témoin.

Il n'est pas imperméables à la violence qui se produit au sein de leur propre famille ;

même s'il n'assiste pas à l'acte violent, il prend conscience de sa réalité,

l'enfant n'étant jamais un spectateur passif et inconscient.

Cette forme de violence augmente le risque de violence directe à l'encontre des enfants.

L'enfant, qui s'interpose pour défendre sa mère, risque de recevoir

des coups de la part du père : dans ce cas,

le Dr. Annibali applique l'approche genrée

lorsqu'elle aborde la violence dont l'enfant est le témoin, puisque, dans la plupart des cas,

la violence est exercée par les hommes à l'encontre des femmes.

Cela n'exclut en rien la violence

des mères à l'encontre des pères, ou du moins d'une femme

à l'encontre d'un homme, mais d'un point de vue statistique, celle-ci est moins fréquente.

Les enfants exposés à la violence courent cinq fois plus de risques de devenir violents à l'âge adulte que les enfants qui n'ont pas été témoins de violence.

Les conséquences de la violence dont l'enfant

est le témoin sont :

un sentiment de peur, d'anxiété, de surcharge, de tristesse,

de dépression grave, des sentiments de colère, de culpabilité, d'inaptitude et de honte.

Les enfants perdent confiance en eux et dans les autres, ils peuvent développer

des troubles psychosomatiques,

des difficultés à contrôler leurs impulsions, des problèmes scolaires,

des troubles de l'apprentissage et du langage,

une perte de maîtrise intestinale, des difficultés relationnelles

et un syndrome de stress post-traumatique

disosi l'expérience traumatisante se produit dans le cadre d'une relation de confiance, comme le cadre familial.

Au niveau bio-psychosocial,

quand l'enfant est témoin de violence, les conséquences se

manifestent dans les comportements, les émotions, les capacités cognitives, sur sa condition physique, mais également dans ses relations.

L'enfant vit un bouleversement total, la violence devient normale et en conséquence,

La normalité, c'est la violence.

and consequently normality is violence

Soit, l'enfant va considérer le comportement violent comme

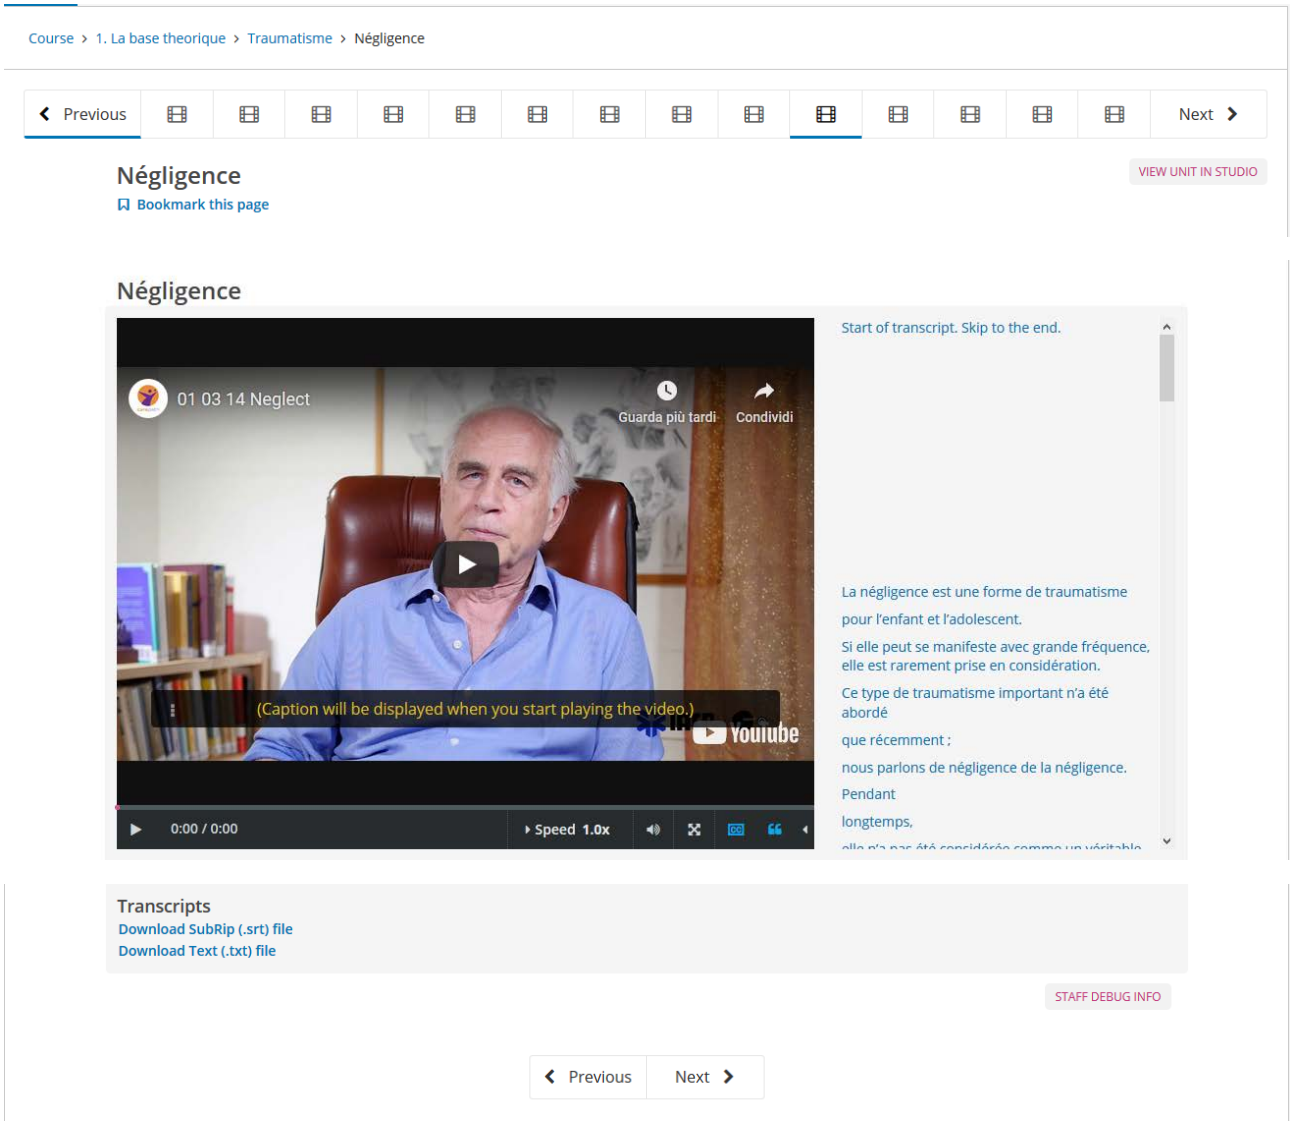
normal et physiologique,

it il va atténuer le côté dramatique de l'expérience au risque de probablement répéter

ces mêmes comportements.

Nous devons donc mettre l'accent sur la violence dont l'enfant est le témoin,

et sur son impact présent et futur.



Transcript

La négligence est une forme de traumatisme

pour l'enfant et l'adolescent.

Si elle peut se manifeste avec grande fréquence, elle est rarement prise en considération.

Ce type de traumatisme important n'a été abordé

que récemment ;

nous parlons de négligence de la négligence.

Pendant

longtemps,

elle n'a pas été considérée comme un véritable traumatisme,

mais au mieux comme une partie congrue dans la typologie des traumatismes existants.

En réalité, nous pensons aujourd'hui qu'il s'agit du traumatisme le plus répandu

et celui qui a les conséquences les plus graves sur le long terme.

Par « négligence », on entend l'adoption de comportements d'omission
de la part des personnes susceptibles d'offrir des soins.
Ces omissions désignent, même
s'il n'y a pas de risque grave et imminent de préjudice,
une série de manquements qui s'étirent sur une longue période de temps.
Ils peuvent, par exemple, accompagner un traumatisme de type I.
Il est probable
qu'un abus susceptible d'être bien
ou suffisamment toléré,
le sera moins
e l'absence d'un parent capable
de comprendre
et d'aider, de soutenir et de protéger
l'enfant victime du traumatisme.
En conséquence, si la négligence peut accompagner un traumatisme de type I,
elle peut également être la cause d'un véritable dommage.
Il existe plusieurs types de négligence,
dans les soins de santé,
l'éducation, l'accueil de l'enfant,
la protection face aux risques environnementaux,
les besoins physiques, le soutien affectif qui
vient principalement de la famille ou,
du moins, des personnes qui s'occupent de l'enfant.
Si on peut accorder moins d'importance
à ce type de négligence,
dans les faits,
il inculque chez la personne concernée le sentiment de ne pas être protégée
et donc de vivre dans un environnement hostile où elle ne jouit d'aucune garantie de sécurité.
Concernant
les types de négligence,
affective ou physique,
on distingue deux aspects totalement opposés.

Dans certains cas, l'émotion est négligée quand nous sommes confrontés

à des personnes responsables froides,

détachées et peu impliquées.

Par contre, la négligence physique

peut se limiter aux aspects purement matériels,

les besoins fondamentaux,

ou s'étendre aux besoins éducatifs de l'enfant,

qui peut ne pas recevoir de ses parents

les informations nécessaires

dans un contexte relationnel.

On parle également de négligence médicale

quand les personnes responsables de l'enfant omettent de soigner une maladie,

quand celle-ci s'aggrave

et devient particulièrement dangereuse ou néfaste.

Il y a également négligence

morale quand on n'éduque

pas l'enfant aux aspects éthiques

et moraux des comportements.

Alors que ces types de négligence peuvent peser sur la santé publique, ses conséquences

ont été longtemps minimisées.

De nos jours,

nous sommes conscients

qu'une longue exposition

à la négligence peut non seulement causer des maladies,

telles que les troubles de l'alimentation,

mais également une diminution de la quantité de matière grise dans le cortex.

En conséquence, les victimes présentent

des capacités cognitives très inférieures

à celles des sujets normaux.

Ainsi, les données montrent combien il est important de traiter la négligence et d'essayer de stabiliser le contexte familial et individuel.

Il s'agit d'offrir des soins ainsi que

l’attention qui suscite

un sentiment

de sécurité chez l’individu et le sentiment d’être protégé et compris.

Pour conclure cet aperçu des troubles traités, des troubles alimentaires jusqu’à la négligence,

soulignions la fréquence des troubles de négligence chez les personnes susceptibles de développer un régime alimentaire déséquilibré et,

in fine, de perdre totalement le contrôle de leur alimentation.

Il est nécessaire d’envisager une relation thérapeutique qui accorde une attention particulière à la personne

– un intérêt sincère pour elle grâce à

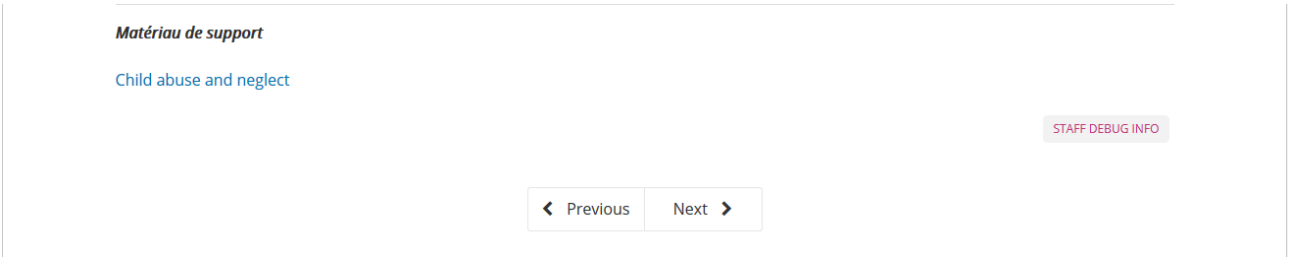
une attitude empathique

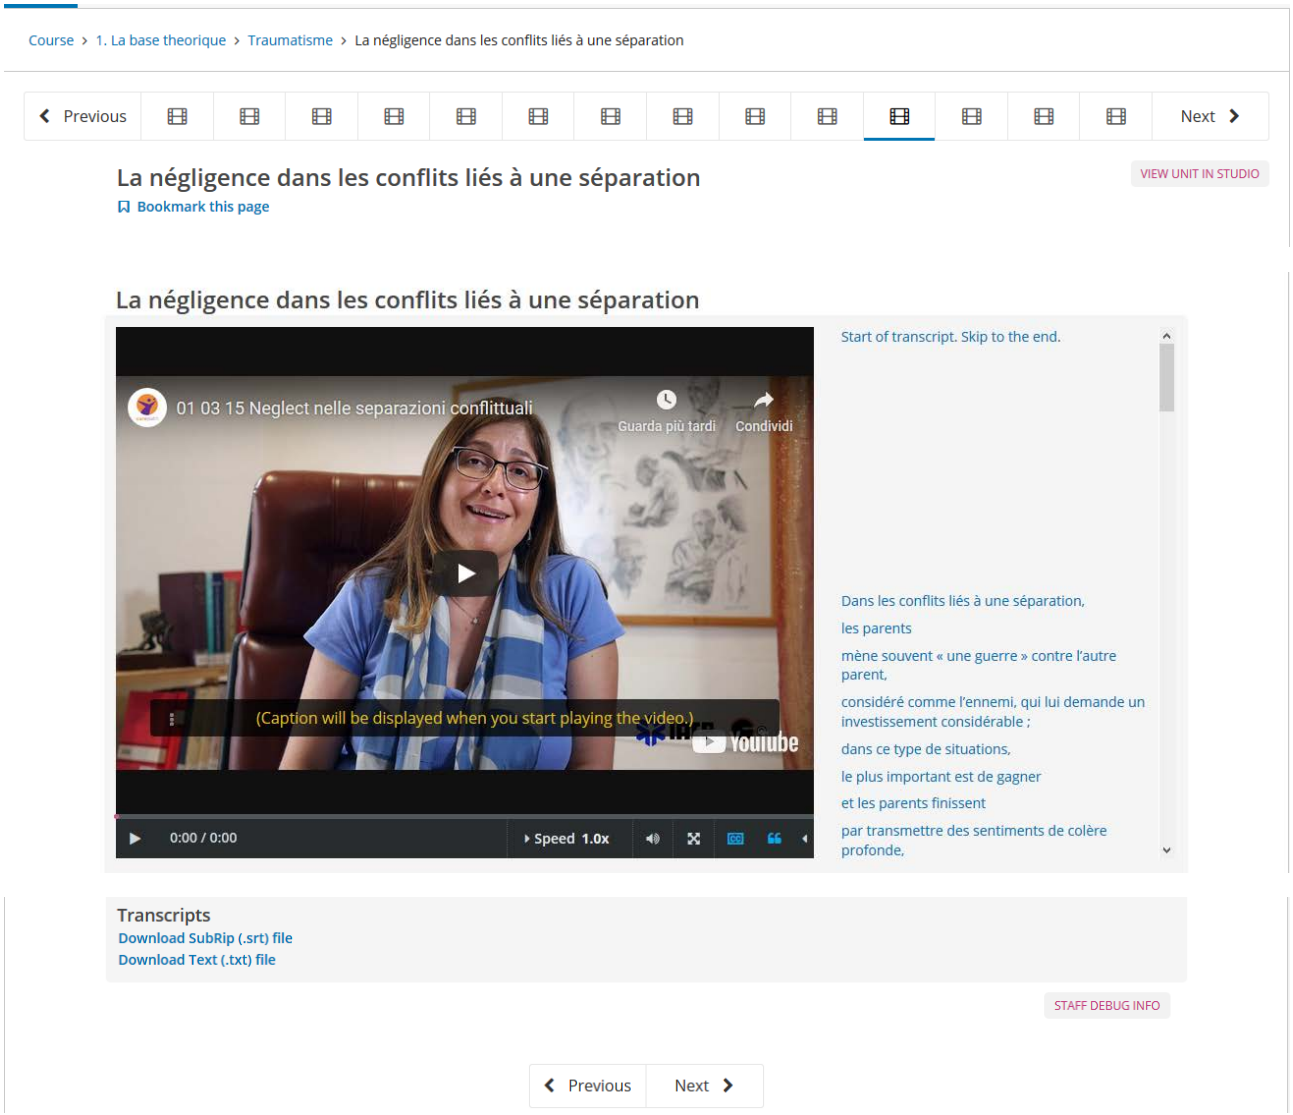
et compréhensive.

Depuis peu, c’est l’un ds aspects les plus importants pour gérer

un traumatisme insidieux qui, s’il n’ été découvert que récemment,

rivalise de gravité avec les autres grands traumatismes.





Transcript

Dans les conflits liés à une séparation,

les parents

mène souvent « une guerre » contre l'autre parent,

considéré comme l'ennemi, qui lui demande un investissement considérable ;

dans ce type de situations,

le plus important est de gagner

et les parents finissent

par transmettre des sentiments de colère profonde,

qui montrent

combien il leur

est difficile d'affronter les sentiments propres

au processus de séparation :

déception,
douleur, abandon, vide, solitude
et sentiment d'échec.
En fait, ces personnes ont du mal à gérer
ce qu'on appelle le divorce psychologique.
Dans ce contexte,
l'enfant apparaît comme la
personne à protéger ;
malheureusement, ce n'est pas toujours le cas,
Il devient
le pivot et
les parents commencent
à communiquer à travers le mineur –
the child becomes
l'enfant qui devient une passerelle entre les parents,
un motif de discussion,
chacun des parents
déclarant ne vouloir
que son
bien.
Le bien-être de l'enfant devient une excuse
derrière laquelle se cachent les déceptions,
les jalousies
et les contrariétés personnelles.
La protection de l'enfant
disparaît alors qu'elle devrait toujours être présente.
Elle est même essentielle
dans les situations
de ruptures.
Ce que les parents pourraient et devraient faire,
c'est collaborer et coopérer sur tous les aspects liés à la parentalité,
afin de soulager

le fardeau qui pèse sur l’enfant. En effet,

childrles enfants, « responsables du bonheur des parents », se sentent coupables de leur séparation 47 00:03:06,540 --> 00:03:09,120 et d’être la cause de leurs disputes.

A ce stade, l’enfant est oublié,

moment choisi par le traumatisme pour apparaître :

alors qu’il est très vulnérable,

l’enfant est ignoré par son entourage,

in the moment of greatest vulnerability

ses besoins et ses sentiments

ne sont pas reconnus, acceptés ni rencontrés.

La séparation est toujours traumatisante,

car elle cause des dégâts,

elle crée une division.

Dans l’esprit d’un enfant, le couple formé

par ses parents est un noyau unique qui,

d’une certaine manière, va se diviser.

Cette division extérieure du père et de la mère risque

de créer une fracture interne.

Cependant, dans la tête de l’enfant,

le couple parental

ne cesse pas d’exister,

il perd juste sa force,

son identité,

sa dignité

et sa fonction de guide.

Il existe d’autres facteurs très

lourds

à

porter.

D’autres aspects expliquent l’ampleur du traumatisme,

comme le tempérament de l’enfant

et son aptitude

à tolérer la frustration,

la qualité de la relation et le type d'attachement que les parents

ont pu créer

avant leur séparation.

C'est l'âge de l'enfant qui s'avère

le meilleur indicateur du traumatisme et de son ampleur :

plus l'enfant est jeune, plus

grand sera le traumatisme ;

les parents,

parfois inconsciemment,

enclenchent une série de dynamiques dysfonctionnelles qui enferment l'enfant

dans un rôle strict dont,

en raison de son jeune âge,

il ne parviendra pas

à se

libérer.

he does not yet have that level of awareness

Lui manque encore le niveau de conscience ou une personnalité

assez forte pour se libérer du piège.

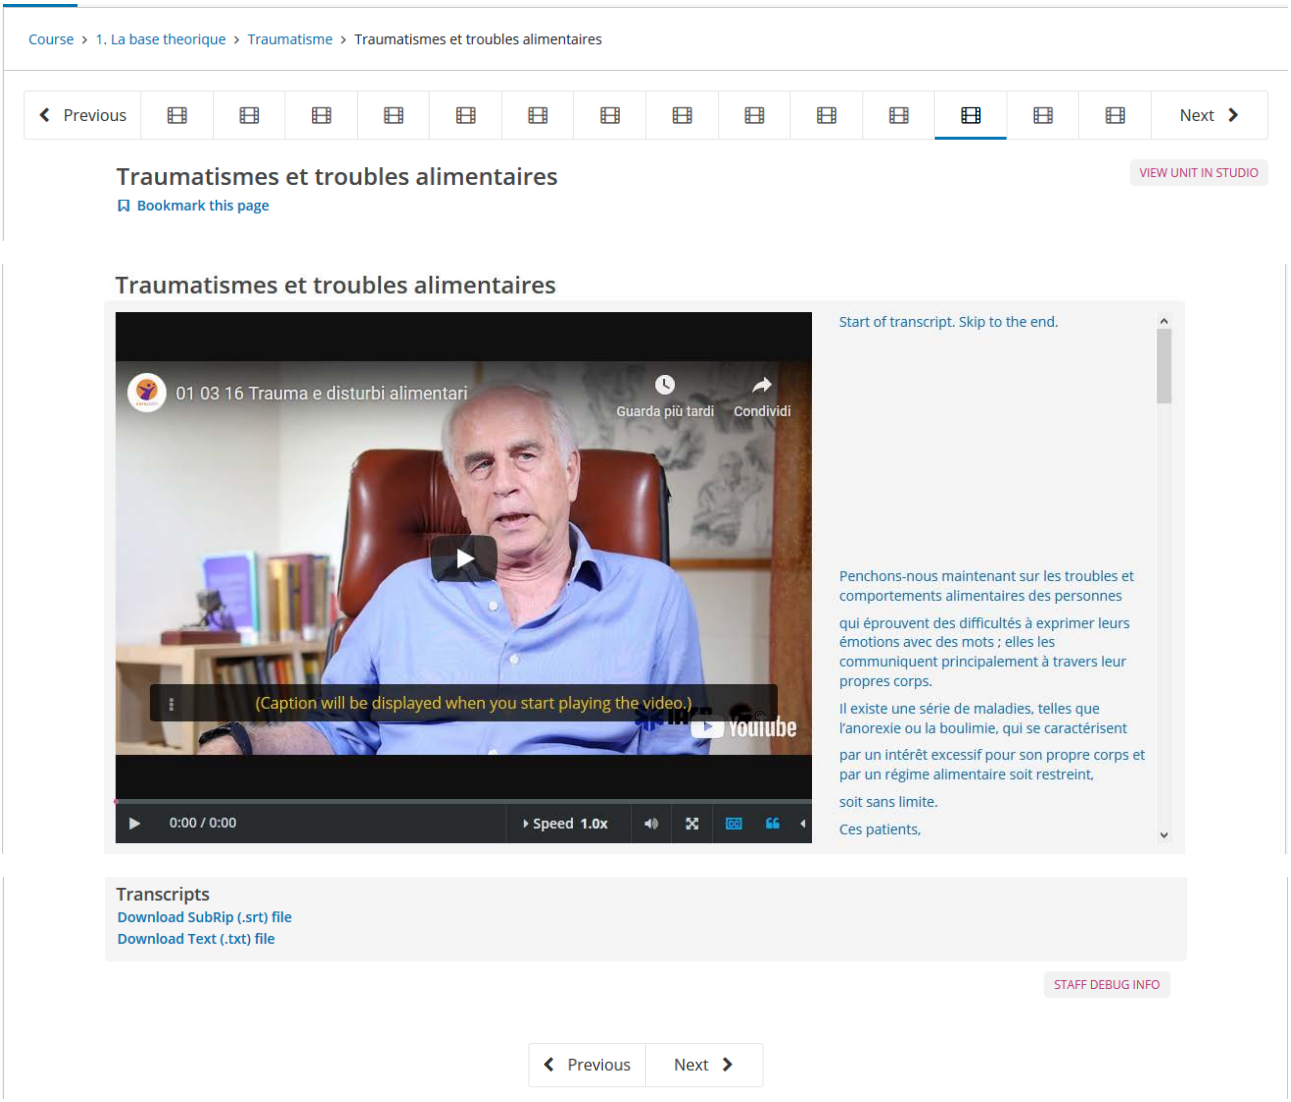
Voilà pourquoi un consultant technique pourrait intervenir dans ces processus,

car il ou elle est capable

de repérer la dynamique familiale

et saura comment

libérer l'enfant.



Transcript

Penchons-nous maintenant sur les troubles et comportements alimentaires des personnes

qui éprouvent des difficultés à exprimer leurs émotions avec des mots ; elles les communiquent principalement à travers leur propres corps.

Il existe une série de maladies, telles que l'anorexie ou la boulimie, qui se caractérisent

par un intérêt excessif pour son propre corps et par un régime alimentaire soit restreint,

soit sans limite.

Ces patients,

surtout s'ils

souffrent d'anorexie,

sont principalement des femmes.

L'anorexie mentale est caractérisée par une perte considérable de poids, qui peut s'avérer très dangereuse, voire mortelle.

Cette perte de poids est souhaitée et recherchée par la personne, qui voit son corps beaucoup plus volumineux qu'il ne l'est réellement.

L'anorexie peut s'accompagner de restrictions sévères. Les prises alimentaires sont très réduites ou

le poids est maintenu à un niveau bas, les ingestions d'aliments étant suivies

de comportements violents d'élimination.

On élimine plus que

ce que l'on absorbe,

ce qui provoque

une perte

de poids.

La boulimie nerveuse,

bulimia nervosa

pour sa part,

est une maladie

où le régime alimentaire est surtout ostentatoire.

Des épisodes de compulsion alimentaire

peuvent se produire,

pendant lesquels le patient consomme de grandes quantités de nourriture.

Ils

peuvent limiter leur poids

corporel en éliminant

la nourriture

grâce à

des instruments inadéquats ou en se faisant vomir,

ou des substances

qui coupent l'appétit,

ou encore grâce à une activité physique intense.

Il s'agit d'une compulsion

alimentaire excessive,

qu'on appelle boulimie nerveuse

ou trouble

de la compulsion alimentaire.

Le comportement
alimentaire n'est plus maîtrisé,
la personne mange sans arrêt
et souffre de compulsion alimentaire ;
elle mange tout le temps pendant plusieurs
heures chaque jour,
c'est un régime alimentaire illimité.
La personne ne parvient plus à réduire ses ingestions alimentaires ni à perdre du poids.
Quand elle atteint un poids considérable,
de 150 à 200 kg,
apparaissent des risques physiques,
l'excès de poids pouvant provoquer
des maladies physiques graves.
Ces pathologies se succèdent, l'individu pouvant passer de l'une à l'autre
au fur et à mesure que sa capacité de contrôle diminue.
Dans le cas de l'anorexie mentale,
le niveau de contrôle reste très élevé
et les personnes sont capables de limiter leur régime alimentaire
pour garder un poids corporel très faible.
Lorsque le contrôle diminue,
elles passent à la boulimie nerveuse.
Les enfants
et les jeunes,
qui souffrent de ce problème,
se nourrissent
- parfois avec excès – pour
garder un bon système de récompense.
Ils possèdent une capacité de contrôle qui se manifeste longtemps après
l'ingestion alimentaire et pas avant et cela leur permet de garder
un poids acceptable.
Concernant le troisième type de maladie, le régime alimentaire incontrôlé,
la personne passe sa journée

à manger,

souvent en regardant la télévision.

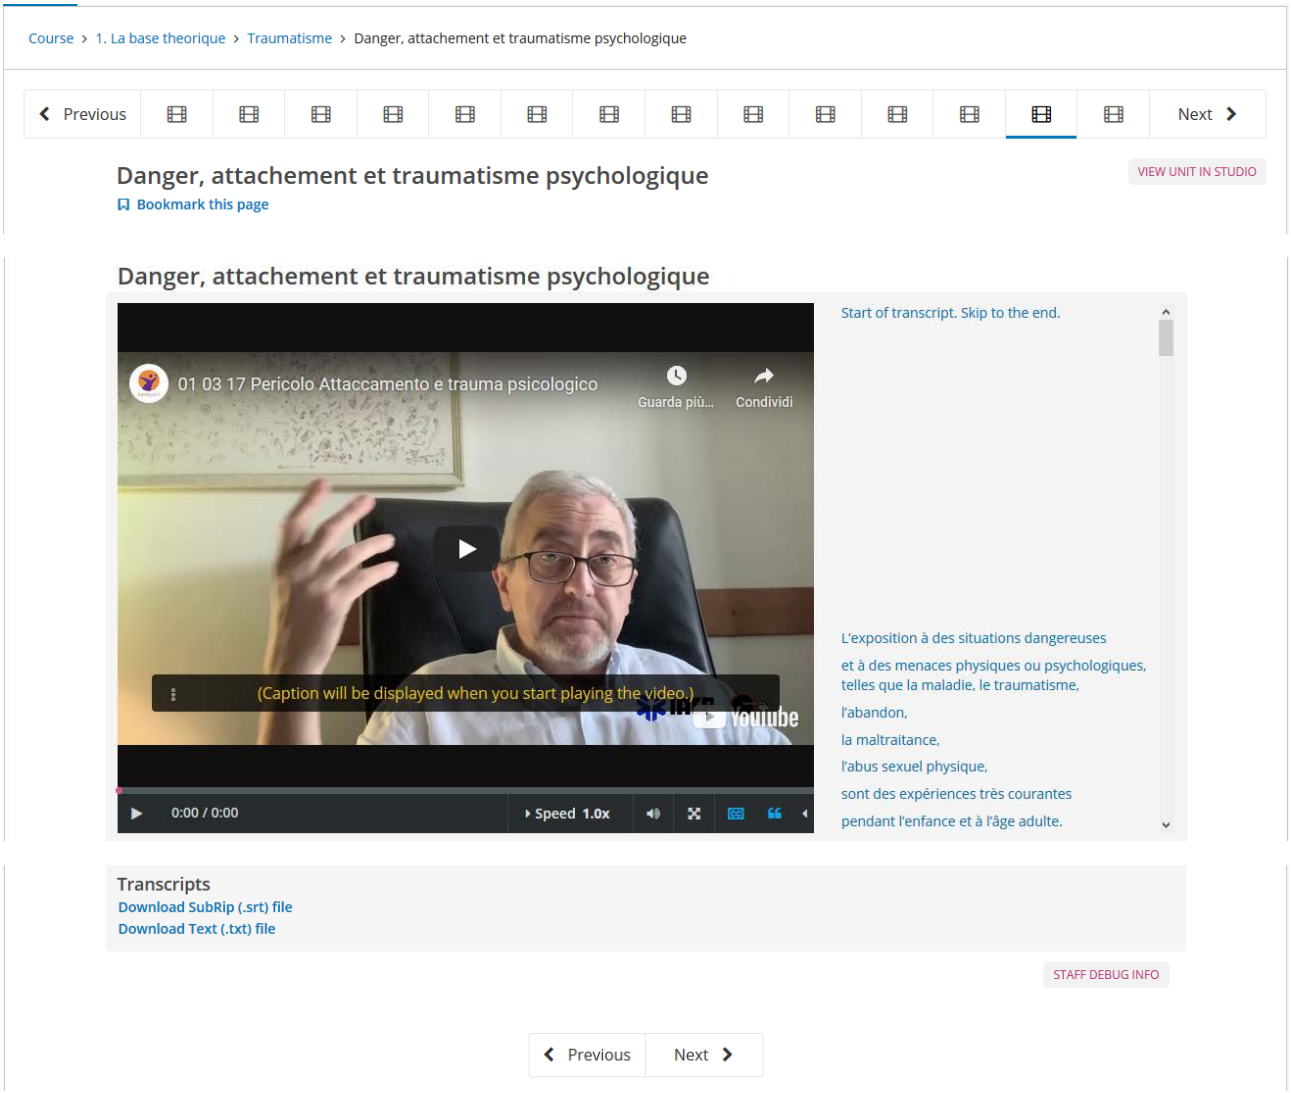
Elle perd conscience de

l'action constante et répétitive que constitue l'ingestion d'aliments.

Quoiqu'il en soit, ces maladies posent une série de questions concernant

le domaine affectif et l'exposition aux traumatismes,

qui peut mener à des troubles alimentaires.



Transcript

L'exposition à des situations dangereuses

et à des menaces physiques ou psychologiques, telles que la maladie, le traumatisme,

l'abandon,

la maltraitance,

l'abus sexuel physique,

sont des expériences très courantes

pendant l'enfance et à l'âge adulte.

Ces expériences

ne débouchent pas nécessairement

sur des traumatismes psychologiques,

les êtres

humains étant

dotés
de capacités d'adaptation
extrêmement sophistiquées,
qui leur permettent d'affronter
des situations extrêmes sans développer nécessairement un traumatisme psychologique.
Si ces situations dangereuses
sont traitées efficacement,
elles perdent leur
potentiel et
perturbateur
et l'individu parvient à rester
en bonne santé mentale
psychologique.
Au fil du temps, notre espèce a développé
des
compétences
interpersonnelles
et des comportements
très sophistiqués, qui servent essentiellement à nous protéger
contre les dangers.
Cet ensemble
de comportements et d'attitudes
constitue
notre système d'attachement.
Le terme « attachement »
vient d'une théorie élaborée
dans les années 50 par
un psychanalyste anglais, John Bowlby.
La théorie de l'attachement
dit que les êtres humains possèdent une prédisposition
à nouer des relations d'attachement
avec des personnalités primaires, souvent les parents,

censées
les protéger
des éventuels dangers.
Dans le cadre de cette théorie, on parle d'attachement dont
la fonction principale,
mais pas unique, est de nous protéger contre les situations dangereuses :
quand une personne se sent suffisamment en sécurité,
elle est encouragée à explorer
l'environnement extérieur, à découvrir ses ressources
et à apprendre à éviter
les dangers qui peuvent se cacher dans leur entourage.
Ces fonctions d'attachement
ont été étudiées chez les enfants de tous âges –
principalement au niveau de la relation que les enfants de 1 à 2 ans entretiennent avec leur mère –
et chez les primates.
Dans les années 50,
des recherches effectuées sur des petits singes
rhésus ont
montré
that demonstrate how important
on small rhesus monkeys
l'importance de la fonction protectrice
de la mère. Chez les primates,
cette fonction est même plus importante que la fonction alimentaire.
L'attachement se subdivise habituellement en deux catégories : sûr et précaire.
L'attachement sûr
est caractérisé par un sentiment de sécurité,
de confiance dans l'entourage
et dans ses propres ressources
et par la possibilité d'être aidé et protégé en cas de danger.
L'attachement précaire
présente

généralement deux types

– attachement précaire-ambivalent et attachement inquiet –

chez les enfants de type C

– et se manifeste par une hyper-activation

du corps avec un accent affectif ;

des manifestations

de colère,

de crainte,

des plaintes concernant

son besoin de protection,

des difficultés de séparation avec la mère.

Le deuxième type d'attachement précaire est l'attachement dédaigneux-évitant

– aussi connu sous le nom d'attachement de type A -

qui,

qui, contrairement au type précédent, est caractérisé par une hypo-activation.

Il s'agit ici d'un détachement par rapport

à ses propres émotions

suscitées par un danger,

donc d'un détachement par rapport à sa peur,

sa colère, son sentiment de vulnérabilité.

On observe

soit un inhibition de leur expression

(par exemple, grâce à une attitude d'indifférence apparente)

soit une expression fausse,

qui devient l'expression d'une émotion opposée (par exemple, sourire lorsqu'on est confronté à quelque chose d'effrayant).

Lorsque ces

modes d'attachement sont efficaces,

ils nous protègent

contre les dangers

émanant de notre entourage

ou de nos relations.

Si
ces stratégies sont efficaces
et suffisamment protectrices,
les conditions nécessaires à l'apparition d'un traumatisme psychologique
ne sont pas remplies et la personne reste dans une situation de sécurité relative.
Les conditions d'un traumatisme psychologique ne se manifestent que si ces
stratégies sont
inefficaces.
Par exemple, quand l'inhibition de l'expression des peurs,
de la colère ou
des besoins ne suffit plus à protéger la personne
face aux menaces environnantes.
En situation de traumatisme psychologique, toutes les activités de traitement mental
subissent l'impact négatif
Il peut s'agir d'un événement soudain et particulièrement intense -
This can come from a particularly intense and sudden event - par exemple,
une maltraitance ou
un traumatisme physique –
ou d'une série d'expériences répétées
qui, ensemble,
prennent une valeur traumatique.
Dans ce cas, on parle de traumatisme évolutif :
l'enfant grandit
dans un cadre familial négligent et néfaste,
inadeguate
toutes ces expériences prolongées
créant un climat propice à un développement inadéquat,
pouvant mener
à un traumatisme psychologique.
La capacité à s'adapter et à retravailler une situation de danger potentiellement traumatisante
dépend de certaines caractéristiques.
De l'individu, de son âge, de sa maturité,

personnalité

et les caractéristiques de son attachement, qu'elles soient ou non efficaces pour le protéger ;

sa force physique et son état de santé

car une personne malade est plus fragile

dans l'élaboration d'une condition dangereuse. C'est d'ailleurs très important,

la disponibilité protectrice des figures de rattachement, qu'une personne qui n'a pas à

se sentir seul face au danger, mais accompagné de relations protectrices de la part des personnes

qui sont prêts à nous faire sentir que nous sommes au milieu de quelque chose.

protégé

et accompagné dans l'élaboration

d'une expérience dangereuse.

Un rôle important est joué par le contexte social : il est fondamental de se retrouver

dans un environnement accueillant, avec des personnes qui accueillent et soutiennent

avec

leur culture

les rituels ou la présence personnelle (par exemple des amis).

Le processus d'adaptation d'un état traumatique n'est pas immédiat mais nécessite du temps,

par exemple

un deuil important - comme ça

du conjoint ou d'un parent -

exige généralement

un ou deux ans afin d'être traité correctement,

sans se transformer en condition

de deuil traumatique.

Quand

une expérience potentiellement traumatisante n'est pas traitée,

est généralement accompagné de

une hyperactivation excessive

émotionnel, avec

des rêves, des cauchemars,

les craintes,

Je ne suis pas sûr d'avoir un sentiment de menace,

des réactions incontrôlées

- comme dans le cas du syndrome de stress post-traumatique -

ou d'une situation d'hypoactivation excessive, c'est-à-dire d'une distance excessive à parcourir

de tout ce qui concerne l'expérience

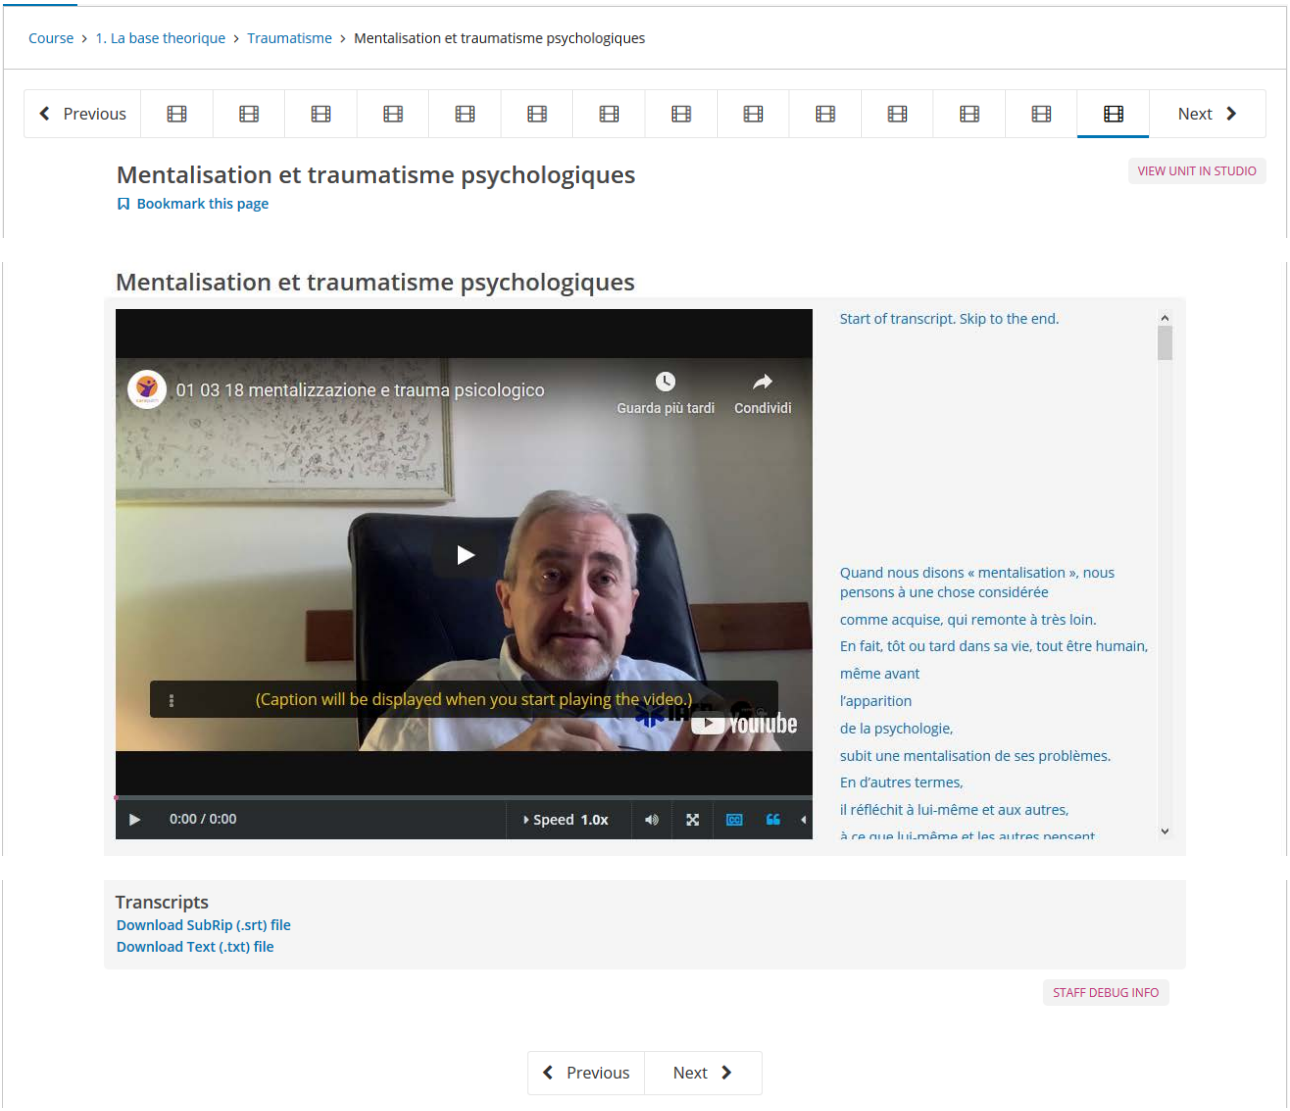
dangereux,

manque de souvenirs,

inhibition affective,

éviter de parler ou de se rendre dans des lieux liés à l'expérience traumatisante.

En présence de ces deux conditions, on peut parler de traumatisme psychologique.



Transcript

Quand nous disons « mentalisation », nous pensons à une chose considérée

comme acquise, qui remonte à très loin.

En fait, tôt ou tard dans sa vie, tout être humain,

même avant

l'apparition

de la psychologie,

subit une mentalisation de ses problèmes.

En d'autres termes,

il réfléchit à lui-même et aux autres,

à ce que lui-même et les autres pensent,

aux réflexions,

sentiments,

besoins,
attentes et croyances
qui nous influencent.
Pour comprendre le concept de
mentalisation,
il suffit
de s'envisager
soi-même et d'envisager
les autres comme des états mentaux.
Ces aptitudes apparaissent
chez les humains aux alentours
de l'âge de 4 ans,
lorsque l'enfant prend conscience
que
ses pensées et sentiments
ne sont pas nécessairement
compris et partagés par les autres. Par exemple, la mère peut parfaitement ignorer
ce qui se passe dans la tête de son enfant.
Quand les enfants s'en rendent compte,
ils apprennent également à
utiliser un mode stratégique
très important
et utile d'adaptation aux problèmes ;
ils
apprennent l'importance du mensonge.
Le mensonge est possible si on accepte
que les autres peuvent avoir un point de vue différent
sur le monde et qu'en conséquence, ils ignorent ce que vous pensez.
Le processus de mentalisation
repose sur une succession
d'étapes.
La première concerne

notre sensibilité
relative
à la perception des états mentaux,
ou à la représentation
de notre état mental ou de celui des autres
(par exemple, comprendre qu'on est joyeux,
triste, qu'on a des attentes, des préjugés)
prejudices)
et
et notre aptitude à interpréter
nos comportements
et ceux des autres sur base de ces états mentaux.
C'est une étape essentiele à notre capacité d'adaptation
(par exemple, si la personne face à nous reste silencieuse,
nous ne pensons pas qu'elle
n'a rien à dire,
nous pensons que son esprit est rempli
d'images et d'idées
et que son silence n'est pas l'expression d'un vide, mais bien un succession d'états mentaux
sur
lesquels repose ce comportement silencieux).
Le deuxième aspect important de la mentalisation
est que l'auto-mentalisation encourage
la régulation du corps.
nous constatons que
nous sommes en colère et si nous pensons
que la cause en est quelque
chose qui
a été dit,
le
fait d'en
prendre

conscience,
de s’en rappeler
les conséquences
d’une action,
enclenche chez nous un mécanisme de régulation de cette colère.
Notre rythme cardiaque, notre respiration, la production d’hormones
déclenchée par la colère,
seront régulés par
des mécanismes psychologiques.
Par exemple, se sentir
coupable d’avoir été en colère contre
un être cher inhibe l’expression
de colère et régule le corps.
Il s’agit d’une fonction de base,
à tel point qu’une personne,
dont les capacités à mentaliser sont faibles,
sera plus exposée aux dérèglements du corps
(pulsations
cardiaques
plus rapides et moins régulières,
réactions émotionnelles incontrôlées
et à long terme,
peut-être les
maladies inhérentes
aux dérèglements constants du corps).
L’une des fonctions principales de la parentalité concerne la mentalisation :
Is to be
penser
aux
enfants
en fonction de leurs besoins,
de leurs sentiments,

de leurs craintes et,
dans une certaine mesure,
se mettre à leur place et percevoir les choses de leur point de vue.
Par exemple, un enfant de trois ans
vit certaines choses
et interprète certains mots ou discours
en fonction
de ses aptitudes d'enfant.
Il est donc essentiel que 116 00:06:17,540 --> 00:06:19,840 les parents
Cette fonction s'appelle la conscience (psychologique)
et fait partie des conditions essentielles au développement
et à la sécurité
des enfants. Un bon parent doit
pouvoir
mettre à la place
se de ses enfants et percevoir leurs besoins.
On a déjà observé chez les mères de très jeunes
enfants qu'elle se mettent
à la place
d'un enfant agité et en pleurs et comprennent
ainsi qu'il a froid ou faim.
Elles donnent une voix
à l'état mental de l'enfant comme si celui-ci
était capable d'organiser ses pensées et de les exprimer.
La capacité à se représenter les états mentaux des enfants
est une condition essentielle pour devenir parent.
La mentalisation permet également de gérer
le stress et les situations potentiellement dangereuses,
en s'adaptant
sans créer les conditions d'un traumatisme psychologique.
Par exemple,
quand un enfant est confronté

au comportement incohérent de son parent
(colère, violence physique ou insultes verbales),
sa capacité d'imaginer l'état
mental du parent sert
d'amortisseur et lui permet d'envisager le contexte dans lequel le parent
agit de cette manière.
Par exemple,
il peut penser : « papa est fatigué et
ce qu'il dit n'est pas vrai ;
il est d'habitude affectueux et il m'aime,
son attitude
a une valeur maintenant
et est du à
un état particulier chez lui,
mais cette valeur n'est pas absolue. » L'attitude décrite ici
le protège
contre les états mentaux des autres
et rend la situation potentiellement moins traumatisante.
On voit clairement chez les adultes à faibles capacités de mentalisation,
ainsi que
chez les personnes souffrant d'un trouble de la personnalité,
qu'ils sont davantage exposés aux traumatismes psychologiques continus.
s ne parviennent pas à contextualiser
ce qui leur arrive. Il le processus de réflexion n'est pas suffisant,
et l'événement
survenu devient
absolu
et potentiellement traumatisant.
Par moment,
l'incapacité
des parents à se mettre dans la peau de leurs
enfants peut s'avérer

dangereuse et provoquer

des attitudes qui, chez l'enfant et l'adolescent,

prendront

peut-être la forme de comportements très agressifs.

Cette agressivité et les comportements qui

les

comportements

qui en découlent peuvent

être interprétés partiellement à travers le prisme du concept de mentalisation.

Si les parents sont constamment irrités

par le comportement de leur enfant,

par exemple quand il

pose

problème ou

est insolent,

les parents commenceront

à lui renvoyer une image négative (par exemple en le traitant d'idiot, de malade ou de nul). 189
00:11:10,260 --> 00:11:12,700 Dès lors, l'enfant

risque de se voir comme une personne malade,

perturbée,

incapable.

Pour combattre cette image négative,

il adoptera des comportements agressifs et chaque fois qu'un adulte s'approchera

de lui pour mieux le connaître,

il risque de réagir très agressivement

afin de maintenir

à distance l'adulte

potentiellement traumatisant.

Lorsque des jeunes sont considérés comme des incapables en classe,

qu'ils doublent,

que les enseignants

ont

une opinion négative d'eux,

il est fréquent qu'à la maison,

leurs parents renforcent cette image négative.

En conséquence, ces enfants réagissent violemment et expriment de la colère

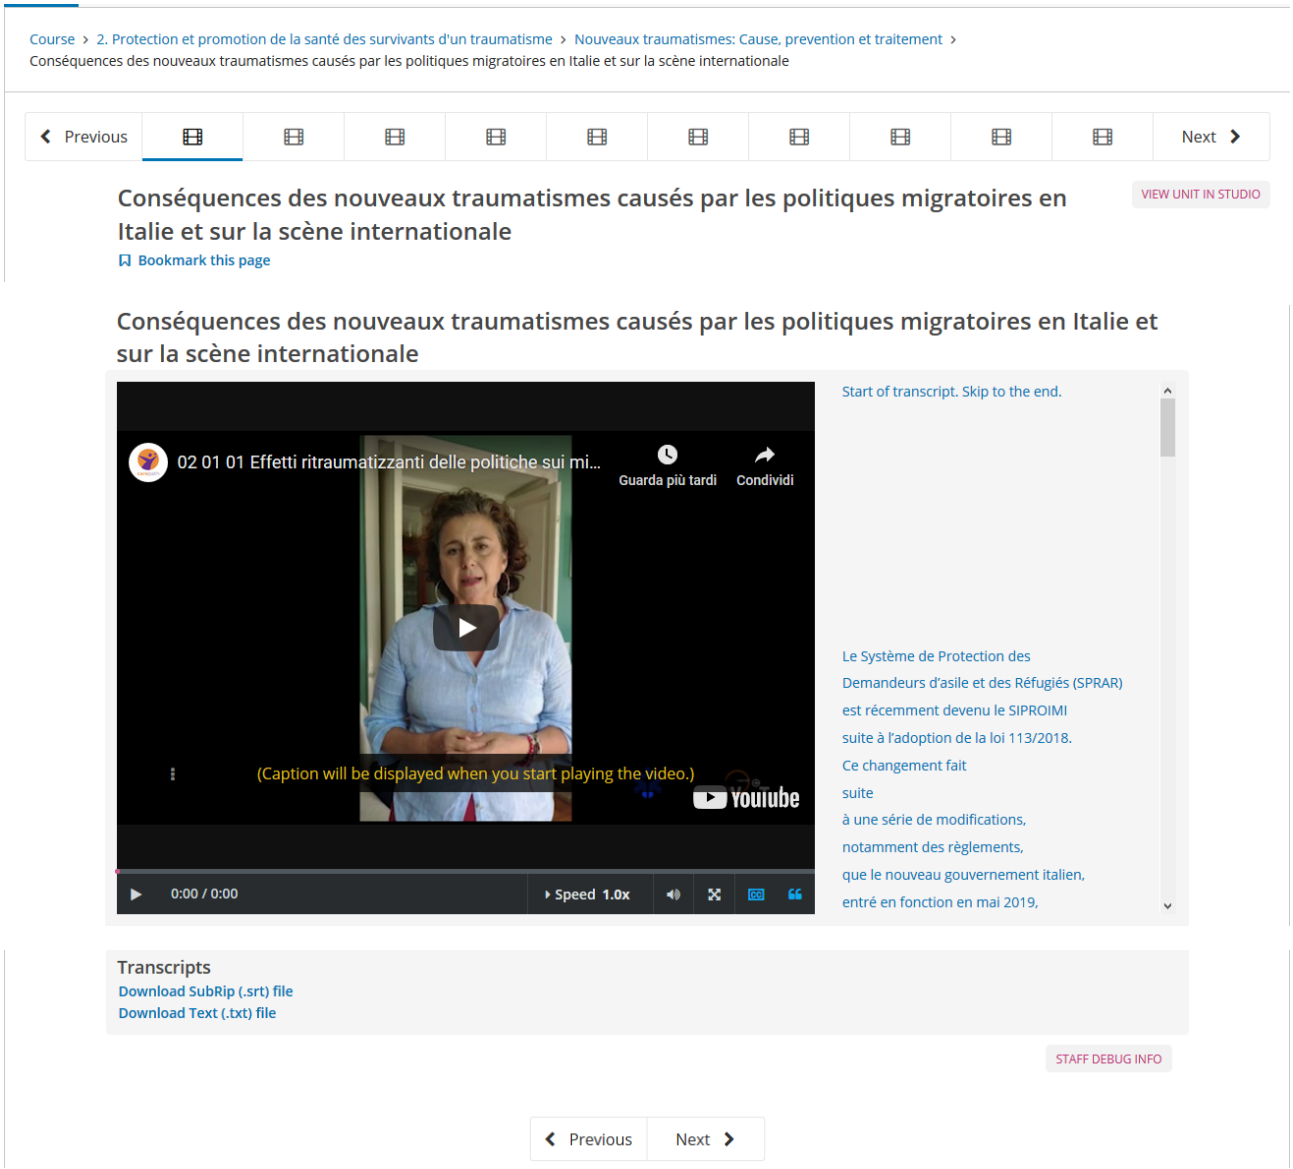
vis-à-vis des adultes qui tentent de les aider

(éducateurs, enseignants),

afin de les tenir

à distance et d'éviter d'être à nouveau perçus

comme des personnes négatives et incapables.



Transcript

Le Système de Protection des

Demandeurs d'asile et des Réfugiés (SPRAR)

est récemment devenu le SIPROIMI

suite à l'adoption de la loi 113/2018.

Ce changement fait

suite

à une série de modifications,

notamment des règlements,

que le nouveau gouvernement italien,

entré en fonction en mai 2019,

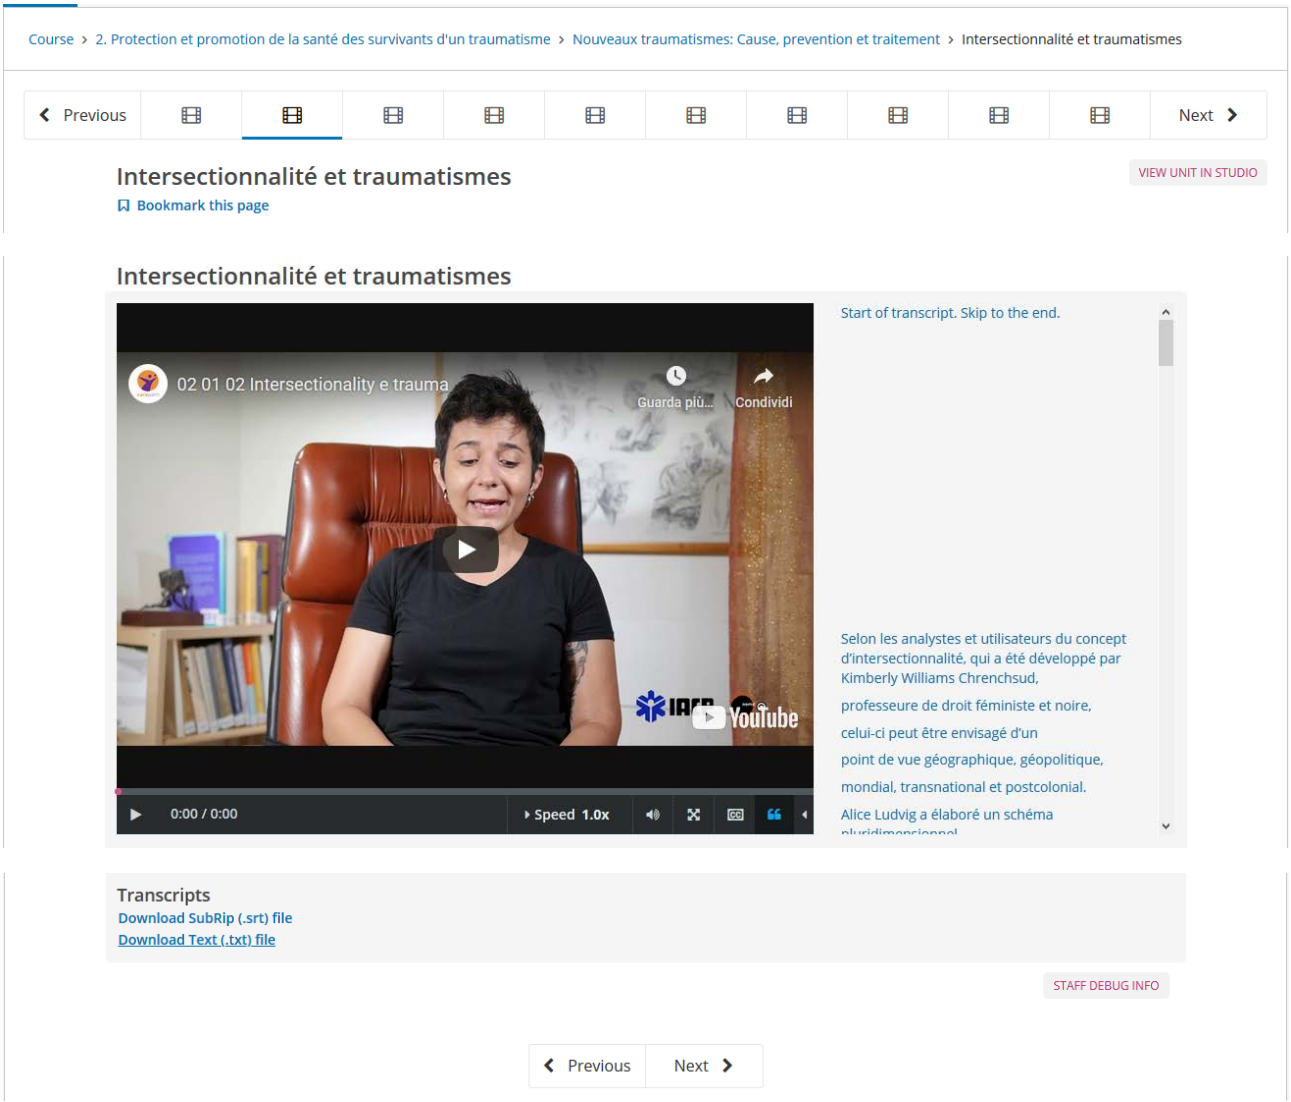
a apportées à la problématique migratoire,

au droit d'asile et donc à l'accueil. Le SPRAR,
mis en place en 2002, s'applique sur
un réseau de municipalités et d'autorités locales qui,
en collaboration avec
les ONG et les associations du troisième secteur,
a choisi de gérer bénévolement les projets d'accueil
et d'intégration des demandeurs d'asile
et des
réfugiés.
Au fil des ans, ce réseau a subi
une évolution progressive et
positive :
de 1.500 places d'accueil au départ,
il est passé à 35.000 aujourd'hui.
L'histoire du SPRAR est marquée
par plusieurs étapes
de changements successifs.
Le premier fut son
institutionnalisation par la loi,
qui en a fait un système central
d'accueil intégré en Italie
stable et officiel.
Auparavant, l'Italie
n'avait aucun système
d'accueil structuré, mais dépendait
exclusivement d'interventions d'urgence.
Un autre changement important remonte
à 2003, when, au moment de la crise
en Afrique du Nord,
lorsque le
modèle du SPRAR
a été reconnu au niveau européen comme

un acteur efficace
d'intégration et
d'inclusion sociale.
Lors de la dernière phase,
la plus récente, le statut
du SPRAR a été modifié :
il ne peut plus
accueillir
les demandeurs d'asile ni gérer
les dossiers humanitaires,
la protection humanitaire
ayant été supprimée.
La loi ne l'autorise plus qu'à accueillir
les mineurs étrangers non accompagnés,
les titulaires d'un droit à la protection internationale (qui ne concerne que peu de
personnes en comparaison avec les demandeurs d'asile).
Il peut également s'occuper de quelques nouveaux
types de permis de séjour,
les « dossiers spéciaux ». Le SPRAR,
devenu désormais le SIPROIMI, pourra à présent prendre en charge
les dossiers spéciaux concernant les traitements médicaux,
les victimes de traite,
les victimes d'exploitation au travail,
de violence intrafamiliale,
de catastrophes naturelles et les personnes
qui se sont distinguées par des actes d'héroïsme.
Il doit toujours s'agir d'étrangers,
et non pas de citoyens italiens
qui bénéficient, pour leur part, d'autres mécanismes de protection sociale.
On peut dire que le SPRAR
possède désormais une composante
« protection sociale » pour les étrangers.

Ce n’est plus un système d’accueil et de protection
pour les personnes concernées
par le droit à l’asile.
Son nouveau statut peut,
sur papier,
sembler relativement positif
dans la mesure où il devient un mécanisme
de protection pour
des personnes vulnérables.
Pour l’instant, la difficulté réside dans
l’obligation pour la personne vulnérable
d’avoir un permis de séjour,
sauf lorsqu’il
s’agit de victimes de traite ou d’abis…
qui reçoivent
automatiquement ce permis
en raison de leur statut de victimes.
Il n’y a aucun critère précis quant
au déroulement des procédures 95 00:03:59,269 --> 00:04:05,480 ni à la désignation
de ces personnes vulnérables
sous la définition,
même juridique, des dossiers spéciaux.
Le seul moyen
d’accéder au SPRAR
et de bénéficier
de tous les services
de protection
qu’il offre
reste l’obtention
d’un permis de séjour
dans le cadre
des dossiers spéciaux.

Les critères et exigences d'accès aux soins
médicaux n'ont pas encore été définis
(typologie de maladie mentale ou physique,
niveau de gravité et calendrier ?).
La période
actuelle est critique :
de nombreuses personnes,
qui avaient accès aux projets du
SPRAR jusqu'il y
a quelques mois, l'ont perdu.
Par ailleurs,
ceux et celles qui ont théoriquement
le droit d'accéder à ces services
ignorent quel
type de preuves
fournir pour
pouvoir l'exercer.



Transcript

Selon les analystes et utilisateurs du concept d'intersectionnalité, qui a été développé par Kimberly Williams Chrenchsud,

professeure de droit féministe et noire,

celui-ci peut être envisagé d'un

point de vue géographique, géopolitique,

mondial, transnational et postcolonial.

Alice Ludvig a élaboré un schéma pluridimensionnel,

comportant plusieurs niveaux de différenciation :

genre, sexualité, race, couleur de peau, origine ethnique, statut, classe, culture…

Le schéma évalue

les innombrables niveaux à envisager

lorsqu'on aide

une personne considérée comme
appartenant à une population minoritaire.
Les politiques pour l'égalité
s'élaborent de plus en plus
sur un plan international,
notamment grâce au travail des Nations Unies et de l'Union européenne.
Pour s'en convaincre, Il suffit d'étudier les directives de lutte contre la discrimination,
l'ensemble des initiatives nationales, régionales et locales,
ainsi que les politiques pour la diversité
et la gestion de la diversité,
actuellement adoptées dans tous
les pays occidentaux et dans de nombreuses entreprises.
Bien sûr, ces politiques n'ont pas pour effet
de lever les doutes et les souffrances des personnes en situation de minorités multiples,
qui peuvent avoir vécu des évènements traumatisants en raison de leur appartenance à une minorité.
Dans le « daily paper » du 17 mai 2018,
on peut lire une citation d'un jeune Camerounais :
« nous étions dans la cuisine en train de regarder une émission télévisée sur les migrants LGBTQI ;
mes amis africains ont commencé à dire
que l'Italie est un pays de merde rempli d'homosexuels
et, à nouveau, je ne me sentais plus libre.
Allen a 22 ans et a fui le Cameroun où il subissait quotidiennement coups et insultes,
Al où il était diabolisé parce que,
dans ce pays, d'après la presse,
l'homosexualité est un délit.
S'il a demandé la protection internationale à l'Italie,
il continue à vivre dans la crainte,
l'homophobie l'ayant suivi jusqu'à la rue Mattea à Bologne
où il a trouvé refuge avec d'autres compatriotes.
Les migrants LGBTQI sont souvent très jeunes.
Faute de pouvoir compter
sur le soutien de leur communauté d'origine,

ils décident de migrer,

mais gardent le stigma culturel de l'homophobie ou de la transphobie.

Rien ne leur garantit qu'une fois en Italie,

ils pourront se frotter aux réalités multiculturelles qui leur permettraient de vivre paisiblement leur orientation et leur identité sexuelles.

Comme l'a souvent souligné Vincenzo Bramato,

président de la communauté Arcigay de Bologne,

lors de nos entretiens, certains pays européens, comme l'Allemagne,

se sont dotés de structures protégées d'accueil des victimes de persécution sur base de leur orientation sexuelle.

Le personnel y reçoit une formation 53 00:03:38,220 --> 00:03:43,680 pour leur éviter d'adopter des attitudes subjectives ou méprisantes,

susceptibles de reproduire la stigmatisation et le traumatisme que les victimes ont vécus.

Si, en Italie, le mécanisme d'accueil ne prévoit pas pour l'instant ce type de structure,

il existe des exemples de bonnes pratiques,

comme l'expérience pilote menée en 2017 à Modène (un petit appartement pour six personnes

a été réservé à des demandeurs d'asile LGBTQI)

ou encore le guichet d'information pour les migrants LGBTQI, à Vérone.

Pour ces

jeunes migrants,

qui sont en pleine phase de développement

de leurs premières relations avec la communauté LGBTQI,

l'appartenance à une minorité ethnique

dans le pays d'accueil est un élément du problème.

En fait, ils appartiennent souvent à une

minorité effrayée et silencieuse, au sein même de leur communauté de référence.

Comme Rogers le souligne, 69 00:04:31,840 --> 00:04:32,620 le traumatisme invisible est multiplié par deux.

Dans le cas du stress minoritaire - si l'on veut reprendre les termes de Vittorio Lingiardi

– il existe un double risque

pour la santé physique et mentale des personnes concernées,

et donc un risque considérable de perte de capital humain.

Former aux services d'accueil équivaut à former aux droits humains

et aux spécificités propres

aux migrants

LGBTQI dans les relations d'aide.

Training must therefore be centered on the person

La formation, pour être véritablement inclusive,

doit se concentrer sur la personne, sur l'accueil et sur la connaissance de ces spécificités.

De plus, les services pour les migrants,

car très souvent ils sont conçus et offerts sans tenir compte de leur orientation

sexuelle et de leur identité de genre,

peuvent perdre en efficacité, tant au niveau de la relation avec le patient

(les jeunes ne reçoivent pas

l'accueil qu'ils devraient)

qu'au niveau de la formation ou des parcours préventifs

(par exemple, pour les maladies sexuellement transmissibles,

une formation pluridimensionnelle est

nécessaire lorsqu'on traite avec des migrants adolescents

appartenant à la communauté LGBTQI).

D'autre part, les services offerts par la communauté LGBT

s'inscrivent solidement dans un modèle culturel de lesbiennes ou gays occidentaux ;

dès lors, les jeunes en

provenance d'autres cultures risquent

de ne pas s'y retrouver.

Les expériences citées précédemment

montrent que les services d'informations,

de soutien et de conseil offerts par les institutions, mais également par les associations but non-lucratif,

peuvent s'avérer inefficaces. En conséquence,

lorsqu'on

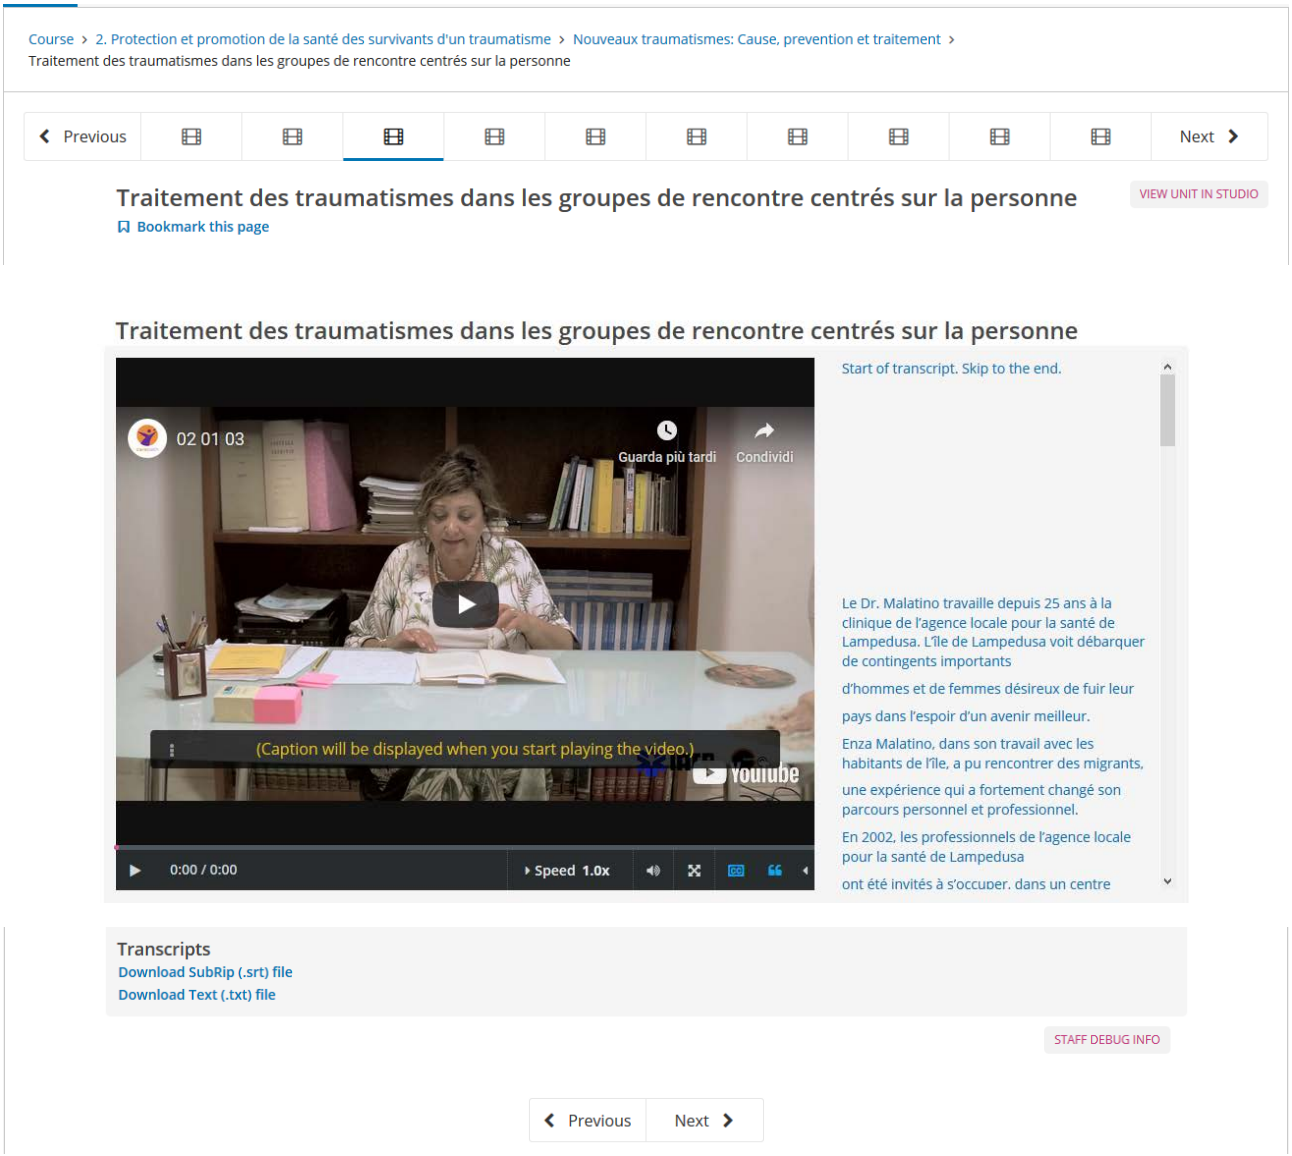
travaille avec des populations en situation de minorités multiples,

une réflexion pluridisciplinaire

s'impose sur la pratique de la relation d'aide.

La formation aux relations d'aide à offrir à ces personnes doit s'inspirer des différentes 106 00:06:54,460 --> 00:06:56,800 - variables d'homosexualité, de bisexualité et transsexualité dans l'histoire

de la psychiatrie et de la psychologie ainsi que des concepts de stigmatisation,
d'homophobie et homophobie intériorisée.
Les prestataires de services doivent recevoir une
information régulière
sur la législation concernant ces questions,
aussi bien dans le pays d'accueil que dans le pays d'origine des personnes concernées.
De plus, il faut
apprendre et approfondir
ses connaissances de la
législation sur l'asile,
car celle-ci change continuellement.
Outre les compétences techniques, il conviendra, au niveau personnel, de développer et d'approfondir une
démarche sensible au genre
et de poursuivre une réflexion sur les droits humains.
Cette exigence s'applique également aux groupes de travail qui offrent des services à ces jeunes.



Transcript

Le Dr. Malatino travaille depuis 25 ans à la clinique de l'agence locale pour la santé de Lampedusa. L'île de Lampedusa voit débarquer de contingents importants

d'hommes et de femmes désireux de fuir leur

pays dans l'espoir d'un avenir meilleur.

Enza Malatino, dans son travail avec les habitants de l'île, a pu rencontrer des migrants,

une expérience qui a fortement changé son parcours personnel et professionnel.

En 2002, les professionnels de l'agence locale pour la santé de Lampedusa

ont été invités à s'occuper, dans un centre d'accueil, de personnes qui avaient effectué un long et pénible voyage

au péril de leur vie. La direction de l'agence locale pour la santé m'a invitée à mener une évaluation psychiatrique des personnes qui avaient

débarqué sur l'île. Il s'est 10 00:01:48,360 --> 00:01:56,569 quasiment impossible d'évaluer leur santé mentale,

avéré au-delà des graves évènements traumatiques qu'elles avaient vécus, car elles provenaient d'une autre culture

et ne demandaient aucune aide ni soutien pharmacologique,

dans leur culture la médecine occidentale n'est pas conventionnelle.

En effet, Le recours à des rites magiques liés

à leurs croyances culturelles pouvait aider certaines d'entre elles.

Il était difficile d'offrir de l'aide et du soutien à ces personnes en souffrance.

J'ai donc envisagé d'organiser des groupes d'écoute.

Pour moi, psychiatre et psychothérapeute formée à l'approche centrée sur la personne de Carl Rogers, l'expérience fut incroyable.

Dans ce genre de groupes,

les personnes s'asseyent en cercle

pour se mettre à l'écoute. L'élément fondamental est l'absence totale de jugement

et le respect profond pour tous les thèmes dont le groupe souhaite discuter.

Ainsi, il est possible de créer un climat de confiance, favorable aux participants,

même si leur état psychique est très problématique, qui pourront ainsi retravailler

leur expérience dans un espace de solidarité collective :

la prise de conscience de son expérience personnelle n'est pas nécessairement individuelle, elle peut être partagée et comprise par les autres.

Cela facilite parfois la résolution de la souffrance,

du conflit ou de l'évènement douloureux.

C'est exactement ce qui s'est passé dans le groupe. Il était essentiel de dégager un équilibre entre le médiateur culturel,

le traducteur (l'animateur ne parlait pas les langues des participants) et

les conditions spartiates : il n'y avait pas de chaises,

certains groupes venaient d'échapper à un naufrage et d'autres ne portaient que des draps de sauvetage.

Malgré cette situation peu orthodoxe,

à ma grande surprise,

nous avons découvert que les valeurs profondes ne se retrouvent pas dans la forme mais dans le fond.

A force d'entendre les témoignages de voyages longs et pénibles

(traverser le désert en Lybie, prendre le risque de se noyer),

les expériences, parfois à ce point traumatiques qu'elles affectaient

le professionnel, les difficultés causées par tant de souffrance et de douleur,

sont devenues le quotidien du professionnel.

Cette expérience a réveillé chez lui un événement qui remontait

à son enfance et qu'il avait oublié : la mort d'une de ses tantes, qui avait été à tellement douloureuse pour lui qu'elle avait disparu de sa mémoire.

Ainsi, lorsqu'on accueille une personne qui a vécu des drames de ce type,

il est essentiel d'offrir une écoute empathique.

C'est la seule manière d'offrir aux victimes la possibilité de s'ouvrir

et de partager leurs expériences. Il importe également d'accepter

la personne sans la juger, afin de créer un sentiment de confiance.

L'empathie est un baume pour l'âme, c'est le signe qu'une autre personne

se met dans votre peau, qu'elle écoute attentivement et qu'elle ressent véritablement votre douleur.

Voilà les trois conditions de base que la recherche de Carl Rogers

estime nécessaires pour susciter un vrai changement dans les groupes de rencontre

Au bout de la réflexion, par Rogers, sur la valeur des groupes de rencontre

pour aider les migrants à reformuler leurs traumatismes, on insiste sur un aspect intéressant :

aucun participant au groupe d'écoute n'a sollicité,

en fin de parcours, d'aide pharmacologique.

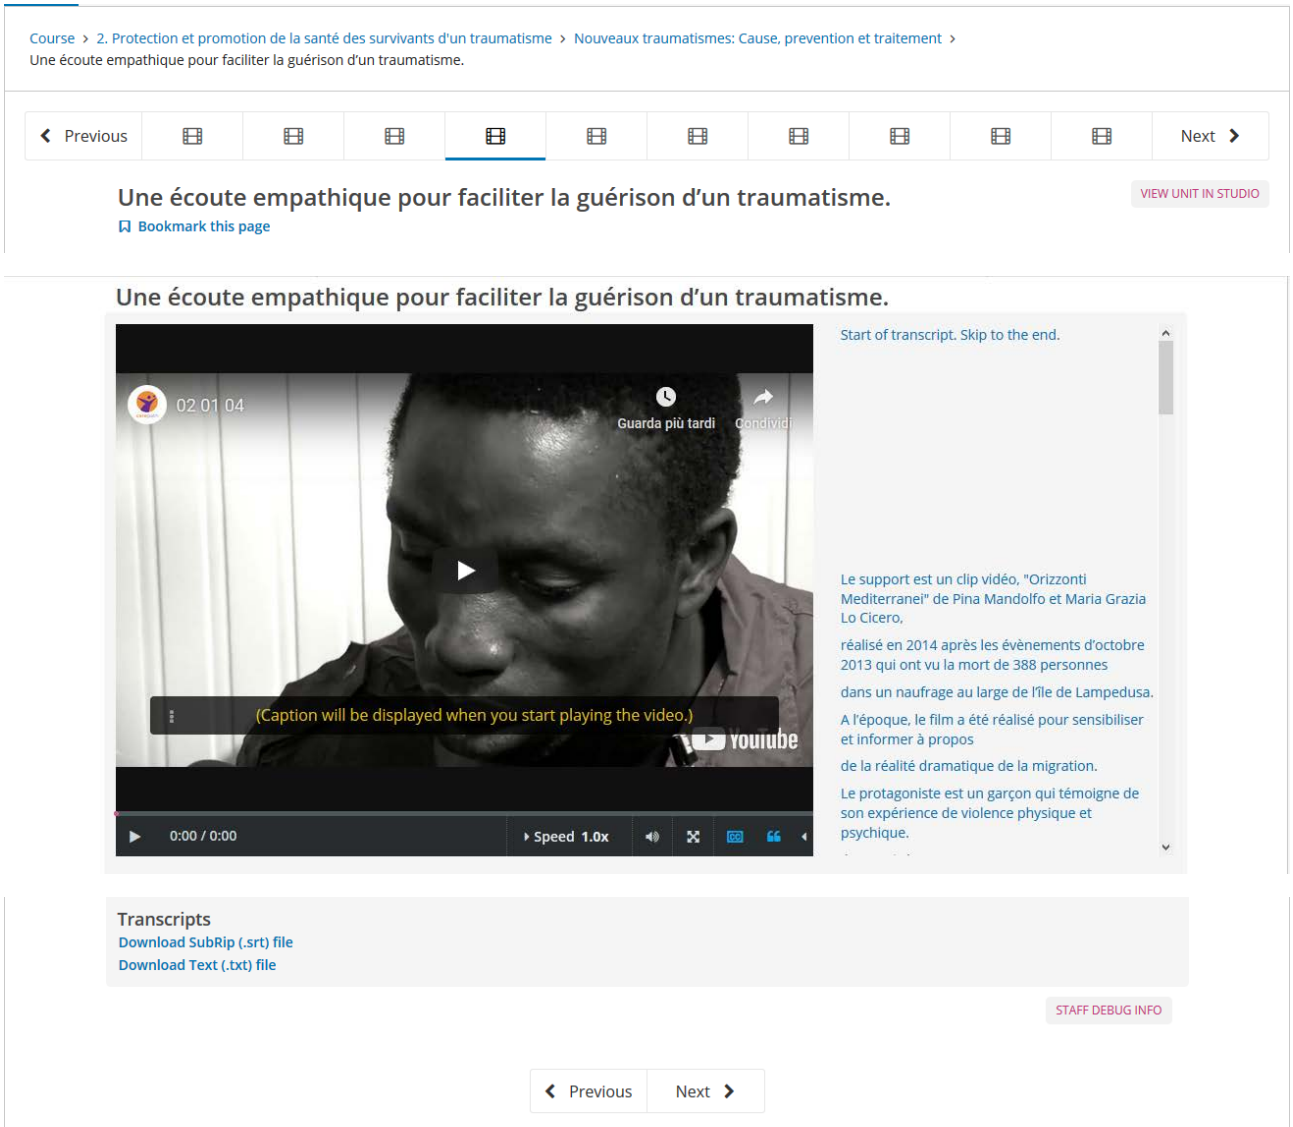
La configuration naturelle du groupe, en cercle, a été appréciée. Peut-être parce que la circularité reproduit dans une moindre mesure

les expériences vécues dans les pays d'origine : en Erythrée par exemple,

il est de coutume que les hommes et les aînés du village se regroupent

en cercle autour d'un grand arbre, qu'ils nomment l'arbre des mots.

Lors de cette rencontre, le tissu déchiré du récit est reconstitué grâce au partage de mots.



Transcript

Le support est un clip vidéo, "Orizzonti Mediterranei" de Pina Mandolfo et Maria Grazia Lo Cicero,

réalisé en 2014 après les évènements d'octobre 2013 qui ont vu la mort de 388 personnes

dans un naufrage au large de l'île de Lampedusa.

A l'époque, le film a été réalisé pour sensibiliser et informer à propos

de la réalité dramatique de la migration.

Le protagoniste est un garçon qui témoigne de son expérience de violence physique et psychique.

Il est arrivé avec sa sœur,

qui a également été victime de violence et de viol. La sœur n'avait jamais parlé de cette expérience horrible à son frère,

qui, lui-même, avait subi le même traumatisme, sans

jamais en parler à sa sœur non plus.

Il avait tellement honte d'en parler qu'il avait demandé que sa sœur ne soit pas présente

car il ne voulait pas qu'elle le sache (il le lui a dit plus tard).

Il avait honte d'être un homme victime de violence.

Ce garçon n'avait que 16 ans.

Dans son témoignage, le garçon raconte ce qui s'est passé pendant son voyage.

Pour éviter de briser son flux émotionnel, nous n'avons jamais interrompu son récit.

Seuls quelques hochements de tête et des regards profonds

l'ont encouragé à poursuivre son témoignage.

La manifestation d'empathie s'est faite par le biais de contacts visuels,

de hochements de tête, d'inclinaisons du corps vers lui,

mais pas de manière verbale ni situationnelle.

C'était nécessaire pour le pousser à parler sans le toucher ;

il voyait tout contact comme source de honte, comme s'il était un enfant

incapable d'avoir une histoire pénible et de la supporter.

Même s'il était plus jeune que sa sœur, il pensait devoir venir à son aide.

A nouveau, nous pouvons observer comment faire preuve de délicatesse,

comment écouter avec empathie pour créer des relations de partage.

CETTE PARTIE DE LA VIDEO EST DIFFICILE A TRANSCRIRE CAR ELLE CONTIENT DES VOIX DE NARRATEURS, DES ENTRETIENS ET DES IMAGES.

La vidéo présente un moment d'écoute de deux récits :

celui d'une fille et celui d'un garçon –

qui sont frère et soeur.

Ils quittent l'Erythrée et arrivent à

Lampedusa en 2014 où ils sont placés dans le centre CARA de Mineo.

Ils y restent en attendant l'obtention d'un permis de séjour.

Lorsque nous tentons de les interroger, de leur offrir une chance de témoigner

de leurs expériences, nous savons qu'il faut leur offrir

une écoute attentive et empathique, un lieu sûr où partager leur récit.

La tâche est délicate car frère et sœur ont survécu à des violences

et à des actes de torture particulièrement graves et tragiques.

Chacun a demandé à s'exprimer en l'absence de l'autre.

Le récit de la fille – de son voyage - commence par sa volonté d'éviter à son frère

de devoir faire son service militaire à 16 ans. Dans son histoire, elle souligne un élément fondamental :

« Je ne parviens pas à oublier, je ne trouve pas la force de parler. »

Lorsqu'elle prononce ces mots, un contact, lors de l'écoute, s'établit entre la fille et le professionnel qui lui prend les mains.

Normalement, il est difficile de recourir au moindre contact physique face à ce type

d'expérience, il est donc préférable de ne pas toucher la victime de traumatismes et de violence physique.

Toutefois, dans le cas qui nous occupe, le professionnel a estimé que la fille avait besoin

d'un soutien plus fort pour continuer à partager son histoire. Le professionnel lui demande donc s'il peut lui tenir les mains.

La demande verbale, préalable à l'action, a suffi pour la convaincre d'accepter.

Grâce à ce contact, un canal puissant et solide d'énergie s'est libéré.

Chaque fois que la fille doit aborder un aspect particulièrement douloureux et traumatisant,

elle a tendance à s'arrêter et le professionnel lui tient les mains pour maintenir

le flux d'énergie nécessaire

à la poursuite du récit.

En conclusion de cet exercice, nous pouvons affirmer que, confronté à des témoignages,

on ne peut ni banaliser, ni minimiser, ni amplifier le récit.

Il importe de l'écouter avec empathie, avec la plus grande attention

pour la manière dont il est raconté. Ecouter en faisant preuve d'une grande sensibilité,

mais surtout d'empathie, et reconnaître la souffrance vécue par autrui.

Voilà l'élément déterminant qui nous a donné accès à l'expression la plus profonde

et la plus intense des émotions dans ce partage poignant.

L'adoption d'un enfant exige de vaincre la nature et surtout la stérilité.

Le geste posé par un parent adoptif est un don précieux,

non seulement pour le parent, qui a enfin un enfant,

mais également pour l'enfant, qui trouve enfin une famille.

Faut-il parler de « parent adoptif », ou simplement se limiter au terme « parent » ?

Bien sûr, le parent adoptif est totalement parent,

autant qu'un parent biologique, comme le montre la recherche, mais également comme le prouvent les relations nouées entre l'enfant et le parent.

Adopter un enfant et avoir un enfant biologique sont des expériences similaires à plus d'un titre.

Pourtant, si le parent adoptif sera surpris lorsque l'enfant l'appellera papa

(ou maman), cela sera une évidence pour le parent biologique.

En d'autres termes, la parentalité adoptive

est peut-être plus intense que la parentalité

biologique. Cependant, le parent doit tenir compte de ceci :

l'enfant adopté a le droit d'être heureux et, pour être heureux,

il a besoin qu'on tienne compte de son histoire.

Ou, elle peut nous être inconnue si personne ne nous l'a racontée ou

si l'enfant l'a oubliée.

Malgré tout, nous devons faire preuve de sensibilité face aux problèmes

que l'enfant peut porter en lui.

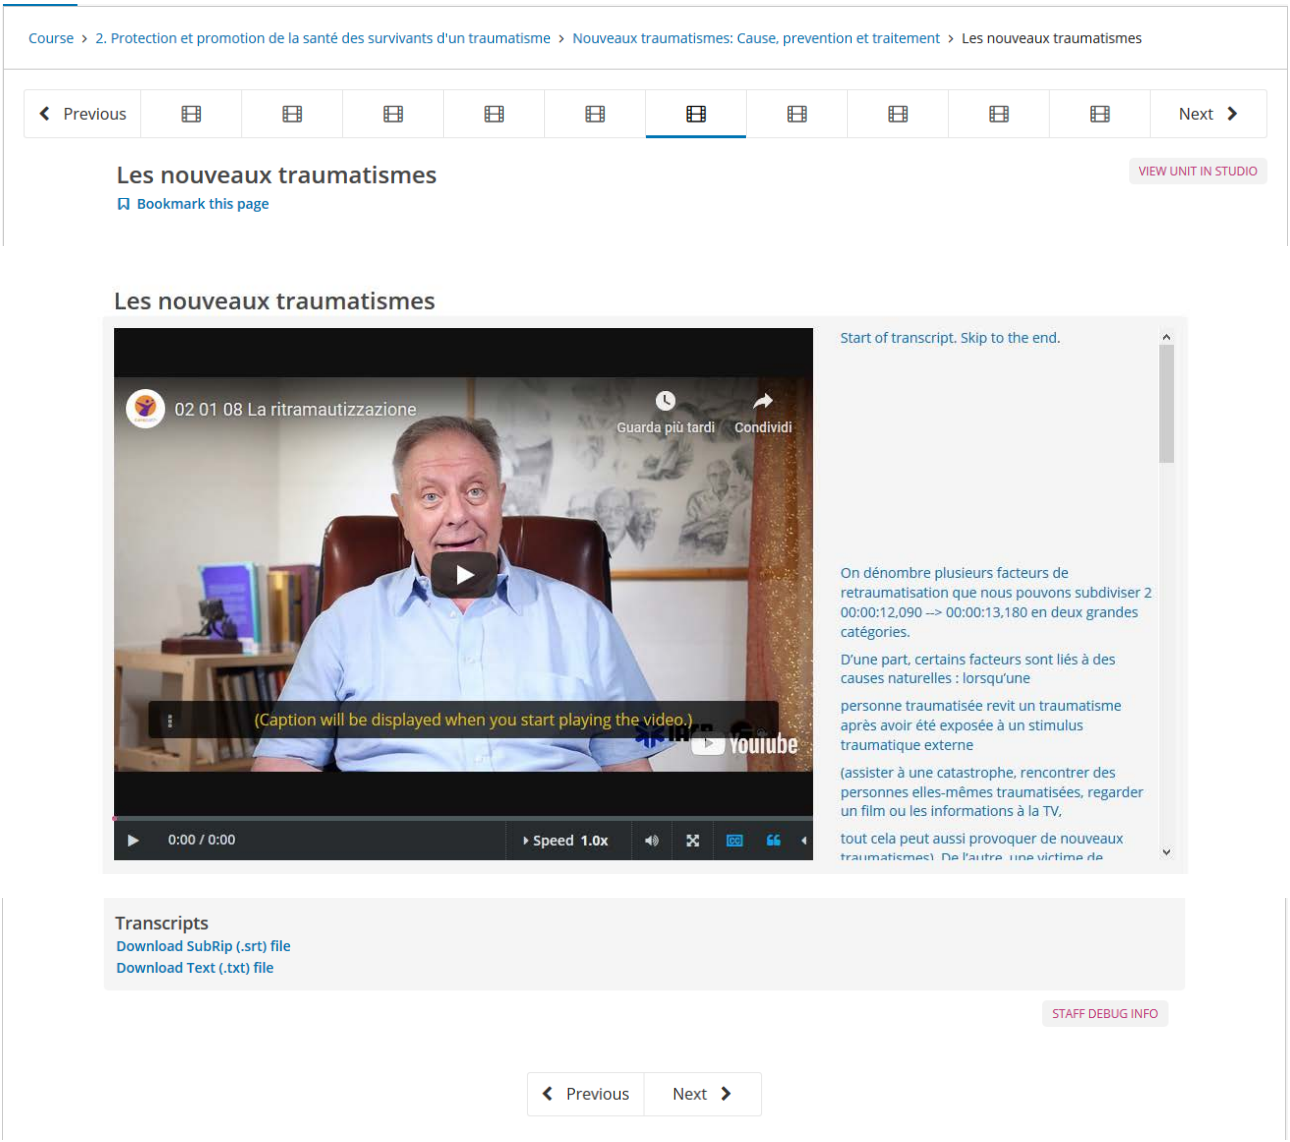
L'enfant adopté, au même titre que l'adulte qu'il deviendra, est souvent confronté à des questions existentielles :

qu'en est-il de mes origines ?

Pourquoi m'a-t-on abandonné ?

Personne ne peut répondre à ces questions, et pourtant la vie est belle et nous devons

continuer à aspirer à une vie meilleure.



Transcript

On dénombre plusieurs facteurs de retraumatisation que nous pouvons subdiviser en deux grandes catégories.

D'une part, certains facteurs sont liés à des causes naturelles : lorsqu'une

personne traumatisée revit un traumatisme après avoir été exposée à un stimulus traumatique externe

(assister à une catastrophe, rencontrer des personnes elles-mêmes traumatisées, regarder un film ou les informations à la TV,

tout cela peut aussi provoquer de nouveaux traumatismes). De l'autre, une victime de traumatismes peut vivre

un nouveau traumatisme causé par le processus d'accompagnement lorsque

celui-ci est assuré par une personne inexpérimentée ou par une organisation

qui n'est pas sensible aux traumatismes.

Même si le problème est fortuit, ne pas être sensible aux traumatismes peut être néfaste pour le patient.

Les garanties et les procédures qu'un prestataire, un professionnel ou une institution mettent en place sensibles aux traumatismes.

pour éviter les nouveaux traumatismes chez les clients s'appellent les soins

Malheureusement, dans le passé, il est trop souvent arrivé que nous provoquions de nouveaux

traumatismes chez des personnes déjà traumatisées, certainement pas par mauvaise foi,

mais par simple ignorance. C'est grâce à la recherche et aux preuves cliniques que nous avons observé que ces patients,

s'ils sont obligés de faire ce qu'ils ne veulent pas, s'ils ne sont pas respectés

dans leur temporalité, s'ils sont obligés de se remémorer des expériences traumatisantes

– pour un motif valable bien sûr – subissent, même à leur insu, des dommages iatrogènes.

Par accompagnement sensible aux traumatismes, nous entendons toutes les précautions, le filet de sécurité développé grâce à la recherche,

qui montre combien il est important de protéger les personnes traumatisées contre le danger des nouveaux traumatismes.

Il s'agit de respecter leur rythme, d'offrir des services centrés sur la personne,

de respecter leurs besoins et leurs sensibilités, mais surtout de ne pas les forcer à faire quoi que ce soit

si elles ne sont pas encore prêtes.

La raison est très simple : nous avons observé que les personnes traumatisées ont besoin d'acceptation,

de gentillesse et d'un lieu sûr pour reprendre des forces avant de se relancer,

avec la vitesse et la prudence dues aux traumatismes vécus,

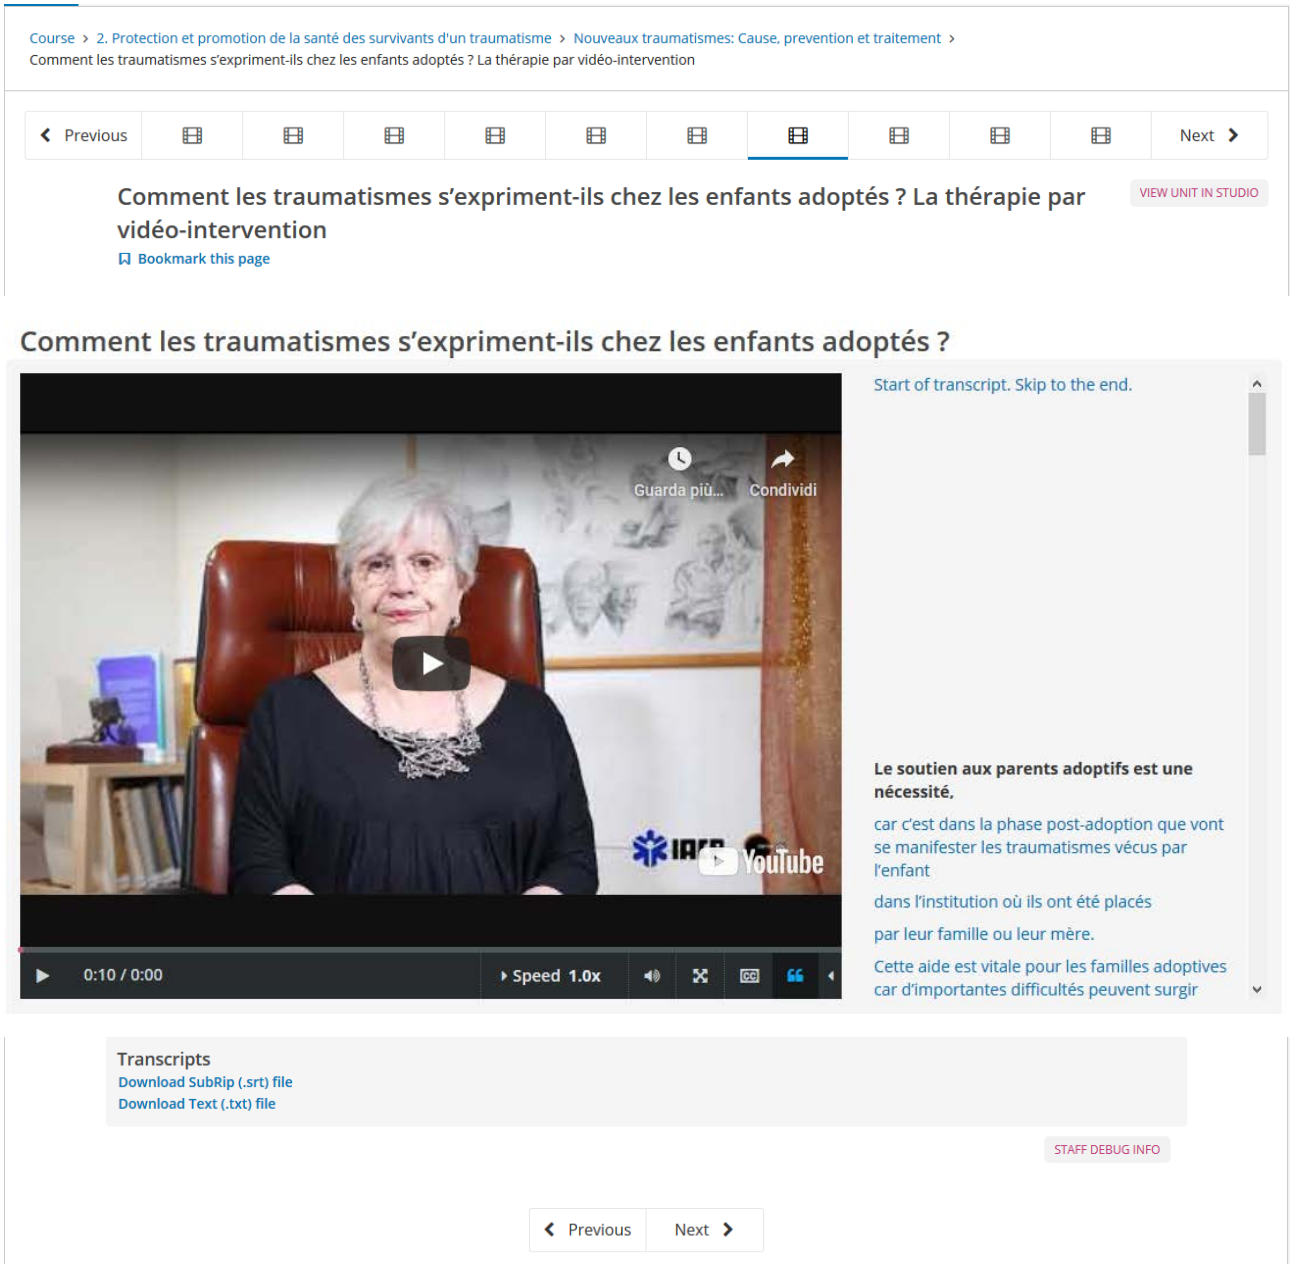
dans leur exploration.

En conséquence, son nous voulons offrir un accompagnement de qualité,

nous devons nous fier

aux capacités autorégulatrices

des victimes de traumatismes.



Transcript

Le soutien aux parents adoptifs est une nécessité,

car c'est dans la phase post-adoption que vont se manifester les traumatismes vécus par l'enfant

dans l'institution où ils ont été placés

par leur famille ou leur mère.

Cette aide est vitale pour les familles adoptives car d'importantes difficultés peuvent surgir

dans la relation entre l'enfant et sa nouvelle famille.

La recherche montre que les traumatismes peuvent briser les relations,

les rendre problématiques et difficiles et les enfants n'échappent pas à la règle.

Etre informés des difficultés rencontrées par l'enfant dans la nouvelle famille

adoptive peut faciliter la tâche des parents ou

du moins les sensibiliser.

Dans les échanges créateurs d'une relation, les échanges interactifs,

les enfants sont difficiles à gérer ; ils peuvent envoyer des signaux déroutants et imprécis,

paraître absents ou désintéressés.

Nous allons analyser chacun de ces aspects, qu'on retrouve

dans toutes les histoires d'adoption.

Par conséquent, et toujours grâce à la recherche, nous savons que chaque échange

interactif est constitué de micro-évènements qui,

analysés dans les détails, influencent les réactions adulte-enfant et enfant-adulte.

Voilà pourquoi il est très important d'utiliser les vidéos.

where the trauma has created conditions that make it difficult to read interactive micro-analytical aspects,

En effet, dans les situations où les traumatismes compliquent la lecture des aspects micro-analytiques interactifs,

il sera utile de les filmer,

de les observer lors des échanges et de voir où

et comment l'enfant se déplace

dans l'échange interactif et comment le parent réagit.

Ainsi, il convient de recommander et d'insister sur l'utilisation de l'outil - vidéo.

La vidéo permet de jeter les bases et d'analyser dans les détails chaque moment,

chaque action dans l'échange entre l'enfant et le parent. Soulignons que cet usage particulier de la vidéo doit être réservé et partagé uniquement avec les thérapeutes spécialisés ;

il ne peut pas être pratiqué par les personnes qui ne possèdent pas cette expertise vu le degré de sensibilité des personnes concernées.

On observe que les enfants adoptés envoient des signaux moins évidents,

plus brefs et moins précis que les enfants non adoptés.

A cet égard, l'utilisation de la vidéo revêt une grande importance car elle permet au parent –

qui filme chaque moment de l'interaction – de voir quand et comment l'enfant parvient à entrer en relation avec lui.

Cette étape dans

l'échange interactif permettra

de nouer un nouveau lien d'attachement.

L'hypervigilance de l'enfant est un autre élément important, essentiel même,

car elle nous raconte l'histoire de l'enfant, ses craintes, l'absence de soins et les moments de négligence.

Mais surtout, elle nous dit si l'enfant a subi de la violence physique, des abus peut-être,

ou s'il a été le témoin de violence.

L'hypervigilance désigne le moment où l'enfant se concentre

plus attentivement sur l'expression de l'adulte,

il en surveille chaque instant pour tenter de décrypter

ce qu'elle signifie et s'assurer que rien de dangereux ne va lui arriver,

ou veiller à ce qu'il n'y ait ni danger ni aucune source de menace dans cette expression.

Cela dénote clairement un manque de confiance de la part de l'enfant envers l'adulte.

Si cette méfiance va s'atténuer par le travail sur la relation adulte-enfant, il peut arriver qu'elle ne disparaisse jamais.

L'enfant peut également faire preuve d'une maladresse affective,

qui risque de blesser profondément les parents adoptifs car ils auront le sentiment

que cet enfant ne se sentira jamais libre d'exprimer son affection et sa proximité affective avec eux.

La responsabilité n'incombe pas à l'enfant mais, comme le montre le rapport,

c'est un fragment de son histoire passée particulièrement douloureux.

Les enfants sont habitués à ne pas s'approcher des adultes pour éviter tout danger.

Ils n'ont donc pas l'habitude de les toucher, ni de les étreindre, même quand la nouvelle relation le permet.

En conséquence, on peut avoir tendance à trop s'occuper de ces enfants,

en exagérant la proximité, en s'accrochant à eux ;

or puisqu'ils ne parviennent pas à moduler leurs contacts avec

l'adulte, ils ne sauront pas quand c'est trop ou trop peu, ils sont en plein désarroi et embarras.

Parfois, l'enfant s'approche de façon très maladroite, de manière presque forcée ;

le parent va le remarquer immédiatement et aura tendance à y coller une étiquette.

Nous préconisons d'envisager ce comportement comme l'expression d'un moment de l'histoire de l'enfant –

il n'a jamais été libre de se rapprocher spontanément d'un

adulte et c'est ce qui explique son comportement plutôt maladroit.

Un autre aspect que le parent verra sera la fatigue et les difficultés à dormir ...

un sommeil extrêmement agité, peu reposant et la difficulté à s'endormir.

Un autre aspect peut être observé dans la difficulté de concentration, souvent interprétée

comme trouble d'apprentissage pas mieux identifié:

l'enfant n'a pas de trouble d'apprentissage,

mais son hypervigilance déclenche des traits émotionnels négatifs si difficiles et épuisants...

et épuisant qui le distrait des tâches qui lui sont assignées.

Une fois de plus, nous verrions que l'enfant est à l'écoute du visage de l'adulte, son

l'expression, sur ce que l'adulte exprime, du danger qu'il peut représenter;

tout cela empêchera l'enfant de se concentrer.

Tous ces aspects sont cependant extrêmement importants, ces comportements sont le récit

d'une histoire passée, ils diront au parent adoptif tout ce qui est marqué dans le

histoire de l'enfant que cet enfant ne peut éventuellement s'exprimer à travers

ce genre de comportements;

alors peut-être qu'il est important de penser que ce sont des informations précieuses qui

peut nous mettre en position de comprendre cette partie du passé de l'enfant, absolument inconnaissable

pour nous, mais qui a créé ce changement dans cette relation telle qu'elle est ...

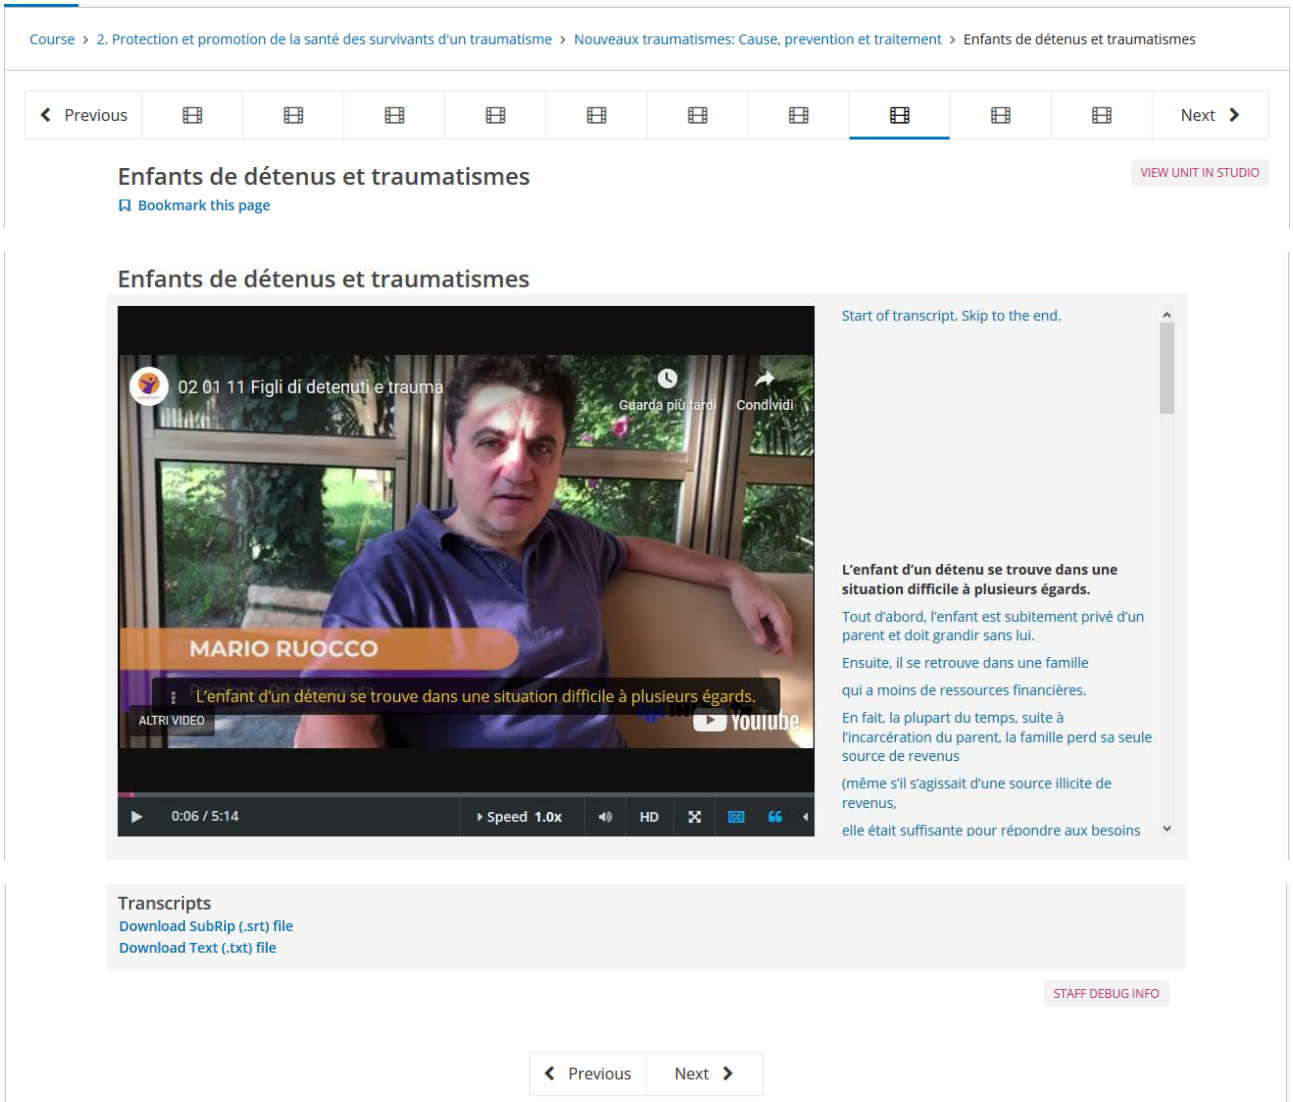
avec le nouveau parent nourricier.

Plus que des situations à corriger, ce sont des comportements à comprendre et à accepter comme

des occasions de comprendre ce qu'ils peuvent d'une histoire passée qui pourrait devenir,

avec ce petit enfant, aujourd'hui un récit partagé.

Comment le récit du passé peut créer un pont avec le récit du présent.



Transcript

L'enfant d'un détenu se trouve dans une situation difficile à plusieurs égards.

Tout d'abord, l'enfant est subitement privé d'un parent et doit grandir sans lui.

Ensuite, il se retrouve dans une famille

qui a moins de ressources financières.

En fait, la plupart du temps, suite à l'incarcération du parent, la famille perd sa seule source de revenus

(même s'il s'agissait d'une source illicite de revenus,

elle était suffisante pour répondre aux besoins quotidiens).

Une des autres conséquences tragiques, et non des moindres,

est que l'enfant devient victime de stigmatisation :

être enfant de détenu équivaut à être enfant de la culpabilité ;

l'enfant, face à la pression sociale,

se forge sa propre opinion et se convainc qu'il

mérite d'être puni. Souvent, les enfants de parents détenus sont des enfants perturbés,

notamment parce qu'il leur manque un parent

– souvent le père – pour les éduquer et leur poser

des limites.

Ce sont des enfants obligés de vivre seuls, la mère devant gérer tous les problèmes

sans plus compter sur l'aide

de son mari.

C'est un tout nouveau défi à relever et, malheureusement, il arrive que même des travailleurs sociaux tombent

dans le piège de la stigmatisation de l'enfant alors qu'ils devraient essayer

de le comprendre et de l'aider davantage que les autres enfants.

En effet, vivre seul avec une mère en difficulté n'est pas une mince

affaire. Comment annoncer à l'enfant qu'un de ses parents est incarcéré ?

Beaucoup de parents, par honte ou par difficulté, disent à l'enfant que l'autre parent

a du partir précipitamment car on lui a offert un nouvel emploi.

Evidemment, le mensonge ne tient pas face aux doutes de l'enfant puisque,

jusque-là, le père rentrait du travail tous les jours.

Pourquoi, alors, partir tellement de jours, de mois, d'années,

manquer tant d'anniversaires et de vacances pour la seule raison qu'on a accepté

un nouvel emploi ? L'enfant comprend vite que c'est un mensonge.

Le mieux à faire est de dire la vérité

à l'enfant :

« …ton père a commis des erreurs et, malheureusement, il doit répondre de ses actes ; mais il va bien, ne t'inquiète pas,

nous pourrons lui rendre visite bientôt. »

Voilà un autre problème dans la vie d'un enfant de détenus :

faut-il lui montrer le parent emprisonné ? Certains travailleurs sociaux

estiment qu'il est préférable d'éviter, le milieu carcéral n'étant pas adapté

aux besoins de l'enfant. Il n'est pas faux que, la porte d'une prison franchie,

on se retrouve face à des policiers, à des endroits pas toujours décents.

Par ailleurs, il est essentiel pour l'enfant de voir son parent.

Il est donc impératif d'organiser des rencontres entre les détenus et leurs enfants.

Si, jusqu'à récemment, des parois séparaient le détenu de ses visiteurs,

aujourd'hui les temps ont changé : de nombreuses prisons sont équipées de salles de jeu ou de pièces plus colorées,

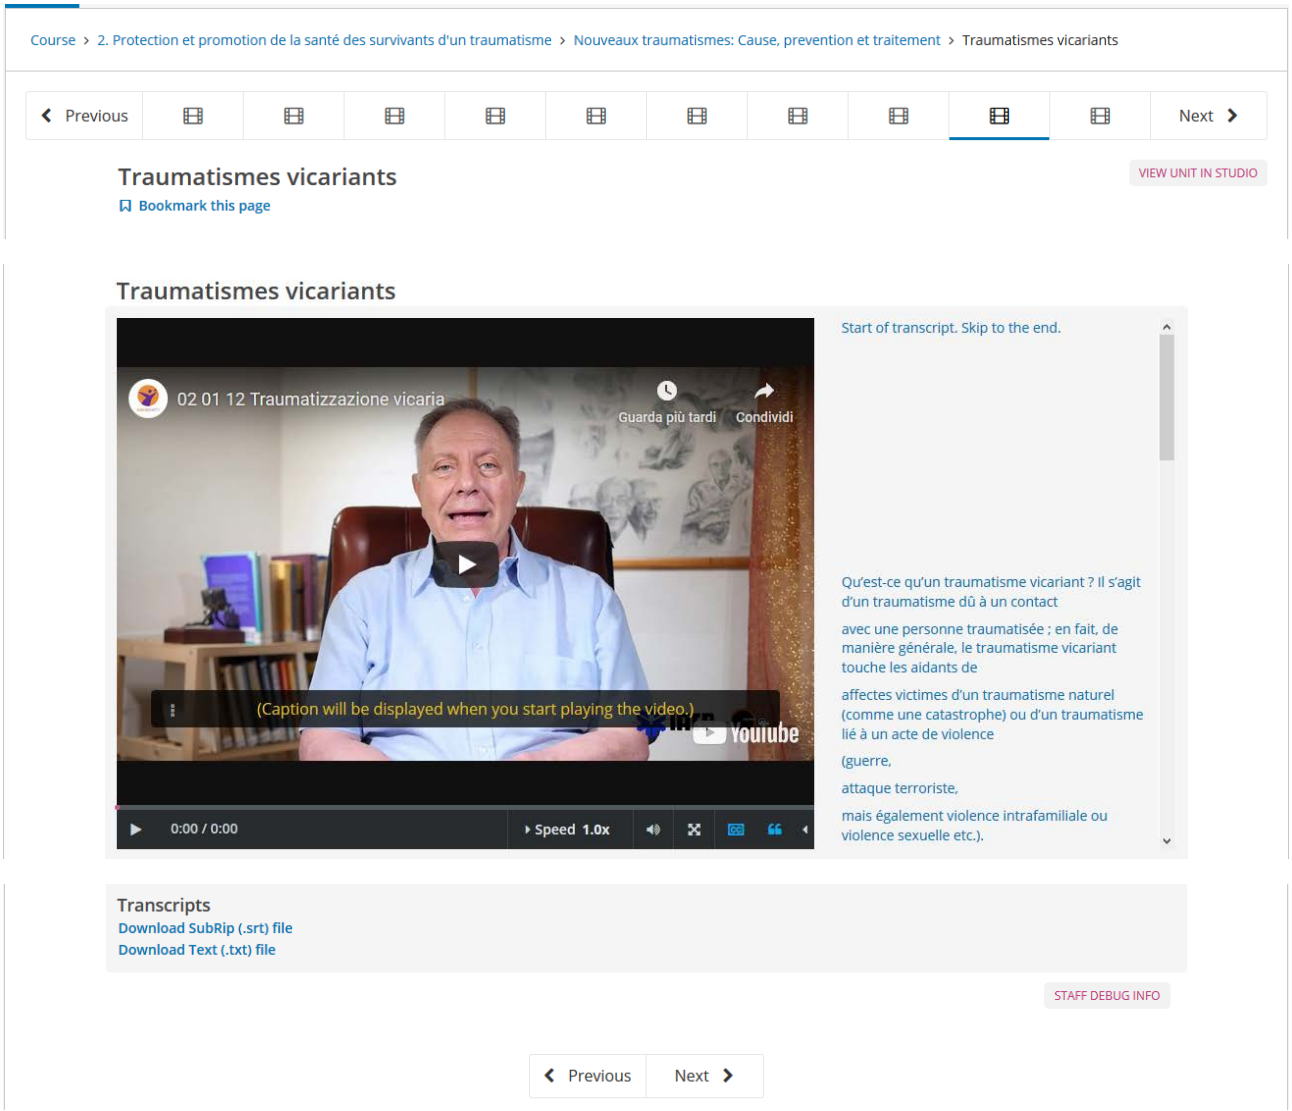
avec des jeux, et les agents pénitentiaires sont mieux préparés à l'accueil des enfants.

Toutefois, ce n'est pas le premier souci ;

il importer surtout d'organiser une rencontre entre le parent et l'enfant,

peu importe si l'enfant se rend dans un milieu adapté ou pas.

Ce n'est bien sûr pas le cas lorsque le parent est en prison pour avoir commis un délit contre son propre enfant.



Transcript

Qu'est-ce qu'un traumatisme vicariant ? Il s'agit d'un traumatisme dû à un contact

avec une personne traumatisée ; en fait, de manière générale, le traumatisme vicariant touche les aidants de

affectes victimes d'un traumatisme naturel (comme une catastrophe) ou d'un traumatisme lié à un acte de violence

(guerre,

attaque terroriste,

mais également violence intrafamiliale ou violence sexuelle etc.).

En résumé, le prestataire est en contact journalier avec les victimes

de traumatismes et leur offre, avec bienveillance, aide,

soutien et contact psychologique...

Mais malgré le sens

profond d'ouverture, d'humanité et l'importance existentielle de son travail, ces traumatismes peuvent peser sur sa santé mentale.

Le prestataire peut alors développer un véritable traumatisme

avec toutes les conséquences que cela implique pour lui.

Il est extrêmement important de prévenir et de limiter l'impact des traumatismes vicariants chez les prestataires et professionnels

susceptibles d'entrer en contact avec des victimes de traumatismes ou de violence. Il s'agit souvent de professionnels de la santé, d'agents de police, de pompiers, de journalistes, de bénévoles et de tout qui,

qui pour une raison ou pour une autre, entrent en contact avec des personnes traumatisées.

Il est tout aussi essentiel de prévenir les traumatismes vicariants, ou plus communément « épuisement professionnel »

(burnout), qui touchent les personnes impliquées dans des relations d'aide.

Ces traumatismes frappent durement ceux et celles qui ne parviennent pas à recharger leurs batteries,

à se déconnecter d'un travail lourd et prenant, mais aussi magnifique.

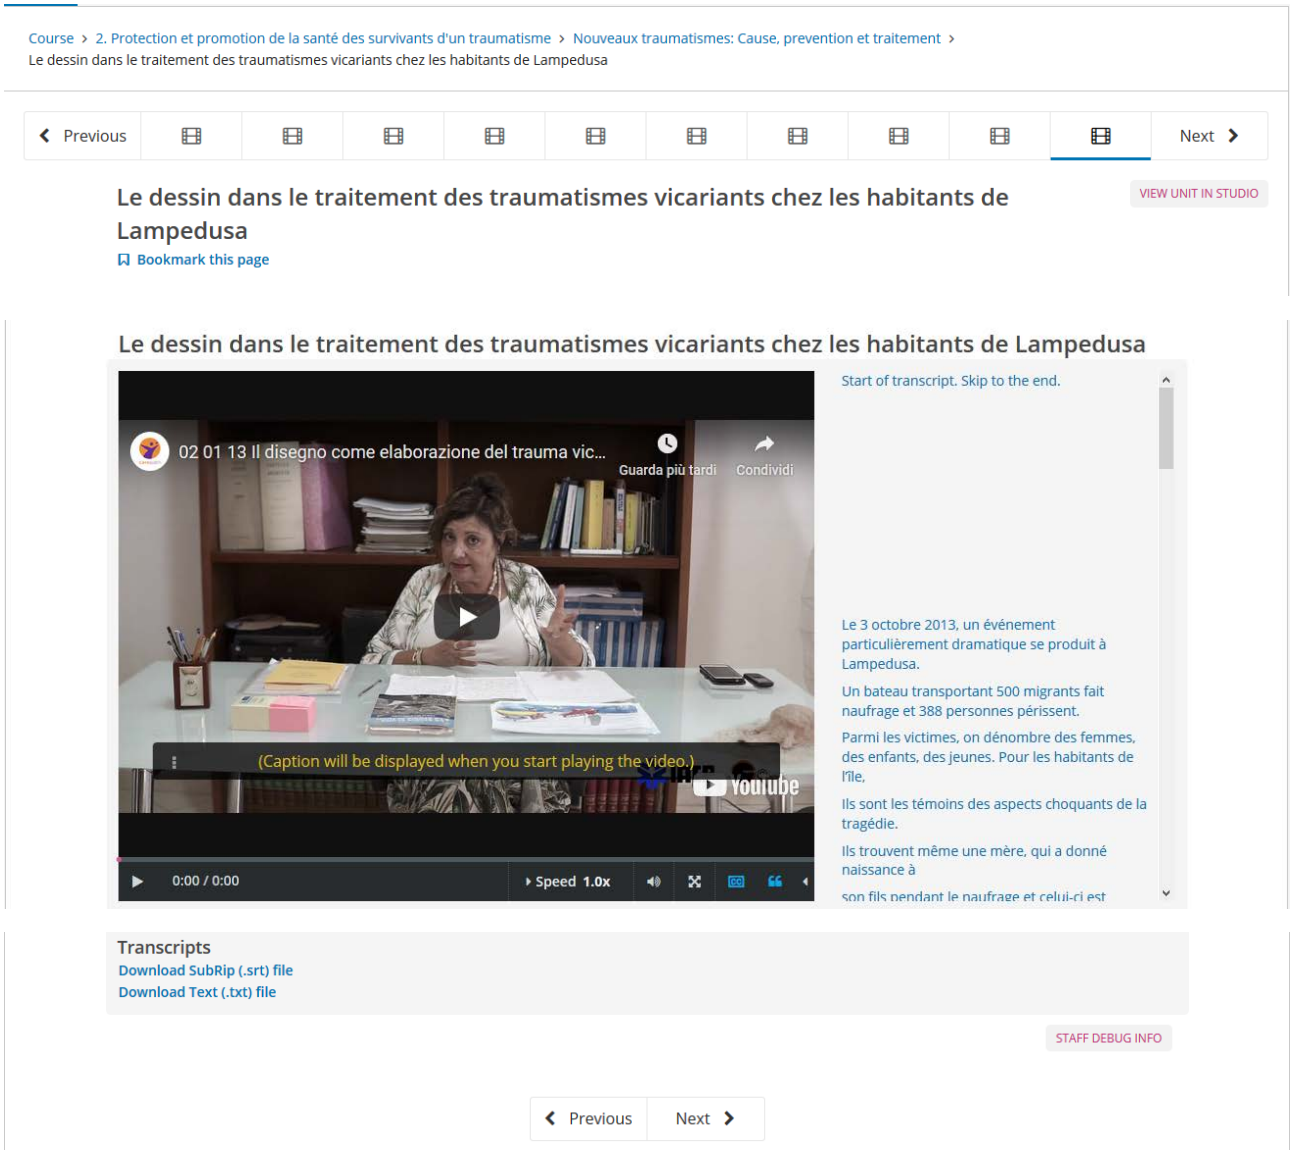
Il est également important d'assurer un équilibre entre la vie familiale et la vie professionnelle car,

pour être efficace dans son travail d'aide, le professionnel devra prendre soin de sa vie privée,

passer du temps avec sa famille, ses amis et s'amuser. En résumé, il est difficile pour les prestataires de services d'aide, animés par la passion, la générosité et l'empathie, de s'aider eux-mêmes.

Ou on ne peut pas donner aux autres ce qu'on ne possède pas. D'un point de vue moral, éthique et professionnel, il est donc nécessaire de stimuler notre résilience, de protéger notre santé et notre bien-être.

En effet, si nous voulons donner le maximum aux personnes que nous aidons, il est essentiel de s'occuper également de la personne avec laquelle nous allons passer chaque minute de notre vie: nous-mêmes.



Transcript

Le 3 octobre 2013, un événement particulièrement dramatique se produit à Lampedusa.

Un bateau transportant 500 migrants fait naufrage et 388 personnes périssent.

Parmi les victimes, on dénombre des femmes, des enfants, des jeunes. Pour les habitants de l'île,

Ils sont les témoins des aspects choquants de la tragédie.

Ils trouvent même une mère, qui a donné naissance à

son fils pendant le naufrage et celui-ci est toujours attaché au cordon ombilical.

l'événement est traumatisant car ils participent tous au sauvetage en mer

et à la récupération de centaines de cadavres.

Cet événement provoque un traumatisme

vicariant au sein de la population.

Nous tentons donc, au sein de l'agence locale pour la santé,

d’offrir une aide d’écoute et de soutien aux personnes qui

ont vécu des expériences traumatisantes.

Les expériences traumatisantes vécues par les enfants,

surtout s’ils sont encore en âge de l’école primaire, sont les plus difficiles à gérer.

A Lampedusa, l’immigration est une expérience de plusieurs années.

Tous les habitants (notamment les jeunes) savent que, souvent,

les voyages de l’espoir se soldent par des pertes humaines. Cependant, les enfants de 6-7 ans sont plus sensibles à ce type

d’expériences et la plupart éprouvent de la peur, de l’angoisse, des phobies.

Ils adoptent les réactions typiques de quelqu’un exposé à une expérience traumatisante,

lorsque la vie est mise en danger ou perdue.

Pour les enfants de Lampedusa, ce tragique événement s’est déroulé dans leur mer,

qu’ils associent à la joie, au jeu et au plaisir ; Cette mer est pour eux un espace de joie et de légèreté,

qui tout à coup devient un espace de mort.

Afin de traiter

les traumatismes vicariants chez ces enfants,

nous leur proposons de réaliser des dessins qui illustrent

comment les enfants répondent et réagissent au traumatisme.

Si deve fare una piccola premessa: l’arte

è uno strumento potente per rendere tangibili eventi dolori e spaventosi, in sé l’arte

Posons une hypothèse : l’art est un instrument efficace pour rendre concrets des événements douloureux et effrayants.

L’art, en tant que tel,

a un effet libérateur et permet de repenser les évènements traumatisants.

Ensuite,

la question se pose du sens d’un événement traumatisant pour les enfants.

Tout dépend du type d’évènements. En effet, un événement traumatisant peut prendre différentes formes :

être provoqué par les humains (par exemple, les guerres et le terrorisme) ou par la nature

(les ouragans, les tremblements de terre et les tornades).

Chacun de ces évènements laisse des traces et des craintes spécifiques dans l’esprit des enfants. A cet égard, il est nécessaire, dans le cas du naufrage survenu à Lampedusa,

de reconstruire la fracture affective et interne vécue par les enfants, qui a aussi touché leur famille.

Ajoutons que des enfants de 6 et 7 ans auront du mal à

comprendre le sens de la mort et nous savons combien les enfants ramènent tout à eux.

A cause de ces évènements et de ces histoires de mort,

les enfants ont maintenant peur de manger du poisson (les poissons se sont nourris des enfants et des mères décédés)

ou de nager dans la mer

(où ils pourraient rencontrer des cadavres).

Il faut donc reconstruire leur

sérénité en utilisant l'imagerie développée sur l'île de Lampedusa.

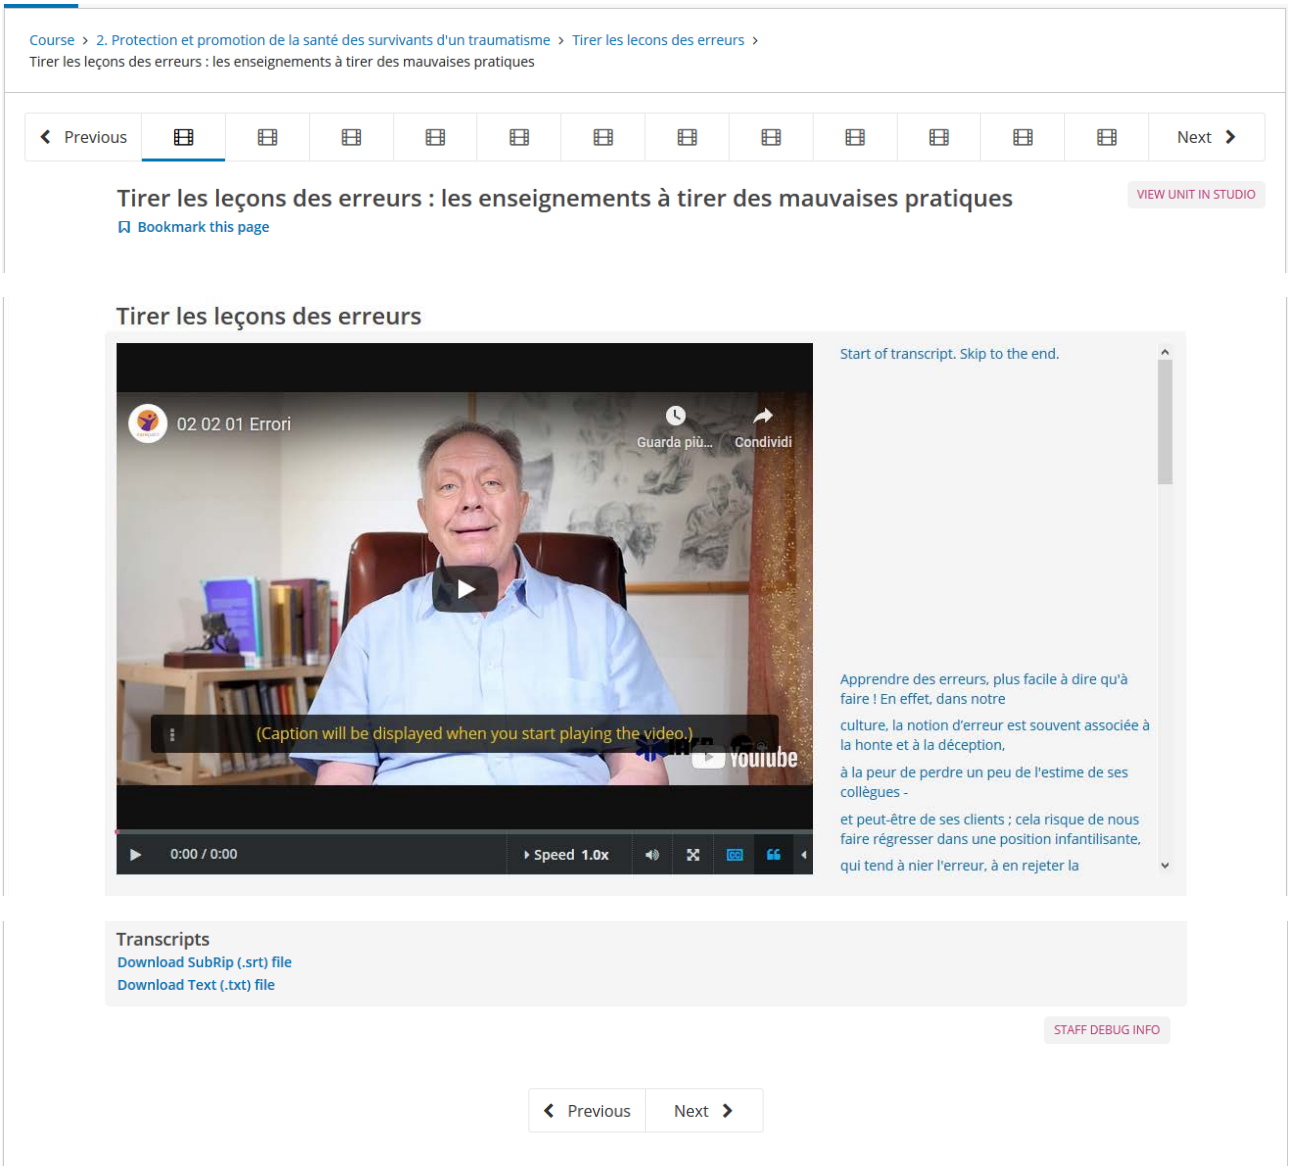
Comme on dit, tout est possible grâce au dessin.

Grâce au dessin, il est possible de construire un récit expliquant comment chaque enfant ressent l'événement car,

même si l'expérience de l'évènement est collective, sa perception variera selon chaque enfant.

Il faut éviter d'offrir immédiatement des mots de consolation,

mais laisser chaque enfant développer une solution personnelle aux angoisses liées au décès et à la disparition (la plus grande angoisse chez les enfants de 6-7 ans), par un soutien verbal et graphique, et par l'écoute qui fait suite à chaque phase de dessin.



Transcript

Apprendre des erreurs, plus facile à dire qu'à faire ! En effet, dans notre

culture, la notion d'erreur est souvent associée à la honte et à la déception,

à la peur de perdre un peu de l'estime de ses collègues -

et peut-être de ses clients ; cela risque de nous faire régresser dans une position infantilisante,

qui tend à nier l'erreur, à en rejeter la responsabilité sur les

autres, à prétendre que ce n'est pas notre faute, etc. Cette attitude de négation nous empêche de voir que, derrière chaque erreur,

se cache un trésor de sagesse.

En adoptant la bonne attitude, en refusant de rester sur la défensive,

nous pouvons nous ouvrir et apprendre de nos erreurs : elles deviennent ainsi nos professeurs et nous aident à

devenir de meilleurs professionnels ; qui plus est, ce faisant,

nous aidons nos patients à apprendre de leurs expériences.

C'est à la fois drôle et tragique : tous nous voulons aider les professionnels à inciter

leurs patients à apprendre de leurs expériences et de leurs erreurs,

tout en favorisant cette prise de conscience davantage chez eux que chez nous ;

nous rechignons à admettre nos erreurs et, ainsi, refusons d'être

ouverts à l'apprentissage.

Une perception dysfonctionnelle des erreurs, comme si elles généraient

une perte d'estime de soi lorsqu'on en tire les leçons, serait censée augmenter notre confiance :

c'est un peu fou. Tentons une image : ceux qui ont peur pensent qu'ils sont lâches,

ignorant que les braves éprouvent de la peur mais décident de la surmonter ;

les intelligents et sages acceptent leurs erreurs et en tirent les leçons.

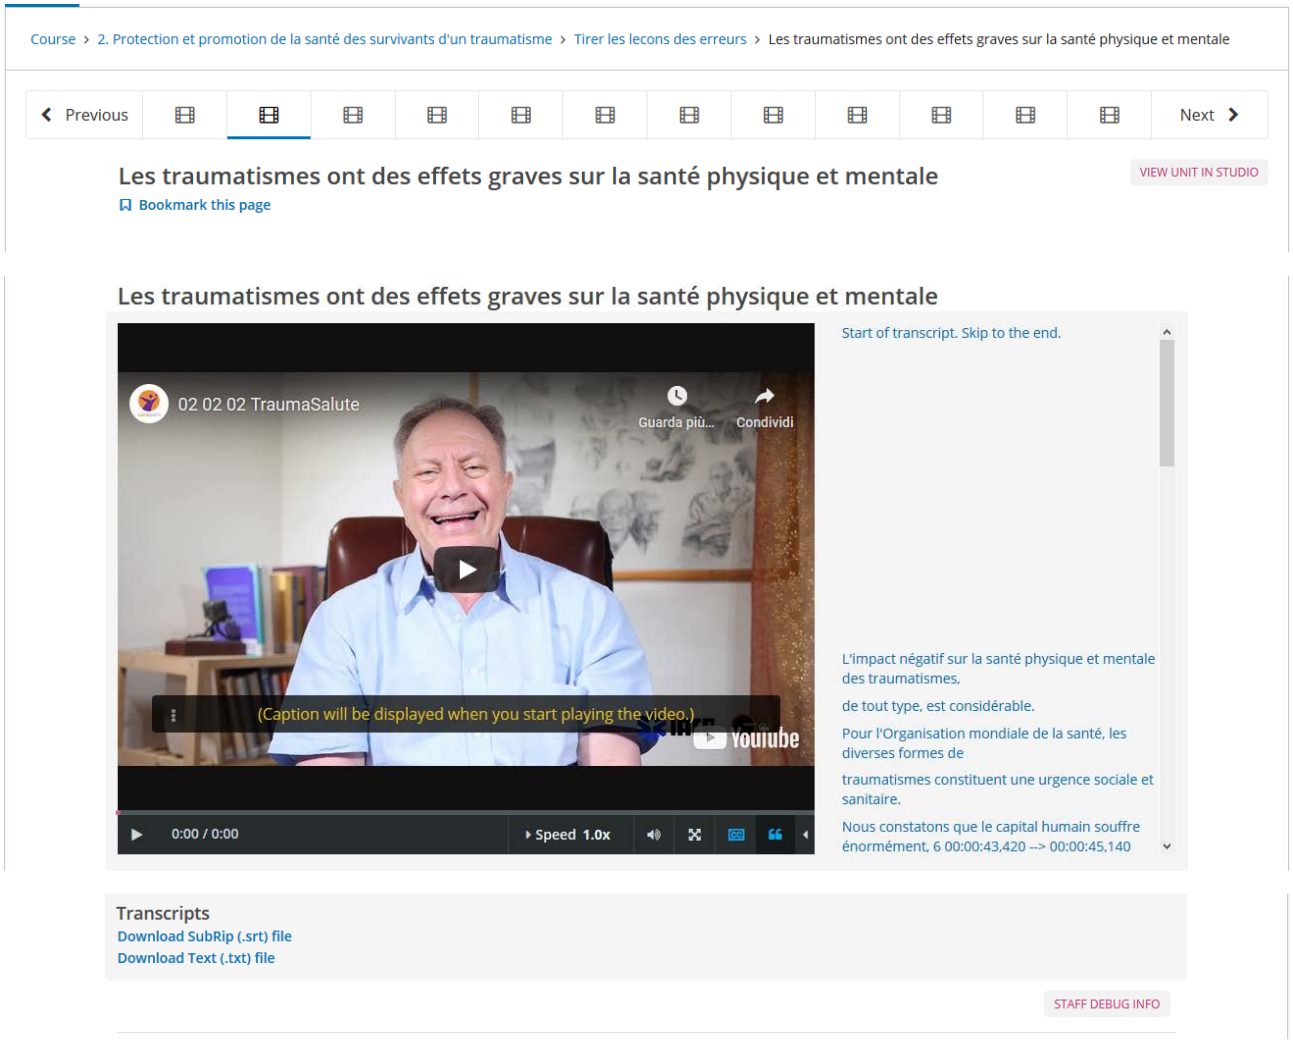
Nous pourrions apprendre beaucoup de nos patients qui sont, davantage que nous,

prêts à tirer humblement les leçons de de leurs expériences pour éviter de répéter les mêmes erreurs.

Au contraire, nous nous condamnons à répéter nos erreurs lorsque nous refusons de les admettre ;

en effet, dans cette hypothèse, nous nous décrivons comme des victimes susceptibles de nous mettre en situation d’impuissance.

Accueillons nos erreurs pour ce qu’elles sont : des maîtres de la sagesse.



Transcript

L'impact négatif sur la santé physique et mentale des traumatismes,

de tout type, est considérable.

Pour l'Organisation mondiale de la santé, les diverses formes de

traumatismes constituent une urgence sociale et sanitaire.

Nous constatons que le capital humain souffre énormément, tant au niveau physique que mental, des traumatismes.

Collectivement, nous contribuons moins efficacement à la prospérité, lorsque

les victimes de traumatismes nécessitent des soins et donc consomment une partie

de nos ressources économiques ; qui plus est, le traumatisme les empêche,

individuellement, de produire de la prospérité pour elles-mêmes,

pour leur famille, pour leur collectivité et pour leur pays.

Nous observons un autre aspect très préoccupant chez la victime de traumatismes :

non seulement souffre-t-elle de dommages au

niveau de sa santé physique et mentale,

mais, principalement dans certains types de traumatismes (violence ou violence sexuelle),

elle risque de passer du statut de victime à celui d'auteur et donc de traumatiser,

à son tour, d'autres personnes innocentes.

Ce glissement horrible montre à quel point le traumatisme est assimilable à un virus qui se propage d'un corps

à l'autre s'il n'est pas combattu, prévenu et traité efficacement dans la communauté.

On peut parler de pandémie, c'est-à-dire d'un problème qui se transmet rapidement d'un individu

à l'autre dans la population, entraînant une grave perte de capital humain.

Dans une approche bio-psychosociale, nous ne pouvons laisser

la responsabilité de la prévention et du traitement des traumatismes au seul secteur de la santé ;

il s'agit d'une tâche politique qui nécessite que toutes les institutions - familles, écoles, organisations professionnelles, monde de la justice des mineurs, législatif –

se sensibilisent à la problématique et s'intègrent dans

un réseau efficace de prévention et de résolution des traumatismes.

C'est dans l'intérêt et pour le bien de tous et de toutes.

Parlons de l'omniprésence du traumatisme : les répercussions des traumatismes

sur la communauté et sur la société apparaissent avec de plus en plus d'évidence.

Dans le passé, les études sur les traumatismes portaient davantage sur l'acuité du traumatisme

et l'exposition à des événements plus ou moins graves.

Au fil du temps, le concept de traumatisme s'est élargi à de nombreux autres aspects.

Le traumatisme est un phénomène omniprésent dans nos sociétés : la recherche nous indique

qu'une personne adulte a été exposée,

ou sera exposée dans l'avenir, au moins une fois à un événement traumatique.

D'après certaines études, comme celle de Benguet, nous savons que, dans le monde entier,

le pourcentage d'occurence de traumatismes est très élevé,

malgré quelques variations. Nous devons donc aujourd'hui tout faire pour découvrir

quels aspects protègent le mieux les gens contre

les traumatismes et lesquels risquent d'augmenter l'exposition aux traumatismes.

Les études sur le sujet nous ont appris que le traumatisme est collectivement à

l'origine de nombreux troubles chroniques aux répercussions majeures sur l'économie et la santé publique,

mais surtout qu'individuellement, un traumatisme empêche la personne concernée d'exprimer

ses potentialités et donc de devenir un citoyen pleinement conscient et efficace de la communauté et de la société dans laquelle elle vit.

Le concept de traumatisme sera encore plus important

si on envisage tous les traumatismes

survenant pendant la période

de développement de l'individu,

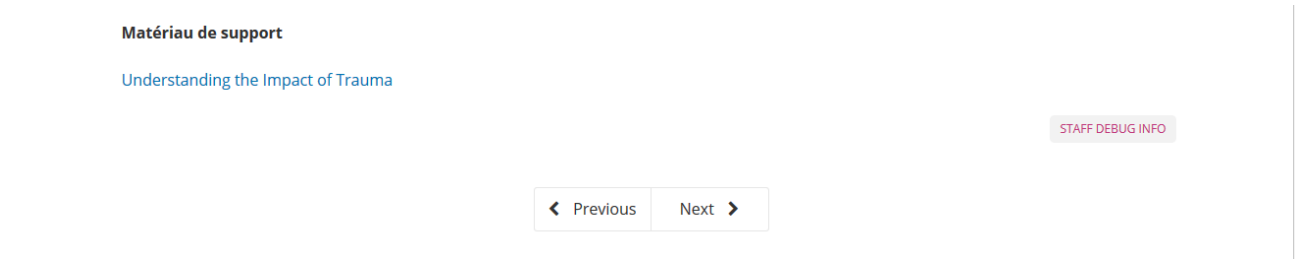
lorsqu'il développe ses

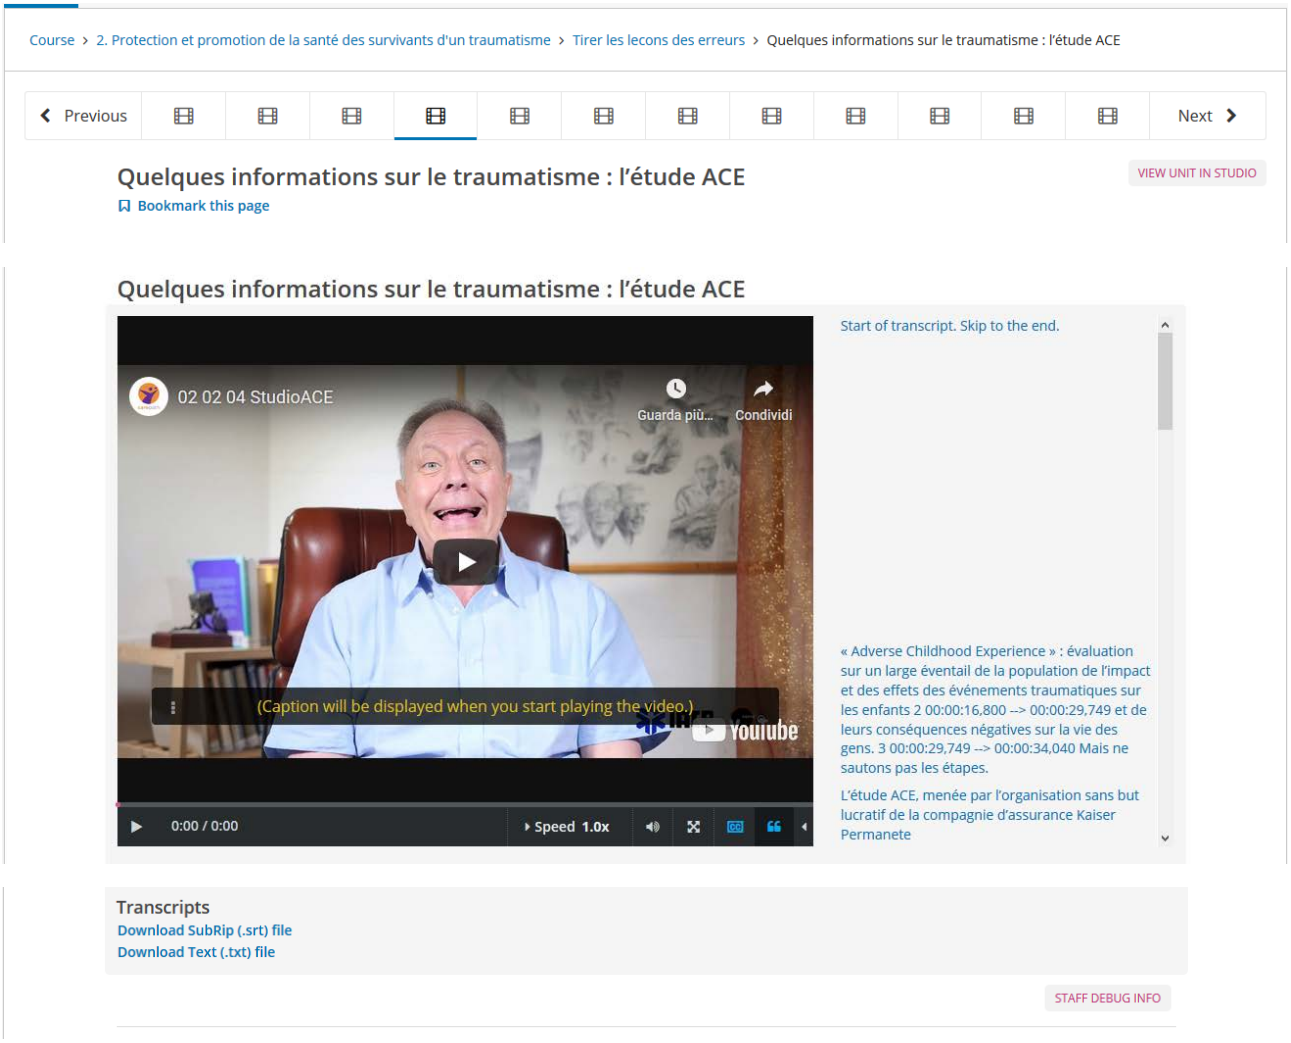
capacités émotionnelles et sociales ;

Il est donc crucial, comme nous

le faisons aujourd'hui à travers ce cours,

d'approfondir notre connaissance du traumatisme.





Transcript

« Adverse Childhood Experience » : évaluation sur un large éventail de la population de l'impact et des effets des événements traumatiques sur les enfants et de leurs conséquences négatives sur la vie des gens. Mais ne sautons pas les étapes.

L'étude ACE, menée par l'organisation sans but lucratif de la compagnie d'assurance Kaiser Permanete

(basée en Californie), s'est penchée sur les expériences négatives vécues au cours de l'enfance.

L'organisation a investi plusieurs millions de dollars pour mener à bien une étude

qui a porté des fruits pour l'ensemble de la communauté scientifique ;

en effet, nous en savons maintenant beaucoup plus sur le sujet ;

qui plus est, chaque répétition de l'étude en a confirmé les données initiales :

en moyenne, au moins un tiers de la population, soit un tiers des citoyens, a connu dans son enfance au moins un épisode indésirable,

un traumatisme. Un plus petit nombre de citoyens est affecté par

deux occurrences traumatiques et un nombre encore

plus petit souffre d'un plus

grand nombre de traumatismes.

La gravité des conséquences est proportionnelle au nombre de traumatismes vécus,

tout comme recevoir plusieurs coups de poignard est pire qu'en recevoir un seul.

Qui plus est, un traumatisme fait plus de dégâts qu'un coup de couteau,

car non seulement il laisse des séquelles négatives – au même titre qu'un coup de couteau -

sur l'apparence physique et mentale de la victime, mais, d'une certaine manière,

il agit comme un virus et pousse

certaines victimes de traumatismes – principalement quand elles ont subi des actes de violences, d'abus sexuels, etc. -

à en devenir elles-mêmes des auteurs une fois à l'âge adulte.

On a donc dit des problèmes mentaux et physiques qu'ils sont souvent associés.

Précisons : les victimes d'un traumatisme essaient instinctivement

de s'adapter à celui-ci, c'est-à-dire de s'en sortir, de gérer l'événement.

Si ce type de gestion d'un traumatisme peut être efficace dans un premier temps,

il finit par coûter cher sur le long terme.

Par exemple, certaines personnes peuvent, afin de gérer les effets du traumatisme, atténuer

leur souffrance par la consommation d'alcool ou de drogues,

ce qui crée un autre problème,

aggrave la situation et les fait sombrer dans l'alcoolisme ou la toxicomanie.

Au niveau comportemental, nous savons que nous avons tendance à éviter

le contact avec les autres, mais, en nous isolant, nous sommes empêchés de « recharger nos batteries ».

Ou d'entretenir des relations sexuelles. Bref, les expériences négatives de l'enfance sont un véritable fléau social

qui coûte très cher, les seuls coûts des traitements et des soins étant déjà très élevés.

Il est donc dans l'intérêt général que nous nous efforcions de prévenir et de traiter efficacement les traumatismes

que nous avons subis dans notre enfance.

C'est tout bénéfice non seulement pour les victimes, mais également pour l'ensemble de la société.

Qu'entend-on par « une approche sensible aux traumatismes » ?

Il s'agit simplement de se concentrer, d'être sensible au traumatisme.

Il s'agit d'une approche visant à prévenir la retraumatisation,

à offrir des services et à concevoir des structures susceptibles de réduire

le risque de retraumatisation et de garantir une efficacité maximale des services.

Nous en sommes également arrivés à définir les bonnes pratiques comme des pratiques

sensibles aux traumatismes

par une attitude d'ouverture aux erreurs commises dans le passé.

Il s'agissait, bien sûr d'erreurs commises non pas intentionnellement,

mais par ignorance, parce que, justement, nous ne savions pas que certains aspects des traitements offerts

à l'époque contribuaient au problème et non à la solution : par exemple,

nous ignorions que susciter chez le patient

un souvenir non souhaité des traumatismes passés, un retour sur les moments traumatisants,

était iatrogène.

Aujourd'hui, grâce aux leçons des erreurs passées, nous disposons d'une série de directives

et de paramètres qui nous aident à prévenir

les dommages et à tirer un maximum des offres de services.

C’est vrai non seulement dans le domaine de la santé et de la santé mentale,

mais dans tous les autres domaines, comme l’enseignement, la vie associative,

la justice pour mineurs ou même le législatif.

Par exemple, dans un enseignement sensible aux traumatismes, les enseignants sauront que l’élève « indiscipliné » ne l’est pas automatiquement parce qu’il ne respecte pas les règles

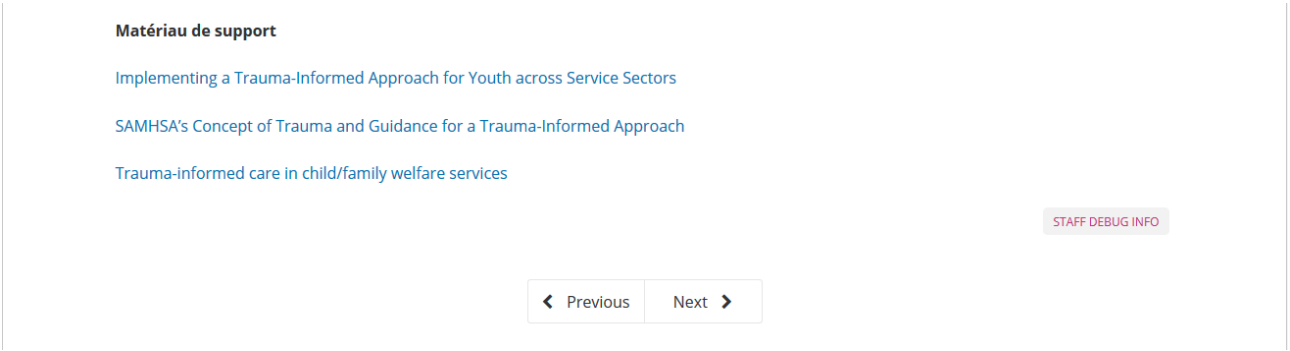
mais il est envisageable qu’il exprime, par son indiscipline, un problème sous-jacent dû à un traumatisme. En être conscient permettra à l'enseignant de gérer

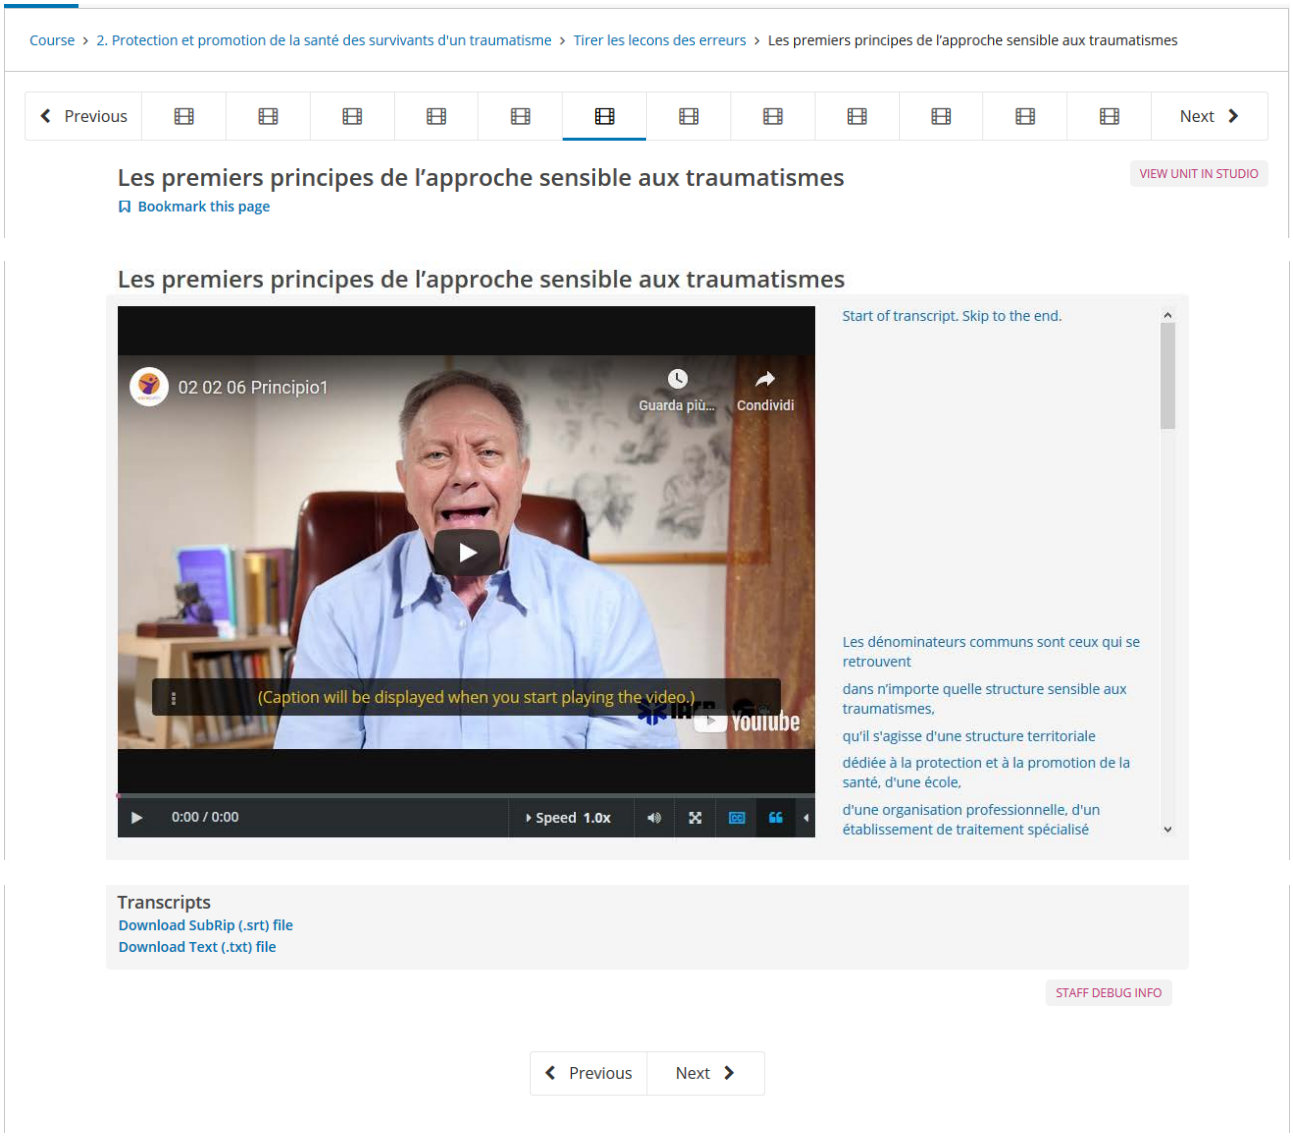
plus efficacement son rôle et d’orienter l'élève problématique vers un psychologue afin que l'élève, s'il a besoin d'aide, puisse être aidé,

et afin d’éviter une aggravation de son problème. Après tout, adopter une approche sensible au traumatisme n'est pas seulement une obligation éthique,

clinique pour les professionnels de la santé mentale, mais c'est également un choix rentable,

car fournir des traitements qui atténuent les dommages est dans l'intérêt non seulement des victimes d’un traumatisme mais de l’ensemble de la société.





Transcript

Les dénominateurs communs sont ceux qui se retrouvent

dans n'importe quelle structure sensible aux traumatismes,

qu'il s'agisse d'une structure territoriale

dédiée à la protection et à la promotion de la santé, d'une école,

d'une organisation professionnelle, d'un établissement de traitement spécialisé

ou même d'un établissement correctionnel dans le système judiciaire.

Une communauté, pour être sensible aux traumatismes, doit posséder ces dénominateurs communs,

qui partagent un même fil conducteur :

ils se retrouvent autour de la volonté de

communiquer aux survivants de traumatismes

un sentiment de sécurité,

physique et psychologique - d'être pour eux un refuge.

Le premier principe fondé sur le traumatisme est que les

établissements doivent offrir une sécurité physique et émotionnelle

permettant à la personne traumatisée de vivre en sécurité,

de sentir que rien de mal ne peut lui arriver,

qu'elle ne subira pas d'attaques,

que rien de mal ne lui sera fait : C'est un endroit sûr où elle ne devra pas être sur le qui-vive, en alerte permanente, en état d'anxiété.

La structure « sensible aux traumatismes » sera accueillante pour tout ce qui concerne

la communication et la méta-communication. Dès lors,

le patient se sentira le bienvenu ; vous lui souhaitez la « bienvenue » et

êtes réellement convaincu que le patient est une personne que vous souhaitez réellement accueillir.

Une structure, pour qu'elle suscite la confiance et un sentiment

de sécurité aux utilisateurs du service, doit transmettre,

à tous les niveaux, un message qui correspondra aux activités qui y sont menées.

C'est seulement dans ces conditions que le client pourra éprouver

une réelle confiance et voir dans la structure un port accueillant, sûr et fiable.

Une structure sensible aux traumatismes ne laissera aucun espace pour la violence,

la honte ni la culpabilité, qui risqueraient d'exacerber

ou de retraumatiser ceux et celles qui ont déjà subi un traumatisme.

Une structure sensible aux traumatismes garantira également la totale confidentialité et le secret professionnel,

la vie privée de l'individu, qui sera ainsi protégé de cette forme de violence.

De plus, le langage qui y sera parlé se concentrera sur la personne,

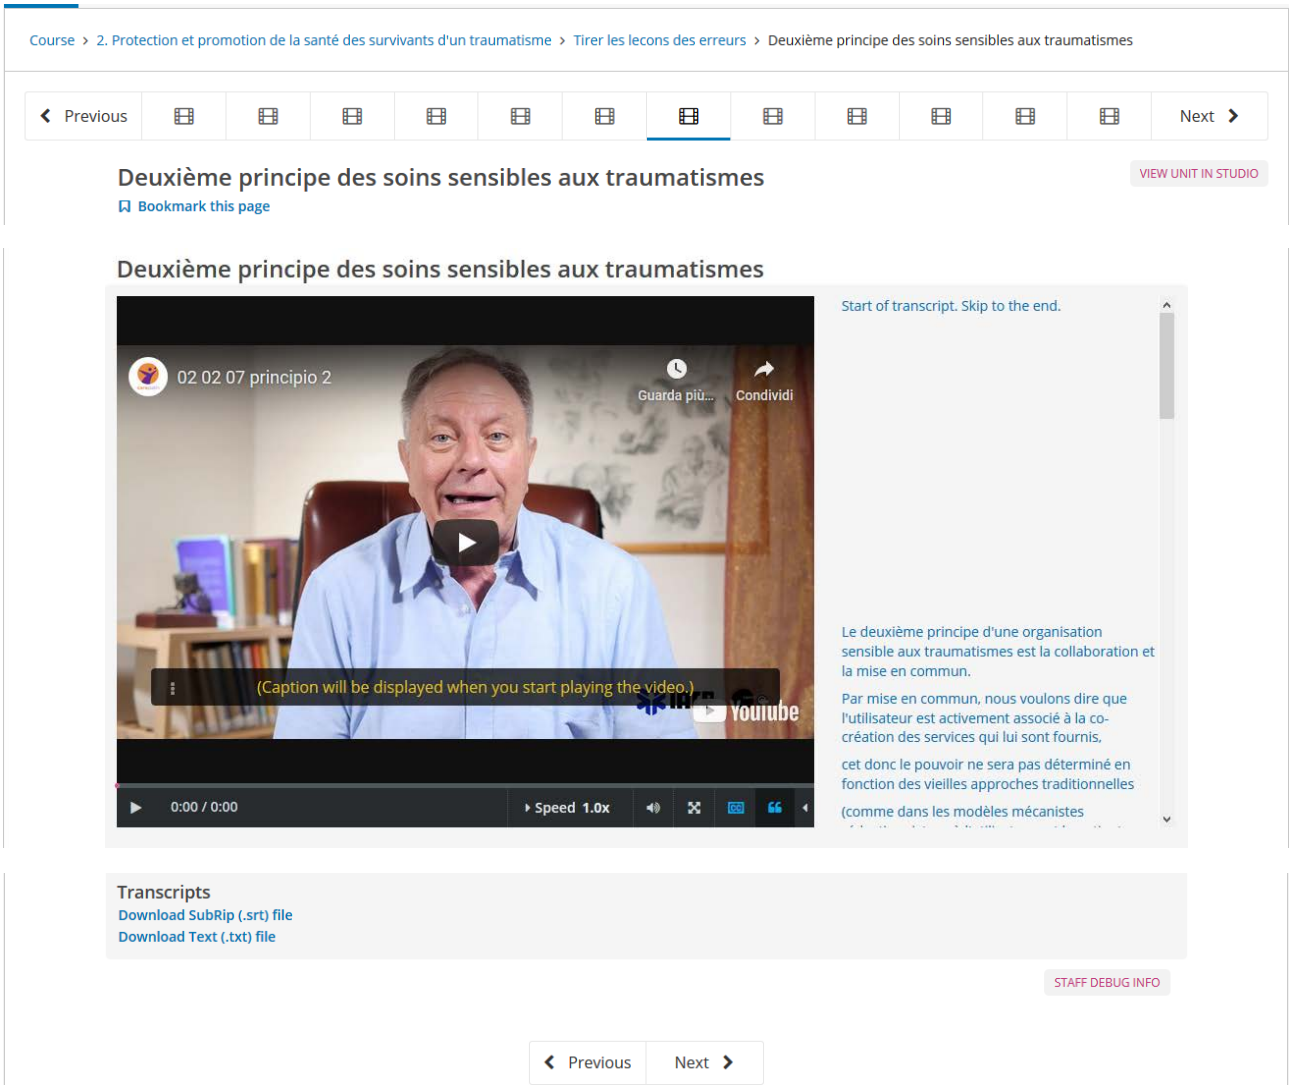
c'est-à-dire qu'elle parlera un langage clair et cohérent que l'usager pourra comprendre,

et non un langage

professionnel cryptique qui

exigera, pour le comprendre,

d'avoir au moins 3 diplômes.



Transcript

Le deuxième principe d'une organisation sensible aux traumatismes est la collaboration et la mise en commun.

Par mise en commun, nous voulons dire que l'utilisateur est activement associé à la co-création des services qui lui sont fournis,

cet donc le pouvoir ne sera pas déterminé en fonction des vieilles approches traditionnelles

(comme dans les modèles mécanistes réductionnistes où l'utilisateur est le patient désigné).

Non, ici, les clients ont leur mot à dire,

et le rôle qu'ils vont jouer est celui d'un acteur du changement,

désireux de retrouver ses capacités et potentialités.

Une structure sensible aux traumatismes fera tout pour que

le patient retrouve son respect de soi,

un objectif crucial pour toute victime de traumatismes ;

mais également de l'espoir ; qui dit « rétablissement »

dit rétablissement de son propre potentiel.

Pareille structure montrera toujours clairement, surtout à elle-même,

que le rétablissement de la santé et de la fonctionnalité d'une personne souffrant

de stress post-traumatique ou

de traumatismes ne peut se faire que par le biais de relations

réelles entre les membres de son personnel et l'usager.

En bref, un bon travail d'équipe, une alliance de travail.

Le partage des décisions est essentiel pour le bon fonctionnement du service fourni.

Tout d'abord, comme le montre la recherche de Karasek sur le stress,

nous savons que, si je subis des stimuli stressants,

mais que je garde un grand pouvoir de contrôle,

le stress en sera réduit.

Par contre, si j'ai peu de contrôle sur la situation, le stress augmentera.

C'est précisément ce principe qui est à l'œuvre ici.

Par conséquent, donner le pouvoir de décision et de contrôle à l'utilisateur du service est déjà une partie de la solution.

En d'autres mots, un patient, une personne avec plus de contrôle sera

capable de mieux surmonter ses problèmes

et d'améliorer sa condition.

La structure sensible aux traumatismes

est systémique et holistique,

en ce sens qu'elle

est bien consciente que ce

sur quoi elle doit opérer s’avère

précisément la construction

sociale d'une réalité traumatisée.

Tous les aspects se combinent

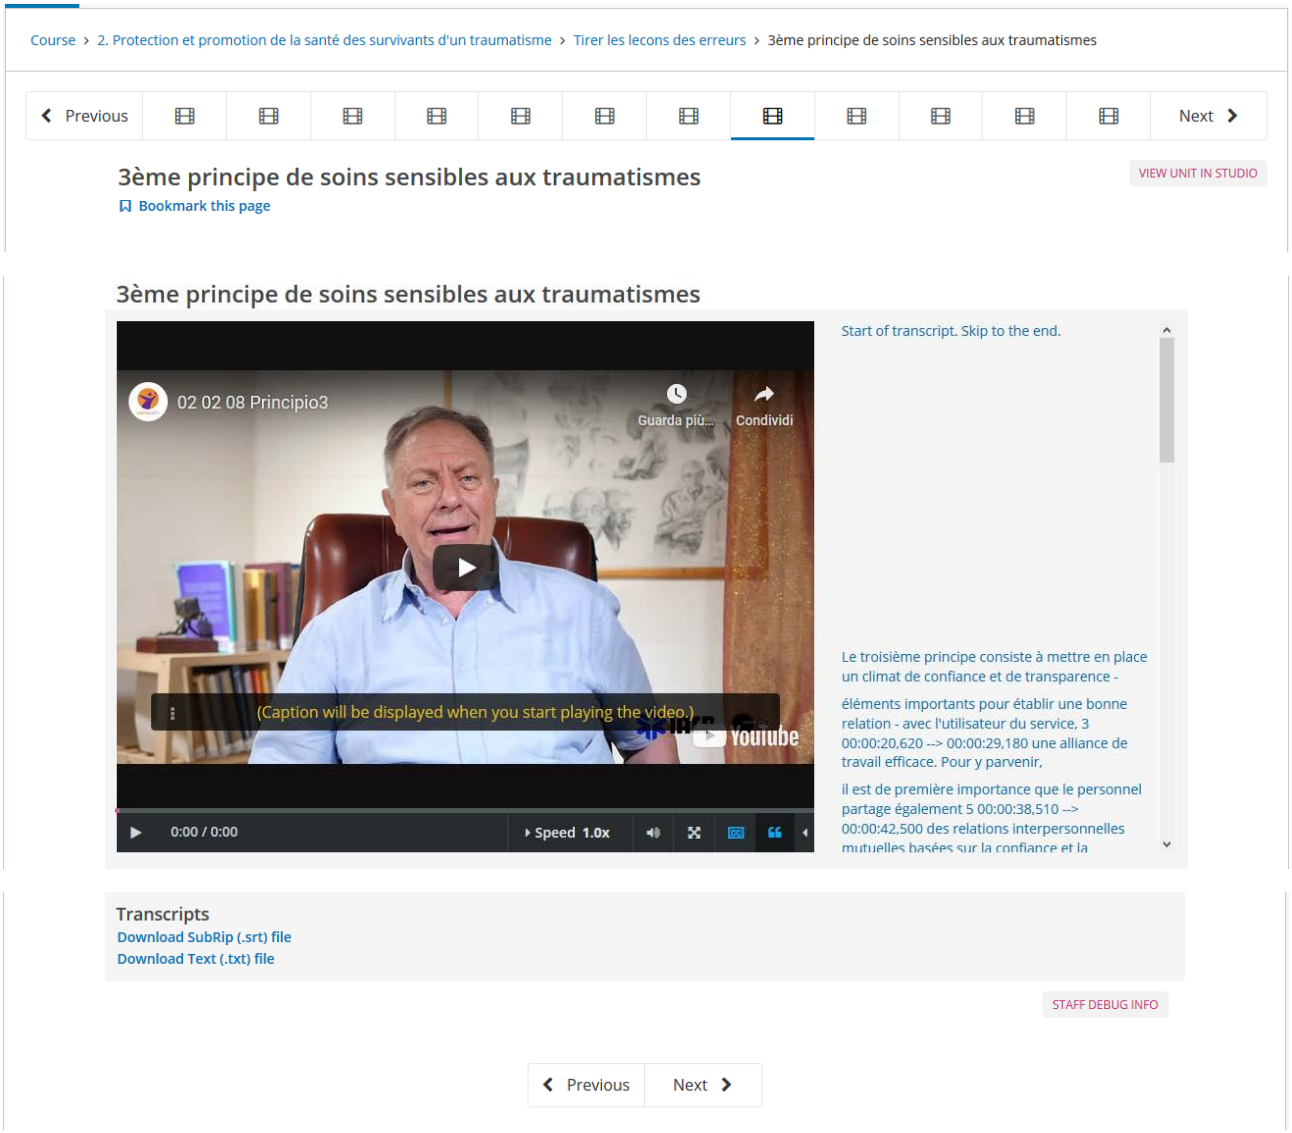
pour faire un tout et, ainsi,

elle prendra soin de l'alpha à l'oméga,

depuis les premiers contacts,

jusqu'à l’accueil,

l'offre de service et tout le processus de suivi.



Transcript

Le troisième principe consiste à mettre en place un climat de confiance et de transparence -

éléments importants pour établir une bonne relation - avec l'utilisateur du service, une alliance de travail efficace. Pour y parvenir,

il est de première importance que le personnel partage également des relations interpersonnelles mutuelles basées sur la confiance et la transparence,

avec toute l'équipe et tout l'équipage, et également des relations interpersonnelles

de qualité avec les usagers et leurs familles.

N’oublions pas le respect des limites et des barrières à maintenir.

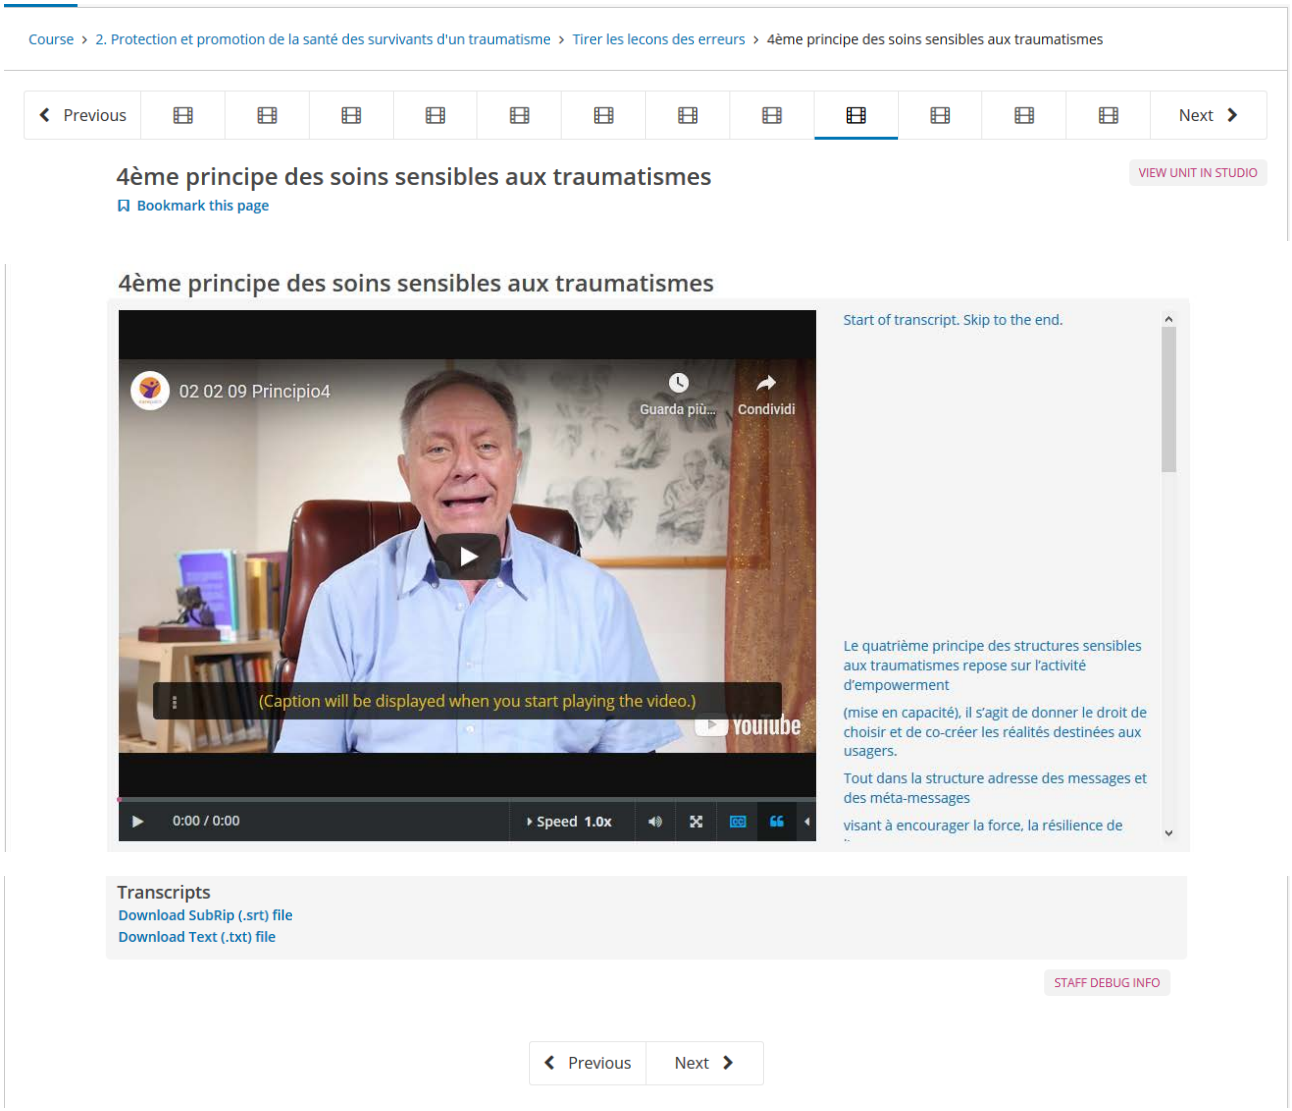
La principale raison en est qu'en ayant des frontières claires,

on crée des espaces de liberté. Ou, ne pas respecter les frontières équivaut à polluer l’espace de travail et à diminuer l’efficacité de l’intervention.

La transparence étant fondamentale, les politiques doivent être formulées dans un langage

clair et transparent, à mille lieues du jargon bureaucratique.

La clarté permet également à tout un chacun, mais surtout aux usagers du service,
à comprendre dans quelle situation ils se trouvent,
quels sont leurs droits et leurs devoirs,
ainsi que tous les aspects de la structure et du personnel avec lesquels ils vont travailler.
De la clarté s'impose également au niveau des rôles de chacun,
sans oublier que les différents professionnels actifs au sein d'une
même structure ont des compétences diverses et s'occupent de différents aspects du traitement ;
personne n'est généraliste et, donc, comme dans une société articulée,
le boulanger fait le pain, le laitier distribue le lait, l'ingénieur dessine des plans et ainsi de suite.
Au centre d'une structure sensible aux traumatismes,
nous retrouvons le respect des droits de l'utilisateur et leur promotion active.
Il est donc essentiel d'obtenir du patient un véritable consentement éclairé et de lui expliquer
dans les détails quelles sont les procédures prévues,
comment le service se déroulera,
pour que le consentement soit authentique et non une simple formalité.



Transcript

Le quatrième principe des structures sensibles aux traumatismes repose sur l'activité d'empowerment (mise en capacité), il s'agit de donner le droit de choisir et de co-créer les réalités destinées aux usagers.
Tout dans la structure adresse des messages et des méta-messages
visant à encourager la force, la résilience de l'usager.
Le choix consiste à promouvoir le changement en
se concentrant sur les forces du patient,
et non sur ses faiblesses ni sur ses dysfonctionnements.
L'objectif est de faire comprendre comment l'usager
a traversé les différentes situations dans le passé,
parfois sans doute pas de la manière la plus efficace,
en bref comment il s'est adapté (coping).
Il s'agit donc de mener une mission, d'appliquer une philosophie d'offre de services

mettant l'accent sur la force des personnes.

En d'autres termes, si on privilégiait, dans le passé,

les pathologies et leur atténuation, aujourd'hui un nouveau paradigme est apparu,

basé sur la santé et les atouts, paradigme que nous essayons d'essaimer.

Les rôles sociaux sont également valorisés ;

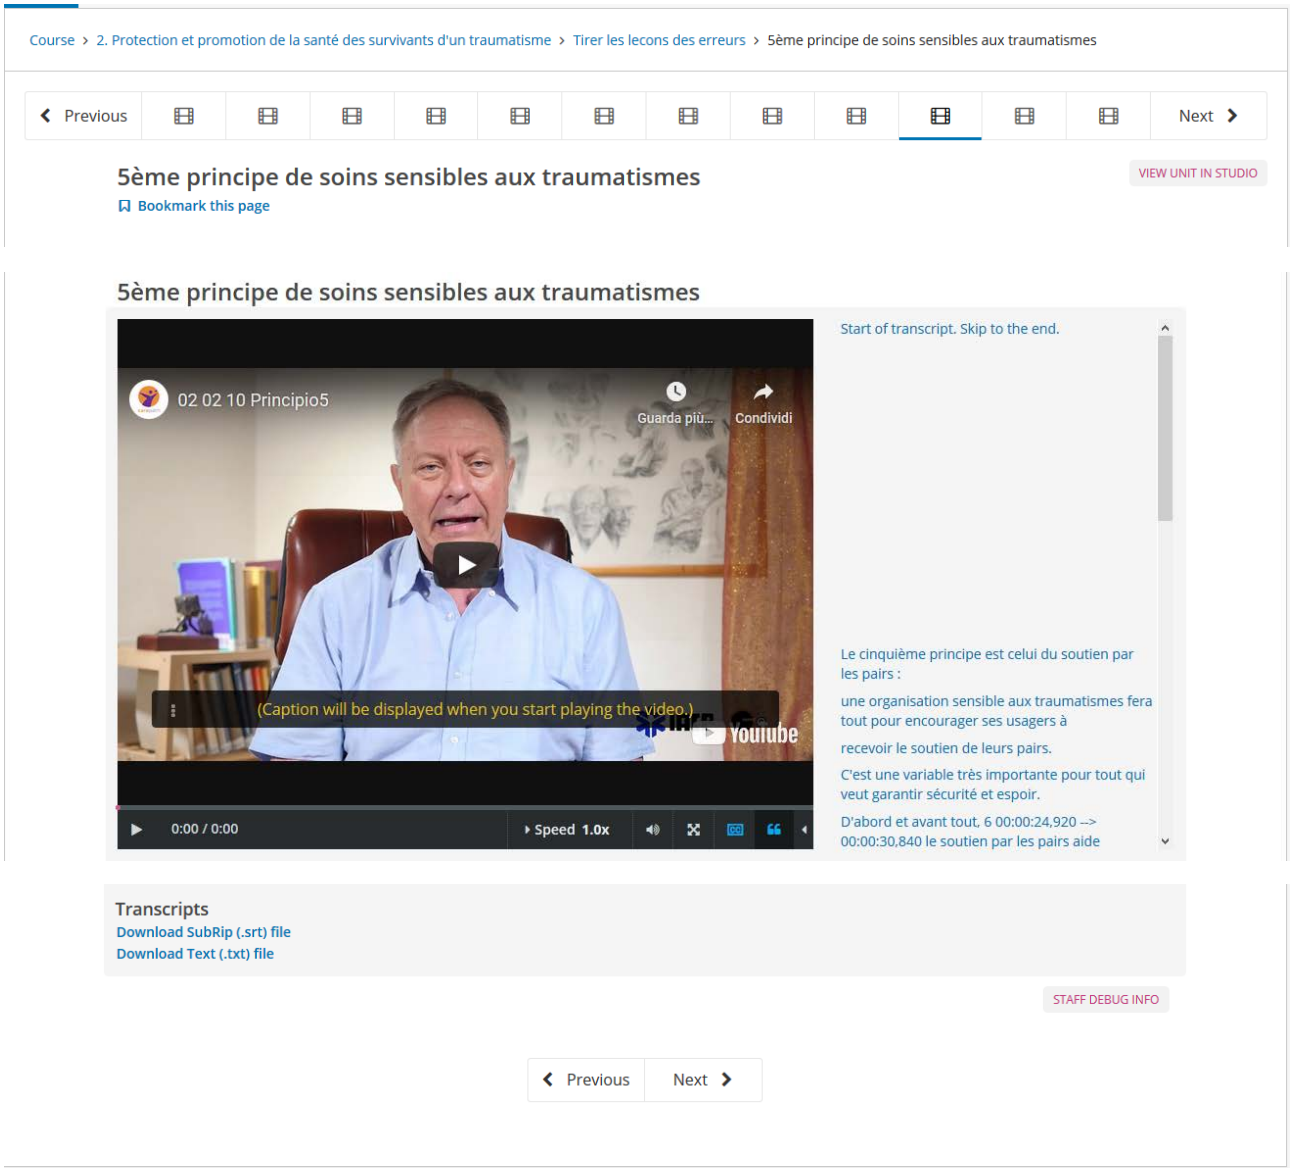
puisque que nous sommes des mammifères sociaux, ils revêtent donc une importance vitale pour notre identité et le développement de notre potentiel.

L'objectif déclaré et poursuivi est de promouvoir l'autorégulation, l'autonomie et les compétences d'autogestion des utilisateurs.

Ainsi la possibilité de se développer également à partir d'expériences traumatiques n'équivaut

pas à mettre en avant chez la personne son statut de pauvre victime,

mais sa capacité de résilience.



Transcript

Le cinquième principe est celui du soutien par les pairs :

une organisation sensible aux traumatismes fera tout pour encourager ses usagers à

recevoir le soutien de leurs pairs.

C'est une variable très importante pour tout qui veut garantir sécurité et espoir.

D'abord et avant tout, le soutien par les pairs aide

les gens à se sentir bienvenus et

suscite chez eux

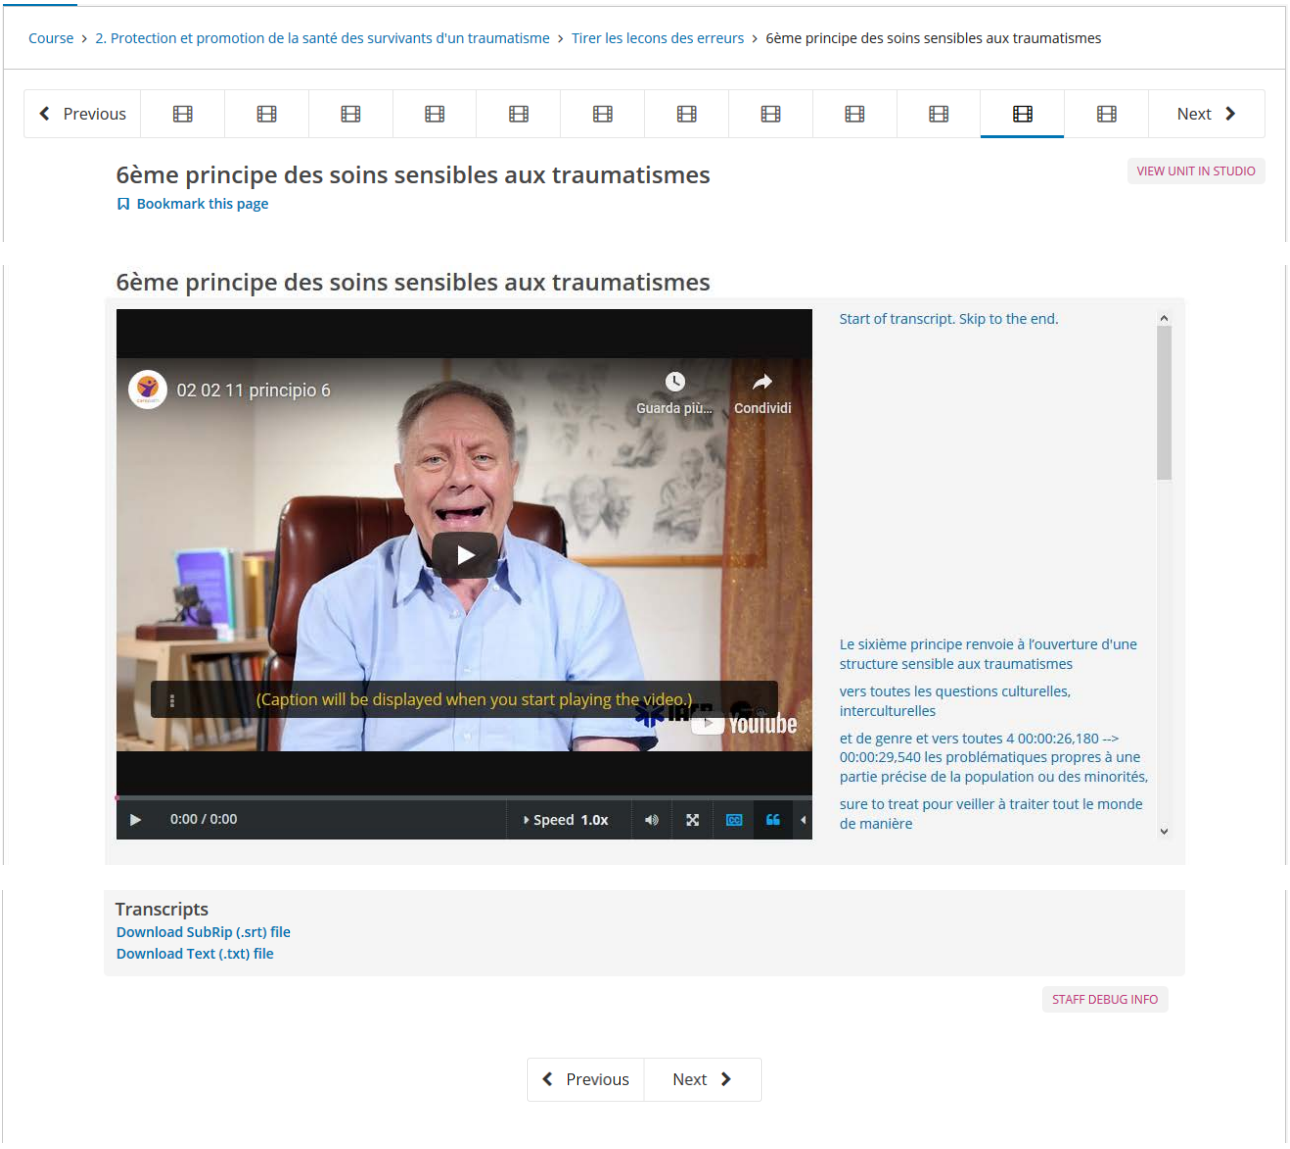
l’espoir de pouvoir s'améliorer.

Bref, il est important d'obtenir le soutien de ses pairs afin de

gagner en confiance en soi, de renforcer son propre potentiel et même d’accroître son estime de soi.

Le soutien par les pairs favorise également les possibilités de

collaboration et donc tout ce qui est positif pour promouvoir son propre rôle social et se sentir actif. Il est indéniable que le soutien par les pairs encourage une communication interpersonnelle favorable à la construction de récits intégrés dans un puzzle beaucoup plus riche et porteur d’autres récits d'espoir et de guérison.



Transcript

Le sixième principe renvoie à l'ouverture d'une structure sensible aux traumatismes

vers toutes les questions culturelles, interculturelles

et de genre et vers toutes les problématiques propres à une partie précise de la population ou des minorités,

sure to treat pour veiller à traiter tout le monde de manière

accueillante et, surtout, démocratique.

Il va sans dire qu'une structure efficace et efficiente évitera toute construction du passé,

gangrénée par des stéréotypes injustes et destructeurs envers les minorités.

Le service fourni sera, par exemple,

sensible aux différences entre

les genres et au respect

de la diversité des genres,

ce qui aidera à utiliser les contextes culturels, les traditions,

les cultures et les origines de chacun des utilisateurs.

La structure construira une réalité fidèle à sa propre philosophie,

afin que toutes les procédures

soient non discriminatoires et sensibles à la diversité.

En outre, elle sera également en mesure de

reconnaître et de traiter efficacement les traumatismes historiques.

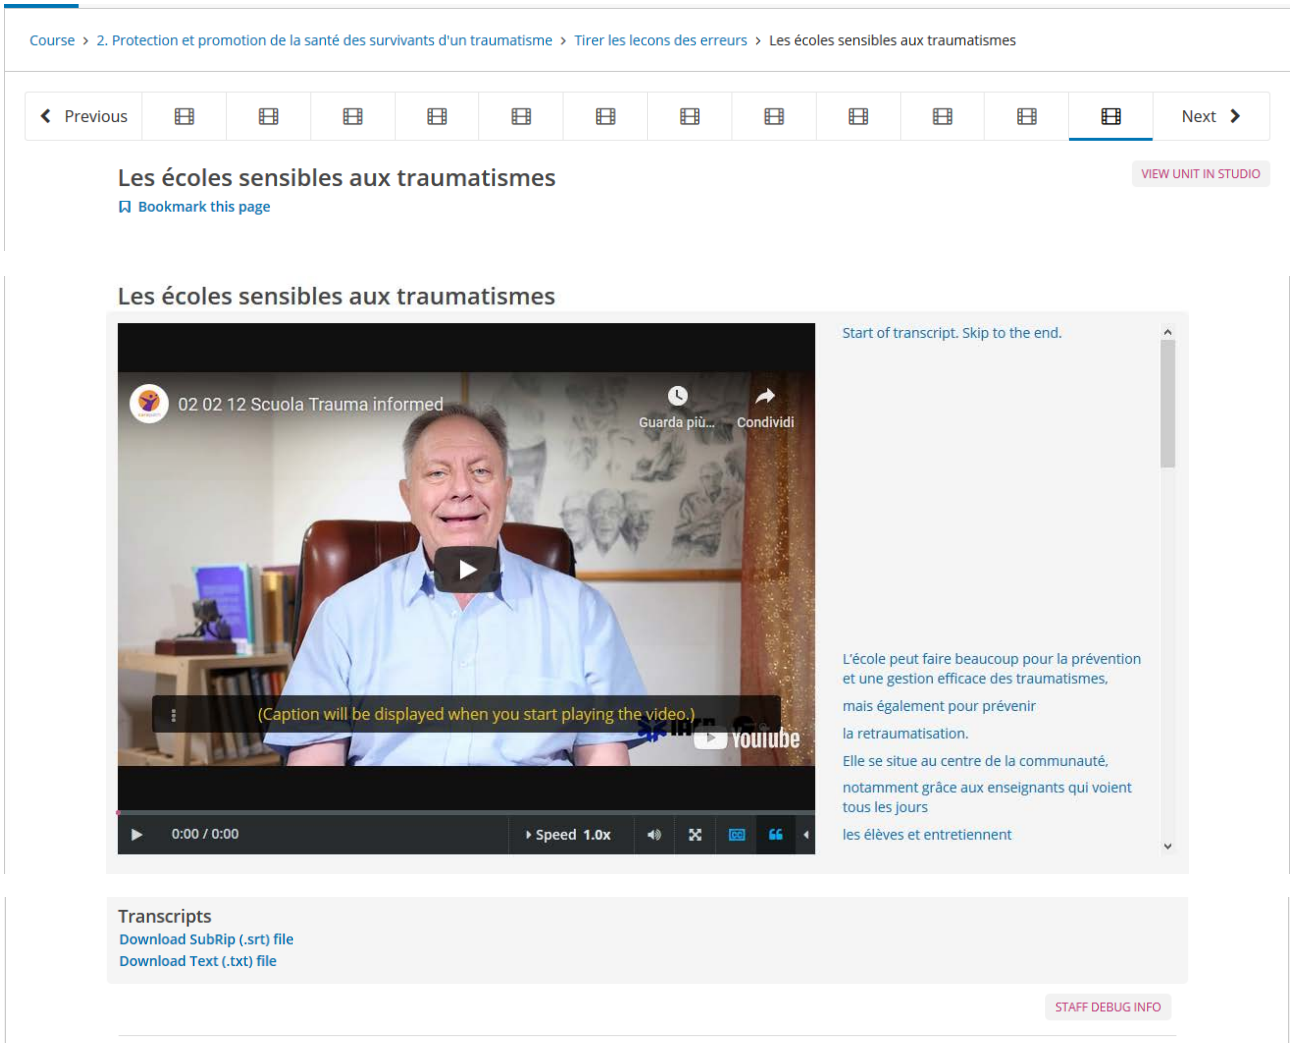
Nous entendons par là les traumatismes de masse qui vont jusqu'à affecter

ceux et celles qui n'en ont pas fait l'expérience directe.

Donnons un exemple dramatique : l'holocauste ;

non seulement des millions de malheureux ont été victimes du délire nazi,

mais également leurs enfants et petits-enfants qui ont subi l'écho de cette bestialité.



Transcript

L'école peut faire beaucoup pour la prévention et une gestion efficace des traumatismes,

mais également pour prévenir

la retraumatisation.

Elle se situe au centre de la communauté,

notamment grâce aux enseignants qui voient tous les jours

les élèves et entretiennent

des contacts fréquents avec leurs familles.

Qui plus est, les enseignants jouissent d'un prestige social,

en raison de leur rôle dans la communauté.

Ainsi, si les enseignants et le personnel

scolaire sont ouverts aux éléments constitutifs

d'une école sensible aux traumatismes,

peut-être pourraient-ils demander à un expert

de les aider à lever le voile sur les problèmes et accepter l’existence des traumatismes.

Dans ce cas, cette école ne serait plus une partie du problème,

mais une partie de la solution,

notamment parce que les enseignants

sensibilisés aux problèmes des traumatismes seront

en mesure de capter les signaux.

S'ils n'ont pas un œil exercé,

ils risquent d’interpréter certains des comportements de leurs élèves comme

de simples manifestations d’un

manque de discipline.

Par contre, s’ils sont sensibles aux traumatismes,

ils pourraient servir de

référence aux élèves et déterminer si l'un

de leurs élèves a besoin d’un soutien en tant que victime d'un traumatisme. Les enseignants peuvent avoir une influence importante sur les parents,

afin qu’ils se sensibilisent eux-mêmes aux traumatismes

et puissent ainsi contribuer de manière significative à la solution.

En bref, la sensibilisation aux traumatismes s’ajoute à la vocation d'une école,

dont le propos est déjà de diffuser les connaissances pour

aider les gens à fonctionner comme des

citoyens volontaristes dans la ville.

Donc, une école sensible aux traumatismes

est pleinement équipée pour remplir sa

mission d'école dans le meilleur sens du terme.

Penchons-nous sur les enseignements de nos 20 années d'expérience professionnelle dans les services destinés aux enfants et aux familles et dans la mise en place de parcours d'aide, de soutien et d'intervention en faveur d'enfants exposés à la violence, témoins de la violence, victimes d'abus ou d'autres expériences traumatisantes.

Au fil du temps, nous avons appris à nous concentrer principalement sur :

la nécessité et l'importance de nouer une relation adéquate

afin de créer un cadre sûr pour l'enfant, qui dépasse les compétences et techniques scientifiques.

Par « sûr », nous entendons un espace propice à

une écoute respectueuse des besoins et exigences du patient.

C'est essentiel lorsque l'enfant a vécu des expériences destructrices de son sentiment de sécurité et d'estime de soi et dangereuses pour sa vie. Dans pareilles situations,

il est nécessaire de garantir e plus grand respect afin que le client reprenne son processus de développement.

Qu'entend-t-on par respect ? Il s'agit d'une véritable écoute - une écoute empathique –

qui ne se focalise pas sur les protocoles et les besoins des professionnels,

mais veut plutôt privilégier le monde intérieur du mineur,

ses besoins, sa temporalité ; autant d'éléments

qu'il convient de respecter car,

souvent, nous rencontrons des mineurs sur la défensive,

susceptibles d'adopter une attitude d'autoprotection.

Il est donc essentiel que le professionnel concerné

ne tente pas de mettre à bas les défenses du patient (en voulant savoir, en s'emparant, en posant des questions),

mais qu'il respecte le rythme de l'enfant,

qu'il soit conscient que la défense est la meilleure manière que l'enfant a trouvée

pour gérer une force oppressante. En rendant progressivement ces défenses inutiles,

on pourra atteindre le cœur de l'enfant.

L'expérience montre combien il est important de se concentrer sur les besoins de l'enfant.

Passons à l'exemple d'une assistante sociale,

qui a travaillé pendant 8 ans au service de la ville de Rome.

Elle s'occupe de la prévention, de la protection et du soutien aux enfants et à leurs familles.

Comme nous l'avons dit, il faut se focaliser non seulement sur les besoins de l'enfant,

mais également sur les caractéristiques et la singularité de chaque situation,

and the uniqueness of any situation, so... also centering on all those involved, in addition to

en tenant compte de toutes les personnes concernées, au-delà de l'enfant et de ses parents.

Dans son travail quotidien, un travailleur social sera principalement en relation avec les parents,

les enfants victimes d'un ou de plusieurs traumatismes

étant le plupart du temps pris en charge et suivis par des spécialistes

formés pour les aider dans ce processus.

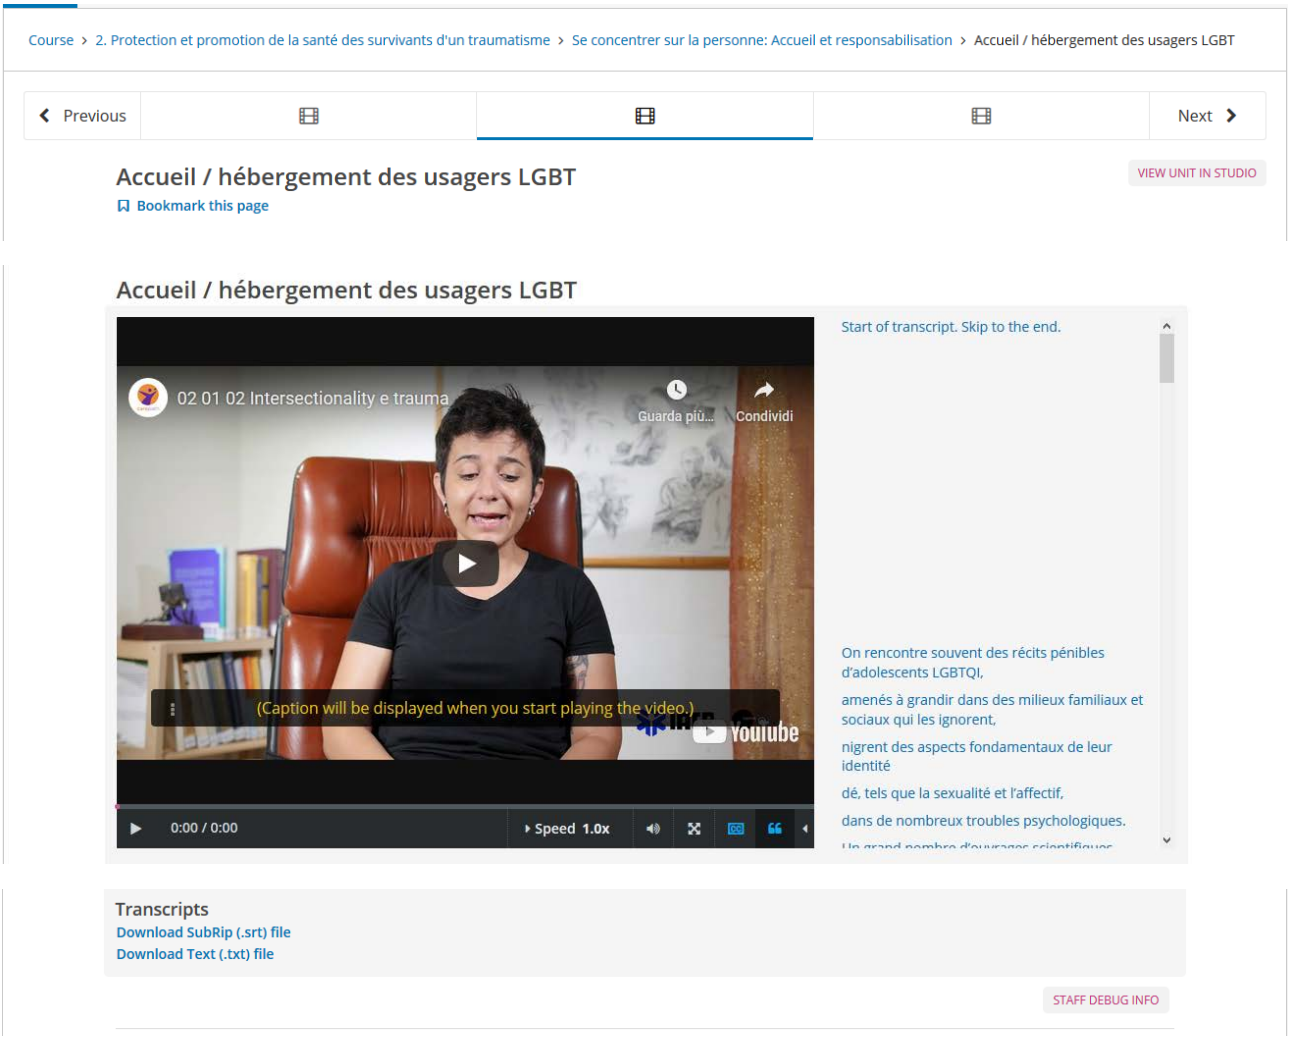
Dans leur travail, les assistants sociaux accompagnent les familles et essayent de se familiariser avec difficultés, leur gravité, leur vulnérabilité,

mais également ce qui a provoqué le préjudice

et le malaise chez leurs enfants.

Ensuite, ils créent des réseaux de soutien, pour les aider à

acquérir et à s'approprier les responsabilités
parentales, garantie que l'enfant aura le droit de grandir paisiblement au sein de sa famille,
dans un cocon protecteur.
En fonction de expériences, quels sont les éléments essentiels permettant aux professionnels
d'agir dans ce sens ? Des compétences professionnelles techniques et scientifiques,
mais également des compétences et des aptitudes liées davantage à la sphère personnelle.
Nous parlons ici de tout ce qui relève
du « monde intérieur » du professionnel : ses émotions, ses préjugés,
ses raisonnements, les hypothèses qu'il pose lorsqu'il entre en relation.
En outre, en tant que professionnels impliqués dans les relations d'aide,
nous sommes des personnes allant à la rencontre de l'autre.
Que se passe-t-il lorsqu'on travaille avec des parents abusifs ou négligents ?
Ne nous voilons pas la face,
il arrive que nous ressentions de la colère,
de l'indignation et même de la crainte ; nous ne devons pas ignorer ces émotions,
qui font partie de nous et s'insinueraient de
toute manière dans la relation thérapeutique. Le plus important est de les reconnaître,
de façon à pouvoir les gérer et à éviter qu'elles
affectent la réalité concrète ou la voilent de subjectivité.
Parfois, le professionnel, troublé par ses propres émotions,
risque d'agir de manière directive ;
le parent devient alors la victime des décisions prises par le professionnel ;
ce n'est pas ainsi qu'on garantira la protection des mineurs, puisque,
faute de se concentrer sur la réalité de la situation,
il sera impossible de comprendre ou de percevoir les besoins des mineurs, et donc de gérer efficacement les interventions.
Concernant la relation directe avec l'enfant, l'intervention du travailleur social est plus limitée.
Elle peut néanmoins contenir une forte composante affective, le travailleur social risquant de combler
ses besoins personnels par l'offre d'affection et d'accompagnement aux enfants traumatisés.
Le travailleur social risque également de se substituer
aux professionnels chargés de suivre et d'aider les enfants à gérer leurs traumatismes.



Transcript

On rencontre souvent des récits pénibles d'adolescents LGBTQI,

amenés à grandir dans des milieux familiaux et sociaux qui les ignorent,

nigrent des aspects fondamentaux de leur identité

dé, tels que la sexualité et l'affectif,

dans de nombreux troubles psychologiques.

Un grand nombre d'ouvrages scientifiques montrent

qu'au sein d'une population non-clinique, ces populations souffrent beaucoup plus

de trouble anxieux, de toxicomanie, de troubles de stress post-traumatique et d'un risque accru de suicide.

Les chercheurs établissent une corrélation entre cette incidence accrue de la souffrance mentale,

le stress lié à l'appartenance à une minorité et l'homophobie sociale ;

ainsi il apparaît que l'invisibilité et le silence

sont les causes et les conséquences d'expériences traumatisantes.

Lorsqu'elles vivent ces réalités traumatisantes, les personnes concernées souffrent de traumatismes cumulatifs,

de traumatismes relationnels et de troubles traumatiques complexes.

Nous constatons donc une relation circulaire entre le préjudice 16 00:01:08,409 --> 00:01:09,820 social,

le sentiment de dissociation,

l'invisibilité, mais également la résilience au

sein d'une population chez qui on nie ces aspects et à qui on refuse,

de surcroît, la citoyenneté, l'appartenance et l'inclusion.

En conséquence, les responsables de l'accueil et de l'aide

aux enfants doivent impérativement

s'interroger sur la manière d'aider ces personnes à accéder plus facilement au droit d'exister,

au droit à la dignité et au droit à l'amour. Les relations réciproques qui durent depuis plus de 50 ans,

les documents, le vademecum, les orientations, qui découlent de

ces recherches font référence

aux dimensions suivantes :

l'homosexualité est une variante normale et positive de la

sexualité humaine et elle n'est nullementun indicateur des troubles mentaux ou du développement :

l'homosexualité et la bisexualité font l'objet d'une stigmatisation sociale,

avec une influence très négative les processus et parcours d'évolution ;

les effets et les comportements homosexuels peuvent apparaître

dans de nombreuses orientations sexuelles ;

les personnes LGBT peuvent mener des vies heureuses et satisfaisantes,

nouer des relations durables dans un couple, fonder une

famille aussi solide que celle des personnes hétérosexuelles ;

aucune recherche scientifique n'établit de lien entre l'homosexualité

et les traumatisme ou les dysfonctionnements ;

rien ne prouve que les essais thérapeutiques visant à modifier

l'ordre sexuel soient efficaces ou dénués de risques.

Les orientations sur la pratique psychologique auprès de personnes LGBTIQ,

publiées par l'APA en 2012, soulignent qu'il est important de tenir compte des

attitudes du responsable de la relation

d'aide envers l'homosexualité et la bisexualité. Non seulement celui-ci doit-il connaître

l'impact de la stigmatisation sur les personnes concernées,
mais également être sensibilisé aux attitudes
implicites et explicites envers l'homosexualité ou la bisexualité.
L'expérience et le point de vue personnels sur ces
questions peuvent peser sur l'évaluation et sur l'intervention.
Les dénominateurs communs préconisés, pouvant être extrapolés à
partir du corpus de documents, peuvent se résumer comme suit :
accepter et accompagner en écoutant avec respect,
sans jugement et avec empathie pour aider l'usager à
surmonter le malaise provoqué par le stress lié à l'appartenance à une minorité ;
prendre des mesures adéquates lors de la prise de contact avec ces personnes :
l'évaluation devrait aider à comprendre la personne dans toute sa complexité, à
prendre en compte les interactions et interconnexions entre le stress
lié à l'appartenance à une minorité, la santé mentale et la dimension spirituelle et intérieure,
ainsi que la place qu'occupe l'orientation sexuelle dans le fonctionnement général de la personne ;
encourager et soutenir les stratégies d'adaptation actives :
nous savons qu'en général,
il est important pour les adolescents de se sentir acteurs de leur vie,
surtout lorsqu'ils doivent gérer des évènements traumatisants.
Le responsable de la relation d'aide devrait aider l'usager et favoriser les stratégies
qui facilitent le traitement cognitif et affectif du facteur de stress ;
comprendre le rôle important
de l'amitié dans la communauté LGBTIQ.
Ne pas oublier que le stress lié à l'appartenance
à une minorité peut mener
à la marginalisation et à l'isolement.
Il est donc essentiel de
renforcer l'accès à l'aide sociale ;
examiner et développer l'identité.
Les dynamiques identitaires sont essentielles et vitales lors de
l'adolescence et chez les personnes LGBTIQ.
Elle doivent donc explorer et intégrer

leurs identités diverses sans nécessairement devoir en privilégier l'une sur l'autre

(par exemple, entre l'identité féminine et masculine) ;

comprendre et intégrer les conflits. La relation d'aide encourage

le dialogue et l'intégration de tout conflit

entre les parties concernant par exemple,

l'orientation sexuelle et les croyances religieuses ;

comprendre la signification sous-jacente des

demandes de changement d'orientation sexuelle

ou des souhaits de suivre un traitement curatif. Dans de telles situations,

il est essentiel qu'un thérapeute expérimenté réalise une analyse des véritables enjeux,

en accepte le sens et analyse ce souhait, qui renvoie à la dynamique sociale et familiale complexe,

et qui a poussé la personne à

considérer qu'une facette de son identité était

inacceptable ;

comprendre et examiner le processus qui consiste à « sortir du placard ».

saisir les niveaux de stress liés à l'appartenance

à une minorité lorsqu'il y a double minorité :

la personne est victime de discrimination en raison de son homosexualité ou de sa bisexualité,

mais également en raison d'autres sources de stigmatisation sociale ;

tenir compte de l'importance du stress lié à l'appartenance à une minorité

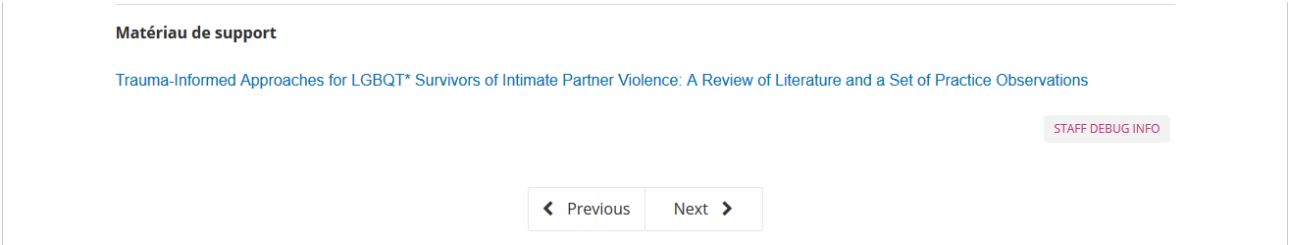
dans la dynamique de couple.

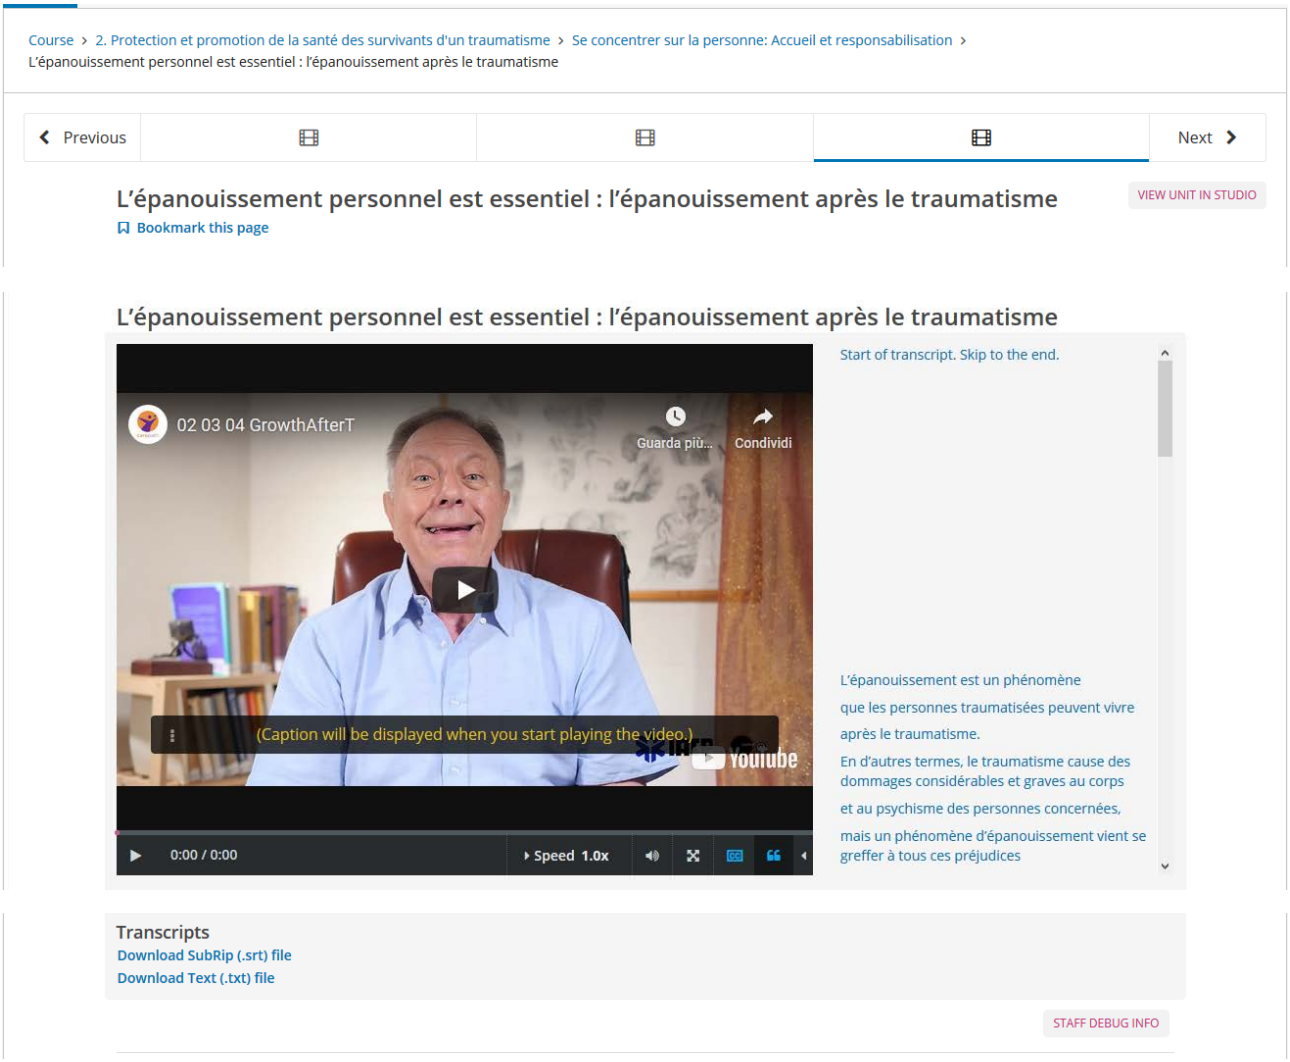
N'oublions pas que les couples gays

et lesbiens ne sont pas reconnus par les principales religions ni par le système

juridique de nombreux pays. Ainsi, il est nécessaire de prendre en compte tout ce qui relève de l'homogénéité

et de l'absence de cadre légal pour ce type de composition familiale.





Transcript

L'épanouissement est un phénomène

que les personnes traumatisées peuvent vivre

après le traumatisme.

En d'autres termes, le traumatisme cause des dommages considérables et graves au corps

et au psychisme des personnes concernées,

mais un phénomène d'épanouissement vient se greffer à tous ces préjudices

chez un nombre considérable de victimes de traumatismes

(avec des exceptions).

Cela montre l'incroyable résilience de l'espèce humaine,

ou peut-être de toutes les formes de vie qui

sont apparues au fil de

l'évolution du vivant sur notre planète.

Quoiqu'il en soit, la tragédie du traumatisme fait basculer la personne,

« détruit », insulte et blesse la victime d'un traumatisme,

comme le ferait un tremblement de terre dont les secousses ébranleraient

jusqu'aux composantes psychiques et physiques de la personne.

Toutefois, dans cette tourmente, le mal n'étant souvent pas a sens unique,

la victime du traumatisme doit s'adapter à une nouvelle réalité.

Certaines personnes parviendront à s'adapter, à se reconstruire, à s'épanouir suite au traumatisme.

D'un point de vue existentiel, elles vivent un épanouissement.

En d'autres termes, elles sont plus ouvertes,

plus enracinées dans les valeurs morales et spirituelles,

elles vivent avec plus de pertinence

et sont davantage connectées à elles-mêmes,

aux autres et au monde ;

elles trouvent

un sens nouveau

et plus profond.

Prenons un exemple personnel :

Je me souviens de l'émotion ressentie à la lecture d'un livre écrit par un collègue,

Victor Frankl, à propos de la tragédie et de tous les traumatismes que pouvait vivre un juif à l'époque du nazisme lorsqu'il se retrouvait interné dans un camp d'extermination nazi.

Dans ces camps, avant de tuer, on humiliait

et on tentait de tuer la dignité humaine,

de manière assez efficace. Cependant, un petit groupe de personnes

est parvenu à survivre physiquement au camp, malgré les traumatismes, et, au niveau psychique,

à devenir meilleur. Comme Frankl le raconte dans son ouvrage « Découvrir un sens à sa vie »",

lui et quatre autres personnes du camp se sont privées du peu de nourriture

qu'ils recevaient pour offrir une aide bienveillante à des personnes plus malheureuses qu'eux

(les malades ou les faibles). Ils ont ainsi pris un risque supplémentaire d'être

envoyé dans les fameuses douches, les chambres à gaz, et d'être exterminés.

Les membres du groupe ont survécu, avant d'être libérés à la chute du nazisme,

et malgré leur faiblesse physique et les traumatismes vécus, ils sont devenus de meilleures personnes.

Ils entretenaient une relation existentielle, plus pertinente, avec eux-mêmes,

avec les autres et avec le monde. C'est un aspect à méditer, qui pourrait nous insuffler un peu d'espoir.

L'impact négatif sur la santé physique et mentale des traumatismes,

de tout type, est considérable.

Pour l'Organisation mondiale de la santé, les diverses formes de

traumatismes constituent une urgence sociale et sanitaire.

Nous constatons que le capital humain souffre énormément, 6 00:00:43,420 --> 00:00:45,140 tant au niveau physique que mental, des traumatismes.

Collectivement, nous contribuons moins efficacement à la prospérité, lorsque

les victimes de traumatismes nécessitent des soins et donc consomment une partie

de nos ressources économiques ; qui plus est, le traumatisme les empêche,

individuellement, de produire de la prospérité pour elles-mêmes,

pour leur famille, pour leur collectivité et pour leur pays.

Nous observons un autre aspect très préoccupant chez la victime de traumatismes :

non seulement souffre-t-elle de dommages au

niveau de sa santé physique et mentale,

mais, principalement dans certains types de traumatismes (violence ou violence sexuelle),

elle risque de passer du statut de victime à celui d'auteur et donc de traumatiser,

à son tour, d'autres personnes innocentes.

Ce glissement horrible montre à quel point le traumatisme est assimilable à un virus qui se propage d'un corps

à l'autre s'il n'est pas combattu, prévenu et traité efficacement dans la communauté.

On peut parler de pandémie, c'est-à-dire d'un problème qui se transmet rapidement d'un individu

à l'autre dans la population, entraînant une grave perte de capital humain.

Dans une approche bio-psychosociale, nous ne pouvons laisser

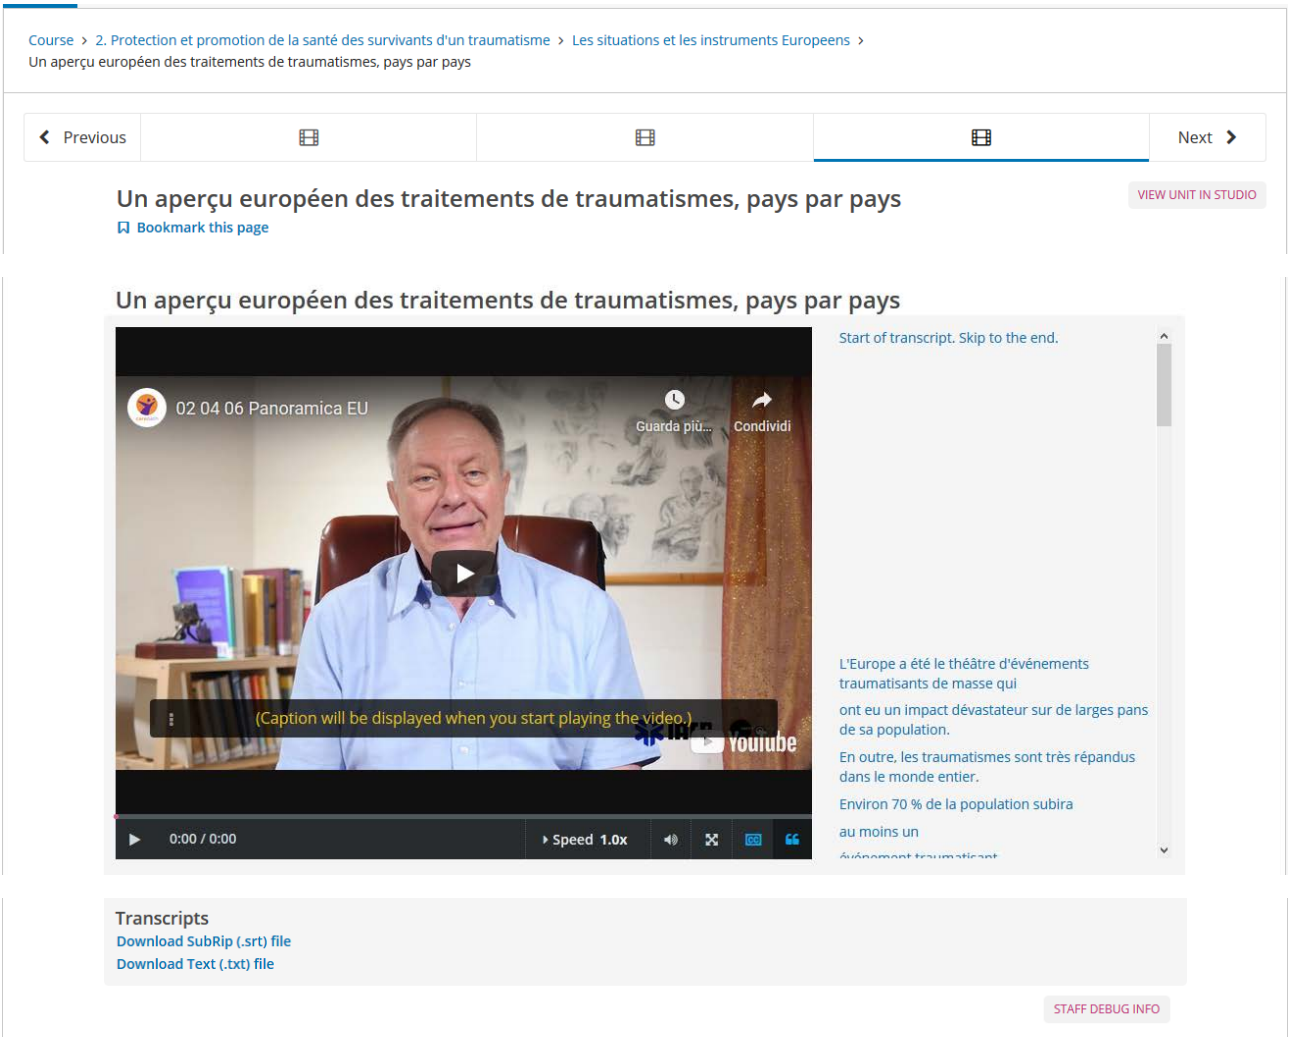
la responsabilité de la prévention et du traitement des traumatismes au seul secteur de la santé ;

il s'agit d'une tâche politique qui nécessite que toutes les institutions - familles, écoles, organisations professionnelles, monde de la justice des mineurs, législatif –

se sensibilisent à la problématique et s'intègrent dans

un réseau efficace de prévention et de résolution des traumatismes.

C'est dans l'intérêt et pour le bien de tous et de toutes.



Transcript

L'Europe a été le théâtre d'événements traumatisants de masse qui

ont eu un impact dévastateur sur de larges pans de sa population.

En outre, les traumatismes sont très répandus dans le monde entier.

Environ 70 % de la population subira

au moins un

événement traumatisant

au cours de la vie.

Il s'agit d'une véritable pandémie : une épidémie généralisée,

et à ce titre les dégâts que causent les traumatismes aux niveaux mental,

physique, comportemental,

social, économique

atteignent une telle gravité que

l'ensemble des nations européennes

– qui sont parmi les plus avancées au monde –

se sont mises en mode alerte, afin d'investir dans la recherche,

le savoir-faire, le financement et afin de développer les compétences nécessaires pour gérer efficacement -

comme nous le faisons déjà pour de nombreux autres phénomènes - cette pandémie. Malheureusement, tout cela n'est qu'un rêve ; incroyable mais vrai :

peu a été fait. Nous voyons quelques rares exceptions ; quelques nations -

comme les pays scandinaves et l'exemple de la Suède - ont étoffé l'offre de traitements

aux victimes de traumatismes, et, au niveau social,

ont investi dans la prévention afin d'anticiper le problème.

Chaque ville s'y est dotée d'un groupe de travail dédié aux traumatismes,

et les professionnels – comme les travailleurs sociaux – reçoivent une formation

universitaire correcte sur la manière de gérer et de prévenir les traumatismes

au niveau individuel, communautaire et national.

Malheureusement, nombreux sont les autres pays européens qui n'ont pas été aussi efficaces.

Prenons le seul exemple de la Belgique, un pays caractérisé par un excellent revenu

par habitant, une capacité de développement de l'industrie et des services hors pair,

mais qui, jusqu'à il y a quelques années, n'était pas en mesure de former les aidants

At professionnels aux compétences modernes et efficaces. A l'université, la construction sociale des profils

des aidants professionnels était trop dépassée pour leur permettre d'acquérir les compétences nécessaires pour une gestion efficace de ce genre de problèmes.

Dès lors, la situation en Europe est loin d'être satisfaisante,

même si les pays scandinaves – au même titre que l'Angleterre et les pays anglo-saxons -

ont eu la clairvoyance de développer une offre correcte de formations et d'investir

thadans la création d'institutions capables d'offrir une aide et un traitement

efficaces aux personnes traumatisées, ainsi que dans la prévention.

Toutefois, dans de nombreux autres pays, comme en Italie,

il reste encore beaucoup de chemin à parcourir avant

que nous puissions maîtriser la situation.

S'il faut admettre le travail remarquable accompli par les instituts de formation en traumatologie

created in créés ces dernières décennies, force est de constater qu'ils ont simplement

a substitutfait ce qui aurait dû être normalement la tâche de l'université :

task of theformer efficacement les différentes professions de la santé, actualiser les techniques de formation,

les services de supervision et de conseil,

et même proposer des diplômes professionnels

pour le traitement des traumatismes.

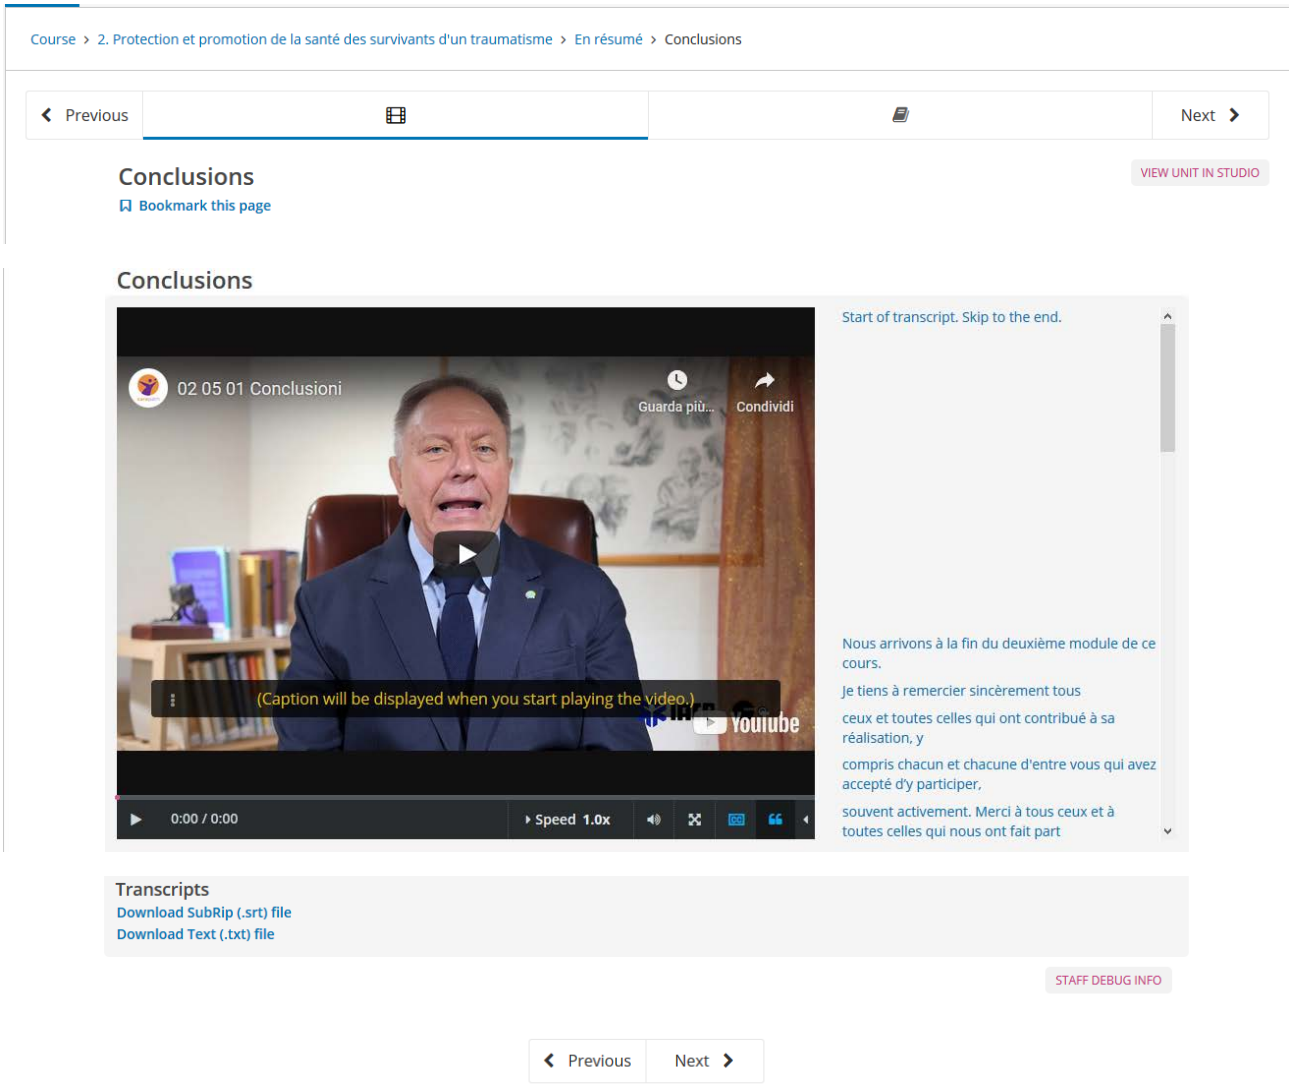
Il reste beaucoup à faire - c'est un impératif éthique et moral -

pour protéger et promouvoir, dans la science et dans la conscience,

les droits des individus et la santé sociale. L'article 33 de la Constitution italienne, comme beaucoup d'autres constitutions européennes,

stipule que la santé est un droit pour chaque citoyen ;

nous devons donc protéger et promouvoir la santé de tous et de toutes : c'est un impératif.



Transcript

Nous arrivons à la fin du deuxième module de ce cours.

Je tiens à remercier sincèrement tous

ceux et toutes celles qui ont contribué à sa réalisation, y

compris chacun et chacune d'entre vous qui avez accepté d'y participer,

souvent activement. Merci à tous ceux et à toutes celles qui nous ont fait part

de leurs commentaires, qui nous ont expliqué leur situation locale,

qui nous ont proposé des solutions et qui nous ont donné la permission d'utiliser

documents, cartes et matériel qui, grâce à vous, amélioreront les éditions ultérieures de ce cours.

Mes sincères remerciements à chaque membre de l'équipe qui a travaillé avec beaucoup de générosité et d'engagement pour atteindre un but dans lequel ils croyaient fermement

et qu'ils partageaient.

Merci à tous les collègues extérieurs à l'institut

qui ont accepté de travailler gratuitement,

de nous laisser utiliser leur image,

et de partager et de diffuser leur contribution

et leur matériel sur le portail de ce cours.

Merci à tous les professionnels de l'IACP pour avoir eu la générosité de partager,

avec tout leur cœur et leur intelligence,

leurs expériences dans le domaine difficile de l'aide aux jeunes victimes de traumatismes.

Merci également à toutes les organisations qui ont travaillé avec nous, et enfin,

merci à tous les partenaires du projet CarePath qui n'ont eu de cesse de nous

aider avec sympathie et amabilité.

Last thanks, icing on the cake,

Mes derniers remerciements iront au chef de projet et à tous ses collègues de l'Université de Turin. Luca Rollè est vraiment

l'un des meilleurs chefs de projet avec lesquels j'ai eu la chance de travailler

dans le cadre d'un projet européen ; j'adresse également

un merci chaleureux à ses collègues de l'Université de Turin,

de la Faculté de Psychologie, tous et toutes sont merveilleux et

ont fait tant et plus pour nous faciliter la tâche.

Merci, merci à tous et à toutes ; bon travail ! Et aux participants de ce cours, nous souhaitons une bonne continuation avec les autres modules. Ciao! Alberto Zucconi et tous les professionnels de l'équipe IACP

VIEW UNIT IN STUDIO

Q.1

15 points possible (graded)

1. Qu'est-ce qu'une relation d'aide?

- ○ Une relation affective basée sur l'aide d'un partenaire à un autre
- ○ Une relation établie entre un professionnel et un utilisateur de services
- ○ Une relation qui répond aux besoins du professionnel et de l'utilisateur de services
- ○ Une relation médecin-patient

2) La théorie générale des systèmes a été formulée par:

- ○ Wertheimer
- ○ Maslow
- ○ Rogers
- ○ Von Bertalanffy

3. Qu'est-ce que l'OMS?

- ○ Organisation mondiale de la science
- ○ Organisation médico-sociale
- ○ Organisation mondiale de la santé

4) L'approche centrée sur la personne a été fondée par

- ○ C. Rogers
- ○ O. Rank
- ○ J. Bowlby
- ○ A. Maslow

5) Laquelle de ces conditions nécessaires à l'établissement d'une relation d'aide n'a pas été théorisée par C. Rogers?

- ○ Empathie
- ○ Acceptation positive inconditionnelle
- ○ Résilience
- ○ Congruence

6) Alliance de travail

- ○ Elle concerne les dispositions contractuelles entre le travailleur et l'employeur
- ○ Elle ne concerne pas l'individu mais uniquement le groupe
- ○ Il est souhaitable de collaborer dans une relation d'aide
- ○ Il s'agit de l'ensemble de règles établies par le professionnel et auxquelles l'utilisateur du service doit se conformer

7) Le manque d'empathie dans la relation d'aide

- ○ Est une qualité professionnelle
- ○ Permet de mieux comprendre ce que dit l'utilisateur
- ○ Est une action recommandée pour éviter l'épuisement professionnel
- ○ Empêche une relation d'aide d'être efficace

8) Qu'est-ce qu'un trouble de stress post-traumatique complexe?

- ○ C'est un terme alternatif pour le trouble de stress post-traumatique
- ○ C'est un trouble dérivé d'expériences traumatisantes chroniques
- ○ C'est une terminologie utilisée lorsque les symptômes du trouble de stress post-traumatique persistent pendant plus de 6 mois
- ○ Il s'agit d'une perturbation causée par un traumatisme de groupe

9) Laquelle des caractéristiques suivantes n'est pas souhaitable dans un système de soins "Trauma Informed Care"?

- ○ Valoriser le patient dans tous les aspects des soins
- ○ Adopter un langage neutre et favorable
- ○ Faire un dépistage correct sur quelle expérience peut être définie comme traumatisante
- ○ Former le personnel au traumatisme et à ses effets

10) Quel est le facteur étiopathogène le plus courant dans le développement d'un traumatisme psychologique?

- ○ Expérience répétée de négligence physique et psychologique de la part des soignants
- ○ Expérience directe de catastrophes naturelles
- ○ Expérience directe de mort subite
- ○ Expérience d'abus sexuels sur des enfants

11) Les soins informés des traumatismes signifient:

- ○ Un ensemble de techniques qui accompagnent l'EMDR et qui facilite le re-travail traumatique
- ○ Un type de psychothérapie
- ○ Une approche systémique de gestion et de soins des personnes ayant vécu des expériences traumatisantes
- ○ Une salle d'hôpital spécifique pour les personnes ayant vécu des expériences traumatisantes

12) La violence assistée est définie comme:

- ○ Un traumatisme lié à la participation à des événements catastrophiques
- ○ Une situation dans laquelle un mineur assiste, directement ou indirectement, ou perçoit les effets d'actes de violence commis sur des figures de référence affectivement significatives pour lui
- ○ Un type de violence infligée par un parent à l'autre parent avec le soutien psychologique et / ou matériel (obtenu par manipulation psychologique) de l'enfant
- ○ Le traumatisme dérivé du fait d'être témoin de phénomènes de violence générale

13) Quelles sont les actions d'intervention recommandées en cas de témoin de violence?

- ○ Détection, protection, évaluation, traitement
- ○ Observation, évaluation, traitement, médiation familiale
- ○ Détection, hébergement familial, traitement, médiation familiale, réinstallation familiale
- ○ Éloignement du noyau familial, médiation familiale, relocalisation familiale

14) Selon le rapport de l'OMS publié en 2013 sur la prévention de la maltraitance des enfants en Europe, combien d'enfants de moins de 15 ans meurent-ils de maltraitances?

- ○ Entre 800 et 900
- ○ Entre 500 et 600
- ○ Entre 900 et 1000
- ○ Entre 400 et 500

15) Le complexe du PTSD diffère du PTSD en ce qu'il:

- ○ Est typique de l'enfance
- ○ Est présent en cas de violence dans une relation de confiance
- ○ Est présent si à côté des symptômes psychologiques, il y a des symptômes moteurs
- ○ Est présent exclusivement chez les femmes et les mineurs

Bienvenue. Au cours de ces deux semaines, nous allons approfondir le sujet de la recherche scientifique.

En particulier, au cours de la première semaine, nous présenterons quelques définitions de la recherche, et tenterons d'énumérer ses typologies,

selon ses applications, ses objectifs et ses techniques.

Nous observerons le processus qui nous mène de l'expression d'un problème théorique (de la théorie)

aux méthodes qui nous permettent de l'explorer

et de produire des données qui peuvent être interprétées et utilisées. Nous allons ensuite intégrer et examiner en profondeur

les principes fondamentaux, les limites et les avantages de la Recherche-Action, comme point de départ,

et mes collègues expliqueront la signification de la Recherche-Action,

pour ensuite expliquer la recherche factuelle.

Après cela, nous explorerons les avantages et les défis de l'intégration

de la recherche factuelle dans les soins

fondés sur les traumatismes. En particulier, la pertinence internationale du sujet nous fournit une perspective transversale

sur les points critiques et les forces

de la transformation de la recherche en pratique clinique. Ici, nous analyserons

les éléments principaux et connexes des bonnes pratiques dans la littérature scientifique,

dont certains sont informatifs. Nous nous questionnerons,

et nous essaierons de comprendre la signification des besoins de formation,

et comment ceux-ci peuvent être soutenus et pris en compte par l'organisation.

Nous ne devons pas oublier qu'une approche de soins adaptées aux traumatismes implique un aspect

et un impact qui sont fondamentaux à la fois au sein de l'organisation

et parmi les membres individuels de l'organisation. A partir de là, nous en profiterons pour discuter de la diffusion scientifique dans l'élaboration

et la mise en œuvre d'interventions spécifiques concernant les soins adaptés

sur les traumatismes. Pour conclure cette semaine, nous aborderons

les aspects évaluatifs dans les organisations

qui développent ou tentent de développer des procédures ou des processus basés sur les traumatismes.

En fait, ils peuvent offrir à leurs employés, 27 00:02:33,950 --> 00:02:40,290 leurs collaborateurs et leurs bénévoles, une formation et une séance d'information à propos des soins adaptés aux traumatismes,

ainsi que des interventions efficaces liées aux

données de recherche en psychothérapie, ou dans la thérapie fondée sur des preuves.

De là, nous passerons ensemble à la deuxième semaine,

ce qui nous permettra d'examiner d'autres questions liées à la recherche.

Je vous souhaite à tous une semaine de cours agréable et une bonne leçon,

en mon nom et au nom de tous mes collègues.

ARTICLE

Il est difficile de distinguer ce qui relève de la recherche et ce qui n'en relève pas. Au fil du temps, plusieurs définitions sont apparues. Penchons-nous sur les plus récentes :

« La recherche vise simplement à trouver une réponse à certaines questions auxquelles on n'a jamais répondu et les réponses dépendent des efforts humains consentis. [...] En fait, la recherche est simplement le processus permettant de trouver des solutions fiables à un problème grâce à un recueil systématique et planifié, à une analyse et à une interprétation de données. » (Singh, 2006, p.1).

« La recherche est un processus créatif de découverte qui évolue au fil d'un itinéraire et de procédures pré-déterminés, qui ont fait l'objet d'une consolidation au sein de la communauté scientifique. » (Corbetta, 2015, p.15).

En règle générale, une recherche est menée « lorsqu'on applique la curiosité et l'intuition dans le cadre d'une démarche systématique visant à répondre à des questions relatives à des phénomènes quotidiens en s'inspirant des expériences et des connaissances déjà acquises. » (Research Italy, 2013).

On distingue plusieurs types de recherche en fonction de son application, de ses objectifs et de ses méthodes d'analyse. En réalité, la recherche peut être « appliquée » ou « pure ». La recherche appliquée vise à trouver une solution à un problème d'application alors que la recherche pure concerne les généralisations et la formulation d'une théorie (Kothary, 2004; Singh & Masuku, 2013). En fonction de ses objectifs, on parle de recherche descriptive, exploratoire, corrélationnelle ou explicative. La recherche descriptive vise à décrire un phénomène, un problème, une situation.

La recherche corrélationnelle analyse la relation entre deux ou plusieurs variables.

La recherche explicative explique pourquoi certaines choses se produisent.

La recherche exploratoire examine la faisabilité d'une étude ou analyse un domaine de recherche peu connu.

Avant de démarrer l'analyse, il convient d'élaborer un plan de travail reprenant les différentes phases de la procédure de réalisation de l'analyse en question; on appelle ces phases les « plans de recherche ».

Selon les techniques utilisées, on distingue :

- la recherche quantitative : il s'agit d'une démarche structurée visant à quantifier la variation ou la diversité d'un phénomène, d'une situation ou d'une attitude grâce à un plan de recherche bien structuré, qui fournit des données quantitatives. Celles-ci peuvent être analysées pour vérifier des hypothèses et tester des relations entre les variables ;

- la recherche qualitative : il s'agit d'une démarche non structurée, explicative, descriptive et inductive par nature, qui prête une attention particulière au contexte. Elle entend identifier et décrire autant de variations que possible dans un phénomène, une situation ou une attitude afin de comprendre les raisons sous-jacentes à leur manifestation. D'où « une vision interprétative et naturaliste du monde; en d'autres termes, les chercheurs étudient les phénomènes dans leurs milieux naturels et essaient de leur donner un sens ou de les interpréter à la lumière du sens que les personnes leur attribuent » (Denzin & Lincoln, 2011, p. 3). L'objectif de la recherche qualitative consiste à décrire et à comprendre les phénomènes plutôt qu'à les prédire et/ou les contrôler (Streubert & Carpenter, 2005).

D'autre part, l'approche mixte mélange les méthodes de la recherche quantitative à celles de la recherche qualitative. « La recherche sociale repose sur la définition des variables, la recherche d'associations entre elles et la volonté de comprendre si et comment la variation d'un élément provoque la variation dans un autre élément. Les variables courantes dans la recherche sociale sont l'âge, le genre, l'origine ethnique, la race, l'éducation, le revenu, l'état civil et l'emploi » (Bernard, 2006, pp. 28-29). Dans un premier temps, nous nous penchons sur le concept de variable :

un élément qui peut adopter plusieurs valeurs. Ensuite, vient le concept de « mesure »: les variables sont mesurées grâce à leurs indicateurs, définis par la variable en tant que telle. La mesure représente la valeur à enregistrer. Toute recherche se doit également de respecter les principes de validité et de fiabilité. La validité implique que la recherche présente des instruments de mesure, des données et des résultats précis ; quant à la fiabilité, elle signifie qu'on obtient les mêmes résultats après avoir procédé à plusieurs mesures avec le même instrument.

Bernard (2006) explique les quatre points fondamentaux qu'un processus de recherche doit suivre :

1. premièrement, la formulation d'un problème théorique (théorie et littérature scientifiques) ;

2. deuxièmement, le choix d'une méthode et d'unités d'analyse adéquates ;

3. troisièmement, le recueil et l'analyse des données ;

4. enfin, la contestation ou la validation de la proposition théorique, qui a servi de point de départ à la recherche.

(Bernard, 2006, p.69)

Recherche-action

ARTICLE

Traditionnellement, la tâche de la recherche a toujours été d'extrapoler des lois inscrites dans la nature du monde par une analyse objective des phénomènes. Le chercheur doit étudier les phénomènes à partir d'une position absolument neutre. La recherche s'attaque par définition à la théorie ; elle tend à la généralité et à la construction de modèles aussi universels que possible. L'action, en revanche, est, dans l'expérience commune, imprégnée de motivations, de désirs, d'émotions et de connaissances souvent illogiques, contradictoires et qui visent à faire, à obtenir et à transformer. L'action est orientée vers la pratique, elle est liée au particulier et au singulier, localiste et situationnelle, historicisée, pas toujours prévisible dans son origine et dans ses résultats (Amerio, 2000). La recherche-action est née avec l'intention de combiner ces deux dimensions traditionnellement considérées comme distinctes et inconciliables. Les deux pierres angulaires de la recherche-action, qui la différencient de la recherche traditionnelle, sont la participation et la coopération. C'est ainsi qu'Elliot la définirait :

« La recherche-action pourrait se définir comme l'étude d'une situation sociale visant à améliorer la qualité de l'action en son sein. En d'autres termes, elle a pour propos d'introduire une évaluation pratique dans des situations concrètes ; la validité des « théories » ou des hypothèses qu'elle génère dépend moins des vérifications « scientifiques » de la vérité que de leur pertinence pour aider les gens à agir de façon plus intelligente et plus compétente. Dans la recherche-action, les « théories » ne sont pas validées de façon indépendante avant d'être appliquées à la pratique. Elles sont validées par la pratique ». (Elliott, 1994, p.97)

Ou encore...

« Il convient de diagnostiquer la situation-problème et de planifier, puis appliquer des mesures correctives, dont les effets doivent être contrôlés, si l'objectif est d'apporter des améliorations. Ce processus global d'analyse-diagnostic-planification-action-vérification des effets s'appelle la recherche-action [...] ». (Elliott, 1994, p.96)

C'est Lewin (1946) qui a développé le modèle original de recherche-action dans le but de comprendre les problèmes existant dans des contextes spécifiques par le partage de connaissances entre des personnes qui sont à la fois chercheurs et sujets d'expérience. L'action prend de plus en plus de valeur parce qu'elle devient un moment de construction des connaissances sur le problème. Le changement se produit en trois étapes :

1. Unfreezing (dégel) : rompre l'équilibre initial en agissant sur les facteurs de résistance liés à l'adhésion aux normes sociales.

2. Moving (changement) : les éléments nouveaux et existants dans le champ se déplacent en fonction des forces agissant en son sein.

3. Refreezing (regel) : la nouvelle situation se stabilise autour d'un nouvel équilibre.

La recherche-action est donc « un recueil et une analyse systématiques de données visant à prendre des mesures et à apporter des changements », générant des connaissances pratiques et susceptibles d'être partagées (Gillis & Jackson, 2002, p. 264).

L'objectif de toute recherche-action est de produire un changement social par l'action (ou les actions), qui est à son tour le but ultime de la recherche (Greenwood & Levin, 1998; McNiff & Whitehead, 2006; MacDonald, 2012).

Les chercheurs, quand ils entreprennent une recherche-action, ont à l'esprit l'hypothèse que la réalité est créée et recréée par un processus social continu. Ils reconnaissent que, selon Argyris et al (1982), les éléments cruciaux d'une approche de recherche menée dans une situation sociale spécifique sont : la collaboration entre les chercheurs et les communautés de référence ; un processus d'investigation critique ; l'accent placé sur la pratique sociale ; et un processus d'apprentissage réfléchi. Cela implique nécessairement un type de recherche différent de la vérification des hypothèses, qui accorde plus d'attention aux thèmes de la recherche, nécessairement déclarés et discutés, pour permettre à toute personne intéressée de soumettre la recherche à un examen critique (Checkland & Holwell, 1998).

Le terme “Action-Recherche” a été introduit par le psychologue social Kurt Lewin dans les années 40

et indique la rencontre entre des mondes jusque-là

considérés comme séparés et opposés: la recherche, qui vise à réfléchir sur les choses,

et l'action, qui vise plutôt à changer

les choses.

L’Action-Recherche permet donc de créer une alliance entre l'aspect cognitif,

Recherche, et l'aspect applicatif, Action ; et exprime une transformation

dans la manière de concevoir, planifier et faire des recherches en Sciences Humaines, dans lesquelles la complexité

des phénomènes étudiés n'est pas simplifiée mais, au contraire, acceptée et prise en compte.

La recherche-action est toujours menée par Lewin dans un cadre de groupe

car le groupe est ce lieu psychosocial dans

lequel les gens construisent leurs actions

et est également un outil qui peut faciliter les processus de changement.

La recherche-action peut être décrite comme une famille de méthodologies de recherche dont l'objectif,

comme nous l'avons dit, est d'activer simultanément une voie d'action

(en d'autres termes, de changement) et de recherche (en d'autres termes, de compréhension des phénomènes).

Ce chemin se déroule à travers un processus flexible qui consiste en une spirale de cycles,

chacun étant structuré en trois étapes consécutives: planification, exécution

et reconnaissance / enquête. Cette dernière étape vise à évaluer les résultats de chaque phase,

préparer une base rationnelle pour la phase suivante et modifier, si nécessaire,

le plan d'action initial.

Que se passe-t-il après le premier cycle de recherche-action?

Une fois les résultats (ainsi que le changement potentiel produit

par rapport à la situation initiale) analysés, un nouveau cycle du processus commence,

dans lequel les nouveaux éléments qui ont émergé de l'activité

menée dans le cycle précédent sont intégrés; ces cycles se répètent jusqu'à épuisement de la situation problématique.

La planification, l'exécution et l'enquête sont soutenues par une évaluation critique

dans laquelle les participants se demandent ce qui a fonctionné, ce qui n'a pas fonctionné,

ce qui a été appris et ce qui peut être fait différemment.

L'évaluation critique de chaque cycle permet aux chercheurs d'action de corriger les erreur

et de réajuster les actions aux besoins réels qui sont apparus au cours de la recherche elle-même.

Quel est l'objectif de la recherche-action?

L'objectif d'Action-Recherche est de générer du changement :

changement de comportement, d'habitudes,

de contextes, etc.

L'hypothèse de base est que le statu quo ne permet pas le bien-être des individus

et que ce n'est que par le changement que la situation peut s'améliorer.

Le changement doit donc être provoqué, puis analysé et compris,

et cela doit être durable.

Selon Lewin, pour que le changement soit durable, il doit passer par trois phases : l

a « phase de dégel », qui s’obtient en agissant sur les facteurs de résistance au changement,

qui sont souvent liés à l'adhésion aux normes sociales ;

la « phase mouvante », par exemple changer et développer de nouvelles croyances,

valeurs et attitudes sur la base de nouvelles informations et passage

d'une ancienne situation à une nouvelle;

il y a ensuite la « phase de reconstruction » ou « recongélation », dans laquelle la nouvelle situation créée

se stabilise autour d'un nouvel équilibre, c'est-à-dire les nouvelles valeurs, attitudes

et comportements qui sont établis et intégrés dans le reste du système.

Un aspect important de la recherche-action est la participation active

du bénéficiaire, qui est en réalité à la fois le destinataire et l'acteur

de l'intervention et doit être en mesure de partager les objectifs de la recherche elle-même.

L'hypothèse de base de la recherche-action est que les personnes avec lesquelles nous travaillons sont des individus actifs,

avec des aptitudes et des compétences qui doivent être impliquées dans le processus de recherche.

Lors de l'adoption de l'approche de la Recherche-Action, on ne peut ignorer l'implication active des personnes

à qui s'adresse l'intervention, et il faut créer une situation de collaboration

et de confrontation avec les acteurs-destinataires de l'intervention.

Un autre élément caractéristique de cette famille de méthodologies

de recherche qui est la recherche-action est l'absence d'une méthode d'intervention prédéfinie à appliquer.

En fait, cette méthode est construite avec le groupe à partir de quelques principes cruciaux

et sur la base des réponses observées au cours du travail.

Il arrive souvent que le modèle initial soit modifié, car le choix de la méthodologie

et des actions à mettre en œuvre se construit au cours du processus.

Jusqu'à présent, nous avons illustré les aspects qui définissent la recherche-action.

Vérifions maintenant les éléments qui la différencient de la méthode expérimentale.

Nous avons déjà dit que dans la recherche-action, il n'y a pas d'intervention fixe.

Ceux qui adoptent cette approche permettent donc à l'hypothèse d'émerger au cours du processus

et de changer de cap grâce à un suivi continu.

Un autre élément de différence est que, dans la recherche-action, nous n'essayons pas de définir les relations causales,

vérifier les hypothèses de la littérature ou déterminer les résultats des traitements sur des échantillons représentatifs

dans le but de confirmer ou de falsifier

des théories générales.

En Recherche-Action, tout au long de chaque cycle, le phénomène sur lequel nous intervenons est davantage

mis en avant.

Nous ne nous soucions pas de la mesurabilité des variables et l'objectif est de résoudre les problèmes

en examinant différents parcours qui ne peuvent être anticipés a priori, mais qui deviennent

le résultat et aussi l'outil du groupe.

Enfin, un autre élément de différenciation est la manière dont les résultats finaux sont présentés;

dans le cas de la recherche-action, ils sont illustrés à l'ensemble du groupe

ou à l'ensemble de la communauté de manière participative, utiliser un langage simplifié

et accessible plutôt que le jargon technico-scientifique qui caractérise les rapports de recherche expérimentale.

L'objectif à atteindre par la présentation des données est de générer de nouvelles évaluations

qui permettent de définir les possibilités d'amélioration possibles.

Enfin, sur la base de ce qui a été dit jusqu'à présent, nous pouvons résumer les principales hypothèses sous-jacentes à la recherche-action:

Le fait qu'elle soit pratique et contextuelle.

La recherche-action prend pour cible les problèmes d'un groupe ou d'une communauté ;

par conséquent, elle est contextuelle dans sa nature, ou en d'autres termes, c'est une recherche localisée qui se déroule dans un contexte ;

- elle vise le changement et se concentre sur la dimension de groupe plutôt

que sur l'individu, à la fois lorsqu'il s'agit d'analyser les processus

et de définir les solutions et les résultats qui ont émergé;

De plus, la recherche-action comporte plusieurs étapes

et un caractère cyclique qui est donné par la conception de la recherche,

qui se configure comme une alternance de phases de connaissance et d'action ;

- elle place la participation au centre du sujet, en termes de coopération et de l'interdépendance

entre les chercheurs et le groupe, ou les chercheurs et la communauté.

L'enseignement est un métier. C'est à la fois un art et une science. C'est pourquoi les meilleurs professeurs

expérimentent toujours et font beaucoup d'erreurs. Mais comment savez-vous ce qui fonctionne réellement?

L'une des options est la recherche-action. Ici, vous pouvez identifier une question, tester une stratégie,

collecter des données et déterminer si cela fonctionne. Le résultat final est

dynamique, innovant et lié directement à votre classe.

La recherche-action fait disparaître la barrière entre les participants et les chercheurs.

En d'autres termes, l'enseignant participe activement à la situation tout en menant la recherche.

Il existe de nombreux cadres de recherche-action

mais ils suivent généralement un processus similaire. Dans la phase 1, vous initiez la planification de la recherche.

Vous commencez par l'enquête, où vous définissez une question de recherche spécifique.

Celle-ci doit pouvoir être réellement testée.

Ensuite, vous effectuez une revue de la littérature pour mieux comprendre le sujet.

Enfin, vous entrez dans le processus de conception où vous déterminez vos méthodes de données,

tenez compte des problèmes éthiques, obtenez les autorisations requises, créez des délais et configurez les systèmes.

Puis, vous passez à la phase d'action. C'est là que vous vous engagez dans plusieurs cycles

d'expérimentation et de collecte de données. Cette dernière peut inclure

des données qualitatives telles que des observations, des artefacts et des entretiens ou

des données quantitatives telles que des enquêtes sur les scores des rubriques ou des données sur les résultats. Vous passez ensuite

à l'analyse. Vous commencerez souvent par organiser les données avec des tableaux

ou des graphiques et à rechercher des tendances spécifiques.

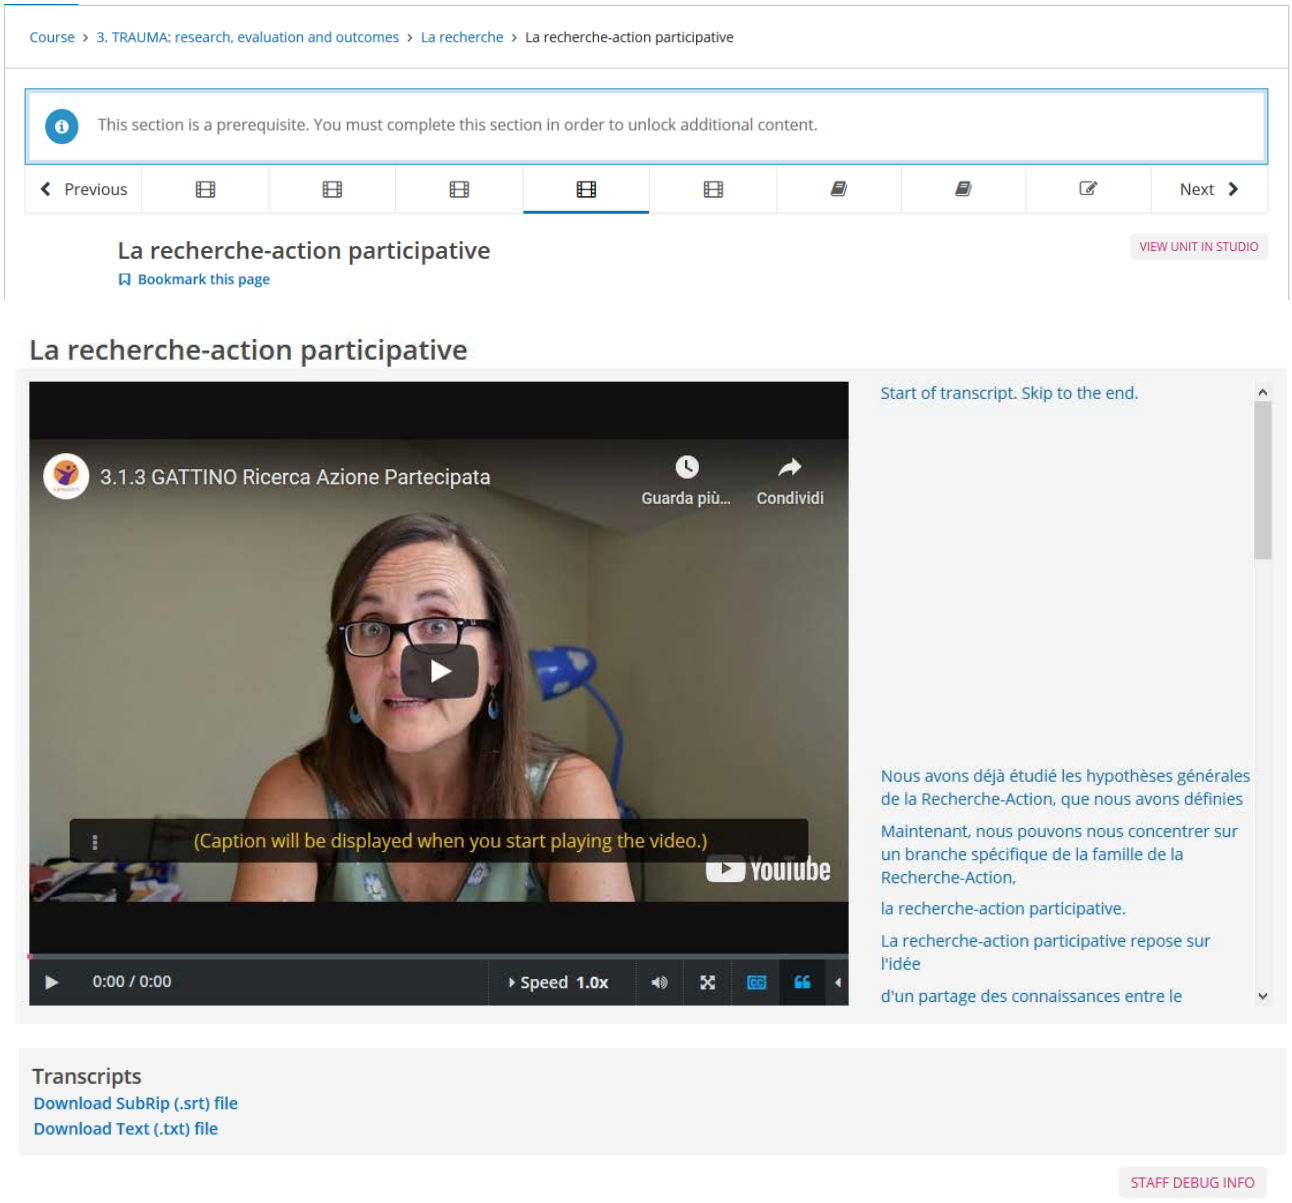
Vous pourrez également en discuter avec des pairs, tenir des notes dans un journal ou créer une carte à points

avant d'écrire vos résultats. Finalement, vous aurez votre conclusion.

C'est à ce moment-là que vous partagerez vos recherches avec le monde et réfléchirez à votre propre pratique.

Cela conduira finalement à de nouvelles questions et le cycle se poursuivra au fur et à mesure que

vous affinerez votre art pour devenir un meilleur enseignant, plus créatif.



Transcript

Nous avons déjà étudié les hypothèses générales de la Recherche-Action, que nous avons définies

Maintenant, nous pouvons nous concentrer sur un branche spécifique de la famille de la Recherche-Action,

la recherche-action participative.

La recherche-action participative repose sur l'idée

d'un partage des connaissances entre le chercheur et les bénéficiaires de l'intervention,

qui en sont aussi les acteurs. Comme nous l'avons déjà mentionné, l'objectif de la recherche-action participative

est le partage des connaissances, afin de concevoir et de redonner

un sens à l'action collective.

La recherche-action participative met en avant la collectivité en encourageant les échanges entre experts et

entre les personnes appartenant au contexte dans lequel elle intervient,

qui sont capables de tirer parti des connaissances locales et des connaissances des experts en faisant ressortir

les multiples points de vue et perspectives qui sont présents

dans ce contexte spécifique.

Ces interventions reposent sur le principe de participation,

comme un outil mais aussi comme un objectif du changement social de l'intervention.

La recherche-action participative établit qu'un problème provient d'un groupe qui est en difficulté

dans un contexte spécifique à un moment historique précis et bien défini.

Le chercheur note donc le problème, il ne le génère pas, et son rôle est d'aider le groupe et la communauté

à identifier les éléments clés afin de pouvoir

poursuivre l'action.

Les personnes qui adoptent l'approche de recherche-action participative doivent donc créer une situation de collaboration et de discussion avec les citoyens

et les opérateurs, lorsqu'ils définissent les problèmes

à étudier, la réalisation des recherches et la préparation

du changement.

ARTICLE

Comme le souligne Vargiu (2008), le domaine de la recherche-action redonne vie à expériences à la fois différentes, mais également unies par deux grands objectifs : la compréhension et le changement. La littérature existante définit la recherche-action comme étant une « famille de démarches » (Reason 1994, Reason - Bradbury 2006) visant à « mettre la recherche au service de la communauté, par l'activation de pratiques participatives dans le but de réaliser la transformation sociale. Ce qui suppose de grandes différences par rapport aux autres formes de recherche au niveau des objectifs que le chercheur se fixe, de ses hypothèses épistémologiques et de ses pratiques. » (p. 206). Selon l'auteur, on peut associer cette « famille » à de nombreuses démarches et pratiques, notamment : 1) la recherche-action, 2) la recherche participative, 3) la recherche-action participative, 4) la recherche-action participative , 5) la science-action, 6) l'enquête-action, 7) la sociologie de l'action (Bartoletto, 2006). Vargiu (2008) y ajoute les expériences qui remontent à la recherche communautaire, à la recherche-action communautaire et participative. Il observe que « la recherche participative et la recherche-action participative peuvent rejoindre la catégorie de recherche que Capecchi (2006) qualifie de « con-ricerca » ». (p. 209). Selon l'auteur, le niveau de participation prévu dans le processus de recherche et l'espace réservé à la dimension subjective et collective dans la définition des objectifs, des éléments de procédure et des instruments qui font toute la différence.

La recherche participative et la recherche-action participative (RAP) prennent une place de de plus en plus centrale dans les sciences sociales (Brydon-Miller et al., 2004; Greenwood et Levin, 1998; Kindon, Pain et Kesby, 2007; Jason et al., 2004; Park et al., 1993; Reason et Bradbury, 2006; Selener, 1997; Taggart, 1997). Comme le signalent Kindon, Pain et Kesby (2007) ainsi que Mackenzie et collègues (2012), la recherche-action participative implique les chercheurs et les participants dans un projet global, qui vise à analyser une condition ou une action problématique dans le but de corriger une situation (Wadsworth, 1998). Il s'agit d'un processus de recherche, d'éducation et d'action basé sur la collaboration (Hall, 1981) visant la transformation sociale (McTaggart, 1997), et dont le point de départ est la reconnaissance de l'existence d'une pluralité de connaissances dans un éventail d'institutions et de contextes (Kindon, Pain et Kesby, 2007). Le processus est cyclique (basé sur des cycles de réflexion-action) : les chercheurs et les participants identifient un problème ou une situation à modifier et entament une recherche basée sur les compétences et les ressources afin de susciter une action pertinente. Les chercheurs et les participants réfléchissent à cette action, en tirent les leçons et passent à un nouveau cycle de recherche/action/réflexion. Comme Kindon, Pain et Kesby (2007) le précisent, ils collaborent également à la définition de méthodes spécifiques au contexte susceptible de simplifier ces cycles. En résumé, la RAP repose sur un processus de participation-dialogue entre les co-chercheurs (Kindon, Pain et Kesby, 2007). Dès lors, la RAP privilégie l'orientation par l'action, qui exige une innovation méthodologique et envisage le processus de recherche ainsi que ses productions : son efficacité est non seulement inhérente à la qualité de l'information générée, mais également au processus de développement des compétences, des connaissances et des aptitudes des participants au fil de l'expérience de recherche (Cornwall et Jewkes 1995; Kesby et al., 2005, 2007; Maguire 1987).

Reason et Bradbury (2006) plaident pour l'adoption d'une approche participative ou d'une vision du monde, qui « exige de nous qu'on se positionne et qu'on réfléchisse, qu'on précise le point de vue instigateur de la connaissance, qu'on envisage la recherche comme un processus de connaissance, qu'on se mettre au service de l'éthique démocratique et pratique de la recherche-action » (p. 7). En phase avec Kindon et collègues (2007), la solution est une vision ontologique, qui suppose que les êtres humains sont des agents dynamiques, dotés d'aptitudes à la réflexion et au changement personnel, ainsi qu'une épistémologie, qui intègre ces aptitudes dans le processus de recherche.

Conformément à l'optique intrinsèquement participative, dans la RAP, le choix des modes et des niveaux de participation ne sont pas opérés à priori par le chercheur, mais font l'objet d'une négociation avec les co-chercheurs et les participants. Les méthodes les plus couramment utilisées dans la RAP se concentrent sur le dialogue, le récit et l'action collective. On utilise principalement (Kindon, Pain et Kesby, 2007) :

- les enquêtes ;
- l'observation par les participants ;
- l'analyse des données secondaires ;
- l'apprentissage par la pratique ;
- le dialogue ;
- l'action politique ;
- le travail et les discussions en groupes ;
- les entrevues ;
- le récit ;
- la cartographie ;
- l'art et les médias communautaires ;
- les diagrammes ;
- les camps éducatifs ;
- les programmes d'échange ;
- les classements et les notations ;
- les analyses, l'écriture et les présentations partagées.

Comme nous l'avons déjà souligné, la recherche active devient de la recherche-action participative en fonction des personnes qui participent à chaque phase et de leur degré de participation. Les participants, en tant que collaborateurs, peuvent influencer la phase de conception, proposer des méthodes, animer des activités et avant tout, réexaminer et évaluer le processus dans son ensemble (Mackenzie et al., 2012). Dès la phase de planification, la RAP tend à recourir aux techniques de recherche bien établies en les adaptant à la situation et cherchant à mettre au point une stratégie (avant l'action) de suivi et d'évaluation de l'incidence de l'action. Cela permet de définir l'ampleur des changements, mais également « d'articuler une épistémologie solide permettant d'évaluer la validité et la pertinence des nouvelles connaissances et du savoir naissant, tout comme une démarche de réflexion systémique » (Ison, 2008). Les procédures efficaces de suivi et d'évaluation offrent une évaluation rigoureuse de l'efficacité, de l'importance et de la pertinence de l'intervention de la recherche-action. Elles proposent également un cadre de causalité en déterminant dans quelle mesure l'activité de recherche a « causé » ou « contribué » au changement souhaité de la situation » (McAllister et Vernooy, 1999)" (pp. 12-13). L'évaluation du processus et des résultats par les participants permet de consolider la participation des parties prenantes et offre la possibilité de co-construire ensemble une participation active et critique, où les voix discordantes sont indispensables et enrichissantes. En conséquence, la RAP exige du chercheur qu'il lâche prise, et qu'il endosse le rôle d'animateur du processus (Kindon, Pain et Kesby, 2007; Janssen et al., 2013).

Comme le soulignent Kangovi et collègues (2014), dans le champ de la santé mentale, la RAP s'avère être une bonne stratégie en ceci qu'elle associe le patient à la conception opérationnelle. Grâce à son caractère coopératif et itératif, les chercheurs, le personnel de la santé et les patients peuvent collaborer à la conception d'interventions validées par les utilisateurs finaux. Elle peut également servir à adapter une intervention existante aux besoins spécifiques et, une fois diffusée, à de nouvelles configurations et/ou groupes de patients. Concernant l'application aux populations jeunes, comme le précisent Shamrova et Cummings (2017), le paradigme des droits de l'enfant a fortement poussé les chercheurs à reconnaître les enfants comme des participants actifs à la construction de sens. Dans ce cadre, la RAP, en tant que mécanisme, permet aux participants de devenir acteurs et d'accompagne l'application des droits de l'enfant (Checkoway, 2011; Quijada Cerecer, Cahill et Bradley, 2013; Shamrova et Cummings, 2017). Qui plus est, la littérature montre que son application produit des résultats également au niveau organisationnel ; la plupart du temps, il s'agit d'une transformation de la culture organisationnelle dans le but : d'augmenter les possibilités de participation ; d'améliorer le niveau d'inclusion de l'enfant ; et de sensibiliser davantage à une meilleure adaptation des programmes aux besoins des enfants et des jeunes (Shamrova et Cummings, 2017). A ce propos, les auteurs (Shamrova et Cummings, 2017), ont identifié une série de choix méthodologiques susceptibles de soutenir une participation pertinente de enfants :

- la formation ;

- la construction et l'utilisation d'outils de recueil de données adaptés aux enfants ;

- la participation active des enfants dans l'analyse des données et dans la lecture des résultats ;

- le choix de lieux pertinents pour la diffusion des résultats de la recherche.

Dans le cadre de recherches auprès de groupes vulnérables, comme le soulignent Lushey et Munro (2015), la RAP peut promouvoir les droits à la participation des enfants et des personnes ayant perdu leur charge, tout en contribuant à la base empirique qui découle des études réalisées sur ces populations.

Sur un plan conceptuel, la recherche-action participative des jeunes est particulièrement intéressante (Anyon et al., 2018; Rodriguez et Brown, 2009). Elle associe les principes de base suivants :

1. elle repose sur une enquête ;

2. les domaines examinés sont les expériences telles que vécues par les jeunes ;

3. elle est participative ;

4. elle présente un caractère transformateur.

Ses principaux processus sont :

a) le partage de pouvoir entre les jeunes et les adultes pendant tout le processus ;

b) la formation et l'application des méthodes de recherche et de plaidoyer ;

c) l'utilisation critique de la réflexion stratégique sur les outils de transformation sociale ;

d) la constitution d'alliances avec les parties prenantes.

Enfin, citons comme exemple de recherches menées sur base du paradigme de la RAP la recherche par Törrönen et Vornanen (2014) auprès de jeunes quittant les structures d'accueil. En accord avec les principes ci-dessus, et comme le soulignent les auteurs, les professionnels et chercheurs se contentaient d'accompagner les jeunes, alors que ceux-ci s'occupaient de mener les entrevues, de recueillir les données auprès de leurs pairs et d'encourager l'expression d'opinions sur les expériences (Törrönen & Vauhkonen, 2012). En fait, priorité était donnée au point de vue des mineurs associés au processus en tant que co-chercheurs ; ces derniers participent donc pleinement au processus de recherche.

De nos jours, il existe différents types de recherche de preuves et il est
important que nous comprenions ces différents types. Il y a la recherche quantitative,
qui s'intéressent aux études interventionnelles et aux
résultats des recherches. C'est le type d'études dans lesquelles on fait
énormément d'analyses statistiques. Ces types d'études peuvent être des essais cliniques,
des essais contrôlés randomisés, des études de cas témoins, et le niveau le plus élevé
serait la méta-analyse et la revue systématique. Les lignes directrices des pratiques clinique sont,
pour la plupart, basées sur la recherche quantitative analytique. Il existe un autre type
de la recherche, appelé la recherche qualitative et la recherche qualitative est vraiment
faite pour comprendre le comportement humain, sur comment les gens répondent

par rapport à leur situation. Donc le type de recherche qualitative que vous voyez, souvent utilisé en soins infirmiers et en science sociale, sont des études comme la phénoménologie, où vous regardez le phénomène d'être malade ou d'avoir une certaine condition. Cela signifie également devoir regarder les groupes ethnographique, basé sur l'anthropologie, nous regardons donc des groupes de personnes qui ont une certaine condition. Nous savons que la recherche qualitative est extrêmement importante pour la façon dont nous dispensons les soins aujourd'hui, parce que vous devez vous assurer que votre patient ait une bonne expérience avec les soins qu'il reçoit. Maintenant le le plus haut niveau de recherche est considéré comme étant de la recherche secondaire et c'est ce que nous appelons la revue systématique ou la méta-analyse, et ce qui est différent à propos de la revue systématique et de la méta-analyses c'est que ca apporte le même niveau de rigueur à l'examen de toutes les recherches qui ont été faites sur un sujet spécifique. Cela apporte le même niveau de rigueur à l'analyse de toute les études. Voici un point d'attention: les revues systématiques sont très différentes des revues de la littérature car les revues systématique et les méta-analyses doivent être évalué par les pairs, ce qui signifie deux personnes ou plus doivent évaluer les études comprises dans la revue systématique ou méta-analyse. Lorsque vous effectuez une revue systématique, vous avez besoin de regarder d'autres point afin de vous assurer qu'il est important de savoir comment nous prodiguons des soins aux patients. Vous devez regarder: est-ce que les résultats de la revue systématique sont réellement faisable? Puis-je vraiment mettre en œuvre cela avec une population de patients spécifique? Est-ce que ce sera approprié? Est-ce significatif pour les populations de patients et ma pratique en tant que fournisseur de soins? Est-ce que ce sera être efficace? Est-ce Que ca fera vraiment une différence? Nous savons cependant que les preuves de recherche sont pas créée égales, donc c'est vraiment important lorsque les fournisseurs de soins de santé s'informent sur la recherche qu'ils obtiennent à partir d'une recherche, ils doivent déterminer quel niveau de recherche ils veulent. À la base, nous avons tous les originaux des études de recherche et ce sont des choses comme le contrôle aléatoire des études et ce genre de choses.

Le niveau suivant serait la revue systématique dans la méta-analyse: encore une fois, la Revue systématique de la méta-analyse est effectuée par un chercheur qui regarde

toutes les recherches originales autour d'un certain sujet,
en faisant une évaluation critique de celui-ci et une synthèse, puis de mettre le tout
ensemble pour une revue systématique, donc c'est ce qui est considéré comme le niveau supérieur de recherche dans la hiérarchie des preuves. Mais tout en haut se trouve notre aide à la décision clinique,
et cette aide à la décision clinique est un outil que les prestataires de santé peuvent utiliser,
ils lisent immédiatement et ils mettent en pratique immédiatement.
Maintenant, pourquoi est-ce important? Parce que les prestataires de soins aux chevet
n'ont pas le temps de lire cent, deux cents, trois cents pages d'une revue systématique ou d'une méta-analyse et ensuite prendre une décision pour un patient: ils doivent
lire la preuve et la mettre en pratique immédiatement et c'est ce que
font les outils d'aide à la décision clinique. Tous les outils d'aide à la décision clinique
doivent être basés sur les revues systématiques, les méta-analyses, le résumé des preuves
ou les meilleurs preuves disponibles.

ARTICLE

Le terme « recherche factuelle » (EBR, evidence-based research) apparaît en 2009 pour désigner la démarche visant à mettre un terme au gaspillage considérable constaté dans la recherche biomédicale (Robinson, 2009), où les études primaires étaient réalisées sans examen systématique des preuves disponibles. Cette approche n'était considérée comme ni éthique ni scientifique (Lund, H. et al., 2017). La recherche factuelle, pour sa part, commence par un examen systématique, qui englobe des questions de recherche prédéfinies, des critères d'inclusion, des méthodes de recherche, des procédures de sélection, une évaluation de la qualité, une extraction des données et une analyse statistique (Lund, H. et al., 2017). L'examen systématique permet de comprendre et de sérier les recherches, d'envisager si elles sont nécessaires et utiles à la communauté, ou si elles représentent un gaspillage éventuel de ressources lorsqu'elles ne débouchent pas sur de nouvelles connaissances scientifiques. « Evidence », une revue en libre accès de la fondation GIMBE (Italian Group for Evidence-Based Medicine – groupement italien pour une médecine factuelle), propose une série de lignes directrices pour la conception d'un projet de recherche factuelle :

1. formuler la question de recherche préliminaire et identifier des examens systématiques pertinents ;
2. évaluer l'intérêt de l'objet, de la qualité et de l'actualisation de la recherche ;
3. évaluer, dans les détails, la population, l'intervention, la comparaison, les conclusions et l'intervalle de temps (PICOT) ;
4. évaluer la méthode utilisée et les résultats.

Enfin, les chercheurs devraient procéder à des examens systématiques afin de définir la question qu'envisagera l'étude, en justifier la nécessité pendant la demande de financement et l'approbation par la commission éthique, interpréter les résultats de la nouvelle étude dans le contexte des preuves disponibles, et formuler une série de recommandations en vue d'une future recherche. Au fil du temps, on a assisté à une croissance exponentielle du nombre de recherches factuelles, qui ont abouti à la publication d'environ deux millions d'articles dans plus de vingt mille revues. Plusieurs raisons expliquent cette croissance : la vocation pédagogique (JAMA, 1992) et le glissement de paradigme (Pagliaro & Colli, 2014) qui ont conduit à cette pratique d'une part et les atouts que présente la recherche factuelle d'autre part :

- elle permet de produire des connaissances et d'orienter la pratique professionnelle dans des domaines où une plus grande incertitude règne autour des interventions menées dans la pratique clinique ;

- elle limite le gaspillage en définissant les priorités des sujets de recherche et en tenant compte des précédents examens systématiques ;

- elle permet une description claire des plans de recherche (public cible, interventions, comparaisons, conclusions) ;

- elle produit des mises à jour et diffuse les examens systématiques ;

- elle intègre les preuves dans la pratique clinique ;

- elle permet une réévaluation continue de nos connaissances (GIMBE).

VIEW UNIT IN STUDIO

Ci-après un exemple de méthode d'analyse utilisée par Bean & Creswell (1980, p 321-322):

« L'étude porte sur un petit collège (1000 inscrits – arts et lettres) mixte et religieux dans une ville du Midwest dont la population est de 175.000 habitants. L'année précédant l'étude, le taux de décrochage s'élevait à 25%. Les élèves de première et de deuxième année présentant les taux les plus élevés, la distribution des questionnaires se fait dans le but d'atteindre un nombre maximum de ces étudiants. Une analyse des taux de défection montre que les filles et les garçons décrochent pour des raisons différentes (Bean, 1978; Spady 1971). Il est donc décidé de n'examiner que le décrochage de la population féminine. Dans le courant du mois d'avril 1979, 169 filles répondent au questionnaire. La recherche porte sur un échantillon homogène de 135 femmes de 25 ans ou moins, célibataires, citoyennes américaines et caucasiennes. 71 de ces femmes sont en première année, 55 en deuxième et 9 sont des élèves du cycle moyen. Parmi ces étudiantes, 95% ont entre 18 et 21 ans. L'échantillon est biaisé en faveur des étudiantes dont les aptitudes sont plus élevées, comme le montrent les résultats au test ACT. Les données sont recueillies via un questionnaire reprenant 116 points, dont [...] la majorité utilise l'échelle Likert de « très peu » à « beaucoup ». D'autres questions concernent des informations factuelles telles que les scores Act, les notes scolaires les plus élevées et le niveau d'éducation des parents. Toutes les informations utilisées dans l'analyse étaient recueillies via le questionnaire, qui avait été élaboré et testé dans trois autres institutions avant d'être diffusé au collège. [Les auteurs ont discuté de l'instrument.] [...] Plusieurs analyses de régression et de trajectoires ont été effectuées en vue de l'examen des données. [...] »

(Creswell, 2014, pp. 181-182)

Ci-après un exemple de recherche qualitative (Cardano, Ortalda, pp. 242-243)

« L'objectif de la recherche consiste à analyser les raisons pour lesquelles les pré-adolescents commencent à fumer (Frohlich, Potvin, Chabot, Corin, 2002). Après avoir retracé la prévalence du tabagisme chez les pré-adolescents sur 32 territoires du Québec et recueilli des informations pertinentes sur les contraintes et les ressources « structurelles » qui tantôt entravent, tantôt favorisent le tabagisme au sein de cette population – la présence de bureaux de tabac, de places publiques où il est interdit de fumer, d'agents chargés du respect des règles en matière de vente de cigarettes aux adolescents et de tabagisme dans les lieux publics – les auteurs se concentrent sur huit territoires et y organisent des groupes de discussion. Sur chaque territoire, les participants sont recrutés grâce aux enseignants de l'école locale, ce qui permet de constituer des groupes de garçons et de filles qui, selon toute probabilité, se connaissent et se fréquentent préalablement à la constitution du groupe de discussion. Dans le cadre de l'étude, la connaissance préalable des participants est une ressource et non pas une limite, car elle permet aux chercheurs d'accéder à des discours moins « formatés » et plus en phase avec la vie des participants. En outre, ces derniers, confortés par le soutien de leurs pairs, peuvent aborder plus sereinement un thème – le tabagisme – qu'il serait plus compliqué de traiter face à un interlocuteur adulte. Grâce à leur connaissance du contexte ethnographique, des codes linguistiques, des pratiques sociales répandues sur les territoires où se déroulent les groupes de discussion, les auteurs sont peuvent surmonter les difficultés propres à l'organisation de discussions au sein d'un groupe naturel : le recours à des expériences communes rarement explicitées dans le discours, le recours à des expressions argotiques, etc. »

(Cardano, Ortalda, pp. 242-243)

Q3.1

4 points possible (graded)

1. Une recherche scientifique...

- ○ commence par un recueil de données ;
- ○ devrait toujours prendre en compte les connaissances déjà acquises ;
- ○ permet toujours un relevé fidèle de la réalité ;
- ○ utilise toujours une méthode unique.

2. Dans une recherche-action...

- ○ le chercheur doit entretenir une neutralité parfaite envers l'objet de la recherche ;
- ○ on tente d'extrapoler les lois inscrites dans la nature par une analyse objective des phénomènes ;
- ○ aucun changement social ne devrait être produit dans le contexte de la recherche.
- ○ on encourage la participation et la coopération des chercheurs ;

3. Parmi les étapes suivantes, laquelle NE S'INSCRIT PAS dans un projet de recherche factuelle ?

- ○ Validation de la théorie par la pratique
- ○ Evaluation des résultats
- ○ Formulation d'hypothèses de recherche
- ○ Examen systématique de la littérature existante

4. L'élément central d'une Recherche-Action Participative est :

- ○ l'accent placé sur l'idée d'une connaissance non partagée entre le chercheur et le bénéficiaire de l'intervention ;
- ○ la séparation claire et absolue entre l'action et la recherche
- ○ le choix a priori des problèmes à étudier et des outils à utiliser
- ○ l'accent placé sur l'idée d'un partage des connaissances entre le chercheur et le bénéficiaire de l'intervention ;

Recherche factuelle en AST/PAT, un point de vue international

ARTICLE

Quiconque organise des services à destination de mineurs victimes de traumatismes se demande notamment comment garantir une formation adéquate et efficace des professionnels en vue d'interventions fondées sur des preuves ou factuelles (Ruzek & Rosen, 2009). Une observation globale du niveau d'application des traitements et des directives fondées sur des données probantes laisse constater, malgré l'importance du thème dans le domaine de la santé publique, des disparités d'application et un intérêt limité pour l'évaluation systématique et les effets à long terme des programmes de formation (Ruzek et Rosen, 2009). De plus, d'un point de vue comparatif, Delaney (2006) a souligné un autre aspect pertinent : au niveau international, les lignes directrices et leur application lors de traitements électifs tout au long de la pratique clinique varient considérablement au niveau national et entre les différents pays (y compris pour ce concerne les réglementations de santé publique). Weiner, Schneider & Lyons (2009) se sont penchés sur les méthodes factuelles (fondées sur des données probantes) de traitement des traumatismes chez les mineurs. Comme le précisent les auteurs, si certaines de ces méthodes ont été mises à l'essai de manière expérimentale ou quasi-expérimentale, la plupart ont été structurées pour des populations adultes, même si elles ont également été appliquées à des mineurs ; par ailleurs, elles ont été évaluées indépendamment des variables culturelles et des différences entre sous-groupes basées sur des facteurs pouvant en influencer les résultats.

A partir de ces observations, on peut se poser une question intéressante sur la validation interculturelle des traitements, ce qui permettrait non seulement d'en accroître l'efficacité, mais également d'explorer les obstacles qui entravent leur mise en œuvre, ainsi que les adaptations que l'on pourrait appliquer à certains sous-groupes ou situations spécifiques. Pour Courtois & Gold (2009) et Layne & co (2014), force est de mettre en avant le traumatisme et ses conséquences lors de la formation des professionnels, en les sensibilisant, dans un premier temps, aux conséquences qu'ont les traumatismes et leurs effets sur toutes les phases du traitement, telles que, et spécifiquement, la participation du patient, l'évaluation et la réponse au traitement. En outre, ils soulignent l'importance, dans ce but, de fixer des normes internationales et des méthodes communes de formation des professionnels aux pratiques factuelles (EBP ; Lyon et al., 2011). Pareilles pratiques (EBP) permettent aux professionnels de poser les meilleurs choix réalisables, validés et adaptés à la situation, en fonction des besoins spécifiques du client, de ses forces et de sa situation (Layne et al., 2014).

Afin de garantir une formation adéquate, la communauté scientifique doit impérativement définir une série de compétences de base, soit le minimum de connaissances que devraient posséder ceux et celles qui travaillent avec des victimes de traumatismes. Plus précisément, pareille intervention devrait améliorer la qualité des services fournis, accroître la responsabilité des professionnels et diffuser une base de connaissances partagées et, souvent, consignées dans des protocoles propres aux différentes branches (psychologie, psychothérapie, sciences sociales, psychiatrie, etc). Le "National Child Traumatic Stress Network" (NCTSN) est un réseau de professionnels, de membres de familles concernées par la problématique, de chercheurs et de partenaires internationaux désireux d'améliorer les normes de soins et l'accès aux services pour les enfants et les familles. Le NCTSN a mis au point un protocole de formation appelé CCCT (Core Curriculum on Childhood Trauma ou Programme de base pour Traumatismes de l'Enfance) (Layne et al., 2011), qui définit les principaux éléments d'intervention (en les incluant dans une matrice intégrée et fondée sur des preuves), les concepts fondamentaux propres aux traumatismes et les compétences thérapeutiques essentielles pour planifier et mettre en œuvre une intervention efficace pour les enfants victimes de traumatismes et pour leurs familles. Deux éléments apparaissent fondamentaux : les objectifs de l'intervention (ce que l'on s'attend à atteindre grâce à l'intervention) et les éléments pratiques (les procédures à appliquer afin d'obtenir les résultats visés). La formation des professionnels s'articule autour de compétences de base, via la définition de "normes d'excellence" en matière de formation aux pratiques et traitements fondés sur des données probantes (EBTT, Evidence-Based Trauma Treatments).

Le CCCT (Programme de base) comprend cinq niveaux : a) Base de données empiriques ; b) 12 concepts de base pour comprendre les réactions au stress traumatique chez les enfants et les familles ; c) objectifs d'intervention ; d) éléments pratiques (actions observables mises en œuvre pour atteindre les objectifs) ; e) aptitudes thérapeutiques (avec deux sous-niveaux : 1) procédures et processus ; et 2) évaluation). Le modèle susmentionné s'appuie sur des pratiques et des compétences factuelles, comme l'évaluation systématique et la collecte d'informations, la théorie de la pratique, l'application de résultats tirés de la documentation scientifique aux situations individuelles des patients, la conceptualisation des cas et la planification des interventions. Dans le cadre de l'examen et de la mise en œuvre du modèle CCCT, un groupe de travail a prévu une séance spécifique de perfectionnement des compétences en analyse statistique et de structuration des protocoles d'étude utiles pour la validation des pratiques cliniques. Ce qui ressort ici est l'intention de développer à la fois des aspects théoriques et des méthodes d'évaluation (multidimensionnelles), ainsi que la base empirique accessible pour l'évaluation et la validation des interventions (en particulier, au niveau des résultats, les facteurs entrant en ligne de compte et l'efficacité des interventions axées sur la situation particulière d'une personne). Briggs & collègues (2012) identifient ensuite comme priorité l'amélioration des normes par « [...] l'élaboration, la mise en œuvre et la diffusion fondées sur des preuves » (p. 1). La structuration des lignes directrices d'intervention - destinées à identifier les meilleurs objectifs et méthodes optimales d'identification (quelle est la meilleure intervention dans des circonstances spécifiques ?), tout en évaluant les résultats - est fondamentale pour les professionnels et pour ceux et celles qui sont chargé.e.s de la structuration des services.

Les modèles de recherche s'avèrent utiles quand ils tiennent compte de l'interconnexion entre les facteurs de risque et les différents résultats afin d'identifier les éléments sur lesquels l'intervention pourrait être axée et, de façon récursive, d'inclure de nouveaux aspects dans la compréhension théorique du traumatisme et de complexifier le cadre scientifique. En fait, il est particulièrement intéressant de noter que les traitements visant à atténuer les symptômes post-traumatiques permettent également de réduire les difficultés fonctionnelles non directement liées à l'objet du traitement ; on peut en déduire qu'un traitement axé sur le traumatisme peut avoir des effets larges et positifs (Layne et coll., 2010).

ARTICLE

Bryson et ses collaborateurs (2017) posent un préalable intéressant qui permet de distinguer deux niveaux de réflexion applicables à l'analyse et à l'évaluation des thèmes du présent module. Les auteurs établissent une distinction entre les traitements spécifiques aux traumatismes d'une part (c'est-à-dire les techniques d'intervention visant à réduire les symptômes liés aux traumatismes) et, d'autre part, les soins sensibles aux traumatismes (SST ou TIC) en tant qu'approche globale visant une transformation du système de soins, y compris, lorsqu'il s'agit de SST, une meilleure compréhension des réponses au stress lié aux traumatismes à tous les niveaux et dans tous les aspects de l'organisation des services. Malgré les nombreuses demandes d'appliquer les principes des SST (TIC) aux services et en dépit des avantages éventuels de pareille décision, les contributions scientifiques sur la mise en œuvre de soins sensibles aux traumatismes pour les patients mineurs sont, malheureusement, limitées (Bryson et al., 2017). Ruzek & Rosen, dès 2009, observaient que les organisations d'aide aux victimes de traumatismes privilégiaient la diffusion de traitements fondés sur des données probantes axés sur les symptômes post-traumatiques et constataient, par conséquent, une augmentation de la documentation scientifique portant sur les facteurs organisationnels liés à l'application et la diffusion des bonnes pratiques.

Cependant, une analyse préalable réalisée par Delaney (2006), confirmée par Ruzek & Rosen (2009) et par Bryson et co (2017) eux-mêmes, indiquait une forte volatilité des taux d'utilisation des pratiques, comme la contention et l'isolement. Qui plus est, comme l'ont souligné Valenkamp et co (2014), puis Bryson et co (2017), peu d'études ont testé l'efficacité de ces interventions par rapport aux autres méthodes d'admission. La volatilité des méthodes d'intervention, selon Ruzek & Rosen (2009), imposerait de procéder à une analyse comparative des lignes directrices et des meilleures pratiques internationales afin de les ancrer davantage, d'un point de vue politique, dans le champ des propositions de changement organisationnel et des pratiques factuelles. Bryson et co (2017) tentent, par un examen systématique de la littérature scientifique, de mettre en évidence les facteurs qui expliquent l'efficacité des soins sensibles aux traumatismes, pour quel type d'utilisateur, dans quelles circonstances, dans quelle direction et pourquoi. Les stratégies les plus largement partagées dans les contributions scientifiques sont : 1) un leadership axé sur le changement ; 2) l'utilisation des données de recherche pour éclairer la pratique ; 3) la formation approfondie du personnel ; 4) l'utilisation d'outils qui empêchent la contention et l'isolement ; 5) le rôle des usagers lors de leur séjour ; 6) les techniques de verbalisation. Face à la nécessité d'analyser la complexité opérationnelle de ces éléments tout en les reliant aux particularités territoriales et organisationnelles, les auteurs choisissent de solliciter des services permettant l'application de soins sensibles aux traumatismes afin de démontrer, à travers le processus de recherche scientifique et dans une perspective longitudinale, l'efficacité des efforts et des changements appliqués pour améliorer la sécurité des patients, ainsi que les résultats à long terme des traitements. Dans le droit de fil de cette approche, Lang et co (2016) soulignent l'importance d'un consensus sur les éléments constitutifs d'un service sensible aux traumatismes et sur la façon de mesurer efficacement les facteurs correspondants. Tout d'abord, les questions centrales sont les suivantes : comment mettre en place une procédure de dépistage optimale ? Comment opérationnaliser au mieux les principes fondateurs des soins sensibles aux traumatismes dans le traitement quotidien de sujets exposés à des événements potentiellement ou certainement traumatisants ? Et quelles peuvent être les meilleures méthodes pour améliorer les services offerts à ceux-ci ? À l'heure actuelle, peu de recherches portent sur l'efficacité des changements apportés aux méthodes d'admission des patients dans les organisations qui appliquent les principes des soins sensibles aux traumatismes, ou sur la pertinence et l'utilité de ces changements au niveau de la santé des usagers participants. Un défi souligné par les chercheurs pourrait, en fait, être l'intégration des recherches sur les pratiques factuelles (EBP) et des meilleures pratiques en la matière afin d'améliorer la qualité de mise en œuvre propres à ces services (tout en analysant l'ampleur de l'impact économique de ces initiatives), par le développement des

compétences du personnel, des procédures de dépistage et des capacités de changement politique. Dans ce processus, un rôle crucial peut être joué par les dirigeants, qui devraient soutenir un processus de changement, parfois radical, même au niveau de la culture organisationnelle (en mettant, par exemple, l'accent sur l'importance des soins sensibles aux traumatismes).

Si une formation sur les traumatismes est un élément essentiel, elle ne suffit pas pour certifier qu'une organisation est réellement sensible aux traumatismes. Un autre aspect important, comme le précisent Kramer et co (2013), est la collaboration entre les différentes agences chargées de l'aide aux mineurs et à leurs familles, qui devraient éventuellement adopter les principes des soins sensibles aux traumatismes. Sur ce dernier aspect, les auteurs ont analysé l'efficacité d'une formation visant l'acquisition de connaissances spécifiques relatives à l'administration longitudinale d'outils d'enquête adéquats (avant et après la formation), ainsi qu'une enquête de suivi analysant dans quelle mesure ces compétences acquises entraînent des changements dans le service concerné. Sur ce point spécifique, soulignons l'intérêt d'une analyse des obstacles rencontrés par l'ensemble du personnel et de la structuration d'une recherche comparative (auprès de groupes aléatoires) afin d'examiner l'utilité des différentes stratégies employées et les besoins de formation continue, également de manière longitudinale.

Diffusion de recherches sur la traumatismes en milieu organisationnel

ARTICLE

Dans un exposé sur la diffusion des recherches en milieu organisationnel, Ruzek et Rosen (2009) en soulignent la complexité : les modèles traitant de la diffusion ont mis en évidence sa dépendance à de multiples facteurs interagissant entre eux à différents niveaux (individuel et organisationnel). Pour Briggs et co (2012), s'il est reconnu qu'un changement dans les connaissances représente le premier pas vers un changement organisationnel, il est tout aussi fondamental de vérifier dans quelle mesure cela se traduit par un changement de comportement réel. Deux aspects semblent importants : la complexité systémique et verticale de la diffusion d'un contenu scientifique au sein des organisations et le processus liant les connaissances et la pratique par un mécanisme complexe de changements individuels et organisationnels. Ce processus met en évidence l'une des résistances les plus fréquentes à la mise en œuvre de nouvelles pratiques exemplaires : la perception que le choix de leur application dans l'organisation est imposé « par le sommet », sans que les cliniciens ne le soutiennent suffisamment (Rohrbach et al., 2006 ; Ruzek & Rosen, 2009). En effet, et dans ce cas, la motivation des professionnels à changer leur pratique organisationnelle est un aspect central.

Comme le suggèrent les contributions des chercheurs, lorsqu'un changement repose sur un accord négocié entre les dirigeants et leurs subordonnés, tenant compte des besoins locaux, il est plus susceptible de réussir (Durlak et DuPre, 2008 ; Ruzek et Rosen, 2009). Un autre thème central est le fait que les organisations de soins de santé n'ont souvent, dans leur personnel, aucune personne chargée spécifiquement de mener des recherches sur des pratiques factuelles (BPE), ni d'étudier les meilleures pratiques et stratégies pour leur application, ni, plus précisément, d'analyser ou d'intégrer de manière systématique et continue les résultats de recherches scientifiques (Berwick, 2003 ; Ruzek & Rosen, 2009). A cet égard, Marvin et Volino Robinson (2018) soulignent que les organisations doivent se doter d'une vision qui envisagerait l'analyse de l'institution ou du service lui-même à la lumière de sa capacité ou de sa préparation à accueillir et à soutenir des interventions de changement (la littérature parle de « préparation organisationnelle », qui peut être mesurée à l'échelle organisationnelle, collective ou individuelle). Prendre en compte cette dimension lors de la phase de planification peut certainement contribuer à pérenniser les nouvelles pratiques, à analyser les obstacles éventuels dans le processus et à conserver une attitude positive envers le changement organisationnel. Dans ce cadre, force est de constater l'importance centrale à accorder à la recommandation visant à élaborer des stratégies ciblées vers le changement dans une organisation donnée (Augustsson et coll., 2017 ; Marvin et Volino Robinson, 2018). La recherche démontre l'importance du leadership et d'une vision managériale dans la co-construction du processus de changement en phase avec les professionnels et dans le partage d'une culture orientée vers l'application des soins sensibles aux traumatismes, qui se concentrerait en tout premier lieu sur l'analyse des besoins du personnel.

Des soins sensibles aux traumatismes

0:00 / 0:00 Speed 1.0x

STAFF DEBUG INFO

ARTICLE

On pourrait définir les TIC (soins sensibles aux traumatismes) comme une approche factuelles permettant de réagir à un traumatisme, mettant l'accent sur la capacité (ou l'incapacité) des membres du personnel à s'inscrire dans une vision des soins d'un patient victime de traumatismes susceptible ou non de déboucher sur des stratégies d'atténuation des risques de retraumatisme de l'usager concerné (Marvin & Volino Robinson, 2018). Dans ce contexte, il est fondamental de prendre soigneusement en compte la complexité des cas de traumatismes générés par des expériences différentes et individuelles. Les politiques, les procédures et le fonctionnement quotidien des soins pourraient constituer de nouvelles expériences traumatisantes ou susciter des réactions liées au fonctionnement individuel de la personne traumatisée, l'empêchant de recevoir les soins dont elle a besoin. Pour éviter ces situations et d'éventuelles frustrations dans le chef des membres du personnel, il pourrait être utile de recourir à des bonnes pratiques spécialement structurées et reconnues à l'échelle internationale (voir, par exemple, les stratégies préconisées par la SAMHSA en 2014). En phase avec cet objectif, les organisations qui appliquent l'approche des soins sensibles aux traumatismes sont invitées à envisager l'impact que peuvent avoir les soins apportés à des sujets porteurs d'histoires traumatisantes sur les membres du personnel dans les services cliniques (SAMHSA, 2014 ; Knight, 2015) et comment aider les professionnels, par la formation et un leadership sensibilisé aux traumatismes, à conserver un bon niveau de bien-être et d'efficacité dans leurs interventions (Manderscheid, 2009). Ruzek et Rosen (2009) ont examiné dans les détails les facteurs qui déterminent la prise en compte, par les services, des résultats de recherches menées sur les pratiques factuelles de traitements des traumatismes. Lorsqu'on évalue de manière attentive les processus de diffusion des pratiques et des recherches, le champ d'analyse se compose de multiples facteurs pouvant influencer l'évolution du processus de soins, la relation des patients ou des usagers potentiels avec les services, la méthode utilisée par les cliniciens pour apprendre de nouvelles techniques de traitement, les changements de type "transformation comportementale" au sein des organisations. Certes, selon les auteurs, il est de plus en plus urgent, dans l'application de la recherche empirique à ce domaine, de valider ou de soutenir les méthodes de traitement applicables d'une manière économiquement pratique. Les chercheurs, en particulier, ont analysé le rôle des facteurs propres aux professionnels et liés aux résultats que la recherche a mis en évidence. Ils observent que, si les évaluations réalisées par des professionnels spécialisés dans le stress traumatique (en particulier ceux ou celles s'occupant de stress post-traumatique) à propos d'une pratique spécifique, de leurs compétences et caractéristiques (par exemple leur niveau d'auto-efficacité), de leur volonté de changer les pratiques opérationnelles (par exemple, adopter une meilleure pratique spécifique en l'intégrant dans leur fonctionnement quotidien) sont autant de facteurs déterminants, elles ne font l'objet que d'études empiriques limitées. Parmi les variables pesant le plus sur leur acceptation de pratiques factuelles, indépendamment de leur cadre théorique, les professionnels citent principalement l'accessibilité aux programmes de formation aux pratiques fondées sur des données probantes (EBP) et leurs questionnements à propos de l'applicabilité des innovations dans les domaines de recherche propres à leur population spécifique (problème de la généralisation des résultats). La méthode de formation qui semble particulièrement efficace pour promouvoir un changement comportemental lors d'une prise en charge semble être la formation intensive, surtout lorsqu'elle exige la démonstration des compétences nécessaires et une mise à l'épreuve par le biais d'une participation interactive aux cours (avec une supervision régulière et donc au-delà des moments de formation et de formation des formateurs).

A propos des facteurs d'innovation, les auteurs soulignent que la perception qu'ont les patients et les professionnels des traitements est un élément essentiel de leur adoption, notamment pour tout ce qui concerne leur efficacité prouvée (même en cas de comparaison avec d'autres méthodes). Pour ce qui est des facteurs systémiques, ils observent que l'existence d'espaces de supervision et d'un soutien administratif et organisationnel conditionne l'application réussie d'une bonne pratique (Fixsen et al., 2005). Plus important encore, il est nécessaire d'apporter une aide empirique à la création de systèmes de soins sensibles aux traumatismes (Ko et coll., 2008 ; Ruzek et Rosen, 2009). De plus, évaluer la mise en œuvre du traitement permet de déterminer dans quelle mesure une pratique factuelle répond aux exigences de diffusion, d'efficacité et de respect des procédures (Rosenheck, 2001b ; DuFrene, Noell, Gilbertson et Duhon, 2005 ; Durlak et DuPre, 2008 ; Ruzek et Rosen, 2009). Citons comme aspect particulièrement intéressant l'analyse menée par Rosenheck (2001a) sur le processus d'interaction mutuellement récursif entre les pratiques fondées sur des preuves (dans leur dimension générale et prescriptive) et les expériences et exigences locales de leur mise en œuvre. L'objectif de suivi, même en dépit du coût des investissements en ressources économiques et en temps consacrés aux services, devrait donc permettre aux [services] de se concentrer sur des éléments cruciaux pour garantir les résultats et l'efficacité du traitement (Ruzek et Rosen, 2009). L'une des questions clés à se poser serait la suivante : comment les modifications apportées par le clinicien en réponse à des besoins spécifiques pourraient-elles réduire, augmenter ou ne pas modifier les effets de l'intervention (Ruzek et Rosen, 2009) ?

Q3.2

3 points possible (graded)

1. Une étude de Ruzek et Rosen (2009) a montré que, dans le contexte international des traitements liés aux traumatismes :

- ○ les traitements ont été appliqués uniformément dans différents pays, ce qui souligne l'efficacité des approches utilisées ;
- ○ la mise en oeuvre des programmes variait grandement, d'où l'impérieuse nécessité de définir les compétences de base ;
- ○ les besoins de sous-groupes spécifiques ont été adéquatement pris en compte ;
- ○ les mêmes traitements avaient le même niveau d'efficacité chez les adultes et chez les enfants.

2. Des soins sensibles aux traumatismes...

- ○ visent à atténuer les seuls symptômes liés au traumatisme, en mettant l'accent sur les techniques d'intervention ;
- ○ mettent en œuvre des techniques telles que la contention et l'isolement ;
- ○ sont exclusivement utilisés avec des mineurs.
- ○ visent à transformer le système de soins en mettant l'accent sur la capacité du personnel à participer à un projet de prise en charge du patient victime de traumatismes ;

3. L'un des avantages de la diffusion de données scientifiques dans les organisations sensibles aux traumatismes est :

- ○ la possibilité d'entamer un processus de mise en œuvre des pratiques factuelles les plus récentes, pour améliorer le bien-être du personnel et des patients;
- ○ la possibilité d'exprimer un intérêt exclusif pour les questions relatives aux groupes de travail ;
- ○ l'application des principes de données probantes suite à une décision imposée par la direction ;
- ○ la transition vers des traitements génériques efficaces pour tous les patients.

ARTICLE

Guyadeen & Seasons (2018) soulignent que, comme bien d'autres disciplines, « la planification possède son propre système d'évaluation » (p. 98). Elle se subdivise en deux parties : « l'évaluation du plan et l'évaluation de la planification. Traditionnellement, l'évaluation de la planification était indépendante de l'évaluation du programme et nécessitait l'utilisation d'approches d'évaluation spécifiques. Actuellement, la discipline de la planification estime préférable de nouer des liens solides entre l'évaluation du programme et l'évaluation de la planification » (p. 98). Dans le système de santé publique, l'évaluation joue un rôle essentiel dans la conception des politiques et de la planification programmatique. « Les deux processus prévoient l'identification d'un problème et une phase de définition » (p.99), suivie de phases de formulation, de mise en œuvre et enfin d'évaluation. La dernière phase vise à évaluer la réussite de l'intervention et à identifier des points à améliorer dans le programme (Pal, 2014; Guyadeen & Seasons, 2018). Comme le précisent Guyadeen et Seasons (2018): « Il s'agit d'un processus structuré qui vise à générer et à synthétiser des informations sur les interventions afin de porter des jugements sur les changements qui en résultent, sur la pertinence d'une intervention et sur le degré d'adaptation entre les résultats escomptés et les résultats inattendus (McDavid & Hawthorn, 2006) » (p. 99). Le processus d'évaluation peut également se concentrer sur le rapport coût-efficacité des programmes et des plans et peut être considéré comme particulièrement pertinent pour les organisations du secteur public : des raisons liées à la responsabilité politique et juridique obligent les gestionnaires à prouver les avantages de leurs actions ou propositions à l'opinion publique et à la communauté (Vedung, 2010; Guyadeen & Seasons, 2018).

Craig et collègues (2008) signalent « que les interventions complexes sont largement répandues dans les services de santé, dans les pratiques de santé publique et dans les domaines de la politique sociale qui pèsent lourdement sur la santé » (p. 1). Ces initiatives sont autant de défis pour les responsables de l'évaluation, Au-delà des difficultés d'application et de méthodologie que les processus d'évaluation de la réussite d'une initiative doivent normalement aborder. En effet, « les interventions complexes sont généralement définies comme des interventions comportant plusieurs composantes en interaction » et présentent « des caractéristiques multiples que les évaluateurs doivent prendre en compte » (Craig et al., 2008, p. 1). Voici des exemples de questions à poser lors de l'évaluation d'interventions complexes : ces interventions sont-elles efficaces dans la pratique quotidienne ? Les effets varient-ils en fonction du groupe cible ou du contexte ? Comment fonctionne l'intervention ? Quelles en sont les composantes principales et comment agissent-elles ?

En général, sous l'angle des procédures et des processus, les meilleures pratiques consistent à créer des interventions systématiques. En d'autres termes : « les meilleures pratiques consistent à élaborer des interventions de manière systématique en utilisant les meilleures preuves disponibles et une théorie adaptée. Et, ensuite, à les tester en utilisant une approche soigneusement échelonnée. Il convient de commencer par une série d'études pilotes ciblant chacune les principales incertitudes de la conception et d'enchaîner sur une évaluation d'abord exploratoire et ensuite définitive. Les résultats doivent être diffusés aussi largement et de manière aussi persuasive que possible et une future recherche envisagée afin de soutenir et de suivre le processus de mise en oeuvre » (Craig et al., 2008, p. 2).

Afin de préciser les éléments constitutifs de ce processus complexe, Rychetnik, Frommer, Hawe & Shiell (2002) nous proposent les définitions suivantes :

INTERVENTION : elle peut être conçue comme un ensemble d'actions visant un objectif de transformation ou de production de résultats identifiables. Les interventions dans la santé publique visent principalement à promouvoir un plus grand bien-être ou à protéger l'état de santé alors que les interventions cliniques ont généralement pour but la prévention ou le traitement de la souffrance chez les individus.

CONTEXTE : il fait référence au milieu social, politique et/ou organisationnel dans lequel l'intervention est prévue/conçue, réalisée et évaluée. Les caractéristiques contextuelles pertinentes pour une intervention varient selon le type d'intervention. Pour les interventions dans la santé publique, les facteurs politiques, organisationnels, socio-économiques, démographiques et environnementaux sont importants.

EVALUATION : il s'agit du processus qui définit la valeur d'une intervention en la comparant à des normes prédéterminées et définies.

PREUVE : elle suppose une lecture interprétative des données recueillies grâce à la recherche officielle ou à des enquêtes spécifiques réalisées selon des normes relevant de la méthode scientifique. La pratique factuelle souligne et traite les conséquences voulues d'une intervention et mesure l'efficacité décisive (aussi en matière de coûts) sur base des données relatives à la mise en œuvre et des résultats de l'intervention.

En outre, les PROGRAMMES comportent une série d'activités visant un résultat connexe spécifique ou une série d'objectifs (McDavid & Hawthorn, 2006; Pal, 2014; Guyadeen & Seasons, 2018). En règle générale, les programmes sont conçus pour transformer les ressources en activités afin d'arriver au résultat escompté (McDavid & Hawthorn, 2006; Guyadeen & Seasons, 2018). Les PLANS, qui peuvent présenter les caractéristiques d'un guide, d'un projet de programmation ou de planification, peuvent jouer un rôle prépondérant dans l'organisation des interventions ou des initiatives en faveur d'une communauté (Baer 1997; Ryan, 2011; Guyadeen & Seasons, 2018). Ils peuvent viser des objectifs globaux car ils présentent une vision basée sur les futurs développements : ils comportent des faits, des objectifs et des politiques pouvant se traduire en un modèle de développement physique ou tangible et s'attaquer à plusieurs problématiques de la communauté (Berke et al., 2006). Les programmes peuvent s'inscrire dans des stratégies de réalisation d'un plan (Guyadeen & Seasons, 2018). Comme l'expliquent Guyadeen & Seasons (2018): « Il est essentiel de signaler que les plans sont des outils évolutifs, à réexaminer et à actualiser sans cesse en fonction de l'évolution des besoins, des connaissances et des expériences (Brody 2003). A ce propos, l'évaluation est essentielle pour garantir l'applicabilité et la pertinence des plans et des programmes » (p. 99).

Premièrement, l'évaluation peut être envisagée comme « une discipline empirique qui génère des informations sur des programmes » (Guyadeen & Seasons, 2018, p. 99) afin de les améliorer et/ou d'orienter les futures décisions. Deuxièmement, l'accent est placé sur le fonctionnement ainsi que sur les résultats du programme. Nous entendons par là que l'évaluation ne concerne pas uniquement l'efficacité du programme, mais s'étend au processus. En effet, elle se concentre sur la manière dont sont gérés les programmes ; elle prévoit une analyse des méthodologies organisationnelles appliquées dans la réalisation du programme, les informations utilisées (par exemple, les ressources), les résultats (par exemple, les mesures concrètes) et le rapport coût-efficacité (Howlett, Ramesh & Perl, 2009; Guyadeen & Seasons, 2018). Enfin, l'évaluation du programme est utilisée pour tenter de rendre les programmes plus efficients et efficaces (Weiss, 1998; Guyadeen & Seasons, 2018), garantir la responsabilité et la qualité (Cousins et al., 2014; Pal, 2014; Guyadeen & Seasons, 2018).

Par conséquent, les décisions concernant les interventions dans le domaine de la santé publique devraient reposer sur une évaluation approfondie des points forts des innovations proposées, mais également des lacunes et des points faibles liés aux éléments probants qui sous-tendent leur application (Rychetnik et al., 2002). Des guides critiques sur l'évaluation des interventions, qui définissent et évaluent les différentes facettes des éléments probants, permettent de tenir suffisamment compte des questions telles que la pertinence et la transférabilité, et présentent des recommandations spécifiques et légitimes concernant la pratique (Rychetnik et al., 2002). Toutefois, il importe également de dégager un équilibre entre l'évaluation rigoureuse et les principaux objectifs si l'on veut maintenir une distinction entre l'évaluation systématique des preuves disponibles et le processus socio-économique complexe qui détermine les décisions politiques et pratiques (Rychetnik et al., 2002).

En outre, Rychetnik, Frommer, Hawe et Shiell (2002) soulignent « la différence entre l'évaluation des preuves et le processus de prise de décisions politiques et opérationnelles concernant la mise en œuvre des interventions. Les faits établis de façon scientifique figurent parmi les éléments pris en considération dans ces décisions » (p. 119). Les auteurs précisent en outre que :

"...les interventions dans le domaine de la santé publique sont généralement complexes, programmatiques et contextualisées. Les preuves de leur efficacité doivent être suffisamment complètes pour englober cette complexité. L'évaluation des preuves doit faire la différence entre la fiabilité du processus d'évaluation du degré de réussite ou d'échec d'une intervention et le succès ou l'échec relatif de la dite intervention. De plus, si une intervention échoue, les preuves doivent aider à comprendre si l'intervention était fondamentalement déficiente (concept ou théorie de l'intervention erroné) ou si elle a été mal réalisée (échec de la mise en oeuvre). Par ailleurs, pour bien interpréter les preuves, il convient de disposer d'informations descriptives adéquates sur l'intervention et son contexte afin de pouvoir déterminer la transférabilité des preuves » (p. 119).

Comme Craig et collègues (2008) le font remarquer, dans la pratique, l'évaluation se fait au prix de nombreuses démarches, qui influencent le choix entre les interventions et les méthodes d'évaluation. De plus, dans le cas d'interventions complexes, plusieurs sources (par exemple, l'acceptation politique) peuvent renseigner les chercheurs et influencer le choix d'un programme d'évaluation idéal. Par ailleurs, si les méthodes expérimentales sont de plus en acceptées pour évaluer les politiques, des objections politiques et éthiques peuvent en limiter l'utilisation. L'évaluation devrait jouer un rôle essentiel dans l'approche critique d'une intervention. Si les gestionnaires décident d'appliquer des méthodes non-expérimentales, ils devraient être au fait de leurs limites méthodologiques et dès lors, interpréter et diffuser les résultats avec prudence. Dans ce contexte, les chercheurs « devraient être prêts à expliquer aux décideurs qu'il faut mener un travail de développement adéquat, à leur présenter les avantages et les inconvénients des méthodes expérimentales et non-expérimentales, ainsi que les compromis nécessaires si on opte pour des méthodes moins satisfaisantes. Ils devraient être prêts à contester le choix des décideurs lorsque ceux-ci privilégient des interventions dont l'efficacité incertaine risque de compliquer la consolidation des preuves par une évaluation rigoureuse ou lorsqu'un changement de la stratégie de mise en œuvre pourrait déboucher sur une évaluation plus informative » (Craig et al., 2008 p. 2).

Plus concrètement, les chercheurs (Craig et al., 2008) soulignent que pour développer une intervention complexe, le processus d'évaluation doit suivre une séquence d'actions précise :

1. identifier les preuves existantes - analyses déjà publiées ou diffusées dans la communauté scientifique sur des interventions similaires (examen systématique et rigoureux des preuves pertinentes, notamment des méthodes utilisées pour évaluer le processus et les résultats) ;

2. définir et développer une théorie - la logique de programmes complexes d'intervention, les résultats escomptés et la manière dont sera réalisée la transformation doivent parfois être explicités. L'une des premières tâches à accomplir consiste à « développer une compréhension théorique de l'éventuel processus de transformation en s'inspirant des preuves et théories existantes et, si nécessaire, en menant une nouvelle recherche primaire complémentaire. Cette tâche doit être réalisée indépendamment du propos (mise au point ou évaluation d'une intervention par le chercheur) » (p. 2) ;

3. modéliser le processus - structurer un modèle précis d'intervention complexe avant de réaliser une évaluation complète permet aux gestionnaires d'intégrer et de recueillir des informations utiles pour la conception de l'intervention et pour son évaluation. Il pourrait s'avérer nécessaire de réaliser d'autres études pour affiner progressivement le projet avant la réalisation d'une évaluation globale. L'évaluation financière constitue un autre aspect intéressant de la phase de conception primaire, car elle peut aider les porteurs de projets à repérer et corriger les points faibles.

Enfin, les chercheurs devraient prêter attention aux énoncés généraux sur les modèles pouvant convenir aux types d'intervention en fonction des différentes questions et circonstances, puis choisir un modèle d'étude basé sur les caractéristiques spécifiques telles que l'effet de taille attendu et la probabilité d'une sélection ou d'un biais de répartition. « Une connaissance de tout l'éventail d'approches expérimentales et non-expérimentales devrait permettre des choix méthodologiques plus judicieux » (Craig et al., 2008, p. 3).

Les processus d'évaluation des programmes peuvent se répartir dans deux catégorie distinctes : l'évaluation formative et l'évaluation récapitulative. On considère comme formatives les évaluations visant l'amélioration des performances d'un programme, car elles permettent d'améliorer les résultats des programmes ou leur efficacité (McDavid & Hawthorn, 2006; Posavac & Carey, 2007; Guyadeen & Seasons, 2018). Les bilans de formation donnent des informations utiles pour des décisions rapides sur le programme (comme l'amélioration de certaines parties et/ou la modification de processus) (Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018). Les évaluations axées sur les résultats, menées après ou tout juste avant la fin d'un programme, donnent des informations sur la réalisation des objectifs du programme et/ou sur la pertinence de la poursuite du processus (McDavid & Hawthorn, 2006; Posavac & Carey 2007; Shadish, Cook & Leviton, 1991; Guyadeen & Seasons, 2018).

En résumé, comme le signalent Wandersman et collègues en 2000, le processus d'évaluation est complexe et articulé (Figure 1).

Evaluation de l'efficacite et de l'experience

ARTICLE

Selon Guyadeen & Seasons (2018), « le modèle d'évaluation historiquement dominant est le modèle scientifique à grande technicité, axé sur les méthodes quantitatives ». Les méthodes et techniques de recherche scientifiques, comme les plans et expériences de recherche systématiques et alléatoires font partie intégrante du processus d'évaluation (Alkin 2013). Cette approche de l'évaluation se concentre sur la mesure de l'efficacité et de l'efficience (Greene 1994) » (p. 100).

Depuis longtemps, les intellectuels travaillent, non sans désaccord, sur son évaluation, ses objectifs, son contenu et ses indicateurs (Jacobson et al., 1999). Par exemple, une des pratiques d'évaluation courantes consiste à évaluer la manière (surtout en termes quantitatifs) dont les programmes encouragent ou entravent la réalisation des objectifs. Cette méthode exige de fixer des objectifs clairs et des indicateurs conformes. L'évaluation de l'efficacité est un processus complexe, qui ne dispense pas de la prise de décisions pertinentes : comme Craig et collègues (2008) le soulignent à propos de l'évaluation de l'efficacité d'une intervention, la randomisation reste une méthode de choix (car, par exemple, elle évite les erreurs de sélection). Si un essai randomisé conventionnel entre groupes parallèles ne convient pas, d'autres plans d'étude méthodologique randomisée doivent être envisagés ou, si une approche expérimentale est impossible, des projets quasi-expérimentaux ou d'observation sont envisageables.

Lors de l'analyse des résultats d'une intervention, si le plan de recherche suit une méthode scientifique, il vise à confirmer ou infirmer l'existence d'un lien de causalité entre l'intervention et ses effets, et à comprendre les raisons de son efficacité ou de son inefficacité. Le plan d'étude définit également le niveaux des preuves qui en découlent. L'examen systématique des essais randomisés contrôlés (RCTs) est l'une des méthodes reconnues la plus communément utilisée pour fournir les éléments probants les plus solides sur les effets des interventions de prévention et/ou de traitement (Rychetnik, Frommer, Hawe & Shiell, 2002). Il peut s'avérer nécessaire d'assurer un suivi sur le long terme afin de déterminer si les résultats escomptés sont avérés ou si des modifications sur le court terme persistent : « bien qu'atypiques, de telles études peuvent être extrêmement informatives » (Craig et al., 2008, p. 3).

Par ailleurs, les niveaux de preuves lors de l'évaluation d'interventions dans la santé publique font l'objet d'analyses approfondies dans la littérature scientifique car ils dépendent du critère utilisé pour évaluer leur crédibilité. A ce propos, l'utilisation des essais randomisés contrôlés dans l'examen des interventions de santé publique continue à susciter la controverse ; notamment en raison de la difficulté de ces études causée par la complexité programmatique des interventions, l'analyse des résultats et à tendance à sous-estimer l'apport des études d'observation. En raison de leur nature, de nombreuses interventions publiques exigent des stratégies d'analyse flexibles et multiples et, selon les auteurs, leur appliquer des études basées sur des modèles d'essais randomisés contrôlés classiques s'avère difficile (principalement parce qu'ils demandent une normalisation très stricte de l'intervention et reposent sur l'hypothèse d'une randomisation basée sur des unités individuelles). Dans leur analyse, les chercheurs soulèvent un point important : l'application de méthodologies non randomisées, lorsque cela est possible, risque de déboucher sur une perte considérable et insoutenable de pertinence ; mais, comme le soulignent Rychetnik et collègues (2002) :

« le seul plan d'une étude n'est pas un critère suffisant pour définir la crédibilité des preuves liées aux interventions dans la santé publique » (p. 121).

Interprétation des résultats

Le processus d'évaluation est un des aspects centraux lors de la conception ou de la mise en oeuvre d'une intervention, indépendamment de ses résultats positifs ou négatifs. En effet, la littérature scientifique (Rychetnik et al., 2002) considère essentielles l'application correcte des procédures prévues dans le programme de l'intervention et l'utilisation de bons indicateurs dans le suivi du processus.

Les théories sur lesquelles reposent les interventions, leur cahier des charges (explication et plausibilité) en lien avec les hypothèses de base concernant l'efficacité et la fonctionnalité des mesures de résultats et d'incidence sont autant de critères importants pour l'évaluation et l'interprétation de la qualité de leur impact sur la santé publique (Rychetnik et al., 2002).

Dans le droit fil de l'analyse de Rychetnik et co (2002), la littérature propose d'autres démarches pluridimensionnelles pour l'évaluation des recherches sur les résultats. Lorsqu'il s'agit d'évaluer les preuves de l'efficacité d'une intervention, on distingue trois dimensions importantes :

1) « la robustesse des preuves, déterminée à la fois par le plan d'étude (niveau), la qualité de la méthodologie et la précision statistique » (p. 122) ;

2) « l'ampleur des effets mesurés » (p. 122) ;

3) « la pertinence des effets mesurés (tels qu'observés dans l'évaluation) par rapport au contexte de la mise en oeuvre » (p. 122).

Les évaluations qualitatives empiriques sont essentielles car elles peuvent influencer les décisions politiques et pratiques dans le domaine des soins de santé. Il faut éviter que l'utilisation de protocoles d'évaluation inadéquats ne donne des exigences irréalistes ou trop onéreuses. Les critères d'évaluation doivent soutenir le processus décisionnel dans la mesure où ils doivent aider à déterminer si les résultats mesurés englobent (a) les intérêts des personnes susceptibles de décider ou de proposer l'intervention et le public cible ; (b) la pertinence ou l'inutilité des effets imprévus ou attendus de l'intervention ; et (c) l'efficacité et l'efficience de l'intervention. La contribution des parties prenantes est essentielle pour la première dimension étant donné la nature sociale et politique de la santé publique. C'est pourquoi, les décideurs et les groupes cibles s'avèrent des intervenants importants lors du processus d'évaluation.

Comme le signalent Guyadeen & Seasons (2018), des modèles d'évaluation insistent fortement sur le pluralisme et sur l'étude des différentes parties prenantes impliquées dans un exercice d'évaluation. De plus, il arrive souvent que des méthodes qualitatives soient utilisées pour mieux comprendre le point de vue des intervenants directement impliqués (Greene, 1994); en effet, ces derniers peuvent jouer un rôle essentiel vu qu'ils sont directement impliqués (par exemple, à cause d'intérêts personnels et financiers) dans l'évaluation.

L'évaluation participative (Cousins, 2004), l'évaluation du degré d'empowerment (Fetterman, 2004), l'évaluation collaborative (Rodriguez-Campos, 2012), et plus récemment, l'évaluation du développement (Patton, 2011) sont de bons exemples de méthodologies efficaces dans ce domaine (Guyadeen & Seasons, 2018).

Evaluation de l'efficacite des interventions: evaluation du processus

VIEW UNIT IN STUDIO

ARTICLE

Comme nous l'avons souligné, un des rôles essentiels du processus d'évaluation devrait être de garantir la grande qualité de la conceptualisation et de l'application des plans. (Guyadeen & Seasons, 2018; Berke et Godschalk, 2009; Baer, 1997). Il peut également confirmer le caractère objectif et systématique des processus de planification et d'analyse de l'intervention, améliorant ainsi la phase préparatoire et permettant d'analyser la cohérence entre les dispositions déclaratoires du projet (objectifs déclarés) et les résultats engrangés (Guyadeen & Seasons, 2018). L'évaluation donne également les outils pour documenter et identifier de façon empirique les lacunes et/ou les atouts (Berke, Smith & Lyles 2012; Guyadeen & Seasons, 2018). L'hypothèse de base est que, pour que les plans soient efficaces et évaluables, une relation évidente doit exister entre les principales composantes du plan (par exemple, ses objectifs et ses politiques) et les mécanismes de mise en oeuvre (Oliveira & Pinho 2010b; Guyadeen & Seasons, 2018). En général, nous pouvons identifier deux grandes formes d'évaluation de la planification : (a) l'évaluation du plan (par exemple, l'évaluation de la qualité du plan, l'évaluation de sa mise en oeuvre et l'évaluation de ses résultats du plan), et (b) l'évaluation de la planification (par exemple, l'évaluation des processus et des pratiques de planification) (Guyadeen & Seasons, 2018). Si l'évaluation de la planification suppose de mesurer l'efficacité du processus de planification, l'évaluation du plan de l'intervention et de ses résultats implique l'évaluation de la qualité du plan, de la réussite de sa mise en oeuvre et de la réalisation de ses objectifs (Morckel, 2010; Guyadeen & Seasons, 2018). Ces processus d'évaluation ressemblent à l'évaluation de programmes en cela qu'ils visent à améliorer les prises de décisions, mais s'en écartent en cela qu'ils mettent l'accent sur le plan, sur la manière dont il a été conçu et sur les résultats induit par l'activité de planification (Guyadeen & Seasons, 2018). En outre et en règle générale, nous distinguons trois types d'évaluation de la planification : l'évaluation ex-ante (ou a priori), l'évaluation continue et l'évaluation ex-post (Guyadeen & Seasons, 2018). Selon Oliveira & Pinho (2010), ces types d'évaluation correspondent aux différents stades de la planification, notamment la préparation du plan, sa mise en oeuvre et son réexamen (par exemple, une fois réalisé).

Bien que, jusqu'à présent, la médecine factuelle ignore la question de son efficacité, le domaine des soins de santé factuels, par contre, cherche à s'en emparer. L'évaluation des preuves dans le cadre des interventions de santé publique doit absolument déterminer si l'efficacité a été mesurée et si le niveau d'efficience a été atteint (Rychetnik, Frommer, Hawe & Shiell, 2002). Qui plus est, « les décisions fondées sur des preuves à propos de la valeur et de l'applicabilité d'une intervention fondée sur le niveau de connaissance de l'efficacité d'interventions identiques, similaires ou analogues, sont habituellement prises et évaluées dans un autre contexte et à un autre moment. Afin d'évaluer la transférabilité des preuves d'une intervention, nous devons disposer d'informations sur (a) l'intervention en tant que telle, (b) le contexte de son évaluation, et (c) les interactions entre l'intervention et le contexte » (Rychetnik, Frommer, Hawe & Shiell, 2002, p. 123). Dans le cas d'interventions complexes, la question de la fidélité n'est pas simple à trancher. Ajoutons un niveau de complexité : une normalisation stricte des procédures peut mettre à mal la spécificité d'une intervention lorsqu'elle est motivée par des besoins locaux (Craig et al., 2008). Pour évaluer la fidélité en lien avec le degré de normalisation requis par le protocole de l'étude, il faut également préciser le nombre de modifications ou d'adaptations autorisées et la nécessité d'enregistrer les changements opérés lors de la mise en oeuvre. Les variations dans la mise en oeuvre – qu'elles soient prévues ou pas – exigent d'autant plus un rapport complet des procédures d'évaluation des résultats et du processus et une description claire de l'intervention pour permettre de la reproduire (Craig et al., 2008).

Q3.3

3 points possible (graded)

1. D'après Rychetnik, Frommer, Hawe and Shiell (2002), l'évaluation se définit comme :

- ○ un ensemble de modifications et de résultats pouvant être prédéfinis ;
- ○ la lecture interprétative des données recueillies dans le cadre de recherches formelles ou d'enquêtes spécifiques ;
- ○ le contexte social, politique et/ou organisationnel de l'intervention.
- ○ le processus permettant de déterminer la valeur d'une intervention par le biais d'une comparaison avec des normes prédéterminées et explicites ;

2. Lors de l'évaluation de l'efficacité d'une intervention, lequel de ces facteurs NE semble PAS être un facteur significatif ? (Rychetnik et al., 2002)

- ○ La pertinence des effets mesurés dans le contexte de la mise en œuvre
- ○ Le nombre d'interventions réalisées par l'organisation.
- ○ L'ampleur des effets mesurés
- ○ La force de la preuve, déterminée par une combinaison de la conception de l'étude, de la qualité méthodologique et de l'exactitude statistique

3. L'évaluation...

- ○ permet la documentation empirique des faiblesses et des forces des plans d'intervention ;
- ○ n'exige pas d'intégration entre les méthodes d'évaluation et le plan à évaluer ;
- ○ doit éviter de prendre en compte l'intérêt des personnes associées aux décisions sur les interventions ;
- ○ ne devrait porter que sur les résultats

Bienvenue. Nous voici à nouveau dans une nouvelle semaine, avec de nouveaux aspects, de nouvelles perspectives.

Au cours de cette semaine, nous aborderons les aspects liés aux meilleures pratiques,

les aspects liés à l'observation et les aspects liés aux indicateurs de la maltraitance et de l'abus des enfants.

Commençons par le premier élément. Nous examinerons ensemble

quels sont les éléments liés à l'intervention de la recherche et de la pratique,

en accordant une attention particulière au développement des meilleures pratiques.

Ensuite, nous examinerons quels sont les aspects méthodologiques de la recherche en matière de Trauma-Informed Care,

que nous avons maintenant appris à comprendre et à lire, et nous aurons l'occasion de mieux comprendre

comment ces principes s'appliquent à la planification d'une recherche, comment utiliser le format de Trauma-Informed Care

dans la recherche, donc le canal de la théorie à la pratique.

Nous allons ensuite essayer d'identifier

les éléments qui constituent une bonne proposition de recherche en allant voir quels sont les aspects liés, par exemple, à une bonne technique qu'est l'observation.

L'observation comme outil clinique, l'observation comme outil pouvant permettre à un opérateur

qui collabore ou a l'intention de travailler ou (pour mille autres raisons)

est disposé à connaître et à approfondir le thème de Trauma-Informed Care peut utiliser l'observation comme méthode,

l'outil d'observation, qui peut à son tour être un outil important pour comprendre le contexte,

et pour comprendre la personne placée dans ce contexte (gardez à l'esprit le sens de Trauma-Informed Care).

Et nous allons ici étudier les exigences et les applications possibles de l'observation clinique et au-delà.

Nous poursuivrons ensuite sur les exemples

et les concepts évoqués ci-dessus en tant que bonnes pratiques, l'observation et la manière dont celles-ci

peuvent être appliquées à l'abus et à la maltraitance des enfants, tout en essayant également d'identifier les indicateurs,

en tenant compte du fait qu'un indicateur est, en tant que tel, juste un indicateur, et n'est certainement pas

un élément fondamental et certain de l'abus et de maltraitance, mais qu'un ensemble d'indicateurs

peut être intéressant pour nous en tant qu'élément à garder à l'esprit qu'il peut y avoir quelque chose à étudier.

À partir de là, nous examinerons les procédures

de contrôle sur l'évaluation des traumatismes et nous essaierons de comprendre avec mes collègues

combien le dépistage des traumatismes peut être important pour la connaissance.

Nous terminerons ensuite avec les aspects liés aux Trauma-Informed Care et les liens avec la recherche,

et comment il peut y avoir un système organisé de processus qui va de la théorie à la pratique.

Si dans la première partie, au cours des deux premières semaines, nous avons discuté et examiné avec des collègues

l'aspect peut-être le plus théorique du traumatisme, avec nous aujourd'hui,

avec ces deux semaines, nous avons discuté de la recherche dans recherche fondée sur des données probantes ou sur l'action dans les Trauma-Informed Care,

à partir de maintenant vous vous dirigerez désormais vers une nouvelle voie qui aura toujours les traumatismes

et les Trauma-Informed Care comme thème central, mais d'un point de vue légèrement différent, notamment le législatif,

pour ensuite aborder les questions liées à la législation, à la recherche et aux politiques.

Nous vous souhaitons, à mon nom et au nom de tous mes collègues,

une bonne progression sur ce chemin; puisque vous en avez maintenant atteint la moitié, peut-être même plus de la moitié,

et qu'à ce stade, vous vous dirigez vers la fermeture de votre MOOC.

Encore une fois, nous vous souhaitons une bonne continuation, et nous nous reverrons à la fin du MOOC.

Introduction aux principaux aspects méthodologiques de la recherche dans l'accompagnement sensible aux traumatismes

VIEW UNIT IN STUDIO

Bookmark this page

Comme l'ont suggéré Newman & Ridenour (1998), la manière dont des chercheurs mènent une étude et les conclusions qu'ils en tirent peuvent fortement différer en fonction de leur approche de la réalité. Par ailleurs, si l'épistémologie étudie comment nous savons les choses, la méthode, pour sa part, renvoie au choix de la technique permettant de procéder à la connaissance des phénomènes (Bernard, 2006).

Comme l'a souligné Lastrucci (1963), la science est « une méthode objective, logique et systématique d'analyse des phénomènes, conçue pour permettre l'accumulation de connaissances fiables » (p. 6). Cela se fait à travers trois objectifs qui guident les choix du chercheur (Bernard, 2006) :

- objectivité : nécessité d'expliciter les mesures, de veiller à la méthodologie et de se référer aux examens par les pairs au sein de la communauté scientifique ;
- application d'une méthode scientifique
- fiabilité

La dimension éthique s'inscrit dans la méthode scientifique. Quand le propos de la recherche est les sciences humaines, une question centrale se pose : comment opérationnaliser des phénomènes complexes par nature ? Ce type de processus repose sur la définition de variables, sur la recherche d'associations ou de relations entre elles et sur la question de savoir si et comment la variation d'une chose provoque une variation dans une autre (Bernard, 2006). Dans ce contexte, un élément fondateur est la mesure et l'identification d'indicateurs valides et fiables, en vue de l'établissement de définitions opérationnelles qui « consistent en un ensemble d'instructions sur la façon de mesurer une variable ayant fait l'objet d'une définition conceptuelle » (p. 38).

Recherche dans l'accompagnement sensible aux traumatismes

VIEW UNIT IN STUDIO

Bookmark this page

Dans le cadre de l'accompagnement sensible aux traumatismes, l'un des concepts clés consiste à utiliser des procédures et des concepts scientifiquement validés. De ce point de vue, une interaction synergique s'impose entre le travail clinique et la recherche afin d'étudier les résultats des traitements et d'évaluer l'efficacité et l'efficience des modèles de fonctionnement des services, notamment par leur formalisation dans des directives et/ou par la garantie que le protocole en question respecte les éléments établis dans la recherche internationale du domaine (Schäfer et al., 2018).

À cet égard, la contribution de la recherche scientifique à l'analyse des définitions dans l'accompagnement sensible aux traumatismes et de ses facteurs sous-jacents conserve toute son importance.

Ainsi, Becker-Blease (2017), Hanson & Lang (2016) et Johnson (2017) signalent un certain nombre d'aspects critiques liés à l'accompagnement sensible aux traumatismes et aux problèmes d'application, comme, notamment, la tendance dans la littérature scientifique à se focaliser sur les aspects théoriques et les principes fondamentaux au détriment des éléments tangibles et de leur applicabilité dans la pratique : « un fossé se creuse lorsque les praticiens doivent transformer la théorie et les principes en pratique quotidienne et, donc, évaluer leur efficacité » (Becker-Blease, 2017, p.3). L'accent placé sur la recherche permet d'évaluer les initiatives, les programmes et les services sensibles aux traumatismes et de déterminer s'ils contribuent à des résultats positifs significatifs.

Lorsqu'on souhaite réaliser un échange fructueux et fonctionnel entre les aspects conceptuels-théoriques et pratiques, l'accent devrait se mettre sur l'analyse de l'applicabilité des procédures et des indicateurs normalisés, tant au niveau des étapes du processus que des résultats obtenus. La littérature scientifique sur le sujet nous incite à envisager plus précisément une structuration de projets de recherche, tant fondamentaux qu'applicatifs, visant à traiter des procédures de dépistage (en fonction de preuves accumulées), et à analyser des procédures d'évaluation dont le but serait d'identifier les événements traumatisants et leurs particularités. En outre et à cette fin, il est important que des études randomisées et contrôlées soient mises en œuvre sur une base expérimentale, afin de tester l'efficacité des interventions sensibles aux traumatismes.

Structurer un projet dans le domaine social et de la santé peut se faire selon trois approches différentes (Leone & Prezza, 1999) : a) synoptique-rationnelle (qui implique une pré-structuration maximale des contenus), b) collaborative - participative ou dialogique (qui privilégie la négociation continue des objectifs entre experts et bénéficiaires) ; c) heuristique (qui prévoit une structuration minimale a priori des objectifs).

Dans l'absolu, un processus de recherche devrait suivre quatre étapes :

1. formulation d'un problème théorique (découlant de l'analyse de la théorie et de la littérature scientifiques) ;
2. sélection des unités d'analyse et de la méthode appropriée ;
3. collecte et analyse des données ;
4. contestation ou soutien de la proposition théorique sous-tendant la recherche.

Comme l'avance Lanzara (1985), « ...tout acteur qui se pose le problème de l'innovation, ou qui choisit d'intervenir dans une situation pour la modifier, a devant lui un problème de conception » (p. 336). La planification est un processus de systématisation ; en fait, la structuration d'un projet de recherche est une phase critique et fondamentale qui implique des choix importants qui conditionneront les résultats. En outre, Leone & Prezza (1999) soulignent que « ...tout qui articule un projet entre différents sujets et réfléchit à la cohérence entre différentes éléments (objectifs, temporalité, opérateurs disponibles...) doit se poser la question de la pratique, ainsi que de la limite et des parties, et c'est exactement, ce qui dans certains contextes, tend à être oublié » (p. 23) ou considéré comme trop complexe et donc impossible à appliquer.

D'un point de vue transversal, les auteurs rappellent les étapes fondamentales de la structuration d'un projet dans le domaine social :

1. idéation : la phase de réalisation ou de proposition du projet ;
2. activation : vérification des ressources, des rôles, des problèmes et des stratégies, analyse éventuelle de la demande (clients) ;
3. planification : élaboration du projet et structuration des phases qui le composent, établissement des délais et définition des choix méthodologiques ;
4. mise en œuvre : début des activités, première vérification des hypothèses, modifications ;
5. vérification : analyse finale des résultats.

En outre, dans une recherche scientifique, une série d'éléments opérationnels sont à épingler :

- définition et analyse de l'objet de la recherche sur base de la littérature scientifique, explication du cadre théorique ;
- identification et explication des buts généraux et des objectifs spécifiques de l'étude (propos de la recherche : exploratoire, évaluative, explicative) ;
- structuration des hypothèses ;
- identification de la population cible, sélection des participants et échantillonnage ;
- procédures d'évaluation, définition d'indicateurs, outils et techniques d'analyse des données collectées ;
- planification (calendrier) et analyse de faisabilité (y compris des aspects critiques et limites).

Par ce biais, le thème de la recherche conditionnera les éléments méthodologiques d'une matrice quantitative, qualitative ou mixte.

Lors de chaque phase du processus de conception, le chercheur pose des questions importantes qui reposent sur les aspects conceptuels et pratiques les plus critiques. Citons parmi ceux-ci le contexte dans lequel la recherche est menée, ainsi que les ressources dont elle dispose.

Le processus étant complexe, il est fondamental de privilégier la formation du personnel, ainsi que l'interaction constante entre les professionnels actifs dans les opérations cliniques et les chercheurs impliqués dans la recherche clinique.

En outre, un autre aspect central est la structuration et la validation d'outils à utiliser en fonction des objectifs tant d'intervention que de recherche. Ceux-ci pouvant prendre différentes formes et s'appliquer à des cibles spécifiques, il est essentiel que tous les acteurs impliqués dans la conception et la mise en œuvre d'un projet collaborent à la formulation de chaque étape du plan de projet, y compris lors des choix méthodologiques.

Q4.1

3 points possible (graded)

1. La définition opérationnelle :

- ○ est formulée avant la définition conceptuelle d'une variable.
- ○ n'est pas utile pour mesurer une variable.
- ○ est formulée après la définition conceptuelle d'une variable.
- ○ est activée lors de la mesure d'une variable.

2. Lors d'un accompagnement sensible aux traumatismes, il est crucial :

- ○ d'imposer une méthodologie d'intervention aux opérateurs.
- ○ d'ignorer les contributions de la recherche scientifique.
- ○ d'ignorer les aspects critiques et les difficultés d'application.
- ○ d'encourager une interaction synergique entre le travail clinique et la recherche.

3. A chaque étape du processus de conception :

- ○ le chercheur ne doit pas se poser de questions importantes basées sur les aspects conceptuels et pratiques les plus critiques.
- ○ le chercheur doit se poser des questions importantes qui reposent sur les aspects conceptuels et pratiques les plus critiques.
- ○ les données doivent toujours être analysées.
- ○ il est nécessaire de prévoir un calendrier

Bonnes pratiques dans l'accompagnement sensible aux traumatismes

Compte tenu des risques importants que font peser des événements traumatiques (Adverse Childhood Experiences, ACE) sur la santé physique et psychologique, de nombreuses interventions ont été développées au fil des ans pour aider les institutions et les aidants professionnels de personnes à antécédents traumatiques à adopter une approche orientée sur les TIC (Baker et al., 2016). En particulier, « une approche basée sur un accompagnement sensible aux traumatismes considère la personne de manière holistique, et non pas seulement comme une liste de problèmes qu'elle rencontre » (Hepburn, 2017, p. 7). Comme l'indiquent de nombreux auteurs (Bryson et al., 2017 ; Bridgett, Valentino & Hayden, 2012 ; Ellis & Boyce, 2011 ; Perry, 2002 ; Rothbart, Ziaie, O'Boyle, 1992), il y a un effet protecteur (effet tampon) lorsque des soignants attentifs et volontaristes entretiennent de bonnes relations lors des soins et de l'accompagnent : la sécurité relationnelle réduit les effets néfastes des traumatismes chez les enfants. On rencontre souvent des situations de stress traumatique dans les cas d'expériences négatives vécues durant l'enfance (ACE), qui se manifestent souvent dans des problèmes cliniques importants (internalisation et/ou externalisation des symptômes), comme on en retrouve fréquemment dans les hôpitaux ou les établissements résidentiels pour adultes et enfants (Bryson et al., 2017 ; Greenwald et al, 2012 ; Hummer, Dollard & Robst, 2010 ; Ko et al., 2008). Citant Elliott et ses collègues (2005) qui ont déclaré que « des services sont sensibles aux traumatismes lorsque le personnel comprend l'impact de la violence interpersonnelle et de la victimisation sur la vie et le développement d'un individu » (p. 462) et que « de nombreuses procédures et pratiques courantes dans le domaine des services réactivent les réactions traumatiques et sont, partant, vécues comme des émotions dangereuses et un obstacle supplémentaire chez les survivants de traumatismes » (p. 446). Soulignons que les bonnes pratiques devraient être évaluées sur la base de critères spécifiques identifiés et détaillés dans la littérature scientifique et comprenant un moment d'évaluation minutieuse des facteurs complexes interagissant dans les événements traumatisants. En fait, dans les situations où le service ou l'organisation s'occupe de victimes d'un traumatisme, on recommande d'orienter l'offre de soins et l'accompagnement social vers la prévention et la réduction des risques (Bryson et al., 2017). Dans ce cadre, il est crucial d'encourager des approches sensibles aux traumatismes : on choisit un accompagnement sensible aux traumatismes (TIC) et une pratique sensible aux traumatismes (TIP) comme paradigmes de traitement, car ils visent à transformer totalement les systèmes de soins en privilégiant dans tous les aspects du service une prise en comte du stress vécu en réponse aux traumatismes, ainsi que les aspects de sécurité et de libre-choix. En outre, pareille approche vise à créer une culture du traitement axée sur la non-violence, l'apprentissage et la collaboration, qui mettra l'accent sur l'ensemble des interactions environnementales et interpersonnelles (Bryson et al., 2017). Après un examen systématique de la littérature, Bryson et ses collègues (2017) ont tiré quelques conclusions importantes :

- - qui dit « réduction de la coercition physique dans les soins psychiatriques de routine et en établissement » (p. 11) dit réduction/élimination de l'isolement ou des stratégies de contrôle et de coercition ;
- - dans le cadre de l'accompagnement sensible aux traumatismes, il est « primordial que les hauts responsables donnent la priorité à un accompagnement sensible aux traumatismes [...], surtout lorsque le personnel doit s'adapter à de nouvelles méthodes de travail » (p. 11) ;
- - les chercheurs soulignent la nécessité de soutenir le personnel par une formation avancée - en particulier sur les séquences de traumatismes - une supervision continue, un coaching et un débriefing ;
- - En cela, il est essentiel d'être à l'écoute des patients et des familles, en accordant une attention particulière à leurs expériences, à leurs besoins, à leurs priorités lors du traitement ;
- - il importe d'assurer une mise à jour constante des données de recherche et une analyse des indicateurs de résultats afin de motiver et de soutenir des services performants et d'améliorer leur efficacité ;
- - la littérature traite abondamment de « la nécessité d'aligner les politiques et les pratiques formelles et informelles sur les principes généraux d'une sensible aux traumatismes » (p. 11).

Bien que ce soit un domaine de plus en plus appliqué, l'efficacité de ce type d'approche n'a pas encore fair l'objet d'assez de recherches scientifiques(Bryson et al., 2017) ; comme le soulignent Valenkamp, Delaney & Verheij (2014) et Chandler (2008), on manque d'études contrôlées randomisées pour tester les interventions et explorer les facteurs critiques dans la mise en œuvre de traitements axés sur l'accompagnement sensible aux traumatismes. Au niveau international, des études empiriques ont montré l'importance de la formation pour que le personnel dispose d'un langage commun à utiliser lorsqu'il doit discuter de l'expérience du patient, et d'interventions à privilégier avec les patients traumatisés (Bryson et al., 2017). L'importance de cette question a également été soulignée par Le Bel, Huckshorn & Caldwell (2008) et par Brown, Baker & Wilcox (2012). Qui plus est, une formation spécifique sur les meilleures pratiques et sur la participation des patients aux activités de formation du personnel (par exemple lorsqu'il s'agit de rendre compte de leurs expériences) s'est révélée utile (Holstead, Lamond, Dalton, Horne & Crick, 2010), au même titre la participation des enfants au débriefing sur les aspects ou les étapes critiques de la prestation de soins (Lebel et al., 2008), le partage des données et le suivi continu des performances/processus (au niveau individuel, collectif et de l'unité) (Bryson et al., 2017). La littérature scientifique sur des stratégies efficaces dans le domaine de l'accompagnement sensible aux traumatismes met également l'accent sur la capacité des organisations à aligner leurs politiques et leurs pratiques sur les principes d'un accompagnement sensible aux traumatismes (Bryson et al., 2017). Dans cette optique, l'environnement et la culture des organisations constituent en soi des outils thérapeutiques et contribuent à la construction d'une « communauté thérapeutique ». Les aspects suivants revêtent une importance particulière : 1) l'objectif de créer un espace de traitement sûr pour les patients et le personnel et 2) la prise en compte des principes de l'accompagnement sensible aux traumatismes dans les déclarations de mission et de vision. En résumé, les principales stratégies en matière d'accompagnement sensible aux traumatismes mises en avant par Bryson et ses collègues (2017) s'alignent sur celles qui sous-tendent la NASMHPD (National Association of State Mental Health Program Directors) ; vous les trouverez au tableau 1.

Tab. 1 Principales stratégies dans l'accompagnement sensible aux traumatismes

Bryson et collègues (2017)
Inclusion communautaire
Implication des dirigeants
Choix du modèle
Transformation de la main-d'œuvre
Orientation axée sur les résultats
Mise en œuvre partagée

NASMHPD
Leadership vers le changement organisationnel
Utilisation des données pour orienter la pratique
Utilisation d'outils de réduction de la contrainte et de l'isolement
Formation du personnel
Amélioration du rôle de consommateur en milieu hospitalier
Techniques de débriefing approfondi

En outre, dans une étude réalisée par Azeem et ses collègues (2011), ces éléments stratégiques ont été testés de manière longitudinale dans le but d'analyser les effets d'une moindre utilisation des techniques de contention et à l'isolement. Les auteurs ont notamment insisté sur les quelques constats suivants :

✓ le leadership joue un rôle clé dans la mise en place d'un changement culturel, en particulier lorsque l'ensemble du personnel partage une même vision de l'accompagnement sensible aux traumatismes ;

✓ la collecte et le partage des données jouent « un rôle clé dans les projets d'amélioration des performances » (p. 12) et dans les processus de suivi ;

✓ il a été démontré que la formation et la formation continue du personnel aux principes des soins axés sur le rétablissement, des soins axés sur la personne et de l'accompagnement sensible aux traumatismes, couplées à des évaluations de performance correspondantes, ont des effets positifs significatifs ;

✓ priorité devrait être donnée aux principes de la prévention primaire via des programmes de traitement individuels tenant compte du passé traumatique et des stratégies du patient, de la famille et du personnel ;

✓ un bon principe pour appliquer un accompagnement sensible aux traumatismes est d'associer le patient et sa famille ;

✓ des activités de débriefing à propos du soutien apporté - notamment pour tous les aspects émotionnels et les changements prévus lors du traitement - telles que les interventions visant à atténuer les traumatismes et l'impact des traumatismes ont été efficacement mises en œuvre.

Lors de leur examen de différentes approches d'accompagnement sensible aux traumatismes, Hanson et Lang (2016) et Johnson (2017) ont identifié une série de questions pouvant avoir de l'importance dans l'analyse des services aux enfants et ont conclu qu'il est possible d'identifier 15 composantes clés dans un accompagnement sensible aux traumatismes.

Les éléments identifiés ont été organisés en trois niveaux (Hanson & Lang, 2016, p. 98) :

1. Formation du personnel :

- Formation requise pour tout le personnel en matière de sensibilisation et de connaissance de l'impact des abus ou des traumatismes ;

- évaluation des compétences du personnel selon des critères définis pour démontrer les connaissances / la pratique en matière de traumatismes ;

- Stratégies / procédures pour traiter / réduire le stress associé aux traumatismes secondaires chez le personnel ;

- Connaissances/compétences sur la manière d'accéder et de se référer aux meilleures pratiques fondées sur des données probantes et axées sur les traumatismes.

2. Services centrés sur les traumatismes :

- utilisation de mesures normalisées de dépistage / d'évaluation basées sur des preuves, afin d'identifier les antécédents et les symptômes ou problèmes liés au traumatisme ;

- prise en compte des traumatismes passés de l'enfant dans la documentation / les dossiers / le plan de service ;

- disponibilité de cliniciens qualifiés et formés aux pratiques fondées sur des données probantes et sensibles aux traumatismes ;

3. Application organisationnelle

- Collaboration, coordination des services et partage d'informations entre les professionnels de l'agence liée aux services sensibles aux traumatismes ;

- Collaboration, coordination des services et partage d'informations entre les professionnels d'autres organismes liés aux services sensibles aux traumatismes ;

- Procédures visant à réduire le risque de re-traumatisation du patient ;

- Procédures garantissant la participation et la contribution des patients lors de la planification des services et de la mise en place d'un système sensible aux traumatismes ;

- offre de services basés sur les points forts et promotion d'un développement positif ;

- mise en place d’un environnement physique positif et sûr ;

- des politiques écrites qui incluent et soutiennent explicitement des principes sensibles aux traumatismes ;

- présence d'un poste de direction défini ou d'un profil de poste spécifiquement dédié à l’accompagnement sensible aux traumatismes.

Éléments essentiels des bonnes pratiques

L'analyse de la littérature et des protocoles d'évaluation des pratiques appliquées au domaine de l'accompagnement sensible aux traumatismes permet de conclure que, pour qu'il y ait bonnes pratiques (potentiellement transférables dans différents contextes), les éléments suivants doivent être garantis :

1) la formation permanente de tous les membres du personnel aux traumatismes et à leurs corrélats. Cette formation devrait être dispensée non seulement aux professionnels travaillant directement au niveau clinique avec les utilisateurs, mais également à tout qui participe à l'organisation à divers titres et aux différentes fonctions ;

2) une formation continuée du personnel interne aux pratiques fondées sur des preuves (EBP) pour le traitement des traumatismes, avec un accent placé sur le comportement des professionnels face aux EBP ;

3) la collaboration avec des experts du domaine afin d'augmenter le nombre de professionnels cliniques formés ;

4) la prise en compte des procédures de dépistage normalisées et fondées sur des preuves dans la pratique clinique et l'utilisation de mesures/outils d'évaluation spécifiques et validés pour identifier les événements traumatiques (ACE) ;

5) une même prise en compte du passé des patients, des symptômes et difficultés rencontrées suite à un traumatisme ;

6) dans le droit fil du point précédent, la reconnaissance de la spécificité du parcours de vie de chaque utilisateur grâce à une écoute active et empathique par l'ensemble du personnel ;

7) la prise en compte minutieuse de l'histoire des traumatismes des enfants lors de la planification de l'intervention ou de sa conceptualisation ;

8) une évaluation approfondie et un contrôle constant des compétences du personnel (utilisation de procédures spécialement conçues) ;

9) un contrôle approfondi du respect des normes fixées pour un bon service d'accompagnement sensible aux traumatismes, afin de pallier d'éventuels manquements ;

10) la mise en œuvre de procédures visant à réduire le stress lié aux traumatismes secondaires et à accroître le bien-être du personnel ;

11) la création et le maintien d'un bon réseau de coopération, non seulement au sein des services mais également avec d'autres agences locales ;

12) un accent placé sur l'importance de la communication : l'objectif premier devrait être de disposer d'un personnel attentif et collaboratif dans la poursuite des objectifs et l'application de procédures partagées et co-construites ;

13) un accent placé sur des procédures visant à réduire le risque de retraumatisme pour les utilisateurs ;

14) encourager la participation des patients à la conception du traitement ;

15) la participation des usagers à la planification du service : veiller à leurs réactions et suggestions pour améliorer l'organisation et les services offerts ;

16) un accent particulier placé sur la fourniture de services basés sur les points forts, pour promouvoir les facteurs de développement positif (par exemple, la résilience, l'empowerment) ;

17) une formation aux stratégies d'organisation d'un environnement positif pour les utilisateurs et pour le personnel ;

18) une attention particulière aux dimensions physiques et structurelles du service ;

19) l'adhésion aux principes de l'accompagnement sensible aux traumatismes et leur promotion via des politiques spécifiques et claires ;

20) un rôle central attribué à la direction et à ses fonctions dans l'organisation du service.

Éléments critiques et défis

Bien qu'il s'agisse d'un point particulièrement mis en avant dans les recommandations de mise en œuvre des meilleures pratiques, l'utilisation de pratiques fondées sur des données probantes fait encore aujourd'hui l'objet de résistance de la part de certains professionnels, organisations et chercheurs (Gray, Elhai, Schmidt, 2007). Les organisations qui réalisent des interventions cliniques suite à des traumatismes ne devraient pas faire l'économie d'une analyse ou, pour le moins, d'une discussion à ce propos, afin de jeter les bases d'une définition coopérative des normes.

En fait, Si l'approche basée sur l'accompagnement sensible aux traumatismes joue actuellement un rôle important dans l'organisation des services et la fourniture de soins aux personnes traumatisées, plusieurs obstacles compliquent encore son application et, même lors d'une phase préalable, sa conceptualisation (Baker, 2016). Que manque-t-il ?

- une définition opérationnelle claire
- la présence d'outils validés psychométriquement permettant d'évaluer les diverses dimensions d'un accompagnement sensible aux traumatismes.

Pour combler cette lacune, Baker et co (2016), par exemple, ont construit et validé un outil - l'échelle ARTIC (Attitudes favorables à un accompagnement sensible aux traumatismes) – afin d'évaluer la présence d'attitudes favorables à un accompagnement sensible aux traumatismes chez le personnel travaillant dans différents domaines d'intervention ou dans divers contextes en lien avec des personnes ayant connu des incidents traumatiques. Dans une publication précédente, « Creating cultures of trauma-informed care (CCTIC) : a self-assessment and planning protocol », Fallot et Harris (2009) ont formalisé un protocole d'auto-évaluation et de planification comprenant six champs susceptibles de connaître des changements au niveau des services, de l'administration ou du système. Tant les opérateurs individuels que les services sociaux et de santé doivent, de plus en plus, prendre en compte la complexité des programmes d'accompagnement sensible aux traumatismes dans leur interaction quotidienne et dans leur relation avec la communauté scientifique de référence.

[Devenir adulte n'est pas simple. Quels sont les défis quotidiens?]

Nous sommes à Rome, interviewant des personnes entre 18 et 22 ans

Qu'est-ce que le TARI? [une taxe italienne sur les ordures]

Qu'Est-ce que c'est?...

Oh, sur les économies ...

Un concept, comme, sur l'économie ...

Le TARI est une chose, une chose politique ...

Oui en effet

Qu'est-ce que le TARI?

Le TARI? Est-ce une taxe?

Vous devez chercher une maison: comment faites-vous?

Que faire? Quelle est votre décision?

Avec les transports publics ...

Giulia l'a trouvé.

Avec une agence immobilière.

Je vis à la maison, avec maman qui m'attend toujours

Quel type de contrat signez-vous?

Je veux dire, je paye tout simplement, je veux dire que je dois payer les contrats,

ok, d'une durée indéterminée,

des contrats à long terme ...

Je veux dire, je viens de commencer l'école de droit ...

mais je viens de commencer! Donc...

Vous faites les 4 ..? [4 + 4, un contrat de logement commun]

4 mois?

Plus 5

L'argent du loyer est de l'argent gaspillé.

Par exemple, l'eau et l'électricité sont incluses dans le prix

4?

Le compte bancaire

Comme, un interrogatoire en latin est plus facile!

Eh, je ne sais pas

Où vous déposez ..

Si vous voulez, nous pouvons parler de Seneca

En cas de problème, qui appelez-vous?

Giulia

Papa

Seneca, qui est mort ... alors maman et

papa pour le moment.

Il est difficile de répondre à certaines questions, mais certains jeunes de tout juste 18 ans

devront les affronter seuls.

Sortants de soins

Je ne sais pas ce que c'est

La Santé … Les besoins? ...

Qui sont-ils?

Les Joueurs de Liverpool

Je ne sais pas ce que c'est, je n'en ai jamais entendu parler

Je ne comprends pas la question?

Clercs

Ce sont des jeunes qui viennent d'avoir 18 ans,

ils vivent dans une famille d'accueil et doivent quitter leur famille d'accueil et trouver une solution d'indépendance

Génial!

[L'avenir se construit de jour en jour]

Que pouvons-nous dire à ces jeunes, allez?!

Que ... Je leur souhaite bonne chance, que peut-on leur dire ?!

En tant que modèle visant à structurer l'offre de services, l'accompagnement sensible aux traumatismes est utilisé dans un contexte large et varié ; Bowen et Murshid (2016) soulignent combien ce paradigme peut tout autant s'appliquer, dans ses principes fondateurs (sécurité, fiabilité et transparence, collaboration, autonomisation, choix et intersectionnalité), aux politiques sociales. Selon la proposition des auteurs, le constat est d'autant plus vrai que l'accompagnement sensible aux traumatismes permet aux professionnels de la santé mentale (en particulier dans le secteur public) de faire tomber les disparités par une action clinique-organisationnelle qui, en raison de sa dimension éthique et déontologique, peut également s'ouvrir à une dimension politique plus large. Reeves (2015) avait déjà souligné comment l'application généralisée de modèles de soins axés sur un accompagnement sensible aux traumatismes pouvait placer au centre de l'intervention la réponse aux besoins uniques et particuliers des responsables des services de réadaptation, réduisant ainsi les inégalités sociales dont souffre cette population vulnérable.

Récemment, Levy-Carrick et ses collègues (2019) ont souligné que l'inégalité de traitement dans le contexte des traumatismes constitue un problème critique dans l'organisation nationale des services de santé, auquel l'adoption d'une approche d'accompagnement sensible aux traumatismes peut remédier, sinon complètement, du moins largement. En fait, au centre du propos des auteurs s'articule le constat que l'application efficace de ce paradigme serait garantie par la pleine participation des soignants à la planification et à la mise en œuvre des activités, et ce à chaque étape. Dans leur livre "Caring for the vulnerable : Perspectives in nursing theory, practice, and research", De Chesnay et Anderson (2019) ajoutent que la santé mentale revêt un caractère politique et participatif (en particulier dans le chef des usagers). Dans cette optique, l'Organisation mondiale de la santé a souvent préconisé des politiques visant à créer un espace de collaboration dans lequel les praticiens et les groupes de défense des droits des usagers des services de santé mentale (groupes de défense), ainsi qu'un large éventail d'autres parties prenantes, peuvent encourager une synergie attentive aux besoins de chacun.

En outre, comme nous le constatons parfois, il est important de fonder sur des considérations politiques la décision de financer des études d'analyse et de promotion des pratiques fondées sur des données probantes, d'établir et de diffuser des normes communes, de définir la proportion organisationnelle et les objectifs communautaires des organisations et des institutions impliquées dans la fourniture de soins (Ko et al., 2008 ; Bateman & Anderson, 2013 ; Levy-Carrick et al., 2019).

Les propos ci-dessus concernent non seulement la dimension générale de la politique de santé, mais également la dimension locale en réponse à des besoins territoriaux spécifiques et, plus spécifiquement, aux politiques de chaque organisation ou de chaque service. La littérature sur l'accompagnement sensible aux traumatismes suggère que, "pour appliquer une assistance sensible aux traumatismes, s'imposent les étapes de préparation, d'évaluation et de changement organisationnel (Harris & Fallot, 2001, Rivard, Bloom, McCorkle, & Abramovitz, 2005) [...] La mise en œuvre de pratiques sensibles aux traumatismes repose donc sur l'utilisation des données de chaque organisation individuelle pour illustrer les phases de planification et d'application" (Hummer et al., 2010, p. 82). Accompagner les politiques via des données issues de centres de recherche constitue incontestablement une priorité et un avantage stratégique (Levy-Carrick et al., 2019). Par exemple, parmi les outils pouvant servir à analyser dans quelle mesure les politiques organisationnelles reposent sur les principes d'un accompagnement sensible aux traumatismes, le protocole CCTIC développé par Fallot et Harris (2009) pourrait être particulièrement intéressant dans la mesure où il éliminerait les domaines et sous-domaines liés à l'évaluation des services et initiatives organisationnels dans le domaine des soins aux traumatisés.

En conclusion, qui dit perspective basée sur un accompagnement sensible aux traumatismes dit une sensibilité accrue à ce que Levy-Carrick et co ont défini comme important (2019) : "aider nos patients et nous-mêmes nécessitera un changement de perspective critique dès le début de la formation, renforcé dans tous ses aspects, mis en place par des professionnels plus âgés et porté par les générations futures" (p. 107).

Q4.2

3 points possible (graded)

1. L'approche de l'accompagnement sensible aux traumatismes :

- ○ ne prend en compte que la dimension psychologique d'une personne.
- ○ favorise un accompagnement global de la personne.
- ○ ne prend en compte que la dimension physique d'une personne.
- ○ ne prend en compte que la dimension sociale d'une personne.

2. Une intervention, afin de prendre en compte les meilleures pratiques, devrait :

- ○ encourager une évaluation approfondie et un contrôle constant des compétences du personnel (utilisation de procédures spécialement conçues).
- ○ ignorer l'histoire des patients et les éventuels symptômes ou difficultés liés à un traumatisme.
- ○ exclure de la pratique clinique des procédures de dépistage normalisées et fondées sur des preuves.
- ○ veiller à ce que le personnel interne continue à exécuter les procédures auxquelles il a été initialement formé.

3. Une bonne proposition de recherche

- ○ fixe des objectifs aussi généraux que possible
- ○ formule toujours des hypothèses de recherche après la collecte des données
- ○ prévoit toujours un échantillon stratifié
- ○ effectue une analyse de faisabilité et définit un calendrier

L'importance de l'observation

VIEW UNIT IN STUDIO

Bookmark this page

Cliniciens et chercheurs sont constamment à la recherche de nouvelles connaissances phénoménologiques, de manière plus ou moins systématique. Ce désir de connaissance naît de l'intérêt ou de la curiosité, d'un regard attentif, à l'œil nu ou à l'aide d'outils, en résumé il nait de « l'observation ».

Mantovani (1995) définit l'observation comme : « [...] une forme de détection visant à explorer un phénomène donné » (p. 84).

L'observation est une activité complexe et exigeante qui nécessite :

- du temps ;
- une liberté intellectuelle ;
- une absence de préjugés et d'idées préconçues ;
- de la conscience de soi ;
- la capacité de ne pas s'impliquer ;
- la capacité de suspendre son jugement.

Dans les contextes de la pratique clinique ou de la recherche, l'observation acquiert une importance considérable, cessant d'être une méthode simple et non scientifique pour se transformer en une méthode flexible, structurée et fiable (Venuti, 2001). Vu les progrès accomplis dans le domaine des études sur les enfants, par exemple, l'utilisation des « biographies d'enfants » a été abandonnée, pour laisser place à l'observation et à l'expérimentation systématiques (Bornstein, 2001). En fait, au fil du temps, les observations naturalistes ont été remplacées par des observations standardisées (Bornstein, 2001). On pourrait soutenir, comme le dit Venuti (2001), que l'observation « [...] sert de pont entre un modèle explicatif de référence et un processus consécutif d'analyse et d'interprétation des données » (p. 58). Pour observer, il ne suffit donc plus de regarder un groupe d'enfants en interaction ou une vidéo illustrant le comportement d'une mère et de son enfant, l'observation devant toujours se référer à un modèle théorique et explicatif, qui guidera le chercheur dans la formulation des hypothèses et l'analyse des données (Venuti, 2001). Ce qu'il faut observer, comment, où et quand, dépendra de l'objectif de la recherche et de l'approche théorique de référence.

Il existe différents types d'observations :

- l'observation psychanalytique, qui a pour modèle théorique la psychanalyse ;
- l'observation selon Piaget, qui a pour modèle théorique la psychologie du développement ;
- l'observation éthologique, qui a pour modèle théorique l'éthologie.

L'observation piagétienne est un type d'observation quasi-expérimental. Il s'appuie sur les approches théoriques de l'interactionnisme, du structuralisme, du cognitivisme et approfondit l'étude du cheminement de la vie mentale au cours du développement (Vigna, 2002). Elle ne se limite pas à l'enregistrement de tout ce que fait l'enfant, mais est guidée par certaines hypothèses qui constituent la base de la théorie piagétienne. L'observateur tente d'établir une interaction avec l'observé dans un contexte naturel (Petter, 1984 ; Vigna, 2002). Les principes de base de cette observation sont au nombre de deux :

1. l'observateur s'adapte au stade de développement de l'enfant et, en interagissant, modifie les conditions mêmes de l'observation ;

2. l'observateur reproduit à plusieurs reprises une même situation de jeu lors de l'observation pour évaluer si la réaction de l'enfant se répète en réaction au même stimulus et n'est pas attribuable au hasard.

Cette forme d'observation a principalement lieu à l'école maternelle ou au jardin d'enfants.

L'approche éthologique, en revanche, s'inspire de la théorie de l'évolution de Darwin et des travaux de l'éthologue Lorenz. L'observation se définit comme éthologique lorsque les observateurs n'influencent en aucune façon le comportement qu'ils souhaitent étudier et annulent autant que possible leur subjectivité. Cette technique est généralement appliquée dans l'environnement naturel où un comportement donné se manifeste spontanément. Toutefois, il est possible d'utiliser le laboratoire comme environnement, à condition qu'il soit équipé de manière à reproduire un contexte familier pour l'enfant (par exemple une salle de jeux).

Elle est particulièrement utile lorsqu'il s'agit d'analyser les premières années de la vie, lorsque le langage verbal est encore absent ou pauvre, et ce pour deux raisons :

1. il est plus facile de définir le cadre de vie naturel des jeunes enfants ;

2. les jeunes enfants ne se rendent pas toujours compte qu'ils sont observés et, en tout cas, ne modifient pas leur comportement en réaction.

L'objectif, dans ce type d'observation, est d'exclure toute subjectivité et d'atteindre un niveau d'objectivité qui permet de tirer des conclusions fiables (Lis & Venuti, 1986). Dans ce cadre, le chercheur utilise des procédures qui permettent l'enregistrement et le catalogage objectif et systématique des comportements, afin de pouvoir les interpréter ultérieurement à la lumière des hypothèses initiales. Parmi les atouts de l'observation éthologique, citons

- un nombre accru d'études descriptives sur le comportement des enfants ;
- la priorité donnée à la recherche longitudinale, considérée comme la plus apte à appréhender correctement le processus de changement et sa signification évolutive.

Cependant, lorsque l'accent est mis sur la description objective, le risque existe d'oublier que l'observation s'accompagne automatiquement de choix. En outre, l'importance de la détection des micro-comportements, qui peuvent être décrits objectivement, ne peut nous faire perdre de vue le sens que revêt un certain comportement à un moment et dans un contexte particuliers.

L'observation psychanalytique, en revanche, est un type d'observation directe, une méthode qui n'utilise aucun instrument en dehors de l'observateur lui-même. Selon le modèle psychanalytique, lorsque la théorie ne permet de prévoir aucun phénomène, « l'inattendu » (Bion, 1962) prend toute sa pertinence. L'observation a, dans ce cas, pour fonction principale de créer un espace où l'inattendu peut s'exprimer. Cela exclut toute intentionnalité de la part de l'observateur, et permet de saisir l'intentionnalité consciente et inconsciente de la personne observée. Les domaines d'application sont les suivants :

- la recherche psychologique ;
- le travail clinique ;
- la formation de psychothérapeutes et d'analystes pour enfants.

L'observateur fait partie intégrante de la situation et observe à la fois les comportements et les verbalisations, ainsi que les humeurs et les émotions. Il doit également évaluer soigneusement ses propres états psychologiques, comme source d'information sur le sujet observé, en utilisant sa propre ressemblance pour différencier ce dernier de lui-même et accepter sa propre présence.

Enfin, on peut observer l'ensemble du noyau familial à travers des tâches structurées dans un contexte clinique ou dans son propre environnement naturel. Ce type d'observation peut se faire lors d'un entretien avec la famille et a pour but de comprendre comment les membres du noyau interagissent entre eux et comment ils communiquent au niveau verbal et préverbal (formes d'intersubjectivité implicite).

Enfin, l'observation est l'une des pierres angulaires des professions dans les domaines de l'éducation et de la formation, car elle permet de construire une « attitude de base » qui devient partie intégrante du comportement professionnel, en tant qu'élément de base de la compétence éducative. Il ne s'agit pas d'un simple outil, mais d'un ensemble d'attitudes, de méthodologies et d'outils. Ceux-ci peuvent être structurés (enregistrement vidéo, grilles, listes de contrôle, etc.) ou non structurés (par exemple, journal de bord). L'observateur doit ensuite suivre une formation qui le dotera des compétences et des connaissances permettant d'utiliser ces outils pour détecter le phénomène qu'il entend étudier (Venuti, 2001). Les données obtenues à partir de l'observation peuvent être à la fois qualitatives et quantitatives. Les données qualitatives ont une structure narrative (Hilliard, 1993), tandis que les données quantitatives peuvent être utilisées pour diverses mesures et analyses (par exemple, mesures de fréquence et de durée, analyses séquentielles, etc.)

En 1969, la psychologue américaine Mary Ainsworth a donné à la psychologie du développement

une nouvelle procédure pour étudier l'attachement chez les nourrissons.

Elle l'a appelé la "classification de situation étrange" et on l'appelle souvent simplement

En tant qu'adulte, on sait quand on a formé un lien d'attachement avec quelqu'un.

On sait ce que l'on ressent et on sait exprimer ses sentiments avec

des mots. Cependant, les bébés et les jeunes enfants

n'ont pas encore développé ces compétences

et les chercheurs doivent donc se tourner vers des techniques plus subtiles.

"La situation étrange", qui mesure la sécurité d'un attachement

chez les enfants de un à deux ans, en est une. C'est une observation participative de 20 minutes au cours

de laquelle le chercheur observe les réponses comportementales du nourrisson à une série de scénarios.

"La situation étrange" d'Ainsworth comprend huit étapes et chacune dure environ trois minutes.

Pour commencer, la mère, le bébé et le chercheur sont tous ensemble dans la pièce,

un petit espace aux couleurs neutres avec des jouets pour bébés.

L'expérimentatrice part après environ une minute et la mère et le bébé

sont seuls pendant environ trois minutes.

Un étranger rejoint la mère et le bébé dans la pièce.

Les chercheurs enregistrent la réponse du bébé à ce nouveau venu, inconnu,

qui est ensuite laissé seul avec le bébé lorsque la mère quitte la pièce.

À ce stade, les chercheurs observent alors le comportement du bébé pour

déceler des signes d'anxiété suite à la séparation.

Trois minutes plus tard, la mère revient

et les chercheurs observent la réponse du bébé suite aux retrouvailles.

L'étranger quitte la pièce. Quelques minutes de plus et la mère quitte également la pièce - laissant le bébé seul pour la première fois dans l'expérience.

La prochaine personne à entrer dans la pièce est l'étranger, et enfin,

au bout de trois minutes, la mère revient et l'inconnu s'en va.

C’est finalement une situation parfaitement étrange pour toutes les personnes impliquées.

Alors, que mesuraient les chercheurs?

Lorsque la mère était dans la pièce avec le bébé, ils ont évalué le comportement du nourrisson selon quatre mesures:

"Proximité et recherche de contacts". "Maintien du contact".

"Évitement de la proximité et du contact" et "Résistance au contact et zone de confort".

Les comportements exploratoires du bébé ont également été enregistrés alors qu'il explorait l'environnement.

Ainsworth a rapporté que les nourrissons affichent l'un des trois types d’attachements:

Les nourrissons fort attachés à leur mère montraient des signes de détresse lorsqu'ils étaient séparés d’elle,

évitaient l'étranger lorsqu'ils étaient seuls, étaient amical en présence de leur mère

et heureux quand elle revenait de l'extérieur dans la pièce.

70% des enfants étudiés entraient dans cette catégorie. 15% des enfants ont démontré un attachement ambivalent

avec leur mère. Ces enfants ont montré une détresse intense lorsque

la mère a quitté la pièce et manifesté une peur importante de l'étranger.

Lorsque la mère est revenue dans la chambre, des enfants ambivalents se sont approchés de la mère mais ont

refusé tout contact.

Ainsworth a rapporté qu'un dernier 15% avait un style d'attachement évitant.

Ces enfants ne manifestent aucun intérêt lorsque la mère quitte la pièce et joue joyeusement avec l'étranger.

Lorsque la mère revient, les enfants évitants semblent à peine s'en apercevoir.

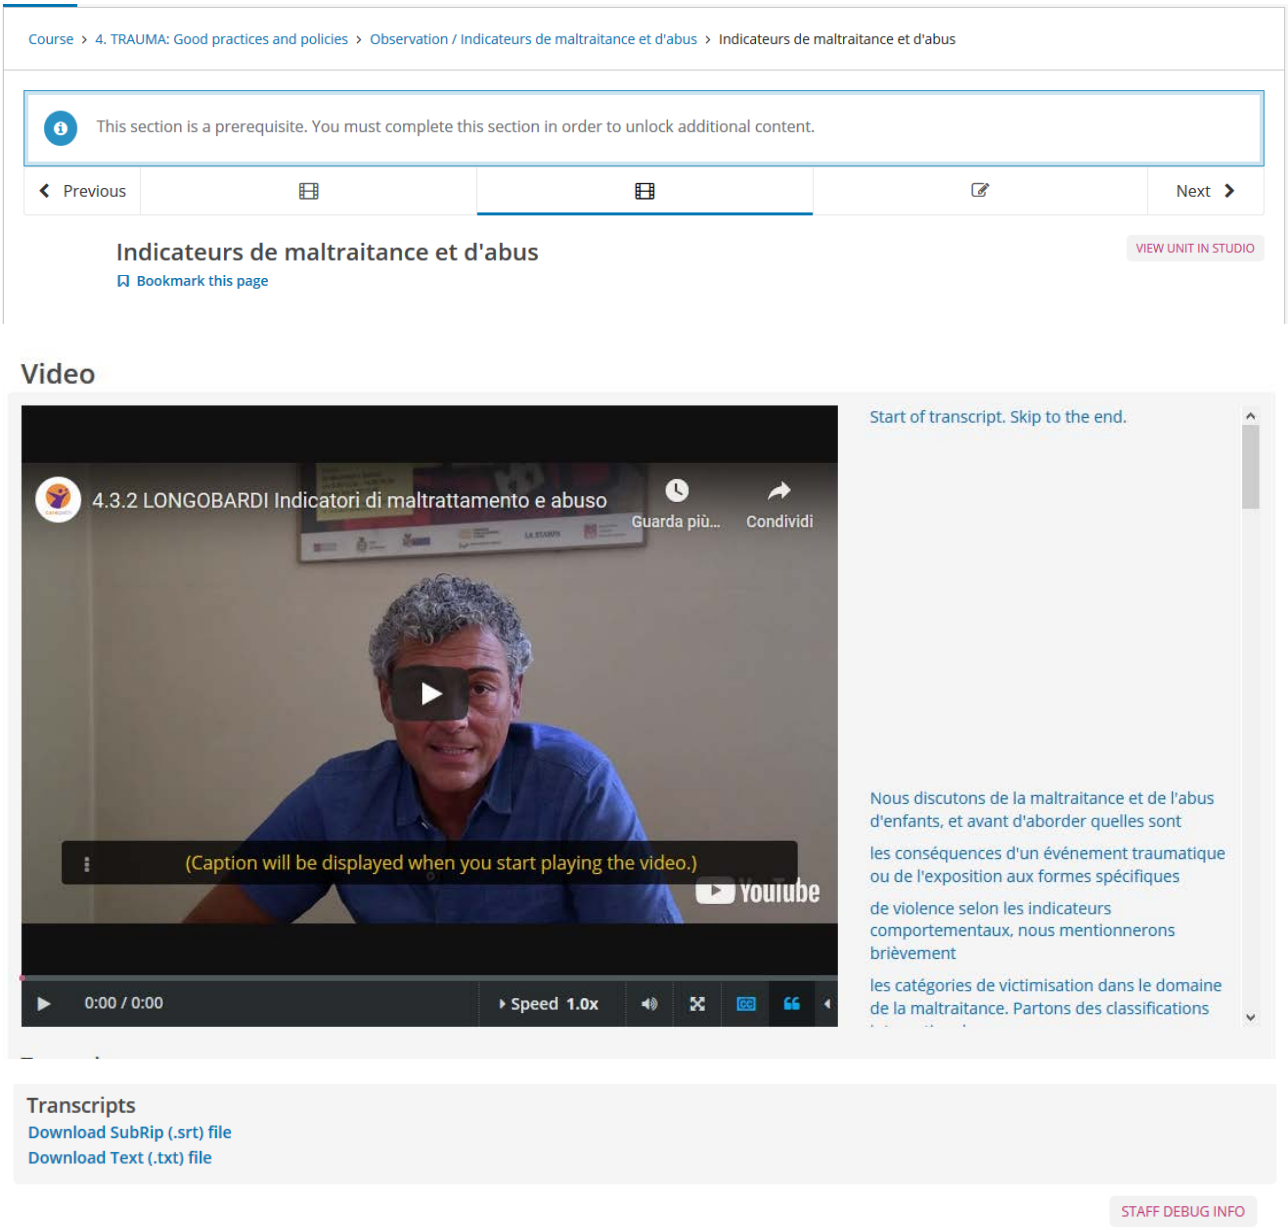
En 1990, le Maine et Salomon ont ajouté qu’un très faible pourcentage était

incohérent dans leurs comportements et défini ce style d'attachement comme "désorganisé".

Il'hypothèse d'Ainsworth sur la sensibilité des soignants suggère que les différences dans les styles d'attachement des nourrissons

dépendent du comportement de la mère envers

le bébé pendant une période critique de développement.



Transcript

Nous discutons de la maltraitance et de l'abus d'enfants, et avant d'aborder quelles sont

les conséquences d'un événement traumatique ou de l'exposition aux formes spécifiques

de violence selon les indicateurs comportementaux, nous mentionnerons brièvement

les catégories de victimisation dans le domaine de la maltraitance. Partons des classifications internationales :

il y a d'abord la violence psychologique, aussi appelée "abus émotionnel" / "abus psychologique",

puis il y a les abus physiques, et enfin les abus sexuels.

En ce qui concerne la violence psychologique, il s'agit de l'exposition à des formes de

violence caractérisée par des dommages physiques que l'enfant subit,

il s'agit donc d'un événement traumatisant très fort puisqu'il a des conséquences sur le développement de l'enfant,

nous verrons sous peu de quels pays je parle. Lorsque nous parlons

de violence psychologique, nous faisons référence aux insultes, le dénigrement, l'isolement social de l'enfant et la négligence ;

ce sont des formes de violence moins visibles,

mais qui ont néanmoins un impact psychologique et constituent donc un événement traumatisant à long terme.

La violence physique est l'exposition formes de violence caractérisées par des dommages physiques ; il s'agit donc d'un événement traumatique très fort, puisqu'il a un impact sur le développement ;

nous verrons bientôt ce à quoi je fais spécifiquement référence. Enfin, les abus sexuels se réfèrent à tous les actes liés à la victimisation qui sont lié à une exposition physique à la violence sexuelle, à l'inceste,

aux attouchements ou à une situation inappropriée qui touche au nom de ceux qui s'occupent de l'enfant dans une situation protégée.

Analysons les conséquences liées aux abus

et à la violence contre un enfant, en tenant compte

à la fois des indicateurs comportementaux et émotionnels. Les conséquences que l'enfant rencontre au cours

de son développement sont par exemple,

troubles de la perception du corps, et donc de son image corporelle;

l'enfant ne peut pas comprendre si son corps appartient à un enfant ou à un adulte, car il est érotisé depuis son plus jeune âge.

Les autres conséquences sont des difficultés chroniques liées au sommeil; en d'autres termes,

l'événement traumatique a un impact sur la régulation du rythme veille-sommeil. Ensuite, il y a des

troubles de l'attention et des difficultés à se concentrer et à faire attention à l'école.

Si l'enfant a moins de 3 à 5 ans, il peut également y avoir des troubles d'évacuation.

Pendant l'adolescence, d'autres manifestations d'inconfort

que l'enfant ou le jeune peut ressentir sont des troubles de l'alimentation, notamment l'anorexie et la boulimie,

des actes d'agression explicites envers tous les sujets qui ont tendance à afficher un

comportement de nature attentionnelle envers l'enfant

(l'enfant peut se défendre lui-même / elle-même avec une agression explicite).

Enfin, les actes d'automutilation, précisément parce qu'il existe une souffrance intrinsèque,

interne à l'enfant, causée par l'événement traumatisant; l'enfant réagit alors en se faisant du mal ainsi qu'à d'autres sujets.

Ce sont quelques-unes des conséquences de l'exposition à des événements traumatisants pendant la petite enfance,

l'enfance et l'adolescence, mais beaucoup plus sont étudiés par la littérature:

difficultés d'apprentissage, isolement et comportements antisociaux tels que l'utilisation

et abus d'alcool et de drogues, comportement sexuel liberé,

exposition à certaines maladies sexuellement transmissibles.

Par conséquent, cela nous fait comprendre comment une trajectoire de développement normale

n'est pas obtenu parce que ceux qui s'occupent de l'enfant et devraient avoir la fonction de garde d'enfants,

maltraitent l'enfant de manière physique,

en battant et en infligeant volontairement de la douleur à l'enfant, de manière sexuelle,

c'est-à-dire en érotisant le corps de l'enfant, ou d'une manière psychologique,

c'est-à-dire en humiliant, en isolant et en dénigrant l'enfant. Ces formes de maltraitance ont un impact traumatisant sur l'enfant avec

les conséquences que nous venons d'explorer. Ces conséquences sont donc des indicateurs d'un comportement

mais aussi la nature émotionnelle et expriment un inconfort que l'enfant éprouve

à un moment précis et sur lequel il est nécessaire d'intervenir tôt,

avant que les conséquences deviennent de plus en plus traumatisantes et inhérentes à la développement de la personnalité du sujet, avec, bien entendu, des conséquences de nature psycho-pathologique.

Schimmenti (2018) souligne combien un traumatisme constitue une lacération profonde pour les individus, pouvant avoir un impact sur leurs processus psychologiques de conditionnement, à de multiples niveaux, et sur leur fonctionnement. Il a notamment des conséquences sur le concept de soi, sur les modalités relationnelles et sur les systèmes de croyance. En outre, l'auteur souligne que de nombreuses études scientifiques ont souligné la fréquence des connexions entre des événements pouvant être définis comme traumatiques et ont montré que l'exposition à des expériences traumatiques multiples augmente le risque de développer une psychopathologie (traumatisme cumulatif), principalement si elle se produit pendant l'enfance et, surtout, dans le cadre des relations familiales. Curran et ses collègues (2018) soulignent également cet aspect dans la littérature scientifique, en ajoutant que :

1. chez les enfants victimes de multiples expériences traumatiques, cela renforce les risques de dépression et d'impuissance (Arata et al., 2007) ;

2. sur un plan longitudinal à l'âge adulte pour les sujets ayant connu des épisodes de violence physique et psychologique, cela entraîne une diminution de l'estime de soi et des capacités d'adaptation aux émotions (en particulier la colère et l'agression), une augmentation des comportements sexuels déviants et des difficultés d'adaptation psychosociale (Sesar et al., 2010) ;

3. chez les victimes d'abus sexuels ou physiques, cela augmente le risque d'éprouver des difficultés psychosociales et de présenter un comportement asocial ou antisocial, des symptômes physiques chroniques, des troubles anxieux ou dépressifs, des symptômes liés à un traumatisme et une dissociation (Higgins & McCabe, 2000).

4. En outre, à l'adolescence, les recherches scientifiques montrent également un risque accru de développement de comportements délinquants, d'abus de substances et d'automutilation, en particulier chez les personnes souffrant de SSPT ou ayant des antécédents de poly-victimisation.

En général, la recherche suggère, d'un point de vue épidémiologique, qu'il existe un lien entre le traumatisme et la gravité de l'altération ; de plus, s'il a été subi pendant l'enfance, il peut avoir des conséquences graves et débilitantes sur le développement des compétences cognitives, émotionnelles et sociales (Curran et al., 2018). Un aspect pouvant influencer le développement et les résultats des expériences traumatisantes de l'enfance est la négligence émotionnelle des figures d'attachement - en particulier celles qui ont des fonctions parentales - pour l'enfant (Schimmenti, 2018). Il est préférable de bien comprendre les mécanismes qui sous-tendent la variabilité individuelle de la réponse psychologique aux traumatismes à la fois pour identifier quels enfants risquent d'éprouver une détresse à long terme et afin de structurer des interventions efficaces appropriées (Ozer et al., 2003 ; Alisic et al., 2011). Plus précisément, soulignons que les enfants réagissent aux traumatismes de manière différente des adultes, en partie en raison de leur niveau de développement et de leurs compétences, notamment quand il s'agit de gérer le contenu mnésique et les réactions émotionnelles aux événements. Lonigan et ses collègues (1998) avaient déjà souligné combien la recherche scientifique devrait se concentrer sur l'analyse des réactions des enfants aux traumatismes et sur les facteurs qui y sont associés. L'une des questions posées portait sur la nécessaire analyse d'indicateurs - pouvant directement s'appliquer à la population enfantine et non pas simplement extrapolés en fonction de conditions rencontrées chez les sujets adultes – relatifs aux réactions normales et psychopathologiques des enfants aux événements indésirables. Un domaine d'investigation intéressant concerne la distinction à établir entre les réactions typiques à un traumatisme et les conditions susceptibles d'induire une réponse psychopathologique en se concentrant particulièrement sur les symptômes qui permettent de distinguer l'un de l'autre et de procéder à une évaluation efficace par les cliniciens (Lonigan et al., 1998). La littérature fournit de nombreuses informations sur les indicateurs de mauvais traitements et d'abus, soulignant qu'il s'agit souvent de signaux non spécifiques devant être lus avec prudence et précaution, car ils ne désignent pas toujours exclusivement la maltraitance. En effet, les opérateurs doivent être en mesure de mieux comprendre la souffrance de l'enfant dans les contextes où il se trouve, afin de bénéficier des meilleures conditions pour qu'il se sente accueilli et aidé à exprimer ses émotions et ses difficultés. En les complétant de techniques d'observation, les opérateurs peuvent utiliser des grilles d'indicateurs pour une étude optimale du problème. À titre d'exemple, veuillez consulter le lien vers un document élaboré par le CE.S.P.IM (Centro Servizi per il volontariato Provincia di Imperia) et intitulé « Il Silenzio dei Passerotti - Projet pour combattre et atténuer les abus et la maltraitance des enfants », où vous trouverez quelques exemples d'indicateurs d'abus et de maltraitance.

Différents types de maltraitance des enfants. Il existe de nombreuses formes de maltraitance des enfants.

Abus en ligne: il s’agit de tout type d’abus qui se déroule sur internet. Cela peut prendre la forme de cyberintimidation,

d’attouchements, d'abus sexuels et d'exploitation ou de violence psychologique,

de la part de personnes qu'ils connaissent aussi bien que d'étrangers. Les abus en ligne peuvent

se produire uniquement en ligne ou également aussi dans le monde réel.

La technologie étant omniprésente, les enfants et les jeunes souffrant de cette forme d'abus peuvent se sentir piégés,

sans issue de secours, puisque cela les poursuit où qu’ils aillent, même dans leur chambre,

censée pourtant être un endroit sûr pour eux. Attouchement: les attouchements se produisent quand un adulte

établit une connection avec un enfant dans l’objectif de les exploiter ou d’abuser

d’eux sexuellement. Cela peut se faire en ligne, dans le monde réel, par un étranger ou une personne qu'il connaît.

Abus sexuels: l’abus sexuel se produit quand un enfant est forcé ou se fait

persuader de prendre part à tout type d’acte sexuel, et ca ne doit pas être physique.

Parfois, l'enfant peut ne pas avoir conscience que ce qu’il se passe est de la maltraitance,

ou que ce qu’on lui impose est mal. Violence physique : la violence physique consiste à blesser délibérément un enfant,

lui causant ainsi des blessures telles que des côtes cassées, des brûlures ou des coupures.

Ils peuvent recevoir des coups de pied, des coups de poing, des gifles, être empoisonnés, brulés ou se faire jeter des objets sur eux.

Les bébés peuvent être secoués parfois si violemment que cela conduit à leur mort.

Négligence : la négligence est un manquement continu à fournir

les besoins les plus élémentaires à un enfant. Les enfants laissés affamés, sans hygiène, non habillés de manière adéquate,

laissés sans abris ou sans surveillance sont autant d'exemples d'enfants négligés.

La négligence peut également prendre la forme d'un parent ou d'un soignant qui ne protège

pas l'enfant contre d'autres types d’abus. Harcèlement:

les harcèlements sont des comportements qui blessent quelqu'un d'autre, comme par exemple

via des injures, ou par le fait de frapper, pousser, répandre des rumeurs, de menacer ou de rabaisser quelqu'un.

Cela peut se produire n'importe où, même dans leur propre maison, et souvent sur une longue période de temps.

La violence émotionnelle, également appelée violence psychologique, lorsqu'un parent

ou une personne qui s'occupe d'un enfant le maltraite ou le néglige constamment

sur le plan émotionnel, ce qui peut impliquerdélibérément d'effrayer ou

d'humilier un enfant ou en l'isolant ou en l'ignorant. Comportement sexuel préjudiciable :

les enfants et les jeunes qui développent un comportement sexuel préjudiciable se nuisent à eux-mêmes

et d'autres en utilisant des mots et des phrases sexuellement explicites, des attouchements inappropriés,

en utilisant la violence et les menaces sexuelles ou en ayant des relations

sexuelles avec pénétration totale avec d'autres enfants ou adultes.

L'exploitation sexuelle des enfants est une autre forme de maltraitance des enfants.

Les enfants et les jeunes personnes exploitées sexuellement

sont des personnes vulnérables qui ont été trompées ou manipulées

en croyant qu'ils sont dans une relation aimante et sûre. On peut leur proposer

de l'argent ou d'autres récompenses pour être ensuite réduits en esclavage. Il se peut qu'elles aient été préparées en ligne et qu'elles deviennent totalement dépendantes de leur agresseur,

ce qui rend le départ encore plus difficile. La traite des enfants est également un abus d'enfants.

Les enfants peuvent être victimes de la traite à des fins de main-d'œuvre bon marché, d'abus sexuels, de servitude domestique, de fraude aux allocations et de mariage forcé.

Q4.3

4 points possible (graded)

1. L'observation se définit comme (Mantovani, 1995) :

- ○ une étape entre un phénomène et son interprétation ;
- ○ une forme de détection visant à explorer un phénomène donné ;
- ○ la description d'une espèce dans un catalogue ;
- ○ une façon objective et fidèle de rendre compte de la réalité.

2. Lors de l'observation, il est important :

- ○ d'éviter d'être influencé par des préjugés et des idées préconçues ;
- ○ d'éviter à tout prix de participer à l'interaction avec l'objet de l'observation ;
- ○ de toujours utiliser des outils d'observation structurés ;
- ○ de veiller à la rapidité du jugement.

3. Chez un mineur, la présence d'indicateurs et de signes associés à des mauvais traitements et à des abus...

- ○ doit être envisagée sans tenir compte des comportements ;
- ○ correspond, dans tous les cas, à des situations de maltraitance et d'abus ;
- ○ entraîne la déchéance immédiate de la responsabilité parentale.
- ○ peut se déduire par l'observation des émotions et des comportements ;

4. Selon Schimmenti (2018), les expériences traumatisantes...

- ○ sont toujours faciles à surmonter (il suffit de parler de l'événement à des amis et à la famille) ;
- ○ ne causent aucun dommage si elles sont vécues comme un événement unique, par le fait de la neuroplasticité ;
- ○ augmentent la probabilité de développer une maladie mentale, en particulier lorsque le sujet est soumis à des expositions multiples (traumatismes cumulés) ;
- ○ doivent être réprimées (il suffit de ne pas y penser).

1. Se familiariser avec les processus socioculturels et juridiques par lesquels les instances mondiales et européennes ont reconnu les enfants comme sujets de droits et l'obligation, pour les Etats, d'intervenir rapidement et efficacement pour leur protection en cas de violence, de maltraitance ou de traitement négligent ;

2. connaître les droits fondamentaux et les principes établis par le cadre juridique international et européen sur les droits de l'enfant permettant l'application d'une approche fondée sur les soins sensibles aux traumatismes (Trauma Informed Care - TIC). Une attention particulière sera accordée au droit des enfants à l'information et à la participation aux décisions les concernant, concernant leur prise en charge et leur avenir après avoir quitté les structures de prise en charge ;

3. connaître et comprendre les instruments juridiques qui garantissent la participation des enfants victimes de traumatismes aux procédures (administratives et judiciaires) nécessitant des décisions concernant leur protection (par exemple, le droit de l'enfant capable de discernement d'être entendu et, dans certains cas, le devoir de demander son consentement) ;

4. comprendre les effets opérationnels de l'approche basée sur les droits de l'enfant (et spécifiquement des droits de participation des enfants) sur les politiques sociales et de santé ;

5. connaître et maîtriser la terminologie juridique.

L'objectif du présent module sera d'analyser le cadre règlementaire et

les principes juridiques fondamentaux sur lesquels reposent les soins sensibles aux traumatismes.

Au terme du module, vous devrez être capable d'utiliser correctement des concepts tels qu'abus,

maltraitance, préjudice et abandon.

L'objectif pédagogique de ce module est de comprendre le processus juridique

et culturel qui a mené, au niveau international et européen, à la reconnaissance des enfants mineurs

are subjects of right and that there is there is an obligation for States to intervene promptly

and effectively to protect them.

comme sujets de droit. Il s'agira également de comprendre que l'état à l'obligation d'intervenir rapidement

et efficacement pour assurer leur protection.

Dans le présent module, vous apprendrez aussi les droits et les principes fondamentaux, établis par le cadre règlementaire international et européen dans le domaine des droits de l'enfant.

a framework that is fundamental for Trauma Informed Care.

Ce cadre est essentiel pour un accompagnement sensible aux traumatismes.

Nous insisterons tout particulièrement sur le droit de l'enfant à être informé et entendu lors des procédures concernant l'aide

et les soins à leur apporter ainsi que leur avenir, et ce même après l'intervention de l'état.

Vous vous familiariserez également avec les mesures

garantissant la participation des mineurs victimes d'abus

aux processus décisionnels relatifs à leur protection,

qu'ils soient administratifs ou juridiques ; ainsi, vous insisterez sur

le droit de l'enfant à être entendu et,

si nécessaire, sur l'obligation d'obtenir son consentement pour la mise

en place d'une mesure de protection.

La dernière partie du module sera consacrée

à l'impact sur les politiques sociales et de santé d'une approche basée sur les droits de l'enfant,

par le biais d'un aperçu général suivi

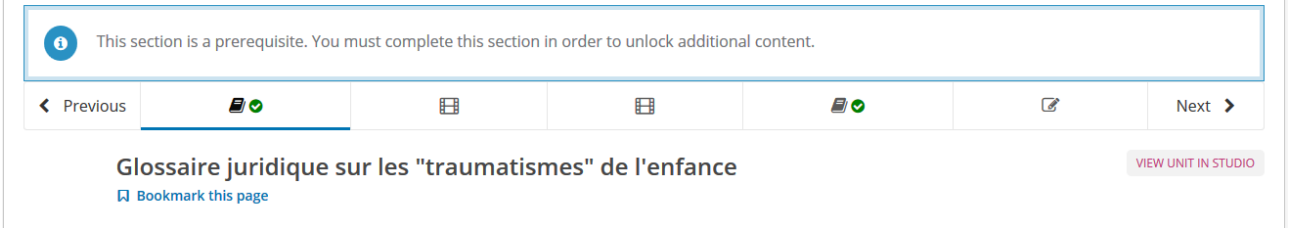
de quelques études de cas ; par exemple, cette partie se penchera sur les politiques

de lutte contre les mutilations génitales, contre les châtiments corporels

au sein de la famille ou sur les politiques de désignation

d'un tuteur pour les mineurs étrangers abandonnés,

qui ont été adoptées par de nombreux pays.



Glossaire juridique sur les "traumatismes" de l'enfance

Le terme « traumatisme » n'est pas couramment utilisé dans le langage juridique.

La Convention internationale relative aux droits de l'enfant (CRC), par exemple, veut « protéger l'enfant contre toute forme de violence, d'atteinte ou de brutalités physiques ou mentales, d'abandon ou de négligence, de mauvais traitements ou d'exploitation, y compris la violence sexuelle » (Art. 19).

Abus et maltraitance

Le Conseil de l'Europe définit la maltraitance des enfants en ces termes : « les actes et insuffisances qui perturbent gravement l'enfant, menacent son intégrité physique, son développement physique, intellectuel et moral, qui se manifestent sous la forme de négligence et / ou de blessures physiques et / ou mentales et / ou sexuelles par un membre de la famille ou d'autres personnes qui prennent soin de l'enfant". (IV Criminological Seminar - Strasbourg, 1978)

Pour l'Organisation mondiale de la Santé : « la maltraitance de l'enfant s'entend de toutes les formes de mauvais traitements physiques et/ ou affectifs, de sévices sexuels, de négligence ou de traitement négligent, ou d'exploitation commerciale ou autre, entraînant un préjudice reél ou potentiel pour la santé de l'enfant, sa survie, son développement ou sa dignité dans le contexte d'une relation de responsabilité, de confiance ou de pouvoir." (Organisation mondiale de la Santé, Rapport mondial sur la Violence et la Santé, 2002).

Tant un abus qu'une maltraitance peut prendre la forme :

- d'un comportement actif (par exemple, coups, blessures, actes sexuels, exploitation)
- d'une omission (par exemple, un manque de vigilance, de la négligence).

L'absence de preuves physiques traumatisantes n'exclut pas l'hypothèse de mauvais traitements ou d'abus. Par exemple, la conduite de l'enseignant / du parent qui humilie, dévalorise, dénigre ou viole psychologiquement un enfant ou le menace peut constituer un abus, lorsqu'il s'agit d'une violence psychologique pouvant porter atteinte à la santé psychophysique de l'enfant et à sa dignité.

Les termes **VIOLENCE et EXPLOITATION** désignent généralement des comportements actifs envers l'enfant.

L'exploitation, en particulier, peut être de nature économique ou sexuelle

- *Article 32 (CDE) : « Les Etats parties reconnaissent le droit de l'enfant d'être protégé contre l'exploitation économique et de n'être astreint à aucun travail comportant des risques ou susceptible de compromettre son éducation ou de nuire à sa santé ou à son développement physique, mental, spirituel, moral ou social. »*

- *Article 34, par. 1 (CDE) : « Les Etats parties s'engagent à protéger l'enfant contre toutes les formes d'exploitation sexuelle et de violence sexuelle. »*

Le Comité des droits de l'enfant des Nations Unies définit la « violence » comme « toute forme de violence, d'atteinte ou de brutalités physiques ou mentales, d'abandon ou de négligence, de mauvais traitements ou d'exploitation, y compris la violence sexuelle ». Dans le langage de tous les jours, le terme de violence est souvent utilisé pour désigner uniquement les dommages physiques et/ou les dommages intentionnels. Toutefois, le Comité insiste fortement sur le fait que le choix du terme « violence » dans l'Observation générale ne doit en aucun cas être interprété comme une tentative de minimiser l'impact ou la nécessité de traiter des formes non physiques et/ou non intentionnelles de dommages (telles que, entre autres, l'abandon et la maltraitance psychologique). (Le droit de l'enfant d'être protégé contre toutes les formes de violence, Observation générale n° 13 (2011) CRC / C / GC / 13, 18 avril 2011).

Enfin, l'expression **ÉTAT D'ABANDON** désigne une situation d'incapacité grave et permanente des parents à s'occuper de l'enfant en raison de négligence, de violence grave ou d'exploitation.

Transcript

Bonjour. L'objectif de la présente vidéo consiste à partager quelques connaissances, d'une part,

sur le processus culturel et juridique qui a débouché sur la reconnaissance

des enfants en tant que sujets de droit (titulaires des mêmes droits que tous les autres êtres humains,

ainsi que de droits spécifiques qui leur sont propres),

et d'autre part, sur le parcours vers la reconnaissance

de l'obligation qui impose à l'état de s'ingérer

pour défendre et protéger les droits

des enfants victimes de violence et de maltraitance. Pour contextualiser mes propos,

je lirai quelques lignes d'un livre de 2006 intitulé « La vie et les règles », publié chez Feltrinelli en Italie,

dont l'auteur, Stefano Rodot, juriste et politicien italien, fut l'un des auteurs de la Charte européenne des droits fondamentaux.

Rodot écrit : « la règle juridique ne peut pas être envisagée comme

une manière de supprimer la souffrance dans le monde,

mais bien comme un critère permettant de définir un seuil de souffrance

tolérable d'un point de vue social et personnel ».

Je pense que ce texte peut nous servir de base dans notre analyse de la réaction de l'état face à la maltraitance des enfants

en cela qu'il souligne l'omnipotence de la loi.

En d'autres termes, même s'il existe des règles juridiques visant à réprimer

la violence et les abus envers les enfants et tenter de les éviter,

malheureusement, la violence et la maltraitance peuvent toujours se produire au quotidien.

De plus, quand il y a actes de violence ou de maltraitance,

l'état n'est pas toujours en mesure d'intervenir de manière opportune et efficace.

J'ajouterai que ces quelques lignes écrites par Rodot posent la question du seuil justifiant

une intervention générale de l'état en protection de personnes confrontée

à de grandes difficultés et une intervention plus spécifique d'aide aux enfants victimes de maltraitance.

Dans ce cas, on peut fixer le seuil quand il y a atteinte et violation du droit à

la dignité humaine. En conséquence, l'état doit intervenir quand le seuil de souffrance

est tel qu'il risque de compromettre la dignité de l'être humain.

Ainsi, le motif d'une intervention de l'état découle de

son obligation générale à assurer la solidarité sociale, la protection des libertés individuelles

et la protection particulière des personnes vulnérables.

Passons maintenant aux étapes essentielles du parcours qui nous a permis de définir

l'enfant comme sujet de droit et de reconnaître l'obligation de l'état à protéger les enfants victimes

d'abus.

L'année 1874 est la première date marquante.

En effet, c'est cette année que se déroule se déroule dans la ville de New York

aux Etats-Unis le procès de la mère d'une enfant appelée Mary Ellen Wilson. L'affaire Mary Ellen Wilson fut l'une des premières à faire la une des journaux

car elle montrait l'absence totale d'un système public de protection de l'enfant.

C'est d'ailleurs suite à cette affaire que fut créée

la première organisation caritative en la matière : la New York Society for the Prevention of

Cruelty to Children (organisation new yorkaise pour la prévention de la cruauté à l'égard des enfants). Retraçons les événements de ce cas particulier ?

Les voisins dénoncent auprès

d'une missionnaire méthodiste, Etta Wheeler, la maltraitance, par sa mère,

d'une enfant censée avoir 5 ans (Mary Ellen, qui est en fait âgée

de 10 ans). Etta Wheeler parvient à entrer dans la maison sous prétexte de venir chercher de l'aide

En invoquant cette excuse, Etta Wheeler parvient donc à entrer

Etta Wheeler entered the home of Mary Ellen's parents and thus personally verified

the situation of the child, who was actually a victim of abuse,

chez les parents de Mary Ellen et constate la situation dans laquelle vit l'enfant : celle-ci est victime de maltraitance physique (elle présente des brûlures, des ecchymoses,

des entailles sur le corps et les vêtements qu'elle porte ne sont pas adaptés à la saison) et psychologique

(l'enfant est enfermée dans une armoire plusieurs heures par jour

et ne peut pas sortir de la maison, si ce n'est quelques minutes en soirée, dans la cour de l'immeuble).

Etta Wheeler contacte les autorités locales et leur demande de retirer l'enfant

du foyer familial. Malheureusement, les autorités locales refusent faute de cadre juridique permettant de retirer un enfant à sa famille.

Etta Wheeler ne renonce pas : elle sollicite et obtient

l'aide d'un avocat spécialisé dans la protection des animaux contre la cruauté.

Et c'est en invoquant ce cadre règlementaire qu'elle obtient le retrait de l'enfant du foyer familial.

En 1874 le procès se termine par la condamnation

de la mère à un an de prison pour maltraitance à l'encontre de Mary Ellen.

Quelques années plus tard, en 1924, le processus d'affirmation

des droits de l'enfant connaît une avancée remarquable. Cette fois, nous nous rendons en Europe dans la ville de Genève.

La Ligue des nations proclame une charte, connue sous le nom de déclaration de « Genève »

ou Déclaration des droits de l'enfant. Encore aujourd'hui, il s'agit d'une charte axée principalement sur les

besoins matériels et affectifs de l'enfant. Elle considère en premier lieu les enfants comme

des bénéficiaires passifs de droits. Par exemple, la Déclaration stipule que

« L'enfant qui a faim doit être nourri ; l'enfant malade doit être soigné ».

Nous devrons encore attendre quelques décennies pour obtenir une nouvelle charte, la Déclaration universelle

des droits de l'enfant, déclaration proclamée à New York en 1959 par l'Organisation des Nations-Unies.

comme des titulaires

directs de droits au même titre que

n'importe quel autre être humain. Par exemple,

le premier principe dit que « L'enfant doit jouir de tous les droits énoncés dans

la présente Déclaration ». Le troisième principe ajoute que « L'enfant a droit,

dès sa naissance, à un nom et à une nationalité. » Cette formulation des droits a ensuite été reprise

au niveau mondial dans le fameux document sur les droits de l'enfant,

la Convention de l'ONU de 1989.

J'insiste sur le mot « convention »

car il s'agir là du premier changement important par rapport aux documents de 1924

et 1959. La Convention de 1989 est un document contraignant pour les Etats

qui l'ont ratifié, contrairement à une déclaration,

qui est un texte purement programmatique. Ainsi, elle a un effet persuasif pour les états bénéficiaires.

La Convention de 1989 est également connue pour son mécanisme de suivi et de contrôle,

qui repose sur la Commission des droits de l'enfant, un organisme basée à Genève et

chargé d'examiner les rapports périodiques des Etats membres sur la transposition

de la Convention dans leurs systèmes juridiques nationaux. La Convention octroie à l'enfant tous les droits que les

chartes internationales accordent aux êtres

humains, ainsi qu'une série de droits spécifiques en tant que personnes en devenir.

Dans le cadre de la maltraitance des enfants, signalons l'Article 19,

qui protège « l'enfant contre toutes les formes de violence » au sein de la famille ;

ainsi que l'Article 34, "Protection contre toutes les formes d'exploitation sexuelles et de violence sexuelle »,

l'Article 35 « protection de l'enfant contre l'enlèvement, la vente ou la traite », l'Article 37 « protection contre la torture, des peines ou traitements cruels, inhumains ou dégradants »,

et enfin l' Article 39,

très important car il établit que : « Les Etats parties prennent toutes les mesures appropriées pour faciliter la réadaptation

physique et psychologique et la réinsertion sociale de tout enfant victime de toute forme de négligence, d'exploitation ou de sévices ».

and social reintegration of a child victim of abuse."

5 points possible (graded)

1) Dans le langage juridique, lequel des éléments suivants est considéré comme un « traumatisme » de l'enfance ?

- ○ Toute forme de violence physique et non physique, même quand l'acte n'est pas commis dans l'intention de la causer
- ○ La seule violence physique, si l'acte a été commis dans l'intention de la causer
- ○ La seule violence physique, même si l'acte n'a pas été commis dans l'intention de la causer
- ○ Toute forme de violence physique ou non physique, si l'acte a été commis dans l'intention de la causer

2) Dans le cas de Mary Ellen Wilson, la victime de maltraitance a bénéficié d'une protection en application de :

- ○ l'interdiction des traitements inhumains et dégradants
- ○ l'interdiction de la cruauté envers les animaux
- ○ l'interdiction des châtiments corporels
- ○ l'interdiction de la maltraitance des enfants

3) Lequel des énoncés suivants est vrai ?

- ○ Les enfants ne sont pas sujets de droits
- ○ Les enfants n'ont que des droits reconnus à toute personne humaine en tant que telle
- ○ Les enfants jouissent de droits spécifiques qui leur sont accordés en tant que mineurs (trainees)
- ○ Les enfants sont sujets de droits s'ils ont la capacité de discernement

4) Lequel des éléments suivants représente un instrument spécifique développé au sein du Conseil de l'Europe pour la protection de l'enfant ?

- ○ La Convention de Lanzarote
- ○ La CEDH
- ○ La Charte sociale européenne
- ○ La Charte de Nice

5) Dans l'arrêt de la Cour européenne des droits de l'homme "Z. ET AUTRES contre le ROYAUME-UNI", lequel des éléments suivants est reconnu ?

- ○ Article 5 de la CEDH (Droit à la liberté et à la sécurité)
- ○ Article 6 de la CEDH (Droit à un procès équitable)
- ○ Article 8 de la CEDH (Droit au respect de la vie privée et familiale)
- ○ Article 3 de la CEDH (Interdiction de la torture)

[explanation Commentaires : la Cour a soutenu à l'unanimité qu'il y avait violation de l'article 3 de la Convention ; qu'aucune question distincte ne se posait en vertu de l'article 8 de la Convention ; avec douze voix contre cinq, qu'il n'y avait pas violation de l'article 6 de la Convention ; enfin, avec quinze voix contre deux, qu'il y avait violation de l'article 13 de la Convention. [explanation]

Glossaire juridique sur les organisations et traités internationaux et de l'Union européenne

Organisation des Nations Unies (ONU) = organisation internationale fondée en 1945 dans le but de maintenir la paix et la sécurité internationales, de développer des relations amicales entre les nations, de coopérer pour résoudre les problèmes internationaux et promouvoir le respect des droits de l'homme ; elle est au centre des efforts d'harmonisation des diverses initiatives nationales. Les membres de l'ONU sont des États souverains ; les Nations Unies ne sont pas un gouvernement mondial et ne légifèrent pas.

Toutefois, l'ONU fournit aux Etats les outils nécessaires pour résoudre les conflits internationaux et formule des politiques appropriées sur des questions d'intérêt commun.

Convention internationale relative aux droits de l'enfant (CDE) = traité international approuvé par l'Assemblée générale des Nations Unies en 1989 qui exprime un consensus sur les obligations des États et de la communauté internationale envers les enfants et reconnaît pour la première fois que les enfants jouissent également de droits civils, sociaux, politiques, culturels et économiques.

Comité des droits de l'enfant des Nations Unies = établi par la Convention des Nations Unies relative aux droits de l'enfant afin d'examiner les progrès réalisés par les États parties dans l'exécution des obligations découlant du traité, il est composé de 18 experts de haute moralité et possédant une expertise reconnue dans le secteur visé par la Convention. Le Comité a pour tâche d'analyser les rapports périodiques sur la mise en œuvre de la Convention que les États parties se sont engagés à présenter conformément aux dispositions de son article 44.

Convention européenne des droits de l'homme (CEDH) = traité international en vertu duquel les Etats membres du Conseil de l'Europe garantissent les droits civils et politiques fondamentaux non seulement à leurs propres citoyens mais aussi à toute personne relevant de leur juridiction. Signée à Rome le 4 novembre 1950, la Convention est entrée en vigueur en 1953.

Cour européenne des droits de l'homme (Cour de Strasbourg) = Cour internationale instituée en 1959 et ayant son siège à Strasbourg. Elle statue sur les recours individuels ou étatiques concernant des violations alléguées des droits civils et politiques établis par la Convention européenne des droits de l'homme. Depuis 1998, la Cour est un organe permanent et peut être saisie directement par des particuliers.

Conseil de l'Europe = organisation internationale dont le but est de promouvoir la démocratie, les droits de l'homme, l'identité culturelle européenne et la recherche de solutions aux problèmes sociaux en Europe. Fondée le 5 mai 1949 par le traité de Londres, elle a son siège à Strasbourg et compte 47 États membres, dont les 28 membres de l'Union européenne.

Attention ! Le Conseil de l'Europe est une organisation distincte de l'Union européenne et ne doit pas être confondu avec ses organes.

Convention du Conseil de l'Europe pour la protection des enfants contre l'exploitation et les abus sexuels (Convention de Lanzarote) = traité par lequel les Etats membres conviennent d'ériger en infraction pénale certaines formes d'abus sexuels perpétrées contre des enfants. Il s'agit du premier traité international qui traite des abus sexuels d'enfants commis au sein de la famille.

Convention du Conseil de l'Europe sur la prévention et la lutte contre la violence à l'égard des femmes et la violence domestique (Convention d'Istanbul) = traité international qui vise à prévenir la violence, à promouvoir la protection des victimes et à prévenir l'impunité des auteurs. C'est le premier instrument international juridiquement contraignant qui crée un cadre juridique complet pour protéger les femmes contre toute forme de violence.

Union Européenne = organisation économique et politique entre 28 pays du continent européen, créée après la Seconde Guerre mondiale dans le but de promouvoir une plus grande coopération économique entre les États membres ; elle est devenue au fil du temps une organisation visant à jeter les bases d'une Union entre les peuples européens, à sauvegarder les pays et à rechercher l'unité politique, garantissant, par une action commune, le progrès économique et social, comme la création d'un marché unique européen et le renforcement de la cohésion sociale.

Charte des droits fondamentaux de l'Union européenne (Charte de Nice) = proclamée lors du Conseil européen de Nice du 20 décembre 2000, elle rassemble tous les droits civils, politiques, économiques et sociaux valables dans l'Union européenne et établit la nature et la portée fondamentales des droits de l'homme pour les citoyens européens. Bien qu'elle ne soit devenue juridiquement contraignante qu'après l'entrée en vigueur du traité de Lisbonne, elle a inspiré, dès son origine, l'activité du Parlement européen. Avec l'entrée en vigueur du traité de Lisbonne, la Charte de Nice a acquis la même valeur juridique que les traités et est donc pleinement contraignante pour les institutions européennes et les États membres.

Cour de justice de l'Union européenne (CJUE - Cour de Luxembourg) = créée en 1952, elle a son siège à Luxembourg et interprète la législation communautaire afin d'en garantir l'application uniforme dans tous les États membres et de statuer sur les différends juridiques entre les gouvernements des Etats membres et les institutions européennes.

Bonjour.

L'un des piliers de la Convention des Nations Unies relative aux droits de l'enfant et, plus largement, l'un des principes de base de la réalisation des droits de l'enfant, est incontestablement la participation des enfants et des jeunes aux procédures menant aux décisions pouvant peser considérablement sur leur vie.

La Convention de l'ONU relative aux droits de l'enfant reconnaît le droit de l'enfant, en tant qu'être humain, à la liberté d'expression dans son Article 12, paragraphe 1; et dans le paragraphe suivant,

elle détermine les instruments garantissant la participation de l'enfant

dans les procédures. Il s'agit principalement du droit à être entendu par le juge ou

par d'autres autorités administratives susceptibles de prendre des décisions dans l'intérêt de l'enfant.

Cependant, le droit à être entendu n'est pas le seul à garantir la participation de l'enfant

dans les décisions qui le concernent.

La Convention européenne sur l'exercice des droits de l'enfant, qui porte plus précisément

sur les procédures judiciaires, reconnaît, dans son Article 3, le droit de l'enfant à « recevoir toute information pertinente » ;

dans son Article 4, elle reconnaît le droit de l'enfant à « demander [...] la

désignation d'un représentant spécial » et « la désignation d'un représentant spécial dans les procédures l'intéressant devant une autorité judiciaire, lorsque le droit interne prive

les détenteurs des responsabilités parentales de la faculté de représenter l'enfant en

raison d'un conflit d'intérêts avec celui-là ».

What does it mean in practice to refer the child's right to be heard heard to his freedom of expression?

Comment la référence au droit de l'enfant à être entendu et à sa liberté d'expression

se traduit-elle dans la pratique ?

Ce processus préliminaire d'écoute de l'enfant vise

avant tout à garantir la possibilité de s'exprimer sur une question très importante

pour sa vie.

On relève des conséquences pratiques sur, par exemple, les méthodes d'écoute : le

processus ne peut pas être mené comme un interrogatoire ou comme l'audition

d'un témoin.

De plus, l'enfant peut refuser d'être entendu

par le juge.

Le droit à être entendu étant un droit, son titulaire peut décider de ne pas l'exercer.

Quelles sont les raisons pouvant être invoquées pour ne pas réaliser ce droit à être entendu ?

On ne peut motiver la non application en déclarant que l'audition est

superflue dans ce cas particulier.

La seule raison permettant d'écarter l'application du droit à être entendu

est que cette écoute pourrait nuire aux intérêts du mineur.

La protection de l'enfant est l'un des autres piliers de la Convention de l'ONU relative aux droits de l'enfant, qui doit

être mis en regard du droit de l'enfant à participer

aux procédures qui le concernent.

Un autre exemple en est la volonté

exprimée par l'enfant lorsqu'il est entendu par l'autorité décisionnelle.

En fait, l'autorité n'est pas tenue de respecter la volonté exprimée par l'enfant.

Elle peut en effet considérer que celle-ci va

à l'encontre de son intérêt.

Prenons l'exemple d'un mineur d'âge qui dans le cadre d'une procédure civile relative à

un cas de maltraitance familiale, insiste pour continuer à le parent

ou l'adulte maltraitant.

Dans ce cas, l'autorité peut refuser

les visites et maintenir sa décision même si elle est contraire à la volonté exprimée par l'enfant.

Il en va différemment des affaires concernant des adultes.

En effet, les adultes ont le droit, par exemple, de refuser un traitement médical même

si cela risque de causer leur décès.

Ce n'est pas le cas pour les mineurs car dans leur cas, comme 54 00:05:43,930 --> 00:05:49,740 je l'ai signalé, le droit à la participation, principalement le droit à l'auto-détermination, doit être mis en balance

avec l'intérêt supérieur de l'enfant.

However, the need for balance requires the judicial authority and, in general, the

Toutefois, l'autorité judiciaire, et les autorités en général, chargée de décider du sort

d'un enfant, doit informer ce dernier de leur décision et lui expliquer pourquoi il n'a pas

été possible de respecter la volonté qu'il/elle a exprimée pendant les audiences.

PRESENTATION DU FILM "THE CHILDREN ACT" (My Lady dans sa version française)

La film a pour principaux personnages Adam, un garçon de dix-sept ans qui, en accord avec ses parents, refuse une transfusion sanguine pour des raisons religieuses, et Fiona Maye, une juge anglaise spécialisée dans le droit de la famille et des mineurs, appelée à décider s'il faut autoriser ou non les médecins à procéder à la transfusion de sang.

Le film nous donne à réfléchir sur deux aspects distincts de la discipline des droits des mineurs à être entendu, que l'on retrouve dans l'art. 12 de la Convention des Nations Unies relative aux droits de l'enfant (CDE).

1) **C'est en étant « entendu » que le mineur exerce sa liberté d'expression**. Dans le film, Fiona rencontre Adam parce qu'elle souhaite le « connaître » et non pas simplement « l'entendre » au sens de la méthode d'interrogation ou d'une audition de témoin. Elle ne se limite pas, durant leur rencontre, à examiner en profondeur les raisons de la décision de refuser la transfusion, mais discute avec lui de différents sujets, tels que la musique et la poésie.

2) **Qui plus est, l'audience ne lie pas le juge à la volonté du mineur**. En fait, dans le film, Fiona décide d'agir contre la volonté d'Adam. Contrairement à l'adulte - qui a le droit de décider de sa propre vie, même si cette décision entraîne la mort (par exemple, le refus d'une transfusion sanguine pour des raisons religieuses) - le mineur ne détient pas ce droit de manière absolue : l'art. 12 de la Convention des Nations Unies relative aux droits de l'enfant (CDE) stipule que quiconque décide doit prendre en considération l'opinion du mineur ainsi que son développement eu égard à son âge et à son degré de maturité, sans que cela ne soit contraignant pour le ou la juge. En effet, si le ou la juge ou la personne appelée à prendre une décision à l'égard d'un mineur estime que la volonté exprimée lors de l'audition n'est pas conforme à l'intérêt du mineur, non seulement il / elle en a le droit, mais il / elle doit décider dans le sens contraire.

Q5.2

6 points possible (graded)

1) Qu'entend-on par « châtiments corporels infligés à un enfant » ?

- ○ Uniquement les châtiments corporels destinés à causer de la douleur à l'enfant.
- ○ Les châtiments corporels exclusivement destinés à causer de la douleur ou de l'inconfort à l'enfant.
- ○ Des actes physiques ou non physiques, à l'exception d'actes posés pour éduquer les enfants.
- ○ des actes non physiques, tels que les menaces, visant à humilier l'enfant.

2) Parmi les énoncés suivants, lequel est faux ?

- ○ La différenciation injustifiée selon l'âge est interdite
- ○ Les mineurs ont le droit, en tant que tels, d'être traités différemment en fonction de leur âge.
- ○ Tous les traitements différenciés selon l'âge sont interdits
- ○ Le traitement des enfants doit s'inspirer du principe de l'intérêt supérieur de l'enfant

3) Parmi les énoncés suivants sur le droit d'un enfant à être entendu, lequel est vrai ?

- ○ L'audition peut se dérouler comme l'audition d'un témoin, mais pas comme un interrogatoire.
- ○ Il ne doit être garanti que dans les procédures judiciaires et administratives qui le concernent
- ○ Il peut être exclu lorsque l'opinion de l'enfant est superflue.
- ○ Il ne doit être garanti que dans les procédures judiciaires et non dans les procédures administratives qui le ou la concernent.

Commentaire : l'enfant a le droit d'être entendu dans toute procédure judiciaire ou administrative l'intéressant, soit directement, soit par l'intermédiaire d'un représentant ou d'une organisation approprié (Article 12 de la Convention internationale relative aux droits de l'enfant - CDE). L'audition ne peut se dérouler comme une interrogation ni comme l'audition d'un témoin. (Voir la video de la contribution du Prof. Long)

4) Dans le cas où l'enfant est entendu, son avis est-il contraignant pour ceux qui décident ?

- ○ Non, mais le décideur doit en tenir compte.
- ○ Oui.
- ○ Non, le décideur peut ne pas en tenir compte.
- ○ Oui si l'enfant a un degré élevé de maturité.

5) Lequel des instruments suivants est un instrument spécifique développé au sein du Conseil de l'Europe sur la violence domestique ?

- ○ Convention d'Istanbul
- ○ Convention de Lanzarote
- ○ Convention internationale relative aux droits de l'enfant (CDE)
- ○ Convention sur les relations personnelles relatives aux enfants

Glossaire juridique sur la participation des enfants traumatisés aux procédures civiles et pénales

VIEW UNIT IN STUDIO

Bookmark this page

Victimisation primaire = maltraitance ou violence, qui cause des souffrances et des blessures physiques et/ou psychologiques.

Victimisation secondaire = souffrances supplémentaires causées par le stress de la procédure elle-même, par le souvenir de la maltraitance subie et par le contact possible avec l'auteur du comportement, avec le juge et avec les avocats.

Procédure pénale = procédure juridictionnelle par laquelle l'auteur du comportement contre le mineur est puni, si son comportement est un crime.

Procédure civile = procédure juridictionnelle par laquelle un juge évalue le caractère adéquat de l'environnement familial de l'enfant et prend les mesures nécessaires.

Audition du mineur = partie de la procédure civile/pénale au cours de laquelle le mineur fait des déclarations sur les faits ayant une pertinence pour la décision du juge.

Consultation du mineur = partie de la procédure (notamment civile) au cours de laquelle le mineur exprime son opinion, avant que le juge ne prenne la décision.

Consentement du mineur = garantie supplémentaire qui consiste en l'obligation pour le juge d'obtenir l'avis favorable du mineur afin de prendre une décision spécifique (par exemple, garde ou adoption).

Représentant = lorsque les parents sont absents, indisponibles ou en conflit d'intérêts, le représentant est une personne qui identifie l'intérêt de l'enfant et le défend tout au long de la procédure.

Avocat = personne qualifiée désignée pour tenter d'obtenir une décision du juge dans la mesure du possible en fonction de l'intérêt de l'enfant.

Professionnel social ou professionnel de la santé = expert en psychologie, psychiatrie ou sociologie, qui assiste l'enfant victime de traumatismes lors des procédures civiles et pénales et aide le juge à évaluer ses conditions psychophysiques et une éventuelle protection nécessaire.

Mesures conservatoires = mesures provisoires, adoptées par le juge, pour protéger le bien-être psychophysique du mineur pendant la procédure.

Transcript

Le procureur de la jeunesse a pour mission d'enclencher l'intervention du

tribunal des mineurs pour la protection des mineurs.

Sur base de cette compétence générique,

lorsqu'un

délit concernant les parents ou d'autres membres de la famille d'un mineur est commis,

deux problèmes apparaissent immédiatement : quid de la coordination avec les procureurs ordinaires

(en charge de de la procédure pénale), afin d'éviter toute ingérence

susceptible de nuire aux enquêtes pénales ?

Comment recueillir des informations

sur le préjudice subi par le mineur

et les

ressources personnelles et familiales, éventuellement d'autres membres de la famille ?

si la procédure de protection du mineur a ses propres temps, il en est de même de la procédure pénale

dont la durée n'est pas toujours contrôlable.

Ce que nous essayons de faire, c'est de demander

à la police de signaler l'éventuelle infraction, simultanément au procureur ordinaire,

en charge de la procédure

pénale contre l'auteur de l'infraction,

et au procureur des mineurs,

en charge de protéger la victime de l'infraction, afin de garantir

une juste coordination rapide et immédiate entre ces autorités,

soit dès le tout début de l'enquête.

Cette façon d'agir,

également soutenue par des accords entre les différents parquets, nous a permis de définir

qui fait quoi, quand et comment, tout en préservant le bon déroulement de la

procédure pénale, mais également les mesures de protection du mineur.

Il arrive parfois, principalement lorsqu'un enfant est admis à l'hôpital

et que les parents ne s'y opposent pas, que l'acte de protection soit retardée et,

donc, que l'intervention du tribunal pour enfants soit également retardée,

la protection de l'enfant étant déjà garantie par

l'hospitalisation ; dans ce cas, le procureur général ordinaire, en charge des

poursuites pénales contre l'auteur, peut enquêter en secret

et de manière efficace.

Si une décision

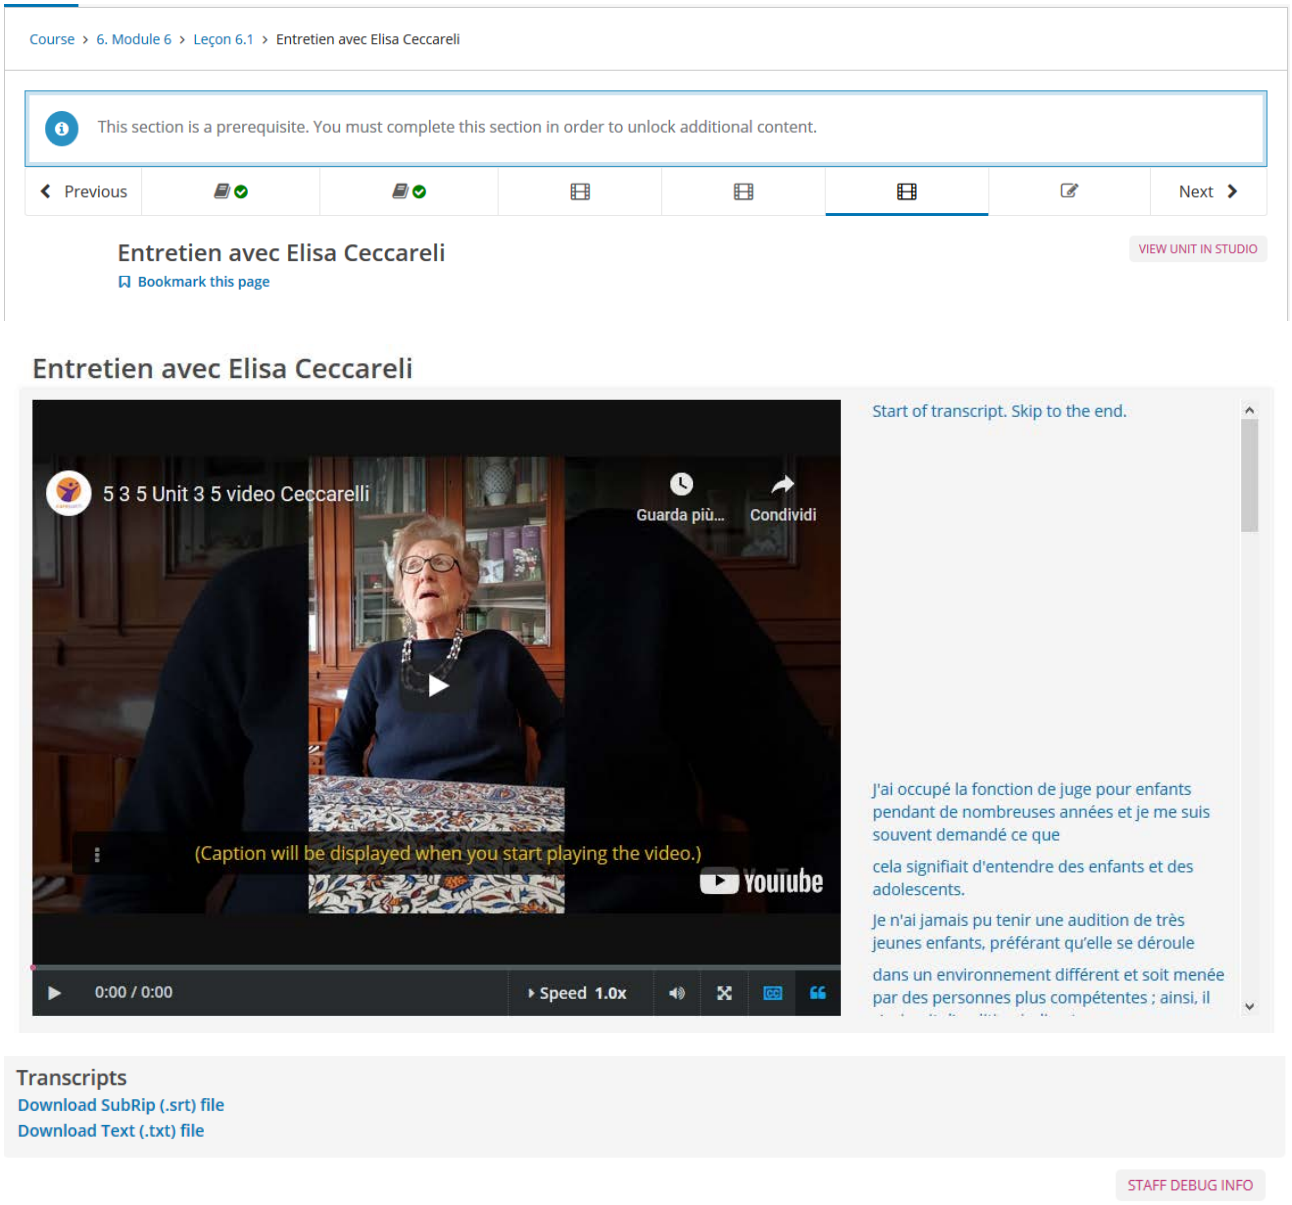
sur la protection d'un mineur ne peut être différée,

il est possible qu'un collègue du procureur, en charge de la procédure pénale, rende une ordonnance de protection administrative

par l'intermédiaire des autorités de police, conformément à l'article 403 du code civil,

afin de protéger le mineur,

en attendant que, par notre recours, le tribunal pour enfants ratifie cette mesure de protection temporaire.



Transcript

J'ai occupé la fonction de juge pour enfants pendant de nombreuses années et je me suis souvent demandé ce que

cela signifiait d'entendre des enfants et des adolescents.

Je n'ai jamais pu tenir une audition de très jeunes enfants, préférant qu'elle se déroule

dans un environnement différent et soit menée par des personnes plus compétentes ; ainsi, il s'agissait d'audition indirecte.

Au lieu de cela, j'ai entendu beaucoup d'enfants de sept, huit, dix, onze ans.

Il s'agissait principalement

d'enfants vivant dans des milieux familiaux extrêmement conflictuels, dont les parents

n’avaient pas choisi de se séparer, mais avaient été séparés et étaient, en fait, toujours été unis par des conflits

qui avaient de lourdes répercussions sur leurs enfants.

Ce que j'ai toujours essayé de communiquer aux enfants,

c'est d'abord qu'il y avait une personne

qui les écoutait, une personne

qui avait une tâche précise : décider de ce qui serait le mieux pour eux ;

and that this decision

cette décision pouvait différer de ce que les enfants

eux-mêmes voulaient, de ce qu'ils avaient exprimé comme souhait.

La décision dépend du tribunal,

elle dépend du juge. C’est le juge qui doit décider ;

donc je prends en compte tout ce que vous me dites,

je vais essayer de faire ce

qui est bon pour vous et,

pourtant, la décision ne coïncidera pas toujours

avec votre désir. C'est quelque chose qui peut arriver au cours d’une vie,

il faut s'y habituer.

J'ai toujours essayé de préserver les aspects positifs de la relation des enfants avec leurs parents.

En général, les pères sont

les plus agressifs dans les relations avec les enfants

et parfois ils forcent les enfants à penser que ces choses

sont utiles dans leur relation conflictuelle avec l'ancien partenaire.

J'ai essayé de

dire : regarde le père, il ne t’en veut pas et tu as raison de l’aimer ;

mais nous savons qu'il a des problèmes, qu'il n'accepte pas la situation actuelle. 32 00:03:12,860 --> 00:03:18,140 En somme, nous devons aussi être capables de préserver la figure du père.

Alors, comment dire ?, si le juge ne doit jamais s’approprier les attitudes conflictuelles de l'enfant,

il doit donner

à l'enfant

la possibilité de dire non,

« je ne peux plus rester avec ce père,

car il ne me comprend pas ».

Je me souviens du cas d'une petite fille de dix ans qui avait deux parents ;

son père avait une attitude extrêmement pathologique et la décision fut :

d'accord, attendons que le père change, s'il peut changer ;

et s'il ne réussit pas à changer, ce ne sera certainement pas l'enfant qui devra supporter tout ce poids.

VIEW UNIT IN STUDIO

Q6.1

7 points possible (graded)

1) La victimisation secondaire est causée par :

- ○ le stress induit par la participation d'un mineur à la procédure ;
- ○ les cas de maltraitance qui ont rendu nécessaire l'intervention de l'autorité judiciaire ;
- ○ le stress induit par le placement dans une nouvelle famille ;
- ○ la répétition de la maltraitance initiale.

2) Le principe de l'intérêt supérieur de l'enfant :

- ○ ne s'applique qu'aux procédures pénales ;
- ○ ne s'applique qu'aux procédures civiles ;
- ○ signifie que le juge doit toujours prendre en considération, au-dessus de tout autre intérêt, le bien-être psychophysique de l'enfant ;
- ○ oblige les Etats à éviter que le mineur ne participe à la procédure menée à la suite des maltraitances subies

3) L'audition de l'enfant comme témoin :

- ○ doit toujours être exécutée par le juge ;
- ○ doit, de préférence, être effectuée dans la dernière partie de la procédure ;
- ○ doit, de préférence, être répété au moins deux fois, pour vérifier la fiabilité de l'enfant.
- ○ doit, de préférence, effectuée au début de la procédure ;

4) L'opinion exprimée par le mineur au cours de la procédure :

- ○ n'est pas exécutoire, mais le juge doit en tenir compte pour prendre sa décision ;
- ○ est toujours obligatoire pour le juge ;
- ○ est obligatoire pour le juge, mais seulement si le mineur est âgé d'au moins 14 ans ;
- ○ est obligatoire pour le juge, mais seulement si le mineur a une capacité de compréhension suffisante.

5) Les procédures pénales et civiles consécutives à des sévices infligés à un enfant :

- ○ sont distinctes, mais la procédure civile ne peut commencer qu'après la procédure pénale ;
- ○ abordent des questions différentes et poursuivent des objectifs différents ;
- ○ sont distinctes, mais la procédure civile ne peut commencer que si les parents ont été condamnés au pénal ;
- ○ poursuivent le même but et le même objet.

6) Quand le juge ordonne-t-il une mesure conservatoire ?

- ○ Au cours de la procédure, pour protéger le bien-être psychophysique de l'enfant.
- ○ A la fin de la procédure.
- ○ Avant le début de la procédure.
- ○ En cours de procédure, pour garantir que la procédure ait une durée raisonnable.

7) Des procédures extrajudiciaires :

- ○ ne sont appliquées que lorsque le cas de maltraitance est grave ;
- ○ doivent toujours être appliquées ;
- ○ sont appliquées lorsque la relation entre l'auteur de la maltraitance et le mineur semble pouvoir être rétablie ;
- ○ ne sont appliquées que lorsque les cas de maltraitance sont d'une gravité mineure.

Social services = range of services, provided by public or private bodies, which respond to collective and personal needs. While the term "services" means standardized services, universally provided to people as members of a category, "social services" respond to "specific needs" of the beneficiaries.

Social Services for children and families = series of measures and activities that meet the general or individual needs of a child and / or his family. These types of services are aimed at satisfying the different needs of children and families, such as specialized and intensive services .

Child-friendly social services = social services that respect, protect and realize the rights of every child, including the right of access to benefits, participation and protection and the principle of the best interests of the child. (Recommendation of the Council of Europe, November 16, 2011, No. 12, on the rights of children and social services for children and their families)

Child-friendly justice = judicial systems that guarantee the respect and effective implementation of all children's rights at the highest possible level, taking into account the degree of maturity and understanding of the child. It is an accessible justice, adapted to the age, rapid, diligent, adapted to the needs of the child and centered on them, in respect of the rights of the child, including the right to due process, participation and understanding of the proceedings, respect for private and family life, integrity and dignity. (See the Guidelines of the Committee of Ministers of the Council of Europe for child-friendly justice, adopted by the Committee of Ministers of the Council of Europe on 17 November 2010)

Early Childhood Education and Care (ECEC) = service offered to children from birth to primary education subject to a national regulatory framework and to compliance with a set of minimum standards and / or procedures for accreditation. The service includes private, public and volunteering services. European countries present different solutions to guarantee the education and care of children below the age of compulsory education. However, ECEC is increasingly becoming an integral part of education systems in Europe.

(See https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=COM:2011:0066:FIN:IT:PDF)

European Higher Education Area (European Higher Education Area - EHEA) = project that aims to achieve a process of convergence and strengthening of higher education or university studies in Europe. This process is in line with the strategies that the European Commission together with the Member States of the Union has launched in recent years to build a true Europe of knowledge and has the main purpose of promoting the mobility and employment of students, improving the quality and make education systems more competitive, attracting students (and teachers) from Europe and other parts of the world. The means to achieve this goal are the support for greater comparability and compatibility between the different systems and the different institutions of Higher Education in Europe, and the raising of their quality.(See https://ec.europa.eu/education/education-in-the-eu/european-education-area_en)

Child-friendly health care = health care policies and practices focused on children's evolving rights, needs, characteristics, resources and capacities, taking into account their opinion. (See https://rm.coe.int/168046ccef)

Child-friendly health care approach = integrated conceptual and operational framework that fully respects the rights and needs of children in the health sector.(See https://rm.coe.int/168046ccef)

STAFF DEBUG INFO

Les compétences attribuées par les différents cadres législatifs aux médiateurs / médiatrices pour enfants concernent diverses actions : écoute et participation, promotion et sensibilisation, collaboration, élaboration de propositions, d'avis et de recommandations.

L'activité d'un médiateur / d'une médiatrice pour enfants joue aujourd'hui un rôle de premier plan dans les politiques visant à assurer la connaissance et le respect des droits des enfants, et permet de donner une voix aux personnes (enfants) qui risquent souvent d'être invisibles :

https://www.youtube.com/watch?v=jWiE2jHX5yE.

En résumé, le médiateur / la médiatrice pour enfants :

- surveille l'application de la Convention relative aux droits de l'enfant et de l'adolescent au niveau national et contribue à faire connaître et à promouvoir la culture des droits des enfants et des adolescents ;
- informe les autorités compétentes de toute violation de ces droits ;
- vérifie que les personnes mineures ont pleinement accès à leurs droits ;
- émet des avis sur les propositions réglementaires concernant les mineurs et sur la protection de leurs droits et de leur développement.

Plus précisément, on peut classer les fonctions et pouvoirs des médiateurs / des médiatrices pour enfants dans deux principales catégories.

1) La première, de type générale, concerne les interventions visant à promouvoir les droits des enfants. Par exemple, le médiateur / la médiatrice pour enfants promeut la connaissance et l'affirmation de l'individu et des droits sociaux et politiques de l'enfance et de l'adolescence, en faisant avancer toute initiative visant à les réaliser concrètement ; surveille l'application, au niveau national, de la Convention relative aux droits de l'enfant ; exprime, à la demande des organes locaux compétents, des avis, des propositions et des observations sur les projets de lois, de règlements et d'actes administratifs et leur l'impact éventuel sur les enfants et les jeunes.

2) Le deuxième domaine d'intervention est plus spécifique et englobe les réponses à apporter aux situations particulières d'enfants en difficulté. En effet, le médiateur / la médiatrice pour enfants reçoit les signalements, même lorsqu'ils proviennent de personnes mineures (par exemple, voir ici), de familles, d'écoles, d'associations et d'institutions, à propos de cas de violation des droits ; il.elle signale aux administrations publiques compétentes tous les cas de violation des droits, à la suite d'actes ou de faits retardés, omis ou exécutés de façon irrégulière, dont il.elle a eu connaissance de la part de sujets publics et privés, ou de personnes individuelles, y compris des enfants.

Quant à son modus operandi, le médiateur / la médiatrice pour enfants ne dispose pas de pouvoirs directs d'enquête, de prescription ou de sanction. Son action s'exprime essentiellement par la voie d'une persuasion morale, c'est-à-dire une force de persuasion exercée à l'égard des sujets publics (décideurs politiques, administrations locales, services territoriaux d'aide sociale, autorités judiciaires) et des entités privées (parents en conflit, organismes du tiers secteur) sur base de son statut d'autorité garante. Ainsi, par exemple, le médiateur / la médiatrice pour enfants peut recommander aux administrations compétentes d'adopter des interventions d'aide et de soutien, ainsi que, en cas d'omission d'agir, des mesures spécifiques ; susciter, au sein des administrations compétentes, la modification ou la révision de mesures jugées préjudiciables aux enfants et aux jeunes ; inviter les administrations compétentes à considérer comme prioritaire l'intérêt supérieur de l'enfant.

L'activité du médiateur / de la médiatrice pour enfants peut s'exercer tant au niveau national que local.

En Europe, a été créé le Réseau européen des défenseurs des enfants (European Network of Ombudsman for Children - site web : https://enoc.eu/?page_id=174) qui se réunit au moins une fois par an pour discuter de questions d'intérêt commun au niveau européen et pour identifier des lignes d'intervention communes.

Les autorités nationales de contrôle collaborent en permanence avec le Réseau international des défenseurs des enfants, avec les organisations et institutions internationales de protection et de promotion des droits de l'enfant et avec une série d'organisations sans but lucratif.

Grâce aux échanges fréquents avec les différents acteurs concernés, les autorités peuvent élaborer des propositions en accord avec les rythmes et les besoins des jeunes.

Un des domaines d'intervention des médiateurs englobe les actes de violence et de maltraitance à l'égard des mineurs (maltraitance psychologique et physique, violence, abus sexuels, négligence, violence assistée). A ce propos, vous pouvez consulter le document de position de l'ENOC sur la violence à l'encontre des enfants :

http://enoc.eu/wp-content/uploads/2014/12/ENOC-position-statement-on-Violence-against-children-2015-FV.pdf

l'expérience d'un médiateur bénévole pour un enfant non accompagné

De nombreux mineurs sont contraints de quitter leur pays et de vivre leur enfance et leur adolescence loin de chez eux, de leurs parents et sans leur famille pour veiller à la protection de leurs intérêts. La plupart d'entre eux ont vécu des expériences traumatisantes avant et pendant leur trajectoire migratoire ou au moment de devoir quitter leur famille.

Dans le droit européen, la Directive du Conseil européen et du Parlement européen, n° 2011/95/EU, définit le mineur non accompagné (MENA) de la manière suivante : « *un mineur qui entre sur le territoire des États membres sans être accompagné d'un adulte qui est responsable de lui, de par le droit ou la pratique en vigueur dans l'État membre concerné, et tant qu'il n'est pas effectivement pris en charge par une telle personne; cette expression couvre aussi le mineur qui a été laissé seul après être entré sur le territoire des États membre*. »

Dans de nombreux systèmes judiciaires européens, le tuteur bénévole est une figure qui gagne en importance. Il s'agit d'un citoyen ordinaire, très compétent, qui est invité à devenir le représentant légal d'un mineur arrivé seuls sur le territoire du pays et à veiller à la protection de ses intérêts, à l'écoute de ses besoins et à développer son potentiel. En d'autres termes, l'institution d'un tuteur bénévole constitue un exemple de citoyenneté active et donc un instrument de politique sociale pour les mineurs.

Carlo Infuso, juriste à Turin, nous parle de son expérience en tant que tuteur bénévole :

« J'ai rencontré V, le mineur dont je suis tuteur, par hasard : il m'a été présenté par la communauté qui l'accueillait. J'ai rencontré ce garçon et je dois avouer qu'après les présentations, nous ne savions pas quoi nous dire. Je l'ai donc embarqué sur ma moto et nous sommes partis faire un tour, nous avons un peu discuté et petit à petit, nous avons noué une relation, qui a débouché aujourd'hui sur une relation agréable, conviviale, marquée par le respect mutuel.

V. démarre enfin sa vie, ici en Italie. Il jouit d'une protection internationale et à son dix-huitième anniversaire, il recevra un permis de séjour dont il pourra bénéficier pendant deux ans. Il pourra alors demander l'autorisation de terminer ses études.

Il a enfin compris combien il est important qu'il apprenne la langue italienne – il ne s'en rendait pas bien compte avant – pour lui, pour approfondir ses relations avec les autres et avec moi, mes amis et les personnes qu'il rencontre grâce à moi. Il comprend aussi qu'il est important qu'il étudie s'il veut travailler comme serveur. Il pensait que ce métier se limitait à servir de la nourriture à table alors que maintenant, il apprend à faire le cappuccino, avec un dessin dans la mousse, à servir en utilisant deux couverts, en se plaçant à gauche et à droite, à disposer les verres à eau, les verres à vin, une nappe... Petit à petit, il découvre le plaisir d'apprendre, apprendre pour le plaisir d'apprendre.

Il est très drôle. Il est jeune, c'est un ado fou de musique. Il porte une boucle d'oreille, il a une coupe de cheveux tendance ... comme tous les jeunes.

En tant que tuteur, ce qui m'étonne, c'est qu'il ne se mêle pas de mon rôle. Par exemple, quand il a fallu choisir le type et le lieu de ses études, V. m'a dit : « Je n'ai pas de parents, tu es mon père italien. Tu décides à ma place parce que je sais que tu prendras la bonne décision ».

Après plusieurs moi, je suis heureux que V puisse dire : « Je suis content qu'on ait choisi ces études ensemble parce que j'adore cette école ».

Le fait que j'ai pu, grâce à des petites choses du quotidien, susciter chez lui de la confiance envers les autres, lui a permis de gagner en estime de soi. Aujourd'hui, V. prend plus facilement des décisions qu'il n'aurait pas pu prendre avant. Il les prend en plus grande conscience, avec plus de légèreté et s'impliquant davantage qu'auparavant.

La relation (tuteur/ mineur) grandit et peut évoluer en bien ou en mal. Dans notre cas, elle a bien évolué et elle nous a permis de construire quelque chose.

Je me réjouis de pouvoir dire que V. vient passer le week-end chez moi ; ce soir, il va probablement préparer quelque chose à manger et on est vraiment très heureux.

Q6.2

5 points possible (graded)

1) Dans des situations de violence domestique ou en cas de conflits avec les parents, les enfants et les adolescents :

- ○ doivent avoir accès à des avis et des conseils médicaux confidentiels sans le consentement de leurs parents s'ils ont plus de 14 ans ;
- ○ doivent avoir accès à des avis et des conseils médicaux confidentiels avec le consentement de leurs parents, sans considération de leur âge ;
- ○ doivent avoir accès à des avis et des conseils médicaux confidentiels avec le consentement de leurs parents, s'ils ont un degré de maturité élevé ;
- ○ doivent avoir accès à des avis et conseils médicaux confidentiels sans le consentement des parents, sans considération de leur âge ;

2) La Déclaration européenne de Bucarest sur les enfants est un instrument dont le propos est d'encourager les institutions européennes et les États membres à mettre en place des structures et des mécanismes formels de promotion du droit des enfants et des jeunes :

- ○ à participer aux décisions de l'Union européenne ;
- ○ à être entendus dans toute procédure judiciaire ou administrative les concernant ;
- ○ à recevoir ou communiquer des informations ou des idées sans ingérence des autorités publiques et sans restrictions aux frontières ;
- ○ à bénéficier d'une protection particulière et donc d'un traitement différencié en fonction de l'âge ;

3) Lorsque, selon la loi, un mineur n'a pas la capacité de consentir à une intervention de santé, celle-ci :

- ○ ne peut être effectuée sans l'autorisation de son représentant, d'une autorité, d'une personne ou instance désignée par la loi ;
- ○ ne peut être effectuée ;
- ○ peut être effectuée, même sans l'autorisation de son représentant, de son autorité, de la personne ou instance désignée par la loi ;
- ○ peut être exécutée, même sans l'autorisation de son représentant, de son autorité, de la personne ou instance désignée par la loi, s'il est possible de reconstituer la volonté de l'enfant.

4) La vidéo du Conseil de l'Europe "Parle à quelqu'un de confiance" traite, par des méthodes adaptées aux enfants, du thème :

- ○ du harcèlement ;
- ○ des abus sexuels ;
- ○ des témoins de violence ;
- ○ de châtiments corporels ;

5) Le médiateur / la médiatrice des enfants exerce :

- ○ des pouvoirs d'investigation ;
- ○ des pouvoirs de limitation et de sanction ;
- ○ des pouvoirs de persuasion morale ;
- ○ des pouvoirs réglementaires.

Vous arrivez au bout de ces deux semaines de formation,

pendant lesquelles nous avons défini

et décrit les mesures juridiques et sociales visant

à protéger les mineurs victimes de traumatismes.

Dans cette courte vidéo, je voudrais résumer notre parcours

de formation en revenant sur les grands thèmes abordés.

Premièrement, rappelons-nous que le chemin vers la consécration des droits de l'enfant

a été semé d'embuches.

J’en prends pour preuve le dossier de Mary Ellen Wilson,

qui a connu une fin heureuse uniquement grâce à la ténacité d’une missionnaire méthodiste

et à l’intuition d’un juriste :

pour séparer un enfant

d’un milieu familial néfaste, il a fallu appliquer la loi sur

la cruauté envers les animaux.

Voilà qui est, pour le moins, étonnant.

Toutefois, près d’un siècle plus tard,

le contexte de l’arrêt de la Cour européenne des droits humains dans

l’affaire Z contre le Royaume-Uni

est encore plus surprenant. A la fin des années 1900, le concept de l’obligation d’un état

de corriger une situation familiale problématique pour

protéger le bien-être

d’un enfant n’était pas encore profondément ancrée

dans le système juridique.

En conséquence, la Cour européenne a tiré cette obligation

de la Convention européenne sur les droits humains en la reconnaissant comme un corollaire de

l’interdiction des traitements dégradants et inhumains établie dans son article 3.

N’oublions pas que

le droit international et supranational a permis de combler 29 00:02:02,480 --> 00:02:05,400 les vides juridiques présents

dans chaque Etat.

Nous devons également nous souvenir

de la Convention de New York et des autres nombreuses lois adoptées

par le Conseil de l’Europe et plus récemment,

par l’Union européenne.

C’est uniquement grâce à ces lois que s’est répandue la conscience du mineur

en tant que sujet autonome de droits, titulaire d’un statut juridique,

indépendant de ses parents ;

ainsi,

nous pouvons affirmer aujourd’hui que cette idée s’inscrit enfin dans le patrimoine commun de chaque système juridique.

De la même manière,

il est établi que les autorités de l'État ont l'obligation de prévenir et de sanctionner

les abus envers les enfants et d'aider,

de manière efficace, les victimes d'abus à retrouver

complètement leur bien-être psychophysique.

En outre, soulignons que

le mineur est une personne présentant

des spécificités particulières :

sa personnalité est en devenir et,

en fonction de son âge, il ou elle a certainement besoin d'une attention spécifique dont les adultes peuvent généralement se passer ;

cette attention particulière est d'autant plus

vitale lorsque l'enfant a été victime d'abus et de violence,

y compris parfois dans son entourage familial.

En d'autres termes, dès qu'il s'agit de mineurs, on pourrait dire que

les droits acquis par chaque individu ont exigé des avancées indépendantes,

qui tenaient compte de leur situation

particulière.

Il est avéré que l'enfant

possède le droit d'être entendu et d'exprimer son opinion sur les questions qui le concernent.

Toutefois, s'il en va de son intérêt supérieur,

la décision peut

s'écarter de sa volonté exprimée ;

elle peut même en être aux antipodes.

Quatrièmement, le processus

aidant l'enfant traumatisé

à retrouver son bien-être

peut s'avérer aussi douloureux

que la violence ou l'abus subi.

Des procédures civiles ou pénales

s'imposent souvent :

sanctionner l'auteur du délit,

si le comportement incriminé en est un ;
éviter que l'abus ne se reproduise ;
prévoir des indemnités pour les dommages causés ;
et, si nécessaire, rétablir un contexte familial adéquat.
Il ne faut pas oublier le revers de la médaille :
le mineur doit
faire de nombreux sacrifices pour surmonter toutes
les étapes des procédures.
Par exemple, il sera souvent indispensable pour l'enfant de participer
à ces procédures ;
sa participation n'est pas uniquement une question de droit,
mais également un outil pour de découvrir la vérité :
en exprimant son opinion et son expérience, la victime peut fournir
des éléments importants qui permettront au juge de trancher.
Néanmoins, comme nous l'avons vu précédemment,
le risque de victimisation secondaire persiste,
car,
lors des procédures,
le mineur devra probablement revivre les faits et les traumatismes subis ;
il ou elle souffrira peut-être
de l'exposition publique de l'affaire ;
selon toute vraisemblance,
pendant le procès, il ou elle se retrouvera face à l'auteur de l'abus.
Tous ces risques sont importants et doivent être pris en compte.
Ensuite, s'il s'avère nécessaire d'ordonner une procédure d'adoption
ou même de garde du mineur, n'oublions jamais combien
il peut être difficile de nouer des liens avec une nouvelle famille.
Assez paradoxalement, pour surmonter le premier traumatisme
causé par l'abus,
l'enfant risque, dans son parcours,
de connaître de nombreux autres petits traumatismes.
Reste à aborder l'élément le plus important.

La route vers de nouveaux droits et de nouvelles protections
est souvent long et difficile ;
comme nous l'avons vu, ce constat s'applique également aux mineurs.
Cependant, maintenant que
ces garanties existent,
nous devons poursuivre le chemin
et comprendre que la loi seule ne suffit pas ;
les conventions internationales et supranationales, les directives européennes
et les droits nationaux ne suffisent pas.
Il s'agit en fin d'un point de départ,
d'une base sur
laquelle tout le reste doit reposer.
Le plus important – dans ce domaine
- ci plus que dans d'autres – est d'appliquer les garanties prévues par la loi par
le biais de politiques sociales efficaces.
Les administrations centrales et locales doivent
impérativement promouvoir le respect
des droits des mineurs par l'adoption de mesures concrètes.
Parallèlement,
elles doivent financer et mettre en place des services spécifiques destinés aux enfants et aux adolescents,
comme des guichets d'information, des groupes de soutien,
des instances de contrôle.
Signalons par ailleurs le rôle essentiel joué par le bénévolat et
par le milieu associatif, dans la défense et la protection
des droits des mineurs ;
ces associations sont vitales pour la mise
en œuvre de politiques sociales efficaces.
Les administrations publiques doivent être suffisamment
sensibilisées et procéder à des investissement adaptés afin de limiter
les risques de victimisation secondaire :
par exemple, elles doivent absolument prévoir
des salles spéciales pour les auditions,

sensibiliser les juges et les avocats,

ensure the best conditions for the hearing of the minor,

garantir les meilleures conditions pour les audiences du mineur et assurer un soutien psychologique permanent pendant les procédures.

Evidemment, la contribution des premiers utilisateurs de notre formation, à savoir les professionnels qui travaillent avec les mineurs, est primordiale.

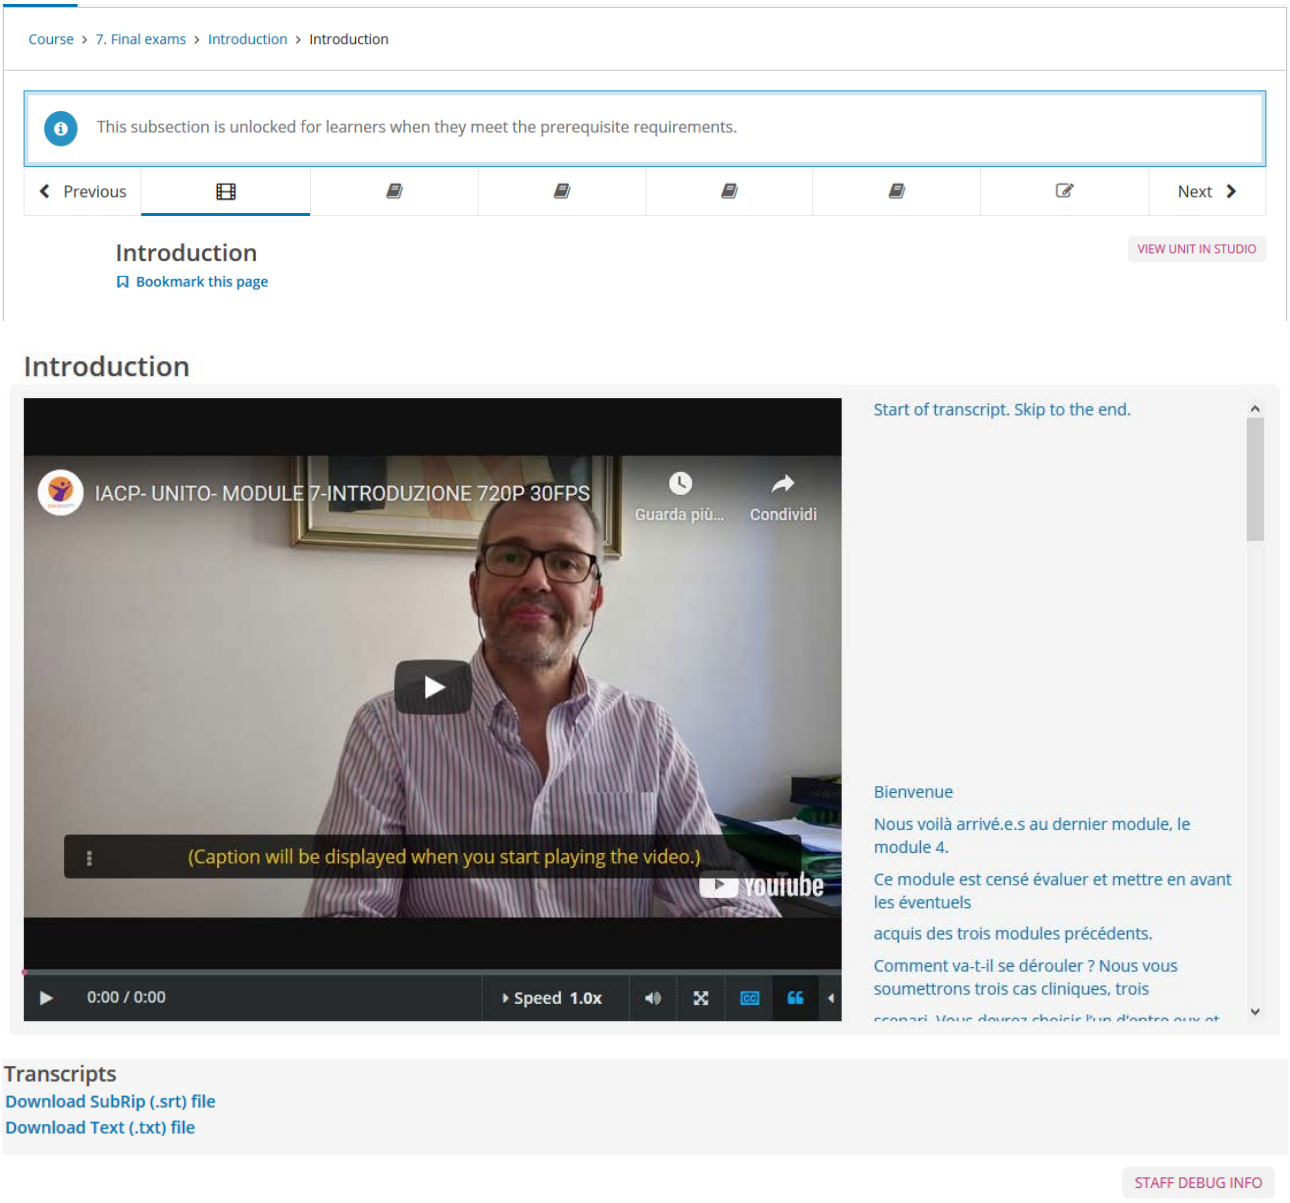
Vous êtes les tuteurs des mineurs en dehors des procédures, qui les aidez à surmonter le traumatisme causé par la victimisation primaire ;

vous êtes les tuteurs des mineurs pendant les procédures puisque vous pouvez rendre supportable un fait, qu'on ne pourra jamais banaliser ; et

vous restez les tuteurs des mineurs après les procédures car vous devrez veiller à la poursuite du difficile chemin vers la sérénité retrouvée lorsqu'il faudra aider le mineur à passer à la vitesse supérieure et atteindre enfin ses objectifs.

Enfin, l'enfant ou l'adolescent victime d'abus devra affronter de nombreuses difficultés, mais comme nous avons tenté de le montrer, nombreux sont les dispositifs qui les aideront à affronter et à surmonter ces défis.

Je vous souhaite donc bonne chance dans vos carrières respectives.



Transcript

Bienvenue

Nous voilà arrivé.e.s au dernier module, le module 4.

Ce module est censé évaluer et mettre en avant les éventuels

acquis des trois modules précédents.

Comment va-t-il se dérouler ? Nous vous soumettrons trois cas cliniques, trois

scenari. Vous devrez choisir l'un d'entre eux et tenter ensuite

de répondre, en mobilisant et en intégrant toutes les compétences acquises dans le module 1 (la théorie),

dans le module 2 (la recherche), dans le module 3 (la partie législative), aux questions suivantes

quels sont les aspects relevant d'un accompagnement sensible aux traumatismes

et comment appliquer ses principes aux trois scenarii?

Comment devrez-vous rédiger ce bref rapport, ce bref compte-rendu ?

Plusieurs alternatives s'offriront à vous. Vous pourrez créer un fichier Power Point,

et donc préparer une présentation ; vous pourrez réaliser une petite vidéo, donc utiliser

ce format ou créer un document Word ou un fichier PDF, ou vous pourrez choisir d'autres

modalités qui vous viendront à l'esprit.

La particularité, la spécificité de ce dernier module

réside dans le fait qu'il s'agira d'une révision par les pairs

votre projet sera évalué par deux participants à la formation parallèlement.

L'évaluation sera réalisée par les pair.e.s. Toutefois, la dernière évaluation relèvera toujours de la responsabilité d'un.e

tuteur/tutrice ou d'une personne responsable du projet.

Il s'agit véritablement de la dernière étape que nous vous invitons à franchir pour obtenir

l'attestation de participation à ce parcours de formation en ligne.

Dès que votre dossier sera complet et que vous aurez terminé votre rapport, vidéo,

présentation Power Point, vous pourrez les envoyer et vous serez associé.e, de manière aléatoire et anonyme,

à un autre étudiant. Ensuite, vous serez, à votre tour, invité.e à évaluer un document, un rapport ou une vidéo.

Enfin, vous procèderez au dépôt final de votre travail,

un.e tuteur /tutrice réalisera une évaluation supplémentaire de celui-ci et validera, ou pas, la clôture de votre parcours de formation

Nous espérons que le parcours aura été agréable, que vous avez appris quelque chose ou

qu'il vous a permis de consolider et de valoriser un nouveau savoir sur

l'accompagnement sensible aux traumatismes. Si vous le souhaitez, à la fin de votre parcours,

vous pourrez envoyer des petites vidéos avec votre nom, votre prénom et quelques brèves

fiches qui nous permettront de certifier que vous avez bien participé à cette formation.

En mon nom, Luca Rollè, et au nom de toute l'équipe du projet Care Path, je vous remercie

encore une fois d'avoir participé et nous espérons vous revoir lors d'une

prochaine édition de la formation.

This subsection is unlocked for learners when they meet the prerequisite requirements.

VIEW UNIT IN STUDIO

During this activity you are requested to analyze the case (Choosing the Scenario you prefer) from a legal, psychological and/or scientific research point of view. You answer should contain your reflections in the light of fundamental principles of Trauma Informed Care.

1. Your can prepare your contribution in

- text (simply enter your answer in the respective area) OR
- you can upload a file containing your contributions. **Important note - the file should be in pdf format up to 5mb.**

In case you have prepared a video you can simply enter the link of your published video so it can be accessed for evaluation.

2. Each learner upon submission of his own contribution has to assess at least 1 contribution from other learners. This is a necessary step, in order to finish the activity.

Important note - In case you need to evaluate a response that is contained into a file, you need to download the file and open it in your desktop/mobile device. make sure that the file has the .pdf extension. If not, please rename your file adding the .pdf suffix at the end.

3. The final step includes the Staff evaluation of your contribution. Upon completion, the final grade will be available to you straight away.

C. F. est une jeune fille de 15 ans envoyée à un service spécialisé par l'hôpital.

Elle fréquente irrégulièrement le lycée ayant notes médiocres.

Elle a été accompagnée aux urgences en raison de l'ingestion d'une quantité excessive de psychotropes. Après l'intervention du service d'urgence, elle a été renvoyée chez elle avec l'obligation pour toute la famille de suivre un parcours d'aide et de soutien.

La jeune fille montre une attitude un peu colérique, ne veut pas assister à l'entretien ni parler de ses affaires et ne comprend pas la raison de cet envoi. Elle prétend avoir fait une “connerie” avec son amie mais elle ne va certainement pas le répéter.

Reconnue la peur imaginable avec laquelle elle a vécu la "connerie" à laquelle elle fait référence, et clarifiée les termes de l'interview, la jeune fille s'ouvre et, exprimant la fragilité de son histoire, se raconte :

Les parents sont séparés, même si pas officiellement, depuis quelques mois et la mère n’est pas à la maison. C. trouve cela positif pour elle-même, elle a une relation très difficile avec sa mère et le fait qu'elle soit loin de chez elle la rend plus calme, même si cela lui a fait perdre une personne qui l'a aidée à faire certaines choses.

Pendant longtemps, à l'école primaire et dans une partie du collège, cette mère a été colérique, elle l’a battue et insultée lorsqu'elle était confrontée à des erreurs ou à des choses que la fille devait faire différemment.

Pour la corriger, la mère la frappait, l’insultait en disant "tu es une conne", "stupide", pour arriver dans la dernière période à des disqualifications plus importantes "tu es une chienne".

Cependant, dans la dernière année de sa vie, C. a commencé "finalement" à ne plus souffrir, mais à répondre à sa mère. Parfois, elles se battaient, ce qui permettait à la jeune fille de faire face aux querelles. Le père est absent toute la journée pour le travail et C. dit qu’il est gentil, il rentre à la maison le soir et ne semblait pas intéressé par le ménage, probablement à cause de la fatigue du jour. Les choses semblent un peu froides entre les parents et il n'y a pas de moments dans la vie de famille où ils font des choses ensemble. Les dimanches sont également passés à la maison ou chez la tante (sœur du père), qui est un point de référence pour C.

Lorsqu'elle a 13 ans, elle commence à fumer à l'école et, avec une copine, elles connaissent la marijuana et la fument. Elle aime le sentiment de détente et d'amusement qu'elle ressent quand elle fume et commence bientôt à fréquenter un groupe de personnes partageant le même "intérêt".

Après quelques mois de difficultés continues à la maison, sa mère commence à être moins présente et l'après-midi, elle sort tous les jours, ce qui permet à C. d'être libre de ramener à la maison qui elle veut et de disposer de l'espace nécessaire. Au début, elle en est satisfaite et ne s'informe pas de ce changement ni des raisons. Elle considère plutôt que cela constitue un avantage pour sa vie. Puis elle découvre un jour, que sa mère va voir un autre homme parce qu’il les trouve assis dans un bar loin de chez eux dans des attitudes amoureuses.

À ce stade, dit-elle, elle trouve enfin le moyen d'obtenir tout ce qu'elle veut, alors qu'elle entre dans un jeu de requêtes avec la mère à laquelle la femme ne peut pas s’échapper : C. veut ramener son petit ami à la maison et demande à la mère de la laisser seule. Au début, la femme ne veut pas mais elle est obligée pour éviter que la fille raconte tout au père. Les demandes de C. et les concessions de la mère augmentent : C. emmène à la maison qui elle veut, fume à la maison, elle est autorisée à acheter de la bière et elle obtient de l'argent pour ce qu'elle demande. Elle paye tout cela avec la colère et les insultes de la femme, qui cède à toutes les demandes même si elle lui fait sentir tout son mépris.

Le père ignore tout cela. En parlant de ça, C. à une attitude de triomphe triste et de grande colère.

Cela dure jusqu'en septembre (environ un an), lorsque son père, ayant découvert la trahison de sa femme, la chasse. À ce stade, C. est encore plus libre et reste seule jusqu'au retour du père, elle commence à être en retard à l'école ou elle ne va pas du tout. Un jour, chez son amie, elles trouvent un médicament que la mère prend et elles décident de l'essayer ensemble. Exactement à la suite de cet épisode, le père est appelé par la mère de l'amie qui trouve les filles endormies sur le lit et dans un état confus et qui sont "malheureusement" emmenées aux urgences.

Cas 2

B. est une étudiante de 15 ans, l'aînée d'une fratrie de deux ; sa mère est entrepreneuse et son père sans-emploi ; les quatre membres de la famille vivent dans la banlieue d'une grande ville.

B. vient à la consultation en raison de douleurs graves et invalidantes, principalement au niveau de la partie inférieure de son corps (jambes et abdomen), qu'aucun problème de santé ne peut expliquer (ses parents l'ont fait examiner par plusieurs professionnels).

Les douleurs lui interdisent de mener un train de vie satisfaisant, approprié à son âge : il lui est impossible de fréquenter régulièrement l'école, d'où un risque d'échec et de redoublement ; qui plus est, il lui est extrêmement difficile de sortir avec ses amis ou de pratiquer quelqu'activité sportive que ce soit, tous ses projets de vie risquant à tout moment d'être anéantis par cette douleur soudaine et perçante.

Lors de notre première session, elle nous apparaît négligée, relativement introvertie (elle baisse sans cesse le regard et chuchote quelques mots) et voutée (elle passe toute notre première rencontre racrapotée sur sa chaise). Elle nous dit avoir décidé de demander de l'aide, car elle est consciente qu'elle doit résoudre un problème qui "la maintient cloitrée à la maison".

Elle montre une connaissance étendue, une grande curiosité et une vive intelligence, à l'opposé de son langage corporel, celui d'une jeune fille pliée en deux et apathique.

Elle explique n'avoir aucune idée de ce qui pourrait avoir déclenché les symptômes, qui sont approximativement apparus au moment de sa puberté.

Elle ajoute entretenir d'excellentes relations avec les membres de sa famille, n'avoir que très peu d'amis et se sentir mal à l'aise dans un groupe, qu'il soit composé de pair.e.s ou d'adultes. Elle adore lire et écouter de la musique, et étudie en autodidacte plusieurs langues.

Au cours de la première année de psychothérapie, pendant laquelle j'ai examiné pourquoi ses symptômes étaient invalidants et me suis efforcée de la rendre plus autonome, j'ai pu circonscrire et apaiser les douleurs : elles apparaissaient un peu avant ses menstruations et ne lui faisaient plus perdre que deux ou trois jours d'école. Malheureusement, l'origine des symptômes restait inconnue et la jeune fille a commencé à connaître de fréquentes crises de panique.

En plus des sessions individuelles de B., je rencontre régulièrement sa famille dans sa totalité, qui, tout en continuant à s'inquiéter de la souffrance de B., reconnaît les grands changements réalisés et les ressources que B. est capable d'activer pour retrouver une vie satisfaisante.

Après deux années de psychothérapie, B. parvient à gérer ses crises de panique, qui sont de plus en plus rares, et utilisent diverses stratégies pour gérer ses douleurs (formation autogène, yoga, fantasmes guidés, techniques de respiration).

Toutefois, lorsqu'elle regarde un film qui contient une scène montrant une agression sexuelle, elle ressent une angoisse soudaine et intense, qu'elle me décrira, lors de sa session suivante, comme un "blackout interne".

Nous commençons à explorer ce sentiment, dans un effort de comprendre ces "fragments de rêve", comme elle les définit dans un premier temps, qui deviennent ensuite des images floues qu'elle a du mal à définir comme des souvenirs ou des fantasmes empruntés d'un livre ou d'un film.

Alors que nous travaillons à son rythme et à sa guise, pour ne pas la forcer ni trop épuiser sur ses stratégies de défense ou ses craintes bien compréhensibles, tout en continuant à soutenir ses ressources internes, B. se rappelle petit à petit d'une personne à qui elle avait été confiée en l'absence de ses parents (et alors qu'elle avait de 3 à 7 ans) et qui l'a agressée sexuellement.

Ce souvenir enclenche un processus qui permet non seulement de signaler l'abuseur, mais également de créer pour B. un espace sécurisée (en effet l'abuseur rendrait de temps en temps visite à sa famille) et de mieux comprendre sa souffrance psychologique, qu'elle ne faisait jusque-là que gérer.

VIEW UNIT IN STUDIO

R, mineur âgé de 13 ans, est signalé au service territorial suite à un renvoi par le Tribunal.

Il fréquente l'école primaire et vit dans une maison d'accueil depuis l'âge de 9 ans.

Lors du rendez-vous, il est accompagné par l'éducatrice de la maison d'accueil. Il fait preuve d'ouverture et veut connaître les personnes qu'il rencontre lors de l'entrevue dont le but est une prise en charge.

Dans un premier temps, il est sociable, répond aux questions, interagit avec les personnes, blague et se montre sympathique.

Lorsqu'on aborde le but de l'entrevue, il exprime toute sa confusion : il ne comprend pas la raison de sa présence, il ne sait ni quoi faire ni ce qu'on attend de lui ; il demande des réponses à ses questions qui expriment son désarroi et ses craintes (d'être éloigné davantage de ses parents, de les faire souffrir, que quelqu'un décide qu'il ne pourra plus les voir, etc....).

Après une période de séparation, les parents vivent à nouveau ensemble, exactement comme à l'époque où R. a fait l'objet d'un éloignement. Le garçon se rappelle des disputes entre ses parents, ils ne s'entendaient plus vraiment, et à plusieurs reprises, la mère, qui est originaire d'un autre pays, a tenté de retourner dans sa famille d'origine.

A chaque départ de la maman, R. était envahi de tristesse, mais également de soulagement, car les disputes cessaient pour un temps. Il aime ses parents et cela lui fait toujours plaisir de passer du temps avec eux.

Il leur parle tous les jours et les voit une fois par semaine lorsqu'ils lui rendent visite au siège de la maison d'accueil.

Cela fait deux ans qu'il y vit et il s'y sent bien même s'il souhaiterait rentrer à la maison ; il ignore si c'est possible.

Il ne se rappelle pas du jour où il a intégré la maison d'accueil, mais il sait que c'est son père qui l'y a accompagné.

La maman est restée à la maison, en pleurs, et cela lui a fait énormément de peine.

Son père s'est montré plus fort, il l'a accompagné et, comme toujours, il l'a abreuvé de paroles, mais sans verser de larmes.

A son arrivé à la maison d'accueil, R., malgré sa peur, a rencontré des gens amusants et sympathiques, qui ont apaisé ses craintes et il s'est facilement lié d'amitié.

R. intègre la famille d'accueil après qu'un ami de ses parents lui ait fait des avances sexuelles et l'ait violé.

Si, dans un premier temps, il ne l'a dit à personne, un jour, la vérité est sortie.

R. (qui en ignore toujours la raison) se retrouve au Tribunal. Cet homme, un ami de ses parents, fréquentait la maison assez souvent, et lui s'y était attaché et savait qu'il comptait pour cet ami : le soir, il lui racontait des histoires et parfois, papa lui demandait de le mettre au lit.

Lorsque de vilaines choses se sont produites et que cela s'est su, le père a accompagné R. à la maison d'accueil afin de le protéger de cet homme.

R. ne sait pas très bien ce qu'il ressent, si ce n'est – dit-il – une énorme confusion.

S'il se sent bien en maison d'accueil, il est obligé d'y respecter des règles strictes et, parfois, il se met en colère et finit par causer des dégâts, aux objets, mais pas aux personnes. Ce qui l'agace tout particulièrement, c'est qu'on lui impose des règles qu'il ne comprend pas lors de ses rencontres ou discussions avec ses parents.

Du reste, à la maison d'accueil, il fait des choses intéressantes (en l'occurrence du sport) et s'entend bien avec son entourage. Il aime être entouré d'amis même si, parfois, il souhaite être seul et préfèrerait qu'on lui fiche la paix.

Il apprécie d'avoir pu nouer une relation spéciale avec une éducatrice qui s'occupe beaucoup de lui.

OPEN RESPONSE ASSESSMENT
This assignment has several steps. In the first step, you'll provide a response to the prompt. The other steps appear below the Your Response field.
IN PROGRESS
1
Your Response
Enter your response to the prompt. You can save your progress and return to complete your response at any time. After you submit your response, you cannot edit it.
The prompt for this section
Analyze the case (Choosing the Scenario you prefer) from a legal, psychological and/or scientific research point of view.
Preparing a contribution (which can take different forms such as: text, video, presentation .ppt) that contains the reflections of the participant in the light of the fundamental principles of Trauma Informed Care, about the chosen case.
Important Note. For piloting purposes please upload only pdf files.
Your response (required)
Enter your response to the prompt above.
Save your progress
THIS RESPONSE HAS NOT BEEN SAVED.

unité

Objectifs d'apprentissage

✓ Acquérir un corpus de connaissances sur les droits fondamentaux et principes établis par le cadre juridique international et européen sur les droits de l'enfant dans lequel l’approche des soins sensibles aux traumatismes (Trauma Informed Care - TIC) peut s’appliquer.

✓ Mieux comprendre la question spécifique des droits de participation des enfants.

Qu’entend-on par « enfant » ?

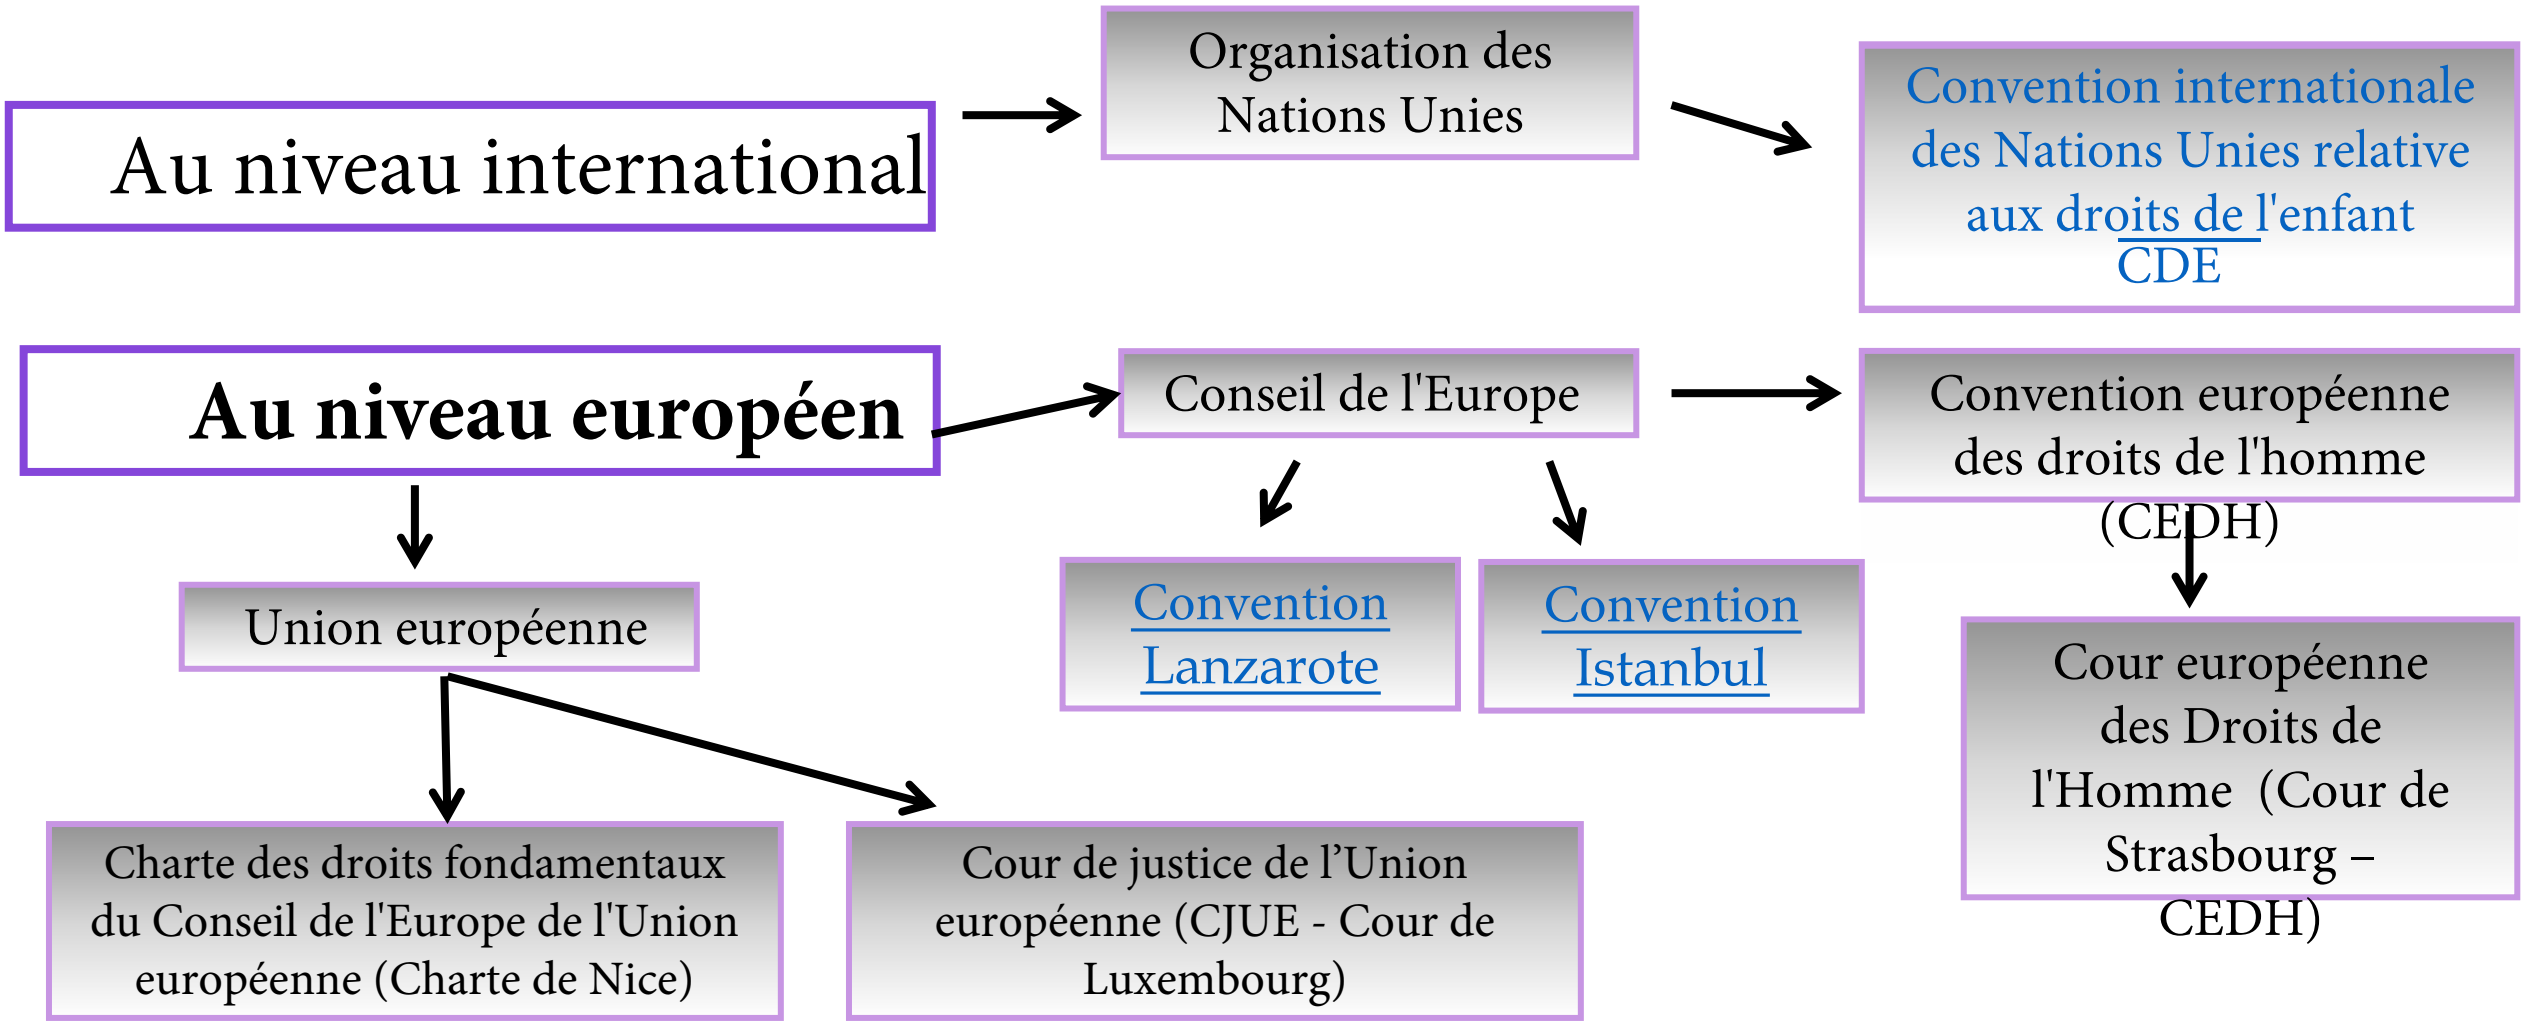
carepath

La Convention internationale relative aux droits de l'enfant (CDE) établit que « un enfant s'entend de tout être humain âgé de moins de dix-huit ans » (article premier).

De même, la plupart des instruments du Conseil de l'Europe concernant les enfants adoptent la définition établie par la CDE.

Puisqu’au sein de l'Union européenne, il n'existe aucune description du terme « enfant », la définition de la CDE est couramment utilisée.

Cadre juridique



DROITS ET LIBERTES DE L’ENFANT

Tous les individus, y compris les enfants, jouissent des libertés et des droits reconnus par les instruments juridiques (conventions, traités, déclarations) relatifs aux droits de l'homme, en particulier la Charte des droits fondamentaux de l'Union européenne (Charte de Nice) et la Convention européenne des droits de l'homme (CEDH).

carepath

DROITS FONDAMENTAUX ET LIBERTES FONDAMENTALES

DROITS CIVILS

DROITS ECONOMIQUES, SOCIAUX ET CULTURELS

LIBERTES ET DROITS CIVILS FONDAMENTAUX

carepath

• On les appelle droits de « première génération » et ils sont considérés comme fondamentaux parce que leur violation porte profondément atteinte à la vie des personnes.
- Ils exigent des États que ceux-ci n'interfèrent pas dans la sphère privée de l'individu et qu'ils s'efforcent activement d’assurer l'exercice effectif d'un droit fondamental

Par exemple, le droit au respect de la vie privée et familiale (art. 8 CEDH) demande aux Etats de ne pas séparer les enfants de leurs parents sauf lorsque cela est strictement nécessaire pour la protection des enfants eux-mêmes, mais également, dans le cadre des mesures prises pour promouvoir le développement des relations entre les parents et les enfants, d’aider le parent qui n’en a pas la garde à avoir accès à son enfant et à surmonter l'opposition injustifiée de l'autre parent.

Droit au respect de la vie familiale

carepath

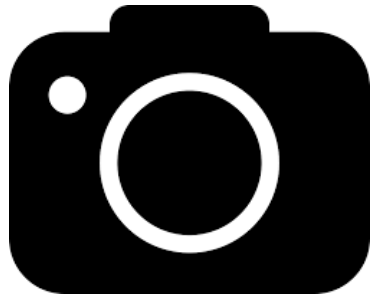
Toute personne a droit au respect de la « vie familiale » telle qu'elle est vécue dans la pratique (l'enfant a, par exemple, le droit de grandir dans la famille et de rester en contact avec ses deux parents après leur séparation).

Articles de référence :

- Article 7 (droit au respect de la vie privée et familiale) – Charte de Nice
- Article 8 (droit au respect de la vie privée et familiale) - CEDH
- Articles 8 et 9 de la CDE

Droit au respect de la vie privée

La notion de " vie privée " développée par la jurisprudence de la Cour de Strasbourg est large et comprend de nombreux aspects de l'identité d'un individu
(par exemple l'intégrité physique et morale de la personne, le nom, l'image, la vie privée et la protection des données personnelles)

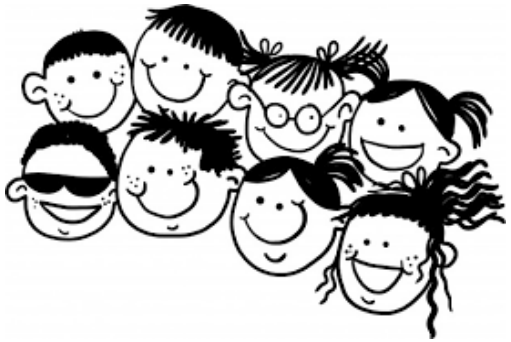


Articles de référence :

Article 7 (droit au respect de la vie privée) Charte de Nice
- Article 8 (droit au respect de la vie privée) CEDH
- Article 16 de la CDE

Non-discrimination

Les différents traitements fondés sur le sexe, la race, la couleur de la peau, les origines ethniques ou sociales, les caractéristiques génétiques, la langue, les croyances ou la religion, les opinions politiques ou toute autre opinion, l'appartenance à une minorité nationale, la fortune, la naissance, le handicap, l'âge ou l'orientation sexuelle sont considérés comme discriminatoires et interdits à moins qu'ils ne servent un but légitime



Articles de référence :

- Article 7 (droit au respect de la vie privée et familiale), Article 20 (Egalité en droit) et Article 21 (non-discrimination) – Charte de Nice
- Article 14 CEDH ; Article 1 du Protocole 12 de la CEDH (non-discrimination)
- Article E (non-discrimination) Charte sociale européenne (CSE)
- Article 8 (droit au respect de la vie privée) CEDH
- Article 2 CDE

Principe de l’intérêt supérieur de l’enfant

carepath

Les enfants et les jeunes ont le droit, en tant que mineurs, de bénéficier d'une protection spéciale et donc d'un traitement différencié en fonction de l'âge

Article de référence :

Article 3 CDE

EXEMPLE 1
Le juge appelé à décider de la garde des enfants après la séparation / le divorce des parents doit décider sur la seule base de ce qui est le mieux pour l'enfant et non pour les parents

Liberté d'expression

Toute personne a droit à la liberté d'expression. Ce droit comprend la liberté d'opinion et la liberté de recevoir ou de communiquer des informations ou des idées sans qu'il puisse y avoir ingérence d'autorités publiques et sans considération de frontières. (Article 11, paragraphe 1 CEDH)

Articles de référence :

- Article 11 et article 24 paragraphe 1 Charte de Nice
- Article 10 CEDH
- Article 12, paragraphe 1 CDE

Le droit de l'enfant à être entendu

« On donnera notamment à l'enfant la possibilité d'être entendu dans toute procédure judiciaire ou administrative l'intéressant, soit directement, soit par l'intermédiaire d'un représentant ou d'une organisation approprié, de façon compatible avec les règles de procédure de la législation nationale (Article 12 - CDE)

Pour de plus amples informations sur le droit de l'enfant à être entendu, voir Unit_2_3_video_Prof.ssa_Long

Articles de référence :

- Article 12 CDE
- Articles 3 et 6 Convention européenne sur l'exercice des droits des enfants

Le droit de l'enfant à la protection contre la violence et l'exploitation

carepath

« Les Etats parties prennent toutes les mesures législatives, administratives, sociales et éducatives appropriées pour protéger l'enfant contre toute forme de violence, d'atteinte ou de brutalités physiques ou mentales, d'abandon ou de négligence, de mauvais traitements ou d'exploitation, y compris la violence sexuelle... » (Article 19, paragraphe 1, Convention internationale sur les droits de l'enfant - CDE)

Case Z. et Autres vs. RU.

Articles de référence :

- Articles 2 (droit à la vie), 3 (traitements inhumains ou dégradants) et 8 (intégrité physique) CEDH; Protocole 1 de la CEDH, article 2 (droit à l'éducation)
- Articles 7 (droit à une protection spéciale contre les risques physiques et moraux) et 17 (droit à la protection) Charte sociale européenne (CSE)
- Convention sur la protection des enfants contre l'exploitation et les abus sexuels (Convention de Lanzarote).
- Convention sur la prévention et la lutte contre la violence à l'égard des femmes et contre la violence domestique (Convention d'Istanbul)
- Directive relative à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie (2011/93 / EU)

EXEMPLE 2 : Être témoin de la violence

La violence ne produit pas seulement des dommages lorsqu'elle est exercée, mais également lorsque les enfants en sont témoins.

Voir, entendre, éprouver de l'angoisse, être infecté et accablé sans pouvoir rien faire. Tout cela équivaut à exposer un enfant à une forme de maltraitance, réalisée par des actes de violence physique, verbale, psychologique, sexuelle et économique, sur des figures de référence ou sur d'autres personnes pouvant avoir un importance émotionnelle dans le cadre familial et domestique. C'est cela, être témoin de la violence. Un phénomène encore caché, presque « invisible », caractérisé par de multiples signaux, dont les effets peuvent être dévastateurs sur le développement physique, cognitif et comportemental des enfants

(Save the Children, https://www.savethechildren.it/campagne/abbattiamo-il-muro-del-silenzio)

Articles de référence :

Article 19 CDE

Article 17 Charte sociale européenne (CSE)

Les enfants qui sont témoins d'un acte de violence en sont aussi des victimes https://www.youtube.com/watch?v=aNbVwD86JqU

L'histoire d'un enfant témoin
https://www.youtube.com/watch?v=hYX8cRkiklE

EXEMPLE 3 : Châtiment corporel

carepath

On considère comme châtiment corporel :

- tous châtiments impliquant l'usage de la force physique et visant à infliger un certain degré de douleur ou de désagrément, aussi léger soit-il
- certaines formes non physiques cruelles et dégradantes, par exemple: les châtiments tendant à rabaisser, humilier, dénigrer, prendre pour bouc émissaire, menacer, effrayer ou ridiculiser l'enfant. (Comité des droits des enfants de l'ONU, Observation générale 8, 2006)

Levez la main contre la fessée ! https://www.youtube.com/watch?v=Aj1fWgCeo-o

Articles de référence :

Article 3 CEDH

Articles 19, 28, paragraphe 2, et 37 CDE

EXEMPLE 4 : Abus sexuels

On considère comme « abus sexuel » le fait de se livrer à des activités sexuelles avec un enfant :

- en faisant usage de la contrainte, de la force ou de menaces; en abusant d'une position reconnue de confiance, d'autorité ou d'influence sur l'enfant, y compris au sein de la famille ;
- en abusant d'une situation de particulière vulnérabilité de l'enfant, notamment en raison d'un handicap physique ou mental ou d'une situation de dépendance.

(Article 18, paragraphe 1, Convention du Conseil de l'Europe sur la protection des enfants contre l'exploitation et les abus sexuels – Convention de Lanzarote)

You can't touch here!
https://www.youtube.com/watch?v=ZNmu7plH5c8

Articles de référence :

- Articles 32 et 34 CDE
- Convention de Lanzarote

DROITS ECONOMIQUES, SOCIAUX ET CULTURELS

carepath

Ils représentent les droits dits de « deuxième génération » que chaque État est appelé à satisfaire afin de surmonter les inégalités sociales, les déséquilibres économiques, les désavantages causés par la nature, l'âge, etc.

Leur exercice concret se fait (malheureusement !) progressivement et de manière compatible avec les problèmes économico-structurels auxquels chaque État est confronté.

Droit à la santé

carepath

« La santé est un état de complet bien-être physique, mental et social et ne consiste pas seulement en une absence de maladie ou d'infirmité.»

(Organisation mondiale de la Santé, 1948)

Articles de référence :

- Article 35 (accès aux soins de santé) Charte de Nice
- Article 25 Déclaration universelle des droits de l'homme
- Articles 24, 25 et 26 CDE
- Article 2 (droit à la vie) et article 3 (droit à l'intégrité physique) CEDH
- Article 11 (droit à la protection de la santé) et article 13 (droit à l'assistance sociale et médicale) Charte sociale européenne (CSE)
- Article 6 Convention européenne pour la protection des droits de l'homme et de la dignité de l'être humain en rapport avec les applications de la biologie et de la médicine, « Convention d'Oviedo »

Droit à l'éducation

« Toute personne a droit à l'éducation. L'éducation doit être gratuite, au moins en ce qui concerne l'enseignement élémentaire et fondamental. L'enseignement élémentaire est obligatoire. L'enseignement technique et professionnel doit être généralisé; l'accès aux études supérieures doit être ouvert en pleine égalité à tous en fonction de leur mérite. »

(Article 26, Déclaration universelle des droits de l'homme)

Le droit à l'éducation ne se réfère pas uniquement à l'apprentissage des matières scolaires de base mais doit être conçu dans un sens plus large. L'éducation doit chercher à favoriser l'épanouissement de la personnalité de l'enfant, de ses dons et aptitudes mentales et physiques. (Article 29 CDE)

<u>Articles de référence</u>

Article 14 Charte de Nice

Articles 28 et 29 CDE

Article 17 CEDH

Article 2 du protocole 1 CEDH

Manuel de droit européen en matière de droits de l'enfant

Avant-propos

Ce manuel de droit européen en matière de droits de l'enfant a été préparé conjointement par l'Agence des droits fondamentaux de l'Union européenne (FRA) et le Conseil de l'Europe, avec l'aide du Greffe de la Cour européenne des droits de l'homme. Il est le quatrième d'une série de manuels de droit européen élaborés conjointement par nos organisations. Les manuels précédents étaient consacrés au droit européen en matière de non-discrimination, d'asile, de frontières et d'immigration et de protection des données.

Nous avons lancé ce nouveau projet conjoint dans le cadre des célébrations du 25e anniversaire de la Convention des Nations Unies relative aux droits de l'enfant – que tous les États européens ont ratifiée – afin de mettre en lumière le rôle des normes juridiques européennes pour assurer aux enfants l'exercice de leurs droits universels.

Les enfants sont des titulaires de droits à part entière. Ce manuel entend donc sensibiliser le lecteur et approfondir ses connaissances des normes juridiques qui protègent et promeuvent ces droits en Europe. Le traité sur l'Union européenne (TUE) impose à l'Union l'obligation de promouvoir la protection des droits de l'enfant. La Charte des droits fondamentaux de l'Union européenne, les règlements et directives de l'Union européenne (UE) ainsi que la jurisprudence de la Cour de justice de l'UE (CJUE) ont contribué à encadrer plus précisément la protection des droits de l'enfant. Au niveau du Conseil de l'Europe, de multiples conventions portent sur des aspects spécifiques de la protection des droits de l'enfant, depuis leurs droits et leur sécurité dans le cyberespace jusqu'à l'adoption d'enfants. Ces conventions contribuent au renforcement de la protection que confèrent aux enfants la Convention européenne des droits de l'homme et la Charte sociale européenne, y compris la jurisprudence de la Cour européenne des droits de l'homme (CEDH) et les décisions du Comité européen des droits sociaux (CEDS).

Le présent manuel est destiné aux juristes non spécialisés, aux juges, aux procureurs, aux autorités chargées de la protection de l'enfance, ainsi qu'à d'autres praticiens et organisations chargés d'assurer la protection juridique des droits de l'enfant.

Nous tenons à remercier le professeur Ton Liefaard, LL.M. Simona Florescu, JD. Margaret Fine, le professeur Karl Hanson, le professeur Ursula Kilkelly, le docteur Roberta Ruggiero, le professeur Helen Stalford et le professeur Wouter Vandenhole pour leur contribution à la rédaction de cet ouvrage. Nous souhaitons également remercier toutes les personnes qui nous ont apporté leur contribution et leur soutien tout au long de la préparation de ce manuel.

ACRONYMES 11

COMMENT UTILISER CE MANUEL ? 13

1 INTRODUCTION AUX DROITS DE L'ENFANT : CONTEXTE ET PRINCIPES FONDAMENTAUX DU DROIT EUROPÉEN 15

1.1. Concepts fondamentaux 17

Point clé 17

1.1.1. Champ d'application des droits de l'enfant 17

1.1.2. L'« enfant » en tant que titulaire de droits 18

1.2. Contexte du droit européen relatif aux droits de l'enfant 20

1.2.1. Union européenne : évolution des droits de l'enfant et domaines de protection couverts 20

1.2.2. Conseil de l'Europe : évolution des droits de l'enfant et domaines de protection couverts 24

1.3. Le droit européen relatif aux droits de l'enfant et la Convention des Nations Unies relative aux droits de l'enfant 27

Point clé 27

1.4. Rôle des Cours européennes dans l'interprétation et l'application des droits européens de l'enfant 29

1.4.1. La Cour de justice de l'Union européenne 29

1.4.2. La Cour européenne des droits de l'homme 31

1.5. Comité européen des droits sociaux 32

2 LIBERTÉS ET DROITS CIVILS FONDAMENTAUX 35

2.1. Liberté de pensée, de conscience et de religion 37

Points clés 37

2.1.1. Le droit de l'enfant à la liberté de religion 37

2.2. Droits des parents et liberté de religion de leurs enfants 39

2.3. Liberté d'expression et d'information 41

Points clés 41

2.4. Droit à être entendu 43

Points clés 43

2.5. Droit à la liberté de réunion et d'association 47

Points clés 47

3 ÉGALITÉ ET NON-DISCRIMINATION 49
3.1. Législation européenne en matière de non-discrimination 51
Points clés 51
3.2. Non-discrimination fondée sur l'origine ethnique ou raciale 53
Points clés 53
3.3. Non-discrimination fondée sur la nationalité et la situation au regard de la législation sur l'immigration 56
Points clés 56
3.4. Non-discrimination fondée sur l'âge 59
Point clé 59
3.5. Non-discrimination fondée sur d'autres motifs 60
Point clé 60
4 QUESTIONS RELATIVES À L'IDENTITÉ PERSONNELLE 63
4.1. Enregistrement de la naissance et droit à un nom 65
Point clé 65
4.2. Droit à l'identité personnelle 67
Points clés 67
4.2.1. Établissement de la paternité 68
4.2.2. Établissement de la maternité : accouchement sous X 70
4.3. Établissement de ses origines : adoption 71
4.4. Vol d'identité 71
Point clé 71
4.5. Droit à la citoyenneté 73
Points clés 73
4.6. Identité des enfants appartenant à une minorité nationale 74
Point clé 74
5 VIE FAMILIALE 77
5.1. Droit au respect de la vie familiale 79
Points clés 79
5.2. Droit de l'enfant d'être élevé par ses parents 80
Points clés 80
5.3. Droit d'entretenir des contacts avec ses deux parents 83
Points clés 83
5.4. Déplacement sans droit d'enfant au-delà d'une frontière – enlèvement d'enfant 91
Points clés 91

6 PROTECTION DE REMPLACEMENT ET ADOPTION 97
6.1. Protection de remplacement : principes généraux 99
Points clés 99
6.2. Placement d'enfants en structure de remplacement 103
Points clés 103
6.3. Adoption 109
Points clés 109
7 PROTECTION DES ENFANTS CONTRE LA VIOLENCE ET L'EXPLOITATION 117
7.1. Violence à l'école, à la maison et dans d'autres contextes 120
Points clés 120
7.1.1. Champ et portée de la responsabilité de l'État 120
7.1.2. Châtiments corporels 124
7.1.3. Abus sexuels 126

APCE	Assemblée parlementaire du Conseil de l'Europe
CCPMN	Convention-cadre du Conseil de l'Europe pour la protection des minorités nationales
CdE	Conseil de l'Europe
CEDH	Convention européenne de sauvegarde des droits de l'homme et des libertés fondamentales (communément appelée « Convention européenne des droits de l'homme »)
CEDS	Comité européen des droits sociaux
CEE	Communauté économique européenne
CEPT	Convention européenne pour la prévention de la torture et des peines ou traitements inhumains ou dégradants
CJUE	Cour de Justice de l'Union européenne (avant décembre 2009, Cour de Justice des Communautés européennes, CJCE)
CouEDH	Cour européenne des droits de l'homme
CPT	Comité européen pour la prévention de la torture et des peines ou traitements inhumains ou dégradants
CRC	Convention des Nations Unies relative aux droits de l'enfant
CRPD	Convention des Nations Unies relative aux droits des personnes handicapées
CSE	Charte sociale européenne
EEE	Espace économique européen
FRA	Agence des droits fondamentaux de l'Union européenne
GC	Grande Chambre (de la Cour européenne des droits de l'homme)
GRETA	Groupe d'experts sur la lutte contre la traite des êtres humains
HCR	Haut-Commissariat des Nations Unies pour les réfugiés
ICCPR	Pacte international des Nations Unies relatif aux droits civils et politiques

ICERD	Convention internationale sur l'élimination de toutes les formes de discrimination raciale
ICESCR	Pacte international relatif aux droits économiques, sociaux et culturels
OIT	Organisation internationale du travail
ONU	Organisation des Nations Unies
RPT	Ressortissants de pays tiers
TFUE	Traité sur le fonctionnement de l'Union européenne
TUE	Traité sur l'Union européenne
UE	Union européenne

Comment utiliser ce manuel ?

Le présent manuel donne une vue d'ensemble des droits fondamentaux des enfants dans les États membres de l'Union européenne (UE) et du Conseil de l'Europe (CdE). Le domaine qu'il couvre est large. Les enfants sont reconnus en tant que bénéficiaires de tous les droits fondamentaux/de l'homme, mais aussi en tant que sujets de réglementations particulières compte tenu de leurs caractéristiques spécifiques. Les droits des enfants constituent un domaine intersectoriel du droit. Dans le présent manuel, l'accent est mis sur les domaines du droit qui revêtent une importance particulière pour les enfants.

Le manuel a été conçu pour aider les praticiens du droit qui ne sont pas spécialisés dans le domaine des droits de l'enfant ; il s'adresse aux avocats, aux juges, aux procureurs, aux travailleurs sociaux et aux autres collaborateurs des autorités nationales, ainsi qu'aux organisations non gouvernementales (ONG) et autres organes susceptibles d'être confrontés pour la première fois à des questions juridiques dans ce domaine. Il s'agit d'un premier ouvrage de référence sur le droit de l'UE et du Conseil de l'Europe en la matière, qui présente point par point les règles du droit de l'UE, de la Convention européenne des droits de l'homme (CEDH), de la Charte sociale européenne (CSE) et d'autres instruments du Conseil de l'Europe. Chaque chapitre débute par un tableau récapitulant les règles applicables en vertu des deux ordres juridiques européens distincts. Ensuite, les dispositions de chaque ordre juridique sont présentées successivement pour chacun des questions envisagées. Cela permet au lecteur d'identifier les points de convergence ou de divergence entre les deux systèmes juridiques. Le cas échéant, référence est également faite à la Convention des Nations Unies relative aux droits de l'enfant (CRC) et à d'autres instruments internationaux.

Les praticiens du droit des États qui ne sont pas membres de l'UE mais membres du Conseil de l'Europe, et, à ce titre, parties à la CEDH, peuvent accéder aux informations pertinentes pour leur propre pays en consultant directement les sections consacrées à la CEDH. Les praticiens du droit des États membres de l'UE devront consulter les deux sections, étant donné que ces États sont soumis aux deux ordres juridiques. Les lecteurs qui souhaitent de plus amples informations sur une question particulière pourront se reporter à la partie « lectures complémentaires » du manuel, où ils trouveront des références bibliographiques plus spécialisées.

Le droit issu de la CEDH est présenté sous la forme de brèves références à des affaires dans lesquelles la Cour européenne des droits de l'homme (CouEDH) a eu

à connaître de sujets liés aux questions traitées dans le manuel, choisies parmi l'abondante jurisprudence de la Cour relative aux droits de l'enfant.

Le droit de l'UE est constitué des mesures législatives adoptées et des dispositions pertinentes des traités, en particulier de celles de la Charte des droits fondamentaux de l'Union européenne telles qu'interprétées par la jurisprudence de la Cour de Justice de l'Union européenne (CJUE, dénommée Cour de Justice des Communautés européennes (CJCE) avant décembre 2009).

La jurisprudence décrite ou citée dans le manuel fournit des exemples tirés de l'important corpus de jurisprudence de la CouEDH et de la CJUE. Le manuel intègre, dans la mesure du possible compte tenu de son champ d'application restreint et de sa nature introductive, les évolutions du droit intervenues jusqu'au 1er janvier 2015, bien que des évolutions plus récentes aient également été incluses lorsque cela était possible.

Le manuel comprend une introduction, qui explique brièvement le rôle des deux systèmes juridiques correspondant l'un au droit issu de la CEDH et l'autre à celui de l'UE, ainsi que dix chapitres de fond couvrant les questions suivantes :

- droits civils et libertés ;
- égalité ;
- identité des personnes ;
- vie familiale ;
- modes de garde alternatifs et adoption ;
- protection des enfants contre la violence et l'exploitation ;
- droits économiques, sociaux et culturels ;
- migration et asile ;
- protection des consommateurs et des données à caractère personnel ;
- droits de l'enfant dans le cadre de la justice pénale et des procédures de remplacement.

Chaque chapitre traite d'un sujet distinct et comprend des renvois à d'autres sujets et à d'autres chapitres qui permettent d'offrir au lecteur une meilleure compréhension du cadre juridique applicable. Des points clé sont présentés au début de chaque section.

Ce chapitre liminaire expose l'évolution du cadre juridique relatif aux droits de l'enfant au niveau européen, les principes fondamentaux qui guident son application et les aspects principaux des droits de l'enfant abordés par le droit européen. Il présente le contexte dont relève l'analyse thématique des chapitres suivants.

1.1. Concepts fondamentaux

Point clé

- Le cadre juridique européen relatif aux droits de l'enfant s'appuie sur des mesures existantes au niveau national et international.

1.1.1. Champ d'application des droits de l'enfant

En ce qui concerne « le cadre juridique européen relatif aux droits de l'enfant », l'accent est mis sur les sources de droit primaire (traités, conventions, législation dérivée et jurisprudence) introduites par le Conseil de l'Europe (CdE) et l'Union européenne (UE). Le cas échéant, il est fait référence aux autres sources européennes qui influencent son évolution, y compris les documents stratégiques clés, les lignes directrices ou les autres instruments non contraignants/de droit souple.

Les enfants ne sont pas exclusivement objets d'une protection, ils sont détenteurs de droits. Ils sont bénéficiaires de tous les droits fondamentaux et de l'homme, et sont sujets de réglementations particulières compte tenu de leurs caractéristiques spécifiques. La majeure partie de la jurisprudence européenne provient de poursuites intentées par des parents ou d'autres représentants légaux d'enfants compte tenu de la capacité juridique limitée des enfants. Si l'objectif du présent manuel est d'illustrer comment le droit s'adapte aux intérêts et besoins particuliers des enfants, le manuel illustre également l'importance des parents/tuteurs ou autres représentants légaux et fait référence, le cas échéant, aux principaux droits et responsabilités conférés aux personnes ayant la charge des enfants. Dans ces cas, l'approche de la Convention des Nations Unies relative aux droits de l'enfant (CRC)[1] est adoptée, c'est-à-dire que les parents doivent exercer leurs responsabilités avec pour principale préoccupation l'intérêt supérieur de l'enfant, et d'une manière qui respecte l'évolution de ses capacités.

1.1.2. L'« enfant » en tant que titulaire de droits

En ce qui concerne le droit international, la CRC dispose, en son article 1er, qu'« un enfant s'entend de tout être humain âgé de moins de dix-huit ans. » Il s'agit du paramètre juridique actuellement utilisé, en Europe également, pour définir un enfant.

Dans le droit de l'UE, il n'existe aucune définition unique officielle de l'« enfant » dans les traités, la législation dérivée ou la jurisprudence. La définition de l'enfant au sens du droit de l'UE peut considérablement varier en fonction du contexte réglementaire. À titre d'exemple, le droit de l'UE régissant les droits relatifs à la libre circulation des citoyens de l'UE et des membres de leur famille définit les enfants comme « les descendants directs qui sont âgés de moins de vingt-et-un ans ou qui sont à charge »[2], adoptant, pour l'essentiel, une notion biologique et économique par opposition à une notion fondée sur la minorité.

1 Organisation des Nations Unies (ONU), Assemblée générale (1989), Convention relative aux droits de l'enfant, 20 novembre 1989.

2 Directive 2004/38/CE du Parlement européen et du Conseil du 29 avril 2004 relative au droit des citoyens de l'Union et des membres de leurs familles de circuler et de séjourner librement sur le territoire des États membres, modifiant le règlement (CEE) n° 1612/68 et abrogeant les directives 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE et 93/96/CEE, JO L 158 du 30.4.2004 et JO L 158 du 29.04.2004, art. 2, para. 2, point c).

Certains actes législatifs de l'UE confèrent des droits différents aux enfants en fonction de leur âge. Ainsi, la directive 94/33/CE relative à la protection des jeunes au travail (directive « Jeunes travailleurs »[3]), qui régit l'accès des enfants au travail officiel et les conditions y afférentes dans les États membres de l'UE, établit une distinction entre les « jeunes » (un terme générique désignant toute personne âgée de moins de 18 ans), les « adolescents » (tout jeune âgé de 15 ans au moins et de moins de 18 ans et qui n'est plus soumis à l'obligation scolaire à temps plein) et les « enfants » (tout jeune de moins de 15 ans, pour qui l'emploi officiel est largement interdit).

D'autres domaines du droit de l'UE, en particulier ceux dans lesquels l'action de l'UE complète celle des États membres (tels que la sécurité sociale, l'immigration et l'éducation) se reportent au droit national pour déterminer qui est un enfant. Dans ces contextes, la définition de la CRC est généralement adoptée.

Dans le droit du CdE, la majorité des instruments relatifs aux enfants adoptent la définition de l'enfant de la CRC. On citera par exemple l'article 4, point d), de la Convention du Conseil de l'Europe sur la lutte contre la traite des êtres humains[4] ou l'article 3, point a), de la Convention du Conseil de l'Europe sur la protection des enfants contre l'exploitation et les abus sexuels (Convention de Lanzarote)[5].

La Convention européenne de droits de l'homme (CEDH) ne comprend pas de définition de l'enfant, mais, en vertu de son article 1er, les États sont tenus de garantir à « toute personne » relevant de leur juridiction les droits définis dans la Convention. L'article 14 de la CEDH garantit la jouissance des droits définis dans cette convention, « sans distinction aucune », notamment sans distinction d'âge[6]. La Cour européenne des droits de l'homme (CouEDH) a accepté les requêtes déposées par des enfants et pour le compte d'enfants quel que soit leur âge[7]. Dans

3 Directive 94/33/CE du 22 juin 1994 relative à la protection des jeunes au travail, JO 1994 L 216, art. 3.

4 Conseil de l'Europe (CdE), Convention sur la lutte contre la traite des êtres humains, STCE n° 197, 15 mai 2005.

5 CdE, Convention sur la protection des enfants contre l'exploitation et les abus sexuels, STCE n° 201, 25 octobre 2007.

6 CouEDH, *Schwizgebel c. Suisse*, n° 25762/07, 10 juin 2010. Voir également FRA et CouEDH (2011), section 4.5.

7 Voir par exemple, CouEDH, *Marckx c. Belgique*, n° 6833/74, 13 juin 1979 (le requérant avait six ans quand la Cour a rendu son arrêt).

sa jurisprudence, elle a accepté la définition de l'enfant contenue dans la CRC[8], adoptant la notion de « personne âgée de moins de 18 ans ».

Il en va de même pour la Charte sociale européenne (CSE) et son interprétation par le Comité européen des droits sociaux (CEDS)[9].

1.2. Contexte du droit européen relatif aux droits de l'enfant

À ce jour, la majeure partie du droit européen relatif aux droits de l'enfant a été élaborée par l'UE et le CdE. Outre les Nations Unies, d'autres institutions internationales telles que la Conférence de La Haye de droit international privé ont également adopté plusieurs instruments importants qui continuent de guider le développement du droit européen. Bien que ces cadres internationaux opèrent séparément les uns des autres, des liens sont de plus en plus souvent établis entre eux.[10] La coopération interinstitutionnelle est particulièrement étroite entre le CdE et l'UE.

1.2.1. Union européenne : évolution des droits de l'enfant et domaines de protection couverts

Dans le passé, les droits de l'enfant se sont développés de manière fragmentaire dans l'UE. D'un point de vue historique, la législation relative aux enfants visait, dans une large mesure, à couvrir des aspects concernant les enfants dans le cadre d'initiatives politiques et économiques plus larges, par exemple dans le domaine de la protection des consommateurs[11] et de la libre circulation des personnes[12].

8 CouDEH, *Güveç c. Turquie*, n° 70337/01, 20 janvier 2009 ; CouEDH, *Çoşelav c. Turquie*, n° 1413/07, 9 octobre 2012.

9 CEDS, *Défense des Enfants International (DEI) c. Pays-Bas*, n° 47/2008, 20 octobre 2009, para. 25.

10 Voir, par exemple, le chapitre 5, qui illustre la manière dont le droit de l'UE relatif à la famille régissant les enlèvements internationaux d'enfants s'articule avec la Convention du 25 octobre 1980 sur les aspects civils de l'enlèvement international d'enfants (convention de la Haye sur l'enlèvement d'enfants).

11 Par exemple, la directive 2009/48/CE du Parlement européen et du Conseil du 18 juin 2009 relative à la sécurité des jouets, JO 2009 L 170, qui met en œuvre des mesures de sécurité pour les jouets pour enfants.

12 Par exemple, la directive 2004/38/CE.

Toutefois, plus récemment, les droits des enfants ont été abordés dans le cadre d'un programme plus coordonné de l'UE, fondé sur trois étapes importantes :

- l'adoption de la Charte des droits fondamentaux de l'Union européenne ;
- l'entrée en vigueur du Traité de Lisbonne en décembre 2009 ;
- l'adoption de la communication de la Commission européenne intitulée « Une place à part pour les enfants dans l'action extérieure de l'UE » et des « Orientations de l'UE concernant la promotion et la protection des droits de l'enfant » du Conseil.

La première étape importante a été l'adoption de la Charte des droits fondamentaux de l'Union européenne en 2000[13]. Avec l'entrée en vigueur du Traité de Lisbonne, le 1er décembre 2009, la Charte a la même valeur juridique que les traités de l'UE (article 6 du Traité sur l'Union européenne, TUE). Elle oblige l'UE et ses États membres à protéger les droits qui y sont consacrés lorsqu'ils mettent en œuvre le droit de l'UE. La Charte des droits fondamentaux de l'UE est le premier texte de niveau constitutionnel à l'échelle de l'UE qui contient des dispositions précises relatives aux droits de l'enfant, notamment la reconnaissance du droit des enfants de suivre gratuitement l'enseignement obligatoire (article 14, paragraphe 2), l'interdiction de la discrimination en raison notamment de l'âge (article 21) et une interdiction de l'exploitation des enfants par le travail (article 32). De manière significative, la Charte contient une disposition spécifique sur les droits de l'enfant (article 24). Celle-ci énonce trois principes fondamentaux des droits de l'enfant : le droit d'exprimer leur opinion librement, en fonction de leur âge et leur maturité (article 24, paragraphe 1), le droit de voir leur intérêt supérieur constituer une considération primordiale dans tous les actes qui les concernent (article 24, paragraphe 2) et le droit d'entretenir régulièrement des relations personnelles et des contacts directs avec leurs deux parents (article 24, paragraphe 3).

La deuxième étape importante a été l'adoption du Traité de Lisbonne, qui, comme indiqué ci-dessus, est entré en vigueur le 1er décembre 2009[14]. Cet instrument a fortement modifié l'UE sur le plan institutionnel, procédural et constitutionnel, en modifiant le TUE et l'ancien traité instituant la Communauté européenne

13 UE (2012), Charte des droits fondamentaux de l'Union européenne, JO 2012 C 326.

14 UE (2007), Traité de Lisbonne modifiant le traité sur l'Union européenne et le traité instituant la Communauté européenne, signé à Lisbonne, JO 2007 C 306, p. 1.

(désormais devenu le Traité sur le fonctionnement de l'Union européenne, TFUE).[15] Cette évolution a renforcé la capacité de l'UE à faire progresser les droits de l'enfant, notamment en inscrivant la « protection des droits de l'enfant » parmi les objectifs généraux de l'UE (article 3, paragraphe 3, du TUE) et en en faisant un aspect important de la politique extérieure de l'UE (article 3, paragraphe 5, du TUE). Le TFUE également contient des références plus spécifiques aux enfants, permettant à l'UE d'adopter des mesures législatives visant à lutter contre l'exploitation sexuelle et la traite des êtres humains (article 79, paragraphe 2, point d), et article 83, paragraphe 1).

Cela a conduit à l'adoption de la directive relative à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie[16], et de la directive concernant la prévention de la traite des êtres humains et la lutte contre ce phénomène ainsi que la protection des victimes[17], qui contiennent également des dispositions répondant aux besoins spécifiques des enfants victimes. La directive établissant des normes minimales concernant les droits, le soutien et la protection des victimes de la criminalité[18], plus récente, consacre une grande partie de ses dispositions aux enfants.

La troisième étape importante s'est déroulée à un niveau plus stratégique, à l'origine dans le cadre du programme de coopération extérieure de l'UE et, par la suite, pour les questions internes. Concrètement, le Conseil de l'UE a adopté les « Orientations de l'UE concernant la promotion et la protection des droits de l'enfant »[19] et la Commission européenne, sa communication intitulée *Une place à part pour les enfants dans l'action extérieure de l'UE*[20], pour intégrer les droits de l'enfant dans toutes les activités de l'UE avec des États qui n'en sont pas membres. De même, en 2011, la Commission européenne a adopté un programme de l'UE en matière de droits de l'enfant, définissant les grandes priorités en vue de l'élaboration de la politique et de la législation relatives aux droits de

15 Voir versions consolidées des Communautés européennes (2012), Traité sur l'Union européenne (TUE) et Traité sur le fonctionnement de l'Union européenne (TFUE), JO 2012 C 326.

16 Directive 2011/93/UE, JO 2011 L 335, p. 1.

17 Directive 2011/36/UE, JO 2011 L 101, p. 1.

18 Directive 2012/29/UE, JO 2012 L 315, p. 57.

19 Conseil de l'UE (2007), *Orientations de l'UE concernant la promotion et la protection des droits de l'enfant*, Bruxelles, 10 décembre 2007.

20 Commission européenne (2008), *Une place à part pour les enfants dans l'action extérieure de l'UE : communication de la Commission au Conseil, au Parlement européen, au Comité économique et social et au Comité des régions*, COM(2008) 55 final, Bruxelles, 5 février 2008.

l'enfant dans tous les États membres de l'UE.[21] Le programme portait également sur le ciblage du processus législatif ayant trait à la protection des enfants, telles que l'adoption de la directive précitée sur les droits des victimes.

Plus récemment, le programme a été complété par une stratégie globale, adoptée par la Commission européenne, pour soutenir les États membres à lutter contre la pauvreté et l'exclusion sociale au moyen d'une série d'interventions dès la petite enfance (pour les enfants d'âge préscolaire et en âge de fréquenter l'enseignement primaire).[22] Bien que cette stratégie et le programme précité ne soient pas juridiquement contraignants, l'un et l'autre sont importants dans la mesure où ils établissent une référence pour l'approche normative et méthodologique de l'UE en matière des droits de l'enfant. Cette orientation stratégique est fortement liée à la CRC et s'inscrit dans une éthique de protection, de participation et de non-discrimination des enfants.

L'UE ne peut légiférer que dans les domaines où des compétences lui ont été attribuées par les traités (articles 2 à 4 du TFUE). Les droits de l'enfant étant un domaine intersectoriel, les compétences de l'UE doivent être déterminées au cas par cas. À ce jour, les domaines pertinents pour les droits de l'enfant dans lesquels l'UE a largement légiféré sont les suivants :

- protection des données et des consommateurs ;
- asile et migration ;
- coopération en matière civile et pénale.

L'article 6, paragraphe 1, du TUE et l'article 51, paragraphe 2, de la Charte des droits fondamentaux de l'UE prévoient que la Charte n'étend pas les compétences de l'UE et qu'elle ne modifie ou ne crée aucune compétence ni aucune tâche nouvelles pour l'UE. Les dispositions de la Charte s'adressent aux institutions de l'UE et aux États membres uniquement lorsqu'ils mettent en œuvre le droit de l'Union. Si les dispositions de la Charte sont toujours contraignantes pour l'UE, elles ne le sont pour les États membres uniquement lorsqu'ils agissent dans le champ d'application du droit de l'UE.

21 Commission européenne (2011), *Programme de l'Union européenne en matière de droits de l'enfant : communication de la Commission au Parlement européen, au Conseil, au Comité économique et social européen et au Comité des régions*, COM(2011) 60 final, Bruxelles, 15 février 2011.

22 Commission européenne (2013), *Investir dans l'enfance pour briser le cercle vicieux de l'inégalité*, Recommandation 2013/112/UE, Bruxelles.

Chaque chapitre suivant dresse un bref aperçu des compétences de l'UE dans les domaines concernant le chapitre.

1.2.2. Conseil de l'Europe : évolution des droits de l'enfant et domaines de protection couverts

À la différence de l'UE, le Conseil de l'Europe détient depuis sa création un mandat clair pour protéger et promouvoir les droits de l'homme. Son principal traité sur les droits de l'homme, ratifié par tous les États membres du CdE, est la Convention de sauvegarde des droits de l'homme et des libertés fondamentales, également appelée Convention européenne des droits de l'homme (CEDH), qui contient plusieurs mentions spécifiques relatives aux enfants. Les principales sont les suivantes : l'article 5, paragraphe 1, point d), prévoit la détention légale d'un enfant aux fins de son éducation surveillée ; l'article 6, paragraphe 1, limite le droit à une audience publique et équitable lorsque l'intérêt des mineurs l'exige ; l'article 2 du protocole n° 1, prévoit le droit à l'éducation et exige des États qu'ils respectent les convictions religieuses et philosophiques des parents dans le cadre de l'éducation de leurs enfants. En outre, toutes les autres dispositions générales de la CEDH sont applicables à tous, y compris aux enfants. Certaines se sont révélées présenter un intérêt particulier pour les enfants, à savoir l'article 8, qui garantit le droit au respect de la vie privée et familiale, et l'article 3, qui interdit la torture et les peines et traitements inhumains ou dégradants. En recourant à des approches interprétatives qui mettent l'accent sur les obligations positives inhérentes à la CEDH, la CouEDH a développé une jurisprudence abondante traitant des droits de l'enfant, qui comprend de nombreuses références à la CRC. Cela étant dit, la CouEDH analyse les recours au cas par cas et, par conséquent, n'offre pas une vue d'ensemble exhaustive des droits de l'enfant au titre de la CEDH.

L'autre grand traité du CdE relatif aux droits de l'homme, la Charte sociale européenne (CSE,[23] révisée en 1996[24]), prévoit la protection des droits sociaux, avec des dispositions spécifiques pour les droits de l'enfant. Elle contient deux dispositions qui revêtent une importance particulière pour les droits de l'enfant. L'article 7 prévoit l'obligation de protéger les enfants contre l'exploitation économique. L'article 17 exige des États qu'ils prennent toutes les mesures nécessaires

23 CdE, Charte sociale européenne, STE n° 35, 18 octobre 1961.

24 CdE, Charte sociale européenne (révisée), STE n° 163, 3 mai 1996.

et appropriées en vue d'assurer aux enfants les soins, l'assistance, l'éducation et la formation dont ils ont besoin (y compris un enseignement primaire et secondaire gratuit), de protéger les enfants et les adolescents contre la négligence, la violence ou l'exploitation et d'assurer la protection des enfants privés de leur soutien familial. La mise en œuvre de la CSE est supervisée par le Comité européen des droits sociaux (CEDS), qui se compose d'experts indépendants statuant sur la conformité du droit et de la pratique des États parties à la CSE, soit dans le cadre de la procédure des réclamations collectives, soit dans le cadre du système de rapports nationaux.

En outre, le CdE a adopté des traités portant sur une série de questions spécifiques relatives aux droits de l'enfant. Parmi eux figurent :

- la Convention européenne sur le statut juridique des enfants nés hors mariage[25] ;
- la Convention européenne en matière d'adoption des enfants, révisée en 2008[26] ;
- la Convention sur les relations personnelles concernant les enfants[27] ;
- la Convention européenne sur l'exercice des droits des enfants[28] ;
- la Convention du Conseil de l'Europe sur la protection des enfants contre l'exploitation et les abus sexuels (Convention de Lanzarote)[29].

Enfin, au niveau stratégique, il est important de noter qu'en 2006, le CdE a lancé son programme « Construire une Europe pour et avec les enfants », un plan d'action transversal consacré aux questions portant sur les droits de l'enfant, y compris l'adoption d'instruments normatifs dans différents domaines.[30] Les objectifs actuels sont axés sur quatre domaines clés[31] :

25 CdE, Convention européenne sur le statut juridique des enfants nés hors mariage, STE n° 85, 15 octobre 1975.

26 CdE, Convention européenne en matière d'adoption des enfants (révisée), STCE n° 202, 27 novembre 2008.

27 CdE, Convention sur les relations personnelles concernant les enfants, STE n° 192, 15 mai 2003.

28 CdE, Convention européenne sur l'exercice des droits des enfants, STE n° 160, 25 janvier 1996.

29 CdE, Convention sur la protection des enfants contre l'exploitation et les abus sexuels, STCE n° 201, 25 octobre 2007.

30 Pour plus d'informations, voir www.coe.int/t/dg3/children/default_FR.asp?.

31 CdE, Comité des Ministres (2011), Stratégie du Conseil de l'Europe sur les droits de l'enfant (2012-2015), CM(2011)171 final, 15 février 2012.

- promouvoir des services et systèmes adaptés aux enfants ;
- supprimer toutes les formes de violence à l'encontre des enfants ;
- garantir les droits de l'enfant en situation de vulnérabilité ;
- encourager la participation des enfants.

Le but principal du programme du CdE en faveur des droits de l'enfant est de soutenir la mise en œuvre des normes internationales dans le domaine des droits de l'enfant par tous les États membres du CdE et, en particulier, de promouvoir la mise en œuvre de la CRC, en mettant en lumière ses principes essentiels, que sont la non-discrimination, le droit à la vie et au développement, la priorité donnée à l'intérêt supérieur de l'enfant dans la prise de décision et le droit des enfants à être entendus.[32]

Le programme a supervisé l'adoption de plusieurs instruments en matière de droits de l'enfant fournissant des lignes directrices pratiques pour compléter les mesures juridiques européennes contraignantes ; il s'agit notamment des instruments suivants :

- Lignes directrices sur une justice adaptée aux enfants[33] ;
- Lignes directrices sur les soins de santé adaptés aux enfants[34] ;
- Recommandation sur les stratégies nationales intégrées de protection des enfants contre la violence[35] ;
- Recommandation sur les droits de l'enfant et les services sociaux adaptés aux enfants et aux familles[36] ;

32 *Ibid.*

33 CdE, Comité des Ministres (2010), *Lignes directrices sur une justice adaptée aux enfants*, 17 novembre 2010.

34 CdE, Comité des Ministres (2011), *Lignes directrices sur les soins de santé adaptés aux enfants*, 21 septembre 2011.

35 CdE, Comité des Ministres (2009), Recommandation CM/Rec(2009)10 du Comité des Ministres aux États membres sur les stratégies nationales intégrées de protection des enfants contre la violence, 18 novembre 2009.

36 CdE, Comité des Ministres (2011), Recommandation Rec(2011)12 sur les droits de l'enfant et les services sociaux adaptés aux enfants et aux familles, 16 novembre 2011.

- Recommandation du Comité des Ministres aux États membres sur la participation des enfants et des jeunes de moins de 18 ans[37].

De ce fait, le programme a permis de faire en sorte que l'Europe soit au cœur des efforts normatifs dans le domaine des droits de l'enfant et a montré la voie à suivre, par divers moyens, pour veiller à ce que la voix des enfants soit au cœur de ce processus. Le programme vise également à soutenir la mise en œuvre de la CEDH et de la CSE et à promouvoir d'autres instruments juridiques existants du CdE concernant l'enfance (la participation, la protection et les droits de l'enfant), la jeunesse et la famille.[38]

1.3. Le droit européen relatif aux droits de l'enfant et la Convention des Nations Unies relative aux droits de l'enfant

Point clé

- Le droit européen relatif aux droits de l'enfant est largement fondé sur la Convention des Nations Unies relative aux droits de l'enfant.

Le fait que tous les États membres de l'Union européenne et du Conseil de l'Europe sont en même temps parties à la CRC donne à cette dernière une position importante au niveau européen. Elle impose effectivement des obligations juridiques communes aux États de l'Europe, ce qui a des répercussions sur la manière dont les institutions européennes définissent et appliquent les droits de l'enfant.

Ainsi, la CRC est devenu la pierre de touche de l'élaboration du droit européen relatif aux droits de l'enfant, de sorte que le CdE et l'UE font de plus en plus appel à son influence. En particulier, l'intégration des principes et dispositions de la CRC dans des instruments contraignants et dans la jurisprudence au niveau européen confère plus de force à la CRC et ouvre des voies d'exécution plus efficaces pour

37 CdE, Comité des Ministres (2012), Recommandation CM/Rec(2012)2 du Comité des Ministres aux États membres sur la participation des enfants et des jeunes de moins de 18 ans, 28 mars 2012.

38 CdE, Comité des Ministres (2011), *Stratégie du Conseil de l'Europe sur les droits de l'enfant (2012-2015)*, CM(2011)171 final, 15 février 2012.

ceux qui cherchent à invoquer les droits de l'enfant en Europe. Des exemples spécifiques concernant cet aspect sont présentés tout au long de ce manuel.

L'Union européenne n'est pas et ne peut pas devenir partie à la CRC, dans la mesure où cette dernière ne prévoit pas mécanisme juridique permettant à des entités autres que des États d'y adhérer. Toutefois, elle se fonde sur les « principes généraux du droit de l'Union » (principes écrits et non écrits, issus des traditions constitutionnelles communes aux États membres), pour compléter et orienter l'interprétation des traités de l'UE (article 6, paragraphe 3, du TUE). La Cour de justice de l'Union européenne (CJUE) a confirmé que toute obligation découlant de l'adhésion à l'UE ne doit pas entrer en conflit avec les obligations des États membres découlant des Constitutions nationales et des engagements internationaux relatifs aux droits de l'homme[39]. Étant donné que tous les États membres de l'UE ont ratifié la CRC, l'Union est tenue de respecter les dispositions et les principes qui y sont consacrés, du moins en ce qui concerne les questions relevant de sa compétence (définie par les traités).

Cette obligation est renforcée par d'autres traités de l'UE, et en particulier par la Charte des droits fondamentaux de l'UE. L'article 24 de la Charte s'inspire directement des dispositions de la CRC, y compris certaines qui ont acquis le rang de « principes », notamment l'intérêt supérieur de l'enfant (article 3 de la CRC), la participation de l'enfant (article 12 de la CRC) et le droit de l'enfant de vivre avec ses parents et/ou de jouir d'une relation avec eux (article 9 de la CRC).

L'importance de la CRC s'agissant d'orienter la définition des droits de l'enfant au niveau de l'UE est exprimée dans le programme de la Commission en matière de droits de l'enfant, qui indique que « [l]es normes et principes établis par [la CRC] doivent continuer à guider les politiques et les actions de l'Union européenne qui ont une incidence sur les droits de l'enfant »[40]. Dans cet esprit, les instruments législatifs concernant les enfants s'accompagnent, presque sans exception, d'une référence explicite à la CRC ou d'une référence davantage implicite aux principes en matière de droits de l'enfant, tels que l'intérêt supérieur de l'enfant, le droit de l'enfant à participer aux décisions qui ont une incidence sur lui ou son droit d'être protégé contre la discrimination.

39 Par exemple, CJUE, C-4/73, *J. Nold, Kohlen- und Baustoffgroßhandlung c. Commission des Communautés européennes*, 14 mai 1974.

40 Commission européenne (2011), *Programme de l'Union européenne en matière de droits de l'enfant*, COM(2011) 0060 final, Bruxelles.

Le Conseil de l'Europe, à l'instar de l'UE, n'est pas, en tant qu'organisation, légalement tenu par la CRC, bien que tous les États membres du CdE soient, individuellement, parties à cette Convention. Néanmoins, la CEDH ne peut être interprétée isolément. Elle doit, au contraire, être interprétée en harmonie avec les principes généraux du droit international. Il convient de tenir compte de toute règle pertinente de droit international applicable dans les relations entre les États parties à la CEDH, en particulier les règles relatives à la protection universelle des droits de l'homme. En ce qui concerne plus précisément les obligations que la CEDH impose aux États qui y sont parties dans le domaine des droits de l'enfant, celles-ci doivent être interprétées à la lumière de la CRC[41]. Le CEDS a lui aussi explicitement fait mention de la CRC dans ses décisions[42]. En outre, les activités du CdE liées à l'établissement de normes et à l'élaboration de traités sont influencées par les principes et dispositions de la CRC. Par exemple, les *Lignes directrices sur une justice adaptée aux enfants*[43] sont directement aiguillées par une série de dispositions de la CRC, sans oublier les observations générales du Comité des droits de l'enfant des Nations Unies[44].

1.4. Rôle des Cours européennes dans l'interprétation et l'application des droits européens de l'enfant

1.4.1. La Cour de justice de l'Union européenne

La CJUE peut statuer sur la base de nombreux types d'actions en justice. Dans les affaires concernant les droits de l'enfant, la CJUE a jusqu'ici principalement statué dans le cadre de renvois préjudiciels (article 267 du TFUE)[45]. Il s'agit de procédures

42 CEDS, *Organisation mondiale contre la Torture (OMCT) c. Irlande*, n° 18/2003, 7 décembre 2004, paras. 61-63 ; CEDS, *Défense des Enfants International (DEI) c. Pays-Bas*, n° 47/2008, 20 octobre 2009.

43 CdE, Comité des Ministres (2010), *Lignes directrices sur une justice adaptée aux enfants*, 17 novembre 2010.

44 Voir ONU, Comité des droits de l'enfant (2007), *Observation générale n° 10 (2007), Les droits de l'enfant dans le système de justice pour mineurs*, 25 avril 2007 ; (2009), *Observation générale n° 12 (2009), Le droit de l'enfant d'être entendu,* CRC/C/GC/12, 1er juillet 2009 ; et (2013), *Observation générale n° 14 (2013) sur le droit de l'enfant à ce que son intérêt supérieur soit une considération primordiale (art. 3, para. 1),* CRC/C/GC/14, 29 mai 2013.

45 La seule exception concerne un recours en annulation : CJUE, C-540/03, *Parlement européen c. Conseil de l'Union européenne* [GC], 27 juin 2006.

dans lesquelles une juridiction nationale demande à la CJUE d'interpréter le droit primaire (c'est-à-dire les traités) ou le droit dérivé (c'est-à-dire les décisions ou la législation) de l'UE concerné par une affaire nationale pendante devant une juridiction nationale.

Jusqu'à ces dernières années, la CJUE n'avait statué que dans quelques affaires concernant les droits de l'enfant. Toutefois, à la suite de l'adoption de plusieurs mesures législatives concernant explicitement les droits de l'enfant et l'importance accrue de cette question, il est probable que la CJUE ait plus souvent à connaître d'affaires concernant les droits de l'enfant à l'avenir.

La Cour a rendu la majeure partie de ses arrêts au sujet des droits de l'enfant dans le contexte de la libre circulation et de la citoyenneté de l'UE, domaines dans lesquels l'Union jouit d'une compétence de longue date. À cet égard, la CJUE a expressément reconnu que les enfants bénéficient des avantages associés à la citoyenneté de l'UE de manière autonome, étendant ainsi le séjour autonome et les droits sociaux et éducatifs aux enfants, sur la base de la nationalité de l'UE[46].

Il n'y a qu'un seul exemple dans lequel la CJUE a directement utilisé la CRC pour déterminer la manière dont le droit de l'UE devait être interprété en ce qui concerne les enfants, à savoir l'affaire *Dynamic Medien*. Cette affaire portait sur la légalité de restrictions en matière d'étiquetage imposées par l'Allemagne en ce qui concerne des DVD et vidéos qui avaient déjà fait l'objet de contrôles similaires au Royaume-Uni. La CJUE a conclu que les contrôles allemands concernant l'étiquetage constituaient une restriction légale aux dispositions de l'UE relatives à la libre circulation des marchandises (qui, autrement, s'opposent à toute double procédure réglementaire de ce type), étant donné qu'ils visaient à protéger le bien-être des enfants. La CJUE a étayé sa décision en se référant à l'article 17 de la CRC, qui encourage les États signataires à élaborer des principes directeurs appropriés destinés à protéger l'enfant contre l'information et les matériels médiatiques qui nuisent à son bien-être[47]. Les exigences en matière de proportionnalité

46 Voir CJUE, C-413/99, *Baumbast et R c. Secretary of State for the Home Department*, 17 septembre 2002 ; CJUE, C-200/02, *Kunqian Catherine Zhu et Man Lavette Chen c. Secretary of State for the Home Department*, 19 octobre 2004 ; CJUE, C-148/02, *Carlos Garcia Avello c. État belge*, 2 octobre 2003 ; CJUE, C-310/08, *London Borough of Harrow c. Nimco Hassan Ibrahim et Secretary of State for the Home Department* [GC], 23 février 2010 ; CJUE, C-480/08, *Maria Teixeira c. London Borough of Lambeth et Secretary of State for the Home Department*, 23 février 2010. Ces affaires sont examinées aux chapitres 8 et 9.

47 CJUE, C-244/06, *Dynamic Medien Vertriebs GmbH c. Avides Media AG*, 14 février 2008, points 42 et 52.

s'appliquent toutefois en ce qui concerne les procédures d'examen mises en place pour protéger les enfants, qui doivent être facilement accessibles et réalisables dans un délai raisonnable [48].

Dans les autres affaires, la CJUE a fait allusion aux principes généraux en matière de droits de l'enfant, qui sont également consacrés dans les dispositions de la CRC (tels que l'intérêt supérieur de l'enfant et le droit d'être entendu) pour guider ses arrêts, notamment dans le cadre des affaires d'enlèvement transfrontaliers d'enfants[49].

Mis à part cela, l'UE a toujours fait preuve de circonspection s'agissant de conférer un caractère décisif à la CRC, notamment dans les domaines politiquement sensibles tels que le contrôle de l'immigration[50], même si la situation est en train d'évoluer dans la jurisprudence récente, comme nous le verrons dans les chapitres qui suivent. Depuis l'adoption de la Charte des droits fondamentaux de l'Union européenne, les références de la CJUE aux articles de la Charte concernant les droits de l'enfant trouvent souvent écho dans des références à la CRC, étant donné les similitudes entre les dispositions.

1.4.2. La Cour européenne des droits de l'homme

La Cour européenne des droits de l'homme (CouEDH) statue principalement sur des demandes individuelles déposées conformément aux articles 34 et 35 de la Convention européenne des droits de l'homme (CEDH). La compétence de la CouEDH s'étend à toutes les questions concernant l'interprétation et l'application de la CEDH et de ses protocoles (article 32 de la CEDH.).

Contrairement à la CJUE, la CouEDH dispose d'une vaste jurisprudence sur les droits de l'enfant. Bien que de nombreuses affaires relevant de l'article 8 de la CEDH, relatif au respect de la vie privée et familiale, soient considérées du point de vue des droits des parents plutôt que des droits de l'enfant, des affaires relevant d'autres dispositions de fond ne concernent pas nécessairement les parents et sont plus clairement axées sur les droits des enfants concernés, telles que

48 *Ibid.*, points 49 et 50.

49 CJUE, C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz*, 22 décembre 2010. Voir le chapitre 5.

50 CJUE, C-540/03, *Parlement européen c. Conseil de l'Union européenne* [GC], 27 juin 2006.

celles liées à la protection contre les peines ou traitements inhumains ou dégradants (article 3 de la CEDH) ou le droit à un procès équitable (article 6 de la CEDH).

Bien que la CouDEH se réfère souvent à la CRC lors de l'examen des requêtes déposées par des enfants ou au nom de ceux-ci, elle n'y accorde pas systématiquement un poids décisif. Dans certaines affaires, les principes en matière de droits de l'enfant tels qu'ils sont exposés par la CRC ont eu une profonde influence sur le raisonnement de la CouDEH, notamment en ce qui concerne l'interprétation que la Cour a donnée de l'article 6 de la CEDH (droit à un procès équitable) en ce qui concerne le traitement des enfants en conflit avec la loi (voir le chapitre 11). Dans d'autres domaines, l'approche de la CouEDH peut varier légèrement de celle de la CRC, par exemple en ce qui concerne l'audition des enfants devant les tribunaux (voir le chapitre 2). Dans certains cas enfin, la CouEDH a explicitement invoqué la CRC.

Exemple : L'affaire *Maslov c. Autriche*[51] concerne l'expulsion du requérant, qui avait été condamné pour un certain nombre d'infractions pénales en tant que mineur. La CouEDH a estimé que, en ce qui concerne les mesures d'expulsion à l'égard d'un délinquant juvénile, l'obligation de prendre en considération l'intérêt de l'enfant exigeait aussi de faciliter la réintégration de celui-ci, conformément à l'article 40, de la CRC. De l'avis de la Cour, ce but ne peut pas être atteint si les liens familiaux et sociaux sont rompus par l'expulsion[52]. La CRC est donc un des motifs invoqués pour constater que l'expulsion était une interférence disproportionnée avec les droits du requérant au titre de l'article 8 de la CEDH (respect de la vie familiale).

1.5. Comité européen des droits sociaux

Le CEDS se compose de 15 experts indépendants et impartiaux que se prononcent sur la conformité de la réglementation et des pratiques nationales avec la CSE, soit par la procédure des réclamations collectives soit par la procédure des rapports nationaux[53]. Les organisations nationales et internationales désignées peuvent déposer des réclamations collectives à l'encontre des États parties à la CSE qui

51 CouEDH, *Maslov c. Autriche* [GC], n° 1638/03, 23 juin 2008.

52 *Ibid.*, point 83.

53 Pour plus d'informations, veuillez consulter le site web du CEDS : www.coe.int/t/dghl/monitoring/socialcharter/ecsr/ecsrdefault_FR.asp?.

ont accepté la procédure de réclamation. À ce jour, les réclamations ont concerné la question de savoir si les États ont violé les droits de l'enfant au titre de la CSE sur des questions telles que l'exploitation économique des enfants[54], l'intégrité physique des enfants[55], les droits des enfants migrants en matière de santé[56] et l'accès à l'éducation pour les enfants handicapés[57].

Exemple : Dans l'affaire *Commission internationale de juristes (CIJ) c. Portugal*[58], il était allégué que, bien que la législation portugaise respecte l'âge minimal de 15 ans pour l'admission à l'emploi établi à l'article 7, paragraphe 1, de la Charte sociale européenne, celle-ci n'était pas correctement mise en œuvre. Le CEDS a considéré que l'objet et la finalité de la CSE était de protéger les droits non seulement en théorie mais également dans la pratique, et donc que la législation devait par conséquent être appliquée de manière effective. Constant que de nombreux enfants travaillaient illégalement au Portugal, il a jugé que cette situation constituait une violation de l'article 7, paragraphe 1, de la CSE.

UE	Questions traitées	CdE
Charte des droits fondamentaux, article 24 (droits de l'enfant) CJUE, C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz*, 2010 (droit à être entendu, enlèvement d'enfant international)	**Droit à être entendu**	CouEDH, article 6 (droit à un procès équitable) Convention européenne sur l'exercice des droits des enfants, articles 3, 4, 6 et 7 CouEDH, *Sahin c. Allemagne* [GC], n° 30943/96, 2003 (audition d'un enfant par un tribunal dans une procédure d'accès)
Charte des droits fondamentaux, article 12 (liberté de réunion et d'association)	**Droit à la liberté de réunion et d'association**	CouEDH, article 11 (liberté de réunion pacifique et d'association) CouEDH, *Parti populaire démocrate-chrétien c. Moldova*, n° 28793/02, 2006 (participation à des rassemblements dans des lieux publics)

Toute personne jouit des droits civils et des libertés inscrits dans les divers instruments, principalement dans la Charte des droits fondamentaux de l'Union européenne et dans la Convention européenne des droits de l'homme (CEDH), telle qu'elle est interprétée par la Cour européenne des droits de l'homme (CouEDH). Outre la Charte, aucun autre instrument juridique de l'Union européenne ne traite spécifiquement des droits civils abordés dans le présent chapitre dans la mesure où ceux-ci s'appliquent aux enfants. Toutefois, au niveau du Conseil de l'Europe, et plus particulièrement au moyen de la jurisprudence de la CouEDH, la portée et l'interprétation de ces droits civils se sont considérablement développées au fil du temps.

Le présent chapitre présente un aperçu des libertés énumérées au Titre II de la Charte des droits fondamentaux de l'Union européenne pour autant qu'elles aient une incidence sur les droits des enfants. Il analyse le droit de l'enfant à la liberté de pensée, de conscience et de religion (section 2.1), à la liberté d'expression et d'information (section 2.3), le droit de l'enfant à être entendu (section 2.4) et son droit à la liberté de réunion et d'association (section 2.5).

2.1. Liberté de pensée, de conscience et de religion

Points clés

- La liberté de pensée, de conscience et de religion, telle qu'elle est garantie par la Charte des droits fondamentaux et par la CEDH, inclut le droit à changer de religion ou de conviction, ainsi que la liberté de manifester sa religion ou sa conviction par le culte, l'enseignement, les pratiques et l'accomplissement des rites.
- Les parents ont le droit d'assurer l'éducation et l'enseignement de leurs enfants conformément à leurs convictions religieuses, philosophiques et pédagogiques.
- Les parents ont le droit et le devoir de guider l'enfant dans l'exercice de son droit à la liberté de pensée, de conscience et de religion d'une manière qui corresponde au développement des capacités de l'enfant.

2.1.1. Le droit de l'enfant à la liberté de religion

Dans le droit de l'UE, l'article 10 de la Charte des droits fondamentaux de l'Union européenne garantit à toute personne le droit à la liberté de pensée, de conscience et de religion. Ce droit implique la liberté de changer de religion ou de conviction, ainsi que la liberté de manifester sa religion ou sa conviction individuellement ou collectivement, en public ou en privé, par le culte, l'enseignement, les pratiques et l'accomplissement des rites. Le droit à l'objection de conscience est reconnu selon les lois nationales qui en régissent l'exercice (article 10, paragraphe 2).

Dans le droit du CdE, l'article 9 de la CEDH prévoit le droit à la liberté de pensée, de conscience et de religion. Trois dimensions du droit à la liberté de religion ont été distillées dans la jurisprudence de la CouEDH : la dimension interne, la liberté de changer de religion ou de conviction et la liberté de manifester sa religion ou sa conviction. Les deux premières dimensions sont absolues et les États ne peuvent en aucun cas les restreindre[59]. La liberté de manifester sa religion ou ses convictions ne peut faire l'objet de restrictions que si celles-ci, prévues par la loi, constituent des mesures nécessaires dans une société démocratique (article 9, paragraphe 2, de la CEDH).

59 CouEDH, *Darby c. Suède*, n° 11581/85, 23 octobre 1990.

Dans sa jurisprudence, la CouEDH s'est penchée sur la question de la liberté de pensée, de conscience et de religion des enfants, principalement du point de vue du droit à l'éducation et du système scolaire public. La religion dans les écoles est un sujet faisant l'objet d'un débat public très animé dans les pays européens.

Exemple : les affaires *Dogru c. France* et *Kervanci c. France*[60] concernent l'exclusion d'un collège français de deux filles de 11 et 12 ans ayant refusé d'enlever leur foulard durant les cours d'éducation physique. La CouEDH a observé que la limitation du droit des requérantes à manifester leur conviction religieuse avait pour finalité de préserver les impératifs de la laïcité dans l'espace public scolaire. La CouEDH a estimé que la conclusion des autorités nationales, selon laquelle le port d'un voile, tel que le foulard islamique, n'est pas compatible avec la pratique du sport pour des raisons de sécurité et d'hygiène, n'était pas déraisonnable dans la mesure où l'école a mis en balance les convictions religieuses des requérantes et les exigences liées à la protection des droits et libertés des autres et de l'ordre public. Par conséquent, elle a conclu que l'ingérence dans l'exercice du droit des élèves à manifester leur religion était justifiée et proportionnée au but poursuivi. Elle n'a dès lors constaté aucune violation de l'article 9 de la CEDH.

Exemple : l'affaire *Grzelak c. Pologne*[61] concerne le cas d'une école n'ayant dispensé aucun cours d'éthique à un élève exempté d'instruction religieuse et l'ayant ainsi privé des notes liées à ce cours. Pendant toute sa scolarité primaire et secondaire (entre 7 et 18 ans), le requérant n'a reçu aucune instruction religieuse, conformément au souhait de ses parents, qui s'étaient déclarés agnostiques. Les élèves intéressés étant trop peu nombreux, aucun cours d'éthique n'a jamais été organisé et la note relative au cours de « religion/éthique » a ainsi été remplacée par une barre sur les bulletins et certificats scolaires de cet élève. D'après la CouEDH, l'absence d'une note pour le cours de « religion/éthique » sur les bulletins scolaires de l'élève relevait de l'aspect négatif de la liberté de pensée, de conscience et de religion, car les bulletins pouvaient mettre en évidence son absence d'appartenance religieuse. Elle s'apparentait dès lors à une forme de stigmatisation injustifiée. La différence de traitement entre les non-croyants qui

60 CouEDH, *Dogru c. France*, n° 27058/05, 4 décembre 2008 ; CouEDH, *Kervanci c. France*, n° 31645/04, 4 décembre 2008.

61 CouEDH, *Grzelak c. Pologne*, n° 7710/02, 15 juin 2010.

veulent suivre des cours d'éthique et les élèves qui suivent des cours religieux n'était donc pas objectivement et raisonnablement justifiée et il n'existait aucun lien raisonnable de proportionnalité entre les moyens utilisés et le but poursuivi. Dans cette affaire, l'État a outrepassé sa marge d'appréciation puisqu'il a été porté atteinte à l'essence même du droit du requérant à ne pas manifester sa religion ou sa conviction, en violation de l'article 14 de la CEDH, lu en combinaison avec l'article 9 de la CEDH.

2.2. Droits des parents et liberté de religion de leurs enfants

Les droits des parents dans le contexte de la liberté de religion de leurs enfants sont traités différemment dans le droit européen et dans la CRC.

En vertu du droit de l'UE, il convient de respecter le droit des parents d'assurer l'éducation et l'enseignement de leurs enfants conformément à leurs convictions religieuses, philosophiques et pédagogiques, en particulier dans le contexte de la liberté de créer des établissements d'enseignement (article 14, paragraphe 3, de la Charte).

En vertu du droit du CdE, en particulier de l'article 2 du Protocole n° 1 de la CEDH, les États doivent tenir compte des convictions (religieuses) des parents dans l'exercice des fonctions qu'ils assument dans le domaine de l'éducation et de l'enseignement. D'après la CouEDH, ce devoir est large, car il s'applique non seulement au contenu et à l'application des programmes scolaires, mais aussi à l'exercice de toutes les fonctions dévolues à un État.[62] Il couvre l'organisation et le financement de l'enseignement public, la définition et l'aménagement du programme des études, la diffusion d'informations ou de connaissances contenues dans le programme scolaire de manière objective, critique et pluraliste (interdisant donc l'État de poursuivre un but d'endoctrinement qui puisse être considéré comme ne respectant pas les convictions religieuses et philosophiques des parents), ainsi que l'aménagement de l'environnement scolaire, y compris la présence de crucifix dans des classes d'écoles publiques.

62 Voir la jurisprudence pertinente de la CouEDH : CouEDH, *Kjeldsen, Busk Madsen et Pedersen c. Danemark*, n° 5095/71, 5920/72 et 5926/72, 7 décembre 1976 ; CouEDH, *Valsamis c. Grèce*, n° 21787/93, 18 décembre 1996 ; CouEDH, *Folgerø et autres c. Norvège* [GC], n° 15472/02, 29 juin 2007 ; CouEDH, *Hasan et Eylem Zengin c. Turquie*, n° 1448/04, 9 octobre 2007 ; CouEDH, *Lautsi et autres c. Italie* [GC], n° 30814/06, 18 mars 2011.

Exemple : l'affaire *Lautsi et autres c. Italie*[63] concerne la présence de crucifix dans des salles de classe d'écoles publiques. Un parent s'est plaint de la présence de crucifix dans les salles de classes de l'école publique fréquentée par ses enfants, affirmant qu'elle enfreint le principe de laïcité selon lequel elle s'efforce d'éduquer ses enfants. La Grande Chambre de la CouEDH a conclu qu'il incombait à l'État, dans le cadre des fonctions qu'il assume dans le domaine de l'éducation et de l'enseignement, de décider si des crucifix doivent être placés dans les salles de classe des écoles publiques et que cette question relève du champ d'application de la seconde phrase de l'article 2 du Protocole n° 1 de la CEDH. La Cour a affirmé que cette décision relevait en principe de la marge d'appréciation de l'État défendeur et qu'il n'y avait pas de consensus européen sur la question de la présence de symboles religieux dans les écoles publiques. La présence du crucifix dans les salles de classe des écoles publiques – lequel renvoie indubitablement au christianisme – donne à la religion majoritaire du pays une visibilité prépondérante dans l'environnement scolaire. Cela ne suffit toutefois pas en soi pour caractériser une démarche d'endoctrinement de la part de l'État défendeur. Aux yeux de la CouEDH, un crucifix apposé sur un mur est un symbole essentiellement passif, auquel on ne saurait attribuer une influence sur les élèves comparable à celle que peut avoir un discours didactique ou la participation à des activités religieuses. En conséquence, la Grande Chambre a conclu qu'en décidant de maintenir les crucifix dans les salles de classe de l'école publique fréquentées par les enfants de la requérante, les autorités ont agi dans les limites de leur marge d'appréciation et ont donc respecté le droit des parents d'assurer cette éducation et cet enseignement conformément à leurs convictions religieuses et philosophiques.

Au titre du droit international, l'article 14, paragraphe 2, de la CRC exige des États parties qu'ils respectent le droit et le devoir des parents de guider celui-ci dans l'exercice de son droit à la liberté de pensée, de conscience et de religion d'une manière qui corresponde au développement de ses capacités. Dès lors, contrairement à l'article 14, paragraphe 3, de la Charte des droits fondamentaux, la CRC concerne l'exercice du droit à la liberté de l'enfant lui-même. Au titre de la CRC, les parents ont le droit de guider et d'orienter l'enfant non conformément à leurs propres convictions, mais conformément aux convictions des enfants. Le libellé de l'article 14, paragraphe 2, de la CRC va dans le sens de la conception générale

63 CouEDH, *Lautsi et autres c. Italie* [GC], n° 30814/06, 18 mars 2011.

des responsabilités parentales de la CRC, qui établit que les responsabilités parentales doivent être exercées d'une manière qui corresponde au développement des capacités de l'enfant (article 5 de la CRC) et qui est guidée avant tout par l'intérêt supérieur de l'enfant (article 18, paragraphe 1, de la CRC).

2.3. Liberté d'expression et d'information

Points clés

- Tant la Charte des droits fondamentaux de l'UE que la CEDH garantissent la liberté d'expression, qui comprend la liberté d'opinion et la liberté de recevoir ou de communiquer des informations ou des idées sans qu'il puisse y avoir ingérence d'autorités publiques.
- Le droit à la liberté d'information ne comprend pas le droit d'accès aux dossiers concernant la garde d'enfants.
- La fourniture de l'accès aux dossiers relatifs à la garde d'enfants, moyennant l'accord du fournisseur d'informations, peut être compatible avec l'article 8 (droit au respect de la vie privée et familiale) de la CRC, à condition que la décision finale sur l'accès revienne à l'autorité indépendante.

Dans le droit de l'UE, le droit à la liberté d'expression comprend la liberté d'opinion et la liberté de recevoir ou de communiquer des informations ou des idées sans qu'il puisse y avoir ingérence d'autorités publiques et sans considération de frontières (article 11 de la Charte des droits fondamentaux).

Dans le droit du CdE, la liberté d'expression est garantie par l'article 10 de la CEDH et ne peut faire l'objet de restrictions que si celles-ci sont prévues par la loi et constituent des mesures nécessaires, dans une société démocratique, à la réalisation d'un des objectifs légitimes énumérés à l'article 10, paragraphe 2.

Dans sa jurisprudence, la CouEDH a souligné que « [l]a liberté d'expression constitue l'un des fondements essentiels [d'une] société [démocratique], l'une des conditions primordiales de son progrès et de l'épanouissement de chacun. Elle vaut non seulement pour les "informations" ou "idées" accueillies avec faveur

ou considérées comme inoffensives ou indifférentes, mais aussi pour celles qui heurtent, choquent ou inquiètent l'État ou une fraction quelconque de la population ».[64]

Exemple : dans l'affaire *Handyside c. Royaume-Uni*[65], la CouEDH a établi qu'une interdiction imposée par les autorités d'un livre intitulé *The Little Red Schoolbook* était conforme à l'exception prévue à l'article 10, paragraphe 2, de la CEDH relatif à la protection de la morale. L'affaire traite du droit à recevoir des informations adaptées à l'âge et à la maturité de l'enfant, un aspect du droit à la liberté d'expression qui est particulièrement pertinent pour les enfants. Le livre, traduit du danois, a été écrit pour des écoliers et abordait toute une série de normes sociales, dont la sexualité et les drogues. Des jeunes traversant une phase critique de leur développement pouvaient interpréter certains passages du livre comme un encouragement à se livrer à des expériences précoces et nuisibles pour eux, voire à commettre certaines infractions pénales. Par conséquent, selon la CouEDH, les magistrats anglais compétents « étaient en droit de croire à l'époque, dans l'exercice de leur pouvoir d'appréciation, que le Schoolbook aurait des répercussions néfastes sur la moralité de beaucoup des enfants et adolescents qui le liraient »[66].

Parmi les autres affaires concernant des enfants et faisant référence à l'article 10 de la CEDH, on retrouve des affaires qui portent sur le droit à l'accès à des informations relatives à des enfants placés.

Exemple : L'affaire *Gaskin c. Royaume-Uni*[67] concerne une personne qui a été placée pendant la majeure partie de son enfance, période durant laquelle l'autorité locale a conservé des dossiers confidentiels. Parmi ces dossiers figuraient des rapports rédigés par des médecins, des enseignants, des officiers de police et agents de probation, des travailleurs sociaux, des visiteurs de santé, des parents nourriciers et des membres du personnel d'établissements scolaires. Lorsque le requérant a voulu accéder à ces dossiers dans le cadre d'une instance en justice pour dommages corporels à l'encontre de

64 Voir, par exemple, CouEDH, *Handyside c. Royaume-Uni*, n° 5493/72, 7 décembre 1976, para. 49.

65 *Ibid.*

66 *Ibid.*, para. 52.

67 CouEDH, *Gaskin c. Royaume-Uni*, n° 10454/83, 7 juillet 1989.

l'autorité locale, cet accès lui a été refusé. La confidentialité de ces dossiers avait été garantie dans l'intérêt public à un fonctionnement adéquat des services d'aide à l'enfance, qui se trouverait sinon menacé car les informateurs hésiteraient à rédiger leurs rapports en toute franchise. De l'avis de la CouEDH, les personnes ayant été placées durant leur enfance ont un intérêt primordial « à recevoir les renseignements qu'il leur faut pour connaître et comprendre leur enfance et leurs années de formation »[68]. S'il convient de garantir le caractère confidentiel des dossiers officiels, un système qui subordonne l'accès aux dossiers à l'acceptation des informateurs, comme au Royaume-Uni, peut en principe être tenu pour compatible avec l'article 8 de la CEDH si les intérêts de quiconque cherche à consulter des dossiers sont sauvegardés au cas où un informateur ne répond pas ou ne donne pas son consentement. Dans un tel cas, il doit exister un organe indépendant chargé de prendre la décision finale sur l'accès. Aucune procédure de ce type n'était à la disposition du requérant en l'espèce et la Cour a conclu à une atteinte aux droits du requérant au titre de l'article 8 de la CEDH. Toutefois, la Cour n'a observé aucune violation de l'article 10 de la CEDH et a répété que la liberté de recevoir des informations interdit essentiellement à un gouvernement d'empêcher quelqu'un de recevoir des informations que d'autres aspirent ou peuvent consentir à lui fournir, mais n'oblige pas un État à communiquer à l'intéressé les renseignements dont il s'agit.

2.4. Droit à être entendu

Points clés

- En vertu du droit de l'UE, les enfants ont le droit d'exprimer leur opinion librement. Celle-ci est prise en considération pour les sujets qui les concernent, en fonction de leur âge et de leur maturité.
- La CEDH ne prévoit aucun droit absolu des enfants à être entendus par les tribunaux. Cette exigence doit être établie à la lumière des circonstances spécifiques de l'espèce et dépend de l'âge et de la maturité de l'enfant.
- Au titre du droit des Nations Unies, le droit de l'enfant d'exprimer librement son opinion sur toute question l'intéressant a été reconnu comme l'un des principes généraux de la Convention des droits de l'enfant.

68 *Ibid.*, para. 49.

Dans le droit de l'UE, l'article 24, paragraphe 1, de la Charte des droits fondamentaux prévoit que les enfants peuvent exprimer leur opinion librement et que celle-ci est prise en considération pour les sujets qui les concernent, en fonction de leur âge et de leur maturité. Cette disposition est de portée générale et ne se limite pas à des procédures précises. La CJUE a interprété cette disposition en rapport avec le règlement Bruxelles II bis.

> Exemple : l'affaire *Joseba Andoni Aguirre Zarraga c. Simone Pelz*[69] concerne le déplacement d'un enfant mineur de l'Espagne vers l'Allemagne, en violation de la décision relative à la garde de l'enfant. Il a été demandé à la Cour de justice si la juridiction allemande (c'est-à-dire celle du pays où l'enfant a été emmené) pouvait s'opposer à l'exécution d'une décision rendue par un tribunal espagnol (le pays d'origine) sur le base du fait que l'enfant n'a pas été entendu, ce qui enfreint l'article 42, paragraphe 2, point a), du règlement (CE) n° 2201/2003 (règlement Bruxelles II bis) et l'article 24 de la Charte des droits fondamentaux. L'enfant s'était opposée à son retour lorsqu'elle avait exprimé son opinion au cours de la procédure devant le tribunal allemand. La Cour de justice a établi que l'audition d'un enfant ne peut pas constituer une obligation absolue, mais si le tribunal décide qu'elle est nécessaire, il doit offrir à l'enfant une possibilité réelle et effective de s'exprimer. Elle a également considéré que le droit de l'enfant à être entendu, tel qu'il est prévu dans la Charte et dans le règlement Bruxelles II bis, exige que les procédures et conditions légales permettant à celui-ci d'exprimer librement son opinion soient mises à sa disposition et que cette opinion soit recueillie par le juge. Le juge doit prendre toutes les mesures appropriées en vue d'une telle audition, en fonction de l'intérêt supérieur de l'enfant et eu égard aux circonstances de chaque cas d'espèce. Selon l'arrêt de la CJUE, les autorités du pays où l'enfant a été emmené (l'Allemagne) ne peuvent toutefois pas s'opposer au retour de l'enfant sur la base d'une infraction au droit à être entendu commise dans le pays d'origine (l'Espagne).

Au titre du droit du CdE, la CouEDH n'interprète pas le droit au respect de la vie privée et familiale (article 8 de la CEDH) en ce sens qu'elle exige toujours que l'enfant soit entendu en audience. Il revient en principe aux juridictions nationales

69 CJUE, C-491/10 PPU, *Joseba Andoni Aguirre Zarraga c. Simone Pelz*, 22 décembre 2010 ; voir également la section 5.4, qui aborde plus en détails cet arrêt et le fonctionnement du règlement Bruxelles II bis.

d'apprécier les éléments rassemblés par elles, y compris la manière dont les faits pertinents ont été établis. Les tribunaux nationaux ne sont pas toujours tenus d'entendre un enfant en audience lorsqu'est en jeu le droit de visite d'un parent n'exerçant pas la garde. La question doit être appréciée en fonction des circonstances particulières de chaque affaire et compte dûment tenu de l'âge et de la maturité de l'enfant concerné. En outre, la CouEDH garantira souvent, dans le cadre de la branche procédurale de l'article 8, que les autorités prennent les mesures appropriées pour accompagner leurs décisions des garanties nécessaires.

Exemple : dans l'affaire *Sahin c. Allemagne*[70], la mère a interdit tout contact entre le requérant et sa fille de quatre ans. Le tribunal régional allemand a décidé que l'octroi au père de l'accès à sa fille serait préjudiciable à l'enfant en raison des graves tensions entre ses parents. Elle a pris cette décision sans demander à l'enfant si elle voulait continuer à voir son père. Sur la question de l'audition de l'enfant, la CEDH a fait référence à l'explication de l'expert devant le tribunal régional allemand. Après avoir à plusieurs reprises rencontré l'enfant, sa mère et le requérant, l'expert a expliqué que le fait même d'interroger l'enfant comportait pour celle-ci un risque que la prise de dispositions spéciales durant l'audience ne pouvait éviter. La CouEDH a établi que, dans ces circonstances, les exigences procédurales inhérentes à l'article 8 de la CEDH d'entendre un enfant en audience n'impliquaient pas d'imposer l'interrogatoire direct de l'enfant sur sa relation avec son père.

Exemple : dans l'affaire *Sommerfeld c. Allemagne*[71], la fille du requérant âgée de 13 ans avait clairement exprimé, et ce depuis plusieurs années, le souhait de ne pas rencontrer le requérant. Les tribunaux nationaux étaient d'avis que contraindre cette jeune fille à voir le requérant perturberait gravement son équilibre émotionnel et psychologique. La CouEDH a admis que le processus décisionnel avait assuré au requérant la protection requise de ses intérêts[72].

70 CouEDH, *Sahin c. Allemagne* [GC], n° 30943/96, 8 juillet 2003, para. 73. Sur l'aspect spécifique relatif à l'obligation incombant aux tribunaux nationaux d'apprécier les éléments de preuve qu'ils recueillent, ainsi que la pertinence des éléments de preuve que les défendeurs cherchent à apporter, voir l'arrêt de la CouEDH dans l'affaire *Vidal c. Belgique*, n° 12351/86, 22 avril 1992, para. 33.

71 CouEDH, *Sommerfeld c. Allemagne* [GC], n° 31871/96, 8 juillet 2003.

72 *Ibid*., paras. 72 et 88.

La Convention européenne sur l'exercice des droits des enfants évoque le droit des enfants à exprimer librement leur opinion[73]. Cette convention vise à promouvoir les droits des enfants en leur accordant des droits procéduraux dans les procédures familiales devant une autorité judiciaire, en particulier celles relatives à l'exercice des responsabilités parentales, s'agissant notamment de la résidence et du droit de visite à l'égard des enfants. L'article 3 de la Convention accorde aux enfants le droit procédural d'être informé et d'exprimer son opinion dans les procédures. L'article 4 confère à l'enfant le droit de demander la désignation d'un représentant spécial dans les procédures l'intéressant devant une autorité judiciaire. Conformément à l'article 6, les autorités doivent s'assurer que l'enfant a reçu toute information pertinente, consulter l'enfant personnellement, si nécessaire, et permettre à l'enfant d'exprimer son opinion.

Au titre du droit international, l'article 12, paragraphe 1, de la CRC établit qu'un enfant qui est capable de discernement a le droit d'exprimer librement son opinion sur toute question l'intéressant. Les opinions de l'enfant sont dûment prises en considération eu égard à son âge et à son degré de maturité. L'article 12, paragraphe 2, de la CRC dispose en outre qu'il convient de donner à l'enfant la possibilité d'être entendu dans toute procédure judiciaire ou administrative l'intéressant, soit directement, soit par l'intermédiaire d'un représentant ou d'une organisation approprié, de façon compatible avec les règles de procédure du droit national.

Le Comité des droits de l'enfant des Nations Unies a souligné que les États parties devaient soit garantir directement ce droit, soit adopter ou réviser des lois garantissant que l'enfant puisse pleinement bénéficier de ce droit[74]. En outre, ils doivent garantir que l'enfant reçoit toutes les informations et tous les conseils nécessaires pour lui permettre de prendre une décision dans son intérêt supérieur. Le Comité souligne également que l'enfant est autorisé à ne pas exercer ce droit ; l'expression d'une opinion est un choix laissé à l'enfant et non une obligation qui lui incombe.

73 CdE, Convention européenne sur l'exercice des droits des enfants, STCE n° 160, 1996.

74 ONU, Comité des droits de l'enfant, *Observation générale n° 14 (2013) sur le droit de l'enfant à ce que son intérêt supérieur soit une considération primordiale (art. 3, para. 1)*, CRC/C/GC/14.

2.5. Droit à la liberté de réunion et d'association

Points clés

- Tant la Charte des droits fondamentaux de l'UE que la CEDH garantissent la liberté de réunion pacifique et d'association.
- Ce droit autorise les personnes à défendre leur cause avec d'autres et les protège dans cette action.

Dans le droit de l'UE, l'article 12 de la Charte des droits fondamentaux prévoit que toute personne a droit à la liberté de réunion pacifique et à la liberté d'association à tous les niveaux, notamment dans les domaines politique, syndical et civique, ce qui implique le droit de toute personne de fonder avec d'autres des syndicats et de s'y affilier pour la défense de ses intérêts.

Dans le droit du CdE, l'article 11, paragraphe 1, de la CEDH garantit le droit à la liberté de réunion et d'association sous réserve des restrictions énoncées à l'article 11, paragraphe 2.

La CouEDH a explicitement reconnu le droit des enfants à prendre part à des rassemblements dans des lieux publics. Comme elle l'a observé dans l'affaire *Parti populaire démocrate-chrétien c. Moldova*, il semblerait aller à l'encontre de la liberté de réunion des parents et des enfants que d'empêcher ces derniers de participer à des rassemblements qui visent, en particulier, à contester la politique du gouvernement en matière d'enseignement.

Au titre du droit international, les enfants ainsi que les organisations d'enfants peuvent s'appuyer sur la protection prévue par l'article 15 de la CRC, qui contient le droit à la liberté d'association et de réunion pacifique. De nombreuses formes associatives impliquant des enfants ont bénéficié d'une protection internationale à cet égard.

3 Égalité et non-discrimination

UE	Questions traitées	CdE

UE	Questions traitées	CdE
Directive relative à l'égalité en matière d'emploi (2000/78/CE)	Non-discrimination fondée sur l'âge	CEDH, article 14 ; Protocole n° 12 à la CEDH, article 1 (non-discrimination)
CJUE, C-303/06, *S. Coleman c. Attridge Law et Steve Law* [GC], 2008	Non-discrimination fondée sur d'autres motifs protégés	CouEDH, *Fabris c. France* [GC], n° 16574/08, 2013 (droits de succession des enfants nés hors mariage)

L'absence de discrimination est l'un des principes fondamentaux d'une société démocratique. Tant l'Union européenne que le Conseil de l'Europe ont joué un rôle déterminant dans l'interprétation de ce principe. Les institutions de l'UE ont adapté une série de directives qui sont particulièrement pertinentes dans les affaires impliquant des enfants. La CouEDH s'est constituée une importante jurisprudence portant sur le droit de ne pas subir de discrimination au titre de l'article 14 de la CEDH relatif à l'interdiction de discrimination, lu conjointement avec d'autres articles de la Convention.

Le Comité européen des droits sociaux (CEDS) considère que la fonction de l'article E de la Charte sociale européenne (CSE) relatif à la non-discrimination est similaire à celle de l'article 14 de la CEDH : il n'a pas d'existence indépendante et doit être combiné avec une disposition matérielle de la CSE[75].

Le présent chapitre aborde les principes d'égalité et de non-discrimination et se concentre plus spécifiquement sur les motifs ayant servi à constituer la jurisprudence propre aux enfants. Il fournit d'abord des informations générales sur le droit européen en matière de non-discrimination (section 3.1) et présente ensuite la question de l'égalité et de la discrimination fondée sur l'origine ethnique (section 3.2), la nationalité et la situation au regard de la législation sur l'immigration (section 3.3), l'âge (section 3.4) et d'autres motifs faisant l'objet d'une protection, dont le sexe, la langue et l'identité personnelle (section 3.5).

75 CEDS, *Syndicat des Agrégés de l'Enseignement Supérieur (SAGES) c. France*, n° 26/2004, 15 juin 2005, para. 34.

3.1. Législation européenne en matière de non-discrimination

Points clés

- La législation de l'Union européenne et du Conseil de l'Europe interdit toute discrimination fondée sur le sexe, la race, la couleur, l'origine ethnique ou sociale, les caractéristiques génétiques, la langue, la religion ou les convictions, les opinions politiques ou autres, l'appartenance à une minorité nationale, la fortune, la naissance, le handicap, l'âge ou l'orientation sexuelle[76].
- Lorsque la CouEDH établit que des personnes ont été traitées différemment dans une situation significativement similaire, elle examinera s'il existe une justification objective et raisonnable pour cette différence de traitement. Dans le cas contraire, elle conclura que le traitement était discriminatoire et contraire à l'article 14 de la CEDH relatif à la non-discrimination.

Dans le droit de l'UE, l'interdiction de discrimination prévue à l'article 21 de la Charte des droits fondamentaux de l'UE est un principe autonome qui s'applique également à des situations auxquelles aucune autre disposition de la Charte ne s'applique. Les motifs de discrimination interdits et énumérés dans cette disposition sont les discriminations fondées sur le sexe, la race, la couleur, l'origine ethnique ou sociale, les caractéristiques génétiques, la langue, la religion ou les convictions, les opinions politiques ou autres, l'appartenance à une minorité nationale, la fortune, la naissance, le handicap, l'âge ou l'orientation sexuelle ». En revanche, l'article 19 TFUE couvre uniquement les motifs que sont le sexe, la race ou l'origine ethnique, la religion ou les convictions, un handicap, l'âge ou l'orientation sexuelle.

Plusieurs directives de l'UE interdisent toute discrimination dans les domaines de l'emploi, du système d'aide sociale et des biens et services et elles sont toutes potentiellement pertinentes pour ce qui est des enfants. La directive 2000/78/CE du Conseil du 27 novembre 2000 qui porte création d'un cadre général en faveur de l'égalité de traitement en matière d'emploi et de travail (directive relative

76 Pour un aperçu de la législation européenne relative à la non-discrimination, telle qu'elle est constituée par les directives de l'UE sur la non-discrimination et par l'article 14 et le Protocole n° 12 à la CEDH, voir FRA et CouEDH (2011), et sa jurisprudence mise à jour de juillet 2010 à décembre 2011.

à l'égalité en matière d'emploi)[77] interdit la discrimination fondée sur la religion ou les convictions, le handicap, l'âge ou l'orientation sexuelle. La directive 2000/43/CE du Conseil relative à la mise en œuvre du principe de l'égalité de traitement entre les personnes sans distinction de race ou d'origine ethnique (directive sur l'égalité raciale) interdit la discrimination fondée sur l'origine raciale ou ethnique, non seulement dans le contexte de l'emploi et de l'accès aux biens et services, mais aussi dans le domaine de l'aide sociale (y compris la protection sociale, la sécurité sociale et les soins de santé) et de l'éducation[78]. D'autres directives mettent en œuvre le principe de l'égalité de traitement entre les hommes et les femmes dans le domaine de l'emploi et du travail (directive relative à l'égalité entre les femmes et les hommes)[79] et de l'accès aux biens et services et de la fourniture de biens et services (directive sur l'égalité d'accès aux biens et services)[80].

Au titre du droit du CdE, l'interdiction de toute discrimination s'applique à l'exercice des libertés et droits fondamentaux reconnus dans la CEDH (article 14) ainsi qu'à l'exercice de tout droit garanti par le droit national ou prévu dans toute loi d'une autorité publique (article 1 du Protocole n° 12 à la CEDH). Toutefois, l'applicabilité du Protocole n° 12 est limitée dans la mesure où seul un petit nombre de pays l'ont ratifié et où aucune affaire concernant des enfants n'a été jugée sur la base de ce protocole. Les dispositions contenues dans les deux instruments comprennent une liste non exhaustive des motifs de discrimination qui sont interdits : sexe, race, couleur, langue, religion, l'opinion politique ou toute autre opinion, l'origine nationale ou sociale, l'appartenance à une minorité nationale, la fortune, la naissance ou toute autre situation. Si la CouEDH conclut à l'existence d'une différence de traitement entre des personnes se trouvant dans une situation significativement similaire, elle examinera si cette différence se fonde sur une justification objective et raisonnable[81].

77 Directive 2000/78/CE du Conseil, JO 2000 L 303. Tous les instruments juridiques de l'Union sont disponibles sur EUR-Lex, le portail de l'UE donnant accès au droit de l'UE : http://eur-lex.europa.eu.

79 Directive 2006/54/CE (refonte), JO 2006 L 204.

80 Directive 2004/113/CE du Conseil, JO 2004 L 373, p. 37.

81 Pour un aperçu de la jurisprudence de la CouEDH, voir FRA et CouEDH (2011) et sa jurisprudence mise à jour de juillet 2010 à décembre 2011.

L'article E de la CSE inclut également une liste non exhaustive de motifs de discrimination qui sont interdits : la race, la couleur, le sexe, la langue, la religion, les opinions politiques ou toutes autres opinions, l'ascendance nationale ou l'origine sociale, la santé, l'appartenance à une minorité nationale, la naissance. L'annexe à cet article dispose qu'une justification objective et raisonnable d'une différence de traitement peut être la condition d'âge ou de qualification pour l'accès à certaines formes d'éducation[82], auquel cas la différence de traitement n'est pas considérée comme discriminatoire.

Au titre de l'article 4 de la Convention-cadre pour la protection des minorités nationales (CCPMN)[83], les Parties s'engagent à garantir à toute personne appartenant à une minorité nationale le droit à l'égalité devant la loi et à une égale protection de la loi et interdisent toute discrimination fondée sur l'appartenance à une minorité nationale. Elles s'engagent également à adopter, s'il y a lieu, des mesures adéquates en vue de promouvoir, dans tous les domaines de la vie économique, sociale, politique et culturelle, une égalité pleine et effective entre les personnes appartenant à une minorité nationale et celles appartenant à la majorité.

Les sections suivantes analysent les motifs de discrimination spécifiques qui se sont avérés concerner plus particulièrement les enfants.

3.2. Non-discrimination fondée sur l'origine ethnique ou raciale

Points clés

- L'origine ethnique et la race sont des motifs de discrimination interdits.
- Tant l'Union européenne que le Conseil de l'Europe luttent contre la discrimination des Roms dans les domaines de l'éducation, de l'emploi, des soins de santé et du logement.
- La surreprésentation ou la ségrégation d'enfants appartenant à un groupe ethnique spécifique dans des écoles ou classes spéciales ne peut être fondée sur une justification objective que si des garanties appropriées sont mises en place pour le placement des enfants dans ces écoles ou ces classes.

82 CdE, Charte sociale européenne (révisée) (1996), Rapport explicatif, para. 136.

83 CdE, Convention-cadre pour la protection des minorités nationales (CCPMN), STCE n° 157, 1995.

Dans le droit de l'UE, la directive relative à l'égalité raciale interdit la discrimination fondée sur l'origine ethnique ou raciale non seulement dans le domaine de l'emploi et des biens et services, mais aussi dans l'accès au système de protection sociale, à l'éducation et à la sécurité sociale. Les Roms, groupe ethnique particulièrement vulnérable et de taille importante, relèvent très clairement du champ d'application de la directive. Un élément clé de l'offensive contre la discrimination à l'égard des Roms au niveau de l'UE a été l'adoption d'un cadre de l'UE pour les stratégies nationales d'intégration des Roms pour la période allant jusqu'à 2020[84]. La Commission a ensuite procédé à son suivi annuel des stratégies nationales élaborées par les États membres. La directive relative à l'égalité raciale couvre au moins quatre domaines prioritaires qui sont importants pour les enfants roms : l'éducation, l'emploi, les soins de santé et le logement. L'obtention d'une égalité complète dans la pratique peut, dans certains cas, justifier une action positive au bénéfice des Roms, en particulier dans les quatre domaines prioritaires précités[85].

Dans le droit du CdE, la CouEDH a statué dans plusieurs affaires faisant date qui concernent une différence de traitement des enfants roms dans le système éducatif. Ces affaires ont été analysées sur la base de l'article 14, lu conjointement avec l'article 2 du Protocole n° 1 à la CEDH. La Cour a considéré qu'une surreprésentation ou une ségrégation des enfants roms dans des écoles ou classes spécialisées ne pouvait être justifiée objectivement que si des garanties appropriées étaient mises en place pour le placement des enfants dans ces écoles ou classes, telles que des tests spécifiquement conçus pour les enfants roms et tenant compte de leurs besoins ; une évaluation appropriée et un suivi suffisant des progrès accomplis de manière à garantir une intégration dans des classes ordinaires dès la résolution des difficultés d'apprentissage de l'élève ; et des mesures positives visant à remédier aux difficultés d'apprentissage. En l'absence de mesures visant à lutter contre la ségrégation, prolonger la ségrégation éducative des enfants roms dans une école ordinaire offrant un programme ordinaire ne peut dès lors être justifié[86].

---

84 Commission européenne (2011), *Cadre de l'UE pour les stratégies nationales d'intégration des Roms pour la période allant jusqu'à 2020 : Communication de la Commission au Parlement européen, au Conseil, au Comité économique et social européen et au Comité des régions*, COM(2011) 173 final, Bruxelles, 5 avril 2011.

85 Commission européenne (2014), *Rapport commun sur l'application de la directive 2000/43/CE du 29 juin 2000 relative à la mise en œuvre du principe de l'égalité de traitement entre les personnes sans distinction de race ou d'origine ethnique (directive sur l'égalité raciale) et de la directive 2000/78/CE du 27 novembre 2000 portant création d'un cadre général en faveur de l'égalité de traitement en matière d'emploi et de travail*, Rapport de la Commission au Parlement européen et au Conseil, COM(2014) 2 final, Bruxelles, 17 janvier 2014.

86 CouEDH, *Lavida et autres c. Grèce*, n° 7973/10, 30 mai 2013.

Exemple : dans l'affaire *D.H. et autres c. République tchèque*[87], la Cour a constaté qu'un nombre disproportionné d'enfants roms étaient placés sans raison dans des écoles spéciales pour enfants ayant des difficultés d'apprentissage. La Cour a exprimé des inquiétudes quant au programme de niveau inférieur suivi par ces écoles et quant à la ségrégation engendrée par ce système. Les enfants roms ont par conséquent reçu une éducation qui a accentué leurs difficultés et compromis leur développement personnel ultérieur, au lieu de les aider à intégrer plus tard les écoles ordinaires et à développer les capacités facilitant leur vie au sein de la population majoritaire. En conséquence, la Cour a conclu à l'existence d'une violation de l'article 14 de la Convention, combiné avec l'article 2 du Protocole n° 1 à la Convention.

Exemple : dans l'affaire *Oršuš et autres c. Croatie*[88], la Cour a examiné l'existence de classes réservées aux Roms au sein d'écoles primaires ordinaires. Par principe, le placement temporaire d'enfants dans une classe séparée au motif qu'ils n'ont pas une maîtrise suffisante de la langue n'est pas en soi discriminatoire. Pareil placement peut être vu comme visant à adapter le système éducatif aux besoins particuliers des enfants ayant des difficultés linguistiques. Toutefois, lorsqu'un tel placement touche les membres d'un groupe ethnique spécifique de manière disproportionnée voire exclusive, il faut que des garanties adaptées soient mises en place. En ce qui concerne le placement initial d'enfants dans des classes séparées, la Cour a observé que le placement ne s'inscrivait pas dans le cadre d'une pratique générale destinée à résoudre les difficultés des enfants n'ayant pas une bonne maîtrise de la langue et que les enfants n'ont pas passé de tests portant spécifiquement sur leur connaissance de la langue. Pour ce qui est du programme offert à ces enfants, certains d'entre eux n'ont suivi aucun programme spécifique (c'est-à-dire des cours de langue spéciaux) de nature à les aider à acquérir les compétences linguistiques nécessaires dans le délai le plus court possible. Aucune procédure de transfert et de suivi n'était en place afin d'assurer le transfert immédiat et automatique des enfants roms dans des classes mixtes dès le niveau linguistique adéquat atteint. Par conséquent, la Cour a conclu à l'existence d'une violation de l'article 14 de la CEDH, combiné à l'article 2 du Protocole n° 1.

87 CouEDH, *D.H. et autres c. République tchèque* [GC], n° 57325/00, 13 novembre 2007, paras. 206 à 210.

88 CouEDH, *Oršuš et autres c. Croatie* [GC], n° 15766/03, 16 mars 2010, para. 157.

Le CEDS considère que, si les politiques éducatives à l'égard des enfants roms peuvent aller de pair avec une souplesse des structures qui réponde à la diversité de cette catégorie de la population et tienne compte de ce que certains groupes mènent une existence itinérante ou semi-itinérante, il ne devrait cependant pas y avoir d'écoles séparées pour les enfants roms[89].

Au titre de l'article 4, paragraphes 2 et 3, de la Convention-cadre pour la protection des minorités nationales, les mesures adéquates adoptées en vue de promouvoir une égalité effective des personnes appartenant à une minorité nationale ne sont pas considérées comme un acte de discrimination. Conformément à l'article 12, paragraphe 3, de la CCPMN, les Parties s'engagent en outre expressément à promouvoir l'égalité des chances dans l'accès à l'éducation à tous les niveaux pour les personnes appartenant à des minorités nationales. Le Comité consultatif de la CCPMN s'est régulièrement penché sur la question de l'accès des enfants roms à l'éducation, conformément à cette disposition.[90]

3.3. Non-discrimination fondée sur la nationalité et la situation au regard de la législation sur l'immigration

Points clés

- La protection contre toute discrimination fondée sur la nationalité est plus limitée dans le champ d'application du droit de l'UE que dans celui du droit du Conseil de l'Europe.
- Au titre du droit de l'UE, la protection contre la discrimination fondée sur la nationalité n'est accordée qu'aux citoyens des États membres de l'UE, comme le prévoit l'article 45 (liberté de circulation et de séjour) de la Charte des droits fondamentaux.
- La CEDH garantit la jouissance des droits à toute personne résidant sur le territoire d'un État membre du Conseil de l'Europe.

89 CEDS, Charte sociale européenne (révisée) – Conclusions 2003 (Bulgarie), art. 17, para. 2, p. 71.

90 Voir Comité consultatif de la Convention-cadre pour la protection des minorités nationales (2006), *Commentaire sur l'éducation au regard de la Convention-cadre pour la protection des minorités nationales*, ACFC/25DOC(2006)002.

En vertu du droit de l'UE, la protection contre la discrimination fondée sur la nationalité est particulièrement importante dans le contexte de la libre circulation des personnes. Les ressortissants de pays tiers (c'est-à-dire les citoyens d'un État qui n'est pas membre de l'UE) bénéficient d'un droit à l'égalité de traitement dans plus ou moins les mêmes domaines que ceux couverts par les directives anti-discrimination lorsqu'ils peuvent être qualifiés de « résidents de longue durée ». Pour le pouvoir, la directive relative au statut des ressortissants de pays tiers résidents de longue durée exige, entre autres conditions, un séjour légal de cinq ans[91]. En outre, la directive 2003/86/CE relative au regroupement familial[92] autorise les ressortissants de pays tiers qui vivent légalement dans un État membre à être rejoints par des membres de leur famille, dans certaines conditions (voir également la section 9.5).

Exemple : l'affaire *Chen*[93] concernait la question de savoir si l'enfant d'un ressortissant d'un pays tiers avait le droit de demeurer dans un État membre de l'UE alors qu'il était né dans un autre État membre et qu'il possédait la citoyenneté de ce dernier. Sa mère, dont il dépendait, était une ressortissante d'un pays tiers. La CJUE a considéré que lorsqu'un État membre impose des exigences aux particuliers cherchant à obtenir la citoyenneté et lorsque ces exigences sont satisfaites, il n'appartient pas à un autre État membre de contester ce droit lorsque la mère et l'enfant demandent à bénéficier d'un droit de séjour. La CJUE a maintenu qu'un État membre ne peut refuser un droit de résidence au parent ayant la garde d'un enfant qui est un citoyen de l'UE, car ce refus priverait de tout effet utile le droit de séjour de l'enfant.

Dans le droit du CdE, la CEDH garantit la jouissance des droits à toutes les personnes vivant dans la juridiction d'un État membre du Conseil de l'Europe, qu'il s'agisse de citoyens ou non, y compris à celles vivant au-delà du territoire national, dans des zones qui relèvent du contrôle effectif d'un État membre. En ce qui concerne l'éducation, la CouEDH considère qu'une différence de traitement d'une personne fondée sur sa nationalité et sa situation au regard de la législation sur l'immigration pourrait constituer une discrimination.

91 Directive 2003/109/CE du Conseil du 25 novembre 2003 relative au statut des ressortissants de pays tiers résidents de longue durée, JO 2004 L 16, p. 44.

92 Directive 2003/86/CE du Conseil du 22 septembre 2003 relative au droit au regroupement familial, JO 2003 L 251, p. 12.

93 CJUE, C-200/02, *Kunqian Catherine Zhu et Man Lavette Chen c. Secretary of State for the Home Department*, 19 octobre 2004.

Exemple : l'affaire *Ponomaryovi c. Bulgarie*[94] concerne des ressortissants étrangers sans permis de séjour permanent et devant payer des frais de scolarité pour fréquenter un établissement d'enseignement secondaire. En règle générale, l'ample latitude qui est d'ordinaire laissée à l'État pour prendre des mesures d'ordre général en matière économique et sociale devait être transposée au domaine de l'enseignement, et ce pour deux raisons :

- l'instruction est un droit directement protégé par la CEDH ;
- l'enseignement est un type très particulier de service public, qui sert de nombreux buts sociétaux.

D'après la CouEDH, la marge d'appréciation de l'État dans ce domaine s'accroît avec le niveau d'enseignement de manière inversement proportionnelle à l'importance de celui-ci pour les individus concernés et pour la société dans son ensemble. Si, pour l'enseignement primaire, l'imposition de frais de scolarité (plus élevés) pour les étrangers est difficile à justifier, elle peut être considérée comme pleinement justifiée au niveau universitaire. Compte tenu de l'importance de l'enseignement secondaire pour l'épanouissement personnel et l'intégration socioprofessionnelle, un examen plus attentif de la proportionnalité de la différence de traitement s'applique à ce type d'enseignement. La Cour a expliqué qu'elle n'avait pas besoin de déterminer si un État avait le droit de priver tous les migrants en situation irrégulière de l'accès à l'instruction qu'il offre à ses ressortissants et à certaines catégories restreintes d'étrangers. Dans le cadre de son appréciation des circonstances spécifiques de l'espèce, elle a établi que cette affaire ne relevait pas de « considérations relatives à la nécessité de bloquer ou de renverser le flux d'immigration illégale ». Les requérants n'ont pas essayé d'abuser du système éducatif bulgare, car ils sont arrivés dans le pays alors qu'ils étaient très jeunes parce que leur mère avait épousé un ressortissant bulgare et n'ont eu d'autre choix que de poursuivre leur scolarité en Bulgarie. Partant, il y a eu violation de l'article 14 de la Convention combiné avec l'article 2 du Protocole n° 1.

94 CouEDH, *Ponomaryovi c. Bulgarie*, n° 5335/05, 21 juin 2011, para. 60.

3.4. Non-discrimination fondée sur l'âge

Point clé

- En vertu du droit de l'UE et de la CEDH, toute discrimination fondée sur l'âge est interdite.

Dans le droit de l'UE, la Charte des droits fondamentaux de l'UE mentionne explicitement l'âge en tant que motif de discrimination interdit à l'article 21. L'article 24 inclut les droits de l'enfant parmi les droits fondamentaux protégés. En vertu de la législation actuelle de l'UE en matière de non-discrimination, la protection contre la discrimination fondée sur l'âge est plus limitée que celle contre la discrimination fondée sur la race et l'origine ethnique ou sur le sexe. Aujourd'hui, l'âge n'est protégé que dans le contexte de l'accès à l'emploi, de la même manière que l'orientation sexuelle, le handicap et la religion ou les convictions.

La directive relative à l'égalité en matière d'emploi s'applique aux enfants qui ont légalement le droit de travailler. Alors que la Convention de l'Organisation internationale du travail concernant l'âge minimum d'admission à l'emploi[95], ratifiée par tous les États membres de l'UE, fixe à 15 ans l'âge minimum pour travailler, des différences entre les États membres de l'UE persistent en la matière[96]. D'après l'article 6 de la directive relative à l'égalité en matière d'emploi, les États membres peuvent justifier des différences de traitement fondées sur l'âge. Ces différences de traitement ne constituent pas une discrimination lorsqu'elles sont objectivement et raisonnablement justifiées par un objectif légitime et que les moyens de réaliser cet objectif sont appropriés et nécessaires. Concernant les enfants et les jeunes, ces différences de traitement peuvent notamment comprendre la mise en place de conditions spéciales d'accès à l'emploi et à la formation professionnelle, d'emploi et de travail en vue de favoriser leur insertion professionnelle ou d'assurer leur protection.

Dans le droit du CdE, l'article 14 de la CEDH et l'article 1 du Protocole n° 12 à la CEDH ne mentionnent pas explicitement l'âge parmi les motifs de discrimination qui sont

95 Organisation internationale du travail (1973), Convention concernant l'âge minimum d'admission à l'emploi, n° 138.

96 Réseau européen d'experts juridiques dans le domaine de la non-discrimination, O'Dempsey, D. et Beale, A. (2011), *Age and employment*, Commission européenne, Direction générale de la Justice, Luxembourg, Office des publications.

interdits. Toutefois, la CouEDH a examiné des cas de discrimination fondée sur l'âge en rapport avec différents droits protégés par la CEDH et ainsi analysé l'âge comme relevant de « toute autre situation ». Dans les affaires *D.G. c. Irlande*[97] et *Bouamar c. Belgique*[98], par exemple, la CouEDH a conclu à l'existence d'une différence de traitement entre les adultes et les enfants dans les systèmes juridiques respectifs des pays en ce qui concerne la détention, une différence qui est pertinente pour l'application de la Convention. Cette différence de traitement découlait de la finalité punitive de la détention pour les adultes et de sa finalité préventive pour les enfants. Dès lors, la Cour a accepté l'âge comme un motif de discrimination possible.

3.5. Non-discrimination fondée sur d'autres motifs

Point clé

- D'autres motifs de discrimination, tels que le handicap ou la naissance, ont été abordés dans la jurisprudence européenne relative aux enfants.

Au titre du droit de l'UE, l'article 21 de la Charte des droits fondamentaux de l'Union européenne interdit également toute discrimination fondée sur d'autres motifs qui concernent particulièrement les enfants, comme le sexe, les caractéristiques génétiques, la langue, le handicap ou l'orientation sexuelle. En ce qui concerne tout au moins le handicap, la CJUE a reconnu que le droit de l'UE protège également contre la « discrimination par association », c'est-à-dire la discrimination à l'encontre d'une personne qui est associée à une autre concernée par la caractéristique protégée (comme la mère d'un enfant souffrant d'un handicap).

Exemple : dans l'affaire *S. Coleman c. Attridge Law et Steve Law*[99], la CJUE a observé que la directive relative à l'égalité en matière d'emploi comporte des dispositions visant à tenir compte spécifiquement des besoins des personnes handicapées. Ce fait ne permet toutefois pas de conclure que le principe de l'égalité de traitement que la directive consacre doit être inter-

97 CouEDH, *D.G. c. Irlande*, n° 39474/98, 16 mai 2002 (voir également la section 11.2.2).

98 CouEDH, *Bouamar c. Belgique*, n° 9106/80, 29 février 1988 (voir également la section 11.2.2).

99 CJUE, C-303/06, *S. Coleman c. Attridge Law et Steve Law* [GC], 17 juillet 2008.

prété de manière restrictive, c'est-à-dire comme interdisant uniquement les discriminations directes fondées sur le handicap et visant exclusivement les personnes handicapées elles-mêmes. D'après la CJUE, la directive s'applique non pas à une catégorie de personnes déterminée, mais à la nature même de la discrimination. Une interprétation limitant l'application de celle-ci aux seules personnes qui sont elles-mêmes handicapées serait susceptible de priver cette directive d'une partie importante de son effet utile et de réduire la protection qu'elle est censée garantir. La CJUE conclut que la directive doit être interprétée en ce sens que l'interdiction de discrimination directe qu'elle prévoit n'est pas limitée aux seules personnes qui sont elles-mêmes handicapées. En conséquence, lorsqu'un employeur traite un employé n'ayant pas lui-même un handicap de manière moins favorable qu'un autre employé dans une situation comparable en raison du handicap de son enfant, auquel il dispense l'essentiel des soins dont celui-ci a besoin, un tel traitement est contraire à l'interdiction de discrimination directe énoncée dans la directive.

Au titre du droit du CdE, la CouEDH s'est penchée sur la question de la discrimination à l'encontre d'enfants dans différentes situations autres que celles déjà mentionnées, comme la discrimination fondée sur la langue[100] ou la filiation[101].

Exemple : dans l'affaire *Fabris c. France*[102], le requérant s'est plaint de ne pas avoir pu bénéficier d'une loi entrée en vigueur en 2001 accordant aux enfants « adultérins » des droits successoraux identiques aux enfants légitimes, une loi adoptée à la suite de l'arrêt rendu en 2000 par la Cour dans l'affaire *Mazurek c. France*[103]. La Cour a considéré que le but légitime visant à protéger les droits successoraux du demi-frère et de la demi-sœur du requérant ne l'emportait pas sur sa prétention à une part de la succession de sa mère. Dans cette affaire, la différence de traitement était discriminatoire dans la mesure où elle ne présentait aucune justification objective et raisonnable. La Cour a considéré qu'il existait une violation de l'article 14 de la CEDH, combiné à l'article 1 du Protocole n° 1 à la CEDH[104].

100 CouEDH, *Affaire « relative à certains aspects du régime linguistique de l'enseignement en Belgique » c. Belgique*, n° 1474/62, 1677/62, 1691/62, 1769/63, 1994/63 et 2126/64, 23 juillet 1968.

101 CEDH, *Fabris c. France* [GC], n° 16574/08, 7 février 2013.

102 *Ibid.*

103 CouEDH, *Mazurek c. France*, n° 34406/97, 1er février 2000.

104 CouEDH, *Fabris c. France* [GC], n° 16574/08, 7 février 2013.

Pour les enfants souffrant de handicaps, le CEDS considère qu'en application de l'article 17, paragraphe 2, de la CSE, il est acceptable d'opérer une distinction entre les enfants handicapés et non handicapés. L'intégration d'enfants souffrant de handicaps dans des écoles ordinaires, dans lesquelles des dispositions sont prises pour tenir compte de leurs besoins spécifiques, doivent toutefois devenir la norme et les écoles spécialisées doivent constituer l'exception[105]. En outre, les enfants fréquentant des établissements d'enseignement spécialisé qui sont conformes à l'article 17, paragraphe 2, de la CSE doivent bénéficier d'une instruction et d'une formation suffisantes de manière à ce qu'un nombre d'enfants fréquentant des écoles spécialisées proportionnel au nombre d'enfants fréquentant des écoles ordinaires terminent leur scolarité[106]. Les droits des enfants en matière d'éducation sont abordés plus en détail dans la section 8.2.

Au titre du droit des Nations Unies, l'article 2 de la CRC interdit la discrimination à l'encontre des enfants pour les motifs énumérés dans une liste non exhaustive, sur laquelle figure spécifiquement la naissance. L'article 2 dispose ce qui suit :

> *1. Les États parties s'engagent à respecter les droits qui sont énoncés dans la présente Convention et à les garantir à tout enfant relevant de leur juridiction, sans distinction aucune, indépendamment de toute considération de race, de couleur, de sexe, de langue, de religion, d'opinion politique ou autre de l'enfant ou de ses parents ou représentants légaux, de leur origine nationale, ethnique ou sociale, de leur situation de fortune, de leur incapacité, de leur naissance ou de toute autre situation.*
>
> *2. Les États parties prennent toutes les mesures appropriées pour que l'enfant soit effectivement protégé contre toutes formes de discrimination ou de sanction motivées par la situation juridique, les activités, les opinions déclarées ou les convictions de ses parents, de ses représentants légaux ou des membres de sa famille.*

	Identité en tant que membre d'une minorité nationale	CCPMN, article 5, paragraphe 1 (préservation des éléments essentiels de l'identité)

Les questions relatives à l'identité personnelle n'ont généralement pas été traitées au niveau européen, compte tenu de la compétence limitée de l'UE dans ce domaine. Toutefois, la CJUE a statué incidemment sur le droit à un nom (en particulier le droit que le nom qui a été reconnu dans l'un des États membres de l'UE le soit dans d'autres) du point de vue du principe de la liberté de circulation. Les aspects liés à la citoyenneté et à la résidence ont aussi été instruits sous l'angle de l'article 20 du TFUE. Le CdE a, quant à lui, en particulier par l'intermédiaire de la jurisprudence de la CouEDH, interprété et développé l'application de plusieurs droits fondamentaux dans le domaine de l'identité personnelle. Les sections suivantes traitent donc uniquement du droit du CdE, à l'exception de quelques domaines pour lesquels les questions d'identité personnelle ont été traitées au niveau de l'UE.

Ce chapitre ne renvoie pas à un droit fondamental spécifique. Il offre un aperçu des questions de droits fondamentaux relatives à l'identité, comme l'enregistrement de la naissance et le droit à un nom (section 4.1), le droit à l'identité personnelle (section 4.2), le vol d'identité (section 4.4), le droit à la citoyenneté (section 4.5) et l'identité des enfants appartenant à une minorité

nationale (section 4.6). D'autres questions afférentes sont traitées dans les autres chapitres, en particulier celles relatives aux abus sexuels (section 7.1.3) ou à la protection des données (chapitre 10). Certains de ces droits, comme le droit à un nom, ont été principalement présentés comme droits parentaux mais cette approche pourrait être facilement transposée aux enfants eux-mêmes, étant donné les implications pour leurs propres droits.

4.1. Enregistrement de la naissance et droit à un nom

Point clé

- Le refus d'enregistrer un prénom qui n'est pas impropre pour un enfant et qui est déjà accepté socialement peut constituer une violation de l'article 8 de la CEDH (droit au respect de la vie privée et familiale).

Contrairement aux traités de l'ONU (par exemple l'article 24, paragraphe 2, du Pacte international relatif aux droits civils et politiques (ICCPR), l'article 7, paragraphe 1, de la CRC et l'article 18 de la Convention relative aux droits des personnes handicapées (CRPD)), les instruments européens sur les droits fondamentaux ne mentionnent pas explicitement le droit à l'enregistrement de la naissance immédiatement après l'accouchement ou le droit à un nom à la naissance.

Dans le droit de l'UE, le droit à un nom a été traité du point de vue de la liberté de circulation. La CJUE considère que la liberté de circulation empêche un État membre de l'UE de refuser de reconnaître le prénom d'un enfant tel qu'il est enregistré dans un autre État membre dont l'enfant a la nationalité, ou où l'enfant est né et a résidé[107].

Dans le droit du CdE, le refus de l'enregistrement de la naissance d'un enfant est abordé sous l'angle de l'article 8 de la CEDH.

D'abord, la CouEDH considère que le nom en tant que « moyen d'identification au sein de la famille et de la société » relève du droit au respect de la vie privée

107 Voir CJUE, C-148/02, *Carlos Garcia Avello c. État belge*, 2 octobre 2003 ; CJUE, C-353/06, *Stefan Grunkin et Dorothee Regina Paul* [GC], 14 octobre 2008.

et familiale tel qu'il est défini dans l'article 8 de la CEDH[108]. Le choix des parents relatif au prénom[109] et au nom de famille[110] de leur enfant concerne leur vie privée. La Cour a statué que le refus des autorités publiques d'enregistrer un prénom choisi en se fondant sur le tort ou préjudice potentiellement causé à l'enfant par ce nom ne constituait pas une violation de l'article 8 de la CEDH[111]. En revanche, le refus d'enregistrer un prénom qui n'est pas inapproprié pour un enfant et qui est déjà accepté socialement peut constituer une violation de l'article 8 de la CEDH.

Exemple : dans l'affaire *Johansson c. Finlande*[112], les autorités ont refusé d'enregistrer le prénom « Axl Mick » car l'orthographe n'était pas conforme à la pratique finlandaise en matière de noms. La CouEDH a admis qu'il fallait prendre en compte l'intérêt supérieur de l'enfant et que la préservation de la pratique nationale relative aux noms était d'intérêt public. Elle a toutefois constaté que ce prénom avait été accepté lors de l'enregistrement d'autres naissances et donc qu'il ne pouvait pas être jugé inapproprié pour un enfant. Étant donné que le nom était déjà accepté socialement en Finlande et que rien n'avait prouvé que ce nom avait eu des conséquences négatives sur l'identité culturelle et linguistique de l'État, la CouEDH a conclu que les considérations d'intérêt public ne l'emportaient pas sur l'intérêt d'enregistrer l'enfant sous le nom choisi. La Cour a donc considéré qu'il y avait eu violation de l'article 8 de la CEDH.

La CouEDH a également jugé que la règle selon laquelle le nom de famille du mari devrait être donné aux enfants légitimes au moment de l'enregistrement de la naissance ne constitue pas en lui-même une violation de la CEDH. Toutefois, l'impossibilité de déroger à cette règle générale a été considérée comme excessivement rigide et discriminatoire pour les femmes et par conséquent en violation de l'article 14 conjointement avec l'article 8 de la CEDH[113].

L'article 11 de la CCPMN reconnaît que toute personne appartenant à une minorité nationale a le droit d'utiliser son nom (patronyme) et ses prénoms dans la

110 CouEDH, *Cusan et Fazzo c. Italie*, n° 77/07, 7 janvier 2014, para. 56.

111 CouEDH, *Guillot c. France*, n° 22500/93, 24 octobre 1993, para. 27.

112 CouEDH, *Johansson c. Finlande*, n° 10163/02, 6 septembre 2007.

113 CouEDH, *Cusan et Fazzo c. Italie*, n° 77/07, 7 janvier 2014, para. 67.

langue minoritaire ainsi que le droit à leur reconnaissance officielle, selon les modalités prévues par leur système juridique.

L'article 11, paragraphe 3, de la Convention européenne en matière d'adoption des enfants prévoit la possibilité pour les États parties de conserver le prénom d'origine d'un enfant adopté (Convention sur l'adoption)[114]. C'est une exception au principe général selon lequel le lien juridique entre l'enfant adopté et sa famille d'origine est rompu.

4.2. Droit à l'identité personnelle

Points clés

- Le droit de connaître ses propres origines relève de la vie privée de l'enfant.
- L'établissement de la paternité nécessite de peser minutieusement l'intérêt de l'enfant à connaître son identité par rapport à l'intérêt du père présumé ou allégué, et à l'intérêt général.
- Les accouchements sous X. peuvent être autorisés conformément à l'article 8 de la CEDH (droit au respect de la vie privée et familiale), à condition que l'enfant puisse obtenir au moins des informations non identifiantes sur sa mère et qu'il y ait une possibilité d'obtenir une renonciation à la confidentialité par la mère.
- Un enfant adopté a le droit d'accéder aux informations relatives à ses origines. Les parents biologiques peuvent obtenir un droit légal de ne pas divulguer leur identité mais cela n'équivaut pas à un veto absolu.

Dans le droit du CdE, selon la CouEDH, l'article 8 de la CEDH comprend le droit à l'identité et à l'épanouissement personnel. Les détails de l'identité d'une personne et l'intérêt « à obtenir des informations nécessaires à la découverte de la vérité concernant un aspect important de son identité personnelle, par exemple l'identité de ses géniteurs »[115] ont été jugés importants pour l'épanouissement personnel. La naissance et les circonstances de la naissance relèvent de la vie privée d'un enfant. « Des précisions sur des aspects éminemment personnels de l'enfance, de l'évolution et des antécédents » d'une personne peuvent constituer

114 CdE, Convention européenne en matière d'adoption des enfants (révisée), STCE n° 202, 2008.

115 CouEDH, *Odièvre c. France* [GC], n° 42326/98, 13 février 2003, para. 29.

la « principale source d'information sur [le] passé et [les] années de formation »[116] de cette personne, si bien que l'impossibilité d'accéder à ces informations par l'enfant prête à discussion sous l'angle de l'article 8 de la CEDH.

Selon le droit international, l'article 8 de la CRC prévoit un niveau élevé et assez détaillé de protection du droit de préserver l'identité d'un enfant. Il protège de l'ingérence illicite dans la préservation de l'identité, y compris la nationalité, le nom et les relations familiales, tels que reconnus par la loi. Il garantit aussi « une assistance et une protection appropriées » lorsqu'un enfant est illégalement privé de certains ou de tous les éléments constitutifs de son identité en vue de rétablir son identité le plus rapidement possible.

4.2.1. Établissement de la paternité

Dans le droit du CdE, des enfants ont saisi la CouEDH au sujet de l'impossibilité de déterminer l'identité de leur père naturel. La CouEDH a jugé que la détermination du lien juridique entre un enfant et son père naturel présumé relevait de la vie privée (article 8 de la CEDH). La filiation est un aspect fondamental de l'identité[117]. Toutefois, il convient de ménager un juste équilibre entre l'intérêt d'un enfant à établir la paternité et les intérêts du père présumé ainsi que de l'intérêt général. L'intérêt d'un enfant à avoir une certitude juridique sur sa filiation paternelle ne nuit pas à l'intérêt du père à réfuter la présomption légale de paternité.

> Exemple : dans l'affaire *Mikulić c. Croatie*[118], la requérante née hors mariage a lancé une procédure pour établir la paternité de son père présumé. Le défendeur a refusé à plusieurs reprises de subir un test ADN ordonné par le tribunal, ce qui a conduit à la prolongation inutile des procédures liées à la paternité pendant environ cinq ans. La CouEDH a jugé que, si selon le droit national, les pères présumés ne pouvaient être forcés à subir des tests médicaux, les États devaient offrir d'autres moyens d'identifier rapidement les pères naturels par une autorité indépendante. Elle a donc conclu à une violation de l'article 8 de la CEDH.

116 CouEDH, *Gaskin c. Royaume-Uni*, n° 10454/83, 7 juillet 1989, para. 36.

117 CouEDH, *Mennesson c. France*, n° 65192/11, 26 juin 2014, para. 96.

118 CouEDH, *Mikulić c. Croatie*, n° 53176/99, 7 février 2002, paras. 64-65.

Exemple : dans l'affaire *Mizzi c. Malte*[119], le père présumé n'a pas pu nier la paternité d'un enfant né de sa femme étant donné que le délai légal imparti de six mois s'était écoulé. La CouEDH a examiné l'affaire sous l'angle des articles 6 (droit à un procès équitable) et 8 (respect de la vie privée et familiale) de la CEDH. Elle a constaté qu'imposer un délai durant lequel un père présumé doit intervenir pour renier un enfant vise à assurer une certitude juridique et à protéger l'intérêt de l'enfant à connaître son identité. Ces objectifs ne l'emportent toutefois pas sur le droit du père d'avoir la possibilité de refuser la paternité. L'impossibilité pratique de nier la paternité à la naissance avait dans ce cas placé une charge excessive sur le père présumé, en violation de son droit d'accéder à un tribunal et à un procès équitable tel qu'inscrit dans l'article 6 de la CEDH. Elle constituait aussi une ingérence disproportionnée dans ses droits énoncés dans l'article 8 de la CEDH[120].

L'intérêt de l'enfant à vouloir confirmer la paternité et l'intérêt du père biologique peuvent parfois coïncider. Cela fut le cas dans la situation d'un père qui, en raison de son incapacité juridique, n'a pu lancer de procédure au niveau national pour établir sa filiation avec son enfant. La CouEDH a estimé qu'il n'était pas dans l'intérêt supérieur d'un enfant né hors mariage que son père biologique ne puisse pas lancer de procédure pour établir sa paternité et que l'enfant devait donc s'en remettre entièrement à la discrétion des autorités publiques pour établir sa filiation[121].

Les autorités peuvent avoir l'obligation positive d'intervenir dans les procédures visant à établir la paternité dans l'intérêt supérieur de l'enfant quand le représentant légal (en l'occurrence la mère) de l'enfant n'est pas en mesure de représenter comme il se doit l'enfant, par exemple en cas d'un handicap sévère[122].

Compte tenu du cas spécifique de reconnaissance de filiation entre les parents d'intention et les enfants nés par gestation pour autrui (GPA), la Cour a accepté en principe que les États aient une large marge d'appréciation étant donné qu'il n'y a pas de consensus européen sur l'autorisation ou la reconnaissance de la filiation dans les accords relatifs à la GPA. Toutefois, le fait que la filiation est un aspect fondamental de l'identité d'un enfant réduit cette marge d'appréciation.

119 CouEDH, *Mizzi c. Malte*, n° 26111/02, 12 janvier 2006.

120 *Ibid.*, paras. 112-114.

121 CouEDH, *Krušković c. Croatie*, n° 46185/08, 21 juin 2011, paras. 38-41.

122 CouEDH, *A.M.M. c. Roumanie*, n° 2151/10, 14 février 2012, paras. 58-65.

Exemple : l'affaire *Mennesson c. France*[123] concerne le refus des autorités françaises d'enregistrer deux enfants nées par GPA aux États-Unis dans le registre français des naissances pour des motifs d'ordre public. La CouEDH a jugé qu'il n'y avait pas violation du droit des requérants au respect de la vie familiale car rien ne les empêchait de jouir de leur vie familiale en France et que les obstacles administratifs qu'ils avaient pu rencontrer n'avaient pas été insurmontables. En ce qui concerne le droit au respect de la vie privée des enfants, la Cour a accordé une grande importance à leur intérêt supérieur. Elle a souligné en particulier le fait que l'homme qui devait être enregistré sur l'acte comme le père des enfants était aussi leur père biologique. Refuser la filiation légale d'un enfant quand la filiation biologique est établie et quand le parent concerné reconnaît pleinement l'enfant ne peut être considéré comme conforme à l'intérêt supérieur de l'enfant. La Cour a donc conclu à une violation de l'article 8 de la CEDH à l'égard de la plainte des enfants relative à la « vie privée »[124].

4.2.2. Établissement de la maternité : accouchement sous X

Dans le droit du CdE, l'intérêt d'un enfant à connaître ses origines, en particulier sa mère, doit être pondéré par rapport à d'autres intérêts privés et publics, comme les intérêts de la famille ou des familles concernées, l'intérêt public à éviter les avortements illégaux, les abandons d'enfant, ou la protection de la santé. Les cas où la mère biologique décide de rester anonyme mais où l'enfant peut obtenir au moins des informations non identifiantes sur la mère biologique et a la possibilité d'obtenir une renonciation à la confidentialité de la mère peuvent être conformes à l'article 8 de la CEDH[125].

Exemple : dans l'affaire *Godelli c. Italie*[126], la requérante a été abandonnée à sa naissance par sa mère, qui n'a pas accepté d'être nommée dans l'acte de naissance. La requérante n'a pas pu accéder à des informations non identifiantes sur ses origines et n'a pas pu obtenir la divulgation de l'identité de sa mère. La CouEDH a conclu à une violation de l'article 8 de la CEDH

123 CouEDH, *Mennesson c. France*, n° 65192/11, 26 juin 2014.

124 *Ibid.*, para. 100 ; voir aussi CouEDH, *Labassee c. France*, n° 65941/11, 26 juin 2014, para. 79.

125 CouEDH, *Odièvre c. France* [GC], n° 42326/98, 13 février 2003, paras. 48-49.

126 CouEDH, *Godelli c. Italie*, n° 33783/09, 25 septembre 2012, para. 58.

car l'État n'a pas veillé au juste équilibre entre les intérêts conflictuels de la mère biologique et de l'enfant.

4.3. Établissement de ses origines : adoption

Le droit d'un enfant de connaître ses origines a été particulièrement mis en avant dans le contexte de l'adoption. Les garanties substantielles relatives à l'adoption, en dehors du droit de connaître ses origines, sont traitées dans la section 6.3.

Dans le droit du CdE, l'article 22, paragraphe 3 de la Convention en matière d'adoption des enfants (révisée) constitue une disposition assez ferme sur le droit d'un enfant adopté d'accéder aux informations détenues par les autorités concernant ses origines. Il permet aux États parties d'accorder aux parents d'origine le droit légal de ne pas divulguer leur identité dans la mesure où cela n'équivaut pas à un veto absolu. L'autorité compétente doit être en mesure de déterminer si elle passe outre le droit des parents d'origine et décide de divulguer des informations identifiantes compte tenu des circonstances et des droits respectifs en jeu. Dans le cas d'une adoption plénière, l'enfant adopté doit au moins pouvoir obtenir un document attestant du lieu et de la date de sa naissance[127].

Dans le droit international, la Convention de La Haye sur l'adoption internationale prévoit la possibilité pour un enfant adopté d'accéder aux informations sur l'identité de ses parents « avec les conseils appropriés », mais laisse à chaque État partie le soin de l'y autoriser ou non[128].

4.4. Vol d'identité

Point clé

- Une protection pratique et efficace doit être assurée contre le vol d'identité des enfants.

127 CdE, Convention européenne en matière d'adoption des enfants (révisée), STCE n° 202, 2008, art. 22.

128 Conférence de La Haye de Droit international privé, Convention sur la protection des enfants et la coopération en matière d'adoption internationale, 29 mai 1993, art. 30 (2).

Le vol d'identité se rapporte aux situations où le nom d'un enfant est utilisé à son insu.

Selon le droit du CdE, la CouEDH a traité du vol d'identité en vertu de l'article 8 de la CEDH sur le droit au respect de la vie privée et familiale. Elle a jugé que les États sont obligés d'assurer la protection pratique et efficace des enfants contre le vol d'identité et que les États doivent prendre des mesures efficaces pour identifier et poursuivre les auteurs[129].

> Exemple : dans l'affaire *K.U. c. Finlande*[130], une annonce avait été publiée sur un site internet de rencontres au nom d'un garçon de 12 ans, à son insu. L'annonce mentionnait son âge, son numéro de téléphone et sa description physique et contenait un lien vers un site internet où se trouvait sa photographie. L'annonce était de nature sexuelle et suggérait que ce garçon recherchait une relation intime avec un garçon de son âge ou plus âgé, en faisant donc une cible pour les pédophiles. L'identité de la personne qui avait publié cette annonce ne pouvait être obtenue auprès du fournisseur d'accès à internet en raison de la législation en vigueur. La CouEDH a estimé que l'obligation positive définie à l'article 8 de la CEDH, non seulement pour d'adopter des dispositions en matière pénale qui sanctionnent effectivement les infractions mais aussi pour enquêter sur ces délits et les poursuivre efficacement, revêt une importance d'autant plus grande que le bien-être physique et moral d'un enfant est menacé. Dans cette affaire, la Cour a jugé qu'en étant exposé comme cible pour les pédophiles sur internet, le bien-être physique et moral de l'enfant était menacé. Elle a donc conclu à une violation de l'article 8 de la CEDH.

Les aspects liés au vol d'identité sont étroitement liés à la pédopornographie et à la manipulation d'enfants. Ces aspects sont traités dans la section 7.2.

129 CouEDH, *K.U. c. Finlande*, n° 2872/02, 2 décembre 2008, para. 49.

130 CouEDH, *K.U. c. Finlande*, n° 2872/02, 2 décembre 2008.

4.5. Droit à la citoyenneté

Points clés

- Le droit de séjour des enfants citoyens de l'UE au sein de l'UE ne devrait pas être privé de tout effet utile par le refus du droit de séjour à leur(s) parent(s).
- La CEDH ne garantit pas le droit à la citoyenneté mais un refus arbitraire de la citoyenneté peut relever de l'article 8 de la CEDH (droit au respect de la vie privée et familiale) compte tenu de son impact sur la vie privée d'un individu.

Selon le droit de l'UE, l'article 20, paragraphe 1, du TFUE accorde le statut de citoyen de l'UE à toute personne ayant la nationalité d'un État membre de l'Union. La CJUE a statué sur l'effectivité du droit de séjour des enfants qui ont la citoyenneté d'un des États membres de l'UE mais pas la nationalité de l'État membre de l'UE dans lequel ils résident. Il s'agissait du refus du droit de séjour dans l'Union européenne à un parent en charge d'un enfant citoyen de l'UE. La CJUE a considéré que le refus du droit de séjour à un parent qui est le responsable à titre principal de l'enfant prive le droit de séjour de l'enfant de tout effet utile. En conséquence, le parent qui est le responsable à titre principal de l'enfant a le droit de résider avec l'enfant dans l'État d'accueil[131]. Ces aspects sont détaillés dans la section 9.5.

Selon le droit du CdE, la CEDH ne garantit pas le droit à la citoyenneté[132]. Toutefois, un refus arbitraire de la citoyenneté peut relever de l'article 8 de la CEDH en raison de son impact sur la vie privée d'un individu, qui englobe des aspects de l'identité sociale d'un enfant[133], ce qui renvoie ici à l'identité d'un enfant en société.

Exemple : dans l'affaire *Genovese c. Malte*, la citoyenneté maltaise a été refusée à un enfant né hors mariage en dehors de Malte, d'une mère non maltaise et d'un père reconnu par la justice comme maltais. Le refus de la citoyenneté en tant que tel ne violait pas l'article 8 de la CEDH. En revanche, le refus arbitraire de la citoyenneté en raison de la naissance hors mariage soulevait des questions de discrimination. Un traitement

131 CJUE, C-200/02, *Kunqian Catherine Zhu et Man Lavette Chen c. Secretary of State for the Home Department*, 19 octobre 2004, paras. 45-46.

132 CouEDH, *Slivenko et autres c. Lettonie* [GC], décision sur la recevabilité, n° 48321/99, 23 janvier 2002, para. 77.

133 CouEDH, *Genovese c. Malte*, n° 3124/09, 11 octobre 2011, para. 33.

différencié arbitraire pour ce motif nécessite des raisons solides pour le justifier. En l'absence de telles raisons, une violation de l'article 8 et de l'article 14 de la CEDH a été établie[134].

L'un des principaux objectifs des dispositions des traités sur le droit d'acquérir la citoyenneté est d'éviter l'apatridie. La Convention européenne sur la nationalité contient des dispositions détaillées sur l'acquisition légale de la nationalité pour les enfants et limite les possibilités des enfants de perdre leur citoyenneté[135]. La Convention sur la prévention des cas d'apatridie en relation avec la succession d'États du Conseil de l'Europe contient une obligation d'éviter le statut d'apatride à la naissance (article 10) et stipule le droit à la nationalité de l'État successeur en cas d'apatridie (article 2)[136]. L'article 12 de Convention européenne révisée en matière d'adoption reflète également le souci d'éviter l'apatridie. Selon cet article, les États doivent faciliter l'acquisition de leur nationalité par un enfant adopté par un de leurs ressortissants et la perte de nationalité suite à une adoption est subordonnée à la possession ou l'acquisition d'une autre nationalité.

Dans le droit international, l'article 7 de la CRC garantit le droit d'acquérir une nationalité, de même que l'article 24, paragraphe 3, de l'ICCPR.

4.6. Identité des enfants appartenant à une minorité nationale

Point clé

- Un enfant appartenant à une minorité nationale a le droit d'avoir sa propre culture, de professer et de pratiquer sa propre religion ou d'employer sa propre langue[137].

Dans le droit de l'UE, aucune attention particulière n'a été accordée à l'identité des enfants appartenant à une minorité nationale du point de vue des droits

134 *Ibid.*, para. 43-49.

135 CdE, Convention européenne sur la nationalité, STCE n° 166, 1997, art. 6 et 7.

136 CdE, Convention du Conseil de l'Europe sur la prévention des cas d'apatridie en relation avec la succession d'États, STCE n° 200, 2006.

137 Sur d'autres aspects liés aux droits économiques, sociaux et culturels, voir le chapitre 8.

fondamentaux. En outre, il n'y a pas de jurisprudence majeure au niveau européen qui s'ajoute aux normes du Conseil de l'Europe.

Dans le droit du CdE, l'article 5, paragraphe 1 de la Convention-cadre pour la protection des minorités nationales mentionne explicitement que les États parties s'engagent à préserver les éléments essentiels de l'identité des personnes appartenant à une minorité nationale, à savoir leur religion, leur langue, leurs traditions et leur patrimoine culturel. La CCPMN ne contient aucune disposition spécifique sur les enfants. La question de la langue dans l'enseignement des enfants est traitée dans la section 8.2.

Selon le droit international, l'article 30 de la CRC garantit à un enfant appartenant à une minorité ou à un enfant autochtone le droit « d'avoir sa propre vie culturelle, de professer et de pratiquer sa propre religion ou d'employer sa propre langue en commun avec les autres membres de son groupe ».

Le droit de l'Union européenne et du Conseil de l'Europe garantit le droit au respect de la vie familiale (article 7 de la Charte des droits fondamentaux de l'UE, article 8 de la CEDH). La compétence de l'UE en matière de vie familiale concerne les conflits transnationaux, y compris la reconnaissance et l'exécution de jugements dans les États membres. La CJUE traite de questions relevant de l'intérêt supérieur de l'enfant et le droit à la vie familiale, tels qu'inscrits dans la Charte des droits fondamentaux, en relation avec le règlement Bruxelles II bis. La jurisprudence de la CouEDH relative à la vie familiale reconnaît les droits interdépendants, tels que le droit à la vie familiale et le droit de l'enfant à ce que son intérêt supérieur soit pris en compte, comme une considération primordiale. Elle reconnaît que les droits des enfants sont parfois divergents. Par exemple, le droit de l'enfant au respect de la vie familiale peut être limité pour garantir son intérêt supérieur. En outre, le CdE a adopté divers autres instruments traitant de questions relatives aux relations personnelles, à la garde et à l'exercice des droits des enfants.

Ce chapitre examine le droit de l'enfant au respect de la vie familiale et les droits afférents, notamment leur contenu et leur champ d'application, ainsi que les obligations légales associées et leur interaction avec d'autres droits. Les aspects spécifiques considérés incluent le droit au respect de la vie familiale et ses limites (section 5.1), le droit de l'enfant d'être élevé par ses parents (section 5.2), le droit d'entretenir des contacts avec ses deux parents (section 5.3) et l'enlèvement d'enfant (section 5.4).

5.1. Droit au respect de la vie familiale

Points clés

- Les États ont des obligations positives pour garantir la jouissance effective des enfants de leur droit au respect de la vie familiale.
- Selon le droit de l'UE et du CdE, les autorités judiciaires et administratives doivent tenir compte de l'intérêt supérieur de l'enfant dans toute décision relative au droit de l'enfant au respect de sa vie familiale.

Le droit de l'enfant au respect de la vie familiale inclut plusieurs droits composites, comme le droit de l'enfant d'être élevé par ses parents (section 5.2), le droit d'entretenir des contacts avec ses deux parents (section 5.3), le droit de ne pas être séparé de ses parents sauf si c'est dans l'intérêt supérieur de l'enfant (section 5.4 et chapitre 6) et le droit à la réunification familiale (chapitre 9).

En vertu du droit de l'UE et du droit du CdE, le droit au respect de la vie familiale n'est pas absolu mais sujet à un certain nombre de limitations. Comme le précise la note explicative de la Charte des droits fondamentaux, ces limitations sont identiques à la disposition correspondante de la CEDH, en particulier l'article 8, paragraphe 2[138], à savoir : conformes à la loi et nécessaires dans une société démocratique à la sécurité nationale, à la sûreté publique, au bien-être économique du pays, à la défense de l'ordre et à la prévention des infractions

138 Parlement européen, Conseil de l'Union européenne, Commission européenne (2007), *Explications relatives à la Charte des droits fondamentaux*, 2007/C 303/02, JO 2007 C 303, p. 17-35, voir les explications relatives à l'article 7.

pénales, à la protection de la santé ou de la morale, ou à la protection des droits et libertés d'autrui[139].

La Charte des droits fondamentaux intègre expressément à ce droit l'obligation de tenir compte de l'intérêt supérieur de l'enfant (article 24, paragraphe 2)[140]. Bien que l'obligation de tenir compte de l'intérêt supérieur de l'enfant ne soit pas expressément mentionnée dans la CEDH, la CouEDH intègre cette obligation dans sa jurisprudence[141].

5.2. Droit de l'enfant d'être élevé par ses parents

Points clés

- Le droit de l'UE réglemente les aspects procéduraux du droit de l'enfant d'être élevé par ses parents.
- En vertu de la CEDH, les États ont des devoirs négatifs et positifs pour respecter les droits des enfants et des parents à la vie familiale.

Le droit des enfants de connaître l'identité de leurs parents et le droit d'être élevé par eux sont deux éléments essentiels du droit des enfants au respect de la vie familiale. Ils sont dans une certaine mesure interdépendants : le droit des enfants de connaître leurs parents est garanti par les soins parentaux. Toutefois, ces droits sont parfois distincts, par exemple pour les enfants adoptés ou nés par procréation médicalement assistée. Dans ce cas, le premier droit est associé plus étroitement au droit de l'enfant à l'identité, qui se manifeste par la connaissance de sa filiation biologique, et est donc examiné dans le chapitre 4. Cette section met l'accent sur le second droit : le droit de l'enfant d'être élevé par ses parents.

Le droit de l'UE ne prévoit aucune disposition sur le champ d'application matériel du droit d'être élevé par ses parents. Les instruments de l'UE peuvent viser des

139 CdE, Convention de sauvegarde des Droits de l'Homme et des Libertés fondamentales, STCE n° 5, 1950, art. 8.

140 CJUE, C-400/10 PPU, *J. McB. c. L.E.*, 5 octobre 2010.

141 Voir, par exemple, CouEDH, *Ignaccolo-Zenide c. Roumanie*, n° 31679/96, 25 janvier 2000, para. 94.

aspects transfrontaliers, comme la reconnaissance et l'exécution de jugements à travers les États membres. Le règlement (CE) n° 4/2009 relatif à la compétence, la loi applicable, la reconnaissance et l'exécution des décisions et la coopération en matière d'obligations alimentaires (règlement sur les obligations alimentaires), par exemple, couvre les demandes en matière d'obligations alimentaires transfrontalières découlant des relations de famille[142]. Il établit des règles communes à l'UE visant à assurer le recouvrement des créances alimentaires même lorsque le débiteur ou le créancier est dans un autre État membre de l'UE.

Dans le droit du CdE, la CouEDH a souligné que l'article 8 de la CEDH établit principalement le devoir de l'État de ne pas intervenir dans la vie familiale[143]. Toutefois, les États ont l'obligation positive de prendre les mesures nécessaires pour soutenir les parents et les familles et pour protéger les enfants contre tout abus potentiel[144]. Les enfants ne devraient être séparés de leurs parents que dans ces circonstances exceptionnelles. Si tel est le cas, tout doit être fait pour préserver les relations personnelles et, le cas échéant, pour « réunir » la famille. Les États bénéficient d'une large marge d'appréciation quant à la décision initiale de séparer les enfants de leurs parents[145]. Toutefois, un examen plus approfondi s'impose pour toute autre limitation, telles que les restrictions des droits parentaux aux visites, et pour toute garantie juridique destinée à protéger efficacement le droit des parents et des enfants au respect de leur vie familiale. De telles limitations risquent d'entraver effectivement les relations familiales entre un jeune enfant et l'un des parents ou les deux. De même, les raisons avancées par l'autorité publique pour séparer un nouveau-né de sa mère doivent être extraordinairement impérieuses[146].

Cette marge d'appréciation diminue en fonction de la durée de séparation des enfants de leurs parents et les autorités publiques doivent avancer de fortes raisons pour défendre leur décision de maintenir la séparation[147]. La CouEDH examine si le processus de prise de décision a été équitable et si toutes les parties concernées ont eu la possibilité de plaider leur cause.

142 Conseil de l'UE (2008), Règlement (CE) n° 4/2009 du Conseil du 18 décembre 2008 sur la compétence, la loi applicable, la reconnaissance et l'exécution des décisions et la coopération en matière d'obligations alimentaires, JO 2008 L 7 (règlement sur les obligations alimentaires).

143 CouEDH, *R.M.S. c. Espagne*, n° 28775/12, 18 juin 2013, para. 69.

144 *Ibid.*, para. 69 et suivants.

145 CouEDH, *Y.C. c. Royaume-Uni*, n° 4547/10, 13 mars 2012, para. 137.

146 CouEDH, *K. et T. c. Finlande* [GC], n° 25702/94, 12 juillet 2001, para. 168.

147 CouEDH, *Y.C. c. Royaume-Uni*, n° 4547/10, 13 mars 2012, para. 137.

Exemple : dans l'affaire *R.M.S. c. Espagne*[148], la requérante affirmait avoir été privée de tout contact avec sa fille à partir de ses trois ans et dix mois en raison de son statut socioéconomique. La Cour, qui a conclu à une violation de l'article 8 de la CEDH, a souligné le fait « que les autorités administratives espagnoles auraient dû envisager d'autres mesures moins radicales que la prise en charge de l'enfant ». Elle a aussi rappelé que « le rôle des autorités de protection sociale est précisément d'aider les personnes en difficulté [...], de les guider dans leurs démarches et de les conseiller, entre autres, quant aux différents types d'allocations sociales disponibles, aux possibilités d'obtenir un logement social ou aux autres moyens de surmonter leurs difficultés, comme la requérante avait initialement cherché à le faire. » En conséquence, la CouEDH a jugé « que les autorités espagnoles n'ont pas déployé des efforts adéquats et suffisants pour faire respecter le droit de la requérante à vivre avec son enfant »[149].

Selon le droit international, l'article 5 de la CRC stipule que « les États parties respectent la responsabilité, le droit et le devoir qu'ont les parents [...] de donner à l'enfant, d'une manière qui corresponde au développement de ses capacités, l'orientation et les conseils appropriés à l'exercice des droits que lui reconnaît la présente Convention. » En outre, l'article 9 de la CRC stipule qu'un enfant ne doit pas être séparé de ses parents contre leur gré et que toutes les parties concernées doivent avoir la possibilité de participer aux délibérations liées à cette situation. Les Lignes directrices des Nations Unies relatives à la protection de remplacement pour les enfants étayent plus avant les droits des enfants dans ces circonstances et les devoirs correspondants des États[150].

5.3. Droit d'entretenir des contacts avec ses deux parents

Points clés

- Le droit de l'enfant d'entretenir des contacts avec ses deux parents subsiste dans toutes les formes de séparation parentale, qu'elle soit d'origine familiale ou imposée par les autorités publiques.
- Le processus permettant de garantir le droit de l'enfant d'entretenir des contacts avec ses parents et à la réunification familiale nécessite de prendre en compte l'intérêt supérieur de l'enfant comme considération primordiale en tenant dûment compte de l'avis de l'enfant en fonction de son âge et de sa maturité.

Le champ d'application du droit de l'enfant d'entretenir des contacts avec ses parents dépend du contexte. En cas de décision des parents de se séparer, le champ d'application est plus large et normalement limité uniquement par l'intérêt supérieur de l'enfant. Dans le cas d'une séparation imposée par les autorités publiques découlant, par exemple, de l'expulsion ou de l'emprisonnement d'un parent, les autorités publiques agissent pour servir un intérêt protégé et doivent ménager un juste équilibre entre les intérêts des parties et l'obligation de garantir l'intérêt supérieur de l'enfant. Le droit des enfants d'entretenir des contacts avec leurs deux parents est applicable dans les deux cas.

Dans le droit de l'UE, l'article 24, paragraphe 3, de la Charte des droits fondamentaux reconnaît expressément le droit de tout enfant d'entretenir des contacts avec ses *deux* parents. La formulation de cette disposition clarifie le contenu de ce droit, en particulier le sens de « contact » qui doit : être *régulier*, permettre le développement d'une *relation personnelle* et être sous la forme d'un *contact direct*. Il existe toutefois une réserve : le droit de tout enfant d'entretenir des contacts avec ses parents est expressément limité par son intérêt supérieur. Cette disposition, comme le précise la note explicative de la Charte, est expressément avisée par l'article 9 de la CRC.

Conformément aux compétences de l'UE (voir le chapitre 1), une attention particulière a été accordée à la coopération judiciaire (avec pour objectif de créer une zone de liberté, de sécurité et de justice dans laquelle la libre circulation des personnes est garantie). Deux instruments de l'UE sont particulièrement importants

à cet égard : le règlement (CE) n° 2201/2003 du Conseil[151] (Bruxelles II bis) et la directive du 2008/52/CE Parlement européen et du Conseil (directive sur la médiation)[152]. Le règlement Bruxelles II bis est important du point de vue des droits. Premièrement, il s'applique à *toutes* les décisions relatives à la responsabilité parentale, indépendamment du statut marital. Deuxièmement, les règles relatives à la juridiction (déterminées pour la plupart par la résidence habituelle de l'enfant) sont expressément avisées par l'intérêt supérieur de l'enfant. Troisièmement, une attention particulière est accordée au respect de l'opinion de l'enfant[153].

La jurisprudence de la CJUE dans les cas de déplacement illicite d'un enfant suite à une décision prise unilatéralement par l'un des parents vise essentiellement à préserver le droit fondamental de l'enfant d'entretenir des relations personnelles et des contacts directs réguliers avec ses deux parents (article 24, paragraphe 3, de la Charte), étant donné que la Cour soutient que ce droit rejoint indéniablement l'intérêt supérieur de l'enfant. Pour la CJUE, une mesure qui empêche un enfant d'entretenir des relations personnelles et des contacts directs réguliers avec ses deux parents ne peut se justifier que par un autre intérêt de l'enfant d'une intensité telle que ce dernier prime celui sous-tendant ledit droit fondamental[154]. Cela comprend des mesures provisoires, y compris de protection, conformément à l'article 20 du règlement Bruxelles II bis. La Cour a jugé qu'une appréciation équilibrée et raisonnable de tous les intérêts en jeu, qui doit reposer sur des considérations objectives relatives à la personne même de l'enfant et à son environnement social, doit, en principe, être effectuée dans le cadre d'une procédure en vertu des dispositions du règlement Bruxelles II bis[155].

> Exemple : l'affaire *E. c. B.*[156] concerne une procédure entre M. E. (le père) et M^elle^ B. (la mère), en relation avec la compétence des tribunaux du Royaume-Uni pour connaître et statuer sur le lieu de résidence habituelle

151 Conseil de l'UE (2003), Règlement du Conseil (CE) n° 2201/2003 du 27 novembre 2003 relatif à la compétence, la reconnaissance et l'exécution des décisions en matière matrimoniale et en matière de responsabilité parentale des enfants communs, abrogeant le règlement (CE) n° 1347/2000, JO 2003 L 338 (règlement Bruxelles II bis).

152 Parlement européen, Conseil de l'UE (2008), Directive 2008/52/CE du Parlement européen et du Conseil du 21 mai 2008 sur certains aspects de la médiation en matière civile et commerciale, JO 2008 L 136/3 (directive sur la médiation).

153 Voir, par exemple, Règlement du Conseil (CE) n° 2201/2003, préambule (par. 5, 12, 13 et 19) et art. 8, art. 41, para. 2, point c) et art. 42, para. 2, point a).

154 CJUE, C-403/09 PPU, *Jasna Detiček c. Maurizio Sgueglia*, 23 décembre 2009, para. 59.

155 *Ibid.*, para. 60.

156 CJUE, C-436/13, *E. c. B.*, 1 octobre 2014 (synthèse à partir de http://cases.iclr.co.uk)

de leur enfant, S., et le droit de visite du père. Les parents avaient signé un accord devant un tribunal espagnol qui attribuait la garde de l'enfant à la mère et reconnaissait le droit de visite au père. Ultérieurement, la mère a demandé une réduction des droits de visite qui avaient été octroyés au père par cet accord. Le père a déposé une requête auprès de la High Court en vue de l'exécution de l'accord espagnol. La mère a affirmé qu'elle avait prorogé la compétence du tribunal espagnol et a demandé le transfert aux juridictions d'Angleterre et du pays de Galles de la compétence prorogée. Comme suite à l'appel du père, la Cour d'appel a posé plusieurs questions à la CJUE concernant l'interprétation de l'article 12, paragraphe 3, du règlement Bruxelles II bis. La CJUE a jugé que lorsqu'une juridiction est saisie d'une procédure conformément à l'article 12, paragraphe 3, du règlement Bruxelles II bis, l'intérêt supérieur de l'enfant ne peut être préservé que par un examen, dans chaque cas particulier, de la question de savoir si la prorogation de compétence recherchée est conforme à cet intérêt supérieur. Une prorogation de compétence ne vaut que pour la procédure spécifique pour laquelle la juridiction dont la compétence est prorogée est saisie. Après la conclusion finale de la procédure dont découle la prorogation de compétence, cette compétence disparaît, au profit de la juridiction bénéficiant d'une compétence générale en application de l'article 8, paragraphe 1, du règlement Bruxelles II bis.

En matière de responsabilité parentale, le règlement Bruxelles II bis coexiste avec la Convention de La Haye concernant la compétence, la loi applicable, la reconnaissance, l'exécution et la coopération en matière de responsabilité parentale et de mesures de protection des enfants[157]. En application de l'article 61, le règlement Bruxelles II bis prévaudra sur la Convention de La Haye : lorsque l'enfant concerné a sa résidence habituelle sur le territoire d'un État membre, ou en ce qui concerne la reconnaissance et l'exécution d'une décision rendue par la juridiction compétente d'un État membre sur le territoire d'un autre État membre, même si l'enfant concerné a sa résidence habituelle sur le territoire d'un État non membre qui est partie contractante à ladite convention. L'un des enjeux clés selon le règlement Bruxelles II bis est donc la détermination de la résidence habituelle de l'enfant.

157 Organisation mondiale pour la coopération transfrontalière en matière civile et commerciale (1996), Conférence de La Haye de droit international privé, Convention concernant la compétence, la loi applicable, la reconnaissance, l'exécution et la coopération en matière de responsabilité parentale et de mesures de protection des enfants, 19 octobre 1996.

Exemple : dans l'affaire *Mercredi c. Chaffe*[158], la Cour d'appel d'Angleterre et du Pays de Galles a renvoyé une affaire à la CJUE concernant le déplacement d'un enfant de deux mois du Royaume-Uni vers l'île de La Réunion. La CJUE a statué que le concept de résidence habituelle, pour les besoins des articles 8 et 10 du règlement Bruxelles II bis, correspond au lieu qui reflète un certain degré d'intégration de l'enfant à un environnement social et familial. Lorsque la situation concerne un nourrisson qui séjourne avec sa mère depuis quelques jours seulement dans un État membre autre que celui de sa résidence habituelle, vers lequel il a été déplacé, plusieurs éléments sont à prendre en considération : d'une part, la durée, la régularité, les conditions et les raisons du séjour sur le territoire de cet État membre et du déménagement de la mère dans ledit État, et, d'autre part, en raison notamment de l'âge de l'enfant, les origines géographiques et familiales de la mère ainsi que les rapports familiaux et sociaux entretenus par celle-ci et l'enfant dans le même État membre.

Pour garantir la jouissance du droit d'entretenir des contacts avec les deux parents dans les affaires transfrontalières, les instruments visant à réglementer l'accès à la justice qui précisent comment traiter des litiges complexes sont aussi particulièrement importants. Tel est le cas de la directive 2002/8/CE du Conseil (directive sur l'accès à la justice), qui exige d'« améliorer l'accès à la justice dans les affaires transfrontalières par l'établissement de règles minimales communes relatives à l'aide judiciaire accordée dans le cadre de telles affaires »[159]. L'objectif de cette directive est : d'améliorer l'accès à la justice dans les affaires civiles transfrontalières par l'établissement de règles minimales communes relatives à l'aide judiciaire ; de garantir l'octroi d'une aide judiciaire appropriée, sous certaines conditions, aux personnes qui ne peuvent pas assumer les frais de procédure en raison de leur situation financière ; et de faciliter la compatibilité des droits nationaux en la matière et de fournir des mécanismes de coopération entre les autorités des États membres.

Dans le droit du CdE, le droit de tout enfant d'entretenir des contacts avec ses deux parents est implicite dans l'article 8 de la CEDH. La CouEDH affirme que « pour un parent et son enfant, être ensemble représente un élément fondamental de la

158 CJUE, C-497/10 PPU, *Barbara Mercredi c. Richard Chaffe*, 22 décembre 2010.

159 Conseil de l'UE (2003), Directive 2002/8/CE du Conseil du 27 janvier 2003 visant à améliorer l'accès à la justice dans les affaires transfrontalières par l'établissement de règles minimales communes relatives à l'aide judiciaire accordée dans le cadre de telles affaires, JO 2003 L 026 (directive sur l'accès à la justice).

vie familiale »[160]. Mais elle souligne aussi que ce droit peut être limité par l'intérêt supérieur de l'enfant (voir section 5.4 et chapitre 6). Ce droit est au cœur de la prise de décision judiciaire relative à la garde de l'enfant et au contact avec lui.

Dans une série d'affaires, la CouEDH n'a renvoyé à l'intérêt supérieur de l'enfant ni expressément, ni implicitement dans le contexte de la garde et du contact.

Exemple : dans l'affaire *Schneider c. Allemagne*[161], le requérant avait une relation avec une femme mariée et affirmait être le père biologique de son fils, dont le père légalement reconnu était le mari de la mère. Le requérant a fait valoir que la décision des tribunaux nationaux de rejeter sa demande de contact avec l'enfant et d'informations sur l'épanouissement de l'enfant au motif qu'il n'était ni le père légal de l'enfant et qu'il n'avait pas de lien avec l'enfant constituait une violation de ses droits sous l'angle de l'article 8 de la CEDH. En concluant à une violation, la CouEDH a mis en avant le fait que les tribunaux nationaux n'ont pas du tout tenu compte de la question de savoir si, compte tenu des circonstances particulières de l'affaire, le contact entre l'enfant et le requérant aurait été dans l'intérêt supérieur de l'enfant[162]. Concernant la demande du requérant d'informations sur l'épanouissement personnel de l'enfant, la Cour a jugé que les tribunaux nationaux n'avaient pas avancé de raisons suffisantes pour justifier leur ingérence pour les besoins de l'article 8, paragraphe 2[163], et que donc l'ingérence n'avait pas été nécessaire dans une société démocratique.

Exemple : dans l'affaire *Levin c. Suède*[164], la requérante, une mère de trois enfants bénéficiant d'une protection de remplacement dans un cadre non familial, a fait valoir que les restrictions de son droit d'entretenir des contacts avec ses enfants violaient son droit au respect de la vie familiale. La CouEDH a mis en avant l'objectif des restrictions des contacts, à savoir la protection de l'intérêt supérieur des enfants. Dans ce cas particulier, les enfants avaient été négligés quand ils étaient à la charge de la requérante et le contact avec cette dernière a donné lieu à de fortes réactions

160 CouEDH, *K. et T. c. Finlande* [GC], n° 25702/94, 12 juillet 2001, para. 151.

161 CouEDH, *Schneider c. Allemagne*, n° 17080/07, 15 septembre 2011.

162 Voir aussi CouEDH, *Anayo c. Allemagne*, n° 20578/07, 21 décembre 2010, paras. 67 et 71.

163 CouEDH, *Schneider c. Allemagne*, n° 17080/07, 15 septembre 2011, para. 104.

164 CouEDH, *Levin c. Suède*, n° 35141/06, 15 mars 2012, paras. 57 et 69 ; CouEDH, *K. et T. c. Finlande* [GC], n° 25702/94, 12 juillet 2001, para. 151.

négatives de la part des enfants. En concluant qu'il n'y avait pas eu violation de l'article 8 de la CEDH, la Cour a jugé que l'ingérence dans les droits de la requérante avait été proportionnelle à l'objectif légitime poursuivi (l'intérêt supérieur de l'enfant) et s'inscrivait dans la marge des autorités nationales.

Exemple : dans l'affaire *Sommerfeld c. Allemagne*[165], le requérant dénonçait les restrictions de son droit à entretenir des contacts avec sa fille, qui avait exprimé à plusieurs reprises le souhait de ne pas rester en contact avec lui. Le requérant a notamment fait valoir que l'incapacité des tribunaux nationaux à obtenir l'avis d'un expert psychiatrique constituait une faille dans la procédure nationale. La CouEDH, qui a conclu à une non-violation de l'article 8 de la CEDH, a jugé que le tribunal national était suffisamment bien placé pour évaluer les déclarations de la fille et pour établir si celle-ci était en mesure ou non de se former sa propre opinion.

Exemple : dans l'affaire *Mustafa et Armağan Akin c. Turquie*[166], les requérants, un père et son fils, ont fait valoir que les conditions de la garde ordonnée par le tribunal national avaient violé leurs droits sous l'angle de l'article 8 de la CEDH. Ces conditions empêchaient le fils d'être en contact avec sa sœur, qui était sous la garde de sa mère. En outre, le père ne pouvait pas avoir de contact avec ses deux enfants en même temps car les contacts entre son fils et la mère coïncidaient avec les contacts qu'il avait avec sa fille. La CouEDH a jugé que la décision du tribunal national de séparer le frère et la sœur constituait une violation du droit des requérants au respect de la vie familiale, car non seulement elle empêchait le frère et la sœur de se voir, mais aussi leur père d'avoir la compagnie de ses deux enfants simultanément.

Dans le contexte de la garde et du processus décisionnel, la CouEDH interdit toute discrimination incompatible avec l'article 14 de la CEDH.

Exemple : dans l'affaire *Vojnity c. Hongrie*[167], le requérant a fait valoir que l'accès à son fils lui avait été refusé en raison de ses convictions

165 CEDH, *Sommerfeld c. Allemagne*, n° 31871/96, 8 juillet 2003, para. 72.

166 CouEDH, *Mustafa et Armağan Akin c. Turquie*, n° 4694/03, 6 avril 2010.

167 CouEDH, *Vojnity c. Hongrie*, n° 29617/07, 12 février 2013 ; voir aussi CouEDH, *P.V. c. Espagne*, n° 35159/09, 30 novembre 2010.

religieuses[168]. La CouEDH, qui a conclu à une non-violation de l'article 14 conjointement avec l'article 8 de la CEDH, a constaté qu'il n'existait pas de preuves selon lesquelles les convictions religieuses du requérant impliquait des pratiques dangereuses ou exposaient son fils à un préjudice physique ou psychologique[169]. Les décisions des tribunaux nationaux sur le retrait du droit de visite du requérant a rendu toute forme de contact et la continuation de toute sorte de vie familiale impossible, malgré le fait que la rupture totale de contact ne pouvait être justifiée que dans des circonstances exceptionnelles[170]. La CouEDH a donc jugé qu'il n'y avait pas eu de lien de proportionnalité raisonnable entre une interdiction totale du droit de visite du requérant et l'objectif poursuivi, à savoir la protection de l'intérêt supérieur de l'enfant[171].

Exemple : l'affaire *Salgueiro da Silva Mouta c. Portugal*[172] a été portée par un père qui revendiquait la responsabilité parentale de son enfant. Il soutenait que, dans la procédure nationale, les autorités portugaises avaient rejeté sa demande et attribué la responsabilité parentale à la mère en raison de son orientation sexuelle. La CouEDH a jugé que les autorités nationales ont effectivement refusé la garde au motif qu'il était homosexuel – décision qui ne repose sur aucune justification objective et raisonnable. La Cour a conclu à une violation de l'article 8 conjointement avec l'article 14 de la CEDH.

En outre, le droit de l'enfant à entretenir des relations personnelles avec ses deux parents est expressément cité dans la Convention sur les relations personnelles concernant les enfants du CdE[173]. L'article 4, paragraphe 1, de cette convention dispose qu'un « enfant et ses parents ont le droit d'obtenir et d'entretenir des relations personnelles régulières ». Les principes généraux qu'il convient d'appliquer dans la jurisprudence sur le contact soulignent le droit d'un enfant d'être informé et consulté et d'exprimer son opinion, qui doit être dûment prise en compte.

169 *Ibid.*, para. 38.

170 *Ibid.*, para. 41.

171 *Ibid.*, para. 43.

172 CouEDH, *Salgueiro da Silva Mouta c. Portugal*, n° 33290/96, 21 décembre 1999.

173 CdE, Convention sur les relations personnelles concernant les enfants, STCE n° 192, 2003. Voir aussi Organisation mondiale pour la coopération transfrontalière en matière civile et commerciale (1996), Conférence de La Haye de droit international privé, Convention concernant la compétence, la loi applicable, la reconnaissance, l'exécution et la coopération en matière de responsabilité parentale et de mesures de protection des enfants.

L'article 6 de la Convention européenne sur l'exercice des droits des enfants du CdE définit plus avant les étapes nécessaires du processus décisionnel, notamment les obligations légales[174] : d'examiner si l'autorité judiciaire dispose d'informations suffisantes afin de prendre une décision dans l'intérêt supérieur de l'enfant ; de garantir le droit de l'enfant à recevoir des informations sur le processus et les résultats ; et de ménager un espace sûr pour les enfants concernés afin qu'ils puissent exprimer librement leur opinion d'une façon appropriée à leur âge et maturité.

Il est possible que les enfants soient séparés de l'un de leurs parents d'une autre façon, par exemple en raison de l'emprisonnement de ce parent. La CouEDH a été confrontée à cette situation dans l'affaire *Horych c. Pologne*[175], qui concernait la question des conditions dans lesquelles le requérant, un détenu qualifié de dangereux, avait reçu des visites de ses filles mineures. Elle a noté que les visites d'enfants en prison nécessitent des dispositions particulières et peuvent être soumises à des conditions spéciales en fonction de leur âge, des effets potentiels sur leur état émotionnel ou leur bien-être et des circonstances personnelles de la personne à qui ils rendent visite[176]. La Cour a ajouté que les obligations positives de l'État en vertu de l'article 8 incluent le devoir de garantir les conditions adéquates, engendrant le moins de stress possible pour les visiteurs, pour les visites d'enfants, compte tenu des conséquences pratiques de l'emprisonnement[177].

Enfin, le droit des enfants privés de la liberté d'entretenir le contact avec leurs parents est renforcé par certaines dispositions des Lignes directrices du Conseil de l'Europe sur une justice adaptée aux enfants[178]. Ces lignes directrices affirment expressément le droit des enfants privés de leur liberté « de maintenir des contacts réguliers et significatifs avec leurs parents [et] famille » (Article 21, point a)) (voir aussi chapitre 11).

Dans le droit international, le droit d'entretenir des contacts avec ses deux parents est prévu à l'article 9, paragraphe 3, de la CRC : « Les États parties respectent le droit de l'enfant séparé de ses deux parents ou de l'un d'eux d'entretenir régulièrement des relations personnelles et des contacts directs avec ses deux parents, sauf si cela est contraire à l'intérêt supérieur de l'enfant. »

5.4. Déplacement sans droit d'enfant au-delà d'une frontière – enlèvement d'enfant

Points clés

- La CouEDH exige une approche fondée sur les droits de l'enfant pour les déplacements sans droit en violation des accords sur la garde : l'article 8 de la CEDH (respect de la vie privée et familiale) doit être interprété en liaison avec la Convention de La Haye et la CRC.
- Plus spécifiquement, conformément au droit de l'UE, l'enfant doit être entendu durant les délibérations liées à son retour après son déplacement ou non-retour illicite.

L'enlèvement d'enfant désigne une situation dans laquelle un enfant est déplacé ou retenu illicitement dans un autre pays en violation du droit de garde (article 3 de la Convention de La Haye sur les aspects civils de l'enlèvement international d'enfants[179] (Convention de La Haye)). En vertu de la Convention de La Haye, les enfants déplacés ou retenus illicitement doivent être restitués d'urgence à leur pays de résidence habituelle (article 11, paragraphe 1). Les tribunaux du pays de résidence habituelle jugent du bien-fondé du litige relatif à la garde. Les tribunaux du pays d'où a été déplacé l'enfant doivent ordonner son retour dans un délai de six semaines à compter de leur saisine (article 11). La Convention de La Haye repose sur le principe de l'intérêt supérieur de l'enfant. Cette convention part du principe que le déplacement illicite d'un enfant est nuisible en lui-même et que le *statu quo ante* doit être rétabli le plus rapidement possible pour éviter la consolidation légale de situations illicites. Les questions liées à la garde et aux visites doivent être tranchées par les tribunaux compétents dans le pays de résidence habituelle de l'enfant plutôt que par ceux du pays vers lequel l'enfant a été déplacé illicitement. Plusieurs exceptions limitées au mécanisme de retour sont définies dans les articles 12, 13, et 20 de la Convention de La Haye. L'article 13 contient les dispositions qui ont donné lieu à la majorité des litiges, au niveau national et international. Il dispose que le pays vers lequel l'enfant a été déplacé peut refuser d'ordonner le retour de l'enfant s'il existe un risque

179 Organisation mondiale pour la coopération transfrontalière en matière civile et commerciale (1980), Conférence de La Haye de droit international privé, Convention de La Haye du 25 octobre 1980 sur les aspects civils de l'enlèvement international d'enfants, 25 octobre 1980.

grave que le retour de l'enfant ne l'expose à un danger physique ou psychique, ou de toute autre manière ne le place dans une situation intolérable (article 13, point b)). Le retour de l'enfant peut également être refusé si celui-ci s'oppose à son retour et qu'il a atteint une maturité suffisante pour exprimer son opinion (article 13, paragraphe 2).

Dans le droit de l'UE, le principal instrument réglementant l'enlèvement d'enfant entre les États membres de l'UE est le règlement Bruxelles II bis[180], largement fondé sur les dispositions de la Convention de La Haye. Ce règlement complète et prime sur la Convention de La Haye dans les affaires d'enlèvement au sein de l'UE (considérant 17 du Préambule et article 60, point e)). Bien que la Convention de La Haye reste le principal instrument en matière d'enlèvement d'enfant, Bruxelles II bis a dans une certaine mesure « durci » les règles juridictionnelles en faveur des tribunaux du pays d'origine/de résidence habituelle. De même que pour la Convention de La Haye, les tribunaux de l'État où l'enfant étant habituellement résident juste avant son déplacement/non-retour illicite restent compétents pour les affaires d'enlèvement d'enfant. Cette réglementation maintient les mêmes exceptions au retour que celles prévues par la Convention sur l'enlèvement d'enfants.

Toutefois, selon le règlement Bruxelles II bis, contrairement à la Convention de La Haye, l'État de résidence habituelle demeure compétent pour juger du bien-fondé du conflit lié à la garde même après un ordre de non-retour émis en application de l'article 13, point b), de la Convention de La Haye (article 11, paragraphes 6 à 8, du règlement Bruxelles II bis). Le passage de compétence à l'État vers lequel l'enfant a été déplacé peut avoir lieu uniquement dans deux situations, prévues par l'article 10 du règlement Bruxelles II bis. La première situation prévoit que les tribunaux de l'État de refuge auront compétence si l'enfant a acquis une résidence habituelle dans cet État et que toute personne ayant le droit de garde a acquiescé au déplacement ou au non-retour[181]. La deuxième situation se présente lorsque : l'enfant a acquis une résidence habituelle dans l'État vers lequel il a été déplacé ; une période d'au moins un an s'est écoulée après que le parent qui avait le droit de garde a eu ou aurait dû avoir connaissance du lieu où se trouvait l'enfant ; l'enfant s'est intégré dans son nouvel environnement ; et au moins

180 Conseil de l'UE (2003), Règlement du Conseil (CE) n° 2201/2003 du 27 novembre 2003 relatif à la compétence, la reconnaissance et l'exécution des décisions en matière matrimoniale et en matière de responsabilité parentale des enfants communs, abrogeant le règlement (CE) n° 1347/2000, JO 2003 L 338.

181 Règlement Bruxelles II bis, art. 10, point a).

une des quatre conditions énumérées dans l'article 10, point b, du règlement Bruxelles II bis est remplie[182].

Comme les autres instruments juridiques de l'UE, il convient d'interpréter le règlement Bruxelles II bis conformément aux dispositions de la Charte des droits fondamentaux, en particulier l'article 24. La CJUE a eu l'occasion de clarifier l'interprétation de l'article 24 de la Charte eu égard aux enlèvements d'enfant. Comme indiqué dans la section 2.4, la CJUE a jugé dans l'affaire *Aguirre Zarraga* que le droit de l'enfant d'être entendu, inscrit dans l'article 24 de la Charte, nécessite que les procédures et les conditions juridiques qui permettent aux enfants d'exprimer librement leur opinion doivent être rendues accessibles et que cette opinion soit obtenue par le tribunal[183]. Toutefois, selon la CJUE, seuls les tribunaux du pays de résidence habituelle de l'enfant sont habilités à juger de la légalité de leurs propres jugements sous l'angle de la Charte des droits fondamentaux et du règlement Bruxelles II bis. En vertu du principe de confiance mutuelle, les systèmes juridiques des États membres doivent fournir une protection efficace et équivalente des droits fondamentaux. Toute contestation fondée sur les droits de l'homme doivent donc être portées par les parties concernées devant les tribunaux compétents pour juger du bien-fondé du litige lié à la garde en application du règlement. La CJUE a statué que le tribunal d'un État membre vers lequel l'enfant avait été illicitement déplacé ne pouvait s'opposer à l'exécution d'un jugement certifié ordonnant le retour de l'enfant étant donné que seul l'État d'où avait été déplacé l'enfant était compétent pour juger s'il y avait violation de ces dispositions.

Exemple : l'affaire *Povse c. Alpago*[184] concerne le déplacement illicite d'une fillette vers l'Autriche par sa mère. Les tribunaux autrichiens ont rejeté la demande de retour de la fillette en Italie déposée par le père au motif

182 L'article 10, point b), du règlement Bruxelles II bis prévoit les quatre conditions suivantes : i) dans un délai d'un an après que le titulaire d'un droit de garde a eu ou aurait dû avoir connaissance du lieu où se trouvait l'enfant, aucune demande de retour n'a été faite auprès des autorités compétentes de l'État membre où l'enfant a été déplacé ou est retenu ; ii) une demande de retour présentée par le titulaire d'un droit de garde a été retirée et aucune nouvelle demande n'a été présentée dans le délai fixé au point i) ; iii) une affaire portée devant une juridiction de l'État membre dans lequel l'enfant avait sa résidence habituelle immédiatement avant son déplacement ou son non-retour illicites a été close en application de l'article 11, para. 7 ; point iv) une décision de garde n'impliquant pas le retour de l'enfant a été rendue par les juridictions de l'État membre dans lequel l'enfant avait sa résidence habituelle immédiatement avant son déplacement ou son non-retour illicites.

183 CJUE, C-491/10 PPU, *Joseba Adoni Aguirre Zarraga c. Simone Pelz*, 22 décembre 2010. Pour les aspects concernant la participation de l'enfant à cette affaire, voir l'analyse de la section 2.4.

184 CJUE, C-211/10, *Doris Povse c. Mauro Alpago*, 1er juillet 2010.

qu'il y avait un risque grave de préjudice pour l'enfant. Sur la requête du père, le tribunal italien a, quant à lui, estimé qu'il demeurait compétent pour juger du bien-fondé du litige lié à la garde et a ordonné le retour de l'enfant en Italie et émis un certificat d'exécution en vertu de l'article 42 du règlement Bruxelles II bis. L'affaire a été renvoyée à la CJUE par un tribunal autrichien suite à l'appel de la mère contre la demande d'exécution du certificat visant au retour de l'enfant en Italie. La CJUE a jugé qu'une fois qu'un certificat d'exécution est émis, il n'est plus possible de s'opposer au retour de l'enfant dans le pays requérant (ici, l'Autriche), car le certificat est automatiquement exécutable. En outre, la CJUE a jugé que, dans cette affaire, seuls les tribunaux italiens étaient compétents pour juger du risque grave lié au retour de l'enfant par rapport à son intérêt supérieur. Dans l'hypothèse où ces tribunaux considéreraient ce risque comme justifié, ils étaient les seuls compétents pour suspendre leur propre titre exécutoire[185].

Dans le droit du CdE, la Convention européenne sur la reconnaissance et l'exécution des décisions en matière de garde des enfants et le rétablissement de la garde des enfants du CdE[186]et la Convention sur les relations personnelles concernant les enfants[187] prévoient des garanties pour empêcher le déplacement illicite d'enfants et assurer le retour des enfants[188].

La CouEDH traite souvent d'affaires d'enlèvement d'enfant pour lesquelles elle est généralement guidée par les dispositions de la Convention de La Haye quand elle doit interpréter l'article 8 de la CEDH. Mais la CouEDH effectue systématiquement une analyse de l'intérêt supérieur de l'enfant dans ces affaires. Deux arrêts majeurs de la Grande Chambre reflètent la position de la Cour en la matière.

Exemple : l'affaire *Neulinger et Shuruk c. Suisse*[189] a été portée par une mère qui avait déplacé son fils d'Israël en Suisse en violation de l'accord conclu sur le droit de garde. Comme suite à la requête du père en vertu de

185 Une requête basée sur les mêmes faits a été plus tard déposée par la CouEDH et déclarée irrecevable. Voir CouEDH, *Povse c. Autriche*, décision d'irrecevabilité, n° 3890/11, 18 juin 2013.

188 *Ibid.*, arts. 10, point b), et 16, respectivement ; CdE, Convention européenne sur la reconnaissance et l'exécution des décisions en matière de garde des enfants et le rétablissement de la garde des enfants, STCE n° 105, 1980, art. 8.

189 CouEDH, *Neulinger et Shuruk c. Suisse* [GC], n° 41615/07, 6 juillet 2010.

la Convention de La Haye, les autorités suisses ont ordonné le retour de l'enfant en Israël. Selon les tribunaux et les experts nationaux, le retour de l'enfant en Israël ne pouvait être envisagé que si l'enfant était accompagné de sa mère. La mesure en question demeurait dans la marge d'appréciation accordée aux autorités nationales en la matière. Néanmoins, pour évaluer le respect de l'article 8 de la CEDH, il était aussi nécessaire de tenir compte de tout développement depuis le jugement de la Cour fédérale qui ordonnait le retour de l'enfant. Dans le cas présent, l'enfant était de nationalité suisse et s'était bien intégré dans le pays où il vivait de façon continue depuis quatre ans environ. Même s'il avait un âge où il avait encore une grande capacité d'adaptation, le fait d'être de nouveau déplacé aurait probablement des conséquences graves sur lui et devait être pondéré par rapport aux bénéfices qu'il était susceptible d'en retirer. Il convenait aussi de noter que les restrictions de droit de visite du père avaient été imposées avant le déplacement de l'enfant. En outre, le père s'était remarié deux fois depuis et était de nouveau père mais ne versait pas de pension alimentaire pour sa fille. La CouEDH a douté que ces circonstances puissent contribuer au bien-être et à l'épanouissement de l'enfant. Quant à la mère, son retour en Israël pouvait l'exposer à un risque de sanctions pénales, comme une peine de prison. Il était clair qu'une telle situation ne serait pas dans l'intérêt supérieur de l'enfant, sa mère représentant sans doute la seule personne de référence. Le refus de la mère de retourner en Israël n'était donc pas totalement injustifié. En outre, le père n'avait jamais habité seul avec l'enfant et ne l'avait pas revu depuis son départ à l'âge de deux ans. La CouEDH n'était donc pas convaincue qu'il serait dans l'intérêt supérieur de l'enfant de retourner en Israël. Pour la mère, un retour en Israël constituerait une ingérence disproportionnée dans son droit au respect de la vie familiale. En conséquence, il y aurait violation de l'article 8 de la CEDH pour les deux requérants si la décision ordonnant le retour du second requérant en Israël était exécutée.

Exemple : dans *X c. Lettonie*[190], la mère a fait valoir que le retour de sa fille en Australie, d'où elle avait été déplacée illicitement, l'exposerait à un grave préjudice. Lors des délibérations visant à déterminer si les décisions des tribunaux nationaux avaient ménagé un juste équilibre entre les intérêts divergents en jeu, dans les limites de la marge d'appréciation accordée aux États en la matière, l'intérêt supérieur de l'enfant devait constituer une

190 CouEDH, *X c. Lettonie* [GC], n° 27853/09, 26 novembre 2013, paras. 101, 106, 107 et 115-119.

considération primordiale. Pour aboutir à une interprétation cohérente de la CEDH et de la Convention de La Haye, les facteurs pouvant constituer une exception au retour immédiat de l'enfant en vertu des articles 12, 13 et 20 de la Convention de La Haye devaient être dûment pris en compte par l'État requis, qui devait rendre une décision suffisamment raisonnée sur ce point, puis évaluée sous l'angle de l'article 8 de la CEDH. Cet article imposait une obligation procédurale aux autorités nationales lors de l'évaluation d'une demande de retour d'un enfant, les tribunaux devant tenir compte des allégations contestables d'un « risque grave » pour l'enfant en cas de retour et statuer en donnant les raisons spécifiques. Concernant la nature exacte du « risque grave », l'exception prévue par l'article 13, point b), de la Convention de La Haye concernait uniquement les situations qui dépassent ce qu'un enfant peut raisonnablement supporter. Dans le cas présent, la requérante avait soumis à la Cour d'appel lettonne le certificat d'un psychologue concluant qu'il existait un risque de traumatisme pour l'enfant en cas de séparation immédiate d'avec sa mère. Alors qu'il revenait aux tribunaux nationaux de vérifier l'existence d'un « risque grave » pour l'enfant et que le rapport du psychologue était directement lié à l'intérêt supérieur de l'enfant, la juridiction régionale a refusé d'examiner les conclusions de ce rapport sous l'angle des dispositions de l'article 13, point b), de la Convention de La Haye. Dans le même temps, les tribunaux nationaux n'ont pas tranché la question de savoir si la mère était en mesure de suivre sa fille en Australie et de maintenir le contact avec elle. Étant donné que les tribunaux nationaux n'ont pas pu procéder à un examen efficace des allégations de la requérante, le processus décisionnel en vertu du droit national n'a pas satisfait aux exigences procédurales inhérentes à l'article 8 de la CEDH et la requérante a donc souffert d'une ingérence disproportionnée dans son droit au respect de la vie familiale.

Tout enfant a droit au respect de sa vie privée et familiale, un droit reconnu par l'article 7 de la Charte des droits fondamentaux de l'UE et l'article 8 de la Convention européenne des droits de l'homme (CEDH) (voir chapitre 5). Le droit de l'UE et le droit du Conseil de l'Europe rendent compte de l'importance des relations familiales pour l'enfant, et notamment le droit de l'enfant à ne pas être privé du contact avec ses parents, sauf quand cela est contraire aux intérêts de l'enfant[191]. Il est difficile de trouver un équilibre entre s'assurer que l'enfant reste avec sa famille, conformément au respect de la vie familiale, et garantir la protection de l'enfant contre tout préjudice. Lorsqu'un enfant est séparé de sa famille, il peut être placé dans un foyer d'accueil ou dans un hébergement institutionnel. La vie familiale ne s'achève pas avec la séparation et nécessite un maintien du contact afin d'encourager le regroupement familial si cela est dans l'intérêt supérieur de l'enfant. Dans certains cas la séparation est permanente, notamment par le biais d'une adoption. La finalité même de l'adoption implique de respecter des exigences strictes.

Ce chapitre vise à examiner le droit européen en matière de protection de remplacement. Au niveau de l'UE, la question des aspects procéduraux transfrontaliers liés au placement d'enfants dans des structures alternatives est principalement couverte par le règlement Bruxelles II bis. Ce règlement doit être interprété

191 UE (2012), Charte des droits fondamentaux de l'Union européenne, JO 2012 C 326, art. 24 (3).

conformément à la Charte des droits fondamentaux de l'UE, en particulier l'article 24. La CouEDH a également développé une importante jurisprudence traitant des aspects procéduraux et de fond liés au placement d'enfants dans des structures alternatives.

La section 6.1 donne une introduction à certains principes généraux régissant la situation des enfants privés de soins parentaux, la section 6.2 présente la législation concernant le retrait des enfants de la famille pour un placement dans des structures de remplacement et la section 6.3 examine les normes européennes en matière d'adoption.

6.1. Protection de remplacement : principes généraux

Points clés

- Le placement en structure de remplacement représente une mesure de protection temporaire.
- Le droit international confirme que la prise en charge dans un cadre familial doit être privilégiée à un hébergement institutionnel.
- Les enfants ont le droit de recevoir et de communiquer des informations ainsi que d'exprimer leur opinion concernant le placement en structure alternative.

En vertu du droit de l'UE, du droit du Conseil de l'Europe et du droit international, six grands principes apparaissent en matière de protection de remplacement.

En premier lieu, la protection de remplacement est une mesure visant à assurer la protection temporaire des enfants et à faciliter le retour des enfants au sein de leur famille quand cela est possible.[192] Dans l'idéal, il s'agit donc d'une mesure temporaire. Il peut s'agir d'une mesure de protection dans l'attente d'un regroupement familial, par exemple pour les enfants migrants non accompagnés ou

192 ONU, Assemblée générale (2010), *Lignes directrices relatives à la protection de remplacement pour les enfants*, A/RES/64/142, 24 février 2010, points 48 à 51 ; ONU, Comité des droits de l'enfant (2013), *Observation générale n° 14 (2013) sur le droit de l'enfant à ce que son intérêt supérieur soit une considération primordiale (art. 3, para. 1)*, CRC/C/GC/14, points 58 à 70.

séparés de leur famille.[193] Il peut également s'agir d'une mesure de protection dans l'attente d'une évolution de la vie familiale, par exemple une amélioration de la santé d'un parent ou l'apport d'un soutien aux parents.

Deuxièmement, le droit international confirme que la prise en charge dans un cadre familial (tel qu'un placement dans une famille d'accueil) est la forme la plus adaptée de protection de remplacement garantissant la protection et le développement de l'enfant. Ceci est réaffirmé par les *Lignes directrices relatives à la protection de remplacement pour les enfants* de l'ONU et la Convention de l'ONU relative aux droits des personnes handicapées (CRPD) dont l'UE est signataire.[194] La CRPD déclare expressément que « les États Parties s'engagent, lorsque la famille immédiate n'est pas en mesure de s'occuper d'un enfant handicapé, à ne négliger aucun effort pour assurer la prise en charge de l'enfant par la famille élargie et, si cela n'est pas possible, dans un cadre familial au sein de la communauté »[195]. Le placement hors du foyer parental (par exemple un placement en institution) « devrait être limité aux cas où cette solution est particulièrement appropriée, nécessaire et constructive pour l'enfant concerné et répond à son intérêt supérieur »[196].

Troisièmement, le droit de l'enfant à avoir un tuteur ou un représentant légal comme élément principal permettant d'accéder à des droits plus larges[197]. Bien que le droit de l'UE ne prévoie explicitement aucune obligation générale de désigner un tuteur pour les enfants n'étant pas pris en charge par leur famille, au moins sept directives européennes exigent des États membres qu'ils désignent un tuteur pour les enfants dans différentes situations, dont certaines directement

193 ONU, Assemblée générale, Convention relative aux droits de l'enfant, 20 novembre 1989, art. 22 ; ONU, Comité des droits de l'enfant (2005), *Observation générale n° 6 (2005), Traitement des enfants non accompagnés et des enfants séparés en dehors de leur pays d'origine*, CRC/GC/2005/6, 1er septembre 2005, points 81 à 83.

194 ONU, Assemblée générale (2010), *Lignes directrices relatives à la protection de remplacement pour les enfants*, A/RES/64/142, 24 février 2010, points 20 à 22 ; ONU, Comité des droits de l'enfant (2006), *Observation générale n° 7 (2005), Mise en œuvre des droits de l'enfant dans la petite enfance*, CRC/C/GC/7/Rev.136 (b), 20 septembre 2006, point 18. ONU, Convention relative aux droits des personnes handicapées (CRPD), 13 décembre 2006, art. 23 (5) (voir également art. 7).

196 ONU, Assemblée générale (2010), *Lignes directrices relatives à la protection de remplacement pour les enfants*, A/RES/64/142, 24 février 2010, point 21.

197 FRA (2014a), p. 31.

liées à des enfants n'étant pas pris en charge par leur famille[198]. Par ailleurs, ce corpus législatif est étayé par les Lignes directrices des Nations Unies relatives à la protection de remplacement pour les enfants (généralement concernant les enfants sans protection parentale), la CRC (plus précisément concernant les enfants non accompagnés), et la Convention du Conseil de l'Europe sur la lutte contre la traite des êtres humains.[199] Bien souvent, le mandat du tuteur légal vise à protéger l'intérêt supérieur de l'enfant, s'assurer de son bien-être, et compenser sa capacité juridique limitée (ainsi que parfois exercer sa représentation légale)[200].

Le quatrième principe est implicitement compris dans l'article 24 de la Charte des droits fondamentaux de l'UE, et concerne l'obligation légale de prendre des mesures positives afin que le processus décisionnel lié au placement de l'enfant soit guidé par son intérêt supérieur[201] et que son opinion soit prise en compte[202]. Les observations générales n° 5 et 14 du Comité des droits de l'enfant[203] ainsi que les Lignes directrices des Nations Unies relatives à la protection de remplacement pour les enfants insistent sur la nécessité d'assurer le droit de l'enfant à recevoir des informations, y compris à propos de ses droits et de ses options, ainsi que le droit de l'enfant à « être consulté et de voir ses opinions dûment prises en considération, compte tenu de ses capacités »[204].

Cinquièmement, les droits plus larges des enfants définies dans la Charte des droits fondamentaux de l'UE, la CEDH et la CRC restent applicables en cas de placement en structure de remplacement (famille d'accueil ou institution). Ils

202 ONU, Comité des droits de l'enfant (2009), *Observation générale n° 12 (2009), Le droit de l'enfant d'être entendu*, CRC/C/GC/12, point 97.

203 ONU, Comité des droits de l'enfant (2013), *Observation générale n° 14 (2013) sur le droit de l'enfant à ce que son intérêt supérieur soit une considération primordiale (art. 3, par. 1)*, CRC/C/GC/14, point 15 (g) ; *Observation générale n° 5 (2003), Mesures d'application générales de la Convention relative aux droits de l'enfant (art. 4, 42 et 44, par. 6)*, CRC/GC/2003/5, 27 novembre 2003, point 24.

204 ONU, Assemblée générale (2010), *Lignes directrices relatives à la protection de remplacement pour les enfants*, 24 février 2010, A/RES/64/142, point 6.

incluent des droits civiques et politiques (par ex. les droits à la vie privée, la liberté d'expression, la liberté de religion et la protection contre toutes les formes de violence), ainsi que des droits socioéconomiques (y compris les droits à l'éducation, la santé et la participation à la vie culturelle).[205]

Enfin, l'article 4 de la CRC impose aux États de prendre « toutes les mesures législatives, administratives et autres » afin de mettre en œuvre la convention. Ceci s'applique également dans le contexte de la protection de remplacement. L'article 17, paragraphe 1, point c), de la Charte sociale européenne (CSE) révisée exige également des États de prendre toutes les mesures nécessaires et appropriées tendant à assurer une protection et une aide spéciale vis-à-vis de l'enfant ou de l'adolescent temporairement ou définitivement privé de son soutien familial.

Dans le droit de l'UE, la CJUE a jugé que le règlement Bruxelles II bis s'applique aux décisions de placement d'un enfant hors du foyer familial. Comme indiqué au chapitre 5, Bruxelles II bis inclut dans son approche les principes relatifs aux droits des enfants, soulignant que l'égalité de tous les enfants, l'intérêt supérieur de l'enfant et le droit d'être entendu, notamment, doivent être pris en considération[206]. Les « motifs de non-reconnaissance des décisions en matière de responsabilité parentale » tels que mentionnés dans l'article 23 du règlement Bruxelles II bis sont intéressants à ce titre. L'article 23 dispose que les décisions rendues ne sont pas reconnues :

> *(a) si la reconnaissance est manifestement contraire à l'ordre public de l'État membre requis eu égard aux intérêts supérieurs de l'enfant ;*
> *(b) si, sauf en cas d'urgence, elle a été rendue sans que l'enfant, en violation des règles fondamentales de procédure de l'État membre requis, ait eu la possibilité d'être entendu [...].*

En vertu de ce règlement, la juridiction est déterminée en fonction de la résidence habituelle de l'enfant, sous réserve de quelques exceptions limitées, notamment l'intérêt supérieur de l'enfant (articles 8, 12 et 15 de Bruxelles II bis).

205 Charte des droits fondamentaux de l'UE, art. 3 à 4, 7, 10 à 11, 14 et 24 ; CEDH, notamment art. 8 ; et CRC, art. 13 à 14, 16, 19, 28, 29, 24, 31 et 37 ; ONU, Assemblée générale (2010), *Lignes directrices relatives à la protection de remplacement pour les enfants*, 24 février 2010, A/RES/64/142, section 2.

206 Règlement Bruxelles II bis, Préambule. Voir également chapitre 5.

Dans le droit du CdE, la CouEDH a affirmé que la famille est l'environnement naturel permettant à l'enfant de grandir et de s'épanouir. Cependant, lorsque la famille ne peut offrir à l'enfant les soins et la protection requis, un placement dans une structure de remplacement peut être nécessaire. Un retrait de la cellule familiale interfère avec le respect de la vie familiale. La CouEDH a expliqué que, dans la plupart des cas, le placement d'un enfant dans une structure de remplacement doit être considéré comme une mesure temporaire, et que l'enfant doit à terme regagner sa famille en conformité avec le droit au respect de la vie privée et familiale garanti par l'article 8 de la CEDH.[207]

Bien que la CEDH n'impose pas aux États de devoir spécifiquement fournir des soins et une protection aux enfants, l'article 17 de la CSE exige que les États « s'engagent à prendre toutes les mesures nécessaires et appropriées tendant à assurer une protection et une aide spéciale de l'État vis-à-vis de l'enfant ou de l'adolescent temporairement ou définitivement privé de son soutien familial »[208].

6.2. Placement d'enfants en structure de remplacement

Points clés

- Selon le droit du Conseil de l'Europe, le placement d'un enfant en structure de remplacement devrait être prévu par la loi, poursuivre un but légitime, et être nécessaire dans une société démocratique. Il revient à l'autorité compétente de fournir des motifs pertinents et suffisants.
- Selon le droit du Conseil de l'Europe, le processus décisionnel doit respecter certaines garanties procédurales.

Dans le droit du CdE,[209] le placement d'un enfant en structure de remplacement n'est compatible avec l'article 8 de la CEDH que s'il est conforme au droit, pour-

207 CouEDH, *K.A. c. Finlande*, n° 27751/95, 14 janvier 2003. Le Comité des Ministres du Conseil de l'Europe a approuvé cette approche dans sa Recommandation relative aux droits des enfants vivant en institution, Rec(2005)5, adoptée le 16 mars 2005.

208 CdE, Charte sociale européenne (révisée), STCE n° 163, 1996, art. 17 (1) c.

209 Le placement d'enfants en structure alternative est également un sujet de discussion politique depuis de nombreuses années au sein du Conseil de l'Europe. Voir par exemple la résolution du Comité des Ministres (77) 33 sur le placement des enfants, adoptée le 3 novembre 1977.

suit un but légitime (comme la protection de l'intérêt supérieur de l'enfant), et est considéré comme nécessaire dans une société démocratique. Ce dernier élément implique que les juridictions fournissent des raisons à la fois pertinentes et suffisantes afin d'appuyer les moyens utilisés visant à poursuivre le but recherché.

Exemple : dans l'affaire *Olsson c. Suède (n° 1)*[210], les requérants se sont plaints de la décision de placer leurs trois enfants. Considérant que la décision de placement relevait de la marge d'appréciation de l'État, la CouEDH a plus particulièrement examiné la façon dont l'ordre de placement a été mis en œuvre. Selon la Cour, la décision de placement aurait dû être considérée comme une mesure provisoire, devant être interrompue dès que les circonstances le permettaient, étant donné qu'aucune adoption n'était envisagée. Les mesures prises auraient donc dû coïncider avec l'objectif ultime de réunir la famille naturelle. Dans cette perspective, la CouEDH note que les autorités nationales ont placé les enfants dans différentes familles d'accueil relativement éloignées les unes des autres et de leurs parents. Bien que les autorités aient agi de bonne foi en mettant en œuvre l'ordre de placement, la Cour note qu'il n'est pas acceptable de déterminer où les enfants seraient placés en fonction de raisons administratives, comme le manque de places en famille d'accueil ou en hébergement. Dans un domaine si fondamental comme le respect de la vie familiale, de telles considérations ne doivent jouer qu'un rôle plus que secondaire. Ainsi, concluant à une violation de l'article 8 de la CEDH, la CouEDH a déclaré que les mesures prises par les autorités dans le cadre de l'exécution de l'ordre de placement n'étaient pas étayées par des raisons suffisantes pour les considérer comme proportionnellement justifiées par rapport au but légitime poursuivi en vertu de l'article 8.

Plus récemment, la CouEDH a examiné le bien-fondé des décisions de placement d'enfants en structure alternative relativement à l'article 8 de la CEDH.

Exemple : dans l'affaire *Wallová et Walla c. République tchèque*[211] les requérants se sont plaints du placement de leur cinq enfants dans deux familles d'accueil différentes du fait de leurs mauvaises conditions de logement. La garde des enfants avait été confiée à des familles d'accueil

210 CouEDH, *Olsson c. Suède (n° 1)*, n°10465/83, 24 mars 1988.

211 CouEDH, *Wallová et Walla c. République tchèque*, n° 23848/04, 26 octobre 2006.

en 2002 du fait de l'instabilité économique des parents, et les décisions de placement ont ensuite été levées lorsque leur situation économique et leurs conditions de logement se sont améliorées. Dans l'appréciation de cette affaire, la CouEDH a considéré que le motif soutenant la décision de placer les enfants était l'absence d'un logement convenable, et qu'il aurait donc été possible de prendre une mesure moins drastique pour régler leur situation. Selon le droit tchèque, il était possible d'organiser une surveillance des conditions de vie et d'hygiène de la famille, et de les conseiller sur la meilleure façon d'améliorer leur situation, mais cette possibilité n'a pas été exploitée. Même si les raisons justifiant le placement des enfants étaient pertinentes, elles n'étaient pas suffisantes et les autorités n'ont pas fourni assez d'efforts pour aider les requérants à surmonter leurs difficultés à l'aide de mesures alternatives. En concluant à une violation de l'article 8 de la CEDH, la Cour a également pris en compte les conclusions du Comité des droits de l'enfant de l'ONU, qui a observé que le principe de la considération primordiale des intérêts de l'enfant n'était pas suffisamment défini et pris en compte en République tchèque dans le droit, les décisions de justice et les politiques publiques concernant les enfants.

Exemple : dans l'affaire *Saviny c. Ukraine*[212], les enfants des requérants avaient été placés en raison d'un manque de moyens financiers, les autorités nationales ayant conclu que leurs qualités personnelles mettaient en péril la vie, la santé et l'éducation morale de leurs enfants. Lors de l'examen de cette affaire, la CouEDH a mis en doute le bien-fondé des éléments sur lesquels les autorités locales se sont appuyées et a conclu que les informations disponibles pour mesurer l'ampleur réelle de l'aide prodiguée par les services sociaux étaient insuffisantes. Ces informations auraient été pertinentes pour vérifier si les autorités s'étaient acquittées de leur obligation de protéger l'unité familiale et si elles avaient examiné avec suffisamment d'attention l'efficacité de mesures moins restrictives avant de chercher à séparer les enfants de leurs parents. Par ailleurs, à aucun stade de la procédure les enfants n'ont été entendus par les juges. En somme, bien que pertinents, les motifs avancés par les autorités nationales pour retirer leurs enfants aux requérants ne suffisaient pas à justifier une atteinte aussi grave au droit à la vie familiale de ceux-ci. La Cour a donc conclu à la violation de l'article 8 de la CEDH.

212 CouEDH, *Saviny c. Ukraine*, n° 39948/06, 18 décembre 2008.

Au titre de l'article 8 de la CEDH, la CouEDH exige que le processus décisionnel concernant le respect de la vie familiale respecte certaines garanties procédurales. Elle affirme que le processus décisionnel (procédures administratives et judiciaires) conduisant à des mesures d'ingérence dans la vie familiale doit être équitable et respecter les intérêts protégés par l'article 8. Ce qui est visé à l'article 8 est le fait de savoir si « les parents ont été impliqués dans le processus décisionnel [...] à un degré protégeant suffisamment leur intérêts »[213]. Cela inclut notamment de les tenir informés des développements de façon à s'assurer qu'ils peuvent participer aux décisions les concernant[214] et, dans certaines circonstances, d'écouter les enfants concernés[215].

Exemple : dans l'affaire *B. c. Roumanie (n° 2)*[216], la requérante a été diagnostiquée comme atteinte de schizophrénie paranoïde et conduite à plusieurs reprises par la police dans des services psychiatriques pour y être soignée. Ses enfants ne vivaient plus avec elle et avaient été placés dans un centre d'accueil du fait de la maladie de leur mère. La CouEDH devait examiner si, eu égard au caractère sérieux des décisions prises concernant le placement des enfants, le processus décisionnel dans son ensemble avait suffisamment protégé les intérêts des parents. À cet égard, la Cour a noté que la requérante, qui souffrait d'une sévère pathologie psychique, ne s'est pas vu désigner un avocat ou un tuteur à l'instance pour la représenter lors des procédures, de sorte qu'il lui a été impossible de participer au processus décisionnel concernant ses enfants mineurs. De plus, la situation de la requérante et la situation de ses enfants n'avaient été examinées qu'à seulement deux occasions par une cour sur une période de 12 ans avant que les deux enfants n'atteignent la majorité, et qu'il n'existait aucune preuve de contacts réguliers entre les travailleurs sociaux responsables et la requérante, lesquels auraient pu constituer un bon moyen de signaler aux autorités l'opinion de cette dernière. Pour ces raisons, la Cour a estimé que le processus décisionnel concernant le placement des enfants n'a pas suffisamment protégé ses intérêts, et qu'il y avait donc eu violation de l'article 8 de la CEDH.

213 CouEDH, *W. c. Royaume-Uni*, n° 9749/82, 8 juillet 1987, point 64.

214 CouEDH, *McMichael c. Royaume-Uni*, n° 16424/90, 24 février 1995.

215 CouEDH, *B. c. Roumanie (n°2)*, n° 1285/03, 19 février 2013 ; CouEDH, *B.B. et F.B. c. Allemagne*, n° 18734/09 et 9424/11, 14 mars 2013.

216 CouEDH, *B. c. Roumanie (n° 2)*, n° 1285/03, 19 février 2013.

Exemple : dans l'affaire *B.B. et F.B. c. Allemagne*[217], comme suite aux allégations de la fille des requérants âgée de 12 ans et de son frère âgé de 8 ans selon lesquelles ils avaient été sévèrement battus à maintes reprises, les droits parentaux concernant les deux enfants ont été transférés au Tribunal pour enfants et les enfants placés dans un foyer d'accueil. Le tribunal cantonal a donné l'ordre complet de transférer l'autorité parentale à l'office de la jeunesse en basant sa décision sur les déclarations des enfants. Un an plus tard environ, lors de la première rencontre importante avec ses parents, la fille a reconnu avoir menti et n'avoir jamais été battue, et les enfants ont alors été, par la suite, restitués à leur famille. Lors de l'examen de la plainte des requérants selon laquelle les autorités n'avaient pas examiné les faits pertinents de manière suffisamment attentive, la CouEDH a souligné que le fait que des professionnels prennent des décisions erronées ne signifie pas nécessairement que les mesures prises soient en contradiction avec l'article 8 de la CEDH. La décision de placement ne pouvait être évaluée qu'à la lumière de la situation telle que présentée aux autorités locales à cette époque. Dans la décision de la CouEDH, le fait que le tribunal cantonal ne se soit appuyé que sur les déclarations des enfants, alors que les requérants avaient fourni des déclarations de professionnels de santé n'ayant signalé aucun signe de mauvais traitement, associé au fait que le tribunal d'appel n'ait pas réexaminé les enfants, représentaient des éléments pertinents. Les enfants étant placés dans un endroit sûr à l'époque de l'audience de plein droit, il n'y avait aucune raison de se hâter, et les tribunaux auraient pu mener une enquête relative aux faits à leur vitesse, ce qu'ils n'ont pas fait. Au demeurant, les tribunaux allemands ont échoué à fournir des raisons suffisantes au retrait de l'autorité parentale des requérants, en violation de l'article 8 de la CEDH.

Même placés dans des structures alternatives, les enfants conservent le droit de maintenir le contact avec leurs parents. Ce droit a été reconnu en vertu de la CEDH[218], la CouEDH soutenant que le contact mutuel entre les parents et les enfants est un élément fondamental de la vie familiale conformément à l'article 8. Étant donné que le placement en structure de remplacement devrait normalement constituer une mesure temporaire, maintenir les relations familiales est essentiel

217 CouEDH, *B.B. et F.B. c. Allemagne*, n° 18734/09 et 9424/11, 14 mars 2013.

218 CouEDH, *Olsson c. Suède (n° 1)*, n° 10465/83, 24 mars 1988.

pour réussir le retour de l'enfant dans sa famille.[219]. Selon la CEDH, des obligations positives découlent de ces principes, comme l'illustrent les affaires suivantes.

Exemple : dans l'affaire *T. c. République tchèque*[220], la CouEDH a examiné si les droits du père et de la fille (requérants) avaient été violés par le placement de l'enfant et l'échec des autorités à maintenir le contact entre les deux. L'enfant avait été placé dans un établissement spécialisé après le décès de sa mère et après le rejet de la demande de garde du père en raison de craintes quant à sa personnalité. Ses autres demandes à plusieurs reprises de passer les vacances avec sa fille furent rejetées et le centre thérapeutique conclut que les visites n'étaient pas favorables à l'enfant car elle avait peur de lui, et tout contact a alors cessé. Ultérieurement, les tribunaux ont décidé que le contact entre les deux requérants devait être seulement épistolaire, conformément aux vœux de l'enfant. La CouEDH a insisté, en particulier, sur l'intérêt de l'enfant à maintenir les liens avec sa famille, sauf dans des cas extrêmes ne relevant pas de l'intérêt supérieur de l'enfant. Lors de l'examen de la décision de placer l'enfant, la CouEDH a noté avec satisfaction que les autorités locales avaient examiné attentivement la décision, laquelle avait été prise après avoir entendu l'avis d'experts psychologiques et psychiatriques ainsi qu'en tenant compte des souhaits de l'enfant. Il n'y a donc pas eu violation de l'article 8 de la CEDH comme suite à la décision de placer l'enfant. Toutefois, la Cour a considéré que l'article 8 avait été violé comme suite aux restrictions imposées au contact entre les requérants, notamment du fait d'un manque de contrôle exercé sur les décisions de l'établissement de résidence de l'enfant à refuser le contact, étant donné que ces décisions ont réduit de façon décisive les possibilités de regroupement familial.

Exemple : dans *K.A. c. Finlande*[221], les enfants du requérant ont été placés comme suite à des allégations de violences sexuelles. Pendant la durée du placement des enfants, les contacts entre eux et leurs parents étaient restreints et peu d'efforts ont été mis en œuvre pour organiser la réunification de la famille. Lors de l'examen de l'affaire, la CouEDH a noté que l'État avait l'obligation absolue de faciliter la réunification de la famille

219 CouEDH, *Eriksson c. Suède,* n° 11373/85, 22 juin 1989.

220 CouEDH, *T. c. République tchèque*, n° 19315/11, 17 juillet 2014.

221 CouEDH, *K.A. c. Finlande*, n° 27751/95, 14 janvier 2003.

dans un délai raisonnable, en prenant en compte le devoir de protéger l'intérêt supérieur de l'enfant. Selon la Cour, les sévères restrictions apportées au droit de visite du requérant à l'égard de ses enfants témoignent de l'intention des services sociaux de renforcer les liens entre les enfants et leur famille d'accueil et non de les réunir avec leur famille biologique. Cela a eu lieu malgré une amélioration visible de la situation du père. En conséquence, il y a bien eu violation de l'article 8 de la CEDH.

6.3. Adoption

Points clés

- L'adoption représente une solution de placement alternative lorsque les enfants ne peuvent rester avec leur famille biologique.
- Dans l'adoption, l'intérêt supérieur de l'enfant doit toujours primer sur toute autre considération.
- Selon le droit du Conseil de l'Europe ou de l'UE, il n'existe pas de droit d'adopter, mais le processus d'adoption doit répondre à certains critères afin de garantir le respect de l'intérêt supérieur de l'enfant.[220]

Selon le droit international, l'intérêt supérieur de l'enfant doit être la considération primordiale dans les affaires d'adoption. Outre les principes de l'intérêt supérieur, d'autres principes généraux édictés par la CRC orientent et appuient leur mise en œuvre dans le contexte de l'adoption : non-discrimination, droit à la vie, à la survie et au développement, ainsi que le droit d'être entendu.[223] L'observation générale n° 14 du Comité des droits de l'enfant de l'ONU est à cet égard notamment pertinente car elle évoque le « droit de l'enfant à ce que son intérêt supérieur soit une considération primordiale ».[224]

222 Sur l'intérêt de l'enfant à connaître ses origines dans le contexte de l'adoption, voir le chapitre 4.

223 CRC, art. 2, 3, 6 et 12. Voir également, ONU, Comité sur les droits de l'enfant (2010), *Lignes directrices spécifiques aux traités concernant la forme et le contenu des rapports périodiques devant être soumis par les États parties en vertu de l'article 44, paragraphe 1 (b), de la Convention relative aux droits de l'enfant*, CRC/C/58/Rev.2, 23 novembre 2010, paras. 23 à 27.

224 ONU, Comité des droits de l'enfant (2013), *Observation générale n° 14 (2013) sur le droit de l'enfant à ce que son intérêt supérieur soit une considération primordiale (art. 3, para. 1)*, CRC/C/GC/14, art. 3, para. 1.

De même, l'un des objectifs de la Convention de la Haye sur la protection des enfants et la coopération en matière d'adoption internationale est « d'établir des garanties pour que les adoptions internationales aient lieu dans l'intérêt supérieur de l'enfant et dans le respect des droits fondamentaux qui lui sont reconnus en droit international ».[225]

Dans le droit de l'UE, les droits et les devoirs liés à l'article 24 de la Charte des droits fondamentaux de l'UE sont applicables à l'adoption dans la mesure où ils sont abordés par l'UE.

Dans le droit du CdE, le droit au respect de la vie familiale, conformément à l'article 8 de la CEDH, est applicable et fondé dans les affaires d'adoption. Il existe également deux conventions spécifiques du Conseil de l'Europe sur ce sujet : la Convention européenne en matière d'adoption des enfants[226] et la Convention européenne en matière d'adoption des enfants (révisée)[227]. Ces instruments exigent que l'adoption soit considérée selon une approche fondée sur les droits de l'enfant. La Convention européenne en matière d'adoption des enfants (révisée), par exemple, déclare que « l'autorité compétente ne prononce l'adoption que si elle a acquis la conviction que l'adoption est conforme à l'intérêt supérieur de l'enfant. »[228] De même, la CouEDH souligne que l'intérêt supérieur de l'enfant peut primer sur l'intérêt des parents dans certaines situations, y compris dans l'adoption.[229] La Convention européenne en matière d'adoption des enfants (révisée) exige également que l'adoption ne soit pas prononcée par les autorités compétentes sans « le consentement de l'enfant considéré par la législation comme ayant un discernement suffisant ».[230] Par ailleurs, l'enfant n'étant pas considéré comme apte à comprendre devrait « être consulté dans la mesure du possible et son avis et ses souhaits [...] pris en considération eu égard à son degré de maturité »[231].

226 CdE, Convention européenne en matière d'adoption des enfants (révisée), STCE n° 202, 2008.

227 *Ibid.* Cette convention a été ouverte à la signature en 2008 et est entrée en vigueur en 2011.

228 *Ibid.*, art. 4.1.

229 CouEDH, *Pini et autres c. Roumanie*, n° 78028/01 et 78030/01, 22 juin 2004.

230 CdE, Convention européenne en matière d'adoption des enfants (révisée), STCE n° 202, 2008, art. 5 (1) b.

231 *Ibid.*, art. 6.

Exemple : dans l'affaire *Pini et autres c. Roumanie*[232], deux couples italiens se sont plaints de la non-exécution par les autorités roumaines de la décision d'un tribunal roumain relative à l'adoption de deux enfants roumains. En violation avec les décisions du tribunal, l'établissement privé dans lequel les enfants résidaient en Roumanie avait refusé de les confier aux requérants. La CouEDH a considéré que les relations entre les requérants et leurs enfants adoptés relevaient bien de la vie familiale selon l'article 8 de la CEDH, même s'ils n'avaient jamais vécu ensemble ou établi de liens affectifs Lors de l'examen de l'affaire, la CouEDH a interprété l'article 8 à la lumière de la CRC et de la Convention de La Haye et a conclu que l'obligation incombant aux autorités de permettre aux requérants d'établir des liens familiaux avec leurs enfants adoptés a été circonscrite du fait de l'intérêt supérieur de l'enfant[233]. À cet égard, elle a considéré que l'intérêt de l'enfant pouvait, selon sa nature et sa gravité, l'emporter sur celui du parent. Par ailleurs, en concluant qu'il n'y avait pas violation de l'article 8, la Cour a estimé que l'importance à privilégier les intérêts de l'enfant par rapport à ceux des parents est accrue dans le cas d'une relation fondée sur l'adoption, car l'adoption consiste à « donner une famille à un enfant et non un enfant à une famille »[234].

Exemple : dans l'affaire *Kearns c. France*[235], la CouEDH a considéré comme conforme à la CEDH le fait qu'une femme irlandaise ayant placé son enfant en vue de son adoption en France, ne puisse retirer son consentement formel à l'issue d'un délai de deux mois. La CouEDH a tout d'abord souligné que le refus opposé par les autorités à la demande de restitution visait un but légitime, à savoir la protection des droits et libertés d'autrui, en l'espèce de l'enfant[236]. Concernant le fait d'imposer un délai de rétraction, le droit français a cherché à trouver un équilibre et une proportionnalité entre les intérêts en conflit de la mère biologique, de l'enfant et de la famille adoptive. Dans la recherche de l'équilibre entre ces différents intérêts, l'intérêt supérieur de l'enfant doit primer[237]. D'après les preuves présentées à la Cour, il était dans l'intérêt supérieur de l'enfant qu'il puisse bénéficier

232 CouEDH, *Pini et autres c. Roumanie*, n° 78028/01 et 78030/01, 22 juin 2004.

233 *Ibid.*, para. 155.

234 *Ibid.*, para. 156.

235 CouEDH, *Kearns c. France*, n° 35991/04, 10 janvier 2008.

236 *Ibid.*, point 73.

237 *Ibid.*, point 79.

rapidement de relations affectives stables, et toutes les mesures permettant de s'assurer que la requérante ait compris les implications de son acte avaient été prises. Au vu de ces considérations, la Cour a conclu que la France avait respecté ses obligations légales envers la requérante au titre de l'article 8 de la CEDH.

La CouEDH a également déclaré que le processus décisionnel relatif à l'adoption devait se faire dans le respect de l'interdiction de la discrimination établie par l'article 14 de la CEDH. La CouEDH a notamment examiné si le refus de donner l'agrément d'adoption à un requérant sur la base de l'orientation sexuelle ou de l'âge était conforme à l'article 14 combiné à l'article 8. Ce faisant, elle a réaffirmé que l'obligation de prendre des mesures proportionnées en vue de protéger l'intérêt supérieur de l'enfant était d'une importance capitale.

Exemple : dans l'affaire *Schwizgebel c. Suisse*[238], la requérante, une femme célibataire âgée de 47 ans, n'a pas pu adopter un second enfant du fait de l'écart d'âge entre elle et l'enfant qu'elle souhaitait adopter. La requérante s'est plainte d'être victime de discrimination fondée sur l'âge. La CouEDH a considéré que, dans l'affaire de la requérante, le rejet de la demande d'autorisation en vue de l'adoption poursuivait un but légitime, à savoir protéger le bien-être de l'enfant[239]. Si l'on tient compte de l'absence de consensus européen sur le droit d'adopter en tant que parent célibataire, les limites d'âge supérieure et inférieure et la différence d'âge entre l'adoptant et l'enfant, ainsi que de la marge d'appréciation considérable qu'il convient de laisser aux États dans ce domaine et de la nécessité de protéger l'intérêt supérieur des enfants, le refus d'autoriser le placement d'un deuxième enfant n'a pas transgressé le principe de proportionnalité[240]. Dès lors, la Cour a conclu que la justification avancée par le gouvernement paraît objective et raisonnable et que la différence de traitement litigieuse n'est pas discriminatoire au sens de l'article 14 de la CEDH.

Exemple : l'affaire *E.B. c. France*[241] concerne le rejet par les autorités nationales d'accorder l'agrément en vue d'adopter à la requérante, une femme lesbienne vivant avec sa partenaire et souhaitant adopter en tant

238 CouEDH, *Schwizgebel c. Suisse*, n° 25762/07, 10 juin 2010.

239 *Ibid.*, point 86.

240 *Ibid.*, point 97.

241 CouEDH, *E.B. c. France* [GC], n° 43546/02, 22 janvier 2008.

que célibataire[242]. La Cour a rappelé que l'article 8 ne garantit pas un droit à fonder une famille ni un droit d'adopter. Toutefois, la plainte pour discrimination peut relever du concept plus large d'un droit spécifique, même si le problème en question ne se réfère pas à un droit spécifique accordé par la CEDH[243]. Étant donné que le droit français autorise l'adoption d'un enfant par une personne célibataire, un tel droit ne peut être refusé sur la base de motifs personnels ou discriminatoires. Comme établi par les tribunaux nationaux, la requérante présentait des qualités humaines certaines et des capacités éducatives, ce qui servait assurément l'intérêt supérieur de l'enfant, notion clé des instruments internationaux pertinents[244]. La Cour a considéré que l'orientation sexuelle de la requérante avait joué un rôle déterminant dans le rejet de la demande d'agrément en vue d'adopter par les autorités, qui ont donc agi de manière discriminatoire par rapport à d'autres personnes célibataires ayant reçu l'agrément d'adoption conformément au droit national[245].

Exemple : l'affaire *Gas et Dubois c. France*[246] porte sur la question de savoir si des couples de même sexe doivent bénéficier du même droit que les couples hétérosexuels en matière d'adoption par le second parent. Les requérantes sont un couple de personnes de même sexe liées par un pacte civil de solidarité. Elles ont élevé ensemble une petite fille conçue par insémination artificielle et mise au monde par l'une des deux en 2000. La demande d'adoption simple de l'autre partenaire a été rejetée en se basant sur le fait que l'adoption priverait la mère biologique de l'enfant de son autorité parentale, ce qui aurait eu des conséquences contraires à l'intention des requérantes et à l'intérêt de l'enfant. Dans le droit français, le seul cas où une adoption simple n'entraîne pas la perte de l'autorité parentale par les parents biologiques en faveur des parents adoptifs est lorsqu'une personne adopte l'enfant de son époux ou épouse. Les requérants ont allégué d'une discrimination par rapport aux couples hétérosexuels mariés et non mariés. Après avoir examiné si elles avaient été discriminées par rapport à un couple marié, la CouEDH a conclu que le mariage conférait un statut particulier, ayant des conséquences sociales, personnelles et juridiques.

242 *Ibid.*, point 49.

243 *Ibid.*, points 41 à 48.

244 *Ibid.*, point 95.

245 *Ibid.*, point 96.

246 CouEDH, *Gas et Dubois c. France*, n° 25951/07, 15 mars 2012.

Pour cette raison, il a été estimé que l'on ne saurait considérer que les requérantes se trouvaient dans une situation juridique comparable à celle des couples mariés. Concernant la comparaison aux couples hétérosexuels non mariés, la Cour a relevé que des couples hétérosexuels ayant conclu un pacte civil de solidarité se verraient également refuser l'adoption simple d'après le droit français. La CouEDH a donc conclu qu'il n'y avait pas eu de différence de traitement fondée sur l'orientation sexuelle, et donc aucune violation des droits des requérantes selon la Convention.

Exemple : l'affaire *X et autres c. Autriche*[247] concerne une plainte d'un couple de personnes de même sexe ayant été discriminé par rapport à des couples hétérosexuels concernant l'adoption par le second parent. Les première et troisième requérantes entretiennent une relation stable et la première requérante souhaitait adopter le deuxième requérant, fils de la troisième requérante. Tout comme dans *Gas et Dubois*, la CouEDH a refusé l'idée selon laquelle les requérantes étaient dans une situation similaire à un couple marié dans lequel l'un des époux souhaite adopter l'enfant de l'autre époux. Cependant, la CouEDH a reconnu que les requérantes étaient dans une situation comparable à un couple hétérosexuel non marié. Alors que l'adoption par le second parent est autorisée par le droit autrichien pour les couples hétérosexuels non mariés, le code civil autrichien indique que quiconque adopte un enfant se substitue au parent biologique du même sexe, ce qui implique que l'adoption par le second parent est légalement impossible pour les couples de personnes de même sexe. La Cour a conclu que dans de telles circonstances, il y a bien eu une différence de traitement pour les requérantes fondée sur leur orientation sexuelle et qu'il n'existait pas de raisons particulièrement solides et convaincantes avancées par le gouvernement, en violation de l'article 14 combiné à l'article 8 de la CEDH.

Enfin, la CouEDH examine également plus particulièrement le bien-fondé de respecter l'esprit et l'objectif du droit international en ce qui concerne le processus décisionnel relatif à l'adoption.

247 CouEDH, *X et autres c. Autriche* [GC], n° 19010/07, 19 février 2013.

Exemple : dans l'affaire *Harroudj c. France*[248], les autorités françaises ont rejeté la demande de la requérante d'adoption plénière d'une petite fille algérienne ayant été abandonnée à la naissance et recueillie par la requérante au titre de la *kafala*, soit une forme de tutelle en droit islamique. Les raisons ayant motivé ce rejet sont le fait que le code civil français précise que l'adoption d'un enfant ne peut être prononcée si la loi de son pays l'interdit (ce qui est le cas dans le droit algérien), et que la kafala avait déjà conféré l'autorité parentale à la requérante, l'autorisant donc à prendre les décisions dans l'intérêt de l'enfant. Par la suite, l'appel de la requérante a été rejeté au motif que le droit national était conforme à la Convention de la Haye sur la protection des enfants et la coopération en matière d'adoption internationale, et que l'article 20 de la CRC avait reconnu la kafala comme préservant, au même titre que l'adoption, l'intérêt supérieur de celui-ci. Lors de l'examen de la plainte de la requérante, la CouEDH a rappelé le principe selon lequel, une fois que des liens familiaux sont établis, l'État a l'obligation d'agir de manière à permettre le développement normal de ces rapports et d'établir des garanties légales permettant l'intégration de l'enfant dans la famille, ainsi que la nécessité d'interpréter la CEDH en conformité avec les principes généraux du droit international. Dans son appréciation, la CouEDH a souligné le souci du tribunal français de respecter l'esprit et l'objectif des conventions internationales, notamment la Convention de l'ONU sur les droits de l'enfant. La kafala étant reconnue en droit français, la requérante était autorisée à exercer l'autorité parentale et à prendre des décisions dans l'intérêt de l'enfant. Il lui était possible, par exemple, d'établir un testament en faveur de l'enfant afin de remédier aux restrictions qu'engendre l'impossibilité d'adopter l'enfant. En conclusion, en contournant progressivement l'interdiction de l'adoption de cette façon, l'État défendeur, qui entend favoriser l'intégration de ces enfants sans les couper immédiatement des règles de leur pays d'origine, a fait preuve de respect envers le pluralisme culturel et trouvé un juste équilibre entre l'intérêt public et celui de la requérante. La Cour a donc conclu que les droits de la requérante n'avaient pas été violés.

248 CouEDH, *Harroudj c. France*, n° 43631/09, 4 octobre 2012.

7 Protection des enfants contre la violence et l'exploitation

UE	Questions traitées	CdE

Au sens large, la protection des enfants concerne toutes les mesures destinées à garantir aux enfants l'exercice de leurs droits. Prise au sens strict, elle concerne le droit des enfants à être protégé contre toute forme de violence. Selon le droit international, les États doivent prendre les mesures nécessaires pour s'assurer que les enfants bénéficient d'une protection adéquate et que les droits à l'intégrité physique et à la dignité soient réellement respectés. Le devoir de protection de l'État peut prendre plusieurs formes selon le risque de violence spécifique auquel l'enfant est exposé et selon son auteur. Ainsi, les devoir de l'État sont plus évidents lorsque les enfants sont sous l'autorité et le contrôle de l'État, par exemple lorsqu'ils sont placés dans des établissements publics, ce qui est le cas lorsque le risque de violence est élevé. Le devoir de l'État de protéger peut s'avérer plus compliqué dans les situations où les enfants sont exposés à la violence exercée par des particuliers, comme des membres de leur famille.

La principale compétence de l'UE dans ce domaine est liée aux crimes transfrontaliers (article 83 du TFUE). Des mesures législatives particulières ont été adoptées concernant la pédopornographie et la traite d'êtres humains. L'UE a également adopté une disposition législative obligeant les États membres à d'ériger en infraction pénale diverses formes d'abus sexuels. Au niveau du Conseil de l'Europe, la CEDH (principalement les articles 2, 3 et 8) a précisé les devoirs des États relativement à un grand nombre d'actes constituant une violence contre les enfants. Le CEDS a également été actif dans ce domaine, via sa procédure de communication d'informations et son mécanisme de plainte collective. Par ailleurs, des conventions spécifiques du Conseil de l'Europe, la plus importante étant la Convention du Conseil de l'Europe sur la protection des enfants contre l'exploitation et les abus sexuels (Convention de Lanzarote)[249], sont désormais en vigueur et contrôlent les organismes responsables de surveiller leur mise en œuvre.

Ce chapitre analyse des aspects spécifiques de la violence faite aux enfants et la réponse de la communauté internationale. La section 7.1 traite de la violence à la maison, à l'école et dans d'autres institutions et examine plus particulièrement des sujets comme les châtiments corporels, la maltraitance, la négligence ainsi que la violence sexuelle. La section 7.2 analyse les cas d'exploitation des enfants présentant une dimension transfrontalière, notamment la traite d'êtres humains (à des fins de travail forcé ou d'exploitation sexuelles), la pédopornographie et le pédopiégeage (la sollicitation en ligne d'enfants à des fins sexuelles, « grooming »). Enfin, la section 7.3 traite les cas d'abus où les enfants sont dans des situations particulièrement fragiles.

249 CdE, Convention du Conseil de l'Europe sur la protection des enfants contre l'exploitation et les abus sexuels, STCE n° 201, 2007.

7.1. Violence à l'école, à la maison et dans d'autres contextes

Points clés

- Les États ont le devoir de garantir que les enfants sont bien protégés contre toute forme de violence dans tout contexte.
- Les États ont le devoir d'établir un cadre juridique adapté pour la protection des enfants.
- Les États doivent mener des enquêtes effectives en cas d'allégations d'abus d'un enfant, de violence envers un enfant ou d'atteinte à l'intégrité d'un enfant.

Dans le droit de l'UE,[250] le principal instrument juridique dans ce domaine, fondé sur les articles 82 et 83 du TFUE, est la directive 2011/93/UE sur la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie[251].

Dans le droit du CdE, la CouEDH et le CEDS ont développé un important corpus de jurisprudence concernant la protection des enfants contre la violence dans tous les contextes. De plus, des conventions spécifiques du Conseil de l'Europe, telles que la Convention de Lanzarote, détaillent les garanties nécessaires pour assurer la protection des enfants contre des formes spécifiques de violence.

7.1.1. Champ et portée de la responsabilité de l'État

Dans le droit du CdE, la CouEDH a analysé les formes de violence les plus graves contre les enfants dans différents articles de la CEDH, notamment les articles 2 et 3. La Cour a défini précisément les devoirs incombant aux états lorsque les enfants sont placés dans des établissements étant sous leur autorité.[252] De même, si une certaine conduite ou situation atteint un degré de gravité pouvant être défini comme un traitement inhumain ou dégradant selon l'article 3, l'État a l'obliga-

250 Directive 2011/93/UE du Parlement européen et du Conseil du 13 décembre 2011 relative à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie, JO 2011 L 335/1.

251 *Ibid.*

252 CouEDH, *Nencheva et autres c. Bulgarie*, n° 48609/06, 18 juin 2013.

tion de protéger les enfants contre les mauvais traitements, y compris ceux du fait de particuliers. Les situations comme la négligence par les parents sur une longue période[253], des abus sexuels répétés par des enseignants,[254] le viol[255], ou les châtiments corporels[256] ont toutes été considérées comme relevant de l'article 3 de la CEDH.

En cas de décès, l'État peut être tenu pour responsable conformément à l'article 2 de la CEDH, même si le décès a été infligé par un particulier, et non par un agent de l'État. Les obligations de l'État varient selon les cas, mais son principal devoir est d'assurer la protection *effective* des enfants contre la violence. En cas de formes graves de maltraitance, les obligations incluent le devoir d'adopter des dispositions pénales efficaces appuyées par des mécanismes d'application[257]. Les États doivent adopter des mesures spéciales et des garanties pour protéger les enfants[258].

La CEDH a été confrontée à plusieurs reprises à des affaires de violences faites à des enfants par des particuliers dans des établissements scolaires, des maisons ou d'autres types d'établissements gérés par des acteurs non-étatiques et pour lesquelles la question de la responsabilité de l'État pouvait être soulevée. Plus important encore, la CouEDH a statué que l'État ne pouvait se soustraire à son obligation de protéger les enfants en déléguant l'administration de services publics majeurs (comme l'éducation) à des particuliers[259]. Dans les affaires concernant la détermination de la responsabilité de l'État, la CouEDH a généralement établi une distinction entre l'obligation générale des États de protéger lorsque le risque n'est pas clairement identifiable, et une obligation spécifique de protection dans les cas où la victime était clairement identifiable. Dans le premier cas, la CouEDH a examiné si l'absence d'intervention de l'État avait entraîné un risque de violence réel pour l'enfant victime.

258 CouEDH, *O'Keeffe c. Irlande* [GC], n° 35810/09, 28 janvier 2014, para. 146.

259 *Ibid.*, point 150 ; CouEDH, *Costello-Roberts c. Royaume-Uni*, n° 13134/87, 25 mars 1993, para. 27.

Exemple : l'affaire *Kayak c. Turquie*[260] concerne la mort d'un jeune homme de 15 ans après avoir été poignardé par un autre adolescent à proximité de l'école. La CouEDH a estimé que les établissements scolaires ont obligation d'assurer la protection des élèves inscrits contre toutes les formes de violences. Dans cette affaire spécifique, la CouEDH a statué que la Turquie était responsable au sens de l'article 2 de la CEDH pour avoir échoué à protéger le droit à la vie du fils et frère des requérants du fait de l'absence de système de surveillance efficace à cette époque. Du fait de l'absence d'un tel système, il a été possible pour l'adolescent de prendre un couteau dans la cuisine de l'école, dont il s'était ensuite servi pour poignarder la victime.

Exemple : l'affaire *O'Keeffe c. Irlande*[261] concerne des sévices commis dans les années 1970 dans une école nationale irlandaise. À l'époque, les écoles nationales étaient reconnues et subventionnées par l'État, tandis que la gestion et l'administration étaient organisées par l'Église. La requérante, alors élève dans cette établissement à l'époque, a subi à une vingtaine de reprises des abus sexuels par l'un des enseignants de l'école. Elle n'a porté plainte auprès des autorités publiques concernant ces actes qu'en 1998, après avoir eu connaissance d'autres abus sexuels commis par le même enseignant. La CouEDH devait statuer si l'État pouvait être tenu pour responsable des actes d'abus n'ayant pas été signalés à l'époque par les autorités. La Cour a tout d'abord estimé que les abus sexuels subis par la requérante tombaient sous l'empire de l'article 3 de la CEDH. Puis, en se basant sur de nombreux rapports, la CouEDH a estimé que l'État aurait dû être informé des éventuels risques d'abus sexuels dans les écoles. À l'époque, il n'existait pas de procédure adaptée ayant permis à un enfant ou un parent de porter plainte directement auprès de l'État au sujet de sévices. De plus, il n'existait aucun mécanisme de surveillance de la façon dont l'enseignant traitait les enfants. La CouEDH a donc conclu que l'Irlande a failli à ses obligations conformément à l'article 3 de la CEDH car elle n'avait pas mis en place de mécanisme de protection efficace pour des abus commis sur des mineurs dans des écoles.

Selon la CouEDH, les États doivent également mener des enquêtes effectives au sujet d'allégations de mauvais traitements ou en cas de décès, indépendamment de la qualité de l'auteur, à savoir si les actes ont été commis par des

260 CouEDH, *Kayak c. Turquie*, n° 60444/08, 10 juillet 2012.

261 CouEDH, *O'Keeffe c. Irlande* [GC], n° 35810/09, 28 janvier 2014.

agents de l'État[262] ou des particuliers. Une enquête est considérée comme effective lorsque, comme suite à l'enregistrement des plaintes des victimes ou de leurs successeurs, les États mettent en place une procédure capable de mener à l'identification et à la sanction des responsables de violence contraires aux articles 2 ou 3 de la CEDH.

Selon la CSE, le droit des enfants à la protection contre les abus et la maltraitance relèvent principalement des articles 7 et 17.

Par ailleurs, du fait de la Convention de Lanzarote, les États sont obligés d'ériger en infraction pénale diverses formes d'abus sexuels et d'exploitation sexuelle contre des enfants[263]. Elle exige également des États qu'ils prennent les mesures législatives ou autres qui sont nécessaires pour prévenir les abus sexuels sur les enfants, en organisant des campagnes de sensibilisation, en formant les spécialistes chargés de ces questions, en informant les enfants sur les risques d'abus et en fournissant l'aide d'un spécialiste aux personnes risquant de passer à l'acte. De plus, selon les articles 4 et 5 de la Convention du Conseil de l'Europe sur la prévention et la lutte contre la violence à l'égard des femmes et la violence domestique (Convention d'Istanbul)[264], les États s'engagent à adopter des mesures législatives spéciales et à enquêter sur les actes de violence envers les femmes. Selon l'article 22 de la Convention d'Istanbul, les États sont obligés de fournir des services de soutien spécialisés aux femmes et aux enfants victimes de violence domestique.

Selon le droit international, la CRC est l'instrument juridique principal permettant d'assurer la protection des enfants au niveau de l'État. Conformément à l'article 19, les États Parties prennent toutes les mesures législatives, administratives, sociales et éducatives appropriées pour protéger les enfants contre toute forme de violence. Le Comité des droits de l'enfant de l'ONU a publié un nombre important d'observations générales et de recommandations permettant d'interpréter les obligations des États en vertu de la CRC. Par exemple, l'observation générale n° 13 présente les mesures permettant de protéger les enfants contre

262 CouEDH, *Assenov et autres c. Bulgarie*, n° 24760/94, 28 octobre 1998.

264 CdE, Convention du Conseil de l'Europe sur la prévention et la lutte contre la violence à l'égard des femmes et la violence domestique, STCE n° 201, 2011.

toute forme de violence[265]. L'observation générale n° 5 se réfère aux mesures permettant de mettre en œuvre et contrôler l'application de la CRC dans les législations et les politiques publiques nationales[266].

7.1.2. Châtiments corporels

Le châtiment corporel est généralement défini comme toute forme de châtiment dans lequel la force physique est employée avec l'intention de causer un certain degré de douleur ou de gêne. Bien qu'il s'agisse principalement de frapper des enfants avec la main ou un objet, cela peut également impliquer des actes qui ne sont pas physiques, par exemple des menaces, qui ont comme même résultat l'humiliation de l'enfant[267].

Dans le droit du CdE, la CouEDH a examiné les plaintes relatives à des châtiments corporels comme forme de mesure disciplinaire principalement à la lumière de l'article 3 de la CEDH. Lorsque ce type de mesure atteint le degré de sévérité mentionné à l'article 3 de la CEDH, la CouEDH a estimé que ce châtiment était en violation avec cette disposition[268]. Lorsque les châtiments corporels n'atteignent pas le seuil de sévérité mentionné à l'article 3, ils peuvent néanmoins relever de l'article 8 en tant que droit à l'intégrité physique et morale. Toutefois, la CouEDH n'a jusqu'à présent jamais conclu à une violation sur la base de l'article 8 dans les affaires de châtiments corporels. L'utilisation de châtiments corporels dans les écoles publiques va également à l'encontre des droits des parents à élever leurs enfants selon leurs convictions philosophiques, comme formulé à l'article 2 du Protocole n° 1 de la CEDH.[269]

> Exemple : les affaires *Campbell et Cosans c. Royaume-Uni*[270] concernent la suspension de deux garçons d'un établissement scolaire pour avoir refusé

265 ONU, Comité des droits de l'enfant (2011), *Observation générale n° 13 (2001), Le droit de l'enfant d'être protégé contre toutes les formes de violence*, CRC/C/GC/13, 18 avril 2011.

266 ONU, Comité des droits de l'enfant (2003), *Observation générale n° 5 (2003), Mesures d'application générales de la Convention relative aux droits de l'enfant (art. 4, 42 et 44, par. 6),* CRC/GC/2003/5.

267 ONU, Comité des droits de l'enfant (2007), *Observation générale n° 8 (2006), Le droit de l'enfant à une protection contre les châtiments corporels et les autres formes cruelles ou dégradantes de châtiments, (art. 19, 28 (par. 2) et 37, entre autres)*, CRC/C/GC/8, 2 mars 2007.

268 CouEDH, *Tyrer c. Royaume-Uni,* n° 5856/72, 25 avril 1978.

269 CouEDH, *Campbell et Cosans c. Royaume-Uni,* n° 7511/76 et 7743/76, 25 février 1982, para. 38.

270 CouEDH, *Campbell et Cosans c. Royaume-Uni,* n° 7511/76 et 7743/76, 25 février 1982.

d'accepter un châtiment corporel. La CouEDH a estimé qu'il n'y avait pas violation de l'article 3 de la CEDH car les enfants n'avaient pas été soumis à un châtiment corporel. Cependant, elle a conclu à la violation de l'article 2 du Protocole n° 1 de la CEDH sur la base du fait que, en autorisant les châtiments corporels, l'État défendeur n'avait pas respecté les convictions philosophiques des parents. La CouEDH a également estimé qu'il y avait violation du droit à l'éducation d'un des garçons conformément à l'article 2 du Protocole n° 1 de la CEDH du fait de sa suspension de l'école.

La CSE ne mentionne pas d'interdiction directe des châtiments corporels. Néanmoins, le CEDS a interprété l'article 17 de la CSE comme une obligation[271]. Le CEDS effectuant des contrôles par l'intermédiaire de procédures de communication d'informations et de mécanismes de plainte collective en conformité avec l'article 17, il a estimé que plusieurs États contractants violaient cette disposition en n'interdisant pas toutes les formes de châtiment corporel. Dans trois affaires similaires portées par l'association APPROACH (Association for the Protection of All Children) Ltd. contre la Belgique[272], la République tchèque[273], et la Slovénie[274], le CEDS a conclu à la violation de l'article 17 de la CSE car la législation de ces États manquait de textes juridiques énonçant « l'interdiction expresse et complète de toutes les formes de châtiments corporels infligés aux enfants susceptibles de porter atteinte à leur intégrité physique, à leur dignité, à leur développement ou à leur épanouissement psychique »[275]. Le CEDS a également établi que les lois interdisant les châtiments corporels sur les enfants s'appliquaient aux solutions alternatives de placement comme les hébergements institutionnels, les familles d'accueil et les crèches. À cet égard, il convient de rappeler que l'Assemblée parlementaire du Conseil de l'Europe (APCE) a publié en 2004 une recommandation exigeant des États d'interdire les châtiments corporels[276].

271 Voir, par exemple, CEDS, *Organisation Mondiale Contre la Torture (OMCT) c. Belgique*, n° 21/2003, 7 décembre 2004 ; CEDS, Conclusions XVI-2, Pologne, art. 17, para. 65.

272 CEDS, *Association pour la protection des enfants (APPROACH) Ltd c. Belgique*, n° 98/2013, 29 mai 2015, para. 49.

273 CEDS, *Association pour la protection des enfants (APPROACH) Ltd c. République tchèque*, n° 96/2013, 29 mai 2015.

274 CEDS, *Association pour la protection des enfants (APPROACH) Ltd c. Slovénie*, n° 95/2013, 27 mai 2015.

275 *Ibid.*, para. 51.

276 APCE (2004), Recommandation 1666(2004) relative à l'interdiction du châtiment corporel des enfants en Europe, 23 juin 2004.

Selon le droit international, le châtiment corporel est indirectement considéré comme une forme de violence envers les enfants selon l'article 19, l'article 28, paragraphe 2, et l'article 37 de la CRC. De plus, le Comité des droits de l'enfant a publié l'observation générale n° 8) appelant les États à prendre les mesures appropriées contre toutes les formes de châtiment corporel[277].

7.1.3. Abus sexuels

Les thèmes de la traite des enfants et de la pédopornographie sont respectivement abordés dans les sections 7.2.2 et 7.2.3.

Les abus sexuels sur mineur peuvent prendre diverses formes, dont le harcèlement, les attouchements, l'inceste ou le viol. Les abus sexuels sur mineurs peuvent avoir lieu dans des contextes variés, notamment la maison, l'école, les établissements de placement, les églises etc. Les enfants sont particulièrement vulnérables aux abus sexuels car ils sont souvent sous l'autorité et le contrôle d'adultes et ont accès moins facilement aux mécanismes de plainte.

Dans le droit de l'UE, la directive 2011/93/UE, qui reprend dans une large mesure la Convention de Lanzarote, vise à harmoniser les sanctions pénales minimales pour plusieurs types de délits sexuels sur mineurs.[278] Selon l'article 3 de cette directive, les États membres prennent les mesures de droit pénal permettant de sanctionner diverses formes d'abus sexuels, notamment le fait de faire assister des enfants à des activités sexuelles ou à des abus sexuels, et de se livrer à des activités sexuelles avec un enfant. La directive prévoit des sanctions renforcées si les infractions ont été commises par des personnes de confiance sur des enfants particulièrement vulnérables et/ou en faisant usage de la contrainte. Par ailleurs, les États membres s'assurent que la poursuite de suspects d'abus sexuels sur mineurs est automatique et que les personnes condamnées pour abus sexuels sont empêchées d'exercer des activités professionnelles impliquant des contacts directs et réguliers avec des enfants. La directive prévoit également des dispositions assurant des procédures pénales adaptées aux enfants et la protection des enfants victimes dans les tribunaux.

277 ONU, Comité des droits de l'enfant (2007), *Observation générale n° 8 (2006), Le droit de l'enfant à une protection contre les châtiments corporels et les autres formes cruelles ou dégradantes de châtiments, (art. 19, 28 (par. 2) et 37, entre autres),* CRC/C/GC/8.

278 Directive 2011/93/UE du Parlement européen et du Conseil du 13 décembre 2011 relative à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie, JO 2011 L 335/1.

La directive 2011/93/UE est rattachée à la décision-cadre 2009/315/JHA[279] sur l'organisation et le contenu des échanges d'informations entre les États membres de l'UE sur les casiers judiciaires. Bien qu'elle ne concerne pas spécifiquement les enfants, cette décision-cadre comble un vide important dans le système de protection, en s'assurant que les autorités des États membres aient accès aux casiers judiciaires des personnes condamnées. Cela facilite l'identification de personnes condamnées pour abus sexuels cherchant un emploi dans des institutions travaillant avec des enfants dans d'autres États membres.

Dans le droit du CdE, la CouEDH a examiné les affaires d'abus sexuels selon les articles 3 et 8 de la CEDH. Les plaintes concernent généralement le manquement des États à prendre les mesures appropriées pour protéger les enfants contre les abus. À la lumière de l'article 3, la CouEDH a également examiné si les États avaient mené des enquêtes effectives suite à des allégations d'abus sexuels. Les plaintes de maltraitance de mineurs présentées au titre de l'article 8 concernent l'incidence de tels actes sur l'intégrité physique de la victime et le droit au respect de la vie familiale. Parfois, la distinction est assez floue entre les obligations des États mentionnées aux articles 3 et 8, la CouEDH appliquant un raisonnement similaire pour conclure à des violations des deux articles. Il convient cependant de noter que les affaires liées à l'article 8 sont plus fréquentes dans des situations concernant un déplacement illicite ou un placement et l'incidence que des allégations d'abus sur mineur peuvent avoir sur la famille. Ces situations sont analysées au chapitre 5.

Exemple : dans *M.C. c. Bulgarie*[280] la requérante était une jeune fille de 14 ans ayant porté plainte en affirmant avoir été violée par deux personnes après une soirée. Sa plainte auprès des autorités locales a été principalement rejetée du fait de l'absence de trace de violence physique. La CouEDH a noté que les allégations de viol relevaient de l'article 3 de la CEDH et que l'État défendeur devait mener une enquête efficace sur la base de ces allégations. En concluant que les autorités bulgares avaient échoué à mener une telle enquête, la CouEDH a invoqué le fait que les autorités rejettent généralement les affaires dans lesquelles la victime n'a opposé aucune résistance physique au viol. La Cour a considéré que ce

279 Décision-cadre du Conseil 2009/315/JHA du 26 février 2009 sur l'organisation et le contenu des échanges d'informations entre les pays de l'Union européenne sur les casiers judiciaires, JO 2009 L 93, p. 23-32.

280 CouEDH, *M.C. c. Bulgarie*, n° 39272/98, 4 décembre 2003.

type de preuve n'était pas conforme avec la réalité des faits concernant les victimes de viol et pouvait donc rendre l'enquête des autorités ineffective en violation de l'article 3 de la CEDH.

Par ailleurs, la Convention de Lanzarote fixe précisément le droit des enfants à être protégés contre les abus sexuels. Cette convention adoptée dans le cadre du Conseil de l'Europe est ouverte à ratification pour des États en dehors de l'Europe. Cet instrument juridiquement contraignant est renforcé par pléthore d'instruments juridiquement non-contraignants visant à assurer que les États prennent effectivement des mesures contre les abus sexuels sur mineur.[281]

7.1.4. Violence domestique et négligence d'enfants

De nombreuses affaires de violence domestique comprennent des allégations d'abus sexuel. Dans ce contexte, les obligations des États selon le droit international sont similaires à celles mentionnées dans la section 7.1.3.

Dans le droit du CdE, ce sont souvent les mères qui portent plainte auprès de la CouEDH pour un manque de l'État de respecter son obligation de protéger contre la violence, tel qu'établi par la CEDH. Les affaires de violence domestique soulèvent des thèmes abordés aux articles 2, 3 et 8 de cette convention. Les États doivent s'acquitter de leurs obligations à prendre des mesures efficaces contre la violence domestique et à mener une enquête effective comme suite à des allégations crédibles de violence domestique ou de négligence d'enfants.

Exemple : dans l'affaire *Kontrová c. Slovaquie*[282], la requérante a été à plusieurs reprises agressée physiquement par son mari. Elle a porté plainte à la police, mais a retiré sa plainte par la suite. Son mari a ensuite menacé de tuer ses enfants. Un parent de la requérante a signalé cet incident à la police. Néanmoins, plusieurs jours après cet incident, le mari de la requérante a tué leurs deux enfants puis s'est donné la mort. La CouEDH a esti-

281 Les exemples incluent : CdE, Comité des Ministres (2001), Recommandation Rec(2001)16 sur la protection des enfants contre l'exploitation sexuelle, 31 octobre 2001 ; APCE (1996), Résolution 1099 (1996) sur l'exploitation sexuelle des enfants, 25 septembre 1996 ; APCE (2000), Résolution 1212 (2000) sur le viol dans les conflits armés, 3 avril 2000 ; APCE (2002), Résolution 1307 (2002) sur l'exploitation sexuelle des enfants : tolérance zéro, 27 septembre 2002.

282 CouEDH, *Kontrová c. Slovaquie*, n° 7510/04, 31 mai 2007.

mé que les obligations de l'État relèvent de l'article 2 de la CEDH lorsqu'il connaît ou devrait connaître l'existence d'un risque réel et immédiat pour la vie d'une personne identifiée. Dans cette affaire, les autorités slovaques auraient dû reconnaître un tel risque du fait des échanges précédents entre la requérante et la police. La police aurait dû respecter ses obligations d'enregistrer la plainte de la requérante, de lancer une enquête criminelle et d'engager des poursuites pénales, ainsi que de dûment consigner les appels d'urgence et de prendre les mesures en réaction aux allégations selon lesquelles le mari avait une arme à feu. Or la police ne s'est pas acquittée de ses obligations et ces manquements ont eu pour conséquence directe la mort des enfants de la requérante, en violation de l'article 2 de la CEDH.

Exemple : l'affaire *Eremia c. République de Moldova*[283] concerne la plainte d'une mère et de ses deux filles à propos de l'échec des autorités à les protéger du comportement violent et abusif de leur mari et père. La CouEDH a estimé que, bien qu'au fait de la situation, les autorités n'avaient pris aucune mesure effective pour protéger la mère contre la poursuite des violences domestiques dont elle faisait l'objet. Elle a ajouté que, bien que ses filles aient été psychologiquement affectées par la vision des violences commises par leur père contre leur mère au domicile familial, rien ou quasiment rien n'avait été fait pour prévenir la répétition d'un tel comportement La Cour a conclu que les autorités moldaves n'avaient pas respecté leurs obligations découlant de l'article 8 de la CEDH.

Des affaires de négligence de mineur, soit dans des établissements publics, soit au domicile familial, ont également été soulevées en vertu de la CEDH. Les obligations des autorités dans des situations de négligence d'enfant par leurs parents sont similaires à celles des affaires présentées précédemment. D'une part, l'État doit mettre en place des mécanismes effectifs pour la protection des enfants, tandis que d'autre part, les autorités de l'État doivent agir pour protéger les enfants dans des situations signalées de négligence d'enfant, ou lorsque les preuves de négligence d'enfant à leur disposition sont suffisantes, qu'il s'agisse d'un domicile privé ou d'un établissement privé.[284] Les affaires de négligence dans les établissements privés imposent aux autorités des obligations directes de protection des enfants en s'assurant qu'ils reçoivent tous les soins (médicaux)

283 CouEDH, *Eremia c. République de Moldova*, n° 3564/11, 28 mai 2013.

nécessaires, que les établissements dans lesquels ils sont placé sont appropriés et/ou que l'équipe est formée pour répondre aux besoins des enfants.[285]

La Convention d'Istanbul s'applique également.[286] Bien qu'elle ne concerne pas spécifiquement les enfants, plusieurs références en font mention. Tout d'abord, selon l'article 3, point f), les filles de moins de 18 ans sont considérées comme des « femmes », et toutes les dispositions de la convention s'appliquent donc à elles. Deuxièmement, d'après l'article 2, paragraphe 2, les Parties sont encouragées à appliquer la convention à toutes les victimes de violence domestique, ce qui peut inclure les enfants. En effet, dans les plupart des cas les enfants sont témoins et sont gravement affectés par la violence domestique dans la maison familiale.[287] Enfin, les dispositions de la convention concernant spécifiquement les enfants comprennent des obligations des États à prendre les mesures répondant aux besoins des enfants victimes, à sensibiliser les enfants et à protéger les enfants témoins.

Dans le même ordre d'idée, selon l'article 17 de la CSE, les États sont obligés d'interdire toute forme de violence contre les enfants et d'adopter les dispositions légales pénales et civiles appropriées.

Les problèmes de violence domestique et de négligence d'enfants ont été abordés dans de nombreux instruments juridiquement non-contraignant du Conseil de l'Europe.[288]

7.2. Exploitation d'enfants, pornographie et pédopiégeage

Point clé

- Les autorités nationales ont l'obligation de coopérer et de collaborer étroitement, y compris dans le déroulement des enquêtes, pour protéger les enfants contre la violence.

7.2.1. Travail forcé

Dans le droit de l'UE, l'esclavage, la servitude et le travail forcé ou obligatoire sont interdits (article 5, paragraphe 2, de la Charte des droits fondamentaux de l'UE). Il est également interdit de faire travailler des enfants (article 32 de la Charte). La directive 94/33/CE est le principal instrument juridique interdisant le travail des enfants.[289] Seules des circonstances exceptionnelles autorisent les États à définir l'âge minimum légal pour travailler en-dessous de l'âge minimum légal pour quitter l'école (article 4, paragraphe 2). Les États doivent s'assurer que les jeunes autorisés à travailler bénéficient de conditions de travail appropriées (articles 6 et 7). Par ailleurs, les enfants ne peuvent être employés que pour certaines activités, comme des tâches domestiques ou des activités culturelles et sociales (article 2, paragraphe 2 et article 5). Cette directive prévoit également des mesures de protection spéciales liées au travail des enfants (section III).

Dans de nombreux cas, les affaires de travail forcé des enfants impliquent des enfants victimes de traite.[290] La directive 2011/36/UE concernant la prévention et la lutte contre la traite des êtres humains reconnaît le travail forcé comme une forme d'exploitation des enfants (article 2, paragraphe 3).[291] Les enfants victimes de traite à des fins de travail forcé sont protégés par la directive au même

289 Directive du Conseil 94/33/CE du 22 juin 1994 relative à la protection des jeunes au travail, JO 1994 L 216.

290 Directive 2011/36/UE du Parlement européen et du Conseil du 15 avril 2011 concernant la prévention et la lutte contre la traite des êtres humains ainsi que la protection des victimes, JO 2011 L 101/1, considérant 11.

291 Directive 2011/36/UE du Parlement européen et du Conseil du 15 avril 2011 concernant la prévention et la lutte contre la traite des êtres humains ainsi que la protection des victimes, JO 2011 L 101/1.

titre que les victimes de traite à d'autres fins (comme l'exploitation sexuelle, voir section 7.1.3)[292].

Dans le droit du CdE, l'article 4 de la CEDH interdit de manière absolue toute forme d'esclavage, de servitude, de travail forcé ou obligatoire. La CouEDH définit le « travail forcé ou obligatoire » comme « tout travail ou service exigé d'un individu sous la menace d'une peine quelconque et pour lequel ledit individu ne s'est pas offert de son plein gré »[293]. La servitude englobe, de plus, « l'obligation pour le « serf » de vivre sur la propriété d'autrui et l'impossibilité de changer sa condition »[294]. La servitude représente une forme aggravée du travail obligatoire.

Dans les affaires liées à des allégations de travail forcé, la CouEDH doit tout d'abord déterminer si les allégations relèvent de l'article 4 de la CEDH.[295] Elle examine ensuite si les États ont satisfait à leurs obligations de mettre en place un cadre législatif et administratif interdisant, réprimant et permettant d'entamer des poursuites effectives en cas de travail forcé ou obligatoire, de servitude et d'esclavage.[296] Concernant les aspects procéduraux de l'article 4, la CouEDH étudie si les autorités nationales ont mené une enquête effective comme suite à des allégations de travail forcé ou de servitude.[297]

Exemple : l'affaire *C.N. et V. c. France*[298] concerne des plaintes pour travail forcé de deux sœurs d'origine burundaise. Après le décès de leurs parents, elles ont été confiées à leur tante et à sa famille vivant en France. Elles ont été logées pendant quatre ans dans une cave de la maison dont les conditions de salubrité étaient prétendument très mauvaises. L'aînée des sœurs n'était pas scolarisée et était occupée toute la journée à accomplir les tâches ménagères et à garder son cousin handicapé. La sœur cadette était scolarisée et travaillait pour la tante et la famille après l'école et après avoir eu le temps de faire ses devoirs. Les deux sœurs ont porté plainte auprès de la CouEDH alléguant avoir été tenues en servitude et assujetties à un travail forcé. La CouEDH a estimé que la première requérante

298 CouEDH, *C.N. et V. c. France*, n° 67724/09, 11 octobre 2012.

avait bien été assujettie à un travail forcé dans la mesure où elle devait travailler sept jours par semaine sans rémunération ni congés. De plus, elle a été tenue en servitude car elle avait l'impression que sa situation était permanente et qu'elle ne pourrait pas changer. La CouEDH a également estimé que l'État n'avait pas rempli ses obligations, dans la mesure où le cadre juridique en place n'avait pas permis de protéger suffisamment les victimes contre le travail obligatoire. Concernant l'obligation procédurale de mener une enquête, la CouEDH a estimé que les exigences de l'article 4 de la CEDH avaient été respectées, les autorités ayant effectivement mené une enquête rapide et indépendante ayant permis de conduire à l'identification et à la sanction des personnes responsables. La CouEDH a rejeté les allégations de travail forcé de la seconde requérante du fait qu'elle avait pu aller à l'école et qu'elle avait disposé de temps pour faire ses devoirs.

La CSE garantit le droit des enfants à être protégés contre les dangers physiques et moraux dans et à l'extérieur de l'environnement de travail (article 7, paragraphe 10). Le CEDS a déclaré que l'exploitation des enfants par le travail/les tâches domestiques, y compris la traite à des fins d'exploitation par le travail, devait être interdite au niveau national.[299] Les États Parties de la CSE doivent garantir non seulement qu'ils disposent de la législation requise pour prévenir l'exploitation et protéger les enfants et les jeunes, mais aussi que cette législation est effective en pratique.[300]

La Convention de Lanzarote dispose également que les États doivent ériger en infraction pénale toute forme d'exploitation sexuelle des enfants.

7.2.2. Traite des enfants

Dans le droit de l'UE, l'article 83 du TFUE définit la traite d'êtres humains comme un champ de compétence du Parlement européen et du Conseil de l'UE. L'article 5, paragraphe 3, de la Charte des droits fondamentaux de l'UE interdit expressément la traite des êtres humains. La contribution de l'UE est importante dans ce domaine, du fait qu'il a une dimension transnationale.

La directive 2011/36/UE concernant la prévention de la traite des êtres humains et la lutte contre ce phénomène ainsi que la protection des victimes représente

299 CEDS, Conclusions 2004, Bulgarie, p. 57.

300 CEDS, Conclusions 2006, p. 61 ; CEDS, Conclusions 2006, Bulgarie, p. 113.

le premier instrument juridique adopté par le Parlement européen et le Conseil se basant sur l'article 83 du TFUE.[301] Selon l'article 2, paragraphe 1, de cette directive, la traite est définie comme « le recrutement, le transport, le transfert, l'hébergement ou l'accueil de personnes, y compris l'échange ou le transfert du contrôle exercé sur ces personnes, par la menace de recours ou le recours à la force ou d'autres formes de contrainte, par enlèvement, fraude, tromperie, abus d'autorité ou d'une situation de vulnérabilité, ou par l'offre ou l'acceptation de paiements ou d'avantages pour obtenir le consentement d'une personne ayant autorité sur une autre, à des fins d'exploitation ». Cette directive vise à établir des règles minimales relatives à la définition des infractions et des sanctions dans le domaine de la traite des êtres humains. L'ensemble de la directive est applicable aux enfants, et elle inclut également plusieurs dispositions spécifiques aux enfants concernant l'assistance et l'aide à apporter aux enfants victimes de la traite des êtres humains, ainsi qu'à leur protection dans le cadre des enquêtes et des procédures pénales (articles 13 à 16).[302] Des mesures de soutien spécifiques doivent être prises après une appréciation individuelle de la situation particulière de chaque enfant victime (article 14, paragraphe 1). Les États doivent désigner un tuteur représentant l'intérêt supérieur de l'enfant (article 14, paragraphe 2) et fournir un soutien à la famille de l'enfant (article 14, paragraphe 3). Au cours des procédures pénales, les enfants ont le droit à une représentation, à des conseils juridiques gratuits et ont le droit d'être entendus dans des locaux appropriés et par des professionnels formés à cet effet (article 15, paragraphes 1 à 3). Les autres mesures de protection comprennent la possibilité d'une audience à huis clos et la possibilité pour l'enfant d'être entendu à l'audience sans y être présent par le recours à des technologies de communication (article 15, paragraphe 5).[303]

La directive 2004/81/CE est également pertinente pour les enfants victimes de traite.[304] Selon cet instrument, les victimes de traite peuvent bénéficier d'un titre de séjour délivré par les États membres s'ils coopèrent à l'enquête criminelle.

301 Directive 2011/36/UE du Parlement européen et du Conseil du 15 avril 2011 concernant la prévention de la traite des êtres humains et la lutte contre ce phénomène ainsi que la protection des victimes, JO 2011 L 101/1.

302 Détail des dispositions dans FRA et CouEDH (2014), p. 239.

303 Voir FRA (2015b), p. 79.

304 Directive 2004/81/CE du Conseil du 29 avril 2004 relative au titre de séjour délivré aux ressortissants de pays tiers qui sont victimes de la traite des êtres humains ou ont fait l'objet d'une aide à l'immigration clandestine et qui coopèrent avec les autorités compétentes, JO 2004 L 261, p. 19-23.

Néanmoins, la directive ne s'applique aux enfants que dans les limites fixées par les États membres.[305]

En ce qui concerne l'application, l'organisme de l'UE chargé de l'application de la loi (Europol) et l'unité de coopération judiciaire (Eurojust) jouent un rôle important en assurant la coopération entre les États membres afin de détecter et de sanctionner les réseaux organisés de traite. Les dispositions applicables au niveau de l'UE concernant la protection des enfants victimes sont présentées dans la section 11.3 de ce manuel.

Dans le droit du CdE, la CEDH ne prévoit pas de disposition expresse sur la traite. Néanmoins, la CouEDH interprète l'article 4 de la CEDH comme incluant une interdiction de la traite.[306] La Cour a adopté la même définition de la traite que celle précisée à l'article 3, point a), du Protocole visant à prévenir, réprimer et sanctionner la traite des personnes, en particulier des femmes et des enfants, remplaçant la Convention des Nations Unies contre la criminalité transnationale organisée (Protocole de Palerme) et l'article 4, point a), de la Convention du Conseil de l'Europe sur la lutte contre la traite des êtres humains.[307] La CouEDH détermine tout d'abord si une situation particulière comprend une allégation crédible de traite et si donc elle relève de la portée de l'article 4. Si tel est le cas, l'analyse de la CouEDH suit le modèle présenté dans la section 7.2.1 : la Cour examine si le cadre juridique de l'État défendeur offre une protection effective contre la traite, si l'État s'est acquitté de ses obligations dans les circonstances particulières de l'affaire, et si les autorités ont mené une enquête effective comme suite aux allégations plausibles de traite.

Exemple : dans l'affaire *Rantsev c. Chypre et Russie*[308], la plainte a été déposée par le père d'une jeune fille russe décédée dans des circonstances troubles à Chypre. Celle-ci est arrivée à Chypre avec un visa d'artiste de

305 *Ibid.*, art. 3.

306 CouEDH, *Rantsev c. Chypre et Russie*, n° 25965/04, 7 janvier 2010, para. 282.

307 ONU, Protocole visant à prévenir, réprimer et punir la traite des personnes, en particulier des femmes et des enfants, remplaçant la Convention des Nations Unies contre la criminalité transnationale organisée (UNCTOC), New York, 15 novembre 2000 ; CdE, Convention du Conseil de l'Europe sur la lutte contre la traite des êtres humains, STCE n° 197, 2005.

308 CouEDH, *Rantsev c. Chypre et Russie*, n° 25965/04, 7 janvier 2010. L'affaire ne concerne pas le décès d'un enfant ; toutefois, cette affaire mérite d'être mentionnée du fait de l'absence d'affaires de traite d'enfants et notamment au vu de la menace particulière que représente la traite d'enfants.

cabaret. Après ce qui est apparu être une tentative de fuite, elle est morte à la suite d'une chute du balcon d'un appartement appartenant à des connaissances de son employeur. Son père a déposé plainte contre Chypre et la Russie, se plaignant notamment que les autorités n'avaient pas suffisamment enquêté sur le décès de sa fille. La CouEDH a estimé pour la première fois que la traite d'êtres humains relevait de la portée de l'article 4 de la CEDH. Bien que Chypre possède un cadre juridique approprié pour lutter contre la traite, l'article 4 a été a été violé car la pratique administrative obligeant les employeurs à apporter des garanties financières pour les artistes de cabaret ne représentait pas une protection efficace contre la traite et l'exploitation. De plus, dans les circonstances particulières de cette affaire, les autorités chypriotes auraient dû être conscientes que la fille du requérant risquait d'être victime de traite. La Cour a conclu que la police n'avait pas pris les mesures permettant de protéger Melle Rantseva contre l'exploitation. Enfin, il y a eu violation de l'article 4 par la Russie, dans la mesure où les autorités russes n'ont pas mené d'enquête appropriée sur les allégations de traite.

Le CEDS considère que la traite d'êtres humains constitue une violation grave des droits de l'homme et de la dignité humaine et peut être considérée comme une nouvelle forme d'esclavage.[309] L'article 7, paragraphe 10, oblige les États à adopter une législation qui l'érige en infraction pénale.[310] Cette législation doit être renforcée par des mécanismes de surveillance appropriés, des sanctions, ainsi qu'un plan d'action visant à lutter contre la traite des enfants et l'exploitation sexuelle. [311]

Au niveau du traité, la Convention du Conseil de l'Europe sur la lutte contre la traite des êtres humains est le principal instrument lié à la traite d'êtres humains[312]. Compte tenu de l'ensemble des États membres du Conseil de l'Europe, et du fait que la Convention relative à la lutte contre la traite est ouverte à l'adhésion aux États non membres du Conseil de l'Europe,[313] elle complète la directive 2011/36/

313 Par exemple, la Biélorussie a adhéré à la convention le 26 novembre 2013.

UE et représente un instrument permettant de lutter contre la traite dans les États Parties à la convention, qu'ils soient membres de l'UE ou non, sur la base de normes et d'obligations communes. La mise en œuvre de la convention est supervisée par un groupe d'experts indépendants (le Groupe d'experts sur la lutte contre la traite des êtres humains, GRETA) évaluant régulièrement la situation de chaque pays et publiant des rapports. À partir de ces rapports, le Comité des Parties à la Convention, le pilier politique du mécanisme de surveillance au titre de la convention, adopte les recommandations destinées aux États Parties sur les mesures à prendre pour mettre en œuvre les conclusions du GRETA et suit les progrès.

7.2.3. Pédopornographie et pédopiégeage

Dans le droit de l'UE, la directive 2011/93/UE est le principal instrument juridique traitant de la pédopornographie[314]. La pornographie est définie comme : « tout matériel représentant de manière visuelle un enfant se livrant à un comportement sexuellement explicite, réel ou simulé ; ii) toute représentation des organes sexuels d'un enfant à des fins principalement sexuelles ; iii) tout matériel représentant de manière visuelle une personne qui paraît être un enfant se livrant à un comportement sexuellement explicite, réel ou simulé, ou toute représentation des organes sexuels d'une personne qui paraît être un enfant, à des fins principalement sexuelles ; ou iv) des images réalistes d'un enfant se livrant à un comportement sexuellement explicite ou des images réalistes des organes sexuels d'un enfant à des fins principalement sexuelles ».[315] L'article 5 de cette directive introduit une obligation pour les États membres de l'UE de prendre toutes les mesures assurant que la production, l'acquisition, la possession, la distribution, la diffusion, la transmission intentionnelles, ou le fait d'offrir, de fournir ou de mettre à disposition intentionnellement de la pédopornographie ainsi que le fait d'accéder à ce type de contenu est passible de sanctions.

Dans le droit du CdE, la CouEDH a examiné à plusieurs reprises des affaires liées à la pédopornographie en vertu de l'article 8 de la CEDH.

314 Directive 2011/93/UE du Parlement européen et du Conseil du 13 décembre 2011 relative à la lutte contre les abus sexuels et l'exploitation sexuelle des enfants, ainsi que la pédopornographie, JO 2011 L 335/1, p. 1-14.

315 *Ibid.*, art. 2, point c.

Exemple : dans l'affaire *Söderman c. Suède*, une plainte a été déposée par une jeune fille dont le beau-père a tenté de la filmer pendant qu'elle prenait sa douche.[316] Ses allégations portaient sur le fait que le cadre juridique suédois n'avait pas suffisamment protégé sa vie privée. La CouEDH a estimé que l'État avait l'obligation de définir un cadre législatif offrant une protection appropriée aux victimes, telles que la requérante. Dans le mesure où cette affaire ne concerne qu'une tentative de filmer la requérante, la CouEDH a estimé que ce cadre législatif ne devait pas nécessairement inclure des sanctions pénales. Les recours, civil ou pénal, mis à disposition de la victime, doivent être efficaces. Sur les faits mêmes de l'affaire, la CouEDH a estimé que la requérante n'avait pas bénéficié de recours civil et pénal efficaces contre la tentative de son beau-père de la filmer, en violation de l'article 8 de la CEDH.

L'article 9 de la Convention du Conseil de l'Europe sur la cybercriminalité[317] exige des États Parties qu'ils érigent des sanctions pénales relatives au fait d'offrir, de mettre à disposition, de distribuer, de transmettre, de se procurer ou de posséder de la pédopornographie ou de produire ce type de contenu par le biais d'un système informatique. Une clause importante est que cette conduite doit être intentionnelle. Le Rapport explicatif de la Convention déclare que l'expression « matière pornographique » doit être interprétée conformément aux normes de droit interne concernant la classification du matériel comme « obscène, incompatible avec les mœurs publiques ou ayant à un autre titre un effet pervers »[318]. Néanmoins, l'obligation d'ériger en infraction pénale certains comportements doit non seulement s'appliquer au contenu représentant visuellement un mineur, mais aussi s'il contient une ou plusieurs images réalistes représentant un enfant se livrant à un comportement sexuel explicite.[319]

Par ailleurs, conformément aux articles 21 et 23 de la Convention de Lanzarote, les États doivent prendre les mesures législatives pour ériger en infraction pénale toute forme de pédopornographie. Selon l'article 21, le fait de recruter, de contraindre et de participer à des spectacles pédopornographiques doit être sanctionné pénalement. Selon l'article 22, le fait de faire assister un enfant à des abus sexuels ou à des activités sexuelles doit également être sanctionné

316 CouEDH, *Söderman c. Suède* [GC], n° 5786/08, 12 novembre 2013.

317 CdE, Convention sur la cybercriminalité, STCE n° 185, 2001.

318 Rapport explicatif du Conseil de l'Europe, Convention du Conseil de l'Europe sur la cybercriminalité, point 99.

319 CdE, Convention sur la cybercriminalité, STCE n° 185, 2001, art. 9 (2).

pénalement. Enfin, l'article 23 exige qu'une législation pénale soit adoptée en ce qui concerne le fait de solliciter des enfants à des fins sexuelles par le biais des technologies de communication et d'information. Le Comité de Lanzarote a adopté un avis relatif à cette disposition, lequel invite les États Parties à la convention à envisager d'étendre les sanctions pénales liées à la sollicitation à des affaires où l'abus sexuel ne résulte pas de la rencontre avec une personne, mais est commis en ligne.[320]

7.3. Groupes à haut risque

Point clé

- Les enfants victimes de disparition forcée ont le droit de préserver leur identité ou de la rétablir.

7.3.1. Enfants appartenant à une minorité

Dans le droit du CdE, les affaires de la CouEDH traitant spécifiquement de la violence envers les enfants appartenant à une minorité sont relativement rares en dehors du contexte de la traite d'êtres humains et du travail forcé. La plupart concerne la ségrégation dans les écoles et la discrimination, lesquelles sont analysées dans la section 3.2.

Exemple : dans l'affaire *Centre de ressources juridiques au nom de Valentin Câmpeanu c. Roumanie*, une ONG a porté plainte au nom d'un jeune homme rom décédé dans un établissement psychiatrique.[321] Il était séropositif et présentait une déficience intellectuelle grave. Des conditions épouvantables régnaient dans l'établissement dans lequel il était placé : pas de chauffage, pas de draps ni de couvertures ou de vêtements, aucune aide de la part du personnel, etc. Du fait de l'absence de parent proche de la victime, l'ONG a porté plainte en son nom pour violation des droits prévus aux articles 2, 3, 5, 8, 13 et 14 de la CEDH. La Grande Chambre a décidé que,

320 Avis du Comité de Lanzarote sur l'art. 23 de la Convention de Lanzarote et sa note explicative, 17 juin 2015.

321 CouEDH, *Centre de ressources juridiques au nom de Valentin Câmpeanu c. Roumanie* [GC], n° 47848/08, 17 juillet 2014.

au vu des circonstances exceptionnelles de l'affaire (extrême vulnérabilité et aucun parent proche connu du jeune homme), l'ONG était autorisée à représenter le requérant décédé. Sur le fond de l'affaire, la CouEDH a estimé qu'il y avait eu violation du volet matériel de l'article 2. Les autorités nationales ont été considérées comme responsable du décès de M. Câmpeanu dans la mesure où elles l'avaient placé dans un établissement dans lequel il est décédé du fait d'une mauvaise alimentation, de mauvaises conditions de vie et de l'absence de soins médicaux adaptés. La CouEDH a également conclu à la violation de l'article 2 car les autorités roumaines n'avaient pas mené d'enquête effective sur le décès de M. Câmpeanu.

Concernant les enfants vivant en institution, la Recommandation Rec(2005)5 du Conseil de l'Europe souscrit à la décision selon laquelle le placement d'un enfant ne saurait faire l'objet d'aucune discrimination.[322]

7.3.2. Enfants handicapés

Dans le droit de l'UE, l'Union européenne a ratifié la CRPD, qui est le premier traité international relatif aux droits de l'homme auquel l'UE a adhéré.[323] La CRPD prévoit des dispositions spécifiques relatives aux enfants. L'UE et ses États membres se sont engagés à assurer que les enfants handicapés puissent jouir pleinement de tous les droits de l'homme sur la base de l'égalité avec les autres enfants. Selon l'article 16 de la CRPD, ils doivent prendre des mesures spécifiques pour protéger les enfants handicapés contre toutes les formes d'abus et d'exploitation.[324]

Dans le droit du CdE, les affaires de la CouEDH concernant les enfants handicapés ont soulevé plusieurs questions, notamment le consentement, les obligations des États de protéger contre la mort et la maltraitance, et les conditions de vie dans des établissements publics.

Exemple : l'affaire *Nencheva et autres c. Bulgarie*[325] concerne le décès de 15 enfants et jeunes adultes placés dans un foyer pour enfants souffrant de

322 CdE, Comité des Ministres (2005), Recommandation Rec(2005)5 relative aux droits des enfants vivant en institution, 16 mars 2005.

323 Conseil de l'Union Européenne (2009), Décision du Conseil 2010/48/CE du 26 novembre 2009 concernant la conclusion, par la Communauté européenne, de la convention des Nations Unies relative aux droits des personnes handicapées JO 2010 L 23/35.

324 Voir également section 3.5.

325 CouEDH, *Nencheva et autres c. Bulgarie*, n° 48609/06, 18 juin 2013.

troubles mentaux et de handicaps physiques. La CouEDH a estimé que les enfants avaient été placés dans un établissement public spécialisé sous le seul contrôle de l'État. Les conditions de vie des enfants dans l'institution étaient des plus mauvaises:ils manquaient de nourriture, de médicaments, ainsi que de vêtements et de linge de lit en quantité suffisante, et vivaient dans des pièces insuffisamment chauffées en hiver. Les autorités compétentes ont été alertées de la situation à plusieurs reprises, et avaient donc, ou auraient dû avoir une connaissance exacte des risques pour la vie des enfants. La CouEDH a conclu à la violation du volet matériel de l'article 2 de la CEDH car les autorités n'avaient pas pris les mesures nécessaires à la protection de la vie des enfants sous leur contrôle. Par ailleurs, les autorités bulgares n'avaient pas mené d'enquête effective comme suite aux décès des enfants des requérants. Du fait des circonstances particulières de l'affaire, les autorités bulgares auraient dû engager d'office une enquête pénale. L'enquête s'est révélée inefficace pour plusieurs raisons : elle a commencé deux ans après le décès des enfants, elle s'est ensuite étendue sur une période déraisonnablement longue, elle n'a pas traité de tous les décès et elle n'a pas permis de faire la lumière sur toutes les circonstances concrètes de cette affaire.

7.4. Enfants disparus

Dans le droit de l'UE, la Commission européenne a mis en place une ligne d'assistance téléphonique (116000) pour les enfants disparus.[326] Ce service prend les appels signalant une disparition d'enfants et les transmet à la police, offre des conseils aux personnes responsables de l'enfant disparu, les soutient et contribue à l'enquête.

Dans le droit du CdE, la disparition forcée d'enfants est traitée dans l'article 8 de la CEDH.

Exemple : L'affaire *Zorica Jovanović c. Serbie*[327] concerne le décès allégué d'un nouveau-né à l'hôpital peu après sa naissance, mais dont le corps n'a jamais été remis aux parents. La mère a dénoncé le manquement de l'État à lui fournir des informations sur ce qu'il était réellement advenu de son fils,

326 Décision de la Commission (2007), Décision de la Commission 2007/698/CE du 29 octobre 2007 modifiant la décision 2007/116/CE en ce qui concerne l'introduction de numéros réservés, JO 2007 L 284/31.

327 CouEDH, *Zorica Jovanović c. Serbie*, n° 21794/08, 26 mars 2013.

notamment la cause du décès allégué, ou la date et l'heure de son enterrement. La CouEDH a conclu que le « manquement continu de l'État défendeur à lui fournir des informations crédibles sur ce qu'il était advenu de son fils » équivalait à une violation de son droit au respect de la vie familiale.[328]

Selon le droit de l'ONU, l'article 25, paragraphe 1, point b), de la Convention internationale pour la protection de toutes les personnes contre les disparitions forcées [329] dispose que les États doivent prendre les mesures nécessaires pour prévenir et réprimer pénalement « la falsification, la dissimulation ou la destruction de documents attestant la véritable identité » des enfants, qu'il s'agisse d'eux-mêmes ou dont les parents ont été soumis à une disparition forcée. Les États doivent également prendre les mesures nécessaires pour rechercher et identifier ces enfants, et les rendre à leur famille d'origine. Compte-tenu de ce droit des enfants à préserver et à voir rétablie leur identité, y compris leur nationalité, leur nom et leurs liens familiaux reconnus par la loi, les États doivent mettre en place des procédures légales permettant de réviser et annuler la procédure d'adoption ou de placement d'enfants trouvant leur origine dans une disparition forcée (article 25, paragraphe 4). La convention réaffirme deux des principes généraux sous-tendant les droits des enfants : l'intérêt supérieur de l'enfant comme une considération primordiale, et le droit de l'enfant d'exprimer son opinion (article 25, paragraphe 5). Bien que peu d'États européens aient ratifié cette convention, son importance dans le cadre normatif européen ne doit pas être sous-estimée.[330]

328 *Ibid.*, point 74.

329 ONU, Convention internationale pour la protection de toutes les personnes contre les disparitions forcées, 20 décembre 2006.

330 À la date du 19 février 2015, neuf des 28 États membres de l'UE ont ratifié cette convention (Allemagne, Autriche, Belgique, Espagne, France, Lituanie, Pays-Bas, Portugal et Slovaquie). De plus, les États membres du Conseil de l'Europe suivants ont ratifié cette convention : Albanie, Arménie, Bosnie-Herzégovine Monténégro et Serbie.

Les droits économiques, sociaux et culturels (droits ESC), plus communément appelés droits socioéconomiques ou droits sociaux dans le contexte européen, incluent les droits relatifs au travail ainsi que le droit à l'éducation, à la santé, au logement, à la sécurité sociale et, plus généralement, à un niveau de vie adéquat. Les droits culturels restent très peu développés et rarement pris en compte dans le contexte des bourses et des actions en justice. Certains de leurs aspects sont abordés à la section 4.6 relative à l'identité des enfants appartenant à une minorité ainsi qu'à la section 8.2 consacrée au droit à l'éducation.

Les normes explicites relatives aux droits ESC dans le contexte européen se trouvent essentiellement dans la Charte sociale européenne et la Charte des droits fondamentaux de l'UE, même si la CEDH et ses protocoles incluent également plusieurs dispositions, notamment l'interdiction du travail forcé et le droit à l'éducation. La CouEDH a par ailleurs déclaré que « nulle cloison étanche ne sépare la sphère des droits économiques et sociaux du domaine de la Convention »[331] et considéré que les droits ESC sont inclus dans les droits civils garantis par la CEDH. Ainsi, par exemple, l'accès aux soins de santé a été abordé dans le cadre de l'interdiction de la torture et des peines ou traitements inhumains ou dégradants (article 3 de la CEDH)[332].

Le présent chapitre examine les droits de la CSE présentant un intérêt particulier pour les enfants : le droit à l'éducation (section 8.2) ; le droit à la santé (section 8.3) ; le droit au logement (section 8.4) et le droit à un niveau de vie suffisant et droit à la sécurité sociale (section 8.5).

8.1. Approches relatives aux droits économiques, sociaux et culturels

Points clés

- Garantir la disponibilité des ressources nécessaires est primordial pour assurer la protection des droits sociaux.
- Les éléments essentiels des droits sociaux sont la disponibilité, l'accessibilité, l'adaptabilité et l'acceptabilité.

Dans le droit de l'UE, les droits inscrit dans la CSE ont été intégrés à la Charte des droits fondamentaux de l'UE et sont au même niveau que les droits civils et politiques. Toutefois, l'article 52 de la Charte opère une distinction entre les droits et les principes, car la possibilité d'invoquer les principes devant le juge est limitée.

331 CouEDH, *Airey c. Irlande*, n° 6289/73, 9 octobre 1979, para. 26.

332 Voir par exemple CouEDH, *Factsheet on Prisoners' health-related rights*, février 2015, et *Factsheet on Health*, avril 2015.

Dans le droit du CdE, le CEDS note que lorsque la réalisation de l'un de ces droits est « exceptionnellement complexe et particulièrement onéreuse », la réalisation progressive est évaluée sur la base de trois critères : l'État doit « s'efforcer d'atteindre les objectifs de la [CSE] à une échéance raisonnable, au prix de progrès mesurables, en utilisant au mieux les ressources qu'il peut mobiliser »[333]. Le CEDS introduit également une hiérarchisation en rappelant aux États « l'impact des choix opérés par eux sur les groupes dont la vulnérabilité est la plus grande, ainsi que sur les autres personnes concernées »[334].

Le CEDS affirme, bien que dans le contexte spécifique du droit à la sécurité sociale, que les démarches rétrogrades « afin d'assurer le maintien et la viabilité du système de sécurité sociale existant » sont autorisées pour autant qu'elles ne portent pas « atteinte au cadre essentiel du régime de sécurité sociale national ou priver les individus de l'opportunité de bénéficier de la protection que ce régime offre contre de sérieux risques sociaux et économiques »[335]. La CouEDH admet elle aussi la possibilité de démarches rétrogrades, mais s'assure que la méthode choisie soit raisonnable et propre à atteindre l'objectif légitime visé[336].

Dans le contexte du droit à l'éducation, le CEDS a adopté, conformément à l'approche du Comité des droits économiques, sociaux et culturels des Nations Unies, le cadre analytique relatif à la disponibilité, l'accessibilité, l'adaptabilité et l'acceptabilité[337]. La distinction entre disponibilité et accessibilité est par ailleurs opérée dans la jurisprudence de la CouEDH. Les critères ou éléments essentiels de la disponibilité, de l'accessibilité, de l'acceptabilité et de l'adaptabilité guideront l'analyse présentée ci-après dans la mesure de l'existence d'une jurisprudence pertinente.

8.2. Droit à l'éducation

Points clés

- Les restrictions de l'accessibilité de l'éducation doivent être prévisibles, poursuivre un but légitime, être justifiées et non discriminatoires.
- L'acceptabilité de l'éducation, qui nécessite le respect des convictions religieuses et philosophiques des parents, n'exclut pas la possibilité d'une éducation religieuse ou sexuelle à l'école.
- L'adaptabilité exige des mesures spéciales pour les enfants handicapés ainsi que la possibilité, pour les enfants appartenant à une minorité, de recevoir un apprentissage et un enseignement dans leur propre langue.
- Les enfants ont le droit à une éducation quel que soit leur nationalité ou leur situation au regard de la législation sur l'immigration.

Dans le droit de l'UE, l'article 14, paragraphe 2, de la Charte des droits fondamentaux de l'UE garantit le droit à l'éducation, y compris « la faculté de suivre gratuitement l'enseignement obligatoire ». L'article 14, paragraphe 3, garantit la liberté de créer des établissements d'enseignement ainsi que le droit des parents d'assurer l'éducation et l'enseignement de leurs enfants conformément à leurs convictions religieuses, philosophiques et pédagogiques.

Dans le droit du CdE, l'article 2 du Protocole n° 1 à la CEDH garantit le droit à l'éducation. La CouEDH précise que cet article n'oblige pas les États à mettre un enseignement à disposition des enfants, mais prévoit « un droit d'accès aux établissements scolaires existant à un moment donné »[338]. En outre, le droit à l'éducation inclut également « la possibilité de tirer un bénéfice de l'enseignement suivi, c'est-à-dire le droit d'obtenir, conformément aux règles en vigueur dans chaque État et sous une forme ou une autre, la reconnaissance officielle des études accomplies »[339]. Toutefois, il ne s'agit pas d'un droit absolu et ses limites doivent être prévisibles pour les personnes concernées et poursuivre un but légitime. Les mesures disciplinaires, y compris la suspension ou l'exclusion d'un établissement d'enseignement, sont autorisées pour autant qu'elles répondent aux conditions

338 CouEDH, *Affaire « relative à certains aspects du régime linguistique de l'enseignement en Belgique » c. Belgique*, n° 1474/62, 1677/62, 1691/62, 1769/63, 1994/63 et 2126/64, 23 juillet 1968, point 4.

339 *Ibid.*

relatives aux restrictions autorisées. Pour déterminer si ces formes d'exclusion de l'éducation résultent d'un refus du droit à l'éducation, des facteurs tels que les garanties procédurales, la durée de l'exclusion, les efforts de réintégration et l'adéquation de l'éducation de remplacement seront pris en compte[340].

> Exemple : dans l'affaire *Catan et autres c. République de Moldova et Russie*[341], la CouEDH a examiné la politique linguistique introduites dans les écoles par les autorités séparatistes de Transnistrie. L'objectif de cette politique était la russification. Suite à la fermeture par la force des écoles de langue moldave (utilisant l'alphabet latin), les parents ont dû choisir entre placer leurs enfants dans des écoles où l'enseignement était donné dans une combinaison artificielle de langue moldave et d'alphabet cyrillique et avec des supports d'enseignement produits à l'ère soviétique et les placer dans des écoles moins bien équipées et plus difficiles d'accès, sur le chemin desquelles ils se faisaient harceler et intimider. La fermeture par la force des écoles et le harcèlement qui en a découlé ont été considérés comme une atteinte au droit des enfants à l'éducation constituant une violation de l'article 2 du Protocole n° 1 à la CEDH[342].

Dans le cadre du droit à l'éducation, les parents ont le droit d'exiger le respect de leurs convictions religieuses et philosophiques. Toutefois, « la définition et l'aménagement du programme des études relèvent en principe de la compétence » de l'État[343]. Ce dernier peut également inclure dans le programme scolaire des informations ou des connaissances de nature religieuse ou philosophique, pour autant que celles-ci soient « diffusées de manière suffisamment objective, critique et pluraliste »[344]. Pour garantir le pluralisme, les différences quantitatives et qualitatives au niveau de l'enseignement d'une religion ou d'une philosophie donnée doivent être compensées par la possibilité offerte aux parents d'exempter, partiellement ou totalement, leurs enfants de cet enseignement, notamment la possibilité de ne pas assister à certains cours ou à la formation religieuse dans

344 *Ibid.*, para. 84.

son ensemble[345]. Voir la section 2.1 au sujet de l'approche adoptée par la CouEDH afin de traiter de cette question sous un angle non discriminatoire.[346]

Aux termes de l'article 17, paragraphe 2, de la CSE révisée, les États prennent « toutes les mesures nécessaires et appropriées tendant [...] à assurer aux enfants et aux adolescents un enseignement primaire et secondaire gratuit, ainsi qu'à favoriser la régularité de la fréquentation scolaire »[347]. Le CEDS a également jugé qu'au titre de cette disposition, les États contractants devaient veiller à ce que les enfants en situation irrégulière sur leur territoire aient également accès à l'éducation[348].

Par ailleurs, les établissements d'enseignement doivent être accessibles à tous sans discrimination[349]. Le CEDS a considéré que « l'intégration des enfants handicapés dans les écoles ordinaires [...] devrait être la règle et l'enseignement en école spécialisée devrait être l'exception »[350]. Les États ne disposent pas d'une large marge d'appréciation en ce qui concerne le choix du type d'école pour les personnes handicapées ; il doit s'agir d'une école ordinaire[351].

Les situations relatives aux différences de traitement dans l'éducation au motif, notamment, de la nationalité, de la situation au regard de la législation sur l'immigration, ou de l'origine ethnique sont abordées au chapitre 3.

Selon la jurisprudence du CEDS, l'éducation sexuelle et génésique doit faire partie des programmes scolaires ordinaires[352]. Si les États disposent d'une large marge d'appréciation pour juger de l'adéquation culturelle des supports d'éducation utilisés, ils doivent garantir une éducation sexuelle et génésique non discriminatoire, « qui ne perpétue pas ou ne renforce pas l'exclusion sociale et le déni de la dignité humaine ». Les moyens éducatifs ne doivent pas renforcer « des

stéréotypes avilissants », concernant, par exemple, les personnes n'ayant pas d'orientation hétérosexuelle[353].

Enfin, l'adaptabilité de l'éducation nécessite par exemple « la prise de dispositions pour répondre aux besoins spéciaux » des enfants handicapés intégrés dans des écoles ordinaires[354] (voir également la section 3.5).

En outre, aux termes de l'article 12, paragraphe 3, de la CCPMN, les États parties ont pris l'engagement de promouvoir l'égalité des chances en matière d'accès à l'éducation à tous les niveaux pour les personnes appartenant à une minorité nationale (voir également le chapitre 3).[355] Pour les enfants appartenant à une minorité nationale, l'article 14 de la CCPMN garantit le droit d'apprendre et de suivre un enseignement de sa propre langue[356]. La CouEDH a confirmé que le droit à l'éducation impliquait le droit d'être instruit dans la (l'une des) langue(s) nationale(s)[357].

8.2.1. Droit des enfants migrants à l'éducation

Dans le droit de l'UE, le droit fondamental des enfants à l'éducation, quel que soit leur situation au regard de la législation sur l'immigration, est reconnu dans presque tous les aspects de la réglementation de l'UE en matière de migration[358]. Cela étant, l'UE n'est pas compétente pour déterminer le contenu ou la portée des dispositions nationales en matière d'éducation, mais protège le droit des enfants

353 *Ibid.*, paras. 59 et 61.

354 CEDS, *Centre de Défense des Droits des Personnes Handicapées Mentales (MDAC) c. Bulgarie*, n° 41/2007, 3 juin 2008, para. 35.

355 Voir également CdE, Comité consultatif de la convention-cadre pour la protection des minorités nationales (2006), Commentaire sur l'éducation au regard de la Convention-cadre pour la protection des minorités nationales, ACFC/25DOC(2006)002, Partie 2.1.

357 CouEDH, *Catan et autres c. République de Moldova et Russie* [GC], n° 43370/04, 8252/05 et 18454/06, 19 octobre 2012, para. 137.

358 Voir par exemple l'article 27 de la directive 2011/95/UE du Parlement européen et du Conseil du 13 décembre 2011 concernant les normes relatives aux conditions que doivent remplir les ressortissants des pays tiers ou les apatrides pour pouvoir bénéficier d'une protection internationale, à un statut uniforme pour les réfugiés ou les personnes pouvant bénéficier de la protection subsidiaire, et au contenu de cette protection (refonte) (directive « qualification »), JO 2011 L 337, p. 9-268.

migrants d'accéder à l'éducation sur une base identique, ou, selon leur statut, similaire à celle des ressortissants nationaux. La directive 2004/114/CE relative aux étudiants réglemente les conditions d'admission des ressortissants de pays tiers à des fins d'études, d'échange d'élèves, de formation non rémunérée ou de volontariat[359]. Cette admission couvre l'entrée et le séjour du ressortissant de pays tiers pour une durée supérieure à trois mois. Les conditions générales d'admission des enfants incluent la présentation d'un document de voyage valide, une autorisation parentale pour le séjour envisagé, une assurance-maladie et, à la demande de l'État membre, le paiement d'un droit pour le traitement de la demande d'admission[360]. Les élèves, par exemple, sont tenus d'apporter la preuve de leur participation à un programme d'échange d'élèves mis en œuvre par une organisation reconnue à cet effet par l'État membre concerné[361]. Les stagiaires non rémunérés doivent apporter, à la demande de l'État membre, la preuve qu'ils disposeront au cours de leur séjour de ressources suffisantes pour couvrir leurs frais de subsistance, de formation et de retour[362]. L'accès des étudiants de l'enseignement supérieur aux activités économiques, y compris à l'emploi, est soumis à certaines restrictions[363].

Les enfants de migrants de l'UE qui déménagent dans un autre État membre de l'UE au titre de la législation en matière de libre circulation bénéficient dans ce contexte des droits les plus favorables. Ils ont le droit d'être admis aux cours d'enseignement général, d'apprentissage et de formation professionnelle dans les mêmes conditions que les ressortissants de l'État membre[364], qu'il s'agisse d'enseignement public ou privé ou d'enseignement obligatoire ou non obligatoire. La CJUE a toujours interprété ce droit de manière large afin de garantir un accès égal à l'éducation, mais aussi, plus largement, aux prestations sociales liées à l'éducation ainsi qu'à toute autre prestation destinée à faciliter la participation à l'éducation. Par exemple, dans l'affaire *Casagrande*, l'enfant d'un travailleur

359 Directive 2004/114/CE du Conseil relative aux conditions d'admission des ressortissants de pays tiers à des fins d'études, d'échange d'élèves, de formation non rémunérée ou de volontariat (directive relative aux étudiants).

360 *Ibid.*, art. 6.

361 *Ibid.*, art. 7.

362 *Ibid.*, art. 10.

363 *Ibid.*, art. 17.

364 Règlement (UE) n° 492/2011 du Parlement européen et du Conseil du 5 avril 2011 relatif à la libre circulation des travailleurs à l'intérieur de l'Union, JO 2011 L 141/1, p. 1-12, art. 10, et directive 2004/38/CE du Parlement européen et du Conseil du 29 avril 2004 relative au droit des citoyens de l'Union et des membres de leurs familles de circuler et de séjourner librement sur le territoire des États membres, modifiant le règlement (CEE) n° 1612/68 et abrogeant les directives 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE et 93/96/CEE (directive relative à la liberté de circulation), JO 2004 L 158, p. 77-123, art. 24, para. 1.

migrant a pu accéder à une aide à la formation en fonction des ressources, au titre de la législation de l'UE en matière de libre circulation[365].

Par ailleurs, la législation introduite dans les années 1970 exige des États membres qu'ils dispensent une formation linguistique supplémentaire aux enfants de travailleurs migrants de l'UE, dans la langue de leur État d'accueil et dans leur langue maternelle, afin de faciliter leur intégration dans leur État d'accueil ainsi que dans leur pays d'origine, dans le cas d'un futur retour[366]. Si cette disposition paraît offrir un soutien supplémentaire extrêmement généreux et précieux aux enfants comme suite à leur admission dans une école de l'État d'accueil, son application dans les différents pays a été manifestement inégale et est de plus en plus difficile en raison du vaste éventail de langues à prendre en compte[367].

Exemple : la question à trancher dans l'affaire *Baumbast et R c. Secretary of State for the Home Department*[368] était de savoir si les deux filles d'un travailleur migrant allemand qui s'était installé au Royaume-Uni avec son épouse colombienne et ses filles pouvaient continuer à fréquenter l'école de ce pays après que leur père avait quitté le Royaume-Uni pour un pays tiers, laissant derrière lui son épouse et ses filles. La CJUE a dû déterminer si l'épouse et les filles pouvaient demeurer dans l'État d'accueil indépendamment, bien que M. Baumbast (grâce à qui la famille détenait un droit de séjour) ait effectivement renoncé à son statut de travailleur migrant de l'UE. Pour la CJUE, le facteur décisif était le fait que les enfants étaient intégrés au système éducatif de l'État d'accueil et qu'il aurait été à la fois nuisible et disproportionné de les déraciner à un stade si crucial de leur éducation. La Cour a confirmé que l'importance d'assurer la continuité de l'éducation d'un enfant est telle qu'elle peut permettre d'« ancrer » la résidence d'une famille (qui n'aurait normalement pas pu rester) dans l'État d'accueil pendant la durée des études d'un enfant migrant.

365 CJUE, C-9/74, *Donato Casagrande c. Landeshauptstadt München*, 3 juillet 1974. Ultérieurement confirmé par des arrêts tels que CJUE, C-3/90, *M.J.E. Bernini c. Minister van Onderwijs en Wetenschappen*, 26 février 1992.

366 Directive 77/486/CEE du Conseil visant à la scolarisation des enfants des travailleurs migrants, JO 1977 L 199, p. 32-33. Il est à noter que les enfants migrants ressortissants de pays tiers sont exclus du champ d'application de cette directive.

367 Rapports de la Commission sur la mise en œuvre de la directive 77/486/CEE, COM(84) 54 final et COM(88) 787 final.

368 CJUE, C-413/99, *Baumbast et R c. Secretary of State for the Home Department*, 17 septembre 2002.

La décision *Baumbast* a été suivie à plusieurs reprises[369] et codifiée dans l'article 12, paragraphe 3 de la directive 2004/38/CE[370].

En général, le seul enseignement auquel les enfants ressortissants de pays tiers peuvent accéder dans les mêmes conditions que les ressortissants nationaux est l'enseignement *public* ; en outre, ces enfants n'ont pas droit aux avantages connexes tels que les bourses de subsistance[371]. Certains instruments de l'UE en matière d'immigration vont toutefois plus loin que la simple égalité d'accès en exigeant des États membres qu'ils mettent en œuvre des mécanismes assurant la reconnaissance et la transférabilité des qualifications étrangères même en l'absence de preuves documentaires (article 28 de la directive « qualification »[372]).

Les droits d'éducation des enfants demandeurs d'asile sont encore plus faibles ; ceux-ci doivent bénéficier d'un accès au système éducatif de l'État d'accueil dans des conditions *similaires*, mais pas nécessairement *identiques* à celles appliquées aux ressortissants nationaux[373]. Leur éducation peut ainsi être dispensée dans des centres d'hébergement et non pas des écoles et les autorités peuvent repousser l'accès complet d'un enfant demandeur d'asile à une école pendant une période de trois mois suivant la date de la demande d'asile. Lorsque l'accès au système éducatif est impossible en raison de la situation particulière de

369 CJUE, C-480/08, *Maria Teixeira c. London Borough of Lambeth et Secretary of State for the Home Department*, 23 février 2010 ; CJUE, C-310/08, *London Borough of Harrow c. Nimco Hassan Ibrahim et Secretary of State for the Home Department* [GC], 23 février 2010.

370 Directive 2004/38/CE du Parlement européen et du Conseil du 29 avril 2004 relative au droit des citoyens de l'Union et des membres de leurs familles de circuler et de séjourner librement sur le territoire des États membres, modifiant le règlement (CEE) n° 1612/68 et abrogeant les directives 64/221/CEE, 68/360/CEE, 72/194/CEE, 73/148/CEE, 75/34/CEE, 75/35/CEE, 90/364/CEE, 90/365/CEE et 93/96/CEE, JO 2004 L 158, art. 2, para. 2, point c).

371 Directive 2011/95/UE relative aux conditions à remplir pour le statut de réfugié (directive « qualification »), art. 11 ; directive relative aux résidents de longue durée (2003/109/CE), art. 14 ; directive 2003/86/CE relative regroupement familial, art. 14 ; directive relative à la protection temporaire (2001/55/CE) ; directive sur les conditions d'accueil (2013/33/UE), art. 14, point c) ; et directive « retour » (2008/115/CE).

372 Directive 2011/95/UE du Parlement européen et du Conseil du 13 décembre 2011 concernant les normes relatives aux conditions que doivent remplir les ressortissants des pays tiers ou les apatrides pour pouvoir bénéficier d'une protection internationale, à un statut uniforme pour les réfugiés ou les personnes pouvant bénéficier de la protection subsidiaire, et au contenu de cette protection (refonte) (directive « qualification »), JO 2011 L 337, p. 9.

373 Directive relative aux conditions d'accueil (2013/33/UE). Il est à noter qu'aux termes de la directive relative aux conditions à remplir pour le statut de réfugié (2011/95/UE, art. 27), les enfants réfugiés (qui ont acquis un droit de séjour à long terme) peuvent accéder à l'éducation dans les mêmes conditions que les ressortissants nationaux.

l'enfant, les États membres ont l'obligation de proposer d'autres arrangements éducatifs (article 14, paragraphe 3, de la directive sur les conditions d'accueil)[374].

Dans le droit du CdE, l'article 2 du Protocole n° 1 a été utilisé en conjonction avec l'article 14 pour garantir l'accès des enfants migrants à l'éducation (voir également la section 3.3).

> Exemple : dans l'affaire *Ponomaryovi c. Bulgarie*[375], la CouEDH a examiné l'obligation imposée à deux écoliers russes sans droit de séjour permanent de payer des frais de scolarité pour l'école secondaire. La Cour a conclu que dans ce cas, l'imposition de frais de scolarité pour l'école secondaire avait été discriminatoire et donc contraire à l'article 14 de la CEDH lue en combinaison avec l'article 2 du Protocole n° 1 à la CEDH[376].

La CSE protège les droits d'éducation des enfants migrants à la fois directement (article 17, paragraphe 2) et indirectement, en imposant des limitations aux droits des enfants en matière d'emploi dans le but de leur permettre de bénéficier pleinement de l'enseignement obligatoire (article 7).

Par ailleurs, la Convention européenne relative au statut juridique du travailleur migrant[377] appuie le droit des enfants migrants à accéder « au même titre et dans les mêmes conditions » que les ressortissants nationaux, à l'enseignement général et à la formation professionnelle de l'État d'accueil (article 14, paragraphe 1).

Dans le droit international, l'égalité d'accès à l'éducation des enfants migrants est garantie par la Convention internationale de l'ONU sur la protection des droits de tous les travailleurs migrants et des membres de leur famille (article 30)[378].

L'article 28 de la CRC dispose que tous les enfants ont le droit de suivre gratuitement l'enseignement obligatoire. En vertu de l'article 1, paragraphe 1, point c),

374 Directive 2013/33/UE du Parlement européen et du Conseil du 26 juin 2013 établissant des normes pour l'accueil des personnes demandant la protection internationale (refonte) (directive sur les conditions d'accueil, JO 2013 L 180, p. 96-116.

375 CouEDH, *Ponomaryovi c. Bulgarie*, n° 5335/05, 21 juin 2011.

376 Voir également la section 3.3.

377 CdE, Convention européenne relative au statut juridique du travailleur migrant, STCE n° 93, 1977.

378 ONU, Convention internationale de l'ONU sur la protection des droits de tous les travailleurs migrants et des membres de leur famille, 18 décembre 1990.

ce droit va largement au-delà de l'égalité de l'accès à l'éducation puisqu'il inclut des dispositions relatives au développement de l'identité culturelle de l'enfant, à sa langue et aux valeurs de son pays d'origine.

8.3. Droit à la santé

Points clés

- Les États ont l'obligation positive de prendre des mesures contre les risques sanitaires potentiellement mortels dont les autorités ont ou devraient avoir connaissance.
- Les autorités nationales doivent enquêter de manière adéquate sur les causes de tout décès d'individu.
- Au titre de la CSE, les enfants en situation irrégulière dans un pays ont le droit de bénéficier de soins de médicaux au-delà de l'assistance médicale d'urgence.
- L'acceptabilité des soins de santé nécessite un consentement éclairé ou une autorisation.
- En vertu de la législation de l'UE et de la CSE, sous réserve de plusieurs contraintes, les enfants migrants ont le droit d'accéder à l'assistance sociale et aux soins de santé.

Dans le droit de l'UE, l'article 35 de la Charte des droits fondamentaux de l'UE garantit un droit d'accès aux soins de santé.

Les enfants de migrants ressortissants de l'UE peuvent accéder aux services sociaux et aux soins de santé de la même manière que les ressortissants nationaux, à l'issue d'un délai de trois mois de résidence dans l'État d'accueil[379]. Des droits similaires sont accordés aux enfants de ressortissants de pays tiers ayant obtenu un droit de séjour permanent dans un État membre, bien qu'ils puissent être limités à ce que l'on appelle les « prestations essentielles »[380]. En ce qui concerne les enfants réfugiés et demandeurs d'asile, les États doivent leur garantir l'accès à une assistance sociale appropriée de la même manière que les ressortissants de l'État d'accueil, mais, ici encore, ce droit peut être limité aux « prestations essentielles » (article 29 de la directive « qualification »). La législation exige des

379 Directive relative à la liberté de circulation, art. 24.

380 Directive 2003/109/CE du Conseil du 25 novembre 2003 relative au statut des ressortissants de pays tiers résidents de longue durée, JO 2004 L 16, art. 11, para. 4.

États membres qu'ils fournissent aux enfants migrants vulnérables un accès à une assistance suffisante en matière de soins de santé. Par exemple, les enfants qui ont été victimes de violences ou de torture doivent recevoir un soutien suffisant pour répondre à leurs besoins physiques et mentaux (directive sur les conditions d'accueil (refonte), chapitre IV, article 21, article 23, paragraphe 4, et article 25). La directive « qualification » contient des dispositions similaires pour les enfants migrants vulnérables.

Dans le droit du CdE, la CEDH ne garantit pas expressément un droit aux soins de santé, ni un droit à la santé. Toutefois, la CouEDH a entendu un certain nombre d'affaires relatives à la santé dans des circonstances diverses. En premier, la Cour examine les problèmes de santé qui mettent en danger la vie des enfants. Elle détermine les obligations positives des États aux termes desquelles ils doivent prendre des mesures préventives contre ces risques sanitaires potentiellement mortels dont ils ont ou devraient avoir connaissance.

Exemple : dans l'affaire *Oyal c. Turquie*, l'État n'a pas pris de mesures de prévention contre la propagation du VIH par transfusion sanguine. Par conséquent, un nouveau-né a été infecté par le virus du VIH lors de transfusions sanguines qu'il a reçues dans un hôpital public. Si une certaine forme de réparation a été offerte, la CouEDH a estimé qu'en l'absence de couverture médicale complète pour le traitement et les médicaments de l'enfant jusqu'à la fin de sa vie, l'État n'a pas offert de réparation satisfaisante et a donc violé le droit à la vie (article 2 de la CEDH)[381]. Elle a également ordonné à l'État turc de fournir à la victime une couverture médicale complète jusqu'à la fin de sa vie.

Exemple : dans l'affaire *Iliya Petrov c. Bulgarie*[382], un garçon de 12 ans a été gravement blessé dans le bâtiment d'un transformateur électrique dont la porte était ouverte et qui se situait dans un parc en plein air, où se retrouvaient souvent les enfants et les jeunes. La CouEDH a considéré que l'exploitation d'un réseau électrique représentait une activité faisant courir un risque élevé aux personnes à proximité des installations. L'État a l'obligation de mettre en place une réglementation adéquate, y compris un système permettant de s'assurer de l'application adéquate des règles de sécurité. La Cour a estimé qu'en ne s'assurant pas que le transformateur

381 CouEDH, *Oyal c. Turquie*, n° 4864/05, 23 mars 2010, paras. 71 et 72.

382 CouEDH, *Iliya Petrov c. Belgique*, n° 19202/03, 24 avril 2012.

électrique était sécurisé, alors qu'il était informé des problèmes de sécurité, l'État a commis une violation du droit à la vie (article 2 de la CEDH)[383].

Par ailleurs, les États ont l'obligation positive de prendre en charge le traitement des enfants en situation vulnérable qui sont placés sous la protection des autorités nationales (voir également le chapitre 6 et la section 7.3).

Exemple : l'affaire *Centre de ressources juridiques au nom de Valentin Câmpeanu c. Roumanie*[384] portait sur un adolescent rom séropositif qui souffrait d'un grave handicap intellectuel ainsi que de la tuberculose, d'une pneumonie et d'une hépatite, et qui est décédé à l'âge de 18 ans. Il avait été à la charge de l'État toute sa vie. La CouEDH a détecté de graves lacunes dans le processus décisionnel relatif à l'administration de médicaments et de soins, ainsi qu'un manquement continu de la part du corps médical à son obligation de lui dispenser les soins et les traitements nécessaires. En conséquence, la Cour a conclu à la violation de l'article 2 de la CEDH[385].

Par ailleurs, en l'absence d'une situation d'urgence, la CouEDH a jugé qu'un traitement médical administré sans l'accord parental constituait une violation de l'article 8 de la CEDH.

Exemple : dans l'affaire *Glass c. Royaume-Uni*[386], de la diamorphine avait été administrée à un enfant souffrant de graves handicaps physiques et mentaux malgré l'expression ferme de sa mère de son opposition à un traitement de ce type. La Cour a considéré qu'eu égard aux circonstances de l'enfant la décision des autorités hospitalières de passer outre, en l'absence d'autorisation par un tribunal, à l'objection de la mère au traitement proposé, a violé l'article 8 de la CEDH[387].

383 *Ibid*.

384 CouEDH, *Centre de ressources juridiques au nom de Valentin Câmpeanu c. Roumanie*, [GC], n° 47848/08, 17 juillet 2014. Voir également la description de cet arrêt de la CouEDH au chapitre 7.

385 Voir également la section 7.

386 CouEDH, *Glass c. Royaume-Uni*, n° 61827/00, 9 mars 2004.

387 *Ibid.*, para. 83.

Exemple : dans l'affaire *M.A.K. et R.K. c. Royaume-Uni*[388], une fillette de neuf ans a subi un examen sanguin et des clichés médicaux sans l'accord de ses parents, malgré les instructions explicites de son père de ne pas effectuer d'examen supplémentaire tant que la fillette était seule à l'hôpital. La Cour a conclu qu'en l'absence de toute urgence médicale, ces actes médicaux sans consentement parental constituent une violation de son droit à l'intégrité physique au titre de l'article 8 de la CEDH[389].

Conformément aux articles 6 et 8 de la Convention sur les droits de l'homme et la biomédecine (Convention d'Oviedo)[390], lorsqu'un enfant n'a pas la capacité juridique de consentir à une intervention médicale, celle-ci ne peut être effectuée sans l'autorisation de son représentant, sauf situation d'urgence. Si cette convention n'exige pas le consentement de l'enfant si celui-ci est juridiquement incapable de le donner, elle estime toutefois que l'avis de l'enfant doit être pris en considération « comme un facteur de plus en plus déterminant, en fonction de son âge et de son degré de maturité » (article 6, paragraphe 2).

Par ailleurs, au titre de l'article 11 de la CSE, les parties ont convenu de prendre des mesures visant à prévoir des services de consultation et d'éducation pour ce qui concerne l'amélioration de la santé et le développement du sens de la responsabilité individuelle en matière de santé[391]. L'assistance et les soins médicaux sont garantis par l'article 13 de la CSE à toute personne qui ne dispose pas de ressources suffisantes et qui n'est pas en mesure de se procurer celles-ci par ses propres moyens ou de les recevoir d'une autre source. Enfin, en 2011, le Comité des Ministres a adopté des *Lignes directrices spécifiques au sujet des soins de santé adaptés aux enfants*[392].

Comme l'indiquent les exemples ci-après, le CEDS considère que les enfants migrants résidant irrégulièrement dans un pays ont le droit de bénéficier de soins médicaux au-delà de l'assistance médicale d'urgence. La CSE contient de

388 CouEDH, *M.A.K et R.K. c. Royaume-Uni*, n° 45901/05 et 40146/06, 23 mars 2010.

389 *Ibid.*, para. 79.

390 CdE, Convention pour la protection des droits de l'homme et de la dignité de l'être humain à l'égard des applications de la biologie et de la médecine : Convention sur les droits de l'homme et la biomédecine, STCE n° 164, 1997.

391 En ce qui concerne l'éducation sexuelle et génésique, voir la section consacrée à l'éducation ci-dessus.

392 CdE, Comité des Ministres (2011), *Lignes directrices sur les soins de santé adaptés aux enfants*, 21 septembre 2011.

nombreuses références au droit de l'enfant de bénéficier de services sociaux et de services de soins de santé (articles 11, 12, 13, 14, 16 et 17), valable indépendamment de la situation de l'enfant au regard de la législation sur l'immigration.

Exemple : la décision du CEDS dans l'affaire *Fédération internationale des Ligues des droits de l'homme (FIDH) c. France*[393] concerne l'adoption, en France, d'une loi mettant fin à la dispense de frais médicaux pour les étrangers en situation irrégulière disposant de revenus très faibles et leur imposant le paiement de frais de soins de santé. La CEDS a considéré que les personnes n'ayant pas atteint l'âge de la majorité, y compris les enfants non accompagnés, devaient bénéficier de soins médicaux gratuits.

Exemple : dans l'affaire *Défense des Enfants International (DEI) c. Belgique*[394], le CEDS a conclu à une violation de l'article 17 de la CSE en raison de restrictions de l'assistance médicale fournie aux enfants étrangers en séjour irrégulier. Le Comité a confirmé que « les mineurs migrants en séjour irrégulier ont droit à bénéficier soit de l'aide médicale urgente, soit de soins de santé allant au-delà de l'aide médicale urgente et incluant des soins de santé primaires et secondaires et l'assistance psychologique »[395]. Il a également indiqué que la saturation du réseau d'accueil des mineurs étrangers en séjour irrégulier rendait difficile l'accès aux soins de santé. Le Comité a par ailleurs considéré que l'élimination des causes d'une santé déficiente n'était possible qu'en assurant des logements et des foyers d'accueil aux enfants. Il a donc conclu à l'existence d'une violation de l'article 11, paragraphes 1 et 3, de la CSE due au manque de logements et de foyers d'accueil[396].

La Convention européenne relative au statut juridique du travailleur migrant[397] dispose également que les travailleurs migrants légalement employés sur le territoire d'un autre État, ainsi que leur famille, doivent bénéficier d'un accès égal à l'assistance sociale et médicale (article 19).

393 CEDS, *Fédération internationale des ligues des droits de l'homme (FIDH) c. France*, n° 14/2003, 8 septembre 2004, paras. 35 à 37.

395 *Ibid.*, para. 128.

396 *Ibid.*, paras. 116 à 118.

397 CdE, Convention européenne relative au statut juridique du travailleur migrant, STCE n° 78, 1977.

Dans le droit international, on trouve d'autres dispositions globales sur le droit à la santé à l'article 12 du Pacte international relatif aux droits économiques, sociaux et culturels (ICESCR)[398] ainsi qu'à l'article 24 de la CRC. Ces instruments insistent sur la prévention et le traitement. Le Comité des droits de l'enfant des Nations Unies souligne qu'il importe d'accéder au meilleur niveau de soins de santé et de nutrition durant la petite enfance[399] et d'assurer l'accès des adolescents aux informations sur la santé sexuelle et génésique[400]. Il a également précisé que le droit des enfants à la santé supposait « le droit d'exercer un contrôle sur sa santé et son corps, y compris la liberté de faire des choix responsables dans le domaine de la santé sexuelle et procréative »[401]. Il encourage les États à « envisager la possibilité d'autoriser les enfants à consentir à certains traitements ou interventions médicales sans l'autorisation d'un parent, d'un prestataire de soins ou d'un tuteur, comme le test du VIH ou des services de santé sexuelle et procréative, notamment un enseignement et des conseils concernant la santé sexuelle, la contraception et l'avortement médicalisé »[402].

8.4. Droit au logement

Points clés

- Le droit à un logement adéquat est garanti par l'article 31 de la CSE.
- Le CEDS a déclaré qu'un abri adéquat doit être mis à disposition des enfants aux enfants qui se trouvent en situation irrégulière dans un pays et que les conditions de vie dans un abri doit assurer le respect de la dignité humaine.
- Selon la CouEDH, un logement inadéquat ne justifie pas le placement en institution publique.

398 ONU, Assemblée générale, Pacte international relatif aux droits économiques, sociaux et culturels (ICESCR), 16 décembre 1966, Vol. 993, p. 3.

399 ONU, Comité des droits de l'enfant (2006), *Observation générale n° 7 (2005), Mise en œuvre des droits de l'enfant dans la petite enfance*, CRC/C/GC/7/Rev.1, para. 27.

400 ONU, Comité des droits de l'enfant (2003), *Observation générale n° 4 (2003), La santé et le développement de l'adolescent dans le contexte de la Convention relative aux droits de l'enfant*, CRC/GC/2003/4, 1er juillet 2003, para. 28.

401 ONU, Comité des droits de l'enfant (2013), *Observation générale n° 15 (2013) sur le droit de l'enfant de jouir du meilleur état de santé possible (art. 24)*, CRC/C/GC/15, 29 mai 2013, para. 24.

402 *Ibid.*, para. 31.

Dans le droit de l'UE, l'article 34, paragraphe 3, de la Charte des droits fondamentaux de l'UE indique que le droit à une aide au logement s'inscrit dans la lutte contre l'exclusion sociale et la pauvreté. Aux termes de la directive relative à l'égalité raciale, le logement fait partie des produits et services mis à la disposition du public dont l'accès et l'offre doivent être assurés de manière non discriminatoire[403]. L'égalité de traitement en matière d'allocations de logement concerne les résidents de longue durée. Toutefois, le droit de l'UE vise à garantir, par exemple, en ce qui concerne le regroupement familial, que les membres de la famille ne constituent pas une charge pour les régimes d'aide sociale des États membres[404]. Conformément à la directive relative au regroupement familial, les demandes de regroupement familial doivent prouver qu'un regroupant valable (c'est-à-dire un ressortissant de pays tiers titulaire d'un titre de séjour d'une durée de validité supérieure ou égale à un an et ayant une perspective fondée d'obtenir un droit de séjour permanent) possède un logement considéré comme normal pour une famille de taille comparable dans la même région. Ce logement doit répondre aux normes générales de salubrité et de sécurité en vigueur dans l'État membre concerné[405].

Dans le droit du CdE, la CEDH ne prévoit pas de droit à un logement, mais si un État décide de fournir un logement, il doit le faire de manière non discriminatoire.

Exemple : dans l'affaire *Bah c. Royaume-Uni*[406] la requérante, qui résidait légalement au Royaume-Uni, a reçu l'autorisation d'être rejointe par son fils à condition que celui-ci n'ait pas recours à l'aide publique. Peu après l'arrivée de son fils, la requérante a demandé une aide pour trouver un logement. Toutefois, son fils étant soumis à la police des étrangers, elle s'est vu refuser la priorité à laquelle son statut de personne involontairement sans domicile avec enfant mineur lui aurait normalement donné droit. Les autorités l'ont finalement aidée à trouver un nouveau logement et lui ont ensuite fourni un logement social. La requérante s'est plainte du caractère discriminatoire du refus de lui accorder la priorité. La CouEDH a estimé qu'il était légitime de définir des critères pour l'allocation de ressources limitées

403 Directive (2000/43/CE) du Conseil du 29 juin 2000 relative à la mise en œuvre du principe de l'égalité de traitement entre les personnes sans distinction de race ou d'origine ethnique, art. 3.

404 Voir également FRA et CouEDH (2014), p. 217-218.

405 Directive 2003/86/CE du Conseil du 22 septembre 2003 relative au droit de regroupement familial (directive relative au regroupement familial), art. 7, para. 1, point a).

406 CouEDH, *Bah c. Royaume-Uni*, n° 56328/07, 27 septembre 2011.

telles que les logements sociaux, pour autant que ces critères ne soient ni arbitraires, ni discriminatoires. Le refus de priorité dont elle a fait l'objet n'avait rien d'arbitraire, puisqu'elle avait fait venir son fils dans l'État membre en pleine connaissance de la condition à laquelle son entrée était subordonnée. Par ailleurs, la requérante n'a jamais été réellement sans domicile et d'autres obligations légales auraient contraint l'autorité locale de prêter assistance à elle et à son fils si le risque de devenir sans domicile s'était concrétisé. La Cour a donc conclu à l'absence de violation de l'article 14 lu en combinaison avec l'article 8 de la CEDH.

La CouEDH entend également des affaires d'éviction de familles roms de sites de stationnement de caravanes[407]. La CouEDH a indirectement traité de la question de la qualité du logement en indiquant qu'un logement inadéquat ne justifiait pas le placement d'enfants en institution publique[408] (voir également les sections 5.2. et 6.2.).

Le droit à un logement d'un niveau suffisant est garanti par l'article 31 de la CSE. D'après le CEDS, « [u]n logement d'un niveau suffisant signifie un logement salubre en termes d'hygiène et de santé, c'est-à-dire qui dispose de tous les éléments de confort essentiels tels que l'eau, le chauffage, l'évacuation des ordures ménagères, les installations sanitaires, l'électricité et doit être doté aussi des structures de sécurité requises saines, non surpeuplé et assorti d'une garantie légale de maintien dans les lieux »[409]. Les évictions sont autorisées si elles sont justifiées, réalisées dans des conditions respectant la dignité des personnes et si des solutions de relogement sont proposées[410]. Les conditions de vie dans un abri « doivent respecter la dignité des personnes » : elles doivent « répondre aux exigences de sureté, de santé et d'hygiène, disposer des éléments de confort essentiels tels que l'accès à l'eau et un chauffage et un éclairage suffisants. Une autre exigence fondamentale est la sûreté des alentours immédiats »[411].

407 CouEDH, *Connors c. Royaume-Uni*, n° 66746/01, 27 mai 2004.

408 CouEDH, *Wallová et Walla c. République tchèque*, n° 23848/04, 26 octobre 2006, paras. 73-74 ; CouEDH, *Havelka et autres c. République tchèque*, n° 23499/06, 21 juin 2007, paras. 57-59.

409 CEDS, *Défense des Enfants International (DEI) c. Pays-Bas*, n° 47/2008, 20 octobre 2009, para. 43.

410 CEDS, *Centre européen pour les droits des Roms (ERRC) c. Italie*, n° 27/2004, 7 décembre 2005, para. 41 ; CEDS, *Médecins du Monde – International c. France*, n° 67/2011, 11 septembre 2012, paras. 74, 75 et 80.

411 CEDS, *Défense des Enfants International (DEI) c. Pays-Bas*, n° 47/2008, 20 octobre 2009, para. 62.

En ce qui concerne le logement des enfants étrangers en situation irrégulière, le CEDS indique que le fait de n'offrir aucun hébergement, de même que l'accueil inapproprié dans des hôtels, constituent une violation de l'article 17, paragraphe 1, de la CSE[412]. Par ailleurs, au titre de l'article 31, paragraphe 2, de la CSE relatif à la prévention de l'état de sans-abri, les États sont tenus de fournir un abri adéquat aux enfants en situation irrégulière sans recourir au placement en détention[413].

8.5. Droit à un niveau de vie suffisant et droit à la sécurité sociale

Points clés

- L'accès aux allocations familiales et au congé parental doit être non-discriminatoire.
- Dans le droit de l'UE, la protection sociale des jeunes travailleurs en contrat d'apprentissage ne doit pas être faible au point de les exclure de la protection générale.
- Au titre de la CSE, la suspension des allocations familiales en cas d'absentéisme scolaire constitue une restriction disproportionnée du droit de la famille à une protection économique, sociale et juridique.

Dans le droit de l'UE, l'article 34, paragraphe 1, de la Charte des droits fondamentaux de l'UE dispose que « [l]'Union reconnaît et respecte le droit d'accès aux prestations de sécurité sociale et aux services sociaux » dans les cas correspondant aux branches classiques de la sécurité sociale (maternité, maladie, accidents du travail, dépendance ou vieillesse et perte d'emploi). Le droit à la sécurité sociale concerne toute personne résidant et circulant légalement dans l'UE. Le droit à une aide sociale est reconnu afin d'assurer une existence digne à tous ceux qui ne disposent pas de ressources suffisantes et de lutter contre l'exclusion sociale et la pauvreté. Tous ces aspects sont définis par les « règles établies par le droit de l'Union et les législations et pratiques nationales » (article 34, paragraphe 1, de la Charte).

412 CEDS, *Défense des Enfants International (DEI) c. Belgique*, n° 69/2011, 23 octobre 2012, paras. 82 et 83. Voir également FRA (2010), p. 33.

413 CEDS, *Défense des Enfants International (DEI) c. Pays-Bas*, n° 47/2008, 20 octobre 2009, para. 64.

Selon la CJUE, lorsque les propres ressortissants d'un État membre ne doivent uniquement résider dans l'État membre pour accéder à une allocation d'éducation, il ne peut être exigé des ressortissants d'autres États membres qu'ils présentent un permis de séjour officiel pour accéder à la même prestation[414]. Le refus du congé parental à certaines catégories de personnes, telles que les mères commanditaires ayant eu un enfant grâce à une convention de mère porteuse, est discriminatoire.[415] Il en va de même pour les fonctionnaires de sexe masculin qui se voient refuser un congé parental au motif que leur épouse ne travaille pas ou n'exerce aucune profession, à moins que, en raison d'une maladie grave ou d'un handicap, elle soit jugée comme étant dans l'incapacité de faire face aux besoins liés à l'éducation d'un enfant[416]. De même, les États membres doivent mettre en place un régime de congé parental spécifique pour les naissances de jumeaux, afin de faire en sorte que ces parents reçoivent une aide adaptée à leurs besoins. Pour ce faire, ils peuvent baser la durée du congé parental sur le nombre d'enfants nés et prévoir d'autres mesures telles qu'une assistance matérielle ou une aide financière[417].

Dans le droit du CdE, la CouEDH a jugé une affaire de discrimination présumée en ce qui concerne l'octroi d'un congé parental et d'allocations parentales en Russie.

> Exemple : dans l'affaire *Konstantin Markin c. Russie*[418], un militaire de l'armée russe s'est vu refuser un congé parental, alors que les femmes militaires ont droit à ce congé. De l'avis de la Cour, l'exclusion des militaires du droit au congé parental ne pouvait pas être raisonnablement justifiée. Ni le fait qu'il s'agisse de forces armées, ni les arguments relatifs de menace pour l'efficacité opérationnelle de l'armée, ni les arguments relatifs au rôle particulier joué par les femmes dans l'éducation des enfants ou aux traditions prévalant dans le pays n'ont été considérées comme des justifications à cette différence de traitement. La Cour a conclu à l'existence d'une violation de l'article 14 lu en combinaison avec l'article 8 de la CEDH.

418 CouEDH, *Konstantin Markin c. Russie* [GC], n° 30078/06, 22 mars 2012.

D'autres vastes dispositions relatives au droit à la sécurité sociale, au droit à l'assistance sociale et médicale et au droit au bénéfice des services sociaux figurent aux articles 12 à 14 de la CSE. L'article 16 de la CSE indique explicitement que les allocations sociales et familiales constituent un moyen de promouvoir la protection économique, juridique et sociale de la vie de famille. L'article 30 de la CSE établit le droit à la protection contre la pauvreté et l'exclusion sociale. Certaines créances de sécurité sociale peuvent relever de l'article 1 du Protocole n° 1 à la CEDH, pour autant que la législation nationale génère un intérêt patrimonial en assurant le paiement de plein droit d'une prestation sociale, qu'il soit subordonné ou non au paiement préalable de contributions[419].

L'article 12 de la CSE oblige les États à établir ou à maintenir un régime de sécurité sociale, ainsi qu'à s'efforcer de le porter progressivement à un niveau plus haut.

L'article 16 de la CSE exige des États qu'ils promeuvent la protection économique, juridique et sociale de la vie de famille en prenant les mesures appropriées, essentiellement des prestations sociales et familiales, octroyées dans le cadre du régime de sécurité sociale et disponibles universellement ou sur la base des ressources. Ces prestations doivent représenter un complément de revenu adéquat pour un nombre significatif de familles. Le CEDS évalue l'adéquation des prestations familiales (parentales) en se basant sur le revenu équivalent médian (Eurostat)[420]. D'après lui, l'absence totale de système général de prestations familiales n'est pas conforme à la CSE[421].

Le CEDS admet néanmoins que le paiement des allocations familiales soit subordonné au droit de séjour de l'enfant[422]. D'après lui, l'introduction d'une protection très limitée contre les risques économiques et sociaux pour les enfants (15-18 ans) en contrat spécial d'apprentissage (ne leur donnant droit qu'à des prestations en nature au titre de l'assurance maladie et à une assurance contre les accidents du travail à un taux de 1 %) a pour effet d'exclure une catégorie distincte de travailleurs (les mineurs) de la « protection offerte par le système de sécurité sociale dans son ensemble », ce qui constitue une violation de

422 CEDS (2007), Conclusions XVIII-1 - Introduction générale, p. 11.

l'obligation imposée aux États de porter progressivement le régime de sécurité sociale à un niveau plus haut[423].

La suspension des allocations familiales en cas d'absentéisme scolaire constitue également une restriction disproportionnée du droit de la famille à une protection économique, sociale et juridique.

> Exemple : dans le cadre d'une plainte déposée contre la France, le Comité européen d'action spécialisée pour l'enfant et la famille dans leur milieu de vie (EUROCEF) a fait valoir que la suspension des allocations familiales en tant que mesure de lutte contre l'absentéisme scolaire constituait une violation du droit des familles à une protection sociale, juridique et économique au titre de l'article 16 de la CSE. En jugeant la mesure disproportionnée par rapport à l'objectif poursuivi, le Comité a noté que « la mesure contestée de suspension avec éventuelle suppression des allocations familiales fait peser exclusivement sur les parents toute la responsabilité d'assurer le but de réduire l'absentéisme scolaire, et augmente la vulnérabilité économique et sociale des familles affectées »[424].

La Convention européenne relative au statut juridique du travailleur migrant[425] dispose que les travailleurs migrants légalement employés dans un autre État ainsi que leur famille, doivent bénéficier d'un accès égal à la sécurité sociale (article 18) et aux autres « services sociaux » facilitant leur accueil dans l'État de destination (article 10). De même, la Convention européenne de sécurité sociale protège les droits des réfugiés et des apatrides à bénéficier du système de sécurité sociale de l'État d'accueil (y compris des allocations familiales pour les enfants)[426].

Dans le droit international, le droit à un niveau de vie suffisant est garanti par l'article 11 de l'ICESCR ainsi que par l'article 27 de la Convention relative aux droits de l'enfant.

L'UE est compétente pour légiférer dans le domaine de la migration et de l'asile. Les dispositions relatives aux enfants migrants régissent toute une série de situations migratoires, telles que la migration professionnelle à long terme, l'asile et la protection subsidiaire et traitent également du cas des migrants en situation irrégulière. En plus de la protection accordée aux enfants migrants par l'article 24 de la Charte des droits fondamentaux de l'UE, les articles 18 et 19 de la Charte traitent du droit d'asile et du droit à la protection en cas d'éloignement, d'expulsion ou d'extradition. L'UE a également accordé son attention aux besoins particuliers des enfants non accompagnés, notamment en ce qui concerne les aspects juridiques, tels que la tutelle et la représentation légales, la détermination de l'âge, la recherche de la famille et le regroupement familial, les procédures d'asile, le placement en rétention et l'expulsion, de même que les aspects ayant trait aux conditions de vie des enfants, notamment le logement, les soins de santé, l'éducation et la formation, la religion, les normes et valeurs culturelles, les loisirs et divertissements, les interactions sociales et les expériences de racisme[427].

Dans le système du CdE, quatre conventions soutiennent particulièrement les droits des enfants migrants dans des contextes différents : la CEDH, la CSE, la Convention européenne relative au statut juridique du travailleur migrant et la Convention européenne sur la nationalité. Le présent chapitre s'intéresse essentiellement à l'application des dispositions de la CEDH, notamment de son article 3 (protection contre les traitements inhumains ou dégradants), son article 4 (privation de liberté) et son article 8 (droit au respect de la vie privée et familiale), seul ou en combinaison avec l'article 14 (non-discrimination). Ces dispositions servent à défendre les droits des enfants migrants, réfugiés et demandeurs d'asile et des membres de leur famille en matière de regroupement familial, d'accès à la justice et de résidence dans l'État d'accueil.

Sur le plan international, plusieurs dispositions de la CRC soutiennent les droits de l'enfant dans le contexte de la migration et de l'asile et ont orienté l'élaboration de mesures juridiques au niveau européen. En particulier, l'article 7 protège le droit de l'enfant à l'enregistrement de sa naissance, à la nationalité et aux soins parentaux ; l'article 8 protège le droit de l'enfant à l'identité, y compris à la nationalité, au nom et aux relations familiales ; l'article 9 garantit que les enfants séparés gardent contact avec leurs deux parents lorsque cela répond à leur intérêt supérieur ; et enfin, l'article 22 accorde aux enfants réfugiés le droit à une protection et à une aide spéciales. Par ailleurs, la Convention des Nations Unies relative

427 Pour plus d'informations, voir FRA (2010) ; FRA (2011a), p. 27-38 ; FRA (2011b), p. 26-30.

au statut des réfugiés[428], ainsi que son Protocole de 1967, sont universellement considérés comme la clé de voûte de la protection internationale des réfugiés.

Les sections suivantes sont consacrées à l'entrée et au séjour (section 9.1) ; à la détermination de l'âge (section 9.2) ; au regroupement familial pour les enfants séparés (section 9.3) ; au placement en détention (section 9.4) ; à l'expulsion (section 9.5) et à l'accès à la justice (section 9.6).

9.1. Entrée et séjour

Points clés

- Les ressortissants de l'UE disposent du droit à la liberté de circulation dans l'UE.
- Les décisions relatives à l'entrée et au séjour d'un enfant doivent être prises dans le cadre des mécanismes et procédures appropriés et dans l'intérêt supérieur de l'enfant.

Dans le droit de l'UE, la nature et la portée des droits des enfants varient considérablement selon la nationalité de l'enfant et de ses parents et selon que l'enfant migre accompagné de ses parents ou non.

La migration des ressortissants de l'UE est réglementée par plusieurs instruments juridiques. Les droits accordés aux ressortissants de l'UE sont vastes et visent à favoriser une mobilité optimale dans l'UE. Premièrement, l'article 21 du TFUE dispose que les citoyens de l'UE et les membres de leur famille ont le droit de circuler et de résider librement sur le territoire des États membres de l'UE. En outre, à leur arrivée dans l'État d'accueil, ils ont le droit d'être traités à égalité avec les ressortissants nationaux en ce qui concerne leur accès au marché du travail et leurs conditions de travail, les prestations et aides sociales, l'école, les soins de santé, etc.[429] L'article 45 de la Charte des droits fondamentaux de l'UE garantit également la liberté de circulation des citoyens de l'UE.

428 ONU, Assemblée générale, Convention relative au statut des réfugiés, 28 juillet 1951, Recueil des traités des Nations Unies, Vol. 189, p. 137.

429 Certaines restrictions ont été imposées aux migrants en provenance de Croatie, le dernier État à avoir rejoint l'UE, pour une période de transition jusqu'à juin 2015, avec la possibilité pour les États membres d'étendre cette période jusqu'en 2020.

En outre, les droits des enfants qui circulent avec des parents, ou avec une personne qui en a la charge, ressortissants de l'UE sont également régis par la directive relative à la liberté de circulation[430], disposant que les membres de la famille ont le droit d'entrer et de résider sur le territoire de l'État d'accueil en même temps que le migrant de l'UE initial ou à la suite de l'installation de celui-ci (article 5, paragraphe 1). Aux fins de cet instrument, le terme « membres de la famille » inclut tout enfant descendant direct du migrant de l'UE ou du conjoint ou partenaire, pour autant qu'il ait moins de 21 ans ou soit « à charge » (article 2, paragraphe 2). Les membres de la famille peuvent être ressortissants de l'UE ou de pays tiers, pour autant que le migrant initial avec lequel ils ont emménagé soit un citoyen de l'UE. Pendant les trois premiers mois suivant son installation, le droit de séjour de la famille est inconditionnel. Par la suite, les citoyens de l'UE souhaitant que leurs enfants restent avec eux dans l'État doivent prouver qu'ils disposent de ressources financières suffisantes et de l'assurance maladie nécessaire pour subvenir à leurs besoins (article 7). Les enfants et les autres membres de la famille obtiennent automatiquement un droit de séjour permanent après une période de cinq années consécutives de résidence dans l'État d'accueil auprès du citoyen de l'UE (article 16, paragraphe 2, et article 18). Ils ne sont alors plus soumis à des conditions en matière de ressources ou d'assurance-maladie.

La liberté de circulation des ressortissants de pays tiers n'appartenant pas à la famille d'un migrant de l'UE est soumise à davantage de restrictions. Ce domaine est réglementé en partie par le droit de l'UE et en partie par les législations nationales en matière d'immigration.

Dans le cadre des procédures de protection internationale, les enfants sont considérés comme des « personnes vulnérables » dont la situation spécifique doit être prise en compte par les États membres au moment d'appliquer le droit de l'UE[431]. Cela impose aux États de détecter et de prendre toute mesure particulière dont les enfants demandeurs d'asile, en particulier, pourraient avoir besoin lorsqu'ils entrent sur le territoire de l'État d'accueil. L'article 24 de la Charte des droits fondamentaux de l'UE s'applique aux exigences d'entrée et de séjour de l'acquis de l'UE en ma-

430 Il est à noter que les dispositions pertinentes de la directive s'appliquent également dans l'EEE. Voir également l'accord sur l'Espace économique européen, 2 mai 1992, troisième partie, Libre circulation des personnes, des services et des capitaux, ainsi que l'accord entre la Communauté européenne et ses États membres, d'une part, et la Confédération suisse, d'autre part, sur la libre circulation des personnes, signé au Luxembourg le 21 juin 1999, entré en vigueur le 1er juin 2002, JO 2002 L 114, p. 6.

431 Voir en particulier l'article 21 de la directive 2013/33/UE relative aux conditions d'accueil et l'article 3, paragraphe 9, de la directive 2008/115/CE sur le retour.

tière d'asile dans la mesure où celui-ci concerne les enfants. Il exige que dans tous les actes relatifs aux enfants, qu'ils soient accomplis par des autorités publiques ou des institutions privées, les États membres veillent à ce que l'intérêt supérieur de l'enfant soit une considération primordiale. Plus précisément, le principe de l'intérêt supérieur sous-tend la mise en œuvre de la directive 2013/32/UE relative à des procédures communes pour l'octroi et le retrait de la protection internationale (directive sur les procédures d'asile)[432] et l'application du règlement établissant les critères et mécanismes de détermination de l'État membre responsable de l'examen d'une demande de protection internationale présentée dans l'un des États membres par un ressortissant de pays tiers ou un apatride (règlement de Dublin) dans la mesure où des enfants sont concernés[433]. Les deux textes contiennent également des garanties spéciales pour les enfants non accompagnés, relatives notamment à leur représentation légale. Le règlement (CE) n° 562/2006 relatif au code frontières Schengen dispose que les garde-frontières doivent s'assurer que les personnes accompagnant des enfants sont investies de l'autorité parentale à leur égard, notamment lorsque l'enfant n'est accompagné que par un seul adulte et qu'il y a des raisons sérieuses de croire qu'il a été illicitement soustrait à la garde de la ou des personne(s) qui détiennent légalement l'autorité parentale à son égard. Dans ce cas, le garde-frontière doit effectuer une recherche plus approfondie afin de déceler d'éventuelles incohérences ou contradictions dans les informations données. Lorsque des enfants voyagent non accompagnés, les garde-frontières doivent s'assurer, par une vérification approfondie des documents de voyage et des autres documents, que les enfants ne quittent pas le territoire contre la volonté de la ou des personne(s) investie(s) de l'autorité parentale à leur égard[434].

En vertu du droit du CdE, les États ont le droit, en vertu du droit international et sans préjudice des obligations qu'ils ont contractées dans les traités, y compris la CEDH, de contrôler l'entrée, le séjour et l'éloignement des ressortissants étrangers. Le droit au respect de la vie privée et familiale consacré à l'article 8 de la CEDH est souvent invoqué comme une garantie contre l'expulsion lorsqu'il est question

432 Directive 2013/32/UE du Parlement européen et du Conseil du 26 juin 2013 relative à des procédures communes pour l'octroi et le retrait de la protection internationale (refonte), JO 2013 L 180, p. 60, art. 25, para. 6.

433 Règlement (UE) n° 604/2013 du Parlement européen et du Conseil du 26 juin 2013 établissant les critères et mécanismes de détermination de l'État membre responsable de l'examen d'une demande de protection internationale introduite dans l'un des États membres par un ressortissant de pays tiers ou un apatride (refonte), JO 2013 L 180/31-180/59, art. 6.

434 Règlement (CE) n° 562/2006 du Parlement européen et du Conseil du 15 mars 2016 établissant un code communautaire relatif au régime de franchissement des frontières par les personnes (code frontières Schengen), annexe VII, 6.

d'enfants qui, faute de quoi, auraient été jugés comme n'ayant pas besoin de protection internationale, notamment de protection subsidiaire. Des violations de l'article 8 ont été constatées dans des affaires impliquant des enfants, la séparation forcée de membres de la famille proche étant susceptible d'avoir des répercussions profondes sur leur éducation, leur stabilité sociale et affective, et leur identité[435].

9.2. Détermination de l'âge[436]

Points clés

- Les procédures de détermination de l'âge doivent tenir compte des droits de l'enfant.
- La détermination de l'âge désigne les procédures par lesquelles les autorités tentent d'établir l'âge légal d'un migrant afin de déterminer les procédures et règles applicables en matière d'immigration.

Dans le droit de l'UE, l'article 25, paragraphe 5, de la directive sur les procédures d'asile permet aux États membres d'avoir recours à des examens médicaux, mais exige que ceux-ci soient effectués « dans le plein respect de la dignité de la personne, [soient] le moins invasif[s] possible et [soient] réalisé[s] par des professionnels de la santé qualifiés ». Cette disposition exige également que les personnes soient informées dans une langue qu'elles comprennent de la possibilité que cette évaluation soit effectuée et que leur consentement à l'examen médical soit obtenu. Un refus de se soumettre à une détermination de l'âge ne peut entraîner le rejet de la demande de protection internationale.

Les méthodes de détermination de l'âge appliquées dans l'UE varient considérablement, que ce soit sur le plan de leur nature ou de leur portée[437]. Au Royaume-Uni, par exemple, le pouvoir judiciaire a révisé les procédures nationales d'évaluation de l'âge et a défini, dans le cadre de l'affaire *Merton*, les exigences de procédure minimales à respecter lors de la détermination de l'âge d'un individu affirmant

435 CouEDH, *Şen c. Pays-Bas*, n° 31465/96, 21 décembre 2001 ; CouEDH, *Tuquabo-Tekle et autres c. Pays-Bas*, n° 60665/00, 1er décembre 2005.

436 Voir également FRA et CouEDH (2014), section 9.1.2.

437 Pour un aperçu des différentes méthodes appliquées dans chaque pays, voir les orientations du Bureau européen d'appui en matière d'asile sur les pratiques d'évaluation de l'âge en Europe, Luxembourg, 2014. Voir également FRA (2010), p. 53-55.

être un enfant non accompagné[438]. Ces exigences incluent notamment le droit du demandeur d'asile d'être informé des motifs de rejet de sa demande ou des objections de la personne ayant conduit l'entretien[439]. Les tribunaux nationaux ont également affirmé la nécessité d'appliquer le principe du bénéfice du doute dans les affaires de détermination de l'âge, bien que certains tribunaux nationaux ont interprété ce principe comme étant un simple « examen bienveillant des éléments de preuve » et non pas comme un principe formel de « bénéfice du doute »[440].

Le droit du CdE ne contient aucune disposition spécifique ou jurisprudence de la CEDH relative aux droits de l'enfant dans le cadre de procédures de détermination de l'âge. Toutefois, l'utilisation de pratiques particulièrement invasives à cette fin peut déclencher l'application des articles 3 ou 8 de la CEDH. L'article 3 a été interprété de façon à inclure une grande diversité de scénarios pouvant être considérés comme inhumains ou dégradants, y compris des examens physiques invasifs pratiqués sur des enfants[441]. Selon l'article 8 appliqué à un contexte d'immigration, les autorités peuvent légitimement interférer avec le droit d'un enfant au respect de la vie privée et réaliser des évaluations de son âge si la loi le permet et si ces évaluations sont nécessaires pour protéger l'un des buts légitimes énoncés à l'article 8, paragraphe 2, de la CEDH.

Dans le cadre du droit international, l'article 8 de la Convention relative aux droits de l'enfant oblige les États à respecter le droit de l'enfant à définir sa propre identité. Cette obligation implique celle d'aider l'enfant à faire valoir son identité, ce qui peut nécessiter la confirmation de son âge. Toutefois, les procédures de détermination de l'âge ne doivent être utilisées qu'en dernier recours.

En tout état de cause, les procédures nationales relatives à la détermination de l'âge doivent reposer sur le principe de l'intérêt supérieur. Selon le Comité des droits de l'enfant des Nations Unies, la détermination de l'âge doit prendre en considération l'apparence physique de l'enfant, mais aussi son degré de maturité psychologique. La détermination de l'âge doit être menée scientifiquement, dans le souci de la sécurité de l'enfant, de manière adaptée à son statut d'enfant

et à son sexe et équitablement, afin de prévenir tout risque de violation de l'intégrité physique de l'enfant. Cette détermination doit en outre se faire avec tout le respect dû à la dignité humaine[442].

9.3. Regroupement familial pour les enfants séparés[443]

Points clés

- Les dispositions adoptées au niveau européen ont pour objectif principal de permettre aux enfants de retrouver leurs parents en toute sécurité, que ce soit dans leur pays d'accueil ou leur pays d'origine.
- Au moment de déterminer quels membres de sa famille l'enfant doit rejoindre, la préférence sera donnée à ses parents et/ou aux personnes qui ont la charge de l'enfant.
- Les affaires de regroupement familial doivent être traitées en fonction du principe de l'intérêt supérieur de l'enfant.

En vertu du droit de l'UE, le principal instrument est la directive relative au regroupement familial, qui exige des États membres qu'ils autorisent l'entrée et le séjour sur leur territoire des ressortissants de pays tiers qui sont les parents d'un enfant non accompagné, lorsqu'il n'est pas dans l'intérêt supérieur de l'enfant de les rejoindre à l'étranger. En l'absence de parents, les États membres peuvent à leur entière discrétion autoriser l'entrée et le séjour du tuteur légal de l'enfant ou de tout autre membre de sa famille[444]. La définition de « famille » et les droits qui sont rattachés à ce terme sont dès lors plus généreux dans le contexte des enfants non accompagnés que pour la plupart des autres catégories d'enfants migrants.

En ce qui concerne les enfants demandeurs d'asile, la directive « qualification » souligne la nécessité de veiller dans la mesure du possible à ce que les enfants non accompagnés soient placés auprès de parents adultes dans l'État d'accueil, à ce que les fratries ne soient pas séparées et à ce que les membres de la famille

442 ONU, Comité des droits de l'enfant (2005), *Observation générale n° 6 (2005), Traitement des enfants non accompagnés et des enfants séparés en dehors de leur pays d'origine*, CRC/GC/2005/6, 1er septembre 2005, (V)(a)(31)(A).

444 Respectivement l'article 10, para. 3, points a) et b).

absents soient localisés le plus tôt possible, d'une manière sensible et en veillant à leur sécurité. La directive relative aux conditions d'accueil contient des dispositions similaires pour les enfants non accompagnés qui n'ont pas encore obtenu le statut de réfugié (article 24).

La directive 2001/55/CE du Conseil relative à des normes minimales pour l'octroi d'une protection temporaire en cas d'afflux massif de personnes déplacées et à des mesures tendant à assurer un équilibre entre les efforts consentis par les États membres pour accueillir ces personnes et supporter les conséquences de cet accueil (directive relative à la protection temporaire) cherche également à obtenir le plus tôt possible le regroupement des membres d'une même famille (y compris les enfants) ayant été séparés à la suite d'une évacuation soudaine de leur pays d'origine (article 15)[445]. Toutefois, cette directive n'a encore jamais été appliquée à ce jour. En effet, pour qu'elle soit « déclenchée », une décision du Conseil est nécessaire, et aucune décision de ce type n'a encore été prise.

L'article 24, paragraphe 3, de la directive sur les conditions d'accueil (refonte) exige également des États membres qu'ils commencent si nécessaire à rechercher les membres de la famille de l'enfant non accompagné, le cas échéant avec l'aide d'organisations internationales ou d'autres organisations compétentes dans les plus brefs délais après l'introduction d'une demande de protection internationale, tout en protégeant l'intérêt supérieur de l'enfant. Dans les cas où la vie ou l'intégrité physique d'un enfant ou de ses parents proches pourraient être menacées, en particulier s'ils sont restés dans le pays d'origine, il convient de faire en sorte que la collecte, le traitement et la diffusion d'informations concernant ces personnes soient effectués à titre confidentiel, pour éviter de compromettre leur sécurité. Par ailleurs, conformément à l'article 31, paragraphe 5, de la directive « qualification » (refonte), l'octroi d'une protection internationale à l'enfant ne doit pas interférer avec le début ou la poursuite du processus de recherche.

Le règlement de Dublin dispose par ailleurs que lorsqu'un enfant non accompagné a un ou plusieurs membres de sa famille qui habitent dans un autre État membre et qui peuvent le prendre en charge, les États membres sont tenus, dans la mesure du possible, de réunir l'enfant avec ses proches, à moins que ce ne soit contraire à son intérêt supérieur. Le règlement prévoit en outre l'obligation de rechercher les

445 Directive 2001/55/CE du Conseil du 20 juillet 2001 relative à des normes minimales pour l'octroi d'une protection temporaire en cas d'afflux massif de personnes déplacées et à des mesures tendant à assurer un équilibre entre les efforts consentis par les États membres pour accueillir ces personnes et supporter les conséquences de cet accueil, JO 2001 L 2012.

membres de la famille de l'enfant sur le territoire des États membres, tout en protégeant l'intérêt supérieur de l'enfant (article 6). Notons également que la directive relative aux conditions d'accueil impose l'obligation de commencer à rechercher les membres de la famille de l'enfant non accompagné, si nécessaire avec l'aide d'organisations internationales ou d'autres organisations compétentes (article 24). Ce dernier type d'aide est également prévu dans le règlement de Dublin (article 6).

Le principe de l'intérêt supérieur doit toujours être appliqué au moment de prendre une décision sur le regroupement familial. Par exemple, les parents doivent être en mesure de prouver qu'ils sont aptes à exercer leurs obligations parentales dans l'intérêt de l'enfant. Les tribunaux nationaux jugent illégal le retour de l'enfant dans son pays d'origine lorsque les autorités n'ont pas pu recueillir de preuves attestant de l'existence de dispositions adéquates prises pour l'accueil et la prise en charge de l'enfant dans ce pays (directive « retour », article 10, paragraphe 2).

Dans le droit du CdE, l'article 8 de la CEDH n'octroie pas aux parents migrants et à leurs enfants le droit absolu de choisir où ils veulent vivre. Les autorités nationales peuvent légitimement expulser ou refuser l'entrée de membres de la famille de l'enfant sur leur territoire lorsqu'il n'existe aucun obstacle insurmontable les empêchant de bâtir une vie familiale ailleurs[446]. Les décisions de ce type doivent toujours être proportionnées aux préoccupations d'ordre public plus larges, y compris la volonté d'expulser ou d'empêcher l'entrée d'un proche ayant été impliqué dans une activité criminelle.

Exemple : dans l'affaire *Şen c. Pays-Bas*, la CouEDH a confirmé qu'au moment de trouver un équilibre entre les droits de l'enfant/de la famille et les intérêts d'ordre public plus larges, trois facteurs clés devaient être pris en considération : l'âge des enfants, leur situation dans le pays d'origine et le degré auquel ils dépendent réellement de leurs parents.

Exemple : l'affaire *Jeunesse c. Pays-Bas*[447] traitait du refus des autorités néerlandaises d'autoriser une femme surinamaise mariée à un ressortissant néerlandais, avec lequel elle avait eu trois enfants, à résider aux Pays-Bas au motif de sa vie familiale dans le pays. La CouEDH a considéré que les autorités n'avaient pas tenu suffisamment compte des consé-

447 CouEDH, *Jeunesse c. Pays-Bas*, n° 12738/10, 3 octobre 2014.

quences de leur refus sur les enfants de la requérante et l'intérêt supérieur de ceux-ci. La Cour a conclu à une violation de l'article 8 de la CEDH au motif qu'un juste équilibre n'avait pas été ménagé entre l'intérêt personnel de la requérante et de sa famille à maintenir leur vie familiale aux Pays-Bas et les intérêts d'ordre public du gouvernement relatifs au contrôle de l'immigration.

Dans le droit international, un enfant a le droit de ne pas être séparé de sa famille à moins que la séparation ne soit jugée être dans son intérêt supérieur (article 9, paragraphe 1, de la CRC). L'article 10 de la CRC dispose qu'un enfant dont les parents vivent dans des pays différents doit avoir le droit de circuler entre ces pays afin de rester en contact avec ses deux parents ou pour les rejoindre, selon le droit national en matière d'immigration. Le principe de l'intérêt supérieur consacré à l'article 3 de la CRC est celui sur lequel reposent toutes les décisions relatives au regroupement familial avec un enfant ou un enfant non accompagné. [448]

9.4. Détention

Points clés

- Aux termes du droit européen, le placement d'enfants en détention dans un contexte d'immigration n'est autorisé qu'à titre de mesure de dernier ressort.
- Les autorités nationales sont tenues de placer les enfants dans des lieux d'hébergement de substitution appropriés.

Dans le droit de l'UE, l'article 11 de la directive sur les conditions d'accueil (refonte) dispose que les enfants ne peuvent être placés en rétention qu'à titre de mesure de dernier ressort et uniquement après qu'il a été établi que d'autres mesures moins coercitives ne peuvent être appliquées efficacement. Ce placement en rétention doit être d'une durée la plus brève possible et tout doit être mis en œuvre pour libérer les enfants placés en rétention et les placer dans des lieux d'hébergement appropriés. Lorsque des enfants sont placés en rétention, ils doivent avoir la

448 Selon l'UNICEF, en cas de demande de réunification de l'enfant avec sa famille dans l'État d'accueil, les tribunaux nationaux doivent également veiller à ce que les parents n'exploitent pas leur enfant dans le but d'obtenir un permis de séjour dans ce pays. Voir UNICEF, Application judiciaire de l'article 3 de la CRC en Europe, p. 104. Voir également HCR (2008), Principes directeurs du HCR relatifs à la détermination de l'intérêt supérieur de l'enfant, mai 2008.

possibilité de pratiquer des activités de loisirs, y compris des jeux et des activités récréatives adaptés à leur âge. Selon le même article, les enfants non accompagnés ne peuvent eux aussi être placés en rétention que dans des circonstances exceptionnelles et tous les efforts nécessaires doivent être déployés pour les libérer dans les plus brefs délais. Ils ne doivent jamais être placés en rétention dans des établissements pénitentiaires, mais hébergés dans des centres disposant de personnel et d'installations qui tiennent compte des besoins des personnes de leur âge. Ils doivent être hébergés séparément des adultes.

L'article 17 de la directive « retour » prévoit le placement en rétention d'enfants et de familles dont la demande d'asile a été rejetée sous réserve de certaines conditions. Toutefois, lorsqu'il s'agit d'enfants non accompagnés, ceux-ci doivent être placés dans des centres disposant de personnel et d'installations qui tiennent compte des besoins des personnes de leur âge. Il n'existe à ce jour aucune jurisprudence de la CJUE traitant spécifiquement du placement en rétention d'enfants.

Dans le droit du CdE, le placement en détention des enfants a été abordé dans le cadre des articles 3 et 5 de la CEDH.

Exemple : l'affaire *Mubilanzila Mayeka et Kaniki Mitunga c. Belgique*[449], porte sur le placement en détention d'un enfant non accompagné. Une enfant de cinq ans avait été placée en détention dans un centre de transit pour adultes pendant deux mois, sans bénéficier d'un soutien approprié. L'enfant avait voyagé depuis la République démocratique du Congo sans les documents de voyage nécessaires dans l'espoir de retrouver sa mère, qui avait obtenu le statut de réfugié au Canada. L'enfant a ensuite été rapatriée en République démocratique du Congo, bien qu'aucun membre de sa famille ne l'y attende pour la prendre en charge. La CouEDH avait considéré qu'en l'absence de tout risque que l'enfant ne cherche à se soustraire à la surveillance des autorités belges, sa détention en centre fermé pour adultes ne répondait à aucune nécessité. La Cour a également noté que d'autres mesures, telles que le placement dans un centre spécialisé ou dans une famille d'accueil, prenant davantage en considération l'intérêt supérieur de l'enfant, tel que consacré à l'article 3 de la CRC, auraient pu être prises. La CouEDH a conclu à l'existence de violations des articles 3, 5 et 8 de la CEDH.

449 CouEDH, *Mubilanzila Mayeka et Kaniki Mitunga c. Belgique*, n° 13178/03, 12 octobre 2006.

D'autres cas ont souligné le caractère illégal du placement en détention, même lorsque l'enfant en question était accompagné d'un de ses parents.

Exemple : dans l'affaire *Muskhadzhiyeva et autres c. Belgique*[450], la CouEDH a considéré que le placement en détention administrative, pendant un mois, d'une mère et de ses quatre enfants âgés entre sept mois et sept ans dans un centre de transit fermé constituait une violation de l'article 3 de la CEDH. Dans ses conclusions, la Cour a attiré l'attention sur l'inadaptabilité du centre à la détention d'enfants, ayant de sérieuses conséquences sur leur état psychologique.
